MR. WILL: No. Our cage-free birds do not go outside. However, they live in houses that are, none of the walls are solid. So they're ventilated by nature, and they interact, insects fly in, and receive the morning sun and the afternoon sun into the house.

MS. JAMES: Do you know of any research as far as what the nutritional needs are of birds that are actually outside versus the way you raise them?

MR. WILL: There have been several studies done with that, and as far as I've seen, I haven't seen major changes in any of those. As far as the amount of feed that they graze from the land, I haven't seen major differences.

CHAIRPERSON DELGADO: Any other questions? Okay. Well, thank you very much.
And moving on, we have Leslie Zuck. And after
Leslie, we have Miles McEvoy.

MS. ZUCK: In the interest of your long list, I'm going to relinquish my time.

CHAIRPERSON DELGADO: Thank you, Leslie. That being the case, we have Miles McEvoy, followed by John Foster.

MR. MCEVOY: I'm Miles McEvoy at the Washington State Department of Agriculture, and I'm also speaking on behalf of the National Association of State Organic Programs. I'm the President of the National Association of State Organic Programs, and we have comments on grower groups and commercial availability of organic seeds.

NASOP is a group of state organic programs and state certifiers. We have an annual meeting and training get-together to discuss issues that are important to state departments of agriculture in terms of supporting the organic industry through marketing, through clear standards, and through certification and enforcement.
The one thing that's really important to the state organic programs and to NASOP is protecting organic integrity, and I think that's one of the areas that really needs to be focused on in the National Organic Program. And there's a few different items around protecting organic integrity that I think should be strengthened and looked at, and one is enforcement. I think enforcement needs to be strong and rigorous. There is a lot of mislabeled products out there. There's fraud out there in the organic community. And that when we find fraud, civil penalties should be assessed. Civil penalties can be a real deterrent to fraud, and I think that that part of the National Organic Program should really be used to help to prevent further fraud. Surveillance needs to occur, including random sampling. States can help with doing surveillance inspections. Surveillance is a way to identify problems
that occur when you least expect it, and those unannounced inspections are really different than when you do an announced inspection and people know that you're coming. Unannounced inspections, surveillance inspections, those check-up inspections, those sampling, that's really important to do.

The other thing I think that we've heard is that there's a lack of consistency in terms of how the National Organic Program is implemented by different certifiers, different interpretations. And so I think it's really important that we have continued training from the National Organic Program. We need to hold certifiers accountable through the accreditation process, so bumping up the scheduling of the auditing process I think is really important. But I would also suggest that certifiers also could use some technical assistance, some direct meetings with National Organic Program staff in a non-auditory type of situation so that it's a little more of a
friendly atmosphere.

The work on the web-based training is going to be very important, and that's going to really help out in terms of getting consistent information out to certifiers, and I think that will help a lot. But there's other things that need to happen, as well.

So in terms of grower groups, NASOP does not support the current writing of the grower group. We support the concept of the multi-site certification of the grower group component, but we think there's some concerns with the way that the current proposal is written. And one would be to limit the multi-site certification to producers, limit it to small holders that are under $5,000 in organic sales, and make sure that what is certified through the multi-site process is a legal entity. We support the minority opinion that new growers should be inspected before they're joined into the multi-site certification prior to their
acceptance within the certification program.

And then one thing to keep in mind is that the organic system plans and the internal control system, those procedures are great and they help build integrity. But inspection is really critical. Violations in the states are found in unlikely places. When you do those surveillance inspections, when you're doing those inspections, you're finding things that actually help the operation. And we can't just rely on internal control systems and organic system plans to document and to ensure organic integrity.

So that's it for NASOP. Should I go on with the WSDA comments at this point?

We also have comments for WSDA, Washington State Department of Agriculture.

MS. FRANCES: The NASOP comments were down later in the day for a five-minute spot, and the WSDA comments were now.

CHAIRPERSON DELGADO: Let's proceed.
MR. MCEVOY: Okay, great. Five minutes for commercial availability of seeds. So this is a very important issue. The draft that has come out is much better than previous drafts, but there's still some problems with it from our perspective.

A couple of the problems are some of the assumptions that are made in the draft. One is that the organic seed industry is not growing, and I don't think there's adequate data to show that. I think that, from our experience in Washington State, that the organic seed industry is growing. There's a lot more organic seeds that are being used by growers of all sizes. Small, medium, and large-scale growers are using more and more organic seeds.

The other thing that's said in the draft is that organic growers are unwilling to use organic seeds. That's certainly not our experience. Organic growers are going to a lot of ends to try to find organic seeds to
use, to purchase organic seeds; and they don't use cost as a factor to not use organic seeds. We're not seeing that as a real impediment for organic growers to use organic seeds.

Certifiers that we know are not using cost as a factor to determine commercial availability. They're using the other aspects of the commercial availability and quality of the seeds.

So the proposal, we see it as being quite burdensome, especially for diversified growers. We certify about 800 growers in the state of Washington, and many of those are very diversified. Some of them are small acreage farms, and some of them are larger acreage farms that have hundreds of varieties. And this proposal would be very burdensome on them. When they're planting many different plantings on small acreage, it would be very difficult to meet the new regulatory requirements.

And then the other part of the
proposal is that there's an implied part of
the proposal that says that certifiers allow
the use of organic seeds. What happens is in
our process is that the organic grower has a
procedure in place to verify that they're
using organic seeds and they're only using
non-organic seeds when they're not
commercially-available. And they have
documentation to verify that those non-organic
seeds are not available.

The proposal implies that
certifiers are looking at each and every seed
choice and approving or allowing the use of a
non-organic seed. That's just not feasible.
When growers are using hundreds of seeds and
making lots of different choices on a very
short time frame, it's not possible.

So what we do is we review that
plan, we inspect that plan, and we audit that
plan to ensure that they're only using non-
organic seeds when organic seeds are not
available. And that system works, and it has
worked to increase the number of organic seeds that are being used by organic growers.

The other part of the proposal is to report on the percent of organic seeds used. Again, that's going to be very problematical for diversified row crop operations because of the number of seeds that they're using and the small acreages that they're planting on. And it's also not going to lead to any additional use of organic seeds.

Now, there are some problems with organic seeds being used by larger-scale processors in particular, growers that are getting seeds from the processing industry. There we're seeing not very many organic seeds are being used. So that would be a more targeted way of looking at this development of the organic seed industry. Identify those areas where the organic seed industry is not working or not developing and put our focus and our attention there.
And that might be an area, because it's larger acreage, it's usually a single planting on a larger acreage, we could report back, certifiers could report back on the acreage of the specific varieties that are in non-organic form, and that would give the information to the seed companies of, okay, here you have so much acreage of certain types of varieties that are non-organic, and then they could develop the organic seeds that then could be used.

So the only other thing I wanted to do was that the Puget Consumers Cooperative, 45,000 members in the Seattle area, they have some comments that they tried to submit on aquaculture standards, and so I'd like to submit those into the record. And that's it.

CHAIRPERSON DELGADO: Thank you.

Kevin?

MR. ENGELBERT: Thank you, Miles.

Could you elaborate a little bit when say that
your seed growers are trying to come up with seed in a short order of time? That hasn't been my experience with people that I talk to that that's generally the case and that's where we were coming from. We try to order our seed in the fall. We plan our rotations one, two, sometimes three years in advance. What is there about our proposal that you think couldn't be met in that regard?

MR. MCEVOY: Well, when a grower loses a planting, they want to plant something else to meet a market demand, when they see that there's something that's selling well. They make those kinds of choices on a pretty short time frame. So, yes, they'll have a general plan in terms of the kinds of seeds that they're planning on using during the upcoming growing season. But then as the market developments, as they have particular successes or failures with certain crops, then they are getting additional seeds to meet those changing conditions.
CHAIRPERSON DELGADO: Jerry?

MR. DAVIS: Miles, can you clear up in my thinking what you mean by this specific area that you thought with processors? What is that world you're speaking of? I'm not sure I understand what you mean.

MR. MCEVOY: Growers that are growing organic corn, peas, potatoes for processed organic vegetables, so for frozen vegetables in particular. So what is happening with the processor is providing the seed to the grower, so the processor is the one that has to get the commercial availability or unavailability documentation. The grower is not making the choice in terms of the type of seed that they're planting. The processor dictates what type of seed is being planted because of their harvest schedule.

MR. DAVIS: So when you say that that's an area that you're describing, the
wording we used for the document was the buyer of the organic product, which in this case would be the processor calls the shots on the seed and not the grower. Then it puts them in the loop to say this is what we accept from that entity, from the processor.

MR. MCEVOY: Yes, I think that's very important for certifiers to do that, to put that buyer of the product that's providing the seeds, they're the ones that need to find organic seeds or use their resources to try to develop organic seeds.

MR. DAVIS: And the grower component that you certify in Washington, you're saying the biggest problem you see is with that area versus the general grower?

MR. MCEVOY: Yes, on the smaller diversified farms, we're seeing lots of use of organic seeds, more and more every year. I don't have any specific figures for that; it would take a lot of resources --

MR. DAVIS: What if I told you the
MR. MCEVOY: The larger-scale, no, we're not seeing hardly any use of organic seed. And the excuse or the reason that's given is that they need to have specific varieties because of their harvest schedule because the processor is doing both organic and conventional production, and so they have a certain schedule of harvesting of all these different fields, and so they dictate exactly what variety they're going to plant in a planting day for that harvest schedule. And they use that as one of the reasons why organic seeds are not available.

MR. DAVIS: In the typical Washington state systems that you see, it's either smaller to medium-sized growers that are not sending to processors and tied into that scenario.

MR. MCEVOY: Right.

MR. DAVIS: And then there's the larger growers that all seem to be in that
group? There's not larger diversified growers
that market themselves?

MR. MCEVOY: Yes, they're usually
different types of farming operations. You
usually have larger scale that are going to
wholesale or in the processing industry and
then the smaller scale are doing more of the
direct bargaining, which some of those direct
bargaining operations can be quite large with
hundreds of growers and CSAs and many markets
that are covered.

MR. DAVIS: The Board would appear
to be singling out the large processor type
entities by saying we're going to focus on you
and not apply the same regulations to everyone
across the Board?

MR. MCEVOY: Yes, you would be
focusing on them but not singling them out as
being, giving them stricter regulations.
You'd be focusing on them because that's the
area where the organic seed industry has not
been developed. So understanding what is it
about that industry, why aren't they
developing organic seeds, and then making sure
that there's support structure and regulatory
structure to ensure that that occurs and not
putting all the burden on the small
diversified operations, a different problem,
and don't put that burden on operations that
the requirements, the additional requirements
imposed are not going to lead to increased
development, just reporting the percentage of
organic seeds used. Some of the other parts
of the proposal are quite good, and I have
written comments on this and made specific
recommendations of things to include and
things not.

MR. DAVIS: Thank you.

CHAIRPERSON DELGADO: Hugh?

MR. KARREMAN: Miles, thanks. At
the very end of your public comment, you
mentioned something about aquaculture. And I
was wondering if you could just simply either
summarize or, if it's short, like within two
paragraphs, if you could say what it is because it's going to be entered in the public comment I think we should know what it sounds like.

MR. MCEVOY: Okay. This is not comments from the Washington State Department of Agriculture. This is comments from the Puget Consumers Cooperative, a cooperative of 45,000 members in the Puget Sound area. And, basically, they imposed the recommendations on aquaculture, specifically around the open-water net pens. And they're citing that Washington State has been one of the key states -- I'm not saying that this is true, but this is what they're reporting -- that have allowed open-net pens and that there's been some significant environmental problems. And that's in their comments. It documents some of those specific environmental problems for those open-water net pens.

The other thing that they bring up in their comments is that the open-water net
pens have a negative effect or can have a negative effect on the wild fisheries, the family type of businesses that are quite prevalent in Washington and Alaska. There's a lot of trade or a lot of common businesses that are based in Seattle but work up in the Alaska fisheries. So they're saying that these open-water net pens have a negative effect on that industry.

CHAIRPERSON DELGADO: Steve?

MR. DEMURI: Hi, Miles. Thanks for your comments. On the sign-in sheet I have, it says you're on ethylene pears for organic pears. You're up there in the pear capital of the world. I'd be very interested in hearing your comments on that.

MR. MCEVOY: Well, our organic advisory board met and discussed this issue just two weeks ago. And the board, the state advisory board decided not to comment on ethylene, not to support it or to oppose it. There are a few fruit growers that did say
that that would extend the marketing season
for winter pears, so that's the real reason.
There was questions on, well, if it's allowed
for bananas, why not for winter pears?

There is a problem with winter
pears ripening. They don't ripen evenly, so
that's the whole concept is that if you allow
ethylene for organic winter pears they would
be able to have organic winter pears next to
conventional pears or be sold at the same time
of year as conventional pears. So that
currently can't occur with winter pears.
There's other types of pears that can be
marketed at that same time but not the winter
pears that need certain ripening. So what
they did with the organic pears is they put
them in a room and wait a couple of months
before they ripen and then they release them
to the market.

And the reason why the board
didn't feel comfortable commenting on this is
that, well, I guess they just didn't feel
comfortable. There wasn't consensus so . . .

MR. DEMURI: Do you have any personal opinion on it?

MR. MCEVOY: Well, it seems like if it's allowed for bananas why not for pears?

CHAIRPERSON DELGADO: Bea?

MS. JAMES: Do you have any comments for us as far as how the approval of ethylene for pears may affect the state of Washington's development of their pears with other importers bringing in pears at a greener stage for ripening?

MR. MCEVOY: I don't know specifically. I would say that probably we would be able to out-compete them for the winter pears. Pears grow quite well, just like apples, in Washington state. About ten percent of Washington's apples now are organic, and about five percent of our pear production is organic. And this would probably increase the amount of organic pear production in the state. I don't think it
would negatively impact. It would positively impact our state because it's mostly being promoted by the fruit packers in eastern Washington and by the Washington Horticultural Council, so they wouldn't be promoting this unless they thought it would be promoting Washington state pear production.

CHAIRPERSON DELGADO: Any other questions? Tracey?

MS. MIEDEMA: Thank you. Thank you, Miles. There seems to be a bit of a philosophical underpinning in your approach to the seed document, and you mentioned the burden on smaller farms to burden on certifiers. And I wondered if you could comment from that same philosophical feasibility perspective on the multi-site recommendation? You mentioned, generally, you were supportive but only in the very specific circumstances.

MR. MCEVOY: Yes. I think that NASOP and myself personally support the whole
And to have some way of bringing organic product into the U.S. market. But it needs to be done in a way that protects organic integrity, so we don't want to lose that integrity because then we would lose the confidence of the consumers. So I think that the proposal, as it's written, has a lot of very specific aspects in there, and maybe that just needs to be a little more tight than it currently is.

And that's what the specific proposal is: limited to producers, limited to small holders that are under $5,000 in sales. I know that people don't like that definition. There should be some kind of definition of what is a small holder so it's not available to everyone. And then it has to be a legal entity because, otherwise, the certifier has no body to take action against.

CHAIRPERSON DELGADO: Any other questions?
MR. GIACOMINI: Just a follow-up.

When you say $5,000 limit, do you want the individual members within the grower group to be under $5,000 or the grower group to be under $5,000.

MR. MCEVOY: No, the individual members of the grower group.

MR. GIACOMINI: Okay, all right.

MR. MCEVOY: And I don't know if $5,000 is the right number. But that would enable them to then market their products and still be certified organic.

CHAIRPERSON DELGADO: Any other questions? Thank you. Our next speaker will be John Foster, followed by Jim Pierce.

MR. FOSTER: Thanks to the Board and the Program for your continued energy and productivity. I know Earthbound really appreciates it, and you don't get enough gratitude for that. It's doing positive change, and we really appreciate that. Thank you.
My name is John Foster, and I'm the Senior Manager for Organic Integrity at Earthbound Farm. We're a large grower, packer, shipper or organic fruits and vegetables. Our main claim to fame is salad mixes. We also do a lot of private label work in Canada and the U.S. We also have a pretty full line of all-organic fruits and vegetables. We also do fresh sliced apples, dried fruit, some baked good, all in organic form. We pull products from around 200 suppliers and around 35,000 acres every year. Also, to be fair, prior to coming to Earthbound, I was involved pretty intimately for well over a decade in organic certification.

So I'm going to move real quickly. As some of you know, I don't like reading, but that's the only way I can get through this in five minutes, so forgive me.

First, on commercial availability, I've commented on this before, and I won't
reiterate that. I would only say that there needs to be more attention on what certifiers collect in their OSPs and of what operators often omit or obscure in their OSPs, Organic System Plans. That makes the certifier's job more difficult. That happens a lot, and it's very challenging for both operators and certifiers.

I also want to point out that there's a big difference between a certifier collecting commercial availability information in an OSP and having the resources the condense and verify it and regurgitate that. Those are two different things from a certifier's point of view. So, in short, I would ask that you hold certifiers accountable absolutely for what they're accredited for, but asking more than that you need to be real creative with providing resources to make that happen.

The second thing, on multiple site operations, again something I've commented and
I won't reiterate, if you're going ahead with this, first off I should say the current recommendation, obviously, it shows a lot of effort on this since the last iteration of it. I think that's a good thing, no matter how it turns out. The risk analysis provision I think is particularly important.

It's also my opinion, though, that there are a lot of accredited certifiers that I wonder about the qualifications of staff to implement that right now. So it would need a lot of training, a lot of training, more so than the regular training that's necessary on that subject.

As some of you know, I'm a little worried about the perception of the multiple site certification. So if you're going to do it, it needs to be done really, really cleanly, really tightly, because it's going to be the first place that someone is going to try and drive a wedge into the integrity of the Organic Program and industry.
Third, real quick, the biodiversity thing, Earthbound, we're very enmeshed in biodiversity and organic intersections, particularly as a function of the Leafy Greens Marketing Agreement. I spend a lot of my time solving problems that growers perceive as a function of conflicts. The LGMA metrics really aren't, they aren't mutually exclusive. It just takes more creativity on how you fix that. That's going to be an additional challenge to layer on just the simple features for organic compliance and biodiversity concerns. There's also in California and now Arizona also LGMA concerns that weigh heavily on this.

Lastly, the packaging/processing aids and 100-percent claims, I appreciate this as being a very complicated issue not easily addressed. I think I agree with recommendation number one. I would just ask for clarity on what the "it" refers to. I'm not sure if it means materials or equipment in
that. I'm not sure of the opening line of recommendation two. I don't think that's a true statement, certainly not all the time. The precedents of recommendation three are a little frightening to me, and the first clause of four needs clarity and I think accuracy.

My biggest fear, actually, is that, as written, I think it would motivate some less-knowledgeable growers and handlers to bypass essential food safety considerations. And I'm not saying they would do it deliberately or maliciously, but I think there's a lot of poor insufficiently-educated growers and handlers out there. And largely, in order to differentiate their product in their marketplace and make 100-percent organic claim, my fear is that they would fail to implement sufficient food safety protocols, and that's something Earthbound knows quite a bit about these days. So it would be something I would argue pretty forcefully for when the time comes. Thank you.
CHAIRPERSON DELGADO: Questions?

MR. SMILLIE: John, I really respect your experience and your current involvement in this, and one of the points, philosophical points behind 100 percent is not penalizing companies for doing proper food safety. Rather than saying if you do this operation to increase food safety, whether it's nitrogen flushing or sanitizers, then you lose the 100-percent label. Our intention was we want them to do the food safety operations, and we don't want them to lose 100 percent in some of our cases.

So having said that, recommendation one, can we just go through them quickly? Because you referred to them and I didn't have them in front of me. So recommendation one, sanitizers, what was your comment on that exactly?

MR. FOSTER: When you use the word "it" in there, and I'm not sure whether "it" refers to equipment or materials. It's toward
MR. SMILLIE: Okay. And number two?

MR. FOSTER: Yes, what about it?

MR. SMILLIE: What was your comment or recommendation on number two? When it says hybrid cooling of produce, we've said that if the microbials remain on the final product and consume with it then it would be a clue to 100 percent part.

MR. FOSTER: Yes, I think that first clause is, I think it says that the sanitizers do remain on the product, and that's not always true. And I think that, I'm not sure even if that's the right argument to be making. But in terms of syntax, that's not a true statement. Even if you use chlorine at ambient temperatures, it off-gasses very, very quickly. Citric acid might be different when it's used as a pH buffer, but the chlorine for sure.

MR. SMILLIE: So we should look at
that a little more carefully and be more specific?

MR. FOSTER: Yes.

MR. SMILLIE: Number three, the diatomaceous earth --

MR. FOSTER: Yes. Boy, my big worry with that is if you -- let's see. Two things. One, I think it's more important what the activity being done to the product is, rather than where it's being done to it. For example, we do a lot of field pack of celery hearts and romaine hearts. That's all done in the field, but we use chlorine as wash water in the field on the equipment but also in food contact. So as I'm reading that, I'm thinking that there's a lot of undiscovered country there about whether you're deciding what's processing versus what's post-harvest handling, and is that a function of location? Is it done in a processing facility? What if the farmer has a building that they do this thing in on the farm? Is that processing?
All of that, that's really murky in how this is written right now, and I think putting forward a recommendation like this without going through that thought process is going to be just another train wreck. Who's responsible for train wrecks? That will be very problematic. Again, both with respect to just clarity but also with respect to food safety concerns.

MR. SMILLIE: We agree. The Handling Committee did this, and our purview is -- CAC took this on, and we did not, we missed that. And we realized that that is a flaw in this document. We were addressing processing operations, and we did not take into account post-harvest handling on the farm, the different viewpoints that that comes from. So we have to go back and fix that. We agree, and we're looking for more comments. We've received some written comments on that issue. So what I'm hoping, and we'll find out in public comment because that's why you're
all here, is what parts of this have to go
back for re-work and what parts can be moved
forward.

Number four, did you have a
comment on that?

MR. FOSTER: I did, but I'm not
quite done with three yet, actually. The
other, it's not really philosophical but it's
more procedural, is the example that's used.
There's some, it's not just sanitation there.
There's some pest-control issues --

MR. SMILLIE: This one is just
that diatomaceous earth --

MR. FOSTER: Right. But its
utility is, in my experience, in that usage is
more pest control. Well, there's a whole
other -- what about pesticides applied in the
field? Obviously, that's an extreme example,
but by way of making a point --

MR. SMILLIE: Again, allowed
pesticides.

MR. FOSTER: Agreed. But it's
done in the field, and there seems to be a lot of agreement that, before you cut the product, that's a crop input, and then it gets hazy after that. And that's what needs to get really completely worked through the mill, I think.

MR. SMILLIE: Agreed.

MR. FOSTER: And then number four. Oh, boy, yes, when it says nitrogen, ozone, CO2, and other inert atmospheric acids, I want to be clear that, like, ozone is not an inert gas. That should be really clear in there. And carbon dioxide I would argue is not either, but it's less active than ozone.

But this goes back to the question I've asked a lot, which is when does something stop being what it is and start being something else? So when does manure, is there a magic moment where manure becomes compost? And that's what this gets to, particularly the second line where it says "are not incorporated into organic foods." Maybe with
argon that's true, but certainly not ozone, 
certainly not CO2. There's some kind of 
interaction there on some level. I would be 
happy to have a discussion about how to get 
through that. I don't have all the answers, 
but I know it needs to be a work-through. 
Otherwise, it's going to be yet another 
problem to contend with six months or a year 
down the road.

MR. SMILLIE: I apologize for 
taking so much time, but I wanted to get all 
this out.

CHAIRPERSON DELGADO: No, it was 
very constructive. I appreciate that. Bea?

MS. JAMES: You made a comment 
about the multi-site recommendation needing to 
be really, really, really tight or potential 
problems could arise and, you know, for us to 
make it so that no wedges could get in there. 
Can you give me a couple of examples of the 
way that the multi-site is written site is 
written currently where you see some openings
for problems happening?

MR. FOSTER: Where it's written currently, or where it's implemented currently?

MS. JAMES: The way that we have it written currently.

MR. FOSTER: Okay. The current. I'm not entirely, I have faith that the Program will provide adequate training documents, you know, as time goes on. I'm completely confident in that. But I think there's, let's see -- let me start over. Because there's a perception of kind of playing fast and loose sometimes with organic regulations, oftentimes outside of U.S., I think that the wedge I was talking about is that if someone, if a non-organic minded organization wanted to point fingers at failures in organic integrity, that would be an easy target if, in fact, there is a problem that shows up, say, with, I don't know, coffee or pick your commodity. It wouldn't really
matter the commodity, it would just matter it
would be more, if there is a failure, it could
be very public and I think very damaging
because it would make it easy, a very dramatic
example of someone being able to point and
say, "Well, see that stuff coming in from
overseas? That's not really organic." That
makes a lot of headlines and draws I think a
lot of negative press.

I'm not saying that the way it's
written right now, if it's implemented
perfectly, it's probably okay. But I think
it's more about the implementation of it, and
so the guidance about implementation and
training of certifiers and training of
inspectors would be, I think, more important
on this matter than it would be on some other
things only because the potential for negative
press for the organic brand as a whole is
pretty dramatic, pretty far-reaching.

CHAIRPERSON DELGADO: Any other
questions? Okay. Well, thank you very much.
At this moment, we're going to take a one-hour break for lunch. We are running somewhat late in time. And when we come back at exactly at 1:00, we'll have Jim Pierce start, followed by Brock Lundberg.

(Whereupon, the foregoing matter went off the record at 11:59 a.m. and went back on the record at 1:04 p.m.)

CHAIRPERSON DELGADO: We are ready to start. Mr. Jim Pierce.

MR. PIERCE: Mr. Chairman, thank you so much for putting me on after lunch. I feel like I'm saying a prayer before a circus, but here we go. For the record, I'm Jim Pierce, Global Certification Program Manager for Oregon Tilth Certified Organic, a non-profit organization that supports and promotes biologically-sound and socially-equitable agriculture through education, research, advocacy, and product certification. With 1200 certified operators, we are not the biggest NOP-accredited certifier, but we are
clearly the best.

Comments using the plural "we"
then refer to the universal "we," the queen's "we," or, in this case, the tsar's "we."
These verbal comments will serve to reinforce our written comments, which were included in the soon to be best-selling DVD. My highly-capable associate, Gwendolyn Wyard, will be commenting later on your recommendations pertaining to 100-percent organic materials and pet food.

For what it's worth, I will focus primarily on multi-site certification and commercial availability of seed. I will not discuss the very large elephant in this very small and very warm room, that being pasture.

I will preface my comments with these general observations. We commend you, the appointees of the NOSB, for coalescing into a group that is cranking out solid, well-vetted, on time recommendations. Gone are the five-day crams where we all grabbed printouts
on the way to the airport and wrote comments on cocktail napkins.

I'm long on record with the NOSB as a standards conservative and a materials liberal. By that, I mean I have for years encouraged this Board and Program to adopt strict enforceable policy that preserves organic integrity, while at the same time reviewing and approving materials that are appropriate for use in the system of organic production without being overly prescriptive, as with ethylene.

Today, I would go on record and challenge you with another foundation principles. Get your rock tablets and chisels ready. Intent is far more important in your recommendations than language. And I'll say that again: intent is more important than language. We need only to avail for a moment the pasture pachyderm to see that when the language of the NOSB and the NODPA group was processed defined by the rule to include
mixing, grinding, churning, separating, extracting, slaughtering, cutting, fermenting, distilling, and eviscerating, the language not only becomes as unrecognizable as a whole hog is to a bratwurst, but the intent is seriously jeopardized.

Like the pasture elephant in the room, there's an elephant in the multi-site recommendation. Although alluded to, the recommendation does not clearly define retail and process requirements. On the record and testifying in the past in support of multi-site certification. We currently certify grower groups in Latin America. We expect each and every farm the first year and, as expressed as a concern by the minority opinion, we inspect every new operation in subsequent years.

Internationally, the intent of grower groups is clearly stated on page two of that recommendation, "to assist producers and handlers from less-developed areas into
reaching organic markets." That said, please be clear, clear as in transparent. Address it head-on. Introduce us to the elephant. If this recommendation is intended to be applied to retailers and processors, then this recommendation must include language specific to that sector.

Regarding organic seed, which allows me to say, as written by the NOSB JCC ACC, as with grower groups, international perspective is important here. It's worth mentioning to you that the world watches as you make recommendations. The intent of the issue is not only clear but clearly stated in B3 of the recommendation, namely "verify that organic farmers are making a sincere and ongoing effort to find organic seed variety suitable to their farm." Whoever wrote that, raise your hand and be recognized.

Evaluating equivalency as a factor is a good idea, a great idea in fact. Non-organic seed varieties could arguably be
better suited to assist in organic farming
than organic high yield and hybrids, which
perform at the expense of biodiversity.

Yesterday at the Organic Coalition
meeting, my colleague, Jim Whittle, urged us
to support the allowance of treated foundation
seed in order to develop better organic seed
lines. We urge you, therefore, to consider
his comments.

In closing, I refer you back to
the written comments and urge you to continue
networking with and including your
constituents. By doing so, you will enhance
the hallmark of NOSB transparency. As long as
you continue to stay true to your
constituents, we all are on this Board, albeit
without the lavish expense account.

Finally, and I mean that, as
witnessed by pasture pachyderm, your term,
sentence if you will, as NOSB members
unfortunately does not end after five years.
You owe it to yourself, your fellow board
inmates, your constituents, and to the National Organic Program to remain engaged post-appointment, posthumously if necessary, as your recommendations are processed through the USDA sausage grinder in order to guarantee that the intent of your recommendations stays true. Thank you.

CHAIRPERSON DELGADO: Any questions? Kevin?

MR. ENGELBERT: Jim, thank you very much. How do you enforce intent?

MR. PIERCE: Well, Joe referred earlier to a spirit, which I think is as good as intent. My challenge to you would be to don't write rules for change. Write rules for the ones who intend to follow the intent, and let compliance and enforcement and the process which is in place, accreditation and enforcement, follow-up after the ones who are operating outside of the intent. It's a fine line, and I understand. And I think most of the recommendations you have come up with here
are true to that intent without being too overly prescriptive. I hesitate with that last part because that's where I think, in some cases, you've overstepped your purview by trying to write the rules for the cheaters, as opposed to the vast majority of organic farmers who are not.

MR. ENGELBERT: The reason I ask is because a lot of what we see is writing the rules that can't be attainable. But the intent is not being enforced.

MR. PIERCE: And that's absolutely true. I could argue that the intent of the current pasture rule could be enforced, it simply has not been enforced. We've heard that argument repeatedly. We're not talking about pastures but just, in short, as long as these follow-up recommendations in this proposed rule enforce and support that intent of the original rule, then it's fine. As they get further into new regulation, new record-keeper requirements, new certification
requirements, I think they become more of a burden than an aid. That's all. MR. ENGELBERT: Well, I agree. But if all we had to worry about was intent, this job would be much more simpler.

MR. PIERCE: So would the tax code, but I would challenge you to take a look at the tax code. And it's huge, and people still cheat. You know, at some point, you've just got to find your balance.

CHAIRPERSON DELGADO: Any other questions? Bea?

MS. JAMES: You mentioned that the retail sector wasn't the same from the multi-site recommendation. Does the Oregon Tilth support the idea of retailers following that kind of a platform?

MR. PIERCE: Yes. As long as it's clearly stated and where there's different requirements for growers versus processors and retailers, assuming what that says is acceptable, we would be willing to do that.
And I think Oregon Tilth is out of the main stream of certifiers when we say that. Now, I know, as part of the ACA, that's the position.

CHAIRPERSON DELGADO: Any other questions? Kevin?

MR. ENGELBERT: That brings up a question then. If you think that retail will fall in that purview, how are we allowing them to have, really protect the integrity of organics and benefit consumers?

MR. PIERCE: Well, the proposal, the recommendation that's out has been refined a couple of times. And I think by going back to that weighted scale of inspection and re-certification criteria, that helps a lot. And as long as everybody is inspected first time, new time, and with new inspectors and all the high-risk ones, I think we would probably internal control system, if it can be maintained. In fact, probably, because it's a first system what you're proposing there
with retailers and processors, they have systems in place, they have computerized records; whereas, the third world farmers and the emerging farmers typically do not. It would be easier for them to comply and to maintain that integrity and of consumer concern, as it is with the farms in the third world. And we've seen that model work. That's actually a high-risk model because there is less literacy and less first world knowledge of how to do an internal control system in audits and follow-ups, and, yet, it does work.

CHAIRPERSON DELGADO: Bea?

MS. JAMES: I just wanted to also comment to your question, Kevin, that retail certification is voluntary. And if we create a situation where it's too restrictive for retailers to be able to be certified, that compromises consumers' ability to have that additional enforcement for education.

CHAIRPERSON DELGADO: Any
questions? Well, thank you very much, John.
Next on is Mr. Lundberg, followed by Grace Marroquin.

MR. LUNDBERG: Okay. Thank you very much for allowing me to share my perspectives about our petition to include dried orange pulp and 205 606.

MS. FRANCES: Could you identify yourself?

MR. LUNDBERG: My name is Brock Lundberg, and I'm with Fiberstar, the Vice President of Technology for the company. And to give you a little bit of a background about Fiberstar, we're a privately-owned research and development company. Our objective is improving food freshness and nutrition to enhance natural fibers. We have an exclusive license that we license from the University of Minnesota, and the concept of our technology is to add value to agricultural byproducts and residues, and that's how the company was initially founded.
I worked on this project as a graduate student at the University of Minnesota, started in 1998. And then in 2001, we began commercializing the project. We actually built our first production plant in 2004. The dried orange pulp is the only product that we produce. It's a unique product with functionality and many different applications, for bakery to meat. The dried orange pulp is made only from orange cells. It's the same pulp that you see in orange juice, but we take the leftover pulp that the processor doesn't have that would otherwise go to cattle feed, and that's what we use as our raw material.

There's no chemicals in the process. It's just mechanical grinding and drying. The raw material has 95 percent moisture, so it has a lot of moisture to begin with that is very energy intensive in terms of just drying the product. That's how we get it in the final form.
And it's a unique fiber that isn't produced by other manufacturers. We have the patented technology for the process and for the fiber, and that's the functionality we offer to our customers for fat replacement, reducing calories, moisture retention, and bakery. And that's part of the reason why we're here is actually from requests specifically by our customers. Three or four of our customers specifically ask for being on the National List. And the product is also grass with GRN 154 and approved for use in certain USDA products.

I decided to show a photo of our production plant. We produce this product in Florida. You can see, here's a photo of the outside of the plant. Our raw material is pumped directly from the adjacent orange juice processing operation, so it flows over the bridge through the pipelines to our facility, and we immediately process it in this building right here. This is the facility that we
built in 2003 and 2004. You see the interior part of the plant, the processing equipment. This is the internal wet side, and then right after it's stabilized through the heat exchangers, we go through and we dry it and package it. This is a photo in our packaging room. So it's a fairly simple process, and this is where we produce the product, right next to the orange juice operation in Clewiston, Florida.

Our process, we make 20,000 pounds of dried product on a day, which equates to 400,000 wet pounds of pulp. That's our raw material. We pump the raw material from the adjacent Southern Gardens, and it arrives in less than ten minutes. Just basically from the time that it's squeezed, it goes through finishers, and we pump it over to our operation. We designed the operation this way so that we could reduce or prevent any deterioration in the raw material prior to its arrival to our plant.
The raw material has a high-
moisture content that's very thick. It has
residual sugars in it, and it just all is
conducive to high bacteria growth or enzyme
growth. And we process it on a continuous
basis, we don't operate in batches, just so
that we can keep the material flowing all the
way through the process. And we don't collect
or store or transport any pulp to our
operation in Clewiston, and the reason is
because of the high moisture content and the
rapid rate of decay of the raw material.

Okay. Concerning the availability
of organic orange pulp, first just starting
with the number of oranges measured in boxes,
there's 2.69 million boxes of oranges made in
the year and about 65 percent of that goes
into juice. And when we talked to the top
three organic processors in Florida, there's
250 to 375 pounds of pulp available on an
annual basis, which is, if you remember, less
than the amount that we can process in one day
at our plant. There's a lot of oranges grown, organic oranges grown, both in Florida and California. But we're not working with oranges, we're working with the pulp; that's our raw material, and we need to be close to the orange juice processing operation. And the pulp needs immediate treatment; otherwise, it's going to be deteriorating.

Here's a slide just showing a map in Florida where our operation is. This is right down here in the red, and the closest organic pulp operation is 108 miles away. And our raw material supplier doesn't produce organic oranges just because it's a large operation and they produce 20 million boxes --

CHAIRPERSON DELGADO: Your time is up.

MR. LUNDBERG: Okay. And there isn't the supply of organic fruit within the area. And then the transportation, just regarding, again, there's less than one day's organic pulp supply for us.
In conclusion, the organic orange pulp supply is not commercially available for us. There's no organic orange producers located next to our production facility, plus the amount of total organic orange pulp in Florida is not large enough for us to feasibly transport. The transportation is expensive, especially when the closest processor is 108 miles away and we're dealing with a material that's 95 percent moisture.

CHAIRPERSON DELGADO: Thank you.

Any questions?

MS. WEISMAN: Yes. I can definitely appreciate the difficulty of having equipment that requires, you know, vast quantities. But I'm wondering if you can make any comment about what are the obstacles to smaller-scale equipment being designed that would be more appropriate? I imagine that there's not even a market out there for the amount of organic dried orange pulp, even if the raw material were available.
MR. LUNDBERG: If the raw material were available, there is market available, definitely. So I do want to make that point. That's why I'm here is because of the needs and demand for organic orange pulp. It's not available, but we're trying to do the next best thing so that the suppliers, our customers, can have a functional ingredient they can use in organic products. But there is certainly equipment that could be used, but the amount, I mean it's less than, it's a half a truckload of finished product per year. And we're sending out, typically, every week, we're sending three to four truckloads out. So just the sheer numbers, it wouldn't work for anybody based on 20,000 pounds available in a year versus us being able to make three million pounds. So the problem is really just the size. It's in the numbers, the availability.

CHAIRPERSON DELGADO: Kevin?

MR. ENGELBERT: If this pulp was
transported, if any pulp was transported in a frozen state, or at 32 degrees, would that solve a problem with the transportation that would allow this organic pulp to be converted into the dried pulp?

MR. LUNDBERG: It is possible, but the other problem with transportation is, even at 95-percent moisture, the material looks like mashed potatoes, so it's not easily pumpable. It would have to go into something like drums, or something that you can dump so that you don't have to, because you can't put it in a tanker or anything like that. But it would have to be treated septic still, because it still has a very high amount of enzymes in there that, even if it's frozen or refrigerated, I guess frozen that you wouldn't have the growth, but even refrigerated conditions, it's still going to grow the enzymes.

But the cost still, and if you move a truckload, 40,000 pounds, you're going
to get 5,000 pounds of finished product. So that's the issue. But our 2,000 pounds of finished product based on a 40,000 pound load, so transporting that is going to add a dollar to your cost on a pound basis. It is possible if the numbers were there, but the problem is the numbers in terms of available raw material are so low that -- it's just a lot of technical issues that we have to deal with.

CHAIRPERSON DELGADO: Dan?

MR. GIACOMINI: If you could, as succinctly as you can, you gave us sort of the breakdown of what's it used for as far as fat replacement and that kind of thing, can you give us a little better picture than that of where and how it's being used in the industry, and to really see that it fits in as a place in the organic community?

MR. LUNDBERG: Sure. I would say there's two different categories. One is in fiber, like in general, fiber for, a lot of different fibers: the oat fiber, wheat fiber,
lots of different things like that.

And then the second area is in hydrocolloids, where you have different types of gums that are used for stabilizing, thickening, fat replacement, emulsification. Those are the general applications, but what our product is unique in what it offers is delivering that functionality with something that's extremely simple. And we don't use any chemicals. All it shows up is dried orange pulp on the label.

So we're delivering a functional product, but we're able to replace gums, whether they're chemically synthesized or not, we're replacing those things that have long names on them that people don't understand with a very label-friendly, all-natural dried orange pulp that everybody can understand.

And it's used, our biggest customer is actually a meat product for emulsifying and for providing thickening in a meat. Those are our biggest customer.

Bakery, in the 100-calorie packs that you see,
products where they're designing them to reduce calories, that's what our product does. It's just water and dried orange pulp that can be used as the filler to take out much higher caloric ingredients.

CHAIRPERSON DELGADO: Any other questions?

MS. ELLOR: A couple of questions. You mentioned that it's stabilized before it's processed?

MR. LUNDBERG: Yes.

MS. ELLOR: Okay. Then how long is that stabilized product -- how stable is the stabilized product? Could that be shipped? Taking out the moisture issue, that could be shipped?

MR. LUNDBERG: It could be shipped if it were refrigerated, yes.

MS. ELLOR: Okay. And here's the other question I have. How shelf stable is your final product?

MR. LUNDBERG: It's three years.
MS. ELLOR: Three years. So presumably, you could collect a mass of organic pulp, and then match that up with the demand for organic if the finished product has organic pulp?

MR. LUNDBERG: Yes. If the supply of organic pulp is available, yes.

MS. ELLOR: So you could process all the organic pulp available in an organic form and have --

MR. LUNDBERG: We could do it, yes. But if there was available organic pulp, we would, I mean, for efficiency reasons, we would do exactly what we've done at Southern Gardens, and that is to install a production plant adjacent to the raw material supplier in a central location. I mean, the best way is to pump it, and then we can avoid all the handling and deterioration costs. But yes, the answer to your question is yes.

CHAIRPERSON DELGADO: Steve?

MR. DEMURI: Tina asked part of
the question I have, but I want to make sure
I'm perfectly clear. If you brought all the
available organic orange pulp from the United
States to your plant, you still would not have
enough to produce on your equipment?

MR. LUNDBERG: No. According to
the numbers, there's 2.69 million boxes of
oranges produced in the United States that's
processed into orange juice, and that compares
to the operation, that's over the total United
States. At our citrus plant, they produce 20,
so it's not quite 10. Maybe it's 15 times
more production at Southern Gardens Citrus
compared to what there is in the entire United
States. So although it is a growing industry,
from what we understand, at this time it
doesn't have quantity available for us.

MR. DEMURI: To follow-up on what
Julie asked you, you don't think you could
design a smaller plant closer to a source?

MR. LUNDBERG: Yes, we could.

CHAIRPERSON DELGADO: Any other
questions? Thank you very much. We're moving on now to Grace Marroquin, and remind the Board that we still have 50 on the schedule, so let's concentrate on the issues. After Grace, we'll have Christine Bushway.

MS. MARROQUIN: Hello, everybody.

Good afternoon. My name is Grace Marroquin. I'm President and CEO of Marroquin Organic International in Santa Cruz, California. I founded my company in 1991. That's right, 17 years ago. And we are importers and suppliers of organic ingredients.

Once again, I'm back, and I'm here to address the Board, just as I have done almost every year since 2004, that's one, two, three, four years. Organic yeast was developed in Germany and introduced commercially in the 1990s. I have introduced many organic ingredients on the basis and principle of organic preference. When I learned that organic yeast was available, I was really excited, because this was another
breakthrough in organic ingredients. And I've been around since before organic sugar, since before organic non-fat, since before organic starch, even since before organic basil. And believe me, I was a baby. And I was there, and it was all done on the principle of organic preference. If it was available, it would be used.

Organic yeast is grown on the substrate of organic grains instead of conventional grains. And I know you've heard me say this, but I'm going to say it once again, that above all, organic yeast avoids many synthetic chemicals used in the production of organic yeast. And this is ammonia and ammonia salts, sulfuric acid, caustic soda lyes; all these are pH regulators, synthetic vitamins, and synthetic anti-foaming agents. These ingredients are not allowed in organic production in and of themselves, but yet they're coming in through the back door through organic yeast.
Because these chemicals are all used to produce conventional yeast, the waste water has to be heavily treated in order for it to be disposed of. In organic production, the waste water from the yeast is used to make further organic products.

Despite the fact that organic yeast is available and is not required as an organic ingredient because of the loophole, in order for it to be organic, yeast must be first considered agricultural. The NOP said in 2004 it would not require processors to use organic yeast, and told us that we had to petition to reclassify it. So this we did. So we were petitioning to reclassify it for non-agricultural in Section 205.605(a) to agricultural in 205.606.

Since 2004, we've been asking the Board to make this change. Very, very, very, very few companies would have persisted this long. Anybody with an innovative organic ingredient certainly would have backed down by
now, because it would not have been cost
effective, and they probably lack the
commitment, and they probably are not insane
enough to try this process for this long.

And when you're talking about the
ingredient, you're not just talking about the
one ingredient. They bring an innovative
ingredient to marketplace, and as a result,
more organic flour is being used, more organic
milk is being used, more organic sugar, nuts,
and it goes on and on; thus, more land goes
into organic production, and that's what, for
me, it's all about.

In September of `06, the Combined
Handling Materials Committee voted 8 to 0 to
yeast in 205.606. This was based on the
conclusion that yeast was an agricultural
product. According to the definitions of OFPA
and the NOP final rule, at the 2006 meeting
the Board discussed this recommendation and
voted not to act on it immediately because it
needed to examine two issues, and one was
that, if yeast was reclassified as an agricultural product, it would require yeast supplements in the livestock feed to be organic, and they wanted to examine the impact of this. And then the other issue was there adequate standards.

This was the Board’s plan in 2006, and since this, this has not been addressed. Meanwhile, in the last two years, the European Union has made great strides to recognize organic yeast. In 2007, the EU established that yeast is eligible to be organic both in food and in feed, and in fact, the EU has adopted the general standards. We just received word of this, and it’s going to be published at the end of this year into final rule.

In conclusion, we request that the Board do the following: on the livestock feed, we request that the Board do what it said two years ago, and to ask for public comment regarding the impact on yeast supplements in
the feed. On the question of standards for
production of yeast, we're asking that you
look at the EU standards which are about to be
published.

In addition, the Board may
recommend moving yeast to 205.606 without
specific standards being in place. Yeast is
a fungus and a mushroom. The beautiful little
mushroom is also another fungus that is being
certified right now without NOP standards.
Under the NOP policy statement of August 23rd,
2005, agricultural products may be certified
if they comply with the NOP standards without
specific standards in place. And thirdly, on
the question of recognizing the
microorganisms, we ask that you put this aside
from the yeast as an agricultural product.
We're requesting the Board to defer this. No
bacteria, including any dairy cultures, are
being produced organically. And until this
occurs, there is no basis for requiring that
all bacteria in feed be organic. So yeast is
a separate case, because organic yeast is available.

So ending, this is the approach that the EU has taken. The EU regulation singles out yeast from other microorganisms, and it declares that yeast is eligible to be organic, but does not do the same for bacteria, enzymes, or microorganisms. These remain on a restricted list on the organic materials that are permitted for the EU.

I thank you all. I know this has been very trying, just like for me, but we need to push through this. It's overdue.

Thank you.

CHAIRPERSON DELGADO: Any questions? Dan?

MR. GIACOMINI: I just think it's -- thank you for your comments. I think it's only fair that we do address that this is one of the main issues that's been tried to be tackled by the Materials Working Group of which you're part of. So to say that we have
not done anything, we helped set up that group. Members on this committee are working with that group, that group is coming back to us now for the second time and making recommendations to that. I think we've been looking at it to a certain extent. To say that we have done nothing on those two issues I think --

MS. MARROQUIN: I didn't mean it quite like that. I meant, regarding asking for comments from the livestock industry, nothing's been done on that, and that was asked two years ago. And yes, the Material Working Group has been informed. But we're tackling the entire universe of agriculture, and I know that we're trying to define it. But it's -- as I mentioned, it's pretty frustrating for a company trying to get into this. The commitment's not there. And to tell you the truth, I know that there are manufacturers of organic yeast who can produce organic yeast. And in fact, some of them are
producing organic yeast for feed, but they're
waiting. You know, there's no reason to raise
the bar right now. There is no motivation to
raise the bar, and it's unfortunate that we're
no longer operating from organic preference
like we used to. It used to be easy. If it
was agricultural, you could use a non-organic
if you could prove that, you know, no sewage
sludge, you know. It met, no GMOs, no
irradiation, and it could be used. And if all
the processes were in place and accepted, then
it could be used, and then the motivation came
to produce something organically, because then
you'd be the person on the market.

This guy with Fiberstar, there's
another citrus company doing this now, and
they're producing a product that, in the
organic industry, we need organic antioxidants
to preserve the shelf life of bread. This
replaces BHT and BHA. We need it, but where's
the motivation to do it? And is he going to
come up here for four years? I don't know.
I doubt it, but that's just my opinion.

But again, I really appreciate, because this is a tough process, and it's frustrating.

CHAIRPERSON DELGADO: Joe?

MR. SMILLIE: Well, as you know, Grace, I support your position, and I think that you're right. Unfortunately, as we discussed earlier, in the formation of the National List issues, you got stuck with this flaw. And what we're trying to do is very frustrating for you and for us, too, is we've got to fix it all. You know, we really have to fix the whole thing, because yeast is just a very good example of a material that's been abused because of the initial structure we were handed. And unfortunately, you know, you've suffered because of that.

But, again, we've made a couple of attempts to try and fix this little piece, and I guess the cumulative wisdom of the Board is we have to fix the whole thing, and that's
what the working group is for. And hopefully, I won't be off the Board, because I love hearing you every year. And hopefully, we'll get a fix that will not only bring justice to yeast producers, because I agree with you, you can produce yeast organically, and you can do it with the standards we currently have. The mushroom example is an example of that. I feel confident that a decent certification organization can create the rigor to justify its production as an agricultural product.

But we're sitting there face-to-face with the National List, and I think the Board has decided that we're going to fix the whole structure, and give yeast its proper place rather than just taking an action on yeast alone.

MS. MARROQUIN: Okay. Well, I thank you, and I guess I'm just here to urge it along.

CHAIRPERSON DELGADO: Hugh?

MR. KARREMAN: Yes. Grace, thanks
for coming in again, and I feel bad for you.

MS. MARROQUIN: I'll send you my

bill.

MR. KARREMAN: How exactly is it

that the Europeans did it? Can you somehow

figure out in the Materials Working Group how

they -- I mean, you explained how they did it,

but how you could somehow merge it, or somehow

with the way it is now, or until the Ag/Non-Ag

gets fixed? Because obviously, I guess

they've done it.

MR. MARROQUIN: Yes, well they did

it. And I think, because of all the

ingredients, part of its composition, I

believe, and you can correct me if I'm wrong,

but it's almost like 98 percent of all

ingredients in the yeast, if not 99, are all

organic. And what they did was, you know,

they just separated out, because it's really

the issues of bacteria and enzymes and

microorganisms that sends everybody spinning

out into outer space so that they can't, you
know -- I remember a long time ago we talked about the low-hanging fruit and the high-hanging fruit. Well, this is a low-hanging fruit. And what they did was they separated it out, and that was a way for them to be a little bit more clear about looking at the issue and being able to move it in a decision.

And actually, what's going to happen now is any organic product in the United States that's made that has yeast, and there's lots of them, there's crackers, and pretzels, all baked goods all have yeast in it, those products will not be able to be exported now to Europe once this rule is in place, which again, it's in its final coalition state at the end of the year, will not be able to go in that direction. So they're going to have to come up with a solution to be able to go that way.

MR. KARREMAN: Do you have a smart lawyer that can figure out the way they did it into our system?
MR. SIEGEL: This Board, in October of 2006, wrote a very clear, simple, straightforward policy recommendation that came out of the Combined Handling and Materials Committee 8 to 0. Yeast should become an agricultural product under 205.606 because that's what the definition in OFPA calls for. And that was a good start. There was a discussion of what the remaining outstanding issues were. One was standards, and the other was livestock feed, and those two issues we thought were going to be specifically addressed at that time to clean this matter up. And the past two years, nothing has happened in that direction.

MS. MARROQUIN: But regarding the EU, I know that was the question.

MR. SIEGEL: Yes. Well, the EU is different because it doesn't have the non-agricultural box that yeast is in. Yeast was one of a number of ingredients that could be used as non-agricultural, and the EU decided
yeast could be pulled out of the pack and

given a special status, and that's what they
did. And that's what this Board was ready to
do two years ago.

CHAIRPERSON DELGADO: Could you

identify yourself for the record?

MR. SIEGEL: Richard Siegel,
counsel to Marroquin Organic International.

CHAIRPERSON DELGADO: Thank you.

MS. MARROQUIN: Don't forget about

CHAIRPERSON DELGADO: Any other

questions? A question for the Chair of the

Materials Committee, remind us please, on the
target days to finalize the issue, and also
the follow-up to the Non-Ag? What is the

status of that?

MR. GIACOMINI: The goal is for,
hopefully, we will be able to come up with

something from the Board at the end of '09

before we start having a huge tremendous

turnover. Board members, again, will then
require a tremendous amount of re-education.

CHAIRPERSON DELGADO: And that would include the two questions?

MR. GIACOMINI: And that will be as much as we can possibly tackle.

CHAIRPERSON DELGADO: So we're addressing the issue, and we're trying to move forward on that one as soon as possible, so please bear with us.

MS. MARROQUIN: Thank you, everybody. You're doing a good job.

CHAIRPERSON DELGADO: Okay. Next on, we'll hear from Christine Bushway, and that is followed by Tom Hutcheson.

MS. BUSHWAY: Hi. I just wanted to take a minute to introduce myself. I'm the new Executive Director of the Organic Trade Association, and having been there about two months now, I can tell you it feels sort of like peeling an onion getting the whole organic industry under my belt. And as I get from layer to layer, I find there's more
layers. So I just wanted to say hello, and say that I look forward to working with you.

CHAIRPERSON DELGADO: So nice to meet you. Thank you very much --

MS. BUSHWAY: Thank you.

CHAIRPERSON DELGADO: -- for taking the time to introduce yourself. Any questions from the members of the Board? We certainly recognize the work the OTA has done all along in support of this Board, and we welcome you to your new post.

MS. BUSHWAY: Great. Thank you. I'm enjoying it. Thanks a lot.

CHAIRPERSON DELGADO: Dan?

MR. GIACOMINI: Yes. As Chairman of the Materials Committee, I would also like to thank you for the continuing support you've given to the Materials Working Group, and the resources that you've applied to that in offering us the conference call.

MS. BUSHWAY: Absolutely, we continue to do that. Anybody else? Thanks a
CHAIRPERSON DELGADO: Now we move on to Tom Hutcheson, followed by Ed Maltby.

MR. HUTCHESON: Good afternoon, everyone. Tom Hutcheson, Regulatory and Policy Manager for the Organic Trade Association, OTA. OTA is the membership-based business association for organic agriculture products in North America. Our over 1600 members include growers, processors, certifiers, farmers' associations, distributors, importers and exporters, retailers, and others. OTA's mission is to promote and protect the growth of organic trade to benefit the environment, farmers, the public, and the economy. If you're not a member and you want to, see me, or go online 24/7, OTA.com. Please refer to our written comments for more detail on all the issues covered here.

On technical reviews, it is our understanding that a qualified member of the
NOSB may undertake a technical review of the petitioned material, and that a subcommittee of the NOSB can constitute a technical advisory panel. We have provided suggested definition revisions in our written comments.

On the Materials Working Group document, OTA urges you to favorably consider option number two, which calls for a revision to the definition of non-agricultural, and which offers two alternate definitions. Please find our detailed rationale in our written comments, including some proposals concerning Section 606. We also hope you'll consider our recommendation revising the definition of non-agricultural, and initiate provisions for reclassifying as agricultural appropriate substances presently listed on 605.

On multi-site operation certification, we urge adoption of this document by the NOP as a guidance document. We do not support the minority opinion, as it
could pose an unfair burden on newly-forming producer groups, especially when a family member or former employee of an existing member whose experience with organic compliance might become a new member.

On the 100 percent recommendation, we agreed with the recommendation of neither sanitizers used on processing equipment, nor inert atmospheric gasses used as packaging aids, or carbon dioxide, I might add, ozone, which are already approved, should affect the use of the 100 percent organic label on a product. However, it may not be wise to require that substances used to meet food safety requirements affect the 100 percent organic claim. Diatomaceous earth is the primary product available to organic farmers for stored grain pest control. We request NOSB obtain additional information concerning the impact of such a change before making this recommendation. And as before, please note our written comments about this.
And on seed commercial availability guidance, more on the written comments, we suggest that the rest of the provisions of 205.204(a) be given similar attention, mainly the requirement for use of organically-produced perennial planting stock.

On biodiversity, we welcome attention to the principle of biodiversity in organic agriculture, and we agree that the implementation of this requirement should be strengthened, though we'll be cautious about imposing additional record-keeping burdens, and would urge identifying outcomes to be monitored in the organic system plan rather than through prescriptive practice standards.

On aquaculture, for fish feed, we're concerned about the 25 percent maximum of fish meal and fish oil from wild caught fish and other wild aquatic animals for the first five years, because it's unclear how the nutritional needs of aquatic species can be met from other sources. Until there's an
organic aquaculture industry to provide such byproducts, and since the Aquaculture Working Group has determined that terrestrial livestock byproducts cannot be used, this will be a serious stumbling block for organic aquaculture development. Use of wild fish byproducts is ecologically desirable, given the stringent monitoring and quality control requirements identified in this recommendation. We would suggest allowing a larger percentage of fish meal and fish oil to be derived from sustainably harvested wild caught sources, with a proportional stepwise reduction as an organic aquaculture industry becomes established.

On net pens, the requirement in 255G to minimize adverse environmental impacts from aquaculture production is essential. However, we believe that the performance target specified in (g)(i), of recycling a minimum of 50 percent of all nutrients is not feasible. Fifty percent is a laudable goal,
but accurate measurement is problematic. NOSB should instead propose measuring a simulative capacity by carbon deposits, benthic organisms, and other types of benthic analyses, rather than simply requiring retrieval of 50 percent of all output until a methodology is available for verifying such target.

On pet food standards, we support the proposal, given some important adjustments which are included in our written comments. And on other issues, we've convened a task force on nanotechnology, and hope to have information concerning the applicability of that technology to organic production for later discussion. Thank you.

CHAIRPERSON DELGADO: Questions?

Thank you, Tom. Moving on with Ed Maltby, followed by Dave Engel.

MR. MALTBY: Good afternoon. I am Ed Maltby. I directly represent over 180 producers -- organic dairy producers in the
east from Louisiana to Maine, and can speak on behalf of another 500 organic dairy producers across the country in the Federation of Organic Dairy Farmers or Food Farmers Coalition.

I'd like to thank the NOP, and especially Rick and Barbara for the work they've done in getting the access to pasture rule out. It's been a long time coming, but we're very grateful to have it, and we thank you for your work.

We were going to have a parade of cows coming through here, but the fish people beat us to it. And then we thought of ruminating cows, but the hotel wasn't too good about cleaning up the mess, so we didn't bother with ruminating cows.

We would also like to thank the NOP for holding the listening sessions, one that has happened, and the other two which are due to happen very shortly I understand in early December. It was a great opportunity
for producers to actually talk directly to NOP personnel, and rather than them being some evil bureaucrats sitting in the middle of D.C., they actually realized they were human beings struggling to do the right thing.

The organic community is being energized with the release of the access to pasture rule. And on behalf of over 1300 organic dairy producers across the country, and many other people that have been participating in the task force, for want of a better word, I want to clearly state that we do not need an extension. We are energized. We've had conference calls across the country from farmers, and producers, and interested consumers. They're so dedicated that we start at 8:30 at night Eastern time, and we pick up the Western producers as we go later, and at least most of the farmers now have learned how to click on the mute button, so as they drop off to sleep, we don't need to have to connect them. Now that's been
happening for the last, ever since the rule came out, and we are energized and ready to move forward taking part in the OTA task force, and working with the International Organic Coalition to come up with data, comments, and constructive dialogue.

We're waiting now for the origin of livestock, which we're glad to see is the priority for 2009, and we urge the NOSB Livestock Committee to work with us on some of the recommendations so that we can come up with a rule that meets the standards that we are asking for.

And lastly, we strongly urge that the NOSB or the NOP aggressively enforce the current rules to the best of their ability. It's great now that we've got five or six dedicated enforcers. They're the people with the baseball bats in the back of the room. And it is critical to the integrity of the label. We don't just need to write the rules, we need to get them enforced, and we need to
be able to protect the future incomes of family farmers across the country.

That's all. Thank you.

CHAIRPERSON DELGADO: Any questions? Thank you. Next is Dave Engel, followed by Will Fantle.

MR. ENGEL: My name is David Engel. I am a dairy farmer from Wisconsin, and contrary to the credit up there for Oregon Tilth, I am an Oregon Tilth employee, but I'm speaking with my dairy farmer hat on, and my Executive Director of Natures International Certification Services hat on. And I, too, want to thank the Board and the public for their interest in everything here. It is a critical part of this community that we belong to.

I have passed around my, which will be my submitted comments, more or less, for pasture. I don't want to dwell on them too much here. I do want to offer the perspective, though, as I have in the past
since this discussion began, that not all the
dairy farmers are being represented by the
1300 that Ed has proffered. There's been,
there are many -- Hugh mentioned one segment
of people that are not online, and the extent
that this proposed rule goes to is going to
throw many more people into that pot of people
that will not be able to comply.

You can look at my comments. You
can find me and talk with me later if you'd
like to know more.

The second thing that I would like
to briefly share with you, and is somewhat in
a way a reflection of this proposed pasture
rule, your proposal on the commercial
availability of seeds I think is good in its
intent, but it's very critical, just like with
the pasture rule, that we not put numbers in
the rule that set lines in the sand then that
have to be met or something happens.

I appreciated Miles' comments on
the commercial availability of seeds. I think
he's correct in looking at the different
segments. Another segment that I would add
into that would be what I would call the
commodity seed, the corn, beans, alfalfa.
These people could be buying more organic
seed. And as a certifier, personally, and as
an inspector, I make a specific point of
applying the rule, the 205.204 and the 205.2
commercially available definition. These
things have to be gone into with each grower.
It ends up on my exit interview with them.
And then next year, there's accountability,
and there's improvement. That's the purpose
of this rule, and it's a golden shining star
that we cannot lose sight of, or else we're
going to, in five years, may I say it, like
the banking industry, if we do certain things
now, there's going to be repercussions later.
So I won't say anything more about that.
The only other thing I'd like to
briefly share with you concerns Barbara's very
nice announcement this morning about training.
Again, I can see the progression here is, first of all, we have an AMS training center that is expert in training, putting materials together. And then we have the NOP, who is authorizing this, and they're expert in providing oversight and management. It's their responsibility.

My only concern is the expertise that goes into the content of the training. And the training is going to be on the rule, the content of the rule, and the experts in that area are certifiers, of course, the ACA. I've also thought that the USDA is supporting an eOrganic program that Mr. Riddle is a part of, and they have a wide range of resources there that could be accessed.

I think it's real critical, though, that the content has expertise going into it, just as the module of training itself, the infrastructure for training, and the program that's authorizing this, they have their expertise. But the content or the
training for that, of the content for that
training needs to be accessed appropriately,
too. Thank you.

CHAIRPERSON DELGADO: Questions?

Hugh?

MR. KARREMAN: Thanks, Dave. I'm just wondering, when you're saying there shouldn't be specific numbers in whatever, I guess seed availability or the pasture rule, how exactly -- well, and you know, someone mentioned earlier that the vast majority of organic farmers really truly are farming as the intent of the rule is laid out, but then I've also heard that there's all these people kind of at the margin probing where the weaknesses are.

So if you don't have some specific numbers, how is a certifier going to be backed up by, let's say, the NOP if something goes to court that someone has, you know, done something or not if you don't have some kind of numbers? I don't know. It's just a
question I have in general. I mean, what --

MR. ENGEL: Hugh, I know that's a
question, and I guess a couple of responses
would be, number one, the problem is a
political problem, and I think the enforcement
and the accreditation process should be taking
care of this. It takes care of many other
aspects of -- I mean, I was just visited. I
got a whole list of things as a certifier that
I'm supposed to be doing that they figured
that I wasn't doing properly. I accept that.
Why wasn't, for the individual certifiers that
were at that point at that time with those
herds, why wasn't this identified there?

The other thing that I will say as
a certifier, and this is anecdotal, I have a
very large herd, NICS has a very large herd
that's coming through the process, and they
haven't been, with their previous certifier,
being held to a stronger continual
improvement. This gentleman is putting in
place now, since I was there last year, a
$100,000 bridge that he will be able to get his cows to the other side of this thing that he's been using as an excuse. He'll have access to 200 more acres.

Now, he still will not be able to meet that 30 percent, but that's a continual improvement that he's put in place. And I don't think, my concern is that, with numbers in the rule, you're going to be disconnecting that producer and many smaller ones, particularly with the extent of the specificity that this proposed pasture rule proposes.

CHAIRPERSON DELGADO: Any other questions? Thank you. Next we have Will Fantle, followed by Alexis Baden-Mayer.

MR. FANTLE: Good afternoon. My name is Will Fantle. I'm the Co-Director of the Cornucopia Institute. Our organization has about 2500 members. A vast majority of those members are organic farmers.

I have a couple of areas that I
I want to comment on today. I'm actually not talking about the pasture rule at this point, but I'm going to talk about lecithin initially, and I understand that there's a petition before the NOP and the NOSB to remove lecithin from the National List. This is something that we support. We sent out a letter to Board members a couple of weeks ago. I won't bother to read from that letter, but I will highlight a couple of the points in it which I think are pertinent to this discussion.

First, we believe there is a supply of organic lecithin, a significant supply that can be offered to producers who want to use organic lecithin in their product. Second, by promoting the use of organic lecithin, you are removing from the pipeline a hexane extracted ingredient, something that is very important to getting hexane out of our products that are used in organics. Third, we believe this will level
the playing field. We believe that organic
lecithin may be perhaps more expensive, and we
don't want users of organic lecithin to be
penalized for doing the right thing. It's
important that the playing field be leveled so
that commercial entities are playing together
in a fair manner.

Finally, I would say that this
will send a strong and positive message to the
commercial community that products can be
developed that are organic, and I encourage
you to look at this closely, and I hope rise
to the challenge more quickly than what you've
done with the yeast issue.

Second area I want to talk about
is organic almonds. When I was last here a
year ago, I raised with the NOSB and the NOP
the rather draconian mandate that had been
imposed in California requiring the
pasteurization of all California raw almonds
sold in this country, sold as raw. We're now
a year into the implementation of that
measure, and as of yet, even though I
requested this a year ago, and saw nodding
heads from staff at the Program that they
would get a determination to us, we still
don't know whether or not one of the two
approved treatment alternatives, propylene
oxide, a toxic fumigant, is allowed in the
organic production for pasteurization. I
would still like an answer to that question
from staff at the NOP.

Let me talk a little bit about the
impact of this rule. We have since gone to
court. In September, we again filed, we
worked with farmers, since only farmers and
handlers are allowed to file a lawsuit
challenging this rule, we worked with farmers
to help them file a lawsuit seeking to
overturn this USDA mandate. We think it
stands a pretty good chance in court, but more
importantly, what the organic producers are
telling us, who had niche markets for raw
almonds in commercial entities around the
country, their markets have been destroyed. They are going out of business. More than one producer has told us that the organic sector is being destroyed by this rule. I think that's very important for the National Organic Program and you as Board members to be aware of, because there is going to be a cascade of food safety measures coming down the pipeline in the next few years, whether it's leafy greens, whether it's beef, or whether it's other fresh foods that we eat in the marketplace, there's going to be increasingly stringent requirements placed by the USDA, in some cases the FDA, that are going to govern our access to unadulterated raw foods.

It's very important that you get out in front of this, because you were not in front of this when it came to the almond issue. And we think this is still something that's very important that should be discussed inside the agency.

With that, I'm going to conclude.
And if anybody has any questions, I welcome those. If not, I have a proxy, and tomorrow I will be talking a little bit about the pasture issue.

CHAIRPERSON DELGADO: Questions?

Bea.

MS. JAMES: Could you explain a little bit about why the pasteurization of almonds has ruined sales for the organic almond farmer?

MR. FANTLE: There is a glaring and gigantic loophole in place that has made a huge difference, and then there's also the issue of consumer preference for an untreated product. The loophole that's in place has allowed a flood of imports coming into this country of raw almonds that don't have to be treated. So consumers in the marketplace are choosing those untreated nuts. There are large commercial entities that have switched their product lines away from California almonds, which I think everybody in the
industry recognizes is the gold standard. So the import loophole, and then even with the requirement in this country of the two treatment options, steam heat or propylene oxide, there are consumers that want an untreated product, raw product, and that has just made a huge difference.

I've talked with a number of, on this lawsuit there's 18 plaintiffs right now. A number of those are organic producers. Not all of them, though, are organic. There are raw conventional producers that are also being impacted by this that have joined this lawsuit. And the organic producers that I've talked with, and conventional producers that I've been talking to are telling me thousands and tens of thousands of pounds are in cold storage right now because they have no market for our product, and we need to be in front of this issue.

CHAIRPERSON DELGADO: Any other questions? Okay. Thank you. Moving on then
to Alexis Baden-Mayer, and followed by Devlin Reynolds.

MS. BADEN-MAYER: Hello. My name is Alexis Baden-Mayer. I'm with the Organic Consumers Association here in Washington, D.C. I'd like to talk today about grower groups, aquaculture, and the 100 percent organic claim. First, I want to thank you all for your hard work. I'm very encouraged by the National Organic Program's several new hires in compliance and enforcement, and the plans to make tradings more accessible and accessible to consumers. It's really great.

And I'm also very impressed by the work of the Board. You all are very productive. The grower group certification document is much improved. This September, I had the opportunity to go to Palestine to visit the Palestinian Fair Trade Association's certified organic olive oil production. It's in the area around Jenin. I saw olive trees that were a thousand years old, and I met
farmers whose families have literally been there for about a thousand years making their livings from those trees.

There are 1700 tiny family farms in the cooperative, and they all share a central processing facility. They're building a new processing facility, and it's probably the largest economic development project in the West Bank right now.

In Palestine, and a lot of other places in the global south, they're organic by default. They just don't have the money to take care of their crops the way that we would in the west with industrial inputs. So by banding together to share resources and access international markets, they're finally able to do things, or make it worthwhile to do things like fertilize their crop and clear the lands of trash. So in a place like Palestine, where economic development and self-sufficiency isn't just a path out of poverty but a path towards peace, you can't overestimate the
potential impact of projects like this. So I want to thank the committee for their great work, and urge you all to support the grower group certification recommendation. But I did also listen to the comments today of Miles McEvoy speaking for the National Association of State Organic Programs, and his comments recommending that this be explicitly limiting multi-site certification to producers, small holders, and legal entities. Those are all good suggestions, and I don't think they would change the character of this recommendation at all. I think the recommendation would probably be applied in this way anyway, but those are good recommendations to get in there before you approve that.

I'd also like to talk about the aquaculture standards. Organic consumers are now 69 percent of the population. We're a very diverse group of people, but we're consistent in our reasons for buying organic.
Organic food is safer, is healthier, and is more nutritious. The Organic Consumers Association also wants to turn on people to the bigger picture, and let people know that it's not only that it's safer, healthier, and more nutritious, but organic is also an important part of being able to feed the world, to turn back global warming, reduce food-borne illnesses and diet-related diseases, and ultimately, like I saw in Palestine, to increase stability, economic security, and peace in the world.

And in order to enlist organic consumers in these larger causes, we have to make sure that they continue to be true believers in organic as the way. And you know, there's a lot of green washing out there. There are a lot of competing marketplace claims. And the Organic Consumers Association is not going to change and become the Green Consumers Association, or the Sustainable Consumers Association, because we
believe that organic is the gold standard.

And it's one thing for a group like mine to say, go for organic plus, so organic plus fair trade, organic plus local, but it's very different if we were ever to have to face a competing food standard that actually guaranteed a higher quality of safety, health, and nutrition. And that's what I'm afraid about with the aquaculture standard.

We've got the Marine Stewardship Council certifications out there, and I really wonder what the Monterey Bay Aquarium Seafood Guide would say about organic certified salmon that's farmed in the Atlantic in open net pens. Are we going to create the first U.S. food production system where organic certification isn't the gold standard? Please don't let that happen. My recommendation would be to look at the fish that are already certified by the Marine Stewardship Council as sustainable, and give those organic
certification first. And then save the ones
that are on their bad list for later. There
may be a way to do that.

CHAIRPERSON DELGADO: Thank you.

Any questions? We now have Devlin Reynolds,
followed by Bob Smiley.

MR. REYNOLDS: Hi, thank you. My
name is Devlin Reynolds. I'm with Natural
Forces, and I'm here on behalf of the sorbitol
crystalline canola oil (SCCO) petition for the committee. I guess
I was told to tell a little bit about myself.
I grew up on a small farm in central Iowa, so
I guess I've been in agriculture since I was
born. And kind of what brought me here today
is some of us probably remember the FFA Creed,
and it's the first line, and that is, you
know, "I believe in the future of farming with
a faith born not of words but of deeds." And
my business, Natural Forces, is my deed.

And what we do in Natural Forces
is we go to farmers, producers, and we go to
them and say, look, tell us your problems, and
if you tell us what your problems are, if we
find a solution for it, will you buy it from
me? Pretty simple. And they go, of course,
solve our problems, we'll buy it from you.
Well, I guess it's a business model. Someone
told me last week it was, and that's how I got
to the sorbitol octanoate, the sugar ester
family.

And what I'd like to say is, the
sorbitol octanoate is compatible with the
organic agriculture, and clearly meets the
seven criteria for the addition on the
National List. Sorbitol octanoate is a soft
input. It does control soft-bodied insects,
and what's very good about it is it fits into
all of the IPM programs that I grew up around,
and what I learned, and it does fit a lot
better, I believe, and a lot of the other
growers believe, because it is, I don't want
to say safer, but easier on the environment
than some of the other standards that are in
there today.
And one point that I'd to make is, it was stated in there that we have enough products, that we don't want to just add products just to add products. I work with growers every day, and the one thing that I do know is they have more problems. They have problems everyday. There is a lot of people who won't go to organic production because they don't have the confidence that they can have all the tools they need. One grower can know how to use every tool that's out there today to solve every problem. But quite honestly, most of the producers that are out there cannot. They don't. And so that's why I state there are a lot of problems.

We don't know, and no one can judge. We can all budget, we can all plan, we can all do sterilization, cleaning, do everything we can culturally to prevent pest pressure. But what we can't do is we can't budget or we can't plan for drought. We can't plan for the next blue mold to come up in a
hurricane from the Caribbean. We can't plan on a ship landing in the Great Lakes that has an extra emerald ash borer. And that's why we need to continue to have innovation, because Mother Nature is going to continue to throw problems at us.

And that's why I'd like to state, you know, sorbitol octanoate is not the end of all be all of anything. But what it is is a product. It is a good tool that people can use to solve problems that is as close to benign as a lot of things that are out there today.

The other point is, quite honestly, I do have one product that is a sister product to sugar ester, it's sucrose octanoate, which is on the list. And it has been brought up that, hey, these products are the same. Why would you allow one in, and why would you need the second one? Well, it's kind of like my sister and I. We're from the same family, but we're not the same. She's
better at some things, I'm better at another.
She wouldn't agree with me, but she thinks she
can do it all.

And one example of that, I would
say, is mealy bugs. Now to anybody in this
room, you're like, a, what is a mealy bug,
and, b, who cares? Well, if you have a mealy
bug problem, you care. Sorbitol octanoate is
much better on mealy bugs than sucrose
octanoate. And on a flip side of the coin, if
you are a small producer, and where you do 90
percent of your applications with a one-gallon
pump-up sprayer, you want to use sucrose
octanoate. It's a better product because it
goes in suspension better. These are two very
simple things that might not seem like
anything to you guys in here, but to those two
people, one that has the mealy bugs, and one
that has a one-gallon pump-up sprayer, it's a
big difference.

So we can't just solve one problem
with one product. And what was crazy to me
was the discrepancy between the review recommendation in sucrose octanoate ester and sorbitol octanoate. And so all I ask you is, please look at my letter. And I know you see thousands of letters that are in there. What I would ask is if you'd please take time to look at it and read the points that I've made.

And the last thing I'd like to say is on innovation. You know, you've got several of the letters that are out there. We're so happy we have people like you in here today. You know, we're not Dow, we're not DuPont, we're not those guys. We focus on people that have problems. And Perol Farms is one of them that came to us and said, look, we need more products like sorbitol octanoate, because we have terrible mite problems. We can plan, we can budget, we do everything, but we need more products. And if the committee comes back and says, we have all the solutions to the problems, people like us, who are bringing small products to big problems aren't
going to be coming here anymore.

So what I'd like to say is, I thank you very much for your time, and I'll entertain any questions or comments.

CHAIRPERSON DELGADO: Any questions? Thank you very much. Let's move on then to Bob Smiley, followed by Taw Richardson.

MS. SMILEY: I'm actually not Bob Smiley. I'm Joan Smiley. My father is not well today, so I am here on his behalf. First, I want to introduce my co-presenter and long-time consultant and colleague, Professor Emeritus of wheat science from University of Maryland, Dr. Ed Bestie. So he's going to support me on some of the technical things.

Before I get started, I just want to thank the Board for your commitment, your hard work, your contributions as stewards of the industry but, more importantly, as decision-makers of the industry so that you can ensure the progress. Nothing in this
world stays static, so you, as stewards, making decisions, making sure the standards are held but also that we make progress is really very valuable and I thank you for that. I'm going to stay within my time frame so we can flip pretty fast. So I'd like to petition on ammonium nonanoate as an organic herbicide. The outline for what I want to share today is just ammonium nonanoate as a distinction and also the organic discussion distinctions of natural, organic, and synthetic and how those might overlap or coincide with the realm of synthetic and the organic domain rules are and the rationale to allow the substance for food use as organic. So the request is that our initial petition for ammonium salts or fatty acids be changed to just ammonium nonanoate, and the rationale for that is ammonium nonanoate is just one substance of many considered by the EPA to be a single substance known as ammonium salts or fatty acids. And of these many
substances, ammonium nonanoate is the most
effective as an herbicide and is also most
abundantly found in nature.

Ammonium nonanoate is continuously
produced in nature by the combination of
ammonia in the air or in the soil with
nonanoic acid, which is in nature in many
different ways. And I'll share a few points.

Ammonia is given off by all animal
waste. Most of us know that. It is a part of
the natural nitrogen cycle, and it's in both
our air and our soil at certain parts. That
is one component of the substance. Nonanoic
acid is found in nature in many different
ways, and I realize this is kind of a tough
slide to read, so I'll just make a few points.

Nonanoic acid is given off by green plant
leaves. It's in virtually all human diets.
It's given off by kiwi fruit, frying
hamburger. It's been found in many cities'
drinking waters, as well as many geographies'
rain water. It's been found in the air all
over the world in different studies, so it's all around us all the time.

So you might ask the question if it's all around us all the time and it's continuously produced in the environment, what would have it be natural versus synthetic? Well, the definition of synthetic is that it would need to be produced. It's in the environment all the time, but it biodegrades in less than 24 hours. So it never collects in any kind of harvestable quantity so, therefore, suggests that it could and should be made still for organic use.

So how it's made. It's made exactly the same way it is in nature. It can be made in a coffee cup, a steel drum, any kind of container at room temperature with adequate ventilation just because of the give-off of the ammonia. And it comes together in a solution in water, and it forms instantaneously with no added energy. And that's exactly the same way that it's made in
nature. And if it were not biodegraded in 24 hours, it would be harvestable and we wouldn't be having this conversation probably.

So the food use compatibility.

Ammonium nonanoate is a soap. Soaps are granted tolerance exemptions with minimal risk of active and inert ingredients. And the product that Falcon Lab has a patent on with ammonium nonanoate, there are no other ingredients in the product besides ammonium nonanoate and water. So it's very simply produced, and it's very pure in its substantive form. And, in fact, the EPA said that if there were residue found on food crops, ammonium nonanoate residue found on food crops, it would be undetectable, whether those were placed by human action or found there naturally just in natural residue as it's on the plant.

I'll skip over a couple of next slides, but the point I want to make is that the Senate did allow this group as decision-
makers to make decisions on synthetic products if they also met other organic standards. And I just appeal to you to be that decision-maker.

There was a preamble in the set up of the organic certification program to allow for synthetic exemptions. And one of those exceptions is in the category of soaps. Ammonium nonanoate is a soap, and soap is any salt of an edible acid and the human fatty acids consumption is 100 times higher than exposure to any other kind of soap or household cleaning products or in the environment. So what we might initially think of as soap we're actually ingesting everyday.

And as far as synthetic substances, allow for organic crop production from the EPA standards. EPA list four, which is in our submittable concern, are allowed on food use as pesticide products, and ammonium salts of C8 to C18 are on list 4A and the product ammonium nonanoate is, in fact, listed
for organic production with EPA.

So the difference that this would make for organic agriculture, weed control is the biggest challenge of all organic farmers. It's both an efficacy problem, as well as an economic problem. They're just looking for other ways to do this. We realize that there are alternatives, such as acetic acid or clove oil. Nonanoic acid can be used on a farm at one-fifth to one-third of the price of any of these other products with higher efficacy. And, in fact, USDA has funded tests on nonanoic acid for three straight years against acetic acid and clove oil. So at least part of the USDA is really trying to forward motion on this substance.

CHAIRPERSON DELGADO: Thank you.

Any questions? Kevin?

MR. ENGELBERT: Would you quickly review the beginning of your presentation about requesting a name change from ammonia salts and fatty acid to ammonium nonanoates
and what the difference is between the two?

MS. SMILEY: Sure. Our initial petition was for ammonium salts and fatty acids, but ammonium nonanoate, which is the distinct substance in our product, is one of many in the EPA category called ammonium salts or fatty acids. And in thinking through the decision responsibility of this group, rather than, you know, having a decision based on the burden of all of the inclusive items in ammonium salts of fatty acids, we decided to make a distinction and make a request that the consideration just be given to ammonium nonanoate.

CHAIRPERSON DELGADO: Any other questions?

MS. SMILEY: Did I answer your question?

MR. BESTIE: I think we should mention it is a contact herbicide, and we think it's very effective for what the organic farmers need. We do have it under review as
a 5th or 25B list, and we expect EPA to respond to that petition very soon. Ed Bestie.

CHAIRPERSON DELGADO: Thank you for that. No more questions from the Board? Julie?

MS. WEISMAN: I was just wondering if you could speak to the other items in that group that you are now trying to separate the ammonium nonanoate from. Are those other items you think would be not as environmentally friendly, not as acceptable or compatible with organic principles?

MR. BESTIE: I don't think there's much difference environmentally as far as the risk. The C9 carbons in the nonanoic acid molecule is the most active on green tissue, and it's the most active material to kill the weeds as a directed spray.

MS. WEISMAN: So because this is the most efficacious of those in the group, rather than that other things in the group are
less benign?

MR. BESTIE: Yes. Well, the C8, C9, and C10 molecules have been shown that they primarily have only high-toxicity response on green plants, so the C9 is the most active, and that's why we've chosen to use that in this product.

CHAIRPERSON DELGADO: Jerry?

MR. DAVIS: Could you clarify that little bit? From the petitioner's public comments, they've mentioned that there is approximately 13 materials listed by EPA that would all classify as ammonium salts or fatty acids and only three of them are herbicides. The rest are not biologically active to behave the same way.

So it seems valid what they're asking, to me. It could be more specific. It would have to have a specific CAS number anyway, and we didn't have that information readily at hand when we wrote up the initial recommendation, which is now two years old,
and just kind of edited and brought back up again here.

CHAIRPERSON DELGADO: Any other questions? Bea, followed by Kevin. Go ahead. Bea?

MS. JAMES: You went through your presentation pretty quickly, and I didn't quite, I started to read an area where you were talking about, there was something in there about the potential risks, environmental or health. Can you address that? Are there any --

MS. SMILEY: I don't know that there's anything in here about environmental risks or health.

CHAIRPERSON DELGADO: Kevin, do you want to follow-up with that?

MR. ENGELBERT: You mentioned that there's no detection differences whether it's naturally-occurring or whether it's been applied. But when is it applied relative to harvest? And if you do apply it, wouldn't
that increase the likelihood that it would be
detected upon a product?

MR. BESTIE: Well, since it's not
sprayed on the crop, it should not actually
show up in the product that's harvested. Your
other question about the risk in the
environment, it is toxic to aquatic life. But
at the same time, it forms in insoluble
material with calcium and magnesium. So that
immediately inactivates the molecule as far as
the biological activity in water, and we're
recommending not to apply it in areas near
water. We don't think it would ever end up in
the water streams or ditches.

MR. ENGELBERT: So is there any
chance of the breakdown products accumulating
in the soil?

MS. SMILEY: It bio-degrades in 24
hours.

MR. BESTIE: It degrades to carbon
dioxide. It's metabolized by the organisms in
the soil.
MS. SMILEY: There's no migration in the soil at all.

CHAIRPERSON DELGADO: Any other questions? Okay. Thank you very much.

Moving on, we have next Taw Richardson, followed by Bill Wolf.

MR. RICHARDSON: Good afternoon.

I'm Taw Richardson with Agrosource, and I appreciate the time of the Board and the NOP to discuss a petition that we've lodged related to the entry for tetracycline and amendment to that entry. So if we can proceed on with slide two.

A general outline of the comments that we have and to the core of what we're asking, the petition that we have is for clarification by amendment of the tetracycline entry to the National List through one of two ways. Currently, it's listed as tetracycline (oxytetracycline calcium complex). We would like to see removal of the parenthetical or, in turn, inclusion of oxytetracycline
hydrochloride within the parenthetical.

Other elements relevant to this are: the equivalence of the two materials, the hydrochloride and calcium, the fact that there will be no increase in use of antibiotics by this action, and that the clarification will result in fair treatment for our product within the market.

As you well know, the Sunset Review by the NOSB to the NOP was to accept renewal and was done back in June of 2006. And our point is that both oxytetracycline hydrochloride and calcium are both tetracycline. And so this petition just seeks to clarify that by amendment.

And further to that, there's no addition of use or product by this action. And per the feedback that we received from the Board back in May, we've removed peaches and nectarines, which would have been a new use, from the petition we have with you.

The basis for this clarification
in a little more detail, as I touched on earlier with both of these forms, hydrochloride and calcium, are considered equivalent materials. That's unambiguously documented in EPA's pre-registration eligibility document from 1993 and their tolerance re-registration eligibility document from 2006. And they make no regulatory distinction at all between oxytetracycline hydrochloride or calcium. And then, also, the NOSB itself, within it's TEP, recognizes oxytetracycline as an inclusive category for these things and also recognizes EPA's position of interchangeability and equivalence.

Also, there are many entries in the National List that do not specify a salt form. The closest most related to this would be streptomycin, and the National List does not specify a salt, so under that you could use streptomycin base, streptomycin sulfate, streptomycin nitrate, and there's no
distinction made.

Also, the issues that have been raised by the NOSB related to the use or the issues with the hydrochloride, they also, based on equivalence, would also relate directly to oxytetracycline calcium. So we believe that that equivalence also addresses all those issues that have been raised.

If we do get the approval of petition, we do think it will do several things. One, it will address the favoring of one equivalent commercial product over another and, secondly, allow for appropriate free trade with these products in organic and non-organic crop farming. There are two things that are relevant to that. One is with just distribution. Distributors will want to carry one product. If there's an organic designation for one and it doesn't have it for another, they're going to choose the one that has that designation. So that's a serious competitive disadvantage for us with an
equivalent product to them. And, secondly, the same thing with farmers. When they grow both organic and non-organic palm fruit they don't want to carry two products, one for each. They want to have one product in the barn that they use. So those are serious issues for us just to be able to compete fairly in the marketplace.

And then, finally, in this area, it will not increase the use of tetracycline in organic or, for that matter, non-organic palm fruit farming. There's basically, each year, going to be a certain size pie. It's all a matter of how that pie gets divided up, whether we're able to really participate effectively within that or whether we're precluded from doing that.

Next slide, please. And, in conclusion, a clarification via amendment to the National List is warranted in our opinion. Tetracycline has an entry on the National List via the Sunset Review. These are equivalent
tetracycline materials for regulatory purposes for EPA and for NOSB. There are direct examples of other National List entries that make no arbitrary distinctions between salts, and issues raised by NOSB apply to both oxytetracycline hydrochloride and to calcium. This action will not increase the use of oxytetracycline in any markets and just allow for normal competition to occur. An amendment ensures a time line consistent with current sunset in 2012. So we would not be on a new time line. We're on that tetracycline time line, and the decision is made accordingly. A clarification will allow free trade and create a level playing field for Agrosource, which is what we ask for. And approval of tetracycline to the National List, along with these facts presented, we believe warrant this clarification and amendment. And just to address it on a more fundamental basis, we agree with the decision
that the Board made in 2006 after sunset, because we know what growers need and we know how devastating a disease this is for growers, and that's our primary focus in the things we do. But also we understand what you're confronted with. We can read the tea leaves, organic growers can read them, non-organic growers can read them. You go into the supermarket and people see chicken antibiotic-free; they see these things. And so all of us have to look at that and project what is going to occur in the future and how we react to that.

But, today, tetracycline is approved for use on palm fruit, and we're just asking that we be given that same consideration. Thank you.

CHAIRPERSON DELGADO: Any questions? Jerry?

MR. DAVIS: Given that the organic pear and apple usage of antibiotics in general is pretty small compared to the conventional
market, the amount that is applied to
conventional fruit, from a marketing
standpoint, if streptomycin and tetracycline
came off the approved organic list and were no
longer available, that would probably be just
as helpful to you, wouldn't it? Because you
would no longer have that marketing impediment
of the competing product that has the organic
designation that yours currently does not.

MR. RICHARDSON: I'll say two
things for that. One, I know you're aware how
devastating a disease this is, so we want to
be very clear that we're very concerned about
growers. And we know that in certain
circumstances, these are the only things that
will keep them from having their orchard look
like it's been hit by a flamethrower. So we
know that.

But that being said, for us
personally, yes. We're being hurt more by the
fact that it's under the organic approval than
we are if it were not because we're being
precluded from the bigger portion of the
market by our competitor raising the fact that
we don't have approval from the Board.

CHAIRPERSON DELGADO: Hugh?

MR. KARREMAN: I agree with the
rationale on what you're saying up there, and
I think you understand our predicament here at
this level. But when it came up for sunset,
you do realize it was a very split vote on
that. It wasn't like a unanimous type thing.
And I guess, you know, to do so little -- I
guess I'll just stop there to save time. But
I agree with what Jerry was saying
essentially, after what I just mentioned.

CHAIRPERSON DELGADO: Any other
questions? Bea?

MS. JAMES: Towards the end, you
stated the real core issue is that
tetracycline is seen as an antibiotic, and
consumers don't associate that with organic
products. So for somebody who is in retail,
if consumers were educated that this was being
applied, how would you go about giving me
advice, as a retailer, that this application
is somehow different than antibiotics being
restricted in other areas?

MR. RICHARDSON: Well, I don't
think I would try to get into a strong defense
position of these from an organic standpoint.
I think that's why there's so much conflict
within the Board on how to deal with this and
why animal producers say we're not using,
we're not going to use this where a crop
producer is using it, why these arguments
arise. But, you know, it's a semi-synthetic
original, originally coming from a bacterium,
so it's naturally derived and it's altered for
handling. And that's the fundamentals, but
the desire, because of the broader issues
related to antibiotics in the entire food
chain and the implications to human health and
the prevailing attitudes that people have
about antibiotics, I don't think we would have
an easy time.
MS. JAMES: Yes. Just, you know, in comment to that, I have to say that it's hard enough to educate people about organic and the different tiers, let alone when consumers who are more educated and knowledgeable find out about things like this. It makes it very difficult to try to say that the organic seal really means what we say it's supposed to mean.

MR. RICHARDSON: And that's why our petition is for an amendment to an existing use. Whether we are applying our product or not is not changing the fact that tetracycline is being used on palm fruit. It's just keeping us from being able to compete in the marketplace and sell our product, not only in organic but broadly within the market. That is really the fundamental issue for us. We're not wanting to get into a judgment about making this decision today because it's not appropriate; it's a Sunset issue or a special issue for the
Board to address.

CHAIRPERSON DELGADO: Kevin,
followed by Dan and then Hugh.

MR. ENGELBERT: Have you seen any
resistance in the growers that are using your
competitor's product to the disease that it's
controlling? And do you think that adding
this additional product will -- I know you say
there's not going to be any more use of
tetracycline altogether. But adding another
product, will that increase or decrease the
likelihood that this disease is going to
develop resistance to it and increase or
decrease the likelihood that a more suitable
product would be developed?

MR. RICHARDSON: It would be
neutral, in my opinion, and we've looked at
this very, very carefully. There's about a
25-year history now, and a lot of
investigation on the part of researchers
independent of us that have done this work in
Washington State University and in California
and the like. Particularly in the Pacific Northwest, they've looked at this very closely and they don't see evidence of shifts in populations related to tetracycline. So that, we don't believe, is an issue. And because there will be no more used one way or another, we believe it's a neutral issue.

And your second question, I'm sorry, was?

MR. ENGELBERT: Would approval of this substance increase or decrease the likelihood that a substance that's more compatible with organic farming, that is it's not an antibiotic, be developed to control these?

MR. RICHARDSON: And that I can address very definitively, as well. We look all the time for replacements for these products because we recognize the trends that are occurring. Just exactly what we're talking about today is what is perfectly germane to us as we look forward and what we
can expect from these products in the future, how they might be used or might not be used. So we're constantly looking, not only because of issues related to use of antibiotics but also because of issues having the breadth of products that are acceptable to growers and consumers.

I was on the phone yesterday on the train down here after reading a paper from an international symposium combing through, looking for anything that someone might have identified that would be useful and more benign in the eyes of consumers for this purpose. But that's a very, that's been a very tough nut to crack.

CHAIRPERSON DELGADO: Hugh, followed by Dan.

MR. KARREMAN: I guess part of your rationale was you're getting squeezed out of the conventional industry because people that use maybe organic version of, you know, the tetracycline, if it's allowed for organic,
will not buy your product, so they'll just buy
the other company's product. And I feel like
it's almost like the organic industry on that
point is being used just for conventional, for
selling in the conventional industry. That
doesn't sit too right with me.

MR. RICHARDSON: It's having that
impact on us, yes.

MR. KARREMAN: Well, I think it
would be, I mean, to me, clearly, I'm just
saying this petition to be off the list, and
I would think that would stimulate orchard
growers to come up with alternative ways to
treat this problem, whatever it is, just like
in the livestock industry with real, living,
breathing animals we've had to do the same
thing.

MR. RICHARDSON: I understand the
comment. The only caution that I would make
is we are a privately-held smaller company
relative to most crop protection companies,
and this is an area that we look at very
intensively. We have not been able to find
candidates even to look at that we thought
were going to be effective or that didn't have
some problem we didn't want to try to address
in a regulatory process. We do look because
we get very focused on this, whereas for major
companies this is really very small. But we
do comb, so it's not that easy to find
something to replace this as with other areas
of disease or insect or for weed control.

MR. KARREMAN: Neither is it with
livestock, but it's been getting done by
certain people in the industry. Now, it's
slow, but it can happen. And if it's still in
there, it may not. It kind of caps the
stimulus to do so.

CHAIRPERSON DELGADO: Dan?

MR. GIACOMINI: Well, I mean,
that's been across the board in the organic.
I mean, if there's an organic version, a
version useable in organic and not useable in
organic and you're a retailer supplier with
conventional and organic, you bring in the one product that everybody can use. I mean, that's pretty typical of the industry.

Not even so much for yourself, but, Jerry, he's presenting here, essentially, an annotation change. Your recommendation to the Crops Committee is, in addition, a new listing. Is there anything else that you need to -- is there a consideration within Crops to look at it that way or is there anything else that you need to be able to do that?

MR. DAVIS: We discussed that scenario of making an annotation change and rejected it. And I can get into all that reasoning tomorrow during the presentation. I will be bringing up the ins and outs of what we discussed. Rather than just cover one small segment of it right now, I'd rather --

MR. GIACOMINI: Well, why we had him. I didn't know what his schedule was, so just whether you had, if that had been considered.
MR. DAVIS: We considered it and rejected it for various reasons. Mostly, it centered around we don't want to send the wrong signal to the consumers. We don't want to jeopardize here the organic seal, and that is the, I believe, in my opinion, the driving force behind this whole decision-making is this is a very threatening substance, it is not accepted, it is hated, and we did not want to take any action that would allow it to be thrust into the media or anywhere saying, well, look what the NOSB has done, in my opinion. But, again, I really didn't want to get into that right now.

MR. GIACOMINI: I just wondered whether there was anything else you needed to --

MR. DAVIS: No.

MR. GIACOMINI: -- look at that.

MR. DAVIS: No, we vetted all of that.

MR. GIACOMINI: Good.
MS. HALL: I just have one quick question. Is there any economic advantage that your product would offer growers? Since it seems like right now this is the only effective item that treats this. Is there any advantage in the competitive market, you know, looking at kind of how economics works? If there's options with your product being there, would it have the effect of lowering price for the input?

MR. RICHARDSON: I don't know that I can make that statement. We went into this business because there was a need for more stable, better formulations, and we knew this was a devastating disease and very much a niche market that could have devastating implications if the disease got out of hand, which it does frequently. And so we developed better formulations of the product that were more stable and better served the market, we felt, from that perspective. But we don't
think we could contend here, that it would be fair to contend that we're going to make some significant price reduction in the cost to growers.

CHAIRPERSON DELGADO: Any other questions? Okay. Thank you very much. Next is Bill Wolf, followed by Jo Kraemer.

MR. WOLF: Thank you for this opportunity. It's been many years since I've addressed the National Organic Standards Board. In fact, many of you I don't know. I'm Bill Wolf, and I'm President of Wolf, DiMatteo & Associates. I'm also an organic farmer. In the past, I've participated in many businesses and activities in the organic field, including the manufacturing of organic pest controls, the development of natural fertilizers, acting as the President of OTA, et cetera.

I've been very involved in materials we've used and in helping to develop some fundamentals. I'm going to talk very
briefly about the umbrella, starting with the
umbrella of continuous improvement and the
importance of continuous improvement from all
aspects of the regulations, especially
improving better farming, improving selection
of materials, and promoting organic
preference.

With only five minutes, I'm going
to jump straight to five requests that I urge
you to consider that's in the document that I
have shared with you and sent to the web.
One, I would like you to consider each new
proposed organic farming input on its merits
and their potential to provide growers with
innovative softer choices, not based on
numeric count on the current list. I'd like
you to take a look at the review process
that's now going on. I'm going to address
that in a little more detail today.

Two, I would encourage the support
of the development of organic ingredients and
applaud the fact that you've just received the
lecithin -- petition to remove lecithin from 605 and to remove liquid lecithin from 606.

Three, I applaud the Materials Working Group proposal and suggest that either options three or four make the most sense because the law and the intent of organic was not to separate out organic preference but to focus organic preference exclusively on all materials that are not organically produced now.

Four, I applaud the Joint Crops and CAC Committee recommendation to encourage the use of organic seeds. And I also approve and believe that the 100-percent labeling claim clarification from the CAC makes sense.

I'd like to drop back for a moment to the Crops Committee work and focus on that because that is an area I worked on for many years. And I'm very concerned about a fairly substantial policy shift that's occurred with this meeting that I don't think people are fully aware of. I believe it's a philosophy change, and it is basically saying that if
there are already materials on the list that serve to kill a given bug or control a given problem, then we don't have to add any more materials.

The NOSB itself has a policy board manual that passed October 17, 2001 that establishes criteria. The law establishes criteria, and the regulations establish criteria. The Federal Register established the criteria for reviewing materials. And those criteria are based on whether it's compatible with organic production, whether there's a need for it.

A quote from one of the rejections, the reform crops materials rejected by the Crops Committee in this round and presented to this meeting. With all due respect, I fundamentally disagree with the principles behind those rejections. I'll quote one of those. This material is not essential to organic farming as there are, quote, many alternative insect control methods
and materials already available. Adding another synthetic material to the National List in this case would be inconsistent with the original intent of OFPA, which severely limits the routine addition of exempted synthetics. In the case of this specific material, it's taken ten years for that material to come forward to the point where it's being considered at this Board meeting, and I wouldn't call that a routine addition of an exempted synthetic. So I respectfully disagree and believe that you really need to take a look at the original priorities.

I believe that this is a dangerous shift in policy for a number of reasons. One, I think it will reduce innovation. It will reduce the development of research and alternatives for farmers, and it would reduce funding directed at organic farming.

I worked very hard for a number of years to help create the first green bank in America called New Resource Bank, and its
purpose is to help fund and develop programs for organic and other green businesses. And I know that the repercussions are already occurring. People are going, whoa, I can't head in that direction of helping to develop products that would be used successfully in organic farming, because, in fact, it's almost impossible to get something through that process.

So, in closing, my concern is that I think you really need to take a look at what message that sends because I believe that one of our biggest priorities is to encourage organic farming and the expansion of acreage, and I think that this message does not do that.

CHAIRPERSON DELGADO: Any questions? Jerry?

MR. DAVIS: I'm trying to flesh out your last statement a little bit. I'm hearing that, in your opinion, the drift that the current committee or Board as a whole has
taken of rejecting materials is fairly routine and almost letting nothing past, your philosophy then would be better, that the organic movement would be better served to be a little more free to approve synthetic materials that are benign in nature rather than get hooked up on saying, synthetic. No, we don't want synthetics, and we're just going to say no unless there's really a compelling reason for it.

MR. WOLF: I think there has to be compelling, you know, basically, I think that there does have to be compelling reasons, and I think that the criteria that were developed over a very long period of time clearly articulate that. I mean, I'll get into the specifics as an example. Sorbitol, the decisions that were made by the committee as to how it fit the criteria differ on the very printout than the decisions that were made by the Crops Committee when it was chaired by Jim Riddle several years ago for sucrose
octanoate. Comparing those two, the materials are chemically very similar but have different effects in the environment on specific insects. But in terms of the criteria of whether it's compatible with organic agriculture, whether there is a need, the decisions that the Crops Committee made were different. There was a huge inconsistency in that regulatory decision process, and that sends a message that there's a tightening, that even if you met the criteria there's an opinion that it's very difficult to add materials to the list. And I think you really need to look at that process.

MR. DAVIS: I took part in the sucrose, the original sucrose deliberation, sucrose octanoate ester, as a very newborn member, albeit; but part of the reason the Crops Committee this time around with sorbitol octanoate, we approved the sucrose octanoate ester and saw the sorbitol material as, why do we want to add another one when we have
something so close? Yes, there are
differences, but is there a compelling reason
to add something that's just a little bit
different and risk jeopardizing the overall
perception of organic as very limited use of
synthetics? Let's not just keep adding, you
know, if we add two or three materials every
year, we're going to have a list that will
just be ridiculous at some point.

MS. WOLF: Okay. I see your
point. I don't agree with the premise, and
that is that we should be looking at what are
the materials that organic farming currently
uses that are harsher. I mean I believe some
of these materials can replace botanicals that
are natural that are one of our bigger risks,
like the use of pyrethrin is the most dominant
insecticide used in organic farming in
general, and it has much more environmental
negative impact than sorbitol does. Sorbitol
is the only one of those two that could be
used in greenhouses. I mean, I've looked at
the product and I've looked at both of them, and there are substantial differences in the use pattern and in specific insects.

And so the general question about sugar esters, it's kind of an oversimplified question. So I understand the conclusion. I disagree with it.

And I'm not worried about having a lot of materials on the list for growers to choose from. I hear from growers all the time who don't want to convert to organic because there are so few options in rotation for insect control and in economic control.

Personally, I'm a strong advocate, and I think the Crops Committee said this, that the fundamental principle should be good management, encouraging earth worms, encouraging beneficial insects. But the tools do have to be there. And I think you might be in a situation where if you approve sorbitol, you'd get hops off the 606, which I think would be a much bigger win for this Board.
MR. DAVIS: Some of the lack of information that we, as a committee, felt we were getting was the differences between the sucrose material and sorbitol material. The dominant thing that the petition put forth and what I could read in the web site information on the two materials is sorbitol is a lot cheaper, and that was the take-home message. I don't think it was really given to us that specifics are, okay, you just made one, sucrose octanoate is not registered for use in greenhouses or would not be a --

MR. WOLF: It has a much shorter withdrawal period. I shouldn't try to, there are technical people in the room who could answer those questions.

MR. DAVIS: Okay. We'll save that then.

CHAIRPERSON DELGADO: While we're discussing the philosophical differences. We have Hugh, followed by Jo.

MR. KARREMAN: Bill, thanks. Two
quick things. Your perception that maybe the
philosophy of the Board is changing a little
bit and it's tighter to get things on the
list, as it was to, let's say, compared to
five years ago, maybe that is correct in a
sense for various reasons but also that I
don't know if we want the list to get bigger
and bigger and bigger and bigger all the time.

But also perhaps that, for the
Sunset Review, at least from what we've been
talking about, it sounds like once something
gets on the list it's pretty much on there
unless new material evidence comes about to
take it off. So I think it should be harder
to get through the passing barriers to get on
the National List. At least that's my view on
the Sunset issue, and maybe that's why it's a
little bit harder to get on, as well as for
other reasons.

CHAIRPERSON DELGADO: Joe?

MR. SMILLIE: Well, one small
point. This is a very interesting
conversation. It's very constructive, this dialogue that's occurred. I just have to give you credit on the hops issue, having suffered through putting hops on 606. You know, I'll make that deal. I'll get on the Crops Committee and vote so we can get hops on 606. But it illustrates the point, you know, if that tool was there maybe we would win, you know, you lose in one area and you win in the other.

The other issue is more procedural, and that is, for those people who are experts in their field and are petitioning particular materials, like Devlin, I trust that you will be here tomorrow because I think Jerry's point is there's a whole body of stuff when we get to whatever it's called, sorbitol, when we get to that issue, it would be very instructive to have you here and have that time then when we're focused on that material.

CHAIRPERSON DELGADO: Any other questions? Thank you. I appreciate that.
I'm very conscious about the time. We're one speaker away from the break, and that is Jo Kraemer. And, Board members, I remind you that we still have about 40 speakers ahead of us.

MS. FRANCES: Rigo, should be at 3 and then 3:07, and I've got two people that have planes to catch and one that has to be out of his room by 3:30. So I'm just really conscious of that and want to take care of that.

MS. KRAEMER: I'll go later. That's fine.

CHAIRPERSON DELGADO: Can we do that?

MS. FRANCES: Tim Redman and Steve Mohr I know both have travel issues.

MR. REDMAN: I'm fine, and Steve Mohr is fine.

MS. FRANCES: Steve Mohr is okay, and Tim Redman I know has to be out of the room at 3:30.
CHAIRPERSON DELGADO: Joe, can you take a break and --

MS. FRANCES: There he is.

CHAIRPERSON DELGADO: We understand you're anxious to leave us. We are anxious to hear you. Please, five minutes.

MR. REDMAN: Thank you. I'm Tim Redman. I'm the President of Blue Horizon Organic Seafood Company. We started this company about three years ago, and we named it Blue Horizon Organic Seafood Company because we thought that we would do some work with organic seafood, and we haven't been able to do that yet.

That said, I want to commend you all for all of the volunteer work you do here on this Board. I think it's long, long-reaching and important, all the work that's being done by all these groups out here, the people carrying around the fish signs today, our watchdogs. I think that's all important.

I'm here to urge you, as a Board,
to pass through to lawmaking the seafood standards. There is a need in the marketplace. There is demand for what's called organic seafood because organic seafood will represent the consumers' clean, safe food. It will represent food that is also environmentally produced in an environmentally positive way. Those are two critical things that organic means to consumers. There's demand for it.

There's confusion in the marketplace galore right now. I know that because I talk about organic seafood to a lot of trade people and to a lot of consumers. You know, it's just amazing when you talk to a consumer about organic seafood how many blank stares you get or how many question marks just pop up in the eyeballs. It's there. The confusion is there, and it needs to be erased by a solid standard and definition. Trade is also being restricted.
There is no trade in organic seafood now.
There could be and there should be, so there is trade that's being hampered.

And also a high standard for seafood farming in particular needs to be set.
I disagree with the person up here who suggested that wild seafood be, I think she's gone, but that wild seafood be the first to be included within an organic definition. But a high bar needs to be set within the aquaculture industry. There are groups defining or doing their best to set seafood farming standards, and they address, primarily concerns for the environment, which is great. But that's just part of the picture, and the organic definition will, by far, exceed any standard, as it's being proposed now.

So I want to recommend to the Board that you adopt the seafood standard, that being recommended now by the Aquaculture Working Group. That group has done just a huge amount of background work in finding the
best definition. I think they've done that.

So that's basically it. There's
demand for organic seafood. There's confusion
and concern in the trade marketplace. There's
restraint of trade right now because of that,
and a high bar needs to be set. So I
encourage you to pass into lawmaking an
organic standard. Thank you.

MR. GIACOMINI: Just for
clarification, the Livestock Committee made
some changes to the AWG proposal. We also
presented it in two different formats: the
nutritional side and the net pen. Do you
support both of those, support changes to
them? What is your stand on those two
specifically?

MR. REDMAN: You mean you made
recommendations to the most recent
recommendations from the AWG, you made some
revisions to that? I haven't seen those, so
I'm sorry. We work primarily with shrimp,
which has no problem qualifying under the
current standards proposed.

MR. KARREMAN: Right. I read in your written comment that you posted you use a lot of organic shrimp, even though you don't have to, and that's very laudable. And the shrimp would make it; you're right. I guess we posted two documents. Are you referring to that as the AWG document? Because there are documents. What is up for vote at this meeting are two documents that the Livestock Committee is recommending to pass by the full Board. It's not specifically the AWG recommendation we base things off of, just so you realize that as a person immersed in the industry.

MR. REDMAN: Okay. Thanks.

CHAIRPERSON DELGADO: Any other questions? Thank you. We will take a five-minute break and come back at 20 after the hour so we can continue.

(Whereupon, the above-entitled matter went off the record at 3:15 p.m. and
resumed at 3:28 p.m.)

CHAIRPERSON DELGADO: As soon as
the rest of the Board comes quickly down to
take their positions, I would like to request
that Jo Kraemer please step up to the mic. If
you're coming up to introduce yourself and
also thank you for the patience.

MS. KRAEMER: I'd like to thank
you for the opportunity to let me offer
comment, but actually the reason I'm here is
to request comments from you, the Board, and
also the meeting participants.

CHAIRPERSON DELGADO: Excuse me.

Members of the public and members of the
Board, please, we're in session now. Can you
lower the volume? We can allow the speaker to
proceed. Go ahead.

MS. KRAEMER: Thank you. My name
again is Jo Kraemer. I'm a chemist and
sampling manager for AMS' pesticide data
program. I'm here today to tell you about a
new project that we're going to be doing.
Most of you know about PDP. If you don't, our program collects and analyzes samples from across the country, about 12,000 samples a year, for pesticide residues. We sample mostly fruits and vegetables, although we do do some processed commodities. We do fruits and juices. We do grains, meats, poultry, dairy products, even aquaculture. We're sampling catfish right now. We've done honey, specialty projects, pear juice concentrate, trizol projects, nuts, and also drinking water.

Our primary data user is the EPA. They use our data for their risk assessment. The samples are primarily collected from distribution centers and terminal markets throughout the country. Our collectors randomly collect samples from each of these places without regard to a grower, a distributor, whether it's organic or not. So everything is randomly collected, which brings me to the point of my comment here.
Looking at our database, we see that we have only about one or two percent of our data that is actually organic results. And I have read many, many papers that makes reference to and drawing conclusions from, say, only seven or ten organic commodities from a certain group, compared to the hundreds or tens of thousands of samples that we collect. So what we're going to do now is we need more organic samples.

What we're projecting to do is we're starting a pilot program starting in January. We're going to be collecting only organic samples. So my question to you all is -- we're in the process of developing it now. We're going to start at a half-sampling rate. We're going to start out with a commodity of bagged lettuce. We're not targeting any specific product that has anything to do with pesticides on it or not. It's mostly logistics.

Lettuce is a very high-consumption
item. It's also high-consumption for young children. It's already being collected by our microbiological data program, so, logistically, it's very easy for us to go ahead and collect right now. Also, it is readily available throughout the country. In some places, we collect, our small mom and pop places, just very small, so we want to make sure we get a commodity that we know is there organically.

My question to you all is -- we need some suggestions, questions, guidance, ideas, where to go with this project once we start it. If you all have any comments that you'd like to incorporate certain commodities or anything, we'd liked feedback from you. I'm here just to let you know that our web address, and plus you can look at, we have data on the web, if you'd like to write down the web address it's www.ams.usda.gov/pdp. You can see what we're sampling every year. You can contact me at
jo.kraemer@usda.gov or you can contact myself or Diane Haynes. Diane, would you stand up here? She's in the back there. She is our technical director and deputy director. So if you have any pesticide residue questions, you can contact her. I'll be here today and tomorrow. If you have any comments, we would like to take them for future directions for our testing of organic products. Thank you.

CHAIRPERSON DELGADO: You're welcome. Any questions? Steve?

MR. DEMURI: It doesn't sound like you had any specific plans for the data you collect, but if you happen to find something that was over, that had pesticides on it that was organic, would you give that information to the enforcement folks at the USDA?

MS. KRAEMER: Diana, what do we do with the data?

MS. HAYNES: (Talking off mic.)

MS. KRAEMER: We're not enforcement, we're a monitoring program, so we
would notify the proper agencies.

MR. DEMURI: And what would the
NOP do with that information? I mean, any
comments from the Program? If you receive
data from her group that there was an organic
product out there that had pesticides on it,
what would you do with that information?

DR. ROBINSON: I'm not sure. It's
not a zero tolerance program. We do know that
there are some levels of pesticides already.

My understanding is --

CHAIRPERSON DELGADO: Barbara --

DR. ROBINSON: Oh, I'm sorry. Jo,
correct me if I'm wrong, but my understanding
is you already do collect or do samples of
some organic products?

MS. KRAEMER: Yes, and it's a very
low percent.

DR. ROBINSON: Right. So they're
expanding their coverage. What are we going
to do with it?

CHAIRPERSON DELGADO: Is the
microphone on?

DR. ROBINSON: Yes. I mean, what are we going to do with it if we can get data on it? If the PDP were suddenly to find that there's a tremendously increased pesticide levels in organic produce, what we would do, I guess, is it, obviously, would increase our concerns and make us, you know, tell the compliance and enforcement people to start doing a more careful job of its enforcement and auditing. That would be something we'd start taking a look at more closely. But just to say that there's some pesticide residue in produce wouldn't do anything. It's not a zero tolerance program.

MS. KRAEMER: I was just going to say this might be something for you all to consider and help direct us on what you'd like to see done with the data.

CHAIRPERSON DELGADO: Okay, excellent. Hugh?

MR. KARREMAN: Is it just on crops
you're looking at or other organic products, as well? Because I got sent something to me in the mail the other month regarding organic milk and looking at, say, analytes.

MS. KRAEMER: We have in the past tested milk for pesticides, three different times actually in the history of our PDP program. We do have some organic samples which we found some residues, but it was low. What is your question exactly?

MR. KARREMAN: I'm just wondering if it was just crops or if you're actually going to be also looking at milk products, as well.

MS. KRAEMER: Well, in the past, we have just randomly, across the board, collected a few samples that amounts to about one or two percent per commodity that we tested. We test about 16 or 17 different commodities each quarter, and they're rotated every two years. We do have organic commodities in there that we test across the
board, whether it's grain, dairy, fruit and vegetables, drinking water, whatever. So we do test everything.

But what we're proposing to do to get more data out there that can be used by whoever wants to use it is to intensify and get some good data out there that can be used to determine what really is in those commodities. If this pilot project works, we'd like to continue it on year to year and switch commodities as we go.

CHAIRPERSON DELGADO: Okay. We have Julie, followed by Mark.

MS. WEISMAN: I have two questions, one to follow on what you were just saying. Would the hope be to get more refined baselines of what constitutes background pesticide, like, say, for certain types of crops as opposed to what would then be an indicator that something is going on that's not supposed to be? Is that --

MS. KRAEMER: Well, there are
certain environmental pesticides that are in there now that you can't do anything about, the metabolites and everything. We're just testing across the board. We have a list now, which I do have a list and I could show whoever wants to look at them, the analytes that we're going to be testing for lettuce is coming up. And, of course, it depends on what we found in lettuce in the past, what we think might be out there. It depends on the commodity.

MS. WEISMAN: And my second question is are you limited to domestically-grown crops, or are you going to be looking at things coming in from --

MS. KRAEMER: Very good question. We do both domestic and imported, and we show in our book, we find, actually, that a lot of imports have a little bit more than domestic. But, again, it depends on the commodity, but we will be testing both imports and domestic.

CHAIRPERSON DELGADO: Barbara,
followed by Jennifer.

DR. ROBINSON: The other thing to remember, too, is that, you know, in the past, when PDP reports the pesticides, you know, the other thing to consider is what pesticides? There's things like DVT or DVT's metabolites. Those things persist in the soil for 50 years, and you're not going to get rid of those things. And there can be extremely low levels, things like dioxin and stuff like that. We require that producers not apply prohibited substances for three years when they convert land. There's very little virgin land and probably no virgin land left in the United States.

So I don't want people to look at this as the, okay, gosh, PDP is out there and, you know, they've tested organic products and they find some levels of pesticides. That doesn't mean that producers are out there deliberately applying prohibited substances. I mean, the fact of the matter is there have
been chemicals applied that persist in the soil for many, many years. And the levels are reported, or you can get the levels reported because we've asked back to PDP because we get these questions occasionally and the nature of the exact pesticides. And they're low, they're old pesticides, they're stuff that's been applied in the soil previously. We're not seeing, you know, evidence, when we look at it, that there's evidence that people are not complying with the regulations.

CHAIRPERSON DELGADO: Jennifer?

MS. HALL: So I just want to clarify that you're looking to the Board and the organic community to give you feedback on different crops and products that we would find helpful --

MS. KRAEMER: Whatever input you'd like to give to us. We're just developing this project right now. We're starting out just with a small collection of one commodity, and we'd like to know where to go with it,
what data needs are out there, where you would
like to see it go.

MS. HALL: So what's to be tested
and then what sort of results we might be
curious about once that data is collected; is
that right?

MS. KRAEMER: Right.

MS. HALL: Okay.

CHAIRPERSON DELGADO: Any more
questions? Thank you very much. We're moving
on to Steve Mohr, followed by Brian Baker.
Just to let you know, we're on number 22 of
60.

MR. MOHR: Thank you for your time
today. My name is Steve Mohr from Onalaska,
Wisconsin. I'm here today representing my
company, which is Foundation Organic Seeds,
LLC. We are a grower and marketer of organic
seed, corn, alfalfa, clover, and organic
grasses. I'm wearing two hats today. I'm
also a member of the International Organic
Inspectors Association. I've been active for
five years doing that, so I get to see kind of both sides of what's going on in the market out there. I'd like to mention a few things today as it relates to some of your proposals.

I see in the discussion section, when I read that, it looked like, as a panel, you got it really nailed down and identified a lot of the problems and some things that might, long-term, really serve the industry, specifically if we could increase usage it will increase the availability and selection of organic seeds. We really need the money coming in and these guys buying and supporting us in order to support them with more and a better line of products.

But, unfortunately, as an inspector and a marketer, I do a lot of on-farm calls, especially with larger farmers in different states. You kind of target the bigger, what I call commercial organic producers, rather than the guys that are living organic as a lifestyle in the farm
they're in as a business. And I've noticed some actually going back to untreated seed, and this trend is disturbing because it looks like they're getting better educated on wording, with how the NOP rule is worded, and then we are doing a better job as certifiers, inspectors, and marketers of educating them how to get around the rule or just go by the letter rather than the spirit of the rule.

Some examples, just as marketers, here's a letter I got from one of my competitors in another state. Two organic producers fall this year. One section says, "This year, we have reduced quantities of organic corn available due to a shortage of available organic production agents, so we have produced some of our own corn hybrids conventionally as untreated seed. If you purchase this seed, we will provide you with the letter explaining the substitution to your certifier."

So they're doing the work for the
farmer and making it all okay. And I'm not
living in a glass house. I can't throw the
stones because I've done some of the same
stuff. Usually, though, when I have some
products that have specific traits, like corn-
borer resistant corn, leafhopper resistant
alfalfa, things the farmer needs to actually
get a crop, not an extra five bushels of yield
or save himself, you know, 30 bucks a bag,
what these folks will be doing.

And there's other examples I've
seen. They're doing inspections. There's a
large outfit in the Midwest. They've got
consultants out. They do soil tests. They
promote organic, but their seed line they sell
is conventional. And their explanation letter
to give to their farmer customers is, "Here's
this list of products, and we have determined
that these products are better under organic
situations than comparable organic varieties."
No evidence, no documentation, just the letter
saying we say it's so, and, of course, they're
selling. So we're kind of helping them along.

Unfortunately, I think they've
gotten to know Section 205.204(a)(1)
equivalent organic variety. They have a
different definition than most people. Most
farmers, when they talk equivalency, they're
referring to yield, which is money to them.
And if you can't meet or beat what they're
using then you don't get the business.

When I was up in Michigan, some of
the large farmers I called on in October, I've
already ordered their untreated seed, so you
can get on the farm if you can promise you'll
beat what they're using. And part of your
explanations today under what the farmer can
do, there is a word in there, a couple of
them, that says if he has on-farm yield trials
and can show that the untreated is better,
he's good. That just scares me to death
because I've got to compete with all that
DuPont corns, Monsanto corns, Syngenta corns,
and Dow corns. They own Pioneer, DeKalb,
Novartis, Syngenta. That means on-farm trial. My company has to beat any and all of them to get the business so they will buy organic. If I can't beat them, they don't have to buy organic. So that's what myself and the other organic producers are up against out here.

There is an answer. I think if we emphasize seed type instead of variety, emphasize seed traits, specific traits, and then de-emphasize the word equivalent. I think that will help give the certifiers here more to go on and less paperwork in doing it that way.

So, in conclusion, I'd ask please don't accept on-farm trials as the last word in whether they use organic or conventional.

CHAIRPERSON DELGADO: Any questions? Kevin?

MR. ENGELBERT: One thing you didn't touch on. Do you foresee any problems in the future obtaining the genetics that are currently being bought up by all the big seed
companies, or are they still going to be available for organic growers like yourself?

MR. MOHR: I have a conventional company, as well, that my seed license is through, and there are better hybrids available. If we have to compete with these untreated conventionals, we can compete with it, but we're going to have to get treated inbreds to do it because of the conventional list that's out there available to us who are licensed with these large, licensed with, like, some of the Syngentas and some of the big breeding outfits, they license out their stuff. You can get it, but only about half of it is available untreated. Some are off limits because whoever bred them, invented them, might be a chemical company, might be a smaller company, they don't want it out the door untreated. They know it's going organic and, for whatever reason, maybe it's purity issues, maybe it's lawsuits, maybe they don't like organic.
But if we would take those, grow them, and just sell them untreated, yes, then we could compete with these on-farm things and have a little better lineup. But just another point along with that, the products we have now, myself and my competitors at Blue River and some of the other ones, we're in like the University of Wisconsin field trials. We've got corns that go over 200 bushels an acre, which is probably 80 bushels higher than the average organic. But that's not good enough for an on-farm trial. It's what happens out there, what he's been using.

So the genetic potential is there now to do more than what most of these guys need, but we're fighting. When you get on that farm you've got to take it away from the untreated stuff in a lot of cases, not all of them. There's a lot of guys that do make an effort, and a lot of these farmers do a good job of sourcing organic. But we need a lot more volume to really increase for us to do a
better job than these organic growers.

CHAIRPERSON DELGADO: Any other questions? Joe?

MR. SMILLIE: I heard what you said. You've read our recommendation, and you had one specific about the on-farm trial. Did you have any other specific comments?

MR. MOHR: It would be nice if you could get away from the words "equivalent" and "variety." A lot of people misuse the term "variety." They say define your variety. I get calls, "Do you have organic Pioneer 37B08?" "Well, no, only Pioneer has got 37B08." "Well, I need that. I need that in organic variety or organic form," "Well, you're never going to get it because it's a chemical company." But they're using that, they're twisting it.

The same way with alfalfa, and alfalfas are really varieties. Alfalfa is a little different game than corn. We can get away from that and just say seed type, and
they think, well, type is corn, it's canola, it's millet, you know, it's more easily distinguishable. And then if they need a specific trait, I don't have a problem with them, especially if we can't get what they need, then, yes, they need seed to plant. But if we can just get away from some of the wording that's in there because the guys are twisting it to their favor.

CHAIRPERSON DELGADO: Any other questions? Okay. Well, thank you. We'll move on to Brian Baker, followed by Jean Mann. And it's my understanding that, Brian, you have a proxy?

MR. BAKER: Yes, that's right. I have a proxy from Miguel Guerrero. And, also, if it pleases the Chair, I would like to introduce Renee Mann, OMRI's Review Program Manager, and would ask if it's all right if she spoke first and then I followed after her and then you reserve your questions until after both of us have spoken. That will save
some time.

CHAIRPERSON DELGADO: We'll go on then with Ms. Mann, and you'll have five minutes.

MR. BAKER: She also has a proxy.

CHAIRPERSON DELGADO: You have a proxy, Jean?

MS. MANN: Renee Mann. I have a proxy from Dave Decou.

CHAIRPERSON DELGADO: Okay. So you'd have ten minutes.

MS. MANN: I won't take it all.

CHAIRPERSON DELGADO: Please.

MS. MANN: Okay. Again, my name is Renee Mann, and I'm the Review Program Manager at OMRI, the Organic Materials Review Institute. Thank you to the NOSB for being here and listening to our comments, and thank you for all of your hard work.

I just want to say something real quick about OMRI. We're an independent non-profit organization whose mission is to review
input materials for use in organic production.

We're very happy this year to have achieved ISO 65 accreditation and also to have been recognized as a reputable third party source for verifying input materials by the NOP. So we're very excited about that.

I was going to talk briefly about inerts and petitioned materials. So for inerts, we want to say that we support the NOSB in their re-opening the discussion on inerts, which is really important to us because we review a lot of pesticide materials. As you may know, we look at all the ingredients in pesticide materials, including active and inert ingredients. And, right now, because we're reviewing fully-formulated products, it's confusing to us what's going on with, well, not confusing but it has been a challenge to review input materials to the 2004 list.

So we don't actually have an opinion at this time about what should be done
with inerts, but we did want to point out --
great, huh? I did want to point out that
there's one recommendation to accept the 40
CFR 180.950 list, which I see makes sense.
Unfortunately, not all of the 4A material is
moved on to that list, so I wanted to point
out that some of them would not be allowed if
that was the only piece that you adopted into
the NOP rule or recommended.

I also needed to point out that
most of the 4Bs are not on that list. From
the products that we've reviewed, I know that
about or up to half of the pesticide materials
contain 4Bs, and so if you were to only accept
180.950 then a lot of the products would come
off of our list. I'm not saying that's a bad
thing. I'm just saying that that is a
consequence, a possible consequence.

So we're offering our assistance.
If you'd like to learn what kind of materials
on our list and what kind of inerts are in
those pesticide products we would be willing
to discuss that with the Board. Obviously, some of that information is confidential, but sometimes we can gather information together so that it doesn't relate to one particular pesticide product. So we can give you some of that information when you're developing your recommendation.

The other thing I want to talk about is petition substances. We don't have any specific comments on the petition substances, but I just wanted to ask that TAP reviews get posted to the web site because not all of them were available. So that's a little bit hard for us to comment when the TAP reviews aren't available.

Last is the procedure to handle technical reviews. I forgot I was going to mention that. OMRI considers the independent review of the materials important. We said this in our written comments, so I'm just repeating that. And aside from the issue of who actually conducts the TAP review, I wanted
to implore you all to make sure that when the
TAP reviews are done that they include
complete technical information. OMRI relies
on TAP reviews at times to clarify what has
been added to the National List. It's not an
ideal situation. Hopefully, the National List
makes sense on its own, but that's not always
ture. So we go back to TAP reviews. It's
extremely helpful to us when the TAP reviews
are not redacted and parts are confidential
information, but I understand that that
happens. Nevertheless, whatever public part
of the TAP review you could put on the web
site that would be fantastic for us.

The other thing is whatever
recommendation you make, please do put the CAS
numbers and the 1(a) taxonomic classification
in there. That's extremely helpful for us,
and that allows for a clear recommendation.

Finally, one example, the
information that you put into the TAP reviews
is important to us because we had to go back
in peracetic acid and processing to check to see what was intended when that material was added. And, unfortunately, when there's confusion, you end up communicating with the NOP back and forth a lot and spending a lot of time trying to figure out what was the intention of what was added to the list. Was it peracetic acid? Was it the stabilizers of peracetic acid, HEDP? There's other materials that we commonly see, so the very first thing that happened when that was added to the list is we had a number of products under review, and we couldn't list them because there was still confusion after peracetic acid was added to the list. So more clarification in the TAP reviews, more in-depth review of the formulations that are used to make those synthetic materials or non-synthetic materials is very important to OMRI.

I think that's it. Brian? Thank you.

MR. BAKER: And I'm Brian Baker,
the Research Director of the Organic Materials Review Institute. Mr. Chair, Madame Director, members of the NOSB, and staff of the NOP, thanks, again, for the opportunity to speak. I'm going to be speaking on materials, materials, and more materials, and I don't know if anyone expected anything else from me.

OMRI understands how difficult materials review can be, and you need all the help you can get. You should rely on the whole community that's here to help you. We're here to serve you and assist you to make well-informed, broadly-supported, and transparent recommendations. We ask you to not go it alone.

This isn't any reflection of your qualifications. We understand there are well-qualified experts on the NOSB. But in the interest of a better process, we respect the role that the NOSB plays as a stakeholder body, and there's an expert function that also needs to be played. And the intention was to
have a technical advisory panel that's separate from the NOSB that's convened by the NOSB in order to serve that expert function. Separation of function was a very important part of what the organic community put together. And we hope that you're not stretched beyond your limits in your volunteer work. Any recommendation to amend any section of the National List should be made only after you have an external technical review. We think that's good sense.

We found the notice to take petitions off the table a bit puzzling, and we're concerned why it's coming up at this point and what it means. All of the substances we found in the notice, the specific substances, these were all petitioned prior to July 13th, 2000 and the revision of the National List petition process. This may be semantics. I don't know if it's significant, but it looks, according to our records, these substances were all addressed.
They're not still on the table; and, in some cases, we have no record of them ever even being petitioned. And several of them had been not just completed, but they appear on the National List and our written testimony documents where they currently appear on the National List.

So we're just wondering what's up there. But, at the same time, there are a number of substances that appear to have fallen through the cracks. Some we see are on this meeting's agenda, but there are several that we think the NOSB should take up because they've never been fully addressed. These are also documented in our written testimony and include things like potassium carbonate, phosphoric acid, sodium lactate, potassium lactate, soy protein isolate in polymers.

We're aware that there was an effort to get clarification on synthetic/non-synthetic or what was currently on the National List. But we don't have anything
documenting the NOSB consideration of these clarifications. And there's just sort of, the petitions are still open from what we can tell. We are looking for clarification there.

OMRI applauds the Materials Working Group, Kim Dietz, Gwendolyn Wyard, and leading the Materials Working Group in that difficult task. OMRI's staff and members of the advisory council were involved in the process, but, at the present time, OMRI supports option one, which is no change in the status quo.

Can the National List, can the process be better? We think it can; there's no doubt. But there's no clear consensus for any of the alternative options, and we think that these all deserve to be developed more, discussed more by the organic community, and carefully considered before any of those options are adopted. All the stakeholders need to be consulted on it, and the people who will be impacted by the change that have not
been part of the discussion today, they need to be heard.

So I'm hoping that the Materials Working Group will come up and come and make us an option we can't refuse. What I ask for is the irresistible option and something that would have the broad consensus and support of the organic community would be embraced.

I would like to point out that the whole question of agriculture and non-agriculture is just the start. We really need guidance on what's synthetic and what's not synthetic and look to that project that got so far and still has not been finalized. We'd like to help bring that to completion.

There's also the distinction between what's production and what's processing, what's handling. And then what's an ingredient? What's a processing aid? What's a cleaner, sanitizer, and disinfectant? These categories in the rule, these categories on the National List are somewhat blurred and somewhat fuzzy.
We would like to have a bright line and understand there's a need for discretion, a need for ambiguity. But on the whole, life would be a lot simpler if we could just say what was what.

So we ask to reaffirm the previous recommendations made on synthetic and non-synthetic. We're seeing with the continued advance in technology questions about genetic engineering are getting more complicated and difficult to solve. It's not as clear-cut or as simple as it was in '97 or 2000. So that's another complicating factor that deserves attention. And contamination by prohibited substances, such as pesticides, we heard earlier from the PDP, this is also an issue that deserves attention and how we can deal with the incursion prohibited substances into organic food.

OMRI has not dealt with 100-percent organic label. We find ourselves completely outside of that discussion. We
don't review if a substance can be used in a 100-percent product. We just don't go there. Our written comments suggest five different ways to resolve the problem, and there may be others. But right now I think the proposal leaves more questions than answers.

With that, I'd just like to close with saying that OMRI was established for public benefit. We see a good working relationship with the NOSB and the NOP as essential to fulfill our mission. Please let us know how we can be of service. Thank you.

CHAIRPERSON DELGADO: Questions?

Okay. Thank you very much.

MR. BAKER: Thank you.

CHAIRPERSON DELGADO: Up next is Kim Dietz, followed by Emily Rosen.

MS. DIETZ: Good afternoon. My name is Kim Dietz, and I'm not going to be commenting on Materials Working Group yet, so you'll have to wait until tomorrow. I feel like there's suspension in the air. Gwendolyn
and I will be having a presentation about 8:45
or 9:00, somewhere in there in the morning.
And we'll try to summarize in 15 minutes about
54 pages of our work over the last year.

So I'm Kim Dietz. I'm with
Smucker Quality Beverage, and I'm going to be
making comments somewhat on behalf of my
company and then also take that hat off and
make comments as a past NOP member and
materials person.

So with that, from a company
standpoint, I wanted to just comment on
ethylene for pears. We do a lot of organic
pear juice, and we do not need ethylene. And
I believe I was on the Board when we
originally voted on that, so we specifically
have one intent for ethylene. We talked about
pears and all kinds of different things, but
we didn't feel it was needed at that time.
And I think from even Miles' comment in
Washington, I'm not sure whether people are
really using it that much. When you put pears
inside of a big room to ripen, they produce
their own ethylene. Now, it might not be
consistent, but do we need pears year-round?
I don't know. That's a question you'll have
to decide.

So my other comment to that would
be if you are going to change the annotation,
there was discussion about, well, if it's okay
for bananas and it's okay for pears then it's
okay for this, you should just consider
dropping the annotation all together.
Because, otherwise, somebody else is going to
come up in a year or so and say, "Well, what
about for this?" and you need to just kind of,
if you're going to allow it then allow it. If
you're going to limit it specifically for
something, limit it. But if you don't know
why it's okay for one and not the other then
drop the annotation all together.

Okay. As far as materials, I'll
take my company hat off for a minute, three
words of advice for you: process, history, and
consistency. Sitting in the audience is somewhat painful sometimes as a past person who's dealt a lot with materials. Use the tools you have, again; follow the process.

You have a lot of history here, a lot of different people who have worked on materials.

When I hear things like, well, we're just not going to put it on there because there's too many materials, yes, you're the keepers of the list. That's true. But if you're not going to add something, make sure you have a legal ramification not to do that. If there's a similar material on the list, then you need to really be specific why something shouldn't be allowed and have some legal something behind that. Don't just say there's two things. If you're not sure, if there's something that you need more information on, you need to defer the vote because you're not doing the people who come to these meetings a service if you vote on something you don't have all the information
that you need. Either you get it before the
meeting, get it at the meeting, or defer the
vote until you have everything.

        Just history again. There's a lot
of information out there on past history on
materials, how to do the process. You've got
a lot of tools out there for that and the
consistency, as well.

        Lastly, on the 100-percent
labeling, I really don't have any comments on.
I support your recommendation. I just believe
that you need to have something going out of
this meeting for the industry. We have
products on hold, labels on hold, waiting for
the decision to come out of this. So a lot of
people are somewhat working on changing 100-
percent off the labels, and some people have
already gone down that road. So there's a lot
of money being invested, a lot of time, based
on some of the other, I guess, people telling
you they need to change their labels. So I'm
not quite sure what's going on with that.
Oh, and, lastly, on materials, your Federal Register notice, we're waiting on a material, our company is waiting on a material that was petitioned in 2004. The recommendation was in 2007, and it's still not even in the Federal Register notice. So please make sure those keep getting through the process because we're holding off some new products for that.

Okay. Any questions?

CHAIRPERSON DELGADO: Any questions? Steve?

MR. DEMURI: Looking back, seeing where we distinctly describe why it was allowed for tropicals and not for pears or other fruits. And I can see your point and I agree with you that why have the annotation, but there really was no description of what the previous Board was thinking. Do you have any idea of what that might have been?

MS. DIETZ: Well, I believe the petition, I'm not sure, but I believe it was
for specific use at the time, and that's what we voted on. And that's why we went into it with the annotation.

CHAIRPERSON DELGADO: Joe?

MR. SMILLIE: Process information, your other coats, and then you say that we should get that 100 percent out the door. There's a conflict there. We realize that our intent, like a lot of intents for the 100 percent, was a good intent. But it has been pointed by a number of commenters, there's some technical inaccuracies in the recommendation. There's some murky area. There's some bad definitions. And to clean those up during this meeting is a possibility, but when we listen to public opinion until 9:00 at night, time disappears.

So although I agree with you, I'd like to get the 100-percent recommendation out the door, we would have to be able to do a lot of work on that document right now in order to get a more feasible document out the door. It
was my intention, as chair, to get what we could from those recommendations out. And if there were a couple of issues that were cloudy just drop those. But it looks right now, and I'm waiting to hear more opinion, whether it's right, whether the correct approach is to get it right and do it later or to get what we think is basically pretty close to good and get it out there because I realize, as you have stated, that there's a lot of people out there making decisions on their labels that involve a lot of money and a lot of product.

One of the decisions that isn't brought up, not whether to change the label from 100 percent or not, is to whether not to use, let's say an inert gas, like nitrogen, and just put the product out there for the shorter shelf life, for example, or not to use carbon dioxide to fumigate the berries and just hope they don't develop, you know, fungal spores or what have you. So there's a lot of things at stake here on that issue, and we
want to get it right and we want to serve the industry, and it looks like we have a lot of work to do to get it right before we can get our intent clear to put it out.

That's a long comment, but I'd like you to answer because you said follow the process.

MS. DIETZ: Right. And the reason that I said that about the 100-percent label is because there's been directed by the NOP to companies to change. So we're in the process of that change, and then, all of a sudden, there's a recommendation by the Board, so now we're in this limbo land. You know, we need to be able to have time to say, okay, well, let's just hold off and not do any label changes and wait another year and have 100-percent label claims out there and go as-is or come out of this meeting with a recommendation on what we're going to do moving forward.

Somewhere it needs to give. We need to know what to do; I guess that would be
my comment. Not to push it through, but we need direction coming out of this meeting where the 100-percent label claim stands. Are we just going to back off a little bit until the decision is made and people continue to label as-is; or do we move forward in changing labels?

MR. SMILLIE: I would like to ask the Program if they would want to comment on this issue.

CHAIRPERSON DELGADO: Any comment from the Program? Any questions?

MS. DIETZ: Thank you.

CHAIRPERSON DELGADO: Okay. Up next is Emily Brown Rosen, followed by Gwendolyn Wyard.

MS. ROSEN: Hi. I'm Emily Brown Rosen. I'm the Policy Director for Pennsylvania Certified Organic, an organic certification agency right around the corner here. Thank you for the opportunity to comment again and one more for your patience.
This, you know, it turned out to be a big deal
to comment at NOSB meetings, and it's great,
you know, that you're willing to seat here and
do this, and I think it's also very important
for the industry. I'm thinking maybe we could
schedule more listening sessions at some point
in the future because I can see how it's
getting hard for you to manage this. But
whatever. I'm glad to have an opportunity.

We have also provided written
comments, hopefully you've seen them, that are
more detailed. So I'm just going to kind of
summarize them here quickly. Oh, I do have a
proxy from Melanie Saffer. Did you get that
on your list? But, hopefully, I won't need
that full time.

MS. FRANCES: We put you down for
tomorrow.

MR. ROSEN: I might not need that.

Okay. So, number one, the Materials Working
Group, I was glad to participate in that
group, and I think we did great work. I
really thank Gwendolyn and Kim for providing
leadership and putting together some really
good information. As you can see, it's a very
large document.

We had a lot of diversity of
opinions. We did try to slim it down to tease
out some of the key points more this time
around. But, you know, it's a tough issue.

At this point, my feeling is that there's not
any option that's going to be perfect, but we
urge the Board to move forward quickly on
adopting a recommendation. I think the
Materials Working Group has done enough on
that topic and it's your turn to take it up
and hopefully get a recommendation for us next
meeting that we can all jump on board with.

In the meantime, we'd be happy to keep
working, speaking for myself at least, but I
think most of the group would like to keep
working on the synthetic/non-synthetic thing
and get something to you before the next
meeting, so we can move ahead on these
critical issues.

I had sort of a mental block after I worked on it all during the summer, so I didn't get you a written comment on this. But re-reading the other comments and reading Oregon Tilth's comment, I think option three is the best choice. That's my opinion. I think this is, you know, a bit of a change, but what this basically does is require commercial availability of all items on 205.605, and you change the title of 605 from being non-agricultural to just being non-organic substances. So they're not clearly agricultural or non-agricultural. I think this is doable because OFPA doesn't even mention the word "agricultural." You save 606 for all the things that are clearly agricultural.

Keep yeast and microorganisms and bacteria all in 605. There will still be a requirement to use them in processed food when they're commercially available. You can still
certify them as organic if you can produce them according to standards because they're just on the list as non-organic at the moment. They're not there as non-agricultural.

So, legally, I don't think that's a problem. And that way it's kind of the best of all worlds. It also does not interfere with the livestock requirements, which, you know, unfortunately, have a split system with the processing list. Everything has to be on the list. With the crops and livestock list, we have this open-ended list with, you know, synthetics on the list and then naturals that are not listed. So it kind of conflicts. That's part of our problem here, trying to make a rule that works for, a list that works for processing and doesn't conflict with the needs of our livestock and crop materials.

So I think that will work. It may not be perfect, but I think it will work. And it also bumps up this whole idea for organic preference, you know. When we can do it, when
the technology is there, when people are better at finding organic substrate for microorganisms or bacterial cultures, then it can be done, and we'll still keep pushing the envelope that way. So I know I'd just like to go forward. You know, whatever you do, we've got to go forward because we've got to try to be more consistent here.

Second, 100-percent organic label. We do agree with many commenters. And as certifiers, we've had a continuing round-robin about how difficult the 100-percent organic label is, how confusing it is, and really causes more problems than it's worth, it seems like. One solution would be to drop this category as a label claim. It's not in the OFPA. It's not permitted in Canada or the EU, and it causes a lot of confusion. People can still make truthful label claims about 100-percent organic ingredient content of their product. It just does not have to be a labeling claim category.
Right now, there are some products that are not even eligible for the 100-percent organic label claim, but they can claim 100-percent organic ingredients because, you know, all the ingredients are organic. You know, there's processing aids that don't end up in the final calculation. It's confusing because the calc rules and calculation are not the same as the description of the category. So, you know, we just lose the whole thing and a lot of the problem would go away.

If we are going to keep this category, there should be a very clear bright line. NOP gave us some guidance, like, two years ago, and I thought it was good. I thought it was very helpful at our certifier training. Basically, if a product is formulated or used or manufactured in any way with a substance that's on 205.605 or is on 606 and is not organic, then it's not 100-percent organic. It's got to be 100-percent organic ingredients. And that does include
things like antimicrobial washes. It does include, you know, things like inert gasses. So, you know, that's another easy way to enforce it, and it gives a very high standard for what it all means.

I did give you more details in my written comments. I think another breaking line would be that materials used in crop or livestock production for post-harvest handling that are on the list for that use or natural for that use. Those would be allowed as part of the crop or the livestock production. Once it goes to further handling off farm and is, you know, washed or sanitized or, you know, treated in some way, then it would lose its eligibility. But as I said, you know, that's getting into the weeds there.

I'd also like to say that in the National Organic Coalition comments on grower groups, there's a very good definition of post-harvest handling. You might want to take a look at that for future reference if you
1 decide to go that route.

2 Another problem with this paper,

3 which I would like you to pull back this

4 paper, is that it provides an implied

5 enforcement of the NOP policy statement on

6 food contact substances. I don't think you

7 meant to, but you opened a huge door into

8 another can of worms here, which is the whole

9 policy about antimicrobials washing, you know,

10 when does it have to be on the list and when

11 doesn't it? And I think that deserves a lot

12 more attention than you were able to do in

13 this review. So I just think you should

14 remove all that and just retest your thinking

15 there. And, in fact, in my comments, I gave

16 you a complete rewrite of your document, if

17 you just want to use it.

18

19 Number three, certifying

20 operations with multiple production unit sites

21 facilities, we remain concerned about the

22 general language in a number of places in this

document. We think it's greatly improved from
the last time around. It's very good on the
risk categories for grower groups, but still
we find that it's ambiguous. It still could
be interpreted to apply to handlers,
retailers, or any certified entity. I think
you should revise the document to make sure it
only applies to farmer/producer operations.
That was the theme of the vast majority of the
comments last time around, and I think that
your intent now was to move this forward for
grower groups. If you're going to take it up
separately, take it up separately. But don't
leave it ambiguous right now; I don't think
that's helpful.

Our concern that the proposed
changes in definitions, which are the only
regulatory changes you proposed here, would
have other ramifications not anticipated,
especially the narrow definition of "site."
In my reading, it says a site is an area where
production is managed. So, to me, it sounds
like you could go inspect the offices of a
company that has five different plants. And just, by itself, that definition I think will cause problems, so I think you need to think about how that would impact.

Fourthly, out of five, policy and procedures manual. Procedures to handle technical reviews, I ditto what Brian said about a need for independent reviews of petitions by experts. And in your document, I think you made an error on your procedure because it's the NOSB, not the NOP, that convenes the TAP. That's the language in the OFPA.

So you do need to work closely with the NOP to see that this happens. And if you need help from the community to make this happen, you should let us know, and we'll be out there, you know, talking to people and trying to make this happen or raising more money or whatever there needs to be for the Board to function properly. But it's really an important function.
Well, it's legally debatable whether NOSB can act as their own TAP. We ask that if you do intend to provide in-house TAP reviews and then the expertise of the subcommittee that's doing it should be documented. You also should be providing a written review compiled of the review that you've undertaken and indicate the reference material consulted. Right now, the use of current checklists may be adequate to document the Board decision, but it does not substitute for a TAP review. It requires that the Board submit to the secretary the results of the Board's evaluation and the evaluation of a technical advisory panel for all substances considered for inclusion on the National List.

So, you know, this is two different things. You know, they're not just one checklist. If there is no TAP review, I think you're putting yourself at liability because you do not have the separate independent review.
As an example, when there are no TAP reviews, we run into problems later down the road. For instance, ethylene for pears, that came up. Part of the reason you don't know, the history was that all the prior TAP reviews were not posted. I posted them in my comments. They were considered comments, which Claudia is going to present later, goes through quite a detail on the whole ethylene thing. It was considered, tomatoes was the first thing that, you know, people wanted to use that for, and that was always considered off the table because, you know, the whole point of organic is we don't have gassed tomatoes that are not ripe we need to market. There is a quality issue and an authenticity issue I should say.

So I don't think that this, since you didn't have a TAP review, I feel like you didn't do justice. I think you should delay that decision. It's just, you didn't have complete information. In fact, that ethylene
petition itself wasn't posted until, like, very late before the meeting. So I don't think there's a good chance for everyone to look at this.

Then the other point, as illustrated by the petition on seaweed-derived calcium, you're recommending to allow that based on the fact that it's a natural form of a mineral, which may be true, but the only information we have is from a petition where there's confidential business information that is redacted. So how do you know exactly how it's formed? How do we know how to evaluate similar products? That should just be off the table that you do not do a half review when there's confidential business information and we don't know how it's manufactured. So I have one more point here.

CHAIRPERSON DELGADO: Your time is up.

MS. ROSEN: Okay. Well, I have one more point, but it's brief. Okay. The
status of petition materials on the web site,
I think, you know, this whole point about the
missing petitions and the ancient ones that
are surfacing and then the recent ones that we
don't know where they are is just a symptom of
needing -- and I know NOP is working on it,
and I know poor Valerie is trying to get it
together, but we're willing to help. A
lot of us have historical information in our
files, but we really need a better method for,
like, when the petitions come in so that we
can have a long as period as possible to
collect information from the public. That
way, you'll get more and better diverse
information.

CHAIRPERSON DELGADO: Thank you.

Any questions? Hugh?

MR. KARREMAN: Thanks, Emily.

Just in regards to the TAP reviews, I tend to
agree with you that the fifteen of us on the
Board might not have the expertise to do
something, but then, again, we might. It
depends on the case. But your implication was that third-party groups would have the expertise. I tend to agree, at least with one particular group I'm thinking of. But what makes an expert an expert in reviewing things? Are you scientifically trained as far as agronomy, as far as medicine, as far as livestock? Or is it you know the organic rules really well? Or is it -- I don't know. How do you --

MS. ROSEN: On OFPA, there's criteria for technical expertise, and it lists a number of fields like, you know, agronomy, toxicology. I think there's four or five different general categories listed there.
The Board previously and the Program has a whole set of criteria for selecting contractors and statement of work. I mean, it's all been hashed out many times before. But, yes, they should have good scientific expertise. They should be able to address the particular sector of the topic, you know, if
it's veterinary, if it's agronomy, whatever. They should be able to demonstrate a range of expertise.

There may be, you know, within the USDA, there's probably some good science people that can help out, too. I just think there needs to be, like Brian was saying, an expert review and then your stakeholder review because it is inherent a little bit of conflict when some of your members are doing a review and then the other ones are supposed to be questioning you about your review. I mean, it's not necessarily the best setup.

CHAIRPERSON DELGADO: Joe, followed by . . .

MR. SMILLIE: As far as the multi-site document, your comments on that, I thought we were fairly clear that right now the document is mute on everything but growers. That was the intention and if you find language in there that doesn't meet that intention, we'll be glad to take a look at it.
But right now it is mute on anything but growers. It doesn't rule out possibilities in the future, but that was the intention of the committee at this point in time.

Second thing is I couldn't agree more with you on the 100-percent. Just drop the sucker. You know, cut the Gordian knot, whatever you want to do it. We didn't come up with that recommendation, but we'll be glad to consider it, and maybe the Program will be also. And we can save us a lot of pain going through all the different details and just drop it.

But that having been said, if that doesn't happen, I would disagree with your comments on the preclusion. I think that the rule, the regulation is clear when it says processing aid. And when I look at some of these substances, let's say nitrogen flush, that's not a processing agent. I think that you can -- the CFRs are becoming, to me, to appear like the Bible. You know, you can just
about get anything out of them you want. But, to me, when you just judge overall what the CFRs have to say, things like nitrogen flush aren't a processing aid, and the regulation says processing aids.

So I would like to push forward with that particular part of it and not reduce it to just inert gasses. We'll just drop the inert part of it and just go with the gasses because I think, you know, we're looking at food safety issues that are important, and we're looking at claims that are justified, and I would just disagree with your interpretation of the CFRs on that particular set of issues.

MS. ROSEN: If I could respond briefly, I think some of the gasses are used to prevent oxidation in packaging. But in that same definition of CFR, they're also used as propellants or as, you know, like carbon dioxide could be used as a carbonate. So depending on the use, it may or may not be a
processing aid. I mean, there's no distinction on the list. So I would say that's fine, but you need to make a distinction on the list of which things you feel are not processing aids for which uses because, otherwise, some people will be allowing it in some 100-percent labels and others will be allowing it in other human products. You know, it's not clear.

CHAIRPERSON DELGADO: Kevin?

MR. ENGELBERT: Thank you, Emily. I agree with your thoughts about the grower groups being strictly for producers, and I didn't get it from the document that that's all it was for. So I do think there's some tweaking needed there. But I'd also like some comment from you about --

CHAIRPERSON DELGADO: Kevin, can you say it on the microphone, please?

MR. ENGELBERT: Could you also give some comment briefly about the parameters for grower groups? We can't just go with
intent, I don't think. Where do we set the
limit for grower groups? Is it based on
income, size of the farm, number of
operations, the product? I don't remember
anything in your comments about that.

MS. ROSEN: I did support the
criteria that the CACC came up with. I think
they're a good start. It was contributed by
a lot of different groups, and I can see pros
and cons of the 5,000 K limit, but, you know,
I would not presume to know enough about how
those small holders operate. I do think the
intention is for small holders, but I'm not
sure what the best way to accomplish that is.

CHAIRPERSON DELGADO: Any other
questions? Thank you, Emily. Now we have
Gwendolyn Wyard, followed by Tim Redman.

Gwendolyn?

MS. WYARD: Good afternoon. I
believe I have a proxy, but I'm not so sure.
I don't see it up there. I have about seven
minutes.
MS. FRANCES: I think a lot of the people who have a proxy, if they want to go a second day. They want to go a little bit on Monday and a little bit on Tuesday, that may be the case.

CHAIRPERSON DELGADO: And members of the Board, I urge you to consider coming tomorrow. We have a lot of people ahead, and if you are talking about a similar topic don't hesitate to team up and come together. That would be most effective and most productive for us.

MS. WYARD: Thanks. My name is Gwendolyn Wyard. I'm speaking today on behalf of Oregon Tilth. We have over 700 members and over 1200 certified clients. My position, I'm the Processing Program Reviewer and Technical Specialist, also known as the fermentation expert.

So starting off with pet food, the comments while submitted by Oregon Tilth were actually written by my dog. We've been
attentively following the work of the Pet Food
Task Force since 2005, and she asked that I
personally come here and thank the Task Force
and the Board for the development of the
standards and that I point out a few technical
corrections that are needed, namely because
pet food standards were written prior to
205.606 changes and prior to the NOP
clarification on agricultural livestock feed
supplements and additives.

The proposed pet food standards
under 205.237, they imply that all
agricultural ingredients in the made-with
category must be organic. Number two, the
organic category, they do not provide an
exception for ingredients listed on 205.606.
And, number three, they don't specify whether
allowed supplements and additives under 603
need to simply be non-synthetic or whether
they need to be non-agricultural and non-
synthetic. This has been a very confusing
area in the livestock standards, and I want to
make sure we get it right in pet food standards.

So after close examination, Wula, the smarter-than-average dog, preferential carnivore and occasional grazer, finds the standards to be more akin to the regulations for human food versus livestock. Combining pet food with livestock under the same heading is a recipe for confusion. She, and, therefore, we, feel that petfood would be best placed under its own section.

We suggested 205.240 in our comments, but, at the time, Wula wasn't up to speed with the proposed pasture regulations. That spot is taken. But we believe that there are 28 more sections reserved and open, so let's talk about 205.241. The point is to put pet food into its own section and then combine that with the detailed composition standards of 301.

Our suggested technical corrections are spelled out in edit mode in
our written comments, and I'll be delighted to
answer any questions you have on those when my
five minutes are up.

Guidelines for the 100-percent
labeling claim, again, I thank the NOSB for
your work really on this doozy of a topic.
You have our six pages of written comments
complete with seven examples to demonstrate
our point. In short, we agree that materials
used on food contact surfaces and gasses used
for packaging applications should not affect
the 100-percent organic label. We disagree
that sanitizers used in produce rinses and
hydrocooling, as well as diatomaceous earth
used for post-harvest pest control, prevent
the product from being labeled 100-percent
organic. I might add that I asked my dog
about this, and she did just wave her paw and
say that 100-percent category is more trouble
than it's worth and trotted off after a
squirrel.

So the CACC Committee reasons that
the residue from pest control material or
sanitizer remaining on product is consumed as
part of the final product and is, in effect,
an ingredient, therefore disqualifying the
product from the 100-percent organic claim.
This line of thought does not account for how
and when the materials used. It ignores
classifications that are already in place by
the EPA, FDA, and USDA, and it does not take
into account how that now organic product will
then be factored into organic calculations.

With respect to labeling products
and determining the organic content of a
product, the regulations refer to ingredients
and processing aids only. Therefore, Oregon
Tilth's position is as follows: production
inputs, namely sanitizers and pest materials,
on agricultural commodities used during pre-
imposed harvest activity should not impact the
100-percent organic label. As supported by
the regulatory language in 301, loss of the
100-percent organic label occurs when a non-
1 organic substance is used during processing
2 and functions as a processing aid or as an
3 ingredient.
4
5 We run into the problem that the
6 heading on 605 and 606 refer to ingredients,
7 and all other remaining lists refer to crop
8 production and livestock production. So we
9 agree with OMRI's third and fourth options
10 that 205.601(l) could refer to post-harvest
11 handling and, the fourth, the heading of 605
12 could refer to substances. In other words,
13 strike the word ingredients, as several of the
14 materials on 605 are not ingredients.
15
16 There's a real void when it comes
17 to placing post-harvest pre-processing
18 materials. We are especially concerned that
19 the recommended guidance doesn't account for
20 how the organic content of a product is
21 calculated. The recommended guidance would
22 result in the revision of hundreds upon
23 hundreds of certificates. Most raw fruits and
24 vegetables would lose their 100-percent
organic status prior to being processed. Farm
certificates, which historically have been
viewed to represent 100-percent organic raw
products, would need to specify organic. And
the products listed would then need to be
defaulted to 95-percent organic when I'm
running calculations.

So how do we go back? How do we
know what the percentage -- how would you
calculate the percentage, especially if you're
pointing to pest materials and sanitizers as
ingredients? We would have to figure out how
to calculate those into products, and that
would be very problematic.

This is a significant divergence
from the understanding and practices the
industry has built itself around for the past
ten years, and we ask that the Committee
please reconsider their guidance on this
extremely important issue. Thank you.

CHAIRPERSON DELGADO: Questions?

Tracy, followed by John.
MS. MIEDEMA: Thanks Gwen. I have a question for Deputy Administrator Robinson while Gwen is up here. You made some excellent technical corrections to the organic pet food recommendation, and this comes up from time to time where a correction comes at just the right moment. Our typical way of dealing with this in committee is to have sort of a midnight scramble of redlining recommendations, putting the audience through a painful exercise of onboard editing, and then voting on the edited either slightly or significantly edited version.

And just from a process standpoint, if we have a recommendation, plus some excellent written comments, does the Program layer those together? Can you just take that forward, or should we continue with our midnight scramble inserting of important edits?

MS. WYARD: Or can I put my work on Valerie's computer and your computer and --
MS. MIEDEMA: And a follow-up, just to continue, you know, I know that type of thing is possible. And taking into account that we need to mete out what we feel really should be taken and added to the recommendation and what shouldn't. But I guess the follow-up there is that on a question like where should organic pet food reside in the regulation, that's ultimately going to be a programmatic decision. And so what I guess I'm trying to make sure we do is we don't spin our wheels when we shouldn't be, yet we give you the best possible data to work with.

DR. ROBINSON: The most important thing is that we get a clear recommendation from you, you know. That it's not just a question of we get the Board's recommendation and then we get a bunch of, oh, but then we got these suggestions and these suggestions, so we have addendums to that so that we're not sure what is it you want us to add to your
recommendation.

So the most important thing is that whatever you give us it's clear to us what it is you are recommending and why. There's not really any ambiguity there. We're not getting something that says, okay, we want the labeling like this and then there's option A, option B, and option C. Otherwise, we're just going to keep coming back to you and saying, why did you do this? What is it you want?

It's not the format that you give it to us in. I don't care if it's hand-scratched. I care that it's clear is what I'm saying.

CHAIRPERSON DELGADO: And the highlight then, the highlight is to make sure that a committee, when they're proposing a recommendation that their intentions are clear, so the Board is given time and will be able to vote on a clear intent., and then send that out.
We have Joe. Sorry. We have Tracy. Tracy is going to follow up with a comment.

MS. MIEDEMA: Just to add that to my colleagues that worked on the Organic Pet Food Task Force, we really do need to insert these recommendations and per Barbara's advice just now, so let's talk after today.

CHAIRPERSON DELGADO: On the basis of procedure, we do have the time available. If you feel uncomfortable with your recommendation, you can always withdraw that or work on it sometime tonight and present a different updated version. It's really up to the committee. Follow-up from Bea.

MS. JAMES: This is just a quick comment to that. I think I've heard Barbara say in the past it's better to do it right than to do it fast.

CHAIRPERSON DELGADO: Any other questions? Joe?

MR. SMILLIE: Personally, I agree
with your comment. I think your comment on
the 100 percent are good, and I would like to
take those forward with our committee.

Back to the issue of get it right,
the problem with our organization is we can't
meet in a week, get the recommendation fixed
and the move it forward. You know, it's going
to be delayed for a sizable period of time.
So that's a conundrum we face.

At the risk of, we opened the food
contact substances box, and we'll try and
close it as quickly as possible. Agreed with
that. But the difference between, again, I'm
not sure that the entire audience or the
community understands the two issues that you
brought up. There's a difference, at least in
my understanding, between the 100-percent
claim and the calculation. And you put them
together saying that if we take away the 100-
percent claim language that it will cause you
and me and every other certifier in the room
untold hours of work working on calculations.
You can have an organic product that is 100 percent but can't use the 100-percent claim, right?

MS. WYARD: It could contain a non-inorganic processing aid, so it can't be labeled as 100-percent organic, but it contains 100-percent organic ingredients in Section 302, the first two ingredients. So I think I can speak for, well, I'll speak for Oregon Tilth, the way that we've been doing calculations for years and years and years, we calculate ingredients. We don't calculate processing aids.

MR. SMILLIE: So how would this recommendation affect the calculations game?

MS. WYARD: Well, now, because we have clarification from the program, when we're doing calculations, the only way that we, you know, the formulation has 20-percent of an organic ingredient, unless I know the actual percentage of that ingredient, I'm going to take 20 percent times 0.95. Now, if
my client wants to track down the actual percentage, which is 97, now I'm going to take 0.97. Well, by that time, it's the 20 percent.

But the supply chain, if it's losing it's 100-percent label category, the certificates represent the label category. So I'm going to be sitting with a certificate that says organic, and now I'm going to go back to my client and say I need you to tell me what the actual percentage is, or we can just default to 95. There are going to be raw agricultural commodities that, for years in their formulations, have been factored in at 100 percent because they're single-ingredient raw agricultural commodities.

So it's just going to put everybody into this mode of having to chase down the actual percentage based on the use of, perhaps, a pest control material used in a grain silo. That type of information is never going to make it into a formula.
MR. SMILLIE: And I don't think it would. I think that if you look at the product profile, it will say apple, not apple with, you know, chlorine on it or wheat with one speck of diatomaceous earth on it. So it will lose, perhaps, its 100-percent claim, but it won't lose the 100 percent of the calculation.

MS. WYARD: I mean, with processing aids, you still consider them 100-percent organic ingredients, but part of the proposal that you're putting out there is that you're saying, well, there's residue, so they're kind of, in effect, ingredients. That's really problematic. They're not ingredients.

MR. SMILLIE: That's certainly not the intention of the recommendation.

MS. WYARD: So, I mean, if you were to go down the path of saying if it comes in contact, and we don't care if it's during washing, before processing, after processing,
it loses the 100 percent because it is used on, it comes in contact. Don't talk about ingredients. That way, we know, okay, it can't be labeled as 100-percent organic, but at least for calculation purposes we can use 100 percent if the only thing that's been used is the sanitizer and wash.

CHAIRPERSON DELGADO: Julie?

MS. WEISMAN: Can we conceive of the possibility, along the lines of making the distinction of losing the labeling category as far as retail products go without sacrificing what currently happens on certificates?

MS. WYARD: You know, you go on the products, you go down the shelves in the grocery store, there is very few products that use that 100-percent label. It's the calculation part that you're going to lose it on the certificates.

MS. WEISMAN: Does it help to separate those out?

MS. WYARD: Yes. I mean, we're
already in a situation now where we have to
figure out a better way to communicate,
certifiers communicate to one another,
operations communicate, getting that
percentage passed on forward so that everybody
is not in this chase-down game. I mean, if we
had known from the very beginning about the
clarification on calculations, we would have
put our certificates together differently. We
would have had that percentage right there.

I mean, I say throw out the 100
percent -- this is Gwendolyn Wyard -- throw
out the 100-percent category and just put the
percentage, the ingredient percentage on the
label. That tells the consumer, you know, 97-
percent organic. That's straightforward. But
I think we run in -- you know, throwing away
the 100-percent category, from a consumer
perspective, so they hear that, you know, the
NOSB, NOP, it was too hard; we just threw out
that 100-percent category all together, that's
going to be, that's --
CHAIRPERSON DELGADO: Any other questions?

MS. WYARD: I thank you for your time.

MR. ENGELBERT: You're saying that feed grain has been running to a bin and has had diatomaceous earth added to it loses its 100-percent organic status. What's the implication then? Because livestock had to be fed 100-percent organic feed.

CHAIRPERSON DELGADO: Can you repeat the question?

MR. ENGELBERT: If we say that 100-percent, that livestock have to be fed 100-percent organic feed, but you say in your recommendation that grain has been treated with diatomaceous earth will lose its 100-percent organic status, how are you going to resolve that conflict?

MR. SMILLIE: Again, it's 100-percent claim, not 100 percent. You've got to understand there's a 100-percent claim, and
then there's 100 percent. So grain does not lose its 100 percent. It's still 100 percent, but you couldn't sell it retail as 100-percent organic because the so-called processing aid, which Gwen and I do not believe is a processing aid but a pest-control material, would preclude it from the claim but not the calculation. It would still be 100 percent to a dairy farmer.

CHAIRPERSON DELGADO: Dan?

MR. GIACOMINI: The regulation right now says that agricultural products included in diet must be organic. The 100 percent is really not the issue, whether it's the agricultural product is a certified organic product. So, I mean, there would be legitimate and illegitimate things you could do to it, but that doesn't change the organic nature of the agricultural product.

CHAIRPERSON DELGADO: Richard?

MR. MATTHEWS: You know, I've answered this question somewhere in my history
with the program, and I know that, in fact, I told Tom Hutcheson probably less than a year ago that something like diatomaceous earth or the carbon dioxide used for pest control in a grain bin would not disqualify the grain product from being considered as organic in a 100-percent organic product. In other words, you could still label a product 100-percent organic even if the wheat in there had had diatomaceous earth in the grain bin. That's no different than any of the other synthetics that are on your list for pest control.

So pest control in the field, pest control in the grain bin, what's the difference? I mean, we're not going to say that a cherry pie made with 100-percent organic ingredients that didn't use any synthetic processing aids couldn't be called 100 percent because it had an allowed pesticide used on the strawberries, nor would we say that for the wheat that's used to make the pie crust. I mean, that's my position on
it.

MS. WYARD: That's Oregon Tilth's position, too. There you go.

CHAIRPERSON DELGADO: Thank you.

MS. WYARD: Okay. Thank you.

Thank you very much.

CHAIRPERSON DELGADO: Up next, we have Urvashi Rangan.

MS. RANGAN: This is going to be the first fish demonstration in a NOSB meeting. First demonstration ever. Good afternoon. I'm going to take this off so you don't stare at it and not listen to me, but I'll leave it right here.

Good afternoon. My name is Urvashi Rangan. I'm a Senior Scientist and Policy Analyst with the Consumers' Union. We're the non-profit publisher of Consumer Reports. And I'm here today because we're extremely disappointed with the recommendations on the aquaculture standards, and they fall significantly short of consumer
expectations. You've heard me up here before.

I'm going to go into a lot of those details again. We've run another national poll out this November with similar statistics to the one we ran in June 2007.

We acknowledge the years of work that have gone into this and that organic aquaculture needs different standards than other livestock. But we feel the recommendation a year ago was closer to what it needed to be than the recommendation that's come out for this meeting.

These recommendations do not meet the same bar for other organic livestock production. In fact, it's a lower bar, which, if enacted, will compromise organic quality and value and undermine consumer confidence, not only in the organic fish that they buy but in all the organic products that are out on the market. This is a significant deviation from what organic principles are and where the bar ought to be.
You acknowledge in the recommendation that consumers may not want organic fish to eat wild fish and propose an additional conditional organic label to differentiate certain fish from others. That violates Section 2102 of OFPA that ensures that organic production meets the consistent standard. You cannot alter that label just to differentiate a different production system.

Allowance of the 25 percent wild fish for fish meal fails to meet consumer expectations on multiple levels. It doesn't adequately address the contaminant issue. In June 2007, more than 90 percent of consumers in our poll said that they wanted organic fish to be free or low in contaminants.

Moreover, the 25-percent level may also compromise the nutritional value of that particular fish and not actually make it nutritionally equivalent to its conventional counterpart. It falls short of the 100-percent organic feed requirement. Our
November 2008 poll, and I'll be happy to provide those details and written comment, show that 93 percent of consumers agree that organic fish should be produced with 100-percent organic feed, like all organic animals. This is what consumer expectations are, and to deviate from that seriously undermines the integrity of this label. It also creates a far more complicated and defensive strategy to manage contamination and sustainability in fish meal. And the recommendations tend to rely on vague environmental principles and weak regulations to address the problem, specifically Section 2107(a) that requires periodic residue testing. That requirement is only once every five years. That is an inadequate standard to monitor contaminants in fish meal. Sourcing from sustainable, quote/unquote, fisheries that minimize environmental impact, these are vague principles, and we've seen what happened with
pasture when we don't have specific standards in place. It's not meaningful as a standard. There's no standardized definition of what those mean, and it's subject to a wide array of interpretations.

The stepwise decrease of fish meal also produces an unnecessarily complicated management system for fish meal. If you stick to the 100-percent organic feed requirement, you create clean channels for organic fish meal to be produced, and when there is enough for carnivorous fish to eat 100-percent organic fish meal you have a nice clean production channel. This stepwise decrease is really going to unnecessarily lead to more complication, and we don't think it's a feasible strategy.

Consumer confusion over this issue is summed up in your proposal under 205.612 that creates a gross exception by allowing the use of a prohibited material in all of these cases. It's very confusing to a consumer that
you are going to allow a prohibited material, up to 25 percent of it, for use in organic fish meal.

Finally, we want to comment about the wild fish amendment and the fact that that seems to be in play. National Organic Program, you haven't promulgated on this, and the public has not had an opportunity to comment on wild fish. We don't understand why it's in play if it isn't promulgated. When we ask about you regulating fraudulent organic fish claims, we were told, that hasn't been promulgated. We can't regulate fraudulent claims. Well, we can't cherry-pick what we can push forward from the OFPA that hasn't been promulgated and what hasn't.

And for all of these reasons, including the environmental pollution reasons, which I will defer to Food and Water Watch and CAAR, we believe that fish that are not fed 100-percent organic feed, that come from polluting systems, that may be contaminated
with mercury and PCBs, and may be
nutritionally-inferior to their conventionally
wild counterparts, don't add up to an organic
label on fish that consumers want. We also
respectfully submit 16,000 signatures to you
that echo the same sentiment from consumers.
Thank you.

CHAIRPERSON DELGADO: Questions?

Hugh?

MR. KARREMAN: Thanks, Urvashi.

We are listening to all public comment, of
course, very closely. And you didn't have a
written one, did you, this time?

MS. RANGAN: I'm sorry. I didn't
have time, but I will be submitting it during
this session, which, Valerie; is that correct?
You can enter it in the docket here.

MR. KARREMAN: I didn't want to
have missed it. Regarding the amendment in
OFPA that it's not been promulgated -- I can't
say that word too well. Sorry. But wouldn't
this regulation that we're trying to possibly
pass be the promulgation of that in the act?
I mean, everyone says that it has not been
initiated. This is the initiation of that
amendment.

Ms. Rangan: If that is the case,
I think, one, it's very slippery, and pardon
the fish pun. But, secondly, I do not read
this as being a promulgation of the wild fish.
If that's what it is, that's news to me and I
think it's news to the public. Wild fish, if
wild fish can then be certified as organic, I
haven't read that in any of the
recommendations.

Mr. Karreman: No, we're not
saying that. We're saying wild fish can only
be used as feed in a decreasing manner over
ten years I think it is, and that's it.
There's going to be the byproduct of the wild
fish that's already in the human food chain.
We're using byproducts of that and not letting
them go to waste. That's the wild. That's
how we're seeing this part of the act, the
increment, not as fillets. Never have wild-caught certified organic fillets. Never, never. Just so you know that.

MS. RANGAN: So just to respond to that, that part of the act is two sentences, I think, and says something about wild fish to be eligible to be labeled as organic. You can't splice that thing or split it into two and say we're only dealing with half of that statement for fish meal and not deal with the rest of it. If you're saying it's the basis for a rationale that you're using in promulgating these regulations and in making your recommendations, then that needs to be promulgated and needs to be publically debated first, so we can figure out if that's really a reasonable ruling of that particular part of the act. We haven't done that yet. That hasn't gone under public debate. And to use this to debate that I think is disingenuous.

CHAIRPERSON DELGADO: Any other questions? Bea?
MS. JAMES: With all the consumer feedback that you received, I hear in your comments that the consumers were really concerned and not supportive of the idea of wild fish being used as a feed for certified organic fish. So I also was wondering if, in any of the comments that you received, if there was any feedback around environmental issues? That all of the wild caught salmon for our purposes is one thing, but what about the wildlife and what would that do to the wildlife?

MS. RANGAN: Thanks for asking, Bea, and I had the one-minute mark-up, and I didn't really get to that point. But environmental pollution is very present on consumers' minds. They buy organic because they think that environmental standards are being considered and that the highest environmental standards are being enacted. And, in fact, over 90 percent of consumer response, both on a June 2007 poll as well as
the November 2008 poll, say that they do not want to buy organic fish that comes from systems that pollute, especially in the open ocean.

MS. JAMES: Yes, the pollution, but also just the depletion for, say, you know, the wildlife in Alaska, Canada?

MS. RANGAN: We didn't ask consumers that specific question, but the answer to that really lies with the scientific body of evidence. And I think groups like CAAR and Food and Water Watch are going to be able to share and have shared those scientific studies. In fact, even at the aquaculture symposium we were all at last year, it was very evident that the ramifications of open net pens in the ocean lead to many, many, many problems, including depleting the wild stocks around them, including sending disease and parasites out into the ocean. We don't want a toilet flush going on in organic production. It shouldn't be that way. It should be in
closed controlled systems where you can 
control the inputs and the outputs. That's 
what all other livestock are held to. It's 
what consumers expect of that standard.

CHAIRPERSON DELGADO: Any other 
questions?

MR. KARREMAN: As far as the net 
pens go, essentially what you just talked 
about, you know, aren't land-based 
agricultural animals also penned in? Aren't 
there discharges from farms, whether they're 
organic or conventional? Hopefully, less from 
organic. Aren't they breathing the air that's 
coming in from upstream or whatever? I mean, 
you know, there are parallels.

MS. RANGAN: You know, there are 
some parallels here, we can say, look, they 
all share the same air, and the air goes in 
and over and out. But there are scientific 
studies that show massive adverse effects to 
wild populations. If you look at farm salmon 
-- I can't even speak anymore -- salmon farmed
alone from open net pen systems, there are several cases where that intensive farming has crushed immediately into the ocean, disaffecting up to 90 percent of the wild populations around it. That doesn't happen in other livestock farming. And I think when you're talking about water systems, you're talking about a very different system. That's why it took so long to come up with these standards because it isn't a cow swimming in water. These are very different. But in terms of controlling as best you can the environmental pollution that stems from it, you've got a big problem on your hands if this recommendation goes through the way it is.

MR. KARREMAN: Can I --

CHAIRPERSON DELGADO: Hugh?

MR. KARREMAN: Is this okay?

CHAIRPERSON DELGADO: Yes.

MR. KARREMAN: So even with the proposal that stands -- you know, I think a lot of people have a lot of problems with the,
you know, so far with the organic potential of aquaculture because everyone is basing everything on the conventional salmon industry and what's gone so wrong with it. In our proposal, is it the exact same? I think our proposal has a lot tighter standards in it for the environment and a lot of other factors. And I just feel that a lot of people are just knee-jerk reflexively opposed to it because the conventional salmon industry and, you know, I don't think we're almost been given a fair shake in a sense. I mean, I think a lot of the people out there haven't even read the document. They're just like, can't do it.

MS. RANGAN: It's a great question. I mean, are you doing something better than conventional? Sure. Are you doing something that meets the high bar for organic? You're not. And I think that's where the crux of this issue comes into play, which is it doesn't go without question that everything should qualify to be organic. And
in this particular case, the line really does seem to be clearly drawn in terms of the fish production where these open net pen systems that flush their waste directly into the ocean, they may not be as loaded up with antibiotics, perhaps, as conventional farms but still cause problems. And they are not in line with what organic principles are.

And so our response to you, Hugh, is it may be better, use another label for it. It's not organic.

MR. KARREMAN: One last thing. It's always focusing on salmon. What about the fellow who's out in Hawaii that's come here a couple of times, Neil Sims, and his net pen system out there? Is that just as hellishly bad as the salmon?

MS. RANGAN: Salmon illustrates the problem. We think those production systems are wrong for any kind of fish. I think salmon is talked about a lot. It's obviously one of the most highly-consumed
fish. But it only illustrates the fact that
those open net production systems don't jive
with organics.

CHAIRPERSON DELGADO: Any other
questions. Okay. Thank you very much.

MS. RANGAN: Thank you.

CHAIRPERSON DELGADO: At this
point, we are due for a 15-minute break. The
Vice Chair is correct. We were due for a
dinner break. We will continue. I also would
like to encourage the remaining speakers, we
still have a long list. We're not even
halfway. If you can please team up. I notice
the number of speakers with concerns of
agriculture, if you can team up. The same
with multi-site. We do have still some work
to do ahead tonight, and we appreciate your
cooperation.

We're going now for a ten-minute
break, and we're coming back at 25 after.

(Whereupon, the foregoing matter
went off the record at 5:11 p.m. and went back
on the record at 5:28 p.m.)

CHAIRPERSON DELGADO: We'll start

with public comment again with Mr. Dick

Martin. Please proceed. Five minutes.

MR. MARTIN: My name is Dick

Martin. I'm with Martin International

Corporation, a seafood import/export company.

I'm educated as a marine biologist and have

been in the aquaculture industry for 30 years.

I'm commenting on aquaculture standards

tonight.

At the outset, it's my

understanding that the new recommendation by

the committee of the Board must present a

viable model on both practical and economic

scale. This must be made as a basic premise

if we're able to complete the recommendations

and move forward on this.

The latest recommendations, in my

opinion, are close, so close, but still

slightly impossible as they're written. The

proposal, as written, places burdens on the
aquatic system that aren't necessarily shared terrestrial systems and should be parallel and equitable to them.

In particular, on net pen issues, the proposed zero impact by predators is idealistic and untenable. We can seek to mitigate any impact, yet no one can guarantee the elimination of it. The language should be changed to include direct impact and eliminate unrealistic to zero impact.

Two, the proposed requirement to guarantee the recycling of 50 percent of all nutrient input is equally idealistic and untenable. The fact that one cannot obtain really reliable and accurate qualitative and quantitative data reduces that value, the value that variable as a sole determinant of environmental impact.

The recommendations should consider the ability of the local ecosystem to assimilate the portion of the nutrient input without which the proposal remains flawed and
unfair. Nutrient input is a single variable of environmental impact. Benthic analysis must also be included. I suggest the Board examine the parameters and techniques utilized in the study, *Eutrophication Assessment of Scottish Coastal Waters Supporting Aquaculture* presented at the OSPAR convention at the Hague in 2006 and include that technology in the type of analysis when considering the totality of an environmental impact. The key is to work within a similar capacity of the local ecosystem, which demands a case-by-case analysis and eliminates an idealistic one-size-fits-all concept that's currently in the recommendations.

Regarding the feed recommendations, point one, determining the definition of sustainability is clearly one of the most difficult challenges of this process, the one facing the industry at large. The various terms used in the paragraph are excellent considering elasticity of the
definition. It should be expanded to include the terminology managed responsibly, as to avoid conflicting opinion in the field between governmental and private organizations.

Two, the proposed limits of fish meal and fish oil in the recommendations are also idealistic and untenable. Provision must be made to eliminate arbitrary requirements that do not take realistic biological and economic variables into consideration.

Third, the recommendations limiting feed ratios and establishing FCRs for cultured species should not be held to a limit below the values established for similar species in the wild. Conservation of forage fisheries for use as feeding cultured aquatic species should be of a primary importance, yet the allowance of fish meal and oil in terrestrial models should be outlawed before limiting the use in aquatic models with the health benefits to the human consumer are preserved and maximized.
Additionally, I would like to be on record as supporting the various amendments and changes proposed by the AWG which modify the Livestock Committee's proposal. The changes proposed by the AWG modify the recommendations to the extent of becoming workable on all levels on a real-time basis.

Finally, I urge the NOSB to reach a tenable and workable conclusion at this meeting to ensure final rule-making on aquaculture standards that will proceed without further delay. Thank you.

CHAIRPERSON DELGADO: Any questions? Okay. Thank you very much. Up next is Douglas Low, followed by Tony Ruccio. Tony is not here. We can count him out.

MR. LOW: My name is Douglas Low, and I'm Managing Director of EWOS Scotland, and I thank you for this opportunity to comment on the proposed aquaculture standard. EWOS is a global aqua-feed manufacturer. The EWOS Scotland makes feed mostly for salmon,
and 15 percent of our output, about 8,000 tons, is compliant with organic standards set by European private standards bodies, such as Soil Association; OFF, Organic Food Federation; ABW; and Natural Land. We've been active in organic sector for ten years and are committed to further growth a significant niche market for smaller farmers.

We would like to contribute to the development of a workable U.S. organic standard that would include salmonids. It should allow for viable production of healthy salmon, fit with the principles of organic movement, and meet the concerns of environmentalists and consumers.

As the proposed standard stands, it would not be possible to produce organic salmon, but we believe that the standard could be changed in a way that would be possible to include salmon farming and remain true to organic principles.

I've got four things I'd like to
comment upon, and that is the acceptability criteria for wild fisheries used for fish meal and oil, permitted levels of fish meal and oils, on contaminants, and on nutritional requirements of salmonids.

As it stands at the moment, few feed forage fisheries meet the proposed criteria with regard to stock health and level of exploitation. The need for sustainability is recognized by stakeholders, and fisheries are being managed more responsibly. And when they are, we see stock health improvements or recovery. It's going to take time, and it will be universal.

What we see is an alternative approach which we would advocate, and that is the preferential and unrestricted use of trimmings, meals, and oils. These are the byproducts of fish for human consumption. The Aquaculture Working Group has also recommended this. It's a sensible use of a valuable resource, given the convention-efficiency of
fish. It's preferable to use these materials in aquaculture, rather than pig production or pig food. It does not increase pressure on feed fisheries. It differentiates organic from conventional. It is sustainable if the source fisheries are responsibly managed.

Here are some examples of the status of feed fisheries, and we could see that there are some fisheries, such as Atlantoscandian herring and Icelandic herring that would provide trimmings which meet requirements for being sustainable. In our industry, we do a lot of work in assessing the status of fish stocks that we use. And, basically, we try to responsibly source materials.

Next slide, please. The nutrition of salmonids is well understood, and it will soon be possible for the aquaculture industry and salmon farming to be net producers of marine protein and oil. We know that salmon can be reared on very low levels of fish meal
and oil, certainly less than ten percent, but
it requires the use of, for example, synthetic
amino acids, solvent extraction of plant
materials, and in the end product, in the
fish. All of the three is very limited.

We can't do this in the organic
confined diets without compromising growth and
health. Organic plant materials for feed are
limited in range and availability. It will
improve over time, but it will take several
years. We suggest step targets for plant
inclusion is an option that should be
considered.

Fish meal and oil is highly
digestible, and while excessive inclusion of
plant materials results in increased
environmental impact. Please note that the
achievable minimum of fish meal and oils is
about 70 percent.

On contaminants, North Atlantic
fish do accumulate contaminates, and this ends
up in meals and oils. Aquaculture is a
victim, not the cause. The fish meal industry has developed cleaning technologies and monitoring regimes, but these, in some cases, are not organic compliant. We, ourselves, wanted to monitor 14 environmental contaminants regularly. And it is possible to remove most contaminants, not all. In the finished article, the fish are found to have levels well inside EU regulatory limits.

You need to clarify the wording of the proposal again. The aquaculture working group has made these points, and that is we can remove most contaminants but not all.

Finally, on nutritional requirements of salmon, omega-3 and astaxanthin are accumulated from the natural diet in wild fish. They're essential in certain stages of the life cycle but not all. They bring significant health benefits to consumers and should not be restricted, and a change of wording in the proposal would be necessary.

I hope that this contribution will
help you in development of a workable standard
that does include salmonids. Thank you.

CHAIRPERSON DELGADO: Any
questions, please? Up next, we'll go past Tony
Ruccio who is not here, and Grant Cumming,
followed by Dick Martin.

MR. CUMMING: Hello. My name is
Grant Cumming. I'm representing Grieg Seafood
Hjaltland UK Limited. I would like to thank
the Standards Board for the opportunity to
make a representation today. We are a part of
a Grieg Seafood Group. We are the third-
largest producer of Scottish-farmed salmon,
and we are the largest UK producer of organic
salmon.

We are an integrated farming
company with processing and sales facilities,
as well. And we are certified organic salmon
by the Organic Food Federation, and the
Natural Land European Standards.

This is just a little background.
This is where we're based, off the North Coast
of Scotland, famous for Shetland ponies, Shetland sheepdogs, and I hope soon in the U.S., as well, for Shetland organic salmon.

I want to comment today on the net pens and related management issues. In general, I would like to say that we're very happy with the general approach. It seems to be based on planning and risk assessment, and that fits in very well with the organic certification in the EU as it stands just now.

What you're probably all aware of is that the same process that's currently happening inside the European union. And within the next I would guess three to four months, we will have aquatic organisms organic standard for Europe, as well. And I would urge yourselves, as I've urged the European standard makers, just to consult with each other, hopefully to make sure that we don't build any unnecessary contradictions into the two schemes.

Next slide please.
I'll take a little moment to go through one or two specific points. On the aquatic livestock health, I've got to say that the standards are challenging, but we're up for it. We're going to give it a go. And what I do need to say is it looks like the standards with regards to the therapeutics are going to be quite a bit tougher than the European standards. Now, we'll still give it a go and try and produce salmon to your standards, but it will probably affect the volume and the supply to the marketplace. But it becomes exceedingly important for us that the U.S. standards are harmonious with the EU standards. That there are no contradictions that prevent a supply in U.S. markets while meeting the EU standards.

On the aquatic living conditions sanction, I noticed that you're restricting the use of non-organic aquatic animals in the facilities to species either native to the environment or unable to breed successfully in
the environment. Now, it may be a given or I may have missed it somewhere, but I didn't see that for the actual organic species themselves. And I would suggest that what we should be looking to do is to produce native organic species in native waters. So I would suggest that we're not trying to produce Pacific salmonids in the Atlantic and we're not trying to produce Atlantic salmonids in the Pacific.

Next slide please.

On the section on aquaculture facilities, we've got the 50 percent recycling of nutrients input, which we have already touched on. Now, I'm guessing that this is really aimed at making sure that we maintain the balance the ecosystem and preserve the environment surrounding the immediate fish farm. So my question would be is 50 percent enough? And I think in order to answer that question, we have to look at specific cases because it will depend upon two things. It
will depend upon the amount of nutrients going into the environment and the environment's ability to assimilate the nutrients.

I want to just ask you what is going to be meant by recycling. A little bit vague. Does that mean I actually have to remove, as a farmer, 50 percent of the nutrients, recycle them myself? Or can we look at the environment's ability to recycle the nutrients? And exactly how we're going to measure whether or not 50 percent of the nutrients have been recycled is also a question I have. I think it's quite easy to measure the nutrients going in, but it's going to be almost impossible for the certifiers I think to measure whether or not we've taken 50 percent back out.

Now, the position in the UK with regard to nutrient inputs is pretty tough. We're required by the government to monitor the sediment, and water column, to ensure that we are not having an unacceptable impact upon
the environment. We have to do a lot of regular basic testing looking at redox potentials, looking at biodiversity, to ensure that the sediment is in good order. And the government is doing quite a lot of testing in the water column to make sure there's no eutrophication occurring.

Now, most of the work seems to show that we are generally within the balance of capacity. And where we're not, the government will actually reduce our tonnage or make us take steps to reduce our input into the environment.

In general, research seems to show in the UK that within three to 24 months of a site not being used any longer, the sea bed recovers to what they term a natural state. Water column monitoring studies around the UK and from around Shetland are showing that there's no different in the nutrient levels in the water with high aquaculture activity and the offshore control samples.
Next slide please.

I would suggest altering the wording of the phrase, with 50 percent, to read, the aquaculture facility must include a suitable waste management plan approach, which must, one, demonstrate a provision of scientific evidence that the facility is not having a long-term irreversible negative impact upon the surrounding ecosystem, benthic, or water column. It would be in the interest of the farmer to do the testing to prove that we're not damaging things.

I'll not touch on feed management because we really don't have the time. I've already got my one minute, so we'll move on to the next slide. I'll just urge you to speak to the feed manufacturers and make sure that we get a workable standard.

And I would just like to thank you again for the opportunity to speak. And if there's any questions, I'm happy to take them.

CHAIRPERSON DELGADO: Questions?
Thank you very much. We move now to Dick Martin, who has a proxy for Neil Sims.

MR. MARTIN: I tried to practice my Aussie accent, and it didn't come out very well, so I'll do my best. On behalf of Neil Sims from Kona Blue, the NOSB Livestock Committee and members of the Aquaculture Working Group are to be commended for their diligence and perseverance in developing draft organic standards for fish feed and net pen systems. This is a very political process, but it seems that we have been able to move towards broad general acceptance of the need for organic standards that include net pen culture of marine fish.

It may be helpful to recall that politics is the art of possible. In several cases, however, what is proposed in the Livestock Committee's recommendations is simply not possible. Organic standards were developed for terrestrial agriculture firstly by developing the practices on the farm and
then by codifying these practices within the organic rules.

Here, however, the Livestock Committee and others who have commented are proposing rules for organic aquaculture that have no basis in farm practices. It seems that the basis for some of these rules is an obtuse desire to wish into being a more holistic, biodynamic, ecosystem-based way of life. It's admirable, but it's illogical. And the standards are impossible to meet in two glaring ways. One, nutrient recovery. The requirement for a performance target recycling of a minimum of 50 percent of all nutrients has only ever been achieved in non-commercial research trials. Even if it were possible to do this, the adverse environmental impacts of growing that much algor or bybel biomass would be far worse than the impacts of the nutrients themselves.

The best approach to minimize adverse environmental impacts is to encourage
fish farmers to locate their net pens and sites with optimum water flow. Yet, this obligation for nutrient recapture compels the farmers to relocate their net pens in areas where nutrients will stay concentrated and available to other trophic levels.

Please remember all of the available evidence suggests that in open ocean aquaculture there's no measurable nutrient loading in the effluent. Please refer to the water quality monitoring data on our web site, konablue.com.

So if there's no impact, what are we trying to save and preserve here? Why should we not let nature assimilate the nutrients and use them as she sees fit? Why is there this compulsion to force the farmer to do in a concentrated fashion that which nature can accomplish far more effectively in her own diverse, disparate, and dispersed manner? Why must we be so self-absorbed to think that we humans must derive the benefit
of nutrient recycling? Is it not sufficient, is there not still intrinsic value to have the ecosystem cycle the nutrients through?

That's the key premise of the open ocean aquaculture: to work with the ocean's ecosystem. To insist on capturing the nutrient recycling for human use, is to say that open ocean aquaculture can never be organic.

I, therefore, propose that the wording for the nutrient recapture provision include an exception that provides for net pen sites in highly exposed offshore locations to be exempted from this requirement, that they can demonstrate that there's no appreciable increase in nutrients from farm operations.

Second, on fish meal and fish oil sources, the Livestock Committee has previously rejected the notion of using poultry or other organic terrestrial animal byproducts in fish feed primarily on the basis the European organic standards do not allow
the use of terrestrial byproducts. So why
then would Livestock Committee not embrace the
only meaningful alternative that's been
adopted by the Europeans and allow the use of
edible seafood byproducts from sustainable
fisheries?

Yes, Kona Blue has shown at a
research scale that we can reduce fish meal
and fish oil levels in the diets of Kona
Kampachi to a one-to-one ratio of wet fish in
to wet fish out exists. But, we can only do
this by using edible seafood byproducts from
a sustainably-managed British Columbian Hague
fishery and by using poultry's processing
byproducts, as well. What organic principle
does this offend? Is it recycling? Is it
reuse the nutrients? And is it impossible?

We would contend that organic feed
should rightly be able to be included in
edible seafood processing byproducts from
sustainably-managed fisheries and processing
byproducts from organic poultry in unlimited
quantities. If you feel so compelled that you must restrict one, then so be it. But you cannot prohibit both and expect to be able to encourage growth of an organic fish farming industry.

I rarely agree with Food and Water Watch. I wholeheartedly endorse Patricia Lovera's comments to the NOSB dated 11/3/2008, where she asserts that the goal of organic culture systems should be to minimize environmental impact and promote biodiversity. I believe that allowing for natural assimilation of nutrients in open ocean net pen systems and encouraging the use of edible seafood and organic poultry processing byproducts in fish diets helps to minimize environmental impacts and promotes biodiversity. Your rule-making should reflect this. Sincerely, Neil Sims.

CHAIRPERSON DELGADO: Thank you.

Any questions? Hugh?

MR. KARREMAN: Just a question.
What other species use net pens other than salmon? Like the Kona Kampachi obviously, but what other ones? Like what percent of the industry?

MR. MARTIN: The bass fisheries.

MR. KARREMAN: And are they near the shores, or are they -- he's out in the open water. He really means way out, right?

MR. MARTIN: Well, there's gray area there. Some are near the shore, and some are open water but they're still within, you know, it's not as if the horizon doesn't have land. They're not hundreds of miles offshore. They're still manageable by easy access, but they're considered the open ocean because they're not in protected area. You also have cobia production. That's just starting, but that's going to be a huge species that's going to be coming forward. You have, sable fish is now being experimented with, halibut is being raised, cod is being raised. They are a combination of in-shore and I wouldn't say
classically offshore like Neil's but somewhere in between.

Everyone would love to be offshore, but then you run into nature. You run into weather, and you run into practical situations. For example, aquaculture is a very low carbon, I would almost consider it a carbon-neutral industry. You're not burning fossil fuels to propel this industry forward. But if you start going offshore and you start using -- I mean, it's relative, but still it's a relatively, part of it is the management of being able to physically get there and back and manage the fish sensibly and practically.

MR. KARREMAN: So there is a growing market or growing industry of other species than the salmonids?

MR. MARTIN: Absolutely. Absolutely. We don't see it that much in this country. It is imported in this country, but it's mostly used as a whole fish. And here we don't consume that much whole fish, small
whole fish. We don't cook whole fish at home.

MR. KARREMAN: And are these other species that you're talking about, are they, do they migrate between salt and fresh water at all? Say in the salt water, they're permanently --

MR. MARTIN: No, not all. Not all. Bass and green do not. Cobia, I don't think cobia, I think that they exist just in the sea. They're a tropical breed, same as Neil's fish.

CHAIRPERSON DELGADO: Okay. Any other questions? Okay, thank you. We will recognize you in a minute. Thank you very much. Up next is Ramkrishnan Balasubramanian, and after that is Patty Lovera.

MR. BALASUBRAMANIAN: Well, thanks, Rigo, for trying to pronounce my first name and last name. Well, thanks, everyone. First of all, thanks for a good recommendation. My name is Ram, and I'm the Certification Program Director for QCS, and we
do operate a private aquaculture program.

The 2000 data from the Food and Agricultural Organization, FAO, and the status of aquaculture indicates two things: aquaculture is the way to go for the future, and more and more species are farm-raised. As we define and build the model for organic aquaculture, the aquaculture industry needs to have the allowance of fish meal and fish oil to get jump-started.

Between 2007 and 2008, there were a few peer-reviewed scientific articles published which was carefully studied by our program in which they evaluated different species with a different diet and have concluded the need for fish meal and fish oil for the carnivores. An exclusion of fish meal and fish oil will affect the quality of the final product. This paper identified a few alternatives. However, at this point of the time, it's not commercially-feasible.

Yes, QCS does support the AWG
recommendations, but we also want to be pragmatic and see the Livestock Committee's recommendation as to the way to move forward. However, we have concerns, and also a few clarifications on the existing recommendations.

First, the concerns. I don't know whether this is what the Board wanted to accomplish, the unintended consequences of catching fish species which was never intended to be caught for fish meal or fish oil purposes. And if that's not the case then I will withdraw what I said.

There have been several species, such as menhaden, which is not meant for consumption of human beings, that will be used or seven species which is not exploited in the past could be exploited under this provision. However, we have collected enormous data, and feel comfortable that many, if allowed under the regulation, you can expect in a typical situation the trimmings and fallout by any of
those species can vary up to 20 to 40 percentage. That could be used as the fish meal and fish oil as a compromising position.

And then we seek clarification on the following statements, especially the word, under the 205.252(b), the word minimize. There are several other language, similar wordings, than the word minimize in reference to minimizing the nutrient load into the river. Hugh brought up the question to one of the participants is what is the difference between a water body and the land systems? As many of you may know, 90 percent of the U.S. seafood consumption comes from externally. Some of them are systems that is exactly in a public land system that people use it as a drinking water source. It is being used to irrigate land-based system, land-based production systems, so that's the concern. So as a program, as a certification program, there are many certifiers here, we would have a problem in enforcing this to define what the
word minimize exactly means.

The next clarification we seek as a certification agency is what does the word, sustainable, mean? Sustainable what is to you may not be sustainable to us. It could be social, economic. And when we enforce this, if the rule is passed, it's going to be very difficult.

The third word we seek clarification is 205.252(i) is the phrase, the next recruitment cycle. Honestly, I didn't understand what the Committee is to trying to reference, and we seek clarification on that to be consistent, if this passes, to have a consistent interpretation. And, again, 205.252(m), the word, organic process to remove the contaminates, and I hope these words are better defined or we have more information on this for us as a certifier.

I know it's pretty much early in this part of the process. It still has to be published by the NOP, but I just want to make
sure these are addressed before it goes to NOP
so that you we don't have another chaotic
situation. Thank you.

CHAIRPERSON DELGADO: Questions?

Okay. Thank you very much. Moving on, Patty
Lovera. And after her, we will have Marianne
Cufone.

MS. CUFONE: In the interest of
time, Patty and I consolidated, and actually,
we're all from Food and Water Watch, so I'm
actually Marianne Cufone. Since we were using
props earlier, I thought I would bring one of
my own. We'll see if you can guess which one
is the farmed and which one is the wild. I'll
tell you afterwards.

My name is Marianne Cufone. I'm
here on behalf of Food and Water Watch. We're
a national non-profit consumer action
organization. I'm the director of their fish
program there. I'm also an environmental
attorney. I've been working on fish farming
issues for many years. I sat on the State of
Florida Advisory Panel when they created their aquaculture regulations. I was the Vice Chair of the Gulf of Mexico Fishery Management Council Advisory Panel on offshore aquaculture while they were developing their regulations, and I also testified in front of the National Ocean Policy Subcommittee for the U.S. Senate Commerce Committee when they were having hearings on the national offshore aquaculture legislation. So I have a pretty good history on this particular subject.

When I first heard that the Board was considering standards for organic seafood, I thought, well, it's impossible to label currently any seafood as organic in keeping with the principles of that label. And so I didn't believe that you were actually talking about this.

Then I learned the Board was actually considering labeling carnivorous fish farmed in open pens and cages as organic and, frankly, I was stunned. There's no
requirement to have organic seafood, and we shouldn't be grading on a curve here where better seafood production gets the organic label. That's not what organic is all about. What you're composing is far from what should be called organic, and I just heard people ask for an even lower standard because they don't believe they can meet what you're proposing currently. So I think that's really disturbing.

You asked Urvashi earlier about environmental issues associated with ocean fish farming or open water fish farming. I want to share some of those with you today and let you really consider whether this is something that should be called organic.

So open water fish farms can be really dirty. These farms allow free flow of water between the cages and open pens, so concentrated amounts of food, waste, diseases, and any chemicals or antibiotics that can be used on the cages or in the farms can flow
straight to the waters.

A report about one ocean fish farming facility affiliated with University of Hawaii, you were talking about Hawaii a lot earlier so I wanted to mention this, said that the farm grossly polluted the sea floor and severely depressed sea life. This is not no impact, according to Mr. Sims. This is not no impact. In Norway and British Columbia, numerous problems have occurred with parasites spreading from caged farm salmon to wild salmon.

Open water fish farms can also cause ecological damage. Pens and cages have escapes. There's no way to fully contain the wildlife. It can be due to human error, weather, equipment failure, and a variety of other things. Escapement can affect native populations. Farmed animals are often different than wild fish, whether or not they're the same species. They can change in captivity. A prime example is snapper farm
off of Culebra near Puerto Rico, which doesn't exist anymore, but they used to grow cobia, and the cobia didn't look like wild cobia at all. They were, arguably, the same species, local. But they just didn't look the same because sometimes they change in captivity because things are different in a farm than they are out in the wild.

So these fish can intermix with wild fish, change habits. A lot of fish have learned behaviors, like spawning or feeding. Those things can change when you intermix farm fish with wild fish.

Additionally, farm fish can overtake wild fish. Often, they're bred to be stronger, bigger, reproduce faster than wild fish. And when they get out into the regular population, they can overtake the wild species, and that can change the ecosystem completely over time.

Farm fish can increase fishing pressure on wild fish. We've been talking a
lot about the fish feed issue, and that's really significant. Already, major amounts of wild fish are removed from ocean waters. About 23 million to 33 million tons annually worldwide were used for feed in recent years. One-half of the world's fish meal already goes to aquaculture and nearly 90 percent of fish oil. This isn't organic. Calling fish organic that contain any amount of wild fish just isn't appropriate.

As part of the record of submitting a compilation of scientific and other pieces that discuss assorted concerns with open water fish farms, please review and consider them carefully prior to making any decision about organic seafood. And I'll be submitting those shortly.

I provided a lot of the same information to Congress when I testified before them, and the bill that they were considering wasn't passed. And one of the major reasons was because there were numerous
environmental and human health and economic concerns. To allow fish produced in open water pens and cages to be labeled organic isn't a responsible choice. It smacks in the face of what the organic label is supposed to be. This recommendation is about more than farmed fish. It's about consumers' trust in the organic label. And to change that could really change what people think of organic overall.

I urge you to reject the proposed standard. And we also have 15,000 consumers that urge you, as well. I wanted to submit for the record over 15,000 comments that we had to us to provide to you. I have those on electronic CD. We wanted to save some trees while we're saving some fish. And just also wanted to briefly show you that we also got several hundred postcards, they're included in these, from people that said that they're a U.S. citizen interested in where their seafood comes from, and they urge you not to undermine
the trust consumers have in the U.S. organic label. If fish can't meet the strict standards or organic production then there should not be an organic label. Thank you.

CHAIRPERSON DELGADO: Questions?

Hugh?

MR. KARREMAN: I'm not going to engage you that much I promise, you talked in front of Congress. But I'm just wondering a lot of people are saying, you know, aquaculture, even with the way we propose this in our documents, you know, the standards of aquaculture will be diminished and everything. What in general -- maybe this is a really stupid question, but what in general are people's perceptions of what organic agriculture is right now for livestock?

MS. CUFONE: Well, as long as you mention that, Dale Kelley actually is going to come up after me, and she sort of did a standing poll with people that she talked to on her way here from Alaska. She's come all
the way from Alaska to talk to you about this.

But, generally, people's expectations of organic are chemical-free and made in such a way where environmental standards are considered. Quite frankly, this document needs a lot of work. It doesn't meet the general perception of organic. You know, most consumers don't have the time to do the in-depth kind of study that folks like me do on food and seafood, and so I understand probably better than the average bear what organic actually means. But out in the general public, they think it means something special. And this particular standard that you're proposing is not special.

CHAIRPERSON DELGADO: Any other questions? Thank you. Next up is Dale Kelley, followed by Shauna McKinnon. Next, as I said, is Dale Kelley, followed by Shauna McKinnon.

MS. KELLEY: Good afternoon, and thanks for staying late to take our comments
today. My name is Dale Kelley. I'm the Executive Director of the Alaska Trollers Association. We represent hook-and-line salmon fishermen in Alaska. I'm also on the board of the United Fishermen of Alaska and an officer of Commercial Fishermen of America. And my comments today, such that they are, will represent those groups. And not that this is all about me -- oh, and our offices are located in Juno, Alaska. And, no, I can't see Russia from my house. Let's get that out of the way.

I think you should know just a little bit about me just so you can kind of put my remarks in context because, although I was kind of identified as Food and Water Watch and we work with them a lot, we work with a lot of people on a number of issues with regard to the marine environment.

My schooling includes pharmacy and fisheries biology. I spent ten years in pharmacy before I went over to the fish side.
I grew up ranching. I cultured fish, I've commercially fished, and I've caught fish on my fly rod. So there's many different ways that, as an individual but also as a representative of a large number of fishermen, I look at this issue.

We've been engaged in the fish farm issue from Alaska Trollers Association and United Fishermen of Alaska since the mid 80s when they began talking about farming fish off our coasts, and we didn't like that too much in the state. Our state is a very fish-reliant state, heavily dependent, 150 fisheries, not many more communities than that in the whole state. Most of them are reliant in some format on commercial fishing. My fleet, for instance, one out of every 35 people in my region works on the back deck of one of our boats, and that doesn't count all of the other 18,000 commercial fishermen in Alaska and certainly the 7,000 in my region.

So we are very concerned about the
health of the ocean, and wholesomeness and purity of products, because, quite honestly, people are confused when they go to the marketplace these days. They hear so much about fish. Is it endangered? Should I eat farmed? Should I eat wild? The organic label I think just is adding to some of that confusion, quite honestly.

So, as you heard, I did my little non-statistically relevant scientific sampling on my way from Alaska, and I asked everybody I could. My basic question was, What do you think organic is? What does that mean to you when you see organic? and their response, with one exception, was pesticide free. And I didn't count how many people; that's how bad my survey results were. But I know I asked at least 30, because I was pretty rigorous about it there for a while. We had a delay. The one other person said, her first response was expensive and her second response was pesticides.
So, obviously, people don't understand what the Organic Program really is about and what your standards are, and I'm learning quite a bit about it, and we learned more about it in the late 90s or early 2000s when Alaska fishermen, the state of Alaska even, asked this Board to certify our seafood as organic. There's pros and cons to all of that. I understand all those arguments of why this Board didn't do it, which makes it particularly confounding that our natural and wild product doesn't qualify but a fish in a net pen would. Because what I understand of your standard is that it's supposed to be natural and that these products are kept in a somewhat natural environment. Well, when I was raising full Herefords and they're grazing on a large pasture, you know, pretty low density, that's much more reminiscent of home on the range than high-loaded density net pens hung in an ocean.

Sustainable practices. One of the
reasons the bills have not passed, and I've
worked with our congressional delegation on
legislation for years, one of our major
counts is the managing agency, NOAA, has
gone from a code of conduct, voluntary code of
conduct, to statutes that really aren't
effective and don't involve a national set of
standards, like we have for our other ocean
regulatory processes, that kind of guide what
the national interest is in the ocean.

I see I have very little time
left, but one thing I do notice talking to a
couple folks here is that, obviously, part of
agriculture already manages aquaculture, and
you have a set terrestrial-based program that
I don't really understand very well and I'm
not going to pretend to tell you what I think
I know about it. But you don't have the same
regulatory process in the ocean yet. And I
believe you really need to get national
standards and statutes agreed to by the people
as a nation because once you put those fish in
the water -- we catch Atlantic salmon in our fishery a thousand miles a way from where they're produced. We don't allow fish farming, but we have nonindigenous species that we're catching that are coming from fish farms.

A host of issues. You've heard it all. But I would just announce that you might be very careful before you branch into the ocean for organic standards or anything else involving farmed fish. I'm not going to say good or bad about it; there's just a lot of work to be done before we involve ourselves. They don't seem very organic to me either, as a consumer.

CHAIRPERSON DELGADO: Thank you.

Any questions? Hugh?

MR. KARREMAN: What do you think of what we heard that the EU is doing as far as allowing the byproduct of edible fish to be used for feeding organic fish there in the EU? What do you think of that?
MS. KELLEY: Well, you know, obviously, for the EU, per se, but just full utilization of species is always a good. I mean, I'm all for that. I do think that there could be some pressure put on our regulatory agencies with respect to our TACs, our total allowable catch, in some of these fisheries. I notice in your proposal that it mentions pollock fishery off of Alaska, for instance. This year and probably next year they have taken deep cuts to their TAC from just stocked defines that they're not really sure about. So I do wonder if there would be increased pressure if you have another industry relying on the byproducts of the wild capture fishery to produce. So that's another thing you might not have thought of.

MR. KARREMAN: What if that industry was responsibly managed, or all the other kind of terminology that --

MS. KELLEY: Well, we believe ours is. We're really known for it. MSC, they
came to Alaska to certify our salmon fisheries, because we're known, we have sustainable built into our constitution. It's not even a choice. A voluntary code of ethics for conduct for fish farming was so appalling to me, I'd be embarrassed to ask for it. But, yes, obviously, it needs to be a sustainably-managed fishery. And if I was a fish farmer, if I put myself on the other side of that, and I'm relying on a product and suddenly it's not a deliverable, you know, when you do production over here that's relying on that fish.

CHAIRPERSON DELGADO: Any more questions? Okay. Next is Shauna McKinnon, followed by Rachael Hopkins.

MS. MCKINNON: I don't think that Rachael is going to be presenting. She was the next person. My name is Shauna McKinnon. I'm presenting on behalf of the Living Ocean Society. Living Oceans is the largest marine-dedicated conservation organization in Canada,
and we're based in British Columbia, and we're also one of the seven members of the Coastal Alliance for Aquaculture Reform. This is a coalition that was formed in 2001, and the mission of the coalition is to work together to address the impacts of open net cage salmon farming, and specifically trying to encourage industry and government to change practices to protect wild salmon and to protect marine ecosystems.

Maybe I'll just start by saying that this is the first time that I've presented to the NOSB in person, but I've been with my colleagues submitting submissions for two years now, and I know that the Board has put in a lot of thought to this issue and has a lot of dedication. So I thank you for doing that. And I'm thankful to be having this opportunity to present in-person today.

For the Coastal Alliance for Aquaculture Reform, because we're based in B.C., we spend a lot of time, a lot of
research capacity has gone into documenting
and researching the impacts of open net cage
salmon farms, so that's dealing with net cages
and carnivorous species. Because of this, in
B.C. there is a lot of awareness of the
negative impacts of the industry. So when
speaking in Canada, oftentimes I end up
talking more about the positive aspect of
aquaculture and where some of the
sustainability can be improved and some of the
success stories that are already there.

So I just would like to start with
that, from CAAR's perspective, we support the
development of organic aquaculture standards,
and we support that in types of aquaculture
where the fish farmers can be net producers of
fish protein. So the one-to-one fish in and
fish out would be the minimum standards. And
we also promote the development of aquaculture
where marine ecosystems and biodiversity can
be protected and promoted.

So in the submission that I have
handed in electronically, I deal with both the wild fisheries and the net pens issues, but my comments today are going to focus more on net pens. But if you have questions specifically around the wild fish, I encourage you to ask me questions.

So the reason why I'm here, coming all the way from Vancouver, is because Canada is one of the world's top producers of net pen farmed salmon. And, basically, all farm salmon production is done in net pens at the moment. Roughly 90 percent of the farm salmon produced in Canada is exported to the U.S., and that's why the standards that the NOSB is developing are very important to our own production systems.

So pretty much all of the fresh farmed salmon that you buy in the U.S. comes from Canada, and pretty much all of the frozen farmed salmon you find on your shelves will be coming from Chile. So this is an industry where you're very much relying on exports.
So because there is so much farmed salmon production in Canada, there is years of research that independent scientists and conservation groups have been engaged in to better understand the environmental impacts from hundreds of thousands of fish being raised in net pens. And there were questions earlier about why is there so much focus on salmon. Well, it's mainly because salmon is the biggest experiment that we've had in net pen fin fish production, so that's our best example of what some of the problems can be and how we need to address those.

So the results of these research really do not show an optimistic picture for making net pen production more sustainable. In fact, a global study conducted last year and published last year found that everywhere salmon are farmed in net pens wild salmon and trout suffer. From a metanalyses, they found that for every 1,000 metric tons of net pen salmon produced, wild salmon and trout
populations decreased by one percent. So in many areas, this translates to more than a 50 percent decline in wild stocks near farms.

I've gone way over time, so maybe I'll just quickly hit on some of the main points. For one of the standards that are in the proposed net pen standards, Section 205.255 states that net pens must be fitted to avoid migratory routes of native species and to avoid disturbing reproductive patterns of local species, I'm very happy to see that in there because it shows that the NOSB has been listening to the science, what the science is telling us, which is wild fish need to be separate from net pens. They cannot be in the same place because net pens do not offer ways to control the spread of parasites and disease between farmed and wild fish. Escapes cannot be controlled in net pens, and in organic production in Europe escapes are continuing. And that does have ecological implications for wild fish.
And maybe in closing what I would really like to focus on is that the U.S. does not need to take Europe's lead on certifying open net pens. Just as in U.S. organic livestock standards, you continue to prohibit use of antibiotic and chemical treatments, unlike in Europe. Net pens can be kept out of the U.S. standards.

Research is showing us that the most environmentally-sustainable aquaculture practices are those that use closed contained systems, like ponds and solid-wall tanks, on land or in the ocean because these systems offer ways to ensure waste is recycled, limit the flow of disease and parasites, control escapes, and reduce algae blooms. So these are all things that are needed to be done to control escapes. Thank you.

CHAIRPERSON DELGADO: Questions?

MR. KARREMAN: So how would you, what do you think about using byproducts from edible fish for salmon in containment tanks?
MS. MCKINNON: That's a good question. I think one of the things you need to look at is separating organic standards from what would be the most sustainable option because I think the questions around using wild fish in feed are very different for organics than if you were looking to create a single standard outside of organics. So just to speak from a sustainability perspective, yes, recycling nutrients is a good option. But as the speaker before me suggested, creating a demand for fish that may not always be there can be problematic, and you don't necessarily want to build your whole production on a resource that's not in your control.

CHAIRPERSON DELGADO: Any other questions? Thank you very much. Next is Jim Pierce, followed by --

MS. FRANCES: Actually, next is --

CHAIRPERSON DELGADO: Sorry.

Okay.
(Simultaneous speakers.)

MR. PIERCE: Then if it's okay, I can go ahead and split my five minutes with Mr. Israel Snir, who is a Honduran net pen tilapia producer. So you're going to lose all the humor out of this one. I'll try to keep it to two minutes. Ready?

Okay. For the record, I'm Jim Pierce, rainbow trout producer, in support of the aquaculture recommendations for fish meal net pens on behalf of the Aquaculture Association of Wisconsin. Good job, Livestock Committee, for consuming and digesting the myriad of information from the symposium and especially from us, the fish farmers, and for constructing tough love goal-based standards.

These recommendations, on a macro view, represent goal-based continuous improvement policy that clearly meet the tenets of organic farming through the established system of an auditable organic system plan, such as we encourage you to do.
Heed the producers, not the obstructionists, and please pass these recommendations.

The ten-year step down allowance for fish meal including stringent contamination testing and labeling for consumers is a bridge to a shifted paradigm where innovative fish farmers will be able to demonstrate to the world that, like pork and poultry, there are better practices than conventional and net pen production. There are better practices than conventional net pen production.

The idea of a separate section of aquaculture practices is a wonderful idea since siting, raising, feeding, and other practices are so very different. However, the creation of Section 611 and 612 as a separate list for approved aquaculture materials is not a good idea. Fish are livestock. The two lists can and should be combined.

I thought I would also rely on a prop. Again, thank you for your dogged
efforts to get these recommendations out. The Wisconsin Aquaculture Association feels that there's a valuable market niche and significant consumer allegiance to be captured with an organic label, not only for vegetarian species but for all farm-raised fish. We urge you to pass them, to include them with the recommendations that have been passed already and, most importantly, continue communicating with the fish farmers. And I will now cede to Mr. Israel.

MR. SNIR: Okay. Thank you, Jim, for inviting me on behalf of the AWG. I changed my plans to be able to share with you. I have three minutes, so I'll do it quickly, and I guess tomorrow I'll have a couple more minutes.

Okay. I represent the Regal Springs Group. We are the world's largest tilapia producer, fresh and frozen, 20 years in operation, over 50,000 metric tons in production in Honduras and Mexico. I'm not
here by myself. I'm here on behalf of the
more than 4,000 employees and tens of
thousands of their families and communities,
the people who are producing your food.

We all should agree that all
people, regardless where they are, the
language, the money they have, their religion,
all deserve to eat better and healthier food.
Regal Springs makes it happen every day and
night directly and indirectly. Regal Springs
tilapia is the world's largest net producer of
organic tilapia fillets. In El Cajon in an
artificial, fresh water hydroelectric
reservoir. In Honduras is where we work. Our
aquaculture facility is fully embedded with
people and nature, enough to mention that this
very lake is the home to 5,000 protected
crocodiles habitat, and we all live in peace
and harmony.

Organic, for us, is not the
product, it's a way of life. The goal is
organic communities producing organic food for
better health, better education, housing, nutrition, and more. Our company, Aquafinca, since four years ago is recognized and certified by two of the leading organic certifiers in Europe, Natural Land and Biospace for reproduction and processing of frozen and fresh tilapia fillets for the EU market. We can convert all Aquafinca conventional production to organic if it is readily available, and it is not. Our diet is vegetarian. We feed no animal products, byproducts; and, therefore, solely depend on organic grains and cereals byproducts for human consumption.

However, our desired market is America. Regal Springs has a supplemental interest and is eager to be able to service our natural markets and, therefore, seeking to be certified as soon as possible by the USDA. We have the ability in short terms to continuously provide you with our organic tilapia fillets to satisfy your very demanding
markets from our fully vertically integrated
truly organic tilapia fillet operation.

Along the years, Regal Springs
tilapia has developed, created and
demonstrated its own religion to make our
company sustainable. We believe we found the
balance between environment, people and the
economy to offer the new holy triangle for the
aquaculture industry. Our slogan, It is not
about fish, it is about people, became a
reality in our project. We speak five
languages. We operate in three continents.
We practice four religion. The tilapia is our
first and most common.

We close the cycle. We are closed
net producer. We have zero waste. We have
zero chemicals. Our lakes are stocked and
naturally populated with indigenous wildlife
creatures surviving on our feed also. All our
processed byproducts are utilized for fish
meal, oil. All of those could become organic.

We are operating in a reserved
area for the dramatic changes life of the
surrounding communities and for such better
preservation of the natural wildlife and
forests by the local communities. Our
communities are greener. Our water is
cleaner. Our people are healthier. We desire
to make our product available for your
markets. We fully support the proposed AWG
standards. We found them workable and really
seek for promoting the common goals. Thanks.

CHAIRPERSON DELGADO: Questions
for our speaker? Dan?

MR. GIACOMINI: Yes, Mr. Israel,
as host of AWG Livestock Committee net pen
recommendation, do you find that workable?

MR. SNIR: Very much so.

CHAIRPERSON DELGADO: Any other
questions? Thank you both. Up next is Becky
Goldburg. And, Marty Mesh, you decided to go
after? Marty will go after Becky.

MS. GOLDBURG: Well, thank you. I
want to begin by saying I'm, of course, Becky
Goldburg, and I am a member of AWG and a former member of the National Organic Standards Board. I recently moved to a new profession professionally as the Director of Marine Science at the Pew Charitable Trust. That said, I want to make very clear that I'm speaking today only for myself and not for Pew, which has not established a position on the proposed organic aquaculture standards.

I first want to thank the Livestock Committee for all their hard work on drafting standards for fish feed and net pens, and I really appreciate all the time you put in. I've seen it from a distance. That said, I think the draft standards could benefit some from further revisions, and I'm going to make a few suggestions today.

The first thing I want to do is, particularly to the net pen standards, to emphasize the importance of a utility of using performance standards. I think it's safe to say now that there's a wide agreement among
people who worked on environmental issues that it makes sense to use performance standards when possible. In other words, to specify as a standard a measure of impact that is de minimis or acceptable.

Such performance standards have several advantages. First of all, they help to spur innovation, as they're not prescriptive about which practices must be used to achieve a goal. Second, they also ensure that an environmental concern is addressed, rather than simply prescribing practices that must be followed and-- we hope-- address an environmental impact.

As you well know from just today and many other NOSB meetings, the environmental impacts of net pens in aquaculture are highly controversial. In my eyes, many of them are well documented, especially in salmon farming. Employing performance standards provides a means to ensure that these impacts are actually
addressed. And I'm delighted to see that the Livestock Committee has recommended at least some performance standards. The best example is the requirement for the 50 percent recycling of nutrients, by which I assume the Livestock Committee intends to be nitrogen and phosphorus, and a little clarity on that might be useful.

That said, by drafting such a measure, you're ensuring that environmental goals are met, and you will meet the high bar for organic production. Should the NOSB choose to further revise the net pen standards, I would really urge you to look towards additional performance measures where possible.

That said, I'd now like to talk briefly about three issues with the proposed feed standards. And as you're aware, there's some very good policy and ecological reasons not to allow wild fish in aquaculture feed used in organic production. Some of these
were well described in Mark Bittman's article on seafood which appeared in this Sunday's New York Times and, I gather, was distributed to you earlier this afternoon.

For practical reasons, the Livestock Committee and the AWG both have recommended a step-down provision to end the use of fisheries products and feeds— or at least wild fisheries products and feeds. However, I'm concerned about the ambiguity at the end of this step-down process as currently proposed.

The proposed standard in 205.612 reads, "The following non-synthetic substances may not be used in organic aquatic livestock production: fish meal and fish oil from wild caught fish and other wild aquatic animals, except"— and the except provides for 12 years of step-down, ending with an allowable five percent inclusion rate in years 11 and 12. But there's no mention of what happens in year 13.
So it's possible that this standard could be interpreted as continuing to allow fish meal and fish oil use. That's clearly problematic, and I urge the NOSB to clarify this language so it ambiguously steps down to no wild fish.

Another issue that's critical to address is the use of the word "sustainable" to describe fish used in feed. Sustainability is not so easy to determine, especially for small in the food chain or forage fish typically used in feed. Forage fish populations play critical roles in marine ecosystem health. Forage fish consume plankton and become food themselves, transferring energy throughout the marine food web up to top predators.

By conventional fishery management measures, most forage fisheries are actually not in trouble. This is largely because these measures focus on maintaining enough fish in the water to replenish populations. However,
what conventional single species fisheries management fails to recognize is the compelling scientific rationale to leave additional forage fish in the water to support marine food webs.

Setting what are called total allowable catch levels that account for the ecosystem roles of these fish appears critical to ecosystem health. The science of setting such catch levels is emerging, although several jurisdictions ranging from the state of Washington to the country of Peru are trying to do so. But the proposed standard does not make clear the need for such management. If the term "sustainable" is used, I urge that language be added to make clear that a sustainable forage fishery encompasses an ecosystem definition of fisheries management, not a single species one. Another alternative would be simply not to use the term "sustainable," but please don't leave the recommendation as it is.
The final point I'm going to make in two seconds, condense it, is that you have a requirement in 205.105(f), which is a provision that says that the amount of wild fish that goes into feeding aquatic animals cannot exceed one pound of wild fish product fed for every pound of live cultured aquatic animals harvested. You really should say wild fish fed for every pound of aquatic animals harvested. Otherwise, "wild fish product" could be interpreted as "dehydrated fish," and you end up with a lot more fish-in and fish-out. Thanks a lot.

CHAIRPERSON DELGADO: Questions?

Thank you. Next is Marty Mesh, followed by George Leonard.

MS. FRANCES: George Leonard sent me an email that he couldn't be here, and he offered to share with Shauna McKinnon. And I don't know if she's to deliver oral comments or just --

CHAIRPERSON DELGADO: Oral
comments. So next up will be George Kimbrall.

MR. MESH: My name is Marty Mesh, and I used to have Bellevue Gardens Organic Farm, which is still in existence. I serve on the board of the Southern Sustainable Agriculture Working Group on the board of the Organic Trade Association, and none of my comments should be interpreted as the OTA policy as the Executive Director of Florida Organic Growers and its certification program of QCS.

I want to thank the Board and the committees for all the work that you've done. Thanks goes to the department. Welcome to the new folks. It seems like they've already left. And I wanted to say thanks to Richard Matthews for his years of work if, indeed, this is the last meeting that we'll see him. Something tells me it probably isn't.

I did have a comment on the meeting space and, you know, the public's desire to have public comment and input and
watch and listen to the Board's work would
call for a little bit larger room that would
actually have people able to sit down.

I have some comments to make from
Elizabeth Henderson, an organic farmer, on
this seed issue, and so let me read those to
get them into the record. "I'd like to second
the comments in regard to commercial
availability and sourcing of organic seed (see
below), and I'd like to add the following
comments. As a farmer, I can tell you that
our farm has attempted to increase our use of
organically-produced seed. On our farm, we
grow a great diversity of crops and varieties
of those crops, over 250 varieties in all.
Every year, we try new varieties that are
organically-grown in our effort to replace
non-organically grown varieties. However, the
quality of at least some of those seeds is
really poor. For example, fully half of the
organic mammoth melting snow pea seed that we
used this year was not snow peas but some sort
of inferior shelling pea. Organic seed potatoes are in short supply, very high in price, and require expensive shipping. Repeatedly, we have been given our money back on organic potato seeds because it was diseased. We submit a long list of non-organic seed used to our certifier every year explaining these problems. The NOSB requirement to document calls, faxes, or e-mails to seed suppliers does not make sense for vegetable growers. We order seed from catalogues, hard copy or online, and we should be able to simply show that they consulted the seed catalogues of three or more companies that carry organic seed. Many thanks for your attention. Elizabeth Henderson."

In Vermont, I'm getting farmers who submitted formal comments that I have here to read, if you'd like. And if I do read them, you'll save yourself five minutes later on from the Vermont person who will also talk about pasture if I read them.
The bottom line is that we also have concerns about the seed issue and urges some caution as the young organic seed industry blossoms and finds balance with the regulatory overburden threat. I would like to suggest the possibility of forming a working group to come up with recommendations to include the seed industry folks, growers, and certifiers. I believe earlier today I did an informal poll on the re-certifiers, farmers, that were willing to serve on such a working group to try to come to some bottom ground by the organic seed industry folks, as well.

Fish. I'm hopeful that, as I have stated for years, that the opportunity to move forward with regulation for aquaculture, which would allow innovative pioneers to differentiate their products in the marketplace. These folks would serve as leaders and examples in how production teams can be adopted and approved to improve not only their own bottom line but as a solution
to global challenges in environmental damage. We hope an aquaculture standard serves as a challenge for aquaculturists, which many have stated publically they're willing to try and meet, not looking for a way to call what is being done as organic.

I urge my colleagues in the environmental and consumer communities to at least embrace an opportunity for paradigm change for an industry to be jump-started in aquaculture. We've advocated for years, and if we had gotten started then we would be years down the road towards having an organic aquaculture industry and the environmental benefits that go with it.

I have a response to the person on the orange pulp petition. I have a proxy. The orange pulp position-- I'd like some additional time to engage in discussions with the petitioner, to do some research, and talk to citrus folks in the organic industry to form a more updated opinion. I noticed some
of his figures were old and outdated with 1999
and 2003 references.

Which brings me to okra, an okra
update. A follow-up to the okra situation,
FOG, Florida Organic Growers-- and no southern
okra grower has ever been contacted by the
petitioner or Campbell's, who mentioned that
you guys were interested as well in the
organic okra product-- or the petitioner,
General Mills, that I know of, with any
specificity such as variety desired, amount to
be contracted for, or any talk about fair
pricing or contract details.

For comments directed to me about
the clock is ticking, they should be more
directed to the petitioner or companies
wishing to use non-organic okra as to the
progress of outreach undertaken by them. I
still believe that this could be a great
poster child of a project if companies would
act fairly, responsibly, and put as much
attention to sourcing organic okra as they did
to petition it.

Maybe the rest of it is for tomorrow. And if you want Vermont Organic Farmers' statements, I have those documents. I believe you've already received them in written form from Vermont Organic Farmers.

Oh, the 100-percent organic. I knew there was one more. We agree with Oregon Tilth's positions. To save time, we won't go into it. We certainly need clarity in the industry, and as long as that organic sharing pie that Richard was talking about could have the oxygen taken out and put nitrogen in so that it wouldn't spoil-- you know, the same way as the organic coffee producers that wanted to put nitrogen at the very top and take the oxygen out so the coffee beans stay fresh and call it 100-percent organic coffee, then we support the position, and I confirm that that was their intent as well, although she didn't talk about the packaging flush.

Thanks.
CHAIRPERSON DELGADO: Is there any questions, Steve?

MR. DEMURI: Do you have reason to believe that there’s a lot more organic orange pulp available than what the petitioner has told us?

MR. MESH: Without an opportunity to do some more investigation and really look at acreage and talk to people in the organic citrus industry, I wouldn’t want to go on the record. You know, but the speaker—again, some of the data they show is 1999. This is 2008. While I recognize that data takes years to sometimes assimilate, gather, and publish, 1999 data to encourage you all to approve a petition for non-organic material— or 2003 was the last reference, I believe, that I saw—seems at least to deserve a little bit more updated attention to data. And I offered to do that, and I offered to engage in conversations with them, as well.

CHAIRPERSON DELGADO: Any other
MR. MESH: We also have a transition program right now on organic citrus in Florida to help growers reduce or eliminate the use of pesticides. It's ongoing right now, and with the farm bill, you know, we believe that there's going to be more reason for growers to transition. If you put something on a list like that, you know, it's one less reason of a byproduct that would be available to them to sell.

CHAIRPERSON DELGADO: Any other questions? Thank you. Up next, George Kimbrall.

MS. MCKINNON: I'm actually going to deliver the comments for George Leonard. He prepared spoken comments, but it will be quite quick.

CHAIRPERSON DELGADO: You desire to get those comments out of the way?

MS. MCKINNON: Yes, I said that I would.
CHAIRPERSON DELGADO: All right.

Go ahead, please. You've got five minutes.

MS. MCKINNON: So I'm speaking today on behalf of George Leonard, who's the Aquaculture Director at the Ocean Conservancy, and he also submitted comments electronically, which hopefully can be distributed to everybody.

MS. FRANCES: You can e-mail today.

MS. MCKINNON: Great. Yes, I submitted them very late. So, on behalf of George, thank you for the opportunity to comment on the proposed organic aquaculture standards for feed in net pens. Ocean Conservancy has engaged in the NOSB's deliberations on these issues over the last several years through George Leonard's current affiliation with Ocean Conservancy, as well as previous affiliations with Monterey Bay Aquarium. We commend the National Organic Standards Board for their diligence in
 attempt to resolve these substantial
challenges surrounding the concept of organic
in open net pen farming.

As the Board is all too aware, the
issue is both intellectually complex and
politically charged. A large number of
conservation, fishing and consumer groups have
been and continue to be opposed to fish meal-
dependent species grown in open net fence
systems being unable to receive the coveted
USDA organic label. There is considerable
merit to the arguments that have been made to
date before the NOSB.

At this stage in the debate, NOSB
must make a decision about which of the two
potential paths to pursue to resolve this
issue. The first and simplest path is to
exclude net pens and fish meal and oil-
dependent species from consideration of the
USDA organic label at this time. This would
allow U.S. organic fish farming industries to
develop a low trophic level species, such as
catfish, tilapia, and shellfish, while a reliable source of organic feed is developed and sustainability solutions for net pen aquaculture are explored.

The second, and much riskier path, is to allow wild fish net pens to move forward, as reflected in the proposed organic aquaculture standards. The success of the second path is far from assured. It is highly dependent on developing successful compliance and verification procedures and seriously risks the reputation of the organic label through both consumer confusion and allowing environmental degradation to occur under the auspices of the USDA organic program.

Like many conservation groups, Ocean Conservancy remains troubled that the Board appear poised to pursue the second path. We believe the most prudent approach is to reject the proposed standards and return to recommendation to exclude wild caught fish in net pen systems at this time.
Should the NOSB move forward with its current approach, we conclude that it must fully embrace performance-based metrics throughout all of the standards, and build a robust mechanism for their verification for the resulting standards and certified product to be able to withstand public scrutiny. And more formally making our case, in our written comments we build on a discussion paper authored by Cory Pete and George Leonard and delivered at the NOSB Organic Aquaculture Symposium in October 2007.

We conclude that should the NOSB not be willing to fully embrace performance metrics for wild fish in net pens and fully support the development of a verification and compliance system, then we would strongly recommend that the Board choose to exclude wild fish in open net pen systems from consideration for organic status at this time.

Given the substantial environmental challenges of these production
systems and the high expectations of organic consumers, there's only one chance for the NOSB to get it right. If the Board has any doubt that these issues cannot be satisfactorily resolved, the proposed standards as written is ill-advised. Thank you for your consideration of our comments and for entertaining our written submission.

And I would just add one thing. If you do have a chance, in the full submission that George Leonard submitted last night, he goes into great detail of what performance metrics could be for each of the impact areas, and it's definitely worth reading through and considering.

MR. KARREMAN: George has given a very extensive review of performance metrics. I was just wondering, as far as everyone—well, a lot of the people that would be opposed to us moving forward on the second path, as you say, always say, "why don't we start slow and kind of explore net pens and
see how it goes." I just wonder what kind of
time frame would you think if we just had
tilapia and catfish starting in? What kind of
time frame do you think it would take in years
or decades to have enough fish meal and fish
oil for other species that need that for their
diet?

MS. MCKINNON: I'm definitely not
in the position to give you an answer on that
because I'm not an aquaculture researcher. I
can tell you that one of the biggest
innovation areas in aquaculture right now is
exploring the reduction of the use of wild
fish meal and oil because it's very expensive
and it's a limited resource. So there's a lot
of research going into substitutions,
including innovation and using algae. There's
one producer in B.C. that's looking at using
milk proteins as a substitute. You heard
earlier about Neptune Industries and using
insect feed as a protein source.

I mean, it's difficult to give an
answer to say what the innovation period would be, but it's definitely something that's moving ahead with or without the Organic Program.

MR. KARREMAN: But shouldn't we be, in general, for organic animals, feeding them through their natural instinct of needs? You know, at the symposium, we heard a lot about feeding corn and soybeans, and then we get the synthetic amino acids, and that sounds a lot like poultry, which right now in the organic industry are not fed actually their natural diet at all. And so, you know, philosophically, do you think it's ever going to be possible to feed fucivorous fish what they truly instinctively want, instead of giving them an alternative substitute that doesn't satisfy their natural behavior actually?

MS. MCKINNON: Well, if you're looking for a way to feed fucivorous fish that have been expressing their natural behavior
and eating their natural diet, then wild fish
would be the choice you would make. So it
does raise the question, if there are fish
that can't fit within the Organic Program and
the current organic standards then it does it
make sense to include them in the program?
But I'm not expressing the opinion of George
Leonard at the moment. I hope he would agree
with me but--

MR. KARREMAN: Probably.

MS. MCKINNON: I can't say that
for sure.

CHAIRPERSON DELGADO: Any other
questions. Thank you very much. Moving on to
George Kimbrall, followed by Deborah Brister.

MR. KIMBRALL: All right. Good
evening. It's not afternoon anymore. I'm
going to try to keep this brief. My name is
George Kimbrall. I'm an environmental
attorney with the Center for Food Safety, so
I'll keep it brief because I'm tired and so
you all must be exhausted. And, secondly,
many of the colleagues here that have come
from other, the alphabet soup of non-profits
that have been present have provided
substantial comment on these aquaculture
issues and the environmental impacts thereof.
Also, I'm a lawyer and not a scientist, so
I'll try to stick to that.

The Center for Food Safety is a
non-profit membership organization that works
to protect human health and the environment by
curbing the proliferation of harmful food
production technologies and promoting organic
and other forms of sustainable agriculture.
CFS represents members throughout the country
that support organic agriculture and regularly
purchase organic products.

We've been part of this process
throughout, I think working on it since 2001.
This is my first time presenting in front of
the Board, so I appreciate the opportunity to
comment here today. We did file substantial
comments on the proposal, 25 pages, 100
footnotes or so, so I also would fall back on
that, as well as our earlier comments, for
anything that I leave open.

So along with the people that have
presented from Food and Water Watch and
Consumers' Union and Ocean Conservency and
CAAR and anyone else that I left out, we're
opposed to the standards, and we stridently
urge the Board to rethink them and go back to
the drawing board on the standards. We don't
think they meet the high organic standard. We
think they undermine the organic standard.

With regards to the net pens,
you've heard quite a bit about the
environmental impacts. You know, the science,
I think, is pretty clear that escapes are
unavoidable, that there is the principle of
biodiversity and conserving that with regards
to organic that I think places another layer
on top of that and makes the idea of open
water net pens contrary in that way.

I mean, producing fish this way
may be the driving force behind the fish farming market. I think it is. But we don't think that's enough reason to mislead consumers by applying to it the organic label. Again, as others have said, we think fish in closed systems where inputs are organic and can be controlled and contained should be certified organic. That's where we would start.

One thing I haven't heard yet is the use of the natural behavior standard. It seems to me that the Committee's proposal is somewhat contrarian in that it uses it with regards to the feeds and expressly denies that it applies with regards to the net pens. This strikes me as classic arbitrary and capricious behavior if there was a regulation interpreting a statute. It cannot decide to abide by the standard when it chooses only when it suits its purpose, i.e. only for feeds but not for net pens.

With regards to the fish feed
issue, CFS again believes that only wild
caught fish should not be used to obtain
"organic fish meal and fish oil," and that
allowing to do so is contrary to OFPA, the
implementing regulations, and the prior
recommendations of NOSB.

Feed of up to 25 percent is not a
supplement in any common sense meaning of the
word. Moreover, the definition of "fish meal
and fish oil" is as feed, not as a supplement.
Under the proposed rule or the recommendation,
fish meal would be considered livestock, which
is an agricultural commodity and therefore
feed and not a feed supplement or a feed
additive. This loophole that's created by
this proposal we think is much larger than
just aquaculture and creates a very bad
precedent that undermines the entire organic
standard in this way.

Nor is requiring the "sustainably-
sourced" label on wild fish a remedy for this.
The public would still be led to believe that
USDA approves of this practice by the application of the organic seal. Since sustainably-sourced is an unenforceable and undefined standard, the label would be misleading.

It is true that the Stevens Act allows the possibility for wild fish to eventually be labeled organic. However, as we heard earlier today, we don't view this as an implementing regulation outlying that statute. Rather, we view it as an attempt to circumvent any possible regulation along those lines by using wild feed as a supplement as an end around that regulatory requirement.

The reality is, there are substantial, perhaps insurmountable, challenges to labeling wild as organic and that the wild label, as you heard earlier from the Alaskan fisherman that was here, no longer needs or wants it. Thank you.

In conclusion, CFS believes that aquaculture systems that do not deploy fish
meal and fish oil and can meet the recommended standards should be the first products to the organic market. There are substantial gains that can be made in displacing fish meal and fish oil in the diets of some marine species, and the desire to enter the organic market can serve to further stimulate urgently-needed research.

The Committee has stated that, to quote, "only allow organic certification of low trophic-level species would greatly limit organic aquaculture under USDA standards."

This cannot possibly be a basis upon which to allow organic certification. Yes, a different standard would be more limited, but it would also be meaningful.

So we call on the Board to reject these standards on fish feeds in open water net pens. Thank you.

CHAIRPERSON DELGADO: Any questions?

MR. KARREMAN: Just one question
on the arbitrary and capricious activity of
the Board regarding the natural behavior being
suppressed by net pens, if I understand it
right from salmon farming, they usually start
running at about six years old, and the salmon
that are usually filleted are about 22 months
before they would ever run and go spawn. So
in a sense, it's not inhibiting their natural
behavior at the time that they would be
slaughtered. But also, parallel to land-based
agriculture, certainly there are pens that
stop animals from running around. I mean,
calves, baby calves, I would think you would
push for, have to be on the mother cows. I
would think, just in your logic right there,
have to be with mother cows, so I --

MR. KIMBRALL: I think it's apples
and oranges, frankly. I think that's part of
the problem within organic aquaculture
standard. You know, it's a different beast
entirely. So you have to make those
logistical changes to address it, but we also
don't have wild herds of cows roaming around, we have to worry about becoming genetically deformed based on escapes of farm-raised cows. I mean, we have a surviving, thriving commercial hunting/gathering society here on the one hand, and the impacts there are going to have to be taken into consideration.

With regards to the natural behavior, I think you're respectfully, you know, cutting hairs. I mean, I think, yes, maybe there's a difference there, but no one is going to say that a salmon's natural habitat is in a confined net pen. They're migratory fish. They travel thousands of miles, you know, across the oceans. So I will respectfully disagree.

MR. KARREMAN: What do you think about closed containment for fish? Not net pens, but closed containment where they are steel barrel in a shed? Is that not hindering their natural behaviors?

MR. KIMBRALL: Well, I mean, I
think that's not what the proposal is in front of us.

MR. KARREMAN: But we're just talking about natural behavior. I know, I mean, with the net pens and all that, I'm not going there. I'm just saying you brought up the natural behavior, so I am, too.

MR. KIMBRALL: Well, I can only comment on the proposal in front of me, which, as I said, I think is an arbitrary and capricious interpretation of the standard if it was a proposed rule.

CHAIRPERSON DELGADO: Any other questions? Thank you. Moving on, we have Deborah Brister, followed by Lisa Engelbert.

MS. BRISTER: Hello. I'd like to thank the Board for the opportunity to speak to you today about organic aquaculture standards. My name is Deborah Brister, and I'm a research fellow at the University of Minnesota.

I stood before the Board nearly
ten years ago, and at that time I made recommendations of a greater degree of participation by those in the aquaculture sector and other stakeholders was needed for the development of organic aquaculture standards before they were implemented. This led to the first ever organic aquacultural workshop held at the University of Minnesota and the creation of a number of national and international organic aquaculture working groups. I'm happy to know that this recommendation has indeed come to fruition.

Today I'd like to share a few more comments that I have regarding the September 28 draft recommendations, and then let you know about a tool that we've developed at the University called an aquaculture sustainability matrix, which we're now using as a systematic way to compare various organic aquaculture standards.

So first my comments. I'd like to commend the Livestock Committee and the
Aquaculture Working Group for their excellent work on developing organic aquaculture recommendations. I'm glad to see that the NOP will now consider allowance of fish meal and oil as possible aquatic animal feed ingredients. It's never made sense to recommend that fish that are naturally piscivorous be required to consume feeds made from vegetable sources when they do not naturally eat them. Of all the types of equal labels out there for seafood, organic is the one equal label that should guarantee that organic piscivorous fish eat what they would normally eat in the wild.

I'd like to encourage the Livestock Committee to simplify one section in the recommendations that's difficult to understand, and it does need clarification. The section I'm referring to states this, and I'll read it because I think to hear it you can get a sense of the need for more clarification. Section 205.252(d) states,
"Feeds for aquaculture products for human consumption must contain lipids from fish oil or other omega-3 sources produced by microorganisms or other organic plants to meet the nutritional requirement of specific lipids for the particular aquatic species, except that other lipids from organic sources may be provided in feeds for aquatic animals that have specific dietary requirements for such ingredients to the extent necessary to meet the minimum requirement for that lipid in that aquatic animal." That's like the longest sentence I've ever seen. It does need some clarification. And one recommendation I would have would be maybe modify the section just above it, 205.252c, and state simply, "Aquatic animals must be provided with their natural feeds and lipids consistent with the need to optimize health and growth of the aquatic animal."

I'd also like to commend the Livestock Committee for including net pens
within the organic aquaculture standards recommendations. I think it's extremely important to provide an opportunity for all types of aquaculture systems to at least have an opportunity to try for organic certification as a goal. Not only does this encourage innovative thinking by aquaculturists who want to pursue organic certification, but it then demonstrates to the conventional aquaculture sector what is possible, thereby raising the bar for net pen operations overall.

I've got a couple of other -- how am I doing on time? I have one minute? Okay. So I do have a couple of other comments about the recommendations, so if you want to ask me after I'm done, I'll be happy to share it.

In my remaining time, I'd like to discuss with you a long-term project that we at the University have been developing for a number of years. The aquaculture sustainability matrix, which is a tool that
I've presented at a number of conferences in recent years, including most recently the United Nations Workshops on Aquaculture Certification held in Thailand, China, Brazil, India, and the United States. During the Brazil workshop, I presented this FA working paper that I've handed out to you just now, so you've got that in front of you.

Recently, I've been working with colleagues to do comparisons of independent organic aquaculture standards using the matrix, and I'm also currently using the tool to assess recommendations for organic aquaculture standards between the United States and Europe.

So as you know, especially from our previous speakers, the European organic aquaculture standards are actively being developed right now, and the European Commission is actually hoping to finalize those standards by January of 2009. Another gentleman said maybe in three or four months,
and I think that's actually more realistic right now.

But because of the market potential for organic aquaculture products in both the United States and Europe, we feel it's very important that the organic standards for aquaculture be as harmonized as possible to reduce potential trade barriers. Other organizations have done side-by-side comparisons between standards, but we feel there's a better way to assess these standards. The very nature of standards development usually involves taking previously established standards and then building on them. And in this way, it's possible to miss some elements of sustainability, which all --

CHAIRPERSON DELGADO: Your time is up. Wrap up, please.

MS. BRISTER: Okay. Which truly all organic standards should raise eventually if they're continuing to compete in the marketplace with other equal labels seafood.
So all I wanted to say is that I am doing a comparison right now. It will be done in approximately two weeks. I will be submitting it to the European Commission, and I would also like to submit it to the NOSB, as well.

Okay. Thank you very much.

MS. FRANCES: Lisa goes tomorrow.

CHAIRPERSON DELGADO: Tomorrow.

On both cases?

MS. FRANCES: Yes.

CHAIRPERSON DELGADO: Very good.

Thank you for that. Keith Olcott? Are you here? Great. Please, come up, and he will be followed by Peggy Miars.

MR. OLCOTT: Okay. I'm not here to talk about aquaculture. We're way back to multi-site certification. And I compliment you all on your endurance. I'm sure Dante
didn't have any clue about this particular circle of hell.

So I'll just preface this by saying Equal Exchange is one of the largest fair trade companies in the United States. We've been around for over 20 years now. We have direct relationships with growers, 33 small-scale organizations in 19 countries throughout Latin America, Africa, and Asia. And each year, many of our folks, purchasers, quality control staff visit our producer groups, virtually all of whom are cooperative and use what you allude to in your document as the multi-site certification. We would like to respectfully suggest that you call it group grower certification, because we would like the emphasis to be very much on growers exclusively, at least in this part of your program.

So we commend the CACC for incorporating many of the suggestions raised in the May `08 meeting. And since we've
already submitted a copy of our comments where we want to tweak that just a little bit, we think you're like 97 percent there. I just want to focus on a few points that other organizations have raised as concerns about the current recommendation, and I want to speak to those.

So specifically I'm referring to the recommendation for a $5,000 threshold for taking growers out of multi-certification status, the restriction on production units of 100 individuals or ten square kilometers, and the idea that multi-site certification should not be recognized as a distinct category of accreditation. This is an accretion from various groups speaking to various points.

All these points have been addressed to one degree or another in previous testimony at the November meeting and the May meeting. And the CACC presumably has digested that, and I actually don't see any of those presently stated in the current
recommendation, and we're pleased with that. These points were addressed, for example, by the National Organic Coalition, OCIA, IOIA, and IFOAM, not necessarily all of the points by all of these groups.

In our estimation, a well-executed internal control system can address the issues of scale, be they monetary, numerical, or geographical. The one notable exception that triggered all of these discussions about group grower certification, there was a long history of success employing this method of certification. Likewise, the intricacy and rigor involved in a well-designed internal control system is precisely why it should be recognized as a distinct category of accreditation, and other people spoke to that earlier today talking about the rigor that's involved and the training that should be involved with these ICS groups. So that's why we think it should be recognized as a distinct category.
We are concerned that the monetary, numeric, and/or geographical thresholds might make sense to employ in the United States--might make sense. But they're not necessarily appropriate or effective thresholds to employ across the board throughout the developing world.

So just a quick example with the $5,000 limitation. That could be a logistical and organizational hardship for some of our producer partner cooperatives because the value of some of the commodities we buy--for instance, coffee--can vary dramatically from year to year. And somebody had suggested perhaps you would average a two-year period, but that might not suffice either. So you can imagine the situation where if there's good crop years and bad crop years, people would be in and out, in and out of the organization and how would you keep track of that as a certifier?

And I think I'm just going to have
to wrap it up there as one example. There's more in that document that I gave you.

CHAIRPERSON DELGADO: Thank you.

Questions from the Board. All right. Thank you very much.

MR. OLCOTT: Thanks. Oh, there is a question.

CHAIRPERSON DELGADO: Tracy?

MS. MIEDEMA: Just very quickly. I read your comment very closely, you know, at the key stakeholder group, the coffee growers you represent, opinions really need to be brought to the floor. And I did want to ask you a question about-- in your written comment you referenced IFOAM World Board resolution back in June, and you characterize it as, basically, that the IFOAM World Board was strongly rejecting any possibility of an internal control system model being extended to any other groups besides grower groups. And the gist of your written comment really focused on keeping this construct solely for
growers, and then you stated the resolution, and I was just curious how you interpreted that motion 29.7 as strongly rejecting the possibility? I read it quite differently, and I just wanted you to connect the dots for me.

MR. OLCOTT: Well, now I might have to read it again now that you put it that way. Obviously, as part of the National Organic Coalition, that's something we came to all together. I know someone else can speak to that in their testimony. But the way I read it and the way you read it is so completely different, can somebody jump in on this? Okay. Maybe we should defer?

MS. MIEDEMA: We can wait until then. That's fine. Thank you.

CHAIRPERSON DELGADO: Another question from Dan.

MR. GIACOMINI: As you read the recommendation that was put forth, breaking the grower group into production units and then with subunits, what would be -- your
Equal Exchange is a grower group, is that right?

MR. OLCOTT: No, no. We're a fair trade wholesaler, basically in the United States. We buy --

MR. GIACOMINI: Okay, okay, okay.

I apologize for that.

MR. OLCOTT: That's okay.

MR. GIACOMINI: But in your experience of working with these groups, what proportion of the grower subunits in a typical production group would be over the 5,000 threshold in a typical year?

MR. OLCOTT: I don't have the statistics. It can vary from country to country. So I could try and get that information for you, but I can't say on average this number of people would be over. But in some years, in some countries for some products, it could be significant. For example, with cocoa right now, chocolate is through the roof, so it could be a significant
number of cocoa producers right now.

Alternatively, the bottom could fall out of
the market and then . . .

CHAIRPERSON DELGADO: Any other
questions? Bea?

MS. JAMES: Just as a follow-up to
Tracy's question, so does Equal Exchange, does
your organization have a position one way or
another as far as other sectors being able to
model multi-site certification?

MR. OLCOTT: We think right now it
should be, the recommendation as it currently
exists should apply only to grower groups, so
I'm not saying it should preclude other
groups, but I think it should be a separate
scope of work.

MS. JAMES: Okay. So the way that
it's written, just to have a specific one for
farmers but that you're saying that if there
was the possibility of a different construct
using that, that it should be addressed
separately?
MR. OLCOTT: Right.

MS. JAMES: Okay.

CHAIRPERSON DELGADO: Any other questions? Okay. Thank you very much. Up next is Peggy Miars, and I understand you have a proxy, correct?

MS. MIARS: I do have a proxy, but, don't worry, I'm not going to go anywhere near ten minutes. So good evening. It's kind of like being at a really great party and the hardy partiers are still here and the rest have wimped out. It's fun.

So I'm Peggy Miars. I'm Executive Director of California Certified Organic Farmers, and we are here representing 2,000 certified operations, a half a million acres in certified farmland, and 80 percent of the organic farmland in the state of California.

My first comments were going to be about the Sunset procedures, but I believe, Dan, you addressed our comments this morning, which seemed like yesterday, because our
comments were about how to amend an
annotation. And I believe what you said this
morning was to handle them through the
petition process. However, that isn't clear,
and we would request that it be clarified
somewhere in the policy manual, wherever it's
appropriate.

The next topic is the grower
groups, and we do want to thank the Committee
for the work that you've done on this issue.
And it is the third time that CCOF has
submitted comments opposing grower groups
under the NOP. And we believe strongly that,
in order to maintain the integrity of the
organic standards, that all producers must
complete the entire certification process,
including on-site annual inspections.

We do continue to oppose the
classification of multiple production units and,
therefore, oppose recommendations in this
document that imply acceptance of those units.
And I heard Joe a few times today say that the
document was intended to not include processors and retailers, but, as you heard from other presenters today, that's not clear. I think it should clearly exclude those groups under the NOP.

So we do want to state again that we have concerns about grower groups in general, and we do believe that the applicability of multi-production units to retail and processing is unacceptable. However, we do realize that we're in the minority, and so long as grower groups are allowed, we agree with the minority opinion that all new operations should be inspected when they enter the group. And as long as grower groups are allowed, we believe, as others have said, that they should only be allowed for small holders with less than $5,000 in U.S. organic sales.

The next topic is the list for inerts. And we do appreciate the fact that the Board is taking up this topic, and we're
eager to participate in future discussions and share the expertise that some of our folks in CCOF have. However, this discussion paper did come out a bit late before the comment period deadline, and we did not have time to assemble the information that was requested. Since most inerts in pesticide formulations are confidential, we typically rely on the organic materials from Washington State Department of Agriculture to obtain the disclosure of those inerts.

Of the few that we have reviewed, we do know that the inerts are used as carriers, adjuvants, anti-foaming agents, UV inhibitors, emulsifiers, and preservatives.

And we do have one brief comment about the concept of reviewing each inert individually. It's very hard to get the information to complete a petition or a TAP review for many of the inert substances. There's not much data about their effects in the environment, and because many of them are
considered to be trade secrets there's not that much data disclosed about the manufacturing methods. So a requirement to review each one could eliminate a huge number of products in the organic production. We do urge the NOSB and the NOP to work closely with the EPA to address this issue, and I understand that there is going to be someone from the EPA here.

Next item, pet food standards. We appreciate the work that's been done on this. We do believe that specific language is needed for pet food in the rule, which will enable that category to further grow. We do agree that the labeling should be similar to the labels for human food. Consumers that understand human food labeling will easily understand the pet food labeling.

And as far as where it falls in the rule, I know that Gwendolyn brought up possible separate section, so I would suggest that you take a look at that. So we're
pleased to support the proposed recommendation
and ask you to move those forward.

Very, very briefly on pasteurized
almonds. I wasn't going to talk about this,
but it was brought up earlier. That is a
major concern for almond growers in
California. It was explained this morning, so
I won't go into great detail, but there are
two things that are happening with organic
almond growers in California. You did hear
that California provides all the almonds for
the country, organic almonds. We're concerned
because, as you heard, imports from other
countries are allowed to be sold in the United
States unpasteurized, whereas growers in
California are required to pasteurize them, and
that's a major concern. I realize that's not
anything that you can do anything about, but
you need to be aware of that.

And as you heard, the organic
almond growers are losing market share because
of that, and they're really concerned. And
what I have heard from people is that if they continue to lose that market share, they're just going to get out of organic entirely, and we would hate to see that.

I, again, want to encourage this Board to hold meetings in other parts of the country. At the last meeting, I heard you say that you wanted to hear from more organic farmers. California has got more organic farmers and more organic acreage than any other state, and I urge you to hold a meeting in California or somewhere on the West Coast so that organic producers there have an opportunity to speak to you directly. And I would also say that we at CCOF would be really pleased to line up some organic farm tours for any of the committee members that are interested.

My last comments are probably more directed at the Program staff. Regarding the certifier training that's being talked about, as you heard earlier, the certifiers who
really need it don't tend to show up. So I would request that that be made some sort of a requirement, that it be addressed in the accreditation process, and handle it that way.

And then we're grateful about the budget increase and with the increased staff, which were really great to see. We urge you to focus on materials reviews and enforcement activities as your top priorities. Thank you.

CHAIRPERSON DELGADO: Questions?

Bea?

MS. JAMES: Thank you for your comments. I was wondering if you could elaborate why you think just retailers in particular, why that construct would not, that internal control system would be a higher risk than a farmer grower group?

MS. MIARS: Well, and I would put retailers and processors together into one group when I'm talking about this. And I don't know if the issue would be a higher risk so much as perception or, excuse me, the
intent of the original rule, which I believe was to support the small growers, primarily in the third world countries who couldn't either afford to do this or they were in areas that were so remote that it was going to be difficult to get to them for inspections. So that's how I would make that distinction.

MS. JAMES: So it mostly has to do with the cost that you think there's an association between the retailer having more funds available?

MS. MIARS: I would say so, yes.

MS. JAMES: But as far as just philosophically, a retailer being able to follow a good internal control system using a multi-site construct, would you think that that's something that would be acceptable?

MS. MIARS: Can you repeat that?

MS. JAMES: Just the concept, if you take away the piece that has to do with, you know, the financial capability of a retailer being able to do that, there are some
small retailers, co-ops, that own more than one location that don't necessarily have as much funds as some other retailers that perhaps would have more, so there are examples of that, that if you were to just remove that completely, the idea of a retailer being able to follow a good internal control system using a multi-site construct in their certification, is that something that you think would be feasible?

MS. MIARS: Well, I think I need to correct something that I just said, which is to put the retailers and the processors together. When you ask the question that way, I would separate them out because retailers, as you said earlier today, are not required to be certified. It's voluntary. Therefore, if it's voluntary, they should meet the highest standards of the rule, and they should be inspected annually. And as I said, the intent there was for the small growers and the retailers are optional. Am I making myself
clear there?

MS. JAMES: Yes. I'll probably

catch you afterwards.

MS. MIARS: Sorry. It's late.

CHAIRPERSON DELGADO: Any other

questions? Okay. Thank you very much. Let's

move on then to Katherine Dimatteo, followed

by Jim Riddle.

MS. DIMATTEO: Okay. Thank you

very much for waiting to hear from me all day.

My name is Katherine DiMatteo. Now that I

have ascended to the presidency of the IFOAM,

International Federation of Organic

Agriculture Movements, I have been corrected

by my Italian members that I have always

pronounced my name wrong.

So thank you very much for your

good work, your attentiveness. I have passed

around the comments that we submitted

electronically. I'm not sure if you've all

had a chance to read them. It's just for your

convenience. I'm also going to just summarize
quickly the comments that you did receive on group certification or multi-site certification. You received plenty of comments electronically, 19 of which supported the principles and concepts of the CACC recommendation. Many of those comments did so without any changes whatsoever. Ten of the twenty comments supported the IFOAM position, half of which did so unconditionally. So just a quick summary of what you received electronically in case you didn't read all of those.

I have a few things from my written comments just to emphasize. IFOAM thanks you, the CACC, for recognizing the variety of farms and farm organizations that exist worldwide. The continued acceptance of group certification is cortical for the growth of the organic sector and for securing and improving the livelihoods of thousands of small holders and thousands of growers, small or otherwise, in developing countries and in
other countries around the world.

IFOAM is pleased that the focus of this recommendation is on producer groups and believes that if multi-site certification is to be extended throughout the supply chain in the future, this will require the development of additional sector-specific criteria. So in answer to the question about our motion at the general assembly, that motion that was passed by the general assembly that was referred to in a number of comments said, basically, that our goal is to ensure that producer groups are able to continue to be certified organic under a group certification scheme but that we support the framework that allows for future consideration of additional criteria for the other sectors, and that's what our general assembly agreed on by majority vote and that is the position that we bring forward to you today.

I also want to emphasize that we cannot judge other people by the standards
that we set for ourselves economically here in the United States. And I think that it would be a travesty to set a $5,000 limit for the individual members of the grower groups. I think we have no basis for doing that. Are we wanting to say that they're limited in the income that they can ever have? Are we saying that they should never be part of a group, a collective, of people that are growing together and are learning together and are learning from each other's experiences, having continuous improvement by the benefit of being with other groups? So I really urge you not to try to limit this by using either geographic or monetary or other types of limitations. And, in fact, we very much support the way that the recommendation is currently written because it does, in its criteria for groups and in its criteria for sampling and for the internal control system, really addresses all those things. And as you read that recommendation, I think you need to
read it with that eye that the guidance is there for making the decisions about what can and cannot work in groups with smart management and how those groups should be divided so that they can be adequately and efficiently and effectively managed.

A few other points. We do not support the minority opinion that all new entrants are immediately a high risk location and that we recommend that the assessment of which members classify as high risk be left to the accredited certifying agent based on the criteria that's been recommended in the CACC recommendation.

And I think the last thing that I'd like to point out from my written comments is that IFOAM appreciates the overall reasoning for sampling, the attention given to risk factors and the determination of the sampling procedure, and the conclusive remark on the relevance of the internal control system to detect non-conformities. IFOAM
recognizes the efforts made by the CACC to reach agreement on sampling guidelines that are not overly prescriptive for certification bodies and that accommodate for various group conditions.

I really urge you to, in your deliberations and consideration, to move this recommendation forward and to not, again, lean towards prescription. One of the things that we used to say about agriculture when we all were talking about a different alternative system, including organic, we talked about the reductionist thinking that was applied to conventional agriculture. X amount of pounds of pesticides applied at periodic points during your production. Do that, and you will be, you know, you will be successful. You know, here's a formula, like a recipe, that you can follow on your farm. I'm really hoping that organic doesn't move in that direction where we rely solely and expect testing and/or very prescriptive requirements
to be the basis of what determines what an
organic system is. Thank you very much.

CHAIRPERSON DELGADO: Thank you,
Ms. DiMatteo, and congratulations on your
wonderful, wonderful election. Any questions
for Ms. DiMatteo? Yes, sir?

VICE CHAIRPERSON MOYER:
Katherine, thanks for your comments. One
question. Do you see the need to limit the
number of people who would be in a grower
group?

MS. DIMATTEO: I think that that -

VICE CHAIRPERSON MOYER: -- grower
group would be established?

MS. DIMATTEO: No. I don't think
you should limit a total number for the grower
group because I think that the situation is
going to be different everywhere we go. The
situation that, you know, of tea, for
instance, or cocoa or even coffee, you know,
there may only be one or two plants that are
part of a default group, so it would take a
large group to have sufficient quantity to be
efficient and to be able to sell to large
wholesalers who would want that product.
Otherwise, the cost wouldn't even, you know,
merit the farmer from selling the product, and
they wouldn't have that market.

So I think that the breakdown into
production units should handle that. So if
you have a very large group, you know, it
should be broken down into production units
that are based on either the geographic
region, the number of farmers, you know, in a
particular location or the number of farmers
that can be effectively managed through the
internal control system. And I think that
those are the things when a certifier is
looking at that plan from the group that they
should determine whether the decisions about
how to manage the group, whether those are
good decisions, and they should ask for
changes to those decisions about how to break
into production units, ask the group to change
those if the certifier believes that they're
not going to be able to manage the size of
their groups. Does that answer the question?
Okay.

CHAIRPERSON DELGADO: Any other
questions from the Board? Okay. Thank you
very much.

MS. DIMATTEO: Thank you.

CHAIRPERSON DELGADO: And up next
is Jim Riddle.

MR. RIDDLE: Say who's on deck
before I start?

MS. FRANCES: Sam Welsch is on
deck.

MR. RIDDLE: Thank you. Good
evening, and I do have a proxy from Joe Dietz,
OCIA seat committee chair. I want to thank
you all for being here still, and I especially
want to thank the NOP staff for your hard work
in getting the pasture proposed rule out. I
want to thank you, Rick, for all of your work
over the years. You've written a good rule.

I also am very appreciative of the new staff that's been brought on board, I think that's really a good move, and the training plans that I've heard about today.

I do encourage that, as that training moves forward, that it utilize existing technical experts, including IOIA, the International Organic Inspectors Association, as well as some of the emerging resources through extension, because that's USDA funded and let's really maximize our resources and put them to work well.

I am now Organic Outreach Coordinator at University of Minnesota. And when I appeared before you in May, I mentioned about the eOrganic project, developing organic information resources electronically through extension, and I'd just like to give an update and let you know that that is moving forward to launch with an official rollout at the Eco-Farm Conference on January 20th. So that is
moving forward.

So with that, I'll remove my

university identity and shift to some comments

in support of those from OCIA regarding the

seed recommendation. I do support the Crops

Committee's draft. I think you've heard a few

comments today to polish some parts of it.

That's fine, but I think that draft should

move forward. It provides some good guidance.

The one issue that it does not

address is the issue of treated seed and

limitations that places on access to genetic

materials. And I heard my name referenced

that I'm advocating that treated seeds be

allowed, and that's not exactly true. What I

am advocating is that the Crops Committee

consider an exemption to allow licensed seed

producers to use treated foundation seed stock

in the production of organic seed, to consider

it, to have a thorough discussion of this, and

to get the data to know how much of a problem

this is. I ask you to add this to your Crop
Committee work plan and consider forming a working group of seed industry, farmers, and others, certifiers, to really gather the information on this and some of the other issues not addressed in your current draft.

The thing that got me on this was the realization that an organic farmer has to try to get organic seed. But if they can't find it, it's not commercially available, they can use totally conventionally-grown untreated seed.

And the organic seed producer cannot do that to produce an organic seed. The system is rewarding the conventional seed industry using conventional practices to provide these untreated seeds that are being used to produce organic crops, and that's really unfair and it's not in anyone's best interest. So I think there's some discrepancies, discrimination, that needs to be addressed and look at this to see if there should be an allowance.
There's two ways of going about it. One would be a petition to place all these different possible seed treatments on the National List for a very limited annotation. But the other, to look at the rule in 205.204(a)(5), which currently allows the use of treated seed when application of materials required by federal or state sanitary regulation. That's a blanket allowance without listing those individual materials in a given situation.

So there already is a precedent for something similar where there could be consideration of a blanket allowance for licensed seed producers to used treated foundation stock seed when untreated foundation stock seed is not commercially available. And one of the problems is a lot of these foundation seeds are only grown out maybe every five years, and then they're treated and put in the bank. And for someone wanting access to those genetics, they simply
aren't available anymore.

So there's some limitations, but I want you to study it. I've received some anecdotal and some information be submitted tomorrow from OCIA, but I think it's a serious issue that should be on your work plan.

Okay. Some of the other things that are up for discussion or vote at this meeting I'd like to comment on. First, I would really like to thank the CACC for the improvements that you've made to the grower group certification recommendation. I think that it integrated the 2002 recommendation and then addressed some of the deficiencies in it and has really good criteria for regulating and moving that whole system forward.

I do think there is some confusion in the introductory paragraphs. They aren't in the guts of the recommendation, but that's where you heard some comments today where it still kind of goes back and forth of whether it's about processors or just producers. And
I hear that it's only producers, and that's what I read in the body, but there's some of the introduction that makes that unclear.

For retail chains, though, when I go into a store, say Super Target, and it says the name of an accredited certifier and it says inspected to guarantee compliance with U.S. standards and has the USDA seal, I understand that that store is actually inspected, and they haven't been. And I'm glad the NOP has cracked down through accreditation and said that's not allowed, but it is confusing and misleading to consumers.

But I invite you to be creative in how you address the retail situation. And one possibility, instead of applying this grower group model, would be to use the existing regulatory infrastructure. Retail stores get inspected all the time. Why can't the inspectors that go in those stores cover off organic compliance, just as well as health and accuracy of scales and all the other things
that they're regulating? Let's be creative
and look at different solutions without
weakening the consumer perception that a store
is indeed inspected.

I'm glad you have the biodiversity
on your work plan discussion document there.
I endorse the comments the Wild Farm Alliance
will be making and think that it is a
requirement in the rule. It's inherent in the
definition of organic production, and it
should be addressed during the accreditation
process to see what certifiers are doing to
check on those existing requirements.

I was pleased when Barbara said
earlier that the training will be based on
organic system plans for a portion of the
training. I think that's really smart. It's
something a lot of certifiers already have
adopted, the forms that the Board has
recommended and ATTRA has up. And this is
going to be increasingly important because
there will be a crosswalk between organic and
NRCS on the organic system plans. But in my comments I submitted before the meeting, it's come to my attention two important questions are not being asked about post-harvest handling on the farm OSPs about cleaning methods and pest control, and I provided those in detail.

My major concern, though, today, what you have before you is the materials review change to the Board policy manual that's being proposed. Defining a TAP, and this is from your language, "Group of third-party experts convened by the program to provide a technical review related to a material petitioned under review by the NOSB. A subcommittee of the NOSB may comprise a TAP." Two big problems with that.

First, the law says the Board shall convene technical advisory panels. Your draft says the Program, so I think you need to bring it into compliance with the law. You say it's a group of third-party experts. A
subcommittee of the Board is not third party. That's yourselves. You need a third-party expert. So those are a couple of problems I see with that. I ask you to just hold on that, give it further consideration.

Get legal counsel on this. If you haven't had OGC or some legal counsel, this is a huge legal issue. You need to comply with the law. It's not just a Board policy manual issue. Thank you.

CHAIRPERSON DELGADO: Thank you.

Any questions? Dan?

MR. GIACOMINI: Yes, Jim, we do need to do some tweaking on some of those things, but this document, the technical review document, actually does come from legal recommendations and the Program dealing with the process of TAPs and technical reviews in light of 606 and all those things. That's where this document comes from. It's not just us wanting to come up with another document and put more stuff in the policy and
procedures manual.

MR. RIDDLE: Well, a lot of the recommendations of the Board have background that cites the law, cites the regulation. This does not, and was that just the Program opinion or was this OGC saying --

MR. MATTHEWS: Office of General Counsel saying that the Board can do be its own TAP.

MR. RIDDLE: No, no. The question I have is about the Board shall convene TAPs, not the Program shall convene but the Board, the law says the Board --

MR. MATTHEWS: Oh, well, yes, the Board. But OGC has determined that the Board can convene a TAP committee of itself.

MR. RIDDLE: Okay. But then you should change the language because that would not be a third party.

CHAIRPERSON DELGADO: Any other questions? Bea?

MS. JAMES: You know, I like the
idea of thinking creative on how retailers can actually become certified, but I've heard a couple of inspection agencies come up here and say that they've had difficulty just getting their inspectors to attend training. How then would you envision state inspectors becoming educated enough to be able to perform these inspections?

            MR. RIDDLE: Yes. Well, there are states that are running functioning organic certification programs so state employees can conduct organic inspections right now, and they can multitask and do other things, as well. So I think the model is there. There are some states that could be, you know, looked at or piloted. We're going to have a lot more people trained throughout the system. NRCS is going to be doing a lot more training, extension are getting up to speed, and I think that the regulatory side can, as well.

            The certification of retailers is voluntary, so there's an opening here to do
something creative. They've already got plenty of inspectors coming in their door, and I think this has a lot more long-term sustainability. It cuts miles; you're not flying people all over the world to do these. These are already coming to the stores. Plus, it broadens the regulatory net, so to speak, of organic. It brings more people into that.

MS. JAMES: I don't disagree with that. I guess I just would want to go on record saying that we need a solution for retailers sooner than when I think that would probably be --

MR. RIDDLE: Yes, well, the solution is there, individual inspection of each operation.

CHAIRPERSON DELGADO: Julie?

MS. WEISMAN: That's okay because Bea actually asked a question that I had.

CHAIRPERSON DELGADO: Jennifer?

MS. HALL: Jim, with regard to grower groups, do you have a feeling on when--
MR. RIDDLE: Oh, on the new growers? Well, how do you ever start a grower group? That's my problem with it. I think you've created really good criteria that is risk-based and it empowers the certifier to make those determinations. If anything, there probably should be more unannounced inspections occurring of grower groups, you know, just as a check there because there is a larger risk factor that you've introduced. But as far as just new growers, if it's a functioning ICS, they're going to be getting the training, they're going to be using the inputs, they're part of a legal entity. I don't think that that's the biggest risk here. But it does put a limit on how do you start a new one as a grower group because they're all new members, so they all have to be individually inspected. Why would you ever start a new one if, you know, every operator has to be individually inspected to start off with? That's not a grower group anymore.
CHAIRPERSON DELGADO: Any other questions? Thank you.

MR. RIDDLE: Thank you.

CHAIRPERSON DELGADO: Moving on to, do we have Sam or not? No? Okay. Moving then to Beth --

MS. FRANCES: Claudia Reid.

CHAIRPERSON DELGADO: Claudia Reid.

MS. REID: Good evening. This is my very first NOSB meeting, so I was going to start off by asking you not to ask me any questions, but I think I don't have to say that. You probably don't want to ask me any questions. I do have a proxy, but I really doubt I'll need to use it.

I'm going to be speaking to four issues very briefly: materials procedures; procedures to handle technical reviews; tabled materials status; and one of the petitioned materials, ethylene on pears.

Our comments have, my set of
comments have to do with the materials procedures because, as you probably know, CCOF is one of the oldest and largest certification organizations, and we have provided the background for much of the work that you have all originally done here at the NOSB and by the industry for materials review. Thus, we feel uniquely concerned that the NOSB be able to continue to provide this thorough objective, high-quality evaluation of existing and new substances currently being considered for the National List.

My name is Claudia Reid, and I'm the new Policy Director for CCOF.

On procedures to handle technical reviews, CCOF agrees with the premise behind your recommendation that the NOSB often requires specialized expertise for review of petitions. The NOSB should not feel obligated to be a technical advisory panel, though.

We liked, you had five phases in that document and we liked numbers one, two,
three, four, and six, but we really felt that phase five was incomplete. We recommend that you add another bullet to that phase five, another bullet point to phase five, that would provide technical expertise in addition to the NOSB for reviewing the reports, especially when there's an alternative to the substance in the organic production system. I don't know if that makes sense now hearing all these other 12 hours' worth of comments. This was written before, 12 hours ago.

On the status of tabled materials, the recommendation to take from the table previously tabled petitioned substances, we really, really were impressed with the work that you did. And I know one of our staff was involved in that, and she is just amazed at how much work it was and how hard you all worked.

As you will see in our previously submitted written comments, we make a distinction between the materials listed in
your recommendation that were tabled and which we feel were already officially set aside following the 2000 Federal Register Notice and a number of other items that were actually petitioned but never dealt with by the NOSB. You heard somebody else bringing this up earlier this morning, too, this same issue. Our written comments list those materials along with a brief description of what we feel happened to each one of those petitions. And I'm not going to read those names to you. They were actually several of the names of the materials that were read earlier today.

Our clients are still waiting for answers on several of those items, and we urge the NOSB to move these petitioned items to the NOP for consideration instead of just setting them aside. Our comments on these items don't reflect a position one way or the other on the material. We just simply want to have them moved forward. We are requesting a full TAP
review of these materials and the appropriate NOSB evaluation for each of these before we take a position.

Clarification of the definitions on the National List. We have participated in the work of the Materials Committee, one of our staff people has, and we applaud your efforts on this hugely time-consuming job. We do have a concern that the amount of work that goes into this might take away valuable time and energy from the very basic work almost completed by NOSB in the year 2006 regarding synthetic and non-synthetic determinations and the associated terms, such as extraction, purification, and formulation.

Several petitions are being held up until this matter is finalized, and there are other petitions being held up until there is more guidance about the definitions.

We strongly urge you to take up the 2006 recommendations again. Put them up for public comment, if necessary, and take
action to resolve those unresolved issues.

And on ethylene and pears, using ethylene for ripening bananas and pineapples made sense to CCOF because neither one of those commodities are grown on the continent of the U.S. We do have organic citrus growers in California who would like to petition to remove ethylene for de-greening of citrus because it's being abused by importers. They are using it to mask unripe imported fruit and then it gives all of organic citrus a bad name, a bad reputation.

We would like to ask that the NOSB consider this type of situation potentially happening when you looked at ethylene for pears. The potential misuse of ethylene, was that considered in the review for pears?

We are dismayed at this statement in the NOSB recommendation that, quote, "Consumers miss out on several of organic pears because without the use of ethylene organic fruit of acceptable quality cannot be
distributed."

The consumer expectation of having access to pears all year long is not a criterion by which this petition should be judged. We also ask for a truly objective evaluation of alternatives to ethylene to be completed.

That was it. Nice and short. I think it was like six minutes.

CHAIRPERSON DELGADO: Any questions for our speaker? Well, thank you for your presentation. Next up we have Kathie Arnold. Okay. So next then we have our last speaker for the night, Barbara Blakistone.

MS. BLAKISTONE: Good evening. I'm Dr. Barbara Blakistone from National Fisheries Institute. I'm the Director of Scientific Affairs. The NFI is the nation's leading advocacy organization for the seafood industry. It's member companies represent every element of the industry from fishing vessels at sea to the national seafood
restaurant chains, from responsible agriculture to a marketplace supporting free trade, to ensuring consumers have the facts on the health benefits of fish and shellfish. NFI and its members support and promote sound public policy based on scientific research.

The National Fisheries Institute urges the Livestock Committee to complete its work so that final rule-making can begin on organic standards for aquaculture. We know consumers eagerly await the USDA organic label for aquaculture fish.

NFI looks to the Aquaculture Working Group as key advisors for the outstanding technical issues of net pens and fish feed. And so NFI supports the recommendation and asks the Livestock Committee to take them into serious consideration to enhance the organic standards process.

A number of AWGs recommendations have been incorporated. More important ones
are detailed in the AWG report that have not
been taken into account by the Livestock
Committee.

We note some of particular
significance to NFI in the AWG report on fish
feed and related management issues. Point
one, we find the term aquatic livestock and
aquatic crops oxymorons and worthy of
revisiting in the final language of the
proposed organic aquaculture standards. We
recognize that terms define livestock, part
205.2, must include aquatic animals in the
definition but agree with the Aquaculture
Working Group that nomenclature must carefully
differentiate aquatic from terrestrial. Terms
like aquatic livestock and aquatic crops are
not commonly used and are confusing, and we
favor terms such as aquatic animals and
aquatic plants.

Point number two, the Aquaculture
Working Group has recommended adding language
into part 205.252 that states a limit on the
amount of wild forage fish, menhaden, herring, anchovies, that can go into feeding aquatic animals, specifically one pound of wild fish fed for every pound of live weight of cultured aquatic animals at harvest. No limit is being proposed for recovered trimmings from wild fish in order to encourage use of the remaining carcass for organic fish feeds. NFI very much favors the effort towards sustainability, in this case recycling of the fish.

Point three, in the section noted in point two, the use of composted manure has been excluded from the test even after the Crops Committee carefully reviewed the use of compost manure to fertilize aquatic plants intended for organic fish and asserted that its use presents no health hazard to humans. NFI agrees with the AWG and commends the group in support of the use of this sustainable cycle, such as composting, to recover valuable nitrogen and carbon.
Point four, we will not argue that the organic seafood standards document might not be the place for this notation but wholeheartedly support AWG's point that if wild caught sustainably-sourced fish meal or oil fed to organic aquatic animals must be so designated on the package, then such fish meal or oil fed to organic terrestrial animals must also be designated. The organic consumer deserves a level playing field.

Again, as we commented above, NFI defers to the technical knowledge of the aquatic Aquaculture Working Group on the report on net pens and related management issues.

However, when AWG's comments red flag that a zero-impact standard for management of predators in part 205.254 is unnecessary, the total prevention of disease will never be achieved as required in part 205.255 and that a 50-percent minimum performance target for all nutrients is
unnecessary in part 205.255 to achieve
limiting discharge of macro nutrients. NFI
asks if the Livestock Committee has raised the
bar above what is reasonable. Where there are
overzealousness in these particular areas
block organic seafood standards for some years
to come.

NFI looks towards rule-making in
eyearly 2009 but only after the language
proposed in these standards by the Livestock
Committee reflects what is the current state
of science and technology of aquaculture.
Thank you for this opportunity to speak.

CHAIRPERSON DELGADO: Okay.

Questions?

Hugh?

MR. KARREMAN: Thanks for your
comments. And you started and you also
finished by saying the standard based on
science and, you know, that's always a good
sound basis to be in. But I know, just in the
public sphere, science doesn't always win the
day totally. And so, actually, and the opposing viewpoints also have their science, right? I mean, they do, and we've had a symposium. So I'm just kind of wondering, you're pretty much in favor of what we're proposing with some AWG language changes and all that, but how would you respond to all the opposition that's out there, as far as what they have to say? I'm just curious. We have to balance that out in our decisions, you know. It's pretty strong.

MS. BLAKISTONE: That's why I'm not on the Board.

MR. KARREMAN: Okay. Fair enough. I just thought I'd give you a possible ... 

MS. BLAKISTONE: I know the opposing views and, yes, they're very difficult to negotiate, and the process enters into the scientific process. We've got to find a medium. You'll never satisfy everyone, but you try to get the majority.

CHAIRPERSON DELGADO: Any other
questions? Well, thank you very much. That
concludes tonight's list of speakers. Thank
you, members of the Board, for your patience,
and thank you, members of the Board, for your
endurance.

We will meet tomorrow at 8:00
promptly, and I would remind the Board members
that our dinner is waiting for us outside, and
we'll be eating in this room.

UNITED STATES DEPARTMENT OF AGRICULTURE

NATIONAL ORGANIC STANDARDS BOARD

MEETING

TUESDAY,
NOVEMBER 18, 2008

The board meeting was held at the Savoy Suites Hotel, 2505 Wisconsin Avenue, NW, Washington, DC, 20007, at 8:00 a.m., Rigoberto Delgado, Chairperson, presiding.

PRESENT:

RIGOBERTO I. DELGADO, Chair
JEFFREY W. MOYER, Vice Chair
GERALD DAVIS

STEVE DEMURI
KRISTINE ELLOR
KEVIN ENGELBERT
BARRY FLAMM
DANIEL G. GIACOMINI
JENNIFER M. HALL
BEA E. JAMES

HUBERT J. KARREMAN
TRACY MIDEEMA
JOSEPH SMILLIE
JULIE S. WEISMAN

Public Comment on NOSB Action & Discussion Items ................ 315

Adjourn
MR. DELGADO: Good morning. We are starting this day two of our meeting. And first of all, we have Ms. Weisman, and I would like to thank whoever is responsible for these wonderful and extended tables. It's Al.

Thank you.

(Applause.)

Welcome to all of you to day two. We have also a busy schedule today, and we're going to start with a discussion on the recommendations on the part of all the committees.

With nothing else to say, and let's get back on schedule and start immediately with our Policy Development Committee chair, Dr. Barry Flamm, please.

POLICY DEVELOPMENT COMMITTEE

MR. FLAMM: The Policy Development Committee has 10 recommendations for new language in the policy development manual, the policy procedure manual and in the new member
guide.

All this is a team effort of the Policy Development Committee, so following that concept, each of the members of the committee will present. In most cases they took the lead on it, but like I said, all this was a team effort.

An important part of that team is our esteemed chairperson, and he is not available to make presentations, but he was a major part in the development of all this. So to lead off, Hugh, will you present the technical directions, please.

MR. KARREMAN: Yes. Thank you very much.

Okay. The first item we are going to discuss in policy development is the technical corrections. Basically technical corrections are those actions needed to slightly change some of the wording that perhaps happened or were placed in the Federal Register from a recommendation by the NOSB,
and then accepted by the Secretary. And those changes sometimes -- for example, like with the livestock medicines, the withholding times came in through a little bit differently than the NOSB recommended, and due to external reasons -- nothing the NOSB could have really done, because the FDA weighed in, but the recommendation came through differently in the Federal Register, and then was voted on by the NOSB.

As well as -- so that would be like one example. Something perhaps needing a technical correction or we need to be aware of sooner than later as a board.

A second example would be unforeseen consequences of a recommendation voted on by the board that might require more annotations to fit the needs of the industry. The example given is the absence of an explicit description of what methods of extraction are allowed for specific materials, and if it's not annotated correctly, it could
result in the unwanted use of materials
extracted using prohibited extraction such as
hexane with the colors on 606, using hexane
and ethanol. They were not reviewed, but
water and oil extraction were.

So basically, you know, the
recommendation needs maybe some tweaking, but
it's already gone into the Federal Register.

So what we recommend is -- it's an
internal NOSB thing within the policy and
procedures manual, and so what we are
recommending is to minimize the confusion in
the organic community, the board needs to
monitor and correct discrepancies between
items which have been voted on and their
subsequent insertion in the Register. When --
some examples I just mentioned.

So here are the three steps that
we would like to recommend. The secretary of
the board, with the assistance of the National
Organic Standards Board executive director,
shall review all additions to the Federal
Register and report to the board any discrepancies between board recommendations and those published in the Federal Register.

Two, when the program incorporates changes to recommendations voted and presented by the board, the program is expected to communicate these changes prior to final action by the program to the board chair, vice chair, and secretary.

The board chair, vice chair, and secretary will report such activities to the board and then work with the program in order to assist the program in stating the exact reasons for such deviations in the preamble to the rule for changes posted.

And then three, in the cases of unintended consequences, with a published recommendation, the chair of the board, with the approval of the executive committee, will assign an appropriate committee to resolve the issue.

The Policy Development Committee
moved three in favor and zero opposed to accept this part of our policy manual.

There you go, Barry.

MR. FLAMM: Thank you.

MR. DELGADO: Any public comments, please? Are there any questions? Why don't we wait until the end of the presentation and then we'll ask for comments and feedback from the board.

So proceed with our next item.

MS. JAMES: Mr. Chairman just asked me to summarize the recommendations so that we can get through these 10 quickly.

So the next one is procedures for handling public comments at NOSB meetings, and in a nutshell this recommendation was crafted based on the desire for the board to have dinner before 10.

(Laughter.)

MS. JAMES: And that summarizes it. No.

The recommendation takes a current
NOSB policy for public comment at NOSB meetings and it strengthens it by further defining public comment into eight points. I won't go into all of those eight points, but just talk mostly about the changes that are highlighted in the recommendation.

Point one remains the same.

Point two states that presenters are encouraged to submit public comment in advance so that the NOSB can review recommendations electronically and we can save on the paper distribution at meetings.

Point three states that all persons called upon who are absent from the room could miss their opportunity to speak.

Point four includes the addition of the discretion of the chair to extend time past five minutes of sign-up.

Point five requests presenters to state their name and affiliation at the beginning of their public comment.

Point six stays the same.
Point seven states that presenters should not speak for more than 10 minutes unless otherwise indicated by the chair. The main thing there was "unless otherwise indicated by the chair" was added.

And point eight stays the same.

There's also -- we also added additional suggestions from the board into three different bullet points, and to summarize those:

Point one is that the NOSB will attempt to accommodate all persons requesting public comment. However, if people sign up at the last minute or that -- okay. Persons who have signed up to address the NOSB for their five-minute slot and have also served as a proxy for another person will be placed on a waiting list if they wish to speak for a third time on the same topic and will be considered at the discretion of the chair, depending on the availability of the time. And this should allow more members of the public time to
present, and the main point there is really just to make sure that we're allowing all people, particularly people who haven't signed up to speak, the opportunity to speak.

And then the next bullet is that members of the public are asked to define clearly and succinctly the issues that they are trying to address so that we are -- at the beginning so that we are really clear on what it is that you are lobbying for.

And the third one is members of the public should be considerate about speaking more than one time on the same topic to allow more members of the public the opportunity to speak.

And those last three bullets that I just read are really in consideration. The board would like you to consider it. It's not something that is required.

That pretty much concludes the public comment recommendation.

MR. FLAMM: And next we continue
with the election of officers?

MS. JAMES: Yes. Okay,

recommendation for guidelines for developing -- let's see here -- for further process for the election of officers.

The main point of this recommendation is that during the election of officers, it's usually at the very end of our meetings, and we developed this so that we can actually get out of here to catch our flights.

So that's the main point of that recommendation.

The first part of the recommendation adds the election of officers as part of the officers' duties. That was never clearly defined in the policy and procedure manual.

The second part of the recommendation outlines a process for the election of officers, including defining exactly what those steps will be. We divided it up into point A, B, C, and D, which include
nominations.

Point A is nominations.

Point B, the voting schedule.

Point C, eligibility of the vote.

And Point D, counting procedures for the vote.

And there's further explanation of exactly what those points involve.

And unless there's questions later, that summarizes that recommendation.

MR. FLAMM: And finally the committee work plans.

MS. JAMES: Okay. The last recommendation is for the guidelines for developing committee work plans. This recommendation outlines that the committee chair, working with the committee, should follow three general steps in producing a work plan.

One, list all the issues before the committee.

Prioritize the issues.
Three, set a calendar or timeline to complete your plan.

And four, obtain feedback from the executive committee as well as the program.

And then further action points to assist these steps are also outlined on the recommendation.

MR. FLAMM: Thank you.

MR. KARREMAN: The next recommendations on sunset. I found when I came on the board earlier this year in reading the manual of -- both manuals that I found I was totally lost at what sunset was about.

There was not sufficient background, and the charts were confusing and so forth.

So we took on during this round to try to provide a clarification for the policy and procedure manual through outline of what has been done and present it in a simplified fashion, giving background and so forth.

One of the keys, I think, of a
beautiful flow chart that Rigo developed that
if you follow it closely and line it up with
the steps in the narrative, it pretty much
outlines what happens in the sunset.

Sunset is described and the sunset
procedure is required under the act. There
never was regulations actually issued on this,
so the procedures have evolved over time.

I think as you see -- and I won't
going into all the details, but what is outlined
here is I think a balanced process of
considering all the evidence from the previous
-- from the initial petition, TAPS, whatever
was available at that time, plus new
information, comments from the public, and the
expertise of the assigned committees.

So in summary this outlines the
process in ways that hopefully it's clear to
the public and clear to the members of the
board.

The next is recommendations.

Hugh, would you present that, please.
MR. KARREMAN: The next recommendation is -- it's to formulate. It's basically the structure of how to formulate a committee recommendation to provide consistency in the content of all NOSB recommendations.

Essentially there's six parts. The introduction basically is a brief summary of the recommendation.

Then a background section that should present the issues that justify the development of the recommendation, any relevant task work.

Third part would be relevant areas in the rules that the recommendation hinges upon or in OFPA.

And then a discussion which could expand on the intent of the recommendation, showing its strengths, weaknesses, opportunities, and threats.

And the fifth part is the recommendation itself, is the core or
deliverable of the recommendation.

And then the sixth part would show
the committee vote, and then if there's a
minority opinion, that would be attached after
where the committee vote is shown.

MR. FLAMM: And now we move to
recommendations. We have a couple of
recommendations with the new member guide.
Bea, would you discuss the recommendation on
training?

MS. JAMES: Yes. This is very
simple. With the new member guide, we just
added the addition of new members making sure
that they read the FACA training PowerPoint
that Valerie has put together, which is
located on the nationalegglosscenter.org Web
site.

That's it.

MR. FLAMM: Actually a fifth
member of our team -- we always treat her like
a member of the team -- is Valerie Frances,
and she works with us on all these
recommendations and makes the link, helps us,
certainly helps me continuously.

The last item for the new member
guide is a database update, and Valerie, would
you present that, please?

MS. FRANCES: Barbara alluded to
this yesterday. It's certainly in her report
in response to Tracy's questions to what
happens to all the recommendations. And this
has been an ongoing project since I began, and
back -- I archived, you know, to the best of
my ability on every recommendation made by the
board. I still find some as I go, and I
incorporated that into an Excel spreadsheet,
although I've had to go through the process
now of updating every link there because we
redid our entire Web site. So all my links
were how the Web site used to be set up.

I'm also now beginning a process
of creating worksheets within that that then
archive the history of specific issues, and so
anytime anybody asks me a question, I research
the issue and lay it all out on each worksheet, the whole history of that issue.

So working towards, really, a more workable -- I think of it as a Rubik's cube, you know, in how data works, and would like to get us to a place where we can utilize this and even put on the Web site somehow, but begin to look at those recommendations that are out there that were either guidances or rule changes that we just haven't gotten to, how to triage them, and what more work needs to be done or, you know, give us some sort of status, will work ever be done on it. Just try to bring everything up to date. And so that's an ongoing project that I'm working on. So that's where that's at.

MR. FLAMM: Thank you. Before I ask if there's any comments or questions from the board, I neglected to mention on sunset that we did receive a couple of public comments, two of which dealt with the question of annotations and the language in the
recommendation on annotations has been in the new member guide all along, which is that the material is evaluated in sunset as it was listed in the annotations.

I'm not sure whether the way we had this written confused the commenters or not, but in any case, we did have two questions that raised it, asking why didn't NOSB look at annotations after sunset, and in fact I think we do.

So I just wanted to add that to my previous comments.

So now I guess we'll entertain questions and comments, and you can direct your question to the -- at least initially to the person who made the report. Is that right, Mr. Chairman?

MR. DELGADO: That's fine. Any questions --

MR. FLAMM: How much time do we have for questions?

MR. DELGADO: Not very much, but
we're in discussion mode. So are there any questions for the Policy Development team?

Any clarifications? Yes. Tracy.

MS. MIEDEMA: I had one on just developing committee work plans. This has been something that's been a little bit confusing to me all along. It's sort of what seems to percolate to the surface, and I really am pleased to see more rigor to how we build our work plan.

But I don't see anything in here that talks about the NOP asking us to take up issues, and from what I heard yesterday, that those recommendations are actually the ones most likely to get acted upon.

I want to make sure that we are prioritizing that work. So if you could just help me understand. In the section it talks about identifying all issues, where that falls, what the program, or what the Secretary of Agriculture would like us to work on.

MS. JAMES: Tracy, it's the third
point down, special petitions from the National Organic Program, such as clarifications on a particular issue or guidance, but maybe we used the wrong word by saying special petitions.

MS. MIEDEMA: Because normally the way the NOP requests come to us is in a much less formal manner. It's usually on a conference call. It's in this room. And we're only talking about building our work plan, and the special petition goes from us to the team, the highest priority work landing on the work plan.

MS. JAMES: Maybe it should say request or suggestions from?

MR. FLAMM: I think we had discussions at our executive committee on how some of this will be sorted out, in discussions with her, and maybe that didn't come across as clear as we intended.

MR. DELGADO: Very good.

Wonderful question.
Any other -- Tracy, any others?
Dan?
MR. GIACOMINI: Thank you, Mr. Chairman.
I think there's just a few things on a couple of these that I think might do with some constructive tweaking. In the election of officers, under the voting schedule, we say new officers resume the position after the fall board meeting. I believe historically it has been after the election, at the conclusion of the meeting, and the new officers actually are the ones who close the meeting, if I have that -- if I remember that correctly.

Also down in the counting of votes, where we're dealing with ties and revotes, I think it would be good to have an allowance in there for a person to be able to withdraw, which is not there now. But that would help, be something that would help clarify.
On the sunset document, one of the things that I've noticed in the policy and procedure manual that I think is an overall view of something that we need to look at working on and clarifying is that it tends to say "approved" or "prohibited." Really, everything, as we're listing things on the national list, is what we approve, and it's whether we're allowing it or prohibiting it. It depends on what kind of a substance it is. That's in the background on the sunset review.

I would suggest something along the lines of continued listing of an exempted material already listed on the national list, rather than talking about approved or prohibited.

Also, I think it would be very constructive in the sunset process, since one of the aspects of the sunset process is what is new, is to include a review of the original recommendation.

And I would suggest that -- I
would recommend adding that to the document.

MR. FLAMM: That would definitely be in there, Dan. Maybe our language wasn't clear enough.

MR. DELGADO: Anything else, Dan?

Hugh?

MR. KARREMAN: It's kind of wordsmithing, just wondering on the discussion that as far as when we look at things for sunset and we re-review, you know, what was the original petition, Dan, what if at the time of the original petition, due to need for a particular product, whatever it is, you know, we look at the checklist and we look at all the information, and I think I'd be honest to say that sometimes things -- let's say there's like potential harm to the people in the factory that make a particular material, I think that is one of the checklist items, you know, and that's manufactured, that not all the checklist items seem to always be given equal weight, depending on what the
material is and what might be needed. And so that in the future at sunset, it may be -- it's going to be a different sitting board that, you know, that that item may mean something different, you know, harmful to the people in the manufacturing of material, than it did to the original board, and I think it would be okay to look at that differently by people on the future board, even though it's the same -- literally the same information, but it was just viewed differently previously.

MR. DELGADO: Dan?

MR. GIACOMINI: That's always a possibility, but we can't get there unless we include in the process of sunset the review of the original document. So I mean that's -- you know, this is what we're looking at here, is what do we put in this document, and I think we need to include that we should recommend that we go back and we get that original recommendation.

MR. KARREMAN: Agreed.
MR. DELGADO: Any other comments?

Does that conclude your presentation? Thank you very much, and I congratulate you on your wonderful work this year as chair of the Policy Committee. In spite of the fact that you're the newest member of the board, you had the courage to step up and take over the committee. I congratulate you for that.

Moving on then to the next point, we have a Joint Materials and Policy Development Committee work, and the chair of the Materials Committee will give us their presentation. Dan.

MR. GIACOMINI: Thank you, Mr. Chairman.

JOINT MATERIALS AND POLICY DEVELOPMENT COMMITTEE

MR. GIACOMINI: The evolution as the program and the industry has grown, we've had a number of inputs into that along the lines of lawsuits and changes in viewing of
how things and what things go on the national list and how they are required to be there, has forced the -- sort of the reevaluation of handling this process. It significantly came to the fore in the review of the 606 items on the question of whether they had been properly TAP'd as required by OFPA.

The program in consultation with general counsel, as Richard said yesterday, reviewed that and the determination has been that the board can serve, and members of the board, committees of the board, can serve as the TAP review, but at the same time we all recognize the need for additional expertise, and additional knowledge and outside of the board, and in some situations the workload would just be unbearable for the board to handle, even when we do have the expertise.

So this is a clarification of that development of the process. We do need to do some tweaking in this along the lines of who convenes the technical review, actually.
So -- and that is the process we're clarifying here, is that the -- in a sense the board is serving as a TAP when necessary, when possible. There are certain things in the 606, raw ingredient items and agriculture, that do not need generally the outside additional review.

But the -- so there's a clarification that the outside third party review is now being -- has been reviewed according to the program as the technical review to supplement the TAP when necessary. That's the essence. We also go into and review the process of developing questions, specific questions within the committee, to ask for the technical review and to ask for that technical review to be done, and we further list things to evaluate those reviews when they are completed.

That's the essence of the document. There are a few things that need to be tweaked from public comment, a few other
items that need to be worked on, but that is
the essence of it, and I think as extensive a
document as it is, if anyone has specific
questions, we can deal with those.

MR. DELGADO: Okay. Thank you.

And I also have to remind the board that we
are in the process of presenting
recommendations. We are not done with public
input yet, so there is opportunity to update
those, make any changes to your
recommendations, just as the chair of the
Materials Committee will be doing.

At this point are there any
questions for the chair of the Materials
Committee? Bea.

MS. JAMES: Dan, yesterday we
heard some people talk a little bit about
their concern that the NOSB would actually
perform a TAP, and I was wondering if you
could give me your, you know, perspective on
that.

MR. GIACOMINI: Well, we have been
told that we are able to perform the TAP, but
that is not the say -- that is not the end of
the process, necessarily, if there's not the
time, not the expertise, and I think most
members of the board would generally prefer in
a technical item, in most of the synthetics,
most of the things that would go on everything
except 606, and include some of the things
that will be coming up on 606, that an outside
technical review, external technical review,
will be requested.

There's no effort within this
document and no intent of the document to in
any way decrease the external technical review
process. It's merely a way of handling the
requirement of OFPA to have these reviews
within the change of 606, was the main
emphasis to this.

MR. DELGADO: Julie?

MS. WEISMAN: Yes, I actually
wanted to just add a comment that maybe would
put things in a little perspective because I
have heard a lot of the fear in many people on the board and in the room about this issue, which is that before we started actively needing and having to add materials onto 606, there was no even possibility -- like every material that was petitioned was going to need an outside third-party technical review. And when we first were presented with the situation where we were now going to be reviewing agricultural products, it only then occurred to us that it's possible that some things -- petition materials -- maybe don't need third-party technical reviews, if they're something very, you know, simple or raw or whatever.

And we have also on the board gone through a learning curve in realizing that just because it's an agricultural product doesn't mean that it's simple.

So there is no thought that just because something is being petitioned for 606, it will not get a third-party technical
review. It's only really that there is now
the possibility that sometimes there are
materials that will come along that perhaps
can be reviewed appropriately by the expertise
that's on the board if we have time to do it.

And so this is really only to open
up that possibility, not to propose some
radical change in how things have always been
done.

Is that fair?

MR. DELGADO: Any other questions,
comments? Dan.

MR. GIACOMINI: I'd just like to,
you know, if there's no questions, I'd like to
include that in addition to the issues brought
in public comment, the statement that I made
regarding the documents in -- other documents
in the policy and procedure manual is we will
try to go through this and clean up the
addition or removal, clarification that I
talked about, and also we are looking at on --
I can't tell you what page it is, because I
don't have -- Valerie, if you could go to the page after procedure for handling technical reviews. Next page.

We are looking at the C and E. We are very interested -- the board is very interested in knowing the effective interactions in light of what has affectionately been known as the Applegate decision.

So -- and what that says is that anything on the list, anything that interacts with it, that -- yes, if you combine and you create a new material, that new material is also considered on the list.

So we are very interested in including in the technical review what new substances we may be allowing, as much as possible, when any interactions and creation of new materials come -- arise from what else is on the national list.

But C and E is asking the question of what interactions come from everything else
in the universe. And that's a little burdensome, I think, in the technical review.

So we will be looking to modify that to include a request for the result of combinations of items already on the national list in the same section. There's also no value in knowing what interaction there is from an item on 605 with 601.

So we will try and keep it relevant. We will try and not over -- make it overburdensome, but we believe that it's very important that we know what those potential things are moving forward.

MR. DELGADO: Any other questions?

Kevin.

MR. ENGELBERT: Just one quick one as a reminder point, and maybe under definitions, under technical advisory panel you start out with a group of third-party experts, and then under technical review, you say a report prepared by a third-party expert, singular. Maybe those two should be
coordinated to avoid confusion, that the
technical review could also be done by a group
of experts.

MR. GIACOMINI: One of the changes
we need -- additional changes we need to make
is deleting third party from the definition of
technical of the TAP, because that -- what we
are saying in this document is that the TAP
can be the board.

MR. DELGADO: Any other questions?

All right. Thank you, Mr. Chairman. Now we
are moving on to the next point, also handled
by the Materials Committee, and specific
recommendations. Back to you.

MATERIALS COMMITTEE

MR. GIACOMINI: Thank you, Mr.
Chairman.

This is the discussion on the
document to take items from the table. This
is purely a parliamentary procedure to try and
get things right. We have been requested in
public comment numerous of times -- numerous
times over the years to find out and to satisfy and take care of all these old petitions that have in one way or another gone by the wayside and have never received full final action.

In the process of that -- we are working to do that, and we appreciate in the public comment the lists that various individuals have provided us of petitions that have not seen the end light of day.

We are working with the program on clarifying those, finding, figuring -- trying to establish the status of those, and when possible, if the interest is still within the petitioner, of moving ahead with those.

One of the things that we found in that process is that petitions were put aside in various ways, and in dealing with that, parliamentary -- within parliamentary procedure a very typical way of shelving something is to table it. It puts it up there and you don't act on it again until you take
it off the table. Legislatively that's the way a lot of things get killed, is to table because you cannot take action on them again legally within the rules of parliamentary procedure without taking them from the table.

In the process of evaluating and reviewing old petitions, we came across what we believe are items that were tabled at the board level. Therefore, they require action at the board level to take them off the table so that they can be reconsidered. That is not to say that we are immediately going to go into action on them; they will go back to the program, the program will, if they are multiple item petitions, be rejected. If they are -- if they are individual items, they will be -- the petitioner will be contacted to find out if they still want to continue. If they are very old petitions, the program may even request that a new petition be submitted.

But -- and likewise, if that action was taken at the committee level, then
it is the committee that can take the action
to take from the table.

But in this case, we believe that
these are -- it was not -- we tried to be as
inclusive and do as good a job as we could,
but we're not claiming in any way for anyone
think, and we certainly do not believe, that
this was an exhaustive process. We have not
reviewed the transcripts of every public
meeting of the NOSB since its inception, but
these seem to be items that we have found that
were tabled at the board level, and we are
merely trying to take the proper action to
bring them back into play.

Any questions?

MR. DAVIS: In referencing some of
the public comment, one that specifically
lists several materials, that -- a couple of
them seem to be ones that it was actually in
the NOSB court when it was -- I don't know if
it was officially tabled, but using that
verbiage, but they seemed to have been in the NOSB court, and now they are waiting for the synthetic, nonsynthetic issue to be resolved.

The two materials I reference, for example, would be phosphoric acid use in -- for pH adjustment in aquatic plant extracts, ammonium bicarbonate.

Were those ones that would or should be included on that list there, or is that something different? Different status, you think, than what you tried to list?

MR. GIACOMINI: I don't -- I was not able to go through and track -- we were not able to go through and track each of those items to a particular meeting, to a particular transcript.

But with the historical memory that we were able to communicate with, a number of these items, when they reached the board level, are pulled back by the committee. It's not the full formal vote of tabling at the board level that is what we need to deal
with here. If it was tabled within the
committee, the committee can take it off.

MR. DAVIS: No, I understand. The
list that you made was stuff that was
officially tabled by the full board?

MR. GIACOMINI: At the full board
level. Technically it requires full board
action to bring back into play.

MR. DAVIS: Okay.

MR. GIACOMINI: And again, one of
the questions that was asked yesterday, well,
where did this come from? It came from the
request that we've had at almost probably
every meeting since I've been on the board to
try and deal with these old petitions. That's
what we're trying to do.

MR. DELGADO: Any other questions?

Just to follow up, Dan, do you
have an idea of how many materials we have
tabled at the committee level? And if so,
what would be the action item on that? Are
you planning on contacting the committee
chairs to try to get those moving? Give us a
status.

MR. GIACOMINI: Well, a number of
those old petitions that are on those lists
are still in the process. A few of those are
coming up for a vote at this meeting, and we
will be continuing to work with the program in
cooperation with the program. It's
challenging enough to go through the
transcript records, much less going through
all of the old committee report records.

We may just need to allow the
committees to deal with those as we identify
them and find them and reestablish what the
status is.

As far as the number, I have no
idea.

MR. DELGADO: Okay. Thank you.

Any other questions for the
committee?

Thank you.

Well, thank you, Dan. That was
very good, and I applaud your efforts of trying to clean up the list of pending items. And we are on schedule, I'm reminded by my vice chair. We're ahead of schedule, and we're moving on to the next topic. You're actually not done, Dan. We're moving on to the clarification of the definition of the national list, so back to you.

MR. GIACOMINI: Thank you, Mr. Chairman.

We're not done, but this is not my part, a big part of my -- the big part of this is not my job right now.

Another issue that the board has been dealing with extensively over the years, the ag/non-ag question, the synthetic, nonsynthetic question, the concept of agricultural synthetics which could require that it's both on 606 and 605 at the same time, and the fact of resolving the issue of is it the substance or is it the process that
got that particular version of the substance that is the primary factor.

This came to -- in the efforts to resolve these issues, I believe a year ago at this meeting, we, in cooperation with a number of people from the public and the organic industry, former NOSB members, it was decided to convene a working group on this matter. It is open to everyone that wants to participate. It has been -- it's coordinated through the conference call system, and graciously provided by the Organic Trade Association, to allow these phone calls to occur, and that committee, that working group, has been on a very regular basis trying to deal with these issues.

They have now worked on the ag/non-ag issue for approximately a year, and they will be looking at the synthetic-nonsynthetic hopefully within this next six months before the spring meeting.

But right now what we are looking
at, what we are looking for, what we're going
to be doing, is a presentation by the cochairs
of that group, Kim Dietz and Gwendolyn Wyard,
to give us a presentation of where the
evolution and where we have ended up and where
they are in that process at this time.

MS. DIETZ: Good morning. There's
been a little bit of change of plans here.
Gwendolyn ate a bad piece of cantaloupe this
morning, so she's in the back, and I just cut
her off so she can go back to her room. So
we're going to meet in a little bit.

So we're going to kind of split up
the slides, and I'll do the introduction, and
then Emily and Rich will help me as well.
That's what a working group is all about,
right?

Okay. My name is Kim Dietz, and
I'm one of the original founders of the
Materials Working Group.
The Materials Working Group is an
ad hoc committee that represents a broad
spectrum of backgrounds in segments in the
organic industry. Participation in the group
is open to anyone who is interested.

The Materials Working Group was
formed following a November 2007 NOSB meeting
to work on clarifying issues surrounding the
definitions of nonagricultural, nonsynthetic,
synthetic and nonsynthetic, and to assist the
NOSB in developing recommendations and
guidance documents relating to those
definitions.

Meetings were held weekly during
the time leading up to the main meeting, and
a discussion paper was presented at that
meeting by myself and Gwendolyn.

In 2008, the group reconvened our
weekly conference calls with a goal to bring
forward more detailed discussion documents
regarding issues surrounding nonagricultural.

We'd like to thank the Organic
Trade Association for allowing the Materials
Working Group to use their teleconference
Additionally, special thanks go to the hard work and dedication of the participants, and I'm going to read their names, because I think it is important for you all to know who was involved in this committee.

Andrea Caroe, past chair of the NOSB; Brian Baker; Craig Weakley; Emily Brown Rosen; Grace Marroquin; Grace Gershuny; Jessica Walden; Julie Weisman; Katrina Heinze; Kelly Shea; Kevin Engelbert; Kevin O'Rell; Pat Pearson; Dan Giacomini; Rose Koenig; Richard Theuer; Sue Biard; Susan Ulery; Tom Hutcheson; Victoria Saavedra; and Zea Sonnebend.

We submitted 54 pages of documents, and you can tell by the list of the people on the committee, very technical group, and leading that group was very interesting, but we're doing it. So that's really my role, is to set the calls, set the agendas, work with Dan, try to figure out what timelines we
need, and get it done.

Couple of comments about the group. We are an independent group. We were formed that way, whether it's right, wrong, or indifferent. We're not necessarily an affiliate of the NOSB. We're here to assist freely. And we're not an affiliate of OTA, although OTA graciously allows us their staff time and conference calls.

And it's really the involvement, the work that we've done, and the involvement is what is the outcome.

I read a couple of comments, and they said there were some biased opinions. Well, you know, we've done the best we can, and my only response to that would be you have to participate and make sure you're engaged, and this is the outcome of it.

We will continue with the NOSB. Okay. So let's go through the slides. We're going to talk about status
quo, we're going to talk about our different options, we're going to talk about a survey that the group did.

In a nutshell, even with that wide list of people that you saw there, the names, we still can't even come up with a conclusion on the definition of ag/non-ag.

So what you have before you is a task, but we have narrowed it down one more time, so here is the status quo definition of nonagricultural.

Okay, the definition of nonagricultural is ambiguous. Not a product of agriculture, such as a mineral or bacteria culture, that is used as an ingredient in an agricultural product.

For the purpose of this part, it also includes any substance such as gums, citric acid, or peptin that is extracted from, isolated from, or a fraction of an ingredient product so that the identity of the agricultural product is unrecognizable in the
extract isolate refraction.

So that is what is currently being used as the definition of nonagricultural.

What you see up in the pictures up there are soybeans and then soy lecithin, so an example of something that's gone from agricultural to nonagricultural. And then we have gums up in the upper right corner.

Okay. Next.

Status quo. The rule states that agricultural products can be organic. Presumptions that nonagricultural is nonorganic only.

So a lot of even members of our group feel that if it's nonagricultural, then it means nonorganic.

Status quo determines one placement for material on the national list, whether it's eligible for certification, whether it's subject to commercial availability.

Current 205605 substances are
available as organic, consistent with -- so long as they're consistent with 95 percent organic agricultural ingredients or formulation, such as yeast flavors, dairy cultures. Extracted isolated derives from organic agricultural material, such as flavors, bleach lecithin, and glycerin. And that is again the status quo.

Next slide.

Some of our primary issues that the group discussed and really again couldn't come up with a definite conclusion was on agricultural origin. Where does it begin.

And this is probably the work of the board where you're going to take it from here.

A lot of discussion and controversy over whether or not agricultural has to be land-based. A wide variety of opinions there. Land-based activity related to plants, soil, and livestock in a traditional farm setting.

Other issue, broad range of
activities that include any living organism
intentionally raised or gathered by humans for
our own use.

And subpart (c) is divided into
crops, livestock, and handling. That's the
rule.

And then the definition of
livestock, however, includes other nonplant
life.

So there's really the four areas
that need to get resolved so the industry can
move forward.

The pictures on the bottom -- I
don't know if Gwendolyn is still in the back
of the room -- she's right next to me. Would
you like to chime in? Because these are
interesting.

MS. WYARD: Try to bear with me.
I'm kind of in and out of the bathroom here.
Okay. So what we've going on in
the pictures up at the top there that, you
know, most people look at those and they say,
well, that is an agricultural system, those
are traditional farms.

Down in the bottom, just to get
the old noggin rolling, we've got a picture of
chlorella, and that's the far left picture.
And then right next to it, that's chlorella
production. So controlled environments,
controlled tanks, where the chlorella is being
grown. And we picked that as an example
because chlorella was one that is being
petitioned for 606.

And, you know, noted in the
recommendation, the board did say, well, it's
a photosynthesizing plant, so that seemed to
be part of the criteria that we used in
deciding it was agricultural.

If you keep going over, you have a
yeast cell, and then right next to it, that is
yeast production. In fact, that's the lady
that's making the organic yeast in Germany.
Sourdough started there.

And that production -- a lot of
the conversations that have come up is that, you know, an agricultural product is soil based, it's connected to the land, and if you are growing an organism in a facility, in a tank, in a controlled environment, temperature-regulated, pH-regulated, that is not a farm, so to speak.

So if that's where your production is starting, that's where something is growing, that would be considered agricultural.

So these are the discussions and this really becomes very apparent, it's a very philosophical divide as to what is agricultural and what is not.

So the primary issues, this first one, where does it start. And this is really where the work has been hung up over the years. When OTCO submitted our proposal in 2004, for clarification on this issue, we submitted a flow chart in that first box, and said is it a plant, is it an animal, is it a
fungus. We really have never gotten past that first box. That's the discussions and about very much focused on yeast.

So we really need to look at the world of living organisms, and keeping in mind that we've got a regulation that talks about crops, livestock, and handling. Is that our world of agricultural? But then you have to look into those -- into the definition of crop, and when you go into livestock you see nonplant life, and so that really opens the door to, you know, a whole host of living organisms and what was intended by that.

Go on to the next slide, please.

So once you figure out where it starts, then you have to figure out if and when it stops. So does something lose its agricultural status? And if so, how? Is it because of a chemical change? Does it match up with the definition of synthetic? If that chemical change occurs, what if it's because of a biological process? What if it's
enzymatic? What if it's a mechanical method?

What if something is heated? What if bread is
baked and chemical changes occur, does that
make it nonagricultural?

The definition of agricultural
product in OFPA and in our regulation, it
really doesn't define itself, because it says
agricultural is an agricultural product,
either raw or processed.

So we know -- and this is very
important -- that it includes processed, and
we do have a definition of processing.

So if you take something that
starts out agricultural and you look at that
long, you know, eviscerating, cutting,
chopping, slicing, that definition, are all of
those methods okay, whatever that agricultural
product undergoes? Is that processing? Or
does that, even if a chemical change occurs,
does that make it synthetic and therefore
nonagricultural?

That's been a huge part of the
discussion, is does synthetic equal
nonagricultural?

Go on to the next slide, please.

Okay, things are heating up a little bit.

So one of the big hang-ups we've had when we start talking about changing the definitions of nonagricultural, providing clarity, we start looking at items that are listed on 605, and we say, well, okay, yeast. It is a living organism. It can be grown up on organic agricultural substrate. Maybe that is more appropriately listed on 606.

Maybe glycerin. Glycerin is derived from oil. It started out as agricultural. Goes through maybe high pressure, high heat, chemical changes occur. You have a split between the glycerin backbone and the fatty acids. It started out as olive oil or some sort of vegetable oil. Did those processes turn it into something that's nonagricultural?
You move things on to 606, and really the heart of this discussion has been about yeast. In the livestock world, commercial availability doesn't exist. So if you deem something agricultural, processors will have the ability to say, well, it's not available in the quality, quantity, or form that I need. However, the livestock producer will have to use organic. It doesn't have that commercial availability option.

So I think the community was ready to move yeast on to 606, but we saw a real inequity and looked at the burden that that would place on the livestock industry.

So we have in our paper, I believe on page 4, we explored some options, some potential regulatory changes where the main one is that you would make an exception, basically, for items that are on 606. Agricultural items on 606 could be fed to livestock, nonorganic, up to 5 percent. It was an option that was
explored. It's something that, you know, we encourage you to look at as well, what would be the implications of that, is it even possible. But we were looking for a way to somehow put the livestock sector and processors on a level playing field.

Okay. So I don't want to spend too much time on this, but I do want to demonstrate a little exercise that we went through where we started out -- and actually I'm just going to focus on the 11 materials.

We took the group and we picked 11 familiar materials that are on the national list, and we played with different definitions to see how that would affect our answers, namely that the consistency or lack thereof consistency.

So the first definition -- go ahead, please -- we took the whole second part of the nonagricultural definition that is so ambiguous and contradicting, and we just cut it out, and we said let's see what happens if
we just say it's not a product of agriculture, leave those two examples in there, mineral or bacterial culture. So that was the first revised definition.

The second one, we removed those examples of mineral and bacterial culture. Nobody -- so far we haven't found any disagreement on mineral. We haven't heard anybody argue that mineral is agricultural.

Bacterial culture, on the other hand, that's been a problem. So we said, well, let's just remove those examples and say it's not a product of agriculture. And let's also provide a new definition of an agricultural system, and let's tie it to the land. Let's say that it has to be soil based, soil-producing crops, livestock, or poultry.

Okay, that's the next definition.

Now we've included those examples -- well, the example of mineral. Another example that has gone undisputed is atmospheric gas. So mineral, atmospheric gas,
nonagricultural. Everybody was on the same page.

And then we took that agricultural system and we said, okay, this one is not connected to land or soil. This one is going to be any living organism, more or less, that anything that's managed by humans. And then we qualified managed -- intentional gathering, producing, raising, growing, domestically or in designated wild harvest areas, by persons for human or livestock consumption.

So another definition that we played with.

Go ahead.

And so this is the survey results, and so the first column, everybody looked at each one of those materials and just read the existing definition of agricultural product. And most people said yes. Lactose is agricultural. Egg white lysozymes.

In all cases, there was agreement.

For the most part, you can see where it kind
of separates out once you get down to fermented products, citric acid, fermented products, fermentation is a really important one to focus on. Kelp.

And there, with our existing definition, when you get into kelp, then people are saying, well, soil, water, agricultural.

Then you put the nonagricultural definition out there, and again, now there a lot of people are saying, well, it's also nonagricultural.

First, revision No. 1, is it nonagricultural. Several people said no. In all cases for the first three. But you can see it still jumps around.

Revision No. 2, it's jumping around, it's very inconsistent.

The third definition, that was -- we had the most consistency on that third one.

Go on to the next slide.

The exercise was somewhat
inclusive. It really deserved more attention and more discussion, which we didn't get to, but a few things that definitely came out of it is that you can, with our definitions, depending on which one you're reading, it can go to agricultural and nonagricultural.

And better definitions do yield more consistent differentiation, and of course we really had no consensus amongst our group.

So go ahead.

So we took those exercises and we said, well, we really do need to try to come up with definitions that have more examples, and more detail to it.

So what we are providing you -- and this -- change it on this slide, too. That's actually supposed to be A and B. We couldn't figure it out. When it's on my computer, it says A and B. When you put it on anybody else's computer, to goes to A and A.

(Laughter.)

Everybody kept saying, Gwen, you
got to change it. I have changed it.

MR. DELGADO: Gwen, I suggest A
and non-A.

(Laughter.)

MS. WYARD: All right. Okay, so
we're offering you two definitions to work
with. Definition A, we've stuck the examples
of mineral and atmospheric gas.
Noncontroversial examples, we think, so far.

We have said for the purpose of
this part, agricultural refers to the
production or handling of crops or livestock.

We are including that second part
to say let's exist within the context of OFPA
and the regulation. Let's use existing terms.
Let's focus on crops and parse that out and
say, well, is -- crop is defined as a plant in
our regulation, so there's going to be a need
to look at the term crop, plant, and does that
include -- is that chlorella, is it kelp, or
livestock.

And then once you go into the
livestock definition, you have to address nonplant life.

The second definition, non-A, we have stuck with the examples of mineral and atmospheric gas, and lopped off that whole confusing section part, and said it doesn't originate from agricultural system, and then we have provided this definition of agricultural system which is all-encompassing of all living organisms that are raised by humans.

We are not qualifying, defining where that happens, whether that be soil or air, water. We recognize that there are insects and lots of little critters that are extremely important food sources throughout the world, and the second definition is really embracing that. It could be any living organism.

You could essentially get there with definition A as well because of nonplant life, but definition non-A is more committal as
far as saying if you're a living organism that's being managed by humans for human or livestock consumption, it can be agricultural.

Okay, next slide, please.

I just went through this without -- you can go on to the next slide, too. That was just the explanation that I provided.

And again, that's the explanation that I provided, so you can go on to the next slide.

Okay, I'm going to pause, and I want to -- since I am one voice representing many others, I just want to make sure I haven't missed anything, or if there's anybody -- how many people on the group are out in the crowd? Would you raise your hands?

(Show of hands.)

Okay. Is there any -- are you sitting out just antsy, going she forgot to say something, she really needs to bring something up? Richard? Would you --

MR. THEUER: One point that we
concluded -- I'm Rich Theuer, North Carolina, former board member.

One of the points that we came to was that with certain definitions, something can be neither agricultural nor nonagricultural.

(Laughter.)

So you had some where it was both with some definitions, and with other definitions, it was neither because the definitions are not mutually exclusive.

MS. WYARD: And you have something that I -- it's not in our paper, and I don't know that anybody -- there are some things that are agish --

(Laughter.)

They are composed of agricultural and nonagricultural ingredients together, you know. I mean that's what we're looking at with yeast, and why is there organic yeast on the market. Because at formulation 95 percent of it is organic. So you have a combination.
So I'm going to run through the options.

The first option is a very important one to consider. Don't change anything. Oh, well, I guess we're not biased on this.

But it's very possible to provide clarity using guidance documents. The scope of agricultural, that certainly could be clarified with guidance documents.

The second part of the definition, if you feel that something does lose its agricultural status, then spend time on the second part of that definition, and you could provide guidance to clarify when does something lose its identity. How does something -- how do you lose the identity of the agricultural product.

So you -- those examples are problematic because you've got gums on 605 and 606, pectin on 605 and 606, and perhaps you just cut out the examples and provide guidance
that would further clarify that second part, and then rely on the petition process to get materials to where they need to go.

So, you know, considering keeping things as is and not making regulatory changes is number one to look at.

Number two. Okay. Okay, so option two, we are going to retain the current headings for 605 and 606. We are going to revise the definition of nonagricultural.

Now you get to choose door A or door B. For this option, A or B can fit. It will change things, but that's something the NOSB needs to look at, and then relist the items to correspond with the chosen definition.

And then we have also provided suggested criteria for adding items onto 205606. Number one, that it comes from agricultural origin. And if processed, it's done so using methods defined under 205.2. So the definition of processing.
An item that goes onto 606 does not contain a synthetic component unless allowed under 205605, and then for use in organic products, the clarification -- and this is something that we put out there for a while and we think it's really important that we get clarification from the program because it will help us in our determination of agricultural and nonagricultural, because we find that there are certain criteria or -- certain criteria for using agricultural ingredients in organic products that will sometimes get tied into or -- tied into a definition of agricultural when it really has more to do with what is allowed in an organic product than it does whether or not it's agricultural or nonagricultural.

So 606 items, can they be produced using synthetic solvents and synthetic processing aids? Can they contain synthetic components that aren't on the national list. We have requested -- I know Oregon
Tilth from PCO has been requesting clarification on this for two years, so with that clarification, we feel like that should be criteria that gets included on adding things to 606.

And then I just want to point out that you have an appendix B, and so for all of our suggested options, we've gone through and we've made -- we've demonstrated all the places in the regulation that would need to be revised if you go with this option. We've detailed it out. We've looked at every section in the rule, and crossed out, et cetera, et cetera.

Valerie, you can go on through this.

Option No. 3, in this one we are dropping the term nonagricultural from 605 and leaving reference to nonorganic -- really it should say nonorganic substances only. The ingredients can be problematic since we have more than just ingredients under 605, but the
point is to remove the term nonagricultural from the heading, so that you will have a list of nonorganic substances. These could be ones that are nonagricultural. They could be ones that are agish, such as yeast, microorganisms, recognizing that, well, they may not be the traditional farm-grown type of product, but they do -- their production does really on agricultural product, most of it. So it definitely has agricultural and environmental implications, and according to the composition standards of an organic product, it could be organic.

So this would be a way to not put yeast or microorganisms definitely under agricultural, and this is thinking of the livestock dilemma, but recognizing that they are agish, and apply commercial availability to 605, recognizing that you apply commercial availability to that list because of items such as yeast that have both -- are produced using both ag/non-ag components.
Suggested criteria for 606 remains the same, and again, in appendix B we have gone through and looked at every place in the regulation where the term nonagricultural is used in reference to 605 and crossed all that out, so you can see and really get a feel for the amount of rule change it would take to go with this option.

And then we have -- with this option we've plugged in definition A, which is the one that refers to crops and livestock.

So recognizing again that 605 could contain agricultural, agish, and nonagricultural, and I say agricultural as well. I think what's not up there, under the criteria that I believe is in the document, is that 605 would also be a place where you part substances that can't be organic because no standards exist. We feel like 606 should be reserved for ones that are clearly agricultural, meet that criteria, and standards exist for it.
We put the requirement for somebody to search for a commercially available organic ingredient, if there are no standards, they don't really -- there's no business for them to be on 606. So that's what this option is embracing.

Okay. Then option No. 4 -- and keeping in mind, too, these are in order of no change to the most change.

Option No. 4 combines 605 and 606, and it removes reference to ag and non-al altogether. You just have a list of allowed nonorganic substances that are either synthetic or nonsynthetic. We've removed the distinction of ag and non-ag because OFPA doesn't make that distinction. OFPA only makes the distinction between synthetic and nonsynthetic.

We have retained the definition of nonagricultural to further define agricultural product. So again you have, you know, option A or B, or definition A or B, that could be
plugged in here.

We have also separated out cleaners and sanitizers, so we -- again in option, or appendix B, we've completely rearranged the list. Basically we took everything under 606, assumed that that was nonsynthetic, but it's interesting. If you go through and look at how that list is now set up in appendix B, you do see some items that are listed as nonsynthetic and other items listed as synthetic. It's an interesting placement just to look at it that way and see where everything is set up.

Okay, let's go ahead and move on.

MS. FRANCES: We have sanitizers on 606?

MS. WYARD: Oh, yes. Thank you.

So we are using now 605 as the combined 205 and 606, and now 606 is its own list for cleaners and sanitizers. So we separated them out so it's clear which items are being used as either ingredients or processing aids, and
then we pulled out cleaners and sanitizers, and we feel like this -- the discussion here plays into the conversation about 100 percent organic, and having a place to put substances that are used in handling operations but not as ingredients or processing aids.

Thank you for asking that.

Go ahead.

Oh, yes, the lovely flow chart.

So this, down at this -- I'm not going to take you through this in detail because I think we're running short on time, but this is just an example.

One, this could be the guidance. This in addition to a narrative, this could be guidance that would maybe go in status quo. You could adopt concepts in a particular option and then explore whether or not you could provide clarification without rule change.

You know, obviously the -- we feel like there's going to need to be some rule
change. We really -- some of us.

(Laughter.)

I'll be very careful on that.

There was no consensus. We never reached full agreement.

But here what we have done is we have brought together option 3 and definition A, and it brings together the questions. We've taken the parts of the definitions and turned them into questions. Is it a proper livestock derivative intended for human or livestock consumption. Is it processed. If it's processed, has there been a chemical change. And if so, is that change a result of the processes described under 278.

So we are now saying, okay, there's been a chemical change, but it's a result of processing, and if it's in our definition of processing, then you could have an organic product that would undergo a chemical change. So we wanted to align chemical change with what is allowed under the
definition of processing.

And then the question about have any synthetic solvents, synthetic processing aids, that ties back into the criteria in 606.

So I think a flow chart along with a narrative, you know, along with rule change, we think that there's going to need to be a guidance document in addition to rule change, and this would be an example of how that would look.

Okay. Next slide, please.

MS. DIETZ: Okay. This is what the group feels the NOSB needs to clarify. The NOSB needs to clarify whether an agricultural product -- example, vegetable oil -- that undergoes a chemical change via mechanical or biological methods can still be agricultural.

Does an extract derived from an agricultural product, via hexane or synthetic solvent, become nonagricultural.

These are issues that the industry
has not been able to deal with for 20-
thing years.

Does an agricultural product
combined or reacted with a nonagricultural
substance become nonagricultural. That's been
an issue that hasn't been resolved in many
years.

What if the nonagricultural
substance is on the national list.

Is a product of fermentation
agricultural or nonagricultural.

These are some of the things the
NOSB needs to decide, if agricultural extends
to any living organism cultivated or gathered
by humans for humans or livestock consumption.
That's another land-based issue.

Next slide.

In summary, clarification is
crucial and the national list needs to be
cleaned up accordingly. This has been an
ongoing -- I think it's time, we've got some
of the meat on the bones, and we're ready to
deal with these issues.

Definitions and list requirements
should encourage the development of organic
food, ingredients, and feed.

Changes to the regulation should
be minimized, and the resolution must be
consistent with OFPA, so we've tried to look
at that in all of our definitions.

And the work on agricultural
versus nonagricultural cannot completed until
synthetic and nonsynthetic is completed.

And this goes back to Dan when we
talked about trying to look at it as a whole.
That's something you guys are going to have to
decide. Can you move forward with the ag/non-
ag as we move forward with the synthetic,
nonsynthetic, as an industry.

I think that's it. That's all the
slides.

Thank you. We appreciate the
effort devoted by the NOSB in moving forward,
moving toward a resolution of these complex
issues, and offer this discussion document as background to further work on the subject. We will continue to offer our support.

I don't know if we have time of questions or how you want to handle it from this point.

MR. GIACOMINI: Do we have time for a few? Yes, we do. Just before I open it to the floor, two things very briefly, hopefully. Just to clarify the status of the situation, I think probably one of the most shocking things I've ever heard since I was on this board was when we presented the document with the new paradigm and the possibility of considering continuing a year ago is that this is easy and it's all been done before, and you just have to compile all the old NOSB documents.

Is this easy?

(Laughter.)

Okay. Thank you.

Number two, Gwendolyn, the
statement I'm going to make now may have a lot of people heading for the door. You said that you have never had an issue of a mineral not being non-ag.

MS. WYARD: Never.

MR. GIACOMINI: We are considering at this meeting calcium from seaweed. This is technically -- the closest thing chemically to it would be a limestone carbonate. It is the structural part of the seaweed. The seaweed dies, falls to the floor, they pick it up off the floor, they grind it up, wash it, and send it out.

I can very easily imagine the interpretation of this limestone carbonate product being considered agricultural.

MS. WYARD: Well, if seaweed is agricultural and it's derived from seaweed --

MR. GIACOMINI: It's the structural part of the seaweed and there's no chemical change involved.

MS. WYARD: So it's a different
mineral than the mineral that went undisputed, ones that are mined from the --

MR. GIACOMINI: Yes.

MS. WYARD: Just when you think you --

(Laughter.)

MR. GIACOMINI: Not to have to go into a big discussion about it, but the possibilities do exist.

MS. ROSEN: Well, I would just add the natural source of the mineral. It doesn't matter if it's agricultural. It's -- there's no -- it came from seaweed, it's natural. It's for crop, livestock, whatever use you want to put it to. Or human use. But it's -- you know, we could have a whole separate debate on the certifiability of seaweed and kelp, too. I mean that's something could use a little bit of discussion.

MR. GIACOMINI: So opening up to the floor. Joe.

MR. SMILLIE: Well, first of all,
I want to thank the blue ribbon panel of the working group. You've done a fabulous job on an obviously difficult topic. And this is the kind of public participation that this board absolutely relies on to get its work done. So once again, our immense thanks.

Now we're down to five or six options. It's going to be tough and, you know, it's going to be tough to come to a decision, but I think we do -- I think this board does have to come to a decision because we've got to cut the knot on this one.

Two comments. One is I just don't feel that we really -- and I could be wrong on this -- have to decide the synthetic, nonsynthetic. I think if we go with this one first -- and I believe that since organic is about agricultural, we should make our decision on ag/non-ag, and let that lead us into our decision on synthetic, nonsynthetic, rather than trying to do both at the same time.
The second thing is a comment was made that you can't certify something unless there's a standard. And that's become pretty controversial these days.

(Laughter.)

And one thing I'd like to point out is we do have something that Tina is actually sitting here representing, and that's mushrooms. And, you know, we're certifying mushrooms --

MS. ELLOR: Under the crops standard.

MR. SMILLIE: Under the crops standard.

MS. ELLOR: Because they are a crop.

MR. SMILLIE: Because they are a crop. And they come from a compost pile, not necessarily from a co-ge chamber, and we don't have a specific mushroom standard.

So, Gwendolyn, did you want to follow up on that?
MS. WYARD: Right. Well, but some standards being used like -- so we're talking about say fish oil. There are no aquaculture standards. So that would be an example of fish oil, if you were to take the option where you remove the distinctions and you would put fish oil on the 605 without the non-ag distinction because there are no standards yet. So you don't put it on a list where people are supposed to go out and source it when it's not out there because there are no standards. That was the idea.

MR. SMILLIE: I don't want to drag it out, but if you go -- well, take a look at two of your favorites, yeast and kelp. You know, kelp does not come from the soil, so some of the definitions don't work, but yet we certified that.

MS. WYARD: Well, and we question how it's being certified.

MR. SMILLIE: Wild crop section.

MS. WYARD: Right, but we're still
questioning how contaminatin prevention can happen. But with yeast we have -- we are using standards. Again, we're using the processing standards.

But when you go through the regulations and you try to certify fish, you can't find a standard to plug it into.

MR. DELGADO: Barry?

MR. FLAMM: Yes. For a newcomer, this has been an extremely interesting topic of discussion for me. But I have a question which will probably show my ignorance, but I'll ask it, anyway.

I don't quite get why gathering -- and it may not have any consequence in what you come out with, but why is gathering considered agriculture? I always thought of a hunting-gathering society, and even today, as being preagriculture.

And like I say, it may not have any consequence, but almost everywhere I see, gatherer is part of a definition of
agriculture. And you can write this off if it's not of consequence.

MS. WYARD: Well, we have wild harvest in our regulation, so --

MR. FLAMM: But is it --

MS. WYARD: I understand, yes.

Well, and we were looking at the intentional act of -- because you are intentionally gathering food for consumption. I mean I get what you're saying, because when you look at history and how people collected their food, agricultural came after hunting and gathering and breeding.

MR. FLAMM: And without raising it.

MS. WYARD: No, we're gathering it. We're -- you know, we're finding an area and gathering it for food.

Julie, do you want to -- or anybody else?

MR. DELGADO: Julie.

MS. WEISMAN: Yes. I just think
it might be helpful for us to remember that
the statute that brings us here is the Organic
Food Production Act, and gathering as it's
practiced today is producing food, and I agree
-- I understand what you're getting at in
terms of hunter-gatherers, but that's a
sociology issue.

(Laughter.)

MR. FLAMM: Well, I mean today
there's a lot of gathering societies still
exist in the world and in our own country.

MS. WEISMAN: I'm not saying that
it's not a modern issue, but that's a
sociology construct, not an OFPA -- I'm asking
you to stick to the OFPA paradigm and not take
on all of the social sciences.

(Laughter.)

MR. DELGADO: We have a comment.

MR. GIACOMINI: Yes, in responding
to Joe's statement, the materials and working
with anyone else certainly on the board that
wants to work with us, we will take this and
consider what we can move forward on before
the working group reaches a completion.

One of the difficulties that we
have envisioned is if we decide that something
can be considered agriculturally synthetic, we
have a hard time seeing that we would move
ahead with one half without the other.

I mean there's implications there.
We have cellulose on 605(b) as a synthetic.
If we are going to say that that is an
agricultural synthetic, technically we may
need to put trees on 606.

So there are implications there
that we would need to look at which make it
difficult to move with only part of it.

MR. THEUER: Could I have just a
quick response? Some of the group also had
the same -- this is Rich Theuer -- had the
same objection to kelp as being agricultural,
for the same reasons that you raised.

MR. DELGADO: Hugh.

MR. KARREMAN: Just two things.
As part of the gathering, I don't know a thing about this, but at least it's kind of you're managing it in a circumstance, you're watching over it. It's not like you're just freely running around and you gather whatever you happen to find. I mean it's in a defined area that you're gathering from, so it's kind of managed, which is what organics is all about.

But I also -- I just hope that -- it was brought up briefly earlier in the presentation about using, I think it's items on 605, for livestock production.

MS. WYARD: It's on 606.

MR. KARREMAN: Yes, and that's been an ongoing issue as far as, you know, the yeast with the livestock and all that. So I would like to explore that a lot more, because, you know, with a 100 claim for human retail product, you know, the livestock kind of have it tougher than, you know -- it's got to be a 100 percent ag, and yet people can buy organic, USDA organic things on the shelf that
are not 100 percent ag and yet it still has a seal.

And I really think that livestock should have that same benefit.

MR. DELGADO: Dan.

MR. GIACOMINI: One of the things that we will hopefully see where the program stands on when I ask Barbara how to find the status of recommendations was that document -- and Kim may know the data on this document better than I do -- where the NOSB recommended that items on 605 be considered as allowed for livestock feed.

Complicating the issues of that is, number one, that was a pre-Harvey recommendation, which changes the whole structure of 605, 606.

The other thing is the consideration of there's a tremendous amount of byproduct flow through the food chain that could be used tremendously as livestock feed, which would be a tremendous reintroducing of
nutrients.

So a possibility would be whether
you can utilize those things as raw
ingredients, or whether you use them as part
of that byproduct stream, one way or the
other.

MR. DELGADO: Bea.

MS. JAMES: I want to thank you
guys for this document. I was so, you know,
impressed and actually when I -- I saved it
for last of all my reading materials because
I was intimidated, and I thought, well, okay,
here comes another complicated subject matter
in a document that's probably just going to
confuse me even more. But I felt like you
guys really looked at a lot of the different
options and that I have my own opinion about
what option I think would serve the industry
best, and I want to ask what your guys'
opinion is on the different options that you --
you know, if you as a group ever said, okay,
well, where do we stand as a group, what
option takes the majority?

MS. WYARD: That's why you have four.

MS. JAMES: But there's more than four people in your group, so there must be --

MS. WYARD: So that's a concern, which we put together, and we had all the definitions. We were more looking at what's more -- what's going to be more consistent, and that's really the answer.

We couldn't come to any conclusion as a group. We all have our own personal opinions on what we think would work as well. So I can't really answer that as a group. We don't have a consensus.

MS. JAMES: The main reason I ask is that some of those options look grueling as far as, wow, this is just going to take so much time and rule change, and -- but if it's the best possible option, I think that that's really --

MS. DIETZ: And that's what we
attempted to do with that chart, to see what is the best option. And so we may have to go -- I mean we think that there should be some rulemaking. That's me as the chair, but some of the other members don't feel that. The status quo is just as good. So that's really where you guys have to -- and I think really this has to go out to the public. We need public comment, and this is just some work to get some guidance to get some ideas out there so the public can take it and you can take it from there.

MS. JAMES: Just in closing, I want to thank you again and all the people that worked on this document. I remember back when we first started and Rose Koenig and, you know, the whole conversation and how complex it was, and I really appreciate your work on this.

MS. DIETZ: And it's been a good marriage of industry and board, and I think that it's worked very well, even though it's
not official or anything, but it's worked.

MR. DELGADO: Richard.

MR. MATTHEWS: Yes. I want to answer Dan's question with regard to whether or not we've acted on the recommendation relative to all materials in 605 being accepted in livestock. That recommendation was vetted with the FDA, and it is not accepted. And I believe that it was addressed in the proposed rule to the final rule on livestock materials that was published last design certification. The final rule was published then, but I believe that the preamble to that addressed that particular issue.

But it has been addressed in a rulemaking someplace, and it was rejected after consultations with FDA.

MR. DELGADO: Thank you. Any more questions? Hugh.

MR. KARREMAN: Maybe I should have known that, but that comes as a surprise. I
think that would be like where you could let
the board know, if possible, beforehand or
write when that has happened, like this is
what the FDA said, because I wouldn't have
asked my question. So thank you.

MR. DELGADO: Julie.

MS. WEISMAN: Just real quick. I
participated in this group, and I just want to
say to Kim and Gwendolyn that what's here is
impressive, even for someone who was involved
in the process; maybe more so, because there
were so -- there was so much material, so many
possibilities, so many permutations, and it is
-- even having participated in the process --
especially having participated in the process,
it's really helpful to see it all up here in
black and white. Thank you.

MR. DELGADO: Any other questions?

Kevin.

MR. ENGELBERT: Just for the
public record, if you don't mind the work on
synthetic and nonsynthetic, if anyone would
want to join the group at this point, would they be welcome? Would you consider it closed right now?

MS. DIETZ: Yes, the question was if anybody wanted to join the group to work on the synthetic-nonsynthetic, the answer is yes. Just contact me. I'll be here all day today and tomorrow, or Gwendolyn, and we'll get your e-mail address and add you to the list.

We have calls every week. So just contact us.

MR. DELGADO: Dan?

MR. GIACOMINI: And I would like to extend that special part of that request. The working group is industrywide, and there are people that are affiliated with all parts of it, but it is definitely certified and processing weighted. Any people with a more extensive background in crops or livestock would certainly be welcome on the group.

MR. DELGADO: And I have one question. I just want to join the choir here
and let you know that we're very grateful. We appreciate your work, both to the leadership of the group and to the members of the group that were part of this wonderful example of leveraging the popular know-how, if you will, and helping the board.

So thanks again.

(Applause.)

MR. DELGADO: On that note, we're going to have a well-deserved 10-minute break. We'll see you here at 10 o'clock.

(Recess.)

MR. DELGADO: Welcome back after this break. We are about to start our nonbreak session. And we'll start with -- Joe, are you ready? It is the turn of the Compliance, Accreditation, and Certification Committee to talk about their proposals, and I will yield to the chair, Joe Smillie.

MR. SMILLIE: Thank you, Mr. Chair.

We -- it's Certification,
Accreditation, and Compliance, just to be clear. We like to start with compliance, right.

CERTIFICATION, ACCREDITATION, AND COMPLIANCE COMMITTEE

MR. SMILLIE: Thank you, Mr. Chair.

Our committee has been working pretty hard on a number of issues. We have two recommendations for this meeting, the multisite recommendation and the 100 percent recommendation.

We're going to start off with the multisite recommendation. As a lot of you know and a lot of you have participated, this has been an important issue that is desperately needed by the industry to move forward with, and we've gone through a couple of iterations, and we are pretty happy with what we're presenting now.

We have been very happy with the public comment on it, and one of the things I
would like to point out -- or two things I'd like to point out about the document before Tracy leads us through a detailed analysis, is that the appendices are important. A lot of people -- the recommendation itself is pretty long and technical, but the appendices are a very important part of it, and I urge all of you with interest in the document and in its implementation, hopefully through the NOP, that these appendices are regarded as an integral part of the document. Because a lot of the details, which a number of people are worried about and concerned about, are contained in some of the selections we made as far as the appendix material, including the title and the multisite, which is an isoterminology, and we want to stay on that iso base and work it into the organic world as much as possible.

The second item I want to point out is that there is a minority report on this document, but as the minority report itself
says, the minority is in favor of the document in all but one instance.

The minority report reflects the opinion that there was one particular item out of maybe 100 items or less, but that they just couldn't agree with.

So, please, when you read the minority report, it is a minority report, but it is in favor of the entire document with one small change.

So with those two items, I'd like to ask Tracy Miedema to walk us through the document.

MS. MIEDEMA: Thank you, Mr. Chairman, and good morning, everyone.

This is the third time our committee has presented on what we call certifying multisite operations, and this topic is also known as community grower groups, it's known as certifying smallholders, and it's known as various other terms out there in the industry.
Nevertheless, it's a topic that has -- it's a means of certification that has been very well established in practice, but we discovered a problem. And the program really discovered a problem with what was happening in reality and with our regulation.

The reason we are here is because of a directive from the program, so I want to state right up front that based on what we heard yesterday from Deputy Administrator Robinson, this would be a priority recommendation that the program would be acting upon.

So the problem part of the regulation is section 205.403(a)(1), which states that a certifying agent must conduct an initial on-site inspection of each production unit, facility, and site.

Hence, our designation of grower groups as multisites. And we are just really trying to have our language fit with the regulation.
So, you know, therein lies the problem. This implies that every smallest divisible bit must get looked at by a boots-on-the-ground outside accredited certifying agent.

Well, that's not what was really happening. And so a year-and-a-half ago, we proposed a legal framework where in groups or multi-fed operations could continue to exist. And that requires a rule change. That requires, at the very least, some new definitions that are firmly acted upon through a guidance document.

Yesterday one of the commenters mentioned, well, this word "site" with its definition leaves a gaping loophole for very little inspection to occur, for inspection to only happen at the centralized managed facilities.

Well, in order for these groups to go forward, we need to define site as the centrally managed unit.
However, we go on for dozens of pages on what the inspection protocol should actually look like, and drilling down into each site, drilling into what can be called subunits or members and all of the risk analysis that needs to occur to the site -- who gets looked at, with what frequency.

We also go into great detail about how these members should be clustered in the production units.

So our first recommendation -- I'm sorry, our first guidance document a year-and-a-half ago provided a legal framework to deal head on with 205.403 in the fact that the reality didn't match the regulation.

We took a varied 30,000-foot view of an internal control system as a viable construct for doing organic certification, and we didn't look at it as a method of certification that was somehow subpar. Rather, what we tried to do was look at how can we ensure that it is never subpar.
We didn't take a biased approach and say, only impoverished Third World smallholders should have access to the construct. And, in fact, I have yet to hear a convincing argument for how the exclusion of others from using this construct actually helps smallholders.

However, this was the hot button issue, and what I'm referring here to is this idea that an internal control system being used as a means of inspection could get extended beyond the smallholder group.

It continues to get raised in this meeting, even though we went mute on the topic in this final recommendation that we're putting forth.

Now just, you know, moving into the timeline here of the last 18 months, what we did in one year or -- let's see, I guess that would be six months ago, we put forth detailed guidance. That was what you all are calling for here on the board and the public
asked us for it.

We said, okay, you've laid out the legal framework, now, you know, put some flesh on those bones. Tell us what these things really look like, how they should work. The program asked us for that information as well. Give us some guidance so we can train certifiers in how to go in, put these organic system plans to work together to build an organic system plan with groups and have something that's rigorous and valid in every instance.

So we also received an enormous amount of public comment that wanted to limit internal control systems and the notion of group certification very narrowly to farmers.

Yesterday Jim Pierce referred to this elephant in the room. We didn't intend this recommendation to have an elephant in the room marching around.

In fact, we are quite explicitly mute on the topic of producers and retailers
being able to use this construct in the future because we still think it's very possible, probable, it's happening right now, and there's many retailers that are certified in this manner that are scrambling trying to figure out what to do because of an item posted on the NOP Web site in May that quite unequivocally said that grower group model does not apply to retailers.

Unfortunately, retailers have not -- and, you know, any type of processor group is not going -- has not been granted the luxury of time that seems to be being granted to smallholder farming operations.

I also wanted to respond to one item yesterday that was raised during public comment that said, well, you know, we've got a situation here that's going to look really kind of -- it's going to look kind of sexy in the media if we have some imported organic product and there's fraud and, you know, here's a gaping area where problems -- let's -
- we need not to conflate these two issues of imported product and multisite operations. These are completely -- completely independent of one another.

If there's fraud from imported product or fraud on domestic product, that's an enforcement issue. Fraud can happen as surely in a single-producer operation as it could in a multisite, so implying that, you know, multisite is inherently a greater risk to consumer perception is -- I don't think it's true.

So this recommendation, we're beyond the guidance document stage. We put forth a couple of guidance documents. We had a minority opinion, as Joe mentioned, that stated every new entry, every new member who comes onboard should be looked at by an outside member. Keeping in mind there's a clear difference here between surveillance and review, that an internal control system does, and an outside inspector does.
What the minority opinion suggests is that every new member should get looked at by an outside inspector.

So we would like to put forth the recommendation with this minority opinion. Procedurally I believe we can vote on a recommendation in its entirety, including a minority opinion, and frankly let the program suss out which way they want to go on that.

But there's going to be some decisions made at the program level. We are not -- you know, we have not dotted every single "i" and crossed every single "t" on this issue, but we need to act. We need to move this forward.

There's a lot of stake, and we have seen that the program can move swiftly with groups that are using this construct that they have with retailers. If they were to move swiftly with smallholders, we could have, you know, tremendous upheaval for not just us organic coffee drinkers, but, you know,
vulnerable farmers around the world.

That's all I have.

MR. SMILLIE: Thanks, Tracy.

I'm just adding one thing.

There's a key component in this, and we originally proposed that it be a new scope of accreditation, that multisites certification be part of the -- be separate from crops, processing, livestock.

That was rejected at that time by the NOP, but we would like, as hopefully we get a positive vote on this recommendation, we would like the NOP, you know, to take it really seriously, that not every certification organization is going to be equipped or ready to take on this type of certification; that the training component that Barbara talked about yesterday, the training modules, are going to have to be very clear, because a risk analysis approach, which this is a lot based on, is a very, you know, highly technical domain that certifiers will have to get up to
speed on before, I think, they can start
getting into the business of multisite
certification.

So the scope of training and the
fact that not necessarily all certifiers will
be able to do this until they are up to speed
on it I think is very important, and we will
rely on the NOP that hopefully once this
recommendation is adopted by the board and
moved to the NOP, the NOP will, you know, make
that particular training available.

Because, as I said, in the
appendices, there's a lot of technical detail
on how this is going to happen.

Second item, second recommendation
that we have brought to the table is the 100
percent, and again I just want to clarify that
what this recommendation is about is the label
claim of 100 percent. We are not addressing
the issue of calculating components of a
multi-ingredient product in this
recommendation. Even though it may or may not
impact that calculations issue, that's not the
purpose of this recommendation, and we'll try
to make that clear as we move forward.

This was a response. This is the
kind of thing that the NOSB does when we hear
from the community there's an issue out there,
there's some problem, will you address it. We
took it up, we got into it, and we had all the
best intentions getting into it, and luckily
we have a wonderful community out there that
lets us know when we're on track and off
track, and we heard some excellent comments
yesterday in public comment on our
recommendation.

We listened very carefully, and we
will react, and I will ask Julie to give us
the update.

MS. WEISMAN: Well, as you know,
this committee did make a recommendation. It
was published. At the risk of repeating Joe's
comments, we were fortunate to receive very
thoughtful and valuable public comments about
it, and through that process it has become obvious that the CAC, maybe because of our composition or maybe for other reasons, approached the issue very narrowly with an eye only towards the 100 percent labeling category of the products that are packaged for retail, and without really considering what other impacts this -- what other issues, important issues, could be impacted by this recommendation.

What public comment has brought to light are very critical issues which I think narrow down to two things. One is the issue of materials that are used post-harvest versus materials that are used during processing.

The recommendation we have -- as we have proposed it would have very drastic consequences, obviously, now if post-harvest materials were considered ingredients -- considered as processing ingredients. And it would possibly, it sounds like, set up a very strong disincentive for using basic food
safety practices, and this is of grave concern to the committee now that we have realized that this is one possible outcome.

The other issue that is impacted, which Joe alluded to, and I'll keep comment about it brief, was that this recommendation would have an impact on how organic percentage is calculated, because if growers were to continue using the food safety practices that they have been using, it would knock a lot of the products that are currently listed on their organic certificates in the 100 percent category out of the 100 percent category and create mayhem in the rest of the industry in terms of how organic percentages are calculated.

That has already been a problematic issue that is still, you know, troublesome to sort out. So we do not want -- we are very concerned about adding to that difficulty.

So in light of these very valid
concerns, the committee, although we haven't met as a whole group, in just conversations since yesterday, I think that we want an opportunity to meet and decide whether we should move this recommendation forward as is, whether we should try and do like a midnight amendment process -- I hate those, but sometimes we've got to do them -- or to even discuss perhaps maybe whether this should be pulled back. But that's a question right now because the committee hasn't met yet.

So I think that it was the thought of the chair and myself, perhaps, that in the interest of time at this meeting today, because this recommendation may be substantially altered, not to present it as it is because it is has a lot of sort of very in-depth information that takes a lot of time to explain, and that maybe we should not present it at this time and pending our committee meeting later sometime today to decide what we do, how we do want to proceed with it.
Is that a fair summary?

MR. SMILLIE: Yes. And that concludes our presentation.

MR. DELGADO: Any questions from the board? Jennifer.

MS. HALL: For the benefit of the board and for the community, I would like to take the opportunity to share a little bit more about the spirit and intent of the minority opinion.

As Joe mentioned, I definitely feel very solid about the integrity of using a good strong internal control system as a management tool, but also as a manager of many organizations, to me, the long-term success of the organization or group, as it is described here, also rests on a really strong foundation of training up front.

So I think it's a little bit misinterpreted that I actually see new entrants as automatically high risk, and it really is more about the second half of the
paragraph that talks about it, and that it really is about trying to establish a more solid up-front training and foundation and particularly given the fact that these smaller locations can be independently held, that it's an opportunity up front to get them all on the same page.

MR. DELGADO: Any comments?

MR. SMILLIE: Thanks, Jennifer.

We do want to make one clarification in the document. I wanted to, you know, see if there were any other questions from the board first, but once that's cleared, then what we would like to do is do a little red-lining, which is little a clarification of one of the sections that's had the most confusion.

MR. DELGADO: Let's do that clarification now for the board.

MR. SMILLIE: Okay. So unless there's any other questions, we'll move to the clarification.
Tracy.

MS. MIEDEMA: Thank you.

Valerie, would you please go to page 7.

We wanted, in discussing sampling protocols, to make sure there was an element of random sampling. And when you start talking about percentages of percentages, it just can get confusing if you aren't crystal clear.

So what we went ahead and did -- and this was after the document was published, so for the benefit of the public and probably for the board, we wanted to show you that we have inserted a couple of examples of what we mean when we line out the sampling protocol.

So if you could scroll down a little bit. The page numbers may have shifted a bit. Okay.

So what we have said that was confusing was the high-risk sample of identified and inspected. Twenty-five percent
of the remaining subunits to be inspected should be selected randomly and so on.

So if you all would just turn your attention to the board. The way we have clarified this is to say once the annual sampling percentage rate is determined by the ACA -- so, you know, let's go -- let's just be clear right there -- the ACA determines the sampling rate based on a long list of risk criteria. The highest then, the highest risk subunits are identified and inspected.

Of the remaining samples to be inspected annually, at least 25 percent of these subunits should be selected at random.

You know, the reasoning behind that is that this helps to prevent the complacency that might be inadvertently encouraged by a certifier focusing only on higher risk members of the multisite operations.

Then we go through a couple of
MR. DELGADO: Does that conclude that item?

MR. SMILLIE: Yes.

MR. DELGADO: So we'll open it up to questions. Dan.

MR. GIACOMINI: Thank you, Mr. Chairman. Thanks, Joe and Tracy.

I agree with the philosophy of where we're going here, but as I go through the document and I listen to public comments and I hear -- you know, look at other situations, there are some things in this that I still have some problems with.

First of all, I think the justification for this, that is how inspections are being conducted currently, is a very weak argument; that if the problem is incomplete inspections being done, we need to
fix the inspection process rather than to create a document to justify it.

So I disagree with that comment as being partly behind where this is coming from.

Number two, on the specifics, I really object on page 2 to -- there's two places where it refers to the possibility of the "may reduce or eliminate the need for a direct inspection or observation."

I have a hard time going along with this document where we say -- where we are allowing a consideration that we may reach a point that the need for an inspection would be eliminated. That's in the first paragraph on page 2 right above the OSP at the end of the paragraph. Up at the top, Valerie. "May reduce or eliminate the need of a direct observation by inspection."

I don't -- I have a problem with that "eliminate," and it's duplicated down in the last paragraph right above the footnotes, "internal control systems that reduce or
eliminate the need for a direct observation."

I don't -- I can't -- I have a hard time agreeing with that direction, that implication of where that could go.

MS. MIEDEMA: May I respond.

MR. DELGADO: Tracy.

MS. MIEDEMA: I think that's an excellent catch, actually. And what we need to do there that could, I believe, allay your concerns, which are very valid, is where it says the word "subunit" and take out the word "or site." Because that's what we're talking about here. And that was an oversight on my editorial process. And that would then comport with the rest of the document.

MR. GIACOMINI: Personally I would prefer we add "eliminated" or "eliminate."

MS. MIEDEMA: Sure.

MR. GIACOMINI: The second point is in a question on page 8, at the bottom of page 8, "all noncompliances detected," go down through the sentence, "are required to be
I don't see here when that reporting is required to occur. Is it at the detection of the noncompliance? Is it just within the annual inspection? Because I can see some situations developing where, okay, we won't report this. If they find it in the inspection, then we'll report it, because I think there's some different teeth that can be involved in those implications.

MS. MIEDEMA: I'd like to respond to that one as well. This is actually enshrined in all organic that noncompliances should always be reported, and I think we are starting to get into an enforcement issue where, you know, this is really -- a noncompliance spotted here is no different than on a single, you know, production unit type operation. If it's wrong, it's wrong, and it needs to be pointed out in the same manner.

So getting as prescriptive as, you
know, reported within 24 hours or something like that, is more prescriptive than anything else that we line out for certifiers.

MR. GIACOMINI: Okay. Well, that brings me to my next point. When you say it's no different, I have a hard time looking at this document and not seeing a concession being made. There are concessions -- we have requirements, you know, that -- you know, if you're a small grower in the United States, at $5,001 you have to have an inspection. We are allowing certain ones, because of the structure of their organization, not to be inspected.

Now they do have the internal control unit, and that review, and I understand all that. But it is a -- there are concessions being made. And what I don't see in the document is really -- and I'm sorry if I'm being unfair here -- I don't see where we're getting anything back.

I think the consideration -- I
like the consideration of -- I like the -- I agree with the minority report of requiring that all new people must be done. I do not see a contradiction in requiring that all growers' subunits in a production system that earned more than $5,000 in the previous 12 months would have to be inspected, and part of the inspection outside the high-risk group.

I don't see any problem with requiring -- and this may be in there, I may have missed this, but just as I was making notes, requiring that every subunit that had a noncompliance has to be inspected in the next inspection period.

I don't see -- I like the addition you made at 25 percent. I think maybe we could -- you know, what I was thinking along the lines is a percentage of acres or a percentage of value of the production unit has to be included in that inspection sample.

Finally, I just wanted -- there's a couple of places where you deal with random
selection, and I agree with random selection, and it is a factor that would minimize the number of repeat inspections within the same subunit.

However, I'm not comfortable on a random basis, just by random chance. You could go 10 years without seeing a particular subunit. I think we need a maximum number of years between actual inspections of each subunit within a production system -- five years, six years, whatever, but I'm uncomfortable with the randomness allowing it -- random could be they're just never seen.

So if we're not going to require new ones and we don't have a maximum between inspections, you've got subunits in there that have never been inspected, seen by an inspector, and I have a hard time going along with that. Maybe it's too much.

MR. DELGADO: Response, Tracy?

MS. MIEDEMA: Thank you, Dan. You know, I think we start out from a little bit
of a different philosophical perspective on this, and then the chasm starts to widen as we get down into the details.

What I have seen is that, you know, if you look at the public comments submitted this time, 19 of 20 were generally supportive, and we're going to have -- you know, there is going to be some devil in the details, but, you know, all in all we had to - - we had to make a decision on one side or the other.

And all of the items that you pointed out are areas that we took public comment and took account very carefully. It's an issue of do we believe these are feasible, do we believe it's right, do we believe smallholders should have a role in organic? And if our general tilt at the beginning of that conversation is yes, then a lot of details fall out of that. And if the general philosophical bent is no, then the details sort of all in the other direction.
Then we can't quite bridge the divide if we start out from a -- you know, philosophical difference.

We started out believing that this can and should carry on as a viable certification if, and only if, a rigorous set of criteria were developed, and we believe that this set of criteria provide that rigor.

MR. DELGADO: Joe.

MR. SMILLIE: Yes. I think Tracy summed it up really well. You know, you can go both ways on this.

My personal belief is that if you look at the list of risk analysis, all the points you make could be added to that. I think that if ACA is doing their job, they will do those.

For example, anyone with a noncompliance in the past that corrected it would be a high risk and they would be inspected again.

But the idea -- eventually we get
to the point are we going to try and write a
prescriptive regulation in this document, or
are we setting forth a series of criteria by
which people are going to be judged?

We believe we have gone really
depth on a lot of these issues, and I think in
some cases too far. I think that basically
what our job is to do is to be clear in our
intent to the program, and not to get so
prescriptive as to tie the ACA.

For example, why I disagreed with
the minority opinion -- it sounds good that
every new member should be inspected and
welcomed into the group and have the visit of
the, you know, the third-party inspector.

But when you start to work that in
detail, it means that you're pulling away a
whole group of people. You know, some of
them, you know, don't need to be inspected, if
you look at a risk analysis benefit. And if
you include all of them, your sample gets big,
so the tendency then, from a certifier point
of view, well, we're doing all these new
people, so you cut back on some of the -- you
know, the guy high in the mountains, in the
low corner, or the guy near the border. You
cut back. And I think the risk analysis, the
importance of the risk analysis approach, is
that you really want to identify risk. And if
new members are risks, by all means, you know,
they need to be checked. They need to have
that inspection.

But if they are not, if there's
eight of them, all side by each, as we saw in
Kennebec, you know, that you don't really need
to do all eight.

So where you are going I'm not
disagreeing with, but I'm saying it becomes
very prescriptive, and I believe it's the
training of the ACA and the criteria that
needs to be put forward, and not to go down
the overly prescriptive route on this route.

But that's the way I -- we
approached it.
I also once again want to reiterate if you go to the appendices -- and I mean not that you'd want to, but there's a lot of detail there that we intend the program to go into.

So that's about as best as we can answer it at this point.

MS. FRANCES: Can I clarify something? In the appendices, there's actually a reference there.

MR. SMILLIE: Thank you.

MR. DELGADO: We have Bea, followed by Jeff.

MS. JAMES: Dan, I was wondering if you could elaborate a little bit more on the comment that if there's a current practice going on, and that we are trying to create a document to justify, maybe you could be more specific.

MR. DELGADO: Dan.

MR. GIACOMINI: Maybe I misheard part of Tracy's introduction to the document,
but I believe that's what -- the essence --

some of the essence of what she explained.

MS. JAMES: For this particular

recommendation?

MR. GIACOMINI: Yes. Just now.

MS. MIEDEMA: I believe you were

referring to 205.403, and it states that every

production unit site and facility must be

inspected. That's not what was happening in

reality, if we look at site being a small

divisible unit. There were not and are not

today boots on the ground at every small

divisible unit. And it totally addressed head

on 205.403. Every grower group in the world

is out of compliance.

So that's what I was talking about

making the language match the reality, not --

lots of integrity, but simply disallowing

another lawsuit because this went all the way

to appeal, and so, you know, we've got a

problem here, and that's why we decided to

address that head on.
MR. DELGADO: Jeff.

MR. MOYER: Yes. Joe and Tracy, I got some basic problems with this document that Dan really touched on very clearly.

One of the stringent arguments that we continuously use in the organic marketing program is that when we talk to consumers, we tell them that every farm is inspected all the time, so we have inspections.

I understand the internal control system steps in and takes over part of that role. However, talking with growers who are involved with internal control system inspections, they all have said -- not the inspectors, but the growers -- have said you don't really pay as much attention when it's the internal inspector as we do when it's the external inspector.

I've seen that -- my wife works in a microbiology lab, and they have internal control systems. But it's the same thing
there. When it's the internal inspector who you just had lunch with, it's a little bit different than when the outside inspector comes from ANSI or somebody else.

So I have concerns over the fact that, you know, as Dan pointed out earlier, you pointed out in your example, a random sampling of when you have 100 growers, two? Two are selected as random testing? Your chance of getting picked is almost as good as winning the lottery. I mean you're just -- you're not really not going to get selected that quickly.

And so Dan's suggestion of having a maximum number of years between inspections, while it does change this document and force us to have more boots on the field in terms of inspectors, I think when you're talking to consumers and you're trying to alleviate their fears that product is inspected -- when you're talking about -- you know, as you pointed out, Tracy, a lot of product that's coming from
overseas where there's already serious
concerns, I think that we are asleep at the
switch if we pass this regulation the way it's
stated. Representing the consumer.

MR. DELGADO: Any response?

Tracy.

MS. MIEDEMA: Well, a comment on
your metaphors there. Your wife's company.
You would need to extend that metaphor and say
that she has a lab that has an internal
inspection, and her lab has a whole bunch of
other labs they work with. And so the
pressure she has is not just from this gal she
had lunch with who's going to come look, but
if she falls down, she jeopardizes all the
other labs.

There's an enormous amount of
pressure within these systems to comport with
the law and keep the entire organization's
products organic.

So there's -- you know, it's not a
one to one, your metaphor there, I would
argue.

I also am concerned with this notion that you're looking at inspection as some sort of lottery system. We have accredited certifiers, agents of the government, that are in charge of these organic system plans. And what you're inferring is that they are unqualified to do their job, and that the entire system is flawed.

What I would, I guess, ask you to do is point within these criteria what is missing, rather than sort of blithely referring to it as a lottery system that confuses consumers. Because all inspection is sampling. I work at a farm that is about 5,000 acres. There are not boots marching over all 5,000 acres. All inspection is sampling. And if consumers believe that a pair of boots have trod over all 5,000 acres, that's a misperception out there, same as organic means no pesticides, something we
contend with, something we know there's an inherent risk when there's those misperceptions. But all inspection is sampling.

And that's not wrong, that's just what inspection has to be.

MR. DELGADO: No response to that? We have Hugh, followed by Dan.

MR. KARREMAN: Just a brief remark. I mean Dan had a lot of very exact points, but they're -- from random sampling you may never visit a subunit or a unit and you have to. I mean for me to like this document and go for it, you have to have some minimum that every single unit -- not all in the same year, but maybe in a rolling kind of fashion -- gets inspected, at least every five years or something. And they have their ICS happening, but you could really have some units falling through the cracks. Just -- that's got to change in the document.

MR. DELGADO: Dan.
MR. GIACOMINI: I realize I ran through a number of things, but one thing that I would like, you know, the committee to address -- and Joe, if you would -- I certainly do not agree with the concept that I tended to hear or I think I heard in some public comment that anyone -- any unit grower over $5,000 can't belong to a grower group. I don't necessarily agree with that, but could you address the issue, and if I can frame it this way, can you possibly discuss the situation that every grower in the United States with $5,001 has to be inspected on the ground by an NOP inspector annually, whereas someone who is part of a grower group in Venezuela or China or -- and makes twice that amount but since they're a part of the grower group, they would not have to be inspected annually? I can see that as an absolute media nightmare that will blow up in Barbara's face far more than hops ever did.
MR. SMILLIE: Well, I go back to the same basic thing. If you've got -- and again, there are so many different examples. People have to understand the wide range of different types of grower groups there are on that.

Certainly if you've got the classic situation which everybody imagines when we talk about grower groups, which is, let's say, the Central American coffee group, you've got people who farm exactly the same way and have roughly the same hectarage. Okay, they all have smallholding plots.

If there's a large group -- and also because of the social construct or something like that, there are some growers in there who have larger plots, they would show up as in the risk analysis. That's my belief, that they would show up, that if you looked on that list, which is right there, you go through that list, and, you know, there could be even more things added possibly to it that
are contained in the references. That's how you spot that. That's how -- you know, so there's like five big growers and like 800 little growers. Those five are, in my analysis, if the ACA is doing their job, they would be inspected every year because they're larger, because they stand out, because there's something different about them. Now they have to have the same OSP. Remember, all of these subunits are operating from the same OSP. If that big unit has a different OSP, they don't fit the criteria. They can't be part of the group, and they would be like, sorry, guys, you can't be part of this group; you're different. You've got a spraying machine; nobody else has a sprayer. So, therefore, you're out. Remember, you've got to go back to the real basics of this. The legal entity. Somebody said, well, we can't like this document because it has to be defined in public comment as a legal entity. That's a
given. You have to be a legal entity. You
have to operate from a single OSP, you have to
have a functioning ICS with all the
restrictions we place on it.

So in that sense I would believe
that they would be pointed out by -- through
the, you know, that list of risk analysis, of
why they would stand out as different.

MR. GIACOMINI: What if all the
subunits within a group were over 5,000? Then
only a part of them would.

MS. MIEDEMA: No, actually there's
no floors. It's quite possible that a third
party is going to come in and say, you know,
I'm looking at this organic system plan. One
hundred percent of the small statistical units
must be looked at every single year.

We don't say that, you know, it
has to be a small number. In fact, you know,
it's very likely that as this gets
implemented, the range is going to be very
broad. You know, maybe it's going to range
from 10 to 70 percent get looked at.

But, you know, that's this snowflake thing of the organic system plan.

They look very different here in the U.S.

Every organic farm's organic system plan looks different from every other organic system plan. We don't have a checklist system here with USDA organic, we have a system that actually conforms to geography, to crops, to individual circumstances.

Yet, like a snowflake, it has structure and logic to it. Every one of these organic system plans is going to look different and so are the inspection protocols and rates.

MR. DELGADO: We have a comment from Richard.

MR. MATTHEWS: Yes. I'm sitting here and I'm listening to this, and everybody is talking about the Third World countries. And Dan spoke to it specifically, about outside the United States.
Unfortunately, ladies and gentlemen, it is my understanding that there are certifying agents here in the United States that since this policy or recommendation was accepted by the Department, you now have grower groups certified in the United States.

And I guess I could use Steve as an example, in Campbell's Soup. He has lots of contracts, and unfortunately there's no definition of geographical proximity, so Steve, as Campbell's, could say, okay, everybody that we contracted with in North America is now a grower group. Campbell's forms a grower group. Is that what you want? That's what this document does.

MR. DELGADO: Response from Joe.

MR. SMILLIE: I respectfully disagree. If you look at the document, it will say "are located within geographic proximity is defined by access to the same collection or post-harvest handing facility in
common soils, water source, slope, topography, or other physical features."

That's just one of the guidelines. Steve would also have to put together an internal control system. Steve would also have to ensure that each tomato grower followed exactly the same OSP.

You cannot herd cats, and I doubt very much whether -- if I came and looked at Steve's system, I would find so many holes in it right off the bat, I believe that he wouldn't qualify.

MR. MATTHEWS: So -- but it's happening.

MR. SMILLIE: That's why we would like the NOP to adopt our recommendation and enforce a regulation which, in your wisdom, you will take our intent and come up with something that doesn't allow it to happen.

MR. DELGADO: Any other questions?

Bea.

MS. JAMES: Okay, now I can't
leave this conversation without just giving
another plug for the pink elephant in the
room, and I don't mean to beat the pink
elephant, you know, to death here, but I know
that the CAC heard loud and clear from public
comment around retailers and processors being
a part of this recommendation and that was
removed. It wasn't removed with the idea that
it would not ever be considered as a separate
recommendation that potentially the CACC would
look at.

I think one of the things that I
find interesting is that risk criteria have
not been developed for retailers at all, and
yet there's been this blanket decision that
100 percent inspection should happen at the
retail level. And to me, that just seems
unfair, and I think that retailers who have
voluntarily taken it upon themselves to become
certified so that they can help with education
at the consumer level have done so not because
they're trying to take a shortcut with
becoming certified, but because they want to be able to articulate what the USDA organic seal means in a way that has value and meaning.

And so I just want to pose that I think it's very important that the certifiers that we heard from in public comment and also some of the ones that spoke yesterday, who pointed out that they think retailers and processors should definitely not be a part of this recommendation, I think that that's already been addressed, but I also see the need for us to address it on a separate level so that we can develop risk criteria specifically for that sector and go forward with determining whether or not it's an opportunity for retailers and processors to use the construct of multisite.

MR. DELGADO: Comments?

MS. MIEDEMA: I'd like to just make one final comment addressing Mr. Matthews' scenario he described.
He described all the rewards and none of the risk, and these folks who decide to bind together share an enormous amount of risk. And it's a perverse logic to say that a bunch of production facilities are going to bind together when they don't have to, to save a few bucks on inspection. It's a perverse logic.

We can't look at this construct without looking at both the risks and the rewards, and what you laid out was only the reward side.

The risk applies an enormous amount of pressure to each individual player.

MR. DELGADO: Good. I think we're ready to move on to the next point. Thank you for a wonderful debate on both parts.

Let's move on then to our next point. We are about 29 minutes behind schedule, so hopefully we'll make it up soon.

Our next topic will be our Joint Crops & Compliance. I'm thinking that
involves commercial availability and biodiversity, and I understand that Mr. Davis will be in charge of leading the discussion.

MR. DAVIS: Yes.

JOINT CROPS & COMPLIANCE, ACCREDITATION, AND CERTIFICATION COMMITTEE

MR. DAVIS: This joint committee, there are two items that we'll be going over right now. The first one would be the commercial availability guidance regarding the sourcing of organic seed.

The second would be the biodiversity discussion and the initial work working on a guidance document concerning biodiversity and ongoing work that will be going forward from here.

I will do the presentation on the seed, with a little help from Joe Smillie, and just a heads-up to you, Barry, the biodiversity, you'll be doing that one.

Okay. On the commercial availability of organic seed, we are working
on, have been working on revisions and
hopefully improvements to a previous document
that was a recommendation from 2005 from the
board. So we have a -- do we have that up
there, Valerie?

Okay. And the changes that we
have made, the new changes, are highlighted in
blue. Do they show up on that screen that
way? Sort of. It's hard to see it as real
clear.

But before we go to the changes
specifically, I wanted to go to the overall
overview of why we are working on this. A lot
of public comment is received, that you get
the feeling that people, certifiers and
growers, would just prefer that this topic go
away and just leave us alone and let us do
what we're doing.

And then others say, no, no, this
is very important. We need to address some
issues here. And in discussions with the
committee, particularly in the Crops
Committee, but also when we worked in Joint Committee calls, was that we are attempting to encourage more usage of organic seed and in doing that we want to -- we do not want to single out any one group, meaning certifiers or growers or even the NOP, as all the work that would be required to implement these changes would be concentrated in any one area. We want to spread the responsibility and the workload out of accomplishing these recommendations.

I think it needs to be highlighted again why this is important. I'll just read a statement from the discussion part of the document.

The board highlights that further development of the organic seed industry is the key to increasing commercial availability of organically grown seeds and subsequent increased usage by growers. Again, the goal is to promote the continued growth and improvement in organic seed production and
subsequent usage by organic growers without
hurting or putting undue burdens on growers.

It is not the committee's
intention to have major noncompliances handed
down to farmers trying to abide by the seed
commercial availability section of the rule.

Achieving the goal of a healthy, viable
organic seed industry is important, especially
when considering the pathway the conventional
seed industry is taking toward increasing
inclusion of biotechnology, i.e., genetic
modification of seeds, which would all be
excluded methods in the organic rule. The
organically grown movement will not benefit
from allowing the organic seed production
industry to stagnate. The status quo would be
a big problem for the organic movement down
the road if we do not address this at this
time, in my opinion.

If we allow that industry, the
organic seed production sector, to stagnate
while the conventional seed production sector
moves on to the likely future situation in which traditionally bred and produced seed is only an afterthought, a relic of bygone days, the organic seed and the organic producers, these are the ones who can maintain and support viable varieties that work in organic and the production of the seed to support organic production.

Many people have made statements that -- well, I won't go there. Never mind. Too long. We're behind.

But, anyway, it is important, and I, as a spokesman for this group, hope that I haven't belabored this issue too much.

Moving on to the document itself, I wanted to go to the new changes, which is page 3 right there. Okay.

We separated in sections of the NOP rule the new role that we want to encourage, and I'll just read it quickly.

Emphasize protocols for determining commercial availability of organic
seeds during the accredited certifying agency training programs.

Currently we are told that it's not being emphasized and so certifiers don't see it as that important.

Number two, emphasize to ACAs that organic seed usage by clients must be monitored and improvement in percentage usage is expected and must also be monitored. Documentation of the levels of organic seed usage and evidence of improvement in their percentage versus total seed usage by the ACA's clientele should be audited as part of the NOP accreditation reviews.

Number three, inform ACAs during training sessions that the issuance of both minor and major noncompliance statements to growers on this issue is the tool to be considered in all audits as a method to incentivize growers to use more organic seed in their operations.

Now moving on to the ACA's role,
section B, number one. Continue to enforce requirements for use of organic seeds applying NOP guidance on commercial availability of seeds. Document the organic seed usage status of their clients and be prepared to present the information to the NOP as part of the ACA's accreditation audits.

Two, emphasize that seed price differentials between organically grown and conventionally grown seed are not a factor in determining commercial availability.

Three, verify that organic farmers are making a sincere and ongoing effort to find organic seed varieties suitable for their farm.

Four, impress upon growers and clients that if known sources of organic seed are available, they must be sought out and utilized or face the possibility of having individual crops decertified. This possibly could occur following the issuance of noncompliance
statements over a period of no less than two yearly audit cycles.

It is recognized that production of seed takes multiple years. You could make the decision one year to inform your organic seed supplier or other seed supplier that you want this particular organic seed. It would take -- it probably wouldn't be until the third year before you would actually get seed, even if you requested it, in many cases, because of the development time it takes to bring that seed through the production process.

The next change in the ACA section is not -- it's within an existing section, number five. We did make a couple of insertions on point B, the new part is -- I'll read it.

As part of the validation process, copies of the applicant's documentation from previous years should be consulted to determine if they are making any progress in
their search methods and results.

So that would be a new thing where the ACAs would need to consider previous inspections relevant to their organic seed acquisition and availability to determine if the current year's situation with the grower and their amount of organic seed usage is an improvement from previous years.

And then point D, we recommended a strikethrough on -- where it says maintain and submit upon request to the National Organic Program, and the strikethrough would be crop varieties permitted by each agency, and inserted instead the wording documentation -- maintain and submit documentation of the organic seed usage status, current percentage levels as compared to historic levels of uses by acres of each certified operator.

And I know I'm getting bogged down here with too many details. I'll get through this.

Moving on to the grower section,
section C. The certified growers' role in increasing organic seed use.

Number one, document annually all seed usage to determine the percentage of organic seed usage versus total seed usage on an acreage basis.

Number two, search for and request organic seed for all crops grown.

Three, document a diligent search for organic seed by listing and legitimately working with a minimum of three seed vendors that are known within the industry as organic seed suppliers.

So there's three different sections of responsibility, starting with the NOP program, moving to certifiers, and then to growers.

In public comment it was mentioned that perhaps buyers and/or processors who call the shots on what organic growers are -- what varieties are growing need to be brought into the loop and maybe delineated in that area of
the document and not be left to a reference at the end of the document.

The Joint Committee will discuss that possibility and see if we want to make an amendment at this meeting.

One more addition to the 2005 document was on page 4 -- or is it 5. Yes, on page 5. In reference to the database.

Further, the NOSB recommends and encourages the establishment of -- and we inserted new information of a two-way national database by an independent party. This database should provide public access to current information on the availability of organic seed varieties, and the new wording also would be and allow for the posting of requested varieties and quantities of organic seeds from growers in a manner that protects private company business information.

In other words, not just what seed is available by the different organic seed producers, which those databases already
exist, but also what is being requested that
is not available at this time. Again, just a
suggestion and a recommendation, not anything
we can really do much about as far as what the
NOP and NOSB can do.

That's the gist of the changes.
And I wanted to turn it over to Joe to discuss
the ACA's part of this. Most of the public
comment we have been receiving is coming from
the certifier saying mostly their objection to
a lot of this, so I thought I'd let Joe see if
he can deal with that.

MR. SMILLIE: All of a sudden, the
seat seems to get hotter here.

(Laughter.)

Yes, I represent the
Certification, Accreditation and Compliance
Committee, and these are certification,
accreditation, and compliance issues we are
talking about.

Number one, the overview is that
seed is really important. Seed is like
critical and essential to the survival of the organic industry. And as we all know, organic is an agricultural methodology. You know, it may be looked at as a labeling claim, but what it's about is about agriculture, and agriculture is about seed.

If we don't protect our future and protect organic seed, we are going to be very limited as to what we can do to affect agriculture around the world.

That's why even though this is an extremely complex and complicated issue, we must address it, and we have to be really firm about it.

It's going to cause a fair bit of pain, and what we're saying as the Joint Committee is we want everyone to share the pain. We are not trying to -- we don't want to have what so often occurs is, you know, called the circular firing squad, where the seed companies blame the growers, the growers blame this, the certification blames that,
everybody blames each other. You're not doing enough, and sort of a "not in my backyard" approach. Don't put the burden on me. I'm the poor grower. Don't put the burden on me. I'm just the seed company trying to survive.

And so what we have to do is bite the bullet and all agree that we have to address this issue. We had a public comment the other day that just rocked me, and I don't usually get rocked too often by public comments. But the guy said, yeah, we can put -- you know, we'll advertise, we'll put it in a letter to a grower that says how they can, you know, beat the certification analysis of did you search for organic seed. We'll even write the letter for you, so you can buy our conventional seed and get this letter that, you know, will suffice for the certification agent.

I mean, you know, it's got to stop. We've got to move forward on organic seed, and that's the principle which our
committee took, is that everybody has to share in the burden of doing it. Nobody wants to. It's going to be burdensome, but we have to do it. There's no choice on this issue.

So as far as the certifications, which I represent, which I'm sure they're not going to be happy with me, even though we're -- you know, certification organizations do have already, you know, a pretty large role in it, I think everything in this recommendation is doable.

Now, again, when you get to recommendation -- you know, this recommendation, you know, it has words like "verify" and "should" and, you know, it's a guidance document.

So what the NOP will be doing and what the certifiers will be doing will depend on I think a series of negotiations between the sectors. And what we're pointing out, I think, more than anything else is that there has to be negotiation on this. Nobody can
hide their head in the sand on this issue.

It's in the regulation. We have a regulation that's clear. It's clearer, I think, than 401(c). It says you should use organic seed, period.

MR. DAVIS: Must.

MR. SMILLIE: Must use organic seed. Thank you, Gerry.

You must use organic seed, and yet we're not. And we have to. And what we have to do is figure out the best way to leverage it bit by bit. Somebody does a little bit, then somebody else does a little bit more, and we leverage it all up.

The NOP has to dance with the partners on this one. This is going to require careful coordination. We don't want to see, you know, people coming and hitting the certification writer and saying you didn't enforce it. It says in the regulation you have to do this, you didn't do it, you know, you're going to lose your accreditation. We
don't want to see that happen to the grower,
we don't want to see that happen to the seed
companies. Everybody has to work together to
make this work.

I think this recommendation, even
though there's all sorts of issues with it,
and we did hear a lot of good public comment
on it, I think nonetheless as a guidance
document, we want to move this one forward at
this meeting and really start to tackle what
I think is a big problem in the organic
industry, and everybody has to share in the
work to get it done.

MR. DELGADO: Any questions? Jim,
followed by Kevin and Jennifer.

MR. MOYER: Thank you, Mr.
Chairman.

I just wanted to follow up on what
Joe said in that as we were working on this
document, the whole idea of shared pain was
really, really important, and this idea that
we do need to work together, particularly that
the program include this as part of their auditing of the ACAs, as we look at what they're doing and what their inspectors are doing with the boots on the ground, as we heard, they are the folks that are out there and can help collect this information.

At the same time, the ACAs need to enforce or need to impress upon their growers that this is something that's being taken seriously now, and that they do risk at some point decertification of a particular crop if they have shown repeatedly that they are not interested in finding seed that is known to be available.

So I think everybody shares in the burden this way, everybody has a little bit of extra work to do, but the outcome should be well worth the work.

MR. DELGADO: Kevin, followed by Jennifer.

MR. ENGELBERT: Briefly, I just wanted to add, there's no additional burden
for growers large or small that use organic seed. The situation continues to present itself where the intent of the rule in OFPA is clear. And we don't know how much farther we can go, how much more prescriptive we can be, and if we may eventually get to the point where we just recommend that organic seed must be used, period.

We don't think we're at that point, but we hope that the industry, the community of farmers, certifiers, realize that this is a serious issue because, like Joe said, organic agriculture begins with organic seed, and this industry has to move forward.

MR. DELGADO: Jennifer.

MS. HALL: I have three things. I'll start with the easiest one first.

One is just a correction on some language. On the last page, where it starts, "Further, the NOSB recommends and encourages," number one, just after the inserted language, where it stops, "private company business
information," I think due to the insertion into a prior document that there's a little bit lost in translation. It continues that "producers using nonorganic varieties not appearing on the database," which is a little bit incorrect in the sense that the way the database is described in the document, it would actually only list organic varieties available, so nonorganic would never appear on the database. So it just kind of needs to be finessed.

I think we get the intent, but the language is off.

The second point is that as I listened to the comment and I listened to -- reread from Gerry of the overriding goal of continuous improvement in the use of organic seed, that perhaps there is a way to keep all the components and put them in a little bit different order and really emphasize the improvement end of it, and that in inspections, if the inspector could first look
to demonstrated improvement. And since we've
inserted "looking at the last year's
inspection," if there is a percentage
improvement in the amount that that is
obviously displaying the intent of the grower
and the progress of the grower to go the right
direction, but only if there isn't some --
maybe there's some level of percentage you're
looking for before you would then go looking
for the documentation and kind of do the
deeper dive on all of the letters and all
those things, that would then supplement why
that person was not able to go and improve
their process. So opportunity there.

And then the third one is in
looking at this, as we also spotlight at this
meeting a little bit the conversation about
biodiversity, I think it is important to
remember that biodiversity is not just about
wildlife, but it is also about the
biodiversity in the crops that are grown, and
that not all of the crops that enhance that
fundamental equation right now are available in organic form, and I think it is a little bit dangerous to go marching too far and headlong into demanding organic seed, and then discriminate where heirlooms are not available organically right now, and where that biodiversity could then be diminished over time, and that right now organic certainly shares the halo that heirlooms convey with flavor, and it's great. In the public eye, it's a lot of consumer candy, if you will, to still want to go this direction. And I would hate to see that get decreased as a means of people wanting to support organic because it excludes some other really great things.

MR. DELGADO: Comments from the chairs?

Okay, any other questions? Dan.

MR. GIACOMINI: You know, based on the intent and what we're looking at here, I support the document. There's one little bit in it that I am concerned actually could slow
development of the usage, and that is expressed in A(2) and in 5(b) where we talk about the monitored improvement and calculating percentages.

If improvement is measured as going from five to 10 to 15 to 20, that's one thing. If improvement -- but that's not the way everybody buys seed. If you're a livestock producer and you have your pasture ground with your pasture crops and then you have, say, corn silage, that corn silage that year may take you from 20 to 80 percent, or 20 to 100 percent.

But even with field trials, or even on farm field trials with variations from year to year, with variations in germination rates, variations in contamination from weeds and other things, you may run a small trial that worked, and the next year you put all your corn in there, and it's a disaster.

The way we're describing the sort of requirement to constant improvement, that
guy took a huge risk in improvement, and it may be that the only thing -- the best thing he can do to survive -- he can't live with another year like that corn crop. He may need to go back to 20 percent next year. And I'm concerned that when we're monitoring these numbers and we're just looking at that percentage and saying, okay, it has to stay the same or it has to grow, well, then, the only way we're going to -- farmers is going to do that is by taking it in very small bites. If you were not -- if we're going to punish them for trying to take the big risk, I think there's a potential that we're actually going to be slowing the progress and the implementation of utilizing organic seed.

MR. DELGADO: Comments from the chairs?

MR. DAVIS: Dan, you make a good point. In certain situations where the grower only grows one item, you know, silage corn, for example, and he does take that big jump
and he says I like this variety, I'm going to buy all this organic seed -- I don't know how to answer that. That is a potential risk.

MR. GIACOMINI: Even though -- even from a case of somebody who grows 10 different crops at 10 percent each, I mean you make the commitment of trying an organic variety on one of those, it didn't work, you pull back and you go looking again over the next couple of years.

I can see it even in the case of other crops.

MR. DAVIS: Yes, and it can happen. You can have crop failures where a 100 percent of one crop one year could be all organic seed, and there's a crop failure and there's no seed of that available in the next year, then it makes you look bad if you only have one crop.

This is -- you know, it's an overall picture. So I guess -- me, personally, I didn't think of the more one-
1 dimensional grower that only has one thing and
2 what that would mean to -- you're right, he
3 would probably choose the more cautious course
4 of saying, okay, Mr. Seed Supplier, I want a
5 little more organic seed, give me this
6 variety, and they'll just slowly work up
7 rather than take the big jump.
8
9 MR. DELGADO: Jim.
10
11 MR. MOYER: Well, Dan, I think
12 we've tried to make some allowances within
13 this document for that -- not that we were
14 considering that very thing, because I mean it
15 could happen. But if you read -- if you
16 listened to what Gerry said initially when he
17 said it's not the committee's intention to
18 have major, minor, or noncompliances handed
19 down or decertification of a crop, that is the
20 intention is not to do that.
21
22 If you look at the certified
23 grower's role in increasing organic seed under
24 C(4)(a), it does allow for the justification
25 of the use of farmers under that circumstance
could justify why they changed their percentage, and again it's not the intention to file a major or a minor noncompliance. That's the relationship you have with the ACA and the inspector on the ground, and you work that out. That's the dance that I think Joe was talking about, and the program is going to recognize that when they do an audit of that ACA.

You know, if that particular item was selected and viewed during the audit, there would be a justification for it.

MR. GIACOMINI: I just felt that there was a need to sort of get that concept and that idea on the record so that those considerations would be made during the evaluation processes, that it wouldn't be a required of holding or increasing every year.

MR. DELGADO: Joe.

MR. SMILLIE: We agree, and it's a case by case, as Jeff pointed out. The key -- I think the key component is that we want to
see the ACAs have a monitoring tool. You know, in other words, that there's some -- if the crop is from 80 to 20, and you go out and he's got pictures of the crop fallen down or whatever, well, that's justified, and it's not an issue.

But we want to see the tool, the monitoring tool, being used.

MR. DELGADO: Comments from the program?

DR. ROBINSON: Well, I think, Dan, your point is more about results and not intent or effort, and I think this recommendation, and I think the question being asked and Joe's point about what the program would do or not do, is to look at effort and intent by the producer, and then by the ACA, and then of course by us, in order to get this thing going and ratchet it up.

There's certainly in crop production -- nobody can predict. You are never going to be able to predict the results.
I mean that's the nature of crop production. That's just what happens in agriculture. You can plant and, you know, there's always going to be crop failures, and that will happen. That is the nature of the risk of agriculture. So you can't penalize somebody for taking a risk. You can penalize them for not taking the risk in perpetuity or after a certain number of years, and that's what the recommendation is saying, you know. If your SOP demonstrates or fails to demonstrate that you do not make the attempt to source organic seed, then after, you know, a period of two years, first the ACA should take enforcement action, and then if the ACA fails to take the enforcement action, the program should step in and take the enforcement action. At least that's the way I'm reading this. And I think that's what you're trying to communicate. But if you take the action and, you know, the results fail, well, the results fail. At least you tried.
MR. DELGADO: Any other questions?

Julie.

MS. WEISMAN: I just wanted to make an observation as someone who has been involved in this process but not as a crops person, that -- and not -- and to pull the focus over to the issue of availability of seed for farmers to used, as opposed to what we were talking about just now, what happens after it's been available, that this issue of commercial availability of seed is -- but it is very similar to the issue of commercial availability when we are considering whether items should or shouldn't go on 606.

Basically it's the same problem of how can we encourage the -- the problem is encouraging, I'm going to just say cultivating, but that might confuse things. So the problem with encouraging the development of more and more varieties of organic seed is identical to the problem of encouraging processors to make organic minor
ingredients.

I think that -- I guess I'm encouraging everyone to keep that in mind, the crops people to keep that in mind as we start to continue to address the issues of commercial availability, not only with regard to putting things on the list but also with regard to taking things off the list.

Also I think that as that situation unfolds, there will also be tools, maybe, or lessons or things that will help inform the continued progress on this issue with seed.

That's it.

MR. DELGADO: Any other questions or comments?

Okay. Let's move on then to the next topic, Gerry, and I'll just remind the board that we are running late, and this is it. So if you can summarize it for us, please. Barry.

MR. FLAMM: I'll make it short.
This is a discussion document implementing biodiversity consummation to move forward requirements in the regulations, move forward guidance that the NOSB has already issued. I think the discussion document has worked to an extent, but we received about 60 public comments, and I've got to give special credit to the Wild Farm Alliance for all the work they've done on this. They have done some really excellent work.

I see some parallels to seed discussion we've had. For example, the regulation does state that we must consider biodiversity. This is, I think, not a conflict for the concepts of organic farming and, in fact, I think probably about everybody in this room agrees with the need to consider biodiversity, not for a larger human society but also the value it presents to their own farm.

So the discussion document gives the background and outlines four potential
avenues to pursue a recommendation this coming spring. And again it's sort of like the seed document. It's divided up so everybody is involved. I won't say pain, I'll say gain in this case. But in this case, it will be because of our material involvement has a particularly important role in something that in 2004 the board had issued guidance documents, but there's been sort of a gap in the follow-through because of our checklist on materials does not specifically address NOSB. You have probably all read this, and I think one of the emphases is on training at every level, but another emphasis is a follow-through by certainly a certifier, and there has already been for the OSP some great work done that can and should be used. And many inspectors and many certifiers are already using it, but it's not uniform, and I think part of what I would see the recommendation coming out of this is how to get more uniformity and further compliance.
So to accomplish that, there is a role spelled out for NOP, and also specifically on the audit policies.

So from the comments, most people must have read the document, so I don't think I have to go into any more detail on it at this time. We will be working on it with the intent of presenting recommendations at the spring meeting.

MR. DELGADO: Very good. Any questions from the board? Bea.

MS. JAMES: Just one suggestion. During your deliberation of the recommendation, I would recommend that you look at the possibility of adding biodiversity under 205.2, terms defined, so that we can eliminate that confusion that often comes out when we are talking about the word "it."

MR. FLAMM: It's -- we'll look at that. But the regulations themselves, biodiversity is addressed in several places already in the regulation, so it's my feeling
the regulation does not need any additions or
-- it's strong enough. I think to me the
emphasis is on looking forward and
implementing what we already have.

We'll look at everything, and I'll
call on you.

MR. DELGADO: Any other questions?

MR. FLAMM: She's included now.

(Laughter.)

MR. DELGADO: Any other questions?

Let's move on then. That concludes, Gerry,
with your Joint Committee work. I appreciate
both of you for that, and we will continue on
to the next point, always conscious of the
time budget we have here, so we appreciate
your briefness on this.

Gerry, we are going on to the
Crops Committee, and back to you, sir.

CROPS COMMITTEE

MR. DAVIS: The Crops Committee

has four items, four petition materials, that
is, on the agenda.
The first one would be tetracycline hydrochloride. The petition is for adding tetracycline, oxytetracycline hydrochloride, in particular, for control on the national list under section 205.601. I think that says.

Currently there is a tetracycline, a different formulation of tetracycline, on the list, so that the petitioner was quick to point out that this could be looked at as adding new material or actually just changing the specific annotation on the original material to not just oxytetracycline calcium as it currently lists, but all forms of oxytetracycline.

The committee considered it, and felt -- and went through the evaluation criteria, and felt that it maybe marginally satisfied criteria one. There was disagreement on that within the committee, but we, through consensus, agreed that, okay, it's relatively benign to the environment and
humans, but arguably there are some factors there that were considered that were not.

But the real gist of it, of the discussion centered on the fact that we felt the material failed both evaluation criteria two and three, and to give a little institutional history on this material, when tetracycline calcium, the form it's currently on the list, came up for sunset the last time and was voted on at the NOSB meeting, it barely, barely passed.

In fact, I distinctly remember the vote in that it was so close that the final person giving their vote I believe was Nancy Ostiguy, and she was actually counting in her head all the votes and analyzed -- she sat there for a minute deciding how she was going to vote because her vote either way would have either approved or killed the material.

So I only say that now to say that this material in general has been on the verge of being removed from the list, and many, many
people within the community would like to see it gone, and that's enough said about that.

We felt there are other alternatives that are beginning to be developed in the apple and pear production areas. Some growers in the Pacific Northwest, for example, are already exporting to Europe where this material is not allowed in crop production, so they are somehow accomplishing that, although with difficulty, I hear.

So there are other materials slowly in principles and practices becoming available that are coming into production to allow the use without this material -- I mean allow production without this material.

On category three, is it compatible and consistent with the organic regulation? This is where we felt as a committee it really falls down. There are no other instances in the rule anywhere that allow antibiotic use in livestock or anywhere else.
So we felt it is very inconsistent to leave these materials on the list, and the thought of adding another form of the same material, that was really the area that the Crops Committee just couldn't get past, and it's all spelled out up here in that section B for anyone that wanted to read the more detail of the reasoning.

The vote within the committee was zero yes and six no, and I'll open the floor to any questions or discussion on that. Hugh.

MR. KARREMAN: I'm not going to reiterate my feelings on this. I'm just wondering maybe as a procedural type thing, is the petitioner now asking for this to be recommended simply as tetracycline? Could you clarify it? Or was it tetracycline hydrochloride? I need to know that for the next question.

MR. DAVIS: Specifically the top line says in parentheses, oxytetracycline hydrochloride. That's the specific material.
MR. KARREMAN: Okay. Because --

well, at some point in the future I'm going to
do something about it, but if it was
tetracycline itself and only tetracycline, so
it covers both the salts of the tetracycline,
which this manufacturer makes the other one,
what's already on the list, and we voted a
straight-up vote on tetracycline here, and it
didn't make it at the board level, what would
that do to the tetracycline salt that's
already on the list?

MR. DELGADO: Jerry?

MR. DAVIS: I don't have an answer
for that. Dan probably does.

MR. GIACOMINI: The petition as
the Crop Committee presents it to the board
today is as the petition was originally
submitted, which is a new listing, a new
addition of an additional item.

The alternative that was what they
tried to propose, what the Crop Committee also
considered, would be considered an annotation
change. So it would either be presenting it
like this as a new item on a separate line, or
it would be, without getting my book out,
deleting the specification of the salt within
tetracycline listing.

MR. KARREMAN: Okay. So then if
someone were to make an amendment to just add
this, if it was -- I guess it would have be up
to the petitioner, I'm just asking if this
comes up to a board vote as tetracycline, and
then it doesn't pass, what would happen to the
other tetracycline that's already on the list?
That's really the question.

MR. GIACOMINI: If it had come up
as an annotation change and it failed, then
the existing listing would stand. Because
it's not a petition to remove.

MR. DELGADO: No, but the question
is what would happen if a motion is to list
tetracycline and it's --

MR. GIACOMINI: That's still
separate and in a petition to remove any
MR. DELGADO: Is that clear?

MR. KARREMAN: Yes, but how can that be if we vote no to tetracycline? I understand where you're coming from, but I mean how is it logically that we would both say vote no to tetracycline in general, at a current board in public, and then there's still a tetracycline on the list? That just can't -- that doesn't jive except for procedural technicalities.

MR. DELGADO: We were talking about a specific petition that is clear as to what they want. They're not asking for a renewal of material, so we would not be able to proceed with a hypothetical scenario that you're talking about.

Julie first, then followed by Gerry.

MS. WEISMAN: I just only want to reiterate what you already started to say, which is that removing a material requires
very specific criteria to be met that would in no way be met with this procedure.

MR. KARREMAN: And I guess I have a question.

MR. DELGADO: Excuse me, Gerry, and then we'll go back to you.

MR. DAVIS: Julie, your statement just now was referring to removing the annotation.

MS. WEISMAN: No, I'm following on his -- on the hypothetical, that if it gets -- the petition is tetracycline. Because of this specific petition for adding to the list, and it fails the board as tetracycline, he wants to know if then procedurally what's already on the list then goes away, has to come off the list, and I am saying things have to come off the list in a very certain specific way. And this can't be the way it happens.

MR. DAVIS: Okay, so my follow-up comment to that is the original, as Dan said, the original petition presented it as a
separate material, but in the statement from
the petitioner in public comment, you know,
now that they are learning more about the
process, they don't care if it's add the new
material or change the annotation, they're
willing to go either way.

MR. DELGADO: Thank you.

MR. KARREMAN: I apologize. I
just wanted to say how would they look at
that? I realize there's a whole separate
thing to take something off, but isn't there
some legal oddity if we -- at the program
level?

MR. DELGADO: Let's consider the
questions we have from Joe and Bea.

MR. SMILLIE: You know, that's an
issue and I understand the issue, but that's
not the place for this issue. The petition --
we have to address the petition. The petition
is asking for -- to add the material or change
the annotation. That's what we have to
address, and I think the board, regardless of
its feelings on tetracycline in general, has
to look at the petition for its own value, and
all they're saying is equal playing field for
material that's already allowed.

So, to me, unless the Crops Committee can demonstrate to me that there's
a reason why this material is different from - - and again, I didn't study this like you
guys, so I'm relying on you, but I'm asking
you as a committee explain to me why this
material would be rejected when a comparable
material has already been allowed. I need to
know the answer to that.

MR. DELGADO: Bea, followed by
Jeff.

MS. JAMES: Well, logically it
seems like, you know, what Hugh is pointing
out is there's a contradiction. But there's
a procedure also for how we remove petitions.

However, just because something is
already on the list doesn't mean that that's
justification for adding something similar to
that. It has to stand on its own accord. And
you can't say that just because tetracycline
is already on the list, why would we reject a
petition for another form of it to be added.
They are separate issues and they should be
looked at separately, in my opinion. Just
like petitioning for the removal is a separate
issue, petitioning for the addition should
also be looked at as its own petition and not
just because something is already on the list
similar to it.

MR. DELGADO: Jeff, followed by
Kim.

MR. MOYER: Yes. Joe, I think
what you're going to see with a lot of the
materials that we're starting to look at,
there's great similarities in the material,
but it does have a different CAS number, so it
is recognized as a separate material. You're
going to see that with sorbitol as well. I
mean we're starting to get different
iterations of the same material that was on
before, and eventually that list gets that very long. It's like, okay, you know, this, this, and this. And the next one on the list, this, this, and this, because they're all similar but yet they are different, and that's why they're being marketed that way.

MR. DELGADO: Gerry, please respond to that.

MR. DAVIS: I do want in fairness to this petitioner, this material, to compare sorbitol octanoate to sucrose octanoate and say they are similar, their relation to each other is the same as this, it's much, much more specifically the same than that analogy.

MR. DELGADO: Tina, followed by Kevin.

MS. ELLOR: Yes. And Jeff made my point. We chose to look at this as a separate material because it is a different CAS number, and we didn't send it out a separate TAP. So we chose not to do that. I mean, you know, but we are looking at it as a different
MR. DELGADO: Kevin, followed by Joe.

MR. ENGELBERT: We heard from Bob Pooler at our meeting, at our last meeting, and his quote from that meeting is, "It's different from the calcium complex that's currently on the list, so it would have to be a separate material."

MR. DELGADO: Joe.

MR. SMILLIE: Well, okay, I'm not going to beat this horse to death, but my understanding is the petition says to change the annotation as well as add the material, whichever the committee in its wisdom -- did you consider both of these?

MR. DELGADO: Gerry.

MR. DAVIS: The petition did not actually state to change the annotation. That was something that was brought up in committee discussions, that that was one way to accomplish their goal. You know, they're not
experts in the petition process, to understand
going into the process, which way to
accomplish that. So I believe the petition
itself -- but I guess the petitioner could
maybe -- you know your petition very well, and
maybe you could state that for the public
record, what it did say.

MR. DELGADO: Petitioner, can you
approach the microphone and identify yourself, please? And the question is very specific.
Are you willing to change your petition from
adding to the list to changing the annotation?

MR. DAVIS: I just was asking him
what did your petition state. Was it stated
as I want to add this material to the list, or
do I want to change the annotation?

MR. RICHARDSON: Taw Richardson
with Agrosource.
And the petition requested to
address tetracycline, the listing for
tetracycline, which is the listing. And we
initially, just as a piece of history,
initially we followed the guide -- what we
were asked to do by NOP for our petition.

That's why the original petition
was structured the way it was because we were
asked to do it -- we were told we had to do
it.

After going through the main
meeting, we realized, which we thought
initially, that it should have been dealt with
as tetracycline. So we came back with
specifically either -- and we used the term
"parenthetical" in our petition, which should
have in your vernacular been annotation, but
we asked that the annotation either be removed
or in the wisdom of the board, if they thought
it should be included as part of the
annotation, to use the calcium complex and
hydrochloride.

But our first preference was a
removal of the annotation. We thought that
was the best way to address it.

MR. DELGADO: Okay, okay?
MR. MOYER: Taw, your original petition was for expanded use as well?

MR. RICHARDSON: Yes. Yes. But, again, we didn't understand the implications of that at the time. That's why we withdrew that in this revised petition. So it strictly is related to apples and pears, which is the current usage for tetracycline.

MR. DELGADO: Any other questions for the petitioner? Okay, thank you very much.

MR. RICHARDSON: Thank you.

MR. DELGADO: Any other questions on the part of the board for this material?

Okay, Gerry, back to you.

MR. DAVIS: I have a question.

(Laughter.)

We did discuss whether we'd change the annotation or just leave it this way. There was -- I believe there was some uncertainty on the difficulty of changing the annotation versus just addressing this as a
stand-alone material, and I guess I would like input from the program on changing the annotation -- if this were amended to a vote for changing the annotation or not on the already listed material, are there problems with that procedure?

MR. DELGADO: Comment from --

MR. MATTHEWS: If you wanted to add it as a new item, then we would propose that. If you wanted to change the annotation in some way, we would propose a change to the annotation.

MR. DELGADO: Okay, at this point the chair would like to recommend that the committee get together and discuss this.

MR. DAVIS: Definitely.

MR. DELGADO: And find the motion that they want to bring to the table tomorrow.

MR. DAVIS: Okay. Moving on to the next material.

Sorbitol octanoate. The petition is for adding sorbitol octanoate as insect
control on the national list in section 205.601(e). The committee felt that it failed evaluation criteria 2 and 3, No. 2 being that it's not essential. This material is not essential to organic farming, as there are many alternative insect control methods and materials already available. Adding another synthetic material to the national list in this case would be inconsistent with the original intent of the OFPA, which was intended to severely limit the routine addition of exempted synthetics.

We put an attachment of that OFPA preamble to document that statement.

The petition was clear in its statement in that it was -- this is just like sucrose octanoate, pretty close, but it's a lot cheaper. And I guess the committee really objected to that, because it voted to add sucrose octanoate two or three years in a different board, different situation, that now we must accept another material that's not
identical but, you know, similar.

The vote was zero yes to add it to the list by nos or absent. Any discussion?

MR. DELGADO: Questions from the board? Hugh?

MR. KARREMAN: I certainly can understand why your committee didn't like the response that, well, it's going to be cheaper. I hear that a lot from my farmers, you know, alternatives when I'm out in the field, but also I just think we need to keep in mind what Jeff said, actually, about CAS numbers, and if this is a different material, even if it's a cousin, it's a different material.

MR. DELGADO: Dan?

MR. GIACOMINI: Could the Crops Committee address the issue of -- I understand how it's close and it's cheaper. I don't like buying the cheaper argument, either. Could you address the discussions of difference in solubility and difference in target organisms?

MR. DAVIS: Well, there was public
testimony yesterday that was brought to bear on the difference in target organisms a little bit, different crops, greenhouse production. It was mentioned that the sorbitol material would be more appropriate for that, and the sucrose material is not.

Evidently the sucrose material is not working on mite control in hops, so they have hop growers who are very interested in it. So there are differences in activity. They are not identical materials, but they are close. The same principle. It's a suffocant type soft-bodied insect control.

MR. DELGADO: Joe.

MR. SMILLIE: Well, again, the same issue. I want to hear from the Crops Committee because you guys studied it -- I didn't -- I want to hear what the criteria -- was the criteria you applied to this material different than the criteria that was applied to the other material?

MR. DELGADO: Gerry, do you want
to respond? Tina.

MR. DAVIS: I can respond to that.

But first I want to go into a little history on the sucrose material. That one was presented mainly as a livestock material at the -- I forget which year that was, my first year on the board, I believe, or second year -- for its benefits and perceived need in the apiculture production as a mite control for application to bees.

And so that was the big thrust of it. Nancy Ostiguy, former board member, the expert, spoke up for it, and the -- but it was determined at that time, well, if it's approved for crops, we probably should approve the crops usages also, so as not to have a discrepancy, and it kind of piggy-backed in on the perceived need in livestock, in my opinion.

So now we have another material piggy-backing on something that was piggy-backed on a livestock material.
MR. DELGADO: We have Tina, followed by Joe.

MS. ELLOR: And, you know, we always use the same checklist and the same criteria where, you know, the committee compositions constantly change, but we always use the same checklist, but what changes is that as we add materials to the list we have to consider those materials as we go through the checklist.

So we also looked at it that way, that there was already this other material. So in that way, you know, we did look at it differently. But we always use the same criteria.

MR. DAVIS: So to flesh that out a little more, the original sucrose material, it passed the criteria on is it essential, because there was nothing else available for mite control in bees. That was the driving force for that material being approved.

That is considerably different
than the criteria as it applies to the sorbitol material for general crop usage.

So that sucrose passed that criteria back then. It can be, you know, decided by the committee that the sorbitol material doesn't pass the general crop use criteria because there are several good materials as well as practices for insect, and particularly aphid, soft-bodied insect control.

So we are not being capricious in approving the one or the other. There are different circumstances.

MR. DELGADO: Joe.

MR. SMILLIE: As Rigo, in his list earlier, we still have more public comment to go. So I'm looking for the public to also comment on this issue in general. So I'll hold any more comments.

MR. DELGADO: Jeff.

MR. MOYER: Well, I was just going to say, Joe, that in the context of this
committee makeup, we do, as Tina said, follow
the same checklist that everybody follows, and
we look at that. But we do have to take into
account materials that were passed. We did
talk with Nancy about this particular
material. I went back and spoke with her
about it, and what her feeling was on it, on
the subject.

And then for better or for worse,
you know, this committee does look at OFPA and
say what is the intent of the rule which is,
in my opinion -- I speak for myself, not the
committee -- is to -- and we heard testimony
yesterday to the contrary -- but is to keep
the list small, and to not allow that many
synthetic materials on there.

So if there is a synthetic
material that is currently on the list, it's
not -- at least I don't feel it's in my best
interest, representing consumers, to try to
make that list as long as possible when
somebody else comes up with a material that's
similar and says, hey, about me, and then how about me, and how about me, and how about me, and how about me, and how about me. I can't help it.

That's my view.

MR. DELGADO: Joe.

MR. SMILLIE: That one I have trouble with, Jeff. I have trouble with that, that reasoning. I don't have trouble with the necessary needs for mites and honey. I didn't know that was part of the first reason, because essential needs are just that, and for all the mites and honey it is a big issue and important.

So that makes sense to me as a differentiation between the two materials.

Your second reason, going back to OFPA that doesn't want to allow synthetics, you have to go to the criteria, you know, not -- nothing else.

MR. MOYER: Right, but when you go to the criteria, those other materials on the
list, and that was my point. There's other materials on the list that do that.

MR. SMILLIE: Yes, but we've heard testimony that there's different effects on different things and, you know, being a hophead myself, you know, if the hop growers need this -- you know, I got blasted for getting hops on 606, which I think was a good decision, and I'd love to take it off. And if this material helps me get hops off 606, then God bless it.

MR. DELGADO: Any other comments from board members? Questions? Okay.

Well, we're done. We reached -- it's 12 o'clock right now, so I guess it's fair to take a lunch break of about one hour. We'll come back here at 1 o'clock, the scheduled time, and we'll proceed with discussion on the Crops Committee. An hour. See you at 1 o'clock.

(Whereupon, at 12:03 p.m., the meeting recessed for lunch, to reconvene at 1:00 p.m.)
MR. DELGADO: We'd like to resume the discussion of the Crops Committee, and we had just finished one item, and we are moving on to pelargonic acid and ammonium salts in fatty acids. While the Crops Committee chair is getting ready, please be mindful of the time. We are running half an hour late, and we have a lot to cover, and I know it's important to get feedback and provide input, but please bear that in mind.

We also have afterwards a session for public comment. We have a number of people who have already signed up for our discussion.

Are you ready, Mr. Chairman?

MR. DAVIS: Yes.

MR. DELGADO: Please proceed.

MR. DAVIS: The next material is pelargonic acid petitioned for use as an herbicide, with the condition of -- with the
existing annotation for use only in farmstead
maintenance, roadways, ditches, rights of way,
building perimeters, and ornamental crops.
It's on the national list 205.601(b)(1).

Another material that was
petitioned earlier, considered at another
meeting, and then withdrawn, similar to the
other herbicide. So some of this work is from
a little while back that the committee did.

The committee felt that it -- as
far as going through the evaluation criteria,
criterion one, impact on humans and
environment, we thought it was relatively
benign and satisfied the criteria for that.

On criterion two, whether it was
essential and availability criteria, the
committee agreed that they felt it did not
pass the criteria, as well as the number
three, the compatibility and consistency with
organic farming regulations. We felt that it
did not satisfy that, either.

On the criterion three, the main
reason that we felt it was inconsistent was
that they were petitioning for use as if it
was a soap-based herbicide, and we, after
investigating it and questioning the
petitioner for further information and
response from them, that they never did
support that it is in fact a soap, even though
it's in -- it's a fatty acid, but they never
did claim that it qualifies as a soap.

So that was one question we had to
answer.

The other thing on the -- is it
essential or not, the next -- this material
and the next material both called to question
the ideas are synthetic herbicides appropriate
in organic farming practice. Are they
necessary, are they essential, and some people
might say that herbicides would be helpful,
and some growers might say, yes, we would like
such a thing, although I fail to see a big
groundswell of public comment in the written
transmissions, at least, that spoke up for
that.

We just felt that there are a lot of weed control options other than adding synthetic chemicals to the national list to accommodate that.

Just basically that was why the committee voted zero yes, five no, to not add this to the list, the national list.

Any discussion or questions?

MR. DELGADO: Questions, comments from the board? No comments, questions? Okay. You can proceed with the next one.

MR. DAVIS: The next material, we compared to what was posted on the Web site. We -- I'm going to have to find it in a different spot here. Excuse me a minute.

We did make a -- based on input from the petitioner, who requested in their public comment yesterday, they asked that we change the name from ammonium salts of fatty acids to a more specific name, ammonium nonanoate, so that editing was done last
night, and the CAS number is actually put there in the -- where it says "petition is for," ammonium nonanoate, CAS number such and such, to be allowed as an herbicide in organic crop production.

As part of the committee deliberations, it was determined that this material is a soap-based herbicide. It does qualify as a soap, a true soap, going by EPA regulation and determination.

So we did put in here a comment that the -- we felt that the substance was not compatible with the provisions of the rules for general use on crops or cropland, but since this material is a soap-based herbicide, the current listing in 205.601(b)(1) as annotated would apply to this form of salt, which is ammonium salt of fatty acid.

So that was in effect a clarification for this material, specific material, that it would be eligible for use, for farmstead use, ditches, roadways, and
ornamental crops.

This has -- as far as the evaluation criteria, again, relatively benign in the environment; in fact, all these fatty acids would be consumed by soil bacteria and degraded very quickly. They would use it as a food source and actually grow on it, probably.

Criterion number two, is it essential for organic farming, and the committee voted that it was not, based on many, many alternative practices, and weed control. We list many of them. And also the fact that this material, as well as the pelargonic acid, we did not want to discourage the development of natural herbicide options that are coming to the fore, such as the -- an example would be lemon grass oil formulations that are fairly effective herbicides that are fairly new on the market.

We felt that approving synthetics out of hand would very readily squash the
development of natural herbicide options if that is what organic growers want, is a material to be able to spray on weeds to kill them. We did not want to select -- give preference to the synthetics over the development of naturals.

So in a nutshell that was, I believe, why the committee voted zero yes, five no, there was one absent, to reject this being put on the national list.

Any discussion or questions?

MR. DELGADO: Questions? No comments?

Yes, Julie.

MS. WEISMAN: I was just wondering, like you mentioned these lemon grass preparations. Are those -- do those specifically target the same kinds of weeds that the ammonium nonanoate would be attacking?

MR. DAVIS: They are -- the lemon grass oil formulations, that is brand new on
the market. I have tested it personally, just
beginning to develop by a company who has
provided input to us before, the Murone
Enterprise. I'm not sure of the exact company
name. But she has spoken before us before
several times.

Very broad spectrum, will burn
most anything they touch. I don't think they
would be -- I don't know -- I haven't tested
either one of them enough to speak to whether
they are all very broad spectrum or contact
herbicides.

MR. DELGADO: Any other questions?
Okay. There are no questions. Let's proceed
with the next item, please.

MR. DAVIS: Excuse me just a
minute.

The next item is the soilless
growing systems discussion item. It was not
posted. I would like to defer that to the
work plan section of the meeting tomorrow,
because essentially that is really all it is,
is just a work plan update for the Crops Committee. There's nothing new there.

MR. DELGADO: So you'll give us more details on that tomorrow?

MR. DAVIS: Yes.

MR. DELGADO: Very well. Let's move on then to the next topic, which is list 4 inerts.

MR. DAVIS: Okay. The background on this for list 4 inerts in pesticide formulations is that the EPA has changed their policy somewhat in that the national listing for the -- the organic national list references list 4 inerts used in pesticide formulations as a one-item entry that encompasses many, many materials as they are used in pesticides.

The EPA determined that they wanted to do away with that, that listing and nomenclature, and notified the program that the NOSB would have to look at changing that listing and coming up with something
different, because we could not allow the
status quo to continue because they were
changing their stats on it and their listing
of it.

They have since changed the
listing of these minimal risk type inerts --
I'd say that in quotes, minimal risk. They
have listed it specifically in section 40 CFR
180.950, titled as "Tolerance Exemptions for
Minimal Risk Active and Inert Ingredients,"
which is attached to the end of this document.

So we are seeking input from the
public to see what is the consensus, see if
there is a consensus on which way to go. Do
we -- and there are several options that we
list here as possible solutions. I'll read
them now.

The NOSB will begin public
discussion of these matters as this meeting,
November 2008. Public comment is invited to
comment on the possible solutions described
below. Public comment is heavily encouraged
to identify the number and nature of synthetic materials deemed to be vital in pesticide formulations used in organic farming. We are hoping to get some good input from various concerns that have that expertise.

Possible solution options. The NOP has suggested that a substitution of the language in the rule currently as list 4 with the new regulatory reference of 40 CFR 180.950, the minimal risk ingredients.

They do correlate, but they are not identical at all. There are a lot of materials that are on one that are not on the other, but they are similar, I guess.

Number two, adopt the original 2000 version of the list 4-A inerts, which is attached as attachment 1, as an itemized list with ongoing reassessment through the sunset process.

Number three, adopt the minimal risk ingredients currently found in 40 CFR 180.950. This would entail a one-time
adoption of the materials currently on this list, with ongoing reassessment through the sunset process.

Option four, eliminate blanket inerts lists and adopt a policy of requiring inerts and pesticides to be petitioned individually.

Five concerns the list 3 inerts currently used in passive pheromone dispensers. The current policy is that they need to be petitioned individually and are subject to regular sunset reevaluations, that has already been in place as an NOP policy for a couple years now, since we were first notified about the EPA change.

We wanted to throw this out to the community to where we get input and begin work on a possible recommendation for the spring 2009 meeting, and that was the purpose of this discussion document.

MR. DELGADO: Any questions?

Jeff.
MR. MOYER: One of the things that we wanted to mention that didn't make it into this document at posting was on item three, option three. What we were talking about doing there was a one-time acceptance of CFR 180.95, but then moving forward, any new materials that would be -- want to be added to the list would have to be petitioned.

And, furthermore, if EPA changes lists CFR 180.950, it would not affect this list. So in that regard, it begins to separate us from the EPA's list because there was a lot of things that they'll put on their list that we don't want to have on our list.

So it's a one-time acceptance by reference, but from then on any new materials would have to be petitioned to us. They would not automatically go on if EPA changed their list again in the future.

MR. DELGADO: Comments from --

Gerry?

MR. DAVIS: No, that's absolutely
MR. DELGADO: Dan?

MR. GIACOMINI: Just a question. As we go through this process, we don't really need to discuss it now, but I'd like to know what the answer is. What is going to be the implication, the impact on the pesticide formulations because of this change? Is the change that we're making going to fit in with what they're going to be forced to do or not forced to do because of these regulations, these numbering changes?

MR. DAVIS: Right. And there was some public comment that I'll call attention to from OMRI yesterday where they mentioned that they thought that the former list 4-B materials, which are not part of this new CFR listing with EPA -- generally they've been left off of that list -- the statement was made that fully 50 percent of their approved formulations contain list 4-B ingredients, which would be a problem.
MR. GIACOMINI: No, what I'm asking, though, is within the pesticide formulation industry, is this change that has gone on at EPA going to affect the way they formulate things?

MR. DAVIS: For even conventional agriculture, you mean?

MR. GIACOMINI: Yes. I mean, for instance, those formulations, are they likely to be changed because of this EPA change? That's sort of what I'm wondering in deciding how we can go about it.

It may be solved within what we're doing simply by knowing how -- what their forced reaction is going to be.

MR. DAVIS: Okay. There are people here that might be able to comment on that, but I can't speak for them.

MR. DELGADO: Gerry, you're calling someone specifically from the public?

MR. DAVIS: Emily.

MS. ROSEN: Well, I was just going
to say Chris Pfeifer from the EPA is going to be dealing with that.

MR. DAVIS: If he's willing, sure.

MR. DELGADO: Yes. Come to the microphone, please.

MS. FRANCES: I wanted to follow up on what Jeff said.

MR. DELGADO: Okay. Can you hang on, please.

MS. FRANCES: What we currently do is incorporate by reference. A one-time adoption would be an adoption of the list of individual items, and that's not the same language. I just wanted to make sure it was understood for the record.

MR. MOYER: I think that that's a very important point because that is what we talked about, was not doing it by reference as I stated. I apologize for that.

But reading the list over as a list of itemized materials, not bringing the list by reference number but bringing it over
as an itemized list of material, there is 83 materials on that list. And all of the 83 materials are listed individually so that they can be sunset as individual materials, and we can then deal with them as a board. Coming forward, the new materials, even though the EPA might put them on their list, we would not.

                    Thank you, Valerie. I appreciate that.

                  MR. DELGADO: Please identify yourself for the record.

                  MR. PFEIFER: Yes, my name is Chris Pfeifer. I'm the EPA's liaison to USDA NOP, and I work with the biopesticides program.

                  MR. DELGADO: We have specific questions for you. Dan, why don't you ask your question?

                  MR. GIACOMINI: Is the change that you've made in your listing, does that have a direct impact on how formulations of those
pesticides will be made?

MR. PFEIFER: No. List 4 has never been, or the list system, has never been a system that has actually determined how our pesticides were formulated. It was more or less a thumbnail way to do reassessment or a quick and dirty way to work with different programs, whether they were the organic program or unregulated pesticide program for 25(b)s.

So, no, the list system does not affect that. We have always used 40 CFR as our source material for pesticide formulation.

MR. DELGADO: Any other questions?

Gerry.

MR. DAVIS: I have a lot that in speaking with Mr. Pfeifer earlier I don't think he is prepared to answer my type of questions until he consults more with his associates.

MR. PFEIFER: To finalize, I just can't speak for the agency going forward. I
can give a little thought on the historical thinking.

The agency in the past has expressed an interest in narrowing the inerts list a little bit simply because they believe that it would reflect better on the integrity of the program, mainly because there has not been any ecological assessment attached with the inerts determinations in the past.

So list 4 as it was originally contrived was not really built around any ecological thinking, and as reassessment came again and it spoke more or less to human toxicology and didn't really address the ecological issues.

You know, again, this is USDA's program, but it's always been our feeling that it's a principal program built around both ecological and human health concerns.

So that's about as much as I'm prepared to say unless there are some specific questions.
MR. DELGADO: Any other questions?

Okay, well, thank you very much. We are going back to the schedule, and we have Tina next. Do you have a presentation?

MS. ELLOR: No, Gerry already covered it.

MR. DELGADO: Okay, any other questions? Very good. Does that conclude --

MR. DAVIS: That concludes our presentation.

MR. DELGADO: Thank you very much. We will proceed right away with the Livestock Committee. Dr. Karreman.

LIVESTOCK COMMITTEE

MR. KARREMAN: Okay, thank you, Mr. Chair.

I would like to discuss our recommendation for fish feed and net pens. This is a continuation of a rather lengthy assignment that the Livestock Committee of the National Organic Standards Board has had in conjunction with the agricultural working
After that, I would like to ask Jennifer to talk about the bivalves and due to time and everything, the animal husbandry discussion we'll just let go for now as a work plan like Gerry mentioned.

So I think everyone knows that the board passed a estimate of agriculture recommendations to send up to the board February 2007, and they are in the hopper right now. They have not been acted on by the board as far as we know.

Regardless of what happens with these recommendations in the next day when we vote, we would like to have the board start promulgating those recommendations that we have already passed on up to that in February 2007.

MR. SMILLIE: You mean the NOP program?

MR. KARREMAN: Yes. I'm sorry.

The program. I misspoke. Okay.
So we have that already on record.
And so before I get into the fish feed issue
document, which will be first, I just want to
say that, you know, we have a lot of science
on both sides of the issue, and hopefully
there's some nice middle ground as well, and
that's what we try to strive to attain here at
the board.

Okay, so for our document,
basically I already gave you the background
about where we're at and how the -- is that
hurting your eyes, Joe? I apologize. I don't
know what's up.

All right. I'll sit back. How's
that? I'm trying to hide behind this post,
you guys.

(Laughter.)

All right. How's that back here?

Is that okay? All right.

So what I want to get at is
basically I want to go over the discussion
points a little bit, and then get into the
regulatory framework, and then our recommendation, the red-letter changes that were already posted on the Web. Okay.

So we as a board, you know, wanted to respect the current knowledge of nutritional needs of aquatic animals for fish meal and fish oil that they need, if they need it, and we would expect a certified organic fish meal and fish oil would be becoming increasingly available in the future if this program starts.

We want to make sure that their diets are nutritionally complete, and we want to make sure as a board that the sourcing of fish meal and fish oil sources are from responsibly managed sustainably caught fish. And the sustainability of wild-caught fisheries is paramount. Okay.

And then we also discussed in the discussion part of the document still why we feel that marine-based fish oil is needed for potentially farmed organic aquaculture species
because plant-based oils, oils from plant-based feed, as well as even freshwater fish, may not have, according to what we know from the agriculture working group and other scientific folks, the correct -- the exact correct oils that are needed in the diets of fish.

Okay. All right. So that's somewhat the background discussion.

We believe that we have the regulatory framework to consider this document. Under OFPA 2102, section 2102, under the term livestock -- the term livestock means any cattle, goat, swine, poultry, equine animals used for food and the production of fish used for food, wild or domesticated game or other nonplant life.

We also relied upon OFPA section 2107(a), No. 6, that would require periodic residue testing by certifying agents of agricultural products.

Also then in 2107(c) of OFPA,
regarding wild seafood, in general
notwithstanding the requirement of
2107(a)(1)(a) requiring products to be
produced only on certified organic farms, the
Secretary shall allow through regulations
promulgated after public notice an opportunity
for comment, wild seafood to be certified as
labeled -- to be certified or labeled as
organic, in consultation and accommodation
with the Secretary of Commerce, the NOSB,
producers, processors, and sellers, and other
interested members of the public.

So we believe that we are at this
point potentially promulgating OFPA in regards
to fish oil or fish oils from wild-caught
species. We think we have that in OFPA to go
on.

And so the committee voted seven
in favor, zero opposed, to go ahead with this
document.

Okay. So now how do you want me
to go through the recommendations? I mean
there's quite a bit. Just the --

MR. DELGADO: Concentrate on the

highlights. You can review the comments of

the public and discuss what approaches to
take. You can incorporate those.

MR. KARREMAN: I'll do the

comments like that at the end but, you know,

there's a fair amount of red-lining here.

MR. DELGADO: I think the public

has had sufficient time to review the

recommendations.

MR. KARREMAN: Okay. All right.

MR. DELGADO: So just briefly

highlight them, the most important ones.

MR. KARREMAN: Well, basically

part of the public comment regarding this

issue of wild-caught fish oil has been based

on that it's not allowable in OFPA, and I just

mentioned that we believe it is, and that the

-- that livestock, which fish would fall

under, under OFPA, need to be fed 100 percent

organic feed, which we understand.
And the reason we put the exemption to use in a step-down fashion, fish oil derived from marine wild-caught fish in 612(a) essentially on the national list, and not in let's say 252 under the feed section, is because if it's in the feed section, it would have to be certified organic 100 percent for the animals that are eating it, whereas as an exemption on 612, we feel that it can be used but in a stepped-down, phase-out type situation in order to get the industry started.

That was actually in consultation with the program, and that's what we've done.

Okay. Is there any discussion at this point here?

MR. DELGADO: Any comments, questions? Please proceed.

MR. KARREMAN: Okay. We definitely -- we got a lot of public comment written -- go ahead, Valerie.

MS. FRANCES: I guess I'm just
wondering how you're going to put the aquatic animal versus the aquatic livestock terminology.

MR. KARREMAN: I think it was the AWG that's supposed to use aquatic animals instead of aquatic livestock, and we certainly -- I think we could make that change without any substantive, you know, meaning change.

So and just so the public knows, we have taken public comment seriously, and there's some very strong views on either side of this, and we do plan to have a Livestock Committee meeting this evening to take into account further public comment this afternoon as well.

So one thing that we definitely don't want to do is have byproducts of land-based livestock going into the fish because there's a lot of consumers that would not want to have that for organic fish. That's why we have kept it at a byproducts for edible fish or for fisheries. Okay. That has come up as
a question.

I think we need to define, perhaps, better the term sustainably, since we did say wild fisheries need -- the sustainability of the wild fisheries is paramount in potentially harvesting the byproduct.

We think that using the byproduct of edible fish is a good, complete usage of a resource that's already there. We were told by the agriculture working group that right now they actually use fish oil, they make it into diesel fuel and run it in their boats up there because it costs too much to bring it to the mainland, and we think it would be better used to feed fish than be used as diesel oil. That's part of the reason we want to use that.

Let's see. One thing, the Ocean Conservancy, George Leonard, gave a lot of valuable input at the symposium, and the idea of performance standards, which might apply more to net pens which I'll talk about in a
minute, but there were some good -- I think we could use some performance standards in our document that we might want to mention.

Let's see. There has been questioning about the extra label on products, on aquatic animal products that have been potentially fed these wild-caught trimmings.

Some people yesterday and also in a written comment said that it would be confusing to the consumer. We also know, however, that some consumers of organic fish may not want to buy that fish that was fed wild-caught, and yet other consumers we know would actually want that because they know that those fish have been fed a very complete natural diet. That may become certified.

Go ahead, Kevin.

MR. ENGELBERT: And we also wanted to make the point that by adding that label, there's no deception involved whatsoever. We want to be sure that also consumers realize that that organic fish was fed wild-caught
trimmings.

MR. KARREMAN: Okay. So I'm open to any discussion you guys want on this. I can go on to net pens.

MR. DELGADO: Questions on the topic of feed. No questions? Dan?

MR. GIACOMINI: Just one further statement, and I had a lot of work to do so you may have covered this, but in separating off the national list in consulting with the program, it was also -- it was pretty well established that even if fish and aquaculture stayed in 603, they wouldn't automatically be granted the use of everything that was on 603.

So by saying that by separating it off to this other section we would create this new work and new petitioning -- well, they would all pretty much have to be reconsidered, anyway, to the information that we received at that time.

MR. KARREMAN: That's a very good point. As a matter of fact, we are proposing
-- but you don't want me to go into all the
details -- section 609, 610, 611, and 612, and
I think it's very clear that there are no
other materials so far on that list, and they
will need petitioning. So it's not a
transfer. I just wanted to make that clear.

But we can't go there yet until
this might pass.

MR. GIACOMINI: We even looked at
the consideration of the possibility of
bringing over the things as generic as the
vitamins and minerals, and we were recommended
not to do that, either.

MR. KARREMAN: Well, we did bring
over the structure, though.

MR. GIACOMINI: The structure,
yes.

MR. KARREMAN: The structure is
all we brought over. So basically we're just
-- we're trying to have aquatic animals have
their own section in the rule because they are
very different than land-based animals. There
are some similarities, but as everyone has said, they're very different, so that's how we're -- that's why we created the new section.

MR. DELGADO: Any other questions, comments? Go on to next one.

MR. KARREMAN: All right. Net pens. So this is another part of the issue that was put off in February and March 2007, and we have come up with a recommendation based once again a lot on the agriculture working group, which they have been indispensible. They have been always willing to work with us every minute over time, and yet at some point we did have to say, hey, look, you know, now we have to work on it as the board, as the Livestock Committee.

So a lot of this has agriculture working group input, but we have also tempered it to try to take into account the organic community, because net pens have been historically kind of a hot button issue, as I
think we all know.

So basically -- first it should be said that -- I want to say, and I think I said yesterday, that net pens, everyone always associates net pens and salmon together, but there are other species out there that are grown in net pens. Tilapia is grown in net pens, just so everyone knows that. I heard that today. And so we have to be, you know, careful in accepting and think about ramifications of net pens not just for salmon, okay, because there are other species out there, too.

And, as well, just so people know, closed containment systems, if the program does enact rulemaking, we are already past at the March 2007 meeting. So we already have a containment type situation, and now we are looking at open water net pens.

So essentially what we believe we have done is looked at net pens and said, okay, we know how they've been used from the
aquaculture symposium; we know what is possible; and we tried to tighten up, and perhaps we can tighten more by more specific language, the performance metrics.

The issue of escapes, the issue of the nutrient management, some people have commented that the 50 percent nutrient recycling is not feasible. Some people say it is feasible.

So we are going to hopefully err on the side of the people that agree with us on the 50 percent nutrients are, you know, recyclable.

As far as the issue, I think we need to -- and in our document we do address the siting of net pens. Perhaps we need to tighten that up more or even preclude certain areas of having net pens.

But I think that a lot of the public comment posed on net pens has been really strongly based on existing conventional salmon farming in the Northwest, and our
proposal is truly a major improvement, we believe, and not even attainable by a lot of growers out there. And organics isn't for everybody, and I realize people will say not everything can be organic, and I would agree with that.

But if people can meet these standards that we have for these net pens -- and we're open to tightening up some language from the public comment we got -- then I believe that net pens can be done in an environmentally friendly fashion that improves the environment as well as provide food for people.

So I guess I'll take comments from rest of the board.

MR. DELGADO: Questions?

Questions from the board? None. I'm surprised.

MR. KARREMAN: Okay. Well, okay, that's fine. We're going to have public comment this afternoon, and I do look forward
to it. I guess yesterday I was pretty engaged
in public comment and with the aquaculture
commenters, and I apologize to anyone if I had
been a little bit too aggressive. I didn't
mean that, but I think it brought out really
a lot of good information that the whole board
can use as we deliberate on this before we
vote tomorrow. And we'll have some more this
afternoon.

So I guess if that's it for net
pens right now, then I would like to turn it
over to Jennifer to just briefly discuss the
discussion item on bivalves and mollusks.

MS. HALL: So I am presenting on
behalf of the Livestock Committee our current
state of art as it regards the interim final
report on bivalves and mollusks.

The committee has continued its
partnership with the aquaculture working group
to bring the organic community another
document for consideration in our attempt to
determine a correct fit for cultured aquatic
animals with the existing regulations, and we present here a revised interim final report on bivalve mollusks from the AWG for comment. It is a discussion document at this meeting. We have already voted to accept the report as it was presented by the AWG. They did receive, when it was open to comment, a fairly comprehensive comment from the Pacific Coast Shellfish Growers Association, and while the Livestock Committee continued pretty in-depth work on net pen and feed issues that we had delayed from prior meetings, we thought it best to allow their expertise to dig into the concerns raised by that comment and continue to revise the document for another submission. So that is what this is, is their final work that replies to the comments that were received.

So we are basically open for comment on this document. We have used much of the very strong and detailed language from the bivalve mollusk document to enhance our
presentations on the net pen one. Their siting language was much more detailed. It was very helpful as we tried to tighten our own language as we revised the net pens.

I would say that due to the complexity that has been raised by the community that sits before us today, as well as kind of in our own committee, as we move forward we will still wrestle I think perhaps even a little bit more in this piece of work with where it fits in the regulation vis-a-vis the management of inputs.

It does a pretty great job of raising the bar on siting and where to place these operations, and on managing the environmental impact. But due to the way they are cultured, it is not an intensive system of input management. And so that is something we will continue to discuss and invite comments as it regards that topic, too.

That's it. Discussion?

MR. DELGADO: Any questions?
Questions from the board? Okay, no questions.

Thank you.

MR. KARREMAN: That pretty much wraps it up, Rigo. That pretty much finishes the aquaculture presentation as we have it.

The animal welfare, as I mentioned, has been put off because of every Tuesday at 3 o'clock we were talking aquaculture since the last meeting, and we hope to get back to that, so we're going to put that off, but otherwise as everyone knows, we have a meeting tonight after dinner for livestock. Okay.

MR. DELGADO: Jim?

MR. MOYER: I just want to take this moment to put on the record to thank the entire Livestock Committee for the amount of work that they put into this aquaculture standard.

While it is only a few pages long, it represents a tremendous amount of work, not only in committee but working on subsequent
calls with the aquaculture working group, and also to thank Valerie for sitting in on all those calls as well. I think that there was a tremendous amount of work done here, and hopefully we can get something going. Thank you.

MR. DELGADO: Very good comments, and I join in those congratulations.

That does conclude the Livestock Committee, and we're going on to our next topic right away. We're almost on schedule, back on schedule, and it's now Julie Weisman, please.

HANDLING COMMITTEE

MS. WEISMAN: On schedule, you say? We can fix that.

(Laughter.)

MR. DELGADO: You were kidding.

MS. WEISMAN: Actually -- no.

Actually we have nine materials on our agenda, which is a record low for us, although it's a substantial amount of work.
I think what I want to address first, because it's come to my attention that it was cause for some consternation, is although there are nine materials on the agenda for the meeting, seven recommendations were delivered. And I think that because our -- I don't know. I don't want to get us off schedule, so I want to acknowledge that there are materials that we don't have recommendations for at this meeting that were on the agenda, and I understand that there are people who traveled down here particularly and especially and spent money and fare to be here for the recommendations.

So I want to acknowledge that there is some justified disappointment.

I also do want to say that I think that it's not the first time that this has happened, and that I think that we have a -- we're becoming more professional in getting agendas agreed on farther ahead before the meetings, and having them posted in time, and
this is I think an unfortunate consequence of that improvement in our procedures, that now all of our timelines have gotten pushed out. So I'll move on from there.

MR. DELGADO: Julie, just a clarification. Is it the intent of the committee then to include these materials in the work plan?

MS. WEISMAN: Absolutely.

MR. DELGADO: Great. Thank you.

MS. WEISMAN: Also -- this is what I meant when I said I'll take care of us being almost caught up. I wanted to say something -- I felt that it was warranted to say something about a petition or a couple of petitions that are not on the agenda for today's meeting. And those are -- there are two petitions for -- concerning lecithin.

We, everyone in this room, we have about almost 20 years of experience in looking at and thinking about and figuring out what should be required for a material to be
listed, to be added to the national list.

Throughout that time period, organic stakeholders have remained to this day, as of yesterday and including this afternoon, I'm sure, in continuing to inform the NOSB and the program on what the requirements should be and what that process should be.

In recent years, in the past couple of years since I've been on the board, we've been covering some new ground. The redefined requirement to list agricultural products on 606 has caused us to review those requirements anew and to look at things like commercial availability.

This summer the Handling Committee received their first petitions for the removal of a listed item. Now it's not the first time that the board has looked at petitions to remove, but in the past those have always been based on new information coming to light that had to do with the safety of the material or...
new information about toxicity, either to
to people or the environment. This is the first
time that we have looked at petitions to
remove on the basis of the commercial
availability of the organic version of a
listed item.

So we should be kind of used to
this by now. We are once again in virgin
territory.

Now it could be that I'm a little
short on history. That's possible, and if
that's the cause, I'm sure someone is going to
step forward and help me out. But there's
been alarmingly little, if any, precedent on
which the board right now can base this kind
of a decision. But we figured it out before
and I'm sure we'll figure it out now.

The issue is very intimately
related to the issue of items being listed on
606, and I will go on record as saying that
personally I did push for encouragement, I did
encourage people to have a positive attitude
towards listing items on 606, and because I personally believe that that spurs the development of organic ingredients.

That is with the ultimate goal being the delisting of nonorganic ingredients.

The other piece I'd like people to keep in mind is the current state of the national list, where there is no organic preference, and commercial availability does not apply to items on 605, and at times I have been concerned that some of my fellow non-handling board members don't realize that there's no incentive for manufacturers to put time and energy into developing organic ingredients if there is no incentive such as commercial availability or organic preference.

So developing potential, developers and manufacturers of organic ingredients won't remain engaged in that process very long if we don't figure out a way to -- if we don't figure out the ways to bring those things off the list when those materials
do get developed.

And if that happens, then everyone's fears become realized, that the listing of 606 ingredients does then become hollow and static and possibly detrimental to the organic industry.

But we're not there yet, and I don't think that's where we're going to go. The Handling Committee, in looking at this new territory, has a lot of questions that have come up. We have been already discussing this on committee calls since the summer, and I would like to share some of those questions because I would like to refine further the kind of public comment that we're getting about this.

One question is are TAPs as essential, are technical reviews as essential to the removal of an ingredient as they are to the listing. And if there is a difference, how are they different. If there's a difference in what should be in those
technical reviews, we would like to know what those differences -- what people think those differences should be.

Should commercial availability -- this is another question -- should commercial availability be considered in a different light for removal than it is currently for listing.

And then there are some factors probably that don't change with whether it's a petition for removal or a petition for addition.

An example of that would be how we weigh the competing views of different stakeholders, that that's probably going to remain the same.

But it's because of these kind of questions that the Handling Committee made -- took the unprecedented step of asking for public comment on an item which is not even on the agenda for this meeting. Because we are wanting to address this in a very timely
fashion.

The need to act expediently but methodically on this issue is great, and we felt compelled to begin the process of eliciting public comment way ahead of the spring meeting, which is where I am hoping we will be maybe taking action on these, but then we'll see how it goes.

And I will say that we did get a lot of comments, which I was heartened by. So, anyway, a lot has been said so far in the meeting about what I think of as a dialectical relationship between the board and the stakeholder community that takes place through the public comment process, and so I am asking all of you out there to remain as actively engaged as you have always been and consider the questions that we are posing to you, so that we can be that much farther along in our thinking, and our fleshing out of this issue by the spring meeting, that we will be able to make a well-considered recommendation based on
well-articulated criteria.

And with that, I will now -- we will plunge into the actual materials that are on the agenda for this meeting.

I'm going to start with the 605 materials. There are four of them on the agenda. Two of them are being deferred because the TAPS -- we were waiting for technical reviews, and they couldn't be completed in time.

Now, with that, I will say that in the old days, because I'm looking at my -- one of them -- the two materials in question, I'll specify them now, we had sodium chloride acidified that was being petitioned to 605(b) in the category of chlorine materials. And then we also have proprionic acid, also being petitioned to 605(b).

The agenda for this meeting was voted on at the executive committee call on August 8th. That is the date that the Handling Committee received the technical
review for sodium chloride acidified.

In the old days, probably we could have cranked that sucker out on the 30th day before the meeting date, with just like seconds to make the requirement for public comment.

But we've gotten more professional since then, and we don't fly on that tight a timeline. I apologize that I think the organic community and petitioners may not -- have no way of knowing that we're improving our processes.

So the way things are working now in late 2008, that's not enough time for us to turn around a recommendation. And with the propionic acid, actually, that technical review was received by the Handling Committee on October 9th, and I think that our publication deadline for recommendations had already passed by then, so that wasn't even a possibility. So I am sorry for anyone out there who was disappointed and was expecting
to hear recommendations on these today. And I am sure that we are -- well, around here I've learned not to ever say I'm totally sure, but I'm pretty sure we're going to have those delivered at the spring meeting.

That being said, I would like to move on now to recommendations that we do have. The first one is going to be calcium from seaweed, and actually Katrina Heinze was originally supposed to present this, so I'm kind of doing it on the fly here a little bit, but I think we'll be okay. I do miss Katrina right now, though.

Calcium derived from seaweed is produced from basically the skeleton of seaweed on the ocean floor that's mineralized. In this particular case it is harvested, if I can use that word, off the Irish coast.

This mineralized seaweed gets washed and it's hard, it gets milled into a powder, and the result is a substance that's intended to be used as an ingredient for
nutritional -- for added nutritional value, for its health benefit.

The chemical composition of this is over 95 percent the calcium and then the other 5 percent are kind of calcium-related compounds, calcium carbonate and magnesium carbonate.

We had a lot of discussion earlier today about minerals that potentially were agricultural products. There's a lot of issues based potentially, but the Handling Committee has managed to avoid them this time around because we believe that calcium for this use is included in the listing of nutrients, vitamins, and minerals already on 605(b).

So we did not feel that it was appropriate for this material to be added separately to the national list to 605(a) since the use of the material is currently allowed through that existing listing for nutrient minerals.
And this -- so that actually, that is our recommendation. Calcium seaweed derived as petitioned does not need to be considered for addition to the national list since the use of this material is currently allowed through the existing listing of nutrient minerals on the national list, section 205.605(b). That was passed by committee vote five yes, no dissenting, there was one absent that day.

MR. DELGADO: Questions, Dan?

MR. GIACOMINI: We've been discussing this quite a bit, and I just feel it's important and vital to the industry to understand this, what we're doing here.

The committee is determining that this is a nonsynthetic product. That's 605(a). They are saying that it is already allowed because of a listing on 605(b) for synthetics.

We have requested the program to address the issue of whether this is a blanket
crossover between 605(a) and (b) or a specific implementation because of the specific annotation for the minerals listed in 605(b).

Barbara, can you address that?

DR. ROBINSON: I did answer it before.

MR. GIACOMINI: Yes.

DR. ROBINSON: The FDA's regulations -- in fact, I think I sent you the citation there. It is in fact -- I can't remember the exact wording, but it is -- I think when I sent you back the citation from FDA's regulations, I don't remember the exact wording, but in the FDA regulations it's illegal to -- in fact, or of a fashion to discriminate or promote one nutrient over another because one is natural or one is nonsynthetic and one is synthetic.

So that nutrient, vitamins, and minerals, even though it shows up on our list under the synthetics, under FDA's regulations, those include both nonsynthetics and
synthetics.

So the fact that you determine it to be a nonsynthetic is of really -- doesn't matter.

MR. GIACOMINI: Right.

DR. ROBINSON: Okay.

MR. GIACOMINI: It's specific -- so that everyone here and it is in the record, it's specific to the annotation and not a blanket crossover, if it's listed on the one and it comes from the other, we can go use that over there.

DR. ROBINSON: Yes.

MR. GIACOMINI: Okay.

MR. DELGADO: Any other questions?

Thank you. Julie.

MS. WEISMAN: We have one other 605 material that's being petitioned for addition to the 605(b) synthetic, and that is ethylene for pears, and Steve DeMuri is going to present that.

MR. DeMURI: Thank you, Julie.
As Julie mentioned, we did have a petition for ethylene specifically for ripening of pears on the national list 205.605(b).

As you heard in public comment yesterday and in written comment, we want to note that it's been approved by previous boards for use in tropical fruits and for the degreening of citrus.

It is produced by pyrolysis of hydrocarbon feedstocks, such as natural gases. It includes crude oil. Or from ethanol. So it definitely is a synthetic material.

It is produced naturally by ripening fruits. However, this petition is specifically for synthetic ethylene, and the naturally occurring ethylene is not commercialized as a process, so making ethylene for use in post-harvest handling at this point.

We did receive a good amount of written and public comment, both during the
comment period and again yesterday. Thank you very much for that. Including a couple of folks who were able to provide some TAP information that was not available to us on the Web site previously. That was very helpful, and we appreciate those comments.

Many of the commenters believed that the approval of the use of ethylene for organic pears would increase that market. A lot more pears appear to be available as organic and also possibly increase the length of the season for the availability of organic pears. That was derived from several of the comments.

What the Handling Committee does is vote on the addition of this synthetic to the list, four yes, zero no, and two absent. Any questions?

MR. DELGADO: Questions? None.

Okay. Can you repeat the vote, please?

MR. DeMURI: The vote was four yes and zero no, two absent.
MR. DELGADO: Thank you. Any other questions? Julie.

MS. WEISMAN: Next I have two petitions which were petitions that were made with yet to be determined whether they were going to be appropriate more for 605(a) or for 606, and these are two algae. One is chlorella, and the second dumontiaceae.

I will make a general comment about this. Both of these petitions failed, I think unanimously. Both were -- and this is where, you know, petitioning onto 606 is still a new process and there is an exchange that is continuing and a feedback loop that is going on where it's actually through the petition process that we are getting a better handle on what these -- what 606 petitions need to contain in order to be viable petitions.

So this, like a number of petitions -- many petitions that were heard at the two previous meetings, there was a kind of a blanket statement made about searching
databases and not finding any mention of any of these being available organically. And we want more specific information than that.

So I'll start with the chlorella petition. Is that chlorella up there? Okay.

This is an algae. I think there have been times when it's been questioned as to whether that would be considered a potentially agricultural or a nonagricultural product, but the line up until now at least at the state that we're now is that anything that's photosynthesizing will be considered potentially agricultural and therefore eligible for 606.

So this is a red algae, a red-brown algae, which photosynthesizes. It is produced in tanks, and it is then -- in what is described in the petition as a hermetically sealed unit, and it's collected, extracted, and spray-dried onto astragalus root, and then ground. And it is a powder that is used for health benefits.
Our biggest problem with this petition and where it did not -- it actually -- we felt that it met criteria as being agricultural, and the problem is that there is certified organic chlorella out there. Now it may not be in the form that this petitioner wants it, but the petition didn't make any mention of the existence of this organic material, and so -- and therefore did not even address why the organic material wasn't adequate for their use and what might be the obstacles towards making a form that was available for their use.

So this voted -- this was a -- this failed to pass a recommendation at the committee level. The vote was zero yes, four no, and two people were absent that day.

I do want to say, though, that in light of the -- this also raises some issues that came up this morning in the material working group presentation which is the question of an agricultural product, and does
it have to be land based, or is it a system
that's managed, and the question of whether we
have standards for that management. And these
are all issues that are swirling around these
two. Even though they're not passing this
time, I think that the issues that they raised
are important to point out.

So before I -- should I just move
into the next algae? Okay. We're going to
move on to the dumontiacae. I think I've been
pronouncing that right.

MR. DAVIS: It would probably be
"dumontiacae" (pronouncing).

(Laughter.)

MS. WEISMAN: Okay, I'm going to
try this again. Dumontiacae is also a red --
a photosynthesizing red algae which is
indigenous to Pacific coastal areas of North
America from Alaska down to southern
California. Unlike the previous algae we
discussed, this is -- and I'm quoting the
petitioner here -- ethically wild harvested
from the ocean floor in the Pacific, and it is then air dried and packaged. I don't think the process gets too much more simple.

But we did have questions about what was meant by ethically wild harvested. It is also a material that would be added for nutritional and health benefit added ingredient.

Once again, we did not -- as with the other petition, we did not feel that the petitioner's broad statement that they had, you know, checked a couple of well-known places that -- I think I'm not allowed to say specifically because then -- anyway. It didn't state the usual places that we all look, and didn't find anything, and didn't look any further or make any other comment about why the wild harvested could not -- you know, what the obstacles might be of that being certified organic.

And so we did not feel that there was -- that the evidence -- that they really
had done their homework, and so this petition also failed for the same reasons as the other. I believe by the same vote. It was zero yes, four nos, and two were absent that day.

MR. DELGADO: Any questions?

Hugh.

MR. KARREMAN: This is something I brought up a few meetings ago when you spoke the Latin names, Rigo, of the petitions at that time, but I really would like to see on petitions with plants the Latin binomial name. We had this discussion before, and Richard agreed, or the program agreed, I should say, sorry, that the Latin binomial name is the preferred thing. Because this is a very -- I don't know what level, you know, terminology that is, but that's a much more big-umbrella term than the Latin binomial. So, please -- maybe that should be in the policy and procedure manual or something, I don't know.

MR. FLAMM: That's a family name.

MR. KARREMAN: Well, I would
recommend --

MR. FLAMM: The ending always the family. So it's the same for every plant family.

MR. KARREMAN: Extremely. And so it should be the genus and species, and however many of them they want, just not the family name, or higher. I mean it's just kind of vague, that's all.

MR. DELGADO: Any other questions?

MR. KARREMAN: One other thing that Kevin just mentioned also, if that is what they petition for, for that family name, then they're even on a weaker kind of basis because, you know -- I mean there's that much more they could be looking for in the organic availability.

MR. DELGADO: Any other comments, questions? Very well. You can go to the next.

MS. WEISMAN: Okay. We also had three materials that we looked at this time
around that were being petitioned for 606.
And they are buck hull powder, black pepper extract, and dried orange pulp.

Gerry, I just had a moment of panic as to whether -- are you prepared to present the buck hull powder?

MR. DAVIS: Sure.

MS. WEISMAN: Okay. Okay. I couldn't remember if I asked you or not. I would like to ask my colleague Gerry to present the recommendation for buck hull powder.

MR. DAVIS: The buck hull powder refers to the hulls of buckwheat. When the grain is milled, they typically pull the outer black hull off of it, and this particular petitioner was petitioning -- the use was it's a colorant for soba noodles, buckwheat noodles, and we checked into claims of commercial unavailability and felt that the petitioner did not provide sufficient information on their investigation of global
supplies from other buckwheat production areas.

They mentioned at the bottom of page 1, we kind of put it in a nutshell or a buckwheat shell, the petition provided information on the obstacles for growing and importing organic buckwheat to Australia where the petitioner, being a manufacturer of soba noodles, is located.

However, the petition does not address the fact that the organic soba noodles are currently made and sold in the U.S. from certified organic buckwheat. They refer to Chinese supplies of buckwheat and Japanese millers and they kind of focused on that sector, and did not consider the global supply, or they considered it and they did not put it in their petition that they considered it, and explained anything about it.

So we felt they did not do the job, and going to page -- the last page, category four, some pertinent -- the grain is
produced all over the place, and they just did 
not investigate why other areas of the globe 
could not be a potential supply.

There may be reasons, but they 
didn't spell it out. And the fact that we 
were able to find soba noodles produced in the 
U.S. from Canadian grain sources that were 
certified organic, those two things 
especially caused the committee to vote to 
deny the petition and not include it on 606.

MR. DELGADO: Any questions on 
that? Okay. Julie.

MS. WEISMAN: Okay, I'd like to 
now look at the black pepper extract powder, 
and Joe Smillie is going to talk about that 
recommendation.

MR. SMILLIE: Right. This 
petition basically is -- was denied. The 
petition does not provide sufficient 
information to demonstrate the material cannot 
be obtained organically in the appropriate 
form, quality, or quantity.
So it meets the first three criteria, no problem, but criteria No. 4, we had issues with, in a similar sense of a lot of the things we have discussed.

Basically, we felt that the search by this petitioner was not exhaustive in the least, and that we felt that it would be -- that they did not present us a convincing argument that they could not use currently available organic black pepper, both fruit and oil extract, for further processing.

The petition was very complete. I mean the technical information was good. They went into great detail about this product, which is used as a -- in the sense of a black pepper as a flavor or a condiment. It's used to increase bioavailability of other nutrients, and hence it's processed in three or four steps, and they said that the final step product wasn't available, but going back two steps, there is black pepper available and there is black pepper oil available, and why
this couldn't be contracted for further processing -- I mean it's possible that it can't. But they did not present that argument, and we can't fill in blanks. We have to see that as a major part.

All the rest of the petition was accurate and thorough, but again the exhaustive search.

So moving to the last page once again, good old category four, which seems to be -- I mean we need to put out -- we need to get the information out to petitioners to point out that they are continually failing on the same issue.

In other words, show us that you can't get organic. You know, the information is always good on, you know, the process and grass and all the other things, but it always fails when it comes down to why couldn't you get it orgg. And we, you know, off in this magical world of ours of, you know, Google and all these other search engines, we go out
there and we see it there, you know. So we
know it's there. Maybe it's not there in
sufficient quantities, and we have gone this
argument with other materials, but again, the
petitioner didn't present any kind of detailed
information on why the current organic black
pepper supplies and black pepper oil supplies
couldn't fill this need.

I can't find the voting on my
document. Valerie, can you -- So it was
petitioned to be added, and it was zero yes,
six no, no absent, and no abstained and no
recused.

MR. DELGADO: Any questions?

Okay. Yes?

MS. FRANCES: I just wanted for
the record to state to put these
recommendations out there, and petitioners
have the opportunity to provide you with that
additional information during the public
comment process, either through
writtencommentsandregulations.gov, or here, or
come to the meeting and tell us more. So I
just wanted to say that. So it's not a done
deal once the committee makes its
recommendations.

MR. DELGADO: Good comment. Yes.

Julie, do you want to add

something else to that?

MS. WEISMAN: You know, what I can
-- I'll -- we have one more material, and
Steve is going to present that, and you know,
and actually I think at that time I'll say
something more general about the 606
petitions.

MR. DeMURI: Okay. The last one
for the Handling Committee today is dried
orange pulp, and we had a petition for
205.606. It is used as a moisture retention
agent and that substitute in baked goods,
pastas, salad dressings, confectionery,
processed cheese spreads, and frozen food
entrees.

As you heard yesterday, it's a
fairly benign process to make this stuff. It's -- the material is a byproduct of orange juice processing. It's kind of what's left over from the physical extraction process to make orange juice, and basically what the producer does is heat treat it to stabilize it. They mix it, dry it, and mill it, physically mill it. So it's a pretty simple process.

It did pass fine categories one through three, impact on humans, environment, essential and available, and compatibility and consistency, but again like the previous material, it failed category four in our minds because the petitioner did not provide sufficient information to demonstrate that material could not be obtained organically in an appropriate form, quantity, or quality.

Now there were two things with this petition. First of all, we weren't convinced that there weren't enough organic oranges out there to produce the dried orange
pulp in an organic form. And also there was
an equipment issue. That came up a couple
times yesterday during the public comment
period, that this particular producer has very
large equipment, which is understood, but
never really was answered on the question why
couldn't you build something on a little bit
smaller scale to produce the organic version
of this dried orange pulp.

So it did fail based on that
criteria No. 4.

There was a little bit of public
comment on that. We thank you for that. Mr.
Lundberg did a good job yesterday of giving us
background on the material. Thank you. That
was very good.

The committee vote was zero yes,
five no, and one absent.

MR. DELGADO: Okay, any questions
on that material? Gerry.

MR. DAVIS: The one question left
in my mind from the public comment yesterday
was we discussed the fact that the data
presented on the amount of organic orange
juice being produced in Florida was fairly old
data. I'm not sure how much more is there now
that the organic marketplace has grown.

But also I never really got an
impression of if smaller equipment was built
and installed next to an organic source, that
would fulfill their requirements on quick
handling and so forth.

With newer data of what's
available for orange pulp from organic orange
juice, how much of a percentage of their -- of
the marketplace for orange juice in organic
products would that represent? I'm not sure
that was made clear. I don't know if anyone
else on the board heard something that I
missed.

MR. DeMURI: I did not have an
answer to that myself. Is the petitioner in
the audience today? Can you let him answer
that?
MR. DELGADO: Yes. Please come up to the microphone.

MR. DAVIS: And I guess the question would be, to try to boil it down, if you first exhausted the supply of orange pulp from organic orange juice with one installation of the equipment, then how much additional would have to come from conventional?

MR. LUNDBERG: Well, first, the --

MR. DELGADO: State your name, please.

MR. LUNDBERG: Brock Lundberg with Fiberstar, petitioner for the dried orange pulp.

First regarding the data, the amount of available orange pulp, it is a half a truckload is the current number, 20,000 pounds on a dry basis, and I'm not sure how it got misunderstood that that was old data. I apologize for that. But it actually is current data. We did talk to the largest
orange juice processors in Florida about this information, and that's where the source came. That's less than a month old, that information.

I did talk to Marty Mesh about that, too, to confirm, and he didn't disagree that that is reliable numbers. He's with the Florida Organic Association.

And regarding that 20,000 pounds, that would represent roughly 1 percent of our total market, and that's now -- that's only after three years of manufacturing. Our business is growing and the organic is going to be a large part of the business. That's approximately at least 10 percent of our business opportunity is in the organic area.

We have many large manufacturers that have been asking for us to be on the list, and large and small, I should say, and but the reasons for the availability -- I mean there's two different reasons. We get -- when there's orange pulp, we get 20 times less. We
have a 100 pounds of raw pulp, we get five pounds of finished product. That's the first thing.

Secondly is all of the pulp has much higher value when it's used in juice, and most of the pulp does go back into making juice, organic juice is a growing industry. But a lot of the pulp that's used goes back in the juice.

We use the byproduct that's left over and made into otherwise cattle feed, so we are -- essentially when the organic industry -- we'll benefit the organic juice manufacturers, when there is growth, by providing them with added value for their product stream.

But -- go ahead.

MR. DAVIS: So while that might help us to understand the small amount of supply then that you just highlighted was the organically grown and produced orange juice typically retains most of the pulp and is not
as much being pulled out.

MR. LUNDBERG: Exactly. The majority of the pulp goes into orange juice. Exactly.

Thank you.

MR. DELGADO: There were a few comments. Hugh.

MR. KARREMAN: I apologize. How many orange growers are there in Florida, and what percent are organic, certified organic, and is there a major difference in size of the groves between certified organic and conventional?

MR. LUNDBERG: Sure. Yes, there is a difference in supply. There's two different issues regarding supply.

First there's -- on a -- I don't know that I know the acres off the top of my head, but I know in terms of total oranges produced. There's approximately 2.7 million boxes of fruit produced in the United States, and most of that is in Florida, and the pulp
is -- the pulp goes into juice, but regarding what that represents compared to the total, the total is in the range of approximately 20 million boxes is produced in -- I'm sorry, not 20, 20 is at Southern Gardens Citrus. Two hundred million -- Southern Gardens Citrus, which is where our processing operation is at, includes that 200 million boxes is the total amount produced of the standard nonorganic variety of oranges that goes into juice.

That's about -- yes. Yes, that
2.69 is there on that slide.

MR. DELGADO: Jennifer.

MS. HALL: Yes, thank you.

Do I remember correctly that yesterday you said that the function of this organic pulp is as a thickener, and that it can potentially replace chemically derived options that are currently used?

MR. LUNDBERG: Exactly. And that's what -- that's why so many organic producers or food ingredient manufacturers
like the product, is just because of the functionality it delivers of normal -- of a lot of chemically derived preservatives, stabilizers, emulsifiers. It's got a very creamy mouth feel, and it's unique compared to a lot of gums because of the cleanness of both the label, as well as the mouth feel of the product.

MS. HALL: Thanks.

MR. DELGADO: Barbara.

DR. ROBINSON: I just -- did I hear the committee say that you thought was an alternative was having the company make smaller equipment?

MS. WEISMAN: That was just me yesterday. You can't pin that on the committee. That was just my personal question.

DR. ROBINSON: Okay. All right.

MR. DELGADO: So the answer to your question is yes, we were looking at an alternative.
MS. WEISMAN: That was my question why can't it be done on a smaller scale. I'd like to elaborate, okay, because I think that sometimes we get petitions from the end user who has no control over how this is going to be manufactured, and I looked at that differently than when the petition comes from a manufacturer.

I'm a manufacturer, and the scale on which I do organic production, I do much smaller than what I did conventional production. And so I'm trying to understand why that can't happen in this instance.

DR. ROBINSON: Okay. I was just hoping we weren't making -- we weren't voting against something because of the scale. We could ask them to make smaller equipment, and then we'd reconsider this.

MR. DAVIS: That was why I asked the question, Barbara, of what percentage of your marketplace, if you were to build equipment to exhaust all that organic orange
pulp that there is, if you did that first and then moved on to conventional for the additional, I wanted to see what is that marketplace. And he said only about 1 percent of what we need for our organic -- for your organic customers or all customers?

DR. ROBINSON: Right, but you also want to consider the potential market, too.

MR. DAVIS: Right. True. True.

MS. WEISMAN: And that's very important because there is this dynamic relationship between the demand and then supplying. When the supply starts to come, then the demand follows.

DR. ROBINSON: Correct.

MR. DELGADO: Okay. Let's go back to Dan.

MR. GIACOMINI: I think what Julie was saying is important here. I think another factor that's important is that this is a proprietary process, and by putting it on the list, we are allowing them to say we'll never
have to.

DR. ROBINSON: Never have to what?

MR. GIACOMINI: Never have to have
an organic source because no one can ever push
us into having one. There will never be a
commercial availability -- there's a
possibility of never having a commercial
availability of an organic source when they
own the process of making this product.

MR. DELGADO: Tracy.

MS. MIEDEMA: I sense that we are
so engaged in this topic, like we were with
okra, because something intuitive feels like,
hey, there's an organic version of that
commodity. Come on. And we're really not
looking at the processing side.

And as someone who works for a
large organic processor who processes millions
and millions of pounds, I understand that. We
don't flip on our "on" switch for anything
under 20,000 pounds, and we can't. It's just
not feasible.
You know, what we're really getting to here -- and this is to your comment, Dan -- is this philosophy behind statistics, whether it spurs or spurns demand -- or sorry, supply of organic products out there in the marketplace.

If you use 606 as an opportunity list, then we think it spurs the supply of new organic product.

So, you know, in the case of okra, Marty came up here and made this very compelling argument that, hey, nobody has come to me and asked for organic okra. Well, what if organic IQF -- I'm sorry, what if IQF okra had been put on 606? Some products that developed? Guess what. Now there's this opportunity list of organic growers who'd say I get to go to the front of the line, and that manufacturer has to buy my organic okra.

Somebody can look at dried orange pulp, for instance, on 606 and say, hey, I want to make that, and I'll beat Fiberstar
because those manufacturers have to come to me
for the organic version.

So, you know, we don't have enough
evidence yet to know how often it spurs and
how often it spurns the supply, but we're
going to start accumulating that evidence, and
it's reasonable to think that in many
instances we will have more organic products
because of its presence on 606.

MR. DELGADO: Dan.

MR. GIACOMINI: I completely agree
with what you're saying, but anybody can grow
okra, relatively. But in the case where you
own the proprietary rights to process, that
makes it a little bit different.

MS. MIEDEMA: A point of order.
And I -- it was not okra, and it's not organic
oranges, it's not oranges we're talking about.
It was IQF okra, and this says dried orange
pulp. And there are some very specific things
that happen in processing about heat and
transportation, and you don't get to just sort
of accumulate a bunch of this stuff and set it aside over a year's time and wait to turn your processing machine on.

What Brock was explaining to us is if little dribs and drabs of organic oranges showed up, they can't kind of turn on their machines for those 100 pounds each day as it shows up.

So we have to keep in mind the specific item that's being petitioned.

MR. LUNDBERG: Just one follow-up comment. I do know other processors coming out with dried orange pulp, and it's -- and I don't know whether or not that would infringe patents. I can't comment on that, but certainly it has been made before. It's been made before us, and just that alone would mean that there's ways that other people can produce it.

MR. DELGADO: Steve, followed by Bea.

MR. DeMURI: In my mind, the
process worked here because when we first --
when we visited about a few months ago we
didn't have all the information we needed.
You saw that, came and gave us more
information, and backed it up, and now we can
make a more informed decision.

So I commend you for that. For
future reference, I think for anybody here
that wants to petition us, it also helps to
get back-up from the people you're selling to.
If they come to us and say we need this, then
we know that it's necessary for the industry.

MR. DELGADO: Am I to understand
that the committee will be changing their
position on this?

MR. DeMURI: We'll talk about it.

MR. DELGADO: Very good. We have
Bea, followed by Jennifer.

MS. JAMES: Under the evaluation
criteria, it says here that it is produced by
taking the pulp and washing it with water,
stabilizing with heat and water, mixing,
drying, grinding. I'm just curious as a stabilizer and an emulsifier, is the flavor in there, so everything you use it for would have an orange --

MR. LUNDBERG: No, it's very bland. We remove the flavors in the washing, so that allows us more market and that it can be used in more products, because of the bland flavor and neutral odor.

MS. JAMES: So there's no chemicals used when you take the flavor out?

MR. LUNDBERG: It's just water.

MR. DELGADO: Any other questions?

Jennifer.

MS. HALL: In addition, I think it's helpful to, if there are specific items that might be able to be removed from the list as the result of the addition that are more harmful, it's helpful to know that.

MR. LUNDBERG: Okay.

MR. DELGADO: Any other comments, questions?
MS. JAMES: Well, you know, to just kind of -- off of what Jennifer just said, do you know offhand what other items on the list could potentially be affected by this being added?

MR. LUNDBERG: I'm sorry, I don't know offhand. I could come back up and probably in an hour's time and tell you that.

MS. JAMES: Will you be here tomorrow?

MR. LUNDBERG: Yes.

MR. DELGADO: Any other questions, comments? Okay, Julie, back to you.

MS. WEISMAN: We're done with materials, but we have -- oh, I'm sorry. Yes, we're done. Thank you very much for being here.

MR. DELGADO: Right. So we can move on to the next item, which is --

MS. WEISMAN: Right. The next item is the pet food recommendation. And for that presentation, I'm going to turn it over
to Tracy Miedema.

MR. DELGADO: Tracy.

MS. MIEDEMA: I'm so glad we have something warm and fuzzy to talk about.

(Laughter.)

I hope.

Okay, the National Organic Program came to us four years ago and asked for the recommendations that we are presenting today - - Barbara's over there telling me, and we thought they were slow.

(Laughter.)

Six months later, a task force had been formed, and this group was comprised of experts from industry and certification, and some other groups, 12 people. They spent about a year coming up with a task force recommendation and brought it to the board, and to this board in April 2006.

Just a little bit of background ground. Pet food regulations are quite baffling, actually. All 50 states have their
own rubric certification, and you really need
a professional consultant every time you build
a pet food package because you have to build
a label that cuts across all 50 states.

Then, you know, what we were doing
is layering on top of that our regulations.
So it was very complex, and this group did a
fantastic job of threading the needle.

But something happened after April
2006 which was the Harvey case, and we had to
reevaluate the way this recommendation by the
task force was written.

Frankly, it languished. This
recommendation languished in a back room for
about a year, and tremendous demand for this
information has been coming from the industry,
but just an anecdote here. A few days at one
of the country's biggest pet food product
shows in Las Vegas, called Superzoo, a couple
of months ago, and I talked with a lot of
people about organic pet food, and just kind
of beating the bushes and finding out how
people were feeling about what was happening there, and a tremendous amount of confusion, anxiety. They feel like they were in neutral. They had invested money in developing organic pet food, and so what we have is a little subindustry here that wants to grow and wants to fulfill its destiny, and it's time we really give them what they need.

So what our committee did in conjunction -- we've still been working with the task force -- is revise the organic pet food task force recommendation to reflect changes based on Harvey. Based on some excellent comment that has come in in the last few weeks, we even made a few more tweaks which, Valerie, when she pulls our recommendation, I'm going to show those additional highlights, because we really wanted to get this right.

It's a very technical recommendation. One thing that I would say to the organic pet food people out there is that
just like an organic shortbread cookie might not be more nutritious than a regular old conventional shortbread cookie, the organic pet food does not present itself as somehow having a nutritionally superior line of pet food, and that was one of the main points of confusion I found at that pet food show.

So, you know, this is talking about the practices and everything that's been tried in OFPA and not reinventing pet food, per se. However, we do comply with everything in AAFCO in this recommendation. That takes primacy to what we did here.

In terms of the -- you know, some of the highlights of the proposed rule change, we're talking about putting this regulation in the pet food -- or, sorry, in the Livestock section, because we're feeding animals, but the label claims labeled the same way human food does, because it's humans that are buying it. So that's why that split has occurred.

And at this point I would like to
invite Emily Brown Rosen up to the podium because no doubt there could or will be questions that Emily can do much a better job answering than I can.

MR. DELGADO: Emily, can you approach, please.

MS. MIEDEMA: One other highlight I guess I wanted to make based on some comment that came in yesterday is how 606 items would appear, and we proposed parsing 606 into A and B, and we got help from the program on how this should be parsed, so that a bunch of pet food-sounding ingredients didn't kind of get commingled with the other 606 items. It's just an appearances thing.

And with that, I would turn it over to the board.

MR. DELGADO: Questions? Questions from the board? Jeff?

MR. MOYER: Yes, I was just going to say sitting in on the few calls that I did sit in on, I was completely amazed at how
complex the basic pet food industry is in terms of labeling and the way they work, and for us to have dovetailed into there like we did I think was just a real credit to those people that did much more work than I did. So it's a very well thought-out document.

MS. ROSEN: I think it was a challenge, because I've -- I mean I've already given presentations to AAFCO on what organic means, but we're going to need more presentations to organic to what AAFCO means, because there's two sets of regulations that they have to comply with, and it's a little bit of a puzzle.

MR. MOYER: I think after reading this, my dog should apply for another home because my dog gets what he gets and this is --

(Laughter.)

MR. MOYER: -- much more complex.

MS. ROSEN: These are just little minor changes that we picked out where we
missed a few spots on the 606 changes. So it's basically what you saw earlier.

MR. DELGADO: Are you going to review those changes?

MS. MIEDEMA: Sure. Let's just go through those very quickly. There's three items, and comments came up from our eagle eye, Gwendolyn Wyard, and were seconded by Emily, who was vice chair of the organic pet food task force. So I went ahead and layered those in.

One of the additional comments was to propose an entirely different section of the regulation devoted to organic pet food, and we are not recommending that because I feel that that's a programmatic decision that the program can opt to do or not do later on.

So if you look at -- what page are we on there, Valerie?

MR. MOYER: Seven.

MS. MIEDEMA: Okay.

MS. ROSEN: This is 237(c), and
this fits in with the livestock section which we are now calling livestock feed and pet food, so we've added this new step (c) which was in addition to the -- I should back up a little bit.

The 237(b) are things that are not prohibited for organic livestock operations, but not prohibited for pet food formulations. So this is a separate addition.

Pet food must be composed of agricultural products that are organically produced and, if applicable, organically handled, except that nonagricultural nonsynthetic substances and synthetic substances are allowed under 603 and 605 may be used as food supplements.

And so this goes along with the proposed change in the livestock feed pasture rules, actually, so that we are just identifying that items on 603 or 605 that are natural, nonsynthetic, but they're not agricultural, they'll be allowed for use. If
they're agricultural, they still have to go through the 606 process. So this was put in more to clear that up, which has been a little bit of a -- livestock feed and also now it's trying to be all the same with the Harvey thing.

And then it goes on to add that nonorganic agricultural ingredients allowed under 606 may be used in products labeled organic provided they are commercially unavailable in organic form and allowed by FDA for animal feed.

So it just covers all bases. It's not -- it was our intent to do this, but we had missed it before.

MS. FRANCES: The addition for the livestock community's benefit was (b)(7), the feed, it cannot feed organic pet food to livestock was requested.

MS. ROSEN: That happened over the summer. That was earlier.

MS. FRANCES: Yes. Just to make
sure people didn't see that.

MS. ROSEN: That should be underlined also, actually, yes. Because that's not in the -- that was a concern to the committee that somehow, you know, this loophole for like maybe they're getting pet food or it will end up in the livestock feedstream, which does happen. In the real world there is what they call salvage or distressed pet food that ends up as livestock feed. So that's a prohibition here.

MR. DELGADO: Any questions?

Jeff.

MR. MOYER: I just have one question, Tracy. I'm going well outside my realm of expertise, but in terms of definition that you have on page 2, at the very end of that we say that this does not apply to the zoo animals, and I understand that, but as I think about the near term and what's happen with the -- sort of the greening of all industries and the whole claims of
sustainability, I can see where in the near
future zoos would be very interested in
feeding organic diets to their animals. Is
this the groundwork for that, or is that way
outside --

MS. MIEDEMA: That came from the
pet food industry. They didn't -- I guess
they're feeling there's a whole different
nutrient recommendations for zoo animals, and
they just felt like this is the bread-and-
butter, this is cats and dogs, and you know,
minor other species, and we just -- they had
their reasons they didn't want to throw that
in here because I think it's still undeveloped
in the natural world, too, and the committee
really talked about it, didn't want to add
that to the mix right now.

You know, it's not really pressing
at this moment, and we need to get this thing
done first. So I mean we could take it up
later if there became a pressing need for it.

MR. DELGADO: Any other comments,
questions? Tracy, anything else?

    MS. ROSEN: Oh, well, there was a few other changes we didn't finish.

    MS. FRANCES: One thing I just did, the language that was recommended for another program for 605 and 606 to be offered, because that wasn't really -- it was incorporated as a concept in the Handling Committee's recommendation, but not the actual wording for 605 and 606. Do I just drop that into this document?

    MS. ROSEN: Oh, you mean this change that actually happened?

    MS. FRANCES: How it will actually impact the rules. I just wanted to -- just so people understand the language. Okay.

    MS. ROSEN: Where are you putting that? In the regulatory part in the beginning, or are you just --

    MS. FRANCES: Yes, the 605 includes pet food.

    MS. MIEDEMA: Valerie, I would
rather you didn't do that. We did discuss this very point in committee, and we preferred to keep it as a note that the Handling Committee recommends, and since we discussed it already, I just prefer we keep it out of there.

MS. FRANCES: But just for people to see how it would look. You can take it out if you want, out of your recommendation, but this was what was discussed as to how it would ultimately appear.

MS. MIEDEMA: I think we're going to get --

MR. DELGADO: When you come to a decision, it's up to the committee to decide what is it that they want to vote on.

Any other questions on the part of the board? And we thank you very much for all your help. We appreciate it.

Back to you, Julie. Does that conclude this segment?

MS. WEISMAN: That's all, folks.
MR. DELGADO: Fantastic. Thank you very much. We are only a couple of minutes off schedule, and we are due for a nice break.

(Recess.)

MR. DELGADO: We're ready for the board members to come and take your places so we can start the public comment.

(Pause.)

Okay, we're ready to start with our public comment section, day two, of our meeting, and the first person up to provide comment is Carrie Brownstein. If you could please approach the podium, and followed by Urvashi Rangan.

Carrie Brownstein, please approach the podium. Carrie will be followed by Urvashi Rangan and Brian Connolly.

While our presenter makes her way up to the podium, I would like to remind the board members that we have an hour and 45 minutes of public comment scheduled, but we
have 35 presenters.

Carrie, can you please introduce

yourself for the record, and your comments

start right now.

MS. BROWNSTEIN: Five minutes?

MR. DELGADO: Five minutes, yes.

MS. BROWNSTEIN: Okay.

PUBLIC COMMENT ON NOSB ACTION AND

DISCUSSION ITEMS

MS. BROWNSTEIN: I am Carrie

Brownstein from Whole Foods Market.

I submitted comments and posted

them to the site, the NOSB site, so I probably

will not read through all of my comments, but

hopefully the group has a chance to look at

those comments.

There are a couple points that I

wanted to make that I made in my printed

comments. I think that there is some greater

clarity needed on a few of the proposed

standards with respect to how some of the

terms are defined and greater specificity
needed on some of the standards.

So just a couple examples of this.

In the aquatic livestock feed, livestock feed, about using wild fish, and calculating the -- you know, figuring out how much wild fish is acceptable, I think that it needs to be specified whether the trimmings from fish processing will be counted in a calculation, and in our standards at Whole Foods Market, we do not require that trimmings or processing wastes are calculated in what we call the fish-in, fish-out. So I think that could use some specification.

Around contaminants, I think the important point is that environmental contaminants, is that the standard refers to regulatory levels, but -- for allowable levels of contaminants, but there are no regulatory levels really, and so as it's written it's kind of unclear whether the group was talking about following European regulatory levels or if there was an error in assuming that there
are established standards for PCBs, mercury
and things like that, in feed.

So I just wanted to mention that.

The term sustainably sourced for
the fish meal, fish oil that goes into feed,
I really think that needs to be defined. It's
-- for Whole Foods Market, we have reserved
the term sustainable for just products that
are certified by the Marine Stewardship
Council. You know, as you know, in terms of
production fisheries, you know, there aren't
really that many that would qualify from the
MSC group.

So I think that's just -- that
kind of specificity is needed.

And when it comes to the net pen
category, there's a bunch of areas where I
think more clarification is needed. For
example, will hormones for sex reversal be
prohibited for grow-out stock only, or also
for brood stock? That's important. It's used
for brood stock in trout, but, okay, I have to
hurry.

So there's a couple of really quick points then.

The aquaculture working group had a couple of interesting comments, so I agree with them that the aquatic plants and aquatic animals are good terms to use rather than livestock and crops when you're talking about aquaculture.

I also like some of the specifics that they put in their comments, like the use of acoustic harassment devices should be prohibited. Those are the kinds of specifics in our Whole Foods Market's standards that we try to put in so that people knew exactly what kinds of practices on the farm are allowed and are not allowed.

So I also like this point that in the rules for fish meal and fish oil that they should apply to terrestrial livestock. I thought that was an interesting point as well.

Finally, it's really a great thing
to have performance targets, and we tried to
do this in our standards as much as possible.
But regarding the nutrient reduction of 50
percent through cycling, I'm just a little
curious where that number came from. I tried
to find numbers as we were working on our
standard that we could do, and I wasn't quite
sure if there was science supporting that
particular number, because I think it's great
to have a performance target, but if it's
arbitrary, I'm not sure if that gets you
necessarily where you want to go in terms of
on-the-farm performance level.

So I do please hope that you can
check out the printed comments that we
submitted online, and hopefully find
opportunities for greater specificity,
especially on things like predator standards,
where there are specific things that you could
require, like no acoustic harassment devices
and greater definition on those kinds of
standards.
Thank you.

MR. DELGADO: questions, Dan?

MR. GIACOMINI: Carrie, excuse me.

MS. BROWNSTEIN: Sir.

MR. GIACOMINI: Yes. I notice when I go into your stores, you do have accredited farm fishing program. Without going into the specifics of it, I have talked to some of the guys behind your fish counters at some of your various stores, and -- but as from your perspective, the store's perspective, how is that program -- how is it going, how is it being accepted by the consumer to be dealing with these kind of things, which we're being told are not acceptable by the consumer? What are you seeing?

MS. BROWNSTEIN: Well, we just released the new aquaculture standards in July of 2008, so they are new. But the feedback that we have received has been really positive, and in terms of the implementation
of the standards, we are in the implementation phase.

So, you know, it's going to take a little while, but the point is that all of the farms will have to be operating completely under those standards. And so, you know, it's a process of getting everybody up to speed, and so far I think it's going really well. We've got some great relationships with these producers that are working really hard to make this happen.

MR. DELGADO: Any other questions? Joe?

MR. SMILLIE: Yes, I just wanted to clarify, you guys have the ability to note a sustainability standard you can adhere to. We lack that ability. We can't refer to a nongovernmental sustainability standard. We explored that earlier because that's one of the things that we wanted to do is pin it to sustainability as far as the feed mill goes, but basically it's difficult for us
to have a nongovernmental standard and a governmental regulation.

So until such time as the community create, you know, sustainability standards that are acceptable, we are stuck without, you know, a donkey to pin the tail to as far as our desire for sustainability.

Isn't that correct, Hugh?

MR. DELGADO: Jeff?

MR. MOYER: Yes. Carrie, I was just wondering if you can expand just briefly on what your waste management standards are. You brought up the 50 percent recycling. What exactly is doing that?

MS. BROWNSTEIN: We looked at it from the input side in terms of looking for the producers to reduce the amount of nutrient inputs in the form of feed and fertilizer.

We did not put a 50 percent reduction or a particular percentage reduction on that particular standard. But we did look at it from the input side, especially because
of the context of net pens and open water systems, it seemed a little bit easier to keep track of the inputs.  

But we are looking -- I mean I think there's a lot of consistency here in terms of what we are trying to achieve, you know, in terms of recycling nutrients. We are looking to producers to find ways to recycle these nutrients, and so, you know, the kinds of integrated multitrophe, integrated aquaculture systems that I think you probably had in mind in this standard, I think those are fantastic, and we're looking to find producers who can do that. It was just that that particular number of 50 percent of reduction, we just had a little trouble finding, you know, a justification for that exact number.

MR. MOYER: Thank you.

MR. DELGADO: Kevin.

MR. ENGELBERT: How many producers are you working with? Do you know, off the
top of your head? And what types of seafood --

MS. BROWNSTEIN: So our

aquaculture standards cover all farm fish
except for mullet. So we're talking about
salmon, Arctic char, steelhead, tilapia,
farmed shrimp, and then, you know, those are
really the big ones, and then there's
obviously some fish that are not quite as
popular. You know, here we're talking about
Mediterranean sea bass, sea bream, and of
course there's cod, we don't really deal much
with farmed cod.

But there are other species that
are covered under the standards, but the
standards were really designed for those big
ones.

And in terms of producers, I don't
have the number of producers offhand. It's
not an enormous number because we try to
develop long-term partnerships with our
suppliers that are working to, you know, be a
part of our firm.
MR. DELGADO: Kevin.

MR. ENGELBERT: And how are you finding the enforcement of your standards working out? Are you having trouble doing it, or is it -- or are you able to follow through on these standards?

MS. BROWNSTEIN: It's going okay so far, and you know, in the beginning there were some producers that had to be eliminated because they weren't meeting the standards, but many of our producers have already had the same kind of outlook on how aquaculture should be done, and we've had long-term relationships with these suppliers.

So many of these suppliers were really already on this honor program before we had a chance to release them. But there were some that, you know, that didn't make it.

MR. DELGADO: Bea.

MS. JAMES: On your Web site, you have a page that's devoted to seafoods and talk about Whole Foods' commitment to making
sure that you are committed to sustainable practices and you talk about supporting fishing practices that ensure the ecological health of oceans and the abundance of marine life.

Do you consider the ocean net pen farming method be one that does not?

MS. BROWNSTEIN: Well, I think with net pen aquaculture, there's a huge range in the kind of practices that are out there. So I think if it's done well, it can be a good source of seafood, and I don't use the term sustainable in general, but we tend to say environmentally responsible, environmentally friendly.

But it's -- you know, I think with net pen aquaculture specifically, because that sounds like what you're specifically interested in, it's a question of finding people that are doing it right. And so, you know, with our -- we talk about suppliers on our Web site a bit. We have a blog on our
site, if you check it out we have a couple
features. You know, we're only working with
maybe three salmon suppliers, you know, so
it's not like we're speaking about the rest of
the universe in the salmon industry.

But I think it can be done well.

MR. DELGADO: Bea.

MS. JAMES: Another follow-up
question.

I know in your stores, when I go
into your stores, that there is an emphasis,
a heavy emphasis on sustainability in your
fish department, and if you ask the guy behind
the counter, they usually have answers that
focus around that aspect of the fish that you
sell.

Do you have consumers that are
asking for organic fish, or is the main
concern for consumers that you see at Whole
Foods around sustainability?

MS. BROWNSTEIN: Well, we have had
a policy for a little while now that we don't
sell fish that is labeled organic, and we do
have people asking us sometimes why, and we
explain it to them. And, you know, we do
provide this kind of information to our
customers in various formats.

We did a podcast and we explained
this to our customers, and we respond to
customer e-mails about these kinds of
questions. But we have people asking about,
you know, all aspects of seafood, whether it's
from questions about sustainability, or
whether it's questions about contaminants, or
whether it's, you know, about aquaculture. We
get all kinds of questions. We have pretty
engaged customers that, you know, really want
to know. Maybe they're a representative
sample of the general people, so we see all
kinds of things.

MR. DELGADO: Hugh.

MR. KARREMAN: I apologize,
Carrie, for not being in the room when you
spoke, but I did read your written comments,
so I'm happy to have them.

I just wanted to -- so maybe you've already mentioned this, but of your producers that you have in your program right now, would they be able to -- how do our standards -- I'm not trying to compare standards with NOSB and you guys, but would your producers be able to produce also certified organic by these standards that we are proposing, or, you know, amending slightly?

MS. BROWNSTEIN: Well, I think that's a good question because in the process of developing my comments, I did speak to a number of our producers, the ones who I know would be interested in producing under an organic standard. So I was very curious about what their perspective on it would be.

So specifically related to the net pen standard, one of our most engaged producers said, you know, it's not clear to me from many of these standards exactly how we
can or can't produce fish.

And so that -- I tried to address some of those things in my comments about the need for greater specificity.

You know, for example, under the predator standards of how you handle predators, it doesn't say whether you can use acoustic deterrent devices or not, and it doesn't explain I think quite enough on how things can or can't be done.

And I know you don't want to be too prescriptive, I'm sure, but at the same time I think there was in the net pen standards a little too much vagueness. And that was coming, you know, from some of the producers who said it's not totally clear to me if I would comply with these standards.

I'm not sure what I can and can't do.

MR. DELGADO: Hugh?

MR. KARREMAN: Just a follow-up.

I really appreciate everyone's comments for sure, and I -- George Leonard
from the Ocean Conservancy now, did you consult with him or to look to their -- to what he always is talking about, performance metrics, and how do you feel about that, performance metrics to show compliance?

MS. BROWNSTEIN: Right. Well, in the development of our standards, we did talk a lot with George Leonard and folks at other organizations, and obviously there's a lot of support for having performance metrics, and we try to do that in our work as much as we can, as long as we can find a performance metric that seemed logical and not arbitrary. So I think they're really good to have if you can -- if there's one that's sensible, I think it's a great idea.

It makes it, you know, a lot easier to interpret the standards and informs the producers more specifically as to what they need to work toward.

MR. KARREMAN: Okay. Thanks.

MR. DELGADO: Bea?
MS. JAMES: Sorry, one more question. I know and respect that you -- Whole Foods stopped selling live lobster because of the inhumane standards that you felt were not being followed for that, and do you see net pen or pond-raised as being humane for aquaculture?

MS. BROWNSTEIN: Well, as you know, we have a very big effort under way on animal welfare for farm animals under our five-step program, and this is something that we have not yet addressed in our aquaculture standards. We felt like there was a lot to tackle in the first round of standards for farmed fish so, you know, in terms of, you know, what it looks like right now, I mean I think that there are questions to look into and say -- there are arguments on both sides of it. We spent two years doing research on the sustainability components of aquaculture, so without spending a little time looking into
the animal welfare aspects of it, you know, it's really hard for me to say because I understand that, you know, in some people's perspective, it's more natural or more humane to be in an open water pen than it would be to be in a tank.

And on the other side, you know, there's other points. So it's difficult to say yet.

MS. JAMES: Is that something that Whole Foods plans on doing some research on?

MS. BROWNSTEIN: I'm sure we'll look into that. Our next big project, I know you mentioned wild fish, and the sustainability. Right now we're focusing our efforts on developing our guidelines for wild-capture fisheries.

MS. JAMES: Thank you.

MR. DELGADO: Any other questions?

Thank you very much, Carrie.

Next is Urvashi Rangan, followed by Brian Connolly.
MS. RANGAN: Thank you. I sound a little different because I'm sick from my baby, but I'm going to try and make it through these comments.

The first thing I want to do is stress -- my name is Urvashi Rangan. I'm a senior scientist at Consumers Union. We publish Consumer Reports magazine, which reaches over seven million people.

Consumers Union opposes the use of animal byproducts in the pet food recommendation. We feel that pet food should be in line with the livestock feed recommendations, that consumers will not understand why they are not the same, and at the very least we would like to see the loophole or the allowance for conventional animal byproducts in the nonorganic portion of pet food to be omitted.

The fact of the matter is that cats are also subject to mad cow disease.

There are studies on this in the UK, at least...
100 cases of mad cat, and the primary vector for mad cow disease is the transference of animal byproducts in the feed. So we would like to see that closed. And I'm happy to provide those references for you.

I would like to now turn my comments to what we heard during the Livestock Committee's discussion of aquaculture. And, Hugh, my comments are responding to your comments.

We don't think the job of this board is to find a middle ground. Your job is to uphold the principles of the National Organic Program, and not to dilute the standards so that a substandard market can cash in and charge consumers a premium price for something that isn't as organic as other organic food that they are buying.

And an extra labeling proviso is not an answer, and it's not legal, and your obligation under section 2102 is to provide consistency to the meaning of that label. The
standards you have currently for aquaculture do not do that.

American consumers have in fact overwhelmingly, more than 90 percent, said they expect organic fish to be produced with 100 percent of organic feed.

I don't understand how you have arrived at that some consumers maybe will be happy about wild fish food or happy about less than 100 percent, but we have two national polls that indicate that that is not the case.

Environmental pollution from open net fish farms is not limited to the Pacific Northwest. They are in fact widespread problems that happen in Norway, in Scotland, in Ireland. There are plenty of scientific studies to document that, and Chile as well. And that's just to name a few.

So we are concerned about what is being considered here in terms of science and fact in these recommendations.

Let's just be clear, too, about
open net pen systems. We are not just talking
about salmon. We are talking about a system
that is an open system into the natural
environment. No matter what you farm in it,
you flush it into the environment and that is
not in line with organic principles that
control for waste management. It's just not
in line with that.

We think that the use of the
amendment for wild fish feed in this
recommendation is erroneous. If you are
promulgating on that amendment, I would like
that to be made clear that those are the
recommendations you are making so that the
USDA can in fact promulgate, and what part of
it you are trying to promulgate.

But to say that you are doing that
and then to shoehorn this into the national
list because if you looked at the 100 percent
organic feed requirement under livestock, it
wouldn't work, and it would require 100
percent organic feed.
So to now allow a prohibited substance on the national list as a fix to that for fish? It's a disservice to the organic marketplace, it's a disservice to consumers. It's not in fact following the job that you need to do. It sets a really bad precedent.

We have had other industries in here try to get their exemptions to the 100 percent organic feed requirement. Consumers were vociferous about their opposition to that, and what you are doing here is setting a precedent to show how other industries can therefore go about it again.

This is a serious dilution of the organic standards. If enacted, we will have no choice but to advise consumers through our Advice and Consumer Reports, through our advice to the public, that they should not buy organic fish.

Thank you.

MR. ENGELBERT: Urvashi, we've been told by people in the agriculture business that the only way to get these necessary nutrients into the start-up industry is to allow these wild-caught fish oils and fish meals to be included.

Am I jumping to a conclusion by saying that you don't think there's any way that aquaculture could ever be certified as organic?

MS. RANGAN: No. This isn't a jump-start program, though. This is a program that allows a label for any fashion that they qualify for it, and then to charge a premium price for the value that they've added.

You are trying to create a sliding value scale here. That's not what the organic program is about, and it's like consumers pay more for it. They pay more for it because it meets a consistent high bar. We are not saying that you will not be able to produce 100 percent organic fish meal with organic
certified fish. We welcome it. That's how it should be done.

But the bar needs to be set at 100 percent and let the industry innovate to get to that point. By giving them this jump-start, this sort of dilution in the standard so that they can capture this label before they are really ready to is basically allowing a product on the market that will be inconsistent in meaning, that will not have eaten the same 100 percent feed as other livestock, that could be contaminated, that may have come from polluting systems.

It's not what consumers want from the organic fish that they buy, and they have registered that sentiment overwhelmingly.

MR. DELGADO: Hugh.

MR. KARREMAN: On this topic right here right now, we would foresee that farms that produce with the organic feed right at the outset, which would be some but not a whole lot, would indeed even given a higher
premium than those that are having to use some wild caught, and there would be incentive to go as fast as they could to the fully organic fed, you know, type version, and not use that label.

It is also -- I think a lot of the commenters have, I think, forgotten that it is a step-down, prescribed step-down. It's not like it's going to be there forever. And I agree, it is a jump-start. I think that's your term, or maybe Kevin's, or whatever. But it is.

And we -- it's not to lower the bar of organics at all. It is to help an industry start and hopefully get to that 100 percent as quickly as possible. That's our intent. With the step-down and that label.

Okay. I don't know if that label will stick or not, but that is the intent there.

MS. RANGAN: I mean I appreciate that, Hugh. The first thing is unfortunately
you don't set what a premium can be, and so
anyone can set the premium where they want to.
And where deception comes in the marketplace
is people who do try to capture that premium,
and they will, they will exploit it to charge
that premium.

If it says USDA organic, people
are not going to differentiate, and that is
significant. And I don't know how to keep
explaining that this isn't a jump-start
program. This is a program that consumers
expect a certain bar achieved, and you are in
fact lowering that bar. You are not requiring
100 percent organic feed. You have lowered
that bar, and you have done it in a way that
circumvents the livestock feed requirement by
amending the national list. That's not the
way to address this issue.

MR. DELGADO: Bea.

MS. JAMES: So what I think I hear
you saying is that it's not speed to shelf
that you're looking for; that you would
rather, and the consumers that you have gotten feedback from, would rather see a recommendation that would put forward the development of organic seafeed that was truly organic, with organic fish feed, even if it takes the industry five, six, seven years to get to the point where the fish meal is available for producing organic fish.

MS. RANGAN: That is correct. That is what we are trying to do. And in order -- and just to sort of flip this, you come out with this and a consumer says, wow, and they hear all this controversy and they can't quite understand what the debate is about. And so someone like me is trying to educate consumers, says, well, there are certain kinds of fish they do eat 100 percent, and for other kinds they don't eat 100 percent, and a consumer says, why isn't it the same?

And I say because the National Organic Standards Board wanted to cast the net
as widely as possible to jump-start the market. That's not an answer that consumers want to hear, and they're not willing to pay more for that, and in fact it can undermine consumer confidence not only in that organic fish but they will translate that to other organic food products that they buy.

MR. DELGADO: Kevin.

MR. ENGELBERT: Urvashi, I know this isn't an exact analogy, but the dairy industry was given a huge, in your terminology, jump-start by allowing dairy animals to transition into organic production and then produce certified organic milk.

Is this really that big a leap, that big a difference, in your mind, from the aid that was given to the dairy industry to get started, and with enough volume that the plants could have enough product to process that consumers could go to the store, knowing that it was there, knowing that these animals transitioned to organic production over a
period of originally nine months, now 12 months?

MS. RANGAN: Well, Kevin, consumers don't perceive that as a jump-start, they perceive it as a loophole. And we have survey data to show that consumers do not want this shifting going around, with these conventional animals coming on the farm, and after 12 months milking them for organic milk. We have survey data to show that. They would never have accepted it had it been presented to them as a jump-start program. It was, frankly, a loophole, and we perceived it as that, and one that needed to be closed. It wasn't the case for other organic livestock, so why was it the case for dairy farms?

So, frankly, that's been another piece of information that's sort of been flying under the radar but, you know, consumers do want to know how come some organic milk is cheaper than others? And we
constantly have to say because some of them aren't getting pasture, actually, and so that allows a farm to produce a cheaper milk to be sold as a cheaper organic milk, and that's what's happening. And consumers aren't happy about that.

Let's fix these loopholes. Let's not use one loophole as a precedent for another one. That's not the way this program needs to be operating, and I'll tell you, it's really frustrating, and it's really undermining the quality of what organics should be out there.

MR. DELGADO: Hugh, this is the last question.

MR. KARREMAN: Yes. I just want to clarify what Kevin was getting at. It's not what you're talking about now with the original livestock that were coming in. I don't want to get into pasture and all that right now, but it was the old way to get in with the last third of gestation, and you had
to feed 100 percent organic for the last three months. That's what he was talking about.
Just so you know that. Just so you know that.

Now the other thing I wanted to ask you, though, is if in the European system they allow, let's say, poultry byproducts -- we're not going to be allowed to do that here, but just philosophically, would you be in favor of that to feed agriculture -- poultry byproducts?

MS. RANGAN: No. Animal byproducts are prohibited in this program.

MR. DELGADO: Any other questions?

All right. Thank you very much.

Next up is Brian Connolly, followed by Greg Aldrich.

MR. CONNOLLY: Thank you to the committee. My name is Brian Connolly. I was on the pet food task force, and I'll be very brief.

My company is based in Portland, Oregon, called Caster Pollux. We formulate
and produce organic pet food, and I just
wanted to thank the NOSB as well as the USDA
for forming the pet food task force, allowing
us to have a say in these regulations, and for
as when of you decide to adopt the
regulations, it really will help level the
playing field out there. I think there's a
lot of consumer confusion, the way some brands
have chosen to label and package and produce
their food. So I applaud the committee and
thank you again for allowing our input from
the industry.

MR. DELGADO: Any questions? All
right.

MR. CONNOLLY: Thank you.

MR. DELGADO: We'll move on next
to Greg Aldrich, followed by Kristy Korb.

MR. ALDRICH: Good afternoon. My
name is Greg Aldrich. I am an independent
nutritionist in the pet food industry. I am
also a columnist for the pet food industry
magazine, and I write a column every month on
ingredient issues.

I am also an adjunct professor of animal sciences at Kansas State University.

I am here as an independent nutritionist to give comments briefly on these rules that the task force has put together as it relates to the NOSB for pet food as an organic amendment, and generally speaking, I want to first off encourage the committee to accept the standards that were recommended by the task force.

What I want to do is remind everybody that pet foods are complete and balanced, are 100 percent of the animal's daily requirements today, so we will combine typically anywhere from 40 to 60 different ingredients to meet 40 to 60 different nutrients on a given animal's requirement on an every-day basis.

These pets now, there are some 170 million in the United States, living in one out of every two homes. The industry
represents somewhere between $15 billion in
the U.S. to $30 billion annually on a global
sales volume.

The organic opportunity is
somewhere in the neighborhood of 5 percent,
and we are probably now somewhere around a
half percent.

There is tremendous opportunity to
grow this industry, but the consumer has to
understand what organic is, and currently they
feel pretty good about what the ingredient
rules and regulations are under the livestock
guidelines, outlined by AAFCO, the American
Association of Feed Control Officials.

Most of those restrictions and
guidelines give us specific identification for
ingredients that we use on a regular basis and
also nutrients that we have to meet.

One thing I also want to bring to
the committee's attention is that in 2006, the
nutrient -- or National Research Council came
out with the 2006 nutrient requirements for
dogs and cats, and that will now promulgate
the change and update for the AAFCO nutrient
profiles for dog and cat foods over the next
couple of years.

The only change that really will
manifest itself in those upcoming nutrient
requirements is an increase or a recognition
now for a conditional requirement for omega-3
fatty acids, and in some of the discussions
earlier in this room, talking about
aquaculture, some of the same ingredients that
aquaculture uses to fortify diets with omega-3
fatty acids from fish or marine oil sources
are going to be required for dog and cat diets
as well.

To the committee's question
earlier about zoo and exotic animals, those
are not under the auspices of the American
Association of Feed Control Officials or the
FDA as livestock or domestic animals.

So with that, I will answer any
questions.
MR. DELGADO: Questions, comments?

Thank you very much.

MR. ALDRICH: Thank you.

MR. DELGADO: Okay. We do have a question here.

MR. ALDRICH: Yes.

MS. JAMES: Do you work with Caster and Pollux? Are you -- with regards to the other -- no? Yes?

MR. ALDRICH: Yes and no. First off, Brian, I'm going to disclose that I work with Caster and Pollux. I ordinarily do not disclose who my clients are. I'm here today to represent the dog and cat, though. That's it.

MS. JAMES: Okay. Okay. Well, my question was actually more directed on the organics, so I'll ask you at a break.

MR. ALDRICH: Yes. Thank you.

MR. DELGADO: Next, Kristy Korb, followed by Dennis Kihlstadius. Kristy?

Gwen?
MS. WYARD: Kristy couldn't make it to the meeting today, so I'm going to take her place.

Gwendolyn Wyard. I'm a processing reviewer technical specialist for Oregon Tilth.

I'll try to be brief. Thank you.

I'm going to talk about the material working group clarifications, give you a personal perspective from Oregon Tilth, where we're at in this issue.

If possible, we encourage NOSB to minimize regulatory changes, and clarify the definitions via guidance documents. The guidance documents that are circulated for public comment approved by the NOP and clearly posted to the NOP Web site as official guidance. The decision tree that was provided in appendix C. We feel that that is a great example of how this could be accomplished.

This was the original idea that was submitted by Oregon Tilth in 2004. At
that time we didn't suggest any regulatory
changes, but rather a flow chart accompanied
by a narrative.

With respect to agricultural and
nonagricultural, there are two primary issues
that we think can be clarified with minimal
changes to the regulation. At this point we
do feel that change to the definition of
nonagricultural is necessary.

We support the concept that an
agricultural product extends to any living
organism that's raised, cultivated, or
gathered by humans, for human or livestock
consumption, and we find that the NOP
definitions of crop, livestock, and wild
harvest cover the spectrum from itty bitty
little creatures to large creatures living in
soil, air, or water. So this concept, we
feel, is captured by the nonagricultural
definition A.

And then whether or not living
organisms can be certified depends on whether
appropriate standards exist, so you first
determine whether it can be agricultural, and
then you ask whether it can be certified.

The second issue is at what point
something stops being agricultural. In the
context of OFPA, we do believe that the loss
of agricultural identity is connected to the
term synthetic, but it also aligns with the
processing standards.

The OFPA definition of
agricultural includes raw or processed. The
term synthetic should not include the effects
of normal food processing activities. In
other words, the term synthetic should not be
applied to an otherwise nonsynthetic substance
that's formulated or manufactured by
processing.

In this respect, there is no such
thing as a synthetic agricultural product, but
rather a processed agricultural product.

We also encourage the material
working group and the board to persevere with
the NOSB documents of August 2005 and the NOP recommended framework document of March of 2006 to clarify the definitions of synthetic and nonsynthetic.

On the yeast front, we also would like to reiterate the message we have stood by for many years. Yeast are living organisms and their production relies primarily on agricultural material that is available in organic form.

Yeast may not be grown on a farm in the traditional sense, but yeast can be manufactured in accordance with the composition standards for processed organic product.

We recognize that there are agricultural and environmental implications, and we feel that these should be addressed by applying organic principles to yeast used in organic food.

In this respect, yeast should be eligible for organic certification, and
labeled as organic yeast.

While we strongly believe that the handling requirements in 205.270 provide adequate standards, we accept that the larger community may feel more comfortable if organic yeast guidelines are in place, and the appropriate place to house such guidelines is in a guidance document, and we offer our assistance in helping to create such guidelines.

I have a background degree in fermentation science. I'm very familiar with raising yeast, and that is an area where Oregon Tilth and myself could assist the board.

In respect to lecithin, we do not support the removal of bleached or unbleached lecithin from the national list. We applaud the petition. We think it's excellent that somebody has petitioned to have it removed.

However, we think that bleached
lecithin should be listed on 606. It is importantly available in organic form. Therefore, its listing as a nonagricultural substance is no longer appropriate.

Complete removal of one or all the forms is premature with the stable market availability. The supply is fragile. To date there's one supplier for organic lecithin, and based on the information that we diligently collect from our clients, the products offered are in some cases still in testing phase, not consistently available, or they are available in a form that is not suitable.

So we ask that both forms, all forms that are regulated under 21 CFR 184.1400 remain listed, and the commercial availability, form, quality, and quantity left to the discretion of accredited certifiers.

And then finally I just want to point out a little nuance with the algaes that were petitioned for 606. We understand that they are not being recommended for addition.
I am aware that chlorella and nonorganic chlorella is currently being used in organic products. While they were classified or they were referred to as being photosynthesizing plants, they are being petitioned to 606, they also can be categorized as a microorganism, and this is going to get back to the job of agricultural and nonagricultural. We don't have a very good TAP review on microorganisms, so while they're not going to be added to 606, they still can be allowed if somebody submits them and points to the listing of microorganisms on 605.

We don't think that microorganisms, when they are placed on 605, were necessarily meant to extend onto certain types of algae, but it is covered under that category.

With respect to the certification of algae, the one that was harvested from the bottom of the Pacific Ocean, when we look at
wild harvest practice standards, we are not sure how this could ever be certified.

We really believe that items that go on the 606 standards should be -- should exist. We're not sure how contamination prevention could take place at the bottom of the Pacific Ocean, so that's just another nuance to take into consideration.

Thank you very much. And if I don't have any questions --

MR. DELGADO: Questions from the board?

Moving on then, we have Dennis Kihlstadius, followed by Ron Gonsalves.

MR. KIHLSTADIUS: Good afternoon.

Thank you.

My name is Dennis Kihlstadius. I have a company called Produce Technical Services in, of all places, Bemidji, Minnesota, and I work for different commodity groups on ripening fruit.

If you sit on an airplane and tell
somebody you work in ripening fruit, they laugh at you.

So this is your traditional -- I'm sure you've all done this, put some fruit in a bag, have a ripening bowl, either a banana or an apple, and I'm here to tell you to use an apple, bang it, bruise it, it produces 10 times more ethylene than the apple does. The apple produces four times more ethylene than the banana.

So -- and there used to be an old rule that you always had to ripen bananas with ethylene, and they will ripen on their own, but not consistently, and what the retailers want -- I'm going to read you something out of a Post Harvest Technology of Horticulture Crops, published by UC-Davis. It's kind of the authority in ripening in the horticulture for post harvest world, and ethylene, which is C2H4.

The simplest of organic compounds affecting the physiology processes of plants
is a natural product of plant metabolism and it's produced by all tissues of higher plants and by some microorganisms. As a plant hormone, C2H4, ethylene, regulates many aspects of growth, development, senescence, and ripening.

And I just wanted for you to understand that. We have tried in many different ways to produce ripened fruit with let's say a bin of rotting apples or a bin of rotting pears. So it's very consistent, and you can't really do it, because when you're dealing with ripening, you're dealing with parts per million.

So what we found is we can produce this -- and I've read it said synthetically, but what you do is you can break down an ethyl gel and you can create water, carbon oxide, and ethylene. And the ethylene is taken in from the fruit. The fruit doesn't care where it comes from. The group of fruit needs ethylene to have starch-to-sugar conversion.
Without it, you will not have sugar into the fruit, and I'm sure everyone here has had a banana. You wanted it and you ate it, and it was just pasty tasting. There was really no flavor to it. It was a banana, yes, but there was no flavor.

I can guarantee you that was a banana that was ripened at too high of a temperature, where the ethylene receptor site was shut down and it was not received into the banana to convert starch to sugar.

So the pear industry, what we found on the conventional side -- I've been working with the pear industry for over 12 years -- that we can take some of the pears that have high starch content, and instead of putting them into storage for two months and then selling them in the market, we can take them basically off the harvest line, put them in an ethylene process, send them to the retailer, and the consumer will have a good tasting pear. And I'm not asking them to put
it in this bag and eat it in five days. I don't know what product you'd ever want that you can buy on Monday but you can't enjoy it until Friday or Saturday. That's just not the way it works.

Avocados. I worked for the avocado industry for seven-and-a-half years, and ethylene is approved on avocados for organic.

Well, the recipe for pears is the same as avocados and it's the same as bananas. By recipe, I mean the process it would take to condition the pears with ethylene process.

I am just here to say that I think what it will do is increase the use of organic pears on the consumer level, because there is a gap from the time of harvesting until the time of going to market right now for organic pears.

We have proven it with the Anjou pear on the conventional side. We can actually go to market roughly five to six
weeks sooner than we could in the past. And that just means that the consumer can have a pear, you know, that's usable.

Fruit comes from different parts of the world, and during that time, that gap, the offshore pears that would come into the United States during that time, it takes 21 days to get here, first, but they've been off the tree roughly for about four months anyway. So there is no place that we can source pears around the world in the beginning of our season because it's already done in the other season. It's almost six-month reversals of seasons for pears around the world.

So I'm asking that you take a serious look at this. It is used on other products already, organic products, and I think it would be very good for the pear industry.

I have no economic incentive, whether you approve it or not. I don't get paid whether one retailer goes on this program
or not. I'm just here to educate and to bring up, you know, the points that -- or answer questions that you might have about this.

MR. DELGADO: Questions from the board? Gerry.

MR. DAVIS: Could you speak to the comment that we received that they referred to the degreening of citrus using ethylene and the effect it had on imported fruit coming in often in unripe status, and then used to color up with ethylene, but it's not flavorful. Would that exist at all in the pear realm, coming from other northern hemisphere sources?

MR. KIHLSTADIUS: It's very interesting. When you talk about degreening of citrus or the degreening of pineapple, once you pick citrus and once you pick pineapple, you cannot make them taste any better. It's strictly appearance.

And to me, it's kind of the old shell game. You're just painting it a different color. You're not going to do
anything for the flavor of it.

On a pear, you can actually affect
the flavor of it. But as I said, during that
time of the season, when we would really like
this to be used -- we don't use it through a
whole season.

On the conventional side, we will
stop adding ethylene to the pears probably
about February, maybe even April, and that's
because the starch in the fruit is pretty well
used up, so there's not a real economic gain
in the fruit.

And I'm here to tell you if you
can store pears -- I don't care what it is, if
you can store any fruit for 12 months, your
flavor life may be only 10 months. That last
end of any fruit, I don't care what it is,
it's just not going to have the flavor that it
does in the beginning.

The fruit has vigor in it and has
life, and if you can give that pear or that
banana or that apple -- even apples use
ethylene to convert starch to sugar. If you can give to the beginning, you have a better
tasting piece of fruit.

So to answer your question, no, there's really nothing in -- when I hear -- sit in in grocery stores or I talk to people at grocery stores and they talk about ripening this or how do I tell the pineapple, and they're pulling a leaf on it, that means the leaf is loose. That pineapple isn't going to get any better, you know, once it's sitting there.

So you cannot make it better. It's just the degreening. Now you use probably five to seven parts per million to degree citrus. We use 100 parts per billion to ripen pears or bananas or mangoes, papaya.

MR. DAVIS: So it's not an apples-to-apples comparison, to compare degreeing citrus --

MR. KIHLSTADIUS: Exactly.

Exactly. It's a whole separate process.
MR. DAVIS: -- to pears.

MR. KIHLSTADIUS: It's -- ethylene is used to green tobacco. I mean it's on that same principle. You're degreening the chlorophyl.

MR. DAVIS: Thank you.

MR. KIHLSTADIUS: You're welcome.

MR. DELGADO: Any other comments, questions? Well, thank you very much.

MR. KIHLSTADIUS: Thank you.

MR. DELGADO: Next is Ron Gonsalves, followed by Deborah Carter.

MR. GONSALVES: Good afternoon.

As a representative of the organic pear growers, I'd like to thank the organic standards board for the opportunity to speak today in support of the petition to allow the use of ethylene for post-harvest ripening of organic pears.

My name is Ron Gonsalves. I'm the president of Bluebird, a Peshastin, Washington tree fruit packing co-op, a grower's co-op of
over 200 growers celebrating our 95th anniversary.

Bluebird's historical reputation has been that of a dynamic leader of the Pacific Northwest pear industry, currently packing and shipping approximately 7 percent of the Northwest total pear crop.

Many of Bluebird's growers are second- and third-generation pear and apple growers. Bluebird growers are located throughout the state of Washington, harvesting multiple varieties of pears, apples, cherries, and apricots.

Within that varietal tree fruit mix, Bluebird growers follow conventional as well as organic practices.

The Bluebird co-op is also unique in that in addition to its member-growers, the co-op owns and operates over 750 acres of orchard, with half of that acreage in certified organic production.

Bluebird packs and ships fruit
from 51 certified organic tree fruit growers, of which 18 growers farm organic winter and summer pears.

I'm trying to set the stage here as far as our involvement in the tree fruit industry, especially the pear industry.

Bluebird has been involved in packing certified organic pears and apples for over 20 years at our dedicated organic packing facility located in Wenatchee, Washington.

Bluebird's board of directors has invested considerable capital to provide for its growers a dedicated organic packing facility that has helped to position its growers for success in a very fast and expanding organic tree fruit market.

Our dedicated facility also helps to assure that the retailer and ultimately the consumer, that their organic purchase has been packed and handled following strict adherence to both WSDA organic standards as well as national retail fruit safety requirements.
During the past 12 years, the Pacific Northwest has seen significant increases in the organic pear production with Bluebird being an industry leader.

With the current 2008 crop that has just been finished harvesting, Bluebird will pack approximately 10 million pounds of organic pears. This will represent roughly 20 percent of the total Northwest organic pear production.

The consumer demand for conventional winter pears has seen significant increases over the past five years, with all major U.S. retailers committing more retail shelf space to all pear varieties.

One of the reasons for the increased consumption of winter pears has been directly attributed to the increased use of ethylene for conditioning.

The actual ethylene treatment is being done by the pear packer prior to the shipments on on-site ripening rooms and
affordable ripening trailers for following
delivery by the retailer at their regional
distribution centers.

In-store consumer testing

conducted by the Pear Bureau of the Northwest
at major retail stores across the country has
found that pears ripened by the use of
ethylene takes the guesswork out of as to
whether a pear is ripe.

For example, when most produce
ripens, it changes colors and textures.
Pears, on the other hand, do not significantly
change color, therefore making it more
confusing to the average consumer as to when
the best time to eat a pear might be.

Consumers have expressed an
enhanced eating experience when they try pears
that have been conditioned with ethylene and
are more inclined to repeat the purchase of
all pears.

Additional research has shown that
pears harvested from different orchard
locations throughout the Northwest do not ripen evenly under normal cold storage.

The diversity of the large geographic growing regions in the Northwest makes it impossible for all winter pears to be harvested in exactly the same maturity and storage quality.

Ethylene conditioning affects the ripening process without altering or changing the natural inherent aspects of the fruit, such as texture, aroma, or flavor.

Ethylene treatment has allowed for a more uniform ripening of the pear. It also increases the rate of ripening, thus resulting in a more consistent pear to be offered to the consumer sooner each year following the completion of harvest.

Organic production of the Northwest is increasing not only with traditional varieties, such as the Anjou and Bartlett pears, but also with new varieties such as the Concord and Comice pear.
While the conventional pear growers have seen benefits with the increased use of ethylene for conditioning pears, not having this tool available for organic growers and shippers can put them at a disadvantage in today's marketplace.

As more acreage is transitioned into organic farming, the increased production will also be at a disadvantage in the future.

The benefits that the conventional pear growers have experienced and that the consumer has expressed should also be available to the organic growers and the consumer of all pears.

This board has heard and read the petition to use ethylene for ripening organic pears presented by the Northwest Council and the Pear Bureau of the Northwest.

The petition speaks of the scientific considerations and specifically references that ethylene is currently approved for ripening of organic tropical fruits,
organic bananas, and organic citrus in the U.S.

The petition further states that ethylene is consistent with the principles of organic production and is widely accepted in other countries and by other governing bodies.

As a representative of the organic pear growers of the Pacific Northwest, I would like to ask that the National Organic Standards Board consider this petition and support the use of ethylene on organic pears.

I strongly believe that the ethylene would be an important tool for the organic pear growers in a very competitive produce arena.

I also believe that the consumer would be provided a better product when they purchase organic pears that have been conditioned with ethylene.

MR. DELGADO: Your time is up.

Can you wrap up?

MR. GONSALVES: I'm finished.
MR. DELGADO: Thank you.

MS. HALL: So I live in Spokane.

MR. GONSALVES: Yes.

MS. HALL: And there is an organic pear grower just north of me, very well known throughout the state, smaller, but sells direct at farmers markets, and I have consistently bought from that farm and enjoyed it.

I have never really had issues even buying in I mean what I consider bulk on a personal level with uneven ripening to a large degree, and I'm just curious if there is an issue of scale, if it's different for a smaller producer versus large in how you harvest that has some implication on that uneven ripening?

I mean I know pears are really fragile, so I'm just curious how that measures up.

MR. GONSALVES: Well, I think on a scale basis, you know, there obviously is a
scale issue there because of the amount of
pears that are truly grown in the Northwest,
and we can't diminish the fact that that
volume of pears is actually being grown.
And so in our harvesting
procedures, we actually are looking at a pear
that is being harvested to being marketed over
a six- to seven-month period.
So as we get into the volumes that
we currently have, as well as additional
volumes that are being transitioned into
pears, I don't think it's strictly just an
issue of scope or how large this industry has
become, is the fact that we are here now. We
are here with significant volumes of organic
pears, and I think the consideration needs to
be given of how best to deliver that pear to
the consumer and ultimately enhance that
eating experience.
As it's been said earlier, the use
of ethylene has been certified for other
produce. If you buy organic bananas, it is
more than likely that your organic bananas
that you may feed your children are being
ripened by ethylene as well.

So it's not something that we're
here petitioning the fact that this is
something new that we want to use just on
pears, but the actual reality is that we do
have large volumes of pears coming out of the
Northwest, a large volume of organic pears,
and I have seen what the research as far as
the conventional pears that the consumer has
benefited by that -- by the volume of the
pears that are currently available to them on
a conventional level that have been ripened by
ethylene.

MS. HALL: But it is fundamentally
about holding time and extending the season?

MR. GONSALVES: No, not strictly,
because the biggest -- the use of ethylene
would be more on the front end of the season
as opposed to the tail end of the season. As
Dennis said, there comes a point late in the
season where ethylene is not needed.

The primary benefit of ethylene is to get pears to the market sooner because as the biggest pear variety, be it Anjou pears -- not sooner in the sense of it being harvested sooner, but all pears, all Anjou pears are -- their natural quality issue needs to remain in storage, an Anjou pear needs to remain in storage from 30 to 45 days after harvest before it will trigger maturity to ripen.

So the Northwest is confronted with the fact that the Anjou pear being the primary organic pear, to hold that pear in storage for that period of time, 30 to 45 days.

We have seen increased demand by the consumer to get Anjou pears on the market, into the market, sooner each year as they become available.

So the grower that you made reference of, you know, as small as he may be or as big as he may be, he may have advantages
with his harvesting that is unique to him and
is unique to his specific marketplace. But
he's potentially selling pears early into the
season that may or may not be properly
ripened, or may not be in a position to be
properly ripened.

MR. DELGADO: Any other questions,
comments? Tracy.

MS. MIEDEMA: I have another
question. If you have an organic pear and you
put it in the paper bag and five days later
you took it out of the bag, and you have
another organic pear, and you put ethylene
around it and it ripened in -- I don't know
what the duration is, like 24 hours?

MR. GONSALVES: It takes about a
three-day period to ripen.

MS. MIEDEMA: Okay. So after
two and a half days, I'd have the ethylene-ripened pear
and the paper bag-ripened pear, both organic,
and if I sent them to a lab for analysis,
would the scientist be able to tell the
difference in some sort of chemical change to the artificially ethylene versus the good old home paper bag pear?

MR. GONSALVES: Well, what you're ripening that pear with in that paper bag is ethylene. You're ripening it with ethylene that the pear is actually producing in a small confined environment. It's not being -- it's not ripened because it's in a paper bag and it's dark; it's ripened because the pear is giving off ethylene and you're trapping that ethylene into that small container, which is your paper bag. And so the ethylene that you are ripening in that paper bag is very similar to the ethylene that we would use on a large scale to ripen a whole trailer of pears.

The advantage you would have is that you as a consumer would be able to go to the marketplace and, as Dennis said, you can purchase a preripened pear on Monday and take it home and eat it that evening.

On the nonconditioned pear you may
purchase on Monday and take it home and be able to eat it on Friday.

So it's a matter of you as a consumer having the basic knowledge about a ripened pear and five or six other consumers who don't have that background as far as ripening a pear. You may take that pear home and put it in a bag and have an enjoyable eating experience, whereas the average consumer may take that pear home and try to eat it in the current state that it's in and may not enjoy it as much as they would if that pear had been conditioned.

MS. MIEDEMA: Okay. And specifically to my question, I realize it's the ethylene trapped in the bag that's making it ripen. What I'm trying to get at is from an organic consumer's perspective, am I eating a different fruit? You know, our concern is going to be something around -- you know --

MR. GONSALVES: Is there good ethylene and bad ethylene?
MS. MIEDEMA: Specifically to the question would a chemist look at those two pieces of fruit and tell -- could they tell the difference?

MR. GONSALVES: That would be more for the chemist to answer that question, but it is my understanding that ethylene is ethylene, regardless of how it is produced. The molecular structure of ethylene is the same whether or not it's given out by produce or it's generated from ethanol, from corn-based ethanol, which is also a source of ethylene. So there are multiple sources of ethylene that can be used for the conditioning.

So ethylene is ethylene in the sense of where the source may come from is the question in hand is whether or not that's certifiable, but the ethylene itself, whether you trap it in a bag that's being produced by the pear itself, or that it's been produced off site somewhere, and used in a commercial
scale, that ethylene is still the same ethylene.

MR. DELGADO: Jerry.

MR. DAVIS: I'd like to ask you within your production system, are you using -- - what form of starting material are you using to make the ethylene? Is it corn-based ethanol or is it something different?

MR. GONSALVES: The ethylene that we use on our conventional pears today is from an ethanol-based corn that we use in our catalytic generators that then produces the vapor that allows the chamber to be conditioned.

MR. DAVIS: But it is starting as ethanol, not some other method of doing it?

MR. GONSALVES: Yes, that's exactly right.

MR. DAVIS: How common is that with your competitors? Is that the same generally or --

MR. GONSALVES: Yes, I would say
that on the conventional pears, using that as
the gauge, that the source of ethylene is
pretty much a one-dimensional source, and
everybody uses that same source
conventionally. So I would imagine that would
just carry over into the organic arena.

MR. DAVIS: Okay.

MR. DELGADO: Any other questions?

MR. MOYER: Well, yes, now you
bring that up, Gerry, it brings to mind the
question are there any other materials that
outgas or are generated along with the ethanol
that would not happen from the ethanol that's
given off by the pear itself? Because you're
using ethanol, which is something totally
different.

MR. GONSALVES: No, no, no, we're
not using ethanol. We're using ethanol as a
source of ethylene, so there's a process that
the ethanol is converted through a chemical
reaction, the ethanol is converted into
ethylene.
MR. MOYER: I understand that, but along with that process, what else moves with it?

MR. GONSALVES: We don't convert it on site. We actually purchase containers that are 100 percent ethylene that we use for ripening. So we're not converting it from ethanol. On site. We're purchasing a product that's --

MR. DAVIS: I think maybe we might want to ask Mr. Kihlstadius that question.

MS. CARTER: I'm a chemist, and I might be able to answer that.

MR. DELGADO: You're a chemist?

MS. CARTER: Yes, I'm a chemist, and I probably can answer your question for you.

MR. DELGADO: Would you state your name, please.

MS. CARTER: Yes. I'm Deborah Carter with Northwest Horticultural Council in Yakima, Washington. I am the next speaker.
MR. DELGADO: Why don't you get started?

MR. GONSALVES: Have you got any other additional questions?

MS. CARTER: Sure.

MR. DELGADO: And go on with your presentation, and we might come up with a question for you.

MS. CARTER: Okay. The first question, though, that was asked was about whether ethylene generated by fruit is the same as ethylene generated by any other process, whether it be a cogenerator or -- the fruit sees it as C2HR, so it sees it as ethylene rather -- no matter how it's generated, that's how the fruit sees it.

And if you would take it to a lab and you had cut a piece of organic fruit up and you cut a conventional piece of fruit up, both of them would be C2H4. Both of them would be ethylene.

Now as far as the catalytic
generator is concerned, that was another question, the way that operates is that the ethanol that is produced comes from non-GMO corn, and so the ethanol is non-GMO derived, and what it is, it's put into a box which has a zeolite -- has zeolite laying in the bottom of the box. The ethanol is sent into the box, and the temperature is raised, and what happens is that when the temperature is raised, CO2 and water is given off, and ethylene is produced.

And so what happens is the zeolite, or the zeolite that's in the bottom of the containers, picks up the water and picks up the CO2 and leaves the ethylene.

MR. DELGADO: Any questions?
Steve.

MR. DeMURI: The TAP reports that were submitted to us indicated there are other methods of manufacture for that?

MS. CARTER: That's correct.

MR. DeMURI: Like crude oil. Do
you use any of those methods?

MS. CARTER: Not that I know of in our industry. I do know that in the banana industry, they do use those other methods, but Ron is right, in our industry, most people use what's called the epogen for conventional ethylene production, and that's for the ethanol process.

I don't know, maybe there's somebody out there in a small company who's doing it, but most of the ones in the Pacific Northwest do use that process.

MR. DAVIS: So just to clarify, in the actual storages where the pears are stored, are most growers purchasing ethylene made from that process, or they actually have converters in the storage that are doing it on site?

MS. CARTER: Most people have converters. Most of the producers in our area use the converters, ethanol --

MR. GONSALVES: No, no, but the
converter is to convert the liquid ethylene into a vapor process that releases the ethylene.

MR. DAVIS: Most growers are starting with ethanol.

MS. CARTER: Yes.

MR. DAVIS: Putting it in the converter on site at the farm.

MS. CARTER: Yes.

MR. DAVIS: Storage area. Okay.

MR. GONSALVES: Yes. So she's clarifying that technical point that I'm not as clear on as far as that.

MR. DELGADO: Kevin.

MR. ENGELBERT: Ron, I had trouble with your statement that the use of ethanol is compatible with organic agriculture. Most consumers walk into a store and purchase a pear, an organic pear, under the assumption that there's a minimum amount of any type of treatment or processing from the time the pear is grown, harvested, and put on that shelf.
How can you explain the reasoning behind the statement?

MR. GONSALVES: Well, again, as Dennis said, and as well as Deborah mentioned, all pears are ripened by ethanol -- by ethylene. All pears are ripened by ethylene, whether that pear produces it itself or whether we trigger that process by putting it in an environment with ethylene generated creating more of an environment for ethylene.

So all pears are producing, all apples are producing its own ethylene for a natural ripening process. And so when I say it's -- it follows that standard is that ethylene is ethylene, as Deborah said, and whether that pear is producing that ethylene and being trapped in a paper bag, or whether we're producing that ethylene in ripening a greater volume of pears, triggering its natural production of ethylene, because it's all a trigger response, and Dennis could probably talk about that more specifically.
But the ethylene is triggering the receptors within that pear to begin the ripening process.

So as that pear stays in storage for that 30 to 40-day period, it's those receptors that are maturing during that period of time that then will then start producing its own ethylene.

What we are saying is that we would like to be in an environment where we can trigger those receptors sooner to allow that ripening to take place earlier in the season so that we can then market organic pears sooner to the consumer, as opposed to having to wait that 30 to 45-day period in regular cold storage.

MR. DELGADO: Any other questions?

MR. DAVIS: I have one.

MR. DELGADO: Gerry.

MR. DAVIS: Pears that are ripened without the use of ethylene for that 30 to 45-day period, their eventual storage ability,
the length of time they will stay in storage,

can you comment to, either one of you, on does

the nonethylene -- does it start the clock to

where they store the same amount of time

either way, you just have a more limited

marketing period? That's the question.

MR. GONSALVES: There's two ways

that we obviously store pears. One is just
cold storage, cold treatment, whereas we're
putting that pear in a 30-degree environment,
we store pears at 30 degrees, 30 to 32
degrees, but primarily 30 degrees.

That temperature is one way we
store pears. The other way we store pears,
organic, conventional, whatever, is under
controlled atmosphere, where you're all
familiar with controlled atmosphere, where we
take the oxygen out of the environment and we
store the pears at a reduced level of oxygen.

So pears have a certain shelf life
is what I think you're getting to, is how we
actually store the pear at the beginning of
the season.

So when we say we hold that pear for 30 to 45 days, that pear is in cold storage basically going through its maturation that it does in normal storage.

Once we begin to pack that pear, then those receptors are more mature and they begin to develop ethylene themselves.

When you break that cold chain is when that ethylene may or may not be triggered in a more rapid way in the sense of that pear ripening a lot faster than if you maintain the cold chain and keep that pear under cold storage.

You can maintain the quality of a pear for about 90 days under just cold storage. Under CA conditions you can probably hold a pear up to seven months.

So, again, how we store and where the cold chain is broken is really when those receptors start to trigger the ripening process. But they have to sit in the 30 to
45-day period just to allow those receptors to mature and that pear be put in position to mature.

If I could just make one quick comment just briefly on pear and apple production.

We can't turn back the clock as far as the amount of pears and apples that are being produced. The Northwest currently is looking at the largest organic apple crop ever produced, and we are looking at large increases on the pear volumes as well.

As we go forward with these productions, we need to keep pace with what is going to allow us to market, to make these products available to the consumer. We have to keep pace to allow that the quality as well as the "eatability" to be marketed to the consumer. Because at the end of each season over the last five years, we run out of pears. The demand for organic pears exceeds the supply that we're currently under. So as more
and more pears become transitioned, is the sole benefit of sustaining the demand that exists currently as we go forward.

And so we need to maintain these tools that are going to allow us to market a quality pear to the consumer.

MR. DELGADO: Okay. We have to move on. Deborah, would you like to go ahead?

Thank you, Ron.

MS. CARTER: As I mentioned, my name is Deborah Carter with Northwest Horticultural Council.

On behalf of the organic pear industry of the West Coast I would like to thank you for the opportunity to speak in support of the petition to allow the use of ethylene on post-harvest ripening pears.

The Northwest Horticultural Council represents the pear grower and shippers of Idaho, Oregon, and Washington on technical matters, national and international policy issues, trade and food safety concerns.
The California Pear Advisory Board has also allowed me to speak on their behalf.

Oregon and Washington produce 84 percent of the pear crop produced in the United States, and if we add California to that, 98 percent of the U.S. pear crop is produced on the West Coast, and so I am representing 98 percent of the pear crop produced in the United States.

California, Oregon, and Washington have about 2,000 organic pear acres, and there are another 700 acres in transition to organic.

In 2007, 2008, these states produced about 17,000 tons of marketable organic pears. The average pear farm is less than 20 acres.

Like tomatoes, avocados, and bananas, pears are climacteric, and that means that there is a marked respiration that accompanies the onset of ripening, so that's the conversion of starch to sugar.
Both the ripening and the increase of climacteric respiration are triggered by endogenous production of ethylene, which is a natural plant hormone, which is what one of the questions was about earlier.

Pears are harvested at a mature but not a ripe stage, which is very different from degreening pineapple and also degreening citrus.

If left on the trees, pears tend to soften from the inside out, so the center will become mushy by the time the outside flesh is ready.

A mature pear ready for harvest is fully formed but still hard. It can require up to two months of cold storage, depending on the variety, to complete the physiological changes that drive the ripening process.

This is particularly true for pear varieties, our winter pear varieties, and that's basically everything of the Barlett cultivar.
Both ripening and respiration processes are stimulated to occur by an exogenous application of ethylene, and sources of ethylene do vary. But no matter the source, whether natural or external, the pear interacts with the molecule of ethylene as C2H4.

Externally applied ethylene set at about 100 parts per million triggers the pear to start producing its own ethylene. So what's ripening the pear is the pear's own ethylene. What we add to it only triggers the pear to start to produce its own.

Now some may suggest that ethylene is not compatible with organic certification, but as we look at ethylene in the organic scheme, we see that the use of ethylene is consistent with organic practices.

The NOSB's definition states that organic agriculture promotes and enhances biologic cycles, and on a molecular scale this is exactly what ethylene does when it triggers
the ripening process in a pear.

In fact, this board has already approved the use of ethylene for degreening organic pineapple, bananas, citrus, as already discussed.

Exogenously applied ethylene causes no adverse effect on the fruit's biological processes. Research has indicated, and it's been reported in our petition, that although exogenous ethylene may be introduced, the fruit has an internal self-limiting step which inhibits too much ethylene from being produced.

Now this is important. Exogenous ethylene is simply the trigger for the fruit to do what it does naturally. Exogenously applied ethylene does not physiologically alter the ripening process which is consistent with organic production.

You may ask why we need ethylene. We know that increased volumes, as Ron mentioned, it allows producers to reach out to
a broader organic consumer. We all know that consumer demands for organic products are growing, and it's grown probably 20 percent per year over the last 10 years.

We know that researchers in Oregon State University have developed a plan to ship pears which are delivered to the market can be ripened to eating quality in about five days, and maintain a normal shelf life, eliminating the consumer guesswork.

But this process is best obtained using exogenously applied ethylene. If ethylene could be used for organic pears, this same process could be implemented providing the organic consumer a better quality product with no guesswork.

And this process also helps the retailer to better manage his stock.

MR. DELGADO: Deborah, your time is up.

MS. CARTER: Thank you very much.

MR. DELGADO: Any questions from
the board? Okay. Thank you very much. Next is Brian Kozisek. After Brian, we have Maury Johnson.

MR. KOZISEK: Hello. I'm Brian Kozisek with the Organic Crop Improvement Association.

We certify approximately 100 grower groups and I'm here to speak a little bit on grower certification. One of the key ideas behind grower certification is that a group operates as a single unit, even though it's made up of discrete individual production units.

They agree with the stated prerequisites and the organizational requirements with a strong emphasis on geographic proximity for the individual units.

While there is strong evidence that supports the use of the square root group size for sampling, we feel that using the square of principle is not effective for groups larger than 100.
One of the reasons is that sample size for inspections can be an effective tool to manage groups that have a struggling internal control system and other issues that contribute to higher risk.

Increasing sample for the inspections based on risk gives a greater assurance that the organic integrity is maintained, but also has the residual effect of placing economic pressures on the group that encourages ICS development and functioning.

For well-managed groups with good ICS, reduced external inspections should contribute to the financial success of the individual operators.

We feel that for these reasons that the lower limit for required sample size be no less than 15 percent, with no established upper limit.

This would be set at the discretion of the certifier. In practice, OCA
typically uses 20 percent as the size of the sample for even established groups, with the idea that all members will have been inspected at least once in a five-year period.

We feel that a good compromise with the minority opinion is to have all new entrants be inspected but to also include this in the count towards the total for the sample size.

It is our belief that a responsible certifier will consider the number of new entrants into a grower group and adjust the risk evaluation for a higher sampling rate as needed.

The use of subunits may be a tool to manage large group size, but it must not be a subunit in name only. The recommendation should establish a maximum size for a subunit and firm criteria, rather than relying on the certifier to establish this.

As a tool for training by the certifier, we recommend that a minimum of
three of the inspections conducted by a new internal control staff be witnessed by the external inspector in the form of witness audits. This way they identify inconsistencies and also serve as a training tool for the ICS.

Any questions?

MR. DELGADO: Questions from the board?

MR. KOZISEK: Okay, thank you.

MR. DELGADO: Thank you very much.

Moving on, we have Maury Johnson, followed by Matthew Johnson.

MR. HOWARD: I'm Luke Howard. I'm here as a representative for Maury from Blue River Hybrids.

Blue River Hybrids is an organic seed company that produces corn and soybeans, organic corn and soybeans, a little bit of red clover, and a little bit of alfalfa. And so we are here to comment on your further guidance on commercial availability of organic
seed.

We want to thank you for your continuing to discuss the important issues of organic seed and organic crop production under the NOP.

There are several comments and points that we would like to make regarding this document.

The first one. Although it is true that for certain species, the supply of organic seed is limited or nonexistent, it should be recognized and noted that some species -- for instance, field corn -- is sufficiently available, and only about 60 to 65 percent of organic corn acres today are planted with organic field corn seeds.

Supplies are available to plant a higher percentage, and if growers used organic rather than conventional seed, that would be available.

Companies and individuals providing conventional seed to the organic
market often have a significant financial incentive to continue marketing conventional rather than organic seed.

Conventional seed is cheaper to produce and involves less risk, and can be sold to the organic marketplace at a lower price and a better profit margin than organic seed.

Point number three. The document correctly notes that there have been issues of substandard organic seed. A first step to correct this problem would be to emphasize that the organic seed must comply with all Federal and state seed laws, especially when it comes to labeling.

We appreciate that the Joint Committee members recognize in the document that the conventional seed business is moving in the direction of biotechnology, and that it is of utmost importance for organic farmers to recognize that by supporting the organic seed suppliers and growers today, they will have a
better and more secure organic seed supply in
the future.

I really want to emphasize the
point that there’s no justifiable excuses for
certifiers to accept not using organic seed.
We appreciate the efforts of the NOSB Joint
Committee to prepare this document and to
consider the public comments that have been
submitted on previous versions.

Because this topic has had such
serious consideration by the NOSB and has been
openly discussed at NOSB meetings, we have
noticed that certifiers and growers are
becoming more responsible in their
consideration and decisions on their use and
availability of organic seed.

I also want to switch hats a
little bit and I have an organic farm on the
eastern shore of Maryland, where we grow about
200 acres of grain and five acres of
vegetables, fresh market vegetables, so we
kind of do both things. And the name of that
farm is Homestead Farms. And my wife and I
own that.

So when I look at the seed issue,
I see two different issues. I see the row
crops issue and I see the vegetables issue.
And when it comes to row crops, and we talk
about different varieties, one of the things
you need to keep in mind is that when we speak
of varieties in corn and soybeans, we talk
about maturity length. And so we really can't
compare Blue River XYZ hybrid to Pioneer ABC
hybrid because if they are in different
maturity length -- if one is a 98 day and the
other one is a 120 day, they really don't
compare. But if they are in the same maturity
length, then really they do compare.

So if one is a 110 day and one is
a 112 day, they are a comparable hybrid.

The other thing to remember is
that in vegetables, a lot of things are done
in taste and texture and consumer driven. And
again, having the five acres of fresh market
vegetables, I know that sometimes a consumer really wants a certain tomato, and if we can't find that organically, we really need to plant that tomato for our marketing aspect.

So those are really two different issues that you need to evaluate as you look at this.

Really, finding organic seed from a corn and soybean standpoint is not impossible and it's not even difficult today. And when we have competitors out there who are marketing conventional seed against some like a Blue River, it really discredits the situation.

Some of the field testing -- as a farmer, I want to say that some of the field testing that goes on to compare organic hybrids against conventional hybrids, I think is a little slanted to one side.

I've been on several farms where they've planted an organic hybrid next to their favorite conventional untreated hybrid,
and they put that organic hybrid in the lowest
spot in the field or the driest spot in the
field to kind of weigh the results. And
that's a little frustrating.

As a grower, I try to do the right
thing.

Another thing, the percent of seed
used on a farm -- and as some of the
discussions were going on earlier, I was
thinking about my own farm and having just
gone through inspection, and at the risk of my
certifier being in the room, I don't want to
get too deep into it, but --

(Laughter.)

-- the question was asked what
percentage of organic seed do I use. Well,
because we have 200 acres of organic field
crops that are all organic seed and we have
five acres of fresh market vegetables, it's an
unfair weighted example.

And so I just caution you going
forward that you reevaluate that. I know you
want probably some sort of measurement tool, but just be careful with that because it would be easy for me to say, well, I plant 200 of my 205 acres organically. So just another point.

MR. DELGADO: Your time is up.

MR. HOWARD: Any questions?

MR. DELGADO: Any questions from the board? That's it. Okay, Jim, followed by Gerry.

MR. SMILLIE: Do you have any other specific comments to make on the recommendation itself? I really appreciated all your comments, and you know, that's where we are headed with this recommendation.

But I mean from your point of view, like, for example, the database, the two-way database, as a seed producer, is there anything in this recommendation that you think needs tweaking as far as your perspective?

MR. HOWARD: I'm glad you brought up the database because I know there have been some comments made in the written statements
that some farmers don't have access to Internet. We do have electricity at my house and we do have a computer, and we do have access to Internet, and I have never used the database.

Really, I don't see that as an important tool for me. Now if it helps 50 or 75 percent of the other farmers, then that's not saying it's a bad tool. But developing that database, I don't think should limit the enforcement of using organic seed. I see it as a tool and I feel like the excuse is being used as a crutch.

MR. DELGADO: Gerry.

MR. DAVIS: So in the sample of your farm that uses all organic seed on 200 acres of grain, and on the 5 percent that is vegetables -- five acres, excuse me -- in your case what the recommendation is calling for is that we would ask your certifier to check with you on the five acres of vegetables to see if you are showing any improvement at all working
towards more organic seed. Do you have an
issue with that?

MR. HOWARD: Yes. You know, as a
producer we evaluate that every year, and I
would say of the vegetable varieties -- I mean
we all kind of know what a market garden is.
You know, it's all these different varieties,
and my wife kind of manages that, so I try not
to get too deep into choosing varieties.

But we know that there are dozens
of varieties, and I would say off the top of
my head, looking down the list of seeds we
bought this year, a third to 40 percent -- I
don't want to say 50 percent because I think
that's stretching it, but I would say over a
third are certified organic seeds.

And, you know, when we want to try
something new, we try it on a very small
scale, try to find it organically; if it's not
available organically we then use it
conventional and treat it. And hopefully with
the seed suppliers that we have in place today
you know, they're pretty gung-ho at producing organic seed, and that's really been very helpful.

I would say five years ago or four years ago, it was a different situation, but today it's a much easier situation. Not perfect, but much easier.

MR. DELGADO: Any other questions?

Thank you very much.

MR. HOWARD: Thank you.

MS. FRANCES: I just want to say one thing. Rick is actually signed up right now. He had himself, so you cut him off at five minutes. I didn't know if you really didn't have anything more to add, or just wanted to say that he was on as a proxy as well as himself. So just to offer that.

MR. DELGADO: Next is Matt Dillon. And I would like to point out for the board members, we are running extremely late. I would like to move on as fast as possible. We do have a total of 27 speakers. We've got 10
wait-listed there, and we might not have time
to go to them, but, please, measure your
questions.

Please proceed, sir.

MR. DILLON: At first I had
comments today, but after this morning's
session when I heard such goodwill towards
organic seed by the committee, I felt the need
to amend my manifesto and maybe tone things
down a bit.

First, I want to thank the board
for their work, particularly the Joint and CAC
Committees. I also want to thank all the
folks here. This is my first time attending,
and your persistence is awe inspiring. It's
something.

While it's my first time here, I'm
not new to organics and I'm not new to seed.
My first organic crop was in 1982 at a
Benedictine monastery where I lived and went
to school in Elkhorn, Nebraska. I bring that
up because in '82, we didn't have NOSB
guidance, but the monks claimed we had divine
guidance --

(Laughter.)

-- and as often as I keep hearing

about us bringing in the devil in the details,

I'm a little nervous about my loss of faith,

and I think I might need that.

(Laughter.)

I also as the director of an

heirloom seed nonprofit, Abundant Life Seed

Foundation and Organic Seed Catalogue, founder

and the current director of Advocacy for the

Organic Seed Alliance, which is an educational

research nonprofit that's published also

things like a guide for on-farm variety

trials, which might be very useful for some

farmers after the last comments.

I am currently also the policy

analyst for the Organic Seed Growers and Trade

Association on whose behalf I am here today.

You heard from Woody Dericks of

the Organic Seed Growers Trade Association
last in the spring, and I'm going to touch on some of his comments, but go further.

First let me say that OSGATA, as we call the Organic Seed Growers and Trade Association, OSGATA develops, protects, and promotes the organic seed trade and its growers and assures that the organic community has access to excellent quality organic seed that's free of contaminants and adapted to the diverse needs of local organic agriculture.

Now we are a new organization starting in January 2009, but already very diverse with plant readers, seed producers, seed companies, and 47 members at present, a variety of scale from people like Blue River and Seeds of Change to people like Judy Owsowitz in Montana and Brian Campbell in Washington, who are seed producers but also fresh market producers, producing dozens -- Judy produces 78 different varieties of fresh market crops. So we are a diverse group.

So I first want to talk about the
reasons to use organic seed, and Joe did a
good job of that this morning, but I just want
to touch on it real quickly. There are three,
as I see it.

One is because it's the rule.

It's the NOP rule, and the producers need to
use the seed with some allowance, and also
there's also the approved 2005 guidance
recommendations requiring full reporting of
allowances to use nonorganic seed.

Second, because of contamination.

By contamination I don't just mean transgenic,
I also mean chemical contamination. If you
lived in my neck of the woods, where the vast
majority of the world's veg seed is produced,
you would see the chemical contamination
occurring in our waterways, and I'm happy to
provide anybody with an Excel spreadsheet of
some very toxic chemicals that go into
conventional seed production.

There's also transgenic
contamination, and at present the seed we are
planting in our fields, particularly in corn, is helping to contaminate organic food products, both from the conventional seed and also some of the organic seed companies are releasing conventional lines are releasing conventional and knowingly selling contaminated seed. And there are no rules to prevent that.

Third, really the most important reason is the benefit. And the benefit is multiple. It's a benefit primarily to organic producers. It's also a benefit to the markets, and it's really a benefit to the overall spirit of the organic rule and organic integrity.

Now that said, as an association we recognize the need for allowances to plant conventional untreated seed. We understand the folly of drop-dead deadlines, and do not support restricting usage to European style registry that would damage genetic diversity.

And obviously the organic seed
sector would not profit by growers losing
their certification or leaving certification
altogether because of the rules. We want this
to work for one and all.

And as such, we are happy to hear
the recommendations, but we really think we
need to continue to work together on
implementation.

To the recommendations at hand:

Enforcement. We support the recommendation of
the committees that the NOP auditors better
monitor the ACA's use of exemptions.

We also support reporting
percentage use but with some caveats that I
don't think I'll have time to get to, and we
do see that with that reporting of the ACAs,
it needs to be a full reporting of all
varieties for which there is an allowance.

Data collection. The database,
the two-way database is a great idea, it needs
to have crop variety and treat data, not just
variety name data.
Third, on the buyers of organic products --

MR. DELGADO: Your time is up.

MR. DILLON: The last minute went fast. Questions?

MR. DELGADO: Questions? Yes, Julie.

MS. WEISMAN: You went through really quickly, and I appreciate why you did that, because you were trying to get everything in, but I just want to -- when you were talking about transgenic contamination, can you repeat more slowly the part that came there's no rule for that? Can you repeat slowly the --

MR. DILLON: Well, there's currently a rule on transgenic seed, correct, biotech seed, that's currently in the rule. A farmer, an organic farmer cannot plant genetically modified transgenic seed. However, it's being done. The way it's being done is that our corn lines are
contaminated with transgenic. The conventional lines that we're using to create organic lines, as well as the conventional seed that's being planted by organic farmers who are not using the organic seed that Blue River is producing.

And that seed then gets, you know, into the fields and into organic products. So the seed industry is helping contaminate organically.

Seed companies are not required to report to their customers that they don't test for contamination. Last year there was a sweet corn variety tested positive for contamination. One seed company came forward and reported that hybrid variety had been contaminated and pulled it. The other seed companies who bought from that producer did not.

So organic farmers planted contaminated organic sweet corn seed last year. There's nothing to stop that. Seed
companies are not required to reveal that, but it's breaking the rule, and the farmers are now planting transgenic seed.

We're going to be back here again. I mean this exemption -- that regulatory piece is one piece where there's been great effort to move forward. I applaud that. And we need to all work together to continue to work on the regulatory piece.

But we need a seed task force because there are so many complexities, as Luke pointed out, crop-specific complexities, technology complexities in producing hybrid seed, complexities of contamination.

And the seed issue is not going to go away just with these recommendations. We went over it with the ACAs and the farmers to work on solutions together.

MR. DELGADO: Any other questions?

All right, Gerry.

MR. DAVIS: In the public comments, it was brought up about foundation
seed and a request to be able to use treated seed from foundation seed growers. Do you have any comments on that?

MR. DILLON: I think that is a slippery slope. I think it's pretty clear that is not allowed, again it's using conventional seed and it's not supporting the organic industry.

I think particularly in corn there is plenty of public material in red lines available. It's not an issue of availability of germplasm, and so I see no reason for that exemption.

Any other questions?

MR. DELGADO: Any other questions?

MR. DILLON: Okay. Thank you all for your work.

MR. DELGADO: Thank you. Next is Marc Cool, followed by DeEtta Bilek.

MR. COOL: Hi, everybody. My name is Marc Cool with Seasons Change of Santa Fe, New Mexico. I would like to thank the board
and program for allowing us to continue to talk with the seed issue here.

I'll talk about the commercial supply of organic seed.

I put a couple of comments on the Web, on your site. You can read those and talk a little bit more about some other things here.

First of all, it was said today earlier by Joe why we need organic seed, and frankly, ditto. That's the whole story right there. So thanks, Joe, for that.

You also mentioned shared pain. I would like to say that I see it much more as shared gain. If there's more organic seed being used because of regulations and enforcements, that's going to drive the organic seed industry. They will produce more organic seed of specific varieties for growers who will be more successful in the enterprise, producing higher quality products for the end consumer, who then has confidence in the
organic business.

In my mind, that is a gain that we are trying to push here from the beginning, the first link of the food chain, which is seed, indeed. So that's how I see it.

The recommendation as put forth in my mind with one small exception is quite good, and I thank the two committees, Gerry and Joe, for doing that, with everyone that helped with that.

You clearly understand the issue, you describe it very well, you know all the pluses and minuses. You have heard all the stakeholders. We've had a number of meetings here. We've talked about this issue. You have voted as two committees very often to support the recommendation. It's not yet passed the full NOSB board.

And on the one hand, it's a little disappointing because it's taken so much. On the other hand, due process has been followed and public comment has been heard, and there's
been slight modifications made to the recommendation to comply with all the requests and needs of all the different stakeholders.

I believe we are there now, and I would strongly encourage the full board tomorrow to vote in favor of this current Joint Committee proposal.

One thing I would like to add is -- I'm not sure if this is intentionally left out or just purposely -- is that in the two-way reporting section, it talks about -- it no longer talks about the requirements to report derogations.

I feel that if there is on the OSP a list of varieties which are being planted by a grower which are not organic and there is justification to the certifier in their communication on why they are not using organic varieties, I believe that information should be written down and it should also be passed to an organization or in some fashion to NOP, and we could talk in detail about what
that is, but that opportunity list, as we've
called it often, is in my mind very important
to show the organic industry what organic seed
varieties growers want, and therefore what we
need to do in our development or to achieve
that.

So I'd like to ask if that
reporting requirement of derogations could be
reincluded before you vote on that tomorrow.

There's a couple of comments that
have been made in the last couple of days I'd
like to I guess respond to.

One is about biodiversity in
organic. I very strongly -- in fact, in our
company biodiversity is part of our mission
statement. I very strongly want to encourage
biodiversity.

In fact, as I have explained last
May, a very important part of what I see as
the future organic seed industry is developing
organic specific varieties which use
biodiversity available from the past as a way
to bring genes back in that will allow plants
to be adapted to low input conditions and also
have end consumer trades that are very
valuable.

So biodiversity, in my mind, and
organics actually go hand in hand, and they
are not at all in conflict with each other.

A comment was made also that
certification done by certifiers on farms in
many cases is -- it's kind of scary, frankly,
to say --- in many cases it's done on a basis
of has process been followed versus has every
single variety been looked at to determine if
it's organic or not. That, frankly, is wrong.
Every single input, as we all know, on an
organic farm has to comply with organic
standards, including every single variety.

That clearly, to me, is the
current rule and the way it should happen.

People have said there's a large
number of varieties available for farmers, and
many farmers plant a large number of
varieties. Absolutely true.

It doesn't mean, however, it's
difficult for farmers to write down on their
OSP what varieties they use. Farmers know
exactly what varieties they use. They write
it down all the time. They know exactly what
they used last year, the year before, next
year, et cetera. Writing down what they are
using is not a big deal at all.

Organic seed supplies have
increased. Two years ago I commented to the
board that less than 1 percent of fruit and
vegetables organic farms were using organic
seed. That's not somewhere up towards 5 and
6 percent. It's improving; it's doing better.
But after six years, we can still do a lot
better, in my opinion.

So I'd like to ask you to please
vote in favor of this recommendation. What we
will then do as a seed industry is work with
program, work with ACAs, work with growers,
work with yourselves to find a way to
accomplish the goals that you put forth, and then you can move on in your deliberations onto a lot of other important issues.

So with that, thank you, and I have a few questions.

MR. DELGADO: Joe.

MR. SMILLIE: Yes. Marc, the section you're referring to on reporting of -- I love that European word, derogations. We often get compared to the Europeans, and you know, sometimes we don't realize that the role of derogations in the European system is a fairly interesting topic. But that's a different topic.

We are on 5(d) right now. Val, could you put that one up there for everyone, on the CA document, 5(d).

MS. FRANCES: Oh, okay.

MR. SMILLIE: And I've got to ask help from Gerry and Jeff on this, because basically what was said in the earlier recommendation was maintain and submit upon
request to the National Organic Program crop
varieties permitted by each agency.

We struck "crop varieties
permitted by each agency" and substituted
"maintain and submit upon request to the
National Organic Program documentation of the
organic seed usage status current percent
levels as compared to historic levels of usage
by acre of each certified operator."

MR. DAVIS: I'm taking your
question as concerning why don't we have a
specific reporting to the program on what all
these varieties are and so forth in there any
more? Is that what you're saying?

MR. SMILLIE: I think what Marc is
after -- and correct me if I'm wrong, Marc --
is like lots of -- well, what were the
allowances made? What seed was granted
permission -- what varieties were granted
permission to be used conventionally rather
than organically?

And your reason for that, Marc, is
to try and get a fix on --

MR. COOL: Opportunities, demands.

MR. DELGADO: Jim.

MR. MOYER: Well, two things, Joe, that came up. At the last meeting, the ACAs and the growers, they said that's too much work for both sides to handle. So I was wondering --

MR. DAVIS: And the program.

MR. MOYER: Not the programmers, the ACAs and the growers.

MR. DAVIS: No, no, the program also.

MR. MOYER: Well, and the program.

Everybody pushed back on that and said that was a lot of extra work, a lot of extra paperwork. Growers that we spoke to also said it's not their job to do their job for marketing. If you want to find out what growers want, you go ask them. It's not their job to make this list of opportunities for the seed industry.
So we got pushback in a lot of different areas, and so we came to this decision that within the context of what we're trying to do, which is grow the entire seed industry, checking percentages is an easier way for everybody to say I know whether I do 100 percent of my seed as organic, I don't have to write anything down except 100 percent. I know I'm doing 50 percent or 10 percent. I mean we know what that is, and it's very easy for everybody to track that across the board.

Unless you get to the point where there's somebody willing to handle a database, then that would work. But to this point in time nobody has stepped up and said we're going to fund the opportunity -- that database which would then create that opportunity list.

MR. COOL: Is there a question there for me somewhere?

(Laughter.)

MR. DAVIS: Are you a sharing
company? Are you going to share some of that
--

MR. COOL: I'm not sure if it was
May this year or November last year or some
other time, I actually did offer to help with
the program on the database. I believe that's
a huge deal. I believe it's really
straightforward. I'll bet 10 bucks that we
can get Anita's coalition together to help
with that if necessary in both resources and
everything else.

MR. DELGADO: Jerry?

MR. DAVIS: From the committee's
point of view, the Crops Committee at least,
that is what we attempted to hand to you in
the last version of this in previous meetings.
The industry -- because the NOP said that it's
not our role, that is not -- it's just going
to get -- it's go nowhere. They have told us
repeatedly that is going nowhere for the
program to administer that database.

So we didn't want the important
step of improving organic seed availability
hindered by the program saying this isn't
going anywhere.

So we came out with a second step
of, okay, let's see if the industry will fund
it and have a third party such as OMRI or
someone like that do the leg work with the
organic seed industry to fund it. It went
nowhere. No one made any comments at the last
meeting to step up to the plate to say, yes,
we'll do that.

Maybe you guys weren't ready yet,
it was too soon, but that's what we perceive
as what happened.

MR. DELGADO: Tracy.

MS. MIEDEMA: I just think we need
to be very frank here about basic economics
and supply and demand requires transparency.
And the certifiers have come back to us loud
and clear that it is overly burdensome, really
put their foot down at the last two meetings,
that they do not want to report back that
information, it's just overly cumbersome. And without transparency to match up buyers and sellers in any economic model, you have failure.

I think our failure to develop organic seed is evidence that we just don't have transparency. This recommendation doesn't get us there, either, on that one point of transparency. To answer his question very specifically, yes, it was left out deliberately because it got killed by certifiers in the last two meetings.

MR. COOL: Could I respond to that very briefly?

MR. DELGADO: Please respond very quickly.

MR. COOL: So I'm not asking that we develop a database tomorrow. I'm saying I think in the recommendation that we work towards a database with all stakeholders, I think would be a good direction.

MR. DELGADO: Thank you very much.
DeEtta Bilek, and after that we'll have a short break to recover.

MS. BILEK: I want to thank you for this opportunity. I am DeEtta Bilek. I am an organic farmer from Minnesota, and I am currently the second vice president of the OCIA International Board of Directors.

I also chair the Education Committee for the Minnesota Chapter, and our farmer members would disagree with what has been stated here, that there's plenty of corn available to them.

They live in northwest Minnesota, so the climate is definitely different than out east or in Nebraska, and they have not been able to find short season specialty corn, they tell us. They talk about soybean qualities that they can plant there for seed.

So they have brought this concern to the chapter committee, and then we brought it to the International Seed Committee for their discussion.
We also discovered that OCIA International does certify Blue River hybrids, and they certify Lakeland organic seed.

A Lakeland organic seed member has brought forward that they are not able to find foundation seed stock in qualities with diversity that they can produce seed for organic farmers.

So I'd have to disagree a little bit with -- or I'm kind of the opposite of a couple of the speakers prior to me.

OCIA International is a certification agency based in Nebraska. We have been operating for more than 20 years. We certify nearly 1500 chapter members in the U.S. and Canada, plus 700 direct associates, and of those Blue River and Lakeland organic seeds as licensed seed producers for organic corn.

We agree with NOSB that further development of the organic seed industry is key to increasing commercial availability of
organically grown seeds and subsequent increased usage by growers.

While OCIA supports the draft recommendation, we believe that an important issue has not been addressed, and that is being the seed sourcing for seed producers.

Seed companies purchase foundation seed varieties that they cross-breed to produce various hybrids which are harvested and processed for resale the following year. So they have one year to provide seed to farmers.

Several regional seed companies that provide the germplasm and treats have been purchased so now there are only a few remaining that are providing that form in an untreated form for the seed producers.

Nearly all foundation seed stock purchased for seed production has been treated with material that is currently prohibited by NOP. These treatments that are mentioned by our committee are names like Captain and
Apron. They are fungicides and insecticides that are used to protect seed from seed diseases, including seed rot.

There is a statement that's in my full -- in our full comment from Walter Goldstein that indicates minimal adverse ecological effects from these treatments.

Maury Johnson from Blue River has a statement in our full comment. Also he has stated that the seed stock landscape has changed a lot in the last two to five years.

This concern was brought to NOSB a number of years ago. I think, if I remember right, it was 2001, so it is from what our seed producers are telling us, it's more of a concern now than ever.

Seed grower Ray Boughton of Lakeland Seeds states that the organic seed producer has a very limited access to quality nontreated seed.

Our concern is that as long as organic seed producers can only use untreated
seed stock, most foundation seed continues to be available only as treated, organic hybrid developers and organic producers will be very limited in their hybrid selections.

Organic farmers are allowed to plant untreated seed which was grown by conventional seed companies, using treated foundation seed stock commercial fertilizers and chemical pesticides. And this is what Jim Riddle mentioned yesterday.

This is a very unrealistic situation for the organic seed producer. So we are asking that you consider changing 205, 204, to allow treated seed stock.

Thank you.

MR. DELGADO: Thank you. Any questions? Thank you very much.

We are due for a well-deserved break. We are halfway there with the list of speakers, and I would ask you to come back promptly in 20 minutes from now -- five. (Laughter.)
I will say let's do 10.

(Recess.)

MR. DELGADO: Let's start with public comment. Board members, please.

Robin.

MS. ALLAN: In the interest of time, I'm going to read this, and I'll try to do it fast.

Thank you to the board for this opportunity to comment, to all of the committees for all their hard work on all these important topics.

My name is Robin Allan. I'm the grower and livestock certification supervisor with CCOF, an accredited certification agency based out of Santa Cruz, California.

I would like to comment today on behalf of CCOF on three subjects -- biodiversity, commercial availability of organic seed, and 100 percent organic labeling.

First, biodiversity. Of course,
CCOF supports the preservation of biodiversity in organic farm systems. We agree with the Wild Farm Alliance that the NOP regulations as written require organic farmers to protect and preserve biodiversity and preserve natural resources.

In the pursuit of this goal, CCOF includes questions in our inspection reports that specifically address biodiversity issues, and we have been communicating with our clients the need to take biodiversity issues into consideration in their farming systems.

While we agree with the stated goal of the committee discussion paper to improve and increase biodiversity conservation, we do not agree with the No. 2 under the section titled "Main Points of Possible Recommendation," which points the way to biodiversity conservation through the development and implementation of a template organic system plan.

Each accredited certification
agency develops their own organic system plan documents, which are approved by the NOP via the accreditation process.

Requiring specific questions or wording for organic system plans regarding biodiversity would circumvent this process and create additional paperwork burdens for certifiers and growers which are not justified at this time.

The contents of the organic system plan should be left to the certifier to develop and should continue to be approved through the accreditation process and not through additional regulations that mandate specific language to be used.

It is important to note the biodiversity concerns often intersect with other laws, regulations, or industry agreements, such as the California Leafy Greens Marketing Agreement.

While it is important to take biodiversity concern into consideration, it is
also essential that we do not put growers into a catch-22 position by forcing conditions for organic certification which are in direct contradiction with other production requirements.

Again, I reiterate CCOF's support for increased attention to the biodiversity concerns and organic production, and we will comply with any requirements imposed by the NOP equally on all certifiers.

We strongly urge the NOP to notify all certifiers at the same time in writing of any new requirements.

Second, I would like to comment on the document titled "Further Guidance on Commercial Availability of Organic Seed," dated September 22nd.

CCOF is grateful to the committee for the time and effort that they have obviously put into considering the comments they have received on the previous version of this document. We appreciate the revisions
made and believe that this version is a step in the right direction.

CCOF continues to support the growth and development of the organic seed industry, and we are pleased to see the efforts made on multiple fronts to encourage more use of organic seed by organic growers.

While it is clear to us that this version of the guidance is an improvement over the previous version, the recommendation still appears to be based on a few fundamental assumptions that are incorrect.

While the recommendation states that the committee "acknowledges that only a small proportion of the seed currently used by organic growers is certified organically grown seed," CCOF questions the validity of this assumption. Many of our growers are purchasing all or most of their seed from organic sources or growing and seeding their organic seed.

We also strongly disagree that
comparing the percent of organic seed used from year to year is a legitimate or accurate way to measure the increase in the use of organic seed.

Many of our farmers plant 100 if not more varieties of seed each year, and if a grower changes varieties or changes the crops they're planting altogether, comparing whether or not the seed is organic from year to year does not give you an accurate picture of whether or not the grower is properly seeking out organic seed.

We strongly caution against relying on this information to determine a grower's compliance with the regulation.

I have a proxy also.

While we do not think that percentages are a way to get an accurate reading on the state of the organic seed industry, we do recognize that obtaining information on organic seed use will require an increased paperwork burden on the part of
organic growers and accredited certifiers, and we are willing to collect and report the data needed if it is required of all certifiers. We believe organic seed use is an important part of certification, and we all need to do our part to encourage the use of organic seed by organic growers.

Another flawed assumption in this document is that certifiers are approving the use of nonorganic seed for each variety of seed used. Certifiers cannot possibly do this.

Instead we approve the producers' management plan for seeking organic seeds in the marketplace.

While on-site inspectors review the documentation for all seed purchased, requiring explicit certifier approval for all varieties would create a mass burden for certification agencies. It would unduly affect small farmers who plant a large number of different seed varieties.
As was mentioned earlier today, there is an inevitable burden to be shared by all members, including growers, the NOP, and certifiers.

It is the ACA's job to review and inspect and certify the management system of growers, and if the grower describes in their organic system plan their method of seeking organic seed and determining when it is not commercially available, certifiers should not be expected to individually approve specific varieties.

So, finally, as a proxy for Jody Bergeal -- she's Jeff's handler certification supervisor -- I'm going to comment on the recommended guidelines for the use of packaging and processing aids with products labeled and sold as 100 percent organic.

The 100 percent category is unique to the NOP, and the level of complexity required to implement is avoided under other organic standards that do not include this
CCOF often wonders if continuing to allow the 100 percent organic claim is worth the time and energy we spend interpreting it.

However, since the provisions of the 100 percent organic labeling claim do currently exist, it is essential that all stakeholders be completely clear with what the requirements for its use are.

The small business owner who would like to use the 100 percent organic label on their product cannot be expected to meet a standard that is so complex and convoluted as to require high levels of research to understand.

The level of complexity in the proposed guidelines and lack of understanding in the marketplace makes the certifiers' jobs much more difficult as we must then spend time untangling the knots of regulation for our clients in order to allow them to comply.
CCOF feels that the recommended guidelines, while thorough and knowledgeable, are focused on some points that confuse the issue instead of clarifying it. Including information about several other regulations and their interaction with the organic standards is unnecessary.

NOP regulation section 205.301 says nothing may be used to produce a 100 percent organic product except organic ingredients and processing aids.

Therefore, we understand that all components of a 100 percent organic product, regardless of function, must be organic in order for the product to be labeled as a 100 percent organic, and no synthetic or nonorganic processing aids may be used.

Any additional nonorganic material, whether defined as a processing aid, an additive, a sanitizer, a microbial, would preclude the product from being called 100 percent organic.
Therefore, there is no need in the recommendation to differentiate between processing aids, antimicrobials, sanitizers, or additives, as the regulation does not distinguish between these classes of materials.

The spirit of the 100 percent organic category was intended for unadulterated, unprocessed product. Continuing the use of our current interpretation would assure consumers the the products they are purchasing are free of all nonorganic materials.

CCOF presents this step toward consistency in certifying to the 100 percent labeling category. However, we suggest taking a deep breath and a step back and simplifying the approach.

We are glad to hear that the committee has taken the previous public comment into account and may reconsider the current recommendation.
Additional changes to the recommendation should be based on the tenets of the NOP, not on other food safety or production regulations.

They should consider the spirit and philosophy in which the NOP and OFPA were written and be comprehensible by organic operators and consumers.

In the long term we should ask ourselves if the 100 percent organic claim is worth the time and energy spent interpreting it.

Please see our written comments for further discussion on this issue.

Thank you very much for your time.

MR. DELGADO: Any questions?

Julie.

MS. WEISMAN: Well, I think you're very clear about the use of sanitizer -- your position about sanitizers in the 100 percent claim for retail packaged products. Do you have -- do you look at differently how it
impacts say on farm processing?

MS. ALLAN: We do. We don't -- if it's not going to -- if that product is not going to be labeled as 100 percent organic, we don't feel that the use of sanitizers or microbials is an issue in the post-harvest handling.

MR. DELGADO: Any other questions? Hugh.

MR. KARREMAN: I'm not sure if I heard it or not, did you speak at all on animal husbandry?

MS. ALLAN: No. I don't have anything to say about that.

MR. SMILLIE: I want to thank you and CCOF for supporting the commercial availability and being willing to do your share to carry the load. I really appreciate that from accredited certifiers.

Your comments on the 100 percent, I couldn't agree more. I think that, you know, we're going to go back and look at it,
and I think one of the things we will suggest is just eliminating it because the candle doesn't seem to be worth the flame in this case.

But we have to also provide alternatives, and we would like to get some input from CCOF, especially on the post-harvest handling part of it rather than the processing. And again, that's the mistake -- one of the mistakes we made in the document as not sufficiently -- you know, the difference between post-harvest handling and processing is there, and you guys do a lot of that, so we'll look forward to working with you to get some comments specifically on that.

You said that the sanitizers, the microbials basically if they are not making a 100 percent claim, could you just go through what you said there again in answer to Julie's question?

MS. ALLAN: Sure. I guess what I'm saying is I'm referencing when you're
calculating a percentage of organic product. I'm assuming that's what your question was going toward.

MR. SMILLIE: Right.

MS. ALLAN: That if that individual ingredient is not being labeled as 100 percent organic, it's going into a final product, we don't have a problem assuming that that is a 100 percent product.

MR. SMILLIE: Got it.

MR. DELGADO: Bea.

MS. JAMES: You mentioned that you thought -- CCOF feels that the 100 percent claim should just be eliminated, it's too complicated. It was intended for unadulterated products like -- give me an example. Are there still some out there? I mean you're basically saying like produce and nothing really -- or your standards qualify for that anymore?

MS. ALLAN: No, I think there are definitely products that can meet the 100
percent requirements. I think that we're talking about the spirit of it, and I think that's what we're trying to say, is you don't necessarily need a 100 percent -- you don't need highly processed products to be able to be labeled as 100 percent organic. And that is okay if we don't have that.

MR. DELGADO: Any other questions?

Thank you very much.

MS. ALLAN: Thank you.

MR. DELGADO: Next is Kelly Shea, followed by Coni Francis.

MS. SHEA: Hi, there. I'm Kelly Shea with White Wave Foods, and you know us as Horizon Organic Dairy and Silk Soy Milk.

Mr. Chair, in the interest of time, if the board members would review the written comments that we submitted, I would be willing to not take my full five minutes up here.

Instead, I just want to thank the NOSB, both past NOSB boards and present NOSB
board, for the work that you have done around
the pasture rulemaking.

I sat down and looked a little
back in history, and do you realize that
beginning in 1994, with subsequent work in
'95, '98, 2000, 2001, twice in 2005, and then
again with the ANPR in the symposium in April
2006, this board has attempted to help USDA
and help the community address this issue?

So I thank you very much for not
giving up.

We have finally a proposed rule on
pasture we can celebrate. It's not perfect,
but I think it will be a very, very workable
rule.

As well, we are not looking for an
extension on this, and I know that this
rulemaking is not in your hands, but I really
do want to think this board for everything
they've done.

I think we also commend the USDA
for their stated intent to begin further
rulemaking to deal with the uneven playing
field on original of livestock in the rule.
So we are going to continue to
follow that as well, and we are asking the
NOSB that you would as well continue to follow
that issue, and urge the USDA to move forward
with the next piece of rulemaking that we're
waiting for.

Okay. So thank you guys for
everything you do. I know it's a lot of hard,
rough hours, and we really appreciate it.

MR. DELGADO: Thank you. Any
questions? Thanks. Moving on then to Coni
Francis, followed by Rich Theuer.

MS. FRANCIS: I think Valerie is
putting up my little presentation for you, but
I can start with saying that my name is Coni
Francis, and I represent GTC Nutrition. GTC
Nutrition is a manufacturer and supplier of
science-based nutritional ingredients to the
traditional and organic food markets, and one
of the things that I want to do is to thank
the board for the opportunity to comment today, and I especially want to thank the Handling Committee for all their hard work in reviewing the petition materials. I know that this takes a lot of your time, and I know you take your work very seriously.

My comment is on calcium from seaweed, and although yesterday we did hear comments regarding the thoroughness of the review process in regards to the manufacturing of petition materials, in my experience the Handling Committee is quite thorough in their review process and, in fact, they look very seriously at the manufacturing of the materials that are petitioned.

In addition, the material, the calcium from seaweed, has undergone GRAS review, which requires extensive manufacturing information and has received a "no questions" letter from GRAS with the petition GRN-00028.

Further, this material has been certified by the Organic Trust, Ltd., which is
an EU organic body that is there, and if we
could go to the next slide.

The petition material is calcium
that comes from a seaweed. It's produced
actually from a red algae, lithothamnium, and
it grows for about four to five years in the
ocean naturally. It absorbs the essential
minerals and nutrients from the sea, and then
when it is mineralized, the portion drops to
the ocean floor and then it's harvested,
washed, and milled for use as an ingredient in
foods.

The composition of this substance
is over 95 percent minerals. The rest is
essentially moisture that's there.

The mineralized seaweed, in fact,
is a very positive organism in terms of the
fact that this is a very sustainable process
because we don't touch the living seaweed. We
only take that that has died, and so it
continues to produce, and we aren't, you know,
touching them by plant at all.
If I could go to the next slide.

So just to give you a real quick history of the petition for those of you who didn't sit on the Handling Committee, in the spring of 2007 we did send this petition in and asked that it be put on the national list. We asked for it specifically because we weren't sure where to place it and wanted to make sure that we were putting it in the right place.

In September of 2008, it was reviewed by the Handling Committee -- if you'd go to next slide -- and the Handling Committee, as you heard here today, believes that this is a nutrient mineral in accordance with 21 CFR 104.2, and they recommend that this petition doesn't need to be considered and it is currently allowed through the existing things in the 205.605(b).

The next two slides that I have will show you just some composition data so that you can see. The first is looking at
cations and anions, and you can see that largely it is calcium that we are looking at, with small amounts of other minerals that are there.

And then the next slide. This just shows in terms of daily contribution. Since most manufacturers will be using this product to provide either a good or an excellent source of calcium in their product, what you would likely see is that they are going to be looking at that 10 or 20 percent level of calcium, and therefore, as you can see here, if we have a good source of calcium, that's going to provide about 10 percent calcium, and really the only other nutrient that's going to be in very large amounts would be iodine at 7 percent, and an excellent source, you're going to have calcium at 20 percent and iodine at less than 15 percent. So it is largely calcium that we are talking about.

Next slide, please.
So, in summary, this is mainly a source of calcium. We appreciate the consideration of this material, and we want to applaud the Handling Committee for their recommendation not to crowd the list with materials that are already covered under another category. And we feel that it has been correctly classified and support what the Handling Committee has recommended.

Are there any questions?

MR. DELGADO: Any questions?

Okay, thanks very much.

MS. FRANCIS: Thank you.

MR. DELGADO: We now have Rich Theuer, followed by Lynn Coody.

MR. THEUER: Thank you very much for hanging in. I admire your stamina and applaud your dedication.

As you may know, I am Rich Theuer, and I have a presentation.

The reason I am coming to talk to you today is basically to bring to your
attention to the NOP an issue relating to micronutrients in organic crop production.

There currently is a section in the rule 205.601(j) that I believe is being misinterpreted by all of the certifiers, or at least many of them, and since we work on the paradigm that healthy soil creates healthy plants that create healthy animals, we should think of that as we go through what I have to say.

This is the regulation. It describes micronutrients, and then gets into two, Roman numeral I and Roman numeral II.

Can I have the next?

If you look at this, the J61 and J62 mention specific nutrients. Most certifiers are interpreting the 1 and 2 as constituting list of allowed synthetic micronutrients. And the question, the basic question, are those the only specific micronutrients, the ones mentioned, are they the only ones allowed, or do these
subparagraphs pertain simply to the mentioned micronutrients?

In other words, where it says -- it lists zinc and a bunch of others, it doesn't mention, for example, nickle, and nickle is an essential nutrient.

Can I have the next one.

In the regulatory world, for fertilizers, part 205 governs organic crop production, but fertilizers are regulated on a state-by-state basis, not by the Federal government, and AAPFCO, the American Association of Plant Food Control Officials, is the one that establishes standards for fertilizer.

Could I have the next.

In their terms, in their standards, they have this particular definition, and I would like to call your attention to two things:

One, it's essential for the normal growth of plants -- they're agronomists, and
they don't mention animals. And they mention certain nutrients that they consider the microplant nutrients.

Can I have the next.

Well, we got two problems. One is a fuzzy definition of a micronutrient. J6 talks to soil, the fish, and the sea. The AAPFCO standard talks to microplant nutrients essential for the normal growth of plants.

So what micronutrients are we talking about in the regulation?

The other thing is that there's a conflicting list of allowable micronutrients where the rule is inconsistent with the AAPFCO fertilizer standard.

Could I have the next.

So what should be the definition of micronutrient? Is it a nutrient needed in micro amounts for normal growth of plants? Is it also a nutrient needed in micro amounts for the normal growth of animals and humans consuming the plants?
The example there is selenium, which is actually in the rule.

Now 205.601, you refer to soil deficiency, you do not refer to plant deficiency. That gives me hope that we are talking also about the animals that eat the plants, not just the plants.

Can I have the next.

You also have conflicting lists, that they're not the same.

Could I have the next.

These are okay. Chlorine, you get enough naturally, you don't need synthetic.

Next.

These are the same. Sodium, again it's like chlorine.

But now we get to four nutrients in the next slide -- cobalt, selenium, nickel, and iodine.

Cobalt is listed in both places, but if you apply a standard that what is enough for a plant is enough, you're going --
you can have a problem with the animals consuming the pasture, sheep, livestock, ruminants, and so you can have wonderful pasture and dead sheep. And that can occur.

On selenium, somehow the selenium is mentioned in 205.601. It's not listed in the AAPFCO standard. There are some hints that it might be important for plants, but the other side would be it's definitely needed for animals, so I have to talk to the AAPFCO next. I have already been in correspondence with them.

Nickle is not on your list in the NOP, in the rule, but AAPFCO approved it a year ago.

And iodine is not in either. Can I have the next.

And so nickle is essential according to AAPFCO. It's a documented deficiency. Certifiers are not permitting organic growers to use nickle supplemented fertilizers when soil deficiency is
documented.

   Why? J6 is considered an exclusive list. If it's not on the list, they're saying, no, you can't have it, even if it's documented.

   The next is iodine. And that's -- I'm a nutritionist by training. There's a goiter belt in the United States, cretinism is a source of mental retardation.

   OMRI last week just dropped iodine from its listing of acceptable micronutrients. Why? Because the provisions of this rule are considered an exclusive list. If it's not in the list, the certifiers are using that as their exclusive list in forbidding any other additions. And I thought both the Secretary and his representatives should know it, and I thought it would be useful for you to be aware of that as well.

   Thank you.

   MR. SMILLIE: I think we've been
around this before, right, in the gums issue.

And I thought the intention of the board at that point was that if it's -- that your interpretation of what the certifiers are interpreting is correct. This is an exclusive list, because it doesn't say "including but not limited to" kind of language.

But, Dan, I'll defer to you on it.

MR. DELGADO: Dan.

MR. GIACOMINI: The one thing that I would like would be the language that had been in the list originally with the animal mineral listing and see how that language compared. I really don't know where it stands right now, and it would be up to interpretation, you know.

MR. THEUER: In the absence of the Roman numeral I and Roman numeral II sections, the deficiency is documented. So if you just take the 6 without subparagraph I and II, it would actually not be an exclusive.

Thank you.
MR. DELGADO: Any other questions?

Next we have Lynn Coody, followed by Lynn Clarkson.

MS. COODY: Hi, everyone. I'm here to talk today about biodiversity. I'm presenting testimony for the Wild Farm Alliance.

Wild Farm Alliance is a California-based organization working to promote healthy viable agriculture that protects and restores wild nature.

Our activities in the realm of organic agriculture are varied and include publication of two booklets on biodiversity conservation, which I brought copies of if anybody would like to see them. I've brought them here before, but if you'd take a closer look, you may.

They're also available on the Web site free, and they'll be happy to send you copies if you'd like copies of it. They'd like to distribute them widely.
The latest publication is a document that contains specific suggestions about differentiating major and minor noncompliances related to implementation of the biodiversity standard, so it's very specific.

Wild Farm Alliance would like to express thanks to the NOSB's Joint Committee for its discussion paper on biodiversity, and to the NOSB as a whole for taking action on the points we presented in our public comments during the board's meeting last May.

Today I would like to present comments on four topics raised in the Joint Committee's discussion paper.

So the first topic is considering biodiversity during the materials review process. Wild Farm Alliance concurs with the Joint Committee's recommendation that NOSB fully implement a decision made by the board in 2004 to adopt a criterion for a materials evaluation that would ensure that materials on
the national list have a positive impact on biodiversity. That's what the NOSB had passed, and we would like to see that included now.

So Wild Farm Alliance notes the paper's findings, that the evaluation criterion has been added to the materials -- has not been added to the materials checklist used by the committees in evaluating materials. This in spite of the fact that this recommendation received strong support by all commenters.

We ask the NOSB to take all necessary steps to incorporate this criterion when evaluating materials for addition or removal from the national list as well as for decisions related to the sunsetting process.

Topic two. Revising AHRQ's checklist to include assessment of biodiversity. This is the point that we spoke about last May.

We strongly support the Joint
Committee's point that NOP should work with the audit review and compliance branch to revise the checklist used to audit certification agents.

This change would support implementation of the biodiversity standards by all NOP accredited certifiers.

Last May, Wild Farm Alliance came before the NOSB with testimony about our organization's efforts to bring this issue to the attention of both AHRQ and NOP. At that time we identified three specific changes in the checklist that we believe would completely correct this problem.

We have resubmitted the details of this proposal in our written testimony, which hopefully you have on the Web site, and we believe that revisions of AHRQ's checklist represent a critically important step toward implementing NOP regulations for biodiversity in conservation of natural resources.

Taking this step will allow
certifiers to compete on an equitable basis. It will ensure that consumers are getting what they pay for, organic products whose claims of environmental friendliness are backed by accreditation and certification systems that verify these claims.

The third topic is implementation of the biodiversity standard through the organization system plan. We support all the suggestions by the committee about methods for implementing the biodiversity standard through certification and accreditation systems.

We included an attachment to our written comments that provides detailed marked-up versions of the committee's paper containing more suggestions on this topic.

And the fourth and last one is training with regard to the suggestion that the role of NOP in providing training about biodiversity. We have contributed some specific ideas about the contents of such trainings in our written comments and, as
mentioned earlier, Wild Farm Alliance has published booklets designed to provide practical information, suggestions, and examples about implementation of biodiversity standard, so if desired, we would be happy to supply these documents as background information for NOP trainings.

In closing, I would like to thank again the committee and we appreciate the opportunity to review and provide comments on the document and to work with you as additional resources for information if you would like.

Thank you.

MR. DELGADO: Questions? Barry?

MR. FLAMM: Just a comment. I want to publicly thank you, Lynn, and Wild Farm Alliance for the great work that they've done, and also I want to extend my appreciation to everyone that provided comments, and we'll be going over them -- we've already read them, but we'll be going
over them carefully as we prepare our paper.

MS. COODY: Thanks, Barry. I look forward to working you some more.

MR. DELGADO: Any other comments, questions? We go now to Lynn Clarkson, followed by Bill Wolf.

MR. CLARKSON: Good evening. My name is Lynn Clarkson. I'm managing director of Clarkson Soy Products. My company's name is on two petitions that have been submitted to your board, and the petitions are quite complete. We are quite pleased with the way they came out.

I'm here to give you some insight into why we timed our petitions as we did, and to address Julie Weisman's comments about how you encourage an organic ingredients supplier to step into this marketplace.

To do that, I have to give you a little history. Lecithin, which many of you probably can't spell real well, but will be by the time you're done, lecithin is principally
an emulsifier. It's used in almost every process and product on the grocery store shelf.

When the national list started, there was no organic source of lecithin. Why did we get into it? Because we were challenged by a major food company who was in this room a little earlier today who wanted, who embraced the organic policy. They wanted organic lecithin. They asked us if we could try and make it.

Three years later, having fallen off the learning curve at least five times and broken our financial neck at least twice, we learned how to make it. We have been providing commercial lecithin since 2004.

It is in baby food, it is in candy bars, it's in chocolate, it's in energy bars, it's in oil sprays, it's in baked goods, it's in ice cream, and somebody on my way up here just handed me this topic, which is a 70 committee organic product using organic
lecithin. This is one of the companies that cares.

Okay. I'd like you to invite you for a virtual hike down the hill to an organic grocery store that looks a lot like the ones that are actually down there.

We can walk up to almost any category of product on the grocery store shelf. We can walk up and I can put my hand on product A, let's say vegetable oil spray, hand it to you, you read the label, organic lecithin.

Immediately to the left or right of that, I can put my hand on product B, C, and D, hand it to you. You will not be able as a consumer to tell the difference in those products, but those other three products are using conventional lecithin.

I can do this time and time again. We have been relying on the organic-first policy, we have relying on NOP, and we have been relying on certifiers, and I would guess
that there are probably four times as many people scamming the system as really embracing the policy of organic first.

So what are the consequences of that? The organic food chain stays open to the use of hexane, which is a volatile synthetic solvent and a neurotoxic. There's no need for that.

The organic food chain stays open to nonorganic soybeans. No need for that.

Every pesticide that's allowed by the USDA, still involved in the organic food chain. No need for that.

Who wins, who loses? Well, who loses, the organic consumer, the organic farmer, he doesn't get supported, the organic manufacturer of foods who really embraces organic first, and the organic ingredient supplier.

Who wins? The guy who wins is the guy that's gaming the system and looking for the lowest common denominator to get him into
a label category.

What approach have other bodies taken? Take a look at the Soil Association. Effective January 1, 2009, they will certify no product as organic unless it has -- if it's a product that uses lecithin, unless it has organic lecithin in it. None.

Now that's a polar position.

Take a look at the Canadian rule. The Canadians have done something interesting. They've said if you have to have a form of lecithin that's not available organically, it's okay as long as you start with organic lecithin. Soy lecithin. Thank you.

So that removes 99 percent of the incentive for gaming the system because you have to start with organic lecithin. And everybody's organic lecithin starts as a fluid, and then you modify it.

So what we are basically saying is we have lost complete faith in the regulatory system as we have it today to encourage people
to be organic first. We would like something that's clear enough that the NOP knows how and can enforce it without being tied up for years in controversial arguments, at their discretion and judgment and reason.

So that's why we're asking two invitations to you. We are one of the world's lecithin experts, third party. We are available to you in your deliberations if it would be helpful.

If any of you wish to visit the plant where this is done at some time, to help your deliberations, tell us.

Thanks.

MR. SMILLIE: Good presentation, Lynn. I know exactly what you mean. You can see that on the shelves. It's there for everyone to see. But let's cut to the case, two big issues. We have heard presentations from certification agencies saying that their clients are telling them that the organic
lecithin doesn't meet their needs, form, quality, function. That's number one.

Let me get both of them. The second one is this new -- I shouldn't be surprised, but the allergen issue, okay. It's only soy lecithin that you're providing and that there is an allergen issue up there also, that other forms of lecithin or lecithin replacements.

So I'd like to hear you address those two issues.

MR. CLARKSON: Number one, many people said the quality won't work, you have a cognate product that's almost identical. So I wonder.

Secondly, we intercept a lot of e-mails we never intended to as we hit the "respond to all" key.

(Laughter.)

Every one of those goes back to an economic issue, not a quality issue. So I'm saying there are no issues. I'm saying it
puzzles me greatly why three candy bars have to use conventional and another one that just looks like is using organic.

The second thing is I don't know what to do about the allergen issue. Ninety-nine percent of all the lecithin used in the world is soy-based lecithin, so I don't really know how to address that other than cut out a niche for it. I don't know what to do about that.

MR. DELGADO: Any other questions?

Bea.

MS. JAMES: Is your lecithin 100 percent organic?

MR. CLARKSON: We have been offering 100 percent organic lecithin --

MS. JAMES: Unadulterated, 100 percent organic?

MR. CLARKSON: Unadulterated. Now if you want the yeast lecithin, that's at 95 percent.

MR. DELGADO: Any other questions?
Thank you very much. Gerry, you have a question?

MR. DAVIS: Sorry. I was just a little slow. You were speaking quickly in the area of talking about the Canadian system, and I want to make sure I understood what you said, if you could slow down and repeat that about it's okay as long as you start with 100 percent.

MR. CLARKSON: The draft version of the Canadian rule that was supposed to go into effect a month or so about now, it now looks like it's coming into effect the middle of next year, said addressing the issue of bleach lecithin, said if you wish to bleach lecithin and it's not available organically, it's okay to bleach lecithin as long as you start on organic lecithin.

Now that would get us out of the situation where people run to the conventional supplier, and that would be faithful to the consumer, blah, blah, blah.
So there is one. We're not -- and I need to make the point we're not asking to rule out every form of lecithin from the national list. But we can do it the way the Canadians do, and say as long as you start with organic lecithin, it's okay then to use acetone. But right now everything conventional is using hexane, and if it's the oil, they're using acetone.

MR. DAVIS: Joe, could you go back to the expert and how that would be available to the Handling Committee if we have questions?

MR. SMILLIE: We went to the University of Illinois Soy Food and said who is a retired expert who hasn't spent his life on phosphate lipids that we could consult. We have him as part of our presentation in our petitions. He has no tie to us. His reputation is far broader than us. If you wish to put him into debate with anyone, if you wish to ask him questions, we will be
happy to make him available to you.

MR. DELGADO: Any other questions?

Thank you very much.

MR. CLARKSON: You're welcome.

MR. DELGADO: Now Bill Wolf, and followed by Patti Bursten-Deutsch.

MR. WOLF: Hello again. First of all, I am proxying for -- I need to speak very briefly on behalf of Blue River Hybrids, thus the hat.

I am Bill Wolf, and I will get into some other of the issues I was originally planning to talk about, but first I'd like to make a statement for Blue River because of some of the comments and clarify it. This is really for clarification.

MR. DELGADO: You're saying you have a proxy in addition to this time, or you actually --

MR. WOLF: I am going to make every effort to stay within five minutes because I really feel for you guys. This is
just horrible.

MR. DELGADO: Thank you. Thank you.

MR. WOLF: Two issues. One, Blue River is not in favor of using treated seed stock to grow organic seed. They have been referenced as though they were.

Two, Blue River has multiple varieties of corn and soybeans for the north central part of the country, and those were just clarifications because there were implications or statements in other testimony that implied that Blue River was -- that was not the case.

I'd like to take my hat off and switch to some tough topics that you are facing, but first I want to say that the first NOSB meeting I attended was the first NOSB meeting. It was just over the bridge in Key Bridge. And there were 15 board members, one person from the USDA, and four people, four presenters, and I'm -- I just want to say that
the continuous improvement in public comment
and interaction is extraordinary, and the
issues have gotten way more complicated.

I would like to talk first about
the -- as you recall, I submitted and handed
out to everyone a comment that was submitted.
Has everybody got copies of it? If they
don't, I have additional copies.

But I talked about the fact that
the ag-non-ag debate is a debater's heaven,
and if I were a debate coach, I would say now
there's the issue you can debate every year
and you will always have a different outcome
of the debating team, depending on who is
really good at it.

And that's why we at Wolf-DiMatteo
strongly recommended that you look at option
three or four of the materials working group,
because it wasn't intended to be a loophole
for organic preference, and that's what is
happening in many areas on 605, and you will
continue to have that problem unless you solve
the structural problem of having one materials
list with organic preference required on all
materials.

    Item two, I had listed five
specific recommendations we had. I'm going to
add a sixth, and that is that I strongly
encourage you to go forward with the multisite
recommendation pretty much the way it is
presented with some of the editing, minor
edits that I've heard about, and I'm going to
talk from my own experience.

    I have been involved in my own
certifications, helping others being
certified, writing robust organic system
plans, and reviewing operating systems of
grower groups.

    I have never seen an inspection
that looked closely at every field, at every
corner of a barn. The most important part of
the organic certification is the organic
system plan and the audit of that plan, and
reviewing and verifying it and reviewing and
having a really tight internal control system.

In fact, my company believes that everybody who is certified should have their own OSP, like a HASOP plan, not a form that was filled out, and I'm really glad to hear that the NOP is going to tackle as its first guidance document what an OSP contains.

And finally, the last item I need to clarify a few things about materials in sorbitol, and the general -- the statement I made yesterday about the fact that I think there is some issues around materials are being reviewed are substantially structurally different.

I think you all received a copy of seven letters from growers and from PCOs asking for sorbitol to be approved.

I am concerned that the actual process for reviewing has shifted. In the case of sorbitol, it differed radically from the sucrose in that it was declared that it wasn't compatible with organic production on
the petition.

The second point I'd like to make is since some of the comments were made, I went back and looked at the sucrose vote and comments in the 2005 discussion by the board, and this was really a chain of events about how the product was registered.

It was first registered, then the petition was submitted, then the petition was amended to add crops because EPA in fact approved it for those crops. And the only reason sorbitol wasn't applied for at that time is because there was no EPA registration.

So I think I am really concerned that you follow your protocols of consistent review and look closely at the need dynamic, and that's really what I had to say.

Thank you.

MR. DELGADO: Any questions from the board? Thank you.

MR. WOLF: I do have one statement that was your -- when I spoke yesterday, you
said -- someone said, oh, can you tell the
difference between sucrose and sorbitol? And
I said I shouldn't be speaking to that, I
don't know, you should ask the petitioner.
And I was told it would come up during the
committee's discussed deliberation or
presentation of the sorbitol conversation
yesterday. My understanding is that because -
- I mean today, right before lunch. My
understanding is that that difference still
has not been described to you. So I wasn't
able to answer that question yesterday. I'm
sorry it didn't come up at noon time today.
But I do know that the petitioner changed his
flight to be available for either now or for
tomorrow if there are any questions.

MR. DELGADO: Gerry.

MR. DAVIS: I hear what you're
saying, and I think it would be worthwhile to
have them delineate the difference, because I
think the petition that we saw was fairly
deficient in explaining the difference between
MR. DELGADO: Is the petitioner here? Can you please come up to the podium and identify yourself?

MR. REYNOLDS: Sure. Thank you very much. Again, Devlin Reynolds with Natural Forces.

I'll cut right to the crux of the matter.

The first thing I want to point out is in the letters sent to you from the growers, I just want to read one paragraph from a hops grower. It appears hops is a big item here. This is from Tim Perault, if you want to call him. He's in Washington State, if you all know him.

"There are not enough insect control substances on the NOP national list to warrant an investment in additional organic hop acres. A shortage of organic production of hops exists today as the industry cannot produce enough to keep up with demand."
Without additional materials approved for use, we cannot grow our business and meet the demand of the consumer by increasing our organic acreages to help meet the demand."

I don't know any simpler than that. The difference between the two products, first of all, one, the REI. I think we all understand what that is. You spray today, how soon can you go back in and work as a handler or a harvester.

Sucrose octanoate ester has a 48-hour REI based upon the U.S. EPA standards. Sorbitol octanoate is 24 hours.

Everybody here who grows a crop that's perishable understands the difference between 24 and 48 hours. If you have berries, if you have greenhouse vegetables, if you have a you-pick operation, you can't spray day one at 6 a.m. and your crop is ripe and have to wait 48 hours before you can let anybody in there.

So that is a giant difference when
you're talking about perishable crops at the end of the season.

You've got instances that are in those letters from a grape grower in North Carolina. We've got hurricanes coming in, we've got fruit flies, what can we spray in there that we can get out?

Well, they need a product they can spray and get out of there that they haven't already applied this year that socked their beneficials. That's one. And that's the biggest deal.

Leafy vegetables. We all know what we're talking about. Perishable goods.

The second thing is in sustainable agriculture, the processing and the making of sucrose octanoate ester involves recovering the use of solvents. It also has about a 10 X energy use rate to be able to make sucrose versus sorbitol. Sorbitol is a much simpler process. There is no use of solvent, there's no solvent recovery. It's a much more
sustainable type product.

The third thing is the insect control. The two active ingredients -- you know, the one is marketed as a 40 percent AI, the other is a 90 percent AI. Just the consistency of the materials, sorbitol is heavier. When it attacks a larger insect, it will burn a bigger hole in the insect. Don't mean to be crude, but the way it works is it eats the cuticle layer of an insect, burn it out, uncontrollable loss of moisture, okay.

A thinner product does a better job on certain insects, but a thicker product does a much better job -- going back to my mealy bug example. When you have a larger insect, you need something that's going to be stronger on that insect, and that is what sorbitol does that sucrose cannot do.

That's probably not the case with bee mites, but it is the case with mealy bugs, it is the case with leps, it is the case with some of the stronger insects that cannot be
controlled by sucrose.

And so those are the three primary differences. And my question is if we can't vote to allow it now, I'd like to see if we could at least allow for, you know, a review of the product or at least table it.

MR. DELGADO: Gerry.

MR. DAVIS: The question on the two materials on mite control in bees, is it sucrose only?

MR. REYNOLDS: Sucrose is the only one that's registered today for bee control.

MR. DAVIS: That wasn't real clear to us when we were going through it.

MR. REYNOLDS: No, it's -- I'm just saying mathematically from a chemistry standpoint, the molecules in sorbitol probably would not be as good on bee control of mites than sucrose is. But it is not registered today for been control.

MR. DAVIS: And what would have been the scenario if both of those materials
received EPA registration at the same time?

             MR. REYNOLDS: I have absolutely no idea.

             MR. DAVIS: I mean as far as your submitting them for organic consideration.

Would you have submitted them at the same time?

             MR. REYNOLDS: I would have, yes.

             MR. DAVIS: The only reason we -- it's taken a few years longer for us to see sorbitol is because you did not have an EPA registration at the time that the sucrose petition was put in.

             MR. REYNOLDS: It was my understanding -- and again, I was not part of the process when they put it in, so you're asking me something that I have no idea about, and you're asking me if it was me. It's my understanding we can't submit anything until we get an EPA registration, period.

             MR. DAVIS: Right, yes, I understand that. But that explains the delay
in -- because now the issue is, well, we already have sucrose octanoate on the list, why should we allow sorbitol. That's one of the reasons.

MR. REYNOLDS: Sure. Exactly. And again, my reason is because they are two different products doing two different things. Again, you have white sugar and brown sugar. When you make molasses cookies, do you make them with white sugar? No. You make them with brown. Same difference with insect control.

MR. DELGADO: Any questions, comments? Okay. Thank you very much. We will now continue with Patti Bursten-Deutsch, followed by Grace Marroquin.

It is my plan to comment in five
sentences, and this is now two. Will the verification of the 30 percent DMI requirement be based on an assumption of how much each cow is consuming, or is each producer required to demonstrate in some explicit way that each cow actually consumed 30 percent dry matter?

Please consider this and provide clear, concise, and unambiguous guidance to farmers, inspectors, and certifiers.

I appreciate very much all of your earnestness and hard work in what I hope is not a thankless effort.

MR. DELGADO: Very good. Are you addressing that to the board at the moment?

MS. BURSTEN-DEUTSCH: I was hoping Richard would be here, and I feel like it needs to be inserted in the public comment.

MR. DELGADO: Yes.

MS. BURSTEN-DEUTSCH: Thank you.

MR. DELGADO: As I also remind the public, there is always the option of submitting written comments, questions.
Going on with Grace Marroquin.

MS. MARROQUIN: I'm Grace Marroquin with Marroquin Organic, International. I promise I'm not going to talk about yeast. I promise.

Besides being an organic ingredients supplier, I also have a reputation for minor ingredient suppliers. That means those ingredients that are generally used from a half to 3 or 4 percent. And of course, yeast -- I did say the word once -- fits into that category.

But I am here actually because you are discussing citrus pulp, and there were some questions raised in this discussion, and I want to give some support to this issue because I think, Dan, you brought up the question about other companies -- because they have these five patents out there, there wouldn't be this incentive for anyone to do this.

Well, I represent a company called
the Marma Corporation, and they are based in Labelle, Florida, and we are producing a product, we're calling it citrus hummus, which is comprised of citrus pulp and membrane, which is the same product, in addition to the flavino, which is the orange part of the orange, and albedo, which is the white part of the orange. Very similar in action, but it has other additional properties.

But already there is another company standing in there, and at one point it was our understanding that China was producing the citrus-type hummus product a long time ago.

So I want to give them support to the idea also about the problem with raw material availability. Their product, as he mentioned to you, has a 20-to-1 ratio. The product that we are producing is an 8-to-1 ratio, and I called my supplier here about an hour and a half ago to confirm what they had told me, which is there's not enough organic
fruit to be able to do this organically yet.

Now I wouldn't have even aligned myself with the Marma Corporation if it wasn't because I thought there was a possibility of bringing this product out organically, because that's what we do. And there's not too many companies as foolish as ours who look at that little minor ingredient and goes after it, because we feel that with the idea of organic preferences, you put it on 606, and it motivates companies to produce things. And just as if you put this on it, and you're going to find that there will be other companies who will be looking at it, and they may be coming in from Honduras or El Salvador where maybe they have more control of smaller production and they will be able to do it.

But this is how this industry grew, this is why we are here where we are today is because of organic preference.

The industry needs things like shelf life extenders and antioxidants and
preservatives. This product gives them an opportunity for shelf life extenders.

Our product, when we bring it out, will be also a powerful antioxidant. I didn't know they were going to be here today, and I was trying to get my guts up to be able to do another petition which, you know -- and it is a daunting process, but at least if you put something on the 606, there's the opportunity then to produce something organic.

That's all I have to say. And how am I going to petition this? That would be my next question. If someone is petitioning for pulp, then we go pulp and fiber and albedo and flavedo, you know -- but you can talk to me about that separately.

But, again, I just wanted to give some support.

MR. DELGADO: Thank you.

Questions?

MS. MARROQUIN: Thank you all, and good luck tonight.
MR. DELGADO: I guess there's a question. Joe.

MR. SMILLIE: I'll keep it brief.

I have a comment that I believe that the evidence is slowly turning that when you put something on 606, it spurs the growth of organic, and I think that we're starting -- I think the Handling Committee, dealing with this every day, that's what we're seeing.

MR. DELGADO: Thank you. Next we have Katherine DiMatteo.

MS. DIMATTEO: Thank you. Hello. My name is Katherine DiMatteo, and I'm with Wolf, DiMatteo & Associates today.

I like being sort of at the end of the list because I'm picking up the bits and pieces of things that haven't come up yet, I hope.

What I wanted to say is that National Organic Coalition, which is made up of a broad group of environmental and organic farming organizations, including Beyond
In it, they do support the current recommendation with some suggestions for changes to make clear that the recommendation and the criteria are about producer groups now.

So I just wanted to make you aware that this broad coalition in their comment also supports the current statement with some suggestions for changes, and if you can get your hands on that, I think you've seen that -
- some of those suggestions already.

    And I just want to -- I bring that up because I wanted to say that over the course of the last year, we in the community have come closer together on supporting the recommendation.

    So a lot of suggestions that we had come out individually in terms of how to define what a smallholder is, how to define to do the samples, how to put requiring limits on the five-year having -- making sure that everyone got inspected once every five years -- what you are seeing now with the support for the current recommendation is that we have come closer together to support the criteria and the protocols that are being set up in that recommendation.

    I would just caution you, a number of people have said this on different issues during this -- these meetings, that we -- the organic sector is defining ourselves out of existence if we're not careful about how much
we write in as prescription as opposed to process and to clear criterion protocol.

We must be careful. Don't let ourselves be destroyed by lack of trust and giving up on the process-based system that we really believe in.

And I want to add to that comment, I want to read from Grace Keshuni's comment. She had to leave. She was also one of the people who have fallen off the list, but I'm reading this from Grace's comment, which you have, because I agree with it.

Again, now I'm Grace.

"Once upon a time when I was an activist and small organic farmer, organic standards were a self-imposed system of rules developed primarily by organic farmers, those who had to work with them on the ground. Consumer expectations have always figured into organic standards, but there was a general understanding that consumer perceptions of what is pure and natural did not always fit
the reality of organic farming, let alone food processing. Organic standards were not just about marketing products, either. We thought that consumers might well be ignorant about farming and food production, but they could learn. It was more important to support farmers who did the right thing than to pander to consumer fears. Today no one seems bothered by the assertion that consumer expectations, even those grounded in ignorance, are all that matters. Add to that the argument that consumers cannot understand and could care less about the nuances of organic methods and only want to be assured that organic products meet the toughest possible standards. What it often adds up to is unparalleled hypocrisy and betrayal of the early vision of organic in the name of an ideological anticorporate agenda that actually works against the interest of both small farmers and ordinary citizens. In fact, tightening the rules creates more obstacles
for small players to enter the market than for large players who are accustomed to meeting bureaucratic requirements and have paid compliance staffs. They actually prefer to have tighter standards to protect the substantial investment needed to get in. With the myriad crisis we face, not least of them climate change, why on Earth would anyone want to limit the possibility of the broadest possible transition to organic methods without delay."

Thank you very much.

MR. DELGADO: Questions for Katherine? Tracy.

MS. MIEDEMA: Just a quick clarification. Valerie did e-mail out the National Organic Coalition comments, and I have spoken with Lynn Coody about specific wording confusion. So we are on top of that.

MS. DiMATTEO: Okay.

MR. DELGADO: Joe.

MR. SMILLIE: I just wanted to
say, Katherine, you mentioned a fairly large group of people, and you are saying that there was consensus and support of the multisite document, and you said there was a few issues. Could you just briefly hit those ones? We're on top of --

MS. DiMATTEO: Lynn or Emily -- I don't have it in front of me.

MR. SMILLIE: Brief. Well, we've got the one that says change -- oh, my brain.

MS. DiMATTEO: Change post-harvest handling.

MR. SMILLIE: Yes. Change handling to post-harvest handling. We've got that one. If we could just get the titles.

MS. DiMATTEO: Yes. Yes.

MS. ROSEN: Okay, page 1, the title, and all references to multisite to grower groups.

Page 4, change definitions of -- well, there's an insertion of farmer livestock producers in a few places. Definitions. Add
the definition of post-harvest handling.

Production unit. Change the definition to include -- so it says, portion of an organic operation where agricultural products are produced, delete "and/or handled." I mean, you know, if you want us to, we can print it out and give it to you.

MR. SMILLIE: Yes, if you could, that would be great.

I think -- but again we're not talking big ticket items here.

MR. DELGADO: We have Bea.

MS. JAMES: Thank you for your comments, Katherine. Does the group that you are representing, do you know if they support the idea of addressing the multisite construct for retailers and/or processors?

MS. DiMATTEO: Okay, let me just clarify. I am not representing the National Organic Coalition. Wouldn't that be lovely.

(Laughter.)

But I brought them up because I
I thought it was -- I felt it was important that this -- the group, the National Organic Coalition, and some of the other positions that have been presented over time, which were further apart, we have come closer together on. And I think that the National Organic Coalition's position now still would prefer to make it unambiguous that currently this is not a recommendation about handlers or retailers.

MS. JAMES: Separate, as a separate --

MS. DiMATTEO: Well, I'm not going to answer for them on the separate. Personally, for me, Wolf, DiMatteo & Associates, I support that there can be criteria developed that is specific and appropriate for other types of growers.

MS. JAMES: We would love to work with the NOC.

MS. DiMATTEO: Thank you.

MR. DELGADO: Any other questions?

Thank you very much, Katherine. Let's move on
then to Will Fantle, and you have a proxy.

MR. FANTLE: Yes, I have a proxy from Mark Kastel, the codirector of the Cornucopia Institute. I gave that to Valerie earlier today some time.

MR. DELGADO: Please.

MR. FANTLE: I am speaking for Mark Kastel of the Cornucopia Institute, our codirector, and I am going to be talking about the livestock rule. Yes, the livestock rule.

What began as an exercise many years ago in the middle of the last decade to address the problems, the interpretations between pasture and dairy, morphed somehow. It got transformed into the rule that was delivered to us on the 23rd, the proposal that we are calling the livestock rule for its inclusion of additional species under livestock, fish, bee, only, not bees but bee, its take on how we should treat beef, finishing of beef.

In fact, we will suggest that this
is an overly broad and sweeping revision of many, many parts that extend far beyond the problem that has been identified of pasture and dairy.

It is our opinion that the implementation of the rule as proposed will put out of business hundreds of legitimate organic livestock producers. This is something that we need to consider.

And we are left in somewhat of an awkward position with this because our citizen advisers here haven't had the opportunity to comment and weigh in on this rule on many of the provisions -- the new definitions, the rewrites, the new language, that have not been fully discussed, publicly vetted in our hearing process. This is very disappointing.

What that has left us to do, as the organic community consisting of farmers, processors, handlers, certifiers, and retailers, to try and identify what this rule means.
We have been reading hard, we have been trying to pull together different ideas and alternatives and thoughts on what to do, but it's a difficult proposition for us, with so much never being publicly discussed before, and trying to weigh its implications.

The other thing that leaves, at least in the opinion of the Cornucopia Institute, is for the current rule to continue to be enforced.

That means investigations cannot be deferred, as has happened in the past. We have FOIA documents from the NOP indicating that investigations were deferred several years ago because a pasture rule rewrite was underway. This is unacceptable.

We know this rule can be enforced, the existing rule. We have the incident of the Vanderick Farm, the 10,000 herd operation in California that was decertified under this rule. We know that the Aurora Facilities and the findings of fact that were found by the
NOP investigators, 14 willful violations of organic law, further evidence that this existing rule can be enforced, can be used to manage our process. This still needs to be done over the next foreseeable future, for however long this takes to be vetted.

We know that even under the optimistic scenario that this rule, if everything were to sail through as soon as possible, would not take effect until the growing season of 2010.

We have some other specific concerns that I'm going to make a comment on.

Pasturing of cattle for the entire grazing season is important, not just for 120 days, but the entire grazing season.

We know this would be a challenge in parts of the country, in parts of California where the rainfall is much more compressed into perhaps a two-month period of time. We met with dairy farmers last week out there, and we heard this would be a challenge
to them to even meet the 120 days, but they
were willing to do it, to try and make their
best effort at doing that.

The desert dairies in the
Southwest, some of the larger dairies, we
think their pasture must be required to be
irrigated much like any other crop that's
grown in that region. Irrigation is
fundamental to keep that playing field level
so that they can't use lack of pasture as an
excuse to haul those animals off the range or
the pasture.

We would also suggest that three
times a day milking be prohibited. It's a
challenge logistically for any farmer to bring
animals in and out, in and out, in and out,
with a three time a day milking scheme.

If it is allowed in the
continuation, it's not proposed to be
eliminated, we are suggesting it should be, we
think there needs to be more strenuous
auditing done by certifiers to ensure that
this rule is not being cheated on.

The origin of livestock is a
biggie. The proposed language that is in this
rule is not acceptable. In fact, it flies in
the face of what has been suggested by the
NOSB in their recommendation.

We would suggest that the last
recommendation from the NOSB, looking at last
third of gestation, be substituted for the
language that is currently in the rule.

Lastly, I just want to talk a
little bit about the process on this. We have
formally asked for a 30-day extension on this.
We think this is important. The community is
still trying to figure this out. I know there
is not even harmony within the community on
whether or not we need an extension. It's our
opinion we do.

Farmers we know that we're talking
with are still just learning of this rule and
looking at it. Transparency and inclusion
have been hallmarks of the organic process.
This needs to be brought to the sweeping rule to make sure that all of its ramifications are looked at by the process.

Barbara Robinson, the acting program director, just yesterday, when talking about the philosophy of the NOP, said it's better to do it right than quick. Her exact words.

We think that should be applied to this rule as well. Whatever emerges out of the back end of this, Cornucopia wants this rule to be strict. We also want this rule to be enforced.

Thank you.

MR. DELGADO: Thank you.

Questions? Thank you. And that is the last of the listed official speakers.

MS. FRANCES: Lisa Engelbert postponed her comment to give you space last night.

MR. DELGADO: All right. We have
a couple of speakers that signed up recently.

We will allow them to go, and I will ask the board members to consider being economical with your questions. I'm concerned about the time. I know the committees need to work on the specific change, and I would appreciate the members to be brief and concentrate on the issues. That's what we are looking for.

Yes, Tracy?

MS. MIEDEMA: How many more?

MR. DELGADO: We have one, two, three, four, five, six. Yes.

MS. MIEDEMA: Mr. Chair, with all due respect, I move that we adjourn simply to prevent fatigue for tomorrow when we are voting.

MR. DELGADO: The Chair will intend to take up the rest of them here, and we will have an extension of 10 minutes, 15 minutes, to allow a couple of speakers. Hugh?

MR. KARREMAN: I know that someone from the AWG came down from Maine. I'd like
to hear him, Sebastian Belle, if possible. If he's on the list. I think he is.

MR. DELGADO: I really don't know.

If we allow one, we have to allow all of them, and we do have six of them. So if the question was --

MR. KARREMAN: There is a motion. I mean there's a motion that you were asking if there was any questions. I did not second it.

MR. DELGADO: Indeed we have a motion that we adjourn, and we ask if there is a second. Do we have a second? We don't.

We are going up to 20 minutes after the hour, and try to get as many people as possible, and members of the public, I would request that you limit your time as much as possible and concentrate issues so we can be productive and allow this board to go concentrate on dinner.

Up next then we have Luke Howard.

Is he here? Okay, let's move on to Lisa
Engelbert. And after Lisa we're going to have
Harriet Behar.

I definitely will be brief. I'm hungry, too.

A few things that I'd like to comment on, multisite certification. I'm still not clear if the recommendation includes retail establishments. I heard two different comments that took it both ways.

So we don't believe retail establishments should be included in multisite certification. Retail establishments should not be exempt from inspection each year. We feel that there is a high potential for fraud, mainly due to high employee turnover in retail establishments.

Multisite certification should be limited to producers outside the U.S. Anybody inside the U.S. really should be inspected
each year.

            NOP training. Thank you for --
glad to hear that we're going to be having
additional face-to-face trainings. We were a
little concerned that we were going to Web-
based training format, and we weren't really
happy about that, so thank you. It's
important to have the face to face with the
NOP in training.

            Ethylene gas for ripening pears.

We don't agree that it should be added to list
for ripening pears. We don't believe it's
necessary to add substances to make things
easier or faster or get them on the shelf
sooner or keep them on the shelf longer.
That's not really what organic is all about.

            Organic consumers want less
processing and fewer substances used on their
products, not more.

            And quite honestly, if organic
consumers really truly understood some of the
things that are on the list that are being
used, they probably wouldn't be buying those
products.

The NOSB is a gatekeeper in the
organic industry. It's really up to you guys
what goes on the list and what really truly is
needed in this industry.

If unnecessary substances keep
getting added to the national list, at some
point the word "organic" will become
meaningless.

Hundred percent organic label.

Overall, we agree with the recommendation. I
don't like seeing livestock feed labeling
lumped in with human feed labeling. They're
really kind of two different issues there. So
hopefully you'll take that into consideration.

Most feed mills are not labeling
their feed as 100 percent organic. Obviously
anything going into an animal has to be 100
percent organic if it's an agricultural
product, to which you can add allowed
substances, like minerals and things like
that.

Commercial availability of seeds.

We overall agree with the recommendation, but the section -- it's B5D, I believe -- requiring certifiers to submit historical data on acreage and percent of organic seeds used for each producer is problematic.

I really can't imagine the amount of staff time that that is going to take. It's going to be additional staff people needed as certifiers for that one recommendation.

Hopefully this can be handled through ACA trainings and through the accreditation process. Our experience at NOFA New York is producers seem to be using more seeds each year. We are not allowing cost as a factor in determining commercial availability.

I'm not going to comment on the proposed pasture rule. I've already commented in Auburn at the listening session, and we are
going to be submitting written comments on
that, other than saying thank you for getting
it out to the NOP.

Lastly, I would like to comment on
civil penalties. I know they are not being
assessed to operations that are being revoked,
that are found to be fraudulent. I've said
this in prior public comments. I really
believe that's the only way we're going to
stop some of the fraud that's potentially
going on.

A lot of these operations are in
it for the money. They don't care about the
organic integrity. They don't care about the
organic industry. They care about their
bottom line. If they can take short-cuts,
they're going to do it. If they do it and
they get caught and it's jeopardizing the
integrity of organic products in the
marketplace, they need to pay the penalty for
that. Revocation is not enough. They have
already made their money on the organic
system. They don't care if they lose their
certification at that point. They need to be
fined.

That's all I have. Thank you.

MS. JAMES: Thank you for your
comments. I have a question for you. If we
can't make multisite certification work within
our own country, how can you justify that it's
a construct that can work internationally?

MS. ENGELBERT: I would prefer to
see every operation inspected every year,
actually. I realize in some of the Third
World countries there are some small grower
groups in close proximity, all under the same
organic system plan. They have a strong
internal control system, where people say it
can work. We're not certifying any of them.
I can't really comment on that.

MS. JAMES: But you support the
idea of multisite certification for --

MS. ENGELBERT: Those really small
operations that are under really close supervision.

MR. DELGADO: Any other questions?

Thank you.

MS. ENGELBERT: Thank you.

MR. DELGADO: Jennifer, you have a question?

MS. BEHAR: Hello. I'm Harriet Behar, and I believe you all have my comments in front of you. Is that right?

MR. DELGADO: We do.

MS. BEHAR: Okay. Technical review panels. The organic community has lobbied hard to get more NOP funds to cover costs for third-party TAP reviews, so dollars should not be an issue here.

The NOSB puts in many hours working together and strives for a continual atmosphere, making it difficult to challenge the work of another member. With no third-party TAPs, the board is relying on the petitioner as their only source of outside
The board itself is one organism and cannot do TAPs and approve them as complete. This is an inherent conflict of interest, as well as not meeting both the letter and the intent of the OFPA.

The NOSB is a stakeholder board and should not be converted into a board of experts. The OFPA gives the guardianship of the national list to the NOSB as well as giving them the tools to perform this responsibility with the depth and expert input that is necessary.

Please err on the side of more information rather than less. Do not put a responsibility on your shoulders that is not required in the OFPA, nor acceptable for a volunteer board.

Judging a material as straightforward that does not need an outside TAP review assumes that you already know the status of the material before it has gone
through the review.

Again, I ask the NOSB to pressure
the NOP, as I look at Mark Bradley, for the
implementation of the peer review panel as
required in the OFPA, as well as a transparent
program manual as required by ISO.

This should include a clear
procedure that informs the NOSB and the public
on how best to make --

MR. DELGADO: Excuse me, can you
just --

MS. BEHAR: Am I too far away?

MR. DELGADO: -- move closer to
the microphone.

MS. BEHAR: Okay. -- make
recommendations on specific standards they are
drafting on the content as well as the
timeline for the NOP to respond, or ask for
further information to move the
recommendations forward.

The NOSB and the public spend
massive hours on these recommendations and are
frustrated when the NOP decides they are not a priority.

Having a written transparent process for the NOP and the NOSB with communication will help both groups understand each other's priorities in order to move the recommendations forward.

I'm going to skip down to biodiversity.

I support the rewording of the document as presented by Lynn Coody for the Wild Farm Alliance. This does not burden farmers. Biodiversity is the basis of organic farming, a system that mimics natural processes.

There are multiple ecological services provided to farmers such as lower insect problems, as well as improved quality of life and ecosystem when the farmer consciously works to enhance and expand biodiversity on their farm.

And this brings me to materials
and the view of organic as a functioning organic system. Tetracycline, I agree with the committee recommendation to reject this, especially with the thought that two other related items should remove when they sunset.

There is documented evidence of resistance in orchards to these antibiotics as well as ongoing research in both the organic and nonorganic community to find alternatives which include technologically sophisticated monitoring paired with more benign inputs.

Approving this product sends the wrong message that this family of products is not problematic.

Sorbitol. I agree with the committee recommendation to reject this product. While I appreciate growers would like less expensive inputs for insect control, adding more products to the national list sends the wrong message, approving synthetics rather then encouraging the management of insect problems with a systems approach.
Pelargonic acid. This is the same issue. The longer that organic farmers work with their systems, the less weeds are an issue. We do not want to offer material crutches that can be used on farms to cover up poor management rather than having farmers learn their own systems that are site specific for control of their specific weed challenges.

I am also concerned about removing weeds from roadsides and ditches and the negative effect this has on biodiversity and soil erosion.

Ethylene for ripening pears --

MR. DELGADO: Your time is up.

MS. BEHAR: Okay. You have my comments.

MR. DELGADO: Any questions?

Let's move on then to -- we have Barbara Blakistone, followed by Sebastian Belle. Barbara, are you with us? We don't see her. Sebastian, please step to the microphone. Marty Mesh will follow Sebastian, and then we
1
have Brock Lundberg.

MR. BELLE: Good evening, I think.

2
I don't know how you guys do it. I'm very
3
impressed, I have to say, and my sympathies
4
are with you.

5
I'm going to be very brief. Dr. Karreman, thank you very much for mentioning
6
me in recognizing that I was in the room. I appreciate that.

7
I just wanted to make a couple of comments. One is, first and foremost,
8
recognize the hard work and long time that the Livestock Committee has put in on the
9
aquaculture issues. I know this is an issue which you would probably at this stage of the
10
game would much rather see go down the road and not coming back, and I don't blame you.
11
So my apologies for being the source of some hard work and angst there.

12
I also recognize and appreciate the fact that the Livestock Committee, or at
13
least that the AGW may have become
overengaged, and that the Livestock Committee
has needed to have an independent and rigorous
discussion amongst themselves, without the AWG
engaging, and I want to recognize that and
appreciate that.

Having said that, I want to make a
couple comments. I want to make clear that
I'm not commenting on behalf of the AWG. I am
commenting as a person who works for the Maine
Aquaculture Association. We represent about
140, 150 farms on any given year. We are old-
family owned, and we are very small, so I am
not probably the best commenter from the
aquaculture perspective, but I do represent a
group of growers.

At the risk of alienating the
Livestock Committee members, because I'm
coming from the AWG side, I would like to
suggest that you very seriously look carefully
at the latest AWG comments. Those comments
were made respectfully and in the spirit of
trying to take our technical expertise and
seeking to help the Livestock Committee
achieve the goals that they had articulated,
but making sure that the way you did that was
technically sound. And I think that's the key
piece.

I'll highlight a couple things.
One, on the feeds. Recycling processing
waste. Our interpretation, at least my
interpretation is that the one-to-one wild
fish to cultured fish ratio as it's currently
crafted in the standards applies to processing
waste as well as fish coming from industrial
commercial fisheries. We think that is a
mistake. I think that's a mistake.

We should try to reward processors
who are trying to take byproducts that would
normally be thrown away and put in landfills
and allow them to put as much of that as they
can in, and we shouldn't hold them to this
one-to-one wild fish to cultured fish ratio
for processing byproducts.

I certainly support the one-to-one
ratio for the industrial fish commercial end
of things.

Also under the feeds, the
requirement that all pollutants are removed.
I would respectfully assert that there is no
feed in the world and, in fact, no grazing
system in the world that could achieve that
standard. I think that's just not possible.

So AWG did have some language that
they submitted to try to highlight the need to
deal with pollutants and make sure that the
standard was higher than anything else, but
didn't fall into the trap of this all-or-
nothing trap, which I think from a
certification point of view you're just not
going to be able to certify anything.

Net pens. Three key points. Zero
impact on predators, and I think is probably
an unintended consequence, but the reality is
the rest of the standards establish very
strict control and standards with respect to
predator interactions and requires farmers to
maintain biodiversity and establish a proactive predator deterrence program.

Specifically, effective deterrence inherently implies impacts. Okay. Because you are talking about either exclusion or behavioral modification of predators. So you cannot have a zero impact standard and still have a predator deterrence program.

The term "prevent the spread of disease in a facility or to surrounding ecosystems and populations," I would argue that no culture system in the world can prevent. They can seek to prevent, but they cannot prevent, and so that was a modification that AWG put forward.

And finally, the waste management plan. The 50 percent recycling requirement, very high standard. I think when that rolls out, we're going to find that even fish which are so-called from rivers, are going to have a very hard time meeting that. It's going to be very complicated to measure. I don't
oppose that. I would only ask that you have
a phase-in period much the same way as you had
a phase-out period for fish meal and fish oil.
I think that accomplishes, sets the goal,
holds people to it clearly, allows them to
work toward something --

MR. DELGADO:  Sebastian, your time
is up.

MR. BELLE:  Thank you.

MR. DELGADO:  Any questions?

Hugh.

MR. KARREMAN:  Thanks for coming,
Sebastian. I was just wondering -- two
questions. One real quick. Demographics of
your farmers up there that you work with, like
what do they grow, and are they using a lot of
net pens or not? I just want to have an idea
what it looks like up in Maine.

MR. BELLE:  Yes. Fifteen species
we grow. Most of my members are actually
shellfish growers, but we do also grow salmon,
halibut, and cod. Our halibut farms are land
based. Our cod and salmon farms are net pen based. We have 40 sites that are net pen based in the state. On any given year, about a third of those are used, because we rotate between sites on a three-year cycle, so we do crop rotation. I don't know if that helps.

MR. KARREMAN: And then also I did read all your comments, and there are a lot of technical details that the program -- if this gets up to the program, they will take care of some of those details. Okay.

But are you in -- with George Leonard's performance metrics, how do you feel about that kind of approach?

MR. BELLE: Thank you for asking that question. Performance standards are -- well, just as a little bit of background. I engage in the World Wildlife Fund dialogue. I sit on the ISO standards, a committee which is promulgating aquaculture standards for ISO. I sit on the Standards Oversight Committee for the Global Aquaculture Alliance. All of those
groups are debating performance standards.

The AWG talked about performance standards for probably three-and-a-half to four months. The conclusion we came to is if you're really going to do it, it's got to be species specific and it's very complicated, and it's very easy to promulgate performance standards which work for one species and are completely unworkable for another species.

I'll give you an example. Zero interaction genetically between farmed animals and wild animals. In fin fish, there are ways that you can come very close to that. In shellfish, which are broadcast spawners, or in pelagic marine fin fish, which are also broadcast spawners, probably the only way to even get close to that is to use triploids to induce sterility, currently prohibited under the organic standards.

So that's a case where you've got to kind of go through it on a case-by-case basis.
Performance standards are very sexy, I think. They're very -- I mean who can argue against performance standards? But when you really get down into the weeds, they are very, very, very difficult to work through.

MR. DELGADO: Any other questions?

Jennifer.

MS. HALL: It's not a question, Sebastian, but just a thank you to you and all your colleagues on the aquaculture working group. Thanking us for our commitment is -- it's not comparable to what you guys have committed to this cause, and I appreciate you and several others who have also made the trip to this meeting several times personally to share your wisdom with us.

MR. BELLE: Well, I appreciate that. Thank you.

MR. DELGADO: Any other questions?

Thank you very much. We are moving on to Marty Mesh. He's not here. We're moving on to Brock Lundberg.
MR. LUNDBERG: Hi. Good to see

you again.

As an engineer, instead of saying

I'm going to keep it brief, I'm going to say

one minute. One minute.

Okay. I just wanted to provide a

follow-up response to the question asked about

possible replacements for gums or possible

replacements on the ingredients that show up

on 605 or the 606 list.

I did take a look and some of the

possible replacements -- it's not necessarily

going to be exact one-to-one replacements, but

it's all going to be low usage level, and

there are some functionality for fat

replacement in emulsifying, and those

ingredients are alginates, pectin, xanthan

gum, and then the wider extract gums that show

up on the list as well as the gelatins. So

those are the possible replacements. I don't

have exact data specifically how it works, but

just conceptually those are some of the items.
MR. DELGADO: Any questions?

Thank you very much.

Well, that concludes this session.

(Applause.)

I thank all of you for your patience and input from the public. Yes, Joe?

MR. SMILLIE: I don't know if anybody else has got announcements, but I'd like to say that I'd really like to see a CACC meeting tomorrow morning 20 minutes before we start. Twenty minutes before the start of tomorrow morning's CACC.

MR. DELGADO: We start tomorrow at 8 o'clock.

MR. SMILLIE: Not tonight. So 7:40, CACC meeting. Attendance is not optional.

MR. DELGADO: Julie.

MS. WEISMAN: The Handling Committee -- unfortunately we need to find a way to pal out tonight, hopefully not for too long.
MR. DELGADO:  Specific time?

MS. WEISMAN:  Right now, I guess, you know, we need to eat.

MR. DELGADO:  Talk to Julie after dinner, see if they have a specific time for the meeting.

MR. KARREMAN:  We can do it after dinner. That's fine with me. Nine o'clock in here?

(Whereupon, at 7:22 p.m., the meeting was adjourned.)

Adjourn
MR. DELGADO: Good morning. Just as a reminder for our visitors, we do have a sign-in sheet at the back of the room, and we are required by higher powers that everybody has to sign in to have a record of who attended. If you don't agree with me please talk to Katherine, she'll give you the details. But please do sign in.

And we are going to start now with the third day of our meeting. We had the last two days to present our proposal to receive public input, and definitely had a long night, some of us, last night, to incorporate public comment into our recommendations.

And the time has come to discuss those and propose them as recommendations for the board to consider.

Just to remind the board, every - by rules and regulations, two-thirds votes is what we need to pass a motion. That's for
recommendations going out to the program. For those recommendations that deal with the running of the board itself, that we only need a majority.

Joe, you have a question.

MR. SMILLIE: Yes, I just want to clarify it. That means if a person is absent that it would require 10 votes?

MR. DELGADO: That is correct. We do have 14 members present today, and two-thirds would be 9.3, so -

MR. SMILLIE: Right, so if someone said, well, I'm one-third in favor of it and two-thirds against it, that would -

MR. DELGADO: Hopefully we won't get to that situation.

MR. SMILLIE: I'm not fooling around here. I'm serious. I mean if people really want to vote against something, they can't split their votes?

MR. DELGADO: No. They are whole votes, and it's two thirds votes passed. So
if somebody decides to abstain we will have to turn on the calculator and find out what of two-thirds we have.

All right, any questions? Yes, sir.

MR. KARREMAN: How does it work with abstentions in the count? Because at that Penn State meeting I thought we switched something about things go when abstention happens.

MR. DELGADO: If you recall our policy manual does state that it will be counting on the cast votes, and that does not include abstentions. If someone is abstaining, we will have to count the number of actual votes, and consider that as part of the count. Okay. So absentees, abstentions, are not counting toward the vote that CAS number. Is that clear?

MS. JAMES: But you said cast votes under your -- numbers that represents a majority of the people in the room, but it's
not a yes or a no. It is that we voted.

MR. DELGADO: Any other questions?

MS. JAMES: I have one, Mr. Chairman. If you could please also clarify on the votes if a recommendation came from the committee as voting against something, then that means you are voting for that recommendation or for a position. So if you could clarify that.

MR. DELGADO: The recommendations from the committee will always come as stated by the petitioner.

MS. JAMES: Right. So you are either voting for or against the committee -

MR. DELGADO: No, you are against the material.

MR. DELGADO: And the motion will be stated as -

(Simultaneous speakers.)

MR. DELGADO: Do we have a question here? Look, if there is a petition - we'll come up with an example to make things clear -
if there is a petition to include material X on the list, the motion presented by the committee will be, in that situation, right, we move to approve the listing material X on the list, section 202, so and so, right, regardless of what the committee's vote was.

Now I urge you to consider what the committee's vote was, because that will give you an indication of what was the feeling in the rationale for that vote. The committee might have said yes, which essentially was approving what the petitioner was requesting.

If the committee said no, then they would be going against what the petitioner said or requested. So yes, any questions? Julie.

MS. WEISMAN: Just to add to the clarification that this is because a decision was made in the last couple of years to always pose the recommendation as a recommendation for listing, so that it would always be consistent with the quorums and the yeses and
the noes and all that stuff.

MR. DELGADO: That's very good.

Thank you. Any questions.

(Simultaneous speakers.)

MS. WEISMAN: That's part of the reason. It's so that the whole board can vote.

MR. DELGADO: And another point to clean up is, once the committee presents a recommendation to the board, at that point it is out of the hands of the committee. It forms part of the board in any amendments can be actually incorporated into that document.

Obviously the committee will have the right to declare that in a friendly amendment or not, and that will determine whether we are going to debate or not, adding that amendment. So if it's a friendly amendment we will skip the debate, if it's not we will have to vote on considering that amendment. Is that clear?

Any other questions on the ground
rules? Yes, our executive director seems confused.

MS. FRANCES: No, you mentioned that the first thing up is the technical corrections, recommendation that there were changes on it, that what you gave me did not -

I don't have anything that indicates changes to that recommendation. It's only changes to the technical review I think. So I think that is where I think the confusion is. Because I looked at the junk drive gave me - so you said the first one up was the technical corrections, and that there was a change, but there is no change. So I just wanted to make sure we are clear on that.

MR. DELGADO: I think we're fine. And we'll rely on Barry to guide us through that if there are changes.

I have my cheat sheet here as to votes cast that our parliamentarian - that our unofficial parliamentarian has kindly shared with us. And here is a way quickly back to
the number of votes, if we have 14 cast votes, the two-thirds will be 10; if we have 13 cast votes the two-thirds will be 9; 12, 9; 11, against the votes cast, the two-thirds will be 8; and if there were only 10 votes cast, two-thirds would be 7. Thank you for that.

That's going to be our cheat sheet there.

Any questions before we proceed with the board?

Okay, and again urging members of the public who came in late, please sign in, and we'll start with the process.

On that note then we are only nine minutes behind schedule, we will start with the Policy Committee, and Dr. Flamm, if you're kind enough to walk us through the process.

JOINT POLICY DEVELOPMENT COMMITTEE

MR. FLAMM: Good morning.

The policy committee met with materials, represented by the Chair, Dan, last night, and reviewed both public comments on the policy committee's recommendations, plus
the comments that we received from the board,
and also we reviewed comments in the -
comments from the board in our joint
recommendations Dan will cover later.

At the same time the
recommendations are packaged, and we'll just
call for a vote on the total package.

We'll start the ballot with the
technical corrections. If you would go to the
recommendations, there were no changes made in
that document so what you have in your package
is what we will be presenting as our
recommendation.

I won't - my eyes are still blurry
so I won't even try to read that to you. I
hope you can see it.

Okay, there are no changes, so
let's go to the next recommendation, which is
- which is that one? Help me out. Okay, and
I don't believe we had any changes on that one
either, is that correct?

So let's move to the next one.
Okay, election of officers, we did have some changes there. Dee, do you know what those changes were, if you would just summarize it?

MS. JAMES: Under bullet point number two, we accepted the board members' recommendations that clarify that the newly appointed officers will resume their positions at their conclusion of the trial board meeting pursuant to the election.

So that was the change. We took out - we took after the fall board meeting, and replaced it with the conclusion.

MR. FLAMM: Just to clarify when the meeting officers actually took their seat.

MS. JAMES: When the gavel goes down, people take over.

MR. DELGADO: We have a question -- Julie?

MS. WEISMAN: Just, as I read it it should be, they will assume their position after the conclusion because they are newly appointed, not recent.
MR. FLAMM: We'll accept that as a friendly amendment.

MR. DELGADO: All right, would you move to the next one please.

MS. JAMES: The next one is under point B, the counting of the votes. We moved that the executive director may be given the opportunity to vote to break a tie, and we just clarified that the re-vote will take place until the tie is broken, or a candidate will be given the opportunity to withdraw at their discretion.

MR. DELGADO: And those were the only changes?

MS. JAMES: Those were the only two changes.

MR. DELGADO: Any changes? Are those changes clear to the board? Any questions? Can we move on to the next recommendation?

MS. JAMES: Committee work plans.

MR. FLAMM: Committee work plans.
MR. ENGELBERT: Can we back up one moment? Whose responsibility is it to count the votes?

MS. JAMES: The secretary.

MR. ENGELBERT: Then I would recommend that the votes be disposed of by the secretary, not the chair, or secretary, to make sure that that responsibility is delegated and doesn't get neglected.

MR. DELGADO: So there is a comment here regarding votes.

MS. JAMES: It says under point D votes will be disposed of by the chair or secretary.

MR. ENGELBERT: And I would recommend that that be set just be the secretary's responsibility. That's the person responsible for counting the votes -

MS. JAMES: The chair and the secretary count together.

MR. ENGELBERT: They both count?

MS. JAMES: Yes.
MR. ENGELBERT: Okay.

MR. DELGADO: Any other questions?

Are you satisfied?

MR. ENGELBERT: Yes, I thought the secretary alone counted the votes, but they both do, that's fine.

MS. JAMES: Under step one we accepted the friendly amendment from Tracy, the third bullet point down, clarification. We've eliminated special petitions from the national organic program such as clarifications on a particular issue or guidance on enforcement, and we replaced that with requests for suggestions from the NOB.

And that is the only change.

MR. FLAMM: Okay, can we move to the next one, Valerie, please?

MS. JAMES: I think the next one is sunset procedures.

MATERIALS COMMITTEE

MR. FLAMM: The next one is sunset?

MS. JAMES: Oh, the structure
recommendations.

MR. FLAMM: I don't believe there were any changes on structure recommendations. What we presented is a - is what the committee is still presenting as a recommendation. I think we'd move to the next one, please.

MR. DELGADO: And that's sunset?

MR. FLAMM: Sunset.

MS. JAMES: And perhaps Dan or Hugh has the changes on that.

MR. FLAMM: Yes, there were clarification changes, recommended by the materials committee on - just on the front page, on the background, yes, thank you Dan. And it was reworded - oops, what happened to it.

Okay, actually there were no changes. We agreed to a little clarification on the listing material. It was just a language clarification that Dan had suggested. But there is no substantive change in the sunset procedure.
Oh, yes, thank you, Dan. Again, this is something I guess we had implied in our wording we really intended, and Dan pointed out that it was missing. We want in looking at the sunset material we want to look at all sorts of information including what the committee considered in the initial review. So we put that in to make sure that it was clear that that would be looked at. So I don't know what happened.

MR. DELGADO: Dan, can you give your -

MR. GIACOMINI: I didn't mark down exactly where you plugged it in.

MR. FLAMM: Well, it's right at the right point there, following this includes, and then the wording is missing.

MR. GIACOMINI: It should be, this includes the original recommendation from the board to list. From the board.

MS. JAMES: Valerie, are you tracking this?
MS. FRANCES: It came up red, so I'd say track changes may not be on since all the font there is red. But it did come up underlined, so I'm not sure.

MR. DELGADO: And you are keeping track of those changes, right?

MS. FRANCES: Well, I just highlighted it in yellow for you.

MR. FLAMM: That was the only changes on sunset. Go to the next one please, Valerie.

MS. JAMES: There's the new member guide.

MR. FLAMM: Yes, new member guide. There's no changes in that.

MR. DELGADO: So Mr. Chairman, you have reviewed the changes that you make to the three documents from your recommendations for the policy and procedures manual?

MR. FLAMM: That is correct. And I move that the board accept these policy committee recommendations and add these
amended recommendations to the policy development - policy procedure manual.

Ms. James: Second.

Mr. Delgado: The motion has been moved and been seconded. It is moved and seconded to accept changes to the policy and procedures manual and its highlighting as described by the chair of the policy committee.

Discussion? Are there any questions or discussion on the topic?

Are we ready for the vote? The vice chair is asking if I need the remind the board members of any potential conflict of interest. I don't think it is proper or necessary at this point given that it is an internal work document, so we will move on, and I appreciate that.

Ready for the question? The question is on the motion - do we have a question here? The question is on the motion to accept the changes to the policy and
procedures many as described by the chair of
the Policy and Development Committee.

And we'll start taking the vote
this way from aisle C with Dr. Karreman.

MR. KARREMAN: Clarification

please.

MR. DELGADO: Yes.

MR. KARREMAN: I just want to make
sure that people know that there were two,
three, four, five, there are six different
documents for the policy procedure manual, and
we are voting on all those changes at once.

MR. DELGADO: Thank you for that
clarification. Any other questions on that
point?

We'll begin the vote.

Dr. Karreman?

MR. KARREMAN: Yes.

MR. DELGADO: Kevin.

MR. ENGELBERT: Yes.

MR. DELGADO: Jennifer.

MS. HALL: Yes.
MR. DELGADO: Steve.

MR. DeMURI: Yes.

MR. DELGADO: Julie.

MS. WEISMAN: Yes.

MR. DELGADO: Dan.

MR. GIACOMINI: Yes.

MR. DELGADO: Jeff.

MR. MOYER: Yes.

MR. DELGADO: Bea.

MS. JAMES: Yes.

MR. DELGADO: Jerry.

MR. DAVIS: Yes.

MR. DELGADO: Tina.

MS. ELLOR: Yes.

MR. DELGADO: Tracy.

MS. MIEDEMA: Yes.

MR. DELGADO: Joe.

MR. SMILLIE: Yes.

MR. DELGADO: Barry.

MR. FLAMM: Yes.

MR. DELGADO: And the chair votes yes.
MR. MOYER: Mr. Chairman, that is 14 yeses; one absent. It passes.

MR. DELGADO: The ayes have it, and the motion is agreed to.

Let's move on to the next topic, Mr. Chairman.

MR. FLAMM: We have one recommendation for inclusion in the new member guide. It involves training. And I don't believe, Steve, there are any changes in that.

So I move that the policy committee's recommendation on training additional to the new member guide be approved.

MS. JAMES: Second.

MR. DELGADO: It is moved and second to approve changes to the new member guide as described by the Policy and Development Committee chair.

Discussion? Any questions?

Waiting for the question. The question is on the motion to approve the
updates to the new member guide as described by the Policy and Development Committee chair. And we will start our vote with Kevin.

MR. ENGELBERT: Yes.

MR. DELGADO: Jennifer.

MS. HALL: Yes.

MR. DELGADO: Steve.

MR. DeMURI: Yes.

MR. DELGADO: Julie.

MS. WEISMAN: Yes.

MR. DELGADO: Dan.

MR. GIACOMINI: Yes.

MR. DELGADO: Jeff.

MR. MOYER: Yes.

MR. DELGADO: Bea.

MS. JAMES: Yes.

MR. DELGADO: Jerry.

MR. DAVIS: Yes.

MR. DELGADO: Tina.

MS. ELLOR: Yes.

MR. DELGADO: Tracy.
MS. MIEDEMA: Yes.

MR. DELGADO: Joe.

MR. SMILLIE: Yes.

MR. DELGADO: Barry.

MR. DELGADO: Hugh.

MR. KARREMAN: Yes.

MR. DELGADO: And the chair votes yes.

MR. MOYER: Again, Mr. Chairman, that's zero noes, 14 yeses, one absent.

MR. DELGADO: The ayes have it, and the motion is agreed to.

Does that conclude your presentation, Mr. Chairman?

MR. FLAMM: That concludes my presentation.

MR. DELGADO: Thank you very much.

Congratulations.

Let's move on to the next point, which also includes the policy committee, but I understand that the chair of the materials committee will be handling this matter, Mr.
MR. GIACOMINI: Thank you, Mr. Chairman. The document or procedure for handling technical reviews. A few changes. At the introduction adding the information possibly requested in the technical review for a third party specializing in the scientific know-how or with market availability on the issue.

Going to the next, top of page two, Valerie, procedure of the NOSB, the first section, the last sentence was obviously an artifact from somewhere. And we're looking to remove that.

The material review process, adding the qualified of NL on national list, and adding the sentence dealing with the clarification on petition to change annotation as it essentially is a petition to add or remove a substance.

Technical advisory panel definition removing the - where are we here? -
changing that it is convened by the board, and deleting the last sentence.

Yes?

MS. WEISMAN: A question. Does eliminating that other language by the substitution, I just want to make sure that that does not in any way - what's the right word? - that the NOP is still obligated to use the funds that are - they must still hire a panel, an expert panel?

MR. GIACOMINI: Do you sign the check? Yes -

MS. WEISMAN: I just want to make sure that this does not get interpreted as changing any of the current responsibilities that resides with the NOP for making funds available through the National Organic Program to pay for such expert panels.

MR. DELGADO: Dan. Dan you respond to that?

MR. GIACOMINI: No, I believe this is just a clarification requested by public,
in public comment, clarifying that we convene it, but they are certainly the ones that sign the contract - make the contract and sign the check.

MR. DELGADO: Julie, does that answer it?

MS. WEISMAN: Frankly, can I propose a friendly amendment?

MR. DELGADO: Yes. Well, actually on this one we can't because we are still in the clarification process.

MS. WEISMAN: Okay.

MR. DELGADO: So you will be able to once -

MS. WEISMAN: Okay.

MR. GIACOMINI: Phase three -

MR. DELGADO: And just for clarification this is an internal document. It is part of the workings of the board and should not be considered as affecting the workings of the program.

MR. GIACOMINI: Phase 3, Valerie.
The first bullet point there, scroll up, Valerie, the first bullet point I believe was moved to the end of phase 2. That's dealing with a notification between the program and the petitioner. It belonged up in phase 2 rather than the section dealing with the third party expert.

Let's see, after phase 6, and then the procedures for handling technical reviews, the bottom of that page, the bottom – up – where did we go? On two – oh, no, my mistake. Next page.

In the request of information regarding combination with other materials, we are confining that request in general to other materials that are on the national list in the same section; no need to look for combinations of materials between Section 601 and 605. That is the change in Section – in B and in the new C or the old D.

The old C and the old E requesting information on the combinations of all the
things in the universe seemed way too broad
and way too burdensome to be a reasonable
request.

And then on the last bullet point
there, modifying that slightly, environmental
risks and hazards including but not limited to
legalese language.

Following down on that same page,
number three, as regarding requesting of a
third party expert, the requesting of the
technical review, there are times - generally
that is done by the chairman of the committee
reviewing that material, but sometimes it's
done, and it's allowed to be done by the
materials committee.

Down - I believe that is - no, we
have one more. Oh yes, we haven't gotten
there. A clarification on number four, the
decision to define the expertise needed, and
the third party expert is the responsibility
of the committee reviewing the material or
issue.
And I think that was it.

Mr. Chairman, if Julie could -

okay. Are you happy?

MS. WEISMAN: Yes.

MR. DELGADO: We'll be able to make any corrections once we have moved it.

MS. WEISMAN: No, I'm not going to move. I'm staying right here.

MR. DELGADO: All right, state the motion.

MR. GIACOMINI: Mr. Chairman, I move we accept the - where is my - it's not on there. I need to get to the beginning of the document so I know what it's called. I move we accept the recommendation to amend the policy and procedure manual regarding the procedure for handling technical reviews.

MR. FLAMM: Second.

MR. DELGADO: It is moved and seconded to amend the policy and procedures manual to - Barry seconded and it is moved and seconded to amend the policy and procedures
manual to include the section called procedures for handling technical reviews.

Discuss. Now at this point we can make amendments, clarify it, any questions?

Ready for the question? The question is on the motion to amend the policy and procedures manual to include a section called procedures for handling technical reviews.

And we will start taking our vote with Jennifer.

MS. HALL: Yes.
MR. DELGADO: Steve.
MR. DeMURI: Yes.
MR. DELGADO: Julie.
MS. WEISMAN: Yes.
MR. DELGADO: Dan.
MR. GIACOMINI: Yes.
MR. DELGADO: Jeff.
MR. MOYER: Yes.
MR. DELGADO: Bea.
MS. JAMES: Yes.
MR. DELGADO: Jerry.

MR. DAVIS: Yes.

MR. DELGADO: Tina.

MS. ELLOR: Yes.

MR. DELGADO: Tracy.

MR. MATTHEWS: Yes.

MR. DELGADO: Joe.

MR. SMILLIE: Yes.

MR. DELGADO: Barry.

MR. FLAMM: Yes.

MR. DELGADO: Hugh.

MR. KARREMAN: Yes.

MR. DELGADO: Kevin.

MR. ENGELBERT: Yes.

MR. DELGADO: And the chair votes yes.

MR. MOYER: Again Mr. Chairman there were zero noes, 14 yeses, one absent.

MR. DELGADO: The ayes have it, and the motion is agreed to.

Let's move on to the next section,

Mr. Chairman.
MR. GIACOMINI: Thank you, Mr. Chairman. The parliamentary procedure of bringing some sidetracked petitions back into consideration in - due to the fact that they were formally - had been formally tabled by the board.

We have no changes in this recommendation.

I move that we accept the recommendation to take from the table the petition materials.

MR. DELGADO: Is there a second?

MS. ELLOR: I'll second.

MR. DELGADO: Tina has seconded.

It is moved and seconded to take from the table the list of selected materials as discussed by the chair of the materials committee.

Discussion? Bea?

MS. JAMES: Dan, CCOF had made a really good point in their public comment about, take from the table, that in the past
tabled materials were incomplete, and that they actually shouldn't have been tabled, but they said they should have been rejected, but they didn't have the terminology at that point.

And also Whit Wave suggested that we should check with the petitioner to see if the material is still necessary or there is an interest for it to be brought back. And I believe that items tabled for so long should follow some kind of reinstatement or some kind of a process that you might want to address in the policy and procedures manual. But something about pulling these in and reinstating them just doesn't really quite seem to be following an accurate process to me.

MR. GIACOMINI: The use of the procedure to table is classically a procedure to kill. So it may have been that that was some of the intention. However it's difficult to sometimes pull that out of the record.
In an effort to expedite the situation due to the continuing request from the public to deal with all of these old petitions, we felt that it was an action that was reasonable to take at this time in being able to just bring them back and look at them.

Now regarding the next point, none of these will automatically go onto a committee's work plan. They are all going back to the program. The program will look at them and evaluate them. If there are multiple petitions, they will just be rejected. If they are - the old petitions that are not multiple will be - the petitioner will be contacted. The normal procedure from that, if it's a real old petition I would assume the program may even suggest that a new petition be submitted.

We decided to go with the entire group that we knew at the time, and we hope that we don't find more, we decided to go with the whole group so we would not be - so it
would be as transparent as possible and not be accused of trying to bury certain things, and certain old things. This was the list we found. There may actually be none of them that ever come before this board again based on this petition. It's just a procedural way of bringing it back to reconsider and look at it.

MS. JAMES: So can I ask you what your position is on the public comment that stated that there are nine other materials dating as far back as 2002 that weren't on your current take from the table but are still out there in cyberspace or wherever.

MR. GIACOMINI: We have not had an opportunity to look at each one of those through transcripts and records. I believe that we did find a couple of them that it was not a formal full board tabling that was the final action. Again if it's tabled at the committee level, then it's the committee that can do that.
These are just the ones that we found that were done at the final board. We will review those lists, and again, we think the public comment that brought all those lists to us for further things for us to look up and try and track down. And hopefully we will resolve all of these old petitions that have gone by the wayside, fallen through the cracks. And we are not looking to increase the workload. We are simply looking to respond to the public comment that said go back and deal with these issues.

This was a procedural thing that was done that we came across at the full board level that technically to be correct required full board action to bring them back into play.

MR. DELGADO: Okay.

MS. JAMES: Yes, I definitely appreciate that the materials committee did that. I guess I would like to hear from the program as far as what their thoughts are on
resuming old petitions that have been out there for five or six years that we are now looking at again. Can we do that? Do they need to be re-petitioned?

MR. MATTHEWS: Well, first of all, I don't think you are re-looking at them. I think what Dan has said is that he's sending us a list of them, and he wants us to check on the status, and to advise the board on what that status is, and then the board can make up its own mind as to what it wants to do there.

Yes, Barbara is right, it's a housekeeping activity to make sure that something that should have been done but hasn't been done would get done if it needs to be. So it's a housekeeping.

MR. DELGADO: Joe followed by Kevin.

MR. ENGELBERT: Dan would it be appropriate in your motion to not list one of the following -- and include the others that were brought forth that haven't been missed so
you can just say you are going to do this with all that you find, or else list every one of them that you know of right now?

MR. GIACOMINI: I'm the most comfortable only doing the ones we know of. I don't know how proper it would be to just include a blanket statement that between now and the next meeting, anything else we find is considered removed from the table.

MR. DELGADO: Do you want to make that amendment?

MR. GIACOMINI: I don't think anybody is going to sue us over it, so we'll go on.

MR. DELGADO: Was that a yes?

MR. GIACOMINI: Is the program comfortable with that amendment?

MR. DELGADO: Okay, so it is amended.

MR. GIACOMINI: So it'd be these and anything else.

MS. FRANCES: Can you clarify the
amendment for me?

MR. GIACOMINI: I think maybe the easiest way to do that, Valerie, is just on the bold area, hopefully I'm not saying anything from the rest of the thing, but just in the bold area if you just put, identified at this time.

MR. DELGADO: Kevin, is that suitable?

MR. ENGELBERT: That satisfies it.

MR. DELGADO: Very good.

MR. GIACOMINI: And we are not trying to undo any action of former boards to kill these. We are just trying to respond to deal with things - housecleaning of things that went by.

MR. DELGADO: Very good. Did you have a question?

MS. JAMES: So I just want to get clarification from you, Dan, on the backgrounds, the last paragraph.

A positive vote on a motion to
take from the table these petition materials will allow the NOSB to resume consideration of the materials within proper parliamentary procedures.

So maybe you could explain to me a little bit about - just because you are looking at them doesn't mean that a petition is all of a sudden going to be - you mentioned earlier that you were going to contact the petitioner?

MR. GIACOMINI: The action by the board is all of these petitions are sent back to the program.

MR. DELGADO: And what is going to happen once it reaches the program?

MR. GIACOMINI: The program will reject the multiples, and will contact the petitioner. We may even try to see if we can - well, actually now that we are taking from the table, it would be difficult to undo that in the sense of whether it was the intent to kill. But nothing is going to be taken up by
the board immediately. It's going to be re-reviewed, house cleaned up by the program, and if it's considered complete and ready for the board to deal with then it will come back to us.

But the first action by the board and the materials committee will be sending it back to the program.

MR. DELGADO: Bea, did you have any question or was that clear enough?

MS. JAMES: It is. I'm not so sure it's clear how it's stated in that sentence I just read. But I'm willing to just -

MR. DELGADO: Okay, any other questions? Comments?

Ready for the question? The question is on the motion to take from the table a select list of materials highlighted by the committee chair as well as the amendment to that list.

And we will start our vote with Steve.
MR. DeMURI: Yes.

MR. DELGADO: Julie.

MS. WEISMAN: Yes.

MR. DELGADO: Dan.

MR. GIACOMINI: Yes.

MR. DELGADO: Jeff.

MR. MOYER: Yes.

MR. DELGADO: Bea.

MS. JAMES: Abstain.

MR. DELGADO: Jerry.

MR. DAVIS: Yes.

MR. DELGADO: Tina.

MS. ELLOR: Yes.

MR. DELGADO: Tracy.

MS. MIEDEMA: Yes.

MR. DELGADO: Joe.

MR. SMILLIE: Yes.

MR. DELGADO: Barry.

MR. FLAMM: Yes.

MR. DELGADO: Hugh.

MR. KARREMAN: Yes.

MR. DELGADO: Kevin.
MR. ENGELBERT: Yes.

MR. DELGADO: Jennifer.

MS. HALL: Yes.

MR. DELGADO: And the chair says yes.

MR. MOYER: Mr. Chairman, I have zero noes, 13 yeses, one abstention and one absent.

MR. DELGADO: The ayes have it, and the motion is agreed to.

Back to you, Mr. Chairman.

MR. GIACOMINI: I believe I'm done.

MR. DELGADO: You are done? Well, thank you very much, and we are actually ahead of schedule, and thank you for your time and clarification.

Moving on to the next point, it is the compliance and certification committee, and if Mr. Smillie, the chair, can be so kind as to walk us through the motion.
MR. SMILLIE: Thank you, Mr. Chair.

The first item we are going to consider is our first recommendation, certifying operations with multiple production unit sites and facilities under the National Organic Program.

We have a number of edits to make to the document. They are not exhaustive.

MS. FRANCES: Okay, I didn't get one with that.

MR. SMILLIE: We will have to do it on - I don't think it will take a lot of time. And I will ask Tracy to lock the board and Val through some of the --

MS. MIEDEMA: Thank you very much.

We have five minor copy edits that are significant in their meaning, and I have marked up these five edits and numbered them as such, and I'm going to hand that to you, Valerie, and then that will facilitate this editing process a little bit.

The first edit is based on Stan's
suggestion yesterday that we remove the words, or eliminate, in discussing the role of the ICS and its implications having to do with inspection. So that is on page two I believe.

The next four edits are all very similar, and it was a clarification to the word, handling, that was aptly pointed out by the National Organic Coalition and others, to change the words, handling, proposed harvest handling.

The wordsmithing involved in making these four changes varies only slightly in their syntax to make the sentences flow. So there are four instances, and Valerie, I'll let you speak each of those.

MS. FRANCES: So handled post-harvest handling.

MS. MIEDEMA: The editor number, one through five. So if you'd just go to each one.

MS. FRANCES: That's what I'm asking. Was the ones that are handled, post-
harvest handling?

MS. MIEDEMA: Yes. In that one, remove the word, handled. Well, that one - Mr. Chair, do you mind if I stand next to Valerie to make this as painless as possible. Handled post harvest. And later in this paragraph the word, handling, becomes post-harvest handling.

MS. FRANCES: We're almost there, folks. If you can jump back to page two, Dan just pointed out another instance of the words, or eliminated, that I would also like to strike.

Which paragraph was that Dan?

MR. GIACOMINI: Second to last line of the text before the footnote.

MS. MIEDEMA: We've already removed that.

MR. GIACOMINI: Okay.

MS. MIEDEMA: We welcome language from the minority opinion to be incorporated into the document as part and parcel of the
document, if any member of the minority opinion would like to propose that language.

MR. DELGADO: You have to move it first. It has to be submitted open for questions.

MR. SMILLIE: Mr. Chair, I would like to move this recommendation.

MR. DELGADO: Is there a second?

MS. MIEDEMA: Second.

MR. DELGADO: It is moved and seconded. And the motion was to improve the document called Certifying Operations with Multiple Productive Unit Sites and Facilities Under the National Organic Program.

Discussion. This one we can entertain changes, and there is a motion from Jennifer.

MS. HALL: I would like to make a friendly amendment from the minority opinion.

MR. DELGADO: State your amendment, please.

MR. SMILLIE: I'll second that.
MR. DELGADO: No, let's make sure that the proponent of the motion agrees with the amendment, and if you can state the amendment.

MS. HALL: Okay, I would like to, instead of consider new entrants to the production unit a risk factor, I would like to incorporate it into the document as mandatory inspections in their inter-year.

MR. SMILLIE: And you accept that as a friendly amendment.

MS. MIEDEMA: Jennifer, would it be acceptable to excerpt the second to the last paragraph of the minority opinion and insert that directly back into the document?

MR. DELGADO: The minority opinion, second to last paragraph, and that should be at the very end.

MS. MIEDEMA: I'll say that - first let's get to that paragraph at the very end of the minority opinion.

MS. HALL: Sure, we can do that.
MR. DELGADO: So what is it that we are looking for?

MS. MIEDEMA: Would you like to read that?

MS. HALL: It states: all new entrants to a producer unit should automatically qualify as a high risk location if an automatic external inspection for each new member. This process would train all new entrants immediately as to the importance of organic certification, and prevent any new and less familiar producers in the group from not passing it.

MS. MIEDEMA: The section that you identified as that - that would fit is on page seven under inspection sampling and risk analysis.

MS. HALL: Dan, do you have a comment?

MR. DELGADO: Dan, you have a comment?

MR. GIACOMINI: Just for
clarification, do you want the new member inspections as a separate subject, or do you want them included as the proportion of high risk? I mean they'll definitely be done, but do you want them to be considered a portion of the high risk or a totally separate group?

MS. HALL: That's a good clarification. They are a separate group in my mind.

MR. GIACOMINI: I think that brings them in as part of the high risk group.

MS. HALL: Okay. I have other language that we adapted that might work as well. Are you willing to entertain that.

MR. DELGADO: So let's look basically at another way of going. And we will phrase it the way you want it, Jennifer, and we will see if the proponent of the motion agrees, and we will move forward.

MS. HALL: Under Section D, Inspecting the Producer Group Operation, the second paragraph, the end of the first
sentence, it ends with meaningful sample of subunits within - I'll read the whole sentence. Verification of the OSP is largely accomplished by a thorough audit of the functioning of the Internet control system. The company by a physical examination of every producer unit. Generally the headquarters are a common regional handling or collection facility, and a meaningful sample of subunits within any given production unit.

I would like to add, parentheses, with one exception, and insert, all new entrants to a production unit must be inspected in their first year with the group. In subsequent years all successfully certified operations will be inspected per the sampling method described below.

MS. FRANCES: Go a little slower.

MS. HALL: Sorry. Must be inspected in their first year with the group, period. In subsequent years, comma, all successfully certified operations will be
inspected per the sampling method described below.

Keep the last sentence. And then under number one, inspection sampling, enriched analysis, no go back up, sorry, just right in that paragraph, it starts, the certifying agent must have policies and procedures for determining how many of the subunits within a production unit must receive an annual inspection by a certifying agent.

Right here I'd like to insert one sentence - or part of a sentence. Are you ready?

In addition to mandatory inspection of new entrants to the production unit, comma, and then just change the T to a little t.

MR. GIACOMINI: Did she get the first part of that?

MS. HALL: Yes.

MR. DELGADO: Jennifer, does that conclude your -
MS. HALL: It does. I mean that's in addition to the new entrants, and then there is identifying the harvest population.

MR. SMILLIE: Well, I say it's acceptable in the presumption that then at this point in time, once we agree to this change, then the minority opinion as an attached document will disappear.

MR. DELGADO: So we're beginning the minority opinion document. Did you have a question, Jerry?

MR. DAVIS: Just a grammatical question on that very last entry you made. If you could go back up to that when you get a chance.

MR. DELGADO: Any other questions? Very good. Any other discussion? We are in the discussion of this motion. Clarifications? Questions? Jeff?

MR. MOYER: Yes, Joe, I'm wondering if your committee gave any consideration to the discussion we had yesterday regarding some
sort of concession on the idea of a $5,000 limit. Although I know internationally that seems like an arbitrary number, internally with our program it does alleviate some of the fears that I have that there could be some very large growers lumped in with some very small growers, which could indeed have many employers escape inspection.

I'm just wondering what you guys think about that.

MR. DELGADO: Joe?

MR. SMILLIE: Well, two different responses. One, I'm not sure that I can speak for the committee, because I think we did talk about it.

My opinion is that although in essence I wouldn't personally have a problem with it, because I think, you know, some of the growers that we're tied in with, if they could pay $5,000 they'd be in hog heaven. So I don't think in essence it's become an issue. But it does become incredibly burdensome and
difficult and almost like cultural imperialism from my point of view to start to put arbitrary U.S. dollars on that. The idea, the intent of that, I think, is good. But to try and put that in the regulation I think would be burdensome and difficult, and I wouldn't want to do that with this recommendation.

MR. DELGADO: Tracy.

MS. MIEDEMA: To your specific question, Jeff, of whether we discussed it yesterday, we have actually discussed it for 18 months, that very question, with great detail with literally people all over the world, in meetings all over the world.

So it has been very well vetted, hashed, discussed. And one thing to keep in mind when you think about that, it is a tremendous disincentive for a smallholder to succeed if they reach - they sell one too many tomatoes, and they lose their status as being part of a group.
Now assuming that a flag bearer role in their group is actually someone who is
doing well, they would be a knowledge holder and a leader, and putting in a disincentive threshold like that would be counter to the group itself.

MR. DELGADO: Jeff, followed by Jerry.

MR. MOYER: I don't understand how that is any more of a disincentive than it is in this country where if you earn more than $5000 you have to be inspected. And as Joe said there aren't that many. But I don't see that - I think it alleviates - it certainly alleviates my fear, I don't want to speak for anybody else.

MR. SMILLIE: I understand that, Jeff. My understanding is that it wouldn't necessarily put them out of the group. It would just necessitate that they have boots on the ground.

MR. MOYER: No, not at all. In my
opinion it would not put them out of the
group. What - it would put them in the group
that is inspected.

MR. DELGADO: Jerry followed by
Jennifer. Jennifer?

MS. HALL: I just wanted to mention
that we did have that conversation quite a
bit. And I think there is an equal part of
the community that is a little bit frustrated
with how arbitrary the 5,000 has gotten,
because it hasn't been updated, and so instead
took the tack of trying to add more rigor,
which we didn't focus on a lot. We focused a
lot on the risk factors that help identify the
sampling unit; But we did not talk much in
this discussion about the rigor of how you
qualify to even come together as a cluster,
and how those - how those operations have to
meet qualifications to become a group, and
then once they do, it is really part of the
certifiers job to also keep an eye on how
realistic that is.
And the last sentence in Section C, it should be, at the top of page seven on my - it does say that an upper limit on the number of members or subunits included in a given production unit should be based on the feasibility of effective oversight by management personnel and factors such as size and acceptability of the subunits.

So there is more in there than I think got its due attention as to the different roles, and how that needs to be administered. But I understand the point.

MR. DELGADO: Dan.

MR. GIACOMINI: Regarding one thing that Jennifer just said there, and I'm not saying that I don't think this will change the committee, but the 5,000 is in OFPA. It's set by Congress. It would have to be changed by Congress. Like I say, I would be comfortable if we say that each subunit is held to the same standard for inspection as required by OFPA, however we want to put that. That would
allow for Congress to make an amendment to
bring that more into modern dollars if that
ever occurs without us having to go back and
change this recommendation.

MR. DELGADO: Joe.

MR. SMILLIE: Our opinion, and I
think the absolute majority consensus opinion
is that this truly is covered under risk
analysis, as Jennifer clearly pointed out. We
think it's covered, and we think it's a better
way to do it than the $5,000 - that's what we
arrived at in consultation with a lot of
different people.

MR. DELGADO: Huge followed by
Jerry and Tracy.

MR. KARREMAN: I'm just wondering,
is this only for outside the U.S. in
developing countries? Or could this be in the
U.S.? Because I'm just asking, what if there
is a farmer who is cooperative in the U.S.,
and it's really large, and they got people.
And then they say, well, as a coop we have
these certain protocols and ICS and all that, I'm just wondering, would this apply to them as well?

MR. DELGADO: Clarification, Tracy?

MS. MIEDEMA: There's no limitations on who - what nationality would get to use an internal control system.

MR. SMILLIE: As Barbara said, Indiana or India, it's the same regulation.

MR. DELGADO: Jerry.

MR. DAVIS: So I defer initially waiting to hear comments like what Jennifer said. That portion of the document that she cited is really the only part of the document you think that covers that concern of how do you keep a large grower from plopping himself into a grower group?

MR. SMILLIE: I believe the entire document covers that, the entire scope and intent of the document, properly executed by a trained certification agent, covers it. In many more ways than an arbitrary number figure.
would.

MR. DELGADO: Clarification by the executive director?

MS. FRANCES: I would encourage you to perhaps read this list out loud, the criteria for clustering.

MR. DELGADO: Tracy.

MS. MIEDEMA: In response to your question, Jerry, as well, the entire presentation and clarification process are further checks on what you are saying. If a certifier were to wantonly - you know had some hodge-podge internal control system with a faulty organic system plan, puts their very status as an agent of the government at risk. So I mean we have multiple, multiple layers of checks built in. And then when we drill down into the detail level, the criteria for clustering these members into subunits takes into accounts details that would cover something like what you are talking about.
So I can read this list, or you can read this list. We can also read through the list of risk factors. But we have got a macros system, and we've got the micro details, and we really - I think someone said it very eloquently a day or two ago that we can't constantly live in fear of the offenders. We have to write rules assuming that the enforcement capabilities sitting here at the table in front of us will do their job just like it's our job to help give the guidance.

MR. DELGADO: Tina.

MS. ELLOR: But the enforcement people are telling us, Richard and Laura, that you don't see any reason why any size growers can't form their own group.

MR. DELGADO: Richard.

MR. MATTHEWS: Well, I'm not an attorney, but I think an attorney would drive a semi right through this thing, and get a huge grower group, a coop. I mean you heard
from one commenter yesterday that was a coop
for pears that had 100 units. So what is
going to stop that one from doing it?
This - this - I don't see that
this would stand up in a legal challenge. But
I'm not a lawyer. I'm not an attorney. I'm
not a lawyer. But that's my belief.

MR. DELGADO: Tracy.

MS. MIEDEMA: When we talk about
inspection, we always talk about sampling.
And there is a semi truck that could be driven
through every 5,000 acre farm in the United
States that has one member and one organic
system plan. And if what we are saying is, we
are so afraid of fraud that our intent today
is to disallow market access to small holders
around the world, then we should embrace this
sort of fear, right now today, we have small
holder operations around the world that are
strong and rigorous and important and they
belong. We are strengthening the ability of
our program to oversee these operations
through this document. They already exist, and we are making it stronger today.

We are not throwing care to the wind here. We are strengthening what already exists, and we are providing a legal means for this to carry on and even get stronger.

The National Organic Program can take our recommendations, they can dot more I's and they can cross more T's, but we have got to bring this group certification into the National Organic Program as a legitimate means of certification going forward.

MR. DELGADO: Jeff.

MR. MOYER: Tracy, I couldn't agree with you more that when it comes to small holders I think your point is very well made. When it comes to large holders, I don't think your point is well made. I think that I am not still naive to think that the Richard Bransons of his world who are forming large grower groups in India with literally millions of acres, turning millions and millions of
dollars that want to drive through the loophole that Richard just identified over there.

I am not willing to take that risk, and I would hate to throw out the baby with the bathwater on this, and that's why I'd like to consider putting in a - I know the 5,000 seems globally arbitrary. I understand, I was at the IFOAM conference too. I understand what is happening at the IFOAM level.

But this is the US, the aid program, and this is the National Organic Standards Board, and we do as Dan mentioned have a number that we could all argue is arbitrary or outdated. But we do have a $5,000 number that in this country is applicable. I don't think it's imperialistic to place that on international growers that want to do business in this country.

If they are making more than that, it in no way disparages from getting to that
size. They are just going to get inspected.

What is the fear in getting inspected? I
don't have a problem with that, and at some
point I'm going to make a motion, probably
unfriendly, to insert that language.

MR. DELGADO: Tina, and then Dan.

MS. ELLOR: I actually like the way
Dan put it. Maybe you could restate that,
Dan, about we are not necessarily saying
5,000, but holding everyone to the same
standard.

MR. DELGADO: Dan?

MR. GIACOMINI: Boy, I'm lucky to
get something out once. So I have a different
way of looking at it right now, if you would
like me to address that issue.

Joe, is it correct that all high
risk subunits get inspected?

MR. SMILLIE: Yes.

MR. GIACOMINI: Okay, if you were
saying that everybody over $5,000 would be in
the high risk group, they would get inspected,
MR. SMILLIE: It's quite possible.

Let me just go back a second on the 5,000, okay. Right now what you are doing is comparing apples to oranges here, and I just want to point it out. People under 5,000 in the U.S. don't get inspected, and can legitimately sell as organic.

We are talking about these people being inspected, okay.

MR. GIACOMINI: No, what I'm talking about is the public relations semi truck train wreck that could occur on this thing when it comes out in the New York Times that product selling in the United States from someone in China making over $10,000 a year is not being inspected, when a grower in Vermont making 5,000 and I is having to. That is what I'm comparing. I'm not comparing apples and oranges. I don't see it's imperialistic. I don't even see it's arbitrary. It's the law. And if they are already going to be part of
the high risk group in whatever high percentage of times, I don't see the problem with separating them out and saying it to prevent that wreck from occurring, which I can see occurring in absolutely no time at all.

MR. DELGADO: Let's have a response.

MR. SMILLIE: It would take me about a day to respond. The whole point of this is that you have to understand how certification works, and we have to go back to the very beginning of this argument. We are not talking about not inspecting again. We are not talking about - we are talking about a different system that complies with the law that throws the full force of vigor of the regulation into play. And right now you are talking about a detail of it. I don't know what to do with it. So it's a big picture discussion. And you are focusing on one of the details. Again, the fear that seems to be
driving - and you have expressed it clearly, it's fear - we are afraid of a scandal, we are afraid of a train wreck, and all that sort of thing. And if you try to over-regulate, I guarantee you people, you will cause the train wreck by overprescriptive - and I think we are seeing that happen.

That is just a - let me finish. Basically what you have to do is look at the document that we have created. I do not think large growers are going to try and get into groups that have to follow a single OSP. As I talked about yesterday, they have to follow the same OSP, and I don't think they are going to want to get in, and even if they do, if you look at the risk factors, I think they will be identified as a risk and have that additional third party inspection. That's what this document does.

MR. GIACOMINI: Then why are you afraid of separating -

MR. DELGADO: We have Jennifer,
followed by Craig.

MS. HALL: Thank you, Mr. Chairman.

At the outset, Joe, I heard you say that you were open to the $5,000 limit, and just - let me finish - so what I heard Dan saying as a bit of a concession that he is not saying that there needs to be a dollar limit on who clusters together, but if they do, and they do reach over 5,000, then it's a mandatory inspection, which seems to be a feasible compromise, and taking into the reality of different sorts of currency, wherever, however.

MR. DELGADO: Joe, do you want to respond to that?

MS. MIEDEMA: Okay. Esteemed colleagues, I implore you to curb the hyperbole and come back down to earth and look at what the real implications are of this recommendation.

What Dan I believe is referring to is a fundamental misunderstanding of consumers
today of all inspections. The scenario he
describes of consumers being aghast of a field
not getting looked at where some fraudulent
products came from exists today. Those of us
with 1,000-plus acre farms are very aware of
where the inspector is on inspection day. A
lot of that time is in the conference room.
And that does not diminish the strength of the
organic system plan or what inspection really
is.

But let's face facts: inspection
is not well understood by consumers. So the
fear that Dan is expressing exists already
today completing setting aside grower groups.

Five years ago my husband and I
had a small under $5,000 organic farm. We
sold our products into restaurants, and it was
a nice back of the trunk bring organic produce
into restaurants. It was wonderful. And if
we had sold too many herbs and flowers we
would have got bumped up above that, and we
would have felt a little pain that we would
have had to pay that inspection fee. That is the scenario here in the U.S.

The scenario that you got into, the woman who is farming coffee organically and who has access to the U.S. organic market through her certification and earns $5,001 and now is denied access to the U.S. market because she sold one pound too much coffee is a completely different scenario.

So when you start putting these thresholds in and calling these two scenarios equal, we are talking about two separate things. Because if you are talking about she has to now at the $5,000 point pay for an outside Western inspection every year - I see a lot of heads nodding.

MR. DELGADO: Can you finish your statement.

MS. MIEDEMA: The comparison you are making is not equal.

MR. DELGADO: Tina.

MS. ELLOR: But if I understand it
correctly, she wouldn't be bumped out of the
group and have to pay the inspection. It's
just that as part of the group she would be
inspected.

MR. DELGADO: Is that clarification
- 

MS. MIEDEMA: Well, what we're
capturing with that is the cost being
allocated. Maybe they will get spread
throughout the group. It could bring a burden
to bear exponentially when that is the entire
market access to organic.

And what is inherently more risky
about running $5,001 on one of these group
certification operations, so why would we
arbitrarily assign that as always being higher
risk.

MR. SMILLIE: You have to know that
we are certifying the group. These people are
subunits or members of the group, okay. So if
the group makes the money, they pool together,
they sell the coffee or whatever it is and
they all get the money. Each member of that
group gets their share of the total income
less the fees to the group.

If you try to do record keeping
for each member of the group, to try and force
it, it would be possible, and I think the
system could accommodate it as a risk factor.
And I believe it is in there. I believe your
concerns are addressed in this document.

MR. DELGADO: Dan followed by Julie
and then Jennifer, Kevin.

MR. ENGELBERT: I'm trying to get
around this, and all the work that you have
done and I appreciate it. But we still have -
maybe we could drop this $5,000 impasse by
simply having every production unit inspected
every year.

I understand where you are coming
from with the thousands of acres. Counting
all the acres on my farm, pasture, woodland,
cropland, we have 1,400 acres under
management. In another country that might
support 3,000 people. We still have to have every acre looked at every single year.

So you still have an open-ended system where in your proposed recommendation a farm could never be inspected by - based on random sampling.

But theoretically that is another train wreck waiting to happen. If you have a product coming into this country that is contaminated that is traced back to an organic farm subunit that has never had an inspector walked by and look. And trained inspectors can notice different things on different farms simply by driving through.

It seems like it's just a time factor that you are saying, we can't inspect every subunit every year. It can't be done. But I don't like that as an excuse.

MR. DELGADO: Point of clarification.

MR. MOYER: When you say inspected, you mean third party inspection, not internal
control system inspection?

MR. ENGELBERT: Yes.

MR. DELGADO: Julie, followed by Jennifer.

MS. WEISMAN: My point that I wanted to make was actually following up on Tracy's point, although I think that this is an important line of discussion and I am sort of reluctant to interrupt it.

But I also wanted to point out that outside of this - there are certain crops which vary widely in very short periods of time, vanilla being one of them, cocoa being one of them. So factors that don't have anything to do with anything that the farmer did, in other words, from one year the value of the crop - of every person in that production unit would go up and push them over that $5,000 mark, and though individual farmers are not necessarily the ones that are seeing that value.

So I just wanted to point out that
there are factors, global factors of changes in exchange rate, and that certain commodities vary wildly from year to year that will cause additional undue burden to people in those groups.

MR. DELGADO: Jennifer.

MS. HALL: On that same point, and I recognize that it does change around the globe, but I also understand the hesitancy of people who are trying to grapple with it, because it is a global thing. So if it is applied here, in that scenario, at least they don't get bounced out of the group. If the FOPA rule is assigned as a risk criteria, and they may be more expensive within that year, which is unfortunate, in that they would have to have a higher level of inspection. But at least here, when it is applied, there would be parity, and at least that loophole is eliminated ideally.

MR. DELGADO: Any other questions, comments? Barry?
MR. FLAMM: I had originally the same concerns about size and dollar amounts as Jeff, and Dan, and others have raised. And I guess I still have some of those concerns. I became convinced that the structure of this covered it, and that provided the flexibility. But the trouble is, we need flexibility but we don't need loopholes either. And that is where I'm struggling with. I guess I'm still attracted to the suggestions put forward by Jeff and Dan and expressed by Jennifer as a possible alternative to this.

But I think what Joe says in terms of - it's filled in, the committee hasn't ignored these concerns. It's just not as specific as others might like.

So that's all I have to say right now.

MR. DELGADO: Joe.

MR. SMILLIE: I'm going to take Valerie's suggestion. Could you just scroll
down to the risk analysis - down a bit,
actually, you are close.

Val often has many good words of
wisdom; I should learn to pay more attention
to her. The number of production units and
production subsites and facilities,
participating in the -

MR. GIACOMINI: Can you go back and
tell us what this list is?

MR. SMILLIE: Oh, I thought you all
had been very conversant with the document.

Oh, boy, my eyeballs. The
certifying agent must have policies and
procedures for determining how many of the
subunits within a production unit must receive
an annual inspection by the certifying agent,
in addition to the mandatory inspection of new
entrants into the production unit. The
certifying agent must also have policies and
procedures for determining which subunits
present the greatest risks of noncompliance.

Various risk assessment methods
are used, and I refer again to the reference material at the end of this document, are used to both determine sample size and select the appropriate subunits to examine. Higher levels of overall risk for a production unit would dictate a higher proportion of components to be sampled.

The factors below will assist inspection both in determining the sample size and in deciding which components he/she should inspect annually.

It is a responsibility of the ACA to instruct the inspection on which high risk subunits must be inspected, and the number of lower risk subunits that should be sampled, based on their determination of the group's overall risk. The ACA will ensure that this protocol is transparent.

And again this system, all certification systems, rely on the competence of the certifying agent, and their monitoring by the program. And we are seeing that today
as we go through the five year renewal.

The program staff has increased
the compliance and enforcement section
dramatically and significantly, and we have to
keep the faith that everybody in the system is
going to do their role, and we can't
overprescribe for anyone else what they need
to do.

It's not Sunday, is it? Okay.

Here are some of the risk factors.
The number of production units and subunits,
sites and facilities, participating in the
producer group operation. How big is it?
That's important.
The size of the average production
unit and subunits, there we go; that is one of
the first indicators. We are going to look at
the size of them. If there are eight guys
who have a hectare and one guy who's got four
hectares, he's going to get the visit, in my
opinion, my opinion as an ACA.

Maybe somebody else may else may
not look at it that way. I don't know. The size - the degree of uniformity among the subunits within the production - the degree of uniformity. Those eight guys are all on a hectare. They've all got the same amount of bananas. The other guy, he's got bananas, and he's got more. So again he's not uniform. You know it's the nail that rises above the rest. Obviously another reason, that you are going to look at the uniformity. If somebody is not uniform, they are going to be a risk factor.

The complexity of the production system. These guys just harvest their coffee and take it to the grinding machine that takes the cherry off the coffee. This guy has got his own grinder. It's a little different. He's following the same OSP, but he's got his own, whatever it's called, that machine that takes the cherry off the coffee.

Anyhow, the complexity of the production system, the management structure of
the internal control system, how do they function. One of the things that is really important for a certification agent is not just the subunits which everybody is focused on. They are going to focus on the internal control system. They are going to examine that internal control system with a fine-tooth comb, because that is one of their keys. And how that internal control system functions is also going to dictate where the risks show up.

Prohibited materials applied adjacent to a subunit within the previous year, again, that is for every farm, as you know, Kevin. If you've got a neighbor that's spraying on your border, man, that inspector better check out that border real well. Same thing here.

The new entrants - well, now that's enshrined institutionally. Significant expansion of the size of the subunit, obviously a big risk factor, if all of a sudden there was a split or parallel
production. Again, split means two different
crops, parallel same crop; conventional and
unconventional - well, that is obviously a
huge risk factor. That's got to be taken into
account right away.

The number of years the producer
group has functioned - you know, their
training. I mean let's face it, an inspector
goes on a farm, if it's like, you can see the
weed control machinery out there. It's all
shiny. It's been worked. You see the wheat
in the field. You start to get real
comfortable.

You go to a field that's got no
weeds, and the discs are rusty, you are not
comfortable; you start digging. And that's
what inspectors do; that's what ACAs do. The
same thing applies here. They dig. They do
their job.

It is the rate of growth in new
members, previous problems with the
functionings of the ICS. They are
accountable; they are responsible. They are watching staff turnover. ICS totally changes, whoa, we got a problem.

These are all key elements in how risk is assigned.

Potential conflict of interest: all of a sudden there are three brothers on the ICS, and that family, you know, hm, better look at that. Complexity in the types of subunits and/or products marketed - again, there is your indication once again that those larger over $5,000 U.S. units are going to be identified.

The prevalence of conventional production of the same type in the region - very important obviously for everything - whether post-harvest handling or livestock facility is included. Any of the big - you know, let's just use coffee as our favorite example, although maybe we should use ginger and china, it might be more appropriate consider the signs of the times - but whatever
it is, you look at whatever is going to be the hot ticket item. And again, any facilities within the group are going to be boots on the ground third-party stuff. They are not going to skip those.

Okay, compliance with internal frame. You know the ICS takes their job seriously. And everybody has got this idea that the ICS is like, oh yes, I'll take it, don't worry about it. No, these guys are serious. These people are serious. They are protecting the investment and the work of their entire community. If somebody screws up in that group the whole gang can go down.

These people are pledged to protect that; that is their job as an ICS. They take it seriously. They know more about what's going on in that community than any parachuted gringo will ever know. Trust me on that. Well, you don't have to trust me. Legislate it.

Frequency of minor noncompliances.
We see a lot of minor noncompliances. Well, they didn't do this, they didn't do that. Bang, sampling size goes up. That is the job of the ACA. That's what ACAs do, and that is what they are accredited to do.

And again, one of the pleas that perhaps if there is a real problem with this document, to me what you pointed out is not a real problem - it's a problem but it's not a real problem - the real problem is, I think we need a separate scope of accreditation for certifiers that - you know there are crops, livestock processing, and there should be also multi-site. It should be a separate scope of accreditation, taken very seriously. A number of organizations are currently doing it that don't have a big volume of it. They realize what's involved. They say, we're out of this. Let the professional ACAs who do this work all over the world carry it out.

Sorry for the long-winded thing,

but as always, Valerie had a valid point.
So that's the answer to your questions the best way that we can phrase it.

MR. DELGADO: Huge.

MR. KARREMAN: Thank you, Joe, for going through that. That is very reassuring except on one point, and maybe it's just me, but I am very concerned about having a split operation in a grower group. Can you address that? I just - either - well, I'm just very concerned about that.

MR. DELGADO: Joe?

MS. MIEDEMA: Well, it's addressed in a couple of ways. One is, all of the organic product must be sold only through the group. And where I heard this come up was the acknowledgment of family sustenance, and not necessarily a strict adherence to organic practices for their own food to eat. They're a coffee grower, but you know, they have got a little patch of corn or something. And I feel maybe a little - to speak to this more clearly - but this was really left in as a
survival item.

MR. KARREMAN: This is in the U.S. as well. I understand – I mean I understand what you're saying. That's totally fine. But there is something just to me that – I know split operations are allowed and everything. But they ought to be raked over the coals. Every single one of them in this country or elsewhere. Because there are some sitting on farms that really need looking at real hard if they are split operations.

MS. MIEDEMA: I work for a split operation, and am aware of how clearly delineated organic borders need to be, and the extra scrutiny that comes from that, and if that is represented by the notation here as that being an additional risk factor.

MS. JAMES: Well, I think one of the elephants in the room here is that we have to look at economy and supply scale. I'm not an inspector, I'm not a farmer. But I do represent the endpoint where a lot of these
products are sold. And currently 100 percent inspection of all farms is not something that is being practiced. And I would be very concerned that if we couldn't come up with a multisite recommendation that the program as well as the board is comfortable with, that it's going to cloud the system. That if all of a sudden we turn around and we say, 100 percent inspection of all farm sites, that would seriously affect the supply.

And I am not opposed at all - I think I probably side with Barry a little bit - I think some of the feedback has been really good, and especially if the program is sitting over there telling us that we can drive a semi truck through this recommendation, that we shouldn't hold onto it so tightly that we are not willing to look at ways that we might be able to change it so that the rest of the board felt more comfortable with it.

And I want to point out some things that I heard in public comment, and
that I read in a lot of the comments that were posted, and that is, that I think there is a serious concern about sites exceeding a long time limit, without being inspected. I think that that is something that we need to possibly look at.

I think that the definition of selection unit, that maybe we need to look at the idea of that not exceeding 100 individual growers.

I think we also - we did make a - we did acquiesce by adding in the minority opinion which I think is great, that new sites are under a high risk. And defining the size of the average production unit is probably something that should be addressed as well.

Because my concern is that if this recommendation passed and went to the program that they would reject it and then here we are back at ground zero.

So I just want -

MR. DELGADO: Do you have a quick
response, Joe?

MR. SMILLIE: No, nothing is going
to be quick here.

MR. DELGADO: Okay, a response to
the point.

MR. SMILLIE: Number one, that kind
of wholesale reexamination we can't do today.
So let me just try and point out one big
thing. If we do this, you will be drinking
sustainable coffee, not organic coffee. You
will be having sustainable vanilla and
sustainable sugar; not get a recommendation
through that allows for group certification.

Just be very clear what the
ramifications of this are internationally and
for the entire organic industry. I would just
urge you to think about that.

Number two is, if in order to get
this through, and I love open transparent
democratic processes, we have to make a deal
to include in the risk factors that mandatory
inspection for anyone exceeding $5,000 U.S. -
luckily that is dropping like a stone everyday
- if that is the deal-breaker, then we are
willing to discuss it as - to put it in the
risk factor, not as mandatory, but to add it
specifically to the risk factor. Any member
or subunit making more than $5,000 is
highlighted as a risk factor; I'm willing to
consider that as a friendly amendment.

MR. DELGADO: I'd remind the board,
speaking of action items, we haven't
considered any amendments, unfriendly or
friendly, after the first two. So that is a
way to get things through.

So if I understand correctly, are
you making an amendment yourself?

MR. SMILLIE: I don't think I can.

MR. DELGADO: You can, because this
now is a document before the floor.

MR. SMILLIE: Okay, if I could
recognize myself as friendly. Gets a little
schizzy on that.

(Laughter.)
MR. DELGADO: Jeff.

MR. MOYER: Joe, while I had jotted down a comment, I would like to make an amendment to your document. But based on just your recent comment, I don't know if you will like it or not. Because I was not going to call it a risk factor. My suggestion is to put it in the paragraph right above this unit. So my motion is to accept this language placed in page seven, D1 following the - right in the center of the paragraph right in front of where it says, various, is where the sentence would go. And this is the sentence I'm proposing as a motion.

All subunits that gross over $5,000 in organic sales in any year must be inspected by third party during the next inspection cycle - that's in U.S. dollars.

MR. GIACOMINI: Second.

MR. DELGADO: Second. Is that a friendly amendment?

MS. FRANCES: Can you repeat that,
please?

MR. MOYER: I certainly can.

The sentence that I wrote said:

all subunits that gross over $5,000 U.S. dollars in organic sales in any year must have third party inspection at the next inspection cycle.

MR. DELGADO: And that is an amendment to assert.

MR. MOYER: And that was seconded by Dan.

MR. DELGADO: Seconded by Dan. Is that a friendly amendment?

MR. SMILLIE: Can we have the discussion first?

MR. DELGADO: Absolutely. It's been moved and seconded. And it's going to be followed by a discussion. So it's been moved and seconded to amend by inserting the words:

all subunits that gross over $5,000 U.S. in organic sales in any year must have third party inspection in the following year.
MR. MOYER: I said in the following inspection cycle.

MR. DELGADO: And discussion on the amendment?

Tracy followed by Tina then Joe.

MS. MIEDEMA: I believe this is overly prescriptive, and that we are going to prescribe ourselves out of the construct actually working the way it does now, and should continue to work around the world.

And just a quick history on this issue, folks. This board cast a recommendation on criteria for certification of grower groups in 2002. It was quite rigorous, and in fact, in its entirety it has found a home in our recommendation.

It did nothing to prevent the plug being pulled on grower groups around the world, and frankly, whatever we send to the program today they are still going to be able to make mincemeat of - they are going to be able to take or leave. We are giving a
recommendation.

But if our intent today is to tear apart what's happening out there in the world right now, then we should start layering in items like this. If we are to make it more rigorous and give the program our intention, then we should move forward with what it is.

I think our recommendation would not be weakened by including the 5,000 threshold as simply a risk factor, and leaving discretion in the hands of certifiers. In our system, we here, USDA organic, we embrace an organic system plan that is flexible and melds to every farm here in the U.S., single operations. We do not have a one-size-fits-all organic system plan. Let's keep it as a risk factor and allow our spirit of organic to live in the same way in these groups.

Have it be a risk factor and not a prescription.

MR. DELGADO: Tina.

MS. ELLOR: Yes, from some of the
comments we heard, I am a little bit concerned that this would be very very onerous in terms of record keeping. So I'm comfortable with making it a risk factor myself.

MR. DELGADO: Huge.

MR. KARREMAN: Yes, I'd be comfortable with risk factor as well, and I think $5,000 is in OFPA. I think it's fine to have that in there, as some kind of awareness level. But in your sentence, Jeff, if it sits in there or it goes down into the risk factors, the third party inspection following inspection cycle they have to have. But they they are kind of in the risk - not the risk but the general random samples after that inspection, is that what you were saying? Oh, every year - okay, I gotcha, I can read that.

MR. DELGADO: Jim.

MR. MOYER: Well, just so we're clear that if you put this into the list of risk factors, it just gets pooled with the many. It could mean that a farm that earns -
that makes $400,000 may never get inspected by a third party inspection. It just - if - Joe, if there are 10 farms that all earn that much in a large coop, that could easily happen. You are telling me it can't happen?

MR. SMILLIE: The laws of economics, those guys are not going to get together as a group. They are going to get individually certified.

MR. MOYER: They don't have to.

MR. SMILLIE: No, it's much more difficult -

MR. MOYER: I didn't say it's not difficult.

MR. DELGADO: Bea, followed by Tracy.

MS. JAMES: I have a question that maybe you can answer, Joe. Is having a $5,000 sales, would that basically pretty much say that in the United States it's 100 percent inspection?

MR. DAVIS: Grower groups in the
MS. JAMES: Yes, grower groups in the United States, would that be pretty close to creating a 100 percent inspection framework? Close to it?

MS. MIEDEMA: If it's a risk factor, or if it's -

MS. JAMES: No, if it's listed like it is now.

MR. DELGADO: Tracy, you want to clarify that?

MS. MIEDEMA: Most likely if that were listed as Jeff was lining it out, it would do just exactly what it says it's going to do. But it sounds like we are starting to gain some consensus around the idea that there is some riskiness. It's an indication of being bigger. It's an indication of risk; let's let it be that, and add it where it sounds like we are getting some agreement on.

MS. JAMES: Well, my question is really around whether or not we are excluding...
the United States from a multi-site framework because of that?

MR. DELGADO: Dan.

MS. JAMES: Can Joe?

MR. GIACOMINI: If I can respond to Bea, what I see it doing is, it puts the producers in the U.S. in line with federal law. It - there is nothing within that regulation that prevents them from forming a production unit, a grower group. It doesn't prevent them from doing it. It's just that if they are in a group, they conform to the law of if they are over five grand they get inspected. They can still be part of it; they can still benefit from the ICS. They can still have all those benefits, but they get inspected.

MR. DELGADO: Tina, followed by Jerry.

MS. ELLOR: So I'm still not clear where - neither one of these seems to solve both of the problems, the record keeping
problems we heard about and the hole that the
truck can drive through. Neither one of those
seems to me to address those two issues.

Is there some way that you can
think of that we -

MR. DELGADO: I'd remind you that
we are considering an amendment, and we should
focus on that.

On that note, if you want to chime
in and provide comments?

DR. ROBINSON: First of all, if you
are below $5,000 in the United States or any
place else for that matter you do not have to
get inspected or certified; you are exempt
from this law, except for record keeping.

Secondly, if you do not give us
anything, no one will be driving a truck
through anything at all. The longer you
delay, the longer you wait, and that's Rick's
opinion off the top of his head about whether
or not you drive a truck through something.

We got to walk down the hall and
go sit down and talk with legal counsel about what you give us. This is a pretty hefty document. And one of the things I hear up here that I don't really like what I hear is statements to the effect of this: well, since we can't do complete inspections today, why don't we just concede the point that we can't completely do inspections, and just - we'll do something like less than full inspections. And consumers are being misled anyway, so we are going to do something a little bit different.

I don't really like that sentiment about this program. That is not the way this law was written, and that is not the way this regulation was developed. And I hope that is not what consumers are being informed about, because the fundamental - the fundamentals of this program are that it is about inspection. It is about an annual inspection in this program.

It is true, no one expects that an
inspector walks up and down each foot of each acre of each farm; yes, of course not, that is kind of ridiculous. Nobody expects that. I don't think anybody is that naive.

But the fundamentals of this program are that an inspector comes out to every operation every year. You know I get - I'm constantly called by the media, and one of the things I am always asked is, how do consumers know that somebody - that a product or that an operation is in compliance with this program? And my standard answer is, because a certifying agent sends an inspector to an operation. We don't certify the product; we certify the operation. It's the operation that we hold accountable.

So I really don't - I'm sorry, I know this is a little bit of me being on my soapbox, but I don't like hearing that, well, you know, accreditation - I mean certification that just takes place in a conference room. Our auditors don't think it takes place in a
conference room. In fact they write up
noncompliances if they hear the inspector say,
I don't have to go out on the processing
floor. I don't have to go out on the field;
I was there last year. That's considered a
noncompliance and they get written up for it.

MR. DELGADO: Joe, followed by -
DR. ROBINSON: I'm sorry, I wasn't
done, Rigo.

So I don't like to hear that just
because you can't walk the field, or just
because we can't inspect we shouldn't inspect.
We do inspect in my opinion. In the program's
opinion.

Now how we inspect, how thoroughly
we inspect and what we do I'm not saying that
inspection is not also a sampling process. It
is. The thoroughness of it, and we can take
this recommendation and we can do something
with it. We can work with the board, and we
can work with our attorneys. And yes, risk
factors are important. Income can be a risk
factor. The degree of uniformity in my opinion can encompass size and income.

But you know, you guys, you got to come up with something, you have to give us something or we are not going to get anywhere.

MR. DELGADO: Just in the interests of time and moving forward, I want to highlight those points from Barbara. If we give something to the program, we can work on it and perfect it and come up with an end product. I think that was a point to highlight.

Joe, followed by Jerry.

MR. SMILLIE: Thank you, Barbara. I couldn't agree more. I cannot accept this as a friendly amendment.

MR. DELGADO: Jerry.

MR. SMILLIE: To finish that, I could accept it as an addition to the risk factor grouping. But I would like it removed from -

MR. DELGADO: Well, we do have an
amendment - a motion to amend that is already moved and seconded. So it stands as it is, so we are going to vote.

MR. SMILLIE: No, I have a right to deny it as a friendly amendment, don't I?

MR. DELGADO: Not after it's been moved.

MS. MIEDEMA: An outside person can't simply amend -

MR. DELGADO: Yes, they can. This document now before the board, it was made by Jeff, seconded by Dan. And -

MS. MIEDEMA: The person who made the motion has the discretion of whether to accept it - even after seconded.

MR. DELGADO: As a friendly amendment. Which you did not, so we are going to vote. You just stated that it's an informal amendment. You don't agree with it. But it is now before the board, and it's been stated, and we had a discussion about the amendment, and after the discussion we'll put
it in.

Yes.

MR. DAVIS: That goes to my question of the procedural question, as a voting member of the board, do we have to vote yes or not on that particular amendment, or can it be simultaneous with the idea that there is going to be this other amendment -

MR. DELGADO: No. We have to vote on this amendment, approve it or reject it. If it is approved it will be incorporated into this document, and then if there is no other amendment, we will have to vote on that document as it is.

Any other clarifications? Hugh?

MR. KARREMAN: What Barbara just said, I think that that amendment Jeff made has to stay in there, because $5,000 is the threshold for inspections. And if the whole program is based on inspections, or is a fundamental part of it, if you are making more than five grand, you've got to get inspected.
MR. DELGADO: Any other comments or questions?

MR. SMILLIE: Sorry, back to basics again. This is a unit. This is being inspected. The group is a production unit; it is being inspected. What you are talking about is subunits, members of this production unit.

The unit -

MR. KARREMAN: I'm saying a subunit of some 100 unit coop if some subunit is making more than five grand they should get inspected every year.

MR. DELGADO: Dan.

MR. GIACOMINI: In agreement with you and agreement with Jeff I second the motion, the subunit in question here is the farmer. The grower group is not the farmer. That's the ICS; that's the group; that's the over thing, just as we talked about, whether we do it in the coop. This is the farmer; this is the guy at five grand that I think
should be inspected to be in compliance with federal law and not have the train wreck that will occur when something happens.

MR. DELGADO: Any questions?

Any other comments? Are we ready for the question?

The question is on the motion to -

MR. GIACOMINI: Point of order, Mr. Chairman. Clarification: would this be considered a substantive motion at this point, the act of the amendment?

MR. DELGADO: Substantive motion?

Can you clarify?

MR. GIACOMINI: Substantive motion of issues going to the program are two-thirds. Just for clarification, typically an amendment is a majority. I think I would be considered to have a conflict of interest, but in my experience with parliamentary procedure, and I believe in past references with the program on amendments, they are not considered substantive motions that require two thirds.
Do you agree?

MR. DELGADO: I agree with your intent. This is going to be a majority vote. It is an amendment. We are still working on an internal document that has not been presented to the board.

MS. FRANCES: So Dan has a conflict of interest?

MR. GIACOMINI: No, my conflict of interest was in my interpretation of parliamentary procedure, since I have - I believe in one side or the other. So that is where someone could say, well, you have a conflict of interest so your interpretation of parliamentary procedure is not as valid. So I just wanted to qualify that. But I do not have a conflict of interest regarding voting on the amendment.

MR. DELGADO: And once again I'll put the question. The question is on the motion to amend by inserting the words, all subunits that grossed over $5,000 U.S. in
organic sales in a year must have third party inspection in the following inspection cycle. And that will be inserted in paragraph one, inspection, sampling and risk analysis. And we will start taking the vote -

MS. FRANCES: For clarify, we are voting that this would be added?

MR. DELGADO: For clarify purposes you are voting on the amendment -

MS. FRANCES: - to add that?

MR. DELGADO: - to amend by inserting that sentence. And we will start with - are there any questions on that regard before we start the vote? Yes.

MR. KARREMAN: I'm not sure if you said it or not, but in that location.

MR. DELGADO: In that location as stated in the screen.

We will start the vote now with Julie.
MS. WEISMAN: No.

MR. DELGADO: Dan.

MR. GIACOMINI: Yes.

MR. DELGADO: Jeff.

MR. MOYER: Yes.

MR. DELGADO: Bea.

MS. JAMES: No.

MR. DELGADO: Jerry.

MR. DAVIS: No.

MR. DELGADO: Tina.

MS. ELLOR: No.

MR. DELGADO: Tracy.

MS. MIEDEMA: No.

MR. DELGADO: Joe.

MR. SMILLIE: No.

MR. DELGADO: Barry.

MR. FLAMM: Abstain.

MR. DELGADO: Abstain.

Kevin? Hugh - sorry.

MR. KARREMAN: Yes.

MR. DELGADO: Kevin?

MR. ENGELBERT: Abstain.
MR. DELGADO: Jennifer.

MS. HALL: No.

MR. DELGADO: Steve.

MR. DeMURI: No.

MR. DELGADO: And the chair votes yes.

MS. WEISMAN: Let's see, we have two abstentions, one absent, and seven noes, and four yeses.

MS. JAMES: I count eight noes.

MR. DELGADO: So the noes have it, and the motion to amend by inserting the statement already described is lost.

Going back to the discussion,

Tracy followed by Joe.

MS. MIEDEMA: I would like to propose a friendly amendment that we add to our list of risk criteria the factor that any subunit or member earning $5,000 or more per year presents a higher risk.

MR. DELGADO: Second?

MR. SMILLIE: Second.
MR. DELGADO: Can you state specifically where you want that?

MS. MIEDEMA: I'll restate that that should be listed among the risk factors for inspection.

MR. DELGADO: Let's talk about the document location specifically.

MS. MIEDEMA: That would be number one, page seven I believe, sampling and risk analysis, the bulleted list.

They are not in hierarchical order.

MR. DELGADO: And it's going to be in exactly the same sentence we had before, correct, Tracy?

MS. MIEDEMA: Yes. Actually to be consistent with the way this list is written, it should say simply, earning $5,000 per year or more.

MS. FRANCES: Grossing?

MS. MIEDEMA: Grossing.

MR. DELGADO: Clarification from
Julie, yes? Tracy, are you aware of that, 5,000 or more? Right?

MS. MIEDEMA: Yes.

MR. DELGADO: Okay, it is moved and seconded to amend by inserting the sentence, grossing $5,000 or more in U.S. organic sales per year in the section titled, one-point inspection, sampling and risk analysis.

Discussion? Steve followed by Gary?

MR. DeMURI: I like this compromise. I think it's a good place to put it. It puts the onus on the certifiers where it belongs. I think they are all conscientious; they want to do the right thing. And I think this is a great compromise. We need to give the program something they can work with.

MR. DELGADO: Hugh.

MR. KARREMAN: I'd like to call the question at this time.

(Simultaneous speakers.)
MR. DELGADO: The previous question you're talking about?

MR. KARREMAN: The vote. I'd like to vote on this document.

MR. SMILLIE: I will accept that as a friendly amendment.

MR. DELGADO: Okay, you accept it as a friendly amendment. So we don't have to vote -- we do have a second, so we do have to vote and proceed.

Plus I want to make sure that we have the previous question. Was that the intent of your previous question?

MR. KARREMAN: I apologize, Joe, I thought that it was seconded, and we were in discussions, to discuss this. And I said I'd like to call the question on the whole document.

MR. DELGADO: We are doing an amendment.

(Simultaneous speakers.)

MR. DELGADO: If it is agreed with
by the board, we can consider this an
amendment and forget about --

MR. SMILLIE: I accept it.

MR. DELGADO: Any other - yes, sir.

MR. GIACOMINI: I just had one

question. We've had the change underneath
that. I was wanting to ask Valerie if she
could scroll down and see what essentially the
replacement to that first sentence has become.

The highest risk subunits are
identified and inspected.

MS. MIEDEMA: Actually that is
striked out, and we are voting on -- it begins
--

MR. GIACOMINI: No, no, no, once
the annual inspection for fringe rate is
determined the highest risk subunits are
identified and inspected.

MR. SMILLIE: That's correct.

MR. DELGADO: Questions? Do you
have a specific question?

We do have a friendly amendment,
and it's been stated, and now we have - you
are calling the previous question? Now we are
talking about the whole document here. Hugh
had called for the previous question.

MR. KARREMAN: Yes, I even have a
second.

MR. DELGADO: Called and seconded.

The previous question has been ordered - has
been moved.

All those in favor of voting on
the previous question -

MR. SMILLIE: I'll defer to Dan,
but once he calls the question.

MR. DELGADO: The previous question
has been moved on.

Yes?

MR. GIACOMINI: If there is - it
was not a motion to call the previous
question. It was calling for the question.

Unless someone speaks up and continues
debating, you can call it without the added
vote.
MR. DELGADO: I'll take that as a direction, and I'll open the questions to the board of any opposition to the previous question?

If not, I'll put the question.

And the question is on the motion to approve the document called Certifying Operations with Multiple Production Units, Sites and Facilities under the National Organic Program as described by the chair of the CACC, the committee.

And we will start our vote with Dan.

MR. GIACOMINI: Yes.

MR. DELGADO: Jeff.

MR. MOYER: No.

MR. DELGADO: Bea.

MS. JAMES: Yes.

MR. DELGADO: Jerry.

MR. DAVIS: Yes.

MR. DELGADO: Tina.

MS. ELLOR: Yes.
MR. DELGADO: Tracy.

MS. MIEDEMA: Yes.

MR. DELGADO: Joe.

MR. SMILLIE: Yes.

MR. DELGADO: Barry.

MR. FLAMM: Yes.

MR. DELGADO: Hugh.

MR. KARREMAN: Yes.

MR. DELGADO: Kevin.

MR. ENGELBERT: No.

MR. DELGADO: Jennifer.

MR. DELGADO: Steve.

MR. DeMURI: Yes.

MR. DELGADO: Julie.

MS. WEISMAN: Yes.

MR. DELGADO: And the chair votes yes.

MR. MOYER: Okay, Mr. Chairman, we have two noes, 12 yeses, and one absent.

MR. DELGADO: Okay, the yeas have it, and the motion is agreed to. And congratulations to all of us for what
wonderful discussion.

We can move on to a well-deserved break. We are way behind schedule, and we'll take - oops, sorry, that's right, I guess we have a request from the chair of the CACC, and you want to proceed with the next.

MS. FRANCES: I need a break.

MR. DELGADO: Make it quick.

MR. SMILLIE: At this time the committee in its meeting has reconsidered our recommendation for 100 percent, and we'd like to withdraw that recommendation and take it back to committee for further use based on the excellent public input we got on that.

So we'll bring that forward at the spring meeting.

MR. DELGADO: And it is the understanding that you will add that to your work plan.

MR. SMILLIE: Absolutely.

MR. DELGADO: On that note, let's take a well deserved break. Five minutes.
We'll see you in here at 10:23.

(Whereupon, the above-entitled matter went off the record at 10:20 a.m. and resumed at 10:33 a.m.)

MR. DELGADO: All right, we are continuing with our program, and now it's the turn of the crops committee to discuss the proposals. And on that note, Mr. Davis.

JOINT CROPS & COMPLIANCE, ACCREDITATION AND CERTIFICATION COMMITTEE

MR. DAVIS: Thank you, Mr. Chair.

The first action is a joint crops and CACC committee document with further guidance on commercial availability of organic seed.

The joint committee would like to present a couple small edits to the document which Valerie should have on screen.

The only changes are on page four - no it's actually on page five, the last page. I pointed out yesterday there is kind
of a relict artifact left from a previous addition of this. So the sentence was deleted as shown in strike-through there: producers using nonorganic varieties not appearing on the database will need to provide justification for such use. It does not make any sense in there anymore. Once we - that's from a previous addition and now does not belong there any more.

The only other change would be in point number two there on the same page, where it says, buyers of organic agricultural products. For additional clarity we wanted to add, buyers and/or processors. Processors are buyers, but some of the public comment kind of pointed out that that was an important point, so we added that. And again, two other places in that same paragraph: buyer/processor was inserted there.

Other than that we are satisfied as a joint committee with this document, and I move that the board accept this
recommendation.

MR. MOYER: I'll second that motion.

MR. DELGADO: It is moved and seconded to approve the document called: Commercial availability guidance regarding the sourcing of organic seed.

Discussion? Any questions? Steve.

MR. DeMURI: I would like to hear your thinking behind the additional processor statement in the organic seed.

MR. DELGADO: Jerry.

MR. DAVIS: The thinking is that in that section it involves the buyers of organic agricultural products. We feel that by adding that extra statement, processors, it's not changing anything. The processor in this case is the buyer. It's just whether - it doesn't change it at all, it just highlights the processors as one example of a buyer.

MR. SMILLIE: And it brings them
into the picture, also. We want them to be --
to share the pain, or the gain.

(Laughter.)

MR. DELGADO: Thank you. Any other
questions? Comments? Ready for the question?

And the question is on the motion
to approve -- guidance regarding the sourcing
of organic seed, Section 205.204.

And I'll start taking the vote

with Dan - I'm sorry, Jeff.

MR. MOYER: Yes.

MR. DELGADO: Bean.

MS. JAMES: Yes.

MR. DELGADO: Jerry.

MR. DAVIS: Yes.

MR. DELGADO: Tina.

MS. ELLOR: Yes.

MR. DELGADO: Tracy.

MS. MIEDEMA: Yes.

MR. DELGADO: Joe.

MR. SMILLIE: Yes.

MR. DELGADO: Barry.
MR. FLAMM: Yes.

MR. DELGADO: Hugh.

MR. KARREMAN: Yes.

MR. DELGADO: Kevin.

MR. ENGELBERT: Yes.

MR. DELGADO: Jennifer.

MS. HALL: Yes.

MR. DELGADO: Steve.

MR. DeMURI: Yes.

MR. DELGADO: Julie.

MS. WEISMAN: Yes.

MR. DELGADO: Dan.

MR. GIACOMINI: Yes.

MR. DELGADO: And the chair votes yes.

MR. MOYER: Mr. Chairman, we had zero noes, 14 yeses, one absent.

MR. DELGADO: The ayes have it, and the motion is agreed to. Let's go on to the next point. We continue with the crops committee.

MR. DAVIS: The next one would be
materials. The first one on the list would be tetracycline, tetracycline hydrochloride to be specific. The committee met this morning and discussed the public comment that was received and the discussions yesterday on the relative merits of leaving the petition as is for — as a petition for adding tetracycline — oxytetracycline hydrochloride specifically, for fire blight control only on the national lands to apply 601I leaving it as it stands versus the idea of changing it to amend the annotation of the existing material on the list, which is tetracycline — oxytetracycline calcium. This is a different material, different CAS number, we felt it would be problematic to go about it that way to list — to present it as a — just an addendum change — an annotations change, excuse me — and prefer to just let it go forward as is.

MR. DELGADO: So you want to state the motion?

MR. DAVIS: The motion would be to
MR. DELGADO: You are moving to add? You are going with the addition of this material, correct?

MR. DAVIS: Right. The motion is to add this material to the national list as stated on the recommendation.

MR. MOYER: I'll second it.

MR. DELGADO: Seconded. It is moved and seconded that - you have a question?

State the question?

Let me state the question. I was confused by the indication there. It is moved and seconded to add tetracycline - oxytetracycline hydrochloride for fire blight control only onto the national list, Section 205.601(I).

Discussion? Joe?

MR. SMILLIE: Sorry, but I'm a little bit confused on this in two areas. The first area is, and correct me where I'm wrong, Jerry and Jeff, but the first area is, if we
added it as an annotation which you are not going to do, but if we had done that then it would provide a level playing field for the petitioner but would not extend the use of tetracycline in general; it would sunset at the same time as the current material is going to sunset; is that correct?

MR. DAVIS: That is correct.

MR. SMILLIE: But you decided not to do that? You have decided not to change the annotation?

MR. DAVIS: We went with the original petition which was to add this material?

MR. GIACOMINI: Could we check with the program on that issue? It seems to me a reevaluation of this substance and this listing by the board could reset that clock. Could we please ask the program for clarification on that?

MR. DELGADO: Certainly -- comment on that for us. If we change the annotation
would it extend in anyway the sunset provisions on that? Of the calcium materials in this case?

MR. GIACOMINI: If it's a reevaluation of an existing list to change an annotation, is that considered a review by this committee of this substance? And if that annotation is changed in the Federal Register would that reset the clock?

MR. MATTHEWS: We don't believe it would.

MR. DELGADO: The program does not believe that would be affected. So Joe, with that statement, is that clarified?

MR. SMILLIE: Rather than get caught up in parliamentary language, here is my intent, and sorry, maybe I'm not phrasing it properly. My intent is to offer a level playing field to the petitioner. That doesn't extend to the use of tetracycline. So my vote would be, I want to see the petitioner get a level playing field, but if that means
extending the use of tetracycline I would vote no.

So I want to vote my intention, which is to give the petitioner a level playing field with a competitor who uses the same product currently allowed under the regulation, but if that's best accomplished by adding this material, then I could be comfortable with that. But if by adding the material we move the sunsetting of that tetracycline farther along then I wouldn't be comfortable.

Am I explaining myself correct?

MR. DELGADO: Hugh.

MR. KARREMAN: I understand what you're saying totally, Joe, and as to the rationale, I feel the same way. I think that we need to look at this material in the way we're looking at it, and it's tetracycline is the active compound. The salt of this particular tetracycline is kind of to level the playing field, but the active is...
tetracycline. So if it doesn't reset the clock
- and it shouldn't, it should not, because
tetracycline is already on there, and we are
just kind of saying, well, this color of
tetracycline is -- not to get any color,
sorry, sorry -- but you know that this is just
embellishing what is already there, but the
main top one is going to go away, whenever it
does. I agree with that and I hope it is that
way, if that is the motion; I want to hear
that for sure.

MR. DELGADO: Dan and Jeff.

MR. GIACOMINI: I agree with Joe
and Hugh, and I think that as Gerry described,
whether it was problematic depends on how the
annotation is attacked. If the annotation is
attacked by adding this substance to the list
that is already there, of adding a second item
in the parentheses, you have a CAS number
problem, and you have other problems.

If the annotation is attacked by
deleting that in the parentheses, I don't
think you have that problem. I think you accomplish the same thing. I think you level the playing field, and I am - maybe I'm being a little schizophrenic, but I have a problem adding a separate listing. I'm not comfortable adding another item in the annotation. I'm very comfortable deleting that between the parentheses, and at the same time I have no problem at all if at the next meeting we have a petition to remove tetracycline, and I vote for that to happen. I have no contradictions in all those things.

MR. DELGADO: Joe.

MR. MOYER: Yes, two points. One is, I believe at the last meeting when this was discussed, the program did tell us that it reset the clock. So I do think I'd want a clarification on that before we vote.

The second point is, I think removing bracketed information on annotations is a little bit of a risky slippery slope.
There are reasons that many of these annotations were put on, and different formulations of different material react differently in the environment, and within the context within which they are being applied.

And I just think we have to be careful as we look at all these materials that we don't just look at base ingredients and assume that everything else that is being done there is okay moving forward.

MR. DELGADO: Bea followed by Hugh.

MS. JAMES: I would agree with what Jeff just said, and because it was clear yesterday during comment that it was a separate CAS number that it should be looked at separately.

MR. DELGADO: Hugh?

MR. KARREMAN: I'm not an agronomist, obviously, but I would honestly, I understand what you are saying, Jeff, but it's tetracycline; it's not the hydrochloride. And it's a different CAS number. It could
reset the clock. I would rather just see that parenthesis taken out of there. And it's tetracycline, whoever set it, let's kill it soon, but let's not reset clocks and all that if we don't have to.

MR. DELGADO: Barbara?

DR. ROBINSON: Well, I think to your point, Jeff, on the annotation, I think the point is that the annotation is for the purpose of the tetracycline, and the purpose is for fire blight control only. That's really what you are annotating here. It's tetracycline for fire blight control; that's what you want.

MR. DELGADO: It's actually not the annotation. Just for clarification, it's actually the title -

DR. ROBINSON: The original annotation says, tetracycline in parenthesis, oxytetracycline calcium complex. What you want - what you'd be doing is just removing that parenthetical, oxytetracycline calcium
complex. So you'd be left with tetracycline
for fire blight control only, which would
allow the forms of tetracycline, which is what
the petitioner has asked for: tetracycline.

       MR. MOYER: But it does have a
6    separate CAS number, and is for all intents
7    and purposes.

       DR. ROBINSON: Right, but EPA says
8    that these forms are all functionally
equivalent for fire blight control. That's
9    what the petitioners said, so that's what we'd
10   be allowing under the same clock.

       MR. MOYER: And the second question
13   was whether the clock will be reset as you
14   stated, Jeff, and the question again is no -
15   the answer is no.

       DR. ROBINSON: And that's what we
18   would put in the rule. That the clock does
19   not change.

       MR. DELGADO: The clock does not
21   change. Bea followed by Jennifer and then
22   Jerry.
MS. JAMES: So my question for Jerry then is, by creating this level playing field are we then making it so that there are two forms of tetracycline that are being used?

MR. DELGADO: Jerry?

MR. DAVIS: Effectively I think the petitioner stated it accurately when they said that there would be two forms of tetracycline, but the overall use pattern of tetracycline would not increase. There would just be a substitutionary effect at the whim of the marketplace on which one they wanted to choose.

MR. DELGADO: Jennifer.

MS. HALL: Just for clarification, the -- is not here, did -- oh, he said he was leaving, sorry -- he did assess this and say yesterday that he did not intend to reset the clock; that the standing sense, that was fine.

MR. DELGADO: Steve.

MR. DeMURI: Jerry, there are other members that are experts in this area, are
there other forms of tetracycline that would fall into this category later on?

MR. DELGADO: Jerry.

MR. DAVIS: I can't state that for sure. I don't remember from the EPA documents that we went over whether there are additional forms. You'd have to ask that maybe of the petitioner if you wanted to know that. There's none on the marketplace that I know, but I don't know if there are technical forms that could arise.

MR. DELGADO: Could the petitioner please address that question?

MR. RICHARDSON: Paul Richardson with AgroSource. And there are currently only the oxytetracycline base material, oxytetracycline hydrochloride and oxytetracycline calcium registered with EPA. And those are the only forms that I would be aware of that would potentially be used in agriculture, and even the base is not used in agriculture, because its form is really just
the hydrochloride or the calcium.

MR. DELGADO: Tina.

MS. ELLOR: And that was basically question and what came up in our discussions is that we didn't know how many forms there were, and if you took the parenthetical, you know -- we didn't know what kind of door we'd be opening, and really felt like we had to review all of those individually for their effects on the environment.

MR. DELGADO: Bea.

MR. DAVIS: In reading the EPA documentation they do not delineate the different forms of tetracycline as having any different environmental or human health effects.

MR. DELGADO: Bea?

MS. JAMES: My question is, why do we want to create a level playing field for a material that we don't think should be on the list anyway - some of us?

MR. DELGADO: Joe.
MR. SMILLIE: Because it's just fair.

MS. JAMES: In one aspect.

MR. DELGADO: Hugh.

MR. KARREMAN: Bea, I guess the intent, roughly stated by a few of us here, is to get rid of tetracycline. His petition and his public comment basically said, he's squeezed out of market price because it's to be just and fair. That's why I agree. And I'm not even in favor of this material, but I agree with that rationale.

MS. JAMES: So is our duty to be just and fair to the manufacturer or to the organic principles?

MR. KARREMAN: Well, right now, an organic producer, whatever the crop it's used on will be buying it from the other guy. It's not like they are not going to use it. He's just asking that he has fair competition in the marketplace. It's not like it's not allowed right now in organic production; it
is.

MR. DELGADO: Barry.

MR. FLAMM: One of the things we discussed at length in committee was the intent to remove them - these substances through the sunset process. And in that connection we discussed what kind of message approving any new form.

And the petition we had before us is what we addressed, and addressed carefully the second go-round. We did it at the last meeting, and then pulled the vote at the last minute, and we are sort of going around the same block again.

I'm concerned if we change the committee's deliberation on this.

MR. DELGADO: Barbara.

DR. ROBINSON: Mr. Chairman, we just consulted with our attorney, and it will change the clock. It will change the clock.

It will change the clock. Your annotation change does change the clock.
MR. MATTHEWS: Yes, it's considered - even by removing the annotation it's looked at as if you have reconsidered the material and therefore the clock resets.

DR. ROBINSON: I apologize.

MR. DELGADO: Dan.

MR. GIACOMINI: If we are held to the standard of only reevaluating new material at sunset, and I understand that everybody is allowed to make their vote - I'm not aware of a lot of new information that has come to light or will or likely will come to light. We know what this does, and we would like to get it off. The way to get it off is a petition to remove. It's still a matter of what is fair and just and equitable. We're not adding anything new.

I question whether we are affecting the rate - the point in time when we can remove it by the fact that we are changing - resetting the clock and redoing sunset. I still think it's the right thing to do. I
still hope somebody submits a petition to remove it.

MR. DELGADO: Hugh.

MR. KARREMAN: When is the sunset - when will the current listing go?

MR. DELGADO: Jeff.

MR. MOYER: Just to follow up on what Barry said, I think as a board we have to be careful about the message we send to the community when we reevaluate this, and that is what we are doing is reevaluating it and extending the life expectancy of this material for another two years, we have to be careful about that. And that did come up in our deliberations in our committee - five more years. Three from the previous.

MR. DELGADO: Any other questions or comments?

The motion stands then as it is? Okay, I'll put the motion, and the question is on the motion to list tetracycline - oxytetracycline hydrochloride for fire blight
control only on the national list, Section 205.601.

And we'll start taking the vote with Bea?

MS. JAMES: No.
MR. DELGADO: Jerry.
MR. DAVIS: No.
MR. DELGADO: Tina.
MS. ELLOR: No.
MR. DELGADO: Tracy.
MS. MIEDEMA: Yes.
MR. DELGADO: Joe.
MR. SMILLIE: No.
MR. DELGADO: Barry.
MR. FLAMM: No.
MR. DELGADO: Hugh.
MR. KARREMAN: No.
MR. DELGADO: Kevin.
MR. ENGELBERT: No.
MR. DELGADO: Jennifer.
MS. HALL: No.
MR. DELGADO: Steve.
MR. DeMURI: No.

MR. DELGADO: Julie.

MS. WEISMAN: No.

MR. DELGADO: Dan.

MR. GIACOMINI: No.

MR. DELGADO: Jeff.

MR. MOYER: No.

MR. DELGADO: And the chair votes no.

MR. MOYER: Mr. Chairman, we have one yes, 13 noes, and one absent.

MR. DELGADO: The noes have it, and the motion to list tetracycline oxytetracycline hydrochloride in Section 205.601(I) of the list is lost.

Let's proceed with the next.

MR. DAVIS: The next material is sorbitol octanoate, and the petition is - states, to add sorbitol octanoate as insect control on the national list, Section 205.601(e).

We have no further statement to
make about this as a committee. We believe that to add it because it is like sucrose octanoate ester a little bit, and that it's some of the reasoning that was presented in public comment is not sufficient to overturn our original recommendation, and would like to present - have it be accepted by the board for a vote.

MR. DELGADO: Okay, make the motion, please.

MR. DAVIS: I move that we vote on adding sorbitol octanoate as an insect control on the national list, Section 205.601(e).

MR. DELGADO: Any second?

MS. ELLOR: Second.

MR. DELGADO: Seconded by Tina. It is moved and seconded to add sorbitol octanoate as insect control on the national list on Section 205.601(e).

Discussion?

MR. SMILLIE: Was there a TAP done on this?
MR. DELGADO: Jerry?

MR. DAVIS: Yes.

MR. DELGADO: Any other questions? Comments?

Ready for the question? Joe? No? The question is on the motion to list sorbital octanoate as an insect control on the national list, Section 205.601(e). And we will start taking the vote with Jerry.

MR. DAVIS: No.

MR. DELGADO: Kristine.

MS. ELLOR: No.

MR. DELGADO: Tracy.

MS. MIEDEMA: Yes.

MR. DELGADO: Joe.

MR. SMILLIE: Yes.

MR. DELGADO: Barry.

MR. FLAMM: No.

MR. DELGADO: Hugh.

MR. KARREMAN: Yes.

MR. DELGADO: Kevin.

MR. ENGELBERT: No.
MR. DELGADO: Jennifer.

MS. HALL: Yes.

MR. DELGADO: Steve.

MR. DeMURI: Yes.

MR. DELGADO: Julie.

MS. WEISMAN: Yes.

MR. DELGADO: Dan.

MR. GIACOMINI: Yes.

MR. DELGADO: Jeff.

MR. MOYER: No.

MR. DELGADO: Bea.

MS. JAMES: No.

MR. DELGADO: And the chair votes no.

MR. MOYER: I have seven noes, seven yeses, one abstention - I'm sorry, one absent, not abstention.

MR. DELGADO: The noes have it and the motion to list sorbitol octanoate as insect control on the national list, Section 205.601(e) is lost.

Go on to the next section, please.
Jerry, you seem to have a question.

MR. SMILLIE: I just wanted to review it. The motion was to list, and the motion did not gain two thirds?

MR. DELGADO: Correct. We had seven -

(Simultaneous speakers.)

MR. DELGADO: The motion was lost. The motion was to list, and did not have the necessary votes for that.

Any other questions on that matter? Very well, let's continue with the next point, Mr. Chairman.

MR. DAVIS: The next petition is for adding pelargonic acid as an herbicide in farm -- maintenance, roadways, ditches, right of ways, building perimeters, and ornamental crops on the national list, Section 205.601(e)(1).

I have a question for the materials committee chair. On this material,
premeeting the petitioner anticipating - well, after seeing the board - I mean the committee recommendation and that this committee was rejected at the committee level had asked that it be removed from consideration. And the committee considered that and discussed it. Your thoughts on that topic?

MR. DELGADO: So the petitioner, just to clarify, the petitioner would withdraw the petition?

MR. GIACOMINI: The petitioner requested to withdraw the petition. I'm not aware of anything in either from the program or within our policy and procedure manual which gives us definitive direction on that matter. I would think that serious consideration should be given to the wishes of the petitioner in this type of request. However, I believe that all the matters involved should be considered in granting that request. The petition is in the hands of the committee right now for a vote as it was at
the last meeting when the committee was going
to recommend a no vote. Is that correct?

MR. DELGADO: Yes.

MR. GIACOMINI: And the petitioner

withdrew it at that time. They brought it
forth again with some new information. The
committee has again voted to not recommend;
the petitioner has decided to withdraw it
again.

While I fully respect the - I

think the committee and the board should fully
respect the issues of the petitioner, there
are certainly considerations in regard to work
hours, man hours performed, effort put into
this petition, the extended review that has
been done twice, and the potential whiplash
effect that we could be feeling as a board if
it got to the point where every time a
petition was coming up no, it'd just get
pulled back and resent in at the next meeting.

So with no specific guideline to
follow I think that is pretty much in the
hands of the crops committee.

MR. DELGADO: I'd like to ask the policy committee chair if he has any input in the matter.

MR. FLAMM: I'm trying to confirm whether the policy manual says anything specifically on this point. But I know this is one of the work items for spring to clarify the handling of petitions and so forth.

I think I'll have to defer, and have to leave it up to the chair to call it, which I think has been called already by the committee.

MR. GIACOMINI: Mr. Chairman?

MR. DELGADO: Yes.

MR. GIACOMINI: Did you ask the program if they offered any guidance on this matter?

MR. DELGADO: Barbara, would you like to add to this?

DR. ROBINSON: I apologize, I was conferring with Rick about something - another
option that we could consider, and another
vote that we had already made. So I don't
know what your question is?

MR. GIACOMINI: We have a petition
that has been reviewed now twice, and each
time it gets to the board level with a
recommendation to not list it, the petitioner
pulls it back.

We acknowledged that request the
first time and did not vote. There wasn't
anything formal. To do that I think we should
generally acknowledge and recognize requests
by petitioners, but in consideration of
manpower and potential down the road of
continuing whiplash I think it's up to the
chairman of the cross-committee to decide
whether to proceed with that vote or not.

DR. ROBINSON: I would concur with
that.

MR. DAVIS: With all that being
said the crops committee discussed that
request from the petitioner, and for the
reasons highlighted by Dan, we decided to proceed with presenting this making the motion to present this recommendation and be accepted by the board.

MR. DELGADO: Okay, can you state the motion, please.

MR. DAVIS: The motion is, again, to add pelargonic acid for use as an herbicide in farmstead maintenance, roadways, ditches, right of ways, building perimeters, and ornamental crops on the national list, Section 205.601(b)(1).

MR. DELGADO: Is there a second?

MR. MOYER: I'll second that.

MR. DELGADO: Seconded by Jeff.

It's been moved and seconded to add pelargonic acid for use as a herbicide in farmstead maintenance, roadways, ditches, right of ways, building perimeters and ornamental crops on the national list, Section 205.601(b)(1).

Discussion? Tina, followed by Tracy.
MS. ELLOR: This is more a concern, and maybe the policy committee can take this up, that did petitioner know we could not withdraw the petition? The petitioner knew we were going to consider it at this meeting?

MR. DELGADO: Tina, can you get closer to the microphone?

MS. ELLOR: Did the petitioner know that we were going to be considering this at this meeting?

MR. DAVIS: It's on the agenda.

MS. ELLOR: Oh, okay, that's fine.

MR. GIACOMINI: Mr. Chairman, the request to withdraw was only, what, two weeks ago? About? Since all of this has been published.

MR. DELGADO: So the committee knew the outcome of the committee decision for a considerable time.

MS. ELLOR: Okay.

MR. DELGADO: Okay, we're going back to Tracy.
MS. MIEDEMA: During the intervening two weeks was the petitioner notified that we were in fact going to proceed with the vote so they knew to be here today to provide additional information?

MR. DELGADO: Valerie, can you answer that question?

MS. FRANCES: Bob just said that Fisher was invited to the meeting via the meeting notice.

MR. DELGADO: Does that clear it up, Tracy?

MS. MIEDEMA: I guess I feel the petitioner should be granted due process, and they did fulfill their end of the bargain. They withdrew their petition. They came back with additional information in the process, and seemed to be indicating that they believed they can continue to flesh out their case. And it's quite a burden on the petitioner to do this. I don't know that we are going to see a rash of people that would be this
engaged.

But I do understand what we are kind of setting ourselves up for. In any event, I am going to abstain from this because I feel I don't have enough information from petitioner.

MR. DELGADO: Very well. Jerry, would you like to comment on that?

MR. DAVIS: No, I think the discussion is health, and am willing to let everyone state their case.

MR. DELGADO: Okay, any other questions? Comments? Ready for the question?

MR. DAVIS: I would say one thing.

MR. DELGADO: Yes, Gerry.

MR. DAVIS: I am concerned that considering that this is - the petitioner is Dow Chemical I believe, very large company. I'm shocked that they did not come. So I think that in a way makes a statement that perhaps they are under the impression that it was not going to be voted on and given serious
consideration.

MR. DELGADO: Any other questions, comments? Ben?

MR. GIACOMINI: I think we need to recognize that there - within the motion there is no statement - no vote to withdraw. Even an abstention is just setting yourself aside and calling yourself absent - I mean calling yourself present, and allowing the rest of the vote to go to two thirds. It is still an up or down vote of whether it is listed or rejected. It is not within the motion that we are considering right now to have the option to withdraw, and to not take action at this time. Second time they've done it.

MR. DELGADO: Yes, Valerie.

MS. FRANCES: I would just like for the committee to state for the record whether they thought the additional information provided by the petitioner for this second review of this material was truly new information.
MR. DELGADO: Jerry.

MR. DAVIS: In our opinion, no.

The information they submitted was not new information. We asked them to - well, let me back up just a little bit. This section of the national list pertains to herbicides, and specifically soap-based herbicides. So far at least that is the only classification of synthetic herbicides on the national list. So which is why it has the non-crop usage and ornamental crop only designation on it.

The additional information we asked for was, can you tell us if this is a soap? Can it be classified as a soap? And they never answered that question. They did submit more information, but it was more of the same. It was additional information, label information, various things. But it didn't address the question of, where do we put this? What part of the list does this go on?

And through our own study on what
soaps are, and particularly since we had it in another petitioner, petitioning ammonium nonanoate, it's a soap. That's a soap; that fits within the EPA classification of a soap. But we don't understand why the petitioner for pelargonic acid never said, no, this really isn't a soap, or it is. They just did not answer the question.

MR. DELGADO: Dan, you want to clarify?

MR. GIACOMINI: Just for clarification on what Jerry just said, the listing of soap-based herbicides is a listing - specific listing on the national list, but it's not just a listing on a national list. It is the listing within OFPA of allowable herbicides, allowable synthetic herbicides. So not being a soap is not just a matter of what we already have on the national list; it is significant implications to OFPA.

MR. DELGADO: Kevin followed by Joe.
MR. ENGELBERT: I just want to reiterate to the board the amount of time that has been spent on this. And there are a lot of other materials that we have to deal with in the crop committee, and the time spent on this takes away from that. If the motion continues through and this is defeated, it's not gone forever. It can be re-petitioned at some point. That's why the board has decided to move forward. We've put a lot of time and effort into this. A vote needs to be taken in our opinion, and then if there is new information available at some point in time, it may come back.

But we think this is one of those things that as you were talking about earlier about pulling things off the table, it's time for a full board vote on this item for this material.

MR. DELGADO: Can.

MR. GIACOMINI: But the way this vote is, that will be a precedent setting
action of either listing or denying. That's different than as I talked about on the tabled issues, just moving to lay this petition on the table would essentially kill it and set it aside and we never have to see it again, until a petition is refiled. But that would not have the same precedent-setting status of having been rejected at the board level.

MR. KARREMAN: Sorry for being a little slow, Dan, following you, but could you repeat what you said about how this affect OFPA, or somehow the interaction there, please?

MR. GIACOMINI: Well, the listing in OFPA, the soap-based herbicide is the category listing in OFPA. It's not just that it's a current category on the national list. It's OFPA. And that is the only listing of herbicides I believe for synthetic in OFPA. So the fact that it is not a soap is significant.

MR. DELGADO: Jeff.
MR. KARREMAN: So it's not a soap.

MR. MOYER: Thanks, Dan, that's what I was going to say. This is not a soap; it's an acid. And they could not prove to us that it was a soap, so there is no place to put it. It's not allowed even in OFPA. There is no category to put it under.

MR. DELGADO: Any questions?

Barbara, you wanted to add to the comment?

DR. ROBINSON: The production contains an active synthetic ingredient in one of the following categories and soaps is one of them.

MR. DELGADO: Barbara, can you get closer to a microphone.

DR. ROBINSON: Oh, sorry. Hugh, in order to be put on the national list in crops, the substance is used in production under the law, the substance is used in production and must contain an active synthetic ingredient in one of the following categories, and one of those is soaps.
Well, it is a soap. I mean it would have to be a soap, or it would have to fall in one of the other categories. And that was the question, that was apparently the question the petitioner failed to answer.

MR. DELGADO: Jerry.

MR. DAVIS: It's a problem of nomenclature a little bit. I was handed a document that has on the EPA 40 CFR what is that 180.950 listing of inerts of minimal concern for the ammonium nonanoate. And right next to it they put in parentheses, pelargonic acid. Now I'm totally confused, because they are not identical, but nomenclature wise it seems like there is a little bit of overlap here. I really wouldn't mind asking a question of Brian Baker if you had any comment at all on helping us sort this out?

MR. DELGADO: Brian?

MR. SMILLIE: I just want to double check. You had a TAP on this, right?

MR. DAVIS: Oh, yes.
MR. SMILLIE: And the TAP didn't answer that question?

MR. DAVIS: The TAP did not support it was a soap.

MR. SMILLIE: Oh, so the TAP asserted it was not a soap?

MR. DELGADO: Brian Banker, please, step up to the microphone.

MR. BAKER: Brian Baker, research director, Organic Materials Review Institute. We've looked at this particular active substance. It is OMRI's opinion that soaps are alkali salts of fatty acids, and that the fatty acid component by itself is not a soap. It is OMRI's opinion that pelargonic acid is not a soap.

MR. DELGADO: Thank you. Jerry?

MR. DAVIS: Yes, that repeats our concern at the committee level of venturing into new territory, trying to add a material that does not fit an OFPA category because it is not a true soap-based herbicide. And that
is why we did not want to deal with it and just let it be withdraw. We wouldn't like to see a future board have to go through this all again, because it is quite confusing and not easy to sort out. I thought it was time to deal with it.

MR. DELGADO: Valerie.

MS. FRANCES: In EPA's own document it declared that pelargonic acid is not a soap. They indicate it's a precursor, can be used as a precursor to a soap, and they do indicate that. But clearly the board needs to get clarification from EPA as to why it is on the inert of minimal concern there as a parentheses. Is that something that you feel is essential to the question.

MR. DAVIS: That is brand new information that was just handed to me.

MR. DELGADO: Hugh.

MR. KARREMAN: Thank you for that, but I don't think that is germane to this petition not being a soap to get on OFPA. It
is interesting, but that is not the question right here.

MR. SMILLIE: Call the question.

MR. DELGADO: The question is on the motion to list pelargonic acid for use as a herbicide in farmstead maintenance, roadways, layaways, building permitters and ornamental crops on the national list, Section 205.601(b)(1).

Start the vote with Tina.

MS. ELLOR: No.

MR. DELGADO: Tracy.

MS. MIEDEMA: No.

MR. DELGADO: Joe.

MR. SMILLIE: No.

MR. DELGADO: Barry.

MR. FLAMM: No.

MR. DELGADO: Hugh.

MR. KARREMAN: No.

MR. DELGADO: Kevin.
MR. ENGELBERT: No.

MR. DELGADO: Jennifer.

MS. HALL: No.

MR. DELGADO: Steve.

MR. DeMURI: No.

MR. DELGADO: Julie.

MS. WEISMAN: No.

MR. DELGADO: Dan.

MR. GIACOMINI: No.

MR. DELGADO: Jeff.

MR. SMILLIE: No.

MR. DELGADO: Bea.

MS. JAMES: No.

MR. DELGADO: Jerry.

MR. DAVIS: No.

MR. DELGADO: And the chair votes no.

MR. MOYER: Mr. Chairman, you have 14 noes and zero yeses, and one absent.

MR. DELGADO: The noes have it, and the motion to list pelargonic acid in Section 205.601(e)(1) of the list is lost.
The next item.

MR. DAVIS: The next material is ammonium nonanoate, which does involve a change - excuse me just a moment - which we presented yesterday as a change, so we can proceed. I don't need to go over that again. Just a nomenclature change. It was originally an ammonium salts of fatty acid, which is what showed on the meeting notice. The petitioner asked it be changed to ammonium nonanoate. We did that nomenclature change and also added the CAS number on the recommendation.

This material is a soap-based herbicide. It does fit the classification. And because of that, that is part of our explanation on the recommendation. We put in there that since this material is a soap-based herbicide, the current listing in 205.061(b)(1) as annotated would apply to this material which was part of their request is initially, it was only the potassium salts of fatty acids that were listed prior to this.
And they wanted their ammonium salts of fatty acids considered the same.

Again, we made our presentation yesterday and have not changed our - as a committee changed our stance on this, and would move that the board adopt the recommendation for to add ammonium nonanoate CAS number 63718-65-0 to be allowed as herbicides in organic crop production - excuse me - yes that is the way the petition reads. They want it for all crop production, not just farmstead maintenance.

So the motion is to add ammonium nonanoate to be on the national list as herbicide in organic crop production on the national list 205.601.

MR. DELGADO: Is there a second?

MR. MOYER: I'll second that.

MR. DELGADO: It is moved and seconded to add ammonium nonanoate as a herbicide in organic crop production, CAS number specified by the chair and listed on
Section 205.601(b)(1) of the list.

Discussion? Jeff?

MR. MOYER: Point of clarification.

Jerry, according to what our working committee came to the conclusion, this material can already be used for farmstead maintenance.

MR. DAVIS: Correct.

MR. MOYER: As it is it already is on the list and can be used. What they are petitioning for is to now use it on all crop land.

MR. DAVIS: Yes, to use it within crops.

MR. MOYER: Yes.

MR. DELGADO: Any questions on that clarification? Dan?

MR. GIACOMINI: I understand, Jerry, I understand you are not a regulation writer, but how do you envision that - I mean is understanding how this would be listed, does that matter - Barbara, I guess, I'll ask you the question.
The request is – they are looking at it under (b)(1), and (b)(1) is specifically for homestead. It seems it would have to be in a separate section besides (b)(1) if it was going to get generally used.

DR. ROBINSON: Correct. I mean if you want – what, the petition is to add it, say, to be used as an herbicide.

MR. DAVIS: No restriction.

DR. ROBINSON: So you'd be changing the annotation?

MR. DAVIS: Essentially, yes.

DR. ROBINSON: Yes, and then of course we'd be resetting the clock.

MR. GIACOMINI: Well, but they don't want all herbicide soap based. They are specifically only requesting their substance. And they are specifically – they are not wanting this annotation anyway to the overall group.

DR. ROBINSON: What does the current annotation say?
MR. GIACOMINI: Well, the current annotation is listed under B, which is, as herbicides, weed barriers, as applicable. And then one is herbicide soap based for use on farmstead maintenance, roadway ditches, right of way, closing perimeters, and ornamental crops.

I'm just confused how this - not that it really matters to us - but I'm not clear how this would be listed if it did pass.

MR. DELGADO: Jeff?

MR. MOYER: Well, you bring up a very good point, Dan. I mean as a committee reviewing this material there is no allowance in the material for using soaps on crops.

MR. GIACOMINI: There is an allowance within OFPA though.

MR. MOYER: It's not stated within OFPA. It just says soap-based herbicides allowed. It says, for farmstead maintenance.
And then we look at what the rule is trying to say. We are looking at a system that is based
on a set of production practices, not on products. So there are many other things you can use, and we state those in our evaluation of the petition.

There is no allowance in the rule for -

MR. GIACOMINI: Well, there is a restriction. In OFPA there is no restriction.

MR. MOYER: In the rule there is no allowance.

MR. GIACOMINI: Right, there is no place currently to put it.

DR. ROBINSON: It's being used as an herbicide.

MR. GIACOMINI: Yes, but not within any of those qualifying -

MR. MOYER: But not in crops.

DR. ROBINSON: On ornamental crops.

(Simultaneous speakers.)

MR. DELGADO: Point of order.

MR. DAVIS: In OFPA soap-based herbicides is a potentially exemptable
synthetic material. That's all they say about it. The previous board dealt with one form of a soap-based herbicide previously and added it to the list based on OFPA, with that annotation restricting it to noncrop or no crop use only.

So we don't want to get confused between what OFPA says versus what is in the regulations.

DR. ROBINSON: OFPA - set aside OFPA, that is the authorization. In order to put it on the national list it had to be in the law, okay? That is the criteria. Now under the regulations there is an allowance for soap-based herbicides. The use is for farmstead maintenance and ornamental crops. And these are herbicides. It is to be used as an herbicide. What has the petitioner asked for?

MR. DAVIS: They want to use it - to have that restriction removed.

DR. ROBINSON: Without restriction.
Without restriction. So you are in effect considering a soap-based herbicide without restriction? All right, so that is what you are being asked to vote on.

MR. MOYER: That's a synthetic soap-based herbicide, yes.

DR. ROBINSON: Sure.

MR. MOYER: It's a synthetic herbicide.

DR. ROBINSON: That's what you are voting.

MR. DELGADO: Tracy.

DR. ROBINSON: Now you can do that. You are not being asked to replace something here - whatever - you can just vote on that.

MR. DELGADO: Tracy.

MS. MIEDEMA: It seems like the regulation has laid a contour to OFPA already, and that that clearly guides our way on this petition, that it cannot be used on food, and on organic crop production. It's very clearly contoured to be as Barbara said ornamentals
only.

DR. ROBINSON: And to some extent what you could be saying, the regulation already permits soap-based herbicides to be used on ornamental crops. You are being asked whether or not you want to expand the use of soap-based herbicides. You could - in effect you could say, well, there is already an allowance; we don't need to expand it any further. Or: yes you do want to expand it. That is the question before you.

MR. DELGADO: Hugh.

MS. FRANCES: Although the petitioner did narrow the question to not all soap-based herbicides but just theirs.

MR. DAVIS: That will invite other forms of the soaps and fatty acids to say, okay, us too.

MR. DELGADO: Any other questions or comments? Bob?

MR. POOLER: Bob Pooler, National Organic Program. A couple of points of
clarification here.

MR. DELGADO: Use a microphone.

MR. POOLER: A few points of clarification here. I believe with the annotation that is currently listed in the regulation reflects EPA's restrictions, and that's why that particular annotation was inserted into the regulations.

The question is, the question to you is, did the petitioner get an additional allowance from the EPA, and I don't know if that information is within that petition or not, and the petitioner is not in the room to answer that question.

MR. DELGADO: So just to clarify, the petitioner does not have that allowance from the EPA?

DR. ROBINSON: I don't know that, and that is something I assume that you - that I have not received.

MR. DELGADO: Question from Gerry

MR. DAVIS: I'm unclear on what Bob
was just saying. Are you talking about the mishap with the listing as approved for organic on the product label. Or are you talking about just general crop usage for nonorganic purposes?

MR. POOLER: Well, EPA restricts herbicides, soap-based, for farm use maintenance and for ornamental products. That was the EPA's restrictions on soap-based herbicides.

MR. DAVIS: Historically.

MR. POOLER: Historically.

MR. DAVIS: And you are saying that is what covered the initial board's - that was part of the consideration for why they put that annotation on there?

DR. ROBINSON: Correct; this is EPA's restriction.

MS. ELLOR: I'd like to request Emily Brown Rosen to address the board on the subject.

MR. DELGADO: Emily, if you could
approach a microphone.

MS. ROSEN: Emily Rosen, PCO. The petitioner's label, I don't know, it should be in your packet, it's this product Razor. They do have a label that says for use on crop production. Originally I think in '95, when the board first looked at soaps, there was not a label for crop production. But this one has a label on crop production.

And also the Razor label says that EPA approved it for organic production, even though that was a mistake.

MR. DELGADO: Valerie?

MS. FRANCES: If I may offer or submit a comment by a couple of commenters and attached to regulations.gov comments that you may have reviewed, or EPA did this, and it was brought up because people were concerned about it, not because they were in favor of it, but a concern..

MR. DELGADO: Jerry, any comments?

MR. DAVIS: I think it's very clear
what we face here. Bob did clarify that the
reason for the original annotation which is
new information to me and the committee, I
believe, we did not go over that, the new
information that we are receiving is that that
annotation for noncrop usage only was based on
a previous EPA restriction for all crops,
organic or not, and that is in a period of
time changed to where for conventional crops
there is now a labeled usage of this within
crops, and that's what - probably why we are
being asked to consider the change for
organic. It's up to the board to decide if
they think that is a valid request.

MR. GIACOMINI: Does that affect
the Crop Committee's desire to proceed with
this motion or potentially to withdraw it?

MR. DAVIS: It doesn't prompt - you
either withdraw it - but it does definitely
provides new information that we did not
include within our recommendation, historical
information on where the original annotation
came from.

MR. DELGADO: Do you think there is a need to withdraw the recommendation now and study it further? That's Dan's question.

MR. GIACOMINI: Can I do it differently?

MR. DELGADO: Yes.

MR. GIACOMINI: Mr. Chairman, I move that we postpone the vote on this matter until after the Crops Committee has a chance to review the EPA listing on this issue.

MR. DELGADO: We have a motion pending, so we will have to -

MR. GIACOMINI: The motion pending is a general motion. This is a superseding motion that if it's seconded it would go for a vote.

MR. DELGADO: Okay, do we have a second? The motion is for later discussion. No second? Proceed. Steve, you have a question.

MR. DeMURI: Just because the EPA
changes its position it doesn't change OPFA's position.

MR. DAVIS: The only change that I see that's new is that perhaps, and I don't know this for a fact unless someone in the audience was actually there at the NOLB meeting where this was approved, as annotated. We don't know if the - we don't know if the original board - if it had been allowed for crop usage how they would have voted, whether they would have annotated it that way, or if it's only annotated that way as a result of the EPA restriction, just as a matter of course.

As far as I know what the committee believes about this material, and we really vetted it and went over and over it, it's another material that got considered twice. It's not like we haven't gone over it a lot. The reason question still remains: this new information is interesting. It might color the vote a little bit and change
people's mind, but still the basic question is
the same. Should we allowed general use of
soap-based herbicides within organic crops.

MR. FLAMM: The committee carefully
reviewed this material and I don't think this
information from Bob would change our decision
whatsoever. The impacts, the criteria we went
through, I don't think would change at all.

MR. DAVIS: That's what I just – I
appreciate you backing me up on that. The
rest of the Crops Committee is free to chime
in.

MR. DELGADO: Kevin.

MR. ENGELBERT: I would chime in
also, and it doesn't change my opinion at all.
I'd also like to read a quote from Barbara
Robinson from a year ago, at an NOSB meeting,
when we were considering sodium carbonate or
oxyhydrate, our original crop recommendation
was to not approve that for admission. We
moved during a meeting that could substitute
for copper sulfate in rice production. And we
all know the consequences of the continued of copper sulfate.

And Jeff made a statement that the Crops Committee tends to be prejudiced toward putting synthetics on the national list. And that was just simply our position. And Barbara replied: I really want to applaud the committee for exactly what you did. I understand and the board should be prejudiced against synthetics. That is the nature of - that your charge by law. You are supposed to be prejudiced against putting synthetics on the national list. I hope you are.

We take that to heart.

(Simultaneous speakers.)

MS. MIEDEMA: I'd like to call the question.

MR. DELGADO: Calls the question.

The question is on the motion to list ammonium nonanoate on section 205.601(b)(1) with applications described by the chair of the Crops Committee.
And we'll start taking the vote with none other than Tracy.

MS. MIEDEMA: No.

MR. DELGADO: Joe.

MR. SMILLIE: No.

MR. DELGADO: Barry.

MR. FLAMM: No.

MR. DELGADO: Hugh.

MR. KARREMAN:

MR. DELGADO: Kevin.

MR. ENGELBERT: No.

MR. DELGADO: Jennifer.

MS. HALL: No.

MR. DELGADO: Steve.

MR. DeMURI: No.

MR. DELGADO: Julie.

MS. WEISMAN: No.

MR. DELGADO: Dan.

MR. GIACOMINI: Yes.

MR. DELGADO: Jeff.

MR. MOYER: No.

MR. DELGADO: Bea.
MS. JAMES: No.

MR. DELGADO: Jerry.

MR. DAVIS: No.

MR. DELGADO: Tina.

MS. ELLOR: No.

MR. DELGADO: And the chair votes no.

MR. MOYER: Mr. Chairman, you have 13 noes, one yes, and one absent.

MR. DELGADO: The noes have it, and the motion to list ammonium nonanoate on Section 205.601(b)(1) of the list for uses described by the chair of the Crops Committee is lost.

MR. DAVIS: That concludes our presentation.

MR. DELGADO: That concludes the documents presented by the Crops Committee.

(Simultaneous speakers.)

MR. DELGADO: And that earns us the right for a lunch break. We'll resume at 1:00 o'clock so we can continue on with livestock
followed by handling.

Thank you.

(Whereupon, the above-entitled matter went off the record at 11:41 a.m. and resumed at 1:03 p.m.)

MR. DELGADO: Board members, please take your places. We are about to resume the next portion of our meeting. We seem to be on schedule, very surprised and happy.

Before we proceed I would like to make a special parentheses here to recognize a very special person on our team. On behalf of the organic community, Paula and board members, we'd like to recognize our esteemed executive director, Valerie Francis.

(Applause.)

MR. DELGADO: Let's move on to our next topic. But before that, it is my understanding that the chair of the Materials Committee would like to make a special motion; is that the case?
MR. GIACOMINI: Mr. Chairman, I move to reconsider the vote on the listing of tetracycline.

MR. SMILLIE: Second.

MR. DELGADO: It is moved and seconded to reconsider the vote on tetracycline.

MR. FLAMM: Discussion? Mr. Chairman, would you please explain the reasoning for that?

MR. GIACOMINI: We have new information regarding possible action on this petition that we think is worth considering at this time.

MR. DELGADO: Can we have background about the new information? And I would request the program to address that.

MR. GIACOMINI: Do we want to address that now or do we want to do that at the point in time that that further motion is made, the motion to reconsider?

MR. DELGADO: To reconsider, we'll
do that and then we'll go on to vote that if
the motion passes.

Any questions? Are we ready for
the question on the motion? The question is
on the motion to reconsider tetracycline.

This is the vote that we just
took. Is there any doubt on the part of the
board as to what we are doing?

Okay, and the question is on the
motion to reconsider the vote on tetracycline.

And I'll start the vote with Joe.

MR. SMILLIE: Yes.

MR. DELGADO: Barry.

MR. FLAMM: We're not going to have
an explanation of why we are doing that?

(Simultaneous speakers.)

MR. DELGADO: Once again we are
going through the motion to reconsider
evidence on tetracycline.

Once we have approved the motion,
if it is approved, then we will continue on to
reconsider the motion and do the vote again.
That's where we are.

It is the understanding -

(Simultaneous speakers.)

MR. FLAMM: Abstain.

MR. DELGADO: We'll continue then with Hugh.

MR. KARREMAN: Yes.

MR. DELGADO: Kevin.

MR. ENGELBERT: No.

MR. DELGADO: Jennifer.

MS. HALL: Yes.

MR. DELGADO: Steve.

MR. DeMURI: Yes.

MR. DELGADO: Julie.

MS. WEISMAN: Yes.

MR. DELGADO: Dan.

MR. GIACOMINI: Yes.

MR. DELGADO: Jeff.

MR. MOYER: Yes.

MR. DELGADO: Bea.

MS. JAMES: Abstain.

MR. DELGADO: Jerry
MR. DAVIS: Yes.

MR. DELGADO: Tina.

MS. ELLOR: Yes.

MR. DELGADO: Tracy.

MS. MIEDEMA: Yes.

MR. DELGADO: And the chair votes yes.

MR. MOYER: Okay, Mr. Chairman, we have 11 yeses and one absent and two abstentions.

MR. DELGADO: The yeses have it, and the motion is agreed to.

MR. GIACOMINI: Mr. Chairman.

MR. DELGADO: Let us just confirm that we have the right number here.

The yeses have it, and the motion is agreed to.

And we'll start immediately with a motion, tetracycline if that's the case. Are you going to move that?

MR. GIACOMINI: I move to amend the motion on the listing of tetracycline to read,
to change the annotation - the listing and
annotation of tetracycline to read:
tetracycline for use only in organic crop
production for fire blight control until
October 21st, 2012.

MR. DELGADO: Is there a second?

MS. MIEDEMA: Second.

MR. DELGADO: It is moved and seconded to - and let me make sure that I state this right - remove the annotation and replacing that with, for use - tetracycline for use only for fire blight control until October 21st, 2012, as listed on the national list, Section 205.601(I).

Is that correct?

MR. GIACOMINI: Yes.

MR. DELGADO: But we are replacing that with the annotation that it can be used only until October 21st, 2001. You have it there? Great.

Any other questions. Barry.

MR. FLAMM: Does that mean that all
forms of tetracycline? And that changes the
current list? And how do we do that?

MR. DELGADO: Good question, dan.

MR. GIACOMINI: This motion to
change the annotation does a couple of
different things, how many depends on how you
add them up. The first thing that it does is,
it removes the qualifier of what type of
tetracycline can be used at this time.

The next thing that it does is, it
sets an expiration date for the use of
tetracycline in crop production for fire
blight control.

The implication of that is that it
pulls tetracycline out of the normal sunset
process, and - i.e. think Methionine - it is
now an expiration date for the use of
tetracycline for this use. It is not a sunset
item. And in order for it to continue use
after that date it would have to be re-
petitioned, as we do with methionine, as we
did at the last meeting.
Those are the things that this amendment would accomplish.

MR. FLAMM: But just for the record and for clarification, what we're voting on is all forms of tetracycline that will have the expiration date as listed; therefore, not requiring the normal sunset process.

MR. GIACOMINI: It moves it out of the normal sunset.

MR. FLAMM: Okay, so our vote would be based on those conditions.

MR. GIACOMINI: The first vote is the amendment to change the original motion. If this fails we would then need to revote on the original motion because we are looking to reconsider it. So the first thing is whether we are agreeing to change the original motion. The next vote that will be required is to vote on the new listing motion.

MR. FLAMM: But I think we ought to be what's in the record, what we are intending to do, so that it doesn't get changed down the
road somehow.

MR. DELGADO: Okay, so with the comments of the materials chair, the intent is clear.

Would you like to add another - just as a comment. Kevin?

Can you repeat that, we are having problems hearing you?

MR. ENGELBERT: I'm just concerned about the process that we're going through putting it back on the table after it has already been voted down.

MR. DELGADO: Hugh followed by Judy.

MR. KARREMAN: Let me ask this. If we are opening this back up, can we - I apologize for my scratchy voice today - okay, we put the date whatever it is something 2012, I mean technically right now could we make it 2010?

MR. GIACOMINI: The date - we could make it any date we want. The date chosen is
the expiration date of the current sunset.

MR. KARREMAN: So in other words if this is alive and well right now it may not be shortly. If I were to make an amendment to make it die in 2009. I mean is that possible to do at this time if we are opening this back up? I just wanted to know that.

MR. DELGADO: Bea.

MS. JAMES: I support Hugh's suggestion.

MR. DELGADO: You haven't made an amendment, have you?

MR. KARREMAN: I just wanted to know if it's possible. I did not make an amendment. I just wanted to know if it was possible.

MR. DELGADO: Hugh.

MR. KARREMAN: All right, I will make an amendment. I will move that tetracycline's expiration date be changed from what's showing on the screen, if you could show that please, Valerie, from October 21st,

MR. DELGADO: Dan?

MR. GIACOMINI: I don't oppose it, but I think it's worth a board vote on that, so I'll say no.

MR. DELGADO: Okay. So we have a friendly amendment. Is there a second?

MS. JAMES: I second it.

MR. DELGADO: It has been moved and seconded to amend the motion by striking out the date of 10/21/2012 by December 31st, 2009.

Discussion? Jerry?

MR. DAVIS: I can appreciate the board members who really would like to see this material be off the list. I do not think that is fair to the pear growers to - unless they supposedly should have been, could have been, maybe found some other alternatives by now but they haven't. They are in their infancy in the alternate control measures, and they could really use the extra time to get it done.
MR. DELGADO: The program, followed by Joe.

DR. ROBINSON: Well, now you are going to veer off into some other areas, once you do this. Now you - a couple of things. Number one, if you do this, and you are successful just as a practical matter you are pushing the program on the rulemaking side of things, 2009.

And number two, the original tetracycline was on until 2012, even if we were successful in getting the rule out, first of all we'd have to answer to OGC as to now why we are doing that, and then you are liable to get a lot of push back in public comment for why you are interfering with an existing annotation there. It looks a little arbitrary and capricious on that side. Whereas before you were just taking advantage of an opportunity to do what - to eliminate a synthetic that you don't what on the list.

So - yes.
MR. DELGADO: Joe followed by Hugh.

MR. SMILLIE: I agree with what Gerry and Barbara have got to say. I think that the key, though, that's going too far, it's not being fair. Think about the methionine, that's an example, I think about this case. And we are going to act judiciously. We all agree we want it to go, but I don't think we should use this to push back. We've got 2012 already. We are sticking with 2012. We're just leveling the playing field. But then we get a drop-dead date, which is better than where we were before.

MR. SMILLIE: I agree with that, and if possible, I guess I will withdraw that amendment, if that's parliamentary -- possible, and stick with the date that we have here to allow the growers to hopefully find substitutes for that material prior to the end of 2012.

MR. DELGADO: Do you agree to
withdraw the motion?

MR. KARREMAN: I am withdrawing the motion. If it is possible.

MR. DELGADO: It is possible. You have to have agreement of the second to do so. Any pressure?

MS. JAMES: I feel a lot of pressure, because I don't see what the benefit is of us making this change and reopening it if we -

MR. DELGADO: Tina?

MS. ELLOR: The benefit would be that it would no longer be subject to the normal sunsets, and it would drop off. To me, that's a pretty significant benefit.

MS. JAMES: Well, I guess in my short time in observing sunset, things don't just drop off. And there's no point in not agreeing to go ahead and withdraw it, because if everybody else is saying, let's do it, it'd be a waste of a vote. So I accept that.

MR. DELGADO: It is withdrawn, and
we're going back to the original motion of October 21st of 2012.

MR. KARREMAN: Is that date, correct date, program?

MR. DELGADO: It's been confirmed by the director.

Tracy, you had a question there?

Any other questions on this motion to amend? And I have to clarify that. Your motion was to amend the --

MR. GIACOMINI: The recommendation.

MR. DELGADO: -- the recommendation. So, and I want to make sure I understand, because your motion to amend the recommendation presented by the Crops Committee, once it's amended, we'll have to do --

MR. GIACOMINI: We vote on the new recommendation as amended.

MR. DELGADO: Perfectly stated, and we'll do that.

So ready for the question. The
question is on the amendment - on the motion
to amend by adding the - by adding
tetracycline for fire blight control only on
the national list 205.601(I) until October

And we'll start our vote with
Barry.

MR. FLAMM: Could you please
restate the motion?

MR. DELGADO: We are voting to
consider a motion to amend the recommendation
of the Crops Committee by adding October 21st,
2012, as -

MR. FLAMM: And eliminating the -

MR. DELGADO: - and eliminating
the different forms of tetracycline.

MR. KARREMAN: And eliminating
sunset too.

MR. FLAMM: And all forms of
tetracycline will be subject to this
expiration date?

MR. DELGADO: As it's stated in the
motion, you will have that expiration.

MR. FLAMM: And that expiration date is?

MR. FLAMM: I just want to make sure it's in the record.

MR. DELGADO: Any questions from the rest of the board?

We'll start with the vote. Barry?

MR. FLAMM: I vote yes.

MR. DELGADO: Hugh.

MR. KARREMAN: Yes.

MR. DELGADO: Kevin.

MR. ENGELBERT: Abstain.

MR. DELGADO: Kevin abstain was the last one?

Jennifer.

MS. HALL: Yes.

MR. DELGADO: Steve.

MR. DeMURI: Yes.

MR. DELGADO: Julie.

MS. WEISMAN: Yes.
MR. DELGADO: Dan.

MR. GIACOMINI: Yes.

MR. DELGADO: Jeff.

MR. MOYER:

MR. DELGADO: Bea.

MS. JAMES: Yes.

MR. DELGADO: Jerry.

MR. DAVIS: Yes.

MR. DELGADO: Tina.

MS. ELLOR: Yes.

MR. DELGADO: Tracy.

MS. MIEDEMA: Yes.

MR. DELGADO: Joe.

MR. SMILLIE: Yes.

MR. DELGADO: And the Chair votes yes.

MR. MOYER: Mr. Chairman, we have 13 yeses, one abstention, and one absent.

MR. DELGADO: The motion to amend is agreed to. Now we can go on to a discussion of the recommendation as amended.

(Simultaneous speakers.)
MR. GIACOMINI: We have amended the recommendation. Now we have to vote on the amended recommendation.

MR. DELGADO: It's procedure so, Mr. Chairman would you like to submit the amended motion.

MR. GIACOMINI: It is on the record as - the motion has been made as it is.

MR. DELGADO: Without amending, before we amended it.

MR. GIACOMINI: The motion is in play. The motion is on the table already.

MR. DELGADO: The motion is on the table. So we don't have to present it to the board. Our parliamentarian here is stating that we have it before the board. So we have discussion -- it has been stated. Now the motion is to set - to list tetracycline - adding tetracycline for fire blight control only on the national list 205.601(I) until October 21st, 2012. That's the motion.

Questions?
MR. GIACOMINI: Clarification, is that the proper wording for the program to recognize that as an annotation change, saying, adding rather than - and that it's any kind of a separation.

DR. ROBINSON: We'll just change -- we understand it. It just changes the annotation. We got it.

MR. DAVIS: Why is the 2012 date not attached to the part directly --

MS. FRANCES: It's just formatting.

MR. DAVIS: No, I mean why is it not part of that upper sentence?

MR. GIACOMINI: She just rewrote it under your other vote.

MS. FRANCES: That was an earlier committee vote.

MR. DAVIS: Okay, I get you. It's not going to show in two places when we're done. That's my question.

MS. FRANCES: I mean, obviously
you're going to give me a final version of this.

MR. GIACOMINI: It'll only have one line saying what it is not.

MS. FRANCES: We'll get all this right.

MR. DELGADO: Ready for the question?

The question is on the motion to add tetracycline for fire blight control only on the national list Section 205.601(I) until October 21st, 2012.

And we'll start our vote with Hugh.

MR. KARREMAN: Yes.

MR. DELGADO: Kevin.

MR. ENGELBERT: Abstain.

MR. DELGADO: Jennifer.

MS. HALL: Yes.

MR. DELGADO: Steve.

MR. DeMURI: Yes.

MR. DELGADO: Julie.
MS. WEISMAN: Yes.

MR. DELGADO: Dan.

MR. GIACOMINI: Yes.

MR. DELGADO: Jeff.

MR. MOYER: Yes.

MR. DELGADO: Bea.

MS. JAMES: Yes.

MR. DELGADO: Jerry.

MR. DAVIS: Yes.

MR. DELGADO: Tina.

MS. ELLOR: Yes.

MR. DELGADO: Tracy.

MS. MIEDEMA: Yes.

MR. DELGADO: Joe.

MR. SMILLIE: Yes.

MR. DELGADO: Barry.

MR. FLAMM: Yes.

MR. DELGADO: And the chair votes yes.

MR. MOYER: Mr. Chairman, we have 13 yeses, one abstention, and one absent.

MR. DELGADO: The ayes have it and
the motion is agreed. Right.

Well, that concludes our
discussion and presentation on crops related
materials, and we are free to continue on with
livestock, and Dr. Karreman.

LIVESTOCK COMMITTEE

MR. KARREMAN: Thank you, Mr.
Chairman.

We have - our first action item
we're going to vote on here today will be the
proposed fish feed and related management
issues. It is posted up there on the board,
on the screen. Beside the colors aren't
exactly right.

But anyway, first I'd just like to
say last night the Livestock Committee had a
meeting after we all had convened, or the
audience did. We had another two hour meeting
between 9:00 and 11:00 to discuss aquaculture.
And I just want to say that the livestock
committee is an excellent excellent team. I
mean we all really did well.
And I don't know if this will pass, but it is really a pleasure to work with everybody and the good collegiality and constructive input.

So with that said we did take into account input, written input, up to the time of this meeting, public comment, everything. And the only changes, we made a couple of changes that in our view tighten this up even further. And we can go through them.

They were passed by the committee last evening.

So one thing we did was we changed the kind of minor thing, off, wherever it says aquatic livestock we changed it to be aquatic animals. That was something the AWG wanted, and we thought that was pretty neutral, we did.

And then on to page let's see, the recommendation itself. I'm scrolling down on my computer, I apologize. If you could go to page four, Valerie, the recommendation.
We didn't do too much with it.

Actually on page six we inserted a letter, M, and this had to do with basically testing for environmental contaminants, that unfortunately fish in the ocean and farming, and whatnot, can be exposed to, just as regular livestock I think can as well. But anyway we reinserted what the AWG wanted to have in there. It's not much different from what we had, but it's what the AWG wanted in there, as well as what the Ocean Conservancy wanted in there, so we put that in.

And then letter N we added in so that it is very peculiar that fish meal and fish oil cannot be derived from forage fisheries nor or non-organic aquatic feed products not specifically allowed in this section. Okay? So that was another addition.

Okay, besides little aquatic animal insertions there. Okay, on page eight -- yes, Jennifer.

MS. HALL: My question here is
whether or not we want to strike forage fisheries, because further edits will show that we actually strike their availability totally.

MR. KARREMAN: For clarity's sake, you're saying, right?

MS. HALL: Right.

MR. KARREMAN: Okay, for clarity and technicality, yes.

Okay, so then on page eight, regarding the potential labeling of fish, potentially certified organic fish, from using the step-down fashion that we have - we have shown - we want to propose a label that says, environmentally responsible wild-caught fish. The environmentally responsible is from the Ocean Conservancy, that term. That's George Leonard's group that he's with now.

And then more aquatic animal insertions there.

So on 612(a) essentially we were just tightening it up with aquatic animal
insertions again. And then the exception --

okay, so 612(a) is -- I'll read that.

612 says, non-synthetic substances

prohibited for use in organic aquatic animal

production.

The following non-synthetic

substances may not be used in organic aquatic

animal production: A, fish meal and fish oil

from wild caught fish and other wild aquatic

animals except if produced from

environmentally responsible food grade wild

catch fisheries and fed in the following

step-wise levels, a maximum combined total of

25 percent during one year, one through five,
after this regulation is implemented. A

maximum combined total of 15 percent during

the year six through eight, and a maximum

combined total of 10 percent during the year

nine through 10, and a maximum combined total

of 5 percent during the year 11 and 12.

And the rest stays the same. And

that was from the Ocean Conservancy, so it's
not like 25 percent, 25 percent, but it's all
a combined number.

MS. HALL: Sorry, one more
question. Since we are explicitly saying non-
synthetic substances that are not allowed, do
we want to add the forage fisheries?

MR. KARREMAN: Sure, we can do
that. I mean it is already in there in a
sense but we can explicitly say that.

MS. HALL: I mean that is our
intent?

MR. KARREMAN: That is our intent,
and it should be explicit in there.

Sorry, okay, for 612(b), where it
says, B to Z reserved, Jennifer is suggesting
that we have 612(b) to reiterate that feed
from foraged fisheries is prohibited. From
612 itself the whole heading is non-synthetics
that are prohibited from use. So in a sense
we don't need it, but we can put it in.

MS. HALL: That's up to you. If
you feel it's clear.
MR. GIACOMINI: I don't think we need it there, but if you don't want it in the other place that's fine.

MR. KARREMAN: That's fine with me.

Are there other livestock people? Okay, just for clarity and reinsertion. Okay.

Well, that is the document.

So the motion on the floor then is to accept the proposed organic aquaculture standards for fish feed and related management issues as presented here at this time.

MR. MOYER: I'll second.

MR. DELGADO: Jeff seconds, Hugh moved, and it is moved and seconded.

Discussion?

Steve.

MR. DeMURI: How would the committee define environmentally responsible?

MR. KARREMAN: I think that is mentioned earlier in the document before the recommendation itself in the background. In the discussion section I think.
MR. DELGADO: Jim, I believe what you are looking for is in - Jim.

MR. MOYER: In section 205 and 252 L and M, those discuss that.

MR. KARREMAN: Okay, and therefore, Steve, that document that Jeff is talking about is a net-pen document.

MR. MOYER: It's right here.

MR. KARREMAN: Oh, sorry.

MR. MOYER: If you look at L, it discusses -

MR. KARREMAN: Yes, correct.

MR. DELGADO: Steve, is that clear.

We have Jeff followed by Dan.

MR. MOYER: Yes, just to respond to Steve's question again, I think what we're trying to do is avoid the word sustainable and sustainability, because those words have a lot of baggage. That can mean many things to many people. Environmentally responsible is not completely cool; we understand that. But it certainly looks like a duck and quacks like a
duck and we think we know it when we see it
kind of thing. And it really does address the
word environmental, which is what we were
trying to get at.

MR. DELGADO: Dan.

MR. GIACOMINI: I'd just like to
touch on that other amendment; where did you
put that one? The one that Jennifer changed?
Regarding the restriction - there we go, that
one - it came to our attention as we were
working on this, actually we just sort of
remembered, at the aquaculture symposium one
of the presenters that was a researcher, they
had done work on the 12 and 12, fish meal and
fish oil, research, and almost all his work
unaccounted to that but in addition was a
certain percentage of I believe it was squid
meal. And we just wanted to make sure that
those kind of soft issues were taken care of
and not considered potential loopholes down
the line.

MR. DELGADO: Thank you, Dan.
Any questions?

MS. JAMES: I'm just wondering if the committee could respond to how much public comment there was with the opposition of wild feed? I think I counted 14 witness-submitted comments from the public who all adamantly opposed that. And then we also heard yesterday that there were a lot of petitions that were signed in opposition to that.

MR. KARREMAN: I'll try to answer that. Basically we believe at the Livestock Committee that we are promulgating OFPA, the section that talks about wild seafood. This is the promulgation of that part of the Act, and it is only to be - and we believe we have outlined it well here, bright line around it - that it's only to be considered for the byproducts of edible fish, and it shall never be for, as outlined in our document here, never shall wild caught be considered as primary food for humans. It's only to feed certified - potentially certified organic fish
to help the industry get going.

And there is one thing that is pretty important to consider, and that is, a lot of fish need marine oils in their diet, and even if only vegetarian type raised fish are used in the future to provide -- their byproducts to provide feed for certified organic more piscivorous fish, that they will not be providing essential lipids that those piscivorous fish need. And that's something that I don't think was taken into account by the commenters that were talking about that issue.

MR. DELGADO: Any other questions?

Ken?

MR. GIACOMINI: I think I'd like to continue on with Hugh's statement there regarding the fish oil. If you don't do the test fish oil, they won't have fish oil; they'll have something else. If you give fish corn oil, they pretty much have corn oil. So if we want the organic fish to be fish and
provide the benefits in the human diet that
people are eating then we have to provide that
to them. We did consider that and all the
comments that were made. We reviewed as many
of them as we could, and we certainly can't do
anything other than take the number of
signatures at face value.

But those have been part of the
ongoing discussion from the day we started
this process, and the day each one of us
entered it, that's pretty much the first set
of questions we asked.

And for the most part the
information provided in those arguments at
this meeting did not constitute any new
information that we have not considered in our
own deliberations.

MR. DELGADO: Kevin.

MR. ENGELBERT: I also would like
to expound on this for the whole board. The
day - I believe the day after I was lucky
enough to be appointed to the NOSB, the new
members of the livestock committee received emails from Hugh, telling us, you've got to read through this. This aquaculture issue is huge. It takes a long time to get up to speed. And in the nearly three years that I have been studying this we have never had one presentation from anyone telling us how we can get these marine oils and these lipids into organic production in any other way.

We have bounced off every possible wall and direction that we could think of, and this is the only solution that appears to be viable by the program. And we have tried to take a long term approach to this. We are not trying to deceive the public. If people don't want to buy these certified organic products that have been fed wild fish they don't have to. But in 12 years from the time of implementation there will be certified organic fish on the market that have been fed nothing but certified organic feed.

We couldn't find any other way to
get to that point and improve the conditions
of the aquaculture industry. It seemed to be
our only option. We have never been presented
with another viable one. We are confident in
the work that we have done. We think we have
reached, again, without patting ourselves on
the back, we think we have reached the best
possible conclusion.

MR. DELGADO: Bea.

MS. JAMES: Well, first of all I
respect how much work and time has gone into
this recommendation. I would like to hear
from the committee how to address consumer
perception of organic fish not being fed
organic food. But that I think at the end
point of where this product is going to go is
what we end up having to address, what we end
up trying to communicate to the consumer that
the USDA organic really does mean organic, but
I'm sorry, this is different, and it doesn't
have organic feed.

And I know you need this time
stretch, but there is - you say you weren't
proposed any possible scenarios on the fish
oil, but there is the action of not having
this organic fish. That is another option.

MR. DELGADO: You want to respond
to that? Go ahead, Kevin.

MR. ENGELBERT: I agree. But we
don't know what the program will do. We don't
know for sure that this is a viable option,
but this is the best that we have been able to
come up with. And what the program does with
it after this, after consulting with their
lawyers and everything, that will be the final
determining factor.

MS. JAMES: Well, just to respond
to that really quickly, I would say that the
program relies on us to help bring forward
something that we think is credible in the
eyes of the consumer. And if we are not ready
to be able to do that, that's when we get them
in trouble. So we are putting forward
something to them and asking them to make the
final decision with their lawyers on whether
or not we can really do this as organic.

So -

MR. DELGADO: Jeff, followed by
Dan.

MR. MOYER: Well, I had another
comment, but I will quickly respond to Bea, in
that if you look at 205.301 - I'm sorry, 203,
we did put in there that this material that is
fed in with this system must be labeled as
such so that consumers - at least it's as
transparent as we can make it so that
consumers know they are presumably ingesting
some wild-caught material through the organic
process. So that they are made aware that we
did not want it to be slipping through in some
way that we are somehow being perceived as -
I don't want to say duping, but not being
fully forthright in the labeling.

So we are requiring that this
material be labeled at the point.

MS. JAMES: I want to respond to
that. As a retailer, that is what we - if that passes, that is going to be a very difficult thing to have to confront the natural food stores. There is so much confusion around organic fish in the first place, and how we educate them on the differences between sustainable and organic and non-organic, that that - it's a setup for really pointing the finger at, we are coming forward with saying something is organic when it is truly - I mean livestock doesn't get away with this in a lot of their areas, and I think that we need to be careful about what we are doing with fish when there are other criteria that the consumer expects around what the final product is really -

MR. DELGADO: Dan.

MR. MOYER: Well, the point I wanted to make is, it relates to this feed document, and it's going to relate again to the net-pen document, and that is, that these standards we feel at least at the Livestock
Committee level are extremely difficult for the livestock - for the aquatic animal industry to meet and adhere to. This is not going to be an easy breeze walkthrough that we have created - I don't think - at least we didn't attempt to try to create something. And we're hearing push back from the AWG quite a bit that this is going to be tough if they can even do it. And they think they can, but it's difficult. And I want to be fair to the committee to say we have gone well out of our way to try to find something that they could possibly do but was not by any stretch of the imagination easy. And just to respond to your comment on feed, I do think the consumers are going to decide ultimately if this is a doable system or not.

MR. DELGADO: Dan.

MR. GIACOMINI: A couple of things. Number one, to follow on in the part of the discussion that Kevin had regarding the fish oil, on the fish meal side the alternatives we
were presented with were either cholesterol slaughter byproducts or significant amounts of synthetic amino acids. Neither one of those seemed viable or acceptable to anyone in any part of the industry.

Regarding the label I think I was probably the person on the committee who was the least comfortable with the label, not that I have any problem with what this label says, but what it's not saying. Because if you have any of these fish and you don't feed them fish meal and fish oil, the diet they are getting is not a natural diet. So we are having a label that is making something look - in order to be transparent we are having a label to explain what something is and how the consumer may want to consider that; at the same time we don't have a label that says - what the meaning of the other side is.

So I understand what you're saying, Bea, and it's just one of those things. We are trying to be transparent. We
are trying to be up front. We don't even know if it will fly with legal. But we did the best we could.

MR. DELGADO: Julie.

MS. WEISMAN: Yes, and actually I'm not on the committee, so you asked for an answer from someone on the committee. But I feel because I am not on the committee it helps me take a step back. And when we talk about terrestrial organic agriculture, there are organic products. There is also - we struggle often around the issue of consumer perception. But there is not, for instance, a guarantee that organically farmed products will be pesticide free. We just aren't going to do anything - we are going to do the least amount possible to make a worse problem than exists in conventional agriculture.

And I think consumers, notwithstanding all the comments that we have heard, and there have been many many of them, I do also feel like there are a large group of
consumers who may not be as vociferous, who
would much rather have a choice of these -- or
organically raised fish according to a
standard like this than having to buy
conventional fish.

MR. DELGADO: Jennifer.

MS. HALL: This is not new but just
kind of a rephrasing of it. Because I
completely hear Bea and the consumer end of
it. And so I would start with our original
intent to try and establish a label in lieu of
there not being one and that being confusing,
because there are other products with an
organic label that is not USDA, so trying to
find one that delivers that expectation while
also still being quite rigorous.

So on the feed end where we did
end up is exactly how Dan said, that our
overriding desire is to try and establish as
much of a natural diet as possible, given that
there is no supply to do that effectively
right now, trying to phase that in. And I
will admit, I am the champion of the label
from a consumer perspective of trying to be
transparent in that. So there isn't an
explosion when that gets uncovered, and then
there is like this whole, "Oh my gosh, you
duped us again."

And so giving them the choice up
front, and hopefully that the education piece
being that our number one priority being that
they have a natural diet, and that we are
fighting that in so many other arenas where
organic is trying to bring animals back to
that, and that this is a new regulation
overall. So we saw an opportunity to make it
fairly strong, and over time get better at it.

MR. DELGADO: Bea.

MS. JAMES: Okay, going back to
Dan, I guess I respectfully agree to disagree
around the recommendation. And that I think
I -- maybe my position is truly representing
a lot of what we heard from consumers, and
that saying that the best we can do is not a
standard for organics. That organic standards
are organic standards and if we can't meet
those then we shouldn't put forward a
recommendation saying, here is an organic
standard, because then it is truly not.

In response to Julie, saying that
consumers want this instead of nothing at all,
our consumers want organic, and if we don't
provide them with what we know is true to be
organic according to regulations, then to
Jennifer's point, there will be an explosion -
- I think we got a little piece of that here
at this meeting.

So I'm just raising a red flag. I
think that the recommendation has a lot of
really excellent components to it, but maybe
perhaps it's not for all kinds of fish, and
that we really need to look at managing a
recommendation that, no matter how long it
takes, that will truly provide in the end an
organic product labeled as organic that's
organic.
MR. DELGADO: Dan followed by Joe.

MR. GIACOMINI: One of the things that we did a number of years ago when we first started looking at fish oil, and I think it's relevant to any explosions and other things that can happen, was "That's the response from the rest of the industry, and how you feel about this." And frankly, in all this time we really haven't heard any. So I think that is a significant aspect.

The other part of what organic is organic and all these things, I mean even the things that we have dealt with in the last two meetings, we don't have labels on everything, on any parts of the industry that have been allowed to use tetracycline, which is an antibiotic, which is probably -- while there is the big three in the rule, there's also probably the big three for the consumer, and that is one of theirs.

We don't have a label in any part
of the poultry industry that they are adding synthetic methionine.

I think you know I think some of that is real and some of that becomes created.

MS. JAMES: Are you suggesting that that is what we need?

MR. SMILLIE: Tell me if I'm mistaking what you said. The regulations were created by the NOP out of OFPA with our input. In OFPA there exists from what I understand grounds to create an organic aquaculture regulation. When the NOP with NOSB advice created the current regulation, they for whatever reasons didn't choose to make the aquaculture regulation.

Now it's come up. They are asking for our advice to go back to OFPA and create an organic regulation for aquaculture.

So to say that this recommendation doesn't meet the regulation, that would be correct, because the regulation didn't include aquaculture. But this regulation goes back to
OFPA and with our advice gives the program something so that they can create an organic aquaculture regulation.

MS. JAMES: Well, I get that, but we're talking about the standard itself.

MS. MIEDEMA: What I really like about in this recommendation and also the net-pen recommendation is that it does bring us to a crossroads finally. And it's a vastly improved version of aquaculture for both the feed and for the net-pen situation. And if what we can do is tremendously raise the bar, we've seen this in terrestrial agriculture, where the conventional folks really take a page from our book.

And we have the opportunity to tremendously raise the bar. And to know, it's not perfect. Just like aspects of terrestrial organic farming are not perfect. We drive tractors full of diesel, etcetera. And that's real life; that's real food production. But at least we now have the opportunity at this
crossroads to build a vastly improved, yet
imperfect, version of aquaculture or decide
not to have organic aquaculture. We can
decide that today too.

If we don't think we want to go
with something that is less than perfect then
we can say no today. But it seems like we
have actually arrived here, and we can move
this forward.

MR. KARREMAN: I guess Bea, in
response, to being right out of the retail on
the floor there, 2107(c), wild seafood, in the
Organic Food Production Act, in general,
notwithstanding the requirement of Section
2107(a)(1)(a) requiring products be produced
only on certified organic farms, the Secretary
shall allow through regulations promulgated
after public notice and opportunity for
comment wild seafood to be certified for label
as organic.

Wait wait, let me just add on,
sorry. And we are limiting that to not only
the byproduct of human grade fish, we are recycling it. And we think that is environmentally responsible. We feel that this, what I've just stated from OFPA fits, and we are doing exactly what the NLSB is supposed to do on anything regarding OFPA.

I don't understand. I guess I just see the cup half full, not half empty.

DR. ROBINSON: As I said to you earlier today on the multi-site recommendation, let me just say one more time, and particularly in this case, you know, we asked you to develop or to propose standards, which you appear to be close to doing.

You can continue to work on these; that's true. You can also give it to the program, and we may - yes, there is controversy with this; that's clear and that is evident. If you are not satisfied with your work at this point you can pull it back. You can also give it to the program. We can proceed for example with an ANPR, and an
advanced notice of proposed rulemaking.

You know we aren't going to rush
out the door with this thing in a week. You
know us. We obviously move at glacial speed
and sometimes not that fast.

An ANPR, asking the industry,
asking consumers, should we proceed with
rulemaking, should we not, you have given us
grist for the mill.

Again, I guess what I'm saying is,
maybe you should set aside the issue of should
we or should we not; that is the program's --
actually that is our responsibility. That's
the question we then go out and ask on
everyone's behalf, should we open up this
rule.

You provided suggestions. The
question is not done by a long shot.

MR. GIACOMINI: Okay, I wanted to
respond to something Joe said and clarify what
Hugh just read.

First of all fish were not
included in OFPA 90; fish were included in a later amendment. In the later amendment fish used for food were added as a part of the livestock definition in OFPA, okay.

Then, from what Hugh read, the promulgation of the consideration of wild seafood to be considered as organic. We need to be clear what we are doing here. That is not what we are doing. What we are allowing as feed for organically raised fish is the trimmings from environmentally sourced wild caught fish within the same category that wild caught fish have been considered from the inception of the rule, and that is, as a non-agricultural. We are listing it in the section of 612, which is the same as 602 and 604, the restriction of non-ag. What we are doing is initially allowing a significant part of the diet, granted, to come from this source with a step down to the point that is actually probably more restrictive than it would be if we had just left it out.
Is that -- do you understand what we are saying? We are allowing 25, but we are actually getting to the point where it may be zero, even though it stays, never becoming certified organic wild caught. We are never saying that. We are saying that this wild caught from this group of fish is non-ag, and it only that small part of it is allowed as feed.

MR. DELGADO: Jennifer followed by Hugh.

MS. HALL: Small correction on what Ann just said, and that is where we are allowing it is as a nonsynthetic, not as a non-ag.

MS. JAMES: I wanted to respond to Barbara's comments, because yes, I totally and fully trust when our recommendations go into the hands of the program that they are meticulously gone through so that a final recommendation is put forward that represents what the industry wants.
I do feel somewhat protective about how recommendations from us are given to you because I think we are seen as giving you the beginning starting point of that deliberation. And if we are telling you that here is a proposal for you to create an organic product that's not fed organic feed, that in essence we are telling you that that's acceptable. And I'm just - I know I'm in a minority here, but I'm just saying that for me, from a consumer standpoint, that that would be unacceptable. And I think that's what we saw in comments from consumers as well.

MR. DELGADO: Any other questions?

MR. MOYER: I just wanted to follow up on what Tracy is saying in that even if we vote this down, farm-raised fish are going to take place. Consumers say they want that product; they are buying it today. This standard that we are proposing here on both the feed and the net-pens sets the bar
extremely high, and I agree with Tracy, what it will do hopefully is drive the conventional market in this direction, because they are going to see how high this standard is. And if there is a preference shown in the marketplace for this product, they will have to begin to move in this direction.

And I think if our goal is to - part of our goal is to improve the environment this certainly goes a long way toward doing that.

It's like if we vote this down there will be no fish being fed. They will be fed, and they will be fed in net pens. So this raises the bar very high.

MR. DELGADO: Any other comments, questions? Are we ready for the question?

The question is on the motion to approve the document titled, "Proposed Organic Aquaculture Standards, Fish Feed and Related Management Issues."

MS. FRANCES: Question - I'm sorry
to interrupt.

MR. DELGADO: Yes.

MS. FRANCES: I went through, and you had not corrected every aspect of this document in regards to the use of the term, environmentally responsible food-grade wild-caught fish, in all the little label cases in the 301, and I went through with that - I don't want to interrupt as I'm doing this - I just wanted to clarify that I did that.

MR. MOYER: It was late at night.

MS. FRANCES: I understand.

MR. DELGADO: And it was the intent of the committee.

MS. FRANCES: Yes, sorry.

MR. DELGADO: Thank you for that.

Going back to putting the motion is to approve the document titled, "Proposed Organic Aquaculture Standards, Fish Feed and Related Management Issues" as described by the chair of the Livestock Committee.

And we'll start our vote with
Kevin.

MR. ENGELBERT: Yes.

MR. DELGADO: Jennifer.

MS. HALL: Yes.

MR. DELGADO: Steve.

MR. DeMURI: Yes.

MR. DELGADO: Julie.

MS. WEISMAN: Yes.

MR. DELGADO: Dan.

MR. GIACOMINI: Yes.

MR. DELGADO: Jeff.

MR. MOYER: Yes.

MR. DELGADO: Bea.

MS. JAMES: No.

MR. DELGADO: Jerry.

MR. DAVIS: Yes.

MR. DELGADO: Tina.

MS. ELLOR: Yes.

MR. DELGADO: Tracy.

MS. MIEDEMA: Yes.

MR. DELGADO: Joe.

MR. SMILLIE: Yes.
MR. DELGADO: Barry.

MR. FLAMM: Yes.

MR. DELGADO: And the chair votes yes.

MR. KARREMAN: This chair votes not at all though.

MR. DELGADO: Yes, Hugh.

MR. MOYER: Mr. Chairman, we have 13 yeses, one no, and one absent.

MR. DELGADO: Then the motion is agreed.

MR. KARREMAN: Thank you, Mr. Chair. The next topic is the other document for dealing with aquaculture today, "Proposed Organic Aquaculture Standards for Net-Pens and Related Management Issues."

Once again this was worked on a little bit last night. We don't believe there is substantive changes; more just kind of tightening of things, raising the bar higher. Again, really good input from Carrie Brownstein, George Leonard at the Ocean
Conservancy, public comment, and the AWG, taking that into account, areas highlighted in blue are what we added since we talked about this at the discussion yesterday.

The first one, Valerie, is on page five of 10, I believe, under the section 253(c), the producer of organic aquaculture products must not -- (7) whether or not diseased fish are treated they may not be sold as organic. Does that need some syntax changes? But the idea is that you just cannot sell diseased fish as organic, whether or not they are treated.

The next addition we put in to clarify things for the act is under point two 54 aquaculture living conditions, the first sentence saying, a comprehensive integrated predatory management plan which employs non-lethal deterrence as the first course of action shall be developed and implemented as part of the organic system plan.

And we added under there on (b)(3)
we added - okay I'll read three altogether:
lethal measures may be taken only when
predators threaten human safety or are
necessary for predator welfare, and must
include appropriate documentation. Lethal
measures must be in compliance with local laws
and the laws of the United States.

And this is what we added last
evening: there is an absolute prohibition on
predator mortality if the species is listed
nationally or globally as vulnerable,
endangered or critically endangered, i.e.
present on the IUCN red list.

Yes, Valerie?

MS. FRANCES: What does IUCN -

MR. FLAMM: International Union for
Conservation of Nature.

MR. DELGADO: Barry, could you
repeat that?

MR. FLAMM: It stands for
Actually the name is a little -- the official
name now is longer, but anybody would know --

conservation of nature.

MR. KARREMAN: And number four

right below that, the next number is four, we

added number four. This would be underwater

acoustic deterrent devices of any kind shall

not be permitted. I guess I'll have to watch

where they site pens or whatever with the

navy.

The document is for net pens,

okay, so everybody should keep that in mind;

it's not for ponds or containment tanks.

The next part we added to clarify

something was at 255(g)(1), little "I", Becky

Goldberg mentioned this. We made a

performance target of recycling, a minimum of

50 percent of all nutrients which we did hear

from public comment is possible but very
difficult but possible. And we added in

nitrogen and phosphorous.

MR. GIACOMINI: We should delete

the "all."
MR. KARREMAN: Say what?

MR. GIACOMINI: We should delete the "all" for quantifying as nutrients such as nitrogen, phosphorus.

MR. KARREMAN: Okay, yes. So let's delete "all" in front of nutrients and put nitrogen and phosphorous. Should we just have 50 percent of nitrogen and phosphorous.

Going down to K(2), this is where it gets more specific on open water net-pens. And this number two here, just so people know, is that this is so that conventional industry right now uses a lot of Atlantic salmon in the Pacific. This here number two will prohibit that. It would have to be Pacific salmon in the Pacific only, okay? So just want to -- go ahead.

MR. GIACOMINI: Pacific salmon in the Pacific that have not been significantly bred out of captivity.

MR. KARREMAN: So let me read it then. That's why we put this in here, so
we're not getting what's happening in the conventional industry at all.

Number two, only native fish of local genotype shall be cultured. Non-native species or native species with significant genetic divergence compared to wild stock, i.e. due to selective breeding or other processes, may not be certified as organic if produced in net-pens. Operations with escapes greater than 0.5 percent of cultured stock within each containment device over the course of the growing season shall have their organic status revoked.

That's pretty clear I think. All right?

The next section -

MR. DELGADO: Question from the program.

MR. MATTHEWS: If we could go back up to what you were just doing.

MR. KARREMAN: You don't like that "revoked."
MR. MATTHEWS: No, no, operations with escapes greater than a half a percent of cultured stock within each containment device - I could read that to mean 5 percent each. Are you saying that - half a percent of each. Just clarify for me, if they've got 10 containment devices, what would trigger the revocation.

MR. DELGADO: Hugh?

MR. KARREMAN: I know the intent there. I mean maybe revocation is too strong a word for what we are creating here. But go ahead.

MR. MOYER: I think what we've done is, we have got the wrong word in there. Instead of saying, within each, it should say, within any. If it said within any containment device, then it's the individual containment device that we are concerned with. So you can't have one containment device that's leaking, and seven others are all good. I see what you are getting at. Each should be any.
MR. KARREMAN: All right, so let's tighten that up. The next area would be --

MR. MOYER: Hugh, while you are still back on that other spot, we should mention that there was concern and discussion among the group talking about the native fish and genotype rule, because it pertains specifically to some other fish that could be raised in net pens. Net pens aren't only in the salmon. I mean there are other fish in other bodies of water. They could be in bays, they could be in lakes, they could be in rivers, could be in other areas. I think there was concern about that, and maybe we want to discuss that further.

I mean the idea of not being able to raise tilapia anywhere but Egypt or wherever they came from is a little disconcerting.

MR. KARREMAN: It is, but then the tilapia people can come back and ask for what they need.
MR. MOYER: Well that was our discussion yesterday that who's going to come back? You have heard me saying that it's certainly possible that those could still come back to us and say, "Okay, there is no room for us in here." I suppose that could be done. But that discussion did take place at length.

MR. DELGADO: Okay, that's a good clarification. Can we continue with a description?

MR. KARREMAN: Okay, (7)(i): If a species of aquatic plants and animals are used, they must be native species or local genotypes, and that has to do with the recycling of nutrients.

Number (8), farm level effluents and the potential influence of other aquatic farms must be shown not to exceed the natural assimilative capacity of the surrounding ecosystem.

Number (9), in all cases benthic
habitats surrounding net-pens, not just below net pens, surrounding them - must be shown to have significant measurable changes in chemistry and biodiversity. To not have -- I apologize. To not have.

And I do believe that would complete the document and the changes we made last night. Yes.

MR. DELGADO: So would you like to make a motion?

MR. KARREMAN: Yes, I move that the "Proposed Organic Aquaculture Standard for Net-Pens and Related Management Issues" be -- I move that we vote on that.

MR. DELGADO: Is there a second?

MR. MOYER: I'll second it.

MR. DELGADO: There's a second to approve this document entitled "Proposed Organic Aquaculture Standards for Net-Pens and Related Management Issues."

MR. FLAMM: From my standpoint, and
from an ecological, biodiversity conservation standpoint, this is the most important decision that we're facing at this meeting. And I recognize there has been a tremendous amount of work done on this, but I have a great reservation about net-pens themselves in terms of the risk involved, the biological risk. I have particular concerns with net-pens in marine environments, but most concerned with the consequences to the salmon fisheries.

And I'm just wondering what consideration the committee most recently made of perhaps this initial go-round of restricting or limiting at least net-pens to certain species in certain areas where the environmental risks are less.

MR. DELGADO: Jeff.

MR. MOYER: Yes, Barry, I think the committee was extremely sensitive to that discussion, and we've been working on it as you know for years. If you look at Section
205.255(k), we do specifically try at least to
discuss the location of these net-pens, making
it we felt an extremely high bar for anyone to
come into an organic operation of this type to
adhere to.

We also are aware of course that
we have no control over the conventional net-
pen industry, and those are existing or
growing without this type of high bar standard
that again we are putting in front of the
board.

Our goal would be that down the
road those conventional net-pens would have to
begin to adhere to this standard if they
intend to sell fish into the market.

So if you read that, we are very
sensitive to that, and did try to take the
environment and the location of those pens
into consideration. It's going to be
difficult to locate them and satisfy this
rule.

MR. DELGADO: Dan.
MR. GIACOMINI: Yes, just to be a little more specific, Barry, under that item, (k), number one, affects where we could put the net-pens, specifically out of the migratory routes. I believe it's the new number two specifies what they can put in the net-pens, native species not bred to be significantly different than the native populations.

Then we have the recycling issues. We did the disease issues, the anti-fouling, we've done -- we could not come up with a reasonable way that we felt we could justify to say, okay, everything but salmon. So we worked extensively to make it as -- if salmon can do it within these regulations these come as close to satisfying all the arguments -- most of the arguments that we heard that we could conceive.

MR. DELGADO: Jennifer.

MS. HALL: I would like to echo some of Jeff's comments, and actually as the
squeaky wheel on the committee, really, I'm grateful for the sensitivity that has been shown in this document, and it's ever-increasing strength, and I'm glad that there are portions of the aquaculture industry with what has been passed so far that can get into action.

That said, I still really wrestle with the difficulty between deciding between tighter control of inputs and outputs that are a component of closed containment systems, versus a desire for aquatic animals to have their most natural environment, and the ever-increasing demand for seafood overall, versus protecting the environment.

And despite the strong controls that are in place in this recommendation, at the end of the day there still is waste added, and more aquatic species considered predators that could be potentially killed as a result of the presence of net-pens.

And I am not comfortable at this
point with that being considered certified organic net-pens, and I would prefer to start a little bit slower and allow the whole industry time to begin the certifier and producer community to gain some experience and perhaps add a member to the board who brings some expertise to the area.

And while I do believe the recommendation improves conditions from present reality, and I know that is not going to stop, I cannot in good conscience incentivize more of it by putting a seal of organic on it.

MR. DELGADO: Any other comments or questions?

Bea?

MS. JAMES: Well, I have a question for Hugh, because he is the champion behind committee standards, what your position would be for net-pens for fish? I mean do you see that as a place where they would be exercising their natural behavior?
MR. KARREMAN: Well, I think more than in containment tanks. And that's already allowed. But I actually was thinking earlier in discussions, I think a year or more now, stocking density for the net-pens. And yet we were -- we've learned from the people in the industry that apparently very very light stocking densities are not -- I forget the reason - good for the health of the fish. I forget what it was, to be honest, Bea.

Schooling behavior, okay, yes. So I kind of said, "Okay, fine." And I'll be honest, I've kind of been on the fence with the net-pens, but the way this document is written now, especially with what we put in last night, like Dan was saying, we can't really say -- maybe we could say, no salmon, but this is pretty tight. And like you can't site pens in a migratory route; that cuts out that whole Broughton Archipelago that we talked about so much in the symposium. There will not be certified organic net-pen salmon
or any net-pens probably in that area, from this, from what we put in.

So you know, and then like Jennifer was saying, I have to kind of balance out the wild caught, everyone -- there is a growing demand for fish in the world. What are we going to do, just overfish the wild caught out there? And then the other end of the spectrum is, you know, the conventional net-pens which don't look too good.

And so I do believe this strikes a balance in the favor of the environment, and as far as -- back to what you were saying, I apologize, the humane treatment of the fish, net-pens -- I've used this before in public comment with someone -- it does help you manage those fish better than just wild caught. It's a perimeter that you say, okay, that's that unit, we can really manage them and watch them and check for them, pull fish out and look at how they are doing. So I think it really does help with the health of
the animals. Stocking density I was in favor of, but I don't know, it's not good for the schooling behavior, I guess.

MR. DELGADO: Jeff.

MR. MOYER: Well, just to address that, if you look at 205.254(a)(2) three little i's, we do address stocking densities right there. We talk about under the living conditions appropriate population or biomass densities as recommended by species. So each species would have individual stocking densities that fit within their own cultural - - natural cultural behavior that promotes the behaviors of limited aggressiveness, dominant behavior, you can read it for yourself.

But we do address that in there by each species. And further up in that document, in 205.254(a), just "a" in general we talked about the living conditions in the organic system pen, how that has to work into accommodating the health and natural behavior of fish. In two we talk about the need for
exercise, their normal swimming behavior.

So I think we have tried our best
to accommodate all of those natural living
conditions.

MR. KARREMAN: But as far as you
know 254(a)(2)iii, the -- maybe we could
insert something at this point that the least
possible stocking density should be done. I
don't know.

MR. KARREMAN: Yes, I like
appropriate.

MR. DELGADO: Kevin.

MR. ENGELBERT: I am personally
convinced that with this document we are not
creating net pen capos. We are not creating
concentrated animal feeding operations through
these net pens. It will not be allowed.

MR. DELGADO: Bea.

MS. JAMES: Would you consider not
pushing this recommendation, this part of the
recommendation forward for further work?

MR. KARREMAN: To be honest, Bea, I
want to have a vote on this document. If it passes, it does; if it doesn't, it doesn't. We have worked on this for eight years with Agriculture as the NOSB. This I really don't think -- you could give us the next 20 years, Bea, and go around and around in the room with everybody and everything, but we really thought about this a lot of different ways, and there is -- the short answer is no.

MR. DELGADO: Dan.

MR. GIACOMINI: I think the no A is that we did talk about this, the option to not take this to a vote is putting it on a shelf for probably at least two years. With the make up of the livestock committee right now really feels that they have done -- we've done what we can on it, and we don't see a lot of progress being made to continue working on it. In consideration for the manpower that it takes to work on this project and the other issues regarding livestock that are not being dealt with.
And I think that until there would be a fairly significant turnover of members on the livestock committee, I am not sure it would be worth the time as compared to other issues to just turn it over again and try to come back next time.

MR. DELGADO: Barry.

MR. FLAMM: I agree with what Dan and Hugh said about the vote. I think there's been a tremendous amount of work, and I appreciate the efforts last night to try to make this more environmentally sensitive.

I think the vote comes down to how much risk the committee wants to take. Because there are in this system environmental, ecological and risk to biodiversity.

And I wish that we were only talking about starting a net-pen industry. Of course it's already there, and this proposal no doubt vastly improves what is going on. So I'm torn with the fact that maybe this -- I
mean this will make -- the organic part would make things better and less environmentally impact -- so that is very compelling.

On the other hand from an organic standpoint, the high bar that we have on all things organic, this in my opinion doesn't meet that, and frankly I don't think especially for -- I never can pronounce anadromous. What is it? It sounds like I'm talking about love rather than fish that go upstream to spawn. But in any case, salmon and steelhead and those kind of fish, I don't know if they would ever fit this.

I'm a great supporter of aquaculture, and for certain systems, I've been around it in tilapia and carp and all these things, and they are really an important protein source. But this net-pens in marines and open waters really bothers me, and I don't know if I could -- no matter how long you worked on it I don't know if I could in due conscience ever vote for it.
But I'm torn, because I know this is going to do a better job than maybe, as Tracy said, it will pull the other system along. But I guess I have to stay with the high bar, and if we can't do what we think is right for organic, then it shouldn't be labeled organic.

MR. DELGADO: Tracy.

MS. MIEDEMA: Mr. Chair, I'd like to call for the question.

MR. DELGADO: I was hoping you would.

MS. MIEDEMA: But I realize there are other colleagues of mine in line.

MR. DELGADO: Dan.

MS. FRANCES: I have a question I would like to ask the livestock committee. In your preparation, up until the creation of this document before posting it, you were considering language on the genotype and origin of aquatic animals in fact going back to the hatchlings, and that you did not want
to do this part just yet because there was so
much more to consider.

And I just wonder if you really
are ready to do this one little section, K(2).

MR. GIACOMINI: We discussed that.

We did have an overall consideration for the
origin of livestock for all of aquaculture
that we were considering up that point which
we pulled out. This is a specific aspect
relative to net-pens. This is not an overall
origin of livestock, origin of aquaculture
animals. It's just specific, so it is in
addition to what we currently have, which is
from some metamorphic stage. This is not
changing that aspect. It's merely saying what
the genetic background of the animals that go
into the net-pens is going to be, and we did
not feel that that was out of bounds in
dealing with specifically the net-pen issue.

Regarding, Barry, I go through
many of the same things that you - concerns
that you have with this, Barry, and I hear all
of the public comment regarding organic principles, and we can make a list of 1,000 organic principles, but for me it comes down to one thing, and that is, the overall sometimes gradual sometimes quick improvement of the way things are now.

And if organic farming can make those improvements from over conventional farming and conventional agriculture and conventional aquaculture, I am very comfortable with even small progress that is being made.

MR. DELGADO: Hugh.

MR. KARREMAN: I guess I would ask you, Barry, and Bea and Jennifer, is it the net-pens themselves - I kind of know your answer, Jennifer, from us talking - but is it the net-pens themselves, or is it the salmon net-pens which we have heard loud, loud and clear. Because if it's the salmon net-pens we can make a deal happen, but if it's net-pens in general that is a philosophical change that
we just won't be able to bridge I think.

    MR. FLAMM: Hugh, as I said before,
I do have a problem generally with net-pens,
but I think those are -- many of those are --
can be dealt with. I don't believe in the
salmon pen they can be dealt with. So I will
separate the two. Am I making myself clear,
that if salmon was adequately addressed or
eliminated I would have much less trouble with
the net-pens.

    MS. HALL: For me it is definitely
net-pens overall, and their environmental
impact on the fragility of the marine system.

    MR. DELGADO: Bea.

    MS. JAMES: I would second that.

    MR. DELGADO: So in conclusion, in
answer to your question, we do have two who
would vote on concern about the concept of
net-pens and a third who would assent.

    MR. FLAMM: Well, I do have
concerns about net-pens. I'm saying that that
would have to be addressed on an individual
species, and practices might deal with those.  
But I can't see it being dealt with at all in salmon fish.

MR. DELGADO: Is that a call to any action, or can we proceed with voting.

MR. KARREMAN: No, that can go to vote.

MR. DELGADO: The question is on the motion to accept the document entitled, "Proposed Organic Aquaculture Standards, Net-pens and Related Management Issues as described by the chair of the Livestock Committee."

We will start the vote with Jennifer.

MS. HALL: No.

MR. DELGADO: Steve.

MR. DeMURI: Yes.

MR. DELGADO: Julie.

MS. WEISMAN: Yes.

MR. DELGADO: Dan.

MR. GIACOMINI: Yes.
MR. DELGADO: Jeff.
MR. MOYER: Yes.
MR. DELGADO: Bea.
MS. JAMES: No.
MR. DELGADO: Jerry.
MR. DAVIS: Yes.
MR. DELGADO: Tina.
MS. ELLOR: Yes.
MR. DELGADO: Tracy.
MR. DELGADO: Yes.
MR. DELGADO: Joe.
MR. SMILLIE: Yes.
MR. DELGADO: Barry.
MR. FLAMM: No.
MR. DELGADO: Barry.
MR. FLAMM: No.
MR. DELGADO: Hugh.
MR. KARREMAN: Yes.
MR. DELGADO: Kevin.
MR. ENGELBERT: No.
MR. DELGADO: And the chair votes yes.
MR. MOYER: We have four noes, 10 yeses, and one absent.

MR. DELGADO: The yeses have it, and the motion is agreed to.

And does that conclude, Mr. Chairman, with your topics?

MR. KARREMAN: Yes, thank you.

MR. DELGADO: Okay, we are somewhat behind schedule, and we are going to move right on to the Handling Committee with Ms. Weisman.

Julie, do you need extra time?

MS. WEISMAN: Let's take a break now, but it doesn't need to be 15 whole minutes.

MR. DELGADO: Okay, let's break for 10 minutes, 10 real minutes.

(Whereupon, the above-entitled matter went off the record at 2:45 p.m. and resumed at 3:03 p.m.)

HANDLING COMMITTEE

MR. DELGADO: Okay we are about to
1 start with our next topic, which is the
2 handling. Members of the body, please be
3 quiet.
4
5 We need to continue with our
6 agenda, conscious of the fact that we are
7 behind schedule.
8
9 And Ms. Weisman, if you will be so
10 kind as to proceed with the topics of the
11 Handling Committee.
12
13 MS. WEISMAN: We have some
14 materials that we have recommendations on.
15 Everyone heard discussions yesterday, and I'm
16 going to start with materials petitioned for
17 Section 205.605(b), non-agricultural materials
18 that are synthetic, the first of which is
19 calcium from seaweed.
20
21 And it was in brief the Handling
22 committee's recommendation is that calcium
23 seaweed derived, as petitioned, does not need
24 to be considered for addition to the national
25 list since the use of this material is
26 currently allowed through the existing listing
of nutrient minerals on the national list.

Also on 205.605(b) this recommendation passed at committee, five yes, zero no, there was one absent, and we heard from the petitioner yesterday that the petitioner even agrees, is satisfied with this recommendation.

I do also want to mention that one of the concerns raised by my fellow board member was not wanting to set a precedent for the interchangeability of synthetic and non-synthetics, and we were assured that it is only because of an FDA rule applying to this category, nutrients and minerals, that this what appears to us to be a non-synthetic is covered under a category listed on synthetic lists. So it would not apply to all of 605 to address that concern.

So therefore, until -- I never get these procedures right, but I always know Dan or Rigo is going to get me right.

Are we ready for a motion?
MR. DELGADO: Yes, we are.

MS. WEISMAN: I move that we accept the recommendation.

MR. DELGADO: Which is?

MS. WEISMAN: That calcium seaweed-derived does not need to be considered for addition to the national list, since it is use is already covered through existing listing.

MR. DELGADO: That is moved.

MR. MOYER: I'll second.

MR. DELGADO: It's moved and seconded to agree that calcium seaweed derived in this petition does not need to be considered for addition to the national list in Section 205.605(b).

That is what we are voting on. To support the statement that we do not need to list it, correct?

Discussion? Any questions? Are we ready for the question?

The question is on the motion to recommend that calcium seaweed derived as
petitioned does not need to be considered for addition to the national list in Section 205.605(b), and we'll start with Steve.

MR. DeMURI: Yes.

MR. DELGADO: Julie.

MS. WEISMAN: Yes.

MR. DELGADO: Dan.

MR. GIACOMINI: Yes.

MR. DELGADO: Yes.

MR. MOYER: Yes.

MR. DELGADO: Bea.

MS. JAMES: Yes.

MR. DELGADO: Jerry.

MR. DAVIS: Yes.

MR. DELGADO: Tina.

MS. ELLOR: Yes.

MR. DELGADO: Tracy.

MS. MIEDEMA: Yes.

MR. DELGADO: Joe.

MR. SMILLIE: Yes.

MR. DELGADO: Barry.

MR. FLAMM: Yes.
MR. DELGADO: Hugh.

MR. KARREMAN: Yes.

MR. DELGADO: Kevin.

MR. ENGELBERT: Yes.

MR. DELGADO: Jennifer.

MS. HALL: Yes.

MR. DELGADO: And the chair votes yes.

MR. MOYER: Mr. Chairman, there are zero noes, 14 yeses, one absent.

MR. DELGADO: The ayes have it, and the motion is agreed to. Let's continue on to the next topic.

MS. WEISMAN: The next item on the agenda is sodium chloride acidified, and that was as we mentioned yesterday that is deferred at this time. There will be no vote. And the same is true for propionic acid. Those are both high on our list of materials for - well, they are on our list; they are definitely on our list, our work plan.

MR. DELGADO: Let's proceed then
to the next item to vote on.

MS. WEISMAN: Right. Our next item is ethylene for pears, also to be petitioned for Section 205.605(b).

And this is actually a proposal to amend the current listing of 205.605(b) which is ethylene to include the post-harvest ripening of pears. It currently reads, tropical fruits and degraining of citrus. And this would add to that annotation, the ripening of pears post-harvest.

This is also something that we have heard a lot of public comment about. A lot of it has been in favor, but also valid questions have been raised about the need to add a synthetic for the purpose of extending the marketing season. This material actually passed at the committee level by a vote, five yes, zero no, and there was one absent. So I do put forward the motion now that the listing of the ethylene on 205.605(b) be amended to include the post-harvest ripening of pears.
MS. MIEDEMA: Second.

MR. DELGADO: It’s moved and seconded to amend the listing of 205.605(b) to include ethylene for ripening of pears.

Discussion?

MS. HALL: Based on some of the comments yesterday I question the necessity for it from the perspective of, many of the requests were based on improving the experience at the consumer level, yet despite a large supply, the same commenter also said that they consistently sell out.

So I don’t see where the problem is right now.

MR. DELGADO: Any other questions or comments? Jerry.

MR. FLAMM: While it's clear it's not necessary for either pear production or pear marketing or handling, as a pear grower myself I never found it necessary to use ethylene. Certain smaller growers don't have the facilities. It's only a benefit perhaps
to some of the largest producers of pears, and if anything it just gives an advantage to the large over the small.

MR. DELGADO: Any other questions?

Tracy.

MS. MIEDEMA: I'm from a pear-growing state, Oregon, and what I heard yesterday is that there are 30 percent more organic pear trees in transition. There is a tremendous amount of fruit that all comes to the market at the same time, and this substance, which we heard yesterday, is precisely the same thing that would show up if you put your organic pears in a bag. It helps these organic farmers who are committing to converting more acreage to have a market to sell their products.

And from a consumer perspective, and as a mom that buys an enormous amount of fruit for her kids' lunch bags, I really don't plan well enough on Sunday night when I'm grocery shopping to have pears in the lunch
bag on Monday morning. And all this sounds really sort of petty or irrelevant until you think about how consumers really behave out there, and what we are trying to create, an entire system from the organic farmer to the consumer. And it seems like a very benign tool to continue growing this organic crop.

MR. DELGADO: Julie.

MS. WEISMAN: I have a question, actually, and I hoping some of the pear growers in the room, someone will be able to come forward. If extending the market -

MR. DELGADO: Can you state your name, please?

MR. GONSALVES: Yes, my name is Ron Gonsalves from Peshastin, Washington.

MS. WEISMAN: My question is, would the extension of the marketing period for organic pears if they were available in a more usable form for more months of the year, would that have any impact on the amount of organic pears that maybe are coming from outside the
United States?

What market would it be taking away from?

MR. GONSALVES: I don't think it would take away from either market, because I think right now the amount of pears that we have we are marketing in basically a six-month window, say a seven-month window. So as the crops continue to grow as it was stated with the production increasing in the transitional acreage, what we intend to do is that we will continue to market the northwest pears in that same seven-month window. So as these crops get larger we are not looking to extending the marketing in the sense of taking pears further into the spring. We are looking to - our challenge would be to market increased volumes of pears in that same seven-month window that we are currently marketing pears into.

So following that seven-month period is where we start to see the increase in imported pears.
So we are really not taking away from any market. We are actually looking to market increased pears in that same window.

MR. DELGADO: Jeff.

MR. MOYER: Yes, we just heard yesterday, and we heard yesterday, I believe it was from you, that you are already selling out of pears, and you are selling everything you have currently.

MR. GONSALVES: Well, we do sell out of pears. We sell out of as I mentioned earlier, not to confuse the two items, but we currently harvested the largest apple crop ever in the Northwest, and we will sell all the apples at the end of the season. We will sell all the pears that we are currently growing right now. But at the same time the use of ethylene isn't to extend the marketing; it's to enhance the quality of the pears that we deliver to the market in the same market window.

So we are not looking to change
the window at all; we are looking to - we are looking to market a pear that's been enhanced by conditioning the same way.

So I think there is some confusion, and I think some of the letters that were written that talked about extending it, it was never the intention of the industry to look to extend the marketing window of pears, but actually to, the pears that are currently being marketed in that seven-month window, to enhance the pears that are delivered to the retailer and ultimately the consumer.

MR. DELGADO: Jerry - Kevin.

MR. ENGELBERT: I have two questions. Are there currently organic pears being imported into the United States during the periods of the year that you do not have organic pears available?

MR. GONSALVES: There is a substantial amount of import, mostly coming from South America, that begin arriving in
that April time period. So as the Northwest pear crop dwindles, because our ability to store - we are obviously able to store conventional pears longer than we are able to store organic pears. So as the organic pear comes to an end in April, just due to condition issues, the imports begin to show up from South America. And we are beginning to see increased volumes of imported pears. If you are buying a pear - I would say if you are buying a pear from May to August, more than likely you are buying an imported pear.

MR. ENGELBERT: Do you known the companies that import conventional pears into the United States, what they produce their ethylene from?

MR. GONSALVES: For imported pears?

MR. ENGELBERT: Yes.

MR. GONSALVES: I don't know with any certainty that imported pears are being conditioned prior to coming into the United States. A lot of the retailers today, a lot
of your conventional retailers, as well as your organic retailers, have the ability to ripen pears on site in their distribution centers.

So as pears are being delivered to them, as pears are coming into the ports, the imported pears, those pears are then delivered to the distribution centers of your major retailers, and conditioning is taking place on site similar to bananas. Bananas are being conditioned domestically as bananas arrive in the country, and it's the same thing with imported pears.

MR. DELGADO: Steve.

MR. DeMURI: My question was pretty much answered by Kevin's question. But let me ask it a different way. Certain times of the year, are there organic pears and conventional pears side by side, and the conventional pears are of better quality, and you believe the consumers are picking the conventional over the organic because of that?
MR. GONSALVES: If the consumer goes in there, the consumer has identified the fact that their preference is a conditioned pear, I do feel that, over time, that consumer is going to buy the pear that they prefer, which is a conditioned pear, over an organic pear.

MR. DELGADO: Hugh.

MR. KARREMAN: So then I just heard you say that bananas that are coming into this country are conditioned with the ethylene once they are here at the port? Is that correct?

MR. GONSALVES: Yes, that's correct.

MR. KARREMAN: I thought the ethylene was being used in the other countries so that they would survive shipping to here.

MR. DELGADO: Joe, would you like to clarify that?

MR. SMILLIE: You wouldn't want to ripen them, and then ship them. You want to ship them green, and then ripen them.
MR. KARREMAN: Okay, so basically it's like the ethylene is being used already in this country for certified organic bananas, and you are asking for the certified organic pears which would also be in this country.

MR. GONSALVES: Correct. If you had an opportunity to visit a distribution center of a major retailer in this country, you will see all of them have onsite banana conditioning rooms. And as far as conventional pears, that is where the majority of pears are being conditioned is on site at distribution centers prior to going into retail stores.

MR. DELGADO: Jim?

MR. MOYER: I'm just trying to understand what the ramifications of this whole thing might be. If what you're saying is that the treatment with ethylene gets you into the market earlier --

MR. GONSALVES: That's one of the benefits, yes.
MR. MOYER: What does that do to local tree-ripened fruit on a small scale?

MR. GONSALVES: Well again, you have to take into it the the question that was asked yesterday about the scope of the industry. You know, I visited the Whole Foods down the street this morning, and there was Northwest pears in there. So our Northwest pears are being distributed all across the country. The fact that we have tree-ripened, and pears don't really tree ripen, because of the way that the climatic conditions -- they don't really tree ripen.

So we've got to continue to have markets for those pears, those small growers that are growing and satisfying local fruit stands. But at the same time, we're talking about the Northwest pear industry that is transitioning more fruit into the organic arena, and is generating and growing more organic pears that are being sold from coast to coast domestically from the Atlantic to the
Pacific, to the north to the south, as well as exported to Europe and to the UK.

So we are talking about a major industry that is looking to utilize a tool that is currently certified already for the use of organic bananas and other tropical fruit as well as citrus. We are just asking to be included in there, because we do think that it will benefit the industry in the long run as well as provide the consumer an enhanced product.

MR. MOYER: Quick follow up. You don't see that that is going to displace - I want to recognize the ramifications of my vote on local pears, small scale local pear growers.

MR. GONSALVES: No, I don't see where it would impact the small grower as well as the grower who takes his fruit to the local fruit stand to retail. I don't see that is where it's going to challenge them.

MR. DELGADO: Okay, Jennifer.
MS. HALL: I just want to ask a little bit more on this, because typically in a marketplace the first one to market commands the higher price, and people are anticipating a product that has seasonality to it.

And do you not believe then that - on a local grower level - that would potentially not afford them some of that premium?

MR. GONSALVES: No, because the grower, I think that local grower, the local fruit stand grower has a secure customer base. I don't think we are looking to change his opportunities as far as competing with him. We're looking to be able to satisfy the movement of a large volume of pears.

Because that local grower, if he's a five or 10-acre grower, he is going to continue to succeed. We have small growers within our coop as I mentioned yesterday, we have over 200 growers. We have small and large growers within that mix.
Some growers, some small growers choose to retail their apples or pears or soft fruits at a fruit stand. Other small growers choose to become part of the greater system to where their fruit is all pooled with larger growers and take advantage of that market as well.

So the small and the large isn't just from a fruit stand standpoint; it truly is within the industry.

MR. DELGADO: Bea.

MS. JAMES: How many days of ripening do you think that being able to use ethylene would save the tree pears? Because you still can't ship them when they are fully ripe. Any grocery store is going to be bringing them in when they are green enough that they are not going to be damaged in storage.

MR. GONZALEZ: You've got to remember what we are talking about as far as this ethylene treatment is to trigger the
natural production of the ethylene that a pear is going to be emitting itself. So again our process is strictly a triggering mechanism as opposed to a true ripening method.

So it takes three days in treatment. The shelf life of that pear isn't jeopardized in the sense that, the pear doesn't arrive to the retailer in a ripened state. The ripening begins - we trigger the ripening, and the ripening begins over that same - because again if we are shipping pears from the West Coast to the East Coast, it's a five-day travel time, that pear is beginning that ripening process similar to what it would be if it stayed in storage for that same 40-day period.

MS. JAMES: So for clarification then, the ethylene for pears is really used to help increase and trigger so that the sweetness -- is that correct?

MR. GONSALVES: It's used to trigger the receptors, the natural receptors
that each pear and apple has - in this case, pears - the natural receptor that then triggers the release of its own internal ethylene that continues the ripening process. And that conversion is ultimately what it's doing when it converts the starch to the sugar, and that's where the sweetness comes in as far as the pears.

MR. DELGADO: Any other questions?

Jennifer.

MS. HALL: Sorry, I just have one last one. I do want to be careful, because it's a product that is big for my area and I want to support it. But I would just be a lot more sensitive if you tell me you are sitting on a mountain of unsold product. I just don't see that for the expansion of a synthetic application. So it's difficult for me, I have to say.

MR. GONSALVES: Again, the utilization of the ethylene is to trigger the ripening so that we are able to deliver a pear
that is in a state of being able to ripen
sooner at the consumer level. The fact that
we are not looking to change the marketing
window, we are going to sell all of our pears
with or without ethylene, so I don't want to
confuse that element. I'm willing to say that
outright. We will sell all of our pears with
or without ethylene. We are looking to have
the use of ethylene to be able to enhance the
quality of the pear that is delivered to the
marketplace earlier in the season.

So we are not looking to modify
anything that we are currently doing. The
crops continue to grow. We will market those
crops with or without ethylene.

We are looking for the benefit of
the use of ethylene to be able to enhance that
pear to get a better quality eating pear to
the marketplace sooner than we would have.
It's used conventionally. The pears that you
are buying in retail on the conventional level
more than likely have been conditioned. All
1 of your bananas that you are buying have been conditioned. All of your organic bananas that you are currently buying have been conditioned.

So we are looking to utilize it, to utilize the tool of ethylene in the same manner that bananas and tropical fruit are currently utilizing ethylene in that manner.

MR. DELGADO: Joe.

MR. SMILLIE: So to grow the pear market, you've got so much that you are going to sell as organic, unconditioned or not. To grow a market to those consumers who aren't die-hard organic consumers, they are going to judge the pear on the eating quality, not it's ecological benefit. So therefore to grow the pear market this tool will help consumers get organic pears and help pear growers convert to organic, is the way I look at it.

MR. DELGADO: Bea.

MS. JAMES: So just to also to go off on what Joe is saying is that that then --
the organic pear then becomes more competitive in quality with the conventional?

MR. GONSALVES: It allows that pear to be -- the consumer that ultimately purchases a conditioned pear could have that opportunity in the organic arena similar to what we are currently providing in the conventional.

MS. JAMES: As a retailer, I can tell you that is one of the biggest problems we have with pears is the quality, even though the organic consumer usually doesn't want to trade down for the conventional. But the quality oftentimes isn't there unless it is from somebody who is local.

MR. GONSALVES: And as you all know, we package to the same grade standards that USDA regulates us in the same grade standards whether we are packing conventional or organic. So we are putting the same product out there as far as appearance. It is internal quality that we are trying to enhance.
with having the utilization of ethylene on organic pears similar to what we are doing with conventional.

MR. FLAMM: Well, I wouldn't agree that organic pears have a lower quality or organic pears ripened without artificial ethylene, and have less quality. As a previous pear grower I will admit that growing organic or non-organic pears and ripening without the aid of ethylene takes a little more time and a little more skill and it's a little tricky. You've got to know your species, and you have to know the timing.

But I think you can certainly do it and have a high quality pear.

And in terms of Jeff's comment, I certainly - in Montana the Washington pears and apples can compete. It depends on the year and the time, especially they compete in the bigger marketplaces.

The same thing, you can develop your niche markets if you work hard at it.
But still I think the small grower is being put at a disadvantage.

MR. DELGADO: Jennifer.

MS. HALL: So if you come to market earlier, you are - I recently eliminated myself - but saying that organic would be able to displace some conventional sales?

MR. GONSALVES: We sell to retailers that handle both organic and conventional. We sell to retailers that handle just organic produce, but at the same time it's enhancing the quality of the fruit we are delivering. We are not doing it solely to compete with the conventional, but it will enhance the quality of the organic pear that we are delivering to the marketplace.

And again, back to the small grower-large grower, as a coop of 200 growers, we have growers in our coop that are pooled with larger growers, that are as small as the growers that Jennifer is concerned with that are currently satisfying fruit stands.
So it's a grower's independent choice whether he wants to sell locally, or whether that small grower wants to pool his fruit with other growers that are then selling across the whole domestic field, or even export.

So the range of growers are still out there, and the fact that we are a coop that work with large growers, because of our make up and the choice of what we have done, we also service small growers that just choose to do their retailing or their actual selling, not their retail, but do their selling through the coop as opposed to local fruit stands.

So we are supporting small growers and large growers with our current makeup.

MR. DELGADO: Jerry followed by Bea and I believe Steve also wants to make a statement. Please identify yourself.

MR. KIHISTADIUS: My name's Dennis Kihistadius. And I - Ron works basically at the plant, and I get to go travel with
retailers. So I'd like to kind of address what you are saying.

And you are exactly right: the old-time produce men knew what to do with pears. They took them out of the cooler before they put them on the store shelf. I mean they rotated the fruit, and they worked like the fruit stands that's she talking about. We don't have that expertise anymore.

And we are talking about getting into retailers like - Bea likes to hear Wal-Mart, but Wal-Mart does sell organics. And they condition their pears when they come in. And they literally have increased their pear sales double digits in the past five years because of this program. Kroger, Safeway, we just don't have that expertise at store level anymore.

So what we want to do, it's basically priming the pump. We let the fruit get a little bit of ethylene, and then we basically, unlike the banana, we can put it
asleep with temperature. And we ship it to the store cold. And this program is so that when the fruit is on the store shelf, it warms up and it starts to ripen, and then you get a natural rotation as the store level, or if you as the consumer take it home and put it in a paper bag or put it on your shelf, as long as you keep it out of the refrigerator, it will ripen.

So we've lost this produce guy that was there for 20 - 30 years. I mean in high school I worked for a Super Value, never knowing that I'd work with fruit after I got through with the military. And it's just amazing the expertise that we have lost that's gone to either some of the fruit stands you probably buy your fruit from. And these people know their product. They know how to do it. But the mass market that we are trying to hit it's lost, it's gone. You got a kid in high school working there.

MR. DELGADO: Jerry.
MR. DAVIS: Bartlett pears, what's the rule there?

MR. KIHISTADIUS: Yes, Bartlett pears and California -- I worked in both industries. But the California growers' fruit, when it's harvested, it's dead green. It's hard as a rock. And it won't ripen for 21 days on its own even. So the University of Davis, we work real close with Dr. Mitchum there, found that if you can give them an ethylene treatment, you can get them to the market sooner. By that I mean, let's say they harvest on June 30th, instead of waiting until July 21st, when you will have an edible pear, we can shorten that window down to maybe July 10th or July 12th. But it's really critical, on the California river pears, especially the Delta. Lake County, not so much, because of their growing conditions.

MR. DAVIS: So that leads to my next question of, overlap between winter pears - marketing overlap that is - and the early
season small grower in there with Bartlett pears.

MR. GONSALVES: Can I answer that?

MR. DAVIS: Yes, please.

MR. GONSALVES: Most of our pear growers grow winter and summer pears as well, because most of our Anjou pears, which is our primary winter pears are being cross-pollinated by the Bartlett pear. So most of our growers that grow Anjous also grow Bartlett. So the sensitivity of overlapping the crops really becomes, what's evolved is a consumer preference. And what is happening is, on the conventional as well as the organic side, we are selling winter pears earlier each year, not to the detriment of summer pears, but we are selling winter pears earlier each year because the consumer preference is there to have both pears available to it.

So consumers are purchasing one of two different varieties of pears, and that's where the expansion, and that's where the
growth is coming in to the pear dealers, the consumers would buy one pear on a seasonal basis, a Bartlett, until they ran out; then they would buy a winter pear until late in the season. The consumer's preference now is to buy multiple varieties of pears, and when they go into the store their purchasing habits have changed in the sense that pears have become much more of an accepted commodity for them. So the consumer is looking for more than one pear at a time, and that's what we are trying to do by making winter pears available to them earlier.

MR. DELGADO: Bea.

MS. JAMES: Just a couple of points that I wanted to point out is that we are talking about organic pears, and that a local supplier may or may not be growing organically. And if they weren't, then they would be competing with conventional. And then secondly I would - I know that we talk about a level playing field. And so since we
do get bananas, and we have other categories, this seems like more of a harmless entry to add pears to that.

MR. DELGADO: Any other questions?

MR. KARREMAN: I think ethylene was reviewed for tomatoes a long time ago. Is Emily Brown Rosen here? She might know something about that.

MS. ROSEN: Tomatoes?

MR. KARREMAN: Well, it was reviewed previously.

MR. DELGADO: Emily? Any specific questions, Hugh? Why it was rejected, that's the question. For tomatoes.

MS. ROSEN: I think it was '95, '96 that they were looking at pears, tomatoes, bananas. Tomatoes was rejected because it was felt like it was used to artificially ripen tomatoes, you know, so that poor quality tomatoes would be shipped green, and not have the benefit of ripening. Pears, they felt like it wasn't necessary. Bananas, it was the
only way to get bananas shipped into this
country as a -- so that was where it seemed an
essential, necessary element. We did later
add the de-greening of citrus and the tropical
fruits came later in ’99, and that was because
when they were doing bananas they also were
doing the mangoes and the papayas at the same
time in these gassing rooms. And it was the
same shipping problem coming into the country.
But pineapple was never approved for a -- I
think someone mentioned that it was mentioned
as a possible de-greening use in pineapple.
It did not have that use. It only is used in
crop production, you know, like a year ahead
of when you harvest the pineapples. And I
don't think avocados are actually approved
either, because they are considered a
subtropical fruit, not a tropical fruit.
I may it may something that is
done, but it shouldn't be.

MR. KIHOSTADIUS: I worked in the
avocado industry for 7-1/2 years and they have
been doing it since `92, organic.

(Simultaneous speakers.)

MR. KARREMAN: This sounds a little bit different than what tomatoes were kind of looked at back then. It sounds like a little bit different. You are not speeding up ripening per se. I mean I don't want to go into the details, but there are several different - why it was rejected for tomatoes.

MR. GONSALVES: And I think what you did mention in that same time period, `92 - `93 when pears were looked at previously and said it wasn't necessary. The industry has changed considerably, and the use of ethylene on conventional pears was a minor consideration back in that time period as well.

The increase in the benefits that have been evaluated with ethylene has really taken place in the last five or six years.

MR. DELGADO: Conscious of the time here, do we have any other questions? We are
ready for the question. The question is, on the amendment of ethylene for ripening pears for listing on Section 205.605(b), and we are going to start our vote with Julie.

MS. WEISMAN: I'm going to stick with my original vote, yes.

MR. DELGADO: Thank you. Dan.

MR. GIACOMINI: No.

MR. DELGADO: Jeff.

MR. MOYER: No.

MR. DELGADO: Bea.

MS. JAMES: Abstain.

MR. DELGADO: Jerry.

MR. DAVIS: Yes.

MR. DELGADO: Tina.

MS. ELLOR: Yes.

MR. DELGADO: Tracy.

MS. MIEDEMA: Yes.

MR. DELGADO: Joe.

MR. SMILLIE: Yes.

MR. DELGADO: Barry.

MR. FLAMM: No.
MR. DELGADO: Hugh.

MR. KARREMAN: Yes.

MR. DELGADO: Kevin.

MR. ENGELBERT: No.

MR. DELGADO: Jennifer.

MS. HALL: No.

MR. DELGADO: Steve.

MR. DeMURI: Yes.

MR. DELGADO: And the chair votes yes.

MR. MOYER: Okay, we have five noes, one abstention, and one absent, and nine yeses. I stand corrected, it is eight.

MR. DELGADO: Okay, the motion to amend for ethylene for ripening pears for listing on Section 205.605(b) is lost. Let's move on to the next topic. Julie.

MS. WEISMAN: Okay, next we have algae - we'll start with chlorella --

MR. DELGADO: Julie.

MS. WEISMAN: Okay, the next material is a petition for the algae
chlorella. That's how it was petitioned.

I do want to recognize that in the future - it was actually chlorella powder. And I want to recognize that we will make an effort in the future to come up with the names on these types of things.

And it was petitioned to add powdered chlorella to Section 205.606 of the national list. The petition failed. It was zero yes, four no. There were two absent. And it failed to be - basically we were aware that there is certified organic chlorella available, and the petition did not address these specific organic chlorella and why it could not be made into the form that the petitioner required.

And so the recommendation failed at the committee level.

So the motion is for -- to recommend the listing of chlorella to Section 205.606 of the national list.

MR. DELGADO: Is there a second?
MS. JAMES: Second.

MR. DELGADO: It's been moved and seconded to list algae chlorella powder in Section 205.606 of the list.

Discussion? Ready for the question?

The question is on the motion to list algae chlorella powder in Section 205.606. And we will start the vote with Dan.

MR. GIACOMINI: No.

MR. DELGADO: Jeff.

MR. MOYER: No.

MR. DELGADO: Bea.

MS. JAMES: No.

MR. DELGADO: Jerry.

MR. DAVIS: No.

MR. DELGADO: Tina.

MS. ELLOR: No.

MR. DELGADO: Tracy.

MS. MIEDEMA: No.

MR. DELGADO: Joe.

MR. SMILLIE: Joe.
MR. DELGADO: Barry.

MR. FLAMM: No.

MR. DELGADO: Hugh.

MR. KARREMAN: No.

MR. DELGADO: Kevin.

MR. ENGELBERT: No.

MR. DELGADO: Jennifer.

MS. HALL: No.

MR. DELGADO: Steve.

MR. DeMURI: No.

MR. DELGADO: Julie.

MS. WEISMAN: No.

MR. DELGADO: And the chair votes no.

MR. MOYER: Mr. Secretary, we have 14 noes, one absent.

MR. DELGADO: The noes have it, and the motion to list algae chlorella powder in Section 205.606 of the list is lost. Let's go on to the next.

MS. WEISMAN: Okay, the next is the second algae dumontiaceae was petitioned for
Section 205.605 or 606, and it failed - it was determined - it was recommended by committee for addition to 606, however it failed because there was no information in the petition addressing what the obstacle is to the availability of organic.

Not to take up any more time, but I just want to emphasize for future petitioners to 606 that the committee feels like it's really important that if you are petitioning something and you are going to say it's not available as organic, the petition needs to include information on what the obstacle is. So that 606 listing will be a tool to move the organic industry forward, and include -- and encourage the availability of organic ingredients.

With that I recommend the addition -

MR. DELGADO: You move?

MS. WEISMAN: I move to - I move for the addition of algae dumontiacae powder
to Section 205.606 of the national list.

MR. DELGADO: Is there a second?

MR. SMILLIE: Second.

MR. DELGADO: Joe seconded, and the motion has been moved and seconded to add algae dumontiaceae powder to the list on Section 205.606.

Questions? Discussion? Ready for the question?

The question is on the motion to list algae dumontiaceae powder in Section 205.606 of the national list, and we will start our vote with Jeff.

MR. MOYER: No.

MR. DELGADO: Bea.

MS. JAMES: No.

MR. DELGADO: Jerry.

MR. DAVIS: No.

MR. DELGADO: Tina.

MS. ELLOR: No.

MR. DELGADO: Tracy.

MS. MIEDEMA: No.
MR. DELGADO: Joe.

MR. SMILLIE: No.

MR. DELGADO: Barry.

MR. FLAMM: No.

MR. DELGADO: Hugh.

MR. KARREMAN: No.

MR. DELGADO: Kevin.

MR. ENGELBERT: No.

MR. DELGADO: Jennifer.

MS. HALL: No.

MR. DELGADO: Steven.

MR. DeMURI: No.

MR. DELGADO: Julie.

MS. WEISMAN: No.

MR. DELGADO: Dan.

MR. GIACOMINI: No.

MR. DELGADO: And the chair votes no.

MR. MOYER: Mr. Chairman, again, we have 14 noes, zero yeses, one absent.

MR. DELGADO: The noes have it, and the motion to list algae dumontiaceae powder in
Section 205.606 of the list is lost.

Let's move on to the next.

MS. WEISMAN: Okay, the next material that we are going to vote on was a petition for - to add buck hull powder to Section 205.606.

I think that there - that the main issue here was that this was to be used to add color to certified organic buck wheat noodles, and I think it was very well presented yesterday, so all I will say is that the main issue for us was that there is certified organic buck wheat noodles being manufactured and sold in the United States. This was a foreign - petitioner is a foreign manufacturer of that product, who did not do a very good job of explaining why they couldn't source the material.

And it failed unanimously six no, zero yes. There were no absent or abstentions at the committee level.

So at this time I would like to
make the motion for the recommendation to add buck hull powder to the national list on Section 205.606.

MR. DELGADO: Is there a second?

MS. JAMES: Second.

MR. DELGADO: Bea seconds, and it is moved and seconded to add buck hull powder to the national list Section 205.606.

Discussion? Questions? Are we ready for the vote? Tina, did you have a question?

Okay, the question is on the motion to add buck hull powder, black powder, on the list Section 205.606.

We are ready to take our vote, and we will start with Bea.

MS. JAMES: No.

MR. DELGADO: Jerry.

MR. DAVIS: No.

MR. DELGADO: Tina.

MS. ELLOR: No.

MR. DELGADO: Tracy.
MS. MIEDEMA: No.

MR. DELGADO: Joe.

MR. SMILLIE: No.

MR. DELGADO: Barry.

MR. FLAMM: No.

MR. DELGADO: Hugh.

MR. KARREMAN: No.

MR. DELGADO: Kevin.

MR. ENGELBERT: No.

MR. DELGADO: Jennifer.

MS. HALL: Yes.

MR. DELGADO: Steve.

MR. DeMURI: No.

MR. DELGADO: Julie.

MS. WEISMAN: No.

MR. DELGADO: Dan.

MR. GIACOMINI: No.

MR. DELGADO: Jeff.

MR. MOYER: No.

MR. DELGADO: And the chair votes

no.

MR. MOYER: Mr. Chairman, we have
14 noes, zero yeses, one absent.

MR. DELGADO: The noes have it, and the motion to list buck hull powder, black powder, on the national list Section 205.606 is lost, and we are ready to move on to the next material.

MS. WEISMAN: The next material, just for a point of order, it's black pepper extract powder, and that's an error on my part that it is not listed that way on the committee recommendation. But I think it's important to correct. And this was - this petition like the last few did not provide sufficient information to demonstrate why this material couldn't be obtained organically in the form that this petitioner needed, because it was again it was readily apparent to committee members that organic pepper is being grown, and also organic pepper extract is available. And the petition did not even acknowledge the existence of these materials much less why
they can't be - much less identifying the obstacles to them being turned into the form that they needed.

So this material also failed unanimously at the committee level.

So at this time I'd like to state the recommendation which is for the addition of black pepper, extract powder, for listing on Section 205.606 of the national list.

MR. DELGADO: It has been moved.
Is there a second?
MR. GIACOMINI: I'll second.
MR. DELGADO: It's moved and seconded to add black pepper extract powder on the national list Section 205.606.
Discussion? Ready for the question? The question is on the motion to list black pepper extract powder on the national list Section 205.606, and we will start our vote with Jerry.

MR. DAVIS: No.
MR. DELGADO: Tina.
MS. ELLOR: No.
MR. DELGADO: Tracy.
MS. MIEDEMA: No.
MR. DELGADO: Joe.
MR. SMILLIE: No.
MR. DELGADO: Barry.
MR. FLAMM: No.
MR. DELGADO: Hugh.
MR. KARREMAN: No.
MR. DELGADO: Kevin.
MR. ENGELBERT: No.
MR. DELGADO: Jennifer.
MS. HALL: No.
MR. DELGADO: Steve.
MR. DeMURI: No.
MR. DELGADO: Julie.
MS. WEISMAN: No.
MR. DELGADO: Dan.
MR. GIACOMINI: No.
MR. DELGADO: Jeff.
MR. MOYER: No.
MR. DELGADO: Bea.
MS. JAMES: No.

MR. DELGADO: And the chair votes no.

MR. MOYER: Mr. Chairman, we have 14 noes, zero yeses, one absent.

MR. DELGADO: The noes have it, and the motion to list black pepper extract powder in Section 205.606 of the list is lost.

Let's move on to the next one.

MS. WEISMAN: Okay, now, in case you were all starting to fall asleep here, the next material is dried orange pulp.

Originally the committee voted no because we felt that at the time the petition did not really help us understand why this material given a supply of organic oranges being grown in this country why this material could not be made organically.

And I think that - long story short, the Handling committee met last night, and we voted to reconsider. And we voted five yes, zero no, for this material to reverse our
previous decision, because originally it was
a unanimous vote against listing.

The members of the Handling
committee that are here, it was now a
unanimous vote in favor of listing this
material on 606. And I think it's - we had a
couple, and this is another good example of how
the public comment process works well and does
its job, because the petitioner was here. We
had an opportunity to ask a lot of questions,
get a lot of information over the period of
the last three days, or the two days that
preceded last night's vote.

So I would like to move now on a
recommendation to add dried orange pulp powder
to Section 205.606 of the national list.

MR. DELGADO: Is there a second?

MR. SMILLIE: Second.

MR. DELGADO: Joe seconds, and it
is moved and seconded to include orange pulp
dried on the national list, Section 205.606.

Discussion? Joe?
MR. SMILLIE: Yes, the reason why I want to open this up is, we are coming - our Handling committee was coming to the conclusion that including - and I want to just put this on the record; you've heard me say it before - but we are coming to the conclusion that listing things on 606 does spur the growth of organic. And in that sense we fully anticipate organic orange pulp to be on the market, whether it includes slightly different formulations, or whether this company sees the opportunity to go organic.

By listing it we can replace current conventional byproducts that are being used and in the future have organic product in place for the other processing industry.

MR. DELGADO: Okay, Jeff.

MS. WEISMAN: Thank you, because it follows on Joe's point. I think the other thing that was important for me to hear was also that this is replacing - not just conventional but synthetic materials. It will
be replacement, so I see this as an opportunity even before it's there organically, it will open up the possibility that some synthetics we maybe won't have a need for anymore.

MR. DELGADO: Jeff.

MR. MOYER: My question is for either Julie or Joe. It seemed like yesterday that I heard some discussion that what we are actually certifying is a proprietary process. That of course leads to a product. But it brings up concerns in my mind based on what Grace came up with later when she talked about orange - it's just a little mixed up in my head.

MS. WEISMAN: I think it happens a lot in manufacturing that some very very specific process will be patented, but it does not mean, and I was certainly convinced yesterday by Grace and a few other comments that were made, that other people are in line to make things that are very similar, and will
function in an identical way, even if it's not
by the patented process. It will be something
very close, and there will be competition in
the marketplace.

MR. SMILLIE: And our motion does
not include those patent-specific processes.
It's simply for dried orange pulp.

MR. DELGADO: Dan.

MR. GIACOMINI: I don't know if we
can go back to the transcript, or matter of
just clarify - I think I heard you say orange
pulp - dried orange pulp powder?

MS. WEISMAN: I don't have - it's
dried.

MR. GIACOMINI: So just orange pulp
dried?

MS. WEISMAN: I didn't pull it up
because - yes, and that -

MR. GIACOMINI: I heard correctly
when she said powder?

MS. WEISMAN: I meant to. Thank
you for that correction.
MR. DELGADO: Any questions?

Comments?

Are we ready for the question?

The question is on the motion to list orange pulp dried on the list on Section 205.606, and we will start our vote with Tina.

MS. ELLOR: Yes.

MR. DELGADO: Tracy.

MS. MIEDEMA: Yes.

MR. DELGADO: Joe.

MR. SMILLIE: Yes.

MR. DELGADO: Barry.

MR. FLAMM: Yes.

MR. DELGADO: Hugh.

MR. KARREMAN: Yes.

MR. DELGADO: Kevin.

MR. ENGELBERT: Yes.

MR. DELGADO: Jennifer.

MS. HALL: Yes.

MR. DELGADO: Steve.

MR. DeMURI: Yes.

MR. DELGADO: Julie.
MS. WEISMAN: Yes.

MR. DELGADO: Dan.

MR. GIACOMINI: No.

MR. DELGADO: Jeff.

MR. MOYER: Yes.

MR. DELGADO: Bea.

MS. JAMES: Yes.

MR. DELGADO: And the chair votes yes.

Did I miss somebody? Sorry, that's the second time. Gerry, you said?

MR. DAVIS: Yes.

MR. MOYER: Mr. Chairman, we have 13 yeses and one no and one absent.

MR. DELGADO: The ayes have it, and the motion is agreed to.

Any other materials that we need to discuss, Mr. Weisman?

MS. WEISMAN: That is not the last recommendation on the Handling committee agenda, but it is the last material.

We - I am - yes, I am pleased to
say that we are moving onto pet food after
what really has been too long a time, through
no fault of the pet food industry or the pet
food task force, who did very fine work very
early on and then kind of got sidelined in
light of other events that happened in the
organic industry. And I'm glad that we got
back to this, and I especially want to thank
Tracy Miedema who embraced this recommendation
and breathed life back into it. And for Emily
Brown Rosen and Nancy Cook who is not here for
helping us do that.

We are introducing this
recommendation after some - I hope I'm not
going out on a limb here saying relatively
minor edits that were made yesterday. So I
would just like to go ahead and move that for
the acceptance of this Handling committee
recommendation for the adoption of standards
for the production and labeling of organic pet
food.

MR. GIACOMINI: Second.
MR. DELGADO: It has been moved and seconded, and our friends make a motion to accept the document entitled Organic Pet Food Recommendation as described by the chair of the Handling committee.

Yes, questions? Tracy?

MS. MIEDEMA: I'll just go ahead and point out the syntactical change we made so that it is clear to everyone.

On page five, I inserted a pretty klunky notation to the program in describing how to - how 606 could be parsed to be very clear. The -- potentially commercially unavailable pet food only items should be lined out in the program.

This is per the program's advice, but in our recommendation, I -- let's see, Valerie, it's in subpart B, 105. And why I'd like some help with is just in pulling out the way I had inserted this note. You can see right there in call caps. And actually just showing the way that the sections would be
labeled. It's the same thing that the program
suggested to us as a numerical name for the
sections.

And then, Val, can you flip to the
edits that we just received earlier today.
Did you include those earlier?

(Simultaneous speakers.)

MR. DELGADO: Why don't you
describe them?

MS. MIEDEMA: I'll just describe
them. Actually, Emily, would you please --
would you mind approaching, because it's going
to be hard for me to pull these out.

So let's get back to that section.

What we're simply doing is
translating the note that describes this to
actionable language.

Now while these guys are taking
care of business over there, I'll address one
other concern that was raised yesterday by
Urvashi Rangan about the inclusion of
slaughter byproducts. And after having a
conversation with her, and making sure she understood that any items that comprise a small portion, you know, this is either made with or organic, any slaughter byproducts that weren't organic would still have to be on 606. So it doesn't open the door wide open for any conventional slaughter byproducts. They would still have to be listed on 606, one by one.

And after that conversation, Urvashi said, okay. So I wanted to make sure that we skip over that for now.

That was the only concern that I heard in any of the public comments.

MR. DELGADO: Jeff.

MR. MOYER: Tracy, I was just wondering if you could direct Valerie to point out where it had the section that -- I know Kevin and I wanted to make sure it was in there about feeding pet food to livestock.

It's in there somewhere. I just want to double check and make sure for my clarification.

MS. FRANCES: 237(b)7.
MR. DELGADO: Thank you.

Ready with those updates? Tracy, could you describe those for us?

MS. MIEDEMA: You know, I don't think we really need to belabor this. Basically what we describe is the parsing of 606, and we made a notation in the document to show it rather than describe it.

MR. DELGADO: So that's the extent of the change?

MS. MIEDEMA: That's the extent of the change.

MS. ROSEN: Including pet food, in the title of 605. And the word including pet food in the title of 606, and then 606 will have a section A, allowed for all processed products; and then B, allowed for pet food only. So there would be no confusion where you put things there.

MR. GIACOMINI: So 606 would say all processed?

MS. WEISMAN: No, 606 will be now
divided into --

MR. GIACOMINI: But 606(a) will say processed product?

MS. WEISMAN: That's what it's for. Handling.

MR. DELGADO: Any other questions?

MR. GIACOMINI: I think I have one.

MR. DELGADO: Yes.

MR. GIACOMINI: I fully support the document. I just want to make a quick statement. There was one issue in this document that I didn't like from the beginning, and I think it's worth saying now.

The document, when it feels like going to 603, it goes to 603. When it feels like going to 605, it goes to 605. When it feels like going to 606. I just wish the document could have been structured to have a little bit more - I understand why you did it.

MS. ROSEN: Yes, that was discussed that maybe - I think what you are referring to is having it all in one separate pet food
MR. GIACOMINI: Yes, just so it's not - you know, cruising through the regulation, find something wherever you wanted to find something.

MS. ROSEN: We had no problem with it being reorganized like that, the pet food task - this is just the way we did it, and if the program wants to reorganize it for easier reading by the industry or whatever, that can be done.

MR. DELGADO: Richard, do you have a question?

MR. MATTHEWS: Yes, clarification. Is it intended for, A, all the products used in A to also be used in pet food?

MS. MIEDEMA: Say it again, please.

MR. MATTHEWS: Are you intending for all the materials in A to also be eligible for use in pet food?

MS. MIEDEMA: There could be a pet food item in A. B is pet food only.
MR. MATTHEWS: Okay, I just wanted to clarify.

MR. DELGADO: Any other questions?

MR. MATTHEWS: And the reason why I was clarifying that is because pet food is also a processed product.

MS. MIEDEMA: Right, and that's just to acknowledge the fact that cats are obligate carnivores, and there are going to be certain items that need to be in there as pets only.

MR. DELGADO: Any questions?

So are we ready for the question? The question is on the motion to approve the document entitled Organic Pet Food as described by the chair of the Handling Committee.

And we'll start our vote with Tina. I'm sorry, Tracy.

MS. MIEDEMA: Yes.

MR. DELGADO: Joe.

MR. DELGADO: Yes.
MR. DELGADO: Barry.

MR. FLAMM: Yes.

MR. DELGADO: Hugh.

(No response.)

MR. DELGADO: Kevin.

MR. ENGELBERT: Yes.

MR. DELGADO: Jennifer.

MS. HALL: Yes.

MR. DELGADO: Steve.

MR. DeMURI: Yes.

MR. DELGADO: Julie.

MS. WEISMAN: Yes.

MR. DELGADO: Dan.

MR. DELGADO: Yes.

MR. DELGADO: Jeff.

MR. MOYER: Yes.

MR. DELGADO: Bea.

MS. JAMES: Yes.

MR. DELGADO: Jerry.

MR. DAVIS: Yes.

MR. DELGADO: Tina.

MS. ELLOR: Yes.
MR. DELGADO: And the chair votes yes.

MR. MOYER: Mr. Chairman, we have 13 yeses, one absent - I'm sorry, two absent.

MR. DELGADO: Can you restate that, please.

MR. MOYER: Yes, we have zero noes, 13 yeses, and two absent.

MR. DELGADO: The ayes have it, and the motion is agreed to. Very good.

Madam Chair, does that conclude your participation?

MS. WEISMAN: That's all.

MR. DELGADO: Well, thank you very much, and congratulations to all of the chairs for the outcome of the voting, and we are late.

Let's move on straight ahead to the next topic which is election of new officers. And following the procedures which we approved this morning, our acting secretary has prepared some ballots.
ELECTION OF NEW OFFICERS

MR. DELGADO: And the order of the election will be as follows. I'm referring to the policy and procedures manual, please correct me if I'm not doing the right job. But we will start with the elections of the chair, followed by the vice chair after the election, and finally the secretary.

Right now the secretary is distributing ballots, and we will take nominations. Our director will put those nominations up on the screen. We will be numbering those nominations, and that's how we are requesting that you vote. If you approve of nominee one, two or three, circle that individual on the ballot, fold it, and we'll collect those.

These do not have names. That's why I'm asking the board members to observe the list that we will be posting up there, depending on the nominees for the position.

MS. FRANCES: Starting with the
chair, vice chair and the secretary, in that order?

MR. DELGADO: Start with the chairman. Once we vote on that position we'll move on to the next one.

MR. KARREMAN: And are we -- is the list -- she's going to type it as we say it, right? It's not the email the other week?

MS. JAMES: Okay, so to clarify, this new and improved organized process for elections is that somebody will be nominated by one of their colleagues, and Valerie will type up nomination -- under chair, she'll say chair one, and then she'll put the name.

So then you don't want to write anything on here. You select the number of the person in order of how Valerie puts it up here for your vote, and then I'll collect them. Does that make sense?

MR. DELGADO: And the whole intent is to make this process somewhat more professional and efficient. Any other
questions? And we don't have chads here, so -
- questions? Okay, Hugh.

At this point, then, we would like
to contemplate nominations for the chair.

MR. SMILLIE: I'd like to nominate
Tracy Miedema for chair.

MR. DELGADO: Very good. Tracy, do
you accept the nomination?

MS. MIEDEMA: I accept.

MR. DELGADO: Very good. Hugh?

MR. KARREMAN: I'd like to nominate
Jeff Moyer.

MR. DELGADO: Mr. Moyer, do you
accept the challenge?

MR. MOYER: I do.

MR. DELGADO: Okay, any other
names? Any questions?

MR. DAVIS: I nominate Dan
Giacomini.

MR. DELGADO: Dan?

MR. GIACOMINI: I would rather not
split the voting three ways.
MR. DELGADO: So Dan is declining his name on the list.

So folks, there we have it. We have the two candidates for the position of chair. Please circle the one you are voting for, and fold it, and we'll collect them.

After the votes are counted, we will announce the person with the highest number of votes, and the secretary will discard the votes - the ballots, that is.

(Whereupon, the above-entitled matter went off the record at 4:15 p.m. and resumed at 4:15 p.m.)

MR. DELGADO: Congratulations, Mr. Jeff Moyer. You have been elected our new chair.

(Applause.)

MR. DELGADO: We will now proceed with the second position, the second officer's position, which is the vice chair. And I remind the board members that we can nominate individuals that had already run for another
So we'll turn the ballot at this point. So at this point, we need a couple of more.

(Simultaneous speakers.)

MR. DELGADO: Okay, at this point I would like to entertain nominations for those - the position of vice chair. We'll start with Hugh.

MR. KARREMAN: I'd like to nominate Dan Giacomini for vice chair.

MR. DELGADO: Dan Giacomini is nominated.

Julie?

MS. WEISMAN: I would like to nominate Tracy Miedema for vice chair.

MR. DELGADO: Tracy is nominated.

Any other nominees for this position?

Dan, you're willing to run? And Tracy? So there we have it, folks. Number one will be Dan, and number two, Tracy.
So again.

(Whereupon, the above-entitled matter went off the record at 4:18 p.m. and resumed at 4:20 p.m.)

MR. DELGADO: Congratulations to our new vice chair, Mr. Dan Giacomini.

(Appause.)

MR. DELGADO: Our third position is that of secretary, and I would like to entertain nominations?

Bea.

MS. JAMES: I would like to nominate Julie Weisman.

MR. DELGADO: Julie, do you accept the challenge?

MS. WEISMAN: Yes.

MR. DELGADO: Dan.

MR. GIACOMINI: I nominate Rigo.

(Laughter.)

MR. DELGADO: I'm sorry, I have to withdraw. I appreciate the honor. However, I promised to help Julie - well, strike that
comment.

Any other nominations?

MS. JAMES: I would just like to ask if Katrina expressed to you, Mr. Chair, any --

MR. DELGADO: She has expressed her wish not to run this year.

DR. ROBINSON: Mr. Chairman, I have to go get my car out of hock, so I'm going to leave you. I just want to say thank you all once again for your service to the department. And goodbye. I'll see you.

MR. DELGADO: Thank you very much for all your support. And for secretary, we only have one nominee. And we won't do it by ballot. Okay, so by voice I guess we all agree that it will be Julie, our new secretary. And I want to congratulate her for that.

(Applause.)

MR. DELGADO: Moving on to the next topic is committee work plans, and we'll start
with those right away.

I warn the board members that we
are 45 minutes behind schedule, so this is our
chance to make sure that we finish on time.
And we'll start with Handling. Do you need
more time? You're still with materials? Why
don't we stay with materials then while we
give time to Julie to -

COMMITTEE WORKPLANS

MR. GIACOMINI: The items for the
workplan for the Materials Committee --
assuming I'm still Materials chair, Jeff.
Anyway, I guess that's still -- we'll work
that out.

Okay, in no particular order,
because these are all occurring at various
times and simultaneously, continuing work on
petitions and sunset items and as part of that
continuing work to work with the program on
old petitions that can be dealt with, would
come up, including the list received in public
comment.
Continuing to work on improving the tracking system and level of communication regarding petitions, and between the board and the program.

And number three, working with the materials working group and examining the document that we have to see if there is anything we can move forward on at the next meeting, and continuing to work with the group regarding the synthetic-nonsynthetic questions.

Thank you, Mr. Chairman.

MR. DELGADO: Thank you. We move on then to livestock.

MR. KARREMAN: Thank you, Mr. Chair.

We will finish up on the bivalves, and also embark upon the animal husbandry animal welfare topic. And I guess poultry outdoor access is kind of part of that.

And then there is one other thing that has come up. I guess it would come under
things that happen out in the organic community. It's a material type thing. So the topic of vitamins and minerals used therapeutically that are not feed additives, but they are injectable. We would like to look at that as a topic. So injectable vitamins and minerals.

MR. DELGADO: Can you repeat that?

MR. KARREMAN: Injectable vitamins and minerals for livestock.

Dan has something there?

MR. DELGADO: Clarification?

MR. GIACOMINI: Yes, the Livestock Committee will be looking at that. It may lead us to a point where a petition would need to be submitted for listing on a national list. We are just looking to - there are some other vitamin and mineral issues that we are sort of going to be grappling with in that whole evaluation.

MR. DELGADO: anything else? Okay, any questions for livestock?
I didn't ask the same about materials. Any questions for the materials chairman?

MR. SMILLIE: I just want to be clear, Hugh, the aquaculture recommendation that passed today which adds on to the previous one, is that moving forward, or does that have to sit and wait until the bivalve piece is added.

MR. KARREMAN: I think the program would have to answer that. But when we were in discussion yesterday I specifically asked that - whatever happened today, that what we already worked in past March, 2007 starts getting implemented, and then with what happened today hopefully everything can. It's not up to me; it's up to the program of course.

MR. SMILLIE: But that is your understanding?

MR. KARREMAN: The intent for us is to get things started now.
MR. DELGADO: Any other questions?

Bea.

MS. JAMES: I'm sorry, Hugh. I think I captured everything, but did you mention humane standards for livestock?

MR. KARREMAN: Animal husbandry and animal welfare.

MR. DELGADO: Any other questions for livestock?

Okay, thank you very much. Joe?

MR. SMILLIE: Not necessarily in order, we will prioritize however on our first meeting, but certainly 100 percent on having a recommendation for spring, a recommendation hopefully in spring for biodiversity. We will take up, and again the title is important, retail criteria for certification. Retail criteria for certification - or criteria for retail certification is a better way of putting it. Criteria for retail certification, which as you know is currently exempt or excluded from the regulation.
And the last item is peer review.

MR. DELGADO: Anything else?

MR. KARREMAN: That's it.

MR. DELGADO: Okay, any questions?

Let's move on then to crops. Mr. Davis.

MR. DAVIS: The Crops Committee work plan will be - several petitioned substances, kind of a group of several inert materials, inerts and pesticides. Ethylene glycol, tetramethyl decyne-diol, polycaprolactone, isoparrifinic hydrocarbon, those are the four inerts. And then glycine betaine, peracetic acid, an to expand use petition, and sulfurous acid.

Also we have several sunset materials that are due to sunset in 2011. I don't have them here to list. There's a short list, not many.

Other recommendations we'll be undertaking, we'll be working with in the joint committee efforts on the biodiversity document, and list for inerts and pesticide
formulation document also should be a joint committee with materials I would guess, Dan, don't you think, on the list for inerts and pesticides?

MR. GIACOMINI: Oh, that just sounds like a blast.

MR. DAVIS: We with our resident mushroom specialist on board, in the crops committee we are going to relook at mushroom standards, and also revisit and continue the work on soilless growing systems in terrestrial plants. And that is all that is on the work plan at this point.

MR. DELGADO: Any questions for the chair of the crops committee?

Very good. Let's move on then to Handling.

(Simultaneous speakers.)

MS. WEISMAN: So the Handling Committee workplan is headed up by work on the clarification of materials, definition of materials on the national list, to now take
the hand off the materials working group on
the ag-non-ag suggestions that were made at
this meeting, and continue to participate in
their process as they start to delve into the
synthetic non-synthetic piece of materials on
the national list.

And then of course as always we
will continue to review petition materials,
and on 205.605 we're looking at lecithin
bleached, tissue for removal; we will be
looking at sodium chlorite acidified, for
which we now have the technical review that we
had asked for; and the same for propionic
acid for which we now also have the technical
review. Yeast is still on the list, waiting -
I was going to say patiently, but not
patiently really, and shouldn't be patiently -
for the clarification of the Ag/Non-Ag before
we can move ahead with the status of that
petition.

And then on 606 we have a petition
for the removal of fluid lecithin - lecithin
fluid unbleached for removal. We still have
the petition for pectic low-methoxy non-
amidated, to be moved from 605 to 606.

And I think we requested the
technical review for that, and I think we will
wait for that. I think that is in the
pipeline.

And I also have — we have work to
do to refine our review of 606 materials,
specifically to work on clarifying — some
guidance to clarify the use of what we are
calling accessory ingredients in formulated
agricultural products. That came up when we
were adding colored materials onto 606 and
realizing that — what's in the marketplace may
be one form — something was petitioned with
what was considered a relatively benign
solvent or carrier, but that was actually
being manufactured in a variety of ways, so we
want to take a look at that.

We also just to give you a preview
we do have some new petition materials in the
pipeline that have already been handed off to
the - passed to the Handling committee.

For 605 we are looking at
glucosamine, and also propane as a processing
aid. That is going to be fun.

And then for 606 we now have a
petition for chicory root. And also for - in
the category of colors we have a petition for
red corn. We have a petition for myrrh
essential oil, and for wheat germ.

Then fourth item on our Handling -
you see we get big things off, but it seems
like - we also have materials that are for
sunset review in the fall of 2011. We have
nine items. The AMPR for this was already
published.

And for 605(a) we'll be looking -
we'll need to start looking at egg white
lysozyme, almalic acid and microorganisms.

For 605(b) we are looking at
activated charcoal, and Jerry I feel for you
with the pronunciations, cyclohexylamine,
diethylaminoethanol, and octadecylamine, and those are boiler additives. Don't everybody freak out; they are for boilers.

We also have paracetic acid and sodium acid phosphate.

And also continuing to hover here at the bottom of the list structure of the national list, which I believe is going to be part of working with this clarification materials in the definition. It looks like we may have some impact there.

Labor guidance, which I think is also going to be impacted by this Ag/Non-Ag definition. And food contact substances is still on the workplan.

MR. DELGADO: Okay, questions for the board?

Julie, is that it?

MS. WEISMAN: That's it.

MR. DELGADO: Okay, an impressive list. Any questions for our chair? No?

MR. KARREMAN: I just wanted to add
something for livestock. Kevin brought up here, when I said, we hardly ever have any materials for livestock, after Julie has gone through her list, and Jerry has gone through his list. There may be some sunset materials; I need to look at that. I apologize.

We're not used to looking at materials on livestock, plain and pure.

MR. DELGADO: Okay, let's move on to policy.

MR. FLAMM: Okay, what I read off is what the committee agreed to and was presented at the last committee meeting, so it won't be new.

The first item is to clarify and define the concept of priority for petitions. I think that came up in our discussion - oh by the way, this is for the policy and procedures manual.

Continue the systematic review of the policy and procedure manual. We are looking at sections one and two - one and two
has already been done. Reviewing first
Section three, and with particular attention
to the discussion on meeting sites which is
discussed on page 15. Review section four
with particular attention to examining what is
now the assigned responsibilities of the
policy committee to determine whether those
are really what the board wants the policy
committee to be doing.
And then three is evaluation
criterion for - it's in the policy and
procedure manual on page 46, examine that to
see that it addresses biodiversity protection
needs as may be determined when we make
recommendations on the biodiversity paper. So
it'll be cross-checked to make sure it gets
into the proper place in the policy and
procedures manual.
Then under the new member guide --
MR. DELGADO: Does that include the
criteria?
MR. FLAMM: I'm sorry?
MR. DELGADO: Does that include the criteria for the evaluation of the --

MR. FLAMM: Evaluation, excuse me -- that's just -- there is no attention to it specifically for biodiversity in that listing on page 46.

In the new member guide it's proposed to develop a glossary of acronyms for the benefit of new members; and secondly, chat room, if that's what we continue to call it, procedures and restrictions be included in the new member guide.

MS. FRANCES: Not chat board but bulletin board.

MR. FLAMM: Bulletin board now. I knew we had changed the name. That's all I have.

MR. DELGADO: Any questions for the chair of the policy committee?

Well, then that is it. That concludes our points on workplans. And let's move on to the next item which is other
business.

OTHER BUSINESS & CLOSING REMARKS

MR. DELGADO: Any other pending issues that we should be considering? Board members, this is our chance.

Yes, or closing remarks. But I would like to first of all contemplate if there is any other business that we need to consider at this moment.

Okay, hearing none we will move on to closing remarks.

And Bea?

MS. JAMES: I would like to thank Rigo for his year of service as chair of the board, and you stepped up and did an excellent job.

MR. DELGADO: Thank you very much.

(Appause.)

MR. DELGADO: On that note, I guess that's my cue, I would like to say it's been a real honor. And I've been extremely impressed by not only the work within this
group, the board - I think that was expected when you are appointed at this level you are expected to have the highest level of professionalism by most of the press, by the way the community, the organic community, is willing to participate and come out and help us. That public comment, that feedback, that assessment of whatever we do, is unique. I appreciate that enormously.

I want to thank our newly elected chair for his advice and patience and comments as well as Katrina's, the secretary. We will - and Barry of course - we were having calls every week on Mondays just to stay ahead of the game. We hated pop quizzes; I think that was the issue. And that demonstrated a level of commitment that I have not seen very often.

I think we were successful - I said this at the very beginning - we implemented new changes that brought us to a higher level. I think we are more efficient. And that is for all of the work that all of
you have given. And I thank you for that.

I know I have 14 friends for life, and many more from the public. And that is fantastic for me.

So have a nice break. I appreciate that. And if there are no other comments from the public - yes.

MR. MATTHEWS: Just one thing. I understand we want to have a board meeting in April; is that right?

MR. DELGADO: We are looking at the calendar. And the final date of that meeting will have to be defined in the next executive call -- actually the January executive call. So that's an item to be voted on. Is that correct?

MS. FRANCES: Not December.

MR. MATTHEWS: My only point is that we are going to be coming into a time when tourism will pick up again in the spring. We often have difficulty in locating hotels. So the sooner we know the better, so that we
can book a hotel as soon as possible.

MR. DELGADO: We do have a tentative date in answer to that question. We just need to go ahead and finalize it.

MR. SMILLIE: I think there's lots of room out West.

(Applause.)

MS. FRANCES: On the meeting questions, the January 7 call, if you are really thinking in terms of April, you need to have your agenda pretty much decided in order to get it at all.

MR. DELGADO: Any other questions? If that's the case, I would entertain a motion to adjourn.

MR. DeMURI: Mr. Chairman, I move we adjourn.

MR. DELGADO: Okay, this meeting is adjourned. Please have a safe trip back home. Thanks again. Happy Holidays.

(Whereupon, the above-entitled matter concluded at 4:46 p.m.)
lysozyme 360:19

NATIONAL ORGANIC STANDARDS BOARD MEETING

Monday, May 4, 2009

The National Organic Standards Board met in the Franklin and Adams Rooms in the Washington Plaza Hotel, 10 Thomas Circle, Washington, D.C., at 9:00 a.m., Jeff Moyer, Chairman, presiding.

PRESENT:

JEFF MOYER, Chairman
DAN GIACOMINI, Vice Chairman
JULIE WEISMAN, Secretary
KATRINA HEINZE, Member
GERRY DAVIS, Member
TINA ELLOR, Member
BARRY FLAMM, Member
TRACY MIEDEMA, Member
JOE SMILLIE, Member
STEVE DeMURI, Member
BEA JAMES, Member
KEVIN ENGELBERT, Member
HUE KARREMAN, Member

STAFF PRESENT:

VALERIE FRANCES, Staff
BARBARA ROBINSON, Staff
RICHARD MATTHEWS, Staff
DEMARIS WILSON, Staff
ROBERT POOLER, Staff
# TABLE OF CONTENTS

- Approval of Agenda. 3
- Presentation of Chairman Moyer. 4
- Introductions. 10
- Mission and Vision of the Board. 19
- Secretary's Report. 21
- National Organic Program Report. 23
- NOSB Materials Review Process Update. 58
- Methionine Task Force Research Status Report. 85
- Public Comment. 107
CHAIRMAN MOYER: Good morning, everybody. I'd like to officially call the May 4th meeting of the National Organic Standards Board to order.

We have a quorum. The Board members are all seated, and I'd like to get directly to the business of approving our agenda.

We have an agenda that was presented to the Board members. It was presented to the program and posted for the public to view. So at this time what I'd like to do is ask the Board if somebody would make a motion to approve our agenda.

MEMBER ELLOR: So moved.

CHAIRMAN MOYER: Tina made a motion.

SECRETARY WEISMAN: I'll second.

CHAIRMAN MOYER: And Julie seconded that. Any discussion about the
agenda or changes? Anybody see anything wrong
with it?

(No response.)

CHAIRMAN MOYER: Not hearing
anything, I'll call for a vote. All those in
favor of approving the agenda say aye.

(Chorus of ayes.)

CHAIRMAN MOYER: Opposed?

(No response.)

CHAIRMAN MOYER: Hearing none, we
have an agenda. Thank you, everybody.

Appreciate that.

What I'd like to do is welcome
everybody to this meeting, members of the
Board, program staff that's in attendance, and
the general public seated in the gallery. On
behalf of the entire Board, we appreciate you
all being here.

For me I have to say it's a real
honor to sit on this Board today. We've been
extremely busy over the past few months
working very diligently on the items that you
see in the agenda that we've just approved,
and like every working session before us,
we've spent literally hundreds of hours on
conference calls and countless more hours
reading, writing, and thinking about the
complex issues that we're going to be
discussing over the next three days.

And while some of you will agree
with things that we vote on and some of you
will not agree with things that we vote on, I
can assure you that the members of this Board
have worked tirelessly and put their best
effort forward, and I'm extremely proud of
this Board and the work that we've
accomplished here.

And my time is up.

(Laughter.)

CHAIRMAN MOYER: We've recorded
and posted, I believe, Valerie, over 400
written comments for the Board members to read
and educate themselves with, and we expect to
have dozens of comments here over the next
three days or two days given in person. So it's clear that you, the members of the extended organic community have also been doing your work, and we appreciate that and all the effort that you've made to stay connected to the issues that are in front of this Board.

I will say as the organic industry matures, it is becoming increasingly more difficult to find a balance between the integrity of the word "organic" and the desire for the industry to grow and produce and make new products in new product areas.

Words like "nanotechnology" and the concept of linking organic to the cosmetic industry weren't even in the equation when the law was passed however many years ago, but today these are real challenges to this Board and to the program.

The organic industry faces new challenges. Several Board members I know have been deeply involved in some of these
challenges. To date over a dozen food safety bills have been introduced into Congress.

From traceability to the FDA and USDA reorganizations, these pieces of legislation take various approaches to reforming the food and food safety system.

In recent weeks there's been a great deal of misinformation circulated about the impact that some of these bills would have on our industry, and I know that the Organic Trade Association has been engaged in some of these issues and has been sending out information assuring folks that are members of the OTA that these major bills that have been introduced would not put an end to the organic industry as some of the critics have claimed.

By the same token, organic certification does not nor is it intended to be a substitute for compliance with the weather and the spirit of good agricultural practices and good manufacturing practices that insure safe food for consumers.
So I look forward to discussing how the organic standard can support new and existing practices that help insure the safety standard consumers have every right to expect.

As an industry, we have seen serious issues of fraud and cheating over the last several months. Many of you are aware of that, pointing to the need for continued vigilance, and we all have a role to play.

It's important for us all to step up and protect the integrity of the word and the meaning of the word "organic."

Improving consumer confidence in the food industry is paramount to this Board, and if we all do our jobs, we can minimize the impact of organizations and individuals that they might try to have whose efforts are counterproductive to the mission of this Board.

In light of this, our industry continues to shine as a beacon light in an otherwise failing food system. Data from
research around the country now is conclusive that organic production systems not only produce high quality food products, but also through carbon sequestration can have a positive impact on climate change. And finally, we should take pride in the fact that we now have an organic garden on the front lawn of the USDA building. Thank you, program. (Applause.)

CHAIRMAN MOYER: Only a few months ago that would not have been possible, and it's pretty exciting to see that take place. And now what I'd like to do is end my comments and go right to introductions and give each of the Board members the opportunity to introduce him or herself and give a brief summary of your individual position and your representation on the Board. And if we might start with Joe, Joe, would that be all right? Joe.

MEMBER SMILLIE: Well, pardon the
laryngitis, but glad to be here again.
Looking forward to this meeting. Joe Smillie
and the senior VP at Quality Assurance
International, and I represent certifiers on
the Board.

And we have one recommendation
coming up on peer review and three discussion
papers, which I think should prove
interesting.

I'd also like to thank the
consortium of people out there who put up the
money so that you could all have Internet
access while you are at this meeting.

That's it.

CHAIRMAN MOYER: Thank you, Joe.

Tracy.

MEMBER MIEDEMA: Good morning. My
name is Tracy Miedema. I work at a large
pharm in Oregon called Sawbush Island Farms.
About 1,500 of our acres are certified
organic.

My own food journey really comes
from being privileged to live in the Pacific Northwest and be raised on wild food. I still have a strong connection with being as close to the source of food as possible. I'm one of the consumer reps., and I want to help keep the food sources transparent for consumers as possible.

CHAIRMAN MOYER: Thank you, Tracy.

Barry.

MEMBER FLAMM: I'm Barry Flamm from Polson, Montana on Flathead Lake. I'm in one of the environmental positions, and my term goes to 2013. As you can tell, I've only been on the Board a little over a year now, and I chair the Policy Committee.

CHAIRMAN MOYER: Thank you, Barry.

Rigoberto Delgado will not be with us this morning. Due to travel arrangements, he'll be here later on this evening, as will Jennifer Hall.

Tina.

MEMBER ELLOR: Hi. Tina Ellor
from Kennett Square, Pennsylvania. I'm technical director of Phillips Mushroom Farms, and I'm fill the environmental slot on the Board, and my term -- not that we're counting, Barry, are we? -- ends in 2012.

I've been chairing the Crops Committee, which has been an incredible privilege.

Thank you.

CHAIRMAN MOYER: Gerry.

MEMBER DAVIS: Gerald Davis from Arvin, California. I'm a grower representative on the Board. This is my last year on the Board, and I work for a very large still family owned and operated vegetable farm in California.

CHAIRMAN MOYER: Thank you, Gerry.

Katrina.

MEMBER HEINZE: Good morning. I'm Katrina Heinze from Plymouth, Minnesota. I hold the scientist position on the Board, and this is the beginning of my third year. My
background is in chemistry, but my current position is I lead food safety, regulatory compliance, and product quality for Small Planet Foods.

I am a long time organic consumer and mother of two children. So certainly consumer confidence in the organic label is very important to me.

I would like to apologize to my fellow Board members for my absence, unplanned absence, at the last meeting and really a very big thank you to Bea for stepping in and taking on the Secretary responsibilities while I was gone. I know it is a ton of work, and I appreciate it.

CHAIRMAN MOYER: Thank you, Katrina. Well said.

Dan.

MEMBER GIACOMINI: Dan Giacomini, one of the consumer seats on the Board. I'm trained as an animal nutritionist. I live in northern California, in Middletown not far
from San Francisco and the Bay area. I do a lot of work with both conventional and organic livestock and farming and a lot of work in the feed industry and consulting, and being in that area I'm able to be around and in contact with a very vocal and active and politically aware and liberal and all those things consumer group, which you have in the San Francisco Bay area.

CHAIRMAN MOYER: Thank you, Dan.

Julie.

SECRETARY WEISMAN: Good morning. I'm Julie Weisman. I hold one of the handler positions on the Board. I'm actually the former chair of the Handling Committee, but this year I have passed the torch on to Steve. Also have been Vice Chair of the Board and am currently the Secretary, and this is also unbelievably my fifth and last year on the Board. Boy, time flies when you're having a good time.

I have two flavor companies, Elan
Vanilla and Flavorganics, and I am also the mother of children, and since way before I was dealing with flavors, I've been buying organic food for my family and myself.

And I can't believe that this is getting to be the end. Enough said.

CHAIRMAN MOYER: Thank you, Julie.

I'm not sure why you and Gerry sound so happy.

Steve.

MEMBER DeMURI: Good morning, Everybody. My name is Steve DeMuri. I live in Carmichael, California, which is near Sacramento for those of you that aren't familiar with California. I am the fledgling Chairman of the Handling Committee under the tutelage of Julie here, and I work for an "um-um good" soup company. My office is in California, but our corporate office is in New Jersey. So I can give you a hint who it is.

We do have quite a stable of organic products. I do hold one of the handler positions, and this is going on my
third year on the Board as well.

CHAIRMAN MOYER: Thank you, Steve.

Bea.

MEMBER JAMES: Good morning. My name is Bea James. I hold the retailers seat.

Previously I have been the Secretary, and I'm very excited to be at this meeting, to not have to take notes. Thank you, Julie.

I work for a company out in Minneapolis, Minnesota, a 21-store upscale grocery chain called Lunds and Byerly's, and I am the senior manager of organic natural and HBc programs there.

I'm also the mother of two boys, Forest and Harvest. So I really do have roots in Crunchy Granola Bell, and they are very excited when I leave because their grandparents get to give them all the food we're not advocating for today.

(Laughter.)

CHAIRMAN MOYER: Thank you, Bea.

MEMBER ENGELBERT: Good morning.
My name is Kevin Engelbert. I hold a producer seat on the Board. This is my fourth year. My family and I operate a 120-cow dairy farm in Nichols, New York. We also have a retail meat business, and we've just recently started up an organic grain business.

I serve as Vice Chair of the Livestock Committee. I'm on the Crops Committee and also the Materials Committee. A difficult time of year for me to be here, and again, I'd like to thank my sons and now my brother for covering for me so that I can attend the meeting, and it's certainly, again, still a privilege to be here.

CHAIRMAN MOYER: Thank you, Kevin.

Hugh.

MEMBER KARREMAN: My name is Hubert Karreman. I'm a dairy veterinarian, among a lot of certified organic dairy farmers in Lancaster County, Pennsylvania. I hold an environmentalist seat here, probably partly due to my past in soil conservation with the
USDA Soil Conservation Service, and I'm Chair of the Livestock Committee, and I guess we'll leave it at that.

CHAIRMAN MOYER: Thank you.

Kevin.

MEMBER ENGELBERT: I'd like to add one more thing on a personal note. Those of you who know me know my wife Lisa is always at these meetings, but she's not in attendance. Our middle son, his wife is eight days overdue. She couldn't bring herself to come to the meeting with a baby imminent. So if I break into a big smile, you'll know that I've gotten a text message, and I'm a grandfather again.

(Laughter and applause.)

CHAIRMAN MOYER: Thank you, Kevin and Hugh.

And lastly, I'm Jeff Moyer. I'm the Board Chair. I am also the research farm director for the Rodale Institute in Burks County, Pennsylvania. I have my own farm,
about 53 acres. We raise crops and some beef cattle, and it's a pleasure to be here.

I have one other announcement. I would like to ask that members in attendance try to refrain from E-mailing individual Board members during the voting process that will take place on Wednesday. Apparently that has happened, and we'd like to not have that happen. It's not an official policy statement; just a request from the Board.

Next on our agenda, we'd like to go over and just for the record state the mission of this Board, the vision and the mission of this Board, and I'm just going to read it directly as it is written in our policy and procedures manual.

The National organic Standards Board's vision is an agricultural community rooted in organic principles and values that instills trust among consumers, producers, processors, retailers, and other stakeholders.

Consistent and sustainable organic standard
guard and advance the integrity of organic
products and practices.

The NOSB mission statement: to
provide effective and constructive advice,
clarification, and guidance to the Secretary
of Agriculture concerning national organic
program and consensus to the organic
community.

In carrying out the mission, key
activities of the Board include assist in the
development and maintenance of organic
standards and regulations; review petitioned
materials for inclusion on the national list
of approved and prohibited substances;
recommend changes to the national list;
communicate with the organic community,
including conducting public meetings,
soliciting and taking public comments;
communicate, support, and coordinate with the
National Organic Program staff; and provide
information and education on the National
Organic Program.
That is our vision and our mission, and we're pleased to be able to bring that to you today.

The other thing that I will mention is that unlike my previous illustrious predecessors, being Pennsylvania Dutch, I'm going to tell you in advance that I'm going to butcher and bolix every name from somebody who comes up to give public comment. I will do my best not to discriminate against anybody and will probably do it equally to everyone. So I apologize in advance for that.

And now, if we could have the Secretary's report. Julie.

SECRETARY WEISMAN: Yes. We have I'm sure whether to count it as one or two separate things, but I will call them out as two, and we may vote as one if that's appropriate.

We generally vote to accept in the past it was the minutes that were taken by the Secretary, but we have now been practicing for
the last two years using the transcripts from
the meeting and accepting those as the
official record.

In addition, we have passed around
to everyone on the Board this spring the
voting results and tallies from the November
meeting. Actually this was done in the
winter, and I think everyone reviewed and made
amendments at that time.

The Executive Committee on its
last call on April 17th voted to accept the
tally as it was last circulated, and so at
this time we can entertain motions to accept
the meeting transcript and those voting
results as an official record of the 2008
meeting.

I don't know if there's
discussion.

CHAIRMAN MOYER: Will somebody
make that motion or did you make the motion,
Julie?

SECRETARY WEISMAN: I move that we
accept the meeting transcripts and the voting
results that were voted on at the last EC call
as official record of the last NOSB meeting in
November.

CHAIRMAN MOYER: Thank you, Julie.

We have a motion. Would there be
a second?

MEMBER HEINZE: Second.

CHAIRMAN MOYER: Katrina seconds
that motion.

Is there discussion?

(No response.)

CHAIRMAN MOYER: Hearing none, I
call for the vote. All in favor say aye.

(Chorus of ayes.)

CHAIRMAN MOYER: Opposed, if any?

(No response.)

CHAIRMAN MOYER: Hearing none,
that motion is approved and passed, and we
have a Secretary's report.

Thank you very much, Julie.

Now what I'd like to do is ask
Barbara if you might be willing to introduce
your staff or allow them to introduce
themselves and give your report.

MS. ROBINSON: Sure. I'm Barbara Robinson, Deputy Administrator for
Transportation and Marketing Programs, and
presently the Acting Director for the National
Organic Program.

MS. WILSON: I'm Demaris Wilson,
the Associate Deputy Administrator for
Transportation and Marketing Programs.

MS. GUO: I'm Ruihong Guo, the
Chief of Compliance and the Enforcement NOP.

MR. MATTHEWS: Richard Matthews,
Branch Chief, Standards Development and
Review.

MS. SCHMALE: Valerie Schmale.
I'm with Compliance and Enforcement staff.
(Additional introductions made off
microphone.)

MS. FRANCES: Valerie Frances,
Executive Director of the National Organic
Standards Board, and garden coordinator.

(Laughter.)

CHAIRMAN MOYER: And we couldn't live without Valerie. Thank you.

(Additional introductions made off microphone.)

CHAIRMAN MOYER: I'm sorry, but some of the Board didn't hear, and if you could stand up when you introduce yourself in the back. We can't see you.

(Additional introductions made off microphone.)

CHAIRMAN MOYER: Thank you, everybody, for the introduction.

Dr. Robinson.

MS. ROBINSON: Okay. Good morning, Mr. Chairman. Just a few things. First of all, I have some sad news to announce. I don't know how many of you remember Beth Hayden. She used to work with this program and then with the ARC Branch. She was in a glider with a friend of hers,
Alan Melendie, and was missing April 24th, and I just got word last evening that they are confirmed dead. So I am very sorry about that.

Anyway, Beth did do a lot of work for the NOP, and we will miss her. So our prayers go out to her family.

Let me just go on with the NOP update. Our budget this year was increased by $630,000 for FY '09, and we are very pleased about that. We didn't get that budget increase until March, of course. So you know, we're scrambling to make the most productive use of it as possible.

The good news, of course, is that with the new administration and the limelight on sustainability and organic and small and local, we do expect with the appropriations hearings that the NOP budget will be doubled for the 2010 budget.

Now, so that will take us to $6 million in 2010. Now, except that I don't
know, given the way Congress has been acting, whether we'll get that budget in October. It could well be that we don't see that budget increase again until next March, but still that would increase the base of the NOP budget in the outgoing years. So that will be good.

In the meantime we have put out an announcement for a multiple hire at the GS-9 through 12 level. That is out on the street now. So we hope to -- we're going to hire as many people as we can afford right at the moment and try and continue to increase that staff.

I also put forward a memo, a proposal to the administration to separate the National Organic Program as its own program in the agency. I just believe it's time for the NOP to stand on its own. I think it has the resources and the responsibility and the legs, frankly, to do that, and that initiative is being given serious consideration in the administration. So we'll just, you know,
watch and see what happens with that.

The Inspector General is continuing to review the NOP. They did a review of the program in 2005. They are reviewing the program again. They expect to complete the review probably by the end of the fiscal year.

After they complete their review, of course, then we'll respond to that review.

The People's Garden, as you may have heard, there is a People's Garden around the Whitten Complex. The Whitten Complex is USDA Headquarters, the big, white building across from the South Building. Contained within the People's Garden, of course, is a smaller section of that, which is being converted, transitioned to organic, and on Earth Day, there was quite, you know, a celebration of that.

And I did ask Valerie if she would be our point of contact. She is the point of contact for all of AMS for that, for the
organic portion of the People's Garden, and
she willingly agreed to take that on in
addition to her duties as your Executive
Director. So I don't know when she's
sleeping, but she's doing a very, very good
job at that, and I'm quite proud of what she's
doing there.

And thanks very much to the
Rodale Institute, who jumped right in and
delivered ten cubic yards of compost so that
we could get that garden up and started right
away.

PARTICIPANT: (Speaking off
microphone.)

MS. ROBINSON: Yes, and sage
advice. That's true.

And Seeds of Change delivered
what, 24,000 seed packets, and Southern Seeds
Exchange, yes.

Well, we had a lot of seeds
donated, yes, yes. But at any rate, we've had
just a tremendous amount of interest in the
garden, and people walking by, they're just fascinated by this. So we view it as a teachable moment, that it will be just something that we can explain to people what organic is and what it isn't.

Pasture rulemaking, you know, we asked the organic community to please give us substantive comments. So they did, very substantive comments. We got 19,000 comments on this rulemaking.

So we are writing as we go, writing as we analyze, but we really did get some hefty comments this time. We have, I think, I have because I've asked for copies of them, I think, three three-ring binders that are at least two inches thick of the comments. So we got what we asked for this time. So it's pretty significant feedback from the industry. So we expect to publish something later this year.

I've asked Shannon Ellie on my staff to begin work to work on the proposed
rulemaking for original livestock and get that underway.

ACA training, we talked about this at the last meeting, that we want to do Web-based training, and we have sent out an invitation to the ACAs for the all things organic session in Chicago. This is not going to be an NOP A to Z type of training. Instead, we're going to demo some of our training that we've developed so far.

We'll have training sessions on labeling, certification, investigations and complaints. We'll have a general one on labeling, and we'll have one that zooms in a little more in depth on labeling for alcoholic beverages because that's an area that we see continued problems in with TTB, and so we've developed a more detailed how to approve labeling for alcoholic beverages.

And then if we have some more time, later in the afternoon we've got a list of topics that we think continue to be raised...
by ACAs and that we continue to see issues
with dealing with the health and safety
statement that we just put out, fertilizers,
something called "What's in the other 30
percent?" that sort of thing, flavors, and a
few other little fun things that we continue
to see pop up.

We are going to hold an NOP
retreat, program retreat, the first full week
of July, right after the 4th of July holiday.
Because the program is growing, because we
have increased the staff, because we will
increase the staff, because the budget is
increasing, because the spotlight continues to
shine on this program, this program needs to
figure out where it's going, and I really
think a retreat is in order, strategic
planning session for this program.

So it's kind of a Tuesday,
Wednesday, Thursday, maybe, you know, late in
the morning and then go through Thursday
midday. We're going to go off site and have
a facilitated retreat.

I have invited Jeff Moyer to come to part of this retreat as chair of the Board, as I have invited the ARC branch, the Appeals staff, and OGC because I think that we need to reach out and touch all of the folks that we work with, all of the people that we interact with, all of the various staff that we do interact with, maybe not for the entire retreat, but certainly for a good portion of it.

And that leads me to a couple of other things that I think are important, and this thing is really driving me nuts. Let me fix that.

I have discussed this a little bit with my staff, and that is recommendations by the NOSB, and I had asked Valerie to give me a summary of this, and I had discussed this briefly with the Executive Committee of the Board, and I think that they have agreed with me about this.
Since 2002, this Board has made 65 non-material recommendations to the program, and I can tell you in all confidence that we haven't worked on those. I know that we have not worked on those, and I can only imagine that by this time, you know, there must be a certain amount of frustration growing on your side of the table. There is certainly a level of frustration on our side of the table.

It strikes me that, you know, I just have to wonder why are we doing this. Why do we continue to do this? You know, I think maybe what we ought to do is kind of just call a time out here. This may stem from some rational thing in the past, but it doesn't make a lot of sense to me to continue to do this in the future.

We will always work on materials recommendations as a priority. Sunset will come first, and then new materials will come second. That will always be our first priority because that is always the priority,
of course, of the Board and of the industry.

But then it does seem to me that here's 15 of you and now there's, you know, so many of us; it does seem to me to just make logical sense that we should have a working session or some kind of get-together and say, "What do we want to work on? What's important to you? What's important to us? What do you want us to work on?"

Now, you know, we can sit around and say, "Well, how come we haven't done this? And how come we haven't done that?" You know, we can do that, and maybe we should, but once we get beyond that and we want to get to the constructive part of the conversation, you know -- and I'm not saying I have the answers here, but I am saying don't you think we ought to get to that constructive part where we say, you know, "What are your priorities? What are our priorities? What two or three things during the year do you think are the most important and you would like us to pay
attention to?"

I mean, we see work coming from you, but you know, I don't get a sense from you about what is the most important thing. Maybe that's because you're organized by committee, you know. I don't know.

In any event, where I guess I'm going with this is perhaps we should also have a strategic planning session of this Board in concert with the program. I'm not talking about the one we're having in July. I'm saying maybe at a later time this year, and there's a couple of ways we can do it.

A simple one would be to tack it onto an upcoming Board meeting. Another way we could do this, and we did discuss this, because we have a problem with operating in the sunshine and the public may want and may feel strongly that if we all go behind a closed door or something and say, "Well, we're all going to have a strategic planning session with the Board," and the public may say,
"Well, no, you're not. We want to know what the Board is going to work on."

Well, okay. We could do something like we did a couple of years ago with the symposium, the dairy symposium, where we say fine. We'll all go and we're going to have a strategic planning session. The public is free to sit in and observe while we all sit around and work. So nobody is shut out. They can watch us all work, but it's not like a meeting like we're having right now.

So no offense to everybody in the room, and maybe there's a time when you can throw three-by-five cards up and say, "We don't like that idea. We don't want you working on that. You know, bad idea," so that you get some input from the public, but meanwhile everybody is just sitting around working and we have it facilitated or something, right?

Anyway, I'm just tossing this out.

I'm not telling you what to do. I'm just
saying it does bother me and it must bother
you that you keep doing these recommendations
and nothing ever happens. I mean, you must be
getting frustrated.

So that's just my thought. I just
worry about this, and I just think it seems
like we ought to do something more than just
you do this stuff and you feel as though no
one is paying any attention. It's not that
we're not.

We do still have a small standards
staff, by the way. I want to hire more people
there, but until we get more people, we're
busy trying to go after cheaters and
miscalibrators and, as some people out there call
them, Scott laws, and so you know, I just
think we should work on this.

Anyway, on to my next thing. I'm
taking too long.

Nominations for new members.
Katherine is working on those. They are
beginning to trickle in. Please do encourage
people, especially those of you who are so eager to leave, that there might be merit in sitting on this Board. Please encourage people to apply, to volunteer for a thrilling five-year ride on the Board.

Materials dockets. We had one just come back from OGC with six materials on it which will go out as a proposed rule. I think that has gellan gum, tragacanth gum, aqueous potassium silicate, marsala and sherry cooking wines, sodium carbonate, peroxhydrate. I think that's it. I think I've got it.

And a couple of last things. Let's see. Mark wanted me to tell you, and I'm going to butcher this, Mark. So help me out. The ARC Branch just received a peer review for NIST accreditation. Did I say that right?

And last but not least, okay, flavors, fertilizer and renewal dates on certificates. We are going to -- oh, yes. On
the new members, we're calling for two

producers, one retailer, one handler, and one

environmentalist.

Hugh, that must be you. Oh, no.

PARTICIPANT: (Speaking off

microphone.)

MS. RICHARDSON: We've had two

applications and 22 inquiries. Okay. My, all

right, okay.

CHAIRMAN MOYER: Barbara, I think

one of the reasons that we have so few people

throwing their hat in the ring is what you

were just discussing earlier. There is a

sense of frustration at the Board, and we are,
as some of the Board members have mentioned in

our meetings, we are overworked, and when

people from the outside look in and go, "Well,
you're signing up for a lot of work," it does

kind of shrink the pool.

MS. ROBINSON: Well, maybe we can

work that.

CHAIRMAN MOYER: I think if we can
1 streamline that it will make it much better.
2             MS. ROBINSON: Maybe we can work
3 on that.
4             CHAIRMAN MOYER: That's right.
5             MS. ROBINSON: All right.
6 Flavors, fertilizers and renewal dates. We
7 have had a flavor affidavit submitted to us by
8 FEMA, a task force and industry group out
9 there. We want to just go ahead and allow
10 that to be used right now. We're going to
11 approve that.
12             We have always said this. We
13 don't like affidavits. However, we're going
14 to work on a generic affidavit from the
15 program, and we're going to get OMB's approval
16 because we're going to put some toothy little
17 language on it, and we would like to see ACAs
18 start using this, and that little language I'm
19 referring to is something if you've ever been
20 on our Website and you've seen something
21 called the TM-11 form on the export
22 arrangement portion of the NOP Website, up in
the corner of the TM-11 form is some language
that says basically if you are signing this
form and you are falsifying a statement to the
federal government, to an ACA -- I
affectionately refer to it as the hanging
language -- that you can be hung or shot or
put in front a firing squad.

I don't know whether you should
write this down. Anyway, it's where you can't
falsify language to a federal official or you
can be subject to fines and imprisonment.

And so we are going to get that
language approved for affidavits that ACAs
have to use where they have to collect
information of a somewhat voluntary nature on
our behalf in order to make sure that folks
are in compliance with these regulations.

So the flavor affidavit that's
been submitted to us has some variation of
that language, and so we're going to go ahead
and approve that.

The fertilizer recommendation, the
OTA task force has submitted some recommendations to us, and we're giving those very positive consideration right now. We're leaning towards approving those.

Our only concern, and those recommendations, frankly, deal with addressing the 100 yard requirement out there that we've put in place. Our concern on the 100 yard requirement is that if an ACA can verify an auditable plan, an auditable, trace-back plan from a fertilizer manufacturer, they can approve it. If they cannot, the 100 yard physical requirement should stay in place. It's just that simple.

If you can't verify that a company is cheating, don't approve them. I just think it's that simple.

And finally, on renewal dates on certificates, I understand certifying agents want to standardize certificates. We don't have any problem with that. Our only objection is that expiration dates are not
allowed on certificates, but you know, we've seen so many bogus certificates, people saying, "Yes, I'm certified by, you know, PCO." They are not. You know, they've come up with some bogus certificate that they manufactured by PCO, and they're certified by NOFA-New York, but they made one up so that they could go out and, you know -- they said so they could go out and find out milk prices, which had nothing whatsoever to do with finding out milk prices.

You know, we would just as soon ACAs go ahead and put, you know, renewed, last date of renewal, scope of renewal. Go ahead. Put the information on there. Make your certificates standard, but I don't see that we need to standardize your certificate.

If your certificate, you know, you want to have your company on it, that's fine. If you want to have a renewal date on there, the last date of inspection, go ahead. The burden is going to be on you to make sure you
get out there and make sure it's up to date.

I don't have a problem with that.

So like I said, you can't have an expiration date on there, but you may certainly have a renewal date on.

So that's all I have unless you have questions for me.

CHAIRMAN MOYER: Are there any questions? I saw Steve, then Kevin, then Joe.

Thank you.

MEMBER DeMURI: Thanks, Barbara.

Good report.

Can you comment on how things are going with the Canadian equivalency discussions?

MS. ROBINSON: Swimmingly.

They're going very well, Steve. We are confident that -- in fact, we have invited -- we are both planning to meet in June. We agreed in March to our public statement that it was our mutual intention to sign an agreement before the Canadians implement their
1 standards by June 30th.
2
3 MEMBER DeMURI: Thank you.
4
5 CHAIRMAN MOYER: Okay. Kevin.
6
7 MEMBER ENGELBERT: Thank you, Barbara, especially for the update on the
8 pasture role. I can't tell you the
9 frustration that exists out in the dairy
10 community involving that. I'm not going to go
11 into a diatribe about it.
12
13 I also wonder if you could just
14 touch briefly on getting the program to stand
15 on its own two feet I assume is a good thing,
16 but what exactly do you hope to gain from
17 that? Is it something as simple as being able
18 to get your offices all in one spot so you can
19 work more efficiently, or will it give you
20 more clout when you go to other agencies and
21 need work done, or what exactly do you hope to
22 see happen if that does take place?
23
24 MS. ROBINSON: Well, some of it is
25 optics, to use an overused word, I suppose,
26 Kevin. You know, I've come before this Board
now I don't know for how many years, and you
know, as the Deputy Administrator for
Transportation and Marketing, and I'm sure
people are like, "What is that?" You know,
where is that?

And I guess I'm just to the point
where I thought it would be nice if -- and
I've heard this industry ask for many years if
this program could be -- they've asked for a
program to be housed in the Secretary's
office. You've wanted your own office, your
own place in USDA.

And so I guess this is kind of my
way of sort of a happy medium between those to
say that this program should be managed as its
own program within the department. It would
still be in the Ag. Marketing Service, but it
would report to the Administrator of AMS, and
so, I mean, to some extent maybe it is a
little bit optics, but it would be on par
with, say, the dairy programs or livestock and
seed or transportation and marketing, but it
would be the National Organic Program would have its own office in USDA.

Yes, I do think it gives it more recognition, maybe a little more clout. It is going to continue to attract resources down the road. If the resources that are authorized by the farm bill continue to be appropriated, then I just think this program should have its own address.

CHAIRMAN MOYER: Kevin, did you have a follow-up?

MEMBER ENGELBERT: Yes. Would that be something that you would like this Board or the public to take part in encouraging that to happen, or is this something strictly internal in USDA that has to take place?

MS. ROBINSON: I don't think that the Board needs to do anything at this time about it. I think it is being given very serious consideration in the department. I think you have leadership in the department
now that welcomes these kinds of ideas. So I don't think that you have to do anything about it.

CHAIRMAN MOYER: Thank you, Barbara.

The Chair recognizes Joe.

MEMBER SMILLIE: Thank you, Barbara for the update.

The Canadian news is definitely interesting. A lot of people are hanging. It's getting close.

MS. ROBINSON: For about two months.

MEMBER SMILLIE: I know. Labels take a long time to create, but that is good news and hopefully that will continue.

Also, the flavor affidavit, I can't tell you how important that is. It has become a real issue with certification, and I think your approach on, you know, tough language when someone signs an affidavit is a valid compromise because we do need affidavits
because, once again, they are conventional materials, not organic materials.

So I think that that will work. I look forward to getting that out on the street as soon as possible.

As far as renewal dates and expiration of certificates, I understand that you're hemmed in by the language of the regulation and the enabling legislation on expiration dates, and that, you know, they can only be surrendered, voluntary surrender, revoked or suspended, and that we'll live with.

It is a problem with renewals because a lot of times some people have noncompliances, and they don't get their certificate until they rectify those noncompliances, and other people are trading in those materials.

So it does create a problem, but we can deal with it, and again, working together between the ACAs and the program we
can iron out those difficulties and educate all of our certified clients as to what it means because they want the up to date certificate, and they say, "No, we can't accept it until we get an up to date certificate."

And we have to read them, no, it's still valid, you know. So it's a problem, but we'll deal with it. It's not a huge problem, but hopefully with the education we'll start to solve it so that the certified entities could understand what renewal means.

As far as standardization, it's not an issue of who's name is on the top. There's some real basic issues, and I think our recommendation, I would urge you to just take another look at it because there's some core information that we need to be standardized in the certificate.

For example, there is no, from what I understood consistently from the program, that the certificate does not have to
say in accordance with National Organic
Program regulations. They all now are
starting to say that because many of us won't
accept it unless they say that, but we would
like to see that enshrined formally, that the
certificate must say in compliance with the
program. That's a small item.

Then the other issue is, you know,
that we tackled as a group is that the
certificate could say grain. It could say
corn. It could say blue corn, yellow corn,
feed corn. You know, we do need the program
to give guidance to the ACAs as to just
ballpark what you want to see on that
certificate because there's a lot of
frustration really because some sort of filers
will just say, you know, this company is
certified for grain, you know. Then other
people will get more specific. Other people
want to get, in my opinion, too specific and
say Pioneer 365A.

But we need something to get
people a little closer together. Now, maybe that can happen through the work of the ACA self-discipline and that, but we'd like you to take another look at that document to see if we could try and get towards a more standardized certificate from your point of view also, what you would like to see as core information on the certificate. How specific is the listing?

CHAIRMAN MOYER: Thank you, Joe.

MS. ROBINSON: Yes, that's fair enough.

CHAIRMAN MOYER: Yes. Hopefully the program can take that advice. I think it's great advice.

Hugh and then Bea.

MEMBER KARREMAN: Thanks for your update, Barbara.

I just wanted to add something or ask something totally different from what you've been talking about. Livestock Committee and the Executive Board, I think,
knows, but we've been in conversation with the NOP about the topic of vaccines and how some certifiers are starting to look at vaccines differently than has been done for the last seven years since the program was officially started.

I was wondering if you have any official statement on what the program might be thinking about as far as vaccines to prevent disease in organic livestock.

MS. ROBINSON: Are we going to take this up as a discussion item during the meeting?

MEMBER KARREMAN: I don't think it's on the agenda for that.

CHAIRMAN MOYER: It is not on the agenda.

MEMBER KARREMAN: That's why I wanted to ask you about it because --

CHAIRMAN MOYER: It did not come up in our discussions until after the agenda was approved and posted.
MS. ROBINSON: Okay. You know, I want to work with -- yes, we do want to make a statement about that, but I'll tell you what. Let me work with Rick because I don't have something written down as well. Let me make sure that I've got something because I don't want to misspeak. Okay? Because we have discussed this, and I want to make it clear and clearly state what our position is on vaccines. Okay?

So I will do that, but I want to get with Rick and you, and then I'll make a public statement about that.

And before --

CHAIRMAN MOYER: Do you know when you'll be ready to make that statement, Barbara?

MR. ROBINSON: Yes. Well, no. I mean, during the meeting some time.

CHAIRMAN MOYER: It will be today?

I'm just wondering for the members.

MS. ROBINSON: Yes, we can do it
today.

CHAIRMAN MOYER: Thank you.

MS. ROBINSON: And before I

forget, two other things. Of course, some of

you are going to meet with the Science and

Tech folks after the meeting. Jeff, neither

one of us mentioned that, to get together to

discuss to improve the TAP review process,

which is great.

And we are working on a petition

substance database, trying to improve that.

We've got a statement of work with Science and

Tech. They are trying to develop the database

for us and improve that because I know I went

on there and say, "Oh, God, this is terrible."

So we are working to improve that as well.

CHAIRMAN MOYER: Thank you for

bringing that up, Barbara. I should have

mentioned that, that the Board was invited to

sit down and meet with the program and with

the Office of Science and Technology to review

the process and procedures that we'll be using
for TAPs or technical reviews that we've been
going from that office.

There are some concerns that we
need to go over and address, and we're going
to be meeting on Thursday with that group.

Thank you.

Bea, then Julie.

MEMBER JAMES: Thank you for the
update, Barbara. I'm really encouraged to
hear you bring up kind of the pink elephant in
the room, which is that the Board is weighted
down with a lot of work and that working on
prioritization would help us all make sure
that we're doing thoughtful work.

I just wanted to comment that I
believe that slowing down and doing thoughtful
work that is applicable will go farther than
racing to a finish line weighted down with too
many recommendations that we can't really
implement.

And the one thing I wanted to
point out is that after the next meeting, five
of us will be going off, and if there's any
way to have that meeting about working on a
way of prioritizing, I don't want to speak for
my other fellow Board members, but it seems
like it would be valuable to take the wisdom
of the people who have been on the Board and
know how much work there is to do.

MS. ROBINSON: I agree.

CHAIRMAN MOYER: Thank you, Bea.

The Board recognizes Julie.

SECRETARY WEISMAN: Yes. I
actually, going back to the issue about the
meeting with S&T and the going over the
technical review process, I did want to
mention that in public comments before this
meeting as before many meetings, a number of
people had part of their comments that were
directed to how the technical reviews either
are in regards to various issues that we are
working on, specific comments and suggestions
about how those could be addressed and
clarified through the technical review
process, and I wanted people who made such comments to know that we have, you know, collected all of those, and we do intend to incorporate that as well as our own observations and working with the technical review into that meeting.

So I think I've said enough.

CHAIRMAN MOYER: Thank you, Julie.

That's correct, yes.

Any other questions for the program?

(No response.)

CHAIRMAN MOYER: Hearing none, thank you, Dr. Robinson. I appreciate that.

Next on our agenda we have Dan, Materials Committee or materials review process update, if you're ready for that.

MEMBER GIACOMINI: If Valerie is ready for that, thank you, Mr. Chairman.

Materials review update, when I started this, was asked to do this about two years ago, it had been a number of years since...
it had been done at a meeting to review this process. It has been at every meeting sine then.

So if at any point in time people are starting to get bored with it and want to break, just let us know.

Next slide, please.

What we'll review today is a national list of allowed and permitted substances, the petition, and sunset review items, the material review process, the national list criteria, sunset review criteria, an overview of the Materials Working Group, and some final notes.

next slide.

For the national list of allowed and permitted substances, Section 205.601 for crops, are synthetic substances allowed for use in organic crop production, with Section 602 being non-synthetic substances prohibited for use in organic crop production.

Livestock, 603, synthetic
substances allowed for use in organic livestock production; 604, non-synthetic substances prohibited.

Section 605 for handling, non-agricultural, non-organic substances allowed as ingredients in or on processed products labeled as organic or made with organic specific ingredient or food groups: (a) non-synthetics allowed and (b) synthetics allowed.

Section 606, non-organically produced agricultural products allowed as ingredients in or on processed products labeled as organic. Listed non-organically produced agricultural products may be used as ingredients in or on processed products labeled as organic only in accordance with any restrictions specified in this section and only when the product is not commercially available in organic form.

Petition and sunset review items under consideration at this time. Petitioned items for this meeting, spring 2009 meeting,
for 601 of crops, isoparaffinic hydrocarbon, sulfurous acid, and a parasitic acid and list for inerts are two items for discussion only.

Section 603 for livestock, propionic acid and injected use of vitamins and minerals.

Section 605, propionic acid, sodium chloride acidified, propane, and Lecithin bleached petition for removal.

And 606, chicory root, red corn color, Murr essential oil, wheat germ, and another petition to remove Lecithin fluid unbleached.

Other petitioned items that are under review at this time, they have been there in the technical review process or we have received them too late to deal with at this meeting. Tetramethyl -- I won't even try these. You can just read those, folks.

Six, oh, one, 603, clarification on vaccines; 605, glucosamine HCl and a pectin non-aminated which has also been under TAP
review, TR, technical review.

Some additional items of petitioned substances, Mr. Bob Pooler is now the terminator. The petition for potassium phosphate for 603 for livestock after dealing back and forth with the petitioner, I'm sure, over a significant period of time, that petition was determined to be terminated.

Deferred petitions by the petitioners which note no further action at this time are sulfuric acid and yeast.

We are beginning to look at items for 2011 for sunset there under this meeting for discussion, 602 items for 601, nothing for 603. Six, oh, five (a) has three substances listed, and a number for 605(b) and none for 606.

The material review process, the petition process is under the guidelines to either add or delete substances from the national list according to this Federal Register notice.
The material review process is designed for adding new listings to the national list, changing annotations of existing listings already on the national list, or removing items currently on the national list.

The material review process is a minimum -- and that's very minimum, ideal situation which has never and never will be seen -- but an absolute minimum time frame with the national list material review was 145 days, and that does not include rulemaking. That is conditional on completeness of the petition on initial submission, manpower within the specific reviewing committees and the Board overall, time frame relative to the NOSB public meetings on when this substance petition is received, and completion and review of technical reviews.

The material review process day one through 14-plus -- and that plus is significant in later slide -- the petition is
received by the NOP and reviewed for completeness. Issues determined to not be complete and the NOP contacts the petitioner to complete the petition, and under termination of completeness by the NOP, the petition is forwarded to the NOSB materials chairperson.

Day 14 through 45, so essentially that is saying for a minimum of the next 30 days after completion of the previous slide. So if the previous slide takes six months, there is no way that we can complete this next session in 45 days. So it's 30 days from when this -- a minimum of 35 days from when this is received.

The material chairperson forwards the petition to the chairperson of the designated NOSB committee. The petition is reevaluated for completeness to determine if it will be forwarded for an external technical review, and specific issues and questions which the committee wishes addressed in the
technical review are submitted to the NOP.

You jump now to the 60 days prior to the NOSB meeting where technical reviews are sent to the NOSB. TAP and technical reviews are posted on the NOP Website for review and public comment. Committee recommendations are posted for public comment, and 30-day period prior to the meeting where public comment is accepted by the NOP and posted on the Website.

At the NOSB meeting, committee recommendations are submitted. Further comments are accepted from the public, and all public comments are taken into consideration, and action is taken by the full NOPSB Board regarding committee recommendations.

As a final note, during the entire process, all communication between petitioners and the NOSB should go through the NOP office.

National list criteria as according to the Organic Foods Production Act of 1990, as amended, and the NOP regulations,
Section 205.600. In general, item number one, the potential of each substance for detrimental chemical interactions with other materials used in organic farming systems.

Number two, the toxicity and mode of action of the substance and of its breakdown products of any contaminants and their persistence in areas of concentration in the environment.

Three, the probability of environmental contamination during manufacture, use, misuse, or disposal of such substances.

Four, the effect of the substance on human health.

Five, the effect of the substance on biological and chemical interactions in the agroecosystem, including the physiological, including the physiological effects of the substance on soil organisms, including the salt index and the solubility of the soil crops and livestock.
Six, the alternatives to using the substance in terms of practices and other available materials.

And, seven, compatibility with a system of sustainable agriculture, according to the Federal Register docket there, and if anyone would like to reference that, they are certainly welcome.

National list criteria for processing aid or adjuvants, the synthetic substance cannot be produced from a natural source, and there is no organic substitute.

Two, the substance manufacture, use and disposal do not have adverse effects on the environment and are done in a manner compatible with organic handling.

Three, the nutritional quality of the food is maintained when the substance is used, and the substance itself or its breakdown products do not have an adverse effect on human health as defined by applicable federal regulations.
Four, the substance's primary use is not as a preservative or to recreate or improve flavors, textures, colors, nutritive value lost during processing, except where the replacement of nutrients is required by law.

Five, the substance is listed as generally recognized as safe by the FDA when used in accordance with the FDA's good manufacturing practices and contains no residues or heavy metal or other contaminants in excess of tolerance set by FDA.

And, six, the substance is essential for the handling of organically produced agricultural products.

National list criteria for Section 606, agricultural and potentially commercially unavailable. The NOSB considers why the substance should be permitted in the production or handling of an organic product.

The current industry information regarding availability and history of unavailability of an organic form in the appropriate form,
quality and quantity, and this information includes, but is not limited to, regions of production, including factors such as climate and number of regions; the number of suppliers and amount produced; current and historical supplies related to weather events, such as hurricanes, floods, droughts, that may temporarily halt production or destroy crops or supplies; trade related events, such as evidence of hoarding, war, trade barriers or civil unrest that may temporarily restrict supplies; and other issues which may be present which may present a challenge to a consistent supply.

The sunset provision criteria. The sunset provision, according to OFPA is no exemption, which is the listing on the national list, or prohibition contained in the national list shall be valid unless the National Organics Standards Board has reviewed such exemption or prohibition as provided in this section within five years of each
exemption or prohibition being adopted or reviewed, and the Secretary has renewed such exemption for prohibition.

The sunset review criteria for exemptions' national listings were accepted because the evidence available showed the substances were found not harmful to human health or the environment. Substances were necessary because of the unavailability of wholly non-synthetic alternatives, and the substances were consistent and compatible with organic practices.

The sunset review criteria includes the opportunity to revisit the continued need for the exemption. If the review finds that the initial conditions still exist, the regulation is renewed for an additional period of time.

Sunset review is to determine if conditions relevant to the acceptance of the exemption have changed. The sunset review process is not to add a new substance to the
1 national list. It is not to change an
2 existing annotation, and it is not the time to
3 reinterpret unchanged information and
4 conditions. These issues are dealt with in
5 the petition process.
6
7 In working with the Materials
8 Working Group, the Materials Working Group was
9 formed to help the NOSB resolve the issues,
10 questions and confusion regarding the
11 classification and the definition of
12 materials. It includes members from across
13 the organic industry.
14
15 In the spring and fall '08
16 meetings, they issued reports to this body
17 regarding questions on the ag/non-ag question.
18 At this meeting they will issue a report on
19 the synthetic/non-synthetic questions, and
20 which will hopefully allow this Board for the
21 fall '09 meeting to take action on hopefully
22 as many of these recommendations as possible.
23
24 A final note. Public comment is
25 handled via www.regulations.gov. It is to
bring processing of public comment to an equal level across agencies. This process sets a deadline for public comment posted two weeks prior to public meetings.

However, we want to recognize that all public comments received by the NOP is made available to NOSB members for review in advance of the respective vote whenever possible.

And as a final note, again, posting the relevant Websites for the NOP, the NOSB and for the posting of public comment.

Thank you, Mr. Chairman. Are there any questions?

CHAIRMAN MOYER: Are there any questions from the Board to Dan regarding his report and update on materials?

(No response.)

CHAIRMAN MOYER: Okay. There being none, unless the Board has a problem, Richard Matthews would like to add an addendum to the program report dealing with the comment
on vaccines. Any problems from the Board?

(No response.)

CHAIRMAN MOYER: Richard, the mic is yours if you care to take it.

MR. MATTHEWS: This deals with the issue that was raised by Hugh. For a minute there I had a brain freeze. I couldn't remember your name, Hugh.

Two, oh, five, one, oh, five addresses the fact that excluded methods are prohibited under the National Organic Program, and in there it talks about except for vaccines, but it then goes on to say provided that the vaccines are approved in accordance with 205.600(a).

We've looked at this because it has come to our attention that at this point some certifying agents are starting to look closer at vaccines today than they did at any other time since the program was implemented, and some vaccines that have historically been allowed under the program are suddenly being
called into question.

I think there's a multitude of ways that this could be addressed. One of the ways that this could be addressed would be to amend Section 105 to take out the language that occurs after "vaccine." So one option would be where it currently says -- I lost my spot again already. The pages flipped on themselves -- "excluded methods except for vaccines," that could be where the period goes. That would take a recommendation from the Board.

So I would suggest that the Board take that into consideration as to whether or not they want to amend the regulations at 205.105 to allow all vaccines regardless of how they're manufactured.

Quite frankly, for the last seven years, that's how it has been.

Now, just for a little history, the preamble to the final rule addresses 205.105(a)(6) as to how it was structured, and
it basically said, as I said earlier, that if you had a vaccine that was created using an excluded method it was okay as long as the material was reviewed and added to the national list.

And that was done because we had no information as to how prevalent the use of vaccines was -- I mean how prevalent the use of excluded methods was in the production of vaccines. We are no more knowledgeable on that today than we were back when the regulation was written in 2000.

And so the question is: do you want to allow what has been in place really since these regulations were written, or do you now want to start putting extra scrutiny on materials that historically have been allowed under the program, which is exactly what is happening from some certifying agents?

So that's the issue. I mean, do you want us reviewing or do you want to review every vaccine or do you want to amend 105?
CHAIRMAN MOYER: Thank you, Richard.

If you'd stay by the mic for a moment, I believe there are some questions. Hugh.

MEMBER KARREMAN: Thanks a lot, Richard. I think as Chair of Livestock Committee I will take that suggestion to amend 105(e) and work with that within the committee and then hopefully bring it up for a recommendation as vote at the November meeting.

CHAIRMAN MOYER: Bea.

MEMBER JAMES: I just want your opinion. Hypothetically speaking, let's say we had all of the staff we needed; we had all the resources that we needed. If we did, would this part where it says "provided that the vaccines are approved in accordance with 205.600" stay?

MR. MATTHEWS: I think that's up to the Board. I mean, right now it's in there
and that would be the requirement. I personally, if you're asking for my personal opinion, I have a problem with suddenly telling farmers that vaccines that they've been allowed to use for all these years are suddenly no longer good enough. I mean because they've been good enough up to this date, and so why all of a sudden are they no good? Well, it's because somebody discovered that it was made through an excluded method.

We've got to remember that vaccines are there for our safety, as well as the safety of the animals, and so the statute itself says vaccines are allowed. It doesn't say unless they're made using an excluded method. It says vaccines are allowed.

It was a reaction to GMOs that created the exclusion. So the question that this body needs to determine is how important is that exclusion. I mean, up to this point it apparently has not been important because nobody is worried about it, and suddenly we've
got some ACAs that are cracking the whip on it.

CHAIRMAN MOYER: Richard, I think the other issue that the Livestock Committee was looking for some guidance from the program on is in the interim between now and when the Livestock Committee has a chance to act on this, is there some sort of language or stay that can be put in place so that farmers can continue to do what they have been doing at least until November when we have a vote on something. Otherwise ACAs could immediately close the door on that.

MR. MATTHEWS: Yes, we've talked about that as well, and it would be a directive that would go out to the ACAs. You can probably call it an action alert, that would tell them to not start disqualifying things that have been previously approved and to allow the rulemaking process to run its course.

CHAIRMAN MOYER: Am I to
I understand then that that's an official statement and that that will be happening for the purposes of the ACAs in the room?

MR. MATTHEWS: Barbara is shaking her head yes. Yes, it will happen.

CHAIRMAN MOYER: Okay. Thank you for that.

Hugh, you had another comment.

MEMBER KARREMAN: No, just thank you very much for hitting the nail on the head and describing the situation as it is, and we'll be working on it from our part, too.

CHAIRMAN MOYER: Any other questions from the Board for Richard Matthews?

(No response.)

CHAIRMAN MOYER: Thank you, Richard.

We're now scheduled to take a brief break, and we will take a 15 minute break. When we come back, we will be getting a status report from the Methionine Task Force, and then entering into public comment.
1 If you're signed up, please be
2 here and be prepared to speak at the assigned
3 time.
4 Thank you.
5 (Whereupon, the above-entitled
6 matter
7 went off the record at 10:30 a.m.
8 and resumed at 10:49 a.m.)
9 CHAIRMAN MOYER: If folks in the
10 back of the room could please quiet down, I
11 would appreciate that.
12 Before we start with public
13 comment, I am going to take the time to read
14 the policy manual's handbook on public comment
15 because it's relevant and pertinent. I'm just
16 going to read it exactly as it comes from our
17 handbook.
18 All persons wishing to comment at
19 the National Organic Standards Board meeting
20 during public comment period must sign up in
21 advance per the instructions in the Federal
22 Register notice for the meeting. All
presenters are encouraged to submit public comment in writing according to the Federal Register notice.

Advanced submissions allow NOSB member the opportunity to read comments in advance electronically and decrease the need for paper copies to be distributed during the meeting.

Persons will be called upon to speak in the order they sign up. Persons called upon who are absent from the room could potentially miss their opportunity for public comment.

We do have a lot of public comment over the next few days, and your consideration to our timeliness is important to us.

Each person will be given five minutes to speak unless otherwise indicated by the chair. Persons must give their names, affiliation for the record at the beginning of the public comment period.

A person may submit a written
proxy to the National Organic Program or the National Organic Standards Board requesting that another person speak on his or her behalf. No persons will be allowed to speak during the public comment period for more than ten minutes unless otherwise indicated by the chair.

Individuals providing public comment will refrain from any personal attacks or other remark that otherwise impugn the character of any individual, and the Chair will not tolerate that either.

The National Organic Standards Board will attempt to accommodate all persons requesting public comment time. However, persons requesting time after the closing date of the meeting notice or during last minute sign-ups at the meeting will be placed on a waiting list and will be considered at the discretion of the Board Chair depending on availability of time.

Similarly, persons who have signed
up to address the National Organic Standards Board for their five minute slot and have also served as a proxy for another person will be placed on a waiting list if they wish to speak for a third time on the same topic and will be considered at the discretion of the Board Chair, depending on availability of time. This should allow more members from the public the time they need to present.

Members of the public are asked to define clearly and succinctly the issues they wish to present before the Board. This will give NOSB Board members a comprehensible understanding of the speaker's concerns.

And finally, members of the public should be considerate about speaking more than once on the same topic to allow more members of the public the opportunity to speak.

Julie will be your timekeeper. We will be keeping track of the time.

I also want to remind people to please turn off your cell phones. It is
disruptive. I don't think we should have to
mention that in 2009, but sometimes it doesn't
hurt.

MEMBER DAVIS: Mr. Chair.

CHAIRMAN MOYER: Gerry.

MEMBER DAVIS: A quick suggestion
on handling that microphone over there. I
changed it so for shorter or taller people,
rather than pull down on it, which over time
causes it to not want to stay in position,
just spin the cross-arm. Just rotate it,
which will cause the mic to go up or down
versus your height.

CHAIRMAN MOYER: A little
housekeeping. Thank you. Gerry knows his
microphones because I don't. So just take the
microphone and turn it downwards. Rotate it
in its socket. Don't pull the whole thing
down.

Thank you, Gerry. Appreciate
that. It should help things along.

The Board would now like to call
the Methionine Task Force, Dave Martinelli, to
come to microphone, please, for an update.

MR. MARTINELLI: Dave Martinelli,
Coleman Natural Foods and chairing the
Methionine Task Force.

I'd also like to introduce. We
have another task force member here today, Mel
Gehman with Heritage Poultry.

I'm going to be doing the
presentation and Mel will come up for the Q&A
period if there's any specific questions. His
background is much more on the layer side,
whereas our company is broilers.

If you go to the next slide,
Valerie.

I've only got ten minutes. I've
got my own time and a proxy for an additional
five minutes and a lot of material to try to
cover. So I apologize in advance. I'm going
to move through this very quickly.

But just to kind of set the stage,
we had promised and committed to you all that
we would give you regular updates on our progress on alternatives to synthetic methionine, whether it's high methionine corn or naturally produced methionine, and the results of our feeding trials.

So today what we've got is just a quick reminder of why we need methionine and an established report on a variety of alternatives, some information on three different feeding trials and then kind of a looking ahead at what's coming at us in the next year or so with methionine.

Again, a reminder that methionine is an essential nutrient in organic poultry production. It's the first limiting amino acid. As we talked about at the last meeting, we feed supplemental synthetic methionine to cover both the methionine deficiencies in the diet as well as to make up for cystine deficiencies, and the total inclusion rate of synthetic methionine is extremely small. It's about one-quarter of one percent, anywhere
from two to five pounds per ton of feed.

The majority of the bird's needs are met through the grains in their diet. About 70 percent of their methionine and cystine needs are met through the other elements of the diet.

Dr. Walter Goldstein is not going to be here to present today. He's with the Michael Fields Agricultural Institute. We've had a number of dialogues with him back and forth, and I think this is important to try to understand.

There's basically three different types of corn seed that he is working on. There is the soft endosperm, flowery 2, and the hard endosperm, both of which he discussed at the last meeting.

The flowery 2 shows a lot of promise from a methionine content perspective, but there have been some issues in terms of yield drag and high moisture levels in the corn from an agronomic perspective, and those
yields are running about 35 percent less than typical organic corn yields.

We did have a planting project with this corn in Pennsylvania that only yielded about 50 bushels to the acre. So there's still some pretty significant yield drag issues, and obviously farmers fairly enough need to be compensated for any yield loss they've got. So the price premium gets borne by the feed user, and it becomes really prohibitive.

The hard endosperm varieties actually have a less severe yield drag, approximately 20 percent based on the five-year trials. At their best the methionine levels are very comparable to the soft endosperm flowery 2, but there's a tremendous amount of variation in the methionine levels so you don't tend to know with as much specificity how much methionine you've got in the hard endosperm varieties.
Agricultural Institute has come across is a new strain of the soft endosperm that is not a flowery 2. It's an opaque variety. This is very preliminary data, but it would appear that they've got similar consistent methionine levels to the flowery 2 with the yield characteristics more of the hard endosperm. So it's kind of a good balance between the two, and we'll get back to that in a little bit.

I've outlined for you all what we're working on currently in 2009. There's a couple different fronts. The first is the seed corn front. The Michael Fields group is working on 18 different test sites where they're going to be working on 15 different hybrids for planting in the U.S. in the Midwest. They're working a variety of seed companies and universities to get this done. Separately, the Methionine Task Force and the Michael Fields group is partnering with a group of farmers in Indiana
to do seed multiplication trials with seed that we've generated in both Chile and Hawaii over the last two years. And the idea is that they'll do seed multiplication with the seed stock, and then the task force will get back some of the hybrids, the more promising hybrids for further seed multiplication and development.

On the feed corn side -- next slide, please -- we are working on a partnership with the Michael Fields group and also SunOpta to get 90 acres of high methionine corn planted for feeding trials in the Midwest. We've identified growers. We've agreed upon a price premium, and the idea is that the task force will buy this corn back from those farmers and then we've got some different test flocks that we'll be able to run in the fall on a more significant scale feeding high methionine corn.

There's also one of the task force members, Herbrucks Poultry Farms, that have
planted 18 acres of high methionine corn or
are planning on planting 18 acres of high
methionine corn for feeding trials this year
as well.

Lastly, I mentioned about the
opaque variety of corn offering significant
potential. So we're strategizing right now
with the Michael Fields group about doing some
over winter trials in the southern hemisphere
or Hawaii again to try to get seed
multiplication going of this.

Ideally, we'd like to see a little
more field test results before we went to seed
multiplication, but because of the time line
we are under we feel we need to move pretty
aggressively on this, and to the extent we've
seen some very promising results in the lab,
we think this is something we need to put some
effort and time toward and try to jump start
the process a little bit about bringing this
up to a commercial scale.

Segueing away from high methionine
corn into some of the other alternatives, we continue to look at naturally produced methionine. There's really two different avenues we're going down there. We've engaged with the University of Arkansas, Dr. Steve Ricke, on a pilot project to try to find bacteria that produce natural methionine and that we can replicate this on a commercial scale. They are just in the first phase of a three phase research project but have already talked to Dr. Ricke about having him present to you all in the fall and you can hear first hand on what progress they're making on that front.

There is some private party interest in naturally produced methionine as well. We've had one private party in particular that continually expresses to us that they have a solution, but we've been unable to get any specifics about specs or cost or time line, and these are the things
that really make us feel it's viable.

So we're very open to that, but we just can't seem to get a whole lot of traction with kind of the leading party in this.

We have received some information on one potential promising product, an alfalfa nutrient concentrate. I actually believe these folks are presenting here today as well. Much higher methionine levels than soybean meal, which is the primary source of methionine in the diet currently, but when you look at methionine plus cystine, it actually comes out very close. You can see 1.6 percent methionine plus cystine versus 1.39 percent for soybean meal.

So I'm not sure from a methionine plus cystine perspective it really gives us what we need. We had some comments back from our nutritionist, and the whole comment is there, but I'll just read the part in red highlight. Really there's very little difference with the methionine plus cystine
levels. So that still becomes a limiting fact at least with respect to broiler diets.

There is some calcium benefit in this which doesn't really help broilers, but could be of some interest to egg producers. I'm not sure it really solves the methionine issue, but just as an overall dietary inclusion point, it might make some sense.

This product is not yet approved for organic production, but I understand these folks are working with OMRI to get that approval, and not currently produced in the U.S., but again, I believe they're working on that as well.

There was also some discussion about maybe hydrolizing grains to isolate methionine. It doesn't appear currently.

Again, we ran this by some of our nutritionists that we work with in the task force. It does not appear that we're able to cleave off the particular amino acid strains.

At present it seems to be more of enzymatic
solution here than really doing anything with hydrolizing grains.

We'll continue to look at this, but the initial feedback from nutritionists was not particularly promising that we could get a lot of value out of it.

Next slide, please.

So I'm going to move into the trials that we've been running. I unfortunately don't have a lot of information on this trial. I just received this literally over the weekend, but there was an Italian heritage breed, a red-feathered bird broiler trial done in Pennsylvania.

Just to give you a little bit of background, these birds typically are raised for about ten weeks before they're brought to market. They ran a group of no methionine birds, no added synthetic methionine in the diet, and they waited an additional two weeks before bringing the birds in, and they were still not -- even at 12 weeks, they really
didn't have the right muscle structure, and
they weren't really meaty.

And I only raise the question that
relative to some of the animal welfare
standards we're going to be looking at that we
may have some issues with this.

Five minutes or ten? On the full
ten? Okay. I'll to move as quickly as I can
here.

The next slide, this is the layer
trial that you saw last time. These birds are
now at 50 weeks old. In the interest of time
we'll kind of keep moving along here.

There's basically no methionine
group, no added methionine and a control
group. You can see the production levels are
actually relatively close. The no methionine
group is only about five points behind the
control group. So we're seeing some loss in
production, but it might not be as significant
as you would think.

But I think the next slide really
1 illustrates the point that even the control
2 group is significantly lagging what you would
3 normally expect for organic hens to produce at
4 this point in their cycle.

      Normally you'd have about 192 eggs
6 produced at the 50 week mark. The control
7 group is only at 135, and the no methionine
8 group is at 123. So the problem is we don't
9 know if it's a problem with the environment or
10 the chick quality or whatever. We do know
11 they're lagging significantly.
12
13 I'm happy to take any questions
14 about some additional things I can inform you
15 on for layer trials if you would be
16 interested.

16 CHAIRMAN MOYER: Are there any
17 questions or comments from the Board?
18
19 MEMBER SMILLIE: Just a point of
20 order. Since this is the working group that
21 we commissioned, are they held to the ten
22 minute rule on this, Jeff? I mean, it's not
22 --
CHAIRMAN MOYER: That was a decision that the administrative team made early on. If we want to allow Dave Martinelli, certainly it's the Board's discretion to do that.

Opinions? Hugh.

MEMBER KARREMAN: If possible, I would move that we allow him to keep going with his presentation if it's not more than, let's say, five more minutes.

SECRETARY WEISMAN: I just want to ask a question. But the next two speakers, are they also part of your presentation or are they completely independent of you?

MR. MARTINELLI: I know Dr. Goldstein is not going to be here. The other two folks are separate.

SECRETARY WEISMAN: Okay.

CHAIRMAN MOYER: I think it's the Board's opinion that you continue, please.

MR. MARTINELLI: Okay. I'll move as quickly as I can.
CHAIRMAN MOYER: We'll set the clock for another five minutes and hopefully that will be enough.

MR. MARTINELLI: Okay. That's great.

CHAIRMAN MOYER: Thank you.

MR. MARTINELLI: It will easily be done by then.

As you can see, there's some really good stuff here though. There's no significant differences in mortality between the two groups, which I think is a positive. No signs of cannibalism, which we, frankly, expected to find. Feathering looks very good in both groups. No differences in the egg weights, which is another surprising find. That may be somewhat a function of the breed that was used, the high lines. And no noticeable ammonia levels, which again was something we thought we might run into. That may be a function of where the trials were held since they were in Southern California.
You may have different issues in the Northeast if you're trying to run those trials.

So, again, just a quick synopsis of the layer trials: 105 percent feed cost; 91 percent egg production relative to the control group and only 65 percent of normal. The birds are exhibiting some kind of strange nervous behavior, but that's not really quantifiable. The key is that we need to do more trials. We need to get some replication and try to understand why the control group was off so significantly as well as the new methionine group.

I also mentioned that we need -- and you brought this up last time -- that we need trials with organic feed and outdoor access. So there is a new trial that just started with Herbrucks that's identified here. They're doing it in conjunction with Michigan State and a professor emeritus from Clemson University, Woody Williams.

They raised the birds with
methionine in the diet, but they're in the egg production cycle with no synthetic methionine in the diet. They are going to do some pullet trials, but they literally just kind of pulled this together after the last meeting.

I think the important thing is these birds are on organic feed. They do have access to the outdoors, and actually they have extensive outdoor access, three times kind of the normal standard for what Herbrucks runs.

The other important thing is we will be collecting behavioral data, quantifiable behavioral data on these flocks to see if there's any difference in the birds that don't have methionine in their diet.

We are working with Herbrucks in trying to get some additional test flocks going using fish meal as well.

Next slide, please.

I just wanted to point out there's a little bit of noise that's come to our attention out of the EU. They currently have
a standard that allows them to feed ten percent non-organic feed in the diet, and they've been satisfying the methionine requirements in the birds by using fish meal and corn gluten meal, and there's already some discussion in the U.K. particularly about as they ratchet down from a ten percent allowance to a five percent allowance and eventually phase out of non-organic feed ingredients whether they're going to have a problem satisfying the nutritional needs of the birds without methionine.

And basically Dr. Cliff Nixie from the British Poultry Council presented in February at a symposium in Europe and indicated that already you've got an imbalanced diet. So he's got some real concerns about whether as Europe goes through the phase-down, whether they're going to be able to meet the nutritional needs of the birds.

So just looking ahead, this is
kind of what's on our plate in terms of we've
got to get some additional fund raising done.
We've got to work on some additional trial
designs, monitoring the corn planting progress
both here and in the southern hemisphere, and
then also try to get more specifics around
some of the research that's been done in the
University of Arkansas. They naturally
produce methionine and ever mindful of the
fact that we're 17 months away and the clock
is ticking towards our 2010 deadline.
So I think that's within my five
minutes, and I'll take any questions.
CHAIRMAN MOYER: It was. Thank
you very much, Dave. We appreciate that.
A question from Kevin.
MEMBER ENGELBERT: Thank you, Mr.
Martinelli. Would you please explain on that
last chart you spoke of three times the
outdoor access? Would you describe exactly
what the outdoor access was, the area, how
many birds, you know, what stage of their life
MR. MARTINELLI: I'd have to get back to you on that. That's Herbert's trial, and I just don't have the specifics, but I could certainly get that and provide it for the group.

CHAIRMAN MOYER: Thank you, Kevin.

Dan.

MEMBER GIACOMINI: Thanks, Dave.

Just a couple of things. Again, it is not a sunset. There is a cutoff date, and while that date is 70 months away, you're going to need to start working on that petition again soon.

The second thing is I don't think I'm speaking too far out of turn with the members of the Board that I've talked to where we commend you for the work you've been doing, and we encourage you to move ahead on that, but I think the ideal, ultimate achievement of what you're trying to do is probably well out into the future of really trying to put
rations together without the methionine.

So what I would ask you to do is I think in those conversations, again, a full blanket, free wheeling use of synthetic methionine in the next go-round is probably not as likely as you've had before, and so next time come to us with a lot more data on the amount of synthetic methionine that's being used in diets.

You've presented with us now for two meetings in a row that you want it viewed as synthetic methionine plus cystine. Present it to us in that format if that's the way you want us to look at and give us something to start being able to start putting a fence around.

MR. MARTINELLI: Would there be an opportunity to work directly with the Livestock Committee on that, too? I mean, how would we go about engaging in that dialogue? Any suggestions?

CHAIRMAN MOYER: Now, wait. Bob
Pooler has a comment on that.

I'm sorry, Bob. It's hard for me
to see you through the projector. I
apologize.

MR. POOLER: As a petitioner, you
would need to work with the program and work
with me in particular, and then I would work
with the Livestock Committee. Because we
don't know the makeup of the Livestock
Committee when the new members come on.

CHAIRMAN MOYER: Thank you, Bob.
That's correct. We don't have
direct interaction between petitioners and the
Board.

MR. MARTINELLI: That's' fine.

CHAIRMAN MOYER: Gerry. The Board
recognizes Gerry.

MEMBER DAVIS: I was wondering as
part of your presentation you mentioned a
supplier of an alternate methionine source
that hasn't really come up with what they
promise. Is that referring to the
commercially reared insect producer guy?

MR. MARTINELLI: No. This product would be maybe not 100 percent methionine, but an extremely high percentage of methionine. It would just be a natural source of what we currently use in synthetic form.

The insect meal, it's high relative to typical feed inputs, but I think it's like three percent methionine or two and a half percent methionine, and that project has never come to fruition either.

MEMBER DAVIS: So you have checked on the progress of that company --

MR. MARTINELLI: Yes.

MEMBER DAVIS: -- and they haven't.

MR. MARTINELLI: Yes. I mean, they were going to have possibly at some point this year the capacity to produce five pounds a week. So we didn't have enough to do a trial with, frankly.

CHAIRMAN MOYER: Thank you, Gerry.
The Chair recognizes Kevin, then Hugh.

MEMBER ENGELBERT: Dan brings up a point that leads me to ask the use of methionine at a rate of two to five pounds seems like a huge variance for such a powerful amino acid. Is it strictly a variance because of the different feeds that are used or the different time of year or the different types of birds or is it simply a production quantitative figure?

MR. MARTINELLI: It's the different types of birds. I mean, one is layers. One is broilers. One is turkeys, and you know, even ducks and geese and all the other fowl are going to have different standards as well, but it's really specific to the type of bird.

CHAIRMAN MOYER: Thank you, Dave. The Chair recognizes Hugh.

MEMBER KARREMAN: Dave, I was glad to see I think one of the trials with the
layers that the eggs were the same weight, I
guess, quality.

MR. MARTINELLI: Size, yes.

MEMBER KARREMAN: Size, right, and

you know, I guess in organics, you know, we
try to perhaps look more at quality than
necessarily quantity, and you guys are showing
equivalent quality, and that to me counts more
than you guys getting what the conventional
levels are of egg production. So I was glad
to see that.

MR. MARTINELLI: Good.

CHAIRMAN MOYER: Any other

questions for Dave?

(No response.)

CHAIRMAN MOYER: Thank you.

Now we have Walter Goldstein, but
I understand he's not here; is that correct,
Valerie?

MS. FRANCES: Right.

CHAIRMAN MOYER: Then we have

Ralph Emerson and John Emerson on deck.
MR. RALPH EMERSON: Hello. I am Ralph Emerson. I hope my transit time is not deducted from here to there.

CHAIRMAN MOYER: No.

(Laughter.)

MR. RALPH EMERSON: I am in an association, a consultant with VITALFA, which is part of Brewster Foods, California based, and a longstanding organic, if you will, vitamin health food company that's been around for 60 years.

I'm with Innovations Technology. I work in neutroceuticals. We work in immunology with the Defense Department and with the NFL, and our interests are in unique plant based products. And I've been working with the VITALFA group looking at their products derived from French production, and David described it very well a little bit earlier.

And the purpose of my being here is to present more about the availability of
the alfalfa nutrient concentrates, alfalfa derived products from the EU, and ask a question, which is what I know you all certainly need is another question.

The VITALFA, as I mentioned, USA, is an exclusive supplier of alfalfa nutrient concentrate, is its acronym, and a press cake to the natural, if you will, the product feed industry. It's currently AVCO approved, which I'll get into later, and it's in the companion animal area feed.

And both the products, the ANC, which is the concentrated nutrient, which is extremely high in methionine but also in vitamins and other particular chemicals of interest, is separate. It's a process that we describe up on the PowerPoint here as a Pro-San process. The Pro-San process is actually a USDA technology. It was developed up by Berkeley and Albany by Bennie Nuchols. Dr. Nuchols spent -- it sounds like a comic book
character -- but Bennie is a very good research agronomist, scientist -- and they had some time on their hands and decided that alfalfa was a nice crop and could they mechanically -- no chemical extractions -- develop a product.

Well, they did a marvelous job, but unfortunately it was not seized by the industry, and the French decided to take it over and develop it, which they did, and they produce mechanically ECOCERT, ECOCERTIFIED organic, non-GMO, mechanically processed products.

And, on one hand, the ANC is the liquid again, and the press cake, of course, is the solid phase of the fiber.

The methionine in the ANC, the liquid concentrate and formulated in feed is both economic and meets nutritional requirements. This is per work we've done with Foster Farms, which is one of the fifth or sixth ranked poultry industry corporations
based out of Livingston, California, and their
comments follow.

VITALFA, as I said earlier, it's
an ECOCERT France CEE 2092-91 product, and the
good the French have is to dramatically
increase their certified organic growing
fields, and you'll have a letter to that
effect later from Mr. Brewster when he
arrives. He's been delayed. The French have
written and asked for consideration.

Moreover, they're most excited
about fostering our NOP relationship with them
and reciprocities and all of that business.

As I mentioned earlier, Brewster
Foods has a long history, again, in 1939 in
alfalfa research.

Yes, thank you.

MS. FRANCES: His son is giving
his time to his father.

MR. EMERSON: Mr. Brewster is
delayed courtesy of Delta Airlines, I think,
coming from the coast.
Brewster -- and VITALFA entertains them, but VITALFA is the principal corporation -- was the first company to really pioneer the alfalfa health food industry and did so in the '40s quite successfully for humans, and continued that research. The research is one of the reasons that I got involved with what they're doing, largely because of George Gailey's work out of OSU, Oregon State. George is a toxicologist. We did a lot of work, aflatoxin induced tumors, for NIEHS at the time, and it turns out that the alfalfa-chlorophyll-chlorofins business as a separate issue was very intriguing as an anti-carcinogen. And so that has been published by George, who is now my age and emeritus, but that led me into looking at alfalfa, and found a very long history of its use in not only food, but in medicinal chemistries. I went to Dr. Alfonso Morales. Alfonso, Foster Farms, is an immunologist,
nutritionist, and Director of Research, and
his comments are posted. He feels that the
high protein alfalfa meal, again, feed is a
proper step in the right direction,
elimination of other methionines, and I see it
more broadly than that, but those are
Alfonso's feelings.

Foster has a significant and
growing interest in creating more organic
farms in California, assuming it's there next
week.

He feels a high protein alfalfa
meal in the concentrate is an excellent source
of protein, limiting amino acid. You heard
all of that earlier. You've heard about the
synthetic methionine, and in his opinion, the
viable poultry feed formulation, some VITALFA
products have been developed by Foster Farms
and the use of their ingredients.

His preliminary work suggests that
alfalfa meal usage has a potential in the
methionine issue to be used for both the
1 finishers and for the growers. In addition,
2 he has really elucidated other benefits in our
3 discussion in scientific mutual research.
4
5 The xanthophyll issue, naturally
6 beneficial for poultry immunity, and may
7 stimulate feed consumption in pouls on the
8 turkey side for a number of very interesting
9 chemical-biological reasons.
10
11 Moreover, the high nutrient
12 vitamin concentrations are of particular
13 interest, and he has used the Pro-San
14 materials before at Foster Farms. In his
15 opinion, they have been around 25 years, which
16 ties back into Dr. Nuchols' work at the USDA
17 in Albany.
18
19 They found no detrimental effects,
20 and he feels in his opinion -- and I quote
21 from him -- there should be no problems in
22 implementing this product. And they go into
23 shadow prices and how you count in mls in that
24 industry. So I am pleased that he said that.
25
26 The last slide. It's, again, a
reiteration of the Pro-San process, and as I mentioned, they're AFCO approved, and a source naturally rich in vitamins, minerals for animal feed, and Mr. Brewster will bring these compendiums for you. They are strongly committed and a stainable egg environment, organic principles, and we would understand this needs to be certified to the NOP that said it's an alfalfa.

However, this is the point of my whole -- it is a mechanically derived juice high in vitamins, minerals, used certified organic, and the question to you as a group is could this be included in organic poultry rations under those appropriate sections.

And with that I'll conclude early.

CHAIRMAN MOYER: Thank you, Mr. Emerson.

MR. RALPH EMERSON: Thank you.

CHAIRMAN MOYER: We appreciate that. If you'll just stand there, I think we have a few questions.
MR. RALPH EMERSON: Thank you.

CHAIRMAN MOYER: I just wanted to mention to your son my son never would have given the floor up to me. So that's --

(Laughter.)

CHAIRMAN MOYER: -- to your credit.

MR. RALPH EMERSON: Yes, but you notice I had a cane.

(Laughter.)

CHAIRMAN MOYER: Joe.

MEMBER SMILLIE: Maybe I'm missing something, but there is no equivalency agreement with the EU to the EU standard, but on crop productions, the standards are very similar, very little difference between them. ECOCERT is an accredited USDA certifier. I see no problem in approaching ECOCERT and asking them to certify this process to the NOP standard.

MR. RALPH EMERSON: They've sent a letter to that effect, but there was a long
trail of who should talk with whom and how we
get there from here wasn't necessarily a
straight line.

MEMBER SMILLIE: Right. I think
you cut the Gordian Knot really quickly by
just getting ECOCERT to certify that product
to the NOP standard. I don't know, but I
doubt that there's serious technical issues
there. I think it can be done.

Certainly the chances of this
route are pretty much nil because, you know,
the regulation is clear it has to be to the
U.S. standard.

MR. RALPH EMERSON: Yes, very
good. Thank you.

CHAIRMAN MOYER: Good point, Joe.

I think you're right, but if it is produced
organically, it could work.

Hugh, you had your hand up.

MEMBER KARREMAN: I just would
like to see other ingredients in the poultry
nations that include some plant material,
other plant materials than just grains. So I was glad to see this presentation. Hopefully the idea still is to get the birds outside a little and get the real green stuff, but short of that or in complement to that, I think having an alfalfa derived product would be a wonderful thing if it fits poultry nutrition.

CHAIRMAN MOYER: Any other questions by the Board?

(No response.)

CHAIRMAN MOYER: Okay. Thank you.

MR. RALPH EMERSON: Thank you.

CHAIRMAN MOYER: And now we have Mr. Luke Howard and then Liana Hoodes is on deck.

MS. FRANCES: Luke was moved to later in the day because he asked me to make sure -- I know he's here, but if you look on the list, I rearranged it, on the screen. It's a scheduling change.

CHAIRMAN MOYER: I'm getting motions from both sides. Mr. Howard is in the
room and he's trying to get your attention.

MR. HOWARD: I'm ready to go.

MS. FRANCES: Well, you asked me to change your time. So I readjusted.

MR. HOWARD: No, I needed to go this morning because I have farming to do this afternoon.

MS. FRANCES: Okay.

MR. HOWARD: Is that okay? Is that okay with the Board?

MS. FRANCES: All right.

CHAIRMAN MOYER: Yes, please go ahead.

MR. HOWARD: Thank you for accommodating me, and I apologize for the confusion.

My name is Luke Howard, and I'm here representing Blue River Hybrids. You have heard from us before about organic seed issues.

And, of course, we are an organic seed and corn and soybean company based in
Kelley, Iowa, and we distribute seeds nationally from the north to the south, from the east to the west.

And I want to thank you for your time and your attention to the organic seed issues, and your guidance document from last year was excellent, and we really appreciate all of those efforts.

But the purpose of this report is I really want to give you kind of the state of the organic seed industry report. So this is a 2009 update.

For many years we've been seeing an increased usage of organic seed, but this year we've seen a real decline in organic seed usage, especially in the Midwest. For example, we had about 650 -- let me get my facts straight here -- 650 farmers were surveyed throughout the Midwest, basically Michigan, Indiana, Illinois, Iowa, and Nebraska, and of those farmers, most of them said that they were not going to use organic
1 seed to grow corn and soybeans because of
2 price, and that they were actually going to
3 use conventional, untreated seed.

So we're seeing a decline,

especially in the Midwest and the West, and
our sales show that as well. And when we
communicate with other organic seed companies,
we're hearing that same message echoed.

So we have some real concerns.

For example, our company has equal -- we have
had no growth this year as far as our corn
seed sales, and actually in some places we're
down in corn seed sales. These are difficult
times, especially with the volatility of the
grain market, and we can certainly understand
farmers wanting to decrease their input costs.

However, when we look at the
difference between conventional untreated seed
and organic seed, we see about a $40 a bag
differential. Those are very general terms.
Sometimes they are $30; sometimes they are 50
or $60.
So I'm wondering, you know. This translates to about $10 to $15 an acre input cost increase by using organic seed. If you think about the return that the farmers get on their grain, it's still double if not more than double of conventional pricing, and so that $10 extra input cost becomes pretty significant when you're looking at a return of possibly 1,000 or $1,500 an acre.

We've been told that some certifiers are allowing this exemption, and some of the larger farms are really certifying certifier shopping, finding a certifier that will accommodate their needs because they have a favorite hybrid from a Pioneer or another seed company and allowing them to use that product.

We've also heard that hybrids aren't available for their geographic region. We have seed grown in southern Alabama. We have seed grown in Quebec and Ontario. We have seed grown in Maine, and seed grown in
California. So that excuse sometimes is a little frustrating.

I guess in conclusion, because I don't want to take up too much of your time based on the confusion that just happened, we again want to thank you for your support of the organic seed rule, but we would also like to encourage the NOP staff to enforce this rule. It's very important that we really live by our rule because it would be comparable to a farmer maybe not using other organic inputs when they're available.

We would ask the certifiers really enforce this rule, and that they possibly could post this information on the Web when they make an exemption for a farm. So if Farmer A decides to use conventional untreated, possibly that could be posted for the public, and we realize that's a lot of work for certifiers, and we're not going to make any friends saying that statement, but we feel it's important to know that the public
knows what farmers are using when they're not
using organic seed.

        I think that pretty much is it.
If there are any questions, I'll be glad to
answer them based on our experience at Blue
River.

        CHAIRMAN MOYER: Any questions
from members of the Board? Kevin.

        MEMBER ENGELBERT: What did your
prices do from last year to this year for a
bag of soybean and a bag of corn?

        MR. HOWARD: Our prices increased
rather dramatically, just like the price of
corn increased rather dramatically, and so the
price that we increased was maybe about $40 a
bag, but you also need to keep in mind that
when we increase that price, the farmer
growing our seed got most of that increase, if
not all of that increase.

        CHAIRMAN MOYER: I have a question
for the program. Yes, I was just wondering
where are we with the recommendation that we
passed and this Board approved on seed? I believe it was in 2008.

And then you have a comment, too, Richard.

MR. MATTHEWS: Yes. Well, just for starters, price is not a factor, and certifying agents are supposed to insure that their clients are doing due diligence to obtain organic seed. So if there's organic seed out there, they have to use it.

And so it's one of those areas that we're looking at back at the department and trying to come up with some solutions to it, but it is an area that we will be doing more due diligence on our own behalf to make sure that the auditors are looking for certifying agent compliance with the requirements that they require their clients to source organic seed.

And, again, getting back to the question that was raised, price is not a factor. It doesn't matter what the price is.
You have to use the organic seed.

CHAIRMAN MOYER: Yes, I think this Board made it clear in their recommendation that that is the direction we wish to head.

Just a minute, Kevin. Barbara, you have a follow-up?

MS. ROBINSON: Rick and I just met with ASTA last week, American Sea Trade Association, and we did talk with them about what they could do along with the program to help facilitate this a little better, and they're going to help build a database reporting the availability of organic seed, who's got the organic seed, and then we're going to try and work, you know. We've got the ACA database that we've sent out to all of our ACAs. We're going to work with Mike Smith. Poor Mike doesn't know this yet, but we're going to see if we can use that same kind of reporting mechanism, work with ASTA, get that out to seed suppliers, and then get them to report back to ASTA.
They'll, you know, collect all of the information in a usable format and then get it to us. We can, like we did with the hay, the feed suppliers back at the beginning of the program, and then post that on our Website because I think a lot of this is, you know, the more we can report it, we have something that starts growing, a database. We can start closing this noncompliance and get people -- you know, people have less ability to say, "Oh, I didn't know. You know, I don't know that there's any seed out there," and that sort of thing.

We can say, "Well, well, there's the database out there, and you've got to go," and the auditors will be able to say, "Where have you been? You know, did you go and look on this database? And show us your records," and that sort of thin.

CHAIRMAN MOYER: I figure database is a great idea, but it seems from Mr. Howard's report that farmers know the seeds
available and are choosing not to use it anyway. So that wouldn't solve that problem. I think we need the joint action from the accreditation and auditing side to follow up with that.

But, Kevin, you had a comment as well.

MEMBER ENGELBERT: Yes, I want to clarify why I asked that question about price. I'm not saying it should matter at all when you purchase and it shouldn't, but in our little corner of the world, I've learned from other organic farmers that they have saved their own soybean seed, and that might be why your sales are down, because of the huge increase in price and also because they have found seed from a different company that is less expensive. Just from talking to the farmers in my area I know that to be the case, and everyone is expecting because of the lower price that dairy farmers are being paid, the demand for grain has lessened, and they're
expecting the price of organic grains to be substantially lower this fall.

So at least in my corner of the Northeast, I know that a lot of the demand has dropped simply for those reasons. That's the reason I brought that up.

MR. HOWARD: And if corn acres do decrease nationally, then certainly our sales should be down, but we're not hearing that, and we're hearing our statements echoed in other seed companies that are pretty close to the same price for their seed as we are.

So I hear what you're saying, and certainly saving soybean seed is easy enough to do, but saving hybrid corn seed would be pretty tough to do.

Thank you for your time.

CHAIRMAN MOYER: Our pleasure.

Thank you, Mr. Howard.

Michael Sligh for Liana Hoodes,

and Harriet Behar on deck.

MR. SLIGH: Good morning,
everybody. I am Michael Sligh. I am here representing the National Organic Coalition. We're a national alliance of organizations representing farmers, environmentalists, consumers and other organic industry members with the goal of insuring organic integrity is maintained and consumer confidence is preserved.

We have submitted or are in the process of submitting comments on about seven different areas that are before the Board, two of which I want to devote the bulk of my time to today, that being peer review panel and nanotechnology.

We also have provided comments on encouraging greater incorporation of biodiversity as has been reported by the Wild Farm Alliance, animal welfare discussion that NODPA will cover, also mentioning about retail certification, cosmetics, and the 100 percent label requirement linked to materials review.

But for the purposes of my time,
I'm hoping that I can zero in on these two issues of both peer review and nanotechnology. This is, I think, the 17th anniversary of the founding meeting of the NOSB. I'm glad to see that peer review is starting to get traction. We had it in the legislation. We had it in the regulation, and we think it is the cornerstone issue in integrity for the national program.

We applaud Mark and his work in getting ARC recognized by NIST, and we know that's a couple of years of work, but we would like to see the National Organic Program recognized by NIST, including the ISO-17011, and we believe that that is the cornerstone. That is the Holy Grail we're looking for here, and this is what we want to encourage.

And while we do applaud the NOSB for willing to lay their body down to do that work themselves, I know full well that that is way more work that you really can do or should do, and that we strongly urge you not to
1 recommend to look at either ANSI or the OIG as
2 a replacement for NIST oversight.
3 And I want to talk briefly about
4 what you get with NIST that you can't get with
5 those other two recommendations. The main
6 benefit that you get from the NIST recognition
7 is that it is an ongoing relationship. So in
8 order to keep that relationship, it requires
9 you to make and correct your noncompliances
10 with a clearly delineated period of time and
11 allows for regular surveillance of the
12 accreditation program in order to maintain the
13 recognition. These other programs will not
14 provide that level of rigor or accountability.
15 It also gives you independent
16 third party verification free from conflict of
17 interest. It also, I think, in many ways
18 gives this opportunity for the NOSB to play a
19 proper role, which would be to look at these
20 ongoing evaluations and to see if, indeed,
21 there are recommendations that you should be
22 making to improve the accreditation program
So that's a very sound job for you, and not one that I think will add unduly to your burden.

So we strongly recommend this. We concur with Lynn Cody's excellent comments that she has sent you on this topic, and we hasten you to make this recommendation and for the department to move forward on this piece.

I also note that Congress has, I believe, at least three times in their annual appropriations language to the department urged them to put in place peer review.

On nanotechnology, I would just say that this is very much a parallel to biotechnology in the sense that it is both novel and unregulated technology, and organic is a conservative, precautionary approach to agriculture. We urge that you exclude, prohibit or otherwise disallow the use of both nanotechnology, nanomaterials, including those in packaging as well as those that would be in
food or come in contact with food.

The reason that we're here today celebrating the continued growth of organic is partially because the original NOSB made a very good decision about biotechnology. This is your moment in history where you can make yet again a very wise decision about the future of organic, and we urge you to say no to nanotechnology.

I will take any questions if there's time. Thank you.

CHAIRMAN MOYER: Thank you, Michael.

Joe.

MEMBER SMILLIE: Yes, we got Lynn's comments, and we will implement them, and I'll roll that out tomorrow. We'll have a committee meeting to verify that. We do agree.

As far as our role, our role in the recommendation is exactly as you described it. We're not taking over the evaluation of
the NOP program whatsoever. We're simply putting a body in place to make sure that the review by the NOSB is part of its regular function.

MR. SLIGH: That's great, and the NIST will also get you witness audits, which is quite a valuable tool as well.

CHAIRMAN MOYER: Any other questions from the Board? Hugh.

MEMBER KARREMAN: Just one question. Maybe I don't have it right, but I think in dairy production in the processing, making ice cream and various other things, things get refractionated and whatnot. Isn't that nanotechnology already being used, from what I understand? It's already happening that way.

MR. SLIGH: Well, even more so for you to be definitive about the issue because I can clearly tell you without consultation that part of what draws customers to organic is they are looking for an alternative to GMO,
and in many cases nanotechnology is a platform for linkage to GMO into the future.

So you need to be very cautious, and if indeed you believe there is activity already, then I say there is some remedial work that needs to be done on the part of the Board, and this issue.

CHAIRMAN MOYER: Just a minute, Michael. The Chair recognizes Dan.

MEMBER GIACOMINI: Yes, we'll get into this more when we do the nanotechnology discussion, but I just last week had a conversation with a professor at the Dairy Technology Center at CalPoly University, and he confirmed that nanosized particles are naturally created in homogenization. There are also a lot of very simple processes where they are also created in other ways.

So one of the things that we're going to be struggling with in doing that is how to define and how to isolate what we're really talking about. I mean not wanting
something that will -- you know, and then we also have the issues of what we might be required of in the future. But those are part of what makes it difficult just from drawing a line and cutting things up.

MR. SLIGH: Right, but I would caution you not to fall prey to substantially equivalent and also keep in mind that this is like biotechnology in the sense that there is no statutory authority or any regulatory oversight. So you would be stepping out into very, very novel territory to encourage or condone that direction. It may come back to hurt our sales and our farmers in the future.

CHAIRMAN MOYER: Any other questions from the Board?

(No response.)

CHAIRMAN MOYER: Thank you, Michael.

MR. SLIGH: Yes, thank you.

Congratulations to those of you retiring and thank you for your service. I fully
1 understand your commitment.
2
3 Thank you.
4
5 SECRETARY WEISMAN: We do still
6 have one more meeting after this.
7
8 (Laughter.)
9
10 CHAIRMAN MOYER: Harriet, please.
11
12 MS. BEHAR: Good morning. I am
13 going to address something. I gave you
14 written comments, and I'm going to go past the
15 peer review panel just to say that I'm happy
16 to hear that NIST is working with ARC and
17 looking forward to a long and fruitful
18 relationship there.
19
20 I am Harriet Behar, a long time
21 certified organic farmer, organic educator,
22 organic inspector, and most importantly, an
23 organic consumer.
24
25 I appreciate the transparency and
26 exchange of ideas that occurs during these
27 NOSB meetings.
28
29 I would like to address what
30 Richard Matthews talked about with the GMO
vaccine. I really think that the rule already
has a way for GMO vaccines for livestock to be
approved on and put on the national list, and
I believe that they should go through the
process that that -- we shouldn't just blanket
allow all vaccines, GMO or not.

GMOs are different than
conventional, and we do have an allowance to
approve GMOs if they go through the
transparent petition and review process.

Now on technical review panels,
another favorite topic. I'm happy to see that
there has been some use now of outside TAPs,
and I'm optimistic that over time these could
improve as the agency becomes more
knowledgeable about organic production both
here and around the world. I think they need
to be looking at European and other countries
as well.

However, not all petitioned
substances have had TAP reviews, and this
should be rectified. Items requested for
inclusion on 606 should also have TAP reviews
with the handling committee's decision to put
wheat germ on 606 as a good example.

The NOSB should not be put in the
position of having to judge if their fellow
members have done a good job thoroughly
researching a petitioned material. The
organic community has lobbied long and hard
and continues to lobby for more funding for
the NOP. Shortcuts based on lack of funds
should not be taken, especially for this
primary and important function of the NOSB,
which is to decide what is on and what is not
on the national list.

Wheat germ on 606, this item
should not be included on 606. There is
sufficient organic wheat available, and I
believe the petitioner could facilitate the
production of this organic wheat germ. Just
because the organic product is not available
after a few phone calls does not warrant the
inclusion on 606.
Putting wheat germ on 606 would also do a disservice to the many organic producers of organic wheat and processors of wheat products by shrinking their marketplace. Too much emphasis was given on the petitioner's statements of their projected needs and not enough on whether the product was truly unattainable.

Biodiversity. I support the committee's recommendation and believe that this does not put any undue burden on farmers. Many long time, successful organic farmers understand the immense benefits they receive by conserving and enhancing biodiversity on their farms, and a little nudging to others who do not see biodiversity as important will improve their farming systems as well as the environment for all live.

The NOP should make sure that certifiers are verifying conservation of biodiversity during their accreditation visits and desk audits, and this should be
incorporated into the auditor's checklist.

Animal welfare. I agree with much of the document, but I prefer to see the evaluation of the farm and livestock done as a system with body scoring just one of the many evaluation tools. Inspectors can currently verify husbandry by reviewing health records, viewing the housing and outdoor areas and viewing the animals. The current recommendation, I believe, puts too much emphasis on body scoring.

Injectable vitamins, et cetera. I disagree that these should be added to the national list as written. Each item should be reviewed against the off-book criteria and not be given a full class of items such as electrolytes.

Inerts. Put the current items on the national list and have them go through the unset process. When applicable, all new inerts reviewed on a case-by-case basis.

Nanotechnology. The NOSB should
clearly state that nanotechnology is incompatible with organic and is not allowed in food packaging or other materials that are in contact with organic products. The precautionary principle should be used with this novel technology.

Personal care products. The NOSB should stress to the NOP the importance of protecting the organic label in the marketplace and not allow the organic label on body care products that do not meet NOP standards. This is confusing to the consumer and encourages profiteering at the expense of legitimate organic producers.

Voluntary retail certification. I believe the current handling standards can be applied to retailers with no special procedures necessary. I agree with other committee recommendations for propionic acid, propane, bleach Lecithin, chicory root, and red corn color.

I got through just about all of
it. So as you see, I was looking over many of
the things on your docket and gave you my
little piece on each of them.

CHAIRMAN MOYER: Thank you,
Harriet.

Questions or comments from the
Board? Bea and then --

MEMBER JAMES: Thank you, Harriet.

Hi.

I was wondering if you could
comment if you believe from your experience
that retailers understand how to market USDA
retail certification.

MS. BEHAR: You mean do they
understand what the USDA seal meals on --

MEMBER JAMES: Do they understand
once they're certified? Do they understand
how to market that certification at retail?

MS. BEHAR: Yes, I believe that
they then advertise to their customers that
their handling practices in their stores are
having that extra oversight, whereas other
stores that do not have that oversight cannot make that statement.

And as many of us who have worked in retail know, there can be a lot of abuse at retail as far as having iced conventional broccoli dripping onto conventional salad mix below. I've seen this myself at stores.

So those people are not certified, and those consumers buying in those stores hopefully would be aware that maybe they want to go to a certified handler retailer for their purchase of organic foods.

CHAIRMAN MOYER: Thank you, Harriet.

Hugh, you had your hand up.

MEMBER KARREMAN: Thanks for your comments, Harriet.

I just wanted to remind, I guess, the group in general, the organic community, that the animal welfare document is a discussion document this time. So nothing is set in stone. We're trying to get all of your
information, and I'll go into it more
tomorrow. I just want to remind you of that.
Okay?

MS. BEHAR: Okay. I'm discussing here.

MEMBER KARREMAN: Right. No,

that's fine.

And injectable vitamins and minerals, the reason we're looking at that as a section, it's kind of to mirror the Section 603(d)(2) and (d)(3), which allow vitamins and minerals as feed additives, period, the end.

MS. BEHAR: I was concerned really more about the electrolytes.

MEMBER KARREMAN: The electrolytes are allowed on 603 already.

MS. BEHAR: Yes.

CHAIRMAN MOYER: Okay. Thank you,

Harriet.

The Board recognizes Jim Pierce,

Leslie Zuck on deck.

MR. PIERCE: You guys are going to
get a stiff neck over on this side. You
deserve it.

Okay. Ready? For the record I am
Jim Pierce, Global Certification Program
manager for Oregon Tilth, and for the record,
Oregon Tilth is the best certifier.

(Laughter.)

MR. PIERCE: Oregon Tilth has
prepared written comments which are now mired
in regulations.gov, the cyber equivalent of
the La Brea tar pits.

My comments begin by asking you to
pay particular attention to comments of two
women who I learned long ago to obey without
question and whom I suggest you do the same.
First is Beth Unger from Organic Valley, who
will comment on how the Livestock Committee
proposals will affect nearly 1,400 actual
certified organic farmers. My colleague and
genius, Gwen Wired, is the five-year Sisyphus
of the ag/non-ag synthetic/non-synthetic
project. Pay close attention. It's slightly
more difficult than rocket science, and there
will be a quiz.

It may be raining, but the sun is
shining. This is the first time that I/we
have had an NOSB meeting under the "yes, we
can" umbrella of hope and change that comes
from an administration openly favorable to
organic agriculture. As proof, witness that
a USDA parking lot is now an organic garden;
that the chair of the NOSB can drive in and
dump a truckload of what was during the last
administration actually coming out of the back
end of a bull and be commended and
photographed instead ofuffed and
fingerprinted.

The author of the Organic Food
Production Act is now Deputy Secretary of the
USDA. Now, Kathleen Merrigan is no more a
savior to the NOP than Barack Obama is to the
Supreme Court, but the potential is as
exciting as if Jackie Robinson had just been
appointed Commissioner of baseball. Things
are going to change.

Hit the anvil hard then while the iron is hot. Don't blow your credibility by getting political or pandering to personal agenda, but don't be afraid to work for positive change.

As a Board, you have two more meetings together. Make it your legacy to put the NOSB and the NOP on a path of continuous improvement that is the guiding principle, the Holy Grail, of organic farming.

To that end, I would draw your attention to a pearl contained in your ambitious agenda that, if acted upon properly, will manifest the fundamental changes that will make the NOP stronger, higher quality and more respected and so will, as a result, make the yeoman task of the NOSB inmates easier, more effective and possible -- think about this -- fun.

The pearl is not in the bivalve mollusk standard as one might suspect, but
rather in the peer review proposal. To
harvest the pearl, however, you need to
reconsider the proposal in front of you.
You've heard a little bit of this already.

The madness has merit, but the
method is misaligned. Peer review of the NOP
is a federally mandated good idea. However,
offense, but the NOSB members are not up to
the task. Put OPCO in with the cacophony of
voices that favor ISO-17011, accreditation of
NOP through the NIST process. Proper peer
review needs to be the highest priority in
order to minimize miscommunication and
misinformation.

Most of the ongoing challenges
between our public servants and we whom they
serve, challenges such as idle petitions,
inactive recommendations, inconsistent and
unvetted interpretations, delayed rule
implementations, and a nonexistent practice
manual will be addressed with this one action.

Please, harvest the pearl, plant
the seed, nurture it, cultivate it, water it
till first it flowers, and then it bears
fruit.

In the 100 words or so that I have left, I would like to note digress but drill down. The Livestock Committee has a proposal that will clarify the allowance of injectable vitamins and minerals. Good, great, fantastic. But it's important to realize if you do not already that injectable vitamins and minerals are currently right now today commonly administered to organic livestock as needed. It's important that you not only approve the use of injectable vitamins but insist on language that clearly continues to allow this practice.

The consequences of eliminating this proactive nutrition tool from organic farmers would be significant, possibly devastating.

As easy as it is to complain, we have a lot to be thankful for, including a
solid organic regulation foundation and now an
administration willing to advance our agenda.
We are thankful for the long hours and
dedication that you suffer on our behalf, and
for this avenue of transparent public comment.
Thank you for listening.

CHAIRMAN MOYER: Thank you, Jim.

Questions or comments from the
Board?

(No response.)

CHAIRMAN MOYER: Thank you.

We'll try to get in one more
presenter before lunch. Leslie. We have a
lot of folks to get through this afternoon
yet.

MS. ZUCK: Hi. I am Leslie Zuck,
Executive Director of Pennsylvania Certified
Organic, and it says up there I'm going to
talk about livestock issues and various
topics.

So I did want to bring up the
People's Garden because Valerie did a really
1 great job. I was actually there. She did
2 plant a beautiful garden, and not only that.
3 She put together an entire organic system
4 plan. It was really nice. So a beautiful day
5 despite the hail.
6 (Laughter.)
7 MS. ZUCK: I'm not sure what that
8 means, but it was a great attempt.
9 And you've been hearing from
10 various certifiers about various topics.
11 That's typical of these meetings. In the
12 future Pat Kane will be talking about this a
13 little bit. ACA has formed a number of
14 working groups on a lot of the topics you're
15 working on. I'd really like to see some
16 direct collaboration between your committees
17 and the working groups. She'll be talking to
18 you a little bit about that and how you can
19 connect with them.
20 Animal welfare recommendation is
21 good, a good issue, good topics. Let's put
22 some more about poultry in there and remember
that it is really difficult to identify each and every bird in a flock. So we do have an ACA working group speaking or working on poultry, particularly with animal welfare, and that case has lots to do with the density and the outdoor access. We need to go there.

Peer review, I'm not going to say much on that because everyone else seems to want to, but it is good to see it coming up. I'm sure you'll hear from Lynn Cody on this topic.

I just want to remind you that the rule does require an annual review, and the recommendation talks about three years and then it talks about a review every two years and every other year. So I think you probably should really make sure it's annually. Once we get that going and they are accredited, we want to look at that on an annual basis.

Certifiers have to; ARC has to; everybody has to. So we think that's a good idea.

On the 100 percent labeling
claims, just I want to remind you of the purpose of that claim and to be clear that there really isn't any reason. If you're uncomfortable with loosening the rules on that, don't worry about -- I mean, you should be uncomfortable about it. You know, there's no reason to go there except for to assist some of the manufacturers of these products to market their products. The purpose of that claim really is to provide consumer with a choice that is more restrictive than the usual organic product. It's going to be made without any -- you know, it has to have all organic ingredients, and so we'd like to make sure that you keep that differentiation and understand the reason for the difference.

It's not as though you're prohibiting the use of organic on those labels.

So the last topic I had just came up, this GMO vaccines. I just felt like I should say something about it since it was our
actions that kind of brought this to the fore,
and to clarify that PCO does not
philosophically oppose GMO vaccines. We
really do understand the importance of
vaccines in organic livestock management.

So actually in the 12 years that
we've been certifying, I guess we've kind of
been blissfully unaware that GMO vaccines were
being marketed for livestock. So we had not
been reviewing vaccines at all, and it was our
policy vaccines in the rule says vaccines are
cool. So we allow vaccines.

We literally stumbled across
information that one of the vaccines being
used was genetically modified, and so we
looked at the rule, and we realized that GMO
vaccines are prohibited. So we prohibited
that particular vaccine, and we don't know if
all vaccines are GMOS. We've been told that
most of them or a lot of them are, but you
know, if that's the case, then what we need is
a list of them which may be available working
with APHIS, but you know, in the onset of that particular action, because the results of the particular action that we took, we've kind of been accused of splitting hairs over this, and I guess as a certifier we'd like to know, you know, if there was another decision we should have made or could have made in that situation. It would be really helpful to have that list, as we said.

You know, we're not opposed to the use of the GMO vaccines, but I am worried about, you know, the public maelstrom that could result if we do get a directive or an action item coming from USDA saying that GMOs are excluded methods are patently allowed now despite language in the rule that specifically prohibits them.

So let's work on this and figure out what we can do, and I think one of the first steps is to find out what the situation really is. Are all the vaccines out there that are being used on dairy cows and
everything else and organic agriculture right now, are they genetically modified or are they allowed?

And let us as certifiers know what we should be doing because we don't want to, you know, cut people off from that important livestock management tool any more than anybody else here does, but we also don't want to just like look the other way when the rule says they should be prohibited.

CHAIRMAN MOYER: Thank you, Leslie.

Any question from the -- Hugh.

MS. ZUCK: I warned you.

MEMBER KARREMAN: That's fine. We always have good back and forth Leslie.

Regarding the vaccine topic, I think your concern is valid absolutely within the organic community regarding the excluded methods topic. That's kind of half of it, and a big half of it, but there's also the other part of the society that would probably be
agghast that vaccines would be prohibited from
use for prevention of disease in livestock and
organic livestock.

You know, like right now with this
particular flu that is in Mexico mainly, I
guess, but anyway, you know, if a vaccine is
produced or needed to be produced in a quick
way, in a quick fashion, current science
technological advance would probably indicate
they would go through genetically engineered
process to get a very quick vaccine to prevent
outbreaks of, let's say, foot and mouth or
avian influenza or whatever if they need to
because the traditional vaccine production
takes about -- I don't know -- three or four
months or something like that to get going,
and that's the case right now with what
they're doing with the seed stock vaccine that
they're talking about currently.

So, you know, I think we do have
to keep in mind the absolutely excluded method
topic within the organic world, but we also
have to think in even a bigger picture, you know, in agriculture in general, which organics is part of that.

You know, if genetically engineered vaccines were mandated to be used or had to be by law, you know, the organic community would be favorable at least to that in a limited fashion if they're licensed, let's say, or something. It goes beyond just organics in a sense. It's within organics, but it goes beyond that.

CHAIRMAN MOYER: Thank you, Hugh.

Dan.

MEMBER GIACOMINI: Hi, Leslie.

You know, when this first came up, I sat down and I read the rule. I didn't go back and review every page in the preamble. I will admit that, but I think it's sincere to say that there's a difference of opinion on whether GMO vaccines are prohibited, and I think that's a reasonable statement to make.

One, oh, five requests that they
be approved according to 600, and 600 is stating that things need to be on the national list, and under 603 for livestock, biologic vaccines, there's no listing of it; there's no quantifying of it. It doesn't say non-GMO vaccines. It says vaccines. So I think there is a fair interpretation and a reasonable interpretation to say that they are allowed, and to just say that the rule obviously says that they're not allowed and making a statement clarifying and giving it a blanket clearance is a little bit out of line, there are other interpretations and I think they're just as reasonable. But we do need clarity on this certainly, but where we stand right now is not just one point of view that needs to be fixed but multiple points of views.

MS. ZUCK: Sure. And when there is a difference in a rule, if there are different areas -- and Rick Matthews, maybe we agree or disagree. I don't know -- if there's
two contradictory parts of the rule, that's
where usually as a lawyer I would go to the
preamble to try to find out why the rule was
written that way.

We know that the preamble is not
the regulation, but it is useful in
interpreting the regulation. So if there is,
you know, a gray area or if something does
seem to be contradictory, you can go and read
that part, and it is on page, if you would
like to read it, it is on page of the Federal
Register 80554.

"Based on comments received and
because of the potential impact of the
prohibition on the use of excluded methods, it
is still uncertain. We have created the
possibility at Section 205.105(e) for the NOSB
to exercise one very narrow exception to allow
the use of animal vaccines produced using
excluded methods, but only if they are
explicitly approved on the national list."

And they have some really good
discussion in there, and I think that they're saying, yes, it's a good idea, but we don't want to tell everybody that now because there's this big backlash against GMOs. But we're going to give the NOSB the opportunity to add those to the list.

CHAIRMAN MOYER: Thank you, Leslie. I think that's good advice to go back and check the preamble.

Hugh, you had one last question before we break for lunch.

MEMBER KARREMAN: Just being lawyerly, I guess, and I've learned some paralegal maneuvers here on the Board, but doesn't the Act of 1990 precede the preamble of the regulations? So in Section 2110 or USC 6509, under animal production practices and materials, health care, D, and then C under that, you cannot administer a medication other than vaccinations in the absence of illness. Does that not preempt the preamble if that's in the act? I mean just saying that
vaccines are allowed.

MS. ZUCK: I'm not arguing with you that you can allow vaccines.

MEMBER KARREMAN: And there are three other --

MS. ZUCK: It's just like anything else that you allow. You can allow feed to feed the cows, too, but we have restrictions on what kind of feed you can use.

CHAIRMAN MOYER: Okay. Thank you, Leslie.

What we're going to do now is we're going to adjourn this meeting until 1:15. We will be starting promptly at 1:15 with Ed Maltby ready to go and Beth Unger on deck.

So we'll see you in about an hour.

Thank you.

(Whereupon, the above-entitled matter went off the record at 12:10 p.m., and resumed at 1:15 p.m.)
A-F-T-E-R-N-O-O-N  S-E-S-S-I-O-N

(l:18 p.m.)

CHAIRMAN MOYER: This meeting is back in session.

Would Ed Maltby please come to the podium? And Beth Unger is on deck. Once we get our technical difficulties straightened out, Ed, we'll be with you.

Ed, can you continue without the audiovisual?

MR. MALTBY: Oh, I don't know.

That might be difficult, but I can try.

CHAIRMAN MOYER: I think the Board would appreciate if you would go ahead and try to do that. I apologize for that inconvenience.

MR. MALTBY: That's no problem.

My name is Ed Maltby, Executive Director of Northeast Organic Dairy Producers Alliance and Administrator for the Federation of Organic Dairy Farmers.

Unfortunately, the two people I
I want to speak to most directly aren't here, but -- ah, Barbara is there as well.

I would like to make a plea from the 1,800 organic dairy producers across the country that Richard Matthews does nothing but write the access to pasture rule.

(Laughter.)

MR. MALTBY: From the time he gets into work at eight o'clock in the morning to when he leaves at eight o'clock at night, he has no other duties at all.

And the NOSB Livestock Committee provide recommendations relating to organic dairy replacements. We feel both of these issues or the access to pasture issue is something critical both for the integrity of organic livestock and for the future economic security of an industry that is now being devastated by low prices both for organic milk and organic beef.

It's very interesting listening to these other comments where you have certifiers
arguing about the minutia. The unfortunate thing is that when it comes down to -- oh, Mr. Karreman, pleased to see you. That's okay.

Arguing about the minutia and the lingering interpretation of different parts of a preamble to a preamble to a preamble, and I think one of the essential ingredients that sometimes is missed is that these have to be interpreted by farmers who spend their days working, who actually want to do the job right, who invested vast amounts of capital to get it right, and we owe it to those farmers to have clear and understandable criteria for what they can and can't use and not to unilaterally make changes as different things get discovered.

I know my board of directors wanted to know, well, if they want us to do this other stuff, when are they going to give us the access to pasture rule. You give us the access to pasture rule, then we'll start doing a bit more on that side. Perhaps that's
the way to negotiate. We've tried everything else.

I'd like to thank the NOSB Livestock Committee for introducing a discussion document about animal welfare. It is a critical area of all livestock farming, both conventional and organic, and we applaud the start of that discussion.

We also recognize the depth and breadth of that discussion, and we would request from the NOSB that they set up a task force to consider and evaluate what standards can be put in fairly quickly because there is consensus and what standards need further investigation.

We're reluctant to take it to the level of rulemaking because rulemaking as we've learned can take three months, fourth months, four years, five years to get common sense policies in place.

I'm not going to read all of this, but I think from the point of view of
livestock producers we strongly believe that organic animal welfare guidance and standards must be sensible, reasonable, and based in the realities of farming, good husbandry, grazing, natural animal behavior, and natural healing. Obviously the prime one of those is cows should be out on pasture.

Sorry I'm getting a bit repetitive, but they say you've got to repeat it 17 times to get what you want.

One of the issues raised in the discussion document was around the treatment of sick animals, and we agree and have actively advocated for all possible measures to use to treat sick animals, even at the expense of their organic status.

What we do need, apart from new guidance perhaps, is the education of new entrants who have limited knowledge, who mean well, but might not necessarily understand the implications of what they're doing.

Education of inspectors and
certifiers as to what they should be looking for; more education of veterinarians so that organic livestock farmers have veterinarians available and can use them on a regular basis; and of course, high levels of profitability for organic livestock operations to provide an adequate return for the cost of organic production.

Do you want me to stop? I only got started. Do I get three minutes because you got me delayed?

CHAIRMAN MOYER: No.

(Laughter.)

MR. MALTBY: How unreasonable.

CHAIRMAN MOYER: Are there any questions for Mr. Maltby? Hugh, go ahead, please.

MEMBER KARREMAN: Ed, thanks for your input, and I read the Food Farmers' input previous to your comments here. You mentioned just earlier that some items would be in the animal welfare, I
think, contentious. What are they exactly?

MR. MALTBY: I don't think necessarily contentious, but need examination by all of the stakeholders, that we need to understand consumer concerns, but we ought to balance that with scientific knowledge and good husbandry. And I think a further, more detailed analysis of those issues, and I think that by using a task force we can get to the root of some of the easy ones, put them out there, keep up with what is happening in industry, and I think the conventional livestock industry leading the way in some of these things, and we should at least be able to catch up with them and implement some of their standards. A lot of them are already written within the existing rule. They just need to be implemented well.

So I don't really want to get into any distinct specifics right now, but I think that is a discussion that we should be having as a task force or whichever way the NOSB
wants to handle it.

    MEMBER KARREMAN: As far as only
having it as guidance versus regulation due to
the length of time regulation can take to get
through, and I know that from the medicines
that are now thankfully approved after all the
years.

    In the regulations, let's say --
I'm just thinking of I forget the exact number
-- you know, clean and dry bedding must be
provided, but there's no endpoint, you know,
no measurable metric that what we inserted
was clean and dry bedding must be provided so
the animals are clean. I mean because there
are sometimes concerns about that.

    So, I mean, that's a regulatory
change. Is that too much to ask or do you
want to keep that as guidance or I mean --

    MR. MALTBY: From the point of
view of keeping up with the whole marketplace
where you do have at least three or four
labels out there specifically geared to
livestock welfare, I think it would be good to get some of those guidance out there.

   You know, what is a clean animal?

In the winter a clean animal might have some manure on the sides, on the back end. Going out to pasture, the manure might be on the back end. You know, so that then requires a level of skill from the inspector and the certifier to judge which production practice is being used, what time of year.

   So there's all these caveats within there that I know when we looked at the access to pasture and there as some very prescriptive language in there, we had an intense discussion about, okay, how much should be prescriptive, how much should be left up to the certifier, and what is pure common sense?

   Unfortunately, pure common sense, you know, has to be administered in good faith on both sides, which as we know is not always the case.
So I think it would be good to have some guidance through the NOSB on livestock welfare standards that can be relatively easily implemented and can enhance the integrity of the organic seal. I wouldn't like to see us in any way saying that conventional livestock is badly treated or worse treated than organic, but I think it's incumbent upon us to have some of that guidance there to guide consumers that we are, in fact, keeping up with the general trend of marketing.

CHAIRMAN MOYER: Okay. Thank you. Are there any other comments by Board members?

(No response.)

CHAIRMAN MOYER: Thank you, Ed.

MR. MALTBY: You're welcome.

CHAIRMAN MOYER: Beth Unger next and Will Fantle on deck.

MS. UNGER: Hello. I'm Beth Unger from CROPP Cooperative.
We appreciate the opportunity to submit comments for today's agenda. CROPP is a marketing cooperative serving farmers producing organic farm products. We have over 1,300 farmer members located in 32 states. CROPP currently markets over 500 different products bearing CROPP's Organic Valley Family of Farms label and Organic Prairie's label.

I'm going to primarily stay to the animal welfare topic because I see you're very serious about your time limitations, and so going on with that, we believe that the consumers of today are engaged in a dynamic learning process. They are taking on the task of learning for themselves about where their food comes from, how it is produced and processed, and what goes into their food.

CROPP seeks to have the consumer continue to view the organic seal as the gold standard of all labels, and therefore, it is critical that we as an industry see the issues that are important to our consumers and are
willing to take on those issues.

Animal husbandry is very important in our cooperative, as evidenced by some of the policies that we have on our full manual that really do go above and beyond the NOP standards.

We have adopted animal husbandry standards within our cooperative. Development of these standards was not an easy process. But once the standards were adopted, our farmers have worked to improve their operations to meet the standards. Our field staff has received training and visual material to score livestock. The staff is currently working with some of our members scoring their livestock to set the stage for continuous improvement on each farm.

Organic is the gold standard of labels because it integrates the whole system. Therefore, if one portion of the system breaks down, it has ripple effects throughout the system. If the soil is not healthy, the feed
grown for the livestock will be lacking in some fundamental way, and the animal's health will suffer.

A healthy, organic system is a system that already incorporates by necessity many of the animal husbandry standards that are advocated in the labeling world.

In the testimony submitted in November 2007, Kathleen Merrigan and William Lockhertz recommended adoption of the following five straightforward animal husbandry standards as a starting point for clarifying the role of animal welfare in the organic standards.

They are purchase for poultry, prohibition of forest molting; development of standards for spacing in livestock feed lots; and banning of swine gestation crates. These recommendations are a part of the recognition that these production methodologies are not conducive to healthy, overall successful organic systems.
We encourage the Livestock Committee to consider these recommendations put forth in this testimony. Strengthening the standards will provide more meaning to the USDA seal and promote consumer confidence that the organic seal continues to be the gold standard of all labels.

The Livestock Committee's discussion documents successfully hurdling the difficulty in marrying the need to have clear, enforceable standards and the recognition that every livestock operation is different, different animals, different production systems, different regions.

Accordingly, language adopted in the rule should always be outcome oriented, and the rule change language suggested by the Livestock Committee is clearly outcome oriented.

We support these proposed rule changes. However, in looking at the guidances, we do have some concerns regarding
an appropriate infrastructure to support this proposal. The Livestock Committee's guidance proposals contemplate a significant increase in the role of the inspectors to provide oversight of animal welfare standards. There is currently a shortage of good livestock inspectors. The skill level of livestock inspectors must increase to appropriately score livestock to assure compliance.

The cost of organic certification will increase due to the extra time spent on inspections. Therefore, we do not support requiring inspectors to individually score all animals.

Thank you, and I had a little more, but.

CHAIRMAN MOYER: Okay. Thank you. Any questions or comments from the Board? Hugh.

MEMBER KARREMAN: Thank you. And applaud Organic Valley for the welfare animal husbandry standards you've
developed, very detailed, in depth, and I know
that I think your person within the
cooperative was a student of Temple Brandon,
and just so you know that the guidance that we
are discussing at this meeting was taken
straight from Temple Brandon. Okay? She was
on some conference calls we had. So I guess
there's a whatever.

Anyway, as far as the inspectors
needing extra training, I guess so possibly,
but I also have to say that I have given a
talk or two at inspector trainings for IOIA
and have basically put like regulatory
statements on top of the slide and had
pictures of like how it looks good and
pictures of how it looks bad. And more than
a couple of inspectors have thanked me after
the talk and said, "Gee, Hugh, thanks for
showing that because now I know what to look
for."

So it wouldn't take that much
because, you know, they continue to say, "You
know, sometimes I get onto farms and I leave
with kind of an odd feeling like something is
not right," and it just takes some pictures at
an IOIA training session to do that, and I
don't think that inspectors are going to have
to body condition score each and every animal.
Definitely not. That's not the intent. It's
basically to get an overall picture, a
holistic view of what's going on.

Is it clean in the barn? Are the
animals generally in good condition? Are
there just not too many that are limping
around and they're all walking well so they
can go graze on the pasture?

Those kind of bigger picture
things are what I think we want to get at, not
crack the whip on a guy who has, you know,
three lame cows and hone in on that, although
it should be seen by the inspector.

So it's just kind of, you know,
making them more aware of what should be done.

And if you look at the discussion document,
the regulatory language change we're proposing is only on like three or four things and it's only a few words. It's the guidance that I think people are starting to think the inspectors are really going to have to learn a lot about, and like I said, some inspectors have thanked me for showing pictures that show good compliance and bad compliance. I don't think it will be that hard.

MS. UNGER: Thank you for finishing my presentation for me.

(Laughter.)

MS. UNGER: Because that's essentially where I was going with it, you know, with that whole outcome based business, that it is a general impression, and as I stated earlier in my remarks, you know, it's the visual materials that really make a difference. It's how our full staff has been trained to do this very thing.

But it does take experience, too.

Showing them a picture and the reality of
going out on a farm in the varying conditions that Ed had mentioned does make a difference.

And I think that you have to agree that we do tend to have a shortage of good livestock inspectors.

CHAIRMAN MOYER: Okay. Any other questions from Board members?

(No response.)

CHAIRMAN MOYER: Okay. Thank you, Beth.

Will Fantle and Michael McGuffin on deck.

MR. FANTLE: My name is Will Fantle. I'm the Co-Director of the Cornucopia Institute.

We have approximately 3,000 members scattered across the country. The majority of those members, a strong majority, are organic farmers.

I'm going to talk about something a little bit different today than what we've been talking about in the past as we have come
before you. Most of our farmers understand that any organic food that they grow and they can't sell direct, they require the assistance of handlers and processors and, in particular, retailers to bring to the market.

So we wanted to talk a little bit today about the discussion document that was put out from the committee talking about retail certification, and what I brought with me based upon that discussion that we had with retailers in the community concerned about the interest of farmers. I'm going to read some select excerpts of that.

This is a sign-on letter. Approximately 50 retailers from across the country signed onto this from corner to corner across the United States.

It says, "The undersigned retailers of organic food have the following" -- I'm going to have to read this differently -- "have been following the multi-site retailer organic certification discussion. We
support the granting of organic certification status to the retailers of organic food on a store-by-store basis with annual inspections of each store listed on an organic certification."

Now, this is important because this is different from the discussion document and the recommendations made in that. I understand there's not going to be a vote on that, but I wanted to bring this to your attention.

There are several reasons itemized in this. There are some good things in this discussion document. The identification of the need for a strong internal control system, very important, needed, but one of our concerns articulated in this letter and brought forth is the creation of basically a two-tier system.

Some of the signators of this letter have multiple stores, retail stores, and they get those annually inspected, and
they have certification for each one of those
stores. So they are on there as well as
single store operations.

And I just want to close this part
of the letter by saying we are concerned with
equity and fairness, a certification program
that creates a different tier of store
inspection rates for large chains as opposed
to single store or smaller retail operations
creates a competitive advantage based on cost
for the larger operations.

So we're concerned about
integrity, ethics and the confidence of
consumers as they continue to go out, explore
and buy organic food in the marketplace. We
think the individual store certification, as
noted in this letter, provides a premium
value. It's something that retailers can
point to and show their customers. We are
about organics. We've made the effort. We've
gone forward. We're looking at each one of
our stores, and we're working with our
management employees to make sure that they understand organics and are handling it in the proper form.

I want to also just add one other point about some retailers that we have called attention to in the past that haven't been doing this right, in particular, Wal-Mart. We filed a complaint based upon systemic violations of the display and presentation of organics in their stores. The State of Wisconsin Consumer Protection Office reached an agreement with Wal-Mart to stop those practices, as did the USDA.

So again, this type of practice, we believe, allows for the stores that are truly interested to demonstrate to their customers that they are willing to take that extra step to do it right.

One other quick comment on a totally separate subject. I mean, I go back to the organic livestock rule, which we, too, are waiting for, and we support the work of
Mr. Matthews on that. Our one addition to the discussion that we've heard so far is that we want the rule done right. It's not enough just to get it out fast. We want it done right.

So with that I'll close, and if there are any questions that anybody has, I'd be happy to take those.

CHAIRMAN MOYER: Questions or comments from the Board. Bea, then Tracy.

MEMBER JAMES: Thank you for your comments. Appreciate that.

I wanted to ask you if you think that the noncompliance issue with Wal-Mart perhaps could have been due to a lack of understanding or a lack of clarity as far as what was expected of them for retail certification.

MR. FANTLE: It was clearly due to that. We found this in multiple stores in five states, these types of practices. It was at a management level and their reluctance or
1 unwillingness to invest in employee and
2 management training in their chains, in their
3 stores in their chain across the country that
4 contributed to that problem. Their employees
5 did not know how to present organics, did not
6 know the difference between natural or
7 certified organic problems.

8 CHAIRMAN MOYER: Bea, a follow-up?
9 MEMBER JAMES: Yes. So I guess I
10 want to just put it out on the table right now
11 that I think that the heart of where the
12 discussion document is really trying to go is
13 in getting more clarification around what
14 voluntary retail certification means so that
15 all retailers whether it's a single or a
16 multi-site retailer understands exactly what's
17 expected of them.

18 And I think because originally the
19 recommendation was tied in with the farmer
20 grower group that there seems to be some
21 concern with the public and its duly noted
22 that perhaps the recommendation is trying to
find a way to circumvent that construct into
the retailer piece, and we'll discuss this
more tomorrow when the CACC really reviews the
document a little bit more.

But I think that where the
recommendation is trying or the discussion
document is trying to go is just seeing where
the industry has comment and understanding as
far as what does retail certification mean and
how are retailers supporting that.

And I think from a lot of the
comments that I've heard and read regarding
violation, when you have more than one store,
it clearly comes from a lack of understanding,
and so it's the goal of the discussion
document to get to a point where we can more
clearly define some guidance around voluntary
retail certification.

MR. FANTLE: I think you're
correct in that. I think the discussion
document does get at the internal controls and
the management procedures to be put in place
1 to help with that issue, and for that the discussion document is very valuable.
2 Our difference is on the multi-
3 store and the frequency of inspections.
4 CHAIRMAN MOYER: Thank you, Bea.
5 The Chair recognizes Tracy. Your question was answered? Thank you.
6 Anybody else on the Board,
7 questions?
8 (No response.)
9 CHAIRMAN MOYER: Thank you, Will.
10 Michael McGuffin and then Lorna Badman on deck.
11 MR. McGUFFIN: What do I have,
12 five minutes or ten? What is it?
13 CHAIRMAN MOYER: You have five minutes.
14 MR. McGUFFIN: Okay. Good afternoon. My name is Michael McGuffin. I'm president of the American Herbal Products Association, or AHPA.
15 Our members market products. They
sell organic food products like teas. They sell organic supplements, dietary supplements like tablets and tinctures. They sell organic herbal cosmetics like salves and soaps, and we also represent companies that grow organic herbs.

I'm here to discuss the document that was issued by CACC on March 13th where they recommended organic cosmetics and personal care products be recognized explicitly by the NOP and more specifically, I'm here to express support for the stated purpose of that document, which is to present the topic for public discussion and comment and then to incorporate feedback.

I last addressed this Board on a different topic, dietary supplements. At that time NOP had said dietary supplements can't comply with NOP. We argued that we should be able to. That issue was resolved in August of 2005 when USDA issued a memorandum stating that it clarified its position that the issue
or products that meet the NOP program standard
for organic products is based on content
irrespective of the end use.

We think that should also be
applicable to cosmetics generally.

That memorandum in '05 went on to
acknowledge that products may be certified.
Dietary supplement products may be certified.
Cosmetic products may be certified under the
NOP and also closed by stating that if
additional rulemaking is required to address
labeling issues or the use of synthetics and
such products, NOP would pursue rulemaking
expeditiously.

So we've known for four years that
cosmetics and personal care products may be
marketed as organic, and there now are NOP
compliant organic cosmetics in the
marketplace. These are agricultural products
since they're derived from organically grown
plants. There has been much less clarity on
and, in fact, controversy as to whether or not
cosmetics and related products are allowed to bear the word "organic" outside of the NOP, not in full compliance with the NOP.

Some companies view the NOP as designed primarily to deal with foods and believe it to be incapable in its current form of addressing many of the ingredients used in cosmetics even when derived from organicly grown herbs and other plants because they'll fall into the definition of synthetic.

And while the NOP has a process for dealing with some synthetics, many companies don't see an option for marketing organic cosmetics under the NOP. But the continuing interest in this class of organic cosmetics has led to the development of private standards, and in just April of '08 NOP issued a document on cosmetics, body care, products and personal care products in which it stated that these products may be certified to private standards and be marketed to these private standards in the U.S. and that USDA's
NOP does not regulate these labels at this time.

Now, we have member companies that have been involved in the development of the private standards. We have other member companies who think that USDA is abdicating its responsibility to protect the integrity of the organic mark across all classes of goods, and what we do have though is a consensus, is that it's clear that additional effort must be given to making the NOP work for all agricultural products to fix the NOP so that it works even for organic cosmetics and body care and personal care products.

So, again, we support the purpose of presenting this topic for discussion. We have some suggestions for modifying the specific recommendations that are outlined on page 2 of that document. I don't know that I have time to articulate those. So let me see. If I have a few seconds left, I'll come back to that if I do.
But I think another thing that we all agree on is we want to maximize the use of the marketplace for organically grown herbal crops. Our vision is more and more and more acres of organic herbs. It may now be time for USDA's NOP to be called upon to pursue the additional rulemaking that it promised back in 2005 to address labeling issues and the use of synthetics.

Let me just mention one of the points that we would add to modifying the existing regulation. I think we should look at whether or not we can add a new paragraph to 205.605. Right now there's a natural ingredient, synthetic ingredient, and maybe we need a class of synthetics used in cosmetics and include in that not just the ingredient, but something about the processing because what we're looking for is a way to make the NOP work for cosmetics, and that's the key issue, is how do we deal with these synthetics.
I do have other comments, and they'll be in my written comments that I submit to whomever I'm supposed to send those to.

Thank you.

CHAIRMAN MOYER: Thank you, Michael.

Any questions from the Board for Michael? Joe.

MEMBER SMILLIE: In 605(b), rather than creating a different section, although I think maybe in the end run eventually I'd like to have a section that's devoted to personal care; I think that might be appropriate. We have livestock; we have processing; we have crops, and maybe this could be split off. But we can certainly do annotations. So it's a possibility in the future that certain essential ingredients that perhaps are considered synthetic but come from organic ingredients could be annotated for personal care use only. I mean, that's an
option that we would have in the future, to
create a set of allowable synthetics, because
that's probably going to be what's going to be
needed, regardless of where we end up on the
synthetic/non-synthetic debate.

I think probably most of these
things will end up being regarding the
synthetic, but we have got that ability to
create allowable synthetics, and we have the
ability to annotate them for specific uses.

So that's a possible future way without
changing the regulation whatsoever I don't
think.

We could create the possibility of
an enlarged organic personal care industry.

We also can't annotate certain substances that
can be allowed and made with organic
ingredients and not allowed in organic.

So there are possibilities. There
is flexibility within the regulations to
accommodate the personal care industry and its
needs. Again, whether this will be considered
by some people as diluting the organic
standard is the political and social issue we
will have to face.

In your specific comments, which
direction in general does your industry want
to go? Does it want to just work with the
605(b)?

MR. McGUFFIN: What I know is that
the companies that have invested resources in
developing these private standards are not
interested in being able to only put their
product on the back of the package. They want
to be able to grand the product as organic on
the PDP. I don't stand here as knowledgeable
about the complexities of the regulation, as
many of you. So as much as anything my hope
was just to put it forward that I know that I
represent a community that's interested in
trying to make the NOP function so that we can
brand organic products without diluting the
quality of the brand.

And I think one of the issues in
terms of these four specific recommendations,
to add the words "or cosmetics," one thing
that we think is that it would be a whole lot
better to revise the definition of the term
"agricultural product" so that it uses that
language that USDA has used before, that it
says that the term as used herein without
regard to the end use of the product, and
maybe even say "for example, foods, cosmetics,
dietary supplements, and any other product
made from an agricultural crop."

I think that could resolve this a
little cleaner.

CHAIRMAN MOYER: Thank you, Mr.
McGuffin.

MR. McGUFFIN: Thank you very
much.

CHAIRMAN MOYER: Any other
questions?

(No response.)

CHAIRMAN MOYER: Thank you.

Lorna Badman and then Lynn
MS. BADMAN: Good afternoon. My name is Lorna Badman, and I am the senior standards developer at NSF International.

Thank you for your time today.

NSF International would like to inform the NOSB that an American national standard for organic personal care products has been adopted through a consensus process after five years of work. NSF has actively facilitated the diligent work of a volunteer stakeholder group in the development of a personal care standard which follows the example of the NOP and encourages the use of NOP certified ingredients in the development and production of personal care products.

This volunteer stakeholder group remained cognizant of the scope of the national organic program. It was the desire of this group to create a standard that followed the rules of the NOP, but expanded the scope to cover processes that are specific
1 to the production of personal care products.
2 
3 An example would be
4 esterification, the reaction of a carboxylic
5 acid and an alcohol in the presence of an
6 acidic substance which is allowed under NSC
7 ANSI 305, but not the USDA NOP. Products
8 intended to be labeled with the organic
9 processing claims currently defined under the
10 USDA NOP, including 100 percent organic,
11 organic and made with organic, are not covered
12 by NSF ANSI 305.
13 NSF International, an independent,
14 not for profit organization, is a public
15 health and safety company headquartered in Ann
16 Arbor, Michigan. NSF's primary focus is to
17 improve human health through standards
18 developments, testing and certification
19 services that help to improve air and water
20 quality, food safety, and environmental
21 preservation.
22 Since its founding 1944, NSF has
23 adopted 49 ANSI accredited standards, many of
which are referenced in local state and federal regulations.

NSF ANSI 305 was developed by the Joint Committee on Organic Personal Care, which is comprised of a balanced representation of stakeholders, including industry, public health and regulatory officials, academia, and non-government organizations, users, consumers, advocates, and trade associations.

NSF International administered the committee in accordance with the American National Standards Institute's accredited standards development process. ANSI is a private, nonprofit organization that administers and coordinates the U.S. voluntary standardization and conformity assessment system.

ANSI accredits NSF's volunteer consensus standards development process. This accreditation verifies that NSF develops public standards in a manner which insures
openness and due process, allowing for equity and fair play.

The intention of this standard is to address the organic personal care labeling misconception that currently exists in the market. Products not certified to the NOP but claim to be organic which have little organic content are prevalent in grocery and retail stores. NSF invites you to review the standard and take part in the NSF standards development process.

Should you decide to expand the scope of the National Organic Program to cover cosmetics and personal care products, NSF welcomes your review and consideration of a reference to the NSF ANSI 305 in the NOP.

Thank you.

CHAIRMAN MOYER: Thank you. That was very well done.

Any questions? Tracy, please.

MEMBER ELLOR: Ms. Badman, I just had a comment for you. I wanted to make sure
you knew that did circulate the NSF draft, the January 2009 draft, which we thought we had access to as opposed to the final standard, which I know has copyright protection, and so every member of this Board has a copy of that.

MS. BADMAN: Okay, good.

CHAIRMAN MOYER: Thank you, Tracy.

Any other questions or comments from the Board?

(No response.)

CHAIRMAN MOYER: Thank you.

Lynn Clarkson and then Dr. Szuhaj.

DR. SZUHAJ. Szuhaj.

CHAIRMAN MOYER: Szuhaj will be on deck.

MR. CLARKSON: Good afternoon, Board members. I want to take you on a walk through organic evolution of an ingredient, lecithin.

Below the line, when the NOP took its first breath, soybeans existed, but the material above it didn't and that's all
organic lecithin. We support the Handling Committee's recommendation to remove bleached lecithin from 605(b) for a classic reason: an organic version exists.

Number two, we support the Handling Committee's recommendation to remove fluid unbleached lecithin from 205.606. Classic reason: it exists and has been in commercial use since 2004.

We accept the annotation to leave de-oiled lecithin on the national list because de-oiled organic lecithin is not commercially available at this time. Some time in the future it may be, but not at this time.

Next.

These are the organic lecithins that are available at this time. The upper bowl is your standard lecithin used in commerce. Lower left is bleached. Across from it is what we would call a dry lecithin. It does not mean de-oiled. It means that a fluid lecithin was absorbed on a carrier, such
as a multi-dextrin and can be used in a dry situation. It is not de-oiled, which many people confuse between dry and de-oiled.

And at the bottom you have the very low micro lecithin currently in use by cosmetic companies who are concerned that some of the lecithin will get in the eye which lacks the protection of the stomach.

Next.

Since bleached lecithin is of key concern here, I thought you would like to see it being made. The picture on the left is where lecithin in gums is coming out of a process line and being bleached. That is the only time where you can bleach lecithin.

You can de-oil lecithin later. You can take organic lecithin and de-oil it later with acetone. You cannot remove it and later bleach it. It has to be bleached now.

On the right-hand side, finished product, bleached lecithin ready to go into commerce.
Next.

Now, organic lecithin availability. Where does lecithin come from? Typically it comes from an oil seed. On the right-hand side you've got your crop sources, your primary, soybeans, canola and sunflowers. From the source of organic soy, we have fluid, bleached fluid, and dry blend, every one available in organic form.

We have made organic canola lecithin and fluid bleached and dry blend form. I would not say it is commercially available at this time. We're awaiting orders. We have not had any orders for it. We have it sitting on an inventory floor.

Organic sunflower lecithin we have made, but it is not commercially available at this time. It's under development.

Now, out of any of those sources, de-oiled version is not available. So it's appropriate to retain.

Next.
Lecithin under the USDA seal. It should mean organic. It doesn't. You can walk into any store in the country, walk through the grocery store shelves, and looking at the seal you will not know whether organic lecithin or non-organic lecithin is in the product that uses lecithin. You have to read the ingredient package.

The ingredient panel, well, it would be nice to use the seal as a shorthand way to know what you're buying.

Non-organic lecithin, the production system is non-organic farming. Our production system, organic. With the non-organic farming system, any pesticide in use is going to be out in that farm. We will allow pesticides only if they're on the national list. An extraction of almost all of the oil from which lecithin is extracted from the non-organic is hexane. We use pressure and heat. Everything else about what we do is organic.
Next.

Uses: food supplements, release sprays, personal care and industrial. I could lead you through examples in many of these categories starting with infant, toddler and right on through to cookies, but neither you nor I have the time for that. So I've picked a few to show you.

Please, next.

Organic formulas for infants and toddlers. Some use organic lecithin; others don't. If you'll follow the green arrow, it will carry you to a panel showing organic soy lecithin. If you'll follow the red arrow, it'll be a non-organic soy lecithin.

The upper canister on the left is a dry product. You've been told in some comments that it's impossible to mix a fluid lecithin with a dry product. Huh, really? It doesn't look impossible to me.

The lower canister on the left is not under the National Organic Program. It is
a baby food that belongs to a Korean company that very much wanted to be organic. They were our first client for organic lecithin in 2004. They continue to be a client today. That is one of the world's more organic products.

Next.

Chocolate bars using organic lecithin. Some do and everyone on this page does. Every arrow is green. If you'll look at the one on the lower left, you'll see an arrow going to soy lecithin with an asterisk. The asterisk says that it's organic.

Next.

Chocolate bars not using organic lecithin. Now, from a consumer standpoint, these chocolate bars are essentially interchangeable. The marketing department of every company will argue, but they're essentially interchangeable with the one on the prior slide. Not a one of these uses organic lecithin, despite being quite aware of
its existence.

Next.

Certified organic vegetable oil sprays. Lecithin plays a significant role in this. You've got two with organic lecithin and three without.

Next.

So what conclusions can you make from a brief visit through the store and reading panels? I think it would be safe to say organic lecithin now meets commercial quality and supply standards, has penetrated the market significantly.

Two, I think continuing allowance for non-organic lecithin, bleached and unbleached, encourages a wide range of interpretation by vendors, processors and certifiers, all gathered together under the USDA seal.

The NOP rules should encourage organic production and use of organic ingredients, agriculturally grown organic
ingredients. So we would like to ask that the

NOSB support the recommendations of your

Handling Committee. Your decision in favor of

removing bleached lecithin and unbleached

fluid lecithin, as proposed, supports the

organic first principle. It increases market

for organic crops, and it will encourage

innovation and competition.

Final. One more.

We tend to forget often in our
discussions one of the foundation stones, and
that's the organic farm. On the right you've
got one from central Illinois standing in an
organic bean field, growing organic beans,
looking for organic markets.

We have seen an evolution in at
least this ingredient, and I think you'll see
it in other ingredients, and I think we have
now reached the time we need an evolution in
the rules to make it clearer what's acceptable
in the marketplace and what's not.

Now, how do I know what I'm
telling you is the truth? Truth is an elusive concept in many locations. Well, we've monitored our penetration of the market. We talked to users. We talked to people who aren't users, and we reached out to see if we couldn't find an impartial party that knew a lot about phospholipids and lecithin, and we reached out to a gentleman by the name of Dr. Bernie Szuhaj, and we've asked him to speak to you today.

He has a reputation for expertise in this field that's worldwide and goes way beyond my company or this particular discussion. So I would hope that you would regard him as a neutral party of science.

Questions?

CHAIRMAN MOYER: Questions or comments from Board members? I'm sorry. Katrina and then Joe.

MEMBER HEINZE: As we've tried to understand lecithin in all its varieties, I want to make sure I understood correctly that
de-oiled in either an unbleached or bleached form is not currently commercially available.

MR. CLARKSON: The only reliable and high quality method of producing de-oiled amino right now uses acetone, which we cannot use under organic certification. So the answer is we do not currently know how.

There are a couple of techniques that were studied that might work, but those are probably a year to two years away, and I can't tell you that they work.

So the short answer to your question is we can't make, we don't know how to make it right now.

MEMBER HEINZE: So I have a follow-up to that, but then I think what I heard was that it is possible to have organic bleached lecithin.

MR. CLARKSON: Yes, we have it today.

MEMBER HEINZE: So one option that might be available to us would be to move
bleached lecithin to 606 with an annotation
only the dry de-oiled.

MR. CLARKSON: That would be possible.

MEMBER HEINZE: Thank you.

MR. CLARKSON: You're welcome.

CHAIRMAN MOYER: Joe.

MEMBER SMILLIE: My main question was answered. Katrina had the same question, but a follow-up. Could you just walk me through once again how the dry is created from a fluid sprayed on a substance?

MR. CLARKSON: Okay. Whether you're dealing with a conventional or an organic lecithin, you're starting with a base dock of fluid lecithin. It has a very, very low moisture level. All right? So you're not going to dry it with heat. You need to take the oil out to de-oil it.

But to provide you a dry form, you put it on a multi-dextrin or flour as a carrier, as a neutral carrier. In that case
you could make it out of organically certified multi-dextrins or flours, and you would have a dry form of organic lecithin. It would not be de-oiled, and many people that submitted comments and were concerned about using access to a particular form of lecithin were addressing you, in my mind about de-oiled lecithin.

MEMBER SMILLIE: So also as far as the carrier goes, you can choose from a variety of carriers then. You're not restricted to multi-dextrin.

MR. CLARKSON: Correct.

MEMBER SMILLIE: Okay.

CHAIRMAN MOYER: Thank you, Joe. Dan.

MEMBER GIACOMINI: Thanks, Lynn. Regarding the petition for 606, fluid, unbleached lecithin, you have the product.

MR. CLARKSON: Yes.

MEMBER GIACOMINI: It's not
extensively being utilized.

MR. CLARKSON: Excuse me. Did you say unbleached or bleached?

MEMBER GIACOMINI: The unbleached, the petition for 606 right now.

MR. CLARKSON: It is being reasonably extensively utilized. We have set up a table in the back with a number of products you are certainly free to sample, and we've been shipping it commercially since 2004.

CHAIRMAN MOYER: Okay. Thank you. Tracy.

MEMBER MIEDEMA: Is there any difference in the quality or form of this that hasn't been captured yet in your presentation around flavor or mixability that would warrant it staying on 606?

MR. CLARKSON: I am unaware of any differences, but the better person to answer that one would be Dr. Szuhaj. You might be inviting a comment about is there a difference
in flavor color or quality from other sources
of lecithin, such as sunflower lecithin or
canola lecithin, and all I can tell you is
that the people who make those lecithins
publicly announce that they're
interchangeable. There's no difference in
terms of color, flavor or functionality.

CHAIRMAN MOYER: Okay. Thank you,
Lynn.

MR. CLARKSON: You're welcome.

Thank you.

CHAIRMAN MOYER: I just want to
remind the Board that we've gone through 15
presenters and we have about 48 to go yet. So
make sure that your comments and questions are
pointed. We certainly want to get everybody
to have the information that they need as we
move into the decision making process
tomorrow.

Dr. Szuhaj.

DR. SZUHAJ: Thank you very much.

For the sake of clarity, my name
is pronounced "shuhi." Just think of high shoes and reverse it, "shuhi."

I am here to present technical comments on organic lecithin to the Board, and I am the president and owner of Szuhaj & Associates.

Next slide.

Not to bore you with my key technical qualifications, I have my Ph.D. in biochemistry from Penn State University in 1996. I have over 40 years of experience in lecithin and lipids. I have several publications and patents, and I'm past chairman and president of the American -- this is wrong -- that should be the International Lecithin and Phospholipid Society. This would be a promotion. Sorry. I'll send you a corrected.

Okay. Next slide. This is a tough one. This is not the one we should have. This is going to confuse a lot of people because the other one we have is green
and red, and is better. We want that one, the one that looks like that.

I know this is two o'clock in the afternoon and everybody is half asleep, but this will get you awake now. We need to go to the right one. All right. There we are.

Okay. Thank you.

Okay. To clarify some of the questions we're going to talk about, this is the simplified production process for different types of lecithin. Here you can see the oil seeds which might be soy, canola or sunflower, and they go through this process of either being expelled or hexane extraction. Now, the things that are green are organic. The ones that are red are non-organic, and then you can see a combination of organic and non-organic.

What happens is the lecithin is expressed out, and you have crude oil. You add water to this crude oil and you get the gums.
Okay. From here you can take the gums and Lynn said, and you can bleach them, and you can go have a bleached lecithin, or you can take the bleached product and come down here and move remove the oil with acetone.

You can also take the materials from the gums and have the standard fluid lecithin product here and you can blend it. And then when you blend it, you can make the dry product, and I think that's being passed around.

Now, I'd like to correct something here. In the industry the word "dry" is not used. It is just "de-oiled." I don't know where that came from, but that's a misnomer to call it dry, and I think they come up with this because you have a food product and you have the granules. So, therefore, you call it dry, but really in the industry it is called de-oiled.

This one, however, is considered
as a dry product because you have lecithin coated onto a multi-dextrin.

I should mention something here in the area of bleaching. I think some people might think that when we're talking about bleach we're talking about sodium hypochlorite, which is a normal bleaching agent, and you might be using that as part of the discussion here.

Here we're talking about hydrogen peroxide. This is the bleaching agent that's used to lighten the color, and the only thing you're impacting here are the chromophores that are present, primarily the pigments.

Next slide. Oops, we have to go back to the other one. No, we just need to go to one that looks like this. Oh, well, it's apparently not in that. I don't know where it went.

Okay. Well, let me say what's on this sheet, for the Board members here, this was to cover the estimated world's share of
lecithin products. You need to know that there are approximately 250 to 300 million pounds of lecithin worldwide, and liquid lecithins make up about 80 percent, 27 percent which are standard fluid; 38 percent are reacted or modified. The remaining 20 percent is de-oiled, and of that 80 percent goes into the nutritional supplement market and 20 percent goes into the food sector.

Now we can go to the last one that says organic standard fluid products. Okay. Apparently this is the wrong thing that got in here, but what I wanted to say about the organic standardized fluid lecithin, the Board needs to understand that functionality is based on phospholipid composition, not color, not necessarily viscosity or flavor, and the same thing goes with organic bleach. It's the phospholipid composition that makes a difference. Lecithin is bleach with hydrogen peroxide to lighten the color and not to reduce microbes. Microbes are controlled in
the gum drying process.

CHAIRMAN MOYER: Okay. Thank you.

Questions? Joe.

MEMBER SMILLIE: Well, where does the hexane come from in organic lecithin?

DR. SZUHAJ: If you're looking at this word "hexane" here, this is the test method that's used. Use hexane to dissolve the lecithin, and you collect the particle matter on the filter. So there's no hexane in lecithin. That's just a test method.

MEMBER SMILLIE: Oh, okay.

CHAIRMAN MOYER: Thank you, Joe.

Does anybody else have any questions? Tracy, please.

MEMBER MIEDEMA: Would you mind just repeating that bit about the functionality is the phospholipid composition?

DR. SZUHAJ: Right.

MEMBER MIEDEMA: Can you just elaborate a little bit on that?

DR. SZUHAJ: Yes, I can. The
phospholipid content is what makes lecithin do
its function, and the phospholipids are
phosphocholine, phosphoethylnolamine, and
phosphotilenostol. There are three major
phospholipids in lecithin. These are the same
three that you find in almost all of the oil
seeds that were shown up there, sunflower,
canola, and corn, cotton seed. They all have
the phospholipids as the functioning agent in
the product.

CHAIRMAN MOYER: Okay. Thank you very much.

Katherine DiMatteo and then we have Lulu Kurman on deck.

MS. DIMATTEO: All right. Thank you, and I think the microphone is the right height for me.

My name is Katherine DiMatteo. I'm with the consulting firm of Wolf, DiMatteo & Associates, and I have been working with Lynn Clarkson and learning a lot from Dr. Szuhaj about lecithins, and I don't know that
I can answer all of the questions that they have, but I certainly have begun to understand a lot more about it. But what I want to say in particular is urging you to take bleached lecithins off of 605 because you can make lecithins using hydrogen peroxide, which is allowed under the National Organic Program, and you can start with an organic agricultural ingredient, whether that's organic soy or organic canola or organic sunflower. So you can end up with a bleached lecithin in compliance with the regulation.

I also want to urge removing the fluid lecithins from 606, again, because they are commercially available and because your annotation, especially if it says de-oiled, which seems to be the correct annotation or dry de-oiled, would allow for both what is not commercially available and for anybody who is producing something with allergens that can be available in a de-oiled form.
But mainly I wanted to say it's your decision. You have to be decisive, and there's a lot of arguments that have come forward about what is needed by the processing industry, and for many of those who know me and some of you who don't, I'm almost always the one who is characterized as representing the processor and allowing for use of almost everything so that processors can make as much organic product as possible. Because I believe that we shouldn't put artificial barriers in the way so that more farm products are sold. If we can sell as much farm product through processed products, that's great.

But I always believed that because I also always believed that when something was available in an organic form, it would be used, and that when the proof came forward to the National Organic Standards Board, things that were on the list would get taken off, and that's why I would argue strongly always for processors to be allowed to make as much
processed product as they possible could following the rule and even allowing the processing aids that they needed to have.

Now we have a great case. You have a great example right here and an opportunity to move forward and to really follow through on this balance of integrity and growth. We've had the growth. We can maintain the integrity now by taking those lecithins off that no longer are needed to be on the list.

And the last thing I wanted to say, that it really is the time for you to make this decision. Please don't delay this any longer, and here's why. If you make this decision today, it's likely that it won't be implemented or off the list for about two years, and not because of anybody's fault. It's just that it's a long process.

We just heard that the materials that you approved in November of 2007 will soon come out as a proposed rule. So if you
take this off today, there is time for people
in the industry to make adjustments if they
need to to use organic lecithin or to use the
dry de-oiled lecithins in the forms that they
need for their products.

Thank you very much.

CHAIRMAN MOYER: Thank you,
Katherine.

Comment or question? By Joe.

MEMBER SMILLIE: So now that we're
educated about the de-oiled versus the dry,
what you're saying is that if we leave de-
oiled lecithin on 606, that will allow the so-
called allergy concerns to be met.

MS. DiMATTEO: Allergy, yes, and
the de-oiled needs.

MEMBER SMILLIE: De-oiled needs
because we can't de-oiled organic.

MS. DiMATTEO: Right.

MEMBER SMILLIE: Okay. So some
people might move to de-oiled lecithin because
they don't want to pay the price for organic
lecithin, but it does provide that window for those needs that are truthful.

MS. DiMATTEO: Right.

MEMBER SMILLIE: We haven't discussed the whole allergy thing yet, and I think that that's one of the inputs that we got, and you're probably not an allergy expert. So I guess we'll wait on that, but I just wanted to remind the Board that one of the concerns we had about removing lecithin is that people who were allergic or who maybe were truly allergic to soy or maybe allergic to reading soy on a label, maybe it's not really an allergy concern and Katrina may have something to say about that, but that way they could have something on a label that wouldn't affect their allergy concerns, real or perceived.

So I think we'll have to have that discussion once we have someone, if we have someone, that objects to us removing lecithin from the list based on allergy concerns.
MS. DiMATTEO: Right, and I'm not an allergy expert.

MEMBER SMILLIE: Right.

MS. DiMATTEO: I don't even have an allergy.

(Laughter.)

MS. DiMATTEO: But what I would have to say is, and again, this may be surprising for some of you in the room who know me, I don't know that the organic rule has to solve all the problems that are out there. It's about organic. It's not about allergies, and even though, you know, it would be wonderful to meet every single processor's need and every single person's need about the particular kinds of products that they want to have, I don't know that that's the job that you're asked to do.

Thank you.

CHAIRMAN MOYER: Thank you.

Just a minute, Katherine. Julie.

A question from Julie.
MEMBER MIEDEMA: It's actually not specifically a question for Katherine, but I just wanted to be sure that -- I wanted to know if during the discussion period when the Handling Committee is going to be discussing this tomorrow if Dr. Szuhaj is going to still be here tomorrow.

MS. DIMATTEO: Yes.

MEMBER MIEDEMA: Was that yes?

CHAIRMAN MOYER: He indicated yes.

MEMBER MIEDEMA: Thank you. So then I feel more comfortable about moving on because I know we'll still have resources available.

MS. DIMATTEO: Lastly, in the back of the room we've got a display of products with and without organic soy.

CHAIRMAN MOYER: Thank you, Katherine.

Lulu Kurman and Zareb Herman on deck.

MS. KURMAN: My name is Lulu
Kurman, and I'm the manager of Regulatory and Scientific Affairs at Solae, a manufacturer of non-organic bleached de-oiled lecithin sold to producers of products labeled as organic or made with organic. We also sell quite a bit to the conventional food market as well.

I would like to thank the NOSB Committee for allowing me the opportunity to speak today.

Solae would like to express its concern with the Clarkson's soy products petition to remove lecithin, bleached, from Title VII, Part 205.605(b) of the Code of Federal Regulations. As Solae is not aware of any certified organic emulsifier or other substance currently on the national list that provides equivalent functionality to bleached de-oiled lecithin.

In addition, Solae's concerns about the removal of all forms of bleached lecithin from the national list is heightened as we are not aware of any suppliers of non-
Finally, we would like to emphasize the significant difference in form and function between de-oiled lecithin and powdered lecithin, a distinction which we feel is not clearly made in the Clarkson Soy Products petition.

De-oiled lecithin is an emulsifier that exists in powder form. In the production of de-oiled lecithin, liquid lecithin is treated with hydrogen peroxide as a precaution to guard against microbial growth before the de-oiling process commences. A secondary effect of the antimicrobial hydrogen peroxide treatment is a slight bleaching of the lecithin.

The acetone insolubles, or AI, is the active portion of de-oiled lecithin. It consists of a complex mixture of polar molecules, primarily phospholipids. The minimum AI of Solae de-oiled bleached lecithin is typically 97 percent, while the AI of
organic liquid lecithin is typically no greater than 65 percent.

De-oiled lecithin is simply lecithin and does not contain carrier ingredients such as multi-dextrin, which dilute the AI. Other dry lecithin products, however, such as the Clarkson Soy Products granules are produced by combining fluid lecithin with a carrier.

Bleached de-oiled lecithin is used in many food emulsions where water is the continuous phase into which oil is dispersed, known as oil and water emulsions. Examples of product applications can be found in beverage, sauce, soup, dairy product, and frozen dessert categories. The apparent hydrophilic, lipophilic balance, or HLB, of de-oiled lecithin is seven, making it water dispersable and very effective at emulsifying oil into a continuous water phase.

Standard lecithin, such as typical organic liquid lecithin has an apparent HLB of
four. Emulsifiers with HLBs less than six are generally ineffective for making oil and water emulsions.

Powered lecithin that has not been de-oiled is not water dispersable, nor is it an effective emulsifier for oil and water emulsions. Aside from its increased functionality compared to standard lecithin in many food applications, bleached de-oiled lecithin has a blander flavor. The de-oiling process removes much of the bitter and beany tasting components of standard lecithin, making de-oiled more readily usable in foods with a delicate flavor.

The Clarkson Soy Products granules which are not de-oiled cannot be expected to have the same bland flavor profile as de-oiled lecithin.

Aside from the inability of the Clarkson Soy Products granules to function similarly to non-organic bleached de-oiled lecithin, we further question the validity of
the petition to remove lecithin, bleached,
from the national list as Clarkson Soy Products is not offering an organic equivalent that can be labeled as lecithin in compliance with the U.S. food labeling laws.

The Clarkson Soy Products specification for organic soy lecithin granules dated April 2008 states that the product meets lecithin requirements under Title 21, Part 184.1400 of the CFR. The Clarkson specification, however, states the hexane insolubles are less than one percent.

The food chemicals Codex specification for lecithin, which is referenced in 184.1400 of the CFR, lists a requirement for hexane insolubles to be less than 0.3 percent.

In order for a lecithin to truly be called a lecithin or declared as lecithin in an ingredient statement, the additive must meet the food chemical's Codex specification. If a producer of organic products were to use the Clarkson granules in their formula, they
would be required to declare soy phospholipid 
emulsifier or some other adequately 
descriptive and non-misleading name on their 
product label.

Thank you for your attention.

CHAIRMAN MOYER: Thank you.

Any questions or comments from 
Board members? Yes, the Chair recognizes Joe.

MEMBER SMILLIE: Are you going to 
be here tomorrow?

MS. KURMAN: What time?

MEMBER SMILLIE: What time is the 
HC?

CHAIRMAN MOYER: I'm sorry. I 
don't have that part of the agenda. It's in 
the afternoon.

PARTICIPANTS: Two o'clock.

CHAIRMAN MOYER: Two o'clock.

MS. KURMAN: My flight leaves at 
5:15.

MEMBER SMILLIE: You'll be here.

CHAIRMAN MOYER: That's a
1 definitely maybe. Okay. Thank you very much.
2 Appreciate that.
3          MS. KURMAN: Thank you.
4          CHAIRMAN MOYER: The Board
5 recognizes Zareb Herman, and then Amy Nankivil
6 is on deck.
7          MS. FRANCES: Hey, Jeff or
8 commenters, when you are on deck, that's the
9 time to give me the written materials that I
10 can pass out.
11          CHAIRMAN MOYER: Thank you,
12 Valerie.
13          Anything that can save this Board
14 time we certainly will appreciate it as the
15 day wears on. We do have a lot of commenters
16 and presenters to get through.
17          MR. HERMAN: I do have a proxy
18 from Paul Standing of Bloomfield Baker. So I
19 should have ten minutes to share, although my
20 comments should only take about seven minutes.
21          And excuse my hoarse voice. I
22 just have a little case of the swine flu.
(Laughter.)

MR. HERMAN: Just kidding, just kidding.

Can you hear me better?

My name is Zareb Herman, and I am representing the Hain Celestial Group, one of the largest producers of organic products in the United States. We sell over 900 organic products under many brand names, including Arrowhead Mills, Earth's Best, Health Valley, Spectrum, and many others.

Our history of promoting the organic movement in the United States goes back over 50 years. I'm also here today representing Bloomfield Bakers, who produce a large number of organic products at their two manufacturing facilities in California.

In addition, my comments have been endorsed by Country Choice Organics, a manufacturer of organic bakery products.

I'm here to comment on the two lecithin petitions. On the first page of your
handout is a chart that shows some of the categories of our organic products that utilize lecithin as a vitally important processing aid.

In our organic chocolate products, we use lecithin in liquid form. The organic form is available and we have been using organic liquid lecithin for a number of years. The same holds true for our organic spray oils. We use the organic liquid form.

For the next two categories of products, organic frozen desserts and low fat bars and cereals, these manufacturing processes require the use of an IP powdered, de-oiled water dispersable lecithin. This form of lecithin is not available in organic form. There is an organic granular lecithin sold by Clarkson, and I did bring a sample, but that's okay. And this product is, as has been acknowledged, just liquid lecithin that has been plated onto multi-dextrin and rice
flour. It is not de-oiled. It is not a true powdered, water dispersable lecithin, and it does not work in our applications.

Now, if I could direct your attention to page 3 of the handout and toward the middle of the page, and if you could read along with me I'd appreciate it, and this concerns the 606 petition.

The Handling Committee has acknowledged that there is not an adequate supply of organic dry, they call it, dry unbleached lecithin. However, besides the organic granular lecithin that does not work, this is what we know. Nearly all of the powdered lecithin commercially available is bleached. We very recently located one unbleached de-oiled powered lecithin that is sold in Europe. We have not been able to test it.

Now, because the current supply of powdered lecithin is bleached and because it needs to be de-oiled to work, we strongly urge
the Board to keep bleached lecithin on the 605(b) list. If bleached lecithin is removed, we and other companies will most likely have nothing to use in these applications.

If we are able to obtain a source of powdered unbleached lecithin, we recommend that unbleached de-oiled powdered lecithin be added to the list. I guess it would be the 606 list, but one alternative would be to add both the bleached and unbleached powdered lecithin on 605(b). That would be one option.

Now, regarding the use of hydrogen peroxide as a bleaching agent, the majority of suppliers we contacted said that they use it primarily to lower microbial contamination, an important food safety concern. They said that they use it secondarily to lighten the color. However, two of the companies stated that they use it primarily to lighten the color. However, with one exception, the product sold in Europea, they are all using hydrogen peroxide, but it is not present in the
finished ingredient. So it poses no health risk.

I want to make one point about GMOs. I've seen in some of the comments some proponents of these petitions claimed that non-organic lecithin that is used in organic products is sourced from genetically modified soybeans. This is not true. Our organic certifiers require us to use lecithin derived from non-GMO identity preserved soybeans.

Some claims have been made that gums can take the place of lecithin in food products. This is not true. Lecithin is primarily an emulsifier, while gums are used to bind water. We often use gums and lecithin together in the same products.

Some people claim that non-organic de-oiled lecithin contains hexane. This is also not true. Our two principal suppliers of powdered lecithin guarantee less than one part per million hexane residue, and the other suppliers guarantee that residues will be in
the low parts per million range.

When you consider that lecithin is used at less than one percent in food products, and when you consider that nearly all of these products are heated during processing, there is virtually no hexane that can be detected in the food.

We would all like to live in an environment totally free of organic solvents, but unfortunately the technology is just not there yet, but in terms of exposure, pumping one tank of gas into your car will probably expose you to more hexane than a lifetime of eating products made with non-organic de-oiled lecithin.

If you could return to the chart on page 1, there is one additional category of our products, organic baby cereals. We currently product these products in Germany. However, we did find a U.S. company that could produce it using liquid sunflower lecithin as a processing aid. They will not introduce soy
lecithin into their facility because they are concerned that their equipment will be contaminated with soy protein allergens.

And if you've ever worked with fluid lecithin, it's very sticky, and it's really hard to get off your equipment.

Now, the organic liquid soy lecithin that is currently available does test positive for soy protein, and it's a protein that is the allergenic agent in the food.

Now, regarding the sunflower lecithin, to our knowledge, it is not available, commercially available in organic form. If the NOP decides that all liquid or fluid lecithin must be organic, soy free facilities and products that are soy free will not be able to use liquid lecithin in those organic products.

And just to answer a question, de-oiling does not remove soy allergens.

Personally, I am a strong proponent of organic foods. I even managed a
health food store my college days, but as a scientist I make decisions based on facts, not on emotions. We sincerely hope that the Board will make a decision based on facts, not on smoke screens and we believe in some cases misleading information.

Lecithin if a vital ingredient in many organic food products. To deny companies the right to use DOL powered bleached lecithin will result in the loss of many organic products from the marketplace. This will negatively impact farmers, processors, retailers and, most importantly, consumers who will not be able to purchase these products. Many of these products have been consumer favorites for years, and we're talking about millions of pounds of organic ingredients and millions of dollars in sales on these products.

For this reason we strongly urge the Board to keep bleached lecithin on the 605(b) list or you may want to put it on the
606 list, however you work it out.

Regarding the 606 petition and liquid lecithin, we have been using organic liquid soy lecithin from one company, Clarkson, and the supply has been reliable. However, we do have serious reservations about giving a near monopoly to one company. The contacts we have had with these other organic liquid lecithin suppliers have not been good. We contacted the company in India recently, and they told us that they hoped to have organic certification in two to three months. We contacted a French company and spoke with a Fabian. Excuse my French or pardon my French. Anyway, she explained to us that they do not have NOP certificated organic lecithin. We found a U.S. supplier which supposedly was going to sell organic fluid lecithin, but I was not able even to get a specification out of them. So it was not encouraging.
Just one final comment. It's that for companies needing to use lecithin that is free of soy protein allergens, non-organic liquid sunflower lecithin and sunflower lecithin we recommend be added to the 606 list.

Thank you.

CHAIRMAN MOYER: Okay. Thank you, Zareb.

Are there comments or questions?

Bea and then Tracy.

MEMBER JAMES: Thank you for your comments.

My question was I was surprised to see Ersvest products that do not have organic lecithin in them, and the baby formula, in particular, and that Nature's One is able to make that with organic lecithin, and so I'm wondering why you're not.

MR. HERMAN: Well, that particular formula is packed for us. We essentially purchase that formula from that supplier, and
the particular methodology that they use, they explained to us that they cannot use that form. So, you know, for the baby formula products, we really are stuck with this formula provided to us.

And infant formula products go through a lengthy period of approval by the FDA and to introduce any change to one of those takes a very long time.

CHAIRMAN MOYER: Okay. Thank you.

Tracy.

MEMBER MIEDEMA: I just had a question. I'm trying to synthesize this data in real time here while it's coming in as opposed to on day three when we're a little bleary-eyed. And what I'm hearing first from the petitioner and, Lynn, jump up and correct me here if I'm wrong; you said the words it would be appropriate to retain de-oiled lecithin on 606.

MR. CLARKSON: I did.

MEMBER MIEDEMA: Okay, and then
the council from Solae sounded like her company needed the same thing, needed de-oiled, and I'm not sure whether they're talking about needing both bleached and bleached, but it sounds like, yes, both bleached.

MR. HERMAN: Yes.

CHAIRMAN MOYER: Please stand up and state your name for the --

MS. KURMAN: Lulu Kurman from Solae.

We do not make an unbleached de-oiled --

MEMBER MIEDEMA: Okay.

MR. HERMAN: Yes, and that's what we have also found. No one is making unbleached de-oiled lecithin. I shared we found one company that's selling some in Europe, but we haven't had a chance to test it. You know, I know the Handling Committee had recommended that unbleached powdered lecithin we retained, but there is no
unbleached. So it doesn't do us any good. It has to be bleached because that's what's available.

MEMBER MIEDEMA: Okay.

CHAIRMAN MOYER: Valerie, program?

MS. FRANCES: I just wanted to remind folks that when public comment is coming in off the floor and not on the mics it's not captured in the transcript.

CHAIRMAN MOYER: Yes, thank you, Valerie.

MEMBER MIEDEMA: then I'll go ahead and restate that in the audience Lynn Clarkson did affirm that, and he's the petitioner, that he's comfortable with the retention of bleached de-oiled lecithin, and that would be on 606, right?

MR. HERMAN: Yes.

MEMBER MIEDEMA: Okay, and that's workable for both of the commenters that we've just heard from as well. So I'm just trying to find where there's consensus among people
and synthesize.

MR. HERMAN: Well, yes. So then you're saying you could move the bleach from 605(b) to 606. Is that what you're saying you're going to do?

MEMBER MIEDEMA: I'm basically looking at it if we were somehow able to wipe the slate clean and do what is best, you know, what that would look like. So I don't know whether from a regulatory standpoint rearranging things on the list is possible, but we can cross that bridge a little later.

CHAIRMAN MOYER: I think you're right, Tracy. We can wipe the slate clean in that regard and start.

The Chair recognizes Julie.

SECRETARY WEISMAN: Yes, there were two things that just came up from me. I do believe that some questions that the Handling Committee put out just ahead of this meeting regarding -- we have some other information to look at about the microbial
issue and bleaching because I think we do have some conflicting information that we need to sort through.

Secondly, Ms. Kurman from Solae mentioned that they used to make an unbleached de-oiled lecithin a long time ago and that there was no demand for it then, and I have heard also Mr. Zareb also talking about how there's no unbleached dry -- Mr -- wait. That's your first name. Mr. Herman. I'm sorry.

MR. HERMAN: That's all right.

SECRETARY WEISMAN: That there is no unbleached de-oiled lecithin available, and this is an issue that we contend with all the time when we're considering 606 petitions. It doesn't mean that it can't be done, and the fact that I hear that it was done a long time ago and it wasn't being -- but none was sold, that was then and this is now. So I would like to encourage everyone to also keep in mind that maybe I believe for sure there was
no market for it many years ago, but I don't think that would be the case today.

MR. HERMAN: Currently, it is not commercially available. So, you know, we're sort of stuck right now.

SECRETARY WEISMAN: So our job here is now to ask why not. That's what information we need now.

MR. HERMAN: Well, and I have asked these questions of the suppliers, and like I mentioned, the majority of them say that it's there to reduce the microbial count, and so, you know, that's a really important concern in food safety.

SECRETARY WEISMAN: Thank you.

CHAIRMAN MOYER: Thank you, Mr. Herman.

The Board recognized Amy Nankivil and Methias Rebmann is on deck.

MS. NANKIVIL: Thank you.

Many of the points I was going to bring up have been brought up. So I will try
to keep this short and concise.

I am Amy Nankivil. I'm with Northland Organic Foods. Thank you for the opportunity to speak today. I think it's great to finally get everybody together to actually figure this deal out.

So I'd like to make a few comments regarding the Handling Committee's recommendation to remove bleached lecithin as an allowed substance on the national list under 205.605(b). This is the only part of it that I'm dealing with. I'm not dealing with the unbleached part of this.

The last time this issue came before the Board in 2006, the committee summarized its final decision stating it has become clear that although there are plentiful non-synthetic and organic alternatives to synthetic bleached lecithin in liquid form, there is current no such alternative for bleached lecithin in dry de-oiled form. The Board strongly hopes a petition will be
presented in short order to restrict the use of bleached lecithin to dry forms only. My first comment is to point out that nothing has changed regarding the availability of organic forms of dried de-oiled bleached lecithin, the form of dry lecithin that is used as a minor ingredient by almost all organic food manufacturers. I have not seen any information prior to today or today presented by the petitioner to prove otherwise.

I believe the petitioner and his consultant have based their petition to remove bleached lecithin from the national list on three major sources of misinformation. Again, I'm speaking specifically about the dry form. I'm not speaking about the fluid form.

Number one, these are quotes from their petition. There are now certified organic lecithins available to replace the need for non-organic bleached lecithin.

Number two, bleached lecithin is
functionally identical to unbleached lecithin. It differs only in color. The primary reason for bleaching lecithin is only to alter the color of an otherwise agricultural product. And number three, there are very limited applications for bleached de-oiled lecithin in granular or powered form. There are two forms of de-oiled lecithin, bleached and unbleached. Bleached de-oiled lecithin is rarely used.

I'd like to ask your patience while I quickly respond to each of these claims. Number one, unless the petitioner can prove there's a dry de-oiled form of organic bleached lecithin commercially available, then this statement is not true. I have seen nothing in the petition proving there is any such product in which case bleached lecithin dry forms must be left on the national list. Number two, lecithin is not bleached primarily to change the color of the product. Lecithin is bleached as a food
safety issue to control the microbial count. The microbial values being controlled by the use of hydrogen peroxide are total plate count, coliforms, E. coli, salmonella, yeast and mold.

I don't know why Dr. Szuhaj has disputed the fact when he contributed the well known and well respected soy processing book called Practical Handbook of Soy Processing and Utilization, which clearly states hydrogen peroxide is used to bleach the lecithin in order to control microbial count.

In Chapter 10, page 179 under production of lecithin, it states, "The wet gums coming from centrifugation will contain about 50 percent water. The wet gums are susceptible to microbial fermentation and require immediate drying or treatment with a preservative such as a dilute solution of hydrogen peroxide. Required dosages will depend on expected storage time, ambient temperature, sanitary conditions, microbial
types and load."

Dr. Szuhaj actually contributed to this particular chapter in that book. The third point, without exception every single organic food manufacturer I've spoken to has confirmed they're using bleached lecithin, not unbleached, and without exception each of the four primary manufacturers of de-oiled lecithin has confirmed that their products are bleached.

Dr. Szuhaj says in his April 20th comment, "I'm not aware of significant amounts of bleached dry lecithin being generally used in food or personal care items. As an expert in the area I'm not aware of production or use of bleached dry lecithin."

In addition to Solae, there are three other primarily de-oiling facilities that produce dry forms of lecithin: Cargil, Adium and Riceland. I have a letter which I've submitted to you from Riceland foods who has been in the de-oiled lecithin business for
over 30 years. They confirm that over 99 percent of all the raw material they've ever used has been bleached crude lecithin. The quote from their manager states, "In our experience, every time the crude lecithin has not been bleached, microbial problems inevitably result. Unbleached lecithin usually came from inexperienced suppliers or is an operating mishap. The problem always carries over to the final product."

Also included in that packet is a letter from IMCOPA, the largest IP non-fluid lecithin producer, also stating that they bleach all of their crude lecithin which is going into de-oiled product for microbial reasons.

In closing, based on the information that I and many others in the organic industry have supplied, I'd like to request that the same annotation that was recommended for unbleached lecithin under 205.606 be added to the recommendation for
bleached lecithin under 205.605(b), that is, there's not enough information available at this time about the commercial availability of dry forms of organic bleached lecithin. If there's any doubt about this, I suggest putting this off to a future time.

CHAIRMAN MOYER: Thank you, Amy.

Any questions or comments? Joe and then Katrina.

MEMBER SMILLIE: Well, we're going to have to take some time to digest all of this lecithin. That's for sure. What about the argument that we see in the marketplace, that we've seen and that we as a certifier also see all the time, some people making similar products, some use organic and some don't?

MS. NANKIVIL: I'm not a food manufacturer, but I talk to a lot of them.

MEMBER SMILLIE: Right.

MS. NANKIVIL: And I can tell you from one to the next their formulations are
very different. Again, if it's a fluid type product, that's one thing. If it's a dry type mix, that's a complete different issue.

So the fact that there's a fluid bleached lecithin available, that's great. Take it off the list, but it cannot be used in the dry forms, in dry formulations. It simply can't be, and what they're talking about is a different product that's attached to a carrier.

As Solae pointed out, this is not a de-oiled emulsifier.

MEMBER SMILLIE: No, we learned that one. We got that one.

MS. NANKIVIL: Okay.

MEMBER SMILLIE: If in the world of possibilities we could leave de-oiled lecithin on 606, would that solve the problem?

MS. NANKIVIL: No, because 606 is only referring to unbleached de-oiled lecithin, and that's not commercially available. Nobody is making it. Nobody is
using it.

So the bleached form needs to have
the annotation that it should stay on the
list. Whether it goes under 205.605(b) or
205.606, I don't know.

MEMBER SMILLIE: See, the beauty
of 606 is we've got the commercial
availability issue. We can bring that into
play, whereas in 605 we can't touch it, and
that's one of the problem, is that some people
rightly or wrongly -- and I certainly wouldn't
want to judge -- use that. So the way we're
heading is to get rid of the 605. At least
that's what the Handling Committee is
recommending. Get rid of the 605 and think
long and clear about what we're going to put
on 606.

We don't want to shut down the
industry. That's the last thing we want to
do. At the same time we'll honor the
principle of getting as much organic in as
possible.
So yours and other comments should help us in the direction that we want to go, which is get it off 605 and put the right collection of words, the right annotations on 606.

MS. NANKIVIL: I understand.

CHAIRMAN MOYER: Thank you.

MS. NANKIVIL: So may I just comment on mine? Then I would like to retract, if it makes a difference where this is. This isn't my comment; it's only if it's going to be put back on 205.605(b) am I pushing this.

I would like it to remain on the national list of allowed substances. Where that category is I don't know.

CHAIRMAN MOYER: Thank you.

The Chair recognizes Katrina.

MEMBER HEINZE: What a lovely segue into my question. My question has to do with where bleached lecithin belongs on the list, and it has to do with the hydrogen
peroxide, and you may not know the answer today, but certainly I think by the time we make our decision it would be nice to have an answer, which is how much of the hydrogen peroxide remains in the finished ingredient, and kind of to better understand that bleaching process because we'll need to understand that better as we decide where it properly belongs.

MS. NANKIVIL: Well, I think even the Clarkson petition, their fluid is bleached as well. So you'll be addressing that with their product as well because it's using hydrogen peroxide as well.

MEMBER HEINZE: Okay.

MS. NANKIVIL: So yes, and I can't tell you. Lulu or Dr. Szuhaj or someone else may be able to answer that question.

MEMBER HEINZE: Or perhaps a general comment to the public if you could think about that overnight that would be helpful for us.
CHAIRMAN MOYER: Thank you, Amy.

MS. NANKIVIL: thank you.

CHAIRMAN MOYER: Appreciate your time.

Methias Rebmann to the podium. Is Methias here?

(No response.)

CHAIRMAN MOYER: Okay. Moving on, Charlotte Vallaeys, and Charlotte has a proxy and then Tom Harding, I believe, yes.

MS. VALLAEYS: Good afternoon. I also want to comment about soy lecithin, and I wanted to just start off by saying that this is an exciting opportunity to help the organic industry evolve. You know, when there's organic ingredients that become available when they weren't before, it's a great opportunity to show companies that it's worth the investment. You know, if they see that there's something on the national list that's not available organically and they think that they can make an organic version of that,
they're not going to be motivated to do that if this process takes years and years and might eventually never reward them for those investments. So, you know, I think that's something important to think about.

Also, from the point of view of organic consumers who do expect if there is an organic version available of an ingredient, they just expect that the organic label will reflect that and that they can trust that, that they don't have to look at those ingredients lists to see, you know, is it organic soy lecithin or is it not. So that's another thing to think about.

But I wanted to respond to some comments or some things that have been brought up. For example, about hexane residues in soy lecithin, I know that that's true. The residues will be extremely, extremely small, probably not any concern to public health.

But organic is not just about residues. We all know that. It's about the
process of how you make food, and if you
extract it with hexane, there are hexane
emissions that is a concern, and for example,
the Solae plant, according to EPA data, emits
one million pounds of hexane into the
atmosphere every year. So that's a concern.

If we want to have organic food reflect a
better way of making food, then we should
courage the companies that are doing it
without hexane.

And another issue that was brought
up is that it will hurt the organic industry
if a lot of products will no longer be
available organically, if they can't use the
conventional lecithin. But we've seen how
many products are currently out there that are
not using the organic when right next to it on
store shelves is the exact same product,
whether it be chocolate, infant formula that
is using the organic. So it's important to
think about that as well.

And I want to bring up infant
formula because another argument was that, for example, Earth's Best. It takes years and years for the Infant Formula Act because it's true. It's highly regulated, to change your product.

But if you turn over a can of Earth's Best infant formula, you see that it says PVM, Vermont, which means that it's made by PVM Nutritionals, which also makes all the other kinds of formula, and they manage to get DHA and ARA, which I will comment on later; they manage to get that into infant formula. It took them just a couple of years.

Babies Only, which also makes infant formula, has added the organic lecithin since 2004, January 2004. So it has been five and a half years that PVM has had that opportunity. If they really wanted to change their formulation, well, they could. They've had five and a half years to do it.

They managed to do it in way less time than that for another ingredient. So I
I don't see why they can't do it for organic lecithin.

The other thing that was brought up was concerns about monopoly, that Clarkson Grain by now has a monopoly. Well, their plant is running at about a ten percent capacity, meaning that they have so much organic lecithin that is not being used, why would another company right now start offering organic lecithin unless the regulations change to show companies it's worth it to invest in that?

And besides, if I understand this correctly, their process is not patented. So other companies are welcome to start making organic lecithin.

Okay. My next comment is also related to ingredients that are currently not organic that are in organic foods. It's about DHA and ARA, which I know I brought up last year.

I'm happy to see that it is on the
work plan that I will be discussing, at least
microorganisms, which I'm assuming also refers
to DHA and ARA.

And I just wanted to bring up
that, you know, last year when I brought this
up, I actually thought that these synthetic
oils, which are not on the national list, that
they were put in organic infant formula, that
that was an honest mistake, and I've sine
learned a lot of things; that this is not an
honest mistake. I have some documents here
showing that the Compliance Office actually
came to the conclusion that these DHA and ARA
ingredients are not approved for use under the
NOP regulations. That letter was ordered to
be rewritten by the Acting Director of the NOP
to say that they are allowed using the 1995
Board recommendation for nutrient, vitamins
and minerals.

So I don't really know what to ask
for because they're not on the national list.
They're making babies sick. We keep getting
adverse reaction reports from mothers who give organic infant formula to their babies. These babies are getting sick, and it is a subset of the infant populations. So I'm not saying that all babies are getting sick from this, but organics should be a refuge from ingredients that have not been reviewed, that are novel ingredients, that are hexane extracted, and if they're just put in without review to be on the national list before they're added, it really hurts consumer confidence in organics.

So I was going to ask maybe that the Board consider rescinding the 1995 recommendation, which is what is currently used as the justification for allowing these in organic infant formula or maybe a recommendation that Board recommendations do not supersede the actual federal regulations; that that's what certifiers and manufacturers need to follow, is what it actually says, what the federal regulations actually say, and that
a Board recommendation doesn't allow or
doesn't take precedence over the accepted
regulations.

You know, why this is important,
you might be wondering why am I bringing this
up. You know, I'd like just mention, again,
that we are getting adverse reaction reports.
Babies are getting sick from this. It's a
serious issue.

And I know a lot of you out there,
you mentioned when you were introducing
yourselves. The women, you're mothers. You
know, that it's important. It's terrifying to
watch your baby in pain, to watch an infant
screaming, and when I read these adverse
reaction reports, it just -- I mean, it's
chilling to read those.

So I really urge you to consider
this, and I guess that's it.

CHAIRMAN MOYER: Okay. Thank you.

Any questions for Charlotte? Bea, I'm sorry.
I didn't see you. Bea.
MEMBER JAMES: The adverse reaction reports, is that something that you could send to Valerie so she could share it with us?

MS. VALLAEYS: Oh, sure, yes.

CHAIRMAN MOYER: Thank you, Bea.

What we're going to do now, Tom, if you don't mind, we're going to take our break, and we'll start with Tom Harding immediately following the break.

Fifteen minutes, which puts us back here a little before 3:25.

Thank you.

(Whereupon, the above-entitled matter went off the record at 3:09 p.m. and resumed at 3:26 p.m.)

CHAIRMAN MOYER: We do have a quorum on the Board. If we could get started.

Just one minute, Tom.

MR. HARDING: Yes, sir.

CHAIRMAN MOYER: Okay. Quite down
in the back please. Any discussions, take them outside.

Tom. The Board recognizes Tom Harding.

MR. HARDING: Thank you, Mr. Chairman, and good afternoon.

First of all, my name is Tom Harding, Agrisystems International. We're organic program consultants, one for our client who is here today, EcoLab, and for a number of producers and manufacturers who serve the organic industry.

I first want to say that I have been to almost every one of these meetings, I just want to tell you that I really appreciate what you folks have done. This Board has been really involved and very committed, as have all the Boards, and I don't think anyone knows the kind of work that you are really putting in. I want you to know that all of us very much appreciate it.

And that also goes for the
1 National Organic Program. We very much
2 appreciate this partnership. It's important
3 to us. Hopefully it will only grow stronger
4 and stronger, and I hope that we will move
5 toward the release of redundancy and more into
6 the consistency of getting right down to the
7 nitty-gritty.
8             I'm here to speak in favor of
9 adding acidified sodium chlorite to the
10 national list of materials for handling and
11 processing.
12             Our petition was submitted in
13 2006. You all have had a chance to look at
14 it. As you know, it's in the chlorine family,
15 but it acts very differently.
16             You had my comments, which I
17 submitted both in November and we have
18 resubmitted again. They're pretty much the
19 same, and I'll let my client really get into
20 the very specific aspects, but I wanted to
21 point out a couple of things.
22             One of the issues that's really
important to us is that we have a multiple
choice, in other words, a few very effective
food safety materials in the organic
community, and there are a very limited list,
as you know, on the national list, and
secondly, not any of them are really approved
for meat, poultry, seafood, and other things,
including hard surface.

So it's really important that we
have a good battery, particularly with the
consciousness that we have now in the
marketplace, and I'm looking at the proposed
bills on the Hill at the moment on food
safety, and I get real nervous. They're bound
with fees, and they certainly are not bound
with helping aids that really help to get into
the preventative side of our business.

So this is a really important
action. 1 This material here, ASC is a
preventative material. It's really important
that it's used as it's labeled. It has been
approved by almost every authority throughout
the world, and we really support that.

The third point is that I want to support the annotation that the working group and the committees have come forward with. We support the annotation. There's only one concern I have, and I'm not sure why you added the aspect that it had to meet the chlorine requirements of four parts per million because technically speaking, and I'll let Dan speak more specifically from the technology standpoint, we're not talking about chlorine residue. We're really talking about salt as a remainder once this material is used as effective.

Other than that, the annotation looks fairly good and we hope it can go forward on that basis.

The other thing that's very important is that we have the understanding that has been approved by all authorities, as I was saying, but equally important, it has very little if used properly environmental
impact. In fact, it's one of the safest materials we've been using. You probably don't know, but it's almost in everything we drink in one form or another, and certainly it's a lot in animal husbandry as well.

But I encourage you to vote in favor of adding acidified sodium chlorite to the list, and I hope that you will do so, and following me immediately is Mr. Dan Dahlman, who is from EcoLab, if you have any technical questions, but otherwise I want to thank you very much, and I want to give the rest of my time to Mr. Dahlman.

Thank you all and, again, thank you for your good work.

CHAIRMAN MOYER: Thank you, Tom. Any questions or comments from Board members to Tom?

(No response.)

CHAIRMAN MOYER: Thank you, Tom. The Board recognizes Dan Dahlman and Kim Dietz is on deck.
MR. DAHLMAN: Good afternoon. My name is Dan Dahlman. I work for EcoLab, headquarters in St. Paul, Minnesota. I work in the Regulatory Affairs Department there.

I'd first like to not only thank the Board for the opportunity to speak here today, but also for all of your hard work and commitment to the organic industry.

My intention here today is to speak on behalf of EcoLab to support the addition of acidified sodium chlorite solution, or ASC, to the national list and convey to the Board the importance of ASC as an antimicrobial intervention step in the organic food processing industry.

EcoLab petitioned, as Tom said, for the inclusion of ASC back in October 26th of 2006. ASC meets the FDA's definition of a food contact substance and is a processing aid used to control microbes on the surfaces of a variety of products, including meat, poultry, seafood, fruits and vegetables, and hard
surfaces.

ASC has also been fairly tested and proven effective against some of the most serious and infectious pathogenic and spoilage organisms that threaten the food system today. These tests have been thoroughly reviewed by FDA CFSAN and USDA FSIS.

ASC has been accepted by the FDA and is published in 21 CFR 173.325 as a secondary direct antimicrobial food treatment in the processing of poultry, red meat, comminuted and formed meat products, seafood and fruits and vegetables.

The USDA FSIS has also accepted ASC and added it to the safe and suitable directive 7120.1 for use on red meat and poultry.

In addition to the FDA and USDA clearances, the U.S. EPA has evaluated the chemistry, toxicology, and efficacy data of ASC. As a result of these safety reviews, EcoLab's Sonova brand product has been
registered under the EPA registration number of 1677-219 as an antimicrobial agent to reduce the growth of microorganisms that cause spoilage on raw fruits and vegetables, otherwise known as RACS.

EPA has also issued a food tolerance exemption for sodium chlorite in 40 CFR 180.

Organic consumers can have confidence that the use of acidified sodium chlorite is safe for the food supply. ASC breaks down to citric acid, water, and common table salt. ASC solutions do not chlorinate organics and, therefore, have an advantage over treatment with chlorine which can seriously damage aquatic life and form chlorinated hydrocarbons with mutagenetic or carcinogenic properties.

I'd also like to stress today to the Board that there is no one antimicrobial intervention that does it all. EcoLab strongly believes that there's no single
product chemistry that is appropriate for such
a wide variety of intervention points and
application methods present in the processing
industry today.

The food industry itself has
adopted a multi-hurdle approach to food safety
intervention since the implementation of the
HASAP standards in the 1990s. We believe that
offering processors multiple interventions
will allow for each individual processor to
tailor its intervention to the facility's
specific needs. Our goal is to provide our
customers with enough intervention options to
help meet those needs and insure a safer food
supply for the people.

It was mentioned in the technical
evaluation report for ASC that peracetic acid
can be substituted for ASC. I would oppose
this viewpoint as does EcoLab. While both
substances exhibit an oxidative chemistry to
control bacterial growth, each substance has
its place in the processing environment and
each provides its own advantages.

For example, a typical poultry processor may purchase both a peracetic acid product and acidified sodium chlorite product for their facility. EcoLab currently markets a peracetic acid product called Inspects 100, and an acidified sodium chlorite product called Sonova. Inspects 100 is typically used in poultry chillers when a low temperature and longer contact time occurs to insure the greatest reduction in bacterial contamination.

Sonova, on the other hand, is used in situations where a much shorter contact time is required, and typically is used in a pre-chill or post-chill situation or processing steps -- excuse me -- where contact time is limited.

Inspects 100 and Sonova are both effective against Salmonella typhimurium, Campolabacta dejuni, Listeria monocytogenes, and E. coli 015787, and depending on the customer's needs, EcoLab can adapt and tailor
its product line to satisfy those specific needs and offer an antimicrobial control package at each step in the processing line.

We believe that the inclusion of ASC on the national list for processors and handlers is justified and meets the criteria of a synthetic used in organic processing and handling. In the interest of food safety, we urge the NOSB to vote to include acidified sodium chlorite in the national list of allowable substances as a synthetic ingredient allowed in or on processed products in organic or made with organic.

Thank you. Any questions?

CHAIRMAN MOYER: Okay. Thank you, Dan.

Questions by Joe.

MEMBER SMILLIE: Tom mentioned earlier that there's the annotation on the four parts per million chlorine. Could you speak to that?

MR. DAHLMAN: Well, I'm not a
chemist and I don't claim to be, but the breakdown of components would not break down into chlorine. So I don't know what the purpose was to add that in the annotation.

MEMBER SMILLIE: Can I ask the committee?

CHAIRMAN MOYER: Please follow up from Joe to the Handling Committee on the question of ASC or food scientist, yes, absolutely.

MEMBER HEINZE: Remember I was a chemist, not I am a chemist. The purpose of the annotation was to try to make a recommendation consistent with the NOSB Processing Committee recommendation of April 30, 2003. In that recommendation, the Processing committee took up the annotations for all of the chlorine materials that are currently listed.

I won't read the whole five or six pages to you, but I would have that available if anyone wants to read it.
But really it had to do with sanitizers that were used in food contact applications and a desire to limit the chlorine levels in contact with the organic commodity. So I'll read this sentence. It says, "The intent of the original NOSB recommendation for chlorine methyl compliance was to insure that chlorine levels of water in contact with the organic commodity do not exceed four milligrams per liter or four parts per million of residual chlorine."

So then it goes on for quite a bit of discussion. So the conclusion of this recommendation was that there was the original annotations, but there had been quite a bit of confusion in how those annotations had been interpreted. So this recommendation tried to clarify. So then in the recommendation we tried to use this language which obviously didn't help because everyone was confused by
it. So we need to try to get back to this intent and perhaps a little bit more study on the annotation.

CHAIRMAN MOYER: Did that help clarify things, Joe?

MEMBER SMILLIE: Yes. It was just a question. I understand the reason for the annotation, but I'm trying to connect it to this particular product, and the petitioner is saying that it doesn't leave residual or --

MEMBER HEINZE: The intent is not what's remaining, but what contacts the food. So what happens, what's in solution before it touches the food, not after, and what you addressed was after, citric acid and water and table salt.

MR. DAHLMAN: Right, the breakdown, yes.

CHAIRMAN MOYER: Okay. Thank you. Any other questions?

(No response.)

CHAIRMAN MOYER: Thank you, Dan.
Kim Dietz next, Emily Brown-Rosen on deck.

MS. DIETZ: I think I'm short enough I don't have to move the mic.

Good afternoon. My name is Kim Dietz. I'm the regulatory manager for Smucker quality Beverages.

The first thing I want to just announce is that our company has changed our name. So we're not Smucker Natural Foods. So if you see anything from me, you'll see instead of SQB it will be Smucker Natural Foods, SNF.

Mainly we're just growing out of just beverages into other products as well. My background, as you know, most of you know, I was the handling representative from 2000 to 2005, and I worked with the materials group as chair for four years while I was on the Board.

Just a couple of comments today.

I'm going to start off with the materials
discussion document. We have a very limited
time tomorrow, 15 minutes with our group. So
I just want to talk a little bit about the
Materials Working Group.

First of all, I want to just thank
the Board for letting us work with you and the
industry. It's been a very good thing for us.

Our role at this point has been to
bring you the historical perspective on
materials and recommendations, and I think we
all agree that moving forward, we're just
going to be in the background and try to give
you comments once you bring us
recommendations. So we look forward
continuing to work with you.

I'd like to really thank Gwendolyn
because I haven't formally done that. When we
started this group, Gwendolyn and I had never
even worked together, and over the last couple
of years, weekly calls and off calls and
weekends and at night. It's been a really
good friendship. So I appreciate all of your
work that you do with that, and all members as well.

And particularly I want to just thank Organic Trade Association because they've given us their conference call weekly numerous times for many years. So I appreciate that.

Formal comments. I support all of the sunset materials that are moving forward and the continuation of those, and I just want to remind the Board that there is a formal process to remove materials since you're going through a lot of heavy debate this time. I think that's our first petition that I can remember to remove a material.

So just go through your processes. I always say that. Support the 100 percent label recommendation. I think that's also very well.

Some examples, you asked for examples. We used to produce a product, not organic, but a recharged product, which is a
non-carbonated beverage in a can. So we
needed nitrogen to keep the can rigid.

See, there's a lot of applications
out there that you need those inert gases for
packaging.

My other comments, thank you for
the docket on gellan gum. I think I've been
-- the upcoming docket. That material was
petitioned in 2004 and voted on in 2007, and
quite honestly, we had a product formulated to
use that, and labels were almost all the way
through the process. I keep saying, "Oh,
it'll be on the national list. It'll be on
the national list." And we actually has to
reformulate because it's not. So we're
waiting for that, for a new product to come
out. So hopefully that's soon.

Colors. I say this at every
meeting, and I guess I just have to do
petitions to change the annotations on those.
All of those colors that we put on 606, none
of the cast numbers match. If you try to
match those CAS numbers with the colors, there's no correlation. So we have the wrong annotation on all of those colors. I don't know how people are using them out there.

And specifically, I could tell you all them, but I'll go ahead and put something through. It could be a technical correction from the Board, but again, those CAS numbers are wrong.

Specifically I'm going to be working on the beta carotene because we would like to use beta carotene in some of our products, and right now there's no such thing as beta carotene derived from carrots. It's not out there. So that annotation is also incorrect, and it needs to be changed.

I'm just going to make a comment on the lecithin because I think I'm causing a little bit of an uproar. As past materials, I see three ways for you to change the national list. You can petition to add a material to the national list. You can
petition to remove a material from the
country list, and you can petition to change
an annotation.

And I have no personal use. Our
company doesn't use lecithin, and I have not
really paid attention at all before coming to
this meeting, and it seems there's a lot of
controversy on, you know, what's commercially
available, what isn't available, as well as
what you're trying to do.

And I just sat in the back and I
looked up the national list, you know, where
they are. Six, oh, five says bleached and 606
says unbleached, and I looked at the
petitions, and they're both to remove. Okay?

Now, one specifically, 606, is
petitioned to remove a certain form of
lecithin, but it's not in the annotation. So
it seems to me like you either need a friendly
amendment to change that petition to change
the annotation versus remove it. You almost
need to vote on the petitions, and maybe the
organic needs to get involved in this or not, but you're trying to look at changing the annotations, not removing materials, it seems to me.

CHAIRMAN MOYER: Thank you, Kim. Any questions, comments from the Board to Kim?

(No response.)

CHAIRMAN MOYER: Okay. Thank you very much, Kim.

MEMBER HEINZE: Wait.

CHAIRMAN MOYER: Oh, I'm sorry, Katrina. I didn't see you.

MEMBER HEINZE: Just in case we don't get a chance tomorrow, thank you for all of your help with the Material Working Group.

MS. DIETZ: You're welcome.

CHAIRMAN MOYER: Okay. Tracy. Kim, if you have one more moment.

MEMBER MIEDEMA: Okay. So since the petitioner is asking for the removal of fluid lecithin, but the word "fluid lecithin"
isn't actually on the list. That's our clunky thing we're trying to figure out.

Does that mean -- walk us through what our options were if, for instance, we were interested in -- I guess, how do we deal with that?

CHAIRMAN MOYER: Okay. Thank you, Kim.

Valerie, could we do something about the microphone? I don't think it's going through. They're not picking it up over in the corner.

Okay. Thank you, Kim.

Emily Brown-Rosen and Gwendolyn Wyard on deck.

Okay. Thank you, Hugh and Valerie. We'll continue and get started here.

Emily, if you're ready, thank you.

MS. ROSEN: Okay. How's that?

Okay. My name is Emily Brown-Rosen. I'm with Pennsylvania Certified Organic Policy Director.
I have quite a few materials, things I want to talk through here today. So hopefully I can get through them.

First of all, thank you for announcing you're working on the process and you're working with Science and Technology. That's a big step. We have a lot of trouble right now finding the petitions. It's hard to see what's on your agenda for the materials. Like Dan whips through his list here and then we never see that list again. So we'd really appreciate to see a summary of the Materials Committee work regularly because there's no other way to really find it on the NOP Website.

So great that you're working on better communication and better prioritizing and better information because we're really suffering out here trying to keep up with what you're doing.

And things do get lost. We've made comments. CCOF made comments. AMRY made
comments about quite a number of petitions that have kind of gotten lost in the system. So we want to get past that and help prioritize those.

Number two, the docket on 606, where's the final rule on 606? No one asked that question. We have an interim final rule from two and a half years ago, I think it was. Was it 2007? 2007, the 38 new colors and stuff that are on 606. We only got an interim final rule. A lot of us wrote comments to say things like, you know, the CAS numbers are wrong. The annotation on characters is wrong. Those comments were never addressed because we never had a final docket.

So I think if we get that final docket, that will help answer some of our questions, and also will help us to review products because we don't know even -- you know, it's very difficult out here in the certifier world to review products when all of these things are wrong or unanswered.
questions.

For instance, something that came up here today quite suddenly was that synthetic solvents like acetone are being used to extract products on 605 and possibly be put on 606. We have been asking this question, which Gwendolyn and I have filed for the last two years-plus straight. What are synthetic solvents and other synthetic carriers or non-organic carriers allowed in the 606 products? And we have not gotten an answer yet, but it seems like you're going to go ahead and decide something sort of by example without a decision, and that would be the wrong way to do it. So one issue brings up another issue.

Lost petitions, for instance, potassium and sodium lactate as a food additive, these are being put in organic food; was petitioned in 2002, has never been reviewed; and there was one letter that's no longer posted saying this is allowed even though it's not on the national list. It
should be a high priority to review this.

We're really glad you took up acidified sodium chlorite because this is another kind of substance that's been in limbo. It was petitioned, and that's the right thing to do, is to review it and consider it on its merits, not let it be allowed sort of by some back room method. Moxydectin for livestock use, you made a good recommendation to allow it. It got stalled at NOP. I think you need to follow up on that. There's no reason it can't go forward in the rulemaking docket. They have some references in here to help you with that.

More, as public records of all decisions including your synthetic or non-synthetic decisions, we're hoping this will come along with the improved database of substances, and possibly consider a mechanism where people can petition to have you determine if something is synthetic or not.
Sometimes we get hung up in the crops and livestock world on is it just allowed or not, and then we could maybe not go through the whole process to put it on the list.

But where they get us in a synthetic/non-synthetic decision and get it reported and then that's it, I mean, if they're interested in something being ruled non-synthetic so that it can be used.

Okay. Vitamins and minerals in livestock materials. I kind of understand your limitation with putting this under health care because of conflicts with FDA, but we appreciate that you're working to put this on. We do miss the TAP review. We need those TAP reviews so that when we go off in the future to know what we're reviewing, we know what we're reviewing.

It becomes a very large category that's not well identified, and we really appreciate getting TAP reviews on these things.
The existing restriction on excipients does limit them to those approved by FDA and food additives, and so it won't mean all injectables are allowed. I have a list here. I have a few copies. We went through our database. We have 35 improved injectable vitamins. There are about five that we find do not meet these FDA requirements. So the bulk of them are okay, but we do need more clarification on excipients, and I think a number of us would be willing to meet with you to work out how to apply these rules on excipients to multiple products.

Okay. I'll stop there.

CHAIRMAN MOYER: Thank you, Emily.

Comments, questions from the Board to Emily?

(No response.)

CHAIRMAN MOYER: Seeing no hands, thank you, Emily. Appreciate that.

Gwendolyn, the Board recognizes
you, and Grace Marroquin is on deck.

MS. WYARD: Okay. Good afternoon.

For the record, my name is Gwendolyn Wyard.

I am the processing program technical specialist for Oregon Tilth. We are a nonprofit organization dedicated to supporting biologically sound, socially equity agriculture, and I'm here representing over 700 members and 1,200 certified operators.

I'll be drawing your attention to select portions of our written comments submitted to regulations.gov. For further elaborations, detail, and inspiration, we invite you to revisit and study those comments prior to your vote on Wednesday.

The first issue I'd like to draw your attention to is a request for clarification related to the review of materials on 205.606. So this is the issue that Emily was just discussing. PCO and Oregon Tilth, we've requested clarification for the past two years, and to date received
zero clarification. The large majority of the colors on 606 that we're reviewing, they're formulated products. They contain agricultural carriers, standardizing agents like apple juice concentrate, also various non-agricultural carriers and stabilizers.

We'd like to understand how we should be reviewing those formulation aids because they were not reviewed by the NOSB.

Your focus has primarily been on source material and extraction. So that's very important to us to understand how we should be looking at formulated products on 205.606.

On the topic of agricultural versus non-agricultural, we'd like to address the joint committee's rejection of the classification of agricultural synthetic. This concept dates back to the '90s where it was discussed in Senate committee reports. It was embraced by the Handling Committee in 1993 and adopted in the 2005 NOSB guidance document on the clarification of synthetic.
Rejecting this concept will reject history and create a barrier to the development of organic ingredients and products.

The NOP definition of processing and the allowed materials on 205.605 and 606 can and will continue to bring about chemical changes when applied to agriculture raw material.

And the NOP definition of synthetic is based on the occurrence of chemical change. So as a result, minor ingredients derived from agricultural material may be evaluated by the NOSP and placed on the list as a non-agricultural synthetic.

However, it's entirely feasible that the same ingredient classified as synthetic could be produced now in a certified handling facility using organic agricultural substrate and non-organic materials on the national list, and in this scenario the product will have undergone chemical changes.
but those changes are the result of processing methods and materials that are allowed in the OFPA and in the NOP regulation. So Oregon Tilth ask that the NOSB reconsider this topic and clarify that non-organic input classified as synthetic can also be considered agricultural and organic when it's produced in a certified handling facility.

Microorganisms and products of microbial fermentation. Please be more specific with terminology in your final recommendation. There are microorganisms and there are products of microbial fermentation. They should not be discussed as one and the same.

We were surprised to learn that the Board is currently viewing beer, yogurt, and other products of microbial fermentation as non-agricultural. We suggest that the NOSB identify the materials and processes that would result in a non-agricultural
fermentation byproduct. Otherwise, fermentation products consumed by humans and livestock should generally be considered agricultural.

Microorganisms. Oregon Tilth does not believe the use of annotations will clean up the debate. For example, yeast manufacturers would invest significant resources into the use of organic substrate and compliant materials, essentially meeting the requirements for an organic product, but they wouldn't have the benefits of marketing their products as organic. And even more, annotations are extremely difficult to enforce.

We believe the problem can be addressed by the following approach. Continue to list microorganisms and yeast as non-agricultural while organic production standards are developed. Once standards are developed, microorganisms can be classified as agricultural, and this will allow a transition
period for the entire industry, particularly for the livestock sector.

In the interim, the NOP should clarify that yeast and other microorganisms can currently be certified based on the product composition requirements, 205.301, and the handling requirements of 205.270. This is consistent with the allowance to certify natural flavors. If flavors can be listed as non-agricultural and be certified as organic, yeast should also be granted this exception.

And finally, we would like to end by discussing some of the guidance documents that have been recommended by the Board where no regulatory change is needed. It would be extremely useful if the NOP could address the work of the NOSB and approve those guidance documents and prominently post them on the NOP Website, namely, commercial availability guidance documents.

Thank you very much. We offer our support.
CHAIRMAN MOYER: Thank you, Gwendolyn.

Questions, comments? I have one question. Am I to understand that you said that this Board should list microorganisms and yeast as non-ag temporarily, and then once the standard is adjusted re-list them as ag?

MS. WYARD: Keep them listed where they're at as non-agricultural while standards are being developed, and once those standards are developed, then reclassify them as agricultural, once you have those production standards in place.

CHAIRMAN MOYER: Thank you.

The Chair recognizes Kevin.

MEMBER ENGELBERT: Gwen, why wouldn't you want them to have their own separate category? Why eventually agricultural?

MS. WYARD: So that they can be formally recognized and certified as organic.

It's my understanding the barrier to
certifying them as organic is the non-
agricultural classification. Now they're
being certified or we believe that it's
totally feasible to certify yeast based on
the composition standards because you're
looking a formulation that is identical to
many of the other organic products out there.
You have 95 percent organic substrate, and the
rest of the five percent is on the national
list.

So we feel that there is a way
right now to certify yeast. I think we need
to address how they're labeled, how those
yeast products are labeled, but eventually if
we can get standards in place, classify them
as agricultural, you could call them organic
yeast.

Clear as dark beer?
(Laughter.)

MS. WYARD: Made with organic

yeast?

CHAIRMAN MOYER: Thank you,
Gwendolyn.

MS. WYARD: Should I try to better explain that?

MEMBER ENGELBERT: No, no, that was fine.

CHAIRMAN MOYER: Okay. Thank you, Gwendolyn.

The Board recognizes Grace and George Kalogridis is on deck.

MS. MARROQUIN: Can I go yet?

CHAIRMAN MOYER: Please.

MS. MARROQUIN: Okay. Good afternoon. My name is Grace Marroquin. I'm president and CEO of Marroquin Organic International based in Santa Cruz, California, as many of you know, and we are importers and suppliers of organic ingredients.

Once again, I'm here to address the Board. Guess what. Yeast. In response to the specific questions in the discussion document, please refer to our extensive written comments, number 0377.
Let me say that the discussion document is a definite step forward because in the second option it recognizes yeast as an agricultural product. However, it still leaves a long way to go before the Board resolves the issue. Organic yeast was developed in Germany and introduced in the 1990s. I have introduced many organic ingredients of the last 18 years while I was still a baby on the basis of organic preference. When I learned that organic yeast was available, I was really excited because this was a breakthrough for organic ingredients. Organic yeast is grown on a substrate of organic grains instead of conventional, and I'm sorry I have to repeat this, but I do because this is really important. It's production uses no synthetic chemicals. By contrast, conventional yeast uses ammonia, not allowed on the national
list; sulfuric acid, not allowed on the national list; caustic soda, not allowed on the national list; also synthetic vitamins and synthetic anti-foaming agents allowed.

Because of these chemicals used in the production, the conventional yeast waste water is contaminated, and you have to treat it before you can dispose it, whereas the yeast from organic production has no chemicals. None are used, and the waste water is pure and can be reused for organic products.

Now I want to tell you why I've been coming here since 2004, besides being crazy, is I'm simply waiting for the Board to act in accordance with OFPA. Under the definition of agricultural product in OFPA, yeast is an agricultural product.

The proper legal place for yeast on the national list is in 205.606 as an agricultural product. This will make organic yeast a preferred organic ingredient and processors will have to use it if it is
commercially available.

But yeast is still not on 606.

This is a loophole on the list. The national list is not intended to keep organic ingredients off the market. That's not its purpose. This is the loophole. The national list has yeast in 205.605 as a non-agriculture ingredient, and this allows food processors to label their products as organic while using conventional yeast.

Okay. I would like now to address the objections that have been raised. First, the major barrier to classifying yeast as an agricultural product has not been in the impact of yeast on food processing. It has been the impact and the fear that this is going to have on livestock feed. This is why this is being held back, and I understand it.

In the NOP regulations for feed, all agricultural products and livestock feed must be organic. There's no exceptions allowed even if the ingredient is minor. This
is a rigid rule, and in the EU the rule for composition of organic yeast is not as strict. So the main reason the Board has not reclassified yeast as an agricultural product is food is because of the rules on feed. As a food ingredient, organic yeast is being held hostage. The problem here is not yeast, but the rule on feed. Yeast is only a minor ingredient in feed. It is used to aid the digestion in the animals rather than for nutrition. It is one of a number of alternatives for this purpose.

Last year the NOP ruled that molasses in feed was an agricultural product and had to be organic. This created a greater demand for organic molasses and thus leads to greater supply.

The same thing will occur with yeast. Once there is a strict requirement many yeast companies will supply organic yeast for feed. One company, Midwest Bioag, tried to do this back in 2002 and three, and it
I could not sell any of it because there weren't any regulations mandating it.

I know, and I mean I know, that the big boys are right now working on this, and they could implement rather quickly if they had to, but they don't have to right now. They're doing a wait and see.

Standards, yes, we could have standards, but right now, as Gwendolyn mentioned, the August 23rd, 2005, the NOP issued that policy that it would require specialized products to have specific standards as long as they're certified under existing NOP standards.

NOP allows mushrooms, greenhouse, epiculture to be certified to be certified even though they do not have specialized standards.

I'm going to jump.

This is the approach. The EU under the Regulation 834, 2007, singles out yeast from other microorganisms. It declares
that yeast is eligible to be organic in food
and feed, and it does not do this for
bacteria, enzymes or microorganisms. These
remain on a restricted list of organic
materials that are permitted in the EU, and by
the way, Japan has now recognized yeast as
agricultural and, thus, organic.

I thank you all for everything, on
your patients for letting me come here year
after year after year, and for all your hard
work. If you have any questions, I'll be
happy to answer them.

CHAIRMAN MOYER: It's always a
pleasure to have you here, Grace.

(Laughter.)

MS. MARROQUIN: I promise I'll
keep coming back.

CHAIRMAN MOYER: Kevin.

MEMBER ENGELBERT: My sentiments
exactly, but I'd just like to make clear,
Grace, that I don't think that the livestock
issue is what's holding this back. If organic
1 yeast becomes available or becomes part of the
2 rule, then it will become available for
3 livestock. I think there are other issues
4 involved besides that. I don't think that's
5 what's holding us back.
6 MS. MARROQUIN: You know, I
7 appreciate that. I tend to disagree because
8 I know if I were to say to 50 percent of the
9 people sitting in here how many of you think
10 yeast is agriculture, they probably all would
11 say yes, but the concerns that come back is
12 because of the impact on feed.
13 MEMBER ENGELBERT: I didn't
14 address whether it's agricultural or not.
15 That I'm not sure about still, and I
16 definitely don't think it's livestock.
17 (Laughter.)
18 MEMBER ENGELBERT: But if it does
19 become certified organic, you know, the
20 product will become available, and farmers
21 will use it.
22 CHAIRMAN MOYER: The Chair
recognizes Joe.

MEMBER SMILLIE: Well, I hate to get on my soapbox, but the last two presentations I couldn't be in agreement more with. I think that we've done a great disservice to this industry by not recognizing the organic production of fermentation products and yeast. I mean, if we are really going down the path of looking at microbial fermentation that's not agricultural, I think we're making a huge mistake.

I really believe that organic systems plans for yeast and other productions, such as cogi are there and available, and I think we need to recognize them, and I know I've been bleeding this out for the last four years along with Grace, and I just want to get this Board before I leave it to finally recognize the agricultural production and the agricultural nature of microbial fermentations because humankind has been growing these things since we got out of the caves.
MS. MARROQUIN: It's true.

CHAIRMAN MOYER: The Chair recognizes Bea.

MEMBER JAMES: I just want to thank you for coming again, and, okay, so you've been coming since 2004. That's ten written public comments that you do fresh every time, and so maybe you could just maybe take pieces of the different recommendations.

Anyway, thank you for your comments.

MS. MARROQUIN: Thank you. Thank you again.

CHAIRMAN MOYER: Thank you, Grace. The Board recognizes George Kalogridis and Patrick Arnt is on deck.

MR. KALOGRIDIS: I'm George Kalogridis with the GCK Group.

I want to make a brief comment regarding lecithin, not specifically. To me the issue there is a proactive approach by these companies with what they've done to
replace this solvent extracted product that they're using, and had they taken the time and financial resources to try and keep this product they're using as opposed to working with Clarkson Grain to develop what they need for their products, I think that would have been the solution.

I'm talking today about the term of synthetics. I know this Board asked the Material Working Group to try and come up with some definitions of synthetic. I, along with Grace Trashuni, were part of that. The Board did some extraordinarily good work, but the two of us felt that we had gone down a path that was ultimately not that productive.

We recognize the fact that the organic standards were codified in the 1980s; that the law was passed in '90; and the rule was implemented in 2001. A lot has changed since we started this journey, and what we thought was organic and the issues around organic have changed quite dramatically.
The discussions that we had on the Materials Working Group about what is and was not synthetic started to boil down to the nature of chemistry and specifically about which electrons were being cleaved or not being cleaved and who were they coming back into the product after they had been molecularly changed.

Grace and I believe that if we start down the path of telling consumers that something is organic based on molecular chemistry, then we have truly lost our way in organic.

Our proposal is rather simple, but very controversial in that we believe that the best thing to do is to go back to the AHPA, to open it up, to open it up and make substantial changes there as opposed to the continued work-around that we keep doing time and time again in trying to figure out what synthetic really means.

Our proposal is basically to
change the AHPA such that we have synthetic
defined as manufactured from a petrochemical
or mined hydrocarbon resource.

The second alternative would be to modify the term "synthetic chemicals" where it appears in 605.041 and, two, to say "synthetic petrochemicals" and a definition of "petrochemicals," and this would avoid the objection that changing the definition of a commonly understood term, such as "synthetic," would violate public expectations of the clarity and consistency of the law.

The only other section of the AHPA that would need to be changed would be 605.08(b)(1) and 605.08(b)(2). Section 605.08(b)(1) to be amended to prohibit synthetic petrochemicals rather than synthetic ingredients as fertilizers, while synthetic nitrogen produced by the Haber process would not be prohibited.

Section 605.08(b)(2) could be revised to reflect the original intent, which
was to specifically prohibit any synthetic source of nitrogen.

Our believe is that if we go down the road of molecular chemistry that we will end up with discussions like we're having about the lecithin right now with various different technical people discussing whether or not that electron truly is removed or not removed from a product, and I think that we will have lost our organic consumers at that point.

Thank you very much.

CHAIRMAN MOYER: Thank you, George.

Questions or comments from Board members?

(No response.)

CHAIRMAN MOYER: Okay. Thank you, George.

MR. KALOGRIDIS: Thank you.

CHAIRMAN MOYER: Emily Brown Rosen for Patrick Arnt.
MS. BROWN-ROSEN: Thank you.

I will just make a couple more points, and Patrick couldn't be here. So I'll fill in on a couple of the handling points.

On the injectable vitamins, one last point I wanted to make was that for livestock use, that as you proposed it, I mean, it would work, but I really don't think we want to put electrolytes as a stand alone category. Electrolytes are already on the list for health care. They already can use excipients, and the problem if you put them in as some sort of supplement is that we see a lot of formulations that have amino acids and other things that are not approved. Right now we reject the ones that are full of amino acids.

So they are already covered. They're already there. I just wouldn't include them in your recommendation.

Sodium chlorite, acidified. I really appreciate that you went back and
I looked at the 2003 recommendation on chlorine. I think that was a good piece of work, and it's one of those high priority, old NOSB recommendations that needs to come to the top when you restrategize on this.

We have a huge confusion over chlorine in general, in food processing and food sanitation. Certifiers are doing all different things. So you know, you were right. That was the intent, was, you know, originally to limit direct chlorine contact, but the context was more municipal water that's treated with a chlorine product as safe drinking water standard was allowed.

So for free chlorine, CL2, that standard is four parts per million. For chlorite, sodium chlorite, the standard is one part per million of the Safe Drinking Water Act. The product that's being petitioned is being used at something like 500 to 1,200 parts per million for poultry, and I believe they're not supposed to rinse it afterwards.
That's not quite clear to me, but I think that is the use there, no rinsing.

So that's something to consider.

I think that the ACS may be a better product than sodium hypochlorite in terms of the trihalomethane carcinogenic type properties. That does sound better.

TAP didn't have any information about the volatile chlorine. Where does this chlorine go when they're putting it on? I mean, it's very volatile when you mix those solutions. You release chlorine dioxide; you release hypochlorous acid.

So I don't know the recovery rate on the chlorine. Do they get it all or not? I don't know, but certainly it's worthy of consideration. The TAP review was not real detailed.

And I'm also finding that as we look at chlorine in general there's other issues where we've been trying to apply a policy along those lines. For vegetable and
fruit washing, carcass washing, people can use higher than the four parts per million of chlorine product provided there's a rinse with potable water at, you know, four parts or less.

However, some other regulations seem to conflict. That leads to a problem with chlorine on eggs, for instance, egg washing. They use 200 parts per million, and there's various egg grading, Grade A eggs marketing rules under AMS that say you can rinse, you can't rinse, and also EPA is involved.

So there's multiple agencies involved, and I'm still trying to track down who's in charge, but we may need to modify that earlier 2003 piece to look at where are there some exceptions that we may have to grant because we have no choice or else until there are other products available.

There is peracetic acid available on the carcass washing. For eggs peracetic
acid is not labeled. So there's these little
wrinkles here. I mean, we all want safe food,
but we all need help in finding out where the
other regulations are that affect this, too,
and it should be clear so everyone is doing
the same thing.

So right now we don't have that
situation. I think it can be approved. I'm
just going to stop there. That's enough, but
if you have more questions, let me know.

CHAIRMAN MOYER: Thank you, Emily.

Anybody have -- Bea has a question
for you, Emily.

MEMBER JAMES: Emily, in your
comments that you submitted you had said a few
things about retailer certification, and I was
wondering if you could just elaborate a little
bit.

MS. BROWN-ROSEN: Sure. My point
there was mainly that we've had a lot of
controversy in the certification community
about how to do retailer certification and I
think a lot of people feel you can just apply processing rules and are doing that successfully. I mean the handling rules as exist.

However, there has been, I think, some valid legal arguments made whether handlers were excluded; retailers who do not process food are excluded from the definition of handler. If you look at the definition of handler, it says except for retailers who do not process food. So there is some question whether you can even certify them at all because the AHPA and the regulation says that. So we'd just like to get a legal opinion from whoever you get it from on that issue.

CHAIRMAN MOYER: Follow-up, Bea?

MEMBER JAMES: Just as a follow-up, I guess, I would like to ask Barbara if she wouldn't mind making comment on the question that you specifically put in your comments, which was can retailers that don't process be certified. So if the program could
comment on your position with that, please.

MS. ROBINSON: Well, you know,

we've come to sort of a point here, I guess,

where because we issued a scope statement

where we pretty much said that products,

regardless of their end use, could be

certified, we got to a point where we

recognized that just for consistency sake we

know that the rule says that retailers are

exempt from certification, but our position

has gotten to the point, I believe where we

would rather have entities under the

regulatory umbrella than outside the

regulatory umbrella.

And the mere fact that they do not

have to be certified does not mean that they

cannot be certified. They may be certified.

They may seek certification under this

regulation.

CHAIRMAN MOYER: Thank you,

Barbara.

Joe has a comment.
MEMBER SMILLIE: This isn't the retail argument, but I have to go back. Emily, could you go back? I missed. It was in the early part of your comments about chlorine washes can be allowed without a rinse. Could you just repeat that again?

MS. BROWN-ROSEN: Well, the question was can they be allowed without a rinse.

MEMBER SMILLIE: Right. Depending on the concentration.

MS. BROWN-ROSEN: Right. Well, in direct contact with food. We have been interpreting the two or three position, which was, you know, very clearly worked out, to mean, you know, you test at the point of contact with the food, and the final rinse water should be no more than four parts per million or Safe Drinking Water Act for that material. Like chlorine dioxide is only .8 parts per million, and sodium chloride is one and chlorine is four. They have different
Anyway, that should be no higher than Safe Drinking Water Act says. So that's what we've been trying to apply, and then we did run into a few conflicts with certain regulated products like eggs and dairy processing.

MEMBER SMILLIE: And you wouldn't consider washing surfaces direct contact with food?

MS. BROWN-ROSEN: Well, we do. I mean, we'd like clarity on that, too, actually. We require rinsing with potable water, yes, or approved with no restriction like peracetic acid doesn't require rinsing.

MEMBER SMILLIE: And an intervening event couldn't be time.

MS. BROWN-ROSEN: Well, it could be time if they were willing to test for us and show there was absolutely no residue. We do provide alternate paths for them to put that, yes.
CHAIRMAN MOYER: The chair recognizes Hugh.

MEMBER KARREMAN: Emily, just a question on the injectable vitamins and minerals. On the proposed section heading, I think we were trying to say formulate injectable supplements of trace minerals per 603(d)(2), vitamins per 603(d)(3), and electrolytes per 603(a)(8), just in reference to those things, not re-allowing electrolytes. It's more like in reference to those already allowed.

That's all I wanted.

MS. BROWN-ROSEN: Well, I understand that, but I think injectable, I mean, electrolytes is on the list at 603 whatever. It just says electrolytes. It doesn't say oral. It doesn't say injectable. So we assume that means however you want to apply them as a health material.

You know, unless you were going to restrict it otherwise, we've always assumed
that injectables were allowed. And, you know, why would we need to re-mention it?

MEMBER KARREMAN: I guess I would have thought that electrolytes, as stated in (a)(8), would me actually oral. So we want to make sure that the injectable forms would be allowed.

But we can go over that more, but I just want to -- that was our thinking.

MS. BROWN-ROSEN: Okay.

CHAIRMAN MOYER: Thank you, Emily.

Appreciate your time.

MS. BROWN-ROSEN: Thanks.

CHAIRMAN MOYER: The Board recognizes Mark Kastel. Is Mark here?

MR. FANTLE: Not here.

CHAIRMAN MOYER: Thank you, Will.

Patty Lovera and Lisa Bunin on deck.

MS. LOVERA: Hi. My name is Patty Lovera. I'm with the consumer group Food and Water Watch. So I have to talk about a couple
of things quickly. So I'll try to make it
through all of them.

The first one is nanotechnology.

You heard a lot about it today. I think
you're going to hear more, and for us it's a
very basic issue of answering that first
question that you asked in discussion. You
asked about whether nanotechnology is
compatible with organic, and we think the
answer is no, and we think a lot of consumers
think the answer is no.

FDA doesn't have a handle on this
technology. It's essentially unregulated, and
it's exploding into the marketplace for food
through a lot of channels, through packaging,
through additives and flavorings through
contact surfaces and disinfectants, and as
consumer awareness of the technology grows,
they're going to look for a place that doesn't
have it. We believe that organic should be
that place. So this is the opportunity to
figure that out.
And the last point I'll make on that is that, you know, this is similar, we think, to the genetic engineering issue with the cloning issue. We have to find ways in all of the channels of organic, all of the different venues it could make its way in to make sure that it doesn't.

Another topic to cover quickly is the aquaculture for bivalve issue. In the discussion draft, we thought that the Livestock Committee asked very good questions of the Aquaculture Working Group, those five questions, and that really brought up the same issues we're always talking about with aquaculture, is whether this is compatible with the systems approach of organic and we think that just like with other things you've heard from me before about aquaculture, you know, these open water systems where you're not able to control the inputs because the inputs are the ocean or some kind of open body of water, aren't meeting that compatibility
test of organic.

So I thought those were good questions that you all asked of the working group.

On animal welfare, again, you've heard good stuff about this today, and it's incredibly clear from the marketplace that consumers are really interested in this. So obviously it's time for organic to deal with it.

We will just inject into that discussion that access to pasture and the outdoors is a piece of animal welfare, especially in the perception that consumers have about the way animals are raised, and another really important piece of that is density. It's stocking density and how many are put in there.

And as you have this conversation about how to do animal welfare and we've heard good discussion today about whether it's measuring something at the end or it;'s a
systems approach, you know, a piece of that system has to be thinking about that density.

We also wanted to speak quickly just in support of the biodiversity recommendation. That's another issue it's past time for organic to tackle. It is really important to consumers, and we're happy to see that we're about to get there.

And then on personal care products, I think the biggest and most immediate need for consumers is some enforcement which you all pointed out in the document that you write. It's kind of a free for all out there in the marketplace of what's labeled, what's not labeled. I think Urvashi Rangan from Consumers Union is going to get into more detail on this in her comment later on.

But one thing I will throw out there from the consumer perspective that we hear from people is that they're concerned about all of the ingredients in something that
bills itself as organic in any category, whether it's made with organic ingredients or just has organic stuff on the label. They're concerned about all of it. They don't want it to be a vehicle for things that may not be, you know, healthy enough or make their kind of cut for what should be in organic, not just the stuff that is, you know, under that cap of organic ingredients.

And then finally, I will just say that we're a member of the National Organic Coalition, and so we support all of the recommendations they made, especially the ones on peer review and retail certification. They're really important issues to the credibility and integrity of the program, and consumers are obviously very interested in that.

So that was kind of lightning speed.

CHAIRMAN MOYER: Thank you, Patty. Questions or comments, again, from
Board members for Patty?

MS. LOVERA: Thanks.

(No response.)

CHAIRMAN MOYER: Hearing none,

thank you.

Lisa Bunin at the podium and Sam Welsch on deck. Lisa.

MS. BUNIN: Good afternoon. My name is Lisa Bunin, and I'm the campaigns coordinator for the Center for Food Safety, a nonprofit membership organization that works to protect human health and the environment by curving the proliferation of harmful food production technologies and by promoting organic and sustainable agriculture.

CFS represents people across the country who support organic food and farming, grow organic food and regularly purchase organic products.

My comments today address the issues of biodiversity, peer review and nanotechnology. CFS urges the NOSB to support
the guidance document recommendations on the implementation of biodiversity conservation. In the fact of global warming challenges, biodiversity conservation practices can help create the agroecological conditions under which food production systems can adapt to climate change and still maintain their productivity. Biological conservation measures can mitigate global warming impacts by sequestering carbon through the planting of cover crops, perennial crops, native vegetation, and intercropping.

These same practices increase soil microbial activity and diversity and create habitats for beneficial insects and predators, all of which enhance the resiliency of farming systems and the surrounding environment to adapt to climate change. Diverse farm systems are less vulnerable to new pests, the loss of beneficial insects and drought. We urge the NOSB to fully support the committee's
recommendations on biodiversity.

CFS is pleased to see that the NOSB is directly addressing the issue of peer review and certification accreditation. Over the years CFS and others have urged USDA to comply with the mandatory standards and procedures of OFPA to insure that certifying agents operating on the act are accredited and in full compliance.

On October 16th, 2002, CFS and four other NGOs petitioned USDA to create an accreditation peer review panel for the National Organic Program. We have not yet received a formal reply to our petition. We filed the petition in response to growing public concern about whether the NOP was properly performing its role as an accreditor of organic certifying organizations. Our petition was intended to highlight the critically important oversight role that peer review panels play in insuring the integrity of the organic label and in maintaining public
confidence in the organic products labeled with the USDA certified organic seal.

We feel strongly that the panel must be comprised of individuals who not only have expertise in organic production, handling and certification procedures, but also that have experience with methods used to audit against ISO 1711, the industry standard for evaluating accreditation bodies.

CFS agrees with the comments of others and NOC that the peer review panel should not be a task force of the NOSB. Instead we urge you to enlist the services of the U.S. Department of Commerce's National Institute of Standards and Technology to manage the program.

This formal recognition will instill credibility in the NOP certified organic label both nationally and internationally. We urge the establishment of a peer review panel without delay.

The position of CFS on
nanotechnology is that it should be listed as an excluded method under the organic rules because nanotechnology creates novel patented substances that do not meet the OFPA's definition of organic.

Intentionally engineered and manufactured nanomaterials have the capacity to be fundamentally different than the bulk materials from which they are derived by exhibiting new chemical, physical and biological properties at the atomic and molecular level. As such, nanomaterials should be defined as synthetic and prohibited under the organic rules.

It's worth noting that there is a precedent for prohibiting nanotechnology and organics. In 2007, the U.K. Soil Association, one of the world's largest organic certifiers, prohibited manufactured nanoparticles in organically certified products.

Commercial applications of nanotechnology in food and agriculture are
quickly expanding without government oversight or labeling in the absence of adequate risk and ethics research. It's quite possible that certain sectors of the organic industry may already be considering applying these nanotechnology applications, such as in food packaging.

We urge the NOSB and NOP to act now to take a precautionary approach to nanotechnology and protect the integrity of organic by prohibiting nanotechnologies and nanomaterials.

Thank you.

CHAIRMAN MOYER: Thank you, Lisa.

Questions or comments again from Board members?

(No response.)

CHAIRMAN MOYER: Seeing no hands, thank you, Lisa. Appreciate that.

The Board recognizes Sam Welsch and Michael Fiery on deck.

MR. WELSCH: Hello, everyone. I
certainly appreciate all the work that you go
through. It's a lot of work just to prepare
for these meetings on the items we're
interested in. You have to look at
everything, even those you may not be quite so
interested in.

I have a few comments. In the
prepared ones I sent I'll just highlight, and
then I have a couple of other things I wanted
to add.

I'll start with voluntary retail
certification comments. Although there have
been other things added to the scope of the
NOP, like cosmetics and pet food and other
items, they're different from retailers that
are not doing processing because Congress
specifically excluded retailers that did not
process from the definition of handling
operations. And if they're not included in
the definition of handling operation, they
cannot be certified.

That doesn't mean there isn't
plenty of room for voluntary retail
certification because retailers do many things
that are processing for which they could be
certified, such as meat cutting, baking, deli
operations, et cetera. I don't think there's
any specific regulations that are needed for
retail certification of that type. It's the
same type of processing activities that are
done by other handlers. They can be certified
in the same way, including an annual
inspection of each site that's to be
certified.

In fact, I think that's even more
important for retail stores because they have
less separation in terms of time and space
between the organic and non-organic handling
that they do. They are usually a split
operation handling both organic and non-
organic products, and unlike other handlers
that dedicate a certain amount of time or
space exclusively to organic, it's not as
clearly separated in most retail operations.
So I think it's very important that every store that wants to be certified be inspected.

In terms of soilless growing systems, I was very pleased to see the discussion document that came out that essentially said as I've been saying for years: hydroponics cannot be certified because there's no soil involved. As OFPA states, fertility must primarily come through management of organic content of the soil, organic content of the soil. No soil; nothing to certify.

So I would ask that in your discussions, you request that the NOP immediately remove from its Website the answer yes to the question that says, "Can hydroponic operations be certified?" I think it's time for that to be removed and to give notice to those certifiers that have certified such operations that it's time to tell them to get soil in their system or not be renewed in
their organic operations because there are hydroponic operations out there that are being certified, and at the store you can't tell if it was grown in soil or if it was grown in liquid fertilizer, unfortunately many of which are no longer being allowed by the NOP because of the scandals in California.

So I think it's high time to get rid of the soilless operations that have been certified.

Under cosmetic and personal care, I do agree with the main recommendation that they be included under the scope of the NOP. Simply changing one word in the policy that was put out a couple of years ago which said they may be certified, saying they must be certified if you're going to use the organic claim would be a good start.

I know there are problems with many of the items that substances people want to use as ingredients, but I think the process of requesting that those be added to the
national list is the best one to use. Right now it's very confusing to consumers, myself included. You know, I like to be able to look at the label. I don't always read ingredient labels. Sometimes I like to go shop and just see "organic" on the front and know it's organic. It's not true in the personal care aisle. You don't know if it's actually certified to the NOP or if it's certified to some -- well, I use the word not "bogus certification." You know, if it's not NOP, I don't think it's organic in the U.S., and I think that's the way it ought to stay.

Regarding some of the other comments people have made, I am pleased to see that there is support for moving lecithin from the national list. I think it's a good step when we have things that are on there that people have invested in developing and creating organic forms, that we can actually see some of those agriculture products removed.
Regarding comments very early in the day, if you still remember, somebody talked about vaccines. We were one of the certifiers when we started certifying livestock we asked if the vaccines were from GMO sources or not and asked the manufacturers to identify whether the microorganisms or whatever was used in making the vaccines were from GMOs or not.

So that's it. All right. I won't talk about seeds.

CHAIRMAN MOYER: Thank you, Sam. We appreciate your comments.

Hugh and the Kevin.

MEMBER KARREMAN: Sam, since you ended with the vaccine topic and you've been looking at these you told me out there since October 21st, 2002 or whatever, right?

MR. WELSCH: Since I was accredited in 2003.

MEMBER KARREMAN: Okay. Roughly how many do you think in your review, maybe
just off the top of your head if you could,
have been disqualified because of being
genetically engineered versus traditional?
Any numbers roughly?

MR. WELSCH: Well, I'm going to
check the ones that PCO found, but we have not
had any that have been identified as GMO. It
doesn't mean they may not be and they just
haven't informed us of that, but we do look.
It's difficult because of the way most inputs
are reviewed that we don't always have as much
information as we would like, but to date we
have not rejected anyone for that.

MEMBER KARREMAN: Just a quick
follow-up?

CHAIRMAN MOYER: Follow-up again?
Go ahead, Hugh. Follow up.

MEMBER KARREMAN: They're all
licensed products by USDA. So they are kind
of, you know, checkable rather than just
asking the manufacturer. I think there's an
easy way to do that.
MR. WELSCH: We've done some searches on the USDA sites as well. Fortunately, I have other staff who look into those details.

CHAIRMAN MOYER: Thank you.

Kevin.

MEMBER ENGELBERT: I just wanted you to finish your thought on the GMO vaccines and what your opinion is, Sam, and give you the opportunity to finish that subject that you were on.

MR. WELSCH: Well, I think under the current way the rule is written it should go if there's a GMO vaccine on the market that wants to use an organic production, it should be petitioned, and if it's going to be allowed, then it should be approved by this Board.

As far as whether they should or should not be approved, you know, I'm somewhat neutral on that. Generally I don't support the use of GMOs, but this might be a special
case if there are not other alternatives available, but I think right now the rule is written, we cannot approve them if they're made with prohibited methods.

CHAIRMAN MOYER: Thank you, Sam.

Bea. Go ahead, Bea.

MEMBER JAMES: Sam, thank you for your comments, extensive comments on retail, and I will certainly look at those and take those into consideration, but the question I have for you is actually on body care, and I'm wondering if you believe that body care, organic body care should be agricultural, for agricultural products only, ingredients.

MR. WELSCH: Could you say the question again?

MEMBER JAMES: Do you believe that body care that is going to be certified as organic should be for 100 percent agricultural based ingredients?

MR. WELSCH: Well, I think like we currently allow synthetics and other products,
so I think the same kind of mix would be allowed in cosmetics or personal care products, that if it's not agriculture, if it's not a certified organic agricultural ingredient, then it should be on the national list if it's going to be in an organic or a made with organic product, and then if there are substances that are needed in the personal care industry in order to achieve certain functions, then those things should be petitioned and added to the national list. I've heard recommendations that there would actually be a separate portion of 205.605 specifically for body care cosmetic products. So it's easily distinguished from those who are allowed in food.

CHAIRMAN MOYER: Thank you, Sam.

MR. WELSCH: Thanks, Jeff.

CHAIRMAN MOYER: You're welcome.

Michael Fiery to the podium, and Lisa Nichols on deck.

MS. FRANCES: Jeff.
1            CHAIRMAN MOYER: Yes.
2            MS. FRANCES: There is a women,
3            Lendy Banister. I'm not sure if she's here,
4            but there were some travel issue for her.
5            CHAIRMAN MOYER: I apologize. Is
6            Lendy Banister here?
7            (No response.)
8            CHAIRMAN MOYER: No, I don't
9            believe so. Thank you, Valerie.
10           Go ahead, Michael.
11           MR. FIERY: Thank you.
12           Members of the National Organic
13           Standards Board, my name is Michael Fiery. I
14           am vice president in charge of product
15           development currently at Miller Chemical and
16           Fertilizer Corporation.
17           Since this is my first time making
18           a public comment, I feel it's my duty to be
19           brief, and I promise to do so.
20           We've been honored to serve
21           organic growers and certifiers since the mid-
22           1980s with polymer based resins under the
trade name of Nu Film. I appreciate the opportunity to comment on the list for approved inert materials issue currently being discussed.

Miller previously received a letter in 2005 from the U.S. EPA regarding an inert polymer which was completed through reassessment being approved and classified as a List 4(b) inert. EPA acknowledged that the public list of 4(b) inerts had not been updated, but this chemical would be included in the next 4(b) update.

Well, we recognized, of course, in 2005 that EPA had no plans to update that list. This inert polymer was approved for organic use by organic certifiers through the confidential statement formula process, which included the signed document from EPA until the USDA letter specifying that only 2004 inert materials would be accepted.

The current inert polymer in question is cleared under 40 CFR 180.960 as an
inert ingredient in pesticide formulations
applied pre and post harvest to food crops as
a low risk polymer. One of the current
options being discussed at the NOSB or was
discussed at the NOSB November meeting was to
adopt the minimal toxicity inert cleared under
40 CFR 180.950. Since polymers are safe and
non-toxic, along with the fact that EPA
notified us in writing that they would have
placed the polymer on List 4(b) if and when it
was updated, we would respectfully respect
that the NOSB consider accepting polymers
under 40 CFR 180.960 in addition to the
minimal inerts cleared under 40 CFR 180.950.
As a manufacturer who supplies the
required confidential statement of formulas
and manufacturing processes to any and all
certifiers, we believe that the certifiers do
a thorough job of reviewing the documentation
submitted.
One option might be to allow
accredited certifiers to accept documented
letters from EPA on reassessed or new inerts that would meet the minimal risks or criteria of List 4(b).

Finally, we agree that the EPA and NOP and NOSB should work closely to maintain safe, compliant products and establish fair and equitable methods based on science which might allow the USDA, NOP and their certifiers options for retaining or adding new inerts, which are vital for the success and global growth of organic farming.

I thank you for your continued service to the industry.

CHAIRMAN MOYER: Thank you, Michael.

Questions. Gerry.

MEMBER DAVIS: Are you familiar with a -- your material is extracted from pine trees of some fashion, correct?

MR. FIERY: The main resin is an extract from the cellular conifer pine tree stump. That is correct.
MEMBER DAVIS: Are you familiar with a class of like compounds called tall oil and if they are related to your material? They are also pine extracted resins.

MR. FIERY: Tall oil resins, turpentine, there's a whole class of compounds that would be considered, let's say, terpene polymers. I think the difference is, again, in the extraction of how they're extracted and is it a polymer or, in the case of a tall oil, fatty acid, what's the chemistry behind that actual material

What we particularly work with is the actual polymer.

MEMBER DAVIS: Okay.

MR. FIERY: What I'm discussing here now is not so much that polymer as it is an inert ingredient that might be used in that polymer or an inert ingredient that might be used in any pesticide formulation that would be accepted or compliant under the national organic program.
And our concern is that currently only using the old 2004 list, there have been a lot of new inerts since then that have come before EPA or have been reassessed by EPA and commented back to a manufacturer like ourself, and what we're trying to determine is how to take that information, do a reassessment or a new inert being listed as what would be a 4(b) material; how to get those materials allowed for use.

MEMBER DAVIS: Right. The Crops Committee is considering the whole List 4 inert and pesticide issue, and I know your material is somewhat wrapped up in the entire problem, and I was just wanting to ask a few more questions --

MR. FIERY: Sure.

MEMBER DAVIS: -- because I was keeping your material in the back of my mind as one example of something that's already been affected, and we don't want to stumble into a ruling that might affect a whole bunch
MR. FIERY: No, I agree, and again, the List 4 or the inert issue because it's so broad, it's not a particular compound or nothing. I think the one that you're particularly referencing to ours, which was a material that we actually petitioned or went through the petition process, it was sent in 2005 up to the NOSB through the petition process. That was relating to the polymer itself, and from what I understand, that petition was never acted upon. It is on the list as approved or those polymers are approved because of information that had been forwarded, also stating that they were compliant under List 4(b) as low risk polymers at the time.

CHAIRMAN MOYER: The Chair recognizes Kevin.

MEMBER ENGELBERT: I'd like to ask you as a layman and a Crops Committee member one of the things that we're dealing with as
we look at these List 4 inerts is their level in the final product. The inerts that you deal with, can they all get to the point if they have a certain level that they are no longer inert and their properties can be considered an active ingredient? Are these inerts in the --

MR. FIERY: The inerts are used actually in the formulation in this particular situation in order to be able to get that polymer to actually dissolve in water. Normally the polymers we work with are insoluble in water. So part of the function that that polymer resin is playing is allowing the main active polymer which might be 95 to 96 percent of that formulation to stay emulsified in water, and then upon applying to a plant surface, allow the polymer to polymerize properly on the surface over time.

So it is in there as an inert, but it is an important inert because if it was not in the particular product, the product would
not function in the manner which growers have
come to acknowledge its use.

And, you know, often that's been a
comment someone has come back. They would say,
"Well, why don't you just replace that? Do
you know how easy it would be if you just took
that inert out, go back to the 2004 list,
replace it with something that's there?"

And while that could be done, the
product itself and the product performance
would change, and I think the importance in
growers that work with these compounds, you
know, we're not going to for the sake of
selling something. We want to put a product
in the grower's hands that especially under a
brand name have come to recognize that brand
name of giving them performance.

So rather than just putting an
inert in that would be on the '04 list, we
basically feel it's important to keep the
integrity of an inert that got reassessed,
making sure that it is in the product so that
the product's performance wouldn't be affected.

But it is as an inert.

CHAIRMAN MOYER: Thank you, Michael.

MR. FIERY: Thank you.

CHAIRMAN MOYER: Lisa Nichols or Andy LaVigne.

MS. FRANCES: I literally just got an E-mail from Andy LaVigne saying he's not here, and so I told him he's on deck, but we got it.

CHAIRMAN MOYER: Okay. Thank you. I will mention to the Board that I don't think we'll plan on taking a break at five. So just individually as you need to, just in the essence of time, we still have about 18 people to go through yet.

Thank you, Renee.
MS. MANN: Good afternoon or early evening, and thank you for the opportunity to comment.

My name is Renee Mann, and I'm the review program manager of OMRI, the Organic Materials Review Institute.

I'll be commenting on the topics of the definition of materials, petitions that have been overlooked, inerts, and peracetic acid.

First I'll touch on the definition of materials and the discussion surrounding agricultural/non-agricultural and synthetic versus non-synthetic.

OMRI supports the work that's been conducted thus far to clearly define these terms because these definitions have serious implications for the future of the organic industry.

How these issues are resolved requires tremendous deliberation, and I won't say much more than that because OMRI
participated in the Materials Working Group, and there will be others that will express the details of the results of that working group. Regarding overlooked petitions, both OMRI and CCOF submitted lists of overlooked petitions. OMRI would like to remind the Board and the NOP of these petitions, and we encourage you to give a high priority to either continuing the petition review process or updating the petition's substances database to show how the petitions were dealt with.

In general, all of the petitions need to be clearly reviewed. Otherwise the system loses credibility, also, considering these petitions would help OMRI resolve a couple of lingering issues that have been lingering for years with us as well.

I have one small note on petition materials that I made at the last NOSB meeting as well, and that is that OMRI recommends that any material that's added to the national list
include when possible either its CAS number or the Lannean taxonomic identity.

There's many biological materials that don't have really good CAS numbers of Lannean taxonomic identification for them. So I understand that's not going to work every time, but when possible, please do use these.

I notice that some of the NOSB Committee recommendations for consideration at this agenda contain CAS numbers. So thanks for trying to use those.

I'm going to touch on my notes now. Without the allowance for List 4(b) inerts, many currently used inputs would be lost to organic farmers. We went back through our list of products and determined that about 65 percent of the pesticide products that OMRI currently lists contain EPA List 4(b) inerts. This number comes from a data gathering that we did just a couple of weeks ago.

Another point I'd like to make is that the soon to be implemented Canadian
organics standards reference the Health Canada list of inerts, which designated List 4(a) and 4(b) inerts as allowed. So their list was set to correlate to EPA List 4(a) and 4(b), and with the high probability of equivalency between the USA and Canada regulations, it would be good if we kept with our list 4(a) and 4(b) allowed materials that we have right now.

That being said, how do we preserve the status quo? The only way that OMRI sees that we could preserve the status quo would be to include the 2004 EPA List 4(a) and 4(b) in the national list for both crops and livestock, and then allow those materials to be sunset every five years.

You could also accept 189.50, but note that that's not even 4(a) inerts. That's actually a smaller subset of 4(a) inerts. So we have a problem if we go with the recommendation to just accept what's at 189.50.
Okay. And there is always the option to simply currently allow all of the materials at 18900 through 960 by reference.

Okay, and regarding the petition for a peracetic acid in crop production, OMRI support the final recommendation at this time. Because of the urgency of the situation, those formulated products using hydrogen peroxide and that contain peracetic acid, that now is considered an active ingredient, and these materials must be pulled off OMRI's list if peracetic acid is being used as an active and it's not allowed on the national list.

So at this time OMRI supports the annotation change that's been suggested by the committee and hope that there can be a final recommendation at this meeting instead of just a discussion.

And I'm done. So any questions?

CHAIRMAN MOYER: Okay. There are some questions for you, Renee.

Joe and then Gerry.
MEMBER SMILLIE: Actually my question is for the Chair. I've heard twice now about lost petitions. Could we get some clarification on that?

MS. MANN: do you want that from me or --

MEMBER SMILLIE: Whoever.

CHAIRMAN MOYER: What I'd like to do is turn that over to the Executive Director, Valerie Frances for an answer.

MS. FRANCES: Well, this is something that Dan and I and others have talked about. We addressed it somewhat in the last meeting sa well, where we were asking people to bring forth their list.

I don't think there's so much loss as that all sorts of different types of action were take, and they just want them to be revisited and reassessed, brought forward, tabled permanently.

There was this whole group of tabled petitions or no action. So I think
that's what that's referring to, not so much
lost.

MEMBER SMILLIE: They're not lost.

MS. MANN: No.

MEMBER SMILLIE: They're in
process.

MS. FRANCS: Well, they were not
being acted upon.

PARTICIPANT: Stuck in limbo.

MEMBER SMILLIE: Oh, there's a lot
of people in limbo. There are a lot of, a lot
of things in limbo. So okay. That's what I
meant. They're not lost.

CHAIRMAN MOYER: Thank you.

Gerry, if you could just hang on a

MR. MATTHEWS: Just to add onto
that, as Barbara mentioned this morning, we
have a statement of work that we've put out
with Science and Tech to help us develop an
improved database for the recording of all of
the actions that have taken place on all of
the materials, and they are currently working on that project.

CHAIRMAN MOYER:  Thank you,

Richard, for that point of clarification.

MS. FRANCES:  And they've had lots of input from me on making that happen.

CHAIRMAN MOYER:  Does that clarify your question, Joe?

MEMBER SMILLIE:  Yes.

CHAIRMAN MOYER:  Thank you.  Good.

MR. MATTHEWS:  And if anybody needs more details on it, I'm sure Shannon would be more than happy to speak on it because she's the one who's been working with Science and Tech.

CHAIRMAN MOYER:  Thank you.

The Chair recognizes Gerry.

MEMBER DAVIS:  Renee, listening to their responses I don't remember exactly the context of what you said in your last sentence, but if you remember, can you repeat it because I couldn't quite catch part of it?
MS. MANN: I'm sorry. We support the Materials Committee or not Materials Committee, the Crops Committee making a final recommendation at this meeting or this week.

MEMBER DAVIS: Making a final recommendation at this meeting?

MS. MANN: yes, on peracetic acid instead of just discussing, if possible.

CHAIRMAN MOYER: The Chair recognizes Tina.

MEMBER ELLOR: While we have you here, Renee, do you want to comment on the annotation or, you know, limiting the percentage? Would that be -- how does OMRI feel about that?

MS. MANN: I didn't look into detail into that.

MEMBER ELLOR: Okay.

MS. MANN: But it looked acceptable from off the top of my head. I could look into it some more tonight.

MS. FRANCES: and a comment on
1 their request. We can't make a
2 recommendation.

3 CHAIRMAN MOYER: That's correct.
4 One we've posted what our mode of action will
5 be, we cannot change that. So it will remain
6 a discussion item, contrary to your hopes and
7 wishes.

8 MS. MANN: Okay.
9
10 CHAIRMAN MOYER: Any other
11 questions for Renee?

12 (No response.)

13 CHAIRMAN MOYER: Thank you, Renee.
14 MS. MANN: Thank you.
15
16 CHAIRMAN MOYER: Kristen Knox, and
17 Patrick Carr on deck.

18 MS. KNOX: Good afternoon,
19 everyone. That was a very nice segue from
20 OMRI since I'm going to be discussing
21 peracetic acid and the inerts issue as well.
22 We are the petitioners, Biosafe
23 Systems, for the inclusion of peracetic acid
24 to be on 205.601 without annotation. We also
I understand that the committee came back with a recommendation as Tina alluded to to allow it but with a limitation of two percent.

I did submit comment to all of the recommendations, and that is on the posting. I hope you've had a chance to look at that. This is not going to be a complete going through everything that was in the letter because it was rather lengthy, and otherwise I'd like to just summarize the extent of that letter.

Peracetic acid cannot exist without hydrogen peroxide. Therefore we'd like to see it represented in the same manner as hydrogen peroxide, as an oxidizer without any restrictions other than exhausting the other options for organic farming.

We believe it is compatible with organic farming practices, and it is also discussed in the posted comments.

We also believe that there is no true alternative to hydrogen
peroxide/peracetic acid formulations for the immediate knockdown of any pests without residue, without toxicity, and without mutational resistance.

In regards to the issue of HEDP, I know that was a concern, and the recommendations list that it is either a one, two, or three list inert. I don't know where that is on those lists, but it is on the EPA's 2004 List 4(b).

HEDP, just for a little bit more information about it, biodegrades into carbon and phosphorus. The FDA found not concerns for environmental toxicity with HEDP for food contact uses, and it is listed in the 21 CFR along with hydrogen peroxide and peracetic acid to address different food contact applications.

As far as toxicity of HEDP goes, when it's used at its labeled rates, it is far below the indicated EC-50 or NOEC values demonstrated in two different submitted
reports, including the Herr report for phosphates, and with the exception of algae. We do get the algae, but then, again, that's one of our targets. So we don't mind.

And in regards to the inerts issue, we feel very strongly that the list should be inclusive of List 4(b). It affects all of our products and several other products that we know that are out there on the market, and we addressed this as well in a separate letter to the NOSB.

The EPA has already determined that these inerts are of no toxicological concern when they're used at the labeled rates, and in many instances we've gone through a lot of trial and error with finding the correct inerts to be used in our formulations, especially this HEDP, which is a very specific stabilizer that keeps the hydrogen peroxide/peracetic acid in its balance, for lack of a better word.

And the -- I lost my train of
There are many 4(b)s that are on the 180.910, 920, 930, that all have tolerance exemptions for inerts, but they're just not on 950 yet, and why they haven't been evaluated we're not sure, but to just limit it to 950 would exclude, as OMRI alluded to, a lot of products that are out there.

And in many instances there are no substitutions for the inerts that are on the 4(b) or the 950 because that's even more exclusive.

And that's about all I have. Does anyone have any questions?

CHAIRMAN MOYER: Thank you, Kristen.

Questions? Tina.

MEMBER ELLOR: This is a question that would be really helpful if you could answer for us. It was our understanding, and I think Gerry probably was the one who ferreted out this information, about the two
percent limitation. It's our understanding that the products that are on the market now that you make don't contain more than two percent anyway, right?

MS. KNOX: That's true. Well, that's true and it's not true. We do. Two of our main products that are used in the organic agricultural community do contain two percent peracetic acid, and thank you for saying that because I forgot to mention as part of my comments that if it absolutely has to be annotated, that we would like to see it limited to the ppms, parts per million, of the peracetic acid that's in the formulation as opposed to the percentage of the concentrate because we think this is a much more accurate way to get a handle on how much peracetic acid is being applied.

We have a five percent product that's also approved for post harvest washes and for agricultural irrigation, and a 12 percent product that's approved for
agricultural irrigation waters as well, and if
we limit it to the two percent, then those
products are gone.

And when you dilute down either
the five percent or the 12 percent products to
their one to 1,000 at the very least ratios,
you end up with minuscule amounts of peracetic
acid, even less.

The worst case scenario would be
200 parts per million, and that's in a two
percent product at a one to 100 dilution.
Everything else, any of the other
applications, the amount of peracetic acid
goes down.

MEMBER ELLOR: So are there any
applications you could think of that would use
high concentrations of peracetic acid on crops
in the field? MS. KNOX: No. It's just to
treat the irrigation waters. And it's not at
high dilution rates.

MEMBER ELLOR: And if you had to
put a ppm annotation on, what would it be?
MS. KNOX: 200.

MEMBER ELLOR: 200? And that is in the final dilution to use on the crop?

MS. KNOX: Yes. That's the highest application rate for--to our field crop product, at 1 to 100.

MEMBER ELLOR: Okay. Thank you.

MS. KNOX: Okay.

CHAIR MOYER: The chair recognizes Gerry.

MEMBER DAVIS: So let me clarify it to myself, at least what you just said. Your company's wish is, if we put it on a ppm basis, based on rate per acre, not in what it says on the label; correct?

MS. KNOX: No. This is based on what it says on the label. It's a 1 to 100 dilution--

MEMBER DAVIS: No, no, no. I mean, what it says on the ingredients page of the label. Let me clarify myself.

How would a certifier verify, if
we say 200 ppm, how would you envision that

happening? If we base it on 200 ppm--no more

than 200 ppm can be applied to a crop. Is

that what you're suggesting?

MS. KNOX: Yes. I understand what

you're saying now. Yes. With the new

products that are coming out, it's going to

list peracetic acid as an active ingredient at

2 percent. So if you do the math, at 1 to

100, it comes out to the 200 ppm per million

per application.

MEMBER DAVIS: Okay. Then my

follow-up question is 200 ppm applied to--in

the soil water, being washed into the soil,

was our -- from the research we had done and

talked with different people, read a lot of

information coming from other sources other

than BioSafe, the petitioner, was that

peracetic acid is a polar molecule compared to

hydrogen peroxide; correct?

MS. KNOX: I'm not a chemist. I'm

sorry. I can't answer that.
MEMBER DAVIS: Okay. It's a much more active concentration per concentration than hydrogen peroxide as far as sanitizer or germ killing—it takes a much higher concentration of hydrogen peroxide to kill organisms than it does peracetic acid to kill the same organisms; correct?

MS. KNOX: Correct. That's very true, and it's a synergistic effect. The peracetic acid breaks down the cell wall and the hydrogen peroxide then just comes in right behind it and oxidizes the organic matter.

MEMBER DAVIS: So our concern was the effects of—we hadn't thought of limiting it to a 200 ppm application rate to the field, but our concern was that we would--our decision, if we allowed too much peracetic acid beyond what was necessary to maintain the hydrogen peroxide formulations that currently exist, was that—I'm getting confused on how to word this.

There's a potential, whether they
exist now on your label rates and everything, at this moment, there's the potential,
depending on what we allowed, that some day we could have peracetic acid formulations being irrigated on organic crops that would effectively be biocides, killing beneficial and parasitic organisms in the soil at some level. And we thought that was not compatible with organic, to be treating the soil with nonselective biocides. Yes, they kill some things easier than others, but they will kill some beneficials as well as parasites, according to your comments that you submitted, the written comments that you submitted at least.

MS. KNOX: From April? The most recent letter?

MEMBER DAVIS: Yes.

MS. KNOX: Yes. That's our plant pathologist, Vijay Tropicala, had indicated to me that the beneficials are stronger and use a little bit of the p.a., actually, knocks
down the harmful pathogens and gives them a little bit more breathing room, for lack of a better word, to repopulate.

MEMBER DAVIS: Anyway, that was our rationale, was concern about the soil effects of opening the door wide open to potential future parasitic acid formulations labeled in different ways than exist today.

MS. KNOX: I should point out, though, that the product that I'm talking about, where we're using at a 1 to 100 dilution or 200 ppm of the peracetic acid, is mostly filler. It has nothing to do with the soil applications. Our product for soil, Terraclean, is a 1 to 1000 dilution of a 5 percent p.a. product.

MEMBER DAVIS: I understand. We just didn't want to approve something now that would give a company like Biosafe, or others running--you know, "rope" to just--if they could convince EPA it's okay, to bring on to the organic market biocidal soil-applied
1 materials.
2 
3 MS. KNOX: No; we're not looking
to do that; but I understand your concern.
4 
5 CHAIR MOYER: Thank you, Kristen.

Patrick Carr and Terry Gong on

6 deck.

7 MR. CARR: Ladies and gentlemen,

8 I'm Patrick Carr with Diatech. My brief

9 comments are regarding the Diatech petition on

10 isoparaffinic hydrocarbon, and on the inert

11 four list, both of which are before the Crop

12 Committee and the NOSB.

13 The List 4 issue that the NOP has

14 with the EPA was attributing effect on

15 Diatech's petition. I urge the Crop Committee

16 and the NOSB to move toward an expeditious

17 resolution of this problem, that allows the

18 use of inerts that have been vetted by the EPA

19 and not to cause adverse effects to the public

20 health or the environment.

21 This list must be dynamic and

22 responsive to the determinations made by the
EPA in their assessments. Accepting the status quo is not in the best interest of organic agriculture, in my opinion, and the petition process, also in my experience, takes years, and as I will comment later in my comments, appears to lack the technical rigor that goes into an EPA health and safety assessment.

As was made in my written comments, I believe that neither the Crop Committee nor the NOSB can fulfill their responsibilities of duty of care, especially to the standard of being reasonably informed, given the problems with the TAP Report on this issue. The TAP Report contains significant errors and shows a superficial understanding of pyrethrins and its processing, at best.

Judgments made by the Crop Committee based on this TAP Report can only be flawed. Moreover, the multiple errors in the TAP—if the multiple errors in the TAP were corrected, I suspect many of the unfavorable
responses in evaluation criteria would be reversed.

These are distilled down into two problems. First, contrary to what the TA Report says, there is not pyrethrins available to pesticide formulators that the NOP finds acceptable. Thus, the actions of the NOP in this matter have created a monopoly in organic pyrethrins which is not in the best interest of organic farmers in terms of price or product availability.

Second, much of what is in the TAP about the availability of pyrethrins via supercritical extraction is in error. This again reinforces a lack of understanding the TAP has about the processing of pyrethrins. Yes, there is a patent but there are a great many patents and a patent does not make a commercially-available product. I believe there is no supercritical extractive pyrethrins available on the market. I have looked. The TAP premise about the
availability of this supercritical extracted pyrethrins is in error, and it's one of the bases for not believing that the approval of the isoparaffinic hydrocarbon is important.

In closing, the reliance of the Crop Committee on the NOSB--excuse me. The reliance of the Crop Committee and the NOSB on the TAP will cause an injustice to organic farmers that do not wish to be limited to one product and will stifle product improvements that could benefit organic farmers and consumers.

I urge the Crop Committee, at the very least, to postpone a decision on this petition till such time that they have full and accurate information.

I thank you for your time and consideration. I'd only like to make one other brief comment regarding lost petitions, and to quote Daniel Boone, he once made the comment, "I was never lost but I was mighty confused for three days."
And I know my petition very confused for a number of months, until we made a lot of effort to have it located. thank you.

CHAIR MOYER: Thank you, Patrick. The chair recognizes Kevin.

MEMBER ENGELBERT: Thank you, Mr. Carr. Did you post comments, electronically?

MR. CARR: Yes, I did, sir.

MEMBER ENGELBERT: You did?

MR. CARR: In detail.

CHAIR MOYER: The chair recognizes Gerry.

MEMBER DAVIS: Mr. Carr, do you know the extraction method used for the pyrethrins in your competitor's product, MGK?

MR. CARR: No, sir. I don't. I know there's proprietary and that's as far as I know. I also know they won't make it available to outsiders.

MEMBER DAVIS: And are you saying, then, that you mean you don't know what they
use, but you're saying you don't know if
you're using the supercritical extraction
method that you said is not available?

MR. CARR: My understanding, from
talking to a number of people in the industry,
is that that supercritical extraction is not
being used in a commercial process, that MGK
is using some other method, the best of my
knowledge.

MEMBER DAVIS: Thank you.

CHAIR MOYER: Thank you, Mr. Carr.

Terry Gong and then Brad McElroy

on deck.

MR. GONG: Hello. My name is

Terry Gong. I'm a partner with Harmon Systems
International, and I'd like to thank the Crop
Committee for moving this on to where we are
now. Our quest to achieve sustainability has
taken us on a wondrous journey of learning.
We never know what we'll discover along the
way. If we view knowledge that we've amassed
as the building blocks, we'll discover some
things new. We'll even start to discover that maybe something that we thought to be true may not be.

And so I think we all need to look at this as that we don't have to abandon some of the knowledge we have, but that we can fine-tune it, and to reinforce and buttress the things that we know to be correct. Next slide, please.

When we examine the various ecosystems, the truth of nature becomes apparent to what that foundation is. Most people think it's water, but it really is not. If you look at a cave, there's no rain, there's no sun, and so forth.

But as you see, once you get out in the open, there's some rain that occurs, and then there's some rain that occurs a lot, like the rain forest.

But it really isn't so much the water. It is, in my view, the hydrogen that is delivered to that ecosystem. After all,
how could the Earth's soils or these ecosystems be created if rainwater were neutral? Next slide.

Normally, rainwater has a pH of 5.6. I had an opportunity to speak with a NASA scientist at Ames Research, where they're trying to go to Mars, and they actually thought that the rain pH, normal throughout the world, was 5.2.

And I thought, well, that's fine because we're pretty much in the same ball park. And the reason why I bring this up is because I think there's a myth or a notion that rainwater is supposed to be a neutral pH, and it really has never been, because if rainwater were neutral, again, how long do you think it would have taken to create the Earth's soils and our ecosystems. Next slide.

Normal rainwater gets its acidity, mostly, from natural volcanic activity. I've got some images of Kilauea in volcano--excuse me--the Kilauea volcano in Hawaii, and that is
1 purported to product at least 2000 tons of SO2
2 into the atmosphere per day. It's one of--
3 well, last year, there were about 64 active
4 volcanoes among 590 on the surface. Next
5 slide.
6 We don't even know all of the
7 volcanoes and the hydrothermal vents that are
8 going on underneath the ocean, at the ocean
9 floor, under the seas. Less than one percent
10 of the Earth has been mapped, and we're now
11 just starting to find out more about that with
12 robotics and submersibles.
13 Now, clearly, sulfur, in its
14 various forms, has a major role to play in the
15 regulation of life on this planet.
16 The natural acidity of rainfall
17 explains why areas of high rainfall have
18 acidic soils and why areas with low rainfall,
19 the soils are alkaline and basic.
20 Soil always takes on the
21 characteristics of the materials applied upon
22 it, and eons of years has created these soils,
and I think that a lot of these soils, especially here in the East Coast, because you receive such an abundant amount of rain, more than let's say the Western states, long before the Industrial Age and the burning of coal, these soils were probably already acidic. The next slide, please. And with the coal burning, because that 5.2, 5.6 rainwater falls through a plume of SO2 coming from a coal-burning power plant, it falls uncontrolled on to the ecosystem. One minute left. Wow!

Anyway. The point is that this is why acidifying water is so important compared to the East Coast, that the Western states that are dealing with alkaline soil and alkaline water, and there virtually is no way in the world that they can provide enough acidity—and I'll just conclude since I've got the one minute sign—that if we think about it, sulfuric acid absorbed in rainwater has probably more natural—it's the most natural way of acidifying a system.
I've yet to see sulfur fall from the sky, or acidic acid, or the various other approved forms. But we do see rainwater.

CHAIR MOYER: Thank you, Terry.

Questions from the board. Tracy.

MEMBER MIEDEMA: If you could just kind of finish your thought and connect the dots for me. It sounds like you're a real expert on sulfur and pH in the soil, and how rain interacts with that. What is your opinion on the Committee's recommendation, and why?

MR. GONG: The Crop Committee?

MEMBER MIEDEMA: Yes.

MR. GONG: Well, I think that my petition that I wrote, I think it really explains rainwater and the effect of sulfur in the ecosystem. I think it really speaks for itself. I mean, I can't really say everything in five minutes but you go back to the beginning of time, I mean, it's--you'll be able to see if if you look at the petition
carefully.

CHAIR MOYER: Any other questions?

Thank you, Terry. Appreciate your time.

Brian McElroy to the podium and Michael Christensen on deck.

MR. McELROY: Mr. Moyer, can I address you on a point of order, outside of my five minutes, please.

CHAIR MOYER: Certainly.

MR. McELROY: Yes. We have Michael Christensen in the air. It was our impression that we were speaking on Tuesday. So both John Rapp and Michael Christensen, growers, who have gone much out of their way to try to address this body, are not available this afternoon. So if there's any way to accommodate them tomorrow, it would be much appreciated.

CHAIR MOYER: We'll certainly do our best.

MR. McELROY: Okay.
MS. FRANCES: There's no actual space.

MR. McELROY: I understand that.

CHAIR MOYER: Let us talk among ourselves later, and we'll do our best to accommodate that, but I can't guarantee anything at this point.

MR. McELROY: Appreciate your understanding. Brian McElroy. I work with Driscoll Strawberry Associates. We grow raspberries, blackberries, blueberries, strawberries, and we believe that this material, sulfuric acid, provides our growers with an opportunity to improve soil fertility, improve the quality of the uptake of nutrients in the soil by improving the quality of the water we use.

Driscoll's growers, they are independent family growers, family farmers. We grow organic in Florida, California, Mexico, North Carolina, Washington, Oregon, Chile, and a number of places, and we see
applications of this equipment in those areas. We see the benefits of this coming to irrigation system cleaning and maintenance of irrigation systems. Water quality management. Being able to bring water to a pH that is more conducive to crop production. As you know, much of the water in the Western United States can be high in bicarbonates, or slightly on the alkali level.

So balancing that water allows us to balance the soils and make better use of the nutrients.

We also think that this will lead to more efficient use of agricultural inputs and fertility. The current tools that are available, there are some current tools, we recognize them, we use them, organic matter, bringing in additional organic matter, soil sulphur, citric acid, vinegar.

Unfortunately, soil sulphur's not always a good solution because it may require tillage that is not always the best of
solutions, additional tillage, and it may not
work in permanent crop situations.

Citric acid is a very low
efficiency product, and when the product is
low efficiency and you have to use more, it
basically leads to growers asking themselves
why they're using this material so much. So
the low efficiency leads to a nonuse.

Vinegar, clearly, is also a low-efficiency
material and not readily available in the kind
of quantity producers would want to use.

We do see that this process of
burning sulphur is a pretty simple process.
Burn some sulphur, take that and move it in.

It was actually allowed by a number of
certifiers, up until kind of fine reading of
the regulation led a number of people to the
conclusion that there needed to be a petition
on the product for use. So there is a history
of this use being consistent with organic
production practices.

And that really is it. We do see
that this, allowance of this material,
allowance of this equipment to give us this
material is going to allow us to solve some
soil fertility issues on farm. The material
and equipment is available by several sources.

A number of our growers are
familiar with this process because it was used
historically in their region and they're
looking at possibly getting some of that old
equipment out of the barn and tuning it back
up.

So that is my appeal to you to
approve the petition. Thank you.

CHAIR MOYER: Thank you.
Mr. Joe.

Thank you, Brian. You have a
question, Joe?

MEMBER SMILLIE: I can't resist,
Brian. Did you allow it when you were at
CCLF?

MR. McELROY: Yes, we did.

MEMBER SMILLIE: I thought so.
Well, that puts you in a good space then.

MR. McELROY: We allowed it until we didn't allow it.

MEMBER SMILLIE: North Carolina.

You don't use this in North Carolina; right?

MR. McELROY: I don't specifically know if there would be an application in North Carolina. I doubt it.

MEMBER SMILLIE: So combined with the charts that the previous gentleman set up, it's really a low rainfall, high pH soil, that requires this treatment?

MR. McELROY: My understanding is that some producers on the East Coast might use it in greenhouse situations, where you're not getting the acid rain.

MEMBER SMILLIE: Gee, I never thought it would be so good to have acid rain, let me tell you!

CHAIR MOYER: Thank you, Joe.

Gerry.

MEMBER DAVIS: Brian, you
mentioned the growers acknowledged there are several sources of elemental sulfur that's pure enough to be appropriate to fit into the recommendation that the Crops Committee has.

MR. McELROY: Sorry. The soil sulfur?

MEMBER DAVIS: The elemental sulfur for burning.

MR. McELROY: Oh. No, there's--we're--I'm saying there's other sources, other than just the equipment that Harmon Systems is offering.

MEMBER DAVIS: I see.

MR. McELROY: There are other people that manufacture similar equipment.

MEMBER DAVIS: Similar equipment.

MR. McELROY: And there's equipment historically, sitting around on various farms, that was used--my understanding--was used prior to broader use of--now I'm going to blank on it. The other acid on the conventional side. Sulfuric acid.
MEMBER DAVIS: Okay. I misunderstood you. Thanks.

MEMBER KARREMAN: Just a question.

I haven't kept up on the Crops Committee, and sulfuric acid--can't you just use elemental sulfur pattern? I'm just wondering.

MR. McELROY: Well, you can but that's what I said. That requires tillage. So maybe you can go in and put that in, first round on tillage, but if you've got a permanent crop--and then you kind of have to ask about the efficiency thing too, and is that really better for long-term soil?

I mean, what we see with this product is the ability to build better soils, and we're not just talking about adding sulfur. We're talking about places where we've got salt buildup, that this could help us move that through.

We're talking about not losing...
organic ground that's currently certified,
that if we can't rectify the soil fertility
issues, we're going to have to drop that round
and move on, and, you know, it's hard to make
organic round. It takes three years.

CHAIR MOYER: Thank you, Brian.

Appreciate your time.

MR. McELROY: Thank you.

CHAIR MOYER: The Board would like
to call Bryan Sakuma to the podium.

He's on the plane as well.

[off-mike remarks]

MS. FRANCES: I made some
suggestions.

CHAIR MOYER: We have Renee Mann.

Is that correct, Valerie? Renee had spoken
earlier.

MS. FRANCES: She said she went
sufficiently.

CHAIR MOYER: Thank you. On our
list next I have Will Fantle again. Will is
going to give it to the farmers tomorrow, too.
The Board would like to call Tom Hutchinson to the podium and Peggy Miars will be on deck.

MR. HUTCHINSON: Thank you. I'm Tom Hutchinson, regulatory and policy manager for the Organic Trade Association. Our written comments are considerably fuller than what I can mention here, and I urge you to review them as you consider your agenda items, including comments on inerts and the 100 percent label, retail certification, soil-less growing systems, animal welfare and biodiversity.

A couple of other issues. On personal care, or you have "cosmetics," please note that the term "personal care," as OTA uses it, includes soaps as well as cosmetics. The FDA term, cosmetics, does not include soaps, as I understand.

And while NOP regulation is a worthwhile eventual goal, the proposal as it stands does not seem sufficient to resolve
several issues. OTA therefore recommends that NOSB form a task force similar to aquaculture to address the numerous issues raised in our written comments and others that might arise.

On materials and the definition of synthetic, our primary objective in seeking clarification here is to facilitate the expansion of organic producers, land under organic management and the range of organic products on the market.

Clarification will reduce or eliminate significant uncertainty in the crop, livestock and handling input industry, and potentially make more organically-compatible tools available to organic farmers and handlers.

Clarification will also help reduce consumer uncertainty about the meaning of the organic label, and we're confident that our suggestions would not compromise the integrity of the organic label in any way.

Rather, greater clarification will
make the whole organic system more robust and consistent.

We disagree with the conclusion reached in the final paragraph of page two concerning the question of whether an agricultural raw material that is processed, so that it becomes synthetic, is still agricultural. The Materials Working Group did not recommend a classification of agricultural synthetic, and while the realm of potential certified organic synthetic products might represent a small fraction of organic agriculture, several approaches have been suggested to address this issue, including requiring that all handling substances included on the national list in Section 605 and 606 be subject to commercial availability, regardless of their classification.

It would also help for livestock feed requirements to be revised, to be consistent with human food rules, by permitting up to 5 percent nonorganic
agricultural product as livestock feed, also
subject to commercial availability.

Finally, microbiological
production can be considered agricultural and
organic. We note that there currently exists
certified organic products of microbiological
fermentation, including yeast and alcohol.

Finally, I'd like to spend some
time just mentioning that OTA has formed a
food safety legislation task force, and we are
requesting input from the entire organic
community, especially we're looking for input
regarding production or handling research or
practices, including the use of manure that
could help us make the case for preventive,
outcome-based requirements that will not
disadvantage the organic system, both in
production and handling.

We're looking for any kind of
research that anybody might have on food
safety and organic production, and we want the
bad news as well as the good, and the more the
merrier, and anything that anybody can do to help us out in that is more than welcome,
because as has been noted before, there's a lot of activity up there on the Hill and we need to be prepared as soon as possible. We are working with what's going on, and hope to be able to get them the best information we can as soon as possible.

So, please, if anybody has anything like that, you can send it to me directly. Thank you. That's all I have.

CHAIR MOYER: Thank you, Tom.

Any questions or comments for Tom from the board members?

[No response]

CHAIR MOYER: Okay. Thank you, Tom. The chair recognizes Valerie Frances.

MS. FRANCES: I was just told that John Rapp is in fact here. The sulfuric acid seeker; or one of them.

CHAIR MOYER: Okay. The board would recognize John Rapp. Thank you,
Valerie.

MR. RAPP: John Rapp, and I farm with Olsen brothers in Washington State.

We're farming organic blueberries. We have used sulfur burners in the past. We did that to mitigate some of the mineral residue that come out of the wells. Since the introduction of sulfuric acid, we have not done that, but that's in a conventional sense. We have some of the equipment.

It would work well to use in the blueberries. Initially, in our area, we have to buffer the soil down from about 7.5 pH down to about five. That's an initial application of sulfur. Over time, though, you know, ten years, we're not sure that we'll be able to keep that soil down at about 5 pH. It's going to naturally want to come back up.

The use of a sulfur burner would be a very sustainable way to keep this pH down at a lower level, so that we could continue to farm the organic blueberries.
We have experience with a lot of crops' hops. Apples, blueberries, cherries, wine grapes. And sulfur's very common. We use sulfur in organic applications via sprayers on our organic crops of Concors. It's considered organic for our purposes. The basic sulfur applications. But this would a very nice way to very friendly with the soil, we've been there a long time, and it's truly going to be a sustainable way to keep our production going.

Any question?

CHAIR MOYER: Yes, we do have a few questions for you, John. Kevin, and then Katrina.

MEMBER ENGELBERT: Did you say how long you've been certified organic?

MR. RAPP: In the blueberries, we've been certified organic for about three years. In Concord, it's about ten years. Blueberries are very new.

CHAIR MOYER: Katrina.
MS. HEINZE: If you didn't have the sulfur burner as an option, what would you do to lower the pH of the soil?

MR. RAPP: We would probably be using a citric acid application.

CHAIR MOYER: Yes. Katrina, a follow-up?

MS. HEINZE: And why would you consider that less sustainable?

MR. RAPP: That product, the majority of that I think we'd get out of China. The expense of it is getting higher, and I'm not sure what direction that industry is going to go in the future.

MS. HEINZE: Thank you.

CHAIR MOYER: The chair recognizes Tina.

MEMBER ELLOR: I don't know if this is a good time to bring this up, and "beat me down" if it's not. But we had some questions, you know, that we had asked to be answered by our technical review and they
didn't. But it's possible you could help us with this. You said you're using citric acid from China, and we had some questions surrounding whether that's a more sustainable method than this, and we had questions around, you know, how that's produced. Is it non-GMO? You know, a lot of questions about citric acid as a viable substitute for sulfuric acid.

Also we had some questions about why vinegar is not a good substitute, and this might be beyond the scope of anyone in the room but we wanted to know the quantitative differences between citric acid, acidic acid, and sulfuric acid, and their ability to neutralize carbonates and bicarbonates in irrigation water.

So just for the record, we had those questions, you know, so that if anyone can seek us out and answer those questions, that would be great.

MR. RAPP: I'll pass on that.

CHAIR MOYER: John, I had one
question for you. I'm just trying to maybe
get your opinion or your idea about the
concept. That you said mainly you would be
using the sulfur in blueberries cause you have
to get your soil pH from 7.5, or something,
down to 5.0.

What's your thoughts on whether or
not some soils just weren't meant to grow
blueberries? And maybe that's not what we
should be growing there.

MR. RAPP: Well, that is true.

Mother Nature, in our area, gave us a pH that
is not conducive to growing blueberries. The
one thing that turns out to be very
interesting--we get a very good production and
we do not have the typical associated problems
with blueberry production. An example.

Mildew.

Most places that grow blueberries
have a tremendous amount of rain. That is how
the pH gets lowered. But also with that, you
have a lot of mildew problems and product to
market is an iffy thing. In the area that we are, we do not have a lot of rain. We can consistently bring to market a very nice product with just fooling Mother Nature on the pH of the soil. Other than that, the blueberries absolutely love to grow in that area.

CHAIR MOYER: A follow-up question. What's your feeling, then, about whether or not you think you might be creating an unfair advantage for East Coast blueberry growers, or something, where it does rain and they are designed to grow?

I mean, it's always an issue that comes up.

MR. RAPP: You know, since blueberries are fresh product, it's largely a degree of timing, and so I'm not sure that we're going to hit the timing, and along with the transportation costs, I think it's going to equal out.

CHAIR MOYER: Thank you.
Gerry had a follow-up to that, Joe, and then I did recognize you.

MEMBER DAVIS: When you look at blueberry production in the United States, Florida and California production is the earliest. They tend to hit the market at similar timeframes. Columbia Basin, where this gentleman is, I'm assuming...?

MR. RAPP: Yes.

MEMBER DAVIS: --comes in after that, and then the East Coast, a lot of these--you may be in the market the same time as like North Carolina or somewhere like that; right?

MR. RAPP: A portion of; yes.

MEMBER DAVIS: Say that again.

MR. RAPP: Yes; just a portion of, though.

MEMBER DAVIS: Right. And then the more northern areas have their own market timing. You're done by then because it's too warm at that point, and--
MR. RAPP: That's correct.

MEMBER DAVIS: --you do not compete with the bulk of the Northeast growers.

CHAIR MOYER: Thank you, Jerry; appreciate that.

Joe.

MEMBER SMILLIE: Just want to note. Yes, if they use sulfur too, put sulfur into the soil, and to lower the soil pH in order to grow blueberries, we use a lot of limestone, Jeff, to get our calcium into the soil and to raise our pH. So, you know, it's not as if that area's not meant for blueberries. Maybe our area isn't meant for broccoli. But thank God for limestone; right?

CHAIR MOYER: No, I understand, I appreciate that. I just wanted to get his opinion. Thank you.

Any other questions for John?

[No response]

CHAIR MOYER: John, we appreciate your traveling to come and speak with us here
today.

MR. RAPP: Thank you very much.

CHAIR MOYER: Our pleasure to have you here. The board would like Peggy Miars to come to the podium. Or Zea. You don't look like Peggy.

MS. SONNABEND: I don't look like Peggy but I'm trading with her so I can go to the certifier meeting, and she'll go in my spot; if that's okay.

CHAIR MOYER: The board has no problem with that.

MS. SONNABEND: Thank you. I'm Zea Sonnabend with California Certified Organic--

CHAIR MOYER: One moment, Zea. Will you be using your proxy as well?

MS. SONNABEND: Yes.

CHAIR MOYER: Thank you.

MS. SONNABEND: I have a proxy from Jody. I don't think I have a full ten minutes but a little over five.
Anyway, I'm Zea Sonnabend with CCOF, and I've been here many times, and I'm here today to talk to you about materials. So let's get started cause there's a lot of materials on your agenda.

I wanted to say one thing about your document, about priority of petitions. I really raised a question, on the second paragraph of that document, where you said you were going to take petitions to remove over-petitions, to add, even if the petition didn't raise substantive issues about health, and the environment, and that makes it sound to me like you're willing to forgo some of the criteria that you have to fulfill in order to have a petition to remove, and I'd like you to take another look at that second part of petitions to remove, and make it more clear, what you're talking about, and why you wouldn't have to have evidence supporting removal that affects human health and the environment.
I also suggested an additional priority, which I call 2A, which is the petitions received that were never taken up by the NOSB. I never called these "lost."

They're not lost. But they were never taken up by the NOSB.

Consequently, they will not be in past minutes of the NOSB, and I wish Dan was here. Maybe one of you can convey this to Dan when he gets back. They're not in the minutes because they got stalled somewhere in the NOP process, for various reasons.

The list is in my written comments but the most pressing one, that you've heard something about today, a little bit, is the one for turpine polymers, because turpine polymers is stuck in the whole EPA inerts conundrum.

But the petition for turpine polymers that was never taken up because it was ruled to be an inert and reclassified by the EPA, is actually not an inert. It's an
active ingredient in the product, in the way that it's used. And therefore, as an active ingredient, it needs to be addressed by the NOSB, as a petition, to put it on the national list.

So that got further complicated by the EPA ruling because it got reclassified to EPA List 4 in 2005, and yet the statement from NOP only recognized inerts as of 2004. So turpine polymers is a petition that, really, you need to take up, it was a complete petition as far as I recall, all you need to do is send it for a TAP review, and let's please get it on to the agenda. It's the turpine polymers from pine trees have a long history of use in organic as adjuvants, and we really want you to take it up as a petition item for an active.

What Mr. Fiery was commenting on was an additional ingredient that is an inert, that is along with the turpines in his product formulation, and that is under the inerts
policy and needs to be treated as such. But
the polymers themselves are the active
ingredients in those products.

Okay. On to other petition
materials. CCOF supports the addition of
sulfuric acid to the national list. As Brian
said in his testimony, this is not just one
company who makes it. We had every intention,
when we let growers use it before the NOP rule
came in, of having it be in full compliance
with the rule.

We didn't get a straight answer to
of NOP at the beginning, when the rule was
first implemented, about whether it needed to
be petitioned or whether it was just okay, and
when we finally got the answer, which we were
left waiting on for a long time, it was not
the answer that will enable us to keep
allowing it to be used.

So we're happy to see that this is
one of those "dusted off" ones that has come
back to you, and we do hope that you can act
If I had more time, I'd talk about the bicarbonate thing, and that's later; but don't have enough time.

We also support the peracetic acid to be allowed in the equilibrium with hydrogen peroxide. Not necessarily for blanket use. We feel like we need to know more about that. But we were really confused by the way that you posed those documents as discussion items. It wasn't really made that clear to me, what you were trying to get discussed, and if it wasn't that clear to me, it probably wasn't clear to a lot of other people also.

So we understand what the urgent problem is, which is that it's reclassified as active. It is in stasis with hydrogen peroxide. Whatever amount of it needs to be recognized to keep achieving the stasis, we would support the continued allowance of hydrogen peroxide.
Okay. I have one thing to say about the clarification of definitions. I will be taking a little part of the Materials Working Group tomorrow. So the one thing I want to say about the definitions of materials is please just make a decision. I don't care so much what the decision is. We just want a clear decision. Then we'll come back and see the parts that don't work. But a decision would really help us, whatever it happens to be. Thank you.

Now on to the subject of inerts. Well, because it's not easy to come up for the information that you ask for in your request for discussion, as I'm sure you know, I went ahead and just hand-counted the items on the OMRI list that were in the categories that would be allowed to have inert ingredients in them, which is the categories of pest and disease control.

I came up with 346 products listed. Now I will disclaim OMRI on this.
because they had nothing to do with my counting it. I just took the printed list and counted it.

But in order to find out which things have which inert is a huge and laborious process that the OMRI database is not really equipped to do at this time.

However, suffice it to say that any of those things may have an inert and they may have more than one inert, and those inerts might be on 4A, and they might be on 4B.

Renee just did give you the statistic. Approximately 65 percent of those, they think, are ones that have List 4B inert, which would not be transferred over under any of your existing options that only recognized 180.950 of the EPA, or List 4A, as it stands right now, and not List 4B.

So if you can do the math, 346, give or take, by 65 percent, some of which have more, some of which have less inert, you're looking at several hundred inerts,
minimum. So you don't have that great of a
track record of reviewing inerts,
individually.

I hate to say it, but in the whole
time of the NOSB, I think you've done three,
and then we have the fourth one of turpentine
polymers, that we're hoping will come back.
But you've got to pick up the pace if you're
planning to review the inerts individually.

Also, the reason that more haven't
come to you is many inerts do not have a full
amount of studies done on them, especially the
ones that were not moved over in the
reorganization of the EPA list to 180.950.
The ones that were moved over had
a whole--I can never get the acronym right--
but, you know, have had the whole process done
under FQPA or FPQA, or whatever. So thy have
studies. But the other ones don't have in
that's accessible to most of us, and sometimes
that isn't even accessible to the formulators
of the products because they're just buying an
inert package called Surewet or MoreGrow, or, you know, some other thing from another company, and are only buying it for functional effect, and get an assurance from the other company that it's 4B, but they don't necessarily know exactly very much information about it. And so reviewing each inert is very, very difficult.

I made a couple of recommendations. Of course our main goal is we'd like to have as little disruption to the organic industry and the materials review process as it stands right now, because we've worked up a pretty good scheme, and although we need some clarification and some dealing with petitions, but we do have quite a few products available for growers to use that have been reviewed.

So we would like you to, at least as an interim proposal, adopt all of List 4A and 4B, whether that be on the national list, or some addendum. We hope. Then we suggest
that you find some funding, or help find some
funding for OMRI and/or the EPA to complete a
comprehensive database, so you can get a full
idea of what inerts are out there, how many,
what kind.

And third of all, we'd like you to
take more seriously the clause in OFPA that
says, the NOSB shall work with manufacturers.
And then another part of it says, work with
the EPA to fully disclose all the inerts that
are in all of these products. Because if we
had full disclosure, then we wouldn't have
quite so much problem about confidential
information.

CHAIR MOYER: Thank you. Thank
you, Zea. Questions or comments from board
members?

[No response]

CHAIR MOYER: Thank you, Zea. We
appreciate your time.

Peggy Miars will be next up, and
Claudia Reid on deck.
MR. FEDER: I'm Sean and they wanted to switch with me, so that I could go to the certifier meetings, if that's okay.

CHAIR MOYER: The board recognizes Sean Feder, then, in place of Peggy.

MR. FEDER: Thank you.

MS. FRANCES: Do you have a proxy?

MR. FEDER: I do have a proxy for Robin Allen. That's correct.

CHAIR MOYER: Thank you.

MR. FEDER: My name is Sean Feder and I am the inspection operations director for California Certified Organic Farmers, an accredited, certified certification agency. I've been involved with organic certification since 1991. Thanks to the board for this opportunity to comment, and for all of your hard work and diligence in addressing these topics.

And as I mentioned, I will also be commenting for Robin Allen who is CCOF's grower and livestock certification supervisor.
And I'm going to comment on four topics. One is the implementation of biodiversity, and then three livestock topics which I won't list now but I will get to. So first, then, I will comment on the joint crops compliance, accreditation, certification committee's March 5th document, Implementation of Biodiversity Conservation in Organic Agriculture Systems.

CCOF strongly supports the widespread implementation of the NOP regulations regarding natural resource conservation, and so we therefore welcome and support this NOSB guidance proposal. In particular, we believe that implementation of these NOP regulations will be enabled and greatly accelerated when the NOP accreditation check list requires that accredited certifiers implement organic system plans, and inspection reports which address the national resource conservation requirements of the NOP regulations.
And on the whole, we believe that this part of the regulation, in particular, would benefit from strong leadership on the part of the NOP, such as guidelines for issuing noncompliances and specific deadlines for implementation of relevant OSP sections by accredited certifiers.

Another point I'd like to make is that we confer with the accredited certifier association comments, which actually, I was on the committee that helped to draft those, regarding the reemphasis of the term, natural resources over biodiversity, and the reason is because the former, natural resources, is a more practical and familiar term to most farmers.

And biodiversity is of course a vitally important term and concept; however, it tends to connote a particular method of scientific measurement that is not widely applicable to organic farm management or organic farm certification.
And the term natural resources better reflects the actual language used in the key sections of the NOP.

For example, natural resources of the operation is included in the definitions section, 205.2, whereas the term biodiversity is not.

So not that we shouldn't use the term, biodiversity, but just that in our experience as certifiers, we seem to get a better reaction and more understanding and buy-in from the farmers when we think about it in terms of natural resources, and sometimes when we talk about biodiversity, they think about like counting egg shells, or counting the number of species of grass, which is all great and important but not as practical.

Okay. I'm going to move on. And I'd like to briefly report to you on the state of where CCOF is with regards to treatment of the natural resources conservation and biodiversity in our certification program.
We have a natural resource and biodiversity section in our farm inspection form. At this stage, these verification questions aim to identify practices that may fall short of maintaining or improving the natural resources of the certified operation.

And we take really seriously our obligation to require remedial actions of certified operations who do not meet these requirements, and we are also working at the same time to refine and develop our response and compliance thresholds in this area.

We also provide relevant training and reference material to our inspectors, and certified operations. Our organic system plan, while it has always addressed certain aspects of conservation and stewardship, but from the angle of soil management, such as questions about soil erosion and cover cropping, and though we favor the concept, we have not yet incorporated a specific organic system plan section on natural resource
conservation.

It is substantially challenging for both us, and our certified clients, to distribute, collect, and approve new organic system sections for existing clients.

We will eventually implement this into our OSP, and again, we would like to see this be a requirement for all certifiers through the accreditation process.

Next, I'd like to move on to the Livestock Committee's proposed recommendation on the petition to include propionic acid on the national list.

CCOF has reviewed this petition and agrees with the Livestock Committee, that propionic acid as a mold inhibitor for animal feed, does not meet the evaluation criteria for addition to the national list.

The second livestock issue that I wish to address--I wish I had some volcano slides at this point, because I know you guys shave had a long day, but I don't, so you'll
The second livestock issue that I wish to address is the Livestock Committee's proposed recommendation to add new section 205.603(g) regarding the injectable vitamins, minerals and electrolytes.

CCOF applauds the Livestock Committee for taking on this issue and we believe that these products are essential to maintain the health and welfare of organic livestock, and that they are consistent with the Act.

Most--and I think this was mentioned earlier this morning by another certifier. But it is our understanding that most, if not all accredited certifying agencies, are already allowing their certified livestock researchers to use injectable vitamins and minerals as part of their preventative health care systems, and so we will be most happy to see these products added as explicitly allowed.
Our written comments discuss the manner in which the NOP regulations are unclear in the approach to animal drugs, and while these nutritional supplements, under recommendation, are not and should not be commonly thought of as drugs, we are a little concerned that they could possibly be misconstrued as falling under the restrictions of the NOP 205.238(c), which requires there to be illness to administer a drug. So we have a specific request, or suggestion, recommendation, that the proposed wording of the section change include—or start with the term, "as nutritive supplements, colon, formulated injectable supplements."

And that would also actually be consistent with the way that that whole section of the rule is written. Each list is as a particular purpose, and that would ensure that it was intended to be allowed as a nutritive supplement.

Okay. In the interest of time,
I'm going to--I had a little more on that, but I'm going to move on to the last livestock topic, and that's the committee's proposed organic animal welfare guidance and standards.

Of course CCOF strongly believes that animal welfare is an important element of the organic regulations, and the standards have not been super clearly defined, and we understand that intelligent people can disagree on what are the adequate measures taken by livestock producers to ensure animal welfare.

That said, we believe that one of the most significant threats to the perceived value of organic livestock products is the nonspecific requirements concerning animal welfare and living conditions.

While it seems that the intent of the regulations is to provide humane care to animals, the lack of specific requirements prevents consistent interpretation of the requirements and allows for a broad range of
livestock operations to be certified organic.

And so we welcome and encourage

the Livestock Committee in addressing this

issue and attempting to provide some guidance

and metrics to the organic community. And

let's see. We see the discussion regarding

the measurable scoring elements, such as body

condition and cleanliness, as a good first

step. However, CCOF would support more

explicit requirements regarding animal welfare

standards. We encourage the Livestock

Committee to continue their work to ensure

appropriate living conditions in health care

by developing more comprehensive language that

speaks specifically to such issues as animal

density, indoors and outdoors, access to the

outdoors and the allowance of various physical

alterations.

If the regulations can be modified

to clearly identify requirements for livestock

operations, we believe the consumer confidence

in organic livestock will also increase.
1 Thank you.

2 CHAIR MOYER: Thank you, Sean; appreciate your cutting it short.

3 Questions or comments from the board for Sean?

4 Hugh Karreman.

5 MEMBER KARREMAN: Just a comment.

6 Thank you for the constructive addition on -- as nutritive supplements for the proposed new section heading. That's right on.

7 CHAIR MOYER: Thank you, Sean.

8 Finally, Peggy. I said your name three times, and now you finally get to go.

9 Claudia Reid on deck.

10 MS. MIARS: I'm Peggy Miars, executive director of CCOF. Thank you for allowing us to change the order, so that Zea and Sean could get to their meeting.

11 CHAIR MOYER: You're welcome.

12 MS. MIARS: And you'll be happy to know, the longer the day got on, the more I cut my comments. So thank you for the work
that the CACC has done on various issues and
for this opportunity to comment on the
committee's four agenda items today.

Regarding the issue of peer
review, we did submit written comments, and
after discussion with others here at the
meeting, I'd like to amend those to support
the effort to contract with NIST to do an
evaluation of the program, and I think that
undertaking a peer review program will
ultimately solve man of the current issues
surrounding differing interpretations of the
standards, lack of transparency, and a lack of
an NOP quality manual.

A 100 percent organic labeling
claim. The scope of the discussion document,
first of all, was very limited, and certain
uses for atmospheric gases were not even
included. They were left out entirely. So we
wanted to mention that. And we feel that the
simple answer to the 100 percent issue is that
any product--excuse me--use of any product on
605 would remove the final product from the 100 percent organic category, and this is the cleanest way to ensure consistent application of the claim.

And we suggest that the committee consider a qualitative descriptor rather than a quantitative 100 percent statement.

For example, a super duper organic, or ultra organic, or premium organic, or a totally organic dude would be fine, unless you decide to drop the 100 percent claim, entirely, which would not disappoint us, at all.

And we request that you produce a recommendation that's easy to explain, that's able to be applied consistently, and that does not manipulate the rule for specific situations.

We need a document that will help certifiers to regulate the variety of products that are encountered every day, from organic greens in storage, to bag salad, to fresh-
washed product, to canned tomatoes.

Retail certification. We appreciate the fact that retail certification has been removed from the grower discussion. However, we do disagree that NOP guidance or regulatory changes are required to certify retailers.

Other than perhaps an issue that was brought up today about the definition of handler, that does not include retailers, and perhaps that definition could be changed.

CCOF has been applying the organic standards to retailers, locally and nationally, since 2003, without any problems. Some minor clarifications may be helpful in the future regarding employee training and signage, which I know have been some issues.

But overall, we think the rule is sufficient to certify retailers today.

We do continue to oppose less than 100 percent annual inspection by a third party for retail operations, with multiple
locations. The largest chains we're aware of have a few hundred stores, and it is possible to possible to inspect them all each year.

In fact, CCOF has just done so. We recently completed nearly 300 individual store inspections for one chain in about five months.

Retail stores regularly face annual inspections for food safety compliance, so we see no reason why they couldn't also have annual inspections for organic certification.

So we urge you to uphold the existing organic standards by requiring 100 percent third party inspection of retail locations.

And cosmetic, personal care products. In general, we support the inclusion of cosmetics and personal care products within the organic standards, rather than standards that are developed and administered by private businesses.
We recommend as few changes to the rule as possible, the addition of a definition of "cosmetic" and adding the word, cosmetics, to the list of products that can use the organic label, should be sufficient for now.

And lastly, I'm going to make another pitch for the board to hold a meeting on the West Coast. You'll get a different perspective from very passionate and very vocal individuals, I can guarantee you that, and I really do urge you, assuming the budget can allow to meet on the West Coast, because I think it would be a different experience for you, and like I said, a totally different perspective on issues.

So thank you for this opportunity to comment.

CHAIR MOYER: Thank you, Peggy.

The chair recognizes Kevin.

MEMBER ENGELBERT: Thank you.

Would you repeat your comment about--I couldn't quite catch what you said
about any material that's used, that's not a 605, would disallow a substance from, or a food product from being called 100 percent organic.

MS. MIARS: Yes. That was it.

That if you use any product on 605, that the final product should not be able to use 100 percent claim, because it would be a nonorganic ingredient, or--

MEMBER ENGELBERT: But used in what way? As a disinfectant for equipment? Or in the product itself? Or in the packaging? What, exactly, are you referring to? I guess is what I'm not clear on.

MS. MIARS: All of the above.

CHAIR MOYER: The chair recognizes Tracy; then Katrina.

MEMBER MIEDEMA: What about diatomaceous earth in a green silo?

MS. MIARS: And it would be coming in contact with the product; correct?

MEMBER MIEDEMA: Green. Yes.
There'd be no way of removing that diatomaceous earth at any--

MS. MIARS: Yes. Then it should not be able to be labeled 100 percent.

MEMBER MIEDEMA: And if it were the case that most grains were stored that way, preventing 100 percent organic grain, that's your final thought?

MS. MIARS: Well, yes. In fact the 100 percent claim, as you know, isn't really used that much, and so, quite frankly, should probably just go away, and the grain should be called organic.

MEMBER MIEDEMA: Okay. I just wanted to make sure. Thank you very much.

CHAIR MOYER: Katrina.

MEMBER HEINZE: Maybe you just answered this question for me, but, really, you mean that if we use the sanitizer, the product shouldn't be a 100 percent organic?

MS. MIARS: Yes. Because there's too much room for inconsistent interpretation,
and quite frankly, the 100 percent--
personally, I don't think there should be a
100 percent category.

MEMBER HEINZE: Well, that's what
I meant by it. I think you maybe jus answered
the question.

MS. MIARS: yes.

MEMBER HEINZE: I think it's
confusing for consumers, that buy lettuce that
has been appropriately washed. It seems like
it should be 100 percent organic. But maybe
it's just that the label is unclear. Thank
you.

CHAIR MOYER: The chair recognizes
Kevin.

MEMBER ENGELBERT: Yes. I'd like
to get back to that again. Does CCOF certify
any milk plants that use sanitizers in their
pipelines and then process and package organic
dairy products?

MS. MIARS: Yes.

MEMBER ENGELBERT: That seems
inconsistent with your statement to me.

MS. MIARS: Okay. Well, I'll be honest with you. This is a question that'd be better answered by our handler staff, who, unfortunately, we don't have here today.

CHAIR MOYER: My question would be, Peggy, if you use Tracy's example of diatomaceous earth in grain, livestock must be fed a 100 percent organic feed, are you saying that all grain that has diatomaceous earth in the storage tank would not be considered useful for livestock feed?

MS. MIARS: Well, in that situation then, I believe then that the rest of the rule would have to be--rather than saying a 100 percent, you would say organic.

CHAIR MOYER: Okay. The chair recognizes Julie.

SECRETARY WEISMAN: I think that's a very important point that you just made, Peggy. The 195, and made with our labeling claims that are used on the labels of
processed products, almost--mostly, really
sold at retail, I do not believe that those
categories apply to agricultural inputs.
Maybe I'm using the wrong terminology. I
forget it. I hate using the word input.

CHAIR MOYER: Raw.

SECRETARY WEISMAN: Raw materials.

I don't think that those categories apply.

MS. MIARS: And I apologize for my
ignorance, but does it currently say 100
percent organic feed or does it say organic
feed?

CHAIR MOYER: It says 100 percent
organic feed.

MS. MIARS: Okay.

MEMBER MIEDEMA: But we know
that's not true, just based on our use
discussion earlier. I think what we're
talking about with 100 percent labeling
composition is different. In a sense of a
livestock requirement is saying the word "all"
and using the word "100 percent," or else
there wouldn't--

CHAIR MOYER: Yeast is not considered feed, though.

MEMBER MIEDEMA: It is not. Okay.

CHAIR MOYER: Bea, you had your hand up. Please.

MEMBER JAMES: Okay. Sorry. I guess you're getting a "grilling."

I'm not advocating for the multisite construct with retailers, but I'm trying to understand, and I really appreciate your comments that you had about retail certification. What I heard CCOF say is that currently, injectable vitamins are not allowed but they're being used. And that you recognize that they are currently being used, and it could be a detriment if injectable vitamins were not put through by the NOSB. Please allow that to happen.

Yet, on the other hand, retail certification under the multisite construct was also being used and was being practiced.
But I hear CCOF say that they don't support that and that that's not part of what the rule is.

Well, neither was injectable vitamins. And so I'm trying to understand, if you could help me understand how you quantify what should be enforced and what shouldn't be.

MS. MIARS: That is a good question and I didn't write the comments about the injectable vitamins, so I can't really address that aspect of our comments.

CHAIR MOYER: Thank you, Peggy.

We appreciate your patience for us.

The board would like Claudia Reid to come to the podium and Joann Baumgartner is on deck.

MS. REID: Good evening and thank you for the opportunity to once again come and make comments before you.

My name is Claudia Reid, and I'm the policy and program director for CCOF. I will speak to three agenda items today.
Soilless growing systems, lecithin, both bleached and unbleached, and nanotechnology.

The Crops Committee did a really good job of writing this soilless growing systems document that we reviewed, and our staff had a difficult time writing complete comments on it without the full framework of the greenhouse production standards recommendation that was mentioned in the document.

So instead of making your job easier, we're going to make it a little more difficulty by simply asking some additional questions that we'd like you to consider.

Are you referring only to mature crop production in soilless media? Many transplants are grown in media consisting of vermiculite and peat, or core fiber, and in our mind would be soilless.

We would not support a proposal requiring transplants to be grown in soil or compost since they have plenty of time, once
transplanted, to interact with the soil.

Second question. Exactly how much compost is needed in a, quote, compost-based growing media. End quote. CCOF has certified greenhouse production plants for mature crops, such as tomatoes and cucumbers, with a grow-bag type system in which most nutrients are added through water.

But some compost, and other biologically-active substances are added to the media. We would need clarification on the minimum requirement for compost, and whether alternatives like humates, peat, and other approved materials, would be acceptable.

Final question on the soilless-growing systems. Since it's possible to meet every other provision of the NOP rule, other than the soil improvement standard, with soilless media, and, in fact, potentially provide more optimum nutrients--nutrition--sorry, two crops--in the controlled environment than they would get in the field,
thus making the food from them more nutritious, maybe it would be best to suggest allowing such crops to be certified with an alternate label.

A label such as, quote, made with soilless organic inputs, end quote. For certifiers, it comes to the same thing as for all growers. Is there an organic system plan that can be verified, monitored, and enforced? If there is, then there could be some type of certification allowed, even if it wasn't the full NOP organic seal.

For lecithin, bleached and unbleached, and for purposes of our comments, we are not making any distinction between the synthetic and the nonsynthetic lecithin. We support the movement—CCOF supports the movement from nonorganic to organic ingredients, if there is solid evidence of an adequate supply of organic lecithin in an appropriate form and of appropriate quality.

Our comments today are on behalf
of some of our clients. Our comments from our clients indicate that there is not necessarily an adequate supply of organic lecithin in appropriate form or quality.

We have heard from many of our clients, that the quality is what is a problem for them in the manufacture of some of their products. If the supply is not adequate, either in quantity or quality, it might be premature to remove it from the list.

We know that it's going to take a little bit longer for this whole issue to be settled, and we're hoping during the amount of time that it will probably take for this, for you guys to make your recommendation, better quality alternatives will become available in the meantime.

Zea mentioned to me that any of you who had questions about the allergy to soy, which in her case is real, it's not an allergy to the word soy on the label, but a real allergy to soy--she is available to
answer those questions. Obviously, she's not here now.

On nanotechnology, what I want to do, in the interest of time, is you asked specific questions in your document, and we did submit written comments on all of these subject matters. So I just want to go through your written questions and tell you what our answers were.

You asked: As currently understood, is nanotechnology compatible with organic? We believe that nanotechnology is not compatible with organic.

You asked: If not, are the current standards keeping nanoparticles out? And we commented that we believe the current standards do not necessary keep nanoparticles out.

Are any sectors of the organic industry already using nanotechnology? Because labeling is not required, we don't know the answer to that question.
What are the concerns about nanotechnology in food? Our concerns expand on what the Materials Committee document articulated. Lack of a clear definition. Lack of understanding of the atomic and molecular changes that can take place, and that are not well-documented or researched at this time. Inability of current regulatory structure to deal with potential human health and safety threats. Lack of current regulatory structure that could rein in unscrupulous actions by some manufacturers. Lack of knowledge about long-term impacts of nanotechnology use. And I'll stop there. Any questions?

CHAIR MOYER: Thank you, Claudia.

Questions or comments from members?

Steve.

MEMBER DEMURI: Thanks, Claudia. Did your clients indicate which forms of lecithin they're using? Or is it just a blanket statement?
MS. REID: Well, of course I learned a lot about lecithin today, way more than I ever probably needed to know, and I was not interacting directly with the client, and our handler person, who gave me the information, referred to the particular form of the lecithin in a way that I didn't hear mentioned today. I suspect it might have been the oilless. And I'll get back to you on that.

MEMBER DEMURI: Okay. If we could have that information for tomorrow, that would be helpful.

MS. REID: Yes. Okay. I'll e-mail Jody tonight and get it for you.

MEMBER DEMURI: Great.

CHAIR MOYER: Claudia, I had one comment regarding your soilless mix comment, and that was in discussions with the Crops Committee, I think there's a strong feeling that our thought would be that terrestrial plants are designed to grow in soil, not in
1 bags of media where liquid is poured in. So
2 if that went through the way--I think it
3 should--that operation would not be certified
4 as organic.

5 MS. REID: Okay.
6 CHAIR MOYER: That's my personal
7 feeling, not necessarily that of the entire
8 committee.
9 MS. REID: And we'll hear more
10 about this tomorrow, then?
11 CHAIR MOYER: We will.
12 MS. REID: Thank you. All right.
13 CHAIR MOYER: Thank you, Claudia.
14 Joann. And Alexis Baden-Mayer is
15 on deck.
16 MS. BAUMGARTNER: Thank you,
17 members of the board, for the opportunity to
18 give input on biodiversity, conservation and
19 NOP. I'm Joann Baumgartner, the Wild Farm
20 Alliance. We promote a healthy, viable
21 agriculture that protects and restores wild
22 nature, and we encourage you to fully adopt
the recommendation of your Joint Crops and Compliance Accreditation and Certification Committees.

As I'm talking, there's slides up here showing some farms that are conserving biodiversity, and of biological diversity itself.

Writers of the organic act and rule instituted principles and standards that are models for achieving balance of our technological and natural worlds. We live in extraordinary times. While we have the fastest communication yet, which brings quick, positive changes to our world, we are hitting our ecological limits, experiencing global warming, an unsafe food supply, river pollution resulting in 500 oceanic dead zones, unparalleled species extinctions and a pollination crisis.

What is required in NOP to conserve biodiversity and to maintain or improve the natural resources, including soil,
water, wetlands, woodlands and wildlife, helps to address these interrelated critical situations.

Dated vegetation on farms, when conserved on road edges, and tracks too marginal for good yields, or in riparian forests or wetlands, helps to capture excess nitrogen before it off-gases or pollutes waterways, filters pathogens like E.coli, hence making our food safer, slows water down for better groundwater recharge, provides food and cover and corridors for wildlife. Farms that conserve or plant native species that flower throughout the growing season benefit from native bees, which augment honeybee pollination, and in some cases surpasses it.

Economic values can be realized when habitat is present for beneficial insects, rodent-eating predators, and insectivorous birds and bats. Studies show that biodiversity is greater on organic farms than conventional production. This is partly
a function of less-toxic pesticides being used, and partly because of diverse cropping situations, including cover crops.

In different regions of the world, organic farms have better pollination services by native bees, greater success of fledgling birds, a larger abundance of birds and bats and butterflies and spiders than on conventional farms. Additionally, because organic livestock must be raised on pasture during part of the year, grassland birds, like bobolinks, that are in decline, benefit from this habitat.

In 2008, the Farm Bill dedicated significantly more funds to organic farming than in the past. Especially important for biodiversity is the conservation stewardship program that now streamlines applications for organic farmers.

Some certifiers have called attention to the fact that biodiversity is not defined in the rule, and they would like to
I want to point out that there are a lot of words, such as management, monitoring, mulching, hormones, and antibiotics that are not defined, yet they are critical components for certification and compliance.

In addition, the preamble makes it clear that biodiversity is not just a cursory word, but it has intent behind it when it says, "The use of conserve establishes that the producer must initiate practices to support biodiversity and to avoid, to the extent practical, any activities that would diminish it."

The term, natural resources, typically refers to management and extraction, where biodiversity describes values of nature that exist, not only for our benefit, but for the sake of native species and ecological processes. Both terms are important and one
should not be emphasized over the other.

We believe it's crucial for biodiversity and natural resources conservation to be fully developed and implemented. By doing so, the organic community will become more efficient at addressing the intent of the rule and better equipped to benefit from all that nature provides. There's a couple more slides.

These are some slides of farms. Thank you.

CHAIR MOYER: Thank you, Joann. I thought your slides were beautiful, and I tend to agree with you, that the two words are not interchangeable, and we need them both. But comments, other comments from the board? Suggestions?

[No response]

CHAIR MOYER: Thank you very much for your presentation.

Alexis Baden-Mayer in the room?

[No response]

CHAIR MOYER: If not, Marty Mesh.
Mr. MESH: I'm going to let Andy go first.

CHAIR MOYER: Well, then by all means, Andy LaVigne.

MR. LAVIGNE: I brought the microphone for you, Marty, so you're going to have to stand in the middle of the room. And being given the floor by Marty really does concern me since he's behind me. But we do have a little bit of a history in the Florida Organic Advisory Committee.

I appreciate the opportunity and the indulgence with my outlook file and my electronic incapability this afternoon to keep up with myself. But I'm Andy LaVigne, the president and CEO of the American Seed Trade Association, and we appreciate the opportunity to be here with you today.

The American Seed Trade Association is a very diverse group. We have over 715 member companies. Obviously, the seed industry in the U.S. is a multibillion
dollar industry. We represent all sectors of seed production for propagation, organic, conventional and biotech.

We've got a lot of--a growing Biotech Seed Committee, and very active in this area, and working both with the NOP staff and the industry to meet the needs of the growers, and also to begin addressing the area within the National Organic Program dealing with the use of organic seed in the exception.

And my comments today are with respect to the List 4 inerts and List 4A section, specifically, of inerts, and how we deal with that, going forward.

And I want to read a few comments, and then I've got our prepared statement for the record.

We acknowledge that there are complex issues surrounding seed use in today's organic operations, and that these issues are compounded by the underdeveloped organic seed sector within the greater seed industry.
In 2005, the NOSB statement specifically recognized gaps in the organic seed industry by stating--I quote: "That further development of the organic seed industry is the key to increasing commercial availability of organically-grown seeds. and subsequent increased usage by growers. In an effort to advance the organic seed industry, ASTA has worked to encourage the development of organic seed markets, and increase member participation in such markets. Recently, ASTA formally committed members and resources to providing better communication, information and training related to seed production, seed sourcing and seed inputs to the organic community. ASTA believes these efforts will further advance the availability of organic seed, to provide the expertise and knowledge necessary for the organic community to effectively deal with seed, the seed inputs in organic operations.
Our efforts here, and the products on List 4A are important to the organic seed industry, and we feel ultimately are important to the organic grower. As the NOSB and the NOP staff at USDA look at how to deal with this issue, we feel that adoption of the current List 4A inert is the way to go, and if a review needs to be done, then all products should be reviewed in a scientific manner through the resources that—or the sources that AMS, NOP and the AMS have available to them.

Just four quick topics on the areas of interest for the seed industry.

One is the issue of coatings that comes along with the seed industry. It's important for size, buildup, and planting, the uniformity issues, precision planting, as you look to use more advanced material, or implements to plant the seeds, as well as seed placement to ensure better germination.

Seed also is an efficient delivery
mechanism for materials such as micronutrients and amendments that may improve seed viability and performance for the grower, and under certain conditions, as we all know, seed may require both processing inputs to make seed viable.

For example, many lettuce varieties may present photo or thermal dormancy, such that it will not grow under many normal growing conditions. Dormancy must be broken through process and the use of inputs. Otherwise, the seed simply may not germinate.

And lastly, when seed-born pathogens are present, NOP-compliant materials may play an important role in reducing these pathogens, such that the seed viability is improved and disease transmission to the soil is eliminated.

The seed industry is moving to expand organic seed production. However, the use of NOP-compliant materials and technology
will be necessary for the seed industry to ultimately meet the needs of organic production. Therefore, we ask that the NOSB adopt solution option number two from the November 2008 discussion document, which provides to adopt the original 2004 List 4A inerts as an itemized list, with ongoing reassessment through the sunset process. I appreciate the opportunity to submit our comments and we look forward to working with NOSB, and I will attempt to take any questions that you may have this evening. Thank you.

CHAIR MOYER: Thank you, Andy. We appreciate your time. Any questions or comments from board members for Andy?

[No response]

CHAIR MOYER: Hearing none, we appreciate your time.

Marty Mesh.

MR. MESH: Marty Mesh, Florida Growers. I see the glazed looks, lasting between me and happy hour, and so I'm going to
be really brief. Just a technical correction
for Jim. Jim's statement earlier was not
based in science. It was his personal
opinion, and he gets paid to have such an
opinion on OTCO's superiority as a certifier.
So I do want to raise a concern about the
multiple accreditation costs from the
certifier's perspective. We probably spent
over $30,000 in staff time, this year, dealing
with NOP ISO Canadian, and lately, the OIG
audit, accreditation audits, and it's a
tremendous burden on small, nonprofit
certification programs.
I raise concern about George and
Grace's suggestions about opening up OFPA. Be
careful what you want to do. It caused a
great deal of concern from my viewpoint at
least. Brian's request for two farmers to be
heard. I would always urge this board to make
time for farmers, and maybe there'll be one
tomorrow.
This room. You know, with the
additional money that this industry has tried
to get for the NOP, you know, I mean, there's
room now, but the whole day, there are people
out in the hall kind of taking turns, standing
up in back. It's pitiful to think that
without USDA staff time being-- and lodging
costs and travel costs, going somewhere else,
California was mentioned, that we don't have
a room big enough, and that we had to take up
a collection out in the audience to get
wireless, so that people could pull up
documents, you know, and NOP positions or NOSB
recommendations, to be able to share in the
audience as this meeting took place.

And for the record, I've never e-
mailed any NOSB member about any vote. I
barely know how to do e-mails as well. I
think substantively, aquaculture standards, if
Grace is going to bring up yeast again, then
I'm going to bring up shrimp, and urge this
board to move forward with aquaculture
standards, you know, and out of concern for at
least managed aquaculture. The sunset
materials. We want to support them being
relisted. We also support the biodiversity
effort, and when we certify retailers, we
inspect every store.

And then last but not least, a
nonorganic okra update. We still, to this
date, have never been contacted by the
petitioner, by a yet-to-be-named "hmm-hmm
good" soup company that expressed interest, or
anybody else, as far as--you know--not as far
as organic okra, IQF, and I've said it at
every meeting. I will continue to say it.

It's up to the industry that wants
to source a product to contact farmers, maybe,
about hey, how can we make this work? It's
not up to, you know, us to come, keep stuff
from being listed. Nonorganic agriculture
products from being listed. But that's what
we had to do, and I've been waiting, somewhat
patiently, and somewhat not, for the phone to
ring or the e-mail to come, expressing
interest, and there's certainly farmers in the South that grow okra every single year and will continue to do so, and would be happy to work with a company on a fair and equitable long-term relationship.

With that, you guys have done great as usual, and see you next time.

CHAIR MOYER: Thank you, Marty.

Any questions or comments that board members may have for Marty on any of the topics he brought up?

MR. MESH: Nonorganic okra comments.

CHAIR MOYER: Just a minute.

Steve doe shave a comment.

MEMBER DEMURI: I was going to comment that your--I thought we were going to get away without an okra comment. I thought you were going to disappoint me; but you didn't. So thank you.

CHAIR MOYER: Okay. Thank you very much. Thank you, board members. With
that last presenter, this board stands adjourned until promptly, 8:00 o'clock tomorrow morning, when we will reconvene. Thank you very much.

(Whereupon, the above-entitled matter went off the record at 6:42 p.m.)

UNITED STATES DEPARTMENT OF AGRICULTURE

NATIONAL ORGANIC STANDARDS BOARD MEETING

Tuesday, May 5, 2009

The National Organic Standards Board met in the Franklin and Adams Rooms in the Washington Plaza Hotel, 10 Thomas Circle, Washington, D.C., at 8:00 a.m., Jeff Moyer, Chairman, presiding.

PRESENT:

JEFF MOYER, Chairman
DAN GIACOMINI, Vice Chairman
JULIE WEISMAN, Secretary
KATRINA HEINZE, Member
GERRY DAVIS, Member
TINA ELLOR, Member
BARRY FLAMM, Member
TRACY MIEDEMA, Member
JOE SMILLIE, Member
JENNIFER HALL, Member
STEVE DEMURI, Member
BEA JAMES, Member
KEVIN ENGELBERT, Member
HUE KARREMAN, Member

STAFF PRESENT:

VALERIE FRANCES, Staff
BARBARA ROBINSON, Staff
RICHARD MATTHEWS, Staff
DEMARIS WILSON, Staff
ROBERT POOLER, Staff

PROCEEDINGS

(8:03 a.m.)

CHAIRMAN MOYER: Okay, everyone.

The Board is seated, and we're ready to take care of our business. One brief announcement before we get started. I think everybody on the Board knows, but just for the benefit of everyone, Rigo Delgado will not be joining us today, as he had planned and expected. His work project has kept him away, so he won't be joining us at all this week.

All right. If we turn our attention to the agenda, we're ready to start our presentations and discussions by the Committees. And we're going to start this morning with the Policy Development Committee, Chairman Barry Flamm. Barry, if you're ready to go, you're on.

MEMBER FLAMM: Thank you. Good morning. As always, the Policy Development Committee work is a team effort, and in line with that this morning, the presentations of
our recommendations will also be done by team members. And Rigo has always been a valuable member, and we really miss him.

In any case, the first recommendation that we have involves a new addition to the New Member Guide, and this was sort of a pet thing that I thought of when I came on the Board. I was overwhelmed by the number of acronyms, and wanted, for my own personal use, to make a glossary. This ended up on our work plan, and thanks to Tom Hutchinson of OTA, he gave me a great start. He sent a list that he had used to help himself. So, in any case, this first recommendation is a list of acronyms.

The recommendation states that this could be amended at any time without going back for a vote. It's a working tool, and already received several very helpful comments from the public on name changes, and organizations, additions, and that, which will be incorporated before posting. So, that's
the first recommendation.

The second one, Hue will present.

MEMBER KARREMAN: Time for me to present. All right. Thanks, Barry.

This is another addition to the New Member Support Guide, and I think it will be really good for the new five people coming on next year, as the Board is getting on board to the bulletin board, where documents can be worked on in real time, people can add things at any point, and not get lost on updates and emails alone. And, basically, that's it. And it's recommended that this particular section, which, in our notes, shows basic computer screen shots of how to jump around within it. It's the NOSB e-Bulletin Board, titled, and this section will be added to the New Member Guide in Chapter 5, "Suggested Best Practices", immediately after Section E, "Tracking Changes in Word Documents." And then it will be titled, "List of Common Technical Sources Used by NOSB Members." It
will become Section G.

MEMBER FLAMM: Thank you, Hue.

The next section is additions, changes to the Procedure and Policy Manual.

First up is Priority Petition Inclusion in New Member Guide, and Steve has worked on that, and will present it to the Board.

MEMBER DeMURI: Thank you, Barry.

The original document that most of you saw has been modified based on some very good comments we got from the public, both written and orally yesterday, so we met as a Committee this morning and talked about those. Valerie, do you have the revised one? Yes.

Okay.

It's kind of hard to tell, but everything that's in red is a revision from the previous version. The comments revolved around two main themes. The first one was that there could be a potential for petitioners to resubmit petitions, to add or remove substances to or from the list without
new substantive information. So, that was a
very good comment that several people made,
and we wanted to try to tighten that up, so
that we wouldn't have people just continually
repetitioning things over, and over, and over
again, without some kind of new information
coming to the front. So, we did tighten up
some of the sections of the guideline to keep
that from happening, hopefully.

The second comments, the main
theme revolved around old petitions that have
been into the black hole of the NOP/NOSB for
a number of years now. There were some folks
that thought maybe we should include those
into this guideline.

What we decided to do as a
Committee was to leave that as a separate
issue that the NOSB and NOP are addressing.
We heard comments yesterday from the program
that they were going to work with Science and
Technology to try to address those. I think
Valerie is going to address that in her update
this morning. So, we felt that was really a separate issue that we did not include in this document.

MEMBER FLAMM: Thanks, Steve.

MEMBER DeMURI: So, one more thing.

MEMBER FLAMM: Oh.

MEMBER DeMURI: Trying to cut me off there. One thing that's important to remember is that this is just a guideline, so if something comes up that's out of the ordinary, the Committee Chairs, working with the Materials Committee and NOP, can make judgment calls as they need to for unusual circumstances, so this is only a guideline. It's not set in stone. It's not going to take an act of Congress to change, and it could be modified as we go forward, as well.

MEMBER FLAMM: Thanks, Steve.

CHAIRMAN MOYER: Mr. Chairman, do you want your Board members that have questions or comments to present them as each
person presents their particular item, or
would you prefer they wait until the end and
ask questions?

MEMBER FLAMM: Maybe in this case it would be well to take questions now,
because the petition did have a number of issues. So, does any Board member have questions?

CHAIRMAN MOYER: I have one question on the previous presentation.

MEMBER FLAMM: Oh, okay.

CHAIRMAN MOYER: So, I guess I'll ask that now. On the e-Bulletin Board, Hue, I just was wondering if we shouldn't - I'm not sure how to put it in there - but make a statement that folks should make sure they pay attention to emails coming from the e-Bulletin Board Administrator about changing your password, because it seems to be an issue where even with you, people neglect those emails, and suddenly you can't gain access to the site. Just a question.
MEMBER KARREMAN: I think that would be fine, and I have tried a couple of times earlier. But, I agree with you that that should be put in there. Joe?

MEMBER SMILLIE: When I go off the Board, you'll probably have full compliance, because changing passwords, maybe I'm getting old, but I can't remember what the passwords were. And I just finally said goodbye. It's like just too much for me to keep changing my password. And they don't let you use an old one, you can't like rotate, so it's like -- I said goodbye, so I apologize.

MEMBER SMILLIE: No apology necessary, Joe. I'm in the same boat. And it is hard to keep thinking of new passwords. I have them like taped to my wall, and I draw a line through them so I don't use them over again.

MEMBER FLAMM: I think it was Katrina that gave me a tip that works. I don't -- it's just 1, 2, 3 and each, but I
1 keep the same password and go to the next
2 number. Any other questions?
3 Member James: Maybe what we
4 should do is make sure that it's clear that
5 you want to continue to do your dialogue
6 through email, because that seems to be the
7 primary way that we're communicating right
8 now. And that the e-Bulletin does have the
9 passwords that need to be updated frequently,
10 and it's not a substitute for making sure that
11 you look at email, as well. So, we can
12 finesse that wordage.
13 Chairman Moyer: Yes. I didn't
14 want to distract everybody from what we were
15 doing here with Steve. It's just, it's
16 something that comes up. And, you're right,
17 we do most of our current business by email,
18 and then post documents onto the Bulletin
19 Board so other Committees can see what we're
20 working on. That's how we've been using it,
21 anyway. But without a password, it's really
22 useless. Thank you.
MEMBER FLAMM: Part of this material I think Hue already covered, but re-emphasize, this was material developed by Rigo, and it was used in our training session, so it's pretty much moving it over to the New Member Guide. And it doesn't create any policy or things like that. Yes, Dan?

MEMBER GIACOMINI: Yes. Just on the petition guideline, I think it is only a guideline, and it's for our sort of internal paperwork. But I think it's good to clarify that in setting up -- and this priority -- we're really just formalizing the priority list that we've sort of always had. But I think it's good to clarify that simply by having this priority list, everything still moves forward. Nothing becomes shelved because something has a higher priority.

We may try to take faster action on it, but if it is bogged down, for whatever reason, technical reviews, confusion issues, whatever, that action of a bogging down of a
higher priority doesn't derail anything else.
Everything is still moving forward. And
tings from number three may come up before
tings from number one. It's just we try to
push harder on them, but everything still
moves.

MEMBER FLAMM: That's correct.

And as Steve pointed out, in the final
analysis it's a judgment of the Committee and
the Board on where things go. But, as Hue
pointed out, what we're trying to do, some of
these instructions were written some time ago,
especially priority of -- to delist, but it
never found its way into the Policy and
Procedures Manual, so a lot of people either
forgot, or didn't know about it. So, we're
trying to put this together as a reference
point, as a guide, and not anything to
hamstring, because there has to be -- the
Committee will use judgment in determining it.

Okay. Moving on, the next item

for the revision of the Policy and Procedure
Manual. We've been systematically going through the Policy and Procedure Manual trying to update it, and bring things forward, decisions that are already made, or practices in place that weren't reflected in the manual.

In Section 3, which deals with duties of an Executive Director, and of the Officers, and also meetings, we did some updating. There's a more complete description of the role of the Executive Director, and it's trying to reflect what the Executive Director does at this time. The Executive Committee duties were updated and changed, and the wording was replaced as follows. "Only the Full Board" - and this is, I think, a clarification, and I believe better stated - "Only the Full Board may make decisive action on guidance and other policy recommendation from the Committees, including the status of materials proposed for addition or deletion on the National List."

That replaces wording that said,
"Except, the Executive Committee shall not take any action on a recommendation to the Secretary, including status of materials, and on the National List." I think this new wording is clear.

It also clearly assigns the Executive Committee to sort of oversee the proposed work plans of the Committee, and the language is that, "The Executive Committee will provide guidance and feedback to Committees on their proposed work plan." And we took that out of the Policy Committee duties, which the Policy Committee wasn't doing, and we thought more appropriately was a role of the Executive Committee.

The language for Secretary -- actually, this was agreed to at and passed at the last meeting, those duties, you can see up there, which involved technical corrections. The Secretary sort of tracks that, makes sure that what decisions of the Board and what's published in the Federal Register is the same.
And if there isn't, to alert the Board for action to be taken. But this was passed at the last meeting. We're just moving that up into the Policy and Procedure Manual.

Then, finally, the meetings description was much out of date, unclear in terms of FACA requirement, and also when the statement was that the Board determines on its own where the next meeting will be, and sets the schedule. And that hasn't been happening, so this language clarifies the FACA responsibility, and public notification. It also clarifies what does actually come under FACA notification; like we can have get-togethers, certain kinds of get-togethers that are outside the requirements of FACA.

And, then scheduling the Board meeting, this has been reworded to say, "The date and location of periodic full in-person Board meetings normally twice a year will, to the extent possible, be set by consensus of the Board, and in consultation with NOP."
So, that's the changes proposed for Section 3. Any questions on this? Yes, Tracy.

MEMBER MIEDEMA: I have a question back under the Executive Director duties section. It talks about participation of the Executive Director, and that's never been a serious issue, because our Executive Director is immensely gracious, and very good at her job. But there's the risk of sort of a privileged member of the public being a 16th Board Member because of the level of participation of the Executive Director. So, we don't have anything in here that sort of says what that person's role is not. And that's a little bit of a concern, that we don't say they are not to influence the Board in X, Y, or Z. And maybe that's not necessary, but the only word in here that does give me pause is the word "participating" in officer calls, which implies a real, I guess, participation. And I think that we might be
1 able to use a word that better -- facilitates, 
2 for instance, right there to be a little more 
3 clear about what the role is.  
4 MEMBER FLAMM: Thank you for those 
5 comments, Tracy. And we'll consider that. 
6 So, the duties reflects pretty much what's 
7 happening now, but I understand the point 
8 you're making. Thank you. 
9 If there's no more questions, Bea, 
10 would you address Section 4? 
11 MEMBER JAMES: As part of a 
12 systematic review, we're also just trying to 
13 make our way through the Policy and Procedure 
14 Manual, as Barry mentioned, and update it. 
15 So, Section 4 is a description of the Standing 
16 Committee duties, for the most part. It's 
17 very broad, and we updated that for each 
18 Committee to more clearly reflect what those 
19 Committees are doing. And I do have, based on 
20 some public comment, and also some comments 
21 from the Board members, some friendly 
22 amendments that I'd like to be able to make on
this recommendation.

Under the first Committee certification accreditation, it was suggested, because we had it in some of the other Committees, and we missed it on a few, under "The Board is to provide guidance, clarification, or proposed standards of certification, accreditation, and compliance sections of the Organic Regulation." And then after that it should say, "and OFPA." And then on the Crops Committee, after 7 CFR Part 205, we'd like to also add, "and OFPA."

And then we had a public comment that we actually missed removing technical reviews out of the Crops Committee. And we had a public comment that reminded us that technical reviews is not used in OFPA, the Final Rule. And it should be deleted, so that we have consistent language in our description, which is Technical Advisory Panel reports. So, we'd like to just leave it at Technical Advisory Panel reports, and take out
under Crops, "technical reviews." That's the only place we need to take it out.

MS. FRANCES: I just have a question, why wouldn't you want an additional form of information included in the Committee's description?

MEMBER JAMES: Is there an issue with it not being the language that's used in OFPA, or the Final Rule?

MS. FRANCES: This is your policy manual.

MEMBER JAMES: I'll defer to Barry on a final decision for that.

MEMBER FLAMM: Well, we're trying to be responsive to the public comments, and I think since it was only the Crops Committee that this is an issue, and we didn't put it in the other two, that we were being inconsistent. So, we should either put it in all or just drop it. And it was our decision this morning in the Committee to go ahead and drop that in response to concerns expressed,
which doesn't change the content. Jeff?

CHAIRMAN MOYER: Barry, maybe we could get a comment from Barbara or the Program, because I think technical reviews is a term that you folks started to use, and presented to us. Instead of TAPS, we started calling them TRs. Is that -- and that language for TRs, Technical Reviews, isn't in the rule. Is there a reason why you've chosen that language? Should we include that in here? What's your feeling?

MR. MATTHEWS: To tell you the truth, I don't know. And I guess the question that I would pose is, is there a difference between technical review, and Technical Advisory Panel?

CHAIRMAN MOYER: I'm not sure if there is, or isn't. But I know -- I just know from conversations we've had, technical reviews is language that you folks starting using to the Board, and we just adopted it, and started using it in our normal protocols.
MR. MATTHEWS: If there's no
difference, I would suggest going ahead and
removing the language, as suggested.

MEMBER KARREMAN: I think the
technical review term came up only just in the
brief like last few months, so that if Board
members felt they could do it, we wouldn't
have -- that we all could stand as Technical
Advisory Panel. I think that's where it all
came from.

CHAIRMAN MOYER: I think Barry's
got the floor, so he should acknowledge the
commentors. I think Valerie had a comment,
too, Barry.

MEMBER FLAMM: Valerie, did you
want to make a comment?

MS. FRANCES: I wanted to offer --
you use technical review elsewhere in your
policy manual to describe your Materials
Review process, and the addition of technical
reports as being different than Technical
Advisory Panels, because they're done by a
consulting body, rather than a panel convened
to give you feedback on the materials. And it
was partly due to, also, the issue of 606,
where you are serving, in many cases, as your
own Technical Advisory Panel, so I think it
just shows a richer, broader range of input.
And you've been using it elsewhere in your
Materials Review process, so it just seems
odd, if you're going to use it elsewhere, to
not describe it in your Committee Review
process, as well.

MEMBER ELLOR: And that's pretty
much the point I wanted to make, is that, to
me, there's a very profound difference between
Technical Review, and a Technical Advisory
Panel, because a Technical Advisory Panel, as
Valerie indicated, indicates that there's more
than one mind at work reviewing the material.
I think there's a big difference.

CHAIRMAN MOYER: Yes, Bob?

MR. POOLER: Bob Pooler, National
Organic Program. The term "Technical Review",

Neal R. Gross & Co., Inc.
(202) 234-4433
came about from the argument, or public
comment that was presented that items for 205-
606 did not have TAP reviews. And it was the
opinion of the Program, or dialogue between
the Program and the NOSB that the Handling
Committee was, essentially, the Technical
Advisory Panel, and that the reports from
contractors were the technical reviews to be
used by the Committees, the Technical Advisory
Panels for all petitions. Essentially, that's
where the terminology came about.

MEMBER FLAMM: Bea.

MEMBER JAMES: Barry, I would like
to suggest at this time that we table the
topic of Technical Reviews for our Committee
to further explore, and that perhaps we
consider removing it at this time, and that we
put on the work plan for the Policy Committee
to look at technical reviews, how they're
discussed in the Policy and Procedure Manual,
and come up with a more consistent, and clear
understanding of how we're going to be putting
it forward in the description of the
Committees.

MEMBER FLAMM: I think it was the
last meeting, the Policy Committee did review,
and I think with Materials, the TAP, and
technical reviews, so we do have a new
statement on that. I think the points have
been made here are valid, and maybe we should
look at it again. We were, this morning,
trying to be consistent, but also responsive
to the public. But I think maybe we better
look at the removal. It seemed like a simple
thing to do, it was more -- almost like an
editorial thing, but I see that that's not the
case. We'll look at it again.

CHAIRMAN MOYER: Barry, the
Program has a comment.

MR. MATTHEWS: Yes, I just wanted
to remind you that our attorneys have
determined that the Board can serve as its own
TAP.

MEMBER FLAMM: But, I think we
took note of that, but it doesn't, necessarily, mean we would decide that's the proper course to take, but that we have that authority, I think we realize that.

MEMBER JAMES: Okay. So, the Committee will discuss further today the issue of technical reviews being in the descriptions, and, hopefully, be able to talk about that tomorrow then.

Additional changes are moving down to the Handling Committee. Again, after 7 CFR Part 205, we'd like to add, "and OFPA". And then the same for the Livestock Committee. And those are the only additional friendly amendments to the description of the Committees.

MEMBER FLAMM: Thank you, Bea. The next item, very briefly, addition to the Policy and Procedure Manual by diversity requirements. And this will -- I'm passing on this until the actual decision on the -- that the Board makes about our bio
diversity recommendation. But there are several places in the Policy and Procedure Manual that deals with bio diversity, so that would need to be updated when a decision is made.

And, finally, Valerie is going to give a report on the, I guess, Steve said earlier, the black hole. Is that -- sorry, Valerie.

MS. FRANCES: I'm just providing an update on the effort I've been making in terms of tracking recommendations. And I wasn't going to try to clarify the black hole of Material recommendations and reviews. I was actually focusing on the Non-Material, so I'm not quite addressing probably what you referred to earlier, Steve.

But just to expand a little further on what Barbara raised in her report yesterday, which was looking at since 2002 there's been 65 Non-Material recommendations. And I want to offer further that 12 of those
have gone forward with rule making or
guidance, 29 were taken up again and worked
through, and revised, and worked on, and
elements of that would be the 606 work towards
commercial availability requirements, all the
aquaculture, stages of recommendations,
aquatic plants. There's just been an array of
things that you've worked on and improved,
and, so, the example of the 606 commercial
availability as a recommendation did go
forward with guidance. And that came out in
the Federal Register notice on submitting a
petition.
And then, there is the area,
though, of things that have -- need some kind
of additional action or response, and there
are 27 of those. And aquaculture, pet food
are examples of those, along with some of the
discussion that you had yesterday about the
certificates, and expiration, renewal dates,
standardization. Those sorts of things, I
think, are still sort of on the table to be
figured out. But I just wanted to provide a little more of a description of where things are at, and working towards getting some more resolution on how to strategically move forward on those things. So, that's just a little more information.

MEMBER Thank you, Valerie. Sorry for characterizing it that way. That completes the Policy Committee's report on its recommendations.

CHAIRMAN MOYER: Thank you, Barry. We appreciate that report, and your team's hard work, as well.

Moving on, we're going to go to the Compliance, Accreditation, and Certification Committee. Chairman Joe Smillie. Joe, the floor is your's.

MEMBER SMILLIE: Good morning, everyone. We'll follow it in the order that it's presented.

First item is going to be our recommendation on peer review system. And
you'll notice it says "system", because what
we're looking to create is a systemized
approach. I'm not going to go through the
document. It's been posted for quite a while.
I presume the Board and interested public have
read it.

The commentators really didn't
take issue with any of the history or the
regulation citation, per se. But there were
a number of comments on this, mostly in
support, with some additional guidance. The
comments really, quite amazingly, all stemmed
from one fountainhead, the lady known as Lynn
Cody. Her comments were very precise,
succinct, and highly evolved. Most of the
commentators simply cited her comment in their
comment. And we took note of that comment.

The only comment that really
veered from Lynn's core points was the OTA
comment. And that was absolutely technically
correct. OTA pointed out that the peer
review, as mentioned in both OFPA, and the
regulation citations you can read, was set up to evaluate candidates for accreditation. And that was the original intent of OFPA, and the regulation. However, we have evolved to a system that I think is basically universally agreed that it just isn't appropriate for a Peer Review Panel to be evaluating candidates for accreditation; that the real role that we're looking for, and it is an evolution from OFPA and the regulation, is an oversight of the accreditation of the NOP program, itself. And, so, while technically correct, we respectfully disagree with the OTA comment. And we will proceed in our recommendation to talk about the Peer Review System as an evaluation of NOP accreditation.

Basically, if we want to go -- the Committee met and has decided upon a number of additions to our recommendation, and those are underlined above. What we are looking for now in the discussion is an evaluation by ANSI, or the National Institute of Standards and
Technology, NIST, program called the "National Voluntary Conformity Assessment System Evaluation", NVCASE Program II, the ISO 17011 standard.

We also think that evaluations by OIG should be utilized by ANSI or NIST as part of their evaluation, and I would add "system", if you could just add system, Val.

Now, we decided to leave ANSI in as an option for a couple of good reasons. One is, the excellence of the job they did in 2004-2005, and, also, ANSI is the U.S. sole representative at the ISO table. I'm not sure of NIST's involvement in that, but I know that ANSI is the U.S. rep at ISO. We think that's important, and we think ANSI has good credibility. And we certainly wouldn't want to straight jacket our dear friends at the National Organic program. We'd like to give them options to pursue in consultation with the NOSB, and, of course, the public.

We also feel very strongly, based
on recent experiences by a number of accredited certifiers, including my company, that the OIG evaluation is, although internal, and not necessarily directed towards 17-011, extremely valuable, thorough, and competent. And that should be part of the mix. So, any evaluation of the NOP should include the internal evaluation by OIG.

They've been very busy for the last couple of months, and I'm sure we all anxiously await their public report. And we believe that either NIST, or ANSI, should take that into consideration.

So that's basically it. If you can move down, Val, to the recommendation, we've simply added NIST, save type space, to the mix. The other comment that was made orally, I'm not sure that it was a written comment, was that it should be annual. We don't feel that that's appropriate. The accreditation cycle for certifiers is every five years, not every one year, as someone
stated yesterday. And a three-year cycle
gives enough time for the evaluation review,
response, counter-proposal, whatever. It
takes time to go through this, and three years
is plenty. It could be even enlarged, I
believe, to four, possibly even five. But
we'll stick with three for the time being,
since that's the number of years it takes to
qualify as Organic. It's an historically
significant number.

So, to keep it short, that's it.

We accept the public comment that NIST should
be certainly considered, and, actually, as we
heard at the beginning yesterday, if you
weren't here, that the ARC branch,
Accreditation, Review, and Compliance --
Audit Review - I'm sorry - Audit, Review, and
Compliance has achieved NIST accreditation.
So, obviously, the NOP is on their game, and
they're ready to take the next step to fulfill
the regulation and OFPA. I'm done. I'm done
in more ways than one.
(Laughter.)

CHAIRMAN MOYER: Joe, I just wanted to say that I think this is an excellent example of how a Committee does its work, presents it to the public, gets response from the public, incorporates it into their document, makes the changes, and it's a better document because of it, so great work to you.

MEMBER SMILLIE: I will turn it over to Julie.

SECRETARY WEISMAN: Can I make a request?

MEMBER SMILLIE: Sure.

SECRETARY WEISMAN: Can I move down in schedule? I am having a lot of trouble integrating my role as Board Secretary with other responsibilities that I have, including presenting this. And I don't have all my -

MEMBER SMILLIE: Ducks in a row.

SECRETARY WEISMAN: -- documents up, so I would appreciate being able to -
MEMBER SMILLIE: In addition to your work on the Handling Committee, I might add.

SECRETARY WEISMAN: Yes. Thanks.

MEMBER SMILLIE: So, we go from A to Bea.

SECRETARY WEISMAN: I'm sorry, Bea.

MEMBER JAMES: Good one, Joe.

Okay. I'll be talking about our discussion document, Voluntary Retail Certification. And I guess I'd just like to start with posing the question that I think most people had in the public comments, which is, why are we looking at Voluntary Retail Certification?

I think the simple answer is to improve and strengthen retail certification, and to make sure that the Program is providing clear guidance, so that retailers, and certifiers, and consumers know exactly what organic system plan, inspection protocol, and
consumer marketing messages are expected of retailers.

The more complex answer stems from many public comments that we received and heard yesterday, that asked the question, "can retailers be certified, at all, if they are not processing?" Which the Program, I believe, clarified yesterday by stating that, "Continued retailer certification is best served under the umbrella of the Program. And, additionally, the CACC believes that Voluntary Retail Certification is enforceable within the guidelines of the regulation. But that, perhaps the Committee will explore this issue further." And as one of the commentors suggested yesterday, we'd like to ascertain what departments are best served under the current regulation for Voluntary Retail Certification.

I, also, would like to acknowledge that many comments regarding retailer certification were strongly opposed to a
multi-site construct applied to retailers. We definitely heard that message loud and clear. And I'd like to reiterate that the core of this recommendation is to explore how we can strengthen and clarify Voluntary Retail Certification. And it is not to try to scheme a route to create an inspection protocol that would mimic the farmer grower groups.

Our opportunity for addressing retail certification is now, and the Committee absolutely appreciates all the public comments to help steer us in the direction of a discussion document towards a recommendation that we hope to be able to propose at the November meeting. Retailers want to be certified, and have invested heavily in trying to create good organic handling from farm-to-store, so our consumers feel confident about the products that they purchase with the USDA seal.

And just to wrap it up, I'd also like to mention that many commentors also
welcomed, and expressed the need for consistent guidance and regulation to support the continuation of USDA Voluntary Retail Certification. And it's the goal of the CACC to explore this issue so that retail certification is supported by the industry, and understood by consumers. That's all I have to say, and I will take any questions.

MEMBER GIACOMINI: There was a -- I don't remember how many. There are a number of comments suggesting that we -- even though it's voluntary, we write regulations for retailer certification. Where does the Committee stand on that idea?

MEMBER SMILLIE: We're going to look at that. We're going to look at it by departments. Certainly, if any processing, which includes re-labeling and re-packing, I would carefully add, if they're already processing, we believe that they are handlers, so we'll look at it department by department. We may come to the conclusion that the grocery
aisle doesn't qualify, but that the deli, produce, bulk, what else? Bakery, would all qualify as processors, and may not need more specifics.

Again, the specifics, when you get right down to it, might be left up to certification organizations, which are currently doing it now, anyhow, but we might want to add those items to our -

MEMBER JAMES: And I just want to also comment on that. It's actually a lot more complex than that, because bulk foods is often found within the grocery aisle, so it might just be that the grocery aisle would be included. And I know that there are several retailers that have invested in having the grocery department certified, because bulk foods is within the packaged grocery department.

MEMBER GIACOMINI: It just seems that over the past few years, some of the biggest problems we've seem to have had are in
signage. We always talk about the dripping ice, but we have -- and that's what I call physical contamination. Well, I'm just as concerned with what I'll call mental contamination, with bad signage, misrepresentation in advertising, and all those issues. And I think if we're going to go that route and really strengthen the voluntary program, I think we need to really look at those issues.

MEMBER JAMES: I would like to respond to that by saying that I couldn't -- I can speak on behalf of the Committee, that we couldn't agree with you more. And that a lot of the inconsistencies that we see with voluntary retail certification is a misunderstanding of some retailers on what the marketing message needs to be for the consumer. So, we hope to be able to address that by clarifying that, and what our recommendation will be at the November meeting, so thank you for those comments.
MEMBER MIEDEMA: Good morning.

This is a discussion document, and I guess I'll start out by saying that about five years ago, a woman came before our Board, and she did something very dramatic and memorable.

She stood up and she took a bite of a bar of soap, and it lives on in the annals of presentations before this Board.

Well, I brought a bar of soap today, and I'm not going to take a bite of it. And no one is going to wash my mouth with it, but this bar of soap was in our hotel room at the last meeting. And it was -- it says "Organic bar" on it. And this is a mislabeled organic product. And, of course, it was this supremely ironic thing that all of these National Organic Standards Board members were stocked with improperly labeled organic products, and probably completely bogus organic products. There's nothing on here that talks about who certifies it. It just says, "organic", and it says, "Made in China"
on the back. And it was a clever marketing
term for somebody who packaged this up. They
felt completely unfettered in their use of it.
The person buying it wasn't working under any
constraints that they were too worried about,
so it really galvanized my interest in looking
at this issue a lot more closely, and decided
to investigate.

I'm not going to, in making this
presentation, present myself as an expert.

Joe actually has a lot more expertise on the
topic. And there are many members of the
public who are here today, who have devoted
their lives, their entire adult professional
lives to developing standards, and really to
developing healthier personal care products.
But the status quo, it's very confused.

In 2005, the Program issued a
document essentially saying organic personal
care products will move forward. And they
made one comment that's at the very end of
this memo, August 23rd, 2005, that is often
quoted. "The NOP will pursue such rule making
as expeditiously as possible." But things
change, times change. There is a new guidance
issued in April of 2008, that said, "Any
cosmetic body care product or personal care
product that does not meet the production
handling, processing, labeling, and
certification standards described above may
not state, imply, or convey in any way that
the product is USDA certified organic, or
meets the USDA organic standards."

It sounds like drawing a line in
the sand, but there's a giant caveat, and the
giant caveat is what's giving a lot of people
pause in the industry. And here's our thicket
of competing regulations. Because USDA went
on to say that, "USDA has no authority over
the production and labeling of cosmetics, body
care products, and personal care products that
are not made up of agricultural ingredients,
or do not make any claims to meeting USDA
organic standards." So, now we started to
tiptoe into some murky waters. Very much at
the crux of our synthetic/non-synthetic,
ag/non-ag discussions that we're having as
well.

Lastly, the NOP said that,
"Cosmetics, body care products, and personal
care products may be certified to other
private standards, and be marketed to those
private standards within our borders in the
United States. These standards might include
foreign organic standards, eco labels, earth-
friendly", et cetera. USDA's NOP does not
regulate these labels at this time.

So with that sort of rubric in
mind right now, I look back at this soap, and
maybe it is legal. Maybe it was fine, because
maybe there is a certifier at the end of this
who doesn't require their name be printed.
The truth is, I have no idea.

I was at a kids' soccer game a
week or so ago, and was talking with a friend
and colleague of mine about what I was doing
in D.C. this week. And she said oh, I'm not going to buy any of that organic stuff. I just -- it seems all over the place. I don't know if it's really organic. And she was somebody who was very motivated, and wanted to really upgrade her purchases of personal care. And I think it sums up a lot of consumer's feeling right now, is that they just don't -- they don't know what organic means in this realm of products.

Now, it's one of the bright spots in the industry. It's one of the highest growth areas. There's a lot of urgency. There's a lot of interest in companies investing money. And, in fact, a lot of money has been invested. We have this ground swell of attention around the new ANSI Made With Standard, and that'll kind of take its own life, and start, I guess, being used, and adopted.

What we tried to do in this discussion document, first and foremost, was
give a forum for public comment, and get some
public comment on the record for us all to
look at together. But what we state is pretty
bold. I mean, we're saying NOP, own the word
"organic", so that there's no confusion, no
more confusion for consumers. And take that
step.

All of the enormous amount of
regulation that we'd need to write would need
to follow. Maybe there would need to be a
task force. There's certainly a wealth of
informed people to draw from. We didn't
advocate for a task force in our discussion
document. We went right to the heart of the
matter, found places in the regulation that
would need language changes. If you could
scroll down a little bit, Valerie.

We tried to, just the facts,
ma'am, get right to where in the regulation
would need to be changed in order for these
products to have a home in the National
MEMBER JAMES: I don't know if we're capable of even answering this question or not, but one of the concerns that I have is with organic body care, or cosmetics. What is the likelihood that we'll end up needing to have a lot of synthetic, non-agricultural ingredients on the National List, in order to support cosmetics?

MEMBER MIEDEMA: I have some thoughts on that. I'm going to defer to Joe, though, on this one.

MEMBER SMILLIE: My opinion is that it's got to be agricultural. Okay? But it will be, also, definitely synthetic. In other words, you're going to take -- in order to achieve efficacy, the personal care companies have pushed as far as they can push, I think, and we've got some experts in the room, to achieve a certain body of products that meet the NOP standard. To go passed that, to get shampoos and other things, they need essential ingredients, which can be
derived from certified organic agricultural ingredients. But the processes that these ingredients would go through are undeniably synthetic processes. They create chemical change, with even the most liberal interpretations of synthetic, which is not the way we're going. But with the most liberal interpretation of synthetic, they would still be synthetic. And what I would advocate is a separate section of 605C, which would be annotated for personal care use only.

Now, the chemists in the personal care world know a lot about this. And they can come to agreement about which processes are called, in a loose term, "green chemistry." In other words, there's -- originally, and I won't bore you to tears with all this technical stuff, but get ready for it. You're going to have to learn some more chemistry. Barbara, bring out that old manual again on the chemistry thing, because what it is, is that there's -- you can achieve
the same end result through different ways.
It's still esterification, and maybe we'll have some good examples in the public comment, but there is better ways to do it. There's less invasive, less polluting, less irritating ways of achieving that. And those could be qualified, and quantified. So, it's possible, but it will be synthetic. If the NOP takes it on in cooperation with the FDA, or however they work that out, then, basically, we will see a lot of products petitioned to be added to 605. But, again, I believe that it's doable, because we can annotate them for personal care use only.

CHAIRMAN MOYER: I believe Tracy has the floor.

MEMBER MIEDEMA: Kevin.

MEMBER ENGELBERT: I'm interested in what your thoughts are concerning soap. You're going to use cosmetics, rather than personal care products, and you exempt soap from your recommendation, and that was your
example. Is that the only personal care product that doesn't qualify as a cosmetic?
And where do you think that will come into play with your recommendation, or will you eventually talk about, or just deal with the soap?

MEMBER MIEDEMA: It's a great question, Kevin. The reason we used cosmetics, which does include soap, as you -- or exclude soap, as you pointed out, was to really bridge USDA and FDA, so we used this very precise definition that FDA uses. Based on some of the public comment that we're hearing, we probably need to expand what we're talking about here outside of the word "cosmetics."

I think it just gives a lot of people pause, and they're not seeing that as the FDA -- it seems more like makeup, instead of the FDA version, which includes lotions, and shampoos. So, we most likely need to write a definition of personal care. And
there are some good ones. There's a good one
even in the ANSI standard already that we
could turn to, and to make sure soap doesn't
get left out. Katrina.

MEMBER HEINZE: Certainly, as a
consumer who has been confused by this, I
empathize with the goal, and support the goal.
I guess what I'm struggling with, and I'd be
interested in the Program's perspective on
this, is whether it's even within our
jurisdiction, or an option available, since
it's the Organic Food Act. And we certainly
had a number of public comments on that topic.

MS. ROBINSON: We did discuss this
with our legal counsel, because I had that
same reaction, actually, Katrina. My first
reaction was, it is outside of our
jurisdiction. And I believe I raised that on
an Executive Committee call. So, I did
consult with our attorneys, and ask if we had
this jurisdiction. And their reply was
actually, yes, we do, that these are merely
processed products. That's what they would be. And the simple way to approach this, is that -- the way that I came to understand it was that what we would be doing is basically expanding the National List for a broader set of processed products; namely, personal care products that are largely agricultural in their origin, but require additional synthetics in order to be finally produced, and then labeled under our labeling scheme.

So, for example, you could take the NSF standard, the ANSI standard 305 out there, give it to the Board and say do you guys want to incorporate this by reference, and turn around and make a recommendation to NOP that we expand the National List with all of these synthetics, and their annotations, and proceed with rule making to allow for these products to come under the labeling scheme of the NOP regulations.

MEMBER HEINZE: Thank you. I do have a follow-up. I think then as we consider
moving forward, there are several lines of products that have been introduced that do carry the USDA NOP certification, where they've found a creative, innovative, technically sound solution. And, certainly that should be encouraged and rewarded. So, then how do you create a path forward for other products without diminishing a standard?

MEMBER MIEDEMA: Joe.

MEMBER SMILLIE: I would say that the use of the word "organic" on a product means that they've achieved that, and the "Made with" would be the option for a lot of products that won't be able to achieve 95 percent.

The soap example is a good one, Kevin. We even had some comment, if you look at it, to talk about whether you really could certify soap currently. There are, right now, certified soaps, because 605B allows the use of sodium hydroxide. And soap is some sort of palm oil, some vegetable oil reacted with
sodium hydroxide. Now, how much sodium
hydroxide, you get into the calculation game,
and that's one of the problems that we will
face in dealing with personal care products,
is you thought it was hard calculating multi-
ingredient food, start trying to calculate
this stuff. So, some people believe that you
can certify soap, other people believe that
you can't based on how the calculation is
done. So, soap is kind of a good example,
because we do have USDA NOP "Made with" soaps
out there right now. And I think there may
even be organic soaps out there. I'm not
sure, under the NOP label, depending on how
the certifier did the calculations of the
sodium hydroxide.

MEMBER MIEDEMA: Jeff.

CHAIRMAN MOYER: The two questions
I have are, what would we do with cosmetic
products that don't start with an agricultural
base, and don't fall under this category?
Would they then be able to use the word
"organic" without having to be certified, and still add to the confusion? Because they don't fall under this guideline, and we have no authority over it, if it has no agricultural background.

And then the second question I have is how -- the cosmetic industry, from my understanding, seems to be really moving in the direction of nanotechnology. How is that going to impact this whole statement, because we are already seeing all those kinds of products being made virtually invisible through nano-technology.

MEMBER MIEDEMA: Well, these are all excellent questions, Jeff. And the short answer is that if it's not organic, it won't be able to be labeled organic. What this discussion document proposes is planting a flag in the regulation so that we can move forward and answer those questions in detail. We've done things the other direction, which is build a whole thicket of regulation, and
then come to the program, and ask if we can do this at all.

I really wanted to start with the buy-in from the public, and make sure this is the direction the public wanted to go, that it was feasible for the program. I'm very encouraged to hear today that it is, in fact, feasible for the program. And plant that flag in the regulation. It would certainly have to be agriculturally based in some manner. But we don't have to sit here this morning and figure this out. There's people, like I said, who have devoted their entire professional lives. And, for the most part, these questions have been sorted out, and there's debate amongst the companies that are currently producing products that they feel are organic.

It's fascinating to listen to these really smart people debate. There's quite a schism even amongst these folks, but that can all be sorted out.
CHAIRMAN MOYER: Yes. I recognize we won't solve those problems all today. I think part of the reason for this discussion that folks have is to get these questions on the record, so that the public can start to react and respond to them. So, thank you, appreciate that.

MEMBER SMILLIE: The key thing, though, is the USDA owns the word "organic", so nobody can use that word unless they meet what the USDA decides as a regulation.

CHAIRMAN MOYER: Only as it pertains to agricultural products, though.

MEMBER SMILLIE: Right.

CHAIRMAN MOYER: They don't own the word in terms of manufacturing of computers or something.

MEMBER SMILLIE: Correct. We're only talking about agricultural products.

CHAIRMAN MOYER: Right. But some cosmetics don't have any agricultural products in them, is my concern.
MEMBER SMILLIE: Well, then

that'll be FTC's job.

CHAIRMAN MOYER: Barbara has a

response, I believe.

MS. ROBINSON: Well, I think one

of the things -- just sitting here discussing

this. One of the things -- if you go down

this road, one of the things you may want to

really consider, because we'll always confront

the problem, and we've talked about this.

We're going to continue to confront this

problem as this industry grows, of people

wanting to use the generic word "organic" for

products for which we do not regulate. That's

just going to happen. And to cut down on that

green noise, and the devaluation of that word,

I think you really should start contemplating

an additional seal, or an additional label to

go along with the "Made with", that the "Made

with" label also has its own -- we've not

allowed the seal to go on a "Made with"

product, but any kind of USDA recognition on
that product. And I think that's where, if
you would start to give some thought to that,
putting USDA on a "Made with" product, you
would close that door for the non-agricultural
products out there, because then consumers
could see clearly that even a "Made with"
organic product, if it has USDA on it, it's
ours. It belongs to us. And then we can say,
you can say when we're doing education and
outreach, look for USDA's name on a product.
If you don't see USDA on it, it's not ours,
and we don't regulate it. Until we get to
that point, "Made with organic" out there is
a fuzzy world, and it always will be.

MEMBER MIEDEMA: Valerie, and then
Bea.

MS. FRANCES: This is actually a
question for Barbara. You referenced -- well,
you said earlier that we could incorporate a
private standard by reference into our
regulation. Is that really the case?

MS. ROBINSON: I said the Board
could make a recommendation, because there is a private standard out there, and the Board can simply take that private standard, if they chose to, if they liked that private standard. And they can give it to the program as a recommendation. That's all.

MEMBER MIEDEMA: Bea.

MEMBER JAMES: Yes. Tracy, I just wanted to -- I know you're following the OTA, I think you are, the OTA Cosmetic Discussion Board, and I've been watching that, too. And just their last discussion was very similar to what Barbara is referencing. Is there a way for us to have a different way of communicating on a cosmetic label without it being perceived by the consumer that it's the exact same thing as an agricultural product. And it seemed like some of the -- as you mentioned, big companies, highly intelligent companies who have been behind this for a long time -- were supportive of that idea.

MEMBER MIEDEMA: Thanks. Any
other questions? Comments? Thank you.

        MS. FRANCES: I do have one more question. This problem of products that don't contain agricultural ingredients that somehow can use the term organic and be okay, because it's outside our scope of authority, I'm just going to throw the question, is there a way to address that in any other way? And I don't know the answer at all.

        MEMBER MIEDEMA: Go ahead, Joe.

        MEMBER SMILLIE: I don't know, and I'd like some advice from the government people here. But, to me, if someone says "organic", and it's non-agricultural, and it's got an agricultural claim, it's got an organic claim on it, to me, that's misleading the consumer. And that's an FTC area. Am I wrong? So if someone made a complaint about a polyester sweater that said organic -- buy this organic sweater, and it was made of polyester, and some consumer thinking that it was an organic sweater bought it, they could...
take that case to the FTC, because they were misled. But correct me if I'm wrong, government people.

MR. MATTHEWS: I would say that that would be the place to go.

CHAIRMAN MOYER: Barbara, did you want the floor now?

MS. ROBINSON: Sure.

CHAIRMAN MOYER: Okay.

MS. ROBINSON: Ladies and gentlemen, Chairman, members of the Board, it's my honor and my privilege to introduce to you the Deputy Secretary of Agriculture, Kathleen Merrigan.

(Applause.)

DEPUTY SECRETARY MERRIGAN: Whoa, whoa, hey, everybody. Old home week, huh? So, I'm Deputy now. Unbelievable. So, thanks for letting me interrupt, and thanks for inviting me to come to your -- or maybe you didn't know you invited me to come to your meeting. Or maybe even I said I wanted to
come to the meeting. I'm not exactly sure how
all that came together, but I'm glad to be
here, and it's familiar stomping grounds. A
lot of hard work. I feel like I know what
it's like to be in your shoes.

Twenty years ago I was approached
by Mark Lipson and others when I was working
for Senator Leahy to write the Organic Foods
Production Act. And fourteen years ago, I was
on the other side of the table sitting where
you all are today, because I was an appointed
NOSB member, and almost served out my five
years as an environmental representative, but
then became AMS Administrator, and had to go
take care of that little rule, so I was a
little short of serving five years.

So, let me first say thanks to all
the NOSB members for your service. I know how
much hard work it is, what kind of passion you
put in, the long hours, and the pretty active
constituency that we have here, loyal people
that come to every NOSB meeting, and follow
all the iterations, and really give a lot of
important input into the process. I really
want to thank you all. I know it's a long,
long process, and there's no end in sight.

(Laughter.)

DEPUTY SECRETARY MERRIGAN: So, I
want you to know that I think there's a lot of
people at USDA listening, and looking for
opportunities to work with the organic
community in new and important ways.
Secretary Vilsack has been a great, great
leader already. I've been really excited to
be working with him at USDA. He's committed
to achieving greater sustainability throughout
USDA's programs and policies, the National
Organic Program and Body Sustainability. We
are really interested in what you do here.

I notice on your meeting agenda,
one of the things that you have to debate is
bio- diversity. Oh, whoa, that's a big
important issue for the organic world. It's
a principle that a lot of us hold dear. But
I also remember when we were putting out the second proposed rule, and then the final rule, how difficult it was to negotiate that word, just the word "biodiversity" in the definition of organic, what we thought of organic, because OMB and others kept saying well, how are you going to measure it? How are you going to enforce it? These are tough questions, but I know you've got a lot of able minds in the room, and I will welcome whatever recommendations that you come up with in that area.

Let's see. What am I supposed to say to you guys? Well, I want to make a few announcements. First is, I think all of you are familiar with the People's Garden, so some of these are things that you've heard. But in case you haven't, I wanted to bring you up to speed.

The People's Garden was something that was initiated by Secretary Vilsack before I arrived at the Department on April 14th. It
is on the Whitten Lawn. There is a vegetable garden there, pollinated garden, all organic. Valerie was there with a bunch -- a bunch of the staff was there from -- Barbara Robinson, I saw a picture of you with a hoe, or a shovel, or something. I don't know. I think that the organic staff was pretty involved in that. And we have a Secretary of Agriculture who is out there saying, here's the People's Garden, and it's an organic garden. And challenging USDA facilities across this country and abroad to also take on their own gardening activities on their facilities.

Of course, when the press probed me afterwards at the close, I said are you saying that all USDA facilities should be organic gardens? I said no, these are not decisions dictated by headquarters, but we're going to use this garden to help us talk about the role of organic agriculture, and American agriculture, and the importance of standards, and use it as an educational tool.
So, I just want to make sure,
first of all, that you all know about that
initiative. It's exciting. It had a lot of
buzz, and I think there will be a good flow of
events and information that comes from that
over the years.

The second thing, and I'm sure
most of you saw this, an announcement about
the census of agriculture, that USDA is
putting out a survey to all organic farmers,
and we're asking that -- I think they're going
out this week or next -- and we're asking that
the results be turned in in mid-June. Does
that sound right, Barbara? She's shaking her
head. I've got my -- I'm fuzzy on the dates,
but I'm hoping everybody helps us get that
word out, and make sure that happens, because
that data will help us orient USDA programs
appropriately. It's a great opportunity.

And, again, that was something -- I had no
input in that. Secretary Vilsack was on top
of that, and that happened before I got to the
Department. I think that's great.

The third thing I want to announce is that the organic program has grown up.

We've all grown up in a lot of ways. Some of us have grayer hair, some of us have less hair. We know each other well. And I think that considering the growth in the industry, and the demands this program puts on USDA -- I don't mean that in a bad way -- the demands that this program puts on USDA, that I think it's time that we have a Senior Executive Service employee dedicated just to the National Organic program.

Barbara has been doing a great job. We've asked her, though, to do double duty. The National Organic program isn't the only thing she has to do. She has this whole other Division of Transportation and Marketing in an area where I think a lot of our interests in local foods that comes on down from the President, through the Secretary, to me, a lot of those issues are going to blossom
in Transportation and Marketing. And I'm worried about an overload on that system, so we're going to move forward with that, and there'll be an announcement of the position -- and things will be advertised and followed, that sort of thing.

The fourth, and most exciting thing, I think right now that I wanted to announce for today is a big pot of money. How does that sound? A big pot of money always sounds good. Okay. We're announcing today $50 million in funding to encourage greater production in organic food, $50 million to the EQIP program, Environmental Qualities Incentive Program. I know some of you fought for this in the Farm Bill. We're up against a fiscal year clock, and so we need to get the money out of Dodge, and get it spent before we lose it.

This is important financial assistance to help people who are committed to organic production to put those methods and
actions into play. It will be for current certified organic producers, as well as people in transition. A portion of this $50 million will be allocated to every state.

For this current year, because we're up against a fiscal year clock, use it or lose it -- I know some of you probably are in organizations where you're familiar with that situation -- we're using the allocation formula that we've used for the overall EQIP program, so you may look at the allocations, and say why does that have -- why does that state have that big chunk of money, and this state has more organic producers has less? It's just because we're under the gun, and Tom Christiansen -- did I say it right? Okay. -- from NRC, I probably met a thousand times, and he's being very kind, and not reminding me of that, is with me from NRC. That's in case you have the tough questions. But for this year, we needed to do that, because we have time to come up with an organic-only allocation.
formula. But that's the plan for the coming years. And the good news, too, is if there's a state that has a bigger pot than there's an organic demand, the Chief and the staff are planning on reallocating that money to where the greater need is. So, we don't plan on having money sit out of this pot of $50 million unused. We want to get it out there, and we want everyone to benefit from it.

It's going to be available exclusively through a special sign-up. And it's going to be focused on six core practices, conservation, crop rotation, cover crops, nutrient management, pest management, prescribed grazing, and forage harvest management. So, these core practices were identified in meetings that the NRC has had with the organic community, as where the money should be placed.

The funding for every producer is capped at $20,000 a year. This is for this particular organic pot of money. The cap
doesn't apply -- say you may already be
getting EQIP funding, or you might -- I hope
all of you know about the EQIP program. It is
a big pot of money. And this $50 million that
we're talking about that's an allocation for
individual farmers is not inclusive of also
the money that we'll put into technical
assistance, the technical service providers
component of that. And we'll be talking about
that more in the coming weeks.

So, the $20,000 cap is for this
organic pot of money. You might say well,
heck, the regular EQIP doesn't have a $20,000
cap, why is that? Well, that was because we
heard from the organic community that they
wanted that cap there to insure that a few big
operations didn't get the hog share of the
money, that it would be widely distributed,
and available to a lot of small producers.
So, I believe that's reflective of the input
that we received from all of you. And, again,
it's a cap only on that pot of funding.
So, the sign-up for these special organic contracts is going to begin May 11th, and it's going to end on May 29th. And, at that point, applications will be ranked, and we'll figure out what to do. So, time is short. I know, I apologize for that. I know when people are out there in the field, it's really hard to turn those things around. So, what I'm asking all of you is to get the word out right away, to do what you can systematically as organizations, as leaders in the organic industry, to help producers figure out how to navigate this. And, hopefully, we'll have some good come of it.

So, that's what I'm here to say today. I think those are all great things.

(Applause.)

DEPUTY SECRETARY MERRIGAN: Yes.

Thanks.

I do want to say that lastly, I'm holding office hours tonight from 4 to 8 at the Deputy's office for all of you. And I
think Barbara has volunteered a staffer, I
don't know who it is, to sort of sign you guys
up thinking maybe on the 15-minute mark, would
be great fun. I don't have wine and cheese.
It's just going to be a water fountain and me,
but if you want to come by and say hello, or
whisper in my ear, scream at me, that's the
time for it. I could have made it maybe
easier for you, if I had just taken a room
here and had you all come there. But part of
it is, I sort of want you to feel like you
have a little bit of ownership on that corner
office on the Mall. It's been a long time
coming, and so I thought if you want to come
down and visit me there, you're more than
welcome. If people don't sign up for this
time, or there's a big hour gap, or whatever,
I'm not offended. I just wanted to make that
opportunity for all of you. And just looking
at the crowd, if each one of you took a 15-
minute slot, obviously, that's not going to
work. So, to the extent that if people are
coming over, if there are obvious groupings,
that might make sense. Okay?

And then my last message to you
is, I want to be there for you. I want to be
a spokesperson for organic. I'm going to
certainly be tasked by this administration to
be "sustainability central" at USDA. That
said, I'm going to say to you guys the same
thing I told to people from other streams of
agriculture. Organic is just one thing in a
larger portfolio of what I need to do. And,
so, if everyone sort of overwhelms me, that's
not going to work, either. I want to be there
for you, but I've got to be there for a lot of
things. And I'm not quite sure, I'm just
getting my sea legs on the job. I'm not quite
sure how I'm going to do it all. I'm going to
try. So just, if you could help me out, and
be respectful of that, and figure out what
really needs to bubble to the top, and what it
is that you can continue to work through the
processes that you have in place now at USDA,
because I think you have some great staff who work really very long hours. Hopefully, not any more all-nighters. Are we done with the all-nighters? We're done with those. But not only in AMS, but also Tom, people over at NRC asked, there's a lot of enthusiasm about what you do, and I think that you need to knock on those doors, and work out things as you can. Okay?

So, I'm open for some questions, or comments, if people would like. Yes?

Well, I won't pick a particular thing, but let me say this, that -- and it's something that I try to say to myself every day, just general advice, -- the perfect is the enemy of the good. So, the perfect is the enemy -- because you've got public meeting, and you have to --

Okay. So, the perfect is the enemy of the good. And sometimes I think -- and I been a part of this myself, and organically failed in that. We want to get everything perfect, and we want 100 percent
consensus, and all of that. And we've missed some opportunities to move forward. And the market keeps moving forward no matter what. We need to recognize that. And I was here at an NOSB meeting -- Hue, how long ago was it when I testified, two years? Two years ago when I talked about opportunities that I saw in animal care. And we could have a whole comprehensive package on animal care, or we could sort of go for some of the low-hanging fruit approach, and sort of do it in iterations. And I know that there are advantages to do the whole package, the comprehensive approach, but sometimes that means it's going to take several years. In the meantime, the market is making decisions for you. So that would be an example of the perfect being enemy of the good. I think that will stop all questions. I don't know.

CHAIRMAN MOYER: Not to interrupt, Kathleen, but if somebody has a question, please step up to the mic so that the recorder
1 can capture it, or use your mic at your desk
2 here, if you're a Board member.
3
4 MICHAEL: Hi. I just wondered if
5 you had any thought -
6
7 MS. FRANCES: Your name is?
8 (Laughter.)
9
10 MICHAEL: I'm still Michael.
11 (Applause.)
12
13 MICHAEL: I just wonder if you
14 have any thoughts about -- one of the issues
15 we struggled with in the past is how to
16 coordinate across the agency on this topic, so
17 that cross-compliance, and cross-coordination
18 could be a bit more synergistic across the
19 Department. It's a little early, but I wonder
20 if you have any thoughts about that.
21
22 DEPUTY SECRETARY MERRIGAN: Well,
23 I do think that just today coming to talk to
24 all of you, I had some talking points from
25 NRCS, some talking points from NASS, some
26 talking points from AMS, and that is partly a
27 function of me, because I said Barbara put
together some great talking points for me. I said, okay, but there's this other thing, this other thing. And, we really are at the point in time when organic crosses all areas of USDA.

Tom and I, on the drive over here, we were talking about well, okay this is EQIP. What's going on with CSP? What are the opportunities there, the Conservation and Stewardship program, the Conservation and Security program, and so, I guess, some of that has really got to fall at the level of the Secretary or myself. And, particularly, me in terms of being a sort of sustainability coordinator to look across the agencies. And I know, Michael, that was something that we tried to do at the end of the Clinton administration, when we put out the Final Rule. We included a promissory note, if you will, of items we wanted to say to organic farmers and ranchers across the country, and processors, it's not just here's the rule, and
how we're going to enforce it. But, here is
the menu of ways USDA can help you in your
efforts. And, so, I think that's sort of the
orientation I come to the job with.

I don't know exactly how to
conquer the stovepipe organizational barriers
that every kind of large organization has, but
that at least gives you a sense of my mindset.

Katherine?

CHAIRMAN MOYER: Just a minute,
Valerie. We have a question from the Board.

MEMBER SMILLIE: Well, I'm
following up with what Michael is saying.
We're seeing difficulty in the coordination
between FDA and USDA, and any help on that
area would be gratefully accepted.

The other issue that's come up is
how we're going to interact with all the food
safety initiatives. And I just wonder --
there's a lot of talk about getting those all
together under one roof. And I'd like to hear
your views on the interface between
sustainability, and organic farming, and some
of the food safety issues that have arisen
lately.

DEPUTY SECRETARY MERRIGAN: Well,
I haven't yet engaged in the food safety
issues. I'm getting briefed this week from
staff in terms of what's gone on in this
administration before I walked in the door, so
it's a bit premature for me to comment much.
But I will say just being on the Internet,
there is a lot of hysteria over different
legislation that I don't think was necessarily
fact-based. And I just caution everybody in
a highly volatile public arena that we check
facts, and carefully navigate those waters,
because your credibility is everything in
Washington, and anywhere. Right? And, so,
you don't want to lose that. And when the
organic voice is brought into that debate, we
want to make sure it's well researched and
strategic.

MS. DiMATTEO: Katherine DiMatteo,
and this hat that I'll wear with this question is my IFOOAM hat, International Federation of Organic Agriculture Movements. And I just wondered if there -- if you see that there could be more discussion from the Secretary's office at Secretary's levels, and colleagues in other countries, on organic, and the issues of organic development, and mutual support, equivalency and harmonization.

I know that for an agriculture service, and, of course, USTR takes the lead on most of those international discussions, and on trade issues, but when I was on APAC many years back, that there were issues that were discussed out of the Secretary's office. And I just hope and wonder, from your point of view, if organic can be some of those issues that get talked about, and are represented by the Secretary's office and, perhaps, yourself in the international community.

DEPUTY SECRETARY MERRIGAN: I, perhaps, see a Merrigan Worldwide Tour in my
future.

(Laughter.)

DEPUTY SECRETARY MERRIGAN: No.

Absolutely. I take your point, Katherine. I think that there's still a lot of standards work that the NOSB needs to work on, and there will always be. I mean, we always are going to have petitions about materials, and there's still a lot of areas of the rule that can be fleshed out, either through specific rules, or guidance, and that sort of thing. But if I had to sort of look to the future, I'd say we're entering the era of enforcement and equivalency. So, it's about how are we going to facilitate global trade, and make sure that what's coming into this country as organic, is really organic. And what we're sending forward is the same. I think that we're coming closest on agreements with the Canadians, and I think that's exciting, assuming the rule is done. So, anyhow, I think that that's the era we're in. And I
also think that this is now -- first you don't want to come down hard on people when a new rule has been birthed, but 2002, 2009, it's time.

CHAIRMAN MOYER: We have a question, Valerie, from Board Member Kevin Engelbert, if you don't mind.

MEMBER ENGELBERT: Thank you for coming. I appreciate the notice on the EQIP program for organic farmers. I think there's a potential for that to do a lot of good, especially if it's available for farmers that are transitioning to organic. Many of the organic farmers already have made all those changes in their operation to become certified.

My concern since I've been on the Board is that the National Organic program has always been the ugly stepchild since its inception. And with the growth in the organic industry, the Board is continuing to deal with new things from pet food, to now cosmetics,
and aquaculture. I'm wondering if there's any possibility, given the chance that it might be a stand-alone program, to dramatically increase the funding to the program. Because, in spite of the extreme confidence and hard work of the people on the Board, or on the program, I'm concerned it's just going to continue to fall behind with the work that needs to be done, because of the lack of the funding in previous years.

DEPUTY SECRETARY MERRIGAN: Yes.

I hear what you're saying, and certainly, when I came in as AMS administrator and the rule had just sort of got stuck, and I was brought in to help rewrite it, I found that there was a band, a very small number of program staff people working around the clock in a very unsustainable, unhealthy way. And being beaten up, frankly, by the organic community in ways that oftentimes were very unfair. But everyone was frustrated, inside and outside the building, about what was going on. And,
so, as AMS administrator, I had the power to
just cherry-pick people from other parts of
AMS to augment the staff, to make that rule-
making process happen.

I know Barbara wasn't involved in
the program then, but, Barbara, I think I got
you to write some piece of that rule. One of
those OMB -- I don't know what it was -- or
you rewrote it, probably, because Barbara is
a great writer. And, Mark, did I get you
involved? You were in Fruit and Vegetable.
No, you were in Livestock and Seed, so you
were involved in the accreditation portion.
Okay. So there are other people in other
parts of the Department I just sort of pulled
-- some of them landed here, eventually, but
I pulled -- and I think -- I mean, that's
something to think about. And that's
something I need to talk to Barbara in more
detail about.

Everybody wants more money for
their things. And now, as Deputy, I'm in
charge of the budget. USDA this year has a budget of $120 billion. We have somewhere between 104-- and 120,000 employees, depending how you count. I have a really hard time going up to Congress and saying, we need more money. I'd much prefer to look at what our allocations are, and figure about how can we restructure, and make things work. And how can we task people with multiple objectives, and create teams so things work?

That said, I think that just the announcement that the NOP is at the point where it needs to stand on its own in a different way, may mean that there's some reallocation there. I can't make any promises. But I think that we all have to understand that this is a horrible time for the economy, and people are losing their jobs. And I'm going to be very hesitant to be making a lot of Hill visits talking about more money.

Yes, Marty.

MR. MESH: You don't have to talk
about more money. What about just parity, market sharing the problems that organic has. We've been saying the same thing for research funding for a while. You said something about a hundred and something billion dollars? If organic had just whatever that, four to five, if you include farmers' market, direct marketing, and 6 percent of that, I think we could make it work.

DEPUTY SECRETARY MERRIGAN: Yes, I should be care. The $120 billion is this year. That's rolling in the stimulus funds. Normally, USDA operations are just a mere $95 billion a year. My husband won't even let me use our checkbook. He doesn't trust me.

(Laughter.)

DEPUTY SECRETARY MERRIGAN: So, anyhow, things change. I understand, and I've made those parity arguments, Marty. And I will continue to make them internally. But what I'm saying is there -- and after saying animal welfare is important, I hope you
1   forgive this expression, but there many ways
2   to skin the cat.
3
4   (Laughter.)
5
6   PARTICIPANT: Welcome from
7   Massachusetts, which you chose to leave to
8   come to this beautiful city.
9
10  DEPUTY SECRETARY MERRIGAN: Good
11   to see you, Ed.
12
13  PARTICIPANT: Yes. Ed Moltby,
14   NOPA. Just to give you some priority, the
15   Access to Pasture Rule, as you probably know,
16   is being --
17
18  DEPUTY SECRETARY MERRIGAN: I've
19   heard of that.
20
21  PARTICIPANT: Yes. Good. And the
22   Replacement Rule, you've heard of that one.
23   And whatever you can do to push it through the
24   different departments of review. And I had
25   suggested yesterday that Rick should go back
26   under overtime, and should do -- pull a few
27   all-nighters. I will bring the food to his
28   office, and advise him whenever he wants.
PARTICIPANT: But just whatever you can do from the point of view of all these rules and regulations to guide him through the various departments of review in USDA. Organic milk, we've got farmers who are in the same position as conventional dairy farmers now, who are losing money, who are going out of organic. And the quicker we can speed up some of these processes would encourage more livestock farmers to transition. Thanks.

DEPUTY SECRETARY MERRIGAN: Fair enough. I know that you've had a lot of comments already. What's the number up to, Barbara?

MS. ROBINSON: Around nineteen thousand.

DEPUTY SECRETARY MERRIGAN: Nineteen thousand and counting, whatever. Nineteen thousand is a lot. We'll try to do the best we can. And one thing I certainly am committed to, as is the staff, is to make our
decisions fully transparent. I mean, I think that the organic rule-making process that we did under my watch in AMS, I'm very proud of, because a lot of the decisions we made you may not have agreed with, but I think we set up a way where we articulated our rationale in the preamble to the rule, so you knew where we were coming from. You knew the areas where we thought there might be a need for evolutionary thinking. Now, it's like, this is where we're at now, but we understand there's a whole -- or there may be future specifics that will be added on to this.

I think that's really important, and it's our responsibility in our shoes at USDA to use the rule-making process, not just to dictate the rules of the land, but to establish a dialogue with the affected communities so they understand what it is we're hearing, and why we're acting the way we are. And sometimes you all may say one thing, and do something else, but the onus is on us
to explain that, and to provide the rationale.
And to give you enough information to sink us, if you need it. I mean, that's our job. We need to provide it.

CHAIRMAN MOYER: Kathleen, we have a question from Board Member Jennifer Hall.
MEMBER HALL: Hi. Thanks for being here. I am thrilled that you're an ally of the Animal Welfare topics. And I'm curious where you might see a fit for not just as it pertains to organic, but where it pertains to the full gamut of animal production in all of agriculture here, and industrialized production. And where USDA might partner more with EPA to enforce the laws that already exist on the pollution violations that are chronic in that arena as a means of -- taking it from another angle, as well, and not having to create new law to still achieve really good objectives about animal welfare, and how all of that food is produced.

DEPUTY SECRETARY MERRIGAN: Well,
part of my job -- it's a really cool part of
the job, actually -- is I get to go to the
White House quite a bit. I was in a Cabinet-
level meeting yesterday. I mean, I sat around
the table with, I think there were eight
Cabinet Secretaries there, the head of the FBI
was to my right. You know, if you get through
the vetting process, I mean, I think the FBI
investigated me six or seven weeks -- I wanted
to say to them, what do you know about me that
I don't?

(Laughter.)

DEPUTY SECRETARY MERRIGAN: So the
part of having that kind of seat at the table
means be able to reach across departments and
agencies and say, what about this? So,
yesterday I was also sitting next to David
Hays, who is the designee for Deputy Secretary
of Interior. We've got a lot of common
issues, as it relates to forested land in this
country, and BLM land, and grazing, and all of
that. I said, "Let's have lunch." And the
same way, I hope to establish a relationship
with our new EPA Administrator, so where that
all falls out, I don't know. But, I guess
that's part of my job, is to help facilitate
those conversations.

I think animal agriculture in this
country is reeling from Proposition 2 in
California. And when I spoke at a dinner
meeting a couple of weeks ago in front of the
National Meat Association, I said, "This is a
wake-up call. I think it's really important
as you develop standards in animal welfare,
that you continue the track that we all
decided to set 25 years ago or more, where you
don't disparage other production systems, but
you say we're trying to establish a market
that's distinct, and that consumers are
demanding. And we're going to clearly
articulate our standards and label for that,
and then just see what happens. But I imagine
what you do will have an impact on the rest of
agriculture, just as we've seen on the crop
I always say that organic farmers are some of our most under-valued, and certainly not rewarded researchers. (Applause.)

DEPUTY SECRETARY MERRIGAN: Tom, tell them about that part of EQIP. They should know. You remember we were talking in the car. You have to come to the mic, though. You have to be recorded for posterity.

PARTICIPANT: I'm sorry. The component of EQIP?

DEPUTY SECRETARY MERRIGAN: You know, the competitive grant part.

PARTICIPANT: Oh, I'm sorry. Yes. Yes, in EQIP we have Conservation Innovation Grants. It's funded typically at the national level, about $20 million per year. The main purpose is to work with producers on their farm on innovative conservation practices, or approaches to conservation. And we're in the selection process for this year's grants right
DEPUTY SECRETARY MERRIGAN: So, part of it -- part of what I'm going to be doing is -- for not just organic, but for our initiatives, we used to call it local foods -- but now we say, the Secretary would start it out by saying, "Buy Fresh, Buy Local", and he was told that's a copyright or a trademark thing -- so now we say, "Know Your Farmer, Know Your Food", which I actually like better, because I think it's more inclusive, because sometimes the local stuff, the local ward stuff is a little over the edge for me. So, I think this is going to be great. But anything to do in the sustainability world, this is what I'm going to be mentally doing every day that I'm in the job, is sort of cataloguing opportunities, and making sure people hear about them. So, just talking about that on the ride over, it was like oh, you know what, I've done a lot of research on the EQIP program, but somehow that one just
1 went over my head, and I need to learn more
2 about that. So, now it can be on your
3 homework list, too.

PARTICIPANT: From Consumers

4 Union.

DEPUTY SECRETARY MERRIGAN: Old,
5 but not senile -- yet.
6 (Laughter.)

9 PARTICIPANT: I have two questions
10 for you. The first one is about your
11 perspective on consistency in this program.
12 As new products are considered, whether it's
13 aquaculture, personal care, the standards that
14 they have to meet currently on the market sort
15 of languish behind what the food standards
16 are. And consumers are confused, at the
17 least, and feeling misled and deceived, at the
18 worst. And, so, I'm wondering about your
19 perspective on consistency of the application
20 of the bar to various products, because
21 there's a lot of debate about that. And
22 whether you pull the bar down so that you can
increase market capture across new product sectors, or you keep the bar consistent with what other organic products have to meet, and create an incentive for the market in that respect to meet a high bar. So, that's my first question.

And my second question has to do with other labels under USDA that are also very confusing, like the "Naturally Raised", like the discussions around natural. And I'd just like to hear your perspective on the incubation of those label standards, and making sure that they have similar rigor, or some rigor to them in terms of not misleading the public.

DEPUTY SECRETARY MERRIGAN: I love labeling issues, generally, I'll say that. And not just the labeling issues that you may have right now, Consumers Union might have on their plate, but I met with Chairman Joseph Brings Plenty on the inauguration of the People's Garden. He gave a traditional
blessing, that was from the LaCota tribe, I believe. And gave us a story, and song in his native tongue, which was really -- it was really quite lovely, because the Native Americans are the first farmers of this country. It was really quite moving, I thought. And he brought the issue of some of the rice that the Indians were producing, and how other companies who had no association with that kind of rice, were using the label, anyhow. And, so, I have a feeling. just given my history in labeling and consumer right-to-know, that a lot of these issues are going to end up on my desk. I think it's premature to talk about that whole host of labeling issues that are before the department. I'm aware of it, and I haven't gotten into it yet.

You're probably not going to like my answer on your first question in terms of pet care, natural care, because in some ways, things have moved beyond the Kathleen Merrigan stage of writing the law. But when we were
writing the law, was there, again, a Food Production Act? And I guess I wasn't really thinking about food for pets. I mean, that is food, and there's certainly a lot of implications for sustainability, particularly around seafood, I think, when it comes to pet food. But I certainly never thought about cosmetics, because there was already a whole lot of stuff out in the marketplace that was labeled organic that was fairly meaningless at the time we were drafting the legislation. And that just wasn't in our scope.

In part, it was a jurisdictional issue, because it wasn't clear -- some of those issues would fall within the scope of the Committee on Agriculture, Nutrition, and Forestry, and part we just chose not to do it for whatever reason. Some of you in this room were with me in those meetings when we talked this all out. But time has moved on beyond my input in that, so I don't have in my heart of hearts strong feelings that I can articulate
here today about natural care products, to
tell you the truth. I probably could use
some, I know that, but beyond that, I'm not
ready to weigh in.

Okay. A couple of more questions,
and then I'll head out. A compound one. Yes,
Marty. Come on.

PARTICIPANT: An idea for you with
your sustainability network role in your new
job, I'd urge you, I've emailed you already,
but I'd like to share it with all the people
here, is to bring Secretary Vilsack out to
NAL, the National Agricultural Library, a good
person to pry away with that is Senator Tester
of Montana. He knows about you. I made sure
of that myself. He's our organic farmer in
the Senate. He's planting wheat. His people
are out there planting wheat while he's
dealing with the Senate.

The National Ag Library has a
terrific database in the alternative farming
system coordinated and directed by Bill
Thomas. Anybody with a computer here can go on-line to the NAL@USDA website to the alternative farming system, and access and print out some terrific extensive bibliographies on topics such as the history of organics, food safety, food quality, the enhanced nutritive value of organic foods.

Everybody here know about farm parity, and we want to get library parity for NAL. Senator Harkin knows about this. He lit up when I told him about this at an integrative medicine hearing a couple of months back. We want to get NAL on parity in the digital age with National Library of Medicine. Med goes around the world, but if we can get library parity with NLM for NAL, we could revolutionize the whole USDA extension system. Everybody has a computer, which in the Internet age puts people right on the frontier of their own understanding and capacity. And we can do this through NAL, which a subset of which is the Alternative
Farming System. So thanks for being here, thanks for listening. God bless you.

DEPUTY SECRETARY MERRIGAN: Sure.

The National Ag Library is a great resource. And certainly in my last eight years as a Democrat in exile up in Massachusetts, as a college professor I relied upon it a great deal.

MR. HUTCHINSON: Tom Hutchinson with the Organic Trade Association. Living very near Beacon Field in beautiful Greenfield, Massachusetts, where all the trees are flowering at this very moment, and similarly, this idea of sustainability seems to be flowering. And it's very good to hear you taking on that role in USDA.

I think everyone here has the faith that organic would score high on any sustainability scorecard. To increase that confidence in our ecological production management system, it would help to have more fundamental research done on the energy use in
organic, the materials cycling issues, and such. And with the new reorganization of REE, I'm wondering whether or not there might be a generally broader redirection of research within USDA to deal with some of those issues from which organic would certainly benefit. And I think would benefit proportionally more than other systems of agriculture that are not used to thinking in those terms. This also has to do with the siloing question that Michael brought up, and I also appreciate that. This is really an opportunity to do a little bit more, and just wondering your thoughts about how a general shift in research.

One final point, I asked ERS, do you know how much agricultural product in the country is used for food, versus non-food uses? And there was not an easy answer to that. And as we move forward with more consideration of agricultural products as feedstock for our own civilization, the
sustainability question will be even greater.
So, basic research for sustainability I think
would proportionately benefit organic. Do you
see hope in that direction?

DEPUTY SECRETARY MERRIGAN: I
think Mark Lipson, who you probably all know
is one of my best friends, has done a really
great job watch-dogging, I mean, along with a
lot of you, but he's done a particularly great
job. It's taping me in some sort of crazy
way. I don't know what's going on there. But
he's done a really great job watch-dogging the
ag research side of the house, and trying to
point out opportunities for the Ag Research
Service, in particular, to move forward with
an organic agenda. And that network that OFRF
has developed of agricultural scientists and
extension agents score, to think about those
issues, I think has been really quite helpful.
I do think that there are going to be
increasing opportunities. This Farm Bill put
a lot of new emphasis on fruit and vegetables,
and I think that's an opportunity for organic. I always argue the sustainable system has a livestock component, too.

We have a confirmation hearing tomorrow, and one of the four people up for a job at USDA is our nominee to be Under Secretary for REE, Rod Shaw, who comes from the Gates Foundation. I think he's pretty exciting. I think he's going to be an innovator. And when I met him, I shook hands, and I said, "We're going to do a lot of creative things together." I think that's going to be true.

CHAIRMAN MOYER: Kathleen, if you have time for one more question, Board Member Bea James.

DEPUTY SECRETARY MERRIGAN: Two more questions.

CHAIRMAN MOYER: Okay. Bea James has a question.

MEMBER JAMES: Thank you so much for coming, and I just want to acknowledge
that you being here represents some of the change that we're all excited about.

I represent the retail sector, and I think one of the concerns that many retailers have is the potential funding and support for large agrifarms compared to some of the smaller family farms that a lot of retailers work directly with. And will the Department find ways to keep small family farms thriving, as we grow, and seek to feed the demand for organic?

DEPUTY SECRETARY MERRIGAN: Well, I guess it's just saying what you all know, is the census shows us quite dramatically, there's this upsurge of very small farm operations, a lot of them focus on alternative methods. A lot of them are women-led, which I think is kind of cool. And then, there's also a greater number of the larger scale operations, and it's that -- Frank Kirschman talks about all the time, that sort of started the ball rolling, the disappearing middle that
we're all concerned about. A lot of those are your small to moderate-size family farmers. How do we throw a lifeline out to them, whether they're organic, or following other production methods, I think is certainly something that Secretary Vilsack and I are talking about regularly. You know, I certainly -- again, to re-emphasize, the President, one of the very things he said about agriculture, and consistently said about agriculture on the campaign trail, was that he was very interested in revigorating local food systems. And we know the First Lady has a great interest in issues around healthy eating for children. She's very concerned about, as we all are, the obesity epidemic, and how it's affecting children.

I don't know if you've been to the White House garden yet, but it's in the most highly visible spot. You know, when you see the pictures of the White House, people are lined up against that fence, and you see the
fountain there? Okay. The People's Garden is right there where you can see it. And not only that, they have something we don't have, the First Lady's garden, they have something we don't have at USDA, is they have a beehive, pollinators right there, which I think is great. But they're enclosed a little bit -- because we've got a lot of kids running around the Mall -- and say, oh, that's cool. So, a little bit different.

But he really talked about local food systems, and so everyone is looking to me and they say, cool, Kathleen, what are you going to do? Whoa. That just is so structurally challenging to the system that we have in place. And if I want to do something that's more than cosmetic, what is it? I mean, one of the things I'm thinking about is slaughter capacity, because that's, to me, a real bottleneck in the system. But there are definitely others. And I'm really interested, if you want to write me a letter with your
best ideas about how I move forward in that
agenda, I'd certainly appreciate it.

PARTICIPANT: Very quick question.

With all the activity happening across the
USDA and other agencies as well -- RMA, FSA,
NRCS -- have you thought about having a
position within the USDA that coordinates --
someone who is the organic point person that
helps disseminate the information between
those energies, and helps coalesce that
information right there within the USDA,
between all the various agencies. Because,
sometimes, the NRCS doesn't always talk to the
FSA, and that sort of thing. So, have you
thought about that?

DEPUTY SECRETARY MERRIGAN: I've
thought about that, and it's certainly
something I advocated when I was on the
outside during the transition. I think to
some extent people think that's me at some
level, so I've got to make it such that -- I
mean, I know you guys would like a full-time
person doing that, and, certainly, I won't be
doi...g that full-time. But, actually, I have
a little bit of power, so it's not a bad
trade-off. So we'll see how things evolve.
You know, we'll see how things work over the
coming months.

MS. ROBINSON: I'm so happy to see
you there. Thank you, Kathleen.

DEPUTY SECRETARY MERRIGAN: All
right, guys. Have a good meeting.

(Applause.)

CHAIRMAN MOYER: At this time,
what we're going to do as a Board, because
there is a much needed break, we're going to
take a 15-minute break, and we will reconvene
at that point. Thank you for your kind
attention. That will be at about 10:20.

(Whereupon, the above-entitled
matter went off the record at 10:08 a.m. and
resumed at 10:22 a.m.)

CHAIR MOYER: Okay, if we could
quiet down in the back, we have a quorum of
the Board, and the Board is seated. We're ready to go back into session, and we're going to finish up with compliance, accreditation and certification committee work, starting with 100% label claim.

MEMBER HEINZE: Jeff.

CHAIR MOYER: Katrina.

MEMBER HEINZE: So I recognize that Joe and Tracy are not here, but I believe that they wanted to wrap up cosmetics real quick.

CHAIR MOYER: Joe is in the room now.

MEMBER HEINZE: So we may just have to go back to that.

CHAIR MOYER: Personal care?

MEMBER HEINZE: Yes, they wanted to wrap that up real quick.

CHAIR MOYER: Okay. Before we jump into 100 percent label claim, Joe, are we finished with personal body care standards? Or do you have something you need to wrap up
on that?

MEMBER SMILLIE: We are not finished, but we are ended for today.

CHAIR MOYER: Okay, thank you very much.

Julie, if you are prepared with 100 percent claim, we'll start on that.

THE 100 PERCENT LABEL CLAIM

SECRETARY WEISMAN: This is actually something that is also on the agenda at this spring meeting as a discussion document. And I think that we introduced this -- Joe, correct me if I'm wrong -- we introduced this initially last fall?

MEMBER SMILLIE: Yes.

SECRETARY WEISMAN: Or before that? Okay, it was last fall. And it was carried over from then --

MEMBER SMILLIE: It was last spring, actually?

SECRETARY WEISMAN: It was a year ago? Okay. So the issue came up because
certifiers were being required to make decisions that were costly to manufacturers regarding whether they can make a 100 percent claim on their retail labels based on the use of inert atmospheric gases, in other words gases that are part of our atmosphere anyway, in what was called modified atmospheric packaging.

And so what this -- what the recommendation document tries to do, or the discussion document, is lay out the history of why that was a practice that had been going on for some time. It was -- certifiers were required to change it following clarification at certifier trainings; that the program's interpretation, based on all their consultations, was that that voids a claim of 100 percent organic.

What -- and we were actually asked by the program then to clarify that -- to try and give some guidance and clarify that situation.
And so the -- I think the short story on this discussion as it's encapsulated in this document is that CAC reviewed the regulatory language in 7 CFR in OFPA. Also we went back to 21 CFR to look at -- and other parts of the FDA regulations to look at definitions of food additives, ingredients, packaging aids, various definitions. And we purposely made a document that was focused very narrowly on this issue of packaging aids. And we came to the conclusion that the use of modified atmosphere packaging was not an ingredient; was not a processing aid; and that it should not negate a claim of 100 percent.

We had some modest comment on this recommendation. I don't mean modest, I just mean in terms of numbers of comments, compared to other things, the volume of comments on other things that we are going to be talking about at this meeting. And really there were actually three comments that were specifically about the 100 percent claim, and then there
were some other discussions of this recommendation embedded in some of the multiple topics.

But two of the three people that specifically commented about the use of inert gases in 100 percent labeled retail products were food manufacturers -- I think one was an oil manufacturer and one was a coffee manufacturer -- and so they supported this recommendation.

We also had in comments given by some of the certifiers particularly, a more broad request and questioning of the idea that there should even be a 100 percent labeling category. And we agree that that query has merit, but that was not intended to be the scope of this document, and I'm not even sure if it could appropriately be the purview of solely the CAC.

I think that question would have to be taken up either by a different committee or a joint committee would have to be convened.
for that.

The other question that a lot of commenters have wanted to pull in and have requested that our deliberation on this subject include is a whole comprehensive look at all of food contact substance issues that take place post-harvest. That was certainly - and that is also not something that the CAC by itself would ever attempt to address.

So that being said we continue to present this to the rest of the board as a very narrowly focused document only on the topic of modified atmosphere packaging or inert gases in 100 percent labeled retail products.

MEMBER DeMURI: What about the use of these inert gases as overpressure? For instance nitrogen is used quite often in vessels in aseptic processing as overpressure to maintain sterility of those products.

Would you consider including that as part of this document, or would this just be for the
packaging part of it?

SECRETARY WEISMAN: I think we really were envisioning what goes in a final retail package, and what comes into contact with the food product that the consumer is going to eat. And we were really trying to make a line between -- you know, that there is a section that is post-harvest and pre-final packaging that we didn't really feel like it was -- I mean that is almost more of I think probably a handling issue.

MEMBER SMILLIE: Even though I see your point, Steve, it would have to be looked at as a processing aid, and the way we look at nitrogen in the packaging thing is, it's not a processing aid per FDA and CFRs, it's a packaging aid. So hence we believe it could carry the 100 percent, whereas if you are talking about it used in processing you would have to look at it as a processing aid, and hence it would remove that product from 100 percent claim.
SECRETARY WEISMAN: And I also want to remind everybody that this is not a voting item at this meeting. So whatever you want to have be discussed as part of a public discourse, I encourage people to ask their questions now, not that I want to prolong today's agenda.

MEMBER GIACOMINI: Just one quick thing. I was a bit -- when we were talking about the 100 percent document, I was not aware of what the document was actually about. So maybe next time when we continue on this, focus on the atmospheric gas side of it rather than the 100 percent claims, which has a whole other discussion area.

SECRETARY WEISMAN: Yes, and I would like to apologize, because there was a point where we did change the name of the document to inert atmospheric gases, and somehow it still lived on in the agenda as 100 percent, and I'm sorry that we didn't catch that.
MS. FRANCES: It's in the notice that way, when you approved the naming of this document at that time. I think you were still thinking it was going to be a recommendation.

CHAIR MOYER: Anything else, Mr. Chairman, for the compliance, accreditation and certification committee? Do you have anything else?

MEMBER SMILLIE: Nope, that's it.

CHAIR MOYER: Okay, thank you.

Before we move on to the next committee report, I want to mention that we are off schedule a little bit as you are all aware. We will do our best to work toward a slightly new agenda. We are off between 45 minutes to an hour. We are going to work towards that. We will make sure that we have time for public comment at the end of the day like we had planned.

However I did take the opportunity of working with Mark to set up a time for us as a board to meet with the deputy secretary
at 7:30. We have a time slot as a board to go
over there and meet with Kathleen. So
hopefully we will get done in time to do that,
and we certainly hope that the public will
allow us to get done. We need to get out of
here around 6:30 to take the Metro a few stops
down to meet with Kathleen. So that's where
we're at as a board.

Valerie, do you have a comment?

MS. FRANCES: And just to add a
note that pretty much everyone that signed up
for public comment this afternoon are
commenting on discussion documents. And
nothing is on the table for being voted on
with the exception of the two growers that
missed yesterday and want to speak a little
bit today on sulphurous acid. And those
really are the two. And I think one other
person wants to address some of the petition
materials, but it's not detailed in their sign
up what those are.

CHAIR MOYER: Thank you, Valerie,
that's a good point. And I should also point out that if you want to submit written comment the program has agreed to give you a few weeks to get something in to Valerie in writing if you don't get a chance or don't feel you got a chance to get all of your verbal comments out here today. And if you could just be considerate of the Board's need to get out of here by 6:30, we certainly do appreciate that.

Okay, moving on, Joint Crops and Compliance Accreditation and Certification Committee on Biodiversity.

I'm not sure, Tina, are you starting, or Joe?

MEMBER SMILLIE: Well, actually Tina and I are going to let the progenitor -- no, that's the wrong word -- but the person responsible for the document take the lead on this.

CHAIR MOYER: Thank you very much.

JOINT CROPS AND COMPLIANCE ACCREDITATION AND
CERTIFICATION COMMITTEE ON BIODIVERSITY

MEMBER FLAMM: That's almost as bad an introduction as I gave Valerie, Joe.

(Laughter)

But we did have a terrific introduction to this subject by our new deputy secretary, and it was wonderful to hear her endorse so strongly biodiversity conservation.

And she also -- I addressed issues that they faced during the writing of the regulations, and they are still around today; they still haven't been solved.

I also appreciated her comment on the perfect is the enemy of the good. And one of the commenters on the biodiversity paper made the exact same comment. A colleague of mine from Montana, Becky Weed, who has a predator-friendly farm, and in her supportive comments she concluded with the very same line.

The joint committee is presenting a recommendation for a guidance document, and
not any regulatory change. And I think the
terms recommendation and guidance has led to
some confusion among at least one commenter.
But I don't know if there is any question
among the Board about what this is about.
But in any case it's our guidance
document rather than any kind of
recommendation for regulation. So I hope that
is clear.

The -- I think this whole process
is evolutionary. It certainly goes way back
in organic thinking. But it is incorporated
in the regulations, and is incorporated in
much action by the Board over the years, going
back to 2001, and something I had missed, and
Jim Riddle had pointed out, action taken by
the Board at that time.

In 2000 -- but guidance statements
were made by the Board on biodiversity
conservation implementation, both in 2004,
2006.

So the objective of this
recommendation is really to implement what has been agreed to in the past. It really is not so much new policy, or you might say no new policy. It's just trying to get a framework for moving forward and getting everybody on the organic team from -- to share in the -- I would like to say the glory of implementing biodiversity conservation.

We are all so deeply involved in this subject, myself my whole life has been in natural resource management, biodiversity conservation, organic farming. My undergraduate in forestry, and a Ph.D. in biodiversity conservation is what my Ph.D. is in. So I've been really wrapped up in this. I have a lot of -- excuse me if I show too much passion for the subject, but it is something I personally care about deeply, and everybody in this room does. I think the comments we got all show that everybody recognizes both the need and the concern for it. We wouldn't even -- there wouldn't be
agriculture at all if it wasn't for biodiversity, and there wouldn't be -- we wouldn't even have life without biodiversity.

There is a tendency sometimes when we are talking about it for people to think about just the pretty little things that we all love, the pretty birds and so forth, being the biodiversity. But actually most biodiversity is every form of life. It's at three levels which is often neglected: ecosystem diversity; then species diversity which people mostly think of; and genetic diversity which is extremely important, and particularly important in agriculture.

But we also forget about what's below what -- what we don't see below ground. That is critical. In fact there is probably more, in numbers, there is more biodiversity at the microscopic level than there is at the macro level.

But anyway we can't have sustainable agriculture without maintaining
biodiversity, and I think everybody here knows that.

Just to repeat now what is said in the rule, that the use of conserve establishes that the producer must initiate practices, support biodiversity and avoid to the extent possible any activities which diminish it. That's in the regs.

Moving on, in implementing this there has been much work done by lots of different people. But I particularly want to give credit to great work that the Wild Farm Alliance has done in terms of their publication, and trying to provide farmers and certifiers tools to help move this along in a practical way.

In our -- in the recommendation however we view these things as tools, and not as iron clad -- they are not regulations that you have to follow. They are tools, and people can substitute their own tools.

I think just to piece -- you
remember a year ago is when in fact it was
Lynn Cody that made a fine presentation that
urged the -- asked the Board to revisit
biodiversity because she and the Wild Farm
Alliance felt that the program and us hadn't
followed up on it. And the Board at that time
directed the joint committee to look into it,
determine whether something needed to be done.

The joint committee determined
there was -- a discussion paper was sent out.
It was -- got about 60 comments, all of which
were supported with some good ideas. And to
the extent possible those comments were
included in the revised discussion paper.

Let me just summarize. The
guidance really approaches it in three ways I
think. To achieve the goals of improved
biodiversity conservation, number one, the
most important, is to increase education and
information. I think that is where the focus
needs to be, on learning by farmers,
inspectors and certifiers, and trying to get
uniformity in the inspection and certification process. I think that is real high on the list.

And then the second group includes biodiversity in the accreditation audits. And make sure this is addressed when certifying agencies are audited.

And then thirdly is the area of when we review materials, which can have, of course, an effect on the environment. We all looked at that. But more specifically to look at criteria, so that when we review the materials that we consider biodiversity. So those are sort of the three categories.

So in the -- I think if I counted right we received 53 comments on the recommendation that is before you now. I think it's fair to say that there was -- everybody supports conserving biodiversity. Many of the commenters supported the recommendation that was presented, as presented.
As you heard yesterday one concern that was initially expressed by -- I have this, CAC, Certified -- give me the right initials, Joe - ACA, I knew I had it out of order, thank you. That's the reason I had that glossary of acronyms. (Laughter) I should have it in front of me right now.

They supported all the recommendations that are in there. But in their -- they were the ones that raised the confusion about guidance and recommendation.

But also the terminology that -- the term, natural resources, was a more familiar term to farmers than biodiversity. And they actually urged a de-emphasis of the use of that term.

And you heard yesterday that the California certification agency supported that part, while strongly supporting biodiversity conservation. All of them did not -- but that was one issue.

The other was, there was some, at least one commenter commented on the criteria
1 checklist. And that was something that we
2 kicked around quite a bit in the committee on
3 how to best incorporate biodiversity and what
4 language to use in the criteria checklist.
5 Some probably thought it was too general and
6 others I know we had some who thought it was
7 not general enough.
8 But as it stands now biodiversity
9 is inserted in the criteria in a couple of
10 places about the same way as the environment.
11 So it takes a lot of judgment by whoever is
12 reviewing it. It's not a cookie-cutter kind
13 of thing. It takes as almost all the criteria
14 review does.
15 So that essentially you have --
16 leave the recommendations up there now.
17 That's recommendation one on the materials
18 review portion, and it shows in the section
19 you can see there, and biodiversity. And it
20 was in several other places. The comments at
21 the committee level caused some of them to be
22 changed and deleted.
Then go I think the next place it's at is on the third sheet. Let's see, is it compatible with organic production? And it's included there, very general.

The second part is to develop implementation, the organic systems plan. Again each certifier and grower and producer, they are given a -- each given a role. You see that up there. I don't know if I should take the time to read that, the highlights. I think one of the things that was added that came out of the reviews and discussion was the issue of conversion of, virgin land you might say, to organic production, rather than going from farmland and transitioning from farmland to organic production.

And the language that was added was conversion of native habitat to crop production has consequences for biodiversity that must be considered, and producers should discuss such planned conversion with his or
her certifier before action is taken. This is going to take a lot of judgment, and it is kind of -- certainly a difficult issue but a very important one, and we didn't want that overlooked.

Inspectors, a lot of the emphasis here is on training. And in -- with the certifiers, it's having the certifiers look to see what kind of progress farmers, producers, are making. Are they thinking about and including -- and each place is going to be different. And I have to say, there are several different templates or plans out there. But I think the work that people at ATTRA and the Wild Farm Alliance, they've got good guidelines that really help to think about it when you are out there.

Then finally the NOP looks at biodiversity when they do their audits.

I think I'll take questions now, Mr. Chairman.

CHAIR MOYER: Why don't you do
it?

MEMBER FLAMM: Or I guess -- I can do it. Yes, Katrina.

MEMBER HEINZE: You mentioned several times, and so I'm glad to hear it, the need for judgment that is created by your recommendation. And to be honest I'm really concerned about that. As an industry we don't have a great track record of consistency in our judgment. And just like every other commenter, obviously we support -- I support biodiversity and the goals. And I get that we don't want the perfect to be the enemy of the good. And so I'm struggling with that.

But as I look -- and actually I'll start with your recommendation about converting native habitat to cropland. Later on you talk about certifiers, and I'll find the language, you talk about certifiers should document the degree to which producers are addressing this, and only severe violations would lead to suspension or revocation.
So where is the guidance that would help the certifier decide that converting native -- you know, natural habitat to cropland is not or is a severe violation? So I worry about the details. And I'm wondering how you envision providing that guidance and ensuring consistency. I see it as well in the material criteria where you talk about -- how does it affect biodiversity? I think is the question you provide. Is the substance harmful to biodiversity? So if you look at a literal and strict interpretation, you could imagine eliminating a lot of material that folks are using today, vinegar and soap-based natural herbicides. They reduce plant biodiversity. They are plants we don't want there. And clearly we're going to use those materials. But who is to say that some certifier isn't later going to decide that that is not harmful to biodiversity? So we totally get that we want to
increase biodiversity, but it's that consistency of judgment that I think is a very hard to encourage, and like I said we don't have a good track record.

So I'm wondering how you would envision getting to that consistency on something where judgment is incredibly difficult and very gray.

MEMBER FLAMM: Jeff, would you like to say something before I respond?

CHAIR MOYER: Yes, I just wanted to address Katrina's comment a little bit about materials. Materials is just one piece of what would be looked at under this guidance. And certainly if you are going to use one of the materials that you mentioned, what are you doing to mitigate that problem or to enhance biodiversity in some other aspect of your operation.

So it just brings in this whole context of biodiversity. And yes, it's a little bit tricky to say it's a judgment call,
1 because in some cases it will be. But at
2 least it puts it on the plate and on the audit
3 trail of the program. So when they are
4 looking at ACAs, and when ACAs present their
5 thing, they say, look, nobody that you are
6 certifying is doing anything to enhance
7 biodiversity. Everything that someone else is
8 doing is doing that. You are going to get
9 dinged on your accreditation. You know it
10 just pushes it downhill. So it puts it in the
11 forefront for everybody. It's going to be
12 almost impossible because of the depth and
13 breadth of the nation. We talked about
14 natural resources. That's a piece of it. But
15 the biodiversity that can live within those
16 natural resources is just phenomenal. It'd be
17 impossible I think to write a standard that
18 was really really homed in and said you must
19 do this, you must do that.
20 MEMBER HEINZE: I do get that
21 piece. The question is are there things that
22 we need to do? Should this recommendation or
recommended guidance get approved by the Board? Are there things we need to do after that to help with the judgment piece? To help, you know, I'm looking at some -- I've got definition materials staring me in the forehead. Five years from now are we going to be staring at biodiversity and having certifiers up here saying, well, this certifier gave me a severe violation because I converted natural habitat or whatever it's called, and this certifier did this.

And you know, I just worry about the Pandora's Box. So are there things we can do to try to improve the consistency of a naturally hard topic?

CHAIR MOYER: I think Joe wanted to address that.

MEMBER SMILLIE: Yes, I certainly don't speak for all certifiers, but since I'm in the seat representing certifiers, I will be forced to.

I would say that the way it is
going to evolve, and I would look to that -- as you have carefully noted, Katrina, applying hard and fast rules are going to be very very difficult, and I don't think we want to. I think what Barry is talking, it puts it on the table for discussion. And the ACAs will be discussing it. There will be inconsistencies in the interpretation, and that, I won't say it's a good thing, but it's a natural thing. And certain people will take leadership. And the NOP will be sitting back auditing these things saying, well, these guys approached it this way and these guys this way.

So I see it as a slow continuous evolution to best management practices. And as different people step up and create their interpretation, others will be challenged to not have the same interpretation.

So I think in five years, absolutely. As Kathleen said among her many other great statements, there is no end in sight.
So it will be an evolution of best practices and interpretations. And the NOP won't, I don't think, will be drawing hard and fast auditing rules. They will be watching to see the performance of the ACAs, and leadership will be exercised by different people at different times. And we'll just grow that experience.

MEMBER FLAMM: Let me make a comment before I call on Dan. But I'd like to point out that, again, that this is, as far as materials, is just trying to implement a decision that was already made by the Board. So this is not a new decision.

Now it doesn't mean we couldn't revisit that decision. But this is not something new. It just hadn't been implemented by any kind of -- it's actually in the policy manual right now, and the decision was made. It was just never -- the step of adding to the checklist so we could think about it.
And I don't think -- when we say, is a substance harmful to the environment. Boy, that takes a lot of thinking by the committee. When you are going around and I think adding biodiversity, of course biodiversity is part of the environment, but it just tries to highlight, let's think about this a little more closely than perhaps we have in the past. So that's the way I look at it.

Dan, you have a comment.

MEMBER GIACOMINI: Yes, I thought, when I first read the document, I thought it was terrific. And then as I was putting together my material presentation, most of the things that you talk about are already in our criteria list of the things -- of looking at that.

But the -- I think toward a rephrasing the concern that I think I hear coming from Katrina is a concern that I got from reading some of the public comments, is
an interest by a lot of the comments to take 
this from a tool and a piece of the puzzle to 
it being the primary factor.
And it's part of that evolution, 
and we will just have to see where it goes. 
I think we are making a great start, but you 
know, I under -- and I recognize it's an 
extremely underappreciated and under-
emphasized part of it even though it's been 
there all the time.

But it's becoming the primary 
factor is down the road, it makes me nervous. 

MEMBER HEINZE: One more 
question. I'm sorry, I'm still struggling 
with this one. Are there specific practices 
that are happening today that are of concern 
and that we are trying to prevent with this 
recommendation? Maybe folks on the Board 
could help me understand that better? 

MEMBER FLAMM: Well, I can say 
yes, but I'm not going to go into specifics. 

But there certainly are. I don't know if
there are any other -- would you like to?

MEMBER SMILLIE: Sure. One of our adversaries whose name I will not mention continually points out that organic isn't sustainable because it gobbles up jungle or CRP land because it hasn't been treated with a prohibited substance for three years conveniently qualify for organic.

So you clear the land -- bingo, you've got an organic crop coming right off it. Whereas if you had farmed land it takes three years. So there is a financial motivation to clear land.

That's a simple example. There are more complicated and tricky examples. And you get into crop rotation. There you get into an argument that Barry is very fond of, if we ain't got the water we can't have a rotation argument. So there is no biodiversity on large Western wheat farms because they haven't got enough rainfall for cover crops. And you get that argument.
You get into, well, do we really enforce rotations argument. There's a lot of biodiversity that extends into those areas, and those are really gray area calls for a certifier. It's really tough to make those calls. Because technically when you are clearing jungle land to grow soybeans in Brazil -- I shouldn't pick on any one country, it can apply to any country. Is that increasing biodiversity? It'd be pretty hard to answer yes.

CHAIR MOYER: Barry, I believe Barbara from the program had a comment she wanted to make.

MS. ROBINSON: I just think that when you start to talk about noncompliances or how you are going to use this, I guess the program, you're probably going to be looking at this, first of all, we'd want to see certifying agents build this into OSPs, of course. That's where you really want to -- that would be the first place you'd want to
see this being used.

And we tend to look at these things certainly from the lens of what would hold up in an enforcement action. And you can easily see where certifying agents start getting nervous, because they think, oh sure, we issue a noncompliance because somebody had what we think is an egregious violation. They weren't -- we didn't think it was very biodiverse here.

And we can see where down the road, oh boy, that is not going to hold up on appeal. There is nothing specific in the regulation to support this.

Well, I guess that's not what we'd really want to see. What we'd want to see is a robust organic systems plan approved from the beginning that reflects biodiversity. And I think that's really where you are trying to go here, and that's what makes more sense. That's where you'd want this to evolve.

And I think that would address
Katrina's issues, and that would certainly address our issues.

And Joe is right, things like -- we've gotten this question. We got this question during the farm bill. Can land come right out of the CRP and be eligible for certification. We thought that was kind of -- we really had to sit back in our chairs and say, well, gosh, if it was such fragile land to go into the CRP, do we want that land to go into organic production? That seemed kind of an odd question to us to ponder. We are not soil experts, just on the face of it it seemed kind of strange to us. Same with fragile wetlands and that sort of thing. If you've got to put that land into a designated program because of its fragility somehow, we would expect a certifying agent to really give some pause as to why would that land come into organic production? How is it going to be handled, those sorts of things, and be reflected in the OSP. That's where you'd see
these measures.

And so then that would give a certifying agent or a producer much firmer ground, pardon the pun, on which to stand for taking action down the road then. Because you would have the commitment for the biodiversity. If you see where I'm going.

CHAIR MOYER: Barry, and I think to Katrina's question, and I agree 100 percent with what Barbara just said. It allows this document and this checklist kind of process will allow ACAs to initiate the conversation and the discussion with farmers when they are filling out their plan or updating their system plan.

I gave a talk on biodiversity this past winter, and I asked farmers in the room, and some were organic and some were not, what they did to enhance biodiversity. And one farmer said, well, I don't shoot deer out of season.

If that is the answer the ACA
gets, you know biodiversity isn't on the forefront of their mind, and you might want to encourage them to start looking at ways of managing habitat to increase biodiversity.

So I think that is what we are trying to do. And I think you start with those big problems and those egregious errors in judgment and work your way toward something much more concrete.

But I think this just gives -- is a tool to give people the opportunity to do that.

And I would also suggest that in contrary or deference to the comment we heard yesterday about using natural resources as opposed to biodiversity because farmers are more used to that word, I think farmers will become used to the word, biodiversity, when we use it. And I think they are two totally different things. Natural resources is more like the structure that houses the biodiversity, and biodiversity can live or
flourish within that structure. But water
doesn't necessarily disappear if you take out
the biodiversity. So I think they are two
separate words that are connected and joined,
but we should keep them.

MS. ROBINSON: Thank you for that
comment. Tina has a comment.

MEMBER ELLOR: Another area where
this has come to the forefront is -- has to do
with food safety and food safety issues that
lots of biodiversity applications are being
wiped out by the concern that you can't have
any wildlife on your farm because it's going
to poop on something. So that is another area
where this has come up quite a bit recently.

MEMBER JAMES: Barry, I was just
curious why biodiversity wasn't included in
the terms defined.

MEMBER FLAMM: I'm sorry, would
you repeat that?

MEMBER JAMES: I don't know what
that is. There's a mouse in the house.
You have recommended terms defined, and I was curious why biodiversity itself was not included in the terms defined that you are proposing.

MEMBER FLAMM: The terms defined are those right out of the regulation to show what's in the regulation. And biodiversity along with other terms were not specifically defined in the regulations. So it's covered under the organic system plan, and it's discussed in the preamble and elsewhere. Pieces of biodiversity is included in other definitions. But there is no specific definition for biodiversity that's in the reg. And that listing just showed -- was an example of that, and that's the reason it's not in there.

And since there was a decision early on to not go in -- decision not to go for regulatory change we felt that that wasn't really necessary. So it isn't in there. It isn't in the recommendation for that reason.
This was just a background, what you are reading is in the background of what was in the regulation. I'm sorry if that wasn't clear.

MEMBER JAMES: Right. I guess my question still stands, as to whether or not you would consider adding that to terms defined. If we are asking inspectors to look at biodiversity to be clear, or maybe it's too broad of a topic to be able to put into terms defined, I don't know.

MEMBER FLAMM: Well, like I say, since we are not going for regulatory change, and that would be a regulatory change to add that to the regulation -- that's the reason it's not in the recommendation. I guess I'm not explaining it correctly.

CHAIR MOYER: I think maybe I can clarify it. What Barry did was, he took the definitions out of the front of this book, and there is none for biodiversity. And in order to create one you have to go through...
regulatory change, and that is a long
cumbersome process, and we chose as a group to
not do that, and not write a hard and fast
rule on what biodiversity was, but define it
in terms of those check sheets, and let each
farmer define it themselves.

MEMBER FLAMM: But the discussion
document gives kind of a definition right up
front of what we're talking about in terms of
biodiversity, but that is not part of the
regulation, and it's not part of the
recommendation to do that.

CHAIR MOYER: If the board, okay,
I was just going to mention that we are
running further and further behind time.
There is a comment from Wild Farm Alliance,
does the Board want to entertain that comment,
Barry? You have the floor.

MEMBER FLAMM: Yes, I would like
to entertain the Wild Farm Alliance's comment.

CHAIR MOYER: Please be very
brief with your comment.
MS. BAUMGARTNER: Joann Baumgartner, Wild Farm Alliance.

Natural resources is defined in the rule. So it says you must maintain or improve the natural resources including soil, water, wetlands, woodland and wildlife. And as Jeff said, biodiversity falls within that. So there is really distinct guidance on that.

CHAIR MOYER: Thank you, Joann. Okay, is there any other conversation or discussion on this item for Barry? Kevin.

MEMBER ENGELBERT: Just very briefly for Katrina's sake, I don't ever see this becoming a huge problem, simply because farming organically promotes biodiversity, the lack of chemicals, pesticides, herbicides. Every organic farmer you can speak to will tell you they've seen an increase in biodiversity simply by becoming organic.

MEMBER FLAMM: Part of what I'm struggling with is exactly that statement,
that just the nature of being organic
increases biodiversity. So why then this
recommendation, which led to my question of,
are there more specific things we are trying
to prevent. And then should a recommendation
more specifically target those.

    I do appreciate the robust
discussion on this topic. Maybe I'm the only
one struggling, in which case maybe we don't
need quite so much robust discussion.

    CHAIR MOYER:   Well, I think the
discussion is warranted. But I disagree with
Kevin's comment, that I've been on many
organic farms that do not encourage or enhance
biodiversity. They are simply large
monoculture farms that use a one-to-one
substitution.

    You may argue that they are not
truly organic farms, but they just use a one-to-one substitution of an approved product for
a non-approved product, and they go ahead and
they monoculture raspberries or whatever they
might be doing, I don't want to pick on any one particular crop, and it isn't like your farm or mine. So I don't think you can necessarily make that -- and what is what we are trying to correct with this guidance document to say, what are those individual operations doing to begin to encourage and increase biodiversity on farms.

MEMBER ENGELBERT: I'd defer to your experience in traveling and seeing different farms. I was basically speaking from our own -- my own little corner of the world, northeast, and what I've seen on local farms in my area, and just the geographic, the way things lay with the hills, the mountains, the streams, the woodland, it's always going to be part of our terrain. And watching flocks of migrating birds fly over conventional fields and congregate on mine year after year after year because they have learned there's higher quality feed on those fields to glean and safer feed than there is
on the neighboring operations.

MEMBER FLAMM: If I could close

with one -- repeating a statement made earlier
by our new deputy secretary, let's don't make
the perfect the enemy of the good.

CHAIR MOYER: Thank you, Barry,

for a good presentation.

Now we are going to move on to the
crops committee, Tina Ellor, chairperson.

Tina, the floor is yours.

CROPS COMMITTEE

MEMBER ELLOR: Thank you.

First, I'd like to thank the Crops
Committee officially for all the work we put
into the few substances that we have up here.

I'm new as chairman, and Gerry has been
mentoring me through, and a lot of these
things came on board before I was chair, and
coincidentally Gerry did most of the lead work
on isoparaffinic hydrocarbon, sulfurous acid,
paracetic acid, and also the soil systems.

Kevin took point on ferric phosphate, and Rigo
took point on hydrogen chloride. The list for inerts we've all been working on.

So I'd like to say right up front that we've had some challenges with the technical reviews. But on the committee we have a great deal of expertise, and we are trying to work through those deficiencies, what we consider deficiencies in the technical reviews. And we have gone -- certainly we always go outside the TAP for information, technical review, for information and the TAP for information when we had them.

So we have done our best to remedy those deficiencies, and we are working with Dan Opie and Science and Tech in getting more of what we need. But it's been a tremendous challenge working on materials with these technical reviews.

That being said I think they did a very thorough job, which I'm sure will come out in the discussion.

So I'm going to hand it over to
Gerry to go through the recommendations and highlight some of the points of discussion we had. And we'll kind of tag team back and forth talking about the public comments we've gotten on these things and some of the discussion that has gone on since then.

Take it away, Gerry.

MEMBER DAVIS: Thank you, Tina.

The first material is tissue material, isoparrafainic hydrocarbon. The petition is for inclusion of isoparrafainc hydrocarbon under synthetic substances allowed for use in organic crop production. It's an inert extractant used for the extraction of pyrethrins for insect control.

And we looked at it as a committee and voted unanimously that of the three evaluation criteria that it failed all three. And we wanted to highlight a few of the points about the material and for those that didn't read everything.

Isoparrafainic hydrocarbon, also
known in the industry as an Exxon Mobil product called isopar M, it's very common solvent. It's a petroleum distillate. It's a carbon chain in the range of 12 to 16 carbons, mostly C14 I think. And it is used to extract the pyrethrin from the African daisy raw material. Concentration of the pyrethrin extract as produced in Africa I believe is standardized at 20 percent pyrethrin and 80 percent isopar M. And that's the way the petitioner and manufacturer of the finished product receives it I believe in this country. And then they reformulate it into a pesticide product which contains .5 percent pyrethrin, along with diatomaceous earth. The maximum use rate of the material is six pounds per acre, and as a licensed pest control advisory in the state of California, I'm very familiar with the material itself, the formulated material. And six pounds per acre is the typical use rate to
get it to function as a -- for insect control.

At this rate a producer would be applying, when you figure out the fraction of .5 percent pyrethrin versus the solvent carrier that it was extracted with, at that six pound application rate of the formulated product, you would be applying, a grower would be applying, 1.92 ounces of isopar M to the certified organic crop.

Multiple applications are common with these pyrethrin materials as they are most typically used for difficult to control insects such as many beetle species.

The crops committee, we discussed this at length, and we did not consider this fact of almost two pounds of petroleum distillate per acre per application to be an acceptable practice in the organic marketing program.

We discussed that consumer confidence and support for the organic system and marketing order is very important, and I
don't think if it was common knowledge -- we
didn't think, that is -- that if it was common
knowledge that two ounces per acre petroleum
distillate solvent applications to come,
organic crops, edible crops, was a good idea.
So that is the foundation of, I
think, why we rejected it. Why we recommend
rejecting it.
Some of the other points is that
there are other pyrethrin formulations on the
market that are extracted with different
materials. That information of precisely what
materials they use for their extraction was
not available to us because it's proprietary
information and no one would tell us.
Alternative possible extraction
methods also exist using supercritical methods
using high pressure carbon dioxide, liquid
carbon dioxide, to extract the material.
But we were unable to determine if
those were actually used in the industry or
are they just a possible way of formulating
pyrethrins or extracting pyrethrins.

With that I'd like to open it up to any questions? Yes.

MEMBER ELLOR: I just wanted to comment that we do try to read all the public comments, and we had one comment saying that - it was from the manufacturer, with a lot of reasons why they thought we should delay the decision on this or reasons that it should be listed. We didn't have any comments supporting listing it besides that, but we had many comments supporting our decision not to list it.

And there was some great work done on this petition by the whole committee.

MEMBER DAVIS: Seeing no other questions I'll move on to the next material, which would be sulfurous acid.

Bear with me just a moment.

(Pause)

The petition is to include sulfurous acid in the national list at 205601
J, which is the listing for elemental sulfur at this point I believe.

The committee voted unanimously that the material satisfied all the evaluation criteria, criteria one, two, and three, as long as it could be annotated as follows, that the proposed annotation would be on farm generation of the substance using 99 percent purity elemental sulfur per Section 205601(j)(2) only.

The on-farm generation of the substance acknowledges that the material is, under current technology at least, is very transient, and has a -- when produced the acid itself has a half-life measured in hours, so it can't be produced off site and shipped to the farm.

The 99 percent purity portion of that annotation was because that purity of sulfur is readily available in the marketplace from multiple supplies, and it was intended to optimize the on-farm production of the acid.
with the smallest possible environmental impact from the burning of sulfur which produces sulfur dioxide which is injected into the irrigation stream which produces sulfurous acid.

Sulfur dioxide is the compound present in the natural environment that gets into water and the atmosphere producing sulfurous acid and the net effect of pH 5.2 to 5.5 rainwater as the petitioner presented yesterday.

Unfortunately you were not able to get through your entire presentation, so I'm going to try to fill in a few holes for the benefit of the audience and the rest of the Board.

We wanted to respond to some of the public comments, the written comments submitted. First one was a common point that was made by a couple of commenters was that there was no TAP or technical report used for this recommendation. And that is not entirely
correct. The crops committee was anticipating the arrival of the technical report leading up to our deliberations. At the time at the very latest date that we could get this recommendation done prior to posting it had still not arrived.

We had agreed as a committee to -- we were anticipating the technical report to arrive before this meeting, which it did. So we committed to present any new information that was in the technical report as part of our presentation today to account for not having the technical report on hand when we voted.

We did not -- when it did arrive and we analyzed it we did not see new information that we did not go over; so there was nothing to present from that technical report that we did not present in the recommendation, in the evaluation criteria forms.

We made the decision to go ahead
and vote on it before the technical report arrived because we had lots of information on this fairly simple and straightforward material. We had available to us a reasonably thorough and complete petition, a very large and informative U.S. Geological Survey document on sulfur, the base material; and lots of sources for the historical use of the material from when it was an approved input on certification systems such as what CCOF had in California prior to the national rule.

Another comment that was received was concerning the source of the elemental sulfur, and if you could refer to category two, question two, Valerie, would answer some of that comment.

The comment was, when the elemental sulfur on the market comes from petroleum or natural gas, so why do we want to approve this usage.

The substance can be produced from burning naturally occurring mine sulfur, which
is the subject of question two in the evaluation criteria. Is the substance formulated or manufactured by a process that chemically changes a substance from a mineral, naturally occurring mineral source.

Unfortunately, and that was one of the main things we got from the U.S. Geological Survey document was that due to air pollution abatement laws in the 1970s that required oil and natural gas producers to scrub the elemental sulfur out of the oil and gas it put all of the natural elemental sulfur mines out of business because it was far cheaper material than what they could produce by mining, and that was well documented in that report.

So and I think the petition also pointed out that when natural gas and oil disappear, and are no longer in commonplace usage, that the elemental sulfur mines are still there to be reopened and used once again. And in fact I contacted one sulfur
producer in the Gulf states, and I asked him that question about when they shut down their mines and so forth, and the answer I got was that with the high price of oil and gas last year, the price of elemental sulfur to the farm went very high as well. And they actually looked at reopening their mines briefly because the price of sulfur was high enough that they could justify it.

But now things have changed, and the price has gone down to a more normal level, and that's not going to happen anytime soon, so the oil and gas are gone at least. So all elemental sulfur for use as a soil applied elemental sulfur, it comes from petroleum and natural gas, and that's all we have to work with.

So that leads into the last public comment of, well, we have alternate methods here. Why don't we just apply elemental sulfur to the soil? And I wanted to refer to category two, question nine, for that. Is
there an alternative substance? Yes, there are. Soil application of elemental sulfur is possible, and it is used routinely in the Western United States by organic growers to lower the pH of their soil and deal with their high pH irrigation waters. The problem with that is, it's not as desirable as using the sulfurous acid, as with the sulfurous acid you can control, put on a very little bit at a time to basically match your irrigation water with natural rainwater without putting large amounts of elemental sulfur on the soil, which does have impacts on microbial soil life at the rates that you have to spread it and broadcast it on the field to accomplish the desired effect.

So this material would actually soften the blow to the microbiological life in the soil, being that it can be controlled and be applied incrementally at levels that are not as hazardous to that microbial life.

The other natural materials or
alternative substances would be citric acid, which is commonly used now. I think one of the commenters yesterday mentioned using it in blueberries. And it is a very weak acid and requires huge quantities of it. And we analyzed that at the committee level, and I submitted information from the farm that I work for with our high pH irrigation waters that, to amend our well water to rainwater levels, would require -- at the amount of water we apply for a blueberry crop -- would use about 6,700 pounds of citric acid per acre per year. So it is a huge quantity of a very weak acid you have to apply to accomplish the same thing, versus a very small amount of this elemental-sulfur derived sulfurous acid.

So hopefully that gives you -- the commenters -- a broad picture, and the commenters and the Board a broad picture of how thoroughly we went over this and hashed it all about, and didn't just very quickly decide to vote to recommend approval of this
material.

Next would be questions on that.

Steve.

MEMBER DeMURY: Gerry, the use of citric, are there other problems with that besides -- assuming the cost is much higher because you would have to use so much. But are there application issues? Are there other issues that would keep you from using citric over this new substance?

MEMBER DAVIS: Citric acid is always being questioned on whether it is truly natural or not, in the way it is produced. That is one question we analyzed and tried to get some information on that. We didn't get the full answer from the technical report that we asked for on that, on the way that citric acid is made, and the sources of it, where it's coming from. We were told that in general it comes mostly from China because their manufacturing costs are cheaper and they ship it here. So oversight of the production
of it is maybe a little limited. We are concerned about that.

That huge quantity -- 6,000 pounds or more of citric acid -- is well beyond the profit potential of a blueberry crop. You could spend that money and not make any money on the crop, if you were trying to do that.

Seeing no other questions, I guess we'll more on to peracetic acid. The petition was requesting to remove the annotations from the listings for peracetic acid, which currently on the list, 205601(a)(6), 205601(I)(7).

And based on that request to remove the annotations -- which would essentially place no restriction on peracetic acid use in organic farming -- the committee voted unanimously that, based on that criteria that it does not fit, did not satisfy any of the evaluation criteria of impact on humans, environment, is it essential, or is it compatible and consistent with organic and
We acknowledge that we did not want to see the Board reject the material entirely, the petition, because peracetic acid is a component of hydrogen peroxide formulations that are currently widely used in organic production and very important to a lot of people, a lot of farmers. So we did not want to throw that material, that related material and usage, into jeopardy by throwing out the material completely. The main reason that we did not want to remove the annotation to allow expanded use of the material was that -- I mentioned this yesterday -- we were concerned that although the labels on the market today for hydrogen peroxide peracetic acid formulations, they are what they are right now. But if we just gave a blanket approval of the material, it would allow any formulators or producers of the material to -- depending on EPA registrations and so forth -- come up with very strong peracetic acid
formulations that could conceivably be used as
soil biocides -- watered into the soil --
which would have dramatic effects on organic
sustainability and the whole concept of
ecological farming and the biodiversity of
microbial and other life in the soil.

So we just didn't want to open the
barn door and say, yes, do what you are going
to do someday. Right now it may not have been
a problem, but we could very easily see that
it would one day lead to very expanded and
high usage of peracetic acid in a soil
drenched type of application. I hope I'm
explaining this correctly.

So we proposed a separate
recommendation, and that's up there. I don't
think I can read it from here. So based on a
different annotation, an annotation change
from the current, we voted as a committee,
also unanimously, that it changed whether the
valuation criteria were satisfied. We felt
that it changed the impact on humans and
environment, and it also changed the essential 
unavailability criteria.

So I think the comments contained 
there in Section B I already pretty much 
explained in my discourse a minute or two ago.
We did not want to jeopardize the currently 
available hydrogen peroxide formulations that 
rely on that small amount of peracetic acid 
being there to be effective. So we 
recommended that we limit it to no more than 
two percent concentration, which was based on 
the most common and invasive hydrogen peroxide 
formulation that is on the market right now, 
so as not to jeopardize that type of product 
that is currently used a lot.

Any questions? Jeff.

CHAIR MOYER: More a comment than 
a question. What essentially we were trying 
to do as a committee was keep the status quo, 
which by default we had to make this change 
because they changed the way this material 
needs to be listed -- it no longer can be
listed as an inert; it's an active ingredient.

So we have to make some change, we can't just not do something.

MEMBER DAVIS: Yes, I neglected to say that the EPA has changed its regulation, which has forced the hydrogen peroxide formulators to declare peracetic acid as an active ingredient rather than an inert. So that is the big change, and that is what prompted the petition. And we wanted to respect that and try to keep those products that many growers we are told rely on on the marketplace so they could still use them.

We posted these as discussion items rather than for vote, because we are really seeking more public comment and information on the use of these materials, and also on -- there is a stabilizer that has to be in these formulations, that was mentioned yesterday in the public comment. It's called HEDP. It's a phosphate-containing stabilizer that regulates the balance between hydrogen
peroxide and peracetic acid in these formulations, because it is a two way reaction when you mix hydrogen peroxide with acetic acid which forms the peracetic acid.

We were not able to find what we felt was good information on the HEDP as far as its environmental impact and what it's all about. So we didn't feel comfortable voting on it this time around. We wanted to get more information on the HEDP, as well as input from the organic community on the use of these materials, and importance of them to organic growers.

Any other questions?

I turn it back.

MEMBER ELLOR: Thanks Gerry for your yeoman services. We do spend, and everyone on the Board, I don't even need to say this, a tremendous amount of time reviewing these materials, and it's been a real challenge.

The next thing on our list, and
Kevin and I were just talking about this a little bit, was the sunset 2011. And I won't say too much about that, except to say that we've been following the public comments on ferric phosphate and hydrogen chloride, and like I said Kevin is taking point on ferric phosphate. We've had some discussion in committee on that. And Rigo is taking point on hydrogen chloride, and we have also been discussion that a little bit. We haven't done any formal documents on them yet, but so far all the public comments that we have received have been in favor of keeping those on the list. So I don't think I need to say anything more about that. Does anybody want to add anything to that or have any questions about it?

And then, also a discussion document, I have to turn it back to Gerry, because he has been the main author on the soil list systems document. And that is just a discussion document, so we probably don't
have to spend too much time on it. We have
gotten some comments, but that is just a
discussion document.

So in terms of time spent maybe we
can just have a brief talk on that, and list
four, inerts, and pesticides, once again
that's something we received a lot of public
comment, and we are going to be taking that
back into committee and working very hard on
coming up with more on that.

So back to you, Gerry.

MEMBER DAVIS: On the soilless
growing system, this was an old crops
committee agenda item that had been passed on
and passed on, and shoved to the back burner
for a number of years, and we have been
attempting to work this through and get things
voted on and presented.

One central theme that has come up
that we wanted to address at this meeting by
putting it in a discussion item so it would
hopefully prompt public comment, was the idea
that for typically greenhouse growing systems, that hydroponics and aeroponics, variations of those production methods, should not be considered compliant with organic farming regulations, because of the lack of soil. These methods of growing crops is either roots in an inert base substrate, that is not a soil; it could be rock wool or something. Just a place for the plants to attach their roots. Or suspending them in water itself, and let the roots dangle in water. Aeroponics would be roots suspended in air, just mist it with water under plastic covers. So those right now there is a gray area in our rules. It's not specifically mentioned if that is okay or not. So there is beginning to be some emergence of those types of production methods, attempting at least to be certified as organic.

We were unable to determine if there really are any actual operations certified in this country, but it is coming
closer certainly. And so it's time to deal with that issue.

And so we presented this document. It talks about why that -- those methods would not be considered organic, but it also presents the idea for containerized growing of terrestrial crops in, most typically, greenhouses where there is a compostable substrate base of natural materials where all the normal microbial life and soil in vertebrates and beneficial nematodes and on and on, fungi, if it's a type of media where all those can grow and subsist like regular organic farm soils in the field, then it should have the potential at least to be considered as a soil because of the nature of the ecology that grows there, not because it's dirt, but that's what's the same as out of doors farm soil out in the field, and containerized greenhouse media, if they both generate the same soil ecology, we wanted to present the idea for comment of considering
those situations soil. How would you certify
that? How would you -- what would the organic
system plan and all that for that type of
ting, it would need to be developed and
presented hopefully this fall as part of an
update on the NOSB greenhouse standards, which
initially were voted on and approved by the
Board in 2001. They were never adopted or put
into regulation. And there is some interest
now in reviving them and getting some U.S.
greenhouse standards.

We are lagging a bit behind. The
Canadians have their own, and they were
questioning the program on why we don't have
our standards. And I guess, Barb, if you want
to make a comment on that.

MS. ROBINSON: When we met with
Canada in March as a matter of fact they did
ask us whether we had hydroponic standards,
whether we recognized hydroponics. I did speak
with Gerry. I got the crops committee work at
that time.
I told Canada that although we do not specifically prohibit hydroponic production, that it was my understanding that we don't approve hydroponic what I referred to as crops in a bucket in this country.

But I also committed to Canada because they did ask us, they said, can you -- they said, what are you doing? I said, well, actually, we are looking at yours, which made them very happy.

And they asked how soon we could come up with something as guidance, which is all I really could commit to at the time.

They asked if we could come up with something within a year. So I said yes.

My goal is equivalence, so, I said -- well, plus we are going to use theirs.

They've already written something.

So why not? Anything to get them over the line, right? So that is why I was talking with the crops committee, and was interested in this. But I don't see why not.
MEMBER DAVIS: Thank you, Barbara.

So I believe that is all we really wanted to say about this. I would make one response to a public comment, I believe it came from CCOF, about everyone -- the few comments that we did receive on this mentioned, well, we haven't seen these greenhouse standards, so how can we really comment on this.

So granted, we'll see how the greenhouse standards recommendation comes along for this fall meeting.

One question that was mentioned about well, what about transplants, vegetable transplants for example grown for transplanting out in organic production fields. And we as a committee didn't discuss this, but I can think of a response myself, in that working for a farm that uses a lot of vegetable transplants, and it's also in the greenhouse business as well starting this year.
I believe that the soil ecology that is talked about and kind of thrown out here in this discussion item for consideration by the committee and hopefully response and input, the soil ecology that it talks about I believe certifiably we should push our vegetable transplant producers to work towards viable organic soil ecology type principles in their transplant media; not just vermiculite and plants popped in there.

Because the soil ecology as it interacts with the plant and colonizes the plant roots, that all begins right from germination. In fact that is probably the most important time for those plant-symbiotic relationships to form, not -- they collect that for no reason just because it is not really that convenient to construct a properly well balanced compost base at least, or at least -- I'm getting off track here.

So in answer to that public comment, yes, I think it should be more than
just vermiculite. It should be a soil-like media that contains viable soil ecology of microorganisms.

And any questions on this? Tracy?

MEMBER MIEDEMA: Gerry, what about sprouts, edible sprouts? I know we already made special provisions in requiring organic seed for edible sprouts. They have gotten special treatment before. But should your recommendation make organic edible sprout growers nervous?

MEMBER DAVIS: No. Again, that's not -- we pointed out in an earlier incarnation of this work at previous meetings that organic sprouts are not -- that is a different topic that is not part of this work and this discussion.

It's -- already has its set of rules, and hopefully satisfies the needs of that area of production, and we don't need to readdress anything more other than what I think has already been addressed.
Joe, do you have a comment on that? Or something different?

MEMBER SMILLIE: No, your answer satisfies me on that one. You may just want to put it back in so there is no confusion, but that is up to you.

MEMBER DAVIS: Just to say what -- to delineate that idea?

MEMBER SMILLIE: Yes, it's food production, not crops, it's handling or whatever.

I just want a clarification. This will become a recommendation, this document. And you will also come out with a revised greenhouse growing document. There are going to be two recommendations coming out?

MEMBER DAVIS: No, I would anticipate it would be one.

MEMBER SMILLIE: So you are going to take what was done before and blend it into this?

MEMBER DAVIS: Exactly. We have
1 looked at what was done before, and we will do
2 more work on that, make it more complete
3 including work on what constitutes a proper
4 soil media in a greenhouse, get specific about
5 what can be used, what principles should be
6 adhered to. So to give certifiers something
7 to certify.

8 CHAIR MOYER: Joe, this was a
9 missing piece in that greenhouse document that
10 are going back and trying to fill in.

11 MEMBER DAVIS: And again, it's
12 designed to elicit public comment and input to
13 get more information on doing it the right way
14 when we come out this fall.

15 MEMBER SMILLIE: Yes, and parts
16 of the NLP will have to recuse themselves as
17 the people's garden is planning to have their
18 containerized pots certified, as I understand
19 it.

20 MEMBER DAVIS: Dan.

21 MEMBER GIACOMINI: Gerry, you
22 structured this document around the concept of
organic principles. We generally have the
discussion around agriculture. Was there a
lot of public comment that addressed those two
points? Or did the committee do any
consideration on the difference in those two
points? Or did they see any?

MEMBER DAVIS: I'm not sure I
understand your question.

MEMBER GIACOMINI: Well, I think
it's pretty hard to justify, at least it would
be for me, to most consumers, that one tomato
is that different from another tomato. And I
think it would be hard to say that one -- I
think most people would say that both tomatoes
are agriculture.

You used the concept of organic
principles to carve out a section and say, we
don't think that fits with organic. I'm just
-- pertaining to hydroponics, specifically,
I'm just wondering if there was any discussion
about that?

MEMBER DAVIS: Yes, a lot. I
think, Jeff, you probably would be a good commenter on that.

CHAIR MOYER: Well, I don't want to take up too much time, but your answer is accurate. Yes, there was a lot of discussion about that in the context of the fact we're looking at terrestrial plants that need to be grown in a terrestrial situation. It does fit in with the organic principles, and they are both tomatoes, but there are gross differences in the way the tomato acts and responds to its environment.

So we did spend a lot of time discussing that. Kevin, you had your hand up.

MEMBER ENGELBERT: Yes, I was going to bring that up before your point, Dan. We hope the comments that we receive have reasoning behind them, because this is extremely difficult subject. And we are going to begin looking at cosmetics and pet food and all these other things. And the argument that we receive is, if we are not using any
prohibited substances, or doing any prohibited practices, why can't we call hydroponics organic.

So we are hoping the comments that we receive are going to help guide us so that we can come to a sound -- like Gerry said, sound conclusion. And keep these -- this label the way it should be.

MEMBER DAVIS: I'm going to be very interested to see how that discussion goes, because I can see where this format of really focusing on the organic principles rather than just whether something should be considered agricultural or not, could have a huge impact on discussion of other items that we are looking at down the road.

CHAIR MOYER: Tina, back to you.

MEMBER ELLOR: Okay. Well, I think in the interests of maybe trying to get back on schedule, if there is no more discussion we could move on to the livestock committee.
MS. FRANCES: One small point. I just noticed in this soilless discussion document you refer to aquatic plants recommendation, or aquatic plant production standards. And you already made a recommendation on aquatic plants. I didn't really see that phrase.

MEMBER ELLOR: I don't believe we did yet. That would have been --

MEMBER ELLOR: Right, okay.

MS. FRANCES: So just for the record, that's all.

CHAIR MOYER: Tiny, did you want to discuss anything about list for inerts yet?

MEMBER ELLOR: No, only to say that it's constantly in our committee. We are constantly looking for public comment. We got a lot of great information from Henri and from OMRI and from CCOF, and we'll be continuing to work on that unless somebody else has some
discussion about that.

CHAIR MOYER: Okay, what we are
going to do now is, we are going to break for
lunch. Before you go, Barbara has a comment,
and then I'll be back.

MS. ROBINSON: I just wanted to
let everybody know, if you have signed up to
go see Deputy Secretary Merrigan this
afternoon, remember her office is in the
Witten Building. Her office is 202B, but you
need to enter on the Jefferson Street side.
That is the side that faces the mall. The
national mall. You have to check in at the
guard station. You will have to enter where
it says visitors. Mark is going to be down
there, Mark Bradley is going to be down there,
so he'll help everybody who wants to come in.

We have given everybody's name to
Marilyn Pisch, who is Kathleen's secretary,
and so you will have to get cleared in. You
know if you have come down to see us before
they go to put you through the security and
all that jazz. So anyway, that's again, 202B
is her building -- I mean her office -- her
building. She does have the building, though.
Anyway so that is just up on the second floor,
right up next to what we used to call the
cage. So just check in at the guard station.
Your name will be there. If your name is not
there, you're not there. So okay.

CHAIR MOYER: Thank you, Barbara.
This meeting is temporarily
adjourned -- I'm sorry, Valerie has one more
comment.

MS. FRANCES: On the list for
inert question, Chris Fiefer from EPA is here
if you wanted to ask any questions of him.

CHAIR MOYER: Were there any
questions from the Board for Chris Fiefer on
lists for inerts? Yes, we do have one
question. Kevin.

MEMBER ENGELBERT: Could he come
to the microphone and just give a brief
description of why they did away with a
listing of the inerts, those four inerts.

CHAIR MOYER: So you want to know why your life suddenly got miserable?

MR. FIEFER: Hi, I'm Chris Fiefer.

I am not actually authorized to speak with regard to agency policy. I want to get that out of the way right now. It seems like I'm brought up here whenever that is the case.

Let me go back. I think I covered this briefly last time I was here; I spoke a little bit about the back story of the list.

The list was never a statutory list for the EPA; it was kind of a cocktail napkin list developed for our own tolerance reassessments. It was not created with the NOP in mind, nor was it really created with our food tolerances in mind.

That said the list was practical with regard to this program, because the human toxicity of most of the inerts were very well considered.

But as your program has evolved,
and as this list has lost any of its statutory basis, that's the reason why I believe you are being called at to look at a new list system.

CHAIR MOYER: Does anybody else have any questions for Mr. Fiefer while he's in our midst?

I don't hear any. Okay, thank you very much. I appreciate your coming and participating.

We are adjourned until 1:00 o'clock.

(Whereupon, the above-entitled matter went off the record at 12:01 p.m. and resumed at 1:06 p.m.)

CHAIR MOYER: Okay, everybody the Board is seated. We have a quorum, and we are officially back in session. If we could please quiet down in the back of the room we'd appreciate that.

We will continue with our committee work starting with the Livestock
Committee, Hue Karreman, chairman, if you are ready Hue? Please, the floor is yours.

LIVESTOCK COMMITTEE

MEMBER KARREMAN: Yes, okay.

Thank you, Mr. Chair.

We have four items for the Livestock Committee to present for discussion here within the Board today.

The first one that we've been working on is a petition for propionic acid. Some people call it proprionic acid sometimes, but anyway, we are talking about the same thing. And the petitioner was asking for it to be an animal feed preservative as a mold inhibitor, and briefly to kind of cut to the chase I guess, preservatives -- well, first of all we deemed this to be synthetic, and synthetic preservatives are not allowed under 205600(b)(4), which is shown in the cover page there somewhere near, under (d) I think.

So it was a unanimous call on the vote. However we did really talk about this
quite a lot. And we declined the petition, and that was unanimous. In our discussion on it, however, we looked at the propionic acid technical review done by S&T as well as another older petition for calcium propionate that has been reviewed by the Board earlier. And we just happened to see quite clearly the difference of quality in petitions, or technical reviews, I'm sorry.

So it just kind of highlighted to us the quality of the petitions. So even though this substance we are not recommending to be allowed, it helped us look at petition quality. I'll leave it at that, because I know tomorrow part of the board will be meeting with S&T about that topic.

CHAIR MOYER: That's correct. Any questions?

MEMBER KARREMAN: It's a synthetic, preservative, not allowed.

MEMBER GIACOMINI: Not all propionate, propionic acid, is synthetic,
but this was the synthetic form to be listed on 603, so that was what we were looking at.

It was requested as a preservative; that's what we were looking at, within those two boxes that this was a fairly easy decision.

**MEMBER KARREMAN:** Thank you, Dan.

And there are natural forms of propionic acid, and of course they would be allowed if they are natural.

Okay. The next thing up, is a recommendation for -- I'll have to look at my hard copy here, I apologize -- recommendation to add a new section to the national list for synthetics for livestock. The section is proposed 603(g), formulated injectible supplements of trace minerals for 205.603(d)(2). Vitamins per 603(d)(3), and electrolytes per 603 (a)(8), with excipients per 603(f) in accordance with FDA restricted to use by or on the order of a licensed veterinarian.

Note that it is for injected forms
of those materials which have already been on
the list, okay.

The reason the committee came up
with this proposal is that some certifiers are
being selective on injectible vitamins and
minerals, usually based on the excipients or
the carriers or preservatives, and generally
farmers don't really understand that. They
see something as vitamin B complex or vitamin
C injectible, you know, whatever brand, they
are like well, that's vitamin C or vitamin B
complex, or whatever. And they, the farmers,
are looking at using these injectible type
items and minerals for nutritive needs for
their livestock.

They have been generally allowed,
almost grandfathered I guess in a sense. They
are widely used, but once some certifiers
start kind of picking and choosing which brand
names are okay due to excipients and carriage
preservatives, then it gets a little bit
muddled.
And we'd like to clarify that, and that is why we are proposing this section. Basically -- let's see, oh, it is a whole category, and the reason we went that route, there is precedent for that in the list as you all know, 603(d)(2), 603(d)(3), and the excipient ruling, which is actually new at (f), are all category type uses without specific items being listed or not listed.

Now the excipient ruling came out just December, 2007, and if I remember correctly there were not many complaints from the organic community about that category heading coming in.

And so that is why part of the reason we are looking at adding a whole category. The other reason is that in doing some homework on this I think I counted up very easily about 24 different manufacturers of vitamins and minerals, injectible vitamins and minerals. And their processes of making the injectible vitamins and minerals are not
necessarily obtainable. The formulation processes to make injectibles are generally only obtainable when they are in the public domain from patents from the 1950s through the 1970s, and maybe through the '80s. And the injectible vitamins and minerals that a farmer may have in his cabinet right now today may not use that process.

So I did not feel that that would lead to a final conclusion on this, and in relation to the other three categories, categorical allowances under (d)(2), (d)(3) and (f), a new section (g) was and is being proposed.

On public comment generally they were all positive. There were some concerns of course. But VOF had one of their -- I don't know what VOF exactly stands for. I know it's the Vermont Organic Group. They wanted to amend the -- in the very last sentence that they thought it was too stringent to have a veterinarian only order or
administer the injectible vitamins and minerals, and they would like to see it restricted to use by any person trained in the administration of the injectible supplement.

And let's see here, generally in favor, but then there are some people like yesterday during public comment that do want to see every injectible vitamin and mineral TAP reviewed; at least that was my understanding from public comment yesterday.

PCO would like that, and I think Harriet Behar had mentioned that. OTGO in Oregon supports the proposal as is. Kelly Shea is in favor of it as well, and has some extra comments relate to it but not directly so. And CCOF was supportive of it, however they would like to add the term as nutritive supplements in the beginning of the statement.

The reason -- and then I think VCO was mentioning that perhaps this should go under Section A, the medications clause, in 603. The reason we don't want to put it under
the medications clause is that we had an hour, hour and a half long conference call, the Livestock Committee, with some NOP input as well as the FDA Center for Veterinary Medicine, and the moment you start making claims or insinuating medical treatment about these injectible vitamins and minerals, it kind of crosses the line from being nutritional supplement type material into actual treating disease, and that triggers some extra FDA input. And so we would -- the reason we had that conference call with the FDA was to get ahead of things, this time, instead of the medicines that were approved in 2007 where there was a lot of back and forth for a number of years. And they fortunately got approved, but we would like to prevent excessive time going by, because these injectible vitamins and minerals are commonly used as everyone does acknowledge. So that's pretty much the injectible vitamins and minerals document.
round up. Yep, Dan.

MEMBER GIACOMINI: Yes, Hue. I believe it was CCOF made a comment, we unfortunately have not had a chance to go over it, but I'm wondering if you have with any other members of the Livestock Committee, regarding listing this being a nutritional supplement listing including excipients which the language on the excipients is specifically for drugs. Did you ever come up with a way of clarifying that?

MEMBER KARREMAN: Good point. The -- what CCOF said on top of their kind of three word beginning of, as nutritive supplements, formulated injectibles, they also did mention that the excipient wording in (f) the word drug should be replaced with something other than that like health care items. And the reason being that the NOP rule says that you cannot treat animals in the absence of illness, except for vaccines.

And these are nutritive
supplements for whatever reason they are being used, and I think that is what they would like to see so that animal health care products -- and this does dovetail into animal welfare which we'll get into -- are allowed if their carriers or whatnot are GRAS, if they are FDA approved food additives, or they are part of an NADA new animal drug application formulation.

And I believe there was another comment regarding the excipients as well if we are going to look at that, which was overlooked in the 2007 edition, that the excipients we were looking at compounds at that point in that petition process that were all of them happened to be FDA-type compounds with FDA oversight, but there are other ones with USDA oversight, through the APHIS, Animal Plant Health Inspection Service, their excipients for vaccines and biologics that we should add into that excipient clause as well.

So I don't know if we can open up
the excipient clause at this meeting. It is germane to the injectible vitamins and minerals, but I don't know if we can.

MEMBER GIACOMINI: I'd certainly like to hear from the program. My impression would be that this being the national list and that being a separate listing that that may cause a problem in trying to have a recommendation to add a listing and amend a listing at the same time, but if we could hear from the program.

CHAIR MOYER: Richard, would you care to comment, please?

MR. MATTHEWS: You could go ahead and discuss at this time, but you can't take any action because it wasn't on the agenda as an action item. So you can talk about what you want to do for the next meeting. But it does need to be addressed; we are aware of it, and we encourage you to go ahead and address that issue.

MEMBER GIACOMINI: So we can say
that our intent will be once the excipient language is corrected that this is for all nutrient supplement vitamins and minerals that are not restricted by FDA.

MEMBER KARREMAN: Yes, it would include the excipients that are regulated by FDA as well as APHIS. That is the intent.

MR. MATTHEWS: Which by the way was the intent was to cover everything, but what happened was that we failed to make sure that all those that were regulated by APHIS were included. But it was always the intent of both the Board and the department that the excipients cover everything. But there is the technicality that because of the wording in the statement that we cleared through FDA that it didn't include APHIS.

MEMBER KARREMAN: And that was actually part of my fault being the petitioner for them for not also looking at that.

MR. MATTHEWS: No matter what the fault, the bottom line is that we always
intended it to apply to everything, but it has been brought to our attention that there are some that we didn't adequately cover.

MEMBER KARREMAN: So I guess we can take action, and we will, on this recommendation. And only change any wording from public comment or how we see it needed on the actual proposed language addition for the category; not the excipient language, although that will be on the work plan; it has to be now for the next meeting.

Any other questions?

CHAIR MOYER: Okay, next item.

MEMBER KARREMAN: The next item on the list there is aquaculture, and I'm happy to say that Jennifer Hall will be addressing the discussion document with the bivalves.

MEMBER HALL: Thank you, Hugh.

Thank you, Mr. Chair.

I am presenting where the Livestock Committee is with its progress on the proposed organic standards for bivalve and
mollusc production. And I think everyone saw both of the documents that were posted on the agenda. First, the kind of status report of where the Livestock Committee is in its discussions, and kind of trials and tribulations with trying to figure out where and how the bivalve mollusc production fits with organic standards.

And then the AWG's response to those five points of concern or further exploration. Those five points, just to reiterate, are feed control, water quality input, control of harvest sediment, using sanitation measures as indicators, and containment.

I want to say before I go into it that I am personally really glad to be presenting this on behalf of the Board. Our committee has worked with the AWG to really try to understand this whole new arena of organic food production, that aquaculture represents. And with their patience and
continued efforts to educate us, we continue
to learn more and get better at asking the
right questions and exploring areas of
concern.

We appreciate the frustrations
this might create, and are grateful for the
aquaculture working group's consistent
availability and patience.

Comments on what has been posted
have been pretty sparse, which just kind of as
an opening I think reflects the lack of
experience on these topics in the organic
community as a whole in the U.S.

And so I for one hope that our
capacity to respond, approve and recommend
upcoming topics of this nature is enhanced by
the addition of the board member in this
present round of recruitment that brings his
expertise a little bit more. It's been
difficult for all concerned to kind of rifle
through it, and our ability to deal with it
would clearly be enhanced if there were
someone who would better represent the community as a stakeholder.

I participated in a number of the conversations that the AWG had on the phone as the document was coming together originally, and definitely came to appreciate several things. The dedication of the group of professionals involved, the struggle that present law to accommodate the productions of some that is proposed, a true desire to create standards that actually do raise the bar, versus conventional bivalve mollusc production and a great understanding of the already stringent requirements on this type of production.

The AWG has made it a priority to establish measurable opportunities to make their production more organic, from origin of life to siting to control of contaminants, the proposal does make advances in production techniques more suitable to the goals of organic ideals.
And in fact of course as you must know it even goes so far as to stipulate transport requirements and addresses a bit of consumer fraud that doing that incorrectly could lead to. So it actually did go through quite a rigorous process, and took to hear the desire for an organic model to be adopted where they needed to be better than conventional production.

So I just kind of want to go through the points quickly, and just again kind of get the staff's report a little bit beyond what was mentioned in our document.

Number one, with feed control, I would say that a number of items of concern. These five were shared back with AWG and the organic community. But I would say that it is this one that probably represents the largest hurdle, and greatest area of concern. And that it is I think an evolving conversation. We definitely appreciate the AWG's response to this and other points, and we will take that
in general it's just -- it's difficult for us
to kind of wrap our heads around -- if it's in
the livestock area, and typically with most of
what we deal with there is a greater level of
control over what the animals are eating than
in this scenario. So I think it makes it a
little more fluid, and when you talk about
organic and its management and factoring that
into an OSP that just got regular in and out
of water and nutrients that these bivalve
molluscs would be intaking, it's just a bit
hard to figure you could kind of truly manage.
And I think that that, and the fact that it is
not necessarily certified organic feed, that
would be going into them as well.
So I would say that that is
probably the number one issue that still
remains.

On water quality, the siting
requirements definitely do add much more rigor
than -- since there are very few in
conventional production, the stipulations that
they have for really looking at your entire environment, and whether or not it is appropriate for this type of production, it has added considerable merit to -- or considerable value to actually having it be organically certified, and looking at the impacts of that siting, not just on the item being produced, but as with all of the conversation about biodiversity the impacts on that farm as it were on surrounding community of life.

So -- and I think we've kind of gotten stuck a little bit in this new category of production, of aquaculture, and in an effort to understand it better, and not to keep drilling -- Katherine's words -- but definitely kind of looking at the perfect versus the greater good scenario.

But you know we get that management, and all of organic management doesn't necessarily insinuate 100 percent prevention. And that we need to continue to
dialog about where the management is consistent with the label, not just prevention and trying to protect everything; that in farming, in terrestrial, definitely we have an impact. We till fields, we do things that have effect. So to insinuate that we wouldn't in this sort of -- in aquaculture production would be kind of out of bounds really.

On control of harvest sediment, similar but also I think we were looking for some feedback on how much is too much, and that fortunately the AWG did recommend several prohibited practices that really do stretch the habitat. And that is good; I think we were looking for perhaps a little bit more, that there were still some that were feeling like they were on the line. And just kind of using geoduck as an example that the extraction of it seems pretty intrusive to the environment. And so maybe instead of coming forward with a common united front, which we totally understand the committee's desire to
do that, that there may be a need to identify
certain species either from a production or
from a harvest perspective that just don't
quite qualify; something about how they need
to be produced and/or harvested, it just
doesn't work with the bigger picture.

On sanitation the hydrologic zone
of influence, and really defining that along
with coastlines and following even the current
existing regulations they have to follow, they
adequately gave us more information I think
that we were seeking on that, and I think that
even if you with all of these points
containment as well, I sort of came full
circle as I was thinking about it yesterday.
And it's interesting, because we have
approached the entire conversation from the
framework of livestock of course, because
that's where it was coming to us, and that's
what we were asked to do, and it made sense in
our conversation. But we asked them, we asked
AWG to put together that great chart, so it
could be really a lot more clear and really illustrate the differences between conventional bivalve mollusc production and what they are suggesting. And I am very grateful for that. I think it really did start to drill down to a level of comprehension that was really easier to absorb and to really identify those distinctions. And as I went through it I personally started to think about the whole conversation in just a little bit different way. Not that I am suggesting that we punt this issue from our committee, but that if you really think about what bivalve molluscs are, and the AWG has brought this up, that they are analogous to plants, on terrestrial, that plants are kind of filters of the air; that bivalve molluscs have always kind of been filters of the water. And so the passing through of fluid with all this other management to try and control for the quality of that fluid going through, that perhaps it's
using just a little bit of a different framework of thinking about it, and I'm not settled with it. But it definitely brought me to a point of looking at it from a different perspective, and allowing for it to kind of sit in our discussions when we take it back to committee in a different way.

So I would like to talk about that with my committee members when we revisit it a little bit. I don't think it's out of the realm of possibility, and I definitely appreciate the work and, again, the patience of the aquaculture working group to help get us to this point. It has been much appreciated.

So our call really in kind of providing this update is to let you know we haven't put it to the side at all. There have been other issues we certainly needed to address in the meantime. But it is a really deep and ongoing conversation that we have just tried to get more information about.
And so this is kind of another phase of that conversation, but we do hope with these answers I think to come back with a more solid recommendation next time.

So any input, please. Questions?

CHAIR MOYER: I think the Crops Committee doesn't want it dumped on them.

(Laughter.)

No other questions?

Next item, Mr. Chairman.

MEMBER KARREMAN: Okay, thank you very much, Jennifer. And I just want to reiterate, we really have talked about the bivalves quite a lot, and we really appreciate as you mentioned the AWG's response to our questions and hopefully we could have maybe a recommendation for the November meeting. That is the plan.

So the next topic is proposed organic animal welfare guidance and standards, animal health and living conditions. We took this up, this has been on the work plan for a
couple of years now, and as Deputy Secretary Merrigan asked how long has it been, about two years. And she used the term for this, the animal welfare. Let's not make the perfect being the enemy of the good, and therefore go for the long-hanging fruit.

And she did use that in terms of animal welfare, just to keep that straight. I know it's a great term for everything, but it was in terms of animal welfare.

So she brought that up with Margaret Wittenberg two years ago at the November, 2007 meeting, when we had the agriculture symposium. That was kind of a different issue. And basically so we are looking at this partly due to that, but also because the conventional dairy sector is addressing animal welfare, and I just really believe that the organic sector needs to be on a par at least with the conventional sector especially in this topic and perhaps a little bit more if only -- well if only for that
reason, but also to ensure the organic customers of organic dairy products that the animals that are producing the product are being well taken care of.

And I guess as kind of a slight secondary or maybe tertiary to help ensure that some of the NGOs that are focusing on animal agriculture and kind of taking aim at it, you know, can't take aim too easily at organics. I want to ensure that we have the wording in place in case it's ever looked at closely.

So basically we have presented this and there are in consultation I guess maybe informally with the program if this was a few years ago I guess out in maybe during a break, that you know if we feel we need to make any regulatory changes, try and keep it very short, the words, not big paragraphs of things. And so a few, there are a few items — well, let me back up.

We basically in section 238, which
is the health care section, you know there are some questions that come up even with what is written now in the regulation. Such as it is required at a feed ration sufficient to meet the nutritional requirements of being fed. But is it? How do the animals look? And like public comment addressed yesterday in a positive way we are trying to show objective metrics, endpoints, goals, so that inspectors can verify that the animals are indeed being well taken care of.

Also in other parts of 238, some other questions come up that the regulations currently as they are don't necessarily ensure that the animals are clean or not lame or whatever. So we are trying to address those kind of things.

As far as regulatory changes, one that I always cite is 239 under livestock living conditions, let's say. You know, (a)(3), that appropriate clean dry bedding is provided, and if the bedding is typically
consumed it's got to be organic and whatnot.

But it doesn't necessarily ensure that there is a lot of bedding, or any bedding, or much bedding, and are the animals clean, okay.

And as well as for access to the outdoors, shade, shelter, exercise areas, fresh air and direct sunlight suitable to the species in (a)(1). In the case of poultry what kind of access to the outdoors and what areas have direct sunlight. I know I'm jumping around a little. But it's only a discussion document okay.

So there is just basically some unresolved or -- not unresolved, but just some issues that perhaps need clarification.

The public comment on this has been generally good. I haven't seen a public comment of anyone being opposed to animal welfare; that's a good thing. But of course there were concerns raised yesterday regarding some of the guidance that we are also proposing to describe how the animals look,
lameness, fur coat, feathering and whatnot.

And how we need to look at the realities of
different stages of lactation for dairy cows,
and how they change, and body condition, and
we are well aware of that and will be working
on that, and how dairy is different from beef
cattle. And the food farmers have nicely
submitted their comment, and given pictures of
dairy cows and how they -- and body condition
scores that perhaps we can add in for guidance
if we can.

One of the concerns we heard
yesterday, and also in writing was about
inspector training, because it is the
inspector who ensures the system is working
within the OSP and every thing. So the
inspector training we should address more as
well as there were concerns about having to
look at every animal or every chicken, and I
mentioned yesterday in response it's kind of
to look at the big picture, and not get hung
up on the minutiae, at least in animal
welfare, unless there are obvious problems; then they shouldn't be ignored.

And that's why we are trying to make sure that if there are obvious problems that they are not going to be ignored.

The food farmers, Ed Maltby who as here wanted to have a task force on animal welfare. I think informally the Livestock Committee members I've talked with don't really want to see a task force get started on this, because we don't -- I guess we believe we can get their input as well as any other people's input on our Tuesday afternoon conference calls. And let's see, th AVMA submitted a comment, the American Veterinary Medical Association, as well. And that will be put into the public record at some point.

They want to make sure that there is a valid client-patient relationship, veterinarian for the farm, to make sure that indeed the animals are being well taken care of from a third party standpoint, on top of
And both the ABMA and the food farmers refer to the National Dairy Animal Well-Being Initiative being started by the conventional industry. So we will look at that as well.

I could go on and on. I mean animal welfare is a major big issue, just the whole topic, philosophy; but that about sums it up for now in our discussion document; just so people know, we are taking public comment without doubt, and it will be definitely infused into the document.

CHAIR MOYER: Thank you, Hue. Are there questions or comments for Hue on animal welfare? Kevin?

MEMBER ENGELBERT: There is one specific area that we really are looking for public comment in, and that is the outdoor access to poultry, and where the industry and where the Board wants to go with that.

We heard yesterday from the
methionine task force, and the efforts of that
task force are simply to come up with
methionine that is not synthetic that will
allow the current production standards to
continue. And we need to hear from the
community. Is that what we are really after
with the outdoor access for poultry, and what
the response should be from the Livestock
Committee to this issue.

MEMBER KARREMAN: Good point, Kevin. I mentioned it briefly, but thanks for
bringing that up again.

CHAIR MOYER: Dan.

MEMBER GIACOMINI: Yes, I've heard a lot of -- a fair amount of formal here and
informally of concerns from certifiers and
various groups on the scoring systems that we
are listing here and using those types of
things.

A lot of concern that there is not
going to be adequate training; that it is
going to be too difficult to do, like Hue
mentioned of having to look at all the
animals.

And I've done body condition
scoring for 30 years, and it's definitely
evolved. But in doing it it's obvious that
what we are looking at here is not an overall
evaluation of the body condition of hurt
animals. We are looking for the outliers; we
are looking for the problems.

And I think when we go back and we
do this document -- work this document over,
on the body condition scoring we are really
worrying about the ones and the fives; we are
worrying about the cows that are skin and
bones and tremendously -- grossly obese.

When we are looking at the
lameness scoring, we are looking at the
animals that are for the most part
significantly obviously lame. Whether the
animals that are not visually lame are a one
or a two, maybe a three, that is not going to
matter. Because what we are trying to do here
is find a mechanism to find the problems, and
to improve them.

And just like when we start
looking, and another item we've talked with
Temple Grandin on is on hoof lesions and body
lesions, hips and legs and all that kind of
stuff. It's going to be that same thing.
It's going to be giving a tool to help you
find and identify the problem.

You are not going to have to go in
and evaluate all the animals and say, 10
percent, 30 percent, 60 percent, it's going to
be how much of a problem, and over time are we
working -- are the producers working to
improve and lessen that problem.

I think that is where we are going
here. So the discussion like on body score,
oh, we don't have enough training to look at
that, and on and on. Believe me, I can sit
down with somebody in front of three or four
cows, if I can pick the cows out that we are
looking at, you give me the chance to pick
four cows, I can show you in about five
minutes how to do body condition scoring that
is the only thing you will need to worry about
in discussing this type of project.

So it's not going to be that hard
of a process.

CHAIR MOYER: Back to you, Hue.

Or --

MEMBER SMILLIE: I don't usually
ask livestock questions. But are you guys, in
looking at this, are you looking at stocking
densities at all as part of this? As a metric
of --

MEMBER KARREMAN: Not in relation
to dairy cows, I don't think, because that's
in a pasture rule.

MEMBER SMILLIE: I'm thinking
more about poultry.

MEMBER KARREMAN: Well, you bring
up an idea, Joe.

MEMBER SMILLIE: Because that, I
think, I don't want to show my ignorance, but
the Canadians, which we are having an equivalency agreement, aren't they working off that?

MEMBER KARREMAN: They absolutely are. I've been to Canada a bunch lately and they are; they told me that.

Kevin?

MEMBER ENGELBERT: Yes, Joe, they are, that's why I asked the question of the presenter yesterday about what his densities were, the areas of outdoor access, things like that. Yes, it will be part of what we look at.

MEMBER KARREMAN: Just one last thing. Also you know thank you Dan, for those comments; very succinct, and now I can just go off on tangents on this particular topic, because I'm out in the trenches everyday on a lot of farms.

But you know -- you are too, exactly -- but I want to just make sure that people know it's not, at least from my
viewpoint, it's not like if you can do something in organics. I mean organic agriculture is part of agriculture. And it's not if you can do something with your animals; it's how you do it. That's also what we want to look at. As far as procedures done, making sure that proper anesthesia is done, which is why exactly I petitioned for those medicines to be allowed to reduce pain and suffering.

And that plays in, which I didn't even mention, to 238 (c)(7) which is to make sure that animals are treated in a timely manner. And that is what Dan was basically talking about, make sure that the obvious problems are not happening over and over. And if you see something, then the inspector can say, okay, here is the line here. This doesn't fly. And then it has to be addressed. Because some inspectors have told me, like I said yesterday, they leave a farm and they kind of know something is wrong, but they can't put their finger on a reg or a guidance.
And that's why we want to make sure that the extremes are not happening.

CHAIR MOYER: Thank you, Hue. I believe we are prepared to move on to our next point of order, which would be the Joint Materials and Handling Committees, co-chairs Dan Giacomini and Steve DeMuri. I'm not sure, Dan, Steve? Dan's got it.

JOIN MATERIALS AND HANDLING COMMITTEES

MEMBER GIACOMINI: I take the ball from Steve, and I pass it on to Katrina.

MEMBER HEINZE: Well, thank you. I'm not passing it on -- well, at least for the first part.

I know that we have heard a lot on this subject of definition of materials over the last couple of years. And I appreciate the diligence of my fellow board members. I know I have heard from several of you privately that you are sick and tired of this subject and just wish it would go away, and it is so esoteric.
But it is a foundation for many of
the decisions that we make, both as a Board,
and more importantly, that the certifiers are
making, and that our farmers and producers are
making everyday.

So we have 45 minutes for this
subject. We will try to get through it in a
timely way.

There are two things: I will be
reviewing the discussion document on the
definition of materials that the Joint
Committee prepared. I'll try to take 10 or 15
minutes for that. And then we've got a
presentation by the material working group,
and then we should have plenty of time for
discussion.

So with that, to get to our
discussion document, the classification
materials has been debated since before OFPA.
But really it's been the last couple of years
where the NOSB has actively reengaged in this
subject. And there have been a number of
recommendations. There has been a ton of public comment. And there has been lots of thoughtful debate.

The Joint Committee got together I think about a year ago to review all these discussions, all of this input, all the information that the material working group has given us. And our goal is to have a recommendation for a decision at the November meeting.

So really the purpose of our discussion document was to solicit public comment and discussion from the Board to guide us as we develop our November recommendation.

I do want to acknowledge the material working group. They have put a ton of time over the last year into this subject, and particularly you will see the presentation on synthetic-nonsynthetic, they met every Monday for an hour and a half and had intense debate on this subject. So I do want to recognize the amazing contributions made by
those folks.

So a bit of background for that.

The final recommendation on this topic has proved elusive due to very specific materials that illustrate gaps in the current and proposed definitions.

I think a great example of that is all the discussion we had with lecithin yesterday. You know does it belong on 605(b), does it belong on 606, which form, which source, which this. And we always have those kinds of materials that befuddle us is probably the right word.

We have heard a number of public comments and certainly this has been acknowledged by many of us who are intimately involved with this, that there is resounding agreement on virtually all the materials.

It is really just the few that continue to confound us. And it is those few that lead to inconsistent decisions, and the perception of inconsistency in the regulation.
And they get used as examples to demonstrate why consumers shouldn't have confidence in what we do.

So that is really what we are aiming to get at.

Our goal, connected to that, our goal in developing a recommendation is not to rewrite the national list. We expect that our recommendation will confirm and support the vast majority of decisions, and certainly that is our intent.

Okay, so we have worked to look at all these comments and all the information we have been provided. And there are some things that we do agree on, while there are some things that we still disagree on. So I wanted to kind of highlight for you where there is agreement and where there is disagreement.

First we agree that a material is defined both from its source and the process used to make the material. So lecithin, since we are so familiar with that we use that as an
example, lecithin, made from soybeans, we all agree that soybeans are an agricultural material. So their source is agricultural. But depending on how you process it, it could remain agricultural, or it could kind of lose that in its final classification. And there are certainly some other examples as well.

Currently on the list is pectin, again, sourced from apple peel; pretty clear that that is agricultural. But if you -- let's see, if you extract it with hexane and then chemically modify it with ammonia, to make it -- and Joe, you will have to jump in here to make sure I get it right -- but to make a low methoxy pectin, it's listed as synthetic. So it is both source and process. And in general the joint committee agrees that both of those need to be considered when deciding on the final classification of the material.

So because of that, because source and process matter, we generally agree that a
single material, pectin or lecithin, can exist in multiple places on the list. And it exists there because of either source or process.

Let's see. So then that brings us to an area where we disagree. So that would be the matter of microbes, what we call microbial materials. And we are still working on that, on the wording on some of this, or the products of microbiological fermentation.

I want to acknowledge to our fellow board members, those of you who haven't been in these conversations and to the public, we are greatly divided on this subject. We have been divided on this subject for many years, and we continue to be, and we know we need to make a decision and come forward with a recommendation that is a decision, despite our great division.

So the division really stems from two things. Some of the committee members want to find a path to encourage the use of
organic inputs and prevent where possible the
use of synthetics. I think most of us agree
with that, but struggle to find a path to do
that.

Others feel that these materials
are used in such a small percentage, that
organic integrity is not greatly compromised
by their inclusion, and we should not let
these few very small use materials get in the
way of making a decision.

So in our discussion paper we
presented two alternative recommendations that
we were discussing and asked for public
comment to help us with these two options.

So one option is to leave these
microbiological materials or the products of
their fermentation where appropriate, to leave
those on 605, and then use annotations to
encourage the use of inputs that we felt were
appropriate, or to restrict inputs that we
didn't want to use. So that is one option;
leave them as non-ag, and use annotations to
encourage the kinds of behaviors and processing that we want to encourage.

The second option would be to define these as agricultural, but to say that at this time they can't be certified organic because the standard for their production does not exist.

A third option was presented by public comment yesterday, which would be to leave them on 605, but to say that certified organic options did exist, similar to natural flavors as they exist today; so that was a third option that we did not have in our discussion document.

So we requested public comment, and we do appreciate, we got a handful of those, and we know that we will get more. So I wanted to highlight for my fellow Board members the questions we asked.

So we had three areas of conversation that we wanted public comment on.

The first was, we wanted specific examples
where organic principles would be upheld or
organic consumer expectations would be better
met through a clarification of the definition
of materials. And this was really an attempt
to understand why we were working on this, and
why there was so much public interest at our
meetings on this topic, and to really figure
out what is it we are trying to fix to make
sure that our recommendation actually fixes
what we are trying to fix.

The second question related to
that is what do the members of the organic
community hope to see accomplished by
clarifying the classification of materials.
What will be prevented, and what should be
encouraged. Again this is a bit of an
esoteric topic, and for us to spend so much
time on it we want to make sure that we are
actually improving things.

And then finally specific to the
microbes and products of microbiological
fermentation, we really wanted to understand
the benefits and drawbacks of each of our
options that we presented, to understand the
unintended consequences resulting from either
or both of them.

And then we wanted to better
understand, one of the things that does come
up and that we discussed yesterday specific to
yeast is their use in livestock feed. So we
wanted to understand what would be gained if
the materials were to be agricultural, should
they -- when they are used in livestock feed,
should they be required to be 100 percent
organic? And then what were the economic
implications if they are required to be
organic and used in livestock feed.

So those were our questions. So
just to wrap up I wanted to let you know what
we have heard so far from the public. We got
five or six really detailed public comments on
this subject that I would encourage everyone
to read as we move forward in our
conversations.
Every commenter said that we do need to keep working on this, and that resolution on this discussion was needed to improve consistency in decisions, and to increase the transparency, particularly for things that aren't on the list, on the national list of crops and livestock materials that are determined to be nonsynthetic, so those decisions are made not very transparently, so if we have a very consistent process the public comments felt that that would be important.

Several of the commenters noted that most materials are classified by the certifiers when deciding whether materials allowed for use in crops and livestock. So I wanted to specifically read what one commenter wrote.

They said the lack of clear criteria is causing inconsistent decision making throughout the industry. This leads to certifier shopping, embarrassment, lawsuits,
headaches, disenchanted organic consumers, and constant complaining.

So then I did want to thank those folks who commented and gave us a list of the problematic materials for us to use as we evaluate our recommendation.

We did have one commenter who reminded us that for synthetic and nonsynthetic the decision is most always clear. The real debate is whether the material should be listed or not. So they didn't want us to confuse this question of where does it get classified with where should it get listed; that those are very separate decisions. And I think that is an important point that I think has muddled our conversation, that we have perhaps been leery of having things end up being synthetic, because then, oh, they are not going to be listed. Or conversely if something is nonsynthetic, well then it is automatically going to be used, that we do have a mechanism
to allow or prevent use of materials. So I thought that that was a comment to keep close to our thoughts.

So then while they agreed, while our commenters unanimously agreed that we had work to do in this area, and that they really wanted a decision, they of course disagreed greatly on the direction that our solution should take.

We had commenters who disagreed on our perspective on agricultural synthetics, and that actually you could have an agricultural synthetic that was allowed. We had one commenter who supported the idea that wasn't in our discussion document but had been suggested by the material working group in November, that we merge 605 and 606, and apply commercial availability to the entire list. So that is something for us to consider.

One commenter cautioned us to really carefully evaluate the options, because they felt that particularly in the area of
synthetic and nonsynthetic that the suggestion that you will hear from the material working group would cause a lot of previously classified nonsynthetic materials to move to synthetic. And you heard some of that in public comment yesterday as well.

I did want to highlight the suggestion that was made yesterday, that we should limit the definition of synthetic to materials sourced from petrochemicals, so that is out there as well. What I would say is all the comments that have been provided have been very thoughtful, and we do need to really buckle down and think about them and understand them, and make some decisions.

Specific to our friends the microbes and their products, the commenters were as divided as the committee. In general they said the unintended consequences are difficult to predict. Both options have merits and drawbacks. One commenter preferred the second option; someone else preferred the
So I want to wrap up by saying that there is strong agreement from the public, and board members, that we need to make a decision and we need to put this behind us and get to consistent decision making.

I think we all heard the commenter yesterday, and I appreciate this comment greatly, that said, just make a decision. I don't even care if it's the right decision. Right, consistency is better than inconsistency I think is how I would summarize that.

We acknowledge that there are considered differences of opinion and now it is our job. We can't hand it off to the public anymore. It is our job as the NOSB to make a decision. Some people will like our decision; some people will not like our decision. And I think this serves as my public advisory comment, whatever it is, those
1. ads that you see on TV, to my fellow board members, that that is our job.

   So we are going to go. We are going to consider everything we've heard, and we will make a decision, and we appreciate those of you who will continue to be in dialog with us on that. And we appreciate everyone's active participation.

   So we will have a recommendation, for better or for worse, right or wrong, but it will be consistent, at the November meeting.

   So the specific things that we know we need to work on, so you will know what to expect. We will be working with the program to determine feasibility of a couple of things. The feasibility of using annotations for items that are currently on the list to clarify their sourcing process.

   So is that feasible? Is it not feasible? If that is our recommendation, how do we get from here to there?
The idea of how feasible would it be to apply commercial availability to both 605 and 606. We have heard that several times. I know that it is an idea that gets a lot of good discussion that people are very interested in. So we want to understand, is that really an option available to us.

We will develop a decision tree that could serve as guidance for determining the classification of materials, which reminds me, there is one really important concept I forgot to talk about, so I'll get back to that in a second.

And then finally we will finalize our recommendation for the whole microbes, products of microbes, on that hotly debated topic. So that is what we will be looking at.

Let me get back to one really important concept that I skipped in my little notes here. I talked about source and process. We have historically treated this idea of agricultural non-ag and synthetic
nonsynthetic as two separate unrelated

Because we believe source and

process both contribute, the joint committee
generally agrees that these need to be --
these can't be handled as separate and
distinct questions. They need to be handled
linearly. And we think the synthetic-

nonsynthetic needs to come first, and then the
ag/non-ag. So if you get to an agricultural
product that gets crazily processed in some
way that I'm not going to get into the
details, it becomes synthetic, and it may

still have been sourced agriculturally, but at

this point it is a synthetic.

But then from your nonsynthetic

materials to pull out those that are ag and

those that are a mineral or things like that.

And the public comment we received generally

supported that idea that those needed to be

handled in a linear fashion.

So the decision tree will -- that
we will be working on will have those listed that way.

So any questions or comments from the Board? Things you want us to consider?

CHAIR MOYER: Katrina, I'll just say that for once the Board put itself in a position where we can't make a mistake. That is wonderful. Nicely done to that Joint Committee. We've worn the public down, so they will just take anything that we give them.

(Laughter)

MEMBER HEINZE: That wasn't our intent.

CHAIR MOYER: It was not.

MEMBER SMILLIE: This continues as a joint materials and handling committee task, correct?

MEMBER HEINZE: I believe so, yes.

CHAIR MOYER: That is correct, Joe.
MEMBER HEINZE: You want to make sure your voice is heard.

MEMBER SMILLIE: You got that right.

MEMBER HEINZE: Other comments, questions?

CHAIR MOYER: Bea.

MEMBER JAMES: One of the things that you mentioned, Katrina, was that some members of the Board and some commenters feel like it's such a small minutiae amount, why should it matter. I guess just for the record I want to put it out there and say that there is no small percentage in the eye of the consumer, especially as we carve the path forward. And I think that we have to at this juncture be very careful and make sure that we take that into consideration. Thank you.

CHAIR MOYER: Julie?

SECRETARY WEISMAN: Yes, I was going to go back to something specific, that I just want to make sure that I understood.
In your discussion about microbes and the products of microbial fermentation, which I do agree with you that the whole issue of microorganisms has been a big divide across which various of us here and there have been standing.

But products of microbial fermentation, I'm not remembering that discussion. Because I mean for instance organic wine, organic alcohol, are all products of microbial fermentation, and I don't believe that those have been under question by anybody on this board. So I just wanted that to be for the record, that we are not talking about those types of -- yes?

MEMBER HEINZE: You know when we wrote this document those weren't the products that we had in mind. We had things like citric acid and there are some others that aren't coming to me, you guys know I always have these critical moment memory faults. But citric acid, there are five or six others. Is
gelling gum one of them as well? I think that is my favorite. Someone out there can nod at me.

But there is a number of materials on the list that are products of fermentation. It wasn't beer, wine and cheese, those guys. And we just didn't consider that in our document. So that is something that will have to be pulled out when we do this.

CHAIR MOYER: Dan.

MEMBER GIACOMINI: We did have one conversation though where in reviewing the document we were asking the question what is the difference in beer as a result of fermentation being organic, and citric acid if it comes from an organic source being the result of a fermentation, being nonsynthetic. So we did have those conversations.

By no means are we looking to say that beer and wine and those things are not, but there has to be a justification for drawing the line. It can't just be, because
that's where I want to draw it. The
discussion as it went into this document I
think was more to figure out the way that we -
- if we are going to draw a line we need a
justification for it, and we just can't just
make it up.

A couple of other things, and I'll
try to be as brief as I can. But it's -- I'm
always interested when I come to these
meetings and it's not exactly something for
this document, but it was certainly brought up
in your discussion and we hear it every time
I come. And I'm not from the certifier area
of the world. But I always find it intriguing
that almost every certifier comes up and has
at some point in time they will tell us
something that justifies how they are
different than other certifiers. They either
have more animal welfare issues in their
procedure, or they have more bio-security
issues in their procedures, or more
biodiversity issues in their procedures.
But the minute anyone looks at those things and uses them to decide between certifiers, I start hearing all the screaming about shopping around.

And it's just an interesting dichotomy that someone who is not from the certifier realm that I hear at these meetings. I think that is it.

CHAIR MOYER: Hue.

MEMBER KARREMAN: Just back on, I let you guys do all the committee work on that stuff. Like you don't talk about livestock too much.

But one thing, as far as the beer and cheese and all that, can't you just say products that are made -- traditionally longstanding products made from fermentation are different than citric acid? Just a suggestion. Maybe you already thought of that a long time ago.

MEMBER HEINZE: Well, I appreciate the suggestion, because we didn't
I think about it that much.

You know it was so clear to us that beer wasn't what we were worried about that we didn't even address it in our document. So I appreciate the suggestion.

CHAIR MOYER: Any other folks with questions or comments for katrina?

Thank you, Katrina.

MEMBER HEINZE: Well, we still have the material working group. So I think that is Kim and Gwendolyn, right? So while they make their way here, I will publicly tell you guys, these two folks did an amazing job wrangling, I think, at some times the calls had maybe 25-30 people on them, all with great opinions and active, the most active email debate I've been involved in in a long time; anyone who was on their email list would get to work on Monday morning if you hadn't turned on your computer and be flooded, literally. I think one morning I had 63 emails on material working group on a Monday morning,
which is not a good way to start the week.

But Gwendolyn and Kim really
should be commended for their efforts. I did
tease them. I recently changed jobs, and as
a reward was presented a bottle of wine with
the brand, Herding Cats. And I thought maybe
you two deserved a bottle of that as well.

I'll bring it to the next meeting.
I haven't opened it yet.

CHAIR MOYER: Kim, I'm not sure
that microphone is turned on. Would you check
that please?

MS. DIETZ: Okay, with that we'll
go ahead and get started. We are going to try
as much as we can into 15 minutes. So just
from a logistic standpoint I'll open it up.

Gwendolyn is going to go through definitions,
current definitions, and then some proposed
definitions. And then we are going to ask Zia
and Emily to come up, and they are going to
take you through some decision trees, the fun
part, and we will actually have a couple of
examples of materials to help walk you through so you get to really see what is going on with it.

So as we have all been talking about these last couple of meetings, we started this group in 2007 really with the purpose to bring to you the historical perspective, of the work of the past boards, as well as the industry perspective.

We participated a lot, as Katrina has said, and yes, it was like herding cats. Sometimes Gwendelyn and I would get on the calls, and I'd say, okay, you call them, and I'll call them. And I guess that is my HR background, because you have to really love what you do, and the people have passion. And as long as they have passion, it's all worth it. So I'm proud of the work that we've done. So let's go ahead and see the next slide, please.

As you can see we have a very large group of participants. And from the
ag/non-ag to the synthetic documents we added about 30 percent of the number of people onto our calls. Not all of these people participated, but they all certainly got the emails. Whether that is good or bad, if you weren't on the calls you didn't necessarily understand exactly what was going on. But the dynamics were there, and everybody on that list is very highly skilled in their specific areas. So I want to thank them, and also thank the OTI again for sponsoring our weekly conference calls.

So with that, the background papers that we have used, we really went back to the 2005 documents that you see up there. We used the NOSB guidance document on the definition of synthetic, from 2005, as background. We were asked really in collaboration with the board to focus on the NOP evaluation from March, 2006, specifically the questions that the NOP had asked us. So that is really the framework for the
recommendation that we gave to you.

We looked at and used the March 9, 2006 document as well, and then we just analyzed all of those together, and gave to you our proposals.

So the main focus, though, really was looking at that 2006 document and going forward from there. There has been 20 years of work done on these topics, but we all agree, we are almost there, folks, so let's keep working with it.

So with that I'll turn it over to Gwendolyn, and she will go through the definitions, and then we will take you through the decision tree.

MS. WYARD: Okay, thanks Kim. I get the fun stuff.

All right, so if you have the paper in front of you, what I might suggest is keeping the definition of synthetic just right out in front of you the entire time.

Because as Kim mentioned, all of
the definitions that we are going to present
to you, I think we have only included one.
All of the definitions were -- they started
out as part of the NOSB recommendation. And
then there were new proposed definitions that
came from the NOP, specifically the NOSB
recommendation was analyzed by the AMS science
division.

So all we've done is further
refine the proposed definitions that were in
the March 9th, 2006 document. So I just want
to be really clear that we haven't made up
these definitions, but we have refined them.

And what I'm also going to try to
do is provide some commentary that is not
necessarily in the discussion document, some
commentary that will speak to the progression
that occurred, going from the NOSB guidance
document of 2005, to the NOP document of 2006,
to the discussion document that was submitted
to you.

Up on the screen we have relevant
existing definitions, certainly synthetic, which is the definition that we are going to be working with. All of the proposed definitions are terms that are within the definition of synthetic. So we have recognize that, in trying to apply the definition of synthetic in making decisions about what materials should or should not go on the national list, there have been problems in trying to apply different phrases within the definition of synthetic. So we are really parsing out the definition of synthetic, breaking it apart, taking each phrase and defining those phrases.

Non-synthetic certainly is relevant, and then -- next slide, please -- the definition of processing. This definition is going to come up when we are talking about formulation and manufacture.

So we are starting with natural source. This definition was not used. Natural source is not used in the definition
of synthetic. However it was suggested by the
AMS, because the term, natural source, was
used in their definition they came up with of
extraction.

Now we refined the definition of
extraction such that we have removed that
term, natural source. However it is still
important to us, because one of the questions
that the AMS asked the NOSB to consider is
whether microbiological or fungal material
would be considered natural.

So the definition of non-synthetic
refers to mineral, plant or animal matter. So
what we have done in the definition of natural
source - now the AMS definition said mineral,
plant or animal matter -- we have taken plant,
animal, microbiologic and fungal and we have
wrapped that altogether into the phrase,
biological matter.

So naturally occurring mineral or
biological matter used to obtain non-synthetic
inputs for organic production or handling. So
really the creation of this term, natural source, is to help further clarify that which is non-synthetic.

So we are going to go in the order of easiest to most difficult. So that one should be pretty straightforward.

Now moving on to extraction, this is a big topic. The AMS document took the NOSB recommendation on the meaning of extraction and they broke it down into its various concepts and conditions. The NOSB document had a long paragraph that described what extraction meant as well as various conditions that would result in a non-synthetic substance.

So the AMS document came up with the term, extraction, and then went on to list out the specific conditions.

So we are suggesting that the verb form, going from extraction to extract, is more helpful when you are trying to clarify the distinction between extraction and
chemical change. So we are letting extract
stand more on its own.

There is -- to separate, withdraw,
or obtain one or more essential constituents
of an organism, substance or mixture, by use
of solvents or mechanical or physical methods.
So you can extract, and then once that
extraction has occurred, you look at that
extraction process and decide whether a
chemical change has occurred.

So here we have the conditions.
I'm just going to go ahead and read down
through them. These are going to be
definitely an area for everybody to focus on
and comment on.

An extracted substance is non-
synthetic if it's extracted from a natural
source. That is square one; first and most
important question. It has to come from a
natural source.

We have added the condition, it is
present in the same form in the natural
source. It is not chemically changed into a
different substance during extraction. It
comes from a natural source, has a chemical
change occurred.

And also the process of extraction
does not alter the substance into a chemical
form that does not occur in nature.

Important functional properties of
the substance are not altered by extraction.

And finally, it's not contaminated
with a significant level of synthetic
substance that is not on the national list.

Now this last part, so significant
level in this context, and this was, again,
this was what was set forth both with the NOSB
and the AMS document that a significant level
is the amount capable of producing the
functional or technical effect.

So this -- any significant levels
then of the solvent, let's say, that was used,
the chemical that was used to extract -- well,
let me back up first and say that -- and this
is really an important point here, because this comes up in discussion, and we are going to talk about this. You are going to be talking about this with respect to lecithin, but this has been the historical thought, is that the chemicals that are used in the extraction process do not necessarily have to be non-synthetic.

So, you can use a synthetic chemical to extract a substance, and that is okay so long as the substance is not chemically changed.

Now we are going to revisit that concept when we are talking about handling materials versus crop and livestock. This definitely applies to crop and livestock materials. We are going to look at where there may be an exception with handling materials based on a portion of the handling regulations.

What we've also added here with respect to insignificant levels is that it may
be problematic trying to focus on what a technical or functional effect is.

Some examples, you can take aquatic plant extracts and humic acid derivatives. Those are on the national list as synthetic, because they have large amounts of potassium left in them and they have a technical or functional effect, versus let's say hexane, that may be used in the extraction process but it doesn't remain in the product; it doesn't have a technical or functional effect.

There may be other areas that need to be considered, specifically, looking at the applicable regulatory limits that might be set for a particular livestock material or crop material. Maybe FDA or AFCO will set certain contaminants levels. So that is an additional consideration that we are suggesting needs to be looked at.

Okay. Formulation and manufacturing. If you look at the definition
of synthetic, it says a substance that is formulated or manufactured. So in the NOSB recommendation they said that once a substance is extracted, if it then undergoes a chemical reaction as it's processed, formulated or manufactured, it would be considered synthetic.

They also said that formulation or manufacturing, formulation or manufacturing, is not intended to address the processing of an agricultural product by a certified handling operation.

So they have got formulation, manufacturing and processing. And the AMS science division said, let's break this down further. Let's distinguish formulation as a process separate from extraction and processing. Let's provide a definition for formulation. And let's explain the relationship between formulation and synthetic.

The definition that they proposed,
they decided that formulation and
manufacturing, it would be more clear to view
them as synonyms. So they have come up with
this definition that talks about the
manufacturing of an agricultural or handling
input that is derived from a substance,
extracted from a natural source or produced by
a naturally occurring biological process.

They really just went for the
gusto here. They tried to wrap almost all the
requirements that you might consider for what
would be non-synthetic into this general
definition of formulation used synonymously
with manufacturing.

And we're saying let's break this
apart even further. Let's use the verb form
of manufacture. Let's view manufacture and
formulate as two separate things for lack of
a better word.

To manufacture is to make a crop,
livestock or handling input from raw
materials. That is the creation of a
substance. Where to formulate is combining
different materials according to a recipe or
formula to prepare the product being
evaluated.

We see those as being two separate
things, both of which need to be evaluated,
separately.

And then here is the definition
that we have added, another new proposed
definition is to further define the term,
generic, since we do use it in, I think in the
next slide you will see it come up. So that
definition is the common and familiar non-
proprietary name, of a substance.

Next slide. I think I have jumped
ahead here, so we are going to be able to save
some time, and go on with the next slide.

Okay, so some more discussion on
the term, formulate. Formulate generic
substances such as enzymes. Flavors are
examples of formulated products that must be
reviewed for inclusion on the national list.
So much like extraction we have set up conditions for formulated products. So it's a non-synthetic formulated product, contains only non-synthetic substances.

And the process of formulation doesn't transform a component into a difference substance via chemical change, with the exception of substances formed via naturally occurring biological process. That is always the exception for synthetic. Chemical change occurs, that's synthetic except if that chemical change is a result of a naturally occurring biological process.

And then finally the process of formulation results in the retention of important functional properties of active ingredients.

Okay so, manufacture, formally manufacturing, here is where the term, generic input, is used. Formulation is the combining of substances to produce a generic input.

This next part, manufacturing in
this context is not intended to address the
processing of an agricultural product by
handling operation for human or animal
consumption.

So it's really important to stress
that when evaluating substances, manufacturing
applies to non-organic inputs used in crop
handling or livestock operations. Once you
are talking about a certified handling
operation that is making a food product or an
agricultural product, it was processed. So if
it undergoes a chemical change it is not
considered synthetic, but rather a processed
product.

Substance is not defined by OFPA
or in the NOP rule, but it is used in the
definition of synthetic and non-synthetic. It
is used in the new proposed definition. It is
used in the regulation. And it is used
throughout our paper.

The NOSB defined substance in
their 2005 recommendation, and the AMS found
it to be scientifically sound. Namely, it allows for minor variations in the atomic composition or molecular weight of complex bio-molecules.

So really the point here is that the definition of substance, what it is recognizing is that substances don't necessarily have a uniform or static atomic, molecular composition. Therefore the substances are distinguished one from another based on identities. And there are identities that are assigned by the independent naming or regulatory bodies, such as the Chemical Abstract Society, CAS numbers.

And such identities may be based on chemical, technical or functional properties. And this distinction is important as it relates to the definition of chemical change.

Naturally occurring biological process -- this is another one NOSB defined in their documents. AMS found it to be
1 scientifically sound. Their only suggestion
2 is that if you separate it out from the policy
3 stating that substances created this way be
4 considered non-synthetic. So just to be
5 really clear that this is a non-synthetic
6 source, non-synthetic process.
7             MEMBER HEINZE: We want to make
8 sure we have time to see some things go
9 through the decision tree.
10             MS. WYARD: Oh, I'm just getting
11 started.
12             MEMBER HEINZE: I know. So maybe
13 if you could skim the rest of the definition
14 so we could have five minutes for -- I know we
15 are getting close. Just a time check.
16             MS. WYARD: That's perfect then.
17 I'll just say then for chemical change
18 probably the best thing with chemical change,
19 Rather than trying to drill down at all, this
20 was the area that troubled us the most. I'm
21 pretty sure that we all went through a
22 chemical change.
We formed the chemical change committee. Undoubtedly many of us were rendered synthetic. So this -- I'll just say that this is one you are really going to need to focus on. This has always been a problem area, and we have provided plenty of commentary and description in our paper. So next slide.

So finally in closing there were additional concerns, one has come up, this is 205.270(c)(2). This is where the split occurs from solvents that -- chemicals that might be used in the extraction of a crop or a livestock material, where historical thinking is that's fine so long as there is not a chemical change.

But that section of the regulation prohibits the use of volatile synthetic solvents in synthetic processing aids. But it is unclear exactly who that applies to, whether it applies to the certified handler or to the manufacturer of the non-organic
ingredient. It's very ambiguous, but very
very important figuring out in terms of how
you apply that then to the evaluation of
synthetic and non-synthetic materials for
handling operations.

Chemical change, there was some
comments yesterday. George, you know, there
were some members that had a very different
way of thinking about the definition of
synthetic, completely redefining it, going
into OFPA, making constructive changes there.
That was -- came up. We decided not to focus
on that since our focus was on the 2006 paper.
And that's a wrap on additional concerns
there.

So what I will do is exit stage
left, and call up Emily and Zea. They are
going to work some examples through the
decision tree if there is time for that.

We are going to look at citric
acid and we are going to look at soy protein
isolate using the decision tree that was put
together, using all of these new proposed
definitions that I presented here today.

Thank you very much.

MEMBER HEINZE: Thank you,

Gwendolyn. And just a time check. As you
guys know, we went into this an hour behind,
and we are trying to gain time.

So if you could just point --

focus on areas of maybe disagreement, and we
will give about five minutes for the whole
discussion.

Thanks.

MS. SONNABEND: Zea Sonnabend,

member of the materials working group.

I'm giving the example of citric

acid. And I hope you can all see the steps in

the decision tree up there.

This morning it came up in one of

your discussions of alternatives to the

petition. Where is citric acid really from?

How is it made? We are going to look at that

right now.
I happened to be here 14 years ago, and shepherded the initial TAP review of citric acid, and had this discussion with the NOSB 14 years ago along with several original members.

So it seemed appropriate that we go through it again.

Citric acid is used in many uses in organic crops and handling. Acidulant buffer, chelating agent, pH adjuster, foam inhibitor, sequestering agent, mordant, anti-coagulant.

The first question on our decision tree: is the substance manufactured, created, or extracted from a natural source?

And in your handouts we've underlined those terms that are defined in our previous definitions, so you can look back to those definitions.

So the answer to this is yes. The organism that is the source of citric acid is aspergillus niger. It has been grown on a
media that consists mostly of molasses and sugars. While the fermentation media contains some synthetic substances, these are either metabolized or removed by the extraction process.

Question two on the decision tree: does the substance undergo a chemical change? Well, the answer is yes for the end result, but along the way -- I mean the answer is yes in the process, but the end result, the end product, is not chemically changed from the starting material.

Explain: calcium hydroxide is added to the fermented carbohydrate media. Calcium citrate precipitates out and then sulfuric acid is used to remove the calcium as insoluble calcium sulfate and pure citric acid. The substance is therefore precipitated as a salt; ends up back as the same acid in which it began.

One of the controversial areas that we did not fully resolve in our
discussion is whether this so-called
displacement reaction where a salt comes in
and precipitates out being displaced, one ion
displaces the other; and whether in all
circumstances that results in a chemically
changed material. Some of us say no; some of
us say yes; and that might need a little bit
of further work.

But for the purposes of this, what
this particular material, what the NOSB then
went on to say before is to go to question
three. Is the substance produced by a
naturally occurring biological process? And
the answer is yes, aspergillus niger is the
naturally occurring biological process. If
you look back in your definition of synthetic,
it says except for those things produced by
naturally occurring biological process.

So therefore we proceed to step
four: has it been formulated further to
produce an additional generic substance? And
the answer is no.
So the conclusion is that citric acid is non-synthetic because it is part of the exception for naturally occurred biological processes that created the material in the first place, even though some steps that create chemical change have occurred along the way of its extraction and processing.

MEMBER HEINZE: Thank you. Are there any questions for Zea? Comments?

Do folks understand how their proposed decision tree applied in that case?

Thank you, Zea.

Emily.

MS. BROWN-ROSEN: Hi, I'm Emily Brown-Rosen from Pennsylvania Certified Organic.

Okay, so the example they threw in my lap is this one that's been kicking around for along time called soy protein isolate.

So if you look on your -- we gave the Board a handout on this, on the back page,
I pulled out a little description of the manufacturing process that I dug out of some old supplements to supplements of TAP reviews; I think there were three various technical reports on this in 2003 and 4. So and I wanted to do that to illustrate one point, too, is that when you are going through a decision tree it is really really important that you have a good clear understanding of the manufacturing process. I mean, the more information you have the better you can answer these questions, and it all depends on information, how you answer those questions. So that is really worth getting at and working with the contractors I think to get really good manufacturing process.

Okay so in this case question number one -- well, back up a second, and say this was petitioned as a fertilizer soil amendment. It's a derivative of soybeans used as like a nitrogen supplement fertilizer.
Although it also does have a lot of food additive uses as well, but it was not petitioned for that.

Is the substance manufactured, created or extracted from a natural source? And the answer to number one would be yes. We start out with soybeans; that's pretty natural. Pretty obvious.

Number two, does the substance undergo a chemical change? The answer here is yes, and the explanation is that they take the defatted soybeans, which are hexane extracted, pressed, soybean flakes -- this is done like in big conventional soybean plants. They use alkalide acid hydrolysis. There is an alternate method that uses something called poly isopoprylacrylamide gel to do the separation.

But this, the most common is this hydrolysis process, and that is described as hydrolysis of soybeans by a strong base sodium hydroxide, and then a strong acid,
1 hydrochloric acid, which denatures and changes 
2 the chemical properties of the protein in the 
3 soybean meal.

4 The proteins are rendered more 
5 water soluble by these different stages of 
6 chemical processing. In the case of the 
7 polyacrylamide gel, that also changes the 
8 chemical properties, and I think the 
9 solubility of the soy protein.

10 Another reason to consider that 
11 there was a change is that soybean meal has 
12 one CAS number and soy protein isolate has a 
13 different CAS number suggesting that they are 
14 considered two different chemical compounds, 
15 they have different functional properties.

16 So in this case the answer to the 
17 question, yes, it says proceed to question 
18 number three. Then the next question, did 
19 this chemical change, was it caused by a 
20 naturally occurring biological process? No, 
21 in this case it was a direct chemical process, 
22 so the answer is no, and that's where you
would stop and say this substance is in fact synthetic. So that one is fairly straightforward.

Any questions?

MEMBER HEINZE: Thank you. Any questions for Emily? Do you folks get how that went through the decision tree that has been proposed?

Okay, well thank you. Is that it for you guys? Great, well, thank you very much. I appreciate all the hard work and all the education.

CHAIR MOYER: And the Board thanks the materials working group a great deal. Thank you very much.

Katrina, does that conclude your presentation?

(Applause)

MEMBER HEINZE: Hey, you all are clapping because you are glad it's over.

Thank you, everyone.

We are done, Jeff.
CHAIR MOYER: Thank you, thank you very much.

Moving on to the next topic in front of the Board, the Materials Committee, Dan Giacomini, chairman.

Dan.

MATERIALS COMMITTEE

MEMBER GIACOMINI: Thank you, Mr. Chairman.

The materials committee was cruising along between the last meeting and this, and the issue of nanotechnology, its use in all various forms and products, started becoming more and more obvious, and with just a little bit of investigating we went from, boy, maybe we ought to start looking at this before the horse is too far out of the barn, to, wow, the horse is already out of the barn.

So it became -- it moved up on our work plan significantly. But we felt that it was something that we definitely needed to at least start discussion on with the organic
community.

The background, this is a discussion document. And within it we asked a number of specific questions which I won't go into each one, itemizing each one at this time. But we did have fairly uniform agreement with the comments that were presented that nanotechnology is not compatible with organic principles and the organic industry.

What there was not clear agreement on is what is the definition, and where should that line be drawn of what is nanotechnology. There is the issue of the nano-sized particles, the use that it -- what it is used for, and whether there is a change in original use. And there may be other things that come up as this industry continues to develop.

The -- so we had a fairly good agreement, I think, with the comments that we had that we need to consider looking at this, and trying to figure out a way to best define
or to find the agency that is far smarter than us that has done the best job at defining nanotechnology for our purposes.

We certainly are not experts in this field by any means, and we are relying on all the expert help that we can. We did a tremendous amount of work in searching things through from some of the national initiatives on the Internet, and we had tremendous support and help from OTA on some of their background information that they worked on through their nanotechnology task force.

The one thing that I will address based on comment is that we had a number of public comments that felt that nanotechnology should be included now under excluded methods, and that it is already covered. While that may have some intuitive logic to it, when you actually look at the definition of excluded methods, it's fairly exclusive to dealing in genetic and cellular terms. And oftentimes when we are dealing with things like nano-
silver and other products along those lines,
it's -- right now it does not appear that the
definition we have for excluded methods
includes those compounds.

So, Mr. Chairman, it's a fascinating topic. We do have the discussion
document, but I think in the essence of time
I will go to any questions you may have,
questions or comments.

CHAIR MOYER: Thank you, Dan.

Julie.

SECRETARY WEISMAN: I think I certainly have -- we got a lot of written
public comment, some written public comment
about the nanotechnology, and we certainly
heard quite a bit said yesterday during oral
public comments. And most of that rightly
points out that there is a lot that is not
known about the results of the kinds of
particles that could be created by
nanotechnology.

However, I think the reason why
this -- we did not consider this to be a no-brainer is because it is also the case that some very traditional longstanding methods have been in use that do fall under the current definition of nanotechnology, and I'm thinking about homogenizing milk.

So I guess I just want to emphasize that parts of nanotechnology I think are no-brainers in terms of deserving very close scrutiny. But to me it's not the same kind of no-brainer as cloning was, for instance, when we made our statement about that.

So I just want to caution everyone that we have to be really mindful that there are technologies that have been around since -- there are practices that have been around since before the idea of nanotechnology was even dreamed of, and we don't want to do anything -- we want to be very careful about what -- not throwing out babies with bathwater.
MEMBER GIACOMINI: I'll agree with you to a certain extent, Julie, but I think your comment gets to the essence of the problem in the definition. One of the more predominant definitions that we list in the document has three points to it, and it says, in their definition -- within the definition they say that it needs to meet all three points to be nanotechnology, and that is the small particle size of between one and 100 nanometers in size, creating or using structures, devices, and systems that have novel properties and functions, because of the small or intermediate size; and the ability to control or manipulate on the atomic scale.

I think the example you gave, for instance, with the homogenizing of milk, fits number one. There are particles of that size created. But I'm -- I would question whether they meet number two and three. And if they have to meet all three, then they would -- yes, it's nanoparticle size, but it's not
nanotechnology. And that is all part of the problem in trying to figure out what is the definition and where do we draw the line.

And there are many other ones.

There are products you can find in the marketplace. There is a product I found on the Internet that described itself as a nanotechnology ice cream. They make their ice cream and they deep freeze it in liquid nitrogen to create smaller crystal particles.

They are creating nanotechnology size, but even if we question some of the other things, are we -- would we want to not allow liquid nitrogen freezing in the organic industry that would -- that would take some discussion.

There was another soil or plant crop additive -- I don't remember whether it was soil or plant -- that used homeopathic concentrations in the water -- in the irrigation supply. They describe themselves as nanotechnology, but then they talk about it
as homeopathic. They didn't really say whether they were nanotechnology because they were homeopathic, or they were nanotechnology because of what they did to the particle before they went through the homeopathic dilutions.

So it's used -- the term is used as much in marketing as it is in reality and science, and it's sometimes using right now, it's being used to sell as much as it is to truly explain. So that is another part of the problem.

Anything else? If there is no more, Mr. Chairman, back to you.

MEMBER SMILLIE: Joe, what is your plan for this document?

MEMBER GIACOMINI: We will try to keep this document as high on the priority list as we possibly can, but it is definitely going to be secondary to the definition and classification of materials. We would like to say that we could get a recommendation for the
fall, but it will -- we will not -- we won't
allow it to displace timeframe on the other.
The other is, we are not saying this is small,
but that one is longer.

CHAIR MOYER: Any other questions
or comments for Dan?

There being none, I think we are
in need of a brief break. We will take 15
minutes. Be back here please at 3:15, Board
members, ready to take your seats.

(Whereupon at 3:00 p.m. the
proceedings in the above-entitled
matter went off the record to
return on the record at 3:18 p.m.)

CHAIR MOYER: Okay, we have a
quorum. We are going to get started.

Our meeting is back in session,
and we will get started with our next order of
business before this board which would be the
handling committee report, Steve DeMuri,
chairperson.

Steve, if you're ready, the floor
1 is yours.

2 HANDLING COMMITTEE

3 MEMBER DeMURI: I am ready, thank

4 you, Mr. Chairman.

5 Well, it's been a very busy six

6 months on the Handling Committee. We've got

7 a number petitioned items we are going to

8 discuss today.

9 And first of all I'd like to thank

10 the other members of the committee for all

11 their hard work over the last six months.

12 We've had a lot of meetings, done a lot of

13 document reading, a lot of public comment

14 review. And it's been very invigorating and

15 a little bit tiring.

16 I especially want to thank Julie

17 who in addition to being the Board secretary

18 and member, I think, of every other committee,

19 she has also helped to push me out of the nest

20 as the Handling Committee chairman. So thank

21 you very much, Julie, I appreciate that.

22 This is somewhat of a historic
meeting for this Committee and the Board actually because we are considering petitions to actually remove items from the national list. So I think we do -- we know that we need to be fairly quick here because we are late, but we want to make sure that we give everybody enough time to ask questions on these important items. So we will try to be as expeditious as possible here.

We do have nine different petitions that we are reviewing today. For 605(b) we have proprionic acid, sodium chlorite acidified, propane, and bleached lecithin for removal.

For 606 we have chicory root, red corn color, myrrh essential oil, wheat germ, all to add; and lecithin fluid, unbleached, to remove.

We did divvy these up as a committee, and we will go in order of the agenda items, and each committee member that was responsible for doing the bulk of the work
on each item will present those to you.

The first one is proprionic acid, and that happened to be mine. This petition was very similar to the petition you heard about for the livestock committee. It was petitioned as a mold inhibitor in feeds and grains, almost exactly the same as the petition to livestock. The petition is for the synthetic form of proprionic acid; I want to make that very clear, that there are natural forms available. This petition is for the synthetic form only, so that is a very important distinction.

As I mentioned, there are natural forms available.

The few public comments that we received on this item seemed to agree with the committee recommendation. And our recommendation was to not list, and that was a vote that was four no, one absent, one recusal.

I think that is all I need to say.
about this, because you've heard a lot about
the particular substance with the livestock
report. So any questions at this point on
proprionic acid?

No? Okay. The next item we have
on the agenda is sodium chlorite, acidified,
and I will pass the mike on to Katrina.

MEMBER HEINZE: Thanks. Okay,
sodium chlorite, acidified, has been
petitioned for addition to 605(b). I'm going
to give a brief background of what it is, how
it's used, it's regulatory approval and then
some of the conversation that we had as a
committee as we evaluated this, and then
review some of the public comments.

And it is our recommendation to
list this material.

So sodium chlorite, acidified, is
used for direct food contact and indirect food
contact surface sanitation. It is solutions
that are made onsite, and on demand, by mixing
a solution of sodium chlorite with natural
citric acid. So the users of this would have two tanks onsite. One would have about 25 percent sodium chlorite, and the other would have about 50 percent citric acid. When they are ready to use it, they are pumped together with a water dilution, and then used at the point of use.

As you heard yesterday in public comment, the solution breaks down to citric acid, water, and common table salt. And that is one of its advantages over similar materials that are already on the list, that it's breakdown materials are, frankly, pretty benign.

It has regulatory approval very widely, by FDA, USDA's food, safety and inspection service, EPA, and multiple other food safety clearances around the world. Just wanted to read some highlights from our recommendation. So Valerie, perhaps you could go to category one, question two.
It is manufactured in a manner very similar to other materials that are already on the national list, and so as we evaluated its environmental and human health impacts, we considered the fact that there are similar materials that previous boards have said there are maybe some impacts, but frankly those are impacts that we think we can live with given the food safety benefits of this material.

One concern that two materials that are currently on the list have, and those are sodium and calcium hypochlorite, one concern with those that previous boards have is that they have the potential to form trihalomethane compounds when they react with organic material in the environment. And the European food safety authority has reviewed this material, the sodium chlorite, acidified, and determined that those halomethanes have not reported to be formed when this material is used. So again that is a benefit over
currently listed materials.

We did, and we discussed this yesterday, in our recommendation we were --
wanted to reflect that we understood that in 2003 the NOSB processing committee had made a recommendation on the clarification of chlorine contact with organic food. There is quite a history on the annotations of these materials that reflect some confusion about whether or not they can be used in direct food contact, or cannot be used in direct food contact, and then at what levels. And so we wanted to recognize that and be consistent with that recommendation.

We did receive some public comment that asked that in general for the chlorine materials that those imitations be cleared up. So we will be regrouping tonight to have an annotation to either confirm that our annotation we think is consistent with that 2003 recommendation or to adjust it slightly. So more to come on that tomorrow.
The most important thing I think for my fellow Board members to understand is, our recommendation really reflects that we believe that adding the appropriate tools, but adding tools to the tool box of food safety interventions is really really important. As this business grows, as the complexity grows, handlers really need to have the best tools possible in that food safety tool kit.

We heard yesterday from the petitioner that while there are similar materials to the sodium chlorite acidified on the list, that this really is a unique tool that is used by a lot of manufacturers in a multi-layer approach, and that is important. Also it's used at very dilute concentrations, so it is perceived as being more environmentally benign than some other options on the list like sodium hypochlorite. But again, often needs to be used as a multi-layered approach to ensure food safety.

Finally the 2003 recommendation
that I talked about before, specifically speaks to the NOSB wanting to encourage exploration of other methods, beyond the materials that are on the list, for disinfecting the water that is in crop contact. So they do mention ozone hydrogen peroxide, and peracetic acid. So there -- as these sanitizers continue to evolve and there continues to be innovation, I think we need to encourage that by listing things that are other tools in the tool box.

So finally on public comment we did receive five public comments on this material. All of them spoke to the need to better understand the annotations. So as I said we do need to work on that.

Most provided some specific suggestions. One specifically said that current annotations for chlorine materials in general are not clear with regard to direct food contact, and said that the annotations should be made consistent with practice or
practice consistent with the annotations. So that is perhaps some homework for us. So again our recommendation is to list this material.

Questions? Yes, Jeff.

CHAIR MOYER: Katrina, I notice on your recommendation form that your vote was split, and I was just wondering if either you or someone from the committee could explain that.

MEMBER HEINZE: I'm not remembering that. So perhaps my fellow members.

CHAIR MOYER: It was three to one with one abstention, so there was a no vote there; I'm just wondering what that position represents?

MEMBER HEINZE: Does anyone remember that? Miraculously, this was not a just in time recommendation. So our memory is failing us.

CHAIR MOYER: Unless somebody --
1 I mean maybe somebody else on the Board, 
2 whoever voted no, could explain why they did 
3 it, or maybe they don't remember? 
4 MEMBER HEINZE: Does anybody 
5 remember voting no on this? 
6 CHAIR MOYER: I'm curious what 
7 their opinion was that they voted no on. I'd 
8 be curious. 
9 MEMBER MIEDEMA: Katrina, I 
10 remember the argument being that there were 
11 substitutes, but I don't remember how I voted, 
12 sorry. 
13 SECRETARY WEISMAN: I was going 
14 to say, I don't remember how I voted either. 
15 But I do remember the discussion. It had 
16 something to do with the fact that why do we 
17 need this when we already have other things on 
18 the list that serve the same purpose. And 
19 there was a lot of back and forth about 
20 whether this was more benign than things that 
21 were already listed. 
22 MEMBER HEINZE: We did at one
point go back to the petitioner with that specific question that said, there are other things on the list that are perceived to be good substitutes. Why are they not good substitutes? Why do we really need this? And if I remember we had not gotten that answer when we took our vote. But the petitioner sent us a very nice couple page response that articulated very specific examples where producers or handlers need to use this in addition to the things already on the list, specifically peracetic acid. The technical review had said peracetic acid could be used in place of this material, and the petitioner came back and said in fact that is not the case, and here are some examples, and I could make that available if you are interested.

CHAIR MOYER: I appreciate that,

thank you.

MEMBER HEINZE: Any other questions?
Thank you.

MEMBER DeMURI: Thank you, Katrina.

The next item on the list were 205.605(b) is propane, and it's not for barbecuing organic chicken. It was petitioned as a propellant for organic cooking sprays.

Propane is a constituent of natural gas and crude petroleum, and is separated during the production of gasoline using fractional distillation under pressure. We consider it to be a synthetic for that reason.

There are a couple of other reasons why we did vote to not list this substance on 605(b). CO2 is already listed for this use and is used in the industry as a propellant for various kinds of sprays including organic cooking oil now. And there's even probably a better application than that is just a regular old hand pump sprayer that may of us have that you can use
1 to pump oils out onto a cooking pan or
2 something to coat your cooking pans with
3 organic oil.
4 So as a committee we felt that
5 this was not an item that we should recommend
6 to be listed for those major reasons.
7 So the vote on this particular
8 substance was zero yes, five no, and one
9 absent.
10 Any questions on propane?
11 Okay, the next one, one of the
12 most complicated on the list here, this one
13 for 605(b) is lecithin bleached, and I'll pass
14 the baton on to Julie to discuss this item.
15 SECRETARY WEISMAN: The moment
16 you all have been waiting for.
17 I'm going to give Valerie a chance
18 to bring this up on the list.
19 This was both exciting and
20 challenging to work on for a number of
21 reasons. One of the challenging reasons we
22 discovered is that these criteria evaluation
checklists were developed really for the purpose of adding materials to the list, and we had to make some amendments to them which I think probably we would be -- do well to incorporate, and I will point them out to you as we go along -- but we had to make some amendments to be able to use them for the purpose of removal from the national list.

The first one that you see actually -- why does yours look different than mine?

MS. FRANCES: I just did that for the benefit of the audience.

SECRETARY WEISMAN: Okay. That's because I'm not far enough down. Sorry.

So you can see that -- we added a box that didn't use to be there, because it used to be we were only talking about things that were allowed or rejected. So that was one liberty that we took.

But I don't want to spend the whole time talking about the criteria.
evaluation checklist.

The bottom line here is that -- well let's move -- let's move down. And then we will go back to the vote.

In terms of category one, I think that is big enough, that we see that there are now alternatives available, notably organic alternatives, which would address some of the concerns about the use of hexane and peroxides, where we have already seen legislation that may restrict the oil processing operations that use them.

And that same applies to the second item about environmental contamination. And we are talking here obviously about the use of the listed material that we are considering removing.

I'm going to skip down now a little bit. I mean it was a fascinating process, considering all of these from a different perspective, but I don't really -- we want to move ahead because of time.
In terms of the material that we are considering removing in a technical review I'm using -- I'm going to question two here in category two, is the substance formulated by a process that chemically changes the substance extracted, and that crude soy that is obtained in conventional lecithin is obtained from hexane extraction of soy flakes. And then it's de-oiled using acetone.

The lecithin is bleached using hydrogen peroxide and benzel peroxide. I do want to note that in terms of hydrogen peroxide actually is allowed for organic production even, but the benzel peroxide is not.

Question number four, I am referencing the fifth item in category two, which is, is there an organic substitute? Yes, that there are numerous forms of organic lecithin, and several different manufacturers. I'm sure we are going to have a little bit of discussion about that. There has already been
1 public comment. I know we are going to be
2 going back to that.
3
4 Is the substance essential for
5 handling of organically produced agricultural
6 products? We -- the discussion that we had at
7 the time, even though we have heard public
8 comment that questions this, is that we found
9 that there are a wide variety of organic
10 products that are currently available that
11 can't be made without an emulsifier, and that
12 lecithin is the primary emulsifier used in
13 those products; but again, I think the
14 question is, is the organic lecithins are
15 available for that purpose?
16
17 Is there a wholly natural
18 substitute product? The organic forms are the
19 only forms of lecithin that are being produced
20 without synthetic solvents and bleaching
21 agents. And we thought that that was an
22 important -- that makes them an important
23 alternative to the 605(b) listed materials.
24
25 I'm not -- you know I'm not sure -
- I'm feeling the time pressure.

CHAIR MOYER: No, no, you're fine.

SECRETARY WEISMAN: The question, are there alternative substances, again, we know that there are forms of organic lecithin which achieve light color without bleaching; that those are available in commercial quantities; and that there also are other organic and conventional non-synthetic materials, such as gum, which could serve similar functions in certain cases.

Is there another practice that would make the substance unnecessary? Again, the organic version is obtained by expeller press instead of hexane extraction. Using different varieties of soy yielding lighter colored oil, combined with filtration, have been used to achieve the same effect as bleaching.

So I'm going to move now into category three, is the substance compatible
1 with organic handling? We never really -- we
2 never questioned that. Is it consistent with
3 organic handling? Again, we didn't ever
4 question that.
5 Is it compatible with a system of
6 sustainable agriculture? And that is not
7 applicable, because this is a handling, not a
8 production material.
9 Nutritional qualities, it's the
10 same either way. Not primarily used as a
11 preservative, not primarily used to recreate
12 flavors, colors, textures, or nutritive values
13 lost in processing.
14 And I'm going to skip seven
15 because that really more applies to on-farm
16 inputs.
17 Here's the fun one: commercial
18 availability, category four. Basically the
19 issue is that there are -- we see that there
20 are new methods for making organic lecithin
21 that is light in color using only allowed
22 methods.
There are numerous varieties of light-colored certified lecithin, and in terms of the quality the petitioner and the technical review concurred that products that are made with organic lecithin and the listed material are indistinguishable. In other words, looking at finished products that are made with both.

Panel testing has been conducted which confirms this. Then the question of is there quantity sufficient, and the petitioner states that there is currently unsold inventory, and besides that additional capacity available to make organic lecithin sufficient to meet current requirements.

I imagine this is something that will be part of our discussion -- I hope it's going to be part of our further discussion on this.

Regions of production, climate, we did not think were applicable here. We do see that there are at least four suppliers that
were identified of organic forms of -- organic
forms of lecithin.

    It did not seem that weather is a
factor or trade-related issues. There were no
other issues that were presented which would
make us think -- and please keep in mind that
when we answered this set of questions in a
petition to remove, here we are evaluating the
organic form, the availability of the organic
form, as opposed to when this is part of
listing a 606 item.

    Actually I'm not sure that that
was -- confusing, I hope it wasn't. But
anyway, based on our answers to these
questions on the criteria evaluation
checklist, we found by a vote of five no --
five voted in favor of removing, no one voted
against it, and there was one absent.

    And we felt the reason why this
substance -- again, now, when it says the
substance failed criteria, it means that the
listed substance now -- in other words if we
were evaluating the listed substance for addition now, based on the information that was given in the petition, we would find that it was failing the criteria in category two, and also category four, because there are organic -- two, because there are organic alternatives available, and four, because we believe that there is a commercially available supply of the organic substitute.

And that's the story. Questions?

Questions? Gerry.

So this is for bleached fluid lecithin, correct?

No, this is all bleached lecithin.

This is all bleached lecithin, okay.

All non-organic bleached lecithin of any form to be removed.

There was a lot of discussion yesterday and in public
1 comment. Did any of that affect the
2 committee's view?

3 SECRETARY WEISMAN: Thank you. I
4 neglected a very important part of this
5 presentation, which is, yes, there was
6 actually I think there were a total of 267
7 written comments received on regulations.gov
8 ahead of the meeting for this material, not
9 counting comments that were made yesterday and
10 that we may still be hearing later today.
11 I want to say that of those 267
12 comments 240 -- let's see, do I have this
13 right? 243 of them were one template. That
14 was in support of removal, but they were all
15 identical comments.
16 There appear to have been a second
17 template that was being used also in support
18 of removal, and that was -- there were five of
19 those. And then there were -- and this is of
20 the comments that were specifically on the
21 removal of lecithin.
22 There were other comments made
referring to lecithin that were embedded in multiple topic comments that were made, and I haven't even included those in this tally.

But anyway of the original comments that were made, five of -- there were 15 of those -- five supported removal and five opposed, because they felt they needed what they were referring to as the de-oiled varieties. And there were also five that felt that they needed non-soy varieties in order to have -- the issue of allergies was basically being raised. And there was some concern which I think -- we do -- we take seriously, that there may be non-soy varieties that are not available as organics, so we will want to figure out how to address that as well.

I guess -- I think there were also -- I apologize that I probably am not giving a lot of -- so much -- there may be -- have been other comments that were part of the multiple comment things, and I would say that they were on both sides of the board. Some of
the lecithin comments were from the multiple
commenters were in favor of removal, and some
were opposed to removal. One of the reasons
people gave for opposing the removal was that
there were -- that there weren't enough
suppliers. And I think that we agree and we
understand that there aren't many. But I also
have to say that it doesn't -- there is a lot
of organic lecithin available; a lot of
varieties of organic lecithin available; and
you know, because this is new territory,
assessing commercial availability about a
product we are considering removing, I don't
think that it is going to get any better than
this. I mean perhaps one could argue that
with flavors there may be even more variety of
organic flavors available, and yet it still,
you know, is on the national list.

But I -- I think that if we are
not in a position to remove a product with
this -- from the national list with this
amount of organic alternative already in the
marketplace -- I'm not saying that there
doesn't need to be more, but I think that it's
going to take the act of deciding to remove it
to stimulate those additional suppliers that
we want to see.

And I can tell you as a
manufacturer and a developer of an organic
minor ingredient that I am lucky if I can be
the only player in the marketplace for more
than a year. And I would say that two years
is a maximum that I can hold on to my
advantage before other people are in there
nipping at my heels. And I believe firmly
that the same situation will be created for
this material if we vote to remove it.

MEMBER JAMES: And Julie, correct
me if I'm wrong, but didn't somebody say
yesterday that even if we did remove it it
would take time for that to actually happen?

SECRETARY WEISMAN: Well, I think
that we have to put our own sort of memory
together. I think that there is -- the time
between when we -- historically between when we have made a decision -- and up to now they have all been decisions to list -- has been I think a minimum of 18 months and usually much more than that. I mean we had a comment even yesterday asking where is the docket for this, where is the docket for that. It was decided on two years ago.

And I'm not saying this to put any kind of pressure -- I know the challenge the program is up against in making all this happen. And the only exception I will say where they came through phenomenally was where we made the 606 listings. I think three months or four months later there was an interim rule published. And the only reason that happened was because they were already working on whatever they have to do over there to make Federal Register notices be published before we had even made our votes with the idea that if they had to take things out and delete them they would.
So I would say that if we vote tomorrow, it doesn't mean that the use of the material goes away tomorrow. There is a good 18 months, two years, maybe more -- hopefully not more -- before it actually becomes a final rule. And I guess someone from the program could correct me if I'm wrong. There would be an interim rule first for something like this, or not necessarily?

CHAIR MOYER: The Chair recognizes Richard.

MR. MATTHEWS: It would be a proposed rule.

SECRETARY WEISMAN: It would be?

MR. MATTHEWS: A proposed rule.

SECRETARY WEISMAN: A proposed rule, so there would even still be -- we would be getting some -- probably some feedback once that was already a proposed rule.

MR. MATTHEWS: Yes, the only reason the other one went as an interim file rule was because of the Harvey suit.
SECRETARY WEISMAN: Right.

MR. MATTHEWS: OJC is not real keen on letting us do any materials dockets that don't first go through a proposal.

SECRETARY WEISMAN: Okay.

CHAIR MOYER: Joe, you had a question. Then I had Hue second and then Tracy and then Dan. Hue?

MEMBER KARREMAN: Maybe I missed it, but I don't think so. But wasn't there discussion yesterday about the de-oiled variety and how that would be kind of cut off from this, if that would be okay with the petitioner and everything? Or is that a different material?

SECRETARY WEISMAN: That's -- we actually have another lecithin material that we are going to be discussing, and there is a little bit of complexity. And we will, when we -- I will be making some comments in my later presentation that is going to address that.
1     CHAIR MOYER:   Tracy.
2     MEMBER MIEDEMA:   I have a process
3     question. Just for the most continuity in
4     this discussion, could we move up the 606 item
5     on lecithin and talk about them together?
6     CHAIR MOYER:   Let Dan have his
7     comment first.
8     MEMBER GIACOMINI:   Yes, when I
9     was reviewing the public comments on these and
10    just transferring them over to my computer
11    since I don't have online here, it seemed that
12    a lot of those public comments, while they
13    were form letters, they were very specific in
14    stating that there is organic soy lecithin
15    available, and that please not allow the
16    hexane varieties to continue in organic
17    production.
18    With that, and with the comments
19    from yesterday and some other speakers, is
20    there any consideration to limit this to only
21    taking off the soy portion?
22    SECRETARY WEISMAN:   The issue of
hexane extraction has nothing to do with soy.
The soy piece goes to the issue of allergens,
unless I'm misunderstanding your question,
Dan.

MEMBER GIACOMINI: Removing this
from the list as you have, I don't know that part, (b), taking all bleached
lecithin off the list, it would also take all canola bleached lecithin off the list and all sunflower bleached lecithin off the list even from conventional sources.

There is minimal -- we had very limited evidence that that is available in any kind of a commercial form. I'm just wondering unless I misunderstood, I'm just wondering, since much of the comment was related to organic soy lecithin being available, and there is whether we agree with the allergen issue or not, there seems to be a consumer demand for other types of lecithin. And I'm concerned with a blanket elimination.

SECRETARY WEISMAN: I understand,
and I think maybe Tracy's suggestion that we move into the other lecithin petition, because I think that your -- I think that will be addressed.

CHAIR MOYER: Steve, do you have a problem with moving the other item up now?

MEMBER DeMURI: No, I don't. I think that's a great idea. I do have one comment to answer Dan's question. It's kind of the chicken and the egg syndrome again, that there is organic canola available and organic sunflower. There is no reason why manufacturers can't make organic lecithin out of those organic sources.

CHAIR MOYER: In light of the comments we just had, Julie, would you please review the lecithin fluid unbleached? Valerie, can you bring that up? I know we are jumping out of order, I apologize.

SECRETARY WEISMAN: But we were moving into 606 anyway; this just moves it up the list of 606 items. Okay.
The way this was petitioned, I guess I first want to address the way this was petitioned, the petitioner petitioned for the removal for the listing of lecithin -- for the removal of fluid lecithin, unbleached lecithin from 606. In other words it was their intention to only remove the fluid forms of unbleached lecithin.

And it has been pointed out over the last day -- okay -- I wonder if I'm jumping the gun, if I should just go through the petition.

Actually I think these -- the criteria evaluation checklists for these two things were pretty similar. So I think I'm not going to go through them all item by item, because I think a lot of it was covered. I hope I'm not making a procedural error here.

CHAIR MOYER: You might use it to address Hue's question regarding the comment yesterday.

SECRETARY WEISMAN: Remind me
again.

MEMBER KARREMAN: There was talk about the de-oiled form either being allowed or not. Petitioner was amenable to keeping that allowed. So if you could --

SECRETARY WEISMAN: Right, so at the time we voted on this, what we voted to do was actually to -- we agreed with the petition to remove the fluid portion of unbleached lecithin, and what that would cause us to do in effect would be for there to be an annotation that says dry forms only.

I think we also -- and that is in section C if you go back to the cover sheet of this, if you can scroll back, what we've done is -- what we are saying here is that numerous varieties of organic fluid lecithin are now commercially available that perform the same function as fluid lecithin that is included in the current lecithin unbleached.

And so to make that distinction that you are talking about we proposed the
annotation listed under C there as that dry forms only would be added to the current listing of lecithin unbleached.

Now I think at this time I want to -- so let me ask, does that -- and we heard public comment from experts yesterday that explained to us that dry is de-oiled; that those are basically the same thing.

MEMBER KARREMAN: As long as the petitioner is okay with that.

SECRETARY WEISMAN: Now we are going to have a request I think for the petitioner at this point, because a point that was raised yesterday not during public comment, which is why I want to make it public now, is that the handling committee in coming up with this -- in voting this way, in making this recommendation, we were actually doing something other than what we were petitioned to do. What was petitioned was the removal of fluid lecithin from 606. The only problem is that there is no annotation on 606 that says
anything about fluid or dry. So we made something up -- well, first of all, the petitioner asked for something that wasn't actually part of the listing, and then we made something up to address that. And that may not be a good precedent to set, to have the Board come up with things that are not part of what's petitioned, even though it was meant to serve the function of what was petitioned.

So we want to -- the handling committee discussed this, and we believe that if we could suggest a friendly amendment --

CHAIR MOYER: Tracy, please.

MEMBER MIEDEMA: Julie, I'm not sure if I heard you right, but I want to make possibly a technical correction here.

What I believe we heard yesterday from the public was that de-oiled and dry were definitely not the same. And so de-oiled was a process using a solvent removed the oil, whereas dry was taking and spraying it onto an augur or inert, so I think I just maybe heard
you say that they were the same.

SECRETARY WEISMAN: No, the conventional, the non-organic lecithin that is available as dry is all -- is de-oiled lecithin. The only dry lecithin that is being marketed is this organic lecithin that is being spray dried onto say maltodextrin or possibly could be spray dried onto other carriers.

So anyway what we think would be a cleaner process that doesn't set maybe unwanted precedents for future Boards is if the petitioner would agree to a friendly amendment that they amend what they're petitioning in the following way, that rather than petitioning for the removal of fluid lecithin from the listing of lecithin unbleached on 606, that they petition to -- that they accept the idea that this petition is really to change the listing, of lecithin, from lecithin unbleached to read, lecithin de-oiled forms only. We believed that that would
serve the same function.

So is there --

CHAIR MOYER: At this point I think what we should do is call the petitioner to the podium and ask him if he would accept that amendment.

Is the petitioner here? The Board recognizes Lynn Clarkson.

MR. CLARKSON: Dear NOSB, we would accept that amendment. We think that makes it clearer. We think that provides flexibility, and addresses the issues that were brought up by opposing comments yesterday, and supports the development of more organic ingredients.

So we accept.

CHAIR MOYER: Questions from the Board to the petitioner?

MEMBER KARREMAN: So could that officially be said, what the amendment is just at this time since he is right up here.

SECRETARY WEISMAN: Yes, so
therefore, the item that we will be voting on
tomorrow is going to be a petition to change
the listing of lecithin on 606 to de-oiled
forms only.

CHAIR MOYER: Point of order, the
executive director has a question or a point.

MS. FRANCES: I guess in light of
all this discussion going on regarding
synthetic and non-synthetic and non-ag and ag
and the fact that the de-oiled forms are using
solvents such as hexane and acetone, whether
that would really render this appropriate to
be listed de-oiled only on 606, and whether or
not it should be 605(b) and commercial
availability applied to that instead.

SECRETARY WEISMAN: I'll take a
stab at it, and I'll turn it over to you if
you don't think -- it actually -- as far as I
understand all of the conventional lecithin,
including that currently listed on 606, also
includes -- is also produced using those
ingredients. So it would not be putting
anything different on 606 than what is already there.

CHAIR MOYER: Joe.

MEMBER SMILLIE: I also believe that that is an important issue. It was addressed by the materials working group. It's an open question. I don't want to get the two issues together.

What we want to deal with is the lecithin issue. The whole question of solvents used on 606 materials is an important question but it's a different question. So I don't want to deal with both questions at once.

So I would say let's stick with the way we're going, and the annotation, the new petition, and not get into what is a separate and distinct issue as far as the nature of processing for 606 materials.

CHAIR MOYER: Are there any questions for Lynn that he might be excused?

MR. CLARKSON: Let me add that I
I agree with what Julie and Joe said, that it's a separate issue. You are not -- it's already there; it's being used in that form today. You are not putting something new into the pool that wasn't there before. So I accept that. I agree that the solvent extraction issue is an important issue to be taken up at some future time. So I accept your amendment as read.

CHAIR MOYER: Thank you, Mr. Clarkson.

Julie?

SECRETARY WEISMAN: I also wanted to make one more clarification that might not be obvious from this wording change that has been proposed. By making this change we have also taken the word, unbleached, out of the listing, which means we are leaving room for bleached forms of lecithin as they -- to be also included, and it also leaves room for -- within that de-oiled, it can be from any seed.
source. It can be from canola, it can be from
sunflower, it can be from other sources that
would not pose allergy problems for people who
are trying to avoid soy.

CHAIR MOYER: Dan.

MEMBER GIACOMINI: I didn't hear
the very end of what you were saying there,
Julie; I apologize for that, because the first
part of it caught me.

If we go to that chart that Dr.
Szuham gave us, and you look at de-oiled only,
that does not include bleached. That does not
include -- oh bleached, de-oiled only, but no
other forms of bleached. Okay, all right.

SECRETARY WEISMAN: I mean I will
clarify. I think that the presentation that
we saw yesterday clarified that the bleaching
is done with the use of hydrogen -- to the
extent that the bleaching is done with
hydrogen peroxide it will not be a problem for
a 606 listing, because hydrogen peroxide is an
allowed material in organic production, let
alone on a non-organic ingredient.

CHAIR MOYER:  Steve and then Joe.

MEMBER DeMURI:  The other important distinction here is that it moves all the lecithin to 606, and it subjects it to commercial availability scrutiny by the certifiers as well. So it is definitely a tightening of the listing.

CHAIR MOYER:  Joe.

MEMBER SMILLIE:  Well, both Julie and Steve have made the points that I was going to make. But there is one final point, and that is, some of the presentation that was given yesterday that was captured in these documents, the majority, I'm not saying all of it but the majority, for example from Amy's Kitchen, from Hane, their request was, I'll just use one, to deny companies the right to use de-oiled, powder bleached lecithin will result in the loss of many organic products from the marketplace.

I think we solved that particular
comment, and another one saying this company
currently uses de-oiled lecithin in several
made-with organic products. This lecithin is
an important ingredient.

So I think -- I'm not saying it's
a perfect solution, but I think it answers the
majority of both the petitioners and the
people who originally opposed the petition and
did these presentations.

I've gone through all the
presentations, and I'm not saying it's 100
percent, but the great bulk of it is simply
asking for the de-oiled.

CHAIR MOYER: Thank you, Joe,
that's a very good point.

Any other comments for Julie
before we move on to chicory root? Steve, the
floor is back to you.

MEMBER DeMURI: Thank you. Good
job, Julie, on a couple of very complicated
petitions. But now that you've caught your
breath you are up again for chicory root for
SECRETARY WEISMAN: All right.

This actually we can make quite short and sweet. We received a petition quite some time ago for the addition of chicory root extract to 606. And it did kick around between the handling committee and the program for awhile trying to figure out exactly whether it was already covered, whether it was not.

But the determination that we made upon reviewing the petition is that the -- even though chicory root extract as a broad category was what the petitioner was asking to have listed, the manufacturing process that they described in the body of the petition really actually described the manufacturing processes for inolin and okeofructose, both of which are derived from chicory extract. And the handling -- both of these are materials that were previously petitioned for inclusion on 606. So we felt that the petition was redundant.
So we went back to the petitioner and asked, just to make sure, are you wanting something other than these two already listed items to be added to the list. And they said no.

So we found that the petition didn't really require any further action because they materials that they were really looking for are already on the list.

In addition to that I would also like to add on the note of commercial availability that organic chicory root extract is widely available and being used currently. So if they wanted that organic chicory root as a broad category for 606 we probably would have voted no, because it is commercially available.

Questions?

CHAIR MOYER: Next item, Mr. Chairman.

MEMBER DeMURI: Thank you again, Julie.
The next item on our docket here for 606 is red corn color. That was one that I reviewed.

And it's petitioned as a use as a color in a variety of organic foods, beverages, so confectionary, there were a whole host of things that they were asking to be able to use this color in.

It is produced by a simple extraction process. The petition did have some CPI information in it. But in conferring with the program when I was reviewing this, Mr. Pooler verified that it was a fairly benign process, simple extraction process, without the use of any synthetic solvents or other prohibited materials. So it did meet the category one and three criteria, so that was not an issue for us for this particular substance.

But the petition did not sufficiently address the availability criteria in our mind. There are already several red
color extracts available, beets and a few other things that can be used to color organic foods red. The petition did not address why they could not use those colors; they are already listed on 606.

Additionally we know that there is a good amount of red corn available on the market in organic form, and the petitioner did not address why they could not source the organic red corn and find a processor or a manufacturer that could make a color for them out of that organic available corn.

So based on that we did not feel it was sufficient in its availability criteria, and we did vote to reject this particular substance for 606. The vote was zero yeses, four noes, one absent, and one abstention.

Any questions on red corn color?

Okay, the next item we have up is going to be presented by the handling committee wise man, Gerry Davis: myrrh.
MEMBER DAVIS: Where's the frankincense? The petition is for the inclusion of myrrh essential, commiphora myrrha because there are more than one plant that some people use the name myrrh on, for use in perfume.

Going to category one on the evaluation form, all of it was pretty straightforward as far as effects on humans or the environment. And we felt there were no issues there.

Category two we found that question one is it formulated by a chemical process? No, it's just steam distillation of a resin from the plant sap of this particular tree. And it's not changed chemically in question two, the substance used is the material extracted from the natural plant source with no chemical change.

Question five: Is there an organic substitute? No. Petitioner claims that no organically produced myrrh oil is available.
Handling committee members -- more than just myself -- checked with Internet searches and found no evidence of any organic sources.

Is it essential for handling the organically produced agricultural product?

Yes, petitioner claims the substance is a vital component of certain perfumes, and that there is no wholly natural substitute product because the fragrances are specific to this plant material.

The material is produced in regions of the world such as Somalia and Yemen -- two of the biggest producers of it. So in question 10, is there another practice that would make the substance unnecessary -- it seemed like it would be a good candidate for - - if there were fair trade marketing efforts exerted on those regions, to work directly with the indigenous harvesters of this wild plant. There could be some data certified organic wild harvested product, but it doesn't exist today.
Category three, important point, question one, is the substance compatible with organic handling? We said yes, but it's conditioned on something that should be obvious but needs to be pointed out. As long as this substance is used as a component of organically certified perfumes and is part of the 5 percent non-organic portion, and the resultant perfume product cannot have myrrh in the name.

So that was information for the complete for the certifiers and petitioner alike that they can't turn around and call this myrrh perfume if they use this material.

CHAIR MOYER: Point of clarification from Julie.

SECRETARY WEISMAN: Yes, the reason why that comment is included here is because you cannot use the word, organic, to modify the name of something that was not, an ingredient that was not actually organic. So you could call it myrrh perfume, you just
1 couldn't call it organic myrrh perfume. And
2 you could call the product organic whatever
3 lotion the myrrh -- well, I don't want to get
4 into the whole personal care thing, but say
5 hypothetically it's a body oil, you could call
6 it -- which I think actually is what it is
7 being used in -- you could call it organic
8 body oil, and then some place else on the
9 label it could say that this is myrrh, but you
10 can't organic myrrh body oil because the myrrh
11 is not organic.

  MEMBER DAVIS: Thank you for that
12 clarification.
13
14 So going down to category four,
15 the commercial availability, we felt that the
16 description provided by the petitioner was
17 plausible, that the material in its necessary
18 form and quality and quantity is not currently
19 available in organic form. And part of the
20 reason was on question five, number D, that is
21 related to trade-related issues such as civil
22 unrest. It may temporarily restrict supplies.
The petitioner made the case for the difficulty of establishing a certified organic supply due to the inherent civil unrest of the main regions of production such as Somalia and Yemen.

So going back to the front page, the committee voted four yes, zero no, two absent, to allow the inclusion of myrrh essential oil for the use in perfume on the national list in Section 606.

Any questions? Hue.

MEMBER KARREMAN: Not really a question, but I bring this up at other times with plant names. You have a Latin binomial there, and I think it should specify commiphora myrrha, because there is commiphora momo which is also called myrrh. In other words, use the Latin binomial, and we've discussed this before.

MEMBER DAVIS: That's what that is, but I didn't realize there was another species that they also call myrrh. The
information that I went over had a completely
different genus and species, one plant could
be used as myrrh.

CHAIR MOYER: Hugh, you want it
different than the way it's stated up there in
that gray box?

MEMBER HALL: If we have done it
this way before, if you say myrrh essential
oil up there.

SECRETARY WEISMAN: We went
through this with seaweeds also.

MEMBER KARREMAN: Yes, we did.

And we said that we gave the actual Latin
binomial itself and that was it I thought. Or
how did we do that? However we did it before,
let's do it the same away again, that's all
I'm saying.

SECRETARY WEISMAN: Let's go back
to the video, and tomorrow it will be
corrected.

MEMBER DAVIS: So let me try to
understand your question. You are saying
besides commiphora myrrha, there is also
another commiphora different species that is
also a myrrh?

MEMBER KARREMAN: Correct. To
the best of my knowledge from an in vivo
eperiment done with sheep parasites in Egypt.

(Off mike remarks)

CHAIR MOYER: Okay, well, Julie.

SECRETARY WEISMAN: I just also
wanted to sort of highlight one issue that
there are a few historical things that are
going on with petitioned materials for
handling in this meeting, and myrrh is also
one of them. Because I think this is the
first time we've had a material petitioned
onto the national list that was not for a food
product. But this as far as I know this
doesn't have any food uses. It's really
specifically being asked for because it's used
in personal care.

CHAIR MOYER: Dan.

MEMBER GIACOMINI: Yes, on the
question of the listing --

CHAIR MOYER: You can sit way back, I think, and still come in.

MEMBER GIACOMINI: On the question of the listing, we have listing of seaweed, and then with the Latin name in parentheses; we have a listing of hops, and the Latin name in parentheses. I don't see the other seaweed that we have listed here, but there are two examples.

We also did the same with the alvia, with the common name and the Latin name in parentheses. So I think you're fine.

CHAIR MOYER: Any other questions or comments? Kevin.

MEMBER ENGELBERT: I am just curious, given the fact that this is one of the first petitions or the first petitioned material for anything other than a food or a food contact substance, why you didn't request a TAP, or what gave you the confidence that you could find out enough about it without a
TAP?

MEMBER DAVIS: I think this is a good example of a very simple material. If you read the information provided and do searches of information that are available, this is a good example where it's simple enough that just the normal expertise of the committee would function as the advisory panel.

It just didn't seem to be complicated, and I didn't hear any public comments saying otherwise.

MEMBER ENGELBERT: That was my assumption, but I wanted to make sure that I was correct.

CHAIR MOYER: Tracy.

MEMBER MIEDEMA: As I look at this now, and in light of the personal care discussion, I have a little bit of a problem with our annotation about it being for perfume. I think it is very narrowly construed, and there is no reason if we were
going to go ahead and list it on 606 that someone couldn't put it in some other type of personal care product. Or maybe it is edible. I just don't know that we should start labeling it that way.

CHAIR MOYER: Was that what the petitioner specifically asked for?

MEMBER DAVIS: That's what they asked for, so that is the only reason it's on there. But it's a very good point, I agree.

CHAIR MOYER: Tina.

MEMBER ELLOR: I just looked it up on the food chemicals codex and it's listed as a flavoring agent.

CHAIR MOYER: Bea.

MEMBER JAMES: I agree with what Tracy just mentioned, but I know that at retail there are a whole line of essential oils that are agricultural that are certified organic that a lot of retailers are currently selling.

MEMBER DAVIS: And we considered
and looked at sources of myrrh essential oil as part of the literature search looking for organic forms. And there were a couple of suppliers that had very extensive organic essential oil listings, on and on and on, but when it came to the myrrh, not organic.

CHAIR MOYER: Gerry, is that because there is no organic myrrh, or just because there is no organic myrrh oil? We just want to avoid where Marty Mesh comes back and for the next five years and tells me he has organic myrrh, and nobody ever asked for organic myrrh oil. So there is no organic myrrh; is that what you're saying?

MEMBER DAVIS: The presentation that the petitioner made concerning the fact that there is no infrastructure or certification efforts being made to work with that indigenous wild harvested supply of the raw material. So it's a step that could be made. Perhaps the 606 listing will encourage that. But at this point there is just nothing
that has been drawn together to deal with that
wild harvested issue.

CHAIR MOYER: I think this is a very good case for those folks who said 606 is a shopping list for entrepreneurs, that would bring them out. Tracy.

MEMBER MIEDEMA: So procedurally when it's time to vote tomorrow, can I make the motion without the word, perfume?

CHAIR MOYER: I am just not sure -- because the petitioner specifically asked for it this way, can we change the petitioner's request?

SECRETARY WEISMAN: I'm going to ask a clarifying question.

CHAIR MOYER: Wait, let me get the program to answer that.

MR. MATTHEWS: Yes, if you decide it's something that can go onto the list, their recommendation can be for whatever uses are there; it doesn't have to be just for the petitioned use. So if you want to open it up
to all cosmetics or all body care products, or
all cosmetics and body care, that is perfectly
all right for us.

MS. ROBINSON: Jeff, let's not create a single use. That also permits in effect a monopoly use for one outlet there, just to be used for perfume. There may be other uses that we just aren't aware of.

MR. MATTHEWS: And the other thing is, if you say for perfume only, you may in three months get a recommendation that you now approve it for hand lotion, or you may then get another one after that that wants to put it into Tracy's soap.

MS. ROBINSON: Don't annotate the use; recommend the substance.

CHAIR MOYER: I think that is good advice. So there is the answer to your question, Tracy.

MR. MATTHEWS: You do realize though if you take it out without any comment you would be including it in food? Okay.
CHAIR MOYER: Joe.

MEMBER SMILLIE: Tina, does it have a CAS number?

MEMBER ELLOR: Let me pull it up again. Yes, it did have a CAS number. I didn't know what it was.

CHAIR MOYER: Any other questions or discussions on the myrrh?

MEMBER DeMURI: Just wanted -- I did do a literature search on myrrh as well, and I did find some references to it being used in beverages. So it potentially could be used in food.

CHAIR MOYER: Why not?

Steve, back to you.

MEMBER DeMURI: Thank you.

Hugh is another wise man on the Board apparently after his myrrh expose.

Okay, the last item we have for today is another 606 item. It's wheat germ, and Katrina was the reviewer of that substance, so Katrina.
MEMBER HEINZE: I'm really excited about this after all that conversation.

Okay, wheat germ, a material that I think hopefully most people are familiar with, was petitioned for listing on 606. It's intended use is as a flavor or to add nutrition, supplemental nutrition, not remove nutrition, in baked goods.

The petitioner did acknowledge that organic wheat germ is sometimes available. They were just not able to find a quantity or consistency of supply necessary to meet their needs.

So if you remember on 606 there are three things: form, quality and quantity. So this is a quantity.

So their justification was that they contacted the five largest suppliers of organic wheat flour, you know folks who should have a lot of wheat germ hanging around, and were unable to source. They need about 10,000
1 pounds a year; they were able to get 4,000
2 pounds.
3 So I can hear the eyebrows going
4 up in the crowd, and going up on the panel,
5 and ours did as well. We were quite surprised
6 by this, and we all said, oh, that can't be
7 right, so we did our standard Internet search.
8 On my weekly shopping trip to my local coop I
9 said, oh for sure I can find organic wheat
10 germ somewhere in this store. Nope, I took
11 twice as long to go shopping but couldn't find
12 it.
13 So then we did some deeper
14 research and really did an investigation to
15 evaluate this, and we did find support for the
16 petitioner's claim.
17 So I'll take you through that real
18 quick. So organic wheat germ is 2 to 2-1/2
19 percent of the wheat berry. In a typical
20 flour million operation you will reasonably
21 remove a much smaller percentage, so maybe
22 half to 1 percent of the berry will come off
as germ.

    The germ is very high fat, so it

has a very, very short shelf life, as little

as three days. So in a conventional operation

you would take that wheat berry off. Then you

have to send it off to be stabilized to

prevent rancidity. So the methods to

stabilize that are commonly used are steam

either direct or indirect, you toast, use

infrared, or there is chemical treatment,

although even in a conventional stream that

chemical treatment is used for non-food-grade

applications. So really the stabilization

that you would be talking about would be steam

toasting or infrared.

    And that stabilization has to

happen really at the milling operation because

of that short shelf life. Or you need to have

a high quantity of germ that is coming off

your mill to be able to ship it expeditiously

and get it stabilized.

    So what the petitioner said and
was supported by my investigation is, handlers
of organic wheat fine tune their mills to
direct their waste streams. So you have a
choice in a milling operation to divert your
germ stream as well as your bran stream. You
can either divert it to waste, or you can
divert it to go into your flour stream, the
bulk of organic flour millers divert it into
their flour stream so that they are not losing
material. And they just consider it value
added. So in effect when you're buying white
flour you are getting some germ, so it's a
little bit more whole wheat than it would be
otherwise.

So that's typically where it goes.

It goes straight into the white flour and gets
sold.

So of the five handlers that the
petitioner contacted, four send the germ into
the white flour and sell it that way, and one
diverts it to animal food.

So given the small amounts that
come from the mill balanced with the new need,
that is where the petitioner ran into trouble
with this material. And a large organic flour
mill today would produce maybe 2,000 pounds of
organic germ in a day's production. So to
meet the petitioner's need, that's five days
of production. And it just at that point
becomes impractical for that organic flour
miller to build the infrastructure to process
the germ. You are talking, you might run your
mill 360 days a year, and for only five days
you are going to build this huge
infrastructure to process the germ. And now
you are talking one miller out of the many
millers who might be doing this.
So this is a matter of matching
need to demand. You need to create a higher
need in order to create just the practicality
of building that infrastructure to stabilize
the wheat germ.
So really the conundrum here is
that consumers need to purchase more organic
products that have wheat germ in it in order to drive this. And consumers of this product, the petitioner has sold these organic products with wheat germ in them for 25 years, so their concern obviously is having to take this product off the market.

So our recommendation reflects that despite our surprise we felt that petitioner's justification was supported by our independent investigation.

So I want to go back to our recommendation. I didn't do this with the sodium chlorite, but I'll go back and look at the first page.

Obviously this is an agricultural product. It just goes through the mill, so there is -- if it meets the criteria for impact on humans and environment, we felt that it met the criteria for essential unavailability as well as compatibility and consistency. And we did feel that the petitioner demonstrated the fragility of
supply in this case, since there were -- we thought they had gone to quite a bit of work to try to find the 10,000 pounds they needed. So we voted I think six to zero to list this material.

CHAIR MOYER: Any questions or comments from the Board? Kevin?

MEMBER ENGELBERT: Yes, it's very unusual for -- you said part of the supply went to livestock feed?

MEMBER HEINZE: Yep, and I will in full disclosure say, I work for the company that does that. So we, to meet our quality specs in our flours, we don't put the germ into the white flour that we sell, so we divert it and sell it to conventional animal feed.

MEMBER ENGELBERT: Because it doesn't meet the quality specs for this buyer also? Or it doesn't meet your quality specs?

MEMBER HEINZE: No, to meet our white flour quality specs, we do not divert
our germ stream back into the white flour.
So therefore it's a waste stream from our
milling operation, and our waste stream is
solid to animal feed.

MEMBER ENGELBERT: And explain
again what that isn't available to another
purchaser?

MEMBER HEINZE: Because you have
to stabilize it. Someone could buy it. So on
the once a month that we run organic flour
someone could drive up a truck, they could buy
the 2,000 pounds. They would then have to
ship it someplace where they could stabilize
it. It has to be stabilized within three
days. They would have to convince the company
that stabilizes it to do a run of 2,000
pounds, and it's such a small run that it's a
size problem. I see I am not making sense on
that.

MEMBER ENGELBERT: Well, you are.

But this harks back to the problem we had last
year with the -- I mean it seems like if there
is a will, there's a way. And if it's available, rather than divert it to livestock feed, which normally is where things go because it's cheap or there is some type of defect, if this company coordinated, not just with your company, but all the processors of organic wheat or even contracted with growers of organic wheat, that they could make that happen.

MEMBER HEINZE: There is no lack of organic wheat; that is not the issue.

I did, and I'll be fully transparent, I said, hey, cool, there is a market for us on this; go team go. And I got laughed at.

They said that in order to make this practical the need would have to be like 100 or 1,000 times more to even make it practical. Just the amount of resources to build that, it is just -- the need is just not there.

CHAIR MOYER: Barry.
(Off microphone comments)

MEMBER HEINZE: There was no technical review again. On a material like this it's pretty straightforward. If you worked in milling --

MEMBER GIACONINI: Barry,

microphone.

MEMBER FLAMM: Oh, thank you. My question was, is there a TAP on this material? Katrina, I think you answered that you didn't see the need because it was straightforward. And to me it doesn't seem straightforward. I'm not very convinced by what I've heard so far, and I don't -- where is the location of this petitioner?

MEMBER HEINZE: I'll let them --

MR. FLACK: In any case I know in Montana there is, as you point out, a huge acreage of organic wheat growing all the time. There are a million facilities and they are looking for new types of markets.

So I just --
MEMBER HEINZE: But again the petitioner went to quite a bit of work to try to find someone who would do this for them, and had no one step up to the plate. So this is the debate we have every time with these 606 materials. If you put them on the list does that create someone who says, I actually can do that. In this case the petitioner tried.

CHAIR MOYER: We have a bunch of folks that want to comment. Bob.

MR. POOLER: Yes, Bob Pooler. I just wanted to address Barry's question about petitioner location. Bountiful Berry is located or headquartered in the state of Maine.

CHAIR MOYER: Thank you.

Dan you had your hand up, then Tracy.

MEMBER GIACOMINI: Yes, I apologize if I talk too much here for a second. We are looking at a product here that
we know we have a tremendous amount of organic raw material, but there are problems in the processing and stabilizing and that thing. So we are looking to put it on 606.

At this very same meeting -- and we are saying we are doing it because of low quantity -- at the very same meeting we are running through a couple of voting manipulations to take away what has been in the marketplace an alternative source of lecithin that has been conventional, that is not traditionally from soybean, with no information on whether there is enough of that product to really be making organic lecithin from those sources. And when the first -- the first two years ago I believe it was we had a petition here for I believe it was instant powdered milk. The petitioner had done a tremendous amount of work going through all the different milk powdering facilities they could. Everybody would make powdered milk, but nobody would make instant milk. They
found one facility that would make instant milk but they wanted them to buy like a four-year supply a tremendously high price. We rejected that petition and not allow them to use a conventional, so in a sense they are taking products off the market. I believe it was used in baking. I think if we go along with what we are looking to do today on the lecithin and looking at what we've done in the past, this sounds like a real exception to our historic record.

CHAIR MOYER: Tracy.

MEMBER MIEDEMA: I guess I just wanted to point out, this is some of the hardest stuff we do. And it's really the no fun part, because there's going to be losers in this no matter what. And we really have to face the fact that if we put this on 606 a small bakery will have to buy the organic version whereas a very large bakery would get a free past.

However if we don't put it on 606,
there's all kinds of manufacturers out there that want to get in organic, and there is no opportunity list out there spurring the organic version to be produced. And a most likely scenario is that wheat germ will languish along, and an organic version will be less likely to surface in the marketplace.

The impetus just may not be there.

So we don't know how the chips are going to fall when we do this, and frankly there can and will be winners and losers no matter what we do.

CHAIR MOYER: Julie.

SECRETARY WEISMAN: Yes, I just wanted to see if I could possibly help Dan not see as opposing actions the fact that we are recommending the listing of this on 606 at the same time that we -- actually that is part of the same progression. And I -- you don't get to the point where you are able -- consider taking something off of 606 unless you have done something to spur a need for that
material being used, to allow it to be used in its non-organic form. And currently the only way to do that is to list it on 606.

I almost am tempted to ask Lynn Clarkson to step back up to the podium, because I would be interested in his comments about if lecithin were not on the national list would he ever have dreamed of making the investment and engaging in the entrepreneurial activity that he's engaged in that makes organic lecithin available. I see that he's willing to do it, but I guess maybe I'm making my point.

CHAIR MOYER: Given the timeframe we are operating under, the chair is hesitant to call anybody to the podium at this particular moment.

Gerry, you were next. Hue. Tracy.

MEMBER MIEDEMA: One last comment, I did vote yes to 606, so despite my comments about small bakeries being forced to
organic, I endorsed the spurring of the
creation of organic wheat germ. And I think
that is how we should vote.

CHAIR MOYER: I also have a hard
time imagining that the petitioner is the only
potential customer for this product. And I
understand what you are saying about 606 but
you see the problem we have getting material
off the list once we get it on; it is not easy
to do. So you don't see it as a problem, I
know. Okay, but it's difficult to get it off
the list once it's on the list, and that's a
concern I believe some of us have on this
Board.

Katrina.

MEMBER HEINZE: I'll just make
two comments, one in my traipse about my
natural foods coop, there is a lot of wheat
germ I can buy but none of it is organic. And
then second, just a reminder, because it's on
606, and the handling committee says this
every time, doesn't mean that folks can just
use the conventional. They have to prove to
their certifier that they were unable to
identify any, right, so commercial
availability. So good debate, folks.

CHAIR MOYER: Okay, any other
comments or questions from the Board?

Steve, back to you.

MEMBER DeMURI: Okay, thank you
everybody. That concludes the petition
recommendations for us for today.

But I do want to mention, we have
10 sunset items coming up in 2011. There are
three for 205.605(a), and seven for
205.605(b). I won't take the time to explain
any of those, but please we do want public
comments over the next few months on those, so
we would greatly encourage you to do that.
And that will conclude our discussion for the
day from the handling committee.

CHAIR MOYER: Thank you, Steve,
and the handling committee.

The chair recognizes Richard
Matthews from the program.

MR. MATTHEWS: Yes, and I would recommend that the Board move expeditiously on these 10 materials, because in 2012 you will have to have completed your review of some 160 other materials. So early next year we will be putting out an AMPR on that one as well. So time is short.

CHAIR MOYER: Well, if you were trying to make us feel good, Richard, you didn't.

(Laughter)

MR. MATTHEWS: 174 materials, Barbara tells me. No, that's payback for black hole.

(Laughter)

CHAIR MOYER: Okay, thank you very much. That concludes our work plans and the committee reports. The chair wishes to thank all the committees and their members for their tremendous effort and tireless dedication to these issues and these
If you have never sat on a committee, and some of you in the audience haven't, you have no idea how much work and dedication went into this. And whether you agree or disagree with the outcome, as I mentioned in my opening comments yesterday you cannot fault this Board for the tremendous amount of work they did.

So the Chair wishes to thank all of you.

We are going to take literally a five-minute break to the bathroom, and we are going to be back with public comment.

And please, I mean five minutes. We have to get out of here by 6:30 for this Board to be able to get over to Kathleen Merrigan's office, and we will be leaving on time.

(Whereupon at 4:56 p.m. the proceeding in the above-entitled matter went off the record to
return on the record at 5:02 p.m.)

CHAIR MOYER: Okay, the Board is seated. We have a quorum. Valerie, we are going to get started.

Before we start with the list of public commenters, I do want to mention that during the break Harriet Behar let me know that they made a phone call from the back of the room to a food supplier, SK Foods, don’t know them, never heard of them. And they said 10,000 pounds of certified organic wheat germ, no problem, got it. So it runs a little contrary to what we were hearing earlier today. So there is a phone number and a name if somebody wants to call. But it does let you know that the product quite possibly is available in the quantity and quality that the petitioner is looking for.

Thank you, Harriet, and whoever in the back of the room supplied us with that information.

Okay, moving along, public
comment. We are going to start with the list
as we have it posted here.

I will mention that the Board has
an appointment with Kathleen Merrigan. We
fully intend to make that appointment, and we
appreciate the public commenters keeping to
time and the Board minimizing the questions
and comments to specifically extracting
information from the presenter and not
necessarily from making windy comments. I
won't gavel anybody down, but I do appreciate
that, because we certainly want to make our
appointment.

I believe Joann Baumgartner is
number one on the list, is that correct? My
list is outdated.

I'm sorry, Deborah White. Is
Deborah in the room? And Joe Dickson on deck.

PUBLIC COMMENT

MS. WHITE: Good afternoon and
thank you for your time.

We are the Food Marketing
Institute believe these organic issues are very important and we appreciate your volunteer service in advancing the role of the place of organic products in society.

As you may know FMI represents grocery stores and food distributors in the United States and also around the world. Large grocery stores are some of our membership, but fully three-quarters of our members are small independent mom-and-pops and regional chains.

FMI has an organics committee, and we are pleased that Bea James has served on that committee. But it's a very diverse group, and I think that reflects our membership, the diversity of the retail industry, and the diversity of the consumers that our members serve.

For example on our committee we have companies like Mustard Seed, Hannaford, Sprouts Farmers Markets, Publix, Wild Berries Markets, Lund's Whole Wheatery, Ukrops, New Leaf Community Markets -- a read diversity.
And I think that reflects that fact that consumers in a lot of different segments, a lot of different markets, are interested in organic products.

Our members do their best to provide a safe, abundant, affordable, and diverse food supply for their customers. Organic food and products are an important part of the mix. Although not every consumer will prefer organic foods, they are important and should be readily available to everyone, even to those who maybe just want to pick up a couple of organic tomatoes while they are buying their toilet paper and all the rest of their household goods.

Neither the Organic Food Production Act nor the NOP regulations require final retailers that only handle but do not process agricultural commodities to be certified if they want to have organic products. That is, they can sell or package organic products, and no certification is
required.

Nonetheless, the preamble to the final rule expressly recognizes that retailers may choose to be certified, specifically -- and I went back and pulled this out of the preamble, quote: operations that qualify as exempt or excluded operations can voluntarily choose to be certified. So final retailers under the statute and under the regulations are excluded -- or exempt, rather -- from the certification requirements if all they do is handle but do not process. And final retailers that choose to do some additional types of activities are still considered excluded, and certification is not required.

Therefore the issue on the table really is what type of program is necessary to ensure that retailers that voluntarily choose to be certified can do so in a manner that is consistent with OFPA.

More specifically the question is whether a retailer that seeks to obtain a
1 voluntary certification must have all of its
2 stores certified or whether the retail entity
3 as a whole can be certified based on a multi-
4 site audit profile.

And I know from talking with Bea
5 James that this is an issue that you guys had
6 debated for awhile.

8 FMI respectfully suggests that
9 this establishes a false choice. You don't
10 need to choose one or the other. It doesn't
11 have to be either every store or a multi-site
12 audit system. Your recommendations could
13 encompass both.

14 We understand that NOSB has
15 already recognized the value of multi-state
16 audit, so there is no per se prohibition that
17 you guys see.

18 Moreover you guys have recognized
19 multi-state certification or multi-site audit
20 as a valid basis for establishing the organic
21 basis of producers, of entities that are
22 required to be certified under OFPA
specifically for farming communities.

If NOSB can accept use of multi-site as permissible manner to ensure organic standards are met for entities that are required to be certified, certainly it should be a possibility for entities that are doing this voluntarily to also rely on multi-site certification.

So the question then would be what parameters do you need to support retailer certification if they do it by having multi-site rather than every site audits?

FMI supports and expects that regulatory programs will be fair; that the rules won't be rigged in order to preference one type of entity over another; and that they will be consistent. If you will permit this type of regime as sufficient for farmers, then it should also be so for retailers.

So we encourage you to carefully consider this. Retailers can assist in ensuring that more organic products are in
more consumers' homes, and we recommend that
you consider what types of parameters would
make a multi-site inspection service adequate
in your view.

Do you have any questions?

CHAIR MOYER: Any questions or
comments from the Board?

Thank you, Deborah, we appreciate
your time.

Joe Dickson and Timothy Kapsner on
deck.

Is Joe Dickson here?

Timothy? Is Timothy Kapsner here?

And then David Brauner on deck.

MR. KAPSNER: Hi, I'm Tim Kapsner
from Aveda Corporation which is a division of
Estee Lauder. And if you bear with me I'm
going to read my statement so I get it right.

I come here today speaking as a
scientist who has worked in the cosmetic
industry for over three decades. I've spent
many challenging and productive years
1 developing products and ingredients that come  
2 from plant sources. Our industry can help  
3 greatly promote the use of organic  
4 agricultural materials by making highly  
5 functional certified organic products with  
6 plant-derived ingredients.  
7
8 The definition of synthetic and  
9 the concept of synthetic materials were  
10 created in OFPA and the NOP as an input  
11 screening tool. Ingredients and processing  
12 aids used to make food products are classified  
13 as being synthetic or non-synthetic to help  
14 sort them to determine if and how they can be  
15 used in organic agriculture or organic food  
16 processing.  
17
18 Food processing is described as  
19 heating, baking, distilling and many other  
20 physical processes. The concept of a process  
21 resulting in a chemical change and thus  
22 creating synthetic materials was not addressed  
23 either in the law or in the rule. This has  
24 created years of confusion and struggle to
reconcile the current certification and approval system with what the law and the rule actually say.

Examples of this confusion can be found in current NOP national list. The citric acid example discussed a few minutes ago exemplifies this problem perfectly.

Another ingredient which exemplifies this issue is ethyl acetate, manufactured by combining grain alcohol and vinegar in a way that causes a chemical reaction called esterification. If someone were to apply for a certification of an organic product and describe it as a combination of organic grain alcohol and organic vinegar, the product could be certified to the NOP. But if that ethyl acetate is sold as an ingredient to a cosmetic manufacturer it would be considered synthetic as per the NOP definition and prohibited from use in an NOP organic product.

This means that, dependent on
where in the process the rules are being applied, a different answer will result.

There are many examples like this in the cosmetic industry of products made by chemical reactions that can be synthesized within the constraints of the NOP. These materials fit the definition of synthetic, and therefore shouldn't be allowed as ingredients in an NOP-certified organic cosmetic product.

Potential additions to an allowed materials list are always evaluated in the context of their intended use. Annotations can be used to restrict the allowance to a specific use, but a heavy dependence on annotations makes the list difficult to regulate.

However, minimizing or eliminating annotations makes it more likely that a material will be used in a way that was clearly not the intent of its original approval. This is a difficult balance within a single industry such as foods. Adding a new
industry such as cosmetics to a food standard will force this issue into territories that the rule may not be prepared to handle.

Under the NOP the terms ingredient, processing aid, substance and adjuvant are confused and conflated. This has made it impossible to distinguish appropriately one from the other, and to treat them distinctly depending on how they are being used in a specific instance.

Materials such as sodium hydroxide used to make soap combines with the oil and that combination is changed chemically into a new compound. In this process the sodium hydroxide is used as an ingredient, not a catalyst or a processing aid.

All of these issues, which are central to the cosmetics industry, are being handled quite well in all of the independent cosmetic standards currently in development or in use.

The NOP is currently considering
the development of organic standards for several other industries, such as pet food and aquaculture. At the same time the organic food industry is struggling to address some of the issues by the law that initiated it. Living in a house while you are trying to fix the foundation is difficult, but to do that and try to add three additional stories on at the same time is asking for trouble.

Expanding the application of the NOP food standard to cosmetics should not be done at this time.

Thank you for letting us speak.

CHAIR MOYER: Thank you, Tim, those are great comments. We appreciate that.

Questions? Tracy?

MEMBER MIEDEMA: Just a real quick one. Do you think it should be done ever?

MR. KAPSNER: Well, on my statement here at the very end, it originally said, should not be done at this time or maybe
ever. But I cut that out. So I'd have to say, I'm not sure. I think that the industry should be allowed to continue the development of its own standards, as the food industry did. And if at some time the industry can come up with standards that make sense, then it may be time to regulate it. But that hasn't happened yet.

CHAIR MOYER: Kevin and then Joe.

MEMBER ENGELBERT: What's your thoughts on the problems that are going on right now with consumer fraud in cosmetics and personal care products, organic, that truly are?

MR. KAPSNER: Well, that's the whole thing we want to try and avoid. And what I've been trying to do for 12 years now, I've been trying to develop these standards since 1997, is to create a standard that people will get behind, people will recognize, it would be on the label, that people would look for, and that label would be in my mind
created by the cosmetic industry, and then
consumers could look for that label. The
process would be transparent. People could
trust that these means that these standards
had been through a process of industry
consensus. And then they can look for that
label, and the industry can help create some
weight behind something, so that all these
companies that are making unsubstantiated
organic claims would be -- would go away.

CHAIR MOYER: Joe.

MEMBER SMILLIE: Some of what I
wanted to ask was just answered. But Tim,
appreciate all the great work you've done for
the last 12 years and all the committees
you've served on. And I urge you to run for
the NOSB as a scientist and help guide
personal care products into this format.
Because unfortunately the organic food
industry did have that time to develop and
build our foundation on independent third
party certification, get the house ready, and
then when the time came to put the stories on,
we put them on, we put them on quick.

Unfortunately, and some of it may
be due to historical-cultural differences, you
don't have that time. It's a mess out there.
We all know it's a mess. And your solution of
letting industry define a standard and getting
consumers to get behind it, and I'll agree, we
kind of tried that in the food industry. And
we came to the conclusion that we needed
government to get in and get a regulation and
get consistency and conformity in the use of
the word, organic. And they've done that.

So unfortunately, I don't think
you've got the time to let the industry grow
on its own accord, because we are seeing label
claims out in the marketplace, and by
competing organizations. And they are not
going to say, oh, you're better than us; we'll
support you. They are going to hold onto
their turf. Companies are going to hold on to
their turf, and we need, like immediately I
think, a consistent standard for personal care items, because consumers want it, and they expect organic to mean organic. And that's unfortunately the way I think it is.

But I urge you to bring all of the knowledge which you have greatly contributed to, especially your knowledge of synthetics and how we can have good synthetic products, and put it through the NOSB so that we can help a good standard that you would be proud of for consumers and for companies like yours.

MR. KAPSNER: I agree to a certain extent, but the question still remains as to whether the issues that I brought up about the definition of synthetic -- I tried in all of my standards, one of my first objectives was to eliminate the use of the word, synthetic. Just because it's a non-issue, because synthesis means bringing two things together and making something new, and that goes for making babies and making bread and creating new words in the English language
as well as making chemical compounds.

So if you are stuck with a food world view of synthetic being something that is bad, and something that has this definition in the food world, that is going to give us a different perspective than the cosmetic industry has on what synthesis is.

MEMBER SMILLIE: I couldn't agree with you more.

CHAIR MOYER: Brief followup.

MEMBER SMILLIE: Okay, brief followup, I couldn't agree with you more. That is what we are debating right now. We are not against what you are saying. There is a group trying to broaden that understanding of what synthetic means, and we are right in the middle of it. It's a perfect time.

CHAIR MOYER: Thank you, Joe.

Bea.

MEMBER JAMES: Just real quickly, did you submit your comments to Valerie?

MR. KAPSNER: No, I have to do
that yet.

MEMBER JAMES: And I also was hoping that Deborah White would be able to do that as well.

MR. KAPSNER: In it's current form it's barely readable. But I'll clean it up and get it to her, electronically.

CHAIR MOYER: Thank you, Bea.

Any other Board members with questions or comments?

Tim, we appreciate your time.

Thank you very much.

David Bronner, and Diana Kay on deck.

MR. BRONNER: Thank you, Mr. Chair. Thank you, NOSB Board.

This is a day I've been waiting for for a long time. Actually I've had a serious possibly of federal regulation in the personal care space. As the CCAC document notes it's a disaster. The term, organic, is as meaningless as natural.
It was interesting, you guys were talking about myrrh, and how you couldn't say organic myrrh perfume because myrrh wasn't organic, but even if the perfume itself was 95 percent and otherwise known as a product -- here we have such a ridiculous situation it's beyond belief.

This is organic fair trade certified cocoa butter body wash where the only organic ingredient is the cocoa butter. Everything else in this product is not organic. It leads with water and sodium sulfate, cacoaminopropyl hydroxysulfane, glycerine, cocoa MEA, acolytes, copolymer and then cocoa butter, organic cocoa butter. I mean it's like way down. This product doesn't meet -- it doesn't meet any private standard in the world, regulation. There's not a private standard this product complies with. And because we don't have a single standard, it enables companies that do not comply with even the most permissive standard.
And that's what we have. It's not a question OASIS or NSF. It's just like -- it's just a mess out there.

And then in regards the intent -- I mean there is a certain basic set of processes that everyone more or less agrees on should be included -- not everyone, I should say, there is a spectrum of opinion. But insofar as there are additional processes not currently allowed in the NOP, they are understood to be processes that don't use petrocarbon and use an inorganic reagent like hydrogen or sulfur trioxide, or certain things that if you don't get petrocarbon, you can use it as organic agriculture material.

And the debate is, if you make like sodium cacao sulfate, which is a well described well understood process within various industry efforts, is it -- can it be an organic personal care product? Or should it be restricted to a made-with-organic personal care product?
And that is basically where we are at. It's an irreconcilable difference. It is not going to be solved by having competing industry standards. So basically the private standards out there all have the same set of processes give or take one; they have a similar set of preservative allowances, and it's just a category debate. Is it organic, or is it made with organic?

And that is the situation, and just allowing competing standards is not the solution. And basically this decision needs to be made. And insofar as soap, we make soap, both 070 soap primarily, also 95 soap products. We are willing to see soap come down to 07. We don't want to see it be wedged, allowing all kinds of synthetics, having organic, certain cocoa sulfate shampoo. I mean we are willing to see the chips fall. But we do want to see a federal regulation and just clean up the mess.
Thank you.

CHAIR MOYER: Thank you, David, appreciate those comments.

Questions or comments from the board? Tracy?

MEMBER MIEDEMA: So how, David, would you answer the question about the lack of say foundation that the prior commenter made, in building these additional floors? How do you see this actually feasibly happening?

And that may be an unfair question because you are not part of the program, but from your perspective, how do you see something like this going forward?

MR. BRONNER: The foundation has been laid. I mean we all spent the last 10 years laying, okay, here is the set of processes, additional processes we want and we know what they are. And there is such a thing as organic personal care that is not made with organic. And the compromise that got worked
out in NSF is okay, when you start using green
chemistry and pulling apart ingredients,
putting them back together and all this stuff
that industry wants to do, well, there should
still be a distinction been an unhydrogenated
organic lotion where you are just -- organic
oil, organic cocoa oil and a natural
emulsifier versus a product that is
hydrogenating organic oil, that is making
ester products and doing XYZ chemical
processing, it's like, okay, well, that should
be a category distinction.

So we know what these processes
are. We know what green chemistry is. It's
all worked out. Is it organic or is it made
with organic? And a decision is easily made,
and that's right now what the fight is, is two
standards, and had the same processes, and one
is organic and one is made with organic.

MEMBER SMILLIE: Do you see it --
CHAIR MOYER: Go ahead.

MEMBER SMILLIE: Do you see it
possible that the OASIS work or the NSF work could be dropped into 605(b)? Is it that simple?

MR. BRONNER: Yes, I would say that you could have an annotated list specific to personal care. You'd list the conditional processes, hydrogenation, sulfation, you know the associated reagents, just like NSF standard, annually released standards, have been written.

And really, I mean Tim, myself, we all worked real hard in generating this foundation. And unfortunately things kind of flamed out in the category debate.

But yes, I think it's pretty straightforward to bring in regulation. And these private standards are by like ECOCERT, Soil Association, they are food certifiers. And they are also making and certifying cosmetic standards. There isn't this wide gulf between the two, quote process standards, and it's about additional process allowances.
And these ingredients are a little -- I mean you have to kind of look at them as multi-ingredient ingredients, like these that we are talking about, like these processes like sulfation, bring in sulfur trioxide and attaching it to an organic fatty chain. So there is an organic component, but it's an inorganic.

So that's why --

MEMBER SMILLIE: The calculations, are they going to be beyond mathematical grasp?

MR. BRONNER: No, we addressed that in NSF by just assigning values. Like we say, okay, use this process, sulfation, rather than say okay well, the molecular weight difference is lower over acetyl fatty acid chain is whatever, like you just say it's going to count, contribute, if the sulfate of fatty alcohol contributed 60 percent of its weight to the product, we really went through all this stuff over 10 years, like all these
1 issues were hashed out. And it's interesting
2 where I am. I'm in between the kind of
3 perspectives. Usually I'm not the pragmatist,
4 but in this case --
5
6 CHAIR MOYER: Okay, thank you
7 very much, David, appreciate your time.
8
9 In fairness to all the presenters,
10 I just should let the Board know that I have
11 20 names on my list, and we have one hour. So
12 I don't know how many are actually on this
13 list, Valerie, but let's just try to be as
14 expeditious as possible. I apologize for
15 that.
16
17 MS. FRANCES: There's been a few
18 adjustments.
19
20 CHAIR MOYER: Okay, thank you.
21 Dianna Kay and Sebastian.
22
23 MS. KAY: Hi. For anybody who
24 doesn't know me I am Diana Kay, and I
25 represent today our company Terressentials.
26 We are USDA-certified organic processor of
27 certified organic body care products.
I too have been in this industry for 18 years, and I was a member of these committees. And I'm going to kind of deviate just a little from my written comments, which I will leave here. But I feel after listening to the two previous presenters that I must put back in what I cut out. I hope you can all hear me.

I have observed, and I speak for a smaller part of the industry, not the industry, and I'm going to articulate that. Because one of the things that we saw, and what we feel, not just opinionwise, is that these committees were not balanced. I know there was one submission that said this was a balanced committee. And whether anybody wants to hear it or not, it was not. Consumers were not represented, and I'm going to disagree with all of these people.

Just one example, this was an ongoing argument. You cannot have a body care product without chemical preservatives. This
is a book called Preservative Free and Self-
Preserving Cosmetics and Drugs: Principles and
Practices. It is available on Amazon.com,
and I'd say that if there is any chemist out
there who doesn't have this book and they are
making products for somebody, perhaps they
should invest and buy this book.

Okay, I've heard a whole lot of
stories about the surfactants and emulsifying
agents that can be used. We don't need these.
The industry -- the industry needs them
because it affects their bottom line. They
can use totally natural products that haven't
been processed, and we've proven that it can
be done. And they are choosing not to because
they need to have these inexpensive
ingredients that will last on a shelf for five
years.

That is why they want to use
hydrogenated materials, because once they
strip out of the oily component that can go
rancid -- and I think that is what we were
1 talking about with wheat germ oil, or wheat
germ, stabilizing it -- once you strip that
out, okay, then you have a product that is
left basically a wax, that would be alive
forever. And that is what they want.

Does that suit the consumer, and
what the consumers want as real organic? No,
it doesn't, and it doesn't need to happen. So
I'm here speaking for them.

But I also have a few other
points, so I'm going to kind of jump back with
some of those. And kind of try and talk back
and forth here. I hope you can all hear me.

We were pleased though to read
about the CACC's recommendation, I think it's
great. I do have one caveat with that, and
that is that I don't believe that there should
be a category of made-with-organic that
forgives body care companies from not being
certified. I think it has to go all the way,
just like it is for food. And here is why.

We have lip balm products that are products
that people eat. I know Julie is over there, she has been supplying us for years with certified organic materials, so she know where the real deal is.

Medical creams, for mothers who are breast feeding, this is a product that babies will ingest. Do they need to have a made with organic product that has hydrogenated fat that a woman will rub on her breast for her child to ingest? We could have potential residues here of nanoparticle -- we all know that there is a catalyst that is involved. This is why hydrogenated products are not approved under the NOP. We don't want these kinds of things in our organic -- 100 percent organic or made with organic. We say, go strict all the way. And let's bring everything back home where it belongs to the food standards. Because we have 100 products right now, we've got 100 more right now waiting to come out that don't involve the synthesis that everyone else is talking about.
And these are products that our customers are screaming for. They are demanding it. They are writing us letters telling us what they want.

I have to point out a couple of things, thank you for the reminder. We also agree with registration of stores and certification, but I want to point out, I have some handouts here, we are seeing the proliferation of organic being used not just on body care products but on stores. One of the problems we are running into is organic salons. If you google organic salon you will be shocked to see what is coming up. We have stores that are calling themselves organic marketplace, organic this. Customers, consumers, are going into these stores believing that these stores are certified stores selling these products. We really would like to see the NOP come down on these stores and make a major crackdown.

We also have website businesses
that are using the word, organic, and trying
to sell products that are not certified.

I agree, we need to take immediate
action, and I would like to see that now. So
that is the point that I wanted to make about
that. Try to rush through here.

CHAIR MOYER: Diana, I think
you've rush as much as you can rush. You
bring up great information. Valerie could you
get the name of that book for the Board before
we leave.

Other questions for Diana from the
Board?

MS. KAY: Not a single question?

CHAIR MOYER: It wasn't because
your presentation lacked information, I can
assure you.

MS. KAY: Unfortunately I didn't
get to all of it. But I will leave a copy for
you.

CHAIR MOYER: Okay, thank you
very much, Diana.
Sebastian.

MS. FRANCES: Please, there's been a change in order.

CHAIR MOYER: Thank you, Valerie.

I didn't see that. Joanna Baumgartner on deck.

MR. BELLE: Good evening, folks.

Sebastian Belle from Maine Aquaculture Association. Thank you very much.

I'm going to be very brief.

You've had a long day as always. Our association is a producer association. We represent both shell fish and fin fish growers, about 147 farms in the state of Maine; about 70-30 shell fish-fin fish is the makeup of our association.

I'm also a member of the aquaculture working group. And all I want to do today is thank the livestock committee for their willingness to consider our input in trying to address their concerns. We really appreciate it from the AWG's point of view.
that you were willing to listen to our suggestions.

I want to also communicate greetings from George Lockwood. He says hello to everybody. He couldn't come here. But I do think our response to your concerns was kind of a sincere effort to try and solve some of your concerns.

A couple of responses are quite technical, and so I would just ask if the livestock committee in your deliberations has questions, please don't hesitate to reach out to us and use us as a resource, and we are more than willing to explain, and particularly the hydrologic zone of influence, that gets kind of funky when you really delve into it. But it is a very important piece I think of our response. So we'd be glad to explain that further.

And finally we really hope that you as a committee continue to use us as a resource, and continue to have a dialogue as
you go forward in your deliberations, because
we think it's a positive way to do things.

Thanks very much for your efforts,
and thank everybody on the Board, for your
efforts, because you've had a long day, and
you've put a lot of time and effort in.

CHAIR MOYER: Thank you,
Sebastian. I believe we may have some
questions for you. Question from Jennifer?

MEMBER HALL: Yes, Sebastian, I
just have one question. And I do appreciate
all the diligence, and you bring up a good
point about the hydrologic zone of influence,
and the details that are involved in that.

Is it realistic to think all those
things are measurable, that a certifier can
use those tools in real life?

MR. BELLE: We had a lot of
discussion about that, and we actually reached
outside the group to a bunch of physical
oceanographical modelers, and asked them
specifically is what we are proposing crazy?
Is it achievable? If it is achievable, how would you then check that it had been achieved, and how would a certifier approach that?

So we had a lot of debate, and we reached out to, there was one modeler up in our neck of the woods, in the northeast who is really a world renowned oceanographic modeler, we'd be glad to give you their names directly. You can have your own discussion directly with them. And then we also had a West Coast modeler.

And the answer we got back basically was, our first try was a good try but it was technically flawed in a couple of ways. And so we adjusted it before we submitted our comments. And they both said that particularly the zone of influence stuff is difficult but it is achievable, and it's also something that because it is quantitative and you have a lot of data there, that a certifier could go in and audit that, the
results of that process, and verify that in fact what you are asserting as a producer you had actually achieved. So that is the short answer.

CHAIR MOYER: Follow up, Jennifer?

MEMBER HALL: Yes, not directly. But I do want to reiterate, if there is any way that the AWG can encourage applicants to the Board that I think that would be a good idea.

CHAIR MOYER: Okay. One more question that I have for you, Sebastian, in two minutes or less. We continuously get stuck on bivalves with the whole concept of the fact that we are not feeding them, they eat what washes by. Can you convince this Board that that, how can we get around that issue? It's the biggest stumbling block for us. You and the rest of the AWG have done an excellent job in your rebuttal, but that thing just keeps hitting us flesh in the face.
MR. BELLE: Not surprisingly, we struggled a lot with that. And there are a lot of people in the traditional shellfish community who frankly are just mystified by that concern.

And we took, certainly those of us who represent growers frankly took a lot of -- from our members about even suggesting that what they were doing wasn't organic and perfect in some way.

The hydrologic zone of influence was part of the response to that concern. Basically what we did was, we did not want to -- we had a lot of discussion about whether or not we should go kind of the product testing route. And we recognize that within the organic community that's something that people are very uncomfortable with. And it's really a process certification as opposed to a product certification. So we tried to kind of combine those approaches.

And the purpose of the hydrologic
zone of influence is basically to document all the possible sources of contaminants that would impact the feed that those bivalves are consuming, and then to include in that a routine testing of those feed sources. So that although we are not testing the finished product, we are actually testing the feed sources and then using sentinel animals as kind of if you will a fence around the farm. So that is how we approached it.

I recognize that it is not perfect. We are not culturing the algae organically that we are feeding to the animals. We do have provisions in the proposal to allow for that kind of shellfish operation to occur on land and do that, so there is an ability to do that. But the reality is that land-based aquaculture is extremely capital intensive, and to suggest that a small owner-operator is going to build a land-based farm and then culture algae and feed them algae is probably unrealistic from
a reality point of view.

CHAIR MOYER: Dan.

MEMBER GIACOMINI: Hi Sebastian,

there was a couple of comments questioning
your, what you were just talking about of
surveying that possible contaminants. They
were basically saying there is no way you can
get far enough up the watershed. What do you
project in there specifically?

MR. BELLE: Yes, what we did was,
in that circumstance we reached out to actual
feeding rate experts on bivalves, and
phytoplankton culture experts. And we said,
given these parameters from a temperature
point of view, what is the lifespan of a
single celled algae phytoplankton and what is
the feeding rate for a bivalve?

And then we looked at flow rates,
and went back to our oceanographic modelers
and said, well, what we've been told by the
phytoplankton experts and from the feeding
rate experts is that phytoplankton under this
1 set of temperature regimes lives and basically
divides at this rate. So how far away do we
have to go given the flushing rates?
And so obviously it is dependent
on temperature and flushing rates and the
lifespan of the phytoplankton that you are
concerned about. And so that is why in the
hydrographic zone you actually have to come up
with -- you have to define based on those
parameters how far away from the farm you have
to go in order to predict whether or not a
phytoplankton has been exposed to something.
And there is a margin of safety in there as
well. So you go further than that zone of
influence.

CHAIR MOYER: Thank you,
Sebastian. I think I speak for the entire
board, and certainly the livestock committee,
when I say we look forward to participating in
these conversations as we move forward over
the next few months.

MR. BELLE: Well, thank you very
much for your time.

CHAIR MOYER: Thank you for your time and for being here.

Joanna, and then I don't have the list up there, but is it Michael Henson? Well, let's just leave it at that. Thank you.

MS. BAUMGARTNER: Okay, thank you.

SECRETARY WEISMAN: Is this with a proxy or as a proxy?

CHAIR MOYER: This is as a proxy.

Five minutes.

MS. BAUMGARTNER: Yes, but I'm going to make it shorter.

CHAIR MOYER: Thank you. The Board appreciates that.

MS. FRANCES: She has a proxy from Sam Earnshaw, Community Alliance with Family Farmers, and then someone moved and traded places with her so she could go sooner so she could leave.

CHAIR MOYER: Thank you.
MS. BAUMGARTNER: Yes. So of course I'm up here to encourage you to fully support and adopt the biodiversity conservation recommendation.

It's been since 2002 that we began working on this issue with a broad community of certifiers and inspectors and conservationists. So there is lots of materials out there. There's these guys that we worked on with folks. We heard from certifiers that they actually wanted noncompliance spelled out, so we came up with this guide with Lynn Cody's help and she brought this to you last year.

I passed this around to you also. So this is the summary of the 12 major noncompliances. And this page shows the most egregious instances that would warrant certifiers' actions, the one that could give the organic community a black eye.

They probably rarely occurred. In most cases of noncompliance certifiers can
notify their farmers that they need to fix
problems within a given time and they will do
so, and their certification will not be
revoked.

The rest of this guide, minus that
one page, is -- has 20 pages of compliances
that farmers can do that help certifiers
understand all the thing that do work for
biodiversity conservation.

ATTRA, which holds the model
organic inspection questions that the NOSB
approved in 2005 on their website, they have
recently created an OSP that has those
questions answered. And this is it. Next
slide.

I wanted to point out that the way
those questions, they are model questions
certifiers, don't have to use them, but some
certifiers are. The way that it is set up is
that it starts with natural resources, and
then subsequently there are different sections
of biodiversity, biodiversity management for
whole farm issues. For uncultivated areas, for cropland area biodiversity. Next.

When livestock are involved. Next. And when wild crop harvesting enterprises are involved.

They have also created this wannabe organic farms plan, and so it's just an example, but it helps farmers understand what they can do. And so like here they say, we are going to deal with invasive species. We are going to plant beneficial insect refuges. We are going to plant some native vegetation buffers on two sides of the farm. And we are going to put up a bat box.

So but not only does ATTRA have this on their website, Rodale Institute also does. And there's going to be two other documents like this. This one is for small farmers. There is going to be one for large field crop farmers, and then one for livestock.

So I just want to end saying that
we encourage you to approve this
recommendation, and I think it will do a lot
for organic farming.

Thank you.

CHAIR MOYER: Thank you, Joanna.

Any questions for Joanna or comments from the Board?

Thank you. We appreciate your time. I will mention as the next presenter comes up to the Board that we do have a series of taxicabs for Board members that will be waiting out front at 7:00 o'clock. But we have to pack up and get out of this room and get there so we can go en masse down to the Witten Building and we will do that.

Michael. Do I have the correct person? Dag. I'm sorry, Dag Falck.

MR. FALCK: Thank you. It's Dag Falck. Thank you very much for taking the time to take our comments and it's very interesting watching the process here from Canada.
We are doing very similar things to what you are doing, but you are way ahead of us, so we are learning so much, so you better be careful because we might catch up.

I am bringing comments from Nature's Path. I work for Nature's Path. We are the largest certified organic cereal producer in North America. And it's a bigger issue, when you get bogged down with all the details that I see you are working with, similar to what we are working with in Canada, you can lose sight of the bigger issues sometimes. But they also are important because they can overtake you.

And for us what we want to bring to your attention is natural claims infringing on the organic market. And we found that misleading and unverified marketing claims that may imply organic method productions are used, these claims are being seen more and more in the marketplace, and many consumers are confused between natural and organic.
With some of these Natural Brands communications we see claims that imply organic production to the natural sphere. We actually have evidence of one of the brands stating on their website, natural foods are foods without pesticides or artificial additives, as well as minimally processed and preservative free.

So as an industry we have -- and we must -- go to great efforts to educate the consumer about what organic production and processing means, and why consumers can trust the organic label.

And our comment to the NOSB is to ask for a task force or a committee or whatever structure you want to be working with with a mandate to prepare a recommendation to the USDA NOP to protect this certified organic label in the marketplace, specifically by defining natural for all product categories that are currently covered by the NOP, and to establish and pass a natural labels claims act.
or regulation, not just a policy with no enforcement authority. Because that's what we've got right now. We've got a situation where there is no definition out there. The most common definition referred to dates back to 1982, to relate to natural, and it's called -- it's written in policy memo #0055, natural claims. But it only applies to meats and poultry, and it's also very weak in its definition.

So there have been many many comments given over the years saying that this is a serious issue, that we need to have a definition for natural, so that people are wanting to claim natural, they know what the guidelines are so their consumers will also be happier knowing what it is, and also it won't be infringing on what we have worked so hard to create.

I've looked through the national grant programs regulatory assessment, and the -- picked up some of the language there for
why the NOP was originally developed, and organically produced food cannot be
distinguished visually from conventional food, and cannot necessarily be distinguished by
taste. Therefore consumers must rely on
labels and other advertising tools for product
information.

However consumers face -- I'm jumping around a little bit here -- consumers face difficulties in discerning the organic attributes of a product, and many producers and handlers have sought third party certification of organic claims. So part of the reason that brought us to where we are today was to clarify the confusion in the marketplace.

And in the benefits of the final rule, also from the regulatory assessment, one of the points is providing a common set of definitions and organic attributes. So this idea of organic attributes I feel the natural confusion is kind of infringing in on the
organic attributes saying that things are done organically -- they don't use the word organic, but they use all the words, like no pesticides, no fertilizer, no this and no that. And they can't be verified, and they can't be -- we can't take anybody to task for it and say, hey, that's not right, because there is no common definition.

So to summarize, the lack of a clear guidance and a binding regulation or act to enforce consistent labeling in the marketplace that does not infringe on lawful certified organic claims has been brought up for many years by many different parties in the organic industry, even companies marketing natural but not organic products have asked for clear guidance to help the consumer to select products that are what they say they are.

We feel that it is time for this issue to be thoroughly addressed before it threatens the success of organic products.
And we particularly saw the evidence of this in the marketplace that we're in with the recent recession. A lot of companies took more advantage of this confusion, and actually kind of manufactured confusion to their advantage. So and I will hand you a copy of that. Thank you.

CHAIR MOYER: Thank you, Dag. We have a couple of comments or questions. Bea and then Katrina.

MEMBER JAMES: Thank you for bringing that up. I recognize that that is absolutely an issue in the marketplace, the distinction between natural and organic. I guess my question to you would be, how would you envision merging that definition between the conventional market and the natural market? It's such a huge request that you ask, and this Board's focus is really on organic, and we are still grappling with trying to define that.

MR. FALCK: Yes, I mean that is
the big question is how are the mechanics
going to work on this. But first of all we
want to bring up the importance of the issue.
And then some of the solutions might include
the NOP working within other government
departments to request that we need this, not
that the NOP is responsible for developing it,
because it is outside the organic -- it has
nothing to do with organic, and that's the
point. So but where organic is being
infringed on, and since the NOP is here to
protect organic trade and to clear up
confusion in the consumer, well, that
confusion that we originally clarified by
having the organic claim being verified and
all that, well, that confusion is now re-
happening. But it is not re-happening with
conventional; it's re-happening with natural.

MEMBER HEINZE: You covered most
of it. While I am sympathetic to your
comments, I just wanted to make sure that
everyone knew that natural is clearly under
the FDA jurisdiction, and is actively being worked on.

MR. FALCK: Okay, any more questions?

Okay, thank you very much.

CHAIR MOYER: Thank you. I believe Jay Hanson is next, Jaydee Hanson, I apologize. And Kathy Jo Wetter is on deck.

MR. HANSON: Well, good afternoon, or good evening, whichever we're at now. Thank you for your long service on this committee today and all the other days you work on.

The Center for Food Safety which I am representing both on behalf of myself, on behalf of George Kimbrell, our senior attorney, is a nonprofit membership organization that works to protect human health and the environment by curbing the proliferation of harmful food production technologies, and promoting organic and other forms of sustainable agriculture.
We have about 40,000 members around the country, and some in Canada. With our sister organization, the International Center for Technology Assessment, we've worked on the issue of nanotechnology for some time.

The International Center for Technology Assessment works primarily on new technologies and trying to assess them to see how they benefit or don't benefit the public.

We have a particular project on nanotechnology called Nanoaction, through which we coordinate campaigns and represent our members.

You have I hope enough of you, I hope there are enough copies, to have a copy of principles for the oversight of nanotechnologies and nanomaterials. This document has now been endorsed by over 80 organizations on six continents. If you'd like it in Spanish, French, German, Japanese or Chinese, it is now available on the Nanoaction website.

We have also been together with
International Center for Technology Assessment, the lead organization, filing two legal petitions, one with the FDA in 2006, and one with the EPA in 2008. Our petitions request those agencies to use their existing authorities to address issues created by the rapid commercialization of nanotechnologies in various sectors.

We -- one of the products you've talked about some here today is the subject of the petition to the EPA. And that is nanosilver as a antimicrobial agent. A little parenthetical comment: we will probably submit to you later some more comments on synthetic and your definition of synthetic.

A couple of things that I think are going to become more and more problematic with nanotechnology, one is percentages. Nanotechnology may be an extremely small percentage of a product, but because of the activity that is enabled through nanotechnology may have a greater effect on
the product than the volume, and volume
challenges I think will come up. But we will
talk some more about that later. You all have
our 10-page long comments, so I'm not going to
go through them.

But in summary, we believe that
nanotechnology is contrary to organic
principles. Nanotechnology will further
entrench an industrial chemical agriculture
and industrial foods as dominant paradigms to
the detriment of public health and the
environment, and as such we think that
nanotechnology is antithetical to organic
principles and should be prohibited from the
USDA organic standard.

We think that because
nanotechnology involves the manipulation of
materials and creation of structures and
systems at the scale of atoms and molecules,
the mere fact that a larger scale version of
material is a permitted substance -- do I have
one minute, or do I have both of the five
minutes? Okay.

We think the mere fact that the larger scale is permitted doesn't mean the nanoscale should be permitted. Intentionally created nanomaterials are novel, frequently patented substances that have the capacity to be fundamentally different in ways the scientific community has not fully understood.

As such engineered and manufactured nanomaterials should be defined as synthetic and prohibited substances, and should be presumed excluded.

One of my mentors was a man named Harrison Brown who was the geochemist for the Manhattan Project, and the man who first discovered how to isolate plutonium. Harrison Brown would turn over in his grave listening to some of the discussions of nanotechnology.

You will hear people say, well, nanotechnology is all around you; you shouldn't worry about it. Harrison would say, yes, radiation is all around you. That
1. doesn't mean you shouldn't worry about it.
2. There are going to be processes
3. that create incidentally nanomaterials. What
4. we are talking about is intentionally created
5. nanoparticles and nano materials, and that's
6. really what we think you have before you.
7. The time to act, we think, is now.
8. Nanotechnology is being rapidly
9. commercialized. The U.S. government and other
10. governments are putting lots of money into it.
11. Very little money is going to the health and
12. safety aspects of it.
13. The standard for the size of nano
14. particles I think is going to be an important
15. element. I've recommended to a committee in
16. the state legislature of California that they
17. actually use 300 nanometers, not the 200
18. nanometers that the soil association uses, or
19. the 100 nanometers that the National
20. Nanotechnology Initiative uses. I believe the
21. key issue is, does the changed substance have
22. properties that change how it worked
chemically and how it worked physically. Has its quantum physics changed? Has its optics changed? Those questions are going to be important.

That being said our organization does support the Soil Association of the UK's standard in 2007. I -- try to very quickly not run out of time -- we've answered all of your questions. And in general you should understand that we don't think nano belongs in organic.

We have pages and pages of scientific argument that we will be happy to provide you. And our petitions to the FDA, and our petitions to the EPA, could help you unpack that.

I would also be happy to give you the comments that I have passed on to a committee in California. Those are J.D. Hanson's comments, not the comments of the Center for Food Safety at this point. And I thank you.
CHAIR MOYER: Thank you, Jaydee.

We appreciate those comments, and the time you spent bringing that information to us. And anything you can pass on to the program, they will make sure that the materials committee gets that, and we will review that and include it in our thought process.

MR. HANSON: Please note in our written comments we have made page by page comments sometimes on your discussion draft where we have some questions on that. I know it's late, and you are tired and everybody else is, so I'll stop now, and thank you very much.

CHAIR MOYER: Any questions or comments for Jaydee? Again, we appreciate your time coming to us today and bringing that information.

MR. HANSON: One last thing: I chair, or I'm the U.S. co-chair for the Trans-Atlantic Consumers Dialog Committee on Nanotechnology, and through that I've had a
chance to interact with a number of the European groups. And I assume you have on your radar screen that the European Commission is dealing with two things related to nano, a nano cosmetics directive is coming out fairly soon, it's almost finalized. I believe it's got one more reading in the European Parliament. That will be requiring labeling. Likewise there is a nano food directive that is going to come out by the end of the year, that will also require labeling of nano substances. So you have the possibility if you don't exclude nano from organic products here, that you will have organic products, in order to be sold in Europe, that will have to be labeled. And I think that is going to raise confusion on the part of people here.

Thank you.

CHAIR MOYER: Okay, thank you very much, Jaydee. Appreciate that.

Kathy Jo Wetter, and then Valerie,
if you can tell me who's next, Urvashi Rangan, that's who's next. Thank you very much.

No Kathy Jo? Or Urvashi? And then John Foster. Is John here? He left?

MS. RANGAN: Good evening. I'm speaking for Michael Hanson and myself. We are both from Consumers Union, and I'm going to try and make it fast.

Good evening, my name is Urvashi Rangan. I am just recently director of technical policy in the technical department for Consumers Union. We publish Consumer Reports magazine.

I'm here to hit a lot of topics, so let me just get started.

The first is nanotechnology, and there's been a lot of discussion. We don't agree it's compatible with organic systems. Here's where I think a line could be drawn, which is in the intentional manufacturing of nano-engineered materials for use in organic production. I think if you can draw that line
there, it will then forgive the nano particles generated in homogenization and other production methods that are currently in use while prohibiting the intentional manufacturing of nano materials for use in organic production. I think that is one way at least to get around this.

One thing this does bring up, though, is the generation of nano particles from physical methods, so you can grind something and pulverize it until you get a nano particle. And I think we would regard that as a chemical biophysical change to that particle. And that plays into the synthetics definition as well. So it needs to be tracked all the way through.

We think that that method used to generate a nano material ought to be prohibited so that you can't grind silver into nanosilver, or titanium into nanotitanium, and use it in organic products.

But I think if we can phrase this
and draw the line at intention to manufacture, that may be one way to at least get this beast off the deck and start at least drawing the lines in the sand as to where it is prohibited, and in the case of homogenization, where it would just be acceptable.

With genetically engineered vaccines, that came up. We generally believe that genetic engineering doesn't play a role in organic production. And we understand, in my conversations with Harriet, that there may be a part in the regulations that requires, at the very least, a review of vaccines that may be genetically modified, just like a synthetic material.

At the very least that requirement should be enforced. But we think actually the Board ought to consider full prohibition on genetically engineered vaccines. It's a prohibited method, consumers don't expect anything used in organic production to contain genetic engineering. And that will be a very
complicated education task going forward as this bubbles to the surface.

Definition of synthetic materials:

we were really pleased to see the presentation that went up based on Rosie Koenig's original draft of what synthetic is and what it isn't. We do not agree, we strongly disagree with the previous comments that the OFPA should be opened up; that synthetic materials should just be limited to petrochemical-derived compounds. That is simply completely out of line with consumer expectations and with science. Whether it's in a personal care product or whether it's in food, a synthetic substance is a synthetic substance. You can pull it out of a coconut, and if you chemically process it into something and you change the chemical nature, that is a synthetic ingredient. And that is the scientific basis of that; that's chemistry 101. So to futz with that constantly in these conversations is really to do a disservice to
the organic program. And a change like that
would really undermine the integrity of what
organic has come to be. So we strongly
disagree with that, and we are quite
supportive of the document that was presented
today by the working group. We would just
encourage you to look at the pulverization and
the generation of nano materials within that
document as well.

On personal care products,
fascinating discussion today. We also believe
that that product class has to come in line
with food for all the labeling tiers, not just
for one or two of them, for all of them; and
that means creation of sections on the
national list that will deal with the
synthetic materials that are used in the non-
organic portion of those products.

There are a lot of examples for
why you should do this. I'm going to submit
the written comments to Valerie, including
thallates and fragrances, though, and that
even means for your organic tier. You've got a fragrance, you've got thallates in it. That could be used under the 5 percent portion. Same with the made-with organic ingredients. Consumers are looking to these products so they can mitigate their exposure to some of these harmful chemicals that are on the market, whether it's perabins, whether it's thallates, whether it's EDTA, and whether it's even a synthetic ingredient that is derived from a natural material. There are plenty of synthetic substances that come from coconuts that are highly irritating in personal care products. We think those materials ought to be reviewed by this Board and listed one way or the other, or simply not used at all, because that's what a synthetic material is. That's what the job of this Board is to do. And we don't want to see any non-organic portion of any product category be able to sort of be a Wild Wild West of ingredients. So I'll leave my comments on
personal care products at that.

I will also just say that the FDA does not require any pre-market approval of cosmetics. So while you are looking to FDA for some guidances, they don't have a very good track on personal care products, in addition to the labeling problems that someone brought up, that Nature's Path brought up for food, those same problems exist for personal care products. Hypoallergenic, fragrance free, natural -- all don't mean anything on that product category. They all fall under the jurisdiction of FDA.

So it's something for this Board to keep in mind. Because if organic is going to mean something more, then it shouldn't be diluted by those other claims that are currently out there.

Biodiversity, we strongly support that biodiversity document. We think, however, a line needs to be added in 205.200, and that production practices dot dot dot must
be able to demonstrate that they maintain or improve the natural resources of the operation including soil and water quality. If you can't demonstrate it, there should be not a not-applicable section, a not-applicable box. We think that these principles ought to apply to all production systems that come under the national organic program.

We also think biodiversity should be included in the checklist for the accreditation process so that all certifiers are aware of the requirement and deemed as having the expertise and competence to verify it.

We really do applaud, though, that document as being a progression of the organic standard, and really serves the organic marketplace very well.

As new products are added to the scope, however, that document is going to need to be updated. And I can't get away without talking about aquaculture. If you look at
open net pens, and you start to read the biodiversity document, those two things don't fall in line with one another, and neither does the bivalve recommendation at this point.

So if we are moving toward aquaculture at some point those -- we believe the biodiversity document needs to be augmented to also include production practices that go on in aquaculture, and whether or not they are really compatible with organic production.

On animal welfare, we again commend this board for putting out an animal welfare document; it's been a long time coming. Consumers really expect that this program is taking animal welfare issues seriously, and we would just agree with the comments made by Patty Lavera from Food and Water Watch and many others that there is more to it than just that. And while we are really pleased that Temple Grandin's input was accepted and put into this, Temple Grandin has
1 actually participated in the development of
2 several animal welfare standards, many of
3 which have much more robust standards than
4 this particular discussion document contains
5 right now. And we would really encourage you
6 to look at the programs that are out there,
7 certified humane, whole foods animal welfare
8 standards. There are many programs out there
9 right now that have space requirements,
10 density requirements, animal treatment
11 standards regarding tail docking and de-
12 beaking. We think those things have to be
13 considered, and we want this Board to use
14 what's out there as a base for your
15 deliberations around that topic.

16 Finally on retailer certification,
17 we strongly support retailer certification for
18 organic. There are so many confusing things
19 when consumers get to the store, and it is a
20 way for stores to differentiate themselves,
21 and we also agree that there is a lot of
22 natural organic commingling at the retail
stores that really does need to be dealt with. I'm not sure based on the last comment that you all can take on natural and agree that that is something that has got to be dealt with at a higher level than this agency. But that is an important part of distinguishing organic from natural in the marketplace, and something we work on all the time in trying to educate consumers around that topic.

And finally, I would just maybe urge that you might consider what retailers should not be using the organic label. I also have seen organic dry cleaning, organic lawn care services. And this is a real problem. We get questions all the time from consumers about the variety of retailers offering organic services. If they don't meet an NOP program, we just think they shouldn't be allowed to use that term. And again, we encourage this Board and the national organic program to stop the allowance of people using
the organic claim whether it's on fish today, dry cleaning tomorrow. It shouldn't be out there. It mucks up the marketplace.

    Thank you.

CHAIR MOYER: Thank you, Urvashi.

Any questions or comments? Hugh?

MEMBER KARREMAN: Just a quick comment, Urvashi, on the animal welfare. We are definitely going to be taking a lot of input. We just wanted to get something out there to start the conversation.

MS. RANGAN: And we are glad it's out there, thank you.

CHAIR MOYER: Kevin.

MEMBER ENGELBERT: We'd also appreciate some specific comments with regard to the biodiversity document and the aquaculture issues we are working on.

MS. RANGAN: For the language changes, Kevin, that I recommended, I have it here in the written document. Thanks.

CHAIR MOYER: Any other questions
or comments? Thank you, Urvashi. Appreciate your time very much.

Next we have Bill Wolf and then Kelly Schea on deck.

Bill.

MR. WOLF: Hi. You guys have had a long day. I want to give you a gift. I use it pretty regularly. My staff tells me that it actually has helped a lot, and they have thanked the manufacturer or the producer of it for improving my mood in the office periodically. But that is not what I was going to talk about.

We submitted, Wolf, DiMatteo and Associates submitted written comments to you about a number of items: removal of lecithin from the national list, inert atmospheric gases, the sunset of materials, biodiversity, list for inerts, clarification of definitions of the national list.

Today I really want to talk very briefly about -- kind of an umbrella concept
that you all face in some of your decision making, and some of my personal experiences around that. And before I do I want to introduce Oliver the earthworm. Oliver was introduced to me by -- actually by Jeff when he brought 10 yards of compost to the people's garden in D.C., and I had the pleasure of helping to shovel some of it into wheelbarrows with Valerie, and we --

CHAIR MOYER: I was wondering where Oliver got to, so thank you.

MR. WOLF: He is being cared for very well from what I understand. Is he in the peas? He lives with the peas. Anyhow Joan took a picture of Oliver, and I wanted to share him with you.

And I wanted to talk about some concepts behind organic agriculture being about healthy soil and the dynamics of biodiversity, of ecosystems and of how earthworms like different materials.

So that really comes back to a
long historic precedent around how many organic policy decisions were viewed back over the years. And thinking like an earthworm is a phrase that I've used personally for 30-something years. And people go, what are you talking about? All it really is is to say, put yourself in the role of saying, well, what would earthworms like? What would be better for earthworms on this planet? And how can we measure our ability to improve the system by the number of earthworms we have encouraged -- number more earthworms.

So I think that is an interesting principle behind decisions about organic regulations.

With that in mind, actually, I want to go back to our earthworm for a second, because yesterday you heard quite a bit about a range of topics. One of them was around organic field seed, and there were some questions about the potential decline in the percentage of use in organic seed. And
actually I read some reports and looked at some of the surveys, and conventional untreated field seed now represents a slight increase this year in the percentage of acreage from completely uninspected facilities. We don't even really know if they are really untreated seed, because that is very difficult to determine. There is no inspection. I mention that, because I think we need to take a look at how all inputs are reviewed, and there is a task force addressing that within OTA. But it raises questions about the whole process of exceptions, exceptions being anything that isn't organic in our system, whether it's on any of the national lists. So to the next slide, briefly I want to summarize by saying, I as part of continuous improvement we strongly encourage you at this meeting to, one, remove lecithin from 605; two, amend the lecithin listing on
606 to read de-oiled only; and longer term I'd like to place three ideas out there for further consideration.

One, the posting of all exceptions that are granted by certifiers, so that we understand what commercial availability decisions are being made.

Right now we are doing it in the opposite, we're saying you have to list everything that is organic that is available. We should be looking at the opposite, I think, the exceptions.

Two, we continue to say, and we said this in November, we believe that merging 605 and 606 and applying organic preference to all materials would make a massive difference in how the system is gamed by producers.

And finally, issue and enforce the organic seed guidance.

Thank you.

CHAIR MOYER: Thank you, Bill.

And thank you for the mind bomb. Anybody have
any questions or comments for Bill? Joe.

MEMBER SMILLIE: Merging 605 and 606, could you just go into detail about how it might solve the problems where we say we have a no-win situation?

MR. WOLF: Well, we are spending a lot of time in the debate about synthetic versus non-synthetic and ag versus non-ag, where to put it on the list. And instead we'd be saying, okay, if it's not a clearly natural material it needs to be -- if it is not -- in the case of 605 and 606, if it's not certified organic, and it's going to be in an organic food product, then it has to be on this list, and this list is complete, and if there is a commercially available organic form of that item, then it should be used instead. It would be a much simpler process, and it would solve your problem about yeast; it would solve your problem about debating where to put lecithin, et cetera.

It would be a rule change, but it
is one of the suggestions that the materials working group presented in its report last November, and we supported it in our comments.

MEMBER SMILLIE: Second follow up, when you say certifiers have to declare the exceptions, you mean all rulings on commercial availability?

MR. WOLF: Yes, and I've discussed this with a number of certifiers. And I realize that that is a burden. But if it were done in a structured and grouped way, so that we understood the volume of decisions, it would encourage production to fill in those gaps, and it would make the whole system accountable. The certifiers are agents of us, of the USDA and of the people. And to know what those decisions are rather than -- I'm not talking who it was for, or the specifics of which item it was or what field, but generically.

MEMBER SMILLIE: But you don't mean exceptions, you mean commercial
availability.

MR. WOLF: Commercial available -

- I'm calling it exceptions to being organic.

Anything that is commercial, not organic that
you made a decision, it's okay to use that.

CHAIR MOYER: Thank you very

much, Bill. Kelly, and then Dave Rogers on
deck.

MS. SCHEA: Kelly Schea with

White Way Foods. I'll make a deal with you

all, in the interests of time. If you will

read the comments I submitted to regulations

dot gov, I will be really really brief right

now. Is that a deal?

Okay, so I submitted comments

about sunset materials, and specifically

listed the sunset materials that we would like

to stay on the list.

As well I submitted comments to

the policy development committee on their

priority of petitions, specifically asking you

to remember that the secretary can develop
emergency procedures, and that should be your number one priority, because that is only a 12-month exception, right. And secondly, where issues like livestock health care items come up like this issue about vitamins and minerals, that should be a top priority.

So I do understand that it was just a prioritization guideline, but I'd like you to take that into account.

The livestock committee did put forward the proposed recommendation for vitamins and minerals that might be given to animals either intramuscular or subcutaneously, and I really want you to remember that before OFPA, since OFPA, since the regulations. This is happening every single day on farms. It's widely accepted. It's on certifiers' websites as something farmers are allowed to do. Extension agents, veterinarians and consultants all recommend this. So there needs to be a mechanism, and I'm staring down at you, Richard Matthews,
needs to be a mechanism for making sure that
this continues to be allowed as you go through
and do your work, okay, that is very
important.

And it also should be a category.

Do not start reviewing and TAP reviewing every
single vitamin and mineral that is already
allowed to go in the mouth of a cow just
because it is going to be injected in them for
herd health purposes.

And lastly, I just really want to
give a friendly reminder to the Board that
your raison d'etre, so to speak, your number
one responsibility, is materials. You have
been given statutory authority by Congress for
materials in organic. And so I think that the
community never wants to see the Board short
shift the amount of time they give to
discussing materials, the national list, how
that should be done, how that should be
organized, because that is your number one
responsibility and why you are sitting in
1 those chairs.

2 Okay? Thank you very much.

3 CHAIR MOYER: Question by Joe and then Hugh.

4 MEMBER SMILLIE: Nice try, Kelly.

5 MS. SCHEA: What did I try? Ask her how many minutes I shaved off for you all.

6 MEMBER SMILLIE: Well, you are not going to get away that easily.

7 Speaking of materials you also commented upon the lecithin issue. I just want to know if the way we are going if you could offer your comments on that.

8 MS. SCHEA: What I heard the Board say, and what I heard the petitioner, Mr. Clarkson, say is that not all forms of lecithin are available, and he was mainly focused on soy. He did say that the sunflower product was not available. So as long as whatever way you organize this that the liquid sunflower lecithin that I commented about is still available, then do it whatever way works
for you.

MEMBER SMILLIE: Is it de-oiled?

MS. SCHEA: Let me look here and I'll tell you. It is -- I don't have anything about de-oiled. All I know is it's liquid, fluid, lecithin. I don't know. Okay, it's not de-oiled then; I don't know.

CHAIR MOYER: Hugh.

MEMBER HEINZE: Just one thing, Kelly, per the injectable vitamins and minerals, it's not just subcu or IM, it's also for IV use; it's any kind of injection.

MS. SCHEA: Yes. Well, the IV is put in either subcu or IM, right? Okay, I'm not a vet, and I'm not an R&D person.

Anything else for Kelly? Okay, thank you very much.

CHAIR MOYER: Anything else?

Thank you, Kelly, appreciate your time.

Dave Rogers. Dave Rogers is not here.

Harriet Behar.
MS. BEHAR: And I can get you this in written form tomorrow after I print it out.

I am Harriet Behar, and I will do my best to channel Lynn Cody in her fervor for quality systems and ISO accreditation.

First I want to clarify that there are two parts to the accreditation puzzle. The first is AHRQ which accredits organic certifiers to ISO Guide 65.

They are now -- and they are now in that process of being recognized by NIST for doing that type of accreditation. This is a terrific step forward.

The second is the accreditation of national organic program itself by NIST. This would include how they work with stakeholders, the way policies and procedures are set, as well as the transparency and consistency of the implementation of those policies and procedures as presented in their quality manual. In order to have the accountability
and the continual improvement necessary for a consistent program that implements the organic regulation, it is important that the national organic program itself in addition to AHRQ go through the NIST recognition process.

Joe is right in that ANSI is the U.S. rep to the ISO process, but NIST also works very closely with the process. ANSI is an accreditation body but not a recognition body. Guess who oversees ANSI to make sure that ANSI complies with ISO 17-01-11. It's NIST. Okay? ANSI is recognized by NIST.

ANSI services would best be used by the NOP if they wanted to hire a third party to do an internal audit identifying what is okay and where there are problems. ANSI cannot grant recognition and would provide no continual oversight of NOP's corrective actions, timely input to implementation, continued quality improvements. ANSI would only come to audit NOP when NOP voluntarily asks them to do so with no set timeline, no
follow up. They simply submit an audit report
to the NOP and that is that; NOP is not
required to do anything after an ANSI audit.

NIST provides the formal
recognition program which does provide that
regular oversight. And I will submit with my
comments all the things that NIST does, which
is quite a bit.

This recognition that they provide
is very important. This is what they are
looking for internationally.

So I just want to say in summary,
because I know everyone is tired, that it is
important that we look at having NIST do the
recognition of both AHRQ and the NOP, and that
if you want to use ANSI, that they would do
internal audits but not do the actual
oversight of the NOP. That should be done by
NIST. And Lynn offers that anyone can call
her at any time. If you need her phone number
it will be in the written comment. She is so
anxiously out there on the West Coast waiting.
So if you have any questions about why we didn't agree with the inclusion of ANSI as a choice between NIST and ANSI, I'm trying to give you the difference there.

CHAIR MOYER: Thank you, Harriet, I appreciate that.

Yes, sir.

MEMBER SMILLIE: Again, part of the recommendation allows for NIST?

MS. BEHAR: Yes.

MEMBER SMILLIE: As far as ANSI goes, it says it asks for a three-year cycle. So yes, ANSI won't enforce. But we can put it on a three-year cycle, just the same as NIST is on a three-year cycle.

MS. BEHAR: Right, but ANSI will not give you the recognition internationally that NIST will.

MEMBER SMILLIE: My gut feeling is that USDA, we need a good evaluation program that is going to work, and I'm sure NIST would work, and I think ANSI will work
too. And as far as recognition, I don't think
the USDA is really horribly worried about it
quite frankly.

CHAIR MOYER: Okay, thank you
very much, Harriet. The Board appreciates you
being here.

The Board would now recognize
Lindy Bannister.

MS. FRANCES: And Jeff, not to
forget Michael Christensen and Brian over on
the right, the sulfurous acid commenters.

CHAIR MOYER: I'm doing my best.

MS. BANNISTER: Thank you very
much.

I'm going to make it really quick.

I know that we started with FMI, talking from
a retailer's point of view. I'm the general
manager of the Wedge Coop in Minneapolis.
It's the largest single store coop in the
United States. We do about $30 million out of
our retail business out of an 11,000 square
foot store. We have a warehouse that is
45,000 square feet. We do another $10 million out of that, and we have a 100-acre organic farm.

All of our process is certified organic. And from a retailer's point of view, having that certification in our store is a very long process. Our staff is very involved. They spend hundreds of hours a year making sure that what we put out is what we say we are going to put out; that our certification process is complete from the time we bring the product from the farm to the consumers' hand. It's not a point of differentiation for us to be certified, it's a point of pride.

And it's a point of pride that we can take a producer, a manufacturer or a grower's product from the time they hand it over to our drivers, bring it to our warehouse, bring it to our store, and we hand it to the consumer.

So when we are talking about the
multi-site rule, and I know that you spoke
about it yesterday, certification for an
individual retail store should be a living,
breathing document that lives in the
departments in the store, and it cannot happen
in a conventional huge chain. I've worked in
conventional stores for 20 years before I got
to the world of coops. The chain of command
and the trickle-down effect does not work the
way it needs to work for certified organic.
Whatever you translate the word coming from
above, every manager translates that
differently, and the education is not
available in the conventional stores for the
staff or for the consumers to be able to get
the whole word about what organics is.

And I really urge you when we are
talking about certification for retailers,
that you really look at that process. Thank
you very much for listening.

CHAIR MOYER: Thank you, Linda,
we appreciate those comments. Any questions
for Lindy from members of the Board? Or comments?

Thank you. We appreciate your comments and being brief.

Okay, finally, Michael Christensen or Brian Sakuma or both of you if whoever --

MR. CHRISTENSEN: Good evening.

Thanks for squeezing me in here. And I appreciate your efforts in putting in these long days in the name of organic agriculture.

So I too will be brief.

CHAIR MOYER: Could you identify yourself for the record?

MR. CHRISTENSEN: I'm sorry, Michael Christensen, I work for Reiter Affiliated Companies. We're based in California, and we grow about 1,000 acres of organic berries, and then several thousand more acres non-organic.

I'm here in support of the addition of the sulfurous acid to the materials list. In the -- our growing in
California, we are semi-arid, we have some water quality issues there that aren't very favorable for growing berries as far as pH, and this sulfurous acid could help us do a better job applying fertilizers and being more efficient users of these amendments when we get this soil pH into the right range of 6.5 to 7.0, then the fertilizers become more available to the plant, and we can use less of them, and be better stewards of the soil through the use of that.

And let's see, what else? This also should help us with our efficient use of water. The sulfurous acid will help in the maintenance of the drip irrigation systems. And when those are maintained well and they provide uniform application, then we should be able to use less water and be more efficient with it.

I will leave it at that. I appreciate the time late in the day. Thank you.
CHAIR MOYER: Michael, we appreciate you taking the time to come all this way and be as patient as you have been to present your information to us.

Steve.

MEMBER DeMURI: As an actual grower, what would prevent you from using citric acid for the same use?

MR. CHRISTENSEN: We do use it on a small scale. From what I understand it's largely a matter of practicality, because it was mentioned earlier about the volumes required to make a substantial change in the pH, or more than negligible change in the pH.

We did a quick survey of our organic growers, and we are using citric acid on, say, less than 10 percent of our organic acres right now. And when we ask our entire group of growing management how many would use it, it went up to something like 800 of the 1,000 acres. So everybody wants to be able to use pH adjustment to be a better fertilizer.
user. That citric acid tool just isn't there
from a practical standpoint.

CHAIR MOYER: Thank you, Michael.

This Board always appreciates farmer comments
above and beyond many others. And we
appreciate your time and effort to come out
here. We know it's a hardship.

Any other business before the
Board before we adjourn for the evening?

Then we are adjourned, and we will
meet out front. Taxi cabs will leave for the
Witten Building exactly at 7:00. Please don't
be late.

(Whereupon at 6:38 p.m. the
proceeding in the above-entitled
matter was adjourned.)
UNITED STATES DEPARTMENT OF AGRICULTURE

NATIONAL ORGANIC STANDARDS BOARD MEETING

+ + + + +

Wednesday, May 6, 2009

+ + + + +

The National Organic Standards Board met in the Franklin and Adams Rooms in the Washington Plaza Hotel, 10 Thomas Circle, Washington, D.C., at 8:00 a.m., Jeff Moyer, Chairman, presiding.

PRESENT:

JEFF MOYER, Chairman
DAN GIACOMINI, Vice Chairman
JULIE WEISMAN, Secretary
KATRINA HEINZE, Member
GERRY DAVIS, Member
TINA ELLOR, Member
BARRY FLAMM, Member

TRACY MIEDEMA, Member
JOE SMILLIE, Member
JENNIFER HALL, Member
STEVE DEMURI, Member
BEA JAMES, Member
KEVIN ENGELBERT, Member
HUE KARREMAN, Member

STAFF PRESENT:

VALERIE FRANCES, Staff
BARBARA ROBINSON, Staff
RICHARD MATTHEWS, Staff
DEMARIS WILSON, Staff

ROBERT POOLER, Staff
# TABLE OF CONTENTS

| Opening Remarks, Chairman Moyer                      | 4           |
| NOSB Presentations and Discussions:                  |             |
| Policy Development Committee, Mr. Flamm              | 4           |
| New Member Guide - approved                          | 6           |
| Policy & Procedures Manual - approved                | 6           |
| Compliance, Accreditation and Certification Committee, Mr. Smillie | 12          |
| Approved document for guidance                       | 12          |
| Joint Crops and Compliance, Ms. Ellor                | 14          |
| Biodiversity recommendation - approved               | 18          |
| Crops Committee, Ms. Ellor                           | 19          |
| Motion to list Isoparaffinic Hydrocarbons - defeated | 34          |
| Motion to Include Sulfurous Acid on List With Annotation - approved | 57          |
| Livestock Committee, Mr. Karreman                    | 58          |
| Motion to Include Propionic Acid on List 205.603 - defeated | 61          |
| Motion to Include Vitamins and Minerals Injected as supplements - approved | 75          |
| Motion to include Sodium Chlorite Acidified on list with annotation - approved | 114         |
| Motion to List Propane - approved                    | 123         |
TABLE OF CONTENTS (Continued)

Motion to Remove Bleached Lecithin from 205.605(b) - approved 164

Motion to annotation on 206.606 to read lecithin de-oiled - approved 173

No Further Action on Chicory Root - approved 175

Motion to add red corn color to 206.606 - defeated 178

Motion to add myrrh essential oil to list 206.606 - approved 189

Motion to list wheat germ on 206.606 - defeated 199

Committee Work Plans for 2009:

Policy & Development - Mr. Flamm 204
CAC Committee - Mr. Smilllie 214
Crop Committee - Ms. Ellor 218
Livestock Committee - Mr. Karreman 223
Materials Committee - Mr. Giacomini 227

Handling Committee - Mr. DeMuri 230

Sunset and Other Business 234
CHAIRMAN MOYER: Good morning.

The Board is seated and we have a quorum. We're ready to conduct business. Good morning everyone. That didn't sound very energetic. Thank you. Okay. I trust everybody on the Board has accomplished their work last evening and is ready to go and get to work.

So we'll get started right away with our voting schedule on our action items, starting with the Policy and Development Committee, Barry Flamm, chairman. Barry, if you want to bring up your first item.

MEMBER FLAMM: Thank you, good morning. First on the agenda is the Policy Committee's recommendations to add to the new member guide a glossary of acronyms and also e-bulletin board procedures, and we would like to combine that into just one vote. It's mostly procedural material for members and the glossary I'd like to point out will be kind of
a living document and we already have some excellent suggestions and corrections that will be made before it's posted.

So with that I'd like to move that the Policy Committee's recommendations to add glossary acronyms and e-bulletin board procedures to the new member guide be approved. Do I have a second?

MEMBER JAMES: Second.

MEMBER FLAMM: Is there any discussion? Apparently no discussion. I'd like to call for a vote. Is that your prerogative?

CHAIRMAN MOYER: I believe that is my prerogative but that's all right.

MEMBER FLAMM: Sorry.

CHAIRMAN MOYER: No, that's not a problem at all. I heard no discussion so we will call for a vote starting with Joe Smillie.

MEMBER SMILLIE: Yes.

MEMBER MIEDEMA: Yes.
1             MEMBER FLAMM:    Yes.
2             MEMBER ELLOR:    Yes.
3             MEMBER DAVIS:    Yes.
4             MEMBER HEINZE:   Yes.
5             VICE CHAIR GIACOMINI:  Yes.
6             SECRETARY WEISMAN:  Yes.
7             MEMBER DEMURI:   Yes.
8             MEMBER HALL:     Yes.
9             MEMBER JAMES:   Yes.
10            MEMBER ENGELBERT:  Yes.
11            MEMBER KARREMAN:  Yes.
12            CHAIRMAN MOYER:  And the Chair
13 votes yes. The motion passes. Mr. Vice
14 Chair, what is the vote?
15            VICE CHAIR GIACOMINI:  The vote
16 is zero no and 14 yes and one absent.
17            CHAIRMAN MOYER:   Thank you Mr.
18            Vice Chair.
19            VICE CHAIR GIACOMINI:  That was
20 zero no, 14 yes and one absent.
21            CHAIRMAN MOYER:   Okay. Mr. Flamm,
22 your next item?
MEMBER FLAMM: The next policy committee recommendation is changes to the policy and procedure manual, revamped petition and priority policy statements and changes to Section 3 and Section 4 of the manual.

We do have a couple of changes that we and the committee have agreed to and would like to make that are based on comments that we heard yesterday. And Steve, if you would just briefly explain what the changes are for the petition priority policy.

MEMBER DEMURI: Certainly I can do that. As Barry mentioned, we made a few changes based on public comment and discussions within our committee. If you look on the document up on the screen there, in Section 1(b) we added a statement to the effect that petition to remove material presently on the national list not based on serious health, environmental or regulatory concerns, but based on other new information such as commercial availability status will be
assigned a priority too and the reason we stuck that in there was because there was some concern that possibly there could be some re-petitioning of items for no apparent reason other than just re-petitioning them hoping to get them through maybe with a new Board or something. So we did clarify that a little bit.

And then the bottom of that same section in the last sentence it says, "if the resubmitted petition contains substantive new information to warrant reconsideration," so it just kind of bolsters the statement up above in Section (b).

And then moving down to Section 3 of the document, petitions to reconsider material for addition to the national list, add a sentence at the bottom that says, petitions for listing a substance that have been previously rejected by the Board must contain substantive new information to warrant reconsideration.
So those are the changes to the document from the earlier version that was posted on the web site.

MEMBER FLAMM: Thank you, Steve. Is there any questions, well I'll get to that later. Next in Section 3 we did have a comment on the executive director position and we discussed it in committee but I think it was something that we want to give more consideration to. We're not going to ignore that comment but at this time we're just proposing what was presented yesterday in Section 3.

In Section 4 we have a couple of changes. And Bea if you would explain those please.

MEMBER JAMES: The changes are the same as what we had proposed yesterday. We are actually going to remove technical reviews at this time and will evaluate whether or not we want to add that into all of the committee positions at another time. But for
now the changes stand as they are, so Valerie
if you could remove technical reviews.

MEMBER FLAMM: Thank you Bea. So
with the changes in priority of petition
statement and what Bea just explained, I'd
like to move that the Board adopt the revamped
priority policy statement and the changes in
Sections 3 and 4. I so move.

MEMBER JAMES: Second.

CHAIRMAN MOYER: We have a motion
on the floor and a second by Bea. Is there
any discussion? Hearing no discussion, the
Chair calls for a vote and after you vote if
you can wait until I call your name to vote so
that the recorder can capture who's voting I
would appreciate that. The voting will start
with Tracy Tracy Miedema. Tracy?

MEMBER MIEDEMA: No.

CHAIRMAN MOYER: Barry?

MEMBER FLAMM: Yes.

CHAIRMAN MOYER: Tina Ellor?

MEMBER ELLOR: Yes.
CHAIRMAN MOYER: Mr. Davis?

MEMBER Davis: Yes.

CHAIRMAN MOYER: Ms. Heinze?

MEMBER HEINZE: Yes.

CHAIRMAN MOYER: Mr. Giacomini?

VICE CHAIR GIACOMINI: Yes.

CHAIRMAN MOYER: Ms. Weisman?

SECRETARY WEISMAN: Yes.

CHAIRMAN MOYER: Mr. DeMuri?

MEMBER DEMURI: Yes.

CHAIRMAN MOYER: Ms. Hall?

MEMBER HALL: Yes.

CHAIRMAN MOYER: Ms. James?

MEMBER JAMES: Yes.

CHAIRMAN MOYER: Mr. Engelbert?

MEMBER ENGELBERT: You can call me Kevin. Yes.

CHAIRMAN MOYER: Mr. Karreman?

MEMBER KARREMAN: Yes.

CHAIRMAN MOYER: Thank you for that correction. And the Chair-- I apologize. Mr. Smillie?
MEMBER SMILLIE: Yes.

CHAIRMAN MOYER: And the Chair votes yes.

VICE CHAIR GIACOMINI: One no, 13 yes and one absent.

CHAIRMAN MOYER: Thank you Mr. Vice Chair. I believe that concludes the Policy and Development Committee's voting agenda.

We'll move on to the Compliance, Accreditation and Certification Committee, Chairperson Mr. Joe Smillie.

MEMBER SMILLIE: We will be holding on the peer review system's recommendation. I really don't have much to add after what I said yesterday. But I'd like to motion that the Board accept the document for guidance on a peer review system.

SECRETARY WEISMAN: Second.

CHAIRMAN MOYER: We have a motion made by Joe and a second by Julie. Is there any discussion? Hearing no discussion -- I
apologize. Tracy? Oh okay. Hearing no further discussion the Chair will the vote starting with Barry.

MEMBER FLAMM: Yes.

CHAIRMAN MOYER: Tina?

MEMBER ELLOR: Yes.

CHAIRMAN MOYER: Gerry?

MEMBER DAVIS: Yes.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: Yes.

CHAIRMAN MOYER: Dan?

VICE CHAIR GIACOMINI: Yes.

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: Yes.

CHAIRMAN MOYER: Steve?

MEMBER DEMURI: Yes.

CHAIRMAN MOYER: Jennifer?

MEMBER HALL: Yes.

CHAIRMAN MOYER: Bea?

MEMBER JAMES: Yes.

CHAIRMAN MOYER: Mr. Engelbert?

MEMBER ENGELBERT: Kevin replies
yes.

CHAIRMAN MOYER: Hue?

MEMBER KARREMAN: Yes.

CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN MOYER: And Tracy?

MEMBER MIDEMA: Yes.

CHAIRMAN MOYER: Thank you everybody. I believe that concludes the compliance—

MEMBER SMILLIE: Does the chair vote?

CHAIRMAN MOYER: The Chair votes yes. Thank you very much.

VICE CHAIR GIACOMINI: Zero no,

14 yes, one absent.

CHAIRMAN MOYER: I believe that concludes the compliance, accreditation and certification committees voting docket.

We will move on to the Joint Crops and Compliance Accreditation and Certification Committee vote on biodiversity and I'm not
sure if Tina or Joe is handling that discussion. Joe?

MEMBER SMILLIE: Does the Chair have to present it?

CHAIRMAN MOYER: No, not at all. It's just that in the Chair's docket and so one of the chairs can hand it off to--

MEMBER SMILLIE: We both agreed to let Barry present it.

CHAIRMAN MOYER: Barry?

MEMBER FLAMM: The biodiversity recommendation was I think well vetted by both the public and the members sitting here yesterday. I move that the biodiversity recommendation as approved by the Joint Committee be approved by the full Board.

MEMBER HALL: Second.

CHAIRMAN MOYER: We have a motion on the floor and a second. Is there any discussion on the biodiversity docket?

Katrina?

MEMBER HEINZE: I just want to
make sure I know what I'm voting for. As I review your document it looks like there are two categories of recommendation so the first is to add the word "biodiversity" in two questions on our material review sheet. And then the second category is a list of actions that must occur. So that producers need to incorporate biodiversity and the OSP inspectors receiving training. Certifiers have to adopt an OSP that includes this. And then some action to the national program, so those are our requirements now if we vote yes.

Is that correct?

MEMBER FLAMM: That is correct and that was an excellent summary. Thank you.

CHAIRMAN MOYER: Is there any other discussion? Hearing none, the Chair will call for a vote and it's been pointed out to me that before we have each vote I will ask if there is a conflict on the interest on the item that we're voting on. I apologize for not doing that in the first few items.
So is there a conflict of interest on this voting item? Hearing none, we will begin with the vote with Tina.

MEMBER ELLOR: Yes.
CHAIRMAN MOYER: Gerry?
MEMBER DAVIS: Yes.
CHAIRMAN MOYER: Katrina?
MEMBER HEINZ: Yes.
CHAIRMAN MOYER: Dan?
VICE CHAIR GIACOMINI: Yes.
CHAIRMAN MOYER: Julie?
SECRETARY WEISMAN: Yes.
CHAIRMAN MOYER: Steve?
MEMBER DEMURI: Yes.
CHAIRMAN MOYER: Jennifer?
MEMBER HALL: Yes.
CHAIRMAN MOYER: Bea?
MEMBER JAMES: Yes.
CHAIRMAN MOYER: Kevin?
MEMBER ENGELBERT: Yes.
CHAIRMAN MOYER: Hue?
MEMBER KARREMAN: Yes.
1            CHAIRMAN MOYER:   Joe?
2            MEMBER SMILLIE:   Yes.
3            CHAIRMAN MOYER:   Tracy?
4            MEMBER MIEDEMA:   Yes.
5            CHAIRMAN MOYER:   Barry?
6            MEMBER FLAMM:   Yes.
7            CHAIRMAN MOYER:   And the Chair
8            votes yes.
9            VICE CHAIR GIACOMINI:   Zero no,
10           14 yes and one absent.
11           CHAIRMAN MOYER:   Thank you Mr.
12           Vice Chair, the motion passes.
13           MS. FRANCES:   Just a quick
14           question. Who seconded?
15           VICE CHAIR GIACOMINI:   Jennifer.
16           CHAIRMAN MOYER:   And co-chairs, I
17           believe that concludes the voting docket for
18           the Joint Crops and Compliance Accreditation
19           and Certification Committee vote. We are
20           moving well ahead of schedule, this is great.
21           We will start our work now with
22           the Crops Committee, Tina Ellor.
MEMBER ELLOR: The first material on our docket is isoparrainfinic hydrocarbon.
The petition is for inclusion of isoparrainfinic hydrocarbon under synthetic substances allowed for use in organic crop production in list 205601. The petitioner yesterday made the request for him to withdraw the petition which, you know, since we've given this considerable consideration, spent the money, spent the time, we as the crop committee decided to go on with the vote and I'm going to hand it over to Jeff for further explanation on that.

We did consult with Barbara and Richard on this and they said it's fine for you to go ahead with it.

CHAIRMAN MOYER: Thank you, Tina.

Yes, the crops committee in particular and the Board in general has spent a lot of time on this particular material. The program has spent money on this material and the petitioner late yesterday requested that we
remove the petition from our voting docket this morning.

The committee in discussion among itself, and in consultation with the program, has decided because of the time, the energy and money already spent, that we will move forward with this material and the petitioner will have the right to take any action they want after the vote to re-petition or move forward in whatever direction they'd like to move forward with.

So we will be moving forward and voting on this particular item. Any questions from the Board on that action? Yes, Katrina?

MEMBER HEINZE: The petitioner presented in their public comment quite a bit of technical information that they felt was not reviewed in a technical review. Could the committee maybe articulate why we don't need to consider that?

CHAIRMAN MOYER: Certainly. I'll turn the microphone and the floor back over to
Tina.

MEMBER ELLOR: We did consider the comments and we were well aware of the deficiencies in the technical review. And we did our best and with a lot of research and a lot of time, to make up for those deficiencies in the technical review and we feel like we have the expertise on the crops committee to have filled in those deficiencies in that technical review. And we also sent it back to Science and Tech for additional information and to get some information back, and we'll be going over this.

But none of the additional information changed how we would have voted or how we voted on this material.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: It would maybe help me if you could briefly go over what the petitioner submitted and kind of talk about why it doesn't affect your recommendation.

MEMBER ELLOR: Okay. Gerry's
going to take this.

What they actually submitted then, did you read that? What they did was they went through by point where they thought the tab was deficient. We had already done that in committee for ourselves, you know, before we ever voted on this item and we did spend many hours going over the technical information and doing a lot of work on the internet, doing a lot on the material lists.

And we as committee, you know, it did not change our mind on how this substance is used and the alternatives available.

MEMBER HEINZE: I'm certainly not putting that in doubt. I'm just not a crops expert so this is more a matter of educating me so I can properly balance your recommendation with what the petitioner says. This is in no way a disparagement of your work and your review, I just need a little bit more education.

CHAIRMAN MOYER: The Chair
recognizes Gerry Davis.

MEMBER DAVIS: As Ms. Ellor said, we did go over individually the petitioner's written comments that they submitted and the main area of contention that I saw that there's a potential that the petitioner had a point was the unknown nature of the other main supplier of pyrethrin in this country who has a labeled and organically approved formulation. What extractant they do use is an unknown, we don't know.

And for your benefit I would say if let's say the petitioner decides well this isn't fair and calls into question the other companies extractant and say this is really no different than what we have, we'll be looking at that again later on to see if that one warrants coming off the list as well.

That doesn't change the fact that putting a petroleum distillate on it of almost two ounces per acre for every single application in this material does not make
sense in the organic rules at all. And that's
the main point that the crop committee took
issue with.

MEMBER HEINZE: Is there any
collection that voting not to list this material
has the potential to have pyrethrin not be
available? In the event that the other
supplier is using this material and we don't
know it.

MEMBER DAVIS: We did consult
with OMRI who does list the other material and
because of confidential information they could
not tell us what the extractant is but they
assured us that it is not the isoparrafinic
hydrocarbon. And I asked for a qualitative
statement from them on do you anticipate
issues with the extractant that they use and
they said no, to us it is in a different not
quite like the isoparrafinic hydrocarbon as
far as having issues and what EPA lists of
inerts it was on, and it does seem to have a
better chance of staying on the list.
And that's the best information we could get because of this mess of confidential business information that it's hard to break through and people don't want to say what their inerts are unless they have to.

CHAIRMAN MOYER: Tina?

MEMBER ELLOR: The other thing that we considered is that we have no other comments urging us to list this except for the petitioner. So we didn't have farmers you know lining up to say they really needed this. So that weighs heavily on our decision as well.

CHAIRMAN MOYER: The Chair recognizes Valerie Frances, executive director.

MS. FRANCES: I just wanted to turn your attention to category 2 and number seven's answer which offered a little more information about pyrethrins.

MEMBER DAVIS: One more comment I had was there is a patent out there for liquid
carbon dioxide extraction of pyrethrin. We're not sure if that's what these other two suppliers that are mentioned up here use as their extractant but at least it is a potential method. And if the organic crop production and safer brand products are called into question at a later date and their inert is also problematic that they're using for extraction, there are other options out there for development within the industry if they so choose to stay on the market.

CHAIRMAN MOYER: Are there any other points of discussion that anyone wants to record. Katrina, are you satisfied?

MEMBER HEINZE: I would just beg your indulgence. I'm trying to pull up the public comment from the petitioner real quick.

CHAIRMAN MOYER: I'm sorry?

MEMBER HEINZE: I just need a couple of minutes to pull up the public comment.

CHAIRMAN MOYER: That's fine.
1 Take your time. The Chair recognizes Bob
2 Pooler from the program. Mr. Pooler?
3 MR. POOLER: Yes. Gerry and Tina,
4 I just wanted to know how you considered the
5 EPA information on this substance, whether
6 you've delved into it and looked at it because
7 I believe at one time they wanted to classify
8 this as a list four. So if you could comment
9 on that please.
10 MEMBER DAVIS: We did consult
11 that information but I don't remember the
12 details Bob. I got conflicting stories on what
13 list they were originally on. Brian Baker
14 from OMRI said in his opinion he believed it
15 was on list 2 or 3 at one point and managed to
16 get on list 4 at a later date. But I don't
17 know that I had official documented evidence
18 to say what list it was on at any point.
19 I read all the EPA information
20 supplied, I just don't recall what magic list
21 it was on. I went through all the
22 information as far as the toxicity and what
CFR it's under and on and on and on. And we did consult all that information and go through it. But it didn't change the committee's opinion that it's definitely a problematic material in organic. The EPA says one thing but we have a different standard as far as is what's acceptable to EPA in conventional agriculture acceptable to organic.

CHAIRMAN MOYER: The chair recognizes Tina.

MEMBER ELLOR: And if you look at question No. 8 on category 1, it goes into some of that information. U.S. EPA 2008 table 3, 40 CFR part 63, that gives some information that we considered when we were looking at this.

CHAIRMAN MOYER: I will mention that the Chair, in consultation with the crop committee and the program, are reluctant to send a message to the community that when they see the direction that a vote is going at a
very late date choose to withdraw a petition
at great expense in terms of time and real
dollars to the program and the Board, only to
bring this back when a new and different Board
is seated here and go through the entire
process again with quite possibly additional
final expense to the program and certainly
time and expense to the Board.

And I think the petitioners had
ample opportunity to make their decisions at
a much earlier date or work in consultation
with the program to move information to us
more readily if they thought they had
something.

But we felt we did a very thorough
job of filling in the gaps that were missing
in the tap of the technical reviews that were
supplied and the information from the
petitioner. Dan?

VICE CHAIR GIACOMINI: Yes, I
think if it really looked like there was some
and different information that also came down
that those are reasonable requests. But if
the committee and the Board are comfortable
with the decision and the positioning and
placement of that new information with what
they've already had and it fits in and, you
know it's nothing really new, that we can
certainly move ahead.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: One last
question. Thank you for your indulgence. In
the petitioners' public comments they say that
even today with the other technology there's
not enough pyrethrin on the market to fit the
need. Did you have a chance to evaluate that?
I know you did so thank you.

MEMBER ELLOR: Yes, we did. And
this is a problem we've had with deficiencies
in the technical reviews. You have to count
on more than the petitioner's word, you know,
to get at this information. And we have lots
of resources to do that. We may not feel like
we should have to do that but we do. So, yes,
we did.

MEMBER HEINZE: And what did you learn?

MEMBER ELLOR: We learned that there is pyrethrin available on the market and once again we had no farmers lining up to assure you that they really needed this.

MEMBER DAVIS: In 15 years of working with pyrethrin on a large organic vegetable farm, we have never ever been told that there was a short supply or pyrethrin. Not once. This particular company our farm has used the material, they push hard. They push very hard in their marketing strategy to say the least. Very high pressure. And it's not just our farm, it's happened to Ms. Ellor, it's happened to other people I've consulted with in California. They push very hard to make sure that they move their product. So it doesn't look like a short supply situation to me.

CHAIRMAN MOYER: Is the committee
1 chair ready to make a motion?
2 MEMBER ELLOR: Let me get back to
3 my main document here so I can do this
4 properly. I'd like to make a motion to vote
5 on the petition material for inclusion of
6 isoparrafinic hydrocarbon under synthetic
7 substances allowed for use in organic crop
8 production on the national list 205601. Do I
9 have a second?
10 CHAIRMAN MOYER: The motion is to
11 list the material. Is there a second?
12 MEMBER FLAMM: I second.
13 CHAIRMAN MOYER: Barry seconds
14 that. Is there any other points of
15 discussion? Is there a conflict of interest
16 on this material? Hearing none, the Chair
17 calls for the vote starting with Gerry Davis.
18 MEMBER DAVIS: No.
19 CHAIRMAN MOYER: Katrina?
20 MEMBER HEINZE: No.
21 CHAIRMAN MOYER: Dan?
22 VICE CHAIR GIACOMINI: No.
CHAIRMAN MOYER: Julie?
SECRETARY WEISMAN: No.
CHAIRMAN MOYER: Steve?
MEMBER DEMURI: No.
CHAIRMAN MOYER: Jennifer?
MEMBER HALL: No.
CHAIRMAN MOYER: Bea?
MEMBER JAMES: No.
CHAIRMAN MOYER: Kevin?
MEMBER ENGELBERT: No.
CHAIRMAN MOYER: Hue?
MEMBER KARREMAN: No.
CHAIRMAN MOYER: Joe?
MEMBER SMILLIE: No.
CHAIRMAN MOYER: Tracy?
MEMBER MIEDEMA: No.
CHAIRMAN MOYER: Barry:
MEMBER FLAMM: No.
CHAIRMAN MOYER: Tina?
MEMBER ELLOR: No.
CHAIRMAN MOYER: And the Chair votes no. Mr. Vice Chair?
VICE CHAIR GIACOMINI: 14 no, zero yes, one absent.

CHAIRMAN MOYER: The motion to list isoparaffinic hydrocarbon has been defeated. Next material Tina?

MEMBER ELLOR: The next material on our agenda is sulfurous acid and the petition is to include sulfurous acid on the national list 205.601.

I did get some additional information from the petitioner this morning and if we need to bring that up in discussion I can do that.

CHAIRMAN MOYER: Do you think that information is relevant to the Board? And does it affect you and the committee's--

MEMBER ELLOR: It may be and I'll read it out in the record just because it answers some of the questions we had forwarded to the technical committee. Once again we need to consider the source to be even handed here, but we can make our own judgment on
that.

Our question was what are the relative advantages and disadvantages of using acetic acid or citric acid, vinegar or citric acid, weaker acids to do the same job. And I'll read into the record his answer to that, unless Valerie has it and can put it up.

The issue concerning sulfurous acid versus current organically approved acid such as acetic and citric go beyond a simple comparison as to their efficacy. It also invokes the fundamental question as to which method best represents the most natural way to accomplish and provide what is needed as well.

I have attempted to point out a few of these differences and they are as follows. Number one, and it's up on the board there is you want to read along. When elemental sulfur is oxidized into sulfur dioxide, each mole has the propensity to bond with the mole of water to form the unstable compound of weak acid known as sulfurous acid.
which results in causing the two original hydrogen ions from the water to sequentially unlock as free active hydrogen and sulfate in the irrigation solution, and the equation is up there.

Since the hydrogen is already present and readily available as water, the major advantage for onsite production of sulfurous acid is that it eliminates the need for growers to import acid-containing materials. This is because sulfurous acid users can unlock all of the hydrogen ions needed for acidification and pH adjustment directly from the grower's own water source located onsite. The only imported material needed will be the OMRI approved elemental sulfur and the equipment to oxidize it.

And I don't know if I need to rred through this. Let's skip down to No. 4.

CHAIRMAN MOYER: The Chair recognizes Valerie Frances.

MS. FRANCES: I'm sorry.
Apparently I have the wrong version up. I didn't realize that so let me try to go back into my e-mail and find the corrected one and download that.

MEMBER ELLOR: Okay. In the meantime I'll continue on to Point 4, which is we need to ask ourselves the basic fundamental question as to which method represents the most natural and sustainable way to introduce this into a farming system, and he goes through the options that we went through yesterday, applying elemental sulfur on soil, and the crops committee did discuss this point and some of the problems with that and Rigo and Gerry had a lot to contribute to this point. That when you apply it to the soil it does require tillage and also there's a much greater chance of run off, you know, that it just runs off with the rain.

Using acetic and citric acid, which we also looked into, it just takes tremendous amounts and we had questions about
which is the better more sustainable method importing huge quantities of citric acid to apply or you know generating on the farm. And we as a committee kind of thought that generating it on the farm was the more sustainable practice. Or onsite manufacturing the use of sulfurous acid. I'm trying to think of the other things.

The other thing that appealed to me about this I suppose is that it's using a waste material, you know, a very pure form of sulfur that's recovered from smokestacks in pollution control which appealed to me, but that's more on a personal note.

Gerry, do you have anything to add?

MEMBER DAVIS: Just on that last point about it being a recovery material. The 99 percent pure elemental sulfurs that are pulled out of natural gas and oil supplies, are essentially pure sulfur and they're indistinguishable from sulfur that would have
been mined, I haven't seen any, it hasn't been
mined for so many years that I don't even
remember or know what mined sulfur looked like
or what its impurity level was. But I don't
imagine it's any more pure than what they're
able to extract from these sources.

CHAIRMAN MOYER: I'm sorry,
Richard Matthews from the program.

MR. MATTHEWS: I really don't
know anything about this material so I'll say
that right up front.

But I do have a question for you.
What I have to ask is could this material come
onto the farm and be used other than through
burning? I'm just trying to anticipate
something down the road, okay, because the
annotation doesn't mention that it's created
through the burning. It just talks about on
farm. And so what I want to know is could
this come in through a means other than
through the burning of sulfur on the farm
because it sounds like what you've wanted to
do is allow on farm burning, not necessarily having it come in on a tanker truck or whatever or barrels or whatever.

So I'm just asking for that clarification because we're going to have to answer that question down the road probably.

CHAIRMAN MOYER: Yes, that was a point that the committee discussed and Gerry if you want to address that.

MEMBER DAVIS: Yes, I alluded to that yesterday but I know there wasn't enough time to really go into it. We went over that extensively and I studied it in the literature very extensively to make sure that sulfurous acid, according to the claim of the petitioner, it's not that it cannot be manufactured in a factory and shipped somewhere, it just is unstable.

It has a half life measured in hours so the degradation of it is so rapid once it is formed in a water solution that there is absolutely no way that there's time
to formulate it offsite and ship it to the farm. And we annotated saying on farm generation of the material because at this point with current technology that's the only way to produce it.

And you know I studied data bases and looked at all kinds of wild ways that they have considered and tested trying to stabilize the material and essentially the bottom line message was that we can't do it yet. Maybe some day. This is why we put it in the annotation so the "some day" doesn't come.

CHAIRMAN MOYER: The Chair recognizes Kevin then Katrina?

MEMBER ENGELBERT: On the Crop Committee's recommendation I was the member that abstained because being from the Northeast this problem of having too high a pH is completely foreign to me. And so I've tried to learn all I can about but I still have concerns and I'd like to voice them. I wouldn't be fulfilling my responsibilities if
I didn't.

I abstained because we were hoping to get a thorough TAP to learn about any possible environmental impacts with the use of this material and having it burned on the environment and on human health. That was not forthcoming.

We got something from SNT but it still didn't address my concerns.

Another concern I have is with the burning of the sulfur. That to me isn't really compatible with organic principles. And also technically because this sulfur is from petroleum or natural gas based products it's a synthetic and we're not allowed to use synthetic fertilizers.

Joe made the point yesterday that we have lime to deal with our acid problems in the Northeast, and that's true, but we can't burn it, we can't use it hydrated lime and we can't use lime that's a byproduct of manufacturing. Those uses are limited to
conventional farmers. And I mean I understand all the points about the benefits of doing that but I still have all those concerns and I wanted to voice them.

CHAIRMAN MOYER: Thank you Kevin.

Katrina?

MEMBER HEINZE: I think I heard you say this but I just wanted to confirm. There is no other way to on-farm generate besides burning? Is that correct? And then I have a follow up question.

MEMBER DAVIS: At least according to the petition, the petitioner, this is the only way to produce it on farm. Again, there's some highly technical ways of farming it in a manufacturing facility but it is not stable and does not maintain itself long enough to ship it somewhere.

MEMBER HEINZE: And then my follow up, is there a reason that in your annotation you said that on farm generation instead of more specifically calling out the
burning process?

MEMBER DAVIS: No, no specific reason, just that's the verbiage that came out when we tried to figure out a way to annotate it. And it was only annotated that way based on what if some day they come up with some really strange, highly synthetic with stabilizers and all kinds of stuff, some way of formulating this stuff and we didn't want to allow for that in the "some day."

CHAIRMAN MOYER: Tina?

MEMBER ELLOR: And it's also historically the way it's been done and it's been allowed, you know, by certifiers in the west. And we had a lot of people come forward and actually say that they would really like to use this and they had used it in the past until there was a clarification about it. And now they couldn't. So I think that's really why.

CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: Yes, sorry about
this. But what's this burning problem?

Richard mentioned it and everybody's mentioned it. Well they burn it, I mean last I remember burning wasn't the worst thing in the world. I mean what's this burning issue? What's the burning issue there?

CHAIRMAN MOYER: Well I think part of it refers to what Kevin mentioned about why but let me turn the floor over to Katrina.

MEMBER SMILLIE: Well hydrated lime is allowed.

CHAIRMAN MOYER: Yes, for certain things. Katrina?

MEMBER HEINZE: I want to clarify my question. My concern is not the burning. I strongly support this material. My question is do we have the right annotation to make sure that this material is allowed and everyone understands that we've listed what we wanted to list. I don't have the burning question, I have the annotation question.
CHAIRMAN MOYER: The Chair recognizes Richard Matthews from the program.

MR. MATTHEWS: Yes. I didn't have a problem. I wasn't expressing an opinion on the burning. What my concern was that we have to write the preamble and then we have to interpret this later on when questions come up and, quite frankly, I really appreciate the discussion that you've just had because that's going to help a whole lot when we go to the write the rule if you voted, I mean I don't know what your vote is, but if you vote to put it on, all of this conversation will help us greatly in creating the discussion in the preamble which will later then help in the interpretation as well. Thank you.

CHAIRMAN MOYER: That is the reason we have the discussion too. We want to help you out Richard. Gerry?

MEMBER DAVIS: Unfortunately, the petitioner's presentation yesterday premised
unfamiliarity with the time constraints and how quickly time can get away from you when you're trying to speak.

He wasn't able to really show what type of apparatus performs this and it's not just a simple burning thing where you burn it and throw it in the water. It's rather detailed and I don't know if the Board would like to see the specifics of what is done to give a little more information.

CHAIRMAN MOYER: Would that help the Board in their decision making?

MEMBER SMILLIE: That's what I was going to request. I think we have the petitioners here, at least a couple of them anyhow.

CHAIRMAN MOYER: If the Board thinks that's helpful the Chair is willing to entertain that. Katrina?

MEMBER HEINZE: I have no opinion on that question. I am interested in knowing if anyone else on the Board has a question
about the annotation because if everyone else
thinks the annotation is the right one I'm
satisfied with our discussion at this point.

CHAIRMAN MOYER: Anybody on the
Board have an opinion to support or discuss
the annotation? Joe?

MEMBER SMILLIE: Could you read
it again please.

CHAIRMAN MOYER: Certainly.

Tina?

MEMBER ELLOR: On-farm generation
of substance utilizing 99 percent purity
elemental sulfur per 205.601 J2 only.

CHAIRMAN MOYER: Just as it's
stated up there on line C. Gerry?

MEMBER DAVIS: Again, if the
petitioner, if he was interested in obtaining
one, he could explain that this is, he would
probably say I would expect, this is the only
way to produce this material and this is how
it's done.

CHAIRMAN MOYER: The chair
recognizes Hue?

MEMBER KARREMAN: I bought a bag of, if I'm reading this right, it says 99 percent purity elemental sulfur you can use and the source is what you've been talking about, you burn that on the farm. Right?

Okay.

So I bought a bag of elemental sulfur for topical use and livestock, totally different. You can buy elemental sulfur 99 percent pure in a bag so you could do the same thing, right, that's a natural. So burning it would seem fine because you could do it with the natural or whatever material you're talking about originally.

MEMBER DAVIS: Well unfortunately there is no natural source of elemental sulfur. All the mines have been put out of business by the petroleum and natural gas recovery programs for clean air laws. And when that industry phases out some time in the future and there's no longer that need to
1 recover all that sulfur from the oil and gas,
2 the industry for sulfur will have to revert to
3 steam extraction of elemental sulfur from
4 subsurface sulfur mines, which is the way it
5 was done.
6
7 CHAIRMAN MOYER: The chair
8 recognizes Jennifer?
9
10 MEMBER HALL: Thank you Mr. Chair. I just kind of wanted to give the Board
11 feedback based on a comment that Tina made in
12 the last material. And that is that I think
13 we do certainly look at petitions a little bit
differently when they have strong backing from
14 the farmer community. And I don't typically
15 get a lot of direct e-mail from my own area
16 about particular items. And I did definitely
17 get several e-mails supporting this material
18 from our constituents up in the Northwest as
19 a really helpful item. And so I just kind of
20 wanted to add that into the conversation.
21
22 CHAIRMAN MOYER: The chair
23 recognizes Katrina then Steve.
MEMBER HEINZE: Again, I want to reiterate I support the material; my question is do we have the right wording in the annotation to properly articulate our intention to allow it? And I haven't heard anyone say anything so I'm assuming everyone's happy with it. Also I haven't heard anyone say anything about the annotation.

CHAIRMAN MOYER: My conclusion Katrina is that everyone else is happy with that annotation. I appreciate that question. Steve?

MEMBER DEMURI: I think I understood you Gerry but just to reiterate. You said there was no other way to make this other than burning, so somebody couldn't bring on a little chemical lab onto their farm and produce this substance, correct?

MEMBER DAVIS: What is needed to produce the sulfur dioxide so it can be injected into the irrigation stream which produces the sulfurous acid, I wouldn't claim
to say that burning is the only way to produce sulfur dioxide on a farm, I can't picture any way to do it naturally with natural materials but I could be wrong.

CHAIRMAN MOYER: It sounds like maybe Katrina and other members of the Board would feel more comfortable if we adjust the annotation to include the word "burning." Can the committee suggest some language while Joe makes a comment.

MEMBER SMILLIE: I still have the burning issue. What's the deal? Why does burning -- is it like a chemical change you guys are concerned about?

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: Joe, I just want to try, I think I can clarify for Joe. The issue is not having a problem with burning; the issue is making sure that it could not be done any other way. We want it to be limited to burning. I believe that's the concern of the other of our colleagues.
CHAIRMAN MOYER: I believe that is the current concern is to make sure that there would not be some other on farm method of generating that would be in violation of other phases of the rule that because of this lack of the word "burning" in the annotation could sneak in. And I think that's a very good point. Jennifer?

MEMBER HALL: Yes. I would like to suggest a friendly amendment to the Crop Committee to change the annotation read "produced by on farm burning."

Or Gerry just suggested maybe "on farm generation of substance burning 99 percent purity elemental sulfur." Would that work as well?

CHAIRMAN MOYER: I think putting the word "only" behind burning might help.

MEMBER HALL: Burning only? On farm generation of substance by only burning 99 percent? "On farm generation of substance, by burning only 99 percent elemental sulfur."
So do we need a motion to accept that or can the Crops--

CHAIRMAN MOYER: Is there still some discussion Joe?

MEMBER SMILLIE: Just a process question. Do we or do we not need to consult the petitioner when we are in the act of changing the petition?

CHAIRMAN MOYER: I don't think we do Joe. I'll refer you to the--

MR. MATTHEWS: No.

MEMBER ELLOR: Because we're not changing the petition, we're changing the annotation.

CHAIRMAN MOYER: That's correct. We're making our annotation. I'm sorry, Hue?

MEMBER KARREMAN: So that's the motion right there, right?

CHAIRMAN MOYER: I believe we have a friendly amendment and I want to make sure that it's been accepted by the committee.

MEMBER ELLOR: Well, I can't
1 speak for the whole committee but it's fine
2 with me. How is the rest of the committee
3 feeling?
4
5 CHAIRMAN MOYER: Gerry?
6
7 MEMBER DAVIS: I think that's
8 appropriate. It was not left out on purpose
9 but it is more specific.
10
11 CHAIRMAN MOYER: A further word
12 from Dan?
13
14 VICE CHAIR GIACOMINI: Mr.
