## INSTRUCTIONS

GENERAL: Send an original copy of the application, exhibits and \$250.00 fee to U.S. Dept. of Agriculture, Agricultural Marketing Service, Grain Division, 6525 Belcrest Road, Hyattsville, Maryland 20782. (See Section 180.175 of the regulations and rules of practice.) Retain one copy for your files. All items on the face of the form are self-explanatory unless noted below.

### ITEM

- 5 Insert the date the applicant determined that he had a new variety based on the definition in Section 41 (a) of the Act and decision is made to increase the seed.
- 13a First, give the genealogy, including public and commercial varieties, lines, or clones used, and the breeding method. Second, give the details of subsequent stages of selection and multiplication. Third, indicate the type and frequency of variants during reproduction and multiplication and state how these variants may be identified. Fourth, provide evidence on stability.
- 13b First, give any special characteristics of the seed and of the plant as it passes through the seedling stage, flowering stage and the fruiting stage. Second, describe the mature plant and compare it with a similar commercial variety grown under the same conditions, and indicate the differences.
- 13c A supplemental form will be furnished by the PVPO to describe in detail a variety for each kind of seed.
- 13d Provide complete data indicative of novelty. Seed and plant specimens or photographs of seed and plant comparisons clearly indicating novelty may be submitted. Seeds submitted may be sterile.
- 13e Indicate whether applicant is the actual breeder, the employer of the breeder, the owner through purchase or inheritance, etc.

## 13A. Exhibit A. Origin and Breeding History of the Variety

McNair 701, C.I. 15288, is a reselection from McNair 2203, C.I. 15228, which originated from a F<sub>4</sub> selection at the Virginia Agricultural Experiment Station in 1964. It was from the following hybrid: Redcoat sib//Norin-10/Brevor/6/Seneca/5/Asosan/3/Supreza/Redhart//Chancellor/4/Transfer.

Reselections from the yield test were grown as head-rows in 1966-67 and in single 12' rows in 1967-68. Of 20 selections in this group, 3 were found to be slightly different from the others. Instead of roguing and bulking the uniform lines, as originally planned, all 20 went into a strains test in 1968-69. The original selection, number 2203, had shown good resistance to leaf fust (*Puccinia recondita tritici*) but to be segregating for powdery mildew (*Erysiphe graminis*). Of the 20 selections, 10 were found resistant to powdery mildew as well as to leaf rust. The mildew resistant group produced an average of 66.8 bushels per acre compared to 57.8 for the non-resistant group. In 1969-70 a drill strip was planted to each of the 10 mildew resistant lines as well as continuing the testing for yield. In these drill plots the same 3 selections which appeared to be slightly off-types in 1969 showed the same irregularities in 1970 and were discarded. The other 7 were bulked and became 701. The identities of the seven lines are being maintained however, prior to the breeder generation. At present our only reason for maintaining the identity of each line is because it is convenient to do so.

The only variants seen in these 7 lines are a few plants, less than .05%, with white, rather than brown chaff. To date it is not clear whether these are normal segregates or not.

McNair 701 will be maintained by reselecting a number of heads from each of the 7 lines, growing these in head-rows and roguing any off-types. The remainder will be grown the following year in 12' 4-row plots, rogued if necessary and then bulked. This process will continue, with the opportunity of eliminating one or more of the 7 components if this becomes advisable due to previously unobserved differences in the lines.

13B.

~~12B.~~ Exhibit B. Botanical Description of the Variety

McNair 701 is an early variety, maturing 5-6 days ahead of Blueboy. It has a short, reasonably stiff straw with brown chaff. It has good resistance to races of leaf rust and powdery mildew which normally occur in the southeast, as mentioned in Exhibit A.

## 13D. Data Indicative of Novelty

McNair 701 is recognizable by a combination of three characters- semidwarf habit, earliness, and brown chaff. It had an average height of 99 cm. at 16 locations across the South during 1970-71 and was 3-7 days earlier on the average than other semidwarfs. At individual locations in its adapted area it was as early as or earlier than any presently released varieties and was the only one with brown chaff. The large kernel size (averaging over 40 gm/Mk) is a secondary distinguishing factor. McNair 701 is further distinguished in those areas of Georgia where Hessian fly is a problem, by its resistance to the prevalent races of this insect pest.

~~12E.~~ Exhibit E. Statement of the Basis of Applicant's Ownership

McNair 701 is the property of McNair Seed Company. This variety was developed by Dr. Gordon K. Middleton and J. R. Bennett, who were employed by McNair Seed Company during the time of its development. All costs of development were borne by McNair Seed Company.
