

# Dextrin

## Handling/Processing

### Identification of Petitioned Substance

<b>Chemical Name:</b> Dextrin	<b>CAS Number:</b> 9004-53-9
<b>Other Names:</b> Pyrodextrin Torrefaction dextrin	<b>Other Codes:</b> EINECS No. 232-675-4 INS No. 1400

### Characterization of Petitioned Substance

#### Composition of the Substance:

The petitioned substance is partially hydrolyzed starch converted by heat alone, or by heating in the presence of suitable acids and buffers, in some cases followed by enzymatic treatment, from unmodified native starches (e.g. corn, waxy maize, wheat, rice, etc.), which is a polysaccharide comprising glucose monomers joined in 1,4-linkages. Dextrin is built up of D-glucose, which contains 6 carbon atoms, 12 hydrogen atoms, and 6 oxygen atoms to form a ring structure (Potter, 1973), and has an intermediate chain length. Its molecular formula is  $(C_6H_{10}O_5)_n \cdot xH_2O$  (Merck Index, 2006).

Figure 1. Dextrin Chemical Structure

#### Properties of the Substance:

Dextrin(s) refers to a group of hydrophilic (water loving) polysaccharides and is an incompletely hydrolyzed starch. Dextrins are also a stage in the normal digestion of starch occurring in the human gastrointestinal tract. They represent a broad range of products with considerably smaller molecular size than native starch. They are similar to starch in that they are composed principally of alpha-D-anhydroglucose units joined through 1,4-linkages; they differ from starch in that dextrinization reduces the molecular weight and increases branching in the molecule (SCOGS Report No. 75). The petitioned substance occurs as free-flowing white, yellow, or brown powders and consists of polygonal, rounded, oblong, or truncated granules (FCC, 2010-2011). Dextrins have low viscosity; they are partially to completely soluble in water but insoluble in alcohol (Hassid, 1993; Merck Index, 2006).

There are three derivatives (Burdock, 1997; Merck Index, 2006): (1) White dextrin has light color, odorless, and soluble in cold water (solubility ranging from 5 to over 90%). When dissolved in cold water, it gives a red color with iodine, and, when soluble in hot water, it gives a blue color with iodine. (2) Yellow dextrin (canary dextrin) has light brown to yellow color, slight odor, and low viscosity; it is very soluble in cold

42 water. (3) British gum (starch gum) has dark brown color, odorous, and high viscosity (compared to  
43 yellow and white dextrans); it is very soluble in cold water, giving a reddish-brown color with iodine.  
44

#### 45 **Specific Uses of the Substance:**

46  
47 Dextrin, as a food additive, is used as a formulation aid, a processing aid, a stabilizer and thickener, and/or  
48 a surface-finishing agent in accordance with FDA §184.1277(c)(1).  
49

50 In the petition, it stated that dextrin is used in a variety of food applications for nutritional and functional  
51 benefits. It can be served as a source of soluble fiber in foods and beverages. The anticipated use of the  
52 dextrin is for French fries, batter and breading, soups, sauces, confections, beverages, snacks, cereals,  
53 puddings, yogurts, and baked goods. Typical use levels for dextrin in foods and beverages, in accordance  
54 with the petitioner, are between 1-10%.  
55

56 Other uses of this substance include excipient for dry extracts and pills; preparing emulsions and dry  
57 bandages; thickening dye pastes and mordants used in printing fabrics in fast colors; sizing paper and  
58 fabrics; printing tapestries; preparing felt; manufacturing printer's inks, glues and mucilage; polishing  
59 cereals; in matches, fireworks, and explosives (Merck Index, 2006).  
60

#### 61 **Approved Legal Uses of the Substance:**

62  
63 EPA – Dextrin (CAS No. 9004-53-9) is listed under 40 CFR §180.950 (e) Specific chemical substances.  
64 Residues resulting from the use of these chemicals (such as dextrin) as either an inert or an active  
65 ingredient in a pesticide chemical formulation are exempted from the requirement of a tolerance, if such  
66 use is in accordance with good agricultural or manufacturing practices.  
67

68 FDA – 21 CFR §184.1277 Dextrin is under *Listing of Specific Substances Affirmed as DIRECT FOOD*  
69 *SUBSTANCES AFFIRMED AS GENERALLY RECOGNIZED AS SAFE*. This ingredient is used in food with  
70 no limitation other than current good manufacturing practice.  
71

#### 72 **Action of the Substance:**

73  
74 In general, dextrin has low viscosity, cold water solubility, and tendency to form gels or pastes. Its actions  
75 in different usages are as follows:  
76

- 77 • A formulation aid – Dextrin used to promote or produce a desired physical state or texture in product.
- 78 • A processing aid – Petitioned substance used as manufacturing aids to enhance the appeal or utility of  
79 a food or food component.
- 80 • A stabilizer and thickener – It is used to produce viscous solutions or dispersions, to impart body,  
81 improve consistency, or stabilize emulsions.
- 82 • A surface-finishing agent – This substance used to increase palatability, preserve gloss, and inhibit  
83 discoloration of foods.
- 84 • A source of soluble fiber – Because the non-digestible glucoside linkages lead to incomplete  
85 hydrolyzation, only a small percentage of dextrin is absorbed in the small intestine and the rest is  
86 slowly fermented in the large intestine (Slavin et al., 2009).  
87

88 <b>Status</b>
------------------

#### 89 **Domestic:**

90  
91  
92 EPA – Dextrin (CAS No. 9004-53-9) is listed on List 4A – *Minimal Risk Inert Ingredients – By Chemical Name*,  
93 updated August 2004. Dextrin with EPA PC (Pesticide Chemical) Code 084503 is included on *Alphabetic*  
94 *Active Chemical Code List*, March 31, 2008 edition, of *Pesticide Data Submitters List*. In addition, dextrin is

95 listed under the subsection 180.950 (e) *Specific chemical substances* of the section 180.950 *Tolerance exemptions*  
96 *for minimal risk active and inert ingredients.*

97  
98 **FDA** – Dextrin is affirmed as GRAS, see the above, the Approved Legal Uses of the Substance section.  
99 Dextrin may be used as a formulation aid, a processing aid, a stabilizer and thickener, and a surface-  
100 finishing agent.

101  
102 **International:**

103  
104 **Codex** – “Dextrins, roasted starch” is listed in Table Three (*Additives Permitted for Use in Food in General,*  
105 *Unless Otherwise Specified, in Accordance with GMP*) of Codex General Standard for Food Additives. This  
106 substance was adopted in 1999. It is classified as an emulsifier, a stabilizer, and a thickener.  
107 ‘Dextrins’ was evaluated previously for an ADI<sup>1</sup> for man by the Joint FAO/WHO Expert Committee on  
108 Food Additives in 1969 and 1974. “Not specified” for estimate of acceptable daily intake for man is stated  
109 in the report of WHO Food Additives Series 17 (1982).

110  
111 **European Union** – “white or yellow dextrin, roasted or dextrinated starch, starch modified by acid or  
112 alkali treatment ...” are not considered to be food additives. See Regulation (EC) No 1333/2008 of the  
113 European Parliament and of the Council of 16 December 2008 on food additives.

114  
115 **Canada** – Dextrin is listed in Natural Health Products Ingredients Database. Purposes: binder, diluent,  
116 emulsion stabilizer, stiffening agent, thickening agent, viscosity increasing agent.

117  
118 **IFOAM** – Not listed.

119

120 **Evaluation Questions for Substances to be used in Organic Handling**

121  
122 **Evaluation Question #1: Discuss whether the petitioned substance is formulated or manufactured by a**  
123 **chemical process, or created by naturally occurring biological processes (7 U.S.C. § 6502 (21)).**

124  
125 The petitioned substance, dextrin, is partially hydrolyzed starch produced by a chemical process called  
126 hydrolysis (Wurzburg, 1992). It is prepared by using dry heating or roasting unmodified starch with or  
127 without an acid or alkaline catalyst (Burdock, 1997). The acid catalysts include hydrochloric, phosphoric,  
128 and nitric acid; the alkali catalysts include sodium hydroxide and hydrolysable salts of weak acids, such as  
129 carbonates, hydrogen carbonates, perchlorates, and hypochlorites (Tomasik et al., 1989).

130  
131 Unmodified starch is usually acidified with small amounts of acid and placed in heated, agitated vessels  
132 called reactors or roasters. The temperature is increased at a controlled rate and then maintained at a  
133 maximum temperature for varying lengths of time. The resulting product is cooled, blended, and  
134 sometimes aged (Burdock, 1997).

135  
136 A fluid bed technique can also be used. Unmodified starch is placed in a reactor and suspended or  
137 fluidized in a stream of heated air. The starch is then acidified and, as in the conventional or “roaster”  
138 process, heated under controlled conditions of time and temperature until the desired end product is  
139 attained. With the several degrees of freedom possible in such processes, a range of dextrin with widely  
140 varying properties is produced (Burdock, 1997).

141  
142 In some cases, starch is heated with acid and followed by enzymatic (amylase) treatment to form  
143 indigestible polysaccharides called resistant dextrin (including maltodextrin). Resistant dextrin is a class of  
144 soluble fiber (Slavin et al., 2009; IOM, 2005).

145

---

<sup>1</sup> Acceptable Daily Intake.

146 [Note: Burdock (1997) has indicated that the specific chemistry of the dextrinization process is not  
147 established, but many theories have been advanced. Certainly, the process reduces the strength of the  
148 chemical bonds which give the starch granule its integrity and brings about molecular scission(s) that both  
149 reduce molecular size and alter molecular arrangement. In those cases where acids are present, simple  
150 hydrolytic cleavage is believed to occur. Because of altered paste viscosities and congealing characteristics,  
151 preferential scission of specific chemical bonds producing these properties probably occurs. In some of the  
152 most highly converted dextrin, scission followed by recombination of the fragments is indicated.]  
153

154 **Evaluation Question #2: Describe the most prevalent processes used to manufacture or formulate the**  
155 **petitioned substance. Further, describe any chemical change that may occur during manufacture or**  
156 **formulation of the petitioned substance when this substance is extracted from naturally occurring plant,**  
157 **animal, or mineral sources. (7 U.S.C. § 6502 (21))**  
158

159 In general, dextrin is prepared by dry heating corn, waxy milo, potato, arrowroot, wheat, rice, tapioca, or  
160 sago starches; or by dry heating the starches after treatment with safe and suitable alkalis, acids, or pH  
161 control agents (21 CFR §184.1277).  
162

163 Commercially, there are three types of dextrin. Each type represents a range of products depending on the  
164 specific temperature, acid concentration, and time of reaction employed. Product properties also depend  
165 on the starch source (WHO Food Additives Series 17, 1982; Wurzburg, 1992; and Burdock, 1997):

- 166 (1) White dextrin — It is manufactured by heating dry starch in the presence of acid (such as  
167 hydrochloric acid) at a low temperature, generally below 150° C, for a short period of time.  
168 White dextrin may also be obtained by further continuing the acid process for making thin  
169 boiling starches to yield lower solubility products. They represent a broad range of products  
170 with considerably smaller molecular size than native starch.
- 171 (2) Yellow or canary dextrin — It is manufactured in a similar manner as white dextrin, but at a  
172 higher temperature, more time, but using less acid. The high water solubility products may be  
173 produced. Apart from depolymerization, a good deal of internal rearrangement occurs with  
174 formation of highly branched molecules.
- 175 (3) British or starch gum — It is manufactured by adding little or no acid (in some cases, buffers are  
176 used), and high temperatures. British gum is not as low in viscosity as yellow dextrin or white  
177 dextrin.  
178

179 **Evaluation Question #3: Provide a list of non-synthetic or natural source(s) of the petitioned substance**  
180 **(7 CFR § 205.600 (b) (1)).**  
181

182 Dextrin is produced in the human body by an enzyme called amylase which presents in human saliva. The  
183 salivary amylase mixes with the food in the mouth, and then acts on the starch in a slightly alkaline  
184 medium to convert it to dextrin (Guthrie, 1975).  
185

186 In *Revised Monograph—Dextrin*, the Committee on Food Chemicals Codex of Food and Nutrition Board of  
187 Institute of Medicine (IOM) (1996) has reported that dextrin is partially hydrolyzed starch converted by  
188 heat alone, or by heating in the presence of suitable food-grade acids and buffers, from any of several  
189 grain- or root-based unmodified native starches (e.g., corn, waxy maize, high amylose, milo, waxy milo,  
190 potato, arrowroot, wheat, rice, tapioca, sago, etc.).  
191

192 No information sources reviewed specifically address non-synthetic dextrin.  
193

194 **Evaluation Question #4: Specify whether the petitioned substance is categorized as generally**  
195 **recognized as safe (GRAS) when used according to FDA's good manufacturing practices. (7 CFR §**  
196 **205.600 (b)(5))**  
197

198 The petitioned substance (dextrin, CAS No. 9004-53-9) is affirmed as generally recognized as safe (GRAS)  
199 in 21 CFR §184.1277. In accordance with FDA, the affirmation of dextrin as GRAS as a direct human food  
200 ingredient is based upon the following current good manufacturing practice conditions of use (§184.1277):

- 201
- 202
- 203
- 204
- 205
- The ingredient is used as a formulation aid as defined in §170.3(o)(14); as a processing aid as defined in §170.3(o)(24); as a stabilizer and thickener as defined in §170.3(o)(28); and as a surface-finishing agent as defined in §170.3(o)(30).
  - The ingredient is used in food at levels not to exceed current good manufacturing practice.

206 The following are excerpts from 21 CFR Part 170 *Food Additives* §170.3 *Definitions*:

207 “§170.3 (o)(14) Formulation aids: Substances used to promote or produce a desired physical state  
208 or texture in food, including carriers, binders, fillers, plasticizers, film-formers, and tableting aids,  
209 etc.

210 §170.3 (o)(24) Processing aids: Substances used as manufacturing aids to enhance the appeal or  
211 utility of a food or food component, including clarifying agents, clouding agents, catalysts,  
212 flocculants, filter aids, and crystallization inhibitors, etc.

213 §170.3 (o)(28) Stabilizers and thickeners: Substances used to produce viscous solutions or  
214 dispersions, to impart body, improve consistency, or stabilize emulsions, including suspending  
215 and bodying agents, setting agents, jellying agents, and bulking agents, etc.

216 §170.3 (o)(30) Surface-finishing agents: Substances used to increase palatability, preserve gloss, and  
217 inhibit discoloration of foods, including glazes, polishes, waxes, and protective coatings.”  
218

219 This GRAS substance was evaluated by the Select Committee on GRAS Substances (SCOGS) in 1975. The  
220 SCOGS concluded that there was no evidence in the available information on dextrin that demonstrated, or  
221 suggested reasonable grounds to suspect a hazard to the public when they were used at levels at that time  
222 or might reasonably be expected in the future (SCOGS Report No. 75).  
223

224 In addition, dextrin is listed under *Everything Added to Food in the United States (EAFUS)* in FDA/CFSAN’s  
225 the Priority-based Assessment of Food Additives (PAFA) database. The EAFUS list of substances contains  
226 ingredients added directly to food that FDA has either approved as food additives or listed or affirmed as  
227 GRAS.  
228

229 **Evaluation Question #5: Describe whether the primary function/purpose of the petitioned substance is**  
230 **a preservative. If so, provide a detailed description of its mechanism as a preservative. (7 CFR § 205.600**  
231 **(b)(4))**  
232

233 In the FDA regulation (21 CFR §184.1277), dextrin may be used as a surface-finishing agent as defined in  
234 §170.3(o)(30) – substances used to increase palatability, preserve gloss, and inhibit discoloration of foods.  
235

236 However, no information sources reviewed specifically address the primary function/purpose of dextrin  
237 as a preservative.  
238

239 **Evaluation Question #6: Describe whether the petitioned substance will be used primarily to recreate**  
240 **or improve flavors, colors, textures, or nutritive values lost in processing (except when required by law)**  
241 **and how the substance recreates or improves any of these food/feed characteristics. (7 CFR § 205.600**  
242 **(b)(4))**  
243

244 As described in Evaluation Question (EQ) #4, dextrin may be used as a formulation aid (including carriers,  
245 binders, fillers, plasticizers, film-formers, tableting aids, etc.) to promote or produce a desired physical state  
246 or texture in food; as a processing aid (including clarifying agents, clouding agents, catalysts, flocculants,  
247 filter aids, crystallization inhibitors, etc.) to enhance the appeal or utility of a food or food component; as a  
248 stabilizer and thickener (including suspending and bodying agents, setting agents, jellying agents, bulking  
249 agents, etc.) to produce viscous solutions or dispersions, to impart body, improve consistency, or stabilize  
250 emulsions; and as a surface-finishing agent (including glazes, polishes, waxes, and protective coatings) to  
251 increase palatability, preserve gloss, and inhibit discoloration of foods.  
252

253 According to the petition, dextrin can be used to provide structure to foods and to replace fat and  
254 shortening to lower fat content in foods. It can also be used as a bulking agent in sweet baked goods to

255 lower the sugar content. Dextrin can be added to a coating for confections or fried foods to increase shelf-  
256 life and/or crisp texture; applied to the food surface for adhering spices and other particulates, in addition  
257 to improve shine and appearance; used as a carrier in spray dried vitamins and flavors to aid in the process  
258 as well as protect the encapsulated materials from oxidation; and added to the reduced fat or sugar  
259 beverages to provide mouth feel and flavor improvement.

260  
261 No information sources were identified to suggest that the petitioned substance be used primarily to  
262 recreate nutritive values lost in processing.

263  
264 **Evaluation Question #7: Describe any effect or potential effect on the nutritional quality of the food or**  
265 **feed when the petitioned substance is used. (7 CFR § 205.600 (b)(3))**  
266

267 “Dextrin is used in a variety of food applications for nutritional and functional benefits” is stated in the  
268 petition. Dextrin can be used as fat replacer to lower calorie content of foods. In Kirk-Othmer Food and  
269 Feed Technology, Wiley (2008) has indicated that dextrin is well known for its ability to mimic several of  
270 fat sensations, including mouth-coating, the melting sensation, and the richness of fat. It is a traditional  
271 ingredient modified to provide enhanced functionality in reduced-fat systems. Dextrin provides 4 kcal/g  
272 compared with 9 kcal/g of fat. It is commonly used in salad dressings, puddings, spreads, frozen desserts,  
273 and dairy foods.

274  
275 Dextrin can also serve as a source of soluble fiber in foods and beverages or as a fiber supplement. In  
276 “Soluble fiber dextrin enhances the satiating power of beverages” study (Monsivals et al., 2011), it has concluded  
277 that the supplementation of foods and beverages with soluble fiber dextrin is one way to increase fiber in  
278 the diet that might prove effective in helping consumers control their appetite and energy intake. In  
279 addition, Slavin and co-workers (2009) have reported that supplementation with soluble fibers may be  
280 useful in individuals at risk of a lower than recommended dietary fiber intake. According to *Dietary*  
281 *Reference Intakes for Energy, Carbohydrate, Fiber, Fat, Fatty Acids, Cholesterol, Protein, and Amino Acids* by Food  
282 and Nutrition Board of Institute of Medicine (IOM) (2005), an Adequate Intake (AI) for total fiber (dietary  
283 fiber<sup>2</sup> and functional fiber<sup>3</sup>) in foods is set at 38 and 25 g/day for young men and women, respectively,  
284 based on the intake level observed to protect against coronary heart disease.

285  
286 **Evaluation Question #8: List any reported residues of heavy metals or other contaminants in excess of**  
287 **FDA tolerances that are present or have been reported in the petitioned substance. (7 CFR § 205.600**  
288 **(b)(5))**  
289

290 According to the specification of dextrin in Food Chemical Codex (2010-2011), it stipulates the impurity  
291 acceptable criterion for a heavy metal is not more than 1 mg/kg of lead.

292  
293 No information sources can be identified to suggest that the petitioned substance contains residues of  
294 heavy metals or other contaminants in excess of FDA’s Action Levels for Poisonous or Deleterious  
295 Substances in Human Food.

296  
297 **Evaluation Question #9: Discuss and summarize findings on whether the manufacture and use of the**  
298 **petitioned substance may be harmful to the environment. (7 U.S.C. § 6517 (c) (1) (A) (i) and 7 U.S.C. §**  
299 **6517 (c) (2) (A) (i))**  
300

301 The petitioned substance is originated from starch, a naturally occurring carbohydrate polymer. Natural  
302 macromolecules contain hydrolysable linkages that are susceptible to biodegradation by the hydrolytic  
303 enzymes of microorganisms (Bohlmann, 2005). No adverse effect to soil organisms and crops would be  
304 anticipated. The dextrin would not be expected to persist in the environment.

---

<sup>2</sup> Dietary Fiber consists of nondigestible carbohydrates and lignin that are intrinsic and intact in plants.

<sup>3</sup> Functional Fiber consists of isolated, nondigestible carbohydrates that have beneficial physiological effects in humans.

305  
306 During the manufacturing process, dextrin roasters and starch/dextrin transfer, storage, and loading  
307 facilities employ fabric filters to recover starch/dextrin emissions in dry form for immediate recycle to the  
308 process. [Note: A dextrin roaster is a reactor vessel, or a series of vessels, in which starch is reacted,  
309 through the addition of heat and/or chemicals, to form the dextrin. Starch/dextrin transfer, storage, and  
310 loading facilities include any facility used to blend, mix, mill, grind, screen, convey, transfer, store, or load  
311 for shipment (including, but not limited to, bag, truck, and railcar). This also includes the bag dumping of  
312 additives into the starch for dextrin producing.] Since the pollutant is also the product, source reduction  
313 cannot be practiced in this industry (i.e., nothing can replace the starch). However, pollution prevention is  
314 exhibited in the industry through the total use of the scrubber and fabric filter “waste” streams in in-  
315 process recycling and the loading of trucks and railcars using vacuum pressure systems (EPA-453/R-94-  
316 060, 1994).

317  
318 In the document of *Rationale for New Source Performance Standards: Starch Production Plants* (1994), EPA has  
319 stated that there are no solid or liquid waste impacts associated with the standards. This is because all  
320 particulate matter recovered by control devices as well as all water used in wet scrubbers is typically  
321 recycled back into plant processes.

322  
323 According to the petitioner, any effluent from the manufacture of dextrin would be treated within the  
324 limits established under waste water permits and sent to a Publicly Owned Treatment Works (POTW)<sup>4</sup>.  
325 There may also be particulate matter generated during the manufacturing process. Particulate matter  
326 would be collected by dust collectors and/or scrubbers. Any remaining air emissions are within the Title V  
327 air permit<sup>5</sup> limits. Any waste dextrin product would go into a recycle stream and used in downgraded  
328 products or go to a landfill. Recycling programs at the plants recover approximately 95% of the waste.  
329

330 In the EPA regulations, “Dextrins, CAS No. 9004-53-9” is listed under the subsection (e) *Specific chemical*  
331 *substances* of § 180.950 *Tolerance exceptions for minimal risk active and inert ingredients*, in addition to on EPA  
332 List 4A – *Minimal Risk Inert Ingredients* of *List of Inert Pesticide Ingredients*. The determination that a  
333 chemical is minimal risk is based on a recognition of the overall safety of the chemical (such as very low  
334 toxicity or practically non-toxic) considering the widely available information on the chemical’s known  
335 properties, and a history of safe use under reasonable circumstances. Minimal risk substances on List 4A  
336 are recognized as safe for use in all pesticide products subject only to good agricultural or good  
337 manufacturing practices (EPA, 2010).  
338

339 For occupational exposure, it is a possible physical irritant from dust particles. In case of eye contact,  
340 particulates may scratch eye surfaces and cause mechanical irritation. The petitioned substance can  
341 produce a nuisance dust which should be maintained below a time weighted average of 10 mg/m<sup>3</sup> in  
342 accordance with Material Safety Data Sheet (MSDS) in the petition. Fine dust dispersed in air, in sufficient  
343 concentrations and in the presence of an ignition source, is a potential dust explosion hazard. Personal  
344 respirator (NIOSH<sup>6</sup> approved) for conditions of use where exposure to the dust or mist is apparent, a half-  
345 face dust/mist respirator may be worn; for emergencies or instances where the exposure levels are not  
346 known, use a full-face positive-pressure, air-supplied respirator (MSDS, Reagents, Inc.).  
347

348 **Evaluation Question #10: Describe and summarize any reported effects upon human health from use of the**  
349 **petitioned substance. (7 U.S.C. § 6517 (c) (1) (A) (i), 7 U.S.C. § 6517 (c) (2) (A) (i) and 7 U.S.C. § 6518 (m) (4))**

---

<sup>4</sup> Publicly owned treatment works (POTW) collect wastewater from homes, commercial buildings, and industrial facilities and transport it via a series of pipes, known as a collection system, to the treatment plant. The POTW removes harmful organisms and other contaminants from the sewage so it can be discharged safely into the receiving stream.

<sup>5</sup> Title V air permit also called a title V operating permit that most large sources and some smaller sources of air pollution are required to obtain. This requirement comes from Title V of the Clean Air Act, as amended in 1990. Most title V permits are issued by State and local permitting authorities.

<sup>6</sup> National Institute for Occupational Safety and Health.

350  
351 'Dextrins' was evaluated previously for an acceptable daily intake (ADI) for man by the Joint FAO/WHO  
352 Expert Committee on Food Additives in 1969 and 1974. In 2008, a monograph of *Dextrins* (WHO Food  
353 Additives Series 17) was published with additional available data. The committee commented that "these  
354 substances are regarded as identical to the intermediates formed in the normal digestion of starch and  
355 normal constituents of food." Moreover, "Not specified" was assigned for 'estimate of ADI for man' under  
356 the evaluation section of this monograph. The statement "ADI not specified" means that, on the basis of the  
357 available data (toxicological, biochemical, and other), the total daily intake of the substance, arising from its  
358 use or uses at the levels necessary to achieve the desired effect and from its acceptable background in food,  
359 does not represent a hazard to health. For this reason, and for the reasons stated in individual evaluations,  
360 the establishment of an acceptable daily intake in mg/kg body weight is not deemed necessary (WHO  
361 Food Additives Series 17, 2008).

362  
363 According to the Select Committee on GRAS Substances (SCOGS) Report on "Dextrins" (1975), animal  
364 feeding studies showed dextrins to be digested and metabolized to a limited degree without toxic effects  
365 when fed at levels many times greater than those present from use of these products as a direct food  
366 additive, or at levels that are orders of magnitude greater than might occur by migration from food  
367 packaging materials containing dextrins. Therefore, the committee concluded that "There is no evidence in  
368 the available information on dextrins and corn dextrin that demonstrates or suggests reasonable grounds  
369 to suspect, a hazard to the public when they are used at levels that are now current or that might be  
370 reasonably expected in the future."

371  
372 In the report of *A Review of the Role of Soluble Fiber in Health with Specific Reference to Wheat Dextrin*, Slavin  
373 and co-workers (2009) stated "The evidence suggests that soluble fibers help to regulate the digestive  
374 system, may increase micronutrient absorption, stabilize blood glucose, and lower serum lipids, may  
375 prevent several gastrointestinal disorders, and have an accepted role in the prevention of cardiovascular  
376 disease." Soluble fibers could also promote the growth of colonic bacterial flora (prebiotic effect). They  
377 concluded that supplementation with soluble fibers (e.g. wheat dextrin) may be useful in individuals at  
378 risk of a lower than recommended dietary fiber intake. Institute of Medicine (2005) also reported that  
379 "Resistant dextrins can potentially be classified as Functional Fibers when sufficient data on physiological  
380 benefits in humans are documented."

381  
382 In addition, both dietary and functional fibers can promote physiological processes that are associated with  
383 satiety. For example, they can slow gastric emptying, reduce the glycemic index<sup>7</sup> of foods, modify the  
384 release of gastrointestinal hormones, and modify the absorption of other nutrients (Monsivais et al., 2010;  
385 Howarth et al., 2001).

386  
387 Dextrin can be made from a wide variety of starch, such as wheat, corn, rice, potato, or tapioca. It is  
388 important for people with food allergies or intolerances to know the origin of the dextrin. For instance,  
389 wheat-based dextrin may be found traces of gluten, the product containing this dextrin should be avoided  
390 by the individuals with wheat allergies or by the people with celiac disease who cannot tolerate gluten.

391  
392 **Evaluation Question #11: Provide a list of organic agricultural products that could be substituted for**  
393 **the petitioned substance. (7 CFR § 205.600 (b)(1))**

394  
395 As described in EQs #1 and #2, dextrin is partially hydrolyzed starch converted by heat alone, or by  
396 heating in the presence of suitable acids and buffers, or by heating acids and enzymes, from any of several  
397 grain- or root-based unmodified native starches (e.g., corn, waxy maize, high amylose, milo, waxy milo,

---

<sup>7</sup> The glycemic index (GI) is a ranking of carbohydrates on a scale from 0 to 100 according to the extent to which they raise blood sugar levels after eating. Foods with a high GI are those which are rapidly digested and absorbed and result in marked fluctuations in blood sugar levels. Low-GI foods, by virtue of their slow digestion and absorption, produce gradual rises in blood sugar and insulin levels, and have proven benefits for health.

398 potato, arrowroot, wheat, rice, tapioca, sago, etc.). Dextrin consists of D-glucose units, which are primarily  
 399 linked with alpha-1-4 glycosidic bonds, connected in chains of variable length.

400  
 401 Maltodextrin, made by partially hydrolyzing starch, is typically composed of a mixture of chains that vary  
 402 from three to nineteen glucose units long (Sugar Association, 2011). According to 21CFR §184.1444,  
 403 maltodextrin is affirmed as GRAS. It is a nonsweet nutritive saccharide polymer that consists of D-glucose  
 404 units linked primarily by alpha-1-4 bonds and that has a dextrose equivalent<sup>8</sup> (D.E.) of less than 20.  
 405 Maltodextrin is prepared as a white powder or concentrated solution by partial hydrolysis of corn starch,  
 406 potato starch, or rice starch with safe and suitable acids and enzymes (21 CFR §184.1444). The term  
 407 "maltodextrin" can be applied to any starch hydrolysis product that contains fewer than 20 glucose units  
 408 linked together, in accordance with the Sugar Association.

409  
 410 Maltodextrin has been utilized by the food industry for its low viscosity, low sweetness, clarity, and bland  
 411 flavor (Luallen, 2002). It can be used as an anticaking and free-flowing agent, bulking agent, stabilizer and  
 412 thickener, and surface-finishing agent (FCC, 2010-2011). In addition, maltodextrin is used as a formulation  
 413 aid (e.g. act as a carrier or encapsulating agent for essential oils and other flavors) and processing aid (e.g.  
 414 act as a crystallization inhibitor for frozen foods); it is a starch-based fat replacer (Macrae et al., 1993).

415  
 416 Based on the database of NOP Certified Operations, as of 2010, following is a tabulated list for the names  
 417 and addresses of companies producing maltodextrin and rice dextrin (NOP Certified Operations, 2010):  
 418

PRODUCT	COMPANY	ADDRESS
Maltodextrin	Laxon Corporation	421 Amapola Ave., Torrance, CA 90501
Maltodextrin	Seven Bridges Cooperative Microbrewery, Inc.	325A River St., Santa Cruz, CA 95060
Maltodextrin	Ag Commodities, Inc. aka LFO, B20, AGRP	2913 El Camino Real, Suite 620, Tustin, CA 92782
Maltodextrin	Marroquin Organic International, Inc.	303 Potrero Street, Suite 18, Santa Cruz, CA 95060
Maltodextrin	Newport Flavours & Fragrances	833 N. Elm Orange, CA 92868
Tapioca maltodextrin	Grain Processing Corporation	1600 Oregon Street, Muscatine, IA 52761
Maltodextrin	SP 272 - Corn Products Brasil Ingredientes Industrias Ltda	Rua Paula Bueno, N° 2935 Jd. Alvorada Mogi Guaçu - Sp Cep: 13840000, Brazil
Maltodextrin	Habib-ADM Ltd.	2nd floor UBL Building, I. I. Chundrigar Road, Karachi, 74000, Pakistan
Tapioca maltodextrin	H-H Technology/Zanaceutica	Calle Marcos Farfan 3181.Urb. Industrial Independencia. Lima, Peru
Rice dextrin	NanJing Axiom Foods Co., Ltd.	Room 101, Building No.2, World Windows Software Zone, No.12, DingHaiMen, Nanjing, Jiangsu, 210013, China
