Guidance
Decision Tree for Classification of Materials as Synthetic or Nonsynthetic

Underlined terms defined on page 2

Start with a substance

1. Is the substance manufactured, produced, or extracted from a natural source?
   - No extraction
   - No

2. Has the substance undergone a chemical change so that it is chemically or structurally different than how it naturally occurs in the source material?
   - Yes
   - No

3. Is the chemical change created by a naturally occurring biological process, such as composting, fermentation, or enzymatic digestion; or by heating or burning biological matter?
   - No

   Synthetic

   Yes

   Nonsynthetic (Natural)

2b. At the end of the extraction process, does the substance meet all of the criteria described at 4.6 of NOP 5033?*

* Excerpted from NOP 5033, 4.6 Extraction of Nonorganic Materials:
  - At the end of the extraction process, the material has not been transformed into a different substance via chemical change;
  - The material has not been altered into a form that does not occur in nature; and
  - Any synthetic materials used to separate, isolate, or extract the substance have been removed from the final substance (e.g., via evaporation, distillation, precipitation, or other means) such that they have no technical or functional effect in the final product.
Definitions (bolded terms in 7 CFR 205.2)

Agricultural inputs. All substances or materials used in the production or handling of organic agricultural products.

Agricultural product. Any agricultural commodity or product, whether raw or processed, including any commodity or product derived from livestock, that is marketed in the United States for human or livestock consumption.

Allowed synthetic. A substance that is included on the National List of synthetic substances allowed for use in organic production or handling.

Chemical change. A process (i.e. chemical reaction) whereby a substance is transformed into one or more other distinct substances.

Enzyme. A protein that catalyzes a chemical reaction.

Extract. To separate, withdraw, or obtain one or more constituents of an organism, substance, or mixture by use of solvents (dissolution), acid-base extraction, or mechanical or physical methods.

Formulate. To combine different materials according to a recipe or formula.

Generic. The common and familiar non-proprietary name.

Manufacture. To make a substance from raw materials.

Natural source. Naturally occurring mineral or biological matter.

Naturally occurring biological process. A process that occurs due to the action of biological organisms or subcomponents of biological organisms, such as enzymes. Examples of naturally occurring biological processes include, but are not limited to, fermentation, composting, manure production, enzymatic processes, and anaerobic digestion.

Nonagricultural substance. A substance that is not a product of agriculture, such as a mineral or a bacterial culture, that is used as an ingredient in an agricultural product. For the purposes of this part, a nonagricultural ingredient also includes any substance, such as gums, citric acid, or pectin, that is extracted from, isolated from, or a fraction of an agricultural product so that the identity of the agricultural product is unrecognizable in the extract, isolate, or fraction.

Nonsynthetic (natural). A substance that is derived from mineral, plant, or animal matter and does not undergo a synthetic process as defined in section 6502(21) of the Act (7 U.S.C. 6502(21)). For the purposes of this part, nonsynthetic is used as a synonym for natural as the term is used in the Act.
Substance. A generic type of material, such as an element, molecular species, or chemical compound, that possesses a distinct identity (e.g. having a separate Chemical Abstracts Service (CAS) number, Codex International Numbering System (INS) number, or FDA or other agency standard of identity).

Synthetic. A substance that is formulated or manufactured by a chemical process or by a process that chemically changes a substance extracted from naturally occurring plant, animal, or mineral sources, except that such term shall not apply to substances created by naturally occurring biological processes.

Table 1. Classification examples of inputs:

<table>
<thead>
<tr>
<th>Substance</th>
<th>Classification</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ash (burned wood)</td>
<td>Nonsynthetic</td>
<td>Substance is created by burning biological matter.</td>
</tr>
<tr>
<td>Calcium carbonate (limestone)</td>
<td>Nonsynthetic</td>
<td>Substance is produced from a natural source (mined mineral) and does not undergo chemical change.</td>
</tr>
<tr>
<td>Calcium oxide (quicklime)</td>
<td>Synthetic</td>
<td>Substance is produced from a natural source (mined mineral), but undergoes chemical change caused by heating the mineral.</td>
</tr>
<tr>
<td>Citric acid</td>
<td>Nonsynthetic</td>
<td>Substance is created from a naturally occurring biological process (microbial fermentation of carbohydrate substances).</td>
</tr>
<tr>
<td>Gibberellic acid</td>
<td>Nonsynthetic</td>
<td>Substance is extracted from a natural source without further chemical change</td>
</tr>
<tr>
<td>Liquid fish products – pH adjusted with phosphoric acid</td>
<td>Synthetic</td>
<td>Substance is derived from a natural source, but is treated with synthetic acids for pH adjustment.</td>
</tr>
<tr>
<td>Molasses</td>
<td>Nonsynthetic</td>
<td>Substance is derived from a natural source and chemical change is due to heating or naturally occurring biological processes.</td>
</tr>
<tr>
<td>Newspaper</td>
<td>Synthetic</td>
<td>Substance is manufactured via a chemical process.</td>
</tr>
<tr>
<td>Raw manure</td>
<td>Nonsynthetic</td>
<td>Substance is from a natural source and used without further processing.</td>
</tr>
<tr>
<td>Rosemary oil</td>
<td>Nonsynthetic</td>
<td>Substance is extracted from a natural source.</td>
</tr>
