# A Study of the Dairy Forward Pricing Pilot Program And Its Effect on Prices Paid Producers for Milk

## Chapter 1

### Introduction

The Consolidated Appropriations Act of 2000 amended the Agricultural Marketing Agreement Act of 1937<sup>1</sup> to mandate the implementation of a Dairy Forward Pricing Pilot Program (Program) through December 31, 2004. The law allows proprietary milk handlers<sup>2</sup> regulated under the Federal milk order program to contract for future deliveries of milk from milk producers or their cooperative associations at prices exempt from minimum Federal milk marketing order blend prices. The program is voluntary, and the exemption applies only to milk used for nonfluid purposes. The law further requires that a study be conducted on the Program to determine the impact of forward contracting on milk prices paid to producers in the United States. The results of the study were initially to be provided to Congress no later than April 30, 2002, but that date was later extended to fall, 2002. The extension allowed for the completion of the study based on data received through questionnaires, which were originally scheduled to be mailed during the period that anthrax disrupted mail deliveries.

#### *Forward Contracting in the Dairy Industry*

In its simplest form, a forward contract between a milk buyer and a milk producer (or cooperative) is an agreement to sell a stated quantity of milk, for a stated period into the future, at a stated price.<sup>3</sup> A forward contract is a type of risk management instrument that has potential benefits to both parties. Producers and handlers are able to “lock in” prices, thereby reducing risk associated with price and income volatility and enhancing their ability to obtain new or continued financing. A forward price contract is a tool that can be used alone or in conjunction with other pricing tools to manage price risk.

---

<sup>1</sup> Section 23 of the Agricultural Adjustment Act (7U.S.C. 601 et seq.), reenacted with amendments by the Agricultural Marketing Agreement Act of 1937, as enacted in Public Law 106-113 (113 Stat.1501A -519), signed into law on November 29, 1999. See Appendix A for the legislative language.

<sup>2</sup> Cooperative associations acting as milk handlers may participate in the Program to the extent that they receive pooled milk from non-member producers or other cooperatives.

<sup>3</sup> For a general discussion of agricultural risk management, see **Managing Risk in Farming: Concepts, Research, and Analysis**, by Joy Harwood, Richard Heifner, Keith Coble, Janet Perry, and Agapi Somwaru, Economic Research Service, U.S. Department of Agriculture. Agricultural Economic Report No. 774. <http://www.ers.usda.gov/publications/aer774/aer774.pdf>

It is common for dairy cooperatives to enter into forward contracts with their members. Prices paid by dairy cooperatives to their members are not subject to Federal order minimum blend prices. By contrast, prior to the Program, proprietary handlers receiving milk pooled under Federal marketing orders<sup>4</sup> had limited ability to forward contract with producers or dairy cooperatives delivering to them. Such handlers could forward contract, but they were not allowed to pay less than the Federal minimum order blend price to their producers for pooled milk. A handler choosing not to pool a producer's milk could pay the producer less than the Federal order blend. The Program was enacted to expand opportunities for forward price contracting between producers and handlers.

In this study, "eligible handlers" are those handlers that have been enabled to enter forward priced contracts with Federal minimum order price exemption. Since dairy cooperatives receiving only milk from member producers do not have a Federal order minimum price requirement, the Program does not apply to them. Eligible handlers would include proprietary handlers and cooperative handlers that receive milk from sources other than their own members. Plants owned by eligible handlers are referred to as "eligible plants." Likewise, "eligible producers" are those producers that have been enabled to enter forward priced contracts with Federal order price exemption. For the most part, these are independent producers who are not members of cooperatives. However, some producers are members of bargaining cooperatives that do not have a payroll. These producers are paid directly by a proprietary handler subject to Federal minimum order pricing and are therefore eligible producers for the Program.

### *Description of Program*

The Program became effective July 19, 2000, and will expire December 31, 2004. Regulatory requirements are quite limited and apply only to initial contract length; handlers' milk eligible for contracting; dates for signing, filing and making payment; and a disclosure form. (See Appendix B for the final rule published in the *Federal Register*.) Otherwise, milk handlers and producers, or their dairy cooperatives, are free to price milk under forward contracts through any type of mutual agreement. For example, even though milk on the Appalachian Order is accounted for on a skim milk and butterfat basis, forward contracts may be written to pay for milk on a protein, butterfat, other solids, and somatic cell count basis. However, in such markets, the market administrators will continue to account for milk on a volume and butterfat basis and may not have data on component weights and tests. Therefore, the producer will not receive data from the market administrator's office to compare the contract price against the buying handler's pay price for non-contract milk. Furthermore, there are numerous reference milk prices that may be used in writing a contract. Some handlers may offer to contract at a price comparable to the Class III price and add to that a producer price differential and

---

<sup>4</sup> For a general discussion of milk pricing and Federal milk marketing orders, see **Milk Pricing in the United States**, by Alden C. Manchester and Don P. Blayney, Economic Research Service, U. S. Department of Agriculture. Agricultural Information Bulletin Number 761. <http://www.ers.usda.gov/publications/AIB761/>.

premiums, while other handlers may offer a price comparable to the milk order blend price plus premiums.<sup>5</sup>

A handler can only forward contract through the Program for milk to be used for nonfluid purposes, milk classified as Class II, III, and IV. If a handler's volume of milk for nonfluid drops below the amount of milk covered by forward contracts and the contract price is below the order's minimum blend price for the month, the handler is required to pay the higher minimum blend price for the quantity of over-contracted milk. The handler may determine which producers get the higher minimum order price for the over-contracted milk. If the handler fails to indicate which milk is over-contracted milk, the market administrator prorates the quantity of over-contracted milk to each producer having a forward contract with the handler. If a handler's contract milk exceeds the handler's volume of milk used in manufacturing and the contract price exceeds the order's minimum blend price for the month, the issue is moot and the handler continues to pay the producer the agreed-upon contract price for the milk covered by the contract.

In order to help dairy farmers adjust to forward contracting, any first-time contract under the Program is limited to 12 months. Thereafter, the producer or dairy cooperative may contract for a longer period of time, but the exemption from paying minimum Federal order blend prices provided by the Program extends only through December 31, 2004.

Participation in the Program is voluntary for dairy farmers or their dairy cooperatives and handlers. For each contract, the handler must provide a fact sheet and disclosure statement to help insure that producers or their dairy cooperatives understand that contracting is voluntary and that they are giving up the minimum price protection provided by Federal milk orders. A signed disclosure statement must be on file with each contract in the market administrator's office before the contract can be recognized as part of the Program. (See Appendix C for the fact sheet and disclosure statement and for Program questions and answers.) Handlers must submit a copy of their forward contracts under the Program to the market administrator's office of the market under which the milk will be regulated. The market administrator reviews each contract to ensure that it complies with regulations. Forward contracts must be signed and dated by the contracting handler and the producer or dairy cooperative prior to the first day of the first month for which they are to be effective and must be in the possession of the market administrator by the fifteenth day of that month. Payments for milk covered by a forward contract must be made on or before the dates applicable to payments for milk that is not under forward contract under the respective Federal orders. This facilitates administration of the Program and eliminates the possibility of disparate treatment that could result from having different payment dates for contract and non-contract milk. Market administrators are not responsible for enforcing forward contracts.

---

<sup>5</sup> Variation in the method of pricing can cause difficulty in comparing forward contract prices to Federal order prices. In the proposed rule for the Program, USDA had proposed that the basis for pricing milk under the Program be the same as the basis for pricing regulated milk that is not under forward contract. In the four orders with butterfat and skim milk pricing, forward contracts would have been required to be written in those terms; in the seven orders with milk component pricing, forward contracts would have been required to be written in terms of those same components. This proposal was dropped because commenters saw it as an obstacle to effectively hedging contract prices.

### *Milk Price and Situation Forecasts During the Study Period*

This study covers Program forward contracts with deliveries from September 2000 through March 2002. Only four producers delivered contract milk to two plants in August 2000, the first month of program operation. Therefore, this study considers September 2000 as the first full operational month of the program. March 2002 is the most recent month for which we have comprehensive Program data compiled and submitted from all Federal marketing orders.

Since 1980, milk production has increased at an annual average rate of about 1.2 percent. However, in 2001, milk production declined by about 1.4 percent, causing farm-level milk prices to increase sharply. In 2001, the Federal order blend price averaged \$14.90 per hundredweight (cwt.), reaching a high of \$17.08 per cwt. in September 2001 (Table 1-1). The Class III price, the price upon which many contracts were based, averaged \$13.10 per cwt. in 2001 and reached a high of \$15.90 per cwt. in September. The Class III price in 2001 averaged 35 percent higher than in 2000 (Table 1-2).

United States Department of Agriculture's (USDA) Class III price projections for the study period are compared with actual Federal order minimum Class III prices in Table 1-3. Projected Federal order Class III prices for 2001 were consistently projected for less than the actual announced Federal order Class III prices with the exception of the 4<sup>th</sup> delivery quarter. Projections for 2000 and 2002 tended to be higher than realized prices.

An examination of futures market prices reveals similar expectations. Table 1-4 displays a comparison of average Chicago Mercantile Exchange (CME) Class III futures prices for the study period with actual announced Federal order Class III prices. In 2001, futures prices were below realized prices with only a few exceptions. As with the USDA projections, Class III futures prices for 2000 and 2002 tended to be higher than actual announced Class III prices.

These forecasts and others did not anticipate the changing supply and demand conditions of 2001. As a result, contract prices for 2001 tended to be much lower than non-contract market prices for milk. We believe that if the study had covered a longer period of time, the results may have been substantially different. As stated in USDA's Final Rule for the Dairy Forward Pricing Pilot Program:

“Over time, we would expect to see forward prices to producers below the blend price in some months and above the blend price in other months.... On balance, the pluses and minuses should cancel each other out since, one could argue, the desired objective of forward contracting is to remove the uncertainty and variability in prices...”<sup>6</sup>

### *Attributes of Contracts*

There were numerous variations in how contracts were structured over the study period. Contract volumes varied greatly. The largest contract was a 12-month contract for about 168 million pounds of milk, or about 14 million pounds per month. On the other end of the scale, contracts for 10,000 pounds of milk per month were not uncommon.

The delivery periods covered by contracts varied greatly. Contracts ranged from 1 month to 18 months in length. Some contracts provided for the same price each month while others provided for separate prices each month. For this analysis, the latter type contracts were considered separate contracts for each month. For example, if a producer signed a contract to deliver 100,000 pounds of milk in each of the months from January through June 2001 at a different specified price each month, this study views such an arrangement as 6 separate monthly contracts.

The time from contract signing to the first delivery under the contract ranged from 1 to 20 months. Table 1-5 displays a cross tabulation of the lengths of contracts and time from signing to date of first delivery. As discussed above, producers were limited to 12 months for the duration of the first contract signed. However, it was not uncommon for producers to sign multiple contracts over a short period of time that covered more than 12 months of future deliveries. A large number of producers signed 12-month contracts that were not scheduled for initial delivery until 2 to 4 months later. Many producers signed 1-month contracts for delivery from 1 to 9 months after signing.

There were several ways in which handlers defined the product to be delivered under contracts. Most commonly, contracts specify pounds of milk to be delivered. Of these contracts, some further required the remainder of the producer's production to be delivered at the handler's non-contract price. Some contracts specified only the pounds of butterfat, protein, and other solids to be delivered, rather than pounds of milk. Other contracts specified milk pounds with minimum requirements for components. Many contracts specified a certain percentage of the producer's marketings – up to 100 percent – to be delivered at the contract price. There were 7 cases of complementary contracts where a specified quantity was to be delivered for one contract price, and the balance of the producer's deliveries would be accepted and paid at another contract price.

Table 1-6 delineates the contract pricing methods according to the defined product to be delivered. The most common type of pricing method specified payment per hundredweight of milk. For these contracts, contract-milk prices were computed as they would be for non-contract milk. Then a contract adjustment was applied based on the difference between the contract price and the announced Class III price at 3.5 percent butterfat. In some contracts, the mechanics concerning this price adjustment were absent from the contract or were only referred to in vague terms.

Many contracts were priced in terms of components, usually butterfat, protein, and other solids. Some contracts were priced in terms of butterfat and nonfat solids. Contracts in

the Southeast were written in terms of butterfat and skim milk—the same terms used in the Southeast Federal milk order. There were some contracts that were stated in terms of a cheese yield value. A formula was used to convert the cheese yield value to a milk price.

Contracts that define delivery volumes in *pounds* perhaps carry some risk for the producer—risk that producers with contracts that define delivery volumes in terms of *percentages of production* do not incur—because of the potential for coming up short on deliveries. The data indicates that some producers—particularly those pooled in the Upper Midwest order—did not always deliver the contracted amount. There also were some producers who came up short on deliveries in the Central, Southeast, and Mideast orders. The data indicates that there were no producers who delivered less than the contracted amount in the Pacific Northwest or Western orders. Table 1-7 displays the short deliveries for the Upper Midwest. Table 1-8 displays the short deliveries for the Central, Southeast, and Mideast orders combined. Some contracts contained provisions for penalties for short deliveries.

#### *Data Used for the Analysis*

Two types of data were collected for the study. In order to evaluate the participation and the impacts of the Program on producers and handlers, Federal milk order market administrators collected data on contracted milk volumes and prices. In order to evaluate the industry's perception of the Program, surveys were used to gather facts and opinions from participating and non-participating producers, cooperatives, and handlers. Further, information on the attributes of participants and non-participants were collected in the surveys.

Payroll and Contract Data. Each Federal milk order market administrator's office provided data concerning forward contracts from payroll records and copies of the contracts that they received. Data were collected for the 19-month period of September 2000 through March 2002. Monthly data are from four categories: (1) Federal order data, including number of producers, number of plants, and volume of producer deliveries; (2) contract data, including prices, quantities, and dates; (3) participating producer data, including quantities actually delivered and prices received; and (4) participating handler data, including milk volumes received and number of eligible producers per handler.

For years some dairy cooperatives have offered their member-producers the opportunity to lock in milk prices for future deliveries. Since some dairy cooperatives compete with proprietary handlers for a milk supply, the expanded forward contracting opportunities for proprietary handlers may have had an effect on contracts offered by dairy cooperatives to their members. Specific information concerning such contracts is unavailable to us. We also do not have data on forward contracts of cooperatives or proprietary handlers that were in effect before the Program began. Consequently, we are

unable to compare forward contracts in effect prior to the Program with contracts included in the Program.

The letter R that appears in some of the tables denotes restricted data. Section 8d of the Agricultural Marketing Agreement Act of 1937, as amended, prohibits the Secretary of Agriculture from releasing any information of a proprietary nature. Data provided to the Secretary by fewer than three parties is considered restricted because aggregation of such information may not prevent individual disclosure.

Survey Data. To obtain market participant perceptions and attributes, questionnaires were designed for dairy producers, cooperatives, and plants (See Appendix E). On or about April 10, 2002, each Federal order market administrator's office sent questionnaires by U.S. mail to:

- Eligible producers -- all producers whose milk was pooled on a Federal order during June 2001 and who were not members of a cooperative association, with the exception of certain cooperative producers paid by proprietary handlers. Additionally, questionnaires were sent to producers who had been delivering to Kraft's Melrose, Minnesota, plant prior to May 2001.
- Eligible plants -- all proprietary plants and cooperative plants (excluding cooperative plants only receiving milk from members) that received Federal order pooled milk during June 2001. A questionnaire was sent to each plant, regardless of whether the plant was owned by a single-plant firm or one of several owned by a multi-plant firm.
- All cooperatives that delivered Federal order pooled milk to a proprietary plant during June 2001. Each cooperative was sent only one questionnaire even though several cooperatives have milk pooled in more than one Federal order.

In concert with e-government initiatives, questionnaires also were provided electronically on the Internet, and respondents were given a choice of responding by postage-paid return mail or on the Internet. Questionnaires were sent to 16,686 eligible producers, to 144 cooperatives, and to 705 plants (including 96 cooperative plants). Response rates were 21.9 percent for producers, 35.2 percent for plants, and 60 percent for cooperatives. Of the 4,140 total responses, 132 were through the Internet. Of the 132 Internet responses, 65 were from producers.

1/ Some contracts specified delivery over multiple months but separate prices for each month. For this analysis, such arrangements were counted as multiple one-month contracts. For example, if a producer signed a contract to deliver 100,000 pounds of milk in each of the months from January through June 2001, at a different specified price each month, this analysis views such an arrangement as 6 separate monthly contracts.

2/ There were 2 contracts that scheduled deliveries in the same month as they were signed. The first deliveries under these contracts were not included in the Pilot Program.

**Table 1-6: Contract Pricing Method by Defined Product to be Delivered****Product: Pounds of milk**

## Chapter 2

### Milk Producers as Parties to Forward Contracts

#### *Characteristics of Contracting Producers*

An average of 653 producers per month participated in the Dairy Forward Pricing Pilot Program (Program) from September 2000 through March 2002.<sup>1</sup> The number of producers whose milk was pooled in the Federal order markets averaged 66,555 per month, and producers eligible for the program averaged 16,616 per month over the same period. Eligible producers comprised about 25 percent of pooled producers. Contracting producers averaged about 4 percent of the eligible producers and about 1 percent of all Federal order producers (Table 2-1).

Contracting producers had farms located in 16 states (Table 2-2). Wisconsin and Minnesota producers comprised over three-quarters of participants, with Wisconsin having 45 percent and Minnesota having 32.6 percent.

Producers with milk pooled in seven of the eleven Federal Milk Marketing Orders participated in the Program during the study period. These included the Central, Mideast, Northeast, Pacific Northwest, Southeast, Upper Midwest, and Western orders. We refer to these orders as the “Seven Orders.” The Upper Midwest had the largest numbers of both producers and handlers participating. Much of the data concerning each of the other six orders is restricted since the data are for less than three handlers or producers. For this reason, most of the data is aggregated for the six orders other than the Upper Midwest. We refer to these orders as the “Six Orders.”

Enumerated in Tables 2-1, 2-3, and 2-4 respectively, are the numbers of producers delivering pooled milk, producers eligible for the Program, and contracting producers for all Federal orders, the Upper Midwest, and the Six Orders. Forward contracts for the beginning of 2001 appeared to be attractive relative to price forecasts, and many of the contracts were for the calendar year. As a result, the participation rates increased markedly in 2001 compared to the last third of 2000. Participation peaked in April of 2001 with 1,141 producers—78.6 percent of the 1,452 total participants for the study period—delivering milk under forward contract.

The number of contracting producers declined by 361 in May of 2001. The drop in the number of producers primarily is due to the sale of a proprietary plant to cooperative associations. When the cooperatives purchased the plant and began paying producers, the contracts were no longer part of the Program. In May 2001, there was also a shift of contracts from the Upper Midwest to the Mideast order. While contracting producers

---

<sup>1</sup> Only four producers delivered contract milk to two plants in August of 2000, the first month of program operation. Therefore, this study considers September 2000 as the first fully operational month of the program.

under the Upper Midwest order dropped from 898 in April to 375 in May, the number increased in the Six Orders from 243 to 405.

Another sharp drop in the number of contracting producers under Federal orders occurred at the beginning of 2002—from over 700 in December 2001 to less than 175 in the first quarter of 2002. It is likely that many producers chose not to participate in 2002 as the result of losses on contract milk throughout much of 2001. At least one handler that offered contracts for 2001 was unable to contract for any milk in the first quarter of 2002. Also, it is possible that given less interest from producers, ambivalent handlers felt less competitive pressure to offer contracts and decided not to offer contracts for 2002.

### *Contract Producer Milk*

Pooled deliveries over the study period averaged 9,969 million pounds per month, and eligible producer deliveries averaged 2,449 million pounds per month (Tables 2-5). As noted above, a monthly average of 66,555 producers had milk pooled in Federal orders, and 16,616 were eligible to participate in the Program (Table 2-1). From these monthly averages for milk volumes and producers numbers, we compute monthly averages of 150 thousand pounds per pooled producer and 147 thousand pounds per eligible producer. The monthly average per participating producer was 358 thousand pounds (Table 2-8). Thus, the average contracting producer delivery was more than twice the average producer delivery for all Federal orders. Moving into 2002, the difference was greater with the monthly average being 863 thousand pounds delivered per contracting producer.

Although 3.9 percent of the eligible producers per month on average participated in the Program during the study period (Table 2-1), contract milk from these producers averaged 5.3 percent of eligible producer milk (Table 2-5). However, contract milk deliveries represented about only 1.3 percent of the total pooled milk during the study period.

Producers' contract signing and milk delivery activity is aggregated by quarter in Table 2-6. The most active quarter for signing contracts was the fourth quarter of 2000. In the Upper Midwest, the greatest number of producers signing contracts in the fourth quarter of 2000 delivered contract milk in the first and second quarters of 2001. In the Six Orders, the greatest number of producers signing contracts in the fourth quarter of 2000 delivered contract milk in the second and third quarters of 2001.

Although the number of contracting producers fell sharply in 2002, the proportion of participants with large deliveries increased sharply. Contracting producers are categorized according to the size of total monthly deliveries in Table 2-7 and graphed in Figure 2-1. The smaller producers—those with total deliveries of less than 100,000 pounds per month—made up the largest category on average at 43 percent. Producers delivering 100,000 to 400,000 pounds per month came in a close second, making up about 40 percent of the total number on average. The percentage of large producers in the program grew from around 3 percent at the start of the Program to around 23 percent

at the end of the study period. Most of this change is due to a larger decrease in participation by smaller producers.

The relative participation of small producers to large producers over the study period can be observed in the monthly averages of contract and total pounds delivered by contracting producers. Table 2-8 displays these averages for the Upper Midwest Federal milk market order, the Six Orders, and the Seven Orders. Participants in the Upper Midwest have generally been smaller on average than those in the Six Orders. In the Upper Midwest, the average of total deliveries per contracting producer started at about 123 thousand pounds per month at the beginning of the study period and grew to about 776 thousand pounds per month by the end of the study period. The Six Orders' average monthly deliveries began in the range of 400 to 600 thousand pounds per month in 2000, dipped down into the range of 300 to 400 thousand for 2001, and shot up to over 1 million pounds per month in 2002. The average monthly deliveries per contracting producer are displayed in Figure 2-2.

Although there are some exceptions, deliveries on average for contracting producers typically ranged from 60 percent to 80 percent of total deliveries. However, the distribution of producers by contract delivery as percentage of total deliveries is widely dispersed as displayed in Table 2-9. More than half of the contract producers fell in the 25 to 75 percent range. More than a fourth of the participating producers contracted for 100 percent of total deliveries.

In each of these tables, it is inappropriate to add numbers of producers across for signing quarters. Producers who delivered over multiple quarters would be counted more than once. Likewise, it is inappropriate to add numbers of producers down for delivery quarters. Producers who signed multiple contracts over more than one quarter for delivery in the same quarter would be counted more than once.

1/ Program refers to Dairy Forward Pricing Pilot Program.

2/ Seven Orders refers to the Federal Milk Marketing Orders with participation in the Program. These include the Central, Mideast, Northeast, Pacific Northwest, Southeast, Upper Midwest, and Western orders. Six Orders refers to all of these orders except for the Upper Midwest.

1/ Program refers to Dairy Forward Pricing Pilot Program.

2/ There were some contracts, priced per hundredweight, for which contract payment adjustments were made to producer payments based on the contract pounds that were more than 100 percent of pounds actually delivered. Contract payment adjustments were based on the difference between the contract price and the Class III price at 3.5 percent butterfat. Such adjustments can add to, or subtract from, non-contract prices that would have otherwise been received.

Figure 2-1: Percentage of Participating Producers By Pounds of Total Deliveries Per Month

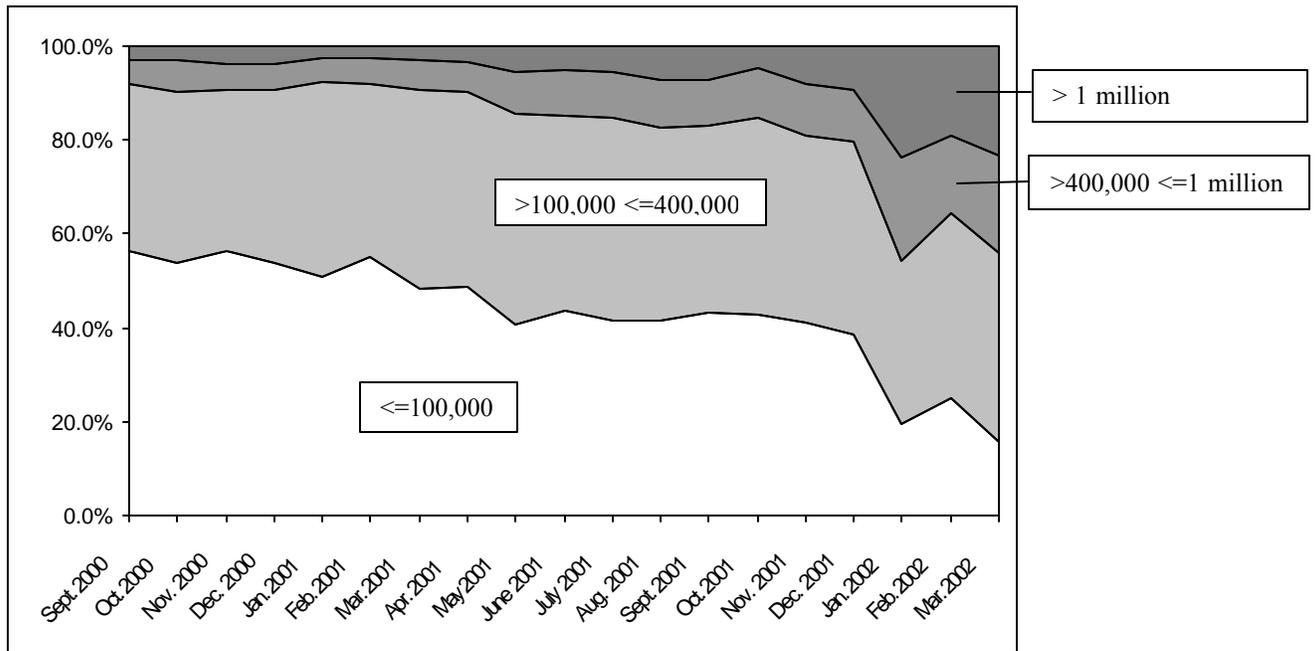

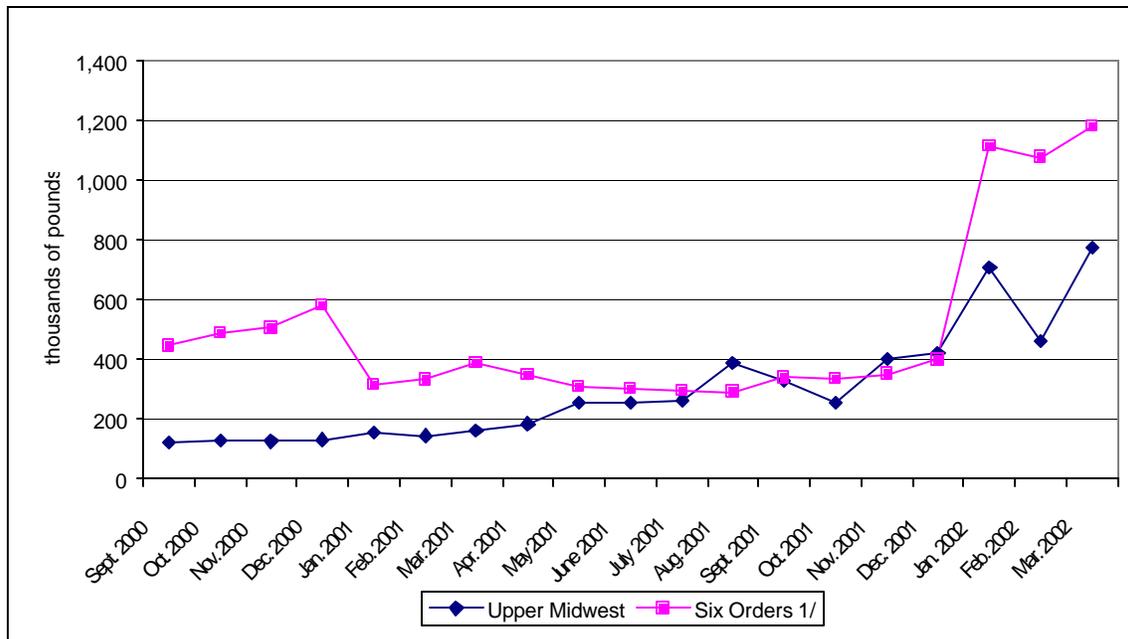

Figure 2-2. Average Total Pounds Per Participating Producer Delivered Per Month

1/ Six Orders refers to the Federal Milk Marketing orders other than the Upper Midwest with participation in the Program. These include the Central, Mideast, Northeast, Pacific Northwest, Southeast, and Western orders.

## Producer Questionnaire Response

The producer questionnaire was designed to provide some insight into the factors that affect producers' decisions on whether or not to participate in the Program. Questions were asked to determine whether producers were accustomed to using risk management tools in their business, whom they relied upon for advice concerning the Program, why they did or did not participate, and whether they were satisfied with the results.

Appendix E includes a copy of the questionnaire that was sent to 16,686 producers who were eligible to participate in the Program. Responses were tabulated and statistical tests were used to analyze differences in response rates and differences in effects of variables on participants and non-participants.<sup>2</sup>

### *Response Rates and Program Participation Rate*

Of the 16,686 questionnaires that were sent to eligible producers, 3,646 responses were received for an overall response rate of 21.9 percent. Responses were received from producers in all orders (Table 2-10). The largest response rates are for those orders where only one or very few surveys were sent: 100 percent response for Arizona-Las Vegas, 100 percent for Florida, and 54.5 percent for the Southwest. The Southeast had the lowest response rate of 14.9 percent. The remaining orders had response rates ranging from 18 to 31 percent.

Of the 3,646 responses received, 313 (8.6 percent) indicated that they had participated in the Program (Table 2-11). In this discussion, we refer to data received from Federal Milk Order Market Administrators as population data while we refer to data obtained from the questionnaire as survey data. From the population data, we are able to estimate the response rates of participants vs. non-participants. The best estimate of the number of eligible producers equals the number of questionnaires sent—16,686. According to the population data, 1,452 (8.7 percent) producers participated in the program over the study period. From these numbers, we estimate the number of participants and non-participants that did not respond. Both Program participants and non-participants are well represented in the survey. The response rate for participants is about 21.6 percent while the response rate of non-participants is 21.9 percent (Table 2-12). The difference between response rates of participants and non-participants is statistically insignificant. The participation rate of respondents, 8.6 percent, is very close to the 8.7 percent participation rate of the population.

---

<sup>2</sup> For analyses that compare two groups, i.e. respondents v. non-respondents or participants v. non-participants, two-way frequency table tests were used. Results of these tests appear in footnotes of the tables. A high chi-square value with a corresponding low probability value indicates that there are significant differences between the two groups with respect to the variable being analyzed. A probability value of .01, for example, indicates that there is only a 1 percent probability that differences between the two groups with respect to the variable are due to chance alone. Non-responses, shown as "Unknown" in the tables are not figured in the chi-square calculations. For more discussion concerning two-way frequency table tests, see *Applied Statistics and the SAS Programming Language* by Ronald P. Cody and Jeffrey K. Smith, Prentice Hall, 4<sup>th</sup> edition, Upper Saddle, New Jersey, pp. 75-78.

### *Participation versus Non-Participation*

Program participation rates of responding producers did not differ greatly by size of producers. Respondent participation rates are highest, about 10.5 percent for the two middle size groupings (marketings of 100,000 to 400,000 pounds per month and 400,000 to 1,000,000 pounds per month), followed by a 9 percent participation rate for producers marketing greater than 1,000,000 pounds per month, and a 6 percent participation rate for producers marketing less than 100,000 pounds per month. There is some dissimilarity between the population and survey data with respect to size of participants. Of the participating respondents to the survey, the highest percentage, 45.7 percent, had monthly marketings of 100,000 to 400,000 pounds per month. The second largest group with 34.2 percent had marketings of less than 100,000 pounds per month (Table 2-13). The population data indicate that, as a monthly average, the highest percentage of participating producers, 43 percent, had marketings of less than 100,000 pounds per month. The group with 100,000 to 400,000 pound marketings per month made up 39.7 percent of the average number of participants (Table 2-7). With the survey, all producer size categories are well represented even though the distribution is not a perfect representation of the population.

Responding eligible producers are concentrated in the Upper Midwest (1,188), the Mideast (993), and the Northeast (760), followed by the Central (272) orders. (See Table 2-14.) The Upper Midwest order had the most contracting respondents with 158 (50.5 percent), followed by the Mideast order with 65 (20.8 percent) and the Central order with 53 (16.9 percent). The rest of the orders had less than 10 percent each. Both the population data and the survey data indicate that the Upper Midwest had the greatest number of participating producers. However, the population data indicate that the monthly average of participants with milk pooled on the Upper Midwest order was about 64.3 percent of total participants, considerably more than the 50.5 percent indicated by the survey (Tables 2-1 and 2-3). The survey indicates that the Central order had the highest percentage of participating respondents, 20 percent. Although not displayed in this report, this is consistent with the population data which shows that the Central order had the highest participation rate in most months.<sup>3</sup> Both the survey and the population data indicate that the Upper Midwest had the second highest participation rate. The survey participation rates for the other orders are fairly consistent with the population participation rates.

The States with highest respondent participation rates are South Dakota at 34.3 percent, followed by Minnesota at 25.2 percent, Idaho at 24 percent, Illinois at 19.7 percent, and Wisconsin at 13.1 percent (Table 2-15). New York, while having more participants than Idaho, South Dakota, or Illinois, had a participation rate of only 4.3 percent. Both the survey and population data indicate that the highest numbers of participating producers were located in Wisconsin and Minnesota. However, the percentage of participating respondents located in Minnesota, 13.1 percent, is significantly lower than the percentage reflected by the population data—32.6 percent. Both the survey and the population data

---

<sup>3</sup> Data is not provided for each order since this could reveal proprietary information relevant to less than three handlers or producers. Data for the Central order is included with the Six Orders in this report.

indicate that participating producers are concentrated primarily in the central upper Midwestern States and that their milk is marketed through the three orders in the central United States. These three orders have a higher proportion of Class III utilization than for all Federal orders.

A major factor associated with respondents contracting under the Program is the use of other instruments such as forward contracts, futures contracts, or options to reduce price risk for fuel, feed, and milk (Table 2-16). Of the participating producers, about 42 percent reported management of fuel or feed price risks, while only about 27 percent of non-participants reported such activities. Over half (53.4 percent) of participating respondents managed milk price risk through methods other than the Program, while only 7.7 percent of non-participants did so. It is likely that many contracting producers evaluated the risk reduction benefit under the Program along with possibilities on the futures and options markets. Contracting producers may have used the Program in conjunction with futures and options contracts.

Significant differences exist between participating and non-participating respondents with respect to number of potential buyers. Of the responding participants, 182 (58.1 percent) reported 2 or more potential buyers of their milk, while 56.4 percent of non-participants reported only 1 potential buyer (Table 2-17). This possibly coincides with a higher degree of competition in areas where forward contracts are more likely to be offered.

Finally, there are significant differences between participants and non-participants with respect to handler offerings. Of the participating respondents, 72.5 percent report that their handlers offered contracts to all producers, as compared to 21.5 percent for non-participating producers (Table 2-18).<sup>4</sup>

#### *Reasons for and Results of Contracting*

Contracting producers were asked why they contracted. Of the responding participating producers, 55.3 percent had only one reason, but 39 percent of them had more than one reason (Table 2-19b). Nearly three-fourths of responding contracting producers (74.4 percent) contracted to assure a more stable cash flow, and 7.0 percent contracted to satisfy lender requirement. Almost 45 percent of the contracting respondents contracted because the offered price was considered attractive (Table 2-19a). Twenty-eight (8.9 percent) participating producers indicated that there were other reasons for participating in the program. Among the comments of these producers, 8 respondents stated that they participated in order to gain experience with the Program, and 5 respondents indicated that a handler representative influenced them to sign.

---

<sup>4</sup> One of the selections for response to this survey question is “Do not know.” Those who marked this selection could have possibly been in one of two groups. They either were not aware as to whether or not their handlers offered contracts, or they were not aware of the extent of the contract offerings. Of the responding participants, 16.6 percent selected “Do not know,” while 60.3 percent of the non-participants marked this selection.

Most prominent among the contracting producers' means of evaluating forward contract prices were the futures markets and the producers' own forecasts—each with about 55 percent (Table 2-20a). Among the other selections, 37.4 percent used other professional forecasts, including those of USDA, universities, and private forecasters, while 20.8 percent of the respondents compared the forward contracts from competing handlers. Twenty-five respondents (8 percent) indicated that they used other means of evaluating contract prices. Among the comments of these producers, 8 respondents stated that a broker assisted them, and 6 respondents commented that they had relied on the handler. Nearly 60 percent used two or more sources of information to evaluate prices (Table 2-20b).

Concern that producers could be pressured into signing contracts “to maintain a relationship with a buyer” led to a second question to directly address the issue (Table 2-21). Only 2.6 percent of the contracting producers strongly agreed. This response is consistent with the reason given by 1.6 percent of the contracting producers who indicated that they signed contracts to maintain a relationship with their buyer (Table 2-19a). An additional 4.6 percent of participants slightly agreed that a contract was necessary to maintain a buyer. However, nearly 75 percent of participants disagreed, either slightly (14.7 percent) or strongly (57.2 percent) that a contract was necessary to maintain a buyer for their milk.

Nearly sixty percent of contracting respondents who realized lower prices than the market levels indicated that they likely will not contract in the future (33.5 percent) or that they will reduce future contract volumes (24 percent). (See Table 2-22a.) Consistent with these responses is the response from 57.8 percent of the contracting producers who thought the price loss was too large of a tradeoff for the price risk avoided (Table 22b). However, 26.2 percent of the contracting producers considered the price loss a reasonable cost to assure a stable price. This question was marked as not applicable by 10.9 percent of the producers who indicated that the contract price exceeded the comparable market price.

### *Non-Participant Characteristics*

Responding producers who did not participate in the Program, 3,313 producers, comprised 91.4 percent of the respondents. Such producers offered a number of reasons for not forward contracting. The primary reason given by 43.9 percent of the non-contracting producers was that their buyer did not offer contracts (Table 2-23a). Similarly, 43.3 percent indicated that they considered the offered contract price to be too low.

About 1 percent of the non-contracting producers reported that their handler denied them a contract. Of those denied a contract, 35.5 percent (11 producers) said they were denied because their volumes of delivery were too small (Table 2-24a). For those who indicated other reasons for denial, comments revealed that a few respondents confused the Dairy Forward Pricing Pilot Program with the Dairy Options Pilot Program, stating that the

program was not offered in their county.

Florida	0	0.0	1	0.0
Totals	313	100.0	3,333	8.6

Chi-square 126.6, DF 5, Prob <.0001

The six orders with the least numbers of responding participants were grouped for the chi-square test.

1/ For the Appalachian order, 3 respondents indicated that they participated in the Program even though there was no participation for that order. These producers may have been pooled on the Appalachian order at the time the survey was taken but on another order when they delivered milk under a Program contract.

## Chapter 3

### Milk Handlers as Parties to Forward Contracts

#### Handler and Plant Participation

A total of 22 handlers participated in the Dairy Forward Pricing Pilot Program (Program) at some time during the study period. These handlers had plants receiving contract milk regulated under 7 of the 11 Federal milk marketing orders (Seven Orders). There were 4 Federal milk orders—Appalachian, Florida, Southwest and Arizona-Las Vegas—for which no contract milk was pooled during the study period of September 2000 through March 2002. Handler participation reached a peak in September and October 2001 when 21 handlers were receiving forward contract milk.

The Federal order market with the greatest number of handlers offering forward contracts was the Upper Midwest. Since January 2001, there have been more handlers receiving contract milk in the Upper Midwest than in all other orders combined (Table 3-1). During the peak period, there were 14 handlers in the Upper Midwest receiving contract milk compared with 10 handlers in the Central, Mideast, Northeast, Pacific Northwest, Southeast, and Western orders combined (Six Orders). For this comparison, a handler with plants in two or more markets in the Six Orders was counted only once.

The number of handlers pooling contract milk under the Mideast order increased from 2 to 3 during the period June through August 2001. This was the result of an Upper Midwest plant pooling on the Mideast order during this period to take advantage of the differences in blend prices. In September, when the Mideast pooling standards returned to a higher level, the handler again became pooled on the Upper Midwest order.

In the Western order, two handlers received contract milk at times during the study period. Initially only one handler was pooling contract milk on that order; however, during the period from January through May 2001, no contract milk was pooled. Then from June 2001, through the end of the year, one handler continuously pooled contract milk on the Western order, but a second handler pooled contract milk only intermittently. During some months this handler pooled no contract milk and in other months pooled milk on both the Western and Upper Midwest orders. This handler, a non-pool plant, could pool milk only to the extent that the handler could associate milk with pool distributing plants regulated under the two Federal orders, and the handler chose not to do this in every month. For the first quarter of 2002, this handler pooled contract milk on the Western order each month.

In the peak months, there were 35 plants regulated under 7 of the 11 Federal milk marketing orders receiving contract milk. See Table 3-2. When a handler owns more than one plant in an order, unit pooling allows the receipts to be combined, and individual producer deliveries to separate plants cannot be determined. Nearly all of these plants were Class III cheese plants, with the exceptions of 2 primarily Class II plants.

The number of plants receiving contract milk under the Program represents a small proportion of the number of plants receiving pooled producer milk under Federal order regulation. On average during the study period, 25 plants received contract milk (Table 3-2). On average, 980 plants received pooled producer milk under the Federal order system each month, of which 691 on average were proprietary plants. Excluding the Class I distributing plants from this group leaves an average of 434 plants that manufactured most pooled milk received into dairy products. Thus, over the study period, the plants receiving Program contract milk represent 2.5 percent of all plants, 3.6 of proprietary plants, and 5.7 percent of proprietary manufacturing plants receiving pooled producer milk. Focusing on proprietary manufacturing plants, the percentage of plants receiving contract milk was at its lowest in October 2000 at 2.5 percent and at its highest in October 2001 at 7.8 percent. For the first quarter of 2002, this percentage was about 6 percent.

The Upper Midwest market, which had the most handlers offering forward contracts, also was the market with the greatest number of Program participating plants—11 plants receiving contract milk on a monthly average basis (Table 3-3). With respect to Program participating plants as a proportion of the proprietary manufacturing plants, the Northeast market ranked first at 15.2 percent, but this represents only 1.2 of its average 7.9 proprietary manufacturing plants.<sup>1</sup> The Upper Midwest market tied for second with the Central market (8.0 percent) with respect to contracting plants as a proportion of the proprietary manufacturing plants. The Central market had the second highest average number of plants receiving contract milk—7.2 plants on a monthly basis. The remaining markets averaged 2.4 plants or less receiving contract milk on a monthly basis.

#### *Contract Milk Relative to Handler Receipts*

To measure the impact of the Program on participating handlers receiving contract milk, the following indicators were constructed: (1) the volume of milk from producers eligible to participate in the Program, (2) contract volumes received, and (3) and eligible producer milk plus bulk milk receipts. Our discussion is limited to pooled milk volumes received by handlers for Federal orders where the handlers' plants received contract milk. This is only part of the milk volumes received by some participating handlers since they may have had plants that received milk pooled but none contracted in other Federal orders, that operated in State-regulated markets, or that operated in unregulated markets. Because some handlers jointly pool milk for multiple plants, we discuss milk volumes of handlers rather than plants, understanding that some handlers operate one or more plants receiving producer milk contracted under the Program.

The total volumes of milk received by the relevant plants of participating handlers are calculated as the receipts of milk from eligible producers plus the receipts of bulk milk

---

<sup>1</sup> Numbers referenced are not necessarily whole numbers because of changes for each order from month to month.

from other plants and cooperatives (Table 3-4).<sup>2</sup> Milk deliveries from eligible producers accounted for 87.5 percent on average over the study period of total milk deliveries to participating handlers.

Average monthly milk deliveries received by these handlers totaled 644.8 million pounds while deliveries of contract milk averaged 130 million pounds, or 20.2 percent during the study period. During 2001, contract milk averaged 167 million pounds monthly, dropping off to 87 million pounds during the first quarter of 2002. The single highest month for contracted milk receipts was September 2001 (205 million pounds), accounting for 25.1 percent of all milk receipts by these handlers. Since eligible producer milk was on average 87.5 percent of the total milk receipts for these handlers, contract milk as a percentage of eligible producer milk would run slightly higher. See Table 3-4 for additional milk delivery data and comparisons by month.

### *Handler Participation by Size*

To determine whether the Program was used more extensively by a particular size handler, participating handlers were arrayed according to total monthly receipts of milk. Three size categories were established: (1) less than 25 million pounds per month; (2) 25 million to 50 million per month; and, (3) more than 50 million per month. (See Table 3-5.)

The Program was used monthly by at least 6 handlers throughout the study period. Some of the monthly variation between the categories is the result of handlers electing not to pool contracted milk every month and of changing pool volumes of handlers. In 2000, participation by handlers in each size category was evenly divided at a constant 2 plants per category each month. From January 2001 through February 2002, the category with the largest handlers, those with monthly receipts of at least 50 million pounds, varied between 4 to 6 handlers. Participation of the largest handlers reached a maximum of 7 in March 2002. The number of handlers in the medium-sized category reached a peak of 6 handlers in June and July 2001, stayed constant at 5 through February 2002, and declined to 3 in March 2002. The number of handlers in the smallest size category increased as 2001 progressed, reaching a maximum of 11 handlers in October 2001. The number of smaller handlers decreased toward the end of 2001 and varied between 6 and 7 handlers in the first quarter of 2002.

---

<sup>2</sup> Contracted pounds received are considered relative to pooled producer milk excluding that from cooperatives and all pooled producer milk plus bulk fluid milk product (FMP) receipts. Bulk FMP receipts include milk from cooperatives. The term “bulk FMP” is used to distinguish these milk receipts from receipts of packaged milk. Our calculations could be short of the actual total milk received by some handlers to the extent that plants receive packaged milk. Most milk contracted through the Program is milk received from eligible producers as defined in Chapter 1. These are mainly independent producers although some cooperative producers are also eligible because they are paid directly by a proprietary handler.

### *Reducing Price Volatility - Contract Milk by Size of Participating Handler*

To determine the usefulness of the program to participating handlers as a hedge against milk price volatility and to measure of the ability of handlers to offer acceptable contracts to producers, the total volume of contract milk was compared against the total milk receipts of the participating handlers. The greater the percentage of milk under contract, the more insulated handlers should be from milk price volatility. This measure was reviewed according to the handler size categories previously delineated and is presented in Figure 3-1.

For participating handlers with less than 25 million pounds of eligible milk deliveries (Figure 3-1,a), 22 percent of the milk delivered to the handlers was under contract in the peak month of January 2001. The proportion of milk under contract declined gradually from February 2001 through March 2002. By the end of the period, participating handlers in this category had less than 5 percent of their total milk supply under contract.

In January 2001, handlers with greater than 25 million pounds but less than 50 million pounds of eligible milk receipts (Figure 3-1,b) on average had 37 percent of their total milk receipts under contract. This percentage dropped to about 21 percent on average for the remainder of the year, and for the first quarter of 2002, the percentage was about 15 percent.

The largest participating handlers had 25 percent of their milk under contract in the first half of 2001 (Figure 3-1,c). The proportion increased to an average of 29 percent in the second half of 2001. During the first quarter of 2002, the average percentage of contract milk dropped to 11 percent.

1/ Program refers to the Dairy Forward Pricing Pilot Program.

2/ Seven Orders refers to the Federal Milk Marketing Orders with participation in the Program. These include the Central, Mid-east, Northeast, Pacific Northwest, Southeast, Upper Midwest, and Western orders. Six Orders refers to all of these orders except for the Upper Midwest. The number of handlers for Six Orders and Seven Orders is not simply the sum of the handlers for individual orders because some Program participating handlers had pooled milk in more than one order.

1/ Program refers to the Dairy Forward Pricing Pilot Program.

2/ Reflects plant milk receipts of handlers pooling producer milk in the seven markets (Northeast, Southeast, Central, Mideast, Pacific Northwest, West, and Upper Midwest) where contracted milk is pooled under the Program.

3/ Excludes cooperative producers' milk, unless handler is responsible for producer payroll.

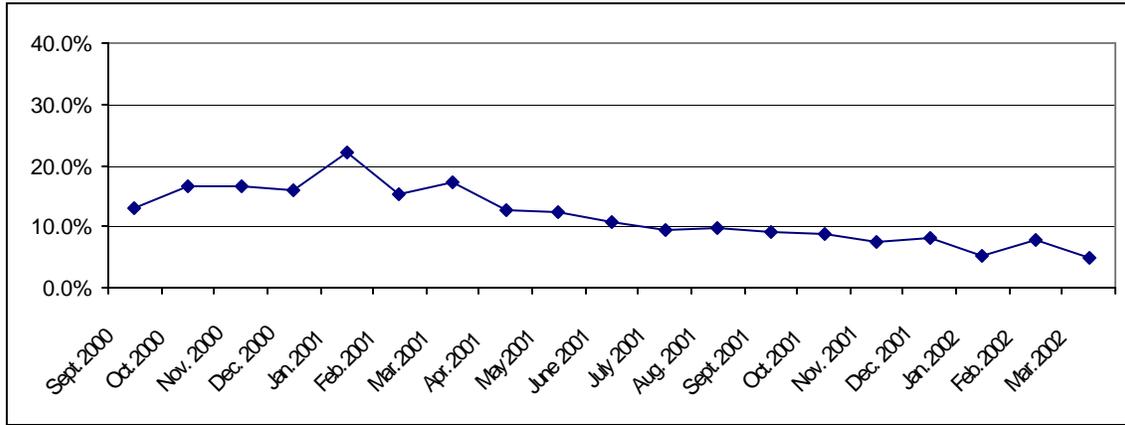

**Table 3-5: Participating Handlers by Pooled Milk Receipt Category in the Seven Orders<sup>1/</sup>**

1/ Reflects the plant numbers in the seven markets (Northeast, Southeast, Central, Mideast, Pacific Northwest, West, and Upper Midwest) where handlers participated in the Program.

**Figure 3-1: Contract Pounds as a Percent of Handlers' Total Monthly Milk Receipts<sup>1/</sup>**

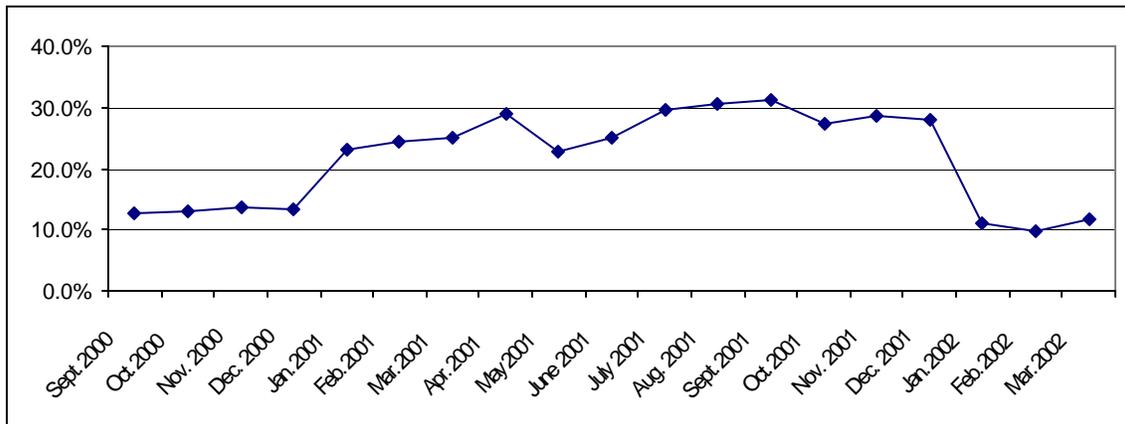

a. Participating Handlers With Less Than 25 Million Total Pounds Per Month

b. Participating Handlers with 25 Million to 50 Million Total Pounds Per Month

c. Participating Handlers With More Than 50 Million Total Pounds Per Month

1/ Total Monthly Milk Receipts are defined as eligible producer milk plus bulk fluid milk product (FMP) receipts received by plants of handlers that received contracted milk under the Program. The term "bulk FMP" is used to distinguish these receipts from receipts of packaged milk.

## **Plant Questionnaire Response**

The plant questionnaire was designed to evaluate milk handlers' perceptions of the Program. Questions were asked as to why they used the Program, how it affected their businesses, and whether they would continue to offer forward contracts to their producers in the future. A copy of the questionnaire that was sent to 705 proprietary and cooperative plants is found in Appendix E.

The plant questionnaire generated usable responses from 248 plants, 21 which were Program participants and 227 which did not participate (Table 3-6). Of the 21 participating plants, 20 are proprietary plants and one is a cooperative-owned plant. Both participating and non-participating plants are well represented by the survey. Of the plants that were sent questionnaires, about two-thirds of all participating plants responded while about one-third of all non-participating plants responded.

Eighteen plants, or 85.7 percent, of the Program participants responding were predominantly Class III plants; and 2 plants, 9.5 percent, were predominantly Class I plants (Table 3-7). Class I participants can participate only to the extent that they also pool milk used in manufacturing classes. Of the non-participants responding, 139 plants (61.2 percent) were predominantly Class I plants and 40 plants (17.6 percent) were predominantly Class III plants. Only 3 predominantly Class IV plants responded, and these plants did not participate in the program.

### *Participating and Non-Participating Plant Characteristics*

Participating plants tend to be larger, with 42.9 percent of participants pooling 30 million pounds or more per month, and 61.9 percent pooling at least 20 million pounds per month (Table 3-8). Comparatively, 31.3 percent of the non-participating plants that responded pooled less than 10 million pounds per month and 57.7 percent pooled less than 20 million pounds.

While participating plants tend to be larger than non-participating plants, it is not clear that participating handlers tend to be larger than non-participating handlers. A greater proportion of participating plants, 57.1 percent, reported to be single-plant firms (Table 3-9). This rate was somewhat higher than for non-participating plants, which reported being only 44.5 percent single plant firms. Of the participating plants belonging to multi-plant firms, 28.6 percent belonged to firms with 2-5 plants and 1 plant, which had a mix of Class I and manufactured class utilization, belonged to a firm with 6 to 50 plants (Table 3-10). Forty-seven non-participating plants reported that they belonged to firms with 6-50 plants. (It should be noted that many of these participating and non-participating plants that reported to be part of multi-plant firms could belong to the same firm.)

The Upper Midwest Federal milk marketing order regulated 12 (57.1 percent) of the reporting participating plants (Table 3-11). The Central order follows with three plants,

with two or less in the remaining orders. Wisconsin had the highest percentage of participating plants, 47.6 percent, with no more than 2 participating plants in any of the other States, which were mostly in the Midwest (Table 3-12).

### *Respondents' Program Opinions on Market Effects*

One of the early concerns expressed by the industry was the possibility of the Program making it more difficult to attract milk for Class I purposes (Table 3-13). Of the two participating Class I plants that responded to the survey, one indicated that the Program had no effect on ability to attract Class I milk while the other plant indicated that the Program made it harder. Of the non-participating Class I plants, 51.1 percent indicated no effect while 7.9 percent indicated that the Program made it harder. A significant number, 38.8 percent, indicated that the question was not applicable. This response may mean that no competitors in their procurement area were offering contracts under the Program. Our survey did not cover Class I milk buyers who purchase milk solely from dairy cooperatives. Since the Program did not affect cooperatives' ability to forward contract with its members, any effect on their Class I milk customers would be indirect and small.

As to the Program's effect on a plant's ability to procure a milk supply for manufacturing, the responses were mixed (Table 3-14). Of the responding participating plants, 38.1 percent indicated that the Program made milk procurement for manufacturing easier for them. Two participating plants actually responded that the Program made it harder for them to attract milk for manufacturing. Ninety-one non-participating plants (40.1 percent) reported that the program did not affect their ability to attract a supply of milk for manufacturing purposes. Half of the non-participating plants responded that the question on ability to procure milk was "not applicable" to them. Of the 113 non-participating plants that answered as "not applicable," 69 are predominately Class I plants. Some of these may not view the question as applicable to them. Another explanation for many of "non-applicable" responses, whether the plants were Class I or manufacturing plants, may be that no competitors in their procurement area were offering contracts under the Program.

Participating plants were more likely than non-participants to use price protection tools for fuel, energy, and dairy product markets, as well as other pricing tools to offset milk price volatility (Table 3-15a). Milk price protection other than the Program was used by 61.9 percent of all participating plants. Such tools could include futures and options contracts for Class III and Class IV milk or cross hedging with some of the dairy product futures and options markets. Among non-participants, other milk price protection was reported by only 7.9 percent. The use of fuel and energy price protection tools was reported by 66.7 percent of all participating plants, but by only 29.1 percent of non-participating plants. Similarly, 66.7 percent of the participants reported using two or more other price protection tools compared to only 11 percent of the non-participants (Table 3-15b). Of the non-participants, 52 percent indicated using no price protection tool. Thus, the survey indicates that those who had used some type of price protection in

the past, were more likely to offer forward contracts under the Program and were more likely to use forward contracts in combination with other price protection tools.

### *Participating Plants – Contracting Activity*

Participating plants mostly offered the same contract terms to all producers (90.5 percent; Table 3-16). Most participating plants accepted contracts in order of receipt (70.8 percent; Table 3-17a) while 4.8 percent accepted contracts from large producers first and 23.8 percent had other criteria for acceptance. Of those indicating other acceptance criteria, one respondent commented that contracts were limited to 100 percent of production, another stated that contracts had a 10,000 pound minimum, and another commented that contracts were accepted only in increments of 200,000 pounds. One plant indicated that contracts were offered, but no producers accepted contract offerings.

Plants used a variety of devices to cover contracts with producers (Table 3-18a). Futures and options contracts were used by 66.7 percent of the plants, 47.6 percent of the plants used long-term contracts to sell manufactured products, and 28.6 percent were to some extent self-protected. Thirteen plants (57.1 percent) used one device to cover the contracts, five plants (23.8 percent) used two, and three plants (14.3 percent) used three devices (Table 3-18b).

Although the Program is authorized only through December 31, 2004, participating plants were asked if they would continue to offer contracts in the future if the Program were reauthorized. Fifteen plants, 71.4 percent, answered this question affirmatively (Table 3-19). Five plants (23.8 percent) would do so only if necessary to compete for milk.

There was early concern expressed by the industry that the Program could result in the sale of more finished products under long-term contracts. This in turn could have an impact on the data available for the National Agricultural Statistical Service (NASS) dairy product price series. Long-term contract sales of finished products reportedly were increased by 7 plants, 33.4 percent of the participants (Table 3-20). One plant reported an increase of 50 percent or more, and 6 plants reported an increase of less than 25 percent. See Chapter 5 for additional discussion of this topic.

### *Non-Participating Plants—Considerations*

A question was asked of non-participating plants to discover their reasons for not offering contracts under the Program. Of those responding, 120 plants, 52.9 percent, indicated that they did not offer contracts because most of their milk was used for Class I purposes (Table 3-21a). Two other reasons—“competition did not offer contracts” and “producers not interested”—were each reported by 22 plants. Sixteen plants reported that they offer contracts outside of the program subject to Federal order minimum prices. However, there is probably some misinterpretation of this selection. We found that 14 of these 16

plants are cooperative plants. This selection was probably chosen because the plants offer contracts outside of the program to their members that are not subject to Federal order minimum prices. Thirty-nine respondents indicated that there were other reasons for not participating. From this group, 17 respondents commented that they do not receive producer milk or that they receive their milk from cooperatives, but they gave no reasons for not considering forward contracts with cooperatives.

A single reason for not contracting under the Program was given by 78 percent of the non-participants (Table 3-21b). Two or more reasons were given by about 10 percent of the non-participants.

As an indication of perhaps limited growth in the Program, 6 non-participating plants out of 227, only 2.6 percent, reported that they would likely offer contracts in the future.

## Responses to Questions Concerning Participants and Non-participants

**Table 3-6: Did you offer contracts under the *Forward Contracting Pilot Program*?**

Respondents	Number of responses	Percentage
Participants	21	8.5
Non-participants	227	91.5
Total Number of Respondents	248	100.0

**Responses to Questions Concerning Only Non-Participants**

**Table 3-21a: If you did not offer forward contracts under the *Forward Contracting Pilot Program* to your producers, please mark all the following that apply. Selected reasons.**

Reason for not participating	Number of Non-Participants	Percentage of non-Participants
Competition did not offer forward contracts.	22	9.7
Producers were not interested in forward contracting.	22	9.7
Most milk is used for Class I purposes and is ineligible.	120	52.9
Plant offers forward contracts outside of program subject to Federal Order minimum prices. 1/	16	7.0
Other reason.	39	17.2
Plant likely will offer in near future.	6	2.6
Did not make a selection.	28	12.3

Percentages do not add to 100 because respondents could choose more than one answer.

1/ Includes fourteen cooperative responses, who likely interpreted the category to include the milk they pool on Federal orders, for which minimum prices are drawn from the pool, but for which cooperative members' revenues may be re-blended and forward contracted outside of the Pilot Program.

**Table 3-21b: If you did not offer forward contracts under the *Forward Contracting Pilot Program* to your producers, please mark all the following that apply. Number of selected reasons.**

Number of Selections	Number of Non-Participants	Percent
None	29	12.8
One	177	78.0
Two	15	6.6
Three	6	2.6
Total	227	100.0

## Cooperative Questionnaire Response

The cooperative survey was initially designed to study characteristics and opinions of cooperatives participating in the Program as milk sellers. Since only one cooperative participated in the Program as a milk seller during the study period, the survey is not useful for this purpose. However, the survey does allow us to compare cooperatives offering members forward contracts to cooperatives not offering forward contracts. We are also able to gain some information concerning the effect of the Program on cooperatives offering forward contracts to members.

Of 84 respondents to the cooperative survey, 19 respondents (22.6 percent) indicated that they offered forward contracts to their members (Table 3-22). Only one (5.3 percent) of the contract-offering cooperatives reported total milk pounds handled of more than 250 million per month (Table 3-23). This contrasts with 13.8 percent of the non-contract-offering group handling 250 million pounds of milk per month. While the largest percentage of contract-offering cooperatives handles 10 to 50 million pounds per month (47.4 percent), the largest percentage of non-contracting-offering cooperatives handles less than 10 million pounds per month (30.8 percent), with the 10 to 50 million pound category coming in a very close second (29.2 percent).

For both contract-offering and non-contract-offering cooperatives, Class III milk tends to be the dominant class of milk, with about 42 percent from both groups in this category (Table 3-24). Class I is ranked second for both groups, with 21.1 percent for contract-offering cooperatives and 33.8 percent for non-contract-offering cooperatives. It is interesting that 2 contract-offering cooperatives indicated Class IV as a predominant class of milk while there were no non-contract-offering cooperatives in this category.

There is a notable contrast between the two groups with respect to Federal marketing orders (Table 3-25). Contract-offering cooperatives pooled most of their milk in the Upper Midwest Federal Milk Marketing Order (57.7 percent) while the non-contracting cooperatives pooled most of their milk in the Northeast Federal Milk Marketing Order (64.7 percent). Second place for the contract-offering cooperatives is the Northeast (15.8 percent), while second place for the non-contract-offering cooperatives is the Upper Midwest (8.0 percent).

The survey indicates that contract-offering cooperatives are more likely than non-contract-offering cooperatives to use tools such as forward contracts, futures contracts, or options to reduce price volatility. This is the case for feed, fuel or energy, dairy product markets, and milk (Table 3-26a). Of the cooperatives offering forward contracts to members, 42.1 percent reported use of at least one type of tool to reduce price risk (Table 3-26b). For the cooperatives not offering forward contracts, only 10.8 percent reported use of at least one type of price reduction tool. It is interesting that only 3 of the 19 contract-offering cooperatives indicated that they used price protection methods for milk. This seems contradictory to their responses indicating that they had offered forward contracts to members. One possible explanation is that some contract-offering respondents may not think of their forward contracts primarily as price risk reduction

instruments for the cooperative. Perhaps some cooperatives perceive forward contracts as tools to acquire, keep, and satisfy members rather than as tools to reduce price volatility for the cooperative.

Cooperatives that had offered contracts to their members were questioned concerning the effect of the Program on their contract offerings. The majority, 13 respondents (68.4 percent), indicated that the program had little or no effect (Table 3-27). Two reported that the Program made offering contracts necessary in order to meet competition, 1 indicated that the Program made offering contracts easier, and 4 did not make a selection.

## Cooperative Questionnaire Responses

**Table 3-22: Has the cooperative offered forward contracts to members?**

Contracts offered to cooperative members	Number of responses	
	Number of responses	Percentage
Yes	19	22.6
No	65	77.4
Totals	84	100.0

## Chapter 4

### Prices for Forward Contract Milk Marketed Under the Program

The economic function performed by Dairy Forward Pricing Pilot Program (Program) is the reduction in the uncertainty of prices paid and received for milk through forward contracting. In this study, prices received by producers for forward contracted milk are compared to the prices that would have been received for the milk had it not been contracted. The analysis includes a comparison of average prices by signing quarter to delivery quarter, and a comparison of forward contract average prices to Federal milk order average minimum prices (at producers' tests) and futures market average prices for milk.

The great majority of handlers participating in the Program are cheese makers, and their contract prices are usually related to Federal order Class III prices. In most contracts, prices are either expressed in terms of the Class III milk components used in Federal orders or just as a price for Class III milk. Contracts frequently provide that the handler will pay a producer price differential (PPD) and customary premiums in addition to the contract price for Class III milk and/or components<sup>1</sup>. The PPD paid by the handler may be different from the Federal order PPD, and customary payments are often described as the normal quality premiums paid, but are not detailed in the contract.

Price comparisons in this chapter are the differences between the average pay prices for producers' milk under contract (the contract price) and for such milk if not under contract (the non-contract price.) The prices are compared for the same plant locations, are for milk of the same component tests, and are based on the gross pay prices for milk before deductions for hauling, promotion, and normal marketing charges. We assume that premiums and PPDs paid by handlers are the same for contract and non-contract milk. The average contract and non-contract prices discussed and reported in the tables are average prices received, weighted by pounds of contract milk. For a detailed discussion of how prices were computed, see Appendix D.

---

<sup>1</sup> The producer price differential (PPD) is part of the minimum blend price in Federal orders with component pricing plans. The PPD reflects the producer's portion of the Class I and Class II differentials; the Class IV price relative to the Class III price; location adjustments; differences in the pool values of protein, butterfat, and other solids compared to their Class III values; and other factors. The producer's minimum Federal order milk price is the value of components at minimum prices—or the Class III price at producers milk test—plus the PPD. In the orders with skim milk and butterfat pricing plans, a Uniform price is calculated as a weighted average or pool value of skim milk and butterfat priced at minimum class prices. A value analogous to the PPD can be calculated as the difference between the Uniform price and the Class III price. For more pricing detail see **Code of Federal Regulations**, Title 7, Parts 1000 to 1199; and Dairy Programs' Price Description at [http://www.ams.usda.gov/dyfmoms/mib/fedordprc\\_dscrp.htm](http://www.ams.usda.gov/dyfmoms/mib/fedordprc_dscrp.htm). Handlers may pay PPDs that are identical to the Federal order PPDs, or may pay different PPDs calculated with their own formulas. The Federal order assures that producers receive at least the Federal order minimum blend price, and is otherwise indifferent to the payment systems used by handlers and producers. However, prices for milk contracted under the Program may fall below the Federal order minimum blend price.

We make comparisons between average contract prices and Federal milk order average minimum blend prices (at producers' tests) and find that there are instances of contract prices falling below the Federal order minimum. We also compare differences between average contract prices and average Class III futures prices on the Chicago Mercantile Exchange (CME). The use of the futures market is an alternative to the Program for many dairy farmers. Finally, to address concerns of some industry participants, we look at any impact that the Program may have had on CME cash markets for dairy products.

### **Forward Contracts and Price Variability**

Over time, our expectation is that prices received by producers for contract milk will average about the same as prices for milk not under contract. It is clear that forward contracting is of value to some producers and handlers because it affords them a reduction in price variation or price risk. Economic theory holds that risk-averse producers will produce the same amount of commodity at a lower, stable price as they would at a higher variable price. There also are benefits to handlers from stable prices. However at this time, we cannot determine if either party to a contract for milk tries to negotiate a premium or discount related to risk aversion. Instead, we believe that each party uses the best information available at the time the contract was entered into with the expectation that contract prices will be reasonably close to current price projections.

An overall measure of the Program's effect on producer milk prices is captured by the differences between average contract and non-contract prices, and the differences in variability of these prices. From September 2000 through March 2002, contracts were signed under the Program for milk that was pooled on 7 of the 11 Federal milk marketing orders. Orders pooling contract milk were the Upper Midwest, Pacific Northwest, Western, Central, Mideast, Southeast, and Northeast (Seven Orders). For the Seven Orders, the 19-month average contract price was \$14.02, \$0.49 less than the non-contract price (Table 4-1). (Monthly price tables are provided in Appendix F.) The standard deviation, which is a measure of spread in prices around the average, is \$1.80 per hundredweight for the non-contract price and \$0.51 for the contract milk. The price range for non-contract milk over the period is \$5.71 per hundredweight, but for milk under contract is only \$1.63. Thus, the program reduced the volatility in prices from \$5.71 to \$1.63 per hundredweight, but the average price was \$0.49 per hundredweight or about 3.4 percent lower.

The effect of contracts stabilizing milk prices is presented graphically in Figure 4-1. From September 2000 through February 2001, monthly average contract prices exceeded the non-contract prices. Non-contract prices increased dramatically from April to September 2001 and exceed contract prices before again falling below contract prices in November 2001. The gap between contract and non-contract prices continued to widen in the first-quarter of 2002. It is likely that contract prices remained above non-contract prices during the second and third quarters of 2002, as milk prices continued to be pressured downward by increased milk supplies. Figure 4-2 shows the differences

between contract prices and non-contract prices and between contract prices and Federal order minimum prices for the 19-month period.

To add additional perspective, contract prices were compared against prices paid in recent years for Grade A milk. This Grade A milk price is comparable to the prices for contract and non-contract milk in that the prices are at producer tests and are f.o.b. plant prices, and include quality, quantity, and other premiums. Average annual fluid grade milk prices, at test, averaged \$14.17 per hundredweight for the period 1997 through 2001, ranging between \$12.44 in 2000, and \$15.50 in 1998. Over the 19-month study period, the price for contract milk averaged \$14.02. We expect that as the Program continues, average contract prices may continue to be near recent historical averages. The price for milk contracted in the third quarter of 2000 averaged \$14.01 per hundredweight, which was quite close to the 1997-2000 average fluid grade price of \$13.94.

Fluid grade milk price: U.S. annual average, at test

1997	1998	1999	2000	2001	Average
\$13.40	\$15.50	\$14.42	\$12.44	\$15.09	\$14.17

Source: USDA, National Agricultural Statistics Service

### *Upper Midwest and Six Orders*

The Upper Midwest order had the greatest Program participation in terms of both producers and handlers. Participation in the other six Federal orders with contract milk (Six Orders) was such that to avoid disclosure of proprietary information these markets are combined in the following analysis. Also, because of restricted data, the months of September and October 2000 are excluded from the following analysis. Thus, the following relates to the 17-month period November 2000 through March 2002 rather than the 19-month period used in prior chapters of this report.

To compare the Upper Midwest and the Six Orders with the Seven Orders, 17-month statistics are also provided for the Seven Orders in Table 4-1. For the Seven Orders, reducing the study period by two months has the effect of increasing the average non-contract milk price from \$14.51 (19 months) to \$14.68 per hundredweight. The 19-month average contract milk price is reduced by \$0.02 per hundredweight to \$14.00 per hundredweight. The average difference between the contract and non-contract prices for the 17-month period is \$0.67 per hundredweight compared to \$0.49 for the 19-month period, with the average non-contract price being higher in both periods. The standard deviations increase modestly by going to the 17-month period, but the extreme price points and the price ranges are unchanged.

Average contract prices compared to non-contract prices averaged \$0.66 per hundredweight less in the Upper Midwest and \$0.65 less in the Six Orders.<sup>2</sup> The Upper

---

<sup>2</sup> It would be expected that since the Seven Order average contract and non-contract prices lie between those prices of the Six Orders and the Upper Midwest, the Seven Order average price difference would lie

Midwest and Six Orders diverge when it comes to variance reduction. The Upper Midwest had less price variability for the non-contract milk than the Six Orders, a standard deviation of \$1.67 as opposed \$1.98, respectively. In comparison, the price variability for contract milk was less in the Six Orders with a standard deviation of \$0.42 per hundredweight than in the Upper Midwest with a standard deviation of \$0.82.

Prices in the Upper Midwest for non-contract milk ranged from a high of \$17.27 to a low of \$11.77 per hundredweight, a difference of \$5.50. For contract milk, prices ranged from \$15.20 to \$12.58 per hundredweight, a difference of only \$2.63. The maximum non-contract price exceeded the maximum contract price by \$2.07 per hundredweight. The minimum contract price exceeded the minimum non-contract price by \$0.81 per hundredweight.

In the Six Orders, average prices for non-contract milk ranged from a high of \$18.46 to a low of \$12.31 per hundredweight, a difference of \$6.15. For contract milk, prices ranged from \$15.31 to \$13.77 per hundredweight, a difference of only \$1.54. The maximum non-contract price exceeded the maximum contract price by \$3.16 per hundredweight. The minimum contract price exceeded the minimum non-contract price by \$1.46 per hundredweight.

### **Forward Contract Prices by Signing and Delivery Quarter**

There appear to be two notable factors that affected the difference between contract and non-contract prices. Contract prices were more likely than not to be consistent with delivery-date market conditions when the time span between the signing and delivery dates was shorter. Forecast prices influence contract prices, and forecasts are influenced by market conditions at the time of forecast.

#### *Contract Milk Under Seven Orders*

Quarterly average contract milk prices by signing and delivery quarter are found in Table 4-2a and illustrated in Figure 4-3. Contracts were signed in one quarter for milk to be delivered in succeeding quarters, possibly more than one year later. Contracts signed in third quarter 2000 had prices averaging closest to the \$14.02 per hundredweight, the 19-month average contract price. Contracts signed in first quarter 2001 reflected the outlook

---

between the Six Orders and Upper Midwest average price differences. However, the Upper Midwest contracted volume decline in 2002 was significantly greater than that in the Six Orders, shifting the weighting to the Six Orders in calculating the Seven Orders average prices. In addition, in most of 2001 contract prices were less than non-contract prices, but contract prices exceeded non-contract prices in first-quarter 2002. This combination of shifts caused the improbable ordering of differences in the average contract and non-contract prices. However, the ordering of price differences is logical for every individual month, for the Nov. 2000 through 2001 averages, and for the first-quarter 2002 averages.

for lower prices in 2001. As market prices began to climb in 2001, contract prices at signing also rose. Prices provided by contracts signed in second quarter 2001 ranged from \$14.15 to \$14.96 per hundredweight, and prices in contracts signed in third quarter 2001 reached \$16.00 per hundredweight. By fourth quarter 2001, signing prices had fallen back down to reflect the expected drop in 2002 market prices. Contracts signed in first quarter 2002 for delivery in that quarter averaged \$13.66 per hundredweight.

For comparison purposes, average non-contract prices applicable for the signing and delivery quarters are shown in Table 4-2b. Prices differ by delivery quarter for contracts entered into in the same quarter because of the differing number of plants, orders and volumes of non-contract milk that was associated with contracting plants. Average Federal order minimum prices for the same quarters are presented in Table 4-2c. Calculating market and Federal order minimum prices in this manner allows us to examine differences in comparable prices.

The average differences between contract and non-contract prices according to signing and delivery quarter are shown in Table 4-2d and Figure 4-4. Clearly shown are the effects of market expectations in the signing quarter on differences between contract and non-contract prices. As signing quarters progressed from 2000 through the first quarter of 2001, contract prices for future delivery periods underestimated ultimate market prices to a greater degree. By the second quarter of 2001, a momentum had been established toward higher market prices. Although contract prices were less than non-contract prices in the second and third delivery quarters of 2001 for all signing quarters, differences for contracts signed in the second and third quarters were less than differences for contracts signed in previous quarters. As non-contract prices fell in the fourth quarter of 2001, differences between contract and non-contract prices moved in a positive direction. Prices for contracts signed in the second half of 2001 for delivery in fourth quarter 2001 were higher than non-contract prices. For the first delivery quarter of 2002, contract prices were higher than non-contract prices for all signing quarters.

The amounts by which non-contract milk prices exceeded contract milk prices were largest in the third quarter of 2001. The greatest gap, \$4.33 per hundredweight, was for milk contracted in the fourth quarter of 2000 for delivery in the third quarter of 2001. Contract milk prices in excess of non-contract prices were greatest, \$1.97 per hundredweight, for milk contracted in the third quarter of 2000 for delivery in the fourth quarter of 2000.

Contract milk prices were less than the Federal milk order minimum prices in the second and third quarters of 2001. Contract prices for all other signing and delivery quarters, with the exception of contracts signed in the first quarter of 2001 for delivery in the fourth quarter of 2001, received more than the comparable Federal order minimum price.

### *Upper Midwest and Six Orders*

Tables 4-3a through 4-3e provide quarterly average prices and comparisons for milk pooled under the Upper Midwest Order. Tables 4-4a through 4-4e provide the same information for the Six Orders. Differences in contract and non-contract prices follow similar patterns in the two sets of tables. For example, the Upper Midwest average price for milk contracted in the first quarter of 2001, for delivery in the fourth quarter of 2001, was \$0.97 per hundredweight less than the comparable average non-contract price. The same price comparison for the Six Orders is a negative \$1.03 per hundredweight. The general patterns for the Upper Midwest and Six Orders are consistent for all signing and delivery quarters. However, the magnitudes of the price differences vary between the two groups. For the Six Orders, the greatest amount by which the average non-contract price exceeded the contract price, \$4.75 per hundredweight, occurred for milk contracted in the fourth quarter of 2000 for delivery in the third quarter of 2001. The greatest amount by which average contract milk prices exceeded the non-contract average was \$1.66 per hundredweight and occurred for milk contracted in the third quarter of 2001 for delivery in the first quarter of 2002.

### *Gross Values of Contract Deliveries*

As noted earlier, the number of producers participating and the volumes of milk marketed under the Program have varied. Contract volumes were the greatest when non-contract prices exceeded contract prices by the greatest amount. Thus the impact on farm cash receipts from milk marketing by contract producers was greater than that implied by just the difference in average prices over the study period. See Figure 4-5.

In the Seven Orders, from September 2000 through March 2002, contract producers marketed a total of 3.6 billion pounds of milk, of which 2.5 billion pounds (69 percent) were contract milk. Gross cash receipts for all milk marketed by contract producers were \$514 million before deductions for hauling, promotion, and marketing. See Table 4-5. Contract milk grossed \$343 million. Had the contract milk been marketed without contract, the gross cash receipts for that milk would have been an estimated \$371 million, \$28.2 million higher. Thus, gross cash receipts for all milk marketed by contract producers as a group were reduced by an estimated 5.2 percent during the study period.

Information relative to similar gross cash receipts for the Upper Midwest Federal milk order and the Six Orders combined are in Appendix G.

### **Forward Contract Prices and Futures Prices**

As an alternative or a supplement to participation in the Program, producers could have sold milk futures contracts on the Chicago Mercantile Exchange (CME).<sup>3</sup> Of course,

---

<sup>3</sup> Milk and dairy product trading on the CME includes Class III and Class IV milk futures, butter futures, options on futures contracts, and spot markets for butter, cheese, and nonfat dry milk.

smaller producers may not have this alternative since monthly futures contracts are for 200,000 pounds each. For some contracts, the handler acts as a middleman between the producer and the futures market. Some handlers sell futures in order to offset their risk contract positions. For these reasons, it is useful to compare results from the contracting with the results from the futures market. Since most contract milk has been for Class III purposes, the likely alternative to compare against was the CME Class III futures prices.

As an alternative from the producer's prospective, we estimated how producers would have fared if, instead of forward contracting, they had purchased futures contracts. We assumed that the futures contracts were purchased in the same months that forward contracts were signed and that delivery period and amounts were the same as under forward contracts. Our comparison considers neither brokerage fees nor any margin calls that might have occurred during the futures' contract period.

A forward contracting producer chooses to give up the non-contract price and to accept instead the contract price for a portion of his milk. As an alternative, a producer could have sold futures contracts on the CME for future delivery of the same portion of his milk, accepted the non-contract milk price at the time of delivery, and added his gains or losses from the futures market to the price received for his milk, to arrive at his net milk price. Average Class III futures prices-- by forward contract signing and delivery quarter and weighted by monthly pounds forward contracted under the Program-- are shown in Table 4-6a. The corresponding average Federal order Class III prices in Table 4-6b similarly reflect the monthly pounds contracted over the quarter. The quarterly average prices in the delivery quarters are different to the extent that the monthly delivery proportions vary by signing quarter. The differences between average Class III futures and Federal order Class III prices are calculated in Table 4-6c. It is this difference that would be added to the producers' non-contracted milk price had they used the Class III futures markets to protect their milk price.

A comparison of the use of CME futures contracts to Program contracts is shown in Table 4-7. Table 4-7a shows the quarterly prices received for contract milk under the Program. Table 4-7b shows the quarterly non-contract prices to which has been added any gains or losses from the futures market and calculated in Table 4-6. Table 4-7c shows the amount by which average quarterly prices under Program contracts would have exceeded net prices received by producers who used the futures market to stabilize milk prices.

Producers were better off, on average, with contract prices than with futures in 17 of the 25 signing-delivery combinations. Producers would have been better off signing forward contracts in the first three delivery quarters and the last delivery quarter of the study period. In the second through fourth quarters of 2001, how a producer fared depended on when the forward contract was signed and when the futures contract was sold.

## **Addendum - Price Information After Study Period**

As the data collected for the 19-month study period was being analyzed and this report was being written, it became obvious that additional information provided by contracts for delivery in 2002 could be reshaping the picture. Given the precipitous decline in 2002 milk prices from 2001 levels, it appears that producers who signed contracts in 2002 may have protected themselves by contracting at prices that will likely be attractive in 2002.

Although no actual data on deliveries made or prices received were available beyond March 2002, limited contract information was available with price levels for deliveries to be made in April through August 2002. Table 4-8 shows the number of producers for which we had contract information each month. From this information, we were able to define two groups for which the contracts provided both price and volume information. For one group, prices were specified as Class III milk prices and for the other, milk component prices. About 80 of the available contracts did not specify pounds of milk or components and therefore could not be used in this estimation.

Contract prices were converted, if necessary, into prices for Class III milk containing 3.5 percent butterfat. We were then able to compare these base contract prices (without premiums or PPDs) with announced Federal order minimum Class III prices. For contracts quoted on a Class III milk price basis, the average quoted price exceeded the announced Federal order Class III price by \$2.30 per hundredweight during this 5-month period. Those contracts written on a milk component price basis exceeded the announced Federal order Class III price by an average of \$2.41 per hundredweight.

Thus, the additional limited available information indicates that milk delivered under contracts in 2002 received a higher average price than non-contracted milk. This illustrates the potential value of market participants following a consistent marketing strategy. Had the producers who dropped out of the program after 2001 stayed in, the negative differences on contract and non-contract prices may have been balanced out and their revenues stabilized.

## **Dairy Forward Pricing Pilot Program Impact on Chicago Mercantile Exchange Cash Dairy Product Markets**

There were concerns expressed by several in the industry that the Dairy Forward Pricing Pilot Program (Program) could result in less volumes of dairy products traded on the Chicago Mercantile Exchange (CME) cash markets. The State of California uses CME cash market prices to price milk under their marketing order program, and it is generally believed that a large share of the cheese and butter sold wholesale in the United States is priced based on the CME cash market prices. Federal milk orders use weekly wholesale prices of butter and cheese collected by the National Agricultural Statistics Service

(NASS) to establish minimum class prices. NASS wholesale product prices and the CME cash market prices are highly correlated.

Historically, dairy product cash markets occasionally have been referred to as “thin” markets. Trades on the CME occur primarily when buyers and/or sellers believe that the current market price level does not adequately reflect the supply and demand conditions for the product. Experience has shown that any firm attempting to buy or sell a dairy product at a price level which differs from the general industry consensus price must be prepared to buy or sell large quantities of the product in order to raise or lower the market price. The Commodity Futures Trading Commission has stated in a letter to USDA as recently as December 2001, that “although there are relatively small numbers of actual transactions, the spot butter and cheese call sessions are closely monitored by a number of commercial traders in various segments of the dairy industry who stand ready to participate if conditions warrant it.”

Specifically the questions we looked at were, “If by contracting a milk supply, will manufacturers of butter and cheese have a better handler on their input costs, will they sell more of their finished product under long-term contracts with their customers rather than on the spot market? If there are more long-term contracts for butter and cheese, will there be less activity on the CME cash markets for these products?”

Question number 15 on our plant questionnaire asked if handlers sold more of their products under long-term contracts because they were able to lock-in a price of milk, the major input cost. Of the 21 responding, 16 indicated that they sold no additional product under long-term contracts, 5 cheese plants indicated that sales under long-term contracts had increased less than 25 percent, and 1 cheese plant indicated that such sales had increased by 50 percent or more. Although these responses suggest additional interest in committing products to long-term sales contracts, data are not available to estimate volume increases or the volumes of cheese and butter currently sold under long-term contracts by all contracting and non-contracting manufacturers. Even if those cheese plants who indicated that they had increased the volume of product sold under long-term contracts had instead sold all of the cheese that they produced from contracted milk under long-term contracts, the additional contracted volume would amount to less than one percent of monthly American cheese production.

Next, we reviewed the average monthly volume of total activity (includes sales, bids, and offers) and sales activity on the CME cheese and butter cash markets from January 1998 to August 2000 (before the program implementation), and from September 2000 to March 2002 (since implementation). To reduce the short-term variation in activity on the CME, the data were converted into three-month moving averages. (See Figures 4-6 and 4-7.)

The average monthly volume of total activity on the combined CME block and barrel cheese markets after Program implementation was almost 60 cars, or 27 percent, less than activity prior to the Program. A similar comparison of monthly sales activity of blocks and barrels showed a decrease of almost 35 cars, or 33 percent. The average monthly

volume of total activity on the CME butter market has been down more than 35 cars (18 percent) following implementation of the Program while the monthly average of total sales decreased by 7 cars, or 10 percent.

Market factors other than forward contracting of milk are more likely responsible for the reduced CME activity. It appears that there is less activity on the CME when the price remains stable. For example, a sustained strong growth in milk supply kept cheese prices near the price support level in early 2000, which likely limited transactions on the CME. More transactions took place in August, September, and October as prices moved to levels that the market felt more adequately reflected supply and demand conditions. In contrast, during the first nine months of 2001, cheese prices on the CME increased steadily due to a decrease in milk production. During the period the market did not resist the price increase, and thus it took fewer transactions to raise the price and keep it there. Although the questionnaires provided some indication that some contracting handlers had increased the volume of butter and cheese they sold under long-term contacts, it is unclear whether the decrease in activity on the CME cash markets has been a result of the Program.

Range	74,186	1.536	6.152	5.717	-4.616	-4.181

Source: Appendix Table F-1, F-2 and F-3.

/1 For a detailed description of how average prices are computed, see Appendix D.

/2 For the Upper Midwest and the Six Orders, price statistics are provided for 17 months rather than 19 months. Data for September and October of 2000 are restricted due to Program participation by less than 3 handlers. Data provided by fewer than three parties is considered restricted because aggregation of such information may not prevent individual disclosure. For comparison purposes, statistics for the 17-month period are provided for the Seven Orders.

/3 Seven Orders refers to the seven Federal orders with participation in the Program during the study period—the Central, Mideast, Northeast, Pacific Northwest, Southeast, Upper Midwest, and Western orders. Six Orders refers to all of these orders except for the Upper Midwest.

## Chapter 5

### Summary and Observations

This study examines the Dairy Forward Pricing Pilot Program (Program) over the period of time from September 2000 through March 2002, a period of nineteen months.

As measured in terms of reduction in price volatility, the Program has been effective. The average monthly price received for contract milk was \$14.02, ranging from a low of \$13.23 to a high of \$14.86. The average monthly price of the same milk, had it not been under contract, was \$14.51, ranging from a low of \$12.04 to a high of \$17.75. Over the study period, the volume of milk marketed under contract was greatest in months when contract prices were below non-contract prices.

Contract prices are influenced by forecasts of market conditions at the time contracts are signed. In this respect, the behavior pattern is similar to that of the CME Class III futures market. Returns to Program participating producers have generally been as good as, if not better than, returns to producers from hedging on the futures market. Data for the study period, and limited information concerning prices past the study period, indicate that prices received for contract milk may be about the same as long-run average non-contract prices for U.S. Grade A milk.

Contracts under the Program have taken many forms. Contracts vary widely in contract quantity, duration, length from signing to first delivery, quantifying method, and pricing method. In some cases, contracts are very detailed--designed to cover nearly any contingency. In other cases, contract terms are vague and leave room for interpretation. This sometimes leads to ambiguity concerning whether or not Federal Order minimum price requirements have been met for the portion of participant milk not under contract. At least one legal action has been brought because of misunderstanding of contract provisions. Arbitration hearings have dealt with a dispute between nineteen producers in Wisconsin who claim that the contracts they signed with Kraft Foods, Inc. had an escape clause.<sup>1</sup> It appears important that both parties of a Program contract have professional assistance in understanding all provisions.

Participation in the Program has been small when considered in terms of numbers of producers, numbers of handlers, or milk quantities. A total of 1,452 producers and 22 handlers participated in the program over the study period. On a monthly average basis, 3.9 percent of eligible producers participated in the program, and 5.7 percent of proprietary manufacturing plants participated. Contract milk averaged 5.3 percent of pooled milk received from eligible producers per month. Participation by producers peaked in April 2001 with 1,141 producers participating, but dropped off sharply in 2002, reaching a low point of 137 producers in February 2002. Participation by handlers peaked in September and October 2001 with 21 handlers participating. Participation

---

<sup>1</sup> Article by Mike Ivey, "Dairy Farmers Challenge Kraft Over Pricing Contract," *The Capital Times*, Madison WI, September 12, 2002.

declined to 16 handlers by March 2002. For participating handlers, the average percentage of eligible producer milk under contract in markets with participation in 2001 ranged between 23 and 30 percent. The percentage dropped to less than 15 percent in 2002.

During the study period, there was a decrease in the percentage of small producers participating in the Program. More than half of the participants marketed less than 100,000 pounds per month at the start of the study period. The percentage in this small-producer category had declined to less than 20 percent by the end of the study period. By contrast, the percentage of large producers--those marketing more than 1 million pounds per month--made up around 3 percent of the total at the beginning of the study period, and increased to around 20 percent by 2002.

Although there has been forward contract activity in seven of the eleven Federal Milk Marketing Orders, activity has been concentrated overwhelmingly among cheese manufacturers in the north central area of the country. Most of the participating producers and handlers pooled milk on the Upper Midwest, Central, and Mideast orders. On average about 46 percent of the contract milk has been pooled on the Upper Midwest order. Of the total number of producers, 45 percent have farms located in Wisconsin while 33 percent have farms located in Minnesota. Although the Central order had fewer participating producers than the Upper Midwest, the Central order had the highest participation rate among eligible producers in most months. With the exception of the four beginning months of the Program, more than half of the participating handlers have had milk pooled on the Upper Midwest order.

Our Producer Survey results indicate that participating producers were generally more accustomed to using price protection tools than were non-participants. Nearly three-fourths of participants indicated that they contracted in order to assure a more stable cash flow. Participants were more likely to have more than one potential buyer than non-participants, and they were much more aware of handler contract offerings than non-participants. Most participants relied on futures markets or their own forecasts to evaluate contract prices. Most participants whose contract prices were below their non-contract prices indicated that they would discontinue forward contracting or reduce contract volumes. The result is consistent with the reduction in participation for 2002.

The Plant Survey indicates that many participating plants use the Program contracts in combination with other price protection programs for milk, dairy products, and other inputs. Plants reported using a variety of strategies to cover contracts with producers. Most plants reported that they offered the same contract terms to all producers. Over a third of participants indicated that forward contracting had resulted in more long-term contracting of dairy products. There were mixed responses concerning the Program's effect on the ability to attract milk for manufacturing purposes. Thirty-eight percent of participants indicated that procurement of manufacturing milk had been made easier, while the majority of non-participating plants indicated that the Program had no effect on their ability to obtain milk. Although some Class I plants indicated that the Program had

affected their ability to attract a Class I milk supply, most indicated that the Program had no such effect.

Legislative Language: Dairy Forward Pricing Pilot Program

**H. R. 3428**

To provide for the modification and implementation of the final rule for the consolidation and reform of Federal milk marketing orders, and for other purposes.

**IN THE HOUSE OF REPRESENTATIVES**

**November 17, 1999**

\* \* \* \* \*

**SEC. 3. DAIRY FORWARD PRICING PROGRAM.**

The Agricultural Adjustment Act (7 U.S.C. 601 et seq.), reenacted with amendments by the Agricultural Marketing Agreement Act of 1937, is amended by adding at the end the following new section:

**SEC. 23. DAIRY FORWARD PRICING PILOT PROGRAM.**

(a) PILOT PROGRAM REQUIRED- Not later than 90 days after the date of the enactment of this section, the Secretary of Agriculture shall establish a temporary pilot program under which milk producers and cooperatives are authorized to voluntarily enter into forward price contracts with milk handlers.

(b) MINIMUM MILK PRICE REQUIREMENTS- Payments made by milk handlers to milk producers and cooperatives, and prices received by milk producers and cooperatives, under the forward contracts shall be deemed to satisfy--

(1) all regulated minimum milk price requirements of paragraphs (B) and (F) of subsection (5) of section 8c; and

(2) the requirement of paragraph (C) of such subsection regarding total payments by each handler.

(c) MILK COVERED BY PILOT PROGRAM-

(1) COVERED MILK- The pilot program shall apply only with respect to the marketing of federally regulated milk that--

(A) is not classified as Class I milk or otherwise intended for fluid use; and

(B) is in the current of interstate or foreign commerce or directly burdens, obstructs, or affects interstate or foreign commerce in federally regulated milk.

(2) RELATION TO CLASS I MILK- To assist milk handlers in complying with the

limitation in paragraph (1)(A) without having to segregate or otherwise individually track the source and disposition of milk, a milk handler may allocate milk receipts from producers, cooperatives, and other sources that are not subject to a forward contract to satisfy the handler's obligations with regard to Class I milk usage.

(d) DURATION- The authority of the Secretary of Agriculture to carry out the pilot program shall terminate on December 31, 2004. No forward price contract entered into under the program may extend beyond that date.

(e) STUDY AND REPORT ON EFFECT OF PILOT PROGRAM-

(1) STUDY- The Secretary of Agriculture shall conduct a study on forward contracting between milk producers and cooperatives and milk handlers to determine the impact on milk prices paid to producers in the United States. To obtain information for the study, the Secretary may use the authorities available to the Secretary under section 8d, subject to the confidentiality requirements of subsection (2) of such section.

(2) REPORT- Not later than April 30, 2002, the Secretary shall submit to the Committee on Agriculture, Nutrition and Forestry of the Senate and the Committee on Agriculture of the House of Representatives a report containing the results of the study.'

## Appendix B

Final Rule: Dairy Forward Pricing Pilot Program

information requirements and duplication by industry and public sector agencies. Finally, the Department has not identified any relevant Federal rules that duplicate, overlap or conflict with this rule.

In addition, the Committee's subcommittee meeting on November 9, 1999, and the Committee meeting on November 10, 1999, where this action was deliberated, were public meetings widely publicized throughout the raisin industry. All interested persons were invited to attend the meetings and participate in the industry's deliberations.

A proposed rule concerning this action was published in the **Federal Register** on January 31, 2000 (65 FR 4583). Copies of the rule were mailed by the Committee's staff to all Committee members and alternates, the Raisin Bargaining Association, handlers, and dehydrators. In addition, the rule was made available through the Internet by the Office of the Federal Register. That rule provided for a 60-day comment period which ended March 31, 2000. One comment was received.

The commenter supports the change in desirable carryout, but expressed concern over the impact of the change on the Committee's program to promote California raisin sales in foreign markets. The purpose of this rulemaking action is to change the desirable carryout to more accurately reflect actual carryout inventory and early-season shipments. Desirable carryout is the amount of tonnage from a specific crop year needed during the first part of the succeeding crop year to meet market needs. Failure to provide adequate raisins for market needs during the first part of the crop year would likely have a negative impact on prices and sales later in the season. Such an impact would likely be felt in domestic and foreign markets. The increase in desirable carryout would make more raisins available to handlers as free tonnage, and might reduce the amount of reserve raisins handlers purchase to meet their market needs. However, Committee sponsored promotional activities are not expected to be negatively impacted by this action. Those promotional activities are planned and implemented later in the season, when carryin inventories and the size of the new crop are known. Additionally, those promotional activities are planned by the Committee with the most recent information available, and approved by the Department.

Accordingly, no changes will be made to the rule, as proposed, based on the comment received.

A small business guide on complying with fruit, vegetable, and specialty crop marketing agreements and orders may be viewed at the following web site: <http://www.ams.usda.gov/fv/moab.html>. Any questions about the compliance guide should be sent to Jay Guerber at the previously mentioned address in the **FOR FURTHER INFORMATION CONTACT** section.

After consideration of all relevant matter presented, including the information and recommendation submitted by the Committee, the comment received, and other available information, it is hereby found that this rule, as hereinafter set forth, will tend to effectuate the declared policy of the Act.

Pursuant to 5 U.S.C. 553, it is also found that good cause exists for not postponing the effective date of this action until 30 days after publication in the **Federal Register** because: (1) The 2000-2001 crop year begins on August 1, 2000, and this rule should be effective promptly because the order provides that the Committee meet on or before August 15 to compute and announce the trade demand, and the desirable carryout level is a necessary item in that calculation; (2) this action is a relaxation in that it will make more raisins available to handlers especially for use early in the season; (3) producers and handlers are aware of this action which was unanimously recommended by the Committee at a public meeting; and (4) a 60-day comment period was provided for in the proposed rule, and the comment received is addressed in this final rule.

#### List of Subjects in 7 CFR Part 989

Grapes, Marketing agreements, Raisins, Reporting and recordkeeping requirements.

For the reasons set forth in the preamble, 7 CFR part 989 is amended as follows:

#### **PART 989—RAISINS PRODUCED FROM GRAPES GROWN IN CALIFORNIA**

1. The authority citation for 7 CFR part 989 continues to read as follows:

**Authority:** 7 U.S.C. 601-674.

2. Section 989.154 is amended by revising paragraph (a) to read as follows:

#### **§ 989.154 Marketing policy computations.**

(a) *Desirable carryout levels.* The desirable carryout levels to be used in computing and announcing a crop year's marketing policy shall be equal to the total shipments of free tonnage during August, September, and October for each of the past 5 crop years, for

each varietal type, converted to a natural condition basis, dropping the high and low figures, and dividing the remaining sum by three.

**BILLING CODE 3410-02-P**

## **DEPARTMENT OF AGRICULTURE**

### **Agricultural Marketing Service**

#### **7 CFR Part 1140**

[Docket No. DA-00-06]

#### **Final Rule for Dairy Forward Pricing Pilot Program**

**AGENCY:** Agricultural Marketing Service, USDA.

**ACTION:** Final rule.

**SUMMARY:** This final rule establishes a pilot program which exempts handlers regulated under the Federal milk order program from paying producers and cooperative associations the minimum Federal order price(s) for that portion of their milk for nonfluid use that is under forward contract. Establishment of the pilot program is required by a November 1999 amendment to the Agricultural Marketing Agreement Act of 1937 (AMAA).

**EFFECTIVE DATE:** July 19, 2000.

**FOR FURTHER INFORMATION CONTACT:** Nicholas Memoli, Marketing Specialist, Order Formulation Branch, USDA/AMS/Dairy Programs, Room 2971, South Building, P.O. Box 96456, Washington, DC 20090-6456, (202) 690-1932, e-mail address [Nicholas.Memoli@usda.gov](mailto:Nicholas.Memoli@usda.gov).

**SUPPLEMENTARY INFORMATION:** This rule implements an amendment to the AMAA which directs the Secretary of Agriculture to establish a temporary pilot program for forward contracting of milk under Federal milk marketing orders. The effect of the amendment is to permit a handler to pay producers or cooperative associations a negotiated price, rather than the minimum Federal order price, for milk that is under forward contract, provided that such milk does not exceed the handler's nonfluid use of milk for the month. The amendment appears in Section 3 of H.R. 3428 of the 106th Congress, as enacted by Section 1001(a)(8) of Public Law 106-113 (113 Stat. 1536). It was signed into law on November 29, 1999. The

amendment specifies that the pilot program shall only apply to federally regulated milk that is not classified as Class I milk or otherwise intended for fluid use and that is in the current of interstate or foreign commerce or directly burdens, obstructs, or affects interstate or foreign commerce in federally regulated milk. The pilot program expires December 31, 2004.

This pilot program does not invalidate, supersede, or otherwise change existing milk contracts between handlers and dairy farmers. Contracts eligible for this pilot program shall be those contracts beginning no earlier than the effective date of this final rule.

Pursuant to 5 U.S.C. 553, it is also found and determined that good cause exists for not postponing the effective date of this rule until 30 days after publication in the **Federal Register** because: (1) The pilot program is a voluntary program that does not require extensive preparation for those handlers and dairy farmers who choose to participate in it; and (2) most handlers and farmers desiring to participate in the program are anticipating the publication of this rule and would like to have their contractual transactions under the program effective as soon as possible.

#### **Executive Order 12988**

This final rule has been reviewed under Executive Order 12988, Civil Justice Reform. This rule is not intended to have a retroactive effect and will not preempt any state or local laws, regulations, or policies, unless they present an irreconcilable conflict with this rule. There are no administrative procedures which must be exhausted prior to judicial challenge to the provisions of this rule.

#### **Executive Order 12866**

The Department is issuing this rule in conformance with Executive Order 12866. This rule is not economically significant for the purposes of Executive Order 12866.

The forward pricing pilot program is a voluntary program that will permit a handler and a producer to negotiate prices that, at times, may be below the minimum order prices that would otherwise apply to such milk. Some producers, proprietary handlers, and cooperative associations now negotiate forward contracts on part or all of their milk. The pilot program will expand the opportunities to engage in forward contracting by exempting participating proprietary handlers from the minimum prices to producers and cooperative associations required under Federal milk marketing orders. These

regulations do not affect the ability of cooperative associations to forward contract with their members.

#### **The Regulatory Flexibility Act and the Effects on Small Businesses**

Pursuant to the requirements set forth in the Regulatory Flexibility Act (RFA) (5 U.S.C. 601 *et seq.*), the Agricultural Marketing Service (AMS) considered the economic impact of this rule on small entities and has prepared this final regulatory flexibility analysis.

The legal basis for this rule is set forth in an amendment to the AMAA signed into law on November 29, 1999, that directs the Secretary of Agriculture to establish the dairy forward pricing pilot program. The Secretary was directed "to establish a temporary pilot program under which milk producers and cooperatives are authorized to voluntarily enter into forward price contracts with milk handlers."

The pilot program will provide the dairy industry, which has experienced substantial price volatility in recent years, with another tool to deal with such volatility. With the phase-down of the dairy price support program to a safety-net program, the prices of dairy products have fluctuated to a much greater extent than they did during the prior 20 years. This price fluctuation has created problems for processors of manufactured dairy products (*e.g.*, butter, nonfat dry milk, and cheese), the dairy farmers who supply these processors, and the retailers, school systems, and other public institutions who provide these products to consumers.

Under the Small Business Administration's definition, a dairy farm is a small business if it has annual gross revenues of less than \$500,000 and a handler is a small business if it has fewer than 500 employees. For the purposes of determining which dairy farms are "small businesses," the \$500,000 per year criterion was used to establish a production guideline of 326,000 pounds per month. Although this guideline does not factor in additional monies that may be received by dairy producers, it should be an inclusive standard for most "small" dairy farmers. For purposes of determining a handler's size, if the plant is part of a larger company operating multiple plants that collectively exceed the 500-employee limit, the plant will be considered a large business even if the local plant has fewer than 500 employees.

Based upon the most current information available, USDA identified as small businesses approximately 66,327 of the 71,716 dairy producers

(farmers) that had their milk pooled under a Federal order in January 2000. Thus, small businesses represent approximately 92.5 percent of the dairy farmers in the United States. On the processing side, there were approximately 1,200 plants associated with Federal orders in January 2000, and of these plants, approximately 720 qualify as "small businesses," representing about 60 percent of the total. At the present time, 142 cooperative associations represent 61,405 dairy farmers under the Federal milk order program. In addition, there were 10,311 dairy farmers who were not affiliated with any cooperative association in January 2000. Of these nonmember producers, 9,559 meet the SBA's definition of a small business.

The recordkeeping and reporting requirements for this rule are minimal. At the present time, any handler that enters into a forward contract with a producer presumably has written proof for such an arrangement. Under the pilot program, a handler will be required to submit a copy of each forward contract with a producer or a cooperative association to the market administrator of the order that regulates the milk. In addition, the handler will be required to attach a specific disclosure statement to each forward contract with each producer under the pilot program. The disclosure statement will have to be signed by each dairy farmer entering into a forward contract. The disclosure statement explains that a dairy farmer entering into a forward contract under the pilot program forfeits his or her right to receive the minimum order price(s) for that portion of their milk that is under contract for the duration of the contract period. These requirements are discussed further in the Paperwork Reduction Act section of this document.

In drafting the rule, the Department considered whether any limit should be established for the amount of milk that a dairy farmer could forward contract. We decided not to impose such a limit because we did not wish to interfere with a dairy farmer's desire to forward contract all of his or her milk. Also, in order to gain as much knowledge as possible about the types of forward contracts that might be offered by handlers, we believe it is beneficial to allow handlers and dairy farmers to decide between themselves how much milk to put under forward contract and how much milk to keep under minimum Federal order pricing.

Comments were specifically requested on the impact of this rule on small businesses. Many comments, particularly from dairy farmers and

cheese plant operators, stated that the pilot program would assist them in running their business. No comments were received from a small business stating that the pilot program would be a burden to them.

The Department does not believe that the forward pricing pilot program will unduly burden small entities or impair their ability to compete in the marketplace. In fact, by providing another tool to reduce price risk, the pilot program may aid small businesses in competing with larger entities that have the ability to use existing futures and options markets, and other means, to reduce their price risks.

Several provisions that were in the proposed rule have been modified or eliminated in response to those commenters who noted that these provisions could limit the ability of small businesses to participate in the pilot program. A provision that would have provided a 3-day period in which a forward contract could be canceled has been removed to facilitate hedging of forward contracts, and a provision limiting initial forward contracts to 6 months has been changed to 12 months to better reflect dairy farmers' budgeting practices. In addition, another change was made so that proprietary handlers that do not operate pool plants can participate in the program. These provisions are discussed in more detail in the discussion of the rules applicable to the pilot program.

The Department has not identified any relevant Federal rules that duplicate, overlap, or conflict with this rule.

#### **Paperwork Reduction Act of 1995**

The information collection requirements contained in this final rule were submitted to the Office of Management and Budget (OMB) pursuant to the Paperwork Reduction Act of 1995 (44 U.S.C. chapter 35) for emergency approval and such approval was granted. A separate 60-day notice seeking public comment on the information collection will be published after this final rule is issued. OMB has assigned this request No. 0581-0190.

Under the pilot program for the forward contracting of milk under Federal milk orders, a one-page disclosure statement was designed so that the Secretary's representatives administering the pilot program can be certain that dairy farmers have entered into the pilot program voluntarily. The disclosure statement is attached to a fact sheet containing general guidelines to help dairy farmers understand the forward contracting process. It also explains to the dairy farmer that the

program is voluntary and that by entering into the program with a handler, the dairy farmer will be forfeiting his or her right to the minimum prices provided under the order. The form should take no more than 15 minutes to be read, understood, and signed by a dairy farmer. We estimate that the number of dairy farmers involved would be approximately 8,000, and the total annual time burden would not exceed 2,000 hours.

Handlers will be required to submit their forward contracts under the pilot program to their respective market administrator's office. There are 2 reasons for this. First, the market administrator must be able to review the contract to ensure it is signed and to verify that it complies with the regulations provided here. Second, the Department is required to conduct a study of forward contracting under the pilot program to determine the impact on milk prices paid to producers in the United States. This study must be submitted to Congress no later than April 30, 2002. In order to do such a study, the Secretary will have to review, summarize, and evaluate the different types of contracts that were written under the pilot program.

The time required for handlers to prepare and submit copies of contracts would approximate 30 minutes per contract. If all of the nearly 1200 plants associated with Federal orders decide to forward contract under the pilot program, the total annual burden to submit these contracts would be 600 hours.

In the proposed rule, and as continued in this final rule, the disclosure statement described above must be submitted each time that a dairy farmer enters into a forward contract under the pilot program. Several commenters stated that this requirement was redundant and resulted in unnecessary paperwork. They suggested that the disclosure statement should only be required to be submitted the first time that a dairy farmer enters into a forward contract under the pilot program. Except for these comments with respect to the disclosure statement, no other comments were received that relate to paperwork reduction or information collection.

While we are concerned about burdening handlers with unnecessary paperwork, we do not believe that the very short disclosure statement specified in Section 1140.1(e) of this final rule would create such a burden. Furthermore, we are not convinced by the argument that producers need be

told only once that entering into a forward contract precludes them from receiving the order minimum prices for their milk. Forward contracting by producers is a significant departure from the historical regulatory environment. As such, it is essential that producers fully understand the consequences of entering into a voluntary contract that forfeits their right to receive minimum order prices for milk. By signing a disclosure statement for each contract, producers will be certifying that they have been given the opportunity to review the Forward Pricing Pilot Program Fact Sheet that describes the program, provides some advice, and cautions the producer to fully understand the terms and conditions of each contract.

#### **Public Comments**

A proposed rule was issued on February 25, 2000 (44 FR 10981). Interested parties were given 15 days to file written comments concerning the proposed rule. These comments were accepted by regular mail, e-mail, and by fax. A total of 97 comments were received. These comments came from—in order from most to least—dairy farmers, handlers, federal and state legislators, futures industry representatives, banking industry representatives, and other interested parties. All of the comments are available for viewing on our web site: [www.ams.usda.gov/dairy/for\\_contr\\_pilot.htm](http://www.ams.usda.gov/dairy/for_contr_pilot.htm).

#### **Discussion of Rules Applicable to Pilot Program**

Under the rules adopted here to administer the pilot program, producer milk under forward contract with a handler in compliance with the rules will not be subject to a Federal milk order's minimum price requirements provided that such milk does not exceed the handler's Class II, III, and IV utilization of milk for the month in the market that regulates the milk. This rule contains a clarification in § 1140.2(a) to make it clear that in order to be eligible for exemption from minimum order pricing under this pilot program handlers must be in compliance with the program rules.

For convenience, a handler's combined Class II, III, and IV utilization is defined as the handler's eligible milk. In the case of a multi-plant handler, the handler's Class II, III, and IV utilization will be combined together for all of the handler's milk regulated under one order. A handler will only be exempt from paying the order's minimum price(s) on its quantity of eligible milk.

The determination of which producers' milk is over-contracted is left to the handler. If the handler fails to make this determination, the market administrator will prorate the over-contract milk to each producer and cooperative association having a contract with the handler.

Although handlers participating in the pilot program will not be required to pay producers and cooperative associations the order's minimum uniform or component prices for contract milk, they will still be required to account to the pool for all milk they receive at the respective order's minimum class prices. In the case of milk received by transfer from a cooperative association's pool plant, a handler may forward contract for all such transferred milk that is not used in Class I and will be exempt from paying the cooperative the minimum class prices for contract milk.

In the proposed rule (See § 1140.2(a)), forward contracting under the pilot program was restricted to a handler that operates "one or more pool plants." In this final rule, this has been changed to read "any handler defined in §§ 1000.9 and 1135.9." The language in the proposed rule would have excluded proprietary handlers that do not operate pool plants from participating in the pilot program. As noted by Kraft Foods in its comment, "this limitation is not in the statute creating the pilot program, and would unnecessarily exclude a number of handlers and producers from enjoying the benefits intended by Congress."

The language contained in the proposed rule would not have permitted forward contracting for many manufacturing plants that use pooled milk for their manufactured dairy products. In fact, many nonpool plants that receive producer milk by diversion from pool plants would have been unable to forward contract under the pilot program.

In providing for the forward contract pilot program, Congress provided handlers who forward contract with an exemption from paying the minimum Federal order price to producers with whom they have contracted. The November 1999 amendments to the Act did not *permit* handlers who manufacture Class II, III, and IV products to forward contract because any handler, even handlers with all Class I milk, could have forward contracted prior to the amendments. What the amendments did do, however, was excuse handlers from paying producers minimum order prices for Class II, III, and IV milk under forward contract.

The language in § 1140.2(a) for the proposed rule stated that only pool plant operators could forward contract and be exempt from minimum Federal order pricing. This language, however, does not take into consideration the complex marketing arrangements that exist between pool plants, cooperative association bulk tank handlers, and nonpool plants.

In many markets, milk of nonmember producers that is regularly received at a nonpool plant is actually pooled by a pool plant operator or by a cooperative association through its deliveries to a pool plant. The nonmember milk delivered to the nonpool plant is reported as producer milk diverted to a nonpool plant by the cooperative association on its monthly report of receipts and utilization to the market administrator. Alternatively, if a cooperative association is not involved in the transaction, such milk could be reported by a pool plant operator on its report.

Many nonpool plant operators that receive nonmember milk that is pooled through another handler issue checks to their nonmember producers. They submit their payrolls showing these payments to the market administrator. Nevertheless, these nonpool plant operators are not responsible under the order for paying their nonmember producers the minimum Federal order price; it is the handler—*i.e.*, either the cooperative association or pool plant operator—that pools the milk for them who would be held responsible for an underpayment.

In this final rule, only producer milk that is under forward contract with a handler in compliance with the rules provided here will be exempt from the order's minimum prices. In the case of nonmember milk that is reported as producer milk by a cooperative association handler or pool plant operator, but payrolled by a nonpool plant operator, the cooperative association or pool plant operator, respectively, will be held responsible for any underpayment to a nonmember producer in the event that milk under contract becomes subject to minimum order pricing (for instance, in the case of over-contracted milk). In this way, cooperative association handlers, pool plant operators, and nonpool plant operators may continue the complex arrangements that have evolved to pool milk under the Federal milk order program and all will be permitted to participate in the pilot program.

The language in § 1140.2(a) of this final rule has been modified to reflect the change from "handler that operates one or more pool plants" to simply

"handler." As defined in § 1000.9, handler includes not only the operator of a pool plant or a nonpool plant, but also a broker serving as a handler as provided in § 1000.9(b) and a cooperative association acting as a handler with respect to milk delivered to a pool plant or diverted to a nonpool plant. Finally, the term "handler" includes a proprietary bulk tank handler as defined in § 1135.9 of the Western order.

Any handler participating in the pilot program will still be required to file all of the reports that are now required under an order. This includes reports of receipts and utilization of milk and monthly payroll reports that show all information now required under the orders.

Handlers participating in the pilot program will have to submit to the market administrator a copy of each contract for which it is claiming exemption from the order's minimum pricing. This contract must be signed prior to the 1st day of the 1st month for which the contract applies and must be received by the market administrator by the 15th day of that month. For the first month that the pilot program is effective, contracts must be signed on or after the day on which the program becomes effective. For example, if the program becomes effective on July 17, contracts for August milk must be signed between July 17 and July 31 and must be in the market administrator's office by August 15.

It is the responsibility of each handler to give to each contracting dairy farmer or cooperative association a disclosure statement informing them of the nature of the pilot program and providing them with certain information that they should consider before entering into a forward contract. The disclosure statement must be signed on the same date as the contract by the dairy farmer or cooperative association representative and will have to be returned to the market administrator together with the contract by the 15th day of the month. Any contract that is submitted to the market administrator without the disclosure statement will be considered to be invalid for the purpose of being exempt from the order's minimum pricing and will be returned to the handler.

Several commenters objected to having to submit a disclosure statement each time they contract with a producer. They argued that attaching a disclosure statement to the first forward contract with a producer was sufficient and that having to do so with each succeeding contract involved unnecessary paperwork.

As noted earlier in the section dealing with the Paperwork Reduction Act, we do not believe that the very short disclosure statement specified in Section 1140.1(e) of this final rule would create such a burden. In fact, it is only one paragraph long and can easily be incorporated in the body of a forward contract itself or can be handled as a one-page supplement that may be attached to the forward contract.

In its proposed rule, the Department proposed 2 provisions to help dairy farmers adjust to the new program. One provision would have required that each forward contract under the pilot program contain a clause that gives a dairy farmer 3 days to change his or her mind about forward contracting their milk. The 2nd proposed provision would have limited the contract period for first-time contracts under the pilot program to 6 months. Both of these proposals were opposed by a majority of the commenters who addressed these issues.

Numerous commenters contended that these 2 provisions would be very damaging to the pilot program, even rendering it totally ineffective. One commenter who specializes in hedging price risks noted that the 3-day cancellation provision would severely constrain a handler in offsetting its risk if it had to wait for 3 days after signing a contract before it could safely hedge a price commitment that it had made 3 days earlier. With respect to the proposed rule limiting first-time contracts to 6 months, many commenters observed that a 6-month contract would not match up with a dairy farmer's budgeting process.

In response to those commenters who argued that having to wait 3 days would subject handlers to extraordinary, unreasonable price risk, we undertook a careful review of the options available to handlers for hedging such risk. In particular, we analyzed the costs associated with purchasing at-the-money put options in lieu of selling futures to hedge forward contracts during the 3 days when a forward contract could be canceled. We also looked at the costs incurred in selling futures and simultaneously purchasing an equivalent amount of at-the-money call options to hedge the price risks associated with entering into forward contracts during the 3 days when the contract could be canceled. Our analysis indicates that the costs of the 3-day cancellation provision could amount to between 10 and 15 cents per hundredweight. These costs would likely be passed on to producers in the form of lower contract prices which

could dampen any interest in the pilot program.

In proposing the 3-day cancellation clause for producers who enter into forward contracts under the pilot program it was our intent to help farmers adjust to the new program and to protect them from undue pressure in signing forward contracts. However, based on the comments and on our analysis it is clear that the 3-day cancellation provision would result in some additional costs to handlers who enter into forward contracts and hedge such contracts by using the futures market. Such costs could be passed on to producers in terms of lower forward contract prices. Therefore, while we continue to see merit in this provision, we must conclude that, on balance, the 3-day cancellation provision could work against the interests of dairy farmers by denying them the opportunity to utilize forward contracts under the pilot program. Accordingly, this provision has been removed from this final rule. Nevertheless, we will carefully monitor whether producers have been provided with adequate time and information before entering into forward contracts with handlers under the pilot program and will revisit this issue if necessary.

With respect to the 6-month forward contract restriction for producers forward contracting for the first time, we still believe that a restriction for first-time forward contracts would have merit. However, we are convinced by the comments submitted that the maximum contract length should be changed from 6 months to 12 months to be more consistent with budgeting and banking practices. After a producer has entered into his or her first forward contract under the pilot program, subsequent contracts could be written for longer periods of time.

A 3rd proposed provision that was widely opposed by commenters and received virtually no support would have required the basis for pricing milk under a forward contract to be the same as the basis for pricing milk that was not under forward contract. Specifically, in the 4 Federal orders with butterfat and skim milk pricing, forward contracts would have been required to be written in those terms, and in the 7 orders with component pricing of milk, forward contracts would have been required to be written in terms of those same components. This provision was proposed for 2 reasons. First, we thought such pricing would be more understandable to producers who had part of their milk subject to minimum order pricing and part of it subject to forward contract pricing. Second, we thought that such pricing would be

easier for producers to verify using testing data provided by the market administrator.

This proposal was seen by commenters to be unnecessarily limiting and an obstacle to effectively hedging contract prices, which may be based upon futures market prices that may not price each component of milk. Therefore, it has been removed. However, producers who are not members of a cooperative association should understand that their milk weights and tests will continue to be handled in the same way by the market administrator even if they choose to enter into a forward contract which prices their milk on a basis that differs from the order in which their milk is pooled. For example, if a producer under the Appalachian Order, which prices milk to dairy farmers on the basis of skim milk and butterfat, enters into a contract that prices milk on the basis of protein, butterfat, other solids, and somatic cell count, the producer will not receive data from the market administrator to compare against the buying handler's test data. If the producer wishes to verify these tests, he or she will have to do so at their own expense.

As proposed, payments specified under a forward contract must be made on the same dates as order payments which they replace. No comments were received in opposition to this provision and it should be carried forward for several reasons. First, nearly every handler entering into forward contracts would have some milk that is subject to minimum order pricing. It is highly unlikely that these handlers would establish a dual accounting and payment system even if they thought that different payment dates would be preferable to those specified under the order. Second, if handlers paid producers under contract at different times than producers not under contract, this disparate treatment could cause problems which might influence the success of the pilot program for reasons entirely apart from more predictable pricing. Third, from an administrative standpoint, it will be much easier to administer the pilot program if payments are made on the same day as minimum order payments.

Some commenters argued that the market administrator should enforce forward contract prices just as they do minimum order prices. Another comment stated that the regulations should enforce payment of all contracts.

The Act requires the Secretary to establish a forward pricing pilot program. Milk for nonfluid use which is covered by forward contracts under the

pilot program is exempt from the minimum price provisions of the orders. We do not believe it should be the role of the market administrator or the Department to determine the terms of forward contracts or to enforce negotiated prices. Payment for milk covered under forward contract is required to be made by the dates specified in § 1140.2(e) of the regulations.

Some commenters argued that allowing a handler to draw money from the producer-settlement fund and not pass it on to its producers could create disorderly marketing conditions. One commenter concluded that allowing a handler to keep the difference between the order's blend price and the contract price was an unjustified windfall to the handler.

This issue merits some discussion. Frankly, we do not know what form forward contracts will take under the pilot program. We do know the nature of some forward contracts prior to the pilot program. In the Upper Midwest, where much of the milk that is pooled is used for Class III use, many forward contracts provided for a Class III price plus a pool draw. If a handler was a cheese operation, the pool draw would equal the difference between the order's blend price and the Class III price.

It may be that this same formula will be the popular way to forward contract under the pilot program, but there are several variables that make this unclear. First, the pilot program applies to all Federal order markets, with Class I utilizations ranging from 90 percent to 10 percent. There is a significant difference in the pool draw between these extremes. Second, forward contracts may only cover milk used for Class II, III, or IV use. While a contract providing for a Class III price plus the pool draw might make sense for a cheese plant, it may not fit well with an ice cream or butter-powder operation.

Producers who are contemplating forward contracting should keep in mind that their benchmark price is the Federal order blend price. That is the minimum price that they would receive in the absence of a forward contract. Thus, it seems reasonable that when producers negotiate a forward contract price, they would hope to approximate, ideally, the minimum blend price plus applicable premiums averaged over the forward contract period.

As noted above, we do not know how handlers will arrive at forward contract prices. They could look at futures markets for guidance. A forward contract price could be a flat blend price approximation; it could be an average futures market cheese price plus a pool

draw; or, for a butter-powder operation, it could be an average future butter and powder price on a hundredweight basis plus a pool draw.

Over time, we would expect to see forward prices to producers below the blend price in some months and above the blend price in other months. When the contract price is below the blend price, the pool draw could accrue to the contracting handler. On the other hand, when the contract price is above the blend price, the contracting handler will have to supplement the pool draw to pay the producer the contract price. On balance, the pluses and minuses should cancel each other out since, one could argue, the desired objective of forward contracting is to remove the uncertainty and variability in prices, not to reduce a handler's cost by cutting its payments to producers. In fact, if producers continually find that they are losing money by forward contracting, it would seem illogical for them to continue to do so.

Some commenters also argued that handlers with forward contracts under the pilot program should be prohibited from excluding milk from regulation or, as it more commonly called, depooling milk.

This issue would by necessity involve amendments to Federal orders, unlike the pilot program, which involves no amendments to Federal orders. The depooling issue is really separate from forward contracting and is not appropriate for consideration in this informal rulemaking process.

Participation in the pilot program must be entirely voluntary on the part of dairy farmers and handlers. If the Department believes that the program is being used to coerce dairy farmers into signing contracts providing for prices that, on average, are consistently below minimum order prices, steps will be taken to halt such practices. One indication that such practices could be occurring would be complaints from dairy farmers that they were dropped because they refused to sign a forward contract with a handler. Another indication might be manifested by the replacement of one group of dairy farmers with another group of dairy farmers who have entered into forward contracts with the handler. It is conceivable that some farmers might intentionally enter into a forward contract that would consistently provide a price below the minimum order price simply to get their milk pooled on a particular market for possible future benefit. This type of activity would undermine the concept of minimum prices to dairy farmers and lead to the type of conditions that the AMAA was

enacted to remedy. Should these types of activities occur after the pilot program becomes effective, the Secretary would consider appropriate actions to halt such activities.

Many commenters, including several members of Congress, took issue with our reference to suspend or terminate the pilot program in the discussion part of the proposed rule. Other commenters, however, specifically welcomed the discussion of these contingencies.

It may be true, as one commenter stated, that it is unnecessary to state that the Secretary of Agriculture can terminate the pilot program if he finds that it is operating in conflict with the Agricultural Marketing Agreement Act. However, we see no harm in stating what may not be obvious to all pilot program participants: If the program is abused, steps will be taken to stop the abuse.

Therefore, based on the rationale set forth in the proposed rule and in this document we are adopting provisions of the proposal as a final rule, with the changes discussed in this document, as well as several technical changes made for clarity.

Additional information about the pilot program is included in the Department's program announcement. The information is also available on the Dairy Programs' web site ([www.ams.usda.gov/fmor/index.htm](http://www.ams.usda.gov/fmor/index.htm)) and is available from local market administrator offices.

For the reasons set forth in the preamble, Title 7 of Chapter X of the CFR is amended by adding a new Part 1140 as follows:

## **PART 1140—DAIRY FORWARD PRICING PILOT PROGRAM**

### **Subpart A—Definitions**

Sec.

1140.1 Definitions.

### **Subpart B—Rules Governing Forward Contracts**

1140.2 Rules governing forward contracts.

*Authority:* 7 U.S.C. 601 *et seq.*

### **Subpart A—Definitions**

#### **§ 1140.1 Definitions.**

(a) *Pilot program* means the dairy forward pricing pilot program provided by an amendment to the Agricultural Marketing Agreement Act of 1937 (7 U.S.C. 601 *et seq.*) signed into law on November 29, 1999 (Section 3 of H.R. 3428 of the 106th Congress, as enacted by section 1001(a)(8) of Public Law 106–113 (113 Stat. 1536)).

(b) *Eligible milk* means the quantity of milk equal to the contracting handler's Class II, III, and IV utilization of

producer milk, in product pounds, during the month, combining all plants of a single handler regulated under the same Federal order.

(c) *Forward contract* means an agreement covering the terms and conditions for the sale of milk from a producer defined in §§ 1001.12, 1005.12, 1006.12, 1007.12, 1030.12, 1032.12, 1033.12, 1124.12, 1126.12, 1131.12, and 1135.12, or a cooperative association defined in § 1000.18, and a handler defined in § 1000.9 or 1135.9.

(d) *Contract milk* means the producer milk covered by a forward contract.

(e) *Disclosure statement* means the following statement which must be signed by each producer entering into a forward contract with a handler before the market administrator will recognize the terms and conditions provided in such contract.

#### Disclosure Statement

I am voluntarily entering into a forward contract with \_\_\_\_\_ (handler's name). I have been given a copy of the contract and I have received the USDA's Pilot Program Fact Sheet to which this disclosure statement was attached. By signing this form, I understand that I am forfeiting my right to receive the order's minimum prices for that portion of my milk that is under forward contract for the duration of the contract. I also understand that my milk will be priced in accordance with the terms and conditions of the contract.

Printed Name:

Signature:

Date:

Address:

Producer No:

(f) *Other definitions.* The definition of any term in parts 1000–1135 of this chapter apply to, and are hereby made a part of, this part.

### Subpart B—Rules Governing Forward Contracts

#### § 1140.2 Rules governing forward contracts.

(a) Any handler defined in §§ 1000.9 and 1135.9 may enter into forward contracts with producers or cooperative associations for the handler's eligible milk. Milk under forward contract in compliance with these rules will be exempt from the minimum payment provisions that would apply to such milk pursuant to §§ 1001.73, 1005.73, 1006.73, 1007.73, 1030.73, 1032.73, 1033.73, 1124.73, 1126.73, 1131.73 and 1135.73 for the period of time covered by the contract.

(b) A forward contract with a producer or cooperative association participating for the first time in this pilot program may not exceed 12 months. In no event shall a forward contract executed pursuant to this part extend beyond December 31, 2004.

(c) Forward contracts must be signed and dated by the contracting handler and producer (or cooperative association) prior to the 1st day of the 1st month for which they are to be effective and must be in the possession of the market administrator by the 15th day of that month.<sup>1</sup> The disclosure statement provided in § 1140.1(e) must be signed on the same date as the contract by each producer entering into a forward contract under the pilot program, and this signed disclosure statement must be attached to each contract submitted to the market administrator.

(d) In the event that a handler's contract milk exceeds the handler's eligible milk for any month in which the specified contract price(s) are below the order's minimum prices, the handler must designate which producer milk shall not be contract milk. If the handler does not designate the suppliers of the over-contracted milk, the market administrator shall prorate the over-contracted milk to each producer and cooperative association having a forward contract with the handler.

(e) Payments for milk covered by a forward contract must be made on or before the dates applicable to payments for milk that is not under forward contract under the respective Federal order.

(f) Handlers participating in the pilot program will continue to be required to file all reports that are currently required under the respective marketing orders and will continue to be required to account to the pool for all milk they receive at their respective order's minimum class prices.

(g) Nothing in this part shall impede the contractual arrangements that exist between a cooperative association and its members.

Dated: July 13, 2000.

#### Federal Home Loan Bank Advances, Eligible Collateral, New Business Activities and Related Matters

**AGENCY:** Federal Housing Finance Board.

**ACTION:** Final rule.

**SUMMARY:** The Federal Housing Finance Board (Finance Board) is amending its Advances Regulation and other regulations to implement the requirements of the Federal Home Loan Bank System Modernization Act of 1999 by: allowing the Federal Home Loan Banks (Banks) to accept from community financial institution (CFI) members new categories of collateral to secure advances; expanding the purposes for which the Banks may make long-term advances to CFI members; and removing the limit on the amount of a member's advances that may be secured by other real estate-related collateral. The Finance Board also is making related and other technical changes to its regulations on General Definitions, Powers and Responsibilities of Bank Boards of Directors and Senior Management, Federal Home Loan Bank Housing Associates, Community Support Requirements, Community Investment Cash Advance Programs and Standby Letters of Credit, and adopting a new regulation on New Business Activities.

**DATES:** The final rule is effective on August 17, 2000.

**FOR FURTHER INFORMATION CONTACT:** James L. Bothwell, Director, (202) 408–2821, Scott L. Smith, Deputy Director, (202) 408–2991, or Julie Paller, Senior Financial Analyst, (202) 408–2842, Office of Policy, Research and Analysis; or Eric E. Berg, Senior Attorney-Advisor, (202) 408–2589, Eric M. Raudenbush, Senior Attorney-Advisor, (202) 408–2932, or Sharon B. Like, (202) 408–2930, Senior Attorney-Advisor, Office of General Counsel, Federal Housing Finance Board, 1777 F Street, N.W., Washington, D.C. 20006.

#### SUPPLEMENTARY INFORMATION:

##### I. Background

##### A. Historical Benefits of Federal Home Loan Bank System

The Federal Home Loan Bank System (Bank System) comprises twelve regional Banks that are instrumentalities

<sup>1</sup> Contracts that have been signed prior to the effective date of these rules are invalid under the pilot program.

## Appendix C

Forward Pricing Pilot Program Fact Sheet and Disclosure Statement

and

Questions & Answers Concerning Pilot Forward  
Contracting Pricing Program

**Forward Pricing Pilot Program Fact Sheet and Disclosure Statement**  
Agricultural Marketing Service, U.S. Department of Agriculture

1. The Forward Pricing Pilot Program is a voluntary program that allows dairy farmers and handlers buying their milk to enter into forward contracts for that portion of milk that the handler uses for nonfluid milk products. Dairy farmers are under no obligation to participate in this program and may continue to have their milk priced under the order's minimum payment provisions. If a handler pressures a dairy farmer to sign a forward contract, this should be reported to the market administrator immediately.
2. By entering into a forward contract with a handler, a dairy farmer gives up the right to receive the minimum Federal order prices for the amount of their milk under contract.
3. The first forward contract involving a dairy farmer or cooperative association that is participating in the pilot program for the first time is restricted to 12 months. Thereafter, subsequent contracts may be of unlimited duration provided that they do not extend beyond the pilot program termination date, December 31, 2004.
4. Dairy farmers entering into a forward contract should understand all of the terms of the contract, including how their milk will be priced, the length of the contract, and any charges or deductions that will be made. If a formula will be used to price your milk, you should understand how the formula works and what factors affect its movement. You should understand what will happen if you cannot fulfill the terms of the contract. What may you be liable for? You should also understand what remedies are available to you if the processor defaults on the contract.
5. The terms and conditions of a contract must be in writing. If you and the handler to whom you deliver your milk renegotiate or modify any terms of the contract, the changes must be put in writing as an amendment to the contract and submitted to the market administrator. The contract should contain a clause explaining how disagreements will be settled.
6. Market administrators will continue to be responsible for verifying the accuracy of the weights and tests of your milk on the same basis as if your milk was subject to Federal order pricing. If you should choose to price components of your milk that are not tested for and priced under the order in which your milk is pooled, you will have to arrange for private testing of your milk to verify the buying handler's weights and tests.
7. The following disclosure statement must be signed by each dairy farmer that enters into a forward contract with a handler under the pilot program. The disclosure statement must be attached to each contract submitted to the market administrator. Contracts that are submitted without the disclosure statement will be considered to be invalid for the purpose of exempting a handler from an order's minimum pricing provisions. Forward contracts must be signed by the producer and handler prior to the first day of the month for which they are effective and must be in the possession of the market administrator by the 15<sup>th</sup> day of that month.

## Disclosure Statement

I am voluntarily entering into a forward contract with \_\_\_\_\_ (handler's name). I have been given a copy of the contract and I have received the USDA's Pilot Program Fact Sheet to which this disclosure statement was attached. By signing this form, I understand that I am forfeiting my right to receive the order's minimum prices for that portion of my milk that is under contract for the duration of the contract. I also understand that my milk will be priced in accordance with the terms and conditions of the contract.

Printed Name: \_\_\_\_\_

Signature: \_\_\_\_\_

Date: \_\_\_\_\_

Address: \_\_\_\_\_

Producer No. \_\_\_\_\_

## **Questions & Answers Concerning Pilot Forward Contract Pricing Program**

**Q:** Will all dairy farmers be guaranteed an opportunity to participate in this pilot program?

**A:** In order to participate in this program, two things are necessary. First, the handler to which a dairy farmer delivers milk must be willing to offer the dairy farmer a forward contract. Second, the handler must have non-fluid uses of milk--i.e., butter, powder, cheese, ice cream, yogurt, etc.--to cover the quantity of milk under forward contract.

**Q:** Can a handler force a producer to enter into a forward contract?

**A:** A handler cannot force a producer to enter into a forward contract. The Consolidated Appropriations Act 2000 (i.e., Section 3 of H.R. 3428 of the 106<sup>th</sup> Congress, as enacted by Section 1001(a)(8) of Public Law 106-113), gives the Secretary of Agriculture the authority to implement this pilot program. If the program is abused, the Secretary will take appropriate remedial action.

**Q:** How do we know that a producer has “voluntarily” entered into a forward contract with a handler?

**A:** Before a handler can be exempt from paying a producer the Federal order’s minimum price(s), the market administrator must have a signed copy of a forward contract with both the handler’s and producer’s signatures. The contract must be signed prior to the first day of the month for which it is to be effective and must be in the possession of the market administrator by the 15<sup>th</sup> day of the month. In addition, attached to each contract must be a disclosure statement signed by the dairy farmer or cooperative association representative entering into the forward contract.

**Q:** Is there any restriction concerning the length of a forward contract?

**A:** A contract with a producer or cooperative association participating for the first time under the pilot program is limited to 12 months. Thereafter, any contract under the pilot program involving this producer or cooperative association may be unlimited in length provided that it does not extend beyond the pilot program termination date, December 31, 2004.

**Q:** Can a producer enter into a forward contract with more than one handler?

**A:** Yes.

**Q:** Will the market administrator verify the weights and tests of milk under forward contract?

**A:** The market administrator will verify the weights and tests of milk of producers who are not members of a cooperative association in the same manner as would be done if the milk were not under contract.

**Q:** What happens if, after a handler has entered into forward contracts, the handler's non-fluid use drops below the amount of milk covered by forward contracts?

**A:** If this should happen and the contract price exceeded the order's minimum price(s) for the month, the issue would be moot and the handler would continue to pay the producer the agreed-upon contract price for the milk covered by the contract. If, on the other hand, the contract price was below the order's minimum price(s) for the month, the handler would be required to pay the higher minimum price(s) for the quantity of over-contracted milk.

**Q:** In the situation just described, who determines which producers get the higher minimum order price for their over-contracted milk?

**A:** This determination is left to the handler. If the handler fails to indicate which milk is over-contract milk, the market administrator will prorate the quantity of over-contract milk to each producer and cooperative association having a forward contract with the handler.

**Q:** Can a handler enter into a forward contract with a cooperative association?

**A:** Yes.

**Q:** Can a forward contract between a handler and a cooperative association cover milk transferred from the cooperative association's plant?

**A:** Forward contracts can apply to bulk milk or milk components transferred from a cooperative association's plant.

**Q:** How will a handler's Class II, III, and IV utilization be determined?

**A:** Each month the market administrator will combine all of the handler's reported Class II, III, and IV utilization for all of the handler's plants receiving producer milk under the specific order.

**Q:** Will a handler's forward contracts with producers relieve the handler of responsibility for supplying the market with milk for fluid use if the market administrator increases shipping requirements for supply plants, balancing plants, and/or a system of supply plants?

**A:** No, any handler operating a pool plant will be responsible for meeting the order's pooling requirements regardless of the impact such requirements may have on a handler's outstanding forward contracts. This responsibility would extend to any modification of shipping requirements resulting from a market administrator's adjustment of such requirements under the order.

**Q:** Will market administrators enforce payment of the contract price for milk covered by forward contracts?

**A:** No, market administrators will only enforce payment of the minimum order prices provided under the order for milk that is not subject to a forward contract.

**Q:** For that portion of their milk covered by forward contracts, will handlers still be subject to the order's classified pricing system?

**A:** Yes, even though a handler has forward contracted for a portion of its milk supply at a price that is higher or lower than the minimum order price, the handler will still be required to account for all of its milk receipts at the classified prices provided by the order and will still be required to make a payment into the producer-settlement fund if its classified use value exceeds the marketwide average. On the other hand, if a handler's classified use value is below the marketwide average, the handler will draw a payment out of the producer-settlement fund at the difference between its classified use value and the value of the milk at the marketwide average use value.

**Q:** For milk under forward contract, will a handler have to make partial and final payments by the dates required under the order?

**A:** Milk under forward contract will not be subject to the amount of payment specified under the order but contract payments will be required to be made on the same day as minimum order payments are required to be made.

**Q:** Can the components of milk under forward contract be priced on a different basis than the components of milk that is subject to minimum Federal order pricing?

**A:** Yes, milk under forward contract can be priced any way that the handler and producer mutually agree upon.

**Q:** Why restrict forward contracting to milk that is not used for fluid use?

**A:** This restriction was specified by the legislative amendment.

**Q:** Will market administrators have any role in reviewing or approving forward contracts?

**A:** Market administrators will review a forward contract to be certain that it is in compliance with the rules governing the pilot program. They will ensure that the contract is signed by both parties and will make certain that a signed disclosure statement is attached to each contract entered into by a dairy farmer under the pilot program. Other than reviewing the contract for these items, the market administrator will not comment on or seek to change a contract that has been approved between a producer and a handler.

## **Appendix D**

### **Computation of Prices for Dairy Forward Pricing Pilot Program Study**

## **Computation of Prices for Dairy Forward Pricing Pilot Program Study**

The method used to compare prices for contracted milk is outlined below. Prices are calculated for contracted milk at test—the contract price; for the same milk had it not been contracted—the non-contract price; and for the same milk had it been priced under the Federal order—the Federal order minimum price. The method applies equally well to the variety of methods in pricing and quantifying contract milk and components found in Dairy Forward Pricing Pilot Program forward contracts.

As noted in the discussion, handlers have used a wide variety of methods in pricing and quantifying contract milk and components. This raises some difficulties in aggregating data to compute average prices. This is further complicated by the fact that payroll data provided by handlers usually does not distinguish between contract and non-contract milk for the producers who have part of their milk under contract.

The approach is to first calculate the non-contract value of all milk delivered by each contracting producer by applying the handler's prices for milk components and the handler's PPD to the milk delivered. The non-contract price per hundredweight is calculated by dividing this value by total milk delivered. The non-contract value is then subtracted from the total gross value paid before deductions, yielding the value attributed to the contract. This contract value is divided by contract volume to yield the contract value per hundredweight. The contract price per hundredweight is the sum of the non-contract price and the contract value per hundredweight. The key assumption is that the PPD and premium paid by the handler apply to both contracted and non-contracted milk. Similarly, the Federal order minimum price per hundredweight is calculated for the milk using the Federal order prices adjusted for location and the producer's milk tests.

### **Price Calculations**

The price computation for non-contract milk is straightforward. Participating handlers usually use pricing formulas that are the same or similar to Federal milk marketing order (FMMO) minimum pricing formulas. For example, in an order with component pricing, most handlers pay a producer price differential (PPD), butterfat price, protein price, other solids price, and a somatic cell count adjustment. These component prices, which may or may not be the same as the FMMO minimum prices, have been provided to the market administrator offices. In our example, handler component prices are the same, but the PPD paid by the handler is less than the Federal order PPD adjusted for location. Handlers often pay premiums in addition to component prices. Although in most cases handlers have not provided their formulas for premiums to the market administrator, the total premium paid to each producer has been provided. To determine if a handler has met FMMO minimum pricing requirements for non-contract milk, the price at test per hundredweight, including the premium, is compared to the FMMO minimum blend price at test.

Payroll data provided by handlers includes the gross value of the milk before deductions for hauling, promotion, and marketing charges. It also provides pounds of milk delivered and the component tests. Since we have information necessary to compute non-contract milk prices at test, we can calculate a gross value before deductions that a forward-contracting producer would have received had there been no contract. We attribute to the contract the difference between this computed gross value and the gross value that the producer actually received. From the contract, we know the contract pounds. We can therefore derive a price received, at test, for contract milk.

The following example serves as an illustration:

Payroll Information

Gross value on payroll for all milk, before deductions  
for hauling, promotion, and marketing charges      \$11,770.18

Total pounds	86,305 lbs.	
Contract pounds	40,000 lbs.	
Butterfat pounds	3,219 lbs.	
Protein pounds	2,563 lbs.	
Other solids pounds	4,919 lbs.	
Somatic cell count adjustment		\$77.67
Premium		\$516.53

Non-contract prices paid by handler

PPD	\$0.7100 per cwt.
Butterfat price	\$1.3817 per pound
Protein price	\$2.0884 per pound
Other solids price	\$0.0965 per pound

Federal Minimum order prices

Same as handler's non-contract prices in this example, except that the Federal order minimum PPD adjusted for location is \$0.7600.

Computation of gross value of all milk had there been no contract

Handler's PPD value	(\$0.71 X 86,305 lbs.) / 100 =	\$ 612.77
Butterfat value	\$1.3817 X 3,219 lbs. =	4,447.69
Protein value	\$2.0884 X 2,563 lbs. =	5,352.57
Other solids value	\$0.0965 X 4,919 lbs. =	474.68
Somatic cell count Adjustment		77.67
Premium		516.53
Non-contract gross value before deductions for hauling, promotion and marketing		<u>\$11,481.91</u>

Computation of Federal order minimum gross value of all milk had there been no contract.

PPD value	(\$0.76 X 86,305 lbs.) / 100 =	\$ 655.92
Butterfat value	\$1.3817 X 3,219 lbs. =	4,447.69
Protein value	\$2.0884 X 2,563 lbs. =	5,352.57
Other solids value	\$0.0965 X 4,919 lbs. =	474.68
Somatic cell count Adjustment		77.67
Federal order minimum non-contract gross value before deductions for hauling, promotion and marketing		\$10,533.85

Handler's milk price at test before deductions had there been no contract:

$$\text{Gross value} \quad \text{total pounds}$$

$$(\$11,481.91 \quad / \quad 86,305) \times 100 = \underline{\$13.30}$$

Federal Order minimum blend price at test before deductions had there been no contract:

$$\text{Gross value} \quad \text{total pounds}$$

$$(\$10,533.85 \quad / \quad 86,305) \times 100 = \underline{\$12.21}$$

Computation of price received for contract milk at test:

Gross value for all milk received, before deductions	\$11,770.18
Gross value of all milk had there been no contract	11,481.91
Difference attributed to contract	\$ 288.27

Difference per cwt. attributed to contract:

$$(\$288.27 \quad / \quad 40,000 \text{ contract lbs.}) \times 100 = \$0.72$$

Computed price received for contract milk at test:

Milk price at test had there been no contract	\$13.30
Difference attributed to contract	0.72
Computed price received for contract milk at test	\$14.02

This method of computing the price received for non-contract milk assumes that the producer price differential and premium are calculated identically for contract and non-

contract milk. In other words, we assume that there is no price discrimination relevant to the producer price differential and the premium with respect to contract v. non-contract milk. Some contracts state, for example, that a producer will be paid “all applicable premiums,” without any further details. Such language may leave room for some error in this assumption. We also assume that the component proportions for contract milk are the same as that for non-contract milk.

We can now compute a gross value of contract milk, a gross value of contract milk had there been no contract, and a gross value of contract milk if the Federal order minimum blend price had been applicable:

Gross value of contract milk:

$$\begin{array}{r r r r r} \text{Contract pounds} & & \text{Contract price per cwt.} & & \text{Gross value of contract milk} \\ (40,000) & \times & \$14.02 & / 100 = & \$5,608 \end{array}$$

Gross value of contract milk had there been no contract:

$$\begin{array}{r r r r r} \text{Contract pounds} & & \text{Non-contract price per cwt.} & & \text{Gross value of contract milk} \\ & & & & \text{had there been no contract} \\ (40,000) & \times & \$13.30 & / 100 = & \$5,320 \end{array}$$

Gross value of contract milk if the Federal order minimum blend price had been applicable:

$$\begin{array}{r r r r r} \text{Contract pounds} & & \text{Federal order minimum} & & \text{Gross value of contract milk at} \\ & & \text{blend price per cwt.} & & \text{Federal order minimum blend price} \\ (40,000) & \times & \$12.21 & / 100 = & \$4,884 \end{array}$$

To compute the average contract price per hundredweight for a month or signing-delivery quarter combination, we total the gross value of contract milk for all of the producers, divide by contract pounds, and multiply by 100. Actual stated contract prices usually do not include premiums or PPDs. They are usually in addition to the contract price. Since we do not use actual contract prices to compute this average price, our computed price is technically the average price received for contract milk rather than the average contract price. For ease of reading, however, we call it the average contract price.

To obtain a valid comparison of the contract price to the non-contract price for a month or signing-delivery quarter combination, we total the gross value had there been no contract for all of the producers, divide by contract pounds, and multiply by 100. We then get the average price of contract milk had there been no contract. This is not the average price paid for non-contract milk since we have weighted the price with contract pounds instead of non-contract pounds. For ease of reading, however, we call it the average non-contract price. We follow the same procedure for the Federal order minimum blend price.

To compute average contract, non-contract, and Federal order minimum blend prices for the study period, we compute simple averages of the weighted monthly averages as described above.

Plant Questionnaire,

and

Cooperative Questionnaire

**FORWARD CONTRACTING PILOT PROGRAM STUDY  
PRODUCER QUESTIONNAIRE**

According to the Paperwork Reduction Act of 1995, an agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a valid OMB control number. The valid OMB control number for this information collection is 0581-0190. The time required to complete this information collection is estimated to average 15 minutes per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, sex, religion, age, disability, political beliefs, sexual orientation, or marital or family status. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at 202-720-2600 (voice and TDD).

To file a complaint of discrimination, write USDA, Director, Office of Civil Rights, Room 326-W, Whitten Building, 14<sup>th</sup> and Independence Avenue, SW, Washington, DC 20250-9410, or call 202-720-5964 (voice and TDD). USDA is an equal opportunity provider and employer.

AMS Control Number

**TO BE COMPLETED BY ALL PRODUCERS:**

1. Pounds of milk produced and marketed per month during the past year:
  - Less than 100,000 pounds.
  - 100,000 to 400,000 pounds.
  - 400,000 to 1,000,000 pounds.
  - More than 1 million pounds.
  
2. My farm delivers to a plant/handler regulated under Federal Milk Order Name \_\_\_\_\_, or Number
  
3. My farm is located in (State)
  
4. How many potential buyers for your milk did you have during the past year?
  - One.
  - Two or three.
  - Four or more.
  
5. Have you used forward contracts, futures contracts, or options to protect yourself against price changes in: (Select all that apply.)
  - Feed?
  - Fuel or energy?
  - Cull cows?
  - Milk (other than through the *Forward Contracting Pilot Program*)?
  
6. The handler receiving your milk:
  - Offered forward contracts to *all* producers.
  - Offered forward contracts to *some* producers.
  - Offered forward contracts to *no* producers.
  - Do not know.

7. Did you sign a contract as part of the *Forward Contracting Pilot Program*?

- Yes. (Skip 8 and 9 below. Proceed to questions 10 through 14.)
- No. (Proceed to question 8.)

**COMPLETE ONLY IF YOU DID *NOT* SIGN A FORWARD CONTRACT UNDER THE FORWARD CONTRACTING PILOT PROGRAM:**

8. If you did not sign a forward contract under the *Forward Contracting Pilot Program*, please mark all of the following statements that apply to you.

- My handler did not offer forward contracts, and I did not want to change handlers.
- I thought that the market price would be higher than the contract price offered.
- I heard about the contract offer too late to contract.
- I probably will sign a forward contract in the near future.
- I wished to sign a forward contract, but my handler denied a contract to me. (If you check this box, please answer question 9. Otherwise, stop here.)

9. If you were denied a contract even though your handler had contracts with other producers, what was the reason(s)?

- Volume too small.
  - I was too late. Contracts were offered on a “first come, first serve” basis.
  - Quality problems.
  - Other. Please specify:
- 

**COMPLETE ONLY IF YOU SIGNED AT LEAST ONE FORWARD CONTRACT UNDER THE FORWARD CONTRACTING PILOT PROGRAM:**

10. What were your reasons for signing a forward contract? (Select all that apply.)

- To assure a more stable cash flow.
  - To satisfy lender requirement.
  - Attractive contract price.
  - To maintain a relationship with my current buyer.
  - Other, please specify:
-

11. What information did you rely upon to determine a suitable contract price? (Select all that apply.)

- Discussions with neighbors.
  - USDA, university, and/or private price forecasts.
  - Futures market prices.
  - Comparison to other forward contract price offers.
  - My own analysis of my cost of production and my own price forecast.
  - Other, please specify:
- 

12. Although the *Forward Contracting Pilot Program* is voluntary, I felt it necessary to contract in order to retain a relationship with my current buyer?

- Strongly agree.
- Slightly agree.
- Don't know.
- Slightly disagree.
- Strongly disagree.

13. If your contract price was less than the relevant comparison price (Class III price, blend price, etc.) during the contract period, how will this affect your future contracting decisions?

- Probably will not forward contract again.
- Probably will reduce the amount of milk production I forward contract.
- Will have no effect as I evaluate the next contract.
- Not applicable. My contract price was greater than the relevant comparison price during the contract period.

14. If you contracted to reduce price volatility and the contract price was less than the relevant comparison price during the contract period, do you consider the difference to be a reasonable tradeoff for the price risk you avoided?

- Yes, it was reasonable.
- No, it was too large.
- Not applicable. My contract price was greater than the relevant comparison price during the contract period.

**TO BE COMPLETED BY ALL PLANTS:**

1. Of the milk you pool under Federal orders, what annual percentage falls into each class?

- Class I        %.
- Class II       %.
- Class III      %.
- Class IV      %.

2. Total pounds of milk pooled per month during the past year:

- Less than 10 million pounds.
- 10 to 20 million pounds.
- 20 to 30 million pounds.
- More than 30 million pounds.

3. The plant is generally regulated under Federal Milk Order Name

\_\_\_\_\_, or Number

4. The plant is located in (State)

5. The plant is owned by:

- A single dairy plant firm.
- A multiple dairy plant firm. If so, please enter the number of dairy plants owned by the firm?

AMS Control Number

6. If your primary use is Class I, how has the *Forward Contracting Pilot Program* affected your ability to attract a supply of milk for Class I uses?

- Made it easier.
- Unchanged.
- Made it harder.
- Not applicable.

7. How has the *Forward Contracting Pilot Program* affected your ability to attract a supply of milk for manufacturing (Class II, III, or IV) uses?

- Made it easier.
- Unchanged.
- Made it harder.
- Not applicable.

8. With regards to your plant's dairy operation, have you used forward contracts, futures, or options to protect against prices change in: (Select all that apply.)

- Fuel or energy.
- Labor.
- Dairy product markets.
- Milk (other than through the *Forward Contracting Pilot Program*)
- Other, please specify:

\_\_\_\_\_.

9. Did you offer contracts under the *Forward Contracting Pilot Program*?

- Yes. (Skip number 10. Answer questions 11 through 15.)
- No. (Answer only question 10 below.)

**COMPLETE ONLY IF YOU DID *NOT* OFFER FORWARD CONTRACTS UNDER THE FORWARD CONTRACTING PILOT PROGRAM**

10. If you did not offer forward contracts under the *Forward Contracting Pilot Program* to your producers, please mark all of the following that apply.

- The competition did not offer forward contracts.
- Producers were not interested in forward contracting.
- Most of our milk is used for Class I purposes and is therefore ineligible for contracting under the pilot program.
- We offer forward contracts outside of the pilot program that are therefore subject to federal order minimum price requirements.
- Other, please specify:

\_\_\_\_\_.

- The plant likely will offer forward contracts in the near future.

**COMPLETE ONLY IF YOU OFFERED FORWARD CONTRACTS UNDER THE FORWARD CONTRACTING PILOT PROGRAM**

11. Did you offer the same contract terms to all producers?

- Yes.
- No.

12. For contracts offered, did you: (Select all that apply)

- Accept first those contracts from large producers?
- Accept first those contracts for 100 percent of production?
- Accept all contracts in order of receipt without regard to contract volume?
- Accept for other reason? Please specify:

\_\_\_\_\_.

- No producers accepted contracts offered.

13. How did you cover your accepted contracts? (Select all answers that apply.)

- Long-term contract to sell manufactured products
- Used the Futures and Options markets.
- Self-protected.

14. Would you continue to offer forward contracts if the program were continued beyond December 2004?

- Yes.
- Only if necessary to meet competition.
- No.
- Don't know.

15. Did you sell more of your finished product under long-term contracts with buyers because you were able to forward contract a milk supply?

- No.
- Less than 25 percent more.
- From 25 to 50 percent more.
- 50 percent or more.

**FORWARD CONTRACTING PILOT PROGRAM STUDY  
COOPERATIVE QUESTIONNAIRE**

According to the Paperwork Reduction Act of 1995, an agency may not conduct or sponsor, and a person is not required to, respond to, a collection of information unless it displays a valid OMB control number. The valid OMB control number for this information collection is 0581-0190. The time required to complete this information collection is estimated to average 15 minutes per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, sex, religion, age, disability, political beliefs, sexual orientation, or marital or family status. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at 202-720-2600 (voice and TDD).

To file a complaint of discrimination, write USDA, Director, Office of Civil Rights, Room 326-W, Whitten Building, 14<sup>th</sup> and Independence Avenue, SW, Washington, DC 20250-9410, or call 202-720-5964 (voice and TDD). USDA is an equal opportunity provider and employer.

AMS Control Number

**TO BE COMPLETED BY ALL COOPERATIVES**

1. Total pounds of milk handled per month during the past year:

- Less than 10 million pounds.
- 10 to 50 million pounds.
- 50 to 250 million pounds.
- 250 to 500 million pounds.
- More than 500 million pounds.

2. Of the milk you pool under Federal orders, what percentage falls into each class?

Class I	<input type="text"/> <input type="text"/>	%.
Class II	<input type="text"/> <input type="text"/>	%.
Class III	<input type="text"/> <input type="text"/>	%.
Class IV	<input type="text"/> <input type="text"/>	%.

3. Of the milk you pool under Federal orders, what annual percentage is pooled in each order? Please enter percentages adding to 100%.

Northeast	<input type="text"/> <input type="text"/> <input type="text"/>	Appalachian	<input type="text"/> <input type="text"/> <input type="text"/>	Florida	<input type="text"/> <input type="text"/> <input type="text"/>
Southeast	<input type="text"/> <input type="text"/> <input type="text"/>	Upper Midwest	<input type="text"/> <input type="text"/> <input type="text"/>	Central	<input type="text"/> <input type="text"/> <input type="text"/>
Mideast	<input type="text"/> <input type="text"/> <input type="text"/>	Pac. Northwest	<input type="text"/> <input type="text"/> <input type="text"/>	Southwest	<input type="text"/> <input type="text"/> <input type="text"/>
AZ-Las Vegas	<input type="text"/> <input type="text"/> <input type="text"/>	Western	<input type="text"/> <input type="text"/> <input type="text"/>		

AMS Control Number

4. Has the cooperative used forward contracts, futures market contracts, or options to protect itself against price changes in: (Select all that apply.)
- Feed?
  - Fuel or energy?
  - Labor?
  - Dairy product markets?
  - Milk (other than through the *Forward Contracting Pilot Program*)?
5. Has the cooperative offered forward contracts to members?
- Yes. (If yes, proceed to question 6.)
  - No. (If no, skip question 6. Proceed to question 7.)
6. If the cooperative has offered forward contracts to its members, has the *Forward Contracting Pilot Program*: (Select all that apply)
- Made it easier to offer forward contracts to your members?
  - Encouraged you to offer forward contracts to your members?
  - Made it necessary for you to offer forward contracts to your members to meet competition?
  - Had little or no effect on the cooperative's ability or need to forward contract with its members?
7. With how many of your buyers have you signed a contract as part of the *Forward Contracting Pilot Program*?
- None. (If you answer "None," stop here.)
  - One.
  - 2 or 3.
  - 4 or 5.
  - More than 5.

**COMPLETE ONLY IF THE COOPERATIVE SIGNED FORWARD CONTRACTS UNDER THE PILOT PROGRAM**

8. What were the reasons for signing a forward contract(s) to sell your members' milk? (Select all that apply.)
- To cover forward contracts with member producers.
  - To assure a market for a portion of the members' milk.
  - To lock in an attractive price.
  - To maintain a relationship with a buyer.
  - Other, please specify:  
\_\_\_\_\_
9. What information did you rely upon to determine a suitable contract price? (Select all answers that apply.)
- USDA, university, and/or private price forecasts.
  - Futures market prices.
  - Comparison to other forward contract price offers.
  - Our own price forecast.
  - Other, please specify.  
\_\_\_\_\_

/1 Six Orders refers to the six Federal orders with participation in the Program other than the Upper Midwest—the Central, Mideast, Northeast, Pacific Northwest, Southeast, and Western orders.

/2 For a description of how gross values are computed, see Appendix D.

/3 Program refers to Dairy Forward Pricing Pilot Program.
