15 Chairman, at this point in time I don't
16 believe we actually have the motion on the
17 table, so this is just a discussion item for
18 them to include in their motion.
19
20 CHAIRMAN MOYER: Thank you. You
21 are correct.
22
23 MEMBER ELLOR: I can make a
24 motion that we list -- the motion is to
25 include sulfurous acid on the national list
26 205.601(j) with the annotation "on farm
27 generation of substance, by burning only 99
28 percent elemental sulfur per 205.601(j)(ii)
only."

CHAIRMAN MOYER: Is there a second to that motion?

MEMBER KARREMAN: Second.

CHAIRMAN MOYER: Second by Hue.

Any other discussion? Hearing none, is there a conflict of interest on this particular material? Hearing none we'll start the vote with Katrina.

MEMBER HEINZE: Thank you everyone for your indulgence. Yes.

CHAIRMAN MOYER: Dan?

VICE CHAIR GIACOMINI: Yes.

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: Yes.

CHAIRMAN MOYER: Steve?

MEMBER DEMURI: Yes.

CHAIRMAN MOYER: Jennifer?

MEMBER HALL: Yes.

CHAIRMAN MOYER: Bea?

MEMBER JAMES: No.

CHAIRMAN MOYER: Kevin?
MEMBER ENGELBERT: No.

CHAIRMAN MOYER: Hue?

MEMBER KARREMAN: Yes.

CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN MOYER: Tracy?

MEMBER MIEDEMA: Yes.

CHAIRMAN MOYER: Barry?

MEMBER FLAMM: Yes.

CHAIRMAN MOYER: Tina?

MEMBER ELLOR: Yes.

CHAIRMAN MOYER: Gerry?

MEMBER DAVIS: Yes.

CHAIRMAN MOYER: And the Chair votes yes. Mr. Vice Chair?

VICE CHAIR GIACOMINI: Two no, 12 yes, one absent.

CHAIRMAN MOYER: And the motion to include sulfurous acid with the annotation passes.

CHAIRMAN MOYER: I believe that concludes the voting docket for the Crops
Committee and we will move on to the Livestock Committee. Mr. Karreman if you're ready.

MEMBER KARREMAN: Okay.

Livestock Committee wants to recommend, well we'll make a motion at some point here to add Propionic Acid to the national list on 205.603. And of course petitioned as an animal feed preservative as a mold inhibitor. So the list 603 is a synthetic allowed but it is a preservative and keep that in mind with the voting.

The committee unanimously voted to not recommend to list this. That's it, Mr. Chair. Any questions? Or that's up to you.

CHAIRMAN MOYER: Thank you. Are you bringing that in the form of a motion now?

MEMBER KARREMAN: I will now.

Okay. So the motion is to list propionic acid on 205.603 as an animal feed preservative.

CHAIRMAN MOYER: Thank you. Is there a second to that motion?
MEMBER ENGELBERT: I will second that.

CHAIRMAN MOYER: Second by Kevin.

Any discussion on this particular item? Hearing none the Chair will call for a vote but before that is there a conflict of interest for any Board member on this particular material? Hearing none we'll start our vote and the vote will start with Dan.

VICE CHAIR GIACOMINI: I'm making sure, the motion is to list it?

MEMBER KARREMAN: The motion is to list. If you want to list it, it would be a yes vote.

CHAIRMAN MOYER: That's correct.

VICE CHAIR GIACOMINI: No.

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: No.

CHAIRMAN MOYER: Steve?

MEMBER DEMURI: No.

CHAIRMAN MOYER: Jennifer?
1 MEMBER HALL: No.

2 CHAIRMAN MOYER: Bea?

3 MEMBER JAMES: No.

4 CHAIRMAN MOYER: Kevin?

5 MEMBER ENGELBERT: No.

6 CHAIRMAN MOYER: Hue?

7 MEMBER KARREMAN: No.

8 CHAIRMAN MOYER: Joe? Joe is absent. Tracy?

9 MEMBER MIEDEMA: No.

10 CHAIRMAN MOYER: Barry?

11 MEMBER FLAMM: No.

12 CHAIRMAN MOYER: Tina?

13 MEMBER ELLOR: Yes.

14 CHAIRMAN MOYER: Gerry?

15 MEMBER DAVIS: No.

16 CHAIRMAN MOYER: Katrina?

17 MEMBER HEINZE: No.

18 CHAIRMAN MOYER: And the Chair votes no. Mr. Vice Chair?

19 VICE CHAIR GIACOMINI: 13 no,

20 zero yes, 2 absent.
CHAIRMAN MOYER: And the motion to list Propionic Acid has been defeated. This Board will now take a brief recess for 15 minutes and we'll be back.

(Whereupon, the above-entitled matter briefly went off the record.)

CHAIRMAN MOYER: Okay. Hue, if you want to resume your work on materials and I think we're at vitamins and minerals injected as supplements.

MEMBER KARREMAN: Thank you, Mr. Chair. The Livestock Committee has proposed, and we discussed yesterday, about adding a section to the national list on 603 regarding injectable forms of already approved vitamins and minerals and electrolytes that are on the list and as you all heard from testimony most certifiers were very much in favor of this. It's already happening out there, it's kind of been grandfathered.

What we talked about yesterday was
that due to consideration of FDA concerns and requests and interaction as this will be worked through the system with the NOP in consultation of course with FDA, that we make sure that this listing is termed in such a way that these are nutritive supplements and not medical treatments -- and they are.

They're vitamins and minerals, okay, and electrolytes, and since we're also looking at the excipients in this new section to be added we need to make sure, and I want to have it here on the record, that we will be as the Livestock Committee working on making a really simple change in the excipient clause that exists right now for the November meeting so that we're not only talking about drugs per se because drugs are treatments and as we all know you cannot treat any organic livestock in the absence of illness. Okay?

And these are nutritive supplements that we're looking at on this proposal therefore to include the excipient
clause within the new section we need to make sure that the excipient clause says let's say it for animal health products instead of just drugs. Okay? Just so that's out there and people know we're going to make it all blend together correctly but we can't work on that excipient clause at this meeting because it was not put on the agenda. Okay?

All right. So with that the Livestock Committee is presenting this recommendation and I move that we accept a new section, add a new section to the list at 205.603(g) potentially formulated injectable supplements of trace minerals for 205.603(d)(ii) vitamins per 205.603(d)(iii) and electrolytes per 205.603(a)(viii) with excipients per 205.603(f) in accordance with FDA and restricted to use by on the order of licensed veterinarian.

MEMBER JAMES: I'll second.

CHAIRMAN MOYER: We have a motion on the floor and a second. Is there a
1 discussion? Kevin?

2 MEMBER ENGELBERT: Yes, I'd like

3 to offer a friendly amendment. I would like to

4 propose that we begin the wording with "as

5 nutritional supplements" and then pick up with

6 "formulated injectable."

7 CHAIRMAN MOYER: There's a

8 friendly amendment on the floor. Hue, do you

9 accept that amendment?

10 MEMBER KARREMAN: Absolutely.

11 CHAIRMAN MOYER: Valerie, can you

12 type that in so the rest of the Board can see

13 it as Kevin mentioned it. Hue?

14 MEMBER KARREMAN: Well maybe Dan

15 will get on this here. Should it be

16 nutritional or nutritive because on a lot of

17 vitamin and mineral bottles it says as a

18 nutritive source. So I think we need to

19 have, if the friendly amendment would allow.

20 Okay. Make that as nutritive supplements,

21 that would be more in line with what's

22 already-- I think just as nutritive
supplements actually because we're talking about vitamins and minerals?

CHAIRMAN MOYER: Dan?

VICE CHAIR GIACOMINI: Yes. I just want to make sure we have some clarity in the record.

MEMBER KARREMAN: Okay. Just a last little continuation of that rewrite there. As nutritive supplements, formulated injectables -- take off the injectables and take away supplements there since it was already mentioned.

CHAIRMAN MOYER: Thank you for that clarification Hue. Dan?

VICE CHAIR GIACOMINI: I just want to make sure that we have it in the record in case this can help the program in their preamble issues.

Again, the reason we did this was to make sure that everything was as clear and as straight with FDA as possible. That we needed to list it as a nutritive supplement so
that it did not require that it was only in
the treatment of a disease, and so that it did
not require that whatever was being used was
specifically listed and approved for that use.

No. 1.

No. 2 is that in going this route
we are by no means prohibiting the use of this
substance in the treatment of a disease
because use of these in the treatment of a
disease would be because of a nutrient
imbalance. So it's not that by this wording
someone can look at it and say well it's only
for nutritional uses, it's only if they're a
little deficient, not if they're sick. So
it's for nutritional supplements as needed bt
also if the vet says that cow's sick and this
is what we want to treat her with, that's part
of it.

CHAIRMAN MOYER: Thank you Dan.

Hue?

MEMBER KARREMAN: Yes, just to
add to that to bring clarity maybe for the
preamble. This is not for infectious disease.
It's more for a metabolic imbalance that can
be readily corrected and that's not
necessarily a disease. It just might need a
nutritional boost. It's not for an infectious
type problem.

CHAIRMAN MOYER: Thank you Hue.

Barry?

MEMBER FLAMM: Hue, there were
comments from the public on the GMO question.
How did the committee discuss that?

MEMBER KARREMAN: That Barry was
actually in the vaccine topic that came up.
This is not vaccines. We have to deal with
that, that's going to be on the work plan for
next--

MEMBER FLAMM: Thank you for the
clarification.

CHAIRMAN MOYER: I have a
question for you Hue. We had heard some
comment yesterday about the fact that the
words "licensed veterinarian" were in there in
the changes, did the committee discuss that at all?

MEMBER KARREMAN: Yes. I think it was VOF wanted to have it just as you know trained person that can administer it.

Basically, that wording restricted to be used by or on the order of a licensed veterinarian is kind of there to work with the FDA, okay, because that's a term they recognize. The other thing is it doesn't mean that oh gosh, I've got to call the veterinarian to give a shot of Vitamin B? No. Because it says to use by the vet but also on the order of a vet.

So if a vet says, hey John, you really need to give this cow some Vitamin A, D and E or selenium and E, they can do it themselves without the vet having to do it. It's more for the wording for the FDA.

CHAIRMAN MOYER: I appreciate that on the record, thank you Hue. We have a motion on the floor and a second, is there any
other discussion? Bea?

MEMBER JAMES: I have some questions and you know -- strike that. I just need some information about would the vitamins need to be listed individually or could they be listed as a group or would they need to be listed at all?

MEMBER KARREMAN: Okay. The reason they need to be listed at all, to answer that one first Bea, is because right now on the under (d)(ii) and (d)(iii) it says vitamins and minerals under those two listings as feed additives. And that's been told to me in no uncertain terms by a certifier that that's the only way that vitamins and minerals can be used at this point. Thus this recommendation.

As far as I think you had three questions there. The other one was listing each individual vitamin and mineral and electrolyte individually. Okay? Yesterday I mentioned how precedent has already been set
by d(ii) d(iii) and f and (a)(viii) and that whole categories have been allowed. This is just for the injectable forms of those categories. Okay? So you know that.

Regarding looking at each brand manufacturer of each vitamin formulation, which they do vary, okay, they do vary quite a bit and I think in my original homework on this I saw about 24 manufacturers of vitamins and minerals of injectables. Okay. And basically they have their own private formulation processes that would have to be looked at.

So in a nutshell it would be like hundreds of pages for us to go look at each individual vitamin, mineral as the injectable form of what's already on this list for feed additives. And notice also that the vitamin and mineral injectable formulation manufacturers have not petitioned this. Who is petitioning this are the end users, the veterinarians and the farmers who do not have
access to that information, that's confidential information and seeing that and only having the old patents available in the public domain and then realizing like, hey, precedent has been set by these other categorical listings and that's the reason that this is being presented.

MEMBER JAMES: Thank you for that clarification.

CHAIRMAN MOYER: Dan?

VICE CHAIR GIACOMINI: Yes.

Thank you for asking that question. I think this a good time to throw out a very related topic to this and as material Chair and also on the Livestock Committee dealing with this, the process for putting items on the national list has become a process of single substance items with the requirement of what's supplied being extremely favorable to the manufacturer of that substance.

What we were dealing with here was a substance of not only a group of things, No.
1, but a process No. 2 and the need for it coming from someone who was not the manufacturer, No. 3.

We tried to address those issues with the program as how do we work around the process that has been set up? And it just became a matter of time that we didn't have the time to figure out a way to resolve all those issues in a universal global setting in order to get this done for this meeting.

That is still something that we are going to need to sit down and try and figure out because, as I look at the material process, you know, and the process that we have in place, there are certain unintended biases that have gone into it. And something coming and being called for by the people who need to be using the product are at a disadvantage from the people who are trying to sell and make a profit.

And it's really something that we need to address.
MEMBER JAMES: If I could just respond back to that. I appreciate that comment and I think it's really great to get that out on the record because I support this recommendation but I see down the road if we weren't to address it that it could potentially be a problem.

CHAIRMAN MOYER: Thank you.

Katrina, did you have your hand up? No.

Julie?

SECRETARY WEISMAN: Just as an aside. I think this is a very good example of not letting the perfect defeat the good.

CHAIRMAN MOYER: Thank you. Any more discussion? We have a motion and a second and I'm going to call for the vote. Is there a conflict of interest on this group of materials? Dr. Karreman?

MEMBER KARREMAN: You can judge it as you want but you have a farmer who might be using these and a veterinarian who does use these sitting on the Board here; we're the end
users as Dan was just mentioning. I'm not the manufacturer. And the nutritionist that recommends it but I don't make anything off of it.

CHAIRMAN MOYER: Does the Board have a problem with them voting? The Chair does not. Hearing no comment vote or abstain as you see fit. Okay. The vote will start with Julie?

SECRETARY WEISMAN: I vote yes.

CHAIRMAN MOYER: Steve?

MEMBER DEMURI: Yes.

CHAIRMAN MOYER: Jennifer?

MEMBER HALL: Yes.

CHAIRMAN MOYER: Bea?

MEMBER JAMES: Yes.

CHAIRMAN MOYER: Kevin?

MEMBER ENGELBERT: Yes.

CHAIRMAN MOYER: Hue?

MEMBER KARREMAN: Yes.

CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: Yes.
CHAIRMAN MOYER: Tracy?

MEMBER MIEDEMA: Yes.

CHAIRMAN MOYER: Barry?

MEMBER FLAMM: Yes.

CHAIRMAN MOYER: Tina?

MEMBER ELLOR: Yes.

CHAIRMAN MOYER: Gerry?

MEMBER DAVIS: Yes.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: Yes.

CHAIRMAN MOYER: Dan?

VICE CHAIR GIACOMINI: Yes.

CHAIRMAN MOYER: And the Chair votes yes. Mr. Vice Chair?

VICE CHAIR GIACOMINI: Zero no,

14 yes.

CHAIRMAN MOYER: One absent.

VICE CHAIR GIACOMINI: One absent.

CHAIRMAN MOYER: Thank you. The motion to include vitamins and minerals injectables as supplements as stated in the
motion passes. Thank you. And I believe that concludes the voting docket for the Livestock Committee.

Moving ahead on our agenda we'll move to the Handling Committee, Steve DeMuri, chairperson. Steve, the floor is yours.

MEMBER DEMURI: Thank you Mr. Chairman. Okay, here we go. We have nine items on the agenda this morning to be voted on. The committee members gave detailed descriptions of these items yesterday. As we go through them I'm going to direct most of the reiteration of what we talked about yesterday to the people that actually worked on these because they're the experts. They're expected to dive into these and learn as much as they can and help the rest of the committee make a recommendation. So I'll direct a lot of this to them as each individual item comes up.

The first one on our list propionic acid, CAS No. 79094. And this is
exactly the same substance that was voted down
by the Livestock Committee just 45 minutes
ago.

It was petitioned as a use as
preservative, a mold inhibitor for feeds and
grains for human consumption and it failed on
a couple of accounts, primarily because it is
a preservative and there are alternatives out
there that can be used.

So having said that, is there any
discussion, any questions?

CHAIRMAN MOYER: Would you like
to make a motion?

MEMBER DEMURI: I would. I
would like to move that propionic acid be
added to the national list under Section
205.605(b).

CHAIRMAN MOYER: Do I hear a
second to that motion?

SECRETARY WEISMAN: Second.

CHAIRMAN MOYER: Seconded by
Julie. There is a motion on the floor with a
1 second; is there any discussion on this
2 particular material? Hearing none I will
3 call for a vote. Is there a conflict of
4 interest on this material before we vote?
5 Again hearing none, we will start the vote
6 with Steve?

7 MEMBER DEMURI: No.
8 CHAIRMAN MOYER: Jennifer?
9 MEMBER HALL: No.
10 CHAIRMAN MOYER: Bea?
11 MEMBER JAMES: No.
12 CHAIRMAN MOYER: Kevin?
13 MEMBER ENGELBERT: No.
14 CHAIRMAN MOYER: Hue?
15 MEMBER KARREMAN: No.
16 CHAIRMAN MOYER: Joe?
17 MEMBER SMILLIE: No.
18 CHAIRMAN MOYER: Tracy?
19 MEMBER MIEDEMA: No.
20 CHAIRMAN MOYER: Barry?
21 MEMBER FLAMM: No.
22 CHAIRMAN MOYER: Tina?
MEMBER ELLOR: No.

CHAIRMAN MOYER: Gerry?

MEMBER DAVIS: No.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: No.

CHAIRMAN MOYER: Dan?

VICE CHAIR GIACOMINI: No.

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: No.

CHAIRMAN MOYER: And the Chair votes no. Mr. Vice Chair?

MS. FRANCES: I hate to bring this up but Julie did recuse herself from this material.

SECRETARY WEISMAN: Oh God, I'm so sorry.

MS. FRANCES: And it just popped in my head and I know you've already voted.

CHAIRMAN MOYER: Thank you Valerie for bringing that to the attention of the Board. Julie?

SECRETARY WEISMAN: I'm
multitasking in a way. I have never had to do it before but it actually true that at the committee level I did recuse myself from the vote because I am a manufacturer of national propionic acid which it would definitely affect -- the outcome of this would affect the sales of my product.

CHAIRMAN MOYER: You might want to consider changing your vote to an abstention?

SECRETARY WEISMAN: No, I think I need to be recused. This is pretty clear, this is pretty clear.

CHAIRMAN MOYER: Thank you Valerie and thank you Julie. If the vice chair would make a note of that and the secretary change that vote to a recusal. And now Mr. Vice Chair, the vote please?

VICE CHAIR GIACOMINI: 13 no, zero yes, one absent and one recuse.

CHAIRMAN MOYER: Thank you Mr. Vice Chair. With that vote propionic acid is
voted down and the motion is defeated. Your next material Steve?

MEMBER DEMURI: Thank you. The next one for 205.605(b) is sodium chlorite acidified and I'd like to ask Katrina to give a brief summary of the material, summarize what she said yesterday. And then we'll ask for a discussion.

MEMBER HEIZE: Thank you. So just a reminder that this material has been petitioned for listing on 605(b). It is in essence a mixture of two things so at the facility they'll have two tanks, one will be sodium chlorite, one will be citric acid. They mix them and dilute with water at point of use.

I'm not going to go through all the discussion but just highlight it. The committee did recommend by a vote of three yeses, one no, one absent and one abstain to list this material with an annotation. And our rationale for that was that this is a more
benign environmentally and human health material than some of the other chlorine materials that are on the list. It is a very important new tool in the food safety tool box. That's kind of the short version of that.

So there's two things that I wanted to highlight after our discussion yesterday. One was we had had a question from the Chair about our committee vote to better understand that discussion, and I went back and looked at the notes last night and in fact we had not gotten the response from the petitioner on our questions regarding how this tool was different than the tools that were already on the list. Just because of the time crunch we were under we had to take the vote ahead of that.

And so when the petitioner came back they were able to articulate that there are uses where this material is used instead of peracetic acid which was the material that the technical review said could be
substituted. So there are situations which the
petitioner could articulate where users are
using either both peracetic acid and this
material or whether they can use this and not
peracetic acid.

And the reasons for that, if I can
find them, hold on a sec. I'm waiting for it
to open on my computer. The reason is that
this material is used in situations where a
much shorter contact time is required than
peracetic acid. So it has to do with kind of
the processing conditions.

So are there any questions on that
topic?

CHAIRMAN MOYER: Hearing none,
the Chair would entertain a motion.

MEMBER HEINZE: So then we have
the annotation which we did talk about as a
committee. So I would draw your attention,
there are three parts to the annotation. So
the first part talks about use which our
annotation says this is for a secondary direct
anti-microbial food treatment and indirect food contact surface sanitizing.

And we're so specific in that, that the current materials are listed for indirect food contact surface sanitizing but in 2003 the SOB processing committee met or made a recommendation that said that that really did not reflect the original intent for the current listings of chlorine materials and certainly that's a matter that needs to be addressed.

But we wanted to be clear in our recommendation that this could be used for direct anti-microbial food treatment.

The second part of the annotation has to do with the residual chlorine levels in the water and again going back to the 2003 recommendation, this really stems from a concern that the Board had at the time about residual chlorine on food that consumers would consume and you know the belief that consumers maybe don't want to be eating bleach. That
really after further review is not relevant to this material. Once it comes in contact with the food it breaks down to citric acid and table salt. So we'll be having a discussion about removing that part of the annotation.

Then the third part of the annotation speaks to the citric acid that is used as part of the sodium chlorite solution, and we did feel that we wanted to make a note that the citric acid that they couldn't just use any citric acid, that they should use the citric acid that was allowed for use in organic, and that's the citric acid listed on 605(a). Any questions?

CHAIRMAN MOYER: Bea?

MEMBER JAMES: Katrina, in your recommendation form it says that under Section Category 1 No. 13, the manufacturing process employed in the production of sodium chlorite does not include any specific purification stats, heavy metal, lead and the final production as a result of their occurrence in
the starting material that are obtained from
the natural sources.

And I'm wondering what your
committee stats were on that.

MEMBER HEINZE: We wanted to be
transparent. That was reflected in the
technical review that we received. Our
evaluation of that was that that is no
different than the materials currently on the
list. This material is processed very similar
to the materials already on the list so we
felt that that was equivalent to materials
that previous Boards had chosen to list.

And as a scientist, I'm searching
for the words to say this the right way, I
felt that this was a very technical evaluation
of the situation. Firstly speaking as a
scientist you're trained to say I'm 95 percent
certain within statistical allowance that this
is a true statement. I think that this is a
caveat statement, that in fact there is no
documented evidence that heavy metals are
there but because they couldn't find evidence
that they weren't there, they felt that they
had to make this statement. Does this make
sense?

CHAIRMAN MOYER: The Chair recognizes Joe.

MEMBER SMILLIE: I agree. Is the annotation going too far in specifying the
use of the citric acid?

CHAIRMAN MOYER: The Chair had the same question. It seems very, very
complex as an annotation.

MEMBER SMILLIE: Yes, well you know I was tutelaged by Miss No Annotations
Chair and man that's a lot of annotations.

And I'm just wondering we're asking them to
use a citric acid and I'm just wondering is that going too far? Or is that what they
petitioned for?

MEMBER HEINZE: That is not what they petitioned for. I did want to say, and
I need process help on this piece, in informal
conversations it is the intention of the
Handling Committee to recommend that we not
have the second part of the annotation. We
feel that it is perhaps confusing and not
necessary for this material. So in my motion
can I just drop that or is that something that
since it's a change from our recommendation
that we need a motion to do.

CHAIRMAN MOYER: Comment from Dan
and then Joe.

VICE CHAIR GIACOMINI: If that's
agreed to by the committee you have not yet
made your motion.

MEMBER HEINZE: We have not
formally voted on that.

CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: I would like to
make a friendly amendment to remove that
annotation.

CHAIRMAN MOYER: I think you need
a response from Katrina before Dan can--

VICE CHAIR GIACOMINI: We haven't
had a motion. There's no motion currently on the Board.

CHAIRMAN MOYER: Right Dan. It does not need to be put in the form of a friendly amendment, just make your suggested language change.

MEMBER HEINZE: Does anyone on the Handling Committee disagree with removing that when I make my motion?

MEMBER DAVIS: I'm okay with it.

CHAIRMAN MOYER: Gerry?

MEMBER DAVIS: Just to make sure I understand. The reason for taking that out is because unlike the sodium hypochlorite materials that required that type of annotation, this material is different in that the chlorine is deactivated and converted to chloride as part of the usage of the material. Do I understand it correctly?

MEMBER HEINZE: Yes and no. Yes, I think there is some debate when we consider the sanitation for the other materials and
whether it's necessary for them as well. It was compromised language as I went back and re-read and re-read and re-read the 2003 recommendation yesterday. It was compromised language to reflect that the Board was uncomfortable with having chlorine materials on the list but felt very strongly that having them on the list from a food safety perspective was very important. So they wanted an annotation to reflect that perspective, I don't think it serves any technical value. It was more of a message. Does that make sense?

CHAIRMAN MOYER: Dan?

VICE CHAIR GIACOMINI: It seems from what I'm hearing the committee say in their recommendation that this actually may be one of the more preferred chlorine compounds to be using. If that is the case, I'm confused with any annotation that is more severe and more strict than what is listed currently under chlorine materials in general.
And I would also like to ask the program in the listing of this item would this go in as a separate listing or would this just be a new item listed within the parentheses of chlorine materials as it's currently listed on the list?

CHAIRMAN MOYER: Comment from the program?

MEMBER DEMURI: I believe it would just go in as its own separate item.

CHAIRMAN MOYER: Thank you.

MEMBER HEINZE: To answer your first question Dan, to be honest when I reviewed this material and tried to be complete in my evaluation, I biased towards trying to be respectful of a previous Board's recommendation and as we discussed this morning got public comment on Monday. I think we've come to understand that recommendation better. And to make sure our recommendation today not to have that annotation.

MEMBER DEMURI: So how much of
the annotation are we looking to eliminate

MEMBER HEINZE: We haven't
discussed part 3, the citric acid. Joe had
raised the question that whether we were too
restrictive in that portion. Are there any
comments on that piece?

To your point it is a better
alternative than other things on the list so
I think Joe's point is well taken that perhaps
this is too restrictive. I would support that
change but I'm interested in other
perspectives.

CHAIRMAN MOYER: Tina?

MEMBER ELLOR: Can this be
acidified with others acids that are on the
list and if it can would there any downside to
using those other listed acids?

MEMBER HEINZE: That matter is
addressed in either the technical review of
the petition. Let me check real quickly.

CHAIRMAN MOYER: Kevin?

MEMBER ENGELBERT: Could you
repeat, I can't remember whether you said this or not but under chlorine materials there's calcium hypochlorite, chlorine dioxide, sodium hypochlorite and there's also peracetic acid, peroxyacetic acid and hydrogen peroxide. Did you receive comments from end users of these products saying that they needed another, as you said yesterday, tool in their tool box?

MEMBER HEINZE: We did receive comment from end users. I do believe we did receive some public comments supporting this.

CHAIRMAN MOYER: Any other questions or comments? Jennifer?

MEMBER HALL: Yes. Katrina, if you could please and I don't mean to belabor this but if you could just reiterate for me how it is better than current options.

MEMBER HEINZE: Certainly. It is used at a lower concentration, at a very low concentration because of the dilution factor. And then also its breakdown products are citric acid and table salt. I'm wondering
1 Geoff from the guidance whispered in my ear,
2 I was wondering the petitioner could you
3 answer the question about whether it can be
4 acidified with other things?
5             CHAIRMAN MOYER:   If the
6 petitioner will come forward the Board will
7 recognize them. Just please state your name.
8             MR. DAHLMAN:    Yes. The current
9 FDA listing for sodium chlorite allows for any
10 grass acid to be used. We currently use
11 sulfuric acid ad sodium acid sulfate as well
12 as citric acid, so the preferred option here
13 would obviously be the citric acid because
14 it's already listed.
15             CHAIRMAN MOYER:   A question from
16 Bea and then Julie.
17             MEMBER JAMES:   Well as long as
18 you're up here. We received public comment
19 where there was a concern that the toxicology
20 reports in the recommendation and in the
21 review were not adequate and I'm wondering if
22 you could or if you have any information about
environmental or human health effects that might educate me a little bit more.

MR. DAHLMAN: As far as any studies that I've seen, the breakdown components create no chloromethanes or chlorohalogen. There's no environmental effects that we have seen. The breakdown components are benign.

CHAIRMAN MOYER: Does that satisfy your answer? Okay. Katrina?

MEMBER HEINZE: Both the technical review and the petition provided an abundance of research papers supporting that there aren't any environmental, negative environmental impacts.

There was one to Jennifer's question that I forgot to bring up that the technical report did mention that a downside of the other chlorine materials on the list is that they can form trihalomethanes which are you know not viewed positively from an environmental impact. This material does not
form those.

CHAIRMAN MOYER:  Do we have any other questions for the petitioner?  Jennifer?

MEMBER HALL:  I guess my question for you then is, is this your company's attempt to provide industry with a better alternative than is presently there.

MR. DAHLMAN:  I don't necessarily say it's better but, like Katrina said, it's another tool in the toolbox.  It has its application along with peracetic, for example, in a poultry processing plant; acidified sodium chlorate has a much shorter contact time so when birds are being processed on the line you can spray it and make that quick kill, get your knockdown of the pathogens and move on.  Whereas the peracetic is more used in the chiller bath when the birds are soaking and cooling down half of that processing step and the peracetic is used for longer contact times.

So they both have their
1 application.

 MEMBER HALL:   Thanks.

 CHAIRMAN MOYER:   Gerry?

 MEMBER DAVIS:   And I apologize ahead of time in case the answer to this question was in the material. But are there other suppliers of this material besides your company?

 MR. DAHLMAN:   I believe so, yes.

 MEMBER DAVIS:   As far as you know is there any hindrance in the marketplace to keep other companies from supplying this material to the industry?

 MR. DAHLMAN:   No.

 CHAIRMAN MOYER:   Steve?

 MEMBER DEMURI:   Yes. Gerry, I can confirm that there definitely are other suppliers as we've looked into it.

 CHAIRMAN MOYER:   Are there any other questions for the petitioner?

 Thank you for your time.

 Appreciate your help in clarifying those
questions.

VICE CHAIR GIACOMINI: I have one more for the petitioner. This product also has uses in animal agriculture, I understand you plan to come forth and bring forth a livestock petition and it involves direct contact with the animals. Do you have any data that there is any problem at all with that direct contact that we would be interested in?

MR. DAHLMAN: No, not to my knowledge. That petition will be coming soon and we've looked at both options for peracetic and ASC specifically in poultry drinking water and are working on that right now.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: I wanted to get back to the citric acid part of it. No one has any questions for the petitioner.

CHAIRMAN MOYER: Thank you, you're excused. Thank you Katrina.

MEMBER HEINZE: I thank the
petitioner for his comments. I think given
that I do think it is appropriate to have a
petition that limits the acidifier, I'm not
sure that's a word, to citric acid.

CHAIRMAN MOYER: Tina?

MEMBER ELLOR: I think the
annotation may not be necessary as what's on
the list will limit what acidifier you can
use. So it would seem more appropriate, if we
need an annotation which I really don't think
we do because if it's not on the list you
can't use it as an acidifier, to say limit it
to listed acidifiers. Oh Julie's got a
problem with that, sorry.

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: Yes. I don't
believe that's true. The list that exists
where citric acid is, is a list of things that
can be used in an organic product in the 5
percent of an organic product. If this
material is listed this way, they are not
limited particularly; in other words, they're
not limited to using other things on the list because this is not an organic product.

CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: I think the process we should follow is that I will make a motion to accept this. Then I'll get a second, then we'll have a discussion and if there is friendly amendments we'll make them then and then we'll vote.

So hearing no disagreement, I'd like to make a motion to accept the petition with the annotations as is in front of us.

CHAIRMAN MOYER: Thank you, Joe. Is there a second to that motion? We have a motion on the floor.

MEMBER DEMURI: I'll second.

CHAIRMAN MOYER: Steve seconds that motion. Discussion please.

MEMBER HEINZE: I'd like to offer a friendly amendment to remove the sentence that starts with "Residual chlorine" and ends with "water act."
MEMBER FLAMM: Second.

CHAIRMAN MOYER: We had a friendly amendment and it was accepted. Valerie, if you can or Joe if you want to read or somebody read exactly what we're going to be voting on. Joe since it's your motion. Do you need new glasses? Steve, do you want to read it?

MEMBER DEMURI: I can read it.

The motion is to accept a listing for sodium chlorite acidified on 205.605(b) with the annotation, secondary direct antimicrobial good treatment and indirect food contact surface sanitizing. Citric acid used must meet requirements as listed in 205.605(a).

CHAIRMAN MOYER: Is that the amendment, the friendly amendment that you have made Katrina?

MEMBER HEINZE: Yes.

CHAIRMAN MOYER: Thank you.

Julie?

SECRETARY WEISMAN: Can I raise a
discussion item separate than this amendment
having to do with the last part of the
annotation? Is that appropriate or do I have
to raise it as a friendly amendment and then
we have discussion? Okay.

I propose a friendly amendment
that we remove the last annotation as well.

MEMBER SMILLIE: Second.

CHAIRMAN MOYER: Okay. We have a
motion with two friendly amendments on the
floor. Valerie, if you can strike the last
line. Gerry?

MEMBER DAVIS: What if I don't
agree with that? Where do we address that?

CHAIRMAN MOYER: Discussion
please. I just had her draw a line through it
so we could see what we were looking at.

Gerry, go ahead.

MEMBER DAVIS: I need to have it
explained to me why we don't need that.

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: Yes. 605(a)
is a list of ingredients that can be used up
to 5 percent in a product that's labeled
organic. Okay. It is not a list of
ingredients that are ingredients in materials.
And Katrina can state it more clearly.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: I wasn't going to
say it more clearly. I was going to offer a
friendly amendment on top of yours, I'm sorry,
to add an annotation that says "acidified with
citric acid only" because I think that
addresses the acidified question.

MEMBER SMILLIE: Second.

CHAIRMAN MOYER: I heard another
friendly amendment and a second. Do you accept
that? Yes. Okay. Could we Valerie please,
I know you're having trouble keeping up with
this it's not easy, if you could add the
language that Katrina just mentioned so that
the Board can view that. Acidified with
acetic acid only. I'm sorry citric acid only.
Thank you. Gerry, then Dan then Katrina.
MEMBER DAVIS: It's a follow up to what just happened. I'm taking it that the issue you had with the original sentence, citric acid used must meet requirements as listed in 205.605(a) is the 205.605(a) part of that, not the idea of acidifying with citric acid? Okay.

CHAIRMAN MOYER: Thank you, Gerry. That is correct. Dan?

VICE CHAIR GIACOMINI: Yes, we now have an annotation that I understand. And the way it had been written I would be very concerned that we would have someone coming in and saying okay but you can only acidify at the 5 percent level. And I don't think that's where we wanted to be going.

And if we're just saying you know whatever the manufacturer says is that you need to acidify, this is what you're going to acidify with, we know that's already something they use. Like I say it's something I understand and I think it's very reasonable.
CHAIRMAN MOYER: Program has a comment. Barbara?

MS. ROBINSON: You know a simple way to fix this is that currently under 605(b) where we have chlorine materials and the annotation reads "disinfecting and sanitizing food contact surfaces" and then it has the business about residual chlorine levels.

We were discussing this and we said what you could do is just amend that particular category to read as follows: "Disinfecting and sanitizing food and food contact surfaces." Then just add this material to the end.

CHAIRMAN MOYER: Thank you, Barbara. Katrina then Joe.

MEMBER HEINZE: We appreciate the suggestion. I guess a process question we didn't feel that was within the scope of this petition, that that topic was addressed in the 2003 recommendation and since for this specific petition our technical review only
addressed the sodium chlorite acidified, we
greeted that our recommendation needed to be more
narrowly focused.

MR. MATTHEWS: The only thing
that we're saying here is for example this
category is already used for the antimicrobial
properties for sprouts so you know direct with
food is already covered in this. It's not
very explicit so if you added the words
"related to antimicrobial" and then added the
substance at the end, that may be a solution.

I'm not saying that it definitely
is but right now the three that are already
there would be allowed for contact with the
food. We've already been allowing that and
sprouts is the example that I can think of
readily.

So all we're saying is that if you
just wanted to clarify it with the sanitation
plus add the material you could do it that
way. Otherwise, you would have to do it as
a separate item which is again up to you as to
how you want to recommend it.

CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: I agree with Katrina. I think we should move forward with the process we have and the program certainly can you know add those to the regulation. But I think we should stick with what we're doing right now rather than starting all over again because there may be some unforeseen interpretation of that that we're not dealing with. If we stick with this product and this annotation and get it in, we can deal with the other later.

CHAIRMAN MOYER: Dan, you had a comment?

VICE CHAIR GIACOMINI: Thank you.

CHAIRMAN MOYER: I think you addressed Dan's comment. Kevin?

MEMBER ENGELBERT: I have two questions and I apologize for being late with them. They're probably more appropriate for the petitioner but maybe the committee can
handle them. I don't want to make an assumption but I'm assuming that this material is relatively new and that's why (1) it wasn't already on the list and (2) that it's not recognized as grass, generally recognized as safe.

CHAIRMAN MOYER: Yes. Katrina?

MEMBER HEINZE: Both those statements are correct, so it is relatively new and it goes to the new grass process where you self recognize and have the science behind it which the petitioner supported.

CHAIRMAN MOYER: Program.

Barbara?

MS. ROBINSON: If you leave it in as a separate category you should leave your residual chlorine level statement back in there.

MR. MATTHEWS: Because this is going to be sprayed in but then there's going to be runoff so the runoff would have to meet the safe water drinking. That's what you've
1 got in here for the rest. I mean you can use
2 higher concentrations but with the residual
3 water it has to be brought down. So if you're
4 going to have a separate section it's our
5 belief you would have to have that statement
6 in there.

7 CHAIRMAN MOYER: Okay. Yes, we
8 have a motion on the floor. We have several
9 friendly amendments that have already been
10 made and accepted. I think we're going to
11 need somebody on the Board to make another
12 friendly. Dan?

13 VICE CHAIR GIACOMINI: I just
14 have-- before I'm comfortable in how I want to
15 go here, by adding food to the existing
16 annotation, that would by no means change the
17 current allowed usage of the three chlorine
18 items?

19 MR. MATTHEWS: No, because we've
20 already been allowing it to go directly onto
21 food and then the example that comes to mind
22 real quickly is sprouts. And when you have
sprouts you do use a much higher concentration and then you have the safe drinking water level as the residual water.

CHAIRMAN MOYER: Thank you, Richard. I believe the Board would like to recognize the petitioner for one more moment if you could maybe shed some light on this as we struggle with the language.

MR. DAHLMAN: Dan Dahlman EcoLab. The chlorine residual is very confusing, especially with this substance. The residuals are broken down from two components, UV light and organic load, so the second and literally within seconds of contacting organics, this stuff breaks down. It's gone. You won't find it.

So adding that chlorine residual level annotation really is just going to confuse certifiers I believe.

CHAIRMAN MOYER: Thank you for that comment. Tina, then Joe.

MEMBER ELLOR: So if I understand
you correctly there essentially is no chlorine residual with this substance?

MR. DAHLMAN: Not after breakdown no. Once it contacts this organic load and hits UV light, you'll be hard pressed to find it.

CHAIRMAN MOYER: Joe and then Valerie.

MEMBER SMILLIE: That was my understanding yesterday. That was my complete and total understanding. And that's we moved to friendly amendment. That's what I understood about this material. There isn't a chlorine residue.

CHAIRMAN MOYER: Thank you, Joe. The Chair recognizes Valerie Frances.

MS. FRANCES: I just would like him to restate the specific breakdown products.

MR. DAHLMAN: No problem. With citric acid obviously citric acid and table salt and water, you have the chloride from the
table salt and then there's a chlorate and a chlorite ion I believe but those are both under 0.1 ppm. So to use an HPLC method analysis you're not going to find it. And furthermore to run that kind of test you're in the $50,000 dollar range just to run that test.

CHAIRMAN MOYER: Okay. Thank you. We have another question or a comment from Richard Matthews.

MR. MATTHEWS: The explanation seems to take away our concern.

CHAIRMAN MOYER: Thank you. Dan, you had question?

VICE CHAIR GIACOMINI: No.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: I appreciate all the discussion. I think too there's a lot of puzzled looks around the table so I think where we are right now is that we have a motion to list sodium chlorite acidified for secondary direct antimicrobial food treatment.
and indirect food contact surface sanitizing acidified with citric acid only, and I just want to reiterate, this is a lot of technical conversation so I just want to go back to where I started. This is a good addition to the food safety tool kit and is a better option than a lot of things currently on the list despite its complicated annotation.

CHAIRMAN MOYER: Thank you Katrina. We have a motion on the floor and a second and we have friendly amendments that have been approved and I would like to call for the vote unless there's further discussion. Gerry?

MEMBER DAVIS: Question for the petitioner. Does this material used as good contact substance could it replace the hypochlorite materials altogether in the industry?

MR. DAHLMAN: Yes. I would say yes, it could. They're all multiple interventions, they all have their
applications and obviously if you had discussions this is a much better alternative when you consider the carcinogenic effects of chlorine.

CHAIRMAN MOYER: Thank you to the petitioner. Okay. We have a motion on the floor, we have a second. We have friendly amendments that have been addressed and accepted. I would like to call a vote.

Before I do that, is there a conflict of interest at all in this material? Hearing none we will start the vote with Jennifer?

MEMBER HALL: Yes.

CHAIRMAN MOYER: Okay. Thank you for allowing the secretaries to catch up. Jennifer voted yes. Bea?

MEMBER JAMES: No.

CHAIRMAN MOYER: Kevin?

MEMBER ENGELBERT: No.

CHAIRMAN MOYER: Hue?

MEMBER KARREMAN: Yes.
1  CHAIRMAN MOYER:  Joe?
2  MEMBER SMILLIE:  Yes.
3  CHAIRMAN MOYER:  Tracy?
4  MEMBER MIEDEMA:  Yes.
5  CHAIRMAN MOYER:  Barry?
6  MEMBER FLAMM:  Yes.
7  CHAIRMAN MOYER:  Tina?
8  MEMBER ELLOR:  Yes.
9  CHAIRMAN MOYER:  Gerry?
10  MEMBER DAVIS:  Yes.
11  CHAIRMAN MOYER:  Katrina?
12  MEMBER HEINZE:  Yes.
13  CHAIRMAN MOYER:  Dan?
14  VICE CHAIR GIACOMINI:  Yes.
15  CHAIRMAN MOYER:  Julie?
16  SECRETARY WEISMAN:  Yes.
17  CHAIRMAN MOYER:  Steve?
18  MEMBER DEMURI:  Yes.
19  CHAIRMAN MOYER:  And the Chair
20  votes yes.  Mr. Vice Chair, the vote?
21  VICE CHAIR GIACOMINI:  Two no, 12
22  yes, one absent.
CHAIRMAN MOYER: Thank you Mr. Vice Chair. With that vote sodium chloride acidified is recommended to be put on the list with the annotation as stated. Thank you. Before we move on to the next item I would like to step back to the vote on propionic acid under the livestock committee because Julie Weisman has recognized that she should have recused herself from that vote which will change the vote but not the outcome of that vote and I suggest we go back and acknowledge that. So if both the Secretary, the Executive Director and the Vice Chair could make that adjustment on their vote sheets I would appreciate it. It does not change the outcome of the vote. MS. FRANCES: Question. CHAIRMAN MOYER: Question from Valerie and then Dan. MS. FRANCES: Is there a need to redo the vote entirely?
CHAIRMAN MOYER: I don't believe so because we're all still seated here and I don't think that's an issue. If it had affected the outcome of the vote I would agree with you. Dan?

VICE CHAIR GIACOMINI: The attested vote is 12 no, zero yes, two absent, one recused.

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: I just sincerely want to apologize for dragging everybody down.

CHAIRMAN MOYER: No need Julie, you're doing a lot of work here and it's hard to keep everything straight on what we're doing.

MR. MATTEWS: Didn't you already do that originally? There's 14 of you there and if you got one recusal--

SECRETARY WEISMAN: We voted twice. It got voted as a livestock material and we didn't catch it until we went on as a
handling material.

MR. MATTHEWS: Oh okay. Thanks

for the clarification.

CHAIRMAN MOYER: Certainly,
you're welcome Richard.

What I plan to do now is we are
ahead of schedule, we're going to follow up
with one more material this morning, propane,
and then we will be taking an extended lunch
break to make sure that all the petitioners
for the afternoon items are in the room. We
knew that the petitioner for sodium chlorite
acidified was in the room so we moved forward
with that. But I think we're going to move
forward with this one more material on the
recommendation of the Handling Committee and
then we will be breaking and get back on
schedule to allow all the petitioners or folks
that were looking for that in the afternoon to
get on board. Question by Joe?

MEMBER SMILLIE: Procedural

question. Yesterday we moved lecithin on 606
to the top, I'm just wondering beforehand if we're going to follow that same format.

So that we would be dealing with the removal of lecithin from 605 then we would be dealing directly right after it with the addition of lecithin 606.

CHAIRMAN MOYER: It's the Chair's opinion that that does make sense. It worked yesterday and the items are closely enough linked that unless the Handling Committee has a problem with that I think that's an excellent--

MEMBER ENGELBERT: It's fine with me.

CHAIRMAN MOYER: Great.

MEMBER ENGELBERT: No, I think that is a very good suggestion. Since we are running ahead of schedule that would also—we hope the lecithin petitioners will be here for the first discussion and that will give the petitioners of the other items more time to catch up with the advancement of the
agenda.

CHAIRMAN MOYER: Joe? Oh I'm sorry, the chair recognizes Andrea Caroe.

Andrea?

MS. CAROE: Thank you.

CHAIRMAN MOYER: Could you please make sure the mic is turned on and then state your name for the recorder.

MS. CAROE: I'm a past member of this Board and I just want to offer you a suggestion as you're discussing these items and getting ready to vote on them procedurally that I think will make things go a little bit faster for you.

As the committee brings their recommendation in, the committee voted recommendation should be a motion immediately. Then your discussion, then your amendments and then your vote. You're doing a lot of discussion before you actually have a motion the table and it's affecting the motion that you want to put on the table but that is still
in committee; you haven't brought it to the
table yet.

So just bring it to the table, as
imperfect as it may be, you have the
opportunity during the discussion to make
those amendments. It just will go a lot
easier. I see you guys spinning trying to
perfect if before you put it on the table and
you don't have your committees together here.
So I just offer that for what it's worth.

CHAIRMAN MOYER: Thank you. The
Chair appreciates that comment.

Moving forward, Handling
Committee, Steve.

MEMBER DEMURI: Thank you Mr.
Chairman. I move that we list propane CAS
74.986 to the national list under 205.605 (b).

SECRETARY WEISMAN: Second.

CHAIRMAN MOYER: We have a motion
and a second. Is there discussion on this
material? Hearing none, I will call for a
close.
VICE CHAIR GIACOMINI: Question, Mr. Chairman, I have a question. I would like the statement from the committee on what their recommendation is on this.

MEMBER DEMURI: Certainly. Our committee recommendation was an unanimous vote to not list propane.

CHAIRMAN MOYER: Thank you, Steve. Now we call for the vote. Is there a conflict of interest on this material? Hearing none we'll move forward with the vote starting with Bea?

MEMBER JAMES: No.

CHAIRMAN MOYER: Kevin?

MEMBER ENGELBERT: No.

CHAIRMAN MOYER: Hue?

MEMBER KARREMAN: No.

CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: No.

CHAIRMAN MOYER: Tracy?

MEMBER MIEDEMA: No.

CHAIRMAN MOYER: Barry?
MEMBER FLAMM: No.

CHAIRMAN MOYER: Tina?

MEMBER ELLOR: No.

CHAIRMAN MOYER: Gerry?

MEMBER DAVIS: No.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: No.

CHAIRMAN MOYER: Dan?

VICE CHAIR GIACOMINI: No.

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: No.

CHAIRMAN MOYER: Steve?

MEMBER DEMURI: No.

CHAIRMAN MOYER: Jennifer?

MEMBER HALL: No.

CHAIRMAN MOYER: And the Chair votes no. Mr. Vice Chair?

VICE CHAIR GIACOMINI: 14 no, zero yes, one absent.

CHAIRMAN MOYER: Thank you Mr. Vice Chair. With that vote the motion to list propane on the national list failed.
This Board will now stand in recess until one o'clock so we have an extended lunch period. And we'll be back then to get back on schedule. Thank you.

(Whereupon, the above-entitled matter went off the record at 11:09 a.m. and resumed at 1:06 p.m.)

CHAIRMAN MOYER: Okay. If Board members could all take their seats and the members in the back of the room could quiet down.

Okay. Board Members we're back in session. We have a quorum, we're seated and we're ready. At this point we're going to turn the meeting over to Steve DeMuri as chair person of the Handling Committee to continue with the materials on your list. Steve, I believe we're on lecithin bleached.

MEMBER DEMURI: That is correct.

Thank you Mr. Chairman. We're on the last 205.605(b) item, lecithin bleached, and to
that I move that we remove lecithin bleached
from the national list 205.605(b).

MEMBER KARREMAN: Second.

CHAIRMAN MOYER: I'm sorry, who
seconded that?

MEMBER KARREMAN: Me.

CHAIRMAN MOYER: Hue gave us the
second. Thank you. We have a motion on the
floor and we have a second and the floor is
now open for discussion. Are there questions
or comments. Steve?

MEMBER DEMURI: Yes. Ms. Julie
Weisman here is the expert on lecithin on this
petition and she would be happy to answer any
questions that your Board might have.

CHAIRMAN MOYER: We have a motion
by Steve, a second by Hue Karreman and the
floor is now open for discussion. Joe and
then Tina?

MEMBER SMILLIE: We received a
lot of comments on this and I went through all
the comments and I can't read all of them but
there was a consistent strain in the comments that opposed removal. There was a lot of comments as everybody's heard from people who supported the motion to remove. A lot of comments. Some of them were very short and others were more lengthy. There was a lot of short ones.

And so that's good and we looked at all of those but we also looked very carefully at the ones who did opposed the removal. And they're pretty consistent. I won't say 100 percent but they're pretty consistent, up in the 90s, that basically these companies, and I'm not going to read their names, but basically we used the de-oiled lecithin and several made with products that lecithin is an important ingredient should not be replaced by standard lecithin for the reasons stated above. We request the oil lecithin continue to be listed as an allowable ingredient.

The comments are all in that vein,
to deny companies the right to use the oil, powered, bleached lecithin will result in the loss of many organic products. So I think that the arguments against removing lecithin from 605 are based on the need for a de-oiled lecithin. So even though right now the motion on the table is to consider removal, we really have to in our responsibility look at this as a package and the package will be presented in two parts. But the package is removal of lecithin from 605(b) and the addition of de-oiled lecithin to 606.

So it really is a package so if we act to remove it from 605(b) I think everyone votes with their conscience but we also need to add it to 606. So I just wanted to put that over-arching comment out there for discussion also as well as the motion on the table to remove lecithin.

And one of the commenters I thought gave us a very useful chart that I really just love seeing. Basically. They
listed the categories of their products and
the form of lecithin used, and then the third
column talked about the organic form
available. And so for some of their products
the liquid, the organic forms available, they
use it. For others they needed a de-oiled and
organic wasn't available and they couldn't use
it.

So the company has done their due
diligence and sometimes it works and sometimes
it doesn't. So I would ask the Board really
as they go through this particular motion to
remember that there is a motion going to
follow to add de-oiled lecithin to 606 and we
really have to look at the two in a certain
sense together even though we vote on them
separately.

CHAIRMAN MOYER: Thank you, Joe.

Other questions or comments. Dan?

VICE CHAIR GIACOMINI: Thank you

Mr. Chairman. Thank you, Joe, for recognizing
and to bring right to the table that this is
a package because I think that's very critical and important for us to recognize. And it's in that structure of the package that I think there's a couple of things that we need to think about.

Right now all forms of lecithin are allowed from all sources. In taking (b) off and restricting (b) listing, No. 1, I heard there was a number of comments discussing wanting to take off the soy lecithin products. There is an organic soy lecithin available, please do not allow hexane processed lecithin in our products.

Between that and the fact that we've really had no information to evaluate on the alternative sources, I have a hard time blanket taking off, you know, totally excluding those other sources. I just don't think it was part of what we adequately reviewed.

The other thing is that and what we're seeming to do in this package is that we
are moving bleached lecithin from 605(b) to 606. This Board removed bleached lecithin, even de-oiled bleached, and said that it was a 605 substance. We're now saying that it's 606. If the Board wants to say that, that's fine but I think we need to be clear that we are not restricting the use of de-oiled bleached lecithin and we're not outlawing bleached lecithin in removing bleached lecithin totally from the list.

CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: Yes. Well let's go through this carefully. We're removing bleached lecithin from 605, we're not putting bleached lecithin on 606, we're putting de-oiled lecithin on 606. Bleached, unbleached, dry, liquid.

VICE CHAIR GIACOMINI: Those who have not been part of all this discussion will just see bleached coming off the list, and I think we just need to be careful in how we describe what we're doing that we're not going
to create a problem down the road of even
maybe some certifier saying bleached lecithin
is synthetic, I can't certify that.

CHAIRMAN MOYER: Katrina then Bea.

MEMBER HEINZE: Sorry, I was
doing the school thing where you keep your
hand up until the teacher calls on you.

Valerie, do you have the green and
red lecithin chart that you could put up. As
with every other commenter I'm glad we're
talking about this as a package. I'm
wondering if we're, I'm not good at analogies,
if we're starting at the front of the problem
instead of the end of the problem.

It seems like all the information
we have, and I am grateful for all the public
comment because I feel like we've learned a
lot. What we want to do is start with once
we're done with this process and done with our
motions and voting, what do we want to remain
on the list? And then work backwards from
there to figure out what our annotation should say.

So I'll put a stab out here. My understanding is that what we would like to have stay on the list is that red box on the right in the middle, the bleached de-oiled lecithin as well as the unbleached de-oiled lecithin so the red box underneath it. And we haven't talked about this yet but I also believe that we've gotten some comments with regards to the source of the lecithin, some comments wanting the non-soy options available, in which case that would be for all forms is the question I'm not totally clear on that.

So if we identify what on this chart we want on, then it seems like we could in a more straightforward process say, okay, which annotations would do that, where on the list would be my suggestion.

CHAIRMAN MOYER: Bea, you had a question or a comment?
MEMBER JAMES: Just a point of clarification. The actual petition that we have is for the removal of lecithin correct from 605?

CHAIRMAN MOYER: Bleached.

MEMBER JAMES: Bleached. Is there a petition for the addition of de-oiled and if there is not a petition is it under our purview?

SECRETARY WEISMAN: I'll answer that. Can I?

CHAIRMAN MOYER: Let me get a comment from the program first Julie. Bob Pooler please.

MR. POOLER: Okay. You have two petitions for removal. You have a petition to remove the bleached lecithin from 605, you have a petition modified I believe yesterday to remove fluid unbleached lecithin. I understand the petitioner accepted as a friendly amendment to have the fluid to be changed to de-oiled. Not correct? All right
1  go ahead Julie you can continue.
2   SECRETARY WEISMAN:  Okay.
3  Technically what was agreed to, and I guess
4  the petitioner will tell me if I'm
5  interpreting it wrong, was that the friendly
6  amendment was instead of the petition being
7  for the removal of fluid lecithin, because
8  that's actually not the way the listing is
9  annotated, they agreed to the friendly
10  amendment that the current listing of lecithin
11  be amended to read lecithin de-oiled forms
12  only.
13   MR. POOLER:   Okay, if I can
14  continue. But the second petition was for the
15  unbleached sources.
16   SECRETARY WEISMAN:  I'm talking
17  about the second petition. The first petition
18  is still for removal from 605(b).
19   MR. POOLER:   Right. And that
20  refers to the bleached.
21   SECRETARY WEISMAN:  And that
22  refers to what is listed right now as lecithin
bleached. And that is still for removal.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: I'm noticing some frowns across from me so maybe just to clarify it. We have two petitions, removal of lecithin bleached from 605(b) with all the changes yesterday, a petition to change the annotation on 606 from lecithin unbleached to lecithin de-oiled forms only. Does that help?

Okay.

CHAIRMAN MOYER: Further discussion. Kevin?

MEMBER ENGELBERT: So that means under 606 the de-oiled can be either bleached or unbleached and even though in the diagram anything that is bleached is considered non-organic.

SECRETARY WEISMAN: No, look at the diagram, Kevin, that's not true.

MEMBER ENGELBERT: Okay.

SECRETARY WEISMAN: It's not the bleaching that makes it -- okay.
MEMBER ENGELBERT: It's the de-oiling, I wanted to be clear on that. That's all yes.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: Hence my suggestion that maybe we need to go backwards instead of forwards. I think if we figure out what we want to leave on the list, then we figure out how it should be classified, I think that might make the process less headache-inducing.

CHAIRMAN MOYER: Another comment from the program. Bob?

MR. POOLER: Should the annotation read "de-oiled unbleached lecithin" or less than whatever.

CHAIRMAN MOYER: No, Bob, I don't think that's what we want. I think we have it the way we want it. That's my understanding and I see the petitioner nodding his head in the gallery so I think we have the petition right. Okay. Tracy then Joe?
MEMBER MIEDEMA: The effect of this is that we are breaking from a prior Board's precedent that bleached belongs on 605. And as long as we're very open with fully acknowledging that that's what we're doing, then we can move forward.

CHAIRMAN MOYER: Thank you, Tracy. Joe?

MEMBER SMILLIE: Yes. I agree. We're fully aware of that. I also want to point out again that both the petitioner and those that, at least those present that objected, those that were here at this meeting that objected to the removal, are both comfortable with our approach.

CHAIRMAN MOYER: Julie and then Kevin?

SECRETARY WEISMAN: I wanted to follow up what Tracy's trying to make sure we all are clear about, that what we understand, would this Board understand any depth of information that we have now today about all
the forms of lecithin and how they're made and the different streams is way beyond anything that was understood at the time that these listing decisions were originally made and at least by the methods that are used now it's clear to me that it isn't whether bleached or unbleached that makes something synthetic or not synthetic.

CHAIRMAN MOYER: Kevin?

MEMBER ENGELBERT: I'd like another clarification if you would please. The de-oiled where the oil's been removed with either acetone or hexane, doesn't prevent this from being listed under 606? It's still an agricultural material?

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: It prevents it from even being organic. You could not have an organic de-oiled lecithin in which acetone had been used. But the non-organic forms that are currently available, in other words those are not organic products.
MEMBER ENGELBERT: But it's still considered agricultural.

SECRETARY WEISMAN: Well, we're going to continue working on that. That was part of some of the open questions that the materials working group raised yesterday, that we should be reexamining.

CHAIRMAN MOYER: Okay. I have Dan and then Katrina and then Tracy.

VICE CHAIR GIACOMINI: As far as what you're looking at, Kevin, that's something that's beyond this discussion. That's part of the whole materials and all that other thing. I disagree a little bit with what Joe said about all what we've heard and everything. We still have a commenter in this room that yesterday was requesting alternative sources of non-organic lecithin besides soy. And we're eliminating those with this listing.

CHAIRMAN MOYER: Let me get Katrina's comment. Katrina?
MEMBER HEINZE: This is directed at Kevin's question. If the lecithin de-oiled is on 605(b), commercial availability does not apply. So if at a later date someone does develop a de-oiled lecithin that can be certified organic, they are not required to use it because the listing is on 605(b).

MEMBER ENGELBERT: Right. I wanted just to make sure that everything is out, that we're all clear on everything and everything is examined. That's all.

CHAIRMAN MOYER: Tracy? Joe, you were next.

MEMBER SMILLIE: Could you repeat your objection again Dan. I just want to be real clear on this.

VICE CHAIR GIACOMINI: We have commenters requesting a form of lecithin from non-soy sources that do not seem to be available in the marketplace in an organic form. We are not allowing them to be used in organic with this listing except for the de-
MEMBER SMILLIE: Well, partially true. My understanding and again this is just my understanding and we may want to start calling some of the petitioners and people who have also made comments to the mic to get it absolutely clear, and that's an option we have because they're in the room.

So the motion to remove removes from 605 any non-soy product. Agreed? Putting de-oiled on 606 allows for non-soy de-oiled product and, of course, if organic bleached or unbleached is produced, that of course is allowed. So we're not closing the doors, we're definitely making smaller doors, but they're not closed.

And from what I understand from the testimony, depending on the type of non-soy, that there is available fluid, non-soy lecithin currently.

CHAIRMAN MOYER: Dan and then Julie.
SECRETARY WEISMAN: I hate to bring this up to point this out, but the listing that we are contemplating would not allow any fluid non-organic lecithin.

MEMBER SMILLIE: So it would have to be organic?

SECRETARY WEISMAN: Right. Yes. Correct.

VICE CHAIR GIACOMINI: The comments that I understood hearing was that there is a wealth, there may be a wealth of organic source material canola sunflower, but I heard absolutely nothing that I remember saying that there is any lecithin from those.

MEMBER SMILLIE: Can I ask the petitioner to have the mic?

CHAIRMAN MOYER: That's what I was going to do right now is going to ask if Mr. Clarkson and if Dr. Szuhaj wants to come with him to the podium to address those concerns it might help the Board.

Please state your name or names
when you get to the podium.

MR. CLARKSON: Yes. My name is Lynn Clarkson, Clarkson Soy Products and I'd be happy to address your question in a broad statement for which I would ask calibration any errors I make from Dr. Szuhaj. If you're taking lecithin from a vegetable oil source, then no matter whether you're pulling it out of a sunflower, a canola, or a soy bean, the lecithins are interchangeable. There may be some very subtle distinctions but for all practical purposes they are identical.

If they're identical, then the functionality is the same. So if you're going to tell me you want a sunflower lecithin, that's the a serious argument? It can't be a functionality argument, it has to be an allergen argument.

We have several responses to that. One is we offer canola lecithin in fluid form, non-allergenic. Now why would you not typically to go a sun or a canola? Because
the lecithin yield coming out of the oil is roughly half of what it is coming out of soy.
Okay.

No. 2, the functionality of a de-oiled lecithin is identical to the functionality of a fluid lecithin. The distinction is in the convenience for the handler.

So anybody that wants to use a conventional path here, for any purposes, could use a de-oiled lecithin and put it in solution whatever they wanted to do.

And the third argument I would have is the organic label is preeminently an organic label. It is not an non-allergen label, it's not an anything else label.

So No. 1 we're offering the alternatives, the amendment to the rule--

VICE CHAIR GIACOMINI: You're offering organic alternatives to soy?

MR. CLARKSON: Yes. The amendment leaves the commercial world open to
conventional sources from whatever plant material. I don't see that you've restricted much of anything here but you have helped the development of organic ingredients. Any science question you want I'll be happy to ask Dr. Szuhaj to address because he's the guy I go to when we get beyond the mundane liberal arts sort of things that I deal with.

CHAIRMAN MOYER: Dan?

VICE CHAIR GIACOMINI: I don't want to touch the allergen issue, the debate of whether there's allergen particles in there, what the concentration is, what the detectability level is. I'm not touching it. What I will touch, and we are a marketing program, is consumer preference. And there seems to be a consumer preference for some of the alternative forms in some products. And I'm concerned of just cutting all of those off with this action.

MR. CLARKSON: Reasonable concern, we have fluid canola in addition to
fluid soy. We don't have on a regular basis fluid sun. There's millions of dollars that need to be spent in some development that we don't know how it will turn out. But by leaving the de-oiled lecithin option in, in the amendment to change 606, everything is available.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: I do not have a question for the petitioner.

CHAIRMAN MOYER: Are there any other questions for the petitioner or Dr. Szuhaj? Kevin?

MEMBER ENGELBERT: Again, I want to be clear on one thing. So you're saying that the de-oiled could be put back into solution to provide a fluid option?

MR. CLARKSON: Yes, I am clearly saying that.

CHAIRMAN MOYER: Gerry has a question.

MEMBER DAVIS: Mr. Clarkson, then
if costs might be a determining factor for producers and handlers wanting to use non-organic de-oiled lecithin, is cost of handling that material and changing it back to a fluid, is there a cost advantage for them to do that rather than just buy the organic fluid from a company like yours?

MR. CLARKSON: If you can source conventionally you've got a cost advantage. When you de-oil, the acetone treatment is expensive. It can probably double the cost of a convention fluid lecithin but it would still be less expensive than your basic organic fluid lecithin.

CHAIRMAN MOYER: Are there any other questions from the Board to the petitioner? Hearing none, you gentlemen are excused. Thank you very much. Any other points of discussion? Katrina?

MEMBER HEINZE: I want to make sure, I agree with Dan that we do have public comment that expressed concern with us
removing non-soy sources of fluid lecithin
from the list and, despite the petitioner's
comments that there is perhaps this re-
fluidizing of the de-oiled, he obviously
benefits from that perspective. And I'm
wondering if either of the public commenters
who commented on the need for non-soy sources
who could give us an alternate perspective to
make sure that we've heard both positions.

CHAIRMAN MOYER: Are any of the
commenters who commented on non-soy sources
available for comment? Okay. If you approach
the podium and give your name.

MR. HERMAN: I'm Zareb Herman
from the Haynes Celestial Group and just to
clarify a point that has come up. Can you
hear me all right? Okay. I believe Mr.
Clarkson said that someone could take a de-
oiled lecithin and put it back into solution
and use it as a liquid although I'm not
personally aware of de-oiled sunflower or de-
oiled canola being available but I haven't
looked into it because if it's an allergen concern then you're going to want to use a non-soy source. And so I personally don't know how that would work because I'm not aware that it's available, those non-soy forms are available as de-oiled.

So I just thought I'd clarify that point. I know you're kind of in a hard place here.

In terms of my own company I mean we did some R&D with a facility that was insisting on using liquid sunflower lecithin but we are currently manufacturing at another location and for our own personal interests we can continue manufacturing there but not move it as we were looking into. So I don't want that you know I'm okay with it representing my company.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: So if the result of our actions today was that there was would be no lecithin listed on 605(b) and lecithin
de-oiled was listed on 606, that would be acceptable to you?

MR. HERMAN: Yes. To the interests of my company and the others that I am representing here today.

MEMBER HEINZE: I appreciate your comments. Thank you.

CHAIRMAN MOYER: We have additional commenters that would like to --

Zea?

MS. SONNABEND: Zea Sonnabend.

I'm wearing my consumer hat here and in no way represent CCOF in this comment. I'm speaking as a person who is allergic to soy beans and I am allergic to soy lecithin. And I hate the fact that I can't eat most chocolate bars because there's lecithin in them. But I appreciate the fact that at least now they label that it's from soy rather than it being from some other source.

The main thing that I wanted to say, you know, I definitely want to push
organic forward and I understand how this
pushes organic forward, and I absolutely think
that it's necessary to label the source of the
lecithin. But even if Mr. Clarkson is able
to produce lecithin from non-soy sources, his
clients are not us consumers. I can't go
there and find a non-soy chocolate bar. If he
is selling to other handlers and it's up to
them to want to make a non-soy chocolate bar,
and there aren't any that I know of that use
non-soy lecithin.

Now it was mentioned to me in
dairy products they do use a lecithin that is
non-soy and so this might become relevant for
dairy products but I can't even tell you how
many products I can't eat because lecithin is
in most bread, most baked goods in general,
lots of lecithin. I don't have a problem if
you take this off the list because I think the
market will drive it; those who care about
allergies will formulate for us allergy
sufferers and those who won't won't.
CHAIRMAN MOYER: Any questions from the Board for Zea before she leaves?
Joe, you had a comment or a question?
MEMBER SMILLIE: Yes. The point which we haven't really discussed yet, well we did, but the point is I'm glad Zea you included that the industry will rise to the occasion because, remember, we don't know exactly how much time before this gets enacted. But maybe we should review that process to make sure we're not speaking out of turn. But there will be from what I've heard, rumor wise, at least 18 months to two years before this gets enacted. And that to me seems like enough time if we already have one manufacturer that's making onsite fluid, it sounds like there could be more in a hurry to me.
It sounds like it's not unexplored, it's not like a whole new thing that people are going to start, it's already been started so I would like to ask the
program if that expectation is reasonable as far as the time between if and when we pass this recommendation and when it is enacted in law.

CHAIRMAN MOYER: Richard, do you have a comment from the program?

MR. MATTHEWS: Yes. Last year we got all caught up with all the material stuff, now we're falling behind again and we're going to be pushing through the summer to get caught up again.

So I would hope that whatever you do today would take no more than 12 months because we've got one docket that is working through final signatures, we've got another docket with some materials that we had some issues with that is being drafted and then we'll be taking up this one as well. So 12 months, hopefully, max. No guarantees but that's the goal.

CHAIRMAN MOYER: Thank you from the program. Julie?
SECRETARY WEISMAN: Just in terms of the timing issue, not that I don't understand what Herculean efforts and rings you jump through sometimes to keep these things moving along but 12 months would be great. Also, historically, that sounds quite optimistic. It would be great, and I support you in it, but it also would be a big improvement over much of what we've seen in the past. So I encourage you.

MR. MATTHEWS: I totally agree with what you just said. We're trying to close that part of the black hole.

The thing that takes so long is that it would have to go out as a proposed rule and it would have to go out as a final rule, you'd have 60 days for comment. It has to go to the attorneys twice. It has to go through departmental clearance twice. It has to have at least a week at the Federal Register twice. Plus we've got to write it twice.
So with all of that and factoring in conversations up front with FDA, EPA on materials, that's kind of the process and it takes a lot of time. But Shannon's pretty good now. We've got Shannon on and she's learning to be our reg writer and she's our material girl.

CHAIRMAN MOYER: Thank you, Richard. I understand Grace that you have a comment, I'm sorry Hue Karreman, you have a question first?

MEMBER KARREMAN: I was just wondering if Zea was wanting to make sure, since she's allergic to the soy, that you know is the soy really removed and not the sunflower or safflower or canola. Are you allergic to them too?

MS. SONNABEND: No, just soy.

MEMBER KARREMAN: That's worse.

So does that -- so what would she like to see?

SECRETARY WEISMAN: She would like to see us take the actions because she
feels that it will maybe move the organic
industry forward to come back with more non-
soy forms of what she would like to eat.

 MEMBER KARREMAN: And not just
have it listed as soy only to be removed?

 MS. SONNABEND: No, that isn't a
question. It seems that others aren't really
even available.

 CHAIRMAN MOYER: Thank you, Hue.

 Grace?

 MS. MARROQUIN: Grace Marroquin.

 A quick comment. I was one of the petitioners
that supported Lynn Clarkson but also made a
nod to the fact that not all lecithins were
the same and that sunflower should not be
removed with all the lecithins because of the
allergen issue. And even though some could
say there's no known allergen left, being not
a consumer I don't have a problem with it but
I do work with manufacturers day in and day
out and we do work with manufacturers that
just will not allow soy at all into their
plants or run them on their lines. 

So by leaving the de-oiled lecithin on 606 as you're saying is correct. 

I don't know anything about the reconstitution, how that works, a manufacturer would be able to comment on that. I do work with one of the suppliers on sunflower lecithin and we have asked for almost three years to produce an organic sunflower lecithin and they haven't been able to. They want to but they clearly say even though, yes, there are sunflowers all over the place and lots of it, as Lynn mentioned, the ratios that they gave me was if you have 100 gallons of soy you get approximately 5 kilos of soy, at least in their production. With sun you have 100 gallons of oil and you end up with 0.5 kilos of sunflower lecithin. 

So you're talking about a greater amount of raw material plus the manufacturing process so I just wanted to support that.

CHAIRMAN MOYER: Joe, you have
one question?

MEMBER SMILLIE: How do I phrase this? If canola was available would that meet the manufacturer's needs, why is it specifically sunflower?

MS. MARROQUIN: No, it's not a matter of-- there isn't any de-oiled canola that I know of available. I know there's four companies that have de-oiled sun. In fact, the company that we work with won't even have it for a while, probably in the fall. What they have now is the one that was talked about in this meeting where the carrier of rice flower or a multidextrine in it at about anywhere from 45 to 55 percent, but that's not what we're talking about.

The de-oiled is virtually 100 percent lecithin so I don't know, and maybe Lynn knows if there's a de-oiled canola. I don't know. But I know that there are de-oiled sun.

So, again, the way you're
proceeding with 606 leaving de-oiled in there is good and you should because then that allows options for manufacturers and consumers. And regarding the fluid, again, I can't speak to the reconstitution on it. But I just wanted to give some support.

CHAIRMAN MOYER: Thank you.

MS. MARROQUIN: And 606, again I said this for four or five or six years, 606 is what drives companies like mine to go and make organic ingredients become available. It has to be on it.

CHAIRMAN MOYER: Thank you, Grace. Katrina?

MEMBER HEINZE: I just wanted to clarify in my head where we are in the process. So we have a motion to remove lecithin bleach from 605(b)?

CHAIRMAN MOYER: Yes.

MEMBER HEINZE: And that's been seconded? And then we proceed to vote on that and then we'll follow with a motion to change
the annotation on 606?

CHAIRMAN MOYER: That is correct.

That is the process.

MEMBER HEINZE: Thank you.

CHAIRMAN MOYER: Valerie?

MS. FRANCES: I am just going to ask this one more time. Why aren't you considering adding a commercial availability annotation to a 605(b) material since this is extracted in the de-oiled form with hexane and acetone?

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: The non-organic lecithin that's currently allowed on 606, that's also using, in other words that uses the same, that's also the hexane extracted. The only lecithin that's not hexane extracted is the organic, the organic's being expelled or pressed.

If you leave lecithin on 605(b) it's not subject to any commercial availability requirement so there will be no
impetus for-- in other words, we've come up with a solution that's going to cover what's required in the industry. We're still I guess maybe not totally finished with the non-soy discussion but I think we're getting there.

MS. FRANCES: I guess I'm asking why not annotate it to do commercial--

SECRETARY WEISMAN: Well you know what, I would love to still have that in our bag of tricks somewhere along the line. I do think that's a possibility but I don't think we need to do in this case because there are so many other alternatives.

MS. FRANCES: Even if you annotate it?

SECRETARY WEISMAN: I think what we're planning to do is a better impetus than that.

CHAIRMAN MOYER: Okay. We have a motion of the floor and we have a second. I am prepared to call for a vote on that. Is there any conflict of interest before we vote
on this material? Hearing none, we will start
the vote with Kevin? I'm sorry?

MEMBER HEINZE: Usually I do my
standard little, we make a boatload of organic
products and at any time may or may not use
some of these materials. So typically you
guys say vote since you're a handler, but I
just wanted to make everyone aware we do use
lecithin, we use organic.

CHAIRMAN MOYER: Thank you for
that honesty. The Board appreciate that. Bea?

MEMBER JAMES: Jeff, could you
please restate the motion?

CHAIRMAN MOYER: Certainly.

Would the person who made the motion, Katrina,
would you--

MEMBER DEMURI: That was me.

CHAIRMAN MOYER: I'm sorry.

Steve. Would you please restate the motion?

MEMBER DEMURI: Sure. The motion

is to remove lecithin bleached from the

national list 205.605(b).
CHAIRMAN MOYER: Thank you Steve.

We're prepared to vote and we'll start the vote with Kevin.

MEMBER ENGELBERT: Yes.

CHAIRMAN MOYER: Hue?

MEMBER KARREMAN: Yes.

CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN MOYER: Tracy?

MEMBER MIEDEMA: Yes.

CHAIRMAN MOYER: Barry?

MEMBER FLAMM: Yes.

CHAIRMAN MOYER: Tina?

MEMBER ELLOR: Yes.

CHAIRMAN MOYER: Gerry?

MEMBER DAVIS: Yes.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: Yes.

CHAIRMAN MOYER: Dan?

VICE CHAIR GIACOMINI: No.

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: Yes.
CHAIRMAN MOYER: Steve?

MEMBER DEMURI: Yes.

CHAIRMAN MOYER: Jennifer?

MEMBER HALL: Yes.

CHAIRMAN MOYER: And Bea?

MEMBER JAMES: Yes.

CHAIRMAN MOYER: And the Chair votes yes. Mr. Vice Chair?

VICE CHAIR GIACOMINI: One no, 13 yes, one absent.

CHAIRMAN MOYER: And with that vote the motion to remove bleached lecithin from 605(b) has passed.

And now Mr. Chairman of the Handling Committee, we are moving your petition on 606 lecithin de-oiled ahead of schedule so please take care of that.

MEMBER DEMURI: That's correct.

We're going to move up the unbleached lecithin petition on 606 up now.

CHAIRMAN MOYER: Will you make a motion to that effect please?
MEMBER DEMURI: Yes. I move that we move the vote for lecithin unbleached fluid, let me restate that. I move that we remove lecithin unbleached fluid from the national list 205.606.

CHAIRMAN MOYER: Are you sure that's the motion you want to make? I don't think it is.

MEMBER DEMURI: What's the motion I want to make? Are we moving to move it up?

CHAIRMAN MOYER: No, would you allow Julie to make that motion for you?

MEMBER DEMURI: I certainly would.

CHAIRMAN MOYER: Thank you.

SECRETARY WEISMAN: Okay. I still may need help in terms of point of order but I believe that the business we took care of yesterday was determining that the petitioner was agreeing to our friendly amendment and perhaps we're going to need to change what's on the criteria evaluation. But this is no
longer a petition to remove fluid lecithin.

What we are considering now, based
on the petitioner's acceptance of our friendly
amendment, is a petition to change the listing
of lecithin on 606 so that it will no longer
be lecithin unbleached, it will now be
lecithin de-oiled.

CHAIRMAN MOYER: Would you please
put that in the form of a motion?

SECRETARY WEISMAN: I move that
we change the annotation of lecithin on 606 to
read "lecithin de-oiled."

CHAIRMAN MOYER: Do I hear a
second on that motion?

MEMBER SMILLIE: Second.

CHAIRMAN MOYER: Joe seconds
that. Discussion? Does everybody understand?

Gerry?

MEMBER DAVIS: So now on Section
C of the page up there you'll need to change
the dry forms only comment to de-oil.

SECRETARY WEISMAN: Actually, you
know what, let's do this now. Let's get it out of the way. Go all the way to top. The petition is no longer for removal. It's not for removal. To amend the listing, can we say amend or do we have to say change? Lecithin de-oiled and just take the word fluid off. That's it.

Point of order, does that have to say the way the current listing is?

CHAIRMAN MOYER: Yes.

SECRETARY WEISMAN: Anybody from the program have a comment?

CHAIRMAN MOYER: The Chair recognizes Dan.

VICE CHAIR GIACOMINI: I think the substance of this is an amendment since this is an amendment to the annotation. The substance listing should be the current listing. So just go back to where you were, undo what you did I think.

CHAIRMAN MOYER: The current listing is lethicin unbleached in the
regulation, it that what were you referring to?

SECRETARY WEISMAN: Yes. The world "fluid" doesn't belong on the top.
Okay. Now we have to go to C I think.

CHAIRMAN MOYER: The chair recognizes Gerry then Tracy.

MEMBER DAVIS: Would it not be most proper in the Section where it says petition is for, you would want to amend the current listing of, or I think change sounds better, to change the listing of lecithin unbleached and then go on to say what the change is.

SECRETARY WEISMAN: Or we could say to amend the listing of lecithin to de-oiled only. Okay, that's good.

CHAIRMAN MOYER: Tracy?

Great. Thank you. Hue?

MEMBER KARREMAN: But wouldn't they still be allowed to use-- I thought we were talking earlier that they'd be allowed to
use the bleached or unbleached so why is this
only unbleached here?

SECRETARY WEISMAN:  No, that's
going to go away. That's just restating what
the current listing is and then what it's
going to be changed to.

MEMBER KARREMAN:  All right.

You're still just at what it currently is.

Okay. But I think we're want to lose the
"only" don't we?

SECRETARY WEISMAN:  Yes. We want
to lose that second "only." Right. That
looks right.

CHAIRMAN MOYER:  The Chair
recognizes Richard Matthews from the program.

MR. MATTHEWS:  The wording starts
out "the amend the," I think you want to say
"to amend the."

CHAIRMAN MOYER:  Okay. Bea?

MEMBER JAMES:  You would remove
the "to" because it says this petition is for
amending. And then pick up right to amending
and take the "the" out.

SECRETARY WEISMAN: Yes. We're in English class here.

CHAIRMAN MOYER: Okay. Do we have the wording correct to satisfy Board member? If so we have a motion on the floor, we have a second. Is there discussion? Bea?

MEMBER JAMES: I'm wondering if Section B needs to be-- Would Section B stay the same then?

CHAIRMAN MOYER: Well that's got to change now.

MEMBER JAMES: Yes, I think it needs to be done now.

CHAIRMAN MOYER: Yes, well let's clean that up before we vote so everyone knows what they're voting on. Tracy, you have suggested language?

MEMBER MIEDEMA: Actually we're voting on a motion, we're not voting on all of the criteria included so I would suggest that the committee goes back through and
incorporates the feedback that appropriately justifies what we're talking about moving.

CHAIRMAN MOYER: Thank you, Tracy. That's an excellent suggestion. Let's vote on the motion that we have on the floor and the second and we'll adjust that language in the evaluation forum later. If we're ready for a vote is there anybody who has a conflict of interest on this material? Other than that one that Katrina already mentioned because of her usage of the material?

In that case I'm ready to call the vote and we'll start with Hue?

MEMBER KARREMAN: So the affirmative is to change?

CHAIRMAN MOYER: The affirmative is to make the change.

MEMBER KARREMAN: Yes.

CHAIRMAN MOYER: Thank you. Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN MOYER: Tracy?

MEMBER MIEDEMA: Yes.
CHAIRMAN MOYER: Barry?
MEMBER FLAMM: Yes.

CHAIRMAN MOYER: Tina?
MEMBER ELLOR: Yes.

CHAIRMAN MOYER: Gerry?
MEMBER DAVIS: Yes.

CHAIRMAN MOYER: Katrina?
MEMBER HEINZE: Yes.

CHAIRMAN MOYER: Dan?

VICE CHAIR GIACOMINI: No.

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: Yes.

CHAIRMAN MOYER: Steve?

MEMBER DEMURI: Yes.

CHAIRMAN MOYER: Jennifer?

MEMBER HALL: Yes.

CHAIRMAN MOYER: Bea?

MEMBER JAMES: Yes.

CHAIRMAN MOYER: Kevin?

MEMBER ENGELBERT: Yes.

CHAIRMAN MOYER: And the Chair votes yes. Mr. Vice Chair if we can have the
tally.

VICE CHAIR GIACOMINI: One no, 13
yes, one absent.

CHAIRMAN MOYER: Thank you Mr. Vice Chair and with that motion and vote, the motion to change the annotation on lecithin in 206.606 to read lecithin de-oiled passes.

Thank you. Mr. Chairman, the rest of your 606 items?

MEMBER DEMURI: Thank you, Mr. Chairman. We'll go on to the next 606 item and I'll see if I can get this one right. It is for the listing of red corn color to 205.606 -- oh chicory. Getting ahead of myself here. Chicory root, excuse me.

So I move for no further action on chicory root to the addition of the national list 205.606.

CHAIRMAN MOYER: Is there a second for that motion? Tracy seconds that motion. We have a motion on the floor to take no action on this material and a second. Is
there any need for discussion? There being none, is there any conflict of interest on this material? Again, being none we will call for a vote on that motion starting with Joe Smillie. Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN MOYER: Tracy?

MEMBER MIEDEMA: Yes.

CHAIRMAN MOYER: Barry?

MEMBER FLAMM: Yes.

CHAIRMAN MOYER: Tina?

MEMBER ELLOR: Yes.

CHAIRMAN MOYER: Gerry?

MEMBER DAVIS: Yes.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: Yes.

CHAIRMAN MOYER: Dan?

VICE CHAIR GIACOMINI: Yes.

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: Yes.

CHAIRMAN MOYER: Steve?

MEMBER DEMURI: Yes.
CHAIRMAN MOYER: Jennifer?

MEMBER HALL: Yes.

CHAIRMAN MOYER: Bea?

MEMBER JAMES: Yes.

CHAIRMAN MOYER: Kevin?

MEMBER ENGELBERT: Yes.

CHAIRMAN MOYER: Hue?

MEMBER KARREMAN: Yes.

CHAIRMAN MOYER: And the Chair votes yes.

VICE CHAIR GIACOMINI: Zero no, 14 yes, one absent.

CHAIRMAN MOYER: Motion passes and no action will be taken on chicory root. Next material Mr. Chairman?

MEMBER DEMURI: Thank you Mr. Chairman. The next material for 205.606 is color red corn and I move for the addition of red corn color to the nation list 205.606.

CHAIRMAN MOYER: Is there a second on that motion?

MEMBER HEINZE: Second.
CHAIRMAN MOYER: Katrina seconds that motion. Discussion on color red corn? Hue?

MEMBER KARREMAN: What was the committee's recommendation again? I think it was to not?

MEMBER DEMURI: The committee recommendation was a unanimous to not list it.

CHAIRMAN MOYER: Any further discussion on this item with this material? Is there a conflict of interest between any Board members and voting on this material? Hearing none, we will move directly to the vote and I will call the vote starting with Tracy.

MEMBER MIEDEMA: No.

CHAIRMAN MOYER: Barry?

MEMBER FLAMM: No.

CHAIRMAN MOYER: Tina?

MEMBER ELLOR: No.

CHAIRMAN MOYER: Gerry?

MEMBER DAVIS: No.
CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: No.

CHAIRMAN MOYER: Dan?

VICE CHAIR GIACOMINI: No.

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: No.

CHAIRMAN MOYER: Steve?

MEMBER DEMURI: No.

CHAIRMAN MOYER: Jennifer?

MEMBER HOWARD: No.

CHAIRMAN MOYER: Bea?

MEMBER JAMES: No.

CHAIRMAN MOYER: Kevin?

MEMBER ENGELBERT: No.

CHAIRMAN MOYER: Hue?

MEMBER KARREMAN: No.

CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: No.

CHAIRMAN MOYER: And the Chair votes no. Mr. Vice Chair?

VICE CHAIR GIACOMINI: 14 no, zero yes, one absent.
CHAIRMAN MOYER: And with that vote the color of red corner fails and will not be added to the list. Mr. Chairman, your next material.

MEMBER DEMURI: The next material is also a listing for a sentence on 205.606, it's myrrh essential oil. I move for the addition of myrrh essential oil to the national list on 205.606.

CHAIRMAN MOYER: Do I have a second?

SECRETARY WEISMAN: Second.

CHAIRMAN MOYER: Julie seconds that. We have a motion on the floor to list myrrh essential oil and a second. Discussion? Tina and then Katrina and then Dan.

MEMBER ELLOR: And I know we talked about this yesterday and I just wanted to be clear. This is just for perfume?

Okay. So should we take the perfume part off then?

MEMBER DEMURI: Yes, we need a
friendly amendment from somebody.

VICE CHAIR GIACOMINI: Well he didn't list that so officially right now it's off.

CHAIRMAN MOYER: Even though it's written there.

VICE CHAIR GIACOMINI: Well his statement was propane. Rocket fuel essential. Everybody wants a little propane in their perfume.

CHAIRMAN MOYER: Okay. If we could stay focused here. We have a motion that was accurately read but not accurately worded on the form. That was seconded by Julie.

SECRETARY WEISMAN: So the vote we're taking is just to put it on the list not to restrict it to perfume?

CHAIRMAN MOYER: That's the way the motion is read.

SECRETARY WEISMAN: Okay.

CHAIRMAN MOYER: Katrina?
MEMBER HEINZE: Point of order.

Since the Handling Committee recommendation was for the longer annotation, do we need to go back and fix all that or we're good?

CHAIRMAN MOYER: I believe we're good. Dan you had a question?

VICE CHAIR GIACOMINI: No, I was just clarifying on that.

CHAIRMAN MOYER: Barry?

MEMBER FLAMM: I'd just like to clarify the availability of supply and the lack therefore, that this species only grows in the area that's described in the petition?

I'm sorry, I should know myself but I didn't have time to really look into it. So could that be confirmed that there is no other area where this grows?

CHAIRMAN MOYER: Steve?

MEMBER DEMURI: I'll defer that to Gerry, he's the one that did all the research on this one.

MEMBER DAVIS: The information
that can be found in the petition as well as looking through internet available information showed that the plants are native to the region of Ethiopia, Somalia, Yemen, portions of Saudi Arabia possibly but it was not mentioned as a main area. And I believe there may be a related plant in India that you can find references to myrrh being made from it but it's not the same species I believe from memory. That's the extent of the information we have as far as the regions of where the plant is native to.

And it's presented as a wild harvested, it's not plantations of this planted out as far as we can tell.

MEMBER FLAMM: I trust your looking at this but was the source some authoritative plant distribution source, or was it just a Google source?

MEMBER DAVIS: No, it was just a Google search of available supplies and where they come from. Various information being
put up by suppliers of myrrh essential oil.
And the petition what they say.

CHAIRMAN MOYER: Bea?

MEMBER JAMES: I think you may have answered this yesterday. But why did the committee decide not to call for a tap on this?

MEMBER DAVIS: Well, what I saw yesterday was that it is not a complex material. The supply problem with it is not based on the material itself, but it is more in the realm of where it's grown. The wild nature of the distribution of the trees and it didn't seem like a TAP, at least the TAPs we've been getting, would give us any information. I don't want to sound negative but I don't think it was going to be effective to ask for a TAP.

MEMBER JAMES: Okay. I guess I was just trying to reference maybe more objectionable data to support the decision so that we know for sure that there is no organic
form of this. We know about the availability.

CHAIRMAN MOYER: Julie and then Dan.

SECRETARY WEISMAN: Yes. I think that you're right, this is an issue that's come up before. But this is not about the fact that there's organic material being grown. It's got a complex processing that requires expensive equipment. It's about where the plant that this comes from is grown, it's grown in areas that are very difficult to have organic certification infrastructure in place.

They're very politically unstable and you'll see if you look on 4 that trade basically and political events are really probably the most serious barrier to having a certified organic supply available. Does that sound right?

CHAIRMAN MOYER: Dan and then Gerry.

VICE CHAIR GIACOMINI: I just
I want to sort of reword Barry's question maybe.

Not that it was a Google search but it's better than a Wikipedia reference right?

MEMBER DAVIS: Yes. I'm sorry I don't remember the details of what I'm thinking of as far as where the information came from. I know where the information came from but I don't remember where those sources that are based on the marketing of myrrh, they may have referenced technical plant distribution information but I don't recall.

I know I didn't go straight to a source of botanical information to find out this information.

MEMBER DAVIS: One other thing to point out, if you do a quick Google search and Ms. Ellor did it yesterday and just asked for organic myrrh essential oil, entries do come up. But when you look into it there's no documentation that it's actually organic. No mention of certifiers. Nothing. It's part of that realm of cosmetics and personal care.
things that people have referenced. There's a lot of organic claims being put out there but when you look for any documentation and all the suppliers that I could identify of myrrh oil as well as other essential oils had very good documentation on who certifies this oil and where it's from and on and on and on. But when it came to their listing of myrrh, there's nothing there. No organic.

CHAIRMAN MOYER: Any further discussion on this material? Julie?

SECRETARY WEISMAN: Can we scroll back to the top because even though I seconded the motion I mean I would actually prefer that it reflect what was the motion that was made and seconded. Oh you struck it. Thank you. Okay. I'm good.

CHAIRMAN MOYER: Steve?

MEMBER DEMURI: Yes, I just want to comment for the rest of the Board. The committee vote was four yes, zero no, two absent.
CHAIRMAN MOYER: Thank you Steve.

If you could restate the motion one time and then we're going to vote on it. I'm sorry, Katrina, I didn't see your hand. Steve?

MEMBER DEMURI: Okay. The motion is to list myrrh essential oil to the national list 205.606.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: I'd like to offer a friendly amendment. Could you go back to that sheet? I can't offer my friendly amendment from my head. I believe we need to use the Latin name so my friendly amendment would be to list myrrh essential oil, we just didn't read it out loud right, so then it's not part of the motion.

VICE CHAIR GIACOMINI: She is right.

MEMBER DEMURI: So I will restate the motion. The motion is to list--

MEMBER HEINZE: I think you just need to accept my friendly amendment, correct?
And then the seconder needs to accept it.

MEMBER DEMURI: I do accept your friendly amendment. Thank you.

SECRETARY WEISMAN: I do as well.

CHAIRMAN MOYER: Thank you. We have a motion on the table that's been seconded. There's a friendly amendment that has also been seconded and accepted. Is there a conflict of interest between this material and any of the members on this board? No myrrh growers here. Okay. Being none I call for the vote and will start with Tracy. I apologize, Barry.

MEMBER FLAMM: No.

CHAIRMAN MOYER: Tina?

MEMBER ELLOR: Yes.

CHAIRMAN MOYER: Gerry?

MEMBER DAVIS: Yes.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: Yes.

CHAIRMAN MOYER: Dan?

VICE CHAIR GIACOMINI: Yes.
CHAIRMAN MOYER: Julie?
SECRETARY WEISMAN: Yes.
CHAIRMAN MOYER: Steve?
MEMBER DEMURI: Yes.
CHAIRMAN MOYER: Jennifer?
MEMBER HALL: Yes.
CHAIRMAN MOYER: Bea?
MEMBER JAMES: Abstain.
CHAIRMAN MOYER: Kevin?
MEMBER ENGELBERT: No.
CHAIRMAN MOYER: Hue?
MEMBER KARREMAN: Yes.
CHAIRMAN MOYER: Joe?
MEMBER SMILLIE: Yes.
CHAIRMAN MOYER: Tracy?
MEMBER MIEDEMA: Yes.
CHAIRMAN MOYER: And the Chair votes yes. Mr. Vice Chair the tally?
VICE CHAIR GIACOMINI: Two no, 11 yes, one abstain, one absent.
CHAIRMAN MOYER: Thank you. And with that vote the motion to list myrrh
essential oil on 205.606 passes. Next material Mr. Chairman.

MEMBER DEMURI: Thank you. The last material for today is also a 606 item. It's wheat germ and I move that we list wheat germ on the national list 205.606.

CHAIRMAN MOYER: Do I have a second on that?

MEMBER HEINZE: Second.

CHAIRMAN MOYER: Katrina seconds that. We have a motion and a second so we're open for discussion on this material. Bea?

MEMBER JAMES: Point of clarification. I know I asked this yesterday but I'm just going to ask it again. In your recommendation category 4, No. 3, you checked not applicable for obtained organically in the appropriate form. And yet the comments say organic wheat germ in the appropriate quality can be obtained. So I'm confused.

CHAIRMAN MOYER: Katrina please.

MEMBER HEINZE: Not really sure
why the X is there. We may have said that
that was not applicable to our decision
because we're really evaluating the question
on quality. It could technically also say that
yes it is available in the appropriate form
and quality.

MEMBER JAMES: In organic form?

MEMBER HEINZE: Yes, the
petitioner acknowledges that they were able to
find 4,000 pounds. That just did not meet
their need for the full production that they
need. So the petitioner is not saying that
they could not find any, they just could not
find enough. And we did have some information
that came to light yesterday that we've done
a little bit more research on. Joe did you
want to talk to that or did you want me to?

MEMBER SMILLIE: No, I'll be
glad to, I did the phone calls. I followed
up on the information that we received
yesterday and contacted the people who
supposedly had it available and these are
brokers and I'm not going to disparage brokers, but brokers tend to be very positive about availability, let's leave it at that.

And when I questioned them they said well no actually they didn't have it available. And I said could they have it available? And they said well no their source had dried up but they were working on a new source and hope to have it available in the near future. That was just one call. That's just the one that was given to me and it was announced publicly yesterday that I followed up on.

We've made other calls, I'm sure we haven't phoned every mill in the United States and Canada and Argentina and Australia.

SECRETARY WEISMAN: Could I ask if the source that you contacted was Grain Millers?

MEMBER SMILLIE: No. It was the one that was brought up publicly yesterday.

CHAIRMAN MOYER: Katrina?
MEMBER HEINZE: The petitioner did contact Grain Millers? I do have a list. I could open that if you're interested of who they did contact. We went back. In addition to the independent research that we did to kind of understand what they'd said, we had asked them to give us the name of the millers that they contacted for sourcing the organic wheat germ. They were Grain Millers, Grain Place Foods, Heartland Mills, Rocky Mountain Milling, ConAg and as I told you they contacted General Mills.

We also asked them to better explain why it couldn't be available or what their challenges were in the supply chain. And then we asked them on their perspective on other issues that would present a challenge to a consistent supply. And they really talked about this choice that millers make to divert the wheat germ into their white flour that is you know that reduces their white strain so most millers do that.
CHAIRMAN MOYER: Steve?

MEMBER DEMURI: I was going to reiterate what Katrina said. I also sent an e-mail to one of our purchasing bulldogs last night, just got an answer back about half an hour ago and they claim that they've searched high and low with millers and could not find any.

CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: You know, we've had a few others like it. Again, it just goes down to your personal philosophy as to whether placing a 606 item on 606 spurs organic production or allows loopholes.

And, you know, in some cases it can do it truthfully but I believe by and large what we're seeing is it does spur production. And now that we've created the historical precedent of removing something from the list, I think that we can now say that's fully operational and that if we do decide to put it on the list, if that becomes
available, that we could see a petition to remove wheat germ from the list with a demonstration of availability. And I think that's the way it should work.

So coming into this meeting you know we had to decide what to do. I wasn't comfortable last night voting either yes or no, and I have to admit I was thinking about the cowardly way out of abstaining, you know, because I just didn't want to take the political heat of putting wheat germ on the list and having every blogosphere, the blogospheres say oh my God, look what they've done. They've put wheat germ on the list. Those bozos at the NOSB, don't they know that organic wheat is all over the place?

But that's not the correct path to choose, and so I believe that if we put it on 606, my personal belief is if we put something on 606 we serve notice to the industry, hey guys, here's an opportunity. Deliver and we will gladly accept a petition for removal.
1 CHAIRMAN MOYER: Bea?
2 MEMBER JAMES: Just a point of
3 clarification that abstaining is not cowardly.
4 It's oftentimes when somebody can't make a
5 good decision one way or another.
6 MEMBER SMILLIE: I wasn't tutored
7 that way.
8 CHAIRMAN MOYER: Thank you Bea.
9 Katrina?
10 MEMBER HEINZE: I just to bring
11 up that the petitioner has been selling
12 products, these products certified organic,
13 with wheat germ in them for 25 years and it is
14 meeting a consumer need presumably for the
15 product. And then concur with Joe. This is
16 about philosophy and we heard Grace Marroquin
17 say to her this is the list. So Grace there's
18 a high need for organic wheat germ, please
19 help us.
20 CHAIRMAN MOYER: Okay. We have a
21 motion on the floor and a second. Is there
22 any further discussion? If not, I'd ask if
there's a conflict of interest between this material and any of the members of the Board? Katrina?

MEMBER HEINZE: I work for a large flour miller in the United States. We do not produce organic wheat germ but a suggestion from the Board on whether I should recuse myself or not.

MEMBER KARREMAN: I thought yesterday you said you did make wheat germ oil and there's no outlet for it so it goes somewhere else.

MEMBER HEINZE: You make wheat germ just because you're a flour miller. We don't sell would be the proper, we do not sell wheat germ because you mill flour you have to be in the wheat germ business. It kind of together.

MEMBER KARREMAN: But that's organic wheat you're using.

MEMBER HEINZE: We do not sell. We throw it away. The organic wheat germ.
CHAIRMAN MOYER: Katrina thanks for being honest. Joe?

MEMBER SMILLIE: I think you should recuse yourself. I think it would be an egregious mistake not to recuse yourself.

CHAIRMAN MOYER: I think that's fair.

MEMBER HEINZE: I will recuse myself.

CHAIRMAN MOYER: Thank you Katrina for your honesty. Okay, I will now call for the vote and we'll start the vote with Tina?

MEMBER ELLOR: No.

CHAIRMAN MOYER: Gerry?

MEMBER DAVIS: Yes.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: Recuse.

CHAIRMAN MOYER: Dan?

VICE CHAIR GIACOMINI: No.

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: Yes.
CHAIRMAN MOYER: Steve?

MEMBER DEMURI: Yes.

CHAIRMAN MOYER: Jennifer?

MEMBER HALL: Yes.

CHAIRMAN MOYER: Bea?

MEMBER JAMES: Well I was going to abstain but I'm going to vote no.

CHAIRMAN MOYER: Thank you Bea.

Kevin?

MEMBER ENGELBERT: No.

CHAIRMAN MOYER: Hue?

MEMBER KARREMAN: No.

CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN MOYER: Tracy?

MEMBER MIEDEMA: Yes.

CHAIRMAN MOYER: Barry?

MEMBER FLAMM: No.

CHAIRMAN MOYER: And the Chair votes no. Mr. Vice Chair the tally please.

VICE CHAIR GIACOMINI: Six no, six yes, no absent, one recuse.
CHAIRMAN MOYER: Thank you Mr. Vice Chair and if my math is correct with that vote wheat germ has been defeated as a motion and will not be listed on 206.606.

SECRETARY WEISMAN: Actually, I think that count is seven yes, six no. It doesn't change the outcome but does it add up to 15 votes.

MEMBER SMILLIE: Mr. Chair, I demand a recount.

CHAIRMAN MOYER: You may.

SECRETARY WEISMAN: Seven no, six yes.

VICE CHAIR GIACOMINI: You know when you have to go that second hand it's just a pain in the neck.

SECRETARY WEISMAN: Just clarifying. I have one other little comment more general.

CHAIRMAN MOYER: Wait till we're finished with this. Do you agree with that count, Mr. Vice Chair?
MS. FRANCES: Can we go round again?

CHAIRMAN MOYER: No, we're not going to revote.

MS. FRANCES: No, no I don't mean re-vote. Can people re-say what they voted because I have an official record to keep here.

CHAIRMAN MOYER: Well afterwards you can check. We have two other records, we're not going to go round the room and do that.

VICE CHAIR GIACOMINI: Yes, I confirm.

CHAIRMAN MOYER: Thank you Mr. Vice Chair, and that does not change the outcome of the election. We have a question or a comment from the executive.

MS. FRANCES: Just noticing on this form the question that Bea had asked regarding the response to category 4 No. 2, the non-applicable answer regarding this
material should have raised the question for me that perhaps this question needs to be a two part question, which does the current and historical industry information and research or evidence explain.

CHAIRMAN MOYER: I'm not sure I understand. Are you talking about changing the form?

MS. FRANCES: Yes, I'm just offering just for some clarity because of the way that this was answered, not applicable and then organic wheat germ is appropriate form can be obtained. I think the problem is the question is so loaded that it's hard to answer yes or no.

CHAIRMAN MOYER: Yes, moving forward that's probably something we may want to address.

MS. FRANCES: Just addressing that. To break it into a two part question.

CHAIRMAN MOYER: Okay. Thank you. But with that vote the voting portion of
this meeting is completed and I think the committee will now take a much needed brief break and we will reconvene here at 2:45 ready to start with our committee work plans for the fall of 2009. Thank you Board Members.

(Whereupon, the above-entitled matter briefly went off the record.)

CHAIRMAN MOYER: Okay. If Board Members could please take their seats. Okay. Board Members are almost seated. We have a quorum. The Board is back in session. Thank you everybody. We're seated and we have a quorum and we'll get back to the business at hand. Even though the voting is done we are not complete yet.

I do appreciate everybody's attention to detail as we went through the voting items and the thoughtful discussion.

A comment from Joe?

MEMBER SMILLIE: Point of order Mr. Chair?
CHAIRMAN MOYER: Yes.

MEMBER SMILLIE: I would like to personally apologize to Bea and anyone else who voted abstaining for their conscience. It is not a cowardly act. It would have been a cowardly act had I done so today. I did not mean to demean anyone who abstains from voting.

CHAIRMAN MOYER: All through history? You're suggesting history.

MEMBER JAMES: Thank you Joe.

And, yes, now you can have your sushi.

CHAIRMAN MOYER: That took courage Joe yes. Okay. Thank you for starting us off with that levity. All right. The next order of business in front of this Board is our committee work plans for the session leading up to our fall meeting. And what I'd like to do now is go committee by committee and I'm choosing to go in the order that we voted because that's how my agenda reads here.
And so we'll start with the Policy Development Committee. Barry as committee chair, unless you delegate, could you please go over your work plans for the rest of 2009.

MEMBER FLAMM: With pleasure.

These items have been submitted to you in advance so it hasn't changed from what I presented at the Executive Committee.

Okay. Our proposed draft work plan for the Policy and Development Committee is as follows:

Action item 1. Continue the systematic review of the Policy and Procedure manual, reviewing Section 5, Duties of Committee and Chairs in Section 6 miscellaneous policies.

Action item 2. In Section 3, which we had on the schedule this time and voted some revisions but we feel in retrospect there is a need to clarify the secretary's duties or discuss making a change regarding taking the Minutes at Board meetings. So the
1 committee will look at that and make a
2 recommendation to the Board.
3
4 Action item 3 is to add to the
5 Policy and Procedure manual clarification of
6 appropriate contact by NOSB members with
7 legislatures, legislators excuse me, such as
8 making invitations to Board meetings.
9
10 Action item 4 will be to
11 incorporate the decisions made at this meeting
12 regarding biodiversity conservation criterion
13 to be added to the evaluation of petition
14 materials.
15
16 Action item 5 is to try again deal
17 with the petition disposition process. This
18 was tabled as our past work plan as not being
19 timely, and the intent is to include in the
20 Policy and Procedure manual procedures for
21 tracking petitions. And these are the ones
22 being developed by the materials committee and
23 already approved by the Board. This would be
24 making sure they got properly in the Policy
Action item 6 is exam again the public comment proxy and the process that's going on.

And we have a couple of other items that have come up at this meeting that we'll discuss in our committee and may come back to the Executive Committee for possible addition to our work plan.

That's where the Policy Committee's work plan stands at this point in time.

CHAIRMAN MOYER: Thank you, Mr. Chairman. Question by Bea?

MEMBER JAMES: Although I am on the Policy Committee I'm unfamiliar with the third point and I was wondering if you could describe a little bit more about what that's about, probably to the whole Board.

MEMBER FLAMM: The clarification with contacting legislators?

MEMBER JAMES: Yes.

MEMBER FLAMM: This was brought
up I believe in Executive Committee, a
question about how or the appropriateness of
individual board member extending invitations
and I think it was sort of asked that the
policy committee look at this and put a
procedure in. Do you want to comment on that
further Jeff?

CHAIRMAN MOYER: I might be able
to clarify that for you Bea. I'm not sure.
During one of the Executive Committee calls it
came to the attention from more than one board
member that was on the call that certain
individuals had contacts with congressional
folks, representatives of their state. And
they want to know what the procedure or policy
would be if they wanted to invite that person,
just as we had Kathleen Merrigan come, come to
this meeting, take the podium and address the
Board.

I think we can see that there
could be benefit to that but there can also be
distraction. So we wanted to make sure that
we had talked about it as a group and that we
came up with a policy, a set of procedures
that you would go through to make sure that
the program knew, that somebody just didn't
call up their Congressman and have them show
up and catch people off guard. It was a point
of discussion.

I don't think it's a big item but
it is something that the program and the
executive committee at that meeting suggested
maybe we should do. I see Hue's hand up and
I think I saw Katrina's.

MEMBER KARREMAN: Just for
clarity's sake then, to clarify this,
regarding contact by NOSB members to invite
elected officials to an NOSB meeting or
something if that's what you're saying.

CHAIRMAN MOYER: Yes. That is
what I'm saying and maybe we have the wording
of that wrong, I'm not sure. But yes, whether
it a Congressman or Senator or President
Obama, you know, what's our policy? I mean he
could be somebody's personal friend here and
maybe we can get him here but we need to know
how to work that in. Just so 15 people don't
go off doing their own thing. That was the
concern.

MEMBER KARREMAN: Well to add to
that if I may Jeff, and I know in the past I
think there's been some question about after
an NOSB meeting a member going up to the Hill
and contacting Congress as an NOSB member.
Should that be addressed or is that allowed or
is that like you're going as yourself? Or
like hey I'm Chair of--

CHAIRMAN MOYER: Can I go along?

MEMBER KARREMAN: I don't know.

I mean should that be addressed as well? I
know there was a problem in the past in 2004
I believe.

CHAIRMAN MOYER: Okay. I don't
think that that's the purview of this
particular board or committee to tell people
how to act as private individuals and if they
1 say they're on this board then they say that.
2 That's just my personal feeling but we can
3 certainly discuss that. Katrina?
4 MEMBER HEINZE: My comment was on
5 a different topic. Is that okay? It related
6 to this work plan.
7 CHAIRMAN MOYER: Are we done with
8 that topic?
9 MEMBER FLAMM: Let me just make
10 one point. These are more notes from our
11 committee meeting. I'm not sure whether you
12 were on that particular one but I apologize if
13 my wording wasn't too precise here. But I
14 think we get the point and thank you for the
15 clarification because that's where it came
16 from and that's how it got on our work plans.
17 CHAIRMAN MOYER: Katrina?
18 MEMBER HEINZE: I was going to
19 make a request. In your discussion on
20 biodiversity you referenced, and I don't have
21 it in front of me, a past recommendation that
22 talked about compatibility with production and
handling I think that was made that had a list of questions to aid us in our evaluation of that compatibility question. And I'm embarrassed to say I have not seen that material before and maybe it's in the policy manual and maybe it's not.

But I think those were very good questions that could aid us as we evaluate materials and I was wondering if perhaps the Policy Committee could look at which of our manuals it would be appropriate to put that list of questions in so that future members would not discover them in an untimely like I did.

MEMBER FLAMM: The criterion sheet are in the manual now and this recommendation's intent was to take what was done and proved today and make sure it got in the manual; it wasn't so much to do a new manual but I'd like to talk separately to understand that--

MEMBER HEINZE: This is a request
for action. Another work plan item for you. It's the list of questions that you reference in your discussion document that talks about compatibility and figuring out where to put those questions, I will show you what I mean, and I think make them more accessible to everyone on the Board.

MEMBER FLAMM: Okay.

MEMBER HEINZE: Because they were very useful.

MEMBER FLAMM: Okay. I'll talk to you later and make sure I understand the point.

CHAIRMAN MOYER: Okay. Tracy?

MEMBER MIEDEMA: I had a suggested work plan item for you all to consider and I think this would be in conjunction with the handling committee. And that would be for Board protocols for investigating potential fragility of supply when we're considering 606 items. We do it in a diligent but uneven manner currently and it
would be nice to have some protocols.

CHAIRMAN MOYER: I might suggest that that's something the Handling Committee wants to take up and bring to the Policy Committee once they have something. Does that seem reasonable? The Handling Committee can at least make mental note of that at this point.

MEMBER DAVIS: Yes, I'll put it on the work plan. It's probably going to be down on the priority list a little bit but it's something we can look into.

CHAIRMAN MOYER: Anything else on Policy and Development? Thank you Mr. Chairman.

Moving on to the Compliance, Accreditation and Certification Committee.

Chairman Joe Smillie.

MEMBER SMILLIE: Well, we are lined up to deliver three recommendations at the November meeting. These were discussion papers and we got very good input, spectacular
input in some cases from the public. So we are planning to have recommendations on retail. I'm not going to title it, the scope of that is still to be determined. But there will be a retail recommendation.

There also will be a personal care recommendation in our new style of recommendation that Tracy outlined the other day.

There also will be 100 percent recommendation, finally, and we're on target with all of those so your little percentage sheet we'll keep making sure, Jeff, that you're informed as to where we're at with each of those as we go along.

We're also going to investigate, look at and probably have a discussion paper on a "made with organic" label possibility that has been a recent topic that surfaced which we think is our purview but if any other committee wants to take it we certainly can have a discussion with them. But kind of feel
that's our territory so we're going to look at that.

Other things may occur. And under the topic of other things may occur, it wasn't really noticed I don't think by the Board that much but the association of accredited certifiers has developed a new program and format in creating working groups of certifiers to deal with topics that they feel need to be addressed.

And I think it's an ideal system and, hopefully, rather than just having comments from certifiers on our issues, we can start to work more closely with the certifier community as these working groups are working on topics that we are also possibly working on such as you know the poultry animal welfare, they have a group on that. So it's not just our committee but since we do represent the certification committee I'd like to bring it to the attention of all committees to please check in with the association of
accredited certifiers as you work on your work plan so that you can see if there's possible working groups there that are doing some of the same work.

For example, in the past we've checked in with OTA working groups on personal care, multi-site and other topics in the past and I think that also the ACA has a lot to offer since these are the people who are actually dealing with sort of the regulations that we helped formulate.

So I just bring that to everybody's attention, leave it up to the chairs to check in with the ACA, Pat Kane is the Executive Director so check in with Pat or via certifier that you're aware of or whatever, and let's use their knowledge to help us create good recommendations and discussion papers.

And so I'll start that off by working with the ACA and finding out what's on the list and trying to make it available to
the rest of the Board.

CHAIRMAN MOYER: Thank you Mr. Chairman, any questions for the CACC committee? Hue?

MEMBER KARREMAN: On that topic I'm just wondering, you know, when there's official convened task forces like the Agricultural Working Group, it's a working group, or the methionine task force. Now I don't know if that's officially convened by us or not. Does it affect-- We listen to the public, that's one of our mains especially for materials, but does it affect in any way if they're officially convened or if they're like ad hoc groups? I'm just asking. As far as official input type stuff like AWG the Agricultural Working Group they were selected I think by the Secretary and I'm just wondering about that kind of stuff.

CHAIRMAN MOYER: Yes, my understanding would be that certain working groups that are officially convened by the
Secretary would have different standing in front of the program or the Board than would an external group that was convened around a certain or particular topic. But that does not mean that this Board should not take advantage of those expertise that are out there in the world that we can garner information from.

And I think we've done that and we will continue to do that. But they would not have the same recognition in front of the program or the Secretary as would a board that he convened, an official working group. Thank you Hue and thank you Mr. Chairman.

Okay. Next group would be the Crops Committee. Chairperson Tina.

MEMBER ELLOR: We have an extensive work plan so I don't think we're going to get out of the fall meeting but we have a lot of materials in front of us. We have ethylene glycol which is waiting for TR. Tetramethyl, well we'll just call it
tetramethyl if you don't mind. Review TR first efficiency which we did and we're waiting to hear back on that one.

Polycaprolactone waiting for technical review.

Glycine betaine waiting for a technical review.

Peracetic acid, we've heard a lot of great comment on that and I hope we're going to bring that back for a recommendation in the fall.

We talked about bringing terpenes back out of the big black hole maybe for consideration again, but we'll decide that as a committee as we do.

We've just had three more materials forwarded to us from the Materials Committee. Ethylene DDA, difluorothane, manganese sulfate monohydrate. We haven't taken any action on that, we'll be looking at the petitions for sufficiency and deciding whether to forward them on for a TAP. That's
where we are for that.

Oh I'm sorry, I forgot to mention,
we are looking at tall oil which is on Kevin's
work plan for the Crops Committee. We've
reviewed that for sufficiency and sent it out
for a technical review.

Sunset materials. This is going
to be a big hairy one. For 2011 we have
ferrous phosphate which Kevin's also looking
at and hydrogen chloride which Rigo has said
he will take point on.

2012 Sunset materials, I hope I
don't have to read all those but if anybody
wants to know what's on the 2012 Sunset I
would be happy to do that. There's an
extensive list which we will get started on,
we don't plan to leave it for the last minute
so in the Crops Committee meetings coming up
we'll divide that and try and start to conquer
that extensive 2012 Sunset list.

On our other recommendations we
have soilless systems, greenhouse which
Gerry's been working on and we hope to bring that forward for recommendation in the fall.

Our first priority is the list for inerts and pesticides issue which we will hope to have something ready for the fall. We've had a lot of great comments on that as well.

Mushroom standards. That would be me. And last but not least we talked as a committee about bringing food safety issues up and I don't know if Jeff wants to talk more about what he had in mind for that because that's got his name on it. He's totally not paying attention to me.

CHAIRMAN MOYER: No, I'm paying attention. I'm trying to look like I'm not paying attention. We're hoping to have a discussion document at best for that.

MEMBER ELLOR: Okay. Does anybody have anything to add?

CHAIRMAN MOYER: I think one of the things that the program will notice and members of the organic community is that give
the time frame that we're operating under,
there seems to be a new sort of shift in the
way work plans are being organized in that we
will have probably a lot more discussion items
at the spring meeting and a lot more voting
items, just as we saw with the CAC Committee
where we brought things forward at this
meeting for the committee to discuss, take
that back and come back with a full
recommendation.

Just given the time frame that we
have to work on things between the fall
meeting and when we have to post things for
this meeting, there's a very small window of
time that we have to work on things. And we
really want to have everybody's input, public
comment and input into these materials and
items. So fall will be a difficult meeting for
all of us in terms of voting. Bob?

MR. POOLER: I just want to let
the Crops Committee know that there will be
changes in the petitions that you're going to
be reviewing. For instance, glycine bentene
has been withdrawn and so there's no technical
report on that. But there are other petitions
that are in the pipeline that are going to be
coming to you.

MEMBER ELLOR: So what you're
saying is you took one away and you're going
to give us many more? Thank you.

MR. POOLER: What can I say?

CHAIRMAN MOYER: Thank you Bob.

Are there any other comments for Tina? Thank
you Tina. Appreciate that and we will move on
to the Livestock Committee. Hue?

MEMBER KARREMAN: Okay. Livestock
committee on the work plan, what's been on the
work plan and there's a couple of extra things
now due to this meeting.

Anyway, the discussion documents
we had on animal welfare, we're going to be
working on and taking in, hopefully, a lot of
input from various sections of the industry.

And bi-valves, hopefully we'll come to some
conclusion on that by November.

The vaccine issue we're going to
be working on, that has to be resolved. And
then we also have to look at making that minor
word change in the excipient section of
606(iii)(f) to change the word "drugs" to I
think "animal health products" or something
like that because of the vitamin and mineral
injectables that we just voted on today.

Of course any materials that might
pop up that we need to review that are
petitioned. And also it's always on the work
plan but apiculture or bees. Always seems to
be on there but doesn't rise to the top yet
unfortunately.

I don't think we have any sunset
items for next year. Do we have to look up to
2012 yet? Okay. Well for 2012, that will be
five years after all those wonderful medicines
got on the list so I guess their time will
have to be reviewed at that point, but I don't
know if we need to start looking at them at
MR. MATTHEWS: I think the Committee needs to begin to address those otherwise there's too many to wait.

MEMBER KARREMAN: It's not that many Richard is it? Okay. Anyway I guess we'll have to address the sunset 2012.

CHAIRMAN MOYER: Question by Dan.

VICE CHAIR GIACOMINI: Is that Federal Register Notice is out also? It's not. Do you know when that's--

MR. MATTHEWS: That will be coming out this year.

VICE CHAIR GIACOMINI: For posting for the November meeting?

MR. MATTHEWS: Well if you're going to start discussing them in November we'll have it out before November.

VICE CHAIR GIACOMINI: That would be good. If we can pre-load any of those into November would be--

CHAIRMAN MOYER: Thank you
Richard. Julie?

SECRETARY WEISMAN: Not that it's specific to livestock but because Hue brought it up, I think that this issue of sunset and there's some 2011 items and 2012 items and maybe we should have a general discussion about that when we finish the work plans for other business, so that everybody can sort of be in the right mind frame as they go into the next period of time before the next meeting.

CHAIRMAN MOYER: Duly noted and we'll bring that up later on. Thank you. Anything else? Bob Pooler also has another--

MEMBER KARREMAN: Just one quick thing. On the excipients we also want to make that change that was not done on the 2007 edition to include aphis or animal plant health inspection service biologics license biologic excipients. You know what I mean Valerie, right.

CHAIRMAN MOYER: Mr. Pooler?

MR. POOLER: This is Bob Pooler.
What I'd like to have, this is for all committees for any sunset item, I would like to receive requests for new technical reports on any items that are going to be reviewed for 2011 and 2012, especially for 2012 we need to begin developing these reports this year.

Thank you.

CHAIRMAN MOYER: Thank you Mr. Pooler. Any other discussion for the Livestock Committee? Okay. Moving on we have the Joint Materials and Handling Committees, Dan Giacomini and Steve DeMuri. Dan, did you want to--

VICE CHAIR GIACOMINI: Definition and classification materials, we will work on that. We've been dealing with this for probably a decade, over a decade in various forms. I think people are to the point where they just want something and they're probably even willing to take it if it's wrong. They won't agree with us if it's wrong and we'll certainly hear about it but I think we've
reached that point of frustration and work.

But it's by no means going to be easy. And I'm going to ask, and maybe this is more appropriate in the session at the end of all the work plans, but we have a tremendous number of sunsets coming up and we have this project for the next meeting. And we may need to pull some of the time that some of your members of the other committees put into other committees working to get this done. And we'd just ask for the consideration of all the other chairs that to get this accomplished it may impact some of what you're looking to be able to complete.

CHAIRMAN MOYER: So that summer vacation, it's off. Thank you Mr. Chairman. Do you also now want to comment on the Materials Committee, I believe you have nanotechnology.

VICE CHAIR GIACOMINI: Yes. For the Materials Committee, first and foremost always is the petition and the sunset process.
Sunset is going to be moving much quicker. We have a short list of 2011 and a big list of 2012. We will have already listed the definition of materials in the joint committee even though that's always part of our discussions.

We will do what we can with nanotechnology. I've been discussing it with a couple of people that made comments and with some people that know the rule and if it looks like we may be able to get a satisfactory recommendation with the least amount of pain involved, we will certainly work to get that done and I think that's a real possibility.

And then No. 4 or 3, however you're adding it up, we have always had in conjunction with what Barry said on our work plan, working to continue to improve communication with the program and tracking petitions and things like that. We will continue to work on that as we have time but it's also going to become more important again.
as we start looking back on and dealing with all the sunsets of new TAPs, questions for new TAPs and all the things involved with that, making sure that we have a good trail of information that gets where it needs to be going and that it's seen once it's there.

CHAIRMAN MOYER: Thank you, Mr. Chairman. Any discussion for the Joint Committee or the Materials Committee on their work plan? Okay. Handling Committee, Steve DeMuiyi chairperson.

MEMBER DEMURI: Thanks Jeff. As Dan mentioned, we're closely with the Materials Committee jointly on classification of materials. I think enough has been said about that but that is one of our top priorities over the next six months.

We still have two petition materials that we're waiting for technical reviews on, one for glucosamine that Tracy's going to handle as soon as we get that, and pectin that Mr. Smillie's going to work on
when we get that technical review.

We have ten 2011 sunset items.

For 605(a) we have egg white lysozyme, L-malic acid and microorganisms.

For 205.605(b) activated charcoal, cyclohexylamine, diethylamino ethanol and octadecylamine, those three are boiler additives. Peracetic acid, sodium acid phosphate and tetrasodium pyrophosphate. So those are the ten items we have for 2011.

We have a good list for 2012 as well that we're not going to start working on right away so we've got a full few months ahead of us. Those will be my top three priorities but we also have some other things on our work plan that we will hopefully try to get to as soon as we can.

Flavor guidance, which hopefully we can get Julie to get us with while she's on the committee and even after she leaves the board. Food contact substances, and then knowing that nanotechnology is probably used
more in handling than it is in most of the
other committees on this board. We would work
with materials on the nanotechnology work as
well.

And then last we have the one that
Tracy asked for us for today and that's
looking into protocol for commercial
availability research for 606 petition items.
And since Tracy's on the Handling Committee I
know just who's going to work on that one.

CHAIRMAN MOYER: Okay. Thank
you, Mr. Chairman, any discussion on this?
Julie and then Hue.

SECRETARY WEISMAN: In the area
of 606 in addition to the commercial
availability matter that got raised, did we
also not have something about protocol for
looking at other, I guess different methods of
manufacturing? In other words the other
materials that may be used along with what's
being petitioned. Right?

MEMBER DEMURI: Yes. My
apologies. What I did was I had circled that  
and moved it down and I forgot to go back up  
and pick it up. I do have refine 606  
procedures. Thank you. And that's to clarify  
use of accessory ingredients in formulated egg  
products. That would be like volatile  
solvents, synthetic carriers, that type of  
thing that are not on the national list.  
Thank you for your good memory.

CHAIRMAN MOYER: Hue?

MEMBER KARREMAN: This is not  
specific to handling, it can wait, it's more  
about sunset.

CHAIRMAN MOYER: Okay. We'll  
wait and bring it up under other business  
because I have it down there. Katrina?

MEMBER HEINZE: Julie handled my  
comment. Thank you Julie.

CHAIRMAN MOYER: Thank you. Any  
other points for the Handling Committee?  
Valerie?

MS. FRANCES: It may not really
just be for the handling committee but the evaluation criteria checklist petitions for removal, dealing with the forms to better address those.

MEMBER DEMURI: I was going to ask that under potential new business because that is something we need to do for removal. List for removal and then maybe revamping the one for adding things to the list. I don't know whose committee that would fall under.

CHAIRMAN MOYER: Well let's bring it up now. Let's jump into other business and we'll start out with forms and a checklist for items to be removed from the national list. It is a topic that came up during our meeting, it came up in the evaluation sessions that I sat in on saying that the checklist just doesn't necessarily work for removal as well as it maybe could. Is that something Policy and Handling want to work on together? How do we want to go about doing that? Materials? Dan?
VICE CHAIR GIACOMINI: Mr. Chairman, I would like us to maybe just set that aside for now. I understand that you're looking for where is it going to be put but I can't imagine anybody's going to get to it in the next six months anyway.

CHAIRMAN MOYER: No, the other place we could put it is we could put it on the program and ask them to take a stab at it and see if the program could come up with a better form that would handle that for us.

I'm sorry, Valerie?

MS. FRANCES: There are also some questions that came up when I believe it was Livestock Committee was trying to answer some of the questions and feeling like things did apply to them. There were some questions being asked on the forms that currently says you know this is not applicable. And when people were really--

CHAIRMAN MOYER: You're right.

There were some items that the Livestock
Committee reviewed and in the evaluation forms there were things that we felt did apply but the form basically put them under Handling and said they didn't apply to Livestock.

I would suggest that maybe those are items that we could review with Richard Matthews and see if the program could maybe come up with some remedies. Dan?

VICE CHAIR GIACOMINI: Maybe if the chairman for each of the committees maybe in a quick meeting with the rest of their committee could sort of review the things that they've come across over the last year, funnel those to me as Chairman of the Materials and we'll send those to the material boy. We'll send those to Bob.

CHAIRMAN MOYER: Yes, I think let's put some work back on to the program if we can. Those are things that should be addressed soon but we don't have the time to do them.

MR. MATTHEWS: You're shifting
that in the wrong direction.

CHAIRMAN MOYER: Pardon me?

MR. MATTHEWS: You're shifting

that in the wrong direction.

CHAIRMAN MOYER: Why is that?

MR. MATTHEWS: We don't need any

more work.

CHAIRMAN MOYER: Neither do we.

Okay. What we'll do is if we agree to follow

up on that recommendation if committee chairs

when they have their next committee meetings

can just funnel some information to Dan, he

can be our clearinghouse to the program with

those things. Julie? A suggestion?

SECRETARY WEISMAN: Yes. I mean

this is a general materials issue and the vice

chairs to represent each committee on the

materials committee so would it not, I mean it

seems to me like this is pretty appropriate

for them to be the conduit and for it to be

addressed in regular material committee

meetings.
VICE CHAIR GIACOMINI: Okay. The chairs can deal with it at their next meeting and give the information to their vice chairs for the next materials committee meeting.

SECRETARY WEISMAN: Okay.

CHAIRMAN MOYER: So let it be written, so let it be done. Okay. Hue?

MEMBER KARREMAN: One thing on the sunset, on the Livestock, we have sunset and we're going to start looking at, if I get it right, for things that are coming off in 2012. So let's see, right now they've been on the list for a year and a half and we have to start looking at taking them off already? I know it's five years. So the things that came on in December 2007 we're not even in December 2009 right we have to start looking at.

CHAIRMAN MOYER: A comment from Julie. We do have a lot of other stuff to do.

MEMBER KARREMAN: Yes, that's the whole thing. I mean there's a lot to do. And they just came on a year and a half ago
technically and it's like, hey, we've got
front burner stuff. I mean it's going to get
done but by the November meeting in 2009 or
what?

MR. POOLER: Nobody said you had
to have it done--

CHAIRMAN MOYER: It's a two year
process.

MEMBER KARREMAN: Right. So we
need to state what they are and that's that?
That's easy.

MR. MATTHEWS: Well, we will come
out with an announcement with a Federal
Register Notice, saying that you're going to
be looking at them. Then you'll have about
three years to get 170 some materials done so
that you have it published on time in 2012.

MEMBER KARREMAN: That's fine.
I'm just thinking of the Livestock Committee.
I mean that's like not 170, that's like--
That's fine. I just thought it was kind of
early to be looking at things that were
essentially just placed on a year and a half ago at the time of this meeting right now.

CHAIRMAN MOYER: The Chair recognizes Julie and then Dan.

SECRETARY WEISMAN: Hue, I'd like for you to like remember way back to our first NOSB meeting. That was February 2005. Yes.

But it wasn't only the pasture meeting. That's right. But other things did happen at that meeting. And one of those things was that we were under the gun and feeling like already the train wreck was coming unless quick action was taken to begin dealing with the materials that were on the original file rule that became final in 2002 which were due to sunset in 2007.

But we only arrived in 2005, they had already been talking about it before we got there.

MEMBER KARREMAN: Yes, it's really closer to a three year process working through all of them.
CHAIRMAN MOYER: Okay. That's fine.

MEMBER KARREMAN: I just wanted to bring it up, that's all.

CHAIRMAN MOYER: You've been outvoted. Dan?

VICE CHAIR GIACOMINI: Well I think it's important to remember No. 1 the Livestock Committee doesn't have nearly as many to go over as Handling does. We wouldn't want Handling to try and conquer all these just between one set of meetings.

No. 2, as Bob said, we're looking at the possibility of needing some new TAP reports. We want to know what substances on the list do we want a new TAP report with. What are the questions we want answered in those new TAP reports and we need to get those requests in to get that TAP report back in time to make the adequate decision in the time frame that you think is more comfortable in your mind.
So there's a lot of things, we can't wait until mid 2010 to start requesting those TAPs or even to start looking at them because when we have a petition and we don't get the TAP report in time, we can just set it aside and it could stand at the next meeting.

We won't be able to put things off. You can't put things off on sunset once we're down to that last meeting when things are going to have to get re-posted.

MEMBER KARREMAN: You have all made your point. I stand corrected.

CHAIRMAN MOYER: The Chair recognizes Julie.

SECRETARY WEISMAN: Actually I'm not sure if I want to rub it in any more. But you know just that it bears to be said because it's following up where Dan just left off, which is that we actually are aiming to make sunset decisions not in time for October of 2012 in the case of those materials. We're looking to have those decisions made you know
even more than, maybe three meetings ahead of
that because our experience last time was that
there were some problem children that took a
while and I believe that we made the final
decision for the 2007 materials, there were
one or two stragglers left that we had to
clean up at that full meeting. So we'd have
to leave room for stuff like that.

MS. FRANCES: And you added more
handling materials in 2007 to 606 and you
added the livestock materials, so any rate
there's even more materials.

SECRETARY WEISMAN: But are they
final-- When does the clock start?

MS. FRANCES: Well that's a good
question.

MR. MATTHEWS: And let's not
forget the rule making process.

CHAIRMAN MOYER: Okay. Dan, you
have another comment?

VICE CHAIR GIACOMINI: No, that
is just the question. When does the clock
start on the 606 when we're still on an interim final rule?

MR. MATTHEWS: It's a good question but I think it would start when 606 was first put out, so the clock is already ticking.

SECRETARY WEISMAN: So June.

CHAIRMAN MOYER: Okay. I think all the committees are well aware of their work plans and their work load. We discussed sunset, the forms, is there any other business that needs to come before this Board? Bea?

MEMBER JAMES: I was wondering, Barbara had mentioned on Monday that there's the possibility of having an additional day added to the November meeting so that we could discuss, as a group, how we prioritize and how we want to go forward deciding on exactly what needs to be worked on by committee and when will the program know whether or not that's going to happen?

MR. MATTHEWS: Well, I don't have
an answer for that. But it is something that I would expect Barbara to be working pretty closely with Jeff on so I'm sure that discussions will start there and then work through the Executive Committee and then a decision will be made whether or not that will be part of the November or even maybe a separate meeting.

CHAIRMAN MOYER: Yes.

SECRETARY WEISMAN: Yes, she had mentioned the summer as an option as well.

MR. MATTHEWS: Yes. You know, we haven't fleshed that out yet but I'm sure that she'll be talking very closely with Jeff as to ideas on that.

CHAIRMAN MOYER: Any other business that needs to come before this Board? If not, before we adjourn I certainly wanted to thank everybody, I'm sorry, Andrea?

MS. CAROE: No, you didn't do anything wrong. I'm listening to you go through the work plans and you all seem
overwhelmed by the work that's on them. I just wanted to bring up a couple of things and you know this but materials are your work plan. All the rest of this stuff, although I know you want to get to it, is secondary. And I would really suggest, since you all represent constituents within the organic industry, that you reach out, use OTA, use the ACAs, use anything you can for subgroups that can do some of the work for you and bring you the tools to make your life easier.

I'm looking at things like flavors, and food contact substances and issues like that, that you can spin your wheels and burn a lot of time or you can give to the industry to bring you summary information so that you can make your recommendations as efficiently as possible and still have all the time that you need to do your first thing, which is materials, materials, materials. So I just wanted to make that point for whatever it's worth. And
by the way I'm Andrea Caroe, former member of
the Board.

CHAIRMAN MOYER: Thank you,
Andrea. Okay. Before we disperse here today,
I did want to take the time to thank the
program and the program staff in attendance.
We couldn't do this work without you. We also
couldn't do this work without the members of
the general public who take the time out of
their busy schedules to attend this meeting or
send in written comment. We depend on that,
we need it, and we certainly appreciate it.
And, as Andrea just mentioned, we
certainly look forward to working closely with
all of you on our work plans as we move
forward in the future.

I also mentioned when we started
this meeting that some folks would be happy
with the outcomes of the votes and some people
wouldn't, but I also mentioned that this Board
would work diligently and hard in the best
interest of the organic community and the word
organic, and I hope you've seen that we've
done that.

So at this moment I would
entertain a motion to adjourn this meeting but
I have something from Kevin and Dan. Kevin?

MEMBER ENGELBERT: You won't
regret it. I just want to thank you for
running a great meeting. It's been very
enjoyable and we appreciate all your efforts,
all your efforts also.

(Applause.)

CHAIRMAN MOYER: Thank you,
Kevin. Dan, the last word before the gavel
falls.

VICE CHAIR GIACOMINI: On the
introductions Kevin always makes a statement
thanking his family. And I think the entire
industry would be good to thank all of our
families because the work load on this is
tremendous and their sacrifice is sometimes
bigger than ours.

CHAIRMAN MOYER: Kevin?
MEMBER ENGELBERT: Speaking of family, two centimeters, things apparently starting to progress.

(Applause.)

CHAIRMAN MOYER: Could I have a motion to adjourn?

SECRETARY WEISMAN: I move that we adjourn.

CHAIRMAN MOYER: I will second.

This meeting is adjourned.

(Whereupon, the above-entitled matter went off the record at 3:35 p.m.)

The Monterey Bay Aquarium
(9:02 a.m.)

CHAIRPERSON MOYER: Good morning, everybody.

Okay, I would like to officially call the November 3rd meeting of the NOSB to order. We have a quorum. The Board is seated.

I would like to move directly to the business of the Board.

We have an agenda that was presented to the Board, to the program, and posted to the public. At this time, I would like to call upon the Board to approve that agenda. If someone would like to make a motion to approve that agenda, I would entertain that.

MEMBER ELLOR: So moved.

CHAIRPERSON MOYER: Tina has made a motion. Do I have a second?

SECRETARY WEISMAN: I will second it.
CHAIRPERSON MOYER: Julie has seconded the motion to accept the agenda as presented.

Are there any additions or corrections to that agenda?

Madam Secretary?

SECRETARY WEISMAN: Yes. One of the things that is on the agenda for a few minutes from now is for us to vote to accept the voting results of the May 2009 meeting as official record. That actually was ratified. It hasn't been posted yet, but it has been ratified, as of midnight last night. So it is now available for posting. I suggest that we move that to later in the meeting, just that one vote.

CHAIRPERSON MOYER: Yes, I suggest we put it on Thursday morning as the first item of our voting around at eight o'clock.

Do I hear any discussion on that?

(No response.)

Okay. Hearing none, I call for
the vote to accept the agenda with that one additional change.

All those in favor say aye.

(Chorus of ayes.)

Any opposed?

(No response.)

Hearing none, we have an agenda, and we are ready to go. Thank you.

I would like to take a brief moment here, if I could, to welcome the Board members, the program staff in attendance, and the general public. Thank you all for being here. I know we have worked hard; you've worked hard, and we are real excited to be here to take care of the business in front of the Board.

I would also like to take this opportunity, on behalf of the Board, to be the first to welcome Miles, the new Deputy Administrator, to the program and to this meeting.

Miles, nice to have you here.
(Applause.)

You realize this is the first of many applauses. So you have to get used to that.

(Laughter.)

Just for the first meeting. After that, you know, the gloves come off later.

(Laughter.)

But this Board really does look forward to working with Miles and with the program under new leadership as we move forward with a lot of the challenging issues in front of us.

As you can see from the agenda we have just approved, the Board has been extremely busy over the past six months. We focused our attention on several materials, which we are going to vote on later this week, and some very specific recommendations that came out of each of our committees.

Like every Committee session before us, we have logged -- I didn't get the
exact number from Valerie yet, but I know it
is hundreds of hours of conference calls over
the last six months and countless more hours
reading, writing, and in many cases laying
awake at night thinking about these particular
items that we are all working on here over the
next three days.

While many of you will agree or
disagree with the outcomes of the votes that
we present here, I can assure you that the
members of this Board have put forth their
very best effort, and I am extremely proud to
be part of this Board and the hard work that
everybody has done here. So I appreciate
that.

We have also recorded over 300 --
I don't know how many, Valerie, 360 or
something -- public comments. Not that many?
Three-hundred-and-something.

MS. FRANCES: Two hundred and one.

Then there were the thousands that were
petitions and various other.
CHAIRPERSON MOYER: Okay. It's a lot.

(Laughter.)

A lot of written comments. We know that there's a large attendance in the room today that wants to speak and present information to us verbally over the next few days. So we know that you have been working just as hard as we have, and we certainly appreciate all of that effort.

One glance at the agenda will give you an idea of the great diversity and complexity of the issues that we have struggled with over the past six months. This Board has not backed away from dealing with the most difficult tasks.

We have tackled head-on the issues of personal body care, retail certification, nanotechnology, animal welfare, bivalves, inerts, and the classification and definitions.

Every member of this Board has
stepped up and contributed in many ways to all these issues related to their particular segment of the community.

Now, in order to move many of these recommendations to the next level, we will need to partner with other government agencies, like the EPA and the FDA, and we know that this will require additional efforts on behalf of the program and the Board as we work to educate these agencies on what the organic standards mean, as well as the expectations of the greater organic community.

All this activity has not gone unnoticed by Congress. The National Organic Program has been allocated additional funds to support the work being placed on our program staff.

Over the next several months, the program is expected to grow, I believe, from 14 people to 31 people, is the number that I heard. Additional program staff will certainly make the workload challenging in the
beginning, as we work to educate them, but then, hopefully, make the work flow much more smoothly over time.

In addition, the Organic Program has been given full status as a separate program, no longer blended into other programs. So that gives us more credibility and, of course, more prominence and more attention.

Much is changing across all of our industry. Managing the change in the marketplace is a very real challenge. Consumers are being asked daily to make choices between labels for natural products, alternative certifications, grass-fed, or pesticide-free. There are also hundreds of confusing labels designed to look just like the USDA organic seal.

That further confuses consumers, as they try to capture more of the organic food dollar. Any actions taken by this Board that further adds to the disillusionment or
confusion of consumers only makes matters worse. To that end, we must all focus our energy on keeping this industry strong, on keeping the word "organic" meaningful, and also on keeping the door open for the growth of what we all want and need. Therefore, the word "integrity" comes to mind, as we all work on the issues that are in front of this Board and in front of your particular communities.

Now what I would like to do is continue by giving each of the Board members the opportunity to introduce themselves, him or herself, giving a brief summary of your individual position, your representation on the Board, and maybe a little something about your background and how you fit into the organic community.

I guess we will start with -- Joe, do you mind starting over on your side of the table, introduction of who you are and your position on the Board?

   MEMBER SMILLIE: Joe Smillie, and
this will be my last year on the NOSB. I represent the certifier, accredited certifiers, basically representing the certification organization. I am also Chair of the Certification, Accreditation and Compliance Committee, which has been pretty busy the last few years.

Serving on the NOSB has been a remarkable experience. There is always that joke: there's two things you don't want to see being made. One is sausages and the other is regulations.

(Laughter.)

Now I fully, completely understand that old saying. It is a real balancing act. I am just very proud of this Board for working together as one unit. In spite of the wide variety of opinion we have, we are always able to work together and there's no factions on this Board, which I am especially proud of and glad to serve with this Board.

There's been a lot of issues. I
I think we are at a point now where all the easy work has been done. Now we've just got very difficult choices. Just going through the classification of materials showed us how difficult our job now is and how attentive you have to be to the issues.

So, in working this year, I found it to be a real challenge to stay on top of everything. One of the worries I have for the NOSB is that we get so involved in our own work that we are not really able to fully participate in some of the other committees' work as we go along.

So sometimes we come to meetings, and we certainly know a lot about our areas, but we haven't been fully briefed on other committees' work. That is one of the concerns I have for the future of the NOSB. As we go deeper and deeper into the crack, that we are able to work out some system that we can keep in touch with each other and the Committee.

But that is my speech for today.
I will leave it to Tracy.

CHAIRPERSON MOYER: Tracy?

MEMBER MIEDEMA: Good morning, everyone.

My name is Tracy Miedema, and I work for a farm in Oregon. We farm about 5,000 acres, about a third of which is certified organic by Oregon Tilth.

I am a consumer rep on the Board and have two more years here of doing work on the NOSB.

I am really, I think, looking forward to hearing everyone's comments and talking with you in the hall and in our breaks and such.

I also wanted to let folks know about something that we are pretty proud of in Oregon. We are making energy from fruit and vegetable byproduct. Our farm is now fully energy-independent.

So I am interested in organic and also some other areas of sustainability,
issues of hunger, and energy independence. I am thrilled to have the chance to serve two more years.

CHAIRPERSON MOYER: Bea?

MEMBER JAMES: My name is Bea James. I live in Minneapolis, Minnesota. I hold the retailer representative seat, and this is my last meeting. Somebody out in the hall said, "Can you run again?"

(Laughter.)

And I said, "You can run away."

(Laughter.)

Yes, but you can't hide.

It has really been an honor to serve on the Board. I just am in awe of the people that I have been able to work with and learn and grow with. Everybody here just does an amazing amount of work. You really don't realize how much work goes into being on the Board until you actually sit on it and you see people try to balance professional, personal, and then this job. So it is a lot, and it has
been great.

I no longer will lay awake at night wondering whether or not bacteria will someday be classified as livestock. So I am going to sleep a lot better.

(Laughter.)

CHAIRPERSON MOYER: Thank you, Bea.

Barry?

MEMBER FLAMM: My name is Barry Flamm. I'm from Montana, Paulson, Montana, beautiful Flathead Lake.

I was appointed to the Board in January of 2008 and came in alone, and have been the junior member up until right now. So I am losing my distinction and special treatment I have received from the Board, the great people on the Board.

As I mentioned, I was appointed in one of the three environmentalist positions. I am Chair of the Policy Committee and serve on the Crops Committee and on the big alphabet
committee with Joe, certification and other
things.

I had owned and managed the first
certified cherry orchard in Montana, which is
something I was pretty proud of, and also grew
certified apples and other fruits and
vegetables.

I have been very involved in the
organic community in Montana and helped put
together the State program, the State
certification program, run by the State
Department of Agriculture, and helped form the
Montana Organic Association.

As I have found in Montana and
everywhere, there is, I think, no greater
group of people than the people in the organic
community. I have been an environmentalist
and a conservationist all my life, but organic
people not only have the right kind of values
and beliefs, but also they are working at it
every day. So I am just delighted to be part
of such a great group. Thank you for being
I look forward to working with the new Board members. I know we've got work all lined out before they even get officially here.

So thank you for the opportunity to serve.

CHAIRPERSON MOYER: Thank you, Barry.

Steve?

MEMBER DeMURI: Thank you, Jeff. My name is Steve DeMuri. I live in Sacramento, California, and I work for a certain unnamed, "Um-um, good" soup company. 

(Laughter.)

My background in organics dates back to about 1989 or 1990, when I was on the startup team for Muir Glen. I have transitioned to another company since then. But I have really enjoyed my time on the Board here. It has been wonderful. It has been invigorating, tiring at times, but,
as Joe mentioned, we do work very well
together, which I find very, very refreshing
in this day and age. We are able to get some
things done, and we have a lot more to do, of
course.

I would like to welcome the four
new members that are coming on. I know at
least one is here today. So get ready for
some fun. We are looking forward to having
you.

And to the four that are leaving,
thank you very much for all your hard work the
last five years, the four that are leaving,
the five that are leaving. Is there five
leaving? I thought it was four leaving.
Five? Okay. Does one of you want to stay?
Thank you for your hard work. It
has been a privilege to work with you, and for
the tutelage you provided to me and the other
newbies as we have come on, we appreciate
that, too. So thank you very much.

CHAIRPERSON MOYER: Thanks, Steve.
Julie?

SECRETARY WEISMAN: My name is Julie Weisman. I am from Tenafly, New Jersey, just up 95 a ways, a piece.

I am currently the Secretary of the NOSB. I am one of the handling representatives. I am also currently and have previously been Vice Chair of the Handling Committee as well as having chaired it prior to my colleague Steve's tenure.

This is also my last meeting. I can't believe it. I don't want to add a lot, you know, take a lot of time out of the agenda. Already things I wanted to say have been said. What a complete privilege it has been to be working with these people and to be part of -- and I don't just mean the Board; I also mean the people that are sitting opposite me from the program.

I don't know how I lucked out to be on the Board during this time that really has felt to me like this is really what
democracy is all about. I am sure this is what it was meant to be. I don't know how many places in government it really does work like this, but I am happy that I got a chance to experience it.

For that reason, I am relieved, at least at the fantasy that I think I will have less work to do; I don't know if that is really going to happen. But it is also bittersweet for me because I have really, really -- being part of this process has profoundly affected me, and I am really thankful for that.

CHAIRPERSON MOYER: Thank you, Julie.

Dan?

VICE CHAIRPERSON GIACOMINI: Thank you, Jeff.

My name is Dan Giacomini. I hold one of the consumer seats on the Board. This is the end of my fourth year. So I will have one more year.
I come from a livestock background. I have worked with dairy animals all my life. But if you spend any time around the San Francisco Bay area, it is impossible not to stay in touch with the consumer.

I think I have said before, you can be a Democrat anywhere else in the country and you come to San Francisco and you find yourself a conservative Republican almost. I have always said, the slogan there is "Where the left is right." They can be so far left that just being basically left is to the right of them. So it is a very active place, very consumer-driven. They are probably some of the most politically- and socially-active people around. It is really impossible not to keep in very tight touch with what's going on in that group.

Also, being a consumer, we purchase all the stuff we need that we can with organic, with some exceptions, but for the most part.
It is a pleasure being on this Board. I have enjoyed the time. It has been a tremendous amount of time, but you just hope that at the end of five years it has all been worth it.

CHAIRPERSON MOYER: Thank you, Dan.

Katrina?

MEMBER HEINZE: Good morning. My name is Katrina Heinz. I am also from Minneapolis, Minnesota. I was raised in that place where the left is right.

(Laughter.)

I don't disagree. I am in my third year on the NOSB, finishing my third year, in the scientist slot. I serve on the Handling and Materials Committee, and had the distinct honor and pleasure -- I think that would be the right word -- to chair the Joint Handling and Materials Committee over the last six months.
I work for General Mills. I don't know our tag line, so I can't do that like the "Um-um, good" soup company.

(Laughter.)

I work for General Mills in our Small Planet Foods Division. I have the responsibility for product safety, regulatory compliance, and quality for our Cascadian Farm, Muir Glen, and Larabar brands.

I grew up in Marin County, just north of San Francisco, raised by a mother who was dedicated to organic and home-grown produce. I can remember her driving an hour to go buy organic milk from Straus Family Farms and me arguing with her about the environmental irresponsibility of that action.

So it has been a long time committed to taking care of the planet.

Because I am the mother of two children, Kayla and Victor, nine and five, who join me on the journey, and I will say they are very proud of the fact that they don't
They shop at Lakewinds Natural Foods Co-ops, and they know what is organic. I have trained them to recognize the seal, so that they know what to buy and what not to buy, and they can do their own shopping.

So that is why I serve on the Board and why it has been a distinct pleasure to work with Board members who are leaving and everyone else, and looking forward to our five new members.

Thanks.

CHAIRPERSON MOYER: Thank you, Katrina.

Rigo?

MEMBER DELGADO: Thank you, Mr. Chairman.

My name is Rigoberto Delgado. And for the last time and just to please my colleague Bea, it is "Rigoberto".

(Laughter.)

I have been giving Spanish lessons
for five years to my colleagues here on the Board.

I am from west Texas. I am a producer representative. I normally wear light, colorful sweaters when I am very happy because I am part of the fantastic five that are leaving at the end of January.

(Laughter.)

Nonetheless, I have to say that it has been a real pleasure to work on this Board. I really made friends for life.

We dealt with a lot of difficult issues, with a lot of challenges, and all the time I think we remained objective and maintained our civility to the best of possibilities.

I am also very impressed with the organic community. This Board cannot do many things without the input that is coming from all of these people in this room. So that is impressive.

I am also very proud to have
formed part of this organic and dynamic
democratic process.

I hope to see you soon in Texas.

We have a brand-new adobe house, and we need
help with goats and the lamb that we are
moving into it.

(Laughter.)

Thank you.

CHAIRPERSON MOYER: Thank you,

Rigo.

Tina?

MEMBER ELLOR: There's not much I
can add to any of that. All of you are very
hard acts to follow.

I am Tina Ellor. I am sitting in
an environmentalist seat. I work for Phillips
Mushroom Farms in southeastern Pennsylvanian.

You can't help but be changed by
the experience of the NOSB. I hope everyone
in the audience gets a chance to sit up here
someday.

Thanks.
CHAIRPERSON MOYER: Thanks, Tina.

Kevin?

MEMBER ENGELBERT: Thanks, Jeff.

Good morning, everyone.

My name is Kevin Engelbert. I operate a certified organic dairy farm in upstate Nichols, New York, along with my family. We have downsized a little bit on cow numbers with what is happening with the dairy industry right now. So we only have about 100 cows.

But our organic beef herd has expanded to up to 60 animals and we still fatten off a few hogs for our retail meat market.

I sit on the Livestock Committee, the Crops Committee, and also the Materials Committee.

Echoing what Tina said, I can't add much to what everybody else has said. It is just simply a pleasure and an honor to serve on this Board and to interact with the
organic community.

I look forward to working with the new members, and I will be sad to see the old members go. They are just a great group of people. It is a pleasure to have worked with them.

We have two new interesting developments on our farm since the last meeting. One is we have started our own cheese label. We are having specialty cheese made under our own Organic Farms label now.

The other development is my youngest son is a junior at Alfred University, and he has made the decision over the summer to come back to the farm full-time when he graduates in May of 2011. So that is going to be three sons on the farm full-time.

As you all know, I have to thank them immensely for allowing me to serve, to put in the time that I do on this Board. We all work 80 to 100 hours a week year-round. For me to commit to the time that I have, it
1 has been a big sacrifice for them. I am very
grateful.

CHAIRPERSON MOYER: Thank you,

Kevin.

Hue?

MEMBER KARREMAN: Do I get the

last word? I never do.

(Laughter.)

CHAIRPERSON MOYER: Sometimes.

MEMBER KARREMAN: My name is Hue

Karreman. I am a veterinarian in Lancaster

County, PA.

I sit on the environmental seat.

All I can say is that the last five years have

been quite a life-changing experience. It has

been a true learning experience as well as a

real honor, and also to learn how the

democratic process works here in the United

States.

I was interviewed by the Lancaster

papers yesterday about my role on the Board

here. One thing that I remembered was, when
we had the Aquaculture Symposium, afterwards I guess I heard some people say, the Europeans say, "Wow, it is so different here. You have so much public input." In Europe, you know, it is all done by committee, not behind closed doors, but not as much public input as we have here.

I know what it is like to be out there. I used to come to the meetings prior to sitting on the Board, and I plan to sit out there again after I am done being here on the Board, to give comment, not so much as maybe a veterinarian, but as a consumer of organic products, and keeping in mind what I know about organic dairy farms.

I guess the one last thing I would say is that pretty much on almost all my decisions up here I have always thought, what would the organic consumer think about what we are doing? But, also, as a veterinarian to 80 to 100 certified organic dairy farmers in Lancaster County, I have, hopefully, served
them well here and brought up issues which
will enable them to take better care of their
cows and general livestock. Some of those
issues will be brought up here at this
meeting.

So let's let the meeting get

going.

CHAIRPERSON MOYER: Thank you,

Hue.

I would also like to mention that
there are two Board members who could not be
with us today because of issues in their own
personal lives. Outgoing Board member Jerry
Davis, he is from California, sits on the
Crops and Handling Committees, could not be
with us, and fourth year Board member Jennifer
Hall from the State of Washington, who sits on
the Livestock and I believe the CAC Committee,
could also not be with us today. But their
work should not go unnoticed by the folks in
the gallery.

Okay. I guess I should introduce
myself, too. Jeff Moyer. I am the current Chair of the Board. I sit on the Livestock Committee and the Crops Committee. I am in my fourth year on the Board.

I am the Farm Director for the Rodale Institute. I have been there, not as Director, but I have been at the Institute since 1976. So they tell me that is a long time, but it seemed to go fairly fast.

And it is a pleasure to be with you today.

The next item on our agenda is to address and look at the mission statement of this Board. Because of the work that we do, I think that it is important that we take just a few minutes, and I am going to read that mission statement. You can all find it in the Policy and Procedures Manual in Section 1, page 6. I encourage you to look at the Policy and Procedures Manual for the Board at your leisure, but I am going to take a moment just to read what we have here.
"The NOSB Vision Statement.

NOSB's vision is an agricultural community rooted in organic principles and values that instills trust among consumers, producers, processors, retailers, and other stakeholders. Consistent and sustainable organic standards guard and advance the integrity of organic products and practices.

"Our statutory mission is to assist in the development of standards for substances to be used in organic production and to advise the Secretary on any other aspects of the implementation of this title."

And the title is OFPA Section 2119(a).

"The NOSB mission statement is to provide effective and constructive advice, clarification, and guidance to the Secretary of Agriculture concerning the National Organic Program and the consensus of the organic community. In carrying out the mission, key activities of the Board include: assist in
the development and maintenance of organic standards and regulations; review petition materials for inclusion on the national list of approved and prohibited substances, known as the National List; recommend changes to the National List; communicate with the organic community, including conducting public meetings, soliciting and taking public comments," which is what we are here for today, "communicate, support, and coordinate with the NOP staff, and to provide information and education to the National Organic Program."

That is our mission. That is what we strive to do over time, and that is what we are going to try to work on today.

I should also mention, before we move on to the next item on the agenda, that this Board and this Chair will not tolerate any personal attacks or disparaging remarks directed to individuals in the audience or to any specific Board member. We certainly
expect everyone to treat each other with respect and dignity, and we won't tolerate anything but that behavior.

Okay, the next item on the agenda would be the Secretary's report by Julie Weisman.

Julie?

SECRETARY WEISMAN: Yes, we have traditionally two things that happen during the Secretary's report. We vote to accept the official transcript of the last meeting, the transcript of the November 2009 (sic) as the official record of the meeting, and the other thing which we referred to earlier would be voting to accept the voting summary that we have been circulating for a couple of months now as the official record of the voting on the recommendations at that meeting. That second part, the voting summary, we already agreed is going to happen on Tuesday.

So, at this time, I move that we accept the transcripts of the May 2009 NOSB
meeting as the official record of that
meeting.

CHAIRPERSON MOYER: We have a
motion on the floor to accept the transcripts
of our previous meeting in May of 2009. Is
there a second to that?

MEMBER HEINZE: I second.

CHAIRPERSON MOYER: Katrina
seconds that.

All in favor of accepting that say
aye.

(Chorus of ayes.)

Anybody opposed?

(No response.)

We have done that. Thank you.

Now what I would like to do is
shift the attention from the Board to the
program. I would like if Barbara Robinson
could come up to the front of the room. Then
we will have the program introduce themselves
as well.

Barbara?
I'm sorry. Hue?

MEMBER KARREMAN: I was just wondering, with the speakers all being way over in there in the corner, is there any way we could have it more in the center here, just for Kevin and Tina and my -- it is going to be all day.

CHAIRPERSON MOYER: I understand that. We will work on that, Hue. Thank you.

MS. ROBINSON: No, you have to turn around, Hue.

Mr. Chairman, I guess I have to introduce myself first. Barbara Robinson, Deputy Administrator, Transportation and Marketing Programs.

Mr. Chairman, I just wanted to remind you, back this spring, we talked about we had proposed to separate the National Organic Program from Transportation and Marketing programs and establish it on its own two feet. That proposal had been accepted by the Administration.
Along with that proposal, we also proposed that the National Organic Program be managed by a senior executive in the Department, and that was also accepted.

So it is my pleasure that, having those proposals accepted, the Deputy also came before you in May and said that she would be moving ahead with that very expeditiously, and she did.

So, on October 1st, we did what is called the magical 1010 in the Department, which is the paperwork terminology, and NOP was officially separated from the Transportation and Marketing programs.

We had a very amicable divorce. No child support, no alimony, no visitation rights, either, I want to say.

(Laughter.)

Although they have been trying very much; they sneak down every now and then to the office.

But, no, it has been very
amicable. The Deputy did select from many, many candidates one, and that is Miles McEvoy. I am very pleased to hand over the reins officially here at this meeting.

It has been my pleasure to serve as the Deputy Administrator and for the past two years as the Acting Program Director for the National Organic Program. I have really enjoyed this job. I have really enjoyed working with all of you. It has been, and you have heard me say this many, many times, to me, this program has been the ultimate Rubik's cube. You could get five sides all perfect and turn it over, and it's, oh, it's an ungodly mess. But you start all over again because it is just one of those things you just can't walk away from.

But it has been a lot of fun. It has been interesting. It has been a challenge. And just to be honest, it has been, personally, probably for a third of my career been the thing that I have loved most
in my career to do. It was hard to walk away
from, but, well, I didn't have a choice.

(Laughter.)

But it really has been fun working
with all of you and working with this program.

Before I do introduce Miles, I
just want to say thank you to Joe and to Rigo,
to Hue and to Bea and to Julie for your five
years of service. I won't be here in January
when I hope that you do come back, but I won't
be here to give you your official goodbye, and
to welcome Jay Feldman, John Foster, Joe
Dickson, Annette Riherd and Wendy Fulwider,
who are the new members who will be coming
onboard, whom I think you will tremendously
enjoy.

They come with just great
backgrounds and a true, true commitment to not
just organic production, but to production
agriculture, to local, to firm-to-consumer
direct marketing, just to the whole ball of
wax. I mean they are in it all the way.
So your commitment is going to be carried out; I am fully, fully confident of it.

But Miles McEvoy brings, also, a strong commitment to this program and to this community. For over two decades, he was the head of the Washington State Department of Agriculture's organic program. He also was the head of NASOP for a number of years.

So there's not a doubt in my mind that he has 100 percent commitment to making sure that the National Organic Program is successful. As I told my staff, and I would give you the same words, you know, good managers, good leaders, it is up to everybody to help them when they come onboard, to show them around.

Working in the federal government isn't easy. Just because you worked in the state government doesn't mean it is, okay, just come onboard and it is the same transfer. It is not. It is difficult. So, if we all do
our best and help Miles find his way around,
then we are all going to help him succeed that
much quicker.

But I have no doubt about his
commitment. I am sure you won't either, as
you get to know him and work with him.

So that is all you will hear from
me today until our new Administrator, Rayne
Pegg, comes down this afternoon. I will stick
around just to introduce her because she also
wants to meet you all.

So, without any more from me, I
would like you to welcome Miles McEvoy.

(Applause.)

MR. McEVOY: It is great to be
here. I am thrilled to be here.

But I want to recognize Barbara's
contributions over the years. She has done an
amazing thing to keep this program together
with very limited resources.

I used to be on the outside
looking at NOP. You know, you have a lot of
opinions about what they are up to. But now, actually being here for a month and realizing the commitment that Barbara had to keep this program together, and the accomplishments that she made with the very limited resources -- and you will see that in the presentation in a few minutes, the really limited resources that she had to work with -- is really a tribute to her work.

I just want to recognize you. We have a certificate of appreciation. It is modeled just like an accreditation certificate.

(Laughter.)

So we are accrediting her as a certifying agent for the future, and it is to Dr. Barbara Robinson, for service to the organic food industry, and specifically, for the negotiation of the U.S./Canadian Equivalency Agreement in June of 2009; for developing the capacity of the NOP compliance and enforcement activities; for the access to
pasture proposed rule, and for the liquid fertilizer directive, and many, many other things.

So thank you so much, Barbara, for your service.

(Applause.)

MS. ROBINSON: Thank you very much.

CHAIRPERSON MOYER: Thank you, Barbara.

And, Miles, the floor is yours.

MR. McEVOY: Okay. Thank you.

So I am very thrilled to be here. I am actually having a pretty good time at USDA. It was pretty scary at first, but it is government. So I am used to state government. The federal government is much larger; many more steps to getting things approved. But the people at USDA have been fantastic. They have been really great to work with. I have a lot of support from the Administration, from the other AMS Deputy Administrators; they have
been really great. The NOP staff is really fantastic.

I want to recognize Valerie Frances and Katherine Benham for putting this meeting together. They have done amazing work to pull this all together. So I think they deserve a round of applause for that.

(Applause.)

Okay. So I am Miles McEvoy. As Barbara said, I have worked for the Washington State Department of Agriculture for over 20 years. I have been involved in organic certification work for a long period of time.

I just moved to Washington, D.C., in mid-September, getting settled in. This is a great place to live. We are looking for hiring people. So I have a lot of great things to say about Washington, D.C. It is a great city, lots of exciting things to do, good bike trails. The weather is pretty good. So really think about it; it is a good place to be.
The next slide.

So I want to start with some founding principles and values that I bring to the NOP.

First of all, I believe that to be successful the NOP needs to collaborate with the organic community, and especially with the certifiers who implement the program. I believe the rules need to be clear and consistent, so that certifiers, producers, and handlers understand the rules that they are working under. If they understand the standards, it is much easier for them to be in compliance.

It is not just the certifiers that need to have clear understanding. It is also the producers and handlers. So that is one of the things that we are really going to work for, is to have the program manual completed and have clear standards available to everyone.

I plan to be as open and
transparent as possible. Organic agriculture prides itself on having a transparent decisionmaking process. I will provide as much information as possible about the program's activities.

"Strict and sensible" is a term coined by Leslie Zuck of Pennsylvania Certified Organic. This refers to the goal of upholding high organic standards, enforcing those standards, but being sensible in the application and enforcement of those standards. So both of those things need to be true.

The regulations can kill us. We have to really be careful that we are strict in terms of enforcing them, but we have to be sensible and practical.

Finally, the program should be as organic as possible, remembering where it came from, paying attention to the biological and interconnected aspects of organic agriculture, and staying true to organic principles that
are well-articulated. For example, IFOAM's principles of care, health, ecology, and fairness. So that is one thing that I hope to bring, is a continual context of having those principles in mind.

Next slide.

In terms of input and collaboration, I have received a lot from various sources about the goals and challenges of the NOP. I have listened to USDA senior staff, reviewed USDA strategic priorities, worked with NOP staff, and reviewed the ANSI 2004 audit and received some preliminary information about the current OIG audit.

I have also received input from NOSB, the National Organic Coalition, the Accredited Certifiers Association, the Organic Trade Association, and the Northeast Organic Dairy Producers Alliance.

I look forward to hearing the priorities from NASOP, Cornucopia, Organic Consumers Association, and IFOAM. So I am
really looking forward to what people want out of this program.

Next slide.

So, in terms of priorities, we have developed some initial priorities for the program. They include publishing the access to pasture final rule, developing a strategic plan -- we hope to do this in January with the National Organic Standards Board -- implementing a peer review process through being assessed by NIST, the National Institute of Standards and Technology, and implementing the corrective actions and obtaining ISO guides 17011 accreditation within the next couple of years.

Revise and update the website to make it more user-friendly, complete and accurate, and up-to-date. There was already some work going on in terms of updating the website. We hope to finish that by early next year.

Hire additional staff for rule
writing, for creating a quality manual, and

conduct more training for staff

and also for ASAs. Create additional training

modules. We plan to do six to nine trainings

in 2010.

Implement or respond to all of the

NOSB recommendations.

Develop and publish a quality

manual for the program.

Develop a program manual of

policies and procedures to provide guidance to

certifiers, producers, and handlers on

interpretations of the NOP. Include the NOSB

recommendations on commercial availability of

seeds, for instance. So there's a number of

NOSB recommendations that don't require

rulemaking. The idea is to incorporate those

into the program manual.

Then, finally, and probably most

importantly, uphold and enforce the organic

standards.
So we have developed a work plan for the program. Some highlights of that work plan include working with the Science and Technology Program to create a petition substances database that will ensure better tracking of the petitions. The database is almost completed. It will be completed by February of next year.

We are developing a training module for the access to pasture final rule that will be completed by the publication date. So, when the access to pasture final rule comes out, there will be some background material and some training information about that.

We are meeting with our Canadian colleagues to ensure smooth implementation of the U.S/Canada Equivalency Agreement.

We are completing rulemaking on the NOSB material recommendations.

Complete the assessment of two
state organic programs, Utah and California, by early 2010.

Developing a penalty matrix and procedures for utilizing civil penalties for willful violations by February of 2010.

These are just a few of the activities that we are engaged in.

In terms of decisionmaking, I want to review our plans on how I plan to handle decisionmaking. There's a lot of decisions that need to be made in the interim between NOSB meetings.

So the plan that we started yesterday with the organic labeling concept is that, when we identify issues, we will attain all of the information that we can, draft a policy. The policy will be based on the NOP regulations. It will be reviewed by the AMS Administrator and the Office of General Counsel. The draft policy will be provided to the NOSB and ACAs for review and feedback.

Once we are satisfied that we have
the best policy possible with the current
information, we will publish it as interim
policy. It will be sent to all ACAs, state
organic programs, and foreign governments that
have recognition agreements, as well as being
posted on the NOP website.

The interim policy will be put on
the next NOSB agenda for review and public
comment, and then, once approved by the NOSB,
incorporated into the NOP program manual as a
final policy.

Next slide.

So the age of enforcement is
something that Deputy Secretary Kathleen
Merrigan has talked about. What does this
mean? How will that be implemented?

So, first of all, as I said, we
plan to create a penalty matrix that will
include civil penalties for violations,
provide clarity on access to pasture with the
new rule, and will be clarifying labeling
requirements. These items will be enforced by
working with the ACAs and through the complaint process.

We are looking at some new initiatives to enhance the NOP's ability to protect organic integrity. These include conducting market surveillance of organic labels and the organic market. We may collaborate with the certifiers, with states, or with other AMS programs that already have staff around the country, to have more eyes reviewing organic labeling claims and ensuring that those are accurate and truthful claims.

We are also looking at requiring ACAs to conduct a certain percentage of unannounced inspections, as, for instance, is required in the IFOAM accreditation criteria. You might want to look at that. I think it is a little interesting in that the organic certification process, which is a very good, robust process to verify organic standards, that for the most part, inspections are announced. You always tell the person when
you are going to get there to do the
inspection. In most regulatory programs,
inspections are not announced. People just
show up, and you have to have your paperwork
in order.

So I think that there is room for
at least some of the inspections in the
organic certification process to be
unannounced inspections, to help to bring more
integrity to the system.

We also plan to utilize pesticide
residue sampling, as required by OFPA, to
identify problems and improve organic
integrity. It is not a zero residue standard,
but pesticide residue sampling can help to
bring more integrity to the system. It
identifies problems.

We also are looking at developing
a system of risk-based inspections to focus
resources on areas with the greatest risk to
organic integrity. For instance, split
operations would probably have a greater risk
than 100 percent organic operations. So maybe
more of the inspections should be focused on
those higher-risk areas.

Next slide.

So a little bit about the
organizational structure of the NOP. It is
organized into four parts: the Office of the
Deputy Administrator, the Standards Branch,
the Accreditation and International Branch,
and the Compliance and Enforcement Branch.

There are also two other AMS
programs that we work very closely with. The
ARC Branch and the Livestock and Seed program
is responsible for all the NOP and ISO audits,
and then the NOP Appeals staff is part of the
AMS Compliance and Analysis Program. So they
are very critical for the compliance
procedures, but they are not directly part of
the NOP.

A little bit about the staffing
plan. Next slide.

So, for the Office of the Deputy
Administrator, it is responsible for the NOSB budget, web page, quality management, personnel, public affairs, congressional inquiries, strategic planning, and overall management and leadership of the NOP.

The plan is for seven FTEs, including three in the NOSB support group, and then some new hires in that group would be an Associate Deputy Administrator, a secretary, which we don't have currently, and a quality manager to handle the quality management system and develop a quality manual for the program.

The Accreditation and International Branch will have six FTEs. That is responsible for accreditation, recognition and equivalency agreements, state organic programs, and also training. It has a Branch Chief, an accreditation manager, and accreditation assistant. So we are looking at, I think, three new hires in that area, and international managers can focus on the
recognition and equivalency agreement; another review specialist to help with the audit review, and a training manager to put together the online training and the onsite training.

The Compliance and Enforcement Branch currently has five FTEs. We actually just hired a sixth one in the College Career Intern Program, and we will be adding one more staff to that area. They are responsible for investigating complaints and enforcing the organic standards.

Next slide.

In the Standards Branch, we are looking at having nine FTEs. That Branch is responsible for rule writing and the NOP program manual. We plan to add six staff to this Branch in order to implement the NOSB recommendations and to complete a program manual to provide clarity and consistency for the NOP regulations.

We plan to hire organic technical specialists in cropping systems, livestock,
and processing, as well as a customer service specialist and a few more rule writers.

We are getting some people in USDA detailed to the program to get some initial work done on the materials docket and to help out with some other initiatives, but we will be doing a fair amount of hiring in that area.

There are also three staff people that we have in NOP Appeals, or funded by the program that are in the NOP Appeals staff.

There is a lot of other budget considerations in terms of costs. One of the ideas was to have a dedicated attorney in the Office of General Counsel because there is so much legal work to do in the National Organic Program.

So that is one of the options that we are looking at.

We don't have our own administrative officer who does a lot of the HR type of work, budget officer. We might need database and web developers and other administrative support.
So what we are looking at is getting that support from other AMS programs, but there is a cost involved in that, as you will see when I review the budget.

Next slide.

Other USDA resources that are important to keep in mind is the AMS Administrator, Rayne Pegg, who will be here this afternoon; Under Secretary of Marketing and Regulatory Programs, Ed Avalos from New Mexico, who just started last week. He will be here, I think, on Wednesday afternoon to introduce himself. Deputy Secretary Kathleen Merrigan and Secretary Tom Vilsack. These are all people that are very supportive of what we are doing in the National Organic Program and good resources for us.

Other USDA offices include our Legal Counsel in the Office of General Counsel; the Livestock and Seed ARC Branch, who conducts the audits; the NOP Appeals team; the AMS Public Affairs and Legislative Office.
that assists with media and congressional inquiries, and also, the AMS Science and Technology Program that is providing the technical reports for the petition substances and also has developed the petitions database for the National Organic Program.

Okay, next slide.

This is a snapshot of the budget and staffing from 2002 to 2010. You can see that there was very limited resources until very recently, six to eight employees, a budget of between $1 million and $1.6 million between 2002 and 2007.

So it really helps to explain, at least for me, why it was so difficult for the National Organic Program to take a lot of recommendations and implement them into rulemaking. They just didn't have very many people to get the work done.

So, with the additional resources that are coming into the program, up to $3.87 million last year and $6.97 million for 2010,
we are looking to have 31 staff in the program. So I feel very lucky to be coming into the program at this time with these additional resources. It will make things a lot easier.

Next slide.

This is very preliminary budget numbers, very rough. The budget was signed last week or the week before; $6.97 million is what we have available.

The first thing that they do is they take 12 percent off for overhead, for a variety of different essential services that AMS provides. Then, beyond that, there's also other administrative services that we have to pay for to get our various work done in personnel or for travel or for all those things that are important.

So we have split up the offices and branches. On the left side, Office of the Deputy Administrator, NOSB, Accreditation and International, Compliance and Enforcement.
Most of the costs are going to be in the salaries and benefits realm. NOSB meetings is a separate line item for $77,000.

But, if you look at it this way, with the three support members that specifically support the work of the NOSB, it is about $717,000 on this very rough estimate of what it costs to run the National Organic Standards Board.

I wouldn't get too hung up with this because this is very, very preliminary. So we will just give you a snapshot and move on.

In terms of training, we are continuing to develop the online training modules. We plan a training manager, as I said, by the end of the year.

We have posted four of the draft modules on labeling, certification, compliance, and investigation online. Those will have continual development. We plan to have a training on the access to pasture final
rule when that comes out.

For 2010, we are looking at three
to five U.S. training events and three to four
foreign events. The training will be
available to organic producers, handlers, and
other interested parties as space permits.

Next slide.

See, this slide shows where the
current certifiers are in the United States.
There's various clusters. We are looking at
having one in California. We are already
committed to the ACA NASOP training in Georgia
and, also, the Upper Midwest Conference, we
will be doing a training there. But then
there's other clusters in the Northwest and
the Northeast that we might also do trainings
in.

Next slide.

In terms of foreign trainings, we
have BOFOC in February. We can catch a lot of
the certifiers there. So we plan to do a
training there.
There's also a big cluster of certifiers in Europe. There's also a big cluster in India, Argentina, and Australia. We are looking to do three to four foreign trainings in 2010 as well.

Next slide.

Recognition agreements. There's nine recognition agreements, but the Canadian Equivalency Agreement makes three of those moot, that we don't really need to concern ourselves with those because they are covered now by the Equivalency Agreement.

So we have six agreements with Japan, New Zealand, United Kingdom, India, Denmark, and Israel. Four out of those six agreements have been assessed, and Denmark and Israel are the two that have not. They will be done by spring of 2010.

Next slide.

In terms of equivalence, we will be meeting with the Canadian Food Inspection Agency in early December to work out some of
the details, some of the issues that have come up with the Equivalency Agreement, to make sure that that continues to run smoothly and meets the needs of the industry in both Canada and the U.S.

We have also gotten a lot of requests from other countries for equivalency agreements, recognition agreements. We have some interest from Europe. So there might be the possibility of restarting work with the European Union on an equivalency agreement, which would be our highest priority since that is the biggest market.

Next slide.

In terms of accreditation, there's currently 100 certifying agents. The newest agents include the Oregon Department of Agriculture, OIA North America, BioHellas in Greece, and AUS-QUAL in Australia, and there's one onsite accreditation audit that still has not been completed. That is Agrior in Israel. That is scheduled for early 2010.
In terms of the Compliance and Enforcement Branch, they have four main functions: managing the NOP compliant system; enforcing organic production, handling, and labeling standards; processing and investigating complaints alleging violations of NOP regulations, and initiating compliance and outreach activities. So, for instance, the compliance and investigation training modules were largely put together by the Compliance and Enforcement Branch.

What they have accomplished: over the last year, they have established standard operating procedures for the complaint-handling process; developed and maintained a complaint tracking and management system; developed enforcement guidelines to ensure consistency in enforcement actions; established branch management systems to increase accountability; developed the
investigation and training module for
certifying agents; conducted compliance-
monitoring activities, and trained and
continue to train staff.

Now this Branch has really been
developed in really the last year. So they
have done a lot of great work in the last
year. They still have a lot to do. There's
a backlog of complaints that they have been
working on. The next slide will show some of
their specific activities.

They received 160 complaints in
fiscal year '09, between October and September
of '09. They closed 95 of those complaints.
They also resolved 30 of the old complaints
that came from AMS compliance. Their average
time to resolve a complaint is 75 days. So we
will see how that goes in the future. We will
keep reporting on these kinds of numbers at
future Board meetings.

They issued 34 warning letters to
non-certified operations, 10 notices of non-
1. compliance to accredited certifying agents,
2. and three notices of proposed suspension or
3. revocation to accredited certifying agents.
4. So they have been very busy.

   Next slide.

   Then their impact has been, from
7. this compliance action, 23 cases resulted in
8. product label changes and, within those 23
9. cases, 185 product labels were changed to
10. bring them back into compliance with organic
11. standards.

   Twelve cases resulted in
12. production process changes, and 31 cases
13. resulted in website changes, and four
14. operations that weren't certified making
15. organic claims became certified. So a busy
17. group of people.

   Moving on to the NOSB
19. recommendations, there's been a lot of concern
20. about that there is a backlog of NOSB
21. recommendations that the NOP has not been able
22. to do rulemaking or implement. What we have
done is we have analyzed those and put them into these three different categories:
standards rulemaking that are significant rules, like the access to pasture rule;
materials, which are additions/deletions to the National List, the sunset materials, and the tabled materials, and then policy and guidance, where no rulemaking is required. I will get into more of the details here.

So, in regard to the practice standards, these are the ones that we have identified that are going to require rulemaking. These are NOSB recommendations.

Origin of livestock was going to be the next one that we took on, and we would attempt to include cloning within that rulemaking docket.

Then there are a number of other recommendations. Apiculture I think is the oldest. Mushrooms, standardization and expiration of certificates, pet food, aquaculture, and greenhouses.
So there's a lot of work here. We can't do it all at once. We have a budget increase, but we won't be able to do all these at the same time. So we are going to look to the NOSB to help us to identify priorities. Which ones do you want us to do first? Do you want us to do the oldest ones first? So that is up to you guys to try to come up with a list for us.

Next slide.

In terms of materials, these are the recommendations that you have made on crops, livestock, handling, and sunset materials. The materials in bold are ones that have already gone through the proposed rule status and are waiting for final rule. Then the ones that are not in bold, tetracycline, peracetic acid, sulfurous acid for crops, those are the ones that we still have to go through the proposed rulemaking process.

The idea on the crop materials, if
I am right, Shannon, is that we will have the proposed rule through, let's see -- no, starting the clearance process by the end of November. Then that process, the clearance process, takes about two months. Then it goes to Office of Management and Budget. That takes 45 to 90 days. So getting a proposed rule on those materials out sometime in the spring. Then we get comments. Then we have to respond to the comments and go through that whole process again.

So the whole process of doing a relatively simple rulemaking, from my understanding, my limited time here at the NOP, is about a year for a simple rulemaking process. So it takes a long time.

Okay, next slide.

Recommendations not needing rulemaking. We made this really small, so you couldn't really see.

(Laughter.)

So I will read the list, and we
will provide this to the Board and probably post it on the website. I am sure there will be ones that people will find that aren't on this list, but these are the ones that we could identify over the last few weeks.

Commercial availability of seeds, peer review, biodiversity, multiple sites for the grower group recommendation, organic research, and there's two recommendations around organic research. There's a lot of recommendations concerning compost, processed manure, compost tea and vermicompost; organic system plans; livestock medications; chelates as feed additives; outdoor access for poultry; planning stock; transitional products; chlorine; wax boxes, and name of the certifying agent on the package, kind of the private label recommendation.

So all of these recommendations, at least our preliminary is that they will not require rulemaking. We can do these in the program manual, and that is what we plan to
1 do. I think we have the target of about June
2 of next year publishing the program manual.
3     Next slide.
4 Tabled materials. Take from the
5 table recommendation I think was from
6 September 2008 recommendation. Our plan there
7 is to evaluate that list and work with the
8 NOSB to determine the next steps. I think in
9 a lot of situations it might require another
10 technical report to be done on these
11 materials.
12     The materials that are included in
13 that for crops include methanol, amino acids,
14 ash coal, creosote, ethephon, controlled
15 atmosphere lime and potassium permanganate for
16 livestock, methanol and amino acids, and for
17 handling amino acids, baking powder,
18 attapulgite clay, magnesium carbonate, non-
19 modified starch, and waxes. So there is a
20 bunch of work there to coordinate with the
21 NOSB the next steps on those materials.
22     Next slide.
A little information on petitions and technical reports. We were working with the AMS Science and Technology Program. They are doing the technical reports for the National List petitions. It costs us $6,000 each for those reports. There's 27 petitions that are in process. S&T has completed four technical reports and has six additional reports that they are working on.

Seven of the reports from S&T have been received by the NOP and they are under review by the NOP and the NOSB. We got them, I think, a little bit late, so they couldn't be on the docket for this meeting.

Then seven petitions do not need a technical report because they are on a 606 list, is what I understand. We also have three petitions that have not been sent to the S&T for a technical report at this point.

Next slide.

Okay, spring NOSB meeting, we are going to have a few requests for the NOSB to
work on a few issues. One is the accessory
nutrients. Clarification of the 1995
recommendation is needed. There's been a lot
of questions about what is included in the
accessory nutrients, a lot of concerns about
that. So we would like the NOSB to relook at
that to clarify that 1995 recommendation and
how broad is your recommendation. What does
that include?

So, depending on what
recommendation you come up with, that could
lead to rulemaking to clarify what accessory
nutrients really are allowed in processed
organic foods.

Other issues: pesticide residues
and compost, corn steep liquor, oversight of
material evaluation programs. I am going to
talk about each of those issues a little bit
here to give you a little primer for the
spring.

Then the plan is to have the next
meeting in California. California represents
1 about a third of U.S. organic ag production.

2 (Applause.)

3 So it just seems appropriate that
4 we should have a meeting out there.
5
6 What I would like to do is have
7 the meetings around the country, so the
8 organic community can have a much easier
9 access to participating in the NOSB meetings.
10
11 All right. Next, soap. Oh, boy,
12 this is a fun one. So, back in July, the NOP
13 posted a draft guidance document for comments
14 regarding the labeling of soap made with
15 organic ingredients. We received, I think, 90
16 comments on that draft. Those comments I
17 think are being posted this week. I don't
18 think they are quite posted yet, but we are
19 posting those comments.
20
21 The comments were not conclusive.
22 They ranged anywhere from we love organic soap
23 to soap is a synthetic and should not be
24 certified organic, to the NOP regulations were
25 not written for soap.
Further, we have been consulting with the FDA. Those conversations have revealed that there may be conflicts between the FDA regulations and the NOP regulations when you try to reconcile the two different regulations and try to find a way to label soap in a way that complies with both regulations. So, basically, it is that Rubik's Cube that Barbara was talking about. It is really a challenge.

So the bottom line: certifiers are responsible for ensuring that products labeled as organic under the NOP regulations are labeled in compliance with the NOP regulations. If ACAs cannot work with the clients to create a product that meets those regulations, you shouldn't be certifying the product. So that is the soap.

Next slide.

Pesticide residues in composts.

Over the summer, random pesticide testing found bifenthrin residues in organic
wheatgrass. When they went back and looked more closely, they found that it wasn't the organic wheatgrass that had the residues; it was the compost that was being used to grow the wheatgrass that contained the bifenthrin residues.

So, due to the amount of bifenthrin that was found in the compost, CFA, California Department of Food and Agriculture, which is a State organic program, notified the organic community and the certifiers that this particular compost or these three composts could not be used in organic production. They did consult with the NOP on that, and we supported their restriction on the use of these composts.

So this is a very challenging issue. We have been trying to come up with some kind of guidance that makes sense because the standard is not a zero tolerance standard for input materials, but there also are things in the rule that say that you can't
contaminate the soil, water, or crops, and
that composites that contain prohibited
substances, synthetic substances, is
prohibited.

So the residues of bifenthrin
ranged from .1 to .4 parts per million. The
EPA tolerance level for bifenthrin in crops
for peanuts and pistachios is .05 parts per
million. So the residues in the compost was
higher than the lowest level for crops.

So what we are looking at doing is
developing a policy that would establish a
UREC level, the Unavoidable Residual
Environmental Contaminant level. We would set
that at 5 percent of the lowest EPA tolerance
level for pesticides detected.

The Washington State Department of
Agriculture, actually, has used this. They
established this level for compost for the
international program. If you know the
Canadian regulations, the Canadian regulations
required the use of organic compost and
organic manure. When Washington State was
developing an equivalent program to get
accredited under the Canadian standards, they
said, well, we can't do that, so we're going
to look at a different way of addressing their
concerns, which was that conventional CAFO
manure and compost was contaminated. We would
do that through testing.

So they established that level of
5 percent of the EPA tolerance level. It
worked fairly well in Washington State. So
that is what we are looking at doing, is
establishing a UREC level at 5 percent of the
lowest EPA tolerance level for a crop,
established on that crop, for compost for
input materials.

So, obviously, this is a very
complex issue. We look forward to further
discussions in the spring.

Okay, the next slide.

Use of the term "organic" on the
principal display panel of products that are
in the made-with-organic-ingredient labeling category. Component staff have noticed that there is an increasingly liberal use of the term "organic" on the principal display panel for products in the made-with category. The made-with category, under 205.304, restricts the use of the term "organic" in made-with products to a certain font size and format.

The NOP plans to clarify that the term "organic" is restricted to the use specified in 205.304, and the use of the term "organic" in a brand name or company name must meet those requirements. Some labels will need to change, and we will allow a transitional time period to allow companies to use up existing labels to comply with this clarification.

So we sent this out. This was trying to follow that new policy; we sent that out to the Board and the ACAs yesterday, and we are starting to get some good feedback on that.
Corn steep liquor. Corn steep liquor is a product of the wet milling process. Other products of wet milling include corn gluten, cornmeal, corn syrup, and corn starch.

OMRI, WSDA, and others have accepted the use of corn steep liquor as a non-synthetic for many years. The NOP hasn't specifically addressed corn steep liquor, as far as I know, but they have allowed the use of corn steep liquor by not addressing it in their accreditation audits.

The addition of sulfur dioxide is part of the wet milling process. There is debate about whether the addition of that sulfur dioxide causes chemical changes to the corn and then would make it a synthetic.

As of November 2nd, WSDA is no longer allowing products with corn steep liquor. My understanding is OMRI is in the process of removing all of their products from
the OMRI list, all the products that contain corn steep liquor from their list.

In the meantime, what we have is a problem of one certifier saying that these products are not allowed and OMRI saying that some of these products are allowed. So that is not a good thing. We need consistency in terms of what products are allowed. It is either allowed or it is not allowed.

Next slide.

So what we are suggesting is that we should continue to allow corn steep liquor until the NOSB makes a determination on whether it is a synthetic at the spring meeting. We think that is the best route to go because it has been allowed within the organic community for many years by the NOP, by certifiers, by OMRI, and that there are other input products that are considered non-synthetic that use synthetics during the manufacturing process. Fish fertilizer, for instance, is allowed that has ethoxyquin in
it. Synthetics can be used during the
manufacturing if they are removed from the
final product. Finally, there is significant
debate on whether corn steep liquor is natural
or synthetic.

We need a transparent and fair
process to remove products from the approved
list, so that when we remove products from the
approved list, everybody gets the same message
at the same time. All products that contain
corn steep liquor would come off the list at
the same time.

So the idea is that let's let the
NOSB make that decision, put it on the agenda.
If the NOSB decides it is a non-synthetic,
from that point forward, that product couldn't
be used. Or, no, if you determine it is a
non-synthetic, it could continue to be used.
If you determine it is a synthetic, and don't
want to add it to the National List, then it
would be prohibited. If you say it is a
synthetic and you want to add it to the
National List, it would be prohibited until we did rulemaking to add it officially to the National List. So that is what we are recommending on corn steep liquor.

Next, I just want to talk about problems with materials. There's inconsistency in approved materials. Some certifiers allow some materials; whereas, some others may be prohibiting them.

OMRI is the best source by far for a consistent list of approved materials, but there are other lists out there. There should be one list. Everybody should be following the same set of approved materials.

And when things come off the list, for various reasons, we get more information, that needs to be done in an orderly fashion, in a way that the industry can be informed, that businesses that have products that were previously approved, that they can have an orderly way of dealing with that. There's an impact on the certified organic farms that
have purchased product. They have product onsite that is, all of a sudden, now potentially prohibited, and, also, the impact on certified organic farms that use products that were approved and are now prohibited.

One of the other problems with materials is the NOP lacks authority over material manufacturers. We get to decide what is used in production, what the certifiers can approve, but we don't have any direct authority over the material manufacturers.

So this is an issue that I think that the NOSB really needs to grapple with. I think that we really need to look at having an NOP either adoption of the OMRI generic list or some way of creating a National Organic Program generic list. Then, if it is not on the list, it is not allowed. So, for instance, on corn steep liquor, it is either on this generic list or it is not.

Then allow OMRI or others to do the brand-name process, but that has to follow
some kind of federal procedures, so that everybody is on the same page, and things, when they get off the list, everybody gets the same message. They all get off the list at the same time.

So that is something to think about, something to work on for the next few months.

I would just like to end the talk with a quote from Wendell Barry, which is sort of about materials or not about materials. This is from 1982, one of my favorite quotes about an organic farm.

And he says, "An organic farm, properly speaking, is not one that uses certain methods and substances and avoids others. It is a farm whose structure is formed in imitation of the structure of a natural system that has the integrity, the independence, and the benign dependence of an organism."

So that's it. Thank you very
(Applause.)

So you might have a few questions,

I would think.

CHAIRPERSON MOYER: Yes, a question from the Board? Joe?

MEMBER SMILLIE: Thanks, Miles.

Wow, the age of enforcement. It sounds exciting, and everything you presented makes a lot of sense.

I think we are all very interested in participating in this, and especially the NOSB has got a number of specified roles that you have lined out, which I think we really welcome and look forward to.

I know there's a million questions on everything. I just wanted to get two up there.

I think the unannounced inspection idea is fantastic. I would like to see that linked to the risk-based assessment.

MR. McEVOY: Right.
MEMBER SMILLIE: I think those two go together.

MR. McEVOY: Right.

MEMBER SMILLIE: Rather than just picking it out of a hat. I think that those two should be targeted.

The pesticide testing has become more and more important as time goes on. We have to work out some equitable way of sharing the cost. Currently, for a certification organization to just straight-up pay for those costs makes it not-a-well-used tool, for obvious reasons. We have to figure out an equitable way of doing that.

And the last thing is a favorite subject, which one of my mentors 30 years ago said he wasn't going to talk about anymore. That's Chilean nitrate. Well, we have to talk about it.

It is now impacting the Equivalency Agreement in a number of ways, and it is coming up for sunset. So the NOSB has
got some serious thinking to do on the nagging problem of Chilean nitrate, which it seems will never go away.

Comments on a lot of the other things, but those are the ones that first come to mind, and I don't want to delay break too much. So I will end there.

MR. McEVOY: Sounds good.

Yes, linking risk-based and unannounced inspections is a great idea, yes.

CHAIRPERSON MOYER: Thank you, Joe.

Any other questions or comments to Miles from Board members? I'm sorry. Barry, please.

MEMBER FLAMM: Miles, have you had any discussion about GMOs and any refinement of the policies and what we are going to do about residues and commingling, and so forth?

MR. McEVOY: That is a very challenging area. Yes, I am not sure what to do about GMOs. There's no tolerance set for
GMOs, but maybe that is something to look into.

That is a very difficult area.

So, no, we haven't really talked about that, of where we are going to go with GMO residues.

CHAIRPERSON MOYER: Any other questions? The Chair recognizes Rigo.

MEMBER DELGADO: Kudos on transparency goals. Fantastic. Being a numbers man, I like the metrics that you are putting up there. I look forward to seeing more of those. Otherwise, fantastic presentation.

MR. McEVOY: Thank you.

CHAIRPERSON MOYER: Okay, if there's no further questions, Miles, I would like if you would take a moment to introduce your team at the table, so that everyone knows who is here from the program side.

MR. McEVOY: Okay. First of all, Valerie Frances, NOSB Executive Director. I think a lot of the Board knows Valerie.
Mark Bradley, Branch Chief of the Accreditation and International Program.

Do you want to stand up?

CHAIRPERSON MOYER: It is your one chance, Mark.

MR. McEVOY: Shannon Nally is the Acting Branch Chief for the Standards Branch. She has been doing lots of extra work on the access to pasture final rule. It is a lot of work. Yes, it takes time.

Ruihong Guo is the Branch Chief for Compliance and Enforcement and has done a lot of the great work of really bringing the procedures and standards together for that part of the NOP, done really great work over the year. So thanks, Ruihong.

Next we have Valerie Schmale, who is with the Compliance -- well, the reason why I hesitate is because she is with the Compliance and Enforcement Branch, but she has been temporarily detailed to the Accreditation Branch to help with our NIST work. So she has
been getting some of our quality manuals
together for that.

Then we have J.D. Melvin, who is the Accreditation Manager and does a lot of the work on the recognition and equivalency work. So J.D. has been really fantastic on moving those things forward.

Then we have Katherine Benham, down at the end, who does all of the administrative support, all of the work that puts this meeting together. Without her work, we wouldn't be here. So thank you.

And there's probably a few more hiding in the back.

Oh, Bob Pooler heads up the Petitions and National List, and also has been doing the Cost-Share Program.

You notice I didn't mention the Cost-Share Program?

(Laughter.)

It is not that it is not important. It is just that we are trying to
get another branch to take on the responsibility of administering the Cost-Share Program. So we will see how that works.

Judy Ragonesi with the Compliance and Enforcement Branch.

And anyone else? Tammie Wilson and Andrew Regalado.

Wilburn, Tammie Wilburn, yes. See, I'm so new, I can't even remember everybody's name.

(Laughter.)

And Tony Strother is in the back as well.

So there's a few of us here.

CHAIRPERSON MOYER: Thank you, Miles.

I recognize now that it was a bit of a test, knowing that you were only here for a month.

(Laughter.)

And I think you did very well.

MR. McEVOY: Okay. Thank you.

CHAIRPERSON MOYER: I believe Hue
has one question. The Chair recognizes Hue

Karreman.

MEMBER KARREMAN: Yes, just one

question, Miles, on the access to pasture

rule. I realize it is not out the door yet, 

but where in the process is it right now? Is

it in OGC or OMB? Can you tell us? Are you

still writing it? Or can you let us know

something on it?

MR. McEVOY: It is almost at OMB.

MEMBER KARREMAN: Almost?

MR. McEVOY: Almost at OMB. I

think it might get there today. It might get

there this week, yes.

MEMBER KARREMAN: Okay. It is

just my farmers always ask after every

meeting --

MR. McEVOY: Yes.

MEMBER KARREMAN: -- what is

happening with ir.

MR. McEVOY: We were hoping it

would be out by the end of the year. It is
more likely January.

CHAIRPERSON MOYER: Okay. Thank you very much.

The next item on our agenda is to take a break. Amazingly, we are on time. I am sure that is going to change as the day goes on.

But, in respect of time, we will be reconvening promptly at 10:45. Please be here then. Thank you.

We are adjourned for 15 minutes.

(Whereupon, the above-entitled matter went off the record at 10:32 a.m. and resumed at 10:50 a.m.)

CHAIRPERSON MOYER: Thank you. If Board members could finish and get seated, we will get started.

The hotel has asked me to make one housekeeping message to all of you. During break periods, if you want to have conversations, they would appreciate it if you keep the conversations away from the
conference room. Our discussion in the hall is bothering a conference that is going on next door to us, and I am sure they would appreciate it if we can keep the volume down. So just move your conversation either outside or further down the hallway toward the lobby. Before I call the first person to the podium, I just want to make one little, brief announcement. That is that I am sure during the course of today and tomorrow, when we have public comment, I will butcher somebody or everybody's name. I will attempt to do it unilaterally and not pick on any one individual or race or creed in particular. I am just not good with names, and I apologize in advance to everyone in the room. We will get started. The first person that we have on our agenda is Rick Mathews. Rick Mathews, if you want to come to the podium? Good morning.
MR. MATHEWS: Good morning.

I think I might be making people nervous. I notice that OIG is here, the Office of Compliance is here, and the Office of General Counsel is here. So I hope I don't make them too nervous.

My name is Richard Mathews. I am President and CEO of NOP Solutions.

Over a decade of my more than three decades of public service at the USDA were devoted to creation, implementation, and administration of the National Organic Program.

My time with the NOP included four years of service as Program Manager, where I guided the program through implementation in the early years of administration.

I have firsthand knowledge of the hard work and dedication of this Board, previous Boards, and the NOP staff. I commend both bodies for their hard work and dedication. Each has done its best to fulfill
the purposes of the Organic Foods Production Act of 1990, AKA OFPA.

The first section of the Organic Foods Production Act states that its purpose is to establish national standards governing the marketing of certain agricultural products as organically-produced products.

In seven weeks, we will reach the ninth anniversary of publication of the NOP final rules establishing those standards. Just two weeks ago, we reached the seventh anniversary of full implementation of those national standards.

OFPA also states that its purpose is to assure consumers that organically-produced products meet a consistent standard. Regrettably, that mandate has not been fulfilled.

The evidence is found in the diverse applications of the standards by the 100 accredited certifying agents. The evidence is found in the numerous enforcement
actions before the NOP compliance and
enforcement staff. The evidence is found in
the nearly three-year backlog of appeal cases
before the NOP appeals staff. It is evidenced
by the diverse comments to the pasture rule
submitted by accredited certifying agents and
their associations.

Accredited certifying agents are
the face and the voice of the USDA seal to
certified entities and consumers, and as such,
they are the backbone of the program.

Certifying agents must fairly and evenly apply
and enforce the standards as written.

For the program to be successful,
there must be consistency across all 100
certifying agents. Accordingly, the NOSB and
USDA must together work to create a clear and
unified voice conveying a single regulatory
meaning to standards that need clarification,
a voice heard and a meaning implemented
consistently by all accredited certifying
agents.
In carrying out its training, accreditation, enforcement, appeals, and standards development and implementation functions, the NOP is regularly confronted with issues demonstrating the need for standards clarification.

The NOP and the NOSB should get together and work together to resolve these differences. The NOP should provide the NOSB with a periodic report describing issues demonstrating a need for standards clarification. This reporting should be done on a regular schedule and in a manner that would not reveal sensitive information. Using this information, the NOSB and the NOP should work together to develop guidance and policy statements convey a single stance for application by the NOP and all accredited certifying agents.

All guidance and policy statements intended to clarify regulatory language should be followed by rulemaking, so as to codify the
clarifications, thereby assuring their enforcement. We have to be conscious that there are attorneys out there who will try to pick apart the guidance statements and undermine the intentions of this Board and the consumers.

Consumers and certifying agents are counting on you and the NOP to fulfill the consistent standard mandate of OFPA. Please rise to the challenge.

CHAIRPERSON MOYER: Thank you, Richard.

Any questions for Richard from the Board? Comments?

(No response.)

The Board recognizes Kim Dietz.

MS. FRANCES: Can I make a quick comment? If you've got items that you would like to pass out to the Board, please, when you are on deck, bring them over to me before you are actually up, and I will help do that. Okay?
CHAIRPERSON MOYER: Thank you.

I should mention that Urvashi

Rangan is on deck.

MS. DIETZ: Ready? Okay.

Good morning.

My name is Kim Dietz. I am here
today just talking as myself and not as my
employer. It gets confusing sometimes. I
want to clarify that.

Thank you for the opportunity to
provide you with public comments. These are
my personal comments.

I already submitted comments on
the sunset process and hope that all of you
take a look at those before your vote on the
boiler materials.

What I want to talk to you today
about is just the history of this vote and
these materials because I think it is
important that you understand where we went
with this.

In 2000, I was appointed as a
handler representative to the National Organic Standards Board. During my first year on the Board, we were asked to identify materials that were currently being used by the industry but not on the National List. At that time, the Handling Committee identified boiler materials because there was confusion on how steam was being used in the industry.

A joint committee was formed between the handling materials and certified representatives to determine the best course of action. The Chair of the Handling Committee, Mr. Steven Harper, and Certifier Representative Jim Riddle together drafted surveys to gather industry use on steam.

The NOSB also asked for the industry to submit petitions on these materials. Because no petitions were received, the industry worked together with NOSB Board members and submitted petitions.

At the October 2001 NOSB meeting, Steven Harper showed the results of those
surveys. Fifty-six processors responded, and 43 stated that they used steam in direct contact with food. Thirteen processors used steam that did not come in contact with food, steam-jacketed kettles and packaging sterilization.

With regards to volatile immunes, and those are the boiler materials that are on the National List today, out of the 43 processors who used direct contact, 21 of those processors turned off the chemicals, and 11 processors did not. Those who did not turn off the steam were certified handlers.

The certifying information shared by Jim Riddle, 13 certification agencies responded. No certifiers allowed direct food contact with steam that contained the volatile immunes. Out of those certifiers surveyed, only three certified handlers used indirect steam. This practice was allowed because the steam did not have direct contact with the food.
TAP reports were compiled by OMRI.

Unfortunately, the TAP reports didn't have enough information for the NOSB to make a recommendation. We, therefore, hired Mr. Richard Theuer to do a supplemental report, and I put this in there because I don't think the Board has that information. I have hard copies. I spoke to Richard, and he actually has the detailed information. We would be happy to supply it to you so you can review it.

He was paid to conduct an independent review of the TAP reports against the NOP work agreement and criteria as well as the petitions to make sure they were thorough and complete. Mr. Theuer's work closed all the loopholes in the TAP and petition process.

It is clear by the results of the surveys and the TAP reports that direct food contact should not be allowed. However, indirect was a practice in certified handling operations. That is why the annotation
allowing for food packaging sterilization was proposed and voted on for allowance by the Board. This annotation was specific to clarify how steam could and could not be used. It should also be noted that those Board members who didn't vote on materials due to conflict of interest, it was solely because they were directly involved in the petition process. I was one of those. I abstained from the vote.

It is my personal opinion that the NOSB did a great job of gathering facts to settle a very controversial issue. Furthermore, the organic industry didn't know to what depth materials were subject to review. Was it limited to ingredients and processing aids or were all materials that came in contact with food required to be on the National List? What category did steam fall into?

We really came forth as an industry to clarify this, so that we could use
those tools and make sure that everybody was consistent with what we did.

I am going to jump forward.

After the vote on the boiler materials, the NOP came out with a policy statement on synthetic substances subject to review. I also suggest you look at that.

Boiler chemicals fall under secondary direct materials. Under that CFR, they are allowed to have direct food contact with the steam.

The annotation by the Board actually took that one step further and restricted direct food contact with the steam.

So, in some ways, again, the question was, did these materials actually even need to be petitioned? Did they even need to be on the National List?

The industry asked the Board to vote on those, so that we could have clarification once and for all.

Anyway, I urge you to reconsider
your recommendation to remove these materials from the National List. The current annotations are restricting their use for non-direct steam application. You can see there is a lot more information in my review that I hope you take into consideration.

By removing these materials, we are just going to further confuse the industry. Again, whether or not these even need to be placed on the National List is a question. But leaving them on there with that restricted annotation is really serving the industry best.

Thank you.

CHAIRPERSON MOYER: Thank you. Thank you, Kim.

Any questions? Yes, Tracy and then Steve.

MEMBER MIEDEMA: Just a quick one, and, Kim, you may know the answer to this. If an additive is secondary direct --

MS. DIETZ: Yes.
MEMBER MIEDEMA: -- and it is added to an organic product, does that preclude it from becoming 100 percent organic?

MS. DIETZ: No. Oh, does it preclude it from the 100 percent label?

MEMBER MIEDEMA: Yes.

MS. DIETZ: Yes. Yes. Yes, it has to be non-synthetic to be used in 100 percent organic.

MEMBER MIEDEMA: It is not the same as packaging, for instance?

MS. DIETZ: Pardon me?

MEMBER MIEDEMA: It is in no way the same as packaging-type contact? Okay.

MS. DIETZ: No, and most of the packaging is in that secondary direct and also in your food contact substances materials.

CHAIRPERSON MOYER: Steve?

MS. DIETZ: Hi, Steve.

MEMBER DeMURI: Kim, thank you very much for your comments, both today and the written comments that you provided. It
has been very helpful, and this is very
helpful as well.

MS. DIETZ: Thank you.

MEMBER DeMURI: I would like to
see Richard's report sometime today, if
possible.

MS. DIETZ: Sure. We can email it
to you.

MEMBER DeMURI: Okay. Thank you.

MS. DIETZ: That would be best.

You're welcome.

MEMBER DeMURI: That's perfect.

Secondly, you were on the Board
when this was originally listed.

MS. DIETZ: Yes.

MEMBER DeMURI: Can you provide
for me and the other Board members a little
bit about the history or how the discussions
went during the listing process? Because in
reviewing the transcripts from that meeting,
there appeared to be some dissension amongst
some Board members --
MS. DIETZ: Right.

MEMBER DeMURI: -- on whether or not this should be allowed or not.

MS. DIETZ: Right. Well, the evolution was whether or not direct steam contact should be allowed. And I have the transcripts, because I read them again myself.

But most of that discussion was really a lot of processors use direct steam to soften apples or soften fruit. So that discussion was with regard to the direct food application. The non-direct steam, which is for the sterilization of packaging and kettles and those types of things, was kind of a separate discussion. That is why we came up with that annotation. So, yes, the Board clearly wanted to prohibit the direct food contact.

So does that answer your question?

MEMBER DeMURI: It does.

MS. DIETZ: Okay.

CHAIRPERSON MOYER: Thank you.
Any other questions or comments from Board members?

MEMBER SMILLIE: Well, just to follow up with what Steve said, also, in that transcript was the expressed, not written consent, no, the expressed desire by the NOSB at the time to see these materials come off the list. That was mentioned.

MS. DIETZ: Yes, the sunset, and if you look at the transcripts, the sunset discussion, we changed the recommendation; we changed the vote. There was a lot of back and forth on what actually should be placed on the National List with these materials.

To my knowledge, the removal and the early sunset of those was if it was direct food contact, not steam for packaging or sterilization. Because, in reality, if you look at the 2002 recommendation for synthetics to be placed on the National List, something that is not even directly contacting food might not even need to be placed on the
National List.

We asked for it to be there, so that it could clarify it, because inspectors were going into plants and saying no steam, but we were using it to temper glass and for packaging.

So, if we had wanted to put a sunset, we would have put it in the annotation, and we didn't.

CHAIRPERSON MOYER: Kevin?

MEMBER ENGELBERT: Kim, could you clarify a little bit for me the concept of direct or indirect contact? I mean, to me, it is either there is or there isn't.

MS. DIETZ: Yes. In this document, I have actually referred to the CFRs. If you want the policy statement, I can show you that as well.

In food, you have categories in CFRs that identify the type of food, whether they are ingredients, processing aids, direct food contact materials, or indirect. So they
are categories. Then we also have the infamous food contact substances.

So it really kind of clearly defines how a food should be used and limited use, if applicable. So it is there as a reference under the Code of Federal Regulations.

The indirect use, there's thousands of materials that are under those CFRs for indirect use. It was mainly a way for the program and the Board to say, how do we get our arms around defining what is subject to review? We said anything that is in the food or comes in contact with the food definitely, and anything that may still be left in the food, in other words, processing aids, or what have you, needs to be subject to review.

MEMBER DeMURI: One followup to that.

CHAIRPERSON MOYER: Certainly.

MEMBER DeMURI: Were there any
discussions during that first meeting or in Richard's report regarding some incidental residue that could be left? For instance, if you are steaming a glass jar, some of that steam is going to condense on the inside of the jar.

MS. DIETZ: Yes.

MEMBER DeMURI: Unless you do something to remove that condensed steam, which would then be liquid, you could potentially have minute amounts of those volatile immunes in that, correct?

MS. DIETZ: We did not get down to that level because it was being petitioned so that we could use it. You know, we didn't talk about that. I mean anything on the National List could be left in there.

MEMBER DeMURI: Right.

MS. DIETZ: No, we didn't.

MEMBER DeMURI: Okay.

MS. DIETZ: Not that I remember.

CHAIRPERSON MOYER: Thank you,
Kim.

MS. DIETZ: Thank you.

CHAIRPERSON MOYER: We appreciate your time.

The Chair recognizes Urvashi Rangan, and Tom Hutcheson on deck.

MR. HANSEN: Hi. I realize I am not Urvashi Rangan, but I am filling in for her. My name is Michael Hansen. I am a Senior Scientist at Consumers Union.

CHAIRPERSON MOYER: Okay.

MR. HANSEN: And I would like to, since we have two sections, I should be able to do this.

It is actually S-E-N.

CHAIRPERSON MOYER: Am I to understand that you have a proxy, then, for --

MR. HANSEN: Pardon?

CHAIRPERSON MOYER: Do you have a proxy? You said two sessions. What did you --

MR. HANSEN: Well, no, it is just,
you see, that there is --

CHAIRPERSON MOYER: Oh, I see.

Okay. Thank you.

MR. HANSEN: I am up as well, staff member.

CHAIRPERSON MOYER: Okay.

MR. HANSEN: I will try to get rid of this in as short a time possible.

CHAIRPERSON MOYER: I am just trying to get the timekeeper squared away. So you have 10 minutes.

MR. HANSEN: Okay. I don't think I will need that.

CHAIRPERSON MOYER: Thank you.

MR. HANSEN: All right. So, first, I would like to thank the NOSB for this opportunity to make comments.

The first comment I would like to make is on the recommendations of the Materials Committee on nanotechnology. Consumers Union fully supports the recommendations of the Materials Committee
that the NOP should, quote, "implement a rule
to clarify that at present the use of
nanotechnology is excluded from all organic
production, processing, and packaging except
as required by law." End quote.

Since we are assuming that the NOP
will follow through on the recommendations of
the Materials Committee, we are not going to
provide detailed comments on the potential
health and environmental problems associated
with engineered nanoparticles. If the NOSB
did decide against this recommendation, we
will be glad to present detailed evidence of
these potential environmental and human health
problems.

In general, Consumers Union
supports the language in the Materials
Committee recommendation with a couple of
exceptions.

One, that under the definition of
nanotechnology, we think you should make it
clear that the size range of concern is not
just 1 to 100 nanometers, but it goes up to 300 nanometers, and that is because particles in that size range have also been shown to have unique properties that could cause adverse effects.

In addition, also as part of the definition, it should be made clear that an engineered particle or structure is considered to be nanotechnology if any dimension that is engineered is less than 300 nanometers; that is even if it later agglomerates, and that is due to the greater increased surface area of the nanomaterials, even when it is tightly clustered together, and also because of some of the problems with trying to figure out whether agglomeration is happening in the product itself or is an artifact of the way you look at the nanoparticles. We ran into this when we looked at sun care products. We also strongly opposed the Materials Committee minority opinion position, which would treat nanomaterials as a synthetic
substance. We think that is a very dangerous proposition because, first, for a number of reasons, first, we think it wrongly confuses naturally-occurring nanoparticles, such as those produced during milk homogenization, with engineered nanomaterials. We are specifically concerned with the deliberate intent to use nanotechnology, not with the inadvertent creation of nanoparticles, in the NOP.

That minority position, which treats engineered nanomaterials as a synthetic substance, would allow a case-by-case determination on whether it is a prohibited material, as companies could petition NOSB to allow such materials as a, quote, "permitted synthetic". This would, in our view, lead to inconsistencies among organic labeled products with some nanomaterials being prohibited and others potentially permitted synthetics.

Thus, you would have an inconsistent definition of organic. We think
that organic should mean no intentional use of engineered nanomaterials, not, quote, "almost no use" or, quote, "subject to discretion". We would point out that, as with genetic engineering, consumers do not expect that organic products they buy will contain deliberately-engineered nanomaterials, and they should not be confused by an inconsistent policy on organics that would allow some engineered nanomaterials, but not others.

For other recommendations, on the recommendation about vaccines, we are not supporting that recommendation. We think the genetically-engineered vaccines, that, basically, they should maintain the status quo; that is, they shouldn't be completely exempted. They should be required to go through the approval process that is laid out in accordance with Section 205.600(a).

The reason for that is it isn't the case that you can't do agriculture without engineered vaccines. There's still a number
of problems that do need to be worked out with
the genetically-engineered vaccines.

I was part of an expert consultation that WHO and FAO put on. One of our recommendations, and this was on engineered animals, we did actually recommend that WHO, FAO, and OIE really need to look at the issue of engineered vaccines because they do raise safety issues. Because there is data that suggests some of these engineered vaccines can hang around for much longer than previously thought.

So, in that area, again, we are not supporting the recommendations to basically give carte blanche to engineered vaccines. We are actually asking you to maintain the status quo.

Then, third, on the personal care products, our basic position is that no organic claims should appear on any personal care product that does not come under the purview of NOP. So that means, we believe,
that for personal care products there should 
be the same standard as food.

We understand that there may be 
some alternative standards for, quote, "made 
with organic" or other non-USDA organic 
products, but we believe that that is not in 
line with the NOP. So we think the NOP has to 
make a decision. You either have to take it 
all on -- that means for all categories -- or 
do none of it.

We think you should take it all 
on, so as to have consistency in the meaning 
of organic, not only within personal care 
products, but also in a consumer's comparison 
of what that product label means vis-a-vis 
food.

There should be one standard, 
whether it is for personal care products or 
food. So one way we think this could be done 
is that there should be a section on the 
National List for, quote, "made with organic",
end quote, and, quote, "organic". So there
should be sections on the National List for these personal care products.

Then, finally, one other recommendation which we wholeheartedly support, and that is the recommendation on retail certification.

I will end there.

CHAIRPERSON MOYER: Thank you, Michael.

Are there some questions? I see Kevin, then Dan, and then Katrina.

MEMBER ENGELBERT: Just briefly, could you tell us how you arrived at 300-nanometer upper limit? Do you think that will eventually rise as more is learned about nanotechnology?

MR. HANSEN: Well, no. There's actually a lot of discussion internationally. Folks had done the 1 to 100, but I know that the National Nanotech Initiative here hasn't come up with a definition. Some of the international folks are also concerned with
that strong cutoff because there are particles in the 200-to-300-nanometer range that have been shown to cause adverse effects. So that is why we think a clear cutoff shouldn't be the 100 nanometers.

I can supply -- I mean I will go back. I can actually get you a couple of those papers, if you would like to see them.

CHAIRPERSON MOYER: The Chair recognizes Dan.

VICE CHAIRPERSON GIACOMINI: Yes, Michael, I think we are going to be doing a little working to tighten up on the definition.

MR. HANSEN: Yes.

VICE CHAIRPERSON GIACOMINI: You used the term "engineered" --

MR. HANSEN: Nanomaterials.

VICE CHAIRPERSON GIACOMINI: -- "nanomaterials". Is that the preferred, most understood within the industry, as small and developing an industry as it is, and without
knowing exactly where it is going to go? Is that the tightest thing we can --

MR. HANSEN: Within the regulatory community and in the technical community, that is what people refer to, is engineered nanomaterials. That is to make it very clear that what you are talking about is intentionality is, of course, important.

VICE CHAIRPERSON GIACOMINI: We are not talking about something you get from the mouth field from deep freeze, from liquid nitrogen freezing and homogenization, and those kinds of things?

MR. HANSEN: No. No.

VICE CHAIRPERSON GIACOMINI: Okay.

MR. HANSEN: When you are talking about, part of the reason that nanotechnology is an issue is because people want to take advantage of the fact that materials at the nano-scale, you basically have quantum effects coming into the case and this dramatically-increased service-area-to-volume ratio. So
people want to take advantage of these novel characteristics of nanomaterials. So we point out that that means that there could be changes. If there are changes in the behavior of a component, there could also be changes in the environmental or health status.

CHAIRPERSON MOYER: Thank you.

Katrina?

MEMBER HEINZE: Nanotechnology is, obviously, a very new technology, in its infancy, and there is a lot that we don't know, particularly about its health effects.

Can you envision a situation in the future where we do know more about their health effects and their benefits, where a specific nanotech particle or technology would bring benefits to the organic industry?

MR. HANSEN: Well, I guess my response to that is it is really ultimately not about whether something is safe or not. The idea of organic is that it is a method. You could have a synthetic chemical. You
could have citric acid produced synthetically, but you don't allow that. It has to come from a natural source.

So I think, yes, you could, if you want to think of it theoretically, you can think of a number of products that might be developed out of engineered nanomaterials that might be very useful, but does that really fit in with the whole philosophy of organic?

I should point out that a lot of the scientists, the World Society of the UK, they are all recommending that there should be actually moratoriums on release of free nanoparticles until we know a lot more.

But I could actually see some beneficial uses in tracking disease and actually identifying disease pathogens and other things that might be used.

CHAIRPERSON MOYER: Thank you.

The Chair recognizes Bea.

MEMBER JAMES: Thank you for your comments. Did you submit them in writing?
MR. HANSEN: The comments on nanotechnology, yes.

MEMBER JAMES: Okay, because you had made a comment that you supported the retailer recommendation at the end of your --

MR. HANSEN: Wait a minute. Say that again?

MEMBER JAMES: At the very end, you had made a comment that you supported the retail recommendation that is out there currently.

MR. HANSEN: Yes.

MEMBER JAMES: Or did I mis-hear you?

MR. HANSEN: The retail certification.

MEMBER JAMES: Yes. Can you give us a little bit more detail on that?

MR. HANSEN: That was just one thing I had with a short conversation with Urvashi yesterday before I left. She said that is one thing that we should comment on.
We think that that is actually a good program to have certification for retailers. We think it is something that is needed. If you would like more details, I can get you those in written form.

CHAIRPERSON MOYER: Thank you, Bea, and thank you, Michael.

Any other comments for Michael?

(No response.)

Thank you for your time.

MR. HANSEN: Thank you.

CHAIRPERSON MOYER: Tom Hutcheson, and then Forest Eidbo on deck.

MR. HUTCHESON: Good morning.

I am Tom Hutcheson, Regulatory and Policy Manager for the Organic Trade Association, OTA. OTA is the membership-based business association for organic agriculture and products in North America. OTA's Board of Directors is democratically elected by its members.

We thank the National Organic
Standards Board for the opportunity to provide comment.

Please refer to our written comments for details.

On animal welfare, OTA agrees that animal welfare is a basic principle of organic production, and the rule needs substantial clarification, especially in regard to poultry, as ruminants will be covered in the access to pasture rulemaking.

Nonetheless, OTA supports the call of many of other commenters not to move this recommendation forward. There has not been adequate time for stakeholders to consider and respond appropriately to this new recommendation.

OTA suggests that NOSB maintain the direction provided last May articulating more clearly the principles on which organic animal welfare standards should be based, and then requesting NOP to undertake rulemaking. NOP would then be able to craft a proposed
rule that works for all stakeholders,
producers, certifiers, the trade, consumers,
and, of course, the animals.

On personal care, OTA agrees there needs to be a greater consistency in the labeling of organic personal care products.

We support both our members who are certified to the NOP rule and those who have chosen to be third-party certified to private standards.

OTA supports the rule changes in the recommendation to the extent that they simply codify existing NOP policy. But if any processed product, regardless of end use, meets the rule, it may be certified. However, it is premature to recommend NOP regulation because of unanswered jurisdictional issues, implications for the National List and international trade, needed additional research on consumer expectations and understanding, and the need to more carefully examine other solutions.

OTA has submitted a white paper on
personal care as part of our written comments,
which we hope will serve both as background
for interested parties and as an aid to
discussion on a range of policy approaches
that might address the current situation.

On definitions, OTA requests that
NOSB defer this recommendation. The
recommendation does not cover several
necessary aspects of the problem.

OTA does support the proposed
changes to the definition of non-synthetic,
deleting "or bacterial culture" and the entire
last sentence of the definition, or even to
delete the definition of non-agricultural
entirely, revising Section 605 to require
organic preference.

We disagree with the suggestion
that a substance may not be both synthetic and
agricultural or even both synthetic and
organic. The definition of agricultural
product in OFPA and the NOP rule includes
processing, and accepted processing methods
can and do create synthetics according to the definition.

On sunset materials, OTA does not support the recommendation that boiler chemicals be removed from the National List, as the alternatives identified are not demonstrated to be viable, and NOSB should examine the impacts on the trade before taking such a step and assuming that an adjustment from current methods will be easy or even possible.

On nanotechnology, although NOSB does not intend to include nano-scale particles incidentally created through normal processing, the definition outlined does not convey that and would include the ability to control or manipulate at the atomic scale, which could be a description of emulsification.

The minority opinion expressed in the recommendation is a better approach. This recommendation is premature. Any products of
nanotechnology that NOSB wishes to prohibit beyond engineering synthetics should be individually considered.

On enclosed or containerized production, OTA supports this recommendation, but notes that it does not provide for the possibility of organic greenhouse production based on aquaponics, the ecologically-complex, integrated culture of aquatic animals and terrestrial plants.

Although not soil-based, aquaponics seems consistent with organic production principles. Such systems have the potential to produce two types of organic products, and therefore, offer the potential for expanded organic production.

On bivalves, we welcome this step and urge you to move this forward to NOP for rulemaking. We understand this will complete the requirements for moving ahead to rulemaking for that.

On retailer certification, looking
at the definition of "raw" and "ready to eat" is important, as is exploring whether there is a distinction in processing for deli, bakery, or any other department in the retail handling operations. We can work with you on that with our good organic retail handling practices manual.

Thank you very much.

CHAIRPERSON MOYER: Thank you, Tom. We appreciate your time.

Any questions for Tom? Steve and then Katrina.

MEMBER DeMURI: Tom, thanks for your comments.

Did you receive any comments from your membership on the boiler chemical sunsetting that we don't already have from folks that responded directly to us?

MR. HUTCHESON: I believe our members would be the same ones who have commented to you on this.

MEMBER DeMURI: Okay. I was just
trying to get an idea if there's others that we weren't aware of.

Okay. Thank you.

CHAIRPERSON MOYER: The Chair recognizes Katrina.

MEMBER HEINZE: Thank you, Tom, for your comments.

I have two questions on the classification of materials. So, in your comments here just a second ago, you said that you supported our definition of non-synthetic. I am wondering if you meant our definition of non --

MEMBER HEINZE: Okay. Then what I heard you say is you support possibly eliminating it altogether? Did I hear that properly?

MR. HUTCHESON: That would be possible if organic preference were required for 605.
MEMBER HEINZE: Okay. So my second question had to do with your position not supporting -- I'm sorry, I am struggling with phrasing here -- our determination around ag synthetics, that we rejected the term that acknowledged the concept.

We had a number of public comments to that point. I am trying to understand the concern.

Is the concern that, if an allowed synthetic was used at under 5 percent with 95 percent organic agricultural inputs, that what we have come up with would classify that as synthetic, the final material? Is that the concern? Or am I misunderstanding the concern?

MR. HUTCHESON: The broader concern is that the definition of synthetic in OFPA is so broad that some agricultural products, when processed, would under the law, the definition in the law and the rule, be synthetic product.
Cooked eggs would be a good example of that. So, then, if you wanted to use that in a multi-ingredient product, all of a sudden your cooked eggs are --

MEMBER HEINZE: You are in a bind?

MR. HUTCHESON: -- non-agricultural, and that doesn't seem consistent.

MEMBER HEINZE: So I am understanding it right, that there are a number of materials or products that are created in full compliance with the final rule, that if you applied a strict, letter-of-the-law interpretation, would be classified as synthetic? Then we would end up in a muck?

MR. HUTCHESON: That is our understanding, yes.

MEMBER HEINZE: Okay. Thank you.

That helps me.

CHAIRPERSON MOYER: Any other questions from Board members?

(No response.)
Hearing none, we will move on.

Thank you, Tom. We appreciate that.

Forest Eidbo next, and Curtis Bel on deck.

MR. EIDBO: For the record, my name is Forest Eidbo.

Good afternoon, NOSB members, Mr. Chairman, USDA, and National Organic Program staff.

Thank you for your work toward regulating a very important sector of our agriculture. I appreciate your commitment to serve for five years on a government board.

The development of true, sound, and accurate organic regulation is a very important part of the future success of organics, and your contribution toward that is to be commended.

I am 16 years old, go to Cooper High School in New Hope, Minnesota. I am here to give you the perspective of someone who
wants to support organics, but sometimes has a hard time understanding the value of organic compared to non-organic.

Let me give you an example. Not long ago, I went to the farmers' market where I approached a local apple farmer. I asked him if his apples were organic, to which he replied, "No, but they were grown sustainably and are local."

Then I asked him, "What does it mean that your apples are grown sustainably?" He told me farmers who take the sustainable approach substitute knowledge for pesticides and fertilizers. They use crop rotations and other agricultural adjustments to solve problems.

For example, soil enrichment produces healthy plants that resist disease, cover crops retard erosion and control weeds, and natural predators such as lady bugs and beneficial bacteria help control pests.

The result is that farmers are
able to minimize their use of pesticides and
fertilizers, thereby saving money and
protecting the environment, similar to what I
imagine organic agriculture is like.

He also told me that he never uses
pesticides or harmful chemicals in his apple
orchard. His apples are only $1.49 a pound
and were of high quality.

Then I thought, why is my local
grocer charging me $2.99 a pound for organic
apples when I can get sustainably-local-grown
apples at the farmers' market? Maybe there is
an additional benefit to certified organic
apples I just didn't know about.

I inquired with the produce
manager at my local grocer. He told me that
organically-grown apples are inspected by an
agency that is accredited by the USDA National
Organic Program. He told me that the
inspection process assures that apples have
been grown according to strict organic
regulation. That was assuring.
But then I told him about the local apple farmer at the farmers' market and that he gave me his word that he never uses his pesticides or synthetic chemicals, but he was not certified organic.

I asked if the USDA National Organic Program gives the same guarantee. This is where my confusion set in.

He told me, "Well, sort of, but there's a thing called the National List of Approved Synthetic Substances," that some stuff listed there might not be completely pure.

My first reaction was this guy, obviously, doesn't know what he talking about. But then I did my own research and I found that he was right. I was about to pay $2.99 for USDA-certified organics that could have been treated with antibiotics. There goes my guarantee.

Under 205.601, tetracycline and streptomycin are listed for use in organic
apple and pear production. I am not an expert in this area by any stretch, but I feel it is important that I come to you to say that some of your decisions are confusing me and possibly other consumers that want to trust organics.

Why is it that in 205.238(c)(1) it states, "The producer of an organic livestock operation must not sell, treat, or represent as organic any animal or edible product derived from any animal treated with antibiotics."? Yet, in organic crops, two antibiotics are allowed.

The regulatory hand of the NOP needs to follow the text of the final rule, which states that the NOP must, quote, "Assure the consumer that organically-produced food meets consistent and uniform standards," unquote.

I am asking you, the NOSB, to make sure that we, the consumers, understand your decisions, so that we can feel good about
putting our dollars toward organic purchases.

Thank you for your time.

CHAIRPERSON MOYER: Thank you very much, Forest. I appreciate those comments, as does the rest of the Board.

Are there any questions for Forest? Bea?

MEMBER JAMES: I just wanted to say good job and thank you for coming up and making your public comment.

CHAIRPERSON MOYER: The Chair recognizes Joe.

MEMBER SMILLIE: Forest, those are good points, and I know Hue agrees with you on the antibiotics. If he can't have them for livestock, why should we have them for apples, right?

(Laughter.)

So these issues aren't new. I am glad you spotted them because it is a complicated issue. I know that sounds like we are covering it over.
But sticking with apples, there may or may not be a good reason for the antibiotics. For example, I really like it when orchardists use a synthetic pesticide. Why is that? Synthetics are evil, right? Not necessarily. And the point I always like to make out is that synthetic pheromone mating disruptives, under FIFRA, it is a synthetic pesticide. It is used to disrupt the mating by causing a blocking of the signals of one coddling moth to another, so that they don't mate and lay the egg in the apple, which causes the worm. It is a synthetic pesticide. So we can't say that our organic orchardists don't use synthetic pesticides. I hope they do use this one because we don't like worms in our apples. But it is an example of why all synthetics aren't necessarily bad and, at the same time, why you can't say that we don't use synthetic pesticides.
It is a benign, non-toxic, excellent solution to what had been a huge problem. How can you tell the apple is organic? Well, there's a worm in it, you know. We didn't like it. We didn't like it in those days that our apples weren't up to snuff.

But because of scientific research, we were able to develop a synthetic pesticide that was allowed by the National Organic Program. So, if that confuses you more, that is okay, because if you are confused, you are right with the rest of us. It is confusing to try to define what is a living, dynamic system. The hard-and-fast rules sometimes cut off the feet to fit the bed.

So you are right, it is confusing, but our intentions are good.

(Laughter.)

MR. EIDBO: Thank you.

CHAIRPERSON MOYER: Thank you,
Joe, I think.

(Laughter.)

The Chair recognizes Dan.

VICE CHAIRPERSON GIACOMINI: I just hope the transcript's got what Joe said about those apples.

Forest, I see you are 16, finishing high school, maybe going off to college. When you are all done with all that, if you stayed in touch with organics and you still have all this interest, keep in mind a possible seat for you up here someday.

(Laughter.)

I think you are off to a great start.

MR. EIDBO: Thank you.

CHAIRPERSON MOYER: Thank you, Forest.

I also would like to comment that I think it is important and you should be commended for taking steps to connect with your food system, to ask those questions.
Some of the questions that you asked of your local producers show that, when you connect with the people who actually produce the food, you can have a great impact.

So, again, you are to be commended for that, and for coming and presenting to the Board. Thank you very much.

MR. EIDBO: Thank you.

CHAIRPERSON MOYER: Okay. Thank you.

The Chair recognizes Curtis Bell, and Jessica Waldon on deck. Curtis Bell?

(No response.)

Okay. Jessica Waldon, and Joe Dickson on deck.

MS. WALDEN: Hello. My name is Jessica Walden. I work for Quality Assurance International. I am going to comment on a few things.

The first thing is the definition of materials. Thank you very much, thanks to the Committee for broaching this topic. It is
extremely complex, and you have done a wonderful job getting through it all.

We generally support the proposed changes. We see that, initially, if the changes are adopted, that it will affect how the made-with organic products are assessed in terms of that 30 percent of known organic ingredients that are allowed.

We know that the non-agricultural ingredients do have to be on the National List, but the difficulty has been determining what is agricultural. We have had a lot of manufacturers approach us with various ingredients stating that they are agricultural. It has been very difficult for us to try to determine whether they are or they aren't, whether they should be on the National List or whether they don't need to be.

In the long-term, we see that these changes will also improve the methods by which items on 605 and 606 are evaluated. We
see that probably some items on 605 will move
to 606, and then eventually even start to be
produced organically. So we see that that is
a move in the right direction.

We don't see that these
recommendations will detrimentally affect
materials used in crop and livestock
production systems because synthetics have to
be on the National List. So we see that it is
all fine so far.

We agree with the approach that a
material is defined by both the source and
also the process by which it is produced. We
also agree with the approach that we first
decide whether or not it is synthetic. Once
it is synthetic, it has to be on the National
List. If it is non-synthetic, then it is much
easier for us to determine whether or not it
fits under the agricultural or non-
agricultural category.

However, there is another change
that needs to be made to the regulation.
Under the heading of 605, currently, the heading does state the acceptable non-agricultural ingredients allowed in organic and made-with products. So that would need further refinement to say something like non-synthetic, non-agricultural and synthetic ingredients that are approved.

We generally accept the definitions of synthetic, how you arrive at that. However, we don't agree with the last point on page 6, I believe, that says that a material is synthetic if it contains at a significant level a synthetic substance not on the National List. That is ambiguous. A significant level doesn't tell us very much. Then, again, we start on this whole problem of where certifiers are inconsistently applying the regulation.

So, instead of including that additional point there, we think that you should, since the rule is already being changed, let's go in further into
205.270(c)(2) and clarify the language there. In that section of the regulation, it talks about synthetic volatile solvents and synthetic processing aids not being allowed for use to produce organic products or ingredients. What we think the intention of that part of the regulation is saying, that any non-organic ingredient used in an organic product cannot be produced using synthetic solvents or synthetic processing aids not on the National List.

However, that part of the regulation doesn't specifically say that. So going into that part of the regulation and clarifying exactly what the intent is would perhaps bring more benefit to this whole argument.

That same section of the regulation also talks about made-with product and, basically, says that volatile synthetic solvents and synthetic processing aids not on the National List can be used for non-organic
ingredients that are used in made-with products. So it does make that distinction. So going and finetuning that language would be a great benefit for the certifiers and the clients that want to get their products certified.

We agree with the proposed definitions in general. We do see that, within the definition of non-agricultural, that agricultural system does need to be defined. There's some question there about what that really needs.

We generally agree with the use of -- I do have a proxy as well. So another six minutes?

We do agree with greater use of annotations. We feel that that will inspire the NOSB to delve further into the many different ways certain materials can be made. Sometimes they can be made in synthetic ways, sometimes not. The source material also can differ.
So we would appreciate further annotations on materials, so that we know where we are going with materials, and also for formulated products that are already on the National List, 205.605, like enzymes, dairy cultures, flavors, we also appreciate annotations there because you have a lot of incidental additives into those materials. Again, certifiers are not sure how far to go with that, when to actually draw the line and say, no, materials not allowed, things like dyes, preservatives, that sort of thing.

In terms of microorganisms and their products, we understand the Committee's rationale behind holding off on classifying them, microorganisms and their products. However, we do feel that currently, if a microorganism or yeast can be certified to the regulation as written currently, that it should be allowed to be certified. And I don't feel that this regulation actually -- or sorry -- this
recommendation was actually trying to address whether or not an organic product that potentially could also be synthetic, according to the definition, I don't feel that this recommendation was actually even trying to cover that at this stage. It does probably deserve some discussion, but I don't think this recommendation was discussing that.

So, just quickly, I wanted to comment on animal welfare and temporary confinement for outdoor poultry. In general, QAI supports amending the sections of the NOP regulation that pertain to livestock, so the intent of the regulation is clear and we can enforce that.

We also support the view, though, of the ACA and the OTA and others that this document should serve as a discussion document for now, until we have more information, in order to make these very important decisions on the regulation itself.

We do, though, ask for further
clarification -- and this is really from the
NOP -- to the interpretation of the NOP
regulations with regard to outdoor access for
poultry.

As a result of this year's round
of audits by the NOP staff, several ACAs, but
not all, were issued non-compliances because
they were allowing their poultry clients to
use specifically-established conditions
described in the regulations to justify
temporary confinement beyond an initial three
weeks of the feathering-out period.

It caused considerable confusion
in going back to clients, where we had to try
to explain that confinement couldn't go beyond
three weeks of the initial feathering-out
period. We were not able to point to the part
of the regulation that actually substantiated
that.

So we need clear guidance, and we
need to be consistent with how certifiers are
meant to follow the regulation. But, more
than that, the guidance needs a phase to be an opportunity for comment, and then we need to go our clients after that time. There's too much confusion.

That also goes to the CDFA banning of composts. We are excited to see that the next agenda is going to include more information on composts and the use of organic in the brand name on made-with products, and several other topics.

Again, though, encouraging that the guidance is put out, that there is enough time to comment, and that it is solidified before we start enforcing, because it causes great confusion, and not everyone who is affected is able to comment.

Then, just to really put it on the radar -- this is not a part of the agenda this time -- is the use of Chilean nitrate in organic farming operations, that all the other standards of the world don't allow it. It also has been linked with perchlorate
contamination, which is a serious issue. So it is something that really needs to be addressed sooner rather than later.

That's it. Thank you very much for your time.

CHAIRPERSON MOYER: Thank you, Jessica.

Questions? Hue, and then Steve, then Dan.

MEMBER KARREMAN: Thanks for your comments.

Over here.

I am not going to get specific on the animal welfare with you right now. Just there is a common thread among a lot of the comments on animal welfare that there wasn't enough time to comment.

All of our recommendations that are put out -- this is not you specifically -- but all the recommendations that are put out by the Board have to be in by a certain date, posted, and there's a certain amount of time
that people can comment.

So, granted, the animal welfare document that we put out is, you know, a lot. We were talking about it earlier in the year. Granted, we changed things from that discussion document, but it is not like we did a surprise attack and you have 35 days just to look at it, and that's it. I mean that is with any recommendation we put out. So I just want to state that.

MS. WALDEN: Noted.

CHAIRPERSON MOYER: Thank you, Hue.

Steve?

MEMBER DeMURI: Thanks for your comments, Jessica.

I gathered from your comments that QAI is against Chilean nitrate being listed. Why wouldn't you put in a petition to have it delisted?

MS. WALDEN: Well, generally, we tend not to petition ourselves, just because
we are meant to represent a huge body of certified producers and handlers. It is really just to sort of put it out there to discuss and sort of sowing the seed, essentially.

CHAIRPERSON MOYER: Thank you, Steve.

The Chair recognizes Dan.

VICE CHAIRPERSON GIACOMINI: Yes.

Hi, Jessica.

On your comments on microbes and feeling that if -- I think you used the example yeast in that case, but it is really to be any of them -- that if they can be grown meeting the regulations, that they should be able to be certified.

Is it in your opinion that there are any now that can meet what the regulations currently state that could be certified? I am specifically looking at the conversion period and whether it fits under origin of livestock, but that whole aspect of it. I am wondering,
if you see anything that can qualify now, how
you view those sections?

MS. WALDEN: You know, QAI doesn't
actually certify any microorganisms or yeast
products at all. So I would imagine it would
even be under something that would be
considered more like a mushroom. It is
something that straddles both the production
and handling aspects of the regulation.

But, again, I don't know in terms
of having to go so far as to change the
regulation completely now. It appears that
some products already are certified. So,
obviously, the certifiers have managed to find
the section of the regulation that does allow
that, those products to be certified.

So I apologize for not knowing
anything else, but --

VICE CHAIRPERSON GIACOMINI: No,
that's okay. That's okay. I was just
wondering, and not even whether QAI did --

MS. WALDEN: Yes.
VICE CHAIRPERSON GIACOMINI: --

but just if you see any -- I don't understand

how any of them would be getting through that.

I mean mushrooms I can understand. It is in

the soil at start. But in some of these where

it is such a start and stop, and stainless

steel tanks, and all the other things, I am

just confused on how they are getting that

through now.

MS. WALDEN: Yes.

VICE CHAIRPERSON GIACOMINI: So it

was just a question of how they are getting

around that part of the regs.

MS. WALDEN: Yes. I don't know

specifics.

CHAIRPERSON MOYER: Thank you,

Dan.

Any other questions from Board

members or comments?

(No response.)

Thank you, Jessica.

A couple of changes here. Joe
Dickson has agreed to move to comment tomorrow. So that puts Liana Hoodes at the podium and Susan Prolman on deck.

Liana?

MS. HOODES: I am Liana Hoodes, National Organic Coalition.

I first would like to apologize that I don't have my written comments completed. I will get them to you later today.

The National Organic Coalition is a national alliance of organizations representing farmers, environmentalists, other organic industry members, and consumers concerned about the integrity of the national organic standards.

The goal of the coalition is to assure that organic integrity is maintained, that consumers' confidence is preserved, and that policies are fair, equitable, and encourage diversity of participation and access.
NOC would like to thank its ongoing, long hard work in reviewing materials issues pertinent to the integrity of this label.

We would also like to take the opportunity to thank, in particular, the outgoing members of the Board for devoting so much of your time during the past four years to the work of the Board: Rigoberto Delgado, Hue Karreman, Gerald Davis, Julie Weisman, and Bea James. Thanks.

And we would also like to welcome our long-time colleague Miles to the leadership of the program. It is great. Good luck.

(Laughter.)

I have to say that that was quite a presentation that really was substantive and gave us a really good feeling that this program is going into its next phase and going to really ramp up what it can do.

In regard to that with TAP
reviews, NOC, we have said this again and again, that Technical Advisory Panel review to be an essential part of the materials petition process. We hope that that would be increased in the budget numbers, that we can see those to be for every material that will go along with the petition.

The petitions and the TAP reviews need to be posted for public to reference prior to the close of the comment period. I also saw in Miles' presentation that I think website stuff will be improved.

Just to note, in the additional money granted by Congress, they did include report language about TAP reviews, talking about comprehensive, scientific review. So that additional budget money was also for scientific review.

List for inerts. We thank the Board for continuing to work on this topic. We recognize that many questions exist as to how the review of inerts will proceed, and
that this discussion paper is the beginning of a process to resolve the issues.

NOP regulations must be amended to reflect the changes made to inert classifications and do so in a manner consistent with OFPA and the criteria in OFPA.

In current thinking at the EPA and elsewhere, we understand that the distinction between active or inert ingredients is becoming less meaningful. It may be that the organic label will take the lead in listing all product ingredients.

NOC has not taken a position on exactly how NOP should proceed with the inerts. We look forward to further discussions by the NOSB and the public, as well as from new, incoming Board members. Specifically, Jay Feldman has a lot of experience in working with the EPA on this. That should really help in furthering this discussion.

We do note that there may be a
longer timeline needed for compliance on this. It will have a big effect on producers in crops, and we need to be really aware of that. We want to see rigor in the review of inerts, but we also want to be able to continue, farmers continue growing.

So classification of materials.

NOC applauds the work of both the NOSB and the long slog of that Materials Working Group in finally laying out basically principles and definitions of synthetics and non-synthetics, as well as the decisionmaking matrix for first determining whether a material is synthetic or non-synthetic, and then determining whether the non-synthetic is agricultural.

We agree, as we have stated before, that annotations are useful and sometimes necessary in clarifying which forms of a substance are reviewed and approved. We are pleased to see the proposal to bring back the practice of first voting on whether the substance is synthetic or not. Kudos again.
It is a big deal, we believe.

Nanotechnology. NOC does not support the use of nanotechnology in organic. We agree with the comments that you will hear by the Center for Food Safety. We also agree about using the precautionary principle in the issue of size.

GMO vaccines. We disagree with the recommendation. Jim Riddle will make some detailed comments on this. We think that, basically, the NOSB should step back, follow established policies and procedures, and amend the recommendation to call for TAP review of GMO vaccines to determine if they are compatible with organic.

Is that it? Okay. Thank you very much.

Any questions?

CHAIRPERSON MOYER: Thank you. Any questions? Katrina, and then Hue.

MEMBER HEINZE: Thank you for your
comments on the classification of materials, especially the kudos.

MS. HOODES: Yes.

MEMBER HEINZE: It was a long slog for the Committee.

MS. HOODES: Yes.

MEMBER HEINZE: So what I heard is you have no concerns. Did I hear that correctly?

MS. HOODES: I think it is very detailed and most of it out of my area of expertise. It lays the foundation.

MEMBER HEINZE: Okay.

MS. HOODES: I think there are probably some issues, but this is the foundation that you can move forward with. So we do agree with --

MEMBER HEINZE: Great. Thank you.

CHAIRPERSON MOYER: The Chair recognizes Hue.

MEMBER KARREMAN: Hi, Liana.

MS. HOODES: Hi.
MEMBER KARREMAN: Regarding the vaccines, do people understand that they have, all vaccines that have been being used since 2002 without much review because it is a preventative? So just keep that in mind. I mean they are already in.

MS. HOODES: Well, there's a couple of thoughts on that. One is that there hasn't been a real review of whether there are non-GMO vaccines available of the same ones. So, if there are, and this is an evolving industry, if there are non-GMO vaccines available, then I think it behooves the organic to not use GMO vaccines.

So I think there needs to be an evaluation of the state of the industry right now and availability.

I also think that GMOs are a special class and they need to be reviewed. Anytime that an excluded method is considered to be used, extra special care needs to be taken. I think that individual reviews do
need to be done, even if the vaccines are already used.

CHAIRPERSON MOYER: A followup, Hue?

MEMBER KARREMAN: So, if someone wanted to use, a poultry producer wanted to use avian encephalomyelitis-fowl pox-laryngotracheitis vaccine made by a specific company, and it is the only one and it is genetically-engineered, and they have a proven outbreak, what would the organic producer do?

MS. HOODES: Well, I think the guidance needs to come from the program on what to do. But if it is the only vaccine, and the issue is a vaccine for AI or keeping all your birds inside, the evaluation may be very well that it needs to be used. But there would be an individual evaluation of that product and whether there is a non-GMO aniline.

MEMBER KARREMAN: Followup, one more?
So let's just say for a fact I know that there's no alternative to that one.

MS. HOODES: Right.

MEMBER KARREMAN: I am looking at the listing right here.

Let's see, Miles mentioned that it is a year's time for a simple review process --

MS. HOODES: Yes.

MEMBER KARREMAN: -- and any time longer, let's say six years for like the medicines that got approved.

So, okay, you have an outbreak happening. What do you do? And it is the only one. Right now, vaccines have been allowed by most certifiers to this point. I am just curious, what do you do for the welfare of the animals in that birdhouse?

MS. HOODES: I think what I am talking about is process, Hue. You said that most certifiers are using it. That is a problem for us. Most are, but some aren't.
1 Because why? This needs to be a consistent part of the regulation.

2 Now, as far as the outcome and the health issues, they do need to be dealt with. First of all, in emergency cases, there are some emergency provisions. I am not sure how those apply. But I think that consistency of evaluation and whether certifiers are using that is important. Maybe there is a way to expedite medicines and vaccines that are needed.

3 Yes, there is a disconnect in how long it takes, but the process has to be transparent and consistent and address the excluded methods and whether or not they are appropriate for organic.

4 So I think there's two parts to that, and one shouldn't supersede the other. I think, as the program grows, these emergency situations or situations that are needed to have decisions right away, there needs to be a process for that.
CHAIRPERSON MOYER: The Chair recognizes Kevin.

MEMBER ENGELBERT: Hi, Liana.

MS. HOODES: Hi, Kevin.

MEMBER ENGELBERT: Hue was trying to get you to answer a simple question. If there's an outbreak of a disease, and he gave the example of this vaccine that is the only one available, should the operation be allowed to use it on their birds?

MS. HOODES: I think there needs to be some evaluation. I really am not qualified to answer that. I do know that outbreaks are a serious issue. I also understand on the AI issue it may be the best way to go, which is to have vaccine rather than have the birds everywhere die. But we want to see evaluation.

And I don't know on the specifics of this. It is not my area.

CHAIRPERSON MOYER: Okay, thank you.
Any other questions for Liana?

(No response.)

Hearing none, we will move on to our next presenter, Susan Prolman, and that will be our last presenter for the morning session. We will start in the afternoon promptly with Beth Unger then.

So, Susan?

MS. PROLMAN: Hello. Thank you very much.

Yes, I am Susan Prolman. I am with the Humane Society of the United States. It is the nation's largest animal protection organization, representing 11 million supporters.

My comments today concern the animal welfare provisions. I have submitted them in writing in great detail. So what I am going to try to do today in five minutes is sort of hit some of the high notes on it.

To start with, I would like to applaud the Livestock Committee for its hard
work and for doing a very good job on this, and ask the NOSB to move forward with the recommended edits that we have submitted.

The Humane Society of the United States agrees that animal welfare is a basic principle of organic production and that this area warrants effective regulation.

We suggest that the rule be accompanied by a guidance document to assist producers in meeting the requirements and to provide further explanation of animal welfare concepts and concerns.

Such a document could help producers comply with NOSB's animal welfare standards and would also allow for the inclusion of information that would be much too detailed if written into the rule.

For example, we applaud the measures that would not allow the use of tail docking and beak trimming, but think that some producers may need additional guidance to prevent tail biting and injurious pecking.
behaviors, such as cannibalism.

Such a guidance document could also help to address monitoring methods and reducing lameness in dairy cattle.

We also ask that the rule explicitly contain a statement of zero tolerance policy for willful acts of neglect and abuse of animals. We believe that, in order to assure that animal welfare standards are being met, it is imperative that organic inspectors make some of their visits unannounced.

Just to start going through some of the provisions, in regard to Section 205.238(a)(2), which is talking about feed, we recommend that it be amended to include the requirement that nutritional content and rationing of feed result in appropriate body condition.

In regard to surgical procedures, we find the language of Section 205.238(a)(5) too vague. We recommend incorporating the
We recommend that the NOSB consider separate requirements relating to the use of anesthetics, analgesics, and sedatives for each species and each surgical procedure. The HSUS offers to develop recommended requirements for the use of these substances for each species and each surgical procedure, if requested by the NOSB or the Livestock Committee of the NOSB.

We also recommend that the NOSB consider requiring the use of pulled cattle in order to eliminate any need for dehorning and disbutting.

In regard to Section 205.238(a)(6), we recommend that there be an addition that each physical alteration shall be recorded in individual animal health records with dates, reasons the physical alteration is needed, and methods of the alteration. We also recommend adding a prohibition on mulesing of sheep.
We believe that the phrase "competent persons" should be better defined to explain the exact training required, and details of such training requirements is the type of thing that could be included in the guidance document.

In regard to Section 205.238(a)(8), we recommend monitoring for lameness and keeping written records on the percent of herd suffering from lameness and the causes. And again, the guidance document could go into approaches to addressing lameness issues.

The HSUS recommends that slow-growing heritage, hardy chicken breeds be used or, at a minimum, encouraged.

We applaud the -- well, excuse me.

Let me back up.

The provision regarding the withholding of medical treatment for sick animals, that it should not be done, we applaud that. We think it is important for
the inspector to evaluate how the animals are being treated, as well as corrective actions being taken and any intentions of the producers to market meat, eggs, or milk from these animals as non-organic.

I am sorry, I have to stop, but the rest of the information is in our comments.

Thank you.

CHAIRPERSON MOYER: Thank you, Susan.

Questions? The Chair recognizes Hue.

MEMBER KARREMAN: Thanks for coming in, Susan.

As I leave the Board, I hope I can help the HSUS and the organic livestock sector, if you want.

My question would be, how would you propose that we make sure that the neglect of individual animals does not happen?

Certifiers just go on the farm once a year.
We have heard there will be stepped-up surprise inspections. I am a cow doc and I like working on individual animals. I am not a herd-oriented person, although you have to be, but it is the individual animals that make up the herd.

So how would you propose that we could state somehow or another about the neglect, that it doesn't happen? It is not an easy thing to answer.

MS. PROLMAN: Yes, yes.

MEMBER KARREMAN: But you did bring it up. How should we go about that?

MS. PROLMAN: Yes. No, I agree, it is not easy to address. I think that, as we say, unannounced inspections are something that we recommend, you know, and explicit statements against neglect can be helpful.

Yes, I am sorry if I don't have a better answer for you.

MEMBER KARREMAN: I caught you by surprise, but it is something that I am
always, always thinking about. Hopefully, the Board in the future, whatever can come out, something about that, because it needs to be addressed.

MS. PROLMAN: Thank you. I agree.

Thank you.

CHAIRPERSON MOYER: Any other questions from Board members for Susan?

(No response.)

Okay. Hearing none, thank you, Susan.

MS. PROLMAN: Thank you.

CHAIRPERSON MOYER: This Board will adjourn for lunch. We will reconvene promptly at 1:30.

We have a lot of comment to go through yet today and we would prefer to get out of here before breakfast.

So we are adjourned until 1:30.

(Whereupon, the above-entitled matter went off the record at 12:11 p.m. and resumed at 1:31 p.m.)
CHAIRPERSON MOYER: Okay. Good afternoon, everybody. Our Board meeting is back in session.

We are ready to resume public comment. I would like to say once again that we have a lot of folks who want to give public comment. The Board does have work to do this evening, and we do have dinner reservations for eight o'clock that we would like to meet, and we appreciate if you can cooperate with us and see that we can get out the door in time to make that meeting.

We understand that your comment is extremely important as well. So we do look forward to that.

So we will start with Beth Unger, and Charlotte Vallaeys is on deck. Thank you.

MS. UNGER: Good afternoon. Thank you so much for this opportunity.

I am Beth Unger from CROPP
1 Cooperative. We are a farmer-owned
2 cooperative with over 1300 member owners in 35
3 states, with a lot of organic dairy producers,
4 egg producers, pork producers, beef producers,
5 all marketing under CROPP Organic Valley Brand
6 and CROPP subsidiary, the organic meat
7 company, marketing under the Organic Prairie
8 brand.

9 I came here today to talk about
10 your animal welfare recommendation. I very
11 much appreciate the work that you have put
12 into this. It is more than due to strengthen
13 the animal welfare. It is out there. The
14 consumers are asking for it.
15
16 There's many labels that are
17 coming out with certified humane, American
18 humane, and I am sure soon the Global Animal
19 Partnership certification. So I applaud you
20 for your work on the Livestock Committee in
21 addressing these issues.
22
23 I would also like to support OTA,
24 CCOF, and the ACA comments, and many other
comments that you will hear today regarding this particular document.

I don't think that this is the time to put forward the recommendation as presented. It needs to be a discussion document, so that you can hear from a lot of the folks who are assembled here today to take a look at this.

We posted our public comment online.

I really appreciate the fact that you spend time reading over 200 documents before you come to this meeting, on top of all of the telephone calls. It is amazing work, and bless you for what you are doing for the organic community.

But we just wanted to respectfully request that you withdraw this recommendation. Keep it as a discussion document and bring it back at another time.

I remember very clearly the proposed rulemaking for the pasture standard
and the amount of comments that that
generated. You take a look at that and other
documents that have come out that have a lot
of prescriptive language in it, and you get
the same general outcry about this is an
outcome-based regulation, and based on
process.

We cannot undermine the importance
of an organic system plan that each producer
and handler generates, and the relationship
that that has with the certifier.

All of this looks -- well, I
should say most of this document that you
created really is very good work. We really
agree with the large part of it, but it is
guidance, you know. We want to keep this
outcome-based. We want to have the importance
of the relationship between each certified
entity and their certifier, and allow farmers
to farm in their own production model, paying
attention to the goals, achieving the goals,
and not being told precisely how to do it.
That is less than five minutes,
and that is in honor of your dinner
engagement.

(Laughter.)

CHAIRPERSON MOYER: Thank you.
The Board certainly appreciates that.

Are there questions for Beth?

Hue?

MS. UNGER: Yes, I knew it.

MEMBER KARREMAN: I like asking questions, you know.

MS. UNGER: I know you do.

MEMBER KARREMAN: Hopefully, I get to a point. But I am sorry I walked in late,
but I read your written comments. I also heard your last half.

So you want us to pull back this
document to be a discussion document because there's just a whole lot of prescriptive-type
information in it, or whatever requirements.

Do you think there's anything in this document that is worth keeping, Beth, as far as no tail
docking of cows? Or should we like pull back
on that and say, "Um, we need to think about
that for the next two years."

MS. UNGER: No.

(Laughter.)

MEMBER KARREMAN: I mean the
Governor of California has signed a law --

MS. UNGER: Yes.

MEMBER KARREMAN: -- that has said
no tail docking of cows. So I think in
organics we should be doing that.

MS. UNGER: Absolutely. I agree
with you. As I said at the beginning, the
part you missed, I think a lot of what you put
in here is very important and right on. Yes,
that should be in there, and from a personal
perspective, I like the idea of purchase for
laying hens, as far as that goes.

But, you know, when you go back to
your discussion document that you put out last
May, the language recommendations that you are
putting in there I thought were very
appropriate in regard to the way the rule has been constructed and has been administered all this time.

It is when you have things in there like a half an acre per thousand pounds of ruminant, to me, that doesn't work in all areas of the country. There are different growing situations, and there are some areas where it is nowhere near enough.

MEMBER KARREMAN: A follow-up one?

CHAIRPERSON MOYER: Certainly, Hue.

MEMBER KARREMAN: So I guess we will be going over all this tomorrow or the next day, of course, making amendments and whatnot. But I would hope that we will be able to keep some things that are not contested at all. So it is a first step.

Then the contested-type things or things that need more discussion, hey, we will discuss more, and we have got a lot of time here; everyone else does; I will be gone.
(Laughter.)

I guess the reason we pulled back from what we had on the discussion document with inspectors doing measuring of lameness and cleanliness, and that kind of thing, body condition scoring, is because on one of our phone calls with inspectors, they said that is really difficult to do. I mean to train people to do that.

So we pulled back from that.

Instead, we are saying cows have to be clean. Cows have to have their tails. Those kind of end goals, so that the farmer can figure it out how to get there.

Now there are other areas, I agree, that we do have specific things which people are worried about and need more discussion. But I do believe there are some end goals that should be in everyone's organic system production plan, since that is the big thing.

We are just making sure that it
has got to be in there in the organic realm,
so that consumers, not just the farmers and
certifiers together, but consumers looking at
the organic world can say, you know, we know
that they are not docking tails; we know they
are keeping their animals clean. And we will
let the farmers figure out how to keep them
clean.

Does that make any sense?

MS. UNGER: Yes.

MEMBER KARREMAN: Okay.

CHAIRPERSON MOYER: Any other
questions for Beth?

(No response.)

Hearing none, thank you, Beth.

Charlotte Vallaey is up.

And you have a proxy?

I'm sorry, could we just wait one
moment, Charlotte?

Barbara?

MS. ROBINSON: Yes.

CHAIRPERSON MOYER: Barbara,
MS. ROBINSON: Mr. Chairman,

members of the Board, thanks for letting me
interrupt just briefly.

I would like to take a moment to
introduce the new Administrator for the
Agricultural Marketing Service, Ms. Rayne
Pegg.

If you just will allow me briefly
to mention Rayne's considerable qualifications
that she brings to this job, because I think
you will find a very, very formidable ally and
a very qualified advocate for this program and
your industry.

Rayne, very interestingly -- I
didn't realize this, either, until we just had
our senior management retreat a couple of
weeks ago -- I knew that Rayne had spent some
portion of her life growing up in that State
known as California, which you guys are
somewhat familiar with. But Rayne also spent
a good portion of her life also growing up the
other side of the country in Maryland as well.

So she is familiar both with the eastern and
the western shores.

Rayne most recently served as the
Deputy Secretary of Legislation and Policy for
CDFA. In that role, she was an advisor to
both the Secretary of the Department and the
Governor of California on legislative and
policy issues.

Rayne represented the Department
before the California legislature, regulating
bodies, and interested parties on issues that
potentially impacted the Department's
programs.

She has worked with growers and
the public to find common ground and reach
agreement on many controversial issues. She
has worked on legislation and public policy
that address invasive species, the Farm Bill,
the Department's budget, organic production,
food safety, farmers' markets, government
oversight, and trade barriers.
Rayne has also had some experience in U.S./Korea free trade negotiations. She has worked with USDA to resolve phytosanitary barriers that restrict the movement of California products to foreign and domestic markets. She has been heavily involved in the fertilizer issues out in California and the Leafy Greens Marketing Agreement.

So if you will join me in welcoming our newest Administrator Rayne Pegg, thank you very much.

(Applause.)

MS. PEGG: Hi. I feel awkward standing here with my back to the crowd, but I will do my best anyway.

It is very nice to finally see all of you. I have heard so much about you, and I am looking forward to getting to know you better as well as the new members that will be joining the Board in January. I understand probably quite a few of them are here today.

This program is clearly a program
that is under a watchful eye, which is good.

It has grown tremendously, and it has been built on limited resources.

The plan is, moving forward, that we increase those resources, we dedicate more funds to this program, to ensure that it can be there for the future and the future problems and questions that it is coming under.

You know, where does this program need to go? I think when it was originally enacted, the NOP didn't really know some of the questions that are coming before it. I know that you, Miles, has laid out a very strict agenda moving forward on some of the things that we need to tackle.

Inputs, what are we going to do about inputs? What are we going to do about consistency in the program and how we apply that consistency throughout not only those producers here in the United States, but the rest of the world?
The biggest thing that we have to protect is the integrity of this program and the integrity of the National Organic Seal when you see it on your grocery store shelves. I know that I am dedicated to that. Miles is definitely dedicated to that. Clearly, the Department is dedicated to that. That is why we have increased its funding so dramatically in the 2010 budget, and we plan to only increase it even more.

I think it will help not only people gain further trust of the organic seal and the organic program; I think it will help us tackle issues more quickly and with a better knowledge base, as we bring more people on with that diversity, and what we need in order to tackle some of the things that we didn't realize we were going to have to tackle and some of these questions that are coming before us.

I look forward to working with all of you. I always have an open door. Please
I feel free to call me at any point, anything that you want to share.

There's a lot of discussion that goes on behind the issues that the NOP is facing, and we need to have those. We need to have those as open discussions. We need your input, and we need you to be a part of the process as we review all of these things and we make decisions in terms of what we are going to do and how we are going to address these things that everyone is asking.

So thank you very much. Thank you very much for your service. We look forward to working with you over the next four years, and then four more, hopefully.

(Laughter.)

So thank you very much.

(Applause.)

CHAIRPERSON MOYER: Thank you, Rayne. I know the Board looks forward to having you in that position and working with you closely, along with Miles, as we move
forward on all of these challenging issues.
So thank you for coming and addressing it. We appreciate that.
Okay. We will resume our public comment now with Charlotte.
Charlotte, I believe you have a proxy? Is that correct?
MS. VALLAEYS: Yes.
CHAIRPERSON MOYER: Okay. And Dave Will will be on deck.
MS. VALLAEYS: Thank you for the opportunity to comment.
My name is Charlotte Vallaeys. I am Policy Analyst with the Cornucopia Institute. I will also be commenting on behalf of Mark Kastel, our Senior Farm Policy Analyst. Mark is in Missouri this week presenting at a conference and couldn't be here.
I wasn't planning on commenting on this, but Miles mentioned the 1995 recommendation for accessory nutrients. So I
I thought I would just remind the Board that this issue includes DHA and ARA, which I have mentioned before at previous meetings.

We have found that these additives, which are currently put in as accessory nutrients, are creating some problems in some infants. So just to be aware of that when you are looking at this, coming up with this perhaps new recommendation. Just keep in mind there is a lot of research out there, and we would be happy to help you and share any information that we have on that.

Next I would like to comment on animal welfare. Cornucopia agrees with the Livestock Committee that animal welfare is a basic principle of organic production and warrants appropriate and effective regulation.

We wholeheartedly support the Livestock Committee's initiative and urge the adoption of stronger, more effective regulations for improving animal welfare.

Thank you to the members of the
Livestock Committee for your work in coming up with these recommendations.

We support stronger animal welfare regulations, but we also believe that the Board should invite and consider input from all stakeholders, which will probably result in even stronger recommendations, regulations consistent with current and common best practices widely adopted in the industry.

From our own research and conversations with our organic livestock producer members, we would like to make the following suggestions for strengthening the animal welfare recommendations:

First, we strongly support the minority position and encourage the Board to consider its adoption. We agree that milking dairy cows more than two times in a 24-hour period is not compatible with fundamental organic management principles, and request that this restriction be included in the recommendation. Pushing cows for high
production results in short, stressful lives and does not meet the expectations of organic consumers.

Accordingly, the provisions in the minority proposal for restricting replacement cow acquisition are also important, since high turnover is indicative of burnout from pushing for high production.

The minority opinion also eloquently articulates the daily cycle and the relationship of a cow's behavior to the pattern of the sun, when cows and other ruminants are allowed to exhibit their natural behavior. The trend of confinement dairy operations to incorporate bright lighting, sometimes 24 hours a day, should be analyzed for its impact on the health and welfare of dairy animals. Again, we believe the minority opinion should be incorporated in its entirety in the final recommendations.

Moreover, Cornucopia requests that the NOSB solicit input from organic dairy
producers on the following recommendations, since we have received mixed feedback:

The first is the provision that animals must be kept clean during all stages of life with the use of clean, dry bedding, when necessary. Some producers worry that an organic operation with cows out on pasture, for example, mud season in Vermont, may not be able to keep their cows totally clean at all times.

The second provision we ask the NOSB to look into further states that the producer must have valid veterinary client/patient relationship with a licensed veterinarian. This measure may be hard on some producers who live in areas where veterinarians familiar with organic practices are hard to find.

Next up, poultry. Since the current standards have been easily interpreted by some certifying agents as allowing producers to keep chickens indoors, it is
important for the new rules to clearly offer no room for loose interpretation. As such, we offer the following suggestions for strengthening the rules:

One obstacle remains to granting true outdoor access, which is the size and number of pop holes. Doors to the outdoor area must be easily accessible to every bird in the house, and this is best achieved through quantitative rules.

We recommend taking a look at the European organic standards as a guide. They require doors with a combined length of at least 4 meters per hundred square meter area of the house available to the birds.

Second, the current recommendation says that poultry reared in houses shall have complete access to pasture, open-air runs, and water, or other exercise areas. We are concerned that this language remains too vague, and the phrase "or other exercise areas" could easily be interpreted as meaning
an enclosed concrete porch, as is currently common. By deleting "or other exercise areas", the recommended rule becomes much more firm and less open to selective interpretation. All poultry should have access to either pasture or open-air runs.

Cornucopia has no comments at this time regarding the recommendations for animals other than dairy cows and poultry. However, we are confident that organic producers involved in raising other livestock animals, such as hogs, sheep, and goats, would be able to provide valuable input. Again, we encourage the Board to solicit input from all organic stakeholders before finalizing the recommendations.

Last, we anticipate that operators of industrial-scale farms will fight stronger regulations that will benefit animal welfare at the expense of their large-scale production model and profits. We strongly encourage the Board to vote on behalf of organic principles,
family-scale producers, respecting consumer expectations in animal welfare, instead of accommodating industrial-scale producers that may oppose stronger regulation.

Some may argue that chickens must be kept indoors to protect their health. Research has shown that overcrowding contributes to stress, which weakens the immune system of animals, and therefore, contributes to disease.

The argument that animals should be kept indoors to promote their health is not only scientifically-invalid, but is also in direct opposition to the kind of production system that organic consumers expect when they pay a price premium for organics.

It is also important to note that during disease outbreaks, such as avian influenza, producers may be required to keep their birds inside. This should be a temporary scenario for emergencies. In no way should producers build houses without outdoor
access and argue that this grants their birds permanent protection. Keeping birds confined will not protect from viruses such as avian influenza, which can be transferred into a biosecure operation on someone's clothing. When consumers, who are increasingly hungry for the story behind their food, learn the reality of some organic production, they lose confidence in the organic label. This harms the entire organic community.

Making sure the reality of organic production is consistent with realistic consumer expectations of organic production, for which they pay a significant premium in the marketplace, should be seen as a positive step.

For these reasons, it is important to move ahead with strong animal welfare standards. However, the input of rank-and-file, family-scale organic livestock producers must be taken into consideration. The timing
of this proposal did not permit its evaluation and two-way dialog with farmers and ranchers around the country who did not have access to the internet.

I would like to note that about 30 to 40 percent of Cornucopia members, for example, do not typically use email. This includes many of our Amish farmers. A 30-day period to them is not adequate time to provide input on this proposal.

Furthermore, because of the controversy subsequent to the release last fall of a wholesale rewrite of the organic livestock regulations, and the impending release of the rewritten draft, we would encourage tabling the animal welfare proposal until final livestock rulemaking is completed.

At that point, industry stakeholders should be invited to participate in shaping the final NOSB animal welfare recommendations. Let's take a minimum amount of time and get this right.
We need to protect ethical practitioners in this industry and close the loopholes that are currently being exploited on industrial-scale operations.

But, just like the proposed rewrite of the livestock standards, animal welfare provisions must not create regulations that are unworkable in real-world conditions. Taking the time now for a collaboration with farmers and ranchers will assure a successful initiative.

Next I would like to comment on vaccines. According to OFPA, the NOSB shall convene Technical Advisory Panels to provide scientific evaluation of the materials considered for inclusion in the National List. This applies to GMO vaccines which must be reviewed and added to the National List in order to be used in organic production. The preamble to the final rule is clear on this.

We do not agree with the Livestock Committee's recommendation that the NOP ignore
the law and regulation in recommending that the NOP should require that any vaccines previously allowed stay allowed, including those derived from excluded methods, until the rulemaking is completed.

We do not agree that the NOP should allow the use of prohibited substances until rulemaking is completed. Doing so would undermine the authority of the NOP and harm the reputation of the NOSB.

One of the Livestock Committee's arguments for allowing GMO vaccines without individual review is to be prepared for an infectious disease outbreak. But, under NOP Section 205.672, emergency pest or disease treatment, such a scenario is already addressed.

In the event of a mandated -- well, I will skip this because my time is -- all right, I'll stop.

Thank you.

CHAIRPERSON MOYER: Thank you,
Questions or comments? The Chair recognizes Hue.

MEMBER KARREMAN: Thanks, Charlotte.

So do I understand that Cornucopia is in favor of specific numbers? I think you said that early on. So, in essence, prescriptive-type regulatory language versus the former speaker said don't do that; just stick with the OSP pretty much.

MS. VALLAEYS: Right.

MEMBER KARREMAN: Sorry, I'm paraphrasing, but how do you reconcile that?

MS. VALLAEYS: Do you mean our position with the previous speaker's position?

MEMBER KARREMAN: Yes, yes.

MS. VALLAEYS: Do I have to reconcile it?

(Laughter.)

MEMBER KARREMAN: You don't have to reconcile it. Sorry. You don't have to
reconcile it.

CHAIRPERSON MOYER: You don't; we do. You don't; we do, yes.

MEMBER KARREMAN: I'm sorry. But you are, basically, saying you do want hard-and-fast numbers for certain things? Okay.

CHAIRPERSON MOYER: Thank you, Hue.

Any other comments or questions for Charlotte?

(No response.)

Thank you.

MS. VALLAEYS: Thank you.

CHAIRPERSON MOYER: Dave Will, and Mark McCay is on deck.

MR. WILL: Good afternoon. How are all of you?

My name is David Will. I am the General Manager, Chino Valley Ranchers. This is Chris Nichols, Vice President of Chino Valley Ranchers, and will soon be the owner of Chino Valley Ranchers once his father retires,
maybe soon. It depends on you.

We are a southern California-based organic and free-range egg producer. Our company has been in business since the late 1950s and has been certified organic since March of 1997.

I wanted you to meet Chris and to know that, if you pass the animal welfare as written, that you will put out of business our third-generation farm, and one of Chris' first business programs will be to actually terminate our employees and close down our ranches.

I brought a label for you, just to kind of see something that, when we read this, that we kicked around. At the start, Mr. Chairman, you said that the goal of this group was not to confuse consumers and to continue to grow the industry, as I wrote down.

This is something we have actually toyed with and looked at. If you could scan that, please? Going to a natural egg that is
fed a certified organic diet. We don't know where else to go, unfortunately. That is something that we are actually going to consider. It has actually tested well, too, which scares us.

It is not that we don't want or need standards to protect the word "organic"; we do. But we need one that reflects the past 12 years of growth and investment since we have started to produce a certified organic egg.

Consumer demand has forced us to expand, and in California we are not able to purchase vacant land zoned for poultry. We have grown the only way possible, which is to buy existing operations, gutting them, and turning them into an organic facility.

All of our organic houses have outside access, but these areas are defined by the existing footprints of the ranches purchased. To get the space required of three feet per bird outside is impossible due to
existing buildings, roads, range areas of other houses, or property lines that we just cannot change.

In addition to the outside space that you are requesting, you are also requesting a change in the inside space from an industry standard of 1.5 to 2 feet per layer. The current 1.5 is used and supported by the free-farm standards, the humane farm standards, and it is also supported by the Humane Society and the new cage-free standards published by the United Egg Producers, which have all gone through lengthy scientific review and standard reviews as well.

The new standard of 2 feet per layer will have a serious impact on our production cost with little or no gain on animal welfare. Layers prey. They flock together for safety by instinct. Adding a half a foot of space per layer will only add empty space at one end of our barns that no birds will utilize, increasing our heating
cost and increasing our fixed cost by 25 percent, due to the flock size reductions.

Don't get us wrong; we do believe that all organic layers need and demand outside access, and that the 1.5 foot per bird inside space is acceptable. In fact, that requirement of having outside access is why we chose CCOF as our organic certifier back in 1997.

We are pleased that the National Organic Standards Board is looking into this issue and making all organic production equal, and to protect the word "organic" with consumers. But we need a reasonable standard that reflects the lack of specific standards for the past 12 years.

Our last concern is that the new standards need to be adapted for layers and broilers. Their life cycle and growth patterns are quite different, and we urge the separation in the standards for the issue of outside access.
Boilers, on average, have a 45-day life cycle, which is much more different than that of an 80-to-110-week layer. We have a much longer life to protect and a much more rigorous vaccine schedule that is regional as well.

We would urge language that allows to keep the pullets inside until their vaccines are administered and it becomes effective and active in the bird. This should come as a regional, depending on each individual producer's and veterinarian concerns.

I know Chris had a couple of things to add.

MR. NICHOLS: Thank you for letting me have a word here.

I have been raised with this business my whole life. We have had cage-free birds since I was born in the late seventies. I have seen it. I have seen how it works. We have moved to organic. I see
the birds, how they act.

In response to space outside for birds, it is very evident, once you go into these production facilities.

A lot of these standards, I would love for everyone here, we invite you publicly now, if you want to come see our farms, if you want to come see the birds, we invite you to do so. That way, you are not just taking our word for it; you are seeing it in front of your face. It is not just something we are saying.

But everything needs to be regulated well. We just want to make sure it is done correctly.

And I appreciate your time.

CHAIRPERSON MOYER: Thank you.

Perfect timing, yes.

Questions for Dave or Chris?

Kevin?

MEMBER ENGELBERT: I want to be careful how I phrase this because I don't want
to give the impression that I am just jumping
down your throat. But your label up here
intrigues me in that you chose to use a small,
little barn with a silo, a landscape, and one
chicken.

(Laughter.)

Does that represent your
operation? Do you think you may be deceiving
consumers with that type of label as opposed
to an image of your current facilities on that
label?

MR. WILL: Absolutely not. That
is just a mockup. We haven't even looked at
the imagery of it at all. It is mainly just
the words that we were using for the value of
the fact that, under these standards, you are
going to force us and a majority of the
business out of the organic certified egg
program, and we will have to become a natural
egg, which has a huge resonance with
consumers.

I have seen many studies by the
Fancy Food Association that natural actually outperforms organic in certain markets. This is an option that we may have to look at if the standard goes into effect as written, that we would have to go to a natural egg, which has absolutely no meaning, no longer carry the USDA seal, and go to fed a certified organic diet, which in a way is kind of a win because it will save us a huge amount of certification cost as well.

But we don't want to do it, and I don't think the consumer wants it done. I think it would be terrible for the marketplace to have it happen.

CHAIRPERSON MOYER: Thank you.

The Chair recognizes Rigo.

MEMBER DELGADO: Yes, you were talking about an increment of 25 percent in your production cost.

MR. WILL: Fixed cost.

MEMBER DELGADO: Fixed cost? What is that in relation to your overall cost?
MR. WILL: Well, our fixed cost would be, if we had a house that was geared for 1.5 foot per bird and we had to go to 2 feet per bird, we are going to lower the number of birds in that facility. So we are going to have less production out of that in number of eggs per day.

So we will have a higher cost of the employee. The utilities really won't change. In fact, they will go up. The taxes on the facility, the mortgage on the facility, all of those costs will go up due to the lower production, and that is going to be passed onto the consumer.

MEMBER DELGADO: In terms of your overall total cost of production, fixed cost is what percent?

MR. WILL: Can I get back to you this afternoon and put a pencil to it?

MEMBER DELGADO: Sure. Because that is critical, yes.

MR. WILL: Ten percent? Feed is,
obviously, the No. 1 cost.

MEMBER DELGADO: I would assume that.

MR. NICHOLS: Increased labor as well.

MR. WILL: Yes. Put on the spot, I --

MEMBER DELGADO: Okay. Is that the only -- a followup, if I may, Mr. Chairman?

CHAIRPERSON MOYER: Certainly.

MEMBER DELGADO: Is that the only objection you have to this document, that the space is too much, or what?

MR. WILL: Our main concern is the outside access and the inside access space per bird, defining that so strict.

The rest of the document, with the changes that have been proposed by the other groups, we basically support. In five minutes, it was hard to get into the fact of the no-force molting and the beak trimming.
I think other people after us are going to cover those as well.

Part of it is we think that you have come in with Canadian standards because you have mirrored them so well, but, unfortunately, in Canada they have an Egg Marketing Association that mandates the number of birds each producer can have. It is not a free market system like we have in the United States.

We also fully support outside access for poultry. We think it is important to have, but we think that, for the last 12 years, you have allowed the businesses to grow. In California, we have been forced to grow the only way that is an option for us. That has space requirements.

To suddenly now change the rules, or to define them further, yes, that is the issue we have. Everything else, for the fact of the requirement of outside access, the requirement of space inside, we think that is
great, yes.

MR. NICHOLS: One thing I have to add: about your outside access, one thing that was presented in that regulation was feeders and waterers outside. Currently, we don't do that because migratory birds are the No. 1 cause of disease for our birds. If we have our drinkers outside, and we have sparrows or blackbirds, or whoever, bringing disease to those pans, and then our birds go over and feed and drink with them, you are just increasing the risk.

This was all based upon science previously to make a safe food product. By adding just the waters and feeders alone, you are adding a lot more risk to the flock.

CHAIRPERSON MOYER: Thank you.

The Chair recognizes Hue.

MEMBER KARREMAN: Just since you brought that up, so then I try to think about, okay, well, I realize chickens aren't cows, but cows have to be outside out on pasture and
there's waterers out there and everything like that. So that has been going on a long time. Sometimes they drop some manure in the water, and it happens. There's not a whole lot of increased disease and mortality on animals that are outside other than chickens.

So I don't always buy the argument that chickens should not be outside because they are going to get parasites from pecking the ground and all that. I know I am going to hear that, but I don't buy that argument because I don't see it with cattle, and there's a lot of them out there.

One question I wanted to ask is, though, the vaccines, you said you are worried how long they have got to be outside because you want to wait until the vaccines take. I am just curious, how often do you vaccinate the birds? How many vaccines are they getting?

MR. NICHOLS: I don't think we made that comment.
MEMBER KARREMAN: No, no, you did, I believe.

MR. WILL: We did a little bit, yes.

First, to your first part of the comment, I don't think we oppose the outside access to birds, either. I don't think we said that there was going to be a risk of increased disease by having the birds outside that concerns us.

As far as the vaccination schedule, in California, I can get you the specific list. It is done by our veterinarian, and I may have it; I am not sure.

But up to about 14-15 weeks, we are vaccinating for different things, Coryza, Salmonella, and a variety of other illnesses.

MR. NICHOLS: Newcastle.

MR. WILL: Newcastle.

CHAIRPERSON MOYER: Okay, the Chair recognizes Kevin.
Mark, just so you will know, we will take drink orders a little bit later on.

(Laughter.)

MEMBER ENGELBERT: The outside access that you provide for your birds right now allows these birds to interact with sparrows or blackbirds or any other bird that flies into that area? It is not caged? It is all --

MR. WILL: No, it is open to the environment.

MEMBER ENGELBERT: So what prevents your birds from leaving?

MR. WILL: We have a side fence that is high enough that they can't get over.

That's it.

MEMBER ENGELBERT: That's it?

CHAIRPERSON MOYER: The Chair recognizes Bea.

MEMBER JAMES: My question has to do with your growth. How long have you been in business?
MR. WILL: The company has been in business since 1953, and then we have been owned by the current owner since the mid-1980s.

MEMBER JAMES: And your annual percent growth per year is, on average?

MR. WILL: Before this year? On average, 18 to 25 percent.

MEMBER JAMES: As you have grown almost 20 percent annually, how often do you have to add new barns?

MR. WILL: We have actually added new facilities, not specifically barns. Since I have been with the company in 2001, we have bought four properties.

MEMBER JAMES: Okay. So, if you were to have to adapt to a larger space per bird, and with a 20 percent annual growth, knowing that you would probably have to add more facilities, would that cost be that much different if you were planning for larger space per bird? How much time of a transition
would you need in order to do that?

MR. WILL: Excellent question.

First, a majority of our existing facilities could never conform. So we would immediately have to scrap all those and go to somewhere else, which would then limit cash flow in order to invest into the new facilities and finding the space.

Unfortunately, again, like I said, in California, we don't have access to zoned agricultural poultry land. It is almost impossible to buy vacant land and go in and do that. Plus, the cost is ridiculously high, land in California in general.

I don't know what we would do if we were painted into that picture as a business. I honestly feel our option would be to perhaps pursue a cage-free certification with some sort of organic feed claim, like we have shown, or go out of business. I honestly don't know what the owners would do at that point.
MEMBER JAMES: So you don't think that, if there was a transition period for existing producers, that that would work for you?

MR. WILL: I don't know that we have the options in some of the facilities. We are hemmed in with other buildings. We are hemmed in with property lines. I don't know how we would get the space in certain facilities, and I don't know that we have enough other facilities that we could open it up.

When you buy a commercial operation that has gone under, you don't have the ability to go in and design from the beginning.

CHAIRPERSON MOYER: Thank you, Bea.

The Chair recognizes Dan.

VICE CHAIRPERSON GIACOMINI: You commented on the 1.5 inside, preferring the 2. Are you comfortable with any number for the
outside?

MR. WILL: Yes. In our public comment, we wrote that we think not 100 percent of the birds will utilize outside access on any given day. We leave our open access for 24/7, and at the peak of the day, we have about 25 to 30 percent of the birds out there.

We felt that, if you start with a square foot per bird as outside access, since you have about a 25 to 30 percent usage, that really translates to 3, 3.5 foot per bird in the entire facility. We were comfortable with that as a number, and put that in our public comment, sir.

Thank you.

CHAIRPERSON MOYER: Okay. The Chair recognizes Hue, then Kevin.

MEMBER KARREMAN: Just a quick question.

CHAIRPERSON MOYER: Briefly, if you can, please.
MEMBER KARREMAN: Yes. What is the lifespan of a chicken house? It kind of adds onto Bea's. What is the lifespan where you are going to redo that chicken house anyway to maybe new standards?

MR. WILL: We have some that were built in the fifties that are still in use. We have just modified their existence.

The ranches we have bought, I don't think any of those were built before the seventies. When we go into a ranch, we leave the walls alone and everything else is torn out.

MEMBER KARREMAN: What is the average for the industry?

MR. WILL: You will probably get some people after me that may have a better answer for that. I'm sorry.

But I would say, you know, what is the amortization? Thirty years? So a minimum of that.

CHAIRPERSON MOYER: The Chair
recognizes Kevin again, briefly, if you can.

MEMBER ENGELBERT: Yes, very briefly.

Just to try to get a better handle on your operation or operations, do you grow any of your own feed? If so, what percentage? And what do you do with your waste that you produce at your facility?

MR. WILL: We do not grow any of our feed. We do have certified organic mills at all of our locations, and we mill all of our own feed that we bring in to our specific standards.

And all of our manure is collected several times during the life of the birds. Then some ranches compost. Most just take and sell it out as fertilizer.

CHAIRPERSON MOYER: Okay, thank you.

MR. WILL: Thank you.

CHAIRPERSON MOYER: We appreciate both of you for your time.
MR. WILL: Thank you very much.

CHAIRPERSON MOYER: You're welcome.

Mark McCay is next, and Greg Herbruck is on deck.

MR. McCAY: I'm certain the Board expected to see Dave Martinelli talking about methionine. I am going to stand in for him today and give an update on the Methionine Task Force. We have a PowerPoint presentation that I will try to go through quickly.

Methionine, the task force was formed about five years ago. Over the past two years, after we got the extension to the annotation, we put together a 24-month work plan. It included three things that we were going to specifically work to address from trying to generate different options for being able to provide the methionine needed for the diets for all poultry production. That is broilers, layers, and turkeys are covered in this.
So we talk about options for high methionine in corn. We sponsored research around naturally producing methionine. Then we are also doing some commercial trials, both on broilers and on layers, with different types of diets to try to see how birds perform with different options for supplemental methionine in a non-synthetic form.

We also committed, obviously, to making regular updates to the NOSB.

For this meeting, discussion of the petition. In August, we made a petition to extend the annotation period to 2015. I will talk about that as well.

There are some additions, there are some changes that we would recommend in terms of how we would position that for getting approval for that extension.

I will go through the updates on the research alternatives, and then get a little bit ahead of what we are going to talk about again in the spring meeting.
So the petition -- and there is a copy on what Valerie has. I have attached it as part of the materials. So it is something that we could provide. It was provided on August 2nd. We would expect that it would be something that would be on the agenda for the spring meeting.

But, basically, a little bit of background on methionine: it is an essential amino acid in poultry. Poultry cannot make it themselves. It has to come from feed.

What currently is happening is that organic poultry aren't able to satisfy the entire nutrient or methionine demands from the sources that we are able to feed them. We supplement about 30 to 40 percent of the required amount of methionine, is in supplemental synthetic form currently.

A little bit of background, also, that poultry and birds are omnivores. We would have expected, typically, that if you go back historically kind of within the 20th
In the 20th century, that broiler and layer feeding programs were actually the supplemental or the additional methionine that the birds needed typically came from bonemeal, meat meal, blood meal, other types of things like that, which are precluded from use in organic feeding regimens. And prior to that, birds which were omnivores, forest-dwellers, would have been able to pick up the necessary methionine through their feeding practices and their scavenging practices, probably from meat-based sources.

Next page.

We talked about that we have submitted the petition to extend the annotation date to 2015. Combined with that, though, the Methionine Task Force has proposed a cap on the usage.

The usages are listed here. This is the total amount of synthetic methionine in the diet over the lifespan of the birds, based on a per-ton-of-feed basis. The next page
actually explains it a little bit better

Actually, the next two pages explain it a little bit better.

As part of the TAP review, in 1994, we -- let's go back one more. No, the other way. Yes, perfect. Sorry.

As part of the TAP review, the National Research Council stated what they thought were the nutritional diet requirements for methionine in the diet of different types of poultry. They were basically the minimal levels that were required not to optimize growth, not to make the birds grow faster, not to increase production, but, basically, just to maintain the general productive activities of the different types of poultry.

Next page.

Down at the bottom are the NRC values for methionine and cystine. A little bit here about why we -- and I think this came up in the last meeting as well. We talked about methionine and cystine in combination.
Methionine in the birds actually converts to cystine. So the cystine requirements of the birds was actually one of the main building blocks for the feathering process. The methionine will meet the cystine requirements of the bird.

So, for both laying chickens and broiler chickens -- I am sorry we didn't have it for turkeys -- those are the NRC values. You can see that the average for laying chickens is .6. The average requirement in the diet for broiler chickens is .75.

The proposed cap requirements -- and I didn't mention on the previous page, but the previous page, the NRC says or commented that, typically, about 60 percent of the methionine requirement in poultry's diets can be provided by the grains and the feeds. The balance, that remaining 40 percent, needs to be provided in a supplemental form.

The proposed caps on these actually represent 33 percent of the NRC
average values. So the average value on
broiler chicken is .6. I am sorry. For a
laying chicken is .6. The .2 percent
represents a 33 percent -- okay, sorry. Going
too quickly.

I have more material that we can
provide on the corn trials, the high
methionine corn trials, and also a little bit
more detail about the grow-out broiler and
layer trials. There is detail and appendices
in the back of the materials that were
provided as well.

The Methionine Task Force also
commented on animal welfare as part of the
public comment period, and that was posted as
part of your packet as well.

CHAIRPERSON MOYER: Okay.

MR. McCAY: Sure.

CHAIRPERSON MOYER: Thank you,

Mark.

I see we have some questions.

Tina, then Katrina.
MEMBER ELLOR: I know this has come up before. Was any of this work done on chickens that had outdoor access?

MR. McCAY: There is one study that has just started off at Herbruck's poultry farm that the birds will have outdoor access availability.

On the broiler pen trials that were originally done, none of those birds had outdoor access. We do now have a research barn in Marin County in California and will start a research trial that will allow the birds to have outdoor access.

MEMBER ELLOR: Can I ask a followup?

CHAIRPERSON MOYER: Sure.

MEMBER ELLOR: What kind of outdoor access?

MR. McCAY: I won't be able to comment on what is going to be available for the layer trial. For the broiler trial, it is what I would call pasture/forage area that
would meet any kind of outdoor access or current organic standards.

CHAIRPERSON MOYER: Thank you, Tina.

Katrina?

MEMBER HEINZE: I was wondering if we can get a copy of your presentation.

MR. McCAY: Absolutely.

MEMBER HEINZE: Valerie can send it to us. That would be great.

MR. McCAY: After the meeting?

MEMBER HEINZE: After the meeting?

MR. McCAY: Yes, we can unplug, and it is on a flash drive.

MEMBER HEINZE: Okay. Great.

Thank you.

MR. McCAY: Sure. Yes.

CHAIRPERSON MOYER: Okay. Thank you, Mark. We appreciate your time.

MR. McCAY: Thank you.

CHAIRPERSON MOYER: Greg Herbruck is up, and Kurt Lausecker is on deck.
MR. HERBRUCK: Good afternoon.

My name is Greg Herbruck. I am an egg producer in Michigan.

I appreciate the chance to comment. I appreciate, also, the effort the Board has put forth, recognizing the need for animal welfare standards for laying hens and all animals.

I think it is in our best interest to be interested as a producer in animal welfare. I think we are on a path of recognizing we need to head in that direction.

We have been an organic egg producer for a little over 11 years. I am a third generation. My family has been in the egg business for over 50.

We have been a part of the growth of the organic business in the last few years. To answer a question, we started with 7,000 organic hens. We are up to about 700,000 in that 11 years. So it has been a huge growth.

Some of these things that we did,
in the last year, my family and I invested $13 million in a dedicated organic site. If you do the math on that, it is about $40 a chicken we have invested.

These new guidelines, as David had mentioned, they weren't designed to give the -- the main restriction is the outside access. It is just, if we give them that much space, they are going to be into drainage issues.

You are going to have environmental issues.

Basically, with the guidelines the way they stand, we would have to double that outside access with a rule requiring letting it set fallow, so you can regrow grass and all that sort of thing. So you are almost going to have an either/or scenario.

That is why we strongly disapprove of the guidelines as recommended. I think there are some things in agreement, we can agree on.

It mentions that they were science-based. I serve on one of our egg
businesses and egg producer animal welfare
committees, and also the audit committee. So
I am intimately involved in animal welfare
issues for our entire industry.

To a person, none of these people
were contacted and our group wasn't. So we
deal with all the scientists and researchers
in animal welfare, and as well as third-party
certification agencies. To a person, none of
them were contacted for input on this thing.

I think that is something that
should be considered in the future, in looking
at this again, as many others have pointed
out, a discussion document to look forward.

So I think there are a few points
we agree on. There are some of the animal
care things, practices, how we take care of,
that I think should consider molting. Feed
withdrawal molting should be banned. The
research would point to molting is a natural
process. There is a basal feed-type molting
where you feed a different protein, mimic the
fall period when birds actually molt, and
allow the practice.

Beak trimming, there are options
other than the blunt blade. You should
consider the infrared effect. It is an
important management tool to prevent two birds
-- if you have two birds together, one may
pick if they've got a strong beak and in a
situation.

But there are several of the other
treatment guidelines we agree with. The main
issues are with the outside access with us.
I don't believe they can be met. As Dave Will
had mentioned also, our facilities weren't
designed -- to put us in that position, we
would not be able to produce organic eggs or
we would have to do, to make that assignment,
we would have to go to 5 to 10 percent of the
capacities to allow for that outside access as
proposed. So, as I mentioned earlier, the
investment we have put into this, we would not
be in the organic business.
Some of the other things we don't agree with, the third of the life. We are in Michigan. Birds are going to sleep inside one-third of their life. The other two-thirds have to be split over 365 days. We have at least five months when the temperature for a high doesn't get over 50 degrees. That doesn't support animal health. To force a chicken to go outside in the winter months, you are risking them to be more exposed to health issues at that point.

Access to the soil. It talks about insects and things like that. We provide a full nutrition in the feed inside. That is one thing that gets them to come back in. If we have some of these outside access rules, the birds will lay a lot of eggs outside, and it will be a matter of trying to find those things. I would not be wanting a consumer to get that egg that took a week or so to find because it got laid outside in some corner of the pasture area.
Wire floors, I think that is an important part of a system.

In summary, I think we should move forward with recognizing this is a base document to start with. I think the USDA program has a base to promote programs. I think some of these things, as proposed, would be a detriment to that.

I think we should consider some of the professionals in this area that are -- in the absence of NOP standards, most producers went to a third party to assure our customers that we are caring for the animals. So I think you should consider the American Humane Association, Humane Farm Animal Care. They have a science-based standard already. Almost everybody to a person, to a company, is doing it now. It may be a base to work from because there are some codified standards that are out there.

I see my time is nearly up. So I will conclude there.
CHAIRPERSON MOYER: Thank you, Greg.

Some questions? Tina?

MEMBER ELLOR: What kind of outdoor access do you provide now spacewise, approximately?

MR. HERBRUCK: Right now, it is around 10 to 25 percent, depending on the design. We have many buildings over the time.

MEMBER ELLOR: Ten to 25 percent of the --

MR. HERBRUCK: Of the inside space, of the living space. Some of that is based on -- what is not recognized is there are different systems. We mentioned 1.5 square feet. Different systems, a lot of these other standards recognize a flat floor space, a raised floor, an aviary style, that enhance the bird health and the birds enjoy being on them.

We have, if you come and look at our outside access, on any day, the birds when
they are growing are outside, and there may be 30, 40, 50 percent of them out at any one time. You put them in a properly-designed system; we may have 50 birds outside. And they have full access. They enjoy it when they come out there, but they enjoy being inside. They have it safer. As Dave Will mentioned, they are prey animals. They tend to find a spot where they feel comfortable.

So, if you properly design a system, they don't go out as much. However, again, we give them that access. They come out; they enjoy it. They do their scratching and all that sort of thing.

MEMBER ELLOR: Can I follow up?

CHAIRPERSON MOYER: Sure.

MEMBER ELLOR: Do they derive any food from their outdoor access?

MR. HERBRUCK: No.

CHAIRPERSON MOYER: The Chair recognizes Hue for a question. If we can be brief, only because we have a lot of
commenters to get through.

MEMBER KARREMAN: A quick question: are you certified like a third-party animal welfare certification? I don't know if you said that or not.

MR. HERBRUCK: Yes. We have the American Humane Association and Humane Farm Animal Care, both of them, as well as United Egg Producers.

So we have to supply all our customers with assurance that we are caring. We have all three of them that we have available to the egg industry.

MEMBER KARREMAN: Because there was a written comment, and I don't know by whom, that said, you know, basically, certified organic poultry operations simply should be also certified to an animal welfare organization.

MR. HERBRUCK: I think the Board should consider they are the trained experts.

Our current inspectors, it is tough enough to
teach them what a chicken life cycle is.

These third-party people are experts in animal welfare, and they come and audit us on those very descriptive issues.

CHAIRPERSON MOYER: Okay.

MR. HERBRUCK: Thank you.

CHAIRPERSON MOYER: Thank you, Greg. We appreciate your time in coming.

The Board would now like to call Kurt Lausecker to the podium, and Bob Beauregard will be on deck.

MR. LAUSECKER: Thank you for allowing me to comment on the proposed NOSB animal welfare recommendations for organic laying hens.

My name is Kurt Lausecker. I am the owner of Nature Pure LLC, an organic egg farm in Raymond, Ohio.

I worked for 30 years as manager of Daley Egg Farm, a layer operation with 2 million laying hens in cages and with 200,000 cage-free organic laying hens.
I have a strong commitment to animal welfare and served on the Animal Welfare Committee of the United Egg Producers. I also like organic food.

Two years ago, I was able to buy the organic part of Daley Egg Farm, including an organic feed mill. The investment at the time was several million dollars. This is my life now and the life of my family. A dream came true when I invested in organic food production.

My farm consists of six laying buildings for 32,000 layers each and one processing room with an egg crater and a cooler. I also have one organic pullet house, and I employ 35 people.

All buildings have state-of-the-art equipment for cage-free organic egg production and were furnished according to current organic and cage-free rules and regulations, as outlined by the AHC and by the National Organic Program.
I agree with the written and verbal comments of my peers which address the many contradictions and potential disease risks associated with the proposed recommendations. I also submitted my concerns, comments, and recommendations to the NOSB in writing.

Today I am just here to let you know what these recommendations would do to my company. I cannot comply. I just do not have additional outside space available.

When the original transition from cage-laying hens to cage-free organic laying hens was made, the existing buildings were utilized. While I am in compliance with the current requirements for outside access, I am very restricted on outside space.

The proposed recommendations would reduce the number of hens in my houses from 32,000 to 3,076. My young company is highly leveraged, and our financing is spread out over the useful life of the buildings and the
If the recommendations will be implemented as proposed without grandfathering or without adequate compensation for my substantial investment, they would force my company out of business and me into bankruptcy. Thirty-five employees would lose their job, and many local organic grain farmers would have to look for another market.

As Miles, the new Deputy Administrator, said earlier, regulations can kill you. I just hope it is not me who gets killed.

Thank you for your consideration.

CHAIRPERSON MOYER: Thank you, Kurt. We appreciate those comments very much. Are there any questions or comments from Board members?

(No response.)

All right. Hearing none, we appreciate your time in coming. Thank you very much.
Bob Beauregard, and George Bass on
dock.

MR. BEAUREGARD: Good afternoon.

CHAIRPERSON MOYER: Good

afternoon.

MR. BEAUREGARD: My name is Bob

Beauregard. I am the manager of the Country

Hen.

The following is in response to

the Livestock Committee's request for public

comment on their recommendations for animal

welfare. Our comments represent the opinion

of George Bass, the owner, and the TCH staff.

The Country Hen, located in

Hubbardston, Mass, supplies supermarkets

across the United States with the first

commercially-produced organic omega-3-enriched

egg.

The Country Hen spent countless

hours developing our organic system plan

months before the implementation date. We

devised a system of providing our hens with
safe, protected access to the outdoors via porches.

As many of you are aware, we encountered difficulties with our then-certifying agency regarding this design, and our organic certification was rejected on this basis. We appealed this decision to Washington, and our appeal was sustained by the USDA AMS.

Based upon this decision, the verification that our outdoor access plan was in keeping with the rule, we quickly implemented this outdoor access design into our organic system plan.

Since this time, we have spent over a million dollars in capital improvements, including all of our porches on existing buildings, two new two-story buildings with their own porches, and initial preparation work to construct our next layer house for future expansion.

We feel strongly that we do comply
with CFR Part 205. It seems unfathomable that a different set of rules could be written at this stage, ones that would completely undermine everything that we have built our organic system plan around for the past seven years.

With specific regard to these proposed recommendations, we would like to thank the Committee for your commitment toward organic integrity.

With that being said, we would hope the committees creating the recommendations will consider, first and foremost, animal health and welfare, biosecurity on poultry farms, protecting poultry from disease, food safety, food production, volume, and price.

From our own experience, birds confined to housing due to weather or other conditions at 1.5 square feet per bird experience prevalent pecking. When cannibalism occurs, it is very hard to watch.
It is cruel. Birds suffer, which is the exact environment that 205.238(a)(5) seems to be attempting to avoid.

We believe layers should be allowed to be peck trimmed and, as new standards, methods, and/or traits can be bred out of the birds, the subject could then be revisited.

The Country Hen is concerned about bird health in a free-range system for several reasons. Although high-path avian influenza, H5N1, has not been introduced in the United States, most experts agree it is just a question of when it will be. Other strains of low-path viruses are somewhat common and characteristically can mutate the highly pathogenic very quickly.

Non-domesticated avian species are common carriers of AI, such as waterfowl, geese, ducks, and/or wild turkeys. They don't exhibit any symptoms, but carry these diseases commonly. The risk is high, and given what
has happened in Europe and Asia in the last few years, it seems to be just a matter of time before we experience it here in the United States.

The recommendation suggests that feed and water be provided in the outdoor areas. Implementing this suggestion would seem contradictory to the health and safety of the hens. It would be inviting natural predators, insects to uncontrollable levels, and rodents.

Experienced farmers know that, when you invite with feed and water, most everyone will show up. They will be sure to bring along something with them, such as Salmonella, E. coli, rabies, ticks, lice, bedbugs. We do not believe that this is in keeping with the best health and safety conditions for the hens at stake.

Biosecurity on poultry farms, and from our experience, again, of farming in a somewhat rural area, you would think that
biosecurity would be simple to control and maintain. Biosecurity practices are the most important means of preventing outbreaks in poultry. This includes preventing access of wild birds to domestic flocks and limiting access to farm buildings. The three most potential hazards are people, trucks, and other avian species.

We, as farmers, use every preventative measure allowed in organic livestock production to maintain healthy flocks. These measures include vaccinations, probiotics, feed additives, et cetera. We believe that our porch system helps to protect the hens from potential poultry diseases.

The FDA has also stepped up the regulations for Salmonella prevention. New regulations require that measures that are designed to prevent Salmonella enteritidis be adopted by virtually all egg producers with 3,000 or more laying hens whose shell eggs are not processed with a treatment such as
pasteurization to ensure their safety.

Free-ranging our layers at 3 square feet per bird on the ground is not in keeping with the health and safety in mind.

The land to range the hens properly would not be practical, nor would the hens be safe from natural predators.

Establishing and maintaining pest control, rodent control, and biosecurity measures outdoors to prevent people and equipment from spreading bacteria throughout the farm would be stringent and would likely not be successful.

It is more detailed in our comment that we submitted.

CHAIRPERSON MOYER: Okay. Thank you, Bob.

I know Hue has a question, and then Bea.

MEMBER KARREMAN: Just another quick question, Jeff.

Is the land -- you are using
porches. I don't want to get into that whole thing. I know there is a history on that. But is the land that your farm is on, is that all certified organic land?

MR. BEAUREGARD: Yes, it is.

CHAIRPERSON MOYER: Thank you, Hue.

Bea?

MEMBER JAMES: I just was wondering how you manage the health and vitality of the chickens if they never have outdoor access.

MR. BEAUREGARD: Well, they are still free-ranged. They are free-ranged in the barn.

MEMBER JAMES: But they can go in and out?

MR. BEAUREGARD: They can go in and out of the barn.

MEMBER JAMES: So other pests and predators can go in and out, too?

MR. BEAUREGARD: No. No.
Actually, they're screened-in porches.

MEMBER JAMES: Okay. So that is kind of outside, but not really outside.

MR. BEAUREGARD: Exactly.

Exactly.

CHAIRPERSON MOYER: That is the issue, Bea, yes.

MEMBER JAMES: Yes.

CHAIRPERSON MOYER: Okay. Thank you, Bob. We appreciate your time.

Next we have George Bass, and Kurt Kreher on deck.

MR. BASS: Thank you very much.

We appreciate what you have done and the opportunity of speaking.

I had a little bit of a stroke.

So some of the times I am not very good, but I hope I can do it.

Thank you. Thank you.

We have had the porches from '02.

Therefore, we had problems with the certifies.

But we worked and worked and worked, and
finally, it was the USDA Agricultural
Marketing Services. In '02, we finally had
it, and it is okay.

So really what happens, and I
think it works, and it works very, very good,
I think. And I will explain about the
porches.

But the big thing that I don't
know if you have ever seen it, about this, but
there are 250 million birds are dead. Now I
don't know if you know that, but there are 250
million birds, about maybe three or four years
ago, in Asia. That is the big thing that
really that does it, is this wild birds. They
go with the connections with the other birds,
and that is really what happens. You should
not get those seabirds with the other
chickens. So that is really what happens. So
it is avian influenza.

Of course, as you know, it is
very, very highly pathogenic of these H5N1,
and that is really what happens in Asia. That
is really what happens.

So I will explain about four

things that we did, trying to get through on

the people and also the NOP and the NOSB.

That is really what we did, and I think it was

okay. So I am going to talk about four

different points.

One is the dirt, the barren dirt.

Then there's the disease and the animals. We

always get the animals. Then you've got the

pandemic. Right now, at this moment, we've

got this pandemic.

So, if you put those chickens on

the barren dirt, it is a little bit crazy. If

you really want to put those chickens on the

grass, the fellow that did it way down in

1924, he was a professor and said they should

have put 100 chickens in an acre. That sounds

crazy. One hundred acres. But that is really

very good for the hens. So, if we would be

doing something like that, we would have to

get acres and acres and acres and acres
because they are very good for the grass. Now
that was 1924.

Now, also, at Cornell, they had
another expert at that time at Cornell
University. They thought it was very, very
good for the grass, to think about the grass.
Really, alfalfa or clover and grass. So that
is really what they should.

Then another, Bob that just was
right here and talked to you people, we did
it. He sent a little expert, and it took a
little time. We got about 50 birds and, all
of a sudden, what happened? The birds were
done. There weren't anything else. There was
birds. So that is one of the problems.

So, anyway, the other one is
you've got disease, which is cocci and
neuritis and worms, intestinal. So, if you
put it outside, that is what you are going to
have, some of the problems.

Then, also, you've got to get
those animals that are going to work, and
you've got the owls. You've got the hawks.

So that is really what is happening.

We thought and thought because the devil of -- we thought that there was really a problem in this Asian, of course. But the big thing in the United States, we don't have anything. We really don't. The United States is free. There's no humans and there's no chickens, and then, evidently, there are no wild birds. But anything at any time could happen. So that is really what happens.

Now they've got about 50-60 countries that have that stuff. Right now, probably I think it is another -- I found 80 acres mentioned about that whole stuff.

We did at one time in the United States, we had three different times.

Thank you very, very much.

Appreciate it. It's wonderful, the time to talk.

CHAIRPERSON MOYER: Thank you, George. We appreciate your time.
Any questions for the presenter from the Board?  
(No response.)

Okay. Thank you very much, George.

Kurt Kreher is next, and Howard Magwire is on deck.

MR. KREHER: Actually, I am Hal Kreher. My brother is Kurt.

Thank you for the opportunity to comment on the proposed livestock welfare recommendations. I appreciate the hard work that went into producing this document. It might not sound like that when I pick at it a little bit, but I do appreciate that a lot of work went into it.

My brother Kurt has already provided written comment.

My name is Hal Kreher. I am a third-generation poultry farmer from Buffalo, New York. I am quite proud of the business that my family has built from a subsistence
farm in the 1930s to one of the few surviving family-owned commercial egg producers in New York State.

There are very few folks left who saw the advances in poultry housing in egg production from the time we grew chickens on the range to the modern-style egg production. It seems that the reasons and research that led to the current system have been lost over the years.

For instance, few of us remember the predation by foxes that required trapping to control. Few of us remember the parasites, both external and internal, that resulted from barnyard life. Few of us remember the heartbreak of a pileup in a floored building, taking away the pullets that you worked so hard to raise. Few of us remember the improvements in health and mortality that came with the separation of birds from their excrement by using wire flooring. Few of us remember the improvements that came from
better drinker designs.

My point is that the current animal welfare recommendations by the Livestock Committee go too far in trying to eliminate practices such as wire flooring that are actually beneficial to the health and welfare of the chickens.

Another example is beak trimming. If left to grow unchecked, a chicken's beak would grow to look much like an eagle's beak. You can all picture that. It is a sharp, hooked weapon.

Chickens naturally have a pecking order, and you have heard that expression before. What it means is that the chickens enforce their dominance by pecking each other. They are not civil in this. If it leads to bloodshed and the chickens do not have their beaks blunted, then not only the initial injured birds, but several others may be injured in the ensuing melee.

There is a new egg safety rule,
CFR 118. Among the requirements is environmental testing for Salmonella enteritidis. I do not know of the incidence of this bacteria in a barnyard, although I have been told, if you look for it, you will find it. But if it is found, then eggs must also be tested to make sure that they are okay.

If the eggs are all right, the area will still need to be disinfected after the flock, according to the rule. How will a pasture be disinfected?

Another requirement of the egg safety rule is that a biosecurity program is in place to, quote, "prevent stray poultry, wild birds, cats, and other animals from entering poultry houses," end quote.

This is difficult to do if the poultry have complete access to the pasture, as required by the proposed animal welfare recommendations. It would also have complete access to the inside for anything outside,
Another requirement of the egg safety rule applies to rodent control, flies, and other pest control. It requires you to, quote, "remove debris within a poultry house and vegetation and debris outside a poultry house that may provide harborage for pests."
This is in direct conflict with the proposed recommendations for open-air runs described in Section 205.239(a)(3).

If organic eggs are raised in a manner where there is evidence to support the possibility of significant contamination by Salmonella, is this a good thing? I don't think so.

There are standards for humane care for poultry which already exist. The American Humane Association has a very comprehensive program for cage-free housing.
There are other standards as well.
Rather than developing a completely separate program, perhaps requiring
producers to follow existing standards off a list of acceptable standards, similar to how the NOP uses different certifiers, would be a better solution.

In closing, I would like to add that eggs are an organic product that could be widely available to the consumer. They could be a gateway organic food. However, the current recommendations would severely limit the ability to supply such a market.

Thank you.

CHAIRPERSON MOYER: Thank you, Hal.

Are there any questions for Hal?

I see Hue and then Dan.

MEMBER KARREMAN: Question: what is the percentage or prevalence of bumblefoot Staph aureus infection in the chickens in wire floor caged houses in general in the industry?

MR. KREHER: I think it is much reduced compared to chickens that are running around on the floor. I don't have figures to
1 cite, but I can give you my own personal
2 observations.
3
4 When I was a child, actually,
5 until the mid-eighties, we had a floor house
6 that had 10,000 birds in it. Every flock you
7 would see one or two birds, and their feet
8 would be all swelled up. You could see they
9 were in pain.
10
11 In a properly-maintained wire
12 floor facility, a caged facility, it is
13 virtually non-existent, you know, if things
14 are properly maintained. Yes, you can cite
15 places that haven't been maintained.
16
17 CHAIRPERSON MOYER: Dan?
18 VICE CHAIRPERSON GIACOMINI: That
19 humane program that you have there --
20 MR. KREHER: Yes, sir.
21 VICE CHAIRPERSON GIACOMINI: --
22 can we have that?
23 MR. KREHER: Sure. It is
24 available online, and I can leave a copy for
25 you.
CHAIRPERSON MOYER: A question for you, Hal, then. Are you inferring in your comments, then, Hal, that you would prefer to have no access to the outdoors at all? Is that what you are saying?

MR. KREHER: No, I didn't mention that.

CHAIRPERSON MOYER: Okay.

MR. KREHER: I mean I think it needs to be controlled access. Having them run around where they can get access to -- I know Hue doesn't believe the parasites that are out there, but, you know, I wish my dad was still around to come to you and tell you what he found in the forties and fifties. And he would explain to you what they did.

I can still remember we used to have a bag. You know, it wasn't used anymore. It was stuck in the barn from long ago. We got rid of it since then. Nicotine powder, that was commonly used to control fowl mites.

You know, if they go outside, they
are going to get that thing. They can go outside into an enclosed area that has screening to keep the other birds from coming in.

Nobody wants to see another Newcastle outbreak like we had in California a few years ago.

CHAIRPERSON MOYER: The Chair recognizes Hue and then Kevin.

MEMBER KARREMAN: Just to clarify, it is not that I don't think there's parasites outside. I just don't think that that should be the automatic barrier, that animals should not go outside. Because you can manage things in such a way that there is an optimal life for the animals outside without them getting parasitized. There's ways to do it, believe me. I have seen it with cattle. I am sure you can do it with chickens.

And anyway, by the way, nicotine is not a prohibited natural for livestock use in organic, not that I would recommend it, but
it is not a prohibited natural for livestock use. For crops it is prohibited, not for livestock, no; just strychnine.

CHAIRPERSON MOYER: Kevin?

MEMBER ENGELBERT: Hal, thank you for your time.

I know we are pressed, but how do we rectify this problem with consumers believing that organic poultry is held not only to a slightly higher standard, but a far higher standard than conventional poultry houses, that they are fed more -- that it is not just simply feeding organic feed, that they are actually animals and they are meant to be outdoors, and that is how they exhibit their natural behavior? When a consumer purchases an organic product, that is what they expect. That is how they expect that animal is raised.

Any thoughts on how we get around this dilemma?

MR. KREHER: Well, you know, that
is a difficult one. Because I think if people think all your food came from a small farm where there's chickens in the barnyard and you go around with your apron and collect the eggs in it, I don't know how you get around that. Because who wants the eggs that are picked up outside in the barnyard? You do? Well, hopefully, they were clean.

CHAIRPERSON MOYER: You asked the wrong group, yes.

(Laughter.)

MR. KREHER: Hopefully, they were clean.

CHAIRPERSON MOYER: Thank you, Hal. We appreciate it.

MR. KREHER: You know, just as a little background, we used to have a lot of tracebacks on eggs. Twenty years ago, you heard about a lot of tracebacks on eggs for Salmonella. You are not seeing it anymore. The reason is because the industry, the commercial egg industry, has
cleaned up their act in regard to rodent control and that sort of thing. We don't have that disease vector. We have eliminated the rodents, which was the big disease vector. It is going to be difficult to do under this system.

So you are bringing back that disease vector that we have strived so hard — in fact, they have passed a law, you know, the egg safety rule, in regards to it.

So I don't know how you get those two, you know, a rule on one hand and a rule on the other hand, how do you get those two to work out?

Thank you.

CHAIRPERSON MOYER: Thank you for that point.

MR. KREHER: And I didn't mean any disrespect to you.

CHAIRPERSON MOYER: Okay. We have Howard Magwire, and then Dr. James Barton on deck.
MR. MAGWIRE: Thank you.

This is the second time I have attended one of your meetings, although when Barbara Robinson was in here, it reminded me of many years ago, before you had to have certification to organic rule, there was a poultry company -- I'll not name them; many of you know it -- I happened to run poultry programs at USDA at that time, and Barbara and I were peers.

But they had long been advertising organic chickens. All of a sudden, USDA said, "Hey, you have to have that certified."

They said, "Fine."

"You have to have organic feed."

"What do you mean organic feed? There's not that amount of organic feed around."

I think they even went to the Hill. So, as they used to say, you've come a long way, baby, or we have, I guess, in this. So accolades to that.
I want to address the Livestock Committee recommendations.

My name is Howard Magwire. I am with United Egg Producers. I work for the farmers that produce 97 percent of the eggs in the United States. You have heard six or seven of my bosses speak this afternoon so far. Be kind to me.

Anyway, I want to speak to the livestock recommendations. Rather than try to address points that my bosses can address much better than I, is to urge you to go beyond the 35 days and give this much further consideration.

As I said, we represent 97 percent of the layer production in the United States. So we have some knowledge about it.

I think, Dr. Karreman, you have our attention. I don't know, maybe we were following melamine or we were watching cap and trade on the Hill, or whatever, but we are ready to be engaged in this thing now and
appreciate you listening to us now. We've got
to be part of the discussion.

The equivalency with Canada thing,
one of the speakers mentioned that. Yes,
Canada has a controlled market. They
guarantee to cover cost, everything else. In
fact, the only time we see Canadian eggs is
when they decide that they've got more than
they can sell at the set prices up there, and
they dump them down here. So it is quite a
different thing.

Right now, we are dealing with
other things like carbon footprint. So, as we
talk expanding acreage to put housing and
birds, that is the other side of the coin that
we have to deal with, too, as somebody called
the EPA.

The producers have made many good
points. As I said, I am not going to try to
go over them. But we need a discussion.

Dr. Karreman, I am not picking on
you again, but you picked on us a little bit.
(Laughter.)

So one of the earlier speakers talked about vaccine. That is just an example there. We have alluded to high-path AI. We have an active group. We have been working for probably four years now. We talk every two weeks on controlling high-path AI in the United States. Vaccination is part of that. Biosecurity is part of that.

The FDA new egg safety rule that goes into effect next summer, in fact, I've got to head out of here tomorrow afternoon and go to Atlanta for a meeting on that. We have committees that look at that, too. Biosecurity is a big part of it, and vaccine is. Probably by next summer, most of the egg producers in the United States, other than some that are exempted from complying with the rule next summer, are going to have to vaccinate for Salmonella enteritidis or FDA is not going to let them market their eggs.
You asked the number of times.

Four times at least, probably three live and one dead, to be effective, so that we can assure FDA and our customers that Salmonella enteritidis is not in the shell of eggs. That is why we need to talk to you.

UEP has standards. They have been referenced. Our standards, we don't care if they are organic or not organic. We believe in animal welfare. Over 80 percent of the layers in this country are in our program; now they may be on some other programs also, but over 80 percent of them on our program -- it doesn't matter if they are organic, if they are free-range, if they are caged -- one minute; I will be quick.

There is science-based, and I can talk about the scientists, but the scientists also go to veterinarians, like you here, and our poultry veterinarians. You heard scientists today, and that's those folks that have been working with it all their life.
They know when the chicken's happy and when it's not, and when it is healthy and when it is not.

I just want to finish up here by saying that we appreciate the grandfathered in this or the discussion of the grandfathered thing and some of the questions, but it is bigger than that.

If we want organic to continue to grow, as it has over the last many years, we've got to have science-based rules, not go by somebody else's agenda, but look at the whole thing and say, how do we meet the science for animal welfare, not animal rights -- I didn't say, "animal rights" -- animal welfare, environmental, carbon footprints, family farms?

It is like President Obama said last fall when he was campaigning, "Yes, we can," and I know that we can, if we all talk about it and work together.

Thank you very much.
Right on time.

CHAIRPERSON MOYER: Thank you, Howard.

A couple of questions. I see Hue and then Joe.

MEMBER SMILLIE: I actually would like to probe this. The Canada card keeps being played here, both Hue and yourself.

We are going to great lengths to describe how the egg marketing system controls that and how their costs are certainly covered to a certain extent. Is that, Hue, because your recommendation is similar to the current Canadian regulation? Have they implemented what you are proposing to some degree?

MEMBER KARREMAN: We based a lot of the animal welfare regulations on the Canadian regs that have now come in because of equivalence. We know it is not compliance.

We realize that, but equivalence.

Those regs have been based on various animal behavior, animal welfare groups
from the University of British Columbia, Guelph, and various other places up there. So the science is actually in the Canadian standards which we have extracted from.

Now, as far as their marketing goes, I don't know. I know they have a quota system on eggs, but not broilers.

MEMBER SMILLIE: Well, I was up attending a couple of trade shows in Canada, and this issue came up. There is this fear in Canada that their egg market is going to get flooded with U.S. organic eggs. That was expressed, and they were greatly interested in our agreement, whereby we are reporting stocking density, herd density, you know, the layers per square foot.

So my understanding was that the different marketing scheme was actually important in this since there is some sort of guarantee that they have that our egg producers don't have, and I don't quite understand how an egg marketing board could
make it easier for Canadians to allow more
foot per bird than a U.S. regulator. I don't
quite get the connection, but, apparently, it
is there.

MR. MAGWIRE: In Canada, unlike in
the U.S., the Board agrees on how many
chickens there will be. If there's 10 million
chickens and they're saying, "We can't cover
our cost and producer profit," -- I don't know
if I turned this off or not -- you cut down
the number of chickens.

We talk about $40 in
capitalization per bird. In Canada, I know
going back 20 years the value of the bird was
$40 because you have to buy the right to raise
the bird, and that is how they control the
market.

This is not an economic thing. I
know it is to us if we have a family that is
going out of business. Organic is organic.
Animal welfare is animal welfare. You've got
to treat your animals right.
But there you can raise the standard to whatever you want, even if it doesn't make scientific sense, and maybe it does fit somebody's agenda, because they still are going to be able to produce an egg and sell it and get their cost back.

And as far as U.S. product dumping on that market, they have quotas. It is just not going to happen that some kind of substandard U.S. product is going to go up there.

Canada has very restrictive SE requirements also. So there's a lot of hurdles we face to put eggs up there.

CHAIRPERSON MOYER: Hue?

MEMBER KARREMAN: Question: I hear with a lot of the poultry folks the vaccines that are needed and everything. I understand that.

If I may ask, what is your thought on the vaccine proposal that is here? Because a lot of the genetically-engineered vaccines
that have been being used for the last seven years in organics actually fall under the poultry?

MR. MAGWIRE: And I am not qualified to speak to that, so I will just be honest.

My point on that is, if there is a concern about what can be used as a vaccine, then we need to extend this discussion and talk about it because we are forced by another agency, a sister agency to USDA, to use a vaccine, not by regulation.

When we commented on the FDA egg safety rule back in 2004, we said you ought to give our producers an incentive to vaccinate because we know it works, and not money, but maybe you come visit them less often. Everybody is afraid of an FDA visit. Maybe we have to sample less. It is very expensive.

We do some very expensive and intensive sampling.

They didn't. When the final rule
1 came out this summer, they didn't give any
2 incentive for vaccination.
3 And I met with FDA and I said, "I
4 guess you really did, didn't you?" And they
5 smiled because they knew they had made the
6 rule so tough that we have to have two things,
7 absolutely strong biosecurity and a
8 vaccination program, or we can't comply.
9
10 CHAIRPERSON MOYER: Okay. Thank
11 you, Howard.
12
13 MR. MAGWIRE: Thank you very much.
14
15 CHAIRPERSON MOYER: We appreciate
16 that.
17
18 At this point in time, the Board
19 is going to take a brief, very brief, break.
20 Keep in mind that we will get back into our
21 seats by 20 after 3:00 on the dot because we
22 have a lot to go through today yet, and the
23 clock keeps ticking.
24 Thank you.
25
26 (Whereupon, the above-entitled
27 matter went off the record at 3:09 p.m. and
resumed at 3:23 p.m.)

CHAIRPERSON MOYER: Okay, we are ready to go. We are back in session.

Dr. Barton, I presume?

DR. BARTON: Yes, sir.

CHAIRPERSON MOYER: Dr. Barton, if you will, we are ready to go.

DR. BARTON: All right. Thank you, Mr. Chairman. Thank you, Committee.

My name is James Barton. I am a Board-certified poultry veterinarian. I have got 19 years of experience. I have worked in commercial poultry farming, veterinary diagnostic labs. I have done scientific investigation, and I have done some teaching.

I am also a certified animal welfare auditor, and I am the immediate Past President of PAACO, the Professional Animal Auditor Certification Organization.

PAACO, through its work training animal welfare auditors, certifying auditors, and certifying animal welfare audits, it has
become the recognized authority on quality animal welfare auditing practices.

I conduct about 20 animal welfare audits every year, and I provide veterinary consulting services to conventional and organic poultry farms.

I am also an AVMA member, and I am a member of the American Association of Avian Pathologists, AAAP. I have the privilege of serving on their Animal Welfare Committee.

One part of my background that I would like to mention, because I think it is pertinent to this group, my family raised vegetables on a small truck farm, if you will, in northwest Arkansas for much of my childhood and early adulthood. In fact, my veterinary school tuition fees and living expenses were paid through the scholarship provided by the hard work of my family raising corn, tomatoes, cantaloupes, watermelons, blackberries, and other crops.

I have been involved in small
farming for most of my life. I spent
innumerable mornings and Saturdays selling
produce at the farmers' market.

I am here at the request of the
AAAP Animal Welfare Committee. My comments
are going to be regarding the welfare needs
associated with organic management of poultry
raised for food production.

General comments: a review of the
proposed welfare recommendations suggests many
of these recommendations are intended to
address behavioral concerns. This is
commendable. However, some of these changes
will have the unintended effect of impairing
physiologic needs that outweigh the potential
improvements in behavior.

We believe organic farmers want to
protect the physical health and welfare of
animals under their care. In looking at how
different housing systems protect the welfare
of animals, it is important to consider all
the factors contributing to the animals'

Neal R. Gross & Co., Inc.
202-234-4433
The proposed recommendations contain criteria that are not directly related to organic requirements, if you will, and will significantly negatively impact the welfare of animals in these systems. The new rules, if implemented, will make organic poultry farming uneconomical and will also adversely affect the health and welfare of chickens and turkeys.

Specifically addressing 205.238, Section (a)-(c), livestock healthcare practice standards regarding beak trimming, there are alternative methods for preventing flock behavior issues such as persecution or cannibalism, but many of these methods are not yet available, such as genetic selection. They may not be consistent with the intent of organic farming, such as the use of synthetic methionine treatment, or they may require a high capital investment, such as specific housing for low light intensity.
So, until alternatives are fully available to farmers, beak trimming and other procedures designed to prevent injuries must be allowed.

The draft recommendations lump all avian species into one category, and the proposal to prohibit beak trimming and toe trimming across all categories of poultry are in error.

The Board should consider amending the proposed rule to prohibit beak and toe trimming in broilers intended for short growing periods, less than eight weeks. However, animals intended for longer-term production, such as older broilers or roasters that are greater than eight weeks old, turkeys, breeding flocks, and egg production flocks, beak trimming should be specifically permitted to control feather pecking and cannibalism.

Additionally, for male poultry being raised for breeding purposes, trimming
the rear toe on each foot should be allowed to
prevent injury to the females during multiple
mating acts that are common in poultry.

Only trained personnel should
perform beak trimming, using proper equipment
and procedures that minimize pain, excessive
bleeding, promoting rapid healing, and prevent
infection.

On Section 205.239(a)(2)(i), space
requirements, lower flock density is not
always directly related to better welfare for
the flocks. In many regions, hen body heat is
important to keep the birds warm, to reduce
the amount of fossil fuel that is burned. If
farmers can't purchase this fossil fuel, this
will lead to higher mortality due to cases of
birds piling.

Required for outdoor access.
Raising poultry indoors has a proven track
record for better poultry health, not to
mention reducing the potential implications
for public health.
With almost certain increases in disease incidence, with the associated negative welfare impact in organic farms, spillover of disease into large commercial farms in the vicinity is likely. The AAAP is particularly concerned about this proposed change.

I will refer you to my written comments for further information.

CHAIRPERSON MOYER: Thank you very much, James.

Questions for James? Kevin?

MEMBER ENGELBERT: Do you know from your studies how long beak trimming has been used in the poultry industry?

DR. BARTON: Well, I can tell you it has been used for my entire career in laying hens and breeder hens. It has not been used in broilers in commercial production for a long period of time. The only discussion of late that has made any mention of the need to beak trim broiler chickens is because of the
resurgence of the heritage breeds. They are much slower-growing. So they actually reach maturity before they reach a marketable weight.

CHAIRPERSON MOYER: Followup, Kevin?

MEMBER ENGELBERT: So could you make an educated case, then, on what caused that practice to be developed? Obviously, it started at some point in time, even though we can't pinpoint when that was.

DR. BARTON: I can tell you that cannibalism and persecution is the highest cause of mortality in cage-free birds today, even with beak trimming. So I am certain that the reason that beaks began to be trimmed for commercial birds was due to the intent of reducing the implications of their attempt to attain a pecking order.

MEMBER ENGELBERT: One more quickly.

CHAIRPERSON MOYER: Go ahead,
Kevin.

MEMBER ENGELBERT: So the keyword there for me was "commercial". What do you mean by the commercial birds? That seems to be the word that has triggered the use of the debeaking practice.

DR. BARTON: People that are raising poultry with the intent of selling them to make money, or selling their eggs to make money, that is commercial.

MEMBER ENGELBERT: At any scale?

DR. BARTON: At any scale. If they invest money in the purchase of that bird with the intent of selling it later, or selling their eggs over a period of time, they are intending to get a return on their investment. Otherwise, it is a hobby. If it is a hobby, then we can talk about all sorts of requirements that really the economic level has no importance.

CHAIRPERSON MOYER: Go ahead, Kevin.
MEMBER ENGELBERT: I failed in my argument, but I do want to make the point that I do know people that are growing birds in my area on a commercial scale that don't do any trimming or debeaking whatsoever.

DR. BARTON: And that may be true, and I can tell you that in Europe peak trimming is uncommon or not done, but they also use other things that mitigate it. For example, in turkey production in Europe, they use extremely low light conditions to keep the birds from persecuting one another.

MEMBER ENGELBERT: Thank you.

CHAIRPERSON MOYER: Any other questions for James? Rigo?

MEMBER DELGADO: Can we talk about practices that could be combined to avoid certain things like beak trimming? I am asking specifically, say, a lower bird population, access to outdoors? Would that influence the level of attack among birds or not? And if your question is affirmative or
negative, do we have any evidence pointing to that fact?

DR. BARTON: I am not sure that we have any real evidence. I know that in situations where birds have access to the outside of doors, they have access to bright sunlight, they tend to be a little bit more aggressive, a little more violent. One of the methods to keep birds from persecuting one another is to keep them under low light conditions.

CHAIRPERSON MOYER: Okay. Thank you very much, James.

DR. BARTON: Thank you.

CHAIRPERSON MOYER: We appreciate it.

I'm sorry, there was one other question? Rigo, please.

MEMBER DELGADO: Just to follow up.

CHAIRPERSON MOYER: Sorry.

MEMBER DELGADO: Now explain to me, how do you define the welfare in the
context of trying to control birds from
attacking each other or trying to keep low
levels of light? You are a certifier of
welfare, animal welfare.

DR. BARTON: Yes, sir.

MEMBER DELGADO: How do you define
that?

DR. BARTON: Welfare is difficult
to define, and it really does depend on who is
defining it. I define welfare based on the
bird's ability to exhibit most of their
natural tendencies and freedom from
preventable causes of distress. For example,
freedom from disease is just as important as
the ability to step outside and see the
sunshine, perhaps more important.

CHAIRPERSON MOYER: Okay. Thank
you very much, James.

DR. BARTON: Thank you for your
time.

CHAIRPERSON MOYER: We appreciate
your time.
The Board calls Mark McCay to the podium and Frank Hurtig is on deck.

MR. McCAY: Back again, last time as a representative for the Methionine Task Force; this time specifically as a representative for Coleman Natural Foods.

Coleman Natural is one of the largest organic broiler producers in the nation. We have organic operations both on the East and the West Coast.

We fully support the NOSB's objective of developing quantifiable animal welfare standards as part of the NOP. We would, however, propose that recommended standards actually be modified in two important ways.

The first is develop the standards for measuring the outcome of the actions proposed in terms of both the animal husbandry, rather than focusing on the structure and the engineering, focus on what does that do to the welfare of the animal.
Combined with that, then pare back the current recommended, what we would consider to be, best practices to include a smaller set of minimum standards for all producers.

The minority opinion that was attached to the recommendation suggested that there are outcome-based metrics that can be used to monitor the health and welfare of livestock: cull rates, veterinary calls, disease frequency. And we agree.

While the minority opinion seemed targeted more towards dairy animals, we would propose our own set of outcome-based metrics for broiler operations. And I have some examples.

On the farm, we can measure the health of the flock through mortality or livability rates. We can measure hardiness and nutrition through lameness and gait scores.

If transportation is involved from
a farming area to a processing plant, that is part of the life cycle of the birds. We would consider that to be a very important area for the health and welfare of the animals to be measured as well.

We can measure the DOA and the trauma that is caused through that process and, also, if the birds are at a processing plant, through the USDA FSIS inspection system. We can also measure health through condemnation rates, also, at the processing facility.

We could measure how well the conditions of the housing, the bedding, the ventilation, and litter management programs were effective, through checking both the foot and hocks for burns or other kinds of conditions.

We believe there should be a smaller list of minimum standards that producers could be reasonably expected to meet. To use examples from the final rule,
there's no use of antibiotics, 100 percent organic feed, et cetera.

We believe that individual producers may need to actually exceed these minimums in order to meet the performance and outcome results that we think should be specified.

Since we are primarily a broiler company, we will also make some specific recommendations to a few areas.

The requirements for the birds to be outside for one-third of their lives should be preempted, we believe, by the current exception of temporary confinement during inclement weather. We actually believe that inclement weather can be defined and should be in the rules.

We don't believe that feeders should be required in the outdoor areas because we actually feel that this conflicts with the objective of outdoor access to encourage the birds to forage naturally in the
soil and the grass.

Producers should be required to provide as much space outside the house as inside the house. Using the current recommendation for broilers, this would be 10 birds for every 12 square feet of space in the open areas. And in addition to that, producers -- and this was mentioned earlier as well -- producers should be required to provide easy access from the indoor area to the outdoor space. We think that is very important.

We appreciate the opportunity to comment on these recommendations.

CHAIRPERSON MOYER: Thank you, Mark.

Any questions for Mark?

(No response.)

Okay. Thank you for your time.

Frank Hurtig, the Board calls you to the podium, and Ed Maltby on deck.

MR. HURTIG: Thank you very much.
As my slides come up here for you to review as I am going through, I want to thank you, and thank you for the opportunity to speak on something besides poultry for a few minutes.

With that, the next slide, please.

I would like to bring to the attention of the Board here for consideration four points relative to eprinomectin and as compared to moxidectin.

First, the environmental footprint, the parasite spectrum, then persistence in the animal, and human safety as things to look at in consideration and reconsideration of inclusion of eprinomectin on the National List.

Next slide, please.

In looking through -- and my apologies because I think the bottom of the page is not showing up there for you -- but in looking through the FOI and various other publicly-available documents, as well as the applications to this Committee, first off, I
would like to call attention to one of the
issues, which is the binding of these products
in the soil.

In fact, when one looks at the
literature, anytime the binding coefficient is
greater than 1,000, that indicates that these
products, these compounds, will not be readily
moved by water in the soil, but that does not
preclude their breakdown in the soil. And in
fact, when one looks at the aerobic breakdown
of these products, both of them break down in
64 or 63 days. Therefore, there is no
persistence of either one of these products in
the soil.

When one looks at, then, other
impacts, especially looking at manure and the
impact on degradation of manure, in fact, one
of the concerns that has been raised and is a
PR issue from some companies is dung beetles,
and especially looking at the larvae of those
particular organisms. When one looks at the
actual impact of dung beetles, even in areas
where they are very common, which happens to be mainly the southern U.S., they do account for probably no more than 10 percent, and often quite a bit less than 10 percent, of the actual degradation.

So, then, we go on down the list here to look at some of these other organisms. Earthworms, plants, soil microbes, and birds. In fact, those, along with cattle themselves actually trampling the manure, are probably some of the bigger -- in fact, they are the bigger -- impacts on degradation of manure.

So, when we look at both of these compounds, in fact, the science would say that there is absolutely no difference in the impact of either of these compounds on degradation of manure.

It is very well spelled out in all the documents filed with the various government organizations, FOIs, et cetera, that both these compounds, when free, can be toxic to aquatic species. However, the good
news is that neither of these compounds, once they are put on an animal, will wash off the animal, even when applying two inches of rain per hour to them, to any greater than a fraction of 1 percent. So, even if an animal was standing in a watershed, there would still be very little, and in fact, it does bind, both of these compounds would bind to the organic matter in the bottom of a watershed and be tied up.

I would call the Board's attention to the fact that, of course, neither of these compounds are ivermectin, which has been, of course, on the list and I know is being reviewed for sunsetting. But they should not, either one, be considered as the same thing or having even many of the similar characteristics.

Finally, the last point, I would call your attention, and it is certainly publicly available, to a letter that Wyeth has received relative to moxidectin and its
environmental impact.

Next slide, please.

Briefly, on the parasite spectra, the main thing here is they are both essentially the same. I call your attention that both of them have a label indication for control of horn flies, which is my next slide then.

That is looking at persistent effects. One of the things that I think this particular slide brings out is how long each of these drugs lasts in and on the animal. That is very easily and quite readily reflected in the number of days' control that are on the label.

Going down through the list, moxidectin is at least twice for everything but horn flies. In fact, there is an effect on horn flies, and that is in the FOI for that product, out through seven days and beyond. It just was simply not enough to get a label point.
So, with that, I would move on to the next slide.

One of the things that has been readily noted in the standards is that there is a withdrawal time for any of these products used in a milking cow for 90 days. In fact, perhaps it would be worth the Board's taking a look at some of the pharmacokinetics of these products.

This particular study by Lanuza, et cetera, shows dormectin, ivermectin, and moxidectin. As one can see, the study went out to 80 days. At the end of 80 days, both ivermectin and dormectin were below the limit of detection; whereas, moxidectin was not.

The next slide, and actually, please skip to the next one. Both of these are the same. The first one shows the data. This looks at the persistence of moxidectin and eprinomectin in the milk. This happens to be a water buffalo study, but it is the only side-by-side study that is out there.
I wish I had one in dairy cows, but it doesn't exist.

The main thing to look at here is that tall bar, which is the area under the curve. That is the amount of moxidectin that is put out in the milk in the 20-day study, and there were a number of animals in the study where at 20 days moxidectin was still seen.

The next slide, please.

This one looks at the human safety.

In conclusion, the last slide, I would say that, first, there is no significant difference between these two products when it comes to environmental footprint. We do have a slightly different spectrum of parasites. There is less persistence of eprinomectin in animal and tissues as well as in milk for eprinomectin versus moxidectin, and there is a higher allowable ADI for eprinomectin.

Thank you.
CHAIRPERSON MOYER: Thank you.

Any questions from Board members for Frank? Let me guess. Hue?

(Laughter.)

MEMBER KARREMAN: Thanks for that presentation.

MR. HURTIG: You're welcome.

MEMBER KARREMAN: I am glad we got to see that, the comparative things. I read through the whole FOIA document for when eprinomectin got approved, and wherever in Pennsylvania, you know, at those labs there.

It is not so much that moxidectin is better or worse than eprinomectin. There's two issues involved with the avermectins, in general, as a family. One is technically, but we have been told that it doesn't matter at this point, technically, there are macrocyclic lactones that are antibiotics. That is on paper.

But this Board has a certain stand on antibiotics except for crops, I think.
(Laughter.)

Sorry, sorry, sorry.

(Laughter.)

But the other thing is this: the intention when moxidectin was put on, and it hasn't come through the process yet, to have ivermectin come off, once moxidectin gets put on.

Since that time, we have had fenbendazole petitioned, and we have voted to allow that to come on, with the intent of moxidectin not being on and ivermectin not being on, or any avermectin.

So it is not that -- eprinomectin looks better on the comparison studies without a doubt. It just that it falls into a certain category of things that we don't want to be expanding the list on.

It is a comment. I am sorry, it is not a question.

CHAIRPERSON MOYER: Thank you, Hue.
MR. HURTIG: And I appreciate that. I guess it was my understanding that the Board had answered the questions relative to macrocyclic lactones and antibiotic, quote/unquote, "status", and that that had been resolved. So am I to understand that that has not been resolved at this point?

MEMBER KARREMAN: The NOP has told us last year or the year before that they will be proceeding with rulemaking for moxidectin, and that because it is only a technicality with the macrocyclic lactone fact, that they are going to proceed with the rulemaking.

But, since then, fenbendazole has been petitioned, and we kind of all can live with that better, at least we have as a Board.

CHAIRPERSON MOYER: Thank you.

MR. HURTIG: So perhaps I guess, then, my petition would be, if there is a possibility for reconsidering eprinomectin, and if some of these other issues would weigh more heavily to allow that, that it be given
consideration.

Thank you.

CHAIRPERSON MOYER: Thank you, Frank.

Ed Maltby to the podium, and Robin Allan on deck.

MR. MALTBY: Good afternoon. It is so wonderful to come up here when you are talking about chickens and not milk all the time. I come here as a minority interest, which is great.

I want to thank those Board members that are leaving. It has been great to work with you. I have worked a lot more with one in particular, but I will continue to do that.

Access to pasture, FOOD Farmers has a request to the NOSB that they recommend to NOP that that rule be effective one day after publication in The Federal Register.

We are very encouraged that the NOP is planning to do educational sessions for
certifiers and inspectors, but we believe that after eight-ten years, then it should become effective the day after publication. That, obviously, allows time for all the implementation, but it is effective immediately.

Animal welfare, just to bring it home, I got a call this morning from AP press wanting to know my comments on the organic slaughterhouse that was closed down in Vermont for animal cruelty. They quoted a person in Vermont that had said that the NOSB is meeting this week in D.C. to sort out animal welfare for organic livestock. Not to put any pressure on you guys.

In our comments which we didn't have time to get to you ahead of time, but we put in writing, we basically ask for the return to a discussion on a lot of these issues. The pasture rule is not yet out. Some of them will be covered by that.

Realities of organic production,
many different production systems, and the emotional tie that organic dairy farmers have with their livestock. We have had our regular annual meetings across the country. I raised the issue of animal welfare, and after they bombarded me with not quite abuse, but "Why should we question what they are already doing?", and I know the answer to that, but it is still something that we have to bear in mind, that we should be positive about what organic agriculture does currently for animal welfare, and not be on the defensive.

Within the existing regulations, a lot of the issues are covered. What we need to do is to look and see how they can be applied.

Altering livestock for cutting off tails is already covered and has been the subject of prosecution in the past, or so I have been told, reliably, by somebody who knows the regulations far better than I do.

So where we can find in the
existing regulations that can be enforced, we have a big gap in educating certifiers and inspectors. If you look at what Whole Foods does with their animal welfare, it is a two- or three-day visit to a farm annually with highly-qualified inspectors that are trained in animal welfare and go down through a checklist. So we are not talking about something that can be easily taught.

Also, to proceed with caution.

When we had the solution to the Harvey lawsuit, it was a quick fix, and we are now suffering dramatically in the organic dairy.

To quickly move on to GMO vaccines, it is a quandary. We need vaccines. Vaccines is the basis of organic livestock.

Some certifiers say yes; some certifiers say no.

We would suggest that you put a moratorium on doing anything. Maintain the status quo while you do investigation, so neither the producers who are currently using
those vaccines will suffer or we don't get a headline in the newspapers that NOSB approves GMO, which does happen at times, from the point of view of taking one small part of a meeting and blowing it out of proportion. I can stop and answer any questions.

CHAIRPERSON MOYER: Thank you. Thank you. The Board certainly always appreciates brevity of comment.

(Laughter.)

But well presented.

Any questions from the Board for Ed regarding the comments he made?

(No response.)

Hearing none --

MR. MALTBY: Thank you.

CHAIRPERSON MOYER: -- we appreciate your time very much. Thank you very much.

Now the Board would like to call Robin Allan to the podium.
And you have a proxy?

MS. ALLAN: I do have a proxy for Jake Lewin. I am going to try really hard not to use it.

CHAIRPERSON MOYER: We certainly appreciate that.

You can set your time, yet.

And Robert Yang will be on deck.

MS. ALLAN: All right. Good afternoon.

My name is Robin Allan. I am here representing CCOF. I am the Director of Grower and Livestock Certification.

We are a nonprofit, accredited certification agency located in Santa Cruz, California. We currently certify about 122 livestock operations, representing over 50,000 organic ruminants and close to a million organic poultry.

Let me begin with my sincere thanks to Dan, Kevin, and Hue, the Livestock Committee members, for your obvious hard work.
To start with the easy stuff --

I'm sorry, and Rigo and Jennifer. Seven of you? Okay. It is the three of you I hear asking all the questions. I thank you all for all of your work.

CHAIRPERSON MOYER: There you go.

MS. ALLAN: All right. So, for the easy stuff, we fully support your Committee recommendation on zylazine, chlorhexidine, eprinomectin, and vaccines.

All right. So, regarding the recommendation on excipients, we do support the recommendation as written. However, we do think that additional guidance is still needed to clarify how we should be applying this section of the rule as certifiers.

It is unclear to us, and I think to other certifiers also, whether an excipient is allowed if it is included in the new animal drug application or new drug application for any branded product or only for the product
for which it is being reviewed.

Additionally, it is unclear whether FDA approval as an indirect food additive is adequate for approval. We would appreciate written guidance on this from the NOSB or the NOP on this subject.

From the recent NOSB comments on excipients in these recommendations, it appears as though the Committee is taking the approach of recommending allowance of any excipient currently used in animal healthcare products. While this approach will ensure there's a wide variety of healthcare products that are approved for use, it does appear to inhibit the development of a market for products specific to organic livestock production.

Organic crop producers have had to seek out formulations of allowed pesticide products, such as dust and sulfur, which do not contain prohibited synthetic inert ingredients. We are concerned that the
approach of allowing all excipients in livestock products may be harmful to the organic industry in the long run.

Additionally, while there may not be other attractive options at this time, we caution against the reliance of basing NOP approval on listing by other government agencies such as FDA or APHIS. As we have seen with the EPA who has an inert conundrum regarding pesticides, reliance on outside agencies can lead to unforeseen difficulties down the road.

Now addressing the animal welfare recommendation, we strongly recommend that the Committee does not present this document to the entire NOSB for a vote this week. We request that it be treated as a discussion document and not as a final recommendation.

As this new animal welfare recommendation is radically different than the discussion document presented at the May 2009 meeting and has wide-reaching effects on the
organic industry, the stakeholders, including producers, consumers, and certifiers, need more time to adequately review the recommendation in full.

I hope that you have had, or will have, a chance to read my full written comments. These proposed recommendations contain language in much greater depth and breadth than the previous documents, and our written comments contain many details which I will not have time to discuss here. I will touch on only a few major points.

First, we strongly support the inclusion of numeric measures in the rule in areas that have clear, quantifiable measurements, such as square feet per animal, specific stocking rates, or minimum age for outdoor access. Clear thresholds for compliance can allow certification to be granted in a more consistent and equitable fashion. We cannot and have not supported numeric measures that are based on estimates,
such as dry matter intake from grazing or impose a massive documentation burden on the producer.

We believe that the vast majority of certified organic livestock producers utilize management practices which protect and promote animal welfare, and that we should not require additional paperwork burdens on producers unless there is a clear need and obvious benefit.

We appreciate the desire to align the NOP requirements with the new Canadian and EU standards. However, we are not convinced that shoehorning the new Canadian specific requirements into the existing NOP regulations is the best approach.

Other organizations have developed humane certification standards outside of organic, and it may make more sense to refer to the requirements of these humane standards rather than the Canadian's or European organic laws.
While much fuss about the specificity of the EU and Canadian prescriptive metrics has been made, it should also be noted that the Canadian requirements are still in an implementation period and are untested in the real world, while in the EU, member states have the authority to grant exceptions to the requirements based on regional issues.

We must be careful to temper our desire for measurable limits with the continued flexibility that can be equally applied to livestock producers worldwide.

We are also concerned that the proposed recommendation might contain language which would conflict with or overlap with the forthcoming pasture regulation, such as specific stocking rates or densities. We strongly recommend that the Livestock Committee ensure that any final recommendation be harmonized with the upcoming pasture regulation.
In our evaluation of which practices to require and what practices to prohibit, we must understand that there may be some tradeoffs between requirements and consequences for animal welfare. Requiring pasture for poultry may lead to increased mortality from disease and predators. Allowing poultry to express its natural behavior of the pecking order while prohibiting beak trimming may lead to increased mortality from cannibalism. Requiring physical alterations to be performed at the youngest age possible may not be in the animal's best interest.

We recommend that the community be granted additional time to come to some relative agreement about how to handle these tradeoffs, many of which were clearly explained in the AVMA's public comments on this topic.

Last, but certainly not least, the current proposed regulation contains language
which appears to require pasture for poultry. This is an entirely new requirement which would have serious, if not catastrophic, effects on currently certified organic poultry producers, due to infrastructure investments and limitations, as you have heard from a number of people here earlier.

We firmly support poultry producers who provide pasture conditions to their birds. However, we do not believe it should be required.

There are a number of other sections in the proposed recommendation which need to be hashed out among the stakeholders, such as whether bedding must be organic if it is not consumed by animals, what constitutes forced molting, and whether it is necessary to disinfect animal housing in which there has been no disease outbreak, just to name a few.

The current document is also missing requirements for animal welfare during transport and slaughter.
Again, we respectfully request additional time for the community to discuss this document and review both the overall approach and the details.

Thanks very much for the opportunity to present these comments.

CHAIRPERSON MOYER: Thank you, Robin.

Questions from the Board for Robin? Hue and then Kevin.

MEMBER KARREMAN: Hi, Robin.

Okay, a couple of questions.

On the specific numbers we have proposed for whatever in the animal welfare section, the reason we did that is, talking to inspectors on a conference call, it is a lot easier for inspectors to say, okay, there's 100 animals in this square feet. How many square feet is that per animal? That is why we did that, for ease of inspection. Okay?

That's why.

MS. ALLAN: And we would agree, we
do support the inclusion of specific metrics for something that is measurable like that.

MEMBER KARREMAN: Okay.

MS. ALLAN: I don't have a comment right now about the actual metrics you proposed.

MEMBER KARREMAN: Right, right.

MS. ALLAN: I think for the number of different measurements that were included, we would need additional time to really see whether or not those are appropriate.

MEMBER KARREMAN: And one of the third-party animal welfare groups -- I won't name it -- but, anyway, on a page, says that their hens, "do not require that hens have access to range, but when range is provided...," and it goes into all this.

So, you know, I am a little bit hesitant now. I was kind of leaning toward like having third-party animal welfare certified on top of organic. But, you know, this first sentence says they don't have to be
out on the range, and that's not good, I don't think.

MS. ALLAN: Well, we do see a big difference between outdoor access and what might be considered rangeland or pasture. For the most part, at the densities at which poultry are outside, they pretty much will destroy any vegetation very quickly. So the type of outdoor land in which they are doing their dust bathing would not be considered rangeland or pasture.

MEMBER KARREMAN: And one on the excipients, if I may?

CHAIRPERSON MOYER: Certainly, the Board will indulge that.

MEMBER KARREMAN: Yes, the excipients, just a brand-new topic for the day.

(Laughter.)

What do you think about allowing, let's say, excipients that are approved in an NADA or NDA, or whatever, to be also, okay,
well, if they are an excipient in that formulation and it has been approved, can it be also, then, an excipient? What do you think about that, I guess as a certifier?

MS. ALLAN: I think what we have seen is that the intent of the allowance is to allow as many excipients as possible. And we have, therefore, taken the approach of, if it is allowed in any, in an NADA or NDA, we will allow it in a product, whether or not it is specific to that product. That is based on the ability to also search by things that are approved in any NADA or NDA.

CHAIRPERSON MOYER: Thank you.

The Chair recognizes Kevin.

MEMBER ENGELBERT: Three things, Robin, and, first, thank you.

Do you think that organic poultry should be required to have outdoor access?

MS. ALLAN: Yes.

MEMBER ENGELBERT: You say no to pasture.
MS. ALLAN: Yes.

MEMBER ENGELBERT: And can you give a specific matrix, not right now, but along those lines? Even though we are not talking about pasture and the document still has to come out, pasture intake is a measurable parameter because all farmers measure what they feed to their cows. Simply by subtracting that out, you can come up with the amount of feed that is being delivered or gathered by the animal in pasture.

Three, are there any other, quickly, radical changes in this proposal that you didn't have time to touch on?

MS. ALLAN: Hopefully, I did list quite a number, I think maybe 15 or 20 in my written comments, off the top of my head, going backwards in answering your question.

Specifically, I think we would support limited amounts of beak trimming and detoeing, as previously noted, for when it does promote animal safety and welfare.
Going back to your second question, we have, very at length and quite publicly, discussed this issue of measuring DMI with Rigo and Dan during the pasture regulation. So I would be happy to discuss more with you, but I respectfully disagree with your assessment of the ability to measure DMI accurately without making estimates.

And No. 1, going back -- sorry -- I don't at this time have any specific requirements that I would ask to be included as far as space. But I think that, as a community, we could come up with one relatively easily and painlessly, and possibly based on what I would think the various humane standards require right now.

CHAIRPERSON MOYER: Okay. Any other questions from the Board for Robin?

(No response.)

Thank you, Robin. We appreciate your time.

Robert Yang, to the podium, if you
would, and Lisa Bunin on deck.

MR. YANG: Good afternoon.

My name is Robert Yang. I work with the Pennsylvania Certified Organic. PCO, as a USDA-accredited organic certification agency, currently certifies about 520 operations; 265 of them are dairy producers, and 100 of them are poultry operations.

And as many others have commented here at the podium, we also acknowledge that animal welfare is currently a topic of great concern for both the producer and consumers, and we are also very thankful for all the hard work that the Livestock Committee has put into putting this proposal together. So we definitely welcome the Livestock Committee's proposal for improving such provisions in the NOP regulations.

However, for this past 30-day comment period, we have personally experienced that it has just been only a limited
opportunity that we have been able to consult
with our own membership, our own producers, on
these requirements that may, in the end, cause
a major change in their current practices.

So our recommendation is to be
able to provide a full opportunity for public
consideration. We respectfully request that
this document be considered for discussion and
not voting at this meeting. So that is our
main recommendation.

We have submitted our comments in
writing to the Committee. I think I would
just take a few minutes here to touch upon a
few points that we have commented on.

I know there has already been a
lot of discussion. A lot of producers came
out here, and they have already, actually,
expressed their views. So I am going to make
it as brief as possible.

Regarding livestock living
conditions, an operator of an organic poultry
operation shall establish and retain perches
of usable height, length, and diameter appropriate for the species, shall be provided.

Our producers express that the language is just too vague. Perches should be required for layer hens, but what if they are in pasture based on mobile housing? What would be required then? And in some cases, perches are not usually needed for the broilers or the turkeys.

So we, in our view, support the humane farm animal care requirements, which is six inches per hen with space available for 55 percent of the flock when in multi-story buildings.

Another comment that we had was for poultry reared in houses shall have complete access to pasture, open-air runs, and water, other exercise areas, subject to the species, on and on. Our comment is that the requirement for pasture for poultry represents definitely a major change in current organic
production practices. We really feel that
this needs much more discussion and
consideration.

Some points that may need to be
considered is whether open-air runs are
sufficient or organic poultry should have
access to vegetation that supplies some
nutrient needs.

And we would also like to point
out that it is not clear in the language
whether confinement for inclement weather will
be accepted for broilers who are slaughtered
at seven to ten weeks, especially if they are
raised in the winter months.

One other thing is the physical
alterations in 205.238(a)(6). I know there
has already been a lot of discussion on that.

We found out that our certified
poultry producers, they do practice limited
beak trimming. They have expressed that they
believe it is a necessary practice to prevent
bird injury.
Many of these producers, they are already certified by the Humane Farm Animal Care, HFAC, which does, actually, currently permit tipping of the beak at less than 10 days. Current PCO policy is actually to allow beak trimming up to 10 days.

So we currently support, also, the Accredited Certified Association language which states that minimal beak trimming is allowed for protection of the flock and must be done in a manner that minimizes pain and stress, no later than 10 days. Debeaking, severe beak trimming is prohibited.

In closing, I would just like to add that PCO does support the comments filed by the Accredited Certifiers Association. We have actively participated in a working group that developed the guidance document on poultry production.

We also request that the NOSB consider whether some components of the animal welfare recommendation might be better suited
as guidance documents and organized according to the animal species. The reason being is, since all of the producers are familiar that the NOP regulations do allow some degree of flexibility in achieving compliance, it would give them more of a guidance to be able to come into compliance.

So that is our final proposal. The only last concern that we have is that maybe these proposed changes may overlap or conflict with the final regulation change on pasture requirements. So perhaps these changes should be tabled until publication of the pasture rule.

Thank you.

CHAIRPERSON MOYER: Thank you, Robert.

Questions from the Board for Robert? (No response.)

Seeing none, we appreciate your time. Thank you very much.
MR. YANG: Thank you.

CHAIRPERSON MOYER: The Board would like to call Lisa Bunin to the podium, and Emily Brown-Rosen on deck.

MS. BUNIN: Good afternoon.

My name is Lisa Bunin. I am the Organic Policy Coordinator for the Center for Food Safety.

CFS is a nonprofit membership organization that works to protect human health and the environment by curbing the proliferation of harmful food production technologies and by promoting organic and other forms of sustainable agriculture.

My remarks today will address animal welfare, GMO vaccines, and nanotechnology. Later, my colleague, Jaydee Hanson, will provide more detailed comments on nanotechnology and be available to answer technical questions.

The humane treatment of animals is an important issue for CFS and its members,
and so is the urgent need to promulgate explicit guidance and standards for organic livestock and poultry management.

Consumer awareness about the ethical treatment of animals in food production is at an all-time high, due in large part to the Humane Society's documentation of the despicable animal-handling practices on a large CAFO and similar footage shown in the movie "Food, Inc."

State battles over the labeling of milk from cows injected with rBGH to produce more milk in less time also has contributed to this national concern.

The time is right for the NOSB to set the bar high for animal welfare practices in organic and for organic farmers to capitalize on this aspect of organic as a competitive advantage over conventional livestock operations.

An important issue for CFS is that organic milking cycles protect the comfort of
animals and that they do not disrupt their natural patterns, which includes access to pasture. Evidence from case studies in Europe and New Zealand demonstrates that two milkings per day not only protect the welfare of lactating animals, but they also are sufficient for producers to obtain acceptable milk yields to remain economically viable.

In terms of livestock stocking rates, we urge the NOSB to include in its definition a measurement of the long-term carrying capacity of pasture based upon available nutrients, climate, and potential ecosystem impacts. When determining a stocking rate for a given producer, the biodiversity impacts associated with pasturing should be evaluated in accordance with the NOP biodiversity conservation guidance document.

We further urge the NOSB to formally recognize the many ecosystem services and benefits that good pasture management affords, including carbon sequestration,
protection from manure runoff, pollution of waterways, soil erosion, and the maintenance of native grasses and species' habitats.

CFS supports the Livestock Committee's recommendation for including clear and specific language detailing the types of animal alterations that are prohibited and allowed by the NOP. It sends a strong message to organic consumers and the livestock industry as a whole that egregious animal welfare practices will not be tolerated in organic production.

CFS supports the Committee's recommendation to ban confinement of laying hens in cages. We also recommend the adoption of nesting, perching, and litter requirements for laying hens to allow them to exhibit their natural behavior. We support complete access to pasture, open-air runs, and continuous access to clean water.

CFS opposes the Committee's inadequate proposed calf housing standard that
would allow six months of calf isolation after birth. Scientific research demonstrates that calves benefit from environments corresponding to their needs as a herd-living species, and the proposed standard severely and unnecessarily limits their natural activity.

We, instead, support the EU's existing eight-week standard of allowable calf isolation as an exemplary welfare practice which allows for consistency with EU regulations, an important consideration for organic food exporters.

CFS does not support the Livestock Committee's recommendation on GMO vaccines, and we urge the NOSB, instead, to follow the required procedures detailed in the final NOP rule for conducting a TAP review of GMO vaccines.

CFS supports the National Organic Coalition and others in their call for the Board to critically evaluate GMO vaccines and organic production, and urge the Board to
address the seven health and environmental
criteria required by OFPA to be used as a
basis for determining whether to allow GMO
vaccines in organics.

CFS believes that the public has
the right to review, evaluate, and comment on
scientific data used to allow GMO vaccines in
organic livestock production. We urge the
NOSB to make the TAP review a priority.

CFS supports the Materials
Committee's recommendation that nanotechnology
is prohibited as an excluded method in organic
production. We urge the Board to formally
acknowledge the many potential health,
environmental, and broad social risks of
nanotechnology presented in CFS's written
comments, and they will be discussed by Jaydee
later today.

CFS strongly opposes the Materials
Committee minority opinion and urges that it
is excluded from the final Board
recommendation. Prohibiting nanotechnology is
the only way to protect organic integrity now and in the future, and it is not expected by organic consumers in their products.

Thank you.

CHAIRPERSON MOYER: Thank you, Lisa.

Questions from the Board? The Board recognizes Dan.

VICE CHAIRPERSON GIACOMINI: Thank you, Lisa.

Under your section on milkings per day, could you get us copies of those case studies?

MS. BUNIN: I absolutely can.

VICE CHAIRPERSON GIACOMINI: Could you please get those to Valerie when you have a chance?

MS. BUNIN: Sure. They are also referenced in our detailed comments.

VICE CHAIRPERSON GIACOMINI: Are they specified as --

MS. BUNIN: They are not attached,
though.

VICE CHAIRPERSON GIACOMINI: They are not attached? Is there at least a link?

MS. BUNIN: I think so, but I will check on it for you.

VICE CHAIRPERSON GIACOMINI: Okay.

If you can't get the actual study, at the very least, a reliable link. Thanks.

MS. BUNIN: Absolutely.

CHAIRPERSON MOYER: Okay.

Katrina?

MEMBER HEINZE: On your comments on nanotech, the minority opinion would have the same effect of not allowing nanotech to be used today, but would allow flexibility in the future, should we learn more, as the science develops.

So I guess I am wondering, since the effect is the same, why the strong opposition?

MS. BUNIN: I think I am going to leave that to my colleague, Jaydees Hanson,
when he comes in and gives his remarks on nanotechnology.

MEMBER HEINZE: Okay.

CHAIRPERSON MOYER: Thank you, Lisa.

MS. BUNIN: Thank you.

CHAIRPERSON MOYER: We appreciate your time.

Emily Brown-Rosen, the Board will entertain you at the podium, and Dave Decou on deck.

MS. BROWN-ROSEN: Good afternoon.

Thank you, and I just want to say I am from Pennsylvania Certified Organic. We thank you for the diligent, extensive work at this meeting. You guys have been really busy. It has been a lot of work to keep up and read it all, but it is great progress. So I am really grateful that you put the time into it.

I know it is a lot of work.

We have submitted our comments in writing. I am going to focus on materials
issues and just highlight a few things, a
couple of new things that came up since I had
more chance to read things. So I will just
ty to hit the highlights. Feel free to ask
any questions.

Also, I don't want to be remiss in
welcoming Miles to his job. It is wonderful
to have an experienced materials guy here, and
we look forward to working with him and all of
you in the future, except for those of you who
have to leave and I am sure you will still be
around to give your advice.

No. 1, list of inerts, I am glad
you put this out there for our discussion. It
is a really important issue. It has been
really hard to figure out where to go with
this, but at least we are talking or getting
more ideas, because we have kind of forced the
discussion here.

We share OMRI's concern. They
have identified a minimum of 250 inert
ingredients that are in pesticide products
that they review. In addition to OMRI review, there's EPA review, there's WSDA review, there's PCO review.

There's a lot of products out there; we don't know exactly how many there are or how many would bother to petition and come forward, but we do agree with the concept that they need to be looked at. We need a new system. We are not sure what is the best option.

I don't think necessarily putting them all on the National List is going to be a great idea. Then you have to sunset review them every five years also, and it is just a huge amount of technical work.

One point I would like to make is I have just been made aware by Jay Feldman, your next incoming Board member, that there are major changes underway at EPA. They have just issued a notice. They are planning to require all inerts in pesticides to be disclosed on labels.
So this is an amazing thing. We have been trying to get this done for like 20 years. You know this, Joe.

So this is a result of lawsuits that NCAP and a couple of environmental groups filed years ago, but with our new Administration, they are just suddenly going to change. So it will take some time, and I am sure there will be opposition, but if it happens, it will make a big difference. We won't have the secrecy thing. We will be able to look at these things, consumers will be able to look at them, and that will have an impact, I think, on what people want to spray on their crops, once they know.

But, as far as options, I am encouraging further consultation with EPA. We had one of the EPA egg people who was here earlier who had to leave, but he will be here tomorrow to answer questions.

I think they are going to be more open to collaborating, and if there is any way
we can possibly work out some kind of sharing
deal where they do reviews of inerts, but we
get an agreement that they can review for
organic products, improve the organic
production label that they currently -- I mean
they currently have a program for organic
production or gardening on labels, meeting the
NOP requirements.

And frankly, they are not doing
the best job right now with that program, but
I think there's new interest in there.
Hopefully, we can get them to improve that
program and maybe take on some of this inerts
review to the OFPA criteria and have a whole
sort of banner, green chemistry kind of label.
So that is the ideal goal. I don't know if we
can get there.

But we need to have those kinds of
discussions. That would be a way to work
collaboratively with the other agencies and
maybe not burden you with this technical
review of inerts.
So we will hear more about that tomorrow, and I have some sort of imaginary ideas about how you could rewrite the rules, but I don't think we are there yet. I just put it in because I know you like language.

Other items: peracetic acid, I am a little concerned about the annotation. Part of the problem is that the petition, the links are broken. I know we have problems with the website, and we are really looking forward to that getting fixed because it made it really hard to review some of these materials before this meeting.

I don't really understand the annotation of 5 percent. I read the petitioner's comments, and I think you probably want to listen to what he says because some of their products are concentrates. Okay? They are 12 percent, but when you dilute them on the farm, they are less than 20 parts per million.

You have to clarify what you are
after here. Are you looking at actual
application rate, which is kind of hard for us
certifiers to -- oh, one minute left. All
right.

Anyway, skipping on, vaccines. We
appreciate that you have provided some
information, but we remain very concerned
there's no TAP review. We think this is a
big-deal issue. I don't take a position one
side or another. Maybe you should approve all
vaccines irregardless of their GMO or not. I
mean I think that could be argued, but I just
don't feel like we have the evidence in front
of us to support it and justify it to the
larger community at this point.

I understand you have been doing
more research and review, and it is just not
there for us to see. So I would like you to
delay or rephrase this, so that we get a TAP
review or more information to justify it. I
think we are going to run into a lot of
trouble with the consumers on this until we do
the required TAP reviews to the OFPA criteria.

I think it is a big issue.

Well, okay, there's a few more things I would like to say, but I guess I ran out of time.

So any questions?

CHAIRPERSON MOYER: Thank you, Emily.

Any questions from Board members for Emily? Hue?

MEMBER KARREMAN: Emily, vaccines.

What would you think if we were to say something to the effect that non-GE vaccines need to be used if they are available?

MS. BROWN-ROSEN: That would probably be a reasonable thing if we are trying to promote non-GMO vaccines, yes. Yes.

MEMBER KARREMAN: Because that is maybe where we go with this because there are some vaccines -- I mean I've got the whole list -- where the only vaccine for that particular problem is a genetically-engineered
vaccine. You know, we are trying to be good
to the animals and not tie the farmers too
tight with their hands both behind their
backs. They already can't use the
antibiotics.

So that seems to be reasonable?

MS. BROWN-ROSEN: Well, I think
that is a reasonable way to go about it, but
I still feel like we need to be able to
justify this to the consumers. I am concerned
that we haven't -- I don't know, maybe what
downsides there are to GE vaccines. I feel
like the report that you posted was very
interesting. It stresses all the benefits
and, of course, we are struggling with
fighting disease, which is really important.

But when you have a TAP review,
you look at what are the risks? What are the
risks to the environment? What are the risks
to the animals, to the humans, to health?

I just haven't seen that anywhere.

Maybe it wouldn't take much to provide that
information, but I don't feel like we -- you
know, when we are down the road and we have to
justify GMO vaccines to consumers
particularly, and we say, well, just look at
this very well-written TAP review that tells
you why and the lack of alternatives; plus, we
are requiring non-GMO whenever possible, and
we are trying to protect the health of the
animals and prevent epidemics. But then you
have something to say to people.

And I also would just like to say
that we have only identified two so far that
have come across our desk, and we are not
penalizing growers for them now because this
is sort of a whole new development and
everything is so up in the air.

So I don't think taking the time
to do a review, and I think most of the
certifiers are allowing them at this point
because they are just not aware -- it is very
hard to find out exactly -- from our end, we
don't have guidance on identifying them,
either.

So, if we could step back and make the policy and make it real deliberative, I don't think it would be harmful to the producers.

CHAIRPERSON MOYER: Kevin, the Chair recognizes Kevin.

MEMBER ENGELBERT: I would just like to play devil's advocate, Emily, and trying to look at all sides of the issue, and two quick points.

One, farmers don't always have the time with an outbreak to wait a week, a month, a year for any type of decision like that.

And, two, we all understand the public relations nightmare. Like someone said earlier, "NOSB allows GMO vaccines."

But we also have to deal with the dilemma of the public relations nightmare if -- Hue used the avian example, but, also, if a hoof-and-mouth disease outbreak occurred in this country like it has in Europe, and
organic animals are either put down or suffer because they weren't allowed to be vaccinated. So I agree, it is a conundrum.

MS. BROWN-ROSEN: Yes.

CHAIRPERSON MOYER: The Chair recognizes Hue.

MEMBER KARREMAN: You know, what do we say to the organic consumers right now with all the animals that have been vaccinated with possibly genetically-engineered vaccines since the last seven years? That is one thing to ponder because it has been happening, period; the end. It's been happening. It is nothing new.

The second thing is the EU allows genetically-engineered vaccines in organics. And that is I don't know how many millions of people over there in their marketplace.

MS. BROWN-ROSEN: Well, my answer to your first -- do I get to answer your first question? Or was that just a rhetorical question? Okay.
You know, organic is continuous improvement. We find this all the time with materials, that we find out something new that we didn't used to know. We didn't used to know.

I mean it is very difficult. They are not required to label genetically-engineered on their labels. We generally accept these vaccines as a good, preventative thing.

When the rules was written, the staff reviewed and there weren't any approved at that time. So we haven't been looking. So now we know there has been a change. So we just tell people we are researching it, identifying it, and moving on. If we find it harmful, we will say no. If it seems the benefits are better than the risks, then we say yes. I mean that is how we always make rules.

MEMBER KARREMAN: I have to add one thing.
CHAIRPERSON MOYER: Hue, briefly, please.

MEMBER KARREMAN: In 2002, when this rule was implemented, there were 32 genetically-engineered vaccines already in the marketplace that were for livestock.

MS. BROWN-ROSEN: Well, then it would have been nice to know that. We didn't know that.

MEMBER KARREMAN: And they are all labeled with an "R" in the totally public biologics listing of APHIS CVB.

CHAIRPERSON MOYER: The Chair recognizes Rigo.

MEMBER DELGADO: Just to follow up on Hue's point, Hue has had considerable experience. We discussed those points at the Committee level.

You brought up the fact that you have experience with those vaccines, the same as Dan, and so forth. So we felt comfortable at this point that there was enough evidence
out there, probably not as strict with going out to a third party, but at least within the Committee we had enough experience to move forward with our recommendation.

MS. BROWN-ROSEN: Well, I appreciate that you collected evidence, but I would like to see a report, so we have something after you are gone to look at. You know, we don't have that.

CHAIRPERSON MOYER: Okay.

MS. BROWN-ROSEN: Thank you.

CHAIRPERSON MOYER: Thank you, Emily.

MS. BROWN-ROSEN: Yes.

CHAIRPERSON MOYER: Dave Decou, if you could come to the podium, we would appreciate it, and Richard Theuer on deck.

MR. DECOU: Good afternoon.

Dave Decou, the Executive Director of OMRI.

Careful; you're going to have two tall guys in a row, so you get to strain your
neck the other way.

I really appreciate the efforts that you guys all go to. I hear a lot of discussion about, it seems like, other projects like, why not review all the inerts and how about personal care products and review all the ingredients that are going to go there? No wonder you all want to retire.

I also very much appreciate the NOP stepping up, planning on getting the petitioned substances database updated and hope to keep it current. That is one of those things we at OMRI use a great deal with a lot of other information.

TAP reviews being a very important piece of our work because, as Emily just indicated, the history of the thought is very important to us. When you guys make a decision and we can't find the history, we don't know what to do five years later when you've all retired.

So I would actually recommend that
you have TAP reviews for anything that goes on
606 as well because I don't know what the
thought process was. Often that becomes an
important issue in the future. If you are
trying to get into the subtleties of a
material issue, some of that becomes very
important.

I am going to talk very briefly
about inerts, List 4. I think one of the
issues that I think is kind of not really
thought of very often, the Canadian organic
regulation cites List 4 in the PMRA, which was
probably originally the same list as the List
4 in the U.S. EPA.

If we go radically far from it, we
are going to have a different set of inerts
from what they are using, what they are
allowing under equivalency. If that is a
concern to anybody, that might be a concern.
My associate is going to talk further about
inerts.

Ferric phosphate is listed as
something to discuss under sunset. Having
read the petition to remove it, it appears the
petition is not arguing about ferric
phosphate, but about EDTA. EDTA, under the
EPA regulations, is listed as an inert under
the products that are used under ferric
phosphate, and EDTA is a List 4B inert.

Unless we can change that
structure or separate ourselves from the EPA's
structure, I don't see a way to change the use
of ferric phosphate, which is also a very
important tool for growers in areas where
slugs are a big problem, California being
probably the biggest one. I live in Oregon
where we raise them bigger.

(Laughter.)

So just a couple of more points.

Miles McEvoy pointed out this problem with
compost with bifenthrin in it, and the
suggested policy that they came up with was to
go for the 5 percent of the lowest EPA
tolerance for any commodity.
OMRI has looked into this. We are kind of living in this big question mark. I think everybody needs to recognize that probably in California, where we have a lot of products that we know a lot about in the composted, probably most of the products that are composted that are using green waste as a source material for their feedstock are going to be prohibited under that line that they are suggesting. I am not saying the line is wrong. I am just saying the reality is that a whole lot of compost is going to become unavailable.

Partly the reality is that California, as a state -- and this is where we in the organic industry kind of fit in a very funny juxtaposition. Everybody wants to save the universe, do recycling. California has a law that is trying to get most of your organic material out of the landfills. So what do you do with it? Well, the best thing to do with it is compost it.
At this point, the organic industry is saying, well, that's a good idea, but don't let us use it. It is sort of what we are going to go on.

We are going to end up in the green, and the organic juxtaposition is going to go on over and over again. Fortunately, you guys get to decide it. Thank you.

I would also like to say that Miles also suggested a resolution with an issue that probably isn't widely known around corn steep liquor. I would like to commend him. That is probably a good consideration, to have corn steep liquor continue to be used until you and the NOSB get to work it through. We would probably like to see a TAP review again.

Thank you.

CHAIRPERSON MOYER: Thank you, Dave.

Questions for Dave from Board members? Joe?
MEMBER SMILLIE: Yes, Dave, you're scaring me here. On what do you base your conclusion that a lot of the green matter waste that goes into compost production is not going to qualify? We are talking about herbicided lawn waste? Or are we talking about agricultural waste?

MR. DECOU: Well, when I say, "green waste", it is usually lawns and clippings --

MEMBER SMILLIE: It is? Okay.

MR. DECOU: -- yard clippings, and so forth.

The reality of this situation has arisen because EPA banned a very commonly-used pesticide, chlorpyrifos --

MEMBER SMILLIE: Right.

MR. DECOU: -- from various uses, maybe completely. I haven't really paid attention to the deeper details.

So I think it is a third-
used, which is this bifenthrin. It has only
recently been allowed to be used on lawns and
gardens.

It happens to be highly persistent
in the sense that it doesn't break down under
soils or microbes. It only breaks down in
sunlight. And it is an insecticide. It is
not an herbicide.

The particular case that came up
was one in which, as Miles pointed out,
wheatgrass was grown in pure compost. The
testing that originated this problem was to
actually take the compost and the wheatgrass
together as the sample. They tested it. It
showed up bifenthrin. Later tests indicated
that the compost had all the bifenthrin, and
none of it had gone up into the wheatgrass.

So this is a very complex issue,
just like vaccines. It is not an easy
question because the public doesn't want us to
have prohibited materials used on the land
that somebody might grow organic crops, but we
live in a world that isn't perfectly clean.  

MEMBER SMILLIE: Yes, that is my concern. We don't get our vegetables from Pluto, as I was quoted as saying, I think, in a recent article.

(Laughter.)

But the whole thing of throwing things to testing is just going to increase the expense. It is going to keep people from composting because, if they are going to be required to do a whole series, a battery of tests to prove that their compost qualifies, we are going to get back into that game where we have to prove we are good by spending money for testing, as in other areas. I am just really nervous about taking that step.

It is one thing like organic to me is composting. That is like one of the key tools that we have, and it is one of the key tools that farmers have. A lot of farmers don't have enough material. They have got to bring in their compost.
You know, segregated compost yards, organic -- I don't know. I am very worried about the path we are taking, going down, to start requiring the testing for all compost. I understand the fears, but I think the downside is also dangerous because, as you said, everything moves around the planet, and we are part of the solution. If we start taking away these tools because we are fearful of consumer expectations, if we define organic by consumer expectations, I think that we could get ourselves without any tools left to fix.

MR. DECOU: That is a possibility.

CHAIRPERSON MOYER: Well said, Joe.

Hue and then Kevin. I'm sorry. You've got to get faster, Kevin.

(Laughter.)

MEMBER KARREMAN: Dave, you mentioned vaccines when you looked over here. I am just wondering what the listing is in the
OMRI Generic Materials Book about vaccines.

MR. DECOU: I can ask my associate

because I don't have a copy with me right now.

I would assume it -- actually, I don't know.

I shouldn't say. As soon as I make a

statement that "I assume", I am in trouble.

(Laughter.)

CHAIRPERSON MOYER: Thank you,

Hue.

The Chair recognizes Kevin.

MEMBER ENGELBERT: Very briefly,

Dave, a new subject, the EDTA. I wanted to

just give you a brief update on where the

Crops Committee was coming from, why this is

a discussion item. We will get into it more

when that comes up.

But when that was approved, we had

learned that the EDTA was not revealed to be

part of that product. Even though it is

listed as a List 4 inert, it is essential for

the product to work. So, in the Crops

Committee's mind, that is not an inert.
That is part of the whole conundrum of looking at all of them and seeing, are they really inerts or not? This is probably the first material that is going to be scrutinized because of that realization. If it essential for the product to work, in our minds, at least the current Crops Committee's minds, it is not an inert.

MR. DECOU: And I can't argue with you, except I deal with EPA definitions. When OMRI does its work, it can't be trying to figure out what the mind of the Crops Committee is at that time.

And it is probably not the first. It is at least the second. Peracetic acid is the exact same issue, only EPA decided to change their minds. That is why it has gone to you, because it was there all along. It was considered an inert until EPA decided, no, it's an active now.

So it is an ongoing issue. I always think these materials issues will just
settle down and go to sleep. They don't.

CHAIRPERSON MOYER: Thank you, Dave. We appreciate your time.

The Board will now call Richard Theuer to the podium; Renee Mann on deck.

I will remind both the gallery and the Board that it is 4:30 in the afternoon and we are now halfway done with our list. So, if everybody can be mindful of the time, both from the gallery and from the Board, I would appreciate it.

MR. THEUER: Thank you. My name is Richard Theuer. I am a retired scientist from North Carolina and a former member of the Board.

A year ago, I came here to ask the question about micronutrients in organic crop production, and specifically, whether the 601(j)(2), where they list zinc, copper, iron, manganese, molybdenum, selenium and cobalt, was an exclusive list or not.

Can I have the next?
Well, when it is considered an exclusive list, several micronutrients that are required for production of crops are eliminated.

Can I go to the next? The one I mentioned of several last year was nickel. AAPFCO recognizes nickel is essential. Certifiers are not permitting it. Nickel deficiency is being found in organic orchards.

Why is it not being permitted? Because the wording of the statute or the law is that it is an exclusive list.

Last year I had two comments after my presentation, and I am back to answer, respond to those comments. Joe Smillie said it is an exclusive list because it doesn't say it is an inclusive list, and I will respond to that. And Dan asked a question, that he would like to see the language that had been in the animal mineral listing to see how that
So I went to the preamble for the regulation. In fact, for the livestock production, when it gets to minerals, it is an extremely science-based approach. It says, "The producer must provide a feed ration including minerals." The definition of feed additive includes minerals.

The next slide. Next. Next.

And the preamble says these additions make the livestock healthcare practice standard more consistent with the NRC's Committee on Animal Nutrition's nutrient requirement series. So there is an authoritative standard that you have for the regulation.

The next slide shows that the section of the regulation is extremely simple and straightforward. Trace minerals are allowed, used for enrichment or fortification, when FDA approved.

When we get to the crops side, it
is very, very different. This one section talks about maintaining the chemical/biological condition of the soil, managing soil fertility, crop nutrients. It doesn't even mention mineral materials.

The next slide.

It says a producer may apply a crop nutrient or soil amendment if it is included on the list in the case of a synthetic.

The next section, also, the producer may not use any -- it confirms Joe's point last year. This (j)(6)(ii) is an exclusive list.

The next. And the next.

Now the question is, there is a section that relates to disease. So is there a disease related to micronutrient deficiency? And the answer is, yes, there is. And disease conditions can be controlled through the application when certain practices are insufficient by application of a synthetic
substance that is allowed on the National
List.

Let me go to the next, and you
might want to look at the board. If you look
at the leaves on the left, you will notice
black around the edges. That is the condition
called mouseear. That is related to a buildup
in urea levels at the edge of the leaf. The
urease, the enzyme that breaks down urea, is
a nickel metalloenzyme. No nickel, no enzyme.
Buildup. Necrosis.
The next slide gives another
picture of the nickel-deficient on the left
and the normal on the right.
That meant, since (j)(6) is an
exclusive list, and we need to have nickel put
on the National List, I filed a petition.
Hopefully, that will wind its way to you over
the next few months. I ask that the NOSB
Crops Committee add this to its work plan when
it comes through the system, so that pecan
growers are not forced to choose between being
organic and being successful.

CHAIRPERSON MOYER: Thank you, Richard.

Any questions for Richard? Kevin?

MEMBER ENGELBERT: I know, time.

What causes the buildup of urea that can't be controlled any other way, right?

MR. THEUER: Well, the buildup of urea -- okay, the pecan plant and a few others, tree nuts, river birch, transport nitrogen from the ground to the leaves in the form of ureides, arginine, that have the urea component in the molecule.

So, when it gets to the top of the leaf, you have to have ureides to break it down to ammonia, so the plant at that edge can do some good. So you have urea because you don't have the nickel enzyme, the urease to break it down into the ammonia that the plant can utilize for protein synthesis, et cetera.

CHAIRPERSON MOYER: I'm surprised you didn't know that, Kevin.
MR. THEUER: Does that answer your question, Kevin?

MEMBER ENGELBERT: Well, no. I am still trying to get at why there's a surplus of the urea. Has there been an application that --

MR. THEUER: No, no. No, nitrogen is transported to the leaf in the form of a urea-derivative by the plant. When it gets there, because there's not enough urease, it can't break it down.

CHAIRPERSON MOYER: Thank you, Richard. We appreciate your time.

MR. THEUER: Thank you.

CHAIRPERSON MOYER: Renee Mann to the podium, if you would, and Keith Pitts on deck.

MS. MANN: Good afternoon. Thank you for the opportunity to address the Board, and thank you all for your hard work.

I am Renee Mann, and I work for
OMRI as the Review Program Manager. I was going to address just a few topics here for inerts.

We really appreciate the hard work that the Crops Committee has put into clarify and put together a recommendation for inerts. We recognize the balance that you are trying to strike between putting a huge list of materials on the National List or reviewing each individual one. So I don't really have an answer for you except to say, please consider that there are a minimum of 258 inerts on OMRI's list. These are inerts confidentially within products that we have reviewed.

So, if you were go to forward with this recommendation to review these materials, you might have that many that come to you within the next six months. Then I think you have given yourself a total of a year and a half to review them. I am not really sure of your whole process of review, but you could be
looking at that many inert materials.

Peracetic acid, I really recommend that you speak with the petitioner Kristin Knox, who is coming up in a couple of comments, about what she thinks is a feasible annotation for peracetic acid. In our comments, we recommended 100 parts per million in the application rate instead of the 5 percent annotation that was recommended.

Then excipients, I just wanted to touch on a little bit. Thank you for tackling the issue of excipients. It has been an issue since it got on the National List.

We agree with the addition of the APHIS-considered excipients. One question I have for the Board is whether you could or would or would like to reconsider the statement of adding healthcare products. I know that you are trying to expand the use from excipients just in drugs to excipients in healthcare products, but healthcare products includes a huge number of materials. It seems
like more than what was recommended or what was mentioned in the recommendation.

So, just from my glancing at the OMRI generic materials list and seeing every single product that is considered a livestock healthcare product, there are a heck of a lot of materials. You might want to open the generic materials list and look, to consider what is going to happen if you add healthcare products -- or excipients allowed in healthcare products to the National List, because we may be looking at a huge expansion of excipients allowed in things like vitamins that are fed instead of just vitamins that are injected.

Then, to address Hue's question about vaccines, in our generic materials list we say that vaccines may be used against problems that are endemic. Those derived from excluded methods must be approved in accordance with 205.600(a). And that's it. And we reference a couple of sections of the
rule, but that is basically it.

Thank you.

CHAIRPERSON MOYER: Okay. Thank you very much, Renee.

Any questions for Renee? Hue?

MEMBER KARREMAN: Thanks for that from your generic materials book.

The reason for the animal healthcare products -- I think that is the term we use -- is because in organics you are not allowed to give any kind of treatment or anything like that to organic livestock unless they are sick. You can't give drugs unless they are sick.

So a lot of farmers will give health enhancements, we'll say, to an animal.

It's all in the wording, Joe.

So there's a lot of products out there, I fully agree and we know that.

However, you know, there always seems to be a whole lot of focus on the excipients rather than the active ingredient, which might be
essential oil of peppermint for some of these lotions that are out there that farmers rub on the udder. It seems an undue focus, like you are throwing out the baby with the bath water with the excipients.

So, keeping that in mind, plus, that drugs aren't allowed for organic cows unless they are sick, we wanted to say animal healthcare products. That is the reason. I think we stated it in there.

But, yes, we know it is going to increase the list, but it is still within the parameters of what is defined in 603(f), "F" like "Frank". Okay?

MS. MANN: Yes.

CHAIRPERSON MOYER: Thank you, Hue.

Any other questions for Renee?

(No response.)

Thank you, Renee.

If Keith Pitts could come to the podium, and Kristin Knox is on deck.
MR. PITTS: I thank you for the time to speak before you.

I am Keith Pitts and work for Marrone Bio Innovations. We are a biopesticide firm based in Davis, California; has been established since 2006, primarily focused on microbial pesticides, but we do do some work and development on plant-based extracts as well.

We are developing our products for agriculture on the whole, in hopes of lowering the toxicity profile of pest management in general. We do have a commitment to formulate, so the products are available for organic agriculture. So, certainly, that is a goal of ours.

That said, even if we were not to pursue an organic label, we would continue to work from the 4B and A list as it exists today, just to keep using minimal-risk products.

In general, I notice OMRI's
comments and support the approach they have
put before the Committee. I think we all know
that EPA recently completed an inerts review
process and, by and large, the regulatory
status of the inerts that are currently
available to us hasn't changed. There are a
few that are going to be taken off, I imagine;
a few that potentially could be added on, if
someone wanted to petition.

So that is probably the most
discrete and, using Miles' sensible and
practical test, that may be the most immediate
way to deal with the issue of housekeeping
between EPA and USDA.

Unfortunately, we didn't go into
this process with an understanding of how the
EPA decisions were going to impact NOSB
decisions. It would have been nice to have
known that early on. That said, we appreciate
the fact that the Board is trying to tackle
this and come up with something that can work
for everyone.
There seems to be an underlying issue that maybe an approach or a philosophy or thinking has changed on these inerts or is evolving. If that is the case, I just would ask that we have a little bit clearer sense of what the rationale is for the change, as well as the criteria that would be used for judging the products.

It appears that their proposal is setting up a new review process for these inerts, mainly, I would assume, to deal with the volume. But I think just having clarity on why we may be going down a different path would help inform all of us.

As far as the timelines, I can't speak to the resources that would be necessary for the NOSB to complete its work, but just I would like you to keep in mind that it can take several months to a year or longer just to nail down a formulation. We are working on some products now that we haven't quite figured out how to stabilize the active...
ingredient.

So reformulation presents challenges to us from an R&D perspective, in addition to the four to six months it would take at best to get an EPA review of a new formulation.

Then we have to go to states and get the new formulation approved, and that, quickly, it can happen in two months. We have some states where it takes over a year now to get the product approved after EPA approval.

Then we have to go to OMRI and get the reformulated product okayed. That can take four months to I think we have one that has taken about 10 months to get the new OMRI label, which we appreciate.

Then, if we do get the new label, we have to go back to EPA with a new label after the new formulation is approved, which can run anywhere from four to eight months. I think some companies have talked about it taking longer to get a label amendment.
through.

And I did not realize the Canada issue. That was new to me. I just will say that we do license products from time to time, and we see things that are IFOAM-certified that have inerts in them that would not be approved here. So I think there is a cascading effect that we need to be mindful of any time we start changing any of these lists.

We look forward to working with you.

CHAIRPERSON MOYER: Thank you, Keith.

Any questions from the Board members for Keith?

(No response.)

Seeing none, I appreciate your time.

Kristin Knox, if you could come to the podium, we would appreciate it, and Michael Fiery on deck.

MS. KNOX: Good afternoon. Almost
good evening, I guess.

My comments right now I understand were distributed, and they are in addition to what was posted for comments back in October to the Crops Committee and to the NOSB Board.

Thank you again for the opportunity to speak here today. We want to thank you, as everyone else is clearly understanding the magnitude of what you do, your dedication to the preservation of organic farming and to the careful consideration of the synthetic substances that you do allow as part of the organic system plan.

As a company, BioSafe Systems strives to provide environmentally-sustainable alternatives to the harsh chemicals that have been traditionally available and, for organics, tools that were never available before.

We hope that we have demonstrated in our previous submissions for the PAA petition that it is safe to the environment
and to humans. There truly are no other organic alternatives to PAA that provide immediate knockdown of the plant pathogenic organisms without mutational resistance, phytotoxicity, or persistence in the environment.

One of the basic principles of organic farming is to sustain and enhance the health of ecosystems and organisms, from the smallest in the soil to human beings. Obviously, the most desirable course to follow would be strict adherence to IPM practices such as crop rotation, cultivar selection, and proper site selection.

We understand and support the respect for soil and the natural growing environment, and we also understand the concern for the effects that PAA might potentially have on the beneficials in the ecosystem.

There are times, however, when conditions will rise that can prove to be
economically devastating. One such example occurred in the Northeast U.S. this past summer when late blight destroyed much of the tomato crops belonging to conventional and organic farmers alike.

Our hydrogen peroxide peracetic acid products have proven to be highly effective against late blight. When applied during high pressure or first sign of damage, PAA chemistry has demonstrated well against phytophthora, both in the soil and on the plant surfaces.

We are not advocating that the chemistry should be used with every irrigation cycle, although it can be. We merely want to make sure that this is a valuable, versatile chemistry that will continue to be available to organic farmers who trust and rely on our products.

Peracetic acid is currently limited to the treatment of fire blight under 205.601(i)(7) and for the disinfection of
equipment, seeds, and asexually-propagating plant material under 205.601(a)(6).

In the most recent Crops Committee recommendations for peracetic acid, dated September 11th of '09, the annotation would state that peracetic acid can be used in hydrogen peroxide solutions up to 5 percent, but the current restrictions to the fire blight and other applications are not addressed.

We would like to emphasize that this petition was originally submitted to include the use of PAA for treatment of all crops or a broad spectrum of plant pathogens and also as an algicide for irrigation waters.

We are very concerned that this current annotation does not sufficiently address these uses, and we would appreciate the Committee taking this item up for discussion as part of this meeting.

We would also like to again urge the Committee to consider listing peracetic
acid as approved in use dilutions up to 200 parts per million, instead of concentrations up to 5 percent. We have demonstrated in previous submissions that peracetic acid at 200 ppm's has a negligible effect on insects and soil nematodes.

Also, our plant pathologist, Dr. Vijay Choppakatla, has provided comments that there is very little effect on beneficial organisms on plant surfaces and in the soil at 200 ppm's. At this level, PAA sufficiently suppresses the plant pathogenic organisms while leaving the beneficials to flourish.

Please take this opportunity to limit the amount of peracetic acid that can be applied as opposed to limiting the concentration percentage, which could potentially be applied at even higher ppm's. We would like to thank OMRI and Dave Decou for the comments that were posted, and for Renee's recent comments as well, on multiple topics, including their support for
On page 2 of his comments, Mr. Decou writes that peracetic acid "is an important tool for farmers to control crop diseases in high-value crops." It also helps reduce the food safety issues originating in production fields.

The two considerations that OMRI wanted the NOSB to consider are, No. 1, listing PAA in ppm's, as the FDA and EPA both limit the permissible amounts of PAA this way, and, No. 2, that peracetic acid be considered in ratio to the amount of hydrogen peroxide.

The concern about the ratio to hydrogen peroxide seems to be for higher concentrations of hydrogen peroxide that can be present within the higher concentrations of peracetic acid. We appreciate the concern, but we want to clarify that, when peracetic acid is created in situ between hydrogen peroxide and acetic acid, as the acetic acid is added in, hydrogen peroxide is taken away.
The peracetic acid actually steals the molecules. So you will never have any combinations with higher hydrogen peroxide and peracetic acid. It has to be converse.

Thank you, again, for your time and consideration of this petition to include peracetic acid for a wider range of use in organic crop production. This is exciting chemistry with an enormous amount of potential.

Emily Brown-Rosen of Pennsylvania Certified Organics indicated in her written comments, also, that peracetic acid products have promise as fungicides to replace the more persistent materials such as copper sulfate or other objectionable products.

Peracetic acid is gaining in acceptance among the organic community, and we are very optimistic about its versatile role in organic agriculture.

I am happy to answer any questions that I can.
1          CHAIRPERSON MOYER: Thank you,
2  Kristin.
3  Tina?
4          MEMBER ELLOR: I have a couple of
5  questions.
6  There is a discrepancy between the
7  OMRI recommendation of 100 ppm as a ceiling
8  and your 200.
9  Also, as a very broad spectrum
10  oxidate, or whatever, I don't really
11  understand how it can take out the bad guys
12  and leave the good guys alone.
13          MS. KNOX: Okay, let's see if I
14  can answer those questions in order.
15          First of all, I can't speak for
16  OMRI's annotation for the 100. I can only
17  speak for our annotation of the 200 ppm's.
18  The 200 ppm's of the PAA is what is present in
19  a 1-to-100 dilution of our product oxidate or
20  StorOx, the 2 percent peracetic acid products.
21  We also have a 5 percent product, which is
22  what the Committee was originally considering
limiting it to, and a 12 percent product, which is mostly for agricultural processing waters.

But, as you go up in the peracetic acid percentage, the dilutions are so high that your ppm's go way down. So there would never ever be more that we could see, 200 ppm's necessary to be added into the concentration -- from the concentration into the dilution, I mean. And we also have submitted data at the 200 ppm level showing that the beneficials do still thrive well. The pathogenic ones are taken care of.

I defer to Dr. Vijay Choppakatla, who also presented comments that you folks should have. If you don't, I can get them again. He discusses that in much better detail, as a plant pathologist, than I ever can, on the likelihood of the soil and on the plant surface.

Did I answer all your questions?

CHAIRPERSON MOYER: Tina, do you
have additional questions?

MEMBER ELLOR: You did, and there was extensive discussion about this in the Crops Committee, and we will probably be discussing it more. But our concern was unleashing this very broad-based germicidal thing, even though it is far more benevolent than other things available, and we certainly take that into account as well.

MS. KNOX: Yes.

MEMBER ELLOR: So we will be discussing it more, and we really appreciate your input.

MS. KNOX: Yes. Dr. Choppakatla does discuss that, how at the 200 ppm level, which I think you really have an opportunity to limit how much can be applied up to a ppm level. By going to the 5 percent concentrations or 12 percent concentrations that are out there, or 15 percents that are out there, you could apply it at a 1-to-100 dilution and be putting way too much down.
there, and then, yes, you will kill absolutely
everything in there.

The way that we have formulated
it, it is so that it is at the level where we
will get the bad guys but not the good guys.

Okay?

CHAIRPERSON MOYER: Any other
questions from any of the Board members? Joe?

MEMBER SMILLIE: Sorry, I haven't
kept up with your work on the Crops Committee,
but your recommendation right now for this
material, she is asking for a broader
application for it. The current Crops
Committee recommendation limits that?

MEMBER ELLOR: Yes, we actually
had two that we voted on. I was counting on
Gerry to be here because he was really the
architect of this. But we weren't comfortable
with broadening the usage of this very broad-
based germicidal thing.

And this is the important
background that is probably missing. It used
to be considered an inert. It was
reclassified as an active. So, as an inert,
it is in many products that are used by
organic farmers. As an active, it had to be
reconsidered. That is really why --

MEMBER SMILLIE: I guess my
question is not the dosage, but the
application. In other words, there are two
issues. One is the percentage that you are
going to allow, like the maximum levels, and
the other is the usage of the material, right?

MS. KNOX: Yes.

MEMBER ELLOR: Right.

MS. KNOX: Because that is the way
I am reading the annotation, is that it is
just still restricted to fire blight, so we
gain nothing.

MEMBER ELLOR: No, it can still be
used is what you have gained. Because,
otherwise, as -- now it is an active, not an
inert.

MS. KNOX: Yes.
MEMBER ELLOR: So it would have to
be repetitioned and go through the whole
process. That is the difference.

CHAIRPERSON MOYER: It is an
oxidizer, Joe.

MEMBER SMILLIE: Yes.

CHAIRPERSON MOYER: It chews up
organic matter like crazy when it is applied
to the soil. It burns up organic matter. So
it is kind of counterintuitive to what we are
trying to do in organic with soil if it is
applied through irrigation systems at high
levels. That is the --

MEMBER SMILLIE: You're talking to
somebody who sprayed sulfur in orchards and
used copper sulfate on grapevines. And if I
can find an effective fungicide for late
blight, that is an incredibly wonderful tool.
Because, as they mentioned, this fall in the
Northeast crops just like died. Right, Steve?
The tomatoes, they didn't get sick; they just
died.
CHAIRPERSON MOYER: Mine did, too, yes.

MEMBER SMILLIE: I don't know. I am not arguing the dose. I think that the deliberation -- I am not on the Crops Committee, and I apologize for jumping in at the last minute, but this one interests me a lot because, to me, the argument should be about the dosage, what is going to hit the target and not damage the beneficials of the soil microorganism. We can work on the dose. But I don't understand the restriction on the usage. That is my question, but I will leave that up to you guys.

CHAIRPERSON MOYER: Well, there is plenty of time for discussion of that tomorrow.

MEMBER SMILLIE: Okay.

CHAIRPERSON MOYER: If we have questions for Kristin, we will entertain those.
Otherwise, thank you, Kristin.

MS. KNOX: Okay. Thank you.

CHAIRPERSON MOYER: We appreciate your time.

Michael Fiery, if you are in the room, come to the podium.

(No response.)

Okay. Michael is not here.

Lisa Nichols? Is Lisa Nichols here?

(No response.)

Fred Betz? If Fred Betz is here, if he would come to the podium?

(No response.)

Okay. We are making progress here.

(Laughter.)

I'm going to start making up names here.

(Laughter.)

Maria Herrero -- I apologize -- Herrero. Is Marie Herrero in the room?
(No response.)

They're leaving.

Chris Dively? Is Chris Dively here?

(No response.)

Leslie Zuck? I know Leslie is back there.

(Laughter.)

Caught you offguard, did we, Leslie?

MS. ZUCK: I'm not sleeping yet.

CHAIRPERSON MOYER: That's what they said when they missed the flight in the Twin Cities, that they weren't sleeping.

(Laughter.)

MS. ZUCK: All right. Bear with me here a minute. I'll be right with you.

Okay.

Hi, everyone. I'm Leslie Zuck, Executive Director of Pennsylvania Certified Organic and, as of today, a famous advocate of strict and sensible standards.
(Laughter.)

Thanks, Miles.

I would like to take a few minutes, five, to be exact, to discuss your discussion document on terrestrial plants grown in containers and enclosures.

PCO certifies operations that would be affected by such a standard, including greenhouses, sprouts, mushrooms, hydroponics, and some combinations of the above.

As an organic greenhouse producer myself, certified by the venerable organization QCS, my own operation would be affected by the recommended standards. So that inspired me -- you know, I'm usually a real quiet and meek bystander -- to actually come up here and offer a few comments on the subject.

The discussion document is very thorough and does a good job, thank you, of addressing most issues, but we do have a few
1 friendly suggestions.

   First, we are going to need a
2 bunch of definitions. You kind of may be
3 aware of that. Aeroponics is something that
4 we haven't talked about before and a few
5 things like that.

    We actually see an amazing amount
6 of very innovative materials and production
7 techniques out there. I am worried that we
8 are going to need more guidance and
9 definitions to really determine if these
10 operations fall under the definition of
11 container- or enclosure-grown crops. Things
12 like unheated cold frames, high tunnels, field
13 tunnels, low tunnels, shade houses, hay
14 groves, you know, are these enclosures? Are
15 they included or meant to be or not meant to
16 be? So I think a little more clarification on
17 that would be helpful because there's some
18 amazing things that people are trying out
19 there.

20 I think it would also be helpful
to have a definition of container. I actually
didn't check the definition on the original
rule. Maybe it is in there. But I think what
you are thinking about, pots, and I am
wondering whether these really large, wooden
boxes people grow sweet potatoes in and raised
beds that are lined with plastic, whether
those would be considered containers because
they go the whole length of the greenhouse.

We certify several acres of
tomatoes that are grown in these really long,
plastic sort of bag-like things that are
filled with compost. So the question is,
would they be subject to crop rotations and
cover cropping or not? You know, how are we
going to kind of apply these good suggestions
and standards to those systems?

I think defining aeroponics and
hydroponics would be useful, and then some
guidance on whether sprouts and micro-greens
are included in the standards. Sprouts, we
know are allowed or already in the rule, and
they are grown in water with no nutrients added. So we probably should at least mention how those are either included or not in this standard.

And micro-greens are grown in flats with little or no nutrients added, depending on the type of micro-greens. So it would actually be a soil-less mix that they are growing in. These would seem to be prohibited under the proposed standard. I just want to get a sense of whether that is where we are going with those because they are quite popular, and a lot of people do grow them and provide those to restaurants and stores.

And another issue you might want to consider is growers purchasing plant stocks or perennial transplants, bringing those conventional -- now we are talking conventional, planting stock and perennial transplants, that they are allowed to buy if organic is commercially unavailable. So they
bring those transplants into their organic
greenhouse operation or their nursery. They
repot it into approved potting mix and then
proceed to resell it as certified organic.

Neither the rule nor this
discussion document appears to prohibit this
practice. Yet, something doesn't quite seem
right about that. So let's try to look at
that, and we can work with you on that.

Because in the past we have tried to have some
guidelines on it, like at least they have to
grow it for a certain amount of time before
they can actually resell it as certified
organic. But, right now, the way we have
things, it isn't really prohibited.

Would the prohibition against
growing medium devoid of sufficient organic
matter prohibit growing certified organic
seedlings in flats filled with an approved
potting mix? These mixes are, by definition,
soil-less, no nutrients. They contain peat
moss, perlite sand, and would meet that test
for nutrient deficiencies.

Growers could add soil or compost, but a lot of times they don't want to because nutrients aren't really necessary at that stage of growth, so it would be a waste. And the soil can introduce pathogens that they don't want inside their greenhouses.

Then I am going to bring up something that some of you may remember. The American Organic Standards, remember that. The American Organic Standards, I am not going to read them here. I was going to, but I don't have enough time.

Any proxies out there? No.

In seven short paragraphs, they really do what you are trying to do here, and I could say some more about that, if people have questions, but the language is really simple and easy to understand and enforceable.

Then you have to add a few more definitions. My suggestion is to draft something similar to the AOS language that we
can refer to because it does include the
field-grown crop regulations, and then it is
not redundant or adding additional regulations
that we don't have in the field-grown crops,
which some of the other certifiers have
commented on, and then leave some of the
specific guidance to the program manual to
really kind of interpret that, which would
alleviate the redundancies on potting mix,
treated wood, commingling, and some of the
complications that we have seen by including
requirements that are not actually required
for field-grown crops, like the sprayers and
the GMO pollen drip.

Any questions?

CHAIRPERSON MOYER: Thank you,

Leslie.

Are there any questions from Board
members for Leslie?

(No response.)

Seeing no hands, we appreciate

your time.
MS. ZUCK: Well, thanks. It is really good work. We appreciate it.

CHAIRPERSON MOYER: Thank you, Leslie. We appreciate that, the comments.

Zea Sonneband at the podium, if you would, and Peggy Miars on deck.

Hi, Zea.

MS. SONNEBAND: Hi. Good afternoon, everyone.

I am Zea Sonneband from California Certified Organic Farmers.

Thank you for the opportunity to address you.

Welcome, Miles. We are looking forward to working with you.

I am getting half my time out of the way by seconding everything that Leslie just said about the plants in containers. There's some things that need further clarification and some very odd things that go beyond farm requirements, like the dedicated sprayer clause. We hope that you will look at
our written comments on that, which second
what Leslie said.

Okay. On the definition and clarification of materials document, we really appreciate that you are finally trying to bring this work to fruition, and we really appreciate the paper and agree with most of it.

We strongly encourage you to start working right away on a decision tree-type model to go along with the clarifications on your materials because you are really going to need it when you review corn steep liquor at your next meeting, as Miles is trying to bring forward.

We also strongly urge that a TAP review be prepared for corn steep liquor because, being part of the group that works with OMRI on this, it is a very complicated situation. We hope to give it some due consideration.

I want to talk briefly about the
petition process. I really am glad that Miles has prioritized dealing with petitions in a more systematic way.

In addition to the category, though, of petitions that he wants to take off the table, there is the category of petitions that are commented on at the previous meetings which were never on the table, and I am calling them petitions that were never taken up by the NOSB, even though they have come in over the years.

I have identified six things that are still left in this category, including terpene polymers; phosphoric acid as fertilizer as part of aquatic plant products; potassium carbonate in aquatic plant products; sulfuric acid as fertilizer, as a manure treatment; sodium and potassium lactate as handling ingredients.

So there are historic petitions on these. They need to get taken up to the NOSB and reviewed.
On the inerts paper, I hope you realized that what you proposed really isn't workable. Emily led me to think that maybe you realized it wasn't and you just had to throw something out.

I supervised the NOSB through the initial TAP review period, and the most we ever did at a meeting was 40 input reviews. So the fact that you are going to do 286 potential inert reviews in addition to reclassifying things between 605 and 606, we need a better idea.

So the best idea is really to try to take the reference out of the rule and put some sort of inert policy in the program manual, I think, because then it will be more flexible to some extent. You can work with the EPA. It can evolve without having to go through the very formal sunset review process. Or you can develop an in-house mini-EPA for organic, if you want to, to look at these inerts.
I also hope that you will address
with a little bit more clarity the liquid
fertilizer directive. Perhaps maybe this is
just NOP and not the NOSB, but I heard
Barbara, and we all heard Barbara, say at the
last meeting that the 100-yard requirement
might be considered to be flexible if there
was a sufficient audit trail.

I believe it, but we have a lot of
people out there who are very squeamish
because that has never appeared in writing,
even though she said it on numerous occasions.
So something really needs to appear in writing
to make the companies -- there are many
companies who do meet every requirement except
the 100 yards, and it would make them feel
more comfortable.

So, since Leslie covered the
greenhouse, I am going to use one minute on
ferric phosphate. If I had a quarter for
every time someone said, "This inert is an
important part of the formulation," and then
has to be reviewed with it, I would be fairly
well off and would take everyone to dinner.

        Many inerts are really active, and
many of them need to be reviewed with it, but
they are not because of the way the inerts
policy is. So, until you change the inerts
policy, you have to stick with ferric
phosphate the way it is, I think, and you
can't just do a separate review of an inert in
one thing and not review the inerts that are
associated with many of the other things that
are already on the National List.

        So thank you.

        CHAIRPERSON MOYER: Thank you,
Zea.

    Any questions from Board members?
Katrina?

    MEMBER HEINZE: So I am trying to
understand that ferric phosphate situation a
little bit more. I will be honest, I don't
understand the inerts policy.

    MS. SONNEBAND: Okay.
MEMBER HEINZE: Could you elaborate on that last 30 seconds that you said?

MS. SONNEBAND: Yes. Ferric phosphate, as it originally was put on the list in 2005, was just ferric phosphate generic thing. In order to formulate a product that is going to work on slugs and snails -- i.e., Sluggo is the main one -- they put it with EDTA and other inert ingredients.

So the NOSB just put ferric phosphate on the list. OMRI or the certifiers look at the formulated package and decide whether or not it is okay.

Apparently, another product had the word "EDTA" in its name, which means they can't really call the EDTA inert; they have to call it active. So, then, that product had to be reviewed as though it was an active, and was turned down by the NOSB.

The petition to remove is because the -- I mean you can't tell who submitted the
petition because it is from a lawyer, but my
guess, just from reading the petition, it was
the competing product that got removed that
doesn't like it that the other one was on
there, and says that it should be removed
because of harmful effects on earthworms.

Well, the removal petition did not
present sufficient evidence of that. So, at
the very least, it would take a TAP review.
But, nonetheless, it is back to the old it's
an inert; it can't be looked at.

MEMBER HEINZE: So, if I am
understanding, because of the list for inerts
on the list, if they are present in a
formulation, they are not part of the review.
Is that the inerts policy?

MS. SONNEBAND: They would be part
of OMRI's review, but they would not be part
of the NOSB's review.

MEMBER HEINZE: Got it. Thanks.

MS. SONNEBAND: Now what that
cOMPANY should have done is a petition to
1 prohibit EDTA. That would be the proper form
2 for you to take it up in, because, then, it is
3 something that is a list for a synthetic, and
4 you could review it and specifically prohibit
5 something on List 4, if you wanted to, but not
6 the generic ferric phosphate just because it
7 is used with.

8 Other questions?
9
10 questions for Zea?
11
12 (No response.)
13
14 MS. SONNEBAND: Thank you.
15
16 CHAIRPERSON MOYER: Thank you,
17
18 Zea.
19
20 Peggy, if you can come to the
21 podium, and Bill Wolf on deck.
22
23 MS. MIARS: I am striving to win
24 the brevity award of the day.
25
26 CHAIRPERSON MOYER: Thank you.
27
28 MS. MIARS: Thank you for this
29 opportunity to provide comments on retail
30 certification. We did not submit comments in
advance. So you just got them handed to you.

CCOF certification services certifies about six retail establishments, ranging from a single store to a chain of about 275 stores.

We appreciate the hard work of the Compliance, Accreditation and Certification Committee, who have been working on this issue for over a year.

We believe the regulations sufficiently define the issue areas of commingling, contamination, and recordkeeping enough to apply them to retailers at this time.

The Committee did bring up the question of labeling, but we are not sure that these concerns are problematic or pervasive enough to warrant significant discussion by the organic community, as evidenced by the very few comments that were received on this topic.

Continued discussion will result
in multiple versions of a recommendation, public comment, handing it off to the NOP for further deliberation and implementation. And instead, we prefer that the NOP use its resources to survey the marketplace to ensure that there is not overt or misleading labeling.

Our written comments address how CCOF has dealt with the scenarios discussed by the Committee. I will let you read those on your own.

We fully support the actions of the Committee and will engage in any further discussion on retail certification, if the organic community warrants it. Our main concern at this time is that the Committee's suggested measures for retailers levy greater requirements on retailers than on certified growers or processors.

I am actually not discussing the other two issues that are up there.

The last thing I wanted to say is
that Miles or someone at USDA took the wind out of what I was going to say as my last comment. You have heard me say before that we would like to see the NOSB meet on the West Coast. As we heard earlier, that is going to happen in the spring. So thank you to whoever made that happen. We appreciate that.

The NOSB should be more accessible to certified operations, and this is one way to do so. CCFO will encourage our members to participate in the process to experience the full scope of how organic regulations are created and amended, and we will tell them to be very brief in their comments.

Thank you.

Did I win?

CHAIRPERSON MOYER: Thank you, Peggy. I believe you did.

Any questions for Peggy? I'm sorry, Bea.

MEMBER JAMES: Thank you for your comments.
Help me understand how, to communicate as a retailer to the consumer, the difference between a deli operation that is selling a salad with organic ingredients and calling it organic, and they are not certified, and a certified organic deli that is going to the trouble to go through all of the certification process following compliance, and also being able to call their salads certified, but they can say, "certified organic" instead of the deli that is not certified that can say, "organic salad".

MS. MIARS: Okay.

MEMBER JAMES: So my question is, from the consumer perspective, they don't really pay attention to the word "certified". They are just paying attention to the fact that it is being called out as organic.

So the deli that is going to the trouble to be certified is not getting any kind of extra competitive advantage next to another retail operation that is selling the
same thing and not certified.

    MS. MIARS: Well, in our comments

at the bottom of the page 1, I think we
address what you are talking about. So, a
multi-ingredient salad that is made in an
uncertified kitchen, we would not call
"organic".

    MEMBER JAMES: "We" as in?

    MS. MIARS: CCOF. Excuse me.

CCOF certification services would not call
that "organic salad".

    MEMBER JAMES: Right, but,
currently, the retailer that is not certified
in a deli or a bakery operation is allowed to
call those products "organic" even though they
are not certified. They just can't say,
"certified organic".

    MS. MIARS: Okay.

    MEMBER JAMES: So the issue that
we see as a potential disadvantage and
confusion is that there's mixed messages for
the consumer who might shop both locations.
MS. MIARS: I think that is an education of the consumer that the retailer needs to do, whether it is through their newsletters or through more clear signage. I think it is an education issue of consumers. I think that is what I would recommend doing.

MEMBER JAMES: So the retailer that is not certified should tell their consumers that they're not certified but they are selling an organic salad anyway? I just --

MS. MIARS: Yes, I see what you are saying.

MEMBER JAMES: Yes. I bring it up because I live in a State that has the highest population of natural food co-ops than any other state. So a lot of them are certified. Some of them are not. They are competing with larger other retailers that are certified in some departments and not in others, and there's this competing disadvantage.

And if we want to encourage
certification at retail, which we want to do --

MS. MIARS: Yes.

MEMBER JAMES: -- we want to make sure that the people that go to the trouble to be in compliance educate their staff and their consumers, put their OSPs in place, that they are getting a value from that, that they are getting an advantage to that, and that consumers are getting a fair message.

MS. MIARS: Yes, yes, I see your point, and we will continue to participate in that discussion. Thank you.

MEMBER JAMES: Thank you.

CHAIRPERSON MOYER: Thank you, Peggy.

Any other questions from members of the Board?

(No response.)

Hearing none, we appreciate your time.

As Bill makes his way to the
podium, I will mention that, as Board members, we are subject to the same organic biological processes as the plants and animals we are talking about. But, in an effort to remain -- I guess we are woefully behind schedule -- so we won't say that to remain on schedule, we will not take a scheduled break, but people can just leave, program and Board members just leave as you need to, hopefully, maintaining a quorum at the table. So we need nine, I believe, to have a quorum. So come and go as you need to, but we are going to keep moving.

Bill?

MR. WOLF: I will not try to compete with Peggy, but I will try to be brief.

First, I really want to thank this Board for all of the hard work and extraordinary number of issues you are grappling with, and all of the documents that were brought forward.

We have submitted written comment
on a number of issues, but today I would really like to go back to some of the roots of organic regulations around the issues of the National List.

I do have a few slides, very briefly, talking about those roots as really being in the soil, and the next slide really addresses some of the principles behind decisions about organic regulations.

That is that, from the beginning, we have thought in terms of what practices encourage biological systems, not static, mechanical systems, but biologically-active systems. The challenges have been, how do you quantify and regulate a philosophy based on that principle?

I think that the discussion of -- next slide, please -- the whole idea of continuous improvement has been captured very well in the regulations. There are a number of places where the regs really talk about having organic system plans that require
continuously-improving soil systems.

I see the regulations continuously improving as well. I am not going to try to go through those examples in the regs where it documents that type of improvement, not only in crop rotation or fertility, but I would like to talk in terms of encouraging the process now.

I have got a couple of broad requests to make that I don't think can all be addressed at this meeting. One is to challenge all of us to encourage innovation. To encourage innovation in the regulatory process, I suggest that we need to, one, have the program require that all commercial availability decisions be publicly available, meaning that those exceptions are available so that we can drive towards the development of those non-organic ingredients that are currently not available, so that we all know what is going on and how those decision are made. So it is completely transparent.
My second suggestion is that organic preference has to be applied to all ingredients on the National List. I applaud the Canadian reg from that point of view because that will push the system further.

As a part of that, I believe that it would be valuable to merge 605 and 606 as one list, and I believe that that is how OFPA was originally discussed and envisioned, and that this is a construct. In the construct that has been established in the rule, we spent a lot of time debating the ag/non-ag, synthetic/non-synthetic, especially around materials.

Those three broad recommendations I just would like to put in front of you. Some of them are captured to an extent in the evolving document that I would like to talk about next.

That is the National List clarification of materials. I think the working document that was posted is
extraordinary. It is real progress in clarifying and articulating the issues.

I think there are areas that have been addressed by some of the commenters today and in the posted comment that suggest some additional improvements. I think that there are one or two definitions we may be able to even drop out, and I am looking forward to the discussion tomorrow of hearing how the Board is viewing those.

But I am concerned about one thing, and that is that the definition of synthetic and the definition of chemical change was specifically intended to capture the precautionary principle and to have us have a vehicle for identifying any manmade synthesized compounds, and requiring that those compounds be reviewed for placement on the National List, so that it is a transparent process.

The challenge is that in today's society there are many, many materials that
touch synthetics and then are used in organic.

That is the nature of inputs in agriculture today.

I have worked in the field of all aspects of organic agriculture, including in a past life being an organic pesticide manufacturer. I've got to tell you that what goes on in the processing of fertilizers and pest controls, as an example, if you tighten that definition too tight, you won't have any inputs. That is one of the risks here, and we need to be conscious of that.

So I am suggesting, if you could identify a way to have that intent be in the document, you have passed.

Finally, I have articulated in my comments the CAS issues, and not requiring the CAS because there are broad categories like insecticidal soaps. That is my two comments there.

I want to honor Oliver the Earthworm at the organic garden at the USDA.
Thank you.

CHAIRPERSON MOYER: Thank you, Bill.

We have some questions here. Katrina and Joe.

MEMBER HEINZE: Thank you for your comments. I really appreciate them.

Your concern about the definition of synthetic and chemical change, does that mirror the concern that was brought up earlier that it could be misinterpreted to apply to products that apply to the final rule? Or is it a separate concern?

MR. WOLF: Well, my concern is that, if you look closely enough at any process for segregating a natural material used today in any quantity, you do have the potential of defining it or arguing that there is chemical change or contact with synthetic compounds.

If we become chemophobes over this issue, then we risk a radical narrowing of
options for organic production and processing, and we end up with a very convoluted process for a huge number of things being looked at on the National List that can't be handled.

MEMBER HEINZE: Can I ask a followup?

CHAIRPERSON MOYER: Please.

MEMBER HEINZE: So, specific to your concern, you would want us to add something to the definition that limits it to manmade synthesized compounds? Am I understanding that properly?

MR. WOLF: Yes.

MEMBER HEINZE: Okay.

MR. WOLF: And whether that is in the description of the intent as part of your document or whether you can actually incorporate it in the actual definition, you guys are much closer to how that would work.

MEMBER HEINZE: Thank you very much.

MR. WOLF: Yes.
CHAIRPERSON MOYER: The Chair recognizes Joe.

MEMBER SMILLIE: I appreciated your comments, Bill, especially the 605 and 606. I think that that's where I will personally want to head also because commercial availability was what drives innovation.

I just saw a recent article that talked about a new organic inulin that is going to be on the market, which is one of our 606 items. Julie and I are steadfast in that posting something on 606 drive innovation. I hope that the manufacturers back us up on that, like the new inulin project.

My question to you, on behalf of the certification community, is when you say you want transparency in the declaration of commercial availability decisions, do you mean that when we grant a 606 item for use, that we have examined, how we have examined or how we justified that they can use that as
conventional because there is no organic available? Is that what you are asking for?

MR. WOLF: No. What I am asking for is that there be a site on the NOP site where every material that has been determined not available in an organic form is listed, and it just says, "cert", and it lists the certifier that has made that decision. It doesn't have to go into a lot of details. Or the numbers of certifiers or some way to have it be publicly available, so that that will drive the research and development of options.

I don't know the detail; we need to work on whether it should be how many times that decision has been made or how many products or how many labels. But I am not looking for it to be by product or even how that decision was made, but have some availability of that information, so that anyone can look at it and say, "Whoa, I'm going to go out and make an organic inulin" because, in fact, there's 47 labels of
MEMBER SMILLIE: Okay, as long as we recognize the fact that it could be granted in one case and not in another, farm quality/quantity. Right?

MR. WOLF: Got it.

MEMBER SMILLIE: Okay.

CHAIRPERSON MOYER: Any other questions for Bill?

(No response.)

Thank you, Bill.

MR. WOLF: Thank you.

CHAIRPERSON MOYER: We appreciate your time.

Grace, if you could come to the podium, we would appreciate it, and Gwen Wyard is on deck.

MS. MARROQUIN: Hello. My name is Grace Marroquin. I am CEO and President of Marroquin Organic International, based in Santa Cruz, California. We have been importers and suppliers of organic ingredients
I have addressed this Board at almost every meeting since 2004, happily. Once again, I am here to talk about organic yeast.

I appreciate the comments of Oregon Tilth and Wolf, DiMatteo and Associates in support of reclassifying yeast on the National List as an agricultural product.

Yeast is a fungus, a living microorganism. Some may believe that fungi, such as yeast and mushrooms, are plants, but fungi are not plants. Now here is the definition of livestock in the Organic Foods Production Act. I am sorry for those people, I know you know this already, but this is for the record. I quote:

"The term livestock means any cattle, sheep, goats, swine, poultry, equine animals used for food or in the production of food, fish used for foods, wild or domestic game, or other non-plant life."
Other non-plant life means living microorganisms such as yeast. The NOP final rule has the same definition of livestock.

Now here is the OFPA definition of agricultural product, and I quote:

"The term agricultural product means any agricultural commodity or product, whether raw or processed, including any commodity or product derived from livestock that is marketed in the United States for human or livestock consumption." End of quote.

These definitions make it clear that under OFPA yeast is livestock, and the products of yeast are agricultural products. However, there is confusion, understandably so, because the National List has yeast listed on Section 205.605(a) as a non-agricultural substance.

The National List is only one part of the final rule. The National List may not make a listing that would conflict with these
1 definitions.
2 The listing of yeast as non-
3 agricultural was a mistake. The National List
4 needs to be amended so that yeast is corrected
5 as an agricultural product and put onto
6 205.606.
7 The Joint Committee recommendation
8 is written as though this definition does not
9 exist in OFPA. At the Board meeting in 2006,
10 the Joint Handling and Materials Committee
11 recommended unanimously, 8-to-0 -- 8-to-0 --
12 to move yeast and dairy cultures to 205.606.
13 The decision was based on OFPA.
14 The Board heard public comment
15 warning that, if yeast was recognized as
16 agricultural, this would require yeast and
17 dairy feed to be organic. The Board said it
18 wanted to review this before it acted,
19 understandably so.
20 This stopped all of the momentum
21 on the Joint Committee to move it to 606.
22 Three years later, the Joint Committee present
recommendation does not offer a solution, just a proposal for further study.

We recognize that putting yeast on 606 could be a problem for the dairy feed. When the NOP wrote the existing standards for 205.237(a), it did not anticipate that microorganisms used in feed would someday be recognized as agricultural products. Now that day is here, and an amendment is needed to 205.237(a).

This amendment should allow non-organic yeast and microorganisms to continue to be used as additives and supplements until organic versions are available.

I know that there are some that fear that any change to the feed standard would give the perception of a weakening of the standard. This amendment would not weaken any existing standard. It would simply allow non-organic microorganisms to continue as supplements, as they presently are now, until there are organic versions available.
I would like to conclude with a few more points. As long as yeast remains listed on 205.605(a), processors are free to use conventional yeast and are not required to seek out organic yeast.

I need to remind you, and it is really important, that presently the reason the Europeans developed organic yeast was because conventional yeast is manufactured using synthetic chemicals, such as ammonia, sulfuric acid, caustic soda lye, synthetic vitamins, synthetic anti-foaming agents. None of these are allowed in organic production; yet, they are being used this way.

The wastewater, you have to have special licenses to treat it. In the organic yeast, the wastewater is used for further organic production, and the substrate is 100 percent organic grains.

I am here on behalf of an organic ingredient, trying to get it recognized. My business and the entire industry grew because
of organic preference. I say viva organic preference.

(Laughter.)

Somebody has some question?

CHAIRPERSON MOYER: The Chair recognizes Joe.

MEMBER SMILLIE: Grace, I guess I will be retired when you come to your next couple of meetings.

(Laughter.)

But you know I am an advocate. I truly believe that yeast is an agricultural substance. I truly believe it can be certified, and I think we can create an OSP or organic compliance plan that will fit.

I think our recommendation, even though it doesn't wholeheartedly endorse what you want, is another, I hate to say it, but another step toward the final liberation of organic yeast.

What is your situation vis-a-vis the petition process, though? At one point in
1 time, you petitioned it.

2 MS. MARROQUIN: The petition is

3 back in. It has been in.

4 MEMBER SMILLIE: Oh.

5 MS. MARROQUIN: It is there. It

6 is in.

7 MEMBER SMILLIE: Do we know about

8 this?

9 MS. MARROQUIN: We mentioned this

10 last time, that it was pulled temporarily --

11 MEMBER SMILLIE: Right.

12 MS. MARROQUIN: -- and put back.

13 It was put back in. We never pulled it --

14 MEMBER SMILLIE: When?

15 MS. MARROQUIN: We never -- that

16 was, what? Dick, do you remember?

17 We pulled it when we thought a

18 vote was going to go down that was really

19 going to shelf this whole thing.

20 MEMBER SMILLIE: Right.

21 MS. MARROQUIN: So we pulled it

22 out temporarily. We just pulled it and put it
back.

CHAIRPERSON MOYER: Right, that's what happened.

The Chair recognizes Katrina.

MEMBER HEINZE: We are looking forward to having it back.

To elaborate on what Joe said, as we went through the classification of materials and we talked about these nebulous things I am going to call biological stuff, for lack of better terms right now, what we realized is there is a lot of different sources, and we talked a lot about yeast.

So there is clearly yeast that we all think can be certified organic and classified as agricultural, but there are production methods that we are not comfortable classifying as agricultural.

To be honest, we lack the technical depth to be able to categorically make a decision. So what we want is a petition that will help us do that. Because
we do believe that your yeast is certified organic, and we want to make that decision. We need help with the technical, though. So a petition would help us with that.

MS. MARROQUIN: So you are talking about submitting another petition?

MEMBER HEINZE: Well, we don't have your petition right now.

MS. MARROQUIN: Where did it go?

MEMBER HEINZE: Because you pulled it.

MS. MARROQUIN: But we put it back on the table.

MS. FRANCES: Pause. It is available to the Committee. It hasn't gone anywhere. It is a document.

MEMBER HEINZE: We can't take action on it.

CHAIRPERSON MOYER: We can't take action until it's --

MS. FRANCES: They withdrew it.

VICE CHAIRPERSON GIACOMINI: It
has not been resubmitted to this Board for action from the program.

CHAIRPERSON MOYER: Or from the petitioner, because the petitioner pulled it from the table.

MS. FRANCES: I have always understood it that it was just within the Handling Committee and they just were not dealing with it until this was resolved.

VICE CHAIRPERSON GIACOMINI: It has never been resubmitted to this Board by the program.

MS. FRANCES: It is available to everyone. It is not like it went anywhere.

MS. MARROQUIN: Exactly.

CHAIRPERSON MOYER: But, technically, the petitioner had pulled it, and only the petitioner can put it back into our table.

MS. FRANCES: And they did.

MS. MARROQUIN: And we did.

CHAIRPERSON MOYER: It wasn't
notified; I don't know anything about it.

MS. FRANCES: It occurred at this meeting.

VICE CHAIRPERSON GIACOMINI: We receive petitions through the program, not from petitioners. It was never resubmitted to us from the program.

CHAIRPERSON MOYER: The Chair recognizes Dan. You had a comment, Dan?

VICE CHAIRPERSON GIACOMINI: Yes, I would like to actually not talk about yeast for a minute because I think I am really excited about the recommendation that you, what you are proposing in amending 237.

The way 237 -- I was just trying to find it through OFPA -- the way 237 is written is actually a slight deviation from the way it was originally written in OFPA. I believe OFPA is a far more correct and reasonable writing.

The problem is OFPA has subtlety and gray areas. Unfortunately, there are so
many times in this industry where we don't want subtleties and gray areas. We want black and white, period. If you don't give me black and white, I don't know how to do anything. I don't even know how to do anything besides the gray. It all becomes gray.

I would really like us to sit down and see if there is a way that we can figure out how to craft that language that would be acceptable to the program, that would stay within OFPA. Because, quite frankly, there are a lot of issues that are involved in this, including other issues, things that will be moved around in the classification of material document, recommendation, that we are working on that could face some problems.

I think this is an area that we need to look at. Unfortunately, it is subtleties, and they are not always welcome.

MS. MARROQUIN: Thank you for saying that.

CHAIRPERSON MOYER: The Chair
recognizes Katrina.

MEMBER HEINZE: No questions.

CHAIRPERSON MOYER: Okay. Then

Tracy.

MEMBER MIEDEMA: This is, Grace, to you and also to Dan. I think we have to wrap our heads around the irony of the fact that the only way we can give preference for organic yeast would be to allow non-organic yeast as a feed additive with some commercial availability stipulation.

I think it is hard for us to wrap our head around the irony of that and to take the risk of how that looks in the media, but it's --

MS. MARROQUIN: But you already allow it.

MEMBER MIEDEMA: Pardon me?

MS. MARROQUIN: It's already allowed, non-organic yeast.

MEMBER MIEDEMA: Exactly. So, therein lies the irony.
MS. MARROQUIN: Yes. Yes. I have to mention that the EU, as of January -- I mean, as we are having these equivalency talks, you have to bear in mind, January 2010, the EU recognizes yeast as organic. They have given the industry four years by saying, in 2014, organic yeast is going to be required in feed and in food. The only thing left on the table in discussions right now is the Holy Grail itself, yeast for beer and wine. But, otherwise, it is going to be required in feed.

You can be sure, absolutely positive, that all those yeast companies, all the major ones are over in Europe, are all working and developing this already. I mean it is already being done for this purpose.

I just want to back up what Bill brought up, which is this industry has grown, and the innovation that has taken place is because of commercial availability, because of organic preference.

So I just say one more time, viva
organic preference.

CHAIRPERSON MOYER: Okay. Any other questions for Grace?
(No response.)

Thank you, Grace.

Gwen, if you could come to the podium, we would appreciate it, and John Ashby is on deck.

MS. WYARD: Okay. Well, good afternoon. I made it to the after-5:00 club. Where is the happy hour? Viva la beer.

My name is Gwendolyn Wyard. I am the Processing Program Technical Specialist for Oregon Tilth.

We are a nonprofit dedicated to promoting biologically-sound agriculture. We accomplish this through research, education, advocacy, and certification of products. I am here representing over 700 members and 1200 certified operators.

You have our comments in writing.

We submitted over 20 pages. I am going to be
summarizing portions of the comments on the clarification of materials, retailer certification, and personal body care standards, if I have time.

We are generally in favor of the recommendation for the clarification of materials. I came to this Board five years ago, in October of 2004, requesting clarification of the definitions of agricultural and non-agricultural. So I am pleased to be standing here today, and I am pleased to say that I really think the recommendation is good. I think some of the minor points that need to be worked out could very well be worked out in the guidance document that are mentioned in the next steps.

I think the recommendation does lay a good foundation for us to move forward. So we would like to see several portions of this recommendation passed at this meeting.

We fully support the first two guiding principles; namely, that the
classification of a material is determined by both source and process, and the same material can be agricultural, non-synthetic, and synthetic.

We are assuming that the first two guiding principles extend to the third guiding principle, but we would like to see the recommendations specifically address whether an organically-sourced material that undergoes chemical changes during processing or as a function of materials that are allowed on the National List could be organic, if produced in accordance with the regulations. We think the answer is yes, and we think that that has been communicated by past Boards, dating all the way back to the mid-nineties. But it is important that it is clarified.

Hot-topic examples of this situation include bleached, de-oiled lecithin in dry form, soy protein isolate, glycerin soap, and products of corn wet milling.

We want to note that, with the
third guiding principle, if something is sourced from agricultural material, and it is rendered synthetic via a chemical change, we need to take a look at the bleached soy lecithin, the bleached de-oiled soy lecithin that has been recommended for 606. Because if you ask that question first, it needs to stay on 605(b). You are putting it over onto 606 to encourage organic production.

So, with that third guiding principle, you are going to inhibit the production of organic ingredients that could be organic. So that is something that needs to be dealt with.

In terms of NOSB practices, we think they are great. We support the recommendation. We do have some concerns about the increased use of the annotations. They create a lot of work for certifiers, not that we are not up for it, but at the end of the day we don't have authority over these non-organic ingredient manufacturers,
1 regulating enforcement.
2
3 We receive usually a statement or
4 an affidavit of some sort saying these are the
5 practices we have or haven't used. So we do
6 have some concerns. We see that they are
7 necessary, but we would like to see them be
8 used as a last-resort stop, if and when they
9 are absolutely necessary.
10
11 We support all of the related
12 definitions proposed in the recommendation to
13 clarify the definition of synthetic. Okay?
14 All of those are fantastic.
15
16 We do not, unfortunately, support
17 the proposed definition of non-agricultural,
18 primarily because it makes reference to an
19 agricultural system which is not defined. It
20 also contradict's the Committee's proposed
21 third guiding principle as it would relate to
22 handling materials.
23
24 There might be a slight
25 misunderstanding on our behalf as far as the
26 contradiction that I am going to talk about.
Jessica Walden, she may have addressed it in amending the heading of 605. But if you classify something as synthetic and you put it under 605, now you have just classified it as non-agricultural, and your definition of non-agricultural states that it is a product that has not derived from an agricultural system. So it is contradicting itself.

And as far as the definition of agricultural system, I believe you pull the definition that was suggested by the Materials Working Group. Only with that definition, the Materials Working Group offered up a couple of definitions to choose from with respect to agricultural system.

So we agree with the minority, too, that without a definition of an agricultural system, non-agricultural has not been fully defined, and the true issue of what qualifies to be organic has not been addressed.

We support the removal of or the
deletion of "or bacterial culture". We recognize that microorganisms can be certified organic. We support their classification as agricultural.

And if you have any questions as far as how they could be certified or any questions about personal body care standards or retailer certification, I would be happy to answer those at this time. Thank you.

Katrina?

MEMBER HEINZE: Thank you for your comments.

Does your concern about the definition of non-agricultural and some of the conflicts go away if we just eliminate that definition?

MS. WYARD: If you eliminate the definition of non-agricultural, then, as certifiers, we are going to be in a tough spot when we have to evaluate made-with products because we do need criteria for differentiating between agricultural and non-
agricultural because, in that 30 percent, non-
agricultural will have to be on the list.

    MEMBER HEINZE: Does that go away

if not ag is really not classified as ag?

    MS. WYARD: If non-ag is not
classified as ag? You mean if you just simply
call it synthetic and remove distinction as --

    MEMBER HEINZE: So maybe,
actually, hold that thought, and after we talk
through the recommendation tomorrow --

    MS. WYARD: Yes.

    MEMBER HEINZE: -- if you like
that, maybe you could let us know.

    MS. WYARD: Sure.

    MEMBER HEINZE: Okay.

    MS. WYARD: Tomorrow. We will get
back to you on that.

    (Laughter.)

    CHAIRPERSON MOYER: Any other
questions or comments from Board members? I'm
sorry, Bea.

    MEMBER JAMES: Well, I have to
thank you for your great comment on the retail recommendation because you really were thorough. I appreciate everything that you had in your comments.

The one question I have for you is, how do we educate non-certified deli and bakery departments that are selling their products as organic because they know that they can? You know, as you mentioned, they are exempt. So they can sell these products as an organic even though they are not certified.

You also made comment that, you know, if the world of retail was truly educated, a lot of this would be happening a lot more.

But what I see happening is the advantage of a store knowing how to certify one department brings them the knowledge to know how to market organic or not market it in other departments. So, then, that is the proliferation of a lot of incorrect marketing.
of the organic term on products that may not
be fully organic or coming from a non-
certified department.

So how do we get to that point
where we can be more clear for the consumer?

MS. WYARD: I don't know; maybe
the program wants to send out an announcement
to all exempt and excluded operations
reminding them that they are exempt and
excluded from certification, but not from
following the Act and the regulations.

So these retailers should be
following the regulations. That was our
comment: that if they were, if they really
understood that, then they are just a stone's
throw from certification, and they would want
to get certified because they would be better
educated and they would be able to market to
their consumers that extra layer that they go
through.

But I think, once retailers
recognize and really, truly understand that
they are just exempt and excluded from certification, and if there were to be some enforcement, going in and doing surprise inspections for retailers that are making organic claims and aren't certified, that might get at the problem. That is an idea.

MEMBER SMILLIE: And that civil penalty would serve notice to the retailer community.

MEMBER JAMES: But, currently, I mean a deli department doesn't have to be certified to call their salad "organic". They just can't call it "certified organic".

MS. WYARD: No, they don't have to be certified to call it "organic", but they need to have records to support the use of all those ingredients going into it, not only the certification, but the quantities used. They need to be able to demonstrate the commingling and contamination preventions that were used, and la-de-da-de-da --

MEMBER JAMES: Right.
MS. WYARD: -- and the recordkeeping. All of the requirements that certifieds are held to, they are, too.

MEMBER JAMES: And how many retailers do you think are actually doing that?

MS. WYARD: I get the feeling that, well, shoot, by numbers, I think some do a very good job at it, but I also hear retailers say, "Well, we don't really want to get certified because we don't want to have to do all that recordkeeping."

MEMBER JAMES: Yes. And I don't want to take up any more time because I know there is a dinner appointment. But I would like to talk to you, maybe outside of this, about your ideas on the deli and the bakeries with the three tiers, 100 percent, 95 percent, and 70 percent. I have questions about that.

MS. WYARD: Yes. Yes, I would love to. I have put together several presentations for retailers on how they can go
about marketing and labeling their products.

It is an area I really enjoy. So I would be happy to.

CHAIRPERSON MOYER: Thank you.

MS. WYARD: Thank you very much.

Thank you so much for all your work.

CHAIRPERSON MOYER: You bring up some excellent points that we need to address, and I appreciate it.

Next will be John Ashby, and Alexis Baden-Mayer is on deck.

MR. ASHBY: Hi. I'm John Ashby, General Manager of California Natural Products.

I am really rather scared because I am fully aware I am one of the very few left standing between everybody and their first beer. So I am going to try to be brief.

I want to comment, actually, on three separate things. One is on nanotechnology. It is a lot of scary stuff that shouldn't be in regular food, much less
shouldn't be in organic food. However, you have got to be real careful what definition you decide to apply.

The definition in the proposal is you just change a few words around, substitute "homogenization" for a couple of words in the definition. If I were lecturing at a food product development class at UC Davis, where I talk a lot, you would get a "B". It is that close to homogenization.

So you are really putting homogenization at risk. And it is not just me saying this. I think it was two months ago, an article in Institute of Food Technology magazine, they talk about how homogenization and fine milling results in nanoparticle formation.

So you have got to be careful that you are not throwing out dairy's ability to homogenize things with the definition. The definition as it stands, as I say, I would give a student a "B" if we just substitute a
a couple of words. It is close enough to homogenization. Very, very risky.

I am not particularly happy with the minority position, either. I think we need to put a lot more care into the definition of the term.

Regarding boiler chemicals, boy, do we use a lot of boiler steam. We not only don't use any of the volatile means, but when I was talking with my plant engineer about it, it looked like he had migraine, the way he grabbed his head, he dislikes it so much.

However, the fact that I don't need to use them doesn't mean that a lot of people don't need them. Whereas some people are able to get away without them, a lot, particularly in the jarring and canning, when you are putting on some kind of a lid, some kind of a hot pack, it is used, and there aren't a lot of substitutes.

I am afraid you are going to really just be kicking a lot of people out of
the program, and a lot of potential people who are maybe looking at putting some organic products into the processing facility. They go to go the engineer, and they say, "We've got to take this out." You will run it, and that will just be the end of it.

So, basically, I am just concurring with pretty much everything Kim said, except adding a little more to it. I think there are a lot of people that are going to have trouble with this. I think it is going to deter a lot of people in the future.

We don't have enough technology that everybody can just easily get around this right now. We just don't have it.

And third, I am going to add the thought that the bifenthrin compost problem in California is a bigger deal. Because I talked to one of the environmental scientists who has been working on this before we found it -- and I'm on the COPAC Committee in California -- before we found it in the wheatgrass. It is
starting to show up everywhere. It is in water. It is in dirt, everywhere.

If you end up with a really, really restrictive definition on the compost, you could end up wiping out everything fast. So I would just encourage some attention to moving in that direction.

None of us want to see this stuff there. The problem is it is like DDT; it is there now. So how do we deal with it?

Any questions? Any answers?

CHAIRPERSON MOYER: Any questions for John? Steve?

MEMBER DeMURI: Yes. Thanks for your comments, John.

Has your company ever used any of those three boiler chemicals?

MR. ASHBY: Gosh, you know, we have been making organic stuff since before the California rule. My history doesn't go back that far.

This plant engineer hates them.
We are so specific about it that we have a process that requires roughly 10 people to approve changing anything.

In fact, today, via an email, I had to approve the use of a chemical in a piece of equipment that doesn't touch food ever. That is how rigid we are about it at this time.

To my knowledge, no, but I have only worked there for six years. So I don't have any skin in the game other than the rest of the organic industry. That is my concern here.

CHAIRPERSON MOYER: Any other questions? Dan?

VICE CHAIRPERSON GIACOMINI: Yes.

Hi, John.

I forget where he was from, the scientist this morning. Were you here then?

MR. ASHBY: Yes. Yes.

VICE CHAIRPERSON GIACOMINI: He talked about including terminology of
"engineered" into the definition of nanotech. I mean this is very close to NNI and the Canadian regs.

MR. ASHBY: And I think they are both huge mistakes --

VICE CHAIRPERSON GIACOMINI: Okay.

MR. ASHBY: -- and going to lead to problems.

I spoke with him about it afterwards. I don't want to be putting words into his mouth, but -- how to put this gently? -- he was not disagreeing with me that the definition needs to be changed.

Maybe I can help by giving you like what I would think would be the "A" answer in a food product development class about homogenization.

Homogenization would be using technology to intentionally reduce the particle size, yes, down into the nano range, so that the product behaves differently than it did before homogenization. That is real,
real close to what is in that definition.

VICE CHAIRPERSON GIACOMINI:

Almost.

MR. ASHBY: Pardon me?

VICE CHAIRPERSON GIACOMINI:

Close. Yes, close.

MR. ASHBY: Yes, that is really, really, very, very close. In fact, the article talks about how you create some freaky stuff, freaky nano-scale stuff, by homogenization.

VICE CHAIRPERSON GIACOMINI: Could you give us, even just on a piece of paper, possibly your recommended improvement for this?

MR. ASHBY: I will make an offer to do that. I am not sure there is a simple solution to it because it is more complicated. You know, once you have heard the definition of what homogenization -- it is intentional; the size happens.

VICE CHAIRPERSON GIACOMINI:
Control of the small size is --

MR. ASHBY: Oh, the whole purpose of homogenizing is to control the small size.

VICE CHAIRPERSON GIACOMINI: Right.

MR. ASHBY: I mean that is the whole purpose of it.

VICE CHAIRPERSON GIACOMINI: But the inadvertent things that are created are the small size, though, not --

MR. ASHBY: No. No. You are purposefully creating small sizes when you homogenize because the particles react differently in the liquid.

VICE CHAIRPERSON GIACOMINI: But the maximum amount that you are trying -- the maximum size you are trying to reach is not a nanoparticle.

MR. ASHBY: That is not always true, no. No, it is not. Sometimes you do -- and remember, when you are homogenizing, you are not creating one size of a particle.
VICE CHAIRPERSON GIACOMINI:

Correct.

MR. ASHBY: You are creating a bell-shaped curve.

VICE CHAIRPERSON GIACOMINI:

Right.

MR. ASHBY: And you've got plenty of nanoparticles. In fact, in the first few microseconds, after the first stage of homogenization, you have got a whole bunch of little nanoparticles. Then some of them recoalesce. That is why most really precise homogenization systems do it again, so it blasts those things apart again. You've got lots of really little particles, and you've got nanoparticles remaining.

CHAIRPERSON MOYER: Are there any other questions from the Board for John?

MR. ASHBY: I will try to do something. I'm not --

CHAIRPERSON MOYER: Rigo?

MEMBER DELGADO: I have a
technical question. When you are trying to
reduce the size of those molecules or
particles --

MR. ASHBY: Particles.

MEMBER DELGADO: -- you are trying
to change some of the behavior of that milk or
that product.

MR. ASHBY: Whatever it is, yes.

MEMBER DELGADO: What if you keep
decreasing the size of those? Would it
eventually turn into something completely
different that you did not expect?

I am going back to what you said,
the intent of --

MR. ASHBY: Okay.

MEMBER DELGADO: -- bringing down
the size of those particles.

MR. ASHBY: Eventually, yes, and
especially as we are learning more about
nanoparticles, we are getting more and more
surprised by what happens when you make some
of these things small.
But what you are really doing in a traditional milk homogenization, which is not the only way homogenization is used in foods right now, but what you are really trying to do is what -- what was his name? -- Michael this morning talked about. Remember the things? It is theoretically nanotechnology manipulation.

You are trying to manipulate the surface area relative to the volume. Because when you change the surface area relative to the volume, the charges on the surface become stronger than the charges inside the big particle that causes it to break apart, and the cream flows to the surface. That is the simplest way to describe it.

So the scientific answer to your question is, yes, you keep going smaller; you get all sorts of different responses. There are limits to standard homogenization equipment and processes. It is hard to average one nanometer coming out, but there
are homogenizers that can get it down there, not in the quantity that you can run milk, and they are very difficult to run, but there are homogenizers that can do that.

CHAIRPERSON MOYER: The Chair recognizes Dan.

VICE CHAIRPERSON GIACOMINI: Here again, if we were to allow, within the definition of nanotechnology, specifically state that nano-sized particles created from process allowed in organic production are not included, would that --

MR. ASHBY: I am going to give you this because --

VICE CHAIRPERSON GIACOMINI: Okay.

MR. ASHBY: -- that is how they create some of these freaky particles, too.

VICE CHAIRPERSON GIACOMINI: Okay.

MR. ASHBY: That is why I am having trouble thinking I can -- I can't think I can come up with an easy solution. I will try to help you in thinking it through.
VICE CHAIRPERSON GIACOMINI: I mean I've got this here, and it is dealing with the all other really high-end stuff.

MR. ASHBY: Right.

VICE CHAIRPERSON GIACOMINI: This is the freaky stuff we are trying to make sure that we deal with.

MR. ASHBY: Exactly. You know, that brings us closer, but then it does allow, it will allow some freaky things.

Some of these really small particles that you create through homogenizing do go across cell walls in weird ways. So it doesn't completely solve the problem, but it better solves it, yes.

CHAIRPERSON MOYER: The Chair recognizes Kevin.

MEMBER ENGELBERT: What size does the homogenization take most of these nanoparticles down to, and is there any other techniques besides homogenization that concern you with this recommendation?
We heard earlier 300 nanometers and lower.

MR. ASHBY: Right.

MEMBER ENGELBERT: Where does milk fall? Homogenization of milk?

MR. ASHBY: On average, much bigger than that, but it is picking up a big end of the tail in that, in the distribution of size; there is a significant number of particles in the nano range.

MEMBER ENGELBERT: There are?

MR. ASHBY: Yes. Depending on how you define it.

CHAIRPERSON MOYER: The Chair recognizes Rigo. You had another question?

MEMBER DELGADO: Well, I was just thinking. Are you still talking about milk at that level, below the 300 nanos, or not?

MR. ASHBY: The homogenization creates a distribution of particle sizes.

MEMBER DELGADO: Okay.

MR. ASHBY: And so, yes,
MEMBER DELGADO: So we are not talking about a completely different product, are we? Or if it changes its properties, you can probably identify those to a certain extent, correct?

MR. ASHBY: Well, you see, as a scientist --

MEMBER DELGADO: I am not getting oil out of this or gasoline or something like that?

MR. ASHBY: As a scientist, I am looking at what the definition of homogenization is relative to how we are trying to define nanotechnology. You are meeting all the criteria of this definition. You are purposefully applying a technology in order to control the particle size, in order that the product acts differently than it does if you don't apply that technology. It is not causing quantum effects, which is one of the freaky things that happens
with some of these particles. They become waves instead of particles, act like waves instead of particles. You are not doing that, that I know of. But, yes, it is acting differently.

CHAIRPERSON MOYER: John, are you going to be around tomorrow?

MR. ASHBY: Yes, I am.

CHAIRPERSON MOYER: Okay. Maybe what we can do is bring John or at least be available to come to the podium for some questions when we discuss this tomorrow in greater detail.

MR. ASHBY: I will let you pick my brain to whatever degree there is anything left to pick.

CHAIRPERSON MOYER: We appreciate that greatly.

MR. ASHBY: Thank you.

CHAIRPERSON MOYER: Thank you.

Okay, Alexis Baden-Mayer, and Steve Frogget on deck.
MS. BADEN-MAYER: Hello. Thank you for allowing me to present testimony today.

I am Alexis Baden-Mayer. I represent the Organic Consumers Association. Nearly 25,000 of our members have sent comments on the issues that are before you this week. Two thousand of those people personalized their letters. So I will try to summarize for you the points that they raised.

Our members strongly support the recommendation for solving the problem of mislabeled organic personal care products. We know it isn't easy to regulate the organic industry. It has grown very fast, and the resources for enforcement have not been adequate.

There have been some tough choices made about where to focus the program's efforts, but if USDA organic certification is going to be meaningful to consumers, it is important to get ahead of the growth in new
sectors and make sure that the law is enforced.

As a consumer, it is still very difficult to make the commitment to buy organic. You have to go out of your way to find organic products. There is less selection, and you have to pay more often.

Consumers who go to the trouble of buying organic are going to be very angry and disillusioned if they find that something they thought was organic isn't actually organic. It doesn't really matter what that product, shampoo or dog food or produce.

Our members' comments described the way they felt about this. They described mislabeled organic personal care as fraud, false advertising, and grand larceny. Many of our members were particularly annoyed by non-certified brands that put "organic" into their name.

So the Committee recommendation is a very simple and elegant way of addressing
this problem. It is not necessary to decide here what the standards ideally for personal care should be, but it is essential that the USDA announce that this is one of their sectors that they are regulating and that they will enforce the law in this category. That is what the recommendation proposes.

On the subject of animal welfare standards, our members strongly support this recommendation for the humane treatment of animals. Our members raise moral and ethical reasons, food safety, and food quality reasons, and also environmental reasons for improving animal welfare.

Our members commonly say that they buy organic for their own health as well as the health of the planet. So, as consumers become more aware of the environmental impact of confinement animal farming, they are looking for alternatives.

Pastures and restorative grazing techniques have great potential to build soil,
reverse erosion, improve water quality, and
sequester global greenhouse gas emissions.
But we can't assume that the industry is going
to take the high road here without explicit
guidance.

The joke in the organic movement
used to be the idea of the organic Twinkie.
We are getting really close to that. Today,
listening to comments, I started to get
concerned about organic Kentucky Fried
Chicken.

Will the organic industry evolve
to produce animal products on the same scale
and in the same manner of modern industrial
dairy, egg, and meat production? We need to
have environmental and animal welfare measures
in place to ensure that organic offers a true
alternative.

Adopting this animal welfare
recommendation is an important first step to
upholding organic as the ethical and
environmental gold standard.
You have heard some really good feedback on the recommendation today. If you all were to adopt the recommendation as is, I am confident that that feedback could be incorporated through the regulatory process.

On the subject of nanotechnology, the Organic Consumers Association strongly supports the recommendation to keep nanotech out of organic. The organic standards have become for many consumers the regulation of last resort. In the absence of precautionary investigations into the safety of new technologies, and in the absence of labeling that would inform consumers of the presence of these new, untested technologies, consumers rely on organic certification.

Consumers don't want to be guinea pigs. They want to have a choice. And right now, the only place they are finding it is in organic.

As one of our members wrote, "I think in 100 years humanity will look back at
today's rampant use of chemicals, genetic engineering, and nanotechnology in the food industry and wonder how we could have ever been so shortsighted. One of the few safe havens people have for these unsafe methods is in choosing organic foods." End quote.

So we are also very much opposed to the idea of deregulating genetically-modified vaccines.

To respond to the question that was given earlier about what to do in a disease outbreak, in a disease outbreak, if the only way you can handle it is through a vaccine, then farmers are going to save their animals and they are going to give those animals the vaccines. At that point, it won't be organic if that vaccine hasn't been approved for use. But that is the same situation that farmers are in with antibiotics. We are looking at public safety and the health of one's animals, and I just can't imagine a farmer not making the choice
to use that necessary vaccine, even if it were not approved in organic use and it meant not be certified for those animals.

CHAIRPERSON MOYER: Thank you, Alexis.

Joe and then Hue.

MEMBER SMILLIE: Thanks for bringing up the personal care issue. Since Miles has been valiant enough to stick to the end, and since he seems to be the last person standing to represent the program -- I would like to ask the program what their current take on the personal care issue is. Not whether they believe it should be part of the regulation, but in this age of enforcement, what the program intends to do about all the products out there labeled "organic" that are on natural food store shelves and everywhere else.

MR. McEVOY: Yes, I think it is a very important issue. It is important to protect the organic label. It is a very
complex issue, and it has some jurisdictional
issues that we need to work out.

It is something that I have not
had time to study over the last month. So it
is something that we need to look into. It is
not on the top 10 in terms of our priority
list, but it is certainly really important.
We will certainly get around to addressing it
sometime. After we hire 15 more people,
right, exactly.

(Laughter.)

CHAIRPERSON MOYER: I think we are
working, Joe, to move it up on their priority
list.

Hue?

MEMBER KARREMAN: Thank you,
Alexis, for the first broad blessing of the
animal welfare document that we have
submitted.

(Laughter.)

It will go under some revision;
that's for sure. But thank you for that.
And actually, also, thank you for saying that about the vaccines, as far as what you would do in an emergency, because that is the correct answer; you win.

Someone ducked it earlier. You have to do what is right for the animals, regardless if they retain their organic certification. So thank you.

CHAIRPERSON MOYER: Than you, Hue. Thank you, Alexis.

Any other questions from the Board?

(No response.) Thank you.

MS. BADEN-MAYER: Thank you.
CHAIRPERSON MOYER: We appreciate your time.

Steve Froggett to the podium, if you would, and Jaydee Hanson on deck.

MS. FRANCES: Can I comment?

Steve Froggett had to leave. He is with the Foreign Ag Service. He will come back
tomorrow and listen to your presentation, but he wanted to give comment from the Foreign Ag Service's point of view, along with Codex. He will submit them electronically, and I will get them to you. We will post them later.

CHAIRPERSON MOYER: Thank you, Valerie. We appreciate that.

Jaydee Hanson? Diana Kaye? Oh, I'm sorry, I didn't see you. Diana Kaye will be on deck.

MR. HANSON: Good evening. I recognize that I am standing between people and beer, and I will not prolong my comments. You have our written comments. Let me also note that you are going to save some time because I am also representing my colleague, George Kimbrell. George is having to deal with a legal matter and can't be here. So I am representing both he and I.

I want to say that the Center for Food Safety and the International Center for
Technology Assessment both have worked on the issue of nanotechnology for some time. The International Center for Technology Assessment is dedicated to providing the public with full assessments and analyses of technological impacts on society. However, and this is where I think the organic program comes in, even the best risk assessments cannot deal with unanticipated consequences.

I think one of the reasons that consumers do go to organic is because they are worried about the unanticipated consequences of some of the ways we have of producing food. So I want to say we applaud the majority that says that nanotechnology is not one of those technologies that should be in organic. We could go on that longer, but you have got our comments, and we appreciate where the majority is.

We think the Committee definition should be changed a little bit because there
are a number of chemicals that change their properties at a size higher than 100 nanometers. I have challenged Mike Roco on this at the National Science Foundation. He heads the National Nanotechnology Initiative.

I said, "Mike, your statement of 100 nanometers is the least scientific statement the National Science Foundation makes."

This is a faith-based statement, not a science-based statement. You believe that magically chemicals change at 100 nanometers. Well, they don't.

Some chemicals are below that, are well below that before they get the properties you are looking for for nano. A number are well above that.

One that is already used in food products as coloring, titanium dioxide, in the 200- and 300-nanometer range, it gets new properties, not down at 100.

So, if you want a science-based
definition that includes 99 percent of what is nano, I would kick it up to 300. The UK Soil Association has 200. I believe the Canadians have 200.

Let me, because you have all the other things there, let me raise the question of the minority report. I think it is very dangerous to believe all the hype there is out there in nano. There's two reasons why it is dangerous.

One, there are claims of nano that aren't nano. I mean people using it as a marketing tool. So that is their problem. If you decide nano can't be in organic, then they are out of that market right away.

There's an agricultural economist, though -- excuse me -- agricultural ethicist that is going around talking to food safety people and food technologists and saying, "Learn from the GMO people. Just don't tell them it's got nano in it."

If you want Paul Thompson to
I testify before you, he will tell you that he has done that. Paul and I are friends; we just disagree on that.

One of my professors was the man who learned to isolate plutonium. I can't imagine him going before a group saying, "Radiation, no real problem with radiation. It's just natural."

What was unique about plutonium was it was an engineered product. What is really unique about this kind of nano is that it is engineered.

We are not talking about smoke. Smoke changes. You burn it. You can use it to cure hams, and it's got nanoparticles in it. We are not talking about that.

We are talking about things that are deliberately engineered for their nano principles. We are not talking about homogenization, unless they have got a better process than I know of that would get it all down in the nano scale.
CHAIRPERSON MOYER: Okay. Thank you. Thank you very much, Jaydee. We appreciate those comments.

I see we do have a few questions. Dan and then Katrina.

VICE CHAIRPERSON GIACOMINI: When you were talking about the change in size, you said that there were things in the 200 and 300 range. Is 300 the right line, though? I mean, on the one hand, we tried to write the definition so that size was part of it, but size isn't all of it. I mean I have heard people make claims up to 500.

MR. HANSON: Yes. Yes. I would say that there are things that will still have changes in their toxicity, changes in their solubility, changes in their quantum things, if you went up that high.

I think you would get 99 percent if you went up to 300. You've got some that are out there. That would be the kind of thing that, at 500 nanometers, that would be
okay under your recommendation. So I wouldn't worry about that.

And if you saw those principles in that remaining 1 percent, you can deal with that under your synthetics. That is where the approach of the minority might be right. But I think if you went to 300, you are going to get most.

CHAIRPERSON MOYER: The Chair recognizes Katrina.

MEMBER HEINZE: So I think we can all agree that today any perceived benefits of nanotechnology, clearly, do not outweigh the unknown risks of nanotechnology.

So my first question is, do you agree with that statement? And my second question is, can you envision a future where that would not be true, where there is some benefit of nanotechnology that is critical in organic? And we know the risks.

MR. HANSON: I can't imagine a future in organics, you know, unless you think
the nano encapsulation of caffeine in chewing
gum, as the military has done, is a great
idea, and you want to have nano gum that can
deliver five times the level of caffeine of
NoDoz now.

But, no. I mean I am being flip,
and you don't have time for me to be flip
I can't at this point, with all
the products I have looked at, see one that
adds something to the organic brand.

CHAIRPERSON MOYER: Okay. Thank
you.

The Chair recognizes Rigo.

MEMBER DELGADO: Can you give us a
nice definition of engineered nanotechnology,
and how do you compare that to homogenization?

MR. HANSON: I would say
engineered to be at the nano scale. I mean,
you know, some of these properties are very
specific. We are not talking about gold here,
but I think it is 40 nanometers, it glows red.
If you have it 50, it doesn't. So some of
these properties are very particular in size. Others aren't; it is everything below that level.  

So, basically, if you can't engineer it to get the property that you claim it has at the nano scale, then I think you are committing fraud. I think there are some products out there that are.

CHAIRPERSON MOYER: I'm sorry, Rigo.

MEMBER DELGADO: A followup: how is that compared to homogenization of milk, for example?

MR. HANSON: Well, homogenization, you know, the last two people before was an expert on that. But homogenization doesn't put everything in the nano scale. It is not intended to put everything in the nano scale. What we are talking about are things that are engineered to be in the nano scale because of the unique properties you get at the nano scale. Some of these properties
are quite powerful and they do work. I am just saying, like some other things that work, you know, genetic engineering works, but you don't put it into organic food.

CHAIRPERSON MOYER: Thank you, Jaydee. We appreciate your comments and your time.

MR. HANSON: Okay. Thank you.

CHAIRPERSON MOYER: You're welcome.

MR. HANSON: I will leave copies for other people out there. I think the Committee has already got copies of our testimony, but I will leave them out at the table.

Also, I have left some copies of the principles of that. If anybody wants it in Spanish, German, French, or Chinese, or Japanese, we've got that, too.

Thank you.

CHAIRPERSON MOYER: Thank you very much, Jaydee. We appreciate it.
MR. HANSON: Have a good night.

Have a good beer.

(Laughter.)

CHAIRPERSON MOYER: Thank you.

The Board recognizes Diana Kaye to

the podium, and Farah Ahmed is on deck.

MS. KAYE: Hi. Thanks for all you

folks hanging out here so late.

Would you like some 100 percent

certified organic cocoa butter to go with

those nuts and chews that you've been eating?

Because I've got it.

Really, I need to stop eating my

products to prove that a person can be organic

because, as I told Bea earlier, I have gained

35 pounds from eating my products.

So can we wrap this up?

I want to start with a quote, if

that is okay with you all. This is quote from

the September 1998 issue of the Natural Foods

Merchandiser. Valerie has the actual copy of

that article.
This is the quote: "Ninety-five percent of a product's ingredients should be organic if the whole product is labeled organic,' says Catherine D'Amadio, Executive Director of OTA. Most natural cosmetics manufacturers agree that the industry should be guided by the proposed national standards for organic foods." Again, that was 1998.

So, if somebody over there on that side of the room might be saying -- I guess I am addressing this to you, Joe, because you brought up the subject and kind of took the wind out of my sails a little earlier, where we were saying that perhaps this might be addressed sometime. Twelve years. We have been waiting 12 years and beyond, okay, for this to be fixed.

We are a little company, and we are getting creamed. Is that right? And I am going to give you some examples. Because, if you notice, in the packet you all have -- this is really punchy -- ingredients for some of
these products.

Are you sure you all don't want a bite? I've got two different products here. One is really great. Both are 100 percent organic. This is cocoa butter and cocoa butter body cream.

This is a product that is on your list. This one says, "organic" and "fair trade certified", and it says, "cocoa butter cream". Wow, it competes with my product.

Please take a look at the ingredients on there. The interesting thing is that, at least in this one product, there is an ingredient that is organic.

Then we have this product, cocoa butter. Cocoa butter, okay? Cocoa butter. Oh, I forgot. It says, "Pure, natural and organic cocoa butter" and this says, "cocoa butter", except it's got a whole bunch of other stuff in it. And it says, "Keep out of reach of children."

That is what we are competing
against. We can't wait another minute. This needs to be fixed because people are buying this. "Keep out of reach of children." Why? It says, "cocoa butter". This is cocoa butter.

Okay, this is a really interesting product. This says, "cocoa butter". However, now it also says, and this is a really nice company, "raw white cacao butter", same thing. That is the Latin name, Theobroma cacao.

On the back -- this is sold in all the food aisles of health food stores across this country -- but it also has instructions for body care use. So tell me, guys, is this a body care product or a food? Is the USDA -- well, I wish there was somebody here. Is somebody going to protect this product? Because we have been abandoned. So which product is it? Food? Body care? Food? Body care?

Sorry. I am so fried with all this.
And, yes, I'm still not done.

Okay, I love this one because this one says, "Pure, natural and organic cocoa butter". And again, we've got cocoa butter. There is no cocoa butter in this cocoa butter. Okay?

Are you all content to sit and let this happen? I know you're not because you guys wrote that great document, and we love it, and we thank you very much for that.

But can you help us work on Valerie and the empty table here? Because we need them to like get the bat and start swinging.

So, really, I would like to end up with one additional quote. This one I really like, too. This is from the Whole Foods magazine, July 2003 issue.

It says, "Going certified organic is now possible because there are rules. In the past many companies had their own interpretation of what organic was and were not competing fairly in the personal care
natural marketplace,' said Jeffrey Light,
Jason's founder and chairman."

And again, that was July 2003. So

hooray, there are organic rules.

Thanks, guys. I appreciate your

patience with me and all this popping.

(Laughter.)

CHAIRPERSON MOYER: Thank you,

Diana.

MS. KAYE: Are you sure you don't

want a bite?

(Laughter.)

CHAIRPERSON MOYER: Any questions

from Board members for Diana?

(No response.)

Okay. Thank you very much. We

appreciate your time in coming to speak with

us.

MS. KAYE: You're very welcome.

Thanks.

CHAIRPERSON MOYER: The Board

would now recognize Farah Ahmed to the podium.
1 (No response.)

2 Jeff Anshus? Thank you. I apologize.

3 MR. ANSHUS: Thank you.

4 My name is Jeff Anshus. I work at Intelligent Nutrients in Minneapolis,

5 Minnesota.

6 We are a small personal care company. We were founded by Horst

7 Rechelbacher, who founded and sold Aveda to Estee Lauder 10 years ago. So this is his

8 project. It is his vision to move the industry, the cosmetics industry, away from the current paradigm that there is and move it to something good, something that is sustainable, and something that is more real.

9 I am here representing all of that.

10 I will be brief because I want to go, too.

11 (Laughter.)

12 We have over 30 products. They are all certified to the NOP standards. We
I have the seal, and we are very proud of it.

We use it as a competitive advantage in the marketplace.

So there are a lot of products out there that you can make. You can't make everything. We get that. You can't compete in the things that you can't compete with, but for the things that are out there, we are very proud of it.

I wanted to thank you guys for your time, energy, and effort, and the opportunity for comment. I think it is very important. I also thank you very much for solving the problem of mislabeled organic personal care products.

I am a chemist and I am a consumer of these goods. I just want to reiterate the problem that a consumer has when they are shopping at a store and they go down an aisle and, suddenly, they enter this mysterious world where organic does not mean organic. That is what is happening. They are shopping
at -- it is in my written comments -- they are shopping at Whole Foods. They are buying their apples, and then they turn the corner and they buy their organic shampoo and there is nothing organic about it.

The NOSB, the vision statement called for consistent and sustainable standards. Rayne mentioned protecting the integrity of the word "organic". That is really what we are talking about, the protection of that word.

We wholeheartedly support the position statement that you guys have. The NOP and consumers are harmed every time a consumer, as she mentioned, every time a consumer purchases products which are mislabeled.

And that's all I've got.

CHAIRPERSON MOYER: Thank you, Jeff.

Any questions or comments? Joe?

MEMBER SMILLIE: Ah, a chemist.
MR. ANSHUS: I am a chemist.

MEMBER SMILLIE: Okay. You've admitted it. So how is the efficacity of your product, the product line that will require surfactants, emollients, and what is your shelf life, stability, in lieu of even the most benign, under the NOP, preservatives, surfactants, emollients, et cetera?

MR. ANSHUS: Sure. Well, we have had to be really smart about it. What we have done personally is we use air-free packaging, so that you are not inoculating the substance over and over again with a preservative system that can't take it.

We have proprietary -- you know, we have worked very, very hard to use -- we've spent, I don't know, well over $200,000 just on testing our goods for preservative testing on them. We came up with the right combination of what we use to preserve our products.

So we have shelf life that is
1 comparable to anything that is on the market.
2 When we have European, the can on there, we
3 put 12 months, which is in line with what
4 other cosmetic goods are.
5
6 What else did you ask?
7 Surfactants, emollients? Of course, we would
8 like more emulsifiers. We would love more
9 surfactant.
10
11 There’s a consumer perception in
12 the world of what a shampoo should be or what
13 a lotion should feel like, and we are
14 constantly telling people that those are
15 chemicals which are created for that specific
16 thing. You know, foaming in shampoo, there
17 are for connecting those things, the oil and
18 the water together, but you have to be smart
19 about how you use energy, how you mix it
20 together, and getting it to emulsify.
21
22 So we are in business. We are
23 selling the stuff. We are not taking them all
24 back. We have a lot of really happy customers
25 out there.
I have done the consumer testing myself and had a really -- you know, people who want the organic products want the implicit message behind what is the certified organic. It is good for the environment, good for them, good for people.

Horst is very fond of saying, "What goes on us goes in us." There is no difference between those.

CHAIRPERSON MOYER: Any other questions for Jeff from Board members?

(No response.)

MR. ANSHUS: Can I just say one other thing, since I had extra time?

CHAIRPERSON MOYER: Certainly.

MR. ANSHUS: I don't know a thing about nanotechnology. I don't. But I do know about aerosol hairsprays, and I know that that sounds really weird. But when you guys are talking about the bell curve, it is exactly what they have debated at length in what makes hairspray safe, or really any aerosol. If you
have WD-40 or aerosol hairspray, or whatever,
the bell curve that they were talking about
earlier, granted there's only a couple of
aerosol manufacturers in the United States
because they keep blowing up, and they won't
let them make any more. It's true.

(Laughter.)

CHAIRPERSON MOYER: That was worth
it.

(Laughter.)

Yes, we never would have asked
that.

MR. ANSHUS: But they do keep
blowing up accidentally, and then they don't
let them fill any more.

But what they are talking about
there is that bell curve about the intent of
what the particle size is. Sometimes aerosol
hairsprays have particles which would lodge in
your lungs and actually choke you to death,
but it is at such an innocuous level that,
while it may be present -- and I think that is
what you guys are talking about when you are talking about the nano stuff. It is about what the intent of the molecule is, if it is a certain size, if that helps. I can talk about aerosol hairsprays a lot, but that's not the point. (Laughter.) I can also tell you I saw an explosion. (Laughter.)

CHAIRPERSON MOYER: I was just wondering how he was getting WD-40 and hairspray in the same sentence, but -- (Laughter.)

MR. ANSHUS: Well, WD-40 and hairsprays are made in the exact same facilities, the same propellant. (Laughter.)

CHAIRPERSON MOYER: Thank you very much, Jeff. I appreciate that.

We needed that.

If Lynn Betz would come to the
podium, we would appreciate it.

MR. ANSHUS: Oh, Lynn, I have Lynn's five minutes, too.

(Laughter.)

CHAIRPERSON MOYER: Thank you.

MR. ANSHUS: In fact, she has the flu and she didn't want to infect you all.

CHAIRPERSON MOYER: Thank you. We appreciate that from her and from you. Thank you. Thank you, Jeff.

David Bronner to the podium. Is David here? Yes. And then John DiLoreto on deck.

MR. BRONNER: Hello. I think I may have to start with what Jeff was talking about. I think people are used to, say, a feel of a synthetic silicone oil in a lotion, but synthetic silicone has a certain feel, and people are used to that, but it has nothing to do with agricultural oil, period, let alone organic agricultural oil.

So like there's an educational
process of like, you know, this is what an
organic jojoba oil feels like; it works. You
are not going to get that what is basically
motor oil feel, but it is organic.

It is just like the education
process -- we all go through like, oh, brown
rice is better than white, and whole wheat
versus, you know, Wonder bread. So there is
that hole, and then once that kind of shift
happens, people come around, and they embrace
it; this is good, you know, and it is not the
bad silicone-feeling stuff, right? So there
is a perceptual shift.

Our soaps, we are the leading
brand of body wash in natural soap, and we
beat all those synthetic, detergent-based
products that are calling themselves organic.

I believe Tracy last time shared
that I guess the impetus behind the current
recommendation was that the soaps in the hotel
said, "certified organic soap" and "made in
China", and they actually had nothing organic.
So I don't know if this is the brand. You know, there's hundreds out there. It says, "made in China". This has "organic" in the brand name, and it says, "certified organic". It is just a pure petroleum-driven, petroleum surfactant-driven product.

I think to the NOP statement, I mean I think the idea is that, like if you came here and a cup said it was certified organic and it wasn't, or the chair you're on said it was certified organic and it wasn't, ideally, NOP would just say, "Look, we have a standard for organic agricultural products across product sectors."

You could say in this product it is made with certified organic aloe vera, or whatever it actually organic about it. Or if the chair is made with some sort of an organic wood, but if it is using lacquer, that is prohibited; don't call it a certified organic chair.

I think in my written comments I
talk a lot of the opposition to opening up the NOP list to a bunch of allowances for personal care. Well, I think that the NOP approach with textile is that, if you say, "organic T-shirt", then it has to be USDA organic, but if it is made with organic cotton, leave it alone. You know, it's a made-with -- we are not getting into and open the NOP list to all the textile stuff. We are just going to let it alone. But if you are going to call it an "organic T-shirt", then it's got to be 095. So I feel like the same approach should be taken with personal care. Okay, let's not worry about trying -- you know, don't let the perfect be the enemy of the good. Let's not worry about made-with organic. It is not so injurious. If this product says, "made with organic aloe vera", that is not so bad. I mean it is a totally lame product, but at least it is not calling itself a certified organic product. It is just saying what is actually organic in it.
And I think Oregon Tilth,
actually, I want to just mention that,
similarly, to not let the perfect be the enemy
of the good, I know there is like this ongoing
debate of synthetic and non-ag, and whatever,
and how that all shakes out. I think Oregon
Tilth's written comments are like we have got
to deal with that first before we can apply
the program to personal care and other product
sectors. I think that can go in parallel.
I personally am fine if soap falls
out of 095 and it is in 070, I mean fine.
However that whole ag/synthetic thing works
out, you know, I don't think that should hold
up the move to regulate the personal care
space.
That's it.
CHAIRPERSON MOYER: Thank you,
David. We appreciate those comments.
Are there any questions for David
from the Board members?
(No response.)
Thank you very much. We appreciate your time.

MR. BRONNER: Yes.

CHAIRPERSON MOYER: John DiLoreto, and Betty Bugusu is on deck.

MR. DILORETO: Well, I was going to say good afternoon, but it is good evening. I will try to make my comments brief because I really don't want to stand between you and dinner.

My name is John DiLoreto.

First, let me thank you for the opportunity to provide my insight and comments today. Because I have significant professional experience in both the organic foods industry and the field of technology, nanotechnology, I feel that I am really uniquely positioned in that respect, after hearing all the comments today. I have heard folks from both sides of the aisle, but I haven't heard very many people who really have experience in both areas. So, hopefully, I
I am a chemical engineer by training, but in 1991 I founded a certified organic bakery in the State of Maryland, and I had the pleasure of serving on the State of Maryland's Organic Certification Advisory Committee for six years. So I have had the opportunity to sit in your shoes at the State level as a certifier.

And the organic foods industry was fairly young at that time. I know you are dealing with a lot of questions today, but I can reflect back to those days, and we dealt with a lot more questions than we had today. At least you have had some time to flesh many of the issues out.

But in my current position, I am the owner of NanoReg, a professional services firm that specializes in nanotechnology regulatory policy and environmental health and safety.

So we have this crossover between
organics and nanotechnology, environmental health and safety, and what nanotechnology really is. And it doesn't hurt that I stayed at a Holiday Inn Express last night.

So under consideration by the Board is a prohibition for nanotechnology, to keep it out of organic foods, 100 percent organic foods. I find this a bit troublesome from the standpoint that you are using the term "nanotechnology". Nanotechnology is not a product. It is not an ingredient. It is not a food substance. In fact, it's chemistry, and chemistry is something that you deal with on a daily basis.

You have lists of substances that are allowed, lists of substances that are not allowed. You have dealt with them as individual chemical substances on a case-by-case basis, and nanotechnology is no different.

Products in nanotechnology are a broad range of chemical substances. Some have
unique properties at the nano scale, but all are separate and distinct substances. And I want to make a real important point here because I have heard nanotechnology demonized to a fairly large extent today, about how bad it is. I heard the term "freaky", which I am not sure is a regulatory term.

But nanotechnology has created some unique circumstances, but not all of the properties that are created through creating nano-scale materials are very different, and they are not very substantive.

The example that I heard before was very interesting because I heard it described as, well, at one size, nanomaterials, they glow, and the other size, they don't. That is false. They do not glow. The difference is that different size particles reflect light differently. So, when you have a smaller particle, you see it as one color. When you see a different size
nanoparticle, you see it as a completely different color. Now those are optical reflective properties. Nothing freaky about that.

Anybody that has seen a glacier and seen where it meets the water and seen that blue glow, that is light reflection. That is just a characteristic of physics.

So I would like to recommend that the Board consider them as distinct materials and deal with them on a case-by-case basis, as you have done with other substances, such as ingredients, additives, pesticides, and herbicides.

I would also like to recommend the Board consider adopting a policy of using internationally-accepted terminology and accepted standards that have already been developed by several standard-setting organizations. The NNI is not such an organization. I work with them fairly regularly.
and they have done a great job of promoting
the use, the benefits, and the development of
applications of nanotechnology. That is what
they do.

So it is important to understand
where some of these terms are being used and
how they are being thrown around.

And let's look for a moment at
what nanomaterials are. That generally-
accepted standard of 100 nanometers is
really -- I am trying to remember the
terminology that was used before -- a
definition of faith. It really was meant to
be a starting point because nanomaterials,
properties of nanomaterials change, some at
100, some at 500, some at 300, which is why it
is important they are dealt with as individual
substances.

I have never liked the concept of
including packaging as an element of food
processing, particularly when I was a
certifier. They are very different. As a
chemical engineer, I have seen hundreds of processes that are the sum total of a variety of specific unit operations. It is difficult for me to compare what goes on a distillation column with what goes on a paper bag. I think that, if you lump them together, you really create an issue that is difficult to resolve.

One point I would like to make has to do with packaging. There are many applications -- I think I have heard the question about nanotechnology: do we ever see a moment when nanotechnology can play a part in organics? It can play a part, and does play a part today. Active packaging, there's a lot of nanomaterials being used on packaging.

If you use this definition where you prohibit nanotechnology, you prohibit the use of RFID devices printed with nano-scale materials that are used for tracking of inventory; you prohibit active displays on paper bags; you prohibit many things beyond
the use of nanomaterials within the processes.

So I think that is my key point.

It is important to look at the fact that we've got different nanomaterials, different uses, and I think they need to be dealt with in a scientific way on a case-by-case basis.

Thank you.

CHAIRPERSON MOYER: Thank you.

Thank you, John.

Are there any questions from Board members for John? Katrina, please, and then Joe.

MEMBER HEINZE: You mentioned using existing standards. I know something we have heard a lot about today is this struggle of the Committee to come up with a definition. Do you have a standard that we should look at that would be helpful to us?

MR. DILORETO: ISO and ASTM both have published standards for nanomaterials, nanoparticles. Those definitions exist. They are published. They are on the web.
MEMBER HEINZE: Great. Thanks.

CHAIRPERSON MOYER: The Chair recognizes Joe.

MEMBER SMILLIE: Explain the RFID example. I was going to ask you which benefits of nanotechnology would you like to see petitioned. Are you familiar with the minority report on --

MR. DiLORETO: Yes, I am.

MEMBER SMILLIE: Okay. So I take it you support the minority report on this?

MR. DiLORETO: Yes.

MEMBER SMILLIE: So, if you were petitioning, just as an example, how would you petition the RFID nano -- the use of nanotechnology in RFID?

MR. DiLORETO: Well, you know, a radio frequency identification tag is put on packages, put on pallets. It is meant to be able to track products throughout the manufacturing, delivery. In fact, Walmart has been requiring it even on the pallets that are
Nano-scale materials are being used to print, to literally print the nanomaterials on paper that will create an electronic circuit where the electronic circuit can be active and act as an RFID tag just by printing the circuit on the package. It is a case where nanomaterials can be used without impacting the integrity of the organic product. And there are other examples of that, but I highlight that one because it is really easy to see how the integrity of the product is not impacted at all.

I haven't even gotten into active displays or active or intelligent packaging that can tell you when a package has gone bad, where the nanomaterials never come into contact with the organic food. So it is important to understand that, certainly from a packaging aspect, an argument can be made that nanomaterials have
a place in the industry and can be used without impacting the integrity of the organic standards.

CHAIRPERSON MOYER: The Chair recognizes Kevin.

MEMBER ENGELBERT: So you speak of these nanoparticles that are used to track packages. Have any studies been done to what the impact is when these packages are discarded and where those nanoparticles end up, what they interact with, and how they are dealt with, whether they are recycled, composted, put into a solid waste disposal facility, whether they are incinerated? Has anything been done to track these particles, regardless of whether or not they come in contact with food, but where they end up when the packaging is no longer used?

MR. DiLORETO: That kind of work is underway at several different facilities, particularly the academic side, USC, University of California Santa Barbara,
Arizona State. Those kinds of studies are underway, where they are now not only tracking where the nanomaterials are ending up in terms of migration pathways, but also what the potential impact is of any of the nanomaterials that make it into the environment and what happens to them.

Some of the studies have already been completed. There are some nanomaterials where they have already been able to see, and I know that the aspect of agglomeration and aggregation was discounted this morning by a speaker. It is important to understand that, for instance, carbon nanotubes, that when they enter the environment, they get into sediments, sludges. They immediately agglomerate into a much larger particle.

They have found that this agglomeration actually acts to make it innocuous because it is no longer small enough to pass through cells. It is no longer small enough to pass through the blood/brain.
1 barrier.

2 So they are finding that some of
3 these materials can be recycled just with
4 other materials, and there really is no
5 negative effect at all. Now I don't want to
6 make that a blanket statement because it is
7 important that we understand that all
8 nanomaterials are not created equal, and that
9 not all of them are going to behave in that
10 way.

11 Even the definition of what is
12 engineered and what is not is an important
13 distinction because I own a bakery. I use a
14 lot of flour. And I've got to tell you all
15 that milled flour and a lot of dust flying
16 around created a lot of nano-scale flour that
17 was in the air in my bakery.

18 Now did they intentionally create
19 nanomaterials? No, not really, but it is
20 engineered.

21 So it is important that we
22 understand that the definition that is being
used in this recommendation is so broad that, from a regulatory perspective, not only is it going to be difficult to enforce, it is going to be difficult to really allow the appropriate uses of nanotechnology in the organic arena.

CHAIRPERSON MOYER: Thank you, John. We appreciate your comments very much.

MR. DiLORETO: Thank you.

CHAIRPERSON MOYER: Thank you.

The Board would recognize Betty Bugusu at the podium, and Marcelo Secco is on deck.

MS. BUGUSU: Good afternoon.

Thank you very much for your patience and for your diligence this evening, actually.

My name is Betty Bugusu. I am a research scientist with the Institute of Food Technologists, otherwise IFT.

First of all, I would like to thank the Board for this opportunity or for
giving IFT the opportunity to comment on the
standards and the recommendations that they
are putting forward on nanotechnology.

I would like to start by thanking
the speaker who just left the podium, and
potentially for making my work easier here.

I think that, before he came on, I was really
a little worried about how to address some of
the scary words that I had heard earlier on
today. But I think I have been in a better
position, and I couldn't agree more with his
comments, as I give more additional comments
from the IFT perspective.

So I will take a minute to tell
you about IFT, for those of you who don't know
us. We are a nonprofit organization,
scientific organization, with about 20,000
individual members working in the area of food
science, food technology, and other related
professions like nutrition. Our members are
drawn from industry, academia, and also from
government.
IFT was founded in 1939. Our mission, IFT’s mission is to advance the science of food, and our long-range vision is to ensure a safe and abundant food supply, contributing to healthier people everywhere.

And my comments are generic, so I will try to kind of put a little bit of flavor as regards to nanotechnology.

So IFT champions the use of science-based solutions across the food chain through knowledge-sharing, education, advocacy, and furthering the advancement of the food science profession.

With regard to nanotechnology, IFT has taken a leadership role in terms of us looking at how nanotechnology can be used in food. This has been done through the establishment of a Food Nanoscience Advisory Panel that consists of members drawn from across our membership categorization.

IFT further recognizes the importance of nano-scale science, engineering,
and technology to positively impact the food and agricultural sector. Therefore, we support objective and well-designed research and development efforts in that sector.

I will just take another minute to kind of enlighten you on some of the potential benefits of nanotechnology in food.

As John already alluded to, food packaging is one of the areas that nanotechnology has great potential for applications. He talked about RFID. I would add other technologies like nano-composite materials. These are materials that are incorporated in our food contact materials for packaging, and they have high quality like increased strength and also they have high barrier properties, which are important in packaging. Definitely he mentioned smarter intelligent packaging, as he discussed.

Another potential area for application is in the area of food quality, safety, and defense. Here we are talking
things like nanosensors, things that would
tell you when the food is bad or if the food
has expired, or something like that.

Then, of course, we have heard
antimicrobial, things that will deal with the
food microorganisms that are important to the
human health.

Another special area is in the
area of food ingredients delivery systems. We
have heard about the availability of some of
micronutrients; particularly those of plant
source is very low. We know people around the
world who are suffering from malnutrition.

Nanotechnology has the potential
to make those materials readily available,
bioavailable, to those consumers and,
therefore, help alleviate malnutrition in
various parts of the world.

Other systems are nano-emulsions.

People have talked here about homogenization.

I would like to add to the fact that
homogenization intent is never to come up with
nanoparticles. However, those are the unintentional result of homogenization.

What this tells us is that we, as humans, have consumed some nanoparticles to some extent following this unintentional production of the materials.

Further, nanotechnology also appears in nature, in products like milk, like has been discussed. The milk proteins, caseins, and what have you, have nanotechnology in them.

And finally, food processing, and this is kind of an enabling technology where you use nanotechnology to produce your materials, but the end products do not consist of nanoparticles.

So I see that my time is up. I have one minute.

The next thing, I want to say that we also recognize that there are challenges and issues that face this technology that need to be addressed. And as I said, IFT is very
active in championing responsible research, so
that all these areas of environment, health,
and safety are addressed.

To that extent, you know, we
advocate for further finding in that area. At
this moment, as we speak, IFT is in the
process of compiling a report to give us the
state of the science in terms of safety of
nanomaterials in food use. That report will
be available the end of this year, and we can
share it with the Board, if necessary.

Finally, I would like to just say
that IFT strongly encourages the Board to
reject the conclusion of the Materials
Committee, and I quote, "exclude and prohibit
the use of nanotechnology and products of
nanotechnology in certified organic
production, processing, handling, and
packaging." End of quote.

Instead, IFT supports the adoption
of our petition that allows for consideration
of each potential application of
nanotechnology on a case-by-case basis. So, ideally, our recommendations are keeping in the minority opinion, submitted by some of the members of the Board.

And finally, as I said, IFT advocates and supports science-based solutions, public policy and legislation initiatives, and especially as they relate to production, processing, and packing of food. So we encourage the Board to consider science-based policy decisions when it regards the use of nanotechnology in organic foods.

CHAIRPERSON MOYER: Thank you.

MS. BUGUSU: And finally, IFT's idea is to enhance collaborative efforts with other stakeholders, both domestically and internationally.

And finally, IFT is happy to work with you to provide background information to help inform your decisionmaking.

CHAIRPERSON MOYER: Thank you.

MS. BUGUSU: Thank you.
CHAIRPERSON MOYER: Thank you, Betty. We appreciate your comments and your time.

Are there any questions from the Board for Betty?

(No response.)

Thank you very much. We appreciate your time in coming to speak with us.

MS. BUGUSU: Okay. We didn't submit the comments, but I will pass copies around and we are happy to send them electronically.

Thank you.

CHAIRPERSON MOYER: We did get those. Thank you very much.

Next up will be Marcelo Secco, and then last on our list is George Lockwood on deck.

MR. SECCO: Good evening, ladies and gentlemen.

CHAIRPERSON MOYER: Good evening.
MR. SECCO: First of all, I would like to thank the Committee to give an opportunity to let us know what is happening with the organic beef production in Uruguay.

Thanks to Valerie, for she is trying to help me in my presentation.

Uruguay is a very small country, so far from here, between Argentina and Brazil and the Atlantic Ocean, with only 3 million people. Mainly, it is an agricultural country, and it is not there, but we have 11 million beef animals and 8 million sheep and lambs. So we are overexposed in that for our history.

Concerning the situation of the vaccination, also exporting into the U.S., BSE-free, and also it has been very well-recognized. It is a collaborating center on animal welfare for the whole Latin America.

Considering environmental, we are in the first place concerning it. This is one of the studies that Yale University and
Columbia are performing in our country, in 146 countries.

And also, we have certain specific characteristics of our grass-fed beef.

PULSA and Tacuarembo are two groups that develop -- they are the only group performing organic beef production in Uruguay, and the way to offer this product all over the world, we were working on that for more than 10 years.

Also, I am one of the farmers of that program involving more than 250 farmers and a lot of services. Also, INIA, it is a national entity of research, that it is involved in supporting the project. And it was, of course, quite a challenge for us.

We are approved for the European Union since the beginning of 2001, and approved by NOP since 2003.

SKAL and, after that, the Control Union is a company that it is a witness of all the effort that the farmers are doing.
Just to show you the charge, the farmers are the ones who really support the program, and all the structure concerning researching, controlling, of course, all affecting that in terms of the U.S., USDA, FSIS; this controls all the activities in Uruguay concerning organic or not, and also supporting that program.

Our production system, in Uruguay's free-range grass-fed is extensive, like biodiversity that we still promote and keep.

In Uruguay, it is very common to combine beef and lamb in terms of production with a long production cycle. And some other characteristic is that we are, in Uruguay, traceback since 2006, and hormones are prohibited by law and controlled by law, and also antibiotics in feed.

Just to give a figure that here in America is more common, we have two separate fields that each beef animal can enjoy over
the year.

But we have some limitations. Our pastures are quite different between the systems, with low production in winter. We don't have as strong a winter as yours, but we have quite a strong winter. Low native pasture quality, mainly in winter and in spring and summer; we were exposed in all the climate changes to some adverse effects like drought in the last two years. Of course, animals in that, it lowers the conditions for consuming grass and strong climate. Animals were really affected concerning their welfare.

So we ask for the National Institute of Regulatory Research to analyze this for you. This is the paper that we have already sent to you two weeks ago. We have some recommendations to be considered here in three areas: sanity, supplementing, and calf supplying.

Sanity, mainly, we have non-allopathic treatment up to now with good
success in Uruguay. We are still developing this since more than five years ago, but up to now we cannot reach the target we need. The recommendations are on the restriction to use some allopathic treatment in the first beginning of the calf's production, previous to any research, just to check with an official lab the copro-parasites, and increasing, of course, the waiting time, as time is necessary, supported by our long production cycle.

On supplementation, it is mainly non-organic, we don't have a non-organic market.

Just for to finish, concerning the calving, just to consider that in the way of our production some weaning calves of nature production can go inside an organic farming production.

That is, of course, mainly the suggestions that we would like to make.

CHAIRPERSON MOYER: Okay. Thank
you, Marcelo.

Are there some questions for Marcelo? Kevin and then Hue. Oh, no, I'm sorry. Hue? Hue, please.

MEMBER KARREMAN: Just a quick question then: what are you saying to us or asking or commenting on, our animal welfare proposal, or are you letting us know what is happening in Uruguay? It looks really good.

MR. SECCO: I'm sorry.

MEMBER KARREMAN: Your presentation --

MR. SECCO: Yes.

MEMBER KARREMAN: -- you are commenting to the Board here about what specifically? Maybe I am really thick. I'm sorry.

MR. SECCO: No, no, no.

MEMBER KARREMAN: I apologize, but are you commenting on the animal welfare document we have proposed and how it affects your production down there?
MR. SECCO: No. Mainly, on the way of the Committee to consider that, concerning all the situations that we have in climate, system of production, an organic farming situation in Uruguay, just to consider if any of these three recommendations concerning sanity, supplementation, and calving replacement should be considered in the future.

It is not a question -- it is a question of animal welfare, the consequences, but it is not a question of the animal welfare, because we were, since 1993, we are, for example, all rated, and whatever, every year. It is not a question of specific welfare. It is just a question of the organic standards, NOP standards for our production.

MEMBER KARREMAN: Okay.

CHAIRPERSON MOYER: Thank you, Marcelo.

MR. SECCO: Thank you.

CHAIRPERSON MOYER: We appreciate
your coming. We know you came a long way to
comment to us, and we appreciate that.

Before you jump up, just one
second.

Valerie, do we have somebody else
on the list that I don't have? Bonnie --

MS. FRANCES: No, it is for

MS. FRANCES: There is no more

signup today out there.

CHAIRPERSON MOYER: George, the

podium is yours. Thank you very much.

MR. LOCKWOOD: Thank you, Mr.

Chair, and thank you for the opportunity to
testify.

I am George Lockwood, Chair of
your Aquaculture Working Group. I am also the

invited proxy for the Monterey Bay Aquarium to

read a comment that they have.

Tomorrow the National Organic
Standards Board will consider the Aquaculture Working Group proposal that is also the recommendation of the Livestock Committee for bivalve mollusks.

I would call to your attention in the report of the Livestock Committee, on page 13, there begins four pages of how our proposal is substantially differentiated from conventional bivalve production. I will comment on three of those differentiations.

First of all, we require a rather sophisticated modeling of the hydraulic zone of influence, which is where in the area where the phytoplankton, which feeds oysters, clams, and other bivalves, grows. We look at the exchange of water, all the different sources of potential contamination, and require that this all be sophisticatedly documented.

We also substantially increased the monitoring that is now going on or is required under the National Shellfish Sanitation Program for coliform indicators of
contamination. These are indicator organisms of a wide range of contamination, not just coliforms themselves.

We have placed on the grower substantially new activities that they must carry out, and have developed what we think is a high management system.

But we have also added one rather novel feature. That is, we have adopted from the National Oceanic and Atmospheric Administration's Mussel Watch Program the requirement to monitor some 230 different compounds that are contaminants in the ocean.

The Mussel Watch Program has 300 locations around the United States where periodically the tissue of mussels or oysters are monitored for these 230 different compounds that include metals and metalloids, PCBs, other industrial chemicals, pesticides, and, most recently, flame retardants.

This program has been very effective in locating the areas where the
waters are highly contaminated and areas where there is very, very little contamination. It is also a very effective program to monitor any changes that are occurring in those areas. Basically, there are two sources of contamination of this long list of compounds. One is from human activities. Where there is a great deal of human activity in high population areas, like New York Harbor, contamination is very great. Where there is very little human activity, such as off coastal Maine, there is very little, if any, detectable contamination.
The other source is from aerosols. Geographically, there is no limitation to where or no concentration of where that might be. It is the same aerosols that contaminate our fields and streams in terrestrial agriculture that are contributing to aquaculture in the ocean.

New in our discussions is the positive environmental effects that having a
A healthy bivalve population will have in the ecosystem. What happens is the bivalves, being filter feeders, are cleaning out the particulate matter which prevents sunlight from reaching to the bottom, for the growing healthy seagrass colonies, for instance. And when you have healthy seagrass, you also have a healthy diversity of other organisms. This is well-documented.

In the case of the Chesapeake Bay, I can remember when the waters were very clear; you could see the bottom a long time ago. What was happening then is the water was being turned over by a healthy bivalve population every 3.3 days, is the estimate. Now that the oysters have been killed off by diseases and other factors to a very, very large extent, it is not 3.3 days; it is over 300 days. As a result, we have a very turbid environment in the Chesapeake Bay with much less biological activity than existed before.

Three weeks ago, the Monterey Bay
Aquarium introduced -- and that is an organization well-known to the Organic Standards Board -- introduced a new rating of super-green for farmed aquatic animals. They picked eight aquatic animals they believe are rated deserving of the super-green rating. These included farmed mussels and farmed oysters.

They have three major criteria for super-green determinations. One is that these organisms are sustainably harvested and grown. Secondly, that they do not contribute substantially or significantly to contamination in the human food chain, and that they have high levels of human health sources such as omega-3 fatty acids.

Monterey Bay Aquarium has asked me to read a statement, and I have handed it out. Did it get around to everybody?

And can I do that, sir?

CHAIRPERSON MOYER: Yes, you have whatever time limit we have. You have four
minutes and 45 seconds.

MR. LOCKWOOD: It won't take very long.

CHAIRPERSON MOYER: It's your four minutes.

MR. LOCKWOOD: This is the Monterey Bay Aquarium's comments on proposed National Organic Standards recommendation on molluscan shellfish standards by the Monterey Bay Aquarium, dated October 30, 2009.

"To whom it may concern:"

And incidentally, the person writing this, Peter Bridgson, until about six months ago, worked for the Soil Association in the United Kingdom as the Aquaculture Program Manager, which developed their aquaculture standards. He is very knowledgeable on a wide range of aquaculture programs and standards throughout Europe and the world.

And here is what their comments are:

"The Monterey Bay Aquarium
recently published a report on seafood sustainability titled, 'Turning the Tide: the State of Seafood'. Of particular interest to the NOSB hearing is a new analysis and set of recommendations for a super-green seafood list; that is, seafood that has been sustainably produced, has significant levels of marine omega-3 fatty acids, and is low in environmental contaminants.

"Of the eight items of this list, produced in conjunction with the Environmental Defense Fund and the Harvard School of Public Health, two are farmed bivalve shellfish, mussels and oysters. The report is publicly available on the Aquarium's website.

"The Monterey Bay Aquarium's Seafood Watch Program has also published three reports on farmed shellfish covering mussels, oysters, and clams that is also available on the Aquarium's website.

"After a detailed assessment of the available science on the environmental
impacts of shellfish culture and the regulatory structure overseeing production, all three shellfish groups are recommended as best choices for consumers.

"The clear conclusion from these reports is that farmed molluscan shellfish are a healthy and sustainably produced source of food.

"The super-green list focuses on contamination by mercury and PCBs, both of which are typically of concern for human health and organisms higher in the food chain due to bioaccumulation. Despite being selective filter feeders, that is, having the ability to selectively ingest and discard particles filtered from the water column near the bottom of the food chain, we recognize that in polluted or contaminated water bodies shellfish are able to accumulate potential harmful levels of a variety of bacterial or chemical pollutants and toxins.

"Close control of the location of
shellfish farms and robust monitoring of both water quality and food safety are, therefore, essential and now integral parts of modern shellfish production. The additional contaminant-monitoring requirements specified in the proposed standards for organic bivalve mollusk places a significant burden on the organic shellfish producer, but presents considerable additional protection for organic consumers and for their trust in the safety of organic products.

"Clearly, the challenge in the case of filter-feeding organic shellfish is in determining the source and heritage of these planktonic and, therefore, mobile feedstuffs. In this respect, we recognize the length with which the proposed molluscan shellfish standards have gone to establishing a highly-managed production system, and specifically, for the inclusion of a protective hydrodynamic zone of influence around the shellfish farm.

"We consider these developments to
be far beyond any other farmed shellfish production standards that the Monterey Bay Aquarium is aware of. The requirements relating to the ACI also place considerable additional demands on organic shellfish producers, but provide a unique solution to address concerns over the source of feed for organic shellfish stocks.

"We consider that, in addition to the locational guidelines for food safety monitoring requirements of the National Shellfish Sanitation Program, the requirements of the draft molluscan shellfish standards will produce a safe, sustainable, and nutritious product that closely aligns with the principles and philosophies on which the organic movement is found."

Signed Peter Bridgson, Aquaculture Research Manager, Monterey Bay Aquarium.

And in closing, Mr. Chair, I simply want to ask tomorrow that you do carefully consider and adopt the Livestock...
Committee's recommendations.

I want to thank you, the Livestock Committee, and the National Organic Standards Board for your patience over the last five years as we have gone through a whole suite of aquaculture standards. Some of you are graduating. We, too, are graduating, the Aquaculture Working Group, but we go on to the joy of the final rulemaking program with the National Organic Program, and we look forward to that.

Thank you for your patience, your perseverance. It has been a great privilege working with you.

CHAIRPERSON MOYER: Thank you, George. The same goes for us; it has been a privilege.

I assume you are going to be here tomorrow to address questions.

MR. LOCKWOOD: I will be here if there are any questions.

CHAIRPERSON MOYER: I am sure
there will be.

We can entertain a few brief questions. I am going to make an announcement that our taxi is going to be out front in 10 minutes.

(Laughter.)

We will be there or I will be there; I don't know where you are going to be.

So, if you have a few questions, it has got to be extremely brief. I saw Tina's hand first, and then Kevin.

MEMBER ELLOR: I just want to say I want to reverse everything you just said. I am so grateful for the work and the persistence that you guys put into this. It is amazing. I want everyone to know that.

MR. LOCKWOOD: Thank you.

CHAIRPERSON MOYER: Thank you, Tina. I appreciate that.

Kevin?

MEMBER ENGELBERT: Ditto. The questions will be tomorrow.
CHAIRPERSON MOYER: Thank you, Kevin. I appreciate that comment.

Hue?

MEMBER KARREMAN: Yes, ditto, George. Just there's light at the end of the tunnel on this one.

(Laughter.)

This issue was here when I first came on the Board, and it is actually going to be done when I leave the Board, unlike pasture.

(Laughter.)

But I am glad we could complete it together. Thanks.

MR. LOCKWOOD: Thank you, Hue.

CHAIRPERSON MOYER: Thank you, Hue.

Thank you, George.

This Board now stands adjourned until eight o'clock tomorrow morning.

(Whereupon, at 7:33 p.m., the above-entitled matter went off the record.)

WELCOME AND INTRODUCTION

CHAIRPERSON MOYER: Good morning, everybody. Good morning, board members.

I'd like to welcome everybody back to day two of our session of our November meeting. I'd like to call the meeting to order, and we don't have - for the benefit of the gallery, we don't have any speeches lined up for this morning. We are going to jump right into our business.

And if you look at the agenda, you will see that we are going to start our meeting with discussions and presentations by committee, starting with the policy committee, so Chairman Barry, if you are ready to get started with your presentation, or your team's presentation, we'd like to jump right into the business of the board.

REPORT OF POLICY COMMITTEE

MEMBER FLAMM: Thank you. Good
The policy development committee has four action items to modify, to strengthen the policy and procedure manual.

Our committee, the policy committee, always works as a team. And in keeping with that this morning, each of the committee members will present one of the action items. And Bea James will lead off.

Bea.

MEMBER JAMES: Thank you, Barry.

The first recommendation is on a clarification of Section 3 in the Policy and Procedure Manual, executive director responsibilities. So what we've done here is just slightly strengthen the language related to the general function of the NOSB executive director, aka Valerie.

And the only change that we made is in the first sentence before all of the bullet points of those duties, and that is that the executive director is to facilitate
the operation of the board while helping to
maintain and strengthen its independence,
other specific functions. And the main reason
for this was to clarify that the executive
director's role is to be facilitator and to
not manage the board per se. And that is
pretty much it on the executive director, if
anybody has any questions.

Okay, going on to the other change
in Section 3 that I think people will be very
happy about is the secretary's duties, which
we lightened up to not include having to take
minutes at the meetings. Oh, do you have an
opposition to that, Julie?

SECRETARY WEISMAN: No. I have
no opposition. Does that mean that I can stop
filling in what we're doing right now?

MEMBER JAMES: Well, you have to
wait until we vote on it.

Because we have transcripts that
are very easy to search now, and because we
have Valerie, we felt that the secretary
duties could be lightened so they could pay more attention to public speaking, and be more engaged and involved. And so that is probably the main change in the secretary's duties.

And those are the updates to Section 3.

MEMBER FLAMM: Thank you, Bea.

The next action item was the review of Section 5 of the Policy and Procedures Manual. And Rigo will present our recommendations.

Rigo.

MEMBER DELGADO: All right, thank you, Mr. Chair.

Again, the purpose of the changes is to keep this living document up to date, and we've done several things to make it clear what was the intent of that Section was, and we added some. For example, the main introductory section that is - we just rearranged some of the wording to make it clear.
The next section duties of committee chairs has the second bullet, you'll see we added the executive committee. This is with the intent of making sure that plans at the committee level have been reviewed and agreed upon with the executive committee. In other words we just want to make sure that there is communication going back and forth.

We added let's see this next subsection, duties of committee vice chairs, we added one more duty, which is the second bullet point that you see right there, highlighted in light blue, and that is a system reviewing the committee meetings for accuracy.

Going on to the following page, the changes that you see there are simply made to allow for better comprehension and parallel form, and in the section called procedures for completing committee recommendations, you will see at the bottom of that we added the line, this time is needed to allow the program to
publish in ANPR and allow for public comment.
That was in relation to a 45-day period that we are asking the committees to submit their recommendations in advance to the program.
Moving forward we have --
MS. FRANCES: Could I say one thing?
MEMBER DELGADO: Yes, ma'am.
MS. FRANCES: I didn't notice this before where it says, ANPR. It's not in ANPR, it's just a Federal meeting notice.
It's just a meeting notice.
MEMBER DELGADO: Okay, so what shall we do, and what is the action item?
MS. FRANCES: Just change the wording.
MEMBER DELGADO: Change the wording, will do. Thank you for the clarification. It's just the meeting then.
Moving forward, again, we've just made sure that when we eliminate some of those words like outline on the following page, if
you move further down there you go, we just wanted to make it consistent and have parallel construction flow better. For those of you English majors, I'm sure you'll be happy.

And then I want to point to the underlined section there that says, recommendations related to materials. Further up. The section called writing committee recommendations, and we split it in two. We had this original section, which is, recommendations not related to material petitions and sunset reviews, and we've seen this, you already approved that.

Then we added the following section, and it's not highlighted as it should be, and we'll blame the gods of the Internet for that. But it's called - Valerie, if you bear with me - it's called - it's right after minority discussion, further down, don't go too fast, further up, one page up, a little more, there. If you highlight that, starting with recommendations related to material
petitions and sunset reviews. And we added
that section just so we could have some - a
guide of how to present those specific
recommendations. And I would like to
highlight the fact that we are adding in the
committee summary a section that explains how
we arrived at that recommendation, which goes
back to one of the comments from the
presenters yesterday. We had presented a
description of what was a rationale for a
specific recommendation, and the public and
the committee - and the board members would
have been more aware of what we followed, so
we think that should be fixing that problem.

And the rest is just again
following page is trying to make everything
even and nice looking. And that is it; no
more changes for Section 5. We were intending
on working with another section that explains
how the board works with the program, but we
decided to wait for that until the next
meeting.
Any questions?

CHAIRPERSON MOYER: Yes, Dan,

just a note, asking on page three, procedures
for completing committee recommendations,
number two, should that be draft
recommendation or committee recommendation?

We are not posting the draft; we are posting
the final committee recommendation, aren't we?

MEMBER DELGADO: Yes, we are.

And that's - just to follow up - that would be

--

VICE CHAIRPERSON GIACOMINI:

Procedures for completing committee
recommendations.

MEMBER DELGADO: Correct. Point
number two, yes, you are absolutely right. So
we should change that. Middle of page three.

Where it says the draft there. We need a
final recommendation. Any other questions?

CHAIRPERSON MOYER: Any other

comments? Questions for Rigo?

Barry, back to you.
MEMBER FLAMM: Thank you.

The next section, Section 6, involves some updates and changes but has a new section, and Steve will present our work and recommendations. Steve.

MEMBER DeMURI: Thank you, Barry.

As Barry mentioned, this is miscellaneous policy, Section 6. There are some changes to some existing policies that have been in the manual for awhile, and some brand new policies in this section. So I'll go over the new ones in a little more detail than the ones that are just revisions.

But the first one is NOSB policy for presenters invited by committees. And a couple of minor changes on this one. On point one, the need to invite a presenter to an NOSB committee meeting must be determined at the committee level. That was a change on that point.

And then on number two we took out the 45-day timeline that was detailed on
that point earlier, and just put it with

enough notice to allow adequate time to

accommodate the schedule of the presenting

party and the NOSB. So rather than have a

strict timeline in there we left it a little

bit more open-ended to accommodate different

situations.

On the next page, and this is a

brand new policy, NOSB policy for members of

the U.S. Congress invited by committees.

Occasionally some of us on the board may want

to invite somebody from the Hill to come and

speak to us for different reasons, and we were

asked to put together a policy for those

procedures to invite somebody. So let me go

through those in a little more detail.

Point number one, need for the

presentation established within the

appropriate committee by the committee

chairperson.

Number two would be that the

committee chairperson should notify the NOSB
chair with a request to issue an invitation
with enough notice to allow adequate time
accommodate the schedules of the presenting
congressional member and the NOSB. Exceptions
are at the discretion of the NOSB chair. This
request should be made before any contact with
the office of the congressional member is
made.

Number three, upon receipt of the
request from the committee chairperson, the
NOSB chairperson will notify the NOP
administrator, and the NOSB executive
director, and a discussion of the request will
be scheduled as an agenda item for the next
regularly scheduled NOSB executive committee
conference calls.

If the original requester is not a
member of the EC, that person may be asked to
attend the EC conference call to provide
background information and describe the
purpose for the invitation at the discretion
of the chairperson.
Number four, approval or denial of the invitation request will be by the NOSB executive committee. When the invitation request has either been approved or denied, the chairperson of the NOSB will notify the original requester of the decision. If denied no further action will be taken; if approved, the invitation can be delivered to the congressional member or staff by either the original requester or by the chairperson of the NOSB at the chairperson's discretion.

Number five, the executive director of the NOSB will work with the member of Congress or staff person to schedule the approved NOSB meeting occurrence at a date and time mutually agreeable to all parties.

And the last point: reasons for presentation, subject area, and bio-slash-resume of presenters to be circulated via email to the entire board at least two weeks prior to the meeting.

So a lot of words there. Just to
try to wrap up procedures for inviting congress people to speak to us at meetings.

The next policy is NOSB policy for public comment at NOSB meetings. One change in this section in point number six we added the proxy request should be submitted in writing; this is in regard to proxies, to the executive director, and include the name of the presenter, presenter's topic, reason for need of a proxy, and be limited to the five-minute specified timeframe. So we are trying to shore up the proxy procedures a little bit there.

So the last section we had changes to was actually an addition, and this is NOSB policies or surveys conducted on behalf of NOSB committees. Occasionally we do need surveys to be taken to do our work, and this policy was put in place to put some rigor around that. An official public survey may be required by an NOSB committee in order to gather critical data necessary for the
development of NOSB recommendations. However, surveys may be costly and must follow strict time consuming review procedures within the USDA and the Office of Management and Budget, OMB. Any survey carried out by the NOSB is considered by the OMB to represent the executive branch and falls within the arena of an ANPR. The Federal Register notice process is the legally recognized method of giving notice to the public, and all surveys must show that every effort was made to allow the public the opportunity to respond with comments.

Therefore the NOSB committee should consider carefully all possible alternative means for obtaining the needed data. If an official survey is concluded to be essential to the committee's work, the surveys including the electronic versions conducted must be approved by the NOSB executive committee before they are submitted for approval to USDA and OMB, and a written
report summarizing the results of the survey must be submitted to the full board and NOP as soon as possible at their completion.

So that was a brand new miscellaneous policy that was added to Section 6, and that is the of the changes and additions to the section. Anyone have any questions.

MEMBER FLAMM: Questions for Steven? Yes, Tracy.

MEMBER MIEDEMA: This is a tiny technical correction. On the part where we were inviting folks from Congress, I think you said NOP administrator, and if we are talking about Miles, I think his title is deputy administrator.

MEMBER DeMURI: Let me find that. Do you have that Valerie?

CHAIRPERSON MOYER: Do you know what line that's on, Tracy?

MEMBER FLAMM: Number Three.

MEMBER DeMURI: Deputy
1 administrator. Did you catch that, Val?

2 CHAIRPERSON MOYER: Any other

3 questions for Steve?

4 Barry, back to you.

5 MEMBER FLAMM: Thank you, Steve.

6 The next and last one involves

7 kind of completing the work that we did at the

8 May meeting. At the May meeting the

9 biodiversity action item was presented, and

10 approved, by the board. As part of that

11 recommendation it involved making changes in

12 our material criteria list which essentially

13 included just being more specific - that's a

14 word I struggled with all my life; I used to

15 say "pacific" and cough when I said it. In

16 any case our addition is to add the words,

17 biodiversity, to category one of the criteria,

18 under item three, and again adding category -

19 under category three, number two to add

20 biodiversity. This like I said was actually

21 approved at the May meeting, and we are now to

22 a point of formally adding it to the policy
and procedure manual, and we felt this extra step was probably necessary in order to do any necessary coordination with the materials committee.

So that concludes our presentation. Are there any questions on this addition to the criteria, or any other questions from the board?

CHAIRPERSON MOYER: I don't see any, Barry, so thank you for your presentations. Very well done; appreciate that.

We will now move directly on to the Compliance, Accreditation and Certification Committee. Joe Smillie, chairperson. Joe.

COMPLIANCE, ACCREDITATION AND CERTIFICATION COMMITTEE

MEMBER SMILLIE: Thank you, Mr. Chair.

The Compliance, Accreditation and Certification Committee welcomes the age of
enforcement. And in responding to that, we
have two recommendations, one is on retail and
one is on personal care, and basically I'll
let the people that were the principal authors
of these documents conduct the review.

We will start with Bea, and slight
clarification: the title of this
recommendation will be, Clarification of
Voluntary Retail Certification.

Bea.

MEMBER JAMES: Thank you, Joe.

The CACC recommendation,
clarification for voluntary retail
certification, is really a starting point for
a more complete guidance document that will
provide direction for retailers. Consistent
compliance guidelines for inspectors and
uniform application of the USDA organic seal
at retail.

The guidance document was
developed in a way that introduces the
complexity of the issues that currently
surround voluntary retail certification, and the recommendation's primary objective is really three-pronged: to acknowledge the existing issues taking place at retail; to clarify by providing answers in the form of a final guidance document; and to support retailers with strong certification clarification, certifiers with consistent correction, and consumers with a clear message.

So the guidance - if the guidance document passes, which we hope it will, the hope is that the NOP will provide answers to many of the questions posed, or they will support continued work on the recommendations for the CACC to develop the answers with the help of the industry.

I'll just summarize some of the key issues that need clarification around this subject.

One, products labeled as organic in perishable departments that are handling
and/or processing, so on the first page of the recommendation background section, this really kind of stems from the Q&A that was posed in April 4, 2008, where somebody submitted a question, may a retail operation be certified. And the NOP responded with the following.

Under NOP regulations, retail operations are generally considered an excluded entity, and therefore do not have to be certified. However a retailer may voluntarily become certified for the products which it handles in accordance with NOP regulations, and if a retailer has an in-store bakery or delicatessen which processes products which are sold as certified organic, that portion of the retail operation must be certified as a handling operation in order to sell, label or represent those products as certified organic.

So yesterday we talked a little about this with some of the public comment that came up, that the problem is that
retailers really are not in a deli or bakery
selling a product that says certified organic;
it just says organic. So there is really not
a huge difference between a deli that is
selling a certified salad that is actually
certified - or not certified, but selling an
organic salad and they are certified, and a
deli that is not certified, and has the
ability to sell off a salad as organic. So
clarification around that.

Second point is that certification
of a grocery department where all products are
pre-packaged and commingling is limited or
nonexistent. There was a lot of public
comment from a - well, there was one from one
cert that they felt that the center store
shouldn't be certified at all because they are
not processing or handling, and they have
given some information there about citing the
rule as to why a grocery department that just
has prepackaged products would not be. But
then Oregon Tilth also had comments about the
fact that it does add extra guarantee for a
grocery store that wants to track all the
products that they are putting in the aisle,
which I can tell you is a lot of work, and I'm
not so sure that that is realistic.

And then three, labeling of
organic cheeses, cut in the cheese department,
where the department is not certified but is
being supplied with USDA organic labels from
the cheese manufacturer for application to
each cut piece of cheese. So a cheese cutter
will get a box that has a big wheel of cheese,
and inside of it it will have the logo and the
label of that manufacturer, that usually
includes if they're organic, certified organic
stickers that go on the sheets. So cutting
cheese is processing, so if you are not
certified and you are cutting that cheese in
the cheese department and you are applying
those labels, then it implies that it's still
a certified organic product. So clarification
around that.
Clear and consistent compliance expectations for the retailers from their certifiers. So inclusion of marking plans and programs are part of the retailers' OSP. Cross inspections of all departments, and not just the one that is being certified. So some certifiers might be coming in to do an inspection for a produce department, and that produce department might be cross-merchandising some certified organic products in another department, or have a scale labeled that says they're certified organic. And then they might be cross-merchandising as well that scale for somebody else to use, and that organic message is coming out of the scale, as certified organic on products that may not be certified organic.

And then lastly training and education courses for retailers, certified or not certified, so that they can be deployment-ready for understanding their role and supporting voluntary retail certification.

Right now there is just not a lot of support
for retailers to continue to be educated, to make sure that they understand. I think it would be great if the industry OTA I know offered to provide an update to their gort manual. They hope to do that in 2010. But there needs to be more education and materials for resources for retailers that are certified or not certified to go to so they fully understand how they should be marketing the message of the USDA organic.

And then lastly, I just want to thank those that provided public comment on this subject. There were eight comments, of which most offered very thorough and extensive answers to many of the questions posed in the recommendation. OTA CCOF, OneCert, MOSA, Oregon Tilth, the Wedge and Whole Foods all provided great insight and expertise to help answer many of the questions in the document. I think one unified message in all the public comment received was the request for more clarity around the questions posed by
the CACC. And that - and support for education for retailers.

And additional comments acknowledged that the rule provides all the necessary regulations for retailers, but just that additional guidance would add more clarity which almost everybody supported.

And Joe, I don't know if you wanted to comment on anything about the regulation?

MEMBER SMILLIE: Right. I think one of the key messages is that only in retail do we have organic and certified organic. Everywhere else organic means certified organic, but in retail you can have organic and certified organic. And I think that can lead to public confusion.

The other important point is that retailers, although exempt and excluded in certain areas, nevertheless have to be in compliance with the regulation. And that is sometimes missed. The exclusion exemption
doesn't exempt them from the regulation. It exempts them from certification. So I think that this document is really important in getting the message out to consumers and retailers, and hopefully seeing an increase which was the real intent of bringing retailers not necessarily into compliance, which would be helpful, but also just bringing them into the loop so that they understand. And with this age of enforcement that is beginning, we may see some added stimulus to the retail community to get involved with certification.

So I think that this document is really important as a step in the beginning, and I do believe, unlike some of my colleagues in the certification industry, that we do need more consistency and clarity in applying the processing and handling regulations to the retail situation. There are some distinctive differences in retail that are different than distributors or processors, and I think that
we probably need not a rule change but
certainly some guidance for that. And I think
that is where we are headed with this.

Bea.

MEMBER JAMES: Thanks, Joe. And
then I also want to acknowledge that Oregon
Tilth really provided a lot of really good
insight and answers to a lot of the questions
that we posed. So I would like to recommend
that that document really be looked at by the
CACC, and since I'm off the board after this
meeting I won't be able to push that agenda,
so I'm saying it now.

And then in closing I also wanted
to just read something that the Oregon Tilth
pointed out, in a second, they said, we also
urge the NOSB to develop a procedure for the
approval and posting of guidance documents to
ensure a conclusive home for your work. It
would be very beneficial to the industry if
the NOP website contained a home for
officially approved NOSB guidance documents.
We are concerned about the status of several other guidance documents that have not to date been addressed by the program. Accordingly we question the fate of the proposed retailer guidance and the worth of everyone's time. We are urging the CACC to follow up on the status of recommended guidance documents, and for the NOP to address the work of the NOSB.

And then they list some specific guidance documents that they are asking about. But I think that is a really good point, to make sure that we actually have a place where people can go and find the resources for guidance to get more information since it doesn't actually go, not something that is officially part of the rule.

So with that I will take any questions, and CACC will take any questions.

CHAIRPERSON MOYER: Dan.

VICE CHAIRPERSON GIACOMINI: Thanks, Bea.

A couple of questions just for
clarity. As I've said before when we go to
this level I'm as interested in what I for
lack of a better term call intellectual
contamination as physical contamination. When
you talk about cross inspection between
departments, does that include signage? Or
looking for inaccurate representation, dairy
case, cereal aisle, things that are pre-
packaged?

MEMBER JAMES: Okay, so when you
say pre-packaged, are you talking about just
like cereal on the shelf? Or are you talking
about things that would be pre-packaged by --

VICE CHAIRPERSON GIACOMINI:
Cereal on a shelf, milk in a carton, those
kind of things that can be there in organic
form, non-organic form, with inaccurate
deceptive signage.

MEMBER JAMES: Yes, I think that
is a really good point. And I would say that
that is something that should be acknowledged
as part of the additional guidance that is
needed for certifiers to do when they are in
cross-inspecting a department. For example
private label products oftentimes don't always
have accurate labeling, and that's one of the
things that could be noticed by an inspection
coming in to do a department.

VICE CHAIRPERSON GIACOMINI: And
then the other question I have is regarding
chains. Are all the stores within a chain if
one is going to be certified are they all
going to be required? Or is there going to be
some, again, intellectual contamination
concerns regarding how it's used in
advertising. I can easily see where you have
anywhere from three in a chain to 500 in a
chain. You certify one, you put it on all
your advertising, and you say that you have a
certified store, but you only did one.

MEMBER JAMES: I'll let Joe
answer this, since there were some recent
changes.

MEMBER SMILLIE: Yes, one of the
real points of this document is how to market their certification. And that is one of the areas we found that there has been abuse; there is no question. Not only within a store, like one department is certified, and then it can sound like the whole store is certified. So that's what this document addresses.

And also with chains, I think you know we are certainly not going to tie people up saying, if you certify one store in chain they all have to be certified. We don't want to go in that direction. We want chains to say, okay, these are the stores that are going to get certified, and that will encourage them to move along. But they just have to be specific in their presentation that this store is certified and not other ones.

VICE CHAIRPERSON GIACOMINI: But that advertising and how they are specific in that assertion is part of this review?

MEMBER SMILLIE: Absolutely. And
actually I think that is one of the key components of this guidance document is after you certify a store you've got very little control over their marketing, and we are recommending that that is part of their organic system plan, that the marketing piece has to be part of that OSB.

CHAIRPERSON MOYER: I think that's an excellent point, Joe, that that is what this does. Bea?

MEMBER JAMES: No, I was just going to point out to Dan on the last page of the guidance document under point (b)(c), should certifiers require retailers to include marketing plans slash programs as part of their OSB as Joe stated.

CHAIRPERSON MOYER: I had one question for you, Bea, in terms of - I'm not too familiar with the retail side of the business, but in terms of the training of the actual staff that does the cutting of the cheese, how much of that goes on today, and
what kind of training support tools would they need to actually make it function better?

    MEMBER JAMES:   Well, I can't speak for all retailers, but I can say that it's just kind of a sliding scale, that it varies. There are retailers, and such as the one that I work for, a 21-store chain, and we only have one department that is certified, and we go through extensive annual education and training as well as testing that takes place four times a year. And those tests go into the file, and the certifier looks at that.

    I don't know if that is consistent with all retailers. I think if there was an expectation of making sure that there was education in place for certified retailers, that that would help the process. So.

    CHAIRPERSON MOYER:   Yes, I guess my concern stems from what Dan was saying about cross-contamination, not only in signage but physical cross-contamination from the
staff that doesn't fully understand the
time. In a farming operation generally
speaking you've got staff that are working on
an organic farm, and they understand at least
the basics of what they are trying to
accomplish. But in a store you've got such a
variety of products on that scale. That was
the reason for my question.

MEMBER JAMES: Well, I'll let Joe
take that. But the rule is clear. If you
certify your department you have to follow
certain steps as far as cleaning, and
handling, and tracking.

MEMBER SMILLIE: Yes, it's been
my experience, and I think the other
certification industry would back me up on
this, is that a lot of times retailers get
involved in it because they want it for
marketing purposes. They find out that the
real value in certification is helping them
increase their liability as far as compliance,
and the staff really get into it. I mean it
really becomes a huge empowerment sort of thing with retailers, and it also enables retailers - and this is not quite understood - as retailers understand their liabilities, and hence, we see a lot of organic product that is in a bag, and it's not produce display, it's like in a bag because they are really worried about cross-contamination.

So it makes them - it gives them an environment, well, we've got to keep the organic sort of bagged and separate, and not open and bounteous in displays and all that. So I think it enables them to - with certification to get the knowledge and go beyond and start to really understand how the system works. And it creates benefits to them in every area.

CHAIRPERSON MOYER: Yes, I was more concerned about the stores, or the retail outlets that are not certified but they are still selling the organic product, and without going through that certification process. The
farms don't do that, but they don't understand either; that was my point.

MEMBER JAMES: That's - I'll bring it back to some of the suggestions from Oregon Tilth in their response to the recommendation, is that if we could create educational platforms for retailers, that they would get some kind of diploma, or certificate, that would help them kind of train the trainer back at store level whether they are certified or not that that would add a lot of value.

CHAIRPERSON MOYER: Katrina.

MEMBER HEINZE: Help me understand a little bit what happens if we pass this recommendation. So I look at your document in the recommendation section, it's a bunch of questions. So I'm trying to understand what a yes vote means.

MEMBER JAMES: Well, as I mentioned earlier, the point of this recommendation is really to try to get support
from the NOP to delve into this further. And we really also wanted to get public comment and insight. We didn't just want to come out with a guidance document that answered all these questions. We wanted to see how our different industry experts would answer the questions. So we have a broad spectrum.

I think one of the things that was in several of the responses in the public comment was concern about being too over regulated. So it's a fine line between making sure that we give guidance without being over prescriptive. So the next step would be if this passes then it would go to the NOP. The NOP could choose to answer the questions on their own, or they could send it back to the CACC and say, we would like you to create an actual guidance document that answers all these questions.

MEMBER HEINZE: How is that different than a discussion document? Is it that you want us to vote so that it goes to
the NOP to get a decision from them? Is that really what you are looking for?

MEMBER SMILLIE: Yes.

MEMBER HEINZE: Thank you.

CHAIRPERSON MOYER: Any other questions for Bea or Joe? Thank you, Bea, Joe.

The next document I want to draw attention - the next recommendation, to the title. The title is, solving the problem of mislabeled organic personal care products. And this deviates slightly from our usual titling, and there is a reason behind that, and I'll let Tracy explain.

SOLVING THE PROBLEM OF MISLABELED ORGANIC PERSONAL CARE PRODUCTS

MEMBER MIEDEMA: Good morning, everyone. Thanks, Joe.

Well, I'd like to start out by stating the purpose of our recommendation. We say the certification, accreditation and compliance committee recommends that organic
personal care products be recognized explicitly by the national organic program to ensure consumers and businesses alike that the products have an unquestioned home in a USDA national organic program.

This sounds pretty simple: we are trying to plant the flag within the program so that the program stakes claims and regulates products that carry the word, organic.

Seems pretty straightforward, and actually we are proposing quite a brief recommendation and insertion of language that would plant that flag in the regulation.

But it's a much more complicated issue than that, and I want to bring to light why this issue is contentious. First of all, FDA did not regulate the term, organic, as it applies to cosmetics, body care, personal care products. But they do regulate that class of products.

USDA regulates the term, organic, as it applies to agricultural products.
Now allow me for a moment here to brief you on the history over the last few years in 2005 on how NOP has tried to bridge that divide, and the divide I'm talking about is not having regulatory purview necessarily over this category of products, but needing to regulate the word organic.

So in 2005 NOP produced a memorandum - and by the way the three documents I'm going to refer to that came from USDA are from the NOP were never put through the federal rulemaking process. They were published online, and became a tacit rulebook. These are not part of 7 CFR 205. NOP can change their mind. But in 2005 the key aspect of this memo was that - and I'm going to quote again - NOP said there are agricultural products, including personal care products, that by virtue of their organic agricultural product content may meet the NOP standards and be labeled as 100 percent organic, quote organic, or may be made organic pursuant to
the NOP regulations.

Now what this did was it pulls personal care products that were being labeled organic out of sort of criminal status, and it leads into the world of being allowed to carry the label. And I use that term, criminal, pejoratively here. There was a lawsuit. The NOP needed to bring some clarity to the fact that hey, if you are producing an agricultural organic product that complies with 7 CFR 205, you are not going to get in trouble, ACAs, if you go ahead and certify that operation.

So we are going along, the industry is starting to develop. Now let me just branch off here and take you back to yesterday's conversation with a parallel industry that grew up where there was some limbo in regulation. And I'm going to refer to the animal welfare and to poultry specifically.

These poultry farmers were toeing the line as they knew it. The regulation
meanwhile was sort of silently developing in the background where we think things were really going to go someday. And the producers, and the folks investing in animal welfare for poultry, were continuing to invest their life savings, hire 35 people, build farms, toeing the line as they knew it. Nine years elapsed, and then we and the program were sort of coming to the fact that we needed to actually be explicit in what the rules are. Meanwhile where people thought they should be following the rule, and where the program and possibly the board thought we needed to be — the gap has grown. And we are where we are today with a great big gap between where some people are and where some people think the industry needs to be.

That gap is starting to form now in personal care products. So what I just referred to, the NOP memorandum stating that, go ahead and use the seal on organic personal care products so long as they meet 7 CFR 205,
that was a little over four years ago. 2008

so a little over a year ago a document showed
up on the web, on the NOP site, that expanded
the use of organic on personal care products
to be okay if you use a foreign certifier or
a private certifier. You can't say USDA
organic. You can't say the word, certified
organic. You can't use the seal. But you can
say the word, organic. Essentially the NOP
was saying, listen, we don't have a body of
regulations in this category. We don't really
have regulatory purview, because that is FDA's
stuff over there.

So private and foreign certifiers
for the time being are okay. Now we've had
another year of that gap widening. Products
being developed. Investment happening against
private and foreign certifiers.

Let's go to the consumers here
now, and ask ourselves honestly, do consumers
really parse the difference between organic
and organic? A moment ago we were asking the
question, do they know the difference between certified organic and organic. Well, when it came to personal care products, you may have two products side by side that both say organic. Because you don't have to use the seal. If you read the fine print, a certified organic product will list the name of the certifier. That might be the only different. So these products that appear side by side could have completely different you know secret decoder rings if you will behind what the word organic means on the product. Now this is no criticism of these businesses taking giant strides to create better, safer products for the marketplace. They are toeing the line. They are doing what the program says is okay, and they are doing wonderful things. It's just that these very businesses that are doing great things are at a tremendous risk right now. Because we don't know what the next guidance document could be. It could be, well, say, foreign and private certifications,
that is not working for us anymore. In fact
we are going to make a rule change. We're in
a limbo land that is not safe for business.

I haven't spent much time talking
about consumer confusion, mainly because it
feels like stating the obvious. When you walk
into a grocery aisle, and you see products
carrying the word, organic, and it doesn't
actually have a regulation behind it, this is
such a clear case of consumer confusion.

Hopefully that is really self-evident.

So what we are recommending is
simply that the NOP explicitly recognize these
personal care products in the regulation. And
to do that some definitions will need to be
added. So you would be talking about a real
rule change, and moving out of the realm of
web-based guidance documents published and to
real rulemaking.

There is precedence for these
different branches of government - not
branches, departments of government - to work
together. USDA has gained memorandums of understanding before, such as when we produced organic alcohol, under ATF. So also with livestock medicines as well. We have precedent for working with other departments. We know that's possible. We can bring that forward in this recommendation if folks need us to note that what we think NOP should do is gain an memorandum of understanding with FDA. That is kind of how they will need to make sausage. But we have heard some feedback that that would be a good thing to have in our recommendation that we don't have in there currently, kind of what the process is going to need to be for NOP.

But we feel that by inserting these definitions, we would bring clarity for consumers, if the word organic has a regulatory underpinning that is consistent every time it's used, and we would help businesses have a solid foundation to work from instead of the really shaky foundations
that is in place right now.

Any questions?

CHAIRPERSON MOYER: Thank you, Tracy. I have one comment that I will make as I look around the room for more questions. I wish Miles was here, because I think yesterday we saw his priority list, and this was not on his priority list. I believe as you clearly stated, Tracy, that consumer confusion could easily be the downfall of this industry. We heard Barbara Robinson say, we own the word. We've heard Kathleen Merrigan say, this is a food document, not a personal care document; we are not interested in going there. So we've heard both sides of the tale from the program. And I really think that we need to get on Miles' priority list, because it is extremely important. It's not a food issue; it's not a food item. But we got to get it there - that's my opinion. It's incredibly important because consumer confusion, as I said in my opening comments,
we are on a thin line here. We heard from
Katrina yesterday that the word, natural, is
gaining momentum, because people don't
understand what is happening in organic. And
as you put it, organic products that are
organic sitting on the shelf with products
that are not organic, and they say the same
things. And consumers don't understand that.
It's very scary. Just a comment, not
necessarily a question, Joe.

MEMBER SMILLIE: Yes, it's a very
complex issue. Let me be very clear about
that. And there are a lot of dangers. There
are downsides to the document too. For the
NOSB and anyone I would strongly recommend the
OTA white paper. They have pulled together a
lot of people. There are a lot of different
sources of information of how we can make the
organic regulation more personal care
friendly, and that is one of the downsides.
One of the downsides is that if we move
through this process and NOP does take - stand
up and take some kind of ownership of the word, organic, there will have to be some compromises down the road, and one of those I think one of the best routes to follow will be slowly petitioning for the addition of more synthetic materials on the list, which is the downside. Right? Everybody is oh, no, no, we are diluting the rule and you are adding more synthetics. But to make it more personal care friendly and enabling the industry to grow that will be one of the downsides; let me be very clear about that.

I personally believe that if we have a section rather than annotations but a section for personal care use only, and since some - that terrible word again - synthetics are added, I don't think that's a bad thing. I think that's a good thing. But some people don't.

The other direction, there are other possible directions we could go, I think that is the best direction to take: slow but
steady, bring it into the house, is part of it. Because I still go back, we have disagreements on this, but OFPA is about agricultural commodities. It's about agriculture. It's not about necessarily food. It's just as much about cotton and hemp, there's the Washington hempsters here, it's about cotton and hemp and it's about all agriculture commodities. And personal care products are based on agricultural commodities. It's not like these things are made in a vat which is chemicals. We can encourage the growth of organic agriculture by allowing personal care companies to support that organic growth, and they've got money. They have margins on these products. They can pay good prices for lavender and all of the things, aloe vera and all of the things that they need. So we would be behooving the growth of organic agriculture, which as far as I'm concerned is what we are about. So I think it's a step in the right direction to
bring personal care products into the house,
and again hopefully in our prioritization
meeting, Mr. Chair, with the NOP, which is
projected to happen, I think we can work with
them. So Tracy, the CACC recommendation is
the first step toward bringing this large
group of products and industry into the house,
and I think it's a step we need to take.

CHIEF PERSON MOYER: Dan, then
Katrina.

VICE CHAIRPERSON GIACOMINI: Yes,
either Joe or Tracy. Is there a reason why
you went the route in this document of
exclusively personal care versus following
theme of whatever document from the NOP was of
non-food use. Which would then include
linens, textiles, whatever.

MEMBER MIEDEMA: It was really
based on the depth of expertise on this
category that was available, and the fact that
NOP had issued guidance documents that were
starting to I guess get rolling. This was
developed and that has a discrete category
that we addressed it discretely.

MEMBER SMILLIE: Just to add to
that, like the soap, the recent NOP directive
on soap. That is you know, I don't know if
you are familiar with that document, but they
came out and asked some questions about how do
we classify soapmaking. You are right in the
wheel house right there of personal care.
Specifically.

MEMBER MIEDEMA: And I'll add one
thing. It's really not fair to the folks who
are producing cleaning products and want us or
others, want the NOP to weigh in on their
organic products. We're just not there yet.

CHAIRPERSON MOYER: Katrina.

MEMBER HEINZE: When I look at
public comment, we had kind of a split in the
public comment. There were a number of folks
who either didn't support the document or
asked that it be deferred or withdrawn. Could
you kind of summarize why people are against?
MEMBER MIEDEMA: Excellent question, Katrina, I apologize for not shedding light on some of that. Okay, a lot of the comments referred to what they believe an outcome would be of planting this flag and the regulation. And for those companies who are using synthetics that are not right now allowed, and they are not on the national list anywhere, there would be reformulation - yes, if what happened is that there was a swift rulemaking, and no - and no allowances made for this class of products to develop with a list of synthetics. Now there's a precedent for category-specific synthetics. We made that recommendation anyhow with pet food.

And there are some things that we carved out and want to allow in organic pet food that we are not saying that we want to start entering the stream of organic human food. So we knew there was a precedent for that. That is probably the biggest problem people have with it is the disruption of
business. Folks have started really
developing this category. They've had four or
five years, and they have invested a lot of
money, and it feels like getting cut off at
the knees. And we empathize, and that's what
I try to bring forward is that planting this
flag in the regulation helps rebuild a solid
foundation or build one where there isn't one.

A couple of other issues that were
brought up: equivalency in the future, again
if we were to have a separate list of
synthetics that got built into 7 CFR 205, the
EU carves off its personal care, organic
personal care products into a little bit
different regulation, as a stand alone. So
would we have an equivalency issues. That's
another problem.

The fact that we've got this
problem with oversight by USDA, what business
does USDA have getting into personal care
products. That's not what they do. They
don't have the chemists. They don't have the
expertise. They don't understand esterfication, saponification, all these chemical processes that are necessary to create all these products, and they should just stay out, stick to their knitting, and let FDA have it later on as appropriate.

And there was also just sort of, this is happening too fast. Give it time.

Okay we are starting the discussion here, but let's kind of see where this goes. Let's not be too hasty. I think those were the main arguments.

CHAIRPERSON MOYER: Katrina,

follow up?

MEMBER HEINZE: So as a consumer who has tried to make decisions in this aisle, it is perplexing. Thank goodness I know the regulation, right. So I am very sympathetic with the impact that that consumer confusion has for us.

Did you consider - so it seems like the purpose of your recommendation is to
try to move this up on the priority list for
NOP, get some action out of them. Did you
consider an alternate option of asking them to
come back in the spring and tell us what they
are going to do about this, rather than
passing this recommendation? Was that a
different option?

MEMBER MIEDEMA: We are
essentially doing what you just asked by
making this recommendation and saying, we
recommend that you claim this category in
which your word and your seal appears on, we
are asking that question. And when we do this
sort of thing, NOP can still tell us to take
a hike, and they can still do nothing. There
are all kinds of paths that could go forward,
but we wanted to make a clear statement that
is it not sustainable where it's at, and I
think that is one thing we can all agree on
that we are on a path right now that doesn't
have - it's not headed in the right direction.

CHAIRPERSON MOYER: Exactly, we
I have a program decision that needs to be made.

I have Julie and then Kevin and Bea.

SECRETARY WEISMAN: Yes, I just wanted to - I think that the path that we are headed down is the issue, and the risk of losing what we have now. And the ownership of the term, organic, I won't take up more time. I just walked down what is that over there, you walk to Whole Foods, I pass at least two dry cleaners that say organic dry cleaning. Now I am not recommending that the USDA try and encompass that in the regulation, although it is problematic. I know lawyers who recommend that a suit be filed, but the fact that that happens - the fact that that happens is why - sorry, I'm a little slow - the fact that that happens is why Tina's point - I forget if it was Tina or Katrina - about the word, natural, starting to have more meaning for consumers even though it is completely unregulated. That is a problem.

CHAIRPERSON MOYER: Thank you,
Julie. I have Kevin.

MEMBER ENGELBERT: Yes, two things. One, I like the recommendation. I like your analogy of the first step and that we are trying to protect organic. I am obviously concerned, Joe, about your approach, what will happen with putting more synthetics on, and that to me is not - is - would be a wrong turn, but I'll be long gone by the time those decisions are made, so there is no point belaboring it right now.

But the one question I do have, I'd be very interested to know under your definitions why you chose the word, under one, an article intended to be rubbed. Why you settled on article. There must be a reason why it's not substance or material. It is just curious.

MEMBER MIEDEMA: To the degree possible we really tied to FDA definitions, so that when memorandum of understanding time came around we didn't have as big a bridge to
MEMBER ENGELBERT: There must be a reason, but I just wondered what it was.

CHAIRPERSON MOYER: Let's save the humor for 4:00 o'clock when we need it. I think that is an excellent point though. I think tying this to FDA and recognizing that we are going to have to partner with FDA whatever the program decides to do is extremely important.

MEMBER SMILLIE: One of the people that was supposed to speak yesterday and I can't pronounce her name, Farah from the personal care counsel, her submission is on the record, and I really recommend everyone to read it, because she represents that industry, the trade association for personal care industry. And her comments were very pointed. Stay out of our industry.

And I think we should take that comment. I was disappointed that she wasn't here to give the oral presentation. Oh, she
is here today? Wonderful. Well, perhaps you can re-up and get back on the list, because we do want to understand where your industry is coming from on this issue. Thanks.

CHAIRPERSON MOYER: Okay, the chair recognizes Bea.

MEMBER JAMES: I just wanted to kind of add to the discussion by saying from the retailer perspective that consumers are looking for preventative solutions, and organic and natural foods have kind of created this natural progression of people who want healthy choices for prevention, and they oftentimes migrate outside of the food area into the HBC department for those concentrated added you know Nutriceutical solutions for being healthy. And the FDA I think that their roots in cosmetics and personal care really lean more towards the conventional side of things, and that over the years the natural industry has just started - has tried to develop these better than products that are
very similar to everything else that sold in a natural food store. So to not have the USDA recognize that this is an area that consumers are wanting an alternative to what has traditionally been seen as a conventional type of product that is regulated by FDA, wanting to move it towards, I'll say, not always but food for the skin, and if it ends up having synthetics to create more of that healthy alternative, that that provides a solution for that consumer that we are trying to help make regulations for, and to ignore personal care could be a misstep on our part, because if you go to any natural food store that is I'll say Whole Foods, their HBC department is huge, and it's well staffed, and it's obviously a stake in the ground that these consumers are looking for these types of choices, so that we should be involved and help make sure that we can provide them with those alternatives.

CHAIRPERSON MOYER: I agree, Bea. I mean I think that we are - this whole
process is a logical conclusion of our own success. So it's - that's what's driving us. And certainly it is going to require some training of FDA folks just like we're doing with EPA or like we're doing with science and tech and trying to get them to understand what are the expectations of our consuming public so that we can drive that train in education.

Any other questions for Bea or Joe? Thank you, Mr. Chairman, and your team, for great work on some difficult topics.

Moving right along we will move to the Materials Committee. Dan Giacomini, chairperson. Dan.

MATERIALS COMMITTEE

VICE CHAIRPERSON GIACOMINI:

Thank you, Mr. Chairman.

The materials committee has one document for consideration at this meeting regarding nanotechnology.

There was a significant amount of - well, let me go back. The - as a follow up
to our discussion document, at the main
meeting this document was presented, written
as a prohibition of the products of
nanotechnology in organic production and
handling. We also wrote the document to
include packaging which some commenters and
some people feel may be outside of our
jurisdiction. The reason that we included
that is because of the extremely high
possibility that this - products of this
technology through general packaging of what
we have in normal processed food and materials
is a potential source of contamination of the
product.

But we include packaging on there,
and we are very comfortable, most of the
committee is very comfortable that we have
that right to make that point.

Public comment was fairly
significant from Organic Consumers
Association, the Center for Food Safety, and
Friends of the Earth. It was impossible to be
absolutely in counting them all; it would have taken all the time that I took in reviewing the materials, and it would have been even further impossible to check for any possible overlaps. But the Organic Consumers Association, a compilation of letters which were I'm estimating were somewhere in the number around 1,500 of specific fairly detailed in some cases. I'm sure it may have started with a boilerplate, but they were in some cases they were fairly elaborate in their comments.

Also a spreadsheet database of 6,817 I believe names of people opposing - supporting the document, opposing nanotechnology in organic production. Center for Food Safety submitted somewhere around 9,000 public comments supporting the recommendation. And Friends of the Earth also supported that. I'm certainly not avoiding anyone else here.
OCA had a further one of 4,800;
that was including a number of different
issues not specifically limited to
nanotechnology.

There were comments from
certifiers, which the majority of them
supported the document. There were some that
supported the minority recommendation. There
were a fair amount of commenters that
suggested that we increased the number, the
size limits in the definition to 300, and
there was some concern in those opposing the
documents, the majority of the opposition was
a concern not to get in the same situation
we're in right now in dealing with vaccines on
the GMO issue.

That the track taken by the
minority opinion was a safer track in that
regard.

But overall the majority of public
comment supported for the most part the
opposition of nanotechnology in organic
productions and handling. We realized that from particularly from public comment that there are some questions over the definitions, and we are trying to decide within committee, and we would be open to any comments from the rest of the board regarding modification of that definition.

The main statement as I said regarding packaging was a concern over contamination. While some people would like the organic industry to save the world and the planet, our concern was not necessarily regarding the bag that people carry home their products from the store in, nor was it a piece of paper that is stapled to a palette that you transport material. We even had a box up here, a little four-pack that someone used to bring coffee in this morning. We didn't write this as a concern for that box, but as a concern more for the cup that the coffee was actually in.

And we are looking at the
possibility of adding language to clarify that point.

The - again the two tracks between the majority opinion and the minority opinion is whether we stay with a complete prohibition or we go through a track of classifying all products of nanotechnology with a very specific definition as synthetic and allowing them to proceed through the case by case review process to eliminate the situation we have with the GMO vaccines.

So with that I'd like to open debate from the rest of the board.

CHAIRPERSON MOYER: Discussion from the board. I have Barry and then Steve and then Joe.

MEMBER FLAMM: Dan, my question involves the comments regarding the size of the nanoparticles. I think that's what struck me the most in going through the comments that were supporting the recommendation. What do you and the committee think about increasing
the size range to 300?

VICE CHAIRPERSON GIACOMINI: We have not had a chance to deal with the real specifics, but I don't think there would be a tremendous objection to that.

CHAIRPERSON MOYER: Steve.

MEMBER DeMURI: Barry touched on something I was going to, but I have another comment too. You answered my question, I had a question on packaging, Dan, in this document. I'm glad to hear that you are not considering RFID tags stuck to a palette to be a problem. So to fix that you can probably just insert the word, primary, in front of packaging where you have it listed, and that should take care of that.

CHAIRPERSON MOYER: Good suggestion.

VICE CHAIRPERSON GIACOMINI: Thank you. Also going back to we were aware of - going back to the size issue, we were aware of the possibility and I think - I think
it's reasonable to say that I have studied this issue and the more we study - the more this issue is studied and researched, the larger particles we will find that carry these characteristics. I would not be surprised in the years ahead that we get at least into the 500 range of size items. That is why when we did this definition we included the word, typically, in the size scale of approximately to allow for a certain amount of wiggle and wobble. So it gives us a good idea, but without absolutely nailing this to the wall.

CHAIRPERSON MOYER: Anything else, Steve?

Chair recognizes Joe.

MEMBER SMILLIE: Steve made the exact point I was going to make.

CHAIRPERSON MOYER: Thank you, Joe.

Chair recognizes Rigo.

MEMBER DELGADO: Yes, Dan, I
think in your terms you define it, you talk
about the intent of nanotechnology. However
in the minority opinion it appears that the
intent of the committee was to include or
prohibit naturally occurring nanoparticles
that come from milk and grain mill and so
forth. Is that the case, or am I failing to
see something here?

VICE CHAIRPERSON GIACOMINI: I
would say that intent is - intent is only as
good as the words in the final result. I
think intent is great, but if it's not what
the regulation says, the regulation is what's
the regulation and not the intent. The intent
of the committee was to not include those.
It's the feeling I believe, and that person
can address that, that we did not
satisfactorily eliminate those substances.
That's part of the situation of
dealing with the definition. To a large
extent the nanotechnology research community
itself seems to be having - just struggling
with the definition. A majority of the committee was concerned that the longer we wait for them to decide on what their definition of nanotechnology really is, as they say the horse is farther and farther out of the barn. We have more situations like we have with animal welfare and poultry where you can't change us now as oppose to the deputy administrator telling us a few years ago that if we didn't include animal welfare in OFPA, but now is the time to add it.

So we have those problem - timeline problems that are always going to exist. The majority of the committee felt that we wanted to be as out in front of this as we possibly could, but no, homogenization in milk, grinding of flour, were not the substances that we were looking to include, and we tried as well as we could to not include them. Maybe we were not as successful as we should have been.

CHAIRPERSON MOYER: The chair
recognizes Julie.

SECRETARY WEISMAN: Well, that's actually a good lead in for my question. And it's again going back to the definition. I recall that there was a lot of comment yesterday, and you've already spoken to that a little bit, about objection to the definition being that specific, you know, one to 100 nanomicrons as the particle size. And I think that I remember a thread that covered a lot of different comments. I can't say for sure that it was the majority, but it seems to be a consistent theme to me that the definition suggesting that the definition be not so much focused on particle size, because - that it should be focusing more on engineering to a particular particle size to achieve a certain function, something like that, and so I guess my question is, is this recommendation, are we thinking of crafting some alternative language for the definition?

VICE CHAIRPERSON GIACOMINI: Most
of the definitions of nanotechnology that I have seen actually lead with the size issue. We did somewhat in an attempt to deflate that emphasis by putting it at the end, and trying to start with the engineering and the intended use.

We did receive after our request from one of the commenters yesterday, and alternative definition. Is it okay if I read this? Product engineered to be in the nanoscale because of specific unique properties that result only in that nanoscale. I don't know where that would sit with all those other official public, I forget what the agencies were that we could look up. But I like this simply because it's so far out of the box. Which is where I like to start thinking from.

CHAIRPERSON MOYER: Chair recognizes Hugh.

MEMBER KARREMAN: Kind of outside of that box, but you are talking RFID on some
things, right? There is our RFID tags that are put in cattle, correct? Is this part of that or just a totally different question? Is that nanotechnology? I don't know, I heard RFID.

VICE CHAIRPERSON GIACOMINI: Good question.

CHAIRPERSON MOYER: Not a good answer, I guess.

(Laughter.)

CHAIRPERSON MOYER: No, no, it's difficult. I was just being a smart ass.

VICE CHAIRPERSON GIACOMINI: That's on the record.

(Laughter.)

CHAIRPERSON MOYER: It's the truth.

VICE CHAIRPERSON GIACOMINI: So if this recommendation were passed the way it is, and that is a nanotechnology, it wouldn't be allowed except in situations where it's required by law. If that is part of the
animal ID issue, the debate of whether that is
going to be required or not is still under
discussion.

CHAIRPERSON MOYER: Julie has a
clarification on the RFID.

SECRETARY WEISMAN: Yes, I just
want to clarify that not all RFID is
nanotechnology. That is a very new
development, and I doubt very seriously
whether the RFID that's being used on herds
now is that. But it could happen, and that's
why we have to have a discussion.

CHAIRPERSON MOYER: The board
recognizes Katrina.

MEMBER HEINZE: Kevin, I yield to
you if your comment is about size. Okay. I
did not vote for this recommendation, and
drafted the minority opinion, and I wanted to
explain that a little bit, and maybe expand on
that after all the public comment we've heard.

It is clear to me, and I do not
disagree, that our stakeholders do not today
I want nanotech in the organic foods that they are purchasing. My concern with the recommendation was not that we prohibit that use today but how we do it.

What I worry about is that we create a situation where organic is known as no-nanotechnology forever, and that in the future, because science evolves, and science is not bad; good things come from science, lots of good things. Like laptops, that we all have sitting here that we all adjust to, right? And science can develop things that are good for the earth, that help with the safety, deliver features that consumers desire in their products. And I don't want to create a situation where in the future those advantages are not available to our organic consumers.

So clearly we don't know enough about the science today, and we should prohibit the use of nanotechnology today while we better understand the science. But I want
to create a situation where in the future this board is not seen as weakening the standards because all of a sudden we are letting nanotechnology, that evil thing that we excluded, into organic. The way we are talking this week about GMO vaccines. We've branded GMO as evil forever, and now we are putting our farmers in a bind. And it's a tough decision, and I want to avoid that in the future, because we don't know what's going to evolve.

So that was my original concern.

So what I proposed as an alternative is that we say all nanotech is synthetic, because it's synthetic, it is prohibited unless this board in whom I have great faith, reviews it, understands the science, understands the benefits and the risks, and approves it.

So the effect would be the same.

It would be prohibited, but it creates a path forward for flexibility. So that was my minority opinion.
I will say after having heard all the discussion this week I am more concerned about the definition than I was when I started. I had concerns originally about how these natural processes would be included, but I kind of thought we could work through that. But having heard all the discussion, I do think that the committee needs to spend some time, and hopefully in the next day and a half, coming up with the definition that more closely matches internationally recognized standards.

CHAIRPERSON MOYER: Thank you, Katrina.

Chair recognizes Kevin.

MEMBER ENGELBERT: Yes, I was going to respond to Julie, but since she is gone I will postpone that and respond a little bit to Katrina and what the majority of the board had the opinion we did.

Like you said it's obvious the public does not nanotechnology in organics.
They want an alternative. Leave nanotechnology to conventional food and agricultural production. By a strict ban in the future that could be overturned, but it will be harder to do than if it's just simply looked at - if nanotechnology is simply looked at as a synthetic.

So either way we are banning it, but I am in favor of the approach that is a stricter ban that makes it harder for it ever to come in, because I don't believe that humans will ever be able to know exactly - or as much as they think they do about these nanoparticles, and how they will interact with other nanoparticles and other chemicals in all these different types of situations.

So that's the reason that at least I myself was more in favor of it, and still abide by that line.

And to address Julie's point about homogenization in flour, we don't believe we excluded those methods right now, because it's
simply part of the process. It's already been
acknowledged and going on. If you were to
take the nanoparticles that were created by
milling, separate them out and try to apply
them to something else, or the few
nanoparticles of fat that become available by
homogenizing, it's something separate, then we
think you are crossing the line. But just
simply those processes right now we don't
think crosses it. We do have to work on the
definition and we will, but that was our
logic; that's where we were coming from with
our recommendation.

CHAIRPERSON MOYER: I had myself
on the list to comment and follow up on what
Kevin was saying, then I'll turn it over to
Katrina.

I agree with what Kevin was
saying, and if you look at the science of
genetic engineering or cloning, clearly there
are probably some things that could be
considered positive in the future. By
eliminating them as we did, as a total process, we have removed from the discussion 99.9 percent of the conversation. Yes, we are discussing it in the context of vaccines, but we are not discussing it in the context of seed or animals in the system.

I think the same thing would clearly happen here, if we discussed the issues on the periphery that affect packaging, or that affect animal tracking, or some of the other tools, we certainly discuss that, but we would not be needing to discuss every point of process that comes along because it's an excluded method. Does that make sense to you, and I'll turn it back to you.

MEMBER HEINZE: It does; I just don't agree with it. I think either way it's going to come to the board. And I think it's clear that the hurdle for a nanotech synthetic to be approved by the board is remarkably high. So I don't think we are going to be reviewing every XYZ nanotech because I think
people know: our consumers don't want it. So it would have to be something that was incredibly compelling for it even to come before the board. So I just think that creates a path that allows us to educate our consumers and engage them in the process.

With regard to your comment, Kevin, about what we intended to do, I know in committee discussion we did not intend to exclude the naturally occurring particles, I just don't think our recommendation does that. If you look at the definition, there are lots of different examples. The favorite one, and I'm sorry this is from conventional, but it could be from organic as well, is Edy's Slow Churned Ice Cream. If anyone has had this, it's 50 percent plus fat standard ice cream. It is created with a perfectly nice process, a slow cooled process that's churned. It creates very much smaller particle size than normal churned ice cream, so it feels in the mouth like a high fat product, even though it
doesn't have the fat. That is, it's engineered to create a different function, and it's what consumers want.

And by the way consumers should be eating less fat and that's a great way to deliver that. And our definition would in my mind clearly capture that. So I just think we have to be very careful of the definition.

CHAIRPERSON MOYER: Thank you, Katrina. I certainly agree that we have to clarify that definition. I guess going back to my previous comment, I think one of the fears that I have, as we look at nanotechnology, because it is so complex, and inherent in some processes, we could end up in a situation unlike we do with GE where it would be a don't-tell-if-they-don't-ask. It could be very difficult to determine whether or not the process involved in producing a particular product involved nanotechnology.

If they don't have to put it on a label, it's not going to be labeled, so how do
you know if it's even in there as a process?
Let me get Tracy, and then you may comment on both of those. Tracy.

MEMBER MIEDEMA: Just quickly to connect the dots to the recommendation we are talking about earlier, on personal care products, this is one of the categories where there is some well developed use of engineered nanoparticles, in products like sunscreen and as long as we allow organic to be used with other certifications, schemas, we're potentially allowing nanoparticles in that category of organic products.

CHAIRPERSON MOYER: Very good point, Tracy. Thank you.

Katrina.

MEMBER HEINZE: To your point, I think our certifiers are pretty good. They have to look at the formula for every product, and that is true across the board. I think they are going to know.

CHAIRPERSON MOYER: Good thank
you. Joe.

MEMBER SMILLIE: Formulas and process we look at.

CHAIRPERSON MOYER: Thank you, Joe.

Any further discussion on this particular item? I think we all had an opportunity to get our opinion out there. There was a lot of discussion, good points.

Thank you Dan. Does that complete your report?

VICE CHAIRPERSON GIACOMINI: That completes the report from the Materials Committee.

CHAIRPERSON MOYER: Thank you very much.

At this point in time I would like to take an adjournment, a bit of a break here. We will take 15 minutes and be back here - well, we'll start promptly at 10:00. Thank you.

(Whereupon, at 9:43 a.m., the
above-entitled matter went off the record and resumed at 10:03 a.m.)

CHAIRPERSON MOYER: Okay, next order of business is to move on to the Crops Committee, Tina Ellor, chairperson. Tina, if you are ready.

CROPS COMMITTEE

MEMBER ELLOR: Thank you, Jeff. The first thing we have on the agenda is manganese sulfate monohydrate, and we decided unanimously as a committee that this is already on the list under - unfortunately we didn't put the proper identification in there. A plant or soil amendment, sulfate, carbonates, oxides or silicates of zinc, copper, iron, manganese, molybdenum, selenium and cobalt; it does not specify the form. And looking it up on the Internet and doing more research they are used interchangeably. So that one is fairly simple. Any questions?

CHAIRPERSON MOYER: Chair
1 recognizes Julie.

SECRETARY WEISMAN: Which one are

2 we talking about? The manganese?

MEMBER ELLOR: Manganese sulfate

3 monohydrate.

SECRETARY WEISMAN: Okay.

4 CHAIRPERSON MOYER: Any other

5 questions for Tina?

Tina, your next item? Oh, I'm

6 sorry, I apologize, Katrina.

MEMBER HEINZE: Sorry. Any

7 public comment?

MEMBER ELLOR: We did have I

8 think one public comment saying that the CAS

9 number is different. But since it doesn't

10 specify a CAS number in the body of the rule,

11 and they are used interchangeably.

12 CHAIRPERSON MOYER: Any further

13 questions for Tina?

Tina, next item, please.

15 MEMBER ELLOR: The next one is a

16 much more complicated one, and one that we
discussed a lot. A little history behind this, and I'm really sorry Gerry is not here because he did so much research and work on this. And there was one point that we were all a little bit unsure of how he had arrived at that number. But we accepted that he had done a lot of research and arrived at this 5 percent number.

We had a lot of public comment on this. And what I want people to understand is that the petition was to expand the uses of peracetic acid and remove all the annotations, so it would be allowed in any application in organic agriculture applied to the soil. We want to keep peracetic acid as a part of hydrogen peroxide formulations, and the two don't exist without the other. And I think where he came up with the 5 percent formulation as opposed to the - and what happened is that peracetic acid was classified as an inert in hydrogen peroxide formulations. That classification changed. We didn't want
to lose the hydrogen peroxide formulations,
but we didn't feel comfortable expanding the
use of peracetic acid throughout all organic
agriculture. It's a strong oxidizer, and I
think the whole committee really didn't buy
that you could just kill the bad things and
leave the good things alone. We thought it
had a pretty big impact on soil ecology.

So I think where the 5 percent
came from is that he somehow ascertained
talking to people in the industry.
Unfortunately I tried to get hold of him, and
I couldn't, who he talked to or where he got
that number, that that was the most common
formulation in hydrogen peroxide was 5 percent
peracetic acid.

If it's not on the label as an
active, which I guess from now on it will have
to be, then you can see how much peracetic
acid there is in any formulation and do a
calculation to 200 parts per million. I'm not
sure, and hopefully we will hear more public
comment about that later, what might be a good solution for that issue.

So the first document that we have on the table is directly to the petition to expand the use of peracetic acid, going to the checklist, we filled in three categories - impact on the environment, essential unavailability criteria, compatibility and consistency, and the comment is, criteria failures all based on the prospect of expanding use of the material to unrestricted crop disease control. It would still be available for fire blight as part of hydrogen peroxide formulation. See attached companion recommendation for peracetic acid in hydrogen peroxide formulations.

So this first document, the motion was to remove the annotation from the listing for peracetic acid on national list 20.061(a)(6), and 205.601(I)(7). We voted as a committee, yes, zero, six no.

And moving on to the next
recommendation, which was our - what we came up to keep peracetic acid so that we could keep hydrogen peroxide. This is peracetic acid annotation change, and our comments on this were the material fails criteria based on the prospect of expanding use of the material to unrestricted crop disease control. And then we reference category one, six, and category three, number two and three. The EPA has changed its regulation whereby small concentrations of peracetic acid formally allowed as an inert ingredient in hydrogen peroxide formulations must now be designated as part of the active ingredients. The Crops Committee does not wish to jeopardize the availability of hydrogen peroxide formulations currently used by many growers - it is very commonly used, and people do want to keep it - knowing that these formulations all contain small formally allowed as inert concentrations of peracetic acid.

The Crops Committee recommendation
pertains to allowing peracetic acid in hydrogen peroxide formulations limited to no more than 5 percent. And where he came up with the 5 percent was from industry people that he talked to that he said that was the most common formulation, to keep these hydrogen peroxide formulations available to growers or users.

So the motion is to amend the annotation from the listing for peracetic acid from the national list, 205.601(a)(6) and 205.601(I)(7), to add to the words in each section, permitted in hydrogen peroxide formulations at concentrations no more than 5 percent. And once again, the committee vote was unanimous to accept these annotations.

And I'm not sure if I've articulated that clearly, and we had many public comments on this, sort of objecting to the 5 percent formulation rule, but that is a 5 percent of the hydrogen peroxide formulation. And I think what our concern is
if we make it 200 parts per million peracetic acid in a hydrogen peroxide formulation that is going to be hard to do, as an end user. And that was I think the rationale behind that.

We had I think that I know, and you can correct me if I'm wrong, we read through all the comments very carefully. One comment that would - and I think it was from PCO - that would like to see the usage expanded on this. Otherwise we didn't really hear any comments asking us to expand the usage on peracetic acid.

The petitioner made a point that had we anticipated that this could have been used again late blight, which was a real problem in the northeast. So we might want to consider that as well.

So if you have questions, and I'm going to ask, since Gerry really was the point man on this but we all talked about it a lot, that the rest of the Crops Committee jump in
and answer these questions too.

Thank you.

VICE CHAIRPERSON GIOACOMINI: A couple of points. First of all, what is the basis for the difference answers in your evaluation criteria in the two formats?

MEMBER ELLOR: Based on the - the petition was to expand the usage. The annotation is to keep the uses that we have already in hydrogen formulations. So I think that is what we were - what the --

VICE CHAIRPERSON GIOACOMINI: So the things we are looking at then use the use of a 5 percent product at unlimited limitations for a single problem, versus what was it, 200 parts per million application rate at a wide use. Is that essentially it?

MEMBER ELLOR: Essentially we as a committee did not want to see the usage expanded to cover the - you know it would be
an option I guess to allow expanded usage and limit the concentration. But still at 200 parts per million it's a very broad sanitizer fungicide bug killer. So 200 parts per million in the soil would have quite a big impact. It's not allowed - in hydrogen peroxide formulations it's not allowed for that use as it stands now.

VICE CHAIRPERSON GIOACOMINI:

When the TAP report was done on this, was it a general review of peracetic acid for crops, or was it limited to the petitioned use at that time?

MEMBER ELLOR: It was limited to the petitioned use at that time.

VICE CHAIRPERSON GIOACOMINI: We don't have a new TR for expanded use.

MEMBER ELLOR: Right. The original TAP was very very thorough. It is one of our good examples of really great TAP reviews, but it was only for use on fire blight and sanitizing equipment and any other
uses that are in the rule now.

CHAIRPERSON MOYER: The chair recognizes Joe.

MEMBER SMILLIE: Conventional use, is it used in say late blight conventionally? Is it licensed for use conventionally?

MEMBER ELLOR: That we would have to ask the petitioner. I do not know.

MEMBER SMILLIE: Could we do that?

MEMBER ELLOR: Yes. Is anyone from BioSafe here?

CHAIRPERSON MOYER: If someone from the petitioner is present in the room and wants to come forward and address that answer, we would agree to entertain it.

Please introduce yourself.

MS. KNOX: Kristin Knox with BioSafe systems. Yes, our labels do include late blight among many other - it's a broad spectrum, algacide fungicide bactericide, but
not an insecticide.

CHAIRPERSON MOYER: Thank you very much. Appreciate that.

Any other questions from board members? Katrina?

MEMBER HEINZE: Could you help me better understand the committee's concern with changing the concentration annotation?

MEMBER ELLOR: We were actually adding a limitation on the concentration. Otherwise, what our fear was, and I think Jeff might be able to articulate this better, is that we would end up with a 95 percent peracetic acid and 5 percent hydrogen peroxide – I don't even know if it's possible that it would happen in nature. So that it wouldn't be coming at it from the side, I suppose.

CHAIRPERSON MOYER: Katrina.

MEMBER HEINZE: I didn't ask my question properly, I'm sorry. So I get why you made the recommendation to add an annotation for concentration. But we heard
public comment that that annotation was not clear. And so - but what I heard when you talked was that the committee is not sure about whether they should react to the public comment or not. So I'm trying to understand that piece better.

MEMBER ELLOR: Okay. We always try to react to public comment, or at least take it in. And unfortunately Gerry did the research on this. And I think what his concern was is that since this was considered an inert in hydrogen peroxide formulations, how is the end user going to figure out, if they are working off peroxide concentrations, are they going to be able to figure out what the peracetic acid parts per million is.

So if we are limiting it to 5 peracetic acid within a hydrogen peroxide formulation, then asking for parts per million of the peracetic acid seems like it would be a difficult thing to do. That was the thinking, and that kind of makes sense to me.
And if I'm not articulating it so it makes sense to everybody then I'll have to say it a different way or have Jeff try it.

CHAIRPERSON MOYER: Any other questions? Dan.

VICE CHAIRPERSON GIOACOMINI: The 5 percent is essentially the concentration rate of the marketed product, the packaged product, correct?

MEMBER ELLOR: Yes.

VICE CHAIRPERSON GIOACOMINI: So if - and then it's diluted into an irrigation system; correct?

MEMBER ELLOR: As a sanitizer, it can be. But it's based on the hydrogen peroxide concentration, not the peracetic acid concentration. The two don't really exist one without the other. We don't want to lose hydrogen peroxide, but we didn't --

VICE CHAIRPERSON GIOACOMINI: If we are using it in the crop situation, on the fire blight type of thing, that's in the water
CHAIRPERSON MOYER: It could be, but not necessarily.

VICE CHAIRPERSON GIOACOMINI:
Okay. I'm just wondering if it's diluted out on application why are we tying the producers' hands at what package he can buy, what form he has to buy the packaging. I don't understand it.

MEMBER ELLOR: It's mostly because this was considered an inert; it's classification was changed. The way it's being used in the industry now is that part of hydrogen peroxide formulation is at 5 percent, so they would be using the same packaging they used all along.

VICE CHAIRPERSON GIOACOMINI:
Less than 12 percent packaging as an inert?

CHAIRPERSON MOYER: No, because the goal was not to have the peracetic acid be the main ingredient. It was just an inert. It was for hydrogen peroxide, in order to have
hydrogen peroxide function you have to have a minimal amount of peracetic acid, and 5 percent seems to be what really makes that work in the industry. Does that make sense? I'm probably not explaining it well either.

VICE CHAIRPERSON GIOACOMINI:

Application is what makes sense to me, and I don't understand why if we are dealing with - if we are concerned with application of how much is used in the environment on the plant that we are trying the hands of the producer of what form of a package he buys.

CHAIRPERSON MOYER: What we are trying to do, Dan, is to basically maintain the status quo. We have to make a change and an adjustment because the rules have changed. It is no longer viewed as an inert. So what we are trying to do is to protect hydrogen peroxide, the way it's being used in the industry today, and thus protect peracetic acid the way it's being used in the industry today but not to expand the use. So that you
would not be able to create a formulation, as Tina said, that was predominantly geared to using peracetic acid instead of the hydrogen peroxide. Does that make sense?

MEMBER HEINZE: Okay, so what I heard was that the concern was that the end user - if they limit the concentration to 200 parts per million at end use, the concern by the committee is that the end user isn't going to know if they're in compliance with that or not, because the amount of peracetic acid is not listed on the package. Did I hear that properly?

CHAIRPERSON MOYER: I believe that is part of it, yes.

MEMBER ELLOR: And since it's been reclassified as an active, I imagine what it's going to be now is probably two active ingredients. So I suppose that active ingredient now could go to - and this is in the tab - the proportion of active ingredient to now active ingredient could change. It
could be a whole lot more peracetic acid. We are not comfortable with that. So that's why we - we are trying to maintain the status quo to say it's 5 percent peracetic acid, which is now an active ingredient. But it could come in a package that's 50-50. Then do you base your application rate on the hydrogen peroxide active ingredient, or the peracetic acid active ingredient. And I don't really - I think that causes much more confusion, anyway, depending on what you are doing.

CHAIRPERSON MOYER: Follow up, Katrina?

MEMBER HEINZE: No.

CHAIRPERSON MOYER: Okay, thank you.

The chair recognizes Barry.

MEMBER FLAMM: I'm probably saying the same thing over again. But the focus was we didn't want to expand the use of peracetic acid. And it came to our attention then that peracetic acid was this component of
hydrogen peroxide which we wanted to continue
to use. So simply the second part of the
recommendation was to allow the continued use
of hydrogen peroxide, but the focus was not to
expand the peracetic acid use. I'm repeating
what's been said in a different way.

CHAIRPERSON MOYER: Thank you,

Barry.

Any other different discussions?

Chair recognizes Julie.

SECRETARY WEISMAN: I just wanted
to make sure of my understanding that these
were actually - either you are for one or the
other of these - no, they go together? Okay,
they are a package deal. Okay.

CHAIRPERSON MOYER: For those who
couldn't see or hear may head nodding, yes,
you are correct, Julie. They are to be a
package deal.

MEMBER HEINZE: I'm sorry, I'm
getting confused again. So are they a
package deal? So the first one expands the
use. So if I thought the use should be expanded, I should vote yes for that, and if I didn't I would vote no. And the second has to deal with hydrogen peroxide concentrations. So I don't have to vote yes for both or no for both; I can make independent decisions, right? They're solving different problems.

CHAIRPERSON MOYER: I'll let the chairperson answer that one.

MEMBER ELLOR: You could, but if you voted no on the first one and no on the second one, we would lose hydrogen peroxide as a tool. That's why they go together.

CHAIRPERSON MOYER: Thank you, everybody.

Tina, back to you.

MEMBER ELLOR: Next on the list is hydrogen chloride for delinting cotton seed. I'm going to turn this one over to Rigo.

MEMBER DELGADO: Thank you, Madam Chair.
We are talking about a sunset product. It's used for delinting. It was first linted in 205.601 (n) back in April 2004, and last what was it a year ago we started receiving public input, a lot of public input especially from the area of Texas, supporting the relisting of this product.

Being that it sunset, our approach was very simple. We just wanted to know two things: one, are there any - is there any new information that tells the committee that this product is too dangerous that it should not be used any longer; and the second point was are there any other technologies or products that could replace this hydrogen chloride.

And we did our homework as follows. We consulted several experts in the university areas, as well as current users of delinting plants, and found that there basically are no alternatives, both mechanical and chemical, that can replace this product,
and the actual use of this HCl is actually a better substitute for what industry is using. They're currently using sulfuric acid. So the committee at that point felt that it was - that we had enough information to recommend relisting this product. It coincides with numerous suggestions that we got from the public input.

The vote was as follows: six in favor, no abstentions, no absences, and no negatives.

So I'm open for questions. Before I continue I should mention that we even went to the extent of contacting manufacturing companies of mechanical delinting processes to see if there was any alternative. And the answer was no. We did check several patents. There seems to be several products in the pipeline, but they are not ready or available in the marketplace. Currently the mechanical procedures tend to break a great deal of the seed, creating a great deal of damage through
heat, and so the mechanical alternative is nonexistent at the moment.

That is my report.

CHAIRPERSON MOYER: Thank you, Rigo. Points of discussion, anybody?

Chair recognizes Dan.

VICE CHAIRPERSON GIOACOMINI: Not a point of discussion, but just a statement. As an animal nutritionist working with organic dairy farmers I can't tell you how many times in the last year I've been contacted wanting to know if I have any producers that would be interested in feeding delinted cotton to their cows, because there wasn't enough of a demand for planting that product within the industry. They all seemed extremely surprised when I told them it wasn't allowed if it was HCl delinted. So just maybe a notice to the program and the certifiers that this is a listing for HCl delinted cotton on the crops side. As I understand the regulation and the national list, that doesn't qualify it
necessarily to cover for the feed issue.

MEMBER DELGADO: Mr. Chairman?

CHAIRPERSON MOYER: Chair recognizes Rigo.

MEMBER DELGADO: To that it is listed on the 601(n), and states clearly that it is only for delinting cotton.

CHAIRPERSON MOYER: Thank you for that clarification, Rigo.

Any other questions on this particular material? Joe?

Hearing none, Tina, I turn the floor back over to you.

MEMBER ELLOR: The next one on the list is ferric phosphate, and the petition to remove it, and the trouble with this is I don't think we've seen the petition to remove it. So I think as a discussion document, we are just going to jump over that one for now unless Kevin wants to add something.

CHAIRPERSON MOYER: Kevin.

MEMBER ENGELBERT: Well, there
was a petition to remove. I think we have seen it. But the problem with it is when ferric phosphate was put on the list it contained a substance that wasn't made known to the committee, Crops Committee at that time, EDTA. So we don't know whether this is a political business move by another company or what. But someone has petitioned to removed it. We have sent it out for another TAP, and hopefully this will be more thorough, so we can understand the way it is actually formulated.

We are hoping to solicit public comment. We've gotten some on this product, and we will hopefully deal with this in the spring of 2010.

CHAIRPERSON MOYER: Joe, you had your hand up.

MEMBER SMILLIE: Yes, I'm sorry, maybe I'm confused. Did we miss manganese sulfate monohydrate?

CHAIRPERSON MOYER: That was the
first material that we covered.

MEMBER SMILLIE: Sorry.

CHAIRPERSON MOYER: The board recognizes Hugh.

MEMBER KARREMAN: On the ferric phosphate, being a good I guess mollusckicide for snails, I don't know if I'll be here at the next meeting for public comment. But being able to use ferric phosphate just for the record as a boundary type thing to keep snails away is very, very, very good. For cattle on pastures to reduce liver fluke, because the liver fluke goes through the snail, as a vector, and the cows eat them up in wet pasture where there's little dikes or canals and whatnot. So just keep it in mind, Kevin, for next year, okay.

CHAIRPERSON MOYER: Chair recognizes Steve.

MEMBER DeMURI: I have a question for the committee. So ferric phosphate is supposed to sunset in 2011? But there is a
petition to remove it in the meantime?

MEMBER ENGELBERT: Yes.

MEMBER DeMURI: What happens if you don't get the petitioner removed before 2011?

MEMBER ENGELBERT: I'm not sure, to be honest with you. I'm not going to try to bluff an answer. We are hoping that we can get through it and decide and then see.

MEMBER DeMURI: How long ago did you put in for a TAP review?

MEMBER ENGELBERT: I think we put in for a TAP review in January.

CHAIRPERSON MOYER: Chair recognizes Valerie from the program for a comment.

MS. FRANCES: I just wanted to remind you that you did look at the petition on ferric phosphate, and you did ask questions, and you did send it for TAP, and it was in question somewhat because it wasn't posted online, and it is now there, and so
anyone can review that too. So if there is
anyone that wants to provide any other
reviewing comments to that, they can.

CHAIRPERSON MOYER: Does that
address your point?

MEMBER DeMURI: Well, so we do
run the risk possibly that it could go off the
risk if the petition to remove isn't
completed?

MEMBER ENGELBERT: I think so.

This is new ground, having someone renew a
petition on an item that sunsets. It's
uncharted waters so to speak.

CHAIRPERSON MOYER: Chair
recognizes Dan.

VICE CHAIRPERSON GIOACOMINI:
Anything in the petition to renew that would
be considered new material would be material
valid for consideration during sunset. So it
can be processed one way or the other, and
still reach the same conclusion.

CHAIRPERSON MOYER: Thank you,
Dan, I believe that is correct.

Tiny.

MEMBER ELLOR: And I think the issue was because we had a petition to add ferric phosphate sodium EDTA or something which we rejected because of the status of EDTA, is it an active, why is it part of the formulation, and what that gentleman said and I think that petitioner is the one who filed a petition to renew, is that it it's in all ferric phosphate, that it's stable and should sunset. But we've since heard that there are formulations of ferric phosphate that don't have it. So these are the issues we've be hashing out in Crops Committee calls. Hopefully we can present it next meeting.

CHAIRPERSON MOYER: Thank you, Madam Chairperson.

Any other comments on ferric phosphate?

Back to you, Tina.

MEMBER ELLOR: Okay. And the
next item on our list, and we've had a
tremendous amount of comment on this, and I'm
going to turn it over to Jeff, because he was
the main architect of that document, is List
4 inerts.

CHAIRPERSON MOYER: Thank you,
Madam Chairperson. I'm sure we'll have no
discussion on this item.

Let me start by saying that in
many ways the attention of the committee by
posting this document have already been met,
and that was to stimulate the conversation and
discussion and get it front and center on
people's radar screen and we have done that.

In review of the document I'd like
to draw everybody's attention to page two of
our recommendation. We talk about the
definitions, and we have an EPA definition for
what an active ingredient is and what an inert
ingredient is. And I won't take the time to
read that now, but I suggest that everybody
take a quick look at that and read it, because
it really pertains to where we are heading
with our particular document.

In looking at the problem that we
have in front of us, which was the changing -
and if you look at the history and background
we put it in there - is EPA's changing of the
List 4 status, it became very clear to our
committee at least that we were not inclined
to take all the materials previously listed on
EPA List 4 list, and that is attached as an
appendix to our document and I don't know how
many hundreds there are there; I didn't go
through and count them all. Actually, I
started to count them all, then I got
sidetracked. There are hundreds and hundreds
of them.

It is not the intent or the
inclination of this committee to list all 700
- 800 of those materials on the national list
in lieu of the List 4 being there as a one-
line item and then it's going to appear that
we put 800 new materials on the list. So our
committee is not inclined to do that.

By the same token our committee recognizes the limitation of time in reviewing a large portion of this list through the petition process and having TRs done, and that was brought up through the public comment that even if we pair that list down to - I've heard different numbers but say 258 - materials, clearly more work than the board, science and technology, all the money that we've got allocated from Congress would go into TRs, and so we had a problem there.

What we were looking for was some middle ground. That is what we attempted to do in this document we pulled together. We tried to take a very complex and complicated issue and make it fairly simple.

And so what we said was - the question we are really asking in this recommendation is, is there a process that could be in place that would bring the manufacturers of these products into the
equation - clearly they know what they are using - is there a tool or mechanism in place that would allow them to make in a confidential format, bring those materials forward in front of this committee and this board, so that - and we chose the word, review, and that's been a very complicated word, because I understand we do have a review process, which is the TAP review process. We were looking at a way to short-circuit that, and really review the products to see - some of them for example could be natural, and already theoretically on the list, just the way they are now. So this is a real simplified way that we could get to at least 80 percent of the materials with 20 percent of the work, and try to maintain a little bit of the status quo. We certainly are not as a committee inclined to remove all the tools from the toolbox that growers and farmers are currently using. That would not be in the
industry's best interests either. So we are attempting to, again, bring the manufacturers into the puzzle and say, give us a list of what you are actually using today. Is there a way we can get those on the list through the creation of a subset list which is either housed by USDA NOP, or by EPA, so that we are going to put one new list, we are going to create that list, put it on as one item, so in effect what we are doing is shrinking the current list of 800 materials down to 250, but listing it as one item.

That was our goal. Whether we achieved it or not is what we are going to discuss now. And I think at this point I would like to turn it over for questions. And I can moderate those questions if people don't find that a conflict of interest.

The chair recognizes Tina.

MEMBER ELLOR: We've had a lot of comments about working with the NOP and the EPA to find a solution to this. And I think
that Chris Pfeifer was in the gallery?

CHAIRPERSON MOYER: Yes, the
chair was going to call Chris to the podium, and this might be an opportune time to do that. Chris, if you would, if you'd come up and maybe fill us in on where the EPA is. Again, like I said, we've already had much of our desired effect, because shortly after we posted this document EPA got engaged in the conversation, program got more engaged, the general public got more engaged, and that's really what we wanted to do.

MR. PFEIFER: Good morning. Let me start with my normal disclaimer. The ACC has no stated position with regard to --

CHAIRPERSON MOYER: Chris, if you don't mind, if you could state your name and your affiliation for the recorder.

MR. PFEIFER: Yes, sorry about that. My name is Chris Pfeifer. I am a regulatory agent with the biopesticides division. I'm also a liaison to the organic
program.

CHAIRPERSON MOYER: Thank you.

MR. PFEIFER: Well, I think the most helpful thing to do, and where the agency can help as you are starting to develop this process, is kind of give you an idea of where List 4 is sufficient. As a practical matter I see a lot of handwringing over how it got formed and what List 4 was all about. But it was a very expedient and I think good way to get the program started. That said, List 4 was never a product of any assessment. Rather it was a wish list or a prioritization list for our reassessment or assessment. Because there is no data to back List 4.

Now you can say for the most part in reassessments what you had was essentially some nontoxic inerts. However in the decision making process to reassess there was never any consideration for either eco-toxicity or persistence. So the deal that you have in doing an inert assessment for List 4, you are
starting from scratch on essentially what are the values that you want to put into this. We don't know, but we are willing to help to the degree we can.

It's - I would have to say that when you look at List 4 you will note that there are a lot of naturals and that it is relatively safe, but there are a fair amount of industrial chemicals on there. Somewhere it talks about picking the lowest hanging fruit. And that will be easy enough. But you really need to have a programmatic lens, I think, on what you are going to do, what are your interests in seeing the inerts out there?

And that's I guess our take on it.

CHAIRPERSON MOYER: Questions or comments directed to Chris.

Tina.

MEMBER ELLOR: I would say what our first question is that we don't even really know what the inerts are in the products we're using. It would help for
someone to have that information, and for us
to somehow you know take a look at that and
see what we actually need or is being used.
And then we could begin to see what we can
take off the list to start with.

MR. PFEIFER: I think you will
find that the majority of the inerts are
probably in the various formulations. I think
that is a good starting point. We have been
through several reassessment programs with our
inerts, and with our active ingredients. And
what we discover is that people come out of
the woodwork all the time with various
ingredients that were in formulations, or were
not initially supported. But again I think
that is why it's a good place to start.

CHAIRPERSON MOYER: Yes, our goal
was to bring those materials out of the
woodwork so we could look at what's currently
being used, evaluate them for whether they are
naturals or whether they are synthetics, and
needed - create a list that we could use to
keep the industry moving forward, and from
that point on, any new materials that would be
suggested to be used in formulations would
have to go through the standard petition
process with TAP reviews.

We have to start somewhere. We
have to prioritize the work. And I think
working with EPA maybe we can do that.

MR. PFEIFER: Our inerts branch
has offered to help to the degree that they
can. I think depending on how this is
structured, there might be some - there might
be the necessity for some additional manpower.
I'm not sure how that would work out, or to
the degree EPA can involve itself. But we are
very happy to be part of that dialogue.

CHAIRPERSON MOYER: Chair
recognizes Valerie from the program.

MS. FRANCES: Hi, Chris. I
wanted to make sure that you had looked at the
evaluation criteria checklist that the NRC
currently uses to review materials, and
whether there was anything that you would -
when you look at that, add to that or change
it or whatever input you could provide.

MR. PFEIFER: You know, I haven't
looked at it really closely. But I would say
that if you applied that lens to the inerts,
you would lose a lot of the inerts. And I
think that's what I'm talking about is finding
that fine balance between your process for
accepting synthetic inerts, and reassessing
inerts that are presently in formulations so
that there can be some kind of comparison
between the two.

CHAIRPERSON MOYER: And that
certainly was at least my position, and that
is my fear, that we will lose too many of
those materials that have been on the list
since its inception, that as Tracy mentioned
earlier, they are almost - they should be
grandfathered in, because they are being used.
How we present that to the public is quite
challenging for this board, because the
perception could be certainly, and most likely
would be taken in many cases, in the wrong
way. So it's a fine line that we are going to
have to walk to keep the industry moving
forward, to allow growers to have the tools
that they have become accustomed to using
that are very much needed. But then moving
forward we would be using that lens for all
new materials coming in. It may seem unfair,
but I learned when I was about 10 years old
that life isn't fair. And so maybe that is
the best place for us to jump off, and that is
what we were thinking in presenting this
document. And I know there are many who
disagree with that course of action.

MR. PFEIFER: Well, just in
conversation with staff, I have heard some
very interesting ideas about approaching this
in a number of ways in terms of identifying
kind of a hit list of industrial chemicals
that are suspect or that have known
environmental persistence. Also there is an
intriguing idea of kind of structuring a
filter process where you say, okay, with these
inerts, these synthetic inerts have no known
human toxicity, and if provided you can
demonstrate a lack of ecological concern
relative to them then you might be able to
kind of formulate a tiered process for
determinations.

CHAIRPERSON MOYER: And our goal
was to as quickly as we could, almost
immediately, shrink the list from 800
materials that I have on my pages here down to
258 or whatever that number is, so that you
could then take that sublist, evaluate it
against that criteria that you just mentioned,
and get a list of — which I think is going to
be a relatively small list, I hope — of things
that we really might want to go out and create
a hit list and get them out of the system.
But in the short term keep the industry moving
forward. So that was the goal of this
document as we wrote it.
Any other questions or comments

for Chris? Kevin?

MEMBER ENGELBERT: Just a quick one, Chris. You touched on it earlier. One of the concerns of our committee is the actual definition of inert. If a substance is included, and as you say it's necessary - or the definition says it's necessary for the effectiveness or to penetrate, in our minds that is not inert. And we are concerned about these substances that actually do play a role in the effectiveness of a product or its ability to do what is intended. To me an inert would be if you have a 50 percent hydrogen peroxide solution, that other 50 percent is still water. It's not impacting the effectiveness or what that does. But when you take something and add it to it that it has to have to be effective, to me that's not inert. And that is one of the things we want to look at, even though we can't do all 800 like Ken said. That is going to be important
to what we look at.

MR. PFEIFER: I hear you. Let's just start off by saying, you see the definition of inerts. But inerts is just kind of a shorthand. The agency actually is supposed to call those other ingredients, because inerts, one might not necessarily be entirely inert in the formulation. It might just not act against the task that they are intended to act against. Oftentimes the devil is more in the inert. Inert makes it sound like a benign term. So the preferred term is other ingredients.

But with regards to what you are talking about, defining inerts relative to active ingredients, the deal with that is any inert that has a synergistic effect should be considered an active ingredient and we do. If the ingredient is active the way we do the reviews, the onus is on the applicant to demonstrate that it is indeed not an active part of the formulation.
That said, a lot of that is missed in some of the reviews, because frankly that can be an academic exercise. So you will probably see some more of that. I've heard several mentions of ingredients, and we struggled there, EPA, peracetic acid. I've been involved in the conversations going back and forth with those. It's very complicated. So we do look at it, but there are misses.

CHAIRPERSON MOYER: Kevin, that's why I specifically drew people's attention to the existing definitions that EPA has, because clearly in our conversations at the committee level we recognized that inerts are not inert in the formulation; and again, that's another reason why we tried to bring in the manufacturers, because until we know the formulation that it's in, or the way it's being used, or whether we know it as a board or whether because of confidential business information it stays at the EPA or the program, we are comfortable with that.
relationship. But somehow we need to know how
it's being used in the formulation to
determine whether or not it really is active
or inert. Because that makes all - the devil
is in the detail for sure. And only the
manufacturers know that detail. To unravel
that puzzle for all these materials would be
just impossible.

Chair recognizes Barry.

MEMBER FLAMM: Chris, I may be
mistaken, but I thought I heard somebody
mention yesterday that EPA planned to list all
the ingredients on the label. Is that
correct?

MR. PFEIFER: Well, that is not
totally correct, as I understand it. The
notice that is referred to was all
ingredients, inert ingredients of
toxicological concern, which I really don't
think would apply to most of the things that
we are dealing with. And I think there was a
list of examples on there, I'm not absolutely
sure. But I will try and inform staff about it. But I\'m almost positive it is only those of toxicological concern, and how that is defined I don\'t think has been developed yet.

CHAIRPERSON MOYER: Chair recognizes Dan.

VICE CHAIRPERSON GIOACOMINI: Yes, I would just like to remind the board that most of the work on this has been done by the Crops Committee. I think we all certainly appreciate that. But to remind us, and especially in livestock, this is essentially the exact same listing on 603 as it is on 601. It is for List 4 inerts with pesticides. So livestock is also going to have to participate in this. And any relisting that is done is going to have to be done on 603 as well as 601.

CHAIRPERSON MOYER: And the Crops Committee did discuss that as we moved forward in the process that the Livestock Committee would have to be brought in. We were
fortunate that there are several members that cross over both teams, or both committees, and we did recognize that the process would have to be expanded to include livestock.

Any other questions or comments for Chris? Any other points of discussion?

Thank you, Chris, we appreciate your time and energy.

MR. PFEIFER: Thank you. I just had one more comment that I thought might be helpful in developing this process. In the national list you have some broad defining criteria for what you expect out of your pesticidal formulations or your inputs. I believe that probably some kind of general selection criteria relative to this process would also aid in developing the requirements that ultimately you are going to make of these ingredients.

CHAIRPERSON MOYER: Thank you, Chris. Tina.

MEMBER ELLOR: So is what you're
saying that we should have a different set or slightly adjust the set of criteria to look at inerts?

MR. PFEIFER: Well, I would say that it would need to be slightly adjusted so that you maintain some of these tools in the arsenal. So yes, that would be my take, it would be too perhaps restrictive.

CHAIRPERSON MOYER: Chair recognizes Valerie Francis from the program.

MS. FRANCES: This is why I ask about, have you looked at the evaluation criteria checklist. That would really help to get specifics back on that form.

MR. PFEIFER: Okay, but I think what I'm referring to is more the criteria that would set out for the active ingredients. So but yes, I will.

CHAIRPERSON MOYER: Thank you, Chris, we appreciate your time. If there are no other questions or discussion on inerts, I'd turn the program
back over to Tina.

MEMBER ELLOR: I believe the last thing we have to discuss, and I'm not going to say too much about this because we got a lot of great comments, and very detailed comments, so I think what we will be doing with this discussion document is taking it back to committee, looking at all the comments, and please keep in touch, those people who had comments and we'll keep in touch with you, and rework the document to take some of those concerns into account.

And of course I should say what we are talking about is production standards for terrestrial plants and containers and enclosures. And unless someone else would like to say more about that. Jeff?

CHAIRPERSON MOYER: I would just like to mention that we heard particularly from PCO yesterday in their public comment, the idea of a need for better definitions. And I would ask that if people from the
general public or the ACAs or someone who has specific language that might help us in that regard, we would certainly entertain those submissions in helping us define specifically what makes sense in your own particular operations. I think that would be helpful, because our goal is to not come back in spring and discuss it again. We want to have a voting document, so don't wait until you see the next posting to say you don't like something, if you can be a little pro-active in getting us some information, not just you, but you brought it up, and we are very receptive to that on this committee. Thanks, Tina.

MEMBER ELLOR: That's a very good point. And Gerry, once again, was the major architect on this document. And he did a tremendous amount of work, and we talked about this for many hours on the phone. And I really appreciate everybody's input on it. We had quite a lot of pressure
from above. Barbara is not here, so I can't look at her, to get this out because of the Canadian equivalency was a big part of that. So I think, unless there are more questions or discussion about that, then we are done.

CHAIRPERSON MOYER: Thank you, Madam Chairperson.

We will be moving on to our next committee which is Livestock Committee, chairperson Hue Karreman. Hue. Oh, if you could wait just one second I have a question from the floor. Chair recognizes Bob Pooler to the podium.

MR. POOLER: I'm Bob Pooler, National Organic Program. I do want to remind you the Crops Committee that do have here on the agenda item sunset for 2012, and I kinda wish that you would discuss that a little bit. It is an important item.

MEMBER ELLOR: Okay, I'm sorry, and Kevin just pointed that out as well. Yes,
that has been on our radar and on our workplan for several months now, and getting busy prepared for this meeting I think where we left it last is we are all going to take a look at that sunset list, and the next step we are going to take is decide which ones we want to get new tabs on, and move forward from there. But you can bet it's on our radar, and on our work plan, and we have been working on it. I don't know if you want more details on that.

CHAIRPERSON MOYER: Hue, if we could hold off on your report for just one moment, following up on the inerts evaluation and assessments, I understand that someone else is here from EPA, Kerry Leifer. If Kerry could come to the podium and explain a little bit about where the EPA is in inerts reassessment, I believe that would be useful to us. Yes, please, to the podium, and state your name and your affiliation for the record.

MR. LEIFER: Good morning, my
name is Kerry Leifer. I'm with the EPA's Office of Pesticide's programs, registration division. Specific to the inert ingredient reassessments, we as part of our responsibilities for the Food Quality Protection Act we reassess the tolerance—well not only the tolerance exemptions for all inert ingredients for which tolerance exemptions were established post-1996. That was basically our mandate under the Food Quality Protection Act. And basically what we were doing was evaluating the data to determine if we could make the reasonable certainty of no harm safety standard related to potential residues of these inert ingredients in food. This is done under our Food Drug & Cosmetic Act authority.

So essentially what we did was kind of a human health risk assessments to make determinations as to whether or not these tolerance exemptions could remain in place, or if they needed to be revoked, or somehow
We basically finished up in 2006, although there were a number of substances which we identified as having an insufficient database, and we basically - we revoked those tolerance exemptions with an expiration date that was two years out, August, 2008. And this was to provide interested parties the opportunity to develop or obtain data. We weren't saying that these things were problematic, just that we didn't have sufficient data to make the finding. So to that end a consortium was formed of both pesticide registrants and inert ingredient manufacturers to support a number of those substances. There were about 132 tolerance exemptions that were on that revocation list, and over half of them were supported with data, either newly generated data or identified data that hadn't previously been made available to EPA. So we used that data, and in August 2009 we ended up extending the
effective date another year. In August 2009 we completed the reassessments for both substances as well.

So basically we made the human health finding under FFDCA and FQPA to establish those. So those are now codified.

A number of the tolerance exemption descriptors changed. Some substances got kind of read in or read out. Because a lot of the descriptors were kind of grouping, class oriented. We have modified some of those. We have also included CAS registering numbers with all these reassessments that we've done.

So that's now codified in the code of federal regulations under 40 CFR Part 180, where we have our tolerance exemptions.

CHAIRPERSON MOYER: Thank you, Kerry.

Are there any questions or points of comments? Chair recognizes Rigo.

MEMBER DELGADO: So I'm trying to understand. You did this analysis on the 600-
odd items that were previously recognized as inert; is that correct?

MR. LEIFER: No, these were - we basically reassessed chemicals that were already in use, that were already listed as food use ingredients for which there were tolerance exemptions, basically an exemption means there was no established maximum permitted level. This is similar to what we do with active ingredients where we establish typically a tolerance with a maximum permitted level, 5 ppm on tomatoes, something of that nature. Most inert ingredients with a few exemptions, most inert ingredients have exemptions from the requirement, but that has to be in place for that material to be used in a food use pesticide formulation. We won't register a product that contains an inert ingredient that doesn't have the appropriate tolerances.

Now these chemicals were already under -- we were evaluating some things which
we had initially established those tolerance
exemptions prior to 1996.

CHAIRPERSON MOYER: Chair recognizes Tina.

MEMBER ELLOR: How does this list slot in with List 4, or is it something completely different? And how many did you look at?

MR. LEIFER: It's not completely different. There is a fair degree of overlap, but they are not one and the same, because some of the - when we put together the initial List 4 there was no consideration to food use versus non-food use. There are some substances on this board that don't have tolerance exemptions for whatever reasons. No one had an interest in using them, they were never petitioned for, therefore a tolerance exemption was never established. And conversely, there were substances that had tolerance exemptions that weren't part of List 4. They were something in the neighborhood of
about 870 line item tolerance exemptions which
probably corresponds to maybe 1,000 chemicals.
Again, some of these tolerance exemptions
cover more than one chemical entity. But - I
can't remember the actual numbers there -
there is a high degree of overlap, but not
complete overlap.

CHAIRPERSON MOYER: Follow up,
Tina.

MEMBER ELLOR: If I wanted to
take a look at this list, what would I look
for? What is this list called?

MR. LEIFER: Well, the substances
that have undergone the reassessment would
appear in the current version of the Code of
Federal Regulations. So 40 CFR Part 180.910,
920, 930, 940, 950.

MEMBER ELLOR: Okay, got it.

MR. LEIFER: The ECFR site has
the most up to date information, because some
of these regulations, the final rules were
just published in September of this year. So
if you are using a dog-eared version of a printed Code of Federal Regulations, it may not appear there. It does appear on the electronic set. So all those substances that are on there have either undergone reassessments or were established post-1996, which meant that the FQPA requirements were in place. We had to make the same findings related to – so special sensitivities to infants and children, aggregate exposure, all of what FQPA had put forth in terms of what we needed to look at.

CHAIRPERSON MOYER: Any other points? Yes, Tracy, Chair recognizes Tracy.

MEMBER MIEDEMA: And this question is for Tina and for the speaker. Do we think that we will be able to take our list of what we have called List 4 inert and determine whether there is eco-toxicity or persistent based on the analysis that EPA has done so far when they come back to the board?

MR. LEIFER: I want to make it
clear that when we did the tolerance reassessment we were focusing on the human health implications of these substances used in food use pesticide formulations. So we didn't explicitly, because it wasn't part of the mandate under FQPA, consider environmental effects. That is typically under our FIFRA authority. We don't have the authority to consider eco effects when we are making a tolerance exemption type determination. So it wasn't really part of that exercise.

Now there are some chemicals on which we have information. We haven't had a program analogous to tolerance reassessment where we've gone through in a systematic fashion and evaluated chemical by chemical basis potential eco hazards. And ultimately typically when we do these things in the pesticide program, under FIFRA, the risk-benefit based statute, we would have to consider risks on a product-by-product basis. So for example a chemical may be - have
concerns for aquatic organisms. However the use patterns of the product is such that it's indoor only, or in some sort of commercial applications that would never find its way to aquatic exposures that might be acceptable. Obviously if that produce were rice herbicide or something like that where it's applied to water may be a concern.

MEMBER ELLOR: And I think that was the point Chris was making about somehow having assessment, working with EPA, having a separate assessment for inerts that is related to the assessment that we use for actives. Somehow - I think that is a vague idea still, it's something we are going to have to take a look at also with the program.

CHAIRPERSON MOYER: Yes, I think Tracy it's one screen that we would certainly look at, but formulation has a huge impact on that, particularly on the environmental impacts that we need to look at.

Any other questions for Kerry?
MR. LEIFER: Actually I have one comment that was made yesterday, and I just wanted to clarify a little bit related to the agency's inert degree disclosure initiatives if you will. We are preparing to issue what's known as an advanced notice of proposed rulemaking, an ANPRN, related to inert ingredient disclosure. That does not commit us to any particular regulatory action. In fact there could be some nonregulatory actions. So we are - when that goes out, it should be by the end of the year, the calendar year, we will talk about disclosing hazardous inert ingredients because we have received a petition, a rulemaking petition, on that. And that's something to address that aspect as well as a broader disclosure. The ANPRN has a number of questions that are posed to solicit comments specific to the various issues related to disclosure of all inert ingredients, disclosure of some subset of inert ingredients, labeling issues, et cetera,
et cetera. So I want to be clear that we
haven't committee to any particular course of
action at this point.

CHAIRPERSON MOYER: So
collectively we won't hold our breath waiting
to see that on the label? I got it.
Okay, anything else from the
board?
Thank you, Kerry. We appreciate
your time in coming to visit us.
Katrina?

MEMBER HEINZE: So what happens
next is you guys are taking this back to
committee to discuss, and we'll get it in the
spring?

CHAIRPERSON MOYER: This is a
discussion document and not a voting document.
We will be taking it back. But the goal will
be to bring it forward by spring with some
kind of resolution, certainly.

MEMBER HEINZE: Would you be
doing that with the livestock committee, or
crops go first?

CHAIRPERSON MOYER: I think the process will be the same, so we will be doing it jointly, and of course working with the program and with obviously EPA. That is our plan.

Dr. Karreman, back to you. I appreciate your patience.

LIVESTOCK COMMITTEE
MEMBER KARREMAN: You are going to have to have some patience for this.

All right, Livestock Committee. We’ve been pretty busy this past half year, or this whole year actually. Probably has the most things on a livestock docket in a few meetings. Our first one we looked at, the only petitioned material we had, was Eprinomectin for a parasiticide. And it was - the petitioner wanted it to be allowed for livestock health care. And we went through the checklist sheet as a committee, and yesterday we heard some public testimony from
the petitioner that actually showed some nice comparisons between Eprinomectin versus moxidectin versus ivermectin, and if you were here in the room listening to that, and then I commented that it looks good for Eprinomectin except that we don't want to be expanding the list in that particular family of parasiticides.

So basically the petition was to add eprinomectin to the list on six of the three. And the Livestock Committee voted unanimously to not allow it on, and that's eprinomectin.

Jeff is gone. Yes, sir. So that is it for eprinomectin. Any questions?

SECRETARY WEISMAN: I see the evaluation criteria checklist, but I was just looking to see what categories it failed that led to the no vote.

MEMBER KARREMAN: Well, essential and availability criteria I think should have been a no. Sorry about that. Because other
very close relatives to that are already on.

Thank you.

VICE CHAIRPERSON GIOACOMINI: I think Item B is correct up there, but the check box was missed.

MEMBER KARREMAN: Yep, right.

Okay? All right, moving along to - oops, sorry.

CHAIRPERSON MOYER: Did Steve have a question?

MEMBER DeMURI: My question was actually the same as Julie's. Great minds think alike.

CHAIRPERSON MOYER: I saw that happening. Katrina.

MEMBER HEINZE: Could you give me a layman's explanation for why we don't let this class of things --

MEMBER KARREMAN: A layman's explanation? Actually there is a technical explanation as to the one that we have been using. Ivermectin is on the list already.
The board already also approved moxidectin to be on the list, which is not yet; somewhere in the hurdles and whatnot of rulemaking. And eprinomectin is also just like moxidectin in a sense and ivermectin in that they are all avermectins, and they are all macrocyclic lactones, which are technically a class of antibiotics, and that kind of put a little bit of sand in the gears, and so while moxidectin was going through rulemaking - it's still not out yet - fenbendazole was petitioned as a parasiticide. And that had a full TAP review back in 1999 with ivermectin levamisole. For whatever reason back then in 1999 they went with ivermectin. Fenbendazole, I think all of us were on the board when it went through, I'm not certain. But we are hoping that once the fenbendazole comes on - it's not at all any kind of antibiotic - that the ivermectin comes off and the moxidectin won't be there and the eprinomectin won't be getting on base. Is that layman enough?
MEMBER HEINZE: Not layman, but I followed it.

MEMBER KARREMAN: Okay, I can speak rationally, good.

CHAIRPERSON MOYER: If there is no further discussion, it's still in your court, Hue.

MEMBER KARREMAN: So the next one is vaccines, which we have heard a fair amount about in public comment, actually on both sides of the issue if I may say. Certifiers have commented that they want to see our recommended changes happen for the most part, and then there have been folks who say no, don't do that.

So a little background on this.

This vaccine recommendation is not a discussion of should we use vaccines in certified organic agriculture. Some of the public comment definitely said that, which is, shouldn't be using vaccines at all, and that's not this discussion.
The reason this came about basically was actually a farmer of mine called me first thing this year, first call I had, and he said, hey Karreman, my certifier won't let me use a certain vaccine any more. What should I do? And he told me why, because it's genetically engineered. And he's been using it for the last five years, been certified five years out of the seven that the program has been going. So it was kind of like a change in midstream from what the guy was used to. So all of a sudden I was like made aware of that.

I can tell you right now that my own personal views on vaccines that I don't hardly recommend them to my farmers. There's like maybe one or two. I truly don't. I've always had very very low vaccine sales. I don't even bring it up, because it is an issue. But this is not the discussion whether we should vaccinate our animals or kids or not. It's specific to the one of five,
205.105(e) section.

But we do need to have preventatives. So even though I don't even recommend vaccines all that much, I realize we have to have prevention here in organics. And there are times when unfortunately - and I will list these vaccines here shortly - that only one - the only vaccine is actually genetically engineered. There is no conventional. And it's going to be used maybe one to two times a year at most; it's not like GMO crops where they are in the ground pollinating and all that with massive acreage. It's a prevention. It's used extremely rarely.

The review paper that we have attached to the document is that, it's exactly that. It's a review paper. And review papers and science are basically, they state what the history of the problem is, whatever it is, or the issue, the topic, what's happening now, and future directions. So it's a review
paper, it's actually a pretty good review
paper, although it's only one, but it kind of
summates what's happening.

It should be stated that
genetically engineered vaccines are allowed in
the European Union certified organic system.

Some of the swine flu vaccine that
is being produced right now in our country is
genetically engineered, and that should be
kept in mind.

And then there were questions on -
for a TAP, and then the question would be on
what exactly. Because most TAPs are one
specific compound like ferric phosphate or
peracetic acid or eprinomectin. These
genetically engineered vaccines are kind of an
umbrella of different production methods, not
just one production method by any means. And
there could be more in the future.

This whole document is more almost
of a legal interpretation of what already
exists than something new because honestly,
the horse, the cow, the chicken on this issue
they are all out of the barn. These vaccines
have been used since 2002, not exclusively by
any means, but they certainly have. That's
all fact, and I don't know if I need to the
apologize to the organic consumers, but if
they didn't know that that's not my problem.
They've been being used, so it's not like,
hey, don't even start this.

And the ACAs have generally all
been allowing them in the Northeast, Upper
Midwest, West Coast. And we have some written
comments, and they agree with our
recommendation.

So let's see, so I want to give
some examples of the vaccines that are out
there and their availability, if you don't
mind, so there was a written comment asking,
or saying that we didn't state what the
vaccines are. This is a listing from the USDA
animal plant health inspection service, Center
for Veterinary Biologics, publicly available,
transparent, anyone can click on it and see it.

I can tell you this, that in March, 2001 there were 47 recombinant vaccines listed on this particular agency site of which 32 are for agriculture, agricultural species. And then in June of 2009, now there are like 100 manufacturers, licensed manufacturers of vaccines in general, and I think it's 38 for agriculture. In 2001 there were 21 genetically engineered vaccines being used for poultry. There were three for bovine, cow, seven for swine, pigs, three for horses, and horses can be certified organic, just so you all know that, and then canine twelve, and feline, seven, and the rabies vaccine, which there is none for large animals but people do use it for large animals, there were four.

They use it off-label for rabies. I know up in Vermont they have a pretty big rabies vaccination type - not program, but a lot of farmers do it up there.
Some of these, I mentioned a few yesterday, but there is only one for avian encephalomyelitis-fowl pox-laryngotracheitis. There is only one, and these are all genetically engineered, so if the poultry house has this problem there is no conventional one to look to. Avian encephalomyelitis-fowl pox-gallisepticum, avian influenza H9N2, avian influenza-fowl pox.

Equine, there is an influence, equine influenza vaccine. For E.coli two of the three available are recombinant. There is more for poultry. Laryngotracheitis, Merrick's Disease, two for two, the only two, they are both genetically engineered. Fowl pox, laryngotracheitis, pox-mycoplasma gallisepticum, Merrick's Type 1 and 3, Merrick's Newcastle, three for three are genetically engineered. Newcastle Fowl Pox, one for one, and cercovirus in pigs, two for two are genetically engineered.
Salmonella dublin, the only Salmonella dublin vaccine there is, and it affects people, it affects all mammals, it affects poultry; the only one is genetically engineered.

So anyway our recommendation, having all that in mind, is to truncate the 205.105(e), which I am trying to find, which is up on the screen, and our logical progression, since I kind of mentioned it is a legal reading of this, and these vaccines are already being used, folks, okay, it's not like it's just starting.

Relevant areas in the rule,

Section 6509(d)(1)(C) of the Organic Food Production Act of 1990 authorizes the use of vaccinations as an allowed health care practice in the production of organic livestock. This authorization was implemented for regulation at 205.238 (a)(6) of the National Organic Program Standards. Those standards were published in the Federal
Register on December 21, 2000. 205.238(a)(6) provides that producers must establish and maintain preventive livestock health care practices, including the administration of vaccines and other veterinary biologics. Further vaccines are approved by NOSB as a group at 205.603(a)(4) and ultimately put on the list without annotation where some other materials listed do specify or limit the amounts of production. It is clear that 6509(d)(1)(C), 205.238(a)(6), and 205.603(a)(4) don't mention about vaccines produced by excluded methods needing to be individually petitioned.

And we do acknowledge that 205.105(a)(6) does provide that organic products must be produced and handled without the use of excluded methods except for vaccines; provided that the vaccines are approved in accordance with 205.600(a).

But even if - even by reading Section 205.105(e) as it is currently written,
the logical progression of reading the
regulation shows that 205.105 allow the
prohibited substances, methods and ingredients
in organic production or handling to be sold
or labeled as 100 percent organic, organic, or
made with organic, the product must be
produced and handled without the use of (e)
excluded methods, except for vaccines,
provided that the vaccines are approved in
accordance with 205.600(a). So we'll go to
205.600.

Evaluation criteria for allowed
and prohibited substances, methods and
ingredients: the following criteria will be
utilized in the evaluation of substances or
ingredients for the organic production and
handling sections of the National List.
Synthetic and non-synthetic substances
considered for inclusion on or deletion from
the National List. Allowed and prohibited
substances will be evaluated using the
criteria specified in the act.
And then on 603 synthetic substances allowed for use in organic livestock production in accordance with the restrictions specified in the section, the following synthetic substances may be used in organic livestock production, A, as disinfectants, sanitizers, medical treatments as applicable for biologics and vaccines.

So in conclusion for the special situation with vaccines and vaccines only, the Livestock Committee would like to permanently clarify that the situation on vaccines, by truncating 105(e) to no longer make reference to excluded methods.

That is our recommendation.

Discussion?

CHAIRPERSON MOYER: Thank you, Mr. Chairperson.

Points of discussion? I see Dan.

VICE CHAIRPERSON GIOACOMINI: I first of all I feel for the court reporter over there trying to get through the names of
all those vaccines.

MEMBER KARREMAN: I will help you later.

(Laughter.)

VICE CHAIRPERSON GIOACOMINI: I completely support this recommendation. The problem that I have with it is that the origin of the problem came from a change of interpretation from what the vast majority of the industry seemed to have been reading the rule and upon further review a reading of the preamble, where there seems to be some discrepancy.

I fully respect intent, and I believe that is what the preamble was doing. But the letter of the law to me seems to be the letter of the law. And if the law does not support the intent, I think a better action would have been for portions of the community to come to the board and ask us to clarify that issue and to resolve the discrepancy, rather than changing the
interpretation to try and make what the letter of the law was saying match the intent, which it does not seem to do.

So I'm a little bit disappointed with the way we had to go about doing this. I completely support what the committee is doing. I completely support what this document is doing to meet the goal of allowing these products to still be used, which they have been used all through the past, and to maintain the ultimate concern for the animal, for the welfare and the health of the animal.

That all being said, I wish we didn't have to make this change, because I think the first connection from Section 105 through Section 603 the continuity is held together much better with this language kept in. But if this is the way we have to go about making sure that these tools are available to keep the animals healthy so they don't get sick so we don't need to use all these antibiotics that nobody wants us to use,
and the animals would be disqualified from
production, then I'm more than happy in
supporting this document to do it.

But I wish we had not had to go
this route.

CHAIRPERSON MOYER: Thank you,
Dan. Chair recognizes Barry.

MEMBER FLAMM: Thank you.

I think the committee has done a
lot of work and made some very persuasive
arguments for allowing GMO vaccines on the
market. And I know there has been a very
passionate exchange. But it probably - this
troubles me more than anything on the agenda.
For one thing it seems to me we've kind of
failed. GMO vaccines are widely used, so
we're saying we're in a corner; we ought to
let it continue. It seems like we as an
organic community that we are surrendering to
GMOs. And this is a problem in other areas,
in growing, we've discussed that when we
worked on the seed document. If we don't do
something there won't be an independent seed industry.

And I just wondered, whatever happened that we allowed the regular vaccines to be taken over by GMOs.

MEMBER KARREMAN: Yes, may I answer?

MEMBER FLAMM: And I'm sorry, I'm making more of a comment than a question. Please answer. I hate to raise issues and raise criticisms without having an answer I can propose. But I'm just very troubled with the blanket allowance. And you made credible arguments for doing it and a very logical one. I'm through.

CHAIRPERSON MOYER: Thank you, Barry. Chair recognizes Hue for rebuttal.

MEMBER KARREMAN: Yes. Basically you are kind of likening it to the seed availability thing, where if you don't force that, to have organic seeds. The vaccine industry, not that I know that much about it,
but I really don't think they are going to bend to the organic industry on this. The vaccine industry is geared to large populations of animals and people. The organic industry is a smidge. I don't think they are going to specifically say, ooh, let's go only make vaccines because then we can get the organic market. That is just my feeling, my understanding. It's just not quite the same as like, well, if we say there can't be any then they are going to start making them for us in the organic industry.

CHAIRPERSON MOYER: Chair recognizes Julie.

SECRETARY WEISMAN: I'm going to remind everyone, there's something that came up in a comment yesterday about this issue. And if there is a legacy I would like to be remembered for as I leave the board, it's going to be as a champion of commercial availability. And I think that what you say is true, though vaccine producers are big boys
and girls in the conventional world, and they have no incentive whatsoever to go out of their way to make anything that we need, but creating an incentive to use non-GMO vaccines if they are made available creates an entrepreneurial opportunity for folks, and I think that we should give that concept serious consideration for adding to this recommendation some kind of language.

CHAIRPERSON MOYER: Thank you, Julie. Board recognizes Bea.

MEMBER JAMES: Thank you. And also, thank you, Hue, and the Livestock Committee for all your work on this recommendation. I know it wasn't easy to put the thoughts together around this topic.

I guess I would just echo what Barry and Julie are saying. Because if repetition of an act creates status quo does that then all of a sudden justify status quo as being acceptable and right. And that's one of the questions that I think was maybe missed
in the recommendation was addressing that particular issue. And I don't know if there is anyway to backtrack the pervasive use of GMO vaccines now. And from what I'm hearing you say, Hue, it sounds like we are kind of in a corner to do something that we don't have a choice. And if as Julie suggests that we try to get into the recommendation something that would create a demand or a need for an alternative, can we do that?

CHAIRPERSON MOYER: Chair recognizes Hue to respond. Can you talk about that?

MEMBER KARREMAN: Yep, I think we can, and I already have it in my head and written down on paper. But also even if we go to the middle ground I would call it, and that's fine with me, I mean what I have, thinking here. You know, I hate to put the dark specter up there, but if there was a foot and mouth disease outbreak here in this country, and if we are allowed to use vaccine
for it, which traditionally USDA has not
allowed, but they have actually discussed it
in background papers and whatnot, I can nearly
guarantee you that that foot and mouth vaccine
is going to be genetically engineered. I
don't think there is going to be a company
saying, hm, the organic folks need a
conventional foot in mouth vaccine, let's make
it right now. And foot and mouth, just to use
that one particular one, and there has been an
outbreak in Britain twice, and that got onto
the continent in Holland, and it's real, that
is a highly - just like the flu, it changes
it's antigenicity all the time. So these
vaccines that are produced, basically are
constantly being produced kind of new all the
time. It's not like some kind of set formula
to make flunixin or ferric phosphate or
whatever. I mean it's a constantly kind of
changing thing. And the way the industry is
going, there is going to be conventional;
there will be. But there is more and more of
this genetic engineered type vaccine. That is all there is to it.

We can stick our heads in the sand but that's the way it is. So just keep that in mind. So even if we do - okay, the middle ground would be this. Oh, you want some more questions?

CHAIRPERSON MOYER: There are some other points of discussion if you want to hold off until you get done.

MEMBER KARREMAN: All right, then, I'm not sure if the wording would be quite right or not, but let's see, so on the recommendation it would say, excluded methods except for vaccines something to the point that conventional vaccines must be used unless none exist. I mean that you must use conventional vaccines - if there are two out of five right now for whatever the vaccines, you got to find those three that are not genetically engineered. But there are other ones like I listed here, one out of one is
genetically engineered; two out of two are genetically engineered for swine circovirus.

So the middle ground, I don't know we'd want to - we can do that tomorrow. But you have to use conventional vaccine, if you are going to use vaccine, if it's available. Otherwise you can use the genetically engineered.

SECRETARY WEISMAN: Hue, would it be more appropriate to say non-GMO vaccines instead of conventional?

CHAIRPERSON MOYER: Yes, the question is conventional and GMO. People don't understand what you mean by conventional.

MEMBER KARREMAN: Sorry. All right.

CHAIRPERSON MOYER: In this case conventional is good.

MEMBER KARREMAN: So non-GMO vaccines must be used unless none exist. I can live with that.
CHAIRPERSON MOYER: Or vaccines made without excluded methods.

MEMBER KARREMAN: Do you want to do this now or tomorrow as an amendment?

CHAIRPERSON MOYER: You can write it tomorrow. I think we know where you are going.

The chair recognizes Joe.

MEMBER SMILLIE: Just use commercially available to be consistent with our usual format, rather than none exists.

CHAIRPERSON MOYER: Chair recognizes Dan.

VICE CHAIRPERSON GIOACOMINI: Two things. One, commercial availability has certain things that means to the program and the regulation, and we have always been limited to 606 on that before of agricultural. If using that term, I want to make sure we get it cleared with the program first.

CHAIRPERSON MOYER: It's always been Julie's and my intention to get
commercial availability into everything.

VICE CHAIRPERSON GIOACOMINI: But the other point I wanted to make in response is to Barry's question of why is GMO, in this instance, why is GE in this instance, so prevalent? The nature of a vaccine is to get something into the body usually into a cell that the body then recognizes as foreign. So that it can mount an immune response to it. In the general historical sense of the conventional vaccines, we used the virus, or a modified virus, or we used the killed virus, or we used the bacteria. Those are – can be very successful vaccines, but at the same time they also can carry a tremendous amount of risk that with a mutation that modified the transferred back to inactive, or that with the transferring of genetic material that dead is even transferred into an active bacteria. And the value of the GMO vaccines, and one of the reasons they are taking off is that they are able to use smaller and smaller
portions of the genetic material from the
diseased microbe or whatever you are talking
about to initiate that immune response without
the risk of it creating an outbreak of the
disease at the same time.

CHAIRPERSON MOYER: Response by
Hue?

MEMBER KARREMAN: Can I add to
that? A lot of the genetic vaccines now,
let's say, you'd be able to differentiate a
vaccinated bison near Montana, Wyoming, the
national park there I can't think of right
away, from the real disease if you vaccinate
them with a subunit vaccine. I'm just
thinking conventional, okay; nothing organic
here. You could tell that that animal
actually had the real Brucella to infect all
those cow herds in Montana, or was it
vaccinated by Brucella, when you are looking
at the blood test for the antibodies in it.
So there is a way to differentiate between hot
virus carrying animal versus one that has been
vaccinated. That is going to happen more and more. And that is what they can do with foot and mouth as well. Say, that one has really got it. Oh, this one by its bloodwork was vaccinated.

CHAIRPERSON MOYER: Barry, chair recognizes Barry. Would you use your microphone, Barry?

MEMBER FLAMM: Are you saying that you can only do that with the GE vaccine, that recognition? You cannot recognize a vaccine agent in a buffalo with a conventional non-GMO vaccine?

MEMBER KARREMAN: Some you can. Actually Brucella has an RB 17 and you can, okay, so I shouldn't have mentioned Brucella. I'm just trying to say that most of them are deletion unit vaccines where they are taking out the hot part that would confuse an antibody test if you are testing two animals, which one had the real disease, versus which one got the vaccine. Most of them are being
actually genetically engineered now, and these regular vaccines you couldn't tell.

CHAIRPERSON MOYER: Chair recognizes Bea for a comment or question.

MEMBER JAMES: It's a question.

I'm kind of - actually, I'm going to wait until this topic is done.

CHAIRPERSON MOYER: Thank you, Bea. Any other questions on this particular topic? Chair recognizes Kevin.

MEMBER ENGELBERT: I think it goes without saying, but I'm going to say it anyway: this is a no-win situation for us. If we vote to approve this vaccine then the headlines are going to be that the scumbags on the livestock committee convinced the rest of the NOSB to allow GMO vaccines in organic production. If we vote it down and there is an outbreak of a serious disease in any region of the country then we are going to be condemned for our poor position on animal welfare in allowing these farmers to keep
their animals from being treated. They will have to leave organic production and be replaced by conventional animals that transition in that did receive the vaccine to protect their animals. It's an extremely troubling issue. It's an unfortunate one. It's what we're faced with.

CHAIRPERSON MOYER: That's why you get paid the big bucks.

(Laughter.)

CHAIRPERSON MOYER: Follow up by Barry.

MEMBER FLAMM: Kevin, does the so-called middle ground solve that problem?

MEMBER ENGELBERT: Hue and I talked yesterday. I think that is our best option, is to put that clause in there. If a non-GMO vaccine is available, it must be used. And a GMO vaccine can only be used in an emergency situation. Or if they don't.

CHAIRPERSON MOYER: Question by Tina.
MEMBER ELLOR: I guess I'd like to side with the commercial availability people. Because there might be some available; there might not be enough available. So I'd like to cover that contingency as well.

CHAIRPERSON MOYER: Thank you, Tina.

Okay, Mr. Chairman, back to you - and that was some of the easy stuff we went through, right? We didn't get to the good stuff right? I believe you are at excipients?

MEMBER KARREMAN: Excipients, let's see. All right, so the next thing we are recommending is I guess a clarification. I'm not sure how it's mentioned in the agenda, but a clarification to 603(f), F like Frank, that came into being on December 12th, 2007 when the medicines came in. And basically and they talked a little bit about this yesterday that there are two terms in here that simply - not simply, maybe - but need to be looked at.
And essentially what we are recommending is, the current one reads, excipients only for use in the manufacture of drugs, used to treat organic livestock, when the excipient is identified by the FDA as generally recognized as safe, approved by the FDA as a food additive, or included in the FDA review and approval of a new animal drug application or a new drug application.

And so, and I mentioned this yesterday to one of the commenters, there is a lot of stuff out there in barns that I've seen, I mean lots of stuff, that you know they are not for like a sick cow or sick calf. They are to enhance the digestion of a calf. They are to enhance the suppleness of a cow's udder; whatever. The animal is not sick, so technically they can't use these things, technically, on these animals. And they're animal health care products. Now animal health care products, their excipients are not specifically stated in what I just read. So
that's why we want to change the word from drug to animal health care products. And then it's highly unfortunate that during that whole process of the six years of the medicines coming through the pipeline that we since the raw FDA in that realm didn't think about the animal plant health inspection service Center for Veterinary Biologic Vaccines, normal vaccines folks, with their excipients for preservatives and all that, that wasn't added in. So we would like to add that in at the very end, semicolon at the end, or approved by APHIS, the excipients. So excipients only for use in the manufacture of animal health care products, used to treat organic livestock when the excipient is blah blah blah, or approved by APHIS.

That is the reasoning. That is what we are proposing.

CHAIRPERSON MOYER: Thank you, Mr. Chairman. Other points of discussion? Chair recognizes Dan.
VICE CHAIRPERSON GIOACOMINI: The way you went through that discussion, just for clarification, the way you went through that discussion, you created in my mind anyway you created a separation between drugs and animal health care products. Are we covering drugs with animal health care products, or should we say animal?

MEMBER KARREMAN: I would - I would say that animal health care products is the more universal term. I would say you don't have to have an "and." If you want an "and" in there, fine. But I would think it would cover or. I mean maybe because we do specifically refer to FDA-type nomenclature after that, so maybe we should keep the drugs in there and animal health care products so - okay, or animal health care products.

CHAIRPERSON MOYER: Thank you, Dan, thank you, Hue. Any other comments or questions for the Livestock Committee on excipients?
Seeing no hands or hearing none,
Mr. Chairman, your next item please.

MEMBER KARREMAN: All right, the next one in my stack of paper here is annotation change for chlorhexidine, which is already on the list at 603(a)(6). The current reading is that chlorhexidine is allowed for surgical procedures conducted by a veterinarian, allowed for use as a teat dip when alternative germicidal agents and/or physical barriers have lost their effectiveness.

Chlorhexidine is a very common disinfectant. It's already allowed for teat dips in surgical procedures. Farmers do use it to cleanse cuts and wounds on animals from barbed wire or whatever. So the thinking is, as it reads now, it can only be used for surgical procedures by a vet or as a teat dip. So what we are thinking of doing is to recommend this change to say then, allowed as a germicide for medical and procedures. So we
are just putting the medical on top of not only surgical. Okay? That is the annotation change.

CHAIRPERSON MOYER: Thank you, Mr. Chairman.

Questions for Hue on chlorhexidine? Seeing or hearing none, Mr. Chairman, your next item?

MEMBER KARREMAN: Okay, next one on the list here is xylazine. This is also an annotation change to xylazine which is already listed at 603(a)(23). Xylazine is the way it's listed here with the annotations, the - it basically the annotation is, use by or on the lawful written order of a licensed veterinarian; or two, the existence of an emergency, and three, it goes through the withholding times. What this recommendation seeks to do is to delete the term, the existence of an emergency. Why is that? That is because Xylazine is actually used, first of all, it's infrequently used, but when it's
used it's not always for emergency. Such as,
if some farmer gets 10 new heifers in that are
a year old and they are not dehorned, and all
his cows are dehorned or foaled or whatever,
and those animals start using their horns on
the animals and really making a problem,
chances are someone is going to get called to
come in and take those horns off. Standard
procedure would be to sedate the animal with
xylazine, and then use a lidocaine, which we
have on the list already, and a local
anaesthetic block, and take the horns off.
That is not an emergency. That can be done
next week; that could be done in three weeks.
So that is kind of why we want to take off
only in the existence of an emergency.
I mean there are other things too.
There are emergencies of course where it is
used to sedate an animal, like with cut milk
vein where you don't want to get kicked in the
head when you are stitching it. But also
let's say a calf with a navel infection or an
umbilical hernia, you want to sedate it to
turn it upside down to do the surgery. That
is not an emergency. There are other examples
like that.

CHAIRPERSON MOYER: Thank you,
Mr. Chairman.

Any questions for Hue? Steve?

MEMBER DeMURI: Any idea why the
original listing said it was only for
emergencies?

MEMBER KARREMAN: Well, you
should read the background that was written.
I wrote the background. It's actually,
someone commented in a written comment where
it was really well spelled out. Because
basically I look back at the 2002 September
and October transcripts. They actually had
two meetings a month apart, and that was right
before implementation. And all those
medicines were just getting into the pipeline
that, eventually, six years later, got
approved. And the board did its best I'll
just say to understand how these pain
relievers and sedatives would work in a
regulatory setting like we sit at. And
butorphanol got on, that's synthetic morphine.
That is not under an emergency clause.
Because one of the board members said, you
know, we should let the vets do what they do.
They know what they are doing with these
prescriptive things. With xylazine they first
said only once in a lifetime. Then they said,
well we'll make it just for emergencies.
So it's an interesting transcript
to read. Anyway that is how it got on that
list.

CHAIRPERSON MOYER: Any other
questions or comments for Hue on the issue of
zylazine? Bea.

MEMBER JAMES: Just a quick
question, because I have no idea. The
withdraw period, does that seem right to you?
I'm just curious.

MEMBER KARREMAN: Yes, the
withdrawal period on zylazine and butorphanol,
that came on in totlazoline and flunixin and
some other long syllable words that are used
to relieve pain and suffering. All are twice
as long as the legal requirement for
conventional.

CHAIRPERSON MOYER: Thank you, everybody.

Mr. Chairman, we will turn the program back over to you again for your next item, keeping in mind that we may not get through this item before we need to take a lunch break, I'm not sure. So let's get started, and see where we end up. I know we are going to get off schedule here probably, but your next item.

MEMBER KARREMAN: All right.

Animal welfare.
A passion not of only mine, but of all the Livestock Committee members that I know of, and also one that is not here. And Jennifer is not here, and at some point I want
to read a little snippet she said for me to read if I remember how to do it.

Okay, animal welfare. First of all, there was some comment, I forget if it was written or verbal, that we are overstretching ourselves as a livestock committee to look into animal welfare and everything. And it should be reminded, and Deputy Secretary Merrigan did say this either two years ago or this past spring that they did not work on the animal welfare at that point because crops and retail type things were really the main things in organic, and they kind of left this door kind of be open, and now we have been walking through it.

But in OFPA 2110(d)(2) it says the NOSB shall recommend to the Secretary standards in addition to those in paragraph one for the care of livestock to ensure that such livestock is organically produced.

So we do have in the statute some backing for going in that literally animal
welfare.

We've been working on this for a full year with the discussion document in May and a recommendation now. And it was brought up originally in November of 2007 when Margaret Wittenberg and Kathleen Merrigan and Willie Lockeretz gave a formal presentation.

So what two years at this point.

The Livestock Committee, from comment, a lot of people are saying, hey, pull back, make it a discussion document. And we have been talking over the last day, and we do not feel we will pull back and make it a discussion document. We want to act on it at this meeting, at least as a first step. It doesn't have to be the whole shebang, but we want to - we have been working on this, and I agree 35 days or whatever it is, 40 days, is not a whole lot of time to comment. But it's also - we do a lot of work before that posting time, so then the commenters have to do a lot of work in that time they have.
It's unfortunate; I'm sorry. But - and sometimes we take too long and it's got to be faster.

Anyway, okay, due to the public comment, those written and oral, last night I reworked the document to take into account a - I think a majority of the public comment that has been presented, both written and oral. And I might have one that last night just for this meeting, just to help us go along. But I want to stress that the entire Livestock Committee really truly worked together as a team very cohesively on this through many Tuesday afternoons starting at 3:00 o'clock to 4:00, 4:30, every week.

And I want to also thank Rigo for writing the introductory parts to what we are having. That is not going to change at all. Okay, Rigo? Okay.

So let's see, so one of the things - so basically we want to make sure that there is a bright line in the everyday lives of
organic livestock so we can hopefully say and 
back up with regulations that organic 
livestock do enjoy a good life while they are 
alive on our certified organic farms and under 
our care. And we need to ensure and maintain 
the consumer confidence; that is a primary 
thing as far as this board goes, I believe. 
I guess I don't have to read 
Jennifer's comment, but that's okay. How 
about we get into it, since we got a lot to 
get into to, okay. 
So if we look at the 
recommendation as posted, and - sorry, I got 
to draw that up -- 
MEMBER JAMES: Hue, would you 
mind Jennifer's comment around just to the 
board at least so we can read it? 
MEMBER KARREMAN: It's 
electronic. It's just an email exchange. 
Okay, I'll read it. 
CHAIRPERSON MOYER: Yes, please, 
because Jennifer can't be here, and she was
invaluable in the discussion. If you can get her comments on the record it would be useful.

MEMBER KARREMAN: Okay. She says, hi, how are you doing, all that. I so wish I could be there for the cause and to thank you personally for so much great progress on the animal issues. I am stunned by the significantly negative response, and I admit that I haven't sifted through all of it but I've sifted through a lot.

My first response is that improvements must happen in farm animal care.

For those calling for a gutting of this, what is it that they want to achieve? If there is a real difference in animal treatment and health, starting from scratch right now will cause unthinkable delay. It has taken this long for group to attempt to address the issues. We started from a well vetted place - the new Canadian rice - crafted the rec in such a way as to minimize controversial rule change, and with the benefit of four daily
hands-on livestock professionals on the committee, granted weighted on bovines, but my response is, why not do all the very basic — why not do all these very basic things now. Get improvements in the lives of these animals and respect for life now, particularly one raised and taken purely for our benefit, and I'm not a vegetarian.

If there are legitimate issues remaining, it won't be difficult to find the support to overhaul later, but that will take years. Of concern, what is most important to the consumer? I represent a growing tide of omnivores who based on the questionable practices of the farm animal agriculture, prefer to purchase locally. It's not just a buy local movement, I can promise you. It's the assurance that I know, and I extend that comfort to my friends and my customers, the farmer, the animals, the conditions, et cetera, and that minimal or no suffering or undue harm, knocking, clipping, et cetera,
what nature gave them to survive, was a part of their life; or withholding treatment that would quickly cure something they do get. I seriously don't think that most people would mind if a farm animal raised for meat or producing eggs or milk got treated once or twice in their life for legitimate illness. It's the insanity of prolonged prophylactic treatment that got people so sensitized on the issue, and so desensitized hermetically to human antibodies. Treating them for things that they do not have purely because the conditions they live in are so subpar. I wouldn't change this about the rule, don't get me wrong. But pooling antibiotics acts as a backdoor and weak attempt to improve living conditions without taking it head on. We were finally taking it head on.

I believe that humane care matters more to people than whether the hay they eat is organic. Clearly whether they eat other animals or an all-grain diet for forging
animals matter. The slightly fertilized forage seems a little lesser harm than many things that occur and still carry the organic label.

Not to minimize the requirements of organic inputs, but it so marginalizes the many other life factors of a living animal.

There are plenty of films out there rapidly educating the public about living conditions and treatment of farm animals raised for food. It discourages me greatly that I cannot share with people any comfort that purchasing organic meats necessarily means they are directing their dollars to a higher bar of production when it comes to living conditions. They are required 100 percent organic food, which is great. But that food need not be the diet nature intended, nor does it guarantee living conditions or physical treatment of a higher caliber. Not enough that it seems enforceable, and not nearly enough to right the wrongs that can happen. I recognize
maltreatment may not be rampant, but I believe the percentage is likely consistent across organic and conventional if you take the sheer volume of animals. I believe a higher percentage of individual farmers in organic likely have higher standards on average. But it's still the big corporate outfits even in organic, that literally pump livestock of all kinds through their systems at unreasonable rates with low oversight or real care for the living animal.

I would very much - last paragraph - I would very much like to have minimum standards of care for organic livestock that are far superior to conventional, and that make a difference in pain and suffering and the quality of life the animal leads. That would justify a doubling of price, not the fact that organic feed just happens to be so hard to come by and inflates the price of a still potentially miserable existence.

I need a better guarantee. I need
more respect for life. I am not alone.

CHAIRPERSON MOYER: Thank you very much, Hue. I think that is extremely well written by Jennifer, and just an indication of the type of valuable contribution that all the committee members made during those seemingly endless hours of discussion to get to this point; certainly not made in a vacuum.

Joe, you also had a question?

MEMBER SMILLIE: The rewrite, has this been run through the committee yet? The rewrite that we are about to see?

MEMBER KARREMAN: No, but it's from public comment. I mean we are going to have to have a committee meeting I would think for this.

CHAIRPERSON MOYER: Chair recognizes Kevin and then Tina.

MEMBER ENGELBERT: No, just to answer, it hasn't, but it will. In the interests of time we want to get through it
right now with everybody, and then the
committee will reevaluate it.

CHAIRPERSON MOYER: All right,
Tina had a question.

MEMBER ELLOR: Pretty much the
same thing. We all have it in our email and
have had a chance to look at it.

CHAIRPERSON MOYER: Thank you.
Chair recognizes Dan.

VICE CHAIRPERSON GIOACOMINI: We
haven't seen the result of this, but we have
had conversations that led to this. So it's
not that it has been outside of the rest of
the committee just by the chair.

CHAIRPERSON MOYER: Thank you for
that clarification, that's correct.

MEMBER KARREMAN: I'm trying to
find that.

CHAIRPERSON MOYER: That's fine,
take your time.

MEMBER KARREMAN: And actually I
think that the public will like this a whole
lot better, than what they did. So if you go
down to the livestock health care practice
standard, 238, page four.

CHAIRPERSON MOYER: You didn't do
anything with terms defined?

MEMBER KARREMAN: No, I didn't do
anything with terms defined. Someone did say
they wanted a definition for carrying
capacity. I figured we had the group
together, we could get one out today, although
there are standard definitions for that in
ecology type books.

Okay, so on 238(a) where it said
that the producer must have a valid veterinary
client-patient relationship with a licensed
vet, I as a veterinarian, gutted that, okay,
because people didn't like that. But the
producer must have a working relationship with
a veterinarian or nutritionist, all right.

That would be new. So that for those areas
that you can't get a vet in easily, hopefully
you are feeding your animals correctly, and
it's not just totally by the seat of your pants. Hopefully there is some professional oversight.

In (a)(2) the Humane Society wanted in blue - that's the new additions. They want the feed rations sufficient basically to have resulting in appropriate body conditions. So that is where we addressed body condition, folks, and guidance can come up later. We can figure that out.

The food farmers didn't like the word, crowding, because possibly that would impinge mob grazing and other intensive grazing that is actually very good. So I added the word, indoor crowding, so that mob grazing could be done.

Okay, anything in red here, folks, is still what the committee put in earlier. The Human Society here in blue on five, once that procedure is undertaken employed best management practices and there were a few public comments saying that we should add in
the word, analgesics, to not leave them out.

That doesn't come up as well on my screen here. Are you guys looking at that at all on your computers? All right.

Physical alterations, number six, I added in blue, among the sheep tail docking and pig teeth trimming and castration, I added in beak tipping. And in number (6)(I) I struck beak trimming and, I struck those words, but we kept the de-toeing of birds is prohibited.

So the beak tipping is in for everybody that was talking about that, writing and verbally talking about it.

Someone mentioned in public comment yesterday that sheep museling, which is something I've never seen, but essentially you cut out the flesh on either side of the tail, I believe, for I don't know what ungodly reason. But they do it; I don't know why.

But anyway, that should be prohibited; that is now in there. Someone knows why they do it,
let me know.

MEMBER KARREMAN: For a fly strike, okay.

CHAIRPERSON MOYER: Just a minute. If there is a comment from the floor, Hue, and you want to hear it, if they would please approach the podium, state their name for the record, and what the comment would be, we'll entertain that.

MEMBER KARREMAN: Okay.

CHAIRPERSON MOYER: Do you want them to come up?

MEMBER KARREMAN: No, that's okay, museling is for fly strike. But so is tail docking, and we are allowing tail docking.

Go back to (I) up there, Valerie, (6)(I), where we now allow beak tipping - that is the correct word, right, poultry folks, beak tipping. On (6)(I) then we want to still actually keep beak - de-beaking is prohibited. So we could put in de-beaking and de-toeing is
Okay, so we had a V for museling of sheep is prohibited. Number seven stays the same. Number eight, added in from the Humane Society, monitoring of lameness, so we are talking about lameness, but not exactly how, just monitoring of lameness and keeping records of the percent of the herd or flock suffering from lameness and the cause.

We are not saying how much is the limit. We are not saying how you go about looking at it. We are just saying you better be monitoring lameness.

There was a small beef producer from Southern California I believe --

CHAIRPERSON MOYER: Hue, if I can interrupt you for a moment, I think we are getting ahead of --

MEMBER KARREMAN: All right, I'm just going down the page.

MEMBER HEINZE: You got ahead of Valerie.
MEMBER KARREMAN: I'm sorry.

MEMBER HEINZE: And apparently I'm the only person looking on this screen.

MEMBER KARREMAN: How far ahead am I?

MEMBER HEINZE: Did you catch that de-beaking? Okay.

CHAIRPERSON MOYER: It was just hard for folks to see what was going on on the screen while you were reading one thing, and something different was on the screen. We are caught up. Thank you, Hue.

MEMBER KARREMAN: Okay, so now we are on (b)(1) talking about phytotherapeutic. We struck the words, excluding antibiotics, because it was confusing from written and verbal comment. And the person in Southern California with some beef cattle mentioned, the same word, shall use the alternative products, really shouldn't be, but we put in, are encouraged to, so it's not like you must use the alternative treatments, but you are
encouraged to do that.

And then I think the AVMA mentioned something about these treatments as well. They are not proven or anything, so how can you say they are working. So I struck the word, working, and I put so that - provided that their therapeutic effect for the condition for which the treatment is intended is improving, clinically, and the farmer can see that.

Someone also again took issue that phytotherapeutic homeopathic are similar products, really are not proven to be effective. So I struck the effectively treating and put in promptly alleviating.

Someone else wanted to strike that the vet has to be there again, so me as a vet, I gutted, under veterinary supervision. So the farmers can just use things however they want.

Let's see, nothing has changed from our - oh, okay, number three, organic
livestock operations shall have a comprehensive plan to minimize internal parasite problems in livestock. Plan will include preventive measures such as pasture management, fecal monitoring and emergency measures in the event of a parasite outbreak. Parasite control plans shall be approved by the certification body.

We think, as the Livestock Committee, that is good. We think it was a certifier or some comments that shouldn't be in there. And I can tell you as a vet out in the field, the weakest link in the chain for organic livestock production with cattle is parasites, hands down, nothing else. So we're taking into account a lot of public comment, but some things do stay.

If you go down, Valerie, to (c)(1), the food farmers were asking in red there. It did say milk and meat from sick animals. They were asking, and probably rightfully so, what is a sick animal exactly?
Is it a Johne's cow, or is it a high somatic cell count cow? So they suggested just simply milk from animals undergoing treatment with prohibited substances cannot be sold as organic or fed to livestock - organic livestock. Makes sense.

On two, again we added the word, analgesics, because we hadn't done that, and they should be in there along with anesthetics and sedatives for surgical procedures.

Am I doing this okay, guys?

CHAIRPERSON MOYER: You are doing fine, thank you.

MEMBER KARREMAN: We jump down to number eight, and that stays like we posted it, that you cannot withhold individual treatment designed to minimize pain and suffering for injured, diseased or sick animals, which may include forms of euthanasia as recommended by the APMA.

Number nine, someone commented that, you know, the government already makes
sure that diseased livestock are not
slaughtered so we struck that, and we are
keeping sick or injured animals must be
identified and treatment recorded in animal
health records.

And then number 10, practice
forced molting or withdrawal of feed to induce
molting; that was a public written comment I
believe.

And then from the minority opinion
I brought up that essentially (d)(I), (ii) and
(iii), basically keeping track of why animals
had left the operation, keeping a list, you
know, why have animals left? What has been
wrong?

MEMBER MIEDEMA: Hue, what is the
number of that?

MEMBER KARREMAN: Ten, 10 then
goes to D. Okay? Are we all good? This will
be presented again tomorrow, folks, in the
gallery. So this is mainly for our discussion
here, so we're all on the same basis.
CHAIRPERSON MOYER: Dan has a comment.

VICE CHAIRPERSON GIOACOMINI: Hue, on number nine, that's under (c) which ends in must not, so you are saying you must not must identify. We are going to have to reword that one.

MEMBER KARREMAN: Thank you. That's simple. That is simple. Can you make a note of that?

So then that is the health care live 238 section, okay. Now what I did --

CHAIRPERSON MOYER: Hue, would you like to stop there maybe and get comments on those particular pieces?

MEMBER KARREMAN: Sure.

CHAIRPERSON MOYER: Rather than take the document in whole, because it is a rather lengthy document.

MEMBER KARREMAN: Yes, not a problem.

CHAIRPERSON MOYER: We covered a
lot of ground there. Just to see if there is any comment from the board.

Okay, so hearing none.

MEMBER JAMES: You guys are going so fast.

MEMBER KARREMAN: I apologize.

CHAIRPERSON MOYER: Question by Bea.

MEMBER JAMES: I just want, because you went fast, Hue, and it's in the one that you emailed us, under 6(I) you did put in there that debeaking is prohibited, correct?

MEMBER KARREMAN: Yes, that is the intent. I think I asked Valerie to put that back in.

MEMBER JAMES: Okay.

MEMBER KARREMAN: But we allow tipping, which is the more common practice apparently, the beak tipping.

MEMBER JAMES: Right, okay.

MEMBER KARREMAN: But not the --
MEMBER JAMES: Okay, I was just confirming that. And then on (b)(2) you took out synthetic medications may be administered, period. And you took out under veterinary supervision because?

MEMBER KARREMAN: Someone objected to that.

MEMBER JAMES: And all of the Livestock Committee agreed with that?

MEMBER KARREMAN: Well, let's put it this way. Like with the excipients, farmers use things for animal health care that are in their cabinet. They got some jug of blue juice stuff. They're going to use stuff without the vet being there. That's acknowledged.

MEMBER JAMES: The only reason I bring it up is because as we add more things to the list, like we are looking at doing tomorrow, I just want to make sure that that is the right direction; that it might --

MEMBER KARREMAN: (b)(2), you
said, Bea? Oh, there. Well, actually that's in direct reference to phytotherapeutic or botanical herbal medicines, and homeopathics. Oh, no, that's actually with synthetic medications may be administered.

I don't mind keeping that in. I was just responding to public comment.

CHAIRPERSON MOYER: Comment by Dan on the same subject, I assume.

VICE CHAIRPERSON GIOACOMINI: Yes. I think there are a lot of cases where an animal has gone down, or an animal is injured, or has an illness. The veterinarian gives the farmer one of these types of treatments. It works on that animal. Next time the farmer has a similar type animal, he is just going to go try that treatment, and he is probably not going to call the veterinarian before he does that. So I think in that case that is not under his administration and supervision, but it was under, you know, under that relationship that we sort of already - we
already had to pull out.

MEMBER KARREMAN: If you want to put a word in there like initially under veterinary supervision. Because you will always have some medicine left over, and that's exactly what they do. That's reality.

CHAIRPERSON MOYER: I think we heard yesterday that some folks don't have the luxury of having a veterinarian that understands the organic process nearly as much as some other folks may have access to. And our response was, our reaction was in response to the general public that made those comments.

Chair recognizes Kevin.

MEMBER ENGELBERT: Bea, I want to clarify, these are items that are on 603. And every farmer has to have a list of medications that they use. And there are instances and times when farmers are perfectly capable of making a decision on what an animal needs. And the time elapsed between trying to get a
1 vet there to confirm it and the time that it
2 is administered can make the difference in
3 whether the animal recovers or not. But it's
4 just simply giving the farmer the ability to
5 treat their animals on their own when they
6 know they have the ability to do so; that's
7 all it is.
8 I know your concern is about
9 abuse, but I don't see that.
10 CHAIRPERSON MOYER: And it's all
11 part of the organic system plan, materials are
12 all listed.
13 Okay, hearing no other comments,
14 let's move on to Section 205.239.
15 MEMBER KARREMAN: All right. So
16 for the livestock living conditions. What I
17 essentially did, you guys, was separate out a
18 mammal section from an avian section, okay.
19 I don't think it would behoove us to do every
20 species. We have aquaculture coming in, and
21 it's aquaculture. And they got their
22 sections. So I just called it mammal. And
then another section down later, avian, for living conditions.

Someone objected to 239(a)(1), rotational pasture, because the pasture rule is coming out; don't even touch that word. So it got struck. Also, and I renumbered these as I went down, because I took out the poultry, which would have been right below that number one. So anyway, the next one down, number two, is access to pasture for ruminants. I struck everything as far as the - what is it, animals per acre, stocking rate. Struck it all because of the pasture rule coming out. Everybody happy?

Let's see, number three, animals must be kept clean during all stages of life. I think that is a fair statement. They don't say how to do it. You guys can figure it out. Building areas for bedding and resting are sufficiently large, solidly built, and comfortable so the animals are kept clean, dry and free of lesions.
1 If bedding is an agricultural
2 product it's got to be in compliance with 237.
3
4 Number four, exercise areas for
5 swine shall permit rooting. We haven't head
6 from any swine people, so everything for swine
7 stayed in. So. Let's see, (b)(1), shelter
8 design to allow for, one, (I), basically I
9 added in from the Humane Society the terms, to
10 turn around, to fully stretch their limbs
11 without touching other animals or the sides of
12 the enclosure. So they're not cramped.
13
14 On going down to number two there,
15 I added in, housing pens, runs, equipment,
16 utensils, shall be properly cleaned and
17 disinfected as needed with approved materials.
18
19 So it's not, when you clean out
20 house every time or whatever, and that's why
21 number three got struck. And so that is too
22 prescriptive. And number four should become
23 number three, thank you, Kevin. Okay,
24 Valerie, everyone?
25
26 Number four it says, calves may be
housed in individual pens under the following conditions - it should be number three. Okay, so people objected to the "until six months of age." And I think the reason we were at the six months of age, because that is a legal time where right now the rule, they have to be allowed to go outside. And in all reality most people use the individual pens or housing until weaning; that is really the way it is, either two months or three months or whatever. But then they start bringing them together, if they haven't already had them in groups. But it's that weaning that the hutch-raised animals usually go to a group.

So that is why six months of age was struck, and weaning was put in, which will mean two or three months for most people; and again, struck at (I) and (ii).

Nothing else has changed from the posted document down through there except the numbering.

C, on page nine, the producer of
an organic livestock operation may provide temporary confinement for an animal - new wording here from the Humane Society - for the following reasons: temporary confinement may last no longer than necessary to safely perform the procedure or address the condition, as opposed to, we had in there, milking, shearing, breeding, hoof trimming or health care procedures, and I added in, and recuperation from an illness. They would allowed to be temporarily confined.

Someone wanted to have us define the term, dangerous, for dangerous weather. Gosh, I don't know, but someone did want us to define dangerous.

And then we go down to number five, (I), and we are looking at that table from the Canadians. And you can see that all the avian stuff has been struck out, because there was a lot of comment about that. But the mammal stuff is still in there. And we didn't hear much comment, or read about it,
about the mammalian space requirements. So the rabbit people weren't here yesterday to talk about their space requirements, they are down there.

Okay, that's the mammalian livestock section. What do you want to do?

CHAIRPERSON MOYER: We are going to take some comments here, and then we might break for lunch.

Comments on 205.239, Dan?

VICE CHAIRPERSON GIOACOMINI: One of the issues that was brought up yesterday, and we'll have to wait and see how you handled it entirely through the poultry, is a factor of investment versus the required change that this would institute, that these things would institute.

In - I'm trying to find it here, I apologize - (d)(1) in 239(b)(1) we add additional language to the ability to lie down. That would be included in what we can do - the housing of calves in number four, in
what is now (b)(3). The language that we
added I would certainly like the producers and
producer groups and certifiers to look at what
we did there and I know we are not looking at
costs; we are looking at animal welfare and
all those things; but the impact of what that
would allow for the size of a calf hutch
concerns me, and I would like - I would
courage the people coming up to give
comments on this today to include that
consideration.

CHAIRPERSON MOYER: Any other
questions or comments on 205.239? Chair
recognizes Bea.

MEMBER JAMES: The removal of -
under livestock living conditions,
205.239(a)(1) and (2), removal of reference to
pasture, pasture is coming but it's not here.
So we really don't know, it's a pretty big
leap of faith that we are assuming it's going
to be right around the corner.

MEMBER KARREMAN: I fully agree,
Bea, and that is why we originally put it in.

But there was very strong public comment to get that out of there; very strong. And I have to trust our new leader - he's gone - Miles, that this will happen.

CHAIRPERSON MOYER: Hue, I might suggest that what we do is put the word, pasture, back in, not necessarily using the word, rotational, put the word, pasture, in. Put brackets around it, and say, pending the NOP recommendations. So at least we have it as a placeholder so we are not ignoring the fact that it's critical to the conversation. So if we could just bracket it and put the word, pending, in there, we can move forward as a solid placeholder knowing that it's coming.

Chair recognizes Kevin.

MEMBER ENGELBERT: This is going to be a major rewrite. So there is going to be an ANPR and then public comment, et cetera, et cetera. And I would hope the pasture rule
is out long before this ever gets written as

a final rule.

CHAIRPERSON MOYER: You would

hope.

Follow up by Bea.

MEMBER JAMES: All the more

reason to make sure that we have it in there

with brackets. So you would put that under

one and two?

MEMBER KARREMAN: It's already in

two as access to pasture. And that's - a

lot of people say, ah, you know, the rule

could already be enforced, site two. So it's

already there. You know that whole stocking

rate thing essentially drove people nuts, and

that's why I took it out. To be honest.

CHAIRPERSON MOYER: Chair

recognizes Tracy.

MEMBER MIEDEMA: This is a

question for Hue, and a corollary to

Jennifer's impassioned advocacy on behalf of

the animals. On behalf of the farmers in this
new area, age of enforcement, we might see
rulemaking happen a little faster. And I
wondered if this recommendation had proposed
generous timelines for farmers?

MEMBER KARREMAN: Okay, that's an
interesting point. It brings up something we
had talked about in the hall a little bit
yesterday, some of us on the committee, is
that - and we are thinking mainly of the
poultry folks - that perhaps a middle ground -
again, I like middle ground - would be that
you know, I don't know how you would word it,
but basically how you have been being
certified up to this point with your existing
house as it is would be grandfathered. But
you build any more new houses, or let's say
you do a major new renovation, it's going to
be done with the new rules.

So I don't know if grandfathering
can be done, but that is something some of us
have talked about as a middle ground. Because
a fellow from Ohio who was here who told us
really a compelling story, and we don't want
to put anybody out of business. But we also
want to raise the bar, so that if he does get
another new house, then he would have to do it
according to this. But he can still have
however many houses he has and being certified
the way he is.

Does that help any?

CHAIRPERSON MOYER: That is
something we discussed.

Tracy, follow up?

MEMBER MIEDEMA: Yes, and I guess
this sort of argues against the point I was
just making, but I think we would create some
barriers to entry and we would create some
pretty serious competitiveness issues with
farms wanted to enter the market if the
established farmers had such a significant
advantage. I'd be more in favor of the kinds
of changes you are making, extremely generous
timelines to implement any changes; and also
just that we very careful to avoid
anthropomorphizing chickens, and that we don't
- you know, the fact that we like sunshine and
fresh air that we don't immediately assume
that chickens want to feel the sun on their
faces. Maybe they like their shadows, I don't
know. But I do really like the idea of the
outcome base matrix.

CHAIRPERSON MOYER: Joe, and then
Barry.

MEMBER SMILLIE: Yes, in adopting
a lot of your material from the Canadian
regulations, I think that was a very
interesting move. And I just want to report
that that regulation is being now implemented
in Canada, and it's going through bumps in the
road. And I was at regulatory meetings in
Canada when we had the same kind of
impassioned speeches from Canadian livestock,
including swine people I might add, quite a
few people who raised swine, and like the
dislocation of the actual facilities is having
a major impact. So I wouldn't be surprised to
see them have to take some actions like what
is being talked about under the word,
grandfathering, to allow for some sort of
orderly change.

So they have hit the bumps in the
road in terms of how they are going to deal
with them. I think the Livestock Committee
should keep track of it also, because you seem
to have hitched your wagon to their
interpretation of this.

CHAIRPERSON MOYER: Follow up by
Hue.

MEMBER KARREMAN: Just a quick
point on that. We have hitched our wagon to
it. We were encouraged to look at the
Canadian regs.

MEMBER SMILLIE: Just for general
information, just so everyone knows, all
certification agents are charged by the NOP
with reporting their current certification of
livestock and reporting on the stocking rates
for all U.S. certified entities, and that is
like part of the commitment from the U.S. to
Canada on the equivalency deal.

So we are reporting on our
stocking rates for future use.

CHAIRPERSON MOYER: The chair recognizes Barry, and then we will break for
lunch. Barry.

MEMBER FLAMM: Although I may be
sympathetic to the dilemma of the people you
refer to in proposing a middle ground. But I
think to add on to what Tracy said, there is
already a competitive disadvantage of so-called factory poultry producing and egg
producers have over the people that are
actually following or closely following what
we are proposing right now.

And I see it right in the market
place how you can get organic eggs for maybe
$1.50, $1.75 a dozen, and the local organic
producer has to sell it at a considerably
higher price. So there is already an
advantage, and I hate to see that continued,
even though I'm sympathetic. But you also
have to think that those decisions were made
with some judgment of what they were getting
into.

I like - I kind of lean towards
what Tracy said in terms of maybe having a
liberal timeline towards enforcement, but not
a grandfather; I don't think that's right.

CHAIRPERSON MOYER: Very good
discussion, and good points, Barry and Tracy,
appreciate that.

At this point in time the board is
going to adjourn for a one hour lunch,
roughly. Let's try to be back here at 1:30 if
we can. We are adjourned until then.

Oh, I apologize, I have one more
message I am supposed to read here. Katrina
needs the Joint Handling and Materials
Committee for one to two minutes before you
run out to lunch. One to two minutes. Thank
you. We are adjourned.

(Whereupon, at 12:39 p.m., the
above-entitled matter went off the record and resumed at 1:41 p.m.)

CHAIRPERSON MOYER: This meeting is back in session. We will continue our conversations with livestock.

Hue, if you want to carry on the conversation, I think we are still taking comments and questions on Section 205.239, that’s where we left off. If you want to continue that conversation Hue.

Are there any further question or comments from board members on Section 205.239 as presented by Hue just before we broke for lunch. If there isn't any conversation on that, I would suggest we move on to the minority opinion on the back. Oh, you still have more?

MEMBER KARREMAN: We have poultry to do.

CHAIRPERSON MOYER: I apologize.

Let's move on to poultry.

MEMBER KARREMAN: So the chart
has all the mammal space and outdoor run and pen space requirements. We struck out all the poultry again, the avian, and yep, now we are on - okay, the avian section on page 10 of 17 here, this was the part that was proposed and posted by the Livestock Committee, kind of short, but it's also been highly contentious as recognized by public comment both verbal and written.

I didn't do too much with it --

VICE CHAIRPERSON GIOACOMINI:

Point of clarification. You said page 10. Is that a new page that you have added?

MEMBER KARREMAN: Well, page 10 of 17 in mine here.

VICE CHAIRPERSON GIOACOMINI: You put it after the minority reports?

MEMBER KARREMAN: Oh, you want the minority reports --

CHAIRPERSON MOYER: No, no, we're just trying to find out where you are on our documents.
VICE CHAIRPERSON GIOACOMINI:

Where is it? You put it after minority opinions?

MEMBER KARREMAN: Yes. You want minority opinions right now?

CHAIRPERSON MOYER: No, no.

MEMBER KARREMAN: It's on page 15.

CHAIRPERSON MOYER: No, we're just trying to find out where you are at.

MEMBER KARREMAN: But we are not doing the minority opinion now.

CHAIRPERSON MOYER: No, we're not.

MEMBER KARREMAN: We are on page 10 out of 17.

CHAIRPERSON MOYER: Thank you.

MEMBER KARREMAN: Does that work?

Is everyone there?

So I didn't do much with the Livestock Committee proposal as such since there was a lot of comment. I did strike on
(d)(I), or on wire flooring, I struck that.

I added some blue written stuff from the Humane Society in (ii) and (iii).

But the main thing I want to get at, folks, is this. I came to the realization that the ACA group did a whole lot of homework on this poultry issue, and I had read their public comment before at home, and I read it again last night or this morning, I don't know what it was, and I said, you know, why don't we look at that, because the ACAs as a group interacted with the poultry producers from what I think, if they are certifiers, interact with farmers and all that; then as a group, there are like seven of them, I don't know off the top of my head, that came up with really I think probably reasonable standards. So I did the smartest thing to do, I just copied and pasted the whole thing, okay. So that the - on page 10 below where we had some contentious things about outdoor access as proposed by the Livestock Committee, and the
grass re-growing and all that, below there is the alternative from the ACAs. And we can go right all through that, but it is really copied and pasted from the public comment that was written, submitted; and the square footage for the pullets, the layers, the broilers, the turkeys and large birds are the numbers from that. And there are citations to the Canadian standards of humane farm animal care and the soil association. They also go into some detail about access to outdoors. Did you want me to go through every single one of these steps? I mean it is submitted written public comment, and it's been inserted.

What would you like?

CHAIRPERSON MOYER: I think a little more detail than you just did, but maybe not everything.

MEMBER KARREMAN: Okay, no problem.

So under (d), the operator of an organic poultry operation shall establish and
maintain poultry living conditions that accommodate the health and natural behavior, and then one, access to materials for dust bathing, adequate floor space areas, outdoor run areas to escape from predators, perches, and then they go and talk about - they kind of describe the perches somewhat, and that there shall be at least 55 percent of the birds at any one time on perches. Access to the outdoors, number two, they talk very nicely in number three about, ventilation must be adequate to prevent buildup of ammonia. We had nothing on that in our proposal.

CHAIRPERSON MOYER: Could you discuss outdoor access, because that was an issue yesterday.

MEMBER KARREMAN: It says access to the outdoors, shade, shelter, exercise areas, fresh air, direct sunlight suitable to the age of the poultry, climate and environment.

I think there is more on that, and
we can take questions of course.

For layers and mature birds artificial light may be used to prolong the day length up to 16 hours. Light intensity should be lowered gradually to encourage hens to move to perches or settle for the night.

Natural light should be sufficient indoors on sunny days so that any inspector can read and write with the lights turned off. So that the lighting issue, which is nice.

Suitable flooring: mesh or slatted flooring under drinking areas to provide drainage. That's it; we didn't have that. That makes sense. Houses with slatted cores must have minimum of 30 percent of solid core area available with sufficient litter for dust baths. That's good.

Litter must be provided and maintained in a dry manner. Birds must have sufficient exit areas appropriately distributed around the building to ensure that all birds have ready access to the outdoors.
Exit areas must allow the passage of not just one but more than one bird at a time, so it can't be these tiny little like cat doors where they can go in and out.

Complete cleanout of poultry house, we were trying to get that as well in ours. It was required if there's been adverse health issues from a previous flock. Otherwise it's got to be changed to maintain a sanitary environment, and then the table with the space allowance is shown. That was on page 11 of 17.

Access to the outdoors, under letter it, and I sequenced these letters in the form - so we went from D to E to F to G to H to K to L, whatever the alphabet is. Okay, so access to outdoors. Outside access and door spacing must be designed to promote and encourage outside access to all birds on a daily basis weather permitting. Producers must provide access to the outdoors at an early age, in order to encourage and train
birds to go outdoors.

We talked about pullets. Once layers are accustomed to going outdoors, a brief confinement period to allow for nest box training is permitted. Okay, this one I really liked, number two. Birds must not be confined to the house due to the quote unquote threat of an outbreak of disease. There must be a documented occurrence of an outbreak in the region or a relevant migratory pathway or state or federal advisory in order to confine birds. And I like that because there is not this perpetual threat out there that, oh, we got to keep the birds in all the time because there is AI, and there are some pigeons, and sorry, that don't fly for organic. But if a state's department of agriculture or federal officials say, we have a declared emergency in Delaware, in Maryland, fine. Then in those areas the birds can stay in. Makes total sense; but not continuously, because we know that's been a problem for some time.
Certifiers have mentioned that.

Producers must maintain record stock documenting periods of confinement, and identify in the organic system plan how they plan to protect the birds from disease and predators. Pasture-based type birds must be provided with access to a variety of vegetation, management must be - pasture areas must be compliance with 203 through 206. And they must be protected from natural predators.

Health care basically refers back to 238, letter J, health care, refers back to 238. Minimal trimming is allowed for protection of the flock, and must be done in a manner that minimizes pain and stress, not later than 10 days old. De-beaking and severe beak trimming is prohibited, which we wanted. Toe clipping or other surgical alterations are prohibited. And I do believe there will probably be some public comment or there was that some toe clipping is needed I think with older birds or breeding birds or something.
But we can revisit that again.

And here forced molting in poultry is prohibited. Withdrawal of feed to induce molting is prohibited.

This is nice, the next section as well. K, with the euthanasia, basically goes through allowed methods of euthanasia, and unallowed methods. I don't have to get too graphic on them, but they are all right there.

And then also carcass disposal,

what do you do with dead birds which of course do happen?

So basically that is the ACA's 239, inserted right there, and it actually, I think it pretty well speaks to what we were trying to get at as a committee. There may be some modifications minorly so that we might want to do. But I think that really does raise the bar in the way we want to go in a way that I know that certifiers were talking with the producers, at least that's my assumption. And therefore hopefully there is
public feedback on this one.

And then the final letter, N, the producers in organic livestock operations must manage manure in a manner that does not contribute to the contamination of crops, soil or water, under plant nutrients, heavy metals or pathogenic organisms, and optimizes recycling of nutrients. And that is in the rule already.

That's it, folks. Any questions?

CHAIRPERSON MOYER: Questions from the board, particularly on the poultry portion of this. Chair recognizes Bea.

MEMBER JAMES: I just want to compliment the Livestock Committee period for doing this. I think it's great, and it's a really excellent starting point for something that should have been implemented a long time ago.

CHAIRPERSON MOYER: Thank you, Bea.

MEMBER KARREMAN: Thanks, Bea.
Talking about starting points long time ago,
when we were talking about grandfathering,
when we were walking as a group for lunch,
probable the grandfathering would not be the
way to go. It would be more like a long lead-
in period. Otherwise if you grandfather, you
keep doing the same thing over and over
repeatedly forever, and we really want to see
the betterment. So somewhere we will put in
some time frame to get there..

CHAIRPERSON MOYER: Chair
recognizes Joe.

VICE CHAIRPERSON GIOACOMINI:
This is difficult. I really like in general
the recommendation. I think it's good. I
think we've got to go there. I'm a little
concerned about the process of rewriting it,
with dropping in whole alternatives at the
last minute. I think the process, I'd like to
see a little more input from the community on
this, especially as you guys are rewriting it
on the fly. We do that too, but this is some
big chunks of rewrite here, and they would
affect other comments that have been made.
I know you have taken into
consideration all the comments, but obviously
don't always agree with each other. And
I'm a little nervous on some of the
prescriptive stocking rates also. I know
that's caused consternation in the area. I
think the straight up animal - well, how do I
describe it? Some of the things in the
document I think are good and ready to go, the
de-beaking, I think that has been thought
through. But the stocking rates really don't
have that much experience with them, and I'm
a little bit hesitant to see the whole thing
go through as a recommendation without some
further discussion on it.

Again, while I do think that the
ACA proposal is an excellent one, that hasn't
had a chance to be commented on, and I just
don't know how much that was created in
conference with poultry growers. I know they
all were here yesterday, and their testimony was, you know, very interesting, and I just think we need a bit more time and thought on this one. I'm hesitant to push it through as the whole package right now because of the last minute writing of it.

CHAIRPERSON MOYER: Thank you, Joe. Do you have a comment on that, Hue, at all?

MEMBER KARREMAN: Should we ask if there are any poultry people here to ask what they might think about the ACA?

CHAIRPERSON MOYER: I'm hesitant to open the door for too much public comment. But I did paint that – maybe what we'd like to do if we can do it rather briefly, I believe Howard Magwire is still in the back of the room. If you could come to the podium and just answer one or two brief questions, and we do want to keep it brief.

I'm hesitant to have anybody speak for the entire industry.
MR. MAGWIRE: Yes, I am too.

CHAIRPERSON MOYER: But I know you do represent the United Egg Producers and so maybe you can address some of the issues that - Hue, you have a question.

MEMBER KARREMAN: The question would be, did you work at all, or do you know what the ACA has proposed, I guess.

MR. MAGWIRE: We also had this discussion at lunch. And again, not speaking for the entire industry, we still have a few companies here, not as many as yesterday, and some are very familiar with the ACA requirements or proposals, and we do think that going that way, I certainly want to echo what Joe said over here about the spacing thing. But we think that you've made tremendous good changes as opposed to I don't want to belittle what you did, but I think these are some good changes you've got in here. And at least when you first started this morning, we - oh my god, they're just
going to move forward with it and no further
discussion. But you have made it very clear
that there can be further discussions through
an advanced notice of proposed rulemaking, and
I think now that there is a document with the
changes you are talking about, is a document
that we can discuss and that's a good place to
go. And it's recognizing comments from both
the activists which I don't very often agree
with, but you very well heard from the people
who are actually involved in animal
agriculture, and we respect that.

CHAIRPERSON MOYER: Thank you.

MR. MAGWIRE: Did that make any
sense to you?

CHAIRPERSON MOYER: It did. If
there are any other questions for Howard,
again, I don't want to open the door for a
great deal of discussion with the public at
this time, but Rigo, if you had a question.

MEMBER DELGADO: Did you have any
input into the stocking rates table?
MR. MAGWIRE: No. May I ask for one correction?

CHAIRPERSON MOYER: Yes.

MR. MAGWIRE: It's contradictory in there, I know you didn't mean it, where it talks about induced molting or forced molting. And the second part of the wording is right, induced molting should only be used if there is not feed withdrawal. That is something that the industry is probably 100 percent of them are there now or they should be.

CHAIRPERSON MOYER: Okay, we can take a look at that particular line item. I think as you sort of indicated, as this process moves forward there will be other opportunities to make adjustments to things, as we present things, even if we vote on it today and it goes to the program, that point it's not carved in stone. They are going to work on it, rewrite it, put it out for more public comment. So there is opportunities for people to have input into the details of the
document once it comes off our table and goes onto theirs. So I would encourage you to stay engaged and your industry to stay engaged as this moves forward, and not to wait and sit back and wait for things to happen but to be a little more pro-active at this point, because it's obvious that it is the intention of this board to move that segment of the organic industry in line with the other segments as well, and we've been encouraged by the community to do that, and it is important to stay engaged from your side.

The chair recognizes Joe. Oh, just a minute, Hue, do you have another question?

MEMBER KARREMAN: Yes, on the wording on that, that was under (j)(4), health care, so it says, forced molting of poultry is prohibited, withdrawal of feed to induce molting is prohibited. So the second sentence you liked?

MR. MAGWIRE: Second sentence,
yes. So you induce molting but you don't withdraw feed which is a common practice until probably just a couple of years ago.

MEMBER KARREMAN: Is that different than the conventional egg producers if we have that in there?

MR. MAGWIRE: Conventional egg producers, if they are not on an animal welfare program, which is very few, they could still use feed withdrawal. The conventional egg producers must do it without withdrawing feed, to more emulate what happens naturally. And basically what you are doing, induce molting, as you know, doctor, you cause it all to happen at the same time rather than here or there. And the poultry experts out there, eating as much food, we just cause it to happen at one time. Whereas you can do it a lot quicker if you withdraw feed. But we know that is not the right way to do it.

CHAIRPERSON MOYER: Okay, thank you very much for coming to the podium. If
you could just restate your name and affiliation for the transcriber.

MR. MAGWIRE: Sure, Howard Magwire with United Egg Producers.

CHAIRPERSON MOYER: Thank you very much.

MR. MAGWIRE: And like I said yesterday, you have our attention. We will be engaged. Thank you.

CHAIRPERSON MOYER: Good. Yes, Joe?

MEMBER SMILLIE: Just for clarity I'd like to ask Pat Kane if she would to give us some background on the ACA alternative. I don't know if you have talked directly with her or not, Hue, but she can clarify how many people were engaged in that.

CHAIRPERSON MOYER: Thank you, Pat, if you could come to the podium, state your name and affiliation for the transcriber. And then if you could keep this brief, I'd appreciate it. Thank you.
MS. KANE: I'm Pat Kane. I'm the coordinator of ACA. We did try to engage as many people as possible. I believe we had about 10 clients that actively submitted comments. We also had comments from animal husbandry specialists that worked with organic producers. We did receive comments from the United Egg Producers, from IOIA folks, and some other inspectors.

CHAIRPERSON MOYER: Okay, questions in specific, Hue?

MEMBER KARREMAN: Specifically to that about how many egg producers or chickens or whatever would that represent? With your ACAs that were signed on to that, there were like seven or eight of them, can you give us a guess, estimate?

MS. KANE: I believe it was about 2 million birds we figured.

MEMBER KARREMAN: How many organic birds in the U.S.? What percent is that, roughly? I have no idea.
MS. KANE: I don't know.

MEMBER KARREMAN: Six million birds? So you got about 2 million, 30 percent, that's significant. Thank you.

MS. KANE: Any other questions?

CHAIRPERSON MOYER: Rigo?

MEMBER DELGADO: Yes, can I ask you a question.

CHAIRPERSON MOYER: Pat, if you could return to the podium, we have one more question from a board member.

Rigo, if you have your question for Pat.

MEMBER DELGADO: Yes, you did have input into the stocking rates table, correct?

MS. KANE: I'm sorry?

MEMBER DELGADO: The table here with the stocking rates, can you give us more background on how you came up with those numbers?

MS. KANE: Yes, our stocking
rates, we looked at EU figures, we looked at
the Canadian figures, and some figures from
the Soil Association. Initially our rates
were - our outdoor rates were as they are in
the table now - I'm sorry, the indoor rates
were as they are in the table now. Our
outdoor rates were considerably larger. And
based on the comments, we did reduce it to
equal the indoor rate, because most of the
producers said that not all of the birds go
outdoors at the same time. So we did adjust
it back towards the same rate as indoors. And
I believe those are the same requirements as
the Canadians.

MEMBER DELGADO: They are
somewhat smaller. I'm looking at the
chickens, for example. Canadian is two, and
you came up with 1.8 for layers. If my
numbers are correct.

MS. KANE: We didn't think they
were two; we thought they were 1.8.

MEMBER DELGADO: Nonetheless you
were able to compare different standards from different countries and come up with an estimate?

MS. KANE: Yes.

CHAIRPERSON MOYER: Rebuttal from Hue?

MEMBER KARREMAN: Rigo, there was a comment somewhere, written or verbal, it's all mashed in my head here, but someone said they thought we pretty just rounded up the 1.8 to 2 square feet that we had, and that would make a significant difference on a gazillion birds. So even though we thought it was like 1.8 to 2 ain't that much, let's just round up, it makes a difference.

CHAIRPERSON MOYER: Thank you, Pat, the board appreciates your time.

Any other questions for Hue?

Katrina?

MEMBER HEINZE: I just wanted to concur with what Joe said, that given all the public comment it is a little bit hard to
digest. So I support the idea of moving forward. But I'm just wondering if like there is some sections that had less comment and some had more comment, if maybe we could move forward, if we desire to do something, to move forward with some, and then table other parts might be an option.

My real question - that was a comment - my real question had to do with milking times per day. I know that was brought up in the minority opinion, and I believe we had some public comment on it. Did you make any changes in reaction to that?

CHAIRPERSON MOYER: If we could finish the poultry piece before we move on to that, I'd appreciate it. But then we will get to the minority opinion. Dan did you have a comment?

VICE CHAIRPERSON GIOACOMINI: I'm very comfortable with the vast majority of what we did. Moving forward, I am a little - not quite sure where I stand on this stocking
density. I'm wondering if that may be a part
that we can just pull back and rework and work
with industry. But we still get the majority
of things outside of crowding, the majority of
the issues of animal welfare into it. That
seems to be a big part of it. I don't know
how that goes over with the rest of the group.

CHAIRPERSON MOYER: I would
suggest that the Livestock Committee is going
to meet this evening, I know that, and we'll
regroup and make our presentation to the full
board tomorrow.

Hue?

MEMBER KARREMAN: Well, on that,
so you are saying basically that table with
the square footage out for now, let it be
worked on, but everything else seems okay to
you? Just so the public knows that that might
be what we are doing.

CHAIRPERSON MOYER: Now, I
believe the next order of business for Hue
would be the minority opinion on that document
and addresses what Katrina was leading into.

MEMBER KARREMAN: The minority opinion is on page 15 of 17. And basically the minority opinion agreed with the original opinion that we had written, but it didn't go far enough with regard to ensuring the health and well being of animals on organic dairy farms to exceed that on conventional farms.

I'm going to cede the floor to Kevin, since he was the author of the majority opinion.

MEMBER ENGELBERT: I don't want to read the whole minority opinion; just some key points.

The minority opinion believes that measurable numbers exist that can be used to monitor the progress an organic dairy farm makes for providing their animals with a stress free and healthy life. These numbers are tied together, and they are also influenced with each other. I believe that certifiers should provide their animals with
a list - or the dairy should provide their
certifiers a list of animals every year, and
also list what animals that have left the
farm. Right now there are some current
certifiers, if I understand it correctly,
don't even have to provide a list of animals.
If you are going to monitor the herd health in
a dairy farm, you need to have an image of the
animals that are on the farm in any given year
and the ones that leave the farm, the reasons
why they left the farm, and how those animals
are replaced.

It's been my experience that the
longer a farm remains organic, the healthier
the soils of that farm, and healthy soils lead
to healthy animals. So you should be very
easily be able to see the improvements in the
health of the animals and a lessening of the
amount of medicines that are used, and a
lessening of the amount of veterinary care
that is required. If these aren't being
observed, then it's my opinion from experience
that there are serious problems with the
operation; that too many times the welfare of
an animal isn't being monitored closely enough
by these figures.

It's also my opinion that a three-
times-a-day milking schedule, or a schedule
that is more than two times a day, is more
stressful on an animal, and it shouldn't be
allowed. There are implications to
reproductive health, to the overall health and
well-being of an animal; that the three times
a day, or a milking of more than twice in a
24-hour period is just too stressful for these
animals. They have to be healthy to milk
three times a day, that's true; but in the
overall picture they have a shorter life span;
they have more health issues; they don't breed
back as well; and they just simply don't leave
- we aren't maximizing their welfare or their
health and minimizing the amount of stress on
their lives. To milk more than twice a day
requires an increase in grain feeding, and
cows are ruminants, they are not meant to eat seeds, i.e. grain. And the more grain they eat the more stress they are under, the more likely they are to have health problems, to be constantly fighting acidosis, and the whole production mode just doesn't jibe with organic agriculture, and what consumers expect when they purchase organic diary products.

Lastly, we all know that providing proper veterinary care is an important part of animal welfare, but an even more important indicator of the concern for animal welfare are management practices that lessen the need for veterinary care. As a safeguard the consumers may purchase organic dairy products knowing that organic dairy animals are indeed treated with respect, and a true caring for their well-being. The minority opinion suggests the following additions to the Livestock Committee's recommendation.

In 205.238, livestock health care practice standard, (c) the producer of an
organic livestock operation must not, milk dairy animals more than twice in any given 24-hour period; (d) organic livestock producers must provide their certifier with the following list each year; (I) all animals on the operation during the current year, including a separate list of all purchased animals; (ii), all animals that have left the operation during the past year and the reason for their departure; (iii) all animals that have had a health issue, including hoof care, and the treatments that the animal received.

And then I offered a guidance document for certifiers, which states: the numbers provided to certifiers in the proposal to add 238(d)(I), (ii) and (iii) should be monitored, to determine the ongoing welfare status of the animals. If animals must be purchased and maintained in overall numbers, if animals continue to leave an operation for the same reasons, or if the same number of animals continue to require treatments or hoof
trimming each year, then there is reason to believe that the care of those animals is not up to organic standards.

Organic livestock operations that are following the letter and spirit of the law should show gradual improvement in these areas over time. Given the diverse nature of livestock operations, the differing health of their soils, and the different types and breeds of animals on individual farms, no set timeline can be established, but each operation should show real improvement.

The one area that I didn't address with this minority opinion is robotic milkers, which are not prohibited under organic livestock operations. And if this was to be adopted the two times a day milking, there might be something along those lines added that says, cows can't be forced to be milked more than two times a day, which under a robotic milking system that would still be allowed to be more than twice a day, because
they enter the robotic system on their own. 
Or if we wanted to keep this, then the robots 
can be set up so that the cows aren't allowed 
to be milked more than two times a day, they 
come into the milking stall, and if it's too 
soon they are simply pushed on through without 
being milked or without being given any grain. 
Grain is used as an enticement to 
bring these animals into these robotic 
milkers, and that therefore would also cut 
down on the amount of grain fat and therefore 
also lead to an improvement in the animal's - 
the health of the animal and their stress free 
- more of a stress-free life. 
CHAIRPERSON MOYER: Okay, that is 
the minority opinion to this livestock welfare 
document. Questions and comments? I see Bea 
and then Barry and Katrina and Hue. Bea. 
MEMBER JAMES: I was hoping to 
hear from maybe Hue or other members of the 
Livestock Committee as to why you did not 
adopt (d) (I), (ii) and (iii).
MEMBER KARREMAN: We did. That's what I wanted to - I raised my hand for Jeff. We copied that right up into - I'll find the page in a minute, but that was taken right into the majority opinion.

CHAIRPERSON MOYER: In our rewrite we pulled those three items out. We did not pull the two times a day milking out.

MEMBER KARREMAN: If I may respond, the food farmers did not mention anything on the two times a day milking. I understand Kevin's viewpoint. I personally don't agree with it, but it's controversial - it's not controversial, but I mean I understand it, but I don't - I don't agree with it. But the others, the (d)(I), the (ii) or (iii) are right in there.

CHAIRPERSON MOYER: Chair recognizes Barry.

MEMBER FLAMM: Thank you. This will be brief. Kevin, you really already covered what I was going to raise, but kind of
reinforces it. I have a European colleague, an organic farmer from Norway, and he raised the – he liked what you did. In fact he understood why you were recommending two times a day and thought that was a good idea. But he did point out the robotic milkers and how they may duplicate natural calf feeding and so forth. So he suggested to me that we ought to allow for that possibility and not rule it out, and you have already discussed that. So I wanted to reinforce that point.

But I generally support what you have done in that minority report.

CHAIRPERSON MOYER: Chair recognizes Katrina? Hue? Any other questions or comments regarding the minority opinion?

Okay, thank you. I guess at this point we would like to ask Miles McEvoy to come to the podium.

MR. McEVOY: Good afternoon. Nice to here. I have the pleasure to welcome Undersecretary Ed Avalos to the board. Ed has
been with the department now for I think two
weeks now? So I'm actually more experienced
than he is at this point. So he really wanted
to have a chance to meet the National Organic
Standards Board. And Ed, this is a really
amazing board that does an amazing amount of
work for the Department of Agriculture and the
organic community. They dedicate countless
hours to working on these issues of organic
agriculture, and come from all over the
country to devote their time to it.

Thanks for coming, and look
forward to hearing your remarks.

REMARKS BY UNDERSECRETARY EDWARD AVALOS

UNDERSECRETARY AVALOS: So

anyway, I'm Edward Avalos. And it is day
eight, and I'm excited to be on board. And I
have heard good things about this board. I
have some friends in the organic business.
They said really good things about the board,
and really pleased to be here.

You probably want to know that
today I did sign up on the Pasture Rule.

(Appplause.)

Where it goes from my desk I'm not really sure yet, but it's progress anyway. It's moving forward.

And I just wanted to emphasize that this administration is really focused on organics, the National Organic Program. We have tremendous support from Secretary Vilsack and Deputy Secretary Merrigan. And I want to assure the board that I also am very much in support of this program, and I work with Miles - I like that name, don't you like the name, Miles? It reminds me of somebody that should be out West.

But anyway, I pledge to work with him and move forward. And I think it's really great that the National Organic Program stands alone. In fact I was touring the offices yesterday trying to meet the personnel. You know USDA is huge. I didn't realize how large USDA was. And I was over at AMS, and I was
just kind of meet and greet with the employees, I wanted to introduce myself as a new undersecretary. And I saw the new facilities for your facility housing; it's very nice. It's nicer than my office. But anyway I just wanted to introduce myself, and the door is open if you have any questions any time, any of you who have concerns, call me, come see me.

Thank you very much.

CHAIRPERSON MOYER: Thank you. A pleasure to have you here today.

(Applause.)

CHAIRPERSON MOYER: Okay, Hue, the floor is back to you for your next item.

MEMBER KARREMAN: Okay, well, that was great news to hears.

CHAIRPERSON MOYER: Yes, it was, wasn't it? Since the livestock is still on the table.

MEMBER KARREMAN: Yes, wow.

Let's see, we are on to
agriculture. I'm trying to draw this up here, sorry. I had it. There it is. Is that me?

That all right? Okay. So we have finally come to the end of the agricultural saga, something like that. After many long years of the AWG working with various renditions of this board, we are pleased to present the recommendation for the bivalves or molluscan shellfish standards. The committee basically has accepted the agriculture working group's latest document submitted to us, which included them answering five very important questions which we posed to them last April I think it was. And you heard George Lockwood yesterday also mentioning the Monterrey Bay Aquarium's embracing the sustainability and the greenness of bivalves. Granted, that is not certified organic, but it lends good credence to their document.

I should mention, and I can go through this, but basically we had a split opinion on this document. And it left our
committee four to three; real split. And why was that split? That was due to a philosophical issue that basically just got played out in the vote. And it is that the majority, or what we are presenting as the majority from committee is saying that bivalves can be grown in very monitored protected as much as possible open water, like in bays and estuaries. Whereas the minority opinion or the other philosophy was essentially saying, hey, look we need a strict a management as possible for all inputs as well, because that is where organics is is the input to make a final product, and so the minority opinion generally was saying, shellfish are okay if they are on land or in ponds and containment tanks, that kind of thing.

Did that sum it up pretty good, Jeff?

CHAIRPERSON MOYER: Well, yes and no. We also included them in the minority
opinion as grown as part of a polyculture system in open waters where they are feeding mainly on the excess feed material from the fin fish operation or whatever other aquaculture crop is being grown with them in that polyculture situation.

MEMBER KARREMAN: Actually, to be honest, I apologize, I thought that was in the majority document.

CHAIRPERSON MOYER: It's in the minority as well. The main point of the minority opinion was that bivalves are filter feeders. They take whatever comes by in terms of the flow of water and are generally produced in tidal waters for the most part where you have tides moving in and out so you have water moving through the system. Very difficult to control, you can monitor but very difficult to control what passes through that system. Because it's not a highly managed system in terms of feeding the bivalves; they eat what comes by, and therein lies the
consummation with the committee.

MEMBER KARREMAN: But in the majority opinion people wanted to see the bivalves in their natural environment more than just on land and in tanks. So it was kind of like bivalves are technically livestock; they got to graze. They got to be out there. That kind of thing.

And also in the document on page 13 of the 24 pages, which we are not going to go all through if that's okay for time, but there is a very nice table of how conventional agriculture, all these different factors in management. And it shows a comparison contrast between conventional agriculture in one column and the proposed organic standard in the other. And that pretty much brought it home to the committee like this is truly very much different than conventional shellfish, bivalve aquaculture, and so that was a good addition that the AWG put in.

CHAIRPERSON MOYER: Thank you,
1 Hue.

   Any questions or comments or
2 points of discussion on this topic? Tina?
3             MEMBER ELLOR:   I'd just like to
4 say that Jennifer and I, and I'm just talking
5 with Jennifer here on the email, were very
6 strongly in favor of the AWG working group
7 recommendation, as it was written. We were
8 really happy and satisfied with the answers
9 they gave us to the questions, and we thought
10 that going to a containment system with all
11 controlled inputs was just headed in the wrong
12 direction for organic. We felt like it was
13 stockyard agriculture for clams.
14             CHAIRPERSON MOYER: Chair
15 recognizes Dan.
16             VICE CHAIRPERSON GIOACOMINI:
17 Yes, we had a number of different options,
18 even --
19             MS. FRANCES: I've asked for
20 help.
21             VICE CHAIRPERSON GIOACOMINI:
Okay. Even within the one minority report we had plans for possibly carving out two or three different versions of that. Yes, Dan Gioacomini, NOSB. Even I think a significant factor was public comment. We had only two public comments on the entire recommendation; both of them were strongly in favor. And we haven't heard a single sound of anyone objecting to this. In many ways it's a bit of a surprise, but it's substantial.

CHAIRPERSON MOYER: Any other questions? Chair recognizes Joe.

MEMBER SMILLIE: Yes, the comment yesterday that really talked about the turbidity of Chesapeake Bay and how creating an organic aquaculture bivalve system was like not only producing organic product in bays and estuaries, but also helping clean them up. And I really agree with Jennifer and Tina's comments, that put them into a CAFO operations is the wrong way to go. And I think we want to bring organic agriculture to the open bays
and estuaries like Chesapeake Bay, and this
one, good lord, we are not being picketed on
this one? You have a lot of support on it, so
I think it's really wonderful to be able to
move forward on this one.

And I just wanted to quote Winston
Churchill in opposition to Hue there, it may
not be the beginning of the end, but it is the
end of the beginning.

CHAIRPERSON MOYER: Okay, I'll
just comment a little bit on the minority
opinion and what our thought process was. It
wasn't to create bivalve CAFOs. No matter how
they are produced or where they are produced
they live in the same type environment. Our
goal was to include them in polyculture
systems where they are produced with fish. If
you look at what we said with net pens and fin
fish we indicated strongly that we felt
polycultures as a mechanism for cleaning up
and maintaining the environmental integrity of
those systems, bivalves could serve a very
integral part, so we saw them being in there.

The whole idea and the concept that we were discussing was that in conventional terrestrial livestock production we feed our animals 100 percent organic feed. When you are feeding fish we determined that they had to be fed 100 percent organic feed with the oil and fish meal concentration allowances that we made in our recommendation.

In the other parts of the aquaculture system again, all of them had to be fed 100 percent organic feed. If you are not feeding these animals, and we are not just talking about clams, we are talking about Dewey ducks and all sorts of things that can burrow deep into the tidal pools, several feet, how do we determine what they are eating? We can monitor what is passing by. We can tell what kind of contamination is there. We can't stop it. We can't change it; we can only determine that an event happened if we monitored the right point in time. But
1 knowing that tidal waters can move very
2 quickly it's very difficult to say that they
3 are eating, certainly not eating anything that
4 is organic, they are eating whatever passes
5 by. It could be construed as wild harvest in
6 a way, that they are harvesting wild. And so
7 in the context of that we thought that we
8 wanted to bring forward the minority opinion
9 to discuss and put on the table that point of
10 discussion. You don't just turn cows loose in
11 the woods to eat whatever they eat. We feed
12 them. And so it's a fed, managed and fed
13 system, organic is with livestock.
14
15 The chair recognizes Kevin.
16
17 MEMBER ENGELBERT: I also wanted
18 to present another perspective from the
19 minority view, just so you understand a little
20 bit more where we are coming from and how we
21 got to the point that Jeff just described. We
22 looked at these shellfish, they are livestock,
23 but the way they are grown is more like a
24 plant. They are planted, they are essentially
planted in the ground. They don't graze; they
don't move; they don't nurture their young;
they don't have faces. They can not
distinguish whether they are sitting in the
Chesapeake Bay or a confined system where
their feed is controlled.

If you took some out of a confined
system and put them into the bay, nothing
would happen. They won't move. They simply
are controlled in and out. And the minority
opinion got to that point by saying, well,
give those choices we would prefer to control
everything that they eat, because like Jeff
said, that is what organic is all about, is
managing - you are not guaranteeing the final
product, but you are the process. And we
thought we ought to at least bring to the
table that people think about, there are in
this instance because of the type of lifestyle
I guess you'd say or the way these animals are
raised we would prefer to see them the way we
described in the minority opinion.
CHAIRPERSON MOYER: Just one follow up sentence. The conversation did sort of analogize them to a greenhouse operation more than - you know if they are plants that are seeded, there is a little more control.

Dan.

VICE CHAIRPERSON GIOACOMINI:

Yes, the livestock committee worked pretty hard on this, and went around and around a lot of times, and we looked at probably close to at least four different potential scenarios, and the AWG recommendation came forth with as much the good faith of the board as wanting to give it the respect it was due. It did come forth four to three. I don't think that any of those other versions that we talked about would have come up to five votes. That is how divided the committee was with different points of view. The recommendation and separation from conventional, not having really organic feed to containment, the CAFO greenhouse situation of these kind of
creatures. I don't know if anything we would
have come up with would have had five votes.

        CHAIRPERSON MOYER: Chair
recognizes Tina then Hue.

        MEMBER ELLOR: And as the
Monterey Bay Aquarium comment pointed out,
this system is much more highly managed than
anything that is available in conventional
grown farm shellfish, and I think one thing
that Jennifer and I felt very strongly about
is that it would be really hard to reproduce
the great things that are in seawater in this
highly managed situation where they are
gathering their feed. I can't imagine
figuring out what's in there and palletizing
it would be a step in the right direction.
There is well managed, well sited, situations
that could be done really well, and it's very
clear from the recommendations where that
separation is.

        And the other thing we were
thinking about is these shellfish in
containment, and the disease and sanitation
issues that would bring up. And we just
innately very strongly felt more comfortable
with something that was closer to their
natural habitat, even their natural food, but
controlled. And monitored. And it's very
well controlled - not very well controlled,
it's well controlled. Better controlled than
any other system out there, and very well
monitored.

CHAIRPERSON MOYER: Chair
recognizes Katrina.

MEMBER HEINZE: I have a detailed
question, and thank you to whoever put this
table together to help us understand the
differences between conventional and what is
being proposed. This is actually the first
time I actually understand the difference.

CHAIRPERSON MOYER: That was AWG.

MEMBER HEINZE: It is incredibly
helpful.

I do have one question that now I
see highlighted looking at the table, on organic control points. One of the things saying this in the proposed standard is documentation of adjacent land uses including affidavits from contiguous land users that prohibited substances have not been applied during the past three years. Is that really practical and enforceable? So if I'm understanding that, that means I'm a bivalve farmer, whatever you would call it, so my neighbors, there are restrictions what my neighbors can do on their property? Am I reading that properly?

MEMBER KARREMAN: Perhaps someone from AWG could just answer that?

CHAIRPERSON MOYER: We do have George Lockwood in the audience. And if George would come to the podium, state your name and affiliation, and I think George can address that question better than anybody.

MR. LOCKWOOD: George Lockwood, chair of the Aquaculture Working Group. I'd
ask Sebastian Bell, who is also a member, if he's available to answer this.

Katrina, what is your question?

What page are you on?

MEMBER HEINZE: I'm on page 13. It's appendix A, it's your lovely comparison table. Under organic control points, fourth one down. And really this is a practical question about if we vote for this recommendation can it be implemented and enforced? Or is this little sentence going to be --

MR. LOCKWOOD: Basically what is going to happen here is, to meet the standards if anybody can, it's going to have to be a very rural and remote kind of operation. Chances are a grower might be up against a national forest, or a national park, and the aviary, the bee people, have the same problem, that oftentimes the certifiers will require them to get affidavits from the adjacent land owners that they are not using prohibited
substances.

So that is what we are insisting on here. And chances are it's going to be in a very undeveloped kind of an area, because everything else forces that. And what we are saying is, just demonstrate that there are no prohibited substances that are being applied on shore that are going to wash into the area.

MEMBER HEINZE: Thank you, that's helpful.

CHAIRPERSON MOYER: Chair recognizes Hue.

MEMBER KARREMAN: I'm thinking of Great Bay in southeastern New Hampshire, Durham area where I used to live and all. How does that work with contiguous landowners there? Because like the land, it's varied land uses. And yet you have - I mean how far into the land would that have to be? Is it right at the edge? Is it 25 feet back like a little buffer zone that you have an affidavit. Or is it the whole seven acres that that
landowner has? I'm just kind of curious now
that you brought it up.

MR. LOCKWOOD: And Hue, I don't
think in the situation you described you are
going to find somebody meeting these criteria.
It's going to be a remote area, something away
from development, where these proposed
standards are going to work. We have excluded
a lot of potential coastline.

MEMBER KARREMAN: Well, the
question though, with the adjacent land use,
I mean there are buffer strips in organics
between land. So let's say you have a
homeowner, and they've got seven acres. But
right along the water line, for whatever
reason, they just don't do anything, it's
natural. So is that bit, or is it the whole
seven acres the guy owns and he put some
pesticide on his lawn out front?

CHAIRPERSON MOYER: Well, Hue, if
you are looking at me, I think that gets to
the heart of the matter of why we had the
minority opinion, recognizing that upstream
and downstream as the water moves it brings in
material it could be from miles away that come
into the Chesapeake Bay. I mean there is no
way of knowing, and that gets to the
philosophical part of our differences, and why
we had a minority opinion.

Chair recognizes Joe.

MEMBER SMILLIE: I know we've had
this argument many times, but the same thing
happens in the land-terrestrial agriculture.
The air moves around the whole planet. Water
moves around the whole planet. People who
irrigate from the Colorado River have the same
issues that anybody setting up in aquaculture
has. Water is the only medium through which
contaminants are carried.

CHAIRPERSON MOYER: I understand
what you are saying. But these things, they
can't move, they just sit there the whole
time. And air moves relatively quickly. They
sit there in the water.
MEMBER SMILLIE: Crops don't move either, and they can get contaminated.

CHAIRPERSON MOYER: I understand what you are saying. That was the point that - a good discussion point that we had.

I'm sorry, Kevin and then Barry.

MEMBER ENGELBERT: Just one quick point, though, Joe, is that the air that is moving around, people are also subject to that. We are talking about them buying a product that has been subject to contaminants that they aren't exposed to where they're living for the most part. That is the difference. I understand your argument, but there is a difference because the contaminants that these shellfish may be exposed to sitting in the Chesapeake Bay, someone that purchases them up in Vermont isn't exposed to unless they buy that shellfish.

CHAIRPERSON MOYER: Chair recognizes Barry then Tiny.

MEMBER FLAMM: I think George
really addressed the question we are talking about right now, because he said the areas that qualify are very limited if any, I think you said, and that they are essentially probably wild areas. And you mentioned parks or national forests, areas in which the headwaters could in fact be pretty much pristine.

So I think George pretty well laid out the parameters that are quite limited. I got competition here. That's okay.

Anyway, I just urge that you think about and hear what he said, and then some of this discussion is not necessary.

CHAIRPERSON MOYER: Chair recognizes Tina.

MEMBER ELLOR: And also consider that we are providing an alternative to conventionally grown shellfish, which is a much better alternative.

CHAIRPERSON MOYER: Any other questions for George? Or George, do you have
a final comment?

MR. LOCKWOOD: Well, a couple of times the Chesapeake Bay has been cited. I seriously doubt if there are very many areas of the Chesapeake Bay if any at all that would pass the mussel watch tests that we're requiring. This really is a substantial difference in these big bodies of water that are adjacent to human activity than remote areas which is off – an island off the coast of Maine, for instance, where there is very little activity. And if the island is off the coast of Maine, remote islands, we think that is where these standards will be practiced.

CHAIRPERSON MOYER: Thank you, George, I think that's valuable information.

Final comment, Hue?

MEMBER KARREMAN: The final comment, the technical thing I was going to say is that what we plan to do tomorrow is, you know, put our majority opinion up for vote for the board, and if it passes, great; if it
doesn't we are going to have to do some mechanism so we vote on the minority one, okay, just so people know that ahead of time, and Dan will figure out how to do that.  

CHIEF JUDGE MOYER:  Okay, thank you, Hue.  Next item on your livestock report, anything to say about 2012 sunset materials?  Nothing really?  

Hue, Dan has volunteered to do that for you.  

VICE CHIEF JUDGE GIOACOMINI:  Everything on 603 and 604 is up for sunset next year, here, except for methionine which has to drop dead.  But everything listed regardless of how it got there, over about half a dozen different documents, they were '07 for '12.  

CHIEF JUDGE MOYER:  Thank you.  Hue, my understanding is, that completes your report?  Thank you.  

Chair recognizes that we are only about two hours behind schedule now.  And we
1 still have some difficult items to go over.
2 At this point in time I turn the podium over
3 to Katrina for the Joint Materials Handling
4 Committee.
5 Katrina, the floor is yours.
6 JOINT MATERIALS & HANDLING COMMITTEES
7 MEMBER HEINZE: Thank you. And
8 you all thought that was fun.
9 Valerie, before I start, do you
10 have the presentation I emailed you a couple
11 of minutes ago? Hang tight, everyone. I
12 recommend everyone stand up, stretch their
13 hands really high to the sky, we are not
14 taking a break; we are just getting the blood
15 flowing.
16 That was great.
17 Okay, everybody.
18 CHAIRPERSON MOYER: Enough
19 stretching. Take your seats. We are going to
20 get started right away.
21 MEMBER HEINZE: So when I do that
22 in a manufacturing plant third shift, none of
them do it. So I'm very operated. Our
operators on the third shift, when I ask them
to stretch never do.

We are now going to move on with a
hopefully lively discussion on classification
of materials. So as Valerie brings up our
presentation, I just want to say that this has
been a long and passionate debate for the four
years that I have either been watching or had
the honor of being on the NOSB.

Yes. And you can be on slide #2.

We have had really wonderful engagement by
lots of different folks; lots of different
recommendations; lots of public comments. I
really want to thank the members of the
Materials Working Group led by Kim Deitz and
Gwendolyn Wyard, for their countless,
countless hours over the last year and a half
of meetings and discussions and debate and
papers. I am not going to go over the
recommendation page by page. I am just going
to hit the intents and the highlights. But I
would ask people to look at all those
documents that are referenced in our document.

Okay, so moving on to our
recommendation, that before we kind of get
into the nuts and bolts, we have had some
really good detailed public comment. And so
it is the intention of our committee, we met
this morning, so you will see some changes
later that we made then. Reaction to public
comment, we are going to meet one more time
before tomorrow. We have a couple of other
things to wrap up.

But I will try to highlight those
comments. Okay.

So next slide, Valerie. So our
recommendation is really divided into four
parts. So there is guiding principles, there
is some regulatory language change related to
synthetic and non-synthetic, there is
regulatory language change associated with
agricultural and non-agricultural, and then
there are some NOSB practices that we are
recommending that this board take up. So first to start with the guiding principles. And really there are three, and these are very similar if not identical to the ones we talked about in May. So the first is that interest in process are equally important in determining the classifications of materials. So that second, as a result, the same material, depending on its source or process, can be either agricultural, non-synthetic or synthetic.

And then our third guiding principle, and this is one that we are still having some discussion on, it was our intention with the scope of our document to really make sure that folks knew this third one, what the intent was of the third one. And we obviously from public comment didn't do as good a job on that as we wanted to. But the intent of the third guiding principle is that if a material is classified as synthetic, then regardless of
source it is synthetic. So I have a visual that will address this in a sec. But if you look at the second bullet point which is something we've added, it is that if a material is manufactured in full compliance with the final rule, it was our intent that that be outside the scope of this principle and our document. So the status of those materials with regard to their use in organics should not be affected by our recommendation.

Next slide, Valerie. So this is not a decision tree; not a decision tree. This is just a pictorial representation of what we are trying to do. So if you start at the top square, we have all materials, so the whole universe of materials. And then based on a set of definitions, which you can see in our recommendations, that world is divided into synthetic materials and non-synthetic materials. Okay? And then from there those non-synthetic materials are again divided into those that are agricultural, and those that
are non-agriculture, again, through a series
of definitions. So that is what we are trying
to do.

Next slide, Valerie. So first
let's look at synthetic and non-synthetic.
And again the definitions are in the
recommendation, and we can pull them up during
our discussion later.

What the majority recommendation
says is that a material is classified as
synthetic if the use of a synthetic leads to
a chemical change in the process or there is
a synthetic present and that synthetic is not
on the national list.

So what does this really mean? So
extraction, we talked a lot about extraction,
and that was discussed in great detail by the
material working group. So if a material is
extracted with a synthetic that is not on the
national list, it's - the material is not
necessarily synthetic. It would only be
synthetic if chemical change happened or that
synthetic was in the final material at a significant level.

Then second, extraction is broadly defined by these definitions. It's not just solvent extraction; it's also mechanical and physical separation, so the example there would be if you centrifuged, pH adjustment is one that will come up later. Oh, yes, so that would be the third point. Chemical change does not necessarily include processes like iron exchange or pH adjustment if the final material is not different from the initial material. Right? So something that is pH adjusted and pH adjusted back and you get the same thing at the end, that is not chemical change.

And then there is formulated products. So there are materials on the list - dairy cultures would be an example, vitamins and minerals are examples - where the material doesn't really exist by itself. It exists where you purchase it or use it in a
1 formulated product. The other ingredients in
2 that formulated product have to be non-
3 synthetic, if they are synthetic then the
4 material is synthetic.
5
6 And then finally in our
7 recommendation we know that the definition of
8 significant level is really important, because
9 we are saying that if the synthetic is not
10 there at a significant level than the
11 materials non-synthetic. The material working
12 group had a lot of debate on significant
13 level; we had debate on significant level. We
14 tried to come up with something that worked.
15 We did get public comment that we need more
16 work on significant level, and so it's our
17 intention to continue with that.
18
19 So let me explain our rationale a
20 little bit. So we went with this
21 recommendation for several reasons. One, it's
22 most closely aligned with what's happening in
23 the industry today, and has been since pretty
24 much the beginning. So if you look back at
early boards, this is how they made decisions about synthetic or non-synthetic, starting in about '95. So this is very consistent with how decisions have been made in this industry. It maintains the status quo, so it's the least destructive to the list, both to the list and to the practices. Because if you remember, most classification decisions are not made by this board and don't show up on the list. They happen everyday in crops and livestock, when someone is looking at whether a material is non-synthetic and can be used in crops or livestock. So this matches what's been happening there. Okay, next slide.

But we do have a minority opinion, and I wanted to highlight this because it reflects a lot of discussion that happened at the material working group, and a lot of discussion that happened in our committee, and I want to make sure the board has time to discuss it as well.
So the minority opinion as kind of paraphrased by me and hopefully during discussion we can talk about this as well, is that if a synthetic is used, then the material should be classified as synthetic, period. So the arguments for this is this is really about transparency. This is black and white; it's very clear to a consumer. We are not going to have a lot of disagreement about this classification. But it has really significant impact. There would be a lot of materials that would be reclassified that are in use today that would be reclassified from non-synthetic to synthetic. So at the end of the day while something this clear is attractive, we just did not feel that this was practical, and it would reverse years of practice in our industry.

So that's synthetic/non-synthetic.

So if you go - next slide, Valerie - okay, so now if you take that definition of synthetic, so there is chemical change or it's formulated...
and has a synthetic in it, all those are now synthetic. What's left is the non-synthetics, and so from those non-synthetics we have to decide which are agricultural and which are non-agricultural. So next slide, Valerie.

Okay, so we are going to take a little time out for products with naturally occurring biological processes. These have troubled us throughout this whole discussion, and even so fundamentally that we don't know what to call them. So first a little arrow, I'm just going to bring the board's attention to this that we got some public comment that said, what's included in this category, what's not. We had discussion among the committee. We are calling them products with naturally occurring biological processes. We don't have a better term. These include the microorganisms as well. So we just beg your patience that we don't have a good term. This morning off the record I called them the biological thingies. We just don't have a
good term. But the microorganisms and the products and their processes.

So what we said about them is, the source and processes are highly varied, so if you look at something as relatively straightforward as yeast, there is the yeast where in Belgium you can take your pot of whatever and capture your yeast and make some of the world's best beer to something sitting in a vat in a chemical laboratory; a huge variety in source. Similarly you have a huge variety in process.

The reality today is that if you look at the technical reports that we've looked at on these materials, they lack the depth and breadth to help us understand all those sources and processes. So we didn't really feel that today we had enough information to categorically make decisions, to say all yeast is this way, all bacterial cultures or dairy cultures are this way and should be classified this way. We need more
information. So we are really taking a pass on these right now.

So our recommendation is to defer making categorical decisions, develop the technical information that we need, but we want to create a pathway so that those products in naturally occurring biological processes could be classified as agricultural, because we believe some of them are. So to do that we are recommending deleting "or bacterial culture" from the definition of non-agricultural, so that those could be agricultural. Maintain the classifications on the national list where they are today, but ask for a petition.

So we are signing up for more work, we acknowledge that. We want petitions on these biological things so that we can better understand source and process, and start sorting through the complexity. And to do that will allow us to be more transparent in how those are classified. So that is our
We heard some public comment yesterday from Grace Marroquin on yeast. We have asked her to make sure that the petition is resubmitted, so that we can really do a deep dive, and make a classification decision. So that is what we are doing on products in naturally occurring biological processes.

Okay, so next slide. So we are back to our pretty picture. We've taken on synthetic. We have pulled out all the biological things. Now we are left with ag/nonag. Next slide. And really we said, this is pretty easy now. Things that are sourced from agriculture get classified as agricultural. Everything else is not agricultural, or nonag.

There is a pretty big effect, so we wanted to highlight that. PNOBP is products of naturally occurring biological processes, sorry.
Okay. So the effect of our recommendation in agricultural/non-agricultural is that the agriculturally sourced materials currently - or some of the agriculturally sourced materials currently on 205.605(a) which his non-synthetics, would move to 606., because they are non-synthetic, and they are agriculturally sorted.

We think this is a great thing because it means commercial availability is in effect now for those. We think handlers should step up to the plate and prove that an organic option isn't available. But that would be the effect of doing that.

So we do have a definition of non-agricultural substance that we recommended. Now it's time for a mea culpa. We had a copy and paste error in our recommendation which led to lots of public comment, so we apologize for that, but thank you for reading it.

What we proposed is that non-agricultural substance - you see the current
definition up there - we deleted "or bacterial culture." We deleted the second sentence, which is about kind of the substantially transformed. What we proposed was a product such as a mineral or an atmospheric acid does not originate from an agricultural system. We had a lot of comments that, well now you have to define agricultural system.

What we meant to propose was that it's a product such as a mineral or atmospheric gas that does not originate from agriculture. For the purposes of this part agricultural refers to the production or handling of crops or livestock, so we haven't had time as a committee to get together and make sure that we all really meant to do that. That is what we talked about doing, but like I said, we made a copy and paste error in our final document.

So hopefully by tomorrow we will have this fixed. Okay. So to walk us through - next slide - some examples, so to walk us
through some examples I want to highlight first the green row. WE also got a lot of public comment about the synthetic definition and its impact on materials that meet the final rule. And Gwendolyn yesterday brought out the bleached soy lecithin that is not commercially available and what that would mean.

So we have been playing around in the last 48 hours with adding a sentence to the definition of chemical change, and that is reflected here in this green row. So I'll just walk you through it. So soy lecithin bleached just a quick reminder, which you should all know from our last meeting, this material is, you have a physical separation of the either solvent extraction physical separation of the soybean oil from the soybean meal. The oil is then extracted. You get soy lecithin which you can bleach.

So the first question is, does the substance undergo a chemical changed? It's
bleached, so yes it is a chemical change. If you look at kind of our intended modification, the question would be, is that an allowed synthetic or not. In this case it is, so the answer would be yes. So the next question is, is the substance created by an actually occurring biological process? No. Is the substance formulated with a synthetic? Not on 205.605(b)? No. So then is the source of the material agricultural? Yes.

So the first questions have to deal with, is it synthetic or not? And then the last question is, is it ag or not. So this was if you say the hydrogen peroxide is a chemical change that meets our definition, then it's synthetic. If you go with a little change you are recommending, then it would not be synthetic. So this one is a little bit tricky and will require more discussion.

So let's look at soy lecithin, deoiled. This one is much more straightforward. So does the substance
undergo a chemical change? Here the answer is no; this is acetone extracted, the acetone does not change the lecithin and is not present at a significant level. So today there is no other method to extract the oil. But wouldn't it be great if someone could come up with a way to do that. So because acetone is used this material cannot be certified organic. The classification isn't about certification, it's about how a material is classified.

So soy lecithin deoiled, there is no chemical change with the definitions and the recommendation. So that chemical change stuff goes away. Not from a naturally occurring biological process. And the product is not formulated.

So it is not synthetic. But it is sourced from agriculture, so it is classified as agricultural. So as a handling material, this would go on 606, commercial availability applies. Handlers have to now, each time they
use it, demonstrate that an organic version is not available. Hopefully that will put pressure on the industry to come up with a way to do this without acetone extraction. And that's our desire.

Okay, the last one I'm going to go through is soy protein isolate. Hopefully I'll get this right. So the key to this one is that in the process an acid is used and a base is used to do pH adjustment. The first one precipitates the soy protein out of solution, so you can do some washing and rinsing and other things. The second pH adjustment puts it back into solution. I think that is right. The material doesn't change. You are just adding and taking off protons. So no chemical change, and then it flows like the soy lecithin, deoiled. Again, this is agricultural. So those are some examples.

I can see lots of frowns in the crowd, so hopefully you will have good
questions for us. So that's how our
definitions play out.

And again pretty consistent with
what's happening today. I tried to pick some
of our troubled ingredients to highlight how
the committee made their decision. So we'll
let that cook in everyone's brain there for
awhile.

I want to just wrap up talking a
little bit about NOSB practices. We made
recommendations on three practices that we
think the NOSB needs to take up so that
classification can be more consistent.

One is we want to go back to
taking two votes on all materials, and this
got strong public comment in favor of it. If
you go back and look at transcripts from early
on in NOSB history they always took two votes
on every material. So the first vote was, how
should it be classified? So someone would
move and say, I move that - name your material
- is classified as synthetic, and there would
be a vote.

Once it was determined what the classification was, then there was a second vote to determine if it should be - what should happen to it. Should it be listed, not listed, printed, allowed, whatever needed to happen.

I think having two separate votes, and the committee felt having the two separate votes added clarity to the classification, and kept the two decisions from getting muddled together. Because classification is not about, should it be allowed to be used or not. It's just classification.

Our second recommendation is annotations, and we recognize that a full out use of annotations is not the way we want to go. We are just saying we want to course correct a little bit, that there are some places where annotations are really important to highlight what source and what process was reviewed, and is being listed; that if we
don't - there are cases where not using an annotation is just as confusing as not using it. So we want to be mindful of that, and be more thoughtful in our decisions about annotations.

And finally what we've learned through all this is, materials are very hard and they are really complicated and there is a lot of detail. We just really need to refocus as a board on really understanding those details, and this is really about having good TAP reviews, and we got resounding comments from the public that we should do that.

Okay, so finally just some public comment. Generally everyone supported the document. There were some concerns about scope that we heard talked about yesterday with regards to, did it affect things like soy lecithin bleached? What about a material that is 95 percent organic agricultural inputs and 5 percent things on the list? So we need to
do some tweaking to adjust to that.

Strong support for developing a guidance document. The NOSB practices, there were a few comments concerned about the direction of the minority opinion, but even more broadly the majority opinion of reclassifying so many things as synthetic that we just put industry at risk. So we had some comments that way.

There was a question about commercial availability, and applying that to 205.605. That was a recommendation that has been made several times by the material working group, or it's been one of the options. And I apologize we neglected to kind of cover that in our recommendation. We did talk to the program, and that is just not an option that they felt was available to us at this point, so that's why that wasn't our recommendation.

There was a concern about CAS numbers. One of the definitions that talks
about the identity of a substance, use CAS numbers as an example of how identities could be determined. It was purely meant to be an example, so you'll see some changes trying to clarify that.

We already talked about concerns with the definition of agricultural. That was brought up by a number of commenters. And there is a comment specific to yeast, that you heard yesterday, that yeast is non-plant life. There is a couple of comments asking us to clarify 205.270(c)(2). We do know that that's out there, and that that question exists. It is our intention to collaborate with the program and address that in our guidance document. So I don't want you to think we have forgotten that request.

And then finally we need a better definition of significant.

So with all that, here is what we are recommending needs to happen next. We need to do a little bit more work on the
definition of nonag. We need to take a little
look at the definition of chemical change with
regards to scope. Hopefully we will have
those done by tomorrow.

After that we need some rule
change that we would collaborate with the
program on. Most importantly we need a
guidance document so we will be working on
that. Our recommendation has some very
specific comments about timing. We don't want
to hopefully pass the recommendation tomorrow
and then have ACAs going out and making all
sorts of decisions that are disruptive to the
industry. So it's our intention that the
recommendation not be implemented until a
guidance document is issued officially and
finally by the program. In the meantime
everything would stay as it is on the list.

We do know there are some changes
to the list, so the recommendation kind of
talks about timing to execute that. And then
we have more work on those biological things.
So that is it. I know it's a lot, I know it's a lot to digest. We really appreciate the folks who read it and their comments, and all the questions we have gotten from board members since our recommendation has come out. So there you go.

CHAIRPERSON MOYER: Thank you, Katrina, very well done.

I remember soon after I started on the board somebody said to me, it's so simple, just write the definition and vote on it. It ain't so simple. I really want to commend Katrina, her joint committee members, and the greater community for all the countless hours of working on this. If you just heard that report and your head isn't spinning, imagine hours and hours of trying to get to this point. I mean I gave up long, long before these folks did, and I commend them for staying at it. It's important work, but it is extremely complex and complicated. So Katrina, I appreciate all your hard work and
your team that you assembled to do that,
inside the board and out, is extremely
important.

Okay, what I'd like to do is see
if there are any comments or questions. I
know all of the board members have gone
through this process more than once, so that
we could do it online. We did it in some
conference calls. We did it on Webinars. We
did it every which way we could. It is
complex and confusing, and it still leaves me
wondering how we did it.

MEMBER HEINZE: So what I was
going to suggest, if Valerie could put up that
part two document I sent you. So this is our
recommendation with the few modifications that
we made this morning, that I can go over when
folks want. And we can open it up for
discussion.

CHAIRPERSON MOYER: Okay, and you
might want to - I know there are two minority
opinions?
MEMBER HEINZE: Oh, yes.

CHAIRPERSON MOYER: So I think we should probably hit on those too. But before we go to the minority opinions, is there any questions or comments that board members would like to make in regards to what Katrina just presented? Everybody has had their shots?

Okay, I don't hear any, Katrina, so the minority opinions.

MEMBER HEINZE: That just means I confused everyone.

CHAIRPERSON MOYER: No, I don't think so, you've done a great job of unconfusing us.

Do you want to go over the minority opinions?

MEMBER HEINZE: I guess I would leave it for folks. I kind of felt like I did those in my discussion.

CHAIRPERSON MOYER: Okay.

MEMBER HEINZE: We had two of them. One was more specific to our
synthetic/non-synthetic. They wanted it to
more broadly include more things in synthetic.
The other was the definition of nonag, I
suppose more the definition of agricultural,
that it shrunk non-synthetics, and that would
have an impact on crops and livestock.

CHAIRPERSON MOYER: Do you know
if the writers of those minority opinions want
to make any comments?

MEMBER HEINZE: I do not.

CHAIRPERSON MOYER: Bea?

MEMBER JAMES: I would like to
hear from the people who did write those, and
just get their input as to some of their
concerns.

CHAIRPERSON MOYER: Yes, I think
they are sort of hanging out there, and I'd
like to get a little more information. I
guess that was what I was trying to do. Dan.

VICE CHAIRPERSON GIOACOMINI: I
wrote minority number one. My concern with
the document, and I agree with 99 percent of
it I would say, but it does create a shrinking of the nonag portion of non-synthetic. There - in the writing of the regulations as I've gone over them a number of times the past couple of weeks most of these restrictions with on the crops side are written as non-synthetic. So using the first criteria cutoff if you remember of the box on the right being non-synthetic, if we agree that what the thing talked about in the crops regulations were fit into that box, I think we are reasonably okay. On the livestock side, however, we still get back to the things that were touched on a little bit with Grace yesterday. We have the change in the way the regulation was written from OFPA that all feeds must be organic, to all agricultural products must be organic. And when we shrink that non-synthetic section and we say, or which - in this - the way we are talking here becomes the lower criteria, set of questions. When we are looking at the things on the bottom right, that box in
regards to feeding livestock gets much much smaller. And the number of things that are kept in the just simply the agricultural box gets much larger. She's got it up there now. And I'm concerned that we could have a tremendous amount of problems and implications down the road because of that. I understand the basis of the recommendation, the handling and processing side, and the value of commercial availability. I wish there were some other things - there may be some other things we can talk to the program about also, but I'm concerned with the livestock side. We have a requirement that if it's ag, it has to be organic. And we have just expanded the things that are in that ag square, because we have eliminated the transition. There is no transition when you are dealing with anything to do with livestock the things that you see on 605(a) of the egg white lysozyme and all those other items, they are not non-synthetic anymore. They are
either synthetic or they are agricultural.

And I am just concerned with what it's going
to mean. I can't give you an example because
I don't know, but it makes me very very
uncomfortable.

CHAIRPERSON MOYER: Thank you, Dan.

Katrina?

MEMBER HEINZE: So Dan your

concern, we've talked about this before but I
just want to make sure, I'm still hearing it
right, your concern is that with making those
non-synthetics that are non-agricultural very
small, we've in essence increased those non-
synthetics that are ag, and the impact for
livestock is, if used in feed they have to be
organic.

And so you're concerned about the
unintended consequences of that down the road?

VICE CHAIRPERSON GIOACOMINI:

Well, there's two sides to that actually. One
is as you say the unintended consequences of
that. Essentially everything - most of the
things - how do I put this? - if they were
from an ag origin and they were in that non-
synthetic box, they are now either
agriculture, and would have to be organic, or
synthetic and have to be on the list. We lose
them both ways. So they would either have to
be relisted on 603, or we can't use them
unless we have organic, because of the way
things are written. All agricultural
products, and we don't have commercial
availability for feed.

And I'm not promoting that we do;
I'm just saying there might be some subtle
ways of looking at things that would not
necessarily be causing huge loopholes.

CHAIRPERSON MOYER: Chair
recognizes Katrina.

MEMBER HEINZE: So is the fix for
that how we classify them, or figure out how
to address the feed requirement?

CHAIRPERSON MOYER: Dan.
VICE CHAIRPERSON GIOACOMINI: I think the answer to that would be how ingrained the industry and the program is in ever looking at that change that was made. My concern is that the willingness to do that is probably small.

CHAIRPERSON MOYER: Is there anyone on the board who would like to speak representing minority opinion #2? Kevin?

MEMBER ENGELBERT: Yes, I wrote minority opinion #2. Briefly I'd like to touch on what Dan spoke of. As those of you who have been at these meetings know, I don't share the concerns that Dan does on minority opinion #1. In the interests of transparency, if these materials become available and they have to be organic, the industry will adapt, and they will become available to dairy farmers or any type of farmer, crop or livestock. So I don't share that deep concern. But I understand why Dan does.

The minority opinion #2 basically
I think this results from, as we heard a speaker say yesterday, if you are a chemophobe then you might not agree with this recommendation. And I guess that I will probably say I am a chemophobe. As part of — without going into details I know what exposure to chemicals can do to you at a young age all the way up to early adulthood, what it can do to your metabolism, and the implications on your health. And I think that organic agriculture, while we are not a zero-tolerance program, and we don't guarantee an end product that should still be our goal.

And the first paragraph of this minority opinion #2, there is a big typo. I'll just read through this first paragraph because I can't really add much to it. First and foremost is there is a decision to define synthetics in such a way that even those that are on the national list are allowed in processing as long as there is no chemical change and the synthetic is not present in the
final material at a significant level.

Somehow the word "not" got added into that first sentence, and it shouldn't be there. Even synthetics on the national list are contaminants, albeit those that are acceptable for a specific use and hopefully only until a more satisfactory alternative becomes available.

In my opinion the NOSB should not be attempting to determine significant levels. If a synthetic is present at all the material should be deemed synthetic. And because humans cannot measure all substance levels precisely enough if a synthetic is used the resulting material should also be considered synthetic.

And again back to what I lead in with, organic consumers expect organic food they purchase to be different from conventional food, and to remain true to organics and organic principles. Even though no chemical change regardless of how it's
defined takes place, the use of synthetics
violates the trust that consumers place in the
organic label.

Another opinion has to do - or
minority opinion has to do with the definition
of non-agricultural substance. That is
somewhat alleviated since we discovered our
faux pas. And that is not as much a concern
now as it was an hour ago.

And lastly the minority opinion
there is also - has a minority opinion that
care should be taken to differentiate between
substances used in crop and livestock
production, and those that are used in
handling, processing or packaging of food.
The decision on substance is made by the crops
committee on October of 1994 to allow
synthetically derived botanicals as non-
synthetics and unlisted might have been
misguided. The NOSB should not use that
decision today to justify the use of processed
material which could end up on store shelves,
either through decoding or packaging, or in 
the processing of those foods.

There is a big difference between 
using a substance to produce food and using a 
substance that may end up being directly 
consumed by humans due to its presence in the 
food or on the packaging. The substances 
should be brought out into the open and not 
hidden behind the veil of inerts or 
biological processes, or a so-called lack of 
chemical change. All ingredients in an 
organic product should be classified and 
listed on the label regardless of their 
origin, how little may be found in the 
product, or if the material was used in 
handling and processing.

And that pretty much sums it up.

CHAIRPERSON MOYER: Thank you, 
Kevin. Thank you, Bea, for asking for that.

Are there any comments? The chair 
recognizes Katrina.

MEMBER HEINZE: I just wanted to
thank both Dan and Kevin for writing a
minority opinion. It was so important given
all the debate we had that that debate be
transparent, and that the rest of the board
understand it. These are not easy decisions.
There are no wrong perspectives. It's just
that the decisions have effects, or
ramifications, that we need to understand. So
we wanted to make sure that those
ramifications really got discussed and people
really understood them as they made a
decision. So we have been told - I don't
think asked is the right word - told by you
out there sitting at the tables that we need
to make a decision, and we need to make a
decision two years ago. So we understand
that. What we have also come to understand
is, not everyone is going to agree with it.
So we just have to - it's our job sitting up
here to make that decision.

So we wanted to make sure those
minority opinions got expressed so people
understood them. So thank you for doing that.

I know it was extra work.

CHAIRPERSON MOYER: Chair recognizes Dan - I'm sorry, recognizes Bea.

MEMBER JAMES: Katrina, wow, that's great work. It's kind of mind boggling. So bear with me on some of my questions, because I'm not an expert by any stretch of the imagination.

Can you elaborate a little bit more on the point that you made on one of the minority opinions about the use of a synthetic not on the national list of approved synthetics should result in a material being classified as a synthetic? And that you had made a comment that that would have drastic ramifications with a lot of reclassification and work. Just explain that a little bit more if you would.

MEMBER HEINZE: Sure. So I'm not a crops and livestock expert. And I'm not going to pretend to be one. But when we
looked at it for awhile in our debates we called them option #1 and option #2, so I'm going to use that terminology. So option #2 is the minority opinion. When we were looking at option #2 really what it says is, if you use a synthetic then the material becomes synthetic. So if you use hexane to extract it or acetone to extract it, or you use sodium hydroxide to do a pH adjustment. And in handling that doesn't have a lot of effect because everything we use have to be on the list somewhere, so it just moves them around on the list. So there is going to be work for the board, but it's not like there is a whole bunch of new materials that have be evaluated. They just need to be moved around.

But the concern came up on crops and livestock where non-synthetics are mostly not on the list today. And as we look back at the historical records, the first ones that came to our attention was botanical pesticides, so pyrethrum would be an example.
So it is extracted with hexane, the hexane is not present in the finished product. So it has been for many many years classified as a non-synthetic. So if we went with option #2 that material - and I have a couple of other examples, but I'm sure other people have much more comprehensive lists than I do - that material would be reclassified as synthetic. The people who are using it today, they have been using it. They don't use it without limitations. Those - people still have to use their organic system plan. They still have to have all their good practices in place before they use stuff like that. But it is in use today. So today the hexane extracted non-synthetic is in use. Because presumably people need it in their collection operations. So if we went with option #2, here is what I think would happen. A whole bunch of those materials would get reclassified as synthetic. The people who need them for their livelihoods and for their operations would petition the
board to have those listed. So the board would have to review the materials, and they would get put on the list, presumably that's what's going to happen.

And I'm not saying we shouldn't do the work, but that is going to be a lot of work to kind of maintain what's happening today. And then the other concern we had is, we get these all the time, for putting all the synthetics on the list. And that's going to be a lot of beating up for maintaining the status quo. In my opinion. That is not necessarily the committee's opinion.

CHAIRPERSON MOYER: Bea, you had a follow up question?

MEMBER JAMES: So by not doing that we are just not telling the public that there is some synthetics, but by doing that we would be transparent; am I hearing you right?

MEMBER HEINZE: Well, we're still telling them, because we are saying here is how a synthetic is defined, and here is how a
non-synthetic is defined.

MEMBER JAMES: But you just said that it's currently happening and if we had to list everything it would take a long time, and it would result in a big list which wouldn't look good but we are doing it.

MEMBER HEINZE: That's why we have a minority opinion. There are differences of opinion on that.

CHAIRPERSON MOYER: Chair recognizes Julie.

SECRETARY WEISMAN: I just wanted to follow up for Bea. I get the feeling that you think that the "it" that we are doing right now is non-synthetics are allowed in crop production. And the definition that has been functioning all this time has been, except where it's annotated on the list, okay, because there are some things that are for use where it specifically says, non-synthetic solvents only. But other than that things can be extracted with synthetic solvents. And it
has been that way all along.

CHAIRPERSON MOYER: Any further questions or discussion? Barry?

MEMBER FLAMM: I'd actually like Kevin to respond to the latest comments on the extraction. I find your minority opinion very compelling, straightforward, easy to understand, and it seems like that's what we ought to be doing and should be doing. But - and I don't see in what you've said that perhaps this extraction problem is really an issue. But I wish you'd address that.

CHAIRPERSON MOYER: Kevin.

MEMBER ENGELBERT: I will as best I can. It's my belief that the human body is more sensitive to chemicals and substances than we can measure. We are sensitive to things down to the level of parts per billion that can't be measured. So even though we would say that this was extracted with a synthetic, and it's all removed, I don't really think technically we can absolutely
guarantee that down to the micro levels that a human body can detect, or can - is susceptible to. And that is basically my point. I think that our organic needs to be an extremely high bar. I don't think that consumers when they purchase a product expect something to contain a substance that was extracted with a synthetic or a chemical. But if it is, even though there may be some pain involved for the industry, I think that needs to be transparent, that that should be - we should be up front about it.

CHAIRPERSON MOYER: Did that answer your question, Barry?

MEMBER FLAMM: Yes.

CHAIRPERSON MOYER: Chair recognizes Bea.

MEMBER JAMES: So maybe these two things aren't related. But I'm trying to get my head around that we are saying nanotechnology and nanoparticles are bad, and we are saying that we should go ahead and let
synthetic extractants be used, and that's just
the way it's always been.

Chairperson Moyer: Katrina,

would you address that?

Member Heinze: We're not letting
solvent extractions be used. We are codifying
what's happening. And has been.

Member James: But we're not
classifying them as a synthetic, and we are
saying that we shouldn't go down that road.

Member Heinze: Because they are
not present in the final material. So in my
mind they are not present. We said if they
are present, it's synthetic. But they are not
there any more.

Chairperson Moyer: Chair
recognizes Julie.

Secretary Weisman: I think to
some extent this - the expectation is that
there are no synthetic ingredients. Right?
And so this is the debate about processing.
What is processing and what is an ingredient.
And it's not any - I guess I feel the way you are asking the question makes it sound like there has been some subterfuge going on which I don't think is the case. OFPA is very clear about synthetic ingredients not being used in organic food. And what we are talking about right now are not ingredients. Maybe that is what you are questioning, but that is what I would say.

MEMBER JAMES: In my opinion, if I could just respond, if you use a chemical, a synthetic chemical to extract hexane for instance on what was it soy protein, okay, there is a fine line between it being an ingredient and it being part of the process, and do we pay attention to that, and that is my point.

CHAIRPERSON MOYER: Thank you, Bea.

Katrina.

MEMBER HEINZE: So I want to make sure the board is clear on this. Remember
this is classification and not allowed or prohibited. So ingredients in food are 605 and 606. They are handling. You have to be on the list. Right? So if there is material that is hexane extracted it is not certified organic; cannot be certified organic. So it must, if it's going to be used in food, be reviewed by this board. So that is handling.

If you're crops and livestock,

different deal. So pyrethrum is a good example. Your hexane extracted. You can be applied to a crop. Because it's not, the material is not synthetic; the hexane is not there at a significant level when that material is used. But also on crops and livestock you are - those - it's not like someone is injecting the pyrethrum into the - I know nothing about crops - is the apple? I'm sorry, I just have to make this up.

Right. It's not like people are injecting it into the produce, and so it is one step removed. It's not in the food. So I think if
you look at those early boards who made that decision I think that is how they thought about it.

But this is classification; it's not - are people going to ingest it. Because if they're ingesting it, it's on the list, it's in handling.

CHAIRPERSON MOYER: Chair recognizes Tina.

MEMBER ELLOR: So based on what you just said, let me ask this question, so any insecticide such as pyrethrum that are formulated with inerts, which all pesticides are, all of a sudden will become synthetics because they contain synthetics?

MEMBER HEINZE: That's correct.

MEMBER ELLOR: So all botanical pesticides that contain inerts or are extracted will now become not natural but synthetic, or not non-synthetic?

MEMBER HEINZE: The inerts are allowed synthetics. So then - right? So
since they are allowed synthetics, so that's okay. Her response was a heavy sigh.

CHAIRPERSON MOYER: Okay, chair recognizes Dan.

VICE CHAIRPERSON GIOACOMINI:
Yes, going back to the big picture on this, just something that I've thought about with it, and we've addressed one issue with the program, and they came back with a very legalistic no. But I'd like them to reconsider it, and I'd like the people who find the study of materials in organic part of their elixir for immortality and what keeps them going to think about this, that in this recognition of source and process it's very likely that in the current structure of the national list, unless it has also changed, we would also have something with the same name, in three different places within the handling framework of the list. Something could be on 606, 605(a) and 605(b). We understand the statement, the program has already said that
commercial availability is mainly part of 606, the agricultural. And we also understand that the program has basically discounted order of preference.

What I've thought about, to save this board and future boards, because it will be much more long after I'm gone, I can just imagine that when this goes through the absolute bombardment of petitions that we are going to get so that something can be listed in every possible place. And I would like the program to consider and people who really look at this stuff to consider the possibility that the listing on the handling portion of the national list, not commercial availability and not order of preference, in a way it would be the reverse of that, but it's for lack of a better term the worst possible version allowed. So that if it is listed on 606, only the agricultural version is allowed. If it is listed on 605(a) an agricultural version of the product is allowed, and a non-synthetic
version of the substance is allowed. And if it's on 605(b) it can be any of the three. I know there are implications within OFPA and review and every thing else. But maybe there is a way that we can creatively structure our review process so that that can become the result, because otherwise we are going to get bombarded where with everything that is already on there, we are going to get two or three more petitions, two more petitions, and everything that comes before us is going to come forward in two or three forms.

CHAIRPERSON MOYER: I'm going to ask that that be the final word for now on this topic. I know we could go around for days and days and days; we have, we will. We are already as I mentioned about two hours behind schedule. I am going to suggest we take a break now until 4:05. We will resume promptly at 4:05, and start with the handling committee report.
Keep in mind, we do have public comments this afternoon and evening yet, and we'll already be here until 7:00 by this clock. So please be prompt to return to your seats.

(Whereupon, at 3:51 p.m., the above-entitled matter went off the record and resumed at 4:09 p.m.)

CHAIRPERSON MOYER: This session of the board meeting is reconvened. And we'd like to start immediately with the report from the Handling Committee, Steve DeMuri, chairperson. Steve, if you are ready, the floor is yours.

HANDLING COMMITTEE

MEMBER DeMURI: I am ready.

Thank you, Jeff

Want to first thank Katrina for the great work she did on that last session.

(Applause.)

MEMBER DeMURI: Can you hear back there? Is that better? I will have to put
the mike in my mouth I guess.

What I was saying was, I wanted to first congratulate Katrina on a great job on the Joint Materials and Handling work that she has taken on, very very complicated and complex subject, and we all appreciate it very much.

What we have on the docket today for the Handling Committee are 10 sunset items. There are three in 205.605(a), seven in 605(b) and nothing from 606. And what we did was, we split these up over almost a year ago now to start looking at them and investigating them. So I will have the folks that did the primary investigation on these items explain them to the rest of the board in preparation for tomorrow's vote.

So we'd like to start off first of with egg white lysozyme for 605(a), and that is Tracy.

MEMBER MIEDEMA: Thank you, Steve.
Egg white lysozome was added to the national list in fall of 2006, and it was added to 205.605(a). Right off the bat I will tell you that we are recommending relisting.

I guess technical aspect of this that is a little unusual is that a TAP review was performed on enzymes, plants and fungal, and that is what our colleagues back in 2003 use to review this material. So I just want to be very upfront on that point. We have a tradition here of accepting - we have a precedent of accepting the work of past boards. And they deemed that TAP sufficient.

How much detail shall I go into about this material itself?

CHAIRPERSON MOYER: Well, in the interests of time, I know we are way behind, why don't you try to keep it brief. I think everybody has probably read the recommendations.

MEMBER MIEDEMA: Okay.

CHAIRPERSON MOYER: So if there
are any questions after you are done, we can
pick up any questions there.

MEMBER MIEDEMA: Sure, okay.

Egg white lysozyme is a purified
enzyme preparation. It's extracted from hen
egg whites. It's a natural enzyme microbial.
The most typical food applications are for
cheese and wine. The materials that are
alternatives for this are generally considered
to be more harsh preservatives such as
formaldehyde, nitrates, nitrin or hydrogen
peroxide.

We - those of us who were present
unanimously voted to relist, and one person
was absent.

CHAIRPERSON MOYER: Thank you.

Good summary. Anyone have any questions for
Tracy?

I've got one question, Tracy. I'm
assuming that you have reviewed the 2003 TAP
and you also determined that you didn't need
any additional information?
MEMBER MIEDEMA: As a class of handling materials it seemed to cover what needed to be covered.

CHAIRPERSON MOYER: Thank you. Steve?

MEMBER DeMURI: Thank you, Tracy. Hearing no questions on that one we will move to L-malic acid. Katrina handled that one for us.

MEMBER HEINZE: I just wanted to start by saying that if I get to be known as the classification person I'm going to be grumpy.

Okay, L-malic acid, we reviewed L-malic acid for relisting on 605(a), non-synthetics allowed. L-malic acid was added to the national list, also in the fall of 2006. After review by the NOSB. This is the first time that it's up for sunset.

L-malic acid is used as a flavor enhancer, flavoring agent, and for pH control in a variety of foods. The original TAP in
2003 actually reviewed three forms of malic acid. The TAP determined that DL-malic acid was synthetic, and recommended that it not be included on the national list. So in reaction to that, and after more work on the TAP, the TAP determined that L-malic, so the L version of malic acid, was naturally occurring and non-synthetic. So it's naturally occurring in fruits such as apples or cherries. So given that it was non-synthetic, it's commercially produced from the fermentation of fumaric acid, which is produced by fermentation of glucose.

There are alternatives such as vinegar or citric acid, but the L-malic does provide some unique properties. The TAP did not find any unacceptable risks.

When we did our review we had no new information. We deeded the TAP sufficient. We did receive two public comments supporting, and no public comments opposed to relisting. So the committee
recommended relisting L-malic acid, and the
version I have in front of me does not have
the vote. By a vote of four yeses, no noes,
and two absents.

Any questions?

CHAIRPERSON MOYER: Any questions
from the board for Katrina? Chair recognizes
Kevin.

MEMBER ENGELBERT: Just one quick
one. This material and the previous one, were
they put on with a three-year sunset? Why are
they being reviewed for sunset?

MEMBER HEINZE: They're 2011
sunset. But we have to review them now to
have enough time to work it through the
process.

CHAIRPERSON MOYER: Any other
questions for Katrina?

Thank you, board. Steve, thank
you.

MEMBER DeMURI: Thank you,
Katrina. We have one more 205.605(a) item
that is up for sunset in 2011. That's microorganisms, and that's one of Joe's favorite subjects so he took that one.

MEMBER SMILLIE: Right. They were petitioned in 2002, and added to the list on September 12th, 2006. Basically microorganisms are essential for the production of many fermented foods, and there are many examples. The TAP review of 2002 reviewed microorganisms. It also reviewed previous TAPs on dairy cultures, yeast and enzymes, and it felt there was no need to review microorganisms individually.

Basically it's noncontroversial. There were no public comments received opposing the use of microorganisms, and many supporting their use. There was one specific comment we received and posted that said we should define more the breadth and scope of microorganisms, which of course we would just love to do, but unfortunately since it's a sunset review item, I don't think that is part of the sunset
1 review process, to change the listing.
2 So we've regretfully declined to
3 take on that task. And basically we recommend
4 the continued use and listing of
5 microorganisms in 205.605(a). The committee
6 vote was five yes, zero no, one absent, zero
7 abstains or recusals. So basically we
8 recommend its relisting.
9 Any questions?
10 CHAIRPERSON MOYER: Any questions
11 for Joe regarding that item? Chair recognizes
12 Tina.
13 MEMBER ELLOR: Just a comment.
14 Microorganism has a definition, right? Maybe
15 not within OFPA, but it's a microscopic
16 organism, especially a bacterium or virus or
17 fungus. I have a school dictionary on my
18 computer.
19 CHAIRPERSON MOYER: Good. That's
20 nice. Any other comments for Joe? Questions
21 or comments? If not, thank you, Joe. Steve,
22 back to you.
MEMBER DeMURI: Thank you, Jeff.

Now we move into the 205.605(b), items up for sunset in 2011. The first one that is on the list is activated charcoal.

Gerry Davis actually did the investigation and review of that material. He is not with us today so I will take that one.

Activated charcoal was first petitioned in 2002. And added to the national list with the annotation, only from vegetative sources for use only as a filtering agent.

The TAP report in August of 2002 reviewed activated charcoal to determine that if it was synthetic that it met fully the criteria of 205.605(b) and should be included in the national list with the annotation that I noted.

We did not receive any new information above and beyond what was already known, that was discussed in the original listing. We did receive six public comments in support of the relisting of activated
charcoal. We did not receive any public comments that were opposed to the relisting of activated charcoal with the annotation.

So based on that information the Handling Committee voted five yes, zero no, one absent, and no abstentions or recusals for the relisting of activated charcoal.

CHAIRPERSON MOYER: Any questions for Steve on this item?

Seeing and hearing none, Steve, back to you.

MEMBER DeMURI: Okay, thank you.

The next item is also 205.605(b), and I'm going to take the next three together, because they are highly related, very closely related. They are all boiler chemicals. The first one is cyclohexylamine. The second one is diethylamineoethanol, and the third one is octadecylamine. So we will talk about those three together.

I wanted to make a couple of comments regarding the sunset process, and I
was waiting for Miles to walk back in, and I'm glad he did. It became very obvious in our discussions in the committee that the sunset process is still a little bit nebulous to us with regards to procedures for determining sunset. When you go back and look through transcripts from old board meetings and even talk to previous board members that were on at different times, there is a little bit of differences in the interpretation of what sunset rule means.

To some folks it means that sunset would mean that if a listed item is not brought before the board and specifically asked to be relisted, that it just goes away, it goes into the sunset, which is kind of the traditional meaning of sunset in other areas. To others it's more of an evergreen type process where it just continues to be listed until somebody comes up, or unless somebody lets the board know that it should not be relisted for some reason, due to new
So what we are asking of the program is maybe to recenter us a little bit on what sunset procedures really should be, give us some definitions of sunset for us to help us and future boards to delve into sunset listings.

This is only really the second time we've had to do sunset, so it kind of needless, and it's going to be happening more and more as years go by. We have a huge set of sunset materials for 2012, so I think it's important now that we get this squared away once and for all.

Any other committee members want to throw their - you're not a committee member, but you can talk about it.

CHAIRPERSON MOYER: Joe, anybody else?

MEMBER SMILLIE: Yes, again, especially with input from Kim Dietz, we've come - we understand now that the procedure is
to relist unless alternative methods become really available and unless there is definitive arguments that - you disconnected me. Right, where was I?

So there were a couple of factors, and we discussed this at our meeting when we got those boiler additives. We also felt that we didn't get - that we had some opinion on the boiler additives saying, yes, these should be relisted, but nothing - no information. So within the committee we canvassed a number of people, a number of organizations, to say are there alternatives now, and we felt there were some approaching. So we decided in committee to not vote for relisting. Again, we weren't 100 percent committed to that, but we wanted to test the process. We wanted to invigorate and get a vigorous discussion on these items, because there was some evidence, again, we need some clarification on that, but these items originally when they were voted on that NOSB membership felt that while they
voted them on but they really felt they should come off when they expressed their opinion as such on the documents that we read.

So we decided, knowingly, consenting adults, that we weren't going to vote for relisting, because we wanted to really get to the bottom of some of the issues that Steve asked the program to address. Is it evergreen, or is it sunset? Exactly what information has to be provided? Is it beyond the shadow of a doubt, or what is the exact rule?

So we were playing a bit of devil's advocate on this, but for a real purpose, because we realized as Steve just mentioned, we've got a lot of sunset materials coming up, and we wanted to get some real clear lines drawn on how we deal with sunset for the future.

So we decided to take that action because we didn't have strong compelling evidence from the public comments that these
should be relisted, and I'll let Steve finish that. But now we've gotten some comments, but even now having reviewed all these public comments, everybody says, yes, relist it, I don't need it but I think the industry needs it. But did we get anyone that said, I need it?

MEMBER DeMURI: No, actually we didn't. Nobody came up and said I have to have this in order to be able to continue processing. There were some allusions to that, but nobody actually said that.

Can I ask him to come up, Joe?

CHAIRPERSON MOYER: Certainly, if the committee chairman wants Kim Dietz to come to the podium, the board will recognize her.

Kim, if you would, please state your name and your affiliation for the transcriber?

MS. DIETZ: I'm Kim Dietz, and I did submit public comments to a past Materials chair. If you look at the Federal Register
notice for sunset there is a process of material review. There is a process to renew the materials, and then there is a process for those who want to continue to use materials. And that is the public process. So I don't know if you have my comments. But I submitted them and the board certainly has them.

So anyway there is a process to remove a material; there has to be evidence by the public that provides an alternative. So to my knowledge there was nothing received through the sunset process on these materials.

So then the second piece is, those people who want to continue to use them just need to submit comments that they want their continued use, and there were quite a few comments submitted for continued use. So there were six due to Federal Register notices, and then for this meeting I believe there were like 10 probably, including the Juice Processors Association.

So there is evidence that the
industry still needs these materials. And then the other thing I just want to mention is that due to sunset procedures, it's not the boards' rule to actually go back and hash out the TAP report and to hash out a new listing. It's either you vote to relist them or you vote to take them off if there is evidence to take them off.

So if you are confused, then you probably should take a few minutes and pull up the CFR, pull up the Federal Register notice, go through the process, and also go through the process on your board policy manual because it is outlined there as well.

CHAIRPERSON MOYER: Thank you, Kim. If there are some questions, I see Rigo and Dan and Hue and Barry. Start with Rigo.

MEMBER DELGADO: I was just going to echo what Kim just said. We do have a process clearly stated in the policy manual that says exactly that. And the other point that I would add to that process is, if there
is evidence that there is a replacement element, product or procedure, that should also be an argument to delist this. It's all clearly stated I think in the policy and materials manual. Maybe we can go back and make it more clear or specific. We are fortunate to have Steve on the committee, so he can help us with that.

CHAIRPERSON MOYER: Chair recognizes Hue.

MEMBER KARREMAN: Just wondering, on a sunset item, there is no new horrible information that came out, and 35 people say, you know, we really don't need this, but one person says, you know, I really still need this, how should the committee reviewing that weigh it? Because it got on the list. It's kind of like, is it evergreen or not? But one person says, you know, we really need this. Does that outweigh the 35 who say, yes, we don't really need it and there is no compelling evidence to take it off.
MS. DIETZ: I think you need to look at the process, look at that Federal Register notice, because there are specific things you have to provide in the public comment to provide evidence that there is a replacement. So the industry has a chance to go back and say, oh, I didn't know that was there; maybe I can use this. So again the process to remove a material through sunset is much more technical than keeping a material. So you really have to provide the evidence to the industry, and there are like six criteria, and I apologize I don't have that in front of me, I didn't realize I was going to come up and do this. But I can certainly give it to you, and it's in my public comments, exactly what you are supposed to provide the industry if there is an alternative.

CHAIRPERSON MOYER: Chair recognizes Dan.

VICE CHAIRPERSON GIOACOMINI: Kim. I'm surprised, it's only been what five
years since you've been on the board, and you
don't have that right off the top of your
head.

MS. DIETZ: I'm sorry, I don't.

I should, huh?

VICE CHAIRPERSON GIOACOMINI: I
would only - I agree with 99 percent of what
you said. There was only one little bit that
I - I'm not questioning what you said, but I'm
questioning the implication of it. And that's
what you said about the old TAP reviews. I
think going back and looking at the old
recommendation and the old TAP reviews is
vitally important. Because what we are
needing to look at is what's new. And unless
we go back and look at what was old, there is
no way of knowing what is new. So I don't
think it's going back to review it and rehash
it and reevaluate it, but we haven't to
understand what it said.

MS. DIETZ: And I agree with you
there. But what you can't do is say, like
with the boiler materials, say, okay, well,
the alternative was stainless steel pipes. Or
the alternative was water rinsing. That was
reviewed at the original TAP review. But
that's not new material. So you are exactly
right - you do need to look at the old to see
what is new, I agree with you there.

CHAIRPERSON MOYER: The chair
recognizes Barry.

MEMBER FLAMM: Yes, I kind of
want to reiterate what Rigo said. A year ago,
because of the same questions that are coming
up right now, the Policy Development Committee
took on examining the sunset procedures and
worked at clarifying them. We worked with the
Materials Committee, and I had the pertinent
language in front of me but I lent it to
Miles. So I can only - but it's a little more
comprehensive than what's been alluded to
here. Certainly - thank you - let me just
read the whole thing so you - and this is what
was approved at last year's November meeting.
It says the appropriate NOSB committee begins review of the material with the intent of providing a recommendation to the entire board for the material's removal or renewal. The remove is constructed based on force of evidence as presented by the board members, public comment and scientific data from other sources. And this includes the original recommendation of the board and the TAP. So the committee may request a third party and another technical review is they like, and if needed verify scientific evidence and claims made during the public comment.

So that is a little more comprehensive. In the final analysis it's still up to the judgment of that committee right now, and I think whether they may have known it or not, I think that the committee proceeded properly, so I don't think that the criticism that the committee somehow didn't follow procedures is correct, because they were really following what was the instruction
MS. DIETZ: I guess where I was concerned was just with the word, evidence. The Federal Register docket, which is the one that the public sees, requires specific evidence to be provided to the industry. I could read that to you if you want me to, but that is what we see.

MEMBER FLAMM: Well, that is true, and maybe that is governing. But you also - the public - this recommendation and approval was public, and it's been public, so it's also officially reviewed in the policy and procedure manual which is our way of conducting business through the board. So I appreciate your pointing out the regulations though.

MS. DIETZ: Yes, again, I think that we just didn't - that evidence - your flow chart actually on page 59 that --

MEMBER FLAMM: Yes, you did see that.
MS. DIETZ: And evidence from public input, and the recommendation didn't say it was from public input, that evidence. It just said it was the sense that there was alternatives. So that's, again, it's could just be wording. But all in all I'm glad this happened. I'm glad that we could clarify sunset. I'm glad that it will get us all on the same page because that is all part of learning. So I'm sorry if my comments were harsh. But I just want to make sure that everybody understands the sunset process, and we can't just take a material off the national list through sunset, because we don't want it on there anymore. We have to provide the evidence to the industry that those alternatives that you list are viable alternatives, to give us a chance to look at those.

CHAIRPERSON MOYER: Very good points, Kim.

Chair recognizes Joe.
MEMBER SMILLIE: Well, wouldn't you agree, it's more of an evergreen process.

MS. DIETZ: Oh, yes.

MEMBER SMILLIE: It's just misnamed.

CHAIRPERSON MOYER: An evergreen process with review.

MEMBER FLAMM: Can I make a comment?

CHAIRPERSON MOYER: Yes.

MEMBER FLAMM: You know the only place it appears is in the law, and the statement is rather brief. You could interpret it that way, but I don't think there - nothing I see in the legislative history that would suggest that this sunset is any different than other sunsets, which usually mean that you have to have a process of reinstatement stricter than anything we are doing right now. So I think we may have trended toward what has been characterized as evergreen, but I don't know if there is any
basis for that trend. And what we were trying
to do in the new procedures, which were
approved, is to say let's take a look at - we
are not throwing out the old, but on the other
hand we have to have room for what is
happening now and allow judgment on the
current committee. And I appreciate your
allowing this discussion.

CHAIRPERSON MOYER: Chair
recognizes Julie.

SECRETARY WEISMAN: Yes, there
was also something that - I agree, this was
important and good in its way that this
happened now, because we are about to go into
a whole new slug, which I'm sorry I won't be
here for, but there was something else that
went on that doesn't have to do with how we
interpret sunset that was different than what
has gone on in the past. The ANPR for this
sunset came out uncharacteristically early.
I believe the ANPR was published on March
14th, 2008, a year and a half ago, and public
comment was received in the 60 days after
that, or maybe - within a month and a half
that followed. And in that period there were	hree comments, but it had been so long ago,
and it's never happened that way before, that
at the committee it was like that was outside
of our memory, and we weren't even aware that
part of our discussion was, that oh, we
haven't gotten any public comment about this,
but that was actually erroneous. There had
already been public comment, and then we
published our recommendation, and there was
more public comment ahead of this meeting. So
the body of evidence is quite different than
we felt it was at the time we were having
these deliberations.

CHAIRPERSON MOYER: Thank you,

Kim.

MS. DIETZ: So that clears up

sunset.

CHAIRPERSON MOYER: I think it

was.
MS. DIETZ: And again, it's in my comments exactly what is required to remove material.

MEMBER DeMURI: Right, and part of my reason to bring it up - I hesitated to bring it up at all, but I wanted to get it on the table, because it is going to be important to our discussion. Those of you who went through and read the recommendation are going to see in the recommendation that the original board, when they made the decision back in 2001 to list it, there was some language in that recommendation that they hoped that future boards would be able to delist these three chemicals because they were toxic. So that also weighed into our original decision to recommend not relisting these three items.

Since that time we got together again and based on the public comment we received since we posted that original recommendation plus what we heard over the last couple of days, we met again today and we
I did vote to recommend relisting all three of these, because we do believe there is some evidence that it is still necessary in the industry for processors.

So on all three of these, the cyclohexylamine, the diethylaminoethanol, and the octadecylamine, we voted five yes, zero no, and one absent to relist.

CHAIRPERSON MOYER: Thank you, Steve. Appreciate that process as well as the presentation.

Your next material, Mr. Chairman? I'm sorry, I thought we had covered that. Are there any more questions for Steve regarding those materials? Or the reasons that the committee chose to vote the way they did.

Thank you.

Back to you, Steve.

MEMBER DeMURI: Okay, thank you.

The next item is also a 205.605(b) item. It's peracetic acid, and Katrina handled that one for us.
MEMBER HEINZE: Okay, we reviewed peracetic acid also known as peroxyacetic acid for delisting on 205.605(b) synthetics allowed. Peracetic acid, that's what I'll call it, was added to the list again in the fall of 2006 based on a review by the NOSB.

So just some historical information. The NOSB reviewed Peracetic acid, but in the proposed rule the program added the equivalent word, perocyacetic acid, because that is how FDA regulations lists the material. So using both common names helps avoid confusion.

This is the first time that Peracetic acid has been reviewed through the sunset process. It's used in the food industry as a sanitizer, to control deposits, odors, biofilms, and then as well, a microbial control agent for food contact surfaces and direct contact with fruit and vegetables.

The TAP review was completed in November, 2000. Everyone agreed that the
material was synthetic but should be allowed with annotation for use in organic handling. I was going to review the annotation for that. So the annotation for this material is for use in wash and/or rinse water according to FDA limitations; for use as a sanitizer on food contact surfaces.

The reason the original board listed this and the TAP reviewers recommended it for listing is the control of food-borne pathogens, and how it effective this material is for that purpose. There are alternatives, but each alternative has drawbacks when compared to Peracetic acid. So some of the alternatives are steam or hot water, which are not incredibly effective sanitizers in all cases.

In the case of other sanitizers and disinfectants, they are certainly no worse with regards to human health, but Peracetic acid is no worse, but certainly it is viewed as being more benign environmentally because
its breakdown products are acetic and hydrogen peroxide.

The TAP review also showed that this material was more effective than others previously recommended by the board.

So the Handling Committee had no new information that would cause us to reevaluate this material. We did receive 11 public comments in support of, and no public comments opposed to, relisting Peracetic acid.

So by a vote of five yes, zero noes, and one absent, we are recommending relisting of Peracetic acid, peroxyacetic acid, on 205.605(b).

CHAIRPERSON MOYER: Thank you, Katrina. Any questions or points of discussion of these materials which I won't pronounce?

Hearing none, back to you, Mr. Chairman.

MEMBER DeMURI: Thank you, Katrina and Jeff.
The next time is also a 205.605(b) substance. It's sodium acid pyrophosphate. It was first petitioned in October of 2002. And added to the national list effective September 12th, 2006. Sodium acid pyrophosphate was originally petitioned for use as a leavening acid in baked goods, and was given annotation at the time of listing for use only as a leavening agent. One that was originally recommended for listing by the NOSB.

We did review the TAP, and did not receive any information. Didn't see anything in the TAP that would have changed since then, since they did the TAP. We did receive three public comments prior to the posting of our recommendation that were in support of relisting sodium acid pyrophosphate, and there were no public comments opposed to it. But since that original recommendation was posted, we did receive a comment from PCO that supported removing the material since it was
not considered to be nonessential, which
wouldn't probably be considered new
information since the original TAP was done.
The committee vote at the
committee level for this substance was for
relisting, yes, give, no zero and one absent;
no abstentions or recusals.

CHAIRPERSON MOYER: Thank you,
Steve.

Any questions from board members
for Steve, or comments regarding this
material?

Seeing and hearing none, back to
you, Steve.

MEMBER DeMURI: Thank you.

The last item for sunset for
handling for 2011, another 605(b) substance,
tetrasodium pyrophosphate, or TSPP it's
commonly known as, it was added to the
national list effective September 12th, 2006.
Based on an NOSB recommendation that was made
in April, 2004. And it also has an
annotation, tetrasodium pyrophosphate has the annotation for use only in meat analog products.

It was originally petitioned for use as a pH buffer, and a dough conditioner for use in organic meat alternative products. It's relatively comment, it's GRAS, it has USDA and FDA approval. Had a fairly thorough TAP done on it at the time of listing. And again a review of that did not point out anything that has changed since that original TAP, and the original decision for listing was made.

We did again receive three public comments in support of, and no public comments opposed to relisting TSPP prior to our posting of our original committee recommendation.

Since that time again, PCO made a comment that allowing TSPP should not be relisted because it is not compatible with NOP criterion 205.600(b)(4).

But again not any new information
1 since it was originally listed.
2   So the committee voted on this a couple of months ago, back in September. We voted yes, five, no zero, and one absent, no abstentions. There were four recusals.
3 CHAIRPERSON MOYER: Thank you, Steve.
4 Any questions or comments from board members regarding this particular material? Again, hearing none, is there anything else in your report, Steve?
5 MEMBER DeMURI: I'd like to talk briefly about sunset, 2012. Let me pull out my big stack of papers here.
6 We have a total of 95 materials that are coming up for sunset in 2012, and we have started talking about these at the committee level. We have 19 205.605 color substances that `well be sunsetting in 2012, and we had 22 other 606 items. There are 20 205.605(a) items, and 30 205.605(b) materials.
7 So we have our work cut out for us
over the next year, or year and a half, in reviewing these 95 materials for sunset in 2012. So like I said we have already started our discussions on these. We have split them up into groups and made some assignments. So we are starting to work on these.

CHAIRPERSON MOYER: Thank you, Steve, for that report. Any final questions from board members for Steve?

If not, that concludes the business of the committees in front of this board, and the next item on our agenda is public comment. I will remind the board and the gallery that it is 10:05, so we have 10 minutes to get through all of those comments.

We have 25 commenters. So I'd just remind people that the board does have a lot of work to do tonight on revising our work load for tomorrow, our recommendations for voting. We want to be sure we have some time and brain capacity left for that, not to
detract from people's making their public comments.

I think we will start right away with public comment and get going.

PUBLIC COMMENT

CHAIRPERSON MOYER: First on the list is Will Fantle from Cornucopia, and Richard Siegel will be on deck. If Will is here? I don't see Will.

We'll take Richard Siegel for now, and Kelly Shea on deck.

MR. SIEGEL: Good afternoon. I'm Richard Siegel, a lawyer here in Washington, D.C. But I'm not going to be making any comment. I am offering my time to Kim Dietz. I gave my proxy to Kim Dietz.

CHAIRPERSON MOYER: Thank you, Richard.

If Kim will come to the podium?

Thank you, Kim.
MS. DIETZ: I'll be very brief.

Another materials process issue that I have to do. I was sitting in the back today with the livestock, and realized that you are trying to change some annotations to materials on the National List, and you are calling them technical corrections, as well as clarifications.

So again there are some procedures in place for changing annotations that have been there for a long time, and so I'm just going to read this.

The Livestock Committee's recommendation to change annotations on materials already on the National List is going against the materials process as defined by 7 CFR Part 205 national list petition process, and annotation to materials currently on the National List can only be changed through the petition process.

NOSB's policy manual as well, on page 50, defines the guidelines for a
technical correction. It requires that a technical correction can only be made if there is an error in the annotation between the timeframe of the original NOSB vote and recommendation and the Federal Register notice recommending the material's placement on the National List.

So in order words if there is actually an error made in the typing or the processing of the annotation. So that is truly a technical correction. And we have battled this for years, really what is a technical correction. But it is really just a transfer of information to the Federal Register notice that is wrong.

So if this board votes on the recommended annotation changes, then you are going against the materials process and setting precedent that any annotation can be changed by committee recommendations. And we have never been able to do that.

The materials process has been
established for consistency, and I would suggest that the vote on these materials be deferred until a petition is received. The NOSB does not have the ability to change annotations as a recommendation or a technical correction unless they meet either of those guidelines.

And I can give those to you if you like. But that is all I have to say. And then thank you, Katrina, for your hard work on the document. It's been 20-plus years that we have battled with materials between synthetic and non-synthetic and ag and nonag, and we are getting there, so I thank you very much, and everybody actually.

CHAIRPERSON MOYER: Thank you, Kim.

Chair recognizes Hue.

MEMBER KARREMAN: We asked the program about this, being that we are individual citizens sitting at the table. We were told that we can submit - whether we have
the way we have - to do a clarification,
although the person who said that is no longer
in the program, although the person is in the
room. I don't know if the person wants to
speak to that at all.

MS. DIETZ: I don't know how you
can go against process. If you make this
decision to allow this, then at any time
committees can change annotations and I'm not
sure that's a transparent and fair process.

CHAIRPERSON MOYER: Would
somebody from the program, Miles, would you
like to address that, or someone from your
staff?

MS. FRANCES: I would only offer
a little information that the question was put
to the Office of General Counsel on a number
of these questions and they felt that these
were all the kind of changes that could be
made.

CHAIRPERSON MOYER: That was the
livestock's understanding.
MS. DIETZ: Well, then, it should be in the petition process.

CHAIRPERSON MOYER: Chair recognizes Bob Pooler from the program. If you could come to the podium. Thank you, Kim.

MR. POOLER: I'm Bob Pooler, National Organic Program. Just want to remind the board that there are petition guidelines out there that were published in the Federal Register, that describe that the only way to amend the National List is through the petition process or through sunset. We did not receive petitions for these materials, so we do not have recognized petitions for these kinds of changes that we are going through.

Thank you.

CHAIRPERSON MOYER: Thank you, Bob.

MR. McEVOY: So it sounds like the program is saying two different things, so I think we have to clarify the facts here.

CHAIRPERSON MOYER: I just heard
two different messages here.

MR. McEVOY: I did too. So something I guess we need to figure out and get back to you with one clear message, because --

CHAIRPERSON MOYER: And you need to do it fast.

MR. McEVOY: Yes.

CHAIRPERSON MOYER: Thank you.

Chair recognizes Hue.

MEMBER KARREMAN: I just want to say that we would not have gone through this process had we not gotten a green light from somewhere in the program. Believe me, we would not have undertaken this to present it at the board, put it on the agenda, get the agenda approved, blah blah blah. So obviously I'm somewhat upset to learn this from Kim, but that is the - all I'm saying is that we were going on good word, maybe we should have gotten it in writing. But that is why we did what we did.
Chair recognizes Dan.

VICE CHAIRPERSON GIOACOMINI: In many ways, Miles, if you are running out on this - well, one more thing, though, this is the - I think this would be the exact same situation we dealt with that we had at the last meeting with injectables. So in a way the precedent was already set, I'm sorry. But I'm not sure that that is entirely - I believe that is the umbrella of where all this started from. It was a little different, in that I think that may have been an entirely new listing as opposed to an annotation change. But that was also not doing through the typical public submitted petition.

MR. McEVOY: Bob just said that the injectables was done through a petition process.

CHAIRPERSON MOYER: Chair just recognizes --

MEMBER KARREMAN: I would say
that the injectables that we voted on as a
full board last time was done this exact same
way, came out of committee.

CHAIRPERSON MOYER: Chair

recognizes Bob Pooler from the program.

MR. POOLER: Bob Pooler, National Organic Program. We did receive a petition
from Dr. Karreman on injectable vitamins and
minerals. I reviewed that petition and I did
reject that petition as incomplete. I sent
you that notice, and I believe essentially you
appealed to the program and found another
method to review that petition and at the last
meeting you had a vote on it. That's the
history of that.

So there was a petition for
injectable vitamins and minerals, if you want
to call it that. But anyway, we did have a
petition for that, so that is not setting
precedent.

CHAIRPERSON MOYER: Thank you for
that clarification. Hue can respond, and then
you, Dan.

MEMBER KARREMAN: When that petition was rejected, Bob, I let it go. I did not correct that petition so that it was officially accepted.

CHAIRPERSON MOYER: Thank you, Hue.

Chair recognizes Dan.

VICE CHAIRPERSON GIOACOMINI: In the normal process we did not receive that petition from the program to review as he said. We proceeded with a different method. Under the approval of the program.

CHAIRPERSON MOYER: Okay, chair recognizes Rigo.

MEMBER DELGADO: Just one technical question. We have on the Crops Committee a petition to remove annotation. Our response as a committee was to reject that petition. But we responded with a second follow up, additional annotation. What is the status of that? Is it affected as well given
the new developments?

CHAIRPERSON MOYER: Technically, yes, I believe so. Chair recognizes Kevin for a comment.

MEMBER ENGELBERT: The Crops Committee got approval from the program.

CHAIRPERSON MOYER: Yes, we did.

MEMBER ENGELBERT: To make that change in annotation just like the Livestock Committee did to change these annotations.

CHAIRPERSON MOYER: Miles, this comment is directed towards the program. I believe that we need some clarification on this and some guidance in the next few hours if you could.

MR. McEVOY: Yes, I need some clarification and guidance as well, so we are working on it.

CHAIRPERSON MOYER: Okay, we appreciate those comments, Kim, sort of. No, we want to get this right, and we appreciate that guidance.
Dan, one more comment.

VICE CHAIRPERSON GIOACOMINI:

Part of Kim's statement is the listing - I'm assuming it's also listed that way on the recommendation unfortunately. Again we had discussion of whether this should be listed as a technical correction. And again I believe we got a recommendation from the program that it was okay to list it in that format on the recommendation and the agenda, and that it was no problem.

CHAIRPERSON MOYER: Thank you, Dan.

The Chair will now call Will Fantle to the program.

MR. FANTLE: My name is Will Fantle. I'm the co-director for the Cornucopia Institute. We are an organization advocating for social justice for family farmers. We have about 3,000 members across the country, the majority of whom are organic farmers. We have hundreds of dairy organic
farmers as well, and just to remind the committee of the testimony that was presented yesterday by policy analyst Charlotte Vallaeys, we did support as well a two times a day milking strategy for dairy.

I had some comments about the website first. I am going to leave some comments with Valerie that were unable to be electronically filed by people who had an interest in the livestock issue. And this was disappointing to us. This was not the first time we've heard this, and I'm going to ask you as a board, and ask the staff at the NOB to see if there is some help that can be done or created on this to make it truly an interactive website so that the public can use this. It is very cumbersome, difficult to use. I have said this before, and it inhibits the ability of people to interact with important officials such as yourself.

So I will leave these additional comments on the proposed livestock regulations.
with Valerie; perhaps they can get into the
record.

I want to turn to the pasture
livestock rule, or the livestock rule as we
call it. This is the third meeting now that
this board has had since the draft rule was
released last year. You still have not had an
opportunity to comment on any of its
iterations. Our organization would like the
NOSB to be involved with such an important
rule, particularly since this rule morphed or
changed from what I think was initially
expected by people across the country who were
looking at this, a rule that became much
broader in scope than just a few tweaks to
dairy and on pasture.

So we hope in the future when
important changes come that there will be
allowances made for your input. We think
that betters the function and process.

I'm going to read a portion of a
letter that we sent to Secretary Vilsack last
1 week regarding the pasture or livestock rule.
2 We are delighted it's out, and moving forward
3 from USDA. We want to see improvements made.
4 But we think that given the gravity of the
5 changes that were initially proposed that it
6 would – and this is what we asked Secretary
7 Vilsack - we respectfully request that you
8 would consider releasing this as an interim
9 final rule, allowing the public to have one
10 last opportunity for input. This approach
11 would allow for the immediate implementation
12 of the rule.
13 Now I know that this board
14 probably can't take any action on that. I'm
15 speaking as much to staff here hoping that
16 they can encourage others at the USDA to
17 approve this as an interim final rule.
18 We are suggesting this because of
19 what happened last year. The rule, and I'm
20 going to read again a portion of this, the
21 draft rule was nearly universally rejected.
22 Whatever the department now
releases will - we assume - be materially
different than the draft version. We believe
that this experience suggests that it would
appropriate to have one last opportunity to
critique and tweak if necessary the rules.

Those of you who are close to
dairy and those of you who are interested in
organic sitting on this board know that we
have a crisis in the dairy community across
this country, both in conventional and
organic, farmers are truly stressed by a
decrease in prices. And it's our contention
that in organics much of that surplus that is
occurring and causing the diminished price in
organics is due to the confined animal
operations that we've been talking so strongly
about being in violation of the rules. So we
think that their milk is helping to depress
the prices that ethical family farmers who are
following the organic rules are now being
forced to suffer under.

So I appreciate your indulgence in
this. I want to offer one last comment here, and that is for the departing members on this board. We appreciate your service. I've talked to a number of you; I know how much work is involved in this, and it's a challenge for you to do this, to take time out to do this in your own lives, and we thank you for that service.

CHAIRPERSON MOYER: Thank you, Will. Questions from the board for Will? Dan?

VICE CHAIRPERSON GIOACOMINI: Thanks, Will.

Let me just say that I think probably to a person on this board we echo your feelings on the occasional frustration with regulations dot gov. I will say though that if you call the help desk, they're really nice, because I had to do that in order to be able to get on and review the document.

MR. FANTLE: That speaks to how difficult it is.
CHAIRPERSON MOYER: Any other questions or comments for Will?

Thank you, Will.

Could Kelly Shea come to the podium, and Joe Dixon on deck?

MS. SHEA: Hello, Kelly Shea with White Wave Foods.

In light of the fact that most of my comments have already been spoken by my colleagues, I will cede my time back to the board, and I will just thank all the members of the board for their incredible hard work, and especially those of you who have put in a great five years.

So thank you very much.

CHAIRPERSON MOYER: Thank you for coming to the podium. We appreciate your time.

Joe Dixon? I thought for a minute you were running away. It's too late for that.

MR. DICKSON: I was counting on a
few more speakers while I finished writing my
comments.

My name is Joe Dickson. I am
quality standards coordinator of Whole Foods
Market. I'm also holding a proxy from
Margaret Wittenberg who was originally
scheduled for this slot, but I don't think I'm
going to use it because it is already after
5:00.

Good evening, members of the
board, NOP staff, and the organic community.
Thank you very much to all the outgoing board
members for all your hard work these years,
and for those of you who aren't leaving I'm
very excited to be joining you in the spring.

Congratulations to Miles on his
new position and to everyone at the USDA for
showing more support for organic and local and
sustainable agriculture in the first year of
the administration, and we've seen it a long
time. It's incredibly uplifting to be a part
of this community in this room at this time.
Since this is my last chance to
give public comment until the beginning of
2016, I thought I'd just use the opportunity
one last time.

First off on the personal care
products recommendation we heard from a lot of
commenters yesterday that noted that the
landscape of organic personal care claims is
sort of a wild west. It's very haphazard and
unregulated, and we see products in stores
making all kinds of organic claims with
varying levels of organic ingredients and
oftentimes very little substantiation.

We know that there is some
potential for further exploration of what
federal agency has the jurisdiction and the
teeth to regulate this. We believe very
strongly that some federal agency needs to
regulate organic personal care claims, and we
hope that the NOB, the NOSB, this community,
the industry, will work together and continue
forward momentum to figure out what path we
need to take to get to a place where organic personal care products are regulated.

Our shoppers don't expect to walk into the personal care aisle from the produce aisle and have to deal with a different definition of organic. I suspect very strongly that other consumers feel very much the same way. It's a very basic problem with the market that does need to be addressed, and I look forward to working with everyone who is interested to get to where we need to get on that.

On retail certification, we also heard a lot of really good comments on that issue yesterday, and support specifically the position of the CCOF, Oregon Tilth and the Organic Trade Association. In general we believe that surveillance, enforcement and education of noncertified and certified retailers would support organic integrity in the industry far better than focusing only on voluntarily certified retailers who are
already under the supervision of a certifying agent.

The certifying agent for a certified retailer is responsible for visiting the stores, evaluating compliance, and in our experience, does a very very diligent job of keeping us on our toes and making sure that our stores are in compliance.

The recommendation asks a series of questions about signage and label claims that we feel are already answered in the rules. There are questions that we have asked and answered with our certifying agents since 2003, and the answers are there.

We don't believe that there needs to be some sort of proscriptive guidance that is focused on retailers. Other than the fact that retailers are exempted from the certification requirement, there is no other basis in the rule that differentiates retailers from any other type of handler.

The rules about commingling,
contamination, documentation, all that stuff is in there, and it's taken some teasing for us as a retailer to make sure that we are in compliance. And it's a lot of work. But the answers are there.

However we do agree with the board or the committee that the certified organic retailer plan does need to be clarified. There are stores out there that have one department certified that we see making certified organic retailer claims that seem to apply to the own store. In our own stores actually every department is certified, and we do claim to be a certified organic retailer. But we feel substantiated in doing that, because we've had every department that handles organic food get certified.

However again there is no reason to single out retailers. The same issue could apply to a certified farm, a certified organic warehouse, a certified organic soup factory. There are all sorts of claims out there that
could apply to an entire operation, and we feel it would probably be more productive to come up with a general recommendation for that type of plan for any type of operation, and not again just focus on retailers.

On animal welfare, consumers expect that organic meat and dairy products come from animals that are treated humanely and allowed to fulfill their natural behaviors. We totally support the fact that this is coming to the forefront of the NOSB agenda, and we support working on the issue.

The current recommendation which we detailed in our written comments which were acknowledged today, the recommendation as it was originally advanced requires substantial clarification and refinement, in a number of areas. We covered those in our comments, and we still feel very strongly that there are a number of stakeholders on this issue that are not here at this meeting.

As you guys noted yesterday, there
were entire categories of producers such as swine producers that didn't comment at all. Which could have been because they weren't aware of this recommendation. We feel that there continues to be an opportunity for a larger stakeholder group of animal welfare advocates, every producer group, retailers, to at least weigh in. And we are not suggesting that the process be bogged down over several years, and continually discussed. But we feel that there still is an opportunity for some sort of a multi-stakeholder group to take on this issue, and it shouldn't be rushed.

I also just passed out - and I apologize we didn't get these in before the discussion today - our comments on bivalve mollusks. That is an issue where we totally support the board's recommendation, with a few opportunities for clarification that will be in our written comments that we believe would make that recommendation much clearer. But in general it's very good that this issue has
been taken up, and we do support the  
recommendation overall.  

And that's all. Thank you very  
much for your time.  

CHAIRPERSON MOYER: Thank you,  
Joe. Any questions from the board or  
comments?  

MEMBER SMILLIE: While I agree  
with you, Joe, on your statement that  
basically the processing and handling parts of  
the regulation adequately cover retailers, I  
think the other part of your statement that  
you've managed over the years working with  
your certifying organizations to deal with it  
and get a really clear understanding, I think  
that is what we want the program to do in its  
guidance documents for those certifiers and  
those retailers who haven't had perhaps your  
experience in interpreting processing and  
handling regulations that are in the  
regulations to specific retail things.  

So I think in a way, certainly in
the macro, I agree with you. It's already covered. But I think the devil is in the
details, and that you've had the experience,
you've worked it out and defined it, and what we just want is for the NOPs through all the
public input to just put that in their guidance document.

MR. DICKSON: And I totally agree. And if there are areas where it seems that different certifiers are interpreting the regulations differently for different retailers, that does sound like an opportunity for some clearer guidance from the program.

CHAIRPERSON MOYER: Chair recognizes Kevin.

MEMBER ENGELBERT: Hi, Joe, welcome aboard.

MR. DICKSON: Thanks.

MEMBER ENGELBERT: I'm a little troubled by your comments that because the swine growers or any other animal operation isn't represented here that we need to
postpone what we hoped to accomplish. This recommendation has been out long enough that we believe that if there was tremendous concern about it they would be represented here, and we are concerned about the delay of such important rulemaking that postponing for another six months would apply. Because as was mentioned earlier, this still will have to go through an ANPR; there still will be a lot of time for public comment; and quite frankly because they aren't here we don't look at that as a justification for saying, oh well, I guess we'll have to wait until they decide to come and express their concerns.

MR. DICKSON: And I think the fact that this board meets every six months and if something gets postponed that means it won't be considered again for another half a year, and I totally agree with what you are saying. Our hope is that if this moves forward as part of the rulemaking process, that we all reach out to make sure that any
voices that might have a perspective on the issue are heard from. And ideally it would have included more of a multi-stakeholder group to begin with.

CHAIRPERSON MOYER: Chair recognizes Hue.

MEMBER KARREMAN: Yes, welcome to the board, Joe, and you will be here getting - you can get the questions next time you're here, and when I'm at the podium you can nail me.

I'm sure you all will. Fair is fair.

I guess - I lost my train of thought, sorry. But you know, with all the stakeholders and over a year's time, I just don't see - I mean they had - there has been input. I mean we have given from last spring - it's amazing, this is what I want to say actually - you know, I guess we really whacked the hornet's nest on this one, because we really got a lot of input from the public on
this recommendation, because it's a recommendation. It seems when there is a discussion document, you get some people interested in it, but they know nothing is really going to move, kind of like, yo, everybody we are going to do something, but you are not really doing it until there is a recommendation like we have.

And you know the process is the process, and I'll just reiterate what Kevin said. There is going to be an ANPR. This whole thing for animal welfare at this meeting if it passes out of this meeting - I don't know if it will or won't - but if it does, just step one. There is a lot more to do. So there will be a lot of time for more input. We are just trying to lay the foundation to get the bar higher.

CHAIRPERSON MOYER: Thank you, Hue.

Any other questions or comments?

Bea?
MEMBER JAMES: Welcome to the jungle.

MR. DICKSON: Thank you.

MEMBER JAMES: I just wanted to say thank you for the comments that you submitted, and one of the things that I'm really looking forward to is kind of passing off that guidance document to you, because of your depth and breadth and experience - I didn't mean it that way - well kind of - because of the depth and breadth of experience that you bring with the magnitude of certification that Whole Foods has done throughout the entire store is really going to add a lot of value to helping to educate all the other retailers out there.

And I think that the recommendation is more of an expose on some of the struggles that are happening in some retail formats that maybe don't have that depth and breadth that potentially - that obviously Whole Foods has got. So I think
that you coming in is excellent timing, and I hope that you will reconsider your statement around the focus on retailers, although I do see that restaurants and probably some other venues that could benefit as well if you broaden that scope, but to grow retail certification is the benefit of creating a guidance document that will serve all retailers so that there is kind of a layman's document out there to help with guidance and understanding.

And I really truly do look forward to your work on that. I think you will do an excellent job.

CHAIRPERSON MOYER: Thank you, Bea. Thank you, Joe, appreciate your time.

The board will call Jim Riddle to the podium, Pat Kane on deck.

MR. McEVOY: I apologize. It won't take long. I apologize for not knowing the process, and just want you to know that the process is important, and I will know
this next time.

But I think what I understand is

that the excipients, that recommendation is

okay because it is a clarification of an

existing recommendation, but the other ones

would require a petition, and I think Rick can

explain it a lot better.

CHAIRPERSON MOYER: Richard, if

you could state your name and position for the

transcriber.

MR. MATHEWS: Richard Mathews,

former with the NOP, now with NOP Solutions.

Anybody that needs help, I need cash.

Hue is correct. On the excipients

I did tell him that he would be able to go

forward with this one, because what happened

was that there was a petition on excipients.

It went through the board; it went through the

rulemaking process. During the comment period

we received no comments that said anything

about our missing APHIS. But after the rule

came out in final form it was brought to our
attention that some of the drugs that are used 
on livestock were missed, and those were the 
one from APHIS, because the annotations that 
put - that states what excipients are allowed 
 inadvertently missed mentioning APHIS, because 
it was intended, excipients was intended to 
cover all drugs, but because of the way the 
annotation is worded it has excluded all of 
the drugs that are actually approved by APHIS. 

So the intent was to go ahead and 
fix that problem. So it is a correction. 
It's a correction to make it expansive and 
cover all of them which was the original 
intent through the petition process. 

Now on the other ones, the 
xylazine for example, that would be a change 
and you need a petition for that. 

CHAIRPERSON MOYER: Chair 
recognizes Hue. 

MEMBER KARREMAN: Even though 
it's already on the list, and it's an 
an annotation change, it's been reviewed. I mean
I know what you are saying, but it did have a full TAP, went through the FDA. You know all about that, Rick.

MR. MATHEWS: In that case somebody should send in a petition saying we need to change that annotation because, and tell us why it needs to be changed. In the case of the excipients you weren't changing the annotation, you were fixing an oversight. In the case of the excipients you are actually changing the substance in the annotation.

MEMBER KARREMAN: So let's just say then, what was presented and posted but coming from a private citizen, a board member who is also a private citizen, be considered as a petition? Do I have to go through a whole --

MR. MATHEWS: You would have to go through the regular procedures. Everybody that has come up here has been right. I mean Bob has been right, Valerie has been right, you've been right. Everybody is right, but
they are talking about different substances.

So in the case of the excipients, what you are doing works. In the case the other substances you need to be following the procedures that Bob laid out and Kim laid out.

MEMBER KARREMAN: What I'm asking, just briefly then, what was posted for xylazine and chlorhexidine, if that gives the reasons for everything, that could be a petition? I mean resubmitted.

CHAIRPERSON MOYER: If you go through the process.

MR. MATHEWS: Yes, it needs to go through the process. But now you need to talk to Bob on that. I can't speak for the department.

CHAIRPERSON MOYER: The chair recognizes Dan.

VICE CHAIRPERSON GIOACOMINI: Okay, so I understand where we stand on the chlorhexidie and the xylazine. On the excipients, we are making two minor changes.
1 You said one is okay. Is the second one okay?
2
3          MR. MATHEWS:   I'm really only
4 familiar with the APHIS part.
5
6          VICE CHAIRPERSON GIOACOMINI:
7 We're changing drugs to drugs or health care
8 products.
9
10         MR. MATHEWS:   That is going
11 beyond the original scope I believe.
12
13         VICE CHAIRPERSON GIOACOMINI:   So
14 we can only make the APHIS change at this
15 point in time?
16
17         MR. MATHEWS:   Off the top of my
18 head I would say that in the case of the drugs
19 and health care, you are expanding the
20 annotation. In the case of just adding APHIS,
21 you are clarifying the original intent, and I
22 wouldn't think you would need a petition for
23 that. But if you are going to expand it
24 beyond drugs, then you are going to have to
25 petition to have the annotation amended to add
26 the health care products.
27
28         VICE CHAIRPERSON GIOACOMINI:
Okay. When we were setting up the agenda, I lost the argument that I did not feel that vaccine petition should be listed as under the category of either materials or technical corrections or clarifications; that it was a change in the regulation at 105.

MR. MATHEWS: And that is my understanding as well.

VICE CHAIRPERSON GIOACOMINI: So even - so contrary to the way it's listed in the agenda, it is still okay to proceed with that?

MR. MATHEWS: Yes. Because you are not changing 603. You are actually changing 105. Correct?

VICE CHAIRPERSON GIOACOMINI: Just asking clarification.

MR. MATHEWS: Well, by changing 105 you are not changing the National List. The listing in 603 remains the same.

VICE CHAIRPERSON GIOACOMINI: That was my - that's why I didn't want it
listed there.

MR. MATHEWS: To put it here as a materials annotation is actually an error in the agenda.

CHAIRPERSON MOYER: That would be an error. Chair recognizes Kevin.

MEMBER ENGELBERT: Dan asked the question. I wanted that clarification. I didn't think that was a change in annotation.

CHAIRPERSON MOYER: Thank you, Kevin.

Chair recognizes Hue and then Tina.

MEMBER KARREMAN: I guess I was just wondering. For those six years that those medicines were going through, Rick, we didn't at all think about USDA stuff. And oh my gosh, afterwards, wow, gee whiz, what a shame. Just to play devil's advocate against what I want to go through, just for a clear process, was it actually - not an oversight, but if we add this APHIS materials, wouldn't
that be - was that part of the intent?

MR. MATHEWS: Well, you were the petitioner.

MEMBER KARREMAN: I was with a couple of people.

MR. MATHEWS: Was that the intent?

MEMBER KARREMAN: Yes, that was the intent.

MR. MATHEWS: All right. You just answered your own question.

CHAIRPERSON MOYER: To stay on time, let's move on. Tina, we have a lot to go through here today.

MEMBER ELLOR: Quick like a bunny, how does this affect the peracetic acid situation?

CHAIRPERSON MOYER: I'm sorry, I didn't hear that question.

MEMBER ELLOR: How does this affect the peracetic acid? Because it's the same issue.
CHAIRPERSON MOYER: It's a question that Rigo brought up. I don't know, Richard, are you prepared to answer that question, peracetic acid, when we are changing that we also need to adjust the annotation of hydrogen peroxide, because if we vote the way the committee voted by default, hydrogen peroxide would fall off the list, and that is not our intent. But because peracetic acid is in formulation with hydrogen peroxide, we feel the need to change the annotation to hydrogen peroxide to keep it on the list. We don't want to vote - I'm not speaking for the board, I'm speaking for the committee.

MR. MATHEWS: So you had a petition to change the peracetic acid.

CHAIRPERSON MOYER: To expand the use of peracetic acid.

MEMBER ELLOR: To remove the annotation.

CHAIRPERSON MOYER: To remove the annotation.
MR. MATHEWS: To remove the annotation from peracetic acid.

MEMBER ELLOR: Right, and we decided what we would do is change the annotation on hydrogen peroxide and peracetic acid instead.

CHAIRPERSON MOYER: If the room could please remain quiet.

MR. MATHEWS: To do both instead of just the one.

CHAIRPERSON MOYER: Right.

MR. MATHEWS: One isn't dependent on the other?

CHAIRPERSON MOYER: No, they are.

MEMBER ELLOR: They are.

CHAIRPERSON MOYER: They are intertwined.

MEMBER ELLOR: They can't be separated.

MR. MATHEWS: In that case, since you had a petition to do the peracetic acid, and you think or you believe that the two are
related, I would suggest - but again you may
want to turn to Miles on this - my reaction
would be, you go ahead and proceed with it,
because the attorneys would let us know
whether or not we could do it.

CHAIRPERSON MOYER: Yes, the door
was opened.

MR. MATHEWS: I've got to break
the habit of the "we" word, though.

CHAIRPERSON MOYER: Briefly, if
we can, the chair recognizes Valerie from the
program.

MS. FRANCES: This very same
question came up with the petition to expand
the use of tetracycline. And it was then -
there was a consult with OGC on that question,
whether you could go ahead and expand the use
of tetracycline in that case, and also add an
expiration date which was not petitioned to
do.

CHAIRPERSON MOYER: But the door
was opened.
MS. FRANCES: The door was opened.

CHAIRPERSON MOYER: Chair recognizes Dan.

VICE CHAIRPERSON GIOACOMINI: I respectfully disagree with you, Valerie. The situation here is that they are recommending an annotation change on something that wasn't petitioned, correct? We are only on the peracetic.

MEMBER ELLOR: Because of the reclassification of peracetic acid from inert to active, they are inextricably linked; they cannot be separated. One cannot exist without the other.

VICE CHAIRPERSON GIOACOMINI: But you are recommending an annotation change for what ingredient?

MEMBER ELLOR: Hydrogen peroxide.

VICE CHAIRPERSON GIOACOMINI: So they are recommending an annotation change for a substance that was not petitioned or part of
the petition.

CHAIRPERSON MOYER: It is part of a petition.

MR. MATHEWS: You just have to explain it real well in your recommendation to the department, and they will go through the rulemaking process, and the attorneys will let you know whether or not you can.

CHAIRPERSON MOYER: Thank you, Richard, I appreciate your time.

Moving on, I apologize, Jim, and appreciate your patience with the board. Jim Riddle and Pat Kane on deck.

MR. RIDDLE: Jim Riddle, University of Minnesota, and I offer my comments on my own behalf, and as a recovering NOSB member, I would like to add for personal privilege for a moment to say a few words before I start my comments, Mr. Chair.

CHAIRPERSON MOYER: That permission is granted.

MR. RIDDLE: Thank you.
Bea, Julie, Rigo, Hue, and for the record, Gerry, wherever you are, I served two years with all of you, and I just want to - it means a lot to me to be here today to thank you for the five years of effort that you all have put in. Everytime I come to one of these meetings I am just blown away by the depth of the issues that are considered, and by the thoughtfulness that this board over the years - different people come and go - but thoughtfulness that this board and the respect that this board shows for each other and for the people that come before you. So I just want to thank you for that service, and I also want to thank all the other board members, and the incoming board members. It's great to have four new appointees here - I know there are five coming on, but four of them are here on their own dime just getting up to speed so they can hit the ground running. And I think that is a really good sign.

I also want to thank Valerie for
sticking with the board, and all that you have
done to keep things flowing and keep things
moving.

I want to thank the program, and
Miles, congratulate you and look forward to
your leadership. And thank Rick, maybe he
left, and wish him well in his retirement.

And I did bring a little something
to share with the program, and this is a
product that my wife purchased October 20th at
the Wal-Mart in Winona. It's HOMS brand Bio
Block organic pest control, big words, organic
pest control - oh, look a USDA organic seal on
this product. Not a single organic
ingredient. Not a name of a certifier. So we
have problems beyond personal care and some
others. So I'll be turning this over to the
program to take a look at.

Also on my flight here yesterday
on US Air in the flight magazine BMD organic
honey throat drops, USDA organic seal on this,
and I'm assured - it doesn't say who it's
certified by, hopefully it is, because it is a food product more or less – but what are the honey standards? We didn't certify honey, but to what standards?

So that just reinforces – I know one of the priorities for the program is moving forward with the aquaculture standards. But just to pass these two things on. Enjoy.

Okay, now for my comments. The organic agriculture and the standards themselves are the very embodiment of the precautionary principle. Look before you leap; know the consequences to the maximum extent possible before adopting new practices or new inputs.

I find that the Livestock Committee's recommendation to allow GMO vaccines with no restrictions, no technical review, no consideration of OFPA criteria, and very little time for engagement of the public, totally turns the precautionary principle upside down. Throw precaution to the wind.
Allow any of this new class—these are novel recombinant substances—into organic agriculture without performing due diligence, the OFPA criteria.

There was just talk about whether this is a national list issue or not, and I'd like to remind you that the National List is empowered by Section 105. That is the holy grail. The National List is a list of exceptions that are only allowed because 105 allows their consideration. And that is where the GMO, the excluded method vaccine language, appears. So you know, you have to consider it as a material recommendation, which is exactly what the USDA has said. And to me that means that the board must consider the OFPA criteria to have both a legally valid and a defensible recommendation that stakeholders can support.

What is the potential for detrimental interactions with other substances? What are the toxicity mode of action, breakdown products, contaminants,
persistence, concentrations in the environment? Probability of environmental contamination during manufacture or use, misuse, or disposal. Possible effects on human health. Effects on the agro-ecosystem. What are the available alternatives? And are these substances compatible with organic production?

None of these have been addressed in the committee's recommendation. There has been a little more discussion today of some of the alternatives, but not put in the context of the universe of vaccines, and how few of those are actually even genetically engineered currently.

The committee's recommendation did not - it makes a passing reference to the preamble, but I find it very helpful to actually read the preamble, which is what I did when the rule came out. I read the language of the rule, and the preamble, and it's always been very clear to me that the
only opening for GMOs is the allowance for consideration to place them on the National List for vaccines. They have never been allowed.

And when you read this language from the preamble, based on comments received, and because of the potential impact of the prohibition of the use of excluded methods is still uncertain, we have created the possibility of Section 105(e) for the NOSB to exercise one very narrow exception to allow use of animal vaccines produced using excluded methods, but only if they are explicitly approved on the National List.

We believe the issue of animal vaccines requires further deliberation as most appropriate to consider it through the National List process which mandates review by the NOSB and technical advisory panels.

Consideration of animal vaccines produced using excluded methods is appropriate for the National List review process, because
animal vaccines we believe are most appropriately considered synthetic material. That is what USDA said. It's pretty unequivocal, and there was some talk today about a middle ground, potentially putting some kind of commercial availability or order of preference language. But we have commercial availability in 606 and in seeds, and it's problematic. And it becomes very subjective of what is a good faith effort. And so I don't see that really as workable. But I think the middle ground already exists, and a win-win; it's not lose-lose, Kevin. There is a middle ground which is for the board to request for these substances, or the classes of substances you identify in the review paper, that those classes of GMO vaccines be - undergo a full technical review, build stakeholders with you, be fully legal, and get this information about this technology transparent and out in the public. It shouldn't be based on one review
paper written by authors in Australia and Europe and with no context of use in organic agriculture.

I just think that is rushing things forward. We are not sitting at a crisis right now. This is a very significant change to the rule. USDA has said, organic prohibits GMOs. If this moves forward, it will change it to in marketing terms, organics prohibits most GMOs. And that's not a very strong stand, and I think we are looking at the possibility of consumer backlash going down this road. Thank you.

CHAIRPERSON MOYER: Chair recognizes Kevin.

MEMBER ENGELBERT: Before we get into your comments, my first question is, you say you are recovering NOSB member. How long do you expect the recovery to take?

MR. RIDDLE: I think it's for life. One day at a time.

CHAIRPERSON MOYER: Did you have
any additional questions, Kevin?

The chair recognizes Hue.

MEMBER KARREMAN: Thanks for your comments, Jim. I kind of had an idea of what might be coming from your written comments. And I truly appreciate them, and it is you know, it's a tough position we are in. Because my question to you is, what do we do with any of the animals that have been treated over the last seven years with these vaccines that technically are prohibited? I guess they should all be identified and taken out of production, because they have to be permanently removed at this point, and how do we deal with the fact that they are already being used, and the consumers haven't said anything? I understand totally what you are saying about, you know, the GMOs, like well, organics might allow some. That's not cool. But you know in reality out in the barns, out in the countryside, I know they have been used, and I don't know to what point, but how
do you address that, because that is reality.

MR. RIDDLE: Well, I think with education and more information, where there are alternatives, different products to meet the same vaccination, you just say you have been using this. It's not appropriate. This is new information that has come to our awareness, and you shift, but are there some that there are no alternatives? I don't think we know that really yet, and are they being used in organic animals where there are absolutely no alternatives? I mean those are the ones to target, that get reviewed either individually or those classes as you have identified, and move them through the process.

It may feel satisfying to vote on this now and think you are done with it. But you are not done with it. It's just going to start rulemaking, no matter what you do. So to call for a full review, it gets all of us together, rather than a risk of significant potential backlash.
But I think through education of producers, of inspectors, of certifiers, and not a heavy hand, because it's not like someone has been trying to cheat. This is not a willful violation. This is not fraud. This is basically an oversight, and to keep that in perspective.

CHAIRPERSON MOYER: Chair recognizes Dan.

VICE CHAIRPERSON GIOACOMINI: Thank you, Jim. I just want to take what you just said a little bit and redirect it back to the program. Because this is another example of something that Miles is going to have to look at and have the program review. The evolution of the petition process is single substances. I don't know if they would readily accept a class of vaccine petition. Number two, the nature of the process and the things requested in that petition process is tremendously biased to the manufacturer. The users of something like
this will never - they are the ones that have
to make the petition saying I need that
vaccine, or I need that group of vaccines -
they will n ever get the information that is
requested - currently requested in the
petition process for it ever get through the
program and get to this board. It just won't
happen.

I know I have pounded the table a
number of times, but we have two huge biases
that are - one is the nature of, that was one
of the problems we had with the injectables,
is they were not going to - what they were
insisting on for a group petition was just
absolutely unwieldy, and the information they
were requesting coming from users or
representatives of users as opposed to
manufacturers, was information that they were
just never going to get it.

So that is another one of those
things that, if this is the way we have to go,
is the producer coming in and saying I need
this vaccine, the petition will never get out of the program.

MR. RIDDLE: If I could respond, I understand your concerns, Dan, and I mean you do have someone coming off the board who is extremely knowledgeable and passionate about this who maybe could represent those producers in helping put together a petition that is targeted at meeting their needs. So I don't see that in this instance as being a huge obstacle.

And there have been classes of substances considered. You bring up the vitamins and minerals, but also amino acids were petitioned and considered as a class, and it came out that methionine was the one that moved forward, but it started off as a class.

So it's not at all unprecedented that that happened.

VICE CHAIRPERSON GIOACOMINI: It would have to involve that.

MR. RIDDLE: Well, it's gone
either way. I would say. I wouldn't say it's evolved.

CHAIRPERSON MOYER: Thank you. I just want to remind the board that at this rate we'll be here until 11:00 o'clock at night, judging by the numbers I'm looking at.

So --

MEMBER KARREMAN: As far as a petition like a person or a farmer petitioning, I agree completely with what Dan said. The reason that the petition for whatever it was that I submitted to Bob, injectables, before got rejected was because let's see there were about 35 manufacturers of injectables that all have CBI or confidential business information, old patents, the new ones you can't get it. I mean it was just humanly impossible to do that petition. I'm just telling you that.

So I don't see it any easier for this particular group of products either.

MR. RIDDLE: If you look at the
language in 105, though, it's provided that the vaccines are approved in accordance with 205.600. It doesn't say individual vaccines, so you can certainly read the regulation either way.

CHAIRPERSON MOYER: Thank you, Jim, we very much appreciate that.

Again, I just want to remind the board that just doing some simple math here we calculate that at this rate we will seriously be here at 11:00 o'clock at night. That is how many people we have to go. We've gone through four in an hour. So.

Pat Kane to the podium and Sam Welsch on deck.

MS. KANE: Hi, my name is Pat Kane, and I am coordinator of the Accredited Certifiers Association, a non profit organization representing 40 USDA accredited certifying agencies.

I would like to thank the NOSB for the opportunity to comment today, and for all
the work that you folks do on behalf of the
organic community. And thanks especially to
all of you who are not going to be here at the
next meeting for your work.

We would like to congratulate
Miles on his appointment as the program
director, and also extend our willingness to
NOP to help with anything that we can help
with.

We also thank the NOP for their
upcoming participation with our professional
development training for the certifiers to be
held in January.

ACA did submit comments to the
NOSB Livestock Committee regarding the animal
welfare recommendation, and we very much
appreciated the work that you folks did on
this work, to start it moving. We believe the
document addresses a very important aspect of
the organic standards, and when complete will
provide a very good background with which to
address the animal welfare requirements.
We also spent the last few months working with our members to draft a guidance for organic poultry production. As part of the poultry work of the ACA poultry outside access working group we did create a comparison chart of various stocking densities, looking at different standards for who required beak trimming, toenail clipping, wing clipping, lighting requirements, perch requirements and pasture.

I can forward the chart to the board if you think that would be helpful, and any further work you might do.

We appreciate the Livestock Committee's willingness to incorporate portions of the ACA guidance document into the livestock recommendation. However we are also concerned about the process used. The major revisions done today also need public comment, which we would hope would result in recommendations that would be more widely accepted and supported.
Thank you to the committee for initiating this work. We hope when complete this recommendation will provide the needed clarity regarding the issue of animal welfare.

At this time Valerie has distributed to you a draft of our organic apiculture guidance document that we have also been working on. Various members of the ACA spent a lot of time and effort to pull this together. It was based on the original NOSB recommendation for 2001, but we did expand it somewhat.

So we hope that the board or the NOP can begin work on this topic, because there is organic honey being marketed, but without definitive standards.

So we would urge the board and livestock committee to begin work on the topic in the near future.

I'd also like to remind the board of the ACA's WWW606 organic dot com website.

This is the organic alternatives to the 606
listings.

We have a few up there. We are getting more everyday, so if you are looking for alternatives and want to know what is currently available in discussions about sunset and all that for 606 materials, please monitor the website. Hopefully we'll be adding more listings.

Thank you for the opportunity to provide comments.

CHAIRPERSON MOYER: Thank you, Pat.

Any questions or comments from board members for Pat? Hearing or seeing none, we appreciate your time.

If Sam Welsch is in the room and would come to the podium.

Joe Casey? And Carissa Gigliotti on deck.

MR. CASEY: My name is Joe Casey.

I'm director of North American Lecithin at Solae LLC. Solae is a manufacturer if
nonorganic bleached doiled soy lecithin sold
for use in products labeled as organic or made
with organic.

I have given Ms. Frances copies of
my prepared statements, but after sitting here
today I decided to deviate from them a bit.

I am aware of the decisions made -
of the decision made during the May meeting to
move deoiled lecithin to 205.606, and I am
also aware of the decision to remove lecithin
bleach from 205.605(b).

But by doing this you are actually
disallowing the use of deoiled lecithin,
because all commercially available deoiled
lecithin today is currently lightly bleached
as an anti-microbial step. Thus if you delist
lecithin bleached from 605(b) without
simultaneously having deoiled lecithin bleach
listed in 606 or 605(b) organic food producers
will not be able to use deoiled lecithin, and
as you have already learned there is currently
no functionally comparable alternative.
After those deviations, I will -

the rest of the time I have I will move back
to some of my prepared statements.

Solae would like to emphasize the
significant differences in form and function
between deoiled lecithin and what is being
marketed as powdered organic lecithin, a
distinction which we feel may not be clearly
defined.

The functional portion of lecithin
consists of a complex mixture of polar
molecules, primarily phospholipids. This is
the basic - can be considered the active
ingredient in the lecithin, or AI.

The purpose of the deoiling
process is to concentrate the active portion
of the lecithin or AI. The minimum AI for
Solae or any deoiled lecithin is 97 percent,
while the AI of organic liquid lecithin is
typically no greater than 65 percent; that is
the liquid product.

Powdered organic lecithin is just
1 liquid organic lecithin that has been plated
2 onto some form of carry out. Thus powdered
3 organic lecithin does not undergo the deoiling
4 process, and the functional portion of the
5 lecithin is even further reduced even less
6 than liquid lecithin.
7
8 Aside from the inability of
9 currently available organic lecithin
10 ingredients to function similarly to
11 nonorganic bleached deoiled lecithin, we
12 further question the compliance of these
13 organic lecithins with US food labeling laws.
14 We have reviewed several product
15 specifications for organic lecithin products
16 that list the hexane insolubles as less than
17 1 percent. Title XXI, Part 184.1400 of the
18 Code of Federal Regulations, however, states
19 that the food chemicals code of specification
20 for lecithin must be referenced to determine
21 if an ingredient meets the requirements to be
22 identified as lecithin.
23
24 The FCC specification for lecithin
lists the requirement for hexane insolubles to be less than point three percent, not less than 1 percent. In order for lecithin to be truly called lecithin or declared as lecithin in an ingredient statement, the additive must meet the food chemicals code of specification.

So now in the interests of time I'll conclude my remarks.

CHAIRPERSON MOYER: Thank you very much, Joe.

Are there questions for Joe regarding his comments? Any questions or comments for Joe?

Hearing or seeing none, appreciate your time. Thank you very much.

Carissa.

MS. BROWN-ROSEN: I tried to get her to talk to you about materials, but she really wouldn't do it. I'm here again. I have a proxy.

CHAIRPERSON MOYER: So if you would just state your name.
MS. BROWN-ROSEN: Emily Brown-Rosen, Pennsylvania Certified Organic, I'm the policy director.

CHAIRPERSON MOYER: Thank you very much.

MS. BROWN-ROSEN: I'm going to talk about classification of materials. I do have one small comment about bivalves, but if I run out of time you can also ask me about it.

We support the proposal that's written that we reviewed, and our comments, we submitted comments in writing in support of the committee.

Now I'm not in support necessarily of some of these proposed changes we have been talking about. I think that would radically change my perspective. But particularly we were in support of the whole extraction idea, limited use of synthetics and extraction, provided there is no chemical change. That's fine, that's historic, that's the way things
have been.

We're not in favor of adding the criteria if a synthetic on the National List is used and it affects change, that it's somehow not synthetic. You know we don't care if it's on the list or not; if you are using - if you are causing a chemical change with a synthetic substance it's synthetic. So that's - I would just invite you to hold off on that additional change. But otherwise I was really pretty pleased with the document. We really agree with the principles. I think Jessica Walden from QAI provided some really good suggestions about modifying the heading of 605. Perhaps if you could call that nonorganic, that could be the home temporarily for things that are derived from agricultural substances, have been changed chemically, and they need a home to go to on the list.

And then later if they are able to be made organically they can just be petitioned to be removed. So I think that may
handle that little paradox.

We agree also with Tilth, the critical details need to be worked out, and the guidance, particularly the decision trees. I also got kind of lost and didn't necessarily follow the rationale on some of these examples here. So there is more work, but basically the way it's written I'm very happy. I think it needs to go forward so we can do the next step of the work.

We agree, many substitutes can be agricultural yet processed in a way that renders them synthetic, and we believe in the case of food ingredients these should specifically be reviewed and approved for use as synthetics that appear on 605.

We agree also that the annotations are useful for clarifying which forms are required, and appreciate as much detail as possible when substances are reviewed, preferably with TAP reviews so that we can refer back to these reviews when we are
evaluating new material, or similar formulations.

We are also glad to see the proposal to bring back the practice of voting first whether it is synthetic or not. This is key, and sometimes that's an important debate to have before you go any further, listing or not listing.

I think - well, we supported the original definition of nonagricultural, except with the amendment to add a definition of agricultural systems. This may be moot we will probably find with the new definitions.

The only problem with putting agricultural items that are - I think you call them derived from agriculture but processed so as to render them synthetic and put them in 605 is of course then we have no incentive to make them organic. So this is where we are back to, we would really much prefer combining 605 and 606 preference. Maybe we can still talk about how to do that, or get another
legal opinion. Because it would just help
with having to split all these hairs.

Now I have another topic that was
off the table here today but I think it's
important to think about for your work plans
on this. It involves personal care also in
the sense that you are saying the scope, we
are only talking about synthetic in terms of
inputs, not products that can be certified,
and that's fine, I agree with that.

But I do realize there is a
crossover. When certified products are
actually ingredients, so we are certifying
ingredients that are then used in organic
processes, food products that become certified
organic. We talk about innovative producers
out there making more and more organic
product, which is great, the manufacturers,
but it is also sort of a loophole in some
sense. If you are worried about synthetics
and the amount of synthetics being in organic
food, if everybody is out there creating novel
ingredients, using organic agricultural
ingredients, like soil, biological mechanical
processes, and then substances on the list,
you can make all kinds of things, and you can
certify them organic, and get them approved,
and they turn up in the product and they never
were reviewed as a synthetic thing that could
be in organic food. For instance there are
people out there with websites selling
emulsifiers, sucrose cocoates, hydrolyzed
protein, glycerin, long chain fatty acid,
steaeric acid - these are all certified
organic. None of these in an non-organic form
would be allowed in organic food.

So it's tricky, do we want to
control this? Can we control this? Is it
desirable to control it? I think it is. I
think we need to talk about some sort of
guidance, what can be certified? Particularly
on these minor food additive ingredients, or
otherwise the door just blows open, because we
do have so many creative manufacturers out
there. So that is a thought for the future.

I did have suggested wording in

my soap comments, so that is it.

Any questions.

CHAIRPERSON MOYER: Thank you

very much, Emily.

Are there questions for Emily from

the board or comments?

Seeing and hearing none,

appreciate your time, Emily, thanks for

coming.

The board will now call Nichelle

Harriet and Sebastian Bell is on deck.

MS. HARRIET: My name is Nichelle

Harriet. I'm with Beyond Pesticides, a

nonprofit group right here in D.C.

First of all Beyond Pesticides

would like to thank the NOSB for all your hard

work, and we are pleased that Jay Feldman, our

executive director, will be joining the board.

I look forward to working with you on these

issues.
Many of our comments have been expressed here earlier, so I'm going to keep this very brief.

First on inert, Beyond Pesticies believes that full disclosure and review of all ingredients only serves to strengthen organic standards and public support for the organic program and legal. The NOSB is having this in its discussion in a period when the manner in which EPA handles inert ingredient disclosure has changed and is continuing to change. And this section 25(b) of FIFRA products meeting the standards for exemption including inert ingredients previously listed on List 4 must be on the label identifying the name and percentage of each active ingredient, and the name of each inert ingredient.

So the distinction between type of ingredient active versus inerts is becoming less meaningful.

Similarly as you know EPA at the end of September announced that it will be
considering the disclosure of all inert ingredients on pesticide labels thus further blurring the distinction between active and inert ingredients.

Full listing of product ingredients goes hand in hand of full review and assessments. We believe that the NOSB and the NOP must work closely with EPA to utilize its staff to conduct assessments. Discussions between NOP and NOSB and EPA should result in a collaboration that utilizes EPA's assessment capability.

Devoting additional resources in EPA's Office of Pesticide programs certainly fits with ongoing efforts to shift the agency's priorities to registering and labeling FIFRA minimum risk pesticides and green approaches to pest management.

In addition the technical advisory panel review process can help inform environmental effects decisions made by the NOSB. Additional funds appropriated by
Congress for TAP reviews serve to emphasize the importance of higher and higher levels of scientific scrutiny.

On GM vaccines, it has been proposed that genetically modified vaccines be allowed in the NOP without significant review. We agree with submitted comments by the National Organic Coalition and Jim Riddle that vaccines that are compatible with organic production and which meet the evaluation criteria as stated in OFPA be subjected to technical review, with transparent and inclusive rulemaking.

We also believe that a petition must be written to consider the various classes of GM vaccines. As laid out by OFPA, GM vaccines regardless of their ubiquity in the marketplace, as suggested in the proposed recommendation, must be evaluated like any other synthetic substance in order to be determined compatible with the principles and
Finally we thank you for the opportunity to comment, and would like our written comments to be entered into the record.

CHAIRPERSON MOYER: Thank you very much, Nichelle.

Any questions or comments? Okay, thank you very much. We appreciate that.

Sebastian Bell and Chris Nelson on deck.

MR. BELL: I don't think Chris is here. I'm not sure, but I suspect he may not be.

Sebastian Bell from the Maine Aquaculture Association. We represent in any given year about 140 - 150 farms in the state of Maine that grow 15 different species, but our principal species are salmon, cod, halibut, mussels and oysters, making comments on the shellfish standards.

And just really wanted to answer a
couple of questions that came up in the committee discussion earlier today, and then also wanted to take the time from the Hue's point of view to thank NOSB and all your time and effort on the aquaculture issue. I know it's been at times an uncomfortable one, but certainly from the aquaculture community we appreciate your efforts.

Also wanted to thank the livestock committee under Hue's leadership, I think at times we were a testy workgroup for him, but he did an able job in managing us and making sure that we stayed on track.

And finally I want to recognize and thank George Lockwood for his leadership on the committee. Many of you who aren't in aquaculture don't know what a pioneer George is in the aquaculture industry, and I think the fact that he is so involved in the organics movement really confirms that he is still way ahead of the curve, even after being in the field for a lot of years. So he
1 deserves a lot of credit.

2 I wanted to offer to folks who
3 have concerns about the lack of control, I'm
4 just going to offer as a sideline if people
5 would like to talk to me about that in the
6 have-the-answer questions. I'm more than
7 willing to do that. I'm not going to do that
8 tonight. We have a long day. But I did want
9 to comment, because I think there are actually
10 some answers to those concerns, and I'd be
11 more than willing to talk about that.

12 I wanted to talk a little bit
13 about land-based production, and just put kind
14 of some reality in that proposal.

15 I went to my shellfish folks and
16 asked them to do back-of-the-envelope
17 calculations on what kind of a facility that
18 entailed for a relatively small food
19 production farm. So an oyster farm for
20 example that was going to grow on land in
21 tanks.

22 And there are two parts to that
facility. The first is the hatchery part where you are supplying seed for it, and that exists in the industry now, and is pretty standard practice.

But the actual grow out part, you have to do two things. You have to grow the algae that you are going to feed to those organisms, and because we have a three-year production cycle on shellfish, most shellfish, that means you have to have three separate year classes in a land-based system. So you have to have triple your annual harvest in that facility.

What that boils down to is that for about a 500-ton farm, which is a relatively small shellfish farm, you would have to build an algae culture facility the size of probably the middle-sized Budweiser brewing plant. That is the first piece of it.

And then when you actually had the tanks for the animals, you are talking about kind of a small oil refinery scale operation
with very large tanks and very large volumes
of water.

So I think it's important for
people to understand when you are talking
about that as an approach I can understand
conceptually how that answers the control
thing, but you are really talking about a
facility which is probably about 50 to 100
acres of very high intensive energy use,
because you have to use lights, to culture the
algae; huge amounts of electricity; very high
energy use for pumping water; so it really is
an industrial firm at that point. It is not
a kind of mom-and-pop operation. And I think
it's unrealistic to expect a small producer to
do that. You are talking about really I would
argue a big CAFO essentially, basically. Even
though I know that wasn't the intent, that's
what you would end up. So just as a point of
clarification.

And thank you.

CHAIRPERSON MOYER: Thank you,
Sebastian, we appreciate those comments.

Are there questions for Sebastian, or comments for him? Okay, thank you.

Hearing none, I think if Bonnie Wideman is in the room, Bonnie, we would entertain you at the podium, and Nicole Dineen on deck. Also gone? I'm sorry. Then we would have Dave Rogers, also gone. Jim Piece. Thank you.

Bonnie.

MS. WIDEMAN: All right, thank you.

My name is Bonnie Wideman, and I'm the director of Midwest Organic Services Association, known as MOSA. And being as we have submitted comments on handling and livestock, and out of our 1,300 clients about 645 of them have livestock, I want to focus on the animal welfare recommendation.

And I know it's hard to please everyone. We were told that the new pasture rule will please everyone, and that will truly be a work of art, because we recognize that
some certifiers are calling for more specificity, and some don't want specificity and they don't want numbers. So how can you please everyone?

And mostly we would like enough specificity that when we have an issue with a client's - with the animal welfare in their operation, on the health of their animals, on concerns about how well they are fed, we have something to hang that noncompliance on.

At the same time we are concerned about too much specificity when items do not apply to all types of livestock, and I wanted to illustrate these. Part of my illustration will also be that I'm not only the director of MOSA but I also have a certified organic sheep and beef farm. So I'll separate the comments.

We sent out the recommendation in our newsletter, and we received a few comments, not a whole lot. Most of them were from poultry producers. And we believe that they will be very happy with the ACA
guidelines.

But many of our comments had to do with the vet relationship, and those were also from the poultry producers. And as I reread what you had, in that it said we have to have that relationship, a herd health plan, and maintain preventive livestock health care practices, I think maybe some of our producers who don't have dairy didn't know that that would apply to them. And I'm wondering in your proposed revisions if you will be striking or modifying the herd health plan, because we have flocks, too.

Okay, well, I will go on here so I don't lose my time. Another just a few little other comments that were made by farmers. A farmer called from Upper Michigan and said, do they know how hard it is to keep animals clean on pasture? I can't tell them where to lie down and whatnot. I took a load of steers to a buyer, and they went running off the trailer, and they said, well, Bonnie, you had
them on some lush pasture.

So you know pastured animals are
going to be dirty sometimes, and this is just
a call for practicality in that regard.

Also we do have some grazers or
primarily dairy farmers who will pasture but
not always have water in front of their
animals all the time. And I think it needs
to be recognized that it is possible to graze
for a period of time and then have them come
back to the barn for water when they come up
to the facilities.

Not everyone is set up with water
in all paddocks is my observation.

Let's see, what else here. The
most important thing though is the working
relationship with the vet or nutritionist, and
this was a comment from many of our farmers,
and I also wanted to tell you that the
majority of our 475 dairy farmers do use a vet
for emergency situations. As far as routine
practices only about a third do, and not that
many have nutritionists. The average herd size of our dairy farms is around 54 cows. And we do not feel that a working relationship with a vet or a nutritionist should be required. I don't feel that it should be the case as a sheep farmer and a beef farmer either, even though I live in a part of the country where there are a lot of organic farms there aren't necessarily the vets that I would choose to rely on. In fact some of them don't respect the organic practices.

My final comment would be for sheep and goats that even though many of us do our lambing on pasture, many operations have confined lambing, and 18 square feet is a little bit larger, especially if you include the four square feet for lambs.

Most of us when we do lambs in the barn have pens at 16 square feet. And this is mostly for tight bonding of the ewing lamb.

All right, that's almost everything.
CHAIRPERSON MOYER: Thank you very much, Bonnie.
The chair recognizes Hue.
MEMBER KARREMAN: Thank you, Mr. Chair.

Thanks for the comments coming from dairy land out there. And one of the reasons for the veterinary or nutritionist being involved is to make sure - I guess to ensure the organic consumer that you know the animals are doing okay, that you are not way out on a limb and there is something wrong going on chronically. That's the intent there.

The other thing is, at least with dairy, to actually use some of the analgesics and anaesthetics and what not, or even have them dispensed, you do have to have a valid client-patient relationship. I know that veterinary groups in my area will not dispense lidocaine to let the farmer do disc budding and the little horn buds, which is promoted by
all certifiers it seems now, without knowing that farmer. So if Farmer Joe calls out of the blue, can you drop off lidocaine, I want it, no, they won't do it, because they don't know that farm.

Now the flip side is of course there is not a whole lot of vets in certain areas like, I don't know, southern Missouri I'll just pick a place, let's just say, so that is a problem there. But the intent is to make sure that the organic consumer can feel assured that these animals do have a second set of eyes looking at these animals, that was the intent.

The other thing was, at least in dairy, the pasteurized milk ordinance for alternative treatments to be used and have in your medicine cabinet, you get a seven point debit if you don't have a valid label on some of these things. So with a veterinary relationship you can do that. If you don't have that you are not going to have it. So
it's almost bordering toward the illegal to not have a vet involved if you are a dairy farm that is shipping milk to the fluid market, and you are using alternative treatments which organic guys do. Anyway, I just wanted to explain the whole veterinary thing.

MS. WIDEMAN: May I response?

CHAIRPERSON MOYER: Absolutely.

MS. WIDEMAN: That's for dairy. I don't have lidocaine in my operation. I have Redman salt and kelp. And I have looked around for a vet, and actually found some that are fairly antagonistic. I had a vet come - and oh, here's another thing, having a vet approve the alterations, no, I believe that it's the farmer, him or herself, that knows what kind of alterations are best. I had a vet come to do my alterations. And we knife cut my steers after they've had a summer on the pasture to enjoy their bullyness out there, which I think is
appropriate. But the vet did not do as good
a job as the custom guy usually did, and could
not handle the cattle. He insulted me by
saying I'm going to give you a free fecal
examination to show you have worms in your
beef. I did not, but I would not like to be
forced to have a relationship with a vet like
that.

Another thing about the
alterations at the earliest age, I don't think
we should all be forced to ban it. Because
there are other considerations. In beef and
sheep you want the animals to bond. I mean I
could go out there and band lambs and steers
when they are born, and I think that would be
a horrible practice. But I think people tend
to want to do what they think is easiest for
an animal; no blood, no pain. It's not true.

So.

CHAIRPERSON MOYER: Chair
recognizes Hue for a rebuttal.

MEMBER KARREMAN: Just a quick,
1 not rebuttal, just a little discussion here.
2 So I think the earliest age thing, I accept
3 that fully. But I guess if you have a large
4 bull that is eight months old and you go in
5 and you castrate it, do you think that any
6 anaesthesia is needed for that?
7 MS. WIDEMAN: It depends on the
8 competency of the person who is going it. One
9 thing that isn't taken into consideration here
10 when you work with blocks and you work with
11 herds is the stress that is involved in
12 handling them. Like when I have my cows on a
13 far - and I have them altogether on a far
14 pasture, and I have a lame animal out there,
15 I am not going to round everyone up and
16 bringing them back to the barn, because that
17 is going to cause harm to everyone else in the
18 herd and the flock. I am going to monitor it.
19 And it's the same thing when you
20 are working animals, if you have to keep them
21 in shoe, in a head gate, long enough for the
22 anaesthetic to take effect, I think that is
more stressful. When we have someone very
competent do our castration, the steers make
less noise than the heifers when you get the
ear tags for them. So that's my view.

CHAIRPERSON MOYER: Thank you very much, Bonnie.

Any other questions? Thank you for your time.

The board will recognize Jim Pierce to the podium, and Marty Mesh on deck.

MR. PIERCE: The comic relief starts now.

CHAIRPERSON MOYER: We could use it.

MR. PIERCE: There was a little bit of confusion getting me on the list. So I was originally going to deliver this yesterday, but I tweaked it a little bit based on your discussions today.

So here we go. My name is Jim Pierce, and my affiliation is Oregon Tilth, and these comments include but are not
limited animal welfare, greenhouse, and
nanotechnology recommendations.

If successful I'm going to
convince you all that the functional beauty
and simple subjective goal-based language such
as included but not limited to, and therefore
the unnecessary of prescriptive livestock
stocking density requirements.

Before working at Oregon Tilth,
the best certifier, my career was at Organic
Valley Crop Cooperative, the best farm
cooperation. One of my last projects at OV
was working at the standard with the farmers
to dissect, debate, delineate and develop
private animal husbandry standards; we called
the husbandry standards.

I learned early on that there were
a few negotiable truisms when working with
farmers, for me, boundaries of etiquette you
just cannot cross. The first for me was, thou
shalt wear thy jeans. If I showed up in
manager pants they would label me as a suit,
and my credibility would be worse than Levi
Johnson lecturing on abstinence.

Here is another ism worth carving
into stone: there are two things you should
never tell a farmer, what they have to do and
what they can't do. Or in the King James
version, what they shalt and what they shalt
not do. Now certainly the cannon of organic
regulations, loaded with thou shalts and thou
shalt nots, thou shalt be inspected every
year, thou shalt not use prohibited materials,
thou shalt keep records sufficient to
demonstrate compliance, thou shalt graze thy
bovines.

But these are goal shalts, not
prescriptive shalts. The Livestock Committee
animal welfare recommendations had both.
However it is the prescriptive shalts that
have generated the most push back. The
greenhouse recommendations to the credit of
the crop committee contains this language,
paraphrase: in lieu of crop rotation and cover
cropping, soil regeneration and recycling practices shall be implemented and documented in order to demonstrate that the required functions of crop rotation and cover cropping have been achieved. Specifically, maintain or improve soil organic matter content. Examples include but are not limited to, that's end quote.

The rule - I am going to skip this paragraph. Here is the point in the revised new international version. One size does not fit all. While prescriptive stocking densities are easier to uniformly calculate, these do not assure animal welfare. They establish a minimal threshold for compliance rather than impetus for continuous improvement. The golden rule of the NOP is to create and enforce outcomes based goals-oriented flexible, geographically adaptable, adoptable and applicable rules that are documented in the organic system plan, verified by inspection, cited in review as
requiring corrective action, and resulting ultimately in the continuous improvement that is the basis, the hallmark, the backbone, the heart, the foundation, the cornerstone, the pinnacle, the anchor, the keel, the crux, indeed the holy grail of the national organic program. You got to love that thesaurus button.

As you revise this animal welfare recommendation, think about how to do so under the template of including but not limited to. Show the farmer the goal without limiting their ability to innovate.

Take a break, turn the page, change the subject: nanotechnology. As stated in our written comments, Oregon Tilth believes and endorses the minority opinion that would create a more flexible approach effectively locking the door to nanotech in organic, while at the same time allowing case-by-case consideration in the future.

We thank you for respectfully
debating that position during your discussion today. To be clear we are absolutely in agreement with the Center for Food Safety and others to prohibit nanotechnology in its present and foreseeable state. However we are not in favor of adding it to excluded methods, thereby prohibiting it forever and ever, amen.

Although nascent and potentially as evil as gene splicing, nanotechnology is exponentially more diverse and complex. Think homeopathy, think veterinary medicine, think energy, think food safety. Shining a critical spotlight on nanotechnology now is proactive and laudable. Banishing it forever as an excluded method would not be.

The precautionary principle is our friend; embrace it.

Thank you to the fabulous five who – your actions on this board has permanently improved it. Thank you for the tenacious ten who remain to carry the torch, and welcome to the class of 2010. Thank you for not running
away screaming after this afternoon's discussion.

Thank you.

CHAIRPERSON MOYER: Thank you, Jim. We appreciate those comments. Are there any questions or comments from - I see Kevin and then Katrina.

MEMBER ENGELBERT: What's the NOSB board you've ever spoken in front of?

MR. PIERCE: I had anticipated quite a few questions. I will tell you this, though, there have been a lot, there have been eight or nine or 10 years worth of this. And the engagement and interaction and capture of comments from the last three years' worth of boards - really the full tenure of your five years on this board - has improved it. And I really do mean that, that you five have dramatically improved the functionality of this board forever the way it works. I don't know which one the very best single one is, but things have been continually improving.
CHAIRPERSON MOYER: That would mean it's this one. Your safe with that one.

MR. PIERCE: Best farm cooperative.

MEMBER ENGELBERT: Right answer.

CHAIRPERSON MOYER: Thank you, Jim. Katrina.

MEMBER HEINZE: I'd like to think more about your comments on animal welfare. Do you happen to submit something in writing?

MR. PIERCE: Yes, they are in writing.

MEMBER HEINZE: Really?

MR. PIERCE: Yes, they are in writing.

MEMBER HEINZE: They are?

MR. PIERCE: Yes, they're there.

MEMBER HEINZE: Those weren't the same ones that you submitted earlier, were they?

MR. PIERCE: Yes, they are, on regulations.
MEMBER HEINZE: They sound so much better when you say them.

MR. PIERCE: No, not these comments.

MEMBER HEINZE: Do you have those comments?

MR. PIERCE: Yes.

MEMBER HEINZE: That would be wonderful, thank you.

CHAIRPERSON MOYER: Any other questions for Jim? Joe?

MEMBER SMILLIE: I just wanted to agree with you, Jim, on your illustration of prescriptive versus including but not limited to. I think that is the way I'd like to see us move forward.

MR. PIERCE: Can I comment on that? You brought this up before. The Canadians have these standards. They love their numbers. And so do the Europeans, but they are not necessarily working for them. So to take them - well, there are actually two
problems. One is to take them might not be
the right numbers; the other is, the Canadian
system is petitionable for regulation, not
only materials. So it can change quite
quickly, and you can very easily find yourself
with an antiquated version of their table that
they have already decided is dysfunctional.

CHAIRPERSON MOYER: Jim, not to
prolong the conversation, but when we talked
about goal-oriented processes earlier, we were
chastised by the certification community and
told that what they wanted to see were numbers
that were verifiable and easy to certify. So
it's difficult to have it both ways.

MEMBER SMILLIE: I would
disagree. What Jim outlined was basically in
the Green Host document. We want to see your
plan, but we are going to leave it up to you
as to how you are going to show compliance to
that, rotation or soil improvement. We are
not going to prescribe that your organic
matter will increase from 3.4 to 3.6.
CHAIRPERSON MOYER: Yes.

MR. PIERCE: Well, one quick comment on that, then, if I may. There has been a lot of recommendations to add guidance language as recommendations. We've been promised the guidance manual - or program manual that will contain a lot of that guidance and suggestion, so there is really no need to write it into the regulation. It's another level. And the Canadians again have done this. Their program manual has a lot of the detail that the regulation does not.

CHAIRPERSON MOYER: Thank you, Jim.

Marty, if you would come to the podium, and Patty Lovesh is on deck.

MR. MESH: All right, Marty Mesh, Quality Certification Services, and Florida Organic Growers.

I think I'll save the retiring board member comments to the very end just because if I right out of time you can ask me.
But I wanted for the record to thank Barbara and Rick - they're gone - Miles' picture the other day really illustrated I think quite vividly for everybody that wasn't aware of how under resourced the program was and how much they tried to accomplish with really a staff less than our own certification program staff, in dealing with the amount of work that they have to deal with. So while we may have disagreed sometimes, my hat goes off to them and I wish them both the best.

So I wanted to congratulate Miles and the new staff and we of course look forward to working with him. We very much appreciated the budget illustration to show how the program is allocating resources, and word is it's a bit more transparent than how it was years ago, and I was glad to see it.

Now that I have said something nice about Miles, let me just be the first one to bring up a concern which is how the USDA may seem to be handling the compost issue, and
how I think they are blessing the California Department of Ag did handle the compost issue.
I have several concerns: who will pay for this testing, and leaving farmers with loads of compost that now they can't seem to use that they purchased that met the regulation, really that had vegetative plant material that's allowed in regulations. And so I think some more thinking needs to go on.

Aquaculture, this isn't the finish. It's only the beginning. And shrimp is a managed ecosystem, and I heard the discussion earlier. We've been here for years asking for shrimp. It's fully managed pond ecosystem, and we look forward to that. We're thankful for the aquaculture working group's work, and look forward to the continuing day when pond shrimp can actually be certified.

We support the materials before the board to be continued. I was so devastated yesterday I misplaced the letters I had in hand to turn in in the napkin with my
1 well thought out comments. But I did notice
2 that today dressing up and having a laptop,
3 y'all are allowing me to speak. So now I am
4 concerned about the proceeding, dress and
5 technology codes being implemented.
6 The pasture rule, let me - the
7 pasture rule, you know, I actually find it
8 intriguing about the interim final rule.
9 Actually the USDA could fix this
10 administratively without adding pain and
11 suffering to dairy producers and certifiers by
12 instructing and monitoring the certifiers to
13 do accreditation of what access the pasture
14 needs without the regulatory overreach which
15 was evident in the first proposed rule. But
16 maybe the train has left the station.
17 And then the supporting nickel,
18 Rich Thur has submitted a petition. He spoke.
19 Our clients faced severe problems with pecans,
20 and a bit of institutional memory may help.
21 In 1995 the AAFCO list of essential
22 micronutrients was accepted with the specific
exclusion of iodine and chlorine. AAFCO then
determined the essentiality of nickel after
the date of the national list was published as
an essential micronutrient, essential in some
cases for plant health. I believe that we
were indeed the certifiers that did not allow
a grower to use it, causing great harm to a
grower in relation to a deficiency documented
by a test as mandated. I feel sad if a
program I supported the creation of will cause
more economic hardship to a grower and
possibly force a certified organic pecan
grower to go back to conventional production
if this path through petitioning and blah blah
blah takes another crop season or two or three
to add to the updated AAFCO list the addition
of a critical micronutrient which should be
on there.

Maybe there can be a, quote,
strict but sensible, unquote, solution to this
minor oversight not to include and update the
list and now to include nickel as an essential
micronutrient. I would accept total responsibility for communicating with any environmental or consumer organizations that have questions.

IQF okra update: well, it seems to me like you know this is the last time they're going to be here, by god, you are not going to cut this one off. It seems like the petitioner would be here stating how many growers they reached out to, the status of those fair contracts offered to produce RQF okra, et cetera. However it's only me again to say as yet as far as I know the petitioner or the supporters have never made even a possible inquiry much less pursue the business relationship.

And I think that in the interests of time and your long day I will close with comments to the board members, but you will have to ask the questions, retiring board members.

CHAIRPERSON MOYER: Question from
SECRETARY WEISMAN: Marty, do you have any comments for the board?

MR. MESH: I do. Well, let me first add another thing to that before I answer the question.

I just wanted to thank the five retiring board members. And it's been a pleasure and I do know how hard y'all work, how painful it is sometimes to try to stay awake and act like you are interested in bad jokes as we come up here.

But you have done a great job and on behalf of all of us we are currently appreciative of all of your efforts who have served, and will now be gallivanting around into retirement, and probably growing a beard like Richard, and starting to relax, dress down a little bit. It will be fun to see.

CHAIRPERSON MOYER: Thank you, Marty. No other comments from board members?

There is one comment or question from Tracy.
MEMBER MIEDEMA: Marty, I sympathize with your organic okra growers, because if we had been able to add that item to 606, those growers would have made transparent to the trade that organic is needed, and what happens with a petitioner like that is they are sort of forced to take a different path. And had that item been added, it wouldn't have – they wouldn't have automatically, the petitioner, been able to use an inorganic variety. And remember getting placed on 606 doesn't give carte blanche to use in an organic variety; it just subjects it to personal availability. So the opportunity list for that was not created.

MR. MESH: The opportunity is still there is a major manufacturer wants to enter into a fair contract with growers to grow organic okra and help them have the infrastructure they need. That's the difference. It becomes possible if the buyer wants to help, and it doesn't if the
responsibility is all on the growers, in my opinion.

And about sunset, does anyone have a question about sunset? And this will be really quick. Come on, Joe, work with me.

MEMBER SMILLIE: I have not heard that question, Marty.

MR. MESH: The sunset, this is of critical importance.

MEMBER JAMES: Marty, I have a question about sunset.

MR. MESH: I actually think the board - I'm glad you asked that - and whether or not you want to finish your question, I can go ahead and provide you an answer. I actually think the board in your comments in this track raised some concerns for me that sunset was never envisioned to be that evergreen. It was meant to be a sunset, and that materials that were to be petitioned and be reviewed and put on the list at some point in time would go off the list. And to put the
whole onus on citizens to provide the absolute concrete proof to come up and prove that there is an alternative; to prove that - I'm sorry, it should be incumbent upon the industry at least a little bit to come, we need this material and here is why.

So I recognize that maybe there is a balance, but it seems to me as though the scale has tipped way too much in the wrong direction putting the responsibility on citizens instead of the industry.

CHAIRPERSON MOYER: Thank you, Marty. We have one more question from Dan.

VICE CHAIRPERSON GIOACOMINI: Marty, I have often sat up here and tried to find in some cases just somebody not recommending that we keep something on. And--

MR. MESH: Wait until Chilean Nitrate comes up.

VICE CHAIRPERSON GIOACOMINI: Well, that is a back door problem. There is a whole other issue. But the thing that I'll
ask you and through you the certifiers is,
really tell us what you want to include and
not just give the blanket, keep everything on
sunset. Because sometimes it's been one or
two certifiers that were the only persons who
made the comment to recommend keeping
something, and if it hadn't been for that I
would have voted it off.

CHAIRPERSON MOYER: Thank you,

Marty.

MR. MESH: I had San Francisco
tied in with a good joke in the compost
section, but I ran out of time.

CHAIRPERSON MOYER: Thank you.

Thank you, Marty, we appreciate that.

Patty Lovera to the podium if she
is here, and Farah Ahmed is on deck.

MS. LOVERA: Hi everybody. My
name is Patty Lovera. And I'm with Food and
Water Watch, which is a consumer group here in
town, and we are also a member of the National
Organic Coalition. So I appreciate you guys
sticking around after a long day to take more public comments.

Because we are a member of NOC and several folks have already talked about GM vaccines and personal care, I'm not going to get into those. I'm going to talk about aquaculture, nanotechnology and if I have time, animal welfare.

So we've been here before obviously on aquaculture. On the bivalve recommendation we were happy to see that there was a lot of focus on water quality. That is appropriate; it's necessary, because of the way that bivalves grow and eat. We do have concerns, historic concerns, about organic aquaculture in open ocean net pens, so adding bivalves to that mix doesn't really do it for us. So that is a piece of the recommendation that we weren't happy to see, but we do appreciate the part about in open ocean bivalve systems, really focusing on what types of understanding you have to have about water
quality and location and testing and going above and beyond what would shut down one of these facilities in a conventional or nonorganic system.

So I think that that reflects your good hard work in thinking through these quality issues. We also wanted to think about - to recommend - or commend, sorry, that we think it's appropriate to require that 95 percent of the weight come under organic management. We thank you for putting that in there.

One point we did want to make on aquaculture, bivalve piece was under the collection method to recommend taking dredging off that list. Environmental impact and not disturbing those bottom layers is a goal which we think it should be for organic systems; we think it is hard to reconcile that with a lot of dredging technology.

So organic technology, I think most of this has been said. We just want to
reiterate our concern about this technology,
about consumers' expectations that it not be
inorganic. And we support the many folks
today that have said it should be prohibited.
So we agree with that majority opinion, and
would like the minority opinion taken out.

We also agree that the definition
should increase the size to 300 nanometers.
You know we have been hearing a lot more from
our members and consumers about their concerns
about nanotechnology. So there is just a
sense that this is a genie we can't stick back
in the bottle. And the precautionary
principle to us means that it should be kept
out in the most definitive way possible out of
organic, because it is one of the types of
things people look to organic to be protecting
them from, and the more we learn about
nanotechnology, which is happening way too
slowly, because it's incredibly underfunded in
terms of environmental impacts, occupational
impact, what it means in the waste water and
waste stream of these plants that use it. It just seems like there are so many unknowns that have no business even having options to get into this type of food that is marketed as being protective and being precautionary.

So finally on animal welfare again, like you have heard from many folks, we think the pasture rule is an important piece for this, so we want to see that as soon as we can. And again this is another area where consumer expectations are incredibly high, and the proliferation of labels in the marketplace. You just have to go to the egg case or the meat case to see all of the claims about animal welfare. It shows that consumers are interested in this. They are confused by the proliferation of labels. And so obviously we think the organic label should be right up there at the top in terms of having really solid standards that are understandable. So we can get smart, things that you guys put in there, things about specific practices,
because that's where the public debate is. That's where people are starting to understand. And we will just echo what some other groups like Center for Food Safety said today about dealing with some of the culturing issues and going beyond just the piece about cages.

So that's it for me.

CHAIRPERSON MOYER: Thank you very much, Patty.

Any questions from the board for Patty? Hearing none, thank you very much, Patty.

Farah Ahmed is up, and Harriet Behar on deck.

MS. AHMED: Good afternoon. Or maybe I should say good evening, because it is getting late.

My name is Farah Ahmed. I'm here to speak on behalf of the Personal Care Products Council. I'd like to thank Valerie for her help in sort of schooling me on the
logistics. I am relatively new to this dialogue. I'd like to thank the board for inviting me and allowing me to speak. Really my purpose is to lay a very and quick foundation with respect to the regulations that surround cosmetics. We certainly filed our comment, and I am happy to take questions on those comments as well. But I thought rather than reiterate those, I'd use this opportunity to lay just a brief overview on the regulatory side of it that may be helpful to some. So essentially the primary laws affecting labeling of cosmetics are derived from the Food Drug & Cosmetics Act, as well as the Fair Package Labeling Act. A cosmetic would be consider misbranded if it's label is false or misleading in anyway or it does not bear the labeling information required by regulation, which is very detailed; or the container is filled in some sort of deceptive manner.
I just want to lay out the definitions now for a cosmetic. These are articles that are intended to be rubbed, poured, sprinkled, sprayed on, introduced into, or otherwise applied to the human body for cleansing, beautifying, promoting attractiveness or altering the appearance.

On the flip side for drugs, and when I say drugs I mean over-the-counter sunscreen, skin protectant, things of that nature, which are regulated. When we say personal care products, I think we generally mean cosmetics, and the other stuff that would be better - definitionally considered drugs by FDA but I think consumers view it all as sort of cosmetics.

Essentially, drugs, the definition really is, intended for use in the treatment or prevention of disease, or an article that affects the structure or function of the body. Although I think we can all recognize that we see advertising from time to time talking
about rebuilding collagen, et cetera, et cetera. But from a technical standpoint those type of claims should be reserved for drugs and not cosmetics.

And you will also see probably in a lot of advertising that products talk about affecting the appearance, reducing the appearance of wrinkles, things of that nature. So that is where these stem from.

So there are clear definitions as outlined by the Food & Drug Administration for both of these categories of products.

So again, intended use. I think the crux of what divides products is how they are marketed, their intended use. Of course I'm oversimplifying a little bit, but I think for our purposes that is generally how these types of products can be divided up.

Of course safety is a primary priority with respect to drug, cosmetics, foods, et cetera. But here we are discussing labeling. So they are combination products,
and I think if you go to the next slide.

Combinations do both, so if you can just think of a sunscreen with a foundation, that would be a combination product. You can go to the next slide.

And here are some examples quickly of what would be considered a cosmetic, and what would be really considered a drug or a cosmetic drug.

So what information is required on a cosmetic product label? Again, the two laws, one of the two is the Food, Drug & Cosmetics Act, which requires the following information, warning statements, what have you. And these are the CFR references if anyone cares, but I can provide a copy of the slides electronically, and we certainly brought hard copies as well. Go to the next slide.

The Fair Packaging and Labeling Act, however, requires a slightly different set of requirements on the label, and these
are outlined here. You can go to the next slide.

These are some of the things that are not required on the label. Actually, surprisingly, the brand name is not required on the label, although I personally like to see what brand I'm buying.

We can just fly through these, these are just illustrative examples of the requirements. I think everyone can be thankful that I'm not a graphic artist, but I did my best. We can keep going.

So let's focus on ingredient labeling. Here we are. The Fair Package Labeling Act, really the crux of this act is to prevent consumer confusion. And we need a fair balance, we need a way to compare product to product, so I think Valerie if we can just keep skipping along toward the end.

With respect to organic, this issue has cropped up quite often, and this is regarding the use of the asterisks in the
labeling. And that is not actually permitted according to FDA regulations. FDA references the INCI dictionary, which is an international dictionary, so it's an international language in terms of unique ingredient names. So when you start using asterisks and parentheticals, we start then raising questions as far as what does it mean, organic in U.S., organic in a different market. So for that reason it's not allowed. So I wanted to make sure that we got that message across.

Any questions?

CHAIRPERSON MOYER: Yes, thank you, Farah. I think there are some questions.

Joe.

MEMBER SMILLIE: Obviously there is a lot here that we need to understand, but the last thing that you seemed to be stressing that asterisks are not allowed by FDA?

MS. AHMED: FDA, the way the regulations break down, FDA references the INCI dictionary as one of the authorities.
Now the INCI dictionary does not include the use of asterisks or parentheticals. And the reason behind that is because the INCI dictionary is an international universal dictionary, and when we start adding parentheticals, for example, the word fresh with organic or natural, it has a different meaning. And it starts to then create a rubber ruler for the consumer so when they look at the label you don't have now the same measure.

MEMBER SMILLIE: I understand that for example it allows lavender but not organic lavender.

MS. AHMED: Correct.

MEMBER SMILLIE: Right, but I didn't - I don't - my understanding was that if it was lavender asterisk, and then down below the asterisk explained, certified organic, that that is not an FDA rule.

MS. AHMED: That is not allowed; technically that is not allowed.
MEMBER SMILLIE: By who?

MS. AHMED: By FDA. The FDA references again the INCI dictionary. The INCI dictionary does not allow for those, for a parenthetical or for an asterisk to be used in the ingredient deck. Now the ingredients can most certainly be called out anywhere else on the label. Typically companies will, underneath the ingredient deck or above the ingredient deck, will call out the organic ingredient and to what standard it it certified to. But it is not allowed in the actual declaration.

And it's an international language. And in the case of multinational corporations that are formulating global formulations, and some are global labels, often, we believe that it's really not just a cost saving but a saving in terms of labeling, the environment and what have you to have that consistency.

CHAIRPERSON MOYER: Chair
recognizes Katrina.

    Oh, I'm sorry, if you had a

3 rebuttal or another question.

4 MEMBER SMILLIE: Again, I agree

5 with you.

6 MS. AHMED: I'm talking as

7 quickly as I can.

8 MEMBER SMILLIE: You're doing

9 great. I think it references the INKY DINKY -

10 dictionary - whew, it's getting late -

11 references the INCI dictionary.

12 MS. AHMED: It does.

13 MEMBER SMILLIE: And the INCI

14 dictionary has that rule, but I wouldn't

15 translate directly as that would be an FDA

16 requirement. And I think as we investigate

17 the relationship between the USDA and FDA.

18 Because right now one of the few things that

19 is really accurate in the cosmetic area is a

20 few companies are at least not claiming their

21 products are organic, and they are restricting

22 their claim to what we in the USDA regulations
like to see, is they are restricting their
claims to the ingredient panel and saying that
their lavender is organic.

And that's a step up from the
people who are claiming the whole product to
be organic, and it's one of the things that we
like to see on the USDA side of things. So as
we - this is going to be a long process
obviously. But as we start working with the
FDA I think we will clarify where we can agree
on ingredient panel listing. But that is one
of the many issues we'll have to get into.

MS. AHMED: And if I may?

CHAIRPERSON MOYER: Please.

MS. AHMED: There certainly are a
lot, and as you mentioned earlier, it's
definitely acknowledged this is a very very
complicated area. Having practiced at the FDA
chief counsel's office I can tell you that in
dealing with these labeling issues there is a
lot involved in changing or accepting, for
example, aqua in lieu of water on a label, to
do something of that nature would require a lot of – would require data. I mean today we have all been saying consumer confusion, but what does that really mean? If you make a data-driven decision that would require adequate and reliable study, actual consumer study, intercept, and typically a 2-3,000 mall intercept study, something of that nature. Typically that was what I was used to dealing with with respect to labeling issues. So without making judgment in terms of the right, the wrong, what's actually happening in the market, I can say that there is a lot of value in outlining clear and transparent process, having data-driven decisions, and really ultimately promoting the mission of the NOP and that's organic farming. So all of those things I think are extremely important issues. They are extremely important issues to our industry, our association. And we look forward to future dialogue.
CHAIRPERSON MOYER: Tracy?

MEMBER MIEDEMA: The issue that you raise about the ingredient panel seems one that's pretty analogous to wine, for instance, where the organic producer has had to comply with a different set of regulations than they are used to having to comply with for a food product. So we do have a precedent for teaching new entrants to a category to comply with a labeling schema.

So that I feel can be rectified relatively simply. Are there other issues you have with the recommendation besides the ingredient panel? That is the only one I heard you bring up.

MS. AHMED: We responded in our comments as far as the recommendation goes. I'd be happy to go over those. But I think to your point as to wine, I am certainly not - unfortunately not a wine expert, or not yet. But I can say that with respect to the labeling side of the cosmetic, the issue is,
when you use an asterisk, what does that specifically mean. So if there was some melding between FDA and USDA, and there is a strict definition for what does organic mean for a specific ingredient that is one thing.

But here we are talking about an issue and from our perspective, it's an international issue, and we are dealing with harmonization and things of that nature, and we certainly don't want to take a step backward, so I think this is something that we need to tread very carefully on, and it may seem like a small or trivial issue, just tiny little asterisks, but it actually is a big issue, and it's just the tip of the iceberg.

You're nodding your head.

MEMBER SMILLIE: Well, I can't believe it's high on FDA's enforcement list.

MS. AHMED: That's a whole other conversation.

MEMBER SMILLIE: What enforcement, you were going to say.
MS. AHMED: I mean, FDA, we certainly believe in a very strong FDA. We have done our best to get funding for specifically the cosmetic division; it's frustrating. I worked there; I don't want to divulge my salary when I was there. I mean you know there is a lot that we can talk about fixing. But yes, I mean enforcement certainly they don't seem to be doing too much. There was a recent warning letter sent to a bakery, a food company, regarding the use of the term, "fresh," if I recall. I'll look it up and send it to you.

MEMBER SMILLIE: We will be talking about this for years.

CHAIRPERSON MOYER: Thank you. Thank you, Joe. Chair recognizes Bea.

MEMBER JAMES: So what I hear you saying is that to move forward we need to not worry so much about the asterisk and spell out organic under every ingredient in the label and then we will be able to work together and
start moving forward?

MS. AHMED: No, that's not what I am saying. What I am saying is that the asterisk is one issue. And as far as identifying all the issues, I think that is going to take time. From my perspective, from our perspective, the question is, should we move forward? If we should, then how should we? When we are talking about a rulemaking or potential rulemaking or guidance, what have you, something that would affect a very large section of a $250 billion industry, it's important to really be clear on really the parameters and the potential outcomes before making a decision on the best way to go, on the timing, things of that nature.

So again I'm not weighing in in terms of making a decision on those things. Our companies are certainly not entirely in agreement, especially when we drill down to the specifics of what is organic and what is not in terms of synthetics and processes.
MEMBER JAMES: But it sounds like you recognize that there is a need to merge the home so to speak of organic body care towards FDA so that consumer confusion is minimized, and we have - that we are not internally arguing over asterisks, but we are doing the best thing to try to label things correctly for the consumer?

MS. AHMED: I think even before making that conclusion or taking that step, I think that we really need to determine, is there consumer confusion? If there is, then what is it? Where does it lie? Is it with the USDA seal? Is it with the private standard? Is it with the term, organic? I mean even before making that conclusion, I'm very hesitant to go in that direction.

CHAIRPERSON MOYER: Bea.

MEMBER JAMES: So next steps for making - giving the information that you need in order for this to manifest would be?

MS. AHMED: I think continued
dialogue. I think sitting around a table and
having a discussion, and hearing from large,
small, medium sized companies in all
directions, hearing from consumers, hearing
from standard setting bodies, hearing from all
relevant stakeholders I think is very
important.

MEMBER JAMES: We had an
educational panel discussion in Pennsylvania
around a different topic, but we brought in a
lot of experts to talk about pasture and get
all of the different issues out on the table,
and maybe perhaps that would be a next step
toward blending the conversation between the
FDA and the USDA National Organic Program.

MS. AHMED: I think that is very
helpful. And I think before making any
decisions the powers that be that make these
decisions, i.e. USDA and FDA, we should I
think it's obligatory for us to arm them with
information from all sides, experts,
consultants, large companies, small companies,
standard setters, certifiers, not just a small 
group, if you really want to make this really 
have legs and make a real positive impact on 
organic farming.

MEMBER JAMES: I thank you for 
your comments, and I think that that is a 
great starting point for the CACC to start to 
develop that dialogue with the NOP and see if 
we can create that.

CHAIRPERSON MOYER: Thank you, 
Farah. We appreciate your time and your 
comments.

MS. AHMED: Thank you very much.

CHAIRPERSON MOYER: Is Harriet 
Behar in the room? I don't see her. If that 
is the case, then we have completed the entire 
list that I have for public comments, and 
without any further ado, this meeting stands 
adjourned until 8:00 o'clock tomorrow morning, 
when we will reconvene in this room.

(Whereupon, at 7:07 p.m., the 
above-entitled matter went off the record.)

Adjourn
CHAIRMAN MOYER: Good morning, everybody. We're going to get your meeting started. The board meeting of the NOSB meeting of November 5th is back in session. I'd like to say that we have just spent the past two days listening to public comment, hearing from board members and committee chairs, committee members on the work that they've been doing over the last six months. All of our information has been posted online for the general public to review. We have seen all the written comment. And at this point in time we're ready to present our information from each committee to the Board for final vote.

At this point in time what I'm going to do is turn the Board over to the Policy Development Committee chair, Barry Flamm to present his items for vote.

Barry, the floor is yours.
MEMBER FLAMM: Thank you, Jeff.

CHAIRMAN MOYER: I'm sorry. Just one moment, Barry. Chair recognizes Valerie Frances from the Program.

MS. FRANCES: One business we didn't take of yet was the acceptance of the May 2009 voting results.

CHAIRMAN MOYER: Thank you, Valerie. You're right. We were going to do that this morning. We had changed our agenda and I had forgotten that, so I appreciate that.

Before you make your presentation, Barry, I'm going to call on Secretary Julie to present that for a vote.

SECRETARY WEISMAN: Yes, normally we vote during the Secretary's report on the first day of the meeting to accept the voting results from the previous meeting, which would have been last May's meeting. And that was something that we had done just prior to the start of the meeting on Tuesday by the

Neal R. Gross & Co., Inc.
202-234-4433
Executive Committee. The Executive Committee accepted the voting record I believe unanimously. And so I move now that the full Board accept those voting results as the record of the votes at last spring's meeting.

CHAIRMAN MOYER: There's a motion on the floor. Do I hear a second?

MEMBER KARREMAN: Second.

CHAIRMAN MOYER: Hue Karreman seconds. And discussion on those voting records from May?

(No audible response.)

CHAIRMAN MOYER: Hearing or seeing none --

VICE-CHAIR GIGOMINI: Mr. Chairman?

CHAIRMAN MOYER: Chair recognizes Dan.

VICE-CHAIR GIGOMINI: Yes, I would just like it put in the record at this time I think it would be appropriate to say that some of those votes were very
complicated. So if someone is looking for
those through this set of transcripts, please
make note that you might want to go back and
look at the actual transcripts and make sure
that you're seeing all the real issues and
exactly what was being voted on, rather than
just the summary on the voting record sheet.

CHAIRMAN MOYER: Thank you, Mr.
Vice-Chair. You're correct, it was a
complicated vote on several of those items.
That is noted in the transcript.

Now we have a motion and a second.
We've had some discussion. Any further
discussion?

(No audible response.)

CHAIRMAN MOYER: I call for the
vote. We'll just do it with a aye or a nay.

All those in favor, say aye.

ALL: Aye.

CHAIRMAN MOYER: Opposed, if any?

(No audible response.)

CHAIRMAN MOYER: Thank you, Julie.
MEMBER FLAMM: Thank you, Jeff.

Good morning, everyone.

Yesterday the Policy Development Committee presented a group of four recommendations for consideration by the Board. And with the permission of the Chair, we would like to, as we have done in the past, combine these into one vote as changes to the Procedure and Policy Manual.

The four action items are a change in Section 3.

I can't really see what's up there, so if I'm out of sync, Valerie, let me know.

Section 3 included changes in the secretary duties and clarification of the role of the executive director.

Section 5 was a systematic review with a number of changes, if you have any
question on what those changes were yesterday.
And there was some small more or less
editorial changes that were made yesterday
during the discussion, and those are reflected
up on the board.

Section 6 involved several
important changes, including a change and
surveys to reflect legal requirements and
policies of OMB and the Department of
Agriculture. A clarification on proxies and
a totally new section on procedures for
contacting elected officials and inviting them
to the meeting.

And finally, was an addition to
the materials criterion checklist to include
biodiversity. And this proposal was approved
last year in the May meeting, the whole
package. I have a friendly amendment from the
ground that makes a correction and more clearly
reflects the intent of the addition to the
criterion.

Kevin, are you prepared to offer
the friendly amendment?

MEMBER ENGELBERT: Yes, I am. On the biodiversity criteria, on the second recommendation you have the qualifier and you add in "and biodiversity." And I think that your intention to make sure that all three of those criteria are met to make sure that it's consistent with biodiversity. But on category 1, No. 3, I think your intent is to get a yes or a no vote. You want to have "if biodiversity is impacted or the environment is impacted," and you don't want to have to have both of them impacted to get a no vote.

So I would offer a friendly amendment that to category 1, No. 3, change to read, "Is the substance harmful to the environment or biodiversity."

MEMBER FLAMM: Thank you. I have discussed this with our committee and we agree to your friendly amendment to change "and" to "or." Thank you.

CHAIRMAN MOYER: I think we need a
motion to accept that friendly amendment.

MEMBER FLAMM: Oh, okay. We do want a friendly amendment in the --

CHAIRMAN MOYER: You don't?

MEMBER FLAMM: Yes. Okay. Mr. Chair, I move that the Board approve the group of four recommendations that we just presented.

MEMBER JAMES: Second.

CHAIRMAN MOYER: We have a motion on the floor and a second. Is there any discussion on these three items as a group? We are voting on them as a group.

VICE-CHAIR GIACOMINI: Three or four?

CHAIRMAN MOYER: Four, I'm sorry. All four items we're voting on as a group.

(No audible response.)

CHAIRMAN MOYER: Hearing no discussion, I will call for the vote, starting with Hue.

MEMBER KARREMAN: Yes.
CHAIRMAN MOYER: Kevin?

MEMBER ENGELBERT: Yes.

CHAIRMAN MOYER: Tina?

MEMBER ELLOR: Yes.

CHAIRMAN MOYER: Katrina? I'm sorry. Rigo?

MEMBER DELGADO: Yes.

CHAIRMAN MOYER: My seating chart is out of order.

Katrina?

MEMBER HEINZE: Yes.

CHAIRMAN MOYER: Dan?

VICE-CHAIR GIACOMINI: Yes.

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: Yes.

CHAIRMAN MOYER: Steve?

MEMBER DeMURI: Yes.

CHAIRMAN MOYER: Barry?

MEMBER FLAMM: Yes.

CHAIRMAN MOYER: Bea?

MEMBER JAMES: Yes.

CHAIRMAN MOYER: Tracy?
MEMBER MIEDEMA: Yes.

CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN MOYER: And the chair votes yes. Motion passes. Thirteen yes; zero no; two absent; no abstentions or recusals.

Is there any other business, Barry, for this Board from the Policy Committee?

MEMBER FLAMM: Not at this time, Mr. Chair.

CHAIRMAN MOYER: Okay. Thank you.

Joe, we turn the Compliance, Accreditation and Certification Committee program over to you.

MEMBER SMILLIE: Thank you, Mr. Chair. The Certification, Compliance and Accreditation Committee has two recommendations on the table. We have not made any changes to these recommendations. The public input has generally been favorable and we'd like to move these forward.
So I would like to move that the NOSB adopt the guidance recommendation, clarification of voluntary retail certification.

MEMBER JAMES: Second.

CHAIRMAN MOYER: We have a motion on the floor from the chairman and we have a second. Is there discussion on the retailer certification category in front of the Board? Katrina?

MEMBER HEINZE: When we talked about this yesterday, what I heard is that this is really a series of questions or things that need to be thought about to develop guidance to strengthen the voluntary retailer certification to address some concerning practices that are being seen in retailing, and really to get the Program's attention that some more work in the retailer arena is needed. Did I understand that correctly?

MEMBER SMILLIE: It's not simply a series of questions. There certainly were a
number of questions in there, but there's also
some very strong guidance points.

CHAIRMAN MOYER: Katrina, follow
up? No?

Any other questions or points of
discussion?

Katrina?

MEMBER HEINZE: So I should say I
am concerned with what we see at retailers.
I'm just not sure this is the right approach.
I would rather see focus on enforcement in the
retail environment by the Program. And I
think one of the public comments we heard
yesterday said that this focuses on that
portion of the retailers who are trying to do
the right thing. And my bigger concern is all
those other folks who haven't even thought
about what they need to do for organics.

CHAIRMAN MOYER: The Chair
recognizes Joe.

MEMBER SMILLIE: Well, no, I think
it brings the attention -- even though the
title is Voluntary Retail Certification, I think through the clarification of that voluntary practice it will become clear to all retailers that they have to be in compliance, whether they seek a certification or not. So I believe this is the first step. By clarifying that, we will get the attention. And again, time is of the essence here. We want to bring this to the attention. And again, it's a guidance. It doesn't require a technical correction or a rule change. It simply gives direction to the NOP for their forthcoming guidance document.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: I am struggling with this one, obviously. Really, there's like, I don't know; I'm not going to have my numbers exactly right, 50,000 traditional retail outlets in the United States, like 190, if you go to non-traditional outlets. It's hard to imagine that we're really going to get at all of those versus the relatively few who
have chosen voluntary certification.

CHAIRMAN MOYER: Chair recognizes Bea.

MEMBER JAMES: That's the point.

That because there is a lack of clear value and understanding with the majority of retailers, that this guidance document, as I stated yesterday, from the public comment that was given by the Oregon Tilth for not only looking at strengthening the voluntary retail certification and the marketing of the USDA Organic Seal, which is one of the things that definitely needs to be clarified, but to develop education for both platforms. So that hypothetically speaking, let's say that the OTA and Oregon Tilth and the NOP, NOSB, work together to develop some educational platforms for retailers to become one, either educated about what voluntary retail certification can add, the value that it can add, how it can strengthen their retail so that they can educate their consumers better, but that they
could, through this education, have some kind of a diploma-ready certificate that said that they have gone through education, they understand how to handle organic products at retail. Or they could go to the gold standard, which is to become voluntarily certified.

So there is a lot of development to do on all of the different possibilities to bring forth more options to retailers. And that's really the starting point of this recommendation and a lot of the issues that were brought up on there, one, talk about some of the things that absolutely have to be clarified under voluntary retail certification. No doubt guidance needs to be written on some of the issues that I brought up, you know, like the cheese and marketing of organic, just calling things organic in a perishable department when you're not processing or handling, all of those kinds of things. Those have to be handled and a
1 guidance needs to be brought out by that. And
2 in addition to that there needs to be
3 education developed for retailers, and that's
4 what this guidance document is bringing
5 forward.
6             CHAIRMAN MOYER:  Chair recognizes
7 Dan.
8             VICE-CHAIR GIACOMINI:  Yes, I
9 think this document is great. You know, there
10 are three predominant places where the
11 consumer touches organic, and it's usually not
12 on the farm. It's generally in the press, at
13 a farmer's market and at the retail. And when
14 we hear all the stories of, you know, big box
15 store X getting, you know, a complaint filed
16 on them for bad signage and we see, you know,
17 the things that all the people in this room
18 see of misrepresentation of the seal and
19 advertising and everything else, I think
20 something like this, I think it's really the
21 right way to go.
22             CHAIRMAN MOYER:  Chair recognizes
Steve.

MEMBER DeMURI: Katrina, I fully agree with you on the enforcement, your enforcement idea there. But, I think this is a separate but highly-related subject. And whether we pass this or not, or whether this has even been written, we should still be asking the Program to step up enforcement. And hopefully with their additional staff coming up here in the next year, they'll be able to do that.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: Thank you, Steve. I agree. To me this is really about enforcement. I worry about the list of priorities that Miles gave us at the beginning of this meeting, the five or six other new priorities we're going give at this meeting. And just how do we ask the Program to balance that out and which is more important. You know, is retailer cert more important? Is animal welfare more important? Is personal
care more important? It's trying to be judicious about how we use our resources.

Thank you.

CHAIRMAN MOYER: Thank you, Katrina.

I should mention that in conversations with Miles, and we are looking at planning a strategic planning session for later, for early in 2010, and I think at that point in time this Board in consult with the Program will work on setting those priorities. And so I think we'll have a voice and some input there, and I look forward to that, as I know the rest of the Board does.

Chair recognizes Dan.

VICE-CHAIR GIACOMINI: I certainly agree with you, Katrina, on that issue of priorities. I think though that as we are two separate bodies in a certain respect, we each need to move ahead with what we can. And I would not want this Board to wait until something is on the top of the NOP priority
list before we gave them what to act on. This is in front of us now. I think it's a good recommendation. I think it's doing a lot of the right things. And even if it comes in at No. 15, it's now on their list. And I don't think we should wait until they're ready to put it up at No. 3 or No. 5 before we give them a recommendation. This Board has acted on it. The committee's done a wonderful job.

I think, you know, waiting until they're ready for it is not really going to improve the recommendation any, necessarily.

CHAIRMAN MOYER: Chair recognizes Miles from the Program, Miles McEvoy.

MR. McEVOY: Good morning. Yes, I think it's important to give the Program guidance. Just because we have priorities doesn't mean that we're not going to address other issues as well. So having this guidance will help us to determine our next steps. We have top priorities, but there's a lot of other things we'll be doing as well. So I
think this would be helpful.

CHAIRMAN MOYER: Thank you, Miles.

Appreciate that. Chair recognizes Bea.

MEMBER JAMES: I just want to point out that the diversity of the Board allows certain individuals who may not necessarily be able to hunker down on materials and handling, and livestock and crops, to be able to develop other very important things that apply to making sure that organic stays strong. And that at retail, that's the final communication piece to the consumer. That's where all the rubber meets the road. And if we are not consistent and we don't try to elevate and embrace retailers to see the value in doing their best possible job of educating consumers and being educated themselves, then we kind of miss the mark with how we communicate to our consumers.

So there is a retailer representative on the Board as part of the diversity of what we all bring to the table,
and I think that there's opportunity for other projects to run parallel at the same time we're working on other priorities.

CHAIRMAN MOYER: Chair recognizes Katrina.

MEMBER HEINZE: So I don't disagree with anything that's being said. It's more the approach. I would feel much more comfortable with a guidance document that addressed some of these questions. I guess I'm more perplexed by a document that doesn't say what needs to happen. It's asking questions. I'm must more perplexed by the approach we've taken. You know, so I'm trying to on the fly here think of an example.

CHAIRMAN MOYER: Chair recognize Joe.

MEMBER SMILLIE: I understand what you're saying and it's not a perfect document. But we don't want to let perfect be the enemy of good, same old story. So, yes, we could take more time and answer those questions now,
but I think we've gotten some of the answers in public comment. And once again, we're not writing a regulation. We're not even writing a guidance document. But we want to get it to the Program and I'm sure they can polish it up and put it into a guidance document format.

It would have been better, agreed, to present them with a fully-fleshed out guidance document with all the questions answered. I think we've gone far enough, being that it is again, a guidance document to a guidance document. I think we're okay with it. But I understand your point; it's well-taken.

CHAIRMAN MOYER: Thank you, everybody, for that discussion. Is there any further discussion on this item?

(No audible response.)

CHAIRMAN MOYER: We have a motion and we have a second. We've had discussion. I'm going to call for the vote. Are there any conflicts of interest on this particular item?
(No audible response.)

CHAIRMAN MOYER: Hearing none,

I'll start the vote with Kevin.

MEMBER ENGELBERT: Yes.

CHAIRMAN MOYER: Tina?

MEMBER ELLOR: Yes.

CHAIRMAN MOYER: Rigo?

MEMBER DELGADO: Yes.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: No.

CHAIRMAN MOYER: Dan?

VICE-CHAIR GIACOMINI: Yes.

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: Yes.

CHAIRMAN MOYER: Steve?

MEMBER DeMURI: Yes.

CHAIRMAN MOYER: Barry?

MEMBER FLAMM: Yes.

CHAIRMAN MOYER: Bea?

MEMBER JAMES: Yes.

CHAIRMAN MOYER: Tracy?

MEMBER MIEDEMA: Yes.
CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN MOYER: And the Chair votes yes.

MEMBER KARREMAN: I didn't get to vote.

CHAIRMAN MOYER: I apologize.

Hue?

MEMBER KARREMAN: I don't think it's going to matter, but yes.

CHAIRMAN MOYER: Twelve yeses; one no; two absent. The motion passes.

Thank you, Joe. Your next item?

MEMBER SMILLIE: Again, the next item, a recommendation solving the problem of mislabeled organic personal care products.

We've got a very short recommendation here. And again, the purpose of the recommendation is to spur action. We recognize very clearly that this is the first of many, many steps that have to be taken in this area. But we want to get it on the
record immediately at this meeting and ask for the Program to take up its mantle. We believe it is their responsibility to set a clear direction on this issue. If they don't want to, we want to hear that; if they want to, we want to hear that. We want action on this one.

What action is to be taken and how long that action will take, it's going to be a while, obviously, but we want to get started. And that's the entire purpose, if I'm not misreading it, Tracy, of this document.

So I would like to move that the NOSB adopt the recommendation solving the problem of mislabeled organic personal care products.

CHAIRMAN MOYER: We have a motion on the floor. Is there a second?

MEMBER FLAMM: I second.

CHAIRMAN MOYER: Barry seconds.

Is there discussion on this particular item?
I'm sorry, Dan?

VICE-CHAIR GIACOMINI: Yes, I agree with the principle of this recommendation to get the Program to take a stand. But at the same time, if the Program doesn't want to enforce this, even if they followed everything we did, they wouldn't have to enforce it. And if they want to enforce it, they don't need this. So I don't really believe that this will do what you're trying to achieve.

No. 2, to use something we have from our experience, we dealt for years with the issue of classification of materials. It came to a head and it came to a major discussion with the Material Working Group because of the face that it had with yeast. Yeast was really a significant face to put on that issue for a large part of the time. And I think, at least in my opinion of watching the group and watching that discussion develop, when we were focused on the face, we
I didn't make progress on the problem. And I'm concerned here that again the personal care is the face of the non-food-use issue. And I wish the committee had focused on this more on the problem of how we're handling non-food-use issues, rather than just going after the face, because we still seem to have that problem.

So, and specifically in the document, really the part that bothers me is putting the personal care into the categories, into the 100(a), 102 and 311. You know, I don't want that to have to become a list of things. I don't think it's necessary. I think we could have done it through the type of language that's used in 300, which I would have much preferred to see that.

And I think also something for us to consider would be -- I think the definition was great in the 300. And then just like Joe, you've always talked about it, come in with 607 as a non-food use synthetic category. But I'm not comfortable at all putting personal
care and creating the precedent of needing a list on all of those things.

CHAIRMAN MOYER: Chair recognizes Tracy.

MEMBER MIEDEMA: Thanks, Dan, for sharing that.

We're doing something even a little more basic than that, and we're attempting to bring some clarity where there is disarray in both the business arena and in the consumer arena. And by speaking to the Program, we want categories approached with a real regulatory stance and not sort of a series of guidance documents on the Web for something as broad as a category.

So to your point, you know, they can already enforce what's out there right now, well, that's very debatable actually. Since there's nothing in the rule that references non-food or the way we've put it here with personal care, I like the idea of the non-food. This is just a starting point.
It's going to take a long time for this to work its way through.

But the Program needs something that they can act against, and companies need something that they can build on. And right now there are three electronic documents that the Program has produced on this category. They don't necessarily even tie to one another. There's a bit of contradiction in the position. And so our attempt here, again, is really to bring clarity where there's some disarray. We didn't try to build a monument on top of a foundation. What we're trying to do here is just start with the foundation.

CHAIRMAN MOYER: Chair recognizes Joe.

MEMBER SMILLIE: Again, I agree with Tracy. And I understand your construct, the way you're thinking, but the consumer doesn't see it that way. They don't see it as like we have to solve the issue of non-food items under organic. They see personal care.
I mean, yes, we're dealing with the face and it's the face that the consumer has to deal with. And it's one of the most egregious ones out there right now. So I think in taking that approach, it's more appropriate in this case. I do understand your construct.

And as far as the idea of how we're going to handle it, that's down the road. My personal preference is to create that section and incur the wrath of consumers for adding synthetics to the list, which is one of the big bugaboos in this approach, is that we're going to maybe add synthetics, so the Board's going to be petitioning for synthetics. And that's why I do like the idea of creating a separate standard, because we can really be clear that these synthetics are for personal care only. It's not that we're, you know, diluting the standard. It's we're creating a new standard for personal care products.

But that's, again, as Tracy said,
we're just trying to build the foundation
here. We're not putting the sills on even
yet.

CHAIRMAN MOYER: I'm glad to hear
that's the direction that your committee is
thinking and moving, Joe, with the creation of
a separate portion of the standard to separate
that out.

MEMBER SMILLIE: I want to be
clear, that's my opinion.

CHAIRMAN MOYER: I understand.

MEMBER SMILLIE: That's not the
committee direction yet. We're waiting to see
how to proceed.

CHAIRMAN MOYER: Chair recognizes
Katrina.

MEMBER HEINZE: I'd be interested
in understanding from the Program what happens
if we pass this recommendation? What are the
next steps? Because it's, in my opinion, not
something that can be turned into regulation.
So does it just die a short quick death, or
what happens?

CHAIRMAN MOYER: Chair recognizes the Program. Miles?

MR. McEVOY: Yes, that's a good question. As I said earlier, we have to study this particular issue. There are some jurisdictional issues that we need to understand, and I would say that it gives us more guidance. It gives us more information about where the Board would like the Program to go on personal care products. Whatever we do has to be in line with our current authority and working with FDA and FTC in terms of where our authority starts and ends, and where theirs are and collaborating with them. So this gives us some direction in terms of what you all want to see the Program do.

What we will do with it, is we'll take it and work with it and meet with OGC and the FDA, and see what we can do with these recommendations, and report back to you in the
Chair recognizes Katrina.

So what if what we really wanted you to look at, to Dan's point, is misuse of the word "organic?" Because I, like Julie, did notice those two dry cleaners that somehow are organic, and you see it lots of different places. And so today the problem is personal care. It will be some other misuse of the word. Because what I'd really like to hear back from you guys is how do we stop that.

That's a good question. There is the NOP complaint process, so for anything that you feel that is mislabeled or violating the organic standards, I really encourage people to file complaints. That's one way for us to look into whether or not there's a violation and then take the appropriate action to change the label, get it off the market, if there is a violation. So
we're always doing that.

There are situations where there are questions about our authority, but if we have a complaint about it, then we have something that will eventually work out. Sometimes, as you have seen, it takes a while if there is lack of clarify in the regulations.

MEMBER HEINZE: Thank you.

CHAIRMAN MOYER: Thank you, Miles.

MS. NALLY: May I add to that?

CHAIRMAN MOYER: Shannon from the Program?

MS. NALLY: We are also working with FTC, just initially starting to work with FTC to help define our jurisdiction, because they would be able to deal more with the use of organic in the term, like organic dry cleaning where it does not pertain to an agricultural product. So that would fall into their jurisdiction on marketing and advertising. And they are currently working
on some green guides as it relates to organic.

CHAIRMAN MOYER: Thank you, Shannon.

Any other questions from the Board for Joe?

I had one question, Joe.

MEMBER SMILLIE: Sure.

CHAIRMAN MOYER: I'm just wondering what your reaction is to the public comment we heard yesterday from Farah Ahmed in regards to language of the FDA, all the things that we heard. I'm just wondering what your reaction is. We just heard that the FDA will impact what we do.

MEMBER SMILLIE: Yes. I really love interacting with them. This is going to be fun. Because they're a trade association, so remember their current position may not be their eventual position. That's their current position.

I think that my own personal opinion is that that's their interpretation.
See, the FDA doesn't say that. They reference INCI, and INCI says that. So I wouldn't call it an FDA position myself. But, we'll see. It's going to be fun to go down that road and see how the PCPC -- I mean, politically correct, politically correct. I mean, how could they be wrong? How they react. Because once, I think, we get some clarity in the personal care market and manufacturers, you know, the big time manufacturers, as well as TerrEssentials and Brauner, start seeing that there's some stability and some clarity in the personal care world, I think they're going to get very interested in organic. And I think we'll see their position change as we give them more clarity in the marketplace.

CHAIRMAN MOYER: Yes, this was my first introduction into the INCI or inky-dinky dictionary, so I had not heard of that before. So either one.

MR. McEVOY: That's about a spider, Jeff.
CHAIRMAN MOYER: Chair recognizes Julie.

SECRETARY WEISMAN: Yes, just briefly to follow on. We have already seen that phenomenon happen. FEMA, not the emergency management agency, but the Flavor and Extract Manufacturers Association, has already been through that where as more of their bigger members began to be stakeholders in organic, they realized that they really had to change their policy to reflect what their stakeholders wanted. And I am sure, Joe, that you are right.

CHAIRMAN MOYER: Thank you, Joe and Julie, for that.

Any other questions or comments? (No audible response.)

CHAIRMAN MOYER: Then I will -- thank you, Kevin.

MEMBER ENGELBERT: Well, I appreciate all the work you've done. And thinking about the point that Dan made, would
you consider, for example, in 205, 102, the use of the term "organic?" Instead of saying "any agricultural product including personal care products," would you consider saying "any agricultural product including any non-food products" and become more inclusive right from the start? You know, I'm not pressing it. I just want your opinion on that right now.

CHAIRMAN MOYER: Chair recognizes Tracy.

MEMBER MIEDEMA: I hear what you're saying, Kevin, and it sounds like a sensible first step on the surface. We don't have the body of knowledge yet for these other non-food categories to sort of make a broad-sweeping all-inclusive. You know, to go back to my foundation building analogy, we only have some depth in knowledge in one area of this non-food space. So I don't think our committee is comfortable kind of expanding it into all food. And again, you know, going back to the real impetus behind this
recommendation, it's to make a statement to the Program that the continuation of, you know, every few years issuing an electronic guidance document as the category spirals out of control is not a sustainable path. That's really what we're trying to do here.

MEMBER ENGELBERT: Thank you. I understand that, and I agree. I just wanted to get your opinion. And this can send a message to the rest of the industry that's using these agricultural products and for non-food items. You know, the thumb that's sticking up that gets the attention, if it's dealt with, there's likely to be another thumb stick up that, you know, violates the consumer trust in such a manner also.

CHAIRMAN MOYER: Chair recognizes Julie.

SECRETARY WEISMAN: Yes, I guess the important thing about having this discussion, and I'm wondering if there's a way that it can be immortalized more in a more
clear way, is that even though we have
envisioned this for personal care proactively
-- I'm not being most articulate, but in other
words, I feel like is there a way that we can
make it clear that we don't intend this
treatment of personal care -- it's really a
prototype for all non-food. Because I do
think that we have enough collective
experience on the Board on this particular
moment in time that we are able to take the
30-foot view and see the train wrecks coming.
And I think that's what the value
of what Dan and Kevin have to say. And it may
be that it's practical and it's the most
expedient to get action to happen to have this
be focused on the personal care, because
there's already very recognizable egregious
stuff going on out there. But we don't want
to have to reinvent this wheel for every
single category that comes down the pike. And
maybe saying this in the record is sufficient
to do that, but I'm afraid five of us are
going to go off and then another five are
going to go off, and in three years, or four
years, or five years who's going to remember
that this is where we meant to go?

CHAIRMAN MOYER: Chair recognizes

Tracy.

MEMBER MIEDEMA: Since we're
predicting what we think might happen, I
believe, if I were to predict, the passage of
this recommendation would simply move this
topic from having no place on the priority
list at NOP to having some appropriate place.
I don't think it's necessarily appropriate for
it to be in the top ten, but maybe it's
important for it to be in the top 20. And if
we opt not to speak to the Program that we
think this is an area where clarity needs to
be brought, I don't think it will make the
radar screen.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: So similar to our
last discussion, I'm struggling with this idea
of recommending rule change that we know isn't ready to be implemented as a way to get a priority on the Program's list. I think there is a different mechanism to do that, whether it's, you know, passing a recommendation that we want the Program to come back and give us a report at our spring meeting, whether it's the broader language suggestions that have been made, because I do think those could, you know, have more long-term legs. I just struggle with this idea of we know it's not right, so we're going to vote for it because we want it to be on their priority list. Just seems like there should be a better mechanism.

CHAIRMAN MOYER: Chair recognizes Tracy.

MEMBER MIEDEMA: Well, I guess I'm going to take exception to that we know it's not right part. We heard from a lot of commenters that they most definitely do think that this is the right step. It may not be inclusive enough. And some of other tools you
reference, maybe task forces, discussion
documents, we've got about 60 of those in the
hopper. This is one way of speaking very
directly to the Program.

We know rulemaking has a long way
to go and this is step one. This is way to
take a definitive step one, as opposed to kind
of a toe wading in. Things have really
started spiraling, guys. You know, when we
have the word "organic" being used with -- and
any set of rules are okay underneath that
word. That's where we're at right now. And,
you know, I would urge us to bring some
clarity here through this tool, this
particular tool.

CHAIRMAN MOYER: Chair recognizes
Joe.

MEMBER SMILLIE: Yes, I feel very
strongly about that, too, Katrina. No more
guidance documents. No more postings on the
question and answer. We need definitive
action and I think rule changes are going to
be required. The category is huge. It's confusing. And once again, it's our word and I think we need to act dramatically to protect it.

CHAIRMAN MOYER: Chair recognizes Bea.

MEMBER JAMES: I would just second what Joe just said. You know, I do think it's important to recognize that there are other types of products that could potentially fall under this area, such as cottons and textiles, like we talked about. But personal care is one of the largest areas for the natural and organic consumer. You know, when you go into a retail store, generally you're going into a pretty big department that is staffed, when you look at these items. And to think that they're just kind of not really floating one way or another between the FDA and the USDA for regulating is very confusing for everything else that is being sold in the store. And there needs to be some really
clear direction for these manufacturers so
that consistent labeling and use of the term
"organic" is in front of the consumer.

CHAIRMAN MOYER: Thank you, Bea.

We have a motion on the floor.

We've had a second. We've had discussion.

Are there any other questions or comments
before I call for the vote?

(No audible response.)

CHAIRMAN MOYER: Then I'm calling
for the vote.

Is there a conflict of interest
before anybody votes?

(No audible response.)

CHAIRMAN MOYER: Hearing none, we
will start the voting with Tina.

MEMBER ELLOR: Yes.

CHAIRMAN MOYER: Rigo?

MEMBER DELGADO: Yes.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: Yes.

CHAIRMAN MOYER: Dan?
VICE-CHAIR GIACOMINI: No.

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: Yes.

CHAIRMAN MOYER: Steve?

MEMBER DeMURI: Yes.

CHAIRMAN MOYER: Barry?

MEMBER FLAMM: Yes.

CHAIRMAN MOYER: Bea?

MEMBER JAMES: Yes.

CHAIRMAN MOYER: Tracy?

MEMBER MIEDEMA: Yes.

CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN MOYER: Hue?

MEMBER KARREMAN: Yes.

CHAIRMAN MOYER: Kevin?

MEMBER ENGELBERT: Yes.

CHAIRMAN MOYER: And the Chair votes yes. One no, twelve yeses, two absent. The motion passes.

Thank you, Mr. Chairman. Is there any other business before the Board?
MEMBER SMILLIE: No.

CHAIRMAN MOYER: Thank you. Then I will turn the mike over to Dan with Materials.

VICE-CHAIR GIACOMINI: Thank you, Mr. Chairman.

The Materials Committee has one document for voting this morning, the nanotechnology document. We do have some proposed amendments that we did not finalize within committee, so we would need to do that here. Do you want us to make the changes that we've talked about and then make the motion, or make the motion of the current doc recommendation and then amend?

CHAIRMAN MOYER: I would suggest we make our changes first and then vote on it.

VICE-CHAIR GIACOMINI: Okay.

CHAIRMAN MOYER: So let's just put it up as a discussion document here to discuss.

VICE-CHAIR GIACOMINI: Katrina, do
you have a comment?

CHAIRMAN MOYER: Chair recognizes Katrina.

MEMBER HEINZE: Since the committee hasn't voted on it, do any amendments have to happen through the motions, because the recommendation from the committee is this?

VICE-CHAIR GIACOMINI: I can go do this easy.

CHAIRMAN MOYER: We'll make it as a motion then?

VICE-CHAIR GIACOMINI: Okay. I move to accept the document on nanotechnology in organic production processing and packaging.

CHAIRMAN MOYER: Is there a second for that?

MEMBER ENGELBERT: I'll second.

CHAIRMAN MOYER: We have a motion and a second. Discussion? Dan?

VICE-CHAIR GIACOMINI: I would
like to present a friendly amendment. First
one, Valerie, is in the definition to change
that to "300," to add the word "engineered" at
the beginning of the definition. In 105(h),
to add "primary packaging."

Right above you. Right there.

Okay. You already got that.

301(8) to add "primary packaging."

And then to change "(g)" to "(h)."

Right there. No, within that same
one. Eight.

And, Mr. Chairman, the person
making the motion accepts that friendly
amendment.

CHAIRMAN MOYER: Thank you, Dan.

Appreciate that.

We have a motion on the floor. We
have a second. We have some amendments to
that document. Is there any discussion on the
document as it's amended?

Tina?

MEMBER ELLOR: I have a couple of
concerns with this, and I'm much more in line
with the minority opinion, although, you know,
if of course we're not given that choice, I'll
probably support it. But, I have a couple of
calls about the definition and some
comments that we had. And I got the websites
that they suggested, ASTM and some other
regulatory, you know, bodies that define
nanotechnology as 100 or under. And I'd like
us to take some time to find out what the
recognized definition in their industry is of
nanotechnology. I guess, that's one concern.

And the other concern is that I'm
completely out of my depth here. I know what
nanotechnology is. I'm familiar with some of
the applications. But for the most part, I
really don't know much about it. And I think
that the minority opinion prohibits it without
completely slamming the door shut. But, I
understand the sentiment, the vast amount of
sentiment is behind this recommendation.

CHAIRMAN MOYER: Dan?
VICE-CHAIR GIACOMINI: Yes, we were looking at a number of potential options of really over working the definition here today, of which we were not quite comfortable with doing. But as far as the size goes, as I've studied the issue, I think what we're going to find is people will set definitions and then someone will find nanotechnology at a bigger size. They'll increase the size and the definition and people will find nanotechnology at a bigger size. I fully expect nanotechnology to be up at 500 soon, when they find something at that size that has unique properties.

So in that respect, the other possibility was pulling it back, reworking the document. And along with that is one comment in the hallway to me was a recommendation to pull back but yet submit a separate motion that says that we endorse the principle of not having nanotechnology in organic, but to rework the document. But in surveying both
the committee and the Board, the predominant
seemed to be that they wanted to move ahead
with this document. So that's where we are.

CHAIRMAN MOYER: Tina?

MEMBER ELLOR: There's just one
more concern I have about the term
"engineered." I think that's a great
addition, but engineered is a pretty broad
category. And I want to make sure that those
things like, you know, things that are
homogenized, why is homogenization not an
engineered? I mean, what you're doing is
making the particles smaller. I'm a little
bit concerned about the vagueness of that.
It's a great addition. It's definitely an
improvement. But, I'm a little bit concerned
about that as well.

CHAIRMAN MOYER: Chair recognizes
Joe.

MEMBER SMILLIE: Yes, again, some
of the arguments to me are convincing, but I
also favor the minority report. One of the
reasons especially is I've got a great deal of faith in the NOSB to deal with this issue as it comes up and I don't think we know enough about it. I was telling the story of my favorite mentor, which was Scott Nearing, once addressed a crowd of rabid anti-nuclear hippies saying that he didn't know if nuclear power was right or wrong, and we were all aghast. Here was our hero telling us he, you know, might support nuclear power. He said, "But I do know one thing for sure, I know that we aren't ready to handle it yet."

So I'm of the opinion also, I don't want to close that door completely. I want to prohibit it, but I would like to be able to look at it as it comes up.

My follow-up question, which I think your document is trying to answer, is the packaging issue. Because originally it said "packaging," and now you've changed that to "primary packaging." Is there a standard universal time for primary packaging? Does
that mean packaging that comes into contact
with the food?

That's what it means? Okay.

VICE-CHAIR GIACOMINI: Industry

standard term.

CHAIRMAN MOYER: Chair recognizes
Steve. Steve, go ahead. Say that again?

MEMBER DeMURI: Primary packaging
would be the packaging that actually touches
the food. For instance, in a bin of tomato
paste, the liner would be the primary package.
The wooden bin on the outside would be a
secondary package.

MEMBER SMILLIE: Okay. Well, that
does answer one of my concerns, because I'm a
big fan of RFID. And if the electronic
circuitry of nanotechnology could give us
readouts not only of origin, identity, value,
scales, all these wonderful things for the
tracking of food, and perhaps an indication of
pathogens, I don't want to ban that. I'm very
interested in that. And that seems to answer
that question and it certainly moves me along the way to supporting the recommendation. But, I also just feel that the minority recommendation gives us a little more flexibility while prohibiting it, but allowing it on a case-by-case basis.

CHAIRMAN MOYER: Chair recognizes Dan.

VICE-CHAIR GIACOMINI: Yes, you know, you always hear the line in real estate, location, location, location. I think the mantra here can be timing, timing, timing. You know, the major focus of this comes from the fact that we're seeing what's happened to the GMO issue in having to deal with vaccines. You know, I certainly don't want to see that train wreck down the road either. In surveying the committee and the Board, the predominance was to let them move ahead with this. I don't think that this document failing is in any way an indication that we don't support the prohibition of
nanotechnology and that we would not then keep it on the workplan for the Materials Group.

CHAIRMAN MOYER: Chair recognizes Joe.

MEMBER SMILLIE: Yes, I totally agree with you. If it was a case of, you know, the first motion failing and then the second motion failing, I would be aghast that I didn't vote for the first motion. You know, how it all plays out I can't determine, but my own personal opinion is I definitely want to pass one of the two, but I would prefer No. 2. But again, you never know how things work out. So that's the intent.

CHAIRMAN MOYER: Chair recognizes Katrina.

MEMBER HEINZE: I have two things. The first is I concur with Steve that "primary" is an industry standard language for that packaging. I do not know if it's regulatory language. And the twain often do not meet. So that's just something to be
considered.

The other is, what I'm hearing is there are a number of people who prefer the minority opinion and so I don't know procedurally the proper way to vote on that first. So do I --

CHAIRMAN MOYER: You can't.

MEMBER HEINZE: Well, but we could make -- hold on. I'm thinking out loud. We can amend this motion, right?

CHAIRMAN MOYER: Yes.

MEMBER HEINZE: So in theory; we're not doing this now, but in theory I could offer some motion to amend this, the result of which would be the minority opinion. We could see if it's accepted. We could vote on it. Is that not correct?

CHAIRMAN MOYER: Chair recognizes Dan.

VICE-CHAIR GIACOMINI: That would be correct. I think as we bring this up to a vote in the current form with the current
recommendation, the Board is telling us whether they want the minority opinion. If we are going to pull back, if we're going to go to the minority opinion, I would much prefer that the Material Committee took that as the direction they want to go and make sure that they get it all right, and we bring it back and do it at the next meeting, rather than trying to cobble it in within what we have.

CHAIRMAN MOYER: Chair recognizes Kevin.

MEMBER ENGELBERT: I'd just like to remind the Board that we need to be cautious in our approach to nanotechnology. Consumers look to organic to be the most pure food possible, and I'm not sure that we're ever going to fully understand nanotechnology, ever. And the recommendation as stated technically doesn't close the door on nanotechnology forever. If at some point in the future there is some type of nanotechnology that is deemed to be 100
percent safe for humans, the environment, manufacture, waste disposal, everything, it would be hard to do, but it would be able to be brought back to the table to the existing Board and dealt with.

I agree with the comments we heard from the public that it's a mistake to consider a nanotechnology synthetic so that it can be dealt with on a case-by-case basis, because there are too many individual cases, in my opinion. And I think at this point in time, given that it's so new, I think the prudent approach is to say we simply don't want it right now.

CHAIRMAN MOYER: Chair recognizes itself. I agree with Kevin. I think that making a real firm stand on nanotechnology, it doesn't stop us in the future from doing something if we need to, if we absolutely need to. But it does make a very strong comment to the consuming public that these types of technology are not going to be found in their
1 food products when they're certified organic.
2 We did the same thing GE, and I know that
3 there could be down the road some products
4 that might be beneficial to the environment,
5 that might be beneficial to human health
6 somewhere. But we took a strong stand. We
7 did it with biosolids, we did it with lots of
8 materials that could in some way, shape or
9 form be proven to be useful down the road.
10 And I think consumers recognize that. It
11 makes it very clean and easy to say this food
12 product line doesn't contain that.
13 I have Barry, and then Dan, and
14 then Tina.
15 MEMBER FLAMM: Thank you, Mr.
16 Chair. You just said everything I was going
17 to say, only better.
18 CHAIRMAN MOYER: Thank you, Barry.
19 Chair recognizes Tina. I'm sorry,
20 Dan and then Tina.
21 VICE-CHAIR GIACOMINI: The
22 definition we have right now is very much in
line with a number of the other definitions around. It may not match exactly some of the alternatives that were presented by some commenters, but it's in line with many of the other definitions of nanotechnology around the world. It's very close to Canada. One of the people participating in the negotiation reviewed it and actually liked our changes better than theirs. It may not be perfect, but in the way that we're doing this document, I think it's adequate. Perfect kills the good, you know?

If we go to the minority opinion, I think the definition of nanotechnology becomes even more critical, because it's only if it fits in within that definition is it synthetic and has to be reviewed? A lot of people may say it's real critical in what we're doing now, and that's true, and it may need improvement. But I think in the minority opinion's version it's even more critical, and I would really want us to really review and
nail down and get that absolutely the best we possibly can.

CHAIRMAN MOYER: Chair recognizes Tina, then Katrina, then Tracy.

MEMBER ELLOR: I'm actually very much behind this and I'm mostly comfortable with it. My concern is; and I respect all the homework you obviously did to come up with this, is that it's not going to knock out, you know, those natural things that we already do and have been doing for a long time. So you know, as long as I can be assured of that, all those small particles that exist in our environment already and exist in our food already aren't going to be somehow affected.

CHAIRMAN MOYER: Dan for a response to that?

VICE-CHAIR GIACOMINI: One of the considerations we added, and I won't make the amendment, but I'll throw it out to the Board. One of the considered we had was adding to the definition that substances created in
processes allowed in organic production and handling do not qualify as nanotechnology.

MEMBER ELLOR: That would be great.

CHAIRMAN MOYER: If you want to consider an amendment to that, go ahead, Tina. I have Katrina and then Tracy.

MEMBER HEINZE: Dan, I respectfully disagree on your evaluation of the definition. So if we exclude nanotech, I think the definition is more important, because you're going to have food processors who may have certifiers who look at that definition and say you're homogenizing, or you're milling, or you're whatever it is, and you're doing engineering and you're creating nanoparticles because they have unique properties. And so what you're doing is now excluded and not allowed. And with this recommendation there is no path for those handlers to use that technology, technology that consumers want us to be using because it
has properties they want in their food, often
with regards to mouth feel and texture. So I
think there the definition is more important
because we're going to have different people
reading the definition differently.

If we go with my proposed minority
opinion, it gives us flexibility as a Board to
evaluate and say, no, that's not within the
intent of that definition.

CHAIRMAN MOYER: Chair recognizes
Tracy.

MEMBER MIEDEMA: Since the
Handling Committee had some diversity of
opinion, can't we as a Board pass a
recommendation that acknowledges that range
and accept and vote on a recommendation that
includes a minority opinion?

CHAIRMAN MOYER: I'm not a
parliamentarian, but I don't think so.

MEMBER DELGADO: Mr. Chairman?

CHAIRMAN MOYER: You can't have
two opinions that you voted on.
MEMBER DELGADO: Mr. Chairman?

CHAIRMAN MOYER: Chair recognizes Rigo.

MEMBER DELGADO: The purpose of having this discussion is to come up with a specific recommendation. The things you're proposing would be conflictive, so it will not be something definite. So that would be the argument. The options we have if Katrina wishes to present an amendment to replace some of the language, we should do that and vote on it and see how the Board feels about it. And if it's approved, then we go back to the original motion. If it's rejected, then we consider the motion that is before the floor.

CHAIRMAN MOYER: But we have to have a definite opinion when we're done.

I have Hue and then Katrina.

Hue?

MEMBER KARREMAN: Rigo said what I wanted to say, because I'm thinking of the aquaculture document that's coming out. We
have a minority opinion on that I just want to
make sure that the mechanism, the hinge point
is there in case the majority doesn't pass
that the minority would be -- it's in place,
that mechanism?

MEMBER DELGADO: Yes.

MEMBER KARREMAN: Okay.

CHAIRMAN MOYER: Thank you.

Katrina?

MEMBER HEINZE: I'm not sure on
the right language, so again you're going to
have to help me. I move to --

What's the right motion to defer
this until later in the day so I have time to
think about my amendment?

VICE-CHAIR GIACOMINI: Where do
you want to put it in the agenda?

MEMBER HEINZE: Well, I just need
a little bit of time, you guys.

VICE-CHAIR GIACOMINI: No, you
tell me.

CHAIRMAN MOYER: No, you have to
make a motion.

VICE-CHAIR GIACOMINI: Pick a time that would be a good time and then we'll do it. It's to postpone definitely.

MEMBER HEINZE: Right.

PARTICIPANT: Table.

VICE-CHAIR GIACOMINI: No, not table. Postpone definitely.

MEMBER HEINZE: Postpone.

VICE-CHAIR GIACOMINI: You want to do it after lunch?

MEMBER HEINZE: Yes.

VICE-CHAIR GIACOMINI: Okay.

MEMBER HEINZE: I would like to postpone until after lunch.

VICE-CHAIR GIACOMINI: Postpone until after lunch.

CHAIRMAN MOYER: The Chair will accept that motion and this is definitely postponed until --

VICE-CHAIR GIACOMINI: No, second and vote.
CHAIRMAN MOYER: We have to vote on that as an entire Board?

VICE-CHAIR GIACOMINI: Yes.

MEMBER HEINZE: I'll second.

CHAIRMAN MOYER: Thank you. We accepted that motion. It's been seconded. Can we vote with just a show of hands or an aye or a nay? I think we can for this.

VICE-CHAIR GIACOMINI: Yes, and it's --

CHAIRMAN MOYER: All those in favor of definitely postponing this until after lunch, respond with an aye.

ALL: Aye.

CHAIRMAN MOYER: Any opposed?

MEMBER FLAMM: No.

CHAIRMAN MOYER: One opposed and one abstain. We had one abstention, one opposed and eleven -- I apologize, two opposed.

VICE-CHAIR GIACOMINI: We can't have a number count with a voice vote.
CHAIRMAN MOYER: So we had some opposed, but the ayes have it. It is --

MEMBER DELGADO: We can determine the result, but not a count.

CHAIRMAN MOYER: The result is that it is definitely postponed until after lunch.

Thank you, Dan. Does that conclude the Materials Committee work in front of this Board at the moment?

VICE-CHAIR GIACOMINI: At the moment.

CHAIRMAN MOYER: Thank you. I will then turn the microphone over to the Crops Committee. Tina, are you ready with your Crops materials?

MEMBER ELLOR: Yes, the first one on the agenda is manganese sulfate monohydrate. And the Crops Committee recommends that manganese sulfate monohydrate as petitioned does not need to be considered for addition to the National List since use of
this material is currently allowed through the existing listing, Synthetic Substances Allowed for Crop Production, 206.601(j)(6)(ii). And I would like to make a motion that this recommendation be accepted.

CHAIRMAN MOYER: I have a motion on the floor. Is there a second.

MEMBER ENGELBERT: I'll second.

CHAIRMAN MOYER: We have a motion and second. Is there discussion on this material?

(No audible response.)

CHAIRMAN MOYER: Seeing or hearing none, I call for a vote.

Is there a conflict of interest on this material?

(No audible response.)

CHAIRMAN MOYER: Hearing none, we'll start the voting with Rigo.

Oh, there is discussion?

MEMBER HEINZE: I just need to have to catch up, just 30 seconds.
MEMBER JAMES: Jeff, can you please restate what the motion is?

CHAIRMAN MOYER: I will ask Tina to restate the motion.

MEMBER ELLOR: The Crops Committee recommends that manganese sulfate monohydrate as petitioned does not need to be considered for addition to the National List since use of this material is currently allowed through the existing listing, Synthetic Substances Allowed for Crop Production, 206.601(j)(6)(ii).

CHAIRMAN MOYER: Thank you. We'll begin the voting with Rigo.

MEMBER DELGADO: Yes.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: Yes.

CHAIRMAN MOYER: Dan?

VICE-CHAIR GIACOMINI: Yes.

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: Yes.
CHAIRMAN MOYER: Steve?

MEMBER DeMURI: Yes.

CHAIRMAN MOYER: Barry?

MEMBER FLAMM: Yes.

CHAIRMAN MOYER: Bea?

MEMBER JAMES: Yes.

CHAIRMAN MOYER: Tracy?

MEMBER MIEDEMA: Yes.

CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN MOYER: Hue?

MEMBER KARREMAN: Yes.

CHAIRMAN MOYER: Kevin?

MEMBER ENGELBERT: Yes.

CHAIRMAN MOYER: Tina?

MEMBER ELLOR: Yes.

CHAIRMAN MOYER: And the Chair votes yes. Zero; thirteen yeses; two absent.

The motion passes.

Thank you, Tina. You're next material, please?

MEMBER ELLOR: This is the very
complicated peracetic acid. Let me just reiterate. The history of this is that the EPA changed the status of peracetic acid from inert to active. And hydrogen peroxide formulations, which are on the list, can't exist without peracetic acid.

The petition is to take off all the annotations, expand the use of peracetic acid to pretty much everything. We, the Crops Committee, were not comfortable with that, so we recommended six to zero that we deny that petition. But, in order to keep hydrogen peroxide and peracetic acid, we need to make some annotations. And Emily pointed out to me this morning, and I think she's right about this; I'd like to, you know, get some input, that not only do we have to annotate the peracetic acid listings, we now have to annotate the hydrogen peroxide listings as well to allow hydrogen peroxide as blended with peracetic acid, because it only exists in that form. If we don't do that, then we'll
lose hydrogen peroxide as a sanitizer in crops
and also as disease control.

So that said, we have two
documents. The first is denying the petition;
and I'll go through that in more detail. And
if we do that and once we've done that, we
have a second document up that would annotate
the peracetic acid listings. And also I think
we need to annotate the hydrogen peroxide
listings to keep those tools in sanitation and
pest control.

VICE-CHAIR GIACOMINI: Point of
order, Mr. Chair?

CHAIRMAN MOYER: Chair recognizes
Dan for a point of order.

VICE-CHAIR GIACOMINI: In lieu of
the discussion that we had yesterday, I would
like to ask the Program of whether changing
the annotation of a substance currently on the
National List that was not petitioned to
change the annotation is within proper
procedure.
CHAIRMAN MOYER: Chair recognizes the Program.

MR. McEVOY: Well, it seems like from what I understand from yesterday that it's not proper procedure. However, the Board earlier has voted to approve hydrogen peroxide, and you're offering kind of a clarification on an earlier approval. So I think you could look at it both ways. So I think what you should do is continue on.

You're using your best judgment to make a recommendation. We'll get legal advice to see how we can implement your recommendation. So that's what I would suggest.

CHAIRMAN MOYER: I don't want to enter into discussion if we don't have to, but if have a point of order, Rigo?

MEMBER DELGADO: Just to add one point to that. This is an amendment in response to a petition, so we're finding some issues. So when you deal with the lawyers, please take into account that we're responding
to a petition and we're finding some issues
within the rule that we were trying to
correct. That's my point.

CHAIRMAN MOYER: Dan?

VICE-CHAIR GIACOMINI: I

appreciate Rigo for adding that, because with
all due respect to Miles, they way you just
said that was awful muddy in what you told us
yesterday regarding the Livestock
recommendations.

CHAIRMAN MOYER: Thank you.

Tina?

MEMBER ELLOR: Our concern as the
Crops Committee is that these are critical
tools in sanitation and disease control, and
we really feel like we don't want to lose
them. Also, it's our sentiment that peracetic
acid is far more innocuous than other things
that are used for the same purpose. And if
peracetic acid can be used for those in place
of, you know, chlorine and copper sulfate and
some other control and sanitation measures,
that we really do want to keep it.

But we were not in favor of expanding the use, because it is a very broad oxidizer. You know, I really don't accept that you can kill only the bad guys and leave the good guys intact. And with expanding use, you could pretty much, you know, put it in your irrigation system and have a constant application to soil, if for some reason you wanted to do that.

Kevin has a comment he'd like to --

CHAIRMAN MOYER: If you're going to make a motion, you should make a motion.

MEMBER ELLOR: Okay. Yes, sir.

The motion is to remove the annotations from the listing for peracetic acid on National List 205.601(a)(6) and 205-601(i)(7). That's the motion on the table.

CHAIRMAN MOYER: Is there a second to that motion?

MEMBER DELGADO: Second.
CHAIRMAN MOYER: We have a motion and a second. Is there any discussion on this material? I see Steve.

MEMBER DeMURI: More of a question than a discussion. So we'll have multiple motions to vote on?

MEMBER ELLOR: There will be two motions to vote on.

MEMBER DeMURI: There won't be an additional one for hydrogen peroxide as well?

MEMBER ELLOR: There may be. You know, I need to look to our parliamentarians for that. If we need to make those additional changes to keep hydrogen peroxide by annotating them to allow peracetic acid in hydrogen peroxide, because they don't exist one without the other, then I guess we will need a motion for that as well.

CHAIRMAN MOYER: Point of clarification. The first motion, Steve, is to remove the annotation at the petitioner's request.
MEMBER DeMURI: Okay.

CHAIRMAN MOYER: Depending how we act on that motion, it will determine what we have to do, whether we have a second motion or not. Because if we vote to remove the annotations, then it works. If we remove, as the committee recommended, to not remove the annotation, then we have to change the other annotation.

Bea?

MEMBER JAMES: So it sounds like everything is contingent on being able to make an annotation as well in hydrogen peroxide? That wasn't a part of the original agenda. What happens if we're not able to make an annotation on hydrogen peroxide?

VICE-CHAIR GIACOMINI: Mr. Chairman?

CHAIRMAN MOYER: Chair recognizes Dan.

VICE-CHAIR GIACOMINI: Right now, the motion is simply to delete the annotation.
I think it would be prudent to deal with that issue and that recommendation, and then we'll move onto the correctness of the annotation changes that we're looking at. Because if this passes, we'll just move on.

CHAIRMAN MOYER: Right.

VICE-CHAIR GIACOMINI: If it fails, then we'll look at what we need to do. But I think clearing this would be a good step.

CHAIRMAN MOYER: We have a motion on the floor. It's seconded. We're in discussion.

Tina, you have a point?

MEMBER ELLOR: So let me try to clear up what this would mean. If we accept this petition use, then it opens up the door for peracetic acid to be used across the board in plant disease control in a very broad base of applications. Gerry had a definite -- and I can read his email to you, really felt that it had the potential to be abused in
agriculture quite a bit, so that you could be
constantly applying peracetic acid. And, you
know, the petitioner's argument was; and I did
read through it pretty carefully, that it
would be just killing the bad stuff. And as
a biologist, as a microbiologist, I don't
accept that. I think that you'll kill the
good stuff, too.

CHAIRMAN MOYER: Chair recognizes
Dan.

VICE-CHAIR GIACOMINI: Removing
the annotation would allow for unlimited use
in unlimited amounts, correct?

MEMBER ELLOR: Correct.

CHAIRMAN MOYER: Okay. We have a
motion on the floor. We have a second. Is
there any further discussion of this item?

Chair recognizes Bea.

MEMBER JAMES: I just want to make
sure, we're voting then to not accept the
removal of the annotation?

VICE-CHAIR GIACOMINI: No, we are
1 voting to remove the annotation. So if you
2 want to keep the annotation, you vote no.
3
4 CHAIRMAN MOYER: Chair recognizes
5 Tina.

6 MEMBER ELLOR: A vote yes would be
7 voting to expand the use of peracetic acid.
8 A vote no would be to not expand the use of
9 peracetic acid.

10 CHAIRMAN MOYER: Okay. We have a
11 motion on the floor. We have a second. Any
12 further discussion?
13
14 (No audible response.)
15
16 CHAIRMAN MOYER: If not, I'm going
17 to call for the vote.
18
19 Is there any conflict of interest
20 on this material?
21
22 (No audible response.)
23
24 CHAIRMAN MOYER: Hearing none, we
25 will start the voting with Katrina.
26
27 MEMBER HEINZE: No.
28
29 CHAIRMAN MOYER: Dan?
30
31 VICE-CHAIR GIACOMINI: No.
CHAIRMAN MOYER:  Julie?
SECRETARY WEISMAN:  No.
CHAIRMAN MOYER:  Steve?
MEMBER DeMURI:  No.
CHAIRMAN MOYER:  Barry?
MEMBER FLAMM:  No.
CHAIRMAN MOYER:  Bea?
MEMBER JAMES:  No.
CHAIRMAN MOYER:  Tracy?
MEMBER MIEDEMA:  No.
CHAIRMAN MOYER:  Joe?
MEMBER SMILLIE:  No.
CHAIRMAN MOYER:  Hue?
MEMBER KARREMAN:  No.
CHAIRMAN MOYER:  Kevin?
MEMBER ENGELBERT:  No.
CHAIRMAN MOYER:  Tina?
MEMBER ELLOR:  No.
CHAIRMAN MOYER:  Rigo?
MEMBER DELGADO:  No.
CHAIRMAN MOYER:  And the Chair votes no.  Thirteen noes, zero yeses, two
absent. The motion fails.

Your next item, Madam Chairperson?

MEMBER ELLOR: The next item, the

motion as it stands now is to amend the

annotations from the listings for peracetic

acid on National List 205-601(a)(6) and

205.601(i)(7) to add the words in each section

"permitted in hydrogen peroxide formulations

at concentrations of no more than five

percent." That's the motion on the table.

CHAIRMAN MOYER: I have a motion

on the table. Is there a second?

MEMBER DELGADO: Second.

CHAIRMAN MOYER: We have a motion

and a second. Now we have discussion.

Tina?

MEMBER ELLOR: And this is what;

and I think that Emily and Rigo brought this

up yesterday, we, I think, would need to

annotate the peracetic acid listings, and let

me go through those just quickly. In

addition, we need to annotate not only the
peracetic acid listings, but also the hydrogen peroxide listings, because one doesn't exist without the other. And I think we don't want to lose hydrogen peroxide as disease control and sanitation.

So hydrogen peroxide appears on 601. It appears in two places. On 205.601(a) as algicides, disinfectant and sanitizer, including irrigation system cleaning systems for hydrogen peroxide. It also appears on 205.601(i) as plant disease control, hydrogen peroxide.

So we may need to amend those to say "hydrogen peroxide may be blended with peracetic acid."

CHAIRMAN MOYER: Chair recognizes the Program, Miles McEvoy.

MR. McEVOY: Yes, I don't think you need to amend hydrogen peroxide. OMRI and WSDA have registered a number of hydrogen peroxide products and this issue has not come up. So I don't see why you would need to
amend that. It's not part of the petition.

It doesn't seem to be an issue. It's
something that just came up. We can look into
it and get back to you on it, but I wouldn't
say -- don't take this one on.

MEMBER ELLOR: I think what's
changed is the EPA's designation of peracetic
acid as an active. It was considered an
inert. It was reclassified as an active. And
the hydrogen peroxide formulations don't exist
without peracetic acid. But, since you're the
man in charge, I'm going to take your word for
it that we don't need to annotate hydrogen
peroxide.

CHAIRMAN MOYER: Question then:

Does that make this entire motion not
necessary? I mean, because the goal of this
motion was to protect hydrogen peroxide.

MEMBER ELLOR: Well, also
peracetic acid, but not in unlimited use.

CHAIRMAN MOYER: Correct.

MEMBER ELLOR: All right. Oh,
you're right. I do see what you mean. And let's think this through. I think is what Kevin was trying to say to me before. Yes, that we can reject the petition to expand usage but keep the current usage in place.

CHAIRMAN MOYER: And that's what we just did with the past vote.

MEMBER ELLOR: And that's what we just did.

CHAIRMAN MOYER: This vote is to protect hydrogen peroxide.

MEMBER ELLOR: Right. So if you don't feel like we need to protect hydrogen peroxide, then we don't need to go down this road either.

MR. McEVOY: Well, there's a difference of opinion.

MEMBER ELLOR: Okay. All right.

MR. McEVOY: And I think that really you should hear from OMRI or Zea or --

MEMBER ELLOR: Okay. Can we do that, please?
CHAIRMAN MOYER: The Chair would recognize, if they'd come to the podium, both Dave Decou and Zea. If you'd like to come to the podium to respond? We appreciate your background and your knowledge here. And if you can state your name for the transcriber.

MR. DECOU: Dave Decou from OMRI.

MS. SONNEBAND: Zea Sonneband from CCOF.

CHAIRMAN MOYER: You guys got to change heights, because you only got one mike.

MS. SONNEBAND: Do you want me to go first?

CHAIRMAN MOYER: Well, it will be easier for you to bend over than for her to jump, I'm sure.

MS. SONNEBAND: Okay. My interpretation of this is you do need to take the vote on peracetic acid, because right now, peracetic acid on a list is only allowed for fire blight. And you want to change the peracetic acid annotation so that it can be
listed along with hydrogen peroxide on the
list. You do not need to change the
annotation for hydrogen peroxide, because it's
already on the list for disease control and
once peracetic acid is on, the two things can
be blended together in a formulation.

MEMBER ELLOR: Okay.

MS. SONNEBAND: So that's my
opinion. But I think you do, because
peracetic acid has specific limitations
already, so that annotation does need to be
changed.

CHAIRMAN MOYER: Thank you, Zea.

I think that goes a long way in helping.

Dave?

MR. DECOU: I agree with Zea. I
think there's a misunderstanding that some of
you have on the Board. Peracetic acid used in
disease control is controlled by EPA, and they
have strict limitations on what levels it can
be applied at. It's not like it can be put on
the ground in unlimited quantities, besides
the fact that it would probably cost too much for most people to even be interested in that. So you know, don't assume there aren't other regulations that apply to it. If it's applied under disease control under the crops area, it's got a strict limitation on how much can be applied at the application rate. I mean, what I'm talking about is not in the container at some concentration, but the concentration when it's applied to the crop.

MEMBER ELLOR: Right, and I believe that that top limit is 100 parts per million, or 200?

MR. DECOU: Depends on the situation, but it's no more than 200 parts per million.

MEMBER ELLOR: Okay. And we were aware of this, and Gerry communicated to us that, you know, putting 200 parts per million out in the soil over a period of time would not be an acceptable use for us. And I think we all agree with that.
MR. DECOU: Okay.

MEMBER ELLOR: But I definitely appreciate that.

MR. DECOU: But it is strictly limited at this point, yes.

MEMBER ELLOR: Right. Okay.

CHAIRMAN MOYER: Thank you, Dave and Zea.

The Chair would recognize Emily for a further point of clarification, Emily Brown-Rosen. If you'd state your name.

MS. BROWN-ROSEN: Emily Brown-Rosen, PCO. I disagree with Zea. I mean, I look at the list and the way it's organized. You know, Section (a) is algicides, disinfectants. And you're voting to change peracetic acid for use in disinfecting, to also be allowed to be mixed with hydrogen peroxide. Then, you are voting to change peracetic acid under Section (i), which is plant disease control, and that's only for use to control fire blight bacteria.
So if you want to preserve the current use of peracetic acid which is normally found in a natural stasis with hydrogen peroxide, which is under No. 4, hydrogen peroxide, you know, just plain for plant disease control, it seems to me as a -- you know, maybe I'm a more literal reader of the categories of the list, that that's where it needs to go.

Hydrogen peroxide I think can and is applied alone sometimes. You know, people use straight hydrogen peroxide, you know, like, maybe not even labeled products, but it's out there, I believe. But, it's also used in -- I think what you meant to say, all peracetic acid is blended, I mean, naturally with hydrogen peroxide. So it's just not captured under straightforward plant disease control. So that's why I recommended that. I mean, you know, maybe you could delay this later and get more opinions, or legal opinions. But, I just think that down the
road, if we want to allow one of these products for a late blight or the ones they use in greenhouse oxidate, the label says fungicide disease control. It doesn't say, you know, disinfecting equipment and seed, or you know, it would be stretching the use that you've approved. This says for use to control fire blight bacteria.

MS. SONNEBAND: And with hydrogen peroxide.

MS. BROWN-ROSEN: Yes. Yes.

(Off-mic comment.)

MS. BROWN-ROSEN: Yes. Okay.

But then it can only be used on fire flight under No. 7.

MS. SONNEBAND: No. Well, and/or.

MS. ROSEN-BROWN: Okay. So she's thinking that the restriction on fire blight is not really a restriction only to the fire blight, which I would disagree with.

MS. SONNEBAND: Well, no, that's what they're going to change. They're going
to say not just fire blight, but also with hydrogen peroxide.

CHAIRMAN MOYER: No, that's not correct, Zea.

MS. SONNEBAND: You don't think that's what they were getting to in that?

Okay. Case closed.

CHAIRMAN MOYER: Okay. Thank you, folks. We appreciate that input.

We have a motion on the floor. We have a second. We are still in discussion.

The Chair recognizes Dan.

VICE-CHAIR GIACOMINI: I really disagree with, not necessarily in the intent, but I really disagree with what you're doing with this annotation under the section of plant disease control where you're adding all of these other things that are not plant disease control. If you want to add the use of peracetic acid for more things, it goes in another section.

CHAIRMAN MOYER: No, that's not
what we're trying to do.

VICE-CHAIR GIACOMINI: The proposed annotation is to change it to -- oh, for (a)(6). I'm sorry, (i)(7). Okay. My mistake.

CHAIRMAN MOYER: Thank you, Dan. Any other points of clarification? Tina?

MEMBER ELLOR: I find I'm still perplexed.

CHAIRMAN MOYER: Join the crowd.

MEMBER ELLOR: Yes, I --

PARTICIPANT: Okay. I didn't see the two -- there are two annotation changes.

MEMBER ELLOR: Oh, well, maybe Katrina can straighten this out.

CHAIRMAN MOYER: Chair recognizes Katrina.

MEMBER HEINZE: Okay. You put a lot of good thought into this before the meeting. Don't let yourself get muddled up.

So all you're trying to do is add the
annotation "permitted in hydrogen peroxide formulations at concentration of no more than five percent" --

CHAIRMAN MOYER: Right.

MEMBER HEINZE: -- so that the peracetic acid can still be used.

CHAIRMAN MOYER: Well, and so that hydrogen peroxide can still be used.

MEMBER HEINZE: Right.

CHAIRMAN MOYER: It protects hydrogen peroxide, which we don't --

MEMBER HEINZE: You're not adding any uses.

CHAIRMAN MOYER: Okay.

MEMBER HEINZE: You're not changing any uses. This is just about reacting to this EPA change.

CHAIRMAN MOYER: Thank you, Katrina. I do think that clears things up and I think --

MEMBER HEINZE: I think it's straightforward.
CHAIRMAN MOYER: -- we are confusing ourselves.

MEMBER HEINZE: But given that, we did have a lot of discussion yesterday about concentration, and I'm wondering if the committee had time to talk about that.

CHAIRMAN MOYER: Chair recognizes Tina.

MEMBER ELLOR: Yes, and this is something once again that Gerry, who's an incredibly conscientious researcher, looked into. And he called several manufacturers and found that these products contain, you know, more or less than five percent, but most of them containing about five percent.

So if you're using peracetic acid and you need to figure out, you know, your final dosage which is regulated to 100 or 200 percent, then we didn't feel like we needed to make that recommendation. But we didn't want to see formulations -- okay.

CHAIRMAN MOYER: Chair recognizes
Katrina.

MEMBER HEINZE: So the petitioner in their written public comment talked about one product they sell that is 12 percent peracetic acid, but is used at such a dilution that its application is actually lower -- or the concentration at end use is lower than the five percent solution. So that's where I get a little bit confused. I can pull that up if --

MEMBER ELLOR: No, I do understand that; and if the Crops Committee could jump in here and help me out here, we were all a little bit perplexed by this, but I did send Gerry an email to say where did you get that number? And I think you're right, since we have defeated expanding the use and the concentration is regulated by other agencies, that we may not need that. Because, you know, instead of shipping all the water around or whatever at the five percent, you know -- so, I'm fine with --
CHAIRMAN MOYER: Yes, I think our comment there, the goal was to make sure that we didn't shift the emphasis away from the hydrogen peroxide to just having a little bit of hydrogen peroxide with a lot of peracetic acid. The goal was to set a number in there so that you couldn't shift the ratio of the components.

MEMBER HEINZE: So you're trying to avoid 80 percent peracetic acid?

MEMBER ELLOR: Right.

CHAIRMAN MOYER: Exactly.

MEMBER ELLOR: Right.

MEMBER HEINZE: I got it.

MEMBER ELLOR: Thank you, Jeff.

MEMBER HEINZE: That's very helpful.

CHAIRMAN MOYER: The Chair recognizes Kevin, then Dan.

MEMBER ENGELBERT: Yes, just to build on that a little bit, that's exactly what we're trying to do. When we talked in
committee about our concerns about expressing this in parts per million instead of a percentage; and I brought that up, Gerry was adamant that we stay with a percentage basis in the final formulation of the hydrogen peroxide/peracetic acid mixture so that there could be no abuse and have higher concentrations than you should. And, you know, this is his area of expertise. They use these formulations and he said this is the proper way to approach this problem.

CHAIRMAN MOYER: Chair recognizes Dan.

VICE-CHAIR GIACOMINI: I have the utmost respect for Gerry on all these issues and I agree with Tina that he's a thorough researcher. But, it seems that you have two concerns here. One is letting the peracetic acid be used in that concentration at, you know, potentially higher rates than the hydrogen peroxide. But if we understand what Dave said, the maximum amount of peracetic
acid is already controlled by other agencies.

In response to that statement, Tina, you said

and your concern is that that number is too

high to be in the following of organic

principles, essentially.

So I respect Gerry's opinion, but

I'm still wondering why we don't have a 100-

part-per-million limit on the application

rate, rather than just the control of the

proportion of it to hydrogen peroxide in the

batch, but they're able to use it at EPA

levels that you're saying the committee does

not feel is too high for organic.

MEMBER ELLOR: I'm going to defer

to Barry on this.

CHAIRMAN MOYER: The floor is

turned over to Barry.

MEMBER FLAMM: You know, there's

two questions here. The first one is

peracetic acid and we voted not to expand that

use. The other is we're talking about

hydrogen peroxide now, and as we understand
it, that isn't produced without having a
component of peracetic acid. We believe that
hydrogen peroxide is a very valuable tool and
we didn't want to inadvertently take that off
the list. We're essentially trying to keep
things at status quo. And now it seems like
this discussion is focusing back on peracetic
acid levels. Well, we've already voted. We
don't want to expand that. We're worried
about the risk of widespread use of peracetic
acid. I think Jeff had said, we don't want
there to be subterfuge of using hydrogen
peroxide as a cover for what essentially
becomes a peracetic acid.

So Gerry's examination was find
out what really is happening in these
products, and the five percent limit is what
he discovered is the limit. But, we're now
shifted over to hydrogen peroxide and we keep
drifting back to re-discussing levels of use
and so forth of peracetic acid. That's not
the question now. It's hydrogen peroxide and
what are the content of peracetic acid now occurring in this product.

CHAIRMAN MOYER: Chair recognizes Kevin.

MEMBER ENGELBERT: I'll do my best to address your concerns, Dan. We're proposing an annotation for a five-percent limit on mixtures with peracetic acid in hydrogen peroxide, period. That's the limit. That will keep the application rates of the peracetic acid onto the crop levels at 100 parts per million or lower. Because of the chemical relationship between the two, you can't get above that with that percentage in the formulations of the two products together. That's the way Gerry explained it to us, that this is the proper approach, because you're not going to apply -- we're not amending peracetic acid to be applied individually. This is an annotation for it to be mixed at a certain percentage level with hydrogen peroxide. And then you have to bear in mind
that hydrogen peroxide comes in different
strengths also, 35, 50 percent, 3 percent, or
whatever.

CHAIRMAN MOYER: Thank you, Kevin.

We have a motion on the floor. We
have a second. Is there any further
discussion? If not, I'd like to call for the
vote.

And, Tina, if you would restate
the motion, and please state what a yes or no
vote entails.

MEMBER ELLOR: Okay. Motion to
amend the annotations from the listings for
peracetic acid on the National List
205.601(a)(6) and 205.601(i)(7) to add the
words in each section, "permitted in hydrogen
peroxide formulations at concentrations of no
more than five percent."

And to sum up, a yes vote would
keep these tools in the organic toolbox
without expanding the use of peracetic acid.

CHAIRMAN MOYER: Thank you, Madam
Chairperson.

Is there a conflict of interest from any board member on this material?

(No audible response.)

CHAIRMAN MOYER: Seeing no show of hands, we will begin the vote and we will begin with Dan.

VICE-CHAIR GIACOMINI: Yes.

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: Yes.

CHAIRMAN MOYER: Steve?

MEMBER DeMURI: Yes.

CHAIRMAN MOYER: Barry?

MEMBER FLAMM: Yes.

CHAIRMAN MOYER: Bea?

MEMBER JAMES: Yes.

CHAIRMAN MOYER: Tracy?

MEMBER MIEDEMA: Yes.

CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN MOYER: Hue?

MEMBER KARREMAN: Yes.
1     CHAIRMAN MOYER: Kevin?
2     MEMBER ENGELBERT: Yes.
3     CHAIRMAN MOYER: Tina?
4     MEMBER ELLOR: Yes.
5     CHAIRMAN MOYER: Rigo?
6     MEMBER DELGADO: Yes.
7     CHAIRMAN MOYER: Katrina?
8     MEMBER HEINZE: Yes.
9     CHAIRMAN MOYER: And the Chair votes yes. I believe that's zero noes, 13 yeses, two absent. The motion passes as presented.
10  Madam Chairperson, your next item?
11  MEMBER ELLOR: Our last material, I'm going to turn over to Rigo to handle, because he did the major work on that. Am I allowed to do that at this point?
12  CHAIRMAN MOYER: You certainly are. Thank you.
13  Chair recognizes Rigo.
14  MEMBER DELGADO: Thank you very much, Madam Chair.
Wonderful. Thank you very much.

I promise I did write all this, but it was so long ago last night that I remember much of it.

The Crops Committee evaluated hydrogen chloride which is a substance used for delinting cotton seed. This is a sunset material. And it's explained yesterday, we looked at alternatives, information on alternative technologies and alternatives products. We found none. And we also looked into additional information on unknown effects of this substance, and we found none.

So therefore, we recommend that it continues to be listed. And at this point, I would like to move to list hydrogen chloride as annotated in Section 205.601(n).

CHAIRMAN MOYER: Thank you. We have a motion to relist this sunset item. Is there a second?

MEMBER HEINZE: Second.

CHAIRMAN MOYER: Katrina seconds
it. We have a motion and a second to relist
this sunset item. Is there any discussion?
(No audible response.)
CHAIRMAN MOYER: Seeing or hearing
none, I will call for the vote.
Is there a conflict of interest by
any board member on this material?
(No audible response.)
CHAIRMAN MOYER: Seeing no show of
hands or hearing nor voice, I will call for
the vote starting with Julie.
SECRETARY WEISMAN: Yes.
CHAIRMAN MOYER: Steve?
MEMBER DeMURI: Yes.
CHAIRMAN MOYER: I apologize, I'm
out of order here. Barry?
MEMBER FLAMM: Yes.
CHAIRMAN MOYER: Bea?
MEMBER JAMES: Yes.
CHAIRMAN MOYER: Tracy?
MEMBER MIEDEMA: Yes.
CHAIRMAN MOYER: Joe?
Joe's absent.

Hue?

MEMBER KARREMAN: Yes.

CHAIRMAN MOYER: Kevin?

MEMBER ENGELBERT: Yes.

CHAIRMAN MOYER: Tina?

MEMBER ELLOR: Yes.

CHAIRMAN MOYER: Rigo?

MEMBER DELGADO: Yes.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: Yes.

CHAIRMAN MOYER: Dan?

VICE-CHAIR GIACOMINI: Yes.

CHAIRMAN MOYER: And the Chair votes yes. We have zero noes, twelve yeses, three absents. The motion passes and the material is relisted.

Are there any other items before this Board, Madam Chairperson?

MEMBER ELLOR: No.

CHAIRMAN MOYER: Thank you. At that point, I believe what we'll do is we'll
take a 15-minute recess and we will reconvene here at approximately 10 after 10:00. Thank you.

(Whereupon, the above-entitled matter went off the record at 9:54 a.m. and resumed at 10:18 a.m.)

CHAIRMAN MOYER: Meeting is called to order. We're back in session. We're in the process of running through our petitions and our voting. And at this point in time we're reading to turn the microphone over the Livestock Committee.

Dr. Karreman, if you will?

(Off-mic comment.)

CHAIRMAN MOYER: I apologize?

(Off-mic comment.)

CHAIRMAN MOYER: Certainly. Chair recognizes Joe.

MEMBER SMILLIE: Did I miss the pots? The containers? We're not --

VICE-CHAIR GIACOMINI: Moved to discussion, Joe.
MEMBER SMILLIE: Oh, it was.

VICE-CHAIR GIACOMINI: The

document itself was discussion.

MEMBER SMILLIE: I'm sorry. Thank you.

CHAIRMAN MOYER: The greenhouse and container? Yes, that's a discussion document.

PARTICIPANT: The greenhouse document was a discussion, correct? Yes.

CHAIRMAN MOYER: Yes, that's a discussion document.

PARTICIPANT: There was an error in the agenda.

CHAIRMAN MOYER: You get to vote next time. It will come back, yes. Okay. We're just waiting for the chair of the Livestock Committee to get his computer fired up.

MEMBER KARREMAN: All right.

Livestock Committee's recommendations are actually are not in the correct order I saw on
the paper we have for voting. How do you want
to do it by? Do you want to do what's on the
agenda schedule, or by the paper? I don't
care.

CHAIRMAN MOYER: I'd like if you'd
follow our voting sheet, if that's possible.

MEMBER KARREMAN: By the paper?

All right. So our first material
is eprinomectin.

Is that up there, Valerie? Not
yet? Okay. That's all right. I'm also
getting there. Got them in order here, guys.

Okay. The Livestock Committee --
how do you do a negative again? I'm going to
state what the motion is.

CHAIRMAN MOYER: Yes.

MEMBER KARREMAN: And that's it.

Yes. Okay.

So the motion for eprinomectin is
to add eprinomectin to 7 C.F.R. 205.603.

That's it.

CHAIRMAN MOYER: Is there a second
to that motion?

MEMBER MIEDEMA: Second.

MEMBER ENGELBERT: I'll second.

CHAIRMAN MOYER: I'm sorry, Tracy had it first.

We have a motion and a second to list or add eprinomectin to the National List.

Is there any discussion on this item?

(No audible response.)

CHAIRMAN MOYER: If you could, Mr. Chairman, give us what the committee vote was on that?

MEMBER KARREMAN: Sure. The committee vote was zero in favor of the listing, seven opposed to listing, no absent, no abstentions.

CHAIRMAN MOYER: Thank you. Is there any discussion there on that item?

(No audible response.)

CHAIRMAN MOYER: Hearing none, seeing no show of hands, I'm ready to call for the vote.
Is there any conflict of interest on this material?

(No audible response.)

CHAIRMAN MOYER: Hearing none, are we prepared to vote?

(No audible response.)

CHAIRMAN MOYER: Okay. We will start the vote with Steve.

MEMBER DeMURI: No.

CHAIRMAN MOYER: Next I have Barry.

MEMBER FLAMM: No.

CHAIRMAN MOYER: Bea?

MEMBER JAMES: No.

CHAIRMAN MOYER: Tracy?

MEMBER MIEDEMA: No.

CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: No.

CHAIRMAN MOYER: Hue?

MEMBER KARREMAN: No.

CHAIRMAN MOYER: Kevin?

MEMBER ENGELBERT: No.
CHAIRMAN MOYER: Tina?

MEMBER ELLOR: No.

CHAIRMAN MOYER: Rigo?

MEMBER DELGADO: No.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: No.

CHAIRMAN MOYER: Dan?

VICE-CHAIR GIACOMINI: No.

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: No.

CHAIRMAN MOYER: And the Chair votes no. I believe that's 13 noes, zero yeses, two absent. That motion fails to pass.

Your next item, Mr. Chairman?

MEMBER KARREMAN: All right. The next recommendation which is on the agenda approved by the Program was to be on the agenda here is the recommendation change to 205.603(f), the excipients. It is to clarify wording. The change would be in the first line -- well, I'll read you what the recommendation is, how's that?
CHAIRMAN MOYER: Thank you.

MEMBER KARREMAN: All the better?

The recommendation is this: For 205.603(f), excipients only for use in the manufacture of animal health care products used to treat organic livestock when the excipient is identified by the FDA, is generally recognized as safe, approved by the FDA as a food additive, included in the FDA review and approval of a new animal drug application or new drug application; or approved by the Animal and Plant Health Inspection Service of the USDA, otherwise known as APHIS.

The committee vote was seven in favor, zero opposed, zero abstentions, zero absent.

CHAIRMAN MOYER: So is that your motion? Did you make a motion?

MEMBER KARREMAN: I move to recommend this for vote.

MEMBER ELLOR: I second.

CHAIRMAN MOYER: We have a motion
on the floor as stated. We have a second.
Discussion on listing excipients?

Julie?

SECRETARY WEISMAN: I just had one question. How did this recommendation fit within the context of the question that was brought up yesterday about technical corrections? I know some were okay and some were not, but I don't remember which ones.

CHAIRMAN MOYER: Chair recognizes Miles McEvoy from the Program.

MR. McEVOY: Yes, this one's fine.

No problems.

SECRETARY WEISMAN: Okay.

CHAIRMAN MOYER: Thank you for that clarification.

Chair recognizes Dan.

VICE-CHAIR GIACOMINI: Hue, can you reread the first line of what you're recommending? Are we including the health care, or did you drop that?

MEMBER KARREMAN: I will reread
the recommendation that we're voting on, which
is motioned and seconded now. To change
205.603(f), excipients only for use in the
manufacture of animal health care products
used to treat organic livestock when the
excipient is -- and the rest of the lines.

VICE-CHAIR GIACOMINI: Okay.
MEMBER KARREMAN: Is that okay?
CHAIRMAN MOYER: It's okay with
me. It's your motion.

Any points of discussion?

Katrina?

MEMBER HEINZE: So this is really
that you're adding the items in italic?
Nothing else, right?

MEMBER KARREMAN: Correct. It's a
clarification.

MEMBER HEINZE: Yes.
MEMBER KARREMAN: Reason is that
back when they were looking at it in 2002, the
transcripts of October 18th, I think, or
October 20th, 2002, page 297, line 22, Mr.
Sieman was talking about excipients in medications and not just drugs. So I think there's always been this nebulous-type wording, needing clarification. And through rule making process, it became drugs. Okay? But in the Board's discussions; and I have the transcripts right here, they were talking that is drugs, medications back and forth.

MEMBER HEINZE: A little bird just whispered in my ear and said we're not voting on what it says up there?

MEMBER KARREMAN: It has been corrected.

MEMBER HEINZE: Oh. I take that back.

CHAIRMAN MOYER: Thank you, Katrina.

The Board recognizes Valerie Frances from the Program.

MS. FRANCES: There had been some discussion about putting the words "animal drugs or health care products" yesterday. And
so I had put that up as a placeholder and as
a reminder perhaps.

CHAIRMAN MOYER: Thank you,
Valerie.

Chair recognizes Dan.

VICE-CHAIR GIACOMINI: Yes, Hue,
based on that discussion, it currently just
doesn't say "drugs." We talked within committee of
going to animal health care products. Is that
inclusive enough of drugs? We talked one time
of adding "drugs or animal health care
products."

MEMBER KARREMAN: I think it's
fully inclusive.

CHAIRMAN MOYER: Point of
clarification. Hue, it now says "animal
health care products." That is correct.

MEMBER KARREMAN: That's one of
the changes.

CHAIRMAN MOYER: Yes.

MEMBER KARREMAN: That is correct,
Mr. Chair. That's the change. That's the key
change, as well as the semicolon at the end,
"or approved by APHIS."

CHAIRMAN MOYER: Chair recognizes
Mile McEvoy from the Program.

MR. McEVOY: Animal health care products do not appear to be defined in the regulations. Animal drug is defined in the regulation. You want to think about that.

CHAIRMAN MOYER: Hue?

MEMBER KARREMAN: Then I would suggest that perhaps the term generally probably recognized in Webster's Dictionary, "medications" is not specifically a drug as FDA sees it. But let's say over-the-counter lotion that you'd put on your skin, that would be a medication as well?

CHAIRMAN MOYER: I would direct that back to the Program. Is "medications" defined?

MR. McEVOY: No, "medications" is not defined.

CHAIRMAN MOYER: Thank you. Chair
recognizes Dan.

VICE-CHAIR GIACOMINI: I would like us to add the words "drug or" back into there, and then recommend to the Livestock Committee to put this on top of their work plan and come back with a definition of animal health care products for the next meeting. And I'll make that motion, if that sounds reasonable.

MEMBER KARREMAN: May I ask a question?

CHAIRMAN MOYER: Chair recognizes Hue.

MEMBER KARREMAN: So Dan, are you saying that we take action on this and then we put on the work plan to define animal health care products?

VICE-CHAIR GIACOMINI: Yes.

CHAIRMAN MOYER: Yes, later this afternoon we'd put that on a work plan.

MEMBER KARREMAN: I can agree with that.
CHAIRMAN MOYER: But you'd have to put the word "drugs" back in there.

MEMBER KARREMAN: Okay.

CHAIRMAN MOYER: And that would take an amendment.

MEMBER KARREMAN: Fine. Who wants to make an amendment? Can I amend myself?

CHAIRMAN MOYER: Yes.

VICE-CHAIR GIACOMINI: I did.

CHAIRMAN MOYER: Any doctor can self-amend them self. Yes, right? Or self-medicate, or whatever.

Chair recognizes Dan.

VICE-CHAIR GIACOMINI: I move that we add "drugs or" before animal health care products.

CHAIRMAN MOYER: Point of order, Miles. Thank you.

MR. McEVOY: Yes, "drugs" is already in the existing regulations, so that's not an addition. The only think you would be adding is the "animal health care products"
part as an addition.

CHAIRMAN MOYER: I see.

MEMBER KARREMAN: Technically, it would be "or animal health care products."

VICE-CHAIR GIACOMINI: Wait.

Question.

CHAIRMAN MOYER: Question from Dan.

VICE-CHAIR GIACOMINI: That's correct, but the motion before this Board right now is as he states it, and in order to get it back to what we said, we need to amend this motion.

CHAIRMAN MOYER: Right.

VICE-CHAIR GIACOMINI: Not that. So we're trying to get this language back into this motion.

CHAIRMAN MOYER: Does the person who made the motion and the second accept that friendly amendment?

MEMBER KARREMAN: I accept a friendly amendment like that, sure.
MEMBER ENGELBERT: First I'd like to -- sorry.

CHAIRMAN MOYER: Tina, do you accept that? You were the second on that?

MEMBER ELLOR: Yes.

CHAIRMAN MOYER: I'm sorry, Tracy was the second on that? Do you accept that friendly amendment?

I thought it was Tina. That's what I thought.

MEMBER ELLOR: Yes, I accept it.

CHAIRMAN MOYER: You accept it?

Okay. We have accepted that.

Kevin, point of discussion?

MEMBER ENGELBERT: Yes, I'd just like to ask anybody on the Board or in the audience, is there anyone that would argue that a drug is not an animal health care product?

CHAIRMAN MOYER: I'm not inclined to bring everybody from the room to the podium, but if anybody on the Board wants to
address that?

Chair recognizes Bea, and then Hue.

MEMBER JAMES: Isn't "drug" defined -- I mean, would that bring the FDA definition in?

And secondly, the FDA obviously -- I don't know if health care products would fall under that, so they might be two separate things.

Anyway, Hue?

CHAIRMAN MOYER: Chair recognizes Hue.

MEMBER KARREMAN: I would agree with you, Bea, in that the term "drug," as I was mentioning yesterday during the discussion, you cannot give drugs per se to non-sick organic animals. Okay? And it's two different terms. The FDA has regulatory approval over drugs and animal health care products, but they look at drugs differently perhaps than animal health care products that
are over-the-counter, and they're under regulatory discretion, not needing NADAs. And it's the excipients in those animal health care products that fall under regulatory discretion by the FDA, which this whole recommendation is trying to address.

CHAIRMAN MOYER: Chair recognizes Julie and then Kevin.

SECRETARY WEISMAN: I'll pass.

CHAIRMAN MOYER: Julie passes. Kevin?

MEMBER ENGELBERT: Well then, I'd also like to point out that in the list of definitions in the National Rule "drugs" is not defined either.

VICE-CHAIR GIACOMINI: Animal drug is. I just asked Miles if that was a problem. He said he didn't think so.

CHAIRMAN MOYER: Okay. We have a motion on the floor. We have a friendly amendment to that motion. Is there more discussion? Bea?
MEMBER JAMES: So Dan, if I heard you correctly, you guys are going to take back and create a definition for animal health care products? Is that what I heard?

VICE-CHAIR GIACOMINI: Yes.

CHAIRMAN MOYER: That's what you heard.

VICE-CHAIR GIACOMINI: It's not quite the same problem as with personal care.

MEMBER JAMES: Thanks for picking up on my vibe.

CHAIRMAN MOYER: A question for the Program: Does that makes sense to you? I see some discussion over there.

MR. McEVOY: Yes, that sounds good.

CHAIRMAN MOYER: Okay. Thank you.

Okay. We have a motion on the floor. We have a second for that. We have a friendly amendment.

Hue, since you made the motion, if you could reread it one more time and tell us
what a yes or no vote means, I think we're ready to go.

MEMBER KARREMAN: Okay. So the recommendation now is: 205.603(f), excipients only for use in the manufacture of drugs or animal health care products used to treat organic livestock when the excipient is identified by the FDA as generally recognized as safe, approved by the FDA as a food additive, included in the FDA review and approval of a new animal drug application or new drug application; or approved by APHIS.

A vote yes would be to make this change. A vote no would be to not make the change. That's what you asked me to say, how it would --

CHAIRMAN MOYER: Yes.

MEMBER KARREMAN: Okay.

CHAIRMAN MOYER: Thank you.

Chair recognizes Kevin.

MEMBER ENGELBERT: Then I'd like to offer another friendly amendment and add
the word "animals" in front of drugs, because "drugs" is not defined in the National Rule, but "animal drugs" is.

CHAIRMAN MOYER: Does the person who made the motion and seconded it accept that friendly amendment?

MEMBER KARREMAN: Not sure.

Because of a mechanism by which all these medicines and their excipients were placed on the list originally, the Animal Medicinal Use Drug Clarification Act of 1996, which allows the use NDAs, or new drug approvals, for animals if there's no approved drug for them. So to limit it to animal drugs would be too constractive, especially for some of the things that have already been placed on the list.

CHAIRMAN MOYER: Point of discussion, Dan?

VICE-CHAIR GIACOMINI: Can you take a look at that in light of the actual definition of "animal drug" that we have here
in the regulation?

Do you want me to read that, Mr. Chairman?

CHAIRMAN MOYER: Yes, that's fine.

VICE-CHAIR GIACOMINI: "Animal drug" is defined as, "Any drug as defined in Section 201 of the Federal Food, Drug and Cosmetic Act, as amended, 21 USC 321, that is intended for use in livestock, including any drug intended for use in livestock feed, but not including such livestock feed."

MEMBER KARREMAN: Still, I would have reservations because there could be a NDA, new drug approval, which is for humans that might be used in livestock. The NADAs are officially approved for the species that they're labeled for. If we look at butorphanol, which is on the list, it's only listed for horse and deer.

And I guess this was a confusion way back when, and I guess I would just like to keep it the way it is.
CHAIRMAN MOYER: Thank you. Two
more points of discussion. Dan and then
Katrina.

VICE-CHAIR GIACOMINI: Yes, I
think it's under the section of livestock
already, and it's been this way without a
problem for three years. I would think if a
problem came up, the NOP would be able to deal
with it without us having to take action, I
would certainly hope. Because I think the
intent of what that says is and what it's
doing is very clear. So I see Miles shaking
his head, slightly; I'll qualify that. You
know, I would rather keep something that has
not caused a problem rather than potentially
something that would add qualifiers and cause
a problem.

CHAIRMAN MOYER: Chair recognizes
Katrina.

MEMBER HEINZE: I concur with what
Dan said.

CHAIRMAN MOYER: Thank you. We
I have a friendly amendment on the floor that has been rejected by the petitioner. Do you wish to make that an unfriendly amendment? (No audible response.)

CHAIRMAN MOYER: Thank you. That amendment dies for lack of a second.

We're back to the original petition as just read by Hue. Again, I believe we're prepared to vote on that. Is there a conflict of interest on that material? (No audible response.)

CHAIRMAN MOYER: Then we will begin the voting with Bea.

I apologize. Barry?

MEMBER FLAMM: Yes.

CHAIRMAN MOYER: Bea?

MEMBER JAMES: Yes.

CHAIRMAN MOYER: Tracy?

MEMBER MIEDEMA: Yes.

CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: Yes.
CHAIRMAN MOYER: Hue?

MEMBER KARREMAN: Yes.

CHAIRMAN MOYER: Kevin?

MEMBER ENGELBERT: Yes.

CHAIRMAN MOYER: Tina?

MEMBER ELLOR: Yes.

CHAIRMAN MOYER: Rigo?

MEMBER DELGADO: Yes.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: Yes.

CHAIRMAN MOYER: Dan?

VICE-CHAIR GIACOMINI: Yes.

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: Yes.

CHAIRMAN MOYER: Steve?

MEMBER DeMURI: Yes.

CHAIRMAN MOYER: And the Chair votes yes. I have zero noes, 13 yeses, two absent. The motion passes.

Thank you, Mr. Chairman. Next item on your agenda.

MEMBER KARREMAN: Okay. Next item
looks to be vaccines. The Livestock Committee had a meeting last night, and due to the discussion phase of our meeting yesterday, we are proposing to amend the recommendation that was posted. Would you like to hear that recommendation as it stands for this vote?

CHAIRMAN MOYER: Yes.

MEMBER KARREMAN: The corrected one out of committee is --

CHAIRMAN MOYER: Yes, voted on in committee.

And if you could put that up there, Valerie? Do you have it?

Oh, she doesn't have the new correction.

MEMBER KARREMAN: No, it's a one-liner.

CHAIRMAN MOYER: Okay. Thank you.

MEMBER KARREMAN: Yes. Ready?

All right. So under 105(e), it should say, "Excluded methods, except for vaccines, provided that" -- which is in the
language that already exists -- "provided that
vaccines manufactured without the use of
excluded methods must be used if available."

CHAIRMAN MOYER: Thank you.

MEMBER KARREMAN: That's it.

CHAIRMAN MOYER: Would you put
that in the form of a motion, please?

MEMBER KARREMAN: So then, the
Livestock Committee recommends that 205.105(e)
be amended to read that -- you want me to read
the whole 105?

CHAIRMAN MOYER: No.

MEMBER KARREMAN: Okay. Then (e),
excluded methods, except for vaccines,
provided that vaccines manufactured without
the use of excluded methods must be used if
available.

CHAIRMAN MOYER: Thank you. Is
there a second to that?

MEMBER ELLOR: I'll second.

CHAIRMAN MOYER: Tina seconds it.

Discussion, Joe?
MEMBER SMILLIE: I'd like to propose a friendly amendment that we add the word "commercial" in front of "available" -- "commercially."

MEMBER KARREMAN: I accept that.

CHAIRMAN MOYER: Hue accepts that.

Tina, do you accept that?

MEMBER ELLOR: I also accept that.

CHAIRMAN MOYER: We accept that friendly amendment.

If you would post that -- put that word up there, Valerie? You already have it.

Thank you.

MEMBER KARREMAN: Is that acceptable to the Program, the use of that term in that form?

CHAIRMAN MOYER: Chair recognizes Miles to answer that question.

MR. McEVOY: Yes, sure. I mean, this is your recommendation and if it's a problem, then we'll let you know.

CHAIRMAN MOYER: Thank you.
Points of discussion on this? I have Katrina and Barry. Katrina?

MEMBER HEINZE: I am not familiar with how the previous provided that language that referenced 600(a), what that did. So is it a problem that it's gone? I'm okay if you just say the answer is no.

MEMBER KARREMAN: Do you want to know then what it says right now? I mean, as it stands right now?

MEMBER HEINZE: No. So the current listing says, "provided that the vaccines are approved in accordance with 205.600(a)." And 600(a) says, "The following criteria will be utilized in the evaluation of substances ... (a) synthetic and non-synthetic substances considered for inclusion on -- need to be evaluated using these criteria."

So I'm wondering if that's language that needs to be kept or not. I totally support the changes you made. I'm just wondering if it's a problem that we lost
the language that was there. I'm not familiar

enough with it to know.

CHAIRMAN MOYER: Thank you,

Katrina. Hue?

MEMBER KARREMAN: Let me back up

here for a second. Okay. I don't know how to

answer that, I guess.

CHAIRMAN MOYER: Chair recognizes

Dan.

VICE-CHAIR GIACOMINI: The route

of approval in the regulation right now is

through 105 to 600(a) then onto the respective

section. And the listing in the respective

section has always been the very generic

biologic vaccines. It's the fact that that

was not qualified as non-GE that created some

of the confusion where it deviated from what

appeared to have been the intent in the

preamble.

To pull out of that hole without

going in and manipulating the National List is

the recommendation from the Program was to go
this route and make that separation.

There is concern that the allowance of genetically modified currently is within the listing of 603(a)(4), and that the separation that's caused by this recommendation really pulls the GMO part of the vaccines out of the National List. I'm not sure if someone came back in and pulled out -- in a sunset someday down the road -- if they pulled out (4) and said we're not going to renew sunset on (4), I'm not sure that would disallow the use of GMO vaccines without going in and altering 105.

MEMBER HEINZE: Thank you. That's helpful.

CHAIRMAN MOYER: Thank you, Dan.

I wish I could say I understood all that, but I don't. But I'm glad Katrina did.

Any other questions or pieces of discussion on this item? I apologize, Barry.

MEMBER FLAMM: Hue, I appreciate what the committee has done in looking at more
of a middle ground approach. I did think I
heard in some of the discussion including
conditions of not only other alternatives, but
also a condition of some emergency that really
makes it important enough to take this, what
I consider a large step, in using a GMO
material -- that the needs and benefits, you
know, outweigh that risk.

Did the committee discuss this
part of the modification?

CHAIRMAN MOYER: Dan -- I'm sorry,
Hue?

MEMBER KARREMAN: Yes, that was
part of the whole thinking process, Barry.
That's definitely a part of the whole impetus
for this. Okay? Is that, if there is some
outbreak of some foreign disease on U.S. soil,
we're going to need something quick and it's
mostly likely these days going to be
genetically engineered vaccine, okay, in the
face of an outbreak to use it to protect the
other animals.
But right now, as it stands, currently; and I went through this on the discussion yesterday, I read off; and I still owe the court reporter the names specifically spelled out, a lot of the vaccines; there's like 32 or 38, and many of them happen to be -- there's only one right now made for a specific condition and it happens to be GE, genetically engineered. So we did totally take into account the specter of some foreign disease happening here on U.S. soil, without a doubt. But there's also already being used currently vaccines which there is no alternative to.

So are you recommending anything at this point?

CHAIRMAN MOYER: Chair recognizes Barry.

MEMBER FLAMM: Well, I'm much more persuaded by a national emergency, animal emergency, that it's worth taking this step and using it. I'm still unconvinced and very
nervous about committing and authorizing what would become a routine use of GMO vaccines. And I know it's in use right now, but we're authorizing it now. And that seems to me to make a difference.

CHAIRMAN MOYER: Chair recognizes Dan and then Hue.

VICE-CHAIR GIACOMINI: Yes, Barry, I look at that situation of the emergency situation. If you look at how governments typically respond, they don't declare emergency when it starts to rain. They only declare the emergency after the flood has occurred.

When we look at the situation of the large hurricane in the South; and I'm not trying to compare this to a hurricane situation, but, you know, the response that sometimes we're able to get in dealing with those kind of situations is not always adequate to the local area. And I would hate to see how many animals would have to die
again, and businesses forced out, you know, liquidated, before the proper channels were approved.

CHAIRMAN MOYER: Thank you, Dan.

I have Hue.

MEMBER KARREMAN: Just for an example here, on the list there's only one vaccine that is genetically engineered for avian influenza H9N2 at this point. So during the autumn flyway right now, if some birds were migrating through; and this is theoretical, but let's say there's AI outbreak with H9N2 it was found. That vaccine is here. It's genetically engineered. You know, so maybe it blends the two for you.

As far as the routine use, you know, what we're trying to say is that you must use vaccines from -- what's the wording? Except for vaccines -- that they're manufactured without the use of excluded methods and they must be used if available. You have to. So you know, I don't see it as
a routine use-type thing. Even if it's once a year on a vaccine, I don't consider that routine. But, you have to look for the conventional, if you will, vaccines at this point still. This does help in those times when there isn't any other one, or when there's an emergency.

CHAIRMAN MOYER: Chair recognizes Julie.

SECRETARY WEISMAN: Yes, I'm just following up on Dan's comment, which is I think there's a reason why the phenomenon happens that official declarations of outbreak or emergency come from government, at whatever level; federal, municipal, state, come after the fact. Because for a great many of these the purpose of making such a declaration is to release funds to clean up the mess. And so, they're not really intended to be proactive. I'm not saying across the board, but that's a lot of the use of those. And so I don't feel confident that they would be sufficient to
head off the kind of situation that Hue's
describing.

CHAIRMAN MOYER: Chair recognizes
Barry.

MEMBER FLAMM: Well, I think there
is provisions for emergency, and we're facing
the same thing with a human population right
now where there was planning ahead. I don't
quite agree that we don't do advanced planning
and stocking.

I appreciate what the committee
has done, but I just don't think it's strong
enough to, you know, satisfy the concerns I
have and that people and commenters who have
expressed great concern by expanding GMO use.

CHAIRMAN MOYER: Chair recognizes
Joe.

MEMBER SMILLIE: A couple
questions and then a comment.
The makeup of the Handling
Committee, how many people were on it?
Livestock.
CHAIRMAN MOYER: Seven.

MEMBER SMILLIE: Seven? And what was the vote on this?

CHAIRMAN MOYER: Seven to zero in favor of listing.

MEMBER SMILLIE: That's troubling. Because, you know, I really respect their work, I really respect their knowledge, but yet I do have concerns and I'm the one who said I hate to have consumers define what organic means. However, I mean, just looking at it from an entirely different perspective, the fallout from this is a sizeable fallout. I don't necessarily believe that's informed opinion, if we take this action. In fact, I believe it not to be informed. I think it's the kind of opinion though that whether it's right or wrong, whether it wants to understand the reasons why we passed it, I doubt it. I don't think that the media or the reaction will be an informed reaction. It will be an emotional knee-jerk reaction that I think is
fairly predictable, you know, that this Board allowed. And I am fearful of the damage that that will cause us, you know?

So that's one of the political concerns that I have. I realize it's entirely political. It's not a technical or regulatory concern. It's a political concern, but I also think that we live in that arena and we have to take that into consideration when we make a vote on this.

And it troubles me also that the voting pattern is going to start over here. I really wish it would start over there. Because I take leads from people on this Board; I'm not going to deny it. And I'm very concerned with this.

I'm wondering, can we find a way, would the committee consider tabling this? Would the committee consider sending it back to committee so we can get, you know, more study, that we can do more education so we can hopefully get for a more informed public
reaction? I don't know. This one really, really bothers me.

    CHAIRMAN MOYER: I have a Hue, and then Julie, Dan, Katrina, Tina, Tracy. I got a bunch. Hue?

    MEMBER KARREMAN: Being that there are, in general, still conventional vaccines, Joe, out there, I would consider that. But it better be darn high on the priority of any workplan. And consumers have to know that they're being used already, which they are. And, you know, I'll be the one out there saying that, if needed, when I'm off this Board, even louder.

    CHAIRMAN MOYER: Chair recognizes Julie.

    SECRETARY WEISMAN: I would not be in favor of tabling this. I would like to quote a fellow board member who can identify themselves if they wish, but I think it was said very eloquently to me, I think the other night, that this is one of those situations
where as a board is that we're going to lose
either way. That's what's going to happen.
And I almost want this to be on the record
proactively that we know we're going to lose
either way.

Because on the one hand, it's
going to be on the record now that not only
going forward, but there have already been GM
being used for livestock emergencies. And if
we don't take action on this and there is an
outbreak, then we're going to be called out on
the carpet for not having been proactive and
anticipating. So we are veterans to what
sometimes feels like the capricious eye of the
public that we are trying to protect. We're
not strangers to that, and this is going to be
one of those situations.

CHAIRMAN MOYER: I will also
mention that, I believe, it's the only place
in the rule where excluded methods are allowed
for -- it mentions them as allowed for
vaccines. So people foresaw what was
happening prior to us getting here and recognize that this is the direction we may be heading.

Chair recognizes Dan.

VICE-CHAIR GIACOMINI: Yes, I'll echo what Julie said in responding to Joe, in that we're going to lose either way, Joe. And the alternative to this motion as we saw it, where it's taken care of in one sweep and one press coverage, is that we have two options: We will either be looking at individual petitions for GMO vaccines to be added to the list, which could be literally at every meeting, or we would at the very least be looking at classes of vaccines, which would also be -- what is there, five or six, which would not able to be done at all and would be every meeting probably for the next three years.

So I think that alternative, if that is the A number one concern, that when you're looking at, you know, damage control,
this may be bad, but the other would be huge and continuing.

CHAIRMAN MOYER: Chair recognizes Katrina.

MEMBER HEINZE: Please don't table your recommendation. I don't see this as a lose-lose. Our job on the NOSB is to be thoughtful, to understand the complexity of these situations, and to make decisions, balancing very difficult conflicting requirements. And I think you guys have made a very compelling argument for why, one, these vaccines are in use. The regulation has allowed them, to the point made by Jeff. And that the animals need them.

CHAIRMAN MOYER: Chair recognizes Tina.

MEMBER ELLOR: And I think I can speak for Jennifer, too, you know, remembering back to our committee discussion, we see this as an animal welfare issue. And I think Kevin said publicly that this is a lose-lose. And
quite honestly, I'd rather lose this way than to see animals suffering because bureaucracy is moving too slowly and, you know, not in their direction. I just don't find that acceptable.

So I would like us not to table this and I'm very much in favor of it.

CHAIRMAN MOYER: Chair recognizes Tracy.

MEMBER MIEDEMA: I want to put a statement on the record as a consumer representative and direct this comment specifically to two of our most vocal consumer organizations who I know are here in the gallery.

The current practice right now is that GMO vaccines are being used. They've been being used for a number of years. The passage of this recommendation restricts GMO vaccines in that it creates a path forward whereby non-GMO vaccines can be developed.

It's actually a win for consumers in the long
run. The practice right now is GMO vaccines.
And I would plead with you that this doesn't become characterized as the doors have been thrown open for GMOs, but rather that we are creating a commercial availability clause and allowing for the development of non-GMO vaccines.

CHAIRMAN MOYER: If it were appropriate to applaud, I would. Bea?

MEMBER JAMES: Well, I think just consumer perception that we're using vaccines at all is probably one of the concerns that's out there, as far as consumer perception. Some people are aware that it's GMO, but traditionally I would just say the practice and use of vaccinations within the natural industry is sometimes just within question on its own.

But, what I wanted to ask Hue is, the argument about an emergency for use, and this recommendation kind of setting the stage
for making that acceptable, if this
recommendation, let's say, doesn't pass and
there was an emergency outbreak, do you think
that that would prohibit what needed to happen
with vaccinations? I mean, wouldn't it just
tump and it would happen anyway?

MEMBER KARREMAN: I believe our
understanding is that there is a -- what's the
term, "derogation," at .672, I believe, where
the Secretary, you know, can make that happen.
But those animals are out of production for a
year. They can re-transition. It's the one
place where they can re-transition. I'm
sorry, if it's not 672, but Jim brought it up,
Jim Riddle brought it up and we were aware of
that. But, our committee felt that when
you're taken out of organic production for a
whole year, you're done, especially with the
conventional, let's say, milk price right now.
And that would just be an economic
catastrophe.

MEMBER JAMES: Taken out of animal
production because of the fact --

MEMBER KARREMAN: Out of the

organic production.

MEMBER JAMES: Because of the

vaccination?

MEMBER KARREMAN: Any prohibitive

material, yes.

MEMBER JAMES: But they're already
doing it. You said that everybody's already
using vaccination.

MEMBER KARREMAN: That's a good

question, Bea. So what do we do with all
these animals that have gotten a prohibitive
material at this point? It's equal to giving
them penicillin, technically, legally, what's
been going on for the last seven years. I'm
not opposed to it. I'm just saying that you
bring up a very good question. What do we do
with all these animals that got a vaccine just
yesterday that happened to be genetically
engineered? What do we do with them? They've
technically been given a prohibitive material.
It's not an emergency.

Let me just say that I think Tracy's point is excellent. Because what we're actually doing here is saying to the world right now, you know, for the last seven years that's got to stop. You have to use conventional vaccines unless they're not commercially available. Right now you can go pick the genetically engineered vaccine and say I want to use that one when there's nine other ones for the same disease which are conventional, but you want to use that one. Now we're saying, no, can't do that. You got to use one of those other nine instead of the genetically engineered one. I think that's an excellent point.

And by the way, a vaccine manufacturer was not petitioning this. Okay? This is coming up from the field. It is entirely an animal welfare topic and issue. So I just want to make that point. And I think it is good we're addressing this as a
board and I withdraw the consideration of tabling it.

CHAIRMAN MOYER: Thank you. Chair recognizes Rigo.

MEMBER DELGADO: I would applaud Tracy as well, and also echo what Hue was saying. We actually avoided this issue for several years. We've been discussing it lightly at the committee level, but the GE term scared us away for a number of years, and we had very good excuses. We had agriculture, we had other topics.

But the thing is that -- and you know very clearly, you know what our dilemma is. On one side we have possibly a pandemic, and the other one is damage to the brand. We were very much aware of that, on the horns of the dilemma, but we had to make a stand. We had to move forward. It's not enough to sweep it under the rug and hope that it will fix itself. These are products that have been used for several years. If we do not
recognize that, they will be affecting a
number of producers. And we have to move
forward.

We do have limitations in the data
that we have, and I know we like to follow the
motto that in God we trust, all others bring
data. Well, we don't have it perfectly here,
but I think that this is a good first step
towards obtaining that data and making sure
that things work.

CHAIRMAN MOYER: Thank you, Rigo.

Chair recognizes Joe.

MEMBER SMILLIE: It is 672, just
for the record. And I appreciate very much
the leadership of the Livestock Committee and
the comments of fellow board members.

CHAIRMAN MOYER: Thank you, Joe.

Chair recognizes Dan.

VICE-CHAIR GIACOMINI: Thank you,
Mr. Chairman. Yes, again echoing appreciation
of Tracy's comments and full support of those.

Bea, in your question regarding
what would happen if this fails, this recommendation, even if it fails, is not an endpoint. It's part of the path and we would shift paths slightly to do that. The status quo right now, as I understand it from the last meeting, was that the Program has said that the status quo continues until you guys reach an agreement. Unless they changed that policy, their status quo policy would be to keep the status quo. So the use of them would be allowed until we would resolve it in some other way. I mean, they would have to come out and say, no, we're stopping this policy and it's no longer allowed, period.

The important point though that I would like us to consider -- Valerie, if you could put that back up, please, if it's not there. I'm concerned and I'm doing this from the standpoint of wanting to keep this as narrow and as focused as possible. I understand Joe's concern. We put in commercial availability, did we not?
(Off-mic comment.)

VICE-CHAIR GIACOMINI: Okay.

Commercial availability is a factor of form, quality and quantity. I think it's a mistake in this case to go that route when a farmer can go to a veterinarian and then reach the decision we have this disease. There are five vaccines available, three of them are non-GMO, two of them are GMO. Gee, doc, what do I do? I think you should use this particular DNA-modified, whatever the different terms are, of the GMO vaccines of the classes. I think you should use that vaccine in this case.

I think we may be increasing the use of allowing the form clause to come into this in this situation. And I think we may be safer in only allowing them to use non-GMO versions by just saying "if it's available."

CHAIRMAN MOYER: Chair recognizes Hue, and then Tina, and then Joe.

MEMBER KARREMAN: I would concur with Dan, because I would say even though I am
a trained veterinarian, you know, I'm not right in the mainstream and at the cutting technological edge. I mean, I hardly use vaccines. Okay?

Bea, just to your thing. Okay?

But, most veterinarians are wanting to use the new thing all the time. It's just the way medicine goes, whether veterinary medicine, dental medicine, human medicine. You're always going for the new thing because of course, hey, it's supposed to be better. I think with the form, function, and whatever the other thing is, quantity on the commercial terminology and the vet saying, hey, use this new one; and the vet doesn't care if it's genetically engineered or not, I mean, but that's what he knows scientifically is the best one right now compared to the older ones, I think that it still should be incumbent upon the farmer who is certified organic to know to get the old conventional one, if it's available. And that's on the
onus of the farmer, even though he can take
the veterinarian's advice, you know, at the
time.

CHAIRMAN MOYER: Chair recognizes
Tina.

MEMBER ELLOR: The reason why I
was in favor of adding "commercial
availability" is mostly the quantity issue.
In the case of an emergency, the quantity of
conventionally-produced vaccines may not be
available. But, if we could just do that with
"availability," then I'm fine with that, too.

CHAIRMAN MOYER: Chair recognizes
Joe.

MEMBER SMILLIE: Well, you know,
we've had on the Handling Committee some
experience with commercial availability. And
once again, it is the decision of the
certifier, remember, to determine whether
that's been met. You know, it's a two-step
process. And yes, it will require a certain
amount of knowledge and experience from the
certifier's side, but if they're accredited to certify livestock operations, they're accredited to have that knowledge and experience in dealing with that.

You know, form, quality, quantity, yes, it's available. It's in California. It's going to take two weeks to get it there, if there is some, and there may not be some. It may be gone by the time you order. You can't put people in a straightjacket like that. And again, in some cases, you know, the Handling Committee's experience has been it's been abused; there's no question about it, but we slowly tighten the vice on it and we slowly get more knowledgeable about it. And we find out that some people in Pennsylvania can get that California vaccine. And other people say, well, we can't get it. Well, excuse me, this vet and those people got it. So you know, the local certifier is going to be aware of that.

So there are enforcement tools
there to put teeth in commercial availability.

It's not just like, oh, I don't have the form or quality or quantity. Those days are gone.

We're much better at enforcing that. It's not as nebulous as it used to be. And I think it's a reasonable thing to place there and put the burden on the ACAs to make sure that it's not abused.

CHAIRMAN MOYER: Thank you, Joe.

I think that's a good clarification of that point.

Barry?

MEMBER FLAMM: I think Joe pretty much covered what I was going to raise. It seems like, you know, the certifiers ought to be -- if there are alternatives and they're working, why haven't they been requiring this all along? That's what puzzles me, that this has been happening when I think it's fairly clear that it exceeded anything that was within what was acceptable in the organic community. So that was my question, but Joe
covered it better than I did and the
complications of it. That's all I have.

CHAIRMAN MOYER: Chair recognizes
Bea.

MEMBER JAMES: Hue, do you have a
summary of the public comments that you got as
far as how many people were opposed and how
many people supported?

CHAIRMAN MOYER: Hue?

MEMBER KARREMAN: In a nutshell,
is that okay right now? Generally, there were
some chain letters. There was actually one
Excel spreadsheet with 2,783 names or
something with no statement on it, but I
figured from the group it was from it was
opposed. Okay? There were some other
consumers groups that said no.

And I guess on the other side of
the balance sheet, the certifiers that
certify, you know, farms and everything like
that, did not come out opposed to it. One
certifier kind of brought it to light, you
know, talked about it more in depth, but you
want me to name the certifiers that -- okay.
But they certify a lot of operations.
So on one side you have the
certifiers saying, you know, this is okay.
And I think the main reason I've always heard
certifiers say, when we talk about this, kind
of like, you know, on the side in general,
it's because it's for a preventive practice
that they haven't looked at vaccines more in
depth. There's a lot more burning issues, I
guess, and it's prevention of disease.
And, you know, I've talked to
inspectors and they see a vaccine on the
shelf, they're like it's a vaccine. You know,
it's not like there's penicillin and
gentamicin and all the other stuff on the
shelf. They see that, major big red flag.
So one side, a certifier is saying
yes, you know, this recommendation we support,
and on the other -- on the consumer side, the
ones that signed those chain letters, you
1 know, no.

2 CHAIRMAN MOYER: Chair recognizes
3 Kevin. I will remind the Board that we're
4 probably about an hour at least behind
5 schedule now, not that I'm pushing.
6
7 Kevin?

8 MEMBER ENGELBERT: As I sit here
9 conspicuously quiet, listening to everyone's
10 comments, yes, our board vote was seven-zero,
11 or our committee vote, but it was the hardest
12 vote that I've made on a committee, and this
13 is going to be the hardest vote that I make on
14 the NOSB, I'm sure. I'd like to vote twice,
15 once from heart and once from my head.
16
17 But on their committee
18 recommendation, Jennifer's logic weighed
19 heavily on my own decision. Like Joe said, he
20 looks to other people on the Board, so do I.
21 And when I'm in committee, I do the same
22 thing.

23 And I look at this situation on my
24 own farm, and one of the tenets of organic
agriculture is openness and transparency in trying to get consumers to know their farm. And we have seen that happen on our operation tremendously. We have people in and out of our farm all the time now with our retail meat business and our burgeoning retail cheese business. And I try to think what would happen if we were faced with an emergency right now, our cows were exposed to some type of disease and we couldn't vaccinate them unless we used an GMO.

I think our customers, without exception, would say please save your animals. We will still support you. I may be wrong, but that's the way I read the public's perception. The knee-jerk reaction is absolutely known. But when you consider the fact that operations would fail, their local source of organic food would disappear, I think in the end run they would probably say do what you have to do to keep your operation viable.
CHAIRMAN MOYER: Chair recognizes Julie.

SECRETARY WEISMAN: I would like to call the question -- what's the procedure here?

CHAIRMAN MOYER: I have one more commenter who had their hand up almost identically timed to you, so I'll take that and then I will call the question.

Bea, final comment, please?

MEMBER JAMES: I do think this is an important subject. I know we're running behind, but this is pretty critical.

Kevin, I guess where I struggle is that from what I've heard from Hue as far as current practices and what is currently outlined for use of vaccinations, it doesn't seem to me like you would not be able to have that option to use vaccinations. If you really needed them, it's already happening anyway, and you would be able to do it. So that's where I struggle, is that we're
creating more of a direction towards vaccinations, even though there is a status quo that is allowing it. So why would you think that you couldn't treat your animals if you needed to if you currently can it right now anyway?

CHAIRMAN MOYER: Kevin?

MEMBER ENGELBERT: Because if we don't pass this, then I wouldn't be able to and retain my certified organic status. I'd lose my milk market and our operation would fail. Ninety-five percent of our income comes from milk and it is sold to our co-op. So if we had to vaccinate our animals with a GMO vaccine to save them, we couldn't survive the 672 option of transitioning back for another year. We'd be out of business.

CHAIRMAN MOYER: Okay. Dan?

VICE-CHAIR GIACOMINI: Also, Bea, in the time it takes to go through all the hoops to get a special approval, cows are dead.
CHAIRMAN MOYER: Thank you. I'm going to turn the floor over to Hue for one last comment and then restate your motion.

MEMBER KARREMAN: Since the question is being called, I would just like to say for the record I think this has been an excellent transparent discussion in public on a critical issue, and we will vote however we do. And I guess we'll leave it at that.

CHAIRMAN MOYER: Restate motion and address which way a yes or no vote impacts it.

MEMBER KARREMAN: The motion is to amend 205.105(e), excluded methods, except for vaccines, provided that vaccines manufactured without the use of excluded methods must be used if commercially available.

If you vote in favor of that, then you do. You do. If you don't, then you don't.

CHAIRMAN MOYER: Thank you, Yogi.

MEMBER KARREMAN: It's a
1 straightforward statement at that point.
2
3 CHAIRMAN MOYER: We have a motion.
4
5 It is on the floor. It was seconded. We had
6 our discussion. We will now call for the
7 vote.
8
9 Are there any conflict of interest
10 before we vote?
11
12 (No audible response.)
13
14 MEMBER KARREMAN: I don't know if
15 there's a conflict of interest with a
16 livestock operation that would use these
17 vaccines.
18
19 CHAIRMAN MOYER: You don't make
20 vaccines. No, I don't think the Board has a
21 problem with that, Kevin. Thank you for your
22 honesty.
23
24 MEMBER KARREMAN: Well, I tried to
25 get out of it.
26
27 CHAIRMAN MOYER: Yes. That was
28 pretty slick.
29
30 We will start the vote with Bea.
31
32 MEMBER JAMES: Great. No.
CHAIRMAN MOYER: Tracy?
MEMBER MIEDEMA: Yes.
CHAIRMAN MOYER: Joe?
MEMBER SMILLIE: Yes.
CHAIRMAN MOYER: Hue?
MEMBER KARREMAN: Yes.
CHAIRMAN MOYER: Kevin?
MEMBER ENGELBERT: Yes.
CHAIRMAN MOYER: Tina?
MEMBER ELLOR: Yes.
CHAIRMAN MOYER: Rigo?
MEMBER DELGADO: Yes.
CHAIRMAN MOYER: Katrina?
MEMBER HEINZE: Yes.
CHAIRMAN MOYER: Dan?
VICE-CHAIR GIACOMINI: Yes.
CHAIRMAN MOYER: Julie?
SECRETARY WEISMAN: Yes.
CHAIRMAN MOYER: Steve?
MEMBER DeMURI: Yes.
CHAIRMAN MOYER: Barry?
MEMBER FLAMM: No.
CHAIRMAN MOYER: And the Chair votes yes. I believe we have two nos, 11 yeses and two absents. Motion passes.

Mr. Chairman, your next material?

MEMBER KARREMAN: Just a little quick conclusion on that.

CHAIRMAN MOYER: Yes.

MEMBER KARREMAN: You know, there's going to be more work for people to look for vaccines which are not genetically engineered. Just for everybody that voted yes on that. Okay? It's going to be more work for the certifiers, more work for the farmers, which it should be. Case closed for now.

CHAIRMAN MOYER: Thank you, Mr. Chairman. Your next material?

MEMBER KARREMAN: All right.

What's up? Let's see. Chlorhexidine. This is a clarification, I guess. It's a clarification. The current -- you want just the recommendation right at to go? The Livestock Committee recommendation.
CHAIRMAN MOYER: If you have a preamble you want to talk about, you're welcome to it. And if not, just read your motion.

MEMBER KARREMAN: Well, the original annotation on this is partly due to my input. It says the current one, okay, right up top is that chlorhexidine allowed for surgical procedures conducted by a veterinarian. Okay. That part of it, I was consulted with by the NOP back in about 2000. This was on the list when it came out in 2002. And I got a phone call from an NOP staff person saying, "Hey, Dr. Karreman, do you use chlorhexidine?" And I said, "Yes, I use it for surgery and surgical procedures." And I wasn't asked further, like, well, do you use it for anything else than that? Okay? So that's how this one sentence got in here. But chlorhexidine in general is used for a lot of medical purposes of which surgery is one.

Anyway, so it's kind of a
clarification on something which goes way back to 2000. Okay?

So the Livestock Committee recommendation is to have 205.603(a)(6), chlorhexidine allowed as a germicide for medical and surgical procedures, allowed for use as a teat dip when alternative germicides, agents and/or physical barriers have lost their effectiveness.

Committee vote was seven in favor of this, zero opposed, zero abstained, zero absent.

CHAIRMAN MOYER: Point of order. I believe we heard conversation yesterday from the Program that we could not take action on these two materials. Am I mistaken?

MR. McEVOY: Yes, there certainly was some discussion about that yesterday and some confusion about that. It sounds like what Hue is saying, it's a clarification. So I would suggest that you take this up and we'll take a look at it to see if there's a
violation of your process. And if there is, we'll let you know.

What you heard yesterday, that there very well could be that you're not following your procedures, but there's no specific petition here. But you're basing your action on your good process that you've gone through for the last six months or more and possibly a misunderstanding about that.

CHAIRMAN MOYER: Yes.

MR. McEVOY: It sounds like there is possibly a violation of procedure. And if so, then it might not be valid to move forward on this.

CHAIRMAN MOYER: Thank you from the Program. Appreciate that clarification. That was my understanding. But it sounds like we will move forward with these.

Mr. Chairman, back to you.

MEMBER KARREMAN: Yes, I guess depending on what you want to do, Mr. Chair, I do have more preamble for the xylazine one,
in case that -- well, you're going to get it anyway, but I want to --

CHAIRMAN MOYER: Yes.

MEMBER KARREMAN: Okay.

CHAIRMAN MOYER: Speaking only for myself, this isn't the first rule I've ever broken. It won't be the last.

If you want to make a motion then?

MEMBER KARREMAN: Okay. Well, the motion is to change the current listing at 205.603(a)(6) to be, "chlorhexidine allowed as a germicide for medical and surgical procedures, allowed for use as a teat dip when alternative germicidal agents and/or physical barriers have lost their effectiveness."

CHAIRMAN MOYER: Is there a second on that motion?

MEMBER ENGELBERT: I'll second.

CHAIRMAN MOYER: We have a motion on the floor and a second. Discussion?

Chair recognizes Hue.

MEMBER KARREMAN: I'll just say
that we worked on this as a committee in a conference call in good faith from word from the Program that we could. We asked specifically if a committee could bring up something to the board level, and the answer was yes. Okay? Now, that was not in writing. But I'm just saying we worked on this in good faith, you guys, just so you know that, just like we do everything.

CHAIRMAN MOYER: Chair recognizes Dan.

VICE-CHAIR GIACOMINI: I think it's reasonable to say on these next two items that if we remember our process, we require a two-thirds vote to pass and an abstention is not counted as a vote. It's two-thirds vote of the votes cast in the presence of a quorum meeting. So I think it's reasonable to say that if you disagree with this process, that to vote no; and we will all assume that the vote no is not necessarily a direct opposition to the action to being taken in the motion.
If you only abstain, then you just leave it up to the rest of the group, which is not exercising your right to state whether you agree with anything to do with the process.

The current statement from the Program though is that go ahead. If we say that you violated the process, and then what we thought didn't really matter, we'll come back to you if there's a problem. But I think if you just want to deal with it on the process issue, you're better off voting no than abstaining.

CHAIRMAN MOYER: Thank you, Dan, for that clarification on parliamentary procedure.

So if you want to avoid going to organic jail, I guess, you can vote differently.

Joe?

MEMBER SMILLIE: I don't know if that's parliamentary procedure or Dan's opinion, but we'll leave it as it may be.

What was the committee vote on
this?

    MEMBER KARREMAN: This was seven in favor, zero opposed, zero absent, zero abstained.

    CHAIRMAN MOYER: Again, as Hue mentioned, after very lengthy discussion, yes. Steve?

    MEMBER DeMURI: Was this subject brought up within the committee, or were you approached from some industry members that asked for you to look at it?

    CHAIRMAN MOYER: Chair recognizes Hue.

    MEMBER KARREMAN: Approached by industry members out in the field. This is a grass roots --

    CHAIRMAN MOYER: Farmers.

    MEMBER KARREMAN: Farmers and, you know, people within the organic livestock health care industry.

    CHAIRMAN MOYER: Other discussion?

    (No audible response.)
CHAIRMAN MOYER: Hearing none, seeing none, we will proceed with a vote. Before we do that, is there any conflict of interest with this material?

(No audible response.)

CHAIRMAN MOYER: Hearing none and seeing none, we will call for the vote starting with Tracy.

MEMBER MIEDEMA: Yes.

CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN MOYER: Hue?

MEMBER KARREMAN: Yes.

CHAIRMAN MOYER: Kevin?

MEMBER ENGELBERT: Yes.

CHAIRMAN MOYER: Tina?

MEMBER ELLOR: Yes.

CHAIRMAN MOYER: Rigo?

MEMBER DELGADO: Yes.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: Yes.

CHAIRMAN MOYER: Dan?
VICE-CHAIR GIACOMINI: Yes.

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: Yes.

CHAIRMAN MOYER: Steve?

MEMBER DeMURI: Yes.

CHAIRMAN MOYER: Barry?

MEMBER FLAMM: Yes.

CHAIRMAN MOYER: And the Chair votes yes.

MEMBER JAMES: And I vote yes.

CHAIRMAN MOYER: I apologize, Bea. I believe we have zero nos, 13 yeses, two absent. Motion passes.

Your next material, Mr. Chairman?

MEMBER KARREMAN: Okay. The next material is xylazine and the committee recommends that there is a -- and I'm going to say clarification, you guys, and I'll explain it in a minute, but a clarification to withdraw the term "the existence of an emergency" in the current listing as it is. So that the recommendation for 205.603(a)(23)
would read, "xylazine, CAS No. 7361-61-7,
federal law restricts this drug use by or on
the lawful written or oral order of a licensed
veterinarian in full compliance with the
AMDUCA and 21 C.F.R. Part 530 of the Food and
Drug Administration Regulations. Also for use
under 7 C.F.R. Part 205, the NOP requires use
by or on lawful written order of a licensed
veterinarian and a meet withdraw period of at
least days after administering to livestock
intended for slaughter and a milk discard
period of at least four days after
administering to dairy animals."

CHAIRMAN MOYER: Thank you, Mr.
Chairman. You want to put that in the form of
a motion?

MEMBER KARREMAN: I move that we
accept that.

CHAIRMAN MOYER: Thank you. Is
there a second?

VICE-CHAIR GIACOMINI: Second.

CHAIRMAN MOYER: We have a motion
on the floor and a second. Is there discussion on this material? Joe?

Hue, there's a question from Joe.

MEMBER SMILLIE: Hue, is this the same situation as the previous material we discussed, it came from the "field?"

MEMBER KARREMAN: Yes.

MEMBER SMILLIE: Okay.

MEMBER KARREMAN: Yes, without a doubt. And -- go ahead, Joe. Sorry.

CHAIRMAN MOYER: Follow up, Joe?

MEMBER SMILLIE: I appreciate the intent of the Livestock Committee in doing this. I think in the future my recommendation would be to urge the field to follow the petition process. I think that even though the intent is good and your ability to drive it makes it more effective; and I don't know if that's driven by your concern for the time it takes for the petition process, in which case we need to make our efforts of making the petition process work quicker, but I think it
would behoove the Board to urge those people
to make the petition so that we can follow the
process more. I realize the intentions are
good, but it starts to sound like, you know,
this committee can make it happen faster if we
put it right into committee and don't go
through the petition process. The petition
process I think is there for a reason. But I
would like to hear your response to it.

CHAIRMAN MOYER: Yes, I think
there's some history with this material, if
you want to address that, Hue.

MEMBER KARREMAN: Yes, I was the
petitioner originally with Organic Valley and
Horizon Organic back in 2002. And I have
those transcripts on line here, which I want
to read from, because you're talking about
procedure and I would say that procedure was
not followed at that point by the Board.
Okay? Just hold on. Let me just read a
paragraph here on the background. Okay?

"Initially, xylazine was
petitioned such that it could only be used 'once in a lifetime' of an animal. Early on during the voting motion to allow xylazine, a friendly amendment to remove the annotation of 'once in a lifetime' was made by a board member and the motion passed. Then through a long discussion that was punctuated by a lot of wonderings about how xylazine is used by veterinarians, how the Board should not interfere with the professional judgment of veterinarians, and not wanting to allow any synthetic to be used routinely, someone then suggested through all the discourse that 'the existence of an emergency' seemed to be what the Board was trying to get at and the annotation was then inserted. Whether an official amendment to add such wording is unclear." Okay?

So there was no motion actually for that. It was inserted. "It is also not clear if the petitioner," me, "was asked by the Board if
the insertion was workable."

So we just had back in the last section before Livestock, two people come up here being asked about a motion, you know, which way should it go and what not. The petitioners were never asked about various amendments that they were putting in with xylazine back then.

Now I got to tell you, the next material back -- it was Wednesday, September 18, 2002, and it's on pages 566 roughly through like 569. The next material that came up was butorphanol. Okay? And they did actually call me, and maybe Leslie remembers that, if you're in the room, Leslie, and other people here might remember, but I was talking into the phone and she was putting it up to the microphone apparently so people could hear and it could get recorded, something like that.

They did call me as the petitioner or for advice on butorphanol. They did not on
1 xylazine.

So I would just say that what we're doing here is a clarification of something which was not done properly seven years ago. So you know, it's not railroad something through. Truly, I mean, xylazine passed; it's on the list. Okay?

Also, you know, as it's written in the first part of the main paragraph before the annotation, it says, "to use by or on the lawful written or oral order of a licensed veterinarian." And then in the annotation it says, "use by or on the lawful written order of a licensed veterinarian." That was actually taken out by motion.

Anyway, like I said in the background here, it was a very interesting transcript to read, and I won't bore you with it unless you say we'd want to hear it. It's very interesting.

CHAIRMAN MOYER: Yes, my point was that it was a petitioned material; it did go
through that process. It just got goofed up and we're trying to clean it up a little bit, if we can. And the question was whether we can use this process to clean it up. That's the question where we're all going to organic jail.

MEMBER KARREMAN: Right.

CHAIRMAN MOYER: Chair recognizes Hue.

MEMBER KARREMAN: So just for the record, for the Program, I want you to know, this is a clarification by the petitioner of the original petition, me, to clarify this. Okay? That's just for the record. It's a clarification.

CHAIRMAN MOYER: Thank you, Hue. Any other discussion on this particular material?

MEMBER DeMURI: Just a question.

CHAIRMAN MOYER: Steve?

MEMBER DeMURI: Any negative public comment on this?
CHAIRMAN MOYER: Hue?

MEMBER KARREMAN: No, only praise.

CHAIRMAN MOYER: Thank you, Hue.

Any other comment from the board members on this particular material?

(No audible response.)

CHAIRMAN MOYER: Hearing none, seeing none, I will call for the vote.

Is there any conflict of interest on this particular material?

MR. KARREMAN: Just to reiterate, I mean, this is coming up from the field. I'm not a manufacturer, but I'm obviously passionate about it. But, it's got to get corrected.

CHAIRMAN MOYER: I don't think the Board has a problem with that. Thank you, Hue.

Okay. We'll start the vote with Joe.

MEMBER SMILLIE: Yes.

CHAIRMAN MOYER: Hue?
1. MEMBER KARREMAN: Yes.
2. CHAIRMAN MOYER: Kevin?
3. MEMBER ENGELBERT: Yes.
4. CHAIRMAN MOYER: Tina?
5. MEMBER ELLOR: Yes.
6. CHAIRMAN MOYER: Rigo?
7. MEMBER DELGADO: Yes.
8. CHAIRMAN MOYER: Katrina?
9. MEMBER HEINZE: Yes.
10. CHAIRMAN MOYER: Dan?
11. VICE-CHAIR GIACOMINI: Yes.
12. CHAIRMAN MOYER: Julie?
13. SECRETARY WEISMAN: Yes.
14. CHAIRMAN MOYER: Steve?
15. MEMBER DeMURI: Yes.
16. CHAIRMAN MOYER: Barry?
17. MEMBER FLAMM: Yes.
18. MEMBER JAMES: Yes.
19. CHAIRMAN MOYER: Tracy?
20. MEMBER MIEDEMA: Yes.
21. CHAIRMAN MOYER: And the Chair votes yes. I have zero nos, 13 yeses, 2
absent. And the motion passes. And that was
the easy stuff.

Mr. Chairman, your next item on
the docket?

MEMBER KARREMAN: Okay. Livestock
Committee had a meeting last night, the
committee meeting which I already mentioned,
and actually it was mainly due to the animal
welfare to prepare it for today's voting. I
have sent everybody an email with the
attachment all cleaned up, all in black
letters now, not blue and red and strikeouts;
got everything out.

What we did at the committee
meeting was to, yes, make a few changes; a
few, not a lot. And while I'm looking them --
just briefly in a moment here, while I'm
getting to them, you know -- let's be honest
here, you know, we are definitely a board that
hears public opinion, and this is the most
easy way that people can state their public
opinion is to us, but, you know, the public
still gets dibs on things that go through the federal process after we recommend something. So this is a foundational-type stepping stone or building block, I guess, for animal welfare improvement. And the public should understand fully that they will have more public input if this passes.

So the first thing the committee did was under 238(a), basically we wanted to look towards the organic system plan. So (a) now reads that, "The producer must include in their organic system plan a list of practices or procedures designed to improve health care of the livestock operation, including," and the list. So that is the overall arching first statement of the health care standard at 238, that the organic system plan essentially has to point out, describe, elucidate how you're going to have your livestock health care, and, you know, it's continual improvement.

If you could go down to (c)(1)
under 238(c)(1), please?

Okay. The last sentence of 238(c)(1) is now saying, "Milk from animals undergoing treatment with prohibited substances or substances with a withholding time cannot be sold as organic or fed to organic livestock." That was inserted last night. The "or substances with a withholding time." Okay?

The next one -- change we made was at 238(c)(9). Okay. Basically, we had to restate something so we didn't have a double negative. So "The producer must not" is the heading for (c) up there, (9) "neglect to identify and record treatment of sick and injured animals in animal health records." That cannot be neglected to be done.

And the only other two things we did, which probably we'll breathe a sigh of relief for most of the commenters, and it is to give more time, is to take out all the numbers in 239(c)(5)(i). So in 239(c)(5)(i),
we have taken out the numbers, but we have
left in the categories, and you'll hear later
on today that will be on the workplan of the
committee for next year to work up those
numbers with the rest of the industry for
mammals and avian species.

And then if you go down to 239(h),
there's the other table. That was dropped in
from the ACA's document, which we really
liked. And we took out the numbers there for
further -- and that's specifically for avian.
That will have to be reconciled with the other
table, truncate the other table. So it's just
mammal, let's say, and then avian for this
one. But those numbers can be worked up with
industry into the future. That's the changes.

So pretty much three minor changes
and then the two tables wiping away those
numbers for further work.

So I move that we accept this
document as shown on the screen and as you all
have at your computers.
MEMBER JAMES: Second.

CHAIRMAN MOYER: Thank you, Hue.

I have a second from Bea.

We have a motion on the floor and a second. I'll entertain discussion on this item. I'll start myself by saying I think the Livestock Committee did demonstrate that they can respond to public comment and still come up with a very powerful and meaningful document, leaving room for more public comment and an opportunity for interaction to work on the points that were of most difficult discrepancy for all of us. So thank you to all the fellow members of the Livestock Committee.

Points of discussion? I see Steve and then Barry.

MEMBER DeMURI: I'll echo what Jeff just said. I commend you for responding as quickly as you did.

One question I have is, you guys studied the public comment probably closer
than I did. Was there any other public comment opposed to this other than the restrictions on the numbers you pulled out?

CHAIRMAN MOYER: Hue?

MEMBER KARREMAN: The only public comment was generally pull it back for a draft discussion document again, please. That was really the --

CHAIRMAN MOYER: And most of that was in regard to stocking recent numbers.

MEMBER KARREMAN: Yes, thank you, Jeff.

CHAIRMAN MOYER: Chair recognizes Barry.

MEMBER FLAMM: If I recall correctly, there was quite a bit of interest and support in the minority opinion, especially Kevin's dealing with milking times a day, which I lean toward supporting also.

And I'd like to hear from either you or Kevin where you stand on that. I'd just like to add one. In my conversations with people in
Montana, you know, they pointed out very much in support of what Kevin recommended with a caveat that perhaps that where robot systems are available -- and I know they're expensive -- but those that sort of mimic a natural feeding, that that would be allowed and rather than the restriction. But could either one of you comment on that, please?

MEMBER KARREMAN: I'll cede the floor to Kevin here in a moment, but I want to let you know that also in the minority opinion there was a part where; and it is in the final document, we brought up that there is a need for really good records about why animals are sick, how many animals are leaving, that kind of culling stuff and the reasons. So that did come up from the minority opinion, but I'll leave the rest to Kevin.

MEMBER ENGELBERT: Well, to briefly reiterate what I spoke of yesterday, it's my belief from experience and talking with our farmers, nutritionists, veterinarians
that forcing a dairy animal to be milked three
times a day is too high a price for an organic
animal to pay.

If you'd like me to go into all
the reasons why, I can do that, but I don't
consider that too prescriptive. The whole
organic rule is about giving farmers goals and
letting them reach them.

And while I understand that the
treatment of animals is of utmost importance
to maintaining their health, I also truly
believe that the methods and procedures, the
routines, the facilities and the environment
that we provide for the animals is even more
important. And it's a proven fact that cows
that are forced to be milked three times a
day, are fed large amounts of grain, they are
under far more stress, require far more
veterinary attention and they have far shorter
life spans.

Yes, they're extremely healthy to
be able to be milked three times a day and
consume all the grain that's required to do that, but if you don't milk them three times a day, you can still get high milk flows, good production with either low or minimal or no grain feeding based on your genetics.

But to take that extra step and push them for their three times a day is very disruptive to their natural cycles of life. And, you know, I mean, even though they're just cows, and some days I don't like cows, they still deserve the right to lay down at night and rest for as long as they naturally desire to. That to me is part of exhibiting their natural behavior. Not simply being able to go out in the pasture and consume food and interact with other animals and have the majority of their diet be forage, they also, in my opinion, deserve the right to not be forced to be into a milking stall every eight hours and pumped for all their worth for a short amount of time and then be replaced.

CHAIRMAN MOYER: Follow-up from
Barry and then Dan.

MEMBER FLAMM: Mr. Chairman, I'd like to propose an amendment, if you can tell me when an appropriate time is to do that.

CHAIRMAN MOYER: Now's as good a time as any. If you want to make a friendly amendment, you're welcome to do that.

MEMBER FLAMM: I'd like to propose an amendment to the animal welfare document -- and I won't get the words quite right and I'd appreciate Kevin's help -- but essentially to limit milking to two times a day, perhaps except where robotic systems that mimic natural feeding behavior is available. And if that isn't quite the right way to say it, maybe Kevin can help out.

CHAIRMAN MOYER: Well, there's a friendly amendment made to you, Hue. Do you accept that amendment?

MEMBER KARREMAN: There will be discussion?

CHAIRMAN MOYER: Not if you and
Bea accept it. If you don't accept it, we'll discuss it more.

MEMBER KARREMAN: I would like to have discussion on it. What do I say then?

CHAIRMAN MOYER: Say no.

MEMBER KARREMAN: No.

CHAIRMAN MOYER: Okay. That friendly amendment was rejected. Well, we have to ask Bea?

Is there a second to Barry's amendment?

(No audible response.)

CHAIRMAN MOYER: It's already been rejected.

MEMBER FLAMM: I'm making an unfriendly amendment.

VICE-CHAIR GIACOMINI: Right. In the case of a friendly amendment, it's the approval of the person making the amendment. And the second, if that's accepted, it can then come forth as an unfriendly amendment.

CHAIRMAN MOYER: Right. Okay.
Thank you.

VICE-CHAIR GIACOMINI: Which it is then a motion to amend the main motion, which requires a second and then discussion on amending the main motion.

CHAIRMAN MOYER: That's correct.

So is there a second on Barry's amendment?

MEMBER JAMES: Barry, can you repeat exactly what your -- it was a little unclear.

MEMBER FLAMM: Sorry.

MEMBER ENGELBERT: Do you want me to try?

MEMBER FLAMM: Yes, Kevin.

CHAIRMAN MOYER: Chair recognizes Kevin for point of clarification.

MEMBER ENGELBERT: The unfriendly amendment, Bea, would read under 205.238, livestock health care practice standard (c), the producer of an organic livestock operation must not, (11) milk dairy animals more than twice (two times) in any given 24-hour period.
with the exception of a voluntary milking
routine that is provided by robotic milkers.

CHAIRMAN MOYER: Is there a second
to Barry's motion?

(No audible response.)

CHAIRMAN MOYER: Hearing none,
that motion dies.

Continue with discussion on the
original motion.

I'm sorry, did I miss something?

I didn't know if I missed a hand.

Okay. Continue discussion on the
original motion, on the original document.

MEMBER KARREMAN: I'm not sure
there's any more --

PARTICIPANT: Did Bea want to --
do you want to second that motion?

MEMBER JAMES: No.

MEMBER KARREMAN: I don't have any
more to say about that document.

CHAIRMAN MOYER: No, is there
other discussion from board members on this
particular motion?

(No audible response.)

CHAIRMAN MOYER: Hearing none, I -- I'm sorry, I keep hearing whispering, so I'm not sure if I'm -- I'm trying to look both ways.

MEMBER SMILLIE: Can you clarify whether they were in discussion on the friendly amendment or --

CHAIRMAN MOYER: Your microphone.

Chair recognizes Joe.

MEMBER SMILLIE: Can you clarify whether you're asking for is there any further discussion on the failed amendment.

CHAIRMAN MOYER: I will. Thank you. No, I'm asking for discussion on the document itself, on the original proposal. The failed amendment is failed. We're going back to the original as proposed by Hue and seconded by Bea, and is there discussion on that particular document? Joe?

MEMBER SMILLIE: You're putting
forward a recommendation that calls for
stocking rates, and stocking rates aren't
included in it. I would think it might be
cleaner -- you know, I know you want to come
back with that, but if you're going to send a
recommendation in, it can't call for something
and then leave it blank. Wouldn't it be
better to just withdraw that section and add
it later?

CHAIRMAN MOYER: Chair recognizes
Hue and then Katrina.

MEMBER KARREMAN: So you mean the
blank tables? Joe, the blank tables?

MEMBER SMILLIE: Yes.

MEMBER KARREMAN: Just take the
tables out? I mean, we could do that. The
reason we did not is that so it is in there.
The data is to be done. And I think you
realize that, you know, that we want to get it
done, but we don't want it to just evaporate
away and not be addressed. And if we take the
table out with the categories, that could
happen.

CHAIRMAN MOYER: Chair recognizes Katrina.

MEMBER HEINZE: Hue, correct me if I'm wrong, but I believe there's precedent for that approach from how you did aquaculture.

CHAIRMAN MOYER: Yes.

MEMBER HEINZE: Is that correct?

CHAIRMAN MOYER: Yes.

MEMBER KARREMAN: You mean like a one, two and three punch?

MEMBER HEINZE: Right.

MEMBER KARREMAN: Yes.

MEMBER HEINZE: Isn't that what we did with aquaculture, that you had -- no?

VICE-CHAIR GIACOMINI: No, the way we did aquaculture is that the sections that were left out were just stated as you can't do this right now. The changes that we made then with net pens and the nutrition, and now the bivalves is essentially amending that original motion. It's not done as an amendment from
this point of view. It's done through the
change, but it was in within that structure.
But it wasn't listed there as -- you know, if
we would have not come back with bivalves, it
would have been you never would have known the
difference. It would have just said "no
bivalves."

CHAIRMAN MOYER: But the bivalves
and net pens and all those things were kept in
as placeholders to finish up with at intent.
It was listed on the workplan.

Hue?

MEMBER KARREMAN: That's exactly
right. They were placeholders, at that's what
these tables are, are placeholders.

CHAIRMAN MOYER: Right. Knowing
that the document is not complete, Joe, until
those placeholders are filled. But we want to
get something --

PARTICIPANT: No, the document
could be complete without --

CHAIRMAN MOYER: Okay.
MEMBER SMILLIE: Well, it's a minor technical point.

CHAIRMAN MOYER: I understand.

MEMBER SMILLIE: But it's more than a placeholder. It's describing a format that must be followed by further work. It's not a placeholder for a possibility of a different format.

CHAIRMAN MOYER: No, I understand.

Hue?

MEMBER KARREMAN: I didn't hear much public comment saying yes or no to that kind of table. It was in the numbers. Two square feet, 1.8, 1.5. So I don't think it's an absolute question of like that should not be in there. It's more like, well, let's work these fine tuned numbers.

CHAIRMAN MOYER: I apologize.

Chair recognizes Joe.

MEMBER SMILLIE: What I heard loud and clear in the comments was, number one, that in general people liked the document.
They didn't like the stocking rates. But what I heard overwhelming was they were uncomfortable with the amount of time they had to comply with it. I think swine mentioned. I think we had other people mentioning different animal groups that had no comment at all. And to me, we haven't heard from a large part of the constituency on this. And my feeling would be not to necessarily format it, because, you know, maybe this format works for swine or goats. Well, nothing works for goats, in my experience. But, you know, it seems just to me you're pre-deciding, you know, the format, and we haven't heard from large constituency groups on this yet.

CHAIRMAN MOYER: Chair recognizes Kevin, then Hue.

MEMBER ENGELBERT: I agree, Joe, we are prescribing format, because these are the areas that we think need to be addressed with the square footage requirements. As far as the swine growers or any other operations
that we didn't hear from, we took that as a sign that we got it right. The poultry people were out here in force. This document has been worked on for over a year and we don't think it's our responsibility to wait for other type of operations to decide to come to the table and voice their opinion. We believe that if they had strong concerns, we would have heard from them. And as has been stated, they will have plenty of time to voice their concerns as this goes through the rulemaking process with the NOP.

CHAIRMAN MOYER: Chair recognizes Hue.

MEMBER KARREMAN: I agree just with Kevin. And, you know, the ACAs said they represent about 2 million birds as far as the avian. And then I asked how many birds certified organic poultry are there in the U.S., and they said about 6 million. So that's a fair amount, Joe, as far as being represented for avian. And, yes, go ahead.
CHAIRMAN MOYER: Chair recognizes Dan.

VICE-CHAIR GIACOMINI: Yes, I agree with what Kevin and Hue are saying regarding this, but I also see an issue with Joe's point, but I'm going to come at it from a little bit different side. I think the intent of the Livestock Committee is to go back and look at stock density. I think it was fairly overwhelming the comments that we did receive regarding the statement we had for stocking the rate within the pasture. I think we agreed to go along with that, not deal with that until the pasture document came out. In light of that spirit, I would like to submit a friendly amendment to the maker of the motion to delete the definition for "stocking rate" from the proposal.

CHAIRMAN MOYER: We have a friendly amendment on the table. Hue, as the person who brought forward that motion, do you accept that friendly amendment, or do you need
it restated?

MEMBER KARREMAN: Can I ask something before I say if I accept it or not?

CHAIRMAN MOYER: Yes.

MEMBER KARREMAN: I mean, what would that do, Dan?

VICE-CHAIR GIACOMINI: We're giving the impression to the public in the way we have structured this document that we plan on coming back and dealing with stocking density. By eliminating this, we are not also potentially giving the impression that we plan on coming back and dealing with stocking rate. The question of whether we come back and dealing with stocking rate would not come before the Livestock Committee without seeing what the pasture rule says. So it's based more on the pasture rule than it is what we're looking at here.

CHAIRMAN MOYER: There's a point of discussion from Kevin on that friendly amendment.
MEMBER ENGELBERT: I want to be clear, Dan. You want to eliminate under terms defined 205.2, stocking rate, a measurement of the long-term carrying capacity of a pasture?

VICE-CHAIR GIACOMINI: Yes.

MEMBER KARREMAN: And that would be essentially to cede the ground to the NOP for the pasture rule until that time?

VICE-CHAIR GIACOMINI: Yes, and it was only mentioned in the statement that we made regarding that within pasture, which we pulled out.

MEMBER KARREMAN: Okay. I accept that.

CHAIRMAN MOYER: Bea, do you accept that? You are the second on that.

MEMBER JAMES: Yes.

CHAIRMAN MOYER: Okay. We have a friendly amendment that was made. It was accepted by both who made the motion and the second. And so that is now considered part of the document.
1   Yes, Rigo?
2   MEMBER DELGADO: Just a
3   clarification. We do use the term "stocking
4   rates" throughout the document with the
5   amendment. But I'm looking at (c)(5), right
6   before the table, livestock section.
7   PARTICIPANT: Living condition?
8   I'm sorry, I don't have that version.
9   MEMBER DELGADO: Right before the
10   table. Here it is, stocking rates.
11   CHAIRMAN MOYER: While they're
12   looking at that, Chair recognizes Joe.
13   MEMBER SMILLIE: Yes, a friendly,
14   friendly, friendly reminder that the ACAs are
15   required by the National Organic Program to
16   tabulate results of their stocking densities
17   for their current clients, livestock clients.
18   So that should be an extremely wealthy source
19   of information to finalize some of these
20   issues.
21   CHAIRMAN MOYER: Yes, we agree.
22   And I think by moving this forward and not
delaying it, people will have actually six months to respond to that, rather than 30 days when we bring out the next regulation. And so, what we're trying to do by moving this forward and off of our plate onto the Program's is to send the message out there that here's the chart, here's what we're going to fill in. You've got literally -- well, apparently probably about six months to work with us to get that in, rather than wait until we post yet another document 30 days, because everybody will still just have 30 days again, just like they did this time to react. And we'll just keep going around and around. So that was the reason and the purpose for doing that. And by leaving the chart in there, it gave people the idea what we're trying to fill in, we need help with those numbers. That was the reasoning. We could argue whether it was a good reason or not, but that was the reason.

Chair recognizes Hue.

MEMBER KARREMAN: Okay. From what
I understood from Rigo and Dan, and Kevin and
I looked at this also right now, under
239(c)(5) we have to simply change a word in
there from "stocking rates" -- got to strike
that and put in "stocking density." That's
just a typo, I guess.

CHAIRMAN MOYER: Yes, I don't
think we need an amendment to change that.

MEMBER KARREMAN: Now that we're
getting rid of "stocking rate" at this point.
Okay? That's for the indoor time when they're
not grazing at all.

CHAIRMAN MOYER: So that's a
friendly amendment by you?
Bea, do you agree?
(No audible response.)
CHAIRMAN MOYER: Bea's nod is
taken as a sign of agreement.
Okay. We have a document in front
of us. Any further discussion on that
document before we --

MS. FRANCES: I do have a
question.

CHAIRMAN MOYER: A question from the Program. Valerie?

MS. FRANCES: 238(c)(1), that last sentence.

CHAIRMAN MOYER: Yes?

MS. FRANCES: Where it was added "substances with a withholding time can not be sold." Forever?

CHAIRMAN MOYER: If you could read that comment back for --

MS. FRANCES: It sounds like forever to me. So I just wanted to --

MEMBER KARREMAN: No, no, no. So that sentence as you have it, "Milk from animals undergoing treatment with prohibited substances or substances with a withholding time cannot be sold as organic or fed to organic livestock" would mean that if someone were to need to use butorphanol or xylazine or flunixin to relieve pain and suffering in their animals, that they need to withhold milk
for, you know, six or seven or eight days.

Whatever is stated in 603 for those listings.

That milk cannot be fed to the calves during that time. Since you can't sell it for organic, you can't feed it to the calves either. Okay? It's got to be dumped for those six days, or whatever it is. That's what it means.

Now, if they've been treated with penicillin, that's a prohibited substance out and out. The cow's going to be gone or the pig or whatever, and you know, again, you can't feed it to the calves.

CHAIRMAN MOYER: Thank you, Valerie.

Chair recognizes Dan.

VICE-CHAIR GIACOMINI: I respect where Valerie is coming from on this, because she's a, you know, non-livestock person coming from the voice of the public from the perspective of public reading it. Do you need until the withholding time has expired to
1 understand that?

2 CHAIRMAN MOYER: If additional

3 language makes it clearer, now is the time

4 to --

5 VICE-CHAIR GIACOMINI: Is that you

6 need?

7 MS. FRANCES: It did seem vague to

8 me. So it seemed like you were implying that

9 forever.

10 VICE-CHAIR GIACOMINI: Okay. So

11 "until the withholding time has expired?"

12 CHAIRMAN MOYER: Could you add

13 that language, please?

14 VICE-CHAIR GIACOMINI: Can we add

15 that? Hue? Bea, is that -- everybody agrees?

16 Okay.

17 CHAIRMAN MOYER: Hue's okay with

18 that and Bea as the second. Thank you.

19 That additional language has been

20 changed in the document and now I will call

21 for the vote.

22 Are there any conflicts of
interest on this?

(No audible response.)

CHAIRMAN MOYER: Hearing none, seeing none --

VICE-CHAIR GIACOMINI: Wait.

CHAIRMAN MOYER: Comment by Dan.

VICE-CHAIR GIACOMINI: Hue, since we're going to be working with this, can you review -- Valerie, can you bring that back up? And, Hue, could you just make a quick look that she put that in the right place?

CHAIRMAN MOYER: I can't read it from here. The comment is it should be at the end.

Chair recognizes Katrina.

VICE-CHAIR GIACOMINI: Animals that are being treated.

MEMBER KARREMAN: Yes. Okay.

CHAIRMAN MOYER: Katrina? No?

MEMBER KARREMAN: Ready? Okay.

Here we go.
CHAIRMAN MOYER: Okay.

MEMBER KARREMAN: So it's going to be two sentences. So it's cut.

So you got, "Milk from animals undergoing treatment with prohibited substances cannot be sold as organic or fed to livestock," period.

PARTICIPANT: "Milk from animals"

MEMBER KARREMAN: Right. And then, "Milk from animals treated with substances" - Yes. Sorry. Actually, that first sentence is good, Valerie. Whatever you're highlighting, it should stay.

PARTICIPANT: She's copying it.

MEMBER KARREMAN: Oh.

PARTICIPANT: You didn't know you could do that.

MEMBER KARREMAN: I didn't know.

PARTICIPANT: Five years and you haven't --

MEMBER KARREMAN: What is that?
Copy and paste? What's that?

CHAIRMAN MOYER: He has gotten track changes though, so --

MEMBER KARREMAN: All right.

CHAIRMAN MOYER: Okay. We have our language.

MEMBER KARREMAN: Okay. So --

CHAIRMAN MOYER: I apologize. I can't read it.

MEMBER KARREMAN: So ready for the second sentence, Valerie?

"Milk from animals undergoing treatment with substances having a withholding time cannot be sold as organic or fed to organic livestock until the withholding time has expired."

CHAIRMAN MOYER: Is the chairman of the Livestock Committee satisfied with that language?

MEMBER KARREMAN: Yes.

CHAIRMAN MOYER: Okay. Tina has an issue with it?
MEMBER ELLOR: No. Well, I just had a comment from the gallery, through my email. No?

CHAIRMAN MOYER: No.

MEMBER ELLOR: Can't go there?

CHAIRMAN MOYER: No, we're not going there. I don't want to get in the habit of just taking emails across the board from people in the gallery.

I have a question from Bea.

MEMBER JAMES: Can you just reread that, those two sentences as completed, please?

MEMBER KARREMAN: And then I think we're done this. Okay.

"Milk from animals undergoing treatment with prohibited substances cannot be sold as organic or fed to organic livestock."

"Milk from animals undergoing treatment with substances having a withholding time cannot be sold as organic or fed to organic livestock until the withholding time
has expired." Okay?

It's basically saying if you treat something with a prohibited like penicillin, it's gone. Can't feed it to the calves. And if you treat it with something that is on the list but has a withholding time attached to it, you can't feed it to the calves.

CHAIRMAN MOYER: Correct.

MEMBER KARREMAN: Or the young stock, sorry.

MEMBER ENGELBERT: What if we say "during the withholding period?"

MEMBER KARREMAN: Okay. Kevin's a stickler. He's good for that. Last sentence there, "Milk from animals undergoing treatment with substances having withholding time cannot be sold as organic or fed to organic livestock during the withholding time." "During the withholding time," That's it. Yes, and then get rid of the "has expired." Yes.

Clear as mud? It's actually a lot clearer. It's clear.
CHAIRMAN MOYER: Yes. Okay. I think we have our motion on the floor. We had a second. We had discussion. I'm now calling for the vote. And appropriately so, we will start the vote with Hue.

MEMBER KARREMAN: Thank you very much. Yes.

CHAIRMAN MOYER: Kevin?

MEMBER ENGELBERT: Yes.

CHAIRMAN MOYER: Tina?

MEMBER ELLOR: Yes.

CHAIRMAN MOYER: Rigo?

MEMBER DELGADO: Yes.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: Yes.

CHAIRMAN MOYER: Dan?

VICE-CHAIR GIACOMINI: Yes.

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: Yes.

CHAIRMAN MOYER: Steve?

MEMBER DeMURI: Yes.

CHAIRMAN MOYER: Barry?
MEMBER FLAMM: Yes.

CHAIRMAN MOYER: Bea?

MEMBER JAMES: Yes.

CHAIRMAN MOYER: Tracy?

MEMBER MIEDEMA: Yes.

CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN MOYER: And the Chair votes yes.

Thank you, Livestock Committee.

Tremendous amount of work. Well done.

Your next item? Bivalves. I understand it's lunch time, but if we'd like to get through Livestock if we could.

MEMBER KARREMAN: Is it already?

Wow.

PARTICIPANT: Bivalves for lunch?

MEMBER KARREMAN: Bivalves for lunch.

CHAIRMAN MOYER: If you're buying.

MEMBER KARREMAN: The committee recommends that the bivalve proposal; and I'm
not going read all of it, we recommend the
bivalve proposal as posted and the vote was
four to three. There, that's it.

CHAIRMAN MOYER: Is there a second
to that one?

MS. ELLOR: (No audible response.)

CHAIRMAN MOYER: Second by Tina.
The document was presented in its
entirety, the same way it was presented to the
Board yesterday. No changes or corrections.

Is there discussion? Chair
recognizes Joe.

MEMBER SMILLIE: I think it's an
excellent document. I think that it deserves
our support and I especially was interested --
I didn't feel good about the minority report
moving it inland. It seemed the exact
opposite direction that we really wanted to
go. We want to create a vibrant organic
aquaculture. I didn't think the minority
report would do that. And I think it's
impractical and untenable. I think the
Aquaculture Working Group has done a great document. And seeing now things starting to change in the aquaculture world as the Monterey Bay starts to swing behind organic aquaculture and will start to overcome all that, you know, incredibly negative reaction we got in our original organic aquaculture proposal. I think that the bivalve document is leading the way to a more reasoned response from some of these groups as we try to differentiate the difference between organic aquaculture and conventional aquaculture.

And I just wish that the document now will go into the hands of the NOP and will, in our February meetings, try and get prioritized so that we can really start this new industry. Because I think the concerns of consumers right now are really paramount. We really need to develop a sustainable healthy organic aquaculture. The oceans are getting depleted. We need to get a positive start on this. And I want to be able to have sushi for
lunch and I want my grandchildren to be able
to have sushi for lunch.

So I think this is a wonderful
document and I think it deserves our support.

CHAIRMAN MOYER: I agree with what

you said, Joe, all except I don't want sushi

for lunch.

Chair recognizes Dan.

VICE-CHAIR GIACOMINI: Yes, I did

not put together the minority opinion on this.

I was one that voted against this

recommendation in committee. I think in my

review, from what I understood of the industry

and what we were putting together, I'll be

very honest, I probably coming into this -- or

at least going out of the committee vote; I'll

put it that way, I don't think at that point

in time there was anything that we would have

come up with as a recommendation for bivalves

that I would have agreed with. I would have

voted no on every version.

But, seeing public comment,
listening to public comment here, seeing the
absolute overwhelming silence of opposition to
this recommendation, seeing the support from
the Monterey Bay Aquarium and seeing how it
fits in with their document of the Super
Green, I will support this document. I'm
supporting this document. I'm in full support
of this document, even though I was probably
the most negative person regarding the
concept, the topic in committee.

CHAIRMAN MOYER: Thank you, Dan.

I would also want to acknowledge
the fine work of the AWG on pulling this
proposal together, for being here all through
the week. I know their comments, I guess it
yesterday, day before yesterday, certainly had
a huge impact on my opinion of where we're
going with this document. And I think Joe is
correct that this is an opportunity for
organic to really lead the way in the entire
aquaculture industry, and I think it's a proud
moment for everybody there.
The Chair recognizes Hue and then Kevin.

MEMBER KARREMAN: Just really briefly, I got to say that, you know, to get it out of committee I voted for it and I could go either way as it was, but with Sebastian Bell's comments regarding what on land would be like, I am all for the majority right now.

CHAIRMAN MOYER: Thank you, Hue.

Kevin?

MEMBER ENGELBERT: Yes, I'm one of the minority opinions, and I'm not going to apologize for that. I think it's important to look at all aspects of this, and my concerns remain with net pens the same as they did with aquaculture. I'm very concerned about the blurring of the lines between wild-caught and organic. And, you know, I don't have serious problems with the document, but enough that I still don't want to support it.

CHAIRMAN MOYER: Thank you, Kevin.

I also was in the minority opinion on that as
So any other questions or comments before we call for the vote?

(No audible response.)

CHAIRMAN MOYER: Then I am prepared to call for the vote.

Any conflicts of interest in this item in front of us?

(No audible response.)

CHAIRMAN MOYER: Hearing none, seeing none, I will call for the vote starting with Kevin.

MEMBER ENGELBERT: No.

CHAIRMAN MOYER: Tina?

MEMBER ELLOR: Yes.

CHAIRMAN MOYER: Rigo?

MEMBER DELGADO: Yes.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: Yes.

CHAIRMAN MOYER: Dan?

VICE-CHAIR GIACOMINI: Yes.

CHAIRMAN MOYER: Julie?
SECRETARY WEISMAN: Yes.

CHAIRMAN MOYER: Steve?

MEMBER DeMURI: Yes.

CHAIRMAN MOYER: Barry?

MEMBER FLAMM: Yes.

CHAIRMAN MOYER: Bea?

MEMBER JAMES: No.

CHAIRMAN MOYER: Tracy?

MEMBER MIEDEMA: Yes.

CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN MOYER: And the Chair votes yes. I apologize.

MEMBER KARREMAN: I got forgotten again. I talked enough.

MEMBER KARREMAN: Yes.

CHAIRMAN MOYER: And the Chair votes yes. Thank you, everybody. I think I have two nos, eleven yeses, two absent. The document passes.
I appreciate everybody's time.

Thank you, Livestock Committee. Does that end your materials in front of this Board?

MEMBER KARREMAN: Yes, that's it for this portion of the meeting. I just want to say that I have really loved working with the Livestock Committee. We are a really great team and I'm going to miss it, but I'm glad we got done what we did. Thank you.

CHAIRMAN MOYER: Thank you. I have 12:25 or so. I think what we'll do is we'll adjourn until 1:30 and we'll be back then. Thank you, everybody.

(Whereupon, the hearing was recessed at 12:25 p.m. to reconvene at 1:30 p.m.)
A-F-T-E-R-N-O-O-N S-E-S-I-O-N

1:38 p.m.

CHAIRMAN MOYER: This meeting is back in session. I will call the meeting to order and we'll start with the first order of business, which was the deferred vote and presentation on nanotechnology pending some language change and a suggestion for a friendly amendment.

So at this point, I'll turn the meeting over to Dan as Materials chair. Dan, where are we on nanotechnology?

VICE-CHAIR GIACOMINI: We were going to take a break until after lunch for Katrina to put together a recommendation based on the intent of the minority opinion. If she would please present that.

CHAIRMAN MOYER: Chair recognizes Katrina.

MEMBER HEINZE: I appreciate everyone's patience and indulgence as I worked to come up with some language. So at this
time, I'd like to offer a friendly amendment.

CHAIRMAN MOYER: Go ahead. Please do.

MEMBER HEINZE: Okay. A friendly amendment with the changes as shown on the screen. Would it be helpful if I emailed it to people? Okay. Hang tight.

Okay. It is on its way.

So as you wait to receive that, let me just, before I go through what I'm presenting, let me give a little preview.

It is clear to me that consumers do not want nanotech in their organic products today. What we don't know is what they're going to want in the future. So you know, the really the science of nanotech, both with regards to its benefits and its risks, is really young today. So what I want to do is to provide an option that delivers on what our consumers want today, but gives them the flexibility to change their mind as they learn more.
I do believe that part of that is causing us difficulty with the definition. I think coming up with a good definition of nanotech is elusive and has more debate. So and what I'm offering, I'm offering a definition that is broader than the definitions currently in use internationally. The reason for doing that is I think our consumers have asked us to cast a wide net and to capture anything in that net that might meet their perception of what is nanotech. Now in the process, we are inadvertently going to capture things we didn't mean to capture. So really my minority opinion is about creating a pathway so that those things that are inadvertently caught have a process to continue to be allowed. And, that as the science evolves, that we have an opportunity to give our consumers the benefits should they want them. So with that, I'll move to the language of the amendment.
So first, I modified some of the language to say that "nanotechnology is prohibited" -- so, this is kind of the preamble language -- "is prohibited except where reviewed by the NOSB and approved for listing on the National List. Where use of nanotechnology is required by law, the specific material will need to be reviewed and approved by the NOSB for listing on the National List prior to use."

So I think it is important that NOSB review and approval be our gatekeeper for use of these materials.

Okay. So then, specifically under terms defined, my recommendation is to, you know, insert a definition of nanotech that includes the word "engineered" that we spoke about this morning and increases the size scale to the 300 nanometer that we spoke about this morning.

Then if you go down to 205.105, which is allowed and prohibited substances,
1 methods and ingredients in organic production
2 and handling, I'm asking for an amendment,
3 whatever I'm doing, that "for products that
4 are sold or labeled as 100 percent organic,
5 organic or made with, the product must be
6 produced and handled without the use of
7 nanotechnology or products thereof, including
8 use in primary packaging except as provided in
9 205.601, 205.603 or 205.605." So can't be
10 used unless they're on the National List.
11
12 There is additional language that
13 I think is necessary for the made-with
14 category, and I cover this in 205.301, product
15 composition. And this is modifying language
16 that was in the majority opinion. So the
17 majority opinion had proposed -- if you look
18 down, Valerie, on 301, under the paragraph
19 that starts with (c), the third line from the
20 bottom, or fourth line. The sentence that
21 starts, "No ingredients." It says, "No
22 ingredients may be produced using prohibited
23 practices specified in paragraphs (f)(1), (2),
(3)," and I'm agreeing with the majority that we add "and (8)."

So just to elucidate that for you guys, 301(f)(1) is -- or what that would say is, "All products labeled as 100 percent organic or organic, and all ingredients identified as organic in the ingredients statement of any product must not (1) be produced using excluded methods; (2) be produced using sewage sludge; (3) be processed using ionizing radiation." And then we add to that the language in (8), "be processed using nanotechnology except as provided in 205.601, 603 or 605. So an organic ingredient could not be processed using those or be produced using those things which we don't like.

So that is my friendly amendment.

CHAIRMAN MOYER: Okay. We have a friendly amendment on the floor.

Dan, you made the original motion.

Do you accept that amendment?

VICE-CHAIR GIACOMINI: Mr. Chair,
I think it may need a little tweaking. I agree with the proposed amendment, but I think it's important at this stage to get the full vote of the Board on this matter. So for that reason, I reject it as a friendly amendment.

CHAIRMAN MOYER: Okay. The amendment was rejected.

MEMBER HEINZE: So I offer it as an unfriendly amendment.

VICE-CHAIR GIACOMINI: And I second. I seconded her motion.

CHAIRMAN MOYER: Thank you. Okay. We have an unfriendly amendment on the floor that was accepted by the person that made the motion. We are now open for discussion on that unfriendly amendment.

Is there discussion? I see Barry's hand. Chair recognizes Barry.

MEMBER FLAMM: Just sort of a point here. I can't really enter in this discussion because I can't read this from here and I've never gotten an email. And there's
just too much detail. I tried to follow
Katrina, but I can't make myself an
intelligent decision on whether I'm in favor
of the amendment or not. Sorry.

CHAIRMAN MOYER: Did I hear you
say, Steve, you could show it to him?

MEMBER DeMURI: No, I said I
didn't get the email either.

CHAIRMAN MOYER: Okay. Folks are
not able to see that board and read it. I
know myself I have trouble reading it. I
don't know what the best way to reconcile that
is.

MEMBER HEINZE: My apologies. I
think I need to send it in a different Word
version. Is that my problem?

PARTICIPANT: No, I didn't get it
at all.

CHAIRMAN MOYER: They haven't
received it.

MEMBER HEINZE: Okay. So let's
see if we can fix. Hold on.
CHAIRMAN MOYER: Please bear with the Board while we try to solve this technical problem so that board members have the opportunity to read the specific language.

While that's happening, are there other points of discussion? Dan?

VICE-CHAIR GIACOMINI: Yes, I support this direction that we're taking here. Again, the timing of the issue coming up with the vaccines, I would want to do everything we can not to avoid that train wreck.

CHAIRMAN MOYER: Chair recognizes Rigo and then Katrina.

MEMBER DELGADO: I'm just questioning the purpose of having a vote on an amendment. If you agree with that and you want to hear what the Board has to say, why not proceed with a normal vote of the items that you agree with, which is the initial motion?

CHAIRMAN MOYER: Dan, if you want to clarify the procedure on our conversation
that we're having on the amendment or the full
document?

VICE-CHAIR GIACOMINI: I think

it's important to get the voice of the Board

on the version of this that they want to do.

It would be fairly cumbersome to accept the

amendment, have it rejected and have us to

come back with the other version.

MEMBER DELGADO: So essentially

you want to discuss the addition --

 MEMBER DELGADO: -- in isolation?

VICE-CHAIR GIACOMINI: Vote on

whether we want to go with this route.

MEMBER DELGADO: Yes.

VICE-CHAIR GIACOMINI: If that

fails, then we just go right back to the other

version.

MEMBER DELGADO: Okay.

CHAIRMAN MOYER: That's correct.

MEMBER DELGADO: Thank you.
CHAIRMAN MOYER: Thank you, Rigo.

Appreciate that.

Chair recognizes Katrina.

MEMBER HEINZE: I know that this is an emotional and difficult decision, and that it is important that we respect the voices of our consumers who said that they are leery of this technology and they don't want it today.

I want to be mindful of the fact that science evolves and science is not always bad. It brings us great things. I am aware of people today who are researching nanotech capability that would allow them to put in a package a sensor that would say there are pathogens in this package. Do not eat it. IT is not good for you. And certainly that technology does not exist today. But I do hope that someday it does exist and I would hate to see our organic products at a disadvantage to non-organic products because our consumers wouldn't have that assurance.
And that's just one example.

I also would not want that sensor in the product that I feed my children, if I didn't know it was safe. I just want to create a path where we can thoughtfully make those decisions.

CHAIRMAN MOYER: Thank you, Katrina.

I would like to say that I understand the ideas and the concepts that this is bringing forward. At this meeting alone and lots of other meetings that I've attended, we've often heard the conversation, and we heard it here in several different instances about the fact that we're now trying to close the barn door after the horse is long out of the barn. This is an opportunity for this Board to close the barn door while the horse is still in the barn. We can open the door later if we have to, albeit it would be very difficult. If it was warranted, I think it could be done.
I think that organic is currently and should remain a bastion that people can move towards in an effort to avoid; God forbid, I don't want sensors in my food, no matter who says it's safe, I can tell when food is bad and when it's not bad. I don't need nanotechnology to tell me that. Well, I understand you can't sense salmonella or something like that. I got you. I still am not a proponent of putting nanotechnology into the organic standard or creating a pathway, as you described it, for that technology to become part of what we're doing.

You could have made the same argument with genetic modification or genetic engineering. Clearly, I can envision where somewhere down the road; not today, somewhere down the road there could be science that has benefit, and that benefit could be rewarding to organic just as it is to conventional agriculture or food production systems.

We've disallowed many different
things. I'm not in favor of cloning; I voted against listing cloning as something we accept. But I could clearly envision where the science of cloning down the road could lead to better breeding techniques or better animals that would benefit the organic industry as well. Yet we took a stand and said that that's not what we want. I would have to say that I am not favor of creating that pathway and opening the door as wide as this document would open it, and let's try to maintain and keep organic as a safe haven for people who want that particular food system.

And I would argue that with the growth of the industry that we've seen over the years, more and more people are heading in that direction, not away from it.

As we hybridize the systems and become more and more like conventional, the line gets blurred and we run the risk of losing consumers that just cannot clearly see the difference between organic and a
1 conventional food supply.
2 
3 I had Dan's hand up and then Barry.
4 
5 VICE-CHAIR GIACOMINI: Yes, just a technical point. We've had this conversation with the Program before. Just want to make sure we clear it with them again. OFPA calls for two-thirds on substance of issues. Those generally in the past were considered the recommendation. This is an amendment to the recommendation and I believe in the past you told us that that would only require the typical majority to pass an amendment. Are you standing by that?
6 
7 MEMBER DELGADO: Point of order, Mr. Chairman?
8 
9 CHAIRMAN MOYER: Chair recognizes Rigo, as they look for that answer.
10 
11 MEMBER DELGADO: I'm sorry, I think we can handle that. I believe we're still doing Board business.
12 
13 CHAIRMAN MOYER: We are.
MEMBER DELGADO: If you're asking about procedures to vote on an item that hasn't been released to the Program, then we should settle those.

CHAIRMAN MOYER: Chair recognizes Katrina, point of order.

MEMBER HEINZE: I think the process is we would vote whether or not to accept the amendment, which is a simple majority. If the amendment is accepted, we still have to vote on the recommendation, which would require a super majority.

MEMBER DELGADO: Exactly.

VICE-CHAIR GIACOMINI: And that was my question to the Program --

CHAIRMAN MOYER: I believe that's my understanding as well.

VICE-CHAIR GIACOMINI: -- that this did not fall under the category of the substantive motion as required by OFPA.

MEMBER HEINZE: But it would still require one.
VICE-CHAIR GIACOMINI: Majority,
if that were the case, to pass the amendment.

CHAIRMAN MOYER: I believe the
outcome of that conversation was that for this
particular vote that we're going to do next,
we need only a simple majority to move it
forward as opposed to a two-thirds majority.
The Chair recognizes Barry.

MEMBER FLAMM: Thank you. By the
way, I still haven't seen the proposed
amendment, but in trying to follow Katrina, I
think this sort of substantially changes and
in fact, I think, undermines the original
proposal, which I completely support. I think
our statement on disallowing nanotechnology
ought to be clear and to the point and not
leave room at this time. I mean, that can be
changed in the future if it turns out, but
right now I think we will save ourselves a lot
of grief in the future if we just have a clear
policy. I think we've got in trouble on other
issues, GMO the biggest, by not taking a
stronger stand. And I don't want to see that
happen here.

So I support the majority of the
committee's proposal on nanotechnology. I
think changing that at this time without build
a really review and think about it is a
mistake. But the thrust of it, it weakens it,
it makes it less clear and I think the public
will not have a very clear understanding of
what we did and why we did it.

CHAIRMAN MOYER: Chair recognizes
Katrina, then Tina.

MEMBER HEINZE: I do understand
your position, Barry. I would want to remind
guys that this is the beginning of the
regulatory process, not the end of the
regulatory process. So it still needs to go
through, you know, the usual review and public
comment. So if there are tweaks or it doesn't
have the effect we want, it will get
addressed.

CHAIRMAN MOYER: So for that
reason, we could go back to the other -- Tina?

   MEMBER ELLOR: I'd actually like

   to speak in favor of the amendment. I think
   that it takes a pretty strong stand and
   because I'm not comfortable; and I don't know
   if I ever will be, with my understanding of
   nanotechnology and how it's applied, I'd
   appreciate taking a strong stand against it.
   And I'm still a little bit uncomfortable
   about, you know, what's out there that we use
   everyday and have for, you know, all of human
   history that might be classified as
   nanotechnology. So I really feel like this
   amendment is kind of the best of both worlds.

   CHAIRMAN MOYER: Hue, then Steve,
   then Bea.

   MEMBER KARREMAN: This is a
   difficult one, kind of like the vaccine issue,
   but I got to say that on that issue, that was
   for living, breathing, sentient creatures to
   relieve suffering and with just blanket
   nanotechnology for use in, I don't know, other
ways than that. I don't know if I can go with that. You all can call me a hypocrite, but that's my reasoning, at least at this point.

CHAIRMAN MOYER: Thank you, Hue.

Steve?

MEMBER DeMURI: I like the amendment. I think, Katrina, you did a good job on it. It sends a clear message. The door is shut and the only way people can open is it is the NOSB. Everything will be looked at. It's no different than synthetics that we're looking at now. Somebody wants something to be listed that maybe is produced using that nanotechnology, then the NOSB would have to approve it. So I believe the door is shut.

CHAIRMAN MOYER: Thank you, Steve.

Chair recognizes Bea.

MEMBER JAMES: I couldn't read it, but I'm reading it Tracy's cell.

CHAIRMAN MOYER: Thank you, Bea.

Julie?
SECRETARY WEISMAN: Yes, to Hue's point, first that I also think that this is a pretty strong stand and I am in favor of the amendment. I think that there could be a situation in the future that we, you know, wouldn't think of right now where animal welfare might be helped by some kind of solution that includes nano. This is the future. You know, I understand the distinction that you make, because it's see in the here and now, but 10 years ago or 20 years ago, or however far back you have to go, you could have made the same comment about your vaccine issue.

CHAIRMAN MOYER: Chair recognizes Barry.

MEMBER FLAMM: Quickly. Maybe that's what worries me. I've already heard all these things that are going to start coming into our system before we even got this approved. People are already thinking of things that they could use it for, and that in
and of itself worries me.

CHAIRMAN MOYER: Thank you, Barry.

Chair recognizes Bea.

MEMBER JAMES: Katrina, can you help me understand a little bit more about why you want to leave the door open a little bit?

MEMBER HEINZE: Nanotechnology is a very, very broad term, and so when I think about it, there's such a broad range of what it could be. Most of it will never be compatible with organic, but there will be things that are compatible once we know the science. We don't know the science today. There will be things that our consumers say they want because the benefits outweigh the risks. We will never zero risk. Even in organic, we will never have zero risk. I think our consumers should be given the credit for being smart and knowing what they want. We just don't today know what that's going to be.

And so what I worry about is; to
back up and be really philosophical, I worry about organic being the industry of no. We are no synthetic chemicals. We are no synthetic pesticides. We are no GMO. We are no this, no that. But really not. We are a processing standard where we try to take care of the health of our consumers, the health of our planet, the health of our animals. And there are hard decisions to be made when we do that. So what I worry about is someday in the future when we say, wow, the benefits of this outweigh the risks. We're facing this hurdle where we branded for nanotech as bad, and I think it's too early to brand it as bad. I do not think it's too early to shut the door on it, but I think it's too early to brand it as bad.

CHAIRMAN MOYER: Chair recognizes Bea.

MEMBER JAMES: I guess the argument is that we don't have enough information and we're assuming the better of
nanotechnology with your change, instead of limiting because we don't know. And that's where I struggle a little bit. And I also don't think that organics is the world of no, because look at everything that we've done to try to keep it viable for all of our industry and manufacturers with the National List and everything else. And plus, if you look on the positive side, the things that we do do are incredible.

MEMBER HEINZE: I don't disagree with that. I do disagree with the fact that this amendment allows us to use nanotech. It prohibits it. It closes the door on the use of nanotech.

MEMBER JAMES: How does it do that anymore than what it was before?

MEMBER HEINZE: Today, either way, it's prohibited. This allows a path tomorrow for someone who's got a technology that they think is capable and they've got the science for us to review it.
CHAIRMAN MOYER: The Chair recognizes Tina; you had a comment, and then Joe.

MEMBER ELLOR: Yes, and I'm not so much worried about what's going on in the future. I'm worried about my lack of understanding about what's out there now that's nanotechnology, like homogenization, like milling. And honestly, I just don't know what we might be prohibiting without leaving a little bit of, you know, a crack in the door. I don't want sensors in my food either.

CHAIRMAN MOYER: Chair recognizes Joe.

MEMBER SMILLIE: Yes, I support the amendment for all the reasons I've mentioned, including faith in the NOSB to make the right decisions down the road.

CHAIRMAN MOYER: Turn your mike on please, Joe. Thank you.

MEMBER SMILLIE: I support the amendment for all the reasons mentioned
before, including faith in the NOSB down the road, you know, put it through the process that everything else goes through.

I do want to remind Katrina though on her statement that organic is the industry of no and no synthetic pesticides, that's not correct. We do allow synthetic pesticides. I won't drag you through the pheromone mating disruptive lesson again. And I think that's one of the strengths of this industry, that we're not just a no industry, that we don't have that like incredibly sharp razor that cuts off synthetic pesticides which is a mating disruptive, which we knew about when we made this regulation and we allowed in saying, oh, this is a good synthetic pesticide. This one really works, does no harm to the ecosystem, meets all of our criteria in 600. And I want to have that same availability for material in the future if, in the wisdom of the NOSB, it meets the criteria, which now that it's placed where the amendment has
placed it, it must meet.

CHAIRMAN MOYER: Thank you.

Chair recognizes Hue, and then

Katrina. I think I have the order right.

MEMBER KARREMAN: Just wondering, Katrina, how does your amendment -- you say it doesn't allow nanotech, but, you know, the door could be opened later. So what's the difference between that and the majority? Basically, the amendment is saying it's a synthetic, you've got to petition. Is that correct? I mean, is that essentially what it's saying?

MEMBER HEINZE: That's what it says.

MEMBER KARREMAN: Yes.

MEMBER HEINZE: It has to be on the National List.

MEMBER KARREMAN: So it's essentially just out there, it's got to be petitioned like any other synthetic that ever was and the majority coming out of the
committee is no? Is that correct?

MEMBER HEINZE: Yes, my view of

the majority is that it brands nanotech as

equivalent to GMO. And I think that is

premature.

MEMBER KARREMAN: That's what the

majority opinion says? I mean, it makes that

inference?

MEMBER HEINZE: I think that's the

effect. I think that's the effect. It's not

what that says.

CHAIRMAN MOYER: Chair recognizes

Rigo.

MEMBER DELGADO: I like the

amendment because you're not leaving the door

open entirely. Like Joe said, you're trusting

the process with the Program and the Board to

make the decision on whether a new technology

is useful and appropriate.

My question is, how do you

compare, Katrina, this approach to other

technologies like cloning and GE that we
absolutely closed the doors on those? I know we have lack of information in those areas, as well as nanotechnology. What is the big difference between cloning and nanotechnology that we should keep that door open to?

MEMBER HEINZE: Nanotechnology is much broader, it encompasses a lot of different things. Those other two very specifically dealt with the science of modifying the DNA, so are much more specific in what they are. This can be physical methods, chemical methods. The difference to me is this technology is so new that we don't really know what it includes and what it doesn't include. So it's a little bit hard to -- my initial reaction, to be honest, was I didn't think the committee should be addressing this because I don't think we know enough to know what we're including and what we're not including.

CHAIRMAN MOYER: Chair recognizes Julie.
SECRETARY WEISMAN: Yes, I also
wanted to at least clarify; and I'm sure if
anyone disagrees with me, they'll let me know,
but I don't believe that what this amendment
does is just say that nanotechnology is a
synthetic and people can just petition it and
it will get the same consideration as any
other synthetic. I mean, if a petition came
before the next meeting for a nanotechnology-
produced ingredient, I don't think the Board
would have grounds to consider it yet. For
instance, if there are no standards for
judging it yet, I would say that some kind of
standard for evaluation would have to be
developed before this Board could even
consider such a petition. Just ask Grace.
I'm sorry.

CHAIRMAN MOYER: Chair recognizes
Dan.

VICE-CHAIR GIACOMINI: Yes, Joe,
you made a statement that you trust the Board.
I don't even always trust myself. And right
now I'm going to say something that probably contradicts what I said this morning, after thinking about it, that I can agree with how Katrina countered what I was saying. One of the problems we have with nanotechnology is the definition. And we may catch things in the definition that we have no intent of being nanotechnology. Just like Katrina says, this is part of what we're allowing to happen as a way to let those things back in. They may have been in all the time, but it's just a matter of the processing issues.

CHAIRMAN MOYER: Chair recognizes Hue.

MEMBER KARREMAN: Julie, you were saying that hopefully there is some standard or barrier, I guess, so it's not just a petition coming in. I mean, you probably haven't thought of that. But I mean I would tend to agree with that for this amendment, that there should be some extra hurdle perhaps instead of just submitting, you know, a
petition, but I don't know what that would be.

CHAIRMAN MOYER: Chair recognizes Julie.

SECRETARY WEISMAN: So are you saying, Hue, that you would want to see some additional language as part of this amendment that specifies that, because right now it just says "accept as allowed on 601, 603 and 605?" And I guess I'm also wondering from the Program's perspective if that's what's required.

CHAIRMAN MOYER: Chair recognizes Hue.

MEMBER KARREMAN: Just a quick reply on that. He brought the idea up; I kind of like it. I wasn't thinking of anything specific.

CHAIRMAN MOYER: Chair recognizes Barry, then Dan.

MEMBER FLAMM: This discussion still reminds me so much of discussions on GMO early. Just trust us. No telling what
wonderful world is going to open up, and it's
great, and all of a sudden we've got something
out of a box that we can't handle. And I
think most of us realize what consequences
there is. And the more I hear the discussion,
the more firm I become in my belief we
shouldn't do this. Because I think we don't
have standards and I can't imagine now how we
would handle a petition that came forward.
And I'm not sure based on discussion I would
trust the outcome, unlike Joe, because I think
we're admitted we don't know what's going on.
We don't know anything about it. That's what
several people say, and yet we would entertain
a petition? I mean, as soon as we pass this,
we're going to be entertaining some petitions.
And when that comes forward, what are we going
to do with them? Anyway, that's my comment.

CHAIRMAN MOYER: I have a question
for the committee. Would the committee
consider rescinding this motion for vote at
this point in time and taking it back to
rework it for the next meeting, given the
discussion that we're having here and the fact
that we are dealing with a subject matter and
a definition that we aren't fully all
comfortable with? I present that to you, Dan.

VICE-CHAIR GIACOMINI: No, I think
we'd proceed.

CHAIRMAN MOYER: Thank you.

Is there any other further
discussion on this unfriendly amendment? Dan?

VICE-CHAIR GIACOMINI: Question to
the Program. In the definition or somewhere
else, do we need to specifically identify the
products of nanotechnology as synthetic to
then say that except as listed on 601, 603,
605?

MR. McEVOY: You're referring to
your recommendation that's up here now?

VICE-CHAIR GIACOMINI: Yes.

MR. McEVOY: And can you repeat
the question?

VICE-CHAIR GIACOMINI: We define
nanotechnology and we say they're not allowed
unless listed in those sections, but we don't
specifically say that they're synthetic. But
we're saying they're prohibited unless they're
on the synthetic list. Is that adequate, or
do we need to make the statement these are
synthetics to make sure we've jumped through
all of the proper hoops?

MR. McEVOY: It seems like your
statement is that in order to allow
nanotechnology they'd have to be on the
National List. Right?

VICE-CHAIR GIACOMINI: They have
to be on the National List for synthetic.

MR. McEVOY: For synthetics? 601,
603, 605?

VICE-CHAIR GIACOMINI: These could
be agricultural products, for instance. If
the definition was too broad and it was flour
in milling, dust caused by milling, it would
be agricultural products and we're saying it
needed to be on the synthetic list. Do we
need to say that products of nanotechnology,
according to this definition, are synthetic?
Or is it covered well enough for you?

MR. McEVOY: Well --

VICE-CHAIR GIACOMINI: You understand our intent?

MR. McEVOY: I understand your intent. It looks like it's covered well enough, but again, we'd have legal review to make sure that it was.

VICE-CHAIR GIACOMINI: Okay.

CHAIRMAN MOYER: I have another question. Maybe it's for you Dan, maybe it's for the Program. This Board doesn't necessarily review processes. We have rejected other petitions in the past that were process-oriented instead of ingredient or material-oriented. If the process ends up making not a material and not an ingredient, but an actual item that is all 100 percent from natural ingredients, they wouldn't even have to come through this process unless it's
a completely excluded method.

VICE-CHAIR GIACOMINI: No, I don't believe so. If they meet the terms of the definition, it would be classified as nanotechnology.

CHAIRMAN MOYER: But we're not excluding nanotechnology.

VICE-CHAIR GIACOMINI: Yes, we are. We're excluding nanotechnology unless it's listed on 601, 603 and 605.

CHAIRMAN MOYER: That's for materials. If it's not a material, it wouldn't even have to come through this process. You're not going to list on 601, 603 or 605.

VICE-CHAIR GIACOMINI: The definition is --

CHAIRMAN MOYER: It's a process.

VICE-CHAIR GIACOMINI: No, the definition is engineered substances, period, of whatever kind, the result of the technology.
CHAIRMAN MOYER: So if you used your milling, for example, and you milled wheat to an extremely fine, then that wheat would be considered synthetic and have to be put on the National List? I don't think so. Just because of that process?

VICE-CHAIR GIACOMINI: No, I don't believe our definition --

CHAIRMAN MOYER: You can't list it there.

VICE-CHAIR GIACOMINI: -- includes that.

CHAIRMAN MOYER: I don't either.

VICE-CHAIR GIACOMINI: But if there are other types of things with ag products that someone determines it to be a product of nanotechnology, then it's prohibited unless it's on the list.

CHAIRMAN MOYER: I have Katrina and then Hue, but I'm going to back to my old adage of closing the barn door when I have a chance.
Katrina?

MEMBER HEINZE: I believe that the definition we have, whether we go with my amendment or the original recommendation, does include wheat that has been milled to an incredibly fine particle. And I believe if we went with the majority opinion that it would be prohibited.

Now, that being said, that may be okay. Right? Because we've said we don't understand the science. So what if that wheat -- I don't think this is true, but what if that wheat had some unique property? I think what I've heard is that folks want us to understand that.

CHAIRMAN MOYER: If I can respond to that, I think what I've heard from the public is they like their wheat just the way it is and that, you know, the general public has said to us close the door while you can. I haven't heard one committee public comment that said create an open path to allow this to
come in.

I have Rigo. I apologize. Hue and then Rigo. I'm sorry.

MEMBER KARREMAN: We're having a very thorough discussion here and just the most recent part it seems like we're not even agreeing on a definition and some basic things. I mean, you're trying to, you know define it and everything, but we're just not on the same page almost. And I think maybe it does need more work to be presented again next meeting. I don't know. Just in the last few minutes it seems we're devolving here.

CHAIRMAN MOYER: I have Rigo and then Bea.

MEMBER DELGADO: I brought up the same point as you were talking about, about the incidental nanoparticles. And I thought that after you added the word "engineered" technology it eliminated those incidental ones, the milling and the homogenization and so forth. I hope that's the case and the
intent. So that's it.

CHAIRMAN MOYER: I appreciate

that, Rigo, but my comment was not based on

the fact that it would be incidental, but be
deliberate, that there would be some sort of
deliberate process without an actual
ingredient or material being created, but a
finished product.

I have Bea and then --

MEMBER JAMES: I would agree with

Hue. I'm really struggling with trying to
come to a consensus on something that we're
not clear on and don't have all the
information that we need. And if I had to
vote on this today, I would abstain. I'm not
in a position to make a decision.

CHAIRMAN MOYER: Again, I'll

present the question to the Materials
Committee. Are you willing to pull back this
document? We've been at it for an hour now.
I don't know that we've gotten too far. We've
got a lot of good information on the table,
but I'm asking the question.

VICE-CHAIR GIACOMINI: With the agreement of the majority of the Materials Committee, I would be willing to withdraw this motion at this time.

CHAIRMAN MOYER: Can you poll your committee?

VICE-CHAIR GIACOMINI: Kevin?

MEMBER ENGELBERT: I would be willing to pull it also.

VICE-CHAIR GIACOMINI: Katrina?

MEMBER HEINZE: Yes.

VICE-CHAIR GIACOMINI: I vote yes.

SECRETARY WEISMAN: I would be willing to pull.

VICE-CHAIR GIACOMINI: We withdraw this motion.

CHAIRMAN MOYER: Thank you to the Board for that lively discussion, to the Program for your help, to Katrina for your hard work over lunch. I certainly appreciate that. I hope you had a chance to eat
something. But it is extremely interesting
and lively discussion. It is a very, very
important topic, I think we all see that, and
I appreciate your committee's hard work, and
you have more hard work ahead of you,
unfortunately. Thank you very much for that.

Boy, we all need a breath.
Exhale.

Well, if that wasn't enough for
you, Katrina, the Joint Handling and Materials
Committee recommendation on classification of
definitions is next on my docket. If you're
prepared, we will entertain that conversation.
Katrina?

MEMBER HEINZE: I am prepared.

And I never though the words "classification
of materials might look easy after that" were
going to come out of my mouth, but hopefully
they will.

So, I have emailed earlier today;
so hopefully everyone has a copy of the
November '04-'09 modifications to our
And, Valerie, I think that's what you are pulling up as well.

I want to thank the Board for yesterday's discussion on this topic. And then what I'd like to review today are changes made by the joint committee. We met earlier this week and voted on these changes and our recommendation passed with five yes, one no, one abstain and one absent.

So before I review the comments, you know, I want to say and acknowledge the members of the joint committee. This recommendation is really the combined work of the committee. It represents hours of debate, respectful points of difference and a focus on finally making progress on this difficult topic. And I am really very grateful to each of you for the many calls we had and the points you brought up.

So what you see in this document; I'm not going to review on the whole document,
I'm just going to highlight the items that have been added and read. Before I do that, there are topics that we received in public comment both this week or in the written comments that led to us making changes to our recommendation. Those are clarifying that CAS numbers are just one way, but not the required way to determine that a substance has changed identity.

CHAIRMAN MOYER: Where specifically --

MEMBER HEINZE: Hold on.

CHAIRMAN MOYER: Okay. Thank you.

MEMBER HEINZE: I'm just giving you the big picture.

CHAIRMAN MOYER: Okay.

MEMBER HEINZE: We added some language to clarify that agricultural is a subset of non-synthetic. We fixed our technical error on the definition of non-agricultural. And finally, we added some language to talk about what's included in the
term "products of naturally-occurring biological processes."

There are also topics from public comment for which we did not make changes, but we added discussion in our intent to do further work on these topics. And really, for these topics it was clear from my presentation yesterday and the discussion that ensued that these changes that I presented that we were considering were too much. They were premature. So we need to pull back. We need to have more discussion on them.

Specifically, that was about the soy lecithin, bleached. We had been considering a change to try to address that public comment and we hadn't had time to think it through, so we're pulling back on that.

So specifically, topics where we're saying we need to do more work is the impact on certified organic products, produced in compliance with the rule, the effect of our third guiding principle on products sourced
from organic, materials that undergo chemical
change either through normal processing or
through the use of a synthetic allowed on
605(b), and then also the public comments
asking for clarification on 270(c)(2).

Okay. So with that, that's kind
of the big picture. Let me go through
specifically the changes.

The first one is on page 6 in the
middle of the page. It is in red. It's the
third full paragraph. We added a paragraph
regarding our intent.

Mr. Chair, should I read the whole
change? Would that be useful?

CHAIRMAN MOYER: Yes, I would.

MEMBER HEINZE: Okay.

CHAIRMAN MOYER: Because some
folks are having difficulty seeing the board,
I would request that you would read that.

MEMBER HEINZE: Okay, so we added
a paragraph in the section on -- so, this is
the discussion section on synthetic/non-
synthetic. We added a paragraph that said, "It is not our intent to reclassify as synthetic products or ingredients that today can be certified organic in full compliance with the final rule. For example, certified organic soy lecithin exists today. It is manufactured from organic soybeans, physically separated into oil and soybean meal. The soybean oil is then hydrated with water or steam and the lecithin gums are physically separated. Certified organic bleached soy lecithin can be manufactured by using less than five percent hydrogen peroxide, which is a synthetic allowed for use in certified organic products, 205.605(b)."

So again, this is just discussion. It speak to our intent. And then you'll see me come back that topic a little bit later.

Oh, goodness. Okay. On page 7; I was really hoping not to have to read this whole thing, we added four paragraphs. I'll read the beginning paragraph.
What this says is, "At the November 3rd through 5th, 2009 NOSB meeting, public comment was heard on two topics related to classification of materials as either synthetic or non-synthetic. The first was a concern that the use of CAS numbers as an example in the definition of substance was not clear. We have modified the proposed definition to address this concern."

And then I list both the original recommendation and the new definition. Later I will tell you what we changed.

"The second concern raised by public comment at the November 2009 NOSB meeting requested clarification on our recommended third guiding principle and the related definition for chemical change."

So public comment requested clarification and then I list some of the things that folks wanted clarification on.

"The joint committee intends to further study these questions and address
them, if possible, during development of our recommended guidance document with the NOP. If not possible, we intend to have a further recommendation specific to this topic at our spring meeting."

CHAIRMAN MOYER: Thank you, Katrina.

MEMBER HEINZE: So that captures that first thing I talked about that we just felt that that recommendation was premature. We wanted to acknowledge that we had been asked to clarify that. And so, we wanted that in our document so that our intent was very clear.

Okay. Again on that page in the last paragraph we added two little words to really get at the idea that agriculture is a subset of non-synthetic. So we just said that, "Materials that remain for classification are all non-synthetic, either agricultural or non-agricultural." So the words added are "all non-synthetic."
Okay. On the next page, again in the discussion for agricultural and non-agricultural, and again speaking to public comment received this week, we said that, "Public comment was heard that questioned our recommended definition of non-agricultural." As we reviewed that, we realized that we had inadvertently included the wrong definition in our recommendation. So I list the current definition, the definition we had proposed and then the definition we intended to propose.

And then the final paragraph says, "We believe that the comments that were addressed to us would have been addressed had we included the proper definition."

Okay. So that gets to the non-ag definition that I said we did address.

On the next page, under the again discussion of products of naturally-occurring biological processes, we added a paragraph that says, "Proper terminology for the products of naturally-occurring biological
processes and the microorganisms that lie at
the heart of these biological processes has
been elusive. For the purposes of this
document, the term "products of naturally-
occuring biological processes includes the
microbiological organisms used in the process;
for example, yeast and bacteria."

And again, that is discussion.

 Originally, when we wrote this document, it
was so important that all our thoughts and all
our debate got on paper. So as we made
revisions this week, we wanted to continue
with that so our intent was very clear, that
we create this historical document that
captures the history of this topic.

Okay. So finally, getting to our
actual recommendation. So everything else was
discussion. So this is page 11 under the
recommendation. Under guiding principles, we
added language under the third guiding
principle that says -- so this is copying our
scope language, "Materials that are
manufactured in full compliance with the final
rule are outside the scope of this principle.
Their status with regards to use in organic is
not affected by this recommendation."

CHAIRMAN MOYER: Would you repeat
that, please?

MEMBER HEINZE: Yes. "Materials
that are manufactured in full compliance with
the final rule are outside the scope of this
principle. Their status with regards to use
in organic is not affected by this
recommendation."

CHAIRMAN MOYER: Thank you.

MEMBER HEINZE: Okay. Under
proposed regulatory language, the definition
of non-agricultural substance, you'll see that
the definition that we intended to propose has
now been put in here. Just as a reminder,
this is a product. "Non-agricultural
substance is defined as a product such as a
mineral or atmospheric gas that does not
originate from agriculture. For the purposes
of this part, agricultural refers to the production or handling of crops or livestock."

And that was a definition proposed by the Material Working Group. We just copied and pasted incorrectly.

Okay. Finally, under our recommendation, for the definition of "substance," we replaced -- it used to say "an element, molecular species or chemical compound that possesses a distinct identity parenthetical e.g." We decided that in this case we needed to make the e.g. more obviously for example, so we said "for example," just so no one missed it; "e.g.s" are easy to miss. And then we used some broader words. So we said "A distinct identify may be demonstrated through the material having a separate CAS number." And then in parenthetical, we added, "In some cases the same material may have multiple CAS numbers." We really wanted to highlight this idea that this is just an example. It is not definitive.
Okay. So that's it for the recommendation.

I did want to highlight that the next steps on this, this is not the end result. The end result of this recommendation is rule change which still needs to happen, which is the definitions. But more importantly it's the guidance document, the document that will help everyone who has to make these decisions make them consistently.

And so our next steps are we need to ask the NOP to do the rule change and the definitions that we're recommending, we need to work with NOP staff to develop a guidance document. They have committed to doing that through their guidance document process, which allows for public comment. I would propose that if we can get that done at the spring meeting, I think having it as an agenda item so that we make sure that that public comment is very transparent would be an important part of this process.
We did add some language to this section of the recommendation to get back at the chemical change and guiding principle No. 3 and that 270(c)(2) that we said we were going to work on.

Then there is a next step for how should ACAs be classifying materials, and we said today there should be no change. They should be doing them as currently listed on the National List and they should only begin using this recommendation once it is codified, for lack of a better word, in the guidance document. Then we outline how we're going to make the changes to the National List that result from this recommendation and then we ask for petitions on the products of naturally-occurring biological processes so that we can continue our work in that area.

So those are the changes made and our recommendation. Should I entertain questions on the changes first, or make a motion?
CHAIRMAN MOYER: I would suggest you make a motion.

MEMBER HEINZE: Okay. So I move that the NOSB accept this document, period?

MEMBER HEINZE: As posted.

CHAIRMAN MOYER: As posted, yes.

Is there a second on that?

MEMBER KARREMAN: Second.

CHAIRMAN MOYER: You're going to have to do rock, paper, scissors again, because you all three at the same -- Hue yelled the loudest, but Joe was right there. You kids pick.

MEMBER HEINZE: I would entertain questions.

CHAIRMAN MOYER: Yes, if there are questions. But before there's questions, I think to state that the work that went into this was tremendous is an understatement. It's unfair to say it in that light of tone, because I mean, just reading over it and listening to that language makes my head spin.
I don't see how anybody could recite any one paragraph of that without tremendous amounts of study. It is very complex, very difficult to understand. And not only people at this table, but people in the room, people that couldn't make it to this meeting that are outside of this audience directly put in a lot, a lot of time, not only in writing this but in thinking it through. So whichever the vote goes, Katrina, you and your team, Dan, everybody involved did a tremendous amount of work and this Board and the greater organic community appreciates it whether they like the end result of the vote or not.

So at this point in time, we'll entertain questions. I see Dan's hand up first.

VICE-CHAIR GIACOMINI: Thank you, Mr. Chairman. Yes, regarding the work on this, it was extensive. And with a year-and-
finally brought it in it was the joint
committee of Materials and Handling, of which
Steve and I were the chairs, and we kind of
put our heads together and said one person
really needs to quarterback this thing and
that we both agreed that with her, all the
time she had put on this project through the
Material Working Group, I think she hit almost
all of those calls, if not all of them, that
we both agreed to talk Jeff into allowing her
to be the chair for this. And I think if I
made one good decision in the last year, that
was probably the best one.

We talked about on the last one
questioning ourselves and everything. I wish
I could give good examples. There's just
something that bothers me about the shrinking
of the non-ag/non-synthetic box. And, you
know, from my family with a little of Italian
still in them, it gives me agita. But I'm
questioning myself and I'm going to see how
the rest of the Board continues on this one.
CHAIRMAN MOYER: I think I also wanted to acknowledge that there are two finely-written minority opinions. The vote was not unanimous on this decision coming out of committee. I think both those minority opinions have value and worth and should not be discounted in our discussion here, if there is any. And sometimes voting with your heart or your head are two different ways to address things, and I understand that completely.

Katrina?

MEMBER HEINZE: Thank you, Jeff, for the good reminder that it is worth highlighting that. Because you're not voting on the changes we made as committee, you're really voting on some, you know, fundamental things to how we classify materials.

Before I say that, where I work we call that being voluntold.

CHAIRMAN MOYER: Voluntold?

MEMBER HEINZE: Because I don't remember being in the conversations where I
was asked to be chair.

CHAIRMAN MOYER: It's true. It did come to me through a back door and --

MEMBER HEINZE: Yes. So like I say, it's a good word, voluntold. That happens to lots of us.

So to highlight, I want to highlight the minority opinions. There are two. The first; and I will paraphrase, but certainly those who wrote them, jump in if I don't paraphrase properly. The first has to do with our definitions and guiding -- really our definitions and how they manifest in classifying the material as synthetic or non-synthetic. Our definitions draw a fine line through chemical change. If chemical change does not happen and a synthetic is not present in the final material at a significant level, then the material is not synthetic. And, you know, for the reasons we talked about yesterday, the majority felt that that was the right way to go.
The minority opinion feels that that is too gray. We need a more black and white approach to synthetic/non-synthetic and that if a synthetic is used, the resulting material should be synthetic. And again, for the reasons we talked about yesterday, the majority did not go with that minority opinion.

The other minority opinion has to do with what results from materials that are non-synthetic and agriculturally-sourced. We moved materials into being classified as agricultural, so we shrunk non-synthetic. And there is some concern about if there would be effects to crops and livestock. The majority of the committee was unable to think of examples or circumstances where that would occur, so did not go with that opinion, and we did not hear public comment to that effect.

CHAIRMAN MOYER: Thank you, Katrina.

More discussion on this item from...
other board members? Chair recognizes Joe.

MEMBER SMILLIE: I think it's important to point out that while we did consciously and I think unanimously or by consensus rule out the idea of an agricultural synthetic, we very carefully crafted language that I want to make sure everybody understands.

Katrina uses words like "outside the scope of the document," and now it's more carefully clarified. This does not -- this document is very clear that it allows a certification process to occur in the cases where something may be ruled a synthetic if it complies with the regulation. So that was my major deterrent in the development of this document and I am now satisfied that that has been dealt with, along with the issue of the CAS numbers, which, you know, was an issue also.

CHAIRMAN MOYER: Joe, would you be willing to give the Board a possible example
of what you just described? Not to put you on the spot, but --

MEMBER SMILLIE: Well, it depends on --

CHAIRMAN MOYER: Joe, your microphone?

MEMBER SMILLIE: It depends on the ruling, but yes -- well, I hate the example; it's the first one that comes to mind, but -- oh, no, I'm not going to go back to the toast and eggs. Jeez, that's bringing back too many painful memories. Toast is not a synthetic. I'm not going there.

No, the glycerine, okay, that could be a result of a synthetic process could be certified as organic, glycerine.

CHAIRMAN MOYER: Glycerine?

MEMBER SMILLIE: Yes.

CHAIRMAN MOYER: Okay.

MEMBER SMILLIE: I also think depending on how someone looked at it that a soy protein isolate could be possibly,
depending on again, you know, origin and process, depending on the ruling made. There could be a ruling made that a soy protein isolate could be synthetic. It also could be certified.

CHAIRMAN MOYER: It would have to go through the petition process, or not? No.

MEMBER SMILLIE: No.

CHAIRMAN MOYER: No, it would not.

Okay.

MEMBER SMILLIE: Correct. If it met the regulation.

CHAIRMAN MOYER: Got you.

Chair recognizes Julie.

SECRETARY WEISMAN: Yes, I just want to further clarify in a more generic way what that whole concept of outside the scope means is that we have this part of the rule that defines what the composition of products that are going to be sold as organic. 100 percent or -- which means 95 percent.

And so that means that once you
have met the formulation requirements, meaning that at least 95 percent of the ingredients are certified organic and anything that's in that five percent or less is on the National List and it has only undergone allowed processes that whatever results from that that's certified organic. And those are outside of the scope of the document. And part of what that does is create a preference for materials that are sourced from certified organic, something that is made from organic ingredients and meets the composition requirements.

I think I might have confused people more. I'm looking at the faces around the table.

CHAIRMAN MOYER: Thank you, Julie. Any other discussion before we call for a vote on this material -- on this docket item?

(No audible response.)

CHAIRMAN MOYER: Okay. Are there
any conflicts of interest in this? Of course, everybody has a conflict of interest, I suppose, who worked on it.

Okay. We'll call for the vote. The vote will start with Tina.

MEMBER ELLOR: Yes.

CHAIRMAN MOYER: Rigo?

MEMBER DELGADO: Yes.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: Yes.

CHAIRMAN MOYER: I thought so.

Dan?

VICE-CHAIR GIACOMINI: Yes.

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: I can't resist quoting my teenage daughter who's in the room. Duh? Yes.

CHAIRMAN MOYER: Thank you.

Steve?

MEMBER DeMURI: Yes.

CHAIRMAN MOYER: Barry?

MEMBER FLAMM: Yes.
CHAIRMAN MOYER: Bea?

MEMBER JAMES: Yes.

CHAIRMAN MOYER: Tracy?

MEMBER MIEDEMA: Yes.

CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN MOYER: Hue?

MEMBER KARREMAN: Yes.

CHAIRMAN MOYER: Kevin?

MEMBER ENGELBERT: No.

CHAIRMAN MOYER: And the Chair votes yes. We have one no, 12 yeses, two absent. This document passes.

Again, thank you to everybody who worked so hard on this document.

Joe has a comment.

MEMBER SMILLIE: I also wanted to add my two cents on what's becoming overblown praise, but I just want to publicly acknowledge Katrina's leadership on this document. She cajoled, prodded, bribed, inspired the committee members to stay at a
task that was extremely difficult, demanding
and mind numbing at times. And no matter how
many times we tried to get out of having
another meeting, she figured out some way to
make us do it. And the last bribe, I might
publicly -- was bringing coffee to the 7:00
meeting yesterday morning. That did it. So
a famous American once said, "By any means
necessary." And that's certainly the
leadership of Katrina. Earned her, you know,
the hurricane nomer that she's given.

CHAIRMAN MOYER: Katrina has the
last word.

MEMBER HEINZE: I do get the last
word. I'm getting far too much credit,
because many other people worked on this. But
one of the things we say where I work is that
working externally has far more rewards
sometimes than working internally. And thank
you for making that true.

CHAIRMAN MOYER: You're welcome.

Okay. Because we're well behind
in our time, we're going to continue to move forward. If board members need to leave the room for whatever reason, that will be tolerated. We're going to jump right onto the Handling Committee and move through those materials before we take an official break.

So at this point, Steve, if you and your committee are ready, we would entertain a voting process on your Handling Committee sunset materials.

MEMBER DeMURI: I am ready. Thank you, Jeff. And I will go ahead and handle all the materials, and then if we have any very technical questions from anybody on the Board, I'll defer some of those to the experts at the table who did the investigation on these.

The first one is 205.605(a) item. It's egg white lysozyme. And Tracy did a good job yesterday of going through that substance. I won't go through it in any detail at this point, but I will mention that the committee voted five yes, zero no, one absent to relist.
It was originally listed back in 2006. This is a sunset item of course. And we did not receive any new information since the time of the original listing or during our investigation that would have caused us not to vote to relist it at this time.

So having said that, I would move that we relist egg white lysozyme to 205.605(a).

CHAIRMAN MOYER: We have a motion on the floor. Do I have a second?

SECRETARY WEISMAN: Second.

CHAIRMAN MOYER: You got to yell faster Tracy. I got Julie for a second.

We have a motion and a second. Is there any discussion on this material?

(No audible response.)

CHAIRMAN MOYER: Hearing none, seeing no hands, we'll move forward with the vote.

Are there any conflicts of interest on this material?
(No audible response.)

CHAIRMAN MOYER: Again, hearing none and seeing none, we will move forward with the vote starting with Rigo.

MEMBER DELGADO: Yes.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: Egg white lysozymes, right? Yes.

CHAIRMAN MOYER: Dan?

VICE-CHAIR GIACOMINI: Yes.

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: Yes.

CHAIRMAN MOYER: Steve?

MEMBER DeMURI: Yes.

CHAIRMAN MOYER: Barry?

MEMBER FLAMM: Yes.

CHAIRMAN MOYER: Bea?

MEMBER JAMES: Yes.

CHAIRMAN MOYER: Tracy?

MEMBER MIEDEMA: Yes.

CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: Yes.
CHAIRMAN MOYER: Hue?

MEMBER KARREMAN: Yes.

CHAIRMAN MOYER: Kevin?

MEMBER ENGELBERT: Yes.

CHAIRMAN MOYER: Tina?

MEMBER ELLOR: Yes.

CHAIRMAN MOYER: And the Chair votes yes. I have zero nos, thirteen yeses, two absent. Your material passes.

Your next item, Mr. Chairman?

MEMBER DeMURI: Thank you, Jeff.

The next item is also a 205.605(a) item. It is L-malic acid, originally listed in September 2006. So it is scheduled to be sunsetted in 2011, unless we take action to relist it, which is what we're voting on today, of course. No new information came to our attention that would cause us not to recommend relisting this material. At the committee level it passed four yes, zero no and two were absent.

So I will move for relisting of L-
malic acid to 205.605(a).

CHAIRMAN MOYER: We have a motion on the floor to relist. Do I have a second?

SECRETARY WEISMAN: Second.

CHAIRMAN MOYER: Julie seconds that. We have a motion and a second to relist this material. Is there any discussion on this material?

(No audible response.)

CHAIRMAN MOYER: Hearing none, seeing none, we'll move onto a call for the vote.

Any conflicts of interest on this material?

(No audible response.)

CHAIRMAN MOYER: Again, hearing none, seeing none, we will start the voting process with Katrina.

MEMBER HEINZE: Yes.

CHAIRMAN MOYER: Dan?

VICE-CHAIR GIACOMINI: Yes.

CHAIRMAN MOYER: Julie?
SECRETARY WEISMAN: Yes.

CHAIRMAN MOYER: Steve?

MEMBER DeMURI: Yes.

CHAIRMAN MOYER: Barry?

MEMBER FLAMM: Yes.

CHAIRMAN MOYER: Bea?

MEMBER JAMES: Yes.

CHAIRMAN MOYER: Tracy?

MEMBER MIEDEMA: Yes.

CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN MOYER: Hue?

MEMBER KARREMAN: Yes.

CHAIRMAN MOYER: Kevin?

MEMBER EN格尔BERT: Yes.

CHAIRMAN MOYER: Tina?

MEMBER ELLOR: Yes.

CHAIRMAN MOYER: Rigo?

MEMBER DELGADO: Yes.

CHAIRMAN MOYER: And the Chair votes yes. Zero no, thirteen yes, two absent.

Your material passes.
Mr. Chairman, your next item?

MEMBER DeMURI: Thank you. The next one is another 205.605(a) sunset item. It is microorganisms, again originally listed in September of 2006. Joe did a good job yesterday of explaining this substance. The TAP review was good. No new information came to us that would cause us not to recommend relisting this material. And at the committee level it did pass five yes, zero no, one absent.

So I move for the relisting of microorganisms to 205.605(a).

MEMBER SMILLIE: Second.

CHAIRMAN MOYER: I was going to ask for a second and we've got one. It's almost like telepathic. You knew what I wanted.

We have a motion and a second on the floor for this material to relist microorganisms. Is there any discussion from the Board?
(No audible response.)

CHAIRMAN MOYER: Hearing none, seeing none, I will call for the vote.

Any conflict of interest on this material?

(No audible response.)

CHAIRMAN MOYER: Again, seeing none and hearing none, we'll start the voting process with Dan.

VICE-CHAIR GIACOMINI: Yes.

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: Yes.

CHAIRMAN MOYER: Steve?

MEMBER DeMURI: Yes.

CHAIRMAN MOYER: Barry?

MEMBER FLAMM: Yes.

CHAIRMAN MOYER: Bea?

MEMBER JAMES: Yes.

CHAIRMAN MOYER: Tracy?

MEMBER MIEDEMA: Yes.

CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: Yes.
CHAIRMAN MOYER: Hue?

MEMBER KARREMAN: Yes.

CHAIRMAN MOYER: Kevin?

MEMBER ENGELBERT: Yes.

CHAIRMAN MOYER: Tina?

MEMBER ELLOR: Yes.

CHAIRMAN MOYER: Rigo?

MEMBER DELGADO: Yes.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: Yes.

CHAIRMAN MOYER: And the Chair votes yes. Zero no, thirteen yes, two absent.

Your material passes, Mr. Chairman. Your next item?

MEMBER DeMURI: Thank you. We're moving quickly. Good.

CHAIRMAN MOYER: Yes.

MEMBER DeMURI: The next item is a 205.605(b) substance, activated charcoal.

First petitioned in 2002 and added to the National List with annotation "only from vegetative sources for use only as a filtering
aid." And that became effective on September 12, 2006, so it is subject to being sunsetted in the fall of 2011, unless we take an action here. No new information came to our attention during your investigation of this material. The original TAP was thorough, in our estimation. At the committee level the substance passed for relisting five yes, zero no, and one absent.

So I move for the relisting of activated charcoal with the annotation "only from vegetative sources for use only as a filtering aid" to 205.605(b).

VICE-CHAIR GIACOMINI: Second.

CHAIRMAN MOYER: We have a motion on the floor to relist and we have a second from Dan. You can tell we're getting tired.

Any points of discussion? Chair recognizes Hue.

MEMBER KARREMAN: Just wondering, so this would be coming off in 2011 if we didn't take this action now?
MEMBER DeMURI: That is correct.

CHAIRMAN MOYER: That is correct.

MEMBER KARREMAN: Okay. So it's November 2009. So there's two more years. So it's going to have another five-year -- don't get me wrong, I'm all in favor of the material. It's more a question of the sunset.

CHAIRMAN MOYER: The process.

MEMBER KARREMAN: So 2011 and 2016 and then it will, you know, go through it again?

MEMBER DeMURI: Right.

MEMBER KARREMAN: So what if, okay, we take the vote now; which I hope it passes, and within the next two years before the first sunset some information comes about that's like just catastrophic to activated charcoal. What happens? Are we too soon ahead to that deadline date by doing the vote? I can see getting the work done. Just wondering.

MEMBER DeMURI: Somebody would
petition, I would hope, to have it removed from the list in that period of time.

CHAIRMAN MOYER: Yes, I think that was Joe's comment. I had Joe's hand. I got Dan's hand and then Katrina.

Dan?

VICE-CHAIR GIACOMINI: No --

CHAIRMAN MOYER: Chair recognizes Katrina.

MEMBER HEINZE: I think it's not just a matter of trying to get ahead of the work, but trying to get ahead of the regulatory time frame.

CHAIRMAN MOYER: Yes. That is correct. Thank you, Katrina.

Okay. We have a motion on the floor and we have a second. We've had some discussion. Any further discussion?

(No audible response.)

CHAIRMAN MOYER: Hearing none, seeing none, I'll call for the vote.

Is there a conflict of interest on
activated charcoal?

(No audible response.)

CHAIRMAN MOYER: Hearing none, seeing none, the vote will begin with Julie.

SECRETARY WEISMAN: Yes.

CHAIRMAN MOYER: Steve?

MEMBER DeMURI: Yes.

CHAIRMAN MOYER: Barry?

MEMBER FLAMM: Yes.

CHAIRMAN MOYER: Bea?

MEMBER JAMES: Yes.

CHAIRMAN MOYER: Tracy?

MEMBER MIEDEMA: Yes.

CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN MOYER: Hue?

MEMBER KARREMAN: Yes.

CHAIRMAN MOYER: Kevin?

MEMBER ENGELBERT: Yes.

CHAIRMAN MOYER: Tina?

MEMBER ELLOR: Yes.

CHAIRMAN MOYER: Rigo?
MEMBER DELGADO: Yes.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: Yes.

CHAIRMAN MOYER: Dan?

VICE-CHAIR GIACOMINI: Yes.

CHAIRMAN MOYER: And the Chair votes yes. Zero no, thirteen yes, two absent.

Your material passes, Mr. Chairman. Next item?

A question, Hue?

MEMBER KARREMAN: If I may, on the activated charcoal. If it's on a food contact list, okay, is that ever going to be allowed right out for livestock use, or is that always -- I'm just curious. You know, we've had this question before and it's on this particular material.

MEMBER DeMURI: If it's petitioned. If they petition it.

MEMBER KARREMAN: Okay. Yes, it's specific with the annotation you have, right?

CHAIRMAN MOYER: Yes.
MEMBER KARREMAN: Okay. All right.

CHAIRMAN MOYER: Yes, it's annotated.

MEMBER KARREMAN: Yes.

CHAIRMAN MOYER: You have to petition to change that annotation.

MEMBER KARREMAN: I guess the generic question is if something's on 605; we've had that question in the past, can it be used for --

CHAIRMAN MOYER: Chair recognizes Dan.

VICE-CHAIR GIACOMINI: Yes, at this point in time listing in 605 does not qualify for use in livestock.

CHAIRMAN MOYER: Right. That's right. You'd have to petition it for that.

VICE-CHAIR GIACOMINI: This substance was petitioned for livestock, passed by the Board and for whatever technical difficulties did not get through rulemaking.
CHAIRMAN MOYER: Yes, you're right. Thank you, Dan.

Mr. Chairman, your next item?

MEMBER DeMURI: Thank you. The next item is also a 205.605(b) item. It is cyclohexylamine. It is the first of three volatile amine boiler chemicals that are coming up for sunset review this year. This particular substance was originally approved by the NOSB in October 2001 and was not listed until 2006, so there was a five-year lag time before it was finally listed. So it is scheduled to be sunsetted in the fall of 2011.

This material and the next two are a little different than the ones we've already discussed today, because we did change our committee recommendation based on public comment. Originally, we had voted not to relist these because we felt within the committee that there were some alternatives available. We knew of some alternatives that were being used, but we did not have a lot of
information at that point in time as to what the entire industry was using and whether or not they needed this or not.

During the public comment period, both written and verbal yesterday and the day before, we did hear from some processors who claimed that either they needed it or they knew of people that needed it in the industry. So that was the reason for changing our original recommendation. And we did that in a committee vote a couple of days ago.

Having said that, at the committee level the most recent vote that we took was five for relisting, zero no and one absent.

So having said that, and there is an annotation with this I should mention that is only for packaging sterilization. That is not to be used for direct steam injection, for heating products, that type of thing. It's only for packaging sterilization.

CHAIRMAN MOYER: Good. Can you put that in the form of a motion?
MEMBER DeMURI: Yes.

CHAIRMAN MOYER: Chair recognizes Julie with a question.

SECRETARY WEISMAN: Yes, I just want to clarify. That packaging sterilization is the only direct contact that's allowed.

MEMBER DeMURI: Right.

SECRETARY WEISMAN: Because the boiler chemicals get used routinely for things like jacketed --

MEMBER DeMURI: Good point.

Right.

SECRETARY WEISMAN: -- which is not -- which wasn't -- there's no contact?

MEMBER DeMURI: That's correct.

And if a processor is running organic products and they're using these chemicals in their boilers and they're only indirectly heating through a steam jacket in a kettle or a tubular system of some sort, and there's no direct contact with the steam, this isn't an issue because there is no contact with the
In the case of packaging sterilization, it's considered indirect contact because the container is steamed or heated to sterilize the package before the product goes in. That steam will condense on the inside of the package and there could be some very minute levels of these materials left possibly. I've never seen any data to that effect, but that was discussed when the substances were originally listed back in 2001, or approved in 2001.

CHAIRMAN MOYER: Thank you, Steve. Do you have a motion to make?

MEMBER DeMURI: So I'd like to move that cyclohexylamine be relisted onto 205.605(b) for packaging sterilization only.

CHAIRMAN MOYER: Is there a second to that motion?

MEMBER MIEDEMA: Second.

CHAIRMAN MOYER: I have Tracy as a second.
We have a motion on the floor and a second. Is there any discussion on this material?

Chair recognizes Kevin.

MEMBER ENGELBERT: Steve and the committee, given the change in your vote are you confident you have had enough time to research these thoroughly and know that all three of these materials must be renewed for the industry without disrupting industry? Is there any way that one of them or two of them could be done away with, or all three? If some people have made the change, have you had a chance to research why others say they can't? Is this, you know, true information?

MEMBER DeMURI: The reason that some people can't make the change is because they have processing plants in areas that have very poor water quality. And according to their engineering departments, in most cases they claim that they can't substitute these with anything else that will not cause a lot
of corrosion in our their boilers and in their
lines feeding steam to their processes.

CHAIRMAN MOYER: Chair recognizes
Julie.

SECRETARY WEISMAN: The other
issue which is sort of paradoxical here is
that one of the practices that sometimes
allows people to not use these boiler
chemicals is they don't add them during the
time that they're doing -- that they're
running organic product.

And that's okay if say maybe 10 or
15 percent of the time that you're running
your boilers you run them with no additives.
Because the rest of the time, if you ran
boilers without these, eventually your
equipment, your pipes would explode.

Facilities that are only running organic
product cannot possibly never put these in
their pipes for the reason that I just
mentioned. So paradoxically, the more organic
product you're running, the less possible it
is for you to rely on the practice of shutting
down the steam and running without boiler
additives for a period of time. Does that
make any sense?

CHAIRMAN MOYER: Chair recognizes
Barry.

MEMBER FLAMM: Thank you. I was
quite surprised that the committee so easily
changed its vote which had previously been
five to zero with one absent against
relisting. And I thought in reading the
committee's recommendation, it had been very
thoughtful and covered all the reasons why
they weren't going to relist. And among those
were that the TAP review showed that this
material was toxic to humans and harmful to
the environment and incompatible with
organics. So it was pretty strong words. The
original committee was divided on this, and I
guess finally persuaded, but with the idea
that this wouldn't be relisted.

I read and heard the same public
comments. I heard a person testify that said he wasn't using it, but he knew of some people who were using it. Well, that's not good enough for me. But, what impressed me was that he wasn't using it.

With all this information and the lack of a reason to continue this, I have no hope we ever would take anything off during the sunset process, because this is pretty strong stuff.

CHAIRMAN MOYER: Point well taken.

Steve, would you or someone on your committee like to address that?

MEMBER DeMURI: Sure, I'll take a first crack at it.

Barry, I totally respect your position on it, and that's why we voted it down the first time. We do also have to recognize that a previous board approved it after much discussion and investigation. And under the sunset rules that we're working under right now for the procedures there is
still some industry need for the chemical, in our opinion. And so what I would hope would happen is if that's not the case, that somebody in the near future would petition to have these removed. But for now we feel like we should give the industry the availability in case there is somebody out there still using that. We believe they're still being used, but other substances could come about in the next few years that could replace these.

CHAIRMAN MOYER: Chair recognizes Barry.

MEMBER FLAMM: Just one additional comment to Steve's comment. I think it's really unfair to always shift this burden to somebody coming forward with a petition. I think we're sitting here right now. We have the authority. We have the responsibility to make the decision ourselves. And then to shift it off to somebody else I think is not fair.

CHAIRMAN MOYER: Chair recognizes
MEMBER MIEDEMA: I am among the five happy flip-floppers on this issue. And we did deviate from our recognized process in voting not to relist. And so, that's what level of thoughtfulness did go into this, Barry. We didn't believe any new information that had come to light. And so, you know, there is real inertia and our sunset process would tell us we must relist.

We dug into an old transcript and we deviated from your process because we listened to previous colleagues who said, hmm, we hope this goes away. But, as a sign that this public/private partnership and public/private governmental partnership works; that is, NOSB meetings, we heard loud and clear 100 percent of the comments that came in told us that we had made a mistake in opting not to re-up this item, and so we listened and changed our mind. There was no new scientific information that came to light.
CHAIRMAN MOYER: Chair recognizes Julie, then I have Dan and Steve.

SECRETARY WEISMAN: Yes, I would also say there was another very important thing that was overlooked when the Board originally voted in the summer not to relist. And that was the fact that there were three public comments that came in right after the first ANPR. This ANPR was published in March of 2008, and during that comment period Three people responded. Two of them were the end users themselves and one was a trade organization representing other end users. And they responded right away and said we need these.

And, you know, it was our oversight over the summer that those comments had been received. That doesn't usually happen. I mean, it was a first that that was so far ahead of our deliberation that we didn't capture those. We were thinking that no one had commented. And that's also another
factor that I think we debated here and could
probably use some better clarity.

But it has been our understanding
that at sunset, yes, we can't let something
sunset, we can't go against a board decision
unless there's new information. However, if
no one comes forward and says they still need
it, that is also a situation where we cannot
responsibly act to relist.

And when this vote was taken, we
didn't think we'd had any comment, and that
was our error, because we had.

CHAIRMAN MOYER: Chair recognizes
Dan.

VICE-CHAIR GIACOMINI: Yes, I just
want to focus on, you know, the problems with
all three of these that were just mentioned
related to the TAP review were aware of by the
committee when they voted it in and they are
not new information. That is not information
now. And by all rights, the reason for going
back to the old petition, the old voting
documents, the old transcripts and the old
technical reports is to know what was known
then so that you can determine what the new
information is. And people are always open to
their free will, but technically our directive
is to deal with the new information and what
may have changed since it was originally voted
on.

CHAIRMAN MOYER: Chair recognizes
Steve.

MEMBER DeMURI: Yes, there was a
certain amount of method to our madness. We
talked about when we originally posted that
first recommendation that this would be a way
to get comment, that if we recommended that it
was going to be delisted, I bet we'll get some
more comments, and we did. And that's what we
wanted.

CHAIRMAN MOYER: Chair recognizes
Barry.

MEMBER FLAMM: This will be my
last comment, I promise.
I think the point -- you did get those comments because you got it from people were self-serving. The original TAP indicated some really serious problems with this material. So I think the responsible thing to have done then was to seek another TAP on these materials and get yourself updated.

If current information is what's holding you back, you cannot count just getting the users' input that they need it, because you've got to think about more than that. And that's what, yes, I think where the failure was, which I didn't think the way you handled it begin with in your decision was.

But now I think you made a mistake by not calling for a TAP. Because you're using your -- you said there's no new information and certainly public comment is one, but the public comment was pretty narrow, you'll have to admit. And they did respond, and you could expect that once you published it, from that source. You didn't get any
broader comment. You should have went out and sought it from the scientific community. So that is my last comment.

CHAIRMAN MOYER: I have Hue next.

MEMBER KARREMAN: I guess listening to Barry, I'm just wondering, Steve, you know, if there was strong language in there originally with the first vote you took. Then, just in the whole process, the sunset versus evergreen, and then we always hope someone petitions to take it away. You know, and yet now there's people that are using I guess alternatives, from what I understand.

You know, the petition process, as Dan has mentioned and I know, you know, from just trying to do it is stacked against the little guy who's out there. So you know, in a sense it is always self-serving. And I guess I'm just taking that into mind. When there was strong language and there are people using an alternative, it kind of gets into almost a 606 situation, commercial
availability, that we should say, you know,

ggee whiz, you know, some people are using the
alternatives that are more organic. Let's.

That's it.

CHAIRMAN MOYER: Chair recognizes

Joe.

MEMBER SMILLIE: Well, I don't

want to -- I think we made the right decision,

Barry. I understand what you're saying, but

I think we made the right decision. I don't

think we needed another TAP. What we needed

was documented evidence that people still

needed this for legitimate reasons, and I

think we got that.

We also wanted to bring some

sunshine to the sunset and clearly illustrate

to this Board and to the public that this

process I think needs to be tweaked. You

know, it is an evergreen process and it does

favor a certain direction. You know, you're

innocent until proven guilty or guilty until

you're proven innocent.
I think we need to look at it.

But right now, I don't know if we have that luxury or not, because right now we're going to be faced with a lot of sunset items. And so now I think this Board is very much aware in the different committees when they deal with sunset what the C.F.R. says, what the Policy Manual says, what the Program says and what the precedent of Board actions are.

So as we go into this huge list of sunset items coming up, we're all very aware of the limitations of the process itself, and we can't necessarily be mavericks, that there is a process there that we are directed to follow.

CHAIRMAN MOYER: I think Barry brings up a good point in his discussion points about the sunset process and the possible need for new technical reviews. Dan brings that up continuously in meetings as we're looking ahead to 2012. And as we begin to review these materials in committee, I
think the opportunity for bringing up
technical reviews on those materials that seem
appropriate, and hopefully there's not that
many of them, but when they are there, I think
Barry's point is well taken that we may need
to take advantage of that.

I have Katrina next and then
Kevin. Then I'll come back to you, Steve.

MEMBER HEINZE: I just want to
remind folks as you vote that our vote cannot
be a referendum on the sunset process.

CHAIRMAN MOYER: Right.

MEMBER HEINZE: That we need to
look at the facts for these materials and
follow the processes. It's currently before
us. Just be respectful of the past decisions
or the decisions of past boards, the fact that
we did have public comment that said this
material is needed and that our independent
look at that material concurred with folks
needing it.

CHAIRMAN MOYER: You just don't
I want to go through materials classification of definitions again.

Chair recognizes Kevin.

MEMBER ENGELBERT: This probably isn't the time, but while it's all on our minds, and Joe brings up the point that the process probably needs to be tweaked, since I've been on the Board and had the sunset process explained to me, I took it verbatim. In the few minutes that I've had to spare in the days that we've been here, I've looked through the National Rule and OFPA to try to figure out how this sunset process became an evergreen process. And I've probably overlooked it in my haste, so if someone can point it out, I'd appreciate knowing it.

But here's the only thing I found on the sunset process. It's under 21187 USC 6517 National List, (e) sunset provision. "No exemption or prohibition contained in the National List shall be valid unless the National Organic Standards Board has reviewed
such exemption or prohibition as provided in this section within five years of such exemption or prohibition being adopted or reviewed, and the Secretary has renewed such exemption or prohibition."

So it might be beneficial for all of us to have some type of a refresher course on that, whether it's our own doing or the Policy Committee or whatever to understand why this sunset process has actually become an evergreen process. And the reason I bring it up now is I think these materials point out part of the issue.

CHAIRMAN MOYER: Thank you, Kevin.

Steve?

MEMBER DeMURI: Thank you, Kevin, I agree with you. I think we need to re-look at that. There's a lot of experience out there from previous board members who would be willing to help us with that, I'm sure. So I actually have that on our workplan for the Handling Workplan to delve into that a little
bit and figure out what happened, where do we go from here, that type of thing with the Program. So we will work on that.

To Barry's point on a TAP review, we made the decision, well, actually I did; I was the primary reviewer, that we didn't need a TAP review because we had more experience on the committee probably than the rest of the industry had. I work with 20 plants that use a variety of different boiler chemicals. Some of them we would never run organic in because we can't get away without using those chemicals. And in some instances we've been able to replace those with other things and run organic. So I do believe that the industry still needs those. I just wanted to make sure that somebody wasn't using -- needed to use them without any other substances they could substitute.

CHAIRMAN MOYER: Thank you, Steve.

Dan?

VICE-CHAIR GIACOMINI: The sunset
1. is not our process. It's the Program's process, right? It's been published in the Federal Register notice, correct?
2. Been published in the Federal Register notice. It was -- I don't know what Valerie's pointing to.
4. VICE-CHAIR GIACOMINI: No, but it doesn't matter. It's not our process. It's the Program's process. They've told us how it works. It's been published in the Federal Register that this is how it works. And it has been a learning curve in the four years that we have been here. But from the very first meeting in Pennsylvania we didn't quite understand it, but it was what they were telling us was the process then. So it's not ours to change. We can work with the Program if there's something. But it's the Program's. It's OGC's. It's not ours.
5. CHAIRMAN MOYER: Thank you, Dan.
Barry and then Tracy.

MEMBER FLAMM: Well, I don't agree with that. I think the only place it appears is what Kevin just read from the Act. It doesn't appear in the rules. And it's very clear that we do have a role, and I think it is our process. And a year ago, we spent a lot of time going through the sunset, rewrote it. You all voted on it. It's in the manual. And I think you ought to reread it, because a lot of history on that. I don't think there is any -- how we ever drifted in this so-called evergreen, whatever that is, I don't know. That doesn't appear anywhere in the Act. It doesn't appear in any legislation I ever saw. So we will interpret it.

If you don't like that, one, you shouldn't have voted on it last year. But let's revisit it. But, that was the idea, was to pin this down and get some better decisions coming out and a more comprehensive decision.

And we talked about it yesterday.
CHAIRMAN MOYER: Yes, I think there's been a lot of discussion on this process. I don't want to go into this too much further. We do have a material motion on the table that we need to vote on. We're not going to change the sunset process sitting here. If that is indeed something that we want to discuss with the Program, I would suggest again that we put that on our agenda to work through the Executive Committee and with the Program on addressing those issues so we can get any points of clarification that we need.

But, I'll entertain a few more comments. Tracy and then Katrina.

MEMBER MIEDEMA: This will be my last one. Just back to what these amine boiler chemicals, amine-containing boiler chemicals are. These are food safety tools. They're to prevent pathogens and food-borne illness. Organic doesn't have as many tools in the toolbox for controlling pathogens and
I don't think we should reduce the size of that toolbox right now.

CHAIRMAN MOYER: Thank you, Tracy. Katrina?

MEMBER HEINZE: I'd like to call the question.

CHAIRMAN MOYER: Yes. That's where we're at now.

Going to call for a vote. Before I do that, I ask if there's any conflicts on any of these materials?

(No audible response.)

CHAIRMAN MOYER: Hearing none, seeing none, we will start the voting with Julie, I believe. I lost track.

SECRETARY WEISMAN: No, I started the last one.

CHAIRMAN MOYER: I apologize for that. Steve?

SECRETARY WEISMAN: Not appropriate.

MEMBER DeMURI: Not appropriate.
1  Yes.
2
3  CHAIRMAN MOYER:  Barry?
4  MEMBER FLAMM:  No.
5
6  CHAIRMAN MOYER:  Bea?
7  MEMBER JAMES:  Tell us how you really feel, Barry.
8  Abstain.
9
10  CHAIRMAN MOYER:  Bea abstains.
11  Tracy?
12  MEMBER MIEDEMA:  Yes.
13
14  CHAIRMAN MOYER:  Joe?
15  MEMBER SMILLIE:  Yes.
16
17  CHAIRMAN MOYER:  Hue?
18  MEMBER KARREMAN:  No.
19
20  CHAIRMAN MOYER:  Kevin?
21  MEMBER ENGELBERT:  We're not voting on sunset, right?
22
23  CHAIRMAN MOYER:  That's right, we're not voting on the sunset process. This is not a --
24
25  MEMBER ENGELBERT:  Handling Committee has done their work. I vote yes.
CHAIRMAN MOYER: Tina?

MEMBER ELLOR: Yes.

CHAIRMAN MOYER: Rigo?

MEMBER DELGADO: Yes.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: Yes.

CHAIRMAN MOYER: Dan?

VICE-CHAIR GIACOMINI: Yes.

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: Yes.

CHAIRMAN MOYER: And the Chair votes yes. I believe we have two nos, ten yeses, two absent and one abstention. Is that correct?

PARTICIPANT: I thought we needed eight.

CHAIRMAN MOYER: We have ten. By my calculation, that material passes.

Mr. Chairman, your next material?

MEMBER DeMURI: Thank you. This next one is also a 205.605(b) material,

similar in function to the one we just voted.
on. It's called diethylaminoethanol, CAS No. 100-37-8. It is also annotated for use only for packaging sterilization. And again, it is a chemical that's added to boiler feed water to prevent or inhibit corrosion in boilers and in steam lines in production facilities.

The TAP that was done for the previous material was the same one. They did them all together basically because they were all petitioned together originally.

I should have mentioned in the last one; I'll mention on this one, that oftentimes these chemicals are used in a blend. So it's not just that they're used individually. Oftentimes they're in a proprietary blend of chemicals that are used for boiler treatment.

Again with this one, we originally voted not to relist unanimously with one absence. And then in another vote we took a couple of days ago, we reversed our decision based on public comment and voted five yes,
zero no and one absent to relist this material.

So I move for the relisting of diethylaminoethanol with the annotation for packaging sterilization only to 205.605(b).

CHAIRMAN MOYER: We have a motion to relist. Do I have a second?

SECRETARY WEISMAN: Second.

CHAIRMAN MOYER: I have a second from Julie. Motion's on the table and there's a second. Is there discussion on this material?

(No audible response.)

CHAIRMAN MOYER: Hearing none, seeing none, I will call for the vote.

First, is there a conflict of interest on this material by any board members?

(No audible response.)

CHAIRMAN MOYER: Hearing none, seeing none, we'll begin the voting with Barry.
1. MEMBER FLAMM: No.
2. CHAIRMAN MOYER: Bea?
3. MEMBER JAMES: Abstain.
4. CHAIRMAN MOYER: Tracy?
5. MEMBER MIEDEMA: Yes.
6. CHAIRMAN MOYER: Joe?
7. MEMBER SMILLIE: Yes.
8. CHAIRMAN MOYER: Hue?
9. MEMBER KARREMAN: No.
10. CHAIRMAN MOYER: Kevin?
11. MEMBER ENGELBERT: Yes.
12. CHAIRMAN MOYER: Tina?
13. Absent.
14. Rigo?
15. MEMBER DELGADO: Yes.
16. CHAIRMAN MOYER: Katrina?
17. MEMBER HEINZE: Yes.
18. CHAIRMAN MOYER: Dan?
19. VICE-CHAIR GIACOMINI: Yes.
20. CHAIRMAN MOYER: Julie?
21. SECRETARY WEISMAN: Yes.
22. CHAIRMAN MOYER: Steve?
MEMBER DeMURI: Yes.

CHAIRMAN MOYER: And the Chair votes yes. I have two nos, ten yeses, one abstention and three absent. So it's nine yeses. That motion passes.

Mr. Chairman, your next item?

MEMBER DeMURI: Yes, the next one is the last of the three boiler chemicals that were up for sunset. It is octadecylamine and it has the same annotation as the previous two, only to be used for packaging sterilization. Everything I said about the previous two can almost carbon copy onto this one.

We did also vote not to relist it originally and then based on public comment we reversed our decision a couple of days ago and voted five yes, zero no, one absent to relist this material.

And again, it is another boiler chemical compound.

So I move for the relisting of
octadecylamine to the National List 205.605(b) with the annotation for use in packaging sterilization only.

    MEMBER MIEDEMA: Second.

    CHAIRMAN MOYER: We have a motion to relist and a second by Tracy. Is there any discussion on this item?

    Chair recognizes Kevin.

    MEMBER ENGELBERT: Yes, and I should have asked this on the first one, Steve. We rejected earlier a motion to put a dewormer on because the properties are so similar to a substance that's already on the list. Are we still sure that these are different enough that they -- I know I asked it, but again would you reiterate? These are different enough that each of these is required, that there's enough difference in what they do that they all need to be on the list?

    MEMBER DeMURI: They all have the same effect. They all inhibit corrosion, but
they all act a little bit differently in how they do that. So depending on the water quality in a specific plant, they may use one or the other or they might use a blend of all three. It just depends on the variation in water quality and production practices in a plant. If they have very long steam lines that run long distances, sometimes they need to use a blend. If it's a short run, then they can maybe get by with just one or two of them.

MEMBER ENGELBERT: Thank you.

CHAIRMAN MOYER: Chair recognizes Dan.

VICE-CHAIR GIACOMINI: Kevin, any difference in these materials would have to be -- should be new information in order for it to affect our consideration.

CHAIRMAN MOYER: Chair recognizes Bea.

MEMBER JAMES: I just have to say that I'm really surprised that you guys didn't
call for a TAP on these. That's all I've got
to say.

CHAIRMAN MOYER: Thank you, Bea.

Any other conversation or
discussion on this? Steve?

MEMBER DeMURI: We had information
that they were still being used, committee
information. And they were toxic to begin
with, so that wasn't going to change. And
that was primarily what the TAP was about.

CHAIRMAN MOYER: Any further
discussion before I call for the vote?

(No audible response.)

CHAIRMAN MOYER: Then I call for
the vote.

Before I do that, is there a
conflict of interest on this material?

(No audible response.)

CHAIRMAN MOYER: Hearing none,
seeing none, I will begin the voting with Bea.

MEMBER JAMES: Abstain.

CHAIRMAN MOYER: Tracy.
1 MEMBER MIEDEMA: Yes.
2 CHAIRMAN MOYER: Joe?
3 MEMBER SMILLIE: Yes.
4 CHAIRMAN MOYER: Hue?
5 MEMBER KARREMAN: No.
6 CHAIRMAN MOYER: Kevin?
7 MEMBER ENGELBERT: No.
8 CHAIRMAN MOYER: Tina?
9 MEMBER ELLOR: Yes.
10 CHAIRMAN MOYER: Rigo?
11 MEMBER DELGADO: Yes.
12 CHAIRMAN MOYER: Katrina?
13 MEMBER HEINZE: Yes.
14 CHAIRMAN MOYER: Dan?
15 VICE-CHAIR GIACOMINI: Yes.
16 CHAIRMAN MOYER: Julie?
17 SECRETARY WEISMAN: Yes.
18 CHAIRMAN MOYER: Steve?
19 MEMBER DeMURI: Yes.
20 CHAIRMAN MOYER: Barry?
21 MEMBER FLAMM: No.
22 CHAIRMAN MOYER: Chair votes yes.
I believe that's three nos, one abstain, two absent and that gives us nine yeses. Motion passes.

Your next material, Mr. Chairman?

MEMBER DeMURI: Thank you. The next one on the list is also a 205.605(b) item. You'll be happy to know it's not a boiler chemical.

CHAIRMAN MOYER: Yes, we are.

MEMBER DeMURI: It's a peracetic acid/peroxyacetic acid, CAS No. 79-21-0. Katrina did a very good job yesterday of describing its uses to you. It is used as a sanitizer in plants. It's one of the tools that processors have to maintain the safety and quality of their food. It was originally listed September 11, 2006, so it is up for sunset in 2011. When the committee voted on it originally a couple of months ago, it passed five yes, zero no and one absent. So I move for the relisting of
peracetic acid/peroxyacetic acid to the National List, 205.605(b).

MEMBER ELLOR: Second.

CHAIRMAN MOYER: We have a motion and a second on the floor to relist this material. Is there any discussion on this material?

Chair recognizes Tina.

MEMBER ELLOR: I'd just like to come out in favor of this one, because it's so much more benign and friendly environmentally than chlorine.

CHAIRMAN MOYER: Any other conversation or discussion on this material?

(No audible response.)

CHAIRMAN MOYER: Hearing none and seeing none, I'd call for the vote.

Is there a conflict of interest before we start on this material?

(No audible response.)

CHAIRMAN MOYER: Hearing none, seeing none, we will start the voting with
Tracy.

MEMBER MIEDEMA: Yes.

CHAIRMAN MOYER: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN MOYER: Hue?

MEMBER KARREMAN: Yes.

CHAIRMAN MOYER: Kevin?

MEMBER ENGELBERT: Yes.

CHAIRMAN MOYER: Tina?

MEMBER ELLOR: Yes.

CHAIRMAN MOYER: Rigo?

MEMBER DELGADO: Yes.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: Yes.

CHAIRMAN MOYER: Dan?

VICE-CHAIR GIACOMINI: Yes.

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: Yes.

CHAIRMAN MOYER: Steve?

MEMBER DeMURI: Yes.

CHAIRMAN MOYER: Barry?

MEMBER FLAMM: Yes.
CHAIRMAN MOYER: Bea?

MEMBER JAMES: Yes.

CHAIRMAN MOYER: And the Chair votes yes. That's zero nos, thirteen yeses, two absent. Your material passes.

Mr. Chairman, your next item?

MEMBER DeMURI: The next item is another 205.605(b) item. It is tetrasodium pyrophosphate. And as I described yesterday, it has the annotation "for use only in meat analog products." It was originally listed in 2006 based on an NOSB recommendation of April 2004.

PARTICIPANT: He switched the order?

MEMBER DeMURI: Oh, the order got switched.

CHAIRMAN MOYER: Did you switch the orders? The question is, Steve, whether you switched the order on our voting sheet. It's just an administrative technicality. It just makes it harder for those recording.
MEMBER DeMURI: Yes, I accidently did. Let me go back and do the right one.

CHAIRMAN MOYER: We appreciate that.

MEMBER DeMURI: That was an error on my part. I flipped too many pages. Sorry about that. Thank you.

CHAIRMAN MOYER: Not a problem.

MEMBER DeMURI: The next item is sodium acid pyrophosphate, a 205.605(b) item. It is also referred to as SAPP. It was originally listed September 12th, 2006. It's CAS No. 7758-16-9. There is an annotation with this one, "for use only as a leavening agent."

The original committee vote was five yes, zero no, one absent. No new information was brought before us or did we find any new information when we did an investigation on this material. So we did vote to relist it at the committee level. So I move for the relisting of
sodium acid pyrophosphate, 205.605(b), with
the annotation "for use only as a leavening
agent."

CHAIRMAN MOYER: We have a motion
on the floor to relist this material. Do I
have a second?

SECRETARY WEISMAN: Second.

CHAIRMAN MOYER: I have Julie as a
second.

We have a motion on the floor and
a second. Is there discussion on this
material?

(No audible response.)

CHAIRMAN MOYER: Hearing none and
seeing none, I will call immediately for the
vote.

First, is there a conflict of
interest on this material?

(No audible response.)

CHAIRMAN MOYER: Again, not seeing
or hearing any, we'll continue with the voting
process beginning with Joe.
MEMBER SMILLIE: Yes.

CHAIRMAN MOYER: Hue?

MEMBER KARREMAN: Yes.

CHAIRMAN MOYER: Kevin?

MEMBER ENGELBERT: Yes.

CHAIRMAN MOYER: Tina?

MEMBER ELLOR: Yes.

CHAIRMAN MOYER: Rigo?

MEMBER DELGADO: Yes.

CHAIRMAN MOYER: Katrina?

MEMBER HEINZE: Yes.

CHAIRMAN MOYER: Dan?

VICE-CHAIR GIACOMINI: Yes.

CHAIRMAN MOYER: Julie?

SECRETARY WEISMAN: Yes.

CHAIRMAN MOYER: Steve?

MEMBER DeMURI: Yes.

CHAIRMAN MOYER: Barry?

MEMBER FLAMM: Yes.

CHAIRMAN MOYER: Bea?

MEMBER JAMES: Yes.

CHAIRMAN MOYER: Tracy?
MEMBER MIEDEMA: Yes.

CHAIRMAN MOYER: Chair votes yes.

By my tally, I have zero nos, thirteen yeses, two absent. And your material passes, Mr. Chairman.

Your next item?

MEMBER DeMURI: Thank you, the next item is the last item. It's also a 205.605(b) item, tetrasodium pyrophosphate. As I mentioned before, it does carry the annotation "for use only in meat analog products." It was originally listed in September 2006 and approved by the NOSB in April of 2004.

The original committee recommendation was for relisting and the vote was yes, five; no, zero; with one absent. I recommend for the relisting of tetrasodium pyrophosphate with the annotation "for use only in meat analog products" to 205.605(b).

CHAIRMAN MOYER: There's a motion
on the floor. Do I have a second?

VICE-CHAIR GIACOMINI: Second.

CHAIRMAN MOYER: Dan seconded. So I have a motion and a second.

Is there any discussion on this material?

(No audible response.)

CHAIRMAN MOYER: Hearing none and seeing none, I will call immediately for the vote.

First of all, is there a conflict of interest on this material?

(No audible response.)

CHAIRMAN MOYER: Hearing none and seeing none, we'll begin the voting process with Hue.

MEMBER KARREMAN: my very last vote on this Board, I'm glad to start this off and I vote yes.

CHAIRMAN MOYER: Kevin?

MEMBER ENGELBERT: Yes.

CHAIRMAN MOYER: Tina?
1    MEMBER ELLOR: Yes.
2    CHAIRMAN MOYER: Rigo?
3    MEMBER DELGADO: As my very last
4    vote, yes.
5    CHAIRMAN MOYER: Katrina?
6    MEMBER HEINZE: Yes.
7    CHAIRMAN MOYER: Dan?
8    VICE-CHAIR GIACOMINI: Yes.
9    CHAIRMAN MOYER: Julie?
10   SECRETARY WEISMAN: My last one.
11   Yes.
12   CHAIRMAN MOYER: Steve?
13   MEMBER DeMURI: Yes.
14   CHAIRMAN MOYER: Barry?
15   MEMBER FLAMM: Yes.
16   CHAIRMAN MOYER: Bea?
17   MEMBER JAMES: End on a positive
18   note, yes.
19   CHAIRMAN MOYER: Tracy?
20   MEMBER MIEDEMA: Yes.
21   CHAIRMAN MOYER: Joe?
22   MEMBER SMILLIE: Yes.
CHAIRMAN MOYER: And the Chair votes yes. I have no votes, thirteen yeses, two absent. And your material passes, Mr. Chairman.

Do you have any other items before this Board?

MEMBER DeMURI: No, I do not.

That is it.

CHAIRMAN MOYER: By my recollection, that concludes the voting process of this Board. We stand in adjournment until 4:00 when we will reconvene with the rest of our business. We deserve a break. Thank you.

(Whereupon, the above-entitled matter went off the record at 3:44 p.m. and resumed at 4:04 p.m.)

CHAIRMAN MOYER: If board members could take their seat, we're going to get started with the rest of our meeting. We're in the home stretch here, folks. Appreciate your patience, both in the gallery and on the
Before we jump into the next agenda item, which is the recognition of outgoing board members, Hue Karreman has asked if he could make a comment for the record.

Hue, the floor is yours.

MEMBER KARREMAN: Sorry to be just on a somber little note. I have just heard out in the lobby that there is maybe perhaps a rumor, whatever, that I produce genetically engineered vaccines and I have a conflict of -- hey, you guys, I want to just state the fact, I do not. And the product I do produce and I plan to produce is a biologic. I've been producing it for the last six, seven years. It's called hyperimmune plasma. And it is all because of 205.238(c)(7), no use of antibiotics, that I've developed a non-antibiotic treatment for infectious disease. It is not producing vaccines. Okay? Sorry. I just had to say that on the record so it's out there and not just little rumor mill like
at the lunch table I heard was out there
today. Thank you.

CHAIRMAN MOYER: Thank you, Hue.

No, I think it's important to get that on the
record. We want to make sure that there are
no conflicts of interest in the voting
process.

MEMBER SMILLIE: I want you to
clarify the nicotine in the barn though.

CHAIRMAN MOYER: Okay. One more
agenda item that I want to do before we get
into recognition of outgoing board members.
And that is, I know that some of the incoming
board members -- I understand four of you are
still in the room. Several of you are unknown
to our fellow board members. If you could at
least stand up. I know Jay I can see back
there. John is here. Joe is here. Wendy.
Okay. Just stay standing, please. Stand up
and stay standing. If you could just say your
name for everybody so they're going to know
who are you coming in.
1 John?
2 MR. FOSTER: John Foster. I work
3 with --
4 CHAIRMAN MOYER: The transcriber can't hear. If I just repeat their name, it
5 will save them from coming up. Well, I didn't
6 want to have to have everybody come up to the
7 microphone.
8 We have John Foster standing over
9 here. Joe Dickson is standing on the side of
10 the room. Jay, you want to put up your hand?
11 Jay Feldman. And Wendy. And I apologize, I
12 don't know your last name yet, Wendy.
13 MS. FULWIDER: Wendy Fulwider.
14 CHAIRMAN MOYER: Wendy Fulwider in
15 the back of the room standing there. So at
16 least the Board now knows who you are. We
17 appreciate so much you coming to sit in on
18 this meeting.
19 (Applause.)
20 CHAIRMAN MOYER: And you know
21 you're in trouble when they give you an
applause before you even start the show.

Okay. At this point, I want to
turn the meeting over to Valerie for a moment
for recognition of outgoing board members.

We have some photos we want to
take, I know that.

Tina, if you would like to get --
we have some gifts for outgoing board members.
We've been saying a lot of thank yous here.

Valerie?

MS. FRANCES: I would certainly
really love it if Hue Karreman, Rigo Delgado,
Julie Weisman and Bea James, if you would call
come up into the center. We want to honor you
and thank you for all your amazing service.
And I know that the service doesn't come from
the Program; it comes from the Board also.

CHAIRMAN MOYER: Yes.

MS. FRANCES: So we're doing a
mutual service recognition.

CHAIRMAN MOYER: That's right. So
if those board members would come to the front
of the room, we do want to take some formal pictures.

(Off-mic comment.)

(Whereupon, the above-entitled matter went off the record at 4:08 p.m. and resumed at 4:13 p.m.)

CHAIRMAN MOYER: We have two more people that we'd like to acknowledge. One of them is not with us at the moment, but one of them is.

Richard Matthews, if you'd come up, we'd like to thank you as well as the Board.

(Applause.)

CHAIRMAN MOYER: We really appreciate all your years of service to the Program, to the community, to this Board and supporting the work that we do. If you have anything you want to say, this is your last chance. And we won't gavel you down. And you
don't have to sign up. You don't have five
minutes.

MR. MATTHEWS: Well, you're
running late, so I'll keep it short. It's
been a pleasure being here at the meeting.
It's kind of fun being on the back row instead
of the front row. But what I've really missed
about the front row is there was so many times
I wanted to grab the microphone and interject
my own thoughts. So it's been really tough
getting acclimated to having to keep my mouth
shut.

(Applause.)

CHAIRMAN MOYER: Just for the
record, we also have a gift bag for Barbara.
She's busy working on her other duties and
tasks, so she's not here. But we'll make sure
that she gets that gift as well.

Thank you. I also acknowledge
that we have a gift bag for Gerry as well.
We'll see if that gets sent out to him. He
did expect to be here, but unfortunately
1 couldn't make it.

2 Okay. The next order of business
3 before this Board is our election of new
4 officers. We have an election procedure that
5 we reviewed before we came to this meeting.
6 The process will be that we will vote for
7 three offices; chair, vice-chair and
8 secretary. We will vote for them in that
9 order, one office at a time, allowing somebody
10 who may not have gotten their first choice as
11 office to submit their name or be nominated
12 from the floor for an alternate position.
13
14 We will start then with the
15 election of our new chair.
16
17 Madam Secretary, if you have the
18 ballots, we'd like to pass those out.
19
20 SECRETARY WEISMAN: Actually,
21 every one has a set now.
22
23 CHAIRMAN MOYER: Oh, everybody has
24 them? Thank you. They're so efficient.
25
26 Everyone should have a ballot with
27 chairman, vice-chairman and secretary, one,
two and three. We will take nominations from the floor for those positions. Just hand write them in in the order that they're given. Circle the one that you select. Fold that up. We will collect it. The Chair opens them, reads them, confirms them with the Secretary and then announces the winner.

Is that process agreeable to everybody? That is the process we have in our Procedure Manual.

PARTICIPANT: So it's totally silent?

CHAIRMAN MOYER: Totally silent.

All done by ballot.

PARTICIPANT: So wait a second. So there's no nominations --

CHAIRMAN MOYER: Yes. No. Yes, the nominations come from the floor right now.

No silent --

Yes. Well, that's one way to do it. No, it's not completely silent. The voting will be silent. The nomination will
not be silent.

Okay. If we have any nominations for any chairman position from the floor, now would be the time to make that nomination.

Chair recognizes Hue, then Tina.

MEMBER KARREMAN: I'd like to nominate Dan Giacomini to be chair of the NOSB.

CHAIRMAN MOYER: Thank you, Hue. We have Dan as a nominee for chair.

Are there any other nominations for chair from the floor? I see Bea and then Julie.

MEMBER JAMES: I would like to nominate Tracy for chair.

CHAIRMAN MOYER: Tracy is nominated for chair. Are there any other nominations?

(No audible response.)

CHAIRMAN MOYER: Do I hear a motion to close the nominations?

MEMBER HEINZE: So moved.
CHAIRMAN MOYER: I think Katrina moved that we close the nominations. Joe seconded it. All those in favor say aye.

ALL: Aye.

CHAIRMAN MOYER: The nominations are closed. Please cast your ballot for the chairman position by circling the name you have on your card.

As one comedian said, talk amongst yourselves.

(Whereupon, the above-entitled matter went off the record at 4:19 p.m. and resumed at 4:22 p.m.)

CHAIRMAN MOYER: Ladies and gentlemen of the Board, if I could have your attention. Behave. I'd say we're going to have to separate you, but we already did and it's not working.

It gives me great pleasure to announce to you the new chairman of the National Organic Standards Board, Dan Giacomini.
(Applause.)

CHAIRMAN MOYER: Thank you, fellow board members.

Now we will do the same process for vice-chair. I will entertain nominations from the floor for vice-chair.

Barry?

MEMBER FLAMM: I'd like to nominate Jeff Moyer for vice-chair.

CHAIRMAN MOYER: Thank you, Barry.

Hue Karreman?

MEMBER KARREMAN: I'd like to nominate Tracy Miedema for vice-chair.

CHAIRMAN MOYER: Thank you, Hue?

Are there any other nominations from the floor?

(No audible response.)

CHAIRMAN MOYER: I will entertain a motion to close the nominations.

MEMBER SMILLIE: So moved.

CHAIRMAN MOYER: Joe moves to close the nomination. I need a second for
PARTICIPANT: Second.

CHAIRMAN MOYER: And I need an aye or a nay. All those in favor, say aye.

ALL: Aye.

CHAIRMAN MOYER: Opposed, if any?

(No audible response.)

CHAIRMAN MOYER: Okay. The nominations are closed. Please cast your ballot.

VICE-CHAIR GIACOMINI: Mr. Chairman?

CHAIRMAN MOYER: Yes?

CHAIRMAN MOYER: As current vice-chair, I think it would be appropriate to suspend the rules this time and you not collect and count the votes maybe?

CHAIRMAN MOYER: I appreciate that.

VICE-CHAIR GIACOMINI: Okay. I'll do that for you.

CHAIRMAN MOYER: And the Secretary
can do it with you.

VICE-CHAIR GIACOMINI: Thank you.

CHAIRMAN MOYER: Or collect them.

VICE-CHAIR GIACOMINI: There are supposed to be two though.

CHAIRMAN MOYER: That's fine.

Yes, you guys count them.

(Whereupon, the above-entitled matter went off the record at 4:23 p.m. and resumed at 4:27 p.m.)

SECRETARY WEISMAN: Mr. Chairmans, acting and current, I'm pleased to announce that Tracy Miedema is the next vice-chair.

(Applause.)

CHAIRMAN MOYER: Thank you, Madam Secretary.

We have one more position to vote for. That is the position of secretary, a very important and hardworking position.

Do we have any nominations from the floor? Bea?

MEMBER JAMES: I would like to
nominate Tina.

CHAIRMAN MOYER: Tina Ellor. Any other nominations from the floor?

(No audible response.)

CHAIRMAN MOYER: Hearing no nominations, do I hear a motion to close the nominations?

PARTICIPANT: So moved.

CHAIRMAN MOYER: It's been moved. And I saw another hand, so I consider that a second to close the nominations. Given the fact that we only have one candidate for that position, by acclimation I declare you secretary. Welcome aboard.

(Applause.)

CHAIRMAN MOYER: Thank you, everybody, for your voting for officers.

The next item on our agenda is committee workplans. What I'd like to do is, I'll follow the same order that we had when we presented our information at this particular meeting. So what we're going to do is, we're
going to start with Policy and Development.
And current chairs, if you can give us your
workplan items, we would greatly appreciate
that.

So I will start by asking,
Chairperson Barry, if you can give us your
Policy and Development Committee workplan?

MEMBER FLAMM: Yes. Thank you, Jeff. Part of what I'll report on the
committee has discussed and we've decided, but
several items have come up in the course of
the meeting that we will probably want to
consult and add to the workplan.

The first item is helping to
prepare training materials for the new board
members, a function that the committee has
done in the past.

The second item, one of which
started out to be part of our review of
Section 5 of the Policy and Procedure Manual.
That was a collaboration process with the
Program. We decided after some time of
looking at it, it was much better to wait
until the new people and Miles got established
and discuss jointly how we can best work
together. And probably something that will be
probably a productive subject at the retreat
that we're talking about, that Miles is
talking about.

We had on our proposed workplan
the review and update of the New Member Guide.
We've been working on the Policy and Procedure
Manual, and without too much attention to the
New Member Guide. And we need to keep those
two in sync.

And then again something we keep
postponing is the update of Section 8 of the
Policy and Procedure Manual; that is, if it's
timely in terms of material reviews and so
forth.

The things that came up during
this meeting would be of course the addition
of the classification of materials in the
Policy and Procedure Manual when that is
completely fleshed out. Well, we'll have to
talk to Materials about whether they think
it's ready to put in the Policy and Procedure
Manual.

Another item that came up was the
public access of guidance documents and having
some procedures on how we can improve that.

It appears that there still seems
to be work to clarify how these technical
corrections, or whatever. So relating to
Hue's proposals and make sure going forward
that there is clarity on that subject.

And then finally, a new proposal
discussing perhaps rotation of the current
Board positions so we don't have so many
people going off at one time.

These last items have not been
discussed with the committee members, but it's
been either suggested by individual members or
just picked up in the conversation. So it's
not really our official plan, but that's where
we are right now, Mr. Chairman.
CHAIRMAN MOYER: Thank you, Barry.

You have a question for Barry, Hue?

MEMBER KARREMAN: Just one question. Maybe I wasn't listening close enough, but what are my proposals?

MEMBER FLAMM: No, it related to your petition or whatever we characterized. Your technical corrections on the agenda. And the questions that came up during that was to, if need be, clarify that in the Policy and Procedure Manual.

Any other questions?

(No audible response.)

MEMBER FLAMM: That's all I have.

CHAIRMAN MOYER: Thank you, Barry.

Appreciate that committee report.

Moving on, we have the Compliance, Accreditation and Certification Committee.

Joe Smillie, chairperson. Your report, please?

MEMBER SMILLIE: Well, as Barry
mentioned, I think every committee has to take into account this February strategy session is going to be crucial, because that will determine, I think, the workplan for the entire NOSB; at least I hope it will, because I really look forward to working with the NOP in the prioritization tasks. So that to me is paramount and that will determine what we think right now is our workplan.

Also, I think, as Tracy just suggested, it's a good idea not to have a long workplan, I think, at this point in time, because of that meeting and some other considerations, namely that the NOP is still, supposedly with all these new hires, going to catch up on a lot of previous recommendations that we made and we don't want to burden them with too many more. I'm not being facetious. I'm actually serious.

The other thing is perhaps now with this new enlarged work crew at the NOP, they'll be coming back to us with questions
about previous recommendations. The one I think from this committee that I'm just anguished about that has gotten no response as yet from the NOP is the expiry date and standardization certificates, something as basic as that for the whole program. We still haven't heard boo from the NOP and I expect to hear something from them. So I'm anticipating that they may get back to our committee with questions about previous recommendations, questions about the ones we just passed; retailer guidance, personal care. So I want to leave some space, if necessary, for responding to NOP work on previous recommendations.

Then down to the two that I think we still have on our workplan. One is the good old 100 percent issue, the issue of the label claim of 100 percent and what that entails. There's been still some controversy and some very bad feelings in the industry about the recent NOP current thinking on that
issue, which we hope to resolve, because again, the NOP has not resolved it at this point.

And last and certainly not least is an expanded version of a workplan that is all about the made-with-organic label claim. The label claim made with organic is, as you just saw, we just got a notice from the NOP that they're looking at the use of "organic" in company names. They're also looking at the use of "organic" as far as like mislabeling of the "made with." We're going to look at that. It was already in our workplan in the narrow sense that we were going to look at seeing what opportunity there is, or whether there's some need or desire for a specific label or subset of the current USDA label to identify that particular labeling claim. And that was a request from the previous NOP administration. Whether this current NOP administration wants it or not, we'll certainly talk to them.
But that's the workplan for the CACC.

CHAIRMAN MOYER: Thank you, Chairman. I think that's a complete list. That will keep you busy for a few months.

Next committee would be Materials Committee. Dan is current chair of that committee.

VICE-CHAIR GIACOMINI: Thank you, Mr. Chairman.

Materials Committee has a number of items on its workplan, some of which will never go away. We always be monitoring and managing the issue of petitions, new petitions as we receive them from the Program.

We will also this next year, and including the first half of the year up to the spring meeting, dealing with 2012 sunset. And the Materials Committee would like all the committees to remember that we're all having to deal with those, and there's going to be a lot of sunset items that we're going to have
to spend time on.

So the third is the classification of materials next step issues, following up on the next step part of that document.

Number four, we pulled back and we'll be re-looking at fine tuning the nanotechnology document.

And then number five, to work with the Program and deal with the issues of the petitions that were involved in the take-from-the-table recommendation from maybe a year ago. That may have just been last meeting, but take-from-the-table. And also the items that have been identified as materials never on the table; we'll call it that, that seemed to have slipped through the cracks somewhere. We'll be working with the Program and figuring out what the status of those are and how to proceed.

CHAIRMAN MOYER: Thank you, Dan. Appreciate that workplan.

I should also mention to your
committee and others, as you sort of did, I
got a note handed to me by Bob Pooler that
says, "Please ask the NOSB committees that are
reviewing 2012 sunset to submit their requests
for new technical reports to the Program as
soon as possible." So as that gets posted in
the Federal Register, those reviews will have
to take place.

Next committee would be Crops
Committee. Tina?

MEMBER ELLOR: Our workplan has
changed very little since we talked about it
in Executive Committee. We have since
received five technical reports, which we have
not had a chance to look at. So the materials
we'll be looking at are ethylene glycol; which
we finally got the technical review for that,
tetramethyldesildiol-something-or-other.

CHAIRMAN MOYER: You know, when
you can't say them, it's fun, I know.

MEMBER ELLOR: Yes.

CHAIRMAN MOYER: Nobody has more
trouble than me.

MEMBER ELLOR: Polycaprolactone,
tall oils distilled, ethylene DDA,
difluoroethane. We're still waiting for
reviews on PGML, which I can't pronounce, so
I'm not going to. And we have a petition to
remove ferric phosphate, and that kind of
slides into our sunset materials. We have
terpenes on here. And somebody brought that
up again, I think maybe Zea, that we want to
drag that out of the dark and take a look at
it as well. It's going to be hard to find
time to do that, but we're going to really
try.

2011 sunset materials. Ferric Phosphate. And then the, I think, 38 or 39;
I can't remember the exact number, of 2012
sunset materials, which we'll be dividing and
conquering hopefully here soon.

Under other recommendations, we
have continuing work with the comments we got
on the greenhouse standards, soil systems.
CHAIRMAN MOYER: One minute, Tina.

Valerie?

MS. FRANCES: I'm sorry, I didn't hear if you said tall oils.

MEMBER ELLOR: Tall oils?

CHAIRMAN MOYER: Tall oils?

MS. FRANCES: You did?

MEMBER ELLOR: Yes.

MS. FRANCES: Did you? Okay.

CHAIRMAN MOYER: Yes. Thank you.

MEMBER ELLOR: As opposed to short ones. I don't know what that means.

Mushroom standards, which actually, you know, I've been talking with Miles about that and hopefully we'll get on that during our next committee meeting Monday.

Talk to you all Monday.

Food safety, which was something we had talked about taking a stab at.

And of course, the never ending, soon to be ended list 4 inerts in pesticide saga, which we'll be working on.
And anyone on the Crops Committee, if you can think of anything I've left out; I think I've covered it all. And that's it. Thank you.

CHAIRMAN MOYER: Thank you, Tina, for that report on Crops.

The next committee would be Livestock. Hue, if you can give us your workplan?

MEMBER KARREMAN: You know, I'm just listing the inerts, and the very first meeting I ever went to at the USDA Building in 2001, they were talking about inerts and this problem. So I hope it gets done some day, that saga.

Our Livestock, the workplan is actually very short, because we got a lot done in the last few years. We're going to; not me, but the rest of the committee, the new committee will be filling in those stocking rate tables hopefully in conjunction, interaction with the industry, come up with a
definition for animal health care products, both of those being on that animal welfare document.

Talked about and maybe actually work on apiculture, honeybees. Finally, they rise to the top.

And then of course the sunset materials for 2012. That's it.

CHAIRMAN MOYER: We won't be working on aquaculture, correct?

MEMBER KARREMAN: We will not. We will not.

CHAIRMAN MOYER: Thank you very much.

MEMBER KARREMAN: We got it done.

CHAIRMAN MOYER: Thank you, Hue, for that report on Livestock Committee.

Joint Materials and Handling Committees is not a standing committee. It's an ad hoc committee. Will you be working during the next session on anything, or is your work completed?
MEMBER HEINZE: No, we will have
-- I'm sorry, guys. We do have the guidance
document to be working on. And then the items
that we were unable to complete. So we do
have some more work. So I'm looking forward
to, in Joe's words; I'm not going to get it in
the right order, bribing, cajoling, whatever
else I have to do. Whatever it takes.

PARTICIPANT: And inspire.

MEMBER HEINZE: Oh. Oh,
inspiring, yes.

CHAIRMAN MOYER: Thank you,
Katrina. Sad to hear that the joint committee
still needs to stay standing, but I'm glad
you're there and you can do that work.

And a question from Hue.

MEMBER KARREMAN: Not a question.

Can I add something to our workplan?

CHAIRMAN MOYER: You're going to
add something to the Livestock workplan?

MEMBER KARREMAN: Yes.

CHAIRMAN MOYER: Yes, we --
MEMBER KARREMAN: She can back up.

CHAIRMAN MOYER: Just one moment.

MEMBER KARREMAN: I'm sorry.

CHAIRMAN MOYER: Are you finished, Katrina, with your workplan?

MEMBER HEINZE: Yes, I am. Thank you.

CHAIRMAN MOYER: Thank you very much. We will return then to the Livestock Committee, Hue, if you have something to add to your list?

MEMBER KARREMAN: I apologize, Katrina. I thought you were done.

MEMBER HEINZE: I was. You were good.

MEMBER KARREMAN: Okay. A compound called methionine. Please add that.

CHAIRMAN MOYER: Thank you very much. Yes, I don't know how we forgot it.

Okay. The Handling Committee.

Steve, chairperson. If, Steve, you can give us your workplan?
MEMBER DeMURI: Thank you. Number one is to work with the joint committee on the follow ups for the clarification of materials including the guidance document. We'll be part of that, half of that committee.

We do have four petition materials. Glucosamine and pectin low methoxyl non-aminated, which have been in the docket for awhile. We're waiting for technical reviews for those for quite a while now. And two fairly new petitions. One for calcium acid pyrophosphate and another petition for sodium acid pyrophosphate for expanded use, in addition to what it's already used for. And I made a request to Bob for technical reviews on those a month or so ago, so those four are on the list.

And then we have a huge amount of sunset materials coming up for 2012. I've already started dividing these up a little bit, but we have 20 205.605(a) items, 34 205.605(b) items and 41 205.606 items, for a
grand total of 95.

CHAIRMAN MOYER: Wow.

MEMBER DeMURI: So that's going to be taking most of our time over the next year or so.

CHAIRMAN MOYER: Yes.

MEMBER DeMURI: And also, what I just added today was sunset procedure clarification. We'd like to be involved in part of that discussion, too.

So and as Joe mentioned, I'm looking forward to the strategy session with the NOP. That could radically dramatically change this list possibly, but that's what we have for now.

CHAIRMAN MOYER: Thank you, Steve.

I appreciate that.

I'm going to put one item on the Programs Workplan, and that is to set the date for that strategic retreat. January, February, those dates are filling up very fast for some of us and we need to work that into
our calendars as quickly as possible from your end. You've got to give us some dates to work with. So I would appreciate that.

That concludes our workplan portion of this meeting. The last item we have on our agenda is to ask if there is any more business before this Board from board members?

MEMBER Demuri: I have one question.

CHAIRMAN Moyer: We have a question from Steve.

MEMBER Demuri: We have a date for the spring meeting yet?

CHAIRMAN Moyer: I know we had blackout dates that we submitted. Did you come up with a date?

MS. Frances: We got so many responses really at the last minute and we've been here, and I really haven't had a chance. I would say roughly probably the last week of April.
CHAIRMAN MOYER: Okay.

MS. FRANCES: But not confirmed at all.

CHAIRMAN MOYER: Thank you very much. Well, it is important to our workplans, because we have to work backward from that date to get our work done so that you have time to post everything.

Good point, Steve. Thank you.

Bea?

MEMBER JAMES: I just wanted to in closing, if I can, a closing comment. Can I do that. Are we ready for that?

CHAIRMAN MOYER: You may do that.

MEMBER JAMES: Okay. I'll try not to get all choked up. It's funny, because I've been like I can't wait to get off the Board.

I just want to thank the NOP for the opportunity to serve. And this experience has been really incredible for me and I've learned a lot. I mean, I probably would be
like the poster child for coming in green.
And learning a lot. And, you know, I mean,
Rigo and I both, I'll never forget that first
meeting, we were just pretty much jaw-dropped
the entire time. But a great thing came out
of that, the New Member Guide, so nobody would
ever be put in that position again.

And from the first board that I
worked with, just incredible people and the
people that, you know, stick it out in the
peanut gallery. What an incredible group of
people that are helping to drive the industry
and do good things. And it's just been a real
honor to be able to do my best to represent
the whole organic industry. So thank you.

And this is what really makes me
get all choked up. Valerie, thank you.
You've just been awesome and I've enjoyed
working with you so much. And I just can't
say enough about what a huge asset you are to
the harmony of the entire program. So namaste
to you.
CHAIRMAN MOYER: Thank you.

MEMBER JAMES: And thank you.

(Applause.)

CHAIRMAN MOYER: Any other business before this Board? Rigo?

MEMBER DELGADO: Mr. Chairman, thank you very much. I just want to echo Bea's sentiments. Hopefully I won't choke as much, but I would like to congratulate you, Mr. Chairman, for such a wonderful meeting today and for conducting the business of the Board throughout this year in such an exceptionally professional way.

I also want to congratulate the new members of the Executive Committee; Dan, Tracy and Tina. These are very exciting times and there are many changes and resources coming this way. And I congratulate the rest of the members and the new members that are coming. I think you'll be able to gain a lot from what we learned, at least that's what I hope will happen. And I'm sure you'll be able
to apply it and improve from what we left behind. I have for sure friends for life here. You have a friend for life and I hope to see you very soon. Thank you.

CHAIRMAN MOYER: Thank you, Rigo.

(Applause.)

CHAIRMAN MOYER: Any other business before this Board? Julie?

SECRETARY WEISMAN: Come on, I got to take my final --

CHAIRMAN MOYER: It is your stage.

SECRETARY WEISMAN: I'll keep it short, though. I've said it before. People are probably sick of hearing me say it, but I got to say it one more time. How blessed I feel to have been on this Board and at this time. And I will miss working with everybody at this table, not that I won't be around and trying to keep you honest and help you out, but it won't be the same. It really won't be the same. And I truly, truly will miss it and appreciate having had this in my life. My
business partner and my family might have other thoughts about it, but it's been a very, very enriching experience and I'm grateful.

CHAIRMAN MOYER: Thank you, Julie.

(Applause.)

CHAIRMAN MOYER: Any other business before this Board? Hue?

MEMBER KARREMAN: Maybe I get the last word in. No, you still do. Darn.

I've just really enjoyed being on the Board, even though it's been totally overwhelming a lot of the time. And I just really know that we have formed really good relationships here on the Board and into the future it will go. And, you know, all I've been wanting to do the whole time is to say when I'm done, hopefully I've made a difference in the lives of the farmers and the animals, so the animals are happy and well cared for. And I think we've accomplished that with many things here on the Board, so thank you very much.
CHAIRMAN MOYER: Thank you, Hue.

(Applause.)

CHAIRMAN MOYER: In that same vein -- I'm sorry. We have another comment? Tina?

MEMBER ELLOR: No, I just want to ask if there's by any chance somebody in the gallery who lives close to Gerry? Is there anybody?

(No audible response.)

MEMBER ELLOR: No?

CHAIRMAN MOYER: We'll --

MEMBER ELLOR: Oh, okay. Then --

CHAIRMAN MOYER: I can take it home. I'll see that it gets shipped. It's a heavy item. I'll send it.

MEMBER ELLOR: Thank you anyway.

CHAIRMAN MOYER: Well, then in closing, I would like to say that Gerry is absent. It is his last meeting. I know if he was here he would have something he'd want to say. I just want it to go on the record that I know Gerry worked extremely hard, would
share all the sentiments of all the other
board members that have spoken on their last
meeting. It's unfortunate that he couldn't be
with us. I know he wanted to be. But he also
has built friendships and respect in the
community that is beyond description, as with
the rest of the board members. So on Gerry's
behalf, I wanted to make that comment.

And on my own behalf I wanted to
say it's been a real honor and privilege to
share as your chair and your vice-chair prior
to this. I know that I'm leaving this part of
the administrative team in very good hands
with Dan, Tracy and Tina. I will miss getting
Dan out of bed at 7:00 on Monday mornings to
have our administrative conference calls. It
was easy for me; hard for Dan. It's nice to
hear Dan swirling the spoon the cup of coffee
going, "Oh, boy." So I will miss that.

VICE-CHAIR GIACOMINI: We'll have
to see if I'm any better at bringing on the
light in the morning than you were.
CHAIRMAN MOYER: Yes. So I did appreciate being your chair. It was an honor and privilege to serve you in that capacity and I thank you very much.

(Applause.)

CHAIRMAN MOYER: We are officially adjourned until spring.

(Whereupon, the meeting was adjourned at 4:54 p.m.)
