WEEKLY HIGHLIGHTS

Mixed Changes in USDA's Grain Export Projections

In its October World Agricultural Supply and Demand Estimates report, USDA projected lower 2012/13 wheat and corn exports, but higher soybean exports than in its previous estimate in September. USDA lowered its projected wheat exports 50 million bushels (mbu) to 1.15 billion bushels (bbu), based on the pace of shipments and stronger expected competition. Projected corn exports (1.15 bbu) were 100 mbu lower, based on slow pace of sales to date and strong competition from Brazil. Projected soybean exports (1.265 bbu) were raised 210 mbu, reflecting higher supplies due to higher acreage and yield, lower prices, and record pace of export sales through early October. As of October 6, year-to-date soybean **barge movements** are 52 percent higher than the same period last year.

Weekly Grain Inspections Down; Soybean Exports Increase

For the week ending October 4, **total inspections of grain** (wheat, corn, and soybeans) for export from major U.S. ports reached 2.05 million metric tons (mmt), down 12 percent from the previous week but 13 percent above last year at this time. Wheat inspections (.360 mmt) decreased 46 percent from the past week as shipments to Asia receded. Corn inspections (.442 mmt) dropped for the third consecutive week. Despite the decrease in total grain inspected for export, soybean inspections (1.24 mmt) continued to increase, reaching the highest level since November 10, 2011 (1.48 mmt). Pacific Northwest soybean inspections (.462 mmt) increased 48 percent from the previous week. Outstanding export sales of soybeans (21.4 mmt) also continued to increase.

Carriers Recommend Ocean Rates Increase for Containerized Grain Exports

The member carriers of the Westbound Transpacific Stabilization Agreement (WTSA) announced several weeks ago general rate increases for grain exports as of October 1. WTSA carriers are recommending increases of \$200 per 40-foot container and \$160 per 20-foot container in order to incrementally raise U.S. westbound rate to compensatory levels. It is too soon to tell if these rate increases will be implemented when applied to containerized grain exports, based on demand for containerized ocean service and competition among the carriers. This is the latest round of increases after those attempted in April and July. Increases are also expected on November 1 for hay, cotton, hides, lumber, onions, and wood pulp.

More Than Two-thirds of Nation's Corn and 58 Percent of Soybeans Harvested

As of October 7, the top three corn-producing States—Iowa, Illinois, and Nebraska—were 36–59 percentage points ahead of their average harvest pace. The top 18 corn-producing States were 69 percent harvested—41 points ahead of the average pace. The top 18 soybean-producing States have harvested 58 percent of the soybean crop, 18 points ahead of the average pace. An early completion of harvest will allow more time for grain shipments to move to Lower Mississippi River exporters before the Upper Mississippi River closes for the winter and repair work. The last grain barge shipments leave the Minneapolis-St. Paul, MN, area around Thanksgiving, and most of the Upper Mississippi River is closed by mid-December. However, while all navigation channels are passable on the Mississippi River, drought-induced navigation restrictions will limit traffic and are expected to last through October.

Snapshots by Sector

Rail

U.S. railroads originated 21,555 **carloads of grain** during the week ending September 29, up 8 percent from last week, 4 percent from last year, and 2 percent higher than the 3-year average.

During the week ending October 4, average October non-shuttle **secondary railcar bids/offers per car** were \$19 above tariff, up \$2 from last week and \$47 higher than last year. Average shuttle bids/offers were \$196 above tariff, down \$93.50 from last week and \$129 lower than last year.

Ocean

During the week ending October 4, 34 ocean-going grain vessels were loaded in the Gulf, up 3 percent from the same period last year. Fifty-two vessels are expected to be loaded within the next 10 days, 13 percent more than the same period last year.

During the week ending October 5, the ocean freight rate for shipping bulk grain from the Gulf to Japan was \$49 per mt, up 4 percent from the previous week. The cost of shipping from the Pacific Northwest to Japan was \$27 per mt, up 13 percent from the previous week.

Barge

During the week ending October 6, **barge grain movements** totaled 262,450 tons, 43 percent lower than the previous week and 37 percent lower than the same period last year.

During the week ending October 6, 179 grain barges **moved down river**, down 40.7 percent from last week; 598 grain barges were **unloaded in New Orleans**, down 12.8 percent from the previous week.

Fuel

During the week ending October 8, U.S. average diesel fuel prices rose 2 cents to \$4.09 per gallon—37 cents higher than the same week last year.

Feature Article/Calendar

Intermodal Grain Shipments Help Satisfy Shipper Concerns and Consumer Preferences

Rail intermodal offers solutions to shipper concerns over rising diesel costs and tightening truckload capacity. It also offers an answer to logistics questions about the continued growth in U.S. exports, the increasing use of inland ports, and additional carrier revenue on empty containers shipped back to Asia. Rail intermodal is defined as the long-haul movement of shipping containers and truck trailers by rail, combined with a truck movement at one or both ends.¹ In fact, intermodal is the fastest growing sector within rail transportation. The Association of American Railroads reports that the intermodal volume for September was 973,715 units, up 2.5 percent from this time last year. This represents the thirty-fourth consecutive month in year-over-year intermodal growth and is on track for setting an all-time yearly record in intermodal traffic.

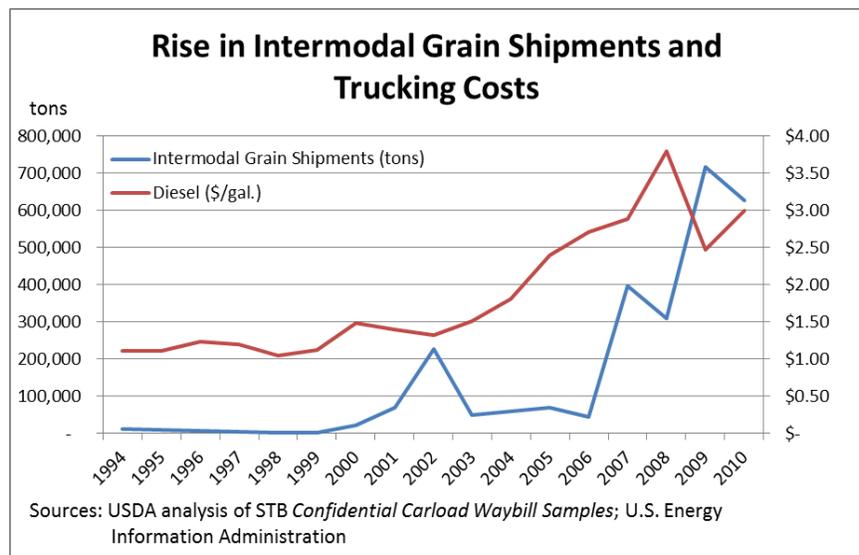

Growth in intermodal volume has also been true for agriculture, including grain. Shippers looking to reduce their over-the-road costs are turning to intermodal as a cost effective solution. While trucking costs increased over the past decade, intermodal shipments of grain became more prevalent (figure).

U.S. agricultural exports have grown steadily over the past decade and have had their two highest-grossing years in U.S. history during the past two years. Containerized exports of grain and related products from the United States increased sixfold from the 2000–2003 average of 1.1 million tons to the 2007–2010 average of 6.6 million tons, according to PIERS data. The growth of U.S. containerized grain exports is due to several reasons.

First, changing consumer preferences, including an increasingly affluent middle class in some developing nations, are demanding more and better quality food to include identity preserved (IP) grains. Second, recent governmental regulations require more complex labeling for agricultural products, such as genetically-modified foods. Containerized grain is ideal for ensuring identity preservation and individualized labeling based on variety and place of origin. Additionally, the global recession reduced demand for overall containerized ocean freight, causing rates to fall. The impact of the recession allowed containerized ocean freight to compete with traditional bulk ocean freight, increasing intermodal business for railroads.

Containerized Grain Export Concerns

IP grains command a price premium above bulk grains in the market but are more costly than bulk grains to process and transport. The logistics surrounding IP grains add to their shipping costs due to the extra expenses incurred to ensure traceability of the product. When processed under conventional means, each separate stage of handling, storage, and shipping IP grains adds cost and increases the risk that the grain becomes comingled or contaminated through contact with other products. In contrast, having the grains loaded into containers at the point of origin and unloaded at the point of final use decreases this risk, allowing for complete segregation of the product and ensuring that the foreign buyer receives the exact product purchased. However, available containers for export can be illusive in rural locales, where many IP grains are produced. Inland ports are often located in large metropolitan areas, not

¹ Association of American Railroads, July 2012, *Rail Intermodal Keeps America Moving*.

where grains are grown. Therefore, additional truck transportation costs are often accumulated to and from the inland port to pick up and drop off the loaded container.

Shipment weight can often be a constraint on which commodities are suitable for containers. Some commodities, such as coal and paper, are too heavy to completely fill a 20 foot container, which is limited to 26 or 28 tons. However, the density of most grains makes them ideal for intermodal shipments.¹ For example, a container would weigh about 28 tons loaded with wheat or 26 tons loaded with corn.

Traditionally, ships have arrived at U.S. ports bringing containerized imports from Asia and other origins. Containers were transferred by truck or rail to points in the interior of the country to be unloaded. This process resulted in extra quantities of containers in the country's interior that were often sent back to ports empty. As the number of containerized imports increased, coastal ports, railways, and roadways became congested with container traffic. Over the past few years, many importers have built distribution centers near the ports, allowing containers to be unloaded and quickly returned to the port. This process reduces the supply of available containers at inland ports for U.S. agricultural exporters, but allows shipping lines to meet the demand of foreign shippers which require the containers to be returned quickly in order to send more imports to the United States. With low quantities of U.S. exports and often lower revenue relative to import container freight rates, shipping lines often send back empty containers in order to keep pace with foreign container demand.

Benefits of Inland Container Ports

The increased use of inland ports offers importers direct access to large metropolitan populations and exporters with a pool of available containers. Containers are offloaded from ships directly onto trains and brought to destinations in the U.S. interior. Inland ports are specialized intermodal terminals characterized by having dedicated rail lines connecting them to one or more coastal ports, and they have traditionally serviced the import sector. Strong growth in U.S. exports, shippers looking to reduce higher trucking costs, and railroad investment in intermodal service have led to inland ports being one of the most efficient ways to export products as well.

Railroads have further facilitated the growth of intermodal movements through investment and design changes in their intermodal terminals. Railroads are building specialty grain transloading/stuffing facilities next to intermodal terminals, providing additional volumes and a quick rotation between import and export containers.² For example, a Class I railroad opened a grain transload facility in Chicago, IL, in 2008 that loads grain into empty containers for export overseas. In addition, railroads have been building capacity for both bulk and containerized commodities at terminals in order to mitigate risk against commodity price fluctuations that may determine modal preference. An exporter may choose a container movement over a bulk shipment if it will bring a higher price or if the buyer prefers a smaller volume to reduce inventory costs.

Outlook

As more grain intermodal facilities are brought online and intermodal services continue to improve, the growth in intermodal grain shipments is likely to continue under the current economic circumstances, which increasingly favor rail over truck for long-haul shipments. This will provide more opportunities for grain shippers to cut costs for traditional sales as well as profitably enter into niche markets for IP grain.

Railroad Fuel Surcharges, North American Weighted Average¹

¹ Weighted by each Class I railroad's proportion of grain traffic for the prior year.

* Mileage-based fuel surcharges for March and April 2007 are estimated. Beginning January 2009, the Canadian Pacific fuel surcharge is computed by a monthly average of the bi-weekly fuel surcharge.

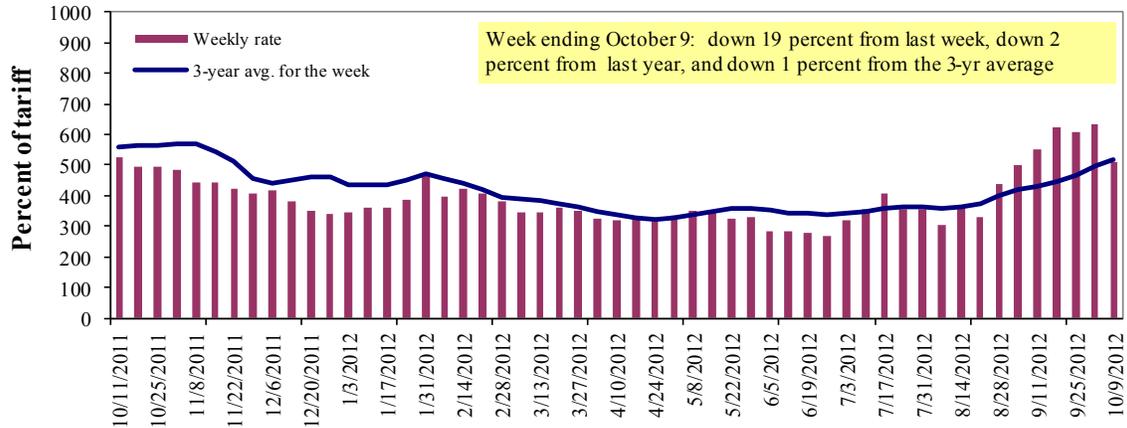

** BNSF strike price (diesel price when fuel surcharges begin) changed from \$1.25/gal. to \$2.50/gal. starting March 1, 2011. As a result, the weighted average fuel surcharge for March 2011 was \$0.227/mile instead of \$0.331/mile.

Source: Grain Inspection, Packers and Stockyards Administration/USDA (www.gipsa.usda.gov); YTD= year-to-date; n/a = not applicable

The United States exports approximately one-quarter of the grain it produces. On average, this includes nearly 45 percent of U.S.-grown wheat, 35 percent of U.S.-grown soybeans, and 20 percent of the U.S.-grown corn. Approximately 59 percent of the U.S. export grain shipments departed through the U.S. Gulf region in 2011.

¹75 percent of food aid from the United States is required to be shipped on U.S.-flag vessels.

Source: Maritime Research Inc. (www.maritime-research.com)

In 2011, containers were used to transport 7 percent of total U.S. waterborne grain exports, up 2 percentage points from 2010. Approximately 11 percent of U.S. waterborne grain exports in 2011 went to Asia, up 4 percentage points from 2010. Asia is the top destination for U.S. containerized grain exports—96 percent in 2011.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all of its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex (including gender identity and expression), marital status, familial status, parental status, religion, sexual orientation, political beliefs, genetic information, reprisal, or because all or part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD).
