SUMMARY

FDL 16-11

Milk production in the United States in January is estimated at 9,859 million pounds, 0.4 percent more than the revised estimate for January 1960 and 9 percent above the 1950-59 average for the month. Relative to population, January production was sufficient to provide 1.75 pounds of milk per capita, 1 percent less than in January 1960 and 2 percent less than the 10-year average for the month. Milk production per cow in crop reporters' herds on February 1 averaged 21.04 pounds, slightly above the previous record for the date set a year earlier. Feeding of grain and concentrates was reported at 7.91 pounds per cow on February 1 or 3 percent more than the previous record February 1 rate a year ago.

January milk production above year ago

Milk production in the United States in January is estimated at 9,859 million pounds. This is 0.4 percent more than the revised estimate for January 1960 and 9 percent above the 1950-59 average for the month. Total output of milk in January 1961 was 4 percent more than in December 1960 compared with a seasonal increase of 5 percent from December 1959 to January 1960. Relative to population, January production in 1961 was sufficient to provide 1.75 pounds of milk per capita, 1 percent less than in January 1960 and 2 percent less than the January 1950-59 average.

Milk per cow at record level

Milk production per cow in crop reporters' herds on February 1, averaging 21.04 pounds, exceeded slightly the previous record for the date set in 1960. The rate per cow increased 3 percent from January 1, the same seasonal increase as in 1960. February 1 rates increased from a year earlier in the South Atlantic States and the West, but decreased slightly in the remaining regions. Unusually severe winter weather in the Central regions and the Northeast was unfavorable to milk production. Compared with January 1, production rates increased in all regions except the South Central. Crop reporters milked 73.2 percent of their cows on February 1, compared with 72.6 percent on January 1 and 73.3 percent a year earlier.

Grain feeding rate continues to increase

Feeding of grain and concentrates, reported at 7.91 pounds per cow on February 1, was 3 percent more than the previous record February 1 rate a year ago and 20 percent above the 1950-59 average for that date. The increase of 12 percent from December 1, 1960 was about the same as the 10-year average seasonal gain during this two-month period.

Feeding rates on February 1 were at record levels in all regions of the country. Grain fed per cow ranged from 6.9 pounds in the South Central region and the West, to 8.6 pounds in the North Atlantic and the East North Central. Other regional rates were 8.1 pounds in the West North Central and 7.6 pounds in the South Atlantic. Of all crop correspondents reporting on February 1, 87.6 percent were feeding grain and concentrates to their milk cows, about the same percentage as a year earlier.

Dairy product-feed price ratios continue favorable

The value of grains and concentrates fed to milk cows on January 15 averaged \$2.94 per hundredweight. This was 7 cents higher than a year earlier. Ration values on January 15 averaged \$2.98 in milk-selling areas and \$2.44 in cream-selling areas. The milk-feed price ratio of 1.50 for January 15 compares with 1.49 a year earlier and the record high for the date of 1.52 in 1927 and 1945. The milkfat-feed price ratio, at 24.7, decreased slightly from mid-January 1960.

1/ Figures for New England States, New Jersey, and Pennsylvania represent combined crop and special dairy reporters; others represent crop reporters only. Regional averages include less important dairy States not shown separately.

2/ Averages represent daily milk production divided by the total number of milk cows (in milk or dry).

3/ Includes grain, millfeeds, and other concentrates.

MILK COWS AND MILK PRODUCTION, 1960

Milk production in the United States totaled 122,920 million pounds in 1960, about 1 percent more than the revised 1959 production of 121,989 million pounds. Milk production estimates for 1955 through 1959 have been revised on the basis of the 1959 Census of Agriculture and other data now available. (See page 17). Annual milk production per cow increased 3 percent from 1959 to 1960, more than offsetting a 2-percent decline in milk cow numbers.

Most of the increase of 931 million pounds in U. S. milk production from 1959 to 1960 occurred in the North Atlantic and Western regions of the country. New York and Pennsylvania accounted for most of the 3-percent increase in the North Atlantic region. Most of the 3 percent gain in the West was in California and Washington. Milk production in the important North Central area showed little change from 1959, with gains in Ohio, Wisconsin, Minnesota, Iowa, and Missouri offset by declines in other States. Production increased slightly from 1959 in the South Atlantic region, but dropped 2 percent in the South Central. The 5 leading States in 1960 milk production are Wisconsin, New York, Minnesota, California, and Pennsylvania.

Annual milk production per cow set a new record of 7,004 pounds in 1960, up 189 pounds from the previous high in 1959. In the revised series of estimates, annual U. S. output per cow has increased 3 to 4 percent each year since 1954. In the East North Central region, the annual rate increased only 1 percent from 1959, partly due to cold spring weather which delayed turning out herds on pasture. The increase in milk per cow was 3 percent in all other regions except the South Atlantic, where it was 2 percent.

The average number of milk cows on farms during 1960 was 17,549,000, a record low in the series of estimates beginning in 1924. Milk cow numbers have decreased each year since 1953, but the decline from 1959 to 1960 was only 2 percent, compared with 4 to 5 percent in each of the three preceding years.

Throughout the North Atlantic region, milk cow numbers were practically unchanged from 1959 to 1960. In the East North Central region, the decline was only 1 percent, with little change from 1959 in Ohio and Wisconsin. Milk cow numbers held up well in Minnesota, but dropped significantly in all other States of the West North Central region, making a regional decline of 3 percent. Other regional declines were 2 percent in the South Atlantic and 5 percent in the South Central. Most Western States showed little change from 1959.

Cows and heifers 2 years old and over kept for milk totaled 19,291,000 on January 1, 1961. This is 1 percent less than a year earlier, and the smallest number since 1909. These estimates, shown by States on page 16, include heifers 2 years old and over which have not freshened. Heifers 1 to 2 years old kept for milk are estimated at 5,034,000, down 1 percent from January 1, 1960. Heifer calves under 1 year old kept for milk increased 1 percent from a year earlier to 5,611,000 head.

1/ Revised on basis of data from the 1959 Census of Agriculture and other data which have become available since the original estimates were made.

2/ Average number on farms during year, excluding heifers not yet fresh.

3/ Excludes milk sucked by calves.

1/ 1950-59 average and estimates for January 1, 1960 revised.

Revised Estimates of Milk Production, 1955-59

With totals recently available from the 1959 Census of Agriculture taken by the Bureau of the Census, the Department of Agriculture has now revised the estimates of milk cow numbers and milk production for 1955-59. Current estimates are based upon information supplied by a sample of dairy farmers located throughout the United States. Every five years these estimates are adjusted, if necessary, toward the more complete information obtained by the Census from all farms.

Sharp changes have occurred in the recent years in milk cow numbers, farm uses of milk and the number of farms. This has made the problems of estimating milk production more difficult. The Censuses of Agriculture indicate a drop of 39 percent in the number of farms with milk cows between 1954 and 1959 and yet the number of milk cows decreased only 18 percent. This shows that there has been a sharp shift toward larger herds and fewer dairy farms during this 5-year period. Sample data available currently did not fully measure the extent of this shift.

Consequently, total milk production estimates have been revised downward, as follows: 1.9 percent for 1959; 1.3 percent for 1958; 1.0 percent for 1957; 0.5 percent for 1956; but only 0.1 percent for 1955. The annual average number of milk cows estimated for 1959 was revised down 7 percent but a considerable part of this decrease was offset by an upward revision in the rate of milk production per cow.

Despite the appreciable revision of the total 1959 milk production estimate to a lower level, the quantity of milk marketed by farmers during 1959 is expected to be only about one-half percent smaller than previously estimated. It is apparent that the sharpest downward revision in milk disposition from farms will be in the estimates of the quantity of milk used in farm-churned butter, fed to calves, and consumed in fluid form on farms where the milk was produced.

More detailed information on the revised estimates of milk production as well as disposition and income from milk, by States, will be published in April.
