The series of first formal NOSB Committee meetings began with a convening of International Issues and Accreditation Committee members in Washington, D.C., May 1 and 2. The meetings of the Crops, Livestock, Processing, and Materials List Committees in Minneapolis, May 4-6, were preceded by a general session, with all Board members present. During this general session, which lasted until close to 5 p.m. on Monday, administrative matters were discussed, presentations by the public heard, and the definition of organic deliberated.

The facilitation of communication among Board members and USDA staff was discussed and ideas for document distribution and interim conference calls presented. Regarding public input, Committee Chairs are to advise the USDA of the technical expertise required to meet their Committee workplans. Interested parties contacting the USDA seeking placement on Committee agendas will be referred to Committee Chairs.

Those outside parties seeking to provide public input in the form of formal presentations at full-Board or Committee meetings are required to submit written testimony. It would be of great assistance if sixteen (16) 3-holed punched copies made available to Board and USDA staff members prior to the presentation, given the limited amount of clerical support available. Documents submitted by the public to Board members will be considered "Working" documents.

Regarding individual Board member responses to unsolicited contact by public parties, it was decided that Board members should encourage these parties to submit their concerns in writing to the full-Board or appropriate Committee Chair.

Committees were notified of the option to hire technical advisors where needed. Interested Committee chairs are to provide a written proposal with purpose and estimated cost along with suggestions for individuals to conduct the work.

Advisory Board funds for Fiscal Year 1992 have been cut to $100,000; no change in the $780,000 in USDA appropriated funds now in the Administration's budget has yet been reported.

During the public input session, the following individuals addressed subjects of relevance to Board decisions:

- Paul Janssen, a natural and organic products distributor from Minneapolis, expressed his hope that the regulations concerning organic production would be workable for all farm sizes.
Bill Welsh, an organic livestock producer from Lansing, Iowa, described the maintenance of long term soil health and the packaging and labelling of organic meat products sold at the retail level as critical components of organic regulations. He also warned the Board that any exception, such as less than 100% feed for organic livestock, would eventually become the rule.

Mel Coleman, a natural and organic beef producer from Denver, Colorado, appealed to the Board for the inclusion of a definition for both transitional and natural livestock products. He commented that there is not enough organically-grown grain to feed all his naturally-grown cattle at the present time. He also explained the audit trail of his business, and stressed that the Organic Foods Production Act is not a food safety act but one that regulates the raising of animals.

Tom Ables, a farmer of 4,000 acres OCIA-certified cropland in Minnesota and South Dakota, expressed his concern that practitioners of the organic philosophy were being excluded in the industry's efforts to self-regulate itself for marketing purposes. He also advised the Board to build a mechanism for change into the recommended regulations, since practitioners are acquiring new knowledge daily.

Jim Glassmand of North County Coop in Minneapolis asserted that Coop consumers are concerned about genetically-engineered organisms derived from gene splicing that in his view would not fit the term "organic."

Ray Gengler, a grower/processor, portrayed his problem in obtaining untreated seeds of the varieties and characteristics to bring in adequate yields as one that may affect many organic growers.

Lyndon Torstenson, a member of the urban-rural Minnesota Food Association, communicated his association's concern about the safety, secrecy, and ethical issues pertaining to biotechnology research and described the consumer's expectation that nature is not fundamentally altered in organic food production.

Arnold Patsoldt, a maple syrup producer from Grand Rapids, Minnesota, claimed that syrup cannot be purely organic when the chemical properties typically added to clear the sap are used.

Robert Sharlou, of OCIA-Wisconsin and a beef producer, counseled the Board in saying that as long as decision-making criteria are established by the October 1993 deadline, the standards and other regulations developed can be reevaluated.

Terry Gips of the International Alliance for Sustainable Agriculture declared that the U.S. standards for organic production must be operative within the world market and also that non-food products presently labelled organic, such as cotton, lawn care products and cosmetics should be addressed in the standards recommended by the Board to circumvent fraud.

Four individuals were invited formally by the Board to make presentations on technical areas of their expertise. Three
addressed the Board on Monday:

- George Kalogridis, OFPANA Processing Committee Chair, described the 15 subcommittees that address the wide variety of processed products and the philosophical approach that is cornerstone to the development of organic standards. He also presented the process by which Earth's Best baby food company obtained the authority to include organic verbiage on its meat product labels, along with other labeling issues.

- Anne Schwartz, OFPANA Livestock Committee Co-Chair, presented results of a survey sent to 1000 organic livestock producers. She also made recommendations to the Board on priorities and criteria for use in the development of organic livestock standards and discussed the constraints that may hinder the process.

- Zea Sonnebend, California Certified Organic Farmers, presented the proposed OFPANA materials list and described the history of its formulation. She gave examples of materials and the broad issues consideration of each material brings forth.

Lynn Coody, USDA/FSMIP Grant Recipient, deferred her presentation to Tuesday morning, to immediately precede the Materials List Committee meeting. She presented the model through which materials for use in organic production can be evaluated, and described areas where further refinement is needed. She pointed out that no list of materials for use in organic livestock production nor processing has yet been drawn up by the industry.

Summaries of the individual Committee meetings are provided below.

INTERNATIONAL ISSUES COMMITTEE

Attendees
NOSB: William J. Friedman, Chair; Margaret Clark; Nancy Taylor; Michael Sligh (April 30-May 1); William J. Friedman; Robert Quinn (May 1-2).
USDA Staff: Harold Ricker; Julie Anton.
Technical Expert: Ron Brewington, Alternative Delegate; Codex Committee on Food Labelling

Meeting Summary
Sections of the Organic Food Production Act relevant to the work of the International Issues Committee were discussed in this first Committee meeting. In particular were the relationship of the Committee to the Secretary of Agriculture, the possible role of the Technical Advisory Panel, international issues relevant to livestock hearings, and accreditation of certifying agents.

In review of Section 2106(b) of the Act, the Committee agreed that the Secretary has discretion to approve or disapprove of NOSB
Joint Committee Meetings
May 1-2, 4-6, 1992
Page Four

foreign certification programs for importation purposes. The role of the Committee will be to give contour to his discretion. This will be primarily achieved through the Committee's examination of three components of foreign programs: (1) application procedures and substance; (2) record-keeping requirements of both the certified entity as well as the accrediting body or responsible public authority; and (3) inspection procedure and substance of both the certification body and the accrediting body or responsible authority.

The Committee determined that all questions relating to materials and practices arising out of consideration of non-domestic certification programs would be referred to the NOSB Materials List Committee. Consensus was also reached regarding the work of the NOSB Livestock Committee, particularly on materials and practices, in that it should guide the International Committee's recommendations to the Secretary on the importation of organically produced livestock and livestock products.

Ron Brewington responded to inquiries about the structure of CODEX Alimentarius and its progress in developing guidelines for organic food production.

A discussion of the European Economic Community's regulations pertaining the import of organic products ensued, and the following three European Council Regulations were examined: (1) Commission Regulation (CR) No. 2092/92, issued 24 June 1991; (2) CR No. 94/92, issued 14 January 1992; and (3) CR No. 92/C 74/05, submitted 5 March 1992.

The Committee met with Christine Sloop and Audrey Talley of the USDA Foreign Agriculture Service (FAS) to discuss response to EEC-imposed deadlines. A memorandum from Lyle Sebranek of FAS had been submitted to all States and known private certifying organizations on 17 April 1992 regarding an interim application process with FAS as the conduit. This precluded the International Committee's interest in an affidavit-based program for private and State certification groups.

The formal resolution adopted by the Board at their first full meeting in March 1992 called upon the Secretary to request U.S. inclusion on the EEC Approved List. The Committee awaits action by the Secretary.
ACCREDITATION COMMITTEE

Attendees
NOSB: Margaret Clark, Chair; Nancy Taylor; Michael Sligh (April 30-May 1); William J. Friedman; Robert Quinn (May 2).
USDA Staff: Harold Ricker; Julie Anton.
Technical Expert: Judith Gillan, OFPANA.

Meeting Summary
This was the first meeting of the Accreditation Committee since its formation. The purpose of the meeting was to establish the criteria for certifier accreditation and initiate the development of a process for accreditation that meets the requirements of the Organic Foods Production Act of 1990.

A statutory review of Section 2115 of the Act was conducted to define the requisite elements of the accreditation program. Sections 2116 and 2117 regarding requirements and peer review of certifying agents were also analyzed. Use of the USDA seal on products labeled organic was identified as an area that needs further definition as the accreditation program is developed.

Judith Gillan presented a history of the development of certification and how OFPANA came to its proposal for a private-public sector accreditation model. It was decided by the Committee that implementation of this model, presented at the first full-Board meeting last March, would require resolution of certain legal questions pertaining to provisions of the Act.

The Committee reviewed the structure that typifies the current private certification organization, of which there are three components: the "Sponsor," which owns the seal and retains the ultimate authority; the certification "Agent," which administers the program, and the "Inspector," which maintains a certain degree of autonomy.

In examination of a functional model for accreditation, three criteria were cited as elemental: (1) competency; (2) independence or freedom from vested interests; and (3) transparency.

Discussion of certification organization structure and criteria for evaluation prompted an analysis of conflict-of-interest issues. Legal opinions were requested from the USDA's Office of General Counsel with regard to this and several aforementioned areas of statute vagueness.

The Committee developed a timeline for action to coincide with the deadlines set forth in the Act. The Committee expects to have drafted for the next full-Board meeting in July a proposal for NOSB
Joint Committee Meetings
May 1-2, 4-6, 1992
Page Six

Phase I of accreditation, which will include a preliminary application structure. The Committee agreed to meet Jun 27-28, 1992, in Millbrae, California, to evaluate the work of industry representatives on program management standards, among other pending tasks.

CROPS COMMITTEE

Attendees
NOSB: Gene Kahn, Chair; Craig Weakley; Robert Quinn; Dean Eppley; E.K. Chandler; Michael Sligh, and William J. Friedman (statutory review).
USDA Staff: Harold Ricker.

Meeting Summary
The first formal meeting of the Crops Committee convened with a statutory review of relevant sections in the Organic Foods Production Act. In discussion of the crop standards embodied in the law, several issues were brought forth for consideration: planting stock sources, irrigation water, erosion, residue testing, emergency spray and drift, botanical pesticides, and the need to define the term "handling." Farms in transition to organic were described as having special documentation requirements.

Manure management was identified as an unregulated area under the farming practices section of the Act, and may be included in the farm plan elements listed by the Committee for discussion purposes. The Committee formally supported a motion to require the incorporation of staged improvements in farm plans.

Dean Eppley added that under the Act the farm plan must be agreed to by not only the producer and certifier but by the handler as well. In presenting the audit trail required for OCIA-certification of his Montana grain farm, Robert Quinn noted that off- and on-farm inputs must be reported under the Act.

In order to provide the NOSB Materials List Committee with recommendations for a preliminary list of inputs for use in crop production, the Crops Committee reviewed what are considered the non-controversial materials on the OFPANA "Inputs for Crop Production" list. The Committee identified the remaining materials on OFPANA's list as (1) requiring confirmation as natural versus synthetic; (2) needing updated annotations; and (3) not registered with the Environmental Protection Agency (EPA) and thus subject to elimination. Materials acceptable to some certifying organizations but not on OFPANA's list were identified, and a list of materials requiring further study before classification was drawn up.

A workplan was developed to assign Committee members to
specific tasks. The Committee expects to have a draft farm plan outlined by June 1 for review by its members prior to the July meeting.

LIVESTOCK COMMITTEE

Attendees
NOSB: Merrill Clark, Chair; Donald Kinsman; Gary Osweiler; Robert Quinn; and William J. Friedman (statutory review).
USDA Staff: Julie Anton.
Technical Experts: Anne Schwartz, OFPANA Livestock Committee.

Meeting Summary
The objectives set forth in this initial Livestock Standards Committee meeting were to review statutes of the Organic Foods Production Act relating to livestock production and processing, to identify issues relevant in the setting of livestock standards, and to develop a Committee workplan.

The meeting was preceded by a tour of two certified organic livestock operations on Sunday, May 3: Welsh Family Farms in Lansing, Iowa, and the Ellinghuysen farm in Winona, Minnesota. The tour was organized by Terry Gips of the International Alliance for Sustainable Agriculture.

References to emergency spray of pasture land, the small farmer exemption, mixed organic/conventional operations, breeder stock, synthetic trace elements, and the term "routine" were among the topics of discussion in statutory review. George Siemon, a Committee meeting guest, suggested the term dairy replacement be included in defining standards for organic breeder stock.

Documents pertaining to the presentation given by Technical Expert Anne Schwartz to the full Board on the development of draft OFPANA livestock standards were distributed, and unaddressed issues were identified and examined. The shortage of livestock inspectors and concerns about adequate producer record maintenance were brought forth as important issues for consideration. The suggestion of utilizing livestock producer Mel Coleman's record maintenance structure was accepted by the Livestock Committee as a suitable audit trail model for adoption.

Advances in the science of animal behavior were discussed, and the minimalization of livestock stress as a disease-preventative measure in production practices was accepted as important for consideration in the development of organic standards. The Committee agreed, however, that the less controversial term "animal well-being" was preferable to the terms "animal welfare" or "animal rights" in discussion of livestock treatment and living conditions.
The regional variation in views of livestock disease treatments and organic feed and species-specific production issues were discussed as issues for the Committee.

Environmental concerns such as manure management, sustainable soil health, and botanical pesticide use were brought forth by Committee Chair Merrill Clark. Consumer perceptions of organic were also considered. USDA staff economist, Julie Anton, presented an outline of a consumer survey on organic meat that should relay critical consumer input.

The Committee considered various means of obtaining input on materials and practices used in organic livestock production. Of concern is input from producers who have largely eliminated conventional materials.

In concluding the meeting, a workplan was established, and member Don Kinsman appointed as Technical Resource Contact for the Livestock Standards Committee. The Committee elected to hold an interim meeting between the next two full-Board meetings to focus on herd health issues.

PROCESSING COMMITTEE

Attendees
NOSB: Richard Theuer, Chair; Donald Kinsman; Eugene Kahn; Craig Weakley, Robert Quinn; and William J. Friedman (statutory review). USDA Staff: Harold Ricker. Technical Experts: George Kalogridis, OFPANA Processing and Labeling Committee.

Meeting Summary
The purpose of this first formal meeting of the Processing Committee was to address the statutory requirements pertaining to processing standards and to develop a workplan.

It was evident from the start that the term "handler" in the Organic Foods Production Act requires definition, considering that the term handler may encompass not only processors but packers, distributors, transporters, and retailers who process in-store. Labelling requirements will also need further definition, particularly when identifying mixed organic/conventional products.

The Committee discussed the Organic Handler Plan required by the Act, and concluded that the plan for processors should incorporate the following components: (1) processing and handling management system; (2) material inputs; (3) packaging; and (4) record-keeping and audit trail. It was agreed that plans approved
by certifying agents should ultimately demonstrate a processor's effort to adopt alternatives for the use of non-organic ingredients.

The processing ingredients criteria outlined in the Act were compared with the draft fruit and vegetable processing standards developed by OFPANA. A discussion of the fact that the Act generally disallows synthetic ingredients ensued, and the Committee concluded that it may be necessary to recommend certain exemptions to the Secretary of Agriculture.

Confidentiality concerns were raised in a Committee discussion of the disclosure of product recipes and/or formulas required from processors in order to determine the percentage organic ingredients.

The Committee decided to hold conference calls every Tuesday, with agendas distributed the Thursday prior. Assignments to the issues of labelling, enforcement, and materials for use in processing were made and a workplan established.

Prior to departure from Minneapolis, the Processing Committee and other interested Board members visited Mill City Bakery in St. Paul, co-owned by John Mattox and Mary Ann Mattox. Mill City Bakery uses organic wheats and flours grown on certified farms in the Upper Midwest.

MATERIALS LIST COMMITTEE

Attendees
NOSB: Nancy Taylor, Chair; Michael Sligh; K. Chandler; Gary Osweiler; Tom Stoneback; Dean Eppley; Rich Theuer; and William J. Friedman (statutory review).
USDA Staff: Harold Ricker; Julie Anton.
Technical Experts: Lynn Coody; Zea Sonnabend.

Meeting Summary
Issues of the first Materials List Committee meeting were introduced at the full-Board presentations given by Zea Sonnabend and Lynn Coody. The Materials List Committee commenced its formal meeting with a review of statutory responsibilities under the Organic Foods Production Act, and discussed factors for consideration in forming a Technical Advisory Panel.

The Materials List Committee proceeded to develop a process for categorizing materials for review, starting with the current draft of the proposed OFPANA materials list. Crops, livestock and processing are categories for materials for review under the Act, and these were subcategorized into six groupings: fertilizers,
pesticides, production aids, post-harvest methods, handling, and processing. Materials on the OFPANA list were identified as requiring EPA or FDA regulatory screening, as were substances requiring definition as synthetic or natural.

The Committee approved a motion to focus review efforts on generic substances rather than brand name formulations. The Committee decided that it will look to the industry to provide brand name review of materials, with NOSB input.

The Committee agreed to a proposal for hiring Lynn Coody and Zea Sonnebend to facilitate the NOSB, EPA, and FDA review process of materials by categorizing and annotating the materials on the draft OFPANA list.

A materials list review process was staged by the Committee in closing, with public notice set for late May. The Committee intends to initiate Federal regulatory review by the responsible agencies in August 1992 and to maximize public input. The Committee proposed the following as the first draft of the staging process for the review of materials. This timeline will be subject to the schedules of the reviewing parties.

**JOINT-COMMITTEE SESSION**

At the wrap-session, the agenda for the next full Board meeting, set for July 7-10 in Fort Collins, Colorado, was discussed at length. The following were suggested as agenda topics: Committee reports; Office of General Counsel responses; budgetary review; approval of Board minutes and procedural guidelines; necessary full-Board actions.

It was determined that the Board needs to develop a process for assessing the following broad issues of concern: biotechnology; environmental impact; humane treatment of animals; social justice; and cost of certification. There may be other issues for inclusion as well.
NATIONAL ORGANIC STANDARDS BOARD
PROCESSING AND HANDLING COMMITTEE
Sheraton Inner Harbor Hotel, Baltimore, Maryland
September 10, 1992
MEETING SUMMARY

Prepared by: Ted Rogers

Attendees: Richard Theuer (Chair), Margaret Clark, Merrill Clark, Donald Kinsman, Craig Weakley, Eugene Kahn; Ted Rogers, Harold Ricker, Julie Anton, USDA staff.

This meeting generally concerned pertinent issues brought forward by the response to a mailing of Processing Committee (PC) position papers dated July 17, 1992. These papers had generated 42 written comments. The comments had stimulated discussion and reevaluation. A revised labeling draft dated September 8, 1992 was the first result of this process.

Because of the intense interest in the subject of wine made from organic grapes, presentations from two experts in the wine field had been requested. Mr. Jim Hunt, a wine specialist with the Bureau of Alcohol Firearms and Tobacco (BATF) discussed BATF's role in the wine industry and the sulfite issue, as related to wine quality and label requirements. Mr. Paul Chartrand, of Chartrand Imports, discussed a method for sulfiting of wine based on burning of sulfur (rather than adding synthetic sulfites) and addressed the quality issue. The Committee took these comments under advisement for future discussion and consideration.

The Committee reviewed the position papers with respect to the percentage organic declaration for foods with liquid ingredients and food containing "water of reconstitution." During this discussion the Committee moved to include "air" with "water" and "salt" as items to be excluded from the calculations of the percentage organic.

There was also a discussion of the percentage organic calculation for foods with inherently variable ingredient percentages. An example was pickles in brine, where size variation causes percentage differences.

A discussion of the certification requirements for foods with less than 50% organic ingredients resulted in a minority/majority position. The minority held that such foods required only the verification of an accredited certifier. The majority held that such product could be produced only by a certified processor.

At the prior invitation of the Committee, Mr. Dane Bernard, of the Food Processing Institute, did a presentation on HACCP
(Hazard Analysis/Critical Control Points). HACCP lends itself to protecting the organic integrity of foods and has applications to the Organic Handling Plan.

The Committee discussed the aspects of the PC position paper dealing with allowable ingredients in organic food. It was agreed that the use of the word "organic" must be consistent and that the use of confusing terms should be augmented with clear definitions or avoided all together.

The Committee received public input during this meeting and at a public input session following.
NATIONAL ORGANIC STANDARDS BOARD
LIVESTOCK COMMITTEE
Sheraton Harbor Inn, Baltimore, Maryland
September 11, 1992
MEETING SUMMARY

Prepared By: Merrill Clark/Julie Anton

Attendees: Merrill Clark (Chair), William J. Friedman, Don Kinsman; NOSB Livestock Committee; George Siemon, Technical Expert; Julie Anton, Ted Rogers, Harold Ricker, USDA.

Chair Merrill Clark described the previous work of the Committee and the various working drafts and position papers in progress for distribution to the public for comment.

Opening discussion centered on the issue of whether an organic livestock operation could be a "mixed" operation, involving both conventional and organic production, or whether organic livestock operations should be moving toward all-organic operations by a certain period of time. Views on both sides of the issue were voiced.

A five-year transition time was suggested, and concerns that conventional production was often necessary on organic farms in order to keep such farms economic were brought out. Others felt the possible cross-contamination of feed, equipment, buildings, etc. would jeopardize organic integrity and consumer confidence in organic production practices.

The Committee concluded that livestock production of the same species with the same product should be required to be entirely organic within five years. However, under other circumstances, the entire farm would not be required to be an 100% organic operation.

Discussion of the certified organic feed standard included the controversy over grazing land versus farm-raised feed crops and discussion of Section 2105(2) of the Organic Foods Production Act of 1990 (OFPA) that appears to exempt grazing land for livestock from the requirement for a three-year absence of prohibited substance use. USDA research on the legislative history of that section is to be furthered. Many were concerned that organic standards for livestock production would be compromised if cattle were allowed to graze pesticide-treated land.

The Livestock Committee noted that it will need to respond to emergency spray exemptions and other issues for which the NOSB Crops Committee has prepared a position.

Resulting from a discussion of the Livestock Committee draft
on materials that are "questionable" for use in organic livestock production, alcohol and hydrogen peroxide were moved to the "allowed" list with restriction to topical antiseptic use and wound cleanser use respectively. Oxytocin was added to the "questionable list." Criteria by which livestock materials are considered "allowed" or "prohibited" was briefly reviewed.

Dr. Edgar Schaefer of the Clark Veterinary Clinic in Mechanicsburg, Pennsylvania, gave a presentation on homeopathic veterinary medicine. He discussed how homeopathic are prepared and how they are used. He stressed the importance of providing individualized treatment to animals and observing closely all symptoms and responses to medications.

Homeopathic medicines involve the use of dilute forms of toxins from nature to build up, rather than repress, the animal's immune system. Dr. Schaefer mentioned that FDA approval for animal homeopathic remedies did not yet exist. Members of the audience questioned Dr. Schaefer about the efficacy of the procedures.

The Livestock Committee husbandry working draft was discussed; several in the audience expressed support for the objectives described in the document.

The meeting adjourned at 4 p.m. The next meeting of the Livestock Committee was set for September 29, 1992 in August, Maine.
Chair Nancy Taylor reported that due to the accelerated timeline proposed at the July meeting for Phase II of the materials review process, the Materials Committee, in conjunction with the NOSB Crops, Livestock and Processing Committees, focused their efforts on developing lists for "allowed synthetic" and "prohibited natural" materials that represented Committee consensus, the Committee had admitted that these would be partial lists. The Materials Committee (MC) had intended to circulate these lists as working drafts and submit a position paper on materials to the full Board meeting in Maine, late September 1992. However, in light of the time constraints, it was reported that the Committees were unable to arrive at consensus on materials and to allow for time to circulate lists and get adequate public input.

Mr. E. K. Chandler reported on his meeting with the American Association of Control Officials (AACO) conference in Indiana, in August 1992. He was sent by the Board at the request of the Materials Committee, to initiate contact and communications regarding MC concerns for the labeling and marketing of certified organic plant and soil amendments and fertilizers. Mr. Chandler was able to meet with the AACO board, who expressed interest in working with the NOSB to define "organic". The Materials Committee decided to continue to work with the AACO. It was decided that Mr. Chandler will chair an AACO task force that is to include Mr. Dean Eppley of MC, Ms. Yvonne Frost of Oregon Tilth, and Brian Baker of California Certified Organic Farmers (CCOF). As the first order of business, this task force will develop a report on the structure of the AACO.

Mr. Ted Rogers and Ms. Julie Anton of the USDA discussed the work they have been doing on National List materials petitions and classifications. A draft of the petition was submitted by Mr. Rogers and amended to include a short form for farmers requiring less information and a long form for manufacturers with more specific information. A second draft will be submitted at the Maine meeting. Ms. Anton described the structure of the database on materials for use in organic production being developed at the National Organic Productions Program office. This database will serve extension agents and interested organic community members, as well as the Board as it analyzes materials for the National List.

Mr. Tom Stoneback gave a review of the initial materials
comparison of the European Economic Community and MOA in organic materials lists, submitted to the NOSB by the Rodale Institute. It was decided that the MC, in conjunction with the NOSB International committee, needs to identify other international certifying agencies that may exist and find out what is on their materials list. Ms. Anton reported that she has already initiated this project and will provide a report to the Committee when it is complete. Mr. Stoneback volunteered to develop a draft proposal (for submission to the full Board in Maine) to accept materials lists of foreign certifying organizations as equivalent to that of the Materials Committee in an effort to facilitate trade.

The crop production materials drafts were not discussed as there had been adequate time given at the Crops Committee Meeting the previous day. Ms. Zea Sonnabend of CCOF did submit her final draft on allowed consensus crops production materials developed from the survey list of the Organic Foods Production Association of North America. The MC made the recommendation to submit this list as a position paper to the Board at the Maine meeting and to then be circulated for public comment.

Mr. Craig Weakley gave a review of the materials draft developed by the Processing Committee. The Processing Committee had not reached consensus on their working draft on processing materials.

In place of Mr. Gary Osweiler, absent Materials/Livestock Committee member, Ms. Julie Anton gave a review of the Livestock Committee's materials draft. The MC identified sections of the draft which need work.

The Committee agreed that a joint meeting with all NOSB Committees in Maine was necessary to discuss the difference in criteria applied to materials decisions that seems to be emerging. The use of the materials format developed at the July meeting could also be reviewed and agreed upon.

The Committee discussed options for developing the Technical Advisory Panel (TAP) in light of the fact that no appropriations exists to pay TAP members. It was decided that a call for volunteers to serve on the TAP would be made, requesting TAP member participation as the need arises for technical expertise. Ms. Taylor will submit a draft TAP participatory request to the Materials Committee in Maine.

Guests at the meeting requested that the committee develop a statement disclosing the intent of the Committee to: (1) conduct work on "generic" materials and allow organic certifying agencies to review brand name materials; (2) request full disclosure of inert ingredients; and (3) propose a phase-out time period for prohibited materials that currently remain on some certifiers materials list. Nancy will work on this statement and submit it to the Committee in Maine.
Chair Gene Kahn distributed packages of the responses to Crops Committee (CC) documents mailed to the public on August 19, 1992. The ensuing discussion was ordered by the topical CC documents.

PLANTING STOCK

Treated Seed: The CC's view that it is difficult to document whether or not an adequate effort was made to locate untreated seeds before sourcing treated seeds for organic crops. The CC will need to be specific about the phase-out period for treated seeds, if one is allowed. Sources of untreated seed were suggested.

Annual Transplants: Allowance of a one-year grace period was suggested to offer transplant growers with no experience in growing transplants organically a chance to learn. The grace period would only be extended in cases where growers can document that non-organic transplants are unavailable. The attendees were reminded that the Organic Foods Production Act of 1990 (OFPA) is being implemented at a time when growers are at different levels of development in terms of purely organic production.

Potatoes: The issue before the CC was whether or not post-harvest fungicide use is acceptable as opposed to seed treatment at the time of planting or when brought out of storage. Seed potatoes are treated as they are brought out of storage and loaded into vans; but they are also treated at the time of harvest and when loaded into storage bins. It was suggested that the wording of the standard be that no secondary seed treatment should be applied. The secondary treatment is usually performed to control bacterial soft rot. In Washington State it is illegal to plant untreated seed on any commercial farm over five acres. There are no "organic" and "State-certified" seed potato sources; hence, a restriction on organic sources may create undue hardship for potato farmers. It was agreed that a publicity campaign regarding the need for organic seed sources was necessary, including a public letter to seed companies encouraging them to source untreated seed.

Garlic: Commenters indicated that there are significant sources of organic garlic. White rot disease endemic to garlic in Oregon,
whereby once a field is infected the disease is impossible to eradicate without fungicide use, was described. However, in the case of garlic, unlike potatoes, the consumer is eating the matured set of the seed. Onions, asparagus crowns, rhubarb and horseradish are cases similar to garlic and are to be considered by the CC.

**Sweet Potatoes:** The primary concern is the parent tubers of sweet potato plants rather than the slips from the tubers. Because presently an industry for the raising of organic tubers does not exist, and because there is no priority to develop one, the CC agreed that treated tubers should be allowed, particularly given that the requirement that slips propagated is already difficult to meet. It was suggested that an allowance be made for Irish potatoes as well as sweet potatoes.

**Strawberries:** The question before the Committee was how to define commercially available at what cost and what level of availability. 95% of strawberry transplants are grown in the Northwest; all growers use methyl bromide.

**Perennial Transplants:** The issue was that mature blueberry stock can be transplanted, as can mature peach tree stock.

**Other comments:** Standards for specialty crops, such as those grown in greenhouses or nurseries, had not yet been addressed by the CC. The CC cited ornamentals, turf grass, cotton and other fibers as crops that may not be considered food but that the CC may be called upon to address.

**EMERGENCY SPRAY EXEMPTIONS**

It was reported that the majority of the Baltimore Livestock and Processing Committee meeting attendees were in disagreement with the CC's position on emergency spray, as opposed to the majority in attendance at the present meeting.

A discussion of the CC idea to set a percentage of EPA tolerance as the maximum level of residue allowed on a crop sold as organic ensued, with the CC finding its purview to set a percentage between 1-10% of EPA tolerance in the Senate Committee Report. It was pointed out that not setting a percentage would be de facto endorsement of 100% of EPA tolerance.

One commenter described the situation in California, where farmers have no recourse once the State or Federal government has mandated spraying, and where a California state of emergency would make the grower 100% responsible for the results of State-mandated spraying, and there would be no grower recourse. Whether or not a grower could negotiate with the State regarding the method of emergency treatment was discussed.

The CC will need to explore legal implications; there is a possibility of creating situations of recourse. Notification would
have to be in written form; organic farmers would have to file with the officials who issue permits for pesticide applications, indicate the boundaries of their farms, provide a statement that the fields are certified organic or in transition to organic, and provide a statement that drift could result in a loss of certification and financial losses greater than to a conventional farmer affected by drift. The orientation of the CC is that if recourse were likelier, the standard regarding emergency spray exemptions would be stricter.

As an industry in California, organic producers have not had the leverage to get "certification" to be legal property, whereby damage to property could be decided in the courts. One attendee suggested that farmers be indemnified for organic crop losses, so that the government would have the incentive to look for alternatives to spraying.

Ms. Nancy Taylor offered her idea of universal flagging to identify fields as under organic production.

PESTICIDE DRIFT POLICY

The CC position is to develop standards that are reasonable and not punitive. The consensus of public respondents was that growers affected by spray drift should lose certification for 36 months; yet the views expressed by the meeting attendees appeared to strongly endorse the CC majority position.

The question of how a grower would know when the farm has been drifted upon was raised. The criteria could be if a grower could identify the visible effects, such as curled leaves and dead bugs.

The CC agreed that there is a lot of work to be done in defining drift and at what point notification would be required. The certifying agent should work with local county agents to ensure proper notification. That a grower failing to provide notification should be decertified was deemed an impractical standard to apply as proof of failure to notify would be difficult. It was evident that the CC will need to use strong wording in the standards to allow growers to seek legal recourse.

Mr. Weakley remarked that although Mr. Miles McEvoy's argument that 20 States do allow compensation for drift, 16 States do not, and asked about the other 14 States. The CC decided that the entire CC position on spray drift needs to be reevaluated.

IRRIGATION WATER QUALITY

A question was raised as to who sets the standards for water quality, and whether or not this should be up to the certifying agent. The CC received one comment that it was vague about the testing requirement in terms of if, when, and how often. Furthermore, growers may have no options to upgrade their irrigation sources. It was argued that until there is an issue
with the crop grown utilizing the irrigation water, the water should not be considered a problem and should not be tested periodically, as the CC position paper on irrigation water quality currently requires.

The Committee was encouraged to address sewage water and chlorinated water (city water) as irrigation sources.

There was a comment that a certifier could not be expected to have the expertise to properly conduct water testing; how much saline or nitrate is too much could be considered a matter for those with practical knowledge in the field.

The CC decided it would reevaluate its position on water quality, with the acknowledgment that water quality issues are very regional. Mr. Bob Quinn pointed out that the Committee is trying to defend its principle of precluding the over-mining or degradation of the soil.

MATERIALS ALLOWED FOR AND PROHIBITED FROM USE IN ORGANIC CROP PRODUCTION

Ms. Zea Sonnebend, technical advisor to the Committee, gave an overview of the process of materials designation. She described the OFPANA survey of certifiers to identify areas of agreement with regard to materials for use in organic production. Some materials tended to be controversial, because the health effects are unknown or because of other concerns. About other materials much is known but there is flat out disagreement, she reported.

The following materials were reviewed by the CC at the meeting:

(1) **Ammonium Soaps**: No substantive comments.
(2) **Antibiotics**: Examples of use were given, such as by pear growers to control fire blight and ivermectin control for mites.
(3) **Basic Slag**: Basic slag is an industrial by-product, of which the impurities in it are unknown. This material is not produced in the United States any longer, though there are large amounts of waste product in the Southeast and in Mexico as well. Basic slag is a fairly soluble source of phosphorus.
(4) **Bleach/Chlorine**: The CC will need to define "disinfectant." The CC had decided that chlorine should not be allowed for post harvest use, including hydro-coolers. Chlorine can form toxic compounds. However, chlorinated municipal drinking water is allowed for irrigation.
(5) **Ethylene Gas**: Tropical fruits other than bananas may be considered for exemption to the prohibition on post-harvest use of ethylene. Natural sources of ethylene, such as other pome fruits, were discussed.
(6) **Gypsum By-Product**: The reason the CC has prohibited this material is because mined gypsum is an adequate replacement.
(7) **Leather By-Product**: This prohibited material received no comments.
(8) Petroleum Distillates: Because the term for these materials is very broad, they may be subject to a special review like botanicals.

(9) Sulfur Dioxide: The CC received a comment that it should be consistent in developing its policy concerning mineral materials. The difference between a sulfur by-product and a sulfite (which may be synthetic) was discussed. Mr. Kahn expressed his desire to rescind the CC decision to prohibit sulfur dioxide and leave it for further discussion. The importance of investigating residue levels on table grapes versus dried apples and post-harvest use versus as a fungicide or miticide was stated.

(10) Vitamin D3: Apparently, there are no health concerns with this synthetic and the natural alternatives are worse.

(11) Arsenic: The CC decided to add "or stake replacement" after "new plantings," in its current document on materials.

(12) Detergents: No comments were made.

(13) Raw Manure: As it is allowed with qualifications in the language of the OFPA, the CC had nothing further to add at this time.

(14) Muriate of Potash: Puerto Rico and Hawaii, as tropical States, may be the most concerned with its continued use.

(15) Piperonyl Butoxide: No substantive comments were made.

(16) Sodium Nitrate: The disagreement over this mined natural material was described as the oldest argument in the organic community. The CC was asked to consider a five-year phase out period. It was explained that although sodium nitrate is not the main fertilizer source for any grower, its use is important when soil temperatures are inadequate to grow certain crops at certain times of the year. The CC will not categorically prohibit water soluble fertilizers, but will likely set use restrictions.

ORGANIC FARM PLAN

The definition of organically grown food on page 292 of the Senate Committee Report was read to the attendees to reference the site-specific farm plans which set up all the procedures for producers to follow to have their products labeled organic. The provision for the farm plan is considered a key element to organic production along with the National List of materials.

It was agreed that the Farm Plan scheme set forth in the current CC working draft was not "user friendly" and in its present state is not simple enough to be applied nationally. The attendees were reminded that the standards are to be written to assure consumers and environmentalists about the conditions under which organic products are produced, and that the standards should not be merely based on the allowance and prohibition of materials.

The Farm Plan standards should serve as general principles to be interpreted through the certifying agency's questionnaire. The section of the CC current Farm Plan draft that is most objectionable pertains to growers' adherence to the Farm Plan. There were concerns expressed that a "big stick" was being placed
in the hands of the certifying agent and that the cultural practices would have to be identified for each variety grown on an organic farm.

The Farm Plan could provide a market opportunity by identifying positive aspects to the retailer, who is the gatekeeper to the consumer market.

Mr. E.K. Chandler presented his paper on soil testing, which he described as "the most valuable soil fertility management tool available when coupled with plant analysis."

RESIDUE TESTING

Mr. Weakley described the statutory requirements for residue testing of organic farms and organic products. The following topics were designated for CC work regarding residue testing: (1) maximum allowable pesticide residue; (2) guidelines for certification agents to fulfill periodic residue testing required in the OFPA; (3) how certifying agents and USDA officials work together when a residue is detected; (4) how to conduct an investigation; and (5) what does residual environmental contamination really mean.

There was time only to discuss the first topic: maximum allowable residue. Mr. Weakley suggested that the CC consider changing the percentage of EPA tolerance requirement to "undetectable" by a chosen testing method.

Ms. Julie Anton and Mr. Ted Rogers reported on a meeting of USDA staff with EPA and FDA officials, whereby FDA involvement in the residue testing of organic products was considered. It was pointed out that the OFPA specifically requires the reporting of positive residue test findings. Residue testing may also be useful for establishing baseline data for crops known to accumulate chlorinated hydrocarbons.

Questions were asked pertaining to who pays for residue testing, and what the testing procedure would be for rotated crops. The EPA has maps to show where "hot spots" (likely residue accumulations) are located. One attendee inquired as to how an inspector would know to require soil testing if the land in question had never been farmed before.

WORKPLAN

The CC wrapped up the meeting by planning the work to be completed over the course of the Fall. Ms. Sonnebend's contracted work was described, including her timeline for completion.

Mr. Quinn and Mr. Sligh suggested that the CC formally request that the International Committee review the CC position papers in light of the need to develop equivalency agreements with foreign countries.
MIXED OPERATIONS

The Committee discussed the Mixed Operation Working Draft #1. Mr. Quinn acknowledged that the intent of the standard is to provide an incentive for conventional growers to convert to organic production. This document was upgraded to a position paper by the CC.

CLOSING

The next meeting of the CC was planned for September 29, 1992, in Augusta, Maine.
Acting Chair Craig Weakley began the discussion by explaining that the Crops Committee (CC) was currently working on eight draft documents related to plating stock policies, emergency spray exemptions, pesticide drift, irrigation water quality, materials, organic farm plan, residue testing, and requirements for mixed conventional/organic operations. Six of the documents have been circulated for widespread public input, and the CC has received numerous written and verbal comments on the content of the documents.

The CC's pesticide drift policy document was discussed first. It was reported that written public input shows about 75 percent disagreement and about 25 percent agreement with the document. Those in disagreement do not want an organic crop that has been drifted upon to be sold as organic and want drifted-upon fields to be decertified for 36 months. It was pointed out that the CC does not think the organic grower should be so severely penalized for a drift incident that is out of the grower's control. In most States, it is difficult and expensive for an organic farmer to gain compensation if his/her organic crop is drifted upon.

Attendee Eric Sideman of the Maine Organic Farmers and Gardeners Association (MOFGA) described the State of Maine's provisions for dealing with fault claims. If the incidence of drift affects less than 10% of the crop land, it is not considered a drift incident. It was suggested that the CC consider defining a "drift incident." The primary difference between the CC position paper on spray drift and the MOFGA standards is that the MOFGA standards focus on residue on the land for production and the CC paper focuses on residue on the product harvested from the land.

With reference to the CC position paper on irrigation water quality, it was reported that 50% of the public respondents were in favor of the CC position. A prominent issue of the discussion related to the consensus view that a "polluter pays" policy should apply in all instances where an organic farmer is subjected to chemical trespass. Concern was expressed that it is unlikely that the NOSB can create a "polluter pays" policy that would be enforced in all 50 States.

It was agreed that one major difficulty with this irrigation water quality issue is that there is very little scientific
information related to the fate of trace amounts of pesticides in water used for irrigation. There is some information about herbicide residues.

It was reported that the CC planting stock position paper received fairly widespread support from public respondents; one third, however, stated that treated seed should be prohibited. The CC will address the issue of allowing treated seed for specific varieties of crops that are chosen for their high yields or other economic qualities and which have no untreated seed sources. It was pointed out that the CC has taken a stricter position than the Organic Foods Production Act of 1990.

90% of the public respondents had indicated their support for a requirement that annual transplants be from organic sources. About 80 percent of the public respondents indicated their support for the potato and garlic sections of the CC planting stock document. It was agreed that rhubarb, asparagus, onion sets, sprouts, and tissue cultured plants should be added to this document.

It was reported that most of the public respondents thought that the organic farm plan document was not realistic, too long, and would be burdensome for farmers.

Acting Chair Weakley summarized the content of the CC residue testing working draft and the CC document on requirements for a "mixed operation" conversion to 100% organic, and indicated that the residue testing document would be reworked.
NATIONAL ORGANIC STANDARDS BOARD
FULL-BOARD OPENING SESSION
Best Western Senator Inn, Augusta, Maine
September 29, 1992
MEETING SUMMARY

Prepared By: William J. Friedman

Attendees: All NOSB members, with the exception of Gary Osweiler, Eugene Kahn, and Thomas Stoneback; Harold Ricker, Julie Anton, Ted Rogers, USDA.

The morning session lasted four hours and encompassed the topics included on the distributed agenda. The morning session was entirely consumed with housekeeping measures.

Motions were passed relating to previous meeting minutes, the creation of an NOSB by-law working group, and the adoption of a NOSB document heading scheme to clarify the stages of our various working papers for the public.

A report from the AMS Administrator's Office by Ms. Chris Patchin was heard regarding the appropriation process for the National Organic Production Program and the NOSB. The requested appropriation was rejected by Congress and other available funds were cut as well. Funding reduction means a delay in the implementation of the National Program is expected. Dr. Harold Ricker discussed staffing issues and the expected decrease in work time available from staff as funding costs become effective. Also, discussed were phone costs for individual Board members and conference call costs.

All six Committees gave reports. All reports were received officially by the Board and those without written Committee reports were directed to submit them within 14 days.
Prepared By: Margaret Clark/Julie Anton

Attendees: Margaret Clark (Chair), Michael Sligh, Nancy Taylor, Bob Quinn, Rich Theuer, William J. Friedman, NOSB Accreditation Committee; Ted Rogers, Hal Ricker, USDA staff; Katherine diMatteo, OPPANA; Nancy Ross, MOFGA; Robert Beauchemin, OCIA; David Haehn, OSFVP; Victoria Smith, New Hampshire Department of Agriculture; Russell Libby, Maine Department of Agriculture.

The Accreditation Committee (AC) voted to approve its Mission and Goals Statement and to accept the draft "Procedures and Standards Governing the Accreditation of Organic Certification" as a Committee working draft. The deadline for comment on the draft was changed to December 1, 1992, to allow a full 60 days for comment.

Chair Margaret Clark reported the consultant hired by the AC in August, 1992, Dr. Charles Benbrook, had not been able to attend the meeting in progress, but would continue with another draft revision on the Accreditation Program after the AC completes its review of comments and makes its next revision.

With respect to Dr. Benbrook's draft, the AC discussed the following general topics, with input from guests and USDA staff:
(1) Criteria, performance, standards and indicators;
(2) Categories of accreditation;
(3) Application;
(4) Conflict of interest, and
(5) Qualifications of inspectors.
The Committee agreed to ask the NOSB Livestock, Processing and Crops Committees for recommendations on the qualifications of inspectors.

Committee work on Dr. Benbrook's draft was divided as follows, with each Committee member responsible for summarizing input on the topic of their own choosing and for preparing proposed draft revisions:
Application - Bob Quinn
Conflict of interest - Rich Theuer
Financial structures and fees - Nancy Taylor
Qualifications of inspectors - Margaret Clark
Criteria, indicators, and competence - Rich Theuer
Transparency - William J. Friedman
Independence - Rich Theuer
Status of accreditation/timing of implementation - Michael Sligh
Qualifications of evaluators - Margaret Clark
Glossary - Michael Sligh

Ms. Clark agreed to prepare a calendar for Committee work, based on weekly conference calls which would follow the circulation of each AC member's work on a given topic. Mr. Ted Rogers agreed to circulate public comment letters received to Committee members, as they accumulate. This procedure is intended to give Committee members the maximum time to review the public comments.
Prepared By: Merrill Clark/Julie Anton

Attendees: Merrill Clark (Chair), William J. Friedman, Donald Kinsman, NOSB Livestock Committee; Julie Anton, USDA; Eric Sideman, MOFGA; Russell Libby, Maine Department of Agriculture; Steve Ellis; Steven McFadden.

The Livestock Committee (LC) working draft on husbandry was elevated to a position paper and discussed at length. Issues related to confinement, animal surgical procedures, and housing of organic livestock were of primary significance. Several language changes were made throughout the document, in preparation for a second release to the general public.

Specific confinement discussion centered around crate-raised veal and caged poultry. No final decision was made on how these situations should be treated in organic livestock standards.

Discussion on parasiticide and other medication use involved an overview of Maine Organic Farmers and Gardeners Association (MOFGA) standards and parallel observations by the LC with respect to farms visited during the tour the day before.

The LC working draft entitled, Criteria for Material Input Selection, was elevated to a position paper and readied for distribution to the public.

Discussion followed on livestock feed and supplement issues. It was reported that MOFGA standards do not require 100% organic feed. The LC draft standards currently require "certified organic feed" for all organic livestock.

The meeting concluded with an agreement by Committee members to strive toward the development of position papers on organic livestock standard topics for distribution to the public as soon as possible. The Committee will be holding conference calls at least twice a month and plans to accomplish much work through written correspondence.
After several housekeeping measures were addressed, discussion ensued regarding a proposal for a de facto determination of equivalency between U.S. and European Economic Community (E.E.C.) organic materials lists. After an informal poll was taken amongst the Committee, the Chair determined that referral to the International Committee (IC) for consideration would be put off until the Materials Committee had prepared its response. In addition, Ms. Julie Anton is identifying other foreign sovereigns with existing organic certification standards, and as the standards are collected they will be analyzed.

In order to facilitate identification and discussion of issues and topics within the International Committee that relate to determinations of equivalency between the E.E.C. and the U.S. organic certification program standards, IC members were given standing Committee assignments that were approved by unanimous consent.

The Committee unanimously approved the preparation and distribution of a memorandum requesting information on potential areas of conflict between the work of the NOSB Committees and proposed or existing standards in other countries. Dr. Kenneth Clayton, Deputy Administrator of the A.M.S. is the designated representative to Codex for A.M.S. The Committee unanimously approved the preparation of a letter to Dr. Clayton requesting more information on the Codex process and its direct impact on the work of the International Committee.

Issues discussed but upon which no decision was reached include:

1. Verification of certification involving U.S. based certifiers operating in other countries that export certified product to the United States.

2. O.C.I.A. President Robert Beauchemin raised the issue of how the United States intends to address the situation where the country from which the product is imported has no U.S. based certifier and no "competent governmental authority" (as discussed in the E.E.C. regulations) or the governmental authority is "rubber stamping" certification entities for operation with its borders.
3. I.F.O.A.M. is attempting to schedule a meeting with the Mexican government, the U.S. government and the Canadian government in the first quarter of 1993. No further information is available at this time.

4. The impact of E.E.C. Regulation No. 2083/92 was briefly discussed.

5. The deletion from the Accreditation Committee draft accreditation program of a section relating to imports was noted.

6. U.S. Agency for International Development personnel are interested in organic agriculture and the work of the Board. Particular interest has been shown in the relationship between organic crops and the Caribbean Basin Initiative for alternative crop production. Ms. Anton will continue to track this interest.
The time scheduled for this meeting was very short; consequently, the Materials Committee (MC) was unable to adequately review and discuss the documents that were presented.

The first topic of discussion was the forms, discussed in Sacramento, for public petition to get materials for use in organic production on the National List. Drafts of these forms, which were long forms (to be used to obtain information from manufacturers) and short forms (for the use of farmers) for each category of material had been prepared and submitted by USDA staff member Ted Rogers. The MC felt the short form required too much information and that both a long and short form for each category of material, crops, livestock, and processing was not necessary. The MC stated its intents to discuss the petition drafts further.

-Mr. E.K. Chandler announced that the draft of the AACO structure was not yet complete and will be submitted to the MC soon.

Chair Taylor presented submitted a draft proposal to accept the European Economic Community materials list as equivalent to that of the United States as discussed at the Sacramento meeting, which had been submitted by absent MC member Mr. Tom Stoneback. However, the MC felt that the proposal was premature and perhaps unnecessary at this time due to the fact that the U.S. list is incomplete and that international organic trade has not yet been affected. The Committee will consult with the NOSB International Committee in further materials list equivalency discussions.

Chair Taylor submitted a working draft of the MC's mission statement, which described the MC's intent to: (1) work on reviewing "generic" materials and allow certifying groups to review "brand name" materials; (2) request full disclosure of inert ingredients; and (3) propose a phase-out period for prohibited materials currently on the allowed lists of some certifying agencies. Ms. Taylor planned to work on a second draft of the mission statement and circulate it to the MC at the upcoming Maine meeting.
At this joint meeting both the materials list format developed at the July NOSB meeting and the Materials Committee phase review process were discussed. The materials list format allows for the identification of data gaps and is intended to prompt the NOSB Committees to list technical questions regarding the use of a particular material that could then be referred to the Technical Advisory Panel. After much discussion and debate regarding the level of detail in the document, the Committees decided the format was useful and voted to adopt the following materials list format:

```
CROP/LIVESTOCK/PROCESSING

CATEGORY: [Crops/Livestock/Processing]
MATERIAL NAME:
Subcategories:
Crops: Pest Control
       Plant & Soil Inputs
       Production Aids
       Post-Harvest Aids
       Sanitation Aids
Processing: Pest Control
           Processing Aids
           Sanitation
Livestock: Pest Control
       Nutritional Feed Supplements
       Health Care
       Production Aids
       Sanitation Aids

Natural or Synthetic:
Use:
Allowed or Prohibited: [EPA, FDA, USDA]
Federal Review: [information or research needs]
Data Gaps: [information the NOSB used in making annotations or used decisions]
Reference Documents or Bibliographies: [information the NOSB used in making annotations or used decisions]
IFOAM or EEC Classification: [allowed or prohibited]
```
The Committees also voted to accept the following phase process for completing the materials lists.

**PHASE I (Completion date Dec. 1992)**
- List materials that the NOSB feels has reasonable agreement on accepted use.
- Seek public input on "reasonable agreement" draft list.

**PHASE II (May 1993)**
- Draft list of prohibited natural substances the NOSB feels has reasonable agreement.
- Draft list of allowed synthetics to be included on the OFPA exempted list the NOSB feels has reasonable agreement.
- Initiate Botanical review process.
- Initiate petition process.
- Seek public input and technical expertise on proposed allowed & prohibited materials list.

**PHASE III (Sept. 1993)**
- List of controversial materials that the NOSB is not in agreement on.
- List of materials needing further discussion and annotations.
- Request for position papers on controversial materials from Technical Advisory Panel and the Public.
- Seek public input on controversial materials and annotations.

**PHASE IV (ASAP)**
- Complete evaluation of all materials to be included on National List based on OFPA Section 2119(m).
- Technical Advisory Panel reports evaluated by NOSB.
- NOSB final recommendations.
- Regulatory review by EPA, FDA, and USDA.
- Final recommendations go to the Secretary of Agriculture.
Prepared By: Ted Rogers

Attendees: Richard Theuer (Chair), Margaret Clark, Merrill Clark, Donald Kinsman, Craig Weakley, NOSB Processing & Handling Committee; Ted Rogers, USDA staff.

This was a brief meeting, carrying forward the review and revision work on drafts of position papers and other draft documents.

The Organic Handling Plan was the principal item of discussion. The two approaches addressed were: (1) to continue with a detailed handling plan as begun in draft Organic Handling Plan, dated September 1, 1992; and (2) to merge relevant elements of an "organic" plan with preexisting FDA regulations covering "CURRENT GOOD MANUFACTURING PRACTICE IN MANUFACTURING, PACKING, OR HOLDING HUMAN FOOD" (21 CFR Ch.1, PART 110). Approach number two would—essentially build upon what everybody already knows, rather than burden organic handlers and processors with an entirely new set of regulations to assimilate. It was agreed that Members would review Part 110 and the Organic Handling Plan before the next conference call in preparation for a discussion of these alternatives.

The processing materials list and criteria were discussed in preparation for the joint meeting with the Materials Committee. There was also a discussion of the wine issue and a new position on sulfites used in wine making.

The meeting closed with a discussion of Committee plans to prepare revised position papers for release for public comment.
NATIONAL ORGANIC STANDARDS BOARD
FULL-BOARD CLOSING SESSION
Best Western Senator Inn, Augusta, Maine
September 30, 1992
MEETING SUMMARY

Prepared By: William J. Friedman

Attendees: All NOSB members, with the exception of Gary Osweiler, Eugene Kahn, and Thomas Stoneback; Harold Ricker, Ted Rogers, Julie Anton, USDA.

The morning session lasted four hours and was entirely consumed with procedural and budgetary matters. Motions were passed setting limits on monthly phone and fax costs incurred by Board members, a 3-hour per-month limit on Committee conference calls, and setting the next full Board meeting for sometime between May 15-30, 1992.

Other procedural matters upon which motions were unanimously passed include:

1. All draft recommendations for consideration at the next meeting by the full Board must be submitted to the Board chair by a deadline to be set by chair, and the chair will also establish the criteria for waiving the deadline upon motion by the Committee chair.

2. The executive Committee will determine the manner of distribution of conference call notes and work product and will poll the Board members regarding the proposed procedure.

3. All Committee chairs must submit a written standing Committee to the Board secretary for inclusion in the minutes.

4. Committees may vote on adoption of publicly distributed position papers and drafts of final recommendations on conference calls.

5. A new Board meeting schedule will be distributed to the public.

6. The executive Committee was delegated authority to approve individual Board member requests to represent the Board at public meetings where Board representation has been requested and there is no expense to the Board.

7. All NOSB members approved for representing the Board at public meetings must provide the staff director and the chair the relevant information relating to their appearance.

The Board also approved the distribution to the full Board of all working drafts and position papers distributed to the
public.

A resolution for submission to the Secretary regarding statutory deadlines and budgetary constraints that has been tabled at the previous meeting was defeated. A resolution regarding staff appreciation was passed unanimously.
Meeting was called to order by Chairman Michael Sligh at 9:00 am.

Members Present: Michael Sligh - Chairman; Margaret Clark - Vice-Chair; Eugene Kahn - Treasurer; Merrill Clark; E. K. Chandler; L. Dean Eppley; Donald M. Kinsman; Gary D. Osweiler; Robert M. Quinn; Thomas A. Stoneback; Nancy A. Taylor; Richard C. Theuer; Craig V. Weakley. Absent: William J. Friedman

USDA Members Present: Harold S. Ricker - Staff Director; Martin F. Fitzpatrick, Jr.; Julie K. Anton; D. Ted Rogers.

There were 36 members of the public attending as observers.

Mr. Tom Stoneback welcomed the National Organic Standards Board (NOSB) to the Rodale Research Institute, and discussed the facility and plans for the week, indicating they were delighted to have the NOSB there.

Mr. Martin (Buzz) Fitzpatrick, Director, Transportation and Marketing Division, AMS, USDA brought greetings from the Department. He briefly addressed budget concerns indicating that the Office of Management and Budget made the decision that no new budgets be approved, and that it was now up to the Congress.

He also indicated that Michael Hankin was being brought back on a detail to help coordinate the organic work. He indicated that Mr. Hankin is strongly dedicated to the organic program.

Mr. Fitzpatrick indicated that the NOSB should take full advantage of the additional funds made available for two more meetings and make as much progress as possible on developing the standards. There is an effort underway within the Administration to eliminate advisory boards.

Chairman Michael Sligh thanked Mr. Fitzpatrick for his comments. The Board members were then asked for a Board member to serve as acting Secretary, given the absence of Mr. Friedman. Dr. Gary Osweiler volunteered and was approved.

The Chairman asked for any additions or revisions to the agenda. It was proposed to add discussion of the By-Laws, and discussion of a letter that he had sent to the Board on proposed criteria for evaluation.

Minutes
Draft minutes for the July meeting in Colorado and for the September meeting in Maine were handed out for review. It was agreed to act on them at the full Board meeting on Friday.

**Budget**

Dr. Harold Ricker provided a report on expenditures to date and projected expenses for the balance of the year given the uncertainty of the location for the September meeting. It was noted that the meeting at Rodale will make it possible to continue reimbursing members for phone and fax expenses in addition to the planned meetings.

Dr. Ricker also distributed a letter to assist the NOSB members in preparing for and dealing with Freedom of Information Act (FOIA) requests.

**Election of Officers and Committee Restructuring**

Chair Sligh asked that members keep in mind the election of officers for Thursday and that Committees consider any needs for restructuring in their meetings. There has been concern expressed about the Materials and International Committees. Mr. E. K. Chandler expressed concern about changing officers in a start up organization. Mr. Gene Kahn indicated that the election should be based on performance.

Crops Committee: Mr. Kahn indicated no changes planned.

Materials Committee: Ms. Nancy Taylor indicated she is resigning as Chair, and considering restructuring the Committee to reflect more of a coordination role. She asked Dr. Ricker to assign more responsibility for liaison with committees and EPA/FDA to staff and he concurred.

Accreditation Committee: Ms. Margaret Clark indicated it was working fine. She indicated she was not sure if an International Committee is needed. She sees import requirements as an accreditation issue.

Livestock Committee: Ms. Merrill Clark indicated she had not heard of any move to change the Chair.

Processing, Handling and Labeling Committee: Mr. Rich Theuer indicated the six people were working well together.

International Committee: Mr. Sligh indicated there is a role outside the U.S. Mr. Friedman had asked Mr. Stoneback to chair the meetings of this committee in his absence.

Mr. Bob Quinn proposed that the NOSB hold off re-evaluation of the committee structure until after the first round of program
development is done. Mr. Chandler supported this. There was
brief discussion of the need for working groups, but the
consensus was to keep the structure as is for now. Mr. Sligh
asked that if a need was seen for working groups to bring a list
of areas to the meeting on Thursday.

Ms. Taylor indicated she would like to use the time between 11:00
am and 12:00 noon for a joint meeting on materials.

**Definition of Organic**

Chairman Sligh noted that Dr. Ricker had distributed a number of
definitions for Board consideration, and that Ms. Margaret Clark
had made an attempt to synthesize them into one. However, there
was considerable differences of opinion among members on the
definition she developed. She has a file of member comments that
she would pass on to anyone willing to work on it. There was
some question about the need for a definition. Hal indicated a
need to develop a definition as part of the regulation, and that
there could be two versions. The first would be a working
technical definition, and the second a short marketing definition
that would have meaning for consumers. He also indicated that if
the Board did not do it, USDA would develop a definition as part
of the rulemaking process.

Mr. Theuer questioned Dr. Ricker as to the fact that the statute
does not call for a definition of organic. Dr. Ricker responded
that it will be needed in the definitions part of the regulation,
and that he is getting many inquiries about the status of a
definition.

Mr. Sligh suggested the need for a working group on the
definition and that anything developed should follow the position
paper format. While Mr. Theuer, Mr. Stoneback, Ms. Merrill
Clark, and Mr. Chandler volunteered, Mr. Sligh asked that it be
on the various committee agendas to come back with names on
Thursday.

**Future Meetings**

The location and general dates for the July meeting have been set
for July 8 to 11, 1993 at the Best Western Village Green Resort
Hotel in Cottage Grove, Oregon. The meeting will be focused on
individual committee meetings, with an agenda to be discussed
Thursday.

For September, the Board has three options for consideration:
Baltimore, Maryland; Arkansas; and Texas. We also have an
invitation to go to North Carolina in November, but no decision
will be made on that until later when we know more about the
funding situation. We will make a decision on Thursday of the
location for the meeting in September.
Ms. Merrill Clark discussed her continuing interest in having a survey of consumers conducted to determine their attitudes and perceptions of organic. This is a follow-up to her meeting with NCAMP. Arkansas representatives indicated they were working on this through their Farmer to Farmer mailing list. New Hope publications expressed interest in surveying their database. It was recognized as a good idea, but concern was expressed about the need to have the questions properly phrased so as not suggest answers and about the population to be surveyed. Mr. Quinn indicated that any questionnaire and procedure should come before the full Board for approval. Mr. Stoneback questioned the purpose and use of the survey. Dr. Ricker indicated that it was not a proper role for NOSB, and that the Board should be working on standards development.

Mr. Sligh briefly summarized a five page paper he had circulated to the board a couple days prior to the meeting. The paper identified 5 evaluation criteria for ongoing review and evaluation of the implementation of regulations: A. How much does it cost and who pays? B. Does it meet the mandate of the law and the intent of Congress? C. Is it accessible to the users? D. Does it pass socio/economic impact analysis? E. Does it facilitate full public participation? The rest of the paper addressed tools for adjusting regulations and recommendations for research needs. Board members indicated that they thought the criteria were excellent. Dr. Ricker indicated that parts two and three (tools for adjusting regulations and research needs) were really up to the Secretary and that the Board should focus on developing standards and the materials list.

Mr. Kahn moved the adoption of the first section lines 20 on page 1 to line 18 on page two. Ms. Taylor seconded. The vote was unanimous.

Ms. Taylor briefly discussed the format for petitions for materials and the need for joint committee action.
Prepared By: Harold Ricker and Julie Anton, USDA/AMS

BRUCE KRANTZ, Marketing Manager for Hynite Corporation, argued that Hynite leather by-product fertilizers are compatible with the organic farming philosophy. Hynite leather by-products are not bioaccumulative and do not oxidize, once in final form. He claimed that only chromium and sulfur remain upon completion of the tanning process. There are eight processing steps to the tanning procedure, some of which may considered synthetic. There is also a need to review the chemicals used in the tanning process.

MARK RETZLOFF, of Natural Horizons, expressed his preference for not listing percentage of organic ingredients on the principal display panel; he recommended that percentages of organic ingredients only be indicated on the information panel. There are vast differences in package sizes and available label space. He agreed with the Processing Committee's minority view on the listing of natural flavors. Regarding livestock issues, he made two points: (1) the use of synthetic antibiotics and parasitcides in organic dairy cattle should be prohibited; and (2) requiring that dairy cattle be pastured for some time during the year will impose a hardship on some producers.

LORNA MCMAHON, an organic grower from Tennessee, with 450 acres of certified organic corn, cotton and spelt and 900 acres in transition, argued for the creation of a certification program for transitional acreage. Without it, she claimed, there will not be conversions of large amounts of acreage from conventional farming. She noted that consumers would like to support transitional farmers, and that there is a need for an transitional label, identifiable in the marketplace. She encouraged the Board to include a recommendation that the transitional label be readdressed in the 1995 Farm Bill.

PAUL BYSTRAK, Commercial Development Associate, Mycogen Corporation, described his company as one that develops, manufactures and markets biopesticides as alternative to chemical pesticides. His presentation was devoted to explaining the CellCap process, what it is and its advantages, using the product MVP Bioinsecticide as a specific example. MVP is essentially a hybrid between two naturally occurring bacteria, Bacillus thuringiensis (B.t.) and Pseudomonas fluorescens (P.f.). As a result of the CellCap Process, MVP would have less environmental and human impact than conventional B.t. products for the following reasons: the hybrid is dead and cannot therefore would not perpetuate itself in the environment nor move
independently to unanticipated locations; P.f. produces no
spores; and the CellCap process sterilizes the fermenter. In
balance, the product has a more specific action, with fewer non-
target effects, and has better foliar persistence, efficacy, and
consistency.

FRED KIRSCHENMANN, of Kirschenmann Family Farms in North Dakota,
represented the Northern Plains Sustainable Agriculture Society
of 200 organic producers. He stressed that only a small group of
farmers really condemn the Organic Foods Production Act and the
work of the NOSB. He noted that the NOSB has not yet heard from
the many farmers who grow good organic grain. He recounted the
history of the Act. Food safety was not an issue when the
organic movement started. The heart of organics is farming in
concert with nature. He argued that the intent of the Act is not
to overly codify organic farming, particularly as the manner in
which the principles are applied varies with farm situations.
The organic farm plan is the key and forces farmers to evaluate
their individual farms. The paperwork is to give consumers a
guarantee. He asked the NOSB to remember that the legislation
has limited objectives and that every problem cannot be solved
with one program.

KATHERINE DIMATTEO, Executive Director of OFPANA, reminded the
NOSB to review the OFPANA standards presented to the Board the
following year. She described the actions of small OFPANA
committees that initiated positions and surveyed organic
community members. Revisions of these positions were circulated,
and larger forums were created to resolve controversial issues.
She commended both the Livestock and Processing Committees for
their hard work in charting new ground. She presented the will
of OFPANA as the following. The Board should create standards
that encourage the growth of organic agriculture and which are
manageable. OFPANA supports the Crop Standards Committee
recommendation to allow split operations. All inerts should be
disclosed, although the phasing in of this requirement should
take place over several years. Lab testing should remain a
verification tool; soil residue testing should be left to the
discretion of certifying agent and not mandated. There is no
infrastructure yet in place to ensure the availability of
untreated seed for all organic growers. There are substitutes
for potassium chloride, and therefore, it should be prohibited.
The percentage of organic ingredients should not appear on the
front panel of processed products. OFPANA does not support the
mandatory use of an USDA seal. Processors should not be required
to list the ingredients of natural flavors. Ms. DiMatteo also
expressed her feeling that the NOSB Livestock Committee's
proposal containing strict requirements for organic livestock
production has already caused damage to potential livestock
production. She stated that she believed the OFPANA National
Organic Livestock Committee's position paper to reflect the
results of its original survey of livestock producers.
PRESTON BOOP, President of the Pennsylvania Association for Sustainable Agriculture, described Pennsylvania organic farmers as the least supportive of Federal regulation. He stated that the final regulations should provide an opportunity for farmer-controlled organizations to participate in the certification system. Rules should not force farmers into "high input" approaches to organic farming. However, botanical insecticides are important tools for controlling unusual pest infestations. Finally, small scale farmers should not be exempt from certification requirements. Such an exemption would create two levels of "organic."

ERIC ARDAPPLE KINDBERG, Arkansas organic grower and editor of Farmer to Farmer, stated that it is important to know what the consumer thinks and to identify what they want to purchase. He described a survey that Farmer-to-Farmer is proposing to send out to organic and non-organic product consumers. He also extended an invitation to the NOSB to meet in Arkansas in September. He stressed that NOSB meetings should be scheduled during the winter months when farmers can participate.

ROGER BLOBAUM, of Blobaum Associates in Washington, D.C., noted the breakdown of goodwill among the many constituencies that had come together to see the Act passed by Congress. He described a primary purpose of the Act, as perceived by those involved in its creation, as being the following: to overcome the market barriers created by the existence of 20 different State organic programs. He said that the pursuit of authorization to file citizen suits, to prohibit the use of all toxic botanicals, to emphasize residue testing, and to ban synthetic inputs under all circumstances was abandoned in an attempt to balance the ability of growers to meet organic production standards with the integrity of the organic product. He remarked that as former director of Americans For Safe Food, he is interested in fraud and misrepresentation in the marketplace rather than the "fine points of organic farming."

JODI SNYDER, an OCIA-certified farmer in Pennsylvania who raises 200 ewes, argued that the certification exemption for small farmers should be revoked. She supported the concept of requiring 100% organic feed, but it is not always available. She believes that antibiotics should be prohibited and is totally against parasiticide use. She noted that herbal worming compounds and diatomaceous earth both work well in controlling parasites in sheep. She agreed with the current NOSB Livestock Committee decision to decertify farms that withhold treatment from sick animals. Slaughter processing standards need to be as equally strict as production standards, with a complete audit trail required. She expressed concerns about split operations, as toxins can leachate and move through 25 foot boundaries.
TONI BEDARD, an OCIA-certified vegetable grower in Pennsylvania, with 22 acres/60 acres rented of 40 mixed vegetables certified organic since 1986, stressed the importance of having regionally-based certifying agencies that can serve to pass on improved techniques to farmers. He suggested nationalizing the high OCIA standards that are now in existence. He argued that a "pure organic paradigm" cannot be "legislated," given the differences among growers of monitoring their farming practices. He noted that the sale of organic products alongside conventional products sparks the interest of conventional farmers in organic farming.

BOB ANDERSON, of Walnut Acres in Pennsylvania, described his operation has serving 100,000 consumers. He stated that although he is in basic agreement with the NOSB on many issues, he is opposed to listing the percentage of organic juice on the principal display panel. This would tend to drive processed products to the lowest level of organic ingredients allowed in a processed product that could still have the word "organic" on its label. Processors with 50% organic ingredients or less should still be required to have an audit trail in place. He did not support full disclosure on spices. He noted that with regard to the NOSB Crop Standards Committee decision on annual transplants, an emergency provision should be handled to support growers that face devastating frosts or poor germination of untreated seed. He expressed his support for allowing the careful use of cannery waste on fields, but the issue is whether product waste is generated within the plant or outside as to whether the waste is considered sewage or field waste.

JOHN CLARK, organic farmer in Michigan, stated that "in the long run, only strict high standards will build organic farming numbers and organic permanence." An input should not be exempted simply because growers have not yet acquired the knowledge to utilize alternatives. He stressed that the creation of a "transitional" label would cause confusion in the marketplace.

LAWRENCE PLUMLEE, physician to the chemically sensitive, expressed his concern that the EPA, in its current review of pesticides, is not considering immunotoxicity or neurological testing. He stated that we already have a food system that is meeting EPA standards, and that a stricter system is needed for organic foods. He was also concerned that there is not a way to determine whether or not food products have been fumigated.

STEVE MCFADDEN, chemically sensitive individual, informed the audience that emergency spray eradication programs were about to be initiated in nine Southern states. He linked aerial pesticide spraying with the instigation of the Los Angeles riots. He noted that chemicals different from those allowed on food can be used for cotton defoliation. He expressed concern for the contamination that can take place in the food distribution channels.
BILL WELSH, organic poultry producer in Iowa, argued that organic standards should not be compromised to allow for the expansion of production. He noted that he now works with three different Japanese companies that have clients who are chemically sensitive. He said that farmers are motivated to develop alternative methods when deprived of antibiotics, and gave the example of when he switched his pigs from milk to vegetable protein and no longer had a problem with scours. He also suggested that density limits be set for dry-lotted cattle that compact crop land and harm soil life.

BRIAN BAKER, Technical Coordinator for California Certified Organic Farmers, expressed his interest in having the national standards reflect current certifying agency standards. He supported the Crop Standards Committee positions, but had many reservations about the Livestock Committee's March 1993 document. He suggested that the NOSB start with the following requirements for organic livestock: 100% organic feed and no subtherapeutical doses antibiotics or hormones. He described standards phase-in periods as "arbitrary and capricious."

TIM SULLIVAN, attorney with Farmers Legal Action Fund, described his reading of the Act as pertains to the authority of State and private certifying agencies. He saw a tension between State and private agencies that are in competition with each other to provide paid services. He stated that the Act does not allow States to accredit private organic certifying agencies. He also argued that the Peer Review Panel is the private sector's role in the Federal accreditation scheme.

DREW NORMAN, owner of a 50-acre organic vegetable operation in Northern Maryland, described some of his needs as a grower. He said that although the need to source inputs from off the farm may decrease over time, off-farm compost is still needed as are row covers (costing $30K per year for 50 acres) and botanical insecticides. He stated that he must presently produce 30-40 different vegetables to be able to support himself as a grower in the organic food market.
CROP STANDARDS COMMITTEE
PRESENTATION TO FULL BOARD
MONDAY, MAY 17, 1993

Prepared by Julie Anton, USDA/AMS

Crop Standards Committee Chair Gene Kahn initiated the Committee presentation to the full Board with a discussion of Residue Testing, Crop Standards Committee Recommendation to the Full Board No. 1. The following sections of the Organic Foods Production Act of 1990 (OFPA) were reviewed: Section 2112(a), 2107(s)(6), 2112(b), 2112(c)(1), 2112(c)(2), and 2119(k)(5).

Chair Kahn explained the Committee's position as in compliance with the intent of the OFPA but not creating a financial burden for producers to carry.

Chair Kahn encouraged those present to consider the development of consumer materials that would help differentiate "organically-produced" from "residue-free" claims.

Residue testing should operate as a random check on the system of organic certification. Chair Kahn presented excerpts from the Senate Agriculture Committee Report [attached], and pointed out that the intent is to test for the presence of prohibited materials at levels greater than unavoidable residual environmental contamination. Chair Kahn noted that pre-harvest testing could be done, as a service to the grower and at the discretion of the certifying agent, if it was anticipated that the food harvested may not pass the required residue tolerance levels.

Mr. Craig Weakley was called upon to explain how the Committee came to set tolerance levels. There were three clear directions the Committee could go with its recommended policy: (1) set a zero tolerance level; (2) set a tolerance level that is equivalent to that adhered to by non-organic producers (100%); or (3) set a tolerance level somewhere between zero and 100%. Mr. Weakley pointed out that the Senate Agriculture Committee Report was the determining factor. Based on the Report, the Committee decided that the residue level should be set at between 1% and 10% of EPA tolerance; based on public response, the Committee recommends that the level be set at 5%. Mr. Weakley provided a copy of the new Committee recommendation to the Board.

National level implementation [lines 189 through 208] was discussed; State level implementation was then addressed. Mr. Weakley explained that the Committee was attempting to keep the cost to producers down. Committee members feel it is fair that the bulk of periodic residue testing is done by Federal and State programs already in place, within which non-organic farmers are not required to pay for the service. The Committee's State-level policy duplicates the Federal-level policy.
At the local level [see lines 232-279], the certifying agent shall develop and implement a system for evaluating the potential for products to contain residues of prohibited substances. Mr. Weakley noted that it is not the Committee's intent to create a local level bureaucracy, with all its expense.

Chair Kahn expressed an interest in taking a "straw" vote to assess current feelings of the Board toward the presented residue testing policy: eleven Board members voted their approval; two members (Mr. Rich Theuer and Mr. Michael Sligh) disapproved.

Mr. Theuer request that a provision be added, allowing a State to set a lower tolerance level. Mr. Weakley responded with concern that the Secretary would not approve a State program setting a lower tolerance level, because it would impede inter-state commerce. He said that no State could establish a tolerance level less than 1%, because of the provisions of the Senate Committee Report.

Mr. K. Chandler proposed that a range of more than 5% or less than 10% be allowed to accommodate the desires of different States.

Mr. Sligh expressed his feeling that to set a permanent tolerance level would be disregarding the development of new techniques in the future. Ms. Margaret Clark s suggested that the tolerance level be subject to a biannual review.

Dr. Gary Osweiler asked what happens when testing implements can only get to 40% of the tolerance level. Mr. Weakley noted that the majority of his inquiries into the subject revealed that it is possible to get to 5% of EPA tolerance levels on the majority of substances. Dr. Osweiler suggested that the phrase, "unless not technically feasible," be added after the tolerance level requirement.

Mr. Weakley explained that the Luke test can get down to 5% for most pesticides it screens for. If a State lab does not have capacity for conducting the Luke test, the sample would have to be sent to another lab. Most States have it but choose not to use it because of cost, Mr. Weakley revealed. He noted that California already has a 5% of EPA tolerance level requirement in State law.

Chair Kahn concluded the discussion by stating that the residue testing policy would be referred back to Committee for a refinement of the changes suggested. He noted in closing that among the 108 letters addressed to the Crop Standards Committee, there was widespread support for the Committee's residue testing policy (which, on the position paper distributed, was stated as between 5% and 10% of EPA tolerance). He read quotes from
91 farmers from New York, respondents McKay and Lawrence, and from
92 Brian Baker, who suggests developing an assessment program.

Emergency Spray Exception, Crop Standards Committee Proposal
to the Livestock Committee No. 1, was presented next, with Chair
95 Kahn reading from the Committee's commentary on the subject
96 [attached]. Chair Kahn noted public input that states that the
97 NOSB should prohibit emergency spray programs; he expressed
98 appreciation for the sentiment but stated that the NOSB must work
99 within the OFPA. The "polluter pays" policy could not be created
100 by NOSB. He explained that without full compensation to organic
101 producers for loss of certification status, such a policy would
102 be punitive.

Excerpts were read from the Senate Committee Report.
103 Residue testing requirements must still be met by producers
104 subject to emergency spray programs. Section 2105(2) of the OFPA
105 was reviewed, and the Committee's recommendation in light of
106 statutory requirements was stated as: agricultural products
107 affected by emergency spray programs cannot be sold as
108 organically produced.

A joint meeting between the Livestock and Crop Standards
110 Committee was announced, whereby the Committee's would develop a
112 joint position on the emergency spray exception.

Chair Kahn noted that certified producers would be required
115 to notify the relevant certifying agent of an emergency spray
116 incident. Requirements for certifying agents were then
117 deliberated. Ms. Margaret Clark remarked that there will be a
118 difference in the residue level detected depending on the timing
119 of the spray, i.e. at planting versus at harvest.

Ms. Merrill Clark asked how the Committee reconciled their
120 position with the OFPA requirement that no prohibited substances
121 can be applied during the three years prior to organic
122 certification. Giving advance notice emergency spray plans to
123 organic producers would help them find a way to substitute
124 treatment with permissible substances. Otherwise, Ms. Clark
125 feared, it would be possible for certain organic farms to be
126 subjected to emergency spray programs "every other year."

Ms. Margaret Clark agreed that without regulatory
128 requirement for notification, the certifying agent can ask but
129 not expect an organic producer to necessarily report an emergency
130 spray incident.

Mr. Bob Quinn said that the three-year statutory requirement
132 applies to the organic farm management system, rather than to
133 situations out of the control of the producer. The punishment
134 applied to an organic producer who deliberately applies
135 prohibited substances within the context of his/her farm system
should not be that applied to a producer who has no say in an emergency spray program. The loss of certification for one year is punishment enough.

It was pointed out that the setting of a one-year period for loss of certification is arbitrary, particularly given that more than one crop may be produced in a year. Mr. Theuer asked about a beginning and ending of the crop production cycle in the case of perennials. Mr. Quinn suggested defining the loss period as a crop season.

Mr. Sligh suggested that the emergency spray policy recommended by the Board include a requirement that it be reviewed annually, and asked how the USDA would handle the conflict between the objectives of a Federally-mandated spray program and a program overseeing the integrity of the "organic" level. Mr. Buzz Fitzpatrick suggested that the Board recommend to the Secretary that he advise policy-makers to be aware of cross-compliance issues.

Mr. Quinn commented that it almost all cases, the sprays used in emergency spray programs do not have a soil residual by nature.

Ms. Merrill Clark described her interpretation of the Senate Committee Report: the exception granted to organic producers affected by emergency spray programs should only be in extreme cases. She suggested that there be full disclosure to consumers.

Chair Kahn took a "straw" vote among Board members regarding the Committee's emergency spray exception as currently written: seven Board members voted their approval; four members voted their disapproval.

Pesticide Drift Policy, Crop Standards Committee Proposal to the NOSB Livestock Committee, was then presented. Chair Kahn read the relevant excerpt from the Senate Committee Report.

He pointed out that the Committee's position requires producers to notify the relevant certifying agent within 48 hours of a drift incident, and the crop drifted upon cannot be sold as organic until the certifying agent has made an assessment of the impact of the drift. The certifying agent must determine if the drift incident actually occurred, and then if so, must determine if the agricultural product can be sold as "organic." Ms. Margaret Clark expressed her concern about who decides when and where to test and about who bears the cost of these decisions.

Mr. Quinn presented his minority position, which states that the penalty for drift should equal that of the emergency spray policy. He said that he is not comfortable with residue testing as means of determining whether or not a product can be sold as
Drift, in many cases, is avoidable; unless there is a deterrent, "chemical trespass" will continue and growers will never be able to collect damages, Mr. Quinn stated. He reported that the majority of public input received by the Committee did not support selling a drifted-upon crop as "organic," even if residue-tested.

Mr. Chandler remarked that the argument is essentially philosophical; producers who are "innocent bystanders" in a drift incident may be forced to pay a penalty "because we refused to recognize scientific evidence that no harm was done to that crop." Mr. Weakley added that the Board should focus on the fact that, in the case of drift, the producer has not violated the OFPA.

Chair Kahn stated that he knew of no growers who had sought legal recourse in a drift incident, even when the applicator could be identified.

Ms. Zea Sonnabend of CCOF explained that her organization customizes its policy to the individual situation. The extent of drift is determined, and the affected crop is not marketed as "organic." However, the affected crop area may only be three rows, and this is assessed. Furthermore, CCOF does not call the punitive action "decertification," so as not to inadvertently harm the reputation of the producer. Three to five cases of drift are brought to the attention of CCOF each year on average.

Mr. Brent Wiseman countered that in Texas there is much recourse for the grower in cases of drift. The State inspector reviews the situation, and makes a determination on a case by case basis; however, it may take 6-7 months for a determination to be made. A private certifying agent would not have access to the records until after the case was settled. He stated that the incidence of drift is seldom, adding up to five cases per year on average. Furthermore, of those five cases, in only two have residues of spray drift be detected. Mr. Kahn remarked that only one case per year is brought up in the State of Washington.

Mr. Brian Baker stated that in California, the burden is on the grower to prove that applicator was negligent. County agricultural commissioners may not recognize the harm drift imposes upon organic producers. The rate of success recovering both time and money losses among growers has been poor. The price premium loss when a grower has to sell an organically produced product on the conventional market is difficult to recover.

Mr. Quinn described the strong chemical trespass laws established in Montana; 2-3 cases are brought to bear each year. Mr. Quinn described how he lost certification status for 3 years
Mr. Weakley expressed the majority Committee view: by making drift policy consistent with the residue testing policy only, there will be incentive for producers to report drift. Chair Kahn called a "straw" vote: 5 Board members voted for the current Committee position; 7 members voted against the position; and one member abstained.

Requirements for a Split Operation, Conversion to 100% Organic, Crop Standards Committee Recommendation to the Full Board No. 1, was presented with Committee commentary [see attached]. Chair Kahn reviewed arguments for and against the mandatory conversion of split operations to 100% organic. He described the Committee position as basing certification solely upon compliance with the OPFA, which allows for the maintenance of organic and non-organic fields within the same farming operation.

Chair Kahn reviewed public responses from the Carolina Farm Stewardship Association, Mark Corley, the Demeter Association, Chip Kraynyk, MOFGA, and two Maine farmers, Mr. Holmes and Mr. Gerritson.

Ms. Julie Anton noted that she had prepared an analysis of public responses on the topics of split operations, the Organic Farm Plan, inputs for organic crop production, and planting stock policies, of which copies were available.

Ms. Margaret Clark commented that the process of conversion is different for different crops. She gave an example of how an apple grower can experiment with different varieties, as long organic production can be subsidized by non-organic production.

Chair Kahn expressed his view that the Board cannot legislate grower intent. It is best, then, to build provisions that assure compliance and prevent a penetration of substances from non-organic fields. He stated that the organic food industry has been built upon on split operations, and that the market base has not been established yet to support a requirement for full conversion.

Ms. Nancy Taylor described her personal experience as an owner of a split operation. Her view is that a split operation should be allowed to remain as such throughout ownership.

Mr. Chandler asserted that the State could mandate full conversion, but a national conversion policy would be intrusive.

Chair Kahn stated that he would strongly support policy allowing private certifying agents to require full conversion.
Ms. Merrill Clark expressed serious reservations about allowing split operations, given the possibilities of prohibited substance leaching and beneficial insect loss. She guessed that there were split operations that make no improvements from year to year.

Dr. Don Kinsman described how pesticide "drift" in a livestock operation is different than in crop production.

Mr. Dean Eppley remarked that the integrity of split operations is based upon the ability of the grower to section off parts of an operation, and ensure that each section is properly managed; such sections may be managed by different employees.

Chair Kahn stated his appreciation for every acre converted to organic production. He gave the example of leased fields surrounded by non-organic fields. He commented that there will be increased scrutiny of split operations, and to question the intent or commitment of split operators is objectionable to him.

Finally, Chair Kahn called a "straw" vote on the Committee's current position: ten Board members voted for the position; one opposed the position; and two abstained.

Organic Farm Plan, Crop Standards Committee Recommendation to the Full Board No. 1 was presented in conjunction with Committee commentary. The basic premise of the commentary was that organic farming is not merely production by prescription to a list of materials. Chair Kahn expressed appreciation for the essay presented by Dr. Fred Kirschenmann, which stressed long-term improvement and a narrative farm plan.

Statutory requirements for the Organic Farm Plan were reviewed. The role of the Livestock Committee in developing their own plan on organic livestock management was clarified.

Ms. Taylor suggested that the Committee include the term, "evaluate," with regard to the progress to be described by the producer in the Organic Farm Plan Questionnaire.

Mr. Quinn stressed that a distinction needs to be drawn between soil building programs and organic by neglect at the farm level. He also noted that producers should address irrigation water quality when describing "trends" on their farms.

Ms. Margaret Clark requested that the Committee address certifying agency ability to review the Organic Farm Plan as an accreditation criteria. Chair Kahn noted this request in the Committee workplan. Ms. Clark asked the Committee to outline elements that must be present in the structure of the Organic Farm Plan document of each certifying agency.
Chair Kahn called a "straw" vote to assess the Board's approval of the Organic Farm Plan approach: approval was unanimous.

Crop Standards Committee Interim Botanicals Policy, Draft Position Paper No. 1, dated April 22, 1993, was presented in brief. Chair Kahn explained that the Committee chose to limit the list of botanicals included in this policy to those with documented and long-term historical use. Dr. Osweiler pointed out the high toxicity of strychnine.

The suggestion to change the word "recommend" to the word "allow" on line 23 was agreed to by the Committee.

It was noted that OCIA prohibits piperylul butoxide (PBO), whereas OFPANA allows it. Ms. Merrill Clark expressed her disapproval of PBO, and petroleum distillates in general. Chair Kahn remarked that PBO reduces the amount of botanical pesticide required for efficacy by 10 times. He noted that PBO originates from sassafras, and that there are differing opinions as to whether or not PBO is natural.

Chair Kahn called a straw vote and received eight votes in favor of the interim position, two votes opposed, and four abstentions.

The document entitled, Planting Stock Policies, Crop Standards Committee Recommendation to the Full Board No. 1, was referred to by Chair Kahn as the Committee's position as of May 5, 1993. Since May 5, public input had been reviewed and policies regarding garlic and onion starts changed to allow non-organic sources until commercially available.

A short discussion concerning seed potatoes ensued, with Chair Kahn describing the excessive transport cost which makes sourcing from remote areas prohibitive.

Lorsban, a pesticide, is commonly used to treat seeds. Such pesticides would not be allowed according to the current Committee position.

Chair Kahn read excerpts from letters from CFSA, MOFGA, OR Tilth, Ward Sinclair, and Jim Boatman of the Idaho Department of Agriculture regarding tissue culture.

The term "commercially available" was viewed as a complex term by the Committee; thus, the Committee concluded that the historic loophole could best be handled by certifying agencies, to whom discretion should be granted.

Mr. Weakley then brought forth the argument that the current Committee recommendation to allow a one-year grace period for
non-organic annual transplants was in direct violation of the OFPA. Chair Kahn reviewed the Committee concern for growers who would have to obtain transplants at great cost or for whom it would be impossible to obtain organic transplants. Mr. Sligh suggested language that would allow for an extended date of compliance and language that would encourage a market in organic transplants to develop.

Chair Kahn called a "straw" vote on the current Committee recommendation and received nine votes of support, 1 vote of opposition, and 2 abstentions.

Inputs for Organic Crop Production, Position Paper No. 2, was briefly discussed. Chair Kahn described the Committee's concern about getting the list of inputs out to growers to dispel some of the confusion across the country. Dr. Theuer asked the Committee how it determined what is natural and what is synthetic. Chair Kahn noted that there are some paradoxes to resolve, such as over wood ash. A Committee definition of "synthetic" is in draft form.

As a miscellaneous note of business, Ms. Margaret Clark relayed a question from Yvonne Buckley of OGBA regarding land released from a conservation program, where no prohibited materials would have been applied for three years.

In concluding the Crop Standards Committee presentation, the Committee workplan was distributed.
GEORGE KALOGRIDIS, of Ojai Organics, a consulting firm in California, reiterated concerns he had expressed earlier about focusing too greatly on the specific needs of chemically-sensitive people. He does not see food safety as the primary issue facing the organics community.

BILL WOLF, of Necessary Trading Company (an input supplier), and an organic farmer in Virginia, described his perspective in support of the Crop Standards Committee's current position on botanical pesticides. He described his Pest Control BioSelector, where botanicals are viewed as a tool of last resort. He sees a gradual move away from reliance on botanicals, giving the example of soaps replacing rotenone. He agreed to provide the Board with research results revealing that there is no real data supporting the report to Congress stating that botanicals are "dangerous."

BRENT WISEMAN, of the Texas Department of Agriculture, stated his support for the allowance of split operations. He noted that 60% of the harvested crop processed at Arrowhead Mills are from split operators. He gave an example of a family farm where the son, who prefers top produce organically, must work with his father, who is only interested in continuing the farming methods he has relied on for years. Mr. Wiseman also described the forthcoming Texas bollweevil eradication bill, within which there is protection for organic growers. He said that the legislation will require organic growers to control the insect, but that alternatives, such as botanical pesticides, are offered. He stressed that the State certification programs should determine the emergency spray exemption policy.

ZEA SONNABEND, of California Certified Organic Farmers (CCOF), announced that her organization awaits a decision on inspection requirements for nut shellers and facilities cold-storing dried fruit. She asserted that CCOF would prefer that the determination of restrictions on natural crop production inputs be made by USDA accredited certifying agents and not be included in the NOSB recommendations to the Secretary. Ms. Sonnabend also noted that CCOF provides an incentive for split operators to convert to 100% organic production by charging a surcharge to inspect split farming operations. She commented, however, that non-organic crops often subsidize upstart organic crops.

JERRY FEITELSON, of Mycogen Corporation, described the cellcap technology utilized to manufacture his company's product, MVP, as fitting certain organic principles. He noted that MVP is
incapable of survival or transgenation in nature, though produced through genetic engineering. MVP and the cellcap process have been registered with the EPA, and are accepted by Jeremy Rifkin's group.

STEVE WALSER, a farmer from the State of Washington, expressed his interest in seeing language in the emergency spray policy which encourages the establishment of buffer zones. He also commented that where Colorado potato beetles were originally controlled with botanicals, seven alternative methods are now employed, with botanicals used as a last resort. He said that an allowance for PBO is important, as it is necessary as a synergist in liquid botanicals, which are preferable to powdered botanicals which get on laborers.

BRUCE KRANTZ, of the Hynite Corporation, described his company's origin as a cooperative of tanners who found leather trimmings had valuable protein and nitrogen. In leather making process, eight synthetic chemicals are typically used but are all washed out, leaving only chromium and sulfur. Ms. Nancy Taylor asked about the vegetable oil tanning practice, which Mr. Krantz stated was limited because of a problem with odor and ventilation. He said that chrome keeps the protein from putrefying. Hynite Corporation is the only company that makes a hydrolyzed leather product.

DENNIS HOLBROOK, who owns in a citrus and mixed vegetable operation and who is president of the Texas Organic Growers Association and on the Texas State advisory board, spoke on the issue of drift. In one case, a grower was able to recover damages from a drift incidence involving a cotton defoliant. In another case where an aerial sprayer had been viewed, the investigation took 8 weeks and he could not sell his crop in the meantime; residue testing determined there had not been a drift incidence, and the grower could recover no damages. Regarding split operations, he asked about how his involvement in a holding management company with absentee landowners.

SUZANNE VAUPEL, a consultant from California, announced her support for the Committee's split operation position. She said a producer may be growing all crops organically, but cannot afford to have all land certified; whole farm certification requirements would be economically prohibitive. She commented that drift is more based on the unknown than emergency spraying: questions such as, was there really an incident, was it reported, arise. She asked about drift in fog that travels for miles. On a different subject, she noted that the definition of pesticide in the Federal Insecticide, Fungicide, and Rodenticide Act applies to botanicals.

JAY FELDMAN, the Director of NCAMP, concurred with the concern for not burdening growers with unrealistic requirements; however,
he stated that the OFPA does not provide for a transitional label
--- if it did, the OFPA would be institutionalizing illegal
actions.
He noted that FIFRA establishes a risk-benefit standard as a
means of distinguishing between residual and current pesticide
levels. Regarding the 620 substances approved by the EPA, only 2
dozens have full data sets, he said. By accepting EPA tolerances,
the Board was accepting "baggage" of inadequacy. He recommended
that the Board determine what is known under the tolerance-
setting procedures. Apparently, 70 carcinogens are accepted
under food policy currently.
STEPHEN MCFADDEN, a representative chemically-sensitive consumer,
made several miscellaneous comments. He described the extent of
mileage covered by medfly eradication. He explained the types of
chemicals utilized in aerial sprays.
JOHN CLARK, an organic farmer from Michigan, remarked on chemical
trespass: he said that the damage to farmer is the disruption of
his/her farming system, from which it may take years to recover.
Also, substance damage on crops may be determined visually,
without residue testing results to prove incident. He commented
on Repeated Toxicological Syndrome, where a lower threshold to
 toxicity is established among humans.
DR. LAWRENCE PLUMLEE, a Medical Science Advisor in the Research
and Development office of the EPA for many years and a physician
of chemically-sensitive people, stated that chemically sensitive
people will incur reactions to botanicals. He expressed hope
that the Committee will develop a more "rational" approach to
tolerance setting.
ERIC ARDAPPLE KINDBERG, an organic livestock and vegetable
producer in Arkansas, suggested the Committee look at organic
production standards in light of both community and grower
responsibilities.
He expressed concern about tailwater from pesticide treated
fields. He did not feel that drift is covered by the OFPA. He
stated that split organic/non-organic livestock production is not
possible since livestock are mobile. He commented that organic
farmers have not been using neem for a long time, and that neem
has not been reviewed by EPA. He recommended that the Committee
provide some direction to certifying agencies regarding nitrogen
source obtention, requiring legume-based rotations, for instance.
AL JOHNSON, representing the 120 members of the Independent
Organic Inspectors Association (IOIA), presented highlights from
highlights from Jim Riddle's letter to the Committee. He
questioned the practicality of mandating 100% conversion of
farming operations to organic production. He expressed concern
that there be some sort of legal protection established for
inspectors while on a farm, including liability insurance.

Regarding the farm plan, on-farm processing should be addressed; otherwise, he expressed support for the farm plan as written. He would like to see generic use of OCIA's easy-to-use farm application. Finally, he commented that documentation on all seed sources is needed.

EMILY BROWN-ROSEN, of NOFA-NJ, voiced her support for split operations, though would like to see an encouragement of full conversion. She pointed out the need for the Committee to look more closely at the biotechnology provision, and to be sure not to disregard such products as MVP that are compatible synthetics and which are valuable and sustainable. She argued that with regard to planting stock policy, there should be an transplant exemption for unforeseen natural disasters, such as killing frosts or sweeping diseases. She encouraged the Committee to develop a brand names list, as it is frustrating to try to get information from companies. In representing OFAC, Ms. Brown-Rosen referred the Committee to a handout, which describes OFAC's latest positions. She noted that OFAC has not come to a consensus on biotechnology issues. OFAC does have a proposal for new wording. She remarked that OFAC unanimously opposed Eric Ardapple's proposal for an Organic Check-off Program.

The Crop Standards Committee public input session closed at 12:30 p.m.
166 Prepared By: Harold Ricker, USDA/AMS

167 Accreditation Committee Chair Margaret Clark introduced the agenda for the meeting which was a presentation of the Committee draft recommendations: Criteria, Process, and Other Procedures.

Criteria for Accreditation

Mr. Richard Theuer then presented the criteria entitled, Competence.

Mr. Theuer indicated the Committee had identified 7 steps to accreditation.

1. Promulgation of the application for certification and certification standards.
2. Submission of the completed application, including the organic plan, by a producer or handler.
3. Initial review of the application by the Certifying Agent.
4. On-site inspection of the farm or handling operation by an inspector.
5. Administrative review and certification determination by the Certifying Agent.
6. Annual inspection and submission of an affidavit by the producer or handler.
7. An applicant appeal process to the Certifying Agent.

The question of a uniform certification form was raised. Chair Clark indicated that judgements are made at the application, (inspection), and approval (decision) phases of certification. Every certifying agency is not required to have the same forms.

Accreditation is the process of evaluating the Certifying Agent. Accreditation also involves: application, field evaluation, decision, and recommendation to the Secretary.

The second criteria is entitled, Transparency (or Record keeping, as the word "Transparency" does not appear in the Organic Foods Production Act of 1990 (OFPA). It involves the following:

. Clearly articulating policies and procedures
. Open accessibility and clear documentation
. Clear and explained roles of officers, staff, inspectors and decision-making bodies
. Open accessibility and responsible appeals
. Disclosure and timely resolution of appeals

The basis of transparency is documentation:
205 . Record-keeping of producers and handlers
206 . Records required to be kept by certifier and available to
207 public
208 . Records required to be kept by certifier and available
209 on request to the Secretary.
210 . Records required to be available about producer,
211 processor with the inspection report.
212 . Record-keeping requirements of the OFPA.

213 Mr. Craig Weakley indicated that the California law is very
214 detailed about the records to be made available or kept
215 confidential.

216 Chair Clark indicated she took the structure from the California
217 Act and abbreviated it.

218 Mr. Weakley indicated he was still concerned about the disclosure
219 of proprietary information.

220 The third criteria is entitled, Independence. Mr. Theuer
221 indicated he had looked at the Conflict of Interest issue using
222 the HACCP approach where conflict of interest is a hazard to the
223 integrity of the inspection process. He recommended that
224 certifying agents have written policies and procedures regarding
225 the application handling process; disclosure of inspectors'
226 interests; the appeal of inspection results; the certification
227 decision-making process; disclosure of interests and affiliations
228 of members of decision-making body including conditions for
229 disqualification; and appeal of certification decision.

230 **Process of Accreditation**

231 Chair Clark then asked Mr. Bob Quinn to present Phase I: the
232 Application Process.

233 Mr. Quinn described the purposes of Phase I:
234 . Groups currently certifying may continue certifying
235 while continuing through the process.
236 . New groups may not begin certifying until Phase I is
237 completed.

238 The Committee would like a list published every six months
239 naming those currently in the process and what phase they have
240 completed. Mr. Quinn presented a diagram to show the flow of
241 activity. With the call for applications, the certifiers would
242 have 90 days to submit applications; the applications would be
243 reviewed by AMS staff for completeness within 60 days; if the
244 application is incomplete it would go back to the certifier for
245 revision with 60 days for completion; if complete, it would go to
246 the peer review panel. If no response, or a certifier does not
247 submit an application within the proposed time period, the
248 certifier must cease certification activities. Peer Review Panel
reviews the application and makes a determination of
"accreditation applied for status" which is not an approved
labeling designation, but allows new certifiers to begin
certifying.

Judgement is called for in the evaluation process beyond the
completeness of the application. This could be done by either
USDA staff or by peer review panel.

Highlights of the Application form (page 28 of the Committee's
document) were described:

1. Basic information - size and scope of organization
   Estimated sales volume
   Areas of competence

2. Memorandum of Agreement

3. Questionnaire
   Question 5 gets into issues other committees are working on.
   State standards require separate forms.
   Policies and procedures should include confidentiality and
   access to records, and where they can be found (foot note in
   manual).

It was emphasized that the Committee is trying to demonstrate
 equivalency and not necessarily standardize all procedures.

It was recommended that the categories of certifiers be reduced
from six to three in the questionnaire on p-30.

Procedures for Phase II, Field Evaluation were presented per the
Draft. The Committee stressed the importance of field evaluation
despite the fact that the OFPA does not specifically require it.
There was some discussion of the content of a site visit and the
fact that an evaluator may have a scoring document. Parts i and
j as listed under content of site visit are optional depending
on the circumstances.

Phase III, Peer Review Panel, was discussed in the context of the
OFPA. Mr. Sligh cited the OFPA and noted the apparent confusion
about whether the Secretary shall or may establish a peer review
panel.

A question from the audience addressed the issue of whether or
not the Committee would recommend a Peer Review Panel. The
Committee stated its support but that it was still working on a
draft document that should not be elevated to a recommendation
until it is all together. The Peer Review Panel is one of the
few places where the public and private sector are actually
verbalized in the process.

Chair Clark stated that the Committee would recommend a Peer
Review Panel in a cost-effective manner that is fair and
representative.
The Organic Certifiers Caucus (OCC) indicated that the costs of preparing for evaluation according to their survey could be at least $3,000.

Without appropriations, administrative costs would also have to be covered.

One estimate predicts costs of:
- $325 for Phase I
- $680 - $3,250 for Phase II
- Uncertain for Phase III

Average costs could depend upon the size of the certifier.

The Committee needs feedback on cost estimates, and there is an effort to weigh cost-effectiveness against an ideal program.

Conference call costs = $10 for set-up, $.49/min x number of people.

A question from the audience involved the costs of Peer Review Panel under the option that establishes regional panels. The Committee considered this an extra layer of decision making.

Regarding the evaluation of handling plan, the Committee was asked why it separates competency in the handler plan from other aspects. The Committee responded that, unlike some aspects, it is not cut and dried - continually need improvement in the plan.

What goes in the plan goes in the standards. How they use it is an accreditation issue. For processing, might look for any training in HACCP.

Need to expand on qualifications of inspectors and general principles of organic food production.

What process do you use in evaluating plans for producers and certifiers. Similar principles?

ACCREDITATION COMMITTEE
PUBLIC INPUT SESSION
MAY 17, 1993

YVONNE BUCKLEY, Executive Director of the Organic Growers and Buyers Association: There are already accreditation models in operation in Canada, and EEC that may work. OGBA has gone through an evaluation.

Would like to see the audit trail expanded on with a clear understanding of the role of the certifier to the producer. OGBA is spending time and dollars tracking product. Does not know how many times certificate is being reused.
BRENT WISEMAN, Coordinator for the Texas Department of Agriculture's Organic Program, disagreed with the accreditation approach. USDA will be talking to Texas and no other. The approval process is designed different from the accreditation process. Not in the business of certifying private certifiers in Texas. Can't handle the liabilities. Private certifiers may be approved by the Department, and every private certifier will receive notice of fee hearing.

DAVID HAENN, Small Farm Viability Project in Arkansas, stated that the language in the document is confusing because it varies from the OFPA (e.g. transparency, competence, etc.). Every body will have the same standards.

Peer Review Panel makeup – certifiers should not be making checks on certifiers – producers and handlers more appropriate. Wants USDA to do certification.

Question: Universities have peer panel – who would be better? Answer: Field evaluation is not in Act as component of review – inherent conflict of interest.

ERIC ARDAPPLE KINDBERG, Small Farm Viability Project in Arkansas, presented a model for accreditation. Congress is not going to appropriate money for accreditation and so need cost effective system. Reviewers don't go to D.C. Knowledgeable people are in the states in the country. Have certified farmers and handlers elected to state panels, and use currently available inspectors.

GEORGE KALOGRIDIS, representing the Organic Food Production Association of North America, expressed support for a public/private format for accreditation – will have a program in the next few weeks – empower the private sector. There are legal questions to the NOSB becoming the peer review panel.

Question: Did you hear the Texas presentation? Answer: Yes, and there are public/private organizations that do space certification.

EMILY BROWN ROSEN, of the Natural Organic Farming Association of New Jersey, expressed concerned about the cost of accreditation. Farmers are in the low income range. $1,400 to a group like them and $500 indemnification adds costs and comes down to $30 per farm over a three year period. Questions the on sight inspection and prefers the IOIA proposal. OPAC supports the two tiered accreditation model and likes the regional models. Areas are richer in volunteers than cash.

Question: Are farmers opting out? Answer: Have strong feedback that people can't pay more than they are paying now.
TIM SULLIVAN, Farmers Legal Action Group, stated that there is confusion between certification of programs and accreditation of certifying agents. States can have additional standards. Who holds certifying agent accountable for additional standards? States should not be in business of accreditation. States should look at private organizations to see if they are performing under OFPA. Need an appeals program and states should not have final say on appeals. USDA will have an independent appeals agency when reorganization is done.

SUZANNE VAUPEL, Vaupel Associates, argued that the "shall" part of the language in the Act for the Peer Review Panel is the strongest part of the law. The "may" refers to how the panel is established. On states setting higher standards - is keeping private certifiers out a restraint of trade? Preemption issue may come into play here.

BRIAN BAKER, Technical Coordinator for California Certified Organic Farmers, asked the Committee to avoid duplication. Ask for a standard set of information and one place to send it to. Make it fair to all certifiers. Suggests a clearing house. Consolidation of multiple certifications under a single seal; information in one place for product exported; information in one place for product imported. Begin putting input in the clearing house at Phase I.
In the absence of International Committee Chair William J. Friedman, Mr. Tom Stoneback, as designated Acting Chair, coordinated the presentations of Dr. Harold Ricker and Ms. Julie Anton of the USDA on international issues of relevance to the work of the NOSB.

Ms. Julie Anton presented a condensed version of a written chronology of United States - European Economic Community negotiations on equivalency in organic product labeling legislation and trade in agricultural products labeled "organically produced." The written chronology is attached. Included in her summary, was a description of the trade disruption seriously impacting U.S. producers, certifiers, and exporters of organic products. Mr. Brent Wiseman commented that Texas has been exporting organic cotton without detainment.

Dr. Harold Ricker reported on the work of the CODEX Alimentarius Food Issues Committee, a committee with representation from 149 countries and sponsored by FAO and WHO. Dr. Ricker described the eight-step process for the development of international regulations, and pointed out that the recent meeting of the committee in Ottawa, Canada, constituted step three.

A meeting held specifically to address organic food product labeling was attended by delegates from twelve countries, the EEC, and IFOAM, and included Dr. Ricker. At this meeting, the delegates agreed to move the organic food product labeling draft ahead to step five in the regulation development process. The next meeting will be held in Geneva this July; by October 1994, the draft is expected to be at step seven. Dr. Ricker urged the Board members to participate in an analysis of the draft on organic food product labeling, providing comments to him by June 1, 1993, for inclusion in his response to the CODEX committee.

Dr. Ricker reported that there is recognition among those working on GATT for CODEX Alimentarius; he noted that if included in GATT, the CODEX guidelines on organic food product labeling would become international law.

From a solicitation of comments from the public in attendance, a Japanese importer, Donald Nordic, reported that the Japanese Ministry of Agriculture, Forestry, and Fisheries, developed draft guidelines for organic food product labeling in
LIVESTOCK COMMITTEE
PRESENTATION TO THE FULL BOARD
TUESDAY, MAY 18, 1993

Prepared By: Julie Anton, USDA/AMS

Livestock Committee Chair Merrill Clark initiated the Committee's presentation to the Board with a bit of background. Ms. Clark commented that livestock standards have historically received less attention than crop standards. She then described the rationale behind Committee decision-making to date, which consists of the following: (1) how can producers be encouraged to enter into organic production; (2) how can regional differences in climate and geography be accounted for, given that production of certain species may not be possible in certain areas without use of prohibited inputs; (3) how can livestock production standards be kept "tight" to lend integrity to the organic label; (4) how is the production of livestock, which are mobile, animate beings, different from the production of crops; and (5) what are the bioaccumulative aspects of inputs used in livestock feed production. [Attach Commentary...Merrill, I need a copy of your overhead]

Chair Clark then introduced the Committee members, describing the expertise of each.

The Livestock Committee Recommendation to the Full Board #1 was presented section by section, each section being introduced with a description of the changes made by the Committee based upon public responses. Ms. Julie Anton announced that she had prepared an analysis of responses to the Livestock Committee's position paper, which she then provided to the Board.

Ms. Clark summarized the primary changes to the position paper as follows:
1. In the National List section, duplicative criteria were eliminated.
2. The requirement for "segregation" of organic livestock from conventionally-treated livestock was removed in three places.
3. Isolation of new breeder replacement stock is no longer required.
4. The reference to semen from certified organic livestock when commercially available was removed.
5. The following new language denotes a change in the Committee's position on feed additives: "Feed additives utilized in livestock ration may be from any source unless prohibited by the National List." The requirement that feed supplements be from organically-produced sources was not changed.
6. The term, "opportunity for exercise," replaces the term, "exercise" in the health care standards section.
Ms. Clark then described the general livestock standard issues about which the Committee would be making a recommendation to the full Board [see attachment...Merrill, I need a copy of your overhead to attach here].

Discussion was then initiated on sources of livestock for certified organic production. The Committee's recommendation to the Board that all livestock of the same species that are part of the same farming operation be certified organic within three years was the first issue of contention. Mr. Theuer suggested replacing the term, "isolation," with the term, "non-contiguous," describing a distinct, physical location that can be identified. Mr. Weakley questioned the three-year period, and suggested that a "relevant" time period be sought from current organic livestock producers. Dr. Osweiler pointed out the rationale for this recommended standard outlined in the Commentary document [see attachment...Merrill, I need a copy of your overhead to attach here].

Dr. Osweiler went on to address contamination from a pharmacology standpoint. Antibiotics can be transferred through contact with the urine and feces of treated livestock; this can happen in pasture as well as at a drylot.

Dr. Theuer described a scenario where twin lambs are born and one gets scours. He asked what happens to the lamb in the period between weaning and separation from the mother? He noted that the certifying agent can take the language of the standard very literally.

Dr. Osweiler pointed out that the requirement was that the producer needs to show that organic and non-organic livestock should not be consuming feed from the same mill and not be kept in the same lot; the physical facilities should be separate. Dr. Stoneback suggested that the "farming operation" could be defined as a distinctly separate functional unit.

Mr. Kahn argued that it is better to create tough standards than to mandate total conversion of a farming operation. He described a scenario where a one out of five of a producer's chicken houses is organically managed; the property is contiguous, but adequate provisions are made for complete separation of livestock. Dr. Stoneback drew the analogy of a tomato processing facility, where cleaning of the equipment must take place prior to the processing of organic tomatoes. Mr. Kahn added that, for example, it takes eight hours to clean out a green pea steamer; this level of effort alone is a strict standard. He restated his belief that it is possible to create adequate conditions for segregation of livestock of different statuses. Ms. Margaret Clark voiced her opinion that a standard mandating total conversion would be hardest on the small
producer. Dr. Theuer noted that Beechnut Corporation maintains separate facilities for Kosher products.

Dr. Don Kinsman led the discussions on slaughter, poultry, dairy, and breeder stock. For each, the statutory requirement was quoted. Dr. Kinsman noted that the Committee had interpreted the Act to require that slaughter stock be from breeder stock managed organically from the last third of gestation.

The idea that sources of poultry and dairy livestock can be non-organic until "commercially available" was discussed at length. Ms. Anton linked the Crop Standards Committee concern regarding the definition of "commercially available" with that of the Livestock Committee. Dr. Stoneback pointed out that the definition of "commercially available" depends on the method of shipping. Ms. Margaret Clark commented that there may be areas of the country with no organic livestock production facilities from which calves for organic beef stock production could be sourced.

Ms. Merrill Clark asserted that the Committee's position on breeder stock was formulated through conversations with growers throughout the United States, with the exception of the South. Dr. Kinsman pointed out that the Committee is of the belief that its position is workable under all conditions. He stated that it is possible to raise lambs for slaughter under the proposed requirements, for example.

Dr. Theuer brought up the question of embryo transfers. Dr. Theuer also asked if organic dairy stock could be slaughtered and sold as organic, to which the Committee responded, only if born of organic breeder stock and raised organically from birth.

Mr. Weakley described the scenario of a non-organic dairy bull calf that has not yet been weaned, and asked if there could be an exception to the organic feed requirement for the first 14 days or so of the calf's life. Dr. Osweiler responded with the statement that treatment [with prohibited materials] would likely occur within the first two weeks of life. Mr. Weakley asked if it would be possible to work out an arrangement with the non-organic producer where the calf would not be treated. Mr. George Siemon pointed out that the Committee's current position that slaughter stock be from breeder stock managed organically from the last third of gestation renders the question moot.

Mr. K. Chandler inquired about the possibility of setting a "reasonable" period of time before slaughter during which the livestock would have to be managed organically; he said that weaned beef calves could be made available for incorporation into an organic operation at 90 days of age. Dr. Kinsman responded that
it is very appropriate to require that pigs and lambs be raised organically from birth and that the weaning periods for various livestock are different and would be difficult to regulate. Dr. Quinn inquired about a requirement that the nursing mother be fed organic feed until the offspring is weaned.

Apparent that the livestock sources issue required more intra-Committee discussion, Chair Clark shifted the discussion to the Committee workplan [see attachment....Merrill, I need a copy of your overhead to attach].

Feed, feed supplements, and feed additives were addressed next. Dr. Theuer argued that allowing synthetic amino acids would violate the criteria set forth by the Committee. Synthetic amino acids are not sustainable, in his view. They can be created by synthesis or through bioengineering. He believes that amino acid requirements can be met by the proper balance of proteins in the ration. Dr. Kinsman responded by pointing out the need to consider ruminant animals, which may risk deficiencies more than monogastricates.

Dr. Quinn inquired about an emergency exemption to the 100% certified organic feed requirement. Mr. Chandler offered the example of flooded fields, occurring often in Texas. Dr. Quinn described cases of drought in Montana where livestock have to be moved from the land.

Mr. Kahn pointed to Section 2105(2) of the OFPA. There is still confusion among Board members as to what the exception to the three-year land in organic production requirement is.

Chair Clark pointed out that there is not explicit statutory requirement pertaining to livestock drinking water. Dr. Theuer commented that almost all water has some traces of hazardous substances, so the "free from contamination" statement in the Committee's proposed standard is not realistic. Dr. Quinn remarked that a farm-level assessment should be made, as water sourced from a mountain spring would not be of the concern that water sourced downriver from an urban area would. Mr. Weakley argued that water quality assessment should be part of the Organic Farm Plan.

Dr. Osweiler presented the health care section of the Committee's recommendations. The change to the second standard in this section was noted. No other comments were made, with the exception of those made in a discussion of consumable livestock bedding and livestock medicines. It was apparent that Board members held differing views of the intent of the OFPA with regard to the use of antibiotics and parasiticides. Mr. Chandler pointed out that the term, "drylot," and the conditions of it, should be defined by the Committee.
With regard to the transportation section of the Committee's recommendations, Chair Clark noted that the reference to segregation of organic and non-organic livestock in transport was removed. Dr. Theuer asked about injury during transport, and noted that downer animals would be treated differently.
GEORGE KALOGRIDIS, representing OFPANA, stated that OFPANA supports the work of its subcommittee on livestock, although the subcommittee's report has not yet received the approval of the Quality Assurance Council. OFPANA is opposed to mandatory time limits on whole farm conversion to organic production. OFPANA is opposed to the barriers to entry indicated in NOSB Livestock Committee's split operations position. Livestock and crops production are not different in terms of a whole systems approach. The OFPA is not a "pure foods" Act. There is a Business and Professionals Act being implemented in the States, whereby false claims cannot be made.

ANNE SCHWARTZ, OFPANA subcommittee on livestock, described the history of industry consensus-building on livestock issues. The first meeting was in Fall 1991 in the Ozarks, which many could not attend due to a blizzard. The next meetings were at Asilomar in January 1992 and at the March CSPI meeting. There were attendees from many States. For a number of issues, consensus was not reached. These meetings constituted the first real discussion on livestock issues only since the Act was passed. Huge holes in technical expertise regarding how to implement The changing structure of the American farm has left many areas of the country without infrastructure. An ability to make slaughterhouses available for small producers is being lost. The changing infrastructure is affecting livestock production more than crop production. Three to five private corporations are producing 60% of the meat consumed in the U.S. It will be difficult to reintroduce livestock onto the American farm. The meetings in different regions come out with completely different standards. A survey was created to reach livestock producers who cannot leave the farm because year-round responsibilities. Physical attendance at meetings causes hardship on livestock producers in particular. Stuart Fishman contacted certifying agencies to determine all livestock producers. The Ozark Small Farm Viability Project and the Humane Society also did some contact work. New Farm published Ms. Schwartz's name and address: generated 250 letters. Materials issues were not addressed. It was decided in the Ozarks that there was no controversy regarding water quality, humane standards, and transportation. Ms. Schwartz expressed her feeling that the issues will blow apart the cooperation of producers. There are persons around U.S. who are waiting in the wings for this to fail. She suggested greater use of grandfather clauses and interim positions; then identify and target research for the most critical needs. Where there are the very fewest alternative veterinarians, there will be the most difficulty. Mr. Gene Kahn
asked for an overview of what Ms. Schwartz's views are on the
proposed standards, to which she offered the following:
. Inputs that are suggested to be prohibited should be on the
technical review list.
. Parasite problems create risks to dairy producers who must
make major investments.
. Allow parasiticide use in breeding stock; there is consensus
among survey respondents.
. There is a major restraint to FDA approval of alternative
vet care. There may be an organized campaign to prohibit
alternative vet care.
. Most of survey respondents could live with a ban on
antibiotics in slaughterstock. There is an issue about calves
with pneumonia not able to be treated when not going to slaughter
for 22 months.
. Feed is the biggest issue in dairy, particularly for small
grower. A reasonable exemption should be made.
. The survey did not address split operations.

MICHAEL FOX, of the Humane Society of the U.S., asked the Board
to embrace the principles of humane sustainable agriculture. He
proposed the notion of bioethics, respect for all life, and all
methods that cause the least harm. A "pro-agra" movement is
needed. Enhance natural and biodiversity. There must be no net
loss of biodiversity. Restore and regenerate existing lands.

STEPHEN MCFADDEN, a chemically-sensitive individual, discussed
emergency treatment of public lands; aerial spraying to kill the
sage in Taos, New Mexico. Many farmers cannot meet bacterial
criteria of EPA drinking water supply. The Committee should look
at sources of amino acids. Visible damage test for
drift/contamination could be conducted.

BRIAN BAKER, Technical Coordinator for California Certified
Organic Farmers, stated that the number of organic beef producers
has not increased. CCOF hopes for the least intrusive standards
for livestock allowed by law. CCOF is against mandated same
species conversion.

ANDREW PERRY, of Northeast Organic Farming Association of
Connecticut, stated that the slaughter facilities in the
Northeast are not at the same par as others around the U.S.
NOFA-CT is concerned about the Committee’s stance on bull calves,
source of livestock requirement. Time is needed to develop an
adequate supply of organic breeding stock. With regard to
organic feed, the Northeast has a lot to learn about grass and
grain production.

BOB EBBERLY, an organic chicken and turkey producer from Ebberly
Farm, operates an USDA-inspected poultry plant and is certified
by NOFA-NY. Regarding the single species issue on same site,
many producers utilizing his plant are contract growers. They
could be required to submit blueprint of site, which must be certifiable. The certifying agency can determine if sites suitable. From biosecurity standard, he is more concerned about commercial chickens getting sick from organic chickens. He is trying to line up grain for 1995; the supply is out there, but expensive. He supports slaughterstock raised on 100% organic feed. He stated that it is difficult to obtain organic chick sources. Mr. Ebberly suggested that processors be bonded based on value of sales to use term organic. The processor would forfeit the bond if he/she illegitimately uses terms. There must be some incentive to prohibit processor from adding non-organic producers to the stream of processed meat from a plant.

GEORGE ROCHE, of the Maryland Department of Agriculture, stated that as long as producers define the containment of organic production, split operations are allowed. Mr. Roche stated that there is No organic feed available in the East. He noted that organic fish producers are increasing in number and that they are dedicated, using recirculating systems of aquaculture.

STACY STRAUS BERKOWITZ, of OEFFA, expressed support for split operations. She strongly objected to $5,000 exemption. Producers should be flexible in developing management strategies to address standards.

ERIC ARDAPPLE KINDBERG, of the Ozark Small Farm Viability Project, stated that the term "organic" must mean something to the consumer and be reasonable. 25% of all farm receipts come from feed production; 50% from livestock. Breeder and replacement stock are essentially same thing, with exception of dairy. There must be separation to prevent fraud. Antibiotics and parasiticides are not exempted by law, but part of evaluation criteria. The Board should make clear that the mother cow is to be fed organic feed.

DAVID HAEHN, of the Ozark Small Farm Viability Project, stated that antibiotics and parasiticides should go through review process: the Act offers a mechanism to put materials into the context of organics. A high percentage of antibiotics in manure can contaminate crops. Colostrum keeps forever in the freezer. There is a lot of organic colostrum available.

MIRIAM STRAUS, representing Albert Straus of Blake's Landing Farm, a certified organic dairy farm in California. The farm is trying to expand to 220 cow dairy, on-farm milk bottling. Production must be made possible and should be humane. Animals treated with restricted substances should be withdrawn and allowed to reenter. Criteria should apply to farmers. The current Livestock Committee feed and medication requirements are too strict. Small calves need to be treated with antibiotics for pneumonia. The transition time for dairy animals should be one year.
JOHN CLARK, of Roseland Farms in Michigan, brought out synthetic amino acid considerations. Amino acids, vitamins, and minerals are feed substitutes and therefore feed. The organic community should be encouraging diversified feed: three small grains. Feeding meat by-products to certified organic livestock in midwest is wrong. Feed supplements should be limited to synthetic trace minerals. Tyson and Conagra ready to benefit from 2 cents savings; the benefit is not so great to the small operator.

ERIC RICE, of the Maryland Food and Farming Association, has been working on livestock standards for Maryland.

1. Can live with feed with two exceptions:
   a. emergency provision; ex. of farmer who loses his barn of feed.
   b. Noxious weeds on pasture: there are State laws that regulate.
2. Water quality: contaminant free is impossible.
3. Commend space and humane treatment of
4. Reviewing HSUS v. USDA research
5. Parasiticides: need allowance for sheep.
7. Split production should be allowed.
8. Aquaculture and crayfishing in Maryland: have been approached

GEORGE SIEMON, organic dairy farmer from Wisconsin, asked the Board to review the OFPA. The label must be protected. Only 2-5% of all livestock in U.S. get a shot of antibiotics. Husbandry provisions have support in the Act from the farm plan provision. Regional considerations about water are a real concern. Mandating pasture is a mistake; the issue is what is best ecologically for each farm. Address density instead. There should be no exception to feed requirement. Pasture is feed; there should be no exemption regarding treatments to the land. He sits on a certification review committee, and has determined that strict standards only way to maintain organic integrity.

PAUL SHAW, of Walnut Acres in Pennsylvania, has 16 holstein steers. Organic holstein steers are not sourceable. Raising such steers from birth is not an attainable goal. The sourcing restrictions should be along the same line of thinking as transplants: one year of organic management before slaughter.
Prepared By: Ted Rogers, USDA/AMS

Rich Theuer the Committee Chairperson opened the meeting at 1:40 p.m., then called upon Craig Weakley to present a review of the ORGANIC HANDLING PLAN - WORKING DRAFT #2 of which he was both author and editor. (Refer to above paper dated April 5, 1993.)

Tom posed a question about boiler additives and the efficacy and advisability of running an organic plant all year without the steam additives. Craig said that it would not be advisable, and that steam injection would be an option. Rich confirmed this saying that the combination of steam injection and charcoal filtration would be a very workable solution. Craig closed the discussion by posing the question: Are boiler chemicals a good thing to use in general?

Michael asked if there were any large scale processing plants that were currently dedicated to organic. Gene answered that Walnut Acres was the closest and it was not large scale. Merrill asked if existing plants were interested in taking on organic or if new plants would come on line. Craig said that there was a need to use existing plants. Gene added that this is driven by demand and that currently processing capacity far exceeds demand. He also indicated that the conventional food companies are dedicated to accommodating the organic food standards. Merrill asked what the usual percentage of organic handled in the conventional plant was. Gene indicated that it was somewhere less than 1%. Craig said that it was 7 days out of a 3.5 month season in California. Merrill wondered if it were possible to have plants dedicated to organics in the future? It was pointed out that while this was possible that demand would have to increase dramatically to employ economies of scale. Gene observed that Walnut Acres was working with a flex system which is not typical in the industry today. Craig closed the discussion by commenting that the standards for organic processing could influence the development of plants in the future.

There has been little comment to date on the current handling plan draft, the deadline for comment is July 1.

Rich then reviewed the committee Draft recommendations on labeling of organic foods. Comments on this paper have been sparse so far; the deadline for comment is July 1 also.
This paper has two elements: Calculation of the percentage of organically produced ingredients, and label statements for foods purporting to be organic foods or to contain organic ingredients.

This proposal should be viewed as supplemental to the FDA regulations.

Two critical points were presented: 1- according to the Labeling Draft Recommendation use of % of organic ingredient on the nutritional panel is mandatory. 2- Non-synthetic substances not available in organic form are the only ingredients allowed by the law in organic product.

Michael asked if the certifier were verifying the percentage of organic ingredient would they be liable for manufacturer's label?

There was a discussion of how the meaning of not available non-synthetic would be handled, Craig indicated that this had been discussed by the committee but that they had not yet taken a position.

"The 50% or more organic ingredient" category applies if you use any non-organic ingredients not on the National List, seal or shield would not be used on this product.

"The Less than 50% organic" category discussion centered around whether the processors would be required to be certified. Rich noted that the law indicated a clear exemption and that, since the label claim was so minor, any extra requirements would be a dis-incentive to use any organic ingredients at all. There were some opinions that this might open up an opportunity for fraud, and some opinions that any use of the word organic should require certification.

Ingredient declarations: The Committee is recommending a strict approach in that any substance that remains in the product must be listed in the ingredient declaration and used in the calculation of % organic.

Disclosure of ingredients: spices, flavors, colors.

The discussion on spices centered on the concern for proprietary information. The discussion closed with the clear alternative, if legal, to list spices in some order other than that of decreasing percentage [such as alphabetical].

The discussion on the listing of ingredients in so called natural flavors concerned the difficulty of getting the information and the dubious nature of the processes used in extracting the flavors.

A continuing discussion about what a synthetic ingredient is when
considering the category of processed foods was carried till the end of the meeting time. The Committee is endeavoring to develop criteria to define the categories of various substances essential for processing organic foods.

Public comment:

John Clark: Complemented the work of the Committee and admonished them to keep it simple. In this he suggested that they should deliver a short list within the categories they were working on.

David Haenn: Expressed some concern for the use of the $5,000 small farmer exemption to deliver organic ingredients to organic processors. He also felt that any processor handling organic ingredients by definition must be certified.

Larry Plumlee: Felt that spices definitely should be listed, as well as flavorings. He advised the board that heat extraction of natural fermentation products sometimes produces toxic substances. He also suggested that synthetic vitamin and mineral compounds could cause reactions in the chemically sensitive and suggested that the purest grade available or affordable should be used. His reasoning indicates that these reactions have more to do with impurities than with the compound itself.

Steve McFadden: expressed some concern about the criteria and category for processing aids and what might be approved in that realm. He also had doubts about nitrogen and the use of solvents in the manufacture of non-organic ingredients. He also suggested that a sophisticated certificate system could be employed and would involve a disk accompanying the product including all information about its production in detail.

Brent Wiseman: Was concerned that certain of his small processor producers might continue to use the TDA seal on their small batch processed products.

George Kalogridis: Speaking for OFPANA George noted that they did not support any % claims on the front panel. He also pointed out that a modified certification was already in use in the industry for those using lesser amounts of organic ingredients and that this would be adaptable for those using less than 50% organic ingredients. He personally advised against using even made from organic grapes in reference to wines containing any sulfiting agent.

John Clark / for Bill Welsh: Noted that USDA/FSIS acknowledges beef raised with out ----- and with certified organic feed now. It just can't be called organic beef.
Eric Ardapple-Kindberg: Stated the % organic in the information panel is not called for in the act. He was well pleased with the ingredient definition. He also insisted that the law meant that baked goods would be yeast raised and that other products would be made from organic ingredients. He also observed that some bio-technology has been in use for some time, sighting the use of colchicine, in plant breeding for doubling chromosome pairs, producing tetraploid used in plant breeding.

Paul Chartrand: again voiced concern for proscribing all sulfiting agents in the bottling of wine. He felt that the Senate report alluded to the use of various synthetic materials.

George Roche: Expressed some concern for guaranteeing the integrity of the audit trail. Concerned particularly with cost of surveillance or investigation of trail to other State. He was supportive of the 50% rules as presented.
Materials Committee Chair Nancy Taylor initiated her presentation at 5:40 p.m., and began by emphasizing the parameters of the national list. There is still some misconception in the community about how the list will be structured. She then reviewed the statement of purpose, formatting of materials being reviewed and the phases of materials tasks.

Dean presented a review of the crops committee's work and positions on materials.

Gary reviewed the Livestock Committee's work covering their categories and reviewed the current list as it is.

Nancy then reviewed the materials review and disclosure policy position and discussed the position on phasing out of possible prohibited materials currently approved by some certifiers.

Public comment:

Brent Wiseman: Urged the committee to consider permitting the new insect growth and reproduction inhibitors as pest management inputs.

John Clark: Questioned the use of pesticide categories. Any pesticide disrupts the ecosystem. Strongly opposes Potassium chloride. Chloride is a known disrupter of soil biota.

David Haenn: The law refers to permitted synthetics, use that language for consistency. On the disclosure issue advise any manufacturer that not using the sun shine tactic will result in delay of approval. Reminded that all substances to appear on the national list must be reviewed by TAP. Also that a special review of botanicals is required.

Bruce Krantz: Felt that Chromium resulting from Tanning process was insignificant in Hynite leather meal product. Gene asked how this process was different from production of super phosphate from rock phosphate. Bruce pointed out that his product was hydrolysed a heat process, and that no acid was used.

Walter Jeffery: Felt that his Potassium Chloride product should be permitted as it is needed in plant production and is more economically available than some of the alternatives.
Steve McFadden: Cautioned against sawdust from treated lumber being used in animal production and questioned the concern about sodium chloride in livestock list. He also wondered about the use of antibiotics from natural sources, and opposed to PBO.

Larry Plumlee: Advised of the concern for contaminants in synthetic vitamins and minerals and suggested a solution might be to use the highest grade available. He also proffered the idea of using sensitive people to indicate where a problem might be by screening the finished product. Suggested Dr. Randolf for the TAP if an expert on chemical sensitivity was required.

George Kalogridis: Confirmed the work of the OFPANA Livestock Committee and its continued viability. Advised that the industries consumer is well educated and could be depended upon to understand the issues. Also asked about the a Homeopathic Pharmacopeia in reference to livestock usage. Ted answered that there is a pharmacopeia for human usage but not for veterinary usage. This is the problem currently and the debate is being carried on between the Vets, the Homeopathic Vets, the Homeopathic Doctors, Homeopathic Pharmacists, and the FDA. That seems to be the proper forum for the debate.
Prepared By: Julie Anton, USDA/AMS

The Board convened with a review of the agenda. Mr. Gene Kahn advised that the Crop Standards Committee would present positions to be voted upon by the full Board, and the agenda was adjusted to reflect this.

Dr. Rich Theuer presented the Processing and Handling Committee report. Conference calls will be held on June 8, 17, and 22, 1993, prior to the July 1993 meeting in Oregon. In preparation for the July meeting, Mr. Weakley will be revising the Organic Handling Plan. The Committee will review the labeling document and work further on processing standards. Ms. Merrill Clark and Mr. Gene Kahn are the Committee appointees for the definition of organic working group. Chair Theuer will develop the Committee's response to the Codex draft by June 1, 1993.

A question was raised as to whether cotton should be assigned to the Processing Committee or to a specific working group. It was agreed that cotton production should be addressed in that cottonseed meal is a livestock feed supplement.

The Committee agreed to discuss the small processor exemption at a later date.

Mr. Sligh thanked Mr. Theuer for an extraordinary job as Chair of the Committee.

Ms. Nancy Taylor, Chair of the Materials Committee, informed the Board that Dr. Tom Stoneback was elected the new Chair of the Committee, and Dr. Gary Osweiler was elected Vice-Chair. Ms. Taylor also announced that Ms. Merrill Clark would be joining the Committee. Input for the July meeting has not yet been developed. A working group for the Technical Review Panel is needed. Mr. Sligh suggested that Mr. Stoneback and Dr. Osweiler work out the details of their respective responsibilities as soon as possible. Ms. Taylor called for a brief meeting of the Committee before the Board adjourned for the day.

The Accreditation Committee report was delivered by Chair Margaret Clark. Ms. Clark officially requested that Ms. Julie Anton be charged with creating a glossary for the Committee's work. Ms. Clark described the anticipated Crop Standards Committee role in devising certifying agency qualifications for reviewing Organic Farm Plans.
Acting Chair Stoneback presented a report of the
International Issues Committee meeting, announcing the following
Committee member assignments with regard to review of the Codex
Alimentarius guidelines: Dr. Bob Quinn, crops issues; Mr. Sligh,
accreditation issues; Ms. Taylor, materials issues; Dr. Theuer,
processing and labeling issues; Mr. Jay Friedman, livestock
issues; and Dr. Stoneback, definitions.

Dr. Stoneback described the Committee's attempt to draft a
definition of "organic" by adapting the Codex definition for use
by the Board. With reference to the ongoing discussions between
the USDA and the European Commission regarding equivalency in
organic food production laws, International Committee
participation in working groups on differences in the laws were
reported.

Finally, import requirements were addressed as situational:
sovereign to sovereign policy will reign if both the exporting
and importing countries have regulations in place; where the
exporting country have no sovereign government involvement in
regulating organic food labeling, special requirements shall be
proposed by the International Committee for adoption by the USDA.

Dr. Don Kinsman responded to the International Committee
report by making the point that there are FSIS requirements in
place for equivalency in quality of meat.

Mr. Kahn commented that as the different positions of the
Board are refined, the workload of the International Committee
will increase substantially in order to address the comparison of
these positions with foreign country standards. The need for a
Board committee on international issues was officially
reaffirmed.

Ms. Merrill Clark, Chair of the Livestock Committee,
presented copies of the Committee's revised version of Standards
for Organic Livestock Production to the Board, and a discussion
of its contents ensued. Mr. Quinn brought forth the issue of
whether or not slaughter stock cattle would be considered
certifiable if not obtained from organic breeder stock but fed
organic feed from birth. Ms. Margaret Clark expressed her
opposition to [lines 305-306.] The discussion centered around
possible points of entry into certifiable organic production. It
was decided that discussion of slaughter stock sources would be
reopened at the July 1993 meeting.

Mr. Kahn, Mr. K. Chandler, and Mr. Quinn requested to join
the Livestock Committee.

Mr. Don Kinsman offered to investigate the livestock density
issue, reviewing U.S. agency and foreign government laws and
guidelines.
The Crop Standards Committee report was given by Chair Kahn. He described the joint meeting held between the Crop Standards Committee and the Livestock Committee to discuss split operations and the emergency spray exception.

Mr. Kahn then reviewed Committee work in progress, announcing that he would provide a written work plan to the Board in the weeks ahead. The final Committee document on spray drift policy will be presented at the July 1993 meeting. The crop production inputs list will be given high priority, with eight or nine particularly questionable materials to be intensively reviewed.

Furthermore, the Committee plans to address cotton defoliation.

The Committee will work cooperatively with the Processing and Handling Committee to define the terms, "extraction" and "synthetic." Specialized standards on mushroom, maple syrup, and greenhouse production will be drafted.

The Committee has yet to decide whether or not to specifically address soil improvement as a proposed standard or as merely guidelines to certifying agents. The Committee plans to recommend policy to the Accreditation Committee regarding how certifying agencies should handle minor infractions.

The Committee plans to resolve all non-agreement materials and sought to initiate the botanicals special review process. Guidelines for brand-name products will be developed. Also, a preamble to the list of crop production inputs will be drafted for approval by the Board.

The organic farm plan will be revised slightly, with a reworking of the questionnaire. It is clear that the wildcrafting section is inadequate. Also, the Committee needs to address farming by neglect.

Finally, the Committee will aspire to consolidate all documents pertaining to crop production, providing a table of contents.

Mr. Kahn pointed out the need for the Board to discuss genetic manipulation.

Mr. Sligh inquired about the small farmer exemption, an issue that cuts across the areas of accreditation, crops, and livestock. It was agreed that Mr. Sligh and Mr. Dean Eppley will work together to formulate language to address the small farmer exemption within the context of the crop production standards.
The Board agreed to officially recommend to the Secretary of Agriculture that cotton production and processing be included in the products certifiable under the Organic Foods Production Act of 1990. The discussion preceding this decision included the following points: Mr. Theuer stated that cotton seed meal and cotton seed oil bring cotton defoliation into the Board’s purview, but questioned whether or not the processing of cotton fiber followed the same logic; Mr. Quinn pointed out that cotton is only defoliated for the purpose of fiber production; Mr. Kahn asserted that it would be irresponsible of the Board not to address cotton; and Mr. Chandler described fiber as a "by-product" of cotton production. The Board authorized the Crop Standards Committee to conduct a fact-finding mission about cotton production, and the request of its members.

Mr. Kahn announced that the Committee would not change chairs at the present time. The primary need for technical assistance would be in the area of biotechnology.

A joint Crop Standards/Livestock Committee document pertaining to split operations [attached] was presented to the Board. Prior to a vote, the following discussion and amendments took place.

Mr. Craig Weakley described how the Committees agreed that full farm conversion would not be mandated but would be encouraged in the farm plan document. It was agreed that USDA-accredited certifying agents should be allowed to make the use of their seal contingent upon full farm conversion. An official vote was taken to elevate the Committee recommendation to a Draft Full Board Recommendation: unanimous approval resulted.

Mr. Weakley presented a revised version of the Committee's recommendation to the Board regarding residue testing [see attached]. He announced that the Committee had been able to address the concerns expressed by Mr. Sligh and Mr. Theuer on Monday, when the previous version of the documents was presented, by making the following amendments: (1) on line 126 on page 5, a sentence was added; (2) on line 132 on page 5, a sentence was added; (3) on line 136 on page 5, a paragraph was added.

Mr. Stoneback questioned the specificity of the language on lines 126-127; there may be a laboratory somewhere that may be able to detect a residue, but it may be far from the site and impose an unrealistic cost on the producer. Addressing Mr. Stoneback's concern, it was agreed that after the word "pesticide" on line 129, a new sentence should be added: "In such situations the certifying agency shall survey the regionally available USDA-accredited laboratories and select the laboratories that are capable of detecting the lowest level for that pesticide." After Dr. Kinsman question the appropriateness of the bracketed
sentence in the same paragraph, the Board agreed that the
bracketed information should appear in the glossary.

Mr. Theuer suggested that the residue testing document be
preliminarily reviewed by FDA and FSIS officials. Dr. Hal Ricker
agreed to ask officials of the AMS pesticide residue testing
program to review the document as well. It was explained that
the USDA has program which involves laboratory testing
[accreditation of labs?]; the Board officially requested that the
USDA provide a list of those pesticides that can be tested by the
laboratories and a description of the capabilities of these
laboratories should be drawn up and provided to the Board.

An official vote was taken to approve the document,
including the revisions cited above; approval was unanimous.

A joint Crop Standards/Livestock Committee document
pertaining to the emergency spray exception [attached] was
presented to the Board. Mr. Kahn summarized Board members'
concerns expressed in the Monday session, and explained that two
sections had been added to the original Crop Standards Committee
document to address those concerns [see lines 8-16, and lines 19-
30]. Prior to a vote, the following discussion and amendments
took place.

Mr. Sligh requested that the document be distributed to
other agencies that might be involved in these programs.

It was agreed that the phrase, "by the government," on line
27 should be changed to "by the responsible government agency."

It was noted that lines 67-68 reflect added references to
pasturage which may not have a production season. Other
references to livestock had been added on lines 95-105, line 109,
line 115, and lines 122-123.

The suggestion by Mr. Stoneback that the parentheses be
removed was approved by the Board.

Ms. Merrill Clark commented that it is likely that consumer
groups will take issue with the fact that the Board's position on
the emergency spray exception does not require a three-year
organic status reinstatement period.

It was agreed that the phrase, "substances allowed under
this title," on line 15 replace the phrase, "National List
substances approved."

An official vote was taken to approve the document,
including the revisions cited above; approval by the Board was
unanimous.
Mr. Kahn then presented a revised version of the Committee's recommendation to the Board regarding planting stock [see attached]. He announced that the Committee had been able to address some of the concerns expressed public input presenters at the Monday session.

The first revision made was to delete lines 60-65. Mr. Kahn explained that the Crop Standards Committee views onions, garlic, potatoes, and strawberry crowns as seeds and therefore allowable under the OFPA. He also pointed out with reference to the strawberry crown proposal that State phytosanitary law requires fumigation with methyl bromide for interstate transport.

In reference to the added phrases regarding transplants destroyed by natural disaster, Mr. Theuer asked about man-made "disasters," such as fires.

Ms. Merrill Clark repeated her concern about the definition of "compatible synthetic."

The phrase, "look for," on line 213 was changed to the word "develop."

It was agreed that the term, "USDA-accredited," should be added in insert #3.

An official vote was taken to approve the document, including the revisions cited above; approval by the Board was unanimous, with the exception of Dr. Osweiler, who was absent.

Mr. Quinn reported the Committee's position on changes to the spray drift policy recommendation to the Board, presented on Monday, summarizing the position as entailing the following concepts:

1. Losses due to drift or emergency spray should be eligible for crop or disaster insurance.
2. The consequence of a drift incident should be the same as an emergency spray event.
   a. Visual evidence provides a determination.
   b. The next crop may be considered for an "organic" designation at discretion of the certifying agent or upon the basis of residue testing.
   c. Drift or misapplication by others of any prohibited material may follow similar procedures.
   d. Only crops harvested from the portions of the field hit by drift should be decertified.
   e. Buffer zones shall be established.

Ms. Taylor reminded the Board of the importance of making the producer responsible for notifying the drift applicator (the potential trespasser) and the relevant government authority(ies) of the organic status of the farm. Mr. Sligh pointed out that...
aerial pesticide applicators are of particularly concern. Mr. Theuer added that a description of how to proceed with a determination of the material sprayed would be needed.

Mr. Kahn noted that the Committee would utilize the same notification language used in the emergency spray document.

Mr. Sligh suggested that the Board request that the Secretary educate pesticide applicators of the liability in spraying around or on certified organic farms. Ms. Margaret Clark commented that such a procedure could work; pesticide applicators can have their licenses revoked if they spray pesticides during bee season.

Mr. Sligh pointed out the problem with absentee owners who hire pesticide applicators and do not inform them of the location of organic farms. Ms. Merrill Clark commented that in Michigan, a registry of organic producers was created, and applicators were required to be familiar with the farms in the registry.

A "straw" vote was called to approve the concepts put forth by the Committee; there was complete support from the Board, with one abstention (M. Sligh).

To conclude the Committee's presentation, Chair Kahn requested that the Board approve the Committee's plan to initiate the Special Review of Botanicals. Research would be conducted, with the result of a fact sheet on botanicals to be prepared by Ms. Anton for the NOSB. Ms. Anton also agreed to contact the National Agricultural Library to initiate a literature search. Dr. Ricker reported that the EPA is in the process of screening the botanical pesticides, utilizing the seven criteria appearing in the OFPA.
Board Members Present: Michael Sligh, Chair; Margaret Clark, Eugene Kahn, K. Chandler, Merrill Clark, Dean Eppley, Donald Kinsman, Gary Osweiler, Robert Quinn, Thomas Stoneback, Nancy Taylor, Richard Theuer, Craig Weakley

Missing: William J. Friedman

USDA Representatives: Harold Ricker, Staff Director; Julie Anton, AMS; D. Ted Rogers, AMS; Donald Derr, FSIS.

Chairman Sligh called the meeting to order at 8:00 am and asked Gary Osweiler to serve as Acting Secretary.

Approval of Minutes

Chairman Sligh called for comments errors or omissions on the July 1992 minutes. It was noted to strike 9 on line 34 of the last page of the minutes. No other changes were proffered. Chairman called for approval. Vote was 12 Yeas and 1 No.

Chairman Sligh called for errors and omissions for the September minutes. It was noted that Mr. Gene Kahn was not present at the meeting. Chairman Sligh called for approval as amended. Minutes were approved.

Chairman Sligh moved to accept the proforma budget statement with the proviso that it will be reviewed at the July meeting.

LIVESTOCK COMMITTEE PRESENTATION TO THE FULL BOARD
FRIDAY, MAY 21, 1993

Prepared By: Julie Anton, USDA/AMS

Livestock Committee Chair Merrill Clark circulated copies of a document entitled, "Comprehensive Livestock Production Standards Document, Recommendation to the Full Board #3" [attached], to the Board members present, explaining it as a truncated version of Recommendation to the Full Board #2. The Livestock Committee (NOSB-LC), having met briefly the evening before, sought to present the Board with sections of Recommendation #2 ready for full Board discussion and vote, particularly given the short time for presentation allowed on Friday.
An informal agenda was also circulated, outlining the NOSB-LC's plans: (1) to describe the definitions as for clarification purposes only; (2) to progress from the last lettered section of the document to the first and to call for a vote on each; and (3) to refer sections with more than ten minutes of discussion back to the NOSB-LC for further work. A "straw" (unofficial) vote would be taken on the sections described in (3) above.

Starting with section G of NOSB-LC Recommendation #3, the proposed livestock transportation standards were discussed. Ms. Clark noted that the NOSB-LC removed reference to sick or injured livestock in NOSB-LC Recommendation #2 because of Mr. Rich Theuer's previous observation that there are provisions regulating the transportation of sick or injured livestock in other Federal law. With little further discussion, the section was called to an official vote and approved unanimously.

Section F, "Recordkeeping for Organic Livestock Producers," was discussed next. Mr. Tom Stoneback questioned the purpose of requiring producers to document their rationale for using synthetic health inputs appearing on the National List. Dr. Gary Osweiler explained the purpose of this standard as to provide the certifying agent with a means of evaluating habitual use.

There was some discussion of whether or not this standard should be removed and designated an Organic Farm Plan guideline. Ms. Julie Anton noted that the issue is really whether or not a producer could be decertified if he/she did not document the use and rationale for use of permissible synthetic health inputs. Ms. Nancy Taylor pointed out that National List annotations will cover such producer requirements to some extent.

The Board agreed to the rephrasing of lines 123-124: "All organic livestock while under organic production shall be traceable through the life cycle."

Section F was called to an official vote and adopted unanimously.

Organic Livestock Healthcare Practices, Section E, was then addressed by the Board. The first issue was whether or not to prohibit the use of both systemic and topical antibiotics in or on slaughter stock. In response to a question by Mr. Gene Kahn about the viability of an antibiotic used in a livestock animal, Dr. Osweiler briefly explained that elaborate withdrawal times have been established based on various scientific studies and that most of the time the antibiotic administered to the animal will be nondetectable before the withdrawal time is up. However, he noted that if injections are administered in the wrong place in the wrong way, there may be more problems with residues.
Mr. Michael Sligh referred the issue to the certifying agencies present at the meeting. Mr. David Haehn of the Ozark Small Farm Viability project commented that in subtropical areas, a cut is potentially life threatening, and therefore, he has no objection to use of topical antibiotics. He stated that the NOSB had covered his concerns about antibiotic residues with the recordkeeping requirement that National List materials be cited along with a rationale for their use. Mr. Eric Ardapple Kindberg of the same agency, on the other hand, agreed with the NOSB-LC proposal to prohibit all antibiotic use in slaughter stock.

Mr. George Siemon, a representative of the OPPANA/OFAC livestock committee, reported that their survey indicated clear support for prohibition of systemic antibiotic use in slaughter stock (88%) and for the allowance of topical antibiotic use in slaughter stock (81%).

Mr. Brian Baker of California Certified Organic Farmers indicated that the producers he interviewed would like to be able to utilize topical antibiotics in slaughter stock but could "live without" systemic antibiotics.

There were concerns expressed by Board members about the definition of "systemic." The consensus was that no official vote could be taken until "systemic" was defined. A "straw" vote was taken on a revision of the NOSB-LC proposal: "The use of systemic antibiotics for the treatment of slaughter stock is prohibited." 8 Board members "straw" voted for the proposal, 4 members voted against the proposal, and one member abstained. It was decided that references to antibiotics would be moved to the National List section of the comprehensive document.

Regarding the second issue under section E pertaining to contamination by treated livestock and treatment of one animal not affecting the status of others, the Board expressed unanimous approval.

The third issue under section E regarding the withholding of treatment to maintain the organic status of a livestock animal evoked minor discussion of the term, "unavoidable suffering."

It was explained by the NOSB-LC that density considerations under part 4 of section E, the "production environment," had not yet been developed by the Committee but would be addressed. It was decided that references to density would be removed from section E until ready for full Board vote.

There was some discussion of the requirement that bedding be organic if edible, particularly given that newspaper, which is often used for livestock bedding, will be consumed by livestock to some extent. Mr. Stoneback argued that it is important that
organic standards do not preclude the interrelationship between
municipalities and farms by prohibiting the use of newspapers,
particularly given that agriculture creates a third of the U.S.
waste problem; Mr. Quinn commented that "recycling should not be
done through organic livestock."

Mr. K. Chandler noted that the term "crate," as utilized in
part 5 of section E, should be defined; Mr. Quinn noted that
"farrowing period" should also be defined.

Regarding part 6 of section E, it was agreed that the
parenthesis utilized in lines 114-115 be removed and that the
word "outdoors" would be followed with the phrase, "with the
following exception:"

An official vote on section E, lines 84-106 and 109-120 was
called and resulted in unanimous approval.

Section D, Sources of Drinking Water, was discussed next,
with no official votes on the language taken. The Board agreed
to drop the term, "by the National List," and discussed how
prohibited substances would be detected and procedures in case of
detection. It was pointed out that there is no EPA tolerance
level set for livestock drinking water. In conclusion, the Board
agreed that the Livestock and Crop Standards Committees should
work together to develop a joint recommendation to the full Board
on water quality.

Section C, Sources of Feed, Feed Supplements, and Feed
Additives, brought a few issues of contention among Board
members. Ms. Margaret Clark stated her preference for a phase-in
to the 100% certified organic feed requirement. Dr. Quinn
suggested a provision for cases of disaster, giving the example
of a livestock barn that burns down in the middle of a blizzard,
with alternative feed sources three days travel away. Dr.
Stoneback recommended that land not treated with prohibited
substances (i.e. fallow) for three years be acceptable as
pasturage for organic livestock.

"Straw" votes were taken to assess the will of the Board.
Section C, written as is, received only one vote of approval.
With a disaster clause written in, 10 Board members expressed
support. With an allowance for untreated pasture land written
in, 9 members expressed support, 2 abstained, and 2 were opposed.
It was agreed that the Board should spend time discussing feed
requirements further.

To conclude the discussion of livestock feed supplements and
feed additives, the Board expressed no objections to lines 70-71,
and no objections to lines 72-73.
Section B, Livestock Sources, evoked extensive discussion. A "straw" vote was taken regarding the language in lines 20-30, and unanimous approval was achieved. The term, "substances prohibited by the National List," was replaced by the term, "prohibited substances."

Discussion of (1) under Breeder Stock was referred to a later discussion of slaughter stock. There were no objections to (2), as rewritten from Committee Recommendation #2. Mr. Kahn, Dr. Kinsman, and Ms. Taylor likened (3) to the split operations language, and the concept was approved by the majority of the Board. Regarding (4), it was noted that the intent is to prevent the cycling of breeder stock in and out of organic status when kept on a certified organic farm; (4) received unanimous approval by the Board. (5) also received unanimous approval, with no discussion.

The issue at hand in the Board's discussion of slaughter stock sources is whether or not to allow day-old or week-old calves, which are not born from organic breeder stock. Three Board members, Ms. Merrill Clark, Dr. Osweiler, and Mr. Sligh, expressed support for the requirement as written; nine Board members disapproved of the requirement; Dr. Kinsman abstained from the "straw" vote.

A "straw" vote was taken on lines 51-61, the Poultry Stock section, and unanimous approval was achieved.

The Dairy Stock section was not discussed.

In conclusion, the Board agreed that a legal definition of "raised" and of the breeder stock requirements was needed prior to further discussion of livestock sources issues.
July Meeting Agenda: Three versions of a proposed agenda for the July meeting had been circulated for approval. Chairman Sligh asked for discussion and approval. Margaret's second agenda was approved unanimously.

September Meeting Dates and Location: Three locations were considered: Baltimore, Fargo, Arkansas, and Lubbock, Texas. It was noted that Baltimore would be too expensive, given the limited budget, and necessitate people being away from work too long if they had to participate in Expo East just prior to the meeting.

After brief discussion on the three locations, Chairman Sligh asked for a vote. The results were Baltimore (1), Arkansas (6), Texas (6). There was further discussion on Arkansas and Texas and it was noted that Arkansas would draw people from a number of as yet unheard from southern states and would offer a low cost facility and arrangements similar to Rodale. The Board approved the selection of Arkansas with dates of September 14-17, 1993 with an optional tour on September 13.

Timetable: A question was raised about the implementation of the program and the need for a timetable. It was also asked that USDA clarify the impact of missing the October 1, 1993 deadline with OGC, and whether an interim program is needed.

Mr. Weakley indicated he would work with OFPANA to get the processors together at Expo East in Baltimore to meet with Board members participating in the show.

By-Law Proposal: Mr. Chandler moved the Board consider modifying how Robert's Rules are used. He thinks they should be used as a guide so as not to tie up the process. Certain things mandated in the law should be kept, but keep the process as simple as possible. The motion was seconded and passed unanimously.

Crops Committee Papers: It was noted that the four papers presented by the Crops Committee yesterday had not been formally approved as draft recommendations. Stoneback moved adoption of them, and Quinn Seconded. The motion passed unanimously.

Committee Changes: Mr. Kahn and Mr. Chandler asked to be appointed to the Livestock Committee in addition to current assignments. Mr. Quinn also expressed interest, but was not sure he would be able to find the time. Mr. Kahn and Mr. Chandler were appointed to the Livestock Committee.

Election of Officers: Chairman Sligh called for the election of Officers and recommended that the office of Secretary be consider
first since Mr. William J. Friedman indicated his desire to no
longer serve in that capacity. Chairman called for nominations.
Ms. Margaret Clark nominated Mr. Craig Weakley. The nomination
was seconded and a motion was made to close nominations. Motion
passed unanimously and Craig Weakley was appointed Secretary.
Chairman called for nominations for Treasurer. It was noted that
the position does not have any requirements now since there is no
budget, but might have if money becomes available. Mr. Gene Kahn
was nominated by Mr. Chandler and seconded. Mr. Quinn was
nominated by Ms. Margaret Clark, but asked that his name be
withdrawn. Nominations were closed and Mr. Kahn was re-elected
as Treasurer unanimously.
Chairman called for nominations for Vice Chair. Ms. Taylor
nominated Ms. Margaret Clark. Mr. Eppley moved nominations be
closed, and Dr. Osweiler seconded. Unanimously approved, and Ms.
Clark was re-elected Vice Chair.
Nominations were called for Chair. Mr. Weakley nominated Michael
Sligh. Mr. Chandler moved that nominations be closed. This motion
was seconded, and approved unanimously. Mr. Michael Sligh was
re-elected Chair.
Other Business: Chairman Sligh asked all Committee Chairs to
limit their use of conference calls to one or two a month, and to
keep them focused.
The Chairman called for a standing ovation for the hospitality
shown by the people at Rodale.
The Vice Chair also called for recognition for those members of
the public that attended through all or most all of the week.
Meeting was adjourned at 11:30 am.
A. DEFINITIONS

These definitions are provided only for the purpose of clarification.

Breeder Stock. Female parent of organic livestock.

Manure Refeeding. The intentional addition of manure or livestock litter to the ration.

Organic Production Methods. Fed 100% organic feed and under organic methods as defined by the recommended standards.

Organically-Raised. Fed 100% organic feed and under organic production methods as defined by the recommended standards.

B. LIVESTOCK SOURCES

(1) Livestock which do not meet the standards for organic livestock shall not contaminate organic livestock remaining in the farming operation with substances prohibited by the National List.

(2) Livestock and/or the products of livestock which do not meet the standards for organic livestock shall be diverted to the conventional market when sold.

(3) The USDA-accredited certifying agency shall include a section in the Organic Farm Plan questionnaire which addresses the producer's progress toward full conversion of the farming operation to organic production.

1. BREEDER STOCK

(1) Only slaughter stock that are progeny of female breeder stock under organic production methods from the last third of gestation or longer shall be considered organic.
(2) Breeder stock purchased for the purpose of producing organic slaughter stock shall be organically raised, with the following exception: if the producer can document to the satisfaction of an USDA-accredited certifying agent that organically-raised breeder stock of acceptable quality and genetic potential are not commercially available, non-organic breeder stock shall be permitted.

(3) Purchased breeder stock shall be under organic production methods from such time such stock is brought onto a certified organic farm.

(4) On-farm breeder stock shall be under organic production methods from birth.

(5) Artificial insemination is allowed.

2. SLAUGHTER STOCK

Slaughter stock shall be born to organic breeder stock and be raised under organic production methods.

3. POULTRY STOCK

(1) All poultry from which meat or eggs will be sold as organically produced shall be raised under organic production methods from day old.

(2) Day-old poultry purchased for the purpose of producing organic poultry stock shall be organically raised, with the following exception: if the producer can document to the satisfaction of an USDA-accredited certifying agent that organically-raised chicks of acceptable quality and genetic potential are not commercially available, non-organic chicks shall be permitted.

4. DAIRY STOCK

[Position under consideration.]

C. SOURCES OF FEED, FEED SUPPLEMENTS, AND FEED ADDITIVES

(1) All certified organically produced livestock must be fed 100% certified organically produced feeds and feed supplements.

(2) Land upon which livestock feed is produced and upon which livestock are grazed or pastured shall be under organic production methods.
Feed supplements utilized in the livestock ration shall be 100% certified organic.

Feed additives utilized in the livestock ration may be from any source unless prohibited by the National List.

D. SOURCES OF DRINKING WATER

Water quality shall not compromise the organic integrity of livestock. Water for livestock shall not contain substances prohibited by the National List. The farm plan shall address remediation action to be taken by the farmer either to provide alternative drinking water sources or correct the water quality problem.

E. ORGANIC LIVESTOCK HEALTHCARE PRACTICES

(1) The use of systemic and topical antibiotics in or on slaughter stock is prohibited.

(2) Livestock which are treated with or fed prohibited materials for healthcare purposes shall not contaminate organic livestock remaining in the farming operation. Use of prohibited materials on individual livestock shall not result in a change of status for the remaining organic livestock.

(3) The action of a producer to withhold treatment to maintain the organic status of an individual livestock animal which results in the otherwise avoidable suffering or death of the animal shall be grounds for decertification.

(4) A production environment which minimizes livestock stress and maximizes livestock health shall be provided; it must include the following factors:

(a) access to shade, shelter, natural air, and daylight suitable to the species, the stage of production, the climate, and the environment;

(b) clean and dry bedding, which is of organic origin if consumable, suitable to the species and where applicable to the husbandry system;

(c) housing design which allows for the conduction of natural maintenance and comfort behaviors and for the opportunity to exercise; and

(d) housing design which provides a temperature level, ventilation, and air circulation suitable to the species.

(e) [Density considerations to be developed upon research of recommended allotments.]

(5) The following types of intensive confinement production systems shall be specifically prohibited:

(a) Poultry raised in battery cages;
(b) Veal raised in crates;
(c) Sows raised in crates, except during farrowing periods.

(6) Continuous confinement of livestock to an indoor housing facility without the opportunity for daily exercise and access to the outdoors (with the exception of extreme climatic conditions, including those which would incur or cause ecologically damage) shall be prohibited. Stanchion barns or tie stalls to which livestock are confined without daily outdoor access and the opportunity for exercise are prohibited.

F. RECORDKEEPING FOR ORGANIC LIVESTOCK PRODUCERS

1. ANIMAL SOURCE AND LIFE CYCLE RECORDS

(1) An identification system must ensure the identity of organic livestock.
(2) Each slaughter animal/poultry flock/fish lot must be traceable through the life-cycle.
(3) A producer shall document all livestock sales and purchases.

2. HEALTHCARE RECORDS

(1) Producers must document use and rationale for use of all synthetic health inputs appearing on the National List.

3. FEED AND FEED SUPPLEMENT RECORDS

4. FEED ADDITIVE RECORDS

G. TRANSPORTATION

(1) Audit trail must remain verifiable throughout transportation.
(2) Contamination by prohibited materials shall not occur during transport.
NATIONAL ORGANIC STANDARDS BOARD

Minutes of Meeting July 8, 1993

USDA Members: Harold Ricker, Michael Hankin, Julie Anton, D. Ted Rogers.

Chairman Michael Sligh opened the meeting at 8:05 am by asking for approval of the minutes from the May meeting. Richard Theuer noted that the Processing Committee minutes were in less detail than the others. Dean Eppley moved that the minutes be approved. Rich Theuer seconded. Motion passed unanimously.

Chairman Sligh called for any changes in the agenda for this meeting. Jay Friedman noted that it did not provide for public input to the International Committee meeting. It was noted and suggested that the Committee Chair provide time with the allocation at the Chair’s discretion.

September Meeting dates were discussed with agreement on September 26-30 and the note that members should fly into Memphis where the Arkansas Land Development Corporation will have transportation arranged to the meeting site. Dr. Ricker discussed the meeting facilities and preliminary arrangements. The facility has capability for 11 single rooms, and the rest would be put up in a nearby motel.

Budget: Dr. Ricker went over a rough budget estimate to indicate how money would be allocated for this meeting and next based on the $30,000 additional funds made available by the Secretary. The Rodale meeting in May allowed the Board to cover its estimated annual phone and fax expenses for Board members and still have enough left for two additional meetings. The budget figures were estimates because not all of the members expenses had been received from the May meeting.

USDA staffing roles: Hal Ricker briefly discussed some of the staffing changes with the addition of Michael Hankin to serve as operations manager and coordinate the work in support of the Board and as we move toward the development of regulations. Ricker indicated that Hankin would become the key person for the Accreditation Committee with Ted Rogers as backup, and Rogers would be key person for the Processing and Materials Committees and continue to improve the mailing list; Julie Anton will continue to be key person for the Crops, International, and Livestock Committees. Hankin will be working to provide some oversight of all activities. Ricker indicated that he was under continuing
pressure from Mr. Fitzpatrick to take on other assignments, but that he would remain as Staff Director for the near future.

There was discussion of the role of minutes, and whether they should reflect official actions only, or whether they need to be detailed to document the justification for the action. Ricker is going to reexamine the FACA requirement with regard to minutes. His view is that the Board meeting minutes have more critical importance than the Committee meeting minutes, as reflecting the views and positions of the Board. The Committee meetings minutes need not be as detailed, but he will double check.

Julie Anton presented a report on public input and the information and action flow process. Hankin indicated that due to the fact that the meeting was running late, that this issue should be brought up for discussion in more detail, at the closing full Board session.

Dr. Ricker then introduced Michael Hankin to make a few comments to the Board. Hankin indicated he was glad to be here, and wanted to acknowledge the work accomplished by the Board and Staff. He indicated a need for a meeting of the Materials Committee, and recommended that no vote be taken on botanicals until after the Technical Advisory Panel review. He suggested that the Board consider modifying its operating structure at future meetings to facilitate full Board discussions on the issues being considered by committees. He cited specific needs for a definition of organics, an audit trail for processing, and looking forward to helping the Livestock Committee move forward. He discussed the need for handling plans to be fairly general in nature to allow flexibility for certifiers.

Craig Weakley asked for clarification on the general nature of handling plans. Hankin responded that the regulatory language would include what is addressed, how it is used, and when it fits.

Bob Quinn asked about the timeline. Hankin responded that we will be better able to move on that after he has been able to review the current status and had discussions with OGC.

Jay Friedman expressed concern that they never see comments from OGC. The answer is that OGC does not want to rule on pieces of the program until they can see how they fit together.

Margaret Clark questioned OGC saying that they should start developing recommendations because they may not recommend what USDA thinks they should be. NOSB position is to recommend what they think is best. Hankin indicated he would work with the committee, and hopefully there would not be major differences.

Chairman Sligh then asked for brief committee reports on their planned activities at this meeting.
Processing Committee - Rich Theuer, Chair - Will be working on a labeling draft recommendation. Will also be working on the Organic Handling Plan including the comments from the May meeting. They will be meeting at 1:00 today and the first order of business will be the resolution of issues under the labeling draft, with the hope to have it ready for Board vote on Sunday. At 4:00 today they will be taking public input. At the Saturday meeting they will be working on a response for the National List - after meeting with the Materials Committee. At 3:00 Saturday they will work on essential substances and criteria for essential synthetics.

Accreditation - Margaret Clark, Chair - There is a revised draft of their accreditation document in a packet that is out for public comment with a deadline for comments of August 15, 1993. Topics to be considered in their meetings include: need for legal definitions, clarification of positions, work on the approval process, peer review panel, logo’s, and enforcement and appeals issues. There is also a question of the October 1st deadline and the need for an agenda revision.

Livestock Committee - Merrill Clark, Chair - Likes the Oregon Tilth proposal on animal and plant analogues. Supports Hankin's statements on the need for more full Board discussion of topics. Walter Graves gave a very good presentation on the interaction of animals and legumes. At the Friday meeting they will be addressing May meeting issues including livestock sourcing, and feed standards. Gary Osweiler and Don Kinsman are giving presentations on antibiotics and parasiticides tomorrow. Jay Friedman is working on Codex discussion, and Kinsman is looking at livestock density issues. Will also look at Hankin’s paper for livestock process, scheduling livestock hearings, emergency feed situations, and land in pasture.

There was a brief discussion of the issues in livestock sources. Friedman questioned whether the livestock standard should be different for different species. He likes the last third of gestation position. Question of differences between slaughter stock and dairy. If you treat all the same, it is easier to manage the program? Gary indicated that there is 9 1/2 month gestation, if you buy a cow in the 5th month and it starts producing milk could it be organic? Friedman’s response, calf yes, mother no. Hankin suggested that the topic needs more discussion before a decision is made. Need to provide an analysis of the topics including producer based organics and the relationship to consumer based consideration of organics.

Question arose among NOSB members on the need to have livestock hearings. Ricker reviewed the history of the hearings, the process, and the need for them.

Gene Kahn indicated strong support for the hearings. K. Chandler indicated the need to have strong viewpoints articulated in
addition to consensus.
Theuer indicated that he thought processing is excluded from the hearings. It was pointed out that the OFPA indicates hearings for livestock products.
Kahn indicated that it would be a fatal flaw to delay action of the hearings, because managers need to know what is planned.
Merrill Clark indicated that much has been distributed already.
Kahn indicated that if you can provide current thinking that is fine.
Hankin indicated the need to have analysis.
Anton expressed concern from the public about not hearing about the thinking of the committee.
Kahn indicated that the preliminary working drafts might solve that.
Friedman indicated he would like the NOSB to co-chair the hearings.
Hankin indicated that the input to be received is not to test the NOSB and Livestock Committee, but wants organic community involvement.
Merrill Clark would like to have positions on various issues for consideration.

Crops Committee - Gene Kahn, Chair - The Crops Committee will meet Saturday from 8:00 to 12:00. They will discuss the draft small farm exemption, time line for materials, mushroom and specialized crop standards, requirements for certifying agents for crops, organic farm plan and integration of it with livestock, wild crafting provisions of farm plan need strengthening, Codex crop standards, and organic definition.

The Crops Committee’s draft recommendation on spray drift was presented by Bob Quinn. When it was presented in May there were 5 members in support, 7 opposed and one abstention. Indications were that there was too much emphasis on residue testing.
Revisions suggested: Remove from I A. "droplets or granules."
Friedman questioned Section II calling for compensation for loss of organic crop. Kahn indicated they were not sure if it is legal, but wanted to be on record in favor of compensation, and thus make a strong statement.
Michael Sligh indicated his desire to include organic training in certified pesticide applicator training. Committee agreed to consider including in number II.
Nancy Taylor suggested a notification requirement by sprayers to organic farmers.
Margaret Clark indicated there is no direct force in the recommendations unless the Secretary chooses to implement policy recommendations.
Hankin said that this may dilute the language of the document, and besides, it may not all go to the Secretary. Craig Weakley indicated he would have to disagree, language might go, but the Secretary is going to do it or not.
Kahn preferred to adopt the language.
Friedman and Ricker agreed that you could develop separate
recommendations for addressing issues that are not authorized under current statute for consideration by the Department, which they might provide to the Congress.

Continuing with the document, Quinn noted that proposed changes suggested in May had been made in Section IV.

Friedman questioned line 124. Are you talking about sites rather than product? He also wanted to question who would handle decertification - should be at discretion of certifier.

Suggested that the committee pull out the wish list and put in a separate document. Review lines 179-187 to clarify.

Margaret Clark commended the committee for doing an excellent job in incorporating comments from NOSB and the public.

Friedman indicated the need to review pasteurage for the 3 year exemption, and also actions that trigger enforcement actions.

Weakley indicated that the intent of Friedman's concerns are addressed in other documents. Friedman may need a reference citation.

Merrill Clark indicated that the Livestock Committee had not seen this document prior to this meeting and feels uncomfortable with the Livestock Committee name on the document. Kahn agreed to remove the Livestock Committee name from the document.

Materials Committee - Tom Stoneback, Chair - This is a double transition with Hankin on staff, and Tom Stoneback and Gary Osweiler replacing Nancy Taylor as co-Chairs. They will spend some time on identifying issues and reviewing the process with a high priority for substances on the list. The Technical Advisory Panel needs to be formed and organized as soon as possible, as well as an understanding of the types of information they will be expected to provide. Need to work through the materials for crops, and the special review of botanicals. Will meet in caucuses.

Nancy Taylor asked where we were with the full disclosure document. Stoneback indicated it is necessary to complete some things this week.

Taylor also questioned the petition form priority, indicating Ted Rogers had another proposal.

Hankin indicated he wants to discuss this further, because the petition form may not be needed until a list is established, but wants to discuss this in committee.

Merrill Clark asked if we could get EPA here for discussion of registration of pesticides and botanicals.

Stoneback indicated procedures for involvement will be worked out.

International - Jay Friedman, Chair - Indicated that Michael Sligh and Bob Quinn have a draft on importation to be discussed, and that Accreditation and International Committees need to meet to discuss it.

Michael Sligh noted that it was 12:00 and that the meeting is adjourned for lunch in order to be on time with the public input session at 1:00 pm. Additional discussion can take place separately or at the full Board session Sunday.
The Committee meeting commenced at 1:00 PM.

Present: Margaret Clark, Merrill Clark, Gene Kahn, Don Kinsman, Rich Theuer and Craig Weakley; USDA representatives Michael Hankin and Ted Rogers.

Draft Recommendation on Labeling

The Committee reviewed its April "Draft Recommendation" in light of the public comment received on or before June 30, 1993, the deadline for receipt of public comments, and the comments received at the May NOSB meeting, when the draft recommendation was reviewed in detail before the full Board. The Committee revised its draft recommendation to prohibit principal display panel presentation of the percentage organic ingredients.

The Committee revised its draft recommendation to reflect a conclusion that the OFPA allowed certified organic handlers to handle only "organic foods."

[Note: On July 11, the full Board accepted the Committee’s proposals for calculating the percentage organic ingredients and the Committee’s definitions for "ingredients" and "processing aids" in foods labeled as "organic."]

The Committee debated once again the specific ingredient labeling, voting in favor of full disclosure of individual spices, flavor components and colors and advancing the draft to the full Board for consideration as a Board draft recommendation. [Note: On July 11, the full Board rejected the Committee’s recommendation on full disclosure of spices, flavor components and colors.]

Organic Handling Plan

The Committee reviewed the draft circulated to the public and reviewed before the full Board in May. No comments have been received. The Committee made minor typographical corrections and will seek full Board approval at the September meeting.

Public Input Session

The Committee received comments from Steve Harper, Rob Feldman, Eleanor Goodman, Bill Powers, David Haenn, Rod Crossley and Greg Pennyroyal.
The Committee adjourned at 6:00 PM.
GENERAL PUBLIC COMMENT TO THE NATIONAL ORGANIC STANDARDS BOARD
INCLUDING PUBLIC INPUT TO THE PROCESSING COMMITTEE AS LAST SEGMENT,
JULY 8, 1993, COTTAGE GROVE, OREGON

Norma Grier provided handouts with her comments, Judy Pegg’s comments and Barbara Kelly’s response to the Ozark survey. She doesn’t support having the NOSB linking up with EPA on tolerance levels.

Eric Ardapple Kindberg - Ozark Small Farm Viability Project - Indicated they were receiving responses to a questionnaire sent to producers and had another for retailers and consumers. Doesn’t like the split meeting format. NOSB has three things to accomplish: materials list; accreditation program; and get certifying agents accredited. On materials, synthetics are disallowed except under section 2118 of the Act, which is explicit. Concern about the relationships among Federal, state and private organizations about provisions for discrediting.

Dr. Joseph Morgan - provided a handout on the concerns of those with multiple chemical sensitivities. He requests that the NOSB set high standards for a reliably safe food supply. If not for all organics, he would like a special identification for foods with zero levels of residue. He was questioned as to whether a % level of residues would be workable, and indicated there had never been a study to determine actual levels that would be workable, and even those might vary with individuals tolerance levels.

Ken Nolley - a chemically sensitive individual - underscores Dr. Morgan’s comments. Needs a steady supply of pure food. One can’t imagine the time spent by the chemically sensitive in gathering food, when they have to rely on an anonymous system. Would favor any system that would help make the buying decision easier. Root crops are notorious for uptake of pesticides. A question was raised about balancing the processor/manufacturer needs versus the chemically sensitive. Ken indicated they only want information and consistent ingredients, and that they don’t want to put existing and small firms out of business.

Walter Jeffrey - provided a follow-up discussion to an earlier meeting at which he spoke on potassium chloride. A question was raised about whether a summary of the benefits is available, and he indicated he had a few copies and that the study is being published.

Ron Garcasz - OCIA and farmer - Addressed the issues of confinement for livestock; antibiotics; and percentage of feed that must be organic. On confinement you need to allow animals to use their natural behavior patterns. It is a husbandry and stewardship issue, and need to balance free range with environmental concern for pasture degradation. On antibiotics, the Committee should stay with the legislation and referenced sections 2105, 2118 (b), (c)
Robert Beauchemin - OCIA President - Expressed concern about the October first deadline, relationship of private certifiers with states, lack of certifying agent on the NOSB, requirements placed on certifiers by the EEC. Recognizes the right of states to register certifiers, but when it adds undue burden on certifiers, it may be against the intent of the law. Suggests adding a certifying agent in an advisory capacity to the Accreditation Committee if they can’t serve on the NOSB.

Brian Baker - CCOF - Expressed concern about the meaning of the term "synthetic" and indicated it was being used differently by the Crops, Processing, and Livestock Committees. When asked what he would do differently in the standards, he would add a liability standard, but nationally, that would have to be passed by Congress.

Zea Sonnabend - California Action Network, and CCOF - Supports having a certifier on the Board. Suggests that accreditation is not an in or out action, but certifiers should be given a chance to correct deficiencies. Also expressed concern about financial support for the Technical Advisory Panel. The questions will be requiring more than yes or no responses, and members should be compensated. The organic community is waiting to hear about inert and brand names and how they will be treated.

Dick Hartman - Recounted the problem of trying to get EPA approval for garlic and water. Took 4 years and should go to the organic community, but needs committee approval. How does the NOSB decide on important issues? If items have both environmental impact statement plus an economic impact statement, they ought to be considered for approval.

Pat Leonard - Oregon consultant - Make the law as tough as possible. Wants a good definition of organically grown food that is comparable to the Good Housekeeping Seal of approval. Farmers want to see the law and the list so they can start farming. NOSB should take the time to develop a good law.

Robbie Lee Evans - Farmer member of Organically Grown Cooperative in Eugene, OR - Concerned that there are no vegetable members on the Board. Wanted mandatory residue testing, but thinks there is no rational basis for the 5% of EPA tolerance (thinks it was pulled out of the air). Thinks there is too much emphasis on what is not on produce, rather than on what is in produce nutritionally.

Katherine DiMatteo - Recently submitted Susanne Vaupel’s materials list documentation. Hope it moves quickly. The law has to be implemented as quickly as possible. Support for the organic label and the question of organic as a guarantee could be detrimental. Fill in the gaps in the regulation and move it.
Steve Harper - Concern that a total prohibition on synthetic components will put a damper on processed foods. Should pay particular attention to boiler water additives. Consider processing aids as ingredients. Concern that different certifying agents will have different standards for synthetics.

Rob Feldman of the Organic Produce Handlers Association - Expressed general concern that the produce handlers had not been included in the process, felt that he/they should have been more involved in the drafting of positions. Particularly concerned that produce handling was taking a back seat to processing and labeling standards in the Processing committees work. He was critical of the representation on the Board of retailers and processors with an absence of handler representation.

He also expressed his constituencies questions about the need to regulate the Organic Sustainable Community. While acknowledging some need for certification, a common definition, and protection against fraud in the market place the recurrent question was what would this add in costs.

Rob read a laundry list of issues that he felt had not been adequately covered in the handling plan and other committee papers. This list included: Water and air quality in cooling; mixed storage; commingling on the same pallet; pallet break down; Trucks boats and airplanes; reconciliation of differences in audit trails; coding to track product. This brought him back to the question of the cost of the whole system.

The Board, and the processing Committee responded by urging him to write down specific recommendations as per his concerns and send them to the committee. Margaret Clark and Craig Weakley pointed out that he (Rob) had been repeatedly asked for his advice and input on the handling plan and a whole array of other issues. Clark and Rich Theuer also noted that the issues that he had greatest concern for simply had not been consulted yet, but were clearly on the work plan, were considered priority issues, and were to be worked on in the near future.

Elinor Goodman - Amy’s Kitchen - Has a small business concern that they would be visited by the government and nailed on small details. Concern whether someone who hauls organic produce from the market needs to be certified. Against percent organic labeling - wants to see justification for putting on the ingredient panel to determine if it is worth it. Cost/benefit of protection against fraud.

Bill Powers, of Badger Mountain Vineyards, served as a spokesperson for the Organic Wine Grape Growers Alliance. They again stressed the need for Sulfur Dioxide from a natural source as a sulfiteing agent. For quality wines to be bottled, kept and marketed up to
100 ppm sulfur compounds are needed. Wines both domestic and imported are currently labeled as made from organic grapes.

David Haenn - Ozark Small Farm Viability Project - addressed the need to move on the National list. Indicated there are provisions for non-synthetic ingredients organically produced; ingredients not technically organically produced (2118(a)2) such as yeasts, gums; Senate report was for items difficult to obtain organically; and that there are no exemptions for processing in the Act.

Randy Buresh of the Eclectic Institute - The institute manufactures botanical extracts using certified organic alcohol made from grapes. Questioned whether non organic Grain alcohol would be accepted as an extracting agent. Urged a definitive standard to support the industry and because organic agriculture was good for the earth.

Rod Crosley - Health Valley Foods - Dislikes the split forum for public input, because has to repeat comments for the Processing Committee. Basically critical of the Processing Committee for not addressing comments provided by organic processors, and making decisions without their input.

Greg Pennyroyal delivered a comment for Lon Johnson of Trout Lake Farms - Responding to the Processing Committee’s Draft Recommendation on Labeling and general comment. Suggested that principle of reconstitution should be fresh cut weight. feels that use of organic on the information panel should require certification of handler any use of the O word should require certification. Full agreement that organic should be a production claim. Wants to stress the need to prohibit the equating of wild with organic, this diminishes the value of organic. The use of the phrase organic or wild must be prohibited. Felt that full disclosure of spices colors and flavors was the best approach. Noted his experience in the flavor and perfume trade as he commented that so called natural flavors were in fact of synthetic origin.
Dean Eppley, K. Chandler, Rich Theuer, Merrill Clark, Michael Sligh, Gary Osweiler, Nancy Taylor, Hal Ricker, Michael Hanken, Ted Rogers and Tom Stoneback were in attendance.

I. It was agreed that the Materials Committee should organize itself to receive recommendations from the Crops, Livestock, and Processing Committees as to those substances which should go through the Technical Advisory Panel procedures and preparation for their appearance on the National List.

II. The second priority was that the Technical Advisory Panel(s) needs to be formed and organized as soon as possible. And, third...

III. The process for review of substances to appear on the proposed National List needs to receive a high priority and be organized.

Mr. Theuer pointed out that "essentially, this is common sense," with Mr. Sligh adding that "a uniform format is needed."

Mr. Chandler suggested "by category."

Mr. Theuer later pointed out that we need a "delisting procedure to take materials off the list as the Secretary is only limited by his inability to add allowed synthetics."

It was agreed that the Materials List construction would be performed by the USDA. Ted Rogers volunteered.

Ms. Taylor raised the question of confidentiality of active and inert ingredients. Discussion centered on full disclosure. Other discussion questioned the role of the certifier and whether proprietary information could be held by the USDA.

The flow of materials review requests to the Technical Advisory Panel from the Materials Committee, through the Technical Advisory Panel and appropriate EPA and FDA approvals, recognized the role of USDA. Subsequent to receiving information from the Technical Advisory Panel the NOSB would offer its work for public review and following comments make its recommendations to the Secretary.
Dr. Ricker stated that he would look into the possibility of available funds to reimburse Technical Advisory Panels for work done. We discussed the important facilitation role filled by the USDA in obtaining FDA and EPA approval. And, the importance of the Extension Service and industry leaders' contacts in developing technical panels.

Mr. Rogers accepted responsibility to structure the format and procedure of Technical Advisory Panels and their relationship to the USDA and National Organics Standards Board. It was noted that the Act empowering the NOSB has seven points which are the criteria for TAP.

Mr. Osweiler stated that we need to start dealing with the known world of synthetics that might be used, and for now deal only with the most controversial natural materials that might be prohibited. Based on this approach the most essential function to complete is preparation of criteria and procedures for evaluating materials for inclusion on the list. These are the benchmarks by which we decide whether a material enters the National List.

Because the Materials Committee receives input from Livestock, Crops, and Processing Committees, and the unique importance that materials play in the organic system, it was suggested that future meetings be held with the full board.
NATIONAL ORGANIC STANDARDS BOARD  
LIVESTOCK COMMITTEE  
July 9, 1993  
Cottage Grove, Oregon

Minutes

Taken by: Julie Anton

Transcribed by: Gary Osweiler

Introduction of Livestock Committee members.

Approval of May 1993 Committee minutes.

Public input on livestock sourcing issues:

A producer of organic beef testified that by Washington State standards, animals under organic production methods for 12 months become certified organic. If animals must be from an organic herd, such a standard would put them out of business. They do not have the acreage for a cow/calf operation where they could source calves from last third of gestation, and do not know of anyone in the State with an organic herd to draw from. They get half of their calves now from an Oregon producer; this producer does not use implants and other inputs, and is sustainable, but not certified organic. He is also careful about quality of calves.

The supplier commented that low-grade cattle, not suitable for market might be the only sources of organic stock. He questioned how reasonable the last third of gestation requirement is. Gary Osweiler responded that 12 months is a long enough "drying out" period to account for removal of drug residues. Merrill Clark commented that Harlan Richie (Michigan State University) says the last 80 days (of gestation) account for the major growth period of animals in the womb.

Eugene Kahn requested legislative review, which Jay Friedman conducted.

Ron Garris, an Oregon Tilth certified organic cow-calf producer in Oregon commented that the last 2/3 of gestation must be under organic methods for
their certification. He has 32 mother cows, 100 total, including feeders on just over 200 acres sells to Portland restaurants. He maintains strict standards and believes there should be a tough standard.

Ann Schwartz commented that Oregon Tilth standards say organic feed is required from birth of the calf. There is an exception for buying a day-old calf to put into program. The last third of gestation for slaughter stock is the standard generally.

David Haenn, Ozark Small Farm Viability Project and a goat and sheep producer gave his strict interpretation of the OFPA.

Albert Strauss, a dairy farmer in Marshall, California (Blake's Landing Farms) commented that in California replacement sources have been treated with antibiotics.

Eric Ardapple Kindberg, a producer experienced with hogs, sheep, and cattle, gave his interpretation of the dairy standard; explained how producers could use their own non-organic cattle as replacement stock. He noted the inconsistency in the law between dairy and slaughter stock requirements.

Brian Baker, Technical Coordinator for CCOF, said the requirement for organic when available will create a burden on certifiers. There is a need now to allow transitional animals.

Eugene Kahn (NOSB) commented that it seems clear that the last third of gestation requirement for slaughter stock is the intent of OFPA.

Brian Baker: There is a frustration of beef growers over the apparent discrimination against beef versus dairy producers.

Committee Discussion:

Don Kinsman suggested possible changes in language to reflect 2 sources, the organic-producing dam and a dam under organic production methods.

There was a review of lines 34-40 of the May 20, 1993 draft.
K. Chandler expressed his interest in a more lenient interpretation of the OFPA to allow expansion of production. There are 43 million cattle slaughtered in a year, 172,000 per day. Most organic operations are less than 50 head on average. The brood herd provides calves raised to 3-7 months (200-500 pounds). Stocker herds are on grass 3-7 months (600-700 pounds). The feedlot period, 120-160 days -- could be shortened to half that number of days. He expressed the need to have sufficient volume to be economically viable and enter the market. This is important especially for cattle, since chicken, hogs, and sheep have a short production cycle.

Eugene Kahn expressed that our concern should be whether or not our approach is reasonable.

Ann Schwartz explained how all programs urge livestock producers to develop an organic breeder stock program.

Julie Anton pointed out that most certifying agencies with livestock standards require from the last third of gestation as a source of slaughter stock which must then be raised organically from birth. She asked Ann Schwartz if certifying agencies are deliberately not making link, as the Livestock Committee has tried to do. Ann said yes, but the issue is still under discussion.

Ron Gargasz, organic beef producer, suggested that slower growth forces producers to be better stewards. OCIA supports organic requirements from the last third of gestation for slaughter stock.

Committee Vote on each Livestock Source Chart:

BEEF: Gary Osweiler, Jay Friedman, Merrill Clark and Don Kinsman voted for the beef sourcing diagram and approach developed by Merrill Clark. Eugene Kahn stated the requirement seemed unreasonable, but do not see alternate interpretations of OFPA. He voted for the proposal, with the reservations stated.

DAIRY: Ann Schwartz commented that the current position might preclude
dairy goats (kid at 5 months, therefore, producing dairy product before 12 months). Don Kinsman noted that the usual practice is to raise for goats for 8 months before kidding.

Voting for the dairy proposal: Merrill Clark, Eugene Kahn, Gary Osweiler, Don Kinsman, and K. Chandler. (Chandler thinks regulations should allow qualified dairy stock to be slaughtered as organic). Jay Friedman voted against the proposal, noting his belief that dairy animals should be born from cows that qualify from the last third of gestation - a standard more consistent with the beef regulations.

Break

POULTRY: The Committee voted unanimously to accept the poultry sourcing recommendations.

Don Kinsman commented that the Committee should include goats under sheep.

Merrill Clark reminded the Committee that at some time fish, bees, and rabbits need to be addressed.

ANTIBIOTICS

Gary Osweiler led a discussion of the characteristics of how foreign drugs, including antibiotics are handled in the body. Printed material supporting the discussion is attached.

Generally drugs go to the liver (where they may be metabolized to something else, and which may change the activity of antibiotic). Then drugs can be excreted by the bile or once in blood may be excreted by the urine. Each synthetic antibiotic will have to be approved individually. Lynn Coody suggested that perhaps groups of (similar) antibiotics may be approved.

Different species reactions can occur to antibiotics or other drugs? e.g. Brahman cattle are more susceptible to organophosphate chemicals.

Half-life is the time it takes for the body to get rid of half the substance presently in the body. Osweiler charts on plasma concentration are attached. Most antibiotics have relatively short half lives; metabolize so quickly that they have to be taken several times per day. Twenty half-lives will generally eliminate detectable traces of the antibiotic; unless retained by body system
in some way. One issue is whether the residue ever get to absolute zero residue. Example of a persistent residue was tetracycline injected into the hip; it is irritating, produces edema around injection site. Usually an improper injection technique or improper use of the antibiotic on other ways result in residue problems where quality control may be lax. Producers may sell treated animals to other producers who then treat again. Failure to observe withdrawal periods is the number one reason for violative antibiotic residues. Sulfonamides are not true antibiotics, but are antibacterial. They recycle easily through feces.

Wm. Hubbert commented that testing occurs at meat packing plants when observation of injection sites indicates that meat may be at increased risk of residue; therefore, meat more often tested than dairy products.

Gary Osweiler raised a question for NOSB to Consider: Is pesticide use on crops analogous to antibiotic use in livestock?

Options for Synthetic Systemic Antibiotics were discussed, and those options offered by Osweiler are attached.

Eugene Kahn requested a legislative overview. Jay Friedman commented that discretion to allow antibiotics is under 2110 (d)(1). Mr. Kahn pointed out sec 2118(c)(1)(B)(i), Synthetic additive ingredients, including livestock parasiticides and medicines. The Senate Report may help to enlighten the intent of the law.

Other Committee Activity:

Review of definition of synthetic.

Review of National List procedure.

Discussion of "Organic Management Practices."

Albert Straus asked when disease becomes life-threatening? He has not found a non-antibiotic solution for foot rot.
Gary Osweiler noted that withholding treatment is against the OFPA. With dairy, it is difficult to divert, so likely the producer would have to sell a treated dairy cow at auction, or to other conventional channels. Mr Straus culls 30-35% of his herd each year. Culling is commonly for mastitis and infertility. He currently is using probiotics, homeopathy, and aspirin as "organic" treatments for mastitis.

Brian Baker offered that CCOF has considered certain antibiotics to be natural. When to refute the presumption that antibiotics are natural is a difficult issue. All certifying agencies allow some use of antibiotics, all with caveats; none identify specific compounds.

Eugene Kahn sees antibiotics as compatible synthetics, because they are altered in manufacturing process.

Lynn Coody's view is that brand names should not appear and that grouping of antibiotics needs to be determined. Ms. Coody suggested language such as "Penicillins, except _____." would be regulatory language. She offered to figure out a way to make analogous to crops.

Gary Osweiler suggested that most antibiotic substances will have come into contact with an organic compound (e.g. hexane). This solvent extraction process would qualify the problem as synthetic.

**Motion on any use of antibiotics:**

"Can any of the products of an animal that has received an antibiotic under any condition ever be sold or labeled as organically produced?" Voting yes were Osweiler, Friedman, Kahn, Chandler, and Kinsman. Voting no was Merrill Clark.—

Jay Friedman sees a need to keep uniformity between breeder and slaughter stock.

**Review of current certifying agency standards.**

Ann Schwartz testified that the consumer-producer-client relationship is most
established in Europe, due to scale of farms. The British Soil Association has always allowed the restricted use of medicines. Oregon producer, Ron Garris always diverts beef cattle when they have been treated with drugs. He is a natural meat producer and has developed a market based on a "no antibiotics" claim. This is an issue with his restaurant buyers.

Pat Leonard, organic retailer, spent time in Alfalfa's, which sells Coleman's beef. Sales people are trained to present foods as "antibiotics and hormones not present and not used". Merrill Clark spoke as a consumer representative. Their shop's consumers ask a lot of questions about antibiotic use. NOSB will have to justify to USDA which withdrawal periods are more appropriate, preventing entry into food chains.

K. Chandler noted that withdrawal time should be 12 months, before product, milk or meat, can enter the food chain.

Motion reconsidered: Clark and Friedman vote no consideration of antibiotics.

Lunch Break

PARASITICIDES

Presentation was given by Don Kinsman. Attachments include Osweiler's synthetic antibiotic use options.

Flies are external parasites. Pink eye is an external condition, but may be caused only by dust.

Brian Baker: Commented on prohibition of use organophosphate for fly control around feed. Pyrethrum can be used on organic rangeland or as dust.

Osweiler described pyrethrin, an extract of pyrethrum, which may have inert ingredients that may be questionable. Brian Baker offered that Pyrethrum is extracted using butanol, commonly, which is then flashed off.

Ann Schwartz: Most programs prohibit nicotine.
Breaking down parasiticide use by species is important. Most all certification programs allow parasiticide use in breeding stock. Organic practices v. time not under organic practice are two different things to define.

Lynn Coody: toxic materials can include naturals products such as wormwoods.

Herbals used as medicines are not registered; how can they be used if not registered?

Julie Anton suggested identifying species and parasite problem and regions and current synthetic parasiticide utilized; then evaluate alternatives, for toxicity and efficacy.

Evaluation whether or not certain substances would be a first line of defense may be difficult. Mr. Kahn related parasiticide/antibiotic restrictions to botanicals. If there is not a farm plan to follow, then producers cannot use the restricted materials.

Ann Schwartz distributedIFOAM standards, referring to pp. 29-30.

Brian Baker described CCOF parasiticide standards, which state that cultural practices must be used by certifying agencies. Mr. Kahn asked about differences among inspectors. Baker replied that with some, there may be need for oversight re: criteria.

Lynn Coody: May be difficult to trace source of problem.

Eric Ardapple Kindberg suggested that loss of organic status from treatment should be a factor in the economic plan of every farm. He proposed that each parasiticide must go through the materials review process.

Jay Friedman: would not want to see every parasiticide go through the review process, as Mr. Kindberg suggests.

Ron Garris: If there is a parasite outbreak in herd, where all animals are infected with worms, losses would be much greater than 10%.
William Hubbert: There may be residues from parasiticide if withdrawal periods are not followed. Twelve programs allow parasiticide use in breeders; 8-9 allow for emergency use. OSFVP: permit emergency treatment for diagnosed medical treatments. Could be widespread abuse because standards lack specificity.

One current Recommendation is to allow National List parasiticides in breeder stock and for documented emergencies in slaughter stock or dairy stock.

Jay Friedman, regarding the emergency use permit, thinks consumers would see documented emergency use of synthetic medicines as reasonable and acceptable.

Julie Anton noted that the Committee will need to establish criteria that define an emergency.

Mr Kahn suggested that the farm plan provision would have some value for defining an emergency. He asked Ann Schwartz if this provision would have broad acceptance. She replied "Yes, except that acute emergency in parasites would need to be treated prior".

Mr. Kindberg does not worm when there is a medium parasite load; in his opinion, this can be determined by the appearance of the livestock.

Ron Gargasz noted that the most persistent parasite problems will occur in breeder stock, which are kept the longest. Treatment must be prior to the last third of gestation.

Brian Baker noted the great regional differences in agriculture and recommended that not just one farmer can speak to what happens on all organic farms.

Need to have some accurate consumer information.

Motion: Could product from livestock that has received restricted use of any synthetic parasiticide be sold or labeled as organically produced? Committee supported the motion, except for Merrill Clark.
FEED STANDARDS

Emergency non-certified organic feed use provision:
destroyed by frost, flood, or other natural disaster = emergency.

Emergency Procedure contingency plans could include going to small farmer
exempted feed source as a first choice, if organic feed is not available.

Some discussion followed on how to verify a feed "disaster". Mr. Chandler
noted that this was determined by the Commissioner's court in Texas.

Criteria to be used by certifying agency to define disaster could include the
terms "Unforeseen, unavoidable, not caused by producer, and not
immediately rectifiable".
A Class 1 emergency is an official government-declared disaster. This might
be grounds for seeking a waiver.

Poor management or poor planning are not sufficient cause for an exception.

Producers should be required to have a contingency plan.

Ron Gargasz read the OCIA emergency provision. They must be officially
documented and pre-approved. "In certain critical years where OCIA forage
crops are unavailable or in short supply due to extreme weather conditions,
the certification committee can allow a farmer to purchase (non-OCIA)
certified organic feed and forage. These inputs must be sufficiently
documented and pre-approved by the certification committee".

Mr. Kindberg commented that producers can plan ahead in cases of drought.

Other issues:

"Withdrawal time" Would depend on type of feed utilized in emergency phase.
Ron Garris suggested zero withdrawal time for non-certified organic feed.
Kindberg and Haenn expressed concerns about integrity of livestock.
Albert Straus suggested disclosure to the consumer.

Two additional issues were discussed:

1. the "certified" aspect of feed
2. the "pesticide-free" aspect of feed.

In emergency situations, the need is to guard against residues.

Mr. Kahn said some certifying agencies will determine that there are almost no emergencies.

Ann Schwartz reported that many States are not requiring 100% organic feed; and that for dairy, there are requirements for just 80% organic feed.

Mr. Friedman gave the opinion that there is no apparent statutory authority for emergency feed provision.

Michael Hankin (USDA) commented that the act could be interpreted as providing an emergency provision.

There was Discussion of a USDA proposal for new procedure on Committee/Board decision-making for livestock issues. The committee voted (4:2) to delay discussion to a later time.

Don Kinsman pointed out that no more than 10% non-organic replacements per year are allowed in some international requirements.

CODEX discussion was deferred to a later time.

MOTION: Gary Osweiler moved to remove amino acids from Committee's list of synthetics to be considered for the National List. Voting Yes were Osweiler, Kinsman, Friedman and Clark. Abstention by Kahn.
Additional Committee Issues:

1. Certain natural feed additives that should possibly be prohibited.
2. Farm Plan.
3. Feedlots/density.
4. Livestock considerations in definition of organic.
5. Labeling & processing
6. Procedure to address antibiotics & parasiticide
7. Untreated pasture.

Mr. Kahn asked the Livestock Committee to review the Crops Committee drift recommendation to the full Board. The recommendation includes provisions on forage which were discussed at the NOSB meeting in May.

Meeting Adjourned Approximately 5:30 PM
ACCREDITATION COMMITTEE MEETING
JULY 9, 1993

Committee Members Present:
RICH THEUER, MICHAEL SLIGH, BOB QUINN, NANCY TAYLOR, MARGARET CLARK, JAY FRIEDMAN
(Arrived late)
ALSO: TED ROGERS, MICHAEL HANKIN, HAL RICKER (USDA STAFF), TIM SULLIVAN

Introduction by Margaret Clark:
Clarity needed on several issues which the committee hopes to address in this meeting:
1. State programs and relationship to federal will be looked at. The committees' assumption is that the states and private certifiers have to go through the same accreditation program.
2. Peer Review Panel
3. Enforcement and Appeals

Tim Sullivan's analysis of Act:
Federal Program standards are guidelines for private & state certifiers.
State Program standards are approved by federal government
Accreditation program approves private & state certifiers
Role of NOSB is to recommend program standards for private certifiers & state organic programs.

Presentations by Miles McEvoy: WA State Dept of Ag.:
Certification may or may not be a role of the states; enforcement and monitoring of organic food trade is the role of the states; and to implement federal labeling laws and FDA regulations. In Washington, state has a certification role and does thorough enforcement and monitoring.

Comment from Nancy Taylor: In Idaho, state has a program and there is a private certifier operating there. State would like all to be under state program.
Question: What about the small growers, how does a state certification program effect them?

Miles McEvoy: States and a lot of non-profit organizations can serve all growers in an area, whether large or small. Washington state subsidizes smaller growers. There may be a differential fee structure for smaller growers under private programs. In a for-profit certification agency there is not the incentive to offer subsidies - goal of these agencies would be to make a profit. If another certification agency wanted to work in Washington, the state would also inspect the farm to check on the work of the certifier. There would not be additional fees from the state.

When products are sold as organic within the state, the product needs to be certified by a recognized certifier- Washington has three criteria: that they are not traders, that there is no conflict of interest and that the program has equivalent standards. Washington does not evaluate the programs in terms of how well they are doing their job. There is not a registration fee, but there may be fees in the future. The accreditation process of the federal government would do a better job and when implemented would replace what Washington state is doing. Washington has a vendor certification program and a “recognition” process to assist the vendors in complying with state requirement that out-of-state product be certified.

Question: Would states want to actively certify nationally?
McEvoy: We would be willing but would prefer not to. Legally might be outside of jurisdiction.
Question: If they acted as agents for the national program?
McEvoy: Then we could certify outside the state but would be able to take any regulatory action (enforcement) unless the product got into Washington state.

Comment from committee member: Certification agent has the authority to decertify (which is a type of enforcement action.)
Question: If a private certifier wanted to set up in the state of Washington,
McEvoy: Yes. We don't see it as threat to the state program, or divisive to the growers. Our office is not concerned about competition from other certifiers because we are doing a good job. The growers in the state wanted the state to set up the program in the first place; and seem satisfied with the program.

Question: Do the larger growers know that fees are different under your program based on size?

McEvoy: The larger growers know they are subsidizing the smaller growers. It generally is not resented. Fees range from $200 to $2500.

Presentation by Robert Beauchemin: President of OCIA - International:
I wish to state some concerns. OFPA mentions that the state has the ability to develop certification programs. But, do they have the ability to develop accreditation programs?

I have been involved with the industry for 15 years. Consistency has been the major point of concern for the industry - standards are about the same, the problems have been with different certifier's procedures. Accreditation is about how do you do business, not what are your standards. The U.S. Accreditation under OFPA should not make judgements on standards which exceed the national standard.

State programs are requiring that private certifiers comply with their certification procedures. What is the difference between registration and accreditation? Long registration forms and extensive informational requirements cross over the line from registration to accreditation (evaluation of the program.) Are they (the states) trying to keep us out?

The legislation in Texas asks for inspection at the time of harvest. If there are 6 harvest times, then that would require 6 inspections which would make the certification expensive. Fees required for registration in Texas are high which are prohibitive to the private certifier operating in the state.

There are 4 points in the purposes of the title: What will be the criteria to apply these four conditions.

Private certifiers need some guidance on what is going to happen on October 1 and what is going to happen in the interim, especially in relation to the requirements of the states.

Who will approve the state programs? The secretary, but who will recommend the criteria used for approval of state program?

Beauchemin read from Paul Branum's letter (director of California's Health and Safety Division) - major point: "If California does not think that the federal program (of accreditation) is adequate, then they will impose stricter requirements." Will states be able to act in this fashion after the OFPA is implemented?

Comment from Margaret Clark: Section 2108 is key - elaboration of criteria is important. What is a responsible amount of oversight by a state?

Beauchemin: Once the national program is in effect, there is mandatory accreditation of private certifiers. If states also require registration, is this a higher standard - what is the need?

Clark: for the state, the issue may be enforcement.

Beauchemin: private certifiers are willing to register who they have certified, where the acreage is, etc. If the registration goes further, there is a problem.

Presentation by Michael Hankin:
I would like to go back to DC with some decisions and consensus so that the staff can get going on the program.
I have some responses to offer to questions and concerns raised by Robert Beauchemin:

Can states develop their own accreditation: no, accreditation reserved for USDA - certifiers operating on a national level. How a certifier does business not the certifiers standards (beyond the national) will be the focus of accreditation.

States can do registration of certifiers but for purposes of doing business within the state not evaluating your capability.

If privates are certifying for national program, the states can not throw you out. If privates are working for the states, that is a different relationship.

Concerning Texas requirements: if the state expects private certifiers to prove equivalency to their standards, then this would be problematic - needs to be considered carefully and a position developed.

USDA has asked the NOSB to develop the criteria to evaluate the state programs. States additional standards have to be consistent with the title - does it meet the intent that the board has set up for the national program. If state programs did not change organic standards but had perhaps regional requirements which are stricter, this would not be considered restrictive.

Until there is a national program, the states may be free to do what they want with their requirements.

The states can not judge the national program, if they do the USDA may have to challenge them in court.

Comments:

Michael Sligh: one area that needs careful attention: when registration is being used as a barrier to trade by the amount of registration fees and registration forms and documents required.

Michael Hankin: registration by states would not have to be approved by USDA but if they received a complaint, the USDA could step in and look at the registration requirements.

Michael Sligh: Could the NOSB be proactive about this in developing criteria for state programs?

Nancy Taylor: How would you see the higher standards of states in relation to imposing trade barriers?

Michael Hankin: both state or private agents would have to certify to the national standard if product carried the federal seal (or language.) If the producer wanted to carry the State seal, they would have to fulfill higher state requirements.

Miles McEvoy: In my opinion, the commerce clause can not be used in regards to state registration of certifiers.

Presentation by Tim Sullivan of FLAG:

We have to continue to look at the big picture - we are going to get buried as we move into the day with the complexity of the issues. We need to keep referencing back to the whole.

Purpose of the law:

1. establish uniformity in the marketplace - it is a consumer law. The consumer needs to know if that the label organic is meaningful.

2. to provide for interstate commerce: also consumer issue and trade issue - federal going to move in for consistency.

A federal program is where it all starts - it is a whole. It is a pitfall to pull apart state and federal programs. There is delegation by the federal program to a state willing to take on responsibilities. Additional standards will be very problematic. Additional standards have to be consistent with federal program. First step for the state is to apply to the USDA. The additional standards issue has to be worked out in the initial approval process. It will be the Secretary who will decide this issue - will these additional standards be consistent with
federal program or will they impede the federal program.

Heart of organic process is the certification program: accreditation under the act guarantees the integrity of the process. There are only two kinds of entities that can be certifying agents: states with an approved program and privates. The organic program is built on this idea of a partnership between the federal government, the states, and private industry.

Additional standards should be a State resources issue not definition of organic; and monitoring and enforcing who does business in their state.

If states have additional standards, how does that fit into the accreditation scheme: additional standards have to be approved by the USDA. State programs will have a monitoring part of the program - can suspend certification. Ultimate authority has to be with the USDA because of basic structure and because of the tension of competition between state and private certifiers. If states accredited, they would be accrediting themselves. The states have to be accredited in addition to getting their program approved.

Question from Bob Quinn: what is the difference between a state program and a state certifier?
Tim Sullivan: two categories of certifying agents: governing state official (when they are a state program) and private individuals. OFPA imposes the structure. If a State wants to be a program, they apply and then if they want to certify, they need to get accredited.

Comments:
Michael Hankin: until a national program is in place, there can’t be approval of state programs. But, I had assumed that the states could apply to be certifiers under the national program.
Zea Sonnabend: California has a state program, but does not do certification. Certifiers have to apply to state to do certification, therefore the state program would have to be approved first before the certifiers could operate.

Question from Rich Theuer: Elaborate on your statement about states rights on resource issues.
Tim Sullivan: Water, for instance, is a resource which some states might have to protect for the benefit of their state. Requirements for one state may not even be necessary for another state. Additional standards will be most problematic especially in terms of consistency.

Question from Zea Sonnabend: would a state apply for accreditation if they don’t have a certification program?
Jay Friedman: no, the federal government standards would preempt the state standards if they don’t do certification.

Question from Robert Beauchemin: law mentions in section 2108 - States may submit a plan for a state organic certification program. What does this mean? Is California law a certification program?
Jay Friedman: no. State program and certification programs can be different. State governing official can chose not to have its own program, but to do certification within the state for the federal program. States can have agents who implement their own program but would not have to be accredited. States are treated different under other federal laws than private entities.

Question from Michael Sligh: I am confused about three ways to be agents under the federal program—could someone provide an explanation?
Jay Friedman: Under section 2108 - 2 implementors of federal program. But, state programs also have implementors. State programs have to be approved.
Tim Sullivan: Jay’s interpretation rests on the view "if applicable." I think if applicable means that if the state has an approved program. State program is
a delegation of the federal program.
Jay Friedman: rulemaking authority is delegated to the State - they have the same authority as the USDA.

Comments:
Rich Theuer: There are obvious legal issues relating to this - this has to generate into work - critical work: what the committee has to recommend the criteria for state program. We have to have standards to recommend to the Secretary. We have to develop a program for accreditation. What work do we have to do to provide decent input to the Secretary.

Jay Friedman: there are minimal differences in our recommendations for state and private, but additional rules for inconsistencies resulting from additional state standards will be needed.

Bob Quinn made a motion to develop committee recommendations to Secretary on criteria for approval of state programs compatible with criteria of 2108 and purposes of Act. Nancy Taylor seconded the motion and the Committee unanimously approved the motion.

Presentation by Hal Ricker:
The USDA is not clear about position on use of logo - looking for guidance and recommendations from committee.

Comments:
Rich Theuer: in processing, this issue had come up with suggestions that for exporting a USDA seal would be helpful, while others think that it will be crazy to do this. In labeling recommendation developed by the processing committee, it would be optional to use USDA logo.

Michael Sligh: do certifiers in the room want producers to use their individual logos? Show of hands in favor of question.

Comments:
Diane Bowen (Executive Director, CCOF): Our certification organization depends on the use of the label. What does the label mean: does it mean certified to federal standard, or to the certification organization’s standards.
Rich Theuer: use of private seal would be left to the discretion of the certification agency.
Margaret Clark: let's agree to use "shield" for USDA and "seal" for private certifiers.
Hal Ricker: to use USDA shields there is usually continuous monitoring by the government - I am not sure if once a year inspection would be adequate under the current practices at USDA.
Michael Hankin: in development of audit trail - identification through words or shield who did the certifying. In processing, it would be the last certifier of the processor.
Margaret Clark: as a retailer, I would like to see that.
Michael Hankin: USDA will keep a list of certifiers and what the products they certify.
Rich Theuer: a numbering code, like FSIS uses, may be used to identify the certifier. Public comment from Tom Harding in the past has recommended that the USDA shield and private certification seal be combined.
Hal Ricker: we need to know the criteria for allowing the additional seal.
Michael Sligh: our role is to say what are the responsibilities of the certifiers to identify the producers they certify.
Ted Rogers: protecting the integrity of the shield becomes one of the responsibilities of the certifier.
Margaret Clark: let's clarify the questions the committee has to address.
Bob Quinn: Use of a shield or a seal? Identification of who certified the producer? I recommend - Use of shield or seal is optional but identification of the certifier should be mandatory.
Michael Sligh: Might be useful for Hal to finish if he has additional points.

Is an organization required to put their name on the label if their grower had not meet higher standards?

Nancy Taylor: If they don’t use an identification like a shield or seal, then identification of certifier is critical.

Rich Theuer: In regard to aspect of requiring certifier’s name to be on the label - After implementation of the law when there is a national meaning to the law that is protected by USDA - is there the urgency to have an certifier identified on the product. If certifier gives names of those certified to USDA, then why the additional info on the package.

Nancy Taylor: For the consumers, it would provide information which has been requested by some of those in public testimony.

Bob Quinn: If you put your name on something, it puts you more on the ball.

Margaret Clark summarized discussion: Identification of certifier should be required. Use of shield or seal optionally allowed. We don’t have a definition of what the seal stands for.

Bob Quinn: Once the accreditation and certification is in place, and we get in the realm of enforcement, this would be a federal process.

Hal Ricker: Depends on the nature of the problem. Some problems could be handled by the certifying agent.

Michael Hankin: Different levels of enforcement - taking the product off the shelf and taking the farm out of certification.

Presentation by Katherine DiMatteo, Executive Director OFPANA:

I have been asked to present a short history of accreditation. Some of my comments may already be familiar to you.

The concept of accreditation and certification exists outside of the organic industry - we are not inventing new processes here. Other industries regulate themselves through quality assurance programs, registrations, and certification programs. The model used in the writing of the Act was based on the accreditation system used by universities and colleges.

The use of a certification program for the organic industry was introduced by farmers who were concerned about fraudulent products. Their concerns 10-15 years ago were based on their strong beliefs in the organic system being a superior system and one which would improve the health of the environment, particularly the soil. As competition and price grew in the organic market, then there was also concern about fraudulent products which would compete with true organic products for price. The certification organizations, as you know, all developed according to different styles and organizational structures.

In the mid-80’s, as the demand for organic products was increasing a number of people in the organic movement (or trade) came together out of a common concern that there needed to be a set of guidelines to keep consistency in the organic production standards and certification decisions. This group of people formed OFPANA. The primary purpose was to create these guidelines (the NOSB received a copy of this document last year.) The guidelines were written in 1986, revised in 1988 and are undergoing further additions/revisions now. The guidelines include a section on certification procedures.

The manufacturers who used multiple ingredients in their products urged OFPANA to develop a system for equivalency among the certifiers because sourcing was becoming a problem. OFPANA developed our logo then (the check in the circle) which was envisioned as a universal seal for organic products. But, getting agreement or buy-in to the program was difficult. At the same time, members of OFPANA, Judy Gillan and Joe Smillie, began to work with IFOAM on their idea for an approval of certifiers. Judy actually was the one to attach the name "Accreditation" to the process.

The rest is current history: the OFPANA Label Mark program never happened, IFOAM
has initiated their Accreditation program this year; and the Organic Foods Production Act of 1990 was passed (with support from the organic community and industry) to provide the enforcement that was not happening within the industry.

With the bumpy road that the Act has had in getting implemented, there have been a number of suggestions for the industry/community to take up regulation ourselves. OFPANA had earlier imagined that this would be a service we could provide as a trade association. Our objectivity would come from having a broad-based membership instead of just one sector of the trade. But as an organization we have put our support behind the implementation of the Act, and will not pursue creating an accreditation service unless the Act is never implemented.

Presentation by Diane Bowen: Here is my image of the relationship between the USDA and the state and private certification programs/standards. I’ve put it into a diagram to help myself see it more clearly.

```
accreditation
state certifiers
private certifiers
private additional standards
```

Private additional standards would automatically be examined through accreditation process. Could theoretically certify to OFPA, and certify (if engaged) to certify to state standards, and to their own additional standards (if approved)

Question from Michael Sligh: are private certifiers allowed to have additional standards? Can I have some comments.

Rich Theuer: I would not say standards but could have additional requirements. Private certifiers can not withhold certification to OFPA, if the producer complies, but could withhold use of private seal, if producer did not wish to meet additional requirements.

Bob Quinn: accreditation process is not going to approve additional requirements, just verification that it is in line (consistent) with the OFPA. It’s not an approval - they will only say if you have done it wrong.

Nancy Taylor: I see different relationships than in Diane’s chart. Private certifier if operating for the state, then accepted by the state.

Ted Rogers: In regards to additional standards, it is the perception of department (USDA-AMS) that they will have nothing to do with them until they come into conflict with the OFPA.

Michael Hankin: Please note some instances of standards and requirements.

Zea Sonnabend: OCIA requires full farm conversion - this is a standard. The CA state law requires certifiers to disclose names and addresses of all those certified - this is a requirement.

Maine could have an additional standard like no copper based materials because of regionally high copper in soil but would not keep out products grown in other states with copper materials.

Michael Sligh: states could have additional standards and private certifiers could have additional requirements.

Rich Theuer: if states would do it, it would not be allowed but private certifiers could do it for use of their seal.

Michael Hankin: We need to keep in mind the consumer point of view and intent of legislation. The more seals that we allow to define organic, the more we get away from the intent of the law and confuse the consumer.

Robert Beauchemin: one of the most consistent group coming to the hearings is the chemically sensistive group - if we don’t allow for higher standards, then how to reconcile to the requests of this group for instance. Where is the middle ground: this is so pure that you can’t afford to buy it or organic to a minimum standard. If we don’t permit this niche in the market to evolve, we will have conflict.
Michael Hankin: can't it be done through the label of the producer rather than at the level of the certifiers seal.

Robert Beauchemin: this is only one example, there is also the Biodynamic seal.

Margaret Clark: can someone on committee work on wording for a recommendation about private certifiers and the use of their seal?

Michael Sligh: why would we do this?

Margaret Clark: for purposes of clarity.

Tim Sullivan: do we have to move into this issue of additional requirements and use of the seal or just leave it as a private relationship between certifier and those who use their seal. Stop at: let them use the seal. Don't get into criteria for additional requirements.

Bob Quinn: as long as it is not in conflict with the law.

Michael Hankin: if we allow the private certifier to have additional requirements for use of seal, the private certifier could not refuse someone to the OFPA. we are requiring for audit that the name of certifier appear on the product -- would that be in conflict.

Bob Quinn: very different, not a conflict.

Rich Theuer: labeling issue - does this committee want to review processing committees recommendation and add/edit it to fit needs of this committee?

Nancy Taylor: add to labeling recommendation that indentification of final product certifying agent is required. Motion: Use of private certification seal is optional at the discretion of the certifying agent to identify product that meets the certifiers additional requirements.

Zea Sonnabend: could be misunderstood - may not have additional requirements, but may allow the use of the seal.

Michael Sligh: if it is at the discretion of the certifier - why do we need to go further.

Tim Sullivan: no legal problem with a relationship between a business and its client. This language will bring trouble.

No second on motion.

Presentation by Eric Ardapple-Kindberg:
On behalf of the Ozark Small Farm Viability Project and others, I propose that in the accreditation program there be localized peer review panel in six regions. Our original proposal suggested peer review panels in each state, but we would like to ensure that there is quality and consistency in the peer review process, so we have accepted this compromise.

Peer review would be composed of 6 regions with one representative per state and one from USDA. Nominating process: can nominate organic producers, handlers and certifying organization representatives. Election is by organic producers and handlers. Each state elects its representative. Accreditation application is sent to USDA who then sends it out to the regional peer review panel.

Diane Bowen: Who runs election?
Kindberg: USDA would run the elections.
Bob Quinn: everyone would have one vote?
Margaret Clark: at regional level, each state would have one vote?
Michael Hankin: why an election?
Kindberg: fulfills criteria established by the board for decision making. If the peer review was on a more local level: you have more information on the track record of the certifier but there is strong concern about clanism -the regional peer review adds a balance of opinions. There is a national peer review panel in this proposal = all 50 members.

Presentation by Katherine DiMatteo: Executive Director, OFFANA:
Within the models presented in draft 7.1 and the model presented this morning, there exists the components for a practical and effective peer review process that meets the mandate of the Act and the needs of the organic community.

There are several points that OFFANA feels are essential in creating the
accreditation program, particularly in regards to the peer review process.

1. There must be a national peer review panel to provide consistency, oversight- if there are regional peer review panels, to develop a professional group, and to give the U.S. organic program respectability and credibility in the international arena.

2. Peers are other certifiers and others who have a working knowledge of organic production and certification. The panel does not have to be a multiple constituency review group.

3. On-site evaluations of certifying agents needs to be mandatory. In the Codex guidelines for accreditation of organic certifiers, on-site evaluation is required. The U.S. program will want to be recognized as equivalent worldwide.

4. The application review is a rigorous examination of the applicant. Constant clarification of the application is done by phone and fax, which reduces cost. Through the review of the application, areas for on-site review will be determined. The evaluators will know what they want to examine before arriving at the certifiers office.

5. Evaluators should be trained individuals and should not just be USDA staff. Government takeover of a grassroots process is the concern of those opposed to the OFPA. The peer review and the on-site evaluation are the few areas where qualified private sector participation is possible.

6. The organic program should include training for the evaluators. There are not a lot of trained evaluators, the most experienced and professional are generally Europeans.

7. There is an important step missing from draft 7.1 and in any discussions I have heard so far: the posting of a public notice that X certifier has applied for accreditation. This gives everyone the opportunity to comment on the qualifications of the certifier. Complaints, personal experiences, compliments, etc. can all become part of the file developed on the certifier and used as part of the application review process. This is the best form of democratic public input - don’t leave it out of the process.

Robert Beauchemin: can the national peer review panel serve to review the certifiers who operate in more than one region?

Katherine: this seems an appropriate role for the national panel.

Presentation by Ted Rogers:
I would like to present some of the ideas we are working on as a department. We agree with a more regional or state by state approach for peer review. Negatives include the electoral nature, cumbersome nature of process, and cost.

We suggest using the six AMS regions, rather than the 4 in the SARE models. 2 representatives per region that would be 12 members on the panel, by some formula representative of producers, handlers and certifiers.

Function of the panel can be carried forward without face to face meetings. Roles to fulfill: to assist us in the review of the applications, writing of application report, assignment of observer per evaluation schedule. USDA staff would be the evaluators - either a member of the peer review panel or designees of the panel will accompany us on the evaluations. (pool proposed by peer review panel and approved by USDA) How Many? depend on how much the certifier is willing to pay. After the evaluation - evaluation report & application report distributed to peer review panel.

These ideas come out of our observations of the committee’s discussions and public comments.

Bob Quinn: how would you train them - the USDA evaluators?
Ted Rogers: being trained now - Julie, Ted and Michael Hankin.
Bob Quinn: how about financial/audit expertise?
Rogers: the role of the evaluators is to see if the certifiers can do what they say they can do.
Michael Sligh: I am concerned because all of our time is real valuable. Is our
advise relevant to the process that USDA will initiate? I get a sense that our work is not weighted equally with the work of the USDA staff.

Hal Ricker: we have a role as staff to propose ideas for you to react to. There is considerable concern about cost of program - the priority is for minimum cost to establish a program with integrity. We have people within USDA who can be drawn into this evaluation.

Robert Beuchemin: the way we design the accreditation process will determine the role of the peer review and the evaluation process. If we are designing it to be a box: here is who fits in and who does not. If we are designing a quality management system: we are deciding on shades of gray and then those involved would be more understanding of the process.

Rogers: evolutionary process - we want it to be an educational process which will be learned with the certification organizations.

Robert Beuchemin: this approach needs to be stated before we can talk about the models. Is the purpose of the accreditation to upgrade the quality of the certification system?

Rich Theuer: in the evaluation process, knowing how FSIS, FDA inspectors come to a plant, there are checklist of minor and major deficiencies but there are improvement factors which are brought out by that checklist and inspection. Do we get into a proposed evaluation form?

Rogers: we would tend more to evaluation criteria - which the committee has already written into their recommendation.

Bob Quinn: add fiscal estimate of cost of USDA working proposal.

Hal Ricker: we could come with an estimated cost.

Presentation by Hal Ricker on October 1 deadline:
Without a program in place or power to enforce, there is little they would/could do.

Question: Would Congress come back wanting to know why nothing in the program was done?

Ricker: nothing to enforce until there is a program.

Question: What happens to product labeled organic in the meantime?

Ricker: There could be a suit filed but otherwise nothing would happen.

Presentation by Tim Sullivan, FLAG:
I have dealt enough with USDA programs that are not implemented in time to know that it is standard procedure. This Act is distinguishable from any that I have seen before because this is a law that affects the citizenry at large. Creates legal liabilities. The law says that organic products sold/labeled after Oct. 1 must be certified by an accredited certification agency. How does the state laws fit into this picture? After Oct 1. - what happens to laws on the books for these states (since the federal law preempts that state law.) Any state law that exceeds the OFPA will be no good after Oct 1, 1993. When OGC gives this interpretation of the implementation date, they are thinking of the other programs which they have dealt with before, not the special characteristics of this Act.

Proposals: interim - no one likes it. We can't have a program on Oct 1, or even April 14, 1994. Options for interim: move something so accreditation can happen. Concern that a paper process only would get started. Danger that a skeletal program will take a life of its own. Suggests a strict short-term paper deadline. OR do all the work to get the program done as much as possible as a skeleton. First priority: allow certification organizations to do business.

Comments:
Nancy Taylor: guidelines in draft to start Phase 1. A timeline is put to that.

Rogers: what is going to drive the problems?

Tim Sullivan: there are a few states already causing problems.

Certifier X is very upset because State X is requiring all kind of things. Is it worth litigation? Or drop standards if they are higher?

Nancy Taylor: You could go with this phase 1 kick in. Accredit certifiers according to national law. Enhanced standards can not be enforced until.
date.
Tim Sullivan: enhanced standards is clear litigation problem.
Can states do anything in this arena after Oct. 1.
Margaret Clark: was it USDA's assumption that the publication process rather than Phase 1 accreditation would be enacted initially?
Michael Hankin: OGC felt whole accreditation program needs to be enacted.
Eric Ardapple-Kindberg: split out parts of the Act - get accreditation in the federal register. (many expressed agreement) The mandate from Congress concerning $500,000 appropriation for organic program is that the accreditation program get implemented. NOSB and USDA have to set a deadline to get this done. Another suggestion, Certifier X should be stalling to Oct 1 and then file a suit with a state for registration requirements.
Tim Sullivan: I don't want to see that happen.
Rich Theuer: what about getting date changed. NLEA had several delays. That might be a possibility.
Michael Sligh: drafted a resolution and sent it to the Secretary, stating that we would not meet our deadline - what happened to that? A press release came out saying that we are going to be delayed. Do we as an advisory board need to determine if something more formal can be done?
Michael Hankin: both the house and senate are aware that the deadline is not going to be reached. Extension of the deadline could be supported by Congress if asked.
Michael Sligh: is extending the deadline opening up the Act?
Michael Hankin: yes, could shut down the whole program.
Bob Quinn: important to set some dates. understood that final recommendations to board at meeting in September. Is that still feasible. Don't discuss interim programs - we will be splintering ourselves.
Robert Beauchemin: the certifiers in the private sector are being put in a very difficult situation - some businesses will get put out of business or will get out of organic. We might be seeing resolution just by seeing some momentum.
Nancy Taylor: put out a statement for when we will get done and ask the states to put their requirements on hold.
Rich Theuer: get list of requirements of the states and put them up against the law - find the sticking points and provide some direction to the criteria for section 2108.
Bob Quinn: some states going pell mell into an accreditation program. Can USDA ask the states to cool it - that their actions are counter-productive.
Hal: I don't know. but I can go back to OGC with the question. OGC would ask: how can we tell if the states are exceeding the law since its not fully developed. Until I know that the Senate is going to recommend appropriations, I can't say we will have a program.
Bob Quinn: concerned about how we best approach the states achieving the least amount of damage.
Michael Sligh: getting two opinions about the deadline & state programs - from Hal and Tim.
Ricker: needs time to think about it
Tim Sullivan: OGC does not fully understand what is going on here. When they do, they will help. State programs do not understand. When everyone understands, its best for everyone. Needs time to think about it. Get communication across and get a healthy dialogue.
Nancy Taylor: Would USDA feel it could get a memo out to the states - look at the law and hold off on requirements that will be preempted.
Ricker: it might be out of line for USDA to do it. Most states have locked at the law, have brought programs in line.
I am meeting with State Dept of Ag. delegates (marketing directors) week after next. Opportunity to talk about the program and what the effects will be in the states. 75 or 80 people will be there. I may also be talking to commissioners and secretaries of the State Dept. of Ags. also at their meeting at a later date.

Enforcement and appeals:
Miles McEvoy: the state will have the authority to enforce the federal law...
their jurisdiction. Who will do enforcement in other states where there is no state laws? Washington State has active organic program so they have staff round to investigate complaints that come in about organic labeling. Other states that don’t have adequate funding may not enforce the law for the federal government.

Michael Sligh: Is your $100,000 budget all from producers and handlers?

Miles McEvoy: yes

Michael Hankin: what is enforcement?

Miles McEvoy: label is enforced - products sold as WSDA certified organic is indeed in the program (protection of the seal.) Drift occurrence, fraudulent use of materials, sale in retail that is not grown under standards, out of state product that claims organic but not under a certification program, also internationally imported products. Doing a good job with produce enforcement, not as thorough with processed product.

Rich Theuer: a certifying agent from a private agency: do they report to the State if they find a producer that does not comply?

Miles McEvoy: It hasn’t been done but don’t know if any have been found in non-compliance.

Tim Sullivan: do you levy fines for violations, what are your administrative process and how do you see this working with OFPA.

Miles McEvoy: have not levied any fines, try to get volunteer compliance, get notice and can request a hearing, it found in non-compliance certification is revoked. Have not gone to a hearing yet.

Administrative appeals process is set in state law - send notice of intent, 20 days to respond, can have a hearing, administrative appeals judge, final review, could file a court claim and go through civil court with a judicial review. Federal appeals section is a little overwhelming. A lot of expense to send notice of intent to suspend certification, if it goes to federal court of appeals it could be even more expensive.

Presentation by Rod Crossley: member of CA organic advisory board. California is moving forward with their program because they feel the federal program will not be in place. Moving forward with 3 cases of fraudulent claims - up to $15,000 in fines.

Director (Paul Branum) may accept the national Act within the 30 days. If you have a complaint about the Act, the director must hold a hearing prior to the implementation of the law.

They think they will continue their organic program. Fully supported by fees to producers and handlers. Program is needed. No money comes with legislation from Washington, DC.

Clark: Could you talk more about this?

Crossley: Tens of thousands of organic acreage in California - too much at stake not to have a state law. Producers have been doing it for a long time and reluctant to switch over to federal law.

Diane Bowen: 23 complaints active in CA. 7 have been resolved. 3 will be announced publicly soon and have received notice. Can go to standard appeals process for state. Urge the NOSB or USDA to remember that the growers and processors are the backbone of the industry; and these state laws are protecting the growers now.

Rod Crossley: a lot of time has gone into making the California law effective.

Presentation by Tim Sullivan:

Enforcement: unusual aspect in this law - not unusual about state and federal government to be partners in enforcement - what is unusual is the role of private agencies in this partnership. Adverse determinations can be made about the state and private agencies, as well, as they are making decisions about producers and handlers. Process has to be very fast because prolonged appeals kill farmers. OFPA brings federal jurisdiction over the whole process. Has to include some kind of process which allows the decision-makers to review and determine final resolutions in the USDA. Appeals process in OFPA and standard federal appeals process needs to be looked at. There is authorization to take the appeals directly to the courts. That opens a wider door to review administrative
decisions. Lot of implications - a very broad thing.

Some fundamental points for appeal process: return to original decisionmaker - for reconsideration; if not resolved, how many more steps will there be. Will there be a state process or will we go directly to the federal process?

Comments:
Rich Theuer: FDA is waiting to get information from the Secretary about organic to apply to FDA regulations. Processors governed by FDA regulations will fall under organic regulations and appeals process.
Michael Hankin: Section 2120 c, 1 c: only time in the act it is not making a reference to state governing official. If there is an appeal to be held, it would go right to the federal.
Tim Sullivan: issues on independence of administrative review, fairness of the process is critical, fairness can not happen if the person who does the administrative review of the adverse determination is also responsible for making that determination.
Provision leaves procedures completely undefined but also gives parties express cause of action to use federal courts.
Michael Sligh: the more user friendly and independent this is, the fairer it will be. Where does it go in the USDS. (conflict of interest and independence) If AMS is the administrator and you go to the USDA for an appeal?
Ricker: There is an administrative appeals process in USDA - outside of AMS.
Rod Crossley: With a fresh fruit and vegetable violation: At what point are we going to stop him from selling fresh produce? during appeals process? Does the law/can the law put a stop order to sell organic?
Miles McEvoy: different process when taking action against producer or the process. revoking certificate: removing property right, (for example).
Ricker: we could provide you with more information. Perhaps, PACA process should be looked out. Department is year away from separate appeals division within USDA. Margaret summarized: important characteristics of an appeals process: expeditious, cost effective, fair.
Sullivan: look internally first at USDA - what is administratively available. then, look at phasing into the independent appeals process being proposed for USDA.
Nancy Taylor made a motion that the USDA come back with more information and then consider our options from that point. Existing internal procedures would be used as a model.
Clark: need an appeals section in our draft before it is released.

Rich Theuer made a motion that by the 15th of September we have the Department’s best effort to summarize existing appeals models. Analyze PACA first. Committee will prepare a draft by the time of the next meeting. Michael Sligh will pick a sub-committee. Seconded by Michael Sligh. Agreed by the committee.

Michael Sligh made a motion to adjourn the meeting. 4:45 PM.
The Committee meeting commenced at 1:20 PM.

Present: The Processing Handling and Labeling Committee met with the Materials Committee for the first hour. NOSB members present were Merrill Clark, Margaret Clark, Gene Kahn, Craig Weakley, Don Kinsman, Rich Theuer, Tom Stoneback, Gary Osweiler, Jay Friedman, Michael Sligh, K. Chandler, Dean Eppley, Nancy Taylor and Bob Quinn. All USDA representatives were present.

Michael Hankin of USDA presented an analysis of the provisions of the OFPA related to the National List of substances allowable in organic food handling. The contradiction between two subparagraphs of Section 2118(c), (A)(ii) and (B)(iii), provides justification to the NOSB to recommend to the Secretary that so-called "essential synthetic" substances required in processing food for human consumption be allowed in organic food. At the conclusion of the discussion of this point, the Materials Committee left to meet with the Livestock Standards and Crops Standards Committees.

General Processing Standard for Organic Foods Handling

The PHL Committee (Margaret Clark, Gene Kahn, Craig Weakley and Rich Theuer) reviewed the efforts of Craig Weakley and Rich Theuer, who identified those aspects of Good Manufacturing Practice (GMP's) used for conventional food processing which must be modified to be appropriate for organic food, as a simple means of communicating with food processors and to the Secretary the PHL Committee's recommendations for Organic Food Handling Standards. The proposals by Weakley and Theuer were slightly modified. Gene Kahn proposed the following definition of "organic integrity," which is critical to this approach:

For the purposes of this Act, the term "organic integrity" is defined as the unbroken chain of custody that guarantees that the identity of a 100% organic food or an individual organic ingredient remains out of contact with prohibited substances and non-organic foods or other non-organic ingredients of the same identity.

Craig Weakley will summarize the comments made in Committee session in a revised document. The Committee will review this document and discuss it by conference call to ensure that the comments of the Committee members are accurately reflected.

The next steps are to review the fresh food handling regulations (PACA) and the meat processing regulations by a similar process. Gene Kahn will spearheaded the fresh food handling regulation
review, with industry participations; the custody chain analysis has already begun. Don Kinsman and Merrill Clark will spearhead the meat processing regulations review; Kinsman already has prepared a brief summary which he will circulate to the Committee.

National List of Substances Allowable in Foods Purporting to Contain Organic Ingredients

The PHL Committee (all in attendance) discussed the mechanism and criteria for reviewing and evaluating "essential synthetic" substances. For criteria, Sections 2118(c) and 2119(m) of the OFPA apply. For mechanism, the criteria of Section 2118(c) will be applied first, giving effect to all provisions of the Act to the extent possible. This review would be accomplished first by the PHL Committee, for recommendation to the Full Board. The Committee will revert to applicants seeking approval of substances which do not meet these criteria, communicating this fact and indicating that the Committee does not intend to submit these substances for inclusion in the National List.

Merrill Clark expressed her beliefs that allowing synthetic substances in processed food labeled as organic goes beyond the letter of the law, that organic processed food should not be compromised with synthetic substances and that processing of organic foods should be restricted to simple processing procedures which do not require the use of synthetic substances.

The PHL Committee discussed with USDA representatives the information requirements of USDA for the National List of substances allowable in handling. The categories of foods and food uses in 21CFR170.3 meet USDA requirements for specifying which foods and which uses are appropriate for substances to be permitted on the National List. These categories also facilitate meeting the requirements established by the Materials Committee for submission of substances to the Technical Advisory Panel.

The PHL Committee briefly discussed the sulfur dioxide exemption that the Committee considers appropriate for "wine made with organic grapes." Sulfur dioxide is a sulfiting agent. Sulfites are prohibited ingredients in organic foods. Therefore, for this exemption to be possible, sulfur dioxide must pass through the National List review procedure mechanism. The Committee so moved and passed this motion.

The PHL Committee discussed the concept of "availability." "Availability" has many dimensions, including the number of suppliers of the substances, the relation between supply and demand, price and quality or grades. Craig Weakley commented that economics should not be a criteria for determining availability; Gene Kahn expressed the opposing point of view. To help eliminate informational impediments to the awareness of what
substances are available in organic form, USDA expressed its intent to create an information bank of available organic substances from feedback and surveys of certifying agents.

Other

Merrill Clark raised the issue of pest management in organic handling and processing operations. To supplement what is already in the Organic Handling Plan requirements, she will prepare a draft drawing on the documents circulated within the Committee by Merrill Clark and Rich Theuer earlier this year.

Rod Crossley of Health Valley Foods protested the Committee's labeling draft document due to procedural issues. The Committee noted that this document was presented to the full Board in Pennsylvania in May and that several individuals from industry provided extremely insightful and relevant comments which the Committee, in fact, responded to favorably during its meeting on July 8.

The Committee adjourned at 5:30 PM.

Richard C. Theuer, Chair
Processing, Handling and Labeling Committee
National Organic Standards Board
Minutes approved by Committee, October 26, 1993
NOSB ACCREDITATION COMMITTEE

JULY 10, 1993

Committee Members Present:
RICH THEUER, JAY FRIEDMAN, MARGARET CLARK, BOB QUINN, NANCY TAYLOR, MICHAEL SLIGL.

ALSO PRESENT: TIM SULLIVAN, TED ROGERS, MICHAEL HANKIN

Margaret Clark opened the meeting with a committee discussion concerning state laws in reference to higher standards. Purpose of the discussion - developing criteria for state standards and approval of state programs:

Suggestions:
Rich Theuer: state resource protection/use is one such criteria, are there others? Compare state programs to identify differences between states and feds and states & states.
Bob Quinn: poll the states - ask them what higher standards they might want to include.
Jay Friedman: look at the laws currently in place in the states.

Michael Sligh: would it be appropriate, if there could be potential problems between the states and the federal laws, for us to be very decisive in our recommendations to the Secretary?

Comments:
Tim Sullivan: Act was drafted to allow states to do state programs, but also discretion given to the Secretary, rather than look at it as states rights to have standards, it's delegation by the secretary.
Jay Friedman: Secretary's discretion has to be controlled by states rights. Rich Theuer: options: we (the NOSB) could do nothing - the Secretary will make his own determination. OR, we could do something but does it have any impact on what the Secretary does?

Comments:
Jay Friedman: if state approval process is different from accreditation, then the Secretary has a lot more discretion - he does not have to take a recommendation. Tim Sullivan: the NOSB has relatively little influence on the Secretary in this particular area.

Michael Sligh: in our priorities, where does this fall? Are we better for having made some criteria, then not at all? Do we send out for comments, do we poll?

Comments:
Jay Friedman: Write to NASCA, express concern about relationship, seek their advice about relationship of the state programs to the federal law.
Bob Quinn: I agree, ask for suggestions about how state approval program would look. how many are going to participate in a program that is different from federal.

Michael Sligh: can we craft some language to send with Hal Ricker next week?
Ted Rogers: Ricker will be meeting with the NASA marketing people in July and the full NASA meeting in September.
Margaret Clark: NASCA may tell us that the States have every right to accredit.
Nancy Taylor: do they have enough information to make a judgement?
Jay Friedman: there is a big political process that happens before these regs become implemented - knowing NASDA's point of view would be helpful - engage them in a dialogue.

This Question was posed to Miles McEvoy:
Miles' response: most states will wait to see what happens on the federal level. In Washington they will comply with federal and probably not add additional standards.

Margaret Clark: survey may be the best vehicle for information
Jay Friedman: what is the scope: preemption with a trickle of state entitlement or state can do what they want as long as they are in compliance with the Act?
Rich Theuer: accreditation committee has been given the responsibility of both state and private certifier issues.

Clark: priority of committee is recommending an accreditation program.

Ted Rogers: would it be helpful for staff to send a memo of guidance to the committee about recommendations for state criteria?

Michael Hankin: if Tim Sullivan would be working with Ted Rogers and Michael Sligh to work on something in writing - letter to NASDA, ready to accept the programs, developing the criteria for standards,

Jay Friedman: have a little difficulty with that - Tim has a view already about relationship between state and federal government. This will narrow the discussion.

Margaret Clark: committee has bought into this interpretation.

Jay Friedman: we have had no input from the states; without consulting them, a draft recommendation would be premature.

Bob Quinn: we don’t want to approve state programs ahead of the federal program. call for applications for the program is not what we want to do. Get input from those effected.

Michael Sligh: we would work on a draft recommendation for the committee to respond to - a beginning point.

Margaret Clark: also, something for the states to react to.

Miles McEvoy: states need to know in general where the standards are going and the general timeline; in addition to the work on accreditation.

Margaret Clark: we need keep perspective about what accreditation is.

Miles McEvoy: the letter (you are discussing) is trying to stop Texas and California from going their own way, ignore them and keep working on your program.

Michael Sligh: letter could come from USDA-we are getting ready to discuss the state programs- here are our ideas- how do you react.

Nancy Taylor: we don’t have to get involved in this criteria thing.

Clark: I would like to have Michael Hankin’s comments on paper -that would be helpful.

It was agreed that USDA would initiate comment on this particular project.

Michael Hankin: can I work with Tim Sullivan on this project?

Margaret Clark: ok with the chair – then USDA might decide to send letter to states.

Rich Theuer: a point of clarification - this committee would prefer that accreditation be a federal activity rather than a state activity - this is my position - not an opinion on Tim’s position.

Jay Friedman: the committee is taking a position that would ask the Secretary to take action which would go against Texas and California which are two of the largest delegations in Washington. We should be cautious about our actions and also the messages to the public.

Margaret Clark proposes: that since we have an application out for comment, USDA can take this application and turn it into a narrative form, and give it back to the committee for response.

Nancy Taylor: what is the purpose?

Margaret Clark: it serves the committee to get the information we need.

Michael Hankin: point of clarification- the USDA will take the application form, and publish it in federal register for comment.

Tim Sullivan: will we move on accreditation as a whole before everything else? is this discussion in context of that?

Margaret Clark: we did not resolve the questions of timing or moving parts ahead of the whole.

Tim Sullivan: I suggest that the committee come to consensus on developing an accreditation program which can be published in the federal register. Put out rules so process can start.

Margaret Clark: do proposed rules include request for information from all those who want to be involved?
Rich Theuer: Would this be a notice in the federal register for notice of accreditation?
Michael Hankin: it would spell out what accreditation will be - the proposed rulemaking.
Margaret Clark: is it also the application? would they then begin to respond to it by applying?
Michael Hankin: no, not fill out the applications but comment on the form of the applications and process.

Bob Quinn: I move that we make a recommendation to the board that accreditation process move forward separately from the entire program.
Jay Friedman: does this motion include state approval process, also? we still have questions about how states will be handled, we should not move forward until we have this resolved.
Bob Quinn: I would think we would move forward without resolving these issues.
Jay Friedman: I would not support favoring one sector over the other.
Bob Quinn: accreditation process and approving state programs are two different programs.

Michael Sligh: what are we suggesting: are we urging USDA to implement a component of the organic title - by putting the accreditation program in the federal register as a proposed rule, comments would come in (to whom) and then it would go out as a final rule.
Michael Hankin: comments come back to USDA, before it gets published in federal register again as a final rule, it goes to OGC.
Jay Friedman: accreditation committee is out of the loop once it goes to public notice.
Michael Hankin: point of clarification: once we finally develop the wording for the accreditation program, comes to the board and committee for final approval, before it goes to OGC for final review, from that point on the committee and board are not in the rule making, published as a proposed rule, comments come in to USDA, committee and board do not see comments, final rules then go out.
Margaret Clark: by September, we finish our draft, we give it to the department, USDA writes regulatory language - sections, subparts, regulatory references, introductions, etc., comes back to committee to develop final wording, and then after it goes to OGC as a final - the committee is no longer involved.
In September our work goes to full board, board approves - does it go out to public comment one more time?
Michael Hankin: because livestock would be having hearings soon, it would not be necessary to have public comment on recommendations from that committee. I would like to ask that the public comments on draft 7.1 suffice as the final round of public comment. The USDA asks for recommendation from committee and board but the USDA needs to be trusted to move it forward into regulations.

Proposed change to motion:
The accreditation committee concurs with the USDA intent to move forward with the accreditation program forward into the regulatory language.

Comments:
Miles McEvoy: the states will continue to develop their own programs in lieu of a federal program. Leave state program approval until there is a full program.
Move forward on accreditation.
Jay Friedman: please clarify - is it state approval and accreditation?
Bob Quinn: No, not state approval
Jay Friedman: then I disagree and would like to see them move forward together.
Michael Hankin: once we send proposed rules to OGC, the review may have an adverse or beneficial effect on a particular company. We can’t then talk about it because it would give unfair advantage.
Jay Friedman: is this board treated as a private party - I would like the board to be included in the review of public comment.
Rich Theuer: originally we were told that we were exparte once it went into rulemaking.
Question: what is exparte?
Answer: outside of the discussion.
Tim Sullivan: formal rulemaking process is the end of the committee’s role in recommendations. Assume all recommendations are taken into consideration before the rulemaking.

Bob Quinn: if this moved ahead, it would not be complete because it did not deal with the rest of the program. Are we saying now that accreditation does not have to wait for the rest of the program. Need a way to bring it along with the whole program – How?

Michael Hankin: when we go out with the final rules, it will go out with stars where incomplete.

Bob Quinn: it gives us an opportunity to see on a small scale how the big scale will work – build trust, see how it works, educate the full board.

Margaret Clark: agrees with motion but also agrees with Jay. Accreditation draft needs to define accreditation as a federal activity. If we define entire approval process – may not be necessary.

Tim Sullivan: also agrees with Jay, but understands the functional process that is making this necessary.

Nancy Taylor: explain approval and accreditation processes and how they are different – this would be valuable.

Jay Friedman: if you move ahead with the accreditation program without the states, you are creating an unfair condition for the states. If you put in something about pre-empting state law, you are opening up to litigation.

Rich Theuer: certifying agent, state or private, can put in their submission.

Michael Hankin: this is the department’s role not the committee’s role.

Rich Theuer: we can only do so much, there are things that the department does and things that lawyers can do.

Bob Quinn: private groups and states are on equal grounds because the rest of the program are not done. Everyone will continue as they are until the entire program is done.

Margaret Clark: Call the question: The committee recommends to the board that the accreditation process move forward in the rule making process separately from the total program.

favor: 2, opposed: 1, abstain: 3

Margaret Clark: I suggest we have private conversations, rework the language and come back for a vote.

Rich Theuer: wants to get from Jay why the state is not favored under this motion.

Jay Friedman: this motion does not move state approval forward (which is different from accreditation) once they are approved as a state program, they are a certifying agent. Can’t certify after Oct 1, 1993 unless you are accredited or approved – privates will be accredited, states will not be approved – unfair.

Michael Sligh: standards have not left station yet, accreditation program goes forward – how do they catch up?

Explained by the committee members as explained earlier by Michael Hankin. (Michael Sligh had been out of the room during that part of the discussion.)

Tim Sullivan: there are problems moving forward like this: identify where there are the greatest problems but then, need to take a stand based on assessment of risk/benefits.

Rich Theuer: don’t underestimate the capability of the department. there will be glitches, that’s why there are technical corrections. we will have our opportunity for comment before the final rulemaking.

Michael Sligh asked for reconsideration of the question. Rich moved, Bob seconded the motion. Jay objects to voting again. All others approved.

Michael Sligh apologizes for being out of the room. did you list out the pros and cons of this recommendation? is our rationale clear? here are our arguments for and against?

Margaret Clark: we will designate speakers for majority and minority positions.

Bob Quinn reread the motion: favor:5 opposed:1
Bob Quinn will prepare presentation to the full board.
Jay Friedman will prepare minority opinion.

Discussion of Peer Review Panels:
Margaret Clark: The peer review models in 7.1 are out for comment to the public now. No final recommendation can be made until comment period is over.
As a process, Margaret Clark suggested that each committee member go around and talk about their original proposals. Nancy Taylor has done some work on costs (see memo to the committee.)

Presentation by Nancy Taylor of her work on program costs. The number of calls and meetings will significantly effect the cost.

- Conference calls: 49 cents per minute
- Per diem $80.00 per day including room and board
- National $600.00 per person airfare
- Regional $350.00 per person airfare
- State $250.00 per person
- Postage $15 per person per panel
- USDA staff 22.50 per hour

Comments:
Margaret Clark: This cost estimate was done as a basis for comparison of options presented for peer review. Options come in very close to each other when cost basis is applied.
Rich Theuer: option A: no-starter based on public input
Margaret Clark: option B1: broad based constituent national panel. I like the elective model. I feel there is support for the regional panels but also feel that there needs to be national as well as regional.
Hal Ricker: option B2: national peer review - smaller group to meet for two weeks, willing to entertain some changes but keep numbers down and the cost down.
Michael Sligh: Option C: trying to balance cost with participation. key places in the law where the public has a hands on role to play. My model was the most extensive public participation and costly of the models. broader view of who are the peers. can be flexible about this. if you have a regional model, you have to have a national oversight.
Margaret Clark: model presented yesterday was similar to Michael Sligh's proposal. Cost needs to be looked into.
Michael Sligh: wants to empower the public to have a role to play. wants to debate whether consumers should be involved in the peer review.
Nancy Taylor: Option D: regional peer review with 4 members each. better understanding of regional environment and certifiers. one of each region will meet as the national peer panel - not necessarily in person.
Margaret Clark: is the entire accreditation process taking place within the peer review?
Bob Quinn: Option E: may be the cheapest but not maybe the best. like the idea of a national body for consistency. selected by the Secretary from a pool submitted by the regions/states/constituencies. waiving on consumer representatives - not peers, not involved in certification, don't have the expertise.
Option F: presented yesterday by Eric Ardapple-Kindberg in modified form.
Margaret Clark: I like to summarize the areas where there seems to be agreement in the models and take a straw vote:
- national coordination (all in favor),
- regional representation (all in favor),
- regional election (all in favor),
- constituency of the panels would be those effected [farmers, handlers (all in favor) certifiers (all in favor) state official of an approved state program (put aside for a following discussion)]

Rich Theuer: let's the use language in the law to describe the members of the
peer review panel: expertise in organic farming and handling wherever they are -
whoever they are. (21/17B) (all in favor) ****

Hal Ricker: peer review is an operating body - can't be too large that it becomes
an advisory board. public comment included all along the process - not necessary
in the peer review.

Nancy Taylor: peer review - we are not even considering the evaluators for the
second phase - this is additional expense.

Bob Quinn: could a peer review panel exclusively operate on conference calls?

Hal Ricker: it would depend on the panel - depends on paper that would have to
be provided for a call to work.

Margaret Clark: I suggest a change: use the language but specify producers,
handlers and certifiers. (all in favor)****

Discussion of the Committee's Workplan:

Rich Theuer: USDA will send us comments on the first and the fifteenth of the
month.

Margaret Clark: committee members please state what they see needs to be done.

Nancy Taylor: there is usually a 10 or 7 day turnaround - could it be 5 working
days for USDA to turn around documents?

Michael Hankin: would have to speak to Julie about that. would try to meet your
deadline.

Rich Theuer: This is a short timeline - to expedite the process, we should
circulate our sections to each other and USDA, don't rely on USDA or Margaret.
before the 15th of September it would be impossible for any documents to be done
- due to August vacation schedule.

Clark: The work that needs to be done: Peer reviews, appeals, state language in
accreditation document, glossary, question of approval of state programs and
language which defines difference between approval and accreditation, costing
peer review, statutory references.

Michael Hankin: don't base recommendations on any legal interpretations, base it
on opinion of the program as a whole, taken to OGC for legal review.

Margaret Clark: committee members will take up with the tasks they have already
agreed to.

Michael Sligh & Nancy Taylor: peer review

Michael Sligh: appeals

Rich Theuer: language, state approval

USDA: glossary

Margaret Clark: in accreditation application, there is still language which
confuses accreditation and approval. Is Jay willing to go through the
application to clarify the language?

Friedman: YES.

Clark will send 7.1 on disk to Friedman and USDA.

Nancy Taylor: 7.1 needs editing - for consistency.

Michael Sligh: one model from the public for peer review was presented yesterday
- have we heard from certifiers on 7.1?

Margaret Clark: there are several avenues for their input and the deadline for
comment has not passed yet. Can the OCC (Organic Certifiers Caucus) help put
together the certifiers thoughts?

Robert Beauchemin: OCC does not have the mechanism to come out with a consensual
position. Depend more on individual comments from certifiers. There may be some
common views held which can be presented. Certifiers are waiting to see it in
its final version before they respond. Those not following the complexities of
the issues, will feel threatened when the final draft is presented.

Pat Leonard: 3 decades of unregulated organic marketing - because of that, there
are cliches formed in the industry. When you (the committee) are looking out
there for comments, dig out the comments from those who are not vocal. Farmers
do not want to cross the certifier - because the certifier controls the farmers
destiny. Farmers go to the certifier who is the cheapest and the easiest.
Nancy Taylor: by the last week in July, there can be a draft on peer review - let's schedule a conference call that week. Draft will be sent to committee by the 12th. Conference call set for July 30th. 7:00 AM PST - 10:00 EST.

Jay Friedman: I would like to wait to redraft the language on the application as it applies to states until after discussion of state approval process.

Rich Theuer: State approval discussion - let's set a conference call August 6th and the drafts will be sent by Monday of that week.

Michael Sligh: Appeals - Let's do that on conference call August 6th.

Bob Quinn: If we can have a complete draft by September meeting, and if board approves next draft which is then sent out for public comment; then, a final recommendation could go to Secretary after next meeting (November?).

Rich Theuer: I thought there was not going to be another set of public comment.

Michael Sligh: do not agree - I would like to discuss this. Draft #7.1 was not a final draft - there were 5 options for peer review in that. Not fair to the public to circumvent their comments on the final draft.

Bob Quinn: I am going to propose that it does go out to the public.

Margaret: Let's put our motion to the full board as we had decided earlier. Could add an amendment when presenting to the full board concerning a final public comment period.

Bob Quinn: If USDA could put regulatory draft together by November, then both could be presented/voted at the same time.

Michael Hankin: this would be difficult

Michael Sligh: I would like to see a vote on having an additional public comment period (4, favor-2, opposed).

Margaret: I suggest we put "going forward" motion separately then discuss with full board the additional comment period. Committee agreed.

Meeting adjourned at 12:10PM.
WALTER JEFFREY

Kallium requested a soil biochemist, Washington State University (WSU), to complete a computer search on the effect of potassium chloride on soils. WSU's research found less than 25 publications [see attached handout] regarding this subject. KCl is not known to be toxic within reasonable osmotic ranges (i.e., -5 to -25 bars): Chloride acts as a nitrification inhibitor. WSU's conclusion is that KCl would have a beneficial effect on soils and soil life. Suggestions were put forth regarding replacements for langenite or naturally mined potassium sulfate, but it was determined that replacements are not suitable. Gene Kahn requested that Mr. Jeffrey document the steps of developing potassium sulfate. Craig Weakley asked Zea Sonnabend whether KCI has been reviewed by California Certified Organic Farmers. Ms. Sonnabend responded that a review has been initiated but she did not bring references to present to the Board.

TIM DEBUS (Registration Specialist, Mycogen Corporation) and DR. JERRY FEITelson (Manager, Department of Molecular Biology, Mycogen Corporation):

Mycogen's Bt product is the first and only genetically engineered product for crops to be approved by the EPA. [See attached handout.] The chemical fixation process destroys and fixes the P.f. cells encapsulating the delta endotoxin crystal within the walls of the dead cells. Mr. Weakley asked whether these are natural or synthetic substances and was informed that the gene is identical. This is a routine biochemical processes that occurs naturally. Bt genes could get into P.f. cells in nature, but this is extremely unlikely. The spore in the Bt cell is eliminated when the gene is transferred. The process to destroy the cell is to drop the Ph with vinegar (acetic acid). The "Cellcap" process was explained as a biochemical process using enzymes, rather than a chemical process. Processes that occur during recombination use the same enzymes that occur in all cells in nature. Whether or not phytotoxins from bacteria are a compatible synthetic under the OFPA is a question before the Crops Committee.

Benefits for organics industry:

Mycogen's Bt product has received an exemption from the establishment of a tolerance level by EPA, no residues are possible. The Bt toxin is highly pest-specific.
Brian Baker inquired as to what kind of precedent would be set if this product were allowed. Destroying cells turns the substance into a biochemical rather than a life form. Cellcap poisons the insects and stops the feeding, but it takes a day for the insects to die. Predators can feast on the larvae, since the insects are not dead but poisoned with a toxin that is not toxic to the predators. Mr. Weakley pointed out that the issue before the Board is really rDNA technology and asked whether any transgenic rDNA products are compatible.

DAVID HAENN (Ozark Small Farm Viability Project)

Only mushrooms grown on logs should be considered organic. (The conventional method of mushroom cultivation typically involves bins of sawdust.) Logs should not be treated for three years. Mushrooms have a high market value in Japan where they are perceived as producing health benefits. A $2 log can produce $15 worth of product. Mr. Haenn does not view shiitake mushroom production as wildcrafting. Spores for inoculation should come from a reputable source or be developed in a closet at the farm site. Mr. Haenn believes this is a good side industry for loggers: logs which would be junk could be sold to mushroom producers. Oystershell mushrooms can also be grown on logs. The real market is in dried or fresh shiitakes. The dried whole mushroom market is almost as big as the fresh market.

SMALL FARMER EXEMPTION FROM ORGANIC CERTIFICATION
Presented by Dean Eppley.

The Committee discussed the affidavit and declaration format. It was agreed that since a declaration does not need to be notarized, the declaration form would be used instead of an affidavit form. Julie Anton pointed out that as it has not been established that there will be a USDA seal; thus, the Committee agreed to change lines 27-29 to read: "A small farmer who sells or labels an agricultural product as 'certified organic' must be certified by a USDA-accredited certifying agency, as proclaimed in the OPFA." Ms. Anton also pointed out that the exemption is for farmers with $5000 or less in sales from organic and non-organic agricultural products, and suggested splitting lines 34-37 into two parts. Unanimous vote elevated this document to a Committee Recommendation to the Full Board #1.

PESTICIDE & FERTILIZER DRIFT AND MISAPPLICATION POLICY,
Recommendation to the Full Board #2

The Committee discussed revised version. Mr. Weakley described edits to the language made for clarity. Mr. Eppley pointed out that reference to "County official" does not apply in every instance as there are situations where a county or designation does not exist. Also, an abatement district is State-level. Ms. Anton inquired about the inclusion of Nancy Taylor's concern about notifying potential
drift applicators. Mr. Kahn and Mr. Weakley indicated that lines 71-74 are adequate to cover potential drift incidents as it would be too difficult to notify all potential applicators. The Committee decided to change "State or county agricultural official" to "public official." Mr. Kahn pointed out that the language referring to residue testing leaves discretion to the certifying agent. Mr. Weakley stated that the certifying agent must operate under the residue testing requirements of the OFPA. K. Chandler suggested adding "all appropriate expenses" to line 55. The issue of training of pesticide applicators will be addressed in a separate letter to the Secretary. Motion to approve was unanimous.

The Botanicals policy will be presented to the full Board.

MATERIALS TIMELINE

Ms. Zea Sonnabend summarized the discussion of Materials list that was presented at the May meeting and identified the following list of materials still in question:

- amino acids
- parahormones
- sunflower hull ash
- ash of all different sorts
- synthetic vitamins
- reclaimed water
- sewage sludge
- potassium permanganate
- insect growth and production inhibitors
- Mycogen Bt product
- leather by-product

Ms. Sonnabend suggested making the Allowed Naturals with Restrictions into an addendum. Tom Stoneback indicated that allowed naturals with restrictions would not have to go through the petition process but would have to be reviewed by the TAP. Uses beyond the restrictions cited would have to be petitioned. Mr. Kahn and Mr. Weakley expressed concern about a "Prohibited natural with exemptions" designation. Lynn Coody and Ms. Sonnabend suggested this would cause confusion in the grower community. Mr. Stoneback described current TAP process. Items that have universal agreement should be "fast-tracked." Mr. Kahn asked about the timeline for a response on the above-listed ten items. Ms. Sonnabend will work on synthetic and extraction definitions again. Mr. Kahn will work on other definitions and an interpretation document.

SPECIALIZED STANDARDS FOR GREENHOUSES
Presented by Zea Sonnabend
Ms. Sonnabend presented a draft from certifying agency standards that are present in effect [See attached]. Mr. Weakley suggested a "permanent" wall be utilized and Ms. Sonnabend noted that it is common in California to have a "split" greenhouse. Mr. Kahn noted strawberry transplants often start in greenhouses in Washington. Ms. Sonnabend discussed standards regarding potting soil mixes. Mr. Weakley inquired whether it was burdensome to require separate soil mixing machines wherein Ms. Sonnabend reply that it was burdensome. David Haenn stated there is a three-year requirement for site and that pasteurization occurs at 180 degrees. Venting of air from non-organic part of the greenhouse should be considered.

SPECIALIZED STANDARDS FOR MUSHROOM PRODUCTION
Presented by Zee Sonnabend

Ms. Sonnabend presented a draft from certifying agency standards that are present in effect [See attached]. Ms. Sonnabend stated that spawn is cultured in a laboratory environment and that organic spawn is not commercially available. Mushrooms are watered with chlorinated water during production/button stage. David Haenn stated that a closed environment requires so much sterilization that it could not be organic. Fungi take over a year to grow. The practices of harvesting logs should be sustainable. Mr. Kahn suggested that cryogenic storage of shiitake mycelium he allowed. Mr. Haenn suggested that a grower could make his/her own spawn; if the product is not sold, there is no need for government inspection. Brian Baker added that operations are certified, not sites. OFPA Section 2109(a) addresses seedlings. Mr. Kahn noted that Ms. Sonnabend's documents should be officially considered a literature search and not a working draft. Rod Crossley raised concern about a possible prohibition of cryogenic freezing. Mr. Kahn pointed out that the NOSB Processing Committee has endorsed cryogenic freezing.

Ms. Sonnabend briefly discussed maple syrup and tissue culture transplants. Mr. Haenn suggested that sorghum syrup, which is similar to maple syrup, be reviewed as well. Mr. Kahn asked Mycogen Corp. representatives for suggested technical advisors and was provided the following persons:
President of Invitro Society, Mike Horn; and
Plant Transformation Manager at Mycogen.

Mr. Kahn has received inquiries regarding early generation potato seed and requests input regarding this. Dr. Jerry Feitelson offered his services as a Committee contact. Mr. Stoneback suggested as an advisor for tissue culture research and asked to be kept in the loop on tissue culture discussion.

Mr. Kahn stated that tropical products shall be covered under generalized crop production standards. Ms. Anton suggested that the Committee look at coffee production standards as organic coffee is grown in Hawaii.
SPECIAL REQUIREMENTS FOR CERTIFYING AGENTS
The following suggestions for the NOSB Accreditation Committee were made by Committee members:

1. Restrictions on inputs compliance;
2. Minor infractions;
3. Whether inspectors can be growers and whether growers can sit on certification committees;
4. Thorough and comprehensive knowledge of organic farming.

Mr. Kahn stated that he did not see a reason for the Committee to pass judgment on a certifying agency that includes growers in its certification decision-making process. Miles McEvoy stated there may be many different models for certification programs; i.e., agricultural inspectors may be used. Mr. Weakley inquired whether or not there should be a general continuing education component. Mr. McEvoy explained how Washington State's Department of Agriculture sends inspectors to pest control seminars in order to keep informed. Mr. Weakley suggested some general recommendations for certifying agent qualifications: (1) knowledge of organic farming; (2) familiarity with organic laws; and (3) annual continuing education. Mr. Kahn will summarize this information in a letter to the Accreditation Committee.

ORGANIC FARM PLAN

Mr. Weakley suggested that the Farm Plan include required components only, following the Processing, Handling Committee's handling plan. The following language was inserted by the Committee at line 67: "Essential components of all farm plans." The Committee decided to integrate livestock concerns into preamble of the Farm Plan and add a livestock questionnaire to the end.

CODEX
Discussion of Codex was postponed as Bob Quinn, International Committee representative, was not available for a presentation.

DEFINITION OF ORGANIC
Mr. Weakley expressed opposition to participating in defining the term "organic." Mr. Kahn addressed the term "organic" in that it means grown or handled in accordance with the OFPA. Mr. Chandler pointed out that in the scientific community, there is a real need to define organic. Mr. Weakley prefers not to develop a definition of "organic" without the full participation of the organics community. A simplistic definition of "organic" was determined to be satisfactory among all Committee members.

REVIEW OF COMPREHENSIVE DOCUMENT
The Committee decided to reorder the components of the comprehensive document prepared by Joann Stewart.

Reorder:
1. Organic farm plan
2. Split operations
3. Inputs for organic crop production
4. Botanical pesticides policy
5. Planting Stock Policies
6. Residue testing
7. Emergency spray
8. Drift policy
9. Small farmer exemption

The definitions will be listed alphabetically, with the OFPA definitions separated from the Committee definitions. Interpretations of the OFPA definitions will be presented. The Committee determined that other definitions which should be included in the comprehensive document are:

synthetic
extraction
restricted
allowed natural
allowed synthetic
prohibited substance
split operation
prohibited substance
commercially available

WORKPLAN

1. Definitions - defined in conjunction with other NOSB Committees

2. Materials to be addressed by Committee before sending to the TAP

   Ash
   Mycogen-type product
   -- killed microbial pesticides
   leather by-product

   [Do not need to work on potassium sulfate.]

3. Work on wording for arsenic restrictions.

The Committee is waiting to receive summary position papers on cotton defoliation. CCOF will provide a description of the issues regarding cotton
defoliation. A representative from the National Cotton Council stated there are production practices that can help use less synthetic pesticides. Regions where there is no early frost do not experience defoliation problems. California and Texas typically do not experience early frosts. Names have been submitted by the National Cotton Council for technical advisors.

Soil improvement guidelines need to be addressed. Ms. Sonnabend has submitted suggestions which will be reviewed.

The Committee briefly discussed brand-name guidelines for certifying agents. Mr. Kahn requested that certifying agencies who handle brand-name requirements provide written input.

The following items are listed according to the priority in which they need to be addressed by the Committee:

1. Farm plan
2. Inputs
3. Definitions
4. Specialized standards
5. Consolidation
6. Soil improvements
7. Brandname guidelines
8. Cotton defoliation

August 16 was set as a deadline for developing the following documents for full vote at the Board meeting in September:

1. Integrated farm plan
2. Inputs resolution
3. Soil improvements
4. Definitions

Conference Call agenda:
Specialized standards issues [Julie will make list of issues]
Brandname guidelines
NATIONAL ORGANIC STANDARDS BOARD

Minutes of meeting July 11, 1993

Members present: Michael Sligh, Margaret Clark, Eugene Kahn, William Friedman, Craig Weakley, Merrill Clark, Nancy Taylor, Richard Theuer, Gary Osweiler, Donald Kinsman, L. Dean Eppley, E.K. Chandler, Robert Quinn.

USDA Members: Harold Ricker, Michael Hankin, Julie Anton, D. Ted Rogers.

Chairman Michael Sligh opened the meeting at 8:10 and presented an agenda for the meeting which was accepted.

A discussion was initiated concerning the recording of minutes during the Committee meetings. It was decided that the Chairperson would have the discretion to either seek volunteer help or request a Committee member to accept this responsibility. If neither option is available, then a USDA staff person would record notes using a laptop computer if possible, and provide the Committee chairperson with a disk of the draft notes. A motion was made to accept this proposal and the proposal was approved.

The next topic of discussion involved the possibility of USDA preparing an outline for the proposed rules. It was suggested that each Committee chairperson should supply USDA with a workplan before July 16, and that USDA would attempt to provide the Board with a regulatory outline for discussion before September 15. The proposed outline will be placed on the agenda for the September meeting. A motion was made to accept the proposal and the proposal was approved.

Discussion then moved to the dates of the September meeting. It was decided that Sunday, September 26, will be a travel or tour day, and the Board meeting would commence on September 27 and continue through noon on September 29. The full Board will meet each day and Committee meetings will be held, if necessary, at night. Public input will be on Monday afternoon. The Board meeting will tentatively adjourn at 3:00 on Wednesday. A motion was made to accept the proposal and the proposal was approved.

Establishing possible future meeting dates after the September meeting was then considered. The first week of November (1-4) in Texas or North Carolina was tentatively approved for the subsequent meeting, with the next meeting possibly held at Asilomar in January either before or after the Conference (January 19-22, 1994).

After a brief discussion and agreement by all persons involved,
it was decided that the Executive Committee would examine USDA’s request to modify the working draft and position paper protocol (in order to make more staff time available for program writing) on the next Executive Committee conference call.

Processing Committee Report
Rich reported that they received good input from industry on drafts and subsequently made revisions in the Committee. Many were opposed to having the percentage organic declaration on the principal display panel. The Committee presented its proposed Board draft recommendation for food labeling and percentage declaration. The need to redefine the scope of the recommendation to foods containing multi-ingredients, as compared to fresh produce, was stated. Also debated were the requirement that the certifying agency and its place of business be identified on the information panel, and the need for certification for organic processors producing foods with less than 95% organic ingredients. Some organic industry representatives have expressed their desire to have certification identification on foods containing 50-95% organic ingredients. Since the Accreditation committee is also discussing the use of certification statements and seals, this issue will be discussed at a later date by the joint Committees.

The following revisions to the labeling document were discussed:

For the calculation of the percentage of ingredients:
1. (b)3 add "if water of reconstitution is included in any part of the ingredients, it has to be considered for all."
   K. Chandler suggested that on page 1, to strike under l(c) "or a similar phrase,“ and the Committee and Board concurred. On b(3) after the comma, add a phrase after "concentrates" to read, "in that food."
   Page 2: 2(b)4 - No percentage on principal display panel.
   Point number 5 - No percentage declaration.
   Add a new Section G: Name and place of business of certifying agent, who certifies the handler shall be included in label information panel. Using words "certified by (FDA code)" in lieu of the address is permissible if the address can be found in the phone book.
   50% or more organic: deleted prior terms so now can "made with organic ___" can be stated on principal display panel.
   For d3, refers to organic certified by USDA certifying agent.
   Last page, point 5(a) defined ingredient and processing aids.
   All ingredients have to be identified.
   (b) Going for full disclosure label.
   K. Chandler responds that full disclosure stifles free enterprise, and Gene Kahn believes that full disclosure releases recipe.
   Vote on (b) by the full Board: 4 Yea; 6 No; 4 absent.
Vote on 5(a): 9 Yea; 1 Abstention; 4 absent.

Sections 1 and 5(a) of the labeling draft recommendation were approved. Sections 2, 3 and 4 will be reconsidered by the Committee to further develop the proposals regarding spice and flavor identification and the need for certification of producers of the various categories of foods containing organic ingredients.

Livestock Committee Report
The Committee presented its position paper on livestock sources. This paper briefly discusses the sources from which breeder, slaughter, dairy, and poultry stock should originate. It was agreed to substitute "organically managed" for "raised," throughout the document. The paper was accepted by the Board (13 Yeas with 1 No) as a draft recommendation, along with the inclusion of a minority statement regarding the possibility of producing organic beef from an animal fed organic feed for only a 12 month period (similar to the milk provision for dairy). At the request of USDA, the recommendation will be held from being mailed for public comment until the status of the livestock hearings is determined by USDA.

Materials Committee Report
The Materials Committee will be moving at a faster pace now to acquire the background information necessary to prepare the National List, including formation of the Technical Advisory Panel. The NOSB Committees will provide lists of substances with relevant usage information on each substance to the Materials Committee by September. USDA, in co-operation with the Board, will begin selection of the Advisory Panel members and develop guidelines under which the Panel will operate.

Kay Chandler will be working with the Association of Agricultural Control Officials to propose rules for using the word "organic" on the label of fertilizer packages.

USDA will supply some available information on botanicals to the Board for their initial review of botanical usage in organic production.

Crops Committee Report
Dean Eppley presented a draft of the Small Farmer Declaration which would be required for farmers selling less than $5,000 in agricultural products annually. The declaration indicates awareness of provisions in the OFPA of 1990 and would be filed with accredited certifying agencies. The draft was accepted with amendments that States could issue additional requirements and that the small farmer exemption did not allow these products to be sold for use in certified organic products. Vote: 9 Yea; 2 No; 1 Abstention; 2 Absent.

The draft recommendation on drift and misapplication of
fertilizer and pesticide was presented by Craig Weakley. The sections concerning required actions by producers and certifiers and the status of affected agricultural products were accepted. The section requesting Federal indemnity for losses was removed and will be submitted as part of a separate document. The vote to adopt as a draft recommendation was: 11 Yea; 2 No; 1 Absent.

Accreditation Committee Report

The Committee reported that it will be developing criteria to be used by USDA in evaluating State organic certification programs for consistency with the National Program.

The Committee also reported on a discussion during the week concerning the placement and meaning of certifiers' logos on foods containing organic ingredients. Questions were raised as to whether the placement meant that the foods were certified according to the Federal standards or to additional requirements that the certifying agencies may be permitted to represent. This topic will be the subject of future meetings.

Additional reports were received on the Peer Review Panel and the impact of the October 1, 1993 implementation date. It was agreed that there would be no interim regulations, but that there is a need to move forward with the recommendations. Brief reports were related concerning the need for USDA to initiate rule writing for the accreditation program, appeals and enforcement ideas, and peer review panel composition and function.

The Committee chairperson reported that the Accreditation Committee approved by vote the affirmation for USDA to proceed with writing and publishing the accreditation program separate from the other regulations. However, the Board was not being asked at this time to approve the Committee's action until the Committee could more clearly explain the new process to the Board. Staff was asked to look at the PACA appeals process and the general USDA appeals process.

On the Peer Review Panel, Margaret Clark indicated a preference for an elected panel, but recognized that there are no provisions for it in the Act. They expect to receive public input on their July 1 draft by August 15, 1993, and they have asked Michael Hankin to discuss with Julie Anton her availability to work on a Glossary.

USDA and the Committee want to move ahead on accreditation to show results and progress, to alleviate concern about the October deadline, and to develop trust for the USDA.

There was a motion to move the accreditation program forward without waiting for the full program development. Margaret Clark then urged defeat of the motion. The Committee withdrew the motion unanimously. There was some discussion about the need to
keep the accreditation process moving.

**International Committee Report**

Friedman reported that a working draft guiding the certification of imported products has been approved and will be sent out for public comment. Also, the need for the International Committee to continue operating separately from the Accreditation Committee was reinforced.
NOSB members present: Jay Friedman, Bob Quinn, Dean Eppley, Gene Kahn, Craig Weakley, Michael Sligh, Margaret Clark, Richard Theuer, K. Chandler, Don Kinsman, and Nancy Taylor

USDA staff present: Hal Ricker, Julie Anton, Ted Rogers, and Michael Hankin

The meeting of the National Organic Standards Board (NOSB), an Advisory Committee to the Secretary of Agriculture for the implementation of the National Organic Program, was called to order September 27, 1993, at 8:40 am by Chairperson Michael Sligh.

A welcoming address was presented to the NOSB, USDA staff and public in attendance (approximately 50 persons) by Mr. Marvin Schwartz, director of the Arkansas Land and Farm Development Center.

Chairperson Sligh presented his opening remarks, commenting on the need for openness and communication during the co-operative development of the organic program and observing that the NOSB serves as the formal voice for the public to the USDA on organic standards matters.

The USDA report was presented by Staff director, Dr. Harold Ricker.

USDA REPORT

The newly appointed administrator of AMS has been named - Mr. Lon Hatamiya from California. Mr. Hatamiya is familiar with organic production methods and will be involved with program development.

Ricker recently met with Deputy Secretary of Agriculture Rominger, Deputy Assistant Secretary Jensen, Administrator Hatamiya, and Deputy Administrator Clayton to discuss the organic program. During this meeting, the issue of using lower pesticide residue foods in the School Lunch Program was brought forth. The administration is already aware that the organic community supports the use of organically grown products rather than products which test below a minimal residue level, but which may not be grown organically.

The FY1994 Appropriations Bill has not yet been signed. Once it is, the Organic Program can establish a presence within USDA and operate under the appropriations. The administration supports continued funding for the program, although is anticipated that the program eventually will have to be self-supporting through user fees. The staff numbers will remain small. The actual operating budget will be less than the $500,000 appropriated due
Ricker next reported on a meeting with the Office of General Counsel regarding the anticipated livestock hearings. Ricker suggested using the Jefferson Auditorium site in the USDA Building in Washington, DC, in order to minimize costs. The DC hearing might occupy two days to accommodate the testimony. Any additional hearings would be held after the DC hearing, and could possibly be held within the subsequent three week period. USDA will publish a detailed notice of hearing in the Federal Register well ahead of the hearing date to allow for the preparation of testimony. Comments will also be accepted from the general public for a period of time following the hearing date(s). The hearings will be conducted by USDA; the preliminary opinion from OGC that NOSB members may help design the hearings and submit questions to USDA staff, but may not participate directly as examiners, will be reexamined. It is expected that the cost of the hearings will be $1,000 per day plus staff travel and per diem costs.

After extended discussion concerning NOSB involvement, locations, and procedures for establishing the hearings, Jay Friedman moved that: The NOSB recommends to the Secretary of Agriculture that the NOSB be represented to the maximum extent possible on the panel of examiners appointed for the Organic Livestock hearings. In addition, NOSB requests that USDA provide a written submission to the NOSB regarding the structure, substance, and procedure of the Organic Livestock hearings prior to formal adoption by USDA for the purpose of receiving NOSB comments. Motion seconded by Don Kinsman. The vote on the motion was: Passed unanimously. The NOSB expressed its desire to maximize the value of the hearings by allowing at least one NOSB member to serve as an official examiner at the hearing.

Ricker presented a brief report on the status of the EEC negotiations. A letter to the EC has been prepared and is expected to be delivered there on September 29. The letter addresses the following three areas of concern to the EC: (1) the format of and authority behind the certifier’s affidavit; (2) the oversight activities for the certifying agents which will be provided by USDA; and (3) import requirements for foreign products entering the United States. A meeting with EC representatives is tentatively scheduled for November.

The status of the NOSB budget was discussed. The FY 93 budget should conclude with a balance of approximately $1,300. (For details of the FY 93 budget, see Appendix #1.) The FY 94 funds available for NOSB operations are anticipated to be $45,071 which would be sufficient for two or three meetings.

During the next few months, it was reported, USDA National Organic Program Staff has a wide assortment of tasks to undertake toward the development of the organic standards and accreditation program. These anticipated assignments include:
*livestock hearings preparation
*accreditation program details
*writing a work plan for Departmental approval
*economic impact analysis statement
*database for determining user fee charges
*position descriptions for current staff
*vacancy announcements for staff to be hired
*continuing negotiations with the EEC on imports
*prepare for 1995 expiration of 4 NOSB terms
*improve mailing list efficiency
*convene the TAPs and conduct substance reviews
*prepare recommendations to CODEX standards
*support full NOSB and NOSB committee meetings

It was announced that Julie Anton will be concentrating more work
time on economic aspects, database creation and international
considerations. Michael Hankin will assume the key staff person
role with the NOSB Livestock Committee formerly held by Anton.

Ricker then explained that the FY94 budget of $500,000 had not
yet been officially appropriated, but that no problems were
anticipated with actually receiving the funds. Once the funding
is received, the Organic Program Staff will become officially
recognized within USDA. Three options were being considered for
the organizational structure. These options are: (1) remain as
part of the Marketing and Transportation Research Branch (MTRB);
(2) become a Section within MTRB; and (3) become a Staff assigned
to the Transportation and Marketing Division Director's office.
Hal recommended the third option for visibility and efficiency,
even though it would require assuming additional administrative
and secretarial responsibilities. Individual NOSB members
expressed support for whichever option provides visibility,
longevity, access to appropriations, and flexibility to utilize
private industry expertise. The ceiling for the number of staff
working on the Organic Program has been set at six persons.
Refer to Appendix 2 for staff estimated expense figures.

Ricker confirmed that the National Organic Program will not be
implemented as of the October 1, 1993 deadline presented in the
"Organic Foods Production Act of 1990 (OFPA)." Ricker again
requested the NOSB to develop a definition of "organic" and
principles of organic production as guidance in writing
recommendations and program language. He reiterated that the
Secretary of Agriculture will be developing a program that will
leave the program to be effectuated through the certifying agents
as long as safeguards are in place.

Michael Hankin presented a proposal developed by Bob Quinn and
himself for establishing a procedure by which the USDA would
utilize final Board Recommendations and communicate with the
Board during the writing of the proposed rules for the Organic
Program. The proposal suggested that USDA would write a draft of the proposed rules based on the Board recommendations. While preparing this draft, USDA would request input from affected government agencies and seek advice from Office of General Counsel. After completion of the draft, copies would be distributed to the NOSB and selected organizations for review and comment. Any changes from the Board recommendations would be noted and supported with commentary. The NOSB could then choose to accept the changes, or prepare an addendum to the recommendations in support of its original position. USDA would consider the addendum and the Board recommendations in developing the actual proposed rule. Both the addendum and the final Board recommendations would accompany the proposed rule document through the Departmental review process.

Considerable discussion on this proposal ensued. The Board expressed its concern that substantial changes may be made to its recommendations during the rule making process and it would be beneficial if the Board could have as much opportunity as possible to consider any modifications. The comments from individual members indicated a preference that USDA become more involved with the Committees during the preparation of final Board recommendations; that the comments from affected government agencies be obtained during this preparation time; and that USDA and the NOSB resolve differences in program language before the NOSB final recommendations are submitted to USDA. A decision on the procedure to be adopted by the Board was tabled until the Wednesday, September 29 session.

Hankin next presented a proposal to divide minute taking responsibilities between the NOSB and USDA. He proposed that the NOSB assume minute taking duties for Committee meetings and USDA assume minute taking duties for full Board sessions. Opinions ranged from acceptance of the proposal to requests that the proceedings of all meetings be recorded and transcribed. Because of the desire to finally resolve this problem and the need to prepare accurate minutes for those persons following Board activities, the proposal will be given further consideration and discussed again on Wednesday.

This concludes the USDA report.

AGENDA REVIEW FOR THE ARKANSAS MEETING

International Committee: The presentation to the Board is expected to consume less time than allocated. The Committee will request the Board to move a Committee Recommendation to the status of a draft Board Recommendation.

Livestock Committee: The presentation to the Board will include the feed, antibiotic and parasiticide issues. The Committee will caucus before its presentation to finalize the documents and
discuss status requests.

**Crops Committee:** The Crops Committee will present a revised Organic Farm Plan for adoption as a draft Board Recommendation and will discuss the formation of the National List.

**Accreditation Committee:** The Accreditation Committee will request that the Committee Recommendation on the Accreditation Program be accepted as a draft Board Recommendation. In addition, the Committee would like to discuss the ISO program, the IFOAM proposal, and the USDA request that the rule making process for the Accreditation Section of the National Organic Program be initiated before other sections of the Program.

**Processing Committee:** The discussion with the Board later in the week will include non-organic ingredients used in processing of organic products and handling standards for fresh produce. The Committee will request that the Organic Handling Plan be accepted as a draft Board Recommendation.

**Materials Committee:** The Committee will discuss the formation of the Technical Advisory Panels and the subsequent review of substances process.

This concludes the agenda review. The meeting was adjourned for lunch at 12:10 pm.
LORNA MCMAHON, an organic farmer from Kentucky, argued strenuously for the right to label agricultural products harvested during the three years prior to organic certification "transitional." The "transitional" label would provide recognition and due returns in the marketplace. She also asked the Board to consider allowing synthetic pheromone bait sticks that are used in the perimeter, or buffer zone, of cotton fields to track and kill the bollweevil. Ms. McMahon then presented a letter from the Louisiana Injured Workers Union. She requested that the Board respond to Bob Odom, Commissioner of Agriculture & Forestry, State of Louisiana, in order to provide him with a greater understanding of the term, "organic." Bob Quinn suggested that a list of issues to be addressed by the Board and the organic community in the future be established.

JACK MINTER, an organic cotton producer from Texas, expressed his concern about a possible crop rotation requirement that he could not meet given the "two inches of land" he has to grow on. He informed the Board that ordinarily in the high plains, it is not necessary to spray for the bollweevil, because freezing temperatures kill off the insect. Furthermore, the bollweevil can handled with bait sticks to keep them out of the cotton fields. He noted that bollweevil control has been particularly difficult during the last three years.

JIMMY WEDEL, an organic cotton producer from Texas, remarked that the imposition of a three-year transition period prevents him from meeting market demand. Margaret Clark suggested that Mr. Wedel develop an argument for a transitional label for cotton separate from other transitional label requirements. William J. Friedman commented that the Board could recommend that States are not precluded from developing transitional programs. Taylor added that Idaho has transitional labeling program. She noted that she and Michael Sligh, among others in the sustainable agriculture community, have been working on policy option papers for the 1995 Farm Bill.

VAN AYERS, an agricultural engineering specialist at the University of Missouri, also spoke on the need for a transitional label.
He stated that there are currently 65,000 acres of cotton in transition to organic, and that he expects that acreage to increase to 100,000 next year. He noted that the Texas State standards provide for the use of bait sticks that contain prohibited materials so long as they do not contaminate the soil or water.
He proceeded to describe flame cultivation as a weed control method that is effected by installing a flame of burning propane
(natural) gas at the base of weed plants; the flame cultivator can flame plants up to 4 inches tall. This method saves 20 man hours per acre (26 v. 6). Weed control is absolutely necessary for cotton production. Electrocuition was another method described: weed plants receive high voltages, which burst plant cells. There are also mechanical ways to sterilize the soil, such as the use of microwaves and hot water.

JOHN ARDREY, Manager, Purchasing Department, Eden Foods, for 15 years, commented that Eden’s standards of processing organic food have been built upon by the Organic Crop Improvement Association. Eden has long-term personal relationships with organic farmers and consumers. Eden has been concerned about processing techniques and aides that are detrimental to health and environment; Mr. Ardrey noted that many of those now accepted by the NOSB Processing Committee would not be acceptable for use in producing Eden foods. Eden has always required a three-year transition period for fields when one year was legitimized legislatively, and many growers were rotating fields in and out of organic production. With or because of a definition of processing ingredients and aides legitimized by governmental agencies, an unlevel playing field for exists for competing companies without the commitment to true organic production. Eden considers "organic" processed food not made from whole food ingredients to be adulterated. The organic food industry is one built by small companies and small producers. It is essential to maintain high standards. Eden is concerned that standards for producers will be stricter than those for processors.

Rich Theuer asked Mr. Ardrey for a list of those ingredients and aides that Eden would consider appropriate. He also asked where Eden acquires its minerals. Mr. Ardrey agreed that certified organic processing aides "cost a fortune"; yet, if there is a higher volume of supply due to increased demand by processors, the cost will eventually be less.

BARBARA ALTMEIR, a woman with multiple chemical sensitivities, called in by telephone to the Board during the public input session. She expressed concern about the emergency spray exemptions for crops. She asked where organochlorines are typically stored, and Gene Kahn responded that all such materials are banned at this time. Ms. Altmeir expressed concern about Demoline, which is used to spray for the gypsy moth. She said this chemical is stored in fat of animal or human that ingests cottonseed. She explained that organophosphates are neurotoxins; once exposed, certain people become sensitive. Parathion, microencapsulated, is commonly sprayed on cotton plants; is the crop then plowed under? Kahn explained that the current Board position is that the certifying agent is allowed the discretion to recommend residue testing; the soil would continue to be decertified if found to be contaminated. Kahn asked Ms. Altmeir to put her concerns in writing, given the difficulty conversing without the proper equipment; Friedman suggested that a
conference call be arranged with the Crop Standards Committee given Theuer's remark about complying with the Americans with Disabilities Act.

TIM SULLIVAN, a lawyer with the Farmers Legal Action Group, said that he has been practicing administrative law for 10 years and has litigated over issues of conflict with the USDA. He stated that, in his view, the NOSB and USDA have different interests and different roles. He said that there will be times when it is appropriate for the NOSB to make recommendations that the USDA will not implement. He noted that, in past cases, the private sector was able to make changes in an USDA Office of General Counsel determination, overturning half of the rules proposed. He suggested that the NOSB pull in all of the information needed to make its own judgements, and stated that the NOSB should not feel influenced to make decisions that it does not feel are right.

The OFPA implementation date should be that which the NOSB determines is best for the organic industry. He remarked in closing that he was representing Southern SAWG.

ROBERT BEAUCHEMIN, President, OCIA International, discussed the partnership between the public and private sector called for in the Senate Committee Report. OCIA's remarks on the concepts presented in Accreditation Committee Draft 8.0 will be submitted, line by line, in writing. Mr. Beauchemin then turned to the IFOAM proposal to the NOSB, which would, in his opinion, avoid redundancy in the accreditation process and save costs for the certifying agencies that certify exports wishing to receive IFOAM accreditation. The producers will ultimately benefit when governments recognize IFOAM. OCIA fully supports the IFOAM proposal, and requests that the NOSB include it in its recommendations to the Secretary. Regarding the Peer Review Panel and Evaluation Process, Mr. Beauchemin commented that the organic industry is much less divided on certification issues than it was before; certifying agencies will benefit from being involved in the review process. The Panel, to be functional, should consist of five members. The on-site evaluators should be chosen from the private sector, rather than the USDA, to separate the "inspection" function from the assessment function of the USDA. These evaluators should be independent and trained. On another topic, the NOSB should make an official statement regarding the registration fees several States have in mind to impose on private certifying agencies, as this creates a situation of unfair competition. Rich Theuer asked a question about how to prevent conflict of interest during the evaluation and Peer Review processes.

BILL WELSH, of Welsh Family Farms in Iowa, expressed his interest in establishing certification procedures for meat processing plants. He noted that if USDA/FSIS inspectors at meat plants were trained organic inspectors, there could be a savings in
paperwork. Certifying agencies could approve the inspectors' qualifications to inspect regarding organic standards. Mr. Welsh then argued: if vertically integrated operations are allowed to use antibiotics, small poultry operations will be put out of business. He analogized antibiotics to the herbicide, Roundup, which will be prohibited under the Act. He asked why the Board could not accept same philosophy for livestock. Theuer remarked that many processing plants have been closed down by FSIS over last several months.

ANNIE KIRSCHENMANN, of Farm Verified Organic in North Dakota, commented that FVO has always had a strong commitment to the oversight function; since 1984, FVO has been reviewed annually by an independent evaluation panel review. Also, FVO has been evaluated twice by IFOAM (in 1988 and 1990). FVO views the evaluator and peer review functions to be one and the same. Evaluators should have a comprehensive knowledge of the certification process, and on-site experience. A good accreditation system serves not only to police but also to educate. The Peer Review Panel should be comprised of certifying agencies, who are the most knowledgeable. Ms. Kirshenmann described FVO as an international certifying agency, one of many turning to IFOAM to meet its accreditation needs to serve the international needs of FVO's clients. FVO supports the IFOAM proposal; USDA should use the IFOAM evaluation as "raw material." USDA experience can be burgeoned by IFOAM experience. Otherwise, FVO expects to be forced out of business due to unwieldy costs. Certifying agencies can only expect to volunteer to evaluate. Decision-making and evaluation should be separate functions, with one carried out by the USDA and one carried out by members of the industry. The Peer Review Panel should rotate; a Panel should be assembled for each evaluation; USDA would provide consistency.

GEORGE SIEMON, an organic dairy Farmer from Wisconsin and member of the CROPP cooperative, commented that the groundwork to create organic livestock production standards has been laid, and that the NOSB should be allowed to be the vehicle to represent organic community; this would be better than there being conflicting positions throughout the industry. Mr. Siemon stressed the importance of private-public partnership, especially as organic regulations will cover a wide variety of commodities. NOSB has already satisfied the requirement for hearings for livestock. There has been public input in all regions of the country, and a large amount of photocopying. The hearings would only add costs and delays to the process of developing standards. Still a legal requirement, necessary. Mr. Siemon asked how organic products fit under marketing orders. Finally, he stated that the Board has already taken brave step toward the humane treatment of livestock (i.e. decertification if withhold treatment); therefore, the antibiotic provision does not need to be adjusted for humane reasons. What income argument is really relevant?
Natural beef marketers are not allowing antibiotics. The use of antibiotics in conventional dairy is shrinking. Tyson is now labeling chickens as no antibiotic use. In CROPP, 25 dairy farmers have stopped using antibiotics. At a time when the industry is moving away from antibiotic use, the organic standards should not allow it.

ROD CROSSLEY of Health Valley Inc. in California, remarked that it will likely take the FDA 18-36 months before it comes forward with rules/regulations. NOSB should go forward with labeling and GMP documents. Theuer responded by stating that the FDA is receptive to getting recommendations in before rulewriting process, so can work out any difficulties. Processing materials are already approved by FDA. The NOSB would be asking for special GMP under 110.

ERIC ARDAPPLE KINDBERG of the Ozark Organic Growers Association presented his view that the NOSB work remaining is minimal. Crops issues can be resolved at this meeting, including the farm plan. There is only one further issue for the Processing Committee: synthetics can be resolved by the National List procedure. The National Institute of Environmental Sciences should be consulted. According to the Senate Committee Report, antibiotics and parasiticides must be examined and placed on the National List, not excluded a priori. Mr. Kindberg advised the Board to get the Technical Advisory Panel in place. ISO 9000 standards, set up in 1968 by the United Nations, will be necessary for international trade and should be incorporated into the accreditation documents. The first round of accreditation should be paid for out of $500K. The maximum cost to farmers should not exceed $25 annually. USDA staff should not be evaluators. The Peer Review Panel should be a composite of farmers, handlers and certifying agencies.

Commenting on the role of biotechnology in organic farming, Mr. Kindberg commented that in nature, hickory does not grow on a pear, whereas pears and apples may cross. The differences in processes are those that are artificial, conducted through a mechanical process, and those which are natural processes. Finally, Mr. Kindberg agreed that the FSIS livestock hearings would not be necessary. He also argued that a portion of the funds received by USDA for the Organic Program be utilized to hire consultants to work on aspects of implementation.

KATHERINE DIMATTEO, Executive Director of OFPANA, remarked that she has been at every NOSB meeting and therefore has another record of NOSB meetings. Ms. DiMatteo supported the idea of ISO 9000 being incorporated into the Accreditation Committee Document. OFPANA’s view is that the accreditation program should be moved ahead, and implemented as soon as possible next year. OFPANA is concerned about disintegration of term, "organic." It would be a positive message to the consuming public to move forward part of the Organic Program, as many new labels are.
challenging the term, "organic." Regarding the NOSB's current position on split operations, OFPANA is in agreement, although would prefer the word "request" rather than "require" in the farm plan section on conversion. Regarding residue testing, OFPANA's Quality Assurance Council is of the position that Federal and State testing agencies should keep results confidential, so that only certifying agent and government agents have access, to prevent the rumor mill from doing damage to the reputations of operators. The Board should tag its 5% of EPA tolerance requirement to 1994 levels to reinforce the idea of an annual review. Regarding the emergency spray exception, OFPANA strongly supports the compensation statement. OFPANA would like to see added a statement such as the following: public agencies must have a published list of guidelines for each emergency spray program, to justify use of prohibited material in emergency spray situation, and give 30 days notice of intent to spray to USDA, certifying agencies, and State governments. She suggested adding "county" to the types of public authorities. Also, there should be notification within 48 hours of discovery. Regarding planting stock policy, OFPANA's view is that non-organic transplants should be allowed if not commercially available, but not if treated with prohibited insecticides; prohibited fertilizer treatment would be acceptable. Regarding drift and misapplication policy, producers should be required to give written, legal notification (by certified mail etc.) of financial responsibility, should any incident occur, to neighbors and county agents. Regarding the small farmer exception, does registration make certifying agency liable? A copy of farm plan and assurance of an audit trail should be provided along with the declaration.

DAVID HAENN, of the Ozark Small Farm Viability Project in Arkansas, noted his tremendous respect for the work of the NOSB Processing Committee. He had remarks regarding the proposed category of essential synthetics. He stated that there can be found no intent in the Senate report nor OFPA Section 2111 for the establishment of such a category. He asked, must processing aides be from a whole food source? He said that by establishing an essential synthetics category, the NOSB will "open pandora's box of exceptions...and sink the pioneering efforts of organic food processors," shutting doors on the incentive to develop wholly natural substitutes. He gave the example of producing natural pectin from apple peels. Although Mr. Haenn saw no place for the transition label, he suggested that growers submit a notarized statement of intention to USDA, which it would then publish, identifying producers with the intent to produce organically. Mr. Haenn stress that there should be enough money spent to keep the public informed.Craig Weakley queried Mr. Haenn about the analogy of essential synthetics for crop production. Mr. Haenn refuted this argument by saying that production inputs are a deviation in the philosophy (necessary for production and handling) that does not
Ms. Margaret Clark asked about Rumford baking powder and Red Star yeast (synthetic stabilizers and ingredients): would Mr. Haenn agree that economies of scale prevent small organic bread bakers from adopting alternatives to these essential ingredients? Mr. Haenn responded by saying that there are other leavening agents available. Mr. Rod Crossley stated that dry yeast and (mined) sodium bicarbonate can replace these ingredients.

ENID WONNACOTT, Director of NOFA-Vermont, stated her view that the Board should emphasize production methods rather than pure food. The Board should figure out what systems work for producers rather than developing a system of standards based on perceived consumer perception, and then put energy into educating consumers. She determined that only Texas does not allow for exception for antibiotic use with withdrawal times of all the active certifying agencies. She stated that it is important to be representative of certifying agencies in existence now. She cited the case of Peter Flint, a small producer with a dairy herd who does not use antibiotics for his cows but who, in an emergency situation (for example, pneumonia in calves), would be served better by an allowance of judicious treatment of a documented emergency, than feel tempted to create deception or treat the calves inhumanely. Also, Ms. Wonnacott argued that medicinal substances should be reviewed by Technical Advisory Panel; she has a has language proposal. The Board should also address the issue of extralabel use: important for minor breeds, and which includes the use of anesthesia for food animals. The NOSB should support an extralabel policy. Regarding certified organic feed, Vermont has always required organic feed, but allows a shorter lead-in time period. Organic grain is 25% more expensive. She stated that a six month lead-in time would be reasonable, arguing that most toxic accumulations in feed are mobilized within six months.

SUZANNE VAUPEL, of Vaupel Associates in California, noted that 15-17 States regulate organic livestock production. The majority of States allow antibiotics for specific diseases and in relation to when the stock will be slaughtered for sale as meat. Feed requirements also differ according to the weight of the animal. Marketing orders should at some point be addressed by the Board. For example, organic almonds should be exempted from the reserve requirement. Where organic food is a distinct product in a distinct market, and could not be substituted, the marketing order should not apply. She believes that where organic producers do pay into marketing order funds, 20% should go towards research into the organic market. She noted that the lemon marketing order has small exemption, whereas the orange marketing order does not. Rich Theuer noted that the FDA should rule on the basis of the common or usual name: i.e. "organic grape" versus "grape"; the NOSB could develop a proposal to FDA. Ms. Vaupel agreed.
MG has some design to look at marketing orders.

ZEA SONNABEND, of California Certified Organic Farmers, argued that a certifying agent member should be appointed to the NOSB; such a person could be a State agent with a non-controversial background. She also argued for funding for Technical Advisory Panel members; furthermore, coordination is crucial to get the right questions to the right people. She noted her concern about the Peer Review Panel election process, seeing it as cumbersome and slow. CCOF's position is that there should be no blanket prohibition on antibiotic use in organic livestock. Specific, targeted use of antibiotics is not a danger. She solicited Board member participation in workshops at the upcoming Asilomar conference in January.

STEVE PARKS, a transitional grower, from Tennessee, noted the high labor cost to control weeds. He argued that premiums are needed by farmers to get them from transitional production to full organic production. Bob Quinn asked: if premium were to disappear, would these would farmers revert to conventional production? Organic farming is a commitment, he stated. Mr. Parks noted that economics is still a driving factor.

A couple of statements made by persons with chemical sensitivities are inserted into the public record as follows:
(1) LYNN LAWSON, who handles a chemically-sensitive persons support group in Chicago, lives on an island in the summer to avoid pesticide drift, and remarked that organic foods should not contain pesticides, antibiotics, nor synthetic parasiticides.
(2) JULIE OCOLA, of Human Ecologist magazine, remarked, "Food makes or breaks our day." Simply, we must know exactly what is in foods, in her opinion.
(3) OTHER COMMENTS FROM CHEMICALLY-SENSITIVE INDIVIDUALS: A multi-tier label should inform consumers of the treatment to the ingredients in the product. The chemically-sensitive can be affected by very low levels of pesticides.
Crop Standards Committee Chair Gene Kahn opened the Committee presentation with a discussion of the Organic Farm Plan. Kahn emphasized that intent of legislators who supported the OFPA was not to micromanage farmers, but rather to improve farms and the growing environment, and to include strict production standards. Kahn presented an excerpt from the Senate Committee Report, which cites the Organic Farm Plan as the "key element in organic production," which is to be used in combination with a strict materials list. Statutory requirements for the Organic Farm Plan can be found in Sections 2103 and 2114 of the OFPA.

Kahn explained that the Committee's recommendation is that the components of the Organic Farm Plan questionnaire must be included in the certifying agencies' documentation. He noted that a sentence referring to trends appears in every question, to prompt the producer to think about progress or regression of his/her farm.

Kahn pointed out the new section of the document referring to "split operations" (lines 105-108): "Comment on any progress made, if any, or obstacles encountered in..." Lines 157-163 contain new language. He also noted that the water source section (lines 168-171) addresses the irrigation water quality issue.

Language was suggested to replace line 204 with the following: "exist near the borders of the organic fields on your farm". A new section referring to the management of wild crops was added (lines 178-182). The harvester of wild crops to be sold as organic would have to have documented a three year history of the land. Language changes were also made to lines 191-194.

Kahn announced that references to livestock production had not yet been integrated into the Organic Farm Plan document, but that the plan is to integrate into the sections where applicable. In response to an inquiry by Jay Friedman, Kahn commented that certifying agencies will have to conduct hazard analyses when confronted with farms with both organically- and non-organically-raised livestock, and ensure that organic integrity is maintained.

Raw manure application is historical. The definition of compost will be established in Committee discussions to come. Sewage sludge is currently prohibited, but should undergo further review.

Friedman noted that critical elements for inspection of split operations, such as water delivery and the storage and cleaning of sprayers, are being analyzed by the New Mexico Organic
Commodity Commission. Kahn added that the important measure is to identify potential sources of contamination where comingling of organic and conventional crops could occur. Certifying agencies are responsible for dealing with the issue in much more detail.

Quinn cautioned that certifying agencies need to be very specific in carrying out assessments of potential contamination.

Kahn noted that the current Organic Farm Plan document represents significant compromise, and that the least strong approach has been adopted.

Language changes were made to lines 65-67: add "parcels and three-year field or land..." Drop parentheses surrounding: "The grower will provide..."

The question on split operations (line 207) was revised to read, "If a split operation, describe your systems for avoiding potential contamination by prohibited substances used on the conventional portion of your farm."

The Board agreed that a critical issue regarding split operations involves the determination of fraud in reported yields. Currently, certifying agencies require maps as part of a tracking system. Ms. Annie Kirschenmann remarked that split operations would have to demonstrate the differentiation of production through the audit trail. Mr. Robert Beauchemin asked if certifying agencies could be liable in cases where split operator fraud was determined. Ms. Zea Sonnabend commented that CCOF does not require full documentation for non-organic portions of a split operation; however, in California, growers do have to file a pesticide use report for every field.

The language in Section IV., Maintaining Organic Integrity, was changed to the following: "The grower shall provide adequate maps of all parcels farmed under his/her control and three year field or land histories as part of his/her certification application..."

Friedman reported that New Mexico is requiring mandatory residue testing for split operations. He pointed out the necessity of developing preambular language to identify where discretion can be exercised by the certifying agency.

Kahn remarked that non-organic farmers typically keep excellent records.

OFFICIAL ACTION

Quinn motioned to raise to the Committee Recommendation to the Board to a Draft Full Board Recommendation; this motion was seconded by Dean Eppley. A discussion ensued.
It was agreed that the accreditation document should ultimately include provisions addressing where certifying agencies have the responsibility to exercise discretion; Friedman agreed to draft this language. A comment was made that the rejected applicant will be allowed to appeal.

Call to motion was approved by unanimous consent of all Board members present.

The remaining time allocated by the agenda to the Crop Standards Committee was ceded to the Processing and Accreditation Committees.
The Processing, Handling, and Labeling Committee (PHLC) began its report to the Board at 9:35 am. Rich Theuer began the presentation by explaining that the PHLC is deliberating on creating a list of non-organic substances that may be used in the three different categories of processed foods containing organic ingredients. These three classes are (1) greater than 95% organic ingredients; (2) greater than 50% organic ingredients; and (3) less than 50% organic ingredients. These non-organic substances contained in the food will either be ingredients, which are present in the final product, or processing aids, which are not contained in the final product.

A brief review of the OFPA was conducted by Theuer. Section 2111 which contains language that (1) synthetic ingredients are not permitted in organic processed foods, as well as language which states that (2) non-organic ingredients are permitted if they are on the National List, was referenced first. The second section reviewed was Section 2118, which reaffirms the non-organic ingredients language present in section 2111, but in which language is provided to allow for exempted synthetics in processing in those cases where the natural product is unavailable.

Theuer then discussed the PHLC attempts at defining "synthetic." He explained that an organic food that undergoes a chemical change or process during its manufacture should not be considered as a synthetic food simply because of the chemical change or process. The PHLC has already offered the consensus that the term synthetic should not be applied to an otherwise non-synthetic food that is formulated or manufactured by processing [as defined in Section 2103 (17)]. The Board concurred with this idea by a straw vote.

Theuer further explained that it appears that the National List will contain three categories of non-organic ingredients: (1) natural, non-organic materials that may be available in organic form (herbs, spices, etc.); (2) non-synthetic materials that cannot be produced organically (gases, yeast, cultures, etc.); and (3) essential synthetic materials which will be approved through the Technical Advisory Panel.

The Board then reviewed certain common non-organic ingredients to discuss in general terms whether foods containing one or more of these ingredients should be labeled "organic", "made with organic ingredients", or contain no mention of "organic." The ingredients discussed were baking powder, calcium chloride, dry baking yeast, sulfur dioxide, vitamins A and D in milk, and ascorbic acid. The various ideas brought forth during the discussion included: (1) the label "organic" is the goal and
should not be used unless production meets the "ideal" conditions of no synthetics and all organic ingredients; (2) "organic" practically should be permitted on the label as long as established requirements, even if less than ideal, are met; and (3) manufacturers will attempt on their own to produce ideal "organic" foods in order to make such statements as a marketing tool.

The members of the Board were polled on a straw vote to determine whether the PHLC should continue in developing a list of essential synthetic substances as part of the National List, for use in organic processed foods containing at least 95% organically produced ingredients. The vote was unanimous with the understanding that the list would be as short as possible and well detailed.

Craig Weakley presented the Organic Handling Plan which previously had been circulated by the PHLC to receive public comment. One revision was made as a result of the comments received in respect to the individuals and businesses that do not need to be certified. Gene Kahn discussed his research to develop recommendations for the extent of involvement of warehousemen and trucking firms in the certification process for organic handlers. The research identified the need to revise the Organic Handling Plan to require certified organic handlers to list all individuals or businesses that sell, transport, or store the products, but who do not take title of the product. Also, these individuals or businesses would be informed in writing of proper organic handling procedures and be expected to sign bills of lading to indicate that the integrity of the organic products was not compromised during possession.

Kahn also suggested that the word "known" be added after the word "all" on page 1, line 53 of the document.

Theuer moved that the Organic Handling Plan be approved as amended as a draft Board recommendation. Margaret Clark seconded. The vote to approve was unanimous.

This concludes the PHLC presentation to the full Board. The morning session was adjourned by Chairperson Sligh at 12:05 pm for lunch.
The meeting reconvened at 1:05 pm.

Margaret Clark presented the Accreditation Committee's Recommendation (draft 8) on "Standards and Procedures Governing the Accreditation of Organic Certification Organizations."

Clark detailed the minor revisions which were made after the public input responses were reviewed. An additional modification was proposed by Julie Anton and Bob Quinn. A brief discussion was initiated to explain the differences between the approval of State programs with organic standards and the accreditation of State agents as certifiers for the National Program. Theuer then moved and Quinn seconded that the modification be accepted. The vote by the Board to accept was unanimous. The modification will be inserted on page 4, line 41, and reads:

It is recognized that private certifying agents have established programs to address specific philosophies and/or regional considerations, and may wish to include requirements for the awarding of the certifying agent’s seal that are supplemental to the standards promulgated in the OFPA. Such requirements shall not preclude the certification to OFPA standards of producers and handlers who do not seek to utilize the private agent’s seal. Furthermore, such requirements shall further the purposes of the OFPA and shall not be inconsistent with the standards prescribed by the OFPA.

Clark then reviewed the Peer Review Panel (PRP) portion of the Committee Recommendation. Clark explained the previous diversity of opinions among the Committee members in designing the PRP system and said she expects that a wide range of comments will be received during the next public input period. The option presented in Draft 8 was a unanimous consensus opinion by the Committee after considering the original choices. In a straw vote, the Board voted unanimously to accept the PRP Section language and directed that the PRP section be included in the document sent out for public input, while acknowledging the need for revision of certain sections. The opinions expressed by the certifying agents present at the meeting mirrored those of the Board.

The wording on page 12 regarding the requirement that records must be available upon request to any person requesting them was questioned by Weakley. Friedman expressed the view that records should be available for review as needed for official purposes, and not available for anyone to view for any reason.

Kahn moved and Weakley seconded the motion that the words "which must be available upon request to any person requesting it" be
deleted from page 12 of the Draft 8. The motion was passed on a vote of 10 to 1 with 1 abstention.

After a brief exchange of comments about evaluating the reasonableness of fees set by certifiers, the actual preparation of a PRP report, and developing conflict of interest language in cooperation with legal counsel, the Board voted unanimously to accept Draft 8 as Draft Board Recommendation.

Three resolutions (Appendix #3) were then presented for a Board vote. The first resolution requested that USDA undertake a comprehensive review of the compatibility of the NOSB Draft Accreditation Program recommendations with ISO guidelines. Theuer recommended slight modifications in the language. Friedman moved to accept the resolution as amended. Motion seconded by Theuer. This resolution passed unanimously.

The second resolution expressed the NOSB resolve to consider the proposal from IFOAM regarding its participation in the USDA Accreditation Program. Quinn moved to accept this resolution and the motion was seconded by Friedman. Theuer offered a secondary motion to move the resolution to the Accreditation Committee. Sligh seconded Theuer’s motion. The resolution passed unanimously. Friedman requested that the International Committee also be involved in the review. The Board agreed and the resolution will be discussed by the Accreditation and International Committees and then presented at a future date to the Board for consideration.

The third resolution introduced by Clark requested that USDA utilize appropriated funds to pay for the costs of accrediting certifying agents applying during the first round of applications. Ricker supported this resolution provided that funds are actually available for this purpose. He also suggested that the reference to using volunteer evaluators for accreditation would probably be unacceptable within operating guidelines established by the USDA’s Office of Inspector General. Sligh offered an amended condensed resolution addressing concerns. This resolution then was passed by unanimous vote.
Jay Friedman assumed the role of acting Livestock Committee chairperson in the absence of Merrill Clark who could not attend the meeting because of illness.

Friedman read to the Board the Livestock Committee's Draft Recommendation on "Livestock Feed Standard." Friedman explained that the Committee is still developing its interpretation of the wording in the Act which excludes livestock from the requirement of being raised on land to which no prohibited substances had been applied for the previous 3 years. However, the Committee has decided that pasture land should be under the 3 year requirement and this decision is reflected in the draft. Friedman related that it is also the will of the Committee that a provision be included for use of non-organic feed in emergency situations.

The Board members were asked for their comments on the feed document. The requests were made to delete in Section B the phrase "...directly or as a supplement to feed rations.." and to delete in Section C the phrase "...in the event of a feed availability emergency." It was agreed to delete these phrases. The Committee also agreed to add the phrase "verifies that an emergency exists" in Section D to modify the wording to read "...provided that the certifying agent is immediately notified of the emergency, verifies that an emergency exists, and establishes a maximum time period during which the non-organic feed may be used."

The Board entered into a discussion concerning the utilization of Bureau of Land Management rangeland in the production of organic livestock. Margaret Clark presented her concerns that because BLM land was rented and not owned, the management of the land was beyond the control of the organic producer/renter and therefore could not be certifiable. Friedman stated that Colorado producers of organic livestock agree with Clark's statement but that the BLM does not spray the rangeland and therefore the lack of management control is not a problem. Nancy Taylor expressed the idea that more research should be done to determine whether certification is possible. Clark made a motion to exempt pasture from the mandatory certification requirement. The motion did not receive a second and was dropped.

The next topic debated was whether 100% organic feed should be required in all situations. Gary Osweiler and Don Kinsman reaffirmed their position that the Act should be interpreted as meaning 100% feed, especially for slaughter animals. Enid Wonnacott expressed the consensus opinion from the NOFA's that the 100% standard is too strict and would be a burden on the existence and growth of organic livestock production in the New
England area. Wonnacott and George Siemon, Technical Advisor to the Committee, both stated that some provision in the feed requirements should be permitted for dairy animals. Michael Hankin and Margaret Clark agreed with the suggestion of Friedman that they should develop a separate document addressing the feed standard for dairy animals, thus allowing the current draft document to proceed through the approval process. It was also requested by Friedman that the current draft document be considered without the inclusion of milk replacer in the category of feed supplement. Milk replacers may be essential in some livestock production systems and yet the replacers may not be available in organic form or may not be able to be labeled as organic if they contain more than 5% non-organic ingredients.

After some additional discussion as to the need to classify animal feed as a processed food, Friedman moved to adopt the Committee's draft livestock feed standard as amended as a draft Board recommendation. Osweiler seconded and the motion passed unanimously.

The second and last document brought to the Board by the Livestock Committee was the working paper "The Use of Synthetic Antibiotics in Organic Livestock Production." The Committee asked the Board members to comment and to conduct a straw vote on the working paper as a preliminary step in developing it as a draft Board recommendation.

The draft was split into 3 sections. The first section precluded the use of antibiotics in slaughter stock intended to be sold and labeled as organic. The second section restricted the use of antibiotics in breeder stock to emergency situations provided that the application did not occur during the last third of gestation or while nursing offspring. The third section allowed antibiotics to be used for any reason in dairy animals with the requirement that milk and milk products not be sold or labeled as organically produced for 12 months following the application.

Gene Kahn spoke in opposition to the intent of the draft, stating that it attempted to micromanage farm practices, exceeded the language in the Act which only prohibits subtherapeutic use and use to promote growth, and would be detrimental to the growth of the emerging organic livestock component of organic agriculture. He emphasized that he was not advocating the unrestricted allowance of antibiotics, but was requesting that it be permitted in very limited circumstances because not all producers are yet able or willing to raise livestock without the knowledge that antibiotics are available when absolutely necessary. He added that consumers are not demanding a ban on the use of antibiotics; rather, they are expecting realistic production methods with the assurance that the finished product will not contain antibiotic residues.
Kinsman agreed with Kahn, but also claimed that because the leading brand of natural beef advertises that no antibiotics are allowed in its production of natural beef, that the organic standards as a whole should be stricter than this brand of natural beef. Osweiler also agreed with Kahn that the ban on antibiotics would be a burden, but reiterated his support for requiring the treated animal to be diverted to the conventional market. Osweiler conceded that diversion, though easily executed for the slaughter category, would be difficult for the dairy category and therefore special considerations may be necessary for dairy. Kay Chandler said he hoped organic producers would be granted an entry level category to the market and then have a chance to improve their production system to one that does not use any antibiotics or parasiticides.

After receiving comments from the public and the other Board members, it was decided to conduct a separate straw on each of the three categories of the antibiotic draft document. The results of the vote were:

- Slaughter stock: 8 aye; 4 opposed
- Breeder stock: 7 aye; 5 opposed
- Dairy Stock: 7 aye; 2 opposed; 3 abstained

Based on the vote, the Committee decided to submit the document for public comment as a Committee recommendation.

The Board adjourned at 5:05 pm.
MATERIALS COMMITTEE REPORT TO THE NOSB

The meeting on September 29, 1993, was called to order by Chairperson Sligh at 8:30 am.

Gary Osweiler presented the Materials Committee report. Osweiler identified three goals of the Committee. These are: (1) the Livestock, Crops, and Processing Committees should submit lists of materials to be reviewed by mid-November; (2) the Technical Advisory Panels need to be organized as soon as possible; and (3) the process for reviewing the materials needs to be established. Osweiler also expressed the need to have a petition procedure in place for companies to submit the names of new materials for review and to provide information about materials already being considered by the various Committees. This petition procedure was differentiated from the referral process by which the various Committees would communicate the names of materials to the Materials Committee and subsequently to the Technical Advisory Panels for review.

Many members declared the necessity for urgency in this entire review process so that the National List would be prepared at the same time that the standards are published. Michael Hankin described his concern that the petition procedure needs to be a formal one that included publication of an official Notice in the Federal Register calling attention to the preparation of the National List and requesting the submission of information relevant to the process.

After identifying the different progress that the three Committees had made in developing the lists of materials for review, the importance of this Committee's work, and the advantages of employing a private sector contractor to coordinate the review, Jay Friedman moved that the Board direct the Materials Committee to formalize the petition procedure and develop the petition substantive elements. Osweiler seconded and the motion was approved by the vote of 8 aye; 3 opposed. The Materials Committee agreed following the vote to formalize a short petition format to be used by each Committee for each material intended for evaluation for the National List. Nancy Taylor and Osweiler clarified that this form would be a formatted document for internal Board and Technical Advisory Panel use and that it should not be confused with the petition process which will be utilized to formally obtain information for and notify the public about the National List. USDA staff persons will work with the Committee to revise and standardize the internal referral document. Rich Theuer noted that the Processing Committee must first determine with the full Board how to define what constitutes an essential synthetic ingredient for processed foods.
Ted Rogers presented a report from USDA about the progress in forming the Technical Advisory Panels. USDA plans to analyze the areas of expertise of persons previously indicating their willingness to serve on the Panels and then to expand the areas represented with persons from Extension Service, Science Division, research groups, and the organic community. He reported that the Panels should be functional by April 1994. Friedman moved that the USDA contract to hire a Technical Advisory Panel coordinator from the private sector. The motion was seconded by Margaret Clark and the motion was approved by a vote of 10 aye; 0 opposed; 2 abstained. Hal Ricker agreed that USDA would consider the resolution, but in the meantime would proceed with forming the Panels.
DISCUSSION

International Committee Chair Jay Friedman presented the current Committee Working Draft entitled, "Importation of Organic Agricultural Products."

Margaret Clark suggested that lines 88-89, "or approval as a State program by the Secretary," and line 112, "or a State program approved by the Secretary," be deleted. Friedman said that this language tracked the applicable sections of the OFPA. Clark noted that removing lines reflected the majority Accreditation Committee position. Weakley asked for clarification of the issues surrounding the debate. Quinn noted that the majority of the Accreditation Committee agreed to treat State and private certifying agencies alike throughout Board recommendations. Friedman stated that in the case of an international document, the approval of State programs should be referenced according to the OFPA.

OFFICIAL ACTION

A motion was called to vote on deleting the language as suggested by Clark: five members voted for the deletion; three members voted against the deletion; and four members abstained. The deletion did not carry, as there was not the two-thirds majority required by the OFPA.

Mr. Robert Beauchemin commented on lines 90-103, saying that the provisions were adequate and similar to OCIA standards.

Margaret Clark remarked that her store receives product from Latin America with seals of agencies that utilize lower standards; this situation needs to be addressed.

Gene Kahn inquired about lines 114-120, which refer to use of the USDA seal on imported products. Hal Ricker commented that he does not expect U.S. certifying agencies to be allowed to place a USDA seal on organic products for export to the United States. Kahn noted that there are bigger issues involved in this section in addition besides multi-ingredient processed products. There may be organic produce from foreign countries imported by packers to keep up a line of product during the U.S. off-season, where packaging has already been set for the year. Kahn asserted that it would be disruptive of commerce to place unnecessary restrictions on labels of imports. Ricker agreed to investigate whether or not a certifying agency will be allowed to place a USDA seal on a product destined for import into the United States. Theuer commented that country of origin labeling may become a problem for organic products in the future.
Weakley argued that if Muir Glen bought organic olive oil to use in its pasta sauce, it would be difficult to accept that Muir Glen could not use the USDA seal, if one is developed, on its final product.

K Chandler remarked that there are no precedents yet set, and that the Board should feel free to develop a unique program, and that this uniqueness should be emphasized to USDA/FDA decision-makers.

Friedman requested that Kahn, Weakley, Clark and he work together with Hal to frame issue for the Office of General Counsel.

Julie Anton stressed that Board members should provide written comments to the Committee’s Working Draft and the other document to be developed by the Committee. This allows the Committee to be better prepared for questions and concerns presented at Board meetings.

OFFICIAL ACTION

A straw vote was called by Committee Chair Friedman: seven members voted in favor of the document; three were opposed; the remaining members abstained from the vote.
FULL BOARD ADMINISTRATIVE MATTERS

After the conclusion of the International Committee discussion, the Board began a session at 10:40 am to address general administrative Board matters. Chairperson Sligh repeated the Board’s intention to complete the submission of final recommendations to USDA during Fiscal Year 1994. Sligh requested the Committee chairpersons to submit to himself and to USDA a time frame and a list of topics that the Committees are still developing into recommendations.

The dates of the next Board meeting were selected as being during the week of January 30 - February 4, 1994. Washington, DC was selected as the primary site for the meeting with the anticipation that the Livestock Hearings could be scheduled to coincide with the Board meeting date. The subsequent Board meeting dates were tentatively scheduled for the week of May 23, 1994, with the site to be selected at a future date. Executive Committee conference calls were approved for the first Monday of every month starting November 1, 1993.

Secretary Weakley reported that the minutes from the Board meeting in May 1993 at Kutztown, Pennsylvania which were tentatively approved at the July meeting were not yet completed. Additionally, he stated that the minutes from the July 1993 meeting in Cottage Grove, Oregon required editing and improvement before they were able to be voted on by the Board. Hankin agreed to submit the revised minutes from the May and July meetings to Weakley by October 29, 1993 along with the minutes from this meeting.

Weakley then introduced the following motion:

1. Full Board meetings, including public input sessions, will be recorded on cassette. USDA staff will be responsible for having the meetings recorded. The Board chairperson will be responsible for assuring that all recognized speakers are identified by name on tape. A private sector secretary will transcribe the tapes into a detailed record of the meetings at USDA expense. The Board Secretary will be responsible for assuring that the tapes are transcribed within two weeks after each Board meeting and that the tapes and a copy of the transcription are promptly delivered to USDA. The Board Secretary shall retain a copy of the transcription.

2. At all full Board meetings, including public input sessions, one USDA staff member and the Board Secretary will take back-up notes to document general discussion topics and all formal actions taken by the Board. The Board Secretary shall submit a copy of the back-up notes to USDA within two weeks after each full Board meeting.

3. USDA staff will complete and submit to the Board
Secretary for editing the first draft of full Board meeting minutes and public input sessions notes, prepared from the transcription, within four weeks after each full Board meeting.

4. The Board Secretary shall edit the draft minutes and public input session notes and return them to USDA within six weeks after each full Board meeting. USDA will mail the revised proceedings to all Board members for review at least two weeks prior to the next scheduled Board meeting.

The motion was seconded by Theuer and approved by unanimous vote.

Bob Quinn introduced a resolution to direct USDA to hire a new staff member with certification experience for the accreditation program. Friedman offered a friendly amendment. Quinn accepted and revised his motion to read:

Be it resolved that the Board recommends to the Director of the Transportation and Marketing Division that the new position to be created in AMS assigned to oversee the accreditation program be filled by or contracted out to a member of the organic community who has experience in certification activities.

The resolution was accepted unanimously.

Quinn then introduced a second resolution directing the Board to appoint a Board advisor on accreditation until the certifying agent position on the Board is officially filled. Kahn suggested that USDA should attempt once again to obtain a legal interpretation from Office of General Counsel (OGC) that would allow for the certifying agent position on the Board to be formally selected by the Secretary of Agriculture. Ricker and Hankin agreed to approach OGC again with the Board’s request. Sligh and Friedman offered an amendment which reissued the resolution on the Board certifier position that was issued at the 1992 Ft. Collins meeting; additionally, the amendment requested USDA to act on the Ft. Collins resolution within 60 days. It was asked that if USDA could not resolve the Ft. Collins’ resolution that the following resolution become effective:

Be it resolved that until an official member of the Board is appointed by the Secretary of Agriculture to represent the certifying agent, that an advisor be selected by the Board to fill that position.

1. That advisor shall be nominated by the Organic Certifiers Caucus (OCC). OCC’s membership is open to all certifying agents and is currently comprised of both state and private certifying agents.
2. That advisor shall be seated at the table of all Board meetings, with all rights of participation except voting.
3. That advisor shall be selected through written
confirmation in time for attendance at the first meeting of FY 1994.
4. That advisor shall become a member of the Accreditation Committee and fulfill any other Committee assignment given by the Chair of the Board.
5. That advisor shall be reimbursed for expenses to the same extent and in the same manner as Board members.

The resolution was accepted by a vote of 10 aye; 1 opposed.
Ricker noted that the allowances for technical advisors to the Board would allow only for certain aspects of the resolution to be fulfilled, if necessary.

Quinn then offered a third resolution requesting the Secretary of Agriculture not to hold public livestock hearings since public comments on the production of organic livestock and livestock products have already been received by the Board at meetings over the last 18 months. Hankin stated that the Act requires formal Notice of the livestock hearings and if the content of this resolution were to be accepted by the Secretary, then the Federal Register Notices for the next Board meetings would have to include language which notified the public that a portion of the Board meetings were being established as livestock hearing sessions. It was decided that the resolution would be amended to incorporate the comments presented during the discussion. The Board conducted a straw vote on the following resolution and directed the Executive Committee to formalize the vote during a subsequent conference call after discussion with Livestock Committee Chairperson Clark:

The Board resolves to inform the Secretary that the statutory regulation that the Secretary hold livestock hearings has been met for the following reasons,

1. The Board has established a Livestock Committee;
2. The Committee has met in 7 states and in every region of the country and held 8 public meetings and has received informal public input at each meeting;
3. The Board has also met and has taken formal public comments during each of its full Board meetings in 6 states;
4. The producing and consuming public have had significant opportunity to comment on the proposed standards;
5. The oral and written submissions of the producing and consuming public have been reviewed, analyzed and incorporated in the current Committee proposals;
6. The Board will distribute its draft recommendations to the same groups and persons that would be notified of the proposed hearings thereby ensuring adequate response (input written as well as oral presentations);
7. The Board will hold at least two additional public meetings with opportunity for the above mentioned public input prior to submitting formal recommendations to the
Secretary;
8. The Federal Register Notice announcing the remaining two Board meetings will contain notice that public input time will be dedicated to receiving comment on organic livestock and livestock product production.

Wherefore,
The expense and time consumed by additional public hearing held by the Secretary are unnecessary and should not be held.

The resolution was approved by a vote of 10 aye; and 1 opposed.

Sligh introduced a resolution delineating the future role of the Board after completion of the final recommendations to USDA for the creation of the National Organic Program. Friedman suggested the Board's role should be to address problems that arise rather than a complete review every two years of the entire program. The resolution was tabled for further consideration.

The meeting was adjourned at 11:30 am.
PUBLIC INPUT SESSION  
National Organic Standards Board Meeting  
January 31, 1994

Preparation Date: February 7, 1994

(1) Stephen Zoller, Vice President and General Manager,  
San-J International, Inc.

HANDOUT. Mr. Zoller focused his remarks on the unique concerns  
of soybean product manufacturers regarding the NOSB Processing,  
Handling and Labeling Committee's literal interpretation of the  
OPPA in calculating the percent organic ingredients in processed  
products to be labeled "organically produced." Mr. Zoller argued  
for water to be included in the calculation of percent organic,  
given that soybeans require a lot of water to make them  
consumable "without serious gastro-intestinal distress." In  
response to a question by Mr. Rich Theuer, Mr. Zoller describe  
the San-J soy sauce as 2% alcohol, 79% water and salt, and 21%  
soybean after fermentation, although the percentage of soybeans  
by weight is twice as high before processing. Mr. Theuer  
suggested that the before-processing weight of the ingredients be  
considered by the NOSB.

(2) John Ardrey (MH or TR)

(3) Annie Kirschenmann, Co-Chair, Organic Certifiers Caucus  
(OCC).

HANDOUT. The OCC, which represents 17 certifying agencies, met  
in Asilomar on January 20, 1994, and hammered out a position on  
the peer review process, which Ms. Kirschenmann presented to the  
Board. Essentially, the OCC views peer review and on-site  
evaluation as one in the same. [Please see the handout for a  
complete description of the peer review process proposed.] Ms.  
Kirschenmann argued that the OCC position is based on a reading  
of the Senate Committee Report, which states that the peer review  
process should utilize existing certifying agencies and base the  
procedure on the university system of peer review, with the  
intent to provide "integrity and consistency." The OCC believes  
in a separation of review and decision-making functions. Ms.  
Kirschenmann also commented that if certifiers cannot be  
adequately represented in Board deliberations, the issue will be  
"revisited at greater cost." Ms. Kirschenmann noted that  
revisions to the OCC position will be made, given that greater  
detail is needed. The OCC has committed to work together and  
negotiate on contentious issues. In response to a concern  
expressed by Mr. Bob Quinn, Ms. Kirschenmann noted that the OCC  
is open to all current certifiers, including State agencies.  
[New Hampshire is currently the only State in the Caucus.] Ms.  
Margaret Clark suggested involving States through NASDA.
Representing his company's product, wastewater treatment solids for use as fertilizer, Mr. Peer described the impending EPA regulations of February 19, 1994. Stricter quality standards will be placed on sludge; more composting with lime stabilization and controls for pathogens and heavy metals will be included. Mr. Peer expressed his feeling that the quality of the BioGro product has improved to the point that he could approach the NOSB. He stated his sense of moral obligation to try and use the wastewater solid products, as he has farmed organically essentially for ten years. Mr. Tom Stoneback suggested that Mr. Peer approach the Composting Council, which sets different grades for sludge products. Mr. Theuer commented that Beechnut prohibits the application of sludge to fields where baby food ingredients are produced for five years prior to harvest. Mr. Peer agreed to provide a copy of the ten heavy metal standards and pesticides allowed at nondetectable levels.

As stated in the IFOAM proposal to the NOSB and USDA of September 23, 1993, there are two possible areas where IFOAM-USDA cooperation may occur: in the domestic accreditation program and in the determination of equivalency for the purpose of verifying imports into the United States. Mr. Commins cited the advantage of utilizing IFOAM's experience: 28 evaluations have been conducted over the course of 7 years. Typically, a 58-page report would accompanying an IFOAM accreditation. IFOAM's services ensure that the three NOSB accreditation principles, competency, independence, and transparency, are adhered to. IFOAM's methodology is investigative. IFOAM could assist in the timely implementation of the OFPA, and is ready to begin to discuss the idea of joint evaluation with AMS. From IFOAM's experience, Mr. Commins suggested that the pre-evaluation phase involve an assessment of application completeness, with the evaluation visit including a second phase of application screening for compliance with the OPFA. Mr. Commins noted that the IFOAM criteria details how an agency is to be assessed; the NOSB proposed questionnaire does not currently provide specific questions which would render detailed responses. Mr. Commins stated his basic satisfaction with the NOSB International Committee's document on import equivalency, with the exception of a few points [brought up in later discussion]. In closing, Mr. Commins noted that the IFOAM Accreditation Programme will be moved to the United States within a year.
(10) Katherine DiMatteo, Executive Director, OFPANA (MH or TR)
(11) Rod Crossley, Health Valley Foods, Irwindale, California.  
Mr. Crossley focused on the fact that processors are governed by the FDA. He stated that the FDA supports organic food labeling because organic production reduces the use of pesticides. The FDA may declare a mislabeling violation if an organic product's label does not meet the letter of the law. Labeling specifications must be made clear. Blanket labeling would not be allowed. Incidental additives must be indicated. It is not currently clear who in FDA will write the FDA regulations governing the labeling of organic processed products; this issue is to be resolved by FDA's legal counsel. CFR 2408C of January 6, 1993, describes FDA's function following action by USDA, and indicates that FDA will determine if additional FDA regulations are needed after the USDA rulemaking procedure is concluded. Mr. Crossley emphasized that the Board needs to consider this factor in developing its timeline, "spinning off" labeling regulations to FDA as soon as possible. Dr. Hal Ricker commented that USDA is working with John Vanderveen and Cathy Carnaval of FDA, in an attempt to coordinate efforts. They have already received an early draft of the NOSB PHL Committee's labeling document.

(12) David Haenn (MH or TR)

(13) Zea Sonnabend, California Certified Organic Farmers (CCOF).  
Ms. Sonnabend asked the NOSB to consider the following concerns of CCOF as it develops its guidelines for accreditation: CCOF is a membership-based organization, with decision-making conducted by volunteers through a local peer review process. She asked if certification decisions must necessarily be made by a paid staff? Dr. Ricker noted for the record that conflict of interest would be assessed on a case by case basis. In response to an inquiry by Mr. Robert Beauchemin, Dr. Ricker stated that the criteria for this assessment would be spelled out. Regarding a document written by USDA staff members Ted Rogers and Michael Hankin on National List issues, Ms. Sonnabend questioned the premise that off-farm inputs must only be used in emergency situations and an inference that farmers bringing in off-farm inputs were suspect, or, "guilty till proven innocent." She noted that the "rank and file" growers do not understand the difference between NOSB and USDA.

(14) Ron Gargasz (MH or TR)

(15) Allen Rosenfeld, Public Voice for Food and Health Policy.  
Mr. Rosenfeld noted his involvement in the writing of the OFPA. He stated that given the recent passage of the nutrition labeling legislation, organic labeling should be consistent. His view is that processors should be required to state the percentage of organic ingredients on the principle display panel, in contrast to the NOSB PHL Committee's current position prohibiting such a statement. Mr. Rosenfeld stressed that the consumer should have as much information as possible. Regarding the allowance of
synthetics in organic processed products, Mr. Rosenfeld argued that only public health considerations be of importance; otherwise, a sunset provision for such ingredients should be developed, and the products containing such ingredients should be clearly labeled. He stated his opposition to the use of ethylene gas to ripen bananas, describing its use as a classic example of product manipulation for commerce purposes. He noted that his problem was not with the 5% non-organic ingredients allowed in processed products labeled organic but with the synthetic ingredients that might make up that 5 percent. In conclusion, he described the recent Public Voice national opinion survey entitled, "What Americans think about agrichemicals?"

(16) Joan Dine, Consumer (MH or TR)

(17) Eric Ardapple Kindberg (MH or TR)

(18) **Jay Feldman, National Coalition Against the Misuse of Chemicals (NCAMP).**

HANDOUT. Mr. Feldman emphasized that the Board needs to aggressively pursue consumer involvement as it develops its recommendations. He cited the results of a recent NCAMP survey, distributed to NCAMP newsletter subscribers. Mr. Feldman stressed his view that full disclosure be required on labels. The farm plan should indicate what inputs are in use and for what time period, and should assess whether inputs are basic or periodic and infrequent.

(19) Tom Harding, Agrisystems International, Inc. (MH or TR)

(20) John Clark, Roseland Farms, Cassopolis, Michigan (MH or TR)
Chairperson Michael Sligh called the National Organic Standards Board (NOSB) meeting to order at 1:00 p.m. and requested that the members of the Board introduce themselves.

Members in attendance were: Dean Eppley, Gary Osweiler, Robert Quinn, Jay Friedman, Don Kinsman, Gene Kahn, K. Chandler, Tom Stoneback, Merrill Clark, Margaret Clark, Rich Theuer, Michael Sligh, and Craig Weakley. Participating as the temporary certifying agent advisor to the NOSB was Robert Beauchemein.

Staff members present from USDA were: Julie Anton, Michael Hankin, Ted Rogers, and Hal Ricker.

The minutes from the July and September 1993 meetings were approved unanimously.

A written USDA update of activities was submitted by Ricker.

Ricker suggested that the Board make a resolution during this meeting to request additional Advisory Committee money from USDA to help cover the costs of the May 1994 meeting and possibly a meeting in September before the end of the 1994 fiscal year.

The Board held a discussion on the appointment of the permanent NOSB Certifier representative. Ricker explained that the OPFA prohibits a certifier representative appointment until after certifiers have been accredited. Robert Beauchemein, from OCIA, was appointed as "advisor" for this meeting and was invited to join Board members at the head table.

Chandler moved that we establish the certifier "advisor" position as a rotating position available to a different person for each meeting. Seconded by Margaret Clark. Passed by unanimous vote.

Margaret Clark moved to strike from the previously accepted resolution (from the Arkansas meeting) the provision that the Organic Certifiers Caucus (OCC) make the nomination for the certifier "advisor" position. Instead, the Accreditation committee would make a recommendation to the NOSB for filling this advisor position and the full board would discuss this and other nominations and make the final decision. Passed by unanimous vote.

Theuer moved to vote at this time on the May NOSB meeting location. Seconded. Motion failed.
A discussion of the process for moving from Draft Recommendations to Final Board Recommendations was initiated by Sligh. Sligh reviewed the current proposed recommendation development process and asked Quinn for clarification of Point 6 which involves receiving USDA comments prior to drafting of the Final Recommendations. Ricker reported that the "inter-agency task force" is scheduled to meet on 2/15/94 with comments back to USDA and the NOSB before 4/1/94. The recommendation process was amended to add step 8: NOSB reviews USDA proposed regulatory language and may submit comments and seek clarification on such language.

The discussion then shifted to the subject of whether minority views should be distributed to the public.

Friedman moved that minority views not be attached to NOSB Final Recommendations to USDA. Passed 9-y, 2-n, 1-a.

Chandler moved that minority views be allowed on all documents except Final Recommendations. Failed 5-y, 5-n, 2-a.

Weakley moved that minority positions be allowed on all documents except Full Board Draft Recommendations and Full Board Final Recommendations. Passed 11-y, 1-n.

Weakley moved that it be incumbent on the minority viewholders to submit minority positions in writing to the Committee chairperson. After the minority position is received by the chairperson, it will be included with the next mailing of the recommendation document to the public. Passed by unanimous vote.

Amendments to Board draft recommendations were discussed next. Friedman moved that written amendments from board members to board draft recommendations be considered at any time during full board meetings. Passed unanimously.

A clarification was sought of the format of the NOSB Final Recommendations to USDA. It was ascertained that USDA will not modify the actual Final NOSB Recommendation document in any way; also, USDA will attempt to provide the majority of its comments and concerns about any NOSB document prior to the vote by the NOSB on the Final Recommendation.

This segment of the meeting concluded with a discussion of the USDA projected timeline for implementation of the Organic Program. Ricker indicated that he thought the target dates as indicated on the handout were achievable.

Next on the agenda was the Genetic Engineering Discussion. Margaret Clark and Theuer discussed their document. Friedman moved that we recognize organisms and their products created by Recombinant DNA Technology as synthetic under the OFPA. Seconded. Passed by unanimous vote.
Friedman moved that no material or substance arising from rDNA Technology be allowed on the National List for 5 years. Seconded. Motion withdrawn by Friedman after several board members expressed concern that more debate and information was needed before a decision is adopted.

Sligh initiated a discussion on the NOSB By-Laws. Referencing page 6 of the 1/25/94 document faxed to all board members by Sligh, Sligh also distributed four new proposals for consideration: 1) A revised proposal for the continuing role of the NOSB; 2) Consideration of certain phase-in regulations with requirements for review and sunsets; 3) Procedures for handling mail Addressed to USDA; and 4) Evaluation Criteria for NOSB Recommendations.

The comments focused around the continuing role of the NOSB. Sligh outlined the various issues and actions that the NOSB must address after the Final Recommendations for program implementation are submitted to the Secretary. Several suggestions were made for modifications to the document and Sligh agreed to make such modifications via the task force.

Margaret Clark then talked about the Technical Advisory Panel (TAP) process and displayed a flow chart developed by the Executive Committee on how the TAP process should work and discussed how the Committees, the Full Board, the TAPs, and the USDA should be expected to work together.

Meeting adjourned at 5:35 p.m.

January 31, 1994

A recorder was not in attendance for the morning session which was the public input session.

The meeting was called to order at 9:00 a.m. by Sligh.
NOSB Members present: Eppley, Osweiler, Quinn, Taylor, Kinsman, Kahn, Stoneback, Merrill Clark, Margaret Clark, Theuer, Sligh, Weakley, Chandler;
Certifier Advisor present: Robert Beauchemein
USDA Staff present: Anton, Hankin, Ricker, Rogers

The public input session was held. (Notes on the presentations by the various speakers are available on file at USDA).

A recorder was present for the afternoon session which began with presentations by Assistant Secretary Pat Jensen and AMS Administrator Lon Hatamiya.

Mark Bradley then led an information seminar on the ISO 9000 program for the Board to consider in its recommendations on accreditation of certifying agencies.
Committee presentations

Friedman began the International Committee report with a discussion of the document "Proposed Rule Regarding Importation of Organic Agricultural Products."

Theuer moved that the International committee develop appropriate language for satisfying the equivalency requirement. Seconded. Motion was then withdrawn by Theuer after discussion.

Weakley then moved that the following language be substituted at Section IV, Importation B. and also at paragraphs A and C of this Section: "Products may enter the US if they bear the official shield, seal, or mark of a certification program or agent regulated by an ISO which is recognized by the Secretary, provided that, the ISO ensures observance of standards equivalent to those set forth in the US organic certification program. Seconded. Passed unanimously.

It was suggested that in the Section on "Exportation of Imported Products", paragraph A, line 28, the following words be deleted: "labeled as organically produced and handled." Accepted as an amendment by the Committee.

It was moved that in Section IV, Importation, paragraph C, that "or" be deleted and "and, if applicable" be inserted at both places where "or" appears. Seconded. Passed 10-y, 3-n.

Sligh moved to table further discussion of the document. Seconded. Failed.

Friedman moved to approve the document, as amended, as an NOSB Draft Recommendation. Seconded. Passed 10-y, 3-n.

Weakley moved that the Resolution entitled "USDA-IFOAM Accreditation Cooperation", submitted by the Accreditation Committee in a previous mailing for review by NOSB members, be adopted. Seconded. Passed by unanimous vote.

The meeting was adjourned.

February 1, 1994

NOSB Members present: Osweiler, Quinn, Taylor, Kahn, Chandler, Stoneback, Merrill Clark, Margaret Clark, Kinsman, Eppley, Theuer, Sligh, Weakley, Friedman;
Certifier Advisor Present: Robert Beauchemein
USDA Staff Present: Ricker, Hankin, Anton, Rogers

The meeting was called to order at 8:00 a.m.
Theuer began a discussion of the various Processing Committee issues. Topics intended to be discussed are: (1) Organic Food Labeling Standards; (2) National List for Processing and Handling; (3) Organic Good Manufacturing Practices; and (4) Organic Handling Plan.

Theuer began with an exploration of tailoring the definition of "synthetic," which will be critical to the discussion of National List issues, for processing, crops, and livestock standards. He discussed three examples of processing ingredients (citric acid, baking soda, and corn starch) which may or may not be synthetic based on how "synthetic" is defined. This topic will be discussed more extensively at the next NOSB meeting.

A straw vote on whether citric acid should be considered as synthetic based on the discussion at this meeting was held. Synthetic status: 11-y, 2-n, 1-a; still appropriate for foods labeled "organic" even though it may be synthetic: 12-y, 2-a.

Similar straw votes were held for baking soda [Synthetic status: 13-y, 1-a; appropriate for organic: unanimous] and for corn starch [Synthetic status: 11-y, 3-n; appropriate for organic: unanimous].

Theuer then switched to a discussion of the Committee labeling document "General Organic Food Labeling Standards."

Merrill Clark commented in regard to non-organic ingredients being allowed in organic foods, and described it as "counterproductive." This was followed by a motion to add at Section 2.B. paragraph 1.b.: 'the non-organic ingredients should be identified with the word "non-organic".' Seconded. Motion failed 1-y, 13-n.

The Processing Committee agreed to a suggested change at Section 2.B., paragraphs 2.a.(ii) and 2.b., to delete the phrase "non-synthetically processed."

The Committee also agreed to a suggested change on Page 0, paragraphs (b), (c), (d), and (e), to insert the word "total" in front of the word "percentage."

Kahn moved that the Board approve page 0 as amended and page 2 as amended. Seconded. Passed 13-y, 1-a.

Weakley moved that page 4 be approved as amended. Seconded. Passed 12-y, 1-a.

Eppley moved that lines 19 through 54 on page 5 be approved. Seconded. Failed 9-y, 5-n.

Quinn moved on a procedural matter that 9 votes out of 14 members 

5 2/94 DC NOSB mtg.
in attendance should constitute a 2/3 majority vote for this meeting and should be sufficient for a motion to pass. Seconded. Failed 5-y, 4-n, 1-a.

Theuer began a discussion of the composition sections of the labeling document. A lengthy discussion ensued on the issue of "availability of organic ingredients." Kinsman moved that the Processing Committee include in the OHP a provision for review between the certifier and the handler as to the availability of an organic source for any non-organic ingredient of agricultural origin used in organically labeled foods. Passed by unanimous vote.

Theuer moved that page 1 of labeling document be approved. Seconded. Passed 10-y, 3-n, 1-a.

A break from the Committee presentation was approved so that the Board could listen to remarks from Deputy Secretary Richard Rominger.

Deputy Secretary Rominger

USDA is committed to implementation of the organic program. Budgetary appropriations are tight. USDA will work closely with the NOSB to get appropriate recommendations in place because Secretary Espy will have to defend the program once it is established. USDA will consider any additional recommendations that NOSB wishes to submit relating to how organic production relates to program policy and work of other USDA divisions, such as crop insurance for organic farmers subjected to accidental spray drift.

Processing Committee (continued)

Theuer reopened the discussion with page 3 of the labeling document. Theuer moved that the board adopt page 3. Seconded. Passed 13-y, 0-n.

Theuer then discussed page 5 of the labeling document. It was moved that this page of the document be sent back to the Processing Committee for further development. Seconded. Passed 12-y, 2-n.

Procedural

At this time, the NOSB conducted a vote on the location and dates of the next NOSB meeting. The two choices were Santa Fe, New Mexico and Fresno, California. Eight members voted for Santa Fe and four members voted for Fresno. The next meeting will be held in Santa Fe, New Mexico during the first week of June. Exact location and dates will be determined later.
Livestock Committee

Merrill began discussion of the Livestock Committee documents.

Use of synthetic antibiotics in organic Livestock production:

Kahn and Chandler presented their minority view on synthetic antibiotic use. The minority opinion presents a less restrictive attitude toward the use of antibiotics.

Merrill Clark moved to adopt the original, majority-view Committee document on antibiotics as a Board Draft Recommendation. Seconded. Failed 7-y, 5-n, 2-a.

Use of synthetic parasiticides in organic Livestock production:

Friedman opened discussion of this document and reviewed the Committee position as written.

Kahn presented the minority view on synthetic parasiticide use which presented a less restrictive attitude toward the practice of administering parasiticides to organic livestock.

Merrill Clark moved that the original, majority-view Committee document on parasiticides be approved as a Board Draft Recommendation. Seconded. Failed 3-y, 6-n, 5-a.

Quinn moved that the livestock committee be instructed by the NOSB to consider the possibility of a phase-in time for implementation of antibiotic and parasiticide standards. Seconded. Passed unanimously.

Livestock Feed

Quinn began discussion of the livestock feed standard document. He indicated that the committee had amended the document as follows:

B. Feed additives fed to livestock shall meet the following requirements:

1. Natural feed additives shall be from any source, provided the additive is not classified as a Prohibited Natural on the National List;
2. Synthetic feed additives shall be materials which are classified as Allowed Synthetics on the National List.

D. Added as the last sentence to D. "Efforts to locate feed which have been produced without use of prohibited substances shall be documented."

Theuer moved that the definition of "feed" in the livestock
committee definitions document be amended to include the phrase "may include bedding." Seconded. Passed by unanimous vote.

Chandler moved to delete the phrase "before conventional sources are used." Seconded. Passed 9-y, 1-n, 2-a.

Weakley moved that we accept the feed standard document as amended. Seconded. Passed by unanimous vote.

**Organic Livestock Healthcare Practices**

Kinsman initiated a discussion of the proposed revisions to this document.

Theuer moved that in the first sentence of paragraph 3, "minimizes" should be replaced by "limits" and "maximizes" should be replaced by "promotes." Seconded. Passed 9-y, 1-a.

Kahn moved that "the conduction of" be deleted from (3)(c)(1). Seconded. Passed by unanimous vote.

Quinn moved that the document be accepted as a Board Draft Recommendation as amended. Seconded. Passed 10-y, 2-a.

**Crops Committee**

Kahn opened discussion of Committee proposed amendments to current crops Board Draft recommendation documents.

**Split Operations**

Eppley moved that at line 82 of the Split Operations document: "requires producers to" should be changed to "requests that producers." Seconded. Passed 10-y, 1-n.

**Residue Testing**

Sligh moved that in the Residue Testing document, line 294, the following phrase should be added after "Act": "Strict confidentiality will be maintained by all parties notified of a drift or misapplication incident during the investigation."

**Planting Stock**

Quinn moved that in the Planting Stock document, line 196, the following phrase should be inserted between "available." and "Plastic": "Pelletized seed is allowed unless it contains prohibited substances." Passed 11-y, 1-a.

Other editorial motions and revisions were discussed and accepted and incorporated into documents which are contained in the December 1993 "Crops Committee Comprehensive Document".

8 2/94 DC NOSB mtg.
Small Farmer Exemption

Kahn presented the Small Farmer Exemption document that had been greatly revised after public input. Quinn moved that the recordkeeping requirement of 5 years be changed to 3 years (line 85). Seconded. Passed unanimously.

Kahn moved that line 97 of Small Farmer Exemption document be changed by deleting "processors" and inserting "certified handlers." Seconded. Passed by unanimous vote.

Kahn moved that the following be added at line 80: "Declaration form must be completed annually." Seconded. Passed 11-y, 2-n.

Chandler moved that the word "ANNUAL" be inserted in front of the word "DECLARATION" at line 108. Passed 10-y, 2-a.

Quinn moved that the document be approved as amended. Seconded. Passed 9-y, 3-n, 1-a.

Materials Committee

The Materials Committee discussion began with Margaret Clark describing the flow chart for the TAP process.

Weakley moved that the flow chart of the TAP process be adopted. Seconded. Passed by unanimous vote.

Sligh recommended that some key categories for the TAP experts to be concerned with when providing information to the NOSB regarding reviewed materials are: 1) how the material is produced and manufactured and what inputs are used; 2) what is the historical use or prohibition of the material in organic production or handling; 3) is the material allowed or prohibited by domestic and international certification agents or programs; 4) information related to the evaluation criteria outlined in OFPA Sections 2118 and 2119; 5) government registration numbers and literature citations that support the information submitted. Weakley moved that Sligh's recommendation be adopted by the board. Seconded. Passed unanimously.

Taylor suggested that the NOSB create a task force to develop the petition process as stated in the OFPA Section 2119 (n) and to develop the process for satisfying the OFPA requirement in 2119 (1) (2). Sligh moved that we charge the Materials Committee with oversight of these tasks. Failed 7-y, 5-n.

Kahn moved to disband the Materials Committee and to charge the Livestock, Crops, Processing, and International Committees with oversight for satisfying the two tasks outlined above. Seconded. Passed by unanimous vote.
Kahn opened discussion of the Crops Committee List of Materials to be considered for inclusion on the National List and indicated that the intent of the Crops Committee is to get NOSB approval to send these materials to the TAP for information gathering as part of the formal review process and to send the document out for widespread public comment.

Taylor suggested that the Crops Committee submit documentation to the TAP that was used by the Committee in drawing conclusions on materials included on its List so that the TAP process could be expedited.

Merrill Clark moved that we send the entire Crops Materials List to the TAP. Seconded. Motion amended to specify that the list of Allowed Naturals be evaluated only for determination of natural vs. synthetic in order to limit the work of the TAP. Passed 10-y, 2-n.

After a brief discussion by Theuer of the Processing Committee's list of materials to be considered for the National List, Weakley moved that the List, excluding the category of non-synthetic, non-organic agricultural products, be submitted to the TAP as part of the formal review process. Seconded. Passed unanimously.

Because of the late hour and without discussion of the Livestock Committee's list of materials to be considered for the National List, Sligh moved that the list be submitted to the TAP as part of the formal review process. Second. Passed unanimously.

Meeting adjourned by Sligh at 10:15 p.m.

February 2, 1994

Sligh opened the meeting at 8:02 a.m.

NOSB Members present: Margaret Clark, Sligh, Theuer, Quinn, Taylor, Osweiler, Kahn, Chandler, Stoneback, Kinsman, Eppley, Merrill Clark, Craig Weakley;
Certifier Advisor present: Robert Beauchemein
USDA Staff present: Hankin, Rogers, Anton

Accreditation Committee

Margaret Clark led a discussion of the Accreditation Program issues.

Margaret explained the Committee recommended changes to Draft #9 as contained in the previously mailed Committee document, "Proposed Revisions to Accreditation Draft Recommendation Version 9.0." Sligh moved that all changes discussed and written in the proposed revisions document through the section on Transparency on page one be adopted. Seconded. Passed by unanimous vote.
Sligh moved that we adopt all changes on the proposed revisions document regarding Producer/Handler Records. Seconded. Passed by unanimous vote.

Sligh moved that we adopt Section 2.A. on the proposed revisions document as amended. Seconded. Passed by unanimous vote.

Quinn moved that section 2.B. of the proposed revisions document be adopted as amended. Second. Passed by unanimous vote.

Sligh moved that section 3 of the proposed revisions document be adopted. Seconded. Passed by unanimous vote.

Quinn moved that the change suggested for the "conflict of interest" section be adopted. Seconded. Passed 12-y, 1-n.

Sligh moved that we adopt sections #5, 6, 16, 17, and 18 of the proposed revisions document. Seconded. Passed by unanimous vote.

Sligh discussed the Draft Appeals Section Insert document dated 1/19/94. Quinn moved to adopt the Draft Appeals Section Insert as part of the Accreditation Draft Recommendation. Seconded. Passed by unanimous vote.

Julie Anton discussed the Fee Structure Model for Accreditation document dated 1/18/94. The NOSB provided some comments on the different alternatives and then requested that USDA develop and clarify the positions.

Margaret Clark discussed a flow chart of the Accreditation Program and focused on the composition of the Evaluation team and of the Peer Review Panel. She asked each Board member for comments on the current approach being taken by the committee.

Quinn began discussion of additions to Accreditation Draft Recommendation #9 contained in the International Committee Recommendation to Full Board, page 4. The first additions would be inserted at line 14 on page 5 of the Accreditation Draft Recommendation #9. The second additions would be inserted on page 30, lines 117-118, of the Accreditation Draft Recommendation #9.

Kinsman moved that the proposed additions be adopted, as amended, as part of the Accreditation Draft Recommendation. Seconded. Passed 11-y, 1-n.

Administrative

Quinn moved that the cycle for the certifier advisor appointment to the NOSB begin at the end of a full Board meeting and end after the following full Board meeting. Seconded. Passed by unanimous vote.

Sligh began discussion of his resolution regarding the receipt of
mail by USDA or NOSB members and actions designed to promote greater accountability. It was moved and seconded that this resolution be adopted with a paragraph 3 added. Passed by unanimous vote.

Sligh began discussion of his resolution regarding the continuing role of the NOSB. Sligh will revise this resolution and submit it for a vote at the June meeting.

Sligh began discussion about the length and format of the June meeting. Quinn suggested that we use the same format as used at Rodale where each Committee had 2 presentations on different dates in order to provide time to re-work critical parts of documents.

Kahn moved that all minority positions presented during discussion of Board Draft Recommendations contain complete alternate proposal language. Seconded. Passed 10-y, 1-n.

Weakley moved that as of March 1, 1994, all Committee chairpersons should submit a list of the current versions of all Committee documents to him for circulation to all NOSB members. Seconded. Passed by unanimous vote.

Processing Committee (continued)

Theuer reviewed the postponed amendments to the Food Labeling standards document section regarding the removal of the certification requirement for processors of the category "foods purporting to contain organic ingredients." Theuer then moved that they be adopted by the Board. Seconded. Passed by unanimous vote.

Weakley briefly introduced the Organic Good Manufacturing Practices Recommendation to the Full Board. He indicated that the document will be mailed out for widespread public input and will be brought to the Board for a vote at the June meeting.

Sligh asked Board members to randomly offer at this time suggestions on issues related to "organic" that should be included in the 1995 Farm Bill. A list was compiled.

Following this, the Washington, DC, NOSB meeting was adjourned at noon.
May 31, 1994

The initial session of the National Organic Standards Board (NOSB) meeting was called to order at 4:35 pm by Chairperson Michael Sligh.

Members in attendance were: Robert Quinn, Jay Friedman, Gene Kahn, Nancy Taylor, K. Chandler, Tom Stoneback, Merrill Clark, Margaret Clark, Rich Theuer, Michael Sligh, and Craig Weakley. Participating as the temporary certifying agent advisor to the NOSB was Victoria Smith from the New Hampshire Department of Agriculture.

Staff members present from USDA were: Harold Ricker, Julie Anton, Michael Hankin, Ted Rogers, and Michael Johnson.

Chairperson Sligh defined the objectives of this meeting as stated in the agenda for May 31 (attached).

Mr. Theuer proposed that the minutes of the last meeting, held in Washington, DC in February 1994, be approved. Mr. Kahn seconded the motion. The minutes were unanimously approved with the following corrections:

1. K. Chandler will be added to the list of attendees for all sessions;
2. Mr. Weakley will be added to the list of attendees for February 2;
3. Merrill Clark's comments during the processing session as regarding the use of non-organic ingredients in organic foods and about the determination of availability of organic ingredients are to be added;
4. On page 5, clarify that the unanimous vote was in favor of the appropriateness for the particular synthetics in organic production;
5. On page 8, a date will be provided for the Crops Comprehensive Document;
and
6. On page 10, fourth paragraph, add "non-organic" after "non-synthetic."

Theuer motioned and Kahn seconded to approve the minutes. Unanimously approved with 2 abstentions.

Eileen Stommes, Deputy Director of AMS Transportation and Marketing Division, formally greeted the Board and indicated the importance of this meeting as a culmination of 2 years work and stated that final NOSB recommendations should be made to USDA with the understanding that the program will continue to evolve after implementation. She emphasized the increased public demand for organic products,
increased international attention, and support from the present Administration as
contributing to the spotlight being shined on the Organic Program.

Margaret Clark introduced Victoria Smith as the attending temporary certifier
representative to the NOSB meeting. Ms. Smith said she will attempt to represent both
the State of New Hampshire program and the privately operating New England
certifiers.

Don Kinsman and Dean Eppley joined the meeting. Ricker reported that Gary Osweiler
regretfully will not be able to attend any of the sessions of the Santa Fe meeting.

Jay Friedman officially welcomed the NOSB, USDA representatives, and attendees to
New Mexico and reiterated his expectations that the Board would aggressively tackle the
agenda for the week and produce Board Final Recommendations.

Hal Ricker gave the USDA report and distributed three handouts (attached):
1. Budget calculations for the NOSB for FY 1994;
2. Estimated timeline for standards and regulatory program development; and
3. USDA staffing report.

The NOSB has an estimated balance of $1,500 for FY 1994; therefore, because a Board
meeting costs approximately $15,000, the next NOSB meeting will not be held until FY
1995.

Regarding staffing, Ricker explained that we do need a larger number of staff persons at
this time to develop and establish the Program. Margaret Clark announced that the
NOSB would be recommending that the Accreditation portion of the USDA program be
supported by user fees, but that all other staff and administrative expenses should be
covered by appropriated fees.

Ricker then explained the appointment procedure for NOSB positions that are due to
expire in 1995. He expects that the notice announcing the initiation of the process would
be published in the Federal Register during June or July 1994.

Ricker reported that Gary Osweiler has previously submitted a letter notifying USDA
that he will not apply for reappointment. Theuer stated that he will relinquish his
position and Taylor suggested that she is not opposed to serving another term, but has
decided instead that she would like another farmer to participate in her place. Margaret
Clark will be seeking reappointment. Bob Quinn, whose term does not expire, has
requested that his appointment be terminated at the same time as Osweiler, Theuer and
Taylor and he will submit this request in writing.

Following a general discussion on the potential locations of Texas, California, and North
Carolina for the next NOSB meeting, Kahn motioned that California be selected.
Weakley seconded. Quinn amended the motion to include the Southeast as the next
meeting site following California. VOTE: Yes - 6. Opposed - 4. Motion failed. Taylor

The members then clarified that portions of an entire draft recommendation document may be moved forward as Final recommendations provided that the meaning and intent was not compromised. Also agreed upon was that Comprehensive documents should be considered as separate documents. Quinn motioned and Friedman seconded that abstentions would not count as votes cast during the voting process and referred to the OFPA language that requires 2/3 of the votes cast to achieve approval of a motion. VOTE: Yes - 12. Abstain - 1. Motion passed.

Discussing the development of a definition of "organic," Ricker declared that USDA does need to have both a working definition and a short publishable definition of the term to facilitate public and government edification. The Board accepted that Chandler would coordinate the accumulation of NOSB documents on the organic definition and submit them to USDA for Staff members to use in developing a definition of organic to be reviewed by NOSB members.

Margaret Clark moved and Taylor seconded to adjourn at 7:00 pm. Unanimously agreed.

June 1, 1994

Members in attendance were: Don Kinsman, Dean Eppley, Nancy Taylor, Robert Quinn, Gene Kahn, K. Chandler, Tom Stoneback, Merrill Clark, Margaret Clark, Rich Theuer, Michael Sligh, Craig Weakley, and Victoria Smith from the New Hampshire Department of Agriculture. Jay Friedman joined the meeting late.

Staff members present from USDA were: Harold Ricker, Julie Anton, Michael Hankin, Ted Rogers, and Michael Johnson.

CROPS COMMITTEE

Chairperson Kahn presented the Crop Standards Committee comprehensive document to the full Board, stating the Committee's intention to have all but the section on botanical pesticides accepted by the Board as Final Recommendations at this meeting. He noted that certain of the issues pertaining to crop standards brought up by Board members at previous meetings had been incorporated into a draft list (attached) for incorporation into a letter to the Secretary requesting that certain existing USDA programs be modified to assist and protect organic producers. Also noted was the fact that the Crops Committee had developed draft greenhouse and mushroom production standards, which
would be brought forward, time permitting.

With reference to the organic farm plan in the comprehensive document, Kahn clarified that the Livestock Committee would be presenting a section pertaining to farm plan requirements for livestock producers during its presentation. This section would then be merged with the crops document to create a complete crops-livestock farm plan recommendation.

First addressing the draft letter to accompany Board recommendations to the Secretary, Kahn described the four considerations listed which were drawn from notes of conference calls and minutes of meetings. He suggested that the Livestock and Processing Committees add issues, if so inclined. Kahn described the lack of inclusion in the Final Recommendations of these four issues as "deficiencies in the Board document about to be voted upon" and affirmed that they should be addressed somewhere in the Board presentation to the Secretary. Sligh expressed support for the approach of a letter; Quinn stated his concern that these issues would "fall out" during the rule-writing process at USDA, and would not be sufficiently considered by the Secretary. At the conclusion of this discussion, Kahn asked that additional concerns be directed to the Crops Committee.

The Board then turned to a discussion of the Spray Drift and Misapplication Policy section of the comprehensive document, starting with the additional language recommended by the Committee on page 3, line 126: "It is recommended that this notification be in writing in order to facilitate any potential legal claims on behalf of the certified organic producer."

Margaret Clark motioned that this sentence be added, and with a second from Sligh, the language was adopted by a unanimous VOTE. Passed.

Taylor asked, with reference to line 63, the meaning of "excluding livestock" (OFPA Sec 2105). The Board agreed to note this lack of clarity for the record, and return to it at a later point.

Sligh moved that the Spray Drift and Misapplication Policy be adopted as a Board Final Recommendation, second from Dean Eppley. VOTE: Yes - unanimous. Passed.

The Small Farmer Exemption (Section 2B of the comprehensive document) yielded greater discussion. Kahn stated that the perspectives presented in this section reflect the Committee's concern that the Program not disproportionately burden the small producer. Quinn presented the additional language of lines 241-243: "There shall be no mandatory filing requirements for the above small farmer exemption provisions. All required information must be on file and available on the premises of the exempted farmer."
Clark pointed out that Texas has a mandatory registration form for small producers. Quinn responded that the intent of the language is not to exclude States from issuing additional requirements with respect to this area, and referred to lines 245-246 which clearly state this. Theuer asked for an explanation of the applicability of the small farmer provisions when a grower markets only within a State and stated his understanding that OFPA only applies to interstate commerce and that there is no Federal jurisdiction in intra-state matters. Ricker interjected that if this were found to be true, the Board could amend their recommendation accordingly at a later date.

Smith commented that without mandatory filing requirements, the producers would probably not bother to create files and she asked how producers would be informed of the small farmer requirements. Quinn noted the Committee's desire to eliminate unnecessary layers of bureaucracy. It was the opinion of Smith that the burden would fall on the private certifying agencies.

Kahn stated that it would not be practical to enforce mandatory filing requirements, and that the recommendations were the best compromise between organic integrity and small producer burden. Weakley moved that the language of lines 241-243 be adopted, and Clark seconded the motion. The language passed with a VOTE of: Yes - 8. Opposed - 2. Abstain - 3. Passed.

Merrill Clark turned the Board toward a discussion of lines 232-233, regarding the allowance for uncertified small farmers to sell at retail outlets citing her concern for consumer confusion. Kahn responded that the Committee had discussed this issue at length. He described the way his company, Cascadian Farm, got off the ground through direct sales to the Rockport Country Store, a place where tourists shopped for gifts. Preventing small producers from taking advantage of opportunities to get started would be unjust. Sligh expressed his agreement, and suggested in a motion that processors be included on line 214; Margaret Clark seconded the motion, and the Board voted to insert the term, "or handled" between "produced" and "are" on line 214. VOTE: Yes - unanimous. Passed.

With reference to the declaration form on page 7, Theuer suggested that the words "produce and" and "or label" be deleted, and that the words "or handled" be added after the first word "produced" appearing on that line. Kahn moved that this amendment be adopted and Theuer seconded. VOTE: Yes - unanimous. Passed.

Margaret Clark moved to adopt the entire section as amended; Kahn seconded the motion, and a discussion ensued. Taylor noted the double negative appearing in OFPA Section 2106(d), and expressed concern for the confusion it may cause those impacted by the small farmer exemption.

In a discussion of enforcement of the small farmer provisions, Weakley pointed out that enforcement would come from activities in the marketplace, not from USDA, which
would be inefficient. Merrill Clark stated that consumers will expect certification. Friedman argued that lines 223-227 are really certification requirements; Weakley retorted by saying that such requirements are standards by which small farmers must conduct themselves in order to market organic products. Anton described her discussions with retailers, most of whom indicated that uncertified produce would not be sold as organic, and she interpreted this as an indication that the marketplace would respond to consumer preferences.

It was motioned and seconded that the Small Farmer Exemption be adopted as amended. The section was adopted as a final Board recommendation by a VOTE of: Yes - 9. Opposed - 3. Abstain - 1. Passed.

Section 2C of the comprehensive document, entitled "Residue Testing" was brought forward by Kahn. In response to an inquiry by Hankin about the residue testing allowance of 5 percent of EPA tolerance in other sections of the comprehensive document, Weakley stated that the reference to 5 percent had appeared in the original drafts of the drift and emergency spray sections, but the Board had not accepted that allowance in this document.

Merrill Clark indicated her preference to change "may" to "shall" on line 474. Kahn responded by saying that the Committee had felt strongly that mandatory testing places too great a burden on growers. Theuer stated that because one may not find a drift residue after rainfall, line 470 should be placed below lines 474-475. Weakley explained that if a crop is directly hit by a drifted substance it could not be sold as organic, but the residue testing could be necessary because the next crop grown on that land could be sold as organic if stated procedural requirements were satisfied.

Friedman asked if private certifying agents would be involved in sampling, in reference to line 447. Weakley stated that State and Federal programs would be relied upon to incorporate organic growers in their sampling practices. Sligh noted that North Carolina had indicated a willingness to do this; Anton described the research conducted during the development of this document that confirmed that the Federal sampling procedures were possible. Friedman expressed concern for the cost burden such activities could place on States.

Kahn described residue testing as a tool by which certifying agencies could evaluate risk and provide information to growers. As an example, Oregon Tilth director Yvonne Frost stated that for certain crops, soil testing can be made mandatory by the certifying agent. In other words, the need for residue testing varies by region and is producer and crop specific.

Hankin commented that the response to the 5 percent of EPA tolerance provision had not yet been received from EPA. (These comments were received and distributed later in the meeting). Theuer stated his belief that testing to 5-10% of EPA tolerance was
entirely within the realm of possibility.

Friedman moved to delete lines 394-404, based on his opinion that "organic" is a product statement according to OFPA Section 2112(c)(1); Theuer seconded his motion. Weakley pointed out that references to 5-10% of EPA tolerance are made in numerous places in the Senate Agriculture Committee report. Margaret called the question. VOTE: Yes - 3. Opposed - 9. Abstain - 1. Failed.

Friedman introduced his next proposal for amendment, moving that the words, "and upon written complaint" be inserted at the end of line 472; Chandler seconded the motion. In discussion, Quinn argued that requiring written complaints is burdensome to certifying agents. Smith agreed with Friedman, stating that the inspection reporting requirements incorporate written complaints. Chandler expressed his interest in requiring that complaints be in writing, because "inspectors can run vendettas against producers, and run up fees." VOTE: Yes - 4. Opposed - 7. Failed.

Theuer offered a compromise, moving that the term "written" be inserted before "complaints" on line 484; Friedman seconded the motion. VOTE: Yes - unanimous. Passed.

Next, Margaret Clark moved that the entire section on residue testing be adopted as a final recommendation; Eppley seconded the motion, and discussion ensued. Theuer suggested that on line 474 the term "sold" should be changed to "produced" or "grown," since the issue is preharvest residue testing. Sligh referred to page 301 of the Senate Committee Report. Clark argued that the recommendations not become an attempt to design residue testing programs for certifying Agents.

Weakley noted that lines 460-465 are meant to serve as broad guidelines in the establishment of local-level residue testing programs.

Merrill Clark moved to strike lines 420-421, and Friedman seconded, with an interest in letting States set a less than 1 percent of EPA tolerance level; VOTE: Yes - 4. Opposed - 8. Abstain - 1. Failed.

Theuer motioned that the words "to be" be inserted before "sold" on lines 467 and 474; the motion was seconded and approved by a VOTE of: Yes - 12. Opposed - 1. Passed.

The previous motion to adopt the entire residue testing section as amended as a Final Board Recommendation was called to question and carried by a VOTE of: Yes - 12. Opposed - 1. Passed.
In conclusion of this session of the full Board, Kahn asked that Board members interested in amending other sections of the comprehensive document submit amendments in writing by the Friday afternoon meeting. The Board members were also requested to review the proposed greenhouse and mushroom standards.

PROCESSING COMMITTEE

The first document to be discussed by the Processing Committee was the Organic Handling Plan which was presented for adoption as a Board Final Recommendation. Weakley led the discussion and opened with a review of public response letters to the document. He identified the 3 major categories of responses as requests to:

1. Remove the waste management section;
2. Define more clearly the types of handlers; and
3. Create language that is more inclusive of livestock.

He pointed out that lines 41-50 of the 9/28/93 proposed final recommendation (Ted Rogers distribution) were new language that enumerated the various types of affected handlers on the basis of transfer of legal title. Margaret Clark explained that the entity holding the legal title is responsible for the inspection and certification of all other persons or businesses handling the product until such time as the product changes legal title again. She clarified that all handlers would either be certified themselves or have their co-handlers inspected as part of the original handler’s certification process.

Kinsman alerted the Board that Attachment 1 should be modified to include language for handlers of livestock products and he offered to develop language for this area before the next session. Sligh expressed the concerns that lighter-volume handlers might have with the language at line 60 that requires UPS and airlines to sign a document acknowledging that organic handling practices would be adhered to during transit to ensure that integrity is maintained.

Friedman offered the following amendment at line 59 after the word "product": Add "and exposure to possible federal civil penalties for violation thereof." Quinn seconded. VOTE: Yes - 10. Abstain - 3. Passed. Quinn offered to amend lines 413-414 and 419-420 as follows and Kinsman seconded: Delete "who does not take...certified" and replace with "who does take legal title to organic products does need to be certified". VOTE: Yes - 12. Abstain - 1. Passed.

Friedman made the motion that at lines 47-48, and elsewhere in the document, the reference to the word "HACCP" be deleted and replaced with "organic integrity assurance system." Taylor seconded. VOTE: Yes - unanimous. Passed.

Margaret Clark moved, seconded by Kahn, that at line 47 in the commentary, the word "do" be replaced with "may" and add: "The handler who holds legal title and is certified must include under the certification all facilities which receive, handle or store the product. All requirements for the protection of organic integrity must be observed and facilities inspected, where applicable." VOTE: Yes - 10. Opposed - 3. Passed.
Friedman commented that this was legally possible only if the persons are agents and proposed replacing at line 54 the phrase "all known individuals or businesses" with the word "agents." Merrill Clark seconded. VOTE: Yes - 4. Opposed - 6. Abstain - 2. Failed. Margaret Clark moved, seconded by Quinn, that at line 486 and at other places as applicable, that "co-processor" be changed to read "co-processor/co-packer." VOTE: Yes - 9. Abstain - 3. Passed.

Theuer motioned, seconded by Friedman, that the category of "waste management" be removed in entirety from the document. Many NOSB members stated a preference to maintain the section in the document because it is a goal of organic manufacturing, while understanding that it should not be a mandatory section of the handling plan. Merrill Clark emphasized that waste management is an environmental concern and is necessary to prevent accidental occurrences of habitat destruction and as such belongs within the context of the Organic Plan. VOTE: Yes - 2. Opposed - 9. Failed.

Kinsman moved and Quinn seconded that at lines 125 and 129 "processing" be changed to "packing." VOTE: Yes - 11. Abstain - 2. Passed.

Friedman moved, seconded by Chandler, that at line 69 of the plan, add after "and", "exposure to possible Federal civil penalties for violation thereof and...". VOTE: Yes - 10. Abstain - 2. Passed.

Friedman moved and Kinsman seconded that the document be tabled and sent back to Committee to make the technical corrections. VOTE: Yes - Unanimous.

The meeting adjourned for lunch. The public input session held after lunch took up the remainder of the day's planned agenda.

June 2, 1994

Members in attendance were: Robert Quinn, Gene Kahn, Nancy Taylor, Don Kinsman, Dean Eppley, K. Chandler, Tom Stoneback, Merrill Clark, Margaret Clark, Rich Theuer, Michael Sligh, Craig Weakley, Jay Friedman, and Victoria Smith from the New Hampshire Department of Agriculture.

Staff members present from USDA were: Harold Ricker, Julie Anton, Michael Hankin, Ted Rogers, and Michael Johnson.

The meeting began with an announcement of the various Committee caucus sessions planned during the week to resolve issues arising from discussion during the Full Board sessions. Ricker suggested again that the Board focus on the major concepts of the Draft Recommendations under consideration in order to actually pass most of the documents through as final recommendations.
Kinsman began the presentation with the Livestock Sources document. He brought to the Board a Committee recommendation that at the end of line 256, a new sentence be added that reads: "If such breeder stock is eventually sold for slaughter, it will not be considered organic." Taylor motioned, seconded by Sligh, that line 256 contain the reference to the restricted allowable use of antibiotics in breeder stock as stated in the Livestock Committee Recommendation on Antibiotics. This reference reads as follows:

"Organic breeder stock may receive application of synthetic antibiotic in the event of a healthcare emergency. In such instance, the progeny may be sold or labeled as organically produced provided that the application to the breeder stock does not occur in the last third of gestation or while nursing the progeny, and the application is prescribed by a licensed veterinarian. The organic breeder stock, having received an application of synthetic antibiotics, is not disqualified from having its future progeny sold or labeled as organic." VOTE: Yes - 8. Opposed - 4. Passed.

Quinn made a motion, second by Merrill Clark, to amend the phrase to be added at the end of line 256 to read, "If such breeder stock is eventually sold for slaughter, it will not be considered organic unless if meets the requirements for slaughter stock." VOTE: Yes - 11. Opposed - 1. Passed. VOTE to approve the breeder stock language as amended in the livestock source document: Yes - 9. Opposed - 1. Absent - 2. Passed.

Kahn moved and seconded by Stoneback that at line 242, the word "shall" be changed to "may." After discussion, Kahn withdrew his motion in favor of Weakley's motion, second by Kahn, that lines 242-244 be deleted and replaced with, "The USDA accredited certifying agents shall include a section in the Organic Farm Plan which requests that producers describe their current efforts and existing obstacles toward conversion." This would be consistent with the Crops Farm Plan recommendation. VOTE: Yes - 10. Opposed - 2. Abstain - 1. Passed.

Kahn moved that at lines 267-269 regarding certified feeds for replacement dairy stock, that the 12 month period be changed to 3 months. He cited WSU research that showed all feed is gone from the rumen within 24 hours and stated that 12 months is a barrier to growth for the organic dairy industry. VOTE: Yes - 4. Opposed - 7. Abstain - 2. Failed. Ricker stated that Kahn could include his concerns in a letter to Secretary Espy. Quinn moved and Theuer seconded that the Livestock Sources document be accepted as a Board Final Recommendation. VOTE: Yes - 8. Opposed - 4. Abstain - 1. Passed.

The next document discussed was the Livestock Feed Standard. Quinn moved, seconded by Chandler, to approve the entire document. During discussion, Friedman moved and Theuer seconded to delete 100% in lines 278 and 281 related to requiring 100% organically produced feed, because of the use of non-organic supplements in livestock feed. VOTE: Yes - unanimous. Passed. VOTE to accept Livestock Feed Standard as Board Final Recommendation: Yes - unanimous. Passed.
The next document discussed was the Feed Availability Emergency Provision which accompanies the Feed Document. Friedman moved to delete lines 555-557. No second. Vickie Smith received clarification that the intent of this document is that the herd animals remain marketable as organic in cases where any emergency feed use category is utilized by the producer." Weakley moved and seconded by Margaret Clark that at line 550, "possible" be deleted and "reasonable" be inserted before "effort." VOTE: Yes - unanimous. Passed. Sligh moved, seconded by Margaret Clark, to accept the Feed Availability Emergency Provision as a Board Final Recommendation. VOTE: Yes - Unanimous. Passed.

The Health care Practices document was next on the agenda. Theuer made a motion, seconded by Margaret Clark, that "With the exception of poultry," be added at the beginning of line 343. Sligh expressed concern about a blanket exemption for poultry. Several attendees stated that poultry could be raised without the exemption for confinement. Kinsman stated that confinement need not be inhumane and inefficient and actually may be helpful in certain situations when carefully managed and approved by the certifying agency. Friedman made a friendly amendment, second by Taylor, to delete lines 343-349 and substitute with species specific standards to be developed later. Theuer and Chandler expressed concerns that such specific standards could border on micro-managing of producers' operations. VOTE on Friedman's amendment: Yes - 4. Opposed - 8. Failed. VOTE on Theuer's original motion: Yes - 6. Opposed - 7. Failed. Weakley moved, Quinn seconded, to delete lines 343-349 and refer the confinement issue back to the Livestock Committee. VOTE: Yes - 7. Opposed - 5. Absent - 1. Failed. Kahn moved, Taylor second, to add at line 344 following "prohibited", "Furthermore, seasonal access to pasture for dairy animals is required."

Hankin queried whether certain regions of the country might then be excluded from dairy production and Sligh replied affirmatively. VOTE: Yes - 3. Opposed - 9. Failed. Theuer moved that lines 299-349 be approved without amendment. Merrill Clark seconded. VOTE: Yes - 3. Opposed - 7. Failed. Meeting adjourned for lunch. This document will be discussed later at this meeting.

MATERIALS DISCUSSION
Reconvening at 1:00 pm, Zea Sonnabend and John Brown, advisors to NOSB and USDA for the review of materials for placement on the National List, began a review of their work and the status of the materials review process. They first reviewed their job descriptions and division of duties. Next, they updated the Board on the recruiting efforts to obtain Technical Advisory Panel (TAP) experts and noted that about 17 persons have replied but that many more are needed. After discussion of whether persons with vested interests should be permitted to participate as TAP members, and after several NOSB members stated a desire to develop a balanced approach to TAP participation, Sligh motioned and Margaret Clark seconded to require a form for disclosure of conflict of interest from all TAP members. VOTE: Yes - 4. Opposed - 8. Failed.
Zea requested NOSB members to help solicit persons to assist with the materials review process. Her next monthly written progress report will address the TAP areas still needing volunteers; USDA will then initiate a recruiting effort to utilize members of government agencies to complete the TAP roster.

Next discussed by Sonnabend was the petition process draft that she had prepared. Theuer moved, seconded by Friedman, that the process be established as follows:

1. Petition to USDA;
2. USDA evaluates completeness;
3. Petition is sent from USDA to TAP coordinators;
4. Petition is forwarded to TAP experts;
5. Researched information is returned to Board for recommendation to USDA.

Weakley offered an amendment that the natural/synthetic determination should be made before it enters into the TAP review. After discussion, Theuer withdrew his motion and the petition process issue will be discussed at a later session during the week.

Zea then reviewed the petition form design. It was decided after a review of the present proposed form that Zea and USDA staff would jointly revise the form so that it is acceptable to the NOSB and reflects the concerns of the USDA. The form will not be split into separate forms for addition and removal of substances from the National List and it will include a request for information on the State registration of a substance.

A paper prepared by Zea related to the natural/synthetic dichotomy discussion was taken up next by the Board. Theuer explained his ideas regarding a progressive approach (from synthetic to natural to organic) for substances used for extraction. After agreeing with Zea that solvents would be included on the National List, Friedman moved and Stoneback seconded that: "Synthetic substances may be used to extract a substance from a natural source provided: (1) the chemical structure of the final extracted substance is not changed by the extraction; (2) none of the synthetic substances used to extract remains in the final extracted product; and (3) the substance used to extract the product is approved on the National List." VOTE: Yes - 11. Opposed - 0. Absent - 2. Passed.

John Brown then reviewed the database setup for materials under consideration for the National List that had been set up by Zea and himself. It was pointed out by Brown that USDA does not intend to review brand names and also that the database will not include inert ingredients. Existing label instructions and restrictions will be utilized in the development of the National List and the database information regarding usage is not intended to supersede label information. The criteria used for substance evaluation will also focus on detrimental interactions independent of effects on the environment and human health.

Some remaining unresolved issues identified during the discussions were:
1. USDA submission of materials that USDA wants to have reviewed for the National List. It was agreed that USDA staff members will complete petitions for these materials and submit them into the review process.

2. Disclosure of inert ingredients in formulations. Two options as stated by Ted Rogers are that (1) USDA obtain full disclosure details from the companies and EPA or that (2) EPA create a label for the product identifying it as acceptable for the National Organic Program. Sonnabend noted that producers may lose the use of some necessary products if full disclosure is required because not all companies are willing to provide this information. She recommended that this be taken into account when debating the full disclosure issues. Sligh proposed the creation of a task force to communicate with manufacturers in encouraging full disclosure of ingredients of substances approved for use in organic agriculture. The task force was formed and will consist of Nancy Taylor, Tom Stoneback, Eric Kindberg, Gary Osweiler, and USDA staff.

LIVESTOCK COMMITTEE

At the conclusion of the materials presentation, the Board resumed discussion of livestock topics. Sligh motioned, with a second by Friedman, that the Livestock Committee Farm Plan amendments to the Crops Committee Farm Plan be accepted. VOTE: Yes - unanimous. Passed. USDA staff will combine the two documents into one Farm Plan recommendation.

Turning to the livestock questionnaire accompanying the livestock farm plan document, Theuer moved, second by Quinn, to delete "or another label" on lines 638 and 641. VOTE: Yes - 8. Opposed - 1. Passed. Taylor moved and Chandler seconded to change "animal" on line 693 to "type"; delete "separate" on line 692; delete "and/or livestock product type" on lines 693-694; and delete lines 695-699 entirely beginning with "Please...". VOTE: Yes - unanimous. Passed. Kahn made a motion, second by Theuer, to add this questionnaire document to the Farm Plan Recommendation. VOTE: Yes - unanimous. Passed.

The Health Care Practices recommendation was revisited again starting with lines 343-349 concerning confinement of livestock indoors without access to the outdoors. Friedman moved, seconded by Quinn, to delete lines 343-349 from the recommendation and refer the confinement issue to the Livestock Committee to develop species specific confinement recommendations to be brought to the Board at the next meeting in October. VOTE: Yes - 11. Opposed - 1. Passed. Quinn moved and Sligh seconded that the phrase, "Livestock confinement standards to be developed later" be added at line 343 and that the Health Care Practices draft recommendation document be accepted as a Board final recommendation. VOTE: Yes - unanimous. Passed.

During the Livestock Committee presentation, the Crops Committee Farm Plan draft recommendation was referenced and briefly discussed. Friedman questioned whether
language should be added addressing penalties to producers who deviate from the Farm
Plan. Kahn replied that deviations, whether major or minor, should remain within the
discretion of the accredited certifying agency with guidance provided by USDA.
Friedman proposed that at line 782 of the Crops Committee Farm Plan, following "farm
management," a new sentence be added that reads, "Minor deviation from the Farm Plan
that does not constitute a pattern of inappropriate deviation shall not constitute grounds

Kinsman moved to delete the following phrase at lines 587-588 of the Livestock Farm
Plan: "in order to produce progressively stronger animals and eliminate a dependency on
and use of veterinary medications." Theuer seconded. Kinsman rejected a friendly
amendment to replace "in order to" with "in an effort to". VOTE to delete the phrase:

Sligh moved and Quinn seconded to approve the Organic Farm Plan document as
amended and to combine the Crops and Livestock language and questionnaires into one

The Board then took before them the Livestock Recordkeeping recommendation.
Friedman moved and Merrill Clark seconded to approve lines 350-361. VOTE: Yes -
unanimous. Passed. Friedman moved and Weakley seconded to approve lines 362-370
after first deleting on line 369 the words, "use and" and replacing with "the," and also
Passed.

Kahn moved, seconded by Weakley, to replace line 381 with: "Prohibited materials shall
not contact livestock and livestock products during transportation." VOTE: Yes - 5.
Opposed - 7. Failed.

Friedman moved and Theuer seconded to approve lines 371-381 of the Livestock
Recordkeeping document and to accept the entire document (lines 350-381) as a Board

Meeting adjourned at 5:35 pm.

JUNE 3, 1994

Members in attendance were: Robert Quinn, Gene Kahn, Nancy Taylor, Don Kinsman,
Dean Eppley, K. Chandler, Tom Stoneback, Merrill Clark, Margaret Clark, Rich Theuer,
Michael Sligh, Craig Weakley, Jay Friedman, and Victoria Smith from the New
Hampshire Department of Agriculture.

Staff members present from USDA were: Harold Ricker, Julie Anton, Michael Hankin,
Ted Rogers, and Michael Johnson.
Slight opened the meeting by announcing the following revised caucus schedule:

- **Crops Committee** - Friday 3-5 pm
- **Accreditation Committee** - Friday 3:15 - 5:30 pm
- **Livestock Committee** - Friday 3:15 - 5:30 pm
- **Petitions Working Group** - Friday 12:30 pm

Plenary sessions on Saturday will be conducted as follows:
- Livestock - 8-10 am
- Crops - 10-11 am
- Processing - 11 am-12 pm
- Committee presentations to the Board (as necessary) - 1-3 pm.

**Accreditation Committee**

Margaret Clark first explained the piecemeal approach that she would be taking in having **Accreditation Draft #10** and the proposed revisions approved by the Board as a final recommendation.

Michael Hankin expressed appreciation for the work of the Committee and asked the Board to focus on the Accreditation Program at this time and defer debate on the matter of differentiation between State Certification Program approval and State Accreditation.

Robert Beauchemein of OCIA, speaking for the attending members of the Organic Certifiers Caucus (OCC), stated that although OCC officially supports its original accreditation position as expressed in its submitted comments to Draft #10, the members present (CCOF, Oregon Tilth, FVO, OGBA, and OCIA) do not object to the Accreditation Committee’s concepts of Peer Review and Evaluation. He stressed that a stronger public/private partnership than envisioned in the USDA staff comments paper is essential. He believes that the Peer Review Committee should be kept small and that it should make recommendations to USDA on accreditation status of applicants. He affirmed that the organic community is not divided on this issue. Hankin thanked him for his concern and stated that, based on the OCC statement, USDA staff would reevaluate its ideas upon returning to Washington.

Theuer made a motion to delete on line 959 of Draft #10 the words "by election."
Second by Quinn. VOTE: Yes - unanimous. Passed.

Margaret Clark then led the session through the topic of Peer Review Panel consultation
(the new sentence for revision #12 of the revisions document) and through the shaded
areas of lines 754, 756, 762-772 and 777 of Draft #10. Board member comments ranged
from stating that there was too much Peer Review Panel involvement to stressing the
importance of public private partnership to desiring that IFOAM not be permitted to do
any USDA accreditation visits. Quinn motioned and Friedman seconded to approve the
Quinn motioned and Eppley seconded to approve the shaded areas on lines 762-764 of
to approve lines 765-768 of Draft #10 permitting the site visit to be contracted to an
approved organization. Smith added and then withdrew a motion to modify line 765
after "agent" with the phrase: "involved in international trade." A motion to add the
phrase: "for purposes of facilitating international trade" after "organization" on line 768
decided that new language should be brought back later this meeting by the Committee.
Sligh motioned and Eppley seconded to accept into Draft #10 the new language stated
in revision #12 of the revisions document that calls for USDA to consult with the Panel

Sligh then moved and Taylor seconded that the shaded areas of lines 809-811, 825-827,
and 838-849 be accepted along with the additional language of revision #14 of the
revisions document. After opening the discussion to comments from the Board and
guests, Margaret Clark heard a gamut of opinions on the subject of spot visits. Crossley
of Health Valley Foods said inspectors may be turned away by the manufacturer and this
facet of certification is too expensive. Friedman stated that notice could be given and
that the visits could be conducted during regular business hours. It was agreed that spot
visits should be included in evaluating an accreditation application, but that the visits
must not be a burden to producers and processors. Theuer said that only government
officials are allowed in by many businesses and Smith agreed that regulations established
by USDA would be necessary for such visits to effectively occur. Bowen of CCOF said
that spot checks should be necessary only when potential problems are noticed and that
advance notice should be given. Friedman moved and Theuer seconded that lines 809-
Passed. Weakley commented that USDA should still consider spot visits for the
Program, but that the current language was unacceptable and should be improved later
by the Board. Friedman then moved, seconded by Sligh, that the sentence, "Optional
field visits of certificants: NOSB shall develop further recommendations" be inserted at
line 809. VOTE: Yes - unanimous. Passed.

Taylor motioned and Quinn seconded to accept the shaded areas on lines 825-827.
Friedman made a friendly amendment that was accepted to change "confidentiality" on

6/94 Santa Fe Minutes II 16
line 826 to "non-disclosure." VOTE: Yes - unanimous. Passed.

Switching to revision #15 of the revisions document, Margaret Clark noted that this merely involved format changes and retitling of sections. Sligh moved and Eppley seconded to accept this technical change along with the correction on line 854 of "30 days" instead of "14 days." VOTE: Yes - unanimous. This technical change did not include accepting the newly suggested word, "stakeholder."

Quinn moved and Eppley seconded to delete "non-profit" on lines 915-917 and accept the technical change of #16 of the revisions document. VOTE: Yes - 11. Opposed - 2. Passed.

Friedman moved and Theuer seconded that at line 913, "will have the option to" should be replaced with "shall have their evaluations include"; and at lines 915-918, replace the entire phrase from "as......certifier" with "as private certifiers shall have their evaluation team include another private certifier."

VOTE: Yes - unanimous. Passed.

The session then adjourned for lunch.

Following lunch, the accreditation discussion centered around the composition of the evaluation team. Quinn moved and Theuer seconded that the shaded areas of lines 896-905 be accepted with the minor revision that the word "peer" be deleted on line 902.

VOTE: Yes - unanimous. Passed.

Taylor moved and Sligh seconded to accept revisions #17 and #18 of the revisions document with the following amendments: change "four" to "three" on line 943; accept the shaded lines 948-949; and add "and livestock" after "cropping" on line 932. VOTE: Yes - 11. Abstain - 2. Passed.

Quinn moved and Sligh seconded to approve lines 906-909. VOTE: Yes - 1. Opposed - 12. Failed. Lines 906-909 referring to optional USDA presence on the evaluation team, and lines 922, are to be deleted.

Weakley moved and Quinn seconded that revision #19 (a title change and the new background commentary) of the revision document be approved. Theuer queried whether this means the Board is accepting the "stakeholder" idea (there was no response). VOTE: Yes - 10. Opposed - 3. Passed.

Revision #21 of the revisions document containing new language on the composition and size of the Peer Review Panel was discussed next. Sligh motioned and Weakley seconded to delete lines 950-973 and 985-986 of Draft #10 and replace them with revision #21. Taylor offered a friendly amendment to revision #21 that was accepted that changes the USDA status on the Peer Review Panel to an official member and
maintains the NOSB status as ex-officio. Theuer offered a friendly amendment that was accepted that adds the phrase, "as well as having expertise in organic farming and handling" after "inspector" on the last line of the first paragraph of revision #21. Friedman offered a friendly amendment that was not accepted to delete the entire first paragraph of revision #21 pertaining to key components of members. Taylor requested a vote on Theuer's friendly amendment - VOTE Yes - 10. Opposed - 3. Passed.

Turning to revision #25 of the revision document concerning the cost of accreditation, Weakley moved and Eppley seconded to accept the revision language with the last two lines about a 2/3 vote to be deleted. Also, the sentence, "The Board further recommends that the ongoing program administration costs above the cost of accreditation be paid for through direct appropriated funds" will be added at the conclusion of the recommendation. VOTE: Yes - 11. Opposed - 1. Abstain - 1. Passed.

INTERNATIONAL COMMITTEE

Committee Chairperson Friedman brought forth the Committee document entitled, 'Proposed Rule Regarding Importation of Organic Agricultural Products," for full Board discussion and vote. Friedman pointed out that the words, "proposed rule," should remain in the title of the recommendation, as it is the interest of the Committee that the exact language of the recommendation be published in the Federal Register.

A brief discussion of the effects of mandatory fumigation at U.S. borders on the integrity of organic imports was initiated by Rich Theuer. This resulted in a motion by Michael Sligh to adopt the following language as an additional section to the document:

"VI. Maintaining Organic Integrity During Importation

Recommendations related to maintaining organic integrity during importation of organic products will be developed later."

This motion was seconded by Bob Quinn. VOTE: Yes - unanimous. Passed.

Friedman noted that the definition of "imported" (lines 17-23) had been changed upon receiving the suggestion from a USDA agency that the definition used commonly in government documents be adopted. The Board accepted this change as stated in the document. Passed.

Mr. Friedman also explained that, with regard to lines 24-29, the Committee had opted to utilize the term, "International Organic Standards Organization (IOSO)" as opposed to "International Standards Organization (ISO)", to make the organization referenced in the recommendation separate and distinct from other uses of the term, "ISO". This change
was accepted by the Board. Passed. In a discussion of lines 27-29, it was agreed that it was not necessary to qualify the activities of an IOSO, since the IOSO would have to be approved by the Secretary.

The Board agreed to consider the term, "product", as used in lines 40-71 to be all-inclusive.

Quinn then presented the Committee minority view cited in lines 73-85. He explained that the intention of was to consider both State and private certifiers as "certifying agents". Taylor brought up the point that by using the terms "State programs" and "certifying agents accredited by the Secretary", States with programs that are not certifying agents would be covered.

Sligh stated that he could not approve certain of the minority view recommendations in isolation because the recommendations were tied together. This statement was made in response to Theuer's suggestion that parts 3 and 4 be adopted, but not parts 1 and 2. Margaret Clark expressed her concern that State approval not be considered a substitution for accreditation, and that the language of the import requirements recommendation not imply this. Ms. Clark motioned that lines 73-85 be adopted, with a second from Quinn. VOTE: Yes - 5. Opposed - 6. Abstain - 2. Failed.

Next, Theuer moved that lines 81-85 be approved. Discussion ensued. Stoneback reminded the Board that all language would be subject to legal review during the rule-writing process, and that any inconsistencies across recommendations would be handled then. Friedman noted that the New Mexico State program had been approached to conduct certification services in Mexico. Theuer withdrew his motion after consideration of State programs which may be accredited with additional certification requirements.

Quinn took the initiative of motioning again that lines 81-85 be approved; Sligh seconded the motion. VOTE: Yes - 5. Opposed - 6. Abstain - 2. Failed.

Ms. Clark again argued that the language regarding State programs implied that States did not have to be accredited; Taylor disagreed, stating that the language was not inconsistent with the Board draft recommendation on accreditation. Weakley inserted that any conflicts in language would be sorted out at USDA.

Stoneback motioned for the entire document, with amendments agreed upon, to be approved; this motion was seconded by Merrill Clark. The document was adopted as a Final Board Recommendation by a VOTE of: Yes - 10. Opposed - 3. Passed.

Following the vote, the session for the day was concluded and adjournment was agreed upon.

JUNE 4, 1994
Members in attendance were: Robert Quinn, Gene Kahn, Nancy Taylor, Don Kinsman,
Dean Eppley, K. Chandler, Tom Stoneback, Merrill Clark, Margaret Clark, Rich Theuer,
Michael Sligh, Craig Weakley, Jay Friedman, and Victoria Smith from the New
Hampshire Department of Agriculture.

Staff members present from USDA were: Harold Ricker, Julie Anton, Michael Hankin, 
Ted Rogers, and Michael Johnson.

Livestock Committee

Merrill Clark initiated Board discussion of the Committee's Antibiotic Recommendation

to the Full Board. After summarizing several written comments that had been received

from the general public in response to Committee recommendations, Merrill Clark asked

Jay Friedman to conduct the document review. Friedman began with lines 391-396 of

the document concerning antibiotic use in slaughter stock, and asked for unanimous

consent to remove the word "synthetic" throughout the recommendation. Theuer so

moved and Quinn seconded. After debate on the implications of prohibiting natural

antibiotics from allowable organic animal health care practices and questions as to

whether there really are natural antibiotics, Theuer explained that his intent was to

exclude all antibiotics and to prohibit any natural antibiotic from being used in the future

Theuer then moved and Kahn seconded that at line 392, the phrase "as medication or

growth promoters" be added after "antibiotics". This would allow antibiotics to be used

as preservatives in vaccines and AI semen as is the common practice. VOTE: Yes - 11.

Abstain - 2. Passed.

Quinn moved and Kahn seconded to accept lines 391-396 as amended as a Board Final

Recommendation. Before the vote, Theuer received clarification that the

recommendation wording as stated does not permit the use of synthetic topical

antibiotics in slaughter stock, but does allow natural antibiotics to be used. VOTE: Yes

Regarding lines 397-406 on the subject of antibiotic use in breeder stock, Kahn moved

and Chandler seconded to add on line 402 following "emergency" the wording: "after all

five conditions listed in the addendum to the recommendation on the use of antibiotics

have been satisfied"; also, delete lines 402-405 starting with "In" on line 402 and

continuing through the first word "veterinarian" on line 405. Merrill Clark stated that the

OFPA should be interpreted as meaning no antibiotics could be administered during the

last third of gestation, but Kahn replied that the five criteria in the addendum are the

"organic management system" referred to in the OFPA as being necessary for the twelve

Abstain - 1. Failed. Merrill Clark moved and Quinn seconded to accept lines 397-406

as a Board Final Recommendation. Kahn pointed out that the wording as stated would

not allow the use of antibiotics during Caesarean deliveries or other delivery

Friedman suggested that unanimous consent be given to begin the recommended language on antibiotic usage in dairy stock with similar wording as appears on lines 398-400. Agreed. After confirming that FDA has concerns about the implications of FDA established withdrawal times being referenced in the organic standards, Kahn moved, and seconded by Margaret Clark, to delete "12 months" on line 410 and replace with "twice FDA withdrawal time or 30 days, whichever is longer"; also, add on to the end of line 411, "and furthermore must satisfy all five conditions listed in the addendum to the recommendation on the use of synthetic antibiotics in organic livestock production."

Margaret Clark made a friendly amendment that Kahn accepted to add "This policy to be reevaluated in two years." After discussion on the merits of different withdrawal times and phase-in opportunities, the VOTE was: Yes - 3. Opposed - 9. Failed. Kahn then proposed a new amendment for line 410 to delete "12 months" and insert "90 days" (with no reference to FDA withdrawal times); and to add at the end of line 411 "and furthermore must satisfy all five conditions listed in the addendum to the recommendation on the use of synthetic antibiotics in organic livestock production." This policy to be reevaluated in two years." Margaret Clark seconded. VOTE: Yes - 11. Opposed - 2. Passed.

Friedman moved and Theuer seconded to replace the 2 year evaluation with a 2 year sunset clause and re-evaluation to determine an appropriate policy. VOTE: Yes - 1. Opposed - 12. Failed.

Weakley moved and Kahn seconded to adopt the May 5, 1994 addendum to the recommendation containing 5 conditions relating to the use of antibiotics. Friedman made a friendly amendment that was accepted to include the word "written" between "a" and "justification" on line 435. VOTE: Yes - unanimous. Passed. In a post-vote motion, Eppley moved and Kahn seconded that "intentional" be inserted in all instances in the addendum to precede "use or application". VOTE: Yes - 11. Opposed - 1. Passed.

Kahn moved and Merrill Clark seconded to accept the antibiotic document as amended as a Board Final Recommendation. VOTE: Yes - 9. Opposed - 1. Abstain - 1. Passed. Stoneback asked for and received clarification that as the recommendation now reads, topical natural antibiotics could not be used on slaughter stock, but they could be used on breeder stock in a health care emergency.
The next document brought forward was the Parasiticide Recommendation for organic livestock production. Taylor moved and Stoneback seconded to change "prohibited" on line 454 to "restricted." VOTE: Yes - 7. Opposed - 3. Abstain - 3. Passed.

Kahn moved and Weakley seconded that at the end of line 454, the following sentence be added: "In the case of young stock intended for slaughter, approved synthetic parasiticides shall be available during the first third of the animal's life and furthermore must satisfy all 5 conditions listed in the addendum to the recommendation on the use of synthetic parasiticides." VOTE: Yes - 10. Opposed - 3. Passed.

Kahn then moved that lines 462-469 of the section on the use of parasiticides in organic breeder stock be deleted and replaced with the OFPANA recommendation on breeder stock: "In the case of breeder stock, approved synthetic parasiticides shall be available to the animal according to the most appropriate time for treatment. If unapproved materials are used during the last third of gestation, that offspring would not be available, for slaughter stock. The breeder animal and her future offspring would qualify for reentry into the organic program as specified elsewhere in the statute"; also, the wording: "Furthermore, the producer must satisfy all 5 conditions listed in the addendum to the recommendation on the use of synthetic parasiticides" is to be added. Margaret Clark seconded. VOTE: Yes - 0. Opposed - 9. Abstain - 2. Failed. It was decided that the OFPANA language referring to unapproved materials in the last third of gestation was not clear. The Livestock Committee was instructed to develop additional parasiticide language and come back to the Board before adjournment on Sunday.

CROPS COMMITTEE

Kahn presented Section 2D of the comprehensive document, "Allowance for a Split Operation." Only one amendment was suggested by Friedman, who sought to grant States a specific right to prohibit split organic/non-organic farming operations. He noted that everyone involved in the formulation of organic standards for the State of New Mexico favored a prohibition on split operations. A motion was made to add the following language on line 575: "Nothing in this recommendation shall be construed as precluding a State program from adopting further limitations on split operations within that State." The motion was seconded. VOTE: Yes - 8. Opposed - 5. Failed.

Weakley moved that the "Allowance for a Split Operation" section of the comprehensive document become a final Board recommendation. The motion was seconded and approved on a VOTE of: Yes - 11. Opposed - 2. Passed.

In presenting section 2E of the comprehensive document, "Planting Stock Policies," Kahn noted that Merrill Clark and Sligh had requested that the term "commercially available" be defined. He explained that the Crops Committee had agreed to adopt the definition
suggested by Sligh: "Commercially available for the purposes of this set of
recommendations means that the producer shall document to the satisfaction of the
certifying agent that these herein specified seeds and transplants could not be obtained
as organic and/or untreated."

Theuer, with agreement from Friedman, argued that this definition was unsatisfactory,
and looked to be "circular reasoning." Quinn commented that the intention was to place
the discretion for defining "commercially available" at the level of the certifying agent.
Theuer presented on overheads the definition he intended to propose during the
Processing Committee presentation. The following motion was made by Kahn and
seconded to add at line 583 the following language: "The determination of commercial
availability shall be at the discretion of the certifying agent and entail the following good
faith efforts documented in writing by the producer: (a) the good faith efforts made to
locate or develop a source of organic transplants or untreated seed; and (b) the progress
made over the previous year to eliminate non-organic transplants or untreated seed.
VOTE: Yes - unanimous. Passed.

Merrill Clark submitted an amendment to line 603 for the purpose of clarity to replace
"and organically grown transplants are not available for replanting" with: "resulting in
non-availability of organically grown transplants for replanting." Sligh moved to accept
this amendment and the motion was seconded. VOTE: Yes - 11. Abstain - 2. Passed.

Clark suggested the following amendment which would require a review of planting stock
policy exceptions to the requirement that all planting stock used in organic production be
organically grown: "These exceptions shall be permitted for two years after
implementation of the OFPA, after which the use of organically grown seed potatoes,
strawberry crowns, onion sets, garlic, and other planting stock is required." Clark's
motion was seconded by Friedman, and discussion ensued. Kahn argued that the
phytosanitary conditions for seed potatoes were not likely to change; Taylor added that
Idaho requires by law that certain procedures be followed for potato producers.
Weakley commented that a review of exceptions to an organic planting stock
requirement would be undertaken every time the certifying agent applied the definition
of "commercial availability." Friedman countered these arguments by stating that a
mandated review in two years might drive the development of organically grown
transplants. The VOTE was called and the result was: Yes - 2. Opposed - 10. Abstain -
1. Failed.

Next, Theuer asked that the Board consider stressing its preference for the use of
organic seed in lines 721-745 of the planting stock section. He moved that the
Committee develop language to address this issue, and report back to the full Board in
October. This motion was seconded by Friedman. VOTE: Yes - 12. Opposed - 1.
Passed.

Hankin noted the apparent vagueness about the issue of non-organic perennial stock
produced on a non-organic section of an organic farm. This precipitated discussion of
the applicability of the allowance for split operations. The majority of the Board agreed
that a nursery where non-organic production methods were utilized could co-exist in a
farming operation with organic production of crops. Friedman argued that this would
allow for abuse. Kahn responded by stating that all contingencies of farming could not
be addressed in the standards. Sonnabend commented that there are places where it
may be preferable to have perennial seedlings produced on non-organic farms and
brought onto an organic farm where the production of seedlings would not be
sustainable.

Friedman moved that the following language be added to line 610: "provided that the
planting stock does not come from the same farm for more than three years". Me ll
Clark seconded the motion. VOTE: Yes - 2. Opposed - 10 Abstain - 1. Failed.

Hankin asked the Board to clarify the intention of the language on line 731 pertaining to
substances excluded by the OFPA. The following new wording was offered: "Seed
treated with substances prohibited by OFPA are prohibited, with the exception of seed
treated with synthetic fungicides appearing on the National List. The requirements
appearing in the section addressing commercial availability must be fully satisfied."

A motion was made by Friedman and seconded to adopt the Planting Stock Policies
Passed.

Kahn then directed the Board to a discussion of the amendments offered by Theuer to
section 2H of the comprehensive document, "Emergency Spray Exception." The
following were adopted by unanimous consent, following a seconded motion:

Lines 1122, 1131, 1141: Change "treated with" to "exposed to";
Lines 1124, 1149, 1159: Change "treatment with" to "exposure to";
Line 1162: Change "treatment" to "exposure"; and
Line 1118: Place a comma between "livestock" and "feed".

Kinsman raised a concern about the definition of "continuous season" on line 1153, and
moved that the term "continuously growing" be used instead. This motion was seconded

Next, Theuer moved that the entire Emergency Spray Exception section be approved as
a Final Board Recommendation; Taylor seconded the motion.
VOTE: Yes - unanimous. Passed.

Prior to closing the Board session on crops, Weakley made a statement commending
Kahn and USDA advisor Anton for their work in ensuring the success of the Committee.
With no time remaining to discuss the specialty crop standards, Kahn asked the Board to review this document (revised and approved by the Committee on June 3) prior to the October meeting and stated his intentions that it could be added to the Board final recommendations on crop production standards.

**Processing Committee**

Weakley renewed the previous discussion on the Organic Handling Plan draft recommendation document. He reported that following the comments received at the previous Board session, the Organic Handling Plan has now been split into two separate documents. These are entitled, Requirement for Handler Certification - Proposed Final NOSB Recommendation and Organic Handling Plan - Proposed Final NOSB Recommendation.

Weakley first reviewed the Requirement for Handler Certification. He explained that lines 665-688 were inserted to clarify the issue of which categories of handlers need to be certified and lines 690-701 were included to clarify legal relations between the different parties.

Addressing particulars within the recommendation, the Board decided unanimously to change "who'' to "which" in line 706. Sligh moved, seconded by Theuer, to include wording at line 708 which references the small farmer exemption clause of the OFPA. VOTE: Yes - 12. Abstain - 1. Passed. Kahn moved and Friedman seconded to accept the new language for the definition of packers (#6) as it pertains to meat packing plants. VOTE: Yes - 12. Abstain - 1. Passed. Sligh moved and Eppley seconded to accept the new language for processors (#10) as it pertains to meat processors. VOTE: Yes - 12. Abstain - 1. Passed.

Weakley motioned and Theuer seconded to delete "under the OFPA" at line 490-491 and add the wording at line 490: ", but its activities as agent, licensee, employee, contractor, or subcontractor for a certified organic handler must be covered under the certification of that handler." VOTE: Yes - unanimous. Passed. Weakley moved and Theuer seconded to accept the Handler Certification document as a Board Final Recommendation. VOTE: Yes - unanimous. Passed.

Weakley then turned to the Organic Handling Plan recommendation document. He explained that the recommendation was basically the same as previously submitted except that the segments pertaining to handler requirements had been separated and moved into the Requirement for Handler Certification document. In addition, he clarified that the waste management section is addressed in the second paragraph and that waste management was now being considered as a desirable practice rather than as a required practice that could affect a certification status. Additionally, Weakley reported a wording change to allow for a written description to suffice for displaying the movement of organic products through a facility, rather than requiring a schematic flow chart.
Weakley moved and Theuer seconded to amend line 110 by inserting after "operation" the phrase, "or its agents, licensees, employees, contractors, and subcontractors who handle its organic products." VOTE: Yes - unanimous. Passed.

Kinsman moved and Kahn seconded to accept the addition of the words, ",(HACCP) or similar system" after the word "Point" in line 127. VOTE: Yes - unanimous. Passed.

Friedman then moved and Weakley seconded to include the FDA or National Food Processors Association definition of HACCP into the recommendation. VOTE: Yes - unanimous. Passed. USDA staff will locate the definition and insert the additional language.

Theuer motioned and Stoneback seconded to replace lines 164-167 concerning the commercial availability of certified organic ingredients with the following language: "For each food labeled as an organic food that contains one or more non-organic agricultural products as ingredients, a written description of: (a) the good faith efforts made to locate or to develop a source of the certified organic form of the ingredient and (b) the progress made over the previous years to eliminate non-organic agricultural products as ingredients." Also, amend Line 169 to read: "For each non-organic agricultural product used as an ingredient. a description of the reasons why the certified organic form of the ingredient is not used." Technically, change (3) at line 169 to become (4) and (4) at line 171 to become (5). VOTE: Yes - 11. Opposed - 1. Abstain - 1. Passed. Also, the "G" at line 438 will become "A".

Friedman moved and Stoneback seconded that at line 318 the following wording be added: "Submission of this information shall constitute compliance that a HACCP or similar system is identified." VOTE: Yes - 11. Abstain - 2. Passed.

Stoneback moved and Theuer seconded that at line 211 "re.:e" should be changed to "manage." VOTE: Yes - 5. Opposed - 8. Failed.

The Processing Committee then requested the Board to consider accepting the Good Manufacturing Practices (GMP) as a Board Draft Recommendation. First, it was noted that a commentary had now been created in response to public input sent in to the
Committee. Weakley stressed that preventing loss of organic integrity was central as the basic principle of good organic manufacturing practices. Theuer made a motion, seconded by Weakley, to add at line 40 after "materials" the words, "or on the list of prohibited naturals." VOTE: Yes - 10. Abstain - 3. Passed.

Weakley discussed the Committee's previously mailed list of proposed changes to the GMP document. Friedman moved and Theuer seconded to approve #1 on the list as written and #2 on the list with the following revision: add after "materials" on the second line, the words "or appear on the National List of prohibited natural materials". VOTE: Yes - 10. Abstain - 2. Passed.

Stoneback moved and Theuer seconded to accept #3 regarding boiler water. The reason for the change was cited as being to specify preventive practices rather than testing for residues. VOTE: Yes - 10. Abstain - 2. Passed.

Kahn moved and Eppley seconded to accept #4 on the list about water used in handling. Sligh stated his concerns that organic integrity is compromised if the same water from a conventional product rinse is utilized on organic products. Crossley from Health Valley replied that a thorough final clean water rinse would eliminate the potential for residual chemicals. Kahn modified his motion to include "thorough" before "final clear water". VOTE: Yes - 9. Abstain - 2. Passed.

Weakley moved and Theuer seconded to accept #5 on the list about ionizing radiation. Weakley explained that a very low level of radiation for inspection of organic food could be allowed, whereas the much higher dose for killing insects and microorganisms should not be permitted if integrity is to be maintained. VOTE: yes - unanimous. Passed.

After mentioning that USDA should ascertain the correctness of the CFR citations, Friedman moved and Eppley seconded to accept the Good Manufacturing Practices document as a Board Draft Recommendation. VOTE: Yes - 11. Abstain - 1. Passed.

Accreditation Committee

The discussion on revisions to Accreditation Draft #10 were renewed after a short break. Margaret Clark clarified that "transparency" as referenced in the draft should be defined as "the public knows how decisions are reached." Weakley expressed concerns that the draft exceeds the intent of the OFPA.

On page 11 of Draft #10, Margaret Clark seconded a motion from Weakley that at line 409-410, the wording "the definition of organic foods includes the availability of" be deleted and the word "basic" be added at line 410 before "information" and the words "is available" be added following "etc." on line 411. Also, "related" on line 414 is to be deleted and "consumers" on line 415 should be changed to "consumer." VOTE: Yes - unanimous. Passed.

Margaret Clark explained other revisions that she was proposing at this time. On line
419, delete "records" and insert "information" and add "and to records by" before
"Secretary." On line 426, delete "in the organic plan prepared by". On lines 508-511,
change item #12 to item #11 and add a new subsection B at line 515 entitled Public
Access to Production and Handling Information. Lines 409-416 are to be moved to this
new subsection B as are lines 508-511 and lines 460-468. Weakley read the following list
of items to also be inserted under Subsection B: "operation name; address; phone; total
acreage farmed; organic acreage farmed; crops grown; growing practices; inspection date;
inspector's name; parcel identification; dates of last prohibited material use; certification
status; and conditions for certification." (Note: see Board decision on public access as
stated on page 29).

The existing subsection B would be changed to letter C and remain entitled, Records
required to be kept by certifier and available upon request to the Secretary or his
representative. VOTE: Unanimous consensus was given by the Board to accept all of
the above recommended changes.

Lines 452-459 concerning records of ingredients and inputs were deliberated next. First,
however, at line 449, Clark proposed: deleting "of all organic ingredients" and replacing it
with "all products handled and all organic ingredients used"; at line 450, delete "made
and"; at line 452, after "inputs", delete "and/or raw ingredients used...quantity" and
replace with "products handled, and date, source, lot number, and quantity"; and, at line
454, delete "date, quantity" and replace with "date, source lot number, quantity". Second

Weakley moved and Quinn seconded that at the end of line 459, the following language
be added: "On at least an annual basis, certifying agencies or their inspectors must
conduct at least one random product commodity tracking within the farmer entity
certified for each certified producer and handler." Kahn offered a friendly amendment
that was accepted. His amendment was to delete the Weakley motion wording after
"tracking" and substitute "that demonstrates the steps of production or manufacturing
prior to the shipment of that product from the premises of that farm or manufacturer."

Sligh made a motion and Stoneback seconded that at lines 475 and 478, "equal(s)" be
changed to "means" and "basic" be inserted before "information" on lines 476 and 478.
VOTE: Yes - unanimous.

Sligh then moved, again seconded by Stoneback, that at line 496 "covering both the
competence of inspectors and their assignment" be added after "criteria." VOTE: Yes -

Turning to page 8, Sligh moved and Eppley seconded to add on line 308, between
"especially" and "contamination", the phrase: "adherence to the Organic Handling Plan
and"... Also, on line 309, add "and water" after "soil." VOTE: Yes - 12. Abstain - 1.
Passed.

Regarding disclosure of certifying agencies fiscal activities on page 14 at line 529, Weakley moved and Theuer seconded to delete "full and clear" and start the sentence with "Disclosure to the Secretary of Agriculture". VOTE: Yes - unanimous. Passed.

In the Purposes of Accreditation section on page 4, line 156-158, Weakley moved and Sligh seconded to delete the phrase: "shall be determined by USDA to not be inconsistent with the standards prescribed by the OFPA." Additionally, at line 155-156, replace "shall further the purposes of" with "not be in conflict with the National Organic Standards". VOTE: Yes - 10. Opposed - 3. Passed.

The Board then reviewed again the public access section of the recommendation, especially the list of information that CCOF makes available to the public. Quinn stated his objection to the extent of information as listed and expressed his belief that much of this information actually should remain confidential. Theuer moved and Sligh seconded to defer this issue of the public access section to the Accreditation Committee and subsequently back to the Board for further development. VOTE: Yes - unanimous. Passed.

Attempting to increase the breadth of the Accreditation document by including areas contained in the American National Standards Institute (ANSI) document on accreditation of bodies, Friedman moved and Kinsman seconded to expand the Table of Contents with the following categories and requested the Accreditation Committee to develop language addressing the categories:

1. Control of the use of the certifier’s mark or symbol;
2. Control of the USDA shield by the certifying agency;
3. Cost of certification; and
4. Suspension or termination of accreditation.

VOTE: Yes - unanimous. Passed.

Kahn moved that a section also be developed and included in the Table of Contents regarding a "Minor Infractions Policy" that the Crops Committee believes should be handled at the discretion of the certifying agency and based on a system to be developed by the certifying agency. Sligh seconded the motion. Extensive debate centered on who would define "minor infraction" and the feasibility of requesting each certifying agency to define minor infraction. Acknowledging the comments of the Board, Kahn withdrew the motion.

Recognizing the importance of a national uniform policy on handling of minor infractions, Margaret Clark substituted a motion that called for the Accreditation Committee to develop appropriate language to advise the USDA and certifying agencies on evaluating minor certification infractions. Merrill Clark seconded. VOTE: Yes - 11. Abstain - 2. Passed.
Friedman made a motion attempting to expand the wording on the certificant appeal process. His proposed motion language, seconded by Kahn, was to replace the seventh step in the certification process as stated on line 240 on page 6 with: "Procedures relating to the handling of complaints and appeals of adverse determinations by the certifying agency. VOTE: Yes - 12. Abstain - 1. Passed.

Friedman also moved, seconded by Theuer, to delete lines 1006-1044 on pages 26 and 27 and replace them with: "Any person adversely affected by any final action or decision of the secretary's Accreditation Program or a governing State official, shall have access to an expedited appeals procedure. Any expedited appeals procedure shall not curtail the due process rights of the party bringing the appeal and shall account for the need of accredited entities to accommodate the needs of their certified producers and handlers." VOTE: Yes - 5. Opposed - 6. Abstain - 2. Failed.

Continuing on with proposed amendments, Friedman moved, second by Theuer, that lines 1008-1009 addressing the Secretary's authority within the review process be deleted. Sligh explained that his main objective was that AMS Organic Staff not handle the appeals decisions. VOTE: Yes - 1. Opposed - 9. Abstain - 3. Failed.

Friedman then moved that at line 1006, the "National Organic Production Program" be changed to "Secretary's Accreditation Program". Tim Sullivan stated that all USDA Organic Program actions, not just the Accreditation Program, should be subject to an expedited appeal process. Friedman said he would want only Accreditation Program decisions to come under this appeals process. VOTE: Yes - 4. Opposed - 5. Abstain - 4. Failed.

Taylor motioned and Friedman seconded to strike on line 1008: "in all cases" and change "must" to "may". VOTE: Yes - 3. Opposed - 10. Failed.

Returning to the discussion from a previous day of the particulars of evaluation site visits, Friedman moved and Quinn seconded to insert the following language on page 20 at line 765 and delete lines 765-772 as they are written: "An international organic standards organization that is recognized by the Secretary for purposes of accreditation of certifying agents may perform on-site evaluations in the United States. Any on-site evaluation performed by such entity may, at the discretion of the Secretary, constitute compliance with the on-site evaluation requirement appearing in the Secretary's domestic accreditation program provided that: (1) All written reports or documents produced or resulting from the on-site evaluation by such organization shall be provided to the Secretary; and (2) Such documents and reports become part of the permanent record of the certifying agent held by the Secretary. VOTE: Yes - unanimous. Passed.

At the conclusion of Friedman's amendments, Quinn moved to accept Accreditation Draft #10 as a Board Final Recommendation. Following a second by Eppley, the Board VOTE was: Yes - unanimous. Passed.
Livestock Committee

At the conclusion of the passage of Accreditation Draft #10, Board members tackled the Parasiticide section of the livestock comprehensive document before adjournment. After briefly discussing the slaughter stock subsection of the recommendation, Kinsman made a motion, seconded by Merrill Clark, to withdraw all previous motions pertaining to the parasiticide document, except for the motion incorporating the addendum into the recommendation. VOTE: Yes - 12. Abstain - 1. Passed.

Once the recommendation was returned to its original content except for the additional addendum wording, Friedman moved that at line 479 the following language be added:

"Any deviations from the above standards shall be species specific and be set forth in a separate document. Such review shall include, but not be limited to, sheep, goats and swine." He also requested that on line 473, the parasiticide withdrawal time for dairy stock be changed to 90 days to be consistent with the antibiotic withdrawal time for dairy stock. Kinsman seconded both parts of the motion. VOTE: Yes - 11. Opposed - 1. Abstain - 1. Passed. Friedman then made the motion that was seconded by Theuer to accept the amended parasiticide recommendation document as a Board Final Recommendation. VOTE: Yes - 9. Abstain - 1. Absent - 2. Passed.

The meeting adjourned at 3:30 pm to allow for an open forum on the approval of State Organic Programs and the relation of State Programs to private certifying agencies.

JUNE 5, 1994

Members in attendance were: Robert Quinn, Gene Kahn, Nancy Taylor, Don Kinsman, Dean Eppley, K. Chandler, Tom Stoneback, Merrill Clark, Margaret Clark, Rich Theuer, Michael Sligh, Craig Weakley, Jay Friedman, and Victoria Smith from the New Hampshire Department of Agriculture.

Staff members present from USDA were: Harold Ricker, Julie Anton, Michael Hankin, Ted Rogers, and Michael Johnson.

Administrative matters were at the top of the agenda on Sunday so that decisions could be made before Dean Eppley and Don Kinsman departed at 9am.

The first topic was to determine the site of the next Board meeting. Theuer moved and Quinn seconded that the meeting be held in California in October. Kahn agreed with the location and stated that California would be an excellent choice because of the size of the processed food industry in the State, because of the relevancy of the National List subject matter to the horticultural operations within the State, and because of the expertise on materials review located in the region. Contrastingly, Taylor supported Texas as the next location, but the Board approved California (during the week of October 11-14, 1994) by a VOTE of: Yes - 7. Opposed - 2. Abstain - 4. Passed.
Merrill Clark and Michael Sligh explained a proposal to host a public outreach seminar before the publication of the Proposed Rule. The seminar could be held in Washington, DC, and include many of the consumer advocacy organizations with the purpose of getting them involved during the development of the program rather than waiting for them to react to the USDA’s rule proposals. Weakley stressed the importance of a meeting agenda structure and the clear presentation of information in an impartial manner. Stoneback suggested instead that USDA and the NOSB inform the press through a formal information presentation day which would be more constructive than such a seminar.

Several persons offered the idea of having the seminar in conjunction with ExpoEast to be held in Baltimore in September. However, the Expo is accessible to industry participants only and is not accessible to the public. To further develop this idea, a NOSB task force was created consisting of Merrill Clark, Margaret Clark, Theuer, Kinsman and Sligh.

Elections of officers for the next twelve months was conducted by Ricker acting on behalf of the Board. Eppley nominated Sligh to continue as Chairperson and Quinn seconded. Friedman nominated Weakley who declined. Weakley nominated Friedman and this was seconded by Theuer. Nominations were closed. Michael Sligh was re-elected as Chairperson.

Chandler nominated Friedman as Vice-Chairperson and Kinsman seconded. Kahn nominated Margaret Clark and Sligh seconded. Nominations were closed. Jay Friedman was elected as Vice-Chairperson.

Kahn moved that the position of Treasurer be suspended until appropriate responsibilities and clear work assignments are developed. VOTE: Yes - unanimous. Passed.

Quinn moved and Weakley seconded that the responsibility for taking the minutes at NOSB meetings be assumed by the USDA and that the NOSB Secretary assist in the coordination efforts with USDA in preparing the official minutes for distribution and acceptance. VOTE: Yes - unanimous. Passed.

Taylor nominated Eppley as Secretary of the NOSB but Eppley declined. Kahn moved and Theuer seconded that Kinsman be nominated as Secretary. Nominations were closed. Don Kinsman was unanimously selected as Secretary.

**Processing Committee**
Theuer led the Board through the last Recommendation, the Labeling document, that was scheduled to be considered at this Board meeting. Starting at page 7 of the *General Organic Food Labeling Standards*, he described how the Committee’s definition of processing aid is different than FDA’s. The FDA provides three situations for a
processing aid that exempts that aid from having to be included in the ingredient listing. However, the Committee regards only the situation listed in the draft recommendation as permitting an exemption from the label listing, since the Committee believes that only when the processing aid is completely removed from the final product should it be exempt from being listed on the label. Theuer stated his support for the inclusion on the National List of all processing aids used even if the aid is removed from the food and would not be required to be listed on the label. Weakley moved and Kahn seconded to accept lines 147-157 as a Board Final Recommendation. VOTE: Yes - 10. Abstain - 1. Passed.

Theuer then reviewed the Chair’s previously mailed summary of changes suggested by the public, FDA and others that are primarily editorial in nature. The summary was identified as being split into two parts, technical corrections and technical amendments. Theuer moved and Weakley seconded that technical corrections 1, 2, and 3 be accepted. Also, on page 1, line 33 of the standards document, delete the period at the end of page 1 and add "or by State or Federal inspectors." VOTE: Yes - 8. Opposed - 1. Abstain - 1. Passed.

After deciding that technical amendment 2 should not be accepted, technical amendment 1 was proposed by Kahn and seconded by Taylor to be adopted. VOTE: Yes - 9. Opposed - 1. Abstain - 1. Passed. Kahn then moved and Margaret Clark seconded to accept page 1, lines 1-33 as amended, as a Board Final Recommendation. VOTE: Yes - 9. Abstain - 1. Passed.

Board members and attendees entered into a discussion as to how certifying agencies would verify the percentage of organic ingredients in a finished product. Eric Ardapple Kindberg suggested that the percentage would be included in the processor application to the certifying agency and would be verified during the initial inspection. Joe Smillie supported this approach and stressed that the certifying agency should have leeway in the verification method used. Smillie read a statement from OFPANA that supported the idea of categories of percentage organic ingredients defining labeling allowances of the use of "organic", but which was adamant against the notion of requiring exact percentage listing anywhere on the label because of costs involved and anticipated enforcement difficulties. Theuer asserted that consumers want the percentage labeling requirement. Rogers of USDA elaborated on the FDA position that percentage labeling would be an unenforceable provision of the Organic Program.

Friedman moved and Kahn seconded that at line 32 of page 1 of the recommendation, the words from "shall" to the end of the page be deleted and replaced with: "shall be calculated by the handler and verified by a certifying agency accredited by the Secretary through documentary submissions and spot checks. Each handler shall be subject to not less than one spot check for each year of certification." VOTE: Yes - unanimous. Passed.
Members of the OFPANA Board of Directors read a statement before having to leave the meeting for their own Board meeting. The following issues were covered in the statement:

1. Strict control should be exerted over the language and type size labeling standards for the greater than 50% organic ingredients category. In this category, "Organic" should be used as a modifier of the ingredients and not as a description of the finished product. There also was concern expressed that this category not allow preservatives, artificial flavors and colors, or other additives that are not permitted for the greater than 95% organic ingredients category.

2. A phase-in implementation for processors who are currently certified.

3. Industry supports the Technical Advisory Panel process and will assist in achieving an expedient review of substances.

4. A few synthetic substances in the greater than 95% category are necessary, yet the industry is sensitive to those consumers wanting organic processed foods made entirely without synthetic ingredients.

Returning to the amendments page, Theuer moved and Friedman seconded to accept technical amendments 3 and 4 into the document. VOTE: Yes - 7. Opposed - 2. Abstain - 1. After comments were made about the extension of the premise set forth in technical amendments 3 and 4 to vegetables, juice, and other products, Quinn moved and Margaret Clark seconded to reconsider the previous motion. VOTE to reconsider: Yes - 9. Opposed - 1. Technical amendments 3 and 4 are not accepted into the document.

Sligh moved and Theuer seconded to accept technical corrections 4, 5, 6, and 7. VOTE: Yes - unanimous. Passed.

On page 3 (2B) of the recommendation document, Theuer asked if there were any comments about 2B, labeling recommendations for "organic foods." Merrill Clark repeated her position that percentage organic ingredients be placed on the principal display panel. Vickie Smith stated that many State regulations do require the identity of the certifying agency on the label. Kahn moved and Margaret Clark seconded that lines 56-77 (2B) on page 3 be accepted as a Board Final Recommendation. VOTE: Yes - 9. Opposed - 2. Abstain - 2. Passed.

On page 5 (3B), lines 100-120, Kahn moved and Margaret Clark seconded to accept the language as Board Final Recommendation. Before conducting the vote, the Board first adopted that on line 119 after "ingredients", the period would be deleted and the phrase "and must not list both organic and non-organic ingredients in conjunction with the word "organic" would be added. VOTE on lines 100-120 as amended: Yes - 8. Opposed - 1. Abstain - 2. Passed.

Theuer explained that the Committee is not bringing forth pages 2, 4, and 6 regarding composition and processing requirements for the three categories as well as labeling standards for "foods that are labeled with an ingredient declaration as containing organic
ingredient(s)." Discussing these pages at this time, he continued, would be premature since information from the National List substance review process is essential to decisions about composition requirements. The Board did give unanimous consent to including lines 34-36 in the Board Final Recommendation document to indicate that language is to be developed later.

Materials Review

Theuer distributed a revised handout of the petition process that had been developed by a working group during the last two days. The steps listed are:

1. Petitioner submits petition to USDA.
2. USDA evaluates petition for documentary sufficiency.
3. USDA notifies NOSB monthly.
4. NOSB provides feedback, if any, to USDA and TAP coordinator.
5. USDA sends petition to TAP coordinators.
6. TAP coordinators compile 2118 criteria data (synthetic/natural) and send to NOSB for information monthly with progress report.
7. TAP coordinators send out petition for review by TAP and agencies against 2119(m) criteria.
8. TAP returns evaluations to TAP coordinators.
9. TAP coordinators review contents for completeness and if complete, they send package to NOSB, committee chairs and USDA.
10. NOSB votes on petition (substance/use).
11. NOSB makes recommendation to Secretary for amendments to the National List.
12. USDA gives written response to petitioner.

Theuer received Board consensus to provide by June 20 to the Board members for their review and approval a schema for Zea Sonnabend and John Brown to utilize in making the natural/synthetic determination at Step 6. If the members approve of the criteria in the schema, then Sonnabend and Brown could make the natural/synthetic evaluation without Board members voting on each substance before the substance enters the review process.

Friedman moved and Quinn seconded to accept the petition process as amended.

VOTE: Yes - unanimous. Passed.

Ricker then announced that USDA would prepare a Federal Register entry describing the petition process in order to formally solicit candidate substances for the National List. The Board gave formal unanimous approval to Ricker's announcement.

Concluding the meeting, Sligh discussed responsibilities during the period between the Santa Fe meeting and the next Board meeting. He noted that USDA will be compiling the Board Final Recommendations into one packet; preparing the minutes of the meeting for Board distribution; publishing the Federal Register petition process entry;
compiling information for the materials review coordinators; developing the Accreditation program; and writing the program standards. USDA assured the Board members that the process will remain open and that comments and drafts will continue to be circulated. Board members stated that they would like to discuss phase-in implementation guidelines recommendations at the next meeting. They will also decide on a procedure for allowing, if necessary, amendments to Board Final Recommendations that arise from Committee discussions. Chandler indicated that he will be bringing to the Livestock Committee language to equalize feed and medication withdrawal requirements for dairy and slaughter stock.

Finally, Sligh brought to the table the 5/27/94 paper entitled, "Ongoing Role of the NOSB" and led a discussion of the points contained in the document. Friedman requested that a comparison of the domestic standards with international standards should be added to the list. Quinn reiterated the need for recommendations for phase-in implementation for producers who currently are certified and for those who will be seeking certification after implementation. Ricker stated his objections to the oversight role that the Board was requesting, but fully supported the Board's objectives to provide recommendations on National List materials, broad program policies, and improvements in USDA programs that would further the Organic Program and benefit organic producers. The Executive Committee will reconsider the stated ongoing responsibilities of the NOSB and submit a revised proposed document for the next meeting.

The meeting was adjourned at 11:30am.
(1) Julie Anton, Research Coordinator, USDA National Organic Program:

A report on the status of private and State organic certification services was given, accompanied by a map noting the location of program headquarters across the United States. A presentation on the status of State legislation pertaining to the labeling of organic food and fiber products was also made. Both are to be finalized and provided in written form within the next couple of months.

Anton also presented her findings based on in-person interviews with 22 natural food retailers across the country; a written report is to be provided at a later date. Board members were advised of retailer views on standards issues as well as on retailer certification. A report of the market status of several categories of organic products was included.

(2) Scott Taylor, representing Lon Johnson of Trout Lake Farms:

A letter from Johnson to the Board dated June 1, 1994, was read, citing his opposition to "the categorical listing of all natural ingredients on the National List." Availability of natural ingredients is "not a valid problem," according to Johnson, who would consider a 2-3 year grace period for natural ingredient producers to come into compliance.

Also read were the views of Mary Mulry, Standards Committee Chair for the American Herbal Products Association, who recommended that herbs and spices appearing on the National List be identified by species. Mulry argues that National List petition procedures should be prescribed for ingredients that are difficult to source; procedures should also be prescribed for the removal of ingredients that become available. Concern is also expressed for the herbs and spices produced in developing countries where "toxic materials are not well-monitored or controlled." She suggests that ingredients sourced from such places be required to undergo testing for compliance with U.S. tolerances.

On a different subject, Mulry states that the term "wildcrafting" not be considered synonymous with "organic."
Craig Weakley countered Johnson's availability argument by stating that Trout Lake Farms Co. had not been able to supply an herb recently due to crop failure, and that there are many times that it is impossible to source a needed organic herb from any supplier at any price.

Theuer pointed out that the petition procedure would not result in instantaneous placement of herbs and spices on the National List, frustrating manufacturers in need of ingredients.

Gene Kahn stressed that the variety of the herb can be critical to a manufacturer, stating that "not all basil is basil."

(3) **Joan Sullivan Cowan, Executive Director for Education, REACH International:**

REACH International is comprised of persons who are chemically handicapped or disabled from "Multiple Chemical Sensitivity/Environmental Illness" (description enclosed in testimony). These people seek a guarantee that organic food has received no contact with synthetic pesticides from seed to consumer purchase. Cowan remarked on a personal history of exposure to agricultural chemicals and their effect on her as one "hereditarily predisposed to becoming chemically disabled." She expressed a greater level of comfort with purchases made from local organic growers, and questioned the integrity of growers with which she is not personally familiar. She recommended that certified organic food meet the standards of "Ecology Action" (located in Willets, California) and the Rodale Institute Research Center.

Stoneback asked if Cowan reacted differently to the same processed product purchased at different times of the year; she replied that she did not purchase processed products.

In response to a question from Eppley, Cowan revealed that 90% of her diet is organic food.

(4) **Rhoda K. Geselle, Executive Director, REACH International:**

A Ph.D. cereal chemist and biochemist, Geselle recommended that the Board consider various ways that organic products could be "contaminated" by chemicals, and suggested requiring: least toxic glues and inks in packaging; segregated transport of organic and non-organic products; regulation of cleaning materials,
particularly those used at the retail level; carbon-filtered water (with reverse osmosis used for purification) for processed products; and prohibition of shelf-life enhancing materials. She also asked that the Board consider what it will take for imported food labeled organic to meet the scrutiny received by U.S.-grown food.

Margaret Clark expressed concern about the cost of filtering water and the cost of having to provide separate transport vehicles; Geselle noted that the people most debilitated by chemical sensitivities were on budgets and could not afford substantial increases in organic food prices.

Chandler reported that the scrutiny of imports from Mexico is increasing; buyers as well as government agencies are testing loads. For example, Pace Company (makers of picante sauce) sample every carton imported.

Geselle noted that hydroponic production is favorably viewed by the chemically sensitive, as pesticide drift is not possible.

(5) **Allen Shainsky, Petaluma Poultry:**

Petaluma Poultry is a completely vertically-integrated, 150,000 per week meat bird operation, which produces and markets 80,000-90,000 antibiotic-free birds per week. Shainsky supports strict standards pertaining to antibiotic use. On the confinement issue, however, he resists any requirement that livestock have access to the outdoors. He claims that his birds are free-roaming within the 10,000-20,000 square foot barns, and that his birds naturally will not go more than 20-30 feet from where they were brooded. His operation allows 1-1/4 square feet per bird (compared with 3/4 square feet in conventional operations); he argued that this is reasonable, given that birds gain 40% of their weight in the last 14 days of life. The birds have an internal body temperature of 107 degrees; at 40 degrees, they would become chilled. Therefore, the birds could not go outdoors in the winter months; it would be misrepresentation to consumers to claim that organic poultry had access to the outdoors at all times.

Shainsky recommended that synthetic vitamins and amino acids be added to the National List; the natural vitamins sources are not stable nor consistent, and would affect the flavor of the meat. He claimed amino acid supplements would reduce ammonia pollution caused
by the overfeeding of protein.

Shainsky uses sodium bisulfate for cleansing the floor of the litter house; the change in the PH environment of the floor exterminates salmonella and clostridium. Weakley argued that soil sulfur would be equally effective for acidification.

Anton pointed out the consumer demand for free-range eggs in California -- an evidently bigger market there than that for organic eggs. Shainsky argued that the real concern for poultry living conditions has to do with cages for egg layers.

(6) Robert Beauchemin, representing Hirzel Canning Company, an OCIA-certified tomato processor:

Hirzel Canning Company recommends the listing of potassium hydroxide as an allowable processing aid. A description of the lye peeling process (provided) emphasizes the benign nature of the aid, which is typically used to "loosen skins from tomatoes, pears, peaches, apples, some vegetables, and many tropical fruits."

Over the last decade, tomato processors in California with large amounts of capital have been able to convert their peeling process to a non-chemical, mechanical means. However, the non-caustic peeler has proved "cost ineffective," and many operations are resuming use of sodium hydroxide for peeling.

Hirzel points out the difficulty small scale, family owned processing facilities across the country will have without the option of utilizing potassium hydroxide as a cost-effective peeling aid.

7. Dave Carter, President of the Rocky Mountain Farmer's Union, Secretary of the National Farmer's Union

Dave represents a large body of medium sized farmers and ranchers. His group is manifesting an increasing interest in the Organic Standards issues, and generally support an alternative and sustainable food system and urge the recognition of the need for expanded research and training in this area. Dave voiced the concerns of the producers in the Farmer's Union that the organic standards maintain some balance, protecting organic integrity without overburdening producers.

Five specific concerns have come to the fore recently:
1. That in making allowances for processors to use non-organic ingredients in foods labeled organic that there be some consistency or equality in restrictions on processors and producers under the National Standards;

2. That the Peer review panel be a balance panel representing diverse concerns and expertise;

3. That there be consistency between imported and domestic standards;

4. That the 1995 Farm Bill contain cost share provisions for conversion to organic methods;

5. In considering the acreage under the Conservation Reserve Program due to come back into production the Farmer’s Union asks:
   * might this be an opportunity for beginning farmers;
   * might this acreage be an opportunity for quick starting into organic production?

8. Robert Beauchemin, speaking for the Organic Certifier’s Caucus

Robert urged that the Peer Review Panel include a recommendation to the Secretary in its function. He also noted the suggestion from the OCC that a third arm of the Accreditation process be a review committee made up of certifiers and NOSB members to perform public oversight of the Accreditation Program.

On the fees issue, OCC thinks it appropriate that all those benefiting from the program cover part of the costs in fees. They confirm the need for public funds in the program, since the public as represented by the organic consumer is a beneficiary. They likewise feel that the relationship between the State and the private certifiers needs to be clarified in recommendations from the Board. The certifiers also think that parameters for reasonable State registration fees need to be recommended by the Board. These fees could be abused in such a way that private certifiers were excluded from certain States.

Robert also cautioned about the difficulties of using a large peer review panel and supported the notion of contracting out the evaluation phase.

9. Annie Kirschenmann, FVO

Annie made three points:

1. FVO supports the current NOSB position on Accreditation and Review;
2. On site evaluation of certifiers by certifiers is critical and will foster program improvement and should not be regionally based;

3. All beneficiaries should share in the cost of the program.

She also urged the finalization of the recommendations on accreditation at this meeting, suggesting that refinements could be an ongoing process.

10. Robert Donley

Robert is involved in the processing of wool and has been approached by a manufacturer to locate and process organic wool. In essence he was asking the Processing and Handling committee and the Livestock Committee how they would approach such standards. He was in turn asked to proffer suggestions for such standards.

11. Ron Gargasz, Chair of the United States Legislative Task Force (USLTF) for OCIA International.

What appears herein is a synopsis of the written transcript of the June 1, 1994 comments received from Mr. Gargasz on June 13, 1994. The USLTF noted the difficult but commendable goals of the NOSB process: attempting to unify organic standards, encouraging organic practices, and assuring consumer confidence in the market place. They warn however that:

- vested interests may be drawing the process beyond the intent of the OFPA;
- it may be difficult to legislate a prototypical formula for success in an implementation plan;
- education, crop improvement, and technical assistance are the critical functions of the Certifying Agent;
- dedicated growers and handlers have invested greatly to get organic production to where it is today and to burden them with a further and rising expense of the program would be unfair;
- although the industry was built on a shoelace, a burdensome federal bureaucracy may result.

They also find it disturbing that after three years they still do not know how the role of the private certifier will play out state to state. Nor are they sure that OCIA will be accredited as one certification organization or on a chapter by chapter basis.

Ron also noted a concern for the general malaise within agriculture as a whole due to operation at 56% of a par exchange rate.

Finally, Ron offered language to assure that a certifying agent’s
accreditation extended to licensed agents of that certifier.

12. **Ron Roller, of American Soy Products, Saline, Michigan**

Ron discussed the ongoing questions related to the calculation of the percentage of organic ingredients in a product, excluding water and salt as is required in the OPFA. His main presentation was on soy milk, and he emphasized that soy milk is not just a mixture of soybeans and water, but rather an inseparable product that should be considered as one ingredient. In the case of soy milk, he pointed out, water must be included in the calculation because of its interaction with the soybeans.

13. **Sharon Palmer, of Seed International, Inc., Rio Rancho, New Mexico**

Sharon presented an overview of the closed system greenhouse which she has designed and is perfecting. The system is designed to produce sprouts for human consumption and feed for livestock. It uses aeroponics growing system approved organic inputs and organic seed. She was also asking if the system is eligible to be certified organic.

14. **Yvonne Frost, Certification Director for Oregon Tilth, a nonprofit research and education organization dedicated to environmentally sound agriculture, testified on behalf of Tilth.** Most of the comments made during the testimony were directed towards Accreditation. Tilth supports the OCC and OPPANA positions on Accreditation. In addition, Tilth believes that the initial costs of Accreditation should be absorbed by the NOP. It was commented that at this point, the industry needs the funding jump-start from the NOP.

15. **Diane Bowen, Executive Director for the California Certified Organic Farmers (CCOF), testified on behalf of CCOF. CCOF supports the OCC position on Accreditation. This support for the OCC position is based upon the results of a consumer poll conducted by CCOF.** Ms. Bowen also commented on the transparency issue, stating that CCOF provides reasonable access to certifier and grower information, particularly for the chemically sensitive consumer. Also, CCOF feels that all consumers should have access to certifier and grower information, with the Secretary having ultimate authority on issues of access. CCOF will be submitting further comments to the Accreditation Committee in the future.

In addition, Ms. Bowen briefly addressed a project related to Materials in organiculture. Brian Baker will be helping the development of the National List through a project that received a $20,000 grant. He will be concentrating on these five areas: botanicals, sewer sludge, livestock inputs, inerts, and recombinant DNA.
16. John Phillips, a scientist in the area of "Natural Biotechnology", addressed several issues. These issues included (as they relate to organics) biotechnology, probiotics, and the creation of fermentation products. Mr. Phillips recommended the exclusion of synthetic biotechnology from organiculture. Also, Mr. Phillips has asked for provisions allowing the use of non-toxic bio-technology in organiculture.

17. Renee Robin, attorney and Director of the National Organic Cotton Association (NOCA), led her testimony with an overview of NOCA. NOCA is a non-profit, organic cotton trade association. Currently the acreage for organic cotton in the U.S. stands around 10-15,000 acres. For the most part, her testimony focused on development and formation issues of the NOCA. There was very little comment about the NOP in remarks.

18. Cissy Bowman, the Vice-President of the Organic Crop Improvement Association (OCIA), testified on behalf of the OCIA, Indiana Chapter. Cissy is the State Coordinator of Organics in Indiana. Indiana hopes that the industry can disregard personal and vested interests at this stage of standard development and move towards more consensus building. Indiana wishes desperately to get the National Program up and going soon, for their state is unwilling to move forward on Organics until the national standards are in place.

19. George Siemon, of the Coulee Region Organic Producers Pool (CROPP), spoke for strict, high standards and a strong, progressive Farm Plan. He expressed concerns about how the implementation of the National Program would occur - specifically, that currently certified farmers might be given an advantage over those seeking certification after implementation. He again stated a desire for a new herd clause for dairy animals.

20. Eric Ardapple Kindberg, of Farmer to Farmer magazine, also addressed the new dairy herd clause, and stated his non-support for the suggestion because of the precedence it might begin for other livestock products. He then asked that the national list process and content be better defined in the areas of synthetic categories, synthetic ingredients allowable in handling, and no synthetic ingredients allowed in organic processed foods. He distributed a letter from Allen Rosenfeld of Public Voice supporting percentage organic ingredient listing on labels.

21. Steven Badger, of Seeds of Change, talked about growing and selling organic seeds on a national level. He emphasized that usage of seeds subject to chemical production (including fungicides) for organic production should not be permitted and that work should start now to increase the availability of organically raised seeds for ecological reasons. He explained the difference between treated, untreated, and organic seeds. Treated is treated at harvest; untreated is not treated at
16. **John Phillips, a scientist in the area of "Natural Biotechnology"**, addressed several issues. These issues included (as they relate to organics) biotechnology, probiotics, and the creation of fermentation products. Mr. Phillips recommended the exclusion of synthetic biotechnology from organiculture. Also, Mr. Phillips has asked for provisions allowing the use of non-toxic bio-technology in organiculture.

17. **Renee Robin, attorney and Director of the National Organic Cotton Association (NOCA),** led her testimony with an overview of NOCA. NOCA is a non-profit, organic cotton trade association. Currently the acreage for organic cotton in the U.S. stands around 10-15,000 acres. For the most part, her testimony focused on development and formation issues of the NOCA. There was very little comment about the NOP in remarks.

18. **Cissy Bowman, the Vice-President of the Organic Crop Improvement Association (OCIA),** testified on behalf of the OCIA, Indiana Chapter. Cissy is the State Coordinator of Organics in Indiana. Indiana hopes that the industry can disregard personal and vested interests at this stage of standard development and move towards more consensus building. Indiana wishes desperately to get the National Program up and going soon, for their state is unwilling to move forward on Organics until the national standards are in place.

19. **George Siemon, of the Coulee Region Organic Producers Pool (CROPP),** spoke for strict, high standards and a strong, progressive Farm Plan. He expressed concerns about how the implementation of the National Program would occur - specifically, that currently certified farmers might be given an advantage over those seeking certification after implementation. He again stated a desire for a new herd clause for dairy animals.

20. **Eric Ardapple Kindberg, of Farmer to Farmer magazine,** also addressed the new dairy herd clause, and stated his non-support for the suggestion because of the precedence it might begin for other livestock products. He then asked that the national list process and content be better defined in the areas of synthetic categories, synthetic ingredients allowable in handling, and no synthetic ingredients allowed in organic processed foods. He distributed a letter from Allen Rosenfeld of Public Voice supporting percentage organic ingredient listing on labels.

21. **Steven Badger, of Seeds of Change,** talked about growing and selling organic seeds on a national level. He emphasized that usage of seeds subject to chemical production (including fungicides) for organic production should not be permitted and that work should start now to increase the availability of organically raised seeds for ecological reasons. He explained the difference between treated, untreated, and organic seeds. Treated is treated at harvest; untreated is not treated at
harvest, but is produced from plants raised on soil to which substances not permitted in organiculture are applied; organic is untreated at harvest and raised on organically managed land.

22. **John Ellis, of Colorado Organic Growers**, spoke about the Small Farmer Exemption. He asked that the maximum amount allowable before certification becomes mandatory be raised to $10,000, citing the fact that many farmers gross more than $5,000 on less than 1 acre and certification costs would be a problem for them.

23. **David Haenn, of Ozark Small Farm Viability Project**, offered critiques of the Crops Comprehensive document. He reminded members that farms, fields, and sites are actually certified, not the food products produced on the land. He took exception with the greenhouse and mushroom proposals that allowed organic production without accounting for the requirement that no prohibited materials be applied for 3 years preceding harvest.

24. **Allan Shainsky, speaking for Steve Mahrt**, who raises egg laying chickens, pointed out that egg layers do not need access to the outdoors. In fact, producers have better control over maintaining uniform flock hen weight if chickens are kept inside. He further offered that uniform hen weight would be better achieved if amprolium and synthetic amino acids and vitamins were allowed up until 16 weeks before the start of laying, at which time organic feed would be initiated.

25. **Steve Wisbausm, of Kansas Organic Producers**, asked that the livestock standards remain strict and that medications not be permitted in organic production. He thought that enzymes could be allowed since charcoal is from a natural source and also that there should be no exceptions for small farmers from the total organic feed requirement. Speaking for himself, Steve referenced his recently submitted comments on accreditation and his concern about having a strong audit trail for organic goods.
The initial session of the National Organic Standards Board (NOSB) meeting was called to order at 8:00am by Board Chairperson Michael Sligh. He began by commenting on the anticipated lengthiness of the scheduled afternoon public input session and stated that he expected the session to run until 9pm. The Board members decided that the public input session would be handled in two hour intervals, with a ten minute break every two hours, until all persons have testified. The Board unanimously adopted the agenda as published and determined that copies of the agenda were available at the meeting for all attendees.

Board members in attendance at today's session were: Robert Quinn, Gene Kahn, K. Chandler, Merrill Clark, Margaret Clark, Rich Theuer, Michael Sligh, Craig Weakley, Gary Osweiler, Dean Eppley, Don Kinsman. Yvonne Frost from Oregon Tilth was recognized at the table as the Board selected certifying agent representative for this meeting. Jay Friedman and Tom Stoneback were absent.

Staff members present from USDA were: Harold Ricker, Michael Hankin, Ted Rogers, and Michael Johnson.

Hal Ricker, National Organic Program Staff Director, followed Sligh with the following update on USDA activities:
1. The impact on the Organic Program of Secretary Espy's leaving the Department will be minimal and should have no effect. However, his departure may impact the new Board nominations for the next meeting if a new Secretary is not appointed and approved before that time.
2. The USDA Reorganization Bill has passed Congress and is expected to be signed by the President this week. Pat Jensen is expected to continue as our Assistant Secretary.
3. Julie Anton (Dunn) has left the Organic Program to focus on Economic Research assignments within the Division. Michael
Hankin will be the principal contact for all Committee conference calls while Hal will continue to participate in the Executive Committee calls. This change should allow the Staff to focus on

4. The Department has added two new staff members: Grace Gershuny, who began on September 6th, and Mary Beth Hayden, who will begin on October 17, 1994.

5. The USDA Office of General Counsel (OGC) has been reorganized and the OGC contact with the NOP will be changing. This is not expected to affect the implementation of the Program, although it did delay responses to accreditation questions and comments on the National List petition that were anticipated before this meeting.

6. The European Union (EU) has declined to accept the United States on the provisional list of third countries, mainly due to lack of US Government oversight of certifying agencies.

7. Recently, the Food and Drug Administration (FDA) reported they are facing serious budget cuts in their random Pesticide Residue Testing Program and have informed us that they do not expect to be able to do any residue sampling for the Organic Program. They have placed organic food residue testing as a low priority because they consider it to be a quality assurance issue and not a food safety concern for the general public.

8. The current status of the Board nominations that have been submitted by category are: 15 farmers, 4 processor/handlers, 9 environmentalist, and 4 retailers. The official expiration date of the current 3 year appointments is January 24, 1995. All new appointments will be for a five year period, unless the member is reappointed and would thereby be subject to the limitation of a maximum consecutive term length of six years. Bob Quinn has submitted his resignation to be effective along with the expiration date of the other four Board members.

9. The Budget Report for FY 1994 was reported (See Attachment A). The Board has received $45,000 for FY 1995, although additional funding later in 1995 may be available as it has in previous years (See Attachment B).

At the conclusion of Hal's report, the Board gave a unanimous proclamation for Julie Anton Dunn's outstanding service to the Board and the Program over the last 3 years.

Turning again to the agenda, the approval of the minutes from the...
May 31 - June 5, 1994 meeting in Santa Fe, New Mexico, was tabled until Friday's full Board session.

The NOSB then entered into a discussion concerning the new appointments and the importance of continuity. The question of whether to return old files and materials to USDA was discussed and it was decided that Board members were welcome to keep them since USDA had a copy of all documents. Chandler moved and Weakley seconded to bring the retiring NOSB members to the next meeting. VOTE Yes - Unanimous. Passed. Weakley asked that the next meeting be held before January 24, 1995, so as not to disrupt the National List review process. Because assurance of this could be stated, Weakley moved and Kahn seconded that all retiring members be requested to attend the next Board meeting at Board expense. VOTE Yes - 10. Opposed - .2. Passed. Chandler moved and Theuer seconded a motion to pay for new appointees (if they are already appointed) to attend the next meeting if it is held before January 24. VOTE Yes - Unanimous. Passed. In addition, Zea Sonnabend, NOSB National List review coordinator, was requested to establish a method by which new Board members would review National List research materials and become informed as quickly as possible.

Kahn requested to have Ricker put in writing his response to Quinn's question stating that endorsements or recommendations for nominees from a Board member will not receive additional consideration and that the Board itself should not endorse any nominees. Members, as individuals independent of the NOSB, may endorse nominees.

Sligh submitted a revised draft of a document stating the NOSB's ongoing role and duties (See Attachment C). The document was previously discussed during the Santa Fe meeting. He asked the Board to review the new draft and be prepared to discuss it during the Friday full Board session. He also requested the various Committees to develop recommendations to the USDA on the phase-in implementation time requirements of the Program.

Merrill Clark resurfaced the notion of a consumer conference to be held in conjunction with the implementation of the program. Ricker explained that the Department could not participate in this activity if it were held after the Proposed Rule was published and before the Final Rule is published. He will
research whether the Board members could participate in the
public forum. In addition, he mentioned recent meetings the staff
has held with various consumer and public interest groups.

Ricker will be attending the Codex meeting in Ottawa later this
month as a delegate from the US and indicated he will discuss the
subject matter further on Friday. Sligh made a request that the
NOSB pay for his travel and expenses to this meeting and the
Board unanimously supported this request.

The transitional labeling topic was deleted from the agenda since
Friedman, who was not at the session, was to lead the discussion.
The Board asked for clarification on the definition and
principles document prepared by USDA staff and distributed at the
meeting. Sligh requested that the Board review the document and
discuss it on Friday and be prepared to recommend as to whether
it should be distributed for public comment.

Chandler identified a need to prepare a simple definition of
organics for the next meeting of the Feed Control Officials in
January or February in San Antonio, Texas. It was motioned and
approved unanimously that NOSB appropriations be allocated to pay
for his expenses associated with attendance at the meeting.

The Board then received presentations from three persons from
Washington, DC, who are involved with Federal programs that have
existing regulations that impact the development of the National
Organic Program. The purpose of the presentations was to inform
the Board of Federal procedures and review processes already in
place to evaluate the safety of medicines, food additives, and
crop production aids. First, Dr. Bill Price, Deputy Director of
the Division of Animal Feeds, Center for Veterinary Medicine,
Food and Drug Administration, discussed the established method
for FDA approval of veterinary medicines and animal feed
medication additives. Dr. Price noted that withdrawal times
required on labels of medications already include an extended
buffer period so as to protect the consumer. Residues, he noted,
come from careless practices or failure of the drug users to
observe stated directions.

He stated that it takes 5-10 years for a company to receive a
new drug approval. He confirmed that topical treatments can be
absorbed into the animal's body. In response to a question about
the use of unapproved medicines, such as diatomaceous earth and
homeopathic and herbal preparations, he answered that the use is
not as much a concern as is the liability of the producer if a
residue of the unapproved medication is detected in the finished
product.

Second, Lawrence Lin, Consumer Safety Officer, Office of Pre-
Market Approval, Division of Product Policy, Food and Drug
Administration, discussed Generally Recognized As Safe (GRAS)
ingredients, food additives and processing aids used in processed
foods. He noted that of the 1,000 substances added to food for
non-flavor purposes, 700 are listed as Generally Recognized as
Safe (GRAS) and the rest are regulated as additives. He informed
the Board that food additives are placed in two categories: (1)
added directly to food as ingredients or (2) facilitate
processing and not directly affecting the food product. He
listed the functional categories, such as emulsifiers, leaveners,
sweeteners, pH control and texturizers, or additives, and
clarified that additives are classified as processing aids when
they do not have a functional effect on the final product. He
reviewed the information required by FDA to determine whether an
ingredient should be classified as GRAS, including environmental
studies and detailed petitions. In his opinion, a particular
natural substance may be equal to or greater than a synthetic
substance in toxicity and, in fact, our bodies may not
distinguish between natural and synthetic substances.

Concluding the presentations, Susan Lewis, Chief, Insecticide and
Rodenticide Registration Branch, Environmental Protection Agency,
reviewed the EPA's registration process for pesticides. She
identified 20,000 registered products of which 675 are active
substances and 1,800 are inert ingredients. In registering
pesticides and establishing tolerance levels, EPA looks at human
health factors, residue analyses, and environmental fate and
effects (including toxicity factors and environmental
persistence). Regarding inerts, these ingredients are not
pesticidally active; when used in food products, inerts must have
an established residue tolerance or an exemption from a
tolerance. She explained the different EPA lists of inerts: List
1 (40) contains those inerts classified as being of toxic concern
and new products may not contain these inerts; List 2 (60) inerts
are potentially toxic; List 3 (800) inerts are unknown as to
toxicity; and List 4 ( ) inerts are (a) GRAS substances used in
crop production or (b) inerts of minimal concern that will not adversely affect public health. Ms. Lewis discussed the separate Reregistration Division within EPA. Specifically, she related that pyrethrins are being looked at closely for their effects on human health and may be reviewed by a Peer Review Panel; neem will not undergo reregistration because it was registered after 1984; rotenone, ryania, sabadilla, strychnine and tobacco dust will not be reviewed until after 1995 because of data gaps; and quassia is not registered yet for use in the US. Piperonyl butoxide is now in a Peer Review Panel review to answer significant toxicity questions that have surfaced. She noted that the reregistration process may take many years, and that the Board can stay current on the review process by reading the EPA quarterly reregistration reports.

At the conclusion of the presentations, the Board had a fifteen minute discussion on the NOSB National List review procedures for botanical pesticides. Margaret Clark asked the Board to consider qualifying its recommendations at this time as provisional. Theuer indicated that until the EPA reregistration process is complete that no decisions should be made. Merrill Clark stated her objections to voting at all because of the volume of material to be reviewed, the number of data gaps, and the need for organic production to move away altogether from the use of natural pesticides. Margaret Clark pointed out that the Board was actually voting whether to make recommendations on prohibiting (not approving) these natural substances that currently are used in organic production. Kahn stated his desire to vote now on the botanicals and to use each individual's best judgment. Zea Sonnabend supported Kahn's statement and noted the NOSB does not need to wait to develop its recommendations until the EPA has concluded its reregistration.

Following this discussion, the Board adjourned for lunch. Following lunch, the public input was held on Tuesday afternoon and Tuesday night until 10:00pm. The summaries of the speeches made by the public input participants is available from USDA upon request.
The meeting was called to order at 8am by Michael Sligh. Board members in attendance at today's session were: Robert Quinn, Merrill Clark, Margaret Clark, Nancy Taylor, Gene Kahn, Gary Osweiler, Dean Eppley, K. Chandler, Michael Sligh, Rich Theuer, Tom Stoneback, Craig Weakley, Don Kinsman and Yvonne Frost of Oregon Tilth.

USDA Staff members present were: Michael Hankin, Hal Ricker, Ted Rogers, Michael Johnson, and Grace Gershuny.

**Retailer Certification**

The morning session began with a presentation by Walter Robb of the Whole Foods retail chain about retailer certification. Robb stated that one of the missions of the entire retailer certification dialogue is to figure out how to meet the Act's intent to ensure organic integrity given that the Act exempts retailers from certification requirements. Robb brought forth the concept of Good Organic Retailing Practices (GORP) as a means of developing voluntary retailer standards. Some points he brought out relative to GORP include: a) no discrimination based upon retailer size; and b) the system developed should work within already existing systems and avoid red tape at all costs.

He identified Texas and Maryland as currently having retailer standards in place. Texas has a particularly good model as it involves the retailer making an application to the certifier. The burden of paperwork is maintained by the distributor, but the retailer keeps records to display proof of certification of the retailed goods. Robb then reviewed in detail the component sections of the GORP document and concluded by stating that it is now being submitted to retailers for comment.

Yvonne Frost of Oregon Tilth presented Tilth's recently developed retailer standards. She identified three main differences between the Tilth and the GORP standards: (1) Tilth requires that retailers who hire co-packers to produce private label products be certified because they are considered as processors in this situation; (2) Tilth includes the produce section of retail stores in its certification because it is misleading to consumers to certify the processing part of a store but not the entire store; and (3) most Tilth certified retail stores do not have
training programs.

Robb responded to Frost's report by stating that produce guidelines should not necessarily be mandatory like the processing guidelines and added that retailers want to allow for a third choice of a transitional organic label. Hankin brought forth the point that retailer certification will not fall under the National Program and questioned the legality of mandatory retailer certification under the Act except within State Programs that are approved by USDA. Margaret Clark and Hankin will pursue the development of a solution to ensuring integrity of organic goods to be maintained through sale at the retail level.

Merrill Clark discussed the pest control section of the Handling Plan and requested that this section be expanded to include a description of activities taken to eliminate the need to use chemical pesticides. She reiterated her concern that the same sprays used in conventional facilities should not be used in organic facilities. Theuer responded to Merrill's concern by stating that only botanicals (pyrethrins with PBO) are permitted by the regulatory agencies to be used now in conventional processing facilities and reminded everybody that pest control is not food handling because the products by law cannot come in contact with food products. Rod Crossley of Health Valley stated that water based pyrethrin sprays should be used in organic processing facilities to avoid the residues left by oil based sprays and noted that pest control practices are written in the Code of Federal Regulations. Theuer polled the Processing Committee and it was decided that the Committee would discuss Merrill's proposed changes to the Handling Plan and the Good Manufacturing Practices documents on conference calls and submit its recommendations at the next full Board meeting.

Following the mid-morning break, Weakley initiated a discussion on labeling of organic bulk products by claiming that bulk products not intended for retail sale should not have to contain the same extent of labeling requirements as are currently presented in the Board's labeling recommendation for consumer packaged goods. After a brief debate about the information retailers would like to have on bulk products and the labeling statements that are required by FDA, Theuer agreed to schedule Committee conference call discussions about revision of the labeling document to accommodate Weakley's concerns. Weakley
also requested that the Committee consider recommending that certification not be required for distributors of bulk products packaged for retail sale for which integrity of the package is assured by packaging methods. Theuer agreed to place this on the agenda for future conference calls.

Weakley then presented views on a policy on the use of non-agricultural ingredients in multi-ingredient organic processed foods. Weakley suggested that the Board finalize a resolution for a formal policy as notice to the industry and that the resolution include the ideas that: (1) the Act is not a carte-blanche approval to use non-organic ingredients; (2) processors should document to the certifiers that the organic form of the ingredient is not available; and (3) efforts to locate and develop organic sources of the ingredients are recorded for review by the certifier. It was noted that this issue is already addressed in the Organic Handling Plan recommendation.

The factors influencing determination of availability and the concept of USDA developing an ingredient database was then debated by the Board. Margaret Clark said that availability should be dealt with on a local level. Kahn agreed with Margaret and voiced his opposition to the USDA subjectively defining availability. He asserted that a more appropriate option would be to allow the market to handle this issue. Merrill Clark asked who would monitor availability if not the USDA. Kahn replied that taste and quality is equally as important as availability and that only the manufacturer and not USDA or the certifier should determine usage requirements. Weakley suggested again that the Board respond to the USDA ideas so that a policy isn't developed without some guidance from the NOSB. Joe Smillie reiterated that good faith efforts on the part of the manufacturers should be sufficient and that certifiers should make the judgment without involvement of the USDA. Theuer suggested that the Processing Committee would develop recommended resolution wording on availability for NOSB review at the next meeting.

After deciding to skip the agenda item dealing with a definition of synthetic, the next discussion item considered by the Board was the Accreditation Committee straw poll relative to additional language regarding the use of private certifier's seals and the USDA Shield. Hal preceded the discussion by expressing concerns
received from processors about the potential expense and clutter related to the required presence of certifier and government labels on organic products. Ricker would like the USDA organic shield to be distinct from the USDA inspected product shield and asserted that there needs to be some identification on the labels indicating that national standards are satisfied. Because the Processing Committee already has recommended wording that states private certifier seals should be optional, Theuer and Margaret agreed to approve joint language before the Friday session.

A final comment from the public asserted that the appearance of certifier labels on organic products will only serve to continue to confuse the consumer. Consumers would continue to make choices based upon certifiers and negate the intent of the OFPA to provide uniform buying standards. This was responded to by Frost who claims that Tilth standards and seal are of value to the consumer in deciding which organic products to purchase.

The ability of private certifiers to adopt enhanced standards was subsequently discussed: an initial presentation was made by Tim Sullivan, part-time technical advisor to the Accreditation Committee. His personal interpretation of the law gives discretionary authority to privates on the particular issue of seal use. He suggested, however, that enhanced standards be avoided by the Program because the OFPA is clear in its distinction between allowing the States to develop additional standards while denying this ability to private certifiers.

Quinn commented that the issue of private enhanced standards was supposedly resolved during the Ft. Collins meeting. He believes enhanced standards should be allowed through Program language that requires certifiers to certify to the National Program, but which permits them to require adherence to stricter certification requirements (two-tier) in order to utilize the private seal. Stoneback commented that the private seal is actually a national seal because all private certifiers are accredited agents of the USDA. Theuer questioned whether private certifiers could then require membership and reject certification applications. Diane Bowen of California Certified Organic Farmers, a private certification organization, expressed concerns about the consequences of requiring private certifiers to function uniformly, especially in the area of fee structure. Mark Squire,
a retailer, reminded the Board that the purpose of a seal is to provide the customer with assurance and that most customers would not care whether it was a private or USDA seal. Margaret will return at the Friday session with revised enhanced standards wording.

Lynn Coody's presentation on the materials review process was entered on the agenda because of personal time constraints with the Board's consent. Lynn emphasized that certain compatible synthetic materials belong in organic agriculture because of the community's agronomic responsibility. She expressed her understanding as to the difficulties faced by Board members in evaluating controversial materials and documenting the reasons for the decisions, especially since information is incomplete for most of the materials being considered. The Board was urged to follow the criteria and to review the categories of substances as stated in the OFPA.

Nancy Taylor then gave an overview of the inerts task force. She briefly discussed the outcome of the task force's October 4th conference call that reviewed both Sonnabend's and USDA's proposal for reviewing inerts. She reported that the consensus of the task force was that inerts should not appear on the National List. There was also general discussion on a phase in period for use of inerts on EPA's List 3 while a program of full disclosure of inerts is developed. It was recognized that any strategy other than the one recommended would serve to slow implementation of the program. The Task Force will report on Friday with additional recommendations on phase-in and the review of inerts for the National List.

Zea Sonnabend then proceeded with a progress report of the Technical Advisory Panel (TAP) process. She indicated that the TAP recruitment process is going extremely slow. The areas of insufficient TAP reviewers are livestock and the processing aids for processed foods. Crops material reviewers are also needed. The Board and USDA agreed to continue to assist Zea in the search for more reviewers.

Sonnabend identified certain areas of current confusion that need to be clarified before the review process continues: (1) resolve whether inerts will be reviewed individually according to the OFPA criteria and voted on by the NOSB for placement on the
National List; (2) resolve whether livestock substances must be registered with the FDA for a specific use in order for the substance to be reviewed for that use for the National List (accept use by organic producers of substances not registered for a particular use); (3) resolve whether processed food processing aids and ingredients will be classified according to the synthetic/natural dichotomy and thereby exclude synthetic substances from processed foods; and (4) resolve how to consider substances for entry into the Program that will be petitioned for review in the future but which are not under review at this time.

The meeting then adjourned for lunch.

Reconvening after lunch, the Board discussed the USDA paper, Resolution of Focus. Prior to the discussion, Hankin explained to Board members that they would need to recognize and understand that the Program lead was now switching away from the Board and to USDA. USDA Staff has the expertise and experience to initiate ideas and ask the Board to provide answers to specific questions raised by Staff. This transition is following the natural course of events as the Program moves away from the standards recommendation phase and into the rulemaking and program implementation phase. Following these introductory remarks, Ted Rogers and Michael Johnson read and explained various sections of the Resolution of Focus of the National List program development paper. The paper introduced USDA's program implementation ideas concerning the categories and types of substances to be reviewed under a Federal Organic Program, determination of availability on a national level, and a strategy to achieve full disclosure of inert ingredients and subsequent review by EPA.

After the presentation, Weakley suggested that the Board verbally comment on the paper section by section. The Board agreed, but first decided to make verbal remarks on the document as a whole. Rich Theuer stated that the paper discriminated against manufacturers that refuse to disclose inerts, questioned who would be subjectively determining availability of organic ingredients, and objected to the National List constraints being applied to the category of foods made with organic ingredients. Merrill Clark believes that the Board's role in the standards process would be negated and objects to the Board's views being considered as subservient to USDA's ideas. Michael Sligh made the statement that the Board should continue to have an ongoing role in the program development and denied the assertion that the
NOSB was just an advisory Board to USDA, but instead is assigned an additional non-traditional role of decision making. Margaret Clark voiced her immediate reaction as anger, frustration and sadness. She thought the wording of the paper is such that the National List process would be moving away from a criteria base to a subjective base, and she reiterated her concern over the language used in the paper, referencing phrases like "generally permitted" and "yet to be determined" as problematic.

Gene Kahn felt that the paper was improperly titled, for in fact there is virtually no focus resolution and his impression was that the Board members were over reacting. Gene suggested that the real source of the problem was tension between the Board and USDA over jurisdiction, responsibility, and the institutionalization of organics. Nancy Taylor expressed her uncertainty over the paper's apparent twist to circumvent the Board's power over the National List. She questioned the future of the Board's jurisdiction in the National List process after the rule making process begins. Don Kinsman viewed the paper as an effort to expedite the program development process. Don agreed and disagreed with different portions of the paper, but did not take offense at it.

Hal Ricker explained the dual role of USDA staff - that of assisting the Board in the development of recommendations and also that of evaluating the recommendations before developing the Program. He made clear that the Secretary will create a workable program and that some of the Board recommendations will not be accepted as part of the National Program. Sligh cautioned against allowing the word "organic" to lose its soul through its institutionalization. Kahn went on to elaborate on variances mentioned in the paper by USDA that were especially important to him, including the omission of setting 5% of EPA tolerance as a residue maximum for organic foods and USDA involvement in determining availability of organic ingredients.

Sligh suggested that written comments be submitted to the USDA staff within one month. November 15, 1994 was set as the date for all comments on the paper to be submitted.

The discussion then turned to specific comments on the document. Comments on the General Comments Section included:

* The Organic Plan could become a regulatory nightmare if all of the references to it materialize as the USDA stated in the paper.
The natural/synthetic determination device was assumed to be in place; more specifics are needed than those listed in the General Comments section.

The idea of accepting a synthetic substance that could "unequivocally" be incorporated into an organic management system is unacceptable.

Comments on the Tolerated Substances Section included:
* The position paper of the Crops Committee (May 19), relative to Botanical Pesticides, seems to better address this issue. The Department should give some contour to the phrase "judicious use". The Crops Committee recommends that the certifiers be able to use discretion in the allowable usage of botanicals. The Committee intends to bring that paper to the full Board.
* The staff should not have discussed fungicides or efficacy issues about fungicides. Some Board members stated their intent that seed treatments be placed on the National List to prevent substances such as Captan from being used in organic farming. An additional comment was made regarding the Department's diligence in creating a burdensome restriction on producers to show progress in securing organic seed. The opinion was expressed that if there is an allowance for synthetic substances to be used in organic farming and if each substance is not placed on the National List, then there is a perception of hiding facts from the consumers. A Board member noted that it was decided at a previous meeting that seed treatments were to be individually named on the National List. Another Board member noted that seed treatments are short-lived at best and agrees with the USDA process to handle them.

Comments on the Organic Processed Foods section included:
* The USDA position on "better choice" synthetic substances for processing gives the impression of trying to exercise sovereignty; this would only serve to bureaucratize the process.
* An opinion was given that the USDA recommendation to abandon distinguishing between natural and synthetic non-agricultural ingredients as a violation of the Act. It was expressed that from an operational point of view, the OFPA states that the Board has to take up the natural/synthetic issue.
* Ingredient disclosure, as proposed by the USDA, violates a principle of the Processing Committee that consumers must know everything contained in an organic product; therefore, any ingredient or processing aid used in producing the product must
appear on the label.

* It was also expressed that the USDA role of evaluating the 5% allowance for non-organic ingredients in an organic product is not proper unless a producer is suspect in questionable activities. Certifiers should be allowed to handle those types of decisions. The Department's role should be to verify that certifiers are policing this issue.

* The Act does not address availability or essentiality. Processors should not be told that they can't use a product that is not included on the National List. All products and materials able to be used should be on the National List.

* The USDA reiterated the notion that the Act was intended to be used as a foundation for the program and that all of the Program language is not contained in the Act as written. There are many gaps, and it is the USDA responsibility to fill in those gaps with the advice of the NOSB.

After the conclusion of the discussion, the Board entered a general discussion on the botanical review and voting process. Zea Sonnabend provided details of her responsibilities as Technical Advisory Panel (TAP) Coordinator. She described the process by which substances submitted to her by the Board Committees are transmitted to individual TAP reviewers who have previously indicated their intent to evaluate certain substances. John Brown, the USDA Materials Review Advisor, provides a literary search for technical background information that accompanies the forms sent to TAP members. These forms are designed to solicit the information needed by the Board in evaluating the substances according to the criteria categories set forth in the OFPA. She emphasized that the botanicals under review at this meeting were being considered for placement on the prohibited natural list because the National List does not have a category for approved natural substances. Sonnabend stated that quassia would not be voted on at this time because it is not approved by EPA for use in the US, and that the vote on strychnine should also be postponed because the TAP review is incomplete.

Rather than begin its formal evaluation of botanical pesticides at this late hour (4:45pm) and also to accommodate the schedules of two technical presenters, the Board elected to amend the agenda by postponing the votes on neem and ryania until Thursday and by allowing Brian Baker and Bill Wolf to make their presentations at this time.
Brian presented an excellent overview of botanical pesticide use in California according to region, crop and specific pesticide. He reported that ryania use had decreased because of an increase in popularity of pheromone confusion techniques. He told the Board that less than 10% of CCOF certified acreage is treated with botanical pesticides and that botanicals are used mostly in extreme or emergency situations because of their expense and the limited window of opportunity available to apply them. Most producers are relying on botanicals as an aid only during the transition from conventional to organic farming. Brian said that CCOF does allow producers to use botanicals in successive years while they search for alternatives, but he has found that establishing beneficial habitats decreases the necessity for botanicals.

Bill Wolf of Necessary Organics, Inc., founder of a catalog supply business for organic producers and President of the Organic Trade Association, spoke about botanical use nationwide. He reported that growers in the Southern US have less ideal conditions than growers in California because of the increased moisture and humidity in the South. He has noticed that growers can reduce the amount of botanicals applied per acre through proper management, that very few growers rely on botanicals as first choice treatments for pest control and that botanicals are usually applied specifically rather than broadcast. Botanicals are preferred over synthetics because they break down rapidly in the environment and because of the safety of their breakdown components. He explained that neem actually operates by disrupting the development of the insect larvae and not through toxic action. But because neem (and other botanicals) are unstable, inerts such as petroleum distillates are necessary to be combined in formulation to increase their viability.

The Board concluded the business of the day by reminding each other that the TAP material is information provided to Board members to assist them in evaluating the substances and that decisions can be made even if the TAP materials are not as complete or thorough as some members would prefer.

The meeting was adjourned at 5:20pm.
The meeting was called to order by Michael Sligh at 8am. Members in attendance were: Robert Quinn, Merrill Clark, Margaret Clark, Nancy Taylor, Gene Kahn, Gary Osweiler, Dean Eppley, K. Chandler, Michael Sligh, Rich Theuer, Tom Stoneback, Craig Weakley, Don Kinsman and Yvonne Frost of Oregon Tilth.

USDA Staff members present were: Hal Ricker, Michael Hankin, Ted Rogers, Michael Johnson, and Grace Gershuny.

**BOTANICALS SPECIAL REVIEW**

The review of botanicals was led by Dr. John Brown, USDA Materials Review Coordinator. Dr. Brown began by indicating that the clause in the Act relative to the special review of botanicals does not require a vote to accept specific botanicals for use in organic farming, but rather a vote to discontinue its use by placing it on the list of prohibited natural substances. He explained that the information contained in the botanicals review notebooks furnished to each member is based upon materials found in various toxicological studies and other sources. He informed the Board again that quassia and strychnine will not be reviewed because quassia is not registered by the EPA and no researchers have been identified yet to review strychnine.

Merrill Clark summarized her handouts from yesterday regarding articles by Elliott Coleman, an organic farmer. Merrill pointed out that the Board is voting on generic substances and not on formulated products. The concern of consumers who purchase organic food, she stated, is that they think they are buying food that has been grown without the use of pesticides when in actuality the food may have been raised with the use of botanical pesticides. She suggested that botanicals should be phased out of organic production, alternatives found to their use, and that the Board should adopt recommendations to wean producers away from using botanicals.

Sligh suggested that USDA press releases should contain the Crops Committee wording about the restricted use of botanicals in organic farming, a description of how the National List substances are incorporated into the organic farming methodology, and clarification that the Board will revisit its botanical reviews as new information is available from EPA.
Theuer noted that 9 votes will be needed to pass a motion to place a botanical on the prohibited natural list (excluding abstentions) in order to satisfy the 2/3 approval requirement of the OFPA.

Hankin reiterated that the Board's decisions on its recommended proposed national list will be further evaluated by the Secretary before the Proposed National List is published in the Federal Register. Taylor, Weakley and Margaret Clark expressed their interpretation of the OFPA that the NOSB has purview over the National List. The USDA responded that the Board's responsibility is to develop and provide recommendations, not the final standards or the final National List of substances.

NEEM

Dr. Brown began with an overview of neem. He noted that all of the information that will be presented by Zea or himself is contained in the notebooks provided to each Board member. John reviewed the Lethal Dose (LD50 - the dose necessary to kill 50% of the test animal population) of neem and reported that the two people who died in another country actually died from aflatoxin poisoning related to harvesting the neem seed. Neem was registered after 1984, so it is not under reregistration review by EPA. Brown reported that neem is gentle on beneficials.

Quinn requested in the future that the Codex and international organic organizations' status be included for each substance along with the private and State certifier status and this was agreed. Osweiler requested more information on long term chronic studies in addition to acute toxicity studies.

Joe Smillie reported that neem is used worldwide in controlling pests for grain storage but it is not yet registered in the US for this purpose. Dick Nielsen of W.R. Grace said neem is now registered in California and that Neemix, their trade name, was registered in all fifty states. Brent Wiseman said that Texas even allows growers to obtain a special permit to apply neem on crops for which it is not registered because of its safety.

Margaret Clark moved to place neem on the prohibited natural list. Kinsman seconded. VOTE Yes - 0. Opposed - 13. Failed.

Unanimous vote to keep neem off the prohibited natural list.
RYANIA
Dr. Brown expressed concern that there may not be sufficient information to conduct a vote on ryania, but the Board decided to continue with the review and decide on postponing the vote at the conclusion of the presentation. Margaret Clark read a letter from a Washington State apple grower, Bruce Spencer, about the benefits of using ryania to control codling moth and about the lack of alternatives available to organic orchard managers. Sligh moved to table the vote on ryania with a second by Merrill Clark. VOTE Yes - 6. Opposed - 7. Failed. Kahn and Weakley stated that they are familiar enough with ryania to proceed with a vote. It was clarified that the Board has more information than the TAP reviewer received and that there should be sufficient research materials available in the notebooks to make a Board decision on a recommendation. After individual members provided comments about the adequacy of information and the ability of the Board to reconsider any vote after new information is received, the Board decided to vote on ryania. Theuer moved to add ryania on the list of prohibited naturals and Kahn seconded. VOTE Yes - 0. Opposed - 11. Abstain - 2. Failed. Ryaania is kept off the list of prohibited natural substances. John Brown will continue to access information to complete the data gaps.

PYRETHRUM
Pyrethrum is usually combined with piperonyl butoxide (PBO) when used in organic production in order to increase its effectiveness. The TAP reviewer recommended that the use of pyrethrum be continued with restrictions. Pyrethrum does contribute to skin irritations and respiratory ailments in humans. Brown said these problems occur most often when the substance is misapplied or precautions are not observed.

Sligh read a letter from Lynn Coody, a TAP reviewer, who stated her desire to have more information, but who also stated her opinion that pyrethrum could be accepted. Brown and Sonnabend will attempt to provide TAP review persons with additional preparatory information in the future if it is requested by the person and if it is available from their resources. Sonnabend reported that no private certifying agency currently prohibits the use of pyrethrum and Osweiler reported that it is used widely in conventional production with very few problems known.
Rod Crossley of Health Valley Foods stated that pyrethrums are an essential component of pest control in processing plants and pose little danger when used according to directions and within a complete pest control program. Reese Moorman asked that its use be continued to allow for transition to organic methods and until alternatives are found by industry.

Theuer moved to place pyrethrum on the list of prohibited natural substances and Kahn seconded. VOTE Yes - 0. Opposed - 10. Abstain - 3. Failed. Pyrethrum is kept off the list of prohibited natural substances. The Board approved a 15 minute break and agreed to reconvene at 10:15.

QUASSIA

Sligh moved and Kahn seconded that quassia not be reviewed at this time because it is not registered with EPA for use in the US. Suzanne Vaupel stated that many products are actually used that are not registered and that quassia is one of them. The Board clarified that its decision not to review quassia would not prohibit its use by those producers who choose to use it despite the lack of proper registration. VOTE to table quassia. Yes - 10. Opposed - 3. Passed.

STRYCHNINE

Sligh moved and Merrill Clark seconded to table a vote on strychnine because of the lack of a TAP review. John Brown stated that he is searching for a TAP reviewer and expects to have the review completed for the next meeting. Theuer expressed that he would be able to vote with the information presented. Taylor and Margaret Clark spoke to the importance of strychnine use until a synthetic with no secondary kill effect is approved. VOTE to table yes - 8. Opposed - 3. Abstain - 2. Vote to table is passed.

Before the review of sabadilla was initiated, Joan Clayburgh of the National Coalition against Pesticides was allowed to make a presentation to the full Board about her group's opposition to the use of botanical pesticides. She declared that the Board should err on the side of safety in its attempt to balance consumer vs. producer needs when evaluating substances. Ms. Clayburgh was specific about the possibility of broad environmental damage occurring from botanical applications and...
asserted that the NOSB review should not be conducted until EPA
provided information to close all of the data gaps. Kahn made
the point that without the benefits afforded by botanicals,
organic farmers may switch to conventional methods. Theuer
claimed that allowing PBO decreases the amount of botanical used
by 10-20%. Merrill Clark questioned how the consumers should be
informed about botanical use on organic foods that they purchase
and called for further education and clear disclosure of
botanical use.

**SABADILLA**

John Brown explained that one TAP report completed for sabadilla
was confusing as to its recommendation for List placement and
that another TAP report (from Bill Wolf) was not returned.
However, Bill Wolf was present to inform the Board directly about
the information that would have been included in his report.
Bill described how sabadilla came back into popular use in 1984
when effective alternatives could not be found for application to
ture plant bugs. It is an irritant to mucous membranes and in
fact is found in sneezing powder. Its LD-50 shows that it is
many times less toxic than rotenone or pyrethrum. He testified
that he is somewhat concerned about the data gaps on sabadilla,
and he corrected the written information in the Board members'
notebooks by clarifying that only the ground seeds are used (no
extraction process) and that inerts associated with sabadilla's
formulation are readily available.

After Bill Wolf's testimony in which he also recommended that
sabadilla not be placed on the list of prohibited natural
substances, Margaret Clark moved and Dean Eppley seconded to
place sabadilla on the list of prohibited natural substances.
Merrill Clark stated her disturbance that the Board was using a
risk assessment approach rather than following the criteria as
stated in 2119m of the OPPA. Brown declared that the information
before the Board was prepared with the goal of providing enough
information to evaluate the substance according to the required
Sabadilla is kept off the list of prohibited natural substances.

**TOBACCO DUST** (actually nicotine and nicotine derivatives)
Sonabend began the review by explaining and apologizing for the
confusion involving tobacco dust, nicotine and nicotine
derivatives. Nicotine was the substance originally placed on the
Crop Committee's list intended for TAP review as a prohibited natural, but it was transcribed with tobacco dust, which is a natural fertilizer, on one of the revisions. She continued that tobacco dust is approved by some certifiers as a fertilizer, but this substance is not registered with EPA as a botanical pesticide and is not being reviewed now. Rather, nicotine and nicotine derivatives are the botanicals and should be considered for placement on the prohibited natural list.

Theuer stated and it was generally agreed that nicotine sulfate is a synthetic ingredient and not a natural botanical pesticide. Zea responded that nicotine by itself is extracted and still is considered a natural substance and appropriate to be considered for the prohibited natural list. The Board concurred that it should be voting on nicotine only and not on tobacco dust or nicotine sulfate.

Theuer motioned and Merrill Clark seconded to place nicotine on the prohibited natural list for all uses. Dave LaTourneau, a tobacco grower and organic inspector, spoke to prohibiting nicotine sulfate and allowing tobacco and tobacco dust. George Siemon, an organic farmer and dairyman, spoke to the potential uses of tobacco in livestock care and asked the Board not to automatically reject tobacco. David Haehn recommended separating nicotine from tobacco and pleaded that philosophical prejudice toward tobacco not become a factor. Brent Wiseman noted that tobacco can be useful in certain situations because it can be grown and used on the same farm and is readily available as a tool for organic farmers. Zea Sonnabend suggested that the Board prohibit only commercial preparations of nicotine. VOTE on Theuer's motion. Yes - 4. Opposed - 7. Abstain - 2. Failed.

Taylor moved and Sligh seconded to table the previous vote on nicotine until more information is available and John Brown can elucidate on the differences between nicotine, nicotine sulfate and tobacco derivatives. VOTE Yes - 12. Opposed - 1. Passed.

ROtenone
Brown reported on the low LD50 of rotenone when tested on rats, its toxicity to fish and birds and on no records of fatalities or poisonings in humans. Kinsman reported that it is used widely for lice, mange and mites in conventional production. John clarified that the Board is reviewing the natural ground root and not synthetic preparations or the synthetic extracted form of
rotenone. Theuer offered that the half life of rotenone is long and the required 24 hour withdrawal time may not be long enough and that there are many alternatives. Brian Baker stated that rotenone is restricted in its applications by private certifiers and that the California Senate repealed its registration because of incomplete information and not because of health reasons.

Merrill Clark requested that the Board take actions to move production away from the use of all botanicals by considering a phase out of all botanicals. David Haehn spoke to its usefulness in livestock and aquaculture. Brian Baker informed the members that rotenone has been debated within the organic community for years and despite its shortcomings and data gaps, there are no alternatives because of the natural/synthetic rule.

Quinn moved and Kinsman seconded to place rotenone on the prohibited natural list. VOTE Yes - 1. Opposed - 8. Abstain - 4. Failed. Rotenone is kept off the list of prohibited natural substances.

The Board then adjourned for lunch. After lunch, separate meetings of the Livestock and Accreditation Committees will be held before the Board participates in a tour of Fetzer Organic Vineyards and Winery at 3pm.

OCTOBER 14, 1994

FULL BOARD SESSION

Members in attendance were: Robert Quinn, Merrill Clark, Margaret Clark, Nancy Taylor, Gene Kahn, Gary Osweiler, Dean Eppley, Michael Sligh, Rich Theuer, Tom Stoneback, Craig Weakley, Don Kinsman and Yvonne Frost of Oregon Tilth.

Staff members present from USDA were: Hal Ricker, Michael Hankin, Ted Rogers, and Michael Johnson.

LIVESTOCK COMMITTEE

Merrill Clark opened with the discussion of the Livestock Committee additions on outdoor access language to the Healthcare Practices document and the new language on antibiotic and parasiticide use in laying hens. Theuer questioned whether species specific language on parasiticide usage had been developed as had been agreed upon at the meeting in Santa Fe.

Merrill replied that the Committee had decided not to take that
route because it decided that the general policy language provided sufficient guidelines and the Committee did not want to set precedent by allowing exceptions to the general policy in its recommendations. Osweiler stated that the National List petition process should provide the means by which persons request use of a substance for a specific purpose.

At this time, the livestock discussion before the Board was temporarily suspended to hear a presentation on PBO from Bill Wolf who would only be able to remain at the meeting for a short while.

**Piperonyl Butoxide**

Bill Wolf made comments relative to yesterday's presentation by Joan Clayburgh of NCAP. Bill asserted that the statement that the OFPA was a food safety Act is inaccurate because the OFPA is actually a means to provide a label for a production management system. Bill also disagreed that PBO is a carcinogen, citing that the concern over PBO's carcinogenic properties stems from a single study that showed liver cancer development in a laboratory rat. He recommended that PBO not be placed on the prohibited natural list. He also agreed that the use of botanicals as a group should eventually be eliminated from organic systems.

**Livestock Committee**

The Board resumed the livestock discussion with the issue of outdoor access for livestock, especially chickens. Quinn and Hankin exchanged comments about whether one flock of chickens that lives indoors its entire life because of weather conditions can be considered organic when another flock of chickens in a better climate is required to be outdoors to be certified as organic. Hankin noted that the issue is not the chickens themselves, but rather the type of housing system upon which the care is based. Kinsman noted the importance of developing a definition for "confinement" to clarify whether this means in a building or in battery cages.

Anne Schwartz interjected that confinement was addressed in the original Senate bill but the language was omitted from the OFPA as a political decision; this robbed the National Program of a fundamental principle. Steve Mahrt asked that broilers and layers be considered separately because their needs are different. Quinn reiterated that good indoor conditions should
be adequate and acceptable for certified production. Sligh discussed the current trend toward producing free range/antibiotic free broilers that are not organically labeled and wondered about the confusion that the consumer would experience if organic broilers could be raised in confinement housing. He cited the strong sentiments in Europe and internationally that the organic label represent an outdoor access requirement. Steve Mahrt stated that the question is truly whether the birds are in cages and not whether they are roaming indoors or outdoors.

Kahn asked that the outdoor access wording be returned to the Committee to clarify the confusion around confinement and the conditions that might comprise acceptable outdoor access. Osweiler concluded that this issue comes down more to philosophy than to healthful practices and acknowledged that most of the input received at the Livestock Hearings was against confinement. Merrill made a motion and Quinn seconded to accept the October 13, 1994 proposed additions to the Healthcare Practices Final Recommendation. VOTE Yes - 0. Opposed - 12 Unanimous. Failed.

Kahn expressed the need for the Board to set a clear precedent as to what direction the Committee should pursue relative to the confinement issue. Kinsman suggested developing guideline language for certifiers to follow, rather than including required production practices in the regulatory language. Taylor moved and Merrill seconded to accept the following language as amendment to the Final Recommendation: "Confinement of livestock with the exception of fish to an indoor housing facility without the opportunity for regular exercise and access to the outdoors is prohibited." VOTE Yes - 4. Opposed - 8. Failed. The will of the Board is that the definition of confinement be worked on further by the Livestock Committee.

Merrill then distributed new wording for line 565 of the Organic Farm Plan. The language reads: "Seasonal access to grazing pasture should be considered a fundamental principle for all livestock species. A producer's Farm Plan should demonstrate movement toward this goal, as well as document that sufficient land resources exist on the farm to provide adequate grazing while protecting soil and water resources". Kahn said that this wording is premature until the confinement issue is resolved and
that this amended language should be set aside until a later date. All agreed to this resolution.

The last Livestock Committee topics were the additions (dated October 13, 1994) to the Board Final Recommendations on antibiotic and parasiticide use to establish guidelines for antibiotic and parasiticide use in organic laying hens. Quinn stated his belief that the guidelines should be patterned more like the guidelines for organic milk production than for organic beef production given the similarity in relation between cows/milk and chickens/eggs. Merrill disagreed with this comparison. Theuer requested and the Board agreed to delete the word "synthetic" before "antibiotic" and "parasiticide."

Osweiler agreed with Quinn as to the inconsistencies. Steve Mahrt stated that his market would be lost if he had to sell his hens, but that it would be maintained if he simply had to observe a withholding time. Dick Krengel spoke to the rare use of antibiotics in layers and the even rarer need to use them on broilers raised indoors. Merrill moved to approve the wording to amend the Antibiotic Final Recommendation and Weakley seconded.

VOTE Yes - 3. Opposed - 7. Abstain - 2. Failed. The parasiticide wording was not voted on and will be reconsidered by the Committee along with the antibiotic amendment for the next meeting.

ACCREDITATION
Margaret Clark reported to the Board about the discussions during the Committee meeting yesterday concerning minor infractions and random spot inspections. Margaret related that certifiers seem to respond to minor infractions on a case by case basis and do not currently have policies in writing. The Committee will develop a list of ways that certifiers can help prevent minor infractions from occurring. Regarding spot inspections, the Committee will wait to receive responses to Theuer's draft of spot visit concepts from the Organic Certifiers Caucus before revisiting the item before the next Board meeting.

The Board then turned to the issue of costs of the first round of accreditation. Sligh introduced NOSB resolution #2 "Concerning the first round of accreditation costs", and explained the resolution as follows: The Board passed a first resolution at the October 1993 meeting in Arkansas which requested that USDA appropriated funds be used to fully cover the costs associated...
with accrediting certifiers during the first round. Sligh indicated that the resolution reflected the concerns of certifiers and the Board now that USDA is publicly presenting proposals putting forth projected expenses that may have to be paid by the certifiers during the first round. The resolution requests that the USDA specify in writing to the NOSB (1) why the USDA failed to act upon the first resolution after being given verbal assurances; (2) what specific costs of the first round will be carried by existing USDA appropriated funds; and (3) what costs are estimated for the certifiers to carry. Teuer said that the language of #1 was too strong, and Ricker stated that he could not respond to the resolution because of the tone with which statement #1 had been written. The Board unanimously willed that item #1 be deleted from the resolution and then VOTED Yes- 9 Abstain - 2 to accept the resolution as amended.

Robert Beauchemin, representing the Organic Crop Improvement Association (OCIA), a private certifying organization, then made a presentation about OCIA's experiences with accreditation costs. OCIA has analyzed the expenses related to licensing 17 of its 60 chapters and found the following: the evaluations required an average visit of two and a half days and the evaluation reports averaged 60 pages. The average per chapter cost was $2,500, excluding follow up monitoring. He also reported that he had received information from the International Federation of Organic Agricultural Movement (IFOAM) Accreditation Program that showed their accreditation time averaging 115 hours per certifier including monitoring of field visits. The four year cycle cost for this program was around $12,000 and was influenced more by the certifier's readiness for the accreditation process than by its size. Additionally, he asserted that the number of certified farmers is not currently increasing in the US and that the EU has also experienced a leveling of certified acreage.

Ricker replied that we expect organic livestock and livestock products to provide growth but that he is not projecting any costs on anticipated growth. Our research shows that 3,500 farmers are certified and 1,500 are non-certified organic; figures are not available for organic processors. The US cost model will probably be based on an annual assessment fee plus the actual costs of accreditation.

Margaret Clark reported that the Committee has not had the
opportunity to further develop its current brief list of areas in which States should be permitted to develop additional requirements, but they may take this up and submit recommendations to the full Board before the next meeting.

Margaret requested that discussion on additional language regarding the required or optional use of the USDA shield on labels be tabled so that the Committee could have more time to analyze the results of its straw vote on the subject. The Board agreed.

Finally, the Board discussed the Committee draft language on the use of the certifying agent's seal. After brief comments about the proposed language, minor changes were made and the following language was adopted as a Board resolution after a motion by Weakley and a second by Merrill Clark on a VOTE of Yes - 10. Abstain - 2. Passed:

"The Board recommends that all certifying agents, both State and private, who are accredited under the National Organic Program, will be allowed to continue full use of their seals, trademarks or logos."

The Board decided to postpone a vote on the provision for additional standards promulgated by private certifiers until the afternoon session.

INTERNATIONAL

Sligh initiated this Committee section of the full Board meeting by explaining that the Codex Alimentarius process involves an eight step process for approval by participating countries and that the organic standards were now at the seventh step. He specified some of the differences between the Codex proposals and the US recommendations:

* Codex requires manure from organic sources
* Codex has a 2 year transition period compared to 3 in the US
* Codex has more liberal livestock production standards
* Codex has an approved substance list whereas the US list will be of approved synthetics and prohibited natural

Ricker reported that additional issues had surfaced within the last two weeks: (1) 3 of 4 responding countries want to prohibit genetically modified seeds, products and organisms; (2) Australia is requesting three times the established withholding time when
livestock medications are used; and (3) Spain is requesting that certain materials (that would seem to be permissible under the National Program) be removed from the Codex annexes. After noting that IFOAM encourages whole farm conversion to organic production, Stoneback moved and Sligh seconded that "In light of the material list amendment and accreditation confusion, the US delegation should have the Codex Committee on Organic Standards follow a course of deliberate speed until the USDA has had a chance to implement its program based on the Board recommendations. VOTE - Yes - unanimous. Passed. USDA agreed to develop a list of imported products from specific countries requiring fumigation before being allowed entry into the US and to compare the Codex list of processed food ingredients and processing aids with the Committee's recommended list.

The Board adjourned for lunch at 11:55am.

PROCESSING
Reconvening at 1:15pm, the Board moved on to the Processing section of the full Board meeting. Theuer informed the members that the Committee is preparing a number of documents for the next board meeting. The subject matters being developed are: (1) pest control amendments to the Handling Plan and Good Manufacturing Practices; (2) allowances to the specified labeling recommendations for bulk products packaged to assure integrity; (3) exemption from certification of distributors who only handle packaged goods where there is no opportunity for compromise to the organic product; (4) determination of the criteria and oversight factors affecting availability of organic ingredients.

Theuer requested the Board to consider accepting Section 4 of the Board Draft Recommendation on Labeling of Processed Foods as a Board Final Recommendation. This section pertains to foods containing organic ingredients that comprise less than 50% of the finished product or to foods that contain any percentage of organic ingredients but have a prohibited substance, processing aid or food additive involved in its manufacture. The wording restricts the use of "organic" to the ingredient listing statement and provides for documentation to be provided by the processor to verify the authenticity of organic ingredients, when necessary, but does not require certification or routine verification. Theuer motioned and Stoneback seconded to accept Section 4 as a Board Final Recommendation. VOTE Yes - 9.
Opposed - 0. Abstain - 1. Passed.

CROPS

The Crops Committee announced that it had three main items on its agenda: improving the process for the review of materials, a Board vote on PBO for the approved synthetic list and language on the preferred use of botanical pesticides in organic production.

First, Kahn asked John Brown to discuss the changes that he will be making to improve the review packages for materials that are presented to members prior to a meeting. These improvements will include: (1) international status of each material; (2) acute and chronic toxicity information; (3) historical use data; and (4) a check-off list for each material according to the criteria stated in Section 2119m of the Act.

Sligh urged, in lieu of reestablishing the Materials Committee, that conference calls be initiated to handle materials issues, and he expressed the importance of the materials review procedures being separate from the regular recommendation process. Sonnabend agreed to coordinate the agenda for materials conference calls. The Board unanimously decided that there should be regularly scheduled materials review process conference calls between John Brown, Zea Sonnabend, the chairpersons of the Livestock, Processing, and Crops Committees, and USDA staff.

The Board reverted back to the discussion regarding the use of PBO that had been ongoing throughout the week. There was first a discussion on the history of PBO for clarification. John showed that PBO is extracted from natural sources, but explained that PBO is considered a synthetic substance because of the process by which it is extracted from the natural source; the Board concurred. Zea noted that its historical use is mixed because its classification as a natural or synthetic has been in doubt. PBO was considered natural, but was found to be synthetic after its manufacturer finally disclosed the necessary information; at that point, certifiers started prohibiting it because of philosophy, not necessarily because of environmental or health concerns. It was previously considered as an approved synthetic in California, but it is currently prohibited there because there are no exemptions for allowed synthetics in the revised California law. Yvonne Frost explained that, historically, PBO was found on various certifiers' materials lists, and so it was
allowed by Oregon Tilth for a while, but now it is prohibited. OCIA does not allow the use of PBO because OCIA could not determine how PBO acts, but Washington State does allow its use. Oregon prohibits PBO use because it is prohibited by Tilth and Tilth prohibits it because it is synthetic. It was indicated that Tilth, Oregon and California would change their regulations if the National Program permits PBO.

Brown explained that PBO acts as a synergist and reduces the amount of botanical pesticides that have to be used by 5-10%. It has a very high LD-50; a very low toxicity, and it has been concluded that environmental exposure is not a risk associated with the use of PBO. There are currently no synergistic alternatives for PBO.

Eric Kindberg reminded that the Board that any active synthetic substance placed on the approved synthetic list has to belong to one of the categories stated in the OPFA. (Board and USDA representatives had decided at a previous meeting that substances currently in use in organic production and processing would be evaluated without regard to category and that the interpretative requirement that the substance must belong to one of the categories would be discussed after the substance had been accepted for the National List.) Rod Crossley stated that processing plants require a PBO/pyrethrum combination because rotenone use is prohibited. David Haehn also made the point about approved synthetics first having to be classified in one of the categories before being evaluated.

Sligh informed the Board that he had called EPA and found out that PBO has been under the reregistration process since 1988; that it is currently in a Peer Review Study because of inconsistent lab research reports; and that the reregistration is anticipated to be completed in October 1995. Based on this information, Sligh moved and Quinn seconded to table a vote on PBO. VOTE Yes - 6. Opposed - 5. Abstain - 1. Failed. Kahn moved and Eppley seconded to place PBO on the list of synthetic active ingredients for the National List and restrict its use to a synergist with botanicals according to EPA regulations and subject to further use restrictions. VOTE Yes - 7. Opposed - 4. Abstain - 1. Failed. John will obtain further information on PBO for a possible reevaluation at a future meeting.
Finally, Kahn distributed a Crops Committee paper (10/14/94) about guidelines for a policy on the use of botanical pesticides in organic production. Merrill clarified that the paper pertained to generic active substances and not formulations. Weakley moved and Quinn seconded to accept this as a Board Final Recommendation. Amendments to language that were first discussed and approved are: (1) add PBO summary; (2) add "generic" in line 34; (3) delete lines 38-42; (4) add "livestock and crops" at line 64; (5) delete "USDA accredited" at line 74; (6) delete "be authorized to use at their discretion"; and (7) change line 76 to read "shall assure". Quinn asked USDA staff to continually update the dates of action for the statuses of the botanicals and PBO. VOTE Yes - 12. Unanimous. Passed. Ted Rogers urged the Board to adopt similar language governing the use of all substances approved for the National List.

The Board then returned to the issue of additional standards promulgated by private certifiers and considered the following refined wording developed by the Committee:

"The Board recommends that certifiers will continue the evolution of the certification process and production requirements that may be additional to those of the Federal Program. These certifiers may make the use of their trademarks, seals and logos contingent on the fulfillment of these requirements. Such requirements must be published and available to all applicants."

Theuer asked to insert wording that the requirements should conform to the National Program, but Weakley said that this is understood without being stated. Hankin asserted his preference that language be included to indicate that the additional requirements would be reviewed by USDA, but the Board rejected this idea claiming that this too was implicit in the accreditation process. Weakley moved and Sligh seconded to accept the language as part of the resolution. VOTE Yes - 10. Opposed - 2. Passed.

Following a 15 minute break, the Board reconvened at 3:25 to conclude the week long meeting. Quinn stated that the PBO vote to table the substance evaluation should only have required a simple majority vote and therefore the vote to approve PBO for the list of synthetics should not have occurred. Sligh stated that he will review the Board's operating policy on this and report back at the next meeting.
The Board voted unanimously to adopt the June 1994 Santa Fe meeting minutes as revised.

Sligh asked for the will of the Board to expand the mission of the inert task force to include the development of a recommendation to the NOSB on how a review of inerts should be handled under the OFPA requirements for the National List. Approved Unanimous.

Margaret Clark made a motion that was seconded by Kahn to accept the document previously submitted for review by Sligh about the "Continuing Role of the NOSB". Approved Unanimous.

The USDA Program Staff paper on the principles and definition of "organics" was briefly presented to the Board by Ricker who explained that it was written to satisfy a Board request from the Santa Fe meeting. Merrill said the paper wasn't specific enough to organics; Kahn said to delete overused words; and Kinsman expressed the need to develop a simpler consumer-oriented definition. It was decided that the Board would submit written comment to the USDA by November 15, 1994.

A discussion on a transitional label was the next topic for debate. Kahn expressed the industry need for some type of transitional labelling program. Sam Fahr of the Arizona Dept. of Agriculture noted that their transitional labeling program uses the terminology "certification pending". Ten members of the Board supported a transitional label in a straw vote, although they recognized the difficulty of the use of transitional organic products in multi-ingredient processed foods. The Board supported USDA Staff's intention to move ahead with exploring a transitional label that maintains all components of organic production standards except the three year rule for no prohibited substances having been applied to the land.

The discussion of implementation guidelines was initiated with a reminder that industry, Committees and certifiers were to have provided comments to USDA before this meeting. Theuer told the Board that specific phase-in recommendations were not needed for organic processed foods because of the time already permitted by FDA for label changes. Kahn said the Crops Committee will provide an update at the next meeting and Merrill said the Livestock Committee will examine the issue on conference calls.
Katherine DiMatteo said that the Organic Trade Association will submit comments after a workshop at Asilomar.

The week of March 20th was agree upon by members as being most convenient to hold the next meeting. North Carolina, Texas and Florida were discussed as potential sites. The Board voted to accept Florida as the next meeting location in hopes of touring organic and transitional organic citrus production.

An official thank you was made to Diane Bowen and CCOF and a round of gratitude was extended to any member of the Board who may not be attending future meetings. Michael Sligh made a motion to adjourn. The meeting was adjourned at 4:35pm.
LIVESTOCK COMMITTEE MEETING

October 13, 1994
Rohnert Park, California

Board members in attendance: Merrill Clark, Gene Kahn, Gary Osweiler, Bob Quinn, K. Chandler, Don Kinsman, and Tom Stoneback.

Staff members present: Ted Rogers and Michael Johnson.

Merrill Clark, Chairperson of the Livestock Committee, called the meeting to order at 1:25pm.

The purpose of the Livestock Committee meeting was to discuss the "access to outdoor" proposal (10/13/94) being developed as an amendment at line 278 to the Board Final Recommendation on Healthcare Practices.

Bob Quinn moved and it was seconded by Don Kinsman to delete "temporary" from line three and line six, and to add "and well being" in line eight after safety. The rationale for flexibility in the language is to give more discretion to the certifier in permitting exceptions to mandatory outdoor access. VOTE: Yes - 4. Opposed - 2. Passed.

The members then entered into discussion to change the wording in line 11 regarding a recommendation that pasture be provided, but K. Chandler subsequently moved and was seconded by Bob Quinn to not make changes to the wording as presented in the proposal. VOTE: Yes - unanimous. Passed.

Just before the close of the meeting, Anne Schwartz submitted some proposed amendments and additions for the document, but the committee did not agree to review them.

The meeting adjourned at 2:35pm.
ACCREDITATION COMMITTEE MEETING

October 13, 1994
Rohnert Park, California

Margaret Clark, Chairperson of the Accreditation Committee, called the meeting to order at 1:15pm. Other Board members present: Nancy Taylor, Michael Sligh, Dean Eppley, Rich Theuer, and (Yvonne Frost). USDA Staff: M. Hankin, H. Ricker, and G. Gershuny. Many members of certifying agencies were in attendance.

Sligh began the meeting by reporting that there was confusion as to whether USDA was going to be able to cover the first round of accreditation costs from appropriated funds. Sligh moved and Margaret seconded to have the Committee approve his developing a resolution before Friday that would be presented to the full Board for a vote. The resolution would require USDA to prepare in writing before the next meeting a more detailed analysis of accreditation costs that would address the division of costs and other Program expenses between USDA and certifiers. VOTE Yes - Unanimous. Passed.

Ricker responded to this vote by stating that although it was USDA's intent to cover all first round expenses, the Budget limitation initiative may restrict USDA's ability to carry out its intent. USDA will try to cover training, Peer Review Panel, and some related costs from appropriated funds. Ricker estimated that the certifiers may need to allow $2,500-$3,000 annually for accreditation related expenses, but emphatically asserted that these are only ballpark figures. Ricker also informed the members that preliminary talks with OGC indicate that certifiers will have to provide liability insurance, but not the much more expensive surety bond that was being rumored.

Turning to the issue of minor infractions, Diane Bowen of CCOF presented a summary of certifiers' policy on minor infractions. Minor infractions was defined as "Departure from any organic practice that will not corrupt the organic integrity of the product." Examples were given as inadequate buffer zones, using fish fertilizer with urea and using unapproved brand name formulations. Anne Mendenhall of Demeter Association said that they handle these on a case by case basis without trying to generalize and establish a formula for punitive measures.
Margaret thought that certifiers needed to develop a policy to ease the nervousness associated with acting as USDA agents. The Accreditation Committee will look at ways to prevent minor infractions, such as education by the certifier and diligent follow-up of specific corrective measures assigned by the certifier to the producer, and present these at the next meeting.

The next agenda item was public access to certification information. The public access policies of Oregon Tilth, Texas and CCOF were reviewed briefly. Tilth requires a written release by the grower before allowing access to records, while Texas has an Act mandating all file information to be available to the public. The critical points to be balanced were identified as the consumers' ability to find out all information about the production of the food versus the confidential nature of certain business related information. No action was taken at this time on adopting additional language for public access to certification information.

Annie Kirschenmann gave an update from the Organic Certifiers Caucus group. Annie reported that the Caucus is developing protocol guidelines for certifiers to follow in settling disputes. She also informed the Committee that Lloyds of London quotes have been obtained for indemnification of the Secretary under the National Program, in case this type of insurance should be needed.

Following a brief exchange of comments about the need for certifiers to comment on Rich Theuer's ideas concerning random spot inspection visits and the need for the Accreditation Committee to further develop criteria for approval of State programs, the meeting was adjourned by Margaret Clark.
(1) John Audrey -- Eden Foods; The primary topic of discussion by Mr. Audrey was organic soy products, and the labeling thereof. Specifically, Mr. Audrey expressed his concern over the method of calculating the exclusion of water from the percentage ingredients in organic soy milk. He also made the assertion that the NOSB labeling recommendation for calculation of % ingredients was in conflict with the FDA National Labeling and Education Act.

(2) Gary Mahrt -- Sheep Herdsman; The topic of discussion of Mr. Mahrt's presentation was the restricted use of synthetic parasiticides in the raising of organic sheep. He raised many concerns about the safety and humane treatment of sheep relative to the non-use of parasiticides. He also talked about the fact that the current NOSB recommendations would prevent any organic lamb from being produced. He urged for consideration of a withdrawal period for their use similar to that of organic dairy cattle. (WTOF)

(3) Gil Preston -- Rose Valley Farms, represented by Anne Schwartz; The topic of the presentation by Anne Schwartz on behalf of Gil Preston centered around the free range meat and egg poultry products. The thrust of the input was the importance of non-confinement for organic livestock. The conclusion was that if livestock is raised in confinement, then it is not truly organic. (WTOF)

(4) Liz Bourret -- Veritable Vegetable; The topic of discussion by Ms. Bourret was the use of ethylene as a ripening agent for bananas. She explained that ethanol is a naturally fermented product that goes through a conversion process to produce ethylene gas that is used to ripen bananas. This material would primarily be used on specialty bananas and plantains, as there is no replacement for ripening of the standard yellow banana. (WTOF)

In her second line of testimony, she discussed the requirements for handler certification. Her residual concerns were that packers, hydro-coolers, and co-packers should not have to be certified. Their facilities should however, be inspected as a part of a grower or handler certification. (WTOF)

Her final testimony was on behalf of Ocean Organic Produce, Inc., a commission merchant which operates a cooler, hydro-cooler and loading dock. This presentation was similar to her previous one and focused on not requiring certification for coolers. (WTOF)

(5) Bu Nugent -- Veritable Vegetable; Ms. Nugent's presentation raised several points regarding the small farm exemption. She
first noted that it is not worthwhile for farmers grossing in the area of $5K to $10K to pay for certification. She then went on to discuss the importance of wholesalers being an outlet for small growers. She suggested farmers with a gross below $5K limit be required to file farm plans and a list of outlets with a local certifier. (WTOF)

(6) Phil Foster -- CCOF; Mr. Foster made some general comments about maintaining the community, grass-roots spirit of the organic industry and not permitting the government to destroy this very important identity component. In addition, while discussing accreditation and the National List, he pointed out that the OFPA implementation should not disrupt regional difference in certification.

(7) Leonard Diggs -- President, CCOF North Coast Chapter; Mr. Diggs commented on the diversity of the organic production in Sonoma County. His focus then shifted to the small grower (less than 1/2 acre) and their insistence on no more rules, regulations, and cost burdens.

Following his discussion on regulation, he supported the use of botanical pesticides in organic farming. He made the statement that the use of botanical pesticides is found prevalent in both large and small grower operations.

(8) Dermot Wynne -- Mr. Wynne gave some commentary on consumer access to information about organic products and certification. He stressed the point that consumers must continue to have access after the National program is implemented. Documentation must be available for the concerned consumer to make informed purchases.

(9) John Wise -- Organic Grower; To the surprise of many, Mr. Wise's presentation was about a current emergency eradication spray event taking place in Ventura County, where his organic farm is located. Under the emergency eradication, there is mandatory spraying of quarantined areas. He brought forth comments about the economic consequences of spray programs to organic growers. He urged the NOSB to consider some alternatives for these situations, some of which were crop insurance and alternative spraying or treatments for these spray programs. Also, he pointed out that products from a quarantine program can be sold as organic, provided the products do not exceed 5% of EPA tolerance.

(10) Lon Johnson -- Trout Lake Farms; Mr. Johnson spoke primarily to the notions of animal care in organic livestock production. He began by stressing the philosophical approach to the issue, followed by the need for efficacious therapy. He stated that as for veterinary medicine, there is little to no history on animal standards. He also stressed to keep the focus on holistic systems. Mr. Johnson supports minimal use of botanical pesticides.

(11) Mark Lipson -- Mr. Lipson's testimony opened with some
general observations about organic programs. He commented that certification, as it currently exists, has increased consumer confidence in organic products. Some of his other points included: a) the National List, inherited from CCOF, should evolve and become more restrictive, b) botanicals are less prevalent than assumed and therefore should not be ruled out as a class of substances, c) animals must have access to treatment and medicines -- but observe strict extended withdrawal times, d) certification and accreditation are our enforcement tools; they must be rigorous and stringent and must provide for enforcement at the State and local level.

(12) Mr. Alan Bornt, Bornt Family Farms, Holtville, California: Mr. Bornt presented two areas of concern. The first addressed the concern that land currently under organic production under the California law might not be certifiable under Federal Regulations because of the "three year provision. He suggested that some sort of grand-fathering might be appropriate to prevent serious impact on the growers effected.

His second concern was that the National List include only the "pure" organic approach. In his opinion there should be no "synthetic-but-safe" compromises made. He also suggested that the Botanical Pesticides be restricted in their use.

(13) Mr. Steve P. Mahrt, Rock Island Egg Farm, Petaluma, California: Mr. Mahrt's primary concerns were indoor confinement of poultry under organic standards, referring to a poultry flock rather than an individual bird, allowances for a synthetic antiprotozoal agent (Amprol), and considering a laying hen flock as equivalent in standards to a dairy herd. In his presentation, Mr. Mahrt related his experiences and opinions on many short comings of a requirement for access to the outside for poultry. He also noted that it might be more practical and was certainly traditional among poultry producers to refer to a flock of domesticated poultry rather than tracking an individual bird. Within the Rock Island Egg Farm, there has been a history of 75% success in managing the coccidiosis problem with vaccination; however, there continues to be a need for the coccidiostat Amprol which is labeled for use in laying hens. Mr. Mahrt urged the consideration of Amprol as an approved [synthetic] material in the National Organic Program. He also drew comparisons between the dairy farmer and the egg farmer and suggested that it would be appropriate to extend the same transitional opportunities to the egg farmer that have been proposed for the dairy farmer.

(WTOF)

(14) Mr. Dick Krengel, California: First, Mr. Krengel delivered the written testimony of Allen Shainsky, of Petaluma Poultry Processors, Petaluma, California. Mr. Shainsky's primary concern is that indoor confinement of poultry not be prohibited under the National Organic Program. He noted a variety of problems regarding outside production of poultry from his experience as a
producer processor. Mr. Krengel then shared his concerns and experiences as a poultry feed supplier to organic and conventional growers. He particularly stressed the market demand for fresh poultry (and eggs) 52 weeks out of the year and his opinion that smaller non-concentrated growers would not and could not answer that demand. He also stressed that the most damaging microorganisms are endemic in any exposed ground system and are best managed in an indoor confinement system. In his experience, predator pressure keeps poultry inside or very near the shelter in many situations. He also noted that land costs influence the way poultry is managed in any given area. (WTOF)

(15) Dr. Randy Kidd, DVM, PhD, 911 West 33rd St., Kansas City, MO: Dr Kidd presented some information on efficacy and safety of alternative forms of livestock health care encouraging the board to consider the alternatives as viable methods. He also offered his services as an expert in alternative forms of health care for livestock. (WTOF)

(16) Ms. Nell Newman, Newman's Own Organics-The Second Generation, Aptos, California: After describing her background and the vision of Newman's Own Organic, Ms. Newman discussed her concerns about the essential nature of sodium hydroxide as a processing aid in the manufacture of pretzels. She emphasized that essentiality by distributing samples of pretzels made with and without the sodium hydroxide bath before baking.

(17) Mr. Rick Miller, Manager, product Development/Technical Services, BIOSYS, Palo Alto, California: Mr. Miller described his company's commercial production and marketing of beneficial insect-killing nematodes (steinernematids). The production and formulation of the BIOSYS products requires the introduction of small quantities of a synthetic bacteriostat to prevent unchecked growth of opportunistic bacteria. The ingredient usually Hyamine (Diisobutylphenoxyethoxy ethyl dimethyl benzethonium chloride monohydrate) appears in the most common nematode product at 5ppm and is completely biodegradable in soil. Mr. Miller urged the board not to recommend prohibition of nematode products based on these minute quantities of bacteriostat. (WTOF)

(18) Mr. David Bunn, Crown Packing Company, Inc., Salinas, California: (Presented by Janning Kennedy) As a mixed conventional/organic grower, Mr. Bunn expressed concern about the barriers to conversion to organic by some standards. In this, he urged the board to recommend the creation of a "transition" label to make the three year requirement more workable. He also urged the board toward moderation in creating a workable National List. Mr. Bunn also stressed the need for botanical pesticides as tools, noting that even the best organic farms have occasional unusual pest infestations and the Botanicals are a viable and necessary solution. (WTOF)
Ms. Janning Kennedy, Salinas, California: Ms. Kennedy expressed a concern for transition into the Federal Program for land now considered organic under the California Law as it is possible that some of it might not meet the three year requirement. She suggested that this land might in effect be "grandfathered" in. This concern for transition extended to "new" land which farmers might wish to bring into organic production, but the three year requirement might cause more economic stress than a willing producer could reasonably withstand. Her suggestion for alleviation of this situation was a federal "Transitional Organic" label. (WTOF)

Mr. Michael Gorman, TKO, California: Mr. Gorman, who runs a large specialty salad production and packing operation much of which is certified organic brought concerns about transitioning land currently under organic production under the California Law which might not qualify in the first year or two of the Federal Program. He suggested that this land might be grandfathered into the National Program as a way to smooth out the transition. He also strongly advocated the creation of a Federal Transitional Organic label to encourage the U.S. organic producers. Finally Mr. Borman urged the Board to take a moderate stand on the botanical pesticides as they continue to be critical tools in management of pest outbreaks.

Mr. George Nororian, Fruitful Valley, Dinuba, California: Mr. Nororian is a producer and canner of organic peaches. He expressed two concerns one was the use of sodium and potassium hydroxide for peeling of fruit. He pointed out that the hydroxyl radical is a major problem in fruit quality for canned products as it causes glutens to convert to glutamates which has a negative effect on flavor. He suggested therefore that this "chemical peeling" not be used in the preparation of Organic fruit for further processing. Mr. Nororian also expressed a deep concern for the use of packing house rejects in commercial production of purees. He noted that these are of low quality, are low in sugars, lack food value and are a general bane on the fruit industry in general and that this practice should not be tolerated in organic processing.

Brian Fitzpatrick -- Farmer/winemaker and member of CCOF and OGWA (Organic Grapes into Wine Alliance); OGWA was organized in 1989, based on French organic wine standards which allow use of sulfur dioxide (SO2). Their mission statement includes "committed to producing a most civilized beverage in a most responsible way." SO2 is not the same as a sulfite, so its use is non inconsistent with OFPA. Use of SO2 goes back to the Romans, and 99% of winemakers use it. The French tried to prohibit it for organic wine, but had to retract the prohibition. Consequences of failure to use SO2 are inferior products with a very high (>20%) rate of returns. The issue is one of sulfite sensitivity in a small percent of the population, not general health risk. No ill effects from sulfites have ever been recorded at concentrations < 100 ppm, which is well over maximum amount
occurring in organic wines. All bottles are currently labelled as "containing sulfites."

(23) Rees Moerman -- Spectrum Oils & member of MPPL Task Force; Advises to "rise above the minute and see the big picture" of the organic industry. We are part of the "Third Wave" as described by Toffler. The word is "CREDIBILITY." Once you lose it, you can't get it back. Consumers have four mental issues: 

**purity, nutrition, care, and value.** These must be balanced so that the quest for the first three doesn't eliminate the fourth. Consumer decisions are based on their belief in the company (in the case of processed products) combined with their belief in the integrity of "organic."

(24) Anne Schwartz -- Ms. Schwartz's remarks specifically addressed living conditions and access to outdoors. It is important to place the discussion within the context of organic principles, not seeking justification in relation to conventional management systems. (Reiteration of principles). Lists health problems which are known to be reduced by access to outdoors and freedom of movement. Notes that respiratory problems are common among workers who manage confined hogs and poultry. Specific replies to concerns raised by Alan Shainsky: Coccidiosis is hard to control in poultry. Rodents are still a problem for indoor management. There are various ways to control predators without confinement. Wild birds haven't been shown to pose problems. Today's "industrial" breeds of birds may not be appropriate in organic systems. States unequivocal opposition to allowing exemptions for confinement livestock production. Re: need to maintain year-round supply of fresh poultry to assure distribution, balance must be struck between marketplace demands for consistency and organic principles. Consumers are aware of seasonal considerations in fresh produce, so can understand similar constraints for poultry. (WTOF)

(25) Kate Burroughs -- Harmony Farm Supply, apple producer; It is unrealistic to require organic garlic and onion sets--they are clearly unavailable on a commercial scale as yet. The Farm Plan requirement as revised is still too much paperwork for farmers. Essential needs should be reconsidered. Supports allowing continued use of botanicals, even though she has stopped using them. "It's not true that if you do things right you'll never have any problems." Advises NOSB to avoid getting involved with brand-name evaluation of materials.

(26) Bill Reichle -- OCIA Central California chapter; Criticism of NOP focus paper on National List: Doesn't like implication of USDA telling NOSB what should be put on the list. This approach gives the government too much power to add or delete materials without adequate public scrutiny. Opposes allowing a certifier's name to go on a label because it will confuse consumers as to whether all accredited agents are in fact equivalent. The criteria for who needs to be certified as a handler should hinge on the possibility for contamination or commingling. Not every
conventional distributor who handles some organic products should have to be certified. Re: accreditation: No "foreign bodies" should be accredited.

(27) Tana Daha -- Hawaii Organic Growers; Biological control is problematic in Hawaii because of restriction on importing predators due to ecological sensitivity of the island system. Argues for consideration of tissue culture propagation as a disease preventive technology. Tropical crops such as banana, ginger and tarot should be permitted to use tissue culture for transplant production. This also provides an avenue for introducing more genetic diversity in these crops since they are brought in sterile media. Botanicals are needed when biocontrols are not available. Evaluation of botanicals should focus on mode of action to determine permissibility. Describes farmer-based experimental approach used by small growers in tropics to evaluate potential pest controlling plants.

(28) Ed Davis -- California cotton producer; Advocates "industry type" label for "organic" such as the generic "wool" or "cotton" mark. He is a state licensed pesticide applicator, and supports the necessity for continued use of botanicals. Main subject is cotton defoliants: Since freezes come late to California, unlike Texas, some means of inducing defoliation prior to harvest is needed. Suggest allowing Sodium or Potassium Chlorate. This doesn't actually kill leaves, but mimics frost damage to trigger plant hormones to initiate defoliation. Amount of material applied is negligible compared with amount of salt contained in a moderate application of compost. (Information sheet provided)

(29) Fred Rohe -- Omega Nutrition; Argues that high temperature bleaching and deodorizing should not be permitted for organic oils and flours.

(30) Lynn Coody -- Organic Agsystems Consulting; Lynn spoke about the Board's role as materials evaluators. She expressed her understanding that the data is incomplete and asked the members to do the best possible based on the information that is available. She thought the botanicals should be restricted in their use and that a phase-out should be used in case any were not permitted. (WTOF)

(31) Hazel Flett -- sheep producer; Hazel related her unsuccessful experiences with raising sheep without the use of wormers. She cautioned about the harmful effects on market development of not incorporating reality with principle. She encouraged allowing parasiticide use in raising organic sheep.

(32) Bob Durst -- Oregon State University Food Science Senior Research Assistant; Bob spoke about processing aids in organic processed foods, proposing that some, like Potassium Hydroxide be prohibited, but others, like Sodium Hydroxide, be permitted, depending on necessity. He thought that if residues were
minimal and the substances were recognized as GRAS, then they should be approved. Bob offered to assist the Board in completing a list of processing aids currently used in organic products.

(33) Cindy Hoops -- Cindy heads up a CCOF Chapter in California. Cindy spoke to 5 separate points: (a) place Magnesium sulfate on the approved synthetic list; (b) don't allow producers to lose certification if a material (later found to be unacceptable) is used in good faith, provided that the material has a negligent effect in soil life; (c) promote healthy soils, not pure food - allow growers to market drifted-on crops; (d) use a residue test to continue the 5% maximum residue allowance in lieu of prohibiting drifted-on crops; and (e) encourage farmers to switch to organics by providing for botanical and emergency antibiotic use.

(34) Craig Weakley -- Muir Glen Tomatoes, Inc., representative and NOSB member; Craig presented a petition signed by ten members requesting that the National Program set a maximum allowable pesticide residue level at the FDA action level or 5% of EPA tolerance or the minimum level of detection (when testing methods cannot measure 5% of EPA tolerance). The Board petition asks the USDA to discuss this issue further with the Board and EPA because allowing a residue level of 100% EPA tolerance would harm the organic industry and is unnecessary because organic farmers don't use the pesticides in the first place. (WTOF)

(35) Bill Wolf -- Past president of the Organic Trade Association, processor of botanicals, and presenting for Vivian Purdy of Necessary Trading Co.; Bill said that AMS should be allowed to develop the marketing Program and that we all should realize that it won't be perfect the first time around. Botanicals are necessary for unexpected problems and they are compatible with provisions of the OFPA. Botanicals are safe and their use should be controlled through the Farm Plan. (WTOF)

(36) Steve Pavich -- organic grape grower for 28 years; Steve urged that the Program get put in place and then allowed to evolve so that conventional growers could begin their conversion to organic methods. He stressed that the Farm Plan design should place minimal burden of farmers and that it should be a mission statement and not a record of practices.

(37) Eric Sunswheat -- compost expert; Eric asked that full disclosure of materials used in finished compost products should be required because of his concern that large processors could get by with using contaminated sewage sludge in compost sold to organic producers.

(38) Charles Hench -- organic farmer; Charles thought that synthetics should be prohibited in organics. He told us that regionalized planting and resourceful natural methods should be sufficient; and, if they don't work on a particular site, then
that particular crop or livestock should not be raised there until a suitable breed or variety is found that does not require synthetics.

(39) Mark Cassidy -- organic grower in the San Joaquin Valley; Mark stated his preference that Magnesium Sulfate (epsom salt) be placed on the National List now that it has been determined to be a synthetic. It is needed for meaty tomatoes and works well as a spray.

(40) George Siemon -- organic dairy farmer; George made several distinct points in his presentation: (a) the timing of certification is important when implementing the Program; (b) the Farm Plan should not be used subjectively to enforce; (c) a new herd clause should be allowed for first time dairy herds that allowed for less than 12 months organic feed; (d) access to outdoors is an important organic principle; (e) ensure that some medications are available to producers by not prohibiting alternative medications; and (f) prevent mislabeling by prohibiting labeling that leads the consumer into assuming that more ingredients are organic than actually are included, such as "organic milk" if the dry milk and cream are not organic.

(41) Eric Kindberg -- organic farmer; Eric wants the petition process sped up and emphasized that the National List must be done by the Board, not USDA. He stressed the List can only contain three components, active synthetics, non-synthetic non-organic ingredients, and synthetic inerts in addition to prohibited naturals. He expanded on his inerts opinion, proposing that inerts on EPA's List 3 are unacceptable for organic production.

(42) Suzanne Vaupel -- attorney at law; Suzanne addressed the Board on the issue of approval of organic fertilizers and pest controls. She noted that EPA and State regulations make it difficult for an organic production aid to be allowed for use in organic agriculture because of the test and financial requirements. She urged the Board to work with the EPA in approval of allowed materials and asked the Board not to reject materials just because they are not yet approved by EPA. (WTOF)

Conclusion of Public Input.
April 24, 1995

The initial session of the National Organic Standards Board (NOSB) meeting was called to order at 8:00 a.m. by Chairperson Michael J. Sligh.

Members in attendance were: Jay Friedman, Dean Eppley, Gene Kahn, Craig Weakley, Michael Sligh, Merrill Clark, Tom Stoneback, K. Chandler, and Don Kinsman. Attending their first meeting as newly appointed members were: Bob Anderson, Fred Kirschenmann, Kathleen Merrigan, Rod Crossley, and Margaret Wittenberg. Participating at this meeting as the certifying agency advisor to the NOSB was Brian Baker of California Certified Organic Farmers (CCOF).

National Organic Program staff members present from USDA were: Hal Ricker, Michael Hankin, Karen Thomas, Ted Rogers, Grace Gershuny, Beth Hayden, and Michael Johnson.

Also in attendance from USDA were: Lon Hatamiya, Administrator of the Agricultural Marketing Service (AMS), and Eileen Stommes, Deputy Director of the Transportation and Marketing Division, AMS.

The Technical Advisory Panel Coordinator present at the start of the meeting was Zea Sonnabend. John Brown was expected to arrive later.
Sligh defined the first order of business as recognizing the retiring board members present. These included: Bob Quinn, Margaret Clark, and Rich Theuer. Gary Osweiler and Nancy Taylor were not present, although Nancy Taylor did arrive on Tuesday and was recognized then for her efforts. Following the presentation of plaques to the retiring Board members, the new members of the NOSB were welcomed and seated. Sligh then introduced Lon Hatamiya to address the NOSB on behalf of Secretary Dan Glickman and the USDA. Mr. Hatamiya made comments relative to the NOSB's roles and responsibilities as implementation of the National Program approaches. Mr. Hatamiya implored the organic industry to set their apprehension aside, be cohesive, and support the National Program. He informed the Board members that expediting the program rulemaking process is a priority and that implementation would be delayed if the Board were to review all aspects of the Program before it was published in the Federal Register. He noted that each member would have full opportunity to comment during the public comment period.

Kathleen Merrigan remarked that a lot of the apprehension comes from the notion that USDA would have final responsibility for constructing the National list of synthetic materials, specifically the idea that the USDA might take the liberty of adding synthetic materials onto the List that were not proposed initially by the NOSB. She asserted that while the NOSB is meant to serve as an Advisory Panel in all other aspects of the Program, the legislation in the 1990 Farm Bill established that only the NOSB could propose and add synthetic materials onto the List.

Other NOSB remarks to Lon included:
Sligh - criticized the Federal Register process and emphasized the need for the NOSB to review the Proposed Rule drafts;

Clark - asked that the NOSB have access to the comments after publication of the Proposed Rule, but before the Final Rule is prepared. (The response was that these are available through FOIA after the Final Rule is published);

Kirschenmann - stated the concern of perception that USDA will succumb to political considerations and write a Program that is not true to organic principles;

Kahn - implored that the National program not contain serious departures from the current status quo in the organic industry and related his personal objections to the Resolution of Focus document as well as NOP staff positions on residue levels as a standard for organic food and percentage organic ingredient declarations on processed food labels.

Baker - stated the community's concern that if authority over the National list is given up now, that it will never be given back by the government.

BREAK.

Following the break, the Board resumed business at 9:15 a.m. to discuss proposed changes to the agenda. Sligh asked that the Board approve the agenda for the week, discuss meeting goals and make nominations for the elections. Chandler moved and Crossley seconded that (1) the full Board administrative session be moved from 4/28 to 4/27 so as to be certain that those board members leaving on Thursday have an opportunity to participate in the important votes before their departures and (2) a materials review session be correspondingly moved from 4/27 to 4/28.
The motion passed unanimously and Sligh suggested that the agenda be continually negotiated throughout the week to accommodate for additional time needed by committees or issues.

The issue of finding agenda time to consider phase-in was discussed, and Anderson suggested that the chairs of the committees meet during the week and then give the Board a general presentation about the implementation issue on Thursday or Friday. Kirschenmann moved and Eppley seconded to so change the agenda. The motion passed unanimously.

The Board decided to set a different time to approve the minutes and review the assignments from the meeting in Rohnert Park. Kahn moved and Chandler seconded that a vote on approval of minutes be postponed until Friday. The motion passed unanimously.

Sligh then reminded the Board that all three NOSB officer positions were up for re-election, including Chairperson, Vice-chairperson, and Secretary. Nominations for these posts proceeded at this time at the request of the members. For Chairperson, Friedman nominated Weakley who declined. Crossley nominated Anderson and Kahn seconded. Chandler moved to close the nominations and Kahn seconded. Anderson was elected by acclamation. For Vice-chairperson, Kahn nominated Sligh and Crossley seconded. Crossley moved to close the nominations and Chandler seconded. Sligh was elected by acclamation. For Secretary, Sligh nominated Kinsman and Crossley seconded. Chandler moved to close the nomination and Stoneback seconded. Kinsman was elected by acclamation.
Following the election of the new officers, discussion ensued on whether committees should continue to elect their own chairs, or whether it should be a full Board decision. Hankin expressed the notion that there should be realignment of committee missions and that the committee structure should be dissolved in favor of ad-hoc committees and taskforces to be more responsive to important issues as they arise during the writing of the Proposed Rule. Sligh and Kahn expressed dissent with Hankin's idea.

Kahn moved and Crossley seconded a motion to allow the full Board to vote on approval of committee chairs after they are selected by the individual Committees. The motion passed unanimously.

USDA Staff Report - Program Leader Hal Ricker proceeded with an update on the National Program activities and program direction. He first introduced new Staff members Karen Thomas and Beth Hayden and announced that he would now be working full time on the Organic Program. He then reviewed recent meetings at USDA about organics, including his involvement with the Integrated Pest Management Committee, an address to the USDA Biotechnology Advisory Committee, attendance at the Minor Use Pesticide Working Group meetings, meetings with FDA on labeling, discussions with APHIS on their Proposed Rule on non-indigenous organisms, and Bob Anderson's slide presentations on Walnut Acres Farm to USDA.

He next briefly discussed the Petition Process and the March Federal Register National List notice. He noted that the Department will establish an ongoing petition process which will be published along with the Final Rule. As for the rulemaking process, the USDA expects to publish...
a portion of the accreditation program in mid to late Summer. The standards are currently being
developed by the program staff and we expect to publish those in Fall. He also reviewed the
various analyses that need to be done for the Federal Register publication and noted that we are
still developing the user fee structure.

He reported that the Department absorbed a $6,000 - $7000 shortfall in the Board’s funding for
the Orlando meeting. Marketing and Inspection Services has lost a portion of its advisory
committee funding as a result of losing the food safety agencies. Kathleen followed with a
suggestion that Hal research the legality of seeking philanthropic donations for the next Board
meeting if funding does not become available. Hal closed with the comment that Board phone
and fax expenses will no longer be covered by the USDA and that the President’s FY 1996
Budget includes an additional $500,000 for the first round of Accreditation.

Merrill Clark initiated a discussion stemming from a letter to Public Voice from the USDA. She
continued by expressing concern about the need for openness regarding major meetings between
USDA and other organizations which have direct interest and formal involvement in NOSB
activities. Ricker followed with comments relative to the day to day responsibilities of the USDA
and its historical precedent for working with other organizations and Federal agencies. Merrigan
reiterated her earlier remark that it is incumbent upon Board members to do outreach activities
and that they must be a conduit of information to the USDA.

BREAK.
Sligh called the meeting back to order at 11:15 a.m. and led a discussion on the definition of organic. He expressed the industry's concern over the lack of a definition for organic.

Kirschenmann requested the Board to adopt a statement of principle that enhances the Codex definition. Stoneback acknowledged the difference between the Codex document and the US legislation in that synthetics that are not harmful are permitted in the US legislation. Friedman moved and seconded by Chandler to accept the Codex definition of organic production as the NOSB's recommendation. Rogers and Weakley pointed out that Codex language may not be applicable since it refers to the "non-use of artificial fertilizers and pesticides." Crossley pointed out that the definition does not include processing and livestock language. After general discussion, it was decided that a definition working group would be organized, consisting of Grace Gershuny, Fred Kirschenmann, Michael Sligh, Tom Stoneback, Brian Baker, and Kathleen Merrigan. This working group agreed to prepare a draft definition for distribution on Tuesday with final approval scheduled for Thursday.

The motion to accept the Codex definition failed with all votes cast as nays.

Material Oversight Working Group:

(The Material Oversight Working Group {MOWG} was established at Rohnert Park to establish the procedure for materials review and voting.

Zea Sonnabend led a discussion of the MOWG's activities since the Rohnert Park meeting. Given the MOWG's mission, the following items (in summary) represent the group's recommendations on the materials review process: (1) A material must have two TAP reviewers; (2) If a substance
is Generally Recognized as Safe (GRAS) under FDA regulations, one TAP reviewer is sufficient; (3) All criteria set forth in the OFPA must be considered; (4) A checklist for completeness will accompany each material; and (5) Each material will be allotted a fifteen to twenty minute discussion period. Rich Theuer will facilitate the processing materials discussion and Hal Ricker will facilitate the crops & livestock materials discussion.

The MOWG recommends that materials voting for processing materials would proceed as follows: The first vote would be to decide whether the material is non-synthetic or synthetic. If a crops or livestock material is determined to be non-synthetic, then there would be no further votes unless a member proposed to place the material on the Prohibited Naturals list. If a processing material is determined to be non-synthetic, the NOSB would vote on approving its use in organic foods. If the non-synthetic processing material is not approved for use in organic foods, then the Board would vote to approve its use in foods made with organic ingredients. If a crops, livestock or processing material is determined to be synthetic, then the NOSB would vote as to whether is should be placed on the National List. If a synthetic processing material is not approved for placement on the List for use in organic foods, then the Board would vote to approve its use in foods made with organic ingredients. All use and application restrictions (annotations) will be proposed during the discussion and a vote will be conducted for the annotation. If no annotation is included with the approved material, then all uses allowed under its registration are permitted in organic production and processing.

Merrigan suggested that, only when voting on materials, the NOSB consider abstentions as a vote
cast when determining the total votes of which a two-thirds majority is necessary for a motion to be approved. Crossley made a motion and it was seconded by Eppley to reaffirm the Rohnert Park voting procedure that abstentions and absences will not count as votes cast. Following the ensuing discussion, Crossley withdrew his motion. Friedman moved and Merrigan seconded the motion that for voting purposes for the National List only, abstentions from voting count as votes cast, but absences and recusals will not count as votes cast and that a two-thirds majority of all votes cast is necessary for a motion to pass. Vote: Yes - 12. Opposed - 2. Passed.

Sonnabend continued, recommending that the MOWG's work continue. Hankin suggested that the task of the MOWG be re-evaluated before the end of the week. The Board agreed to vote on this before the end of the week.

Sligh then requested that 5 minutes be spent on discussing the inerts issues and Sonnabend explained the inerts letter that she had prepared in conjunction with Sligh as follows:

Inerts Task Force Report Discussion

Sonnabend began with a brief explanation of the inerts scenario to the new members. She then brought up a number of questions that needed to be answered: Will there be a phase-in or time line for any new policies on appropriate inerts? Will inert ingredients appear on the National List? How will the NOSB work with manufacturers to find out what inerts are in formulations? How will the inerts be classified by the NOSB after they are disclosed in contrast to the codified EPA scheme of categorizing inerts? Crossley suggested that the task force make
recommendations on active substances and postpone the review of inerts, noting that there will be time after implementation to review inerts. Kirschenmann noted that full transparency is necessary by whatever method is necessary to obtain it. Sonnabend clarified that any vote about the process of reviewing inerts did pertain to actions to be taken after those actives are reviewed that are necessary for implementation of the National Program.

LUNCH BREAK.

The Public Input Session followed lunch and took up the rest of Monday's session. The summary of the Public Input Session is on file at the USDA National Organic Program office.
April 25, 1995

Members in attendance were: Jay Friedman, Dean Eppley, Gene Kahn, Craig Weakley, Michael Sligh, Merrill Clark, Tom Stoneback, K. Chandler, Don Kinsman, Bob Anderson, Fred Kirschenmann, Kathleen Merrigan, Rod Crossley, and Margaret Wittenberg. Also attending was Brian Baker from CCOF.

Staff members present from USDA were: Hal Ricker, Mike Hankin, Mike Johnson, Grace Gershuny, Karen Thomas, Ted Rogers, and Beth Hayden.

PROCESSING, HANDLING, AND LABELING COMMITTEE REPORT:
(Refer to 12/29/94 letter to NOSB from Rich Theuer containing Committee status report)

Amendments for Pest Control:
Weakley reviewed the lengthy discussions regarding pest control measures that have occurred at previous meetings and within Committee conference calls. Kahn moved and Stoneback seconded to accept language modifications, to the Board Final Recommendation on the Organic Handling Plan and the Board Draft Recommendation on Organic Good Manufacturing Practices, that emphasized prevention over control. These modifications would be at Lines 142-143, 144-145, 256-257, 262-263, and 269-270 of the Handling Plan document and Line 62 of the Good Manufacturing Practices document. The VOTE was unanimous to accept the changes.

Organic Good Manufacturing Practices:
Weakley then asked the Board to consider changing the status of the Organic Good Manufacturing Practices Draft Recommendation to a Board Final Recommendation. Friedman queried how processing of non-food products was being addressed. Theuer responded that the OFPA relates to food, not fiber, and requested that this discussion be postponed.

Kirschenmann voiced the concern that food should be altered and processed as little as possible and then asked whether nutritional aspects should be considered in defining "organic foods."

Weakley suggested that the Processing Committee would discuss the subject of "organic Twinkies" on future conference calls. Rogers discussed the importance of defining minimally processed and to have principles to support the definition and create a filter for the inclusion of substances onto the National List. Weakley agreed to consider the subjects of minimal processing and prohibited levels and practices of processing within "organic" foods on future conference calls. Kahn moved and Crossley seconded to accept the OGMP document as a Final Recommendation. VOTE - unanimous aye. Hankin asked whether the Committee intended to put pest control products through the National List review process and include them on the National List. Committee members expressed their intent to place substances used in cracks and crevices on the List with the requirements that all organic food be removed to avoid contamination.

Commercial Non-Availability of Suitable Ingredients in Organic Form

Weakley asked for comments on whether the document should be considered as a draft or final recommendation, noting that it has been discussed for over a year and very few comments were received during public distribution of the document. Kahn moved and Eppley seconded to
consider the document as a Final Recommendation. Clark expressed concern about relying only on paperwork to show good faith efforts to source organic ingredients and suggested that the language be strengthened to force processors to locate organic ingredients. Kahn stated that the use of organic ingredients will be driven by market conditions, and that is where the need for percentage labeling is most critical. Rogers stated that percentage labeling may not be necessary, citing the market relation between producer, processor and certifier. Kahn responded that certifiers should not be asked to determine availability and that additional guarantees are needed to ensure that processors use more organic ingredients. Vote: Yes - 13. Opposed - 1. Motion carried.

Labeling Draft Recommendation amendment:

Motion was made by Weakley and seconded by Friedman to amend the still-draft sections of the Board Final Recommendation on Labeling (February 2, 1994), specifically Section 2.A.2, to add the words, "if they are not commercially available to the handler in organically produced form," at the 4th and 5th lines of the section. Vote: Yes - 13. Opposed: 1. Motion carried.

Labeling Bulk Organic Product

Crossley moved and Kahn seconded the following addition to the Board Final Recommendation on Labeling document, page 4, Line 85:

Information on non-retail containers of an organic product should be given either on the container or in accompanying documents, except that the name of the product, lot identification, organic
identification and the name and address of the handler should appear on the container. Lot identification, and the name and address of the handler may be replaced by an identification mark provided that such a mark is clearly identifiable with the accompanying documents.

The motion was approved unanimously.

*Distributor Exemption*

The next revisions discussed by the NOSB concerned exemptions from certification requirements for those distributors handling sealed processed organic foods. Weakley explained that these proposed revisions are the result of many written comments received by the Committee and that the purpose of the exemption would be to reduce unnecessary burden and cost from industry.

Baker questioned whether exemptions could actually be granted to distributors handling boxes of fruit and expressed confusion as to what types of container handling were exempt from certification. Theuer said the key is whether it becomes opened or not and whether the product inside is protected. Sligh raised questions about which types of containers qualify for being considered as "tamper-evident... or adequate... to maintain organic integrity during normal transportation and storage." Kirschenmann said the concern is to not burden the system with unneeded certification, but yet assure organic integrity and audit trail controls. He also raised the question of treatment of storage spaces with prohibited materials by distributors who are not certified and who are unfamiliar with organic handling practices. Kahn said the person who holds the title should be responsible for following the product through the distribution chain until it is...
sold. The NOSB decided that the Processing Committee should review its recommendation on exemption from certification for handlers handling tamper-evident containers, and report back at the next Board meeting.

Phase-In Recommendation (Processing & Handling)

Weakley then introduced the PHLC recommendation on the phase-in of handler certification. The Committee recommends that handlers selling existing products labeled as organic or made with organic ingredients submit an application within 2 months after implementation of the National Program and that certification be completed within 12 months after implementation.

Kirschenmann suggested including wording changing "existing" to "previously third-party certified," and the Board agreed. Concern was expressed by Baker and Quinn about certifier overload, rushing certification applications, and duplication of certification expenses. The Committee agreed to discuss these concerns and return a revised proposal later in the week.

Weakley then read the PHLC phase-in labeling recommendation that states that all products and ingredients should meet the National Program requirements within 18 months after implementation. Kirschenmann moved and Crossley seconded to accept the labeling recommendation as a Board Final Recommendation. A friendly amendment to add "previously third party certified" in the first line between "all" and "products" was introduced and accepted. The motion was approved unanimously.

CROPS COMMITTEE:
Kahn began the discussion with the *Specialized Standards for Greenhouses and Mushroom Production*. The Board Draft recommendation was read by Kahn and discussion ensued. There was general agreement that the Farm Plan provisions should apply to greenhouse production and language addressing this issue was included at Line 6. Anderson moved and Eppley seconded that the greenhouse standard be accepted as a Board Final Recommendation with the aforementioned revisions. The motion passed unanimously.

Kahn then read the wording from the mushroom production recommendation. Anderson requested, and Kahn agreed, that Subsection (e) be replaced with the following: “Sanitizers and disinfectants not on the national list may not be applied to crops or growing substrates.” There was a friendly amendment accepted to change in section C, line 79 the word “mediums” to ‘media’. Kahn clarified that producers would have to ascertain that the sawdust wasn’t treated and that the certifier would verify this fact. Kirschenmann moved and it was seconded by Friedman to elevate the mushroom document to a Board Final Recommendation. Vote: Unanimous aye.

*Kydroponics*

Kahn concluded his report by reading the hydroponics recommendation that would allow organic labeling for products from soilless media if all other National Program requirements are satisfied. Baker expressed his concerns about the philosophical problems associated with soilless production. Kahn noted that the recommendation only allows for the possibility of an organic hydroponics industry developing. Kahn recognized that hydroponics is a practice that is
dependent on synthetic inputs and wants to open up dialogue with its proponents. Crossley moved and Weakley seconded a motion to accept lines 101-105 as a Board Final Recommendation. Friedman first offered a friendly amendment that was accepted to strike “other applicable” from the document. Vote: Unanimous aye.

In the interest of staying on schedule, Kahn postponed discussion of the Committee definitions document until the next Board meeting.

LIVESTOCK COMMITTEE:
Chairperson Clark presented the following as a proposed addition to the Board Final Recommendation on Healthcare for organic livestock; it is to be added at line 278 (4): “Certified organic livestock farms shall be based on a system that incorporates access to the outdoors and direct sunlight. It is understood that proper livestock health management may include periods of time when livestock are housed indoors. Temporary indoor housing may be justified for: (1) inclement weather conditions; (2) health, care, safety and well being of the livestock; and (3) protection of soil and water quality.” Friedman moved and Kinsman seconded the motion to accept this addition to the Healthcare document. Vote: Unanimous aye. Passed.

Antibiotics in Laying Hens: Friedman moved and Kinsman seconded to accept the Committee proposed language on the Use of Antibiotics in Laying Hens for insertion at line 358 of the Final Recommendation on Antibiotics in organic livestock production. Questions were raised about
whether chickens represented enough of an investment to warrant allowing any medication use. Hankin noted that the livestock hearings indicated that chickens are treated as a flock and not as individual animals. Kirschenmann recounted problems of neglect for animals in systems that don’t allow for re-entry of animals after application of medication and discussed the internal tension created within a producer when forced to decide between using medications or diverting. Vote: Yes - 7. Opposed - 4. Abstain - 1. Absent - 2. Motion failed.

Chandler moved and Friedman seconded to accept the first paragraph only. Vote: Yes - 8. Opposed - 1. Abstain - 2. Absent - 2. Motion carries to include only the following: "The use of antibiotics as a growth promoter in poultry is prohibited. The use of antibiotics in poultry whose eggs or egg products are intended to be labeled or sold as organically produced is restricted."

Kinsman moved and Friedman seconded to accept the second paragraph. Chandler, Eppley and Anderson claimed that the standards should be consistent and allow for reentry after a withdrawal period. Vote: Yes - 5. Opposed - 6. Abstain - 2. Absent - 1. Motion failed.

Kirschenmann talked about principles and consistency, comparing animals and soil. Just as organic principles allow for emergency and restrictive use of synthetics for field production of crops, shouldn’t, he questioned, the same allowances be made for livestock production? He acknowledged, in closing, that hypersensitive perceptions by consumers about antibiotics may be inconsistent with organic principles and recognized the perception that once the medication is used that a residue remains in the animal. Chandler moved and Eppley seconded to add at the
phrase "synthetic parasiticide" in the first paragraph along with antibiotic. Vote: Yes - 7.

Opposed - 6. Abstain - 1. Motion failed.

LUNCH BREAK

After Nancy Taylor was recognized for her outstanding efforts and accomplishments during her 3 year service to the NOSB, the livestock committee discussion resumed. Kirschenmann continued that antibiotics were an unacceptable material for use in the food of an animal, comparing it to anhydrous ammonia use in soil. He concluded that antibiotics should not be used in slaughter animals, but could be allowed in animals whose products were sold as organic provided that time was allowed for the animal's health to recover before marketing the products. Chandler responded that we should also be able to eat the animal after its health has recovered. Baker asked that the Board reexamine the recommended withdrawal times for dairy. Kahn then asked whether science should be used to reevaluate the OFPA requirement that prohibited substances not be used on land within 3 years of harvesting products to be labeled organic. Friedman reminded the Board that consumer perception cannot be factored into an attempt to develop livestock standards solely on the basis of scientific evidence and that in the absence of conclusive scientific data, the highest standard possible should be written. Friedman also stated that he believes the organic label will be devalued in the market place if other labels are used to identify products produced or processed without the use of synthetic medications. Baker proposed that appropriate marketing claims could be used to differentiate the organic label from the no antibiotic label. Kirschenmann then informed the Board that the Livestock Committee would revisit the entire issue of antibiotics in livestock, recognizing that its use is restricted, that the health concerns of livestock and appropriate withdrawal times would be considered, and that principles
of organics would be the foundation of the new recommendations. Friedman reminded the Board that there had been previous agreement not to withdraw Final Recommendations once they were approved. Merrigan spoke to the value of participating in the discussion of livestock standards in their entirety. A unanimous straw vote gave Kirschenmann approval to develop a "white paper" for the Board only on the issue of antibiotic use in eggs. This concluded the Livestock Committee presentation.

**ACCREDITATION COMMITTEE**

Sligh announced that the new Accreditation Committee membership consisted of Kirschenmann, Merrigan, Crossley, Friedman and himself. He enumerated several issues for which the Committee will be developing recommendations, including: State program approval, public disclosure, site evaluation and seal use on labels. Gershuny gave a brief presentation describing the development of the USDA proposals on accreditation and articulated on Staff and OGC participation. She explained the Staff decision not to circulate drafts of proposals because of the confusion engendered by distribution without explanation and supporting documents. Merrigan asked whether USDA envisions a process whereby NOSB would review future drafts so as to prepare Board members for explaining and defending the USDA rule. Gershuny replied that an explanatory paper for accreditation will be distributed before the Proposed Rule. In response to a question from Margaret Clark, Gershuny said that the current Program draft provides for private certifiers to limit certification to members according to membership requirements rather than standards. Other miscellaneous points that Gershuny raised about the current Program draft were: a financial reserve to ensure that producers get certified in case of certifying agent

**finalorlandomine.495**

20
difficulties and affirmation that a Peer Review Panel will be provided for. The presentation concluded with a general discussion about what types of production units (sizes and structures) will need to be certified.

INTERNATIONAL COMMITTEE:

Friedman reported on the International Committee’s current work. He raised a question concerning fumigation and was replied to by Michael Johnson who noted that the staff was in the process of developing a fumigation table which outlines various treatments required by APHIS’s Plant Protection & Quarantine Division. No other business was discussed by the International committee. Friedman did conclude with offering suggestions for a smoother functioning Board process, including: bylaws; explicit agenda details; written Committee presentations distributed to the Board before the meetings; clearly labeled and dated documents; and a briefer summary of materials review information.

BREAK AT 3:00PM.

MATERIALS REVIEW PROCESS

Reconvening at 3:15, Sonnabend led a discussion about how to handle the less well-defined areas of the materials review process, namely inerts and the definition of synthetic. She proceeded to discuss a document entitled “Handling of Inerts Policy at the NOSB April Meeting,” dated April 11, 1995.

Vote 1. Inerts on the National List
This motion is intended to help the Board to move forward in the materials review process by
leaving inerts to be dealt with in the future after publication of the initial National List.
Eppley proposed and Sligh seconded to discuss the following Proposed Motion 1: "Synthetic inert
ingredients shall be reviewed by the NOSB according to the criteria in the OFPA for inclusion on
the National List. This shall be handled as an amendment to the National List after the publication
of the initial List and after the inerts are identified and evaluated."
Hankin noted the Staff's position on inerts and the problems inherent with the NOSB trying to
attain confidential information necessary for reviewing inerts, and observed that the Board's
continuing at this time to develop a policy on inerts review does not contribute to the working
relationship between the Staff and the NOSB. Sligh noted that the Board cannot shrink from its
perceived responsibility to let the industry know where they stand on this issue. Merrigan went
on to discuss some of the historical concerns that the industry has with inerts.

Chandler offered the following amendment: The inert priority shall be after the initial national

Merrigan made a motion seconded by Kirschenmann: The NOSB will make every effort to review
synthetic inert ingredients for their appropriateness in organic production systems. The NOSB
will work with manufacturers of inert substances to obtain full disclosure. This process will take
place after the proposed national list and its subsequent Federal Register publication. Clark
commented that if the NOSB doesn't review an inert, then that inert shouldn't be allowed in
production. Crossley pointed out the difference between full disclosure (for instance,
confidentially to the USDA) and public disclosure (to the general public). Others thought the 
NOSB could be granted an approved status to review confidential information. Rogers noted that 
the NOSB does not have statutory authority to be granted this status or review inerts for the 

Sligh proposed the following motion: Inerts on the EPA List 4 are considered to be minimum risk 
and will be accepted for organic production, with a TAP review and NOSB evaluation according 
to the criteria in the OFPA for those that are synthetic. Inerts proposed for organic production 
on EPA’s List 2 which are potentially toxic and List 3 which are unknown will be compiled by 
the NOSB and forwarded to the EPA as materials for fast-track review and possible 
reclassification by them.

Craig offered an amendment, seconded by Crossley to strike “with a TAP review and NOSB 
evaluation according to the criteria on the OFPA for those that are synthetic.” Sligh remarked 
that he opposed this amendment because he wanted to review each inert rather than accept an 
entire category. Vote: Yes - 8. Opposed - 6. The amendment fails. Weakley then followed with 
a motion and it was seconded by Kahn to table the discussion. Vote: Yes - 10.

Abstain - 2. Motion carried.
Clarification of Synthetic Definitions

Rich Theuer, leader of the Processing materials voting, began this session by outlining the process by which the ensuing materials voting will be handled.

Prior to voting, each Board member will be asked to give their opinion on three questions, which will serve to clarify the material’s status. These questions are: (1) In your judgment, is this substance synthetic, non-synthetic, or abstain / no opinion?; (2) Should this substance be allowed in an “organic food” (95% or higher organic ingredients) (2/3 of those voting is required for approval); and, if question 2 should not receive a 2/3 approval vote, (3) Should this substance be allowed in a “food made with organic ingredients” (50% or higher organic ingredients)?

Theuer continued with a thorough discussion on the various interpretations of the word “synthetic,” first noting that the correct terminology should be "non-synthetic vs. synthetic" and not "natural vs. synthetic." Theuer carefully went through reflections on terminology within the OFPA as it pertains to "synthetic." The Board agreed that the criteria listed in the OFPA Section 2119(m) did apply and were sufficient to evaluate substances for processing. Clark, however, disagreed, affirming that the OFPA did not intend these criteria to apply to processing synthetic substances. Theuer noted that the NOSB may not be the final arbiter of the non-synthetic/synthetic definition, since the USDA, EPA and FDA have to decide and publish an interpretative definition in the Federal Register along with the Rules. Sligh requested a preamble explaining the Board's position on synthetics. Kahn stated that the realities of food manufacturing requires many of these synthetic materials in order to produce food expected by consumers. Kirschenmann offered the two principles of: using only materials that enhance the natural system, and of altering the food as little as possible, as guidance to the NOSB for decision making.
The meeting was adjourned for the day.
April 26, 1995

Members in attendance were: Jay Friedman, Dean Eppley, Gene Kahn, Craig Weakley, Michael Sligh, Merrill Clark, Tom Stoneback, K. Chandler, Don Kinsman, Bob Anderson, Fred Kirschenmann, Kathleen Merrigan, Rod Crossley, and Margaret Wittenberg. Participating as the certifying agent advisor to the NOSB was Brian Baker of California Certified Organic Farmers (CCOF).

Staff members present from USDA were: Hal Ricker, Michael Hankin, Ted Rogers, Grace Gershuny, Beth Hayden, and Michael Johnson.

Technical Advisory Panel Coordinators present were: Zea Sonnabend, John Brown, and Rich Theuer as facilitator

Theuer began by reading from the Conference report section suggesting that it may be necessary for the Secretary to go to Congress for delineation of processed-food synthetic substance categories. Theuer noted that the Board will be reviewing processing aids even though they are not listed on the labels. Weakley noted the Processing Committee's General Annotation for all processing materials, and encouraged the Board to adopt it. Kahn moved and Crossley seconded the following General Annotation as a Board Final Recommendation on Processing: *Allowed synthetic processing materials may only be used for processing applications where a wholly natural substitute material is commercially unavailable. Processors must document in the* 

*Organic Handling Plan efforts to source and utilize wholly natural substitute materials for all*
Vote: Yes - 14. Opposed - 0. Motion carried.

Clark moved and Friedman seconded to "set aside all votes on synthetic processing materials designated for use in certified organic products. Votes on their use in products 'made with organic ingredients' can and should proceed." Clark prefaced her motion by stating "since the OFPA prohibits the use of synthetic additives in processing food labeled ‘organic’ and since the public has come to believe organic foods are processed without synthetic additives or chemicals,” such a motion was in order. Organic processors already manufacture organic foods without synthetic additives, therefore allowing synthetic additives went against the “use natural materials when available” principle.” Wittenberg stated that customers are primarily concerned about pesticide use in foods, and not synthetic materials used to process them; concerns of chemically sensitive persons need to be respected and addressed, but should not be the guiding force behind the organic standards. Weakley asserted that voting is important at this time because there is so much time invested and the NOSB needs to determine what is synthetic so that General Counsel can decide what is permitted under the OFPA. Anderson said that the percentage of organic ingredients is most important, not really the minor ingredients and processing aids. Vote: Yes - 2. Opposed - 11. Abstain - 1. Motion failed.

Materials Discussion

The initial round of the NOSB materials review began with the review of processing materials, led
by former NOSB Processing committee chairperson Rich Theuer, Ph.D. Dr. Theuer was also a leading TAP reviewer for a number of the processing materials. The following notes represent the NOSB voting process that occurred during the remainder of the week. The notes detail the actual votes on each material and some general comments and discussion notes.

**Processing Materials**

**Nitrogen Gas** - Reviewed by Steven Harper, Bob Durst.

Determined to be non-synthetic; Vote - Unanimous.

The NOSB’s decision is to allow this material for use in organic food processing; Vote - Unanimous. Annotation: Oil-free grades; from non-oil source.

Determined to be non-synthetic; Vote - Unanimous.

The NOSB’s decision is to allow this material for use in organic food processing; Vote - Unanimous. Annotation: Oil-free grades; from non-oil source.

Discussion: Michael Sligh made a motion and it was seconded by Merrill to include the listed annotation for nitrogen and oxygen. Vote: Unanimous.

**Diatomaceous Earth** - Reviewed by Steve Taylor, Bob Durst, and Richard Theuer.

Determined to be non-synthetic; Vote - Unanimous.

The NOSB’s decision is to allow this material for use in organic food processing; Vote - Unanimous. Annotation: For food filtering aid only.
Discussion - The NOSB decided that all processing substances must be food grade and meet Food Codex requirements.

Kaolin & Bentonite - Reviewed by Richard Theuer.
Determined to be non-synthetic; Vote - Unanimous.
The NOSB’s decision is to allow this material for use in organic food processing;
Vote - Unanimous.

Kelp - Reviewed by Steve Taylor and Richard Theuer.
Determined to be non-synthetic; Vote - Unanimous.
The NOSB’s decision is to allow this material for use in organic food processing;
Vote: 13 aye / 1 opposed.
Annotation: Allowed for use as a thickener and dietary supplement (as defined in the CFR).
Discussion: Merrill noted the possibility of offering consumers supplements as an attachment to products rather than using fortification techniques. She also expressed the notion of restricting its use to only a thickening agent.

Determined to be non-synthetic; Vote: 9 aye / 5 opposed.
The NOSB’s decision is to allow this material for use in organic food processing;
Vote: 13 aye / 0 opposed, 1 abstention.
Discussion: Should a 2/3 vote or simple majority be sufficient to approve a substance as synthetic? Kirschenmann moved and it was seconded by Weakley that only a majority is needed to make synthetic/non-synthetic determinations, but that a 2/3 vote is necessary to place or prohibit a substance on the recommended proposed National list. Vote: Yes - 12. Opposed - 2. Motion carried. It was also agreed here that if a substance is available in both synthetic and non-synthetic forms, and if the synthetic form is approved for the National List, then users must make the non-synthetic form their first choice.

**Agar - Agar** - Reviewed by Steve Taylor and Richard Theuer.

Determined to be non-synthetic; Vote: 12 aye / 0 opposed, 2 absent.

The NOSB’s decision is to allow this material for use in organic food processing; Vote: 12 aye / 0 opposed; 1 abstention / 1 absent.

**Alginites (As a class)** - Reviewed by Steve Taylor and Richard Theuer.

Determined to be synthetic; Vote: 14 aye / 0 opposed.

The NOSB’s decision is to allow this material for use in organic food processing; Vote: 10 aye / 4 opposed.

**Alginic Acid** - Reviewed by Steven Harper, Richard Theuer, and Bob Durst.

Determined to be non-synthetic; Vote: 12 aye / 1 opposed, 1 absent.

The NOSB’s decision is to allow this material for use in organic food processing;
Vote: 13 aye / 1 opposed.

Determined to be synthetic; Vote: 14 aye / 0 opposed.

The NOSB’s decision is to allow this material for use in organic food processing;

Vote: 12 aye / 2 opposed.

Discussion: Sonnabend noted that there may be genetically engineered versions of xanthan gum.

Sligh moved and Weakley seconded to prohibit genetically modified organisms or their products.

Stoneback expressed concern with attempting to cover this broad category with such a blanket statement. Weakley agreed to rework the language of his proposed enzyme annotation, which read: "enzymes that are produced by microorganisms that are products of recombinant DNA technology are synthetic and are prohibited unless specifically allowed."

Lactic Acid - Reviewed by Rich Theuer and Steve Taylor.

Determined to be non-synthetic; Vote: 13 aye / 0 opposed, 1 absent.

The NOSB’s decision is to allow this material for use in organic food processing;

Vote: 13 aye / 1 opposed, 1 absent.

Discussion: Theuer discussed the genetic engineering problems with lactic acid. Weakley read his lactic acid proposed annotation, which read, "prohibited if derived from microorganisms that are products of recombinant DNA technology." It was noted that as a guiding principle, materials produced by microorganisms that are products of recombinant DNA technology are synthetic and are prohibited unless specifically allowed. (This particular language was not adopted formally by
the Board as an annotation.)

**Citric Acid** - Reviewed by Steve Taylor, Steven Harper, and Bob Durst.

Determined to be non-synthetic; Vote: 8 aye / 5 opposed, 1 absent.

The NOSB’s decision is to allow this material for use in organic food processing;

Vote: 13 aye / 1 absent.

Annotation: Must be produced by microbial fermentation of carbohydrate substrates.

**Lecithin (Unbleached)** - Reviewed by Steve Harper and Richard Theuer.

Determined to be non-synthetic; Vote: 12 aye / 1 opposed, 1 absent.

The NOSB’s decision is to allow this material for use in organic food processing;

Vote: 11 aye / 2 opposed, 1 absent.

Discussion: Kahn noted that the non-hexane extracted form is not workable in his product;

Wittenberg noted that this form is also used in dietary supplements. The Board is also unclear about the availability and performance characteristics of the unbleached lecithin.

**Lecithin (Bleached)** - Reviewed by Steve Harper and Richard Theuer.

Determined to be synthetic; Vote: 13 aye / 0 opposed, 1 absent.

The NOSB’s decision is to allow this material for use in organic food processing;

Vote: 9 aye / 4 opposed, 1 absent.

**Sulfur Dioxide** - Reviewed by Bob Durst, Steve Taylor, and Richard Theuer.
Determined to be synthetic; Vote: 8 aye / 6 opposed.

The NOSB’s decision is to allow this material for use in organic wine processing only;

Vote: 11 aye / 3 opposed. Annotation: Sulfur dioxide may not be added to wine at levels greater than 100 ppm; the level of free sulfites may not exceed 35 ppm in the final product.

Discussion: Crossley discussed the use of sulfur dioxide on grapes and in wine; also the use of it on dried fruit. Sligh expressed the notion that it is not needed for use on dried fruit. Wittenberg supported Sligh’s position on prohibiting its use on fruits, but does recognize the need for this material in wines. Merrigan noted that the language in the listing of sulfites in the OFPA could very well have been a mistake or unintentional.

Mono & Diglycerides - Reviewed by Richard Theuer and Steve Taylor.

Determined to be synthetic; Vote: Unanimous.

The NOSB’s decision is to allow this material for use in organic food processing;

Vote: Unanimous. Discussion / Annotation: Kahn noted that the food industry is trying to get away from the use of these materials, but that it was still necessary for potato flake products.

Sligh moved and it was seconded by Friedman to restrict its use to drum roll drying of food products; Vote: 9 aye / 4 opposed, 1 absent. Motion carries.

Pectin (High Methoxy) - Reviewed by Mark Schwartz, Richard Theuer, and Steve Harper.

Determined to be non-synthetic; Vote: 10 aye / 2 opposed, 2 abstentions.

The NOSB’s decision is to allow this material for use in organic food processing;

Vote: Unanimous.
Pectin (Low Methoxy) - Reviewed by Mark Schwartz, Richard Theuer, and Steve Harper.

Determined to be synthetic; Vote: 14 aye / 0 opposed.

The NOSB’s decision is to allow this material for use in organic food processing;

Vote: 13 aye / 1 opposed. Discussion: Kahn supports the use of this because his company uses low sugar for consumer concerns and preferences.

Sodium Citrate - Reviewed by Bob Durst, Richard Theuer, and Steven Harper.

Determined to be synthetic; Vote: 14 aye / 0 opposed.

The NOSB’s decision is to allow this material for use in organic food processing.

Vote: 13 aye / 1 opposed. Discussion: Oregon Tilth allows the use of this material but the California Certified Organic Farmers does not. Its most common use is in dairy systems.

Potassium Chloride - Reviewed by Bob Durst, Steven Taylor, and Richard Theuer.

Determined to be non-synthetic; Vote: 14 aye / 0 opposed.

The NOSB’s decision is to allow this material for use in organic food processing.

Vote: 11 aye / 3 opposed.

Synthetic Potassium Iodide - Reviewed by Bob Durst, Steve Taylor, and Rich Theuer.

Determined to be synthetic; Vote 14 aye / 0 opposed.

This material is prohibited for use in organic food processing (95% and above).

Vote: 7 aye / 7 opposed. However, the NOSB does allow for the use of this material in foods "made with organic ingredients" (50%-95%). Vote 13 aye / 0 opposed, 1 abstention.
Non-Synthetic Potassium Iodide - Reviewed by Bob Durst, Steve Taylor, and Rich Theuer.

Determined to be non-synthetic; Vote 14 aye / 0 opposed.

The NOSB’s decision is to allow the use of this material in organic food processing;

Vote: 13 aye / 0 opposed, 1 abstention.

Ammonium Carbonates & Bicarbonates - Steve Taylor, Rich Theuer, and Bob Durst.

Determined to be synthetic; Vote: 14 aye / 0 opposed.

The NOSB’s decision is to allow this material for use in organic food processing.

Vote: 14 aye / 0 opposed.

Discussion / Annotation: Sligh moved and Weakley seconded a motion for the following
annotation: “Limited to use as a leavening agent”. This motion passed unanimously.

Ascorbic Acid - Reviewed by Steve Harper, Mark Schwartz, and Rich Theuer.

Determined to be synthetic, Vote: 14 aye / 0 opposed.

The NOSB’s decision is to allow this material for use in organic food processing;

Vote: 13 aye / 1 opposed.

Discussion: There was considerable discussion over an annotation for ascorbic acid, including its
use as a preservative on meats and produce, and its use as a pH adjuster. In conclusion, it was
declared that it could not be verified as to how it is used in all cases; there are no restrictions on its
use.

Determined to be non-synthetic; Vote: 14 aye / 0 opposed.

The NOSB’s decision is to allow this material for use in organic food processing;

Vote: 14 aye / 0 opposed. Only the natural form of this material is allowed.

Discussion: Sligh offered a friendly amendment to integrate the NOSB's recommendation on non-availability with Weakley's prologue statement on the use of synthetic substances only when the natural alternative is unavailable. This passed unanimously.

**Calcium Hydroxide** - Reviewed by Steve Taylor, Rich Theuer, and Bob Durst.

Determined to be synthetic; Vote: 12 aye / 1 opposed, 1 absent.

The NOSB’s decision is to allow this material for use in organic food processing;

Vote: 10 aye / 3 opposed, 1 absent.

**Ferrous Sulfate** - Reviewed by Steve Taylor, Bob Durst, and Rich Theuer.

Determined to be synthetic; Vote: 12 aye / 0 opposed, 1 absent.

The NOSB’s decision is to allow this material for use in organic food processing;

Vote: 10 aye / 2 opposed, 2 absent.

Annotation: This material is allowed for iron fortification of foods that is required by regulation or for iron enrichment by professional recommendation.

**Magnesium Carbonate** - Reviewed by Bob Durst, Steve Taylor, and Rich Theuer.

Determined to be synthetic; Vote: 8 aye / 6 opposed.

There was discussion and concern over the fact that no one was aware of what this material is
currently used for. Subsequently, Weakley made a motion and Kahn seconded to table this
material and refer it back to the processing committee. Vote: 13 aye / 0 opposed, 1 abstention.

Magnesium Silicate - Reviewed by Bob Durst and Steve Taylor.
Determined to be synthetic; Vote: 12 aye / 0 opposed, 2 abstentions.
This material is prohibited for use in organic food processing (95% and above).
Vote: 0 aye / 14 opposed. This material is also prohibited for foods labeled as “made with
organic ingredients” (50% - 95%). Discussion: Crossley noted that this material raises concerns
because of asbestos.

Magnesium Sulfate - Reviewed by Bob Durst, Steve Taylor, and Rich Theuer.
Determined to be non-synthetic; Vote: 14 aye / 0 opposed.
The NOSB’s decision is to allow the use of this material in organic food processing;
Vote: 12 aye / 1 opposed, 1 abstention.

Potassium Carbonate - Reviewed by Brian Baker and Walter Jeffery.
Determined to be synthetic; Vote: 12 aye / 0 opposed, 2 absent.
The NOSB’s decision is to allow the use of this material in organic food processing;
Vote: 11 aye / 1 opposed, 2 absent. Discussion: Craig moved and it was seconded by Jay to
accept the following annotation: Potassium carbonate is allowed only for FDA-approved
applications where natural sodium carbonate is not an acceptable substitute. The motion was
withdrawn and resubmitted by Tom Stoneback. Vote: 12 yes / 0 opposed, 2 abstentions. Motion

Determined to be non-synthetic; Vote: 14 aye / 0 opposed.

The NOSB’s decision is to allow natural bacterial enzymes for use in organic food processing;

Vote: 12 aye / 2 opposed. Discussion: There was some concern raised about the categorical lumping of all enzymes together - it was noted that there should be no universal acceptance of all enzymes. With that in mind, the following annotation was passed by a vote of 10 - 4: “Enzymes that are produced by microorganisms that are products of recombinant DNA technology are synthetic and are prohibited unless specifically allowed. Synthetic bacterial enzymes must be petitioned by a manufacturer or processor.”

Yeast, Smoked - Reviewed by Mark Schwartz.

There were no decisions made on smoked yeast. This material was tabled and sent back to the TAP. More data is needed.

Sodium Hydroxide - Reviewed by Bob Durst, Steve Taylor, and Rich Theuer.

Determined to be synthetic; Vote: 14 aye / 0 opposed.

The NOSB’s decision is to allow this material for use in organic food processing;

Vote: 10 aye / 4 opposed. Discussion / Annotation: The disposal problems with sodium hydroxide were mentioned. It was noted that this substance would be beneficial in processing organic peaches; Anderson stated that he could not support this use. Weakley moved and
Merrigan seconded a motion to accept the following annotation: “Prohibited for use in lye peeling of fruits and vegetables and where the natural sodium bicarbonate is an acceptable substitute.

**Sodium Carbonates & Bicarbonates** - Reviewed by Bob Durst, Rich Theuer, and Steve Harper.

Determined to be non-synthetic; Vote: 14 aye / 0 opposed. The NOSB’s decision is to allow this material for use in organic food processing;

Vote: 14 aye / 0 opposed.

**Silicon Dioxide** - Reviewed by Steve Taylor and Bob Durst.

Baker noted that Steve Taylor’s review is inadequate and Durst’s is confusing and incomplete. Crossley moved and Sligh seconded a motion to table this material. Unanimous.

**Potassium Phosphate** - Reviewed by Bob Durst, Steve Taylor, and Rich Theuer.

Determined to be synthetic; Vote: 14 aye / 0 opposed. The NOSB’s decision is to not allow the use of this material in “organic foods” processing. However, the NOSB does allow for the use of this material in foods “made with organic ingredients.” Vote: 10 aye / 3 opposed, 1 abstention.

**Potassium Citrate** - Reviewed by Steve Taylor, Rich Theuer, and Bob Durst.

Determined to be synthetic; Vote: 13 aye / 0 opposed, 1 abstention. The NOSB’s decision is to allow this material for use in organic food processing. Vote: 10 aye / 3 opposed, 1 abstention. Discussion: This material is essential to the production of...
evaporated milk and other dairy products.

**Crops Materials:**

**Lime Sulfur** - Reviewed by Donald Blackeney.

Determined to be synthetic; Vote: 14 aye / 0 opposed.

The NOSB's decision is to allow this material for use in organic crop production;

Vote: 14 aye / 0 opposed. Discussion: This substance is essential for tree fruit / orchards in the Northwest. Annotation: Restricted to application as a fungicide or an insecticide if no feasible alternative exists.

**Soaps** - Reviewed by Donald Blackeney, Paul Sachs, James Johnson, Joe Kovach, Philip Van Buskirk, Samuel Cotner.

Determined to be synthetic; Vote: 14 aye / 0 opposed.

The NOSB's decision is to allow this material for use in organic crop production;

Vote: 14 aye / 0 opposed. Discussion / Annotation: Prohibited for use as an herbicide. Vote: 9 aye / 3 opposed, 2 abstentions. None of the members on the Board considered this material as natural, as it is sometimes referred to.

**Boric Acid** - Reviewed by Jerald Feitelson, James Johnson, and Brian Baker.

Determined to be synthetic; Vote: 13 aye / 0 opposed.

The NOSB's decision is to allow this material for use in organic crop production;

Vote: 13 aye / 0 opposed. Discussion: This material is used to keep ants away; and can be used
in processing facilities. Sligh moved and Merrigan seconded a motion for the following

annotation: May be used for structural pest control. No direct contact with food or crops being certified. Vote: 13 aye / 0 opposed, 1 absent. Rogers also mentioned that boric acid could be used as fungicide and herbicide.

Ash (from the combustion of biologically derived materials) - Reviewed by Samuel Cotner. Determined to be non-synthetic; Vote: 13 aye / 1 opposed. Discussion / Annotation: Ash is prohibited unless it is from a naturally occurring source.

Ash (from manure burning)

Determined to be non-synthetic. Merrigan moved and Sligh seconded a motion to prohibit manure ash for use in organic crop production. Passed unanimously

Ash (from coal burning)

This material was tabled and sent back to the TAP and the Crops Committee will discuss whether the burning of mineral substances results in a synthetic substance.

Oils- Reviewed by Bill Wolf and Vivian Purdy.

Determined to be synthetic; Vote: 14 aye / 0 opposed.

The NOSB's decision is to allow this material for use in organic crop production;

Vote: 13 aye / 1 opposed. Discussion / Annotation: Crossley moved and Clark seconded a motion to send this material back to the TAP; the motion failed 1 aye - 13 opposed. Merrigan moved and Anderson seconded to accept the following annotation: Allowed on woody plants for dormant and summer pest control. Prohibited for weed control use. Clark asked whether
alternatives were available and shouldn't the Board be more concerned with the environmental
impacts of petroleum based oils. She also noted that these materials were reviewed only by
manufacturers/suppliers of such materials and therefore, did not constitute a proper, unbiased
review. Vegetable oils were identified as having only limited application and effectiveness. Kahn
and Weakley spoke about the long history of the oils in organic production and how essential they
were to California organic agriculture. Vote: 14 aye / 0 opposed.

Sodium Nitrate- Reviewed by James Johnson, Bruce Spencer, Paul Sachs, and Walter Jeffery.
Determined to be non-synthetic; Vote: 14 aye / 0 opposed.
The NOSB's decision is that this material should not be placed on the Prohibited Natural(s) List.
Vote: 4 aye / 10 opposed. Discussion: Merrigan placed and Sligh seconded a motion that would
prohibit all uses of this material. John Brown made the comment that the material is essential for
the growth of seedlings in the northeastern portion of the country. Kahn recognized the strong
opposition to Chilean nitrate and asked that recommendations guiding its use be prepared for the
USDA and the organic community. Friedman moved to have the Crops Committee develop a
position paper for appropriate use restrictions and possible phase out for this material. for
additional reviewing. The motion was seconded by Kahn. Vote: 14 aye / 0 opposed.

Strychnine- Reviewed by Paul Sachs, Gary Osweiler, and John Clark.
Determined to be non-synthetic; Vote: 4 aye / 8 opposed, 1 absent.
The NOSB's decision is to prohibit this material for use in organic production;
Vote: 11 aye / 2 opposed, 1 absent. Discussion: It was noted that strychnine may be available as
both a synthetic and non-synthetic. Chandler moved to allow this material as an allowed synthetic onto the National list, explaining its usefulness on pocket gophers. The motion was seconded by Crossley. The motion was defeated 11-1.

Hydrolyzed Aquatic Plant Extracts - Reviewed by Donald Blackeney, Bruce Spencer, and James Johnson. Determined to be non-synthetic; Vote: 13 aye / 0 opposed, 1 abstention. By the nature of the National List, no further action was necessary on this material. An informative discussion ensued before the vote on hydrolyzed aquatic plant extracts. Baker noted that stability is a problem in some solutions, especially plant and fish extracts, and that otherwise non-synthetic formulations contain preservatives and/or stabilizers to allow marketability. Sligh and Merrigan stated that the NOSB should just vote on active ingredients at this time and postpone the review of inerts and confidential information. Sonnabend introduced the question of whether the solvent used in extraction should affect the determination of whether the active ingredient is classified as synthetic or non-synthetic, noting that the solvents used for plant extraction may be water potassium hydroxide. Sonnabend also asked whether inerts and stabilizers should affect the synthetic/non-synthetic status. Baker noted that the NOSB has not yet decided that extraction with a substance such as potassium hydroxide or ammonia hydroxide makes the end substance synthetic. Clark expressed her view that relying on sea plants for fertilization can lead to depletion of these materials that supply a large amount of oxygen to the atmosphere. She also stated that there are several other environmental concerns surrounding this material.

Pheromones - Reviewed by Joe Kovach and Bruce Spencer.
Determined to be synthetic; Vote: 14 aye / 0 opposed.

The NOSB's decision is to allow this material for use in organic crop production;

Vote: 14 aye / 0 opposed.

Sulfur- Reviewed by Joe Kovach, Paul Sachs, and Walter Jeffery.

Determined to be synthetic; Vote: 9 aye / 5 opposed.

The NOSB's decision is to allow this material for use in organic crop production.

Vote: 13 aye / 1 opposed.

Bordeaux Mixes (copper sulfate and hydrated lime) - Reviewed by Philip Van Buskirk.

Determined to be synthetic; Vote: 13 aye / 0 opposed.

The NOSB's decision is to allow this material for use in organic crop production;

Vote: 13 aye / 0 opposed. This material must be used in a manner that minimizes accumulation of copper in the soil.

Micronutrients- Reviewed by Phillip Van Buskirk, Vivian Purdy, Bill Wolf, and Brian Baker.

Determined to be synthetic; Vote: 14 aye / 0 opposed.

The NOSB's Decision is to allow this material for use in organic crop production;

Vote: 13 aye / 0 opposed. Discussion / Annotation: Micronutrients will be restricted to cases where soil/ plant nutrient deficiency is documented by soil or tissue testing. Micronutrients made from nitrates, or chlorides are not allowed. They are not to be used as a defoliant, desiccant, or herbicide.
Potassium Bicarbonate - Reviewed by Brian Baker and Walter Jeffery.

This material was tabled and sent back to the Crops committee. The Board will wait until there is a registered use for this material before making a decision on its suitability.

Fish Products - Reviewed by James Johnson, Bruce Spencer, and Paul Sachs.

Determined to be synthetic; Vote: 11 aye / 0 opposed / 1 absent / 1 abstain.

The NOSB’s decision is to allow this material in organic crop production;

Vote: 13 aye / 0 opposed / 1 absent. Discussion / Annotation: Liquid fish products can be pH adjusted using sulfuric, citric, or phosphoric acids. The amount of acid used cannot exceed the minimum amount needed to lower the pH to 3.5. Gershuny noted that fortification with nitrogen is prohibited.

Boron Products, Soluble

The discussion of this substance was interrupted by the need to switch to administrative matters.

After the administration section, boron products was inadvertently dropped from any further voting. It will be voted on at the next Board meeting. The initial discussion began with Sonnabend suggesting that the annotation contain language that the product not contain prohibited substances, since there is both naturally mined boron and formulations. It was agreed that the previously adopted protocol for choosing the non-synthetic form for use, if it is available, before the synthetic form, would apply here. Baker noted that Lynn Coody omitted a couple of boron salts from her TAP review. Gershuny and Baker agreed that there were no synthetic boron
salts that were of particular concern to the organic community. (The BREAK occurred at this point).

**Potassium Permanganate** - Reviewed by Brian Baker and Walter Jeffery.

This material was first determined to be synthetic by a unanimous aye vote. It was then tabled and sent back to the Crops committee. During the discussion, Weakley identified this substance as an essential ethylene scrubber for fruit storage used to prevent ripening. Rogers asked if this is a mechanical operation, then why is it being considered for the National List? Baker commented that certifiers are being asked to vote on potassium permanganate's compatibility.

**Nicotine Products** - Reviewed by John Clark.

Determined to be synthetic; Vote: 12 aye / 0 opposed.

The NOSB's decision is to not allow nicotine products in organic crop production. Vote: 12 aye / 0 opposed.

**Tobacco Dust** - Presentation by John Clark.

Determined to be natural; Vote: 12 aye / 0 opposed. The NOSB's decision is to place tobacco dust on the Prohibited Natural(s) list. Vote: 12 aye / 0 opposed.

**Livestock Materials:**

**Aspirin** - Reviewed by William Zimmer and Marta Engel.

Determined to be synthetic; Vote: 12 aye / 0 opposed.
The NOSB's decision is to allow this material for use in organic livestock production;

Vote: 12 aye / 0 opposed. Discussion: Material can be used for crisis management and hard udders. Sonnabend noted that although Dr. Price of FDA/CVM stated in Rohnert Park that aspirin is not an approved medication for livestock and would require a new drug application, Dr. Engel, a TAP reviewer, states that it is registered and so the review is continuing. Annotation: for health care to reduce inflammation.

This material was tabled and the Livestock committee will develop a policy on vitamin and mineral use and a review on general feed additives and then direct the TAP coordinators on how to continue with the reviews. Discussion centered on emphasizing the need for complete nutritional feeds originating from healthy soils as the centerpiece of organic livestock health care practices, although Wittenberg noted that sometimes a diverse diet may be insufficient because each animal's needs are different and varying weather conditions may induce unanticipated stress.

Iodine - Reviewed by Richard Krengel and William Zimmer.

Determined to be synthetic; Vote: 12 aye / 0 opposed

The NOSB's decision is to allow this material for use in organic livestock production;

Vote: 12 aye / 0 opposed. Annotation: feed salt supplement or topical disinfectant.
April 27, 1995

(The following represents the minutes from the Administrative session on Thursday that occurred during the discussion on boron products and for a short time after lunch):

Merrigan moved and Friedman seconded to adopt the following resolution: The Board requests sufficient Departmental resources to convene a NOSB meeting prior to October 1, 1995 to further consider materials and other issues. To reduce meeting costs, the NOSB recommends that the meeting be held in Washington, DC, preferably at a site such as the National 4-H Center where facility costs would be minimal. In devising a meeting budget, the NOP should be aware that nine of the 14 NOSB members will request funds from their home organization budgets in order to forego USDA travel reimbursement. In this way, the NOSB hopes that limited resources can be stretched to cover the travel costs of the remaining NOSB members and NOSB technical advisors. Crossley moved and Eppley seconded that the first meeting of the next fiscal year be held in Texas. The latter motion was approved unanimously.

Committee update reports:

CROPS: Gene Kahn will remain as Chair. The workplan will be developed during the next conference call. Stoneback, with assistance from Chandler and Eppley, will do an in-depth report on sludge for the NOSB. The Crops Committee will remain in existence and will work with USDA to address short term issues as they arise. Calls will be scheduled as needed.
INTERNATIONAL: Jay Friedman will remain as Chair and the Committee will remain functioning as it has been. A conference call is scheduled for May 16. Issues to be discussed include fumigation.

ACCREDITATION: Kathleen Merrigan will serve as Chair. Issues for this Committee currently are state enforcement, site visits, and trademarks.

LIVESTOCK: Fred Kirschenmann will serve as Chair. Issues include aquaculture, honey, wild game, and materials review.

PROCESSING, HANDLING AND LABELING COMMITTEE: Craig Weakley will serve as Chair. The work plan will be developed on the next conference calls. Issues are new materials for the TAP review, distributor exemption, and certification phase-in. The Committee will remain functioning.

Anderson announced that Kirschenmann will take the lead in preparing a NOSB Code of Ethics and Chandler will begin finalizing the By-laws. Sligh, Friedman, Kinsman and Kirschenmann will assist Chandler. Eppley moved and Crossley seconded to accept the proposed Committee Chairs for the next year. Motion passed unanimously.

Merrigan moved and Anderson seconded to delegate a task force to write a preamble for the National List similar to the Processing Committee's preamble, but also describing the purpose and
protocols of the National List and explaining the review and voting process. The vote was
unanimous for Merrigan to coordinate with Sligh and Weakley who will contribute language on
synthetic/non-synthetic substance availability.

The Board then turned to the ongoing task of trying to agree on a definition of "organic." Relying
on the task force report prepared during this meeting week, and incorporating language from the
Codex interpretation of organic, the Board approved the following definition unanimously:

Organic agriculture is an ecological production management system that promotes and
enhances biodiversity, biological cycles and soil biological activity. It is based on minimal use
of off-farm inputs and on management practices that restore, maintain and enhance ecological
harmony. "Organic" is a labeling term that denotes products produced under the authority of
the Organic Foods Production Act. The principal guidelines for organic production are to use
materials and practices that enhance the ecological balance of natural systems and that
integrate the parts of the farming system into an ecological whole. Organic agriculture
practices cannot ensure that products are completely free of residues' however, methods are used
to minimize pollution from air, soil and water. Organic food handlers, processors and retailers
adhere to standards that maintain the integrity of organic agriculture products. The primary
goal of organic agriculture is to optimize the health and productivity of interdependent
communities of soil life, plants, animals and people.

The Board then passed a resolution on inerts which read: Inerts on the EPA List 4 are
considered to be minimum risk and will be accepted for organic production, unless an NOSB
evaluation finds a specific List 4 inert to be unacceptable. Inerts proposed for organic production on EPA's List 2 which are potentially toxic and List 3 which are unknown will be compiled by the NOSB and forwarded to the EPA as materials for fast-track review and possible reclassification. List 1 inerts are prohibited by the OFPA. Clark opposed the resolution and commented that synthetic materials on List 4 and even inappropriate or toxic natural materials cannot be automatically "acceptable" for organic production, without any in-depth knowledge and/or review of such materials by NOSB.

The Board next debated the resolution on the NOSB statutory authority. Anderson spoke first, referring to a railroad analogy with the need for the crew to work together and act responsibly in consideration of its many passengers. He identified the responsibilities that each member of the NOSB and USDA Staff has in acting together as conductor of the train and hoped that differences will be put aside as we work side by side to deliver our payload. Courtesy, honesty, and fresh starts are the concepts to keep in mind as we continue on down the track.

Merrigan read the resolution and the Senate report and affirmed that the resolution is necessary because groups are concerned about the USDA authority over the National List. Weakley, Chandler and Anderson agreed with the interpretation of the OFPA that only the NOSB can propose synthetics for the National List. Ricker replied that it is not AMS' intention to add synthetics to the proposed National List or to act contrary to the Board's wishes, but the Secretary of Agriculture does have final authority over all aspects of the National Program and the real issue is whether the NOSB, an advisory Board to the Secretary appointed by the
Secretary, should be passing a resolution that insists that his advisory Board has more authority than he does for certain aspects of the program. Ricker expressed futility rather than objections to the resolution. All persons commenting agreed that the Board needs to review the materials for the List after they have been reviewed by a TAP member(s) and that USDA's decision about a synthetic proposed for the List by the Board may differ. Kirschenmann then moved and Crossley seconded that the following resolution be adopted, which it was by a vote of 8 - aye, 4 - opposed, and 1 abstention: The NOSB is more than an advisory board in one very important aspect. The Organic Foods Production Act (OFPA) requires the NOSB to recommend to the Secretary the universe of synthetic materials acceptable for organic production (USC 6517 (c) and (d); see also 6518 (k). In turn, the Secretary can, both before and after public comment, delete synthetic materials from the proposed and final National Lists. The Secretary cannot, at any time, add synthetic materials to the List that are not first recommended by the NOSB (USC 6517 (d)(2). This statutory responsibility makes the NOSB unique among USDA advisory boards. The "Resolution of Focus" document should be amended to reflect this special role of the NOSB in establishing the National List. In doing so, the "Resolution of Focus" document would reflect the common understanding of those involved in the construction of the Act, including the organic, environmental, consumer, and humane care organizations who came together in support of the OFPA and now support the NOP. The NOSB understands and respects the role and responsibilities of the secretary in the rulemaking process. With the exception of the placement of synthetic materials on the National List, the role of the NOSB is advisory. Nevertheless, this advisory function is critical to the development of a sound national program. Prior to publication of proposed rules, the NOSB expects to engage in active two-way
communication with the NOP staff to maximize information exchange. Such exchanges will enhance the expertise of the NOP and aid their rulemaking efforts. Further, such exchanges will enhance NOSB understanding of USDA decisionmaking, aid NOSB in providing counsel to the NOP, and prepare NOSB members to educate the public about NOP efforts.

Prior to returning to the discussion of materials, Baker reported to the Board that the impromptu task force had agreed on the following principles:

1. Non-synthetic and allowed synthetic materials may not be combined in formulations with prohibited materials.
2. Carriers, diluents, fillers, emulsifiers, preservatives, excipients, stabilizers, surfactants, wetting agents and other ingredients of formulated products must be consistent with the inerts policy.
3. The use of all materials approved for production must be consistent with their corresponding annotations under the NOP Farm Plan guidelines and with the individual Farm Plan.
4. Procedures to address brand name products will be established at a later time.

The Board agreed in principle without taking a vote.

April 28, 1995

The meeting was called to order at 8:15 a.m. by Chairperson Sligh. Members in attendance were:

Jay Friedman, Dean Eppley, Gene Kahn, Craig Weakley, Michael Sligh, Merrill Clark, Tom Stoneback, K. Chandler, Don Kinsman, Bob Anderson, Fred Kirschenmann, Rod Crossley, Margaret Wittenberg, and Brian Baker from CCOF as the certifier representative.
Staff members present from USDA were: Mike Hankin, Ted Rogers, and Hal Ricker.

The first order of business was a report on piperonyl butoxide (pbo). John Brown reviewed the voting on pbo that had occurred at Rohnert Park in October 1994 and provided additional information that had been requested of him at the Rohnert Park meeting. His professional opinion based on reviewing studies was that there should not be significant concern about approving this substance for the National List. Its benefits include decreasing the use of the active ingredients by as much as 90% and providing effective pest control measures in processing plants.

Crossley would like to see pbo allowed for use in processing facilities for structural pest control and used only with pyrethrin. Kirschenmann urged caution in approving this substance to protect the US organic industry, even if more botanicals have to be used. Kahn said the Crops Committee supports pbo but with heavy restrictions. Sligh brought up the environmentalist concerns about pbo's effects on the immune system and informed the Board that a new EPA report on pbo is due out on May 22. Clark supported the need to avoid risk to the environment and urged rejection of pbo for the National List. Baker said that the ban on pbo has been a hardship for growers and that a pyrethrin/rotenone combination is harder on the environment than pyrethrin/pbo. Friedman moved and Clark seconded to postpone a decision on pbo. The motion passed 11 aye/2 opposed.

After a break, the Livestock Committee presented newly prepared language on the use of antibiotics and parasiticides in laying hens. The Committee language recommended that eggs
from poultry treated with antibiotics or parasiticides not be sold for 90 days following the date of use and that the criteria for use as listed in the Board Final Recommendations be satisfied. This recommendation was based on the principle that animal health must be restored after use of medications, just as soil health must be restored after the use of restricted materials. Friedman opposed the language becoming a Final Recommendation because public comment has not been received on the issue and there may be additional information that was received at the USDA hearings that the new Board members may first wish to review. He also questioned whether evidence was before the board that demonstrated a need for the use of synthetic medications in egg production. Having reviewed the materials derived from the USDA hearings, Friedman concluded that producers were already producing without the chemicals that the board was considering permitting in organic production. The consumer is already getting organic egg products where the organic label means no synthetic drugs have been used. Approval of a label that says “organic” and means synthetic drugs have been used devalues the organic label. After varied comments about customer expectations, consistency with other animal species standards recommendations, longer withdrawal times and the process of developing the language, the Board turned down Friedman's motion, seconded by Clark, to adopt the wording as a Board Draft Recommendation for additional limited comment. The vote was 5 aye and 8 opposed. Motion failed. However, the Board did approve Weakley's motion, seconded by Friedman, to send the language out for public comment as a Committee recommendation. The vote was unanimous aye.

Turning to the issue of genetic engineering, Sligh questioned whether the NOSB should adopt a resolution formally stating that the process of genetic engineering is considered by the NOSB to
be a synthetic process and that appropriate substances be annotated properly regarding the use of
genetically engineered forms. Stoneback cautioned that genetically engineered forms of
substances are already in use to a greater extent than the Board and the organic community is
aware of. Sligh asked for a small task force to develop language to address concerns of consumer
groups. Ricker offered that the USDA Biotech Council would help with defining the various
types of genetic engineering and supported the idea of a small task force writing a position
hopefully before the Codex meeting in May 1996. The task force will be headed by Sligh with
assistance from Kirschenmann, Wittenberg, Baker, Ricker, and Stoneback.

The next topic was evaluation of the materials review process and future priorities. Clark asked
for more and better information from the reviewers and that a copy of Theuer's review sheet be
mailed as an example. Some other miscellaneous comments were: 30 days is sufficient for review
time; improve the selection of the reviewers; eliminate MSDS and FAPS sheets; provide historic
organic use and current status information; send the 2119m criteria out to the reviewers and
provide their responses directly in the notebooks; and watch out for conflicts of interest.
Sonnabend will incorporate many of the above evaluations into the next round of reviews and will
be assisted by Baker in writing the commercial interest disclosure statement for reviewers.

Sonnabend reported on preparations for the next meeting, noting that sludge and chlorine bleach
could be hotly debated materials. She summarized her survey that attempted to confirm the non-
synthetic status of the materials on the Crops Committee allowed naturals list. Several materials
were identified as also occurring in synthetic form and these will be added to the synthetic
materials to be reviewed by the TAP. Ricker informed everyone that Sonnabend and Brown will remain as TAP coordinators at least through the next meeting. He responded to a question from Baker by stating that he expected the proposed National List to be published after the next meeting, so it was essential that all necessary materials be included for review at the next meeting.

BREAK.

Friedman moved and Chandler seconed to have the next NOSB meeting in Austin Texas. This motion passed by 12 aye, 0 opposed and 1 abstention. The dates most convenient for members were October 30 - November 3, 1995.

Approval of the minutes from Rohnert Park was quickly taken up. Clark asked Sligh, Kinsman, Baker and Wittenberg to assist her in increasing consumer involvement in the recommendation and comment process. This was agreed on. Anderson and Crossley agreed to work with Hankin in furthering the completion of the Good Organic Retailer Practices document with Walter Robb of Whole Foods. Positive vocal support was expressed for transitional labeling provisions within the National Program. USDA will provide leadership and will communicate language and status reports to the NOSB as the issue is developed as the National Program moves along. Hankin was requested to prepare a "projects to be completed" list from the Orlando meeting and distribute it to the Board. Revisions will be made on page 20, lines 463 - 464, at the request of Sligh, to correct the sentence to read, "...was just an advisory Board to USDA, but instead is assigned an additional non-traditional role of decision making." Sonnabend noted that the Materials Oversight
Working Group has more members than are identified in the Rohnert Park minutes. Weakley moved and Crossley seconded to accept the minutes as amended. Vote for approval was unanimous except for a recusal by Friedman.

The final agenda item was phase-in recommendations. Kahn read the joint Crops and Livestock Committees recommended wording and, after making minor additions, Friedman moved and Kirschenmann seconded to approve the Committees' recommendation. The motion was passed 11 aye, 0 opposed and 1 abstention.

Weakley read the Processing Committee's recommendation on phase-in (implementation). Clark obtained confirmation that meat products are covered within the body of the recommendation. Friedman explained his concept that the accredited certifying agent's bond to USDA not be subject to forfeiture for actions occurring prior to accreditation. Kahn moved and Crossley seconded the motion to adopt the Processing Committee's phase-in recommendation as amended. The vote was 12 aye and 0 opposed. (Note: All phase-in recommendations comprise Addendum #9 to the Final Recommendations. The addendum language will be incorporated into the Final version of these minutes).

Sligh passed the gavel to Anderson. Appreciation for Michael's accomplishments was shown by all in attendance. The meeting adjourned.
October 31, 1995

The initial session of the National Organic Standards Board (NOSB) meeting was called to order at 8:09 a.m. by Chairperson Bob Anderson.

Members in attendance were: Tom Stoneback, Craig Weakley, Dean Eppley, Don Kinsman, Merrill Clark, Michael Sligh, Bob Anderson, Gene Kahn, K. Chandler, Rod Crossley, Fred Kirschenmann, Kathleen Merrigan, and Margaret Wittenberg. Participating at this meeting as the certifying agency advisor to the NOSB was Tom Tomas of Farm Verified Organic, Inc.

National Organic Program staff members present from USDA were: Michael Hankin, D. Ted Rogers, Michael Johnson, Toni Strother, and Grace Gershuny. Also in attendance from the USDA was Eileen Stommes, Director of the Transportation and Marketing Division, Agricultural Marketing Service (AMS).

The Technical Advisory Panel Coordinator present at the start of the meeting was Zea Sonnabend. John Brown was expected to arrive later, along with advisors Rich Theuer, Lynn Coody, Brian Baker, and Bill Wolf.

Eileen Stommes opened the initial session by commenting on the aggressive agenda set forth by the NOSB. She thanked the Board for its work and noted that the recommendation process is winding down simultaneously with a decline in Federal Advisory Committee funding. She also pointed out that there is still much work to do, and the USDA is committed to a timely proposed rule in 1996. She closed by again thanking the NOSB for its commitment and dedication to bringing together everyone in the organic industry.

On behalf of the NOSB and the USDA, Bob Anderson recognized the retiring Board members and presented them with mementos. Those Board members included: Merrill Clark, Don Kinsman, Tom Stoneback, and Craig Weakley. Michael Sligh was recognized for his service (1992-1995) as the first Chairperson of the NOSB.

Eileen Stommes followed with a presentation to Bob Anderson for his dedication and leadership as the previous year’s chairperson.

Brent Wiseman, Organic Programs Director for the Texas Department of Agriculture (TDA), thanked the USDA and NOSB for selecting Austin, Texas, as the host site for this meeting. The Texas Department of Agriculture Deputy Commissioner, Larry Soward, followed with some
Mr. Soward discussed the history and current status of the TDA Certification Program and noted the lack of organic livestock standards both in Texas and nationally.

USDA Staff Report - Operations Manager Michael Hankin proceeded with an update on the National Program activities and program direction, explaining that Program Leader Harold Ricker was in Costa Rica at the Bio Fair and wished very much that he could be present at this meeting. Hankin first reviewed the funding status for FY '95 and briefly discussed the projected program funding for FY '96. It is expected that the NOP will retain the same level of funding as FY '95 ($500,000), along with a cost of living adjustment ($100,000).

He also reported that there will be a five thousand-dollar reduction in funding for the Board, from forty-five thousand to forty thousand dollars. It is expected that next June would be the first possible meeting date in calendar year 1996. As a note, the nominations for new Board members are officially closed. The Department received seventeen nominations for the five positions.

Hankin followed with information about a number of staffing changes in both the Department and in the Transportation and Marketing Division (TMD). Former Acting Assistant Secretary for Marketing and Regulatory Programs, Patricia Jensen, was replaced by Michael Dunn; TMD has a new director Eileen Stommes, and deputy director, Paul Kepler. TMD also has completed an internal reorganization, and the NOP has acquired an additional staff member, Toni Strother. Toni will be assisting the staff in many areas, including database management.

Next, Hankin reported on the status of the proposed rule. The second draft of the Accreditation portion of the program was recently delivered to the Office of General Counsel (OGC). He then went on to announce that the accreditation program will be published along with the other sections of the program. In closing, Hankin urged the Board to make recommendations on the materials that are up for review, and to avoid tabling materials. He went on to encourage the Board to utilize the materials experts at the meeting (i.e., Zea Sonnabend, Lynn Coody, Brian Baker, Tom Tomas, John Brown, and Rich Theuer) to supplement data gaps in the review notebooks.

LIVESTOCK COMMITTEE REPORT:

Fred Kirschenmann began the livestock committee’s session by calling attention to Paul Thompson’s deliberations on the “Spirit of the Soil” and reminded everyone of the overall objectives of the Board’s mission. He also noted that the following committee documents were up for Board approval: 1) The Use of Antibiotics in Organic Livestock Production; 2) The Use of Parasiticides in Organic Livestock Production; 3) TAP Review of Antibiotics and Parasiticides in Organic Livestock Production; 4) TAP Review of Vitamins and Minerals in Organic Livestock Production; 5) TAP Review of Innoculants and Vaccines in Organic Livestock Production; 6) The Use of Innoculants and Vaccines in Organic Livestock Production; and 7) Revisions to the NOSB Livestock Addendums for Organic Livestock Production.
The Use of Antibiotics in Organic Livestock Production & The Use of Parasiticides in Organic Livestock Production.

(One combined vote was taken for both documents.) Merrill Clark noted that many persons had expressed the opinion to the committee that parasiticides and antibiotics were not needed. Fred followed by stating that the purpose of this recommendation is to present a laying hen recommendation that is consistent with the NOSB’s dairy recommendation. Gene Kahn moved and it was seconded by Rod Crossley to accept the document as a Board Final Recommendation (BFR). Vote: Yes - 10, Opposed - 3. Motion carried.

TAP Review of Antibiotics and Parasiticides in Livestock Production.

Prior to a motion to accept this document as a BFR, Merrill presented the idea that antibiotics and parasiticides should be individually reviewed within the Technical Advisory Panel process. Bob Anderson followed with two recommended changes to the document prior to the motion for approval - a) delete at line 39 “most likely to be” and b) add a two-year review clause to the document. There were no objections to the changes and Rod Crossley moved to accept the document as amended as a BFR. It was seconded by Gene Kahn. Vote: Yes - 11, Opposed - 1, Absent -1. Motion carried.

TAP Review of Synthetic Vitamins and Minerals in Livestock Production.

Merrill pointed out that the statement of principle that was used as a preface in the two previous documents was missing. Gene spoke to her concern, noting that lines 30-36 did in fact provide the principle for the committee’s thinking. Prior to the motion for approval, Bob once again offered the addition of a “two year review clause” and also recommended amending lines 28-29 to read “Producers often may not be able to control the quantity of vitamins and minerals naturally occurring in feedstuffs.” There were no objections. Mike Hankin noted that a list of those supplements (which are to be used in the program) are published in the Federal Register and are all Generally Recognized as Safe (GRAS) by the FDA. Gene moved and it was seconded by Tom Stoneback to accept the document as amended as a BFR. Vote: Yes - 11, Opposed - 1, Absent -1. Motion carried.

TAP Review of Innoculants and Vaccines in Livestock Production.

Bob Anderson recommended the following changes: a) delete “unrestricted” in line 12; b) substitute "deferring initial TAP review of innoculants and vaccines" for “forgoing TAP review of innoculants and vaccines”; and c) add a two-year review clause. There was unanimous agreement on the changes. Gene moved and Dean Eppley seconded a motion to accept the document as amended as a BFR. Vote: Yes - 12, Opposed - 0, Absent 1.

The Use of Innoculants and Vaccines.

The following changes were accepted as amendments to the document prior to the motion for
approval: a) Line 10 - delete the word “unrestricted” and b) Line 16 - Change the word “is” to “may be.” Rod then followed with a motion to accept the document as amended. K. Chandler seconded the motion. Vote: Motion carried unanimously to accept the document as a BFR.

Organic Livestock Production. (This recommendation is a compilation of changes to be made in the Organic Livestock Production Standards section of the NOSB Final Recommendations adopted June 1-4, 1994 in Santa Fe, New Mexico.) The changes reflect new language for the a) veterinarian-client relationship and b) the removal of “growth promoters” from the document.

Craig Weakley moved and it was seconded by Gene to accept the recommendation as amendments to the BFR approved in June 1994. Vote: Motion carried unanimously.

BREAK.

PROCESSING, HANDLING, AND LABELING COMMITTEE:

Following the break, the Board resumed business at 10:20 a.m. to discuss the PHL committee’s new recommendations to the full Board. The following documents up for approval included:

General Organic Food Labeling Standards.

It was noted that approximately 90% of the General Organic Food Labeling Standards have already been passed as NOSB Final Recommendations. The additions represent reiterations and clarification; all information listed in the document has been reviewed for consistency with the OFPA. Gene moved and it was seconded by Bob to accept the document as and addition to the existing Board final recommendations. Vote: Yes - 10, Opposed - 1, Absent - 2. Motion carried.

Allowable Methods of Oil Extraction.

Michael Sligh moved and it was seconded by Dean to accept the document as a Board final recommendation. Discussion followed, and Mike Hankin commented on the language in lines 34-37 regarding hexane. He went on to ask if it was the intent of the committee to prohibit hexane use in the non-organic ingredient components of organic foods and foods “made with organic ingredients,” as the language seemed to imply. Craig followed by saying that this is the committee’s intent. Vote: Motion carried unanimously.

Requirements for Handler Certification.

There were a number of proposed changes to the handler certification document. They represent
both additions and deletions to an NOSB final recommendation, adopted on June 4, 1994, in Santa Fe, New Mexico. The proposed changes are as follows: a) Line 27 - delete the word “should”; b) Line 27 - add after the word ‘integrity’ -- “and the audit trail”; c) Line 29 - delete the word “distributors”; d) Line 30 - add after the word ‘retailers’ -- “and distributors who process’ [OFPA Section 2103 - see below] and substantially transform, repack or relabel”; e) Line 56 - add footnote number 1 - “OFPA Section 2103 Definitions (17) Processing. The term ‘processing’ means cooking, baking, heating, drying, mixing, grinding, churning, separating, extracting, cutting, fermenting, eviscerating, preserving, dehydrating, freezing, or otherwise manufacturing, and includes the packaging, canning, jarring, or otherwise enclosing food in a container.”; and f) Line 80 - add after ‘under the’ -- “OFPA only if they both take title to the organic products and substantially transform, or process, or repackage or relabel these products.”

During the document discussion, Michael Sligh commented that there should be some language in the definitions to deal with the effect of this recommendation on co-ops. Craig and Margaret responded by noting that the committee will address the issue of co-ops and retailing for the next meeting. Rod moved and Gene seconded a motion to accept the additions and deletions as noted in the document. Vote: Motion carried unanimously.

Addition of Synthetic Magnesium Chloride to National List.

Rod began the discussion by commenting on the industry’s mislabeling of magnesium chloride as “nigari”. Margaret Wittenberg went on to reiterate that most of the industry is using synthetic magnesium chloride. Just prior to a motion for Board approval, Ted Rogers noted that the FDA does not recognize “nigari” as an ingredient; therefore, the use of the word is prohibited. Kahn noted that lines 44-48 should not have been included. Rod moved and Gene seconded the motion to accept the document and he also recommended the addition of the word “be” after the word ‘should’. Vote: Yes - 12, Opposed - 0, Abstain - 1. Motion carried.

Use of Nutrient Supplementation in Organic Foods.

Michael Sligh began the discussion by asking for clarification on what “independent professional organizations” are. Rod noted they have no commercial interest in the matter of which vitamins or minerals are used in foods. Merrill then expressed her concern over the addition of accessory nutrients, as well as the categorical acceptance of a large group of vitamins and minerals. Craig clarified that the PHLC was not recommending that vitamins and minerals for human consumption be exempted from the National List process. Gene moved and it was seconded by Tom to accept the document as a BFR with two small changes which included a) Line 16 - delete the word ‘must’ and replace it with “may”; and b) Line 32 - add “and fortification” after the word ‘enrichment’. Vote: Yes - 12, Opposed - 1. Motion carried.
Use of Natural Flavors in Organic Foods (Proposal #2).

It was noted that the original draft of this document went out for public comment and has been responded to. It was also stated that the intent of this document is to prohibit propylene glycol and artificial preservatives. This document differs from the previously submitted Committee recommendation in that this recommendation clearly delineates separate guidelines for “organic foods” and “foods made with organic ingredients”. Gene went on to describe his research on flavor houses, and his findings show that there are no flavor houses currently producing organic natural flavors, but one is starting to carry some with no synthetic carriers, solvents, or preservatives. He cited competitive market forces in the industry as future incentive for the production of organic natural flavors. Rod moved and it was seconded by Gene to accept the revised recommendation as a BFR. Vote: Motion carried unanimously.

Incidental Food Additives in Organic Foods.

Tom Stoneback inquired as to whether or not there were trade secret issues at hand when discussing processing aids. Rod responded by stating that the substances in question can be disclosed to a certifier and that label declaration is not the answer. Merrill followed with comments acknowledging the applicability of this recommendation to “foods made with organic ingredients,” but contested applying it to “organic foods” as well. Craig went on to review the committee’s longstanding debates over this issue and the need to bring it to resolution. Tom moved and it was seconded by K. Chandler to accept the recommendation as a BFR. Vote: Yes - 9, Opposed - 3, Abstain - 1. Motion carried.

LUNCH BREAK.

The Public Input session followed the lunch break. The meeting was adjourned for the day at 5:30 p.m. after the public input session.
November 1, 1995

CROPS COMMITTEE REPORT:

The meeting was called to order at 8:00 a.m. by chairperson Bob Anderson.

Members in attendance were: Tom Stoneback, Gene Kahn, Jay Friedman, Rod Crossley, Craig Weakley, Dean Eppler, Don Kinsman, Merrill Clark, Michael Sligh, Bob Anderson, Margaret Wittenberg, K. Chandler, Fred Kirschenmann, and Kathleen Merrigan. Participating as the certifying agent advisor to the NOSB was Tom Tomas of Farm Verified Organic.

Staff members present from USDA were: Michael Hankin, D. Ted Rogers, Toni Strother, Grace Gershuny, and Michael Johnson.

Technical Advisory Panel Coordinators present were: Zea Sonnabend, John Brown, and Rich Theuer as facilitator.

The following Crops Committee documents were up for discussion and approval at this session:

1) Phase-Out of Chilean Nitrate; 2) Banana Planting Stock; 3) Emergency Spray Exception; 4) Ban on Petitioned Materials; 5) Definitions and Interpretations; and 6) NOSB Materials Review Criteria.

Phase-Out of Chilean Nitrate.

Grace Gershuny briefly discussed the use of chilean nitrate in an organically managed system, noting that its use would still be within the context of the NOP standards. She also made reference to chilean nitrate and international standards -- it is not the intent of the NOP to make our standards identical to other country’s standards. In fact, the USDA will work towards harmonization and agreements where organic principles are the foundation and we will need to acknowledge minor differences. Michael Sligh added that a phase-out will increase the use of chilean nitrate and not decrease it. K. Chandler followed with his support for the allowance of chilean nitrate, mindful of its minor use importance to some organic farmers. Jay expressed his non-support, citing the possible increase in use as Sligh mentioned earlier in his comments.

Gene then cited that the USDA’s Organic Farm Plan scrutiny will deal with its overuse and abuse. K. Chandler moved and it was seconded by Bob Anderson, who after agreement from the Board, added a two-year review clause. The annotation would limit use to 20% of the total nitrogen supplied to a crop. Vote: Yes - 8, Opposed - 6. Motion fails.

In a separate discussion, the Board again discussed Chilean Nitrate use and subsequently passed the following proposal regarding chilean nitrate; Vote: Yes - 13, Opposed - 1.
Chilean Nitrate Special Use Guidelines

The use of Chilean Nitrate (16-0-0) in organic crop production is limited to not more than 20 percent of total nitrogen supplied to a crop. The producer's Farm Plan shall contain specific provisions and strategies designed to substantially reduce the use of Chilean Nitrate over time. The amount and timing of these reductions will be consistent with documented site specific constraints. The Farm Plan will seek to explore each and every alternative to the routine use of Chilean Nitrate in the farming system. These alternatives include, but are not limited to, composting, improvement of compost, leguminous cover crops, interplanting, rotations, microbial enhancements, animal manures, varietal selections, planting date alterations, and reducing amounts of applied supplemental nitrogen. The timing and efficiency of Chilean Nitrate application shall be optimized and documented in the Farm Plan. Certifiers will monitor progress in the reduction of Chilean Nitrate use and will decertify farmers that develop long term dependence on this material. Strong farmer commitment, aggressive action, and measurable results are all necessary elements of this special use of Chilean Nitrate.

This policy shall be reviewed within two years.

Banana Planting Stock.

Michael Sligh commented on the implication of large scale tissue culture use, and its relationship to a lack of genetic diversity (pressures of identical crops on the ecosystem). Bob moved and it was seconded by Rod to accept the banana document as a BFR after making a minor correction to line 12: change 'seed' to "sucker". Vote: Yes - 13, Opposed - 1. Motion carried.

Emergency Spray Exception.

Michael Sligh moved and it was seconded by Dean to accept this document as written. No discussion ensued. Vote: Motion carried unanimously.

Ban on Petitioned Materials.

Rod Crossley moved and it was seconded by Craig Weakley to accept this document. It was noted that the document had not previously been distributed to the NOSB or USDA staff. The substances listed on the document were: glyphosate, thiram, benomyl, captan, and methoxychlor. During the discussion, Ted Rogers explained that these petitioned materials were standards issues, rather than a national list issue, in that their use is prohibited on the farm, but that seed purchased may have been treated with one of these substances. Jay Friedman also expressed concern over the legality of the recommendation, but supports its underlying principle. Kahn explained that by approving this document, the NOSB is deciding without a TAP review, but its knowledge of a material, that it does not meet the seventh criteria in Section 2119(m) of the OFPA (compatibility) and therefore does not need to undergo a TAP review to evaluate its
environmental impact. Vote: Yes - 13, Opposed - 0, Absent - 1. Motion carried unanimously.

Definitions and Interpretations.

This document includes a new section which defines a synthetic analogue, and refines several definitions that were on the previous version of this document.) Fred K. moved and it was seconded by Rod to accept this document as a BFR. Prior to a vote, there were several amendments added to the document. Michael Sligh proposed two technical amendments, both regarding rRNA and rDNA: a) Line 71-72 should read as follows: "Recombinant RNA & DNA Techniques. Techniques that artificially break apart and recombine DNA and RNA molecules with the intent of altering genetic instructions," and b) Line 37 - add after ‘recombinant DNA’ -- "and RNA techniques". Kathleen then recommended the addition of "and must contain only dead organisms." after the word ‘organism’ in line 48. Vote: Motion carried unanimously.

Needing clarification of lines 90-95, Jay received the response from Grace that this new definition will serve as an additional reference and decision making tool. The discussion concluded as Craig moved and it was seconded by Rod to add at the end of the sentence on line 92: “provided that the synthetic material is on the National List.” Vote: Motion carried unanimously.

NOSB Materials Review Criteria.

Grace led the discussion for this document, and noted that it was established to expand the intent of the OFPA criteria listed in section 2119(m)(7), “compatibility with a system of sustainable agriculture”. She noted that this document would be helpful to the staff in providing guidance for classifying petitioned materials that were questionable as to whether they fit within the context of the national program. Grace went on to explain that the document was late in its evolution, but should nonetheless assist the Board in its materials review and evaluation. Fred moved and it was seconded by Kathleen to accept the document, deleting the following in lines 48-49: “Example: pBO. Also, rDNA produced biofungicides might get serious consideration here if they are a good alternative for copper and don’t violate criterion #1 above.” Vote: Yes - 10, Opposed - 3, Absent 1. Motion carried. Following acceptance of the document, Jay moved and it was seconded by Merrill to add the following amendment at line 10: “However, no material may be consistent with organic agriculture and appear on the National List in the absence of a strong factual showing in scientific criteria.” Vote: Yes - 11, Opposed - 0, Abstain - 2, Absent - 1. Motion carried.

Following the document discussions, Tom Stoneback briefed the Board on sewage sludge and bio-solids. Fred urged that the material be moved forward to the TAP and that information collection should continue. The Board was in agreement with Fred’s suggestion.

Discussion Paper: Organic Principles, Standards Development, and Farm Plan Requirements. This paper was prepared by the National Organic Program staff at the request of the Crops Committee, to help clarify how they are looking at the criterion of progressive
improvement as it relates to anticipated NOP Standards and Organic Farm Plan provisions. During the discussion, Craig noted that the use of the word "Tolerated" seems to have a negative connotation and use of the word "Restricted" appears to be a better choice and add more clarity to its meaning. Michael Sligh recommended that the NOP take a look at the Texas ten-point evaluation system. Fred agreed to bring forth a proposal to develop a taskforce to add to the discussion paper's high points.

ACCREDITATION COMMITTEE DISCUSSION:

Use of Private Seals.

Fred Kirschenmann led the discussion on the use of private seals. He explained why the private certifiers want this particular option; Michael Sligh expressed his support for the document. Jay dissented, and spoke to the additional confusion that this will cause in a national program. He also noted that there were a number of unresolved questions in the document and pointed out that there had been no public input on the document. Gene rejected the idea of "seal use" to promote producer achievements and production abilities, and the massive consumer confusion that this would cause. There was additional comment on the paper, and then it was brought to a vote - 5 aye / 6 opposed / 3 abstentions. The motion failed.

In a separate discussion, the issue of private seal usage was revisited on Thursday, November 2. Kathleen began by reading a new proposal, and Fred continued to assert the need for certifier seal usage, because much time and energy have been spent on their development and market recognition. He cited the ability of seals to be indicative of other claims related to practices and standards, e.g., safe for the chemically sensitive. Bob concurred on the right to continue seal usage, but noted that they should not serve as barriers to trade nor should they create further market confusion. Rod agreed as well, but rejected the notion of making superior claims with seals. Fred insisted the issue was differentiation, and that certifiers should secede if this provision was denied. Gene also agreed with allowing private seal usage, but objected to superior claim implications associated with their use. Kathleen defended the "chemically sensitive" example as being above and beyond the organic claim; Tom Stoneback questioned its place or applicability to a national organic program. As the discussion came to a close, Rod moved and it was seconded by Craig to accept the new seals proposal as amended. Vote: Yes - 12, Opposed - 1. Motion carried unanimously. Listed below is the proposal as amended and approved.

SEALS

A certifying agent may permit the use of its seal, logo, or trademark on product labels to:

(a) denote affiliation with or membership in the applicable private certification program or organization;

(b) indicate the state or region of origin of the product; and/or (c) designate claims on the
part of the producer, processor, or product not covered under Sections XXX (organic production standards and National List).

(B) A seal, logo, or trademark shall not be used:

1. to restrict trade or prevent procedures or processors from being certified in accordance with the Act;
2. to imply that products so labeled are superior to other products produced in accordance with Sections XXX (organic production standards and National List);
3. to imply USDA accreditation of certifying activities for claims not covered under Sections XXX (organic production standards and National List); and shall not be
4. required to be displayed on any product offered for sale as “organic” or “organically produced” as a condition of certification.

Next, a document, developed by the Organic Certifiers Caucus organization, was circulated which suggested a new approach for selecting future NOSB meeting certifier representatives. The document will be considered by the Accreditation Committee before recommending future temporary certifier positions to the Executive Committee.

Code of Ethics.

Fred then moved on to the Code of Ethics document, but noted that he did not expect a vote at this time on it. He subsequently led a paragraph by paragraph discussion and met significant opposition to the concept of such a document. Jay moved and it was seconded by Merrill to table the document and to review it again later in the week. The NOSB consented in the majority.

INTERNATIONAL COMMITTEE:

Fumigation Tables

In response to inquiries regarding the fumigation and subsequent status of organically grown fresh fruit and vegetables that are imported into the United States, the NOP, in consultation with the Plant Protection and Quarantine (PPQ) division of the Animal and Plant Health Inspection Service (APHIS), developed a set of “fumigation” tables. Michael Johnson briefly discussed the tables and answered several questions posed by the NOSB and other meeting attendees. There is a copy of the cover letter and tables included in the minutes.1

1See Attachment 2, entitled Fumigation Tables.
As an introduction to the materials review session, Kathleen commented on the recent request to change an NOSB member’s vote registered during the NOSB meeting in Orlando in April 1995. Craig suggested that at the close of each vote, a final tally should be announced so as to ensure accuracy. All Board members were in agreement with this suggestion and further determined that the burden was on the NOSB member to ensure the accuracy of votes; vote tallies would be official as recorded at the end of the voting day. Bob went on to review the Materials Oversight Working Group conclusions and the NOSB voting procedures and noted that the synthetic/non-synthetic decision will be a simple majority and abstentions are counted as a “no” vote, absences don’t count toward the majority, and 2/3 of the NOSB must be present to conduct a vote.

The second round of the NOSB materials review began with the review of processing materials. The round was coordinated by former NOSB Processing committee chairperson, Rich Theuer, Ph.D. Dr. Theuer was also a leading reviewer for a number of the processing materials.

The following notes represent the NOSB materials voting process that occurred during the remainder of the week. The notes detail the actual votes on each material and some general comments and discussion notes. They are listed in the order in which they appear in the document “Summary of NOSB Recommendations for Materials Considered at Austin, Texas, November 1995” that was distributed to the persons on the public mailing list in January 1996.

**Processing Materials**

**Calcium Carbonate** - Reviewed by Rich Theuer, Bob Durst, and Joe Montecalvo. Determined to be non-synthetic; Vote - Unanimous. The NOSB’s decision is to allow this material for use in organic food processing; Vote - Unanimous.

**Cornstarch (Native)** - Reviewed by Joe Montecalvo and Rich Theuer. Determined to be non-synthetic; Vote - Unanimous. The NOSB’s decision is to allow this material for use in organic food processing; Vote - Unanimous. Discussion: Bob Anderson noted and it was agreed upon by the Board that they were only voting on native and unmodified starches.

**Cultures, Dairy** - Reviewed by Rich Theuer. Determined to be non-synthetic; Vote - Unanimous. The NOSB’s decision is to allow this material for use in organic food processing; Vote - Unanimous. Annotation: Bacteria may not be a product of rDNA technology.

**Gums (Water Extracted Only - Arabic, guar, locust bean, and carob bean)** - Reviewed by Joe Montecalvo and Rich Theuer. Determined to be non-synthetic; Vote - Unanimous. The NOSB’s decision is to allow this material for use in organic food processing;
396 Vote - Unanimous. Annotation: Water extracted only.
397 Discussion: Bob Anderson made a motion and it was seconded by Rod Crossley to include the
above listed annotation for gums. Vote: 12 aye / 2 opposed. Motion carried.

398 Yeast, Autolysate - Reviewed by Joe Montecalvo and Rich Theuer.
399 Determined to be non-synthetic; Vote: 13 aye / 0 opposed / 1 abstention.
400 The NOSB’s decision is to allow this material for use in organic food processing;
401 Vote: 13 aye / 1 opposed. Annotation: Yeast (used for source) that is a product of rDNA
technology is prohibited. Discussion: Merrill expressed her belief that this material is a form of
402 MSG in disguise. Rich followed by indicating that this material is a natural hydrolysate, and not
403 a concentrated synthetic, as are MSG’s.

405 Yeast, Bakers - Reviewed by Joe Montecalvo and Rich Theuer.
406 Determined to be non-synthetic; Vote: 13 aye / 0 opposed / 1 abstention.
407 The NOSB’s decision is to allow this material for use in organic food processing;
408 Vote: 12 aye / 1 opposed / 1 abstention.
409 Annotation: Yeast (used for source) that is a product of rDNA technology is prohibited.

410 Yeast, Brewers - Reviewed by Joe Montecalvo and Rich Theuer.
411 Determined to be non-synthetic; Vote: 12 aye / 0 opposed / 2 abstentions.
412 The NOSB’s decision is to allow this material for use in organic food processing;
413 Vote - Unanimous. Annotation: Yeast (used for source) that is a product of rDNA technology is
414 prohibited.

415 Yeast, Nutritional - Reviewed by Joe Montecalvo and Rich Theuer.
416 Determined to be non-synthetic; Vote - Unanimous.
417 The NOSB’s decision is to allow this material for use in organic food processing;
418 Vote: 13 aye / 1 opposed. Annotation: Yeast (used for source) that is a product of rDNA
technology is prohibited. Growth on petrochemical substrates and sulfite waste liquor is also
419 prohibited.

421 Yeast, Smoked - Reviewed by Rich Theuer and Joe Montecalvo.
422 Determined to be non-synthetic; Vote: 13 aye / 0 opposed / 1 abstention.
423 The NOSB’s decision is to allow this material for use in organic food processing;
424 Vote: 11 aye / 3 opposed. Annotation: Yeast (used for source) that is a product of rDNA
425 technology is prohibited. Growth on petrochemical substrates and sulfite waste liquor is also
426 prohibited. The handler must document in the Organic Handling Plan that the smoke flavoring
427 used is produced using a non-synthetic process that does not use synthetic processing aids or
428 additives.

429 Calcium Citrate - Reviewed by Mark Schwartz and Joe Montecalvo.
430 Determined to be synthetic; Vote: 13 aye / 0 opposed, 1 absent.
431 The NOSB’s decision is to allow this material for use in organic food processing;
Vote: 11 aye / 1 opposed / 1 absent / 1 abstention.

**Calcium Phosphates (Di, Tri, Mono)** - Reviewed by Mary Mulry, Rich Theuer, and Joe Montecalvo. Determined to be synthetic; Vote - Unanimous.
The NOSB’s decision is to allow this material for use in organic food processing;
Vote: 13 aye / 1 opposed. Discussion: This material is used in baking powder, fortification, for yeast growth, and a firming agent for yogurt. Craig noted that the Handling Plan will discover other uses for the material that are not currently known.

**Carbon Dioxide (Non-synthetic)** - Reviewed by Joe Montecalvo, Rich Theuer, Mary Mulry, and Bob Durst. Determined to be non-synthetic; Vote - Unanimous.
The NOSB's decision is to allow this material for use in organic food processing;
Vote - Unanimous.

**Carbon Dioxide (Synthetic)** - Reviewed by Joe Montecalvo, Rich Theuer, Mary Mulry, and Bob Durst. Determined to be synthetic; Vote - Unanimous.
The NOSB's decision is to allow this material for use in organic food processing;
Vote: 13 aye / 1 opposed. (The non-synthetic form is preferable to the synthetic.)

**Chlorine Bleach (Calcium hypochlorite, sodium hypochlorite, chlorine dioxide)** -
Reviewed by Joe Montecalvo, Marta Engel, Rich Theuer, Walter Jeffery, and Chris Milne.
Determined to be synthetic; Vote - Unanimous.
Annotation: Allowed for disinfecting and sanitizing food contact surfaces. Residual chlorine levels for washwater in direct crop or food contact and in flush water from cleaning irrigation systems that is applied to crops or fields cannot exceed the maximum residual disinfectant limit under the Safe Drinking Water Act (currently 4mg/L expressed as Cl₂). This substance is to be reviewed again in two years.

**Ethylene** - Reviewed by Joe Montecalvo, Rich Theuer, and Chris Milne.
Determined to be synthetic; Vote - Unanimous.
The NOSB's decision is to allow this material for use in organic food processing;
Vote: 13 aye / 1 opposed. Annotation: for use as a ripening agent for bananas only.
Discussion: Craig moved and it was seconded by Michael Sligh to restrict its use as a ripening agent for bananas only. Fred noted that FVO does allow its use to prevent other problems and is actively seeking an alternative, but that there is no alternative currently. Merrill questioned the nutritional properties of foods that are ripened by a blast of ethylene gas. Gene noted that it is essential for controlled ripening over long distances. Michael Sligh moved and it was seconded by Kathleen to phase ethylene out over a five-year period. Vote: 3 aye / 9 opposed / 2 abstentions. Motion failed.

**Glycerin** - Reviewed by Joe Montecalvo, Rich Theuer, and Mary Mulry.
Determined to be synthetic; Vote - Unanimous.
The NOSB’s decision is to allow this material for use in organic food processing;
Vote - Unanimous. Annotation: Must be produced by hydrolysis of fats and oils.

**Hydrogen Peroxide** - Reviewed by Vivian Purdy and Amigo Cantisano.

determined to be synthetic; vote - unanimous (1 absent).

The NOSB’s decision is to allow this material for use in **organic food processing and organic crop production**. Vote - Unanimous (1 absent).

**Magnesium Chloride (non-synthetic)** - Reviewed by Joe Montecalvo and Rich Theuer.

determined to be non-synthetic; vote - unanimous.

The NOSB’s decision is to prohibit the use of non-synthetic magnesium chloride (from sea water) in organic foods (95% and above); vote: 12 aye / 2 opposed. The NOSB’s decision is also to prohibit the use of non-synthetic magnesium chloride (from sea water) in foods made with organic ingredients (50%-95%); vote: 12 aye / 2 opposed.

**Magnesium Chloride (Synthetic)** - Reviewed by Joe Montecalvo and Rich Theuer.

determined to be synthetic; vote - unanimous.

The NOSB’s decision is to allow synthetic magnesium chloride for use in organic food processing; vote: 13 aye / 1 opposed.

Annotation: Allowable only in the synthetic form if extracted from sea water. Magnesium chloride produced by synthetic processes (e.g., hydrochloric acid reaction) is not allowable.

Unrefined non-synthetic magnesium chloride (nigari) is not recognized by FDA as an allowed food ingredient.

**Nutrient Vitamins and Minerals** - Reviewed by Rich Theuer, Mary Mulry, Joe Montecalvo.

determined to be synthetic; vote - unanimous.

The NOSB’s decision is to allow this material for use in organic food processing;

vote: 10 aye / 4 opposed. Annotation: Accepted for use in organic foods for enrichment or fortification when required by regulation or recommended by an independent professional organization.

**Ozone** - Reviewed by Rich Theuer and Joe Montecalvo.

determined to be synthetic; vote - unanimous.

The NOSB’s decision is to allow this material for use in organic food processing;

vote - Unanimous.

**Potassium Hydroxide** - Reviewed by Rich Theuer and Joe Montecalvo.

determined to be synthetic; vote: 10 aye / 0 opposed / 4 absent.

The NOSB’s decision is to allow this material for use in organic food processing;

vote: 9 aye / 2 opposed / 1 abstention / 2 absent.

Annotation: Prohibited for use in lye peeling of fruits and vegetables and **where** non-synthetic sodium carbonate is an acceptable substitute.
Tartaric Acid (Made from grape wine)
Determined to be non-synthetic; Vote - Unanimous (1 absent).
The NOSB’s decision is to allow this material for use in organic food processing;
Vote - Unanimous (1 absent).

Tartaric Acid (Made from malic acid)
Determined to be synthetic; Vote - Unanimous (1 absent).
The NOSB’s decision is to allow this material for use in organic food processing;
Vote: 10 aye / 4 opposed.

Potassium Acid Tartrate (or Potassium Tartrate made from tartaric acid) - Reviewed by Rich Theuer and Joe Montecalvo. Determined to be synthetic; Vote - Unanimous. The NOSB’s decision is to allow this material for use in organic food processing; Vote: 12 aye / 1 opposed / 1 absent. Discussion: Sligh questioned the essentialness of this material. Craig moved and it was seconded by Merrill to accept the following Annotation: Shall be derived from tartaric acid derived from grapes. Vote: 6 aye / 6 opposed / 1 abstention / 1 absent. The motion failed, and there is no annotation for this material.

Sodium Phosphates - Reviewed by Bob Durst, Rich Theuer, and Joe Montecalvo. Determined to be synthetic; Vote - Unanimous. The NOSB’s decision is to allow this material for use in organic food processing; Vote: 12 aye / 2 opposed. Discussion: Jay and Merrill both expressed the opinion that sodium phosphates should be annotated. Fred moved to annotate, limiting its use as a boiler water additive. Before there was a vote, Jay withdrew his motion and moved to table -- Vote: 4 aye / 9 opposed / 1 absent. Motion failed. Michael Sligh then followed with a motion for the annotation: "Use restricted to dairy foods". Vote: 12 aye / 2 opposed. Motion carried.

Tocopherols - Reviewed by Joe Montecalvo, Rich Theuer, and Mary Mulry. Determined to be synthetic; Vote: 13 aye / 1 opposed. The NOSB’s decision is to allow this material for use in organic food processing; Vote: 12 aye / 2 opposed. Annotation: Must be derived from vegetable oil when rosemary extracts are not a suitable alternative.

Magnesium Stearate - Reviewed by Joe Montecalvo and Rich Theuer. Determined to be synthetic; Vote - Unanimous. This material is prohibited for use in organic food processing (95% and above); Vote: 4 aye / 9 opposed / 1 abstention. However, the NOSB does allow for the use of this material in foods "made with organic ingredients". Vote: 12 aye / 2 opposed.

Ammonium Phosphate - Reviewed by Joe Montecalvo, Rich Theuer, Bob Durst. Determined to be synthetic; Vote - Unanimous. This material is prohibited for use in organic food processing (95% and above). Vote: 0 aye / 13 opposed / 1 absent. This material is also prohibited for foods labeled as "made
with organic ingredients” (50% - 95%). Vote: 6 aye / 3 opposed / 5 abstentions.

Discussion: There was also a motion to reconsider this material, allowing it for use as a yeast food in wine making. Vote: 7 aye / 4 opposed / 3 abstentions. Motion failed.

Colloidal Silica - Reviewed by Joe Montecalvo, Rich Theuer, and Bob Durst.

Determined to be synthetic; Vote: 12 aye / 0 opposed / 2 absent.

This material is prohibited for use in organic food processing (95% and above).

Vote: 1 aye / 11 opposed / 2 absent. This material is also prohibited for foods labeled as “made with organic ingredients” (50% - 95%). Vote: 3 aye / 9 opposed / 2 absent.

Nisin - Reviewed by Joe Montecalvo and Rich Theuer.

Determined to be synthetic; Vote: 10 aye / 3 opposed. This material is prohibited for use in organic food processing (95% and above). Vote - Unanimous. This material is also prohibited for use in foods labeled as “made with organic ingredients” (50% - 95%). Vote - Unanimous.

Sodium Tartrate - Reviewed by Joe Montecalvo and Rich Theuer.

Determined to be synthetic; Vote: 13 aye / 0 opposed / 1 absent. This material is prohibited for use in organic food processing (95% and above). Vote: 8 aye / 2 opposed / 3 abstention / 1 absent. This material is also prohibited for use in foods labeled as “made with organic ingredients” (50% - 95%). Vote - Unanimous. Discussion: Rich noted that citric acid is a suitable non-synthetic alternative for this material. It was also pointed out that this material is used extensively in wine production.

Sorbic Acid - Reviewed by Joe Montecalvo and Rich Theuer.

Determined to be synthetic; Vote - Unanimous. This material is prohibited for use in organic food processing (95% and above). Vote - Unanimous. This material is also prohibited for use in foods labeled as “made with organic ingredients” (50% - 95%). Vote - Unanimous.

Discussion: Margaret Wittenberg mentioned that this material is used in cheese making and is also used in dried fruit.

Baking Powder (Aluminum-Free) - Reviewed by Joe Montecalvo and Rich Theuer.

There was no determination made on this material. Craig moved and it was seconded by Jay to send this material back to the processing committee. Vote: 10 aye / 2 opposed / 2 absent. Craig also moved to add non-modified starches to the TAP review process and it was seconded by Bob. Vote - Motion carried unanimously.

(Crops Materials’ component parts were all reviewed and approved for use in organic foods.)

Alcohol (Ethanol) - Reviewed by Vivian Purdy and John Clark.

Determined to be synthetic; Vote: Unanimous.

The NOSB’s decision is to allow this material for use in organic crop production;

Vote: Unanimous. Annotation: Permitted for use as a disinfectant.
Alcohol (Isopropyl) - Reviewed by Vivian Purdy, John Clark and Marta Engel.  
Determined to be synthetic; Vote: 12 aye / 0 opposed / 2 absent. 
The NOSB’s decision is to allow this material for use in organic crop production;  
Vote: 13 aye / 1 opposed. Annotation: Permitted for use as a disinfectant.  
Discussion: Michael Sligh moved and it was seconded by Jay to return brewery wastes back for  
further review to the TAP. Motion carried unanimously. Also, Rod moved and it was seconded  
by Tom Stoneback to send alcohol (made from methane) for further review to the TAP. Motion  
carried unanimously. 

Ammonium Carbonate - Reviewed by John Clark and Helmut Reidl.  
Determined to be synthetic; Vote: 12 aye / 0 opposed / 2 absent.  
The NOSB’s decision is to allow this material for use in organic crop production;  
Vote - Unanimous. Annotation: For use as bait in insect traps only. Cannot be in direct contact  
with crop or soil. 

Antibiotics (Avermectin) - Reviewed by Jerry Feitelson, Philip VanBuskirk, and Gregg Young.  
Determined to be synthetic; Vote - Unanimous.  
The NOSB has determined that this material is unacceptable for use in organic crop production;  
Vote: 3 aye / 6 opposed / 4 abstentions. 

Antibiotics (Streptomycin sulfate) - Reviewed by Phillip VanBuskirk, Greg Young, and Jerry  
Feitelson. Determined to be synthetic; Vote - Unanimous.  
The NOSB’s decision is to allow this material for use in organic crop production;  
Vote: 10 aye / 3 opposed. Annotation: Permitted for use as a fireblight control in apples and  
pears only. To be reviewed again in two years. 

Antibiotics (Terramycin-Oxytetracycline calcium complex) - Reviewed by Phillip  
VanBuskirk, Gregg Young, and Jerry Feitelson. Determined to be synthetic; Vote - Unanimous.  
The NOSB’s decision is to allow this material for use in organic crop production;  
Vote: 10 aye / 1 opposed / 2 abstentions. Annotation: To be reviewed again in two years.  
Discussion: Gene Kahn will organize a taskforce to further explore antibiotic use in crop  
production. 

Aquatic Plant Extracts (Other than hydrolyzed) - Reviewed by Donald Blakeney, Bruce  
Spencer. Determined to be synthetic; Vote: 11 aye / 2 absent.  
The NOSB’s decision is to allow this material for use in organic crop production;  
Vote: 10 aye / 1 abstention / 2 absent. Annotation: Extraction process is limited to the use of  
potassium hydroxide and sodium hydroxide. The amount of the solvent used is not to exceed the  
amount necessary for extraction. 

Chlorine Bleach (Calcium hypochlorite, sodium hypochlorite, chlorine dioxide) -  
Determined to be synthetic; Vote - Unanimous (2 absent).
The NOSB’s decision is to allow this material for use for organic crop production, organic food processing, and organic livestock production. Vote: 9 aye / 2 opposed / 2 absent.

Annotation: Allowed for disinfecting and sanitizing food contact surfaces. Residual chlorine levels for washwater in direct crop or food contact and in flush water from cleaning irrigation systems that is applied to crops or fields cannot exceed the maximum residual disinfectant limit under the Safe Drinking Water Act (currently 4mg/L expressed as Cl₂). This substance is to be reviewed again in two years.

Coppers, Fixed - Reviewed by Brian Baker and Eric Sideman.

Determined to be synthetic; Vote - Unanimous.

The NOSB’s decision is to allow this material for use in organic crop production;

Vote - Unanimous. Annotation: May be used for disease control. May not be used as an herbicide. Shall be used in a manner that prevents excessive copper accumulation in the soil.

Lignin Sulfonate - Reviewed by Brian Baker, Philip VanBuskirk, and Diana Tracy.

Determined to be synthetic; Vote - Unanimous (2 absent).

The NOSB’s decision is to allow this material for use in organic crop production;

Vote: 11 aye / 1 opposed / 1 absent. Annotation: Allowed for use with micronutrients and macronutrients and as a chelating agent. Also allowed for use as a dust suppressant and a flotation agent.

Magnesium Sulfate - Reviewed by John Clark and Bart Hall.

Determined to be synthetic; Vote - Unanimous (2 absent).

The NOSB’s decision is to allow this material for use in organic crop production;

Vote - Unanimous (2 absent). Discussion / Annotation: Gene noted that this material is usually applied to the soil at a rate of 20 lbs per acre. Merrill moved and it was seconded by Gene to add the following Annotation: “Allowed for use as a soil amendment with a documented magnesium deficiency”. Vote - Motion carried unanimously (1 absent).

Newspaper Mulch - Reviewed by Sam Cotner, Eric Sideman, and Joseph Heckman.

Determined to be synthetic; Vote - Unanimous (1 absent).

The NOSB’s decision is to allow this material for use in organic crop production;

Vote: 12 aye / 1 opposed / 1 absent. Discussion / Annotation: Tom Stoneback noted that the printing industry is now using state of the art equipment and supplies. Most of the inks tend to be soy-based. Gene moved and it was seconded by Bob to accept the annotation -- “Glossy paper and colored ink paper is prohibited.” Vote: 10 aye / 3 opposed / 1 absent. Motion carried.

Determined to be synthetic; Vote - Unanimous.

The NOSB’s decision is to allow this material for use in organic crop production;

Vote: 11 aye / 2 opposed. Annotation: Restricted to petroleum derivatives with a 50% boiling point at 10mm mercury pressure between 415 degrees F⁰ and 440 degrees F⁰ ± 8 degrees F⁰.

Aromatic petroleum solvents including, but not limited to, benzene, naphthalene, toluene and
xylene are prohibited. Allowed for use in organic production as suffocating or stylet oils on foliage and as inert ingredients. May be applied to dormant perennials. Direct application to harvested crop is prohibited. Petroleum distillates may not be used as either weed or carrot oils in organic production. Land covered with petroleum derived pavement and road oils cannot be certified organic for 3 years following application.

Discussion: Zea Sonnabend noted that petroleum distillates are used as carriers and fillers and are necessary ingredients. Merrill commented on the need to move away from a reliance on chemicals, and suggested the addition of "woody perennials" to the annotation. Bill Wolf then followed by stating that the vegetable-based dormant oils aren't yet registered, and that all of the dormant oils currently on the market are petroleum based. He also noted that they are most commonly used in pest control, and pose the least ecological impact.

**Plastic Mulch and Covers [Petroleum based; other than poly-vinyl chloride (PVC)] -**

Reviewed by Sam Cotner and Richard Harwood. Determined to be synthetic; Vote - Unanimous. The NOSB's decision is to allow this material for use in organic crop production; Vote - Unanimous. Annotation: PVC is prohibited. Petroleum-based plastics other than PVC are acceptable. Restricted by OFPA as having to be removed at the end of each growing or harvest season; also, shall not be incorporated into the soil or left in the field to decompose.

**Sticky Traps and Barriers -** Reviewed by Helmut Riedl, John Clark, and Vivian Purdy.

Determined to be synthetic; Vote - Unanimous (2 absent). The NOSB's decision is to allow this material for use in organic crop production;

**Vitamin D1, C, and E -** Reviewed by David Knauft, Donald Blakeney, and Amigo Cantisano.

Determined to be synthetic; Vote: 10 aye / 3 absent. The NOSB's decision is to allow this material for use in organic crop production;

**Vitamin D3 -** Reviewed by Gregg Young and Donald Blakeney.

Determined to be synthetic; Vote - Unanimous. The NOSB's decision is to allow this material for use in organic crop production;

**Arsenate Treated Lumber -** Reviewed by Chris Milne, Eric Sideman, and Sam Cotner.

Determined to be synthetic; Vote - Unanimous. The NOSB has determined that this material is unacceptable for use in organic crop production; Vote - Unanimous. Commentary: Effective on the publication date of the final rule, the use of arsenate (and other prohibited materials) treated lumber is prohibited for new construction and replacement purposes. Certification applicants shall provide records to the certifying agent that arsenate (and other prohibited materials) treated lumber was not installed within 36 months immediately preceding the initial harvest date of any organic agricultural products. In no case
shall arsenate (and other prohibited materials) treated lumber be allowed in installations in contact with the soil and used to grow vegetables (soil beds).

Gypsum By-Product (From flue trappings and fertilizer manufacture, and from drywall manufacture) - Reviewed by Diana Tracy, John Clark, and David Knauft. Determined to be synthetic; Vote - Unanimous.

The NOSB has determined that this material is unacceptable for use in organic crop production; Vote: 4 aye / 9 opposed. Discussion: It was noted (in terms of tonnage) that organic farmers buy a significantly large amount of gypsum each year. There are two primary sources-mined and mixed. Unfortunately, one is not distinguishable from the other.

Killed Microbial Pesticide (Pseudomonas florescens with Bt gene) - Reviewed by Margaret Mellon, Brian Baker, Jerry Feitelson, Daniel Pimentel, and Philip VanBuskirk.

Determined to be synthetic; Vote - Unanimous.

The NOSB has determined that this material is unacceptable for use in organic crop production; Vote: 3 aye / 10 opposed.

Discussion: Bill Wolf spoke against the allowance of killed microbials, as the political climate is not right at this time for their approval. He also noted that the technology definitely needs to be looked at -- it’s not all bad. He suggested that the Board take time to sort out all the relevant issues, and vote on it at a later time. Michael Sligh concurred, and suggested a taskforce take another look at the material. Rod continued, and mentioned the possibility of States requiring the use of genetically engineered forms of materials in the future. Gene commented on the fact that there is much information available on this material and the Board should not base a discussion on fear and superstition. He also noted that the rejection of this material would be a major setback to the organic industry. Brent Wiseman spoke of tests already conducted on these materials, and that many have already been reviewed and determined to be safe. He also noted that they should be reviewed again, prior to approval for use in organic production. Tom Tomas noted that organic certifiers already reject this technology. Jay also concurred with the majority, and that it is okay for organics to reject biotechnology, as organics built on caution. Eric Kindberg noted that this is currently allowed only because it is determined to be dead, and it is not the same as live microbials; it is used for gypsy moth control currently. Brian Baker expressed the view that it is okay to consider its use, but at this time he is not prepared to make a judgement on the material. Craig concurred with Gene and Brian, but noted that the industry is not prepared for the consumer backlash that is certain to follow its approval. K. Chandler rounded out the discussion by noting that IFOAM’s prohibition of this material takes away tools from farmers by categorically rejecting this technology which has the potential to overcome the current chemical approach that is taken by conventional agriculture. Kathleen’s concerns for the material centered around its compatibility with sustainability and the political backlash that was mentioned by Bill and Craig.

Leather By-Product - Reviewed by Brian Baker, Paul Sachs, Walter Glinsmann, and Bart Hall.

Determined to be synthetic; Vote - Unanimous (1 absent).

The NOSB has determined that this material is unacceptable for use in organic production;
Vote: 5 aye / 8 opposed. Discussion: Bob began the discussion by noting that he doesn’t use the product, but would like to consider its appropriateness for organic production. His concern centers around the 3% chromium in the finished product. K. Chandler followed with the observation that people take chromium tablets and he personally wants more information on its effects in the soil. Bruce Krantz of the Hynite corporation explained that EPA has removed chromium from it “concerned” list, and that chromium is not a problem, as it had been considered in the past. Brian spoke against the material, specifically the application of biocides and other synthetic materials that are used in the processing of the hides. Bob moved and it was seconded by Gene to exclude dyed and finished leather by-products - Vote: 11 aye / 1 opposed / 1 abstention. Motion carried. Following the prohibition of this material, Jay moved and it was seconded by Gene for the NOSB to develop a policy on alternative use of waste products (from organic systems). Motion carried unanimously.

Potassium Nitrate (Niter) - Reviewed by Walter Jeffery, Brian Baker, and Bart Hall.
Determined to be synthetic; Vote: 10 aye / 3 absent.
The NOSB has determined that this material is unacceptable for use in organic crop production.
Vote: 12 aye / 0 opposed / 1 absent.

Gypsum By-Product (Mined Source) - Reviewed by Diana Tracy, John Clark, and David Knauf. Determined to be non-synthetic; Vote - Unanimous (2 absent).
The NOSB’s decision is that this material should not be placed on the Prohibited Natural(s) List.
Vote - Unanimous (2 absent).

Potassium Chloride (Muriate of Potash) - Reviewed by Walter Jeffery and Joseph Heckman.
Determined to be non-synthetic; Vote - Unanimous (1 absent).
The NOSB’s decision is that this material should not be placed on the Prohibited Natural(s) List.
Vote: 0 aye / 11 opposed / 2 abstentions / 1 absent.
Commentary: Only the mined source is considered non-synthetic. Any use shall be in a manner that prevents excessive chloride accumulation in soils. Soil testing may be required in both treated and untreated adjacent soils to verify absence of chloride build-up.

Sodium Bicarbonate - Reviewed by Eric Sideman and Walter Jeffery.
Determined to be non-synthetic; Vote - Unanimous (2 absent).
The NOSB’s decision is that this material should not be placed on the Prohibited Natural(s) List.
Vote: 1 aye / 12 opposed / 2 absent.

Sulfur Dioxide - Reviewed by Walter Jeffery and Brian Baker.
This material was tabled by the NOSB and will be sent back to the TAP for further review.

The following petitioned materials are deemed by the NOSB to be synthetic, incompatible with organic farming systems, prohibited by the Organic Foods Production Act of 1990 and should not be reviewed by the Technical Advisory Panel:

Benomyl  Captan  Glyphosate  Methoxychlor  Thiram.
Livestock Materials

Alcohol (Ethanol) - Reviewed by John Clark, Vivian Purdy, and Marta Engel.
Determined to be synthetic; Vote - Unanimous (1 absent).
The NOSB’s decision is to allow this material for use in organic livestock production;
Vote: 13 aye / 0 opposed / 1 abstention.
Annotation: Allowed for use in medical treatments and as a disinfectant. Prohibited for use as a feed additive.

Alcohol (Isopropyl) - Reviewed by Vivian Purdy, John Clark, and Marta Engel.
Determined to be synthetic; Vote: 11 aye / 0 opposed / 2 abstentions.
The NOSB’s decision is to allow this material for use in organic livestock production;
Vote: 13 aye / 1 opposed. Annotation: Approved for use only as a disinfectant.

Alcohol (Methanol) - Rod moved and it was seconded by Tom Stoneback to send this material back to the TAP for more review. Motion passed unanimously.

Brewery Wastes - Michael Sligh moved and it was seconded by Jay to send this material back to the livestock committee for review as a feed ingredient. Motion passed unanimously.

Chlorine Bleach (Calcium hypochlorite, sodium hypochlorite, chlorine dioxide) - Reviewed by Joe Montecalvo, Marta Engel, Rich Theuer, Walter S. Jeffery, and Chris Milne.
Determined to be synthetic; Vote - Unanimous.
Annotation: Allowed for disinfecting and sanitizing food contact surfaces. Residual chlorine levels for washwater in direct crop or food contact and in flush water from cleaning irrigation systems that is applied to crops or fields cannot exceed the maximum residual disinfectant limit under the Safe Drinking Water Act (currently 4mg/L expressed as Cl₂). This substance is to be reviewed again in two years.

Copper Sulfate - Reviewed by Lynn Brown and William Zimmer.
Determined to be synthetic; Vote: 11 aye / 1 abstention / 1 absent.
The NOSB’s decision is to allow this material for use in organic livestock production;
Vote: 12 aye / 1 abstention.
Annotation: For topical use or as an essential nutrient.

Determined to be synthetic; Vote - Unanimous.
The NOSB’s decision is to allow this material for use in organic livestock production;
Vote - Unanimous. Annotation: May not contain antibiotics.

Glucose - Reviewed by Marta Engel and Lynn Brown.
Determined to be synthetic; Vote - Unanimous.
The NOSB’s decision is to allow this material for use in organic livestock production; Vote - Unanimous.

**Hydrated Lime (Calcium Hydroxide)** - Reviewed by Brian Baker. Determined to be synthetic; Vote - 11 aye / 1 opposed / 1 absent.

The NOSB’s decision is to allow this material for use in organic livestock production; Vote: 11 aye / 1 abstention / 1 absent. Annotation: Not permitted for soil application or to cauterize mutilations or deodorize animal wastes.

**Local Anesthetics (Lidocaine and Procaine only)** - Reviewed by Marta Engel and William Zimmer. Determined to be synthetic; Vote - Unanimous.

The NOSB’s decision is to allow these materials (lidocaine and procaine) for use in organic livestock production. Vote - Unanimous.

Discussion / Annotation: Lynn Coody noted that producers usually administer local anesthetics, and that additional anesthetics should be used only under the general supervision of a licensed veterinarian. Merrill moved and it was seconded by Jay to add the following annotation to the approved local anesthetics: *Use requires a withdrawal period of 90 days in livestock intended for slaughter and 7 days in dairy animals.* Vote: 11 aye / 3 opposed. Motion carried.

**Magnesium Sulfate (Mined Epsom Salt)** - Reviewed by Marta Engel, Lynn Brown, and William Zimmer. Determined to be non-synthetic; Vote: 9 aye / 4 abstentions / 1 absent.

The NOSB’s decision is that this material should not be placed on the Prohibited Natural(s) List. Vote - Unanimous (2 absent).

**Magnesium Sulfate (synthetic)** - Reviewed by Marta Engel, Lynn Brown, and William Zimmer. Determined to be synthetic; Vote: 12 aye / 1 absent / 1 abstentions.

The NOSB’s decision is to allow this material for use in organic livestock production; Vote: 12 aye / 2 opposed. Discussion: Brian Baker noted that the non-synthetic form of this material is currently allowed and is in use. Merrill moved and it was seconded by Jay to add the Annotation: “*External use only on non-ruminants only.*” Vote: 2 aye / 12 opposed. Motion fails.

**Milk Replacers** - Reviewed by Lynn Brown and Marta Engel. Determined to be synthetic; Vote: 12 aye / 0 opposed / 2 abstentions.

The NOSB’s decision is to allow this material for use in organic livestock production; Vote - Unanimous (1 absent). Annotation: Emergency use only when fresh milk is not available. Milk replacers based on non-milk products or from BST treated animals are not permitted. No antibiotics may be added. Milk from certified organic animals is preferred.

**Mineral Oil** - Reviewed by William Zimmer, John Clark, Brian Baker, and Marta Engel. Determined to be synthetic; Vote - Unanimous (1 absent).

The NOSB’s decision is to allow this material for use in organic livestock production; Vote - Unanimous. Annotation: For topical use and as a lubricant.
Determined to be synthetic; Vote - Unanimous.  
The NOSB’s decision is to allow synthetic vitamins for use in organic livestock production;  
Vote: 10 aye / 2 opposed / 1 abstention / 1 absent. Annotation: Limited to those approved by 
the Food and Drug Administration for livestock use.  
Discussion: This discussion initially began as the discussion on Folic Acid and was redirected to 
the evaluation of synthetic vitamins as a group. Fred moved and it was seconded by Rod to 
evaluate vitamins as a category, rather than to review each individual vitamin.  
Vote: 10 aye / 2 opposed / 2 absent. Motion carried. Merrill expressed strong objections to 
acceptance of materials in a category format and asked that each substance be individually 
reviewed.  

Determined to be synthetic; Vote - Unanimous (1 absent).  
The NOSB’s decision is to allow synthetic mineral for use in organic livestock production;  
Vote: 10 aye / 2 opposed / 1 abstention / 1 absent.  
Annotation: Limited to those approved by the Food and Drug Administration for livestock use.  

Determined to be synthetic; Vote - Unanimous (1 absent).  
The NOSB’s decision is to allow this material for use in organic livestock production;  
Vote - Unanimous (1 absent). Annotation: No routine or long term use. May be used only when 
necessary to allow an animal to let down milk during the first few days of lactation and also for 
other approved veterinarian uses.  

Alcohol (Derived from fermentation) - Reviewed by John Clark and Marta Engel.  
The NOSB has determined that this material is non-synthetic and not within the scope of the 
National List.  

Probiotics - Reviewed by Lynn Brown, William Zimmer, and Marta Engel.  
Determined to be non-synthetic; Vote: 9 aye / 0 opposed / 3 abstention.  
The NOSB has determined that this material is non-synthetic and not within the scope of the 
National List.  

Colostrum Whey Antibodies - Reviewed by Lynn Brown and Richard Krengel.  
Determined to be synthetic; Vote: 7 aye / 6 opposed / 1 absent.  
Discussion: After considerable discussion and debate over the synthetic / non-synthetic status of 
colostrum, the following votes were taken:  
1) Is colostrum from livestock not treated with BST synthetic?  
Vote: 0 aye / 11 no / 3 absent.  
2) Should non-synthetic colostrum be placed on the National List as a prohibited natural?  
0 aye / 11 no / 3 absent.
3) Is colostrum from livestock treated with BST synthetic?
   9 aye / 0 no / 3 abstentions / 2 absent.

4) Should synthetic colostrum be prohibited for use in organic livestock production?
   12 aye / 0 no / 2 absent.

Following the aforementioned votes, the NOSB moved to table this material. Motion passed unanimously.

November 3, 1995

The final session of the NOSB meeting was called to order at 8:00 a.m. by chairperson Bob Anderson.

Members in attendance were: Tom Stoneback, Craig Weakley, Dean Eppley, Don Kinsman, Merrill Clark, Michael Sligh, Bob Anderson, Gene Kahn, K. Chandler, Rod Crossley, Kathleen Merrigan, Margaret Wittenberg, and Jay Friedman. Tom Tomas was present as the certifying agency advisor to the NOSB.

National Organic Program staff members present from USDA were: Michael Hankin and Toni Strother.

The TAP coordinators and materials advisors present were: Zea Sonnabend, John Brown, Brian Baker, Lynn Coody, and Bill Wolf.

Kathleen Merrigan moved and it was seconded by Don Kinsman to adopt the arsenate treated lumber resolution. There was one friendly amendment - add “and lumber treated with other prohibited materials” to the title and throughout the document. Motion passed unanimously.

Lynn Coody followed with a continuation of the antibiotics presentation. It was noted that two antibiotics have been historically approved for disease control, while Avermectin is a miticide for which other options exist.

Following the antibiotics presentation, an expanded discussion on killed microbial pesticide ensued.

Michael Sligh and Jay Friedman left the meeting at 9:25 a.m. For voting purposes, there were

See Killed Microbial pesticide under crops materials, page 38-39.
now 11 voting Board members.

Immediately following the conclusion of the materials review and voting, Bob Anderson moved and it was seconded by Dean to accept the Orlando minutes. Craig suggested the word “seconded” be added at line 1074 after the word ‘Chandler’ (No objections).

The minutes were subsequently approved by a vote of 9-1, and the NOSB instructed USDA staff to incorporate all previous written revisions submitted by NOSB members, except for the requested vote changes by Merrill.

Margaret Wittenberg was selected as the new chairperson of the Processing, Handling, and Labeling Committee (11-0).

K. Chandler moved and it was seconded by Merrill to have the USDA mail out the NOSB definition of “organic” to the public mailing list. Motion carried unanimously.

Subsequently, the NOSB passed the following resolutions:

**Fiber Processing Standards** - USDA is requested to incorporate processing standards for fibers into the National Organic Program as soon as possible. Because a specific NOSB recommendation on such standards cannot be made before the next meeting of the Board, USDA is requested to use the organic fiber processing standards established by the Texas Department of Agriculture as well as consultations with members of the NOSB Processing, Handling and Labeling Committee as resources for the development of such standards. Craig then moved and it was seconded by Don Kinsman to approve the resolution. Tom Stoneback expressed his support of the fiber resolution. Motion carried unanimously.

**Comment Period for the Proposed Rule** - The public is extremely interested in the development of the national organic program. In order to ensure adequate opportunity for public input on what will be a lengthy and complex proposed rule, we request and urge the USDA to provide a minimum 90 day comment period. Motion carried unanimously.

Bob Anderson then inquired as to how the Board would move ahead on the materials review, and whether or not Zea will continue to serve as the NOSB TAP Coordinator. Kathleen expressed her support for Zea’s continuation. However, Zea said that she was not interested in another contract to continue work. She went on to question what will be done with the monies remaining on John Brown’s contract and what his future role will be. She also expressed her uncertainty as to the USDA’s ability to coordinate the TAP process, and the need for oversight of the USDA. Kathleen then moved forward the Technical Advisory Panel Review Coordinator Resolution: We urge the Secretary to find adequate resources to retain an independent consultant recognized as an expert in organic production, to coordinate the technical advisory panel review process. Her resolution was unanimously approved.

Also at the request of Kathleen, the Executive Committee agreed to develop a policy on what
should be mailed to the USDA/NOSB mailing list. The Executive committee will also decide how to get a sense of the NOSB activities between meetings, in view of the reduced funding. Ms. Merrigan will also lead efforts to coordinate current and past NOSB members in preparing responses to the USDA proposed rule for the National Organic Program.

The ethics document prepared by Fred Kirschenmann was unanimously tabled. The Board also unanimously consented on a Central Midwest location for the next NOSB meeting.

The meeting was adjourned at 10:35 a.m.
The initial session of the National Organic Standards Board (NOSB) meeting was called to order at 11:45 a.m. by Chairperson Bob Anderson.

Members in attendance were: Betsy Lydon, Margaret Wittenberg, K. Chandler, Jean Afterman, Bob Anderson, Fred Kirschenmann, Kathleen Merrigan, Steve Pavich, Dean Eppley, and Michael Sligh. Joan Gussow, Rod Crossley and Jay Friedman joined in later that afternoon. Participating at this meeting as the certifying agency advisor to the NOSB was Brent Wiseman of the Texas Department of Agriculture. Gene Kahn was unable to participate in this meeting.

National Organic Program staff members present from USDA were: Harold Ricker, Michael Johnson, Toni Strother, and Karen Thomas. Also in attendance from the USDA was Eileen Stommes, Director of the Transportation and Marketing Division, Agricultural Marketing Service (AMS).

On the behalf of Lon Hatamiya, Eileen Stommes opened by welcoming everyone to the meeting. She thanked everyone for their patience, hard work and dedication. She also commended the Board’s on its ability to find common ground on many of the more contentious issues that they have been faced with. Eileen then made a presentation to all the new Board members who were present at that time. Those members included Jean Afterman, Betsy Lydon, Steve Pavich, and Bob Anderson (reappointment). She closed by stating that the proposed rule is in its final drafting stages and is moving forward rapidly.

USDA Staff Report - Dr. Harold Ricker, Program Manager of the National Organic Program, was introduced by Bob Anderson. Dr. Ricker went on to introduce the rest of the USDA staff and he also announced that Grace Gershuny has moved to Vermont, but will continue to work for the USDA on a part-time basis. Regarding her position in Washington, there was a vacancy announcement open for it.

Next, Dr. Ricker reviewed the funding status for Fiscal Year 1996. In the next fiscal year (FY 97), Congress has not appropriated any funding for advisory committees. The funding for advisory committees will come from each individual agency’s own funding.

The nomination period has been extended for the following positions on the board: farmer/grower (1), handler/processor (1), consumer/public interest (1), environmentalist (1), and...
scientist (1). Hal urged everyone to help seek out additional applicants. He did not specify when
the proposed rule will be out, but he did note that the USDA is working to make the proposed
rule accessible on the Internet. It will also be available in hard copy.

On the previous executive committee conference call, there was a discussion on what the Board
can do during exparte. Dr. Ricker briefly reviewed some those issues again and Fred followed by
asking if Board members should decline to speak on issues regarding the proposed rule. Dr.
Ricker responded by saying be cautious, and Bob reiterated that Board members could comment
as individuals, but not as a representative of the entire NOSB. Bob closed by noting that this
meeting’s agenda is very aggressive.

The session was adjourned at 12:10 p.m.

The meeting reconvened at 12:50 p.m. and Eileen briefly recognized and presented new Board
member Joan Gussow with a certificate, who had just joined the meeting.

Joe Pierson, Indiana Assistant Commissioner of Agriculture, spoke briefly about the Commission
and commended the Board on its direction and vision. He also went on to welcome everyone to
Indianapolis, IN and to thank the Board for choosing Indianapolis as their meeting place.

The public input session followed Mr. Pierson and subsequently adjourned at 5:36 p.m. The
public input testimony is on file with the USDA.

New Board member orientation followed the public input session at 6:10 p.m. NOSB members
in attendance were: Dean Eppley, Steve Pavich, Rod Crossley, Kathleen Merrigan, Fred
Kirschenmann, Michael Sligh, Bob Anderson, Jean Afterman, K. Chandler, Margaret
Wittenberg, Joan Gussow, and Betsy Lydon. Brent Wiseman was also present. All of the USDA
staff was present.

ACCREDITATION COMMITTEE REPORT:

Kathleen Merrigan stated that the “seal issue” was still a burning issue for the accreditation
committee, especially whether or not private certifiers will be allowed to use their seals to
represent different standards in the national program. The industry is divided on this issue, as
well as the NOSB. Kathleen Merrigan noted that another committee issue is user fees.

CROPS COMMITTEE REPORT:

Steve Pavich did not come prepared to give a report, but did note that bio solids (sewage sludge)
and planting stock for pineapples will be discussed at this meeting.
INTERNATIONAL COMMITTEE REPORT:

Michael Sligh noted that the criteria for determining international equivalency needed to be discussed and he also spoke briefly about the U.S. position on Codex.

LIVESTOCK COMMITTEE REPORT:

Fred Kirschenmann noted that the honey standards for livestock will need to be discussed on Friday.

PROCESSING COMMITTEE REPORT:

Margaret Wittenberg reviewed the processing committee issues: organic fiber, use of dyes in processing, and the use of incidental food additives.

After the committee updates, Bob proposed that the materials committee be reestablished. He reemphasized the legislative responsibility of the Board for materials. He also questioned why certain materials were included in the review books again, and Michael Johnson explained why they were included. These materials included: Sulphur Dioxide, pBO, Leather By-Products, and Killed Microbials.

Bob then looked for a sense from the Board of how they felt about the material reviews. Joan noted some concerns about the materials and reviewers, and Rod noted his inability to make decisions on some of the materials. Overall, the Board expressed discontent with some of the reviews and lumping of materials into categories. Michael Sligh then moved to reestablish the materials committee, and K. Chandler seconded the motion. The motion carried unanimously.

Hal reminded all Board members to submit their expenses in a timely manner.
The meeting was adjourned at 7:00 p.m.

September 19, 1996

The meeting was called to order at 8:10 a.m. by chairperson Bob Anderson.

NOSB Members in attendance were: Jean Afterman, Bob Anderson, K. Chandler, Rod Crossley, Dean Eppley, Joan Gussow, Fred Kirschenmann, Betsy Lydon, Kathleen Merrigan, Steve Pavich, and Michael Sligh. Participating as the certifying agency advisor was Brent Wiseman. Jay Friedman was not present.

Staff members present from USDA were: Harold Ricker, Michael Johnson, Toni Strother, Karen Thomas, and Eileen Stommes.

Technical Advisory Panel Coordinators present were: Zea Sonnabend, Lynn Coody, John
Brown, and Brian Baker.

**Materials Discussion**

Bob Anderson and Mike Johnson reviewed the Materials Oversight Working Group conclusions and the NOSB voting procedures. Mr. Johnson also noted that the synthetic/non-synthetic decision will be a simple majority and abstentions are counted as a "no" vote; absences don’t count toward the majority and 2/3 of the NOSB must be present conduct a vote.

The following votes represent the NOSB materials review and voting that occurred during the remainder of the week. The notes detail the actual votes on each material and some included general comments and other discussion notes.

**Processing Materials**

**Calcium Sulfate** - Reviewed by Joe Montecalvo, Rich Theuer, Steve Taylor, William Zimmer, and Walter Jeffery. Determined to be synthetic; Vote: 12 aye / 1 absent. The NOSB’s decision is to prohibit this material for use in organic food processing; Vote: 11 aye / 1 opposed / 1 absent. The NOSB’s decision is to also prohibit this material for use in foods "made with organic ingredients"; Vote: 12 aye / 0 opposed / 1 absent.

**Chymosin (microbial rennet bio-engineered form)** - Reviewed by Brian Baker, Joe Montecalvo, and Steve Taylor. Determined to be synthetic; Vote: 12 aye / 1 absent. The NOSB’s decision is to prohibit this material for use in organic food processing; Vote: 11 aye / 1 opposed / 1 absent. The NOSB’s decision is to also prohibit this material for use in foods "made with organic ingredients"; Vote: 12 aye / 0 opposed / 1 absent.

**Chymosin (Enzyme Form)** - This material was tabled and sent back to the TAP.

**Clay, various (Fuller’s Earth Attapulgite)** - Reviewed by Joe Montecalvo, Steve Taylor, James Johnson, David Pimental, and John Clark. There was no determination made on this material. Michael Sligh moved and it was seconded by K. Chandler to send the material back to the materials committee for further clarifications; Vote: Motion carried unanimously. The Board was unsure of its current use in organic food processing, and after clarification will send back to the TAP for further review.

**Enzymes: malted/barley** - Reviewed by Joe Montecalvo, Rich Theuer, and Steve Taylor. Determined to be non-synthetic; Vote: Unanimous. This material is prohibited for use in organic food processing; Vote: 5 aye / 8 opposed. [Permitted from an organic source only.]

**Enzymes: mold/fungal, yeast** - Reviewed by Joe Montecalvo, Rich Theuer, William Zimmer, and Steve Taylor. Rod Crossley moved and it was second by K. Chandler to send this material back to the materials committee for further classification; Vote: Motion carried unanimously.
Enzymes: plant, animal - Reviewed by Joe Montecalvo, Rich Theuer, and Steve Taylor. Rod Crossley moved and it was seconded by K. Chandler to send this material back to the materials committee for further classification; Vote: Motion carried unanimously.

Magnesium Carbonate (synthetic) - Reviewed by Joe Montecalvo, Rich Theuer, Steve Taylor, and Walter Jeffery. Determined to be synthetic; Vote: Unanimous. This material is prohibited for use in organic food processing (95% and above); Vote: 4 aye / 9 opposed. However, the NOSB does allow for the use of this material in foods "made with organic ingredients" (95% and below); Vote: 9 aye / 4 opposed.

Magnesium Carbonate (non-synthetic) - Determined to be non-synthetic; Vote: Unanimous.

Bob moved and it was seconded by Rod to send this material back to the TAP for more information on the impurities and contaminants in the natural product. Vote: Motion carried unanimously.

Perlite - Reviewed by Joe Montecalvo and James Johnson. Determined to be non-synthetic; Vote: 9 aye / 2 opposed / 1 abstention / 1 absent. The NOSB’s decision is to allow this material for use in organic food processing; Vote: 12 aye / 1 opposed. Annotation: Filter aid in food processing.

Silicon Dioxide - Reviewed by Rich Theuer, Joe Montecalvo, James Johnson, William Zimmer, and Walter Jeffery. Determined to be synthetic; Vote: Unanimous. The NOSB’s decision is to allow this material for use in organic food processing; Vote: 10 aye / 3 opposed.

Sulfuric Acid - Reviewed by Joe Montecalvo, Rich Theuer, Steve Taylor, and Walter Jeffery. Determined to be synthetic; Vote: Unanimous. This material is prohibited for use in organic food processing; Vote: Unanimous. This material is also prohibited for use in foods labeled as made with organic ingredients; Vote: Unanimous.

Unmodified starches - Reviewed by Joe Montecalvo, Rich Theuer, David Pimentel, and Steve Taylor. Rod Crossley moved and it was seconded by Joan Gussow to send this material back to the materials committee to further define; Vote: 9 aye / 2 opposed / 1 absent. Motion carried.

Whey Protein (Non-Organically Produced) - Reviewed by Joe Montecalvo, Rich Theuer, David Pimentel, William Zimmer, and Steve Taylor. Determined to be non-synthetic; Vote: 12 aye / 1 absent. This material is prohibited for use in organic food processing; Vote: 5 aye / 8 opposed. [Permitted from an organic source only.]

Crops Materials

Amino Acids - Reviewed by Brian Baker and Paul Sachs. Rod Crossley moved and it was seconded by Fred Kirschenmann to send this material back to the materials committee for further classification; Vote: 9 aye / 4 opposed. Motion carried.
Ammonium Soaps - Reviewed by Paul Sachs, Brian Baker, and Bill Wolf. Determined to be synthetic; Vote: Unanimous. The NOSB’s decision is to allow this material for use in organic crop production; Vote: 12 aye / 1 opposed. Annotation: Cannot come in contact with soil or edible portion of crop; to be used as an animal repellant only.

Calcium Chloride (Extracted from brine) - Reviewed by Brian Baker, Walter Jeffery, and Diana Tracy. Determined to be non-synthetic; Vote: 12 aye / 1 opposed. The NOSB’s decision is that this material should not be placed on the Prohibited Natural(s) List; Vote: 1 aye / 12 opposed. Annotation: Allowed for use to correct bitter pit problems in apples allowed for use only in organic cotton production to comply with emergency spray programs or to prevent immediate loss of crop.

Detergents - Reviewed by David Pimentel, Phillip VanBuskirk, and John Clark. Zea Sonnabend recommended that this material fall under the inerts policy. Fred Kirschenmann moved and it was seconded by Steve Pavich to declare that detergents are inert ingredients for the purposes of crop usage; Vote: 8 aye / 2 opposed / 2 abstention / 1 absent. Motion carried.

Fruit Waxes (Plant-Derived) - Reviewed by Paul Sachs, Diana Tracy, Joe Montecalvo, and John Clark. Determined to be non-synthetic; Vote: 10 opposed / 2 abstention / 1 absent. The NOSB’s decision is that this material should not be placed on the Prohibited Natural(s) List; Vote: 7 aye / 4 opposed / 1 abstention / 1 absent. Annotation: Restricted to carnauba and wood-resin.

Fruit Waxes (Animal Waxes) - Reviewed by Paul Sachs, Diana Tracy, Joe Montecalvo, and John Clark. Rod Crossley moved and it was seconded by Bob Anderson to send this material back to the materials committee because of a lack of specific information; Vote: 12 aye / 1 absent. Motion carried.

Gibberellic Acid - Reviewed by Diana Tracy, Brian Baker, Paul Sachs, and William Zimmer. Determined to be non-synthetic; Vote: Unanimous. The NOSB’s decision is that this material should not be placed on the Prohibited Natural(s) List; Vote: Unanimous. Annotation: Must be produced from fermentation of non-genetically engineered organisms.

Humic Acids (from naturally occurring deposits and alkali extracted) - Reviewed by William Zimmer, James Johnson, and Paul Sachs. Determined to be synthetic; Vote: 12 aye / 1 absent. The NOSB’s decision is to allow this material for use in organic crop production; Vote: 10 aye / 2 opposed / 1 absent.

Lime, Controlled Atmosphere - Reviewed by William Zimmer. This material was sent back to the TAP for additional reviews; Vote: 12 aye / 1 opposed.

Magnesium Chloride (Extracted from brine, seawater, and salt deposits) - Reviewed by Brian Baker and Walter Jeffery. Determined to be non-synthetic; Vote: 12 aye / 1 absent. The
NOSB's decision is that this material should not be placed on the Prohibited Natural(s) List; Vote: 4 aye / 9 opposed.

Sewage Sludge - Reviewed by William Zimmer, Brian Baker, James Johnson, Paul Sachs, David Pimentel, Eric Sideman, John Clark, Chris Milne, and Diana Tracy. Determined to be synthetic; Vote: 10 aye / 1 opposed / 2 abstentions. The NOSB has determined that this material is unacceptable for use in organic crop production; Vote: 12 aye / 1 opposed.

Soap-based herbicides - Reviewed by Diana Tracy. Determined to be synthetic; Vote: 11 aye / 2 absent. The NOSB's decision is to allow this material for use in organic crop production; Vote: 11 aye / 2 absent. Annotation: Allowed for use on roadways, ditches, right-of-ways, and around buildings and ornamental crops. Also, Rod moved and it was seconded by Steve to send Pelarganic acid to the TAP. Vote: Motion carried unanimously.

Soap-based algicide/demossers - Reviewed by David Pimentel, James Johnson, John Clark, Chris Milne, and Diana Tracy. Determined to be synthetic; Vote: Unanimous. The NOSB's decision is to allow this material for use in organic crop production; Vote: Unanimous.

Sodium Chlorate - Reviewed by Walter Jeffery and Brian Baker. Determined to be synthetic; Vote: Unanimous. The NOSB has determined that this material is unacceptable for use in organic crop production; Vote: Unanimous.

Sodium Chloride - Reviewed by Brian Baker, Joe Montecalvo, Walter Jeffery, and Diana Tracy. Determined to be non-synthetic; Vote: 12 aye / 1 absent. The NOSB's decision is that this material should not be placed on the Prohibited Natural(s) List; Vote: 3 aye / 9 opposed / 1 absent. Annotation: Allowed for use only in organic cotton production to comply with emergency spray programs or to prevent immediate loss of crop.

Sodium Fluoaluminate (Mined) - Reviewed by Bart Hall and Bill Wolf. Determined to be non-synthetic; Vote: Unanimous. The NOSB has determined that this material is unacceptable for use in organic crop production; Vote: Unanimous.

Sodium Fluoaluminate (Non-mined) - Reviewed by Bart Hall and Bill Wolf. Determined to be synthetic; Vote: Unanimous. The NOSB has determined that this material is unacceptable for use in organic crop production; Vote: Unanimous.

Sodium Silicate - Reviewed by Walter Jeffery. Determined to be synthetic; Vote: Unanimous. The NOSB's decision is to allow this material for use in organic crop production; Vote: Unanimous. Annotation: Allowed for floating tree fruits and fiber processing.

Sulfur Dioxide - Reviewed by Joe Montecalvo, William Zimmer, and Walter Jeffery. Determined to be synthetic; Vote: Unanimous. The NOSB's decision is to allow this material for use in organic crop production; Vote: 10 aye / 1 opposed. Annotation: Allowed for use in
sulfur smoke bombs for control of underground rodents.

**Livestock materials**

**Alcohol (methanol)** - Reviewed by David Pimentel. Material was sent back to TAP for more specific information on: 1) method of manufacture, 2) specific uses, 3) concerns about toxicity, and 4) alternatives. Vote: Unanimous.

**Colostrum Whey** - Reviewed by Lynn Brown and William Zimmer. Determined to be non-synthetic; Vote: 9 aye / 3 absent / 1 abstentions. The NOSB’s decision is to allow this material for use in organic livestock production; Vote: 10 aye / 3 absent. Annotation: No colostrum from rBST treated animals allowed.

After a brief discussion, the NOSB declined to re-open discussion on Killed Microbials, pBO, and Leather By-Product; Vote: 11 aye / 2 opposed / 1 absent.

**Biotechnology Discussion**

Before the discussion began, Michael Sligh distributed handouts with draft language for an NOSB biotechnology policy. Fred read the recommendation, and began the discussion by elaborating on the draft Codex position not to allow genetically engineered products or organisms to be used in organic food production and processing. He followed with more general discussion about the issue and then moved and it was seconded by Jay that the class of genetically engineered organisms and their derivatives be prohibited in organic production and handling systems. Jay then expressed that opinions can be brought forward on this issue without closing off discussions and still retain the position that they are all synthetic. Rod then followed by saying that it was not fair to processors to be forced to determine what’s genetically engineered and what’s not, as the problem of verification still exists. He also reiterated the NOSB’s previous position that allows petitions to come forward on products and then permits the NOSB to vote the material up or down. Zea then noted that she supports Rod’s statements about verification and the motion conceptually, but sides with certifiers, processors and handlers. She went on to discuss yeast streams and whether or not a recommendation like this prevents the possibility of organic bread, organic cheese, etc. She also noted that this recommendation would close many doors where processors do not have any alternatives. Kathleen followed Zea and further expressed the thought that the NOSB can not make up all of the gray areas in the program--but that they could definitely send clear signals of their principles and rationale. Fred again expressed concern over the issue, particularly with the NOSB’s position of looking at materials on a case by case basis. After a few more general comments, the question was called on the motion. Vote: 11 aye / 2 opposed. Motion carried. Please see Attachments for the full NOSB Resolution on Biotechnology.

**Seal Usage Discussion:**
Bob prefaced this discussion by reading the NOSB's resolution on seal usage that was passed at the Austin, TX meeting. Kathleen then recounted the Board's last exchange on the topic, and recognized the varying opinions on the issue. Fred then made several remarks regarding seal usage and also summarized Commissioner Sara Vogel's letter to the Secretary of Agriculture about the issue. He acknowledged that there will be one national standard, but also noted that companies should have the right to distinguish themselves in the marketplace. Margaret then talked about certifier responsibilities for upholding the standards, and that as proposed, individuals would not be prevented from making claims otherwise. She cautioned against certifiers setting themselves up as "The Best" or some other category of being superior to other certifiers. Jay concurred with Fred's notion of certifiers distinguishing themselves in the marketplace, but dissented on the use of seals to indicate that products meet a "higher organic standard". Brent also indicated that a seal was not appropriate for such, and Rod followed with comments regarding potential trade restraint in multi-ingredient products under this type of scenario. After some further discussion, Jay moved and it was seconded by Joan to rescind the resolution. K. moved to table the motion to rescind and it was seconded by Dean. Vote: 7 aye / 4 opposed / 2 abstentions. K.'s motion failed and therefore, no action was taken on the resolution and the meeting adjourned at 6:10 p.m.

September 20, 1996

The meeting was called to order at 8:20 a.m. by Chairperson Bob Anderson.

NOSB Members in attendance were: Bob Anderson, K. Chandler, Rod Crossley, Dean Eppley, Joan Gussow, Fred Kirschenmann, Betsy Lydon, Kathleen Merrigan, Steve Pavich, Michael Sligh, and Margaret Wittenberg. Participating as the certifying agent advisor was Brent Wiseman. Jean Afterman and Jay Friedman were no longer in attendance. It was also noted that 8 members present now constituted a quorum.

Staff members present from USDA were: Harold Ricker, Michael Johnson, Toni Strother, and Karen Thomas.

Technical Advisory Panel Coordinators present were: Zea Sonnabend, John Brown, Lynn Coody, and Brian Baker.

Before beginning, Bob noted that during the public input session, Bruce Krantz had pointed out that the Board had in fact revisited recommendations and that it should, if it be the will of the Board, revisit materials. Dean stated that the Board should be consistent — if issues can be re-opened, then the same should apply to materials. It was noted that the Board should refine its policies regarding revisiting issues and recommendations for clarity and consistency. Bob called for a motion to revisit leather-by-product, and if there was no motion, then the board's original vote stands. There was no new motion.

LIVESTOCK COMMITTEE DISCUSSION
Honey Standards:

Fred Kirschenmann led the discussion on honey standards. Bob agreed to make the changes that were agreed upon and to send a new draft honey recommendation to Fred for distribution to the Board.

The following committee selections and appointments were made:

**Accreditation Committee:**
- Betsy Lydon (Chair)
- Jean Afterman
- Rod Crossley
- Fred Kirschenmann
- Michael Sligh
- Jay Friedman

**International Committee:**
- Kathleen Merrigan (Chair)
- Jay Friedman
- Jean Afterman
- Michael Sligh

**Crops Committee:**
- Steve Pavich (Chair)
- K. Chandler
- Dean Eppler
- Fred Kirschenmann
- Betsy Lydon
- Gene Kahn
- Joan Gussow

**Livestock Committee:**
- Fred Kirschenmann (Chair)
- Bob Anderson
- Kathleen Merrigan
- K. Chandler
- Jay Friedman

**Processing Committee:**
- Margaret Wittenberg (Chair)
- Gene Kahn
- Rod Crossley
- Steve Pavich
- Bob Anderson
- Joan Gussow

**Materials Committee:**
- Jean Afterman (Chair)
- Rod Crossley
- Joan Gussow
- Betsy Lydon
- Margaret Wittenberg
- Steve Pavich
- K. Chandler

**Officers:**
- Bob Anderson (Chair)
- Kathleen Merrigan (Vice-Chair)
- Rod Crossley (Secretary)

**FIBER DISCUSSION**

Margaret Wittenberg led the organic fiber discussion. She also recounted the resolution passed in Austin that the USDA adopt the Texas fiber processing standards. Further, she pointed out the committee’s concerns with the heavy metals used in the dyeing process. Lastly, she reviewed the minor changes to the organic cotton final recommendation, which passed unanimously.
PINEAPPLE PLANTING STOCK

K. Chandler led the discussion on pineapple planting stock. Unfortunately, the Board quickly realized that it was not prepared to move forward on this recommendation and that some additional committee work needed to be done on this issue. Joan moved and it was seconded by K. Chandler to table the discussion and refer it to committee for further elaboration. The motion passed unanimously.

The next executive committee call is set for the first Monday in November at 11:30 EST.

AUSTIN, TX MINUTES

Before moving to approve the Austin minutes, K. Chandler suggested that the USDA use more precise language in the materials voting section of the minutes in the future. Additionally, K. suggested that the biotechnology task force review macro and micro encapsulation and that the crops committee should revisit bio-solids.

Next, the Board formally approved the Biotechnology Policy. (See attached)

Just prior to adjournment, Bob re-acknowledged Brent Wiseman and suggested that if funding permits, to bring the remaining 5 charter members of the board back to one more meeting.

The meeting was adjourned at 1:27 p.m. on Friday.
March 16, 1998

The National Organic Standards Board (NOSB or Board) meeting was called to order at 1:05 p.m. by Chairperson Bob Anderson. Bob began reviewing the four U.S. Department of Agriculture (USDA) Listening Sessions on the National Organic Program Proposal Rule. He noted that the sessions were very positive from the standpoint that everyone supports the USDA developing high standards for organic production.

Bob went on to acknowledge the new Board members attending their first NOSB meeting. Those members included: Carolyn Brickey, Consumer/Public Interest Representative; Marvin Hollen, Farmer/Grower; Bill Welsh, Environmentalist; and Eric Sideman, Scientist.

Next, Bob introduced Keith Jones, the new Program Manager for the National Organic Program (NOP). He also acknowledged Don Kinsman, a charter member of the NOSB. Don passed away in early March.

The public input session followed and the meeting was adjourned at 5:15 p.m. The public input received will be included as a part of the public record on the proposed rule.

March 17, 1998

The NOSB meeting was called to order at 8:08 a.m. by Chairperson Bob Anderson. NOSB Members in attendance were: Betsy Lydon, Margaret Wittenberg, Jean Afterman, Fred Kirschenmann, Steve Harper, Kathleen Merrigan, Bob Anderson, Carolyn Brickey, Eric Sideman, Steve Pavich, Joan Gussow, Rod Crossley, Marvin Hollen and Bill Welsh. Participating at this meeting as the certifying agency advisor to the NOSB was Patricia Kane of the NOFA - NY.

NOP staff members present from USDA were: Keith Jones, Michael Johnson, and Grace Gershuny. Also in attendance from USDA was Eileen Stommes, Deputy Administrator, Transportation and Marketing Program, Agricultural Marketing Service (AMS).

Kathleen Merrigan began the morning session by outlining the NOSB priorities for the upcoming days. These items included:
* Finalize letter to Secretary.
* Develop NOSB reaffirmation statements.
* Determine NOSB position on material “annotations” and manuals.
* Develop augmentation and clarification to prior NOSB positions.
* Write specific statements on top issues of public concern on NOP proposed rule.
* Write letter to Secretary on NOSB role during proposed rule development.
* Discuss NOSB meeting schedule and budget.
* Other – committee structure, role, issues.
* Liaison with other agencies - Environmental Protection Agency, Food and Drug Administration, and the Office of Science & Technology Policy.

Kathleen followed with a discussion of the topics to be covered in the NOSB role(s) letter. The highlights of the letter should include:

* Organic industry is considering and will likely support lawsuits in response to proposed rule. The lawsuits will likely focus on: (1) Language of the Organic Foods Production Act of 1990 (OFPA) is clear and the proposed rule is in violation; (2) Arguments for USDA position on National List is not well supported; and (3) USDA did not appropriately deal with the biotechnology issue.
* The rule does not address or resolve: (1) Synthetics in handling and other OFPA problems (i.e., use of sulfur dioxide SO\_2 in wine, small farmer exemption, etc.) and (2) Secretary’s declaration of what may appear on the National List. It was further suggested that the Board legislatively fix these problems, rather than spend its time debating.

Kathleen went on to discuss the possibility of correcting the National List capitalization in the statute. Grace Gershuny briefly explained the USDA interpretation of the National List section of the OFPA, and USDA’s rationale for adding synthetics to the National List. Bob replied by noting that the OFPA allots the national list process to the NOSB.

Kathleen then requested a vote to provide leeway to refine the brief; Fred Kirschenmann moved and it was seconded by Rod Crossley to allow Kathleen Merrigan to move forward on the brief (13 aye and 1 opposed). Motion carried.

The Board then discussed development of the NOSB reaffirmation statements. In these statements, the Board agreed: (1) Endorses past Board recommendations; (2) Endorses the Board dialogue process; (3) Endorse the USDA-NOSB partnership; and (4) Ask that the USDA recognize the ongoing role of the Board.

A follow-up discussion ensued about additional statements that the Board hoped to develop on ‘annotations’ and ‘program manuals’. Kathleen went on to discuss that Office of Management and Budget (OMB) is opposed to very detailed regulations. This raised the question of how much should be in the rule and how much should be left to program manuals – Kathleen noted the delicate balance, the concerns of flexibility and discretion, the role of the farm plan, and the role of the certifying agent.

Tom O’Brien, Associate Administrator, AMS, briefly discussed the use of program manuals and/or policy manuals in current AMS programs. He noted that National List annotations could be one use for a program manual.
Pat Kane followed by expressing the need for a clear and concise document regarding materials. Joan concurred, and supports the use of a very definitive national list.

The following were identified as needing either augmentation or further clarification:

* Handling principles and materials listing procedure
* Antibiotics and paraciticides
* BSE and animal refeeding
* Manure management
* Fumigation of imports
* Equivalency procedures
* Whole dairy herd conversion
* TAP process standardization
* Genetically modified organisms

**MATERIALS COMMITTEE**

Jean Afterman then led the National List discussion. The items of concern included:

* Annotations should go into rule; materials as recommended should go into rule with change.
* Reservations about operating manuals.
* Concerns about consistency among certifiers.
* Materials as recommended should go into rule without change.
* No consensus on law prohibiting synthetics in processing.

Another topic of concern raised in this discussion centered around the statute’s clear prohibition of synthetics in processing. Joan Gussow reiterated the OFPA’s strict stand that there are no principles in the OFPA for processing activities.

Joan Gussow then led a discussion about USDA removing annotations from the National List portion of the rule. The NOSB agreed unanimously that the materials reviewed and recommended by the NOSB should be made part of the rule precisely as recommended by the NOSB, including the classifications and annotations. Kathleen noted that there should be some allowance for a universe of materials for processing and handling.

Discussion ensued, and Lynn Coody noted that the seven crops criteria do not apply to processing; Fred Kirschenmann suggested the Board develop an interdisciplinary taskforce to develop criteria for determining the appropriateness of materials for processing and livestock, comparable to the criteria used to judge crop materials. Fred Kirschenmann moved and it was seconded by Eric Sideman to establish this task force (Vote: 7 aye, 6 opposed, and 1 absent).

**March 18, 1998**
The meeting was called to order at 8:16 a.m. by Chairperson Bob Anderson. Board members present: Jean Afterman, Steve Pavich, Fred Kirschenmann, Rod Crossley, Steve Harper, Kathleen Merrigan, Carolyn Brickey, Eric Sideman, Joan Gussow, Marvin Hollen, Bill Welsh, Betsy Lydon, Margaret Wittenberg, and Pat Kane as the certifier representative.

He began by thanking the committees and industry representatives on the previous night’s hard work. He also thanked Keith, Tom, Grace, and USDA for all of their work. He then introduced Dr. Isi Siddiqui and thanked him for his leadership in this process.

Dr. Siddiqui, Deputy Assistant Secretary, presented Certificates of Appointment to the new Board members as follows: Carolyn Brickey, Steve Harper, Marvin Hollen, Eric Sideman and Bill Welsh. Dr. Siddiqui then thanked the Board for all its hard work, and acknowledged all those who attended the public input session. He went on to say that the USDA is committed to developing a rule that consumers and the industry can support.

**LIVESTOCK COMMITTEE**

Fred led the discussion of the livestock portion of the rule. As the discussion ensued, Fred moved and it was seconded by Joan to officially endorse the Organic Trade Association (OTA) position relative to the Food Safety Inspection Service prohibition on labeling meat products. **Motion carried unanimously.** (See final Livestock documents as posted to the web for NOSB livestock positions).

**PROCESSING COMMITTEE**

Margaret Wittenberg led the discussion of the procession, handling, and labeling portion of the rule. The following votes were made during the discussion: Rod moved and it was seconded by Bob for USDA to return to the use of “made with organic ingredients,” instead of “made with certain organic ingredients,” as proposed by USDA. **(Vote: 7 aye, 4 opposed, and 3 absent.)** **Motion carried.** Fred moved and it was seconded by Joan to allow the use of private seals on the principal display panel of 95 percent and above organic products, as well as the USDA and State seals. **(Vote: Unanimous - 1 absent.)**

The following resolution was also submitted:

> The National Organic Standards Board (NOSB) endorses and supports the Organic Materials Review Institute’s (OMRI) effort in providing technical information to the NOSB and its committees. Additionally, the NOSB requests that OMRI continue to provide this support during the rulemaking period and also (a) Assist in further identifying materials that need to be reviewed and (b) provide technical support for these reviews. The NOSB further recommends that the USDA and other Non-Governmental Organizations provide subscriptions and other funding vehicles to support OMRI’s ongoing work.

Rod moved and it was seconded by Steve Harper to adopt the OMRI resolution. **Motion**
The meeting reconvened at 2:05 p.m.  

OMRI letter proposal resolution, Rod moved and Steve second, Fred’s friendly amendment.  
**Motion carried unanimously (3 absent).** (See final processing, handling, and labeling documents as posted to the web for NOSB processing, handling, and labeling positions.)

The Board then discussed the legal brief to the Secretary. Resultantly, Fred moved and it was seconded by Rod to continue forward and accept the brief as amended.  
*(Vote: 11 aye, 1 opposed, and 2 abstentions.) Motion carried.*

**CERTIFICATION**

The private seal usage discussion was revisited as well as the use of higher standards. Bob suggested the Board go back to its original position. Rod moved and it was seconded by Carolyn to reaffirm the NOSB’s original recommendations.  
*(Vote: 6 aye, 5 opposed, and 1 absent.) Motion carried.* (See final certification documents as posted to the web for NOSB certification positions).

The session was adjourned at 6:12 p.m.

**March 19, 1998**

The meeting was called to order at 8:20 a.m. by Bob Anderson, chairperson. NOSB members in attendance were: Kathleen Merrigan, Bob Anderson, Carolyn Brickey, Eric Sideman, Betsy Lydon, Joan Gussow, Marvin Hollen, Bill Welsh, Margaret Wittenberg, Fred Kirschenmann, Steve Pavich, Jean Afterman, Steve Harper, and Pat Kane as the certifier representative.

There were additional discussions about certification issues. The following motion was proposed on section 205.219 by Kathleen:

The Secretary shall vest the accredited certification agent with the authority to initially terminate certification (based on known abuse), provided the terminated party retains the ability to appeal that decision to the Secretary. Fred seconded. **Motion carried unanimously.**

**INTERNATIONAL COMMITTEE**

Kathleen moved and it was seconded by Betsy to accept the NOSB International Committee comments. **Motion carried unanimously.** (See final International documents as posted to the web.) Michael Johnson went on to discuss the USDA position on fumigation. Kathleen noted that the proposed rule remained silent on the issue.

Reports from the Livestock and Processing Committees were also discussed and the material can be viewed on Internet at [www.ams.usda.gov/nop](http://www.ams.usda.gov/nop).
The meeting was adjourned at 5:15 p.m.
Official Minutes -- February 1999

NATIONAL ORGANIC STANDARDS BOARD
DRAFT MINUTES OF MEETING

February 9-11, 1999

United States Department of Agriculture
1400 Independence Avenue, SW
Room 3501-South Building
Washington, D.C.

Attendance Record:

Members Present: 13

Jean Afterman
Betsy Lydon
Robert Anderson
Stephen Pavich
Carolyn Brickey
Eric Sideman
Rod Crossley
William Welsh
Joan Gussow
Margaret Wittenberg
Steven Harper
Marc Swartz, Certifying Agent Representative
Marvin Hollen
Fred Kirschenmann

Members Absent: 1

Kathleen Merrigan

Other Attendees:

Dr. Enrique Figueroa, Administrator, Agricultural Marketing Service (AMS);
Keith Jones, Program Manager, National Organic Program (NOP), USDA;
Beth Hayden, NOP, USDA;
Michael Johnson, NOP, USDA;
Tom O’Brien, Associate Administrator, AMS, USDA;
Eileen Stommes, Deputy Administrator, Transportation and Marketing Programs (TMP), AMS, USDA;
Audrey Talley, International Marketing Specialist, Foreign Agricultural Service;
Gary Scavongelli, Associate Deputy Administrator, TMP;
Richard Mathews, NOP, USDA;
Toni Stother, NOP, USDA;
Grace Gershuny, NOP, USDA;
Karen Thomas, NOP, USDA; and
Interested persons from the public
CALL TO ORDER

The meeting was called to order by Mr. Robert (Bob) Anderson, Chairperson of the Board, at 9:10 a.m. on Tuesday, February 9, 1999. Bob gave a brief welcome, thanked everyone for coming, and introduced Marc Schuartz as the certifying agent representative attending this Board meeting. Bob went over the aggressive agenda format, which was different for this meeting. The Committees would begin with updates/progress reports and hold working sessions after the public input session.

COMMITTEE UPDATES/PROGRESS REPORTS

Livestock Committee Update: Mr. Fred Kirschenmann, Chair

Mr. Kirschenmann reported that the Livestock Committee would discuss during its working session public comment on Issue Papers, NRCS practice Standards, NOSB Livestock Recommendations as they relate to manure handling, honey and aquaculture recommendations, and language on hay for temporarily confined ruminants.

Accreditation Committee Update: Betsy Lydon, Chair

Ms. Lydon reported that the Accreditation Committee would discuss during its working session current State and private certifier enforcement policies, what penalty would be leveled for violations, and the previous NOSB recommendations on fee structure.

Crops/Materials Committee Update: Eric Sidman and Carolyn Brickey, Chairs

The committee chairpersons reported that their committees would be discussing manure handling work with the Livestock Committee and National List authority.

Board Procedures Taskforce Update: Carolyn Brickey, Chair

Ms. Brickey announced that the Taskforce Committee would be looking at Board authority, procedures for materials review, and other Board procedures.

International Committee Update: Rod Crossley, Vice-Chair

Mr. Crossley reported that the committee would discuss quarantine practices and Codex.

Interdisciplinary Committee: Joan Gussow, Chair

Ms. Gussow discussed the comments received regarding the survey on Criteria for the Acceptance of Materials Used in Processing and the comments on the Processing Principles Proposal.

Processing Committee Update: Margaret Wittenberg, Chair

Ms. Wittenberg discussed the comments on the retailer questionnaire concerning Maintaining Organic Integrity in Retail Operations.

USDA/ NATIONAL ORGANIC PROGRAM UPDATE

Keith Jones, Program Manager, NOP, USDA
Mr. Jones gave a slide presentation that updated the Board on NOP activities since the last NOSB meeting. Issues discussed were: the NOP budget, USDA’s Food Safety and Inspection Service allowing an interim organic label for meat and poultry, the European Union’s (EU) action on EN 45011/ISO 65, and other issues raised by the 275,603 public comments. Mr. Jones updated the Board on the status of the proposed rule rewrite, stating that internal review would begin as soon as all the sections cleared OGC. He further stated that the plan was to have a joint review with the Department and OMB and that he did not anticipate any problems with the internal review. Additionally, he recommended that the Board’s priority should be on materials, inerts, and recommendations on any new issues.

LIVESTOCK COMMITTEE WORKING SESSION – Fred Kirschenmann, Chair

The Livestock Committee Working Session began with a brief summary of the Committee’s Proposed Recommendations on Wild Animals. Public comment overwhelmingly supported the NOSB’s position on nonconfinement for livestock. He noted situations that would allow for temporary confinement; e.g., inclement weather, protection from predators, etc. Comments on animal medications were again supportive of the NOSB’s positions on antibiotic use, which is to ban all antibiotic use for slaughter stock. There are, however, a number of producers who have expressed concern about a ban on the use of parasiticides.

Zea Sonnabend from the Organic Materials Review Institute (OMRI) presented two charts on materials that are open for Technical Advisory Panel (TAP) review. The charts identified materials that were either referred by NOP from petitioned materials, tabled by the NOSB at a previous meeting, or referred for TAP review by the NOSB but were never completed. (See attachment 1.)

PUBLIC COMMENT PERIOD

The Chair opened the meeting for public comment.

Richard Mandelbaum, CATA/the Farmworker Support Committee

Mr. Mandelbaum was before the NOSB as a spokesperson for the community that makes up its membership. The issue he discussed was “just and humane working conditions.” They have historically been a fundamental component of organic agriculture, both in the management policies of growers and in the minds of consumers. (See attachment 2 for complete testimony.)

Jim Riddle, Independent Organic Inspectors Association

Mr. Riddle presented a press release, "Standardized Certification Forms Published," dated January 31, 1999. Jim informed the Board that the second edition of the IOIA Organic Inspection Manual is now available. He said he felt accreditation was not being addressed in sufficient detail, specifically asking how the reproposed rule will address international compliance, peer review, and synthetics. (See attachment 3.)

Mark Retzloff, Horizon Organic Dairy

Mr. Retzloff gave comments on the NOSB Livestock Committee’s recommendation concerning livestock confinement, in particular the requirement of managed pasture for ruminant animals. Mr. Retzloff said, "We strongly suggest that the NOSB amend the requirement for managed pasture to read 'recommend' or 'encourage' or 'should' instead of 'shall' or 'require.'" (See attachment 4.)

Lynn Coody, for Linda Bullard, President, International Federation of Organic Agriculture Movement (IFOAM)
Ms. Coody read a prepared statement by Ms. Bullard. IFOAM, representing the worldwide organic community, stands with the U.S. organic community in its demand that USDA establish a true public-private partnership in its new version of the proposed rule, as called for in the OFPA itself. IFOAM urged the NOSB to take the international trade aspects of accreditation into account in its deliberations and to recommend that USDA look to this private-sector system for its accreditation needs, rather than creating a costly and redundant accreditation structure within the U.S. Government. (See attachment 5.)

**Jim Riddle, for Emily Brown-Rosen, Northeast Organic Farming Association**

Mr. Riddle read a prepared statement by Ms. Brown-Rosen. The issues addressed were certification, decision-making authority, and options for enforcement. (See attachment 6.)

**Marty Mesh, Florida Organic Grower**

Mr. Mesh thanked everyone for the opportunity to work with them. Marty talked about new Board members’ qualifications, materials requests going out to the public, right of appeal, and enforcement.

**Lynn Coody, Oregon Tilth**

Ms. Coody expressed a concern with constitutional issues, certification, and enforcement. USDA should take a look at other public/private partnerships that are already in place. Certifiers shipping internationally are confused.

**Brian Baker, OMRI**

Mr. Baker expressed his approval of the progress being made by the new management. The NOSB should rely heavily on the expertise that is available. He stated that he looks forward to working with the NOSB on TAP review, particularly moving inerts from the Environmental Protection Agency’s (EPA) list 3 to list 4 and prohibiting inerts from appearing on EPA’s list 1 and 2. Mr. Baker cautioned that the NOSB needs to set aside time for groups to come up with alternatives before completely banning list 1 and 2 inerts. He further recommended that the NOSB use the TAP to determine, based on the seven criteria, materials that are compatible with OFPA. He distributed a list of registered formulations for inert ingredients review which was first presented at the Austin, TX, NOSB meeting. (See attachment 7)

**Michael Sligh**

Mr. Sligh stated that the organic community intends to maintain strong leadership of the future course of organic. The overall proposed regulations must embrace, support, and strengthen the current organic farmers. Mr. Sligh cited 13 issues that need to be considered by the Board or USDA. (See attachment 8)

**Cissy Bowman, Organic Farmers Marketing Association (OFMA)**

Ms. Bowman distributed copies of the OFMA comments on the NOSB Livestock Committee Draft Recommendations for Wild Livestock, the NOSB International Committee Draft Recommendations for Fumigation, the NOSB Livestock Committee Draft Recommendations for Aquatic Livestock Standards, the NOSB Processing Committee survey on Maintaining Organic Integrity in Retail Operations, and the NOSB Interdisciplinary Task Force on Processing and Materials Criteria request for comment on Criteria for the Acceptance of Materials Used in Processing. (See attachment 9.)
Mark King, Certified Retailer

Mr. King has a small 100-percent organic retail produce stand. He would like to keep the product pure and healthful for the consumer. Consumers do not want synthetics in their produce (i.e., genetically modified organisms (GMO), pesticides, etc.).

Phillip LaRaccoa, CCOF LaRaccoa Vineyard

Mr. LaRaccoa spoke to the Board regarding decertification and synthetics. Farmers/wineries don’t want sulfites in their product, whereas the State of California supports this.

Beth Fiteni, National Coalition Against the Misuse of Pesticides

Ms. Fiteni spoke to the Board regarding its position that no synthetics be allowed for use in organic production. She urged the Board to keep in mind people suffering from multiple chemical sensitivity, who rely heavily on the organic industry to provide pure food and clothing that is safe and will not aggravate their symptoms. (See attachment 10.)

Pauline and William Crawford, Los Gatos, CA

Mr. and Mrs. Crawford sent a written statement that addressed: 1) Proposed Rules for Implementing the Organic Foods Production Act, 2) The Organic Foods Production Act of 1990, and 3) The National Organic Standards Board. (See attachment 11.)

Zea Sonnabend, OMRI

Ms. Sonnabend talked about materials and showed a video.

---END OF PUBLIC COMMENT PERIOD---

LIVESTOCK COMMITTEE WORKING SESSION (CONTINUED) - Fred Kirschenmann, Chair

At the conclusion of the public comment session, the Livestock Committee continued its working session with a presentation by Keith Jones, Program Manager, NOP, on draft production language based on the Natural Resource Conservation Service’s (NRCS) practice standards for crop rotation. The NRCS practice standard concept was further discussed with the Board by Beth Hayden of the NOP staff. (For further information on practice standards see www.ncg.nrcs.usda.gov/index.html.) Fred then discussed Organic Watch’s breakdown of comments on the National Organic Program Issue Papers. (See attachment 12.)

WEDNESDAY, FEBRUARY 10, 1999

LIVESTOCK COMMITTEE WORKING SESSION (CONTINUED) - Fred Kirschenmann, Chair

Bob Anderson reconvened the meeting at 9:15 a.m. in USDA's Room 3501-So. Bldg. Bob thanked everyone for staying late last night. The Livestock Committee Chair continued the working session with a discussion on confinement of animals. The issue was raised that OTA’s confinement comments left out: 1) stage of production and 2) stage of transition to organic. Mark Retzloff stated that pasture is not/should not be required.

Fred Kirschenmann discussed two papers sent to the committee by Beth on manure management. (See attachment 13.) The Board showed support for OPTION #2. Brian Baker
noted the need for a composting definition. Eric Sideman expressed concern regarding the 120 days between application of raw manure and harvest of crops proposed by NOP and will get more input to guide NOP on the proper interval. Beth Hayden of the NOP Staff led a presentation on nutrient management. (See attachment 14.)

**JOINT CROPS/MATERIALS COMMITTEE WORKING SESSION - Eric Sideman, Crops Chair, and Carolyn Brickey, Materials Chair**

Eric Sidman started the joint session with a discussion on inert. Inerts have been the single most important topic for both the crops and materials committee. Working with EPA has lent support to a Committee recommendation for the immediate banning of list 1 and 2 inerts, with list 3 to be banned at a future date. Eric further recommended that List 3 be reviewed on a case-by-case basis as some a phase-out will be necessary so as not to disrupt current production. He further stated he expected most of list 4 to be permitted unless specifically prohibited.

It was recommended that the NOSB work directly with the manufacturers to get the information on registered formulations. Carolyn spoke with OGC and EPA in getting this information to develop TAP information. NOP should draft a memo to the manufacturer based on Brian Baker's old list of registered formulations to gather information for a new list. Carolyn indicated that NOP could have a designated officer for signing confidentiality agreements if necessary. The NOSB indicated its timeline for the letter should be about 1 month.

**Crops Committee, Eric Sideman, Chair**

Eric conducted a discussion on practice standards language. The language should specify that manure applications should control the nitrate accumulations in a product. It was noted that California tests and does not have a set limit. Fred indicated the need to address the whole nutrient system. Questions regarding Secretary Glickman’s decision to ban genetically modified organisms (GMO) were raised. Consensus emerged that the materials committee would draft discussion questions on GMO’s for a future meeting. Carolyn stated that she perceives the issue to be how a farmer will know that what he or she is using is GMO free. Rod asked a similar question.

**Material Committee, Carolyn Brickey, Chair**

Carolyn led a discussion on the priority of the National List of material criteria, that the Board should go back and maybe add additional uses. She will review the original Federal Register Notice (See attachment 15) on the criteria for the petition process so new language can be developed for new requests. Annotations should be put back on materials that go through the TAP process at the staff level even though they may not stay in as they go through the OGC/OMB review process.

**ACCREDITATION COMMITTEE WORKING SESSION - Betsy Lydon, Chair**

Betsy chaired the working session discussions on the role of State and private certifiers, enforcement policies, and violation triggers/penalty levels. Discussion centered on a conceptual proposal drafted by Jean Afterman that would allow private certifiers to prevent the use of their service mark (seal) upon: 1) written notification that certification by the private certifier has been terminated; 2) written notification of 30 days to appeal to the Secretary of Agriculture; and 3) written notification of denial to use the private certifier’s seal. Carolyn reminded the Board that OGC has stated that the USDA seal couldn’t be removed until full due process (appeal) has occurred. Lynn Coody of Oregon Tilth presented Oregon Tilth’s Appeal Process. Oregon Tilth has a lengthy process; however, to date there has not been a challenge to their decisions in court.
Jim Riddle of IOIA gave an overview on the IOIA standardized Organic Certification Form Templates. He advocated their use to standardize certification and inspection forms. (See attachment 3.)

Audrey Talley of USDA's Foreign Agriculture Service (FAS) gave a slide presentation entitled "International Organic Food Markets - Opportunities and Regulatory Challenges" (See the FAS Web Site at: www.fas.usda.gov).

INTERNATIONAL COMMITTEE WORKING SESSION - Rod Crossley, Vice-Chair

Rod introduced H. Michael Wehr, Ph.D., Office of Constituent Operations, U.S. Food and Drug Administration. Dr. Wehr presented "Summary Information on the Codex Committee on Food Hygiene (CCFH)," which provided information on the three terms of reference for CCFH. (See attachment 16.)

During this session, Dr. Enrique E. Figueroa, Administrator of USDA's Agricultural Marketing Service, addressed the NOSB. He thanked them for their efforts and expressed the hope that they will continue to move the process forward. Dr. Figueroa discussed the fact that the organic industry was showing tremendous growth by noting that he had given a radio interview with 2,000,000 listeners and that he would be going to Nuremberg and the EU next week. Dr. Figueroa talked about the presentation given during a visit by the farm manager of Prince Charles of the U.K.

Mark Keating presented a paper on alternative quarantine treatment for organic certification. Alternative treatments might be combined temperature treatment, lower oxygen levels, etc. ARS and APHIS have the responsibility for development and enforcement of quarantine treatments. (See attachment 17.)

BOARD PROCEDURES TASK FORCE WORKING SESSION - Carolyn Brickey, Chair

Carolyn began the working session with a discussion on the National List petition process. She stated that the Task Force asked for changes but felt the document used earlier was acceptable except for some outdated language. (See attachment 15.) Carolyn urged the Board to adopt a similar document for processing and livestock materials. The Board encouraged the development of these documents by the next meeting. Additionally, the Task Force will develop criteria for qualifications for new NOSB members by the next meeting. Carolyn posed questions to the Board, such as whether the Board should recommend alternates be named by the Secretary when a member will be away for several months. The consensus was for the task force to make recommendations regarding substitute Board members and the level of their participation in Board activities by the next meeting.

THURSDAY, FEBRUARY 11, 1999

BOARD PROCEDURES TASK FORCE WORKING SESSION (CONTINUED) - Carolyn Brickey, Chair

Bob Anderson reconvened the meeting at 9:15 a.m. in USDA's Room 3501-So. Bldg. A review of the items from Wednesday evening's session was given. Topics covered included: 1) new petition process language; 2) appointment/qualifications of new Board members; 3) Board alternates; and 4) Board substitutes. The Task Force agreed to present its recommendations on these issues at the June meeting.
Re: General Board Procedures. 1) For general actions, the NOSB must take a quorum as a majority. 2) The NOSB will use statutory procedures. 3) Decisive votes of the Board require a two-thirds majority. 4) A material vote requires two-thirds of the Board present at the meeting. Reaction to the conflict of interest language was that the Board needs to get a better understanding. The paper (See attachment 18) will be reviewed internally by USDA and something will be prepared by the Committee for the next meeting.

INTERDISCIPLINARY COMMITTEE ON PROCESSING PRINCIPLES WORKING SESSION - Joan Gussow, Chair

Joan began the working session with a discussion of the changes suggested by commenters to the language in "Criteria for Acceptance of Materials Used in Processing." Joan recognized that many commenters were against the NOSB’s position of allowing synthetic ingredients in processed foods. These commenters assert that the NOSB broke the law by allowing synthetics. Fred expressed concern over the Board’s need to encourage quality products with marketplace integrity. It is the Board's responsibility to determine what can be in organic. The Committee agreed to redraft language in the form of a motion and present it later in the day. (See Board Vote, p. 11.)

PROCESSING COMMITTEE WORKING SESSION - Margaret Wittenberg, Chair

Margaret presented the committee's work on the retailer questionnaire on protection of organic integrity. The committee received about eight or nine comments on allowing voluntary guidelines, confusion over commingling, and the need for education. Margaret indicated this was a work in progress and said that she would report any new information at the next meeting.

NOSB COMMITTEE REPORTS AND ACTION VOTES

DATE: February 11, 1999

Board Vote

Motion: Livestock Committee. Motion by Fred Kirschenmann. Add to the Board recommendation on Confinement of Livestock in an Organic System "stage of production" and "stage of transition of the farm to organic" on the list of exceptions to the requirement that livestock have access to the outdoors. The management practices must make clear that these additional exemptions in no way change the intent that ruminant organic livestock systems be pasture based.

Second: Bill Welsh

DATE: February 10, 1999

Board Vote

Motion: Joint Crops and Materials Committee. Motion by Eric Sideman. Inert ingredients on EPA Lists 1 and 2 shall be prohibited for use in organic production and handling effective on the date of implementation of the final rule of NOP. Synthetic inerts on EPA List 3 shall be prohibited if not specifically approved by the NOSB. This approval process will be completed and published by January 1, 2002. Any inert currently in use in organic production that is not approved by the NOSB will be banned within 18 months after the review is completed and published. To that goal, inerts on EPA List 3 used in products that have active ingredients approved for organic production shall be reviewed by the NOSB on a case-by-case basis for possible inclusion on the National List. The NOSB recommends that inerts on List 4 generally be allowed unless explicitly recommended for prohibition.

Those In Favor: 5 yes

Those Opposed: 6 no

Those Abstaining: 1

Motion does not pass

DATE: February 10, 1999

Board Vote

Motion: Interdisciplinary Committee on Processing Principles. Motion by Joan Gussow. A synthetic may be used if:
1. That processing aid or adjuvant cannot be produced from a natural source and has no organic ingredients as substitutes;
2. Its manufacture, use, and disposal do not have adverse effects on the environment and are done in a manner compatible with organic handling as described in section 6513 of the OFPA;
3. The nutritional quality of the food is maintained, and the material itself or its breakdown products do not have adverse effects on human health as defined by applicable Federal regulations;
4. Its primary purpose is not as a preservative or used only to recreate/improve flavors, colors, textures, or nutritive value lost during processing, except in the latter case as required by law;
5. It is Generally Recognized as Safe (GRAS) by FDA when used in accordance with Good Manufacturing Practices (GMP) and contains no residues of heavy metals or other contaminants in excess of FDA tolerances;
6. Its use is compatible with the principles of organic handling; and
7. There is no other way to produce a similar product without its use, and it is used in the minimum quantity required to achieve the process.

DATE: February 10, 1999

BOARD VOTE

Motion: Motion by Rod Crossley. Be it resolved that the National Organic Standards Board recommends that:

A certifying agent retains the authority to terminate its certification of a certified operation where the certifying agent has made a determination that a certified operation has violated the provisions of the Act and the certifying agent shall advise the certified operation of its action by written notice of the termination of certification.

This Termination Notice shall, in addition to terminating certification of all or any part of the certified operation, advise the certified operation of the following:

1. That a copy of this Notice has been forwarded to the Secretary [Administrator];

2. That the certified operation has 15/20/30 days [length of expedited appeals process] from the effective date of the Notice to appeal the action of the certifying agent to the Secretary [Administrator];
3. That if the certified operation fails to file an appeal within the prescribed time, the Secretary shall without further process and in addition to reaffirming the termination of the certification, terminate the Federal license of the certified operation, effective immediately, and shall enforce and prosecute to the fullest extent of the law;

Failure by the certifying agent to advise the certified operation of the consequences of the Notice of termination shall act as a bar to enforcement by the Secretary until such time as the certified operation has been so advised.

**PLANS FOR NEXT MEETING**

The next meeting is expected to be held June 8-10, 1999.

Suggested agenda items for the next NOSB meeting:

- Aquaculture and honey standards
- Standards for wild animals
- Livestock materials review
- Inerts list to TAP
- Language on Board policy
- Fumigation
- EU/ISO 65
- Processing materials review

The NOSB meeting was adjourned at 4:00 p.m.
Attendance Record:

Members Present: 12

Robert B. Anderson
Fred Kirschenmann
Carolyn Brickey
Kathleen Merrigan
E. Rod Crossley
Stephen Pavich
Joan Gussow
Eric Sideman
Steven Harper
William Welsh
Marvin Hollen
Margaret Wittenberg
Leslie McKinnon, State Rep.
Lee Barber, Certifier Rep.

Members Absent: 2

Jean Afterman
Betsy Lydon

Other Attendees: Eileen Stommes, Deputy Administrator, Transportation and Marketing Programs (TMP), USDA;
Gary Scavongelli, Associate Deputy Administrator, TMP, USDA
Keith Jones, Program Manager, National Organic Program (NOP), USDA;
Grace Gershuny, NOP, USDA;
Beth Hayden, NOP, USDA;
Toni Strother, NOP, USDA;
Karen Thomas, NOP, USDA;
Robert (Bob) Anderson, Chairperson of the NOSB, called the meeting to order at 8:15 a.m., Tuesday, June 8, 1999, in Room 3109-South Building. Mr. Anderson and Mr. Keith Jones, NOP Program Manager, opened the meeting by thanking each member of the Board and the public for the interest exhibited by them in the NOSB meetings. Mr. Anderson then moved to the next order of business, the NOSB Committee Updates/Progress Reports, which were conducted by the respective NOSB Committee Chairpersons.

NOSB COMMITTEE UPDATES/PROGRESS REPORTS

Livestock Committee Report: Mr. Fred Kirschenmann, Chair

Mr. Kirschenmann reported the committee’s activity on aquaculture standards, wild animal production and certification, parasiticides, and honey standards. With respect to aquaculture standards, the committee reported that it is still in the process of receiving responses from the public regarding the recommendations for aquaculture standards. As a result, the committee announced that updates would be made regarding the aquaculture standards. The committee stated that finalization of the aquaculture standards would be tentatively set for the next NOSB meeting in October.

Mr. Kirschenmann also reported that it has not been able to reach a general consensus regarding the regulations of wild animal production and certification. Further, he informed the Board of some technical difficulties with specific issues surrounding the recommendation on the use of parasiticides. Despite these difficulties, he assured the Board that the Committee will soon finalize the parasiticides recommendations and will send the recommendations out to respective NOSB members and related officials as soon as a draft is available. Finally, he discussed that the honey standard recommendations had been reviewed. The committee has recognized some common issues between honey standards and wild animal production. As a result, the honey standards recommendations would need additional refinement.

Crops Committee Report: Mr. Eric Sideman, Chair

Mr. Sideman reported that efforts to develop recommendations for raw manure use are still in progress. He said the Committee is fully aware of the importance regarding the finalization of the manure standards. He also updated the Board on the status of the letters to manufacturers and formulators of pesticides used in organic production. These letters request lists of ingredients, including inert ingredient for various brand-name products. (See attachment 18.) Information received from manufacturers will be reviewed by the NOP to determine whether inert materials used in these formulations are consistent with the Board’s inert policy guidelines.

Materials Committee Report: Ms. Carolyn Brickey, Chair

Ms. Brickey discussed issues that had been established by the Board Procedures Task Force. The Committee is recommending that procedures be established for: 1) Conflict of Interest; 2) Board Alternates and Substitutes; 3) New Members of the NOSB; 4) Procedure for Voting on Materials; and 5) General Board Procedure. After a brief discussion of these issues, Brian Baker
of the Organic Materials Review Institute presented a mock materials Technical Advisory Panel review discussion.

**International Committee Report: Mr. Robert (Bob) Anderson, Acting Chair**

Mr. Anderson, substituting for Ms. Lydon, updated the Board on enforcement-related issues and draft guidelines for quarantine control standards.

**Processing Committee Report: Ms. Margaret Wittenberg, Chair**

Ms. Whittenberg updated the Board on the status of discussions with other organizations on voluntary retailer standards.

**Accreditation Committee Report: Mr. Robert (Bob) Anderson, Acting Chair**

Mr. Anderson, substituting for Ms. Lydon, led the Board through a summary of enforcement issues from certifiers who are concerned about the misuse of organic labeling. One of the questions that arose in the issue papers questioned who would be the authoritative body that enforces regulations to ensure conformity to fair organic labeling practices.

Discussion then centered on USDA’s efforts to comply with the European Union (EU) directive regarding the International Organization for Standardization/International Electrotechnical Commission Guide 65 (ISO 65). The Committee stressed the importance of organic certifying agencies being in compliance with EU requirements that became effective on June 30, 1999. Agencies that comply with these requirements would be capable of providing organic producers the opportunity to export organic products to EU markets. In assessing fees for the ISO 65 assessment program, the Committee urged USDA to take into account the financial condition of many small certifiers and avoid a burdensome fee structure.

**USDA/NATIONAL ORGANIC PROGRAM UPDATE**

Keith Jones, Program Manager

Keith Jones began his report by stating that the NOP staff was still in the process of rewriting the Proposed Rule and discussed the lengthy process of addressing the approximately 290,000 public comments (approximately 280,000 for the first proposal and 10,000 for the Oct. ’98 issue papers) in the preamble of the revised proposal. Following the discussion regarding the revised proposal, Mr. Jones reviewed the recently published ISO 65 assessment program. (http://www.ams.usda.gov/lsg/mgc/iso65.htm). It was noted that comments regarding the ISO Guide 65 rule must be received by August 9, 1999 (60-day comment period). Further, Mr. Jones mentioned that USDA was specifically engaged in concurrent discussions with the U.K, Netherlands, Denmark, Germany, and France, seeking acceptance of the USDA ISO Guide 65 program.

Further, he announced that four board member positions would be expiring in January 2000. USDA would be requesting, in a Federal Register notice, nominations for a farmer/grower, environmentalist, retailer, and handler/processor. Finally, he updated the Board on vacancy announcements for NOP staff and noted that NOP would be hiring at least three new staff members.

**BOARD PROCEDURES TASK FORCE WORKING SESSION – Carolyn Brickey, Chair**

New Members and Criteria
Ms. Brickey led the discussion regarding the need to ensure strong candidates for the four Board vacancies. She stressed the need for the Board to be actively involved in seeking good candidates. Discussion then moved to how best to get information out on these open slots. Margaret suggested working through Organic Trade Association (OTA) and the Campaign for Sustainable Agriculture (CSA). Diane Goodman, a Task Force member, suggested the NOP website as an obvious information distribution mechanism. Joan suggested that Carolyn appoint a current Board member as point person to whom names can be directed for each open slot. Carolyn asked Margaret, Rod, and Fred to bring to the Board tomorrow a plan on information dissemination. Michael Sligh from Rural Advancement Foundation International suggested the Board needed to "provide a contour description of criteria,"--no minutia, just major concepts. Representatives from the CSA and OTA assured the Board they would be active in soliciting good candidates. Finally, Keith stressed the need for a gender and ethnically diverse group of candidates as diversity is a top USDA priority.

Conflict of Interest

The Committee then moved into discussion of policy and procedures on conflict of interest, Board alternates and substitutes, procedures for voting on materials, and general Board procedures. (See attachment 2.)

Public Comment Session

Julie Anton Dunn, AgriSystems International

Ms. Dunn commented on two main issues concerning the development of organic standards: 1) Certified Organic Wild Catch Fish, Seafood, and Sea Products and 2) Genetically Modified Organisms (GMO’s) as Organic Food Processing Ingredients and Aids. Ms. Dunn expressed the opinion that an effort to bring the issue of wasteful by-catch practices to the forefront and to instill principles of biodiversity and ecosystem integrity are ground-setting. However, organic wild catch standards and certification can challenge fisheries to go a step further – to identify contaminant sources, to consider the feeding practices of the target species, and to more resolutely prohibit practices damaging or non-restorative of the marine ecosystem. She further stated that the organic industry should not allow GMO’s to be included in the list of allowed substances in organic food production. If allowed, the window of opportunity would close for the organic industry. (See attachment 3.)

Suzanne Vaupel, International Federation of Organic Agriculture Movements (IFOAM) World Board

Ms. Vaupel encouraged the Board to adopt a 1993 Committee Resolution as an NOSB recommendation to USDA. She believes such a recommendation would: 1) enhance the public/private partnership called for by the OFPA, 2) reduce redundancy in the accreditation process, 3) potentially reduce costs to those certifiers who choose to be accredited by multiple accreditors as well as costs to USDA, 4) and facilitate international acceptance by providing a common accreditation process. She also requested that USDA review the IFOAM Accreditation Program to determine how IFOAM and USDA might work together in the accreditation process. (See attachment 4.)

Katherine DiMatteo, Organic Trade Association (OTA)

Ms. DiMatteo spoke on behalf of the livestock committee of the OTA. She requested that the NOSB implement specific criteria for review of materials to be used in organic livestock production. She also recommended a set of criteria for parasiticide use in livestock production. After making her recommendations, she posed two questions that required the advice of the
NOSB. The two questions posed were: 1) "Are retail companies that own a private label required to be certified, or is the certification of the copacker sufficient" and 2) "Can the private label product carry the seal or identification of the copacker as an indication of certification of the product?" (See attachment 5.)

James Riddle, Minnesota Department of Agriculture, Organic Task Force

Mr. Riddle proposed three structural options for a public/private accreditation partnership: 1) USDA supervision of International Organic Accreditation Service (IOAS) accreditation, 2) USDA accreditation based on IOAS evaluation and recommendations, and 3) USDA accreditation based on IOAS evaluation. Mr. Riddle explained each of the options mentioned and gave brief cost implications of each. (See attachment 6.)

Emily Brown-Rosen, American Organic Standards

Ms. Rosen commented on the various ways the NOSB could use American Organic Standards to enhance the quality of the Proposed National Organic Standards. She summarized the differences between NOSB recommendations and the American Organic Standards. Also, Ms. Rosen suggested that the NOSB should engage in further Technical Advisory Panel (TAP) reviews and provide assistance to the Food and Drug Administration regarding food-safety in organic food production. (See attachment 7.)

Jim Coakley, Beef Producer

Parasiticides were the main focus of Mr. Coakley's comments. He noted the narrow margins in the livestock industry and the small margin of error that could affect the success or failure of the organic subsector of the livestock industry. He addressed beef producers' problems with parasites and referenced scientific research that supports parasiticide use in the production of organic beef as safe and economically beneficial. (See attachment 8.)

Cissy Bowman, Indiana Farmer

Ms. Bowman expressed concern about the NOSB recommendation that producer applicants must be certified organic producers. She believes the producer applicants should not be limited to certified producers. Ms. Bowman also expressed concern over the potential certification of wild harvested animals. She said that wild caught fish and animals cannot be quality assured. However, Ms. Bowman wants to keep the discussions regarding this issue open.

Audrey McShane, Intern and Consumer

Ms. McShane stated that synthetic and processed foods present a problem in organic food production and sales and expressed a concern over organic food labeling and how poor labeling criteria could mislead consumers.

Mark King, Food Retail Outlet Manager

Mr. King noted that about 15 percent of his total sales are organic sales. He stressed the importance of educating employees about organic product handling and its importance to consumers seeking organic products. Mr. King expressed gratitude to the NOSB for restricting the use of GMO's in organic food production. He mentioned that he requires certification of all organic products that are sold in his store to minimize or eliminate commingling and contamination. Also, Mr. King said that the Organic Trade Association guidelines had been helpful to him in establishing good organic retail practices. (See attachment 13.)
Philip LaRocca, C.C.O.F

Mr. LaRocca stated that he was pleased with the training seminar on ISO 65 and is anxious to see documentation that represents a final agreement that legalizes organic trade between the United States and the EU. He also wants USDA to provide some protection for the small organic farmers so that they will not be eliminated as the market matures.

Diane Bowman, C.C.O.F.

Ms. Bowman responded to the American Standards Project. She explained that she was happy to see that they had been established and encouraged participating members of the organic industry to use them accordingly.

Diane Goodman, Enforcement Delegation

Ms. Goodman suggested that accreditation and organic policies be enforced and delegated hierarchically. She proposed that the authoritative structure of the hierarchy flow as follows: 1) USDA, 2) State Programs, and 3) Certifiers. She commented that USDA would delegate enforcement to the States, and organic should be included with other USDA programs that States implement and enforce. In addition, she stated that an instruction manual should be created for State programs, a Memorandum Of Understanding (MOU) should be established between USDA and State programs, and enforcement issues should be brought to and addressed by NASDA.

Marty Mesh, Florida Organic Growers, Organic Certifier

Mr. Mesh asserted that the NOSB should have an organic certifying agent participate as an official Board member instead of just a representative. He noted that materials to be reviewed by the Board were always issued to him in an untimely fashion. He suggested that materials for review be issued ahead of time so that they could be reviewed properly. In addition, Mr. Mesh expressed his acceptance of the ISO 65 training program. Further, he identified the difficulty that small certifiers experience with organic agricultural exports. As a result, he encouraged USDA to support small certifiers. Finally, Mr. Mesh expressed concern over the difficulty of certifying wild caught fish and animals as organic because of the high probability of commingling and other practices that could destroy the organic quality of the animal.

Michael Sligh, Rural Advancement Foundation, International, and Cochair of the Organic Community of the National Campaign for Sustainable Agriculture

Mr. Sligh explained that he would like to see a hard copy of the NOSB procedures made available to interested parties. He stated that the procedures should contain a clear description of the process involving the revision of final rules and making NOSB recommendations. Also, he expressed the importance of disseminating relevant information to the public in a timely fashion for public comment. He reiterated that the NOSB is the eyes and ears of the public and that the distribution of information regarding vacancies of the NOP staff or the NOSB should be made to the public accordingly. Mr. Sligh informed the NOSB that there should be special guidelines to help small entities and farmers cope with the costs associated with accreditation and certification issues. Finally, Mr. Sligh recommended that the NOSB be placed on record as endorsing the American Organic Standards.

Beth Fiteni, Beyond Pesticides/National Coalition Against the Misuse of Pesticides (NCAMP)

Ms. Fiteni referenced the tremendous growth in the organic sector over the past few decades. She raised the issue of expanding organic production by assisting food producers to make the
conversion to organic farming. Further, she suggested that labeling laws should provide consumers and producers the options necessary to respond to marketplace pressures and help the organic sector grow. Thus, she supported labeling practices that allow products that have been "made with organic ingredients" to be labeled as such. She argued that this would not dilute the meaning of organic and would give consumers the option of supporting the production of organic ingredients, which would help expand the organic sector. (See attachment 9.)

Deborah Brister, University of Minnesota, Organic Aquaculture Standards

Ms. Brister recommended three guiding principles on NOSB aquaculture standards:

1) aquaculture standards should be consistent with the goals and objectives of organic agriculture standards so that aquatic producers have the same types of obligations as terrestrial farmers; 2) standards must accommodate the biology and ecology of farmed aquatic organisms, which differ greatly from those of terrestrial livestock and plants; and 3) the Board should actively seek comments from a broad cross-section of aquaculture producers, academics, and consumers of aquaculture products. Ms. Brister made specific recommendations to the NOSB on the following aquaculture topics: 1) Feed; 2) Environment; 3) Origin and Breeding of Stock; 4) Health; and 5) Harvesting. (See attachment 10.)

Lee Arst, Coleman Natural Products

Mr. Arst expressed his support of the recommendation by the NOSB to prohibit the use of hormones and antibiotics and only allow organic animals to eat 100 percent organic feed. However, he opposed the potential prohibition of parasiticide use in slaughter stock. He advocated that parasiticides be allowed in the treatment of slaughter stock, at least until a thoroughly tested natural alternative is developed. He commented that:

1) parasiticides improve the health of the animal when properly used; 2) humane animal treatment demands the use of parasiticides; and 3) if parasiticides are not used, organic livestock producers will have lower profits, hampering their ability to compete in the marketplace. (See attachment 11.)

Rebecca Goldberg, Environmental Defense Fund (EDF)

Ms. Goldberg commented on two main issues. She recommended that the NOSB restrict or ban the use of fish meal in feeds for farmed fish and other animals, and she suggested that it only allow net-cages for fish farming if net-cage operators institute nutrient management plans that recycle nutrients. Expanding on her comments, Ms. Goldberg pointed out that fish meal and fish oils are inefficient feeds because they result in a net loss of fish protein. Also, she expressed opinion that organic certification for net-cage farms should be limited to those farmers with credible plans for recycling and removing the nutrients that they introduce into the habitat. (See attachment 12.)

George Lockwood, Former Aquaculturalist

Mr. Lockwood voiced a concern for the welfare of the small fish farmers. He wanted to make sure that the NOSB would not exclude the small fish farmers when developing regulations and standards. He said that the development of good aquaculture standards is a must.

Dan Herman, Natural Fisheries Institute
Mr. Herman advised the NOSB to be cautious in the evaluation of fish meal and fish oil. He mentioned that Menhaden is an excellent feed source that provides a high level of Omega 3 oils, which result in health benefits.

---End of Public Comment Period---

LIVESTOCK COMMITTEE WORKING SESSION – Fred Kirschenmann, Chair

The working session focused primarily on parasiticide use. Discussion centered on:

1) allowing antibiotic parasiticides to be used in livestock production; 2) restricting the use of parasiticides to last resort measures; and 3) providing deviation standards for species on a special-case basis. Further questions and comments emerged. Questions on how deviations should be evaluated, the probability of parasiticides affecting one species and not another, and the frequency of parasiticide use were raised in the subsequent discussion. It was generally agreed that if deviations were to be allowed, all species must be subject to the same criteria. The question of how to make allowances for standard deviations dominated the subsequent discussions.

Other topics discussed in the working session included the evaluation of management plans to prevent ecological damage, enforcing an extended withdrawal period for materials under Food and Drug Administration jurisdiction, and the potential 5-year phase-out period of parasiticides. In conclusion, the Committee decided that, should the Board allow parasiticide use, it should provide written guidelines governing the deviations from standards. Further, it was agreed that the Board should encourage USDA to give greater attention to researching alternatives to parasiticides and evaluate different forms of parasite control.

Wednesday, June 9, 1999

LIVESTOCK COMMITTEE WORKING SESSION, (CONTINUED) – Fred Kirschenmann, Chair

Presentation by Merideth Sandler, Associate Director for International Affairs, Commerce and Transportation, to Alaska Governor Tony Knowles - Wild Caught Salmon

Ms. Sandler’s presentation focused on why the State of Alaska believes ocean-harvested seafood, particularly Alaskan salmon, is compatible with organic production standards. She explained that ocean-harvested seafood uses sustainable production methods that rely primarily on natural materials and that Alaskan salmon are raised in pristine waters. Her presentation demonstrated that ocean-harvested seafood is an essential element of the Alaskan economy and vital to the economies of its rural and isolated communities. She requested, on behalf of the State of Alaska, an NOSB recommendation allowing ocean-harvested seafood to be certified as organically produced. (See attachment 14.)

Some Board member expressed reservations about wild-caught seafood being labeled as certified organic. The control over feed sources was a central concern. Other Board members stated that, if the feeding grounds of salmon can be controlled, then it should be able to be certified. Still others expressed concern that fish cannot be monitored like other animals. Lacking consensus, the Board tabled the topic for further review and discussion.

Mark Keating announced that there might be a National Aquaculture Convention in the fall. He stated that the conference would let people know what is going on in the Livestock Committee by bringing producers together. He recommended that the NOSB address the issues of fish feed, its variety, and possible certification of feeds originating from wild-caught fish. He also
recommended that efforts be directed toward solving the issue of animal confinement and water quality. Fred Kirschenmann stated that a motion would be crafted regarding those issues. The Livestock committee wanted to make it clear that it must keep separate definitions of feed and supplements. Feed must be 100 percent organic; supplements don't have to be organic but their materials must be approved on the national list (5-percent supplement).

At this juncture, Dr. Enrique Figueroa, Administrator, Agricultural Marketing Service, addressed the Board briefly. Dr. Figueroa thanked Keith Jones and the Livestock and Seed Division for the excellent job it had done with regard to ISO 65 assessment training. Dr. Figueroa stated that the rewritten proposed rule would be precleared in the Department and that he did not expect any major problems or delays once OMB started its review. Dr. Figueroa congratulated Eileen Stommes and her staff on being a finalist in the Kennedy School of Government (Harvard University) Innovations in American Government awards program for the NOP’s Internet rulemaking project. The NOP was one of 25 finalist selected from 1,200 applicants nationwide.

CROPS COMMITTEE WORKING SESSION – Eric Sideman, Chair

Eric Sideman gave an update on the manufacturer letters that were mailed by the NOP. The letter was modified to request the lists of ingredients, including inert ingredients. General committee discussion on practice standards ensued, with the Board offering corrections and changes to the NOP staff.

BOARD PROCEDURES TASK FORCE WORKING SESSION – Carolyn Brickey, Chair

The Committee Chair gave a presentation of criteria for new NOSB members. Edits were included and are to be approved by resolution on Thursday. The Committee went on to discuss conflict of interest; Board alternates and substitutes; procedures for voting on materials; and general Board procedures (See attachment 2.) Carolyn stated that by Mid-August a TAP review process would be initiated with TAP-related information posted on the Internet.

MATERIALS COMMITTEE WORKING SESSION – Carolyn Brickey, Chair

The Committee Chair introduced Mr. Brian Baker, Organic Materials Review Institute (OMRI), who gave an overview and walk-through of a hypothetical TAP review. Mr. Baker used the materials, aspirin and sodium bicarbonate, for the walk-through, these materials having been previously reviewed by the Board.

Thursday, June 10, 1999

Mr. Mark Bradley, AMS Livestock and Seed (LS) Division gave a presentation on the LS ISO Guide 65 program. Mr. Bradley stated that LS was ready to receive quality manuals and will review them on a first-come, first-served basis. The ISO Guide 65 guidelines will be the assessment tool, and the first field reviews will be performed by three auditors. The program will be user-fee funded at $42.20 per hour. Fee increases are being contemplated, but no dollar amounts have been set. Mr. Bradley stated USDA could use documentation prepared in conjunction with other accreditation assessments. He further stated that much of the review work would be in Washington, D.C. but private certifiers would need to have a brief site visit. Costs associated with the site visit would be paid for by the private certifier. Information regarding accreditation status would be posted on the AMS website.

State programs will be required to submit quality manuals for review but will not have to undergo a site visit. Documentation requirements for State programs will include written ISO 65 manuals and an operating manual or policy manual. In response to a question, Mr. Bradley stated that
compliance reports will not be routinely released although they would be subject to release under the Freedom of Information Act.

INTERNATIONAL COMMITTEE WORKING SESSION - Bob Anderson, Acting Chair

A presentation on draft guidelines for quarantine control standard was given by Mark Keating. (See attachment 17.)

PROCESSING COMMITTEE WORKING SESSION – Margaret Wittenberg, Chair

Ms. Wittenberg discussed retailer standards. She made the point that OFPA does not mandate retailer certification and perhaps this issue should be addressed after implementation. She recognized the vital role consumers could play in holding a retailer accountable for certification. Due to the lack of authority under OFPA, any retailer certification would be voluntary. She commented that one critical question is whether the industry should address this issue through general education or regulation. Keith Jones commented that this issue and attendant concerns could be fully discussed during the roll-out of the rule Keith further suggested that discussion of an organic promotion effort within USDA be tabled until after the release of the proposed rule.

ACCREDITATION COMMITTEE WORKING SESSION – Eric Sideman, Vice-Chair

Leslie McKinnon, Program Manager of the Texas Department of Agriculture’s organic certification program, presented its penalty matrix. She noted that each type of violation has a written enforcement procedure outlining steps to follow, notification requirements, appeals process, etc.

The Accreditation Committee suggested the need to establish MOU’s with State programs. It was further suggested that the National Association of State Departments of Agriculture needs to draft legislation for State programs. Keith Jones noted that USDA does not intend to force a State to put a program in place; that is the prerogative of its citizens and legislators. A question regarding traceability was voiced, and the committee had a brief discussion on permitting certifiers to set up an effective and efficient recordkeeping/traceability system. It was the consensus of the Committee to set up an Enforcement Task Force to review enforcement models and make recommendations as to how USDA might work with State and private certifiers. Keith was asked if the NOP had addressed how the small farm exemption would be monitored. He said that the program had not addressed those details.

At this time the Committee heard a presentation by Susan Vopal, representing the International Federation of Organic Agriculture Movements (IFOAM) regarding a previous committee resolution for IFOAM Accreditation by USDA and supporting cooperation between IFOAM and USDA.

NOSB COMMITTEE REPORTS AND ACTION VOTES – Bob Anderson, Chair

DATE: June 10, 1999

Board Vote

Motion: Motion by Fred Kirschenmann. The Livestock Committee moves to prohibit, above levels needed for adequate nutrition, the use of injected, implanted, or ingested animal drugs, synthetic trace elements, feed supplements, and additives for the purpose of promoting or stimulating growth.

Second: Bill Welsh
Discussion:

Call for the vote

Vote:

Those In Favor: 10
Those Opposed: 0
Those Abstaining: 1

DATE: June 10, 1999

Board Vote

Motion: Motion by Fred Kirschenmann. The Livestock Committee moves that feed additives (as defined by the NOSB) must meet the requirements of the June 2, 1994, Livestock Feed Standard and cannot exceed 5 percent of the total feed ration. Multiingredient processed products for animals that are labeled "organic" must comply with the labeling requirement of not more than 5 percent of dry weight, nonagricultural products.

Second: Rod Crossley

Discussion:

Margaret Whittenberg moved to table this motion; this issue needs input and information from the public.

Seconded by: Steven Harper

Call for the vote

Vote:

Those In Favor: 9
Those Opposed: 2
Those Abstaining: 0

Motion Tabled

DATE: June 10, 1999

Board Vote

Motion: Motion by Fred Kirschenmann. The Livestock Committee moves that the NOSB approve the Committee’s recommendation for a deviation from the standard regarding the use of parasiticides in livestock which will then be submitted for public comment.
Second: Joan Gussow

Discussion:

Pass as is with Wallace Institute to craft language to explain the Board’s intent.

Agree in principle, circulate Wallace Institute draft for Board vote.

Motion is tabled

DATE: June 10, 1999

Board Vote
Motion: Motion by Eric Sidman. The NOSB recognizes that the OFPA exempts retailers and handlers that do not process from mandatory certification. The NOP and the NOSB should continue to review this situation providing such assurance of organic integrity to the consumer.

In the meantime, we request that AMS with assistance from the organic trade develop point of purchase materials that provide consistent information about organic certification to the consumer that is sufficiently comprehensive to enable the consumer to determine that the organic integrity has been maintained.

DRAFT DRAFT DRAFT DRAFT DRAFT

National Organic Standards Board

June 10, 1999

Recommendation for Criteria for National Organic Standards Board Membership

1. A general understanding of organic principles and practical experience in the organic community, particularly in the sector for which the person is making application.
2. Demonstrated experience in the development of public policy, such as participation on public or private advisory boards, boards of directors, or other comparable organizations.
3. Participation in standards development and/or involvement in educational outreach activities.
4. A commitment to the integrity and growth of the organic food and fiber industry.
5. The ability to evaluate technical information and to fully participate in Board deliberation and recommendations.
6. The willingness to commit the time and energy necessary to assume Board duties.

Carolyn Brickey moved.

Kathleen Merrigan seconded.

Board Procedures Task Force Report to the Board

June 10, 1999

Board Alternates and Substitutes

Discussion

The Task Force has researched the issue of appointments of alternate NOSB members and the question of allowing members to provide a substitute in their absence. In our investigation, we have found that some other advisory committees under USDA do, in fact, have alternates. Alternates are reimbursed for expenses to attend Board meetings only in the absence of a member whom they are representing. Because the appointment of NOSB members by the Secretary of Agriculture is specifically set out in the Organic Foods Production Act, the statute would have to be amended in order for the Secretary to appoint alternates. The Task Force would not recommend the pursuit of any legislative changes to OFPA until after its complete implementation. At some time in the future, the Board may recommend legislative changes based upon the evolution of the industry and the need to update procedural language. As of this writing, we are waiting to see statutory language that allows the appointment of alternates to other Boards and will reference this information in developing a future resolution to the Board.

Other boards, such as the Agriculture Research and Extension Advisory Board, do not have a provision for alternates but allow members to appoint a substitute in their absence. The substitute may take notes on behalf of the absent member at public Board meetings and on teleconferences in which the member should be present. The substitute may not vote on Board actions, participate in Board discussion unless requested to do so by the Board, sit at the Board table, or in any manner participate with the Board other than as a member of the attending public.

In consideration of the existing precedents, the Task Force presents the following proposal.

Recommendation

Be it resolved by the National Organic Standards Board:

That members of the Board shall be permitted to designate a substitute in their absence to take notes and collect information on their behalf at public Board meetings and to listen in on teleconferences to which the member is expected to participate. The substitute may present documents, proposals, and recommendations on behalf of the absent member and may be called upon by Board members to offer explanation of the submitted material. The substitute may not vote on Board actions, sit at the Board table, or participate in Board discussion except when requested to do so by Board members. Substitutes may participate as a member of the public at open meetings and may offer public testimony on their own behalf. The substitute will not be reimbursed for expenses incurred in attendance at NOSB meetings. In all cases, the designated substitute is a representative of the Board member, not the member's affiliation or business.

DRAFT DRAFT DRAFT DRAFT DRAFT

Board Procedures Task Force Report to the Board

June 10, 1999

Conflict of Interest

Discussion

The purpose of a provision defining "conflict of interest" is to ensure that business conducted by the NOSB be above reproach in all aspects of Board activity. This provision includes, but is not limited to, any Board member or party who owns, manufacturers, or distributes a material for which the party has petitioned the NOSB for inclusion of that material on the National List.

The Board recognizes that Members have been specifically appointed to the Board to provide advice and counsel to the Secretary of Agriculture about policies related to the development of organic standards, the acceptance of materials on the National List, and other related policies. The Members have been appointed because they have professional expertise which enables them to advise the Secretary and may, at times, present inherent conflict of interest which has, as a matter of law, been waived. Therefore, the Board does not intend to restrict its Members from taking positions in favor of or in opposition to petitions or proposals from which their businesses may generally benefit. Given this context, any NOSB member who may derive a direct financial gain from action taken, including, but not limited to, influencing the Board or its decisionmaking process, on behalf of herself or himself or another party, shall disclose his or her interest to the Board and the public, when he/she or his/her affiliated business stands to gain from a vote which he/she casts in the course of Board business. It is, rather, the Board's intention to prevent overt advocacy for direct financial gain.

Recommendation

Be it resolved by the National Organic Standards Board:

That members of the Board shall refrain from taking any official Board action from which that Board member is or would derive direct financial gain. Board members shall disclose their interest to the Board and the public when they or their affiliated business stand to gain from a vote which they cast in the course of Board business. Under certain circumstances, the Board may determine whether it is appropriate for the member to vote.
That members of the Board shall refrain promoting for consideration any material, process, or practice for which the member is or would derive direct financial gain arising out of such Board action. The act of promoting such material, process, or practice shall include private discussion with members of the Board advocating the value of the material, public discussion, and/or written advocacy.

A "direct financial gain" is defined as monetary consideration, contractual benefit, or the expectation of future monetary gain to a Board member, including, but not limited to, financial gain from a party who manufacturers, distributes, or holds exclusive title to a formula for a material or product, process, or practice.

Carolyn Brickey moved.

Rod Crossley seconded.

Miles McEvoy*
Marian Casazza*

*Certifier Representatives—Mr. McEvoy and Ms. Casazza are employed by the Washington Department of Agriculture (WDA) and Quality Assurance International (QAI), respectively.

Members Absent: 1

Joan Gussow

Other Attendees:

Kathleen A. Merrigan, Administrator, Agricultural Marketing Service (AMS), USDA;
Michael Fernandez, Special Assistant to the Administrator, AMS, USDA;
Eileen Stommes, Deputy Administrator, Transportation and Marketing Programs (TMP), USDA;
Gary Scavoneelli, Associate Deputy Administrator, TMP, USDA;
Keith Jones, Program Manager, National Organic Program (NOP), USDA;
Grace Gershuny, NOP, USDA;
Beth Hayden, NOP, USDA;
Toni Strother, NOP, USDA;
Ramona Fernandez, NOP, USDA;
and other interested persons from the public (See attachment A.).
CALL TO ORDER

Robert (Bob) Anderson, Chairperson of the NOSB, called the meeting to order at 1:00 p.m., Monday, October 25, 1999, in Room 3501-South Building. Bob introduced Marion Casazza, QAI, and Miles McEvoy. WDA as the certifier representatives for this meeting. Miles discussed the newly formed National Association of State Organic Programs (NASOP). Mr. McEvoy also encouraged USDA to rethink the handler exemption contained in the Organic Food Production Act in so as to prevent a loss of the audit trail.

Kathleen A. Merrigan, Administrator, AMS, also welcomed the NOSB and the interested persons in the audience. She thanked everyone for coming and gave an update on the status of the National Organic Program's proposed rule. Kathleen said the proposed rule would be going over to the Office of Management and Budget (OMB) about the second week in November. OMB has, by law, 90 days to review the document. This rule is longer than the last proposal due to the approximately 290,000 comments (including the issue papers). She explained the new preamble format which references changes made and not made due to comments and changes made due to information gained outside of the comment process. She said the rule would not be perfect and should not be expected to satisfy everyone but that she believed the rule to be "in the ballpark" for industry and consumer expectations. She further reminded everyone that this is still a proposed rule and there will be another opportunity for public comment.

Kathleen also recapped a meeting she had with the staff of Senator Ted Stephens, R-Alaska. Senator Stephens has requested, through an appropriations rider, AMS to hold two national meetings to begin development of organic standards with respect to seafood. One meeting is to be held in Alaska and one on the Gulf Coast. The information gathered at these meetings will be used to develop draft regulations establishing national organic standards for seafood. These regulations will be published separately from the revised rule and are expected to be published in FY 2000. In closing, Kathleen introduced Dr. Michael Fernandez, as the new Associate Administrator of AMS. Dr Fernandez comes to AMS from the Environmental Protection Agency (EPA).

Bob Anderson updated the Board on adjustments to the posted agenda and alerted the board and guests to a possible room change. He closed, noting that the "amino acids" would be tabled for further information and possibly addressed again at the June 2000 meeting.

Public Comment Session

Allan Shaninsky, Petalumna Poultry Processors, Inc.

Mr. Shaninsky addressed the Board asking them to include the supplemental amino acids (methionine, lysine, and threonine) in their recommendations for inclusion on the National List of permitted materials for use in production of organic livestock. (See attachment 1.)

Mark Retzloff, Horizon Organic Dairy

Mr. Retzloff spoke to the Board on behalf of Horizon Organic Dairy regarding a possible ban on the use of amino acids in organic production. Mr. Retzloff shared with the Board the opinions of the veterinarians, herders, farmers, and the others on the possible ramification of a ban on amino acids. (See attachment 2.)

Bruce Krantz, Hynite Corporation
Mr. Krantz addressed the Board regarding hydrolyzed leather meal. Mr. Krantz advocated for leather meal to be included on the National List. (See attachment 3.)

**Katherine DiMatteo, Organic Trade Association (OTA)**

Ms. DiMatteo discussed the AOS and noted which issues are not included in this third draft. An electronic copy will be available on the OTA web site. She said she believes the draft provides a good industry reference and what it will be looking for in the next proposed rule. She also gave the NOP a document giving NOSB background and key dates. (See attachment 4.)

**Kathleen Downey, Organic Materials Review Institute (OMRI)**

Ms. Downey thanked the NOSB for the opportunity to conduct the Technical Advisory Panel (TAP) review. She explained how the process worked and the prohibitions for disseminating TAP information to the public prior to the Board’s review. She further explained that all materials reviewed for this meeting had been tabled in previous NOSB meetings. She closed saying that OMRI looks forward to a new openness of the process. (See attachment 12.)

**William Jackson, Enviro Consultant Service, LLC**

Dr. Jackson spoke to the Board on enzymes (digestive aids) and that small quantities only are safe and are available form other than animal sources. Dr. Jackson suggested a use of a tailored selection of enzymes that follow certain criteria. (See attachment 15.)

**David Letourneau, California Certified Organic Farmer**

Mr. Letourneau spoke to the Board regarding materials and genetic engineering. He requested that meeting materials be sent out as soon as possible so that the organic community is well informed and able to provide the Board with needed information. He is concerned that materials decisions may negatively impact small producers. Mr. Letourneau also stated that small producers are concerned about the use of synthetics in minor ingredients and processing aids, the use of genetic engineering outside of organic production, and the danger of genetic pollution of organic seed and crops. The burden of responsibility should be placed on the producers of the pollution and not by the organic producers. He talked about the need for the NOSB to address the guiding principles and philosophy of the organic industry.

**Cissy Bowman, Organic Farmers Marketing Association, Indiana Farmer**

Ms. Bowman stated that she was pleased regarding the Board's continuing effort to make information more accessible to the public but regrets that information on tabling the amino acids discussion was not available earlier as some people traveled here today specifically to discuss this material. Cissy also requested that the NOSB ensure that States are informed about decisions in a timely manner. Further, she asked the NOSB to be sure that synthetic ingredients are not included in the National List for processed products.

**Mark King, Food Retail Outlet Manager**

Mark discussed handling of organic food in retail stores and encouraged an organic program of certification of handlers. He explained the experience of implementing a certification program in his store and the positive aspect of working with his certifier. He also noted that genetically modified organism (GMO)-free product is beginning to appear at the retail level.
Marty Mesh, *Florida Organic Growers, Organic Certifier*

Marty discussed the organic impact of GMO's in the environment and responsibility. He commented on the need for a certifier on the NOSB as a regular seat. He said he is representing Florida growers who want to use ethylene for fruit ripening on fruits other than bananas, although he has personal concerns over its use. He doesn't want to encourage picking green fruit. His growers need to have a fruit wax for shipping. He saw organic wild fish at EXPO East and was very concerned about a move to label these products as organic. Organic feed supplements should be separated from organic feed so we can have 100 percent organic feed and also have needed feed supplements. He closed by saying he wants the industry to be more involved in the material review process.

**James Riddle, American Organic Standards (AOS) and Minnesota Department of Agriculture**

Jim addressed three items: 1) organic principles as described in the AOS, 2) potential for a "certified wild" label; and 3) the Minnesota Department of Agriculture Organic Cost-Share program. He stated that he believes AOS will be a de facto national standard until a final rule is adopted. He stressed the need for a principles statement for the national program and urged the NOSB to adopt and recommend to the NOP inclusion of principles in the revised proposal. He referenced sections of OFPA that he believes cannot be fulfilled by wild animal production. He has written a paper that responds and takes an opposing view to Fred Kirschenmann's paper on wild harvest certification. Jim believes there are other opportunities for certification of wild products but not under the organic label. He closed by distributing copies of the application for the Minnesota Department of Agriculture's recently enacted organic certification cost-share program. (See attachment 5.)

**Joseph Mendelson, Center for Food Safety**

Joe restated some previous concerns about the Board procedure issues. He asked the Board to consider an emergency feed criterion that bans conventionally produced GMO feeds. He asserted that only conventional, non-GMO feeds should be used as emergency replacements. He left a document with the Board outlining his suggestion on this subject.

He also voiced concern about buffer zones and GMO's. He urged the Board to adopt a resolution asking AMS to issue a statement regarding protecting organic farmers from genetic drift. He further voiced concern about conversion to organic of fields that previously grew GMO crops and asserted a 3-year withdrawal period may not be sufficient. He closed by reminding the Board of its prohibition of GMO's as it considers enzymes and amino acids.

**Marideth Sandler, State of Alaska**

Ms. Sandler provided additional information on the Alaska certification project as requested by the Board in June 1999. She distributed a document about the Farm Verified Organic (FVO) certification of Capilano Seafood in Bristol Bay, AK. (See attachment 6.) FVO has certified-as-organic, wild-caught red salmon. Ms. Sandler reported on the inspection and certification process.

The Board raised questions about the hearings that will be held to obtain input on standards for organic aquaculture. Keith Jones clarified that AMS has been charged with developing standards for wild-caught fish and aquaculture, not the NOSB. However, AMS will want NOSB involvement and guidance during the process. Essentially, the NOP is charged with gathering information so that the Board can make a recommendation on this issue.
Michael Sligh, Rural Advancement Foundation, International, and Co-chair of the Organic Community of the National Campaign for Sustainable Agriculture

Mr. Sligh voiced appreciation of Bob's comments about fostering public involvement in the materials review process. He advocated the importance of a clear conflict of interest provision for material reviewers. (Note: The statement of work used by the Organic Materials Review Institute and USDA contains such a provision.) He further argued for a clear information policy about Board activities including committee reports, conference calls, etc. He specifically backed distributing minutes of the Executive Committee conference calls. He requested the NOSB carefully review the AOS draft so that there are not two divergent processes in addressing industry/consumer issues of concern. He urged the Board to develop a procedure to alert the public if a given issue will or will not be addressed by the Board. Further, he urged the NOSB to develop a formal recommendation on biodiversity. He closed by urging Board action in the following areas: genetic drift, debeaking, organic cost share, GMO production tracking by USDA or AMS, and a USDA earmark of research dollars for organic and non-GMO seeds. (See attachment 13.)

Emily Brown-Rosen, Organic Certifiers Council (OCC)

Ms. Brown reported on the Organic Certifiers Council of OTA: Pat Kane is now OCC Chair for a 1-year term. Ms. Brown reported that no OCC member certifies wild animals or wild-caught fish. She also said that 18 of 25 certifiers, including two States, have agreed to adhere to the AOS, which does not contain wild-caught fish standards. Ms. Brown noted that the State of Alaska was the only commenter during the development of AOS advocating wild-caught fish certification. She closed by saying there will be no standards for wild certification without consensus among the certifiers and industry.

Jack Samuels, President, Truth in Labeling

Mr. Samuels read from a prepared statement regarding amino acids, specifically glutamic acid and its toxicity, its inclusion in MSG, amino acids produced by genetic engineering, and known carcinogens. (See attachment 7.)

---End of Public Comment Period---

TUESDAY, OCTOBER 26, 1999

NOSB COMMITTEE UPDATES/PROGRESS REPORTS

Accreditation Committee: Betsy Lydon, Chair

Betsy noted the committee will present its strategy and work plan for the next year during its working session.

Crops Committee Report: Eric Sideman, Chair

Eric updated the Board on the responses to the manufacturer's letters on inert ingredients. Letters were sent to manufacturers or formulators on approximately 98 materials. Thirty responses have been received. Eric explained the subsequent process. EPA will be asked to review the identified inerts to determine what list they are on, e.g., EPA list 1, 2, 3, or 4. (Note: The NOSB recommended in the February 1999 meeting that only EPA list 4 inerts will be automatically approved for use in organic production and handling. List 3 inerts will be reviewed on a case-by-case basis.)
Keith noted that manufacturers are very sensitive about releasing information on proprietary formulations, given that USDA does not customarily review these materials. Several Board members noted that manufacturers should see the NOSB as allies in making their products available to organic producers, rather than seeing an adversary.

Carolyn noted that the Board should extend an invitation to the manufacturers to be a part of the review process. Keith reminded the Board that the National List of allowed synthetics is a positive list. At the time of NOP implementation, if a material has not been affirmatively reviewed and added to the list, it is automatically prohibited.

There was also discussion on GMO's. Steve Harper suggested that the committee work with OTA's GMO Task Force on the difficult questions facing the industry.

**Livestock Committee Report:** *Fred Kirschenmann, Chair*

Fred reported the Livestock Committee had seven materials to review, and it would also follow up on recommendations from subsequent Board meetings. Those issues are biodiversity (from February 1999 meeting) and a committee report on wild animal harvesting (from June 1999 meeting).

**Processing Committee Report:** *Margaret Wittenberg, Chair*

Margaret reported that the processing committee is also concerned about the GMO issue. As a result, Margaret and Steve Harper have been active in discussions held by the OTA GMO Task Force.

**USDA/NATIONAL ORGANIC PROGRAM UPDATE**

*Keith Jones, Program Manager*

Keith updated the Board about new staff and introduced Bob Pooler, formerly with the Maryland Department of Agriculture. Bob will be working on livestock issues at NOP and be the primary NOP contact for the NOSB Livestock Committee.

Keith noted that a compilation of the nominees for vacant Board seats should go to Kathleen between mid-November and the first of December. A total of 34 applications were received with only a few received for the retailer slot. It is planned to have new members named before the February 2000 Board meeting. Keith plans to have an orientation/strategic planning session the day before the meeting. He also reported the resignation of Jean Afterman and discussed the process for filling her unexpired term.

Keith also reported on a list of vaccines containing GMO's. The list was provided by USDA's Animal and Plant Health Inspection Service (APHIS) as vaccines has been a difficult question to deal with during the rewrite of the rule.

Bob asked about NOP web support and who on the NOP staff provides web support. Keith said Arthur Neal, who is now permanently assigned to NOP, will be providing web support. Keith noted the difference in the format of the minutes as an example of NOP's continuing effort to make information as easy to use as possible. A number of Board members made positive comments about the new format. Suggestions were made that Executive Committee conference call minutes should be posted to the web. Keith agreed to provide a one page synopsis of all executive committee conference calls.
Keith used this opportunity to discuss upgrades to the NOP web page including the addition of a search engine. Bob asked about a list-serve mechanism and urged a hard mailing to all people on the mailing list asking them to specifically request hard-copy mailings. Keith noted that the purged mailing list is now at about 1,500 names. He stated NOP will be asking certifiers to provide NOP with their mailing lists so that NOP will have a comprehensive data base of the industry.

In closing, Keith reported on the revised rule clearance process and the next steps in implementation of the NOP. He noted the good working relationship will OMB but also noted that by law OMB has 90 days to review the rule. After the next round of public comment, the final rule will again go back to OMB and is subject to a 60-day period for Congressional comment.

Keith noted that program manuals will be drafted until late 2000. Program manuals will be written by NOP staff and presented to the NOSB and the public for comment. Keith said the process will be identical to that used by the National Resource Conservation Service in preparing their field office technical guides.

Additional questions were posed about aquaculture standards. Specific questions were raised about a legal opinion on OPFA language being interpreted to allow certification of wild-caught seafood. Additional questions were asked about the format of the listening sessions to be held in 2000. Keith said plans were sketchy but that the meeting would most likely be a hybrid of a conference and hearing.

BOARD PROCEDURES TASK FORCE WORKING SESSION - Carolyn Brickey, Chair

Ms. Brickey reviewed the recommendations from the June 1999 meeting on Conflict of Interest and Board Substitutes and Alternates. These recommendations have been up on the web and, to date, no public comment has been received. Carolyn stressed the importance of a clear, concise conflict of interest statement. There were no additional comments from the Board. Given the lack of comments, no changes to these recommendations were made.

Carolyn discussed draft procedures for public input on material recommendations. Discussion then centered on public access to TAP reviews before a final NOSB recommendation.

Margaret suggested that the TAP reviews, without the reviewer's name, be put up on the web, e.g., "Cliff Notes" type summaries can be cross-referenced for background data yet they will provide needed transparency. Additional discussion occurred on the need to keep the TAP process free from influence and lobbying. Keith reminded the Board the Department does not influence the selection of the reviewers. A consensus emerged on ensuring the anonymity of TAP reviewers. It was agreed that a condensed version of the TAP review would be put on the web along with a thumbnail sketch of the TAP reviewers, (i.e., a veterinarian with 20 years experience), excluding their names.

Keith explained the procedure for sole-source contracts, explaining that an advisory and assistance contract contains a statement of work and a series of questions that must be answered to prevent any conflict of interest. Keith expressed concern about the possibility of significant public comment on a certain material. Carolyn raised an additional concern about having a legal obligation to respond to these comments. Bob suggested that the web information should be seen as information only. Public comment would be directed to the Board, and these comments would be forwarded to the contractor.

To provide an opportunity for public comment, discussion centered on having a 120-150-day process, essentially creating material reviews every other meeting. Consensus on procedure emerged as follows:
A list of materials to be reviewed will be published in the Federal Register 150 days prior to a Board meeting. This serves as public notification that a TAP review for these materials has been initiated.

Upon publication of this list, the public has the opportunity to provide substantive information (Substantive information will be defined in the new petition.) to the contractor.

Sixty days prior to the Board meeting, the contractor will provide truncated versions of TAP reviews for publication on the web. Upon publication of the TAP synopses, the public will have another 15 days to provide additional substantive information to the contractor.

**MATERIALS REVIEW**

ACCREDITATION COMMITTEE WORKING SESSION - Betsy Lydon, Chair

Enforcement Task Force

The Enforcement Task Force presented its work to date. Discussion ensued about fees for States to do enforcement. No consensus emerged other than a general perspective that effective localized enforcement activities require funding.

Emily Brown-Rosen, a task-force member, clarified the evolution of a tandem document of guidelines for certifiers that will be taken from the list of violations. Miles McEvoy discussed the WDA program, which is hybrid. WDA is approximately 80 percent user-fee funded, with the WDA organic program 100 percent user-fee funded. He once again encouraged the NOP to reexamine the handler exemption as most of organic's added value gets capitalized on at the handler/retailer level. Miles maintained that a user-fee program provides freedom from the legislative influence associated with general revenue-funded programs.

Questions arose on the Memorandum of Understanding (MOU) document distributed to the Board. Keith explained that the AMS/Texas Department of Agriculture model covers Federal/State inspection under the peanut program and should not be considered a direct substitute for meeting NOP’s needs. The MOU document was circulated simply to generate ideas. Keith stated that delegating enforcement down to the States is consistent with the industry’s desire for localized enforcement.

Steve Harper asked about the Organic Farming Research Foundation survey on licensing of a USDA seal. Keith reported that the survey addressed a hypothetical situation and arose from a brainstorming session on alternative fee strategies. He further reported that it is unclear whether NOP has a legal basis on which to charge for a license fee for the use of a seal. Keith concluded by saying that the most interesting, but not surprising, aspect of the survey was the value of the USDA seal is directly related to end user’s perception of program quality.

Other Board members suggested a check-off program as an alternative funding mechanism. The discussion concluded with the Task Force agreeing to provide another enforcement matrix and MOU draft to the Board by the February 2000 meeting.

End of Day General Discussion on Role of the NOSB

Michael Sligh, former NOSB chairperson, provided a Board procedures document adopted at the January 1994, Roslyn, VA, meeting. Michael gave a brief overview of the document. The Board agreed to review the document overnight and discuss it tomorrow.

THURSDAY, OCTOBER 28, 1999

NOSB COMMITTEE REPORTS AND ACTION VOTES - Bob Anderson, Chair

Materials Committee:

Discussion began on changes to the 1995 Federal Register notice on material petitions, and Diane Goodman presented a draft document. The Board will return comments to the Materials Committee, which will schedule a conference call in 2 weeks and get a final draft to Keith by December 1. A fee will be considered to pay for the administration of the application. Carolyn will check for precedent for application fees at EPA. Official application will have to go through OMB clearance. Perhaps there should be an initial application, and then NOP sends the complete petition application package. Keith will look at fee requirements.
Motion: Motion by Fred Kirshchenmann. The Materials Committee will work with the NOP Staff to refine and develop criteria for the petition process by December 1, 1999.

Second: Eric Sideman

Discussion:

Call for the vote

Vote:

Those In Favor: Unanimous

Accreditation Committee:

Betsy Lydon presented a cost-share resolution to create a cost-share program for small farmers. Processors should be included. The Board will develop a cost-share proposal.

Livestock Committee:

Fred announced that parasiticides would be reviewed in the afternoon. Carolyn stressed the need for clear rationale in addressing parasiticides.

Fred reintroduced the tabled motions from the June meeting. The first motion addressed a livestock feed requirement to include certified organic livestock feed and feed supplements.

The other motion was to recommend incorporation of language to ensure biodiversity and ecosystem protection. Some want social concerns included too. The Executive Committee recommended that these motions be addressed at the February meeting.

Fred wanted both motions to be addressed in February. Keith noted that organic systems do not fit into existing models for evaluations. Keith suggested adhering to existing regulatory precedents and definitions as closely as possible without compromising organic core values.

Fred wanted to invite public comment on these issues. Keith suggested looking at the issue from a labeling perspective and work backward. Specifically, how are we going to label feed going to or coming from overseas?

Fred's final proposal grew out of Board action last time regarding the certification of wild animal production. Fred suggested that this issue come as a motion to the next Board. Fred explained his position with FVO and is no longer President. Fred explained the principles of his position on wild systems and his vision for the future. He asked the Board to consider how wild systems and organic systems fit together. He encouraged dialogue on the relationship between the two systems. David Gould at FVO is the point person in developing the certification for Capilano Seafood. (See attachment 16.)

Off-Agenda Activity --Presentation of Plaques to NOSB Members

Assistant Secretary for Marketing and Regulatory Programs, Michael V. Dunn, presented service plaques to the NOSB members whose terms expire in January 2000: Rod Crossley, Fred Kirshchenmann, Margaret Whittenberg, and Kathleen Merrigan. He praised the Board for its hard work and thanked Kathleen Merrigan for her tireless work in advancing the organic program since
she arrived as Administrator of AMS. Kathleen took the opportunity to publicly recognize and thank the AMS staff who have worked on the revised rule over the past few months.

**Those recognized included:**

Paula Collins; Lee Corcoran; Michelle Cottom; Billy Cox; Betsy Crosby; Paula Crosby; Michael Fernandez; Catherine R. Greene; Beth Hayden; Keith Jones; Mark Keating; Richard Mathews; Kathleen Merrigan; Ted Morikak; Craig Morris; Arthur Neal; Bob Pooler; Alan Post; Jim Schaub; Eileen Stommes; Tom Tichenor; Debra Troop; Ken Vail; John Valencia; Tom Walsh.

**Role of the Board-Materials Review:**

Carolyn voiced her perception of a lack of clear strategy in the materials review process.

Discussion then primarily centered on how to concretely address the seven criteria in OFPA in the decision-making process. It was suggested that these criteria may need to be weighted differently or expanded upon to account for the changing needs of the industry.

There was also discussion on the vague and general nature of the 1995 petition document (Feb. attachment #15). There was also discussion on the need for the Board to be more involved in USDA activities.

Richard Matthews reminded the Board that a procedure for removing a material from the National List is needed as well as revamping the original review process. Bob asked that a new petition document be prepared and brought to the February 2000 meeting.

**Action Votes:**

NOSB Resolution

October 28, 1999

Submitted by Betsy Lydon

Accreditation Committee

The National Organic Standards Board strongly recommends that the United States Department of Agriculture develop a certification/inspection cost-share program to ensure that program participants are not unduly burdened by program costs.

**The resolutions passed by a simple majority hand vote (9 yes, 1 no, 1 abstention).**

Crops Committee, Eric Sideman

Board vote to add questions to the TAP for the approval of ethylene from Ethephon. Carolyn is not opposed to considering new information but doesn't want to see votes rescinded. She agrees with Fred that the best thing to do is to rescind the original vote and table it until the next meeting.

DATE: October 27, 1999
Board Vote

Motion: The NOSB recommends that ethylene from Ethephon be reconsidered to be put on the National List of permitted synthetic materials for regulation of flowering in pineapple production after a review of the following questions by the TAP:

1) Determine the methods of manufacturing Ethephon

2) Address the Criteria in OFPA 2119(m) for the material Ethephon

Second: Rod Crossley

Discussion:

Call for the vote

Vote:

Those In Favor: Unanimous

Those Opposed: 0

Those Abstaining: 0

DATE: October 28, 1999

Board Vote

Motion: Rod Crossley moved to rescind and table until the next meeting the previous vote on Ethephon.

Second: Steve Pavich

Call for the vote

Vote:

Those in favor: 11

Those opposed: 0

Those abstaining: 0

Livestock Committee:

DATE: October 27, 1999

Board Vote

Motion: Motion by Fred Kirschenmann. On behalf of the Livestock Committee, I move that the NOSB work closely with the OMRI staff, NOP staff, Appropriate Technology Transfer for Rural
Areas and other USDA Agencies to explore alternative to parasiticide use in organic livestock production. This project would include an effective means of communicating and demonstrating the alternatives to producers.

A proposed work plan would be developed by the Livestock Committee and reported back to the NOSB by June 2000.

Second: Marvin Holland

Discussion: Amendments made by Eric Sideman.

Call for the vote

Vote:

Those in favor: 9

Those opposed: 0

Those abstaining: 2 (out of room)

Off-Agenda Activity

Eileen Stommes presented Grace Gershuny with a plaque thanking her for her efforts and her contribution to the NOP.

Approval of Previous Minutes:

Motion by Robert Anderson. The NOSB moves that the February 9-11, 1999, minutes be approved as amended.

Second: Steve Pavich

Call for the Vote

Vote:

Those in favor: Unanimous

Those opposed: 0

Those abstaining: 0

Motion by Carolyn Brickey. The NOSB moves that the June 8-10, 1999, minutes be approved.

Second: Steve Harper

Call for the Vote

Vote:
Those in favor: Unanimous

Those opposed: 0

Those abstaining: 0

Next NOSB Meeting:

The next meeting is tentatively set for February 1-3, 2000. The next Executive Committee conference call will be December 6. Discussion of June dates ensued, with Eric stating he cannot make a meeting after mid-June and Betsy saying she may not be able to make an early June meeting.

GMO Issue, Wild Issue:

Carolyn will work with OMRI to coordinate a task force. Bob will head up a wild harvest task force.

Board Procedures:

Carolyn will prepare a principles document based on AOS principles.

Question of Orientation for New Board Members:

Keith reminded that Board of his plans to bring the entire Board in at least 1 day early for orientation and a goal setting/strategic planning session.

The meeting was adjourned at 2:25 p.m. (ET).

ROBERT ANDERSON, Chair

Carolyn Brickey
Joan Gussow
Betsy Lydon

Other Attendees:
Keith Jones, Program Manager, National Organic Program (NOP), USDA;
Kathleen A. Merrigan, Administrator, Agricultural Marketing Service (AMS), USDA
Beth Hayden, NOP, USDA;
Mark Keating, NOP, USDA;
Richard Mathews, NOP, USDA;
Arthur Neal, NOP, USDA;
Robert Pooler, NOP, USDA;
Toni Strother, NOP, USDA;
Tom Tischner, AMS, USDA; and
Interested persons from the public (See attachment B).

CALL TO ORDER

Robert (Bob) Anderson, Chairperson of the NOSB, was unable, at the last minute to attend the meeting. Margaret Wittenberg was asked and graciously chaired the meeting. Ms. Wittenberg called the meeting to order at 9:15 a.m., Tuesday, March 21, 2000. Keith Jones, Program Manager, thanked Margaret for filling in at the last minute, and thanked every one for coming.
Margaret Wittenberg introduced the State representative for the meeting, Margaret Misner from Idaho and the Certifier representative, Karen Anderson from NOFA-NJ and thanked them for participating. Keith introduced his staff talked about the fact that they were in an ex parte status because of the proposed rule comment period. Keith asked the audience to write down any questions they had for the Board, and give them to Beth Hayden. Ms. Wittenberg asked that they go around the room to find out who the people in attendance were.

NOSB COMMITTEE UPDATES/PROGRESS REPORTS

Accreditation Committee Report: Ms. Margaret Wittenberg, Acting Chair

Ms. Diane Goodman reported on the activity of the Enforcement Task Force. The task force will attempt to meet at the Natural Products Expo in Anaheim later this week. The task force waited for the release of the proposed rule to move ahead.

International Committee Report: Mr. Steve Harper, Acting Chair

Steve had nothing to report. The committee had been waiting for the proposed rule to be published.

Processing Committee Report: Ms. Margaret Wittenberg, Chair

The Processing Committee also had nothing to report. They had been waiting for the proposed rule to be published.

Livestock Committee Report: Mr. Fred Kirschenmann, Chair

The Livestock Committee had an issue with the proposed rule regarding whole herd conversions and the inconsistency with international norm of requiring 100% organic feed. The 12 month 100% feed would be a burden on small farmers unlike large farmer/produces.

Mark Keating, NOP Staff, gave an update regarding the aquaculture meetings scheduled for Anchorage, Mobile, and Providence. Mark reported the he and Beth Hayden have been working on the seafood meetings. A Federal Register notice will be published, any day, to announce when and where the meetings will be held. A series of questions are included in the notice that describes what we are looking for. Public comment will be open until May 17, 2000, regarding the series of questions. The NOP will be participating in aquaculture workshops in Seattle and at the University of Minnesota. Eric Sideman is concerned that the workshops are being held to develop standards before all the hearings are completed. Eric also thinks the workshops seem to be a staked deck for the people who want wild fish certified as organic. Keith Jones explained that is not the intent of the workshops. They are designed to get all the issues on the table and put some context around them, not to direct the public process. The NOSB will be represented at the aquaculture meetings: Steve Harper will be in Anchorage, Margaret Whittenberg in Mobile, and Eric Sideman in Providence. Steve Harper will also represent the NOSB at the Seattle workshop.

MOTION by Fred Kirschenmann: To commend NOP for conducting the 3 Aquaculture meeting; and get as much information concerning the meetings as possible out. Seconded by Marvin Hollen. Motion passed - 7 in favor, 1 abstaining.

Discussion continued regarding the perception of NOP involvement and the role of the Board in the process of developing aquatic standards. The Board questioned who will decide on the creation of these standards. Keith suggests that after the staff presents information back to the
Board about the workshops and AMS public meetings (these are the only ones AMS is sponsoring), the Board form a recommendation to the Secretary.

Fred continued the Livestock Committee report with a reminder that there are two motions that were tabled from the October 1999 meeting regarding feed supplements and biodiversity in ecosystems that need to be revisited at the June 2000 meeting.

**Crops Committee Report:** *Mr. Eric Sideman, Chair*

In 1998 ethylene was petitioned to be included on the National List for flowering in pineapples. The industry asked OMRI to review ethylene. A NOSB Crop Committee recommendations is on the web ([www.ams.usda.gov/nop](http://www.ams.usda.gov/nop)). One committee member felt that it should be used, the rest of the committee felt that it did not fit in organic production. The committee is willing to table the vote until there is more public comment on the use of ethylene. Some concern has been raised it might open the door for growth regulators. Further discussion about the committee’s recommendation for phase out period in which Keith Jones noted the phase out period would not make it into the final rule because it is not going through the public comment process. Materials can always be petitioned.

**Motion by Eric Sideman:** Table the Ethylene vote until the June 2000 NOSB meeting, pending further public comment. Seconded by Steve Harper. Motion passed - unanimous.

**Materials Committee Report:**

Keith Jones passed out a draft of the materials petition Federal Register notice for the Board to review and make suggested changes. The petition process is meant to be an open process, and petitions can be made at any time. Petitioners can bring back to the Board additional information during the process. Questions have come up regarding an appeals process for anyone who feels they have been unfairly treated, AMS is checking on this.

Diane Goodman reported to the Board on the petition’s drafting process since the October meeting when the Board received a list of items to be contained in the revised petition and added their comments. She noted point not yet included in the current version. Keith Jones responded to issues as follows:

- Regarding the number of times the Board can be petitioned? The number is open within reason, this is meant to be an open process.
- Regarding information necessary for inclusion with the petition, the word "must" will be reconsidered as it implies "imperative" and the intent is to infer "if available".
- Regarding fees, there will be no fees charged for the petition application at this time.

The NOP staff will rewrite the petition document based on Board comment and submit it to the Board tomorrow for review.

**USDA/NATIONAL ORGANIC PROGRAM UPDATE**

**Keith Jones, Program Manager**

Keith gave a brief introduction as to what has been happening with the proposed rule in the past week, with the roll out and several teleconference briefings. Keith Jones discussed the layout of the proposed rule and how the NOP Staff will give a review of each subpart. NOP staff members presented a review of each subpart.
Remarks by Kathleen A. Merrigan, Administrator, Agricultural Marketing Service

For Ms. Merrigan’s written statement see attachment 1, for transcript of her verbal presentation see attachment 8.

Public Comment Session

The following people presented comment to the NOSB. For the verbal transcript of their presentation see attachment 8.

Mr. Jack Samuels (attachment 2)
Mr. Jim Riddle (attachment 3)
Mr. Marty Mesh (attachment 4)
Mr. Michael Sligh (attachment 6)
Mrs. Adrian Samuels
Mr. Bill Wolf
Ms. Emily Brown-Rosen
Ms. Shirley Harvey (attachment 7)
Cissy Bowman

End of Public Comment

The Board returned to the Proposed Rule Review with questions for Kathleen A. Merrigan, Administrator, AMS:

Michael Sligh – What is to be expected in the process of making changes after this public comment period? AMS will be looking to the NOSB for advice on an on going basis for the National List and on the changing nature of the program. Ms. Merrigan notes that the only provision to prevent materials from coming up again and again is a Board Policy.

Marty Mesh – What about a cost share program with any appropriate government program? Depends on budget request. Keith adds that we got this rule through OMB on a promise from the NOP that they will get this money.

Emily Brown-Rosen – Is the comment against GMOs strong enough to hold the prohibition or would it be stronger if it came from OFPA? The comments carry the weight. This goes back to the argument that this is a marketing standard not a food safety standard. Kathleen imagines that we face some challenges in the 50-95 percent and below category and the category of products other than excluded methods. Ms. Merrigan encouraged everybody to think creatively about areas that can support small farmers.

There were no further comments on the Proposed Rule.

ADMINISTRATION – Margaret Wittenberg, Acting Chairperson

The Petition Process was revisited. There was discussion regarding the fact that there are no fees for petitioning. There was concern expressed that the lack of a petition fee opens the door to endless petitions. The OFPA does not provide for petition fees.

MOTION by Eric Sideman to accept the petition document with an offer to keep the name of the petitioner confidential. Fred Kirschenmann seconded the motion. Motion passed - 7 in favor, 1 opposed.
MOTION by Fred Kirschenmann to approve the October 1999 minutes as written. Rod Crossley seconded the motion. Motion passed - unanimously.

The next NOSB Meeting will be held June 6-7, 2000, in Washington, DC.

The Tentative Agenda June 2000:

New Member Orientation and Board Procedure Review

Board Procedure, On-Going Role of the Board

Petition Selection Priorities

Revisit Policy on Timing for Petition Protocol and Public Comment

Role of the Board in Developing Program Manuals

Livestock

Revisit votes on feed supplements, biodiversity in ecosystems

Aquaculture meetings report

Honey standards

Crops

Ethylene vote

Materials

Amino Acids

Finalize Board Comments to the Proposed Rule

Elections

Committee Assignments

The meeting was adjourned at 4:25 p.m.

Members Absent: 1
Marvin Hollen

Other Attendees:

• Keith Jones, Program Manager, National Organic Program (NOP), USDA;
• Kathleen A. Merrigan, Administrator, Agricultural Marketing Service (AMS), USDA
• Sharon Bomer Lauritsen, Acting Deputy Administrator, Transportation and Marketing
• Beth Hayden, NOP, USDA;
• Mark Keating, NOP, USDA;
• Richard Mathews, NOP, USDA;
• Arthur Neal, NOP, USDA;
• Robert Pooler, NOP, USDA;
• Toni Strother, NOP, USDA;
• Tom Tischner, AMS, USDA;
• Darcie Priester, NOP, AMS; and

Interested persons from the public (See attachment B).

Meeting Purpose:
Welcome new members, receive an update regarding certification of aquatic animals, receive committee reports, approve the NOSB’s comments to the reproposed National Organic Program regulations, elect new officers, make committee assignments, and set meeting dates and agenda for the next 3 meetings.

CALL TO ORDER

Robert (Bob) Anderson, Chairperson of the NOSB called the meeting to order at 9:20 a.m. Mr. Anderson thanked every one for coming to the meeting. He introduced the five newly appointed members; Mr. Owusu A. Bandele from Baton Rouge, LA (Farmer); Ms. Kim M. Burton from Chico, CA (Handler); Ms. Rebecca J. Goldberg from Montclair, NJ (Environmentalist); Mr. T. Mark King from Indianapolis, IN (Retailer); and Mr. William P. Lockeretz from Brookline, MA (Environmentalist). Bob stated that he looked forward to working the each of them. Mr. Anderson acknowledged Ms. Hope Crain, (KY) State representative and Ms. Enid Wonnacott, (NOFA-VT) Certifier representative that were present to assist the NOSB. Mr. Anderson gave a quick overview of the Agenda for the days activities.

Motion: Steven Harper moved that the minutes from the March 21-22, 2000, be approved as written. William Welsh seconded the motion. The motion passed unanimously.

USDA/NATIONAL ORGANIC PROGRAM UPDATE

Aquaculture Update: Keith Jones, Program Manager, NOP

Mr. Jones recommended that the NOSB assign a taskforce to address the issues surrounding aquaculture. There will be a workshop on aquatic species on June 23-24, in St. Paul, Minnesota, Becky Goldberg will be speaking and Bill Welch will attend.

NOSB COMMITTEE UPDATES/PROGRESS REPORTS

Mr. Anderson noted the primary focus of this meeting is to develop Board comments to the National Organic Program proposed rule. The following are committee comments on the appropriate sections of the proposed rule.

Accreditation Committee Report: Ms. Betsy Lydon, Chair

Ms. Lydon received comments that section 205.501 General requirements for accreditation (a)(1)’s language is too restrictive. NOP attempted to look at conflict of interest in the context of the committee. The Accreditation Committee was asked to work with NOP on new language for tomorrow.

Section 205.620 Requirements of State organic certification programs. The language needs to be clarified, a clear distinction needs to be made between State certification and State Program. Will the State certify even if they don’t have a state program? (See NOSB Comment)

Crops Committee Report: Mr. Eric Sideman, Chair

Mr. Sideman discussed the crop sections in the "NOSB Draft Comments to Revised Proposed Rule." Section 205.2 Terms defined wanted to add to this section "composted manure and animal parts."

Remarks by Kathleen A. Merrigan, Administrator, Agricultural Marketing Service
Ms. Merrigan thanked the current, new, and old members of the Board for coming together to develop comments on the Proposed Rule.

Ms. Merrigan anticipates that the issue of raw manure and compost will stimulate significant feedback during the comment period. The Organic Food Production Act (OFPA) was drafted as a marketing standard. Manure has the food safety "tag" that is not found in any other standards defined by OFPA. Ms. Merrigan requested that commenters with scientific backup submit it with their comments.

Regarding the National List, the petition will be available tomorrow and this will be an on going process. The National List will be the biggest role of this Board in the future. Ms. Merrigan is working on getting funding for materials review and supports the authority of the Board to approve the National List. She wants scientist in the government to do some of the materials review work; EPA, FDA. There is increasing interest and excitement about organics at the federal level so they may actually want to get involved.

Ms. Merrigan presented certificates of appointment to five new members appointed to the NOSB by Secretary Glickman. New members: Owusu Bandele; Kim Burton; Becky Goldburg; T. Mark King; and William Lockeretz. A notice has already gone out to solicit nominations for five new appointments to the NOSB, two farmer/growers; two consumer/public interest; and a certifier.

BREAK

Crops Committee Report (Continued): Mr. Eric Sideman, Chair

Mr. Sideman continued the Crops Committee comments with Section 205.202 Land requirements. He suggested prohibiting use of the 3-year waiting period as a tool for intentionally rotating in and out of organic status. The intent being to prevent the applications of a persistent prohibited material then not using the land for organic production 3-years.

Section 205.203 Soil fertility and crop nutrient management practice standard. The committee supports this section strongly, but may present other language at tomorrow's session. Should there be a definition for manure? Kim Burton stated that scientific evidence on manure use is sparse and mixed. Becky Goldburg suggested that the Board should err on the side of safety. The restrictions should not be any stricter for manure that for compost. A new waiting period should be made on manure/compost tea. Steve Harper suggests a 60 day time limit on restrictions. (See NOSB Comment)

Processing Committee Report: Ms. Margaret Wittenberg, Former Chair

Ms. Wittenberg reported that the committee believes: (1) the "commercially available" definition needs to be more detailed, especially in practice manuals (See pg. 1 & 7 of comment); (2) the NOSB needs to give priority to the development of organic standards for honey production; and (3) the NOSB made recommendations for standards for mushroom and greenhouse production that should be included in the final rule. The committee also recommended language regarding the issues of transition and whole-herd conversion. (See NOSB Comment)

BREAK FOR LUNCH - 12:50 P.M.

PUBLIC COMMENT SESSION
Jim Riddle – Three documents were presented to the NOSB for the Organic Trade Association (OTA)  
(See attachment 1)

Rod Crossley – Discussed his concern over the materials review process. (See attachment 2)

Paul Chartrand – Mr. Chartrand made comment in support of the NOSB’s 1998 recommendation to allow sulfur dioxide on the National List for use in the processing of wine from organic grapes, which the Secretary rejected in this proposed rule. The 1997 proposed rule allowed use of sulfur dioxide in processing of organic wine, following a 1995 NOSB recommendation. (See attachment 3)

Mr. Martijn VanEs, Dole Fresh Fruit Int. – Mr. VanEs discussed the use of ethylene for flowering induction in organic pineapple. A petition was filed back in April 1998 by organic pineapple growers, researchers and distributors world wide, with the NOP for approval of the use of Ethylene for organic pineapple flower induction. (See attachment 4)

Mr. George Sieman, CROOP Cooperative – Mr. Sieman spoke on behalf of Coulee Region Organic Produce Pool (CROOP) one of the oldest and the largest cooperative of certified organic farmers in the U.S. Mr. Sieman discussed the need for an entry herd clause for organic dairy. This clause is a “deal breaker” for the organic dairy industry. The CROOP applauds the NOSB Livestock Committee’s support for this standard. (See attachment 5)

Mr. Joseph Mendelson, The Center for Food Safety – Mr. Mendelson recommended language to strengthen “excluded methods” prohibition and to ensure NOSB authority over prohibition. (See attachment 6)

Ms. Enid Wonnacott, NOFA-VT – Ms. Wonnacott mentioned issues of concern:

- States should not be given more rights than privates
- conflict of interest
- privates are now allowed to deny certification
- American Organic Standard (AOS) language on new herd transition; she approves
- AOS parasite policy; she also approves

Mr. Phil LaRocca, Certified wine producer – Mr. LaRocca does not think sulfur dioxide should be in organic wine. He thinks the NOSB should go along with the comments on no synthetics. On the issue of conflict of interest there is no reason why certifiers can not check each other.

Mr. Brian Leahy, Director of CCOF

- National List needs to come up quickly
- Should not micro-manage on conflict of interest
- Manure issue is very complicated, you should not regulate by hysteria, there are no current safety studies
- Seeds are another important issue to CA growers

Ms. Emily Brown Rosen, Organic Materials Review Institute (OMRI) – Ms. Brown Rosen presented the NOSB with OMRI’s extensive comments on the proposed organic rule. The documents can also be viewed on the OMRI website (http://www.omri.com). (See attachment 7)

Ms. Cissy Bowman, Indiana Organic Farmer
• Conflict of interest
• Peer review panel should be funded by USDA
• Honey and hydroponics need to be included

End of Public Comment

BREAK

NOSB COMMITTEE UPDATES/PROGRESS REPORTS – CONTINUED 3:30 p.m.

Livestock Committee Report: Mr. Fred Kirschenmann, Chair

Mr. Kirschenmann reviewed the sections of the comment to the proposed rule that the Livestock Committee addressed. Section 205.236 Origin of livestock, the committee recommended language to address the transition and whole-herd conversion issues. Section 205.237 (a) Livestock feed, suggested that the word "pasture" be defined as part of the feed requirement. (See NOSB Comment)

Recessed for the day.

WEDNESDAY, JUNE 7, 2000

MEETING RESUMED 9:20 a.m. - Robert Anderson, Chairperson

It was agreed that a cover letter be attached to the comment that described the goal of the NOSB’s comments and a general statement before Subpart A. Discussion on what needed to be changed on the NOSB comments on the Proposed Rule, started at the beginning with Section 205.2 Definitions.

Crops Committee Report: Mr. Eric Sideman, Chair

The additional changes from yesterdays reports were:

Definitions - "Composted manure and animal parts" change language of the second sentence to, "At a minimum, all materials must reach thermophilic conditions, …. Steve Harper suggested tabling the topic of vermiculture until more information can be provided.

"Excluded Methods", add to sentence, "…are achieved by recombinant techniques."

"Transition," and "Transition Period" – remove "Inclusion of these terms, will clarify the practice and". The paragraph would now begin, "The practice required…"

Subpart B - Applicability:

Section 205.102. Use of the term "organic" is deleted.

Subpart C – Organic Production and Handling Requirements:

Section 205.200 General is deleted.

Section 205.201(a) is deleted.
Section 205.201(5) delete the last sentence.

BREAK FOR LUNCH – 1 p.m.

**Accreditation Committee Report: Ms. Betsy Lydon, Chair**

Subpart E - Certification
Section 205.406 no change from yesterday.
Subpart F – Accreditation of Certifying Agents
Section 205.500 no change from yesterday.
Section 205.501 same language change.
Section 205.509 no change from yesterday.
Subpart G - Administrative
National List
Section 205.640 no change from yesterday.

Motion: Eric Sideman moved that the whole-herd conversion language in Section 205.236 Origin of Livestock be changed as indicated. Second by Joan Gussow. Motion passed unanimously.

**ADMINISTRATION – Robert Anderson, Chairperson**

The Chair open the floor up for nominations for Chair, Vice-Chair and Secretary.

Motion: Kim Burton moved to nominate Carolyn Brickey as Chair of the NOSB. Second by Steve Harper. Motion passed unanimously. Carolyn Brickey was elected Chair.

Motion: Becky Goldburg moved to nominate Eric Sideman as Vice-Chair of the NOSB. Second by Willie Lockeretz. Motion passed unanimously. Eric Sideman was elected Vice-Chair.

Bob Anderson stated he would like to have a professional Secretary work with the NOSB.

Bob Anderson addressed priorities of the Board going forward:

- Petitions
- Materials Review
- Program Manuals
- Board Process

The meeting was adjourned at 4:37 p.m.

**ROBERT ANDERSON, Chair**
National Organic Standards Board

**KEITH JONES, Program Manager**
National Organic Program
Meeting Purpose:

The principal purposes of this meeting are to provide an opportunity for the NOSB to receive committee reports; receive update from the Aquatic Task Force Working Group; to receive an update from the USDA/NOP, and review materials for possible inclusion on or removal from the National List of Approved and Prohibited Substances. Materials to be reviewed at the meeting are: periacetic acid, calcium borogluconate, animal enzymes, leather meal and sodium chlorate.
CALL TO ORDER – MR. ROBERT ANDERSON, CHAIRPERSON

Mr. Robert Anderson called the meeting to order at 2:20 p.m., he welcomed everyone and thanked them for coming. Mr. Anderson had the National Organic Standards Board (NOSB) members introduce themselves as well as the guests assisting them.

Public Comment Session - Mr. Robert Anderson, Chairperson

Tom Harding, AgriSystems International

He testified in favor of organic certification of sustainably harvested wild caught fish. He told the Board that it must look at the system to determine how these fish are managed. He supported labeling all product in a legal and defined way. He encouraged eco-labeling. He also said that "access to pasture" must have a clear definition and that the Board must recognize that all operations under all conditions are not appropriate for pasture all the time. He supported a standards ceiling and recommended that USDA not place a ceiling on standards.

Dennis Blank – He discussed his inability to get free flowing information from USDA or the NOSB. (See attachment 1)

Bob Anderson replied that "not one committee on this Board makes a decision away from this table". Mr. Anderson went on to say that never in his six years on the Board, five as Chairperson, did he ever know of any Board member withholding information from the media. Mr. Anderson finally asserted that it is the responsibility of the media is to engage in accurate reporting.

Bruce Krantz, Vice President/General Manager Hynite Corporation – Mr. Krantz presented comment on the Board's review of Leather Meal. (See attachment 2)

Joe Mendelson – Speaking on behalf of the Campaign for Sustainable Agriculture, he referenced a letter attached to a recent survey results. Mr. Mendelson reviewed the content of the letter with the Board, and discussed issues of transparency and development of program manuals. (See attachment 3)

Brian Leahy, Executive Director of CCOF – Mr. Leahy requested that the Board reject the petition to approve leather meal and sodium chlorate, and spoke in support of the label for "made with organic ingredients".

Cissy Bowman - She expressed concern for keeping small farmers on farms and the need for the stakeholders to include these interests. Ms. Bowman encouraged NASOP to be more involved as many new states developing organic programs are not familiar with the stakes involved.

Tom Hutcheson, Organic Trade Association – On behalf of OTA, he welcomed the new NOSB members. Mr. Hutchenson made reference to OTA's historic role in the development of industry and national standards and the offer of the association to continue that role. (See attachment 4)

The following people were not present but sent public comment to the Board:

Philip LaRacca, President California Certified Organic Farmers (See attachment 5)
Richard C. Nelson, President Nelson & Sons Inc. (See attachment 6)
Peter Granger, Washington Fish Growers Association (See attachment 7)
JANUARY 8, 2001

Dr. Paul Supancic, Chair, NOSB

The meeting reconvened at 9:15 a.m. Mr. Anderson encouraged the Board to stay engaged; stay open and to continue to build on the environment of good working relationships, to strive for more diversity on the Board and in the marketplace. Mr. Anderson passing the gavel to NOSB Chairperson elect Carolyn Brickey. The agenda was reviewed with no changes.

NOSB COMMITTEE ACTION ITEMS – MS. CAROLYN BRICKEY, CHAIRPERSON

Livestock Committee: Mr. Eric Sideman, Chair

Mr. Sideman reported that the use of parasiticides in organic livestock production should be the last resort in organic livestock health care, when animals are severely infected. In conventional production, parasiticides are used routinely. He reviewed the history of how the Board approved Ivermectin as one of the three parasiticides submitted for review. The Board chose Ivermectin because it has the widest number of applications. On the other hand, Mr. Sideman pointed out, Ivermectin does pose an important risk that needs to be addressed. Since Ivermectin is also an insecticide it kills dung beetles and other organisms involved in the decomposition of manure. This is a particular concern with slow release formulations of the parasiticide because such products are designed to be active over an extended period and thus a large portion of the manure deposited over the grazing season is resistant to decomposition. Hence the Livestock committee will recommend an annotation to the approval of Ivermectin that will prohibit the slow release formulations.

Emily Brown-Rosen explained the issue of approvals of ingredients for livestock feed. She introduced a proposal from the committee: if materials have been specifically approved for use in organic processing and also are approved either as listed in 21CFR or the American Association of Feed Control Officials (AAFCO) annual publication for use as livestock feed, the material should be allowed for use in organic livestock feed. Betsy Lydon asked if this is a roll back, to review all the approved ingredients in processing and allow them for use as livestock feed ingredients. Mr. Anderson asked if this policy should work in reverse: to approve if not prohibited, by the AAFCO list and CFR 21. Willie Lockeretz asked if there is a realistic difference in environmental concerns in livestock use that would not be present in food processing. Mr. Sideman will prepare a proposed resolution for the Board.

Materials Committee: Ms. Joan Gussow, Chair

Ms. Gussow presented the Materials Database prepared by Organic Materials Review Institute (OMRI). Ms. Brown-Rosen further explained the database. One purpose of the document is to provide a history of materials review for new Board members. Ms. Brown-Rosen asked for suggestions about format or request for additional information. Board members were asked to respond to Joan Gussow or Kim Burton, NOSB Materials Committee, not to Ms. Brown-Rosen or OMRI. Once corrections to format or accuracy are made. The database will come back to the Board for acceptance. Carolyn Brickey noted that the Board would develop a document for historical Board decisions not dealing with materials. This project will begin shortly.
The Materials Committee report was halted for an Environmental Protection Agency (EPA) presentation.

**PRESENTATION BY MR. JIM JONES, DIRECTOR, EPA PESTICIDE REGISTRATION DIVISION**

Jim Jones explained the status of the inerts review program at EPA. List 3 inerts already in approved organic materials seems like a logical place to begin a review. Owusu Bandele asked if EPA could also review materials for use as fertilizers as well, but EPA does not regulate fertilizers. Keith Jones thought the American Association of Plant Food Control Officials (AAPFCO) might facilitate that. Mr. Jones also discussed a new program that EPA will propose to offer manufacturers who petition EPA the opportunity to obtain a seal that indicates that the product meets OFPA standards for organic use. Manufacturers will need to submit a petition to EPA. This will be a voluntary program at the request of individual pesticide manufacturers. Mr. Sideman raised the question about annotations for organic approval and Jim Jones responded this issue would have to be addressed in the process. Keith Jones asked the Board to think about language for such a label.

Becky Goldberg asked about the public comment period in relation to the March meeting. Jim Jones suggested 90-120 days.

Keith Jones stressed the importance of language on the label. What EPA is doing is allowing additional information to the marketplace, not engaging in oversight of the Board action. The issue is how to communicate annotations. Willie Lockeretz is concerned about use by home gardeners who may misinterpret the EPA label. Keith Jones reminded everyone that NOP does not regulate consumers and home gardeners.

Steve Harper asked how the EPA will deal with materials that the NOSB recommends delisting.

Bob Anderson noted that this is an additional seal that manufacturers would see as a tool, an incentive for organic practice. The EPA organic label would state that organic approval will be allowed according to annotations, according to Jim Jones. Kyle Moppert noted that a violation of label restriction would now be not only an organic violation but also a pesticide violation. Steve Pavich asked how long it would take EPA to come up with this label. Jim Jones indicated that the program could be up and running in about 90 days.

Carolyn Brickey asked for advice about the NOSB petition review process. The Board discussed the opportunities for public comment and whether it would be available for all material applications. Ms. Brickey mentioned there might be some applications that would definitely not receive NOSB approval and some may not have TAP reviews at all. Kim Burton mentioned the October 1999 time line recommended by the Board and wants to consult with EPA.

**Materials Committee - Continued: Ms. Joan Gussow, Chair**

The proposal for materials decisions for Crops, Processing, and Livestock was reviewed. Mr. Anderson suggested that this document go out to the Board with the advanced Board packet.

**USDA/NATIONAL ORGANIC PROGRAM UPDATE – KEITH JONES, PROGRAM MANAGER**

Keith Jones acknowledge the presence of Mr. Michael D. Fernandez, Assistant to the Administrator, Agricultural Marketing Service (AMS), USDA. Mr. Fernandez briefly addressed the Board on behalf of Kathleen Merrigan, Administrator, AMS. Keith Jones discussed the Freedom Of Information Act (FOIA) process.
Keith Jones then reviewed the authorization levels for contracts for service. The Program Manager has authority to execute contracts up to $5,000. Mr. Jones indicated that a contract over $25,000 may not require bidding. Within certain guidelines, contracts can be sole sourced. Mr. Jones addressed in detail the $100,000 contract awarded to OMRI for material technical advisory panel reviews which was originally offered to both OMRI and the Organic Farming Research Foundation (OFRF) at $50,000 respectively. He stated there have been some questions why NOP did not put the materials review contract out for bid. He stated because of the time needed to do a request for proposal it was decided to do a sole source contract under an "urgent and compelling" authorization. Finally, the OMRI contract was submitted to both organizations and OFRF, after review, chose not to execute its purchase order. To continue to obligate the funds, an additional $50,000 was then requested to be awarded to OMRI.

Steve Pavich asked about competition. Mr. Jones said the Department tries to encourage competition for requests for proposals, but indicated that there is little point in requesting proposals if only one person or organization applies. Mr. Jones added that due to the unique and esoteric nature of organic material review, vigorous competition among organizations may not occur.

The discussion returned to FOIA information. Steve Harper asked if some of the information being requested by FOIA could be available on the web. Mr. Jones agreed that some information could be made available, but not unapproved committee minutes and contract details. Until the minutes are approved, they are considered pre-decisional and unavailable to the general public. Willie Lockeretz asked if he should assume that any correspondence between the NOSB and the NOP are subject to FOIA. Mr. Jones answered yes. Any Board business is subject to FOIA.

Keith Jones also explained that NOP is issuing a proposal for a staff person to do administrative assistance for the NOSB. It will be a two-year contract for $20+K and will hopefully be on the street within the week.

Mr. Jones explained that the final rule was undergoing clearance at the Office of Management and Budget and is on target for publication by the year’s end. Ms. Brickey asked about advance notice to the Board regarding the release, and Mr. Jones stated the Board would be briefed by a process similar to that used with the March 2000 proposal. Specifically, the rule will be sent to Board members the day before the press conference and will be on the web for public viewing the morning of the press conference. Mr. Jones said that Secretary Glickman sees this rule as one of his crowning achievements. Media interest is increasing.

The Final Rule becomes effective 60 days after publication if Congress does not object. Eighteen (18) months after the 60 days, the rule will be fully implemented. Betsy Lydon asked if Congressional comments, if any, go directly to Keith. Mr. Jones said he would find out about the protocol under The Small Business Regulatory Enforcement Fairness Act of 1996 (SBREFA). Mr. Jones said that no rule of any kind has been rejected under SBREFA.

The top two issues for NOP after final rule roll-out are program manual development and materials (substance) review. NOP will want input from certifying agents about how the rule will work on the ground and will use feedback from certifying agents and the NOSB as a way to prioritize the program manual development.

Bob Anderson asked Mr. Jones about the status of nominations for new Board members. Mr. Jones replied that the nominations are a priority for the Secretary and Administrator Merrigan but that he is not privy to the status of the selection process. Ms. Brickey stressed the need to have new members in place by the next Board meeting which will focus on implementation of the final rule.
Accreditation Committee: Ms. Betsy Lydon, Chair

Betsy Lydon asked the Board for confirmation that the Enforcement Task Force is heading in the right direction. She distributed the list of considerations for the memorandum of understanding (MOU) between NOP and the States, the same document as previously seen by the Board. Betsy is asking for any new comments. Two matrices, one for Crops and Handling, one for Livestock were also distributed and she asked to come back with comments by December 1. For the benefit of new members, Diane Goodman explained the relationship of the matrices to the MOU with the States.

MATERIALS PROCESS AND REVIEW - Ms. Joan Gussow, Materials Committee Chair

Periacetic Acid for Crops

Discussion: Steve Pavich explained the committee position on the TAP review and recommended approval with annotations. Discussion revolved around the source of acetic acid and the production availability of fermented acetic acid, rather than synthetic acetic acid. The crops committee recommended to allow use for disinfecting equipment, seed and planting stock, and for foliar use for fireblight control. They recommended it be prohibited for soil application, due to concerns that such use is not compatible with a sustainable agricultural system and that alternatives, such as solarization do exist. Foliar use on crops was discussed, and the crops committee found that although the material is broad spectrum in effect, it is of short persistence and breaks down in the environment to water and oxygen. Its potential use as an alternative to antibiotics for control of fireblight was seen as a positive factor.

Several intermediary votes were taken on components of the annotation (vote to allow to disinfect seeds and bulbs; 8-2-4; vote to allow for fireblight control; 10-3-1.) As written, the annotation would not permit soil use.

The TAP review recommended limiting the material to sources derived from naturally fermented acetic acid sources only, however after discussion of the difficulties of identifying and finding sources produced this way, the crops committee agreed to drop this restriction. Steve Harper, processing chairperson, pointed out that the listing should be consistent for all uses (crops, processing, and livestock) and described his research into limited availability of fermented acetic acid sources. When used in processing applications, purity considerations may also limit the source. He also questioned a requirement for a natural source of one component when the material is considered a synthetic anyway. The board considered the overall benefits for use as a disinfectant to warrant dropping the restriction on natural sources.

A question was raised about the uses actually requested in the initial petition. The original petition was from the 1995 petition period, and was only a general request for disinfectant purposes in livestock production and handling, although the TAP review covered other uses. The board agreed with NOP staff person Richard Matthews, that as general policy, the NOSB should only be reviewing uses requested by petitioners.

VOTE: Periacetic Acid for Crops

1. Synthetic or Non-Synthetic – The Board voted unanimously that periacetic acid is synthetic.
   14 - yes, 0 – no.
2. Vote to list without annotation: 0 – yes, 14- no
3. Vote to list with the following annotation: 13 – yes – 0 no, 1 – abstain
"Allowed to disinfect equipment. Allowed to disinfect seed and asexually propagated planting material (i.e., bulb, corm, tuber) used for planting crops. Allowed for fireblight control only with Experimental Use permit with documentation that alternatives including biocontrols have been tried."

Periacetic Acid for Livestock

Discussion: The board discussed a possible additional allowance for veterinary use, but declined to include that in the annotation, due to lack of established need or direct request from a petitioner.

VOTE: Periacetic Acid for Livestock

1. It was approved as a synthetic: 14-0-0
2. Approved with the following annotation: 13-0-1

"For facility and processing equipment sanitation (barns, milking parlors, processing areas)."

Periacetic Acid for Processing

Discussion: There was discussion about approving materials with an annotation and the implication that certain uses may be prohibited if not specified, which is not entirely correct. Becky Goldberg recommended that prohibitions should be clearly communicated. The TAP review mentioned other uses for peeling and bleaching, these were not recommended by the committee. Also the Board discussed how to communicate changes in annotations that may arise with new petitions for a material already approved. A question was raised as to how to provide information about considered and rejected uses, to discourage people from re-petitioning for uses that have already been rejected.

VOTE: Periacetic Acid for Processing

1. It was approved as a synthetic: 14-0-0
2. Vote to list without annotation: 0 – yes, 14- no
3. Approved with annotation of "Allowed for direct food contact only in wash and/or rinse water. Allowed as a sanitizer on surfaces in contact with organic food." 14-0-0

Calcium Borogluconate for Livestock

Discussion: The livestock committee recommended allowing and stressed that it is an emergency use treatment that should be needed only on rare occasions. The TAP review suggested language about preventive measures in the annotation, but this was deemed vague and also covered in the proposed rule language that requires preventive practices before medications are used. Dietary adjustment can be made over time to prevent milk fever. The TAP review mentioned use for grass tetany also, but the board declined to allow for that use without more information or a specific request. A suggestion to require a 48-hour withdrawal requirement, as is required by Codex rules for all medications was not supported. Milk is typically not sold for at least 24 hours after parturition, and will contain mostly colostrum for the first 48 hours.

VOTE: Calcium Borogluconate

1. Approved as a synthetic: 14/0/0
2. Vote to list without annotation: 0 – yes, 14- no
3. Approved with annotation of "For treatment of milk fever only." 14-0-0

**Sodium Chlorate for Crops - Steve Pavich**

**Discussion:** This material was petitioned for use as a cotton defoliant. Kyle Moppert pointed out that currently most organic cotton is coming from dryland production areas due to reduced insect pressure. Eventually more cotton will be grown in lowland areas or areas on the margin of adaptability and defoliants will be more of an issue in those regions. The board discussed the fact that alternatives seem to be available, and that the existing organic cotton industry is managing without this material.

**VOTE: Sodium Chlorate for Crops**

1. Vote to consider the material synthetic: 14 – yes, 0 – no
2. Prohibited Synthetic. 14-0-0

**Leather Meal for Crops – Steve Pavich**

**Discussion:** The crops committee recommended the material be considered synthetic and prohibited. The synthetic determination was made based on the numerous additives introduced through the leather making process. The Board agreed that there are many natural alternatives for fertilizer use that are readily available, and asked what uses the material currently has. The petitioner indicated that leather meal is currently applied to conventional tobacco, citrus, and orchard crops. Willie Lockeretz noted that the record should be clear, that the NOSB rejected the material based on the facts that it is synthetic and it has no specific exemption in OFPA.

**VOTE: Leather Meal for Crops**

1. Vote to consider the material synthetic: 13 – yes; 0 – no. (1 absent)
2. Vote to add to National List: 0 – yes, 13 – no

**Animal Enzymes for Processing – Steve Harper**

There was discussion about which enzymes are currently in use by the industry. The TAP review was presented as a group review of animal enzymes, using animal-derived rennet as the model, and included additional information on six other enzymes. The processing committee considered proposed annotations from the TAP review that restrict incidental additives and preservatives used in enzyme preparations. They noted that powdered forms are preferable, though not always available. Liquid formulations may have sodium benzoate added. The processing committee did not support a requirement for GRAS status. The representative present from the enzyme association explained GRAS as frequently self-imposed, not always FDA- approved with published regulation. FDA has never taken action against enzymes used in the market that claim GRAS and are not regulated by the FDA. It is difficult to determine whether a material is synthetic or natural, depending on the presence of synthetic additives. A request for GRAS status for lysozyme was filed in 1973. The FDA published a Federal Register notice in 1998 proposing to affirm it as GRAS. Given the change in policy, the determination is not expected to be granted any time soon. Joan Gussow questioned whether determination of freedom from BSE can readily be determined.

The board decided to list 6 specific animal enzymes as allowed, without annotation. They did not include a listing for lysozyme, which does not have a final GRAS status from FDA. Discussion ended with the fact that the NOSB is voting on the enzymes, not on the additives.
VOTE: Animal Enzymes

1. Vote to consider the material synthetic: 0 – yes; 12 – no. (2 absent)
2. Vote to list the following materials without annotations and without Lysosyme. 10-yes; 2 – no, 1- abstain (1 absent)

Rennet (animal derived); catalase--bovine liver; animal lipase; pancreatin; pepsin; trypsin.

Recessed for the day.

FRIDAY, NOVEMBER 17, 2000

MEETING RESUMED 9:00 a.m. – Carolyn Brickey, Chairperson

Aquatic Task Force Working Group Reports: Mr. Robert Anderson, Task Force Chair

Mr. Anderson presented an overview of the intention and structure of the Aquatic Task Force and Working Group. The Task Force is made up of an Aquaculture Working Group and a Wild Aquatic Species Working Group. The chair of each group gave a working report to the NOSB.

Aquaculture Working Group – Ms. Margaret Wittenberg, Chair

Ms. Wittenberg explained that the premise for the working group is to determine the feasibility of establishing organic standards. Margaret addressed the issue of fish meal and fish oils as feedstocks for fish as necessarily organically produced. This led to the question of fish as free-ranging and its comparison to poultry on "free range" which is actually "free range" within a confined area. (See attachment 10)

In summary, the majority position of the Working Group is that possibilities exist for organic certification of some aquaculture systems.

Wild Aquatic Species Group – Mr. Miles McEvoy, Chair

Mr. McEvoy summarized the opinion positions of the members of the Working Group regarding the certification of wild fish. (See attachment 11)

Summary points:

Wild organic is neither a "no-brainer" nor is it an impossibility. The working group supports labeling to distinguish good stewardship of aquatic species, organic may not be the appropriate label.

Keith Jones made the statement, to provide guidance to the Board, in his own opinion, that there is probably more knowledge about where wild fish go than there is about where cattle graze on rangeland. He praised the progress Miles and Margaret have made in this effort and how they have provided the Board with information they will need to move forward.

Carolyn Brickey and Bob Anderson explained that today’s goal was to lay out the parallels and comparisons to help the Board approach this issue, not reach any conclusions.

COMMITTEE ACTION ITEMS – Carolyn Brickey, Chairperson
MOTION: Motion by Eric Sideman. The NOSB recommended that the annotation for Ivermectin be amended to prohibit the slow release formulation known as the SR bolus. In addition we request that information continue to be gathered in order to determine if other formulations are a significant risk to decomposition of manure. Marvin Hollen seconded.

REVISED MOTION: The NOSB recommended that the annotation for Ivermectin be amended to prohibit the slow release formulations such as the SR bolus.

The Board discussed whether the annotation would prohibit slow release formulations or to prohibit other formulations. Keith suggests that more data be obtained before the Board makes this decision. Mr. Sideman asked Mr. Jones if this recommendation could make it into the rule. Mr. Jones said that it was not possible now. This raised the question about how changes will be made after the rule is final. Keith responded that the Board will be acting on materials during implementation, so that when the rule is fully implemented, the changes will be reflected. Keith says that any change to the final rule has to go out for public comment, so it is better to raise these issues early in the process. He wants to go through the correction process only once. Kim Burton asked when the National List will be reprinted. Keith Jones wants to talk about this issue in March. The Board needs to act on materials as quickly as possible to get it incorporated into the rule within 18 months.

The Ivermectin motion passed unanimously (12/0/0). (Mark King and Joan Gussow absent)

MOTION: Motion by Eric Sideman. The NOSB recommends that unless otherwise specified in the annotation any substance on the National List of non-agricultural substances allowed as ingredients in an organic processed food product also be allowed for use in organic animal feed, provided it is regulated in 21 CFR for livestock feed or allowed by FDA with discretion to AAFCO. Betsy Lydon seconded.

Discussion: A number of items on the processing list are used in ingredients for feed additives and have been permitted by the board for human food use, such as citric acid, kelp, kaolin, ascorbic acid, tocopherols, glycerin, lecithin, and potassium carbonate. Their status is not clear under the current livestock regulations, which requires that all synthetics appear on the National list. This motion will save the need to re-petition and re-consider these items individually.

REVISED MOTION: The NOSB recommends that unless otherwise specified in the annotation, any substance on the National List of non-agricultural substances allowed as ingredients in an organic processed food product also be allowed for use in organic animal feed, provided it is approved by FDA in 21 CFR for livestock feed or allowed by FDA discretion as stated by AAFCO. Passed unanimously (11/0/0).

MOTION: Motion by Eric Sideman. Mr. Sideman moved that the minutes from the June 6-7, 2000 be approved as amended. Kim Burton seconded. The motion passed unanimously. (11/0/0).

BREAK FOR LUNCH

Materials Committee Work Plan – Ms. Kim Burton, Chair

Kim Burton reviewed the Petition Review Process timeline based on recommendations of the Board that would take 120-150 days from receipt of petition to approval. The Chair suggested that we work backwards, from March approvals back to petition to OMRI. OMRI staff said OMRI needs three months for TAP reviews. If petitions are received by December 1 by NOP they can go to OMRI by December 15. TAP reviews will be open for public comments for 15 days prior to NOSB meetings.
Keith Jones reminded everybody that these contract funds need to be spent which would require the review of 50 materials by October, the end of fiscal year. Keith Jones and Katherine DiMatteo met about three weeks prior to the Board meeting, and he urged OTA to ask the industry to send him a list of material petitions he should be expecting. He has received an indication that about 40 petitions would be sent to NOP. Ms. Brickey asked about a date for OMRI to receive petitions for review in June. Emily Brown Rosen responded with a deadline of February 1, 2001.

Ms. Burton asked about the flow of petitions and requests for comments. Keith wants comments sent to NOP. Dates for petition process and public comment are noted on the chart handed out to the Board.

**Livestock Committee Work Plan – Mr. Eric Sideman, Chair**

Issues identified by Livestock Committee to be addressed in the coming year included:

- Young animal care
- Nutrient management
- Living conditions and stocking rates
- GMO incidentals including compost ingredients, manure from GMO livestock
- Feed additives regarding 100% organic feed, needs to be clarified to determine 5% rule
- Pasture-based living conditions for ruminant animals is still the firm position of the committee but due to the controversial nature of the issue, what pasture-based means needs to be defined.

Emily Brown-Rosen noted the need to address the issue of allowing vitamins as feed additives for livestock, depending on FDA approval by regulation or allowance with discretion for materials listed by AAFCO.

Keith Jones noted that when the final rule comes out, this question may not be an issue, based on any new issues that will be need to be addressed. Many questions and issues may be answered in the Final Rule.

Carolyn Brickey wants to have the work plan for the year posted to the web for industry comment and to provide material for the Board retreat.

**Processing Committee Work Plan – Mr. Steve Harper, Incoming Chair**

The processing committee is waiting for the final rule to determine which parts of the rule will be compatible with processing practices. The committee is also going to be focusing on retailer education and on transitional standards. Steve Harper is waiting for the final rule to formalize the committee work plan.

**Accreditation Committee Work Plan – Mr. Willie Lockeretz, Incoming Chair**

Willie Lockeretz outlined the following issues for attention by the committee this year:

- Continued development on the Enforcement Task Force matrices.
- MOUs with States need to be developed for enforcement
- Peer Review participation with the Department.
- Development of an equitable fee structure especially for small operations.
- Certifier concerns about their role in the politics in accreditation and certification -- more about how they feel rather than about how it will be done.
Tom Hutcheson announced that OCC is hosting an Accreditation Training program for certifiers in February 2, 3, Friday and Saturday. Mark Bradley from the FSIS collaborated with OTA and IOIA in developing the program.

During the final public comment Bob Shine spoke as a small certifier about the issue of the shakeout of small certifiers when the program is implemented and the reaction to the unknown.

**Crops Committee Work Plan – Mr. Owusu Bandele, Incoming Chair**

Steve Pavich stated the Crops Committee should discuss:

- Compost
- Manure
- GMO
- Transitional Certification

**WRAP-UP/NEXT MEETING PLANS – Ms. Carolyn Brickey, Chairperson**

Ms. Brickey wants this work plan consolidated in a couple of weeks and up on the web.

Travel days for the next NOSB Meeting will be Sunday, March 4, 2001, with a NOSB Retreat on Monday, March 5th, and the NOSB Meeting on Tuesday and Wednesday March 6 and 7. The first day of Expo West is Thursday, March 8th.

Ms. Brickey would like to brief Board members on Conflict of Interest at the retreat.

The June NOSB meeting dates are June 5–7, 2001. Suggested locations for the next meeting included La Cross or Madison, WI or the Minnesota area.

The meeting was adjourned at 2:40 p.m.

**CAROLYN BRICKEY, Chair**
National Organic Standards Board

**KEITH JONES, Program Manager**
National Organic Program
Welcome new members, receive an update regarding certification of aquatic animals, receive committee reports, approve the NOSB’s comments to the reproposed National Organic Program regulations, elect new officers, make committee assignments, and set meeting dates and agenda for the next 3 meeting.

CALL TO ORDER

Robert (Bob) Anderson, Chairperson of the NOSB called the meeting to order at 9:20 a.m. Mr. Anderson thanked everyone for coming to the meeting. He introduced the five newly appointed members; Mr. Owusu A. Bandele from Baton Rouge, LA (Farmer); Ms. Kim M. Burton from Chico, CA (Handler); Ms. Rebecca J. Goldburg from Montclair, NJ (Environmentalist); Mr. T. Mark King from Indianapolis, IN (Retailer); and Mr. William P. Lockeretz from Brookline, MA (Environmentalist). Bob stated that he looked forward to working with each of them. Mr. Anderson acknowledged Ms. Hope Crain, (KY) State representative and Ms. Enid Wonnacott, (NOFA-VT) Certifier representative that were present to assist the NOSB. Mr. Anderson gave a quick overview of the Agenda for the day’s activities.

Motion: Steven Harper moved that the minutes from the March 21-22, 2000, be approved as written. William Welsh seconded the motion. The motion passed unanimously.

USDA/NATIONAL ORGANIC PROGRAM UPDATE

Aquaculture Update: Keith Jones, Program Manager, NOP

Mr. Jones recommended that the NOSB assign a taskforce to address the issues surrounding aquaculture. There will be a workshop on aquatic species on June 23-24, in St. Paul, Minnesota, Becky Goldberg will be speaking and Bill Welch will attend.

NOSB COMMITTEE UPDATES/PROGRESS REPORTS

Mr. Anderson noted the primary focus of this meeting is to develop Board comments to the National Organic Program proposed rule. The following are committee comments on the appropriate sections of the proposed rule.

Accreditation Committee Report: Ms. Betsy Lydon, Chair

Ms. Lydon received comments that section 205.501 General requirements for accreditation (a)(1)’s language is too restrictive. NOP attempted to look at conflict of interest in the context of the committee. The Accreditation Committee was asked to work with NOP on new language for tomorrow.

Section 205.620 Requirements of State organic certification programs. The language needs to be clarified, a clear distinction needs to be made between State certification and State Program. Will the State certify even if they don’t have a state program? (See NOSB Comment)

Crops Committee Report: Mr. Eric Sideman, Chair

Mr. Sideman discussed the crop sections in the "NOSB Draft Comments to Revised Proposed Rule." Section 205.2 Terms defined wanted to add to this section "composted manure and animal parts."

Remarks by Kathleen A. Merrigan, Administrator, Agricultural Marketing Service
Ms. Merrigan thanked the current, new, and old members of the Board for coming together to develop comments on the Proposed Rule.

Ms. Merrigan anticipates that the issue of raw manure and compost will stimulate significant feedback during the comment period. The Organic Food Production Act (OFPA) was drafted as a marketing standard. Manure has the food safety "tag" that is not found in any other standards defined by OFPA. Ms. Merrigan requested that commenters with scientific backup submit it with their comments.

Regarding the National List, the petition will be available tomorrow and this will be an ongoing process. The National List will be the biggest role of this Board in the future. Ms. Merrigan is working on getting funding for materials review and supports the authority of the Board to approve the National List. She wants scientists in the government to do some of the materials review work; EPA, FDA. There is increasing interest and excitement about organics at the federal level so they may actually want to get involved.

Ms. Merrigan presented certificates of appointment to five new members appointed to the NOSB by Secretary Glickman. New members: Owusu Bandele; Kim Burton; Becky Goldburg; T. Mark King; and William Lockeretz. A notice has already gone out to solicit nominations for five new appointments to the NOSB, two farmer/growers; two consumer/public interest; and a certifier.

BREAK

Crops Committee Report (Continued): Mr. Eric Sideman, Chair

Mr. Sideman continued the Crops Committee comments with Section 205.202 Land requirements. He suggested prohibiting use of the 3-year waiting period as a tool for intentionally rotating in and out of organic status. The intent being to prevent the applications of a persistent prohibited material then not using the land for organic production 3-years.

Section 205.203 Soil fertility and crop nutrient management practice standard. The committee supports this section strongly, but may present other language at tomorrow's session. Should there be a definition for manure? Kim Burton stated that scientific evidence on manure use is sparse and mixed. Becky Goldburg suggested that the Board should err on the side of safety. The restrictions should not be any stricter for manure that for compost. A new waiting period should be made on manure/compost tea. Steve Harper suggests a 60 day time limit on restrictions. (See NOSB Comment)

Processing Committee Report: Ms. Margaret Wittenberg, Former Chair

Ms. Wittenberg reported that the committee believes: (1) the "commercially available" definition needs to be more detailed, especially in practice manuals (See pg. 1 & 7 of comment); (2) the NOSB needs to give priority to the development of organic standards for honey production; and (3) the NOSB made recommendations for standards for mushroom and greenhouse production that should be included in the final rule. The committee also recommended language regarding the issues of transition and whole-herd conversion. (See NOSB Comment)

BREAK FOR LUNCH - 12:50 P.M.

PUBLIC COMMENT SESSION
Jim Riddle – Three documents were presented to the NOSB for the Organic Trade Association (OTA) (See attachment 1)

Rod Crossley – Discussed his concern over the materials review process. (See attachment 2)

Paul Chartrand – Mr. Chartrand made comment in support of the NOSB’s 1998 recommendation to allow sulfur dioxide on the National List for use in the processing of wine from organic grapes, which the Secretary rejected in this proposed rule. The 1997 proposed rule allowed use of sulfur dioxide in processing of organic wine, following a 1995 NOSB recommendation. (See attachment 3)

Mr. Martijn VanEs, Dole Fresh Fruit Int. – Mr. VanEs discussed the use of ethylene for flowering induction in organic pineapple. A petition was filed back in April 1998 by organic pineapple growers, researchers and distributors world wide, with the NOP for approval of the use of Ethylene for organic pineapple flower induction. (See attachment 4)

Mr. George Sieman, CROOP Cooperative – Mr. Sieman spoke on behalf of Coulee Region Organic Produce Pool (CROOP) one of the oldest and the largest cooperative of certified organic farmers in the U.S. Mr. Sieman discussed the need for an entry herd clause for organic dairy. This clause is a “deal breaker” for the organic dairy industry. The CROOP applauds the NOSB Livestock Committee’s support for this standard. (See attachment 5)

Mr. Joseph Mendelson, The Center for Food Safety – Mr. Mendelson recommended language to strengthen “excluded methods” prohibition and to ensure NOSB authority over prohibition. (See attachment 6)

Ms. Enid Wonnacott, NOFA-VT – Ms. Wonnacott mentioned issues of concern:

- States should not be given more rights than privates
- conflict of interest
- privates are now allowed to deny certification
- American Organic Standard (AOS) language on new herd transition; she approves
- AOS parasite policy; she also approves

Mr. Phil LaRocca, Certified wine producer – Mr. LaRocca does not think sulfur dioxide should be in organic wine. He thinks the NOSB should go along with the comments on no synthetics. On the issue of conflict of interest there is no reason why certifiers can not check each other.

Mr. Brian Leahy, Director of CCOF

- National List needs to come up quickly
- Should not micro-manage on conflict of interest
- Manure issue is very complicated, you should not regulate by hysteria, there are no current safety studies
- Seeds are another important issue to CA growers

Ms. Emily Brown Rosen, Organic Materials Review Institute (OMRI) – Ms. Brown Rosen presented the NOSB with OMRI’s extensive comments on the proposed organic rule. The documents can also be viewed on the OMRI website (http://www.omri.com). (See attachment 7)

Ms. Cissy Bowman, Indiana Organic Farmer
Conflict of interest
Peer review panel should be funded by USDA
Honey and hydroponics need to be included

End of Public Comment

BREAK

NOSB COMMITTEE UPDATES/PROGRESS REPORTS – CONTINUED 3:30 p.m.

Livestock Committee Report: Mr. Fred Kirschenmann, Chair

Mr. Kirschenmann reviewed the sections of the comment to the proposed rule that the Livestock Committee addressed. Section 205.236 Origin of livestock, the committee recommended language to address the transition and whole-herd conversion issues. Section 205.237 (a) Livestock feed, suggested that the word “pasture” be defined as part of the feed requirement. (See NOSB Comment)

Recessed for the day.

WEDNESDAY, JUNE 7, 2000

MEETING RESUMED 9:20 a.m. - Robert Anderson, Chairperson

It was agreed that a cover letter be attached to the comment that described the goal of the NOSB’s comments and a general statement before Subpart A. Discussion on what needed to be changed on the NOSB comments on the Proposed Rule, started at the beginning with Section 205.2 Definitions.

Crops Committee Report: Mr. Eric Sideman, Chair

The additional changes from yesterdays reports were:

Definitions - "Composted manure and animal parts" change language of the second sentence to, "At a minimum, all materials must reach thermophilic conditions, .... Steve Harper suggested tabling the topic of vermiculture until more information can be provided.

"Excluded Methods", add to sentence, "...are achieved by recombinant techniques."

"Transition," and "Transition Period" – remove "Inclusion of these terms, will clarify the practice and". The paragraph would now begin, "The practice required…"

Subpart B - Applicability:

Section 205.102. Use of the term "organic" is deleted.

Subpart C – Organic Production and Handling Requirements:

Section 205.200 General is deleted.

Section 205.201(a) is deleted.
Section 205.201(5) delete the last sentence.

BREAK FOR LUNCH – 1 p.m.

Accreditation Committee Report: Ms. Betsy Lydon, Chair

Subpart E - Certification
Section 205.406 no change from yesterday.
Subpart F – Accreditation of Certifying Agents
Section 205.500 no change from yesterday.
Section 205.501 same language change.
Section 205.509 no change from yesterday.
Subpart G - Administrative
National List
Section 205.640 no change from yesterday.

Motion: Eric Sideman moved that the whole-herd conversion language in Section 205.236 Origin of Livestock be changed as indicated. Second by Joan Gussow. Motion passed unanimously.

ADMINISTRATION – Robert Anderson, Chairperson

The Chair open the floor up for nominations for Chair, Vice-Chair and Secretary.

Motion: Kim Burton moved to nominate Carolyn Brickey as Chair of the NOSB. Second by Steve Harper. Motion passed unanimously. Carolyn Brickey was elected Chair.

Motion: Becky Goldburg moved to nominate Eric Sideman as Vice-Chair of the NOSB. Second by Willie Lockeretz. Motion passed unanimously. Eric Sideman was elected Vice-Chair.

Bob Anderson stated he would like to have a professional Secretary work with the NOSB.

Bob Anderson addressed priorities of the Board going forward:

Petitions
Materials Review
Program Manuals
Board Process

The meeting was adjourned at 4:37 p.m.

ROBERT ANDERSON, Chair
National Organic Standards Board

KEITH JONES, Program Manager
National Organic Program
NATIONAL ORGANIC STANDARDS BOARD
Meeting Minutes
March 6 - 7, 2001

Embassy Suites Buena Park
7762 Beach Boulevard
Buena Park, California

Attendance Record:

Members Present: 15

Owusu Bandele
Carolyn Brickey
Kim Burton
David Carter
Goldie Caughlan
Rebecca Goldburg
Steven Harper
Marvin Hollen

Mark King
Rosalie Koenig
William Lockeretz
James Riddle
Eric Sideman
George Siemon
William Welsh

Members Absent: 0

Other Attendees:

Keith Jones, Program Manager, National Organic Program (NOP), U.S. Department of Agriculture (USDA);
Richard Mathews, NOP, USDA;
Beth Hayden, NOP, USDA;
Toni Strother, NOP, USDA; and

Interested persons from the public (See attachment B).

PUBLIC COMMENT SESSION – TUESDAY, MARCH 6, 2001

The following people presented remarks before the National Organic Standards Board (NOSB).

Mr. Don Bell, Representing United Egg Producers (UEP) – Mr. Bell made comment in regard to the use of the term "organic" interchangeably or in combination as part of a single system. These comments are intended to provide scientific reasons for keeping chickens inside a confinement facility and in providing chickens a cage environment. Suggests "Cage-free Organic" and "Caged Organic" poultry labels. (See attachment 1)

Mr. Jack Samuels, Citizens for Truth in Labeling - Comment against approval of L-Cystine. Points out that there are serious errors in the TAP review of L-Cystine. Mr. Samuels asked that the NOSB not approve L-Cystine for inclusion on the National List of approved materials. (See attachment 2)
Mr. Steven Mahrt, Petaluma Farms – Offered a quick overview of why Methionine is essential to a well-run organic poultry farm to prevent stress by providing a balanced diet, promote feed efficiency and conserve resources. (See attachment 3)

Ms. Robin Downey, Pacific Coast Shellfish Growers Association – Presented a White Paper Developing Organics Standards for Molluscan Shellfish. (See attachment 4)

Mr. Todd Lorenz, Cyanotech – Spoke on certified Organic Spirulina production, and the fact that the Final Rule does not accommodate microalgae Aquaculture. Current production system cannot comply with 20% limit on nitrogen from sodium nitrate. Suggests establishing separate standards for microalgae. (See attachment 5)

Dr. Amha Belay, Earthrise Nutritionalis Inc. – Presented information on the Unique Features of Microalgae Culture Systems: Organic Spirulina production. Supports position of Mr. Lorenz. (See attachment 6)

Mr. Merrill Paxman, Sales and Marketing Manager, Millers’ Honey Company - Representing Clint Walker, President, National Beekeeping Federation and Buddy Ashurst, President, National Honey Packers and Dealers Association. Encouraging organic standards for honey and beekeeping with request for a task force for beekeeping and honey handling under organic methods. Described areas of production standards including post harvest actions. Offers to be involved in honey task force. (See attachment 7)

Ms. Emily Brown-Rosen, Organic Materials Review Institute (OMRI) – 38 certifiers, including 8 states, subscribe to OMRI. OMRI to re-publish their list by June to comply with final rule. The compost requirements of the final rule will require the reclassification of many OMRI approved heated pathogen-free compost products as raw manure. Also requesting removal of natural colors from National List. She believes there was no petition to put natural colors on the National List, and no recommendation by the NOSB. She stated that Environmental Protection Agency (EPA) plans for development of a label to identify products with ingredients approved for use in organic agriculture prompts concerns and specific needs regarding the definitions of synthetic and natural. She expressed the belief that the definitions should not be limited to origin and should address process. OMRI has a concern about volatile oils, permitted methods of extraction for "natural" products, guidance about GMO’s, and regular updates on changes to EPA List 4. Of eighty (80) approved materials on OMRI’s list, half include inerts on List 3 which will no longer be available in April 2002.

Ms. Deborah Brister, University of Minnesota, Aquaculture Working Group Member – Reported on recent workshop issues appropriate to organic certification of aquaculture. Submitted report on organic standards proposed by the workshop. Specifically mentioned feed sources, use of terrestrial livestock by-products for feed, antibiotics, triploidy induction does not involve genetic engineering, and concerns about effluent management. (See attachment 8)

Ms. Katherine DiMatteo, Organic Trade Association (OTA) – Complements to the NOSB and NOP on improvements of transparency and information availability. OTA will support NOSB agendas, but encourages more information about what is being worked on by the NOSB, that doesn’t appear on NOSB agendas. Requests clarification about who is responsible for making decisions on issues not on agendas. What happens to requests for changes and new issues for the NOSB to address when they are not on meeting agendas. Ms. DiMatteo also brought to the Board’s attention the AOS standards for honey, mushrooms, and greenhouses. OTA’s list of 41 questions about the rule will hopefully be addressed. Issues of importance include compost standards, conflict of interest, private label exclusion, and commercial availability.

Mr. Miles McEvoy, Washington State Department of Agriculture, and NASOP – Requested that the NOSB take another look at exemptions and exclusions, especially how the final rule compares to the NOSB’s recommendations from 1994 and 1995. He stated
that the regulations should require certifications of all products that make organic claims, including wholesale distributors and processors that only make an organic claim on the information panel or ingredient statement, especially when the ingredient statement is on the principle display panel. Also concerned about unlevel playing field caused by excluding in-store retail processing. NASOP adds similar comment requesting that NOSB reconsider Applicability section specific to exemptions and exclusions as they impact enforcement and enforcement costs that will be the burden of state organic programs. Also had comments on new compost language, specifically regarding chicken litter, which does not meet the required C:N ratio.

**Mr. Garnett Pirtt**, Capitan Cook Honey in HI – Spoke in favor of honey standards. He is complying with all the requirements and would like to see honey standards in place. Offers to be involved in honey task force.

**Ms. Suzanne Vaupel**, International Federation of Organic Agriculture Movements (IFOAM), CCOF Government Affairs, OTA International Committee - Ms. Vaupel spoke on behalf of IFOAM on four issues. The first issue she addressed was the right of private certifiers to use their seal or logo to represent their standards, which may include additional standards to those in the USDA Regulation. States that certifiers need regulatory certainty regarding NOP interpretations. The second issue was conflict of interest. She believes the regulation excludes certified farmers from serving on the certifier’s board or in positions that are "responsibly connected." This prohibits "stakeholder involvement", which is an ISO 65 requirement. IFOAM is very concerned that conflicts of interest are avoided in all certification decisions. The third was accreditation of foreign certification bodies. The regulation does not include one of the options that the NOSB recommended to USDA. The NOSB recommended that USDA accept accreditation by an international accreditation body. The NOP could: (1) use reports written by the International Organic Accreditation Service; (2) contract IOAS to perform evaluations; or (3) review and recognize IOAS. And the fourth was what IFOAM refers to as small holder certification. Specifically, in Third World countries, groups of very small farmers are commonly organized under a single system that has an internal inspection body. IFOAM encourages USDA to allow for the selection of a statistically representative sample of farmers in such organizations for on-site inspections. (See attachment 9)

**Mr. Joe Smillie**, Senior Vice President, Quality Assurance International (QAI), and Secretary, OTA – Commented that commercial availability and private labeling are issues the NOSB could address. He believes that commercial availability is doable since QAI has successfully enforced commercial availability, and that private labeling could be an enforcement nightmare. He believes that consumers expect companies that commission the manufacturing of organic processed products to be certified. Without certification, there is no oversight of the audit trail. This issue requires a huge technical correction. Also requests that the Board look at what claims can be made that are beyond the purview of the rule. Can this be included in the "made with" category? Urges the Board to address and make it a priority. Also please keep transition to organic on your list. Lastly, there is a need for equivalency and flexibility in the accreditation or approval of indigenous certifiers for imported products. (See attachment 9)

**Ms. Diane Bowen**, OCIA International – Expressed concern that the conflict of interest provision will prevent producers and handlers from serving on certifier boards. This requires a short term fix and should be a high priority for the NOSB Accreditation Committee.

**Mr. Marty Mesh**, Florida Organic Growers, chair of the OTA’s Organic Certifier’s Council – Also spoke about conflict of interest. OCC will submit specific amendatory language in advance of the June meeting. Requests a current update on the situation in Japan from NOP. Also request that the NOSB give its attention to a natural supply of calcium sulfate for tofu processing.

**Mr. Marty Mesh**, presented on behalf of Mr. Michael Sligh, The National Campaign for Sustainable Agriculture. Campaign to meet in conjunction with NOSB’s June meeting. (See attachment 10)

**Mr. Rod Crossley**, Consultant, chair of the CA Organic Advisory Board – Spoke on the National List with respect to what can be added and deleted. Natural colors and flavors should be removed from the National List, since there was no TAP review. Asks about short term approval process for imported ingredients. (See attachment 11)

End of Public Comment
Welcome and Introduction of New Members – Carolyn Brickey, Chairperson

Carolyn Brickey thanked every one for coming and participating in the meeting. She stated that the Board has a grueling schedule that they intended to cover over the next two days. Ms. Brickey recognized the work of past members, welcomed the new members, and encouraged all to stay involved, and to work with Secretary Veneman and the new Administration.

Ms. Brickey mentioned some of the top priorities of the Board: adequate funding; pressing for transitional opportunities and funding for transition; new standards for honey, mushrooms, greenhouses; advice on access to pasture; commercial availability; promoting EPA’s efforts on labeling; and compiling and maintaining an accurate and comprehensive record of NOSB actions and material approvals.

Introduction of New Members filling five vacant positions on the NOSB, the new positions expire in 2006, the new members are:

Certifier: Jim Riddle, Winona, MN
Farmer/Grower: Rose Koenig, Gainesville, FL
Consumer: Goldie Caughlan, Seattle, WA
Consumer: Dave Carter, Aurora, CO
Farmer/Grower: George Siemon, LaFarge, WI

An Agenda review was conducted with no changes.

USDA/NATIONAL ORGANIC PROGRAM UPDATE – KEITH JONES, PROGRAM MANAGER

The Final Rule’s effective date is now April 21, 2001, due to a housekeeping error now rectified. Because of the tremendous amount of work that has to go into developing a proposed rule for honey, mushrooms, and greenhouse standards, much work has to go on in the Department. The NOP will make every effort possible to be open about this activity, but under the current time constraint, it may not always be possible to provide the NOSB with drafts of these documents.

Two issues seem to be most important. Conflict of interest and additional standards. It is not USDA’s attempt to remove farmers from the process of certification, but to keep the certification process free of conflict of interest. Certifiers are allowed to provide for the voluntary use of additional truthful label claims, such as "pasture based organic."

Other areas of concern include "lack of capture" of processing facilities. This may not require a major fix, if any at all. We are mostly concerned with a legal audit trail. Commenters have raised legitimate questions that justify a look.

Another is the issue of commercial availability. What does a certifier have to do to be sure efforts have been made to source organic ingredients? The NOP asks the Board for a specific recommendation; comments to the rule did not provide it.

Another is the subject of technical corrections. Technical corrections cannot change the nature or intent of the rule. They can correct errors in drafting. They are usually done six months to one year after publication of a final rule.

The NOP is also getting interest in labeling for health and beauty aids. We will have consultation with the Food and Drug Administration (FDA) about this labeling category. Also received interest in labeling of organic pet food.

Regarding negotiations with Japan, another equivalency proposal was made to Japan last week to basically accept USDA oversight of ISO 65 and that was rejected. They said no, we have to meet their standards. Their standards are insufficient when measured against our standards. Trade with Japan was a huge area of concern at BioFach. Keith Jones recommends that the NOSB get an update from the Foreign Agricultural Service (FAS) at each meeting regarding negotiations with other countries. FAS negotiates these discussions, not the NOP. The Board cannot make recommendations to FAS, but should be informed about these trade discussions.
Carolyn Brickey asked for reaction to the final rule at BioFach. Reaction depends on who you ask. Keith Jones is pleased with interest from the EU, trying to think through the trade implications of their rule. They appear to be very interested in developing equivalency with us. Documents are being traded again. The EU seems to be interested in moving quickly. Although their livestock standards are basically "do the best you can" and are handled at the regional level.

Rose Koenig asked about comments regarding compost standards and on List 3 inerts. Keith Jones has gotten no comments regarding List 3 inerts. The Department has gone the limit to find funding for materials review and the Board has done what they can to expedite reviews and approvals, but there is no evidence of "all those materials out there that will not be allowed" because so few petitions have come in. The $100,000 for materials reviews this year and $100,000 for next will probably not get used, making it almost impossible to get future funding.

Keith Jones cannot stress to this Board how contentious the issue of compost standards was in terms of regulatory impact, and they will probably not be changed. It was the most difficult and last section of the final rule to get cleared, so there may not be an opportunity to go back and change anything. The NOP is always open to listen, but this particular issue will be very, very difficult to move at all.

Jim Riddle asked about the situation of raw products finished in Japan, what about an additional seal that makes multiple claims, such as "pasture based" or "grass fed" in addition to "EU compliant" or "Biodynamic." This would be fine as long as they are truthful claims. Jim Riddle asked about capture of processors and "private label" companies, and if comments or recommendations from the Board carry more weight on the issue than comments that come from outside the Board. Keith replied, "If the Board wants to use its time to make a formal recommendation, fine, but NOP is looking at this issue, a policy directive can take care of it."

Carolyn Brickey asked about the problem of intermediate ingredients in compost. According to Keith, the question became one of composted manure vs. raw manure. The NOP is hearing, "we just can't comply with this" because it's just too hard. That won't fly. If its an issue of use of language, that might be possible. Office of Management and Budget (OMB) will be the hardest hurdle because of cost. Keith Jones wouldn't be surprised if OMB wouldn't require some study about how it really impacts somebody on the ground. What would be the financial burden of existing language?

Owusu Bandele asked about transitional language. Keith Jones notes that you can still call it "transitional" not "transitional Organic". The Organic Food Production Act (OFPA) is silent on transition and their needs to be additional research on what "transitional" really means to the consumer. The NOP has not precluded existence of a transitional label.

Jim Riddle asked for an explanation of "policy directive". Keith Jones said he always imagined non-regulatory guidance as used by NRCS for additional information. At one time NOP thought they'd just write a manual. After comments started coming in January, he thought of dealing with it one discreet question by one discreet question. Answers would become "policy directives" eventually compiled into a single manual.

Dave Carter asked about small certifier accreditation. Keith Jones explained that accreditation for five years is available except for travel and per diem for evaluators. Keith Jones suggests that there may be some foundation funding available. The NOP wants to engender competition between certifiers. He also would like to see the organic certification cost share program continued and expanded. If adjustments to accreditation requirements are made for domestic certifiers, they must also be made for foreign certifiers.

Willie Lockeretz asked about the possibility of sharing accreditation documents already created by certifiers. The NOP will not use documents from private accreditation bodies. They want to get a handle on certifiers themselves without having to rely on the work of others.
Jim Riddle asked about the time lag for accredited certifiers to do document review of product coming from other countries. Keith Jones answered that if the certifier wants to take the risk, it is a business decision on your part. Jim Riddle understands the certifier is assuming responsibility for that.

Steve Harper asked about the questions and answers promised for the web site by the end of January. The NOP was overwhelmed by questions. The NOP found that many questions were duplicative. Arthur Neal has been tasked with answering questions. He should have a first draft for Keith to review when he gets back next Monday. Keith Jones hopes to have something on the web by the end of March.

Eric Sideman asked about a training session on standards that Keith Jones mentioned in Atlanta, similar to the certification workshop. Keith Jones thinks that might happen in the fall.

Jim Riddle asked if there is a difference between these questions and answers and policy directives. Keith Jones thinks yes. It’s possible to take some of the Q&A’s and turn them into guidance documents, into policy directives, official word.

Willie Lockertz asked about other dates specified in the rule getting bumped up by two months and Keith Jones confirmed that.

**NOSB COMMITTEE UPDATES/PROGRESS REPORTS**

**Livestock Committee – Eric Sideman, Chair:**

The Livestock committee prepared a statement, a guidance document *(See attachment 18)* with the hope that NOP will include more specific guidance in a policy directive. It is important to the Livestock Committee that these issues are included:

- Ruminants must have access to grazing pasture during months when pasture can be grown and provide a significant amount of nutrition from pasture.
- A minimum of 50 percent of the total feed ration should come from edible forage.
- Exceptions will include health and safety of the animal and inclement weather.
- Another exception will be for animals under 6 months old and, animals in final stage of finishing, not to exceed 120 days.

Livestock committee requests public comment on this statement. George Siemon wants to know how the public will get the word out to give comment. Keith Jones will put this up on the web as an NOSB recommendation. Keith Jones clarifies that NOP will not write a directive without an NOSB recommendation. Comments included use of the word forage, as defined by the final rule, and that health and safety should include health of the pasture. Keith Jones reminded everybody that policy directives still do not have the force of law. Keeping that legal framework in mind, is there any more specificity that the NOSB wants in the final rule? For instance, if you say 50 percent of total feed, you should do that, but you don’t have to. You can’t force a producer to hold to that. It’s not a part of the regulation.

Carolyn Brickey asks if there are any requests from certifiers about more specificity in carrying out the terms of certification? Eric Sideman wants to know if a certifier can withhold certification from a producer for not following policy directives. Keith Jones says you can but then you’re going down that path which is much larger. Keith suggests that the committee compile a list of questions and ask where they want more specificity. Keith says that if this is a buzz word for scale, you better get this out on the table. What’s your intent? If your intent is to differentiate about scale, it’s your responsibility to put your biases on the table. If your objectives are that someone is in and someone is out, it has to be on the table. Eric Sideman states that pasture is necessary to the health of the animal. Jim Riddle adds consumer perception as another consideration. Bill Welch wants to know if scientific evidence is necessary. Keith Jones said it’s not necessary to go to that level. Keith Jones reiterated if you want a standard for someone to adhere to you
have to change the regulatory language. Eric Sideman wants to move forward with this recommendation with the intent of incorporating it into the rule. Eric Sideman and George Siemon want this recommendation to include stocking rates that will prevent an operation from keeping, for instance, 150 cows on 15 acres. Dave Carter adds the need to clarify temporary confinement as well. The Livestock Committee will rework their recommendation.

**Materials Committee – Kim Burton, Chair:**

The Materials Committee will continue to manage the materials review process, what needs to be petitioned, what doesn’t need to be petitioned, what can go through certifiers, and how OMRI lists will be used to identify substances not on the National List.

The committee will be pursuing one on one communication with industry for answers to questions regarding material reviews. Inform them that there is $100,000 for TAP review of materials and the lack of material petitions.

Another priority is to develop a policy on updates to the National List, depending on approvals produced at each NOSB meeting. Also, give NOP guidance on removal of items on the list.

The Committee will also update the list of materials reviewed, presented at the last meeting.

**Processing Committee – Steven Harper, Chair:**

Priority for the Processing Committee is the review of materials and suggestions for processors on clarification of need for petitions of materials.

Presentation of a proposal on commercial availability, developed by OTA’s Manufacturing, Processing, Packaging, and Labeling Subcommittee of the Quality Assurance Committee. It can also work for seed as well as ingredients.

Steve Harper reviewed the proposal and asked if it is too technical. Keith Jones thinks this is great. He wants to know the criteria that have to happen in order for a product to be deemed commercially available. Steve Harper asked if he wants an expansion on the definition. Keith Jones responded that the committee will have to get something in there that addresses economic value. Cost has to be clarified. There have to be triggers and one will be cost. NOP did not want to touch commercial availability, but comment has now required that they do.

Some of the information in the proposal is not important to NOP. They will not arbitrate how this will apply. If a material is allowed in the final rule, they will not go further with it. They will not establish a clearinghouse of commercially available materials. That can be done by the industry.

Owusu Bandele pointed out the issue of scale, as a larger producer may not be able to access necessary quantities, where a smaller operation may be able to. Another concern is the paperwork burden. Another is that this may not be appropriate for seeds. Eric Sideman suggests that the Crops committee do the same for seeds. Keith Jones says get this pinned down with a minimum of regulatory requirements. You will not be able to do anything if one producer can find organic seed and another cannot.

Carolyn Brickey can see how this presents incentive to the industry not as Keith Jones does, as a loophole. Jim Riddle echoed Carolyn’s point that this drives the industry to provide organic inputs and seeds. Jim Riddle added that documentation is already happening and certifiers are used to requiring documentation. George Siemon thinks a criterion is needed now. This proposal outlines procedure. Keith Jones said the criteria should include quantity, enough for you to do what you need to do, and the other is the cost factor.

George Siemon asked why OMB is concerned about money. Keith Jones states that’s why people make phone calls, do paperwork, create a regulatory impact for this situation.
Break for Lunch.

**Accreditation Committee – William Lockeretz, Chair:**

Willie reported to the Board that the Accreditation committee does not have any current agenda items for this meeting, but has been asked by the NOP to address two primary issues:

1. For the June meeting, establish criteria for selection of the peer review panel
2. Review with NOP staff the questions and answers to be published on the web

Enforcement is premature and NOP is not ready at this time to address enforcement procedures.

**PRESENTATION BY THE ENVIRONMENTAL PROTECTION AGENCY (EPA)**

Mr. Jim Jones made a quick statement of introduction and also said the OMRI Pesticide labeling proposal they discussed at this morning’s public comment, is shared by EPA and that they are willing to work with the Board and other interested parties. Mr. Jones then introduced Mr. Robert Torla of the Biopesticides and Pollution Prevention Division.

Bob Torla, EPA Organic Label Proposal (See [attachment 12](#))

Mr. Torla stated that the issues Organic Materials Review Institute discussion about EPA organic label included issues of reformulation and label use. Annotations are presenting a problem for EPA in that one product with different uses may require two labels, one that allows it according to the annotation, another that is differently specific. EPA is worried that a manufacturer may not want to apply for more than one label, one approved for organic and one for conventional.

Biologics and GMOs are part of the applicant’s registration process. EPA is not setting policy on what manufacturers put on their labels. EPA will kick back any policy questions to the Board and NOP.

EPA seal cannot be used on exempted products unless registered by EPA, such as garlic or cayenne.

GMO derived ingredients are not allowed by NOP. The question is how does EPA ensure that GMOs are not in the organic labeled product? EPA is unsure how they will deal with this because of the difficulty in detecting GMO’s. For example, you can’t identify GMO in corn oil. If you can’t detect a GMO, it would seem you would have to accept its presence. When EPA does technical reviews they are not making judgements on compliance.

Question came up about EPA allowance of use of the OMRI label. EPA would only allow the OMRI label if it’s truthful.

**INERTS PRESENTATION BY JIM JONES, DIRECTOR OF THE REGISTRATION DIVISION, EPA**

NOP only allows for inerts on List 4. It has come to EPA’s attention that there are 35 or so materials approved by OMRI that include inerts on List 3. This will be allowed only until April 2002. His shop will triage these materials into four categories:

1. Mistakes – Inert actually belongs on List 4
2. Easy to assess (e.g. large polymers)
3. Compounds that need full evaluation and EPA has the data needed
4. Not enough data available to make a determination – not likely to be assessed by October 21, 2002.
By April 2002, substances fitting into categories 1 through 3 can be determined to be list 4 or not. Substances in category 4 most likely cannot be done in time. They will not cancel their use, but will notify that there is not enough information.

Carolyn Brickey asked about new products that have List 3 inerts. Jim Jones said they might not want to register them at all. New products may be reviewed but not a top priority. The next steps will be working with the new Administration getting it through the que, then put it in a Federal Register notice going out for comment.

AQUATIC TASK FORCE WORKING GROUP REPORT AND DISCUSSION - ROBERT ANDERSON, CHAIR

Mr. Anderson gave a brief overview of the structure of the working groups and presentation of reports. Bob Anderson’s intention is for these reports to go up on the web by May 1st allowing enough advanced notice before the June meeting to allow full public information and comment. The public could then make public comment at the June NOSB meeting, allowing the Board to make a determination at the October NOSB meeting.

AQUACULTURE WORKING GROUP - MARGARET WITTENBERG, CHAIR

Margaret recognized the effort put forth by the working group and presented the group’s report. There are two phases of the work of the working group

Phase One – September – November

Feed
Nutrient Management
Siting recommendation
Breeding

Phase Two – November – February

Recirculating System
Healthcare
Living Conditions
Bivalve shellfish

Two opinions were put forward:

1. Wild, sustainably caught fish and fishmeal should be allowed in organic aquaculture. Suggested for inclusion in Section 205.606 on National List as non-organically produced agricultural product allowed as an ingredient in organic products.

2. Organic feed is a component of organic livestock rules. Feed should be organic but would find it acceptable to allow wild fish as nutritional supplement up to 5% of feed for natural amino acids and omega 3 fatty acids.

The Committee also had consensus that organic aquaculture is feasible. Margaret reviewed the report submitted to the Board. (See attachment 13)

WILD AQUATIC SPECIES WORKING GROUP - MILES MCEVOY, WA STATE DEPARTMENT OF AGRICULTURE

The group had consensus on one issue; that there should be some sort of label for wild caught fish, but not necessarily the organic label.
The committee could not come to agreement on whether or not an organic label would be appropriate for wild fish. Miles reviewed the issues addressed by the group and reiterated the lack of ability to come to a decision. (See attachment 14)

MATERIALS PROCESS REVIEW - KIM BURTON, CHAIR

Kim Burton reviewed the NOSB Materials Committee Matrix of activity for review of a petition and process for NOSB approval of a TAP review (See attachment 19). Overall dates are not included due to the need for flexibility. For example, right now the OMRI deadline is March 5th for the June meeting but only 4 petitions have been received, so there is strong likelihood that the deadline will be extended. OMRI is requesting 90 days to do a TAP review. Kim Burton also noted that there are two documents that explain the requirements of the petition process; one prepared by OMRI (See attachment 20), another jointly prepared by OMRI and the California Organic Foods Advisory Board (See attachment 21).

Concern was expressed that sometimes the Board is not provided with enough information to make a decision on whether to approve or deny approval of a substance for addition to the National List. The Materials Committee posed the question of whether the materials review process should be amended to allow amending the TAP based on comments received. Concern was expressed that there are no comments from producers in support of the petitions; the only comments received were negative. Bill Welsh asked if this is because commenters only make negative comments. Eric Sideman asked if this is a problem with the system or a problem with the review that this information is sketchy? It was suggested by a member of the public that a major effort should be made to obtain input from the industry to add to the TAP review recommendations. George Siemon noted that the NOSB is far too dependent on TAP reviews to make materials decisions and that the NOSB needs to have comments from the industry to make these decisions.

The Materials Committee suggested and the NOSB concurred that the TAP summaries should be posted on the NOP web site. The NOP agreed to post the TAP summaries on its web site and to identify who public comments should be sent to.

MATERIALS VOTES:

**Hydroxyquinoline Sulfate (Livestock) Eric Sideman, Chair**

Annotation recommended by the Livestock Committee:

Primary health care must be based on preventative health care (OFPA language is "not in the absence of illness") and may only be used to treat an ailment. According to OMRI this is an over-the-counter drug not approved by FDA for use on animals. OMRI also stated that this is a list 3 EPA substance.

The TAP review provided the following information on Hydroxyquinoline Sulfate. Hydroxyquinoline sulfate is considered to be a poison when ingested. There is insufficient evidence to indicate whether this substance is a carcinogenic. Although one study (Peterson, 1978) observed tumors in rats from hydroxyquinoline. The FDA in 1994 disallowed the use of derivatives of this substance in antifungal treatments as there was not sufficient data to consider the substances to be safe. Quinoline is a poison, when ingested orally or through subcutaneous injection. Contact with the skin produces a moderate toxic reaction and can result in severe irritation. One report (Aiello, 1998) indicated that this substance is potentially neurotoxic when used topically for prolonged periods.

Jim Riddle stated that this is not tested for residue in milk, there is no data on this.

Marvin Hollen noted that this is not water soluble, you have to be diligent in wiping it off.

Rose Koenig asked if there were any comments from growers? None.

Steve Harper asked why this was petitioned? Is it widely used or a tool being used today?
Any Conflict of Interest? None.

TAP Annotation:

For use in a topical salve for dairy cattle in concentrations no higher than 0.3%.

**15-0-0 Synthetic 4 Approved - 11 Prohibited - 0 Abstained. The Material does not pass.**

**Poloxalene (Livestock) Eric Sideman, Chair**

Annotation recommended by the Livestock Committee

Only to be used in the treatment of bloat.

Owusu Bandele asked if mild bloat was considered an emergency?

Mark King asked if there would be residue in the meat?

Rose Koenig asked if this would be recorded in the farm plan?

Jim Riddle asked if this would be allowed for all livestock species?

Goldie Caughlan said oils and detergents are alternatives.

Annotation:

For emergency treatment of bloat.

**15-0-0 Synthetic 15-0-0 Approved. The material is approved with annotation.**

**L-cystiene (Processing) Steve Harper, Chair**

A dough conditioner, antioxidant, flavorant, widely used in processed products. Committee unanimously recommended against approval because other alternatives are available.

Any Conflicts of Interest? Steve Harper works for General Mills. He has no financial gain.

**15-0-0 Synthetic 0-15-0 Prohibited. The material does not pass.**

Recessed for the day.

**Wednesday, March 7, 2001**

Discussion of voting on ingredients in 100% organic, organic and made with organic ingredients by Rick Mathews:

A "made with organic (specified ingredients or food group(s))" product must, in accordance with section 205.105(c) of the Final Rule, be produced and handled without the use of nonagricultural substances used in or on processed products, except when the nonagricultural substances are included in section 205.605 of the National List of Allowed and Prohibited Substances. Accordingly, the reference to nonorganic ingredients in section 205.301(c) refers to agricultural ingredients only and should not be construed to include nonagricultural ingredients.

To further clarify the Department’s intent, a "made with organic (specified ingredients or food group(s))" product must contain at least 70 percent organic agricultural ingredients that have been produced without the use of:
1. Synthetic substances unless the substances and their use are allowed under section 205.601 or section 205.603 of the National List of Allowed and Prohibited Substances.

2. Non-synthetic substances prohibited under section 205.602 or section 205.604 of the National List of Allowed and Prohibited Substances.

3. Non-agricultural substances unless the substances are allowed under section 205.605 of the National List of Allowed and Prohibited Substances.

Additionally, the remainder of the ingredients in a "made with organic (specified ingredients or food group(s))" product (up to 30 percent) may include:

1. Non-agricultural products listed in section 205.605 of the National List.

2. Non-organically produced agricultural products, raw or processed, that have been produced using synthetic, non-synthetic, and non-agricultural substances without regard to sections 205.601 through 205.605 of the National List of Allowed and Prohibited Substances, except that the use of excluded methods, sewage sludge, and ionizing radiation are prohibited. Non-organically produced agricultural products listed in section 205.606 of the National List of Allowed and Prohibited Substances must comply with the restrictions placed on that product by section 205.606.

MATERIALS REVIEW CONTINUATION – KIM BURTON, CHAIR

Calcium Sulfate (Processing) Steve Harper, Chair

Annotation: From mined non-synthetic sources

Changed to Calcium Sulfate – Mined
No Annotation

0-15-0 Natural 15-0-0 Approved The material is approved with no annotation.

Boiler Chemicals (Processing)

Ammonium Hydroxide
Cyclohexlamine
Diethylaminoethanol
Morpholine
Octadecylamine

Steve Harper reviewed a description of the use of steam chemicals. This category is volatile amines that cannot be taken out of the steam. Steve indicated that OTA believes it is imperative to petition the volatile amines that directly come into contact with food. There is a group of chemicals that are designed to stay in the boiler and do not come into contact with food. The group of substances being petitioned do come into contact with food.

The Processing committee looked at these reviews and recognized that there is a lot of information that is not included in the TAP reviews and recommended tabling the vote on these substances until additional information can be submitted.

Dave Carter questioned the agenda calling for review, not a vote, on these chemicals as well as the process of "tabling." Tabling requires a vote to table and another vote to take off the table. Deferring action is much simpler. It was agreed to defer action on Boiler chemicals until the June meeting.
Steve Harper has arranged for an outside expert, not connected to the petition, to explain the circumstances about steam chemicals to the Board. The Board finds difficulty with the process of calling in an outside expert. Rose Koenig expressed concern about setting a precedent and echoed that Carolyn Brickey should have been consulted regarding expert testimony. Carolyn was indeed consulted and approved the guest speaker prior to the meeting. Rose Koenig wants the procedure for calling in outside experts to be clear to the public. George Siemen asked who paid for the expert. According to Steve Harper, OTA will be billed for the expert. Goldie Caughlan feels that it is the responsibility of the NOSB to have this information. Eric Sideman wants to hear this expert now as he (the expert) has to catch a plane. He suggested that the NOSB develop a policy on the use of outside experts.

Carolyn asked if there were any objections to hearing from the consultant. Owusu Bandele abstained. There were no objections.

**Presentation to NOSB on boilers and boiler chemicals**

Steam only must exit boiler – steam has "latent heat" – heat associated with phase change – water does not have latent heat. Want "dry" steam to exit boiler.

Steam produced in a plant is generally used in a variety of ways. Some may be used for direct injection, steam cleaning, steam jackets, heat exchangers, or condensed for hot water needs.

Impurities in boiler water consist of undissolved solids, dissolved solids, and dissolved gases. Undissolved solids are generally not the issue. Dissolved gases lead to corrosion. Most common dissolved gases – O2, CO3, HCO3. CO3 and HCO3 break down to form CO2 gas. O2 and CO2 are "non-condensable gases" with no "latent heat". When steam condenses a condensate is formed. This water then absorbs CO2 and O2. As condensate continues to cool below its condensation temperature, it is more able to absorb corrosive dissolved gases. The O2 can act as a catalyst to form rust and oxygen pitting. CO2 in condensate creates carbonic acid, which is corrosive. Stainless steel and other alloys can be used to avoid corrosion, but they may not be rated for the pressures needed, and may not be able to expand and contract as needed.

Volatile amines – include:

1. Neutralizing amines
2. Filming amines

Neutralizing amines are introduced directly into steam or boiler water to retard corrosion. Some of the neutralizing amines will absorb into the condensate neutralizing the pH of the condensate to prevent corrosion.

Filming amines are introduced directly into steam to coat and prevent pitting.

Neutralizing and filming amines can both end up in or on the product. Filming amines are more likely to remain on the product. Neutralizing amines tend to volatilize.

Facilities that use culinary steam can avoid use of volatile amines by:

De-aeration to drive off O2 prior to boiler - not typically very efficient. Remainder can be scavenged in boiler by adding a de-alkalizer.

De-alkalization – add salts (sulfite/sulfate) to remove bicarbonate and carbonate in boiler. Methods to remove bicarbonate and carbonate tend to be costly one-time investments.
Plants which use amines typically shut off the feed lines during organic production. This can result in substantial corrosion issues and contamination of products with corrosion products i.e. FeO2, etc.

With soft water, amines may not be needed.

In the Northwest, at 50 percent or more of plants east of the Cascades, use of amines is common. West of the Cascades, less than 50 percent of plants uses amines.

Speaker has no knowledge on residue levels in products where amines are used.

What is the least toxic amine? DEAE is seen as least toxic, but this is anecdotal.

Future trends – pre-treatment alternatives are effective, but they are costly. They are being included in new installations.

Can volatile amines be removed by ion exchange before they are released in the steam? This is not a valid concept. It may be possible with an activated carbon bed.

Amines as causes of corrosion – ammonia hydroxide can drive up pH casing corrosion.

The Board decided to defer action on Ammonium Hydroxide, Cyclohexlamine, Diethylaminoethanol, Morpholine, and Octadecylamine until the June 2001 meeting. In the interim, the Board will seek information on levels of the substances in the product, health effects of the substances, existing certifier policies, and economic data.

Break for Lunch at 12:00.

The meeting reconvened at 1:00 p.m.

Zea Sonnabend – Presented a draft document re-constructing past NOSB recommendations (1993-2000). She is also working on a summary of recommendations since the Green Book. She still needs to review the March, 2000, minutes and the Proposed Rule comments.

It was requested that Zea organize the chart in the same order as the Green Book.

The Board would like Zea to prepare a computer file with all recommendations and decisions. Decision wording from Green Book should be typed into a new file with post Green Book decisions added to create a comprehensive record. Zea could do this, but not under the current contract. The document should be made available to the NOP, NOSB, and the public by posting it on web.

Zea will finish locating minutes and records, think about an index, and identify policies. She will also excerpt decisions from meeting minutes, and develop estimate/work plan for full compilation as discussed above.

Carolyn Brickey asked that the Minutes from 11/15-17/01 be reviewed. Eric Sideman raised questions on materials that are not reflected accurately. Approval of minutes was delayed by one week pending e-mail comment and approval. Toni will e-mail current version to 10 members who were at the November Board meeting. Comments should be submitted in revision mode.

Jim Riddle was nominated by Eric Sideman for NOSB Secretary. Jim’s nomination was seconded by Becky Goldburg. Discussion of role of Board secretary; assist and oversee staff minutes, review minutes and distribute to Board members at least 10 days following each Board meeting. Discussion of new staff position. Not likely in foreseeable future. **Role call vote on Jim’s nomination as Secretary. Passed 15 – 0.**

**Items for votes:**
Livestock Committee - none.

Crops Committee – Owusu Bandele presented commercial availability draft (See attachment 15). Corrections: 2nd para 3rd sentence – change "to related" to "relative", 6th para 1st sentence – insert "be" after "should not." Discussion on "or" vs. "and" in definition. NOP will check with the Office of the General Council.

Processing Committee – New commercially available policy draft presented (See attachment 15). Change Criteria, item 3, "3x the cost of the alternative conventional ingredient." Change "input" to "ingredient" throughout. Insert in B2 1st sentence to read "Keep an ongoing publicly available list". Change B4 1st sentence "provide" to "provided." Change B4 2nd sentence to read "If the investigation of the complaint provides significant new information, then the certifier must revisit the exemption." Strike last sentence. Moved by Steve Harper, seconded by Goldie Caughlan to approve as NOSB comment to NOP. Passed 14 – 0 – 1.

Motion to combine and approve the two comments above with the definition being different for ingredients and crops. Moved by David Carter, second by Kim Burton. Becky Goldburg will draft a preamble to combine the two comments above. Passed 15 - 0 - 0.

A new task force was formed to draft a policy for calling expert witnesses. The members included Mark King (Chair), Rose Koenig, Owusu Bandele, Kim Burton, and Steve Harper.

Carolyn briefed the public on the Board’s public comment procedures and requested that people who want to testify, please sign in.

Accreditation Committee: Jim Riddle presented draft “Principles of Organic Production and Handling” (See attachment 16) for discussion purposes. He will e-mail it to all NOSB members. Comments should be submitted to Jim Riddle in revision mode or cited by section number. Accreditation Committee to have revised draft posted by May 5. Steve Harper was asked to make sure the principles do not contradict the final rule. This is an attempt to define "consistent with organic agriculture."

William Lockeretz stated that the committee would like to see the Peer Review Panel (PRP) seated by the end of the year (2001). The Accreditation Committee will draft procedures for selecting PRP members and present them to the Board for approval at its June meeting. The Committee will also suggest a PRP definition which is compatible with 205.509. A draft of the procedures and definition will be presented to the Board by May 5. The Accreditation Committee will also track certifier comments and reactions to the accreditation process. The questions circulated by Willie Lockeretz to 16 certifiers will go out to OCC members. No one objected to this happening.

Crops Committee: Intends to do some additional work on mushrooms, greenhouse production, vermiculture, and compost tea. Monocalcium Phosphate was petitioned and the committee has requested a TAP review.

Livestock Committee: Continue work on pasture. Solicit input on pasture and livestock nutrition from industry experts. Eric Sideman will submit a more detailed plan. Intend to post their work on pasture on the Web by May 5. TAP review for amino acids (DL-Methionine, DL-Methionine Hydroxy analog, and DL-Methionine Hydroxy analog Calcium) for livestock use under consideration at June meeting.

Planning species specific guidelines for "stage of production" by the October 2001 meeting. To be submitted to NOP as suggested policy directives.

Livestock Committee to be involved with NOP draft of honey standards.

Processing Committee: Continue seeking further information on boiler chemicals. To consider Dimethylpolpsiloxane, an anti-foaming agent, and reconsider the uses of Potassium Hydroxide. Steve Harper intends to submit draft language to clarify which materials need to be petitioned for inclusion on National List. Will also look at how novel processes such as ion exchange or UV treatments are evaluated. No timetable presented.
**Materials Committee**: Kim Burton handed out updated work plan ([See attachment 17](#)). Materials Committee will seek further materials for consideration by potential petitioners. Kim Burton will clarify TAP flow chart. Kim Burton and Emily Brown-Rosen will update materials database. The committee will also develop a policy on update of the National List.

Suggestions for OMRI on TAP reviews. Chairs are getting copies of petitions, but these are not going out to all NOSB members. Richard Mathews stated that NOP will send the basic petition to all members. The members can request the supporting information as needed.

One review had 4 reviewers, all others had 3. Emily Brown-Rosen explained that they must have at least 3 reviewers. In one instance, she was not satisfied with the quality of one review, so an additional review was conducted.

George Siemon seeks additional input from the public on materials being considered. Kim Burton will try to organize all information received.

Carolyn Brickey reminded all present to solicit petitions for materials to be reviewed.

Carolyn Brickey summarized work plan. She will notify everyone of their assignments once she gets the draft minutes from Jim Riddle.

Next meeting to be held June 6, 7, and 8 in LaCrosse, WI. George Siemon, Jim Riddle and Bill Welsh will help to organize.

The fall meeting will be held October 15 - 16, 2001, in Washington, DC after Expo East.

Business meeting closes.

Richard Mathews announced that NOSB members are invited to sit in on the certifier training after the comment period concludes. Additionally, Mark Bradley will put on a slide presentation on conflict of interest for Board members later today.

Ten minute break prior to public comment.

**PUBLIC COMMENT SESSION – WEDNESDAY, MARCH 7, 2001**

The following people presented remarks before the National Organic Standards Board (NOSB).

**Jack Samuels**, Citizens for Truth in Labeling - Thanks board for rejecting L-cystine. Informs Board of trend concerning MSG and free glutamic acid sensitivity. Reports incidences of reactions to organic produce, including his own experience after eating an organic potato. Organic farms seem to be using hydrolyzed fish emulsion and enzyme hydrolyzed feather meal. Read from a letter from a physician that stated acid hydrolysis can form carcinogens.

**Garnet Pirtt**, Organic honey producer, Capitan Cook Honey– QAI certified. Reports that conventional honey is contaminated. Asks when proposed honey standard will be posted. Offers to be involved in writing or reviewing draft comments.

**Marty Mesh**, Florida Organic Growers – Thanked the board for the good work done at this meeting. Asks how and when draft organic sprout standards will be released. Supports the development of statement of principles. Calls into question restrictions on gifts that non-profit certifying agents can receive. Asks for NOSB intervention. Read a letter from FOG certified farmer Frank Oakes, Organic Farmer ([See attachment 22](#)) – "Organic farmers are the reason for the NOP. Objects to conflict of interest provisions."

**Ms. Zea Sonnabend** - CCOF comments. Suggestions for work plan items. Moving forward with EPA labeling program clarifications. Genetic engineering policies related to farm inputs needs to be on work plan. Further definition of extraction. Narrow range oils. How far back in production chain to go with synthetics and GMOs?
Mr. Ray Green, CDFA – Explained the comments he is about to make are his own. Impact of NOP on State programs. Policy directives will not be enforceable in CA, unless they are in the regulation. Cannot issue a notice of violation unless there is a regulation section to cite. Can only enforce "must" and "shall" items. When you interpret the law, you are creating a regulation.

Lynn Coody, Organic Ag Systems Consulting - Concerned that USDA is saying that ISO 65 is embedded in the Rule. NOP intends to cover all ISO 65 requirements during accreditation. There are a number of items where the Rule differs from ISO. Certifiers need to know which requirements to meet. Certifiers cannot be held to invisible requirements. There is also an overlap of the current ISO accreditation and NOP accreditation. Technical corrections should be made as soon as possible. Training manuals and programs must be firmly rooted in the Rule. Accreditation Committee should review gap analysis comparison of the Rule and ISO 65, available from the Organic Trade Association.

Richard Mathews responded that the Rule covers all ISO 65 requirements, and the NOP will be issuing a detailed comparison for the June meeting. NOP will be doing more training in April and May and post answers to questions on the website.

Mr. Steve Sprinkel, Organic farmer. Trying to discern how some changes can be made to the Rule. Understands that the NOSB is the vehicle for change. Questions if he must make compost only according to the Rule. Feels that the requirements are overly prescriptive and unreasonable. Feels that there are many others who share his concerns.

Motion to adjourn by Dave Carter, seconded by Bill Welsh. Passed 15-0-0.

Adjourned at 4:50 p.m.

CAROLYN BRICKEY, Chair
National Organic Standards Board

KEITH JONES, Program Manager
National Organic Program
Wednesday, June 6, 2001

8:00 a.m.: Public Comment

10:00 a.m.: Remarks of the Chair, Carolyn Brickey --Overview of the Agenda

10:30 a.m.: Approve minutes from March meeting, Jim Riddle

10:45 a.m.: Break

11:00 a.m.: NOP update and discussion

12:00 p.m.: Lunch

1:00 p.m.: Presentation of Committee Discussion & Action Items

Livestock

- Recommendation “access to pasture” – Eric Sideman

Materials

- Adopt final Materials decision matrix
- Review of materials
- Adopt final policy for updating National List
- Review committee communication with organic industry
Processing

- Adopt recommendation clarifying materials which must be petitioned
- Begin discussion regarding which novel processes will be allowed in organic handling
- Recommend clarification to address potential mislabeling by uncertified processors

Crops

- Draft guidance on compost tea & vermiculture
- Draft recommendations to NOP for greenhouse standards
- Draft recommendation to NOP for mushroom standards
- Begin discussion of transitional labeling & operations

Accreditation

- Adopt plan for peer review panel
- Provide analysis of NOP website question and answer documents to give advice for subject for policy guidance
- Present new certifier outreach report
- Discuss committee draft principles of organic production & handling

2:15 p.m.: Break

2:30 p.m.: EPA Presentation, Janet Anderson, Director of the Biopesticides and Pollution Prevention Division

- Discussion of organic product label proposal
3:30 p.m.: FAS Update on Trade Issues

4:15 p.m.: Begin Materials Process Review

- Explain materials petition process and timelines, decision process for reviewing/approving a material
- Brief review of list of materials
- Review each material
- Board action

5:30 p.m.: Recess

Thursday, June 7, 2001

8:30 a.m.: Materials review process

10:30 a.m.: Break

10:45 a.m.: Complete Materials review process

12:00 p.m.: Lunch

1:00 p.m.: Task Force Report on Board Policy Expert Presentation, Mark King, Chair

1:30 p.m.: Task Force Report on Outreach to Producers, Rosie Koenig, Chair

2:00 p.m.: Aquatic Task Force Working Group Report, Bob Anderson, Chair

2:30 p.m.: Committee Action Items

- Discussion and Board Action
4:00 p.m.: Wrap Up/New Meeting Plans

4:30 p.m.: Public Comment

5:30 p.m.: Adjourn
The NOSB meeting of October 15-17, 2001, was attended by 14 of its 15 members. Absent member was Marvin Hollen.

The NOSB acted on the following items at the October 2001 meeting:

- June 6-7 Meeting Minutes: Approved as amended. Jim Riddle moved to approve and Willie Lockeretz seconded the motion. (14 in favor, 0 opposed, 0 abstaining)

**Livestock Committee Items**

- Access to Pasture Recommendation - Approved as amended. Jim Riddle moved to approve and Goldie Caughlan seconded the motion. (14 in favor, 0 opposed, 0 abstaining)

- Antibiotics in Vaccines and Semen Recommendation - Approved. Dave Carter moved to approve and Kim Burton seconded the motion. (14 in favor, 0 opposed, 0 abstaining)

- Apiculture Task Force Recommendations - Approved. George Siemon moved to approve and Owusu Bandele seconded the motion. (13 in favor, 1 opposed, 0 abstaining)

**Materials Committee Items**

**Crops Materials**

The following materials were determined to be synthetic and prohibited for use in organic crop production.

- Monocalcium Phosphate – For the purpose of conserving nitrogen in the compost pile. (14 synthetic, 0 natural, 0 abstaining; 1 approve, 13 prohibit, 0 abstaining)

- Calcium Chloride – Non Brine Process is synthetic and prohibited. (14 synthetic, 0 natural, 0 abstaining; 0 approve, 14 prohibit, 0 abstaining)

The following material was determined to be non-synthetic and prohibited, with annotation, for use in organic crop production.

- Calcium Chloride - Brine Process is natural and prohibited for use except as a foliar spray to treat a physiological disorder associated with calcium uptake. (1 synthetic, 13 natural, 0 abstaining; 2 approve, 12 prohibit, 0 abstaining)
The following material has been determined to be synthetic and approved for use in organic crop production.

- Copper Sulfate – NOSB approved amending the existing National List usage to add “…; only with documented need as an algicide and tadpole shrimp control in aquatic rice systems; not to exceed one application per field per two year interval; used in a manner to minimize accumulation of copper in the soil and water systems.” This material was previously determined to be synthetic. (10 approve, 3 prohibit, 1 abstaining)

The NOSB reaffirmed its October 26, 1999, vote to allow the use of ethylene for the post harvest ripening of tropical fruit and degreening. Rosie Koenig moved to reaffirm the vote and Eric Sideman seconded the motion. (10 in favor, 0 opposed, 4 abstaining). The current annotation does not allow for degreening. The recommended amendment to the annotation will be included in the proposed rule to amend the National List.

Livestock Materials
The following Livestock materials have been determined to be synthetic and approved, with annotation, for use in organic livestock production:

- DL-Methionine, DL-Methionine Hydroxy Analog, and DL-Methionine Hydroxy Analog Calcium – The NOSB determined that these materials are not consistent with organic agriculture but approved them for interim use, until October 21, 2005, by the organic poultry industry to allow the phasing out of their use. (14 synthetic, 0 natural, 3 abstaining; 14 approve, 0 prohibit, 0 abstaining) The NOSB also voted that if the Office of General Counsel says no to the shorter sunset date, the material remains prohibited and the NOSB will reconsider the material at a future meeting. (8 in favor, 3 opposed, 3 abstaining)

Processing Materials
The following materials were determined to be synthetic and approved for use in organic processing:

- Ammonium Hydroxide – For use as boiler water additive only with removal from the National List October 21, 2005. If the Office of General Counsel says no to the shorter sunset date, the material remains prohibited. (11 synthetic, 0 natural, 3 abstaining; 10 approve, 1 prohibit, 3 abstaining)

- Cyclohexlamine – For use as a boiler water additive for packaging sterilization only. (11 synthetic, 0 natural, 3 abstaining; 8 approve, 3 prohibit, 3 abstaining)

- Octadecylamine – For use as a boiler water additive for packaging sterilization only. (11 synthetic, 0 natural, 3 abstaining; 8 approve, 3 prohibit, 3 abstaining)
- Postassium Hydroxide – Approved amending the annotation to read: prohibited for use in lye peeling of fruits and vegetables except when used for peeling peaches during the Individually Quick Frozen (IQF) production process. This material was previously determined to be synthetic. (14 approve, 0 prohibit, 0 abstaining)

- Cellulose – For use in regenerative casings, as an anti-caking agent (non-chlorine bleached) and filtering aid. (12 synthetic, 0 natural, 2 abstaining; 10 approve, 0 prohibit, 4 abstaining)

The following materials were determined to be synthetic and prohibited for use in organic processing:

- Morpholine – The motion, to allow this material for use as a boiler water additive for packaging sterilization only, failed. (10 synthetic, 0 natural, 4 abstaining; 6 approve, 4 prohibit, 4 abstaining)

- Sodium Phosphates – The motion, to amend the current annotation by adding formulated with soymilk or dry soymilk products, failed. The current annotation remains as published in section 205.605(b)(33). This material was previously determined to be synthetic. (3 approve, 10 prohibit, 1 abstaining)

The following Processing materials have been deferred until the May 2002 NOSB meeting:

- Diethylaminoethanol
- Glycerol Monooleate

**Processing Committee Items**

- No action items.

**Crops Committee Items**

- Composting - The NOSB approved creation of a Compost Task Force to address unresolved compost issues. The task force is expected to recommended additional compose regulations at the NOSB’s May 2002 meeting.

- Greenhouse Production Systems Recommendation - Approved as amended. Jim Riddle moved to approve and Steven Harper seconded the motion. (13 in favor, 0 opposed, 0 abstaining, 1 absent)
• Mushroom Production Recommendation - Approved as amended. Eric Sideman moved to approve and George Siemon seconded the motion. (11 in favor, 1 opposed, 1 abstaining, 1 absent)

Accreditation Committee Items

• Principles of Organic Production and Handling Recommendation - Approved. Dave Carter moved to approve and Jim Riddle seconded the motion. (13 in favor, 0 opposed, 0 abstaining, 1 absent)

• Small Farmer Exemption Recommendation - Approved. Jim Riddle moved to approve and Becky Goldburg seconded the motion. (13 in favor, 0 opposed, 0 abstaining, 1 absent)

• Enclosed in a Container requirement for Exclusion of Handler - No vote due to withdrawal of the item by the Accreditation Committee.

• Certification of Private Label Products Recommendation - Approved as amended. Jim Riddle moved to approve and Kim Burton seconded the motion. (12 in favor, 1 opposed, 0 abstaining, 1 absent)

Aquatic Working Group Items

Aquatic Animal Task Force Recommendations - The NOSB accepted the report of the aquatic animal task force and approved the following recommend:

• No standards be developed for wild caught aquatic animals;

• Standards be developed for the production of farmed aquatic animals that reflect an innovative approach to organic certification while remaining fully consistent with the statutory requirements of the Organic Foods Production Act; and

• If standards are developed for farmed aquatic animals, we recommend that the National Organic Program and the National Organic Standards Board use the aquatic animal task force report as guidance.

Eric Sideman moved to approve and Willie Lockeretz seconded the motion. (14 in favor, 0 opposed, 0 abstaining)

Election of Chair and Vice-Chair
• Dave Carter was elected Chairperson.

• Jim Riddle was elected Vice-Chairperson.

• The position of Secretary will be filled at a later date.

Next NOSB Meeting

• The next NOSB meeting is tentatively scheduled for May 7-9, 2002, in Austin, Texas.
The National Organic Standards Board meeting of May 6–8, 2002, was attended by 15 members, and three former members.

**Members Present:**

Owusu Bandele   Rosalie Koenig  
Kim Burton       Michael Lacy    
Dave Carter      Willie Lockeretz  
Goldie Caughlan  Kevin R. O’Reill  
Ann Cooper       Nancy Ostiguy    
Rebecca Goldburg George Siemon    
Dennis Holbrook  Willie Lockeretz  
Mark King

**Members Absent:**

Marvin Hollen    Carolyn Brickey  
William Welsh    Steven Harper    

**Past Board Members:**

Eric Sideman

**National Organic Program (NOP) Staff:**

Barbara C. Robinson, Agricultural Marketing Service Deputy Administrator for Transportation and Marketing; Richard Mathews, NOP Program Manager; Katherine Benham; Arthur Neal; Toni Strother; Robert Pooler; and Keith Jones.

**CALL TO ORDER:** May 6, 2002 - 8:00 a.m. – David C. Carter, Chair (p. 4)

Dave Carter welcomed everyone to the meeting, and had each member introduce him/herself. He announced a change in the materials process review as relates to an item coming forward for action. The chair of the relevant committee will make a recommendation on the material, then move that the committee vote on the recommendation with a show of hands. However, a Board member can still request a roll call vote, or make amendments, or move it forward for a vote.

**APPROVAL OF AGENDA** (p. 9)

Mr. Carter asked if there were any corrections, additions, or deletions to the agenda. Mark King asked for three corrections.

**ELECTION OF BOARD SECRETARY** (p.10)

Goldie Caughlan was nominated by Mr. Siemon, Mr. Lockeretz seconded, and Ms. Caughlan was elected unanimously.
APPROVAL OF MINUTES (p.11)

The minutes of the October NOSB meeting were approved unanimously with no changes.

Kim Burton stated that the NOSB Meeting Book is posted on the web; and Jim Riddle stated that the Board holds monthly Executive Committee meetings and the minutes are posted on the web 2-4 weeks after each meeting.

The following individuals presented public comment. Each person’s comments were recorded and transcribed for the record. Some individuals also presented written comments. Transcribed comments, and where applicable written comments, can be found at the designated Attachments.

PUBLIC COMMENTS – May 6, 2002 (pp. 13-229)

Pete Gonzales, (Page 836)

PUBLIC COMMENTS CLOSED AT 1:55 p.m.

MEETING RECONVENES: May 6, 2002, 2:20 p.m.

Dave Carter introduced Jim Riddle, who will present the Board’s draft policy manual, which has been under development for 6 months.

BOARD POLICY MANUAL PRESENTATION (p.233)

Jim Riddle stated the need to compile the Board’s policies into one manual to facilitate the understanding of the Board’s workings, especially for new members. Therefore, he, Dave, Kim and Mark formed the Board Policy Task Force and worked on the draft. The draft manual is posted on the web. Mr. Riddle summarized the contents and proposed voting later to adopt 95 percent of the manual (the remainder is being reworked).

NOP UPDATE AND DISCUSSION – Barbara C. Robinson & Richard H. Mathews (p.239)

NOP Website

Richard Mathews said that the NOP website will undergo a major redesign and will be available probably in another 60 days. The NOSB will have a designated place within the NOP website. A lot of new information has been posted over the last couple of weeks, so he encouraged everyone to review the many new documents.

He also stated that although the NOSB Meeting Book has been posted on the website, it may be outdated because of the public comments that were received at the NOP office during our absence.
However, there is a section to review for the public comments, and those that the NOP have received in the interim will be provided to the Board and posted to the website.

Barbara Robinson stated that NOP staff members will no longer answer clients’ (producers and handlers) questions without getting information on the issue from the certifying agent, as well. Then an answer will be given to both the client and the certifying agent.

Appeals Concerns

Jim Riddle expressed the opinion that by getting involved in issues between certifying agents and clients, NOP might be jeopardizing their impartiality if one of these issues results in an appeals proceeding somewhere down the line.

Mr. Mathews stated that all appeals go to the AMS Administrator, not the NOP. He also said NOP would try to make sure the issues were posted in the Q&A section of the website.

Organic Trade Conference

Mr. Mathews encouraged everyone staying for the OTA Conference to come to NOP’s booth. The booth is a joint effort with the Natural Resources Conservation Service, Foreign Agricultural Service, Risk Management Agency, and AMS Direct Marketing. Visitors will be able to view the NOP website and staff members will be there to answer questions.

What Has the Board Accomplished?

Willie Lockeretz said that he has been on the Board for 2 years and would like to know what the NOP/Board has done that has had a tangible specific effect on the organic situation in the U.S. Mr. Mathews stated the Board has reviewed a lot of materials, weighed-in on the revised proposed rule, gave additional comments to finalize the rule, and will continue to raise issues and make recommendations. In addition, NOP could not have gotten this far without the valuable contribution of the Board. He stated that NOP is a group of 8 staff members who set priorities, and are determined to have the program up and running on Oct. 21, 2002; nothing will prohibit NOP from achieving that goal.

Mr. Mathews further stated that the first thing is getting people accredited so they can go out and get people certified so that farmers who are working hard in this industry can continue to sell their product as organic on Oct. 21, 2002. Therefore, the small staff is working extremely hard with this dedicated Board to get everything done, and NOP is sure that the organic industry will be more than satisfied.

Dave Carter added that Barbara Robinson has been asked to compile a list of NOSB recommendations over the last couple of years, stating each recommendation, and whether the NOP agreed, rejected, or modified the recommendation. The Board will use this information as a tool to analyze how the decision-making process works.

PRESENTATION OF COMMITTEE DISCUSSION ITEMS

LIVESTOCK – George Siemon, Chair (p.247)

Feed Ingredients

The Board discussed by-products, preservatives, carriers, incidentals, vitamins and minerals, and enzymes in livestock feed.
Dairy Replacement Animals

After recognizing that the recommendation is not in the proper format and does not address all the issues, the Livestock Committee agreed to revisit the recommendation for submission later.

Access to Outdoors for Poultry

It was decided that the committee would meet this evening for further discussions, since very little could be agreed upon.

Miscellaneous

NOP will provide the NOSB with a document that addresses how to physically structure a recommendation to Secretary and what needs to be included.

**MATERIALS** – Kim Burton, Chair (p. 296)

Explanation of Materials Review Process

Kim Burton displayed and discussed a flow chart of the materials review process.

Report On Current Petitions

Ms. Burton listed the materials to be reviewed at this meeting: calcium oxide, calcium hydroxide, potassium sorbate, sodium propionate, sodium nitrate, Spinosad, diethylaminoethanol, glycerol monoleate, gelatin, dewaxed flake shellac, calcium stearate, and Konjac flour. She also briefly talked about materials to be discussed at the September meeting -- livestock-priority materials and crops and processing.

Revised Petition Process

Ms. Burton and Mr. Mathews discussed the streamlined petition process which changes some of the required information to optional.

Proposed Change to Section 205.606

In keeping with the spirit of the OFPA, the Materials Committee said that they will recommend that the 5 materials listed in Section 205.606 be deleted from the National List. Ms. Burton further stated that it is the finding of the NOSB Materials and Processing Committees that these materials are non-organic agricultural products and should be recognized as such. (Further language changes are noted in the Recommendation Attachment E and could not be discerned from transcript.)

Mr. Mathews explained that an interim final rule will be done on materials sometime before Oct. 21, 2002. Deleting these 5 items should be included in that rule.
PROCESSING – Mark King, Chair (p. 312)

Guidance for Handlers in Documenting Ingredients, Ingredient Affidavit Template (Attach. A)

Mr. King said the Committee will recommend that the NOP put on their website a “handling operation ingredient affidavit template” that the Committee developed to serve as guidance for handlers in documenting that finished products are produced and handled in accordance with the regulations.

Guidelines/Comments for Determining Processing Technologies that Require Review by NOSB (Attach. B)

Mr. King said the document under discussion is being developed to clarify the distinction between process issues and materials issues. The aim is to make it understood that synthetic materials used in processing must be petitioned.

Due to the importance and complexity of this document, the Committee will recommend that action on this document be deferred until the September meeting. The document will be posted on the NOP website for another round of comments.

Organic Handling Plan (Attach. C)

The Committee will vote tomorrow to forward the “organic handling plan template” developed by the Committee to NOP for posting on their website. It will serve as guidance for handlers and certifiers in the certification process.

Mr. Mathews stressed that handlers may use any documents or aid that they wish, as long as they comply with the standards—use of this document is not mandatory.

CROPS – Owusu Bandele, Chair (p. 321)

Compost Task Force Report– Eric Sideman, Chair

Mr. Sideman named all the members of the task force, citing their areas of expertise and credentials. Although a recommendation to change the regulations on compost is included in the report, Mr. Sideman said the Task Force focused their attention on an interpretation of the current standards which would allow other, less restrictive methods and materials, not specified in the regulations, to make compost. He presented these other methods. Mr. Sideman also pointed out that the certifying agent would be ultimately responsible for determining if his/her client’s compost was made in accordance with the regulations.

Members of the Task Force agreed to develop a practice standard that would be available to certifiers outlining the high points of this report. He also named the subcommittee members of the Task Force.

Planting Stock – Rose Koenig

Ms Koenig read the Committee’s clarification statement on planting stock from perennial crops grown as annual crops. This clarification was written mainly to address questions from strawberry growers.
In response to a question from Ms. Koenig, Mr. Mathews stated that if organic seedlings or planting stock is not commercially available, the conventionally grown seedlings or planting stock used in their stead must NOT be treated with any substances not allowed by National List. The only exception to this would be substances required by States. However, after some discussion, Mr. Mathews said he would review the issue and give a final interpretation later.

Hydroponics

Mr. Bandele read the Committee’s recommendation on hydroponic organic agriculture. However, after some discussion, and acknowledgement that according to the “scope” statement recently published on the NOP website, hydroponics are already covered in the existing regulations, it was decided that instead of issuing a recommendation on hydroponics, the Committee would put it on their work plan to develop a more elaborate guidance document.

Transitional Products

Mr. Bandele said that the committee is putting forth what they now term a guidance document on “transitional” products. There was a discussion of the value of the term “transitional” if it cannot be used in conjunction with the term “organic.” Although the Committee seemed to agree that “transitional” labeling is beyond the scope of the OFPA and the NOP regulations, they felt that their guidance document would help to bring consistency to the use of the term “transitional.” Mr. Mathews clarified that this will not be an NOP-sanctioned document, but advice from the NOSB to transitioning farmers.

Organic Farm Plan Form (for submitting changes) (Attach. D & E)

Mr. Riddle said that the Farm Plan form he handed out to everyone was designed to be used as a template that would allow producers a format in which to submit annually any changes in their standing Farm Plan. If the NOSB votes to do so, it will be posted to the web for comments.

ACCREDITATION – Jim Riddle, Chair (p.376)

Grower Group Certification

Jim Riddle briefly described and answered questions on a first-draft guidance document the Committee is submitting to be posted on the web for comments relating to the certification of grower groups and the accreditation of the certifying agents certifying these groups. Grower groups (associations/cooperatives) would be certified as a group, with the certifying agent looking at the group’s internal control system instead of each individual grower.

Accreditation Complaint Procedures

Mr. Riddle stated that NOP is required, under ISO 61 guidelines, develop complaint procedures and make them available to the public. The Committee has submitted some language to NOP to be posted on the accredited certifying agents page of the NOP web site about how to go about submitting complaints about certifying agents. The next step is to draft the actual procedures. Barbara Robinson informed Mr. Riddle that NOP has developed appeals procedures and they will be available at the NOP booth at the OTA conference.
Certifying Agent Issues

Jim Riddle related complaints about the NOP from certifying agents. They include: slow or vague interpretation of the regulations; delay in program manual for certifying agents; all ISO requirements are not contained in the regulations; lack of conflict of interest guidance; lack of enforcement plan; and the need for dissemination of information on the agreement with Japan.

INTERNATIONAL – Willie Lockeretz, Chair (p.388)

US/EU Equivalency

The new International Committee has developed a document outlining criteria that should govern how NOP thinks about equivalency as it enters negotiations with the EU. The document also contains a table—a side-by-side—showing the differences between US and EU regulations. Mr. Lockeretz emphasized that it is not a recommendation, but a think piece to be posted on the web site for comments. Ms. Robinson added that although equivalency is desirable, it is not the only course that will allow trade in organic products between the US and EU.

Adjourned 6:30 p.m.

CALL TO ORDER: Tuesday, May 7, 2002 at 8:00 a.m.

Mr. Carter opened the meeting and announced that the access to outdoors for poultry and dairy replacement animals issues will be reviewed this afternoon and acted upon tomorrow.

ADOPTION OF BOARD POLICY MANUAL (p. 405)

Motion: Mr. Riddle moved that the Board Policy Manual be adopted with the understanding that items will be added and changed as needed.

Second: Nancy Ostiguy seconded.

Discussion: Mr. Riddle went through items that need to be changed or added to the manual. Responding to a question from Mr. Lockeretz, Mr. Riddle explained that changes would generate from the Board Policy Task Force and be presented to the full Board for approval. Until the full Board meets, interim approval may be bestowed by the Executive Committee.

Vote: Unanimously approved.

MATERIALS REVIEW AND NOSB ACTION ITEMS (p. 415)

Ms. Burton set the order for materials consideration.

CROPS COMMITTEE – Owusu Bandele, Chair – (See Attach. F for vote explanations)

Calcium oxide

Motion: Mr. Bandele moved that calcium oxide, a synthetic, should be added to the National List with the following annotations: (a) must be sourced from lime kilns; (b) must be used only when documented
soil tests indicate sufficient or excess magnesium; and (c) must be applied in a form that yields less than a 1-degree Fahrenheit temperature increase when equal volumes of the product and water are mixed.

**Second:** Nancy Ostiguy seconded.

**Discussion:** Questions about cost, annotations, sourcing problems, harmony with Codex, and historical use of calcium oxide in organic production were raised and discussed.

**Amendment:** Mr. Carter proposed that each annotation be voted on separately. Mr. Holbrook seconded. The amendment passes on a voice vote. No nays noted.

**Annotation A:** Mr. Carter asks for a vote on accepting Annotation A. Annotation A is accepted by a vote of 13 to 1.

**Annotation B:** Mr. Carter proposes amending the language, striking “to be used only when documented,” to read “Soil tests must indicate excess magnesium.” The proposal to change the language of Annotation B passes by a vote of 11 to 3.

**Vote 1:** Mr. Carter asks for a vote on accepting Annotation B. Annotation B is rejected by a vote of 9 for, 3 against, 2 abstaining.

**Vote 2:** Mr. Siemon (who voted against) moves for a reconsideration. Mr. Bandele seconded the motion. The motion to reconsider the vote passes 13 to 1.

**Vote 3:** Mr. Carter asks for a vote on accepting Annotation B. Annotation B is accepted by a vote of 10 to 4.

**Annotation C:** Mr. Carter calls for a vote to accept Annotation C. Annotation C is rejected. (No vote count given in transcript.)

**Motion as Amended:** Mr. Carter calls for a vote on the following: Calcium oxide is a synthetic material which should be added to the National List with the following annotations: A, Must be sourced from lime kilns; and B, Soil tests must indicate excess magnesium.

**Vote:** In a show of hands, the motion fails 6 to 7, with 1 abstention.

**Calcium hydroxide– change from oxide**

**Motion:** Mr. Bandele moved that calcium hydroxide is a synthetic material which should be added to the national list with the following annotations: (a) Must be sourced from lime kilns; (b) Soil tests indicate sufficient or excess magnesium; and (c) To be applied in a form that yields less than a one degree Fahrenheit temperature increase when equal volumes of the product and water are mixed.

**Second:** Nancy Ostiguy seconded.

**Amendment:** Ms. Burton moved to amend the language and number of the annotations on calcium hydroxide to correspond with the language and number of annotations in calcium oxide. Ms. Ostiguy seconded. The amendment passes unanimously.
Motion as Amended: Mr. Carter call for a vote on the following: Calcium hydroxide is a synthetic material which should be added to the National List with the following annotations: A, Must be sourced from lime kilns; and B, Soil tests must indicate excess magnesium.

Vote: In a show of hands, the motion fails 2 to 10, with 1 abstention.

Potassium sorbate

Motion: Mr. Bandele moved that potassium sorbate is a synthetic material that should not be added to the National List.

Second: Nancy Ostiguy seconded.

Discussion: Mr. Siemon pointed out that the Livestock Committee considering the same substance for a different purpose.

Vote: Potassium sorbate will not be added to the National List, by a unanimous vote.

Sodium propionate

Motion: Mr. Bandele moved that sodium propionate is a synthetic material that should not be added to the National List.

Second: Nancy Ostiguy seconded.

Vote: Sodium propionate will not be added to the National List, by a unanimous vote.

Sodium nitrate

Motion: Mr. Bandele moved to postpone consideration of the two petitions involving sodium nitrate until the September NOSB meeting.

Second: Ms. Caughlan seconded.

Discussion: In response to a question from Mr. Lockeretz, Mr. Mathews said he couldn't promise that the recommendation on sodium nitrate would make it into a Federal Register docket before October 21.

Vote: Consideration of two petitions involving sodium nitrate is postponed until the September NOSB meeting, by a unanimous vote.

Spinosad

Motion: Mr. Burton moved that Spinosad is a nonsynthetic material that should not be added to the National List under 205.602.

Second: Dennis Holbrook seconded.

Discussion: Mr. Bandele clarified that by recommending that Spinosad not be added to the National List [of prohibited nonsynthetics], the NOSB is saying that it is a naturally occurring substance and can be used in organic production.
Amendment: Ms Burton moves to amend the motion to add the words “of prohibited substances” after National List. Mr. Siemon seconded. The amendment passes 13 to 0 with 1 abstention.

Discussion: Mr. Riddle discussed his objections to the material by pointing out passages in the TAP review on toxicity and persistence. He favors annotations. Ms Ostiguy said this had been discussed in Committee, but the Committee concluded annotations would be difficult to enforce. Mr. Baker (OMRI) said their review was mainly crop-focused, but included effects on livestock of Spinosad residue on feedstuffs.

Amendment and Withdrawal of Same: Mr. Riddle (seconded by Ms. Caughlan) proposed an amendment to add the words “for crop use only,” but withdrew the amendment when the phrase “under 205.602” was added instead.

Friendly Amendment: Mr. Lockeretz adds “under 205.602.” after the words prohibited substances.

Motion as Amended: The motion reads: Spinosad is a nonsynthetic material that should not be added to the National List of prohibited substances under 205.602.

Vote: The motion passes 11 to 3.

PROCESSING COMMITTEE – Mark King, Chair

Gelatin – (Attach. G)

Motion: Mr. King moved that “Gelatin to be listed in 205.606, nonorganically produced agricultural products allowed as ingredients in or on processed products labeled as ‘organic’ or ‘made with organic’ [(specified ingredients or food group(s))].

Second: Kevin O’Rell seconded.

Discussion: In response to a question from Ms. Koenig, Mr. King said that although the committee shared some of the concerns commenters had about possible allergens, the committee viewed the substance as a natural and had to view it in that light. Ms. Burton added that in regards to food safety, processors are required to follow good manufacturing practices which would address this issue.

Vote: The motion passes unanimously.

Dewaxed Flake Shellac – (Attach. H)

Motion: Mr. King moved that the following language be approved: Orange shellac, unbleached, to be listed in 205.606, nonorganically produced agricultural products allowed as ingredients in or on processed products labeled as “organic” or “made with organic” [(specified ingredients or food group(s))].

Second: Ms. Burton seconded.

Discussion: Ms. Koenig wondered why this material was reviewed by Processing Committee instead of the Crops Committee if it is primarily applied to fruit. Mr. Riddle pointed out that although references
have been made to 205.606, the NOSB will be voting at some point to remove the list from 205.606. Mr. Bandele initiated discussion on previous Board recommendations on other forms of this substance.

**Vote:** The motion is unanimously approved, with Mr. Holbrook recusing himself.

### Calcium Stearate

**Motion:** Mr. King moved that the TAP review for calcium stearate be sent back to the contractor for more information and be deferred for consideration at the September 2002 NOSB meeting.

**Second:** Ms. Caughlan seconded.

**Discussion:** Mr. King cited an example of deficiency and in response to a question from Mr. Riddle, Ms. Burton agreed that Board comments on this TAP review should be sent to her.

**Vote:** Motion is passed unanimously.

### Diethylaminoethanol (DEAE)

Mr. King stated that Diethylaminoethanol (DEAE) was petitioned for use in boiler chemical systems, and introduced Steve Harper (former Processing Committee chair) to give background. Mr. Harper stated that DEAE was originally petitioned as part of a group of volatile amines. The rest of the group have all been previously voted on individually. The once-deferred DEAE can now be considered because requested FOIA information from FDA has been received.

Mr. King then gave information on the use of DEAE, citing that the TAP review recommended that the use of DEAE be prohibited. He also cited information provided by industry that the prohibition of DEAE would cause hardship to some of the industry.

**Motion 1:** Mr. King moved that DEAE be listed under section 205.605(b) Synthetics allowed, in the following way: Diethylaminoethanol for use as a boiler water additive for packaging sterilization only. For use as a boiler water additive in agricultural products labeled “made with organic” until October 21, 2005. For use as a boiler water additive in livestock feed until October 21, 2005.

**Second:** Ms. Caughlan seconded.

**Discussion:** Ms. Burton signed the petition to consider this substance so she said she recused herself from voting, citing conflict of interest. Mr. Siemon and Mr. O’Reall also signed the petition. Ms. Burton put forward an amendment to the motion and a discussion ensued on whether someone who had recused herself from voting on the motion could offer an amendment. To resolve this issue, Mr. Carter suggested that a procedural vote be taken.

**Procedural vote:** Mr. Bandele moved, and Ms. Ostiguy seconded, that a vote be taken on the following, as phrased by Mr. Carter: “If you feel that folks that have declared a conflict of interest should recuse themselves from voting, you would vote aye on this motion. If you feel that they ought to be allowed to vote on this material, you would vote no on this motion.” Seven aye votes and 5 no votes (by a show of hands) were counted. Mr. Carter stated, “The motion fails. Those folks that have declared a conflict of interest are not required to recuse themselves.”
Amendment: Ms. Burton moved to amend the motion by changing the annotation to read: DEAE for use as a boiler water additive for packaging sterilization. For use as a boiler water additive until October 21, 2005. Nancy Ostiguy seconded.

Discussion on amendment: Mr. Lockeretz suggested rewording the amendment. Mr. Riddle explained why he opposed the amendment. Ms Koenig concurred with Mr. Riddle.

Vote on amendment: The move to amend the language in the annotation failed by a vote of 2 to 10, with 2 abstentions.

Discussion on Motion 1 (contd): More discussion involving Mr. Riddle, Ms Koenig, Mr. Siemon, Ms. Burton, Mr. King, Mr. Lockeretz, Ms. Caughlan, and Mr. Caughlan ensued relating to the suitability of using this product in all the ways listed in the original motion. Mr. Mathews confirmed that the Board could set a sunset date for substances.

Vote on Motion 1: The motion failed by a vote of 8 to 6.

Motion 2: Ms. Koenig moved to label DEAE a synthetic and prohibit its use in organic production. An unidentified voice points out that since it’s not on the National List, it’s already prohibited.

Motion 3: Ms. Ostiguy moved that language be approved that says DEAE be approved for use as a boiler water additive for packaging sterilization only. Motion dies for lack of a second. Ms Burton pleads for this language, saying not to allow DEAE will hurt the industry on package sterilization.

Motion 3, redux: Ms. Ostiguy moved that DEAE is a synthetic allowed for use as a boiler water additive for packaging sterilization only.

Second: Mr. O’Rell seconded.

Discussion: Ms. Koenig stated there are 2 alternatives to DEAE already on the National List.

Vote on Motion 3, redux: The motion passed, 10 to 4.

Motion 4: Mr. Siemon moved to allow DEAE for use as a boiler water additive in livestock feed until October 21, 2005.

Second: Mr. Lockeretz seconded.

Discussion: At Mr. Lockeretz’s request, Mr. Siemon explained the use of DEAE for making pelletized feed. Mr. King agreed. Mr. Riddle cited lack of comment from livestock industry as his reason for not supporting the motion. Ms. Koenig says she has insufficient information. Mr. Harper spoke to level of DEAE in pelletized feed. Mr. Harper elaborated on how pelletized feed is made.

Vote on Motion 4: The motion failed 8 to 3, with 3 abstentions.

Motion 5: Ms. Koenig moved to send the issue back to OMRI for more review on livestock aspect.

Second: Mr. King seconded.

Discussion: Mr. Baker of OMRI said that sufficient attention has already been given this substance and OMRI would probably have nothing to add.
Withdrawal of Motion 5: Ms. Koenig withdrew her motion.

Glycerol monooleate

Motion: Mr. King moved that pending the results of the effectiveness of organic anti-foaming agents due before the September NOSB meeting, the consideration of glycerol monooleate for inclusion on the National List be deferred until that meeting.

Second: Ms. Ostiguy seconded.

Discussion: Mr. King told Mr. Baker of OMRI that OMRI would not need to review glycerol monooleate further.

Vote: The motion passes 12 to 2, with Ms. Burton and Mr. O’Rell recusing themselves.

Meeting was adjourned for lunch, to reconvene at 2 p.m.

LIVESTOCK – George Siemon, Chair – (pp. 556 – 640)

Feed Ingredients

Vitamins and Minerals

Motion: Mr. Siemon moved to recommend that the allowance for synthetic vitamins and minerals contained in 205.603(d) (1) and (2) be broadened to include materials either listed in the CFR or in Sections 57 or 90 on the AAFCO official publication with the following exceptions: mammalian and poultry slaughter byproducts, bone ash, bone charcoal, bone phosphate, bone charcoal–spent, bone meal-steamed, bone meal-cooked, hydrolyzed fats (sections 33.3, 33.4, 33.5, 33.15). NOSB recognizes the need to review the materials on the list OMRI gave the Board and recommends a review by a TAP process to determine if the materials should be prohibited.

Second: Ms. Ostiguy seconded.

Discussion: Mr. Siemon clarified that the materials on the OMRI list will be allowed until they are reviewed. Mr. Riddle said he thought they should be prohibited until they are reviewed. Emily Brown was brought forward to talk about items on the list and their current usage status. Mr. Riddle requested that the vote be put off until the next day. After more discussion, Mr. Riddle withdrew his request.

Vote: The language as read by Mr. Siemon was adopted by a vote of 13 to 0, with 1 abstention.

Incidentals in Feed Additives

Motion: Mr. Siemon moved to recommend the allowance of incidental additives—as defined by CFR —used in livestock feed ingredients.

Second: Nancy Ostiguy seconds.

Friendly Amendment: Ms. Burton proposes to add the CFR citation to the language of the motion.
Discussion: Ms. Brown of OMRI was asked to give some examples of incidentals. She clarified that it was not so much based on the amount of the incidental ingredient, but the chain of use. The example she gave was that of canned tomatoes contain citric acid: If the tomatoes are used in making tomato sauce, the citric acid becomes an incidental secondary ingredient and is not listed on the label. This can be extrapolated to preservatives in vitamins as opposed to preservatives added directly to livestock feed. Mr. King summarized further discussion of the purpose of the motion by stating that the language in the motion will used as clarification, not rulemaking and not guidance. In response to a request from Mr. Lockeretz, NOP staff defined “guidance document."

Restatement of motion: As read by Mr. Siemon, NOSB recommends to add to the National List the allowance of incidental additives as defined by CFR 21, Part 570.100(a)(3) and used in livestock feed ingredients.

Vote: The motion passes 13 to 0, with 1 abstention.

Vitamins and Minerals redux

Motion: Ms. Robinson moved to reconsider the vote on vitamins and minerals.

Second: Mr. King seconded.

Vote: The motion passed by a voice vote [no voting numbers listed in transcript].

Motion 2: Mr. Carter moved to vote on the following: “The NOSB recommends a change in the National List as follows: The allowance for synthetic vitamins and minerals contained in Section 205.603(d)(1) and (2) be broadened to include materials either listed in the CFR or in Sections 57 or 90 on the AAFCO official publication with the following exceptions: mammalian and poultry slaughter byproducts, bone ash, bone charcoal, bone phosphate, bone charcoal—spent, bone meal-steamed, bone meal-cooked, hydrolyzed fats (sections 33.3, 33.4, 33.5, 33.15). “

Second: Ms. Koenig seconded.

Vote: Motion 2 passes unanimously.

Motion 3: Mr. Siemon moved that the NOSB recommends addition of a new 205.603(g). All materials as annotated in 205.605 can be used in organic feeds subject to FDA or AAFCO regulations.

Second: Ms Ostiguy seconded.

Vote: The motion passed by a voice vote [no voting numbers listed in transcript].

Carriers

Motion: Mr. Siemon moved that the NOSB recommends that agricultural carriers used in feed additives shall satisfy all requirements in Section 205.237.

Second: Ms. Koenig seconded.
Discussion: Mr. Riddle’s request to change “shall” to “must” is rejected based on semantic clarification.

Vote: The motion passed unanimously.

Preservatives

Motion: Mr. Siemon moved to vote on the following clarification: The NOSB recommends that all synthetic nonincidental preservatives used in livestock feed must be approved and listed in 205.603.

Second: Nancy Ostiguy seconded.

Vote: The motion is passed unanimously.

Enzymes

Motion: Mr. Siemon moved to vote on the following clarification: The NOSB recommends enzymes as allowed nosynthetic feed additives, provided they are not derived from excluded methods.

Second: Nancy Ostiguy seconded.

Withdrawal of Motion and Second: After Ms Burton stated that enzymes are currently under 205.605(a) (8), the motion and second were withdrawn.

Probiotics

Motion: Mr. Siemon moved to vote on the following clarification: The NOSB has previously determined that probiotics are synthetics, thus allowed, but the NOSB recognizes that the approved feed ingredient label is direct-fed microorganisms.

Second: Ms. Ostiguy seconded.

Vote: The motion passed unanimously.

DISCUSSION ITEMS DEFERRED FROM MAY 6

Access to Outdoors for Poultry (p. 606)

Recommendation: Mr. Siemon said that the NOSB will recommend clarification of the final rule requirement that poultry should have access to outdoors. Clarification included language to the effect that organic poultry must have access to the outdoors in the months where feasible; the producer may provide temporary confinement because of inclement weather, stage of production, risks to the health, safety and well-being of the poultry, and risks to the soil or water quality; and poultry must be able to choose to go outside.

Discussion: Mr. Riddle said the first point of clarification, “….access to the outdoors in the months where feasible…” is redundant, considering that the exceptions are spelled out. Mr. Mathews stated that State imposed quarantines or such, override the NOP regulations.
Mr. Lacy commented on the issues of disease, welfare, food safety, and customs/expectations. Ms Koenig weighed in that disease prevention/control does not have to be hampered by access to the outdoors. Mr. Lockeretz expressed bemusement at poultry’s ability to choose.

**Motion:** Ms. Koenig moved to fix the language of the recommendation and vote on it today, since 2 members would not be there for the vote on May 7.

**Second:** Mr. Lockeretz seconded.

**Discussion:** Mr. Mathews pointed out that in essence this Board recommendation says that poultry don’t have to have access to pasture. Mr. Siemon and Mr. Carter agreed that what they’re presenting is the minimum standard. Mr. Lockeretz expressed concern about no mention of population density or floor material. Ms. Caughlan talked about the disconnect between consumer perception and reality. Mr. Siemon explained why the recommendation language left out specifics on square feet/bird, etc.

**Motion withdrawn:** Ms. Koenig withdrew the motion with the understanding that the recommendation would be rewritten and voted on May 8.

**Dairy Animal Replacement (p.626)**

**Recommendation:** Mr. Siemon read the recommendation as follows: 1) Organic dairy replacement animals must be raised organically from the last third of gestation unless (i) organic replacement animals are not commercially available, in which case the producer may add replacement animals from nonorganic sources, but those animals shall be under continuous organic management upon entry to the organic operation but no less than 1 year prior to the sale of organic milk.

**Motion:** Mr. Siemon moved to put this recommendation on the web for comments.

**Second:** Mr. Riddle seconded.

**Discussion:** Mr. Riddle asked if breed and quality of animals was what they were thinking when they talk about commercial availability.

**Friendly amendment:** Mr. Riddle added the term “equivalent breed” to the language.

**Discussion (cont):** Mr. Mathews asked for the Board’s thoughts on “entry” versus “replacement.” Mr. Siemon responded that the language covers replacement or expansion. Mr. Siemon said the rule should have contained two ways to enter an organic dairy, and then replacement addressed separately. However, since it doesn’t, the Board is trying to clarify the language that’s there. It was agreed to rewrite the recommendation and take it up again on May 8.

No vote taken.

**MATERIALS— Kim Burton, Chair (pp. 640-648)**

**Clarification of 205.606**

Ms. Burton distributed Draft 5 of the clarification of 205.606 discussed on May 6, stating that she added some language back in. Addition 1: In addition, once the material is placed on the list as not being
commercially available in an organic form the industry no longer has an incentive to develop organic versions of the material. Addition 2: A guidance document on commercial availability still needs to be completed and posted. She also said the Committee recommends that two materials slated for deletion (water-extracted gums and kelp used as a thickener) should be moved to 205.605(a) instead.

Motion: Ms. Burton moved to vote on Draft 5, Clarification of 205.606.

Second: Mr. Riddle seconded.

Vote: the motion passed, 12 to 0, with 2 abstentions.

Konjac flour

Ms. Burton described why and where she put information on Konjac flour into the “book” as an example of a nonorganic agricultural item. In response to a question from Mr. Riddle, Ms. Burton explained there will be no recommendation or vote on this material—it’s just a reference.

PROCESSING COMMITTEE – Mr. Mark King, Chair (pp. 648-654)

As a point of clarification, Mr. King recommended that the ingredient affidavit be posted on the web as a guidance document. He also explained how abstentions are properly tallied in a vote. They will be counted with the prevailing side. It was then determined that incorrect tallying of abstentions affected one of the votes on DEAE.

DEAE

Motion: Ms. Koenig moved to reconsider the motion that would approve DEAE for use as a boiler water additive in livestock feed until October 21, 2005. The motion was previously reported as failed, due to incorrect tallying of abstentions.

Second: Mr. Lockeretz seconded.

Vote: Motion appears to pass by voice vote.

Motion: Mr. Siemon moved to vote on the following: DEAE for use as a boiler water additive in livestock feed until October 21, 2005, shall be allowed.

Second: Ms. Koenig seconded.

Vote: Motion fails, 8 to 5, with one abstention.

CROPS COMMITTEE – Mr. Owusu Bandele, Chair (pp. 654-683)

Annuals or Perennials?

Motion: Ms. Koenig moved to vote on the recommendation discussed on May 6, stating that strawberries or other perennials grown as annuals should be interpreted as annuals and fall in sections 205.204(1) and (2), rather than looking at them as perennial planting stock.

Second: Nancy Ostiguy seconded.
Vote: The motion is passed unanimously.

Treatment of Planting Stock

After some confusion among the Board members was expressed, Mr. Mathews clarified prohibited substances on planting stock this way:

“Under 204, you must use organically grown seeds and planting stock ... which means no prohibited substances, except that nonorganically produced untreated seeds and planting stock may be used to produce an organic crop [when organic seeds and planting stock are not available]. What this means is that the crop may be grown using prohibited substances, because it’s a conventional product or conventional plant. You can do that. What you cannot do under that one is to pluck it out of the ground and dip it into something to treat it or to spray something on it to treat it.

“So basically if it’s preharvest, the addition of the substance is okay. If it’s post-harvest, it is not.”

Confusion still ensued, so Mr. Sideman restated Mr. Mathews’ explanation with a bit more detail. Ms. Burton stressed the importance of trying to find organic seeds and planting stock.

Compost Task Force

Mr. Bandele stated that the recommendation discussed on May 6 is the same as the one being presented for a vote today except for some changes regarding manure processing. He is also including a set of definitions with the recommendation.

Motion: Mr. Bandele moved that the NOSB adopt the Compost Task Force recommendation.

Second: Mr. Holbrook seconded.

Vote: The motion passed by a voice vote. No voting numbers noted.

Post-vote discussion: Mr. Bandele asked Mr. Mathews how this recommendation affected the interpretation of the regulation. Mr. Mathews, Ms Koenig and Mr. Bandele discussed this for awhile. Mr. Sideman said that Ms Robinson agreed to let Mr. Sideman and others to develop a practice standard from the recommendation, which in effect would make it possible to meet the requirements in the regulations without meeting the present requirement for carbon-to-nitrogen ratios. Mr. Mathews said he would need more time to study the issue.

Motion: Ms. Koenig moved to put a compost update, re: NOP’s position, on the agenda for the next NOSB meeting.

Second: Mr. Bandele seconded.

Vote: The motion passed unanimously.

Transitional Products Recommendation

Mr. Riddle read the recommendation on transitional products, which recognized that they are beyond the scope of the OFPA. He said that the recommendation is offered for guidance and clarification, and
to bring consistency to existing state and private requirements. Inasmuch as USDA’s NRCS provides incentive payments to transitional operations, this will provide guidance to NRCS.

**Motion:** Mr. Riddle moved that the Board approve the transitional products recommendation.

**Second:** Mr. Bandele seconded.

**Discussion:** Mr. Lockeretz questioned the act of proposing a recommendation on something over which the Board, NOP, and USDA have no authority. Mr. Mathews agreed. Ms Caughlan agreed. Mr. King supported the recommendation as guidance. Mr. Riddle agreed to posting recommendation on NOSB website with disclaimer.

**Friendly amendment:** Mr. King suggested adding retailers to target audience named in recommendation.

**Vote:** The motion passed 13 to 1.

**Organic Farm Plan Template**

Mr. Riddle explained Organic Farm Plan Template discussed earlier will be posted to the web site for comment.

**Hydroponics**

In response to a question from the audience, Mr. Bandele explained that the Crops Committee accepts that hydroponics is covered under the regulations, but that the Committee will come up with a guidance document at a later date.

**LIVESTOCK COMMITTEE – George Siemon, Chair (pp. 683-690)**

**Access—to—outdoors for poultry**

**Motion:** Mr. Siemon moved that the Board approve the Committee’s recommendation on access to the outside for poultry as originally presented.

**Second:** Mr. Lockeretz seconded.

**Amendment:** Mr. Siemon moved to add the following to the recommendation: The area provided outdoors shall be a minimum of 2 square feet per bird, and that area shall be managed in compliance with all the requirements of this rule.

**Second:** Mr. Carter said Mr. Lockeretz seconded.

**Discussion:** The Board called on the audience for information on pasture for poultry. Ms Brickey responded by advising the Board not to vote on this issue before getting all the information they want. Mr. Mathews reminded that the 2 feet per bird would not be enforceable. Mr. Carter recommended that the amendment be withdrawn.

**Withdrawal of amendment:** Mr. Siemon withdrew the amendment.
Mr. Carter announced that the motion would be taken up again tomorrow (May 8). The Board then discussed the possibility of extending the September meeting to 3 full days. Mr. Carter reviewed tomorrow’s agenda.

ADJOURNED AT 5:00 P.M.

CALL TO ORDER WEDNESDAY, MAY 8 – 8:00 a.m.

LIVESTOCK COMMITTEE – George Siemon, Chair (p.690)

Access to outdoors for poultry (Attach. P)

Mr. Siemon read the committee’s revised recommendation on access to the outside for poultry.

Motion: Mr. Siemon moved that the Board approve this recommendation.

Second: Ms. Ostiguy seconded.

Discussion: Mr. Lacy explained his dissenting vote in committee by saying that science does not support that access to the outdoors is in the best interest of the birds from a health and welfare standpoint, nor in the best interest of consumers from a food safety standpoint. Ms. Caughlan expressed surprise that material underneath the feet of the birds was not addressed. Mr. Mathews said he viewed this recommendation as a clarification, reinforcing that birds must be able to go outside of the building, and this was enforceable as it is already in the regulations. Mr. Lockeretz agreed with Ms Caughlan. Ms Ostiguy and Ms Caughlan agreed that this recommendation might act as a starting point for more detailed guidance. Mr. Mathews said he viewed this recommendation as a clarification, reinforcing that birds must be able to go outside of the building, and this was enforceable as it is already in the regulations. Mr. Lockeretz agreed with Ms Caughlan. Ms Ostiguy and Ms Caughlan agreed that this recommendation might act as a starting point for more detailed guidance. Mr. Riddle suggested that at least scratching material should be provided in accordance with the regulation’s livestock heal care practice standard. He further noted that as an inspector, he would view lack of scratching material as a potential minor noncompliance. Mr. Mathews brought some clarity to the discussion by pointing out that if because of the surface the bird is living on, it isn’t able to do the natural things that are required by the standards, then to say [in a guidance or clarification document] that you can’t have those surfaces is correct—and would not require rulemaking.

Ms Caughlan and Mr. Siemon contemplate an amendment about surfaces. Mr. Mathews suggested striking the sentence regarding a phase-in period.

Amendment: Ms. Ostiguy moved to strike the sentence regarding a phase-in period: A producer shall demonstrate reasonable progress in efforts to comply with this provision; full compliance shall be completed no later than 18 months from October 21, 2002.

Second: Mr. Riddle seconded.

Discussion: Mr. Lockeretz argued for leaving the sentence in. Mr. Riddle supported striking the sentence.

Vote on amendment: The amendment is approved 12 to 1.
Amendment 2: Ms Caughlan moved to add a number 3 to the recommendation to read: Bare surfaces; e.g., metal cement, wood, do not meet the intent of the rule.

Second: Ms. Ostiguy seconded.

Discussion: Mr. Lacy pointed out that if chickens are on a bare surface for a couple of days, the surface is no longer bare, so the amendment is not needed. Ms. Caughlan reiterated her assertion that chicken manure is not waste, but valuable material. Mr. Riddle supports the amendment.

Restatement of Amendment 2: Ms Caughlan changes the amendment to be in the number 2 position instead of number 3 and changes the amendment to read: Bare surfaces other than soil do not meet the intent of the rule.

Vote on original motion as amended: The motion is passed, 12 to 1.

Dairy replacement animals (p.721)

The Board agreed to post on the web for public comment the recommendation for dairy replacement animals.

“CERTIFIED ORGANIC” VS. “ORGANIC” ON LABELS (p. 722)

Mr. Marty Mesh of Florida Certified Organic Growers and Consumers, Inc., and chair of OTA’s Certifier Council was invited to come forward to talk about consumer perceptions and why it is important to allow “certified organic” on labels, not just “organic.” He originally brought up this issue during the public comment period on May 6. Mr. Mathews said he would work to address this issue.

COMMITTEE WORK PLANS (p. 730)

LIVESTOCK--George Siemon, Chair

Mr. Siemon stated that the Committee will:
- Post dairy replacement animal recommendation on the web for comment, with a vote anticipated for the September meeting.
- Develop a checklist for poultry inspections related to issues discussed at this meeting.
- Prepare to discuss excipients in medications.
- Prioritize list of materials for review.

MATERIALS–Kim Burton, Chair

Ms. Burton stated the number of materials for review at the September meeting stands at 31. The Materials Committee will also:
- Manage Materials Review Process
- Work on a draft document identifying ways to improve the communications when a petition is submitted to remove a material from the National List.
- Work on a recommendation to review materials already on the National List.
PROCESSING—Mark King, Chair

Mr. King said the Processing Committee has several materials to review for the next meeting, and will also:

- Continue working on a technologies recommendation
- Forward cultures for a petition.

CROPS—Owusu Bandele, Chair

Mr. Bandele said the Crops Committee will:

- Develop a compost practice standard from the recommendation passed at this meeting.
- Develop guidance on hydroponics.
- Develop guidance on planting stock.
- Review materials.

In response to a question from Mr. Bandele, Mr. Mathews said that the NOP would continue keep the Board informed of issues the NOP has identified from feedback from the organic community. The NOP is also developing lists that would go on the web that would show what materials have been ruled on, and what the rulings were.

INTERNATIONAL—Willie Lockeretz, Chair

Mr. Lockeretz said the International Committee would:

- Continue to develop “that document” [unidentified] which was distributed in a very preliminary form.
- Informally survey groups involved in international organic trade, such as IFO, OTA and USDA-accredited foreign certifiers to get their perspectives.

ACCREDITATION—Jim Riddle, Chair

Mr. Riddle said the Accreditation Committee would:

- Act as interim peer review panel to review the NOP’s accreditation program.
- Review comments on grower group certification criteria and redraft for September meeting.
- Assist NOP in developing enforcement procedures, especially as they relate to States and State Organic Programs.
- Look at the need to merge ISO-65 and NOP accreditation requirements.
- Assist NOP in complaint procedures, as they relate to accredited certifiers.
- Monitor certifier issues.
- Monitor NOP and NOSB websites and provide feedback.

BOARD POLICY TASK FORCE
Mr. Riddle said the Board Policy Task Force will send the adopted Board Policy Manual to the NOP for feedback, then back to the task force, with a report to be made in September. Any changes would be voted on in October.

**PUBLIC COMMENTS – 10:45 a.m.** (p. 747)

**OTHER BUSINESS**

*Best wishes to former Board member* (p.752)

**Motion:** As suggested by Ms. Brickey, Mr. Siemon moved that the Board pass a resolution of best wishes to former Board member Betsy Lydon.

**Second:** Mr. Lockeretz seconded.

**Vote:** the motion passed unanimously, with a formal letter to come.

*Clarifying the regulations* (p.844)

Mr. Mathews wanted to make sure that everyone understood the access to the outdoors for poultry will be treated as a clarification of the regulations. Ms. Burton asked for definitions of clarification document; guidance document; and policy document.

**NEXT MEETING DATES AND PLACE:** (p.847)

September 17, 18, 19 – 16 as a travel date and October 21 and 22, Washington, DC

**MEETING ADJOURNED AT 12:00 P.M.**

**Second:** Mr. Lacy seconded.

**Vote:** The Board voted unanimously to adjourn.
UNITED STATES DEPARTMENT OF AGRICULTURE

NATIONAL ORGANIC STANDARDS BOARD

Walnut Room
Clarion Inn & Suites
2200 IH-35 South

ADJOURNMENT
PROCEDINGS

MR. CARTER: Okay. I want to call to order the meeting of the National Organic Standards Board and, first of all, welcome all of our guests that are here today. I'm Dave Carter. I'm the Chair of the NOSB.

Just a couple of comments to open up the meeting. First of all, I want to welcome, we've got five new members on the Board.

We just finished a orientation training session yesterday afternoon that was very helpful. And I think even though we've got folks that are coming on with very short notice when some critical issues are on the plate to be made, we've got five folks here that have delved in and are ready to get right with it. So we appreciate them being with us.

But also appreciate the fact that we've got here at the meeting today some of our former Board members that are staying around to help move us along.

Steve Harper is here, Carolyn Brickey, and Eric Sideman are all here -- there he is, back there.

Marvin Hollen had wanted to be with us. Marvin has had a heart attack and has gone through some surgery. I got an email from him last night wishing us all well with our meeting.

But I particularly want to thank the former Board Heritage Reporting Corporation
(202) 628-4888
members. Carolyn Brickey, our former chairperson, has done a tremendous job. And I know all the outgoing Board members received a plaque in October, but I think we all owe them a debt of gratitude here and appreciation for the work that they have done. So if we could express that right now.

(Applause.)

MR. CARTER: The other former member that's not with us here at this meeting, of course, is Bill Welsh from Iowa.

I also want to say to the Department that we appreciate the congratulations on getting out the first round of accreditation. So I know that that's been a lot of work, but it does help move us toward that October 21 implementation.

So with that, what I'd like to do, because we do have some new folks and I know some folks in the audience here that are not familiar with the members of the Board, if we could just go down the line here and do some quick introductions of the Board. And we'll start with Dennis. Say who you are and what you do and who you represent on the Board.

MR. HOLBROOK: My name is Dennis Holbrook. I am a citrus grower and vegetable grower, organic grower, in South Texas. And I represent the growers here on the Board.

MR. LOCKERETZ: I'm Willie Lockeretz. I've been
on the Board for two years. I'm at the School of Nutrition at Tufts University. On the Board, I am Chair of the International Committee, and I allegedly know something about the environmental impacts of agriculture.

MR. GOLDBURG: I'm Becky Goldburg. I'm a biologist with Environmental Defense, which is a national nonprofit organization. I work out of New York, and I'm here in an environmental slot.

MR. O'RELL: My name is Kevin O'Rell. I'm with Horizon Organic, am vice president of research and development and quality assurance, and I represent the organic handlers on the Board.

MR. SIEMON: I'm George Siemon. I'm here as a farmer rep. I'm from Wisconsin. I have organic hens, but I'm also part of Organic Valley.

MS. KOENIG: I'm Rose Koenig. I'm an organic producer of vegetables, about 17 acres in Gainesville, Florida, and I also have a background in plant pathology.

MR. RIDDLE: Good morning. I'm Jim Riddle from Winona, Minnesota. I'm a certifier rep on the Board and was an inspector for 15 years. Currently work as a policy specialist, consultant, and general organic activist in that industry.

MR. CARTER: Dave Carter, Westminster, Colorado. At the last meeting I was serving as the president of the
Rocky Mountain Farmers Union. Since then I decided to have a mid-life crisis and switch employment.

So now I serve part-time as Executive Director of the National Bison Association and also do consulting work in Cooperative Development. I'm on the Board as a consumer rep.

MR. MATHEWS: And I'm Richard Mathews, Program Manager of the National Organics Program.

MS. BURTON: Kim Burton, Smucker Quality Beverages. I'm the handler rep for the Board. My background, materials.

MR. OSTIGUY: Nancy Ostiguy, Department of Entomology at Penn State. I'm a toxicologist in one of the environment slots.

CHEF COOPER: Ann Cooper. I'm the Executive Chef of the Ross School in East Hampton, New York, and I have a consumer slot.

MR. KING: Mark King. I am the retail representative on the National Organic Standards Board, a consultant and inspector in the industry. My background is sales and marketing and organic produce.

MR. LACY: I'm Mike Lacy from Athens, Georgia. I'm on the faculty of the College of Agricultural and Environmental Sciences at UGA; spent 17 years as a poultry extension specialist; and a year-and-a-half ago became
Department Chair of my department. And I am a science rep.

But I'm not here as a retail rep, but rather as one of the consumer reps. A long history in organic legislative development.

MR. CARTER: Okay. Thank you. Just one other announcement. When we get into the materials review or approval process in the meeting, we're going to be using a slightly different process. We talked about this yesterday at the Board meeting.

But the Chairs have been discussing these materials -- excuse me -- the committees have been discussing these materials. So when the items come forward at the meeting for action, they will actually come forward from those committees. We will look to those committee chairs to make the recommendation of the committee.

And then, rather than going through and doing the roll call votes on each individual item, the committee chair will just make a motion regarding the recommendation of that committee. We will vote on it by a show of hands.

Any Board member at that time can request a roll call vote, or we can make amendments or move it forward.
But we just think that this is a little more of a systematic way of bringing forward some of the recommendations from the committees.

With that, the agenda is on the table. There is one addition to the agenda I think we need to make. Following our last meeting, Goldie Caughlan has been serving as our interim secretary, but we are required to elect a secretary at this point. So I would put that on the agenda as our next item of business.

But are there any other corrections, additions, or deletions from the agenda?

MR. KING: Yes, Dave. Actually, there are a couple of corrections. Under processing, if you look at the very first item, it says, Natural Flavors, then, Clarification of 205.606. If you just strike Natural Flavors, it should simply say, Clarification of 205.606.

MR. CARTER: Okay.

MR. KING: And then, the third item, which states that we'll be having a recommendation on GRAS materials as inerts is also incorrect. We will not have a recommendation on that at this time.

MR. CARTER: Okay. Is there discussion, or just take that off the agenda?

MR. KING: There will be a very brief discussion as to what's happening.
MR. CARTER: Okay. Any other changes for the agenda?

(No response.)

MR. CARTER: Okay. Hearing none, we'll leave the agenda open as we move forward.

At this time, then, we'll move into the election of the secretary. And is there a nomination for secretary to serve the NOSB?

MR. SIEMON: Yes. I nominate Goldie.

MR. CARTER: Okay. The name of Goldie Caughlan has been nominated. Is there a second?

MR. LOCKERETZ: Second.

MR. CARTER: It has been seconded. Are there any other nominations?

(No response.)

MR. CARTER: Are there any other nominations?

(No response.)

MR. CARTER: Are there any other nominations?

(No response.)

MR. CARTER: Is there a motion to close nominations?

MR. GOLDBURG: I move to close nominations.

MR. CARTER: Is there a second?

MR. SIEMON: Second.

MR. CARTER: All in favor say, Aye.
(A chorus of ayes.)

MR. CARTER: Opposed, same sign.

(No response.)

MR. CARTER: Nominations closed. All in favor of Goldie Caughlan say, Aye.

(A chorus of ayes.)

MR. CARTER: Opposed, same sign.

(No response.)

MR. CARTER: Goldie, you got it despite your campaign to get somebody else. Right?

(General laughter.)

MR. CARTER: Okay. And also, just a note for members of the board, we've been told that we can only have three mics on at a time, so when you say something, make sure you turn off your mic. They said that the room will blow up if more than three mics are on at a time.

If we could turn everybody's attention to the minutes of the October meeting, which minutes are in the book and have also been posted.

Is there a motion to approve the minutes of the October meeting?

MR. LOCKERETZ: So moved.

MR. CARTER: And second?

VOICE: I second.

MR. CARTER: It has been moved and seconded. Is
there any discussion or corrections?

(No response.)

MR. CARTER: Seeing none, all in favor of

approving the minutes, say, Aye.

(A chorus of ayes.)

MR. CARTER: Opposed, same sign.

(No audible response.)

MR. CARTER: Motion carries.

I would also just direct your review in the book,

there is the minutes of the Executive Committee meetings

held since October. They are all final minutes except for

the minutes except for the minutes of the April 12 meeting,

which are draft minutes at this point. Are there any

comments from the Board? Yes.

MS. BURTON: Dave, just a comment that this book

is entirely on the NOP Web Site, for those of you who are

interested in looking at it at anytime.

MR. RIDDLE: I'd like to add that the minutes of

the Executive Committee meeting are being posted on an

ongoing basis, approximately two weeks to a month after each

Executive Committee meeting. And we hold Executive

Committee meetings on a monthly basis.

So if you want to stay up to date on the actions

of the Executive Committee meeting, you can find those on

the Web site.
MR. CARTER: Okay. Then, with that, I believe we're moving well ahead of schedule here. So we can go on to public comment.

Katherine, have you been keeping the -- have you got the sign-up list of the --

MS. BENHAM: [Inaudible].

MR. CARTER: Oh, in front of me. I only have a list with one name on it, Katherine. Is that -- I don't want to let somebody talk for 2-1/2 hours here.

VOICE: It's the printed list.

MR. CARTER: Oh. The printed list. Okay. I was going to say --

Okay. We will call folks forward. You will have five minutes to give a public comment. Jim Riddle will be the official timekeeper, so we will gather you off at the end of five minutes.

We ask that, when you begin your statement, please identify yourself very clearly. We do have a court reporter here taking a transcript of the meeting. So we need to know who is giving the comments. And please come up to the front and use the podium.

We'll start off, then, we've got Gerald Davis Jeff Huckaby.

MR. HUCKABY: Okay. Good morning. My name is Jeff Huckaby. I'm the General Manager for Grimmway Farms in
Bakersfield, California.

We are a family owned business that is owned by the Rod and Bob Grimm families in Bakersfield. We've had organic ties back to 1985, and presently we have over 18,000 certified vegetable acres throughout California.

We use CCOF as our certifier. And although primarily our business is carrots, we have recently expanded to where we grow over 40 different vegetables.

This morning I wanted to comment on three certain issues that have relation to the new organic standards. The first is compost, the second is the process manure, and the third is the Chilean.

I'm a farmer, I'm not a scientist or public speaker, so please bear with me. But I can tell you what we have found that works out in the field and what doesn't.

Our first concern, quickly, on the compost is, of course, the carbon/nitrogen ratio that's coming forward.

Now, I know there have been some committee meetings since that are working on the carbon/nitrogen ratio. But my company buys over 200,000 tons a year of particular composts. We use various composts for different activities.

This is our main source of N, and we use the compost -- most of our compost has a lower C/N ration than proposed. We make certain mixes and blends, depending on
our agronomists' recommendations.

What we're asking is that you possibly look at the carbon/nitrogen ratio and expand that a little bit so that we don't have such a narrow window that we have to meet in order for our program to work.

The second, real quick, is the process manure. There is no mention really in the rule talking about that. I'm mostly talking about chicken pellets. We use over 6 million pounds of chicken pellets a year. This is the key to our fertility program. This is very vital to us as a farmer out in the field with all the crops that we grow.

Some of the suggestions that we're hearing on some of the reviews allow that this may be a different area, that we continue to adapt to the new rule.

But some of the recommendations were 150 degree temperature for one hour, 12 percent moisture. We have a few concerns in that on how the product reacts in the field.

Like I said, I'm not a scientist, but I can tell you what we've had trouble with and what hasn't. When we get much below 12 percent moisture, it's almost impossible for my guys to side-dress the plants with the side dresses. The product has a tendency to crumble, and we can't get a variable rate throughout the field.

Twelve percent works, but when you get into the 9 or 10 percent, we have trouble maintaining a consistent
product. We're not asking for much different, except for
that it look for 12, 13, 14 percent as what we're used to
using, and it seems to work well.

The products that we buy out of California are
not at 150 degree temp for an hour. They're more like 200
degrees, steam injected for a very short period of time.

But I can tell you that over the years that we've
been farming organically and using, you know, this product
on hundreds of thousands of acres throughout the last
several years, we have yet to have a single problem with E
Coli and salmonella, and we ship throughout the world and
throughout the United States. We just need to address this
process manure category.

The third is the Chilean. We support the 20
percent rule but need to continue to have this rule at our
side.

Under certain adverse conditions, we have found
through experimenting and growing on a large scale that
sometimes Chilean is the only thing that can pull us free,
it's the only thing that allows us to get that quick kick.

We're competing with conventional growers out
there right now, trying to make a better organic product so
that we can reduce the number of pesticides in everything
that's being grown out there right now. We need this tool.
We support the 20 percent rule.
Like I said, we have over 18,000 acres of certified ground. Less than half of our ground has ever had any Chilean on it. So we don't use it just out there throwing it at everything. We just use it when we have to. We don't use it on all our crops, just the few that need it under certain conditions.

Basically that's it. I just wanted to just thank you for this opportunity.

We've only got a few tools out there. These are three that are primary to me as a grower. I need these three to keep my program going forward.

We're constantly experimenting and trying other products, but as of right now, these are the three most important we have growing on a large scale.

Thank you.

MR. CARTER: Okay. Thank you. There is a question here.

MR. RIDDLE: Yes. I'm just wondering if you could describe quickly your typical crop rotation on the fields where you do use the Chilean Nitrate and specifically what legumes are in that system.

MR. HUCKABY: Almost every single field that we have, whether we use the Chilean or not, we will grow during our off season some type of a cow pea or bean product that we rotate with --
MR. RIDDLE: For plow down?

MR. HUCKABY: -- for plow down. Yes. That's basically our cycle on all of our crops, you know, on the season before whether or not we grow with Chilean or only with compost or chicken. So it is one of the products that we use consistently.

MR. RIDDLE: Thanks.

MR. CARTER: Okay. Willie.

MR. LOCKERETZ: You mentioned buying in a variety of composts or other organic materials. With that do you get enough information or does your certifier get enough information to be confident that the materials you use are compatible with the rule?

MR. HUCKABY: Yes. We feel very confident that the sources that we are using -- we go out and we spec out exactly what we need. We have -- on our level, we have actually three agronomists on staff that go, they evaluate, they check the records.

Like I said, we buy about 200,000 tons a year, so that we actually have a person that goes around and continually monitors and checks the sources that we're buying from.

MR. CARTER: Rosalie?

MS. KOENIG: I had a question on the manure.

What typically is the, I guess average number of days before
you harvest each side dress of process manure?

MR. HUCKABY: I guess it depends on the crop. Like I said, primarily it's carrots. When we're in carrots, it's probably more in the range of 60 days. On some of the other crops where maybe -- you know, our average carrot crop throughout California ends up being about 110-, 120-day crop, some of them as long as 150.

We try to get it up front and then let it carry through. We might finish out the crop with a little bit of fish or something. We don't use Chilean very regularly on the carrots.

Some of our lettuces, it's a little bit closer. We're talking more like 30 days prior to harvest, 45, depending on the time of the year. We're growing throughout California. Some our seasons are very quick. Some of them, depending on the winter, are longer.

MR. BANDELE: Several of the TAP reviewers mentioned that [inaudible] blood meal and [inaudible]. Could you comment on that?

MR. HUCKABY: Well, our research staff is trying other options out there.

I think one of the problems -- we have used blood meal. We get into another problem that, depending on where the source of blood meal comes from, we get consumers that absolutely won't buy our product if it's beef blood just
because of Mad Cow Disease and other problems we've had.

So a lot of it is availability and getting it in the quantities that we need.

MR. BANDELE: But you mentioned the kick. Would you get a similar kind of kick with blood meal?

MR. HUCKABY: We have gotten -- we can get a pretty good kick through using blood meal, some of the bat guano, some of the others, but not as consistent maybe as we do with the Chilean.

I would have to defer to some of our agronomists to specifically tell you that. But I mean, from what I have seen, we haven't been able to do it on the large scale that we have with the Chilean.

MR. CARTER: Okay. Thank you very much.

MR. HUCKABY: Thank you.

MR. DAVIS: I'm Gerald Davis. You mentioned both our names together, but --

MR. CARTER: That's okay. Come forward. And then, next up will be Cliff Bingham. Go ahead.

MR. DAVIS: Good morning. I'm Gerald Davis with Cow-Organic Vegetable Company. I have worked for this farm for the past ten years as their agronomist and pest control advisor.

At Cow-Organic Veg, we grow carrots, potatoes, onions, cool crops, lettuce, and most any leafy green crop
one could name. We farm in various parts of California, producing a year-round supply of most items we grow.

The quality and appearance of our produce is second to none, organic or non, and is a vital part of several major nationwide retailers' efforts to bring consistent quality organic produce to the expanding marketplace.

I have come here today to inform this Board of the good success we have had using Chilean Nitrate under the current rule's guidelines and ask that you reject the current petition to remove the material from the national list.

The petition before you is substantially flawed in its portrayal of the risks of using Chilean Nitrate and is inaccurate to the point of ignorance concerning alternative materials.

Using Chilean Nitrate according to the current rule, combined with the proper field conditions and management, virtually eliminates or substantially minimizes all of the environmental and health concerns listed in Criteria 1 through 5 of the reviews in this petition.

In our growing process, there is no stream or ground water contamination by excess nitrates. If there is no contamination, then there is no potential human health risks because the risks listed are all predicated on
consuming contaminated water.

The 20 percent of nitrate guideline in the current rule is a very modest amount of nitrate, which eliminates the detrimental effects of excess nitrate levels in the soil or in the vegetables themselves at harvest.

This relatively small amount of Chilean Nitrate that is allowed per crop also helps minimize the amount of sodium buildup in the soil.

Now, a quick agronomy lesson. In all this talk about nitrates in ground water or excess nitrates in soil, let's not forget that most plants must have nitrate form nitrogen in order to grow properly. They can't utilize the other forms directly.

As organic farmers, to make inputs of nitrogen to our crop, we can add nitrate directly, with Chilean Nitrate, for example, or we can add other forms of nitrogen, counting on certain microbes in our soil to convert them to the plant available nitrate.

The amount and rate that this takes place depends on several factors, one of which, the most important, is soil temperature.

The conversion time is most rapid in warm soil, slowing to a crawl at about 55 degrees, and a complete standstill at 40 degrees.

Vegetables like lettuce or broccoli can make slow
but steady growth at 50 degree soil temperatures, but they will outrun the supply of nitrate being converted by our microbial friends in the soil.

This is precisely the situation in the mild winter areas of California where much of the nation's produce comes from November through March each year.

There are a few pockets of land in slightly warmer areas along the Central and Southern California Coasts that do a little better, as alluded to by one of the reviewers in the petition. But housing tracts like to grow there, too, and most of that agricultural land either is or soon will be under concrete.

Anyway, without supplemental nitrate added to these vegetable crops, they stop growing, turn funny color, and begin to succumb to various mildew diseases. This is the biggest reason Chilean Nitrate is so important to organic vegetable production.

Contrary to the opinions of the reviewers in the petition, there are no other viable nitrate supplements. All of the alternate materials listed or alluded to in that review have profound limitations in supply especially, especially if the demand goes up as more acres convert to organic production.

The only material listed that has good supply potential is Phytamin 800, which is a soybean product, but
it has no nitrate content.

None of the materials but one has any significant amount of nitrate in it. The one that does, seabird guano, from the islands off of Peru, is undoubtedly the best manure and guano-based fertilizer going. We used it heavily one year about five years ago, but couldn't buy any the next year.

The Peruvian Government began putting the entire year's production up for bid, and the first year after that it went to a German fertilizer company, obviously because no Chilean Nitrate is allowed in European organic production, so you've got to find a nitrate source somewhere.

Starting a couple years ago, the Peruvians began splitting their 40,000-ton yearly production into eight lots. We considered buying one lot, but decided that if we as one grower could consume one-eighth of the world's supply of seabird guano, that it is not a sustainable material for the long term.

Let's bring this home in the seconds that I have left to speak.

The 20 percent nitrate budget in the current rule is a good rule. It has helped our farm identify precisely when and where the material is essential and eliminated unnecessary use.

It has helped me as an agronomist finally make
the case on the farm for a concerted cover cropping program on our farm.

Now, five years later, we grow and plow down thousands of acres of legume cover crops every year. Our yields and quality are increasing, and we are standing toe to toe in the marketplace with a conventional produce industry that is baffled by us. While they are --

Thank you.

MR. LOCKERETZ: Quick question. I think you said you grow lettuces?

MR. DAVIS: Yes, we do.

MR. LOCKERETZ: Do you test either lettuce or other crops for nitrate concentration?

MR. DAVIS: Yes, we do.

MR. LOCKERETZ: And what kind of results do you get?

MR. DAVIS: I can speak of one study I did with carrots specifically, where I compared three fields under our organic production with three neighboring fields of neighbors growing conventionally, for example.

The nitrate content of the carrots in those situations, there were three fields. The parts per million was 4, 5, and 9 parts per million in the carrots in the
organic fields, and varied from 280 to over 500 parts per million in the conventional carrots.

So we are using Chilean in a narrow window on some carrots and all our other vegetables, usually in the mid-growth stage of the crop, and by harvest, there is no excess nitrate loading in those leaves or below-ground parts.

MR. LOCKERETZ: Thank you.

MR. CARTER: George?

MR. SIEMON: Are you using this on -- what percentage of your crops are you using this, like, both ways? Like of all the carrots you grow, are you using it 100 percent, and of all the crops you grow, are you using it 20 percent?

MR. DAVIS: On carrots, for example, probably maybe 25 percent of the acreage. And it really depends on the time of year. We are a year-round producer, and our crops at some portion of the year encounter substandard soil temperatures, and that's when we would tend to use it.

The other crops, lettuces and -- we use a little higher percentage of the overall acreage. But again, it's contingent on -- during the summertime we can not use Chilean Nitrate at all and produce perfectly good lettuce and broccoli and so forth.

MR. CARTER: Owusu?
MR. BANDELE: Even in those adverse conditions, when you're talking about the temperatures with broccoli, are you still keeping the Chilean Nitrate within the 20 percent range of the crop?

MR. DAVIS: Yes, sir. This is all within the 20 percent range for each crop.

MR. BANDELE: Even with the lettuce, which is quickly growing? How do you do that? I mean, how do you keep that within 20 percent?

MR. DAVIS: If you think about it, most of our crops, when we harvest during that winter period, will spend part of their life cycle in warmer periods, either at the beginning or at the end.

So we are identifying exactly when they need it. And we go right up to the 20 percent limit and stop. That's the best we can do. And it usually works pretty well. Sometimes it's not quite enough, but we just put up with it.

MR. CARTER: Rose?

MS. KOENIG: I just have a question. I mean, we're probably maybe a little bit warmer in Gainesville, Florida, where we grow throughout the winter, too, those similar crops. But we don't use Chilean Nitrate.

MR. DAVIS: Right.

MS. KOENIG: And I'm trying to figure out the
differences. Is it because you have to go -- you have a market demand. I mean, obviously you're a lot larger grower than myself. So if I have a crop delay of maybe ten days in terms of growth, that's fine for my marketplace.

Is it because of your system, that you're trying to meet a consistent demand in the marketplace, and that you -- I mean, I know that it does take longer in our area with lettuces --

MR. DAVIS: Right.

MS. KOENIG: -- compared to the summer.

MR. DAVIS: What is your soil temperature --

MS. KOENIG: It just depends on whether there's cold fronts or warm fronts.

MR. DAVIS: Right. Right.

MS. KOENIG: But probably 55, something like that, 60.

MR. DAVIS: Right. Well, at 55 to 60, you're in better shape than we are. We --

MS. KOENIG: But is it -- that's what -- but what I'm really asking is, is the nitrogen to just keep those crops growing quickly so that you can turn around and put something else in the ground, or is it really that you're suffering from disease pressure? Because --

MR. DAVIS: No. It's --

MS. KOENIG: -- a lot of diseases come on when
you have excess nitrogen. So I was surprised that you had a lot of disease.

MR. DAVIS: Most of the diseases that I mentioned, for example, lettuce, when it's not harvested at proper maturity and it has to wait and go over-mature to get the proper size to meet the commitments that the produce industry expects from us for size, the growth slows down, it gets more mature, and the host plant resistance of that plant is less, and we begin to see mildew.

It's also when it's the most crowded stand conditions, you know, the plants are holding a lot of humidity around themselves because they're all grown up and pushing together. And that's just what we've noticed.

We use the material to keep the supply going. I mean, this is a large farm. We have retailers waiting for product. And when it slows down too far, we can't tell them, Well, wait, we'll get back to you in three weeks, because then their shelves are empty, because their demand goes on, it doesn't stop.

MS. KOENIG: Do you use it other than the wintertime? I mean, are there instances when conditions, soil temperatures are favorable, where you are using it to just, again, rapidly get to the marketplace or improve the quality or --

MR. DAVIS: An example of that might be on
potatoes. Potatoes are such a rapidly bulking item that require a tremendous amount of nitrogen in a very narrow space of time. Yes. We've used that on that even when the soil conditions are favorable because the yield decrease is tremendous without the use of supplied nitrate.

MS. KOENIG: Thank you.

MR. CARTER: Okay. Thank you. I'm going to -- just to remind the committee, now, we've taken 20 minutes on our first two, but we do have about 28 folks scheduled. So please keep that --

Is Cliff Bingham --

VOICE: Cliff is not here today.

MR. CARTER: Okay. Leslie --

VOICE: We're getting more efficient.

MR. CARTER: Yes. We're getting more efficient.

We just caught up some time.

(General laughter.)

MR. CARTER: Leslie Zoick. Okay. And then, after that will be Bob -- oh, boy -- Schmidpknecht,

something like that.

MS. ZOICK: Good morning. I'm Leslie Zoick, Executive Director of Pennsylvania Certified Organic, also known as PCO, a newly accredited certifying agent, and we're very pleased to announce that. And we are proud to be part of the organic program.
I want to commend the Board for the very hard and productive work that you have been doing in the last year-and-a-half.

But as October 21 approaches, we are all as certifiers becoming more concerned about uniform interpretation of the standards. I think that's going to be the biggest challenge coming before us now.

I'm going to talk about chickens. PCO certifies about a million-and-a-half broilers annually and 75,000 turkeys. All of these birds have outdoor access. All of these birds go out year-round in Pennsylvania, and it gets cold there, believe me.

And not only do they have access to the outdoors year-round, they actually go outside. In fact, most are given free access, meaning that the houses are open all the time, and they can roam in or out as they please. And most actually do have rotational paddocks with vegetation, as well.

Meat bird flocks that are kept in their entire lives are not certified.

On the other hand, we certify over 100,000 egg laying chickens, only a fraction of which currently have outdoor access.

The operators that do not have outdoor access at this time are in the process of submitting plans to PCO for

Heritage Reporting Corporation
(202) 628-4888
approval. And you'll be hearing from at least one of those certified operators today, as well, so I won't go into the details of that operation.

Most of those layer operations will not have a problem complying with an outdoor access requirement.

But they do have concerns about the wild fowl coming through our Eastern flyways spreading disease, as well as rodent control. And we have allowed them to express those concerns by permitting a roofed area in their outside yard and wire to prevent the rodent access.

Nutrient management is also more of a problem for the layer houses. They are permitted to have non-natural surfaces, and the roofing does help considerably with the runoff concerns.

PCO does support the NOSB draft recommendation on poultry outdoor access. However, we would like the NOP to consider separate standards for layers and broilers. We would like to have roofed areas allowed.

We are very concerned about the sentence in the draft recommendation that says, Short-lived poultry such as broilers may spend their entire lives inside due to inclement weather and concern for livestock well-being.

We see this as a huge loophole for operators to avoid outdoor access for poultry all together. Inclement weather may be somewhat able to be documented.
Livestock well-being means considerably different things to different people. And that's where the rule interpretation comes in. And we see that as a major, major loophole.

We would like it to say that, you know, poultry which spends its entire lives inside may not be certified, even if it's just that flock or that portion of their production.

We believe that outdoor access for poultry is imperative for preserving the integrity of the organic label.

And if I have a few minutes left, I'd like to speak on dairy replacement animals.

PCO certifies approximately 95 dairy farms, all within the State of Pennsylvania. We represent 7,000 or so cows. I'm here on behalf of those farmers and their cows -- they're busy --

(General laughter.)

MS. ZOICK: -- to support the Board's draft recommendation for dairy replacement stock.

The Pennsylvania organic dairy farms ship to three different milk producers -- processors -- excuse me. About ten farms are certified and currently do not have organic milk contracts as we speak. So if additional organic milk is considerably in demand, there are cows ready
and waiting to produce it for you.

PCO standards have always required that, once a herd is fully converted, all dairy replacement animals must be managed organically from the last third of gestation.

In some cases, if organic replacements are not available, farmers are permitted to purchase nonorganic heifers or transition them over one year, but only if they have demonstrated and documented efforts to find organic replacements, and only up to 10 percent of the herd annually. This exception has been used twice in five years.

PCO does not want to see a blanket allowance for transitioning commercially produced heifers, because it would result in continually in-transition herd, it would unfairly discriminate against farmers who raise their own heifers.

It would put organic heifer operations out of business and therefore result in actually fewer replacement dairy animals being available overall, which in turn would degrade the integrity of organic dairy products in the marketplace.

Thanks for listening. Keep up the good work, everyone. Questions?

MR. SIEMON: Yes. Just so I'm clear, you were saying that the laying hens would be allowed to be outside and still have a roof over them and not an open space?
MS. ZOICK: It's open on all four sides.
MR. SIEMON: I mean, not a direct roofless?
MS. ZOICK: Right.
MR. SIEMON: Okay. I just wanted to make sure.
MR. CARTER: Thank you.
Bob -- is it Schmidpknecht?
MR. MEEKER: Schmidpknecht.
MR. CARTER: Schmidpknecht. There we go. Thank you.
MR. MEEKER: I'm going to speak for him.
MR. CARTER: Okay.
MR. MEEKER: I am Floyd Meeker, Jr., President of Meeker Farms, Incorporated. I have petitioned the NOSB to approve calcium oxide/calcium hydroxide.

I have a product that I have produced for about 20 years called Bio-Cal, has calcium oxide in it, calcium oxide that has been piled in large piles, covers the size of a football field.

The piles have been there for 20 to 30 years. The rain water has hydrated these piles, making calcium hydroxide. These piles are now very good chemically. The fineness of grind is 5 to 10 microns, much better than gypsum or high-cal lime.

But the problem with these piles, they are like toothpaste, impossible to spread with regular bulk.
spreaders.

I mix other organically approved calcium sources with this toothpaste, dry it by mixing with it very small amounts of calcium oxide that has been discarded daily by the lime kiln company that I work with, then it goes through more hydration steps. This makes a very soluble, stable, nontoxic calcium.

And when you go through this process, there is some problems with dust. And we control our dust by just dumping water all the time on this.

We have to keep a certain percent of water in the product at all times during shipping, handling, spreading, and all that process is overseen by the DNR. They give us a permit to operate. If there was any dust created in the process, then we wouldn't be able to operate. We have a permit from the DNR in order to process this product.

What I would like the NOSB to do is to approve calcium oxide when it is fully hydrated, causing the formulation of calcium hydroxide, and when both are buffered and blended to the point where they are less than 10 percent of the total calcium oxide/calcium hydroxide in a product.

A simple test can be done to see how much oxide and how well it's hydrated. You can take a styrofoam cup, mix equal parts of water and product in it, stick a thermometer in it.
If the temperature of the product goes up more than one degree when you add the water, it's not fully hydrated, and you can't use the product.

The TAP reviews mentioned there was lots of problems with cement kiln dust and fly ashes. We're not looking for approval of any of those products. If you can put limitations on it to say, We don't want those products, we don't advocate anybody using those products because there's too many impurities in them.

Our product comes directly from a lime kiln, and that's used to purify drinking water, so it's a good, pure calcium oxide. Many of the other products aren't that.

That's pretty much the end of my comments. Are there any questions?

MR. CARTER: George?

MR. SIEMON: There seems to be this confusion, like you were just saying, about this and the other burn products. Is there some way to isolate this from the other ones? You were just saying if we could annotate it. Any ideas?

MR. MEEKER: Restrict it to only lime kilns only, calcium oxide that comes from lime kilns. That would take out all the impure like cement kilns. Nothing that has been generated electric generation, that would take the flyatias out.
And also, you know, the one degree temperature rise thing to make sure that the product is fully hydrated. That way you're not burning any green crops.

We spread our stuff on alfalfa while it's growing, don't have any trouble with it at all, it's fully hydrated.

MR. CARTER: Yes. Kim?

MS. BURTON: You're currently supplying this material to organic farmers. Correct?

MR. MEEKER: We have in the past, but in recent years, we have not been able to. That was about a third of our business, and we market about 30,000 tons a year.

But, yes. They have all been worried about it not being approved, so they have quit using it. But we have two organic farmers here that are going to talk about when they used to use it, the results they've seen.

MS. BURTON: Okay. Thank you.

MR. CARTER: Okay. Other questions?

MS. KOENIG: How would a farmer be able to identify where that source is coming from, the label? I mean, you're not required to label where the source of that product is, other than if you went through OMRI, of course.

But if a product didn't go through that system --

MR. MEEKER: A test would tell you --

MS. KOENIG: What type of --
MR. MEEKER: You can get a full metals test, and you can get a calcium oxide test. And you know, a regular chemical test would tell you pretty much where it came from.

MS. KOENIG: But it's not labeled, I mean, other than a grower testing a product if they went to the marketplace?

MR. MEEKER: Right. I guess that's true, unless you guys come up with a label that would say, you know, certain products are -- but then you're endorsing products. And that's the whole reason why we came to you with the Bio-Cal name, and you guys wanted to break it apart into certain ingredients and then to certify the ingredients.

But the problem is, when you certify the ingredients, you're opening them up to a bunch of other products that have those ingredients in them that aren't pure.

MR. CARTER: Okay. Let me suggest, too, there are four other folks to testify --

MR. MEEKER: Right.

MR. CARTER: -- with you on this issue, or to give public comment. So why don't we go ahead and take all of those? And if you would just stay up close here.

MR. MEEKER: Okay.

MR. CARTER: And then, when we get done with all of those, we'll take some questions.
So next, Jerry Wolf, and then we have Gary Zimmer.

MR. PRESTON: Okay. We're doing it in a little different order. They asked me to speak next.

My name is Morris Preston with Preston Engineering in Davenport, Iowa. And I drafted the petition materials that were submitted for this.

And I'm going to go right to my main points here. We're pressed for time a little bit.

The main reason that we requested the calcium oxide and calcium hydroxide is, that was the process that the rules required. We originally requested a complex calcium compound which is a generic form of the product that Butch produces.

The rules -- that petition was returned to us, and the rules are that we had to petition for the specific chemical compounds, so that's what we did.

Lime kilns and cement plants are different. The TAP review kind of talked a lot about cement plants. And you can't get lime out of a cement plant. You get Portland cement out of a cement plant, which is considerably different than lime.

Cement plants produce other compounds of calcium. They have silicates, they have irons, they have aluminum compounds. And lime plants produce lime. They take high
quality calcium carbonate, limestone, calcine it to release the CO2, and produce calcium oxide, which one of its primary uses is for water treatment. And it's a considerably different product than Portland cement.

Basically the product that we're talking about is less polluting, less energy intensive, and has no increase in worker safety risks.

And the reason for that is that a lime kiln is not 100 percent efficient. You're not able to get 100 percent yield out of the process, because some of the ground limestone and some of the very fine calcium oxide goes on through the kiln and is recovered as a fine dust.

That particular dust is under-utilized, is a cheaper product, and it's available for Mr. Meeker's product. And it replaces alternative materials. It's also more effective.

It replaces gypsum and limestone. So if you use a ton of this material, that's at least a ton of the limestone that doesn't have to be mined someplace and the associated energy with mining and crushing limestone and the environmental issues associated with that.

So it's actually a little less polluting, a little less energy is used, and the worker safety is already regulated under the lime production through MSHA and OSHA.

And the material is thoroughly wetted, which
controls the dust. The respiration of dry particles is certainly an issue with any dust, and that's very well controlled.

We think the heat test is a very practical way to evaluate the quality of this material. If you buy a load of this material, you can go out there and test it on the farm. Every farm's got a thermometer, I'm pretty sure, or they can get one. And you can tell if that product is up to specification and has been properly hydrated or not by just simply testing it when it comes off the truck.

That's a quality control measure that's used in the production of it which tests that before it goes out. And I guess the biggest question maybe is, why is Bio-Cal more effective? And some of the farmers here are going to speak to that.

But basically it's been their experience that this results in higher levels of calcium content in the forages. That calcium and other mineral content is more easily taken up by animals that consume it, and so they have a better forage, they have a healthier animal, and they don't have to supplement the animal's ration with mineral supplements.

And with that, I think I'll conclude my comments. Thank you very much.

MR. CARTER: We have on the list Jerry Wolf, Gary
Zimmer, and Floyd Meeker. Who is -- okay.

MR. MESSA: Hi. I'm Matt Messa. My wife, Suzanne, and I farm up in West Central Wisconsin. I'm just going to read this to keep my thoughts together.

We've been certified organic since 1994, and we farm about 300 acres. We raise broilers, and we have a cow-calf beef herd.

One of our main sources of income is our cropping. We raise and sell 2- to 400 tons of hay a year, along with corn, barley, soybeans, and oats.

Our farms were purchased in the past 15 years, and all of them were very depleted. Soil tests all called for lime.

We were of the belief back then even that high calcium lime was our best addition, even though it was a lot more expensive. We live in a region where magnesium is real high in our soils, and we don't need to add any.

We felt that the high cal lime would be our best addition without adding to the magnesium overload we already had. The lime did improve our pH, and soil structure did begin to change.

Over time we've learned more about soil and plant function, and were searching for a form of calcium that was more available for our crops. We weren't seeing much change in the forage test results. And although we added calcium
to our land, we seemed to be banking it. The pHs were going up, but we weren't getting any uptake.

We've used gypsum even as a roll fertilizer, but we have to be careful because of the high sulfur content and the potential leaching of other nutrients.

We found out about Bio-Cal probably in the mid-'90s. And as us farmers are known to be, I was skeptical. We did try some. And I'd have to say that of all the soil amendments in my farming career that we've ever used, this Bio-Cal had the most profound effect on our soils and our crop health.

And as we moved our crops into the food system, we were hearing back from people that bought them from us that their animals were healthier, their vet bills were going down, problems with cattle feet and all that was changing.

We have a fair sized list of hay customers, and they like our hay. Some of the effects have been better palatability, over time, increased herd health, and one of their side benefits was increased production.

The forage tests have indicated more than just an increase in calcium content in our forages. There's also increases in phosphorous, magnesium, potassium, and sulfur, which are desirable, too, in hay especially.

We believe calcium is a crucial link in the
function of our soils. It's the vehicle that moves
nutrients into our crops.

Our soils are the basis for our livelihood. We
really believe that Bio-Cal is the one soil amendment that
provides the most available form of calcium for our crops
and the animals they feed.

We have experienced a change in our soils from
hard, packed clay to loose, crumbly ground that has a
noticeable increase in earthworm activity, and for us that's
a good indicator.

One little incident that I wanted to close with
showed me that something is improving for us. Our
conventional farmer neighbor to the north was wandering
around in our woods, and he went down in our fields and was
nosing around. And he collared me in town one day and told
us that he couldn't believe how our farm had changed in the
time we owned it, the soils.

And I guess from an outsider's point of view,
that told us something was going right.

So I want to close that we firmly believe that,
just through our own experience, the Bio-Cal product
undoubtedly fulfills our requirement for calcium needs
beyond our expectations in our system, from our soil
structure and performance right through the health of our
animals that consume it, and it would be really nice to be

Heritage Reporting Corporation
(202) 628-4888
able to use it again.

MR. CARTER: Thank you.

MR. WOLF: Good morning. And finally, yes, I am Jerry Wolf. I finally get up here.

(General laughter.)

MR. WOLF: And I am addressing the same issue, the calcium oxide/calcium hydroxide issue for food production for organic.

I farm with my brother, Chuck, in Elmwood, Wisconsin, about 70 miles east of St. Paul/Minneapolis. We raise -- we have about a 220-acre certified organic dairy farm, with 65 cows. We raise all our own feed. We buy very little off-the-farm inputs.

We try to be as self-sustaining as possible, because we know in the long run that, if we can do it for ourselves, we can do it for ourselves a long time. We raise all our own replacement heifers and sell bull calves off the farm.

In 1993, we started using this Bio-Cal product. And before that, we were liming for pH with dolomitic lime.

And much that I talk about is going to be the same that Matt talked about just because farmers do see the same things a lot, so you'll get some repetition here.

But with the dolomitic lime having the high magnesium in it, we found it was being tied up in the soil,
and even though the soils were high in magnesium, it wasn't coming through in our forage tests, and we were still having to supplement our cattle with magnesium and other nutrients that were lacking in our feeds.

We got involved with a company that had this Bio-Cal product. And you know, the man told us that it would increase our mineral uptake from the soils, things that we banked into our soils for years by fertilization and liming, and we'd be able to get some of that back out of our soils.

Our own soil that we pay taxes on when we purchase these farms, we can do it more efficiently than buying it off the farm. And so that's why we kind of went into this.

And one thing that we found with the Bio-Cal, that not only using this high soluble calcium on our crops, not only did the calcium increase, but it brought the other nutrients out of the soil, too. The magnesiuums, all of a sudden, in our forage tests are coming up.

And at the time that we were in transition between going with a biological company that was helping us out, we were still working with our local coop that does our nutrition work. And so we've got this guy coming on our farm doing computer printouts on our forage tests, making a recommendation on what to feed our cattle.

And the Bio-Ag consultant told us that, There's
no reason why you shouldn't be throttling back on your
minerals and your protein. There's plenty in that feed, and
the tests are showing it. And he says, You should be
throttling back.

And the coop nutritionist says, No. The computer
says that you should still feed so many pounds of this and
so much of that.

So we kind of almost told him that, We want to
cut back. So over a three-month period we rationed back on
the minerals that we were feeding and the protein supplement
that we were buying off the farm.

And we noticed a few things. And I'm going to
state them here. And the first thing was, as a farmer, you
get the dipstick mentality, is you gauge your profit quickly
by running to the bull tank, seeing how what you did the
last couple days affected the dipstick in the bull tank and
how much pounds of milk your cows produced.

And I've learned over the years that it is a
dipstick mentality that probably isn't the best one that
tells the story, because the overall production doesn't
necessarily mean profitability. And I'm a big student on
looking at the big picture.

But we did notice that the production held. It
wasn't -- we weren't losing things by cutting these things
out of our ration.
The animal health increased over that period of time. Our feed bills declined 12- to $1,500 a month, our vet bill declined 4- to $500 a month. The culling rate went down. Our cattle were just healthier.

We notice things in the soil. When you go out and pull weeds by hand because you don't spray anymore, you get close to the soil. And we noticed more earthworms. The soil was looser, the weed pressure reduced, because we weren't relying on the chemicals to do the killing. And we really noticed that it was doing a better job.

The soils became more -- and the crops became more tolerant to changes in the temperature, whether it was hot and cold or wet or dry. They were more able to withstand those extremes.

And we feel that by having this Bio-Cal product in our soil, it just got the biological activity going better, and it just made everything a lot healthier.

And being in the organic world, we can't rely on all the antibiotics and the hormones, which we've come to find that are -- they weren't doing us any good anyway, they were just a crutch, that by keeping the --

Okay. Thank you.

MR. CARTER: Okay. Now, are there any questions for -- oh. There's one more. Okay. Sorry. We've got the cleanup batter coming in.
MR. ZIMMER: I guess that is my role. We're kind of bombarding you a lot about calcium and calcium oxide.

I'm Gary Zimmer, and I'm a dairy farmer in Wisconsin with my children, and we have a dairy and crop farm, and also we have a company that distributes and markets and consults for biological and organic farmers. And we are the distributors of Bio-Cal, and have been for 20 years.

And I guess I have to summarize. And I guess I took the last spot to kind of fill in with some of the things that I thought they missed and some of the things that we've seen out here in agriculture.

First of all, I don't think there's much of a question. One of the TAP reviewers said, Well, there's plenty of calcium in the soil, and we don't really need any more. And I think that research was done with conventional agriculture.

And I think of a lot of organic people really believe that calcium is the key element and the trucker of all minerals, and calcium is quite beneficial.

We have to depend upon getting healthy soils and healthy mineralized crops and healthy livestock. We can't depend upon all of the tools that conventional agriculture has used. And so calcium is really the king of all those different supplements or the different things we want to get.
accomplished on our farms.

A lot of people hit on the fact that calcium does affect soil structure, it does affect plant health. The recent research, and there's a lot of research done in Wisconsin on calcium in potatoes right now, increasing the storability and the quality of potatoes, cut down disease and insect problems.

Calcium hooks to pectin in the plants and forms calcium pectates, which give a thicker skin on the coat of the leave and reduces the insect damage. And the other thing it does, these guys talking about the cows liking the product better with more calcium, is that we get -- this calcium affects this pectin, and pectin are digestible fibers for dairy cows.

I'm a dairy nutritionist by training and got involved in looking at a calcium source. See, the state of Wisconsin has all high dolomitic soils, high magnesium soils, well, dolomitic lime soils. There is no high calcium in Wisconsin.

So when we started looking at a calcium source, we have to truck it from surrounding states, and that's why I was looking for something quite concentrated.

And this calcium source was extremely fine, and in the processing it seemed very safe, and that's what we've been working on for years.
And so we saw the benefits of getting the calcium and the quality of the feed, and the higher levels of fiber. We have a lot of grazers on our dairy farm. We don't buy a lot of grain supplements were. We needed more energy in our feeds. And so we saw all of those benefits.

You say, Well, then, why, if we're short of calcium and calcium is trucker, why another calcium source? Can you get enough calcium out of high calcium lime? And the answer is, you can dump a lot of lime on the soil, and you still don't get the response out of putting more lime.

If you just drive your pHs up and you get a soil that's over-limed, and you're going to interfere with phosphorous and trace metal uptakes.

If you add gypsum, you say, Well, here we've got two natural products, high calcium lime and gypsum, why don't we use gypsum?

And the other answer for gypsum is that you're limited to how much you can put on. If you start looking at your excesses, if you put 150 pounds of gypsum on an acre, then you've already met your sulfur requirements.

So now if you want to put on more calcium, you can't put on more gypsum, because you're going to overload your ground with sulphur, which leaches out your magnesium and some of the other things that in some soils you don't want to see happen.
So really we have some natural sources, and here's a source that we have that eliminates the fact of driving that pH up, you don't have the carbonate in it, and it also eliminates the fact of having that sulfur part in it.

So I see the product out here. It has been used and it has been safe, and it has its place in agriculture. I see the difficulty as how you put it in the slot to eliminate some of the toxic problems that some of the kilns have out here.

Obviously ash has been acceptable and used in organic agriculture. We've got ash from plant materials and animal materials we can use. So why not -- we can also select ash from lime materials.

I've spent years in agriculture for years, long before we had crushers, and so essentially what we're looking at is ash from lime, isn't it? We're burning out the carbon

And so if we limit it to a lime kiln, then we take away the toxic material and put the safety into it. And so that's what we're requesting.

And I appreciate your time and effort. And we've written up that little report on some of the things we wanted to have addressed. Thank you.

MR. CARTER: Okay. Thank you very much.
Now we'll open it to questions. And to those folks at the end of the table, raise your hands high, because I'm having a hard time seeing down the table. So any questions for any of these commenters?

(No response.)

MR. CARTER: All right. Thank you all very much. Let's move on, then, to Liana Hoodes, and then George Bass.

MS. HOODES: Hi. I'm Liana Hoodes. I am making comments today on behalf of the Organic Committee of the National Campaign for Sustainable Agriculture and Rural Advancement Foundation International.

Poultry access to the outdoors, it's been an ongoing concern that the temporary exemptions to outdoor access not become loopholes. The public does not want factory-style confinement operations in organic.

In order to remain true to this very clear public message, organic livestock exemptions must be narrowly defined and well justified. Exemptions must be documented, and every operation must be completely able to meet the requirement for outdoor access before they opt for a temporary exemption from outdoor access.

Exemptions must not be a loophole for factory-style confinement operations, nor can they be permanent allowances due to limitations of the land available to meet
requirements for outdoor access.

Your copies have our full language changes.

Feedlots: The concept of feedlots was introduced in earlier NOSB clarifications without making it clear to the public that the recommendations would indeed allow for organic feedlots.

Despite specific public opposition to dry lots as an allowable outdoor environment and standard feedlots generally being unacceptable in organic production for a number of reasons, the topic has been broached with the public peripherally at best.

We have been, and continue to be, ardent supporters of the NOSB's role in public/private partnership. It is disturbing to us to have such a key issue as organic feedlots raised indirectly and not be given the benefit of full and informed public comment.

We urge the NOSB to be very clear about the process that is being followed for full consideration of the comments received and how legitimate concerns are to be further addressed by NOSB in a direct and public manner.

What is the actual role of NOSB clarifications? Several questions have recently emerged as to the role of the NOSB and of public comments made to the Board in the clarification of the rule.

We're looking for answers to several questions:

Heritage Reporting Corporation
(202) 628-4888
Does the NOP have an operating manual based on the final rule?

If so, what role did NOSB play in its development?

How do NOSB and the public know if their comments were taken into consideration, and if so, in what manner?

Is the Operating Manual publicly available?

It's been our understanding that NOSB was to play a formal role in the NOP final rule manual development so as to ensure public transparency and accountability in the development of the manual.

Yet, following the last NOSB meeting, there has been increasing confusion as to the role of NOSB final rule manual clarifications.

Recent NOSB meeting notes state that certifiers can choose to enforce or not enforce the clarifications. In addition, NOP inspectors have been giving conflicting information to different programs and have been inconsistent with one another.

It is essential that the role of the NOSB and public input in the final rule clarifications be recognized, and that all clarifications be consistent.

NOSB Authority: NOSB is a non-Governmental board with two distinct roles, to provide the Secretary with recommendations regarding implementation of OFPA and to
develop the National List or proposed amendments to the National List.

With regards to the national list, the NOSB must ensure that guidelines concerning the review of processing technologies do not subvert the Board's legal authority to ensure that unapproved synthetic ingredients are not allowed in end products labeled "organic" or "made with organic."

OFPA specifically requires that NOSB will have a role in addressing whether the makeup of processed products is allowable under the Act.

In exempting any food processing technologies from NOSB review, the Board must ensure it is not reducing or eliminating its legal authority over the content of the processed agricultural products.

Thus, all synthetics present in an agricultural product must have undergone TAP review and been approved by the NOSB for inclusion on the National List.

NOP and Accreditation As the accreditation process has proceeded, several questions have been surfacing regarding exactly what process NOP has employed to offer clear evaluation and guidance. Both an Accreditation Manual and a functioning peer review process are lacking. These both must be put in place immediately.

In addition, we continue to be extremely concerned that USDA not discriminate against farmer-based
certifiers where farmers are appropriately involved in their certification organizations.

I defer to others' comments, specifically Marty Mesh, to detail the importance of farmers' involvement in certification organizations.

Grower Groups: We strongly urge NOSB to make a recommendation to USDA to recognize internationally accepted protocols associated with grower groups.

NOSB Director: It is time for NOSB to hire an executive director, a full-time, dedicated staff person to facilitate public transparency, respond to public requests, and generally communicate with the public. And this would relieve NOP of these duties so that they could continue their regulatory function.

Nearly last, but certainly not least, we would like to commend the work of Mark Keating. We were extremely saddened to learn of his reassignment, and would like to go on record as supporting and thanking him for his dedication and excellence in all his work on behalf of organic and the organic community.

Finally, I would just like to tell a quick cautionary tale.

During negotiations over a farm bill that was recently passed, we saw an unsuccessful attempt at pressuring Congress to legislate an exemption to the 100
percent organic feed requirement for poultry. During that same time period, you as a Board had been grappling with outdoor access exemptions and the Department has been looking at outdoor access requirements for poultry.

Through these three unrelated paths, we might envision an organic chicken that never sees the outdoors and doesn't eat organic feed.

Will the consumer continue to pay 3.50 a pound for a bird that's no different than one they can get conventionally for $1.50 a pound? Will organic continue to be defined by high standards which warrant a price premium and exceptional market growth, at over 20 percent a year?

MR. CARTER: Time.

MS. HOODES: Now that the Federal Government regulates the word, organic, it is the job of USDA, AMS, and NOP to assure that integrity and high standards which have been protected by family farmers and farmer-based certifiers continue to be the hallmark of this marketing and production system.

MR. CARTER: I was going to let you get done with your last sentence, and you managed to get through there without a single period.

MS. HOODES: Thank you.

(General laughter.)

MR. CARTER: Any questions for Liana?
MR. CARTER: Okay. Thank you.

Okay. George Bass. And then, after that will be Barat Bisabri.

MR. BASS: Thank you for the opportunity of being with you.

MR. CARTER: You need to go to the mic since we are doing this for a public record here.

MR. BASS: I'd like to thank you for the opportunity. I am George Bass. I've been in the egg business for 30 years. This is my second farm. My first farm was in Bogata, Colombia.

This farm is in Massachusetts. It's called The Country Hen. And we've got about 40,000 layers on this farm; our total is about 67,000.

We're surrounded by neighbors, north, south, and in this direction we've got the Government owning the land. So we can't expand. We've got about 13 acres on this piece of land.

I'd like to present three arguments. First is I think that outside is a danger to the people of Massachusetts, and especially Boston; number two, I'd like to say that there is a danger to our farm; and number three, there's a danger to our employees, which are our animals. Most of our employees are animals.
And this is my first argument here. I think there is a great danger of pollution to the Boston water supply. And this is not a jest, but I think a real fact.

And if we were to let these birds out for three, four months, we would produce about 290 tons of wet manure.

This is -- we're on the watershed of the water that goes into Boston. And the Quaban [phonetic] Reserve is about ten miles to our west. So we're about 1,200 feet from the first brook, which is Natick Pine Brook. And there's no doubt that some of this material would be washed into the Quaban or some of the bacteria would reach the Quaban Reserve.

We've called the people in charge of the Boston water supply -- they call them the MDC -- and we asked them what their opinion was. We explained what our situation was.

And this is a letter from the Quaban Reserve superintendent. And he says, As such the MDC would discourage the activity.

So I think we've got a water problem here with Boston. And I don't want to see the people of Boston riding out and trying to close our farm.

I think we have got a great danger to our company, because if we have to go outside and do it properly, I think it's going to take a lot of land. Now,
some people would contest that. They just want to open the door and have them go outside and run around.

We only have 13 acres. The real -- when they were doing it back in the '20s and '30s, when actually all agriculture was basically organic, the ratio recommended by two professors, one with Cornell and one with Oregon, their recommendations were 100 bird per acre.

And the reason for that was that you could rotate your land with the birds and it wouldn't pollute your land that much. So you needed 100 birds.

Now, if we do that, we're going to need 670 acres to achieve that. In Boston and Massachusetts, you're going to pay about $5,000 an acre. So we've got a land cost of about $3,350,000. The cost of new buildings, that's probably 1.8 million. And I put down cost of moving the whole farm. We're talking about $5 million to move our farm.

We can't possibly do that. I mean, we could, but actually we would become a public charity, and producing a profit would not be a part of the game.

The greatest danger I think is to the birds. There's something going around called Avian Influenza, and I'm sure the poultry people know what that's all about. In Pennsylvania in '83 and '84, it killed about 17 million birds, according to the figure I have.
And today there is an outbreak in Virginia, and there's 2.2 million birds that have been killed already.

Now, where does it come from? According to this veterinary pathology journal -- I'll read it -- "Low pathogenic AI is common in large-scale turkey-producing areas, particularly where semi-confinement or range rearing is still widely practiced."

In other words, chickens are very close to turkeys, and most of the diseases are shared. Waterfowl are the major natural influence. So outside you've got the Canada geese and wild fowl.

I think that the Board should focus inside the barn rather than outside, because I think that's where there's going to be more fenagling.

And I've gone with these standards for many, many years, and I think they're very practical and very fair. We're giving windows to all our barns.

MR. CARTER: Time.

MR. BASS: And we give feeder space and floor space. I think all those things should be emphasized rather than going outside, giving the birds a good home.

MR. CARTER: Thank you.

Questions?

MR. MATHEWS: Mr. Bass, what kind of accommodations are you suggesting for inside the barn?
MR. BASS: Well, I have a picture here, Mr. Mathews, of the inside of our barns. And we've got big, big windows on the top that go around the barn on both sides. I think we've got 170 windows per barn.

And then, we've got soft litter scratch areas where they can spend the afternoon fluffing themselves, dusting themselves, and things like that.

The benches are where they eat and drink, and they can also drop their manure. That's where most of the manure is dropped.

So I suggest that you have adequate floor space and put numbers to it, and adequate windows and put numbers to it, and ventilation and put numbers to that, because I think that's where people are going to be doing all the crowding, trying to escape some of the regimen. And I think it's a big gray area.

And I think everybody would appreciate some hard, fast numbers on how you're going to do that.

MR. CARTER: Okay. Follow-up?

MR. MATHEWS: Yes. Mr. Bass, what -- how long -- you said you've been growing -- or producing eggs for 30 years --

MR. BASS: Thirty years.

MR. MATHEWS: -- starting out in Colombia? What is your history organically?
MR. BASS: This is the oldest organic farm that I know of. We started the organic egg business here in Massachusetts. And this is my experience. And we're certified by QAI right now.

So I feel the organic is the way to go. I think outside -- the feed is the most important thing, I think the feed and the space and the comfort of the birds. Putting them outside I think you're running into AI and all sorts of other problems. So that's my --

MR. CARTER: Okay. Jim?

MR. RIDDLE: Yes. Mr. Bass, you say you're certified by QAI. And as an accredited certifier, QAI has to certify to the rule, and the rule says outdoor access is required presently. So do you have a noncompliance that you have to be addressing right now in your certification? And how are you addressing that, if you do?

MR. BASS: We filled out all their questions, and they asked us how we're doing on the access to the outdoors, and we said, Well, we're making a petition to the Board to have a variance or have them change their position on it.

MR. RIDDLE: So you're not changing your operation at this time?

MR. BASS: We haven't changed our operations yet, because we're just -- they're waiting for us, and we're waiting for them.
MR. CARTER: Okay. Other questions?

(No response.)

MR. CARTER: Okay. Thank you.

Okay. Next we have, and I believe it's Barat Bisabri or Sterrett Robertson.

(No response.)

MR. CARTER: Okay. We're making up more time.

Chris Pierce, and then Steven Gray.

MR. PIERCE: Good morning. A little bit nervous, but I'll roll with it.

I'd like to thank the ladies and gentlemen of the National Organic Standards Board for allowing me to share my comments on behalf of the topic of access to the outdoors for poultry.

I'm with LeValle Egg Farms, and we've been producing certified organic eggs in the state of Pennsylvania since January of 1997.

Our management process begins with day-old chicks. Currently we have five organic laying houses that average around 10,000 birds per barn and three organic pullet houses that we're using to grow those layers.

They're located in various points in the state of Pennsylvania, and we're certified currently with Pennsylvania Certified Organic and NOFA New York.

Each of our farms that we work with is owned and
operated by individual families that on a daily basis take
care of the needs of the laying hens and the pullets.

I'd like to share the concerns that I have in
regards to making it mandatory for us to put our organic
laying hens outside.

Going back, I had an opportunity to participate
in the North Atlantic Poultry and Health Management
Conference in the end of March at Portsmouth, New Hampshire,
in which Mr. Eric Sideman spoke on the topic of organic
standards for poultry.

And as part of Mr. Sideman's presentation, he
mentioned that one of the primary requirements for the
organic consumer that they receive a safe food product for
themselves and for their families to consume.

And as a producer in organic eggs in the
Commonwealth of Pennsylvania, we, too, have set this as our
primary objective.

Based around this concept is our unanimous
participation for all of our flocks in the PEQAP program.
That acronym is for the Pennsylvania Egg Quality Assurance
Program. And it is considered to be a national leader in
the food safety programs for egg production within the
United States.

We have very stringent criteria for rodent
control in the layer houses. As a primary tool for the
reduction of SE, which is Salmonella Enteritis, in the chicken houses and to increase the safety of our eggs, a high level of management expense to maintain the integrity of the house and to keep the rodents out is the heart of our food safety program.

The PEQAP program focuses on the specific needs that were identified by the President's Council on Food Safety during the Clinton Administration to eliminate SE in eggs.

Based upon this conflict in goals, I would make a recommendation to the NOSB to have written into the final ruling that the FDA's official response to meeting this requirement for poultry outdoor access and the relationship in complying with the President's Council on Food Safety for the reduction of SE in eggs.

One of the key components for complying in the PEQAP program is eliminating rodents from accessing your pullet or layer house, and we have worked very hard at eliminating any entry points for rodents that are the size of a pencil's diameter or larger.

There is a wealth of scientific data supporting the fact that both mice and rats are vectors for transmission of SE.

If we're required to modify our houses to comply with the current draft recommendation by creating

Heritage Reporting Corporation
(202) 628-4888
unrestricted access points to the outdoors for our hens, this will diminish all of the accomplishments that we have worked so hard to obtain.

The draft recommendation also identifies that the organic consumer is expecting the production of organic eggs to come from hens that have the ability to go outside.

Following up with my discussion with Mr. Sideman, he identified that he was not aware of any specific data or surveys that the consumer is actually having this expectation.

Mr. Sideman responded to me and said if anyone would know of such data, it would be Dr. Willie Lockeretz from Tufts University.

I had contacted Dr. Lockeretz on the end of March to discuss this subject, and he shared with me that he wasn't aware of any such surveys or information that would identify the organic consumer had those expectations of requiring the organic hens to access the outdoors.

The colder weather patterns in the Northeast mandate farmers provide adequate shelter during a significant part of the year. So producing organic certified eggs in Pennsylvania and the rest of the Northern states would be virtually impossible during the winter months under the draft proposal.

The proposal -- there's my one minute. We're
going to skip down a little bit.

As we talk about the Avian Influenza that's going on right now in the state of Virginia, as of last Thursday, over 3 million birds had been depopulated because of AI.

I do support that there is an opportunity for the production of organic eggs that are raised on pasture, because I believe there is a specialty market looking for this commodity.

I would request that the NOSB try not to meet the needs of two markets by combining the requirements into one set of standards.

I would make a recommendation that there be one set of standards that would be a certified organic pastured eggs, and that the other standards would be those flocks that would be cage-free or roaming organic eggs, and they would meet the standards without accessing the outdoors.

I really do appreciate the hard work that you guys have put into setting these standards.

And the disease factor is really a concern for us. We do want to produce a safe egg that meets the needs that our consumers are looking for, and we also want our birds to live.

And there's two methods that AI -- and please do some research on AI. It's either transmitted from the live bird market, which USDA is really trying to get a hold on,
which is really a challenge, and migratory waterfowl. In Pennsylvania, we have a lot of flocks going through.

So thank you for your time. And any questions, I would be willing to answer.

MR. CARTER: Okay. Any questions for Mr. Pierce?

(No response.)

MR. PIERCE: Thank you for your time.

MR. LOCKERETZ: Dave, a factual update --

MR. CARTER: I was waiting for Willie to --

MR. LOCKERETZ: Point of personal privilege, I think they call it. But for two reasons I'm happy to report that I am not the program director at --

MR. PIERCE: Okay.

MR. LOCKERETZ: But the other reason is because of who is. I think you know her. Her name is Kathleen Merrigan [phonetic].

MR. PIERCE: Okay. I think I got it off the Web site, so I must have --

MR. LOCKERETZ: Well, Web sites aren't always up to date.

MR. PIERCE: That's right. Is that right, Arthur?

MR. CARTER: And you aren't the first person to get Willie and Kathleen confused.

MR. PIERCE: Okay.
(General laughter.)

MR. CARTER: Okay. Thank you very much.

MR. PIERCE: Thank you very much. Any other questions, Dr. Lockeretz?

MR. LOCKERETZ: (No audible response.)

MR. PIERCE: Okay. Thank you.

MR. CARTER: Okay. Steven Gray, and then, next up will be Steven Collier.

MR. GRAY: My name is Steven Gray, Springer Mountain Farms out of Baldwin, Georgia.

An important mandate of the FSIS is to determine whether or not any label is misleading, misbranded, or provides information that is not accurate and truthful to the consumer.

We submit that provisions be made to allow FSIS to approve additional labels for organic meat production practices.

This would mean that labels would reflect growing practices for organic production that does not necessarily require organic feed.

Organic production not only involves feed as currently required, but also involves specific animal husbandry and production practices.

During our last meeting in October, we recommended the Board that alternative labeling be
considered for organic meat production.

The NOP's current regulations allow for 100 percent organic, organic, made with organic ingredients, and then, specified organic ingredients on the labels. We don't have this alternative in meat.

Organic meat production has faltered in comparison to crop production due to lack of label options approved by the USDA FSIS.

The approval for meat amendment allowing for certified organic was not adopted until January of 1999, whereas terminology for the organic crop production has continued to develop over the past decade.

In comparison to crop production, new organic meat production is in its infancy stages. The consumer's response to organically produced meat has been extremely positive, and the market continues to expand into specialty stores and into supermarkets and restaurants across the country.

It is imperative that we not lose this market that we have worked so hard to obtain.

The availability of feed, which is only a small part of the entire organic program, we feel it is clearly evident the commercial availability of feed or changes in the labeling is essential for the organic meat industry to remain viable.

Heritage Reporting Corporation
(202) 628-4888
The absence of commercial availability of feeding grains further substantiates the need for immediate changes and labeling approvals by the FSIS.

Amendments or approved variations to the FSIS labeling policy can accomplish or provide the needed flexibility to allow meat producers to continue the production of organic products until such time as inputs can be readily made available.

We submit the absence of commercial availability clause of feed ingredients further justifies the need for labeling changes. We further submit that all ingredients conventional or organic, should be tested to verify quality and the absence of pesticides or other contaminants.

We further recommend that the additional labeling that is herein requested require testing that the ingredients used contain less than 10 percent of any pesticide residue currently approved by the FDA.

The organic meat producers would still be required to meet all the current standards established within the National Organic Program.

In the absence of additional labeling approval, the organic producer would not be allowed to use the current FSIS USDA organic seal.

The approval of the labeling and associated labeling criteria would allow the producer to use the term,
Organic, or, Raised with organic practices, in the absence of adequate feedstocks, provided the producer has met the requirements of the standards.

I just ask that we have developed a strong market, and we need to continue to develop that market. And to get more and more farmers involved in raising more organic corn, we need some flexibility as the market continues.

Thank you all very much for your time.

MR. CARTER: Okay. Thank you.

Any questions? Yes. George?

MR. SIEMON: So was I understanding that what you would like to see us do is to advocate to FSIS to allow some use of organic -- like you said -- organic conditions, but not necessarily anything on our side of the -- change anything here?

MR. GRAY: Well, no. Because right now the way the standards are written, we don't have flexibility from the Board at all. You do have that flexibility if you're in cereals or grains. You do have that type flexibility.

MR. SIEMON: So you are asking us to change what we're doing to allow various stages of organics?

MR. GRAY: Yes, sir. You would have to have that in the meat production, just like we have that flexibility in the other production.
MR. SIEMON: I didn't know if you were just talking strictly FSIS, or for us, too.

MR. GRAY: Well, because FSIS regulates the meat side, and FDA regulates the other side. So if we don't have this in place, then the FSIS does not have the flexibility, because this is in black and white.

So unless you all recommend to them some flexibility in this labeling, then we don't have any alternatives.

MR. CARTER: Other questions? Kim?

MS. BURTON: How are you currently labeling your product? Are you labeling it as organic?

MR. GRAY: Certified -- the only way we can label it, Certified organic by Georgia Crop Improvement Association.

MS. BURTON: With conventional feed?

MR. GRAY: Well, it's a mixture of conventional and organic feed.

And we will lose that labeling if we don't have some kind of alternative. So that's where our certifiers came to us and said either this changes or basically we will not be able to have that label on that packaging.

MS. BURTON: Okay.

MR. CARTER: Okay. Other questions? Yes, sir.

MR. KING: Yes. Do you have a proposed
alternative in mind?

MR. GRAY: And that's what I was trying to -- the
point I was trying to get at there is --

MR. KING: I mean, specifically?

MR. GRAY: -- right -- that if the feed is not
available, and you can meet the criteria for humane animal
husbandry practices, raising practices, and your production,
those are two phases -- and feed is just such a small part
of raising an organic bird. When you go into how you
raise --

MR. CARTER: Yes. We're not here to debate.

Goldie, Jim is next in line.

MR. GRAY: Go ahead, Mark.

MR. KING: So primarily you're concerned with the
availability of organic feed?

MR. GRAY: Until we can get the transitional to
catch up with the organic feed, what we're saying is, until
we have enough commercial availability of feed out there,
have a transitional phase to --

You want to strive for something, and we want to
strive to get that USDA FSIS seal that says, Organic.
That's where we need to get to. Until we can get to 100
percent organic feed, we can't have that label.

We're not asking for that right at the moment.

We're asking that, until we can get to that point, that we
have some type of alternative label that has been granted to
crop or to vegetable and to different ingredient statements,
so a transitional type labeling, if you would.

I do not think that we should not take 100
percent organic feed. I think we should have 100 percent
organic feed to be able to use the Organic label.

MR. CARTER:  Jim?

MR. RIDDLE:  Yes. Your whole position seems
predicated on the lack of availability of sufficient
quantities.

And I'd like you to describe your attempts, your
company's attempts to develop those supplies, because the
feed is essential. You can't do the birds without the feed, 
so you've got to have the feed.

And before you do, I just want to point out that
in Minnesota the NRCS has EQIP funds to convert to organic
agriculture. 150 farms have signed up. That's about 30,000
new acres coming on of corn and beans.

And I'm wondering what's happening in Georgia and
other states to grow your supply, because, you know, that's
the thing you need to be focusing on.

MR. GRAY:  I'm going to let Dr. Wicker, who is
coming up in about two or three, that's our expert in that
field, answer that question if that's all right with you.
He knows more than I do on that subject.
MR. CARTER: Okay. Goldie was next.

MS. CAUGHLAN: I just wanted to inquire what percentages you are working with now in terms of your feed, organic.

MR. GRAY: Dr. Wicker can give you those percentages that we're working with currently.

MS. CAUGHLAN: Thank you.

MR. MATHEWS: Mr. Gray, you indicated that you would like, I mean, from my understanding, a transitional label for your product. Is that correct?

MR. GRAY: Yes, sir.

MR. MATHEWS: Do you understand that under the National Organic Program traditional -- or transitional product cannot carry the word, Organic? And how does that affect you?

MR. GRAY: Well, what we're -- when you -- at the last meeting, we put in Sunset for commercial availability of, what is it, methylthymine, Jim? I can't remember if that's exactly right. So that set it aside to give people some flexibility.

If we can't have that same type flexibility to get commercial availability of feed into the marketplace to catch us up, we're not going to be caught up by October. We have a few that we can maintain at this point, but we can't grow the market. There's too many -- there's not enough
feed out there to maintain the market.

What I was looking for is -- and that's why I'm coming to you all -- is there an alternative that we can take a look at for labeling until we can get to that production?

MR. CARTER: Okay. Follow-up?

MR. MATHEWS: But it sounds to me like you're still saying that whatever the transitional labeling is, you still want to be able to use the word, Organic?

MR. GRAY: Yes.

MR. MATHEWS: Is that correct?

MR. GRAY: Yes. We want to take -- and whether that's -- that brings other people in to start to produce organically and gets them into that phase where they can, just like we have, Made with organic ingredients, or, Organic, in the other industries, we don't have that flexibility currently in the meat. We need that same type of flexibility.

MR. CARTER: Okay. Owusu?

MR. BANDELE: Yes. I think it's a little different interpretation, as I appreciate it, in terms of the use of the term, transitional.

Because in most of my experiences, transitional folks are folks who maybe, like let's say in the crop situation. Their land may not have been under organic
management for that three-year period. But once they receive the transitional label, then they do all organic practices. So to me it's different.

MR. GRAY: Yes. I stand corrected on your interpretations, because you all are thinking of transitional as in three to five years on a crop to come into production.

And I'm thinking of having a label that brings us from, if you are in the market now, how do we continue to be in that market? And what pushes somebody to go into the next level? How do we get them to be 100 percent organic?

You're not going to be able to keep jumping into organic production without having the availability of feedstuff. It's just not going to happen.

MR. CARTER: Okay. Thank you.

MR. GRAY: Thank you all very much.

MR. CARTER: Now, you made reference to someone else scheduled to testify, and I don't see their name on the list. So unless they're replacing someone, they need to sign in.

MR. GRAY: He has already signed in, so he should be on the list.

MR. CARTER: Okay. Next up is Steven Collier.

Yes. If there are people that have come in that want to give some comment, you need to sign up, because the
only one that has signed up this morning is Jim Pierce.

Okay.

Mr. COLLIER: My name is Steve Collier. I would like to also address access to the outdoors for poultry.

Raising birds outside will most likely result in increased exposure to parasites, insects, and diseases, as well as predation and other vectors that could be injurious to the birds' health as well as create potential food safety hazards.

Birds that are grown in commercial environments today simply are not exposed to parasites and disease agents that will most likely occur should the NOSB require access to the outside.

Birds grown or allowed to have access to the outside will be exposed to additional coccidiosis, ascarids, heticaritus [phonetic], capillaria, and many other parasites.

Birds maintained in a more controlled environment are significantly less likely to contact these agents which could impact bird health.

Food safety should be the primary concern of all of us in the food production industry. FSIS has made food safety a top priority.

Birds raised under conditions requiring access to the outside will have increased risk of exposure to

Heritage Reporting Corporation
(202) 628-4888
salmonella, E. coli, fowl cholera, mycoplasma,
staphylococcus, Clostridium, bronchitis, laryngotracheitis,
and as mentioned earlier today, Avian Influenza.

A draft recommendation dated December 21 of 2001,
recommended access to the outside. The recommendation cited
access to the outside will provide for preventative health,
will become an integral role in health care, and would allow
poultry to reproduce under normal conditions, and that could
reduce stress, strengthen immunity, and deter illness.

I submit that this is not simply true in all
cases. Health and care of poultry as well as well-being to
meet food safety initiatives are mandated by FSIS and can be
far better served when poultry are grown under conditions
that may restrict access to the outside.

The growing cycle of broiler chickens is
relatively short compared to other species. Geographic
locations within this country, which quite often are
extremely cold or extremely hot, do not facilitate free
access year-round. The requirement of free access to the
outside in many cases could be less than humane.

Current production technologies and practices can
provide can provide for adequate space to allow the birds to
grow normally and express normal behavior patterns.
Furthermore, food, water, and proper environment can be
provided under controlled situations.
Lastly, Avian Influenza has been found in numerous flocks in geographic locations in this country. This highly contagious disease can easily spread from wild birds to chickens to turkeys.

Requiring access to the outside can and most likely will jeopardize the ability of farmers, growers, and producers to market their products both domestically and internationally.

Requiring free access does not always provide a platform for improved health of the birds being produced, nor does it provide a platform to facilitate food safety initiatives currently mandated by FSIS.

Questions?

MR. CARTER: Questions?

(No response.)

MR. CARTER: Okay. Thank you.

Next up is Congressman Nathan Deal. Is he here?

(No audible response.)

MR. CARTER: Okay. Dr. John Smith.

Mr. COLLIER: My comments will serve for John Smith.

MR. CARTER: Okay. Wende Elliott, and then after that, Randy --

MR. DURANCEAU: Duranceau.

MR. CARTER: -- Duranceau. There we go. Thank
you.

MS. ELLIOTT: This testimony is presented on behalf of Wholesome Harvest. We are a coalition of organic certified --

MR. CARTER: Please identify yourself for the record.

MS. ELLIOTT: Okay. I am Wende Elliott. I am an organic certified farmer. I raise organic pastured poultry. I am also the coordinator for the coalition, Wholesome Harvest.

Wholesome Harvest sees the current and the proposed organic standards for poultry insufficient because they promote heavily concentrated feedlot and confinement production.

We see pasturing of poultry to be the only production standard that will stop factory style production of organic poultry.

Pasturing poultry meets the consumer expectations, and it improves environmental stewardship, humane treatment of animals, and provides the ecological foundation that organic certification was based on.

Remember that consumers drive the organic food movement. In the 286,000 recent comments from consumers, the Number 4 comment was, No factory farming practices.

The current and proposed standards allow for high
density feedlot or confinement of organic poultry, and that will negatively degrade the validity of the organic label for all other organic products, from organic milk to organic strawberries.

Consumers aren't stupid. When they find out that chickens and eggs are being raised without access to outdoor air, that chickens are being fed GMO feed because it's cheaper than organic feed, they are going to be very cynical about the organic labeling in general. It's going to affect everybody.

If the USDA allows this to continue, they're going to kill the goose that laid the golden egg, to use a poultry metaphor.

The consumer who purchases the organic free range poultry is not visualizing tens of thousands of birds being produced in a corporate feedlot. The consumer wants to buy poultry that's being raised by family farmers, and they imagine it happening on a pasture behind a farmhouse.

The organic movement is successful because of differentiation. The less organic poultry is differentiated from corporate confinement poultry, the more likely consumers are going to abandon the label and all other organic food products.

A member of the NOSB has suggested to us that we drop our request for pasturing of poultry as being too
radical and that we should instead just invent our own little label.

We'll gladly and successfully nationally promote family farm organic birds that are raised on poultry. But just realize that our differentiation is what the consumer is asking for, and it will be the death of consumer interest in organic certified birds.

The current wording and loopholes will without a doubt result in factory farming of all organic poultry by vertically integrated food corporations. They are going to produce the meat cheaper than the family farmer. They will commodify and monopolize the market.

Petaluma Poultry exemplifies the current state of organic poultry products now available to consumers in grocery stores.

In a press release dated February 1, 2002, American Capital proudly announced investing 8.5 million in Petaluma, which they describe as the dominant player, with several hundred employees, operating a hatchery, multiple chicken ranches, a processing plant, and a feed mill.

We recommend that the standard language be modified as follows:

Number 1: Organically managed poultry must have access to outdoor pasture.

We agree with the language in Section 2,
providing the language is changed in Section 1.

The testimony you hear today is not about animals getting sick. It's about how food companies can most quickly capitalize on the exponential growth in consumer demand for organic meat.

It's about how easy it will be for a few corporate players to keep their corner on the organic poultry market if the standards stay lax.

It's about the fact that 96 percent of organic food sales occur in the grocery store. Only 4 percent are farmer direct at farmers markets.

It is wrong to assign organic family farmers to the 4 percent ghetto and to just hand over the label of organic certification to companies who already control the 96 percent of poultry sales and want to keep it that way.

You all know of the environmental benefits of pasturing versus feedlots. The chickens deposit nutrients on the pasture while they range and then work them into the soil.

No environmental problems associated with concentrated feedlot and confinement manure run-off exist if you pasture poultry. Neither are there mechanical problems associated with mechanical over-application of manure in an effort to dump manure from landless animal facilities.

Additionally, there is less dependency on fossil
fuels for hauling manure away, as the pastured chicken applies it for the farmer.

Please know I am a Northern producer. I am aware of hundreds of other Northern pasture poultry producers. We produce organic poultry as a seasonal enterprise on our farms, and we are happy about this. That's why we're farmers. If we wanted to be seasonless, and we wanted to work in a factory, we'd be factory workers.

There are two members of the Livestock Committee that represent four farmers, and those are the only four farmers I know that want to raise organic poultry in confinement in the Northern Midwest.

I'd be glad to answer comments if anyone wants to ask me about influenza.

MR. CARTER: Questions?

MR. SIEMON: I've been trying to study this AI situation, which I don't think is the whole decision basis to make it. But what I've noticed is all the confined birds are getting the sickness.

MS. ELLIOTT: Yes. The Leopold Center did a thorough literature search in April of 2002 in preparation for this hearing. And there wasn't a single organic certified flock or a pastured flock that came down with the disease. All instances were in large confinement facilities.
Certainly this is irrelevant to organic certification, because the disease existed before the label and will continue.

And also, they have found that when they have quarantined an area and checked wild animals, there was no sign of the disease from migratory wild birds that were captured, that it looks like the cause is actually human handlers.

MR. CARTER: Other questions or -- yes. Mike?

MR. LACY: I'm sorry. Are you saying that -- I'm confused about what you're saying about Avian Influenza, that pastured poultry are not susceptible to Avian Influenza?

MS. ELLIOTT: That there is no scientific research that shows that there is an increased risk for the birds to be on pasture, since it's probably transmitted by human handlers, contaminated vehicles that transport livestock, contaminated breeding livestock.

Like all other diseases, when you have a high density of animals or even humans, that's when pathogens spread most easily.

MR. LACY: But most of the veterinarians/epidemiologists do think that the source of Avian Influenza is wild bird populations.

MS. ELLIOTT: From the academics that have...
advised me that whenever they have quarantined an area and checked the wild migratory birds that they are able to catch that they haven't been able to prove that.

MR. LACY: I'd have to check those sources, because I think there is a great deal of literature, scientific literature, that would indicate that wild bird populations do carry --

MS. ELLIOTT: Are carriers?

MR. LACY: Right.

MS. ELLIOTT: Yes.

MR. LACY: And there is a great deal of epidemiological information that shows that birds from live markets which essentially would equate pastured poultry, bird that have been raised outdoors and carried to live markets, are a significant source and probably the initiator of Avian Influenza in commercial poultry.

MS. ELLIOTT: I don't think that the current outbreaks have been linked to wild birds getting into the confinement buildings.

MR. LACY: Actually, I think the current outbreaks have been traced back to live markets in the Northeast.

MS. ELLIOTT: Which would suggest human handlers.

MR. CARTER: Okay. Other questions?

(No response.)
MR. CARTER: Okay. Thank you, Wende.

MS. ELLIOTT: Yes.

MR. CARTER: Next up is Randy. I won't even try the last name again.

MR. DURANCEAU: Duranceau.

MR. CARTER: There we go. And then, after that is Steve Masahrt.

MR. DURANCEAU: Good morning. My name is Randy Duranceau, and you should have heard it chastised or said incorrectly when I was a little kid in Little League. It was really embarrassing.

(General laughter.)

MR. DURANCEAU: I am with Petaluma Poultry, and I am here today to talk about outside access.

But first I would like to make a comment about organic feed with raising organic broilers. And the cost of raising an organic broiler, more than 50 percent of the cost of raising that broiler is due to feed. So I just want to end my comment there.

I'm going to read a statement. Then I'll be glad to answer any questions you have about outside access.

Petaluma Poultry has been raising and processing free range birds, broiler chickens, without the use of antibiotics or animal byproducts, for over 15 years.

Our company was one of the first to offer the...
consumer a free range chicken and was the first to introduce
a 100 percent certified organic chicken in 1999.

For the last year, you all have been wrestling
with the issue of outside access for poultry. In your draft
you state, "Public comment for the two proposed rules on
National Organic Standards shows a clear expectation that
consumers have for access to outdoors as part of humane
management for organically raised livestock."

As I read that quote and reread the draft, there
seems to be a disconnection between the consumer's clear
expectation of outdoor access and what in fact the draft
recommendation is saying.

Organic chickens will only be allowed to move
freely out of and into their houses when it is convenient
and economically feasible for the farmer. The health and
welfare of the chicken is always of utmost importance, but
it seems that economics are playing a larger role.

Words and statements such as, when feasible, when
justified, and temporary confinement will allow farmers to
confine their chickens indoors when outside conditions will
not benefit the well-being of the animals.

We have to take care that, When feasible, and
other exceptions are not interpreted as, Whenever it serves
the economics of my farm. We cannot allow animal health and
well-being to be determined by business health and well-
The future of organic agriculture is based on the trust and confidence the consumer has in the farmers, processors, manufacturers, and retailers within the organic community. If that trust is broken or diluted, what all of us have worked for over the past 30 years will be gone.

We must remember what the organic farming community is doing to preserve that trust and what the consumer is expecting from organic agriculture. The confidence the consumer has in our community must remain strong for our industry to thrive. The trust between the consumer and our community must remain strong, again, for us to survive.

I urge you to review your recommendation to ensure that outdoor access for poultry will be a reality and not overridden by loopholes in the rule.

Now, I've spent a lot of time on the road talking to consumers. I've spent a lot of time talking with people at food shows. I've read a lot of comments people have sent in to the USDA.

Outdoor access and humane raising of all livestock is of very high importance to our consumers. We must remain steadfast in our practices to allow those birds to go outside, to roam outside, to forage outside, to be able to go outside.
Two or three weeks ago, we had an opportunity to show some of our farms to some folks in industry. And when we walked out there to see these birds foraging out in those pastures, outside in the sun and warm, it brought a lot of happiness to the people that were there to see that operation.

A lot of people in the industry or trying to get in the industry are talking about on their labels or on their packaging, Environmentally controlled conditions.

When you allow those birds to go outside, you're breaking the control of the environmental conditions which really ensures those growers the ability to control the costs of production. Outside access breaks those controls. It takes more effort, more management to raise those birds in those conditions.

People trying to get into the business now are used to controlled environments, are used to controlled conditions. Outdoor access breaks those controls.

I urge you to continue and to make sure that those loopholes are not overridden for economic conditions. And remember what the consumer is saying, what the consumer wants, and what the consumer does for our industry.

Thank you.

MR. CARTER: Thank you. Questions? Yes. Rose?

MS. KOENIG: Yes. How large is your operation?
I'm not sure if you stated that.

MR. DURANCEAU: Our operation, we grow annually about -- we produce about 40,000 organic chickens a week.

MS. KOENIG: A week?

MR. DURANCEAU: Uh-huh.

MS. KOENIG: And how is the access to organic feed? Is that a problem for you?

MR. DURANCEAU: That's not a problem at all. Actually, at certain points of the year there's less demand for organic than we can grow. And we're continually trying to develop that market. It's the market that we must continue to grow. In our conditions, in our situation, there's plenty of organic grain, soybean meal, and organic corn. It is costly, though. It is very costly.

MS. KOENIG: And in terms of disease management or disease problems, have you seen or experienced any of the types of diseases that we've been hearing about today?

MR. DURANCEAU: In our area, on the West Coast, we have not seen those issues. And we've been raising free range chickens for 15 years. We know how to do it, we're experienced at it. And it is difficult, and it is costly, and you have to be on top of it. But we can do it. And you can do it.

But when you're used to growing broilers in large, large quantities, 40 million per week, outside access
breaks those controls, and it becomes much more difficult to
manage your flocks and manage what you're doing.

  MS. KOENIG: Thank you.

  MR. CARTER: Okay. Other questions?

  (No response.)

  MR. CARTER: Okay. Thank you.

Next we have Steve Masahrt. Okay. Hi, Steve.

  MS. GOODMAN: Hi. Nice to see you.

  MR. CARTER: And after that will be Robert Hadad.

I've got a revolt up here going on, so we are
going to take a five-minute break, if you'll be patient,
Diane.

  VOICE: [Inaudible].

  MR. CARTER: Well, you know, you mentioned it, and then Rosie left. So --

  (General laughter.)

  MR. CARTER: And I think it's a heck of a good idea, myself. So we will take just five minutes and be back.

  (Whereupon, a short recess was taken.)

  MR. CARTER: Okay. We need to get back. If everyone in the room would please sit down and -- either sit down or take your conversation down the hall.

  (Pause.)

  MR. CARTER: Okay. Just in terms of procedure
here, because we've got a ton of folks that have signed up, and I know a lot of folks have come in specifically to provide some comments. So it is our intention to give everyone a chance to testify.

Do not feel that the five-minute time frame is a minimum time that you have to testify. If you can give us brevity, it's greatly appreciated.

But Diane, you're up.

Also, if you did intend to give public comment and it's something that is not something that we are acting on specifically at this meeting, and you're going to be here for the duration of the meeting, we're also doing public comment on Wednesday. So if you could hold over, that would also be appreciated.

Go ahead.

MS. GOODMAN: Thank you. I am reading this letter to you on behalf of Steve Mart, who is an organic egg producer, Judy's Farm in Petaluma, California.

"Dear NOSB, I am a dedicated certified organic egg producer since 1996. I have also been raising free roaming laying hens since 1983.

"As a caretaker of these hens, I am concerned by the recent NOSB Livestock Committee recommendation that requires outdoor access.

"The first publication of the rules seemed to

Heritage Reporting Corporation
(202) 628-4888
allow for organic egg production to occur in cages. Included in the 250,000-plus responses to the first release of the organic rules was that livestock, including organic laying hens, not be kept in cages. The simplest way to achieve this was require access to the outdoors.

"My personal communications with our organic consumers through our web site or in person has validated that finding.

"However, when I explained to our organic consumers that while we let the laying hens run and exhibit normal chicken behavior, we don't want them to go outside because it is not humane, environmentally sound, nor does it provide for adequate food safety.

"Once provided the explanation, our consumers appreciated the thoughtfulness of our systematic approach to all aspects of organic egg production. Our sales have continued to increase.

"The intent of the regulation for outdoor access is to ensure that poultry is not raised in cages. Freedom of movement and the ability to exhibit natural behavior is an important part of the organic system.

"A properly designed poultry barn should allow for natural ventilation, access to direct sunlight, and room to exercise.

"Many years of studying chicken behavior and
health does not support the notion that outdoor access improves the hen's welfare, otherwise chicken farmers wouldn't have abandoned the practice in the 1940s.

"I will elaborate in the following pages about the concerns the USDA NOP should have about outdoor access to organic laying hens.

"Humane Treatment: One of the keys to raising organic laying hens is the reduction of stress and limiting the exposure to unknown disease vectors and predators.

"During the '70s, the West Coast lost millions of chickens due to Exotic Newcastle disease. This was traced back to exotic birds brought in from South America.

"In the '80s, the USDA had to slaughter millions of chickens because they were exposed to Avian Influenza from migratory waterfowl.

"With both of these cases, the USDA indemnified the producers, paid for their costs of disposing of infected flocks, paid to the producers because of a mandatory eradication program.

"Is the USDA willing to risk increasing the opportunities of these diseases or others reappearing because of the increased exposure to wild fowl in an open system?

"During the '90s, Salmonella exposure from rodents changed the way consumers looked at the once safe
egg.

"In every instance, these diseases were brought on by contamination of a domestic hen by wild or natural vectors.

"Vaccines have helped control some of the diseases, but they are most effective when combined with a rigorous biosecurity program with an emphasis on exclusion.

"Outdoor access creates a parasite load that will compromise the immune system of the laying hen. Mites, a blood sucking parasite, coccidiosis, a protozoan parasite that destroys the intestinal wall, and worms, which deprive the birds of nutrients, create much suffering and leave the bird vulnerable to a host of other debilitating diseases.

"These threats are transferred to the hens by rodents and wild birds which contaminate the feed and environment with droppings and feathers. The chickens then eat this and become exposed to whatever disease they were harboring.

"Once the hens on the ranch have these diseases, there is little or no tools for the farmer to use to break the cycle, because these diseases can remain viable in the soil for years.

"One must not forget that the laying hen has a productive life of over two years, as compared to the broiler, of just seven to eight weeks.
"Most laying hen farms have a separate facility to raise their young laying stock. Typically these houses are isolated from their laying operations in order to limit the disease exposure until the young bird has been properly vaccinated and their immune system has developed.

"A proper vaccination program is the organic farm's number one tool to maintain a healthy flock. On our farm, the pullet, young chicken, receives her last vaccination at 14 weeks.

"This proposed rule would compromise my entire vaccination program by exposing the pullet to unknown vectors before her immune system can mature."

Okay. And he talks about HACCP farms -- I'm going to have to go through this really quickly -- holes in the walls that would keep out rodents; about the environment.

And I'll finish with the last paragraph. This is a suggestion for a solution.

"Organically managed poultry must have access to outdoors during the months of the year when feasible or provide for natural ventilation and direct access to sunlight when present.

"Poultry should have the ability to access a substantial portion of the house freely, while providing dusting and scratching areas.

Heritage Reporting Corporation
(202) 628-4888
"If these requirements cannot be fulfilled because they are using a closed type house, then an area outside of the confines of the building must be provided which provides access to direct sunlight and natural ventilation.

"This recommendation has the bird's welfare as its focal point while not endangering the environment.

"Consumers desire the birds to exhibit natural behaviors in all areas of the country.

"I am only commenting on the egg laying chickens and their needs. The broiler type chicken has entirely different requirements, and this paper does not address their needs."

Thank you.

MR. CARTER: Questions?

(No response.)

MR. CARTER: Okay. Thank you.

MS. GOODMAN: Thank you.

MR. CARTER: Robert Hadad, and then, after that will be Steve Santos.

And if you have materials, make sure that you give one copy to the court reporter so we can have them as part of the official record.

MR. HADAD: Thank you. My name is Robert Hadad.

I am Director of Programs for Farm Animals and Sustainable Heritage Reporting Corporation

(202) 628-4888
Agriculture for the Humane Society of the United States.

And I would greatly appreciate it if you would be able to refer to the paper that I've handed out, because it goes into much more detail than what I can present here at this time.

On behalf of the Humane Society of the United States, the nation's largest animal protection organization, with 7 million constituents who also happen to be consumers, we wish to support strongly the recommendation of the NOSB Livestock Committee that organic poultry should be allowed access to the outdoors.

We agree that access to the outdoors fulfills the integral role in health care and living condition requirements in organic poultry production. Our support for your recommendation is based on all four of the principles you list as its intent:

Number 1: To satisfy the natural behavior patterns. In addition to the natural behavior patterns, as you mentioned, these include foraging, which is a pervasive aspect of behavior in birds fed on concentrated diets, dust bathing, and exploration.

All these behaviors are much more readily carried out in the varied, extensive conditions provided outdoors than in the limited conditions of high-density housing.

Furthermore, varied, complex environments have
other benefits: birds reared in such conditions show more adaptability, less susceptibility to stress, and less fear of humans than those kept in barren conditions.

Number 2: To provide adequate exercise area. This improves foot, leg, and wing bone strength conditions.

Number 3: To provide preventative health care benefits. We concur with the statement that outdoor access has health benefits.

Disease exposure can be avoided by (a) fencing outdoor areas to reduce ingress of wildlife; (b) feeding poultry indoors, which largely prevents the potential of wild birds to spread disease; and (c) using different outdoor areas for successive flocks to prevent buildup of disease organisms.

Health benefits include reduction of stress and strengthened immunity. They also include varied nutrition when this is available.

Number 4: To answer consumer expectations of organic livestock management.

Your comment that consumers expect organic livestock to have outdoor access is consistent with our understanding and with the general NOSB principle, paragraph 1.3, that, "The basis for organic livestock production is the development of a harmonious relationship between land, plants, and livestock."
Denying this principle would devalue the whole standing of organic standards in the perception of the public.

Organic certification is a set of regulations based on the principles of sustainable organic agriculture, and a farmer wishing to be certified must meld with these principles.

I'll jump to what we feel are recommendations. The key points we have made in our written statement would be clarified by alterations to the recommended standard as follows. The word "temporary" is highlighted in the second clause to emphasize the importance of its retention.

Number 1: Organically managed poultry must have daytime access to an outdoor area at least as large as the area of their house during the months of the year when feasible.

The producer's organic system plan must illustrate how the producer will maximize and encourage access to the outdoors by provision of ample doorways and other measures such as cover, for example, bushes, fences, nets, et cetera.

Number 2: The producer's organic system plan should explain how both the birds and their outdoor environment will be protected, including, for example, justification for choice of site.
In exceptional circumstances explained in the plan, the producer may provide temporary confinement because of the items listed below.

Number 3: If the producer of poultry wishes to obtain organic certification, then clear adherence to the rules must be followed.

If the health of a flock, particularly during a period of time, could be jeopardized from an epidemic such as AI, then all appropriate measures must be taken to ensure the well-being of the birds. If this means that total restriction of access to the outdoors is necessary, then this must be followed.

But if this confinement is deemed necessary, then the animal products derived from the birds cannot be sold as organic.

In conclusion, we wish to lend our support for the provision of allowing outside access for all poultry. We hope this will set a precedent for future provisions that ensure greater welfare for livestock.

Livestock can be the cornerstone of a true sustainable agricultural approach.

We won't support certified organic confined animal feeding operations.

Any strengthening of the regulations will go far to build the support and trust of the farmers and for

Heritage Reporting Corporation
(202) 628-4888
consumers.

Thank you.

MR. CARTER: Comments, questions?

(No response.)

MR. CARTER: Okay. Thank you very much.

I lost my list.

(Pause.)

MR. CARTER: Okay. Steve Santos. Is he here?

(No response.)

MR. CARTER: Urvashi Rangan?

MR. RANGAN: Yes.

MR. CARTER: Okay. And then, after that, Stan Welsch. So go ahead.

MR. RANGAN: Hi. My name is Urvashi Rangan. I represent Consumers Union. We're the non-profit publisher of Consumer Reports magazine, with over 5 million subscribers to date.

We also, and I am also the director of our eco-labels project, which is a web site that is a free resource for consumers intended to help them to decipher all of the environmental labels that they are seeing in the marketplace, including food, and of course the organic label sits well within that.

We have been doing this for over two years. We have been a long-time supporter of sustainable agriculture
practices and in educating the consumer about that.

This eco-labels web site project goes even further to set the standards for what consumers should expect from eco-labels in the marketplace.

And we are here today to reiterate our issues from comments submitted to the NOSB on livestock feed, poultry access, and processing recommendations that are not in keeping with consumer expectations of organic.

Before I get to the poultry access comments which I do have, I am going to go over some other comments that are related to some of the processing and livestock feed recommendations, especially with regard to the use of genetic engineering and some of the potential loopholes that have been created with these recommendations.

The first one, as far as processing, we disagree with the NOSB that biologic processes not be reviewed by the NOSB since most if not all, according to the NOSB, are acceptable processes and since most biologic processes, according to that recommendation, do not break covalent bonds.

Biological processes can indeed break covalent bonds. And enzymes, acids, and additives are examples of substances that can be derived from or made with non-pathogenic bacteria and that can be used in organic production and processing.
Therefore, Consumers Union recommends that biologic processes should be required to be reviewed by the NOSB and that the use of substances derived from genetically engineered bacteria should be explicitly prohibited in the processing recommendations.

As far as livestock feed goes, there is a similar loophole created for genetic engineering, and that's related to the issue of carriers.

The current NOSB recommendation states that requirements are not -- there are no requirements established for agricultural products used as carriers in livestock feed ingredients.

While carriers may not meaningfully affect the nutritional quality of the feed ration, the source of the carrier can affect the organic integrity of the feed. Without any requirements, there is a high risk that these carriers could be derived from genetically engineered or pesticide treated crops like corn or soy.

Consumers Union strongly urges the NOSB to regulate the source of livestock feed carriers to be from only organic sources.

Similarly, we urge the NOSB to regulate the source of gelatin that is used in carriers for feed ingredients and to require that that also be from organic sources, especially since most consumers who do purchase...
organic are also concerned about any potential transfer
issues with mad cow disease.

And now on to the poultry access comments. You
may find it interesting, if you go to our web site, which is
www.eco-labels.org, the feature story this month is on egg
production in the United States.

What we realize in educating consumers about eco-
labeling is that most consumers don't understand what
conventional production is all about.

This is a 14-page research paper that outlines
what's going on in conventional production and also
evaluates the 17 eco-labels that we have identified on eggs
and how they match up against conventional production.

Consumers Union disagrees with the NOSB
assessment that nutritional needs of poultry with regard to
access are outside the realm of consumer perception, humane
consideration, or preventative health care management.

Just as ruminant animals receive nutritional
value from access to pasture, consumers expect that poultry
will also be subject to similar requirements. In fact,
access to a vegetative outdoors is critical to the
consistency of the organic label on all certified meat
products.

However, the NOSB recommendations would accept a
concrete driveway with two inches of topsoil to satisfy the
requirement for poultry access to the outdoors. This is not what consumers expect when they are buying organic poultry.

Access to a vegetative outdoors allows poultry to better exert natural behavior patterns such as foraging for insects -- and it sounds like you've heard a lot about that before -- and eating grass, which also happens to aid in digestion, which is part of preventative health care management.

These --

MR. CARTER: Time.

MR. RANGAN: This is what consumers expect from organic poultry production. Thank you.

MR. CARTER: Okay. Thank you.

Questions?

(No response.)

MR. CARTER: Okay. Thanks.

Sam Welsch, and then Emily Brown Rosen.

MR. WELSCH: I'm Sam Welsch, and I am Executive Director of OCIA. We are proud to be a newly accredited certifier, and we're the largest in the U.S. and Canada. And with the numbers of farmers, we probably certify as many farmers throughout the world as any other certifier.

I have many comments. Of course we are interested in all these standards. I'll keep those brief and hope to conclude on Wednesday with some things that
aren't related directly to the standards.

MR. CARTER: Thank you.

MR. WELSCH: I'll essentially just go through the list and express our support for the dairy animal replacement recommendation that replacement animals, whenever possible, should be raised as organic from the last third of gestation.

That the access to outdoors for poultry is an important standard. It should be genuine access, and any exemptions should be clearly temporary exemptions. The language proposed by the national campaign is consistent with the views of our Standards Committee.

The items regarding compost, we support recognition of the broader range of approaches to composting that are actually very in practice among the fields. We oppose any recommendation that hydroponics be certified as organic. We support the recommendations concerning the planting stock.

Strongly oppose labeling transitional products. We feel that those do not -- we've always said if it's organic, it's organic; if it's transitional, it's not organic.

We have worked with grower groups. We feel the current rule does allow us to continue to certify grower groups according to the international criteria that we are
in support of and continue to work for the development of.

The materials that you will be looking at, I think it's clear in most of the recommendations that there are things that are currently prohibited. I would speak specifically -- or prohibited traditionally by OCIA. We would like to see that continue.

Sodium nitrate I would speak to specifically. We do have growers who grow the same types of crops in cold climates, including Canada, without the use of sodium nitrate. And they have spoken to us about supporting removing sodium nitrate from the list. They feel it does give an advantage to others, or, you know, it's blurring the line between organic and non-organic at that point.

I guess just to conclude, you know, what I would like to speak more about on Wednesday relates to accreditation issues. And I know we've all been asking for clarification on what the standards mean.

I think a recent letter that suggests that NOP could get involved in disagreements between interpretations of standards that certifiers might have with our clients might be going -- or I think is clearly going a step too far, blurring the distinction between certification and accreditation.

And those types of issues we -- well, I'll just note that I'll be speaking more about that on Wednesday so
you can move on today.

MR. CARTER: Okay. Thank you.

Any questions?

(No response.)

MR. CARTER: Emily, and then we have Brian McElroy.

MS. ROSEN: You can sign me up for Wednesday as well as today.

MR. CARTER: Okay. That's fine. Works for me.

MS. ROSEN: Okay. Good morning. My name is Emily Brown Rosen, and I am the Policy Director of the Organic Materials Review Institute.

I know most of you, but I would like to welcome the new members to the Board. It's great to see you willing to volunteer for a tough job like this, and we really appreciate your energy and willingness.

We do look forward to working further with NOSB collaboratively in the future, especially on materials issues.

And if you're not familiar with our organization, I'd also like to mention OMRI is a non-profit. It was originally set up by several certification agencies to provide technical services to review generic and brand-name materials used in organic production and handling.

I'm going to talk about a couple of issues here.
I'll hand in my comments later. They're a little bit longer than I can probably say.

But I want to touch on inert ingredients in pesticides, compost task force recommendation, the livestock recommendation.

Inert ingredients. We've been hearing some concerns from the community and from NOSB members about the pace and the progress being made with compliance with the NOP final rule regarding inert ingredients in pesticides.

The rule requires, as you know, that all inert ingredients must fall under EPA's classification of List 4, or otherwise called Inerts of Minimal Concern. And this was directly based from NOSB recommendation in 1999, in February.

We are pleased to report that we are seeing a number of products reformulate, and we are seeing an increase in the number of pesticide products on our review list that do not have List 3 inerts in them.

It's been a gradual process, but we've been notifying manufacturers for the last two years. And it's taken a little while. But two years ago, about half of our pesticide products on our list, which was 32 out 65, still contained List 3 inert ingredients.

And last year, we started working with EPA directly and forwarded them a list of some of these problem
List 3 inert ingredients, and these at that time were in 55 products.

And right now we have just gone through and revised our brand-name product list, and right now we've got 82 products on it that do not have any List 3 inert ingredients. We also have another 25 that we have had to pull aside and put on a segregated list as no longer compliant with NOP rule.

So that's still a significant number, considering that organic farmers don't have a lot of tools for pesticide control. But we do feel like we're making progress, and we are continuing to have a dialogue with EPA.

Based on our continuing discussion, we believe that a significant number of the remaining products on our list, those inert ingredients will be reclassified by August 2002 as List 4. So it won't be all 25, but it will be most of them.

At least those are the ones that we know about. There are certainly other products on the market that farmers have used that, you know, have never registered with us, and so we cannot, you know, vouch for the state of those.

But we do believe that, of the products that are on our list now and will hopefully come back by August, there will be access to farmers of NOP compliant

Heritage Reporting Corporation
(202) 628-4888
formulations in all the allowed active pest control ingredients. This includes copper, sulfur, biological, and botanical ingredients like your neems [phonetic] and your rotunons [phonetic].

The NOSB and the NOP should do all they can to encourage EPA in this action to reclassify the List 3 inerts and also to encourage manufacturers to reformulate their products to meet the NOP rule.

Another option, also, is for manufacturers to petition their specific inert ingredient to be considered for the national list.

OMRI urges NOSB to consider any such petitions fairly and equitably in the regular TAP review process, and that they can be considered after they are subject to disclosure, TAP review according to the criteria, recommendations by the NOSB, and public input. That is another viable way to do it for some problem inert ingredients.

Compost task force, we are generally very supportive of the new task force recommendation. We think it needs to be specified more clearly so certifiers and farmers can understand exactly what is or is not going to be allowed.

If these are additional guidelines for certifiers to follow, they need to know exactly where the bottom line
is on those, and it's not quite clear from the way that the wording is now.

We also are pleased to see that the task force recognizes process manure. We've always reviewed products on that basis, and we think the definition is good, except that the term "freezing" could come out.

We also need that the compost task force recommendation and the livestock recommendation get official sanction as an official NOP policy once this Board approves whatever form it takes so that there is direct guidance to certifiers to know how to implement these new policies.

As far as feed additives, we are really grateful to see this new proposal. It's very detailed, and it's extremely necessary for certifiers to review.

We also would like to thank Mark Keating for his work on this, because it gave a lot of good detail that's needed right now.

There is one question I have, though, in the allowance for incidental --

MR. CARTER: We ask you questions.

MS. ROSEN: Okay. I think there needs to be a better distinction between incidental and carrier, because it's not clear if preservatives are allowed or not in vitamins. Okay.

MR. CARTER: Okay. Questions? Yes.
MR. RIDDLE: What was that question, again? No.
You mentioned in the process manure language about
freezing. And I had similar reaction to that. Why would
you suggest that that be removed? What's your concern
there?

MS. ROSEN: Well, I think the language originally
came from the OMRI generic list, and we had recently
convened a meeting and talked about it.

Really, the 150 degrees temperature plus the time
requirement plus the moisture requirement, all three of
those should be required, but freezing is -- we've never
seen a freezing, and it's theoretically possible, but we
don't have any evidence to support that it's a reasonable
way to reduce pathogens.

MR. CARTER: Okay. Rick?

MR. MATHEWS: The inerts that are on List 3, you
mentioned that you've been working with the EPA on those.
How many of the inerts from List 3 that are commonly used in
products commonly used by organic operations will not have
been moved to List 4 by October 21?

MS. ROSEN: I look at it more in terms of the
products on our list. You know, and we don't have the whole
universe of products, obviously, that farmers can use.

We have redone our generic list, and I will be
handing you all a copy, including the list of pulled items.
So of those 25 products that are pulled, I think at least 18, those particular inert ingredients will be reclassified. But we still do need -- you know, this is still -- EPA has been promising this for a while, and they don't always make their deadlines. But this deadline that they have, August 3, for FUPA. They have to reclassify a lot of different products and establish new tolerances, et cetera.

So they're not doing it just for organic, they're doing it for the industry in general. So I think we'll see good progress there. Does that answer your question?

MR. MATHEWS: Well, not really.

MS. ROSEN: I could give you --

MR. MATHEWS: Not really. I --

MS. ROSEN: I could give you more detailed numbers later, when I go through it from a different angle.

MR. MATHEWS: But you would agree that there's going to be a clear problem for farmers who have been using materials that could put them in jeopardy of losing their certification after October 21 by using what has become a prohibited substance?

MS. ROSEN: Correct. Yes. Especially because the numbers don't always tell you the answers. Some products are very widely used. There's one very widely -- or a couple of formulations of a very widely used copper...
product that doesn't look like it's going to reformulate or
get reclassified. So that could be a problem.

MR. MATHEWS: And I have another follow-up. What
is the status of the List 3 inerts that are commonly used in
pheromones?

MS. ROSEN: The ones that we have looked at in
our process have been considered candidates for
reclassification by EPA. We don't have all the pheromones
on our list.

I think the pheromone annotation might deserve
reconsideration on its own, because a lot of these materials
are affiliated with the dispenser or the plastic twist ties
or, you know, how the pheromone is delivered. And some of
those are not likely -- they're just not very high on EPA's
list.

But if NOSB wanted to do a review to look at the
active ingredients and the various -- you know, write the
annotation to cover certain types of delivery systems --

MR. MATHEWS: Okay. Then, if I understand you
right, the List 3 substances that are used in pheromones
will not be addressed by EPA in that August deadline?

MS. ROSEN: No. No. The ones on our product
list will. But we don't -- I mean, I've heard reports that
there's other products out there that are concerned, and I
really don't know which inerts are in those products.
But I do think that it might be -- if it remains a big issue, then it might be worth looking at the pheromone annotation or those particular materials, whatever they are, that need review.

MR. CARTER: Kim?

MS. BURTON: Emily, when you're sending letters to your customers about potential noncompliance of, say these five materials, these five List 3 inerts that will not be moved, do you put in your letters that the option is to petition --

MR. CARTER: Just a second, Kim.

The cell phone, if you could take it out in the hall.

VOICE: Yes, sir.

MR. CARTER: Also, please turn all cell phones to vibrate.

MS. BURTON: Do you put in your letter to petition --

MS. ROSEN: Yes.

MS. BURTON: -- that substance to the Board?

MS. ROSEN: Yes. We sent out notice to all our manufacturers. We sent several notices, but the latest one in January was, Tell us, because we're taking names off the list in April, if you're going to reformulate, if you're working with the EPA and you're hoping to get a change, or
if you plan to petition. And I think a few petitions may have come in.

MS. BURTON: Yes. We received one for an inert ingredient. Okay. Thanks.

MR. CARTER: George?

MR. SIEMON: You know, you supported the work we're trying to do on the feed, and then you got into pesticides and got way over my head.

MS. ROSEN: Okay.

MR. SIEMON: Excipients in medication, isn't that like where we have to deal with a ton of these excipient issues?

MS. ROSEN: Uh-huh.

MR. SIEMON: And do you feel that a broad base like we trying to do with the feed is the same approach, or --

MS. ROSEN: I really haven't studied the issues yet on excipients. I know there is a large range of materials, and I know some people have concerns with some excipients that are found routinely in medications. So I'd like to see, you know, some research done on it first.

But, yes. It definitely needs to be addressed if we're going to make any progress on medications. So --

MR. SIEMON: By October 21?

MS. ROSEN: Yes.
MR. CARTER: Okay. Rose?

MS. KOENIG: I just wanted to comment I guess to Rick's question and Emily's response.

And you probably are aware that OMRI is going through certain brand names, but they're certainly, as Emily expressed, I mean, they can't make manufacturers apply to them, and they can't make -- you know, growers either know about the products or they don't. So there's probably a slue.

And if you really look at the materials on that list, many of them are very geographically located companies, tending heavily to the West Coast.

So it's likely in certain regions there are going to be growers that are using products that they won't have that information. And I'm not sure what can be done about those situations.

But most of the pesticide products are pretty national --

MS. ROSEN: Right.

MS. KOENIG: -- in use, though. And those are the hardest ones, I think, for certifiers to review generally.

MS. ROSEN: Anybody else?

MR. CARTER: Okay. Rick?

MR. MATHEWS: I guess where I was going with the
questioning is that we do have a lot of products that are commonly used out there, but the regulations as they are written will put certain products out of the reach of organic producers. And I think it's important that we all recognize that.

And both the NOP and the NOSB, working in cooperation with the industry, has got to find a way that farmers can know what it is they can and cannot use, because there is going to be a point at which they are going to be using prohibited materials which will then be certified on that particular acreage. And it's a real concern.

MR. CARTER: All right. Thanks, Emily.

Okay. Jim Pierce. Is Jim here?

(No audible response.)

MR. CARTER: Okay. Yes. The other Jim Pierce. Lots of people with identity crises this morning.

MR. ENGEL: Jim Pierce is my buddy. My name is David Engel. I was asked by Jim to present some testimony on commenting on Organic Valley. I'm an Organic Valley producer. I was one of the original dairy farmers that started Organic Valley, the dairy pool, at least. And I've been a farmer, and I'm presently a dairy farmer. The family is doing the cows back home right now.

There is a couple of concerns that we have at Organic Valley Crop, and one of them is the outdoor access.
It's been very, very interesting to hear the testimony here today. And it reminds me of that picture on the wall right behind us there.

I'm not sure of the historical or archeological significance of it, but there is a line there that her arms tend to indicate. And we're at some point on that line with this big versus small, outdoor versus indoor. And you know, it gets at some point to seem to be an impasse.

And my own example, I'm a smaller dairy farmer, and I'm going to have trouble meeting, as I testified in D.C. in October, meeting the pasture requirement.

However, through my farm plan and the certification agency that I am certified with, I will be addressing that.

I think that's a, you know, it's a simple point, but it's something that we have to keep in mind when we hear the kinds of testimony that's been heard today and, you know, the real strong positions, categorical positions, that are being taken on outdoor access.

The other aspect that I think that has been brought out, and that has to be, you know, you have the organic farm plan and you have the consumer. And I think that this is a point that needs to be taken into consideration.

There was a couple of testimonies here that
represented, through the HSUS, the Humane Society, and Consumers Union, that are representing over 10 million people in the United States. The campaign represents a significant number of people.

And they are -- you know, you may say that they are putting their eggs in one basket over here, you've got to have outdoor access, you cannot have indoor access.

But again, there is a continuum here, that we're at a certain point, each one of us, and we have to move to something better. And that's on the outdoor access.

And then, the dairy replacement issue is again something that I personally would tend to allow one year away from -- having a one-year allowance so you could raise conventional heifers and then bring them in.

However, the organization that I am a part of, I go to the dairy group meetings when I can, and they have all wanted to have last third of gestation.

And I think that the preamble that came with the rule went into that really, really well and explained how that position came about.

And you know, on the one hand, I personally don't buy cattle, I don't have to, but there is going to be some that are going to need it. And then you have the dynamic of being able to grow that industry, which is what the preamble was positing.
I think overall that we need to head for the higher ground for the better good of a larger community. And I was struck by the way Ms. Elliott presented, you know, that these testimonies about the disease problems and the Salmonella and so on, really, you know, that is their experience.

But there is also the truth that they represent a very concentrated approach, and whereas the larger, down the road ten, 15, 20 years, it's going to be much better for us to have many smaller farmers or larger farmers. Petaluma is doing it successfully.

And just in the larger picture I think we need to look at having outdoor access and making the whole industry grow within itself.

So, thank you.

MR. CARTER: Okay. Thank you.

Questions?

(No response.)

MR. CARTER: Okay. Thank you.

Let's see, Zea.

MS. SONNABEND: Hello, everybody. My name is Zea Sonnabend, otherwise known as Materials Girl. I am glad that Emily went for me to give you a little of the background of what I am going to talk about, about inert ingredients and the materials subjects on your agenda.
I am talking today representing California Certified Organic Farmers, one of several hats that I wear. We have 138,000 organic certified acres and pretty much all crops that can be grown in the Continental U.S.

And as such, we are very concerned about the impact of the rule that's coming as it comes in on our growers with regards to materials getting used.

As Emily mentioned -- and this is a copy of one of the pages of the materials that are being removed from the list because they contain List 3 inert ingredients. You will all be getting a copy of this.

While the numbers of materials that Emily gave you are optimistic, and in fact, in years now of working on this, we have made progress in getting reformulation and getting more tools for growers, the impact of the materials going off the list is very large for a number of our growers.

Just Cosite [phonetic] alone here, which is a copper product, going off the list will affect thousands of acres of currently certified organic fruit, celery, and other crops. They are not intending to reformulate.

And while there is another copper that is still on the list, this is an unknown material to most growers. And they are starting to do some trials with it, but having it come in in October is just going to be incredibly
stressful for them.

Also, while it's great that we started working with the EPA 14 months ago now, just about, last March at the meeting, the molasses factor on their part is becoming apparent. And 14 months later, and they said they're going to announce it in August.

Well, here this list is. It came out last week. Our growers are going to see it and go, Oh, my God, I have to stop using this. And then, August a few of them are going to go back on. And they're going to be really confused about, Okay, now we can start using some of these things again and not others.

And this list coming out last week means word is just starting to filter out now. Growers have already bought their materials for the year, they have set up their programs. Trying to switch gears by October is going to be extremely stressful.

We usually like to give people a definitive one-year notice minimum about what they have to do because of ordering supplies.

And then, as Emily mentioned, this is by no means all the materials that are in use.

Rick is perceptive enough to realize that, besides copper, the really problem big problem for us as it all shakes down is going to be pheromones. These pheromones
that may or may not get reclassified are only a few of the pheromones that are in use.

The pheromones that are not on the list at all do contain List 3 inert ingredients. We know that. It affects probably all the cobbling moth twist ties.

You guys are not going to have organic apples, at least not from the West Coast. I don't know what people do in the East. But it's going to affect almost all the organic apple acreage.

The copper products affect almost all the organic stone fruit acreage. You add that on with the oil products, which OMRI finally got one oil on the list, but almost all the dormant oils are not on the list and probably contain List 3s, you're talking about almost all the fruit crops in the U.S. on the West Coast anyway.

So Rick, we would like a statement from the Department about some sort of phase-out program or a leniency step that goes past the October 21 deadline.

Okay. And I'm not going to finish in my five minutes. If anyone wants to ask me a question about what my last comment is so I can have 30 more seconds, I'd appreciate it. Okay.

(General laughter.)

MS. SONNABEND: As far as the current materials, we would also like a statement from the Department

Heritage Reporting Corporation
(202) 628-4888
concerning the materials that you've already taken votes on but didn't end up in the rules.

For instance, what are our rice growers going to do when you approved copper sulfate last fall, it's not in the rule. Okay. This year they can use it. What do they do next year if the rule is not out by next year?

Could we please have a statement saying, Okay, if it's in the interim thing, you can use it in good faith until we do come out with the rule.

Our growers want to follow the rules. They want to be legitimate organic. They want the reassurance of knowing that in process they can still do whatever they were doing.

And last, we support the compost recommendation, and our organization has historically supported sodium nitrate use and feels like we can do an adequate job of monitoring 20 percent and are comfortable with that.

MR. CARTER: Okay. Thank you, Zea.

Okay. Questions for Zea? You need to comment, too.

MR. MATHEWS: This would have probably been saved for the USDA report, but I can give you a little information.

We have a draft document that has already been into the Office of General Counsel. Arthur has met with

Heritage Reporting Corporation
(202) 628-4888
them. We're working to get it into the Federal Register format.

This kind of a rule is rather unique. We are going to put it out as an interim final rule. And our goal was to have it out before October 21.

The document will also include the materials that are approved at this meeting, if there are any.

MS. SONNABEND: Up through this meeting?

MR. MATHEWS: Up through this meeting. So anything from back with the proposed rule through this meeting will be in an interim final rule that will be published prior to --

Hoping all goes well and that we don't run into problems with OMB, because that's really the largest time frame, is in the Office of Management and Budget. They get a minimum of 90 days for the document, and they have the right to ask for an additional 60 days. And we have to go through that process. But our goal is to have everything before October 21.

This Board will also be meeting again in September for the sole purpose of addressing materials. And we've already got a long list of materials. Kim will --

MS. SONNABEND: Just petitioned, or other materials issues?

MR. MATHEWS: These are materials that have been
petitioned and already farmed out. And there's a number of them.

MS. SONNABEND: Okay.

MR. MATHEWS: And we'll be addressing those in September.

Granted, that does not solve all of our problems, but we are, you know, we're a little better off than maybe you were perceiving when you stepped to the lectern.

MS. SONNABEND: Okay.

MR. CARTER: Other questions? Yes. Kim?

MS. BURTON: Comment. As materials chair of this committee, I do find it frustrating at this level that at this point in the game we come up with all these materials that are essential for the industry, and we have been advocating for two years to get materials petitioned, and it has not happened. So a little frustration on my part. And I'll let you comment in just a minute.

I know some of these are, you know, inerts and that type of stuff that we have been working on. But I urge you to petition these materials or form groups to petition these materials so that we can try to get them in for the September meeting.

MS. SONNABEND: Can I ask you a question back, then? Okay. I have growers calling me up every week. And they say, We want to petition the cobbling moth pheromones.
Okay.

How can they petition the cobbling moth pheromones?  A:  It's an inert ingredient, they don't know what it is.  B:  It's a brand-name product.  C:  Even if they did know what it is and it's a List 3 inert, the EPA hasn't reviewed it.  So how can we find enough information to get a petition together?

So if you want us to, we'll turn in the product name and let the TAP reviewers try to find the information from the company.  I just didn't think you wanted a petition like that.  I'd be happy to do that, though, if you would like.

And I've had to tell the growers -- I mean, I have growers who will spend money on it.  But I haven't been able to tell them that I could go ahead and support it, because I can't do a sufficient petition on it.

MR. CARTER:  Kim?

MS. BURTON:  Well, specifically for the pheromones, I know we have, at least my level, and with the Processing Committee and Crops, been talking about redoing the annotation or trying to make a new suggestion.

So that's one avenue that we do need to get assistance with very quickly so that we can get it on for our next meeting.

MS. SONNABEND:  It's a problem with all the List
3 inerts, though.

    MS. BURTON: Right.
    MS. SONNABEND: There isn't enough information to even make --
    MS. BURTON: And there has been talk about
blanketing List 3 inerts. That's not the avenue we want to
go down, either. So I don't really know the answer. And
Rick can comment on it.

    MR. CARTER: Rick?
    MR. MATHEWS: I can shed a little more light on this problem.
    I think it was back in February -- maybe Arthur -- is that correct, February -- we met with a
major -- a representative of a major distributor of pheromones, in particular the twist ties.

Those products, the inerts are actually coming from a company in Japan. The company on this side of the
big water is having trouble getting the information from the company on the other side of the big water. And so even in
this case the manufacturer can't give us the information.

    We asked them, not once, but twice. I sent them a letter last December giving them the procedures for
petitioning. They came back in in February and said they weren't able to do it. I sent them away saying, Petition
the material. I mean, that's all we can do.
And to date we have not received a petition. So it's a really bad problem.

MS. SONNABEND: Yes, it is.

MR. CARTER: Okay. Thank you, Zea -- oh. Sorry. George?

MR. SIEMON: I thought you said that you have an interim solution? I didn't quite -- I think you proposed an interim solution?

MS. SONNABEND: Right.

MR. SIEMON: Would you restate that, please?

MS. SONNABEND: Well, the interim solution is something like an extra year while we work on these problems for, you know, the things going off the list --

MR. SIEMON: So would that be --

MS. SONNABEND: -- or something like, the USDA will enforce all the other rules before they get around to that one.

(General laughter.)

MS. SONNABEND: You know, just something so it's like not immediate decertification on October 22 if you're still using those.

MR. SIEMON: That's very close to allowing Class 3 inerts until further --

MS. SONNABEND: No. It's allowing products that have historically been used already in organic production.
systems.

MR. SIEMON: Until further review?

MS. SONNABEND: Until further -- we wouldn't open it up to all the other things. But if it's already been in use.

MR. SIEMON: I don't know that a wink and a nod is acceptable policy.

MS. SONNABEND: I understand.

MR. CARTER: Rose has a question.

MS. KOENIG: Zea, I had a question. What is your take on -- is it that the market isn't perceived big enough by some of these companies to motivate them to change their formulations? Are they waiting for the EPA to kind of look over those?

I mean, where is the -- and there may be a couple of stumbling blocks.

MS. SONNABEND: Yes. With --

MS. KOENIG: But where do you perceive the problem?

MS. SONNABEND: With Cosite it's the former. A lot of conventional growers use that, and it's just not -- organic is not big enough.

I don't know. Did the pheromone people tell you what their -- what? Did they say?

MR. MATHEWS: In the February meeting we also
discussed the issue of reformulating their product. And by
the time we got done, the conclusion was that if we went
through the normal proposed rule/final rule process, which
would take approximately 18 months, it would be faster than
for them to reformulate their product.

Because it's not simply a matter of reformulating
their product, which they could probably do in a relatively
decent period of time. That product then has to go through
that entire EPA registration program, which --

MS. SONNABEND: We, for instance -- just to give
you an example -- and you probably know this.

But the oil company that OMRI recently approved
came and testified here to the NOSB in Orlando in 1995, and
they started the reformulation process immediately after.
And it took them until the end of last year. They submitted
their product in December, finally reformulated. So it took
seven years -- six years to reformulate, to go through the
whole steps.

They have to find something that works, they have
to make it into their product, and they have to get it
through the EPA. So it takes --

MR. MATHEWS: Right. And 18 months with us is a
lot shorter.

MR. CARTER: Okay. Thank you, Zea.

MS. SONNABEND: Thank you.
VOICE: Dave, [inaudible].

MR. CARTER: Oh.

VOICE: Just one point. I've seen a couple of formulators reformulate, and EPA [inaudible] if you would like a list of resources for inerts.

Many products on our list did not have to go through the whole testing process. And I think EPA is willing to take that into consideration. [Inaudible].

MR. CARTER: All right. Next -- and I'm trying to see if this is somebody who has -- Nathan -- it was somebody else with Cal Oxide. Did we -- Matthew -- okay. Then, David Wicker.

MR. WICKER: Good morning. Thank you. I am David Wicker. I'm with Fieldale Farms. And my colleagues addressed earlier on commercial availability and other topics.

My topic this morning is commercial availability of organic grain and soybean meal.

VOICE: Could you speak up, please?

MR. WICKER: Yes. I will.

The National Organic Standards Board has addressed the lack of organic inputs for several areas of organic farming, one of these being organic seeds.

And they have allowed non-organic seeds to be used within the production of crops, recognizing that
certifying agents do have systems in experiencing monitoring the commercial availability of claims for non-organic seeds.

Last fall at the NOSB meeting they also addressed the use of non-organic strawberry plants, and I believe there was an interim measure to allow non-organic plants to be used to produce organic strawberries.

A similar need is evident for the commercial availability of corn and soybean meal, and I want to address that this morning.

Data on corn and soybean meal availability was presented by Cameron Smoke [phonetic] at the fall meeting. And what I'd like to go into today is our attempts to access commercial quantities of corn and soybean meal.

I am the nutritionist, and I'm also responsible for growing out all the birds, so I do formulate the feeds.

Last fall we contacted a major supplier, one recommended by the Board, on supplying organic corn, and they did not have any available. The statement we got, they had contracted their entire supply to a competitor of ours, and they were under a confidentiality agreement and couldn't tell us who.

We also continued discussions with the supplier. And about two months ago, calling back, and, yes, he does have some available. He has one to three cars a week. That's not enough for our needs.
He also had some -- and prices are quoted in this. If we would outbid other people already contracted, we could gain some more. Now, that's not very well the way you'd want to get into the buying corn and soy.

The other one is, price is a factor. As was stated here earlier, that it's over three times commercial price. All of them that I've quoted, we can buy commercial corn at about $2 a bushel, a little over $2 a bushel, in the Midwest. All these guys were up around 5.80, 5.90, one quote at $6 a bushel.

All right. And the one that really irritated me a bit is, I went back and called individual farmers, 500 bushels or so. These guys were getting paid in the range of $3 a bushel. Quite a spread in the price.

Now, we have also contracted for high-oil corn, non-GMO corn. We use quite a bit of high-oil corn. I can contract that for 18 to 20 cents a bushel over, identity preserved, non-GMO, delivered into our operations. So there's quite a bit of price spread on some of these things that you're getting quoted about.

Most of the individual farmers either sold out or had 500 to 1,000 bushels. It's very difficult to sell large quantities of corn when you're only talking about a tractor-trailer load, very difficult to get.

We contacted several elevators. A feed mill in
the Pennsylvania area. You had some testimony this morning from the Pennsylvania area.

Yes. They can supply me one to three cars a week on a different railroad. Even at the prices they were quoting, which were approaching three times the commercial rate, you add in the differences in the railroad in getting it back to Georgia, quite a bit higher price. Again only a fraction of what I would need.

I had one quote as finished feed, in excess of three times what I can produce the feed for on regular commercial corn, et cetera.

What we're looking at is tremendous developing demand for organic chicken. And ion nutrition is very important in what we're feeding. We'd like to supply some of this.

There is a demand for people producing the corn, a lot more people would like to produce the corn.

Now, I used the example of high-oil corn, and I mentioned nutri-dense corn. And we have gotten nutri-dense corn in here recently, because you asked, what are we doing? High-oil corn will take at least three to four years to develop the market, only get 2 million bushels a year. We're working with the Extension Service in Georgia.

Pearl millet, a lot of people can't grow irrigated corn because we're getting a water shortage.
because of Atlanta, et cetera. Pearl millet gives an
option. We have already told the farmers we would buy all
the pearl millet that they had the seed to produce,
something around 40 to 50 million bushels this year. So
we're out looking for it.

What we're asking for is a transition. It's a
win-win. The corn farmers get a chance to bring in more
grain, more area to produce it. We'd get a chance to buy it
to produce the organic chicken, and we'd produce what the
consumer would like to buy.

Thank you.

MR. CARTER: Okay. Questions? Rick?

MR. MATHEWS: Mr. Wicker, I heard earlier from
Steven Gray that you are using both organic and
conventional. Can you tell us some specifics on that,
please?

MR. WICKER: We are buying some organic --

MR. CARTER: You've got to turn your mic back on.

MR. WICKER: We are buying some organic corn and
organic soy. At times, when you asked the quantity, we
could buy up to about 10 percent at times.

And you get into the production cycle of
broilers. I could buy up to a third of what I needed, but
broilers unfortunately eat all the time and for seven weeks
before I can market them. Some weeks I only may get less
than 10, other weeks I may get up to a third of what I need.

I need to buy out in advance several weeks
tremendous quantities, and I can't get it all the time.
Part of the time I can get portions of it.

MR. MATHEWS: How many birds are we talking about
per week?

MR. WICKER: We're looking at about 300,000. And
I think your other speaker was talking about getting it for
40,000. That's quite a bit of difference in the feed
requirements.

MR. MATHEWS: It was mentioned that you are a
certified operation. Can you tell us what you are certified
for?

MR. WICKER: For organic production by the Crop
Improvement Association of Georgia.

MR. MATHEWS: So your facility itself is
producing 300,000 birds?

MR. WICKER: Yes, sir.

MR. MATHEWS: You don't have any other farmers
that you're contracting with?

MR. WICKER: Yes, sir, we do.

MR. MATHEWS: And are they producing organic
birds?

MR. WICKER: No, sir.

MR. MATHEWS: Okay. So Fieldale Farms has

Heritage Reporting Corporation
(202) 628-4888
farmers that are producing for them for conventional, but
Fieldale does all of the organic production themselves?

MR. WICKER: We have farmers that are producing
both conventional birds, and we have a dedicated group of
farmers that are producing organic birds.

MR. MATHEWS: Are they certified?

MR. WICKER: Yes, sir.

MR. MATHEWS: By whom?

MR. WICKER: By the Georgia Crop Improvement
Association.

MR. MATHEWS: But Georgia Crop Improvement
Association only has one client.

MR. WICKER: The only thing I can tell you is
that the auditors have come in and certified those
production facilities for organic production.

MR. MATHEWS: The Georgia Crop Improvement
Association has inspected your facility and all of these
other farmers and certified those farmers under your
certification?

MR. WICKER: They have inspected our facilities
and also the people who are dedicated to producing organic
certifieds and have certified those.

MR. MATHEWS: So, then, the answer is that the
Georgia Crop Improvement Association has issued one
certification for you and all of your producers?
MR. WICKER: I'd have to defer to Steven on that, but I --

MR. GRAY: That's correct.

MR. WICKER: Yes. I think you're correct.

MR. CARTER: Okay. Jim?

MR. RIDDLE: Yes. I just wanted to make sure that I heard it correctly, that you're certified organic but feeding only 10 to 30 percent organic feed. Is that correct?

MR. WICKER: That is correct. And I believe that's allowed under the current rules until October, if I am correct.

MR. GRAY: Under the other regulations, your feed can be until we can transient in. And we're getting food that we're using now, food that has to be brought in is being certified organic through a process of SA. That will no longer justify it in October.

That's why we're trying to get commercial availability. We're going to lose our --

MR. RIDDLE: Yes. Well, this certainly points out the need for the Federal standard to be enforceable, because --

MR. GRAY: And that is a regulation that was adopted [inaudible].

MR. CARTER: Okay. And also, we need -- if there
is somebody that is called on in the audience, we need to get to come to the mic so we can get this as part of the record.

First of all, I had Owusu, then Kim, then Rick.

MR. BANDELE: Yes. I just wanted to ask, have you made any efforts to contract with farmers for upcoming crops?

MR. WICKER: We are talking with some of the suppliers about doing so, but of course most people have already made those decisions back in about February. Most grain farmers, if you're contracting, buy their inputs over the winter and make a decision about what they're doing with the grain and how much they are raising.

So, no. We haven't contracted individually with any. We've dealt with some people out of Pennsylvania and also the Midwest and asked them about contracting, but we have not yet contracted.

MR. CARTER: Okay. Kim?

MS. BURTON: My question was along the same avenue. When you said you were out seeking alternate feed and seeking sources, whether it's three loads or what have you, did you actually purchase those loads of organic feed?

MR. WICKER: We are -- in fact, I've got three of them with organic soy as a byproduct off the human organic trade. And what we're interested in is, if I cannot get a
phase-in, then we've got to decide about how many birds to
produce, et cetera.

And like some of the other people, we need a
direction from the Board what you guys will allow, because
if you're going to be 100 percent organic, then I've got to
go another route, if you are going to allow phase-in, I can
produce more birds.

So how much I contract, when I go out and say,
I'll contract, I'm putting money on the line, they're
putting facilities on there. And we need some guidance from
you guys about what will be allowed.

MR. CARTER: Rick?

MS. BURTON: I wasn't quite finished. Well, I
guess the direct question was, you know, the law clearly
states you have to have 100 percent organic feed, and you
were out there trying to spot purchase. And did you really
spot purchase to try to comply with the rule?

MR. WICKER: We have bought some loads. There is
more available, not up to 100 percent of our requirements,
but within certain percentages of them, and how many I don't
know, because we still get conflicting numbers.

A guy says, I can sell you all you want. When
you ask him, Well, how many car loads can you send me a
week? Well, one or two this week. Maybe next month I'll
have three. That's not a hard number for me to go out and
base production estimates on.

MR. MATHEWS: The farmers who are producing organic chickens for you, how many of them are there?

MR. WICKER: 132.

MR. MATHEWS: Have any of them tried to secure organic grain?

MR. WICKER: No, sir. Because under our system, we're supplying the feed. And this comes back to a food safety standpoint. I'm the nutritionist. Anything and everything that goes into that feed, I need to know from a food safety standpoint.

MR. CARTER: Mark?

MR. KING: Yes. I'm just curious if you could be more specific as to the feed sources or grain sources that you've contacted. Have you contacted cooperatives, marketing groups? Can you be more specific on that, please?

MR. WICKER: Given some of our earlier comments, I'll give it to you later. I'd prefer not in public.

MR. CARTER: Okay. Other questions, comments?

(No response.)

MR. CARTER: Okay. Thank you.

MR. WICKER: Thank you.

MR. CARTER: Okay. Leslie McKinnon, and then we'll have Gail Faries.

MS. McKINNON: Howdy, you all.
VOICE: Hi.

MS. McKINNON: Is any further introduction necessary?

I'm Leslie McKinnon. I'm coordinator of the organic certification program at Texas Department of Agriculture.

And first and foremost, I'd like to welcome all of the members of the NOSB, the NOP staff, and all of the attendees here at the meeting to the Capitol of Texas, Austin. It's a great town. There's lots to do here. And if you can't find something fun, entertaining, or exciting to do in Austin, you're just not trying.

(General laughter.)

MS. McKINNON: You've got to make some time for that outdoor access. It really is important around here.

(General laughter.)

MS. McKINNON: Okay. Let me get started on my comment. I know we have a tight schedule here.

At the request of our certified organic producers, the Texas Department of Agriculture would like to take this opportunity to make the following comments regarding the petition to include Spinosad, a fermentation product derived from actinomycete, as a material allowed for use in organic production.

In August or September of 2000, organic cotton
producers in the Texas High Plains experienced a severe
outbreak of B Army Worms over a wide geographic area.

The population densities were very, very high and
would have caused substantial economic loss if left
unchecked.

Certified producers requested that the Department
consider allowing the use of a product containing Spinosad
as the active ingredient for emergency control of B Army
Worm.

The TDA Organic Standards Advisory Committee
discussed the issue and was presented with technical
information about the product. Their recommendation was to
allow the product to be used as an emergency measure in
organic cotton.

The Department concurred and informed producers
that the product would be allowed for the 2000 and 2001
production seasons.

In the Lower Rio Grande Valley, where the
majority of Texas citrus and vegetable production is
located, TDA has worked cooperatively with USDA for many
years to control Mexican fruit fly and to monitor for
Mediterranean fruit fly.

Baits containing malathion are normally used to
treat areas surrounding traps where fruit flies are
detected.
Recognizing that this treatment protocol would be detrimental to organic producers, USDA has developed a fruit fly bait formulation containing Spinosad to be used as an alternative to the malathion bait on organic farms.

Having this tool available to eliminate a local outbreak of these devastating pests is essential to preserving the viability of organic farms in the region.

For these and similar emergency uses and where preventative measures have proved inadequate, the allowance of Spinosad as an active ingredient in a pesticide product formulated in accordance with the National Organic Standards appears to be warranted.

Any questions?

MR. CARTER: Rose?

MS. KOENIG: So you in Texas allowed it with restrictions?

MS. McKINNON: Yes.

MS. KOENIG: And was it emergencies? How did you annotate that in your program?

MS. McKINNON: It was for use -- at that time, the committee was just considering the use on a fiber crop. It was when other control measures had failed, had been tried and failed. It was where it was a severe outbreak situation, not just preventative or, you know, a routine type application. It would be a last resort.
I'm trying to remember what other -- we did restrict the time period just through December of 2001, recognizing that at that point we would need to reconsider the issue after the national standards had come out. We were making this decision prior to the publication of the final rule.

And when December of 2001 came around, it was clear that there really wasn't too much to debate at that point, that the specific brand-name product that we had approved would not qualify under the national standards, so we did not reconsider that question at that time.

MS. KOENIG: Have you ever considered Spinosad for any other products, any other crops or in any other context in Texas, or --

MS. McKINNON: It has not come up. There hasn't been a need similar to what happened in the cotton production area, so we haven't had that issue raised.

MR. CARTER: Okay. Jim?

MR. RIDDLE: Yes. I just wonder if you could get your annotation language to the Board?

MS. McKINNON: Sure.

MR. RIDDLE: If you can provide that in writing to us, I'd appreciate it.

MS. McKINNON: Sure. Be glad to.

MR. RIDDLE: Thanks.
MR. CARTER: Okay. Thank you.

MS. McKINNON: Thank you.

MR. CARTER: Okay. Gail Faries, and then Kelly Moorhead.

MR. FARIES: My name is Gail Faries. I'm CEO of the Texas Organic Cotton Marketing Coop.

We currently have 23 active farmers in our coop. We're going to have probably in the neighborhood of 8,000 acres planted to organic cotton this year.

I'm here this morning to recommend that transitional labels be used. We have these farmers that are constantly coming in to our coop.

I want to make my recommendation based on two points, first from a farmer standpoint and second from a consumer standpoint.

First off, our farmers, of our 23 farmers that we currently have right now, only two have jobs off the farm. The rest of them are fully engaged in the farming practice. They're depending on that for their livelihood. They're dedicated to what they're doing.

We'll have 20 to 30 percent of our crop every year that is currently transitional cotton. We have this turnover because of the fact that there are a number of farmers that will go out of business for financial reasons, we have some that retire. So there's going to be a

Heritage Reporting Corporation
(202) 628-4888
consistent every year of new people coming in.

The commitment to come in to organic farming is tremendous. And to have a farmer having to come in and farm organically for three years before he can sell any of his crop, to have to sell the first two crops of that on the conventional market would make it extremely difficult for these new farmers to come in.

And also, from a consumer standpoint, we sell much of our cotton to international companies, worldwide companies. Some of these companies have made commitments to have blending programs to start having a certain percentage of organic cotton in all of their products.

They are not able to have 100 percent organic cotton. There's not that much organic cotton being grown in the United States or even in the world for all of their needs.

What we have been doing is using transitional cotton to fill these markets, for blending programs. And we would like for this to be able to continue under the new national standards.

We have committed farmers, and we would recommend that this be made. This may not apply to any other area other than fiber.

Thank you.

MR. CARTER: All right. Jim?
MR. RIDDLE: Yes. The recommendation coming from the Crops Committee at this meeting on transitional does not use the word, organic.

MR. FARIES: Right.

MR. RIDDLE: It's transitional that stands on its own. And it's my understanding from Rick that that's beyond the scope of the NOP, because it regulates the word, organic, but not the word, transitional.

And so we're looking at a recommendation of this being guidance to the certifiers that do have that in the states that do have transitional.

My question for you is, Is that sufficient? The word, transitional, in and of itself, with uniform consistent guidance from this Board on its meaning? Will that get you where you feel you need to go?

MR. FARIES: I believe it would. I can't speak 100 percent without giving it some thought, but my initial thought is, yes, it probably would.

MR. RIDDLE: Okay. So it doesn't need to have the word, organic?

MR. FARIES: It would be preferable to have, organic, but if we can use some other alternate labeling, that would help.

MR. RIDDLE: Okay.

MR. CARTER: Okay. Rick?
MR. MATHEWS: And just to clarify one point from what Jim is talking about, that would not be a requirement from the Department of Agriculture.

It would be just the Board making a recommendation to certifying agents that they -- recommending that they use this standard, but no one would be compelled, it would not be a part of the National Organic Standards.

MR. CARTER: Thank you.

MR. FARIES: Thank you.

MR. BANDELE: I had a question.

MR. CARTER: Oh. I'm sorry, Owusu.

MR. BANDELE: In terms of marketing, what kind of prices did your transitional cotton bring as opposed to your fully organic?

MR. FARIES: Well, in the past years our transitional probably only bring about 10 to 15 percent less than what our fully organic brings.

MR. BANDELE: Right. But more than the conventional?

MR. FARIES: Currently right now, our fully organic is selling probably in the neighborhood of three to four times what conventional cotton is at this point.

MR. CARTER: Okay. Oh. Mark? We're just not going to let you go here.
MR. FARIES: Okay.

MR. KING: Did you find that your transitional customers were one and the same or similar to your organic clients that you were selling to?

MR. FARIES: As far as -- are you speaking of the qualities of the fiber or the pricing itself?

MR. KING: Well, the qualities, and specifically was it the same entity that was interested in that particular product?

MR. FARIES: We have some companies that only want organic; we have some companies that only use transitional; there's very few that are interested in both.

MR. KING: Okay.

MR. CARTER: Okay. There's going to be a time limit here on, you know, when you can raise your hand.

Okay. Kelly Moorhead, and then Ahma Belay.

MR. MOORHEAD: Aloha. I'm Kelly Moorhead from Cyanotech. We're the Hawaiian spirulina producer and also an organic farmer certified for producing papayas and vegetables in Hawaii.

And I don't use sodium nitrate on my farm because I can use cover crops and composts and manures. But I am asking for your consideration of the sodium nitrate issue. Because it's not going to be heard at this meeting, I'll make it short, I'll give you the truncated version.
There's only two producers in the United States, so I think this is -- we're the only group at your meeting where you get all the producers showing up to comment. Fortunately, there's only two.

(General laughter.)

MR. MOORHEAD: The TAP review, they did not contact us because they went to the California farm. And there's a little bit of differences between the farms, but there is a common thread.

The main one seems to be that this is a mined substance, and mined substances not being considered organic. And we just look at rock phosphate, lime, gypsum, et cetera, et cetera, et cetera, and say these are continually used.

There are environmental consequences, obviously, of mining rock phosphate. Go to Florida and look where it's mined, or Idaho.

And we recognize that there are issues with sodium nitrate. But we don't think this is exclusionary to organic to use a mined substance.

The other issue is leaching the ground water, which is very important and one of the things which we addressed in our petition, which we filed jointly.

We have a monitoring system at our farm for ground water. We're adjacent to the ocean, we're on Hawaii
owned property.

There are three wells right on our property, looking at ground water, that are monitored every month and analyzed by the State of Hawaii. We're not self-policing this. And there's 24 other wells between us and the ocean to make sure that we're not polluting the ground water. So it is examined. And there is a response mechanism in case there's any problem. We're not ignoring that.

The other issue addressed in the TAP review was that sodium will eventually build up in your ponds. Where is it going if you're not producing a high sodium product? That's exactly right. There are exits to this system.

In our case, we have -- when you grow spirulina, you can actually let the nutrients run way down right at harvest, if you're about to clean out a pond.

We take the -- oh. I thought I was running out of time.

VOICE: I'm sorry.

(General laughter.)

MR. MOORHEAD: Okay. I'm buying time. No.

So we let the nitrate and the phosphate run way down before we're going to harvest the pond and clean it out. Otherwise it's all recycled.

In that point we lose media, we lose it to a marsh wetland that we've created which doubles as a

Heritage Reporting Corporation
(202) 628-4888
sanctuary that we have monitored Ducks Unlimited. And we
last year fledged 65 critically endangered Hawaiian stilts
at that facility. And when we started this, there was only
150 of those birds in existence.

So we're using this as part of a system where it
feeds this marshing system. And once again, if we had
significant inputs of nitrate, it would be picked up in the
ground water monitoring.

There are losses of nitrate in that system to
denitrification. The TAP reviewers are worried about
producing air pollution from volatilization, but
denitrification produces nitrogen gas.

So that's just kind of an overview, and I'll
submit the rest by written.

MR. CARTER: Okay. Thank you.

Questions?

(No audible response.)

MR. CARTER: All right. Thank you very much.

MR. BANDELE: I had one. I'm sorry.

MR. CARTER: Oh. I'm sorry, Owusu.

MR. BANDELE: In terms of this marsh situation,
over time you don't think that could possibly create some
environmental hazards?

MR. MOORHEAD: Well, over time -- it's got an
anaerobic sediment layer. There's a lot of aquatic plants
that, over time what we've done is taken those sediments and actually used them to pile up on these islands.

What we have to do in Hawaii is protect the birds from access of predators like mongoose and cats.

It would be possible to use those sediments and sell them for the production of organic products. We have done that with some of the precipitants that show up in the ponds. Some of the calcium and magnesium carbonates have been used by a local producer of fertilizers.

MR. CARTER: Okay. Rick?

MR. MATHEWS: How long have you been working with this marsh system?

MR. MOORHEAD: About four years.

MR. MATHEWS: And what kind of studies are being done on that system?

MR. MOORHEAD: The studies that have been done on it have primarily been for the production of the birds. As far as the nutrient inputs, the main studies are continuing since 1990, I think was the first year they started ground water monitoring. And they haven't detected anything.

The other thing to understand is, underneath our facility it is about 20 parts per thousand, or two-thirds out of sea water salinity. So if there's significant salt inputs, it's not going to affect it.

MR. MATHEWS: Okay. In raising the birds, are
you studying the ecology of the swamp, as well -- or, I mean, the marsh, as well?

MR. MOORHEAD: Well, yes. Actually, with the program our main thing is to make sure that the islands stay clear of bridges, land bridges. And we've gone in and taken earth movers in there and moved the material around.

As far as the birds, it doesn't seem to be affecting the birds at all, because the population has sharply increased since we started the program.

And I don't know if I mentioned, we got the Audubon Society Corporate Business of the year in Hawaii last year for this program.

MR. MATHEWS: Okay. So have the studies that you have done over the last four years shown any kind of problems with the ecology of the marsh at all?

MR. MOORHEAD: No.

MR. MATHEWS: Any improvements?

MR. MOORHEAD: Nothing except, like I mentioned, keeping access. That's been the only problem.

There's a lot of invasive plants that grow in Hawaii that have been somewhat of a problem all over the site outside, and we have to take care of those, too, but we do that with mechanical means.

MR. CARTER: Nancy?

MS. OSTIGUY: Just a comment. One of the things
that -- it's the question about the marsh.

With the Hawaiian stilt being endangered, you are under the Endangered Species Act.

So if anything happened in that pond that then, let's say the salt increased such that you got the similar kind of situation that occurred in the Kesterson National Wildlife Refuge a number of years ago with selenium, if anything of that sort occurred, the Endangered Species Act would kick in, and you'd have to do something to protect the birds.

So in some ways, you can't do anything that would harm the environment.

MR. MOORHEAD: You're correct. And we are working with -- what's the agency -- U.S. Fish and Wildlife. They've gotten copies of our program and decided we're trying to do a good thing. And we got pretty involved with that. We've spent about $200,000 on this program since we started.

MR. CARTER: Okay. Kim, then Jim.

MS. BURTON: Are you 100 percent organic, or do you also do conventional spirulina?

MR. MOORHEAD: We do produce conventional spirulina.

And one thing I want to mention, too, is not all the nitrogen in our system is coming from sodium nitrate.
But the sources that we have such as when we make compost and manure to use, that sort of thing, we tend to get too much phosphorous.

So we'll get -- the balance -- spirulina is about 60 percent protein, so we need a lot of nitrogen. It's about 12 percent nitrogen.

MS. BURTON: And what percentage of your business is organic and what percentage conventional?

MR. MOORHEAD: That's proprietary information.

MS. BURTON: Oh.

MR. MOORHEAD: But it's about half of our production. Yes.

MR. CARTER: Okay. All right. Thank you.

MR. MOORHEAD: Thank you.

MR. CARTER: Okay. Amha Belay, is that how you pronounce it?

MR. BELAY: Yes.

MR. CARTER: Okay. And then, Lynn Coody will be next.

MR. BELAY: My name is Amha Belay, and I am Scientific Director at Earthrise Nutritionals, one of the two companies that produces spirulina in the United States. My colleague has presented his case on several of these issues. I will not repeat them except to perhaps put some points that he may not have done so.
The review has some fundamental questions raised, and we want to address all of those.

The issue of environmental degradation at the source of mining is something that we acknowledge. However, these global environmental problems need time to solve and resolve, and, as my colleague presented it, that such mined sources are also applicable in the conventional organic agriculture.

On the issue of continuous inputs from non-pond sources, again we acknowledge that the input of substances from non-pond sources is incompatible with principles of organic agriculture.

It's our intention to substitute these non-pond and mined sources that are compatible with sustainable agriculture.

However, the challenge is formidable. And all the reviewers have pointed that, and that is currently there is no available form of soluble organic nitrogen in the quantities that we need to produce spirulina.

Indeed, we invite all the reviewers as well as all members of the organic community to lead us to a source of usable completely soluble organic form of nitrogen.

The reason that it has to be soluble is that the algae are -- these are microscopic algae of less than .3 millimeters in size, and they are grown continuously.
recycled by potted wills [phonetic]. So any solids that may be remaining in the ponds will be harvested with the algae. Therefore, the nutrient source has to be completely soluble.

We have researched on various fish emulsions, guano, and the like, and these are not soluble. There is a lot of solids remaining in the ponds.

On the issue of crop rotation, which is another approach, it's an interesting approach conceptually, but in reality it is very difficult.

The reason is Anabaena, for example, can be used. But the growth conditions that Anabaena grows in also invites contamination. And then the Anabaena has to be decomposed into soluble forms before it is utilized for spirulina culture.

The other issue is that Anabaena species and other blue-green algae are also toxic. Even if we chose a non-toxic strain, the potential for contamination by a toxic strain exists, therefore, it will defy the other principle of organic production, which is food safety if we use that. However, we are looking into that, as well.

And some concluding remarks which make this production unique from conventional production is that, for example, the National Organic program allows the use of Chilean Nitrate at 20 percent of input. This level is a
blanket value irrespective of the efficiency of utilization of nutrients.

We know that micro-algae use nutrients at a much faster rate than land plants, and in this case, all the nitrogen is incorporated, almost all the nitrogen is incorporated in the protein; 60 to 70 percent of this product is protein.

And therefore, it's conceivable that conventional organic production at 20 percent input will pose a greater risk of environmental contamination than the same input in spirulina micro-algae production.

Another thing to note is that, in contrast to conventional agriculture, that the whole spirulina is edible. In conventional organic production, we produce crops, but only part of it is edible. Therefore, the conversion of material input to usable organic matter is low in conventional agriculture.

So one has to look at this efficiency of utilization and conversion of matter into boumus.

The efficiency of utilization of land and water is much higher in the spirulina production compared to conventional organic agriculture.

Therefore, we request that these additional considerations, which are very much in line with the principles of sustainable agriculture practices, be looked
at in deciding our petition to annotate the rules to include
use of Chilean Nitrate at 100 percent input.

    Thank you.

    MR. CARTER: Okay. Thank you.

    Rose?

    MS. KOENIG: I just had a question. Do you also
have conventionally produced spirulina?

    MR. BELAY: Yes.

    MS. KOENIG: What's the difference between your
conventional system and your organic system?

    MR. BELAY: At the moment, the main difference is
we have an organic form of phosphorous and potassium as
opposed to in the conventional production we have a
synthetic form of phosphorous.

    MS. KOENIG: So solely nutrient management?

    MR. BELAY: Yes. The rest is completely the
recycling of nutrients. And all the other management, we
have always practiced in the conventional system.

        It's a lined pond, so there is no --

    MS. KOENIG: Right. I understand that. You
don't have to go into that.

    MR. BELAY: But the only difference basically so
far has -- and also, of course, in the handling side, in the
processing side, that the harvesting system is, we have
to --
MS. KOENIG: And what do you use nitrogen-wise in your conventional system?

MR. BELAY: It's the same, Chilean Nitrate.

MS. KOENIG: Thanks.

MR. CARTER: Okay. Owusu?

MR. BELAY: And some ammonium nitrate.

MR. BANDELE: So your organic operation is currently certified, and if so, by whom?

MR. BELAY: We are currently certified under Quality Assurance International.

VOICE: Under who?

MR. BELAY: QAI.

MR. BANDELE: QAI.

VOICE: Oh. QAI?

MR. BELAY: Yes.

MR. CARTER: Okay. Thank you.

MR. BELAY: Thank you.

MR. CARTER: Lynn Coody, and then Valerie Brown.

We have about four more after that, so we're going to continue on here until we --

MS. COODY: Hello, everyone. I'm Lynn Coody, a policy specialist with Organic Ag Systems Consulting in Eugene, Oregon.

And I wanted to come and speak to you because for the last approximately year-and-a-half I've been working

Heritage Reporting Corporation
(202) 628-4888
with certifiers to help them prepare their accreditation applications and to meet the USDA's stringent accreditation requirements.

First, I wanted to congratulate the NOP on the recent announcement of the first round of accredited certifiers and for the detailed information provided about the accreditations on the Web site. I think the whole community has really appreciated that.

And also to let you know that, having reviewed very many accreditation documents on my own, I can really understand the amount of energy that this took to get this together.

So thanks a lot, Rick, and to all your staff for their diligent work.

However --

(General laughter.)

MS. COODY:  -- that said, today I'd like to bring to your attention a few examples of some glitches that occurred in the accreditation process as illustrations of the need for oversight over the USDA's accreditation program, as required by the final rule.

When I first got the list of accredited certifiers, I immediately compared it to the list of applicants to see if, first of all, if all of my clients got accredited, which I hoped that they did, and also to see if
there were any that I was concerned about that weren't accredited.

I did notice one long-time certifier had not been accredited and contacted them immediately to find out if I could help or what the problems were.

They mentioned to me that they had only recently received the results of their desk audit and didn't have adequate time to prepare a response to the USDA, as many other certifiers did. Most of the certifiers that I was aware of had been receiving this similar information even months before, because their accreditation applications had been processed higher, you know, sooner.

So this was a problem because they did not receive accreditation in the first round, even though they felt that if they had been given adequate time they could have addressed all of the problems.

The second case is of a certifier who, not having received any word from the NOP, just a few days before the announcement contacted the NOP and found out that their application had been basically not addressed. They had not been reviewed at all.

To their credit, the Audit and Compliance Division worked through the weekend to do this application, but the problem is, if the certifier hadn't been checking up and calling the NOP, that they would not have been in the

Heritage Reporting Corporation
(202) 628-4888
first round of accredited certifiers, either.

And then, the third case I wanted to mention is that although -- well, there's been huge discussion of the conflict of interest issue throughout the whole process since the rule has come out.

There still were nine certifiers accredited with conditions that they have to fix a conflict of interest problem.

And there has been a lot of consternation on the part of certifiers in general and particularly from some of these ones that weren't approved because of conflict of interest that the USDA has not provided the models that they promised repeatedly to provide about what is acceptable as far as conflict of interest. So it's been kind of a hit and miss proposition for these certifiers.

Okay. So those are my three examples. And in light of these and other certifier concerns, I'd like to remind you, the NOSB, of two responsibilities of the NOP's accreditation program as specified in the rule.

The first is that the operating manual, although that's not mentioned directly in the rule, it is a part of ISO-61, which is directly mentioned in Section 205.509 of the rule.

The operating manual is a manual that tells how the accreditation program is actually administered by the
USDA.

And although there's many -- there's a lot of guidance in the rule about the application process, the accreditation process, and renewal of accreditation, there isn't a lot about -- there's nothing about appeals or complaints or things like that. That's normally covered in this procedural manual.

Secondly, I'd like to point out that in the rule, the same Section, it says that the Administrator shall establish a peer review panel to review the NOP's adherence to ISO 61 and their own accreditation provisions in the rule.

As you know, this has not been -- this panel has not been appointed yet. But I believe that the peer review panel is essential for fair and even-handed application of the accreditation requirements to all certifiers and continual improvement of the system itself.

Just as we've experienced in the certification realm, accreditation and oversight helps everyone to improve in a positive, constructive way.

So in closing, I urge the NOP to support the establishment of the peer review panel as soon as possible as the method for providing this oversight and constructive feedback.

Thank you very much.

Heritage Reporting Corporation
(202) 628-4888
MR. CARTER: Thank you, Lynn. And Rick will --

MS. COODY: Now, remember I said good things in the beginning.

MR. MATHEWS: Oh. Yes. Yes.

(General laughter.)

MR. MATHEWS: Yes, you did. And I appreciate those kind words, and I'm sure the staff does, as well as the auditors who were involved in this. And I will pass that along to them.

MS. COODY: Okay. Thanks.

MR. MATHEWS: I just want to clarify one of the points. Your second point was about the certifying agent. And the language that you used in my mind created the impression that the application came in and just sat there.

And I wanted to clarify that that application was well along the way. The problem came in when it went to the auditor --

MS. COODY: To the auditors. Correct.

MR. MATHEWS: -- for another phase of it.

MS. COODY: That's correct.

MR. MATHEWS: So it wasn't that suddenly we were able to accredit somebody in two days.

MR. MATHEWS: Okay. And this really doesn't
directly address the issues that you were bringing up, but
it's another opportunity to give the USDA report
incrementally.

What I want everybody to understand is that those
first 42 certifying agents are not the only certifying
agents who are going to be accredited. This is still an
ongoing process, and we have not denied accreditation to
anyone.

And all of those, which is now 56 instead of 55,
because now we're up to 98 applicants, those applications
are still in the works. And some of them are at the auditor
level, some of them are pre-auditor level. And in all
cases, the problem is that we need additional information
from the accredited certifying agents to continue the
process.

Our plan is to announce additional accredited
certifying agents weekly. We are not announcing any today,
and that's because we did such a push for the first
announcement, nobody else has qualified yet. We are hoping,
however, to have some more by Monday of next week.

MS. COODY: Great.

MR. CARTER: Okay. Valerie Brown.

MS. ROSEN: Hi. It's nice to be flexible. At
the request of a member of the California Organic Food --

MR. MATHEWS: How many personalities do you have?
MS. ROSEN: Oh, many.

MR. CARTER: Let's not go into that. Let's continue on with your comments.

(General laughter.)

MS. ROSEN: At the request of a member of the California Organic Food Advisory Board, and as past Chair of the California Organic Food Advisory Board, I am presenting a statement from Valerie Brown, who is Deputy Secretary of California Department of Food and Agriculture.

This letter is a request to Dave Carter. This letter is to request the review of Chilean Nitrate, sodium nitrate, that the review of Chilean Nitrate be postponed until the September meeting of the National Organic Standards Board.

Sodium nitrate has been approved for restricted use by organic farmers in California for over 20 years. If this product is totally prohibited in organic production, it could have a negative impact on parts of the organic industry within our state.

The California Organic Food Advisory Board, which met on April 30, 2000, has voiced concern over the extremely limited time line between the release of the technical review and the action by the NOSB.

We feel the organic industry in California needs the opportunity to inform its organic growers of the

Heritage Reporting Corporation
(202) 628-4888
possible prohibition of the use of sodium nitrate.

Postponing the review and recommendation until
the September NOSB meeting will allow the California organic
industry time to prepare position papers and forward those
to your office for consideration.

We thank you for your consideration and look
forward to a positive response to our request.

MR. CARTER: Okay. Thank you.

MS. ROSEN: Thank you.

MR. CARTER: There's Fred Rapdill [phonetic] that signed in, but he didn't say whether he wanted to testify
today or on Wednesday. So --

VOICE: I don't need to speak today.

MR. CARTER: What's that?

VOICE: I don't need to speak today.

MR. CARTER: Okay.

VOICE: Thank you.

MR. CARTER: That takes us down to Brian Leahy, and then Phil La Rocca. I'm having a hard time seeing
whether that's the 6th or the 8th. You're listed as the 8th.

[Inaudible].

MR. CARTER: Okay. Well, it said you wanted to comment on the 8th, so I skipped over you. We'll --

[Inaudible].
VOICE: He wants to comment. He can share it with me.

MR. LAROCCA: I want to comment today, too.

MR. CARTER: Okay. We may need to order in lunch here. Okay.

MR. LEAHY: I think there's more people on this panel than there were organic farmers when I started.

I'm Brian Leahy. I'm the President of California Certified Organic Farmers. I have a couple of things to say, so I'll be brief.

If you could all replay what Zea said in your head, that would be really good, because that is a major concern.

I'll start with sodium nitrate. Sodium nitrate has been an important tool in organic production from the beginning. About 8 percent of our members use it. We keep pretty close tabs on it.

We see that there tends to be some specific regions in California that use it more. Some certain crops seem to get benefits from it.

And we find that the people that are transitioning to organic, during that three years, the fact that it's a fairly reliable and inexpensive source of nitrogen helps a lot with that transition, because those transition years are very hard financially.
And we're finding that some of the growers that have enough resources to really approach organic as a scientific based method of growing are very interested and continue to use it. So we encourage you all to continue sodium nitrate on the national list.

I have to say that I have some real problems with the TAP reviews.

First off, it was just timing. They came out way too late for an adequate response.

As someone who was trained in philosophy and started farming organically a long time ago and learned from some of the people that helped start the industry and the philosophy of it, I have some real problems with the philosophical statements in the TAP reviews, and I think there are some real scientific arguments that can be made against them, too.

So anyways, I just, I would like to reiterate that we encourage you to reject the petition and at the very least push this decision off until September so that the farmers who have relied on this tool for many decades have time to respond.

One of the other issues I'd like to talk about is simply we need to relook at the fact that we have to run two accreditation programs, ISO 65 and USDA's. It's a bureaucratic mess. It's also a little embarrassing for us

Heritage Reporting Corporation
(202) 628-4888
that Europeans can look and see that people that made USDA's accreditation did not make ISO 65 accreditation.

And if we are going to become the world standard, we really need to get back in line with those two.

The third thing I want to talk about very briefly is access to pasture. And you know, we had two consumer groups that I really think we need to listen to.

I can tell you the first time I went into a chicken house to buy manure, about 1980, I quit buying eggs, quit eating chicken. It actually made me embarrassed to be a human being, the way we treated livestock.

And I think that we need to remember that livestock are animals, that -- I know some in the chicken industry consider chickens no more than soybeans with wings, but they are truly an animal.

(General laughter.)

MR. LEAHY: And that's part of the philosophy of organic that we cannot avoid, which is that we need some sort of humane treatment.

You know, there are many carnivores with a conscience, and we want to develop that market. And we simply need, you know, some adequate standards to protect livestock.

So, thank you. Are there any questions?

MR. RIDDLE: Willie.
MR. LOCKERETZ: Concerning these certifiers who did get USDA accreditation but not ISO, what areas or what problems or what was it that led to getting one of them but not the other?

MR. LEAHY: Well, you know, ISO 65 has had the luxury of doing on-site evaluations, and USDA has not. So when they certify, you know, some certifiers, they haven't actually had a chance to go look at them. And it will be interesting to see what happens after that.

But for one thing, you know, I don't quite understand, other than the conflict of interest thing, why USDA did not hook up with ISO 65.

ISO 65, as you know, is really the attempt for the world to have one standard that works, or at least one accreditation program.

So I don't know. I don't know why. I'm not really sure where the different problems are. I just know it's a real problem for us.

I mean, imagine having the cost, bureaucratic nightmare of having two USDA accreditation agents coming into your office. So it is a problem.

MR. CARTER: Okay. Other questions for -- I know we have somebody from the audience who wants to ask a question, but I'm going to pass that over right now.

MR. RANGAN: I just want to help clarify the
answer to that question.

MR. LEAHY: To which -- oh. Yes.

MR. RANGAN: The ISO 65. And we've spent a lot of time reviewing all of the organic certifiers.

One of the problems with the certifiers who are not ISO 65 certified could be a problem of transparency. We have not received organizational information like Board of Directors or funding information for a lot of the certifiers, and that would be a reason for them not to receive ISO 65 certification.

MR. CARTER: Okay.

MR. LEAHY: And Willie, Brian McElroy is in charge of certification for CCOF. I'm not supposed to do that.

He'll actually, on Wednesday, he'll talk about it, because he's the one that screens the most.

VOICE: [Inaudible].

(General laughter.)

MR. CARTER: Okay.

MR. LEAHY: Good.

MR. CARTER: Thank you.

MR. LEAHY: Is that it?

MR. CARTER: Yes.

MR. LEAHY: Thank you.

MR. CARTER: Okay. Marty --
VOICE: You said Phil La Rocca was next.

MR. CARTER: Oh. Yes. Okay. Phil, come on up.

Okay. I felt so guilty about skipping over Marty that I was getting consumed.

MR. LAROCCA: I can let him go first. That's okay.

MR. CARTER: No. Go ahead, Phil. You're in.

MR. LAROCCA: I actually need both days, I have so many comments here. Thank you for this time.

My name is Phil La Rocca. I farm 200 acres of certified organic wine grapes. I have a certified organic winery and 450 head of certified organic sheep for both meat and fiber production. And I say that because on Wednesday we're going to deal with the fiber issue.

Today I would like to start with the sodium nitrate issue, because I'm also Chairman of the Board of Directors for the California Certified Organic Farmers.

We were the ones that set the pattern of the 20 percent use of sodium nitrate. And several years ago, having to deal with an international accreditation board, that issue came up, and I spent about two years of my life dealing with this sodium nitrate issue at CCOF.

And the conclusion came to the fact that, first of all, the information that we got, mostly from the Europeans, was that they were concerned about high saline
187

counts. The information was rather shoddy, and the

conclusion was that they basically used it as 100 percent

fertilizer and overused it, and that was the problem.

The documentation that we got from most of our

California growers actually showed a pattern of one of the

best systems of organic production seen, especially

introduced at that time by Pavadge [phonetic] Farms and Cal

Organic.

So we concluded at that time that 20 percent

sodium nitrate was absolutely not a problem when used in a

proper organic system. And all the growers that we had

under certification used a system that actually was

meticulous.

Point 2: Conflict of interest. I am drawn to

bring this subject up today, after sitting in the audience

and having other speakers before me, but also some of the

comments of some of the speakers, I was ready to jump up and

yell, actually.

The fact of the matter is, in February of this

year CCOF will celebrate our 30th year as a certifier.

We have small growers, large growers. Our seal

is internationally recognized as one with a lot of

integrity. And when you see that, that seal tells you

that's organic.
We have a Board of Directors made up of farmers, certified organic farmers and processors, and there never has been a problem. We've always felt there's been enough firewalls in there to guarantee that the certification outfit was doing its own thing and doing it correctly.

What a body of farmers in a certifying organization does is it adds integrity and clout. It's totally the opposite of a conflict of interest. You have people that actually know what they're doing, in our case, people that actually help found the modern industry of organic agriculture and certification.

So to look around in terms of integrity of certification, I don't think we've really ever had a problem with somebody challenging us that we had some conflict.

Another issue I have to deal with in California, we have -- California State wants to write some new regulations.

And we had some issues that we brought up with them, not that we were against it, but we definitely had some issues.

And one of the arguments that was thrown to us that we needed the State program was that the State was going to give us enforcement.

I come to this Board to put pressure on the NOP. If we're going to have a Federal rule, we should have
Federal enforcement, and we shouldn't have to be dependent on a State to give us that enforcement level.

In that same realm -- and I'll touch on this now -- we have different, for example, fiber standards, cosmetic standards, et cetera, that are just floating around out there.

And the concept seems to be that if you don't have an organic standard from the NOP, then somebody can come up with their own standard. And we're seeing that in the industry.

Right now, even with our wool, we're getting different companies saying, Well, we have different standards that we're following in the processing of this wool.

This totally defeats the purpose of why we have this Board and the NOP. We did this so that we would have a reciprocity of standards.

Now, it's great that we have it for food production. But I do honestly feel that if we don't have these for other standards, and you just have organic floating around for whatever it be, pet food or what have you, what you would have is a lack of integrity in the organic word, plus I also think that it would affect us financially, as well.

So I think if you get a shakiness of what organic
means all the way around, it's going to affect the entire system.

And the last point I think I'm going to be able to get in is on labeling.

Before I left for here, I was contacted by two other wineries, and then, if you count my daughter, three wineries, that we still are a little bit concerned of the issue on labeling, because right now most of the wineries are bottling and labeling product that will not be released till after the rule comes out.

So there is just a little bit of concern, though since I've been here, I was told that some of these things have been ironed out, that if we come out with an improper label that doesn't meet the NOP requirements right now, that some of these products may have to be relabeled, which would be an extreme financial burden.

And since they have been certified under present standards now, I think that that needs to be looked at. But that could be in the commerce trade, so I'm going off a little bit.

Anyway, thank you.

MR. CARTER: Any questions of Phil? Go ahead.

MR. MATHEWS: When it comes to the labeling that is occurring now, we have already provided that the handlers can continue to label their product using their existing
labels up to October 21.

That is the time, the October 21 is when they have to start using the new labels, or at least they have to start following the labeling rules.

Anything that you've already got in the works will still be able to be sold after October 21, so there will be no relabeling of product unless you label it improperly after October 21.

MR. LAROCCA: Right. Then, the other question would be, if you follow all the NOP requirements, and you've labeled, like right now, for example, you can't put the USDA label on your label. So if we meet those requirements, the question is, we can add a USDA sticker, which would be accessed --

MR. MATHEWS: After October 21.

MR. LAROCCA: -- after October 21?

MR. MATHEWS: Right.

MR. LAROCCA: Thank you.

MR. CARTER: Okay. Marty, then Steve Harper.

MR. MESH: And to answer Jim's question, it appears as though Mr. Basson [phonetic] is a certifier involved in a given chicken.

Good morning. My name is Marty Mesh. I'm the Executive Director of a non-profit, Florida Certified Organic Growers and Consumers, Inc., a grower and consumer
based operation also known as FOG, Florida Organic Growers, whose certification programs -- see the link here, for those that have asked me -- the Quality Certification Services, QCS, is ISO compliant and USDA accredited.

I currently chair the OTA Certifier Council and was part of an organic farm for 26 years. I serve on the Board of the OTA, the OMRI, and with the National Campaign for Standards Organic Steering Committee.

I want to thank the old members of the Board for their years of work and welcome the new members. We look forward to working with each of you.

And I hope and trust that your recommendations will be truly based on what is best and true for organic farmers and consumers who trust that standard certification and accreditation maintain what it is they think they are growing and buying as opposed to what may benefit your own or some individual farm, livestock, or processing operation. The public trust depends on it.

I also want to thank Mark Keating for all of his work, and am saddened by his transfer and feel the USDA has lost one of its most experienced, committed, and knowledgeable NOP staff members on organic agriculture. I would encourage you to get him back working on organic agriculture.

A recommendation is needed for a formal link

Heritage Reporting Corporation
(202) 628-4888
between 205.671 and 205.672. USDA has stated that a recommendation from the NOSB could link the two sections together. Otherwise, growers affected by a Government mandated spray program whose product has no residue, or certainly less than 5 percent of EPA tolerance, would not be able to market their produce as organic.

Government mandated spray programs are in place in numerous states at various times for such things as Lyme Disease, Citrus Cankor, medfly, mosquito abatement, and encephalitis, to name a few.

This could affect many, many growers in many different states and is different than the industry standards have been when 5 percent of EPA tolerance was the threshold for the loss of the organic label, as it is in 205.671.

A grower in Florida and California with two years worth of Valencia oranges on their trees at one time who is subject to a single Government mandated spray at a very low concentration should have the produce tested in the same way as the drift case would cause. Efforts should be made to see what levels of any residues are there.

Without a provision for compensation from the Government, the loss of market access for organic farmers could put an organic farmer out of business, since in the case of Valencia oranges there are two seasons worth of

Heritage Reporting Corporation  
(202) 628-4888
fruit on the tree at one time.

A simple action by the NOSB and policy directive could alleviate this injustice.

I'd like to know on the record -- on the record -- if the labeling phrase "Certified organic" will be permitted on labels.

In an unwritten communication from USDA, we were told that the phrase "Certified organic" would not be permitted on a label since it is not one of the labeling possibilities in 205.301.

The labeling term "Certified organic" is in widespread use, and if it is the Department's intent not to allow such a widespread truthful labeling claim, all certifiers and processors need to know quickly. I figure this is a good place for that to happen.

I am also concerned about the tendency of USDA not to inform all certifiers in writing of something, but to deal on a case by case basis between certifier and producer. It clouds the line of accreditor and certifier.

Standards interpretations are critical for this not to be a race to the bottom or how low can the standard go mindset.

Because of time -- you did a good job. But because of time, I'm just moving on to the howevers.

Although it's a big job, I need to vocalize my
frustration with USDA in the accreditation process concerning conflict of interest.

While federally regulated banks have board members who receive bank loans, farmer-based organizations have been treated with seemingly little to no respect.

Do we have to decide between being ISO compliant, which calls for a balance of interests, and NOP compliant, which, contrary to expressed written opinion to Congressional members -- stop that clock, I have a really long last sentence -- to work with certifiers on proposed organizational structure to ensure the management of COI, not one farmer-based organization has had their proposal accepted or publicized.

We were never communicated with for over a year. We submitted our proposal over a year ago and never heard from you.

In summary, I link the drift in the Government mandated spray program's fix COI certification review board -- hang on. We'll skip all that.

Okay. If I had lots of extra time, I could go into a few things.

Maybe there should be a recommendation that if feed is being sold for three times the price, farmers receive three times the price for the feed.

The testimony here today that a USDA accredited

Heritage Reporting Corporation
(202) 628-4888
certifier is allowing anywhere from 5 to 10 to 30 percent
organic feed in certified organic poultry operations and has
132 farms certified when USDA thinks there is one certified
organic entity does not instill a great deal of confidence
in the accreditation which we have worked so hard to get.

MR. CARTER: Okay. Thank you, Marty. And the
court reporter would like to have a word with you out in the
hall, I think.

(General laughter.)

MR. CARTER: Okay. Owusu?

MR. BANDELE: Yes. Marty, I just want to be
clear on your recommendation in terms of the mandatory
spray. So what are you recommending?

MR. MESH: That a recommendation comes from the
Board to link Sections 205.671 and 205.672, which we were
told by USDA that, if a formal recommendation, they could do
a policy interpretation that would cause them to treat
Government mandated spray programs as drift, potential
drift. Right now, without a recommendation from the Board,
you lose market access.

MR. MATHEWS: Who told you that?

MR. MESH: The former Director of the National
Organic Program, Mr. Keith Jones.

MR. MATHEWS: He told you that the emergency
spraying would be treated as drift?
MR. MESH: He said that, if a recommendation came from the Board to link Sections 671 and 672 together, that USDA policy could link them together. You guys are the ones that do this creative policy stuff, not me.

(General laughter.)

MR. MESH: But that came from him. But he said it has to come from the Board.

And I really need -- we need an answer on certified organic labeling, if somebody wants to ask me that question.

MR. RIDDLE: And that was exactly my question. Yes. Could you clarify that situation? Because it's certainly been my understanding that the words "Certified organic" is an allowed label claim.

Where did you get this information, what's it based on, and can we get this clarified?

MR. MESH: We were told by an NOP staff member who looked at a processing label and said, Well, one of the things that would have to come off is "Certified organic." It's not allowed.

The only three labeling options are, 100 percent organic, Organic, or, Made with organic, you know, that it's USDA's position that obviously it's certified, if it's organic after October 21 it's certified.

But again, it's in widespread use, it's on most
every processed product in the marketplace, certified organic yogurt, milk, cheese, vegetable soup, juice, and nobody seems to know about it.

And we asked for clarification in writing and didn't receive it.

MR. CARTER: Rick?

MR. MATHEWS: I've made note of this, and we will get back to you, Marty.

MR. MESH: Thank you, sir.

MR. CARTER: Okay. Thank you, Marty.

MR. MESH: And then, I still have comments for Wednesday.

MR. CARTER: Okay. You're on the list.

Steve, welcome to the podium.

MR. HARPER: Well, thank you very much. It's a little odd to be here after five years sitting on your side. And I just wanted to thank you all for the incredible amount of work that you've done and you will continue to do.

And I'd like to continue working with you representing processors and getting some feedback on processor issues, as well as some other issues.

So today I want to address, as a former representative of processors on the NOSB, the issue of DEAE, a volatile mean in processed food.
MR. CARTER: Could you speak up just a bit, Steve?

MR. HARPER: Okay. So I'm asking that you please consider allowing the use of DEAE with a sunset phase-out for use as a treatment for boiler water steam in organic processing.

The allowance or prohibition of volatile means in steam used for organic processing has had a murky history in regards to certifier standards.

The NOSB in 1995 recommended that no boiler water additives should come in contact with organic food during production as part of the organic GNP recommendations.

This prohibition was based partly on mistaken information that all boiler water additives could be removed using in-line steam traps and filters.

Based on this recommendation, almost all certifiers have adopted standards that have prohibited volatile means.

However, the survey of certifiers conducted by the NOSB Processing Committee in 2001 revealed that the two certifiers that certify the bulk of processors routinely provide variances to production facilities that have difficulty complying with the prohibition of volatile means.

A separate survey also conducted by the NOSB processing survey in 2001 revealed that approximately 20 to
25 percent of the 56 processors surveyed were given variances to use volatiles means during the processing of organic food.

The same survey revealed that another 40 percent of the processors routinely use volatile mean as a normal operational condition, but, because of the short duration of the organic production runs, were willing to turn them off for the organic production.

Only one processor out of those 56 had actually installed equipment to alleviate the need for boiler water chemicals or volatile means in their system.

So in fact, there has been historical allowance for volatile means when production facilities felt that shutting them off would jeopardize the integrity of their equipment.

I personally feel very strongly that volatile means are not consistent with long-term organic standards, just as many of the inert materials used in the crops and livestock sectors are inconsistent with our view of the ideal organic standards.

However, the processing industry needs time to phase out the use of volatile means.

Processors with severe water quality issues such as high levels of carbonates that process only a small amount of organic food as part of their overall percentage

Heritage Reporting Corporation
(202) 628-4888
of production will not be willing to spend the additional
50,000 to $200,000 for equipment to allow production without
use of volatile means.

The vast majority of organic food companies
contract with plants to produce organic food; they do not
own their own manufacturing facilities.

They need to be able to source processors that
are close to the production fields and that are able to
produce a wide array of products in order to continue the
growth of the organic industry.

The immediate prohibition of volatile means in
processing will severely hinder an organic food company's
ability to find a processor to process organic food.

The TAP reviewers, in evaluating volatile means,
called for a prohibition of volatile means without regard to
viable alternatives.

A subsequent independent review of the TAP
reviews requested by the NOSB in the summer of 2001 noted
also that one of the shortcomings of the TAP reviews was the
incomplete identification of alternatives. So even though
the TAP reviewers recommended against it, there was
incomplete identification of alternatives.

Viable alternatives is one of the criteria that
need to be considered when evaluating materials, and
especially needs to be considered when the impact affects 20
DEAE is the volatile mean that is most universally applicable to a wide variety of processing plants. It is the only alternative remaining that is being considered.

I hope that all of the NOSB members have had a chance to review the comments from the six or seven processors that have submitted comments regarding the need for short-term allowance for DEAE.

So again I ask that you please consider the effect of immediate prohibition having on the ability to process organic food and to continue the current growth of the industry.

Short-term allowance with a sunset clause would send a strong message to the industry that alternatives must be put in place.

Thank you.

MR. CARTER: Thank you, Steve.

MR. HARPER: Any questions?

MR. CARTER: Questions? Rose?

MS. KOENIG: I just had a question in terms of time frame in terms of a sunset. And what are you envisioning -- it seems to me from what your statement was is that you would seek out manufacturers that would -- I mean, how would this --
What do you envision that's going to happen in the industry if there is a sunset? Do you see this as building of new facilities --

MR. HARPER: No.

MS. KOENIG: -- or are you going to have the same problem, that people are not willing to invest in that equipment?

I mean, it makes sense to do a sunset if there is a solution. But if there's no solution --

MR. HARPER: Well, what I see is that, because of the historical allowance of variances for this industry that, you know, they're sort of being notified now, right now, that this is not going to be continued. And so October 21 is like five months away.

By putting the sunset clause in there, just like you did on ammonium hydroxide, saying, you know, 2005, that's it, or three years, that's it, they're on notice basically that this is going to disappear and they need to do something about it.

There are -- as the food processing industry develops, more and more plants are using reverse osmosis and other alternatives because of the cost of chemicals, so that is occurring. But the industry is not at that point yet.

MR. CARTER: Okay. Owusu, and then Mark.

MR. BANDELE: Yes. Steve, I was just wondering,
the allowance of variance, was that primarily done by one certifying agent or a host of certifying agents?

MR. HARPER: It was done by primarily two certifiers. There may have been others. But these certifiers were the certifiers that were processing the bulk of -- were certifying the bulk of processors in the United States.

MR. CARTER: Mark?

MR. KING: Yes. Steve, you mentioned --

MR. HARPER: Or at least the vast majority of them. Yes.

MR. KING: You had mentioned viable alternatives and reverse osmosis and some of the other technologies. Could you elaborate on that, what might happen, in other words, if there were a sunset, and how many might invest in that alternative technology?

MR. HARPER: Well, I'm assuming that, as the organic industry continues to grow and becomes much larger, that there will be more incentives for the processors that are only processing like, say less than 5 percent or less than 10 percent of their total output as organic to invest in these alternative systems.

And that's one of the things that -- does that answer your question?

MR. KING: I guess, in addition to that question,
do you see that as the primary alternative at this point, 
reverse osmosis, or are there others that you see as viable 
in, say a 36-month, really a 3-1/2-year time span?

MR. HARPER: Well, in the industry that is the 
sort of the state of the art as far as water treatment 
programs. That and stainless steel piping are the two 
alternatives that are most viable.

MR. CARTER: Okay. Jim?

MR. RIDDLE: Yes. And one other option that's 
currently commonly used is shutting off the injectors --

MR. HARPER: Yes.

MR. RIDDLE: -- at the time of organic 
processing. And I don't want to get into an in-depth 
discussion of DEAE right now, but I did want to respond to 
Owusu on the certifier survey, because I'm the one that --

MR. HARPER: Right.

MR. RIDDLE: -- sent that out. And I had 14 
respondents, and 12 of those prohibit it totally. And, yes. 
Like you mentioned, two that allow limited use, certain 
exceptions, do the bulk of the processors.

But you can see it either way, that because they 
allow it, that's why the certifiers have gone -- I mean, the 
processors have chosen that.

So it once again points out the need for one 
uniform interpretation and application of this.
MR. CARTER: Kim?

MS. BURTON: I just wanted to comment on Mark's question there.

As a processor, there is typically a budget period for large processors at anytime you want to do capital improvements. And I'm sure that the other producers on the Board or anyone out there could comment on that.

I know from Smucker's standpoint, we're currently budgeting right now for two years out for capital improvements. So anything that does have a large dollar impact we're not going to do immediately unless we have it budgeted for.

MR. HARPER: That's a good point. Yes.

MR. CARTER: Okay. Thank you, Steve.

MR. HARPER: Thank you very much for letting me speak.

MR. CARTER: Okay. Oscar Morales.

MR. MORALES: I think it's, Good afternoon, right now.

(General laughter.)

MR. MORALES: Okay. My name is Oscar Morales. I'm from Guatemala, Central America. I have come quite a long ways to make this testament.

The Guatemalan Medfly Eradication Program, I'm the field operation coordinator.
At the present time, possibly the largest fruit fly eradication program in the world, applying integrated pest management techniques such as SIT, stroll [phonetic] insect techniques, biological control with parasitoids, mechanical control, cultural control, ground bait sprays application, area-wide aerial bait spray applications, regulatory measures such as quarantines.

On the 10th of October, 1981, a cooperative agreement between the Governments of the United States and Guatemala -- excuse me, I'm kind of nervous -- was signed with the objective to eradicate the Mediterranean fruit fly, safeguarding the United States and Mexico's agricultural fruit industry from medfly infestations.

In the mid-1980s, area-wide malathion bait sprays were banned from Guatemalan territory. At that time, there was no substitute for malathion bait to be used for eradicating the medfly.

Because there was no insecticide that could open the path to advance in the eradication process in Guatemala, the eradication program turned into a continuous barrier at the Mexican-Guatemalan border.

After continuous efforts to try to find a substitute for malathion baits, in 1999 experimental trials were carried out in Guatemala with -- and I'm not sure if I can say the brand of a product that we were using -- yes?
The experimental trials were carried out in Guatemala with Success 0.02 CB, known as GF-120 here in the United States. This insecticide of natural origin, active ingredient is Spinosad -- I finally got it, okay -- was proved to be effective against the medfly and four other species of Anastepha fruit flies.

It was also proved that it was environmentally friendly, not having a negative impact on pollinators such as honey bees during or after application.

Now, I'm going to get into this a little bit deeper in a couple of seconds.

Another study -- this was a study done -- I've got them over here, and I'll give you a copy -- another study carried out by the Ministry of Agriculture, Food, and Livestock of Guatemala, which is called Efecto de Insecida Success [inaudible], which is -- I'm sorry, but that's the name --

(General laughter.)

MR. MORALES: -- concludes that Success 0.02 CB does not cause death to bees, and there is not a negative impact effect on bee activity in the colonies.

The same study also concludes that Success 0.02 CB does not cause death to parasitoid belaya [phonetic], which is a tekeenied [phonetic] fly used in biological control for the sugar cane barrier -- borer, I think.
Another study, the author is Vargas, taking place in a coffee growing area of Hawaii, which compared the effects of the Mediterranean fruit fly bait sprays containing malathion, another Spinosad, and Floxine. [phonetic] B also carried out a current nontarget study which examined the effects of these bait sprays on fallopius arasanus.

MR. CARTER: Time.

MR. MORALES: Time? Oh. Okay.

There's various studies that conclude that Spinosad, used in the method that we apply it, does not have a negative impact on honey bees and other nontarget insects such as parasitoids, honey bees.

And the main problem that we have is that we have a lot of organic coffee growers and organic fruit growers that are getting into this business.

So this is an emergency project. It's used to safeguard the fruit producers in California, Texas, Florida, Mexico, and hopefully in Guatemala within a few years.

Okay. Thank you.

MR. CARTER: Thank you.

MR. BANDELE: I have one question.

MR. CARTER: Owusu?

MR. BANDELE: Since Spinosad is part of a
naturally occurring organism, people who are using that now still would be in compliance. Is that right? Unless it's modified and annotated to restrict it? Is that correct or incorrect, Rick?

MR. MATHEWS: What they're trying to determine is whether or not it is a natural or a synthetic. That's the first question, because of its process.

MR. MORALES: Right now it's considered natural or organic. Right?

MR. MATHEWS: That's the question that the TAP is trying to answer.

MR. MORALES: Well, Rick, our request is that you do consider it. We do not have another alternative right now. This impact -- the decision that you make right now is not going to only impact the United States, it's going to impact socially and economically Third World countries, and it's also going to have an impact on safeguarding the fruit industry here in the United States.

MR. CARTER: Okay. Jim?

MR. RIDDLE: Yes. You indicated that there are certain restrictions or methods on timing of application that help protect the pollinators and other beneficial insects in your program or from your experience.

I'm just wondering if you would be available to the Crops Committee and if you're still going to be here as
we're developing language around the use of this material to safeguard on some of these very valid concerns.

MR. MORALES: Okay. I came specifically just for this meeting. I'll be here --

MR. RIDDLE: Just today?

MR. MORALES: Just to be here from Guatemala.

MR. RIDDLE: Just today?

MR. MORALES: No.

MR. RIDDLE: Okay. You'll be here through all three days of the NOSB?

MR. MORALES: Yes.

MR. RIDDLE: Okay. Thank you.

MR. MORALES: So any questions you need --

MR. CARTER: Okay. Thank you.

Tom Jones.

MR. JONES: As you can see, I'm not the Tom Jones.

(General laughter.)

MR. JONES: Unfortunately, the person who wrote the petition eloped last week, so I'm the pitch hitter here, so bear with me. I'll keep it very short.

Basically I'm Tom Jones with Taza Tea Company in Portland, Oregon. And we're petitioning the use of fish gelatin for the use as a fining agent in the stabilization of fresh brewed organic tea for use in our ready-to-drink
products.

As a fining agent, gelatin is added to the brewed
tea liquor to create a coagulum with compounds that cause
haze, sediment, off-flavor shortly after brewing. The
coaugulum is subsequently filtered out through various
methods.

Gelatin has been used for this purpose in wine,
beer, and juice for many decades.

An interesting thing about the tea industry,
there's currently no standards for utilization of the term,
Real brewed, or, Fresh brewed, so some tea companies are
adding instant tea to hot water and claiming to be real
brewed. I'll talk to you in a little bit why that is
important.

Taza is committed to producing an authentic tea
product and experience to consumers by actually brewing our
tea.

As mentioned, authentically brewed tea will
develop a very unappealing haze, sediment, and off-flavor
over a very short time period. The use of gelatin as a
fining agent allows for stabilization of the tea.

Some tea products get around this by diluting the
tea and then supplementing with a coloring such as caramel
coloring or what have you and a tea flavoring.

Although our process is much more costly, we
believe that we are providing a more authentic product and experience.

Any questions?

(No response.)

MR. JONES: You like that short?

MR. CARTER: Yes. Appreciate it.

VOICE: Fish gelatin?

MR. JONES: Fish gelatin. Yes.

VOICE: That's new to me.

MR. JONES: It was new to me, too.

VOICE: Yes. That's interesting. Is that part of the TAP review?

VOICE: Yes. The Processing Committee.

VOICE: I know, but the fish gelatin.

MR. JONES: Well, I think it's under gelatin as a whole. I mean, we specifically are interested in fish gelatin.

MR. CARTER: Okay. Thank you.

MR. JONES: Any questions? Is that it?

MS. KOENIG: I have just one question.

MR. CARTER: Oh. Rose?

MS. KOENIG: Have you ever had problems in terms of, you know, consumers having allergic reactions to the use of that gelatin?

MR. JONES: No, we haven't. And that is a
concern. I think one of the reviewers did some really good
work in bringing that up.

We have analyzed our product, and we don't find
any measurable residual, but there is obviously a risk
there.

MR. CARTER: Okay. Kim?

MS. BURTON: Thanks, Rosie, because that reminded
me of a question.

As a beverage producer, you are required to be
HACCP certified. Right?

MR. JONES: Yes.

MS. BURTON: You're HACCP?

MR. JONES: Yes.

MS. BURTON: Okay. So in that HACCP plan, hazard
analysis, critical control point, the beverage industry is
mandated by law now to do that.

MR. JONES: Yes.

MS. BURTON: So part of your plan would identify
this fish as a potential toxin, and you have to --

MR. JONES: Potential allergin. Yes.

MS. BURTON: An allergin. And you have to have
your critical control points documented and make sure that
you flush. It's a very similar plan to organic, where
you're having to ensure that there's no contamination.

MR. JONES: Yes. That's true.
MS. BURTON: Okay. I just wanted to comment on that.

MR. JONES: Good point.

MR. RIDDLE: But you're not required to label, may contain potential allergin, or anything like that?

MR. JONES: Currently not. No.

MR. CARTER: Okay. Thank you.

MR. JONES: Thank you.

MR. CARTER: Okay. We have Sharon --

MS. CAUGHLAN: Excuse me.

MR. CARTER: Oh. I'm sorry. I didn't see your hand up over there.

MS. CAUGHLAN: Follow-up. Not required is different than choosing to label.

MR. JONES: Yes.

MS. CAUGHLAN: Would you choose to label this as a potential allergin?

MR. JONES: I need to look at that. We haven't discussed that within our company yet.

MS. CAUGHLAN: Thank you.

MR. CARTER: Okay. Sharon Krumwedl. Okay. And then we'll have Sissy Bowman, and then Eric Sideman, and the list is done. Oh. Oops. No, it's not. Okay.

MS. KRUMWEDL: My name is Sharon Krumwedl. I am the general manager for Chino Valley Ranchers. And I didn't
initially sign up to speak, so I'm going off my notes.

I sat back there very antsy after hearing all the comments about outside access.

Chino Valley Ranchers has been a member of CCOF since 1996. We are certified organic. We went to CCOF, we were inspected, we did not have outside access. We went to organic, the customer demanded it. To comply with CCOF, we made outside access. That was our first flock, of 3,000 birds.

We now have 80,000 organic certified birds producing eggs. Our eggs are distributed in 26 states. Last year we saw a 40 percent increase in just our organic production. And I believe the reasons why we saw those increases was our customers know we have outside access. They know that we believe in organic.

We have fed organic grain since 1996. We have never had problems sourcing organic grain.

We had some quality problems purchasing the feed from an outside source, so we built our own feedmill. We contract grain, deliver it on a rail car. I've had a couple times where I've had to call the rail company and say, My birds are going to starve and die if you don't get that corn to me. But they've come through.

And we've gotten to the point where we've set up tanks for the corn and for the soybean so we don't put
ourselves in that situation where we're running short. And there has never been a lack of supply.

With good management, you can accomplish that. You pay a little bit more, but your customers are paying a little bit more to get a good product, also.

As far as the outside access and Avian Influenza, it's my knowledge that in the United States Avian Influenza has hit cage production. It hasn't excluded free range productions, but it's hit cage productions. It hit it back in the '80s, and it's here again.

I feel one of the biggest problems these farmers have is they have poor farm management. The equipment sits outside, travels into houses from house to house, there is no biosecurity.

This equipment, from many different ranches, these eggs come on racks or pallets, they come on plastic trays that sometimes get washed by running through some water, and they're mingled between other ranches' material and sent back out to the farms. There is no control.

In February of this past year, I visited a company called Danegg in Denmark, Aftabielfock [phonetic]. It was always my goal.

Since I've been in this business I've heard how the European countries do everything better than we do, and I wanted to see what they do.
Well, these people have an incredible biosecurity procedure. Every rack that comes on to a processing facility from a farm, first the organic eggs are marked, each egg is marked from that farm to that processing facility. So you don't have any commingling or a farmer trying to play games pushing non-organic eggs into organic production.

Material, eggs are unloaded, the material is sterilized and sent back out to the farms. The employees have to change their clothes before going into the processing facility. It's like a medical facility there.

But you know what? This is your life they're playing with. When you have a meat product, a live animal product, you're talking the same thing.

And we have no system like this in the United States to prevent illness that can be carried through the process of what an egg facility has. And it's kind of embarrassing to see. But our farmers need to change the way they handle the biosecurity.

These farms don't have HACCP plans. Some states have come up with the quality assurance plan. We have that in California, but it's minimal.

Thank you.

MR. CARTER: Okay. Ma'am, Rick is going to -- you need to go back to the --
MR. MATHEWS: You indicated that your customers know that you provide access to the outdoors.

MS. KRUMWEDL: Uh-huh.

MR. MATHEWS: So my first question is, how do they know that?

MS. KRUMWEDL: Through our advertisement, and our certification entity has always required outside access.

MR. MATHEWS: So what does your advertisement say?

MS. KRUMWEDL: It shows the birds outside, and it talks about our outside access program.

MR. MATHEWS: Okay. What kind of access to the outside do you use?

MS. KRUMWEDL: It really varies from ranch to ranch. We have one facility that the birds actually roam in an orange grove. There's four houses on that facility where the outside access is orange groves.

We have one facility, which was our first one that we built, like a shed cover outside, that they roam. They probably have about 2-1/2 feet total square foot per bird.

We have three other houses where they have just like a patio area, also, extended from the house.

MR. MATHEWS: The --

MS. KRUMWEDL: And we started that facility with
no cover on the outside, and we found that the birds were afraid to go outside because of the prey. So we did put a cover on those facilities.

MR. MATHEWS: Okay. And the birds that are actually in the orchard, they're not on a pasture. They're out there to do weed control?

MS. KRUMWEDL: Well, those oranges right now haven't been sold at all. The process is possibly getting those oranges certified organic.

They do rotate where they will move the fence around and replant weed on the ground.

MR. CARTER: Goldie?

MS. CAUGHLAN: Do you actually -- on your labels, on your cartons, what does it say currently?

MS. KRUMWEDL: It says that our birds are able to roam freely inside and out, as they choose.

MS. CAUGHLAN: It says outside?

MS. KRUMWEDL: Yes, it does.

MS. CAUGHLAN: Okay. I've seen the label, and I didn't recall that.

MS. KRUMWEDL: Well, we have a couple different labels. The certified organic label does say that.

MS. CAUGHLAN: I am speaking of the certified organic. We sell them. I just wanted to clarify that. I didn't recall -- don't recall that it says outside. Thank
you.

MR. CARTER: Rick?

MR. MATHEWS: One thing puzzles me. You're saying that your advertisement says that they get to roam free.

MS. KRUMWEDL: Uh-huh.

MR. MATHEWS: But it sounds to me like what you're doing is you're basically creating a patio with a roof over it. What kind of roaming free does that provide?

MS. KRUMWEDL: Well, it provides them to move around, to have access to the outside, to the sunshine and to go dust. And we set up branches and have foliage that will be out there from time to time, because they'll eat it. I will say that. If they go outside, they'll eat everything. And you have to move them to a different area and replant.

MR. CARTER: Okay. Thank you.

MS. KRUMWEDL: Thanks.

MR. CARTER: Okay. Sissy Bowman.

MS. BOWMAN: Hello, everybody. Welcome to all the new NOSB members. And to all of you old-timers, it's great to see you again. Nice to be in Texas.

I wanted to address accreditation. And --

MR. CARTER: You need to identify yourself.

MS. BOWMAN: Oh. I'm sorry. My name is Sissy
Bowman. I am an organic farmer.

I am the communications director of Indiana Certified Organic, which is the largest certifier in Indiana, and I'm the director of Hoosier Organic Marketing Education, which is a not-for-profit organization, and I'm the chairman of the Indiana program. But I'm just going to talk for me today. Okay.

We really enjoyed -- I felt everybody was really helpful through the accreditation process. So I'm going to be like Lynn. I'm going to start out with the good stuff. Okay.

We found the people really helpful. And the only real stress that I had I think I laid on myself, because I asked a lot of questions, and every time I did, I got a lot of help. So kudos on that and getting it done in time.

However, with regard to the National Organic Program and to the NOSB, every time that an inappropriate synthetic material or practices such as denying poultry or other animals access to the outdoors happens with this program, you hurt the real organic farmers, the small organic farmers, and you betray the confidence of consumers who drive the organic market.

Remember the national list process, Section 2118. I know that all you ones that have been here a while are tired of hearing me talk about this. But here are some
questions.

Is there a natural alternative? If there is, it's not supposed to go on here.

Is the petition for specific use and application? That's what it says in there.

Are the categories in the Section 2118? Is it appropriate to the categories and to the criteria in Section 2118?

Keep that page open when you review these things and ask these questions. That needs to be done first.

Organic has not historically achieved market growth and consumer trust by just slapping the organic label on a conventional product, yet it seems today that there's a lot of people here that would like that to happen.

Getting certified is hard. I know. I've done it for years. Okay? I've been on the certifier end and on the farmer end. It costs money. Complying with it is hard. Nobody ever promised it was going to be easy.

Of the thousands of certified organic farmers in the U.S. today, most have historically strived to meet the standards.

To lower them now would effectively put many of us in the situation that we're unable to compete with larger operations who are coming in and meeting lower standards and who have justified to themselves, and hopefully not to you,
that money and increasing the marketing of a product is
what's really important.

Yes. The bottom line of a business is growth of
finances and markets, but the bottom line of organics should
be to provide a real choice in the marketplace for
consumers. It is consumer driven. That's what it's about.

And I'm really amazed to see large operations and
processors complain about investments. Has anybody got any
idea what a farmer has to invest before they even raise the
first crop? $200,000, that's a bargain just to set up a
small farm.

There are too many shades of gray that have been
suggested today. Levels of organics such as organic free
range chicken, an organic chicken, or an FSIS label that
indicates that meat has been raised partially organic will
neither build consumer confidence nor provide what consumers
in their 285,000-plus comments requested.

Don't underestimate the consumer. If they don't
trust this program, they won't buy it, and we will all be
out of jobs, USDA, NOP, certifiers, farmers, all of us, and
millions of dollars of taxpayers' money is going to have
been wasted.

As an organic farmer, certifier, and consumer and
one who has fully supported the concept of this regulation,
I will feel I have betrayed the thousands of folks to whom I
have promoted organics to and organic regulations over the last 20 years.

If I see the term lowered in such a way just to increase profits, I'm going to have to contact those people myself and tell them I'm really sorry, I sold them a false bill of goods, and I really don't want to do that.

I have a mailing list of over 15,000 people. Okay? And I have no problem, if I see things go too low, with telling those people and getting a whole lot more comments in.

I have practiced organics on my farm for over 20 years, and I've worked with certification agencies since 1989. And I urge you to uphold the intent of the Organic Foods Production Act and the input from consumers.

You, the National Organic Standards Board and the NOP, hold the future of our business, our farms, our families, in your hands.

All producers have limits, organic or otherwise, land, water, feed. But just because there's not enough room outside for thousands of chickens on a small farm or not enough feed or it costs too much doesn't present a reason sufficient to call non-organic food organic.

I urge you to shape our futures responsibly. You have the power to change the face of agriculture.

And I have just a couple more comments that I
made notes from.

We still need that peer review panel. I totally agree with Lynn on that.

And also I want to address, with regard to things that aren't currently in NOP like cosmetics and things like that, when you allow the use of an unregulated organic label -- okay.

(General laughter.)

MS. BOWMAN: All right.

MR. CARTER: Finish your sentence.

MS. BOWMAN: When you allow the use of an unregulated organic label for products not currently in the rule, you create an industry that's likely to be out of compliance.

Just as we've seen with the meat label, this may put on the market products which in no way resemble the organic standards.

Thank you.

MR. CARTER: Thank you.

Rose?

MS. KOENIG: I just had one quick question. What is your perception in terms of many of the variances that we've been asked to consider today? Do you see them as viable -- I mean, obviously you have a strong opinion on kind of a dilution factor in some of the suggestions.
But you know, how do you come to terms with some of the variance or sunset clauses that are proposed?

MS. BOWMAN: Again I think you have to read OFPA, and I think you need to go back to Section 2118. I think in a lot of the cases where you're talking about variances, some of those materials should never have even been petitioned to begin with, because they're just inappropriate to 2118. OFPA is the Bible for this, you know.

MR. CARTER: All right. Thank you.

MS. BOWMAN: Thank you.

MR. CARTER: Eric.

MR. SIDEMAN: Good afternoon, everyone.

VOICE: Who are you?

MR. SIDEMAN: Who am I?

(General laughter.)

MR. SIDEMAN: My name is Eric Sideman. I no longer am on the NOSB. I am Director of Technical Services --

MR. CARTER: Don't smile so broadly when you say that.

(General laughter.)

MR. SIDEMAN: -- Director of Technical Services for the Maine Organic Farmers and Gardeners.

And I come before you today with a quick response or a quick request for you to work on something before you
leave Austin, Texas this week. And that has to do with
Emily's comments and Zea's comments on List 3 inerts.

I've made the request before, and I'd like to
make it again now to put it on the public record.

And that is, I think one solution to this may be
for the NOSB to make a recommendation to the NOP that they
instruct certifiers or honor certifiers who will issue a
minor noncompliance for the use of pesticides that have List
3 inerts in them that were previously allowed by accredited
certifiers before the NOP program went into effect in
October.

And that's instead of beginning the due process
of removal of certification.

So I suppose that will go either to the Crop
Committee or to materials, Kim.

Thank you.

MR. SIEMON: I have a question.

MR. SIDEMAN: Yes. George?

MR. SIEMON: On medications in livestock, do you
think something like that could be done for some of those
same issues?

MR. SIDEMAN: Yes. And I said that yesterday,
too.

MR. CARTER: Okay. Thank you, Eric.

Now, there was one other gentleman. You wanted
to give comment?

VOICE: A brief comment on the --

MR. CARTER: You need to come forward.

(Pause.)

MR. BRUSSYLL: Thank you. I'm Kevin Brussyll. I have an organic grain farm in Illinois. And I market for over 70 organic grain farmers in the Midwest, Organic Farmers Coop.

In addition, I also network with over 600 organic grain farmers that belong to other marketing associations and coops.

We currently have plenty of corn, small grains, and soybeans available for livestock feed. Furthermore, organic grain farmers are bringing thousands of acres of new production on line each year in anticipation of new demand.

Availability is not the question. Price is the question. In the late '90s, the price of organic grain and soybeans dropped below the costs of production. Grain farmers are still trying to recover from that loss of revenue.

If we allow conventional grain to be fed, the price of organic grain will again drop below the costs of production and in turn force organic grain farmers out of business. This will result in loss of organic grain acres instead of an increase, which we're all looking for.
The established trend in organics is for organic grain to sell for two to three times the price of conventional grain. The current price of conventional grain doesn't cover the costs of production.

Organic farmers want to farm for a living, not for an expensive hobby.

Furthermore, if we don't feed organic feed, then we are not producing truly organic food.

We are not going to grow the organic industry if we dilute the meaning of organic and lose consumer confidence.

Thank you.

MR. CARTER: Okay. Thank you.

Okay. Questions?

Would you be sure to sign in?

Okay. Rick has got one general comment here as we --

MR. MATHEWS: I would like to ask Marty to go to a pad and a pen and respond to two questions for me and this Board before I respond to his question about certified organic being on the primary display panel.

The questions that I have for you, Marty --

VOICE: He is delegating [inaudible].

MR. MATHEWS: Yes. It's called delegation, Marty.
Why is there a need to say, Certified, on the primary display panel when everything is certified? That's the first question. I'm not looking for an answer now.

And then, the second question is, what is the potential economic impact on those who do not use the word, Certified, on their label because their labels are small and they're trying to conserve space? That's --

MR. MESH: You don't want me to answer now?

MR. MATHEWS: No. I want you to submit them to me in writing.

MR. CARTER: Okay. With that, we will close the public comment period.

Just a point of order because we are so -- and I felt it was very important that everybody who did sign up had an opportunity to give comments. So despite the fact that now we're an hour-and-a-half behind our schedule, we will take a 45-minute dinner break here.

And we will come back, and we will go on until six o'clock or so if we need to this afternoon to get through the work.

(Whereupon, at 1:10 p.m., the meeting was adjourned, to reconvene this same day, Monday, May 6, 2002, at 1:55 p.m.)
AFTERNOON SESSION

2:20 p.m.

MR. CARTER: Carolyn used to just wave her magic wand and things would quiet down, but I don't command that much respect. So --

The agenda called for the next item of business to be the update from the NOP, and they're still over -- the service was extremely slow across the street, so they're on their way.

So what I'd like to do is move to the discussion -- the presentation of the Board policy manual.

This is a document that has been under development for about the last six months. Jim Riddle has taken the lead on drafting that document, and we discussed it quite extensively yesterday at the orientation and training session. So I'll just turn it over to Jim to present the draft policy manual.

MR. RIDDLE: Thanks, Dave. Yes. I had the much coveted task of chairing a policy manual.

VOICE: You volunteered.

MR. RIDDLE: Well, when I came on the Board, I was handed my original book, and I turned to the tab for policies, and it was blank. So I thought there was a need for consolidating the policies.

It wasn't the policies didn't exist. They just
weren't compiled into one manual. And to bring continuity to the workings of the Board, and especially for new members as they come on to understand the complex workings of this advisory board.

So Dave and Kim -- I forget who else was -- Mark, but I'm not sure if you were involved in the Board policy task force, but at least Kim and Dave worked with me on these drafts.

And it is posted on the Web site, if any of you are interested in taking a look at the manual as we've brought it forth to this meeting.

And like Dave said yesterday, we spent several hours going through the manual itself. And we identified a little bit of the text that needs some reworking, and we also identified some policies that are lacking. So it is a living document, and we'll continually be amending it and adding to it as needed.

But in presenting it today, I'm not going to walk through it like we did yesterday by any means. I'm just going to summarize the contents of it. And then tomorrow we will propose voting on the manual with the exception of the sections that are still being reworked. But the bulk of it, probably 95 percent of it, we should be able to adopt.

And it did incorporate a number of policies that already had been passed by the Board, so those are
incorporated. But then we developed new policies to
describe what some of our current thinking and current
procedures are.

So the Section 1 of the manual describes the
duties of the Board and officers of the Board in terms of
professional conduct, ethical standards, and conflict of
interest policies. And so it's really just the meaning of
being on the Board is set in writing there in Section 1.

And Section 2 goes into more detail in terms of
the job descriptions. It takes some of the language
directly out of OFPA and lists the various seats for all the
Board members and what the purpose of the Board is according
to the law. So that is just repeated in here, but then you
don't have to turn to the law to find that.

In Section 3 we describe what the officers are,
the chair, vice chair, secretary, and what their
responsibilities are, and also how they're elected.

And that was another thing that hadn't been put
down in writing before, and now it's very clear that
officers are elected for one-year terms annually at the fall
meeting of the Board so that it's very predictable; just
some simple things like that that we needed to get down in
writing.

And then, also, it describes the Executive
Committee, which is composed of the three officers plus the

Heritage Reporting Corporation
(202) 628-4888
chairs of each of the committees.

And Section 4 describes those committees. And the committees of the Board are accreditation, crops, international, livestock, materials, and processing. Those are the committees of the Board. And the chairs of each of those committees are appointed by the chair, the elected chair of the Board, and then that group comprises the Executive Committee.

And the Executive Committee is empowered to act on behalf of the Board during the interim. And like I mentioned earlier today, Executive meets monthly or as needed. But the Executive cannot take any final action on regulatory recommendations, including the status of materials.

But otherwise, in terms of policies and guidance to the NOP, the Executive is empowered to act under our policy.

The Section 5 describes the duties of the committee chairs -- oh. I didn't mention, also, at the bottom of Section 4 it includes a description of the peer review panel. You heard several of the speakers mention the need for that to be appointed.

And the Board already has passed a peer review panel appointment plan, and then, the terms of reference, the work orders, for the peer review panel.
So we have done our work and handed that in to the NOP. But we have since that time learned that the peer review panel must exist as a new FACA committee. And what that means, there's --

FACA is the Federal Advisory Committees Act. And it sets down specific protocols that must be followed in order for the Secretary to appoint a committee. And the NOSB is one FACA committee. And it took two years to get that appointed originally. OFPA was passed in 1990, and the NOSB first met at the end of '92, beginning of '93.

So now that we understand that the peer review panel is a new FACA committee, that does slow down the process.

But in the interim, we look to the Accreditation Committee to serve some of the functions of the peer review panel on an informal basis. But that's not described in the policy manual itself, because that's an interim arrangement. And we certainly are shooting towards the appointment of a real peer review panel following the FACA process. So anyway, that's described in here.

And then, there is also a description of the very useful task forces. We've had task forces on aquatic species, on composts, and on apiculture that bring in experts from outside the Board.

But it must have at least one NOSB member on a
task force, and they have to keep minutes and report to the Board and then cease to function after their particular charge has been concluded. And so that's described in writing for the first time, the composition and functioning of task forces.

And then, Section 5, like I said, describes the duties of committee chairs.

Section 6 is quite a lengthy section. And that is because it lays out the materials review process. One of our biggest jobs under the statute is the materials review process, and so we have already had very detailed policies and procedures for that material review, so those were pasted into the Board policy manual.

And that is a major section of the manual. And I'm not going to go through what all it includes.

But people who are interested in petitioning or inputting on the materials review process would be wise to go on the Web site, especially after this meeting and we post the final version that we will adopt at this meeting just to really understand the NOSB materials review process.

And then, Section 7 is kind of a catch-all. It's miscellaneous policies that don't fit under one of those others. And right now there's only one policy there, and that is we already have a policy for presenters invited by committees.
So when we have a need for technical information, we do have policies on how a committee can invite one or more presenters to give us some technical information at a Board meeting.

And then, we have a few addendums. And the first one is our statement of principles, the organic principles for production and handling that we adopted in October of last year.

And then, we also have a Federal Advisory Committee Act fact sheet that describes how a FACA committee is appointed and what the duties of the Federal officer, because there always has to be a designated Federal officer, and in this case it's the NOP program manager for the NOSB.

So that concludes my presentation of the Board policy manual unless there are any other questions.

MR. CARTER:  Okay. Are there any other questions or discussion? Like I said, we reviewed this in-depth yesterday, so at this point this is just for presentation only.

And if any of you that have gone on to the Web site and looked this over, I mean, this is mostly inside baseball here as far as policies and procedures. But if you have some comments, want to visit with some folks after the meeting later on this evening, we will bring this up, then, for some action tomorrow.
Let's backtrack, then. And I would like to have Rick Mathews and/or Barbara Robinson provide a brief update on the NOP.

MR. MATHEWS: Actually, quite a bit of what we would have presented has already been presented through the comment period in comments that I've made.

I think the two things that I would like to really point out at this time is that our Web site is being redesigned. And I think that you can all look forward to a much easier site to surf in probably another 60 days or so, Barbara? And it's a major redesign of it. And the Board will have its own designated place within the Web site.

The other thing is that there is a lot of new information that has been posted over the last couple of weeks, and I encourage you to go to that site and look at the many documents that have been going up there recently.

For those of you who may not know, the meeting book that the Board has for this meeting is also on the Web. It is actually out of date as fast as we put it up, though, because of the public comment that was coming in. And there is a section within that book that has all the public comments.

Please be assured that those that we received before we left the office on Friday have been provided or will be provided to the Board during the course of this
meeting.

The -- I'm trying to think what else I had in my mind. Barbara has something.

MS. ROBINSON: One thing we wanted to address --

MR. CARTER: You have to come to the mic, as well. Yes. Please designate yourself for the record here and identify yourself.

MS. ROBINSON: I'm Jim Riddle's pen pal.

(General laughter.)

MS. ROBINSON: One thing we wanted to tell you, and we've heard this here today, too, is a concern about the program staff when a client has a question and they call up the NOP.

And there is some concern, whether we mean to it or not, it appears as though we're kind of undermining the certifying agents, which we certainly don't intend to do. We've done that a couple of times, and we ourselves have gotten burned. So we've decided to halt doing that.

What we will do is, when a client calls up because they disagree with what a certifying agent has said, we'll listen to their side of it, and then the very first thing we're going to do is ask them who is their certifying agent.

And we're going to talk to the certifying agent before we give out any answers and find out what the Heritage Reporting Corporation (202) 628-4888
certifying agent said, because there's two sides to every story. And whatever response we give will be given to the certifying agent and then simultaneously to the client. So that should take care of that issue for folks.

It's -- we don't expect -- it's been suggested to us, well, why don't we just tell clients to appeal? The appeal process is really not meant for something I think that people can feel that they can just call up and ask a question about.

But we do recognize that there could be a different side to the story, so we will talk to both parties.

MR. RIDDLE: I have a question about that.

MS. ROBINSON: You can't ask any questions.

MR. RIDDLE: Do I have to send you an email to ask you a question?

MS. ROBINSON: That's right.

MR. RIDDLE: No. Just imagine this scenario: You know, someone, a certifier's client or a certified operation has a difference of interpretation, calls you just like you described, and you draw in the certifier and give an interpretation to both.

But then something happens further down the line, and they have to appeal to the program, but now you are no longer an impartial body. You took a position. Have you
lost your right to be the appeal body by intervening earlier in the process?

And what I am suggesting is that, isn't it better to give guidance to the certifiers as needed, but then just step back and let them do their job?

But give that guidance to all certifiers, because others probably have that question, but don't get kind of hands-on in the direct certification of any one individual operation. It keeps you more neutral in the eventuality of an appeal.

MS. ROBINSON: I think Rick is probably going to answer this. And you know, you're right. We certainly do want to stay neutral.

But Rick, what were you going to say?

MR. MATHEWS: Well, for one thing, we would try and make sure that the issue got posted to the Web site --

MS. ROBINSON: Right.

MR. MATHEWS: -- under the Q&A's. The other thing is that appeals do not come to Barbara or to me. Appeals all go to the Administrator. That's above us. So whatever decisions are made there --

When we make an interpretation of the regulation and then provide that information to the applicant or certified operation or the applicant --

MS. ROBINSON: Certifying agent.
MR. MATHEWS: -- and certifying agent, then their appeal in all the process gets up to the Administrator's level. No appeals ever come to me, only requests for interpretation.

MR. RIDDLE: I did have a question for Rick just on the Web site. It's still going to be the same address, even though it's redesigned?

MR. MATHEWS: Oh, yes. Yes.

MR. RIDDLE: Okay. I just wanted to make that clear, that it's not changing addresses. Okay.

MR. MATHEWS: No. It will be the same address.

The one thing that I was trying to remember a moment ago, I want to encourage all of you who will be staying in this area for the OTA program to come by the USDA booth.

We will have a double booth which includes the Natural Resources Conservation Service, the Foreign Agriculture Service, the crop insurance people, our people within Agricultural Marketing Services Transportation Offices that deal with farmers markets and direct marketing, as well as organics.

We will also be computerized within that booth. We plan to have three laptop computers operating there. And all of those people from the five different groups within the Department of Agriculture will be able to take you to
their Web sites and try to help you out with answering any of your questions. So I encourage you to stop by and see what we've got to offer.

MR. CARTER: Okay. Any other discussion or questions at this point?

(No response.)

MR. CARTER: Okay. Thank you.

Then, let's move on into the presentation of committee discussion items.

MR. LOCKERETZ: Excuse me, Dave. I thought you were asking were there further comments on the specific topics we just discussed, because I have a bigger question.

MR. CARTER: Just with the NOP update?

MR. LOCKERETZ: Yes. Were you moving off that now?

MR. CARTER: We're moving off of that. Yes.

MR. LOCKERETZ: Okay. I had a question, then.

MR. LOCKERETZ: It's been two years to the month that I've been on this Board, and I was thinking about, what has this Board achieved in those two years? And I came up with an extremely short list.

In fact, it didn't have anything on it except for putting items on the national lists, which is a special statutory responsibility given to the Board. The rest of
the Board's actions are all advisory.

And I would like the two of you to take the longer view, very long view, two years, and help me by telling me what the Board has done that has had a tangible specific effect on the organic situation in the United States.

MR. CARTER: You are still a teacher, aren't you?

MR. LOCKERETZ: And you can take as much time as you would like.

(General laughter.)

MR. MATHEWS: Well, Willie, I'm delighted to answer that question.

I think that Bob Anderson could give you an answer to that, Carolyn Brickey could give you an answer to that, and your Board peers could give you an answer to that, those that are still here and those that have gone off over the last two years.

And I, trying to speak on their behalf, would say that this Board has accomplished a lot. The Board has reviewed a lot of materials, it has weighed in on the proposed rule that was issued to -- which was the second proposal, and gave us additional comments which were very helpful in finalizing the rule.

You continue to raise issues and to make recommendations. And this office could not have gotten as
far as we have without the invaluable contribution of the National Organic Standards Board.

I understand your frustration. That doesn't mean that we're not also frustrated.

But if you look around this room, there are more than ten times the number of people in this room, probably even 20 times, what is on the NOP staff.

We're a group of eight people. We have to set priorities. And I can tell you that the number one priority of the National Organics Program is to have this program up and running on October 21, come Hell or high water.

There is absolutely going to be nothing that is going to stop me from achieving that goal.

And the first thing that we have to do to get there, Willie, is to get people accredited so that they can go out and get people certified so that those farmers who are working so hard in this industry, the people that you represent, can continue to sell their products as organic come October 21.

So that very small staff which is extremely dedicated to this extremely dedicated Board is working a lot of hours, and we have set our priorities.

And when we get everything done, I can assure you the organic industry is going to be more than satisfied.

MR. CARTER: Okay. Just to that issue, I mean,
discussion has been held over the last few weeks or several
weeks.

And one of the things that particularly Barbara
has been asked to do and is in the process of doing is
compiling sort of a list of the various NOSB recommendations
over the last couple of years and what was, then, the action
that grew out of that? Was there agreement by the NOP or
rejection or modification or whatever? So that we can use
that as a tool to sort of analyze how the decision-making
process is working here.

So this is going to be an ongoing discussion and
an ongoing process.

So with that, then, I am going to move into the
committee discussion items. And George, you're up first,
with the livestock.

MR. SIEMON: Okay. We're supposed to present
this for a vote here, as well as other discussions?

MR. CARTER: We're not going to put anything to a
vote today. We're just discussing. Yes.

MR. SIEMON: I know. [Inaudible].

MR. CARTER: You need to turn on your mic.

MR. SIEMON: Tab 5 in the book, the first
document is this document that has seven points that relate
to feed ingredients. This has been posted.

And I don't know the exact number of how many
comments we got, but we got a healthy amount of comments. Basically we've tried to take care of some of the loose ends involved in feed ingredients, and the first ones to do with synthetic vitamins and minerals.

We are recommending that we adopt the AAFCO list of minerals with few exceptions. And this again is just what I heard we did with the inerts, trying to speed up our process so that we get this all done by the October 21.

So the only ingredients that we took out were those that were identified as could be byproducts of livestock, feed byproducts. A million in poultry slaughtered byproducts were the only byproducts that were removed.

Some of the comments we got might point out some other ones that we need to remove. But at the very end of this, we recommended that there be an advisory panel developed to look through the lists to see if we had missed any. And we have also added that any natural forms are preferable to synthetic.

Are we just going to go through this, Dave?

MR. CARTER: Yes.

MR. SIEMON: Is that like enough for that one?

MR. CARTER: That's enough. Are there any questions?

MR. SIEMON: Does everybody see where that is?
MS. BURTON: I can't find it.

MR. SIEMON: Tab 5, your Tab 5. Okay. Well, this is --

MS. BURTON: I don't have a Tab 5.

MR. SIEMON: You don't have a Tab 5? I've got an extra one, if you want it.

MS. BURTON: Sure.

Eric, if you want to help me out through this, you helped develop all of this, you're sure welcome to.

MR. RIDDLE: Well, I just want to be clear that we're not going to be discussing the content of these recommendations now. We'll do that after they've been moved tomorrow. Is that true?

MR. SIEMON: This is the discussion time.

MR. CARTER: This is the time to discuss.

MR. SIEMON: As far as I know. So --

MR. RIDDLE: Give me a minute.

MR. CARTER: Okay. I'm wondering if somebody can turn off that mic there, because we're limited.

MR. SIEMON: I've looked through the comments, and I think there's definitely some more materials that need to be added to our exception lists. And we got -- you know, we're not technical enough to do that.

And I kind of like our recommendation because
that's putting it to NOP to look through and see the 
comments and maybe get some review to see if there's any 
other ones that need to be thrown out.

One of the ones we missed was this EDDI, which 
historically has not been allowed in organic production. So 
that's -- and OMRI's got a good list of things, nitrogen 
elements.

So I think we definitely need to go further with 
these exceptions. We as a committee didn't do that. We 
didn't have the technical basis to do that. We just took 
what the rule already said about the byproducts and 
identified what was a byproduct. And one of the comments 
even pointed a few me missed out.

So somewhere we need to get a technical thing to 
see where we're at on these exceptions that we're 
recommending.

MR. CARTER: Okay. Jim?

MR. RIDDLE: Yes. So we're on Number 1 of the 
recommendation of livestock feed ingredients. Is that 
right?

MR. SIEMON: That's right. But I would point out 
that the one in the book is a little different than the one 
that was posted. And I have to admit, Rick, I'm not sure 
when that change happened. But I'm reading it, and I like 
the changes.

Heritage Reporting Corporation
(202) 628-4888
So I don't know if that was something you all have done or, Eric, if that's something we did. I --

MR. SIDEMAN: I thought you did it on the call that I missed.

MR. SIEMON: No. I did not. This final recommendation is not one that I -- unless I just am forgetting that we modified our original one to this. I'm liking what I see.

MR. RIDDLE: Well, I haven't seen it.

MR. SIEMON: Yes. Well, it's in your book.

MR. RIDDLE: I read and reviewed the one that was posted.

MR. SIEMON: I know. Same here. I've got them all here.

MR. RIDDLE: And then I had some questions. I couldn't tell what the recommendation actually was in the one that was posted. So that was my main question, what --

MR. SIEMON: Well, the mission is to allow the AAFCO synthetic vitamins and minerals as a category with the exceptions of the byproducts, to allow those to be used. And I could go into AAFCO, what it is, but that's the basis of what we're doing here.

MR. CARTER: Okay. Rick?

MR. MATHEWS: We did not change in our office any of the recommendations.
So if there is a difference between what is on
the Web and what is in the book, I can't explain where that
comes from.

MR. SIEMON:  Jim, have you got the book?  You can
see it.

MR. RIDDLE:  I haven't looked in the book.

MR. SIEMON:  Yes.

MR. CARTER:  Okay.  Rose?

MS. KOENIG:  I just had a question I guess of
clarification.  So I don't understand what we're going to be
voting on.  I know we're not voting today.  But what you're
saying -- are you saying you just want to request to develop
a technical committee to --

MR. SIEMON:  No.  No.  This is allowing synthetic
vitamins and minerals to be used without going through the
technical process, just like we did with the Inert 4,
without the total list -- the total petition process.  This
is a group allowance of materials.

Right, Kim?  Isn't that what you call it?  Like
the inerts?  Yes.  Definitely.

We don't have time to go through this big, long
list between now and fall.  We're going to train wreck if we
don't allow this.  It's just simply going to happen.

So this is the process that we set out, and this
has been going on, this was done a year ago now almost, or
nine months ago that we've been starting this, because we
don't have time to look through all these materials.

And these are materials that the FDA did not
think that they -- if I understand this right -- had to go
through themselves until they fell down to this AAFCO
process, AAFCO.

MR. SIDEMAN: George.

MR. SIEMON: Eric?

MR. CARTER: Eric, can you come forward?

MR. SIDEMAN: Get a chair.

MR. CARTER: Yes. Because we need to get this in
the --

And while he's coming forward, George, I think
what would be helpful, though, is if you would give us a
preview of the motion that would probably be coming onto the
table tomorrow so we know exactly what part of this we would
be looking at.

MR. SIEMON: Well, I think that's going to be the
recommendation paragraph. It's pretty long, but what is in
your book as recommendation is what I think we're voting on.

MR. SIDEMAN: I just wanted to make a simple
addition to this. I think that in the OMRI comment, their
section where they say some of the AAFCO references that are
allowing synthetic nitrogen sources, I think those are
important enough to include in the motion you make tomorrow.
Those should have been added as examples of items that are on the AAFCO list that wouldn't be permitted, specifically prohibited.

MR. SIEMON: But this final one denotes that there is more work to be done and almost gives that --

MR. SIDEMAN: That's right. Yes. I recognize it denotes that. But I think those synthetic sources of nitrogen are important enough to include.

MS. KOENIG: Yes. I'm not again, you know, approving such a list. It's just -- can you get a copy? I mean, is it a short list? I would just like to see what I'm actually approving rather than just saying a list. I mean, you know --

MS. CAUGHLAN: Well, it's in the back of --

MS. KOENIG: Is it in the --

MS. CAUGHLAN: It's in your book.

MR. SIEMON: No.

MS. KOENIG: No, it isn't.

MR. SIEMON: No. It's not --

MS. CAUGHLAN: Are you not speaking about the AAFCO list? It's in mine.

MR. SIEMON: Your AAFCO list is in yours? I've got -- oh. Yes. There it is. Goldie is right. The very back --

MS. CAUGHLAN: It's in the back of your book, and
it's listed backwards. It goes from here backwards, but it's there.

MR. SIEMON: Yes. The very back of the book, about three pages --

MS. CAUGHLAN: In the back of that section --

MR. SIEMON: Yes.

MS. CAUGHLAN: -- the back of that tab.

MR. SIEMON: Yes.

MS. CAUGHLAN: Somehow it got copied upside down, but it's there.

MR. SIEMON: I mean, this is dealing with our whole issue of how our material process goes. If we were to look at all these materials --

MS. KOENIG: No. I just wanted clarification on what I was voting on.

MR. SIEMON: Okay.

MS. KOENIG: I am not arguing --

MR. SIEMON: No. It declares how big a point it is to go through these.

MS. CAUGHLAN: Did you find it, Rose?

MS. KOENIG: No. But I'll --

MR. SIEMON: Here it is.

MS. KOENIG: As long as I know it's in there.

MR. SIEMON: It's right there. It's at the very back, right before whatever the handwritten Number 17 is.
MR. CARTER: Okay, Jim?

MR. RIDDLE: Yes. I'd just like to follow up on Eric's comment.

And this was the thing that I had trouble with, also, is, clearly you're pulling out certain items from that list, the bone charcoal, bone phosphate, et cetera that you have listed in the draft recommendation, but then you have that statement, NOSB anticipates that additional synthetic and possibly natural sources of vitamins and minerals from the CFR and AAFCO publications may not meet OFPA's criteria for suitability in organic livestock production.

For example, Section Such-and-such of OFPA specifically prohibits urea in livestock feed and other sources of synthetic nitrogen.

I think there does need to be more work done to clearly identify the additional materials that are on those lists which are not compatible besides those bone ash, bone charcoal, et cetera.

MR. SIEMON: Wouldn't we need technical advice for that? I would need technical advice --

MR. RIDDLE: Yes. But otherwise --

MR. SIEMON: -- to make that recommendation.

MR. RIDDLE: Otherwise, the way I read the recommendation, we would be giving blanket approval --

MR. SIEMON: That's right.
MR. RIDDLE: -- to all these things, and then they could be used, when we know full well that some of them are inappropriate.

MR. SIEMON: Well, if we full well know that, then, let's except them. How do I full well know that without a TAP review?

The whole point is here we're going to let in 100 materials and possibly endanger letting five in that we don't want rather than not let in the 100. We've got a tricky situation here timewise. We can't do the 100 reviews by next July.

MR. CARTER: Okay. Kim?

MS. BURTON: George, what I'm hearing you say is something similar to what's in the processing, 205.605, under vitamins and minerals. There is a category for vitamins and minerals, and it references a CFR.

So I would suggest that, if that's what you're proposing, that you look at that. Let me see if I can find it in here.

MR. SIEMON: But this is in addition to CFR.

MS. BURTON: Well, or do something like that model.

MR. SIEMON: Well, I think it does. And of course, there's restrictions in the rule about the abuse of these substances for other purposes besides nutritional
balancing, you know, like growth promoters and that kind of thing. It does refer to that abuse.

        Jim, maybe what we should do, Jim and Eric, is, you know, maybe by September we can except some more out of here after more research.

        But I hate to not be sending the message forward to the public, industry what's going on with these materials.

        MR. CARTER: Well, I agree, George. And --

        MR. SIEMON: Kelly wants to be recognized.

        MR. CARTER: Well, just a second. I agree. I think that what we need to have, though, for tomorrow is that whatever motion comes out clearly delineates what's being adopted and what's being deferred until September.

        So, okay. A comment from the audience. Kelly, you need to come to the mic.

        MS. SHEA: Hi. I'm Kelly Shea. I thought it might be helpful for the Board if I could articulate how this recommendation came into being.

        One of the things we identified on the OTA Livestock Committee as a potential problem was that the fact that the national list under vitamins and minerals for livestock has an annotation that says, As FDA approved.

        And we contacted Dr. Price, who had worked on that portion of the rule, and he said that meant AAFCO and
FDA approved vitamins and minerals.

And we said, Well, the way the annotation is written, it just says FDA. And AAFCO does a lot of the work of approving vitamins and minerals for livestock. And in a lot states, those vitamins and minerals don't need to then go through FDA. The state has requirements in place to automatically adopt AAFCO rulings and language.

So what happens when you limit it to FDA approved is you leave out lots of vitamins and minerals that are completely safe and compatible with an organic system, but they're AAFCO approved under the radar of FDA, and they don't bother to add them all to a CFR. Does that make sense?

MR. SIEMON: Yes. In order for it to be on AAFCO, the FDA has to elect to not put it on the CFR, and they don't raise any objections to it?

MS. SHEA: Yes. They really don't --

MR. SIEMON: So it's going through a certain screen --

MS. SHEA: Right.

MR. SIEMON: -- before it goes to AAFCO?

MS. SHEA: AAFCO is regarded as the guardians of the gate when it comes to livestock vitamins and minerals. So though there are a few things like the mammalian slaughter byproducts and some urea products that
wouldn't be allowed, in general the AAFCO list of vitamins and minerals is fairly innocuous. Emily Brown Rosen is also quite familiar with it.

And you know, maybe you could continue with the language that says, As things are further identified --

MR. SIEMON: Well, that's what it says.

MS. SHEA: -- that are problems, they can be added. But to hold this up while you identify all those I think would be a problem for the organic livestock industry.

Thank you.

MR. CARTER: Okay. Thank you, Kelly.

MS. ROSEN: I just wanted to point something out.

MR. CARTER: Yes. Emily, okay. Yes.

MS. ROSEN: I didn't quite finish handing these all out to everybody, but --

MR. CARTER: But any comment, if you can make it from the mic there, so we can --

MS. ROSEN: I was just going to say, I did a comparison of all the minerals and vitamins that are allowed under 21 CFR or are allowed under AAFCO. It's in a table in the back of the new generic list. Now you can see side by side all the materials that you're talking about. I don't think it is in your meeting book.

So it's a very large list. And our opinion was that 21 CFR provides materials in all the major nutrient
categories. Why go beyond that when you haven't done a thorough TAP review yet on it? So I'll finish handing these out.

MR. CARTER: Okay. Thank you, Emily.

So just to move on beyond this, then, just to know tomorrow what we're going to be voting on and what's going to be moved until September.

MR. SIEMON: Just so I understand, though, it's all right, though, if you have this two-paragraph-long paragraph thing we're voting on?

MR. CARTER: You can do that.

MR. SIEMON: Okay. Fine.

MR. CARTER: You can --

MR. SIEMON: Well, it's what's in the book, so --

MR. CARTER: -- make a motion to adopt the Constitution of the United States.

MR. SIEMON: All right. Okay. We've got --

MR. CARTER: Katherine has a point.

MS. BENHAM: I'm just asking, what are we going to vote on?

MR. SIEMON: Right now we're voting on what the recommendation is under this I of this document.

MR. CARTER: Yes. We're not voting on anything right now.

MR. SIEMON: Right now we're just discussing it.
MR. CARTER: Yes. We're just discussing what will be brought forward for a vote tomorrow. So, Rose, you had comment?

MS. KOENIG: I just wanted -- I think it would be helpful, George, tomorrow if you can specifically -- you know, if it's the list plus your exceptions, then, put that in the form of the motion.

MR. SIEMON: Well, the exceptions right now aren't here.

MS. KOENIG: But you said you had some comments that you wanted to go through.

MR. SIEMON: Well, I think the comments that we got in recommended some other ones to take away, and I agree with that.

Now, do I just do that by my opinion, or this calls for a TAP review of those ones? That's the question. I'd be glad to throw EDDI in here and a few nitrogens. I just didn't know how technical a process we were going through here.

MS. KOENIG: Well, I just think that it's better -- if there's questions on ones that we should exclude, we should not be voting for them within a group and then have to later prohibit them out.

MR. CARTER: Kim?

MS. BURTON: It appears to me that the way we
should do this is -- you're actually making a recommendation
to change the annotation under vitamins and livestock. And
that should be consistent with how the other committees have
been doing it, and that is to either submit a petition or
submit a recommendation to this Board.

Now, if you're going to make a motion tomorrow, I
would suggest you look at the annotation that's currently
under the livestock national list and try to suggest a
change to that annotation.

MR. CARTER: Okay.

MR. SIEMON: All right. Well, these are all
thorny issues here. The rest of them are just as --

MR. CARTER: Jim?

MR. RIDDLE: Yes. I just wanted to echo what Kim
said and to add, it also is the listing for trace minerals.

MR. CARTER: Okay. George?

MR. SIEMON: Okay. Well, the next one is harder
yet probably. So they're all the same, trying to deal with
all these livestock issues that are out there. And that's
about incidental additives in livestock, feed additives and
supplements.

And again, there's -- we're finding that there's
what are called incidentals which have no technical or
functional effect on the feed and are exempted from being
included in the feed ingredients list.
And I mean, this is unfortunate, but there's a whole host of things here. And we just don't have the infrastructure to go through every ingredient in every substrate between now and October 21, was the concern. These are things that are being used in the industry right now and the carriers.

So again we're saying within the restrictions of the Section 237 about feed that -- I'll just read the punchline here -- that we not establish requirements for substances used as incidental additives in feedstock feed ingredients.

So this is a barrier in a lot of ways when it comes to the GMO process, and that's a lot of the comments that we got back, is, where does that fit into here? That's one of the bigger concerns.

But these are very trace amounts of like a yeast or a probiotic product or something where it's a very small amount of agricultural carriers in there.

So it's definitely a problematic area that we're trying to find a solution to so we can keep going as an industry here.

MR. HOLBROOK: Okay. So the recommendation that will be coming forward tomorrow from livestock --

MR. SIEMON: Is to not establish --

MR. HOLBROOK: -- is that the NOSB recommends
that the NOP not establish requirements for substances used
as incidental additives in livestock feed ingredients?

MR. SIEMON: Uh-huh.

MR. CARTER: Okay.

MR. SIEMON: And if we don't do that, then we
won't have -- we'll be saying none of them are allowed
October 21. That's the alternative.

MR. CARTER: Okay.

MS. ROBINSON: George, are you saying that --

MR. CARTER: Go ahead, Barbara.

MS. ROBINSON: Are you saying that not only no
recommendations --

MR. CARTER: To the mic.

MS. ROBINSON: Are you saying no
recommendations --

MR. CARTER: And turn it on.

(General laughter.)

MS. ROBINSON: Okay. Let's try this again. Are
you saying that the Board should not put any limits either
on the amount of those materials in a feed or on whether or
not they themselves have to be sourced to some organic
origin?

MR. SIEMON: Well, yes is the answer, but it's
all within the constrict of this 205.237 which is very
restrictive for what it's used for, and these are feed
additives, no functional, they're incidental additives in livestock feed ingredients. So if you read through there, they're not going to be able to feed it to get around the organic feed thing. That's not the purpose of this.

MS. ROBINSON: Well, I understand that. Let me just play Devil's advocate. I mean, where do you draw the line, then, on what is going to be called organic feed?

MR. SIEMON: Well, organic feed is organic feed. These are additives. Feed is feed, these are additives.

MS. ROBINSON: But they could comprise 5 percent?

MR. SIEMON: Not the incidentals that we're talking about. Oyster shells can be 5 percent. Yes. But incidentals are not, that's not what -- carriers are not what we're referring to.

By the way, you know, in this kind of thing, where there are people starting to carry organic carriers in their feed, you know, for the mineral bases. There's a lot of mineral packs now. But this is kind of a --

And Eric, you're welcome to help me out again, because Mark, Pete, and Eric did a lot of this. But this is a real issue, how we're going to void the many things. I don't know if anybody else has anything.

You want to read 205.237. It limits the amount of use for their product.

Eric, give me other examples besides for the
mineral based carriers. I thought we --

MR. SIDEMAN: I was going to make a comment on the incidentals. That one was also changed from the last time I saw it. And the way it's written now, carriers are going to have to meet the standards for feed if they're on the label. And we've been instructed by FDA that the carriers will be on the label.

But there's some incidental that are added to these feed additives and supplements that would not have to, and those are the ones we're not going to be setting standards for. And there is a problem that you see in the OMRI comments on those, too, that's not addressed.

I'm not sure what my opinion is about it. But there may be some oils or corn starch that are incidentals, not on the label, and with this recommendation, they would be allowed.

MR. SIEMON: Okay. I see what Eric says here. They have split up incidentals and carriers at this time. Originally it was together.

MR. SIDEMAN: Right.

MR. SIEMON: So there are two different standards. Incidentals is what we're not establishing recommendations for. And carriers would have to be identified on the ingredient list so they must be reviewed.

MR. SIDEMAN: That's right. Because when we
first started writing this, we didn't think the carriers were on the ingredient list, but we have been instructed that the carriers would be if they were agricultural products.

MR. SIEMON: So really it's not incidentals, it's incidentals and carriers, and there's two different recommendations here.

MR. SIDEMAN: Right.

MR. CARTER: Okay. Jim?

MR. RIDDLE: Yes. That helps answer the big question I had, because it seemed that these contradicted one another, that the first part saying NOP would not establish requirements --

MR. SIDEMAN: Right. I hear you.

MR. RIDDLE: -- for the substances, and then, in the middle of the paragraph, NOSB recommends that carriers added to a feed ration and therefore identified in the green list must be reviewed under the requirements of 205.237. And that part I supported.

The other part of opening up this totally unregulated allowance for products of excluded methods to be added to livestock feed with no set restrictions on either their composition, quantity, or source, I have real problems with not being reviewed in the process.

MR. SIEMON: Well, as long as you know what the

Heritage Reporting Corporation
(202) 628-4888
alternative is.

MR. RIDDLE: Well, the alternative is to set some limits.

MR. SIEMON: That's what 237 does.

MR. RIDDLE: Okay. So put both incidentals and carriers under 237, that would do it?

MS. GOLDBURG: The language in the recommendation just refers to carriers.

MR. SIEMON: No. There's two -- I didn't catch it at first, because they did change it. The first sentence is about incidentals, the second sentence is about carriers.

MS. GOLDBURG: Yes. But --

MR. SIEMON: And carriers relates to 237. And what Jim just said is you've got to have 237 for incidentals, as well.

MS. GOLDBURG: Yes. Exactly.

MR. SIEMON: I agree with that wholeheartedly. This is all within the additives section, you know, not a growth promoter, not -- you know, this is all --

MR. CARTER: Okay.

MR. SIEMON: Those are the two hardest ones.

MR. CARTER: Do you have follow-up, Becky? You look --

MS. GOLDBURG: Yes. I also wanted to make sure that the language you have here is the definition of
incidentals in 21 CFR. Does FDA actually have an explicit
definition? I guess they must in order to exempt them
from --

MR. CARTER: Emily, can you answer that? Up to
the mic. We'll get everybody trained here before too long.

MS. ROSEN: Yes. I believe it's incidental.
It's the same as in FDA for food, incidental additives, no
technical function or effect. That's where that came from.
I believe they filed a comment on the first draft, as well.

But I think this is improved that it makes a
distinction between carriers and incidentals, but it's not
totally clear here, the GMO issue on the incidentals, and
also, further down we're talking about preservatives not
being allowed unless they're reviewed.

Quite commonly we see that vitamins have
preservatives in them. So where does that fall? That would
be considered incidental by FDA. So does this mean, you
know, vitamins with preservatives or othoxyquin [phonetic]
are allowed now in livestock feed? We need to absolutely
know or else we can't review these materials.

MR. CARTER: Carolyn, did you have --

MS. BRICKEY: I would just suggest, Mr. Chairman,
that this whole topic is enormously complicated, and we are
going more and more bogged down as we move on here.

So might it be a good idea to pass on this and
come back to it at a later point when you feel like you really know what you want to do with it?

You may want to pass on it till September. I hate to be pessimistic here, but this is really difficult, and you want to make sure you get it right.

MR. SIEMON: Okay. The next one is about preservatives. And again, part of what --

MR. CARTER: Wait a second.

MR. SIEMON: Okay. Willie.

MR. CARTER: With that being said, Willie has a question.

MR. LOCKERETZ: Yes. If this is essentially adopted, whether in the September or this meeting, would it go into the interim final rule process or would it be a classical final rule process?

MR. SIEMON: Classical what?

MR. LOCKERETZ: Final rule process. In other words, if we want to go ahead with this, which process governs it? This is a question for Barbara or Rick.

Could this be included in that proposed interim final, or is it different from that?

MR. MATHEWS: Willie, the rule that we're planning to put out in the summer will be interim final, and we will also pursue interim final for the materials that are
approved by the Board at its September meeting.

MR. CARTER: Go ahead.

MR. SIDEMAN: I'd just like to make a comment in support of why the Livestock Committee brought this forward, because it may not be clear.

These materials we're talking about are not on the label, and so it's very hard for certifiers to know which products are permitted and which are not. They can look at the label and see that there may be corn or soy, and definitely those have to be organic.

But the preservatives and the carriers and the vitamins and the minerals may not be listed, and that's why we've come forth with these recommendations.

So there are problems with these recommendations, but I think they're important to stick with and work out the problems and get them passed as soon as we can.

MR. CARTER: Okay. Thank you.

Okay. George.

MR. SIEMON: All right. Again, part of what we've done on the Livestock Committee is just trying to clarify some of the gray areas.

And so the next one we dealt with was preservatives in formulated feed and fee ingredients. And our recommendation is that basically they have to be looked at on a case by case basis, which would be a regular TAP
review. So I'm not sure we need to have a vote on that except for just have it for the public record.

MR. SIDEMAN: But it could pass.

MR. SIEMON: But it could pass. Yes. I could get one through, maybe.

So the next one is we just -- and this is very related to the first one -- is we just pulled out of the AAFCO the definition of mammalian and poultry slaughter byproducts, and we just tried to list those out of the AAFCO. And we did actually get some more comments, and some we possibly missed.

So I think there's not even a recommendation there. That was more just us doing some leg work, as far as I can tell, for NOP. So I don't see -- see, I did all my notes on the other copy I had, and then I get this book and it had different ones in it.

So the enzymes is the next one. And these are just all the many things that are in livestock production that haven't been dealt with.

Basically it's declaring that enzymes are a natural feed additive provided they are not derived from excluded materials, that they're an allowed natural additive and did not consider the substrate material used to produce the enzymes as part of the feed ingredient. So this is a declaration of it being a natural, basically, for our
committee.

Any questions on that, enzymes?

(No response.)

MR. SIEMON: The next is, in '95 we recommended
the addition of probiotics to livestock feed as non-
synthetic. Actually, the word probiotic is not the
commercial or legal word that's used.

And so we're just recognizing that direct fed
microorganisms is the word that's used and that it is a
natural and again not from excluded methods, so that we're
just clarifying a previous decision, because probiotics are
not actually the legal term that's used.

Number 7 is a much different one. And we're
trying -- basically here this is about materials that have
already gone through the process with the process for human
products, for finished retail products, that those same
ingredients should be allowed to be used in livestock
products, livestock feed. This is a crossover, things are
already done.

Now, this is specifically for processed foods.
They can be used in livestock fee.

The same question comes up with some of the crop
fertilizers. This is very different. This has only dealt
with that.

But there are going to be some crossover
questions that come up about livestock, minerals for livestock feed. But that's not what this is about. This is strictly ingredients for processed food are automatically allowed for livestock feed.

And that's the end of that complicated document, seven different points.

I don't know. I don't have the facts in front of me on how many comments we got on that, but that's been out on the Web for quite a while, and we got pretty good comments, I think, on it, pretty good support.

MR. CARTER: Kim?

MR. SIEMON: Kim has got a question.

MS. BURTON: A comment on Number 7. We have discussed in past meetings of allowing anything used in -- under 205.605, allow for processing to be allowed for feed in livestock.

And it appears to me if that recommendation does go forward that you're looking at your enzyme recommendation would be under that list. So enzymes are allowed in processing under some certain restrictions.

So I support the allowance of anything that's been approved for processing to be allowed for feed because if you're going to allow it for humans, you should be allowing it for livestock.

But you might want to just do your homework on
enzymes, and there might be some other things also applicable.

MR. CARTER: Okay.

MR. SIEMON: Okay. Moving on, the next thing on the list was to talk about the dairy replacement animals.

I don't know procedural, Rick, what we're going to do. That was never posted. I'm eager to send a message to the community so they know what the standard is.

But are we going to vote on this this week, or is the fact that it never got posted restricting us from going forward?

MR. MATHEWS: Well, the thing that disturbs me is that back on March 27 I sent out an email to you with a CC to the chair indicating that the recommendation was not in a suitable form and failed to address some issues. And I note that those issues still are not addressed. I think that the committee needs to go back to the drawing board and address the issues that are raised.

MR. SIEMON: Okay. So that's --

MR. RIDDLE: What were some of those issues? Rick, what were the main issues?

MR. SIEMON: I guess that slipped by me. I don't know.

MR. MATHEWS: The issues involve the fact that the document that was submitted never clearly states what is
the problem, who is it a problem for, what are you trying to resolve?

And the recommendation itself, it doesn't address how the proposal would change Section 205.236(a)(2). The new proposed section is in direct conflict with that section.

So we can't have one regulation that says one thing, and then you go down into the body and have the regulation say something else. So that was the primary concern to me.

Your recommendation, also, there's already a 236(b)(1) and (2). It's not clear whether you are doing away with existing 236(b)(1) and (2) through this recommendation. You don't ever mention what is going to happen to that section.

And I've got lots of comments on it. So we can go through those if you would like.

MR. SIEMON: Well, first off, the NOP staff wrote all these numbers. I didn't go through that. So I'd have to go through to see what the complication is.

But certainly we all know there's a lot of questions about what is the intent, because there is a conflict some say between the law and the preamble and how this all works together.

We tried to take all those issues and come up

Heritage Reporting Corporation
(202) 628-4888
with what we thought covered all those. So I don't know what -- we're trying to clarify it.

Arthur?

MR. CARTER: Let me call on Arthur. And again, you've got to come to the mic.

MR. NEAL: I've just got a question. You keep saying NOP staff, and I know that there's only a handful of people on our staff who are, you know, assisting the Board with recommendations and reviewing the work.

MR. SIEMON: Right.

MR. NEAL: And I know that I haven't looked at it, and I don't think that Keith or Bob has looked at it, either.

One of the problems that I continue to see in the recommendations, that the work -- say, for instance, if the recommendation is moved forward, the work that really would have to be done would have to be done by the staff.

Because what Richard was saying, the problem is not stated; it's not saying how the changes recommended would affect other sections in the rule; then, it's not saying who the changes would affect, you know, what's the economic impact, things like that.

And the question keeps being raised, What happens to the recommendations?

And one of the questions I have is, one, who is

Heritage Reporting Corporation
(202) 628-4888
the NOP staff that wrote the recommendation?

MR. SIEMON: Mark Keating wrote this whole thing.

MR. MATHEWS: Let me interject at this point, George, in La Crosse, I specifically told this Board that Mark King was not -- I mean, Mark Keating was not to be writing your work. I repeated that in October, he was not to be doing your work.

It is quite inappropriate for this Board to have a staff member write its recommendation and then turn around and send it back to the Secretary of Agriculture for implementation. We are not going to do that.

MR. SIEMON: But Arthur just said that the staff needs to be the one to finalize the writing.

MR. MATHEWS: We have to finalize the writing, but the recommendation has to be your recommendation, not our recommendation.

MR. SIEMON: Well, this is our recommendation, clearly.

MR. MATHEWS: But you said that we wrote it.

MR. SIEMON: He wrote the front part. Yes. Explaining what the problem was.

MR. CARTER: Okay. Let's --

MS. BRICKEY: I think, Rick, I assume it's the same process that we went through on some of the writings in the Crop Committee, and Mark Keating had also worked with
our committee.

The process had gone I thought fairly well with Mark. We discussed the issues. He would give us points of clarification in terms of the rule. A lot of times we just did not know I think some of the functionings of how those things would be implemented on a programmatic level versus us as NOSB Board members.

But typically we would send something, you know, like I sent the transplant writing that I had compiled after a committee conference call, I would send a copy to usually Owusu or perhaps the whole committee plus to Mark Keating.

Mark then would take it and put it within sometimes the rule language, which personally I'm just ignorant to in terms of how to write at times.

So it's not that he altered the ideas or the forms of what the committee suggested. Instead he put it in a workable form I think that you as a Government program can then adapt into your language of your rule.

MR. MATHEWS: Can I --

MR. SIEMON: Okay. Well, then, I guess I need to be clear. You want to know how -- why the need for this. Is that what I heard, why the need?

MR. MATHEWS: What we want to know is, what is the problem, specific what is the problem? Who is it a problem for? How does this recommendation resolve the
problem? What's the economic impact? I mean, who does it impact besides the person you're trying to help, and what is the impact on those people?

And you really have to -- what you're doing is, you're writing a section that contradicts a previous section. And you have to tell us what you want to do with that previous section.

Right now you're not telling us what to do with the other section. You're not telling us what to do with the sections that you have identified as new sections when there are already existing sections.

MR. SIEMON: Okay. Well, I guess we're not going to be voting on it this week, so we'll just have to go back to the drawing board.

MR. CARTER: Okay. Kim?

MR. SIEMON: No. I'm not --

MS. BURTON: I just had one comment.

MS. BURTON: George, you were asking about the process for posting stuff on the Web and getting public comments. I'm surprised Jim didn't chime up here.

I think it's very important that we be consistent again with our -- if we have a recommendation and it is voted on by this Board to go forward, it has to be posted on that Web site for public comment so that everybody has a
fair share.

And we're going to go through this round and round, whether it's materials or policy or procedures or any kind of recommendation. I think we have to have the public comment.

MR. SIEMON: We -- but let's get real, though, since I'm not doing real well here. What do we have to legally do?

Because I've got a whole world of farmers out there who want answers, and if we're not dealing with anything in September and we're not going to deal with this issue, you're telling the organic dairy community you are answerless besides for what the rule presently says, and everybody is confused by that. And that's the way it is.

MR. MATHEWS: There's nothing to stop you from meeting tonight as a committee and working on it so that you can bring something back to the Board tomorrow that addresses the concerns.

MR. SIEMON: But I was talking about the public -- going on the Web. I was responding to Kim there. Because we've got to get answers out there, you all. The time has come.

MR. CARTER: Okay. Rose?

MR. SIEMON: I'm ready to go on.

MS. KOENIG: I just had a question in terms of
both Crops and Livestock in terms of NOP staff, because this issue may come up, you know, in further committee reports and suggestions and motions and such.

Who will now be the NOP staff person for those committees that we will be using as a contact? Because it's really going to affect how this stuff is going to flow since Mark Keating is not available.

MR. CARTER: Which I think is something that can be determined off line. But that's an issue that needs to be addressed.

Willie? And then let's move on.

MR. LOCKERETZ: Going back to Rick's point about the process by which recommendations get accepted and passed up, did I hear you say that when we submit a recommendation we should include an economic analysis of who gets hurt and who benefits?

MR. MATHEWS: We've been saying for at least a year now that the problem with writing rule-making dockets is that when we just get a short recommendation that doesn't tell us who it's a problem for, who it helps, who it disadvantages, what it is that we're really trying to do, if we don't have those pieces of information, we have to go out and get that information.

For example, your recommendation for sawdust to be organic for mushrooms, it just said you've got to have

Heritage Reporting Corporation
(202) 628-4888
organic sawdust.

In order to have a rule published in the Federal Register, we have to address the economic impact of such a narrow interpretation on sawdust.

So we, NOP, has had to go out to the mushroom industry and gather information that in my opinion this Board should have already been looking into.

MR. CARTER: Okay. Let's not talk about mushrooms here with livestock -- and Willie, hang on -- I mean, because part of this and part of the issue is, and one of the reasons you like to have it posted on the Web, is that's the way that we get feedback as far as the impact.

Because we cannot make unilateral assessments as a volunteer board here knowing full well what the impacts. And that's one of the reasons you get it on the Web, because it gives you that.

Kim? And then --

MS. BURTON: Just one final comment. It seems like our train wreck is coming. A comment: As handlers, we have until October 21 to come in compliance with this rule. And we do have a meeting coming up in September.

And George, I think like to Rick, if we can have a draft that we can work with and it's posted on the Web, if I were a livestock handler, I would say, Look, this is what the NOSB has recommended. We have 17 livestock materials
that are no different than this recommendation.

You have to challenge and go forth to your certifiers and say, These issues are coming up. So --

MR. SIEMON: We did put this forward for posting I think in January or February, so, you know, we've been trying. So we'll have to go back and see if we can do better.

Let's do the access to outdoors for poultry, since we're on such a winning streak here.

(General laughter.)

MR. SIEMON: All the easy ones. Some of these things, you know, whether right or wrong, we were asked to try to clarify what the rule said. And I'm a little confused where these clarifications fit into the actual rule process.

So here it says in the rule access to outdoors, but there's a lot of people who are starting to interpret that that didn't mean that the birds actually had to step outside of the building and be outdoors.

So we were asked to try to clarify that, and I don't know that we did a very good job or not. But we've written up a document that has just a farm plan basis for access to outdoors.

We tried to take what I would call the middle road, still requiring -- and we wrote it strictly for
poultry, since that seemed to be where the controversy was, to try to clarify that.

But we wrote a farm plan approach, like we did with pasture, where the birds have to be outdoors except for temporary exceptions.

Now, we did not require a pasture. And so today you have heard in our presentations so far one side doesn't want any access to the outdoors, the other side wants pasture. Well, we probably did the middle road. Right or wrong, that's what we tried to do.

So we've got a fairly -- some say it's too loose, some say it's wrong. But if you look at what we did here, it's basically a farm plan system.

And there's no -- the way I read this, that means if you're in the poultry business, you have to have an outdoor plan. You may have temporary reasons to pull back inside, but you have to have an outdoor plan, and you have to have the capability to be outdoors.

So this has been posted. And we have got quite a few comments. And recently there's been some efforts and there's a lot of comments coming in now from consumers.

Okay. That's all I have on vote.

MR. CARTER: Just as clarification, the item that will be coming up, then, for action tomorrow is those items that are 1 and 2 under Recommended Standards?
MR. SIEMON:  Exactly.

MR. CARTER:  Okay.

MR. SIEMON:  Everything else is just trying to discuss the issue.

MR. BANDELE:  I have a question, George. On the second point, where you're saying, you've got, one area for justification would be the stage a production up to five weeks of age.

And I'm not a poultry person, but it's my understanding that a lot of times they are up for sale after, what, six weeks or seven weeks. So --

MR. SIEMON:  Yes.

MR. BANDELE:  -- just give me your take on that.

MR. SIEMON:  Well, I like what the OGA has recommended, and they related it to the physiology of the bird, you know -- I'm just trying to find it -- just about the bird feathering. So --

VOICE:  Sufficient feathering.

MR. SIEMON:  Sufficient feathering. I think that five weeks is too long, personally. But there was concern about turkeys, and we were trying to write one phrase for all. So it was -- that was kind of the happy compromise we hit.

I like the physiological way to go at it, though. I think it's much better, because it deals with that.
Because you're already on a farm plan basis.

MR. CARTER: Okay. Rose?

MS. KOENIG: I just have a question of clarification for the vote tomorrow.

MR. CARTER: Yes.

MS. KOENIG: On these recommended standards, am I correct to assume that we're not voting for a change in the rule? These are statements of clarification that are not rule changes? That the rule stays as it exists, but these --

MR. CARTER: The rule is the rule. These are the interpretations.

MS. KOENIG: And so these are just statements of clarification?

MR. CARTER: Yes. And Rick has some issues that he wants to bring up either now, or we can discuss it afterwards. So --

MR. MATHEWS: That's up to you and George.

But --

MR. SIEMON: It sounds like we need to have a little meeting to --

MR. CARTER: Yes.

MR. MATHEWS: Yes.

MR. SIEMON: -- get my marching orders.

MR. CARTER: I think that would be helpful.
Okay. Jim, and then Willie.

MR. RIDDLE: Yes. When you have that meeting, I don't know if you're going to open up the language in the benefits section.

But I found the last sentence of that second paragraph, "There are concerns with increased disease exposure for poultry, but many organic poultry producers feel that this is not the case and in fact feel that there are health benefits."

And I find that to be a bit weak language. And we received some testimony today from the Humane Society that I felt really has some more science-based benefits that I'd like to be injected or considered by the committee to strengthen that benefits section of the rationale.

MR. SIEMON: Well, we didn't have any science, so I hated to put any, you know, like facts in there without true science behind it. So I was honest, you know.

MR. RIDDLE: But we've received some, and I just wanted to point that out.

MR. SIEMON: Okay.

MR. CARTER: Okay. Rose?

MS. KOENIG: Again I would just like to state that -- well, I would like to recommend I guess that, George, you get us to vote on what your recommended clarification is.
We're not going to be -- you know, I think that the intent in that verbiage is --

MR. SIEMON: Yes.

MS. KOENIG: -- fine in terms of our own personal use. But it's going to be hard to get votes on some of those opinionated type things, so --

MR. SIEMON: Just the recommended standards is all the vote is on all these.

We were asked to clarify it and produce this extra wording. But the recommended standards is all we're voting on.

MR. CARTER: Okay.

MR. SIEMON: Okay.

MR. CARTER: Willie?

MR. SIEMON: Willie?

MR. LOCKERETZ: This is the second recommendation in a class that may include more members where the animals have to be.

The first member recommendation in this class was access to pasture for ruminants, which was passed, if I remember correctly, in October of last year, about seven months ago. So my question is, what has happened to that recommendation?

MR. SIEMON: How are these going to be used?

MR. LOCKERETZ: Just what has happened? There
was a recommendation seven months ago by the Board on pasture which is analogous to this one. What has happened to it?

MR. CARTER: Okay. Before we get to that, let's just relate to the poultry, and then we'll close with that discussion on this.

Okay. Any other questions on this particular one?

MR. LOCKERETZ: Yes. So Rick, does this look like the type of recommendation in form and in what it covers, leaving aside whether you approve the content or not, in form and coverage, is this the kind of recommendation that you want to get from us so that you can act on it or not act on it as you choose?

MR. MATTHEWS: Even this document -- to an extent.

Yes, Willie.

But this document does not answer the real problem of, what is a suitable area for meeting the access to outdoors requirements?

MR. SIEMON: [Inaudible] did discuss the whole square foot outside thing. And originally the instructions was to stay away from specifics, and that's really not -- I shouldn't say instructions, that's not correct.

That was the whole leaning for the last ten years, is not get down to square feet. And at the end of
this we kind of started going back to that. Otherwise, you have all the other guidelines in the rule about the environmental care of the land. And when you tie it all together, there is a fairly clear picture of what you're after.

MR. MATHEWS: I think that what we ought to do is to take this into a committee meeting, because, quite frankly, the very beginning of my problem with this proposed language is that it does only two things: One, it adds the word, poultry; second, it says up to five weeks. Otherwise, everything in that recommendation is already in the standards. In fact, the preamble is real clear that poultry are included in the livestock issue.

And we need to get, you know, together and discuss this later.

MR. CARTER: Okay. So we will sit down after the meeting tonight with the Livestock and talk about procedure on that.

The question is still on the table. Willie had asked the question on the status of the recommendation on outdoors for ruminants --

VOICES: Pasture.

MR. CARTER: -- pasture -- excuse me -- pasture for ruminants.

MR. LOCKERETZ: We'll vote on more specification...
and more interpretation and more details to interpret what's
already in the rule. It wasn't challenging what the rule
was putting out, just some of the details.

VOICE: They're clarifications.

MR. MATHEWS: Willie, we'll post that onto the
Web as a clarifying document for you. Okay?

MR. LOCKERETZ: What is the status of a
clarifying document as far as certifiers?

MR. MATHEWS: It's a recommendation.

MR. LOCKERETZ: Not a requirement?

MR. MATHEWS: What you -- you did not recommend
that we change the regulations. You recommended how the
regulation is interpreted. We can provide that to the
certifying agents as guidance.

MR. LOCKERETZ: Does that mean that --

MR. CARTER: Okay. Willie, just --

MR. LOCKERETZ: Does that mean the NOP accepts
this pasture recommendation, if they call it a clarifying
whatever it was?

MR. MATHEWS: I'd have to go back and reread it.

MR. SIEMON: And this does go back to when -- at
one time the goal was to develop a manual, and this is the
kind of work that we were going towards. And that seems to
be not the process we're in now.

So some of this is, we were just trying to help
get a clarification of what -- like the pasture is real
clear. It just says very little in there, and we were
trying to bring more to it.

MR. LOCKERETZ: I still haven't heard the answer
to my question, which is, what happened to that
recommendation?

MR. CARTER: The answer is that it will be
posted. It's still being considered.

MR. LOCKERETZ: Being considered or posted as
a --

MR. SIEMON: He just said he posted it, but he
wants to read it, I think is what I heard.

MR. LOCKERETZ: Posted for informational purposes
or posted for comment, which we've got plenty of already, or
posted --

MR. SIEMON: We've already got comment.

MR. CARTER: Okay. Posted for information and
guidance, Willie. I mean, you can interpret in the answer
here --

MR. LOCKERETZ: Well, the recommendation was a
requirement for pasture. It wasn't a suggestion, it
wasn't --

MR. CARTER: That's in the rule, Willie.

We're going to move on to --

MR. SIEMON: Okay. That's all that we have for
vote. We do have a whole material process we're going through now identifying prioritization for materials to be reviewed, livestock materials reviewed, by the September meeting.

And we are working on something to do with the same issue with medications like we have in the feed additives about the excipients and the incidentals and trying to see if there's a way to deal with that as a category, as well.

So that's all we have on livestock.

MR. CARTER: Okay. Discussion on the report. Jim?

MR. RIDDLE: Yes. Just a suggestion, Mr. Chair. I'd like to get this in the minutes, to add to our work order for the Policy Task Force, is to have some guidance or guidelines on how to draft a recommendation to submit a recommendation in the form/format that is useful to the program, to include an introduction, the rationale, some projected impacts, and the actual draft language itself.

So maybe Goldie, if you can add that to the list you were keeping yesterday that we're going to come back to. And then we can work with the staff on some guidance for drafting recommendations.

MR. MATHEWS: Jim --

MR. CARTER: Okay.
MR. MATHEWS: Jim, this is exactly what we were talking about in our meeting yesterday on the policy manual, that Barbara and I both said that following this meeting we will provide you with a document for inclusion into the policy manual that addresses how to put forth and what should be in the recommendation to the Secretary.

MR. CARTER: Okay.

MR. RIDDLE: So it's in the minutes now.

MR. CARTER: Right.

MR. RIDDLE: Okay.

MR. CARTER: All right. Anything else on the Livestock Committee?

(No response.)

MR. CARTER: Okay. We're going to take a brief break here while Kim sets up for the materials. So this is ten minutes.

(Whereupon, a short recess was taken.)

MS. BURTON: For those of you who are new, who have never seen this, it should be very informative, for those people who have been to the NOSB meetings in the past. This flow chart represents the materials review process that we go through with petitions all the way through completion of a TAP review.

It's a document that we put together to help keep us kind of on time and in line with what responsibilities
each person or each committee has along the review process line.

    Petitions are received by the NOP office. They are reviewed to make sure that they are complete and that all of the criteria and questions are answered that are required according to the petition review process.

    The NOP office then FedEx's a copy to me, the Chair of the Materials Committee, where I take a look at it and somewhat put it through the same process that the NOP staff has done. Does it meet all the criteria? Does it meet the petition requirements?

    From there I take that copy and run to Kinko's very fast and get a couple of additional copies made. Then I FedEx a copy of that to the chair of each committee.

    So within three weeks of a petition being received, the committee chair, along with the Materials chair and the NOP office, has a copy of the petition that has been submitted by the petitioners.

    If for some reason your petition is not complete, the NOP office will send it back to you with a letter of incomplete and tell you the areas that you have to address to resubmit it.

    As soon as the petition is also received, within 30 days they should -- they have a site on their Web site that it actually gives the current status of all the
petitions, when it was received, who it was received by, what it was petitioned for, that sort of thing.

The committee chair, along with myself, the committee chair will take the petition to his committee, his or her committee. They will determine whether or not that petition should be forwarded for a TAP review.

So again you've got another entity, the third entity, actually going through the petition to make sure that it should be forwarded for a TAP review.

They get back to me and say, Okay, let's go for it. And then we designate a contractor to review the material.

So then I take that other copy that I had done at Kinko's and FedEx it to our contractors, requesting a formal TAP be completed.

They have up to 30 days prior to a NOSB meeting to complete a TAP review. That was a two-week time frame, and we just did not have enough time, obviously, to review materials two weeks prior to meetings. So we did ask that 30 days prior to a meeting we receive a completed TAP review from our petitioners.

Also at that 30-day time period, the NOSB has to publish the agenda of what materials are going to be reviewed at that upcoming NOSB meeting. If all goes well, also that lucky 30 day the TAP review should be posted on
the NOP Web site.

   Obviously it's not a perfect system. It's vastly improved, I would say, even over the last couple meetings. But there's times when we just don't get them on time, they don't get posted on time, and they don't get onto the Web site on time. But that's the petition process.

   Comments or questions on that from anyone? I'll open it up to -- okay. Zea?

   MR. CARTER: Zea?

   MS. SONNABEND: A few things --

   MR. CARTER: You have to go to the mic.

   MS. SONNABEND: Oh. A few things have made it to TAP reviews that I wouldn't have passed on if I was the NOSB, like natural products that don't need to be added to the national list and things that the petition was really incomplete about justification.

   So is it just because you don't have enough petitions that you're sending everything along, or are you still working on your screening process?

   MS. BURTON: I would say we're still working on our screening process. And part of it is, you know, you've got new Board members, and this is a new process. So there's been a handful that have gone through, not a lot. And that is greatly improving.

   And I'm actually going to be making a
recommendation here in a few minutes on the processing area for non-organic agricultural. So we're not wasting a lot of our time and effort on TAP reviews or petitions.

Okay. What I'm going to show you next is the list of materials that we're going to review at this meeting. It shouldn't be new to anybody, or at least these materials will be -- recommendations will come forth from the designated committee for review.

Calcium oxide; calcium hydroxide; potassium sorbate; sodium propionate; sodium nitrate; Spinosad; diethylaminoethanol; glycerol monoleate; gelatin; dewaxed flake shellak; calcium stearate; and then, Konjac flour was a petition that we're going to discuss through the Materials Committee.

Okay. Upcoming materials. These materials have been petitioned. Some of them have been pushed through the TAP review process, some of them haven't.

This is the livestock priority materials. The Livestock Committee submitted a list of materials that had a high priority, that were essential to get reviewed in the next meeting.

I've been working with a couple of people on this Livestock Committee to prioritize them, and this is the order of priority that we have set forth.

In other words, the contractor is going to start
working on propylene glycol first. Mineral oil, that's one
that we have to look at; I have not submitted that for a TAP
review.

VOICE: But these have been petitioned?

MS. BURTON: These have all been petitioned.

VOICE: By the Livestock Committee or --

MS. BURTON: Yes. By the Livestock Committee.

Yes. So they are a work in progress.

All right. That was just livestock materials.

Crops and processing materials --

MS. ROSEN: That list is different than the one
that was on the Web. Correct?

MS. BURTON: Yes. There's a couple of additions.

Yes.

So we've got eight materials for Crops and
Livestock -- I mean, Crops and Processing.

MS. SONNABEND: And how were these developed?

MS. BURTON: Petitions were submitted.

MS. SONNABEND: But not by the committee, by --

MS. BURTON: No.

MS. SONNABEND: -- outside --

MS. BURTON: By outside.

Right now we're looking at 29 materials for our
September meeting. If we're alive after that, it will be
amazing. So we're looking at potentially 29 or a few more.
We've got just probably three to four reserves left for TAP reviews in our contracts with our current contractors. So we're going to run out of money here really quick on TAP reviews.

So if you have not submitted petitions, I suggest you do it within the next week. Otherwise, we cannot guarantee that your petition will be reviewed.

MS. SONNABEND: And so are you letting the other committees submit petitions on their own, like Crops Committee can file a petition?

MS. BURTON: Yes.

MS. SONNABEND: And they don't have to fill out [inaudible]?

MS. BURTON: Do you want to talk about that?

MR. CARTER: Yes. Let's talk about the abbreviated --

MS. BURTON: Okay. There is a -- I'll talk to you about it as much as I know. There is a revised petition process, though I'm not sure it's posted on the Web site yet.

What we've found is the petition process was very tedious and cumbersome, especially for some of the farmers who were trying to actually do research for some of the requirements to submit a petition.

What we did was, we went through the statement of
work that we submitted to the contractors and deleted some of the information that was repetitive. In other words, CASS [phonetic] numbers or the chemical makeup, some of the more technical information that we require from the TAP contractors but that we were also requiring from the petitioner.

So we did that so that hopefully we could make it a little bit easier and speed up the process so that we didn't have this train wreck coming, so to speak.

MR. MATHEWS: Just a minor correction to that, Kim, is that --

MS. BURTON: Okay.

MR. MATHEWS: It's just the language.

MS. BURTON: That's fine.

MR. MATHEWS: I'm real picky on language lately. It's not that we've dropped any requirements. What we are doing is, we are changing the requirements to recommended additional information.

All of the things that were listed as needed to be in a petition are still listed. It's just that we've changed the nature of whether it has to come in or it can come in or not.

MS. BURTON: Optional.

MR. MATHEWS: It becomes optional additional information that would still be looked at by the TAP
reviewers, and they have agreed to this process.

MS. SONNABEND: Where --

MS. BURTON: Zea was asking where they can get a copy of the abbreviated petition process.

MR. MATHEWS: We're going to make that available.

MS. SONNABEND: If we have a week --

MR. CARTER: Zea, you need to go to the mic here, because you're --

MS. BURTON: She said if it's a week -- hopefully it's very soon.

MR. CARTER: Okay.

MS. BURTON: All right. We have one recommendation from -- actually, it's a recommendation in conjunction from the Materials and the Processing Committees. We worked together somewhat on this.

If you have a copy of the national list or the NOP final rule, I suggest you turn to Section 205.606.

Okay. There's been quite a bit of confusion amongst the handlers and processing groups with relation to Section 205.606.

As it currently stands -- I'm going to read this verbatim for the Board, because a lot of them haven't seen this document yet.

As it currently stands, Section 205.606 serves as a list of non-organically produced agricultural products.
that may be used when a product is not commercially available in organic form.

When OFPA was written, the Act never intended to require a list of non-organic produced agricultural products, let alone of non-commercially available materials.

The only two categories required for the list were synthetic substances permitted and natural non-synthetic substances prohibited.

The format for Crops and Livestock followed this outline, but somewhere handling went astray.

Additionally, OFPA clearly allows for an exemption of materials used in handling that are non-synthetic but not organically produced.

Below is the exact OFPA language, and I'm not going to read that, the Board can do it.

What is the confusion? The organic handling industry is starting to rely on Section 205.606 as a list of non-commercially available non-organic agricultural materials.

Specifically the NOP has already had one petition requesting the removal of a material under 205.606 because it may or may not be commercially available and several petitions requesting an addition to 205.606.

Unless this is fixed, we are going to create an ongoing problem in material review for the NOSB, not to
mention a waste of our money reserves from our TAP review contracts.

The NOSB Materials and Processing Committees recommend that there be a rewording of 205.606 as described below.

And what I have provided for the Board is, you'll see where we striked out the language that we're recommending be removed, and then underlined some of the language that we're recommending be added.

205.606, Non-organically produced agricultural products allowed in or on processed products labeled as organic or made with organic, any non-organic produced agricultural products may be used in or on processed products labeled as organic or made with organic, specific ingredients or food groups only in accordance with any restrictions specified in this Section and when the product is not commercially available in organic form.

And then, what we are recommending is that there's five materials on this list currently, that we just delete those from the list.

The materials that are currently under 205.606 should be deleted off the national list. It is the NOSB Processing Committee -- and that should be -- and Materials Committee's finding that they are non-organic agricultural products and should be recognized as such.
A guidance document for materials identified under the non-organic agricultural category should be developed out of the scope of the national list.

Conclusion: Clarification of 205.606 will follow the OFPA intent to allow for the exemption of non-organically produced agricultural products on the national list unless this material is reviewed and determined to fall under 205.605.

MR. CARTER: Okay.

MS. BURTON: Okay.

MR. CARTER: For some reason we're down to only one mic working at a time here.

Is there discussion on this document?

Yes. Jim?

MR. RIDDLE: Yes. I agree with and support the document. And one reason is not mentioned here, and I did think it had gotten into the draft.

MS. BURTON: I'm kind of editing it this morning -- or this afternoon.

MR. RIDDLE: Okay. And then, that is that, by maintaining a list of materials that are not commercially available in an organic form, it suppresses the development of those materials from organic sources. And I'd like to get that language back in here as part of the justification or rationale.
And then, also, I thought in the last paragraph right above the conclusion that we had a statement in there about the need of a guidance document on commercial availability to help provide clarification, as well.

And I understand that is something that the NOP has, you know, received public comment on, it was in the Federal Register notice, and has done some work on. And I think that would go along way to help with the situation, as well.

So I'd just like to add both of those things.

MS. BURTON: Okay. I'll get those corrected for tomorrow morning.

MR. CARTER: Rose?

MS. KOENIG: I guess I'm getting to be like Willie and trying to figure out what I'm voting on.

Is this a clarification statement, or is it a rule change, or is it just -- how is this going to be handled, Rick? Because I'd like to get just clarity on some of these issues so that they don't reappear.

MR. MATHEWS: We would take this if it's approved and recommended by the Board and implement rule making to fix 606.

We are the first to acknowledge that 606 doesn't work very well and wasn't very well written.

MS. KOENIG: So as in any rule making, 18 months,

Heritage Reporting Corporation
(202) 628-4888
you're saying, before that would occur?

    MR. MATHEWS: No. We would include this piece or
     at least to include this piece. It all depends on what the
     lawyers tell us. But the intent would be to include it in
     that rule that I've talked having out before October 21.

    MS. KOENIG: So that's that interim rule that you
     were talking about?

    MR. MATHEWS: Yes. It's the interim rule for
     amending the national list. And this would be an amendment
     to the national list.

    MS. KOENIG: All right. Again just a
     clarification for myself in terms of the process, because I
     seem to always have some kind of ignorance to that.

     There were other things that we have mentioned or
     even stuff in Livestock's, I know probably not in the right
     form that you would like it, that look like they're also
     potential rule changes or modifications. Could those also
     go into that interim report?

     And then, what time period are we talking about?
     Because it seems like there's different levels of how
     things are quickly or not quickly going to be pushed
     through.

    MR. MATHEWS: The short answer is no. The reason
     for that is that what we're talking about with the docket
     that I've said is an interim final rule is only for
materials, and this involves materials.

The attorneys have told us that, because when it comes to materials the Board makes the recommendation and we just kind of serve as a pass-through to the public, then, we can go ahead and in the short term, because of the October 21 deadline, go ahead and do materials on an interim rule basis.

The other items would have to go through the full proposed rule/final rule process. Even the interim final rule has a comment period.

MS. KOENIG: Okay. So any rule changing that might have to deal with materials or materials issues. Thanks for the clarification.

MR. CARTER: Okay. Any other discussion on this particular document?

(No audible response.)

MR. CARTER: Okay.

MR. BANDELE: I had a question.

MR. CARTER: Yes. Owusu?

MR. BANDELE: In this context, I know, for example, we're talking about crop material, even though it says non-organically produced, there are some restrictions in terms of prohibited substances, Kim.

So how does that play with this recommendation in terms of processing?
MS. BURTON: I would assume that how this would work was that if there was a non-organic agricultural item out there that somebody wanted to petition to have restrictions or restricted use that they would petition it as such, and then we would put it under 605. Does that make sense to you?

So any non-organic agricultural product that's not commercially available would be allowed unless somebody has petitioned it or unless it is specifically on 605 for restricted use.

MR. BANDELE: Still I see a difference there in terms of, you know, like as far as the crop is concerned, even though it's non-organic, prohibited substances cannot be used to produce that crop. So that would probably mean maybe synthetic fertilizers could but prohibited substances could not.

Whereas this implies to me that in this particular situation those prohibited substances could be used and the product could still be called organic. Am I misinterpreting?

MS. BURTON: If you read, there would be an opening to it, and it would have to be in accordance with any restrictions specified in this section, and that would be the prohibited substances, no GMOs, ion exchange, or whatever the third one is -- my brain is dead -- sewage.
sludge.

That still doesn't answer your question?

MR. BANDELE: No.

MS. KOENIG: Well, I think Owusu is alluding to an issue that we're going to bring up in Crops, just as a point of clarification. Correct?

MR. BANDELE: Yes.

MS. KOENIG: I think we can just deal with it then.

MR. CARTER: Okay. Anything else on materials?

(No audible response.)

MR. CARTER: Okay. Then, let's move on to processing. Mark?

MR. KING: Yes. We have three items. First I'll hand out some copies here. This is a two-page document, so take one of each.

Essentially what this is from the Processing Committee is a handling operation ingredient affidavit. If you think about Section 601 through 606 in the rule as being allowed and prohibited substances, what we've heard and seen really is that members of the organic community have expressed a need for guidance concerning the documentation of ingredients.

So with that in mind, specifically what we're talking about would be documentation that ensures
ingredients have been produced and handled according to annotation.

So the design of this particular affidavit really is to assist handlers in documenting that finished materials are produced and handled only in accordance with any restrictions specified in this section, and this section referring to the appropriate section, 601 through 606, depending on where that ingredient would fall.

So it will be the Processing Committee's recommendation that the following ingredient affidavit template just simply be submitted to the National Organic Program as a guidance document for handling operations.

Therefore, it would be posted on the Web site and offered as a guidance document. And certainly people could comment at that time for, you know, certain improvements, so on and so forth, so just to forward it as a guidance document.

Kim?

MS. BURTON: The inception of this document actually came into play with members of the community in the organic industry, where there was a group of about five or six people that actually drafted this document and submitted it to the Processing Committee and Materials Committee.

MR. KING: Questions, discussion?

(No audible response.)
MR. KING: Seeing none, next item. The next up is something that's been on the Web and certainly in development for quite some time, and that's concerning guidelines for determining what processing technologies require a petition that would be reviewed by the National Organic Standards Board.

And we've had many comments on this. And I will state to you at this time that we have worked very diligently, I think, as a committee in the last few months and certainly in the last few weeks to move this document along.

However, we feel as a committee, and certainly we've heard this strongly from the industry, that this is a very important document. So we will be recommending that this be deferred for further comment until the September meeting.

And what I'd like to do at this time, Steve, if you don't mind, since you've done the bulk of the work on this particular document, to provide us with some history and a little bit of clarity as to what we'll be doing.

MR. HARPER: I'll just give you a little bit of history for new members on the Board.

The NOSB Processing Committee felt that there was a need for clarification of 205.270, which basically talks about allowing mechanical and biological processes to expand...
on that section as far as clarification for the organic community, certifiers, processors, and others in regards to whether there are processes that clearly are not allowable in organic beyond irradiation.

    I think irradiation is the only thing that's prohibited at the present time.

    And also trying to address any novel, new processes that come down in the future, and trying to maintain the intent with the OFPA.

    And so what we did is, this was put out. Input was requested about a year ago. And based on that input, we put together an initial set of guidelines, and that was posted on the Web since last fall, and then, since last -- let's see -- not since last fall -- yes -- since last fall.

    And since that time, then, we've received quite a bit of other comment from OMRI, OTA, and others regarding those guidelines.

    And so the current guidelines that you see in front of you are the culmination of all those comments put together by the Processing Committee.

    Basically what this is is trying to clarify the distinction between what is clearly sort of a process issue versus a material issue.

    And so the guidelines, if you go down through here, will be trying to clarify that, for example, there has
been discussion about ion exchange. Is that --

    MS. KOENIG: I don't have a copy of the
guidelines. The copies you made?

    MR. HARPER: Oh. I didn't make -- okay. I
thought you had copies of this.

    MS. KOENIG: No.

    MR. HARPER: I'm sorry. You don't have that?

Okay. I'm sorry.

    VOICE: Which are you referring to, Steve?

    MR. HARPER: Okay. I'll have to make copies of
all this.

    MR. CARTER: If we can take just a brief break.

    MR. HARPER: I'm sorry.

    MR. CARTER: If you'll turn your microphone off,
apparently we've got to reboot the system.

    (Pause.)

    MR. HARPER: I'll go make copies of these, then.

    I didn't realize that you needed copies. I thought --

    MR. CARTER: Okay.

    MR. HARPER: Okay. Miscommunication.

    MS. KOENIG: If you want to summarize, that's
fine. But you were kind of talking and having us --

    MR. HARPER: Right. I thought that you had
copies in front of you, and I apologize.

    But just to finish up, because I think I can
finish and then make the copies and pass that out to you.

As a summary, it's trying to clarify a process from a material issue so that it's strictly understood that materials need to be petitioned even though they're part of a process.

Such as, for example, just quickly, ion exchange, there has been some discussion of that indicating that maybe the process is acceptable, but clearly the materials -- synthetic materials that are used in there that come in contact with organic materials need to be petitioned for review. And it's a clarification on that.

So I will make copies and pass it out to everybody.

MR. CARTER: Okay. Jim?

MR. RIDDLE: Yes. And I don't know if it's clear to everyone, but the committee's intent is to post this for another round of comment.

MR. HARPER: Correct.

MR. RIDDLE: Yes.

MS. KOENIG: So again, is it a document of clarification, or are you seeking a rule change?

MR. HARPER: This is not a rule change. This is a interpretation -- clarification document being given to the NOP as suggested guidance.

MS. CAUGHLAN: This would also become part of the

Heritage Reporting Corporation
(202) 628-4888
policy handbook as a guidance under materials and under processing.

MR. CARTER: All right. Anything else, Mark?

MR. KING: Yes. One more item. The last item is another document, which we will get you copies of, which is an organic handling plan.

And how this document really came about is that a lot of the certifying agents and handling operations in the industry expressed a need for guidance concerning just production and handling requirements in general.

So in an effort to meet those needs, the guidance documents have really been developed in this case to assist the certification and/or handling operations in this case.

So the recommendation would be --

VOICE: Do you have copies?

MR. KING: -- I will hand out copies later, yes -- an organic handling plan, which is a template here.

The recommendation would be, the Processing Committee recommends this organic handling plan be forwarded to the National Organic Program for posting on the National Organic Standards Board page of the National Organic Program Web Site as a guidance document for the certification of organic handling operations.

And we will vote to forward that tomorrow. We'll provide you with copies so you can look at it prior to that.
Willie?

MR. CARTER: Willie?

MR. LOCKERETZ: Yes. Could you explain that guidance document? Does that mean a recommendation to certifiers or a mandate on certifiers or what? Because I mean, we've heard a lot today.

MR. KING: Well, it's my understanding a guidance document is just that, to provide further guidance to that particular segment of the industry that you would be addressing.

And in this case, you know, if you want to use this example -- and Richard, if you want to chime in here as well, that's great -- it's simply to provide additional guidance in this case to handlers. It's a template so that they can fill it out and have a better understanding of the language that's in the rule.

MR. CARTER: Okay. Owusu?

MR. BANDELE: Yes. I had the same concern that Willie in terms of that. Does that mean, as far as the guidance document is concerned, that, in other words, we make a recommendation to NOP? Does NOP --

I understand that the guidance document would not have the same effect as the rule, so to speak. But does that mean that the NOP will endorse and encourage adoption of the guidance documents that are put forth on the NOSB Web
MR. CARTER: Okay. Rick?

MR. MATHEWS: The guidance document is just that, guidance.

Now, what Mark was holding up a few moments ago is essentially a form that this Board would say, In order to comply with the National Organics standard for this particular situation, we suggest that you use this document as a means of complying with that requirement.

If that handler wanted to use something else, they are free to use something else. The bottom line is, they still have to be able to demonstrate that they are complying with the standard.

MR. CARTER: Okay. Rose?

MS. KOENIG: I just have a question, and it's related to this, but it's a little far reaching.

There was also the check sheet tools that I think were already submitted by ATTRA that both NOP supported and the National SARE Program supported.

This seems -- you know, that project and these types of guidance tools all seem to fit into the same kind of package.

So my question is (a) what's the status of the ATTRA Project that has these similar tools? And then, (b) what is your strategy as far as, how do you see these tools
being, you know, used and provided, not only via the Web site, but, you know, as outreach tools to farmers? Because not every farmer is using the Web.

MR. MATHEWS: We have reviewed both portions of the contract document for guidance to producers, the Crops and Livestock. And we will be completing our initial round of work on that shortly after this meeting.

We've already put that in writing to the people at ATTRA telling them that we would give them our reaction to the documents and ask them to make the changes that we are suggesting.

Once this entire process is complete, it will be documents that are provided to certifying agents. It will also be published on the Web site for everyone to see.

And again, it's all guidance. And the guidance is provided for the purpose of helping people understand how they can comply with the requirements.

Sometimes that guidance, in the example of Mark's, just to reiterate what I said before, if they can create their own form to solve the same problem, they're more than welcome to do so.

MR. CARTER: Okay. Other comments, questions?

(No response.)

MR. CARTER: Okay. Thanks, Mark.

Okay. Crops.
MR. BANDELE: We have several items on the floor for this afternoon. I'm going to start off with the one that actually took the most time, and in some ways, although not in all, was most controversial, and that is with the Composting Task Force that Eric Sideman shared. And I'm going to ask him to come and present that.

MR. SIDEMAN: So once again, I'm Eric Sideman, and I was an NOSB member till a couple of weeks ago. And at the last NOSB meeting, I was appointed by the Crop Committee to chair the Compost Task Force.

So a little bit about the Compost Task Force. I think almost everybody in this room is aware that one of the big problems in the rule that farmers noted right away when the final rule came out was composting, because the parameters that are mandated in the rule for making compost were quite narrow, and they actually made it so on-farm composting would almost impossible for most farms as we know them.

And the points in that were essentially pointed out, or carefully pointed out in many comments, that the carbon to nitrogen ratio was too narrow and that the turning requirements of the pile, at five times in the first 15 days, was much too prescriptive.

So essentially the task force was created to come up with a alternative approach to handling compost, on-farm
especially.

I want to start by introducing the members of the Compost Task Force. And I was chair of the task force, appointed by the Crop Committee.

Dr. Clive Edwards from Ohio State University was appointed to the task force as the vermicompost expert.

We tried to cover all the different areas that we needed to cover through the work of the task force.

Rosie was on the task force as an NOSB member and a farmer.

Kim Kroll, who is in the USDA SARE office, was put on the task force as the sustainable agriculture expert.

Zea Sonnabend was put on the task force as the materials expert.

Dr. Fred Magdoff was put on the Compost Task Force. He's a soil scientist at the University of Vermont, and his specialty is management of organic matter in soils, and he was put on the task force for that expertise.

Dr. Will Brinton, who owns and operates Woods End Laboratory in Mount Vernon, Maine, is a world-renowned compost expert, and obviously we needed a compost expert on the task force.

Dr. Michael Doyle was put on the task force from Georgia. He is a food scientist, microbiologist, and we wanted that kind of expertise in our work.
Dr. Patricia Millner, who works at the USDA agricultural research station in Beltsville, Maryland, is an expert on microbiology and composting and the reduction of pathogenic microbes by the composting process, and she was put on the task force for that expertise.

And Owusu, who is Chair of the Crop Committee, was put on the task force as an NOSB member and a farmer.

The second thing I want to do is acknowledge the support we got from the National Organic Program. Rick Mathews and Barbara Robinson and Mark Keating offered great support to the task force and were part of all of our emails and our initial conversations and got the task force rolling in what ended up to be what I consider to be the correct direction.

The starting point we made was that there are two approaches to take. And one of them was the long-term approach, which would be to change the rule. And we felt that that was going to be much too cumbersome and take much too much time.

And although we recommend that in the task force report, the second approach, which is the short-term approach, is what we spent most of our time on, I would say all of our time.

Next I want to point out that one member of the task force did not sign off on the report. Michael Doyle
from Georgia, the microbiologist, felt, and stated it a number of times, that he thought the goal of composting would be to eliminate pathogens.

And the rest of the task force was happy to accept reducing pathogens to a safe level as the goal of composting.

And based on that particular goal and the outcome of the task force report, Michael Doyle declined to sign off.

The other nine members of the task force all did sign off on the final report and recommend that to the NOSB, which would make it a recommendation to the NOP.

The starting point that we made was looking at the Section of the rule 205.203(c), which is the fertility and crop nutrient section of the rule.

And in this section -- I'll paraphrase -- it essentially says that producers must manage plant and animal materials in a manner that will improve the soil organic matter and in a manner that does not contribute to the contamination of crops, soil, or water with plants, nutrients, pathogenic organisms, heavy metals, or residues of prohibited substances.

And then it goes on to say that animal and plant materials include -- and it has three categories -- raw manure; composted plant and animal materials produced
through a process that, and that's the section that we had to work with; and the third category of materials was uncomposted plant material.

And the starting point for the task force was that, when you read this section, it says that the plant and animal materials that are going to be used for soil amendments may include, but it doesn't say are limited to.

And that was our starting point, that we took that point that it doesn't limit it to those materials mentioned in the rules. And the task force went on to characterize some other materials that may fit the heading of 205.203.

And so the task force went ahead and came up with a number of other materials that could fit under that section.

We're going to make that recommendation to the NOP. Hopefully it gets voted on and approved at this meeting.

And then we are going to develop guidelines to certifiers, that it's going to be the certifier who is actually responsible for evaluating the practices on the farm and determining whether they meet the criteria of 205.203.

And so the certifier would use the farm plan and the records, field histories and the records of the kind of
compost practices occurring on the farm, and working with that farm plan and those records, evaluate whether the practices and materials on the farm meet the standard.

The Compost Task Force then went ahead and identified four other materials that we felt met the criteria in that paragraph. And the first one was compost. And we felt that there are other ways of making compost that could fit that paragraph. And we came up with these short guidelines:

Number 1: That it's made from permitted materials, plant and/or animal, except for incidental residues that will not lead to soil contamination.

And then, 2: That the compost much achieve a minimum temperature of 131 degrees, 55 Centigrade, and remain for three days.

And then, that within the farm plan and on the composting records, demonstration that all of the feed stock in the compost pile heats up to that temperature.

Certifiers, using their expertise, can demonstrate that the compost made in such a fashion meets the paragraph 205.203 by looking at the source of the material, the feed stock used to create the compost pile; the records of the date the compost pile was started and when it was determined to be finished; the dates and the temperature records, the rise and fall of temperature.
And then, also the certifiers may look at other records such as carbon to nitrogen ratio, volume reduction in the pile, carbon dioxide emission from the pile, O2 consumption from the pile, and nutrient stability of the pile as deemed necessary by the certifier.

The second material that the Compost Task Force puts forth as acceptable under 205.203 is compost teas. And we wrote guidelines in there that essentially say that, if used on crops that are going to be harvested in less than 120 days from the application of the compost tea has to be prepared from a high quality compost that was made as described above and that no supplemental nutrients such as sugars and molasses are added to the compost tea preparation during approving stage.

The third material that the Compost Task Force looked that we thought could be acceptable under 205.203 was vermicompost.

Clive Edwards reported to the Compost Task Force that vermicomposting practices do reduce the pathogens in the compost pile, and he gave us guidelines for vermicomposting that would achieve that pathogen reduction. And we outlined those in the Compost Task Force report.

They include regular addition of organic matter to the vermicompost pile, avoiding temperatures higher than 95 degrees Centigrade, and moisture maintained between 70
and 90 percent. And he also gave time periods required for the vermicomposting to take place.

And the fourth material that the Compost Task Force recommends that could fit under the guidelines of 205.203(c) is processed manures. These are manures processed in another fashion other than composting. And these processes that we outline are going to accomplish the same killing of the pathogens.

And we came up with a very simple guideline of heating the manure to 150 degrees, maintaining that temperature for at least one hour, and then drying it down to 12 percent or lower.

We have some recommendations for changes in that processed manure section. One of them is that we take out the word, frozen.

If you look at your copy of that compost recommendation in that processed manure section right at the back where it gives the temperature guideline and the moisture guideline, it also says, Or frozen. That should come out.

And we'd like to add, Or test for pathogens, because as we heard in testimony this morning, there are some processed manures that are heated up to a higher temperature for a shorter duration that may achieve the same pathogen reduction, and so we would like to slip that in.
One other change that we would like to make to the Compost Task Force report that the Crop Committee has already accepted is a list of definitions, and those were circulated to the NOP office and to the Crop Committee.

So what is the next step? The next step would be the development of a practice standard.

A number of the members of the Compost Task Force have agreed to work on developing a simple and concise practice standard that would be made available to certifiers that would outline the high points of this Task Force report.

And that subcommittee of the task force would be me, Zea, Pat Millner from the ARS Lab, and Will Brinton from the Woods End Laboratory in Maine.

And are there any questions?

MR. CARTER: Who is in charge?

MR. RIDDLE: Owusu, you're in charge, I think, so you should do the calling.

MR. BANDELE: Okay. Before so, I have a few of my own, Eric.

A couple of the points that were really contentious would be, number one, the number of turns required, and also you mentioned the rather restrictive C to N ratio. So where in the document is that addressed?

In other words, under the recommendations here,
would farmers still have to deal with those practices?

MR. SIDEMAN: No, they wouldn't. Actually, we felt on the Compost Task Force that those practices essentially were put into the rule to assure that the pile would heat up.

And we felt that the temperature records are going to do the same thing as balancing the carbon to nitrogen ratio or the number of turnings to make sure it's aerated and well mixed.

And so we felt if the composter had records of the temperature and the certifier responsible for evaluating those records in the farm plan how pathogens would be reduced, then those parameters would not be necessary to even mention.

MR. BANDELE: But if the rule is not changed, though, then how --

MR. SIDEMAN: But the way we come about that is what I said in the beginning, is that that kind of composting that is described in the rule is one way of making compost that's accepted. What we've done in our Compost Task Force report is another way that would be accepted to make compost.

MR. BANDELE: All right. Willie?

MR. LOCKERETZ: I have a question. This standard for compost seems to be a performance standard or results
standard, where the compost has to have achieved a certain state before it could be used, or is it something where at the beginning of the season the certifier could look at the intended plan for managing compost and say, That's plausibly acceptable?

MR. SIDEMAN: I think you're both right. I think what would happen is the certifier would look at the farm plan and determine from the farm plan how the farmer or compost maker plans to make their compost. But during site visits they would be evaluating whether that really occurred and looking at temperature records.

MR. LOCKERETZ: And who would be doing these measurements about ammonia/nitrate ratio and --

MR. SIDEMAN: Those are not required. Those are in the report as details of what certifiers could look at if they suspected some kind of a problem, but that wouldn't be required on every facility.

If the certifier was satisfied that the compost was making the temperature and they felt that the pathogens were being reduced because of the ability of the compost to be well mixed and heated evenly, then they wouldn't need to look at those other parameters.

MR. LOCKERETZ: So the temperature is the main thing to go on?

MR. SIDEMAN: The temperature is the main
thing --

MR. LOCKERETZ: And taking a look?

MR. SIDEMAN: That's right. And then, the other parameters that are mentioned in our Compost Task Force report are items that the certifier may want to use for evaluation of the material.

MR. CARTER: Jim, then Rose.

MR. RIDDLE: Yes. I have a couple questions. In both the processed manure section, and then, also, the first, the compost section, it really addresses pathogens very well, but it doesn't address residues of prohibited materials and heavy metals.

MR. SIDEMAN: That's a good point. In the processed manure section, it's not addressed at all. That's an interesting point. And I guess it goes back to the fact that manure is allowed by the rule from any source, and residues in manures have been ignored. The problem in compost is that there are other feed stock that may be carrying residues.

There is a sentence in the compost section that does address it that's one sentence, and I can see how you missed it. But it essentially says that the sources of the feed stock would be evaluated for contamination. I could find it -- I don't have it in front of me.

MR. RIDDLE: Well, and the general requirement in
the rule that the fertility management system must not
contaminate crops, soil, or water with prohibited materials,
heavy metals, pathogens, et cetera still takes precedence.

MR. SIDEMAN: That's right. 205.203 is the
section that you're going to be looking at, and that takes
precedence.

So no matter how the compost is made, if it is
carrying something that's carrying a residue that would
contaminate the soil, it would be prohibited because of the
introductory paragraph.

MR. RIDDLE: Yes. There is evidence of processed
manure leading to accumulation of copper and zinc on organic
farms.

MR. SIDEMAN: Right. But that would come if it
were unprocessed manure, too --

MR. RIDDLE: Right.

MS. SONNABEND: -- because the processing
doesn't add anything to the manure. That would be an
issue -- that would be a different task force.

(General laughter.)

VOICE: The heavy metal group.

MS. KOENIG: Just a couple clarifications. You
said that a smaller group would write a standard. Are you
saying rule change when you say standard?

MR. SIDEMAN: No. This would be a practice
standard. It would be a memorandum or a policy scope paper
distributed to certifiers as how they would be interpreting
the rule as written.

We determined at the end that there doesn't need
to be a rule change. The way 205.203(c) is written, it
says, Includes, it doesn't say, And limited to, that we
could add these other materials and make it clear to
certifiers that these are four other materials that would be
considered acceptable under that introductory paragraph.

MS. KOENIG: The other I guess recommendation,
then, if you're -- you may want to talk to the ATTRA
group -- I mean, they're doing check sheets for growers --
just maybe in this initial process to see if some of that
information could be combined in that paperwork, so not only
are you providing information for the certifiers, but also
making sure that their information going to farmers, any of
it that might deal with that compost issue, would be
covered.

MR. SIDEMAN: Okay. That's a good suggestion.

MR. BANDELE: Jim -- oh. Rick -- I'm sorry --
and then Jim.

MR. MATHEWS: Eric, in the sentence where you
wanted to remove, Or frozen, I heard that you then wanted to
insert, Or test for pathogens?

MR. SIDEMAN: That's right.
MR. MATHEWS: I have a problem with that. I don't have a problem with the testing for the pathogens, but I do have a problem that would arise from the sentence structure at that time.

MR. SIDEMAN: Oh. Okay. So let's just slip it into a different sentence. I only quickly thought it would go there because there was an or before it, so it seemed so natural.

MR. MATHEWS: Yes. The sentence, the way it seems to read as originally written, said that you can do it through the high temperature, you can do it through the drying, or you can do it through the freezing.

MR. SIDEMAN: Oh. But it has to be and the drying, high temperature and the drying. Am I right, SARE?

Yes. It's the high temperature and the drying.

MR. MATHEWS: Okay.

MR. SIDEMAN: And so, then, the pathogen testing would be a separate sentence.

MS. KOENIG: I would agree with that. Yes.

MR. MATHEWS: Okay. Then, the sentence just basically needs some rework, and the addition of the testing for pathogens should probably be a separate statement.

MR. SIDEMAN: Zea, are you willing to rework that sentence so they can vote on that tomorrow?

MS. SONNABEND: (No audible response.)
MR. SIDEMAN: Okay. This was actually a -- I
never pointed that out, but this was really a group effort.
Each of us in the task force wrote different sections of
this, and we did a cut and paste job of putting it all
together. I won't identify each section, although I just
did one, didn't I?

(General laughter.)

MR. MATHEWS: I had a couple of other questions,
and that's on the third page, where it has the definition at
the top, in the middle paragraph, where it says about the
approved feed stocks. And it says, Manure and other
residues from animal bodies, including soil invertebrates.
When you reference animal bodies, does that
include carcasses, composted carcasses, or slaughter house
waste?

MR. SIDEMAN: We meant for it to.

MR. MATHEWS: Okay. I just wanted to be clear
that it did.

Then, on the other part, at the top of that same
page, there is the definition of compost. Well, that's not
the definition from the rule.

MR. SIDEMAN: No. That's --

MR. MATHEWS: It's a nice, sensible definition,
though. And it would seem like that could be a
recommendation for a rule change.
MR. SIDEMAN: And I think it could be. But we were not suggesting a rule change. We were just putting it in here as another definition of compost that would be accepted. Just like many words in the English language, they have more than one definition.

(General laughter.)

MR. SIDEMAN: We thought of using the term, the item in your back of the barn that was formerly known as compost, but thought it was too long.

(General laughter.)

MR. MATHEWS: The other compost. Right. Okay. Well, I am a little confused, but I do like this definition.

MR. SIDEMAN: This, by the way, was very close to the original definition that Bryan Baker and I put together in Ontario, California when I first came on the Board.

MR. LOCKERETZ: Eric, this is mostly about on-farm composting. In the case of more brought-in composts, commercial or otherwise, who is responsible, the producer, the supplier of the compost, or the certifier, for knowing that it's okay to use on organic?

MR. SIDEMAN: Well, ultimately it's the producer. But it's going to be the certifier who makes the judgement call and would say whether it's a permitted material or not.

MR. LOCKERETZ: Because the certifier would not have been there with a thermometer or anything.
MR. SIDEMAN: No. And that's an interesting point. We in Maine have agreed that we're not actually going to be reviewing any materials except for locally made composts, because locally made composts are not likely to apply to OMRI for review as a brand.

But the large scale composters who may be selling their composts across state boundaries I would suggest apply to OMRI for review.

MR. BANDELE: Eric, I had a question in terms of the wording with the vermiculture. And it said like processing must be maintained at 70 to 90 percent moisture content with temperature maintained in the range of 18 to 30 degrees Centigrade for good productivity.

And to me that last phrase, good productivity, kind of means that's really not a requirement.

MR. SIDEMAN: That's right.

MR. BANDELE: I may be aiming at fair productivity.

MR. SIDEMAN: Yes. We've discussed that for years as a certifier.

No. You're right. And I think there are a number of things in the task force report that are not requirements. And that's why we felt that this would not be the document that is going to go to certifiers, that we're going to take essentially the high points of this document
that are requirements and submit those as a practice standard to certifiers.

But I actually would not object to that being pulled out, because some people may want to make poor compost.

The problem with making poor compost is then you don't meet another requirement of 205.203(c) automatically in that you're supposed to be adding materials to maintain or improve the fertility and soil organic matter.

You may still use poorly made compost, but then you would have to demonstrate someplace else in your farm plan that you're maintaining the soil fertility and organic matter by another fashion to meet the other requirements in that paragraph.

MR. BANDELE: We've got other issues. We need to move on. I had one further clarification, maybe from Rick.

As far as the compost tea is concerned, it prohibits the use of sweeteners in that process. And I know that --

MR. SIDEMAN: That's right.

MR. BANDELE: -- there is mixed emotion about that situation. But be that as it may, nothing really prevents a grower from tank mixing or applying the molasses simultaneously with the compost tea.

MR. SIDEMAN: But overriding that, it says
molasses is a naturally occurring compound. Wouldn't that have to be placed on the national list in order for that provision to be effective?

MR. SIDEMAN: Not in my understanding. This was beyond the scope of the Compost Task Force. If somebody wanted to spray sugar or molasses on their plants, that's fine. This was only addressing how they are making their compost.

MR. BANDELE: No. I meant if, for example -- will this prevent --

MR. SIDEMAN: No.

MR. BANDELE: -- compost tea people from using the molasses in the process?

MR. SIDEMAN: Only in -- yes. This will prevent them from using it in the process of brewing the compost tea.

MR. BANDELE: Right. But I'm saying would it take adding molasses to the national list to have that effect, Rick?

MR. MATHEWS: You mean the national list of prohibited materials?

MR. BANDELE: Right. Since it is a naturally occurring substance.

MR. SIDEMAN: I see what you're saying. I don't think so, but --
MR. MATHEWS: But that's an interesting question. I don't have an answer.

MR. SIDEMAN: We would put it on the national list it's only prohibited for adding to compost brewing of compost teas? That's up to you guys.

(General laughter.)

MR. MATHEWS: I mean, it's within the realm of possibility if that's what you want to recommend.

MR. SIDEMAN: We didn't recommend it.

MR. BANDELE: Okay. Thanks a lot, Eric.

MR. SIDEMAN: Thank you.

MR. BANDELE: Appreciate the hard work of the Compost Task Force.

Next we're moving on to planting stock. And Rose drafted that. Can you give us a synopsis?

MS. KOENIG: I want to discuss two things separately. But in your book, the Crops Committee has a statement on planting stock from perennial crops grown as annual crops.

And this effort was really done based on public comment, because there are a number of strawberry growers that didn't know where they fit within the definition of planting stock, whether they were to consider themselves annual or perennial crops.

So we drafted this statement of clarification.
It's not a rule change. It's meant to be a statement of clarification as to what the Crops Committee feels the interpretation should be.

And I will just read it. It's not that long.

And then, this will be the motion, to accept this interpretation, for tomorrow. And then I'm going to bring up another point.

So the motion tomorrow will be to accept this statement of clarification for submission to the NOP.

And it reads: "There are a number of plants such as raspberries and strawberries that are perennial crops grown from planting stock rather than true seed.

"In some farming operations, these crops may be grown as annuals rather than perennials, where new planting stock is used each year to produce one harvest season of an organic crop.

"The Crops Committee recommends that in these systems the planting stock would be considered an annual planting stock and comply with the requirements of the rules as it pertains to seeds and planting stock in Sections 205.204, Sections 1 and 2, rather than those for perennial planting stock that is addressed in Section 205.204, Section 4.

"For annual production, Section 205.204(1) and 205.204(2), addressing annual production, states that non-
organically produced planting stock, whether untreated or treated with a substance on the national list, must be used to produce an organic crop when an equivalent organically produced variety is not commercially available.

"Organic seed or planting stock is required for these crops unless an equivalent organically produced variety is not commercially available." Did I just repeat myself?

"Growers who do not grow these crops as annual planting stock as defined in the rule as a plant grown from seed that will complete its life cycle or produce a harvestable yield within the same crop year or season in which it was planted will be required to comply with the planting stock requirements for perennial crops presented in Section 205.204(4)."

So therefore, for the raspberry growers out there, I know there was a comment out from California where they were actually producing raspberries, harvesting at, I guess it was within a year, but they were keeping those crops as perennials, they still would fall within the perennial rules.

It's really for crops such as strawberries. And perhaps there are growers of raspberries out there somewhere that are just growing them as annuals.

But mostly, the rule is really -- this
clarification is just for perennials that are grown truly as annuals. I hope that's not too confusing.

So again, it's no real change. It's just a statement of clarification. So that is what we're asking, and that's what we're going to put forth as the motion.

The second question is really a question of clarification for Rick. And I'm sorry to ask you this on the spot. But through our conference call with Bob Pooler, who came into the process later, I guess he really couldn't provide us clarification on that.

Our question was that -- and it's a rule interpretation that we went around and around with -- that in Section 205.204(1) it says that non-organically produced planting stock may be used when there is not commercial availability of -- when there's no organic crop available.

Our question was, when you say commercial availability, in terms of that, does that mean you can use whatever is out there commercially conventionally grown?

Because we were having problems interpreting whether that meant that you could purchase non-organic transplants, but they could not be treated with the prohibited substances, and mostly all commercial strawberry production that's done on a conventional farm is being produced with prohibited substances.

So even though we're defining these crops as

Heritage Reporting Corporation
(202) 628-4888
annuals, we're still not solving the problem if that is the right interpretation of the rule.

Do you understand what I'm asking?

MR. MATHEWS: I think so. In 204, it basically provides that the producer must use organically grown annual seedlings and planting stock except, and then it gives the exceptions. You would still have to follow the exceptions that occur here in the regulations.

Does that answer the question?

MS. KOENIG: No, it doesn't. Because what we didn't understand -- well, yes. I guess I'll just ask you the question, and then you can -- because I can't interpret it.

The question is that if I, Rose Koenig, bought a conventionally produced strawberry plant from a strawberry house because there was no organic strawberry plants available, knowing fully well that in those commercial operations they're using fungicides and prohibited materials, mostly pesticides, and probably synthetic fertilizers, are they allowed?

MR. MATHEWS: Okay. If you look at paragraph 2, non-organically produced seeds and planting stocks that have been treated with a substance included on the national list of synthetic substances allowed for use in organic crop production may be used to produce an organic crop when an
equivalent organically produced or untreated variety is not commercially available.

So I think the answer to your question is that if they were treated with a substance that is not on the national list, the answer is they cannot use it.

If they want to use conventional that has been treated, the treatment must be a substance that's on the national list.

MS. ROBINSON: Except for paragraph 5, Rick.

MS. KOENIG: If it's quarantined within your state.

MS. ROBINSON: Right. If it's a requirement of the Federal or State Sanitaries.

MR. MATHEWS: Right.

MS. KOENIG: But perhaps in California, I understand it may be. But in every other state, I'm not aware of any quarantine practices.

MR. MATHEWS: Well, then --

MS. KOENIG: Yes. So basically -- and that is just what I wanted growers to be aware of, because we went around with this on our committee, and we're back at the same problem, basically, for strawberries.

MR. BANDELE: Yes. I noticed, for example, that one of the older NOSB Boards made specific recommendations for several crops, such as strawberry, such as sweet potato,
and few of the other vegetatively produced crops in which
they were making an allowance even when there was a use for
prohibited substances.

So are you saying, then, that the only way to
resolve the strawberry issue would be to take such an
approach, based on what you just said?

MR. MATHEWS: Are you speaking to me?

MR. BANDELE: Yes, sir.

MR. MATHEWS: I see the strawberry issue as
really being, at this point now, two issues. The first one
is, is the strawberry plant an annual or a perennial when
the farmer may only get one crop from it, or in the case of
some people who do it, for two crops? But it would still be
within like a year's time or something like that. That is
one of the problems.

The other problem is the sourcing of that annual
plant. And as the rule says, other than as Barbara pointed
out, unless it is something that is mandated by the State,
you have to use plants that are grown organically. In the
absence of that, you can work on down the list.

But when you get to the part about using one that
is treated, you have to use one that is treated with an
allowed substance.

MR. BANDELE: Yes. Eric, and then Jim.

MR. SIDEMAN: Okay. I disagree, Richard. I
think -- and I'm not a really good rule reader. But I think
the strawberry plants would fit under paragraph 1, not under
2.

And paragraph 1 just says, Non-organically
produced untreated seeds and planting stock may be used to
produce an organic crop when an equivalent organic produced
variety is not commercially available.

And when I asked this question five years ago in
Ontario -- and I can't remember who gave me the answer, that
probably matters, but it may be in my notes -- that the
untreated in that section is referring to treatments that
would be active after the plants were planted.

MR. MATHEWS: No. I --

MR. SIDEMAN: Emily, do you remember that, by any
chance?

MS. ROSEN: [Inaudible]

MR. SIDEMAN: Yes. And it was referring to, for
example, seed treatments. You can use conventionally grown
seeds. You don't have to use organic seeds. And those
seeds were clearly treated with prohibited materials when
they were grown. That's what makes them conventional.

You can't use a treated seed, because it's
treated with a material that's going to be active after you
plant it. That's what's prohibited. And that's how it was
answered to me. And maybe Jim has a clarification on that.
MR. MATHEWS: But this is a progression. It's except that. You could use the non-organically produced untreated seed and planting stock, meaning it's untreated.

The first thing you do is you try to source it organically. If you can't get an organic one, then you move down to the next step. This is that progression that was so --

MR. SIDEMAN: But that still doesn't answer the question of the treatment. The treatment is a treatment that's going to be active after you plant the seed or the planting stock.

MR. RIDDLE: Well, yes. When I read it, the Number 2, when it says non-organically produced, that right there means it was conventional in how it was grown, in and of itself.

And then you take that seed or planting stock and treat it after harvest, after the seed has been harvested or after the planting stock has been removed from the ground. That's when the treatment kicks in. That's when it becomes applicable in this system.

And so there the treatment itself that's applied directly to the seed or planting stock has to be on the list, but it could have been grown non-organically.

MR. SIDEMAN: And treated with prohibited materials, and treated with the materials not on the list.
MR. RIDDLE: While it's growing. That's what non-organic means.

MR. SIDEMAN: That's right. If it were not treated with prohibited materials, it would be organic. This is not only referring to the three-year waiting period. I mean, it could be relating to that, but not necessarily only to that. Also, this is probably talking about the fact that it's conventional because it was treated with prohibited materials, and obviously they're allowed.

MS. KOENIG: But, okay. So I guess what I -- what we need from I think NOP at this point is -- we don't want this issue to come up again two years down the line or for a certifier. It has to be resolved, because it's clearly something that's not 100 percent clear to the average person reading the rule.

And I want Rick to understand that in most strawberry plug production operations, not to which Jim was referring to, most of them take daughter plants and are producing them in plug form in greenhouses. That's the planting stock, and it's treated in the greenhouse in plug form. It's not just coming out of the ground. And those we're also expecting to be covered.

MR. SIDEMAN: Yes. That would be covered, because that's being treated during its growth for its own...
 growing --

MS. KOENIG: So as long as I, Rose Koenig, do not take that plug -- once I pick it up from that conventional farm that's producing it --

MR. SIDEMAN: Or they don't treat it, either. It doesn't matter who treats it. As long as it's not treated after it becomes a plug that's being used for propagation.

MS. KOENIG: Yes. Once I put it in the ground or once I take property of that, I can't treat it with any prohibited substances.

MR. SIDEMAN: Well, it's similar to a seed, too. You couldn't take a seed and treat it with Captan, because that Captan is to be active after the planting.

MS. KOENIG: It's a gray area.

MR. BANDELE: So Rick, what's your final interpretation on that at this point? Because --

(General laughter.)

MR. MATHEWS: My final interpretation? I tell you, I understand where you're going. But before I give a definitive answer, I would like to be able to go back to the preamble, look to see what the preamble is saying, might even have to go back to the previous proposed rule.

And I've got both proposed rules and the final here. I will review the issue. We can take it up again.

One thing that you might consider is, in this
recommendation that you're making, you may want to make a recommendation on that interpretation, as well.

MS. KOENIG: Well, we kind of came to the conclusion that you did, that they were really -- we wanted to make sure we didn't tie the two issues together, because they are separate issues.

One is whether a strawberry that's grown as an annual is treated as an annual, even though it's a perennial as most people think of it. That's very separate from that rule interpretation, because that would apply to many other planting stocks.

The other thing I want to just mention is that, while you're going through those old revised rules, what Owusu was referring to was the Green Book, and I have a copy of that NOSB recommendation out of the Green Book.

MR. MATHEWS: I would appreciate getting that tonight if we can.

The other thing is that I do have a question on the recommendation as you're presenting it.

Would this allow someone to take two crops before they pull them out and replant?

MS. KOENIG: Two crops within the same year?

Yes. Within the same annual cycle of when they -- I mean, a true annual is a year.

MR. MATHEWS: Yes. And that does make sense,
because there are strawberries that are ever-bearers, and you could take continuous crops during the summer.

MR. BANDELE: Okay. Thank you, Eric.

The third item was on hydroponics. And this was a difficult issue, because, as you know, hydroponics is very, very unique. We also have a TAP review petition pending in terms of using of materials with hydroponics. But there seem to be some differences of opinion as to whether or not any hydroponic system would fit into an organic program.

So we did make a recommendation. It's short; I'll read it, and then we'll be open for discussion.

"Hydroponic production in soilless media shall be allowed if all other provisions of the Organic Food Production Act and NOP final rule have been met.

"However, the Crop Committee recommends that the principles of organic production as presented by the NOSB Board be met by any certified organic hydroponic system.

"We recognize it will be a challenge for many hydroponic operations to meet some of the principles, that is, promoting biological cycles, recycling materials, minimizing use of non-reusable resources, et cetera. And we recommend that hydroponic operations that do not meet such principles be denied organic certification."

This is somewhat similar to the recommendations
that the Board made in reference to greenhouse management, in which we did waiver away the requirements for crop rotation for some tomato growers who did not have a crop rotation system. But those growers did have alternative strategies as it applied to soil and plant health.

So in essence, I guess a lot of that determination would still be made by the certifying agent. We are not aware of all the possible applications, so I don't think one blanket answer would solve all. But this is the best that we could come up with.

Now, another point to keep in mind, in recent times it has been said that a lot of the things are already covered. But we don't know whether this is in fact the case with hydroponics or not.

There were different discussions about greenhouse operations. We went forward, and now it's already covered. So this may be a situation in which NOP feels that it's already covered.

But be that as it may, the recommendation of the Crop Committee stands as I just presented.

Yes. Willie?

MR. LOCKERETZ: With all due respect, Owusu --

MS. CAUGHLAN: Microphone.

MR. LOCKERETZ: Got it. With all due respect, I don't see that there is any content in this recommendation.
It says hydroponic crops, if they're going to be called organic, they have to meet all the organic requirements, except this other. You're just saying they have to do what they have to do.

Am I missing something here or is there some real content in this recommendation in the sense that it changes what people may do or says they -- yes.

MR. SIDEMAN: I've got to come up there again, because this is the first time I've ever disagreed with Willie. We want that on the record.

(General laughter.)

MR. SIDEMAN: This standard that we are presenting not only creates the situation where hydroponics has to meet the organic standards that are presented in the rule, but we're also asking them to meet the principles of organic production presented by the National Organic Standards Board, and why this recommendation has meat.

MR. BANDELE: Yes. Jim?

MR. RIDDLE: Yes. Just something that's probably understood by this recommendation, but I just want to point out that all inputs would have to be on the national list and all annotations followed, as well. Right?

MR. BANDELE: That's correct.

MR. RIDDLE: I mean, that's stated when it says it has to follow the rule, but I just wanted to point that
out.

MR. LOCKERETZ: In the very first line in the recommendation, what does "other" refer to? Shall be allowed if all other provisions of the OFPA have been met. Other than what?

MR. BANDELE: Other than the soil requirements.

MR. LOCKERETZ: Oh. Okay. Well, I think this was a candidate for "Not compatible with organic principles" right off the bat because of feeding the plants through the water rather than feeding the soil which then buffers and releases nutrients to be picked up by the plant.

That is about as fundamental a principle of organic crop production as any, and it's waived in this recommendation, as I understand it.

I think that you could have said, Plants grown in water are not compatible with organic principles.

MR. SIDEMAN: That's what I wanted to say.

MR. LOCKERETZ: Oh. So we're friends again?

(General laughter.)

MR. SIDEMAN: I just didn't think Richard would accept that.

MR. LOCKERETZ: Well, you know, let me suggest, if you rule it out as not compatible with organic principles, it would be like the fish, and you'd have a lot more fun.
MR. BANDELE: Yes. And again, I knew that this would be somewhat controversial, but I think it is something that we really need to make a decision on in fairness to petitioners. So I mean, it would be a moot point to go through the whole procedure about Chilean Nitrate and spirulina if in fact the whole system is found to not fit under the organic standards.

So that's really for the Board to determine. But that's the recommendation that we're making at this point.

Rose?

MS. KOENIG: I think that the committee acknowledged that only -- there's only a very, very limited number of hydroponic systems that probably could meet the requirements of the rule.

But we wanted to be open-minded enough to recognize that there may be some very innovative farmer out there that has come up with a very kind of holistic system where they're recycling those nutrients, that were hatched in an integrated operation with a fish.

You know, we were trying to make our minds very open to perhaps some kind of integrated system that may be out there that would be inclusive within the rule.

But, Willie, back to your point, it's my opinion and only my opinion that probably the typical hydroponic
operation that you're thinking about would not cut it in
terms of examination of the rule.

So it's not to say that we're broadly saying that
every hydroponic operation is going to be certified. It's
not that in the least. It's saying that it's a very
actually stringent allowance of an operation.

MR. LOCKERETZ: And who would determine whether
these exceptional systems would meet all these requirements?
Is that up to the certifier or --

MS. KOENIG: Yes.

MR. LOCKERETZ: That strikes me as a big task to
impose on a certifier.

MS. BURTON: I just have --

MR. BANDELE: I can't --

MS. BURTON: Oh. I'm sorry. I just have a --
I'm confused a little bit. But the principles of organic
that this Board adopted, I don't believe they're in the
standard anywhere. And I know that they are a document that
we approved as a Board that we would follow as guidance.

So to me, to put something in here as standards
for hydroponic production when it's really not part of the
NOP rule or standards --

Either you list those out as recommendations and
don't reference it to this document -- I mean, that would be
my suggestion, because a lot of people don't know what those
principles are that we adopted, just to make it clearer so that we can have discussion on each item, perhaps.

MR. BANDELE: Yes. Jim?

MR. RIDDLE: Yes. That's a comment that I was kind of in my mind formulating, too, because where it says, you know, e.g., you know, for example, promoting biological cycles, recycling materials, and then ends with, et cetera, I am a bit uncomfortable with that format.

And I would like to be more precise in exactly which of the principles we feel should be recommended as requirements for these systems.

MR. BANDELE: I think we can maybe reference the final rule as opposed to the principles and pull out some of those same points.

MR. LOCKERETZ: But along the same lines, I'm disturbed by, To meet some of the principles. That word, some, seems to be a very wide open door. That means if you meet a couple of these, you're okay. I think it's stated much better in the first sentence, you have to meet all of the provisions, except you don't have to grow in soil.

MS. KOENIG: I can accept that word change, Willie.

MR. BANDELE: Is that Kim?

MS. BURTON: Yes. One more question. If the NOP has acknowledged that hydroponics are in the scope of

Heritage Reporting Corporation
(202) 628-4888
organic, then, aren't we creating higher standards with something like this, or would this just be a recommendation again for certifiers to follow?

MR. BANDELE: Is that to me or to Rick?

MS. BURTON: I don't know. I'm just confused.

MR. BANDELE: Rick, maybe it would be helpful to get a clarification on, is hydroponics already covered?

MR. MATHEWS: The policy statement that is on the Web with regard to the scope of the National Organic Standards includes hydroponics.

So I guess, in follow-up to that, you're probably making guidance.

MR. BANDELE: Okay. Any more questions on hydroponics? Is that Mark?

MR. KING: Yes. So if I'm hearing you correctly, in the policy statement, Richard, that it's actually covered currently. And so what we need, then, if the Crops Committee deems it to be so, is a guidance document to perhaps further clarify that?

MR. MATHEWS: Yes. For those who haven't read the policy statement on scope, it basically says that any agricultural product or any product made out of agricultural ingredients are within the scope of the National Organic Standards for the purpose of labeling and for the way they're produced and handled.
MS. ROBINSON: I think based on the scope paper and then what Mark is asking and Rick is saying and what Rose started out with, you would want to elaborate your guidance.

If in fact you want hydroponics to embrace very specific parts of the rule to demonstrate that, you know, hydroponics can be done, but only under very strict sort of sets of conditions, then you would elaborate in your guidance material, understanding, of course, that guidance, you know, it could always be challenged.

But that's how you would get those sorts of recommendations out there to the certifying agents so that that would help them apply them.

MR. BANDELE: Okay. I think in the interest of time we will move on.

MR. CARTER: Rose has got one final comment, Owusu.

MS. KOENIG: What I recommend, Owusu, is that I don't think that we need to put forth that motion tomorrow in our recommendation. I mean, our recommendation basically is within the rule. I think we'll just put that on our plan of work for developing the guidance.

MR. BANDELE: Yes. I think that would be a good way to go with this. In other words, we saw it -- before we knew it was already covered, we saw it as a pressing issue.
But since it's already covered, that will give us a little more time to further refine that.

Kim?

MS. BURTON: Would it be appropriate to ask someone in the hydroponic industry to be a task force if you are going to be doing guidance documents for their industry?

MR. BANDELE: In all honesty, we've only had very few comments as far as from hydroponic producers, so I don't know how -- I don't know whether we really need to take a whole task force to deal with that.

MS. CAUGHLAN: Why don't you put something together and put it on the Web --

MR. CARTER: Owusu, to that --

MS. CAUGHLAN: -- as a guidance document?

MR. CARTER: -- I think that some of the input on this particular sector may come from not folks that are already involved in hydroponic production, but folks that are involved in some other things such as fish production that want to take a look at incorporating perhaps a hydroponic as a part of that. So --

MR. BANDELE: Yes. Willie?

MR. LOCKERETZ: I think to make this just a guidance document is a very risky strategy. The content of what you have to say is, most hydroponic systems will not make it. But the language is awfully positive and
encouraging.

The, Shall be allowed, is put positively. But the scope including the policy statement of the scope of the law that says it includes hydroponics sounds as though it could put the burden of proof on those who want to say, No, this system doesn't make it, rather than on those who say, See, it says here hydroponics is within the scope, it says here, Shall be allowed.

I think the language is entirely too positive for what is basically a negative recommendation here. And I'm also a little afraid that you're just opening the door to everybody. You have to prove why they can't come in rather than they have to prove why they can come in.

MR. CARTER: Okay. Owusu, I would recommend if there is no motion that's going to come forward tomorrow, then, let's move on with this and continue the discussion of Crops.

MR. BANDELE: Okay. The transitional product recommendations, Jim drafted most of the document, and the Crops Committee really made very few minor changes on it. And we are putting this forth.

I would like to note, though, that after discussion with the Crops Committee over lunch today, it will still be put forth tomorrow for a vote, but it will be in the form of a guidance document as opposed to a
recommendation to change the rule.

I think the consensus of the committee members is that there is a place for transitional organic even in the rule. But recognizing that this probably is not going to be a reality in the near future, we will put this forth as a guidance document.

Transitional labeling is to me very critical, particularly in areas where the organic movement is not as strong or does not have the historical base as in others.

We are recommending not a watering down of anything, because under this proposal, a producer who would be labeling transitional would follow all the other requirements as any organic producer, the only difference being that their land would not have been under organic management for the three-year period. So we don't see that as a watering down.

A lot of small scale farmers who are moving toward organics need to have some -- I think need to have some kind of economic incentives to help them along in the first few years.

And it may be that health food stores and some of the other folks who require certified organic products would not buy transitional products, but folks in farmers markets could. So we think it's a good justification.

The committee was unanimous in this, and we will
be recommending this, but not as a change in rule, but as a
guidance document.

Willie?

MR. LOCKERETZ: Again this is putting a major change under the not-very-major heading of guidance
document.

This is a big deal, because it addresses something that is not at all in the law or the rule, and it's quite fundamentally new. And I don't see it as coming in as a guidance document.

Also, if a person in the store looks at something and the label says, Transition, and he says or she says, What does that mean? We know what it means. It's the word you can't say, the O word.

Transitional by itself has no meaning. It could be transitioning from being a man, from being a woman, or who knows what. You know, it means in transition.

(General laughter.)

MR. LOCKERETZ: Also, OFPA doesn't say anything about the word, transitional, so why is it not freely available? OFPA only talks about organic.

But since they're not talking about a label, Transitional Organic, but just, Transitional, why does fall under this Board or NOP's scope at all unless it's because you say, Well, transitional means transition to organic.
MR. BANDELE: Yes. Jim?

MR. RIDDLE: Yes. Willie, that's why the recommendation includes a definitions section, and it starts off with that. Transition: The act of establishing organic management practices in accordance with the Act and the regulations.

MR. LOCKERETZ: So will the label say, Transition, Go see this document?

MR. RIDDLE: No.

(General laughter.)

MR. RIDDLE: It's not a matter of will. There are numerous products out there right now labeled, Transitional. There is a market for those products, and there is a need to bring consistency to them.

Right now, yes. It's beyond the scope of OFPA, it's beyond the scope of the regulation. But that doesn't mean that we can't have some guidance, provide some leadership to bring consistency.

There's at least several states and private certifiers that have standards, that are certifying transitional products. But there is no uniformity, no consistency.

And by posting this, I think it would help bring consistency to that and help provide some market recognition and a uniform definition to promote products on.
And also, we do have the NRCS offering transitional support by the word, Transitional, in at least three states now. And what do they look to to define what transitional is? They're looking to us for some guidance here. We've got an opportunity, and I think we should take it.

And this is consistent with practices. And like Owusu said, this isn't loosening anything up, this is tightening. These operators that would use that claim would be certified, they would be inspected, they would be on an organic program, they just wouldn't have the three-year history.

MR. BANDELE: I saw another hand.

MR. MATHEWS: The way I understand this is that what Jim is really recommending is that, rather than asking us to do rule making, which we've already said we would not do, that we're not going to cover transition, they are suggesting, from my understanding, that this would be a Board-only issue.

This would not be sanctioned by the National Organic Program. It would not be part of the National Organic Standards.

What we have with regard to a farm becoming organic is merely a requirement that no prohibited substances be used for a three-year period.
What Jim is trying to do, from my understanding, is to bring some standardization to the industry for converting conventional farms to organic farms.

And this would merely be a document that the Board is telling people, This is what we think you ought to be doing. You're not required to do it, but we think you ought to be doing it as you try to become an organic farm.

MR. BANDELE: A question about -- so, Rick, under this scenario, those states that at the present time have transitional programs could still maintain those transitional programs after October 21 because they are not making the organic claim. Is that correct?

MR. MATHEWS: We're not dealing with transition at all. So whatever the states want to do, whatever private certifying agents want to do is really up to them.

MR. BANDELE: Mark, I think I saw your hand, and then Willie.

MR. KING: Yes. I just -- and it may be in here. But I had a question. If I'm reading this correctly -- and I understand the establishment of organic management practices -- but under -- let's see, where are we at -- a product from an operation completed one or more years of transition period.

Okay. So what you're saying is that you technically through this guidance couldn't label it until
after that, say like the 13th month, in other words. And if so, we're not requiring an inspection here. Right? Is that correct?

   MR. BANDELE: No, no. The other inspection --

   MR. KING: Okay.

   MR. BANDELE: -- under 205(c), inspection in at least one of these to be called a transitional product.

   MR. KING: Okay. So it would have to really occur in the first year at some point?

   MR. BANDELE: Yes.

   MR. LOCKERETZ: Question, Rick. Does the USDA now have the authority to restrict or limit or control the use of the word, transitional, either under OFPA or anything else?

   MR. MATHEWS: Would you repeat the question, please?

   MR. LOCKERETZ: Does the USDA have the right to restrict or limit the use of the word, transition, on a food label?

   MR. MATHEWS: We have already stated that transition is not covered under the National Organic Standards. What we will be regulating is use of the word, Organic.

   MR. BANDELE: Okay. The final item was not on the agenda, but was the organic farm plan template that Jim
Just as is true with the handlers, we would propose that that would be included.

In all actuality, the committee has not voted on this. But we would like to -- I think everybody has had a copy of it, and we would like to put it on tomorrow as a possible action item after review by everyone.

MS. CAUGHLAN: What happened with the transition document?

MR. BANDELE: It's going to be put forth as a recommendation tomorrow.

MS. CAUGHLAN: Thank you.

MR. BANDELE: Jim, did you want to briefly address the template?

MR. RIDDLE: Sure. And also, Goldie, on the transition document, I intend to do a little redrafting and remove those numbers that are rule-based numbers and to put a little introduction section in there to make it clear that this is beyond the scope of the regulation and is just a recommendation of the Board, too. So there will be a new version of it. But none of the actual content will change.

MR. LOCKERETZ: Jim, I suggest you drop the phrase, Certified Transitional, because that stands a snowball's chance in Austin to get accepted by the NOP. We've heard that you can't use, Certified Organic.

VOICE: This isn't going to be accepted by the NOP.
MR. BANDELE: Yes. This is outside the scope.

MR. RIDDLE: It's beyond the scope.

MR. LOCKERETZ: Then, who is it to?

MR. RIDDLE: That's a whole other --

MR. LOCKERETZ: Who is this to? Who is --

MR. CARTER: Okay. Let Jim continue.

MR. RIDDLE: The farm plan template and the farm plan update forms you all got copies of. And those are based on work that was done under a USDA FSMP grant back in 1998, before there was a rule, to bring consistency. And then they have been updated to be compliant with the rule.

And they include the citation numbers from the rule and little summaries of what the rule contents are.

And they have been widely circulated, and numerous certifiers have already used them as templates for their own basic farm plan forms, put their own logos, names on them, et cetera.

By posting them on the NOSB page of the Web site, they would be available to both certifiers and any producers who are just wanting more information and more guidance, someplace they can go to a public site and download these and kind of do some homework as needed to prepare themselves for the real thing, for the real certification.

So they're just tools, just like the affidavit
that Kim had put together that the Processing Committee put forth, tools to help in the compliance process. So that's how they're being offered.

MS. CAUGHLAN: I'm confused, because the farm plan that we've been looking at and discussing is not what I'm seeing here.

MR. RIDDLE: There's two forms. One is the full farm plan form, and this would be filed on an annual basis. A farmer has to file some kind --

MS. CAUGHLAN: So this is the continuation document?

MR. RIDDLE: Right. So they don't have to refile.

MS. CAUGHLAN: Got you.

MR. RIDDLE: They've got a standing farm plan, and then they just have to register any changes, which is a requirement of the rule.

And this actually goes way back. I think it was '95 the NOSB -- that's in the Green Book -- did create an organic farm plan form way back then, but it was heavily narrative and very cumbersome. But the spirit of that plan is carried forth in this.

But we tried to give a whole bunch of check boxes where there's options of various compliant practices that can serve an educational purpose, but also save on
handwriting.

MS. CAUGHLAN: Okay. Jim, this --

MR. RIDDLE: Yes.

MS. CAUGHLAN: The organic farm plan itself is not the document we've been looking at.

VOICE: There's a handling plan.

MS. CAUGHLAN: Handling plan?

VOICE: There's three there.

MS. CAUGHLAN: I read both.

VOICE: You've never seen that one.

MS. CAUGHLAN: I don't have enough to read.

MR. RIDDLE: Okay.

(General laughter.)

MR. BANDELE: Yes. Kim?

MS. BURTON: Jim, I just was curious if this has gone out to the OTA's Quality Assurance Council and whether OCC has -- has any of the trades --

MR. RIDDLE: Yes

MS. BURTON: -- seen this and signed off on it?

MR. RIDDLE: It's been widely circulated to all members of both OCC and ASOP, all the certifiers, and it has also been submitted to OTA.

And whether they have turned it around to QAC members, I don't know. That's up to them.

But we have gone through three rounds of comments
and revisions in this process.

MS. BURTON: Then, again, this would be, if this Board adopts this, then it would be posted on the NOP Web site for comment?

MR. RIDDLE: Yes. Just like the handling plan. Yes. This is not, you know, the end of the process, the end of the road. Right.

MS. BURTON: Okay. Thank you.

MR. MATHEWS: Can I get a clarification, then, Jim? Are you saying that you would be voting to put this on the Web to get feedback and then would later be voting on it a second time in a final version for submission to the NOP to post as guidance, or are you intending to approve it now and give it to the NOP as guidance?

MR. RIDDLE: Well, in following our procedures, I would say it would be more appropriate to post it for more comments before it would go to the NOP in a final form. It may not change. I don't know. Because it's already been subjected to a lot of comments, but not through our procedures.

MR. MATHEWS: Okay. I'm glad to hear that.

MR. RIDDLE: Yes.

MR. MATHEWS: And the reason why I say that is that this recommendation is not on the agenda prior to the meeting.
MR. RIDDLE: Right.

MR. MATHEWS: This recommendation was not posted on the Web site as something that would be discussed here, and this recommendation is not included in the Federal Register document.

MR. RIDDLE: Right.

MR. MATHEWS: So if it had been anything else, I'd have had to get a legal opinion as to whether or not we could have even acted on it.

MR. RIDDLE: Yes. No. It would just be coming from the committee for posting for comment, same as the handling one and the affidavit.

MR. BANDELE: Yes. That concludes, except for one quick comment, if I may, Dave, and that is the urgency of us getting a quick response from Rick in terms of the planting stock, because there are a lot of folks in terms of sweet potatoes, strawberries, and a lot of the other crops that are affected. So the Crops Committee would like to move on that as quickly as possible.

MR. CARTER: Okay. All right. We are now at a quarter of 6:00, but I think we can get through these.

We will go into Accreditation. Jim, you always have non-controversial items.

MR. RIDDLE: Yes. Okay. All right. From the Accreditation Committee, the only draft that we have in the
book is a draft which is a first round draft once again to be submitted for public comment. It hasn't been posted previously. And it's not to lead to a rule change. And this is criteria for the certification of grower groups.

And by grower groups, I'm talking about groups of producers in a close proximity to one another that use uniform production methods and inputs and are organized under one management and marketing system. And this is commonly used for production of coffee, cocoa, tea, spices, things like that.

And currently there is extensive certification of these types of operations that's already occurring, but there's not necessarily uniformity in those certification procedures.

And this does need to be done in concert with the international community, because a lot of this work is done outside of the United States, these types of certifications.

So it's an attempt to bring some consistency, especially to provide some guidance to the accreditation process, because when a certifier that conducts these types of certifications is reviewed, right now there is nothing for the evaluators and the Accreditation Program to look towards for a little more clarity in how they assess this type of certification work.

Because there are several unique things about
grower groups, and that is that when they are inspected by
the certifier's inspector, it's really the quality system of
the grower group that is certified.

It's not every one of the 500 or 1,000 small
farms that's part of the grower group that's inspected on an
annual basis. It's the quality system, what's called the
internal control system. And they have their own inspectors
internally that visit every site and file reports and put
together the organic plans.

So that -- I'm not going to read through it.
It's a fairly long draft, and it does include some addendums
on how these operations are inspected and how the internal
control systems are organized.

And it does not set specific criteria for what
percentage of the farms must be visited on an annual basis
by the certifier's inspector. That's something we are
seeking guidance from the community on.

And it doesn't have any definition or guidance on
a small holder, because typically these producers are very
small, both in terms of the land that they manage and their
annual income. So it doesn't approach any recommendation on
defining small holder, and that's something else we are
seeking guidance.

So hopefully this is ready for posting, meeting
the criteria of the NOP. But it would not be leading to a
rule change.

Any questions or comments about this?

MR. SIEMON: The intent is for this to be used as well in the United States. Correct?

MR. RIDDLE: Yes. It's not limited geographically so long as all the criteria are met.

MR. SIEMON: And then, once you start down that road, then, you said social, geographical. You know, what does that have to do with it? It seems to me it's the system is what has to with it, the management system, the quality control system.

MR. RIDDLE: Yes.

MR. SIEMON: What does -- do the producers all have to be in one group, they all have to be poor, they all have to be this? I mean, it's the umbrella that counts.

MR. RIDDLE: Right. Their internal control system is what's getting certified.

MR. SIEMON: And then is there nothing in the rule that requires annual inspections?

MR. RIDDLE: Annual inspection of the operation.

MR. SIEMON: The operation. Now you're defining the operation possibly as the umbrella organization.

MR. RIDDLE: When you look at the definition of operation -- well --

MR. SIEMON: Yes. You've got the cooperative.
Yes.

MR. RIDDLE: Right. It links to a person. And the definition of person clearly includes --

MR. SIEMON: Association.

MR. RIDDLE: -- cooperative or association.

MR. SIEMON: Okay.

MR. RIDDLE: Any other questions or comments?

MS. KOENIG: I've just have one question on this.

MR. RIDDLE: Yes. Rose.

MS. KOENIG: Just a question of clarification.

So in those groups where you're getting certified as one group, if there is a noncompliance or something within one of those members, then the whole group can get decertified?

MR. RIDDLE: That's certainly a possibility.

Yes. Not necessarily so, but it would be part of the evidence that could lead to the decertification of the -- because it shows a failure of their internal control system.

MR. MATHEWS: Even worse, it could lead to removal of the accreditation of the certifying agent.

MR. RIDDLE: Well, just as any fraudulent certification would or noncompliant certification.

VOICE: Okay. You're good to go.

MR. RIDDLE: Okay. So the next item on the agenda for the Accreditation report is the accreditation complaint procedures.
And I'm just basically briefing the Board here on conversations that I have been having with the NOP as a Accreditation Chair.

And one of the requirements under the ISO 61 guidelines that the NOP has committed themselves to follow as an accreditation body is to have complaint procedures and to post those procedures to the public so that if they have any concerns about the accreditation program itself or the bodies that you have accredited that they have a door open to them, and they know what that door is and actually how to turn the handle.

And so I've submitted some language to post to the Web site on the list of accredited certifiers. If you have concerns about any of the accredited certifying agents, here is how to submit a complaint, and then a little bit of instructions, that it must be submitted in writing and state the evidence upon which your complaint is based.

And that has been accepted, it is my understanding, by the NOP.

But the next step is to actually draft just the outline of the procedures, because as an ISO accreditation body, you have to meet the same requirements that an ISO certifier, and that is have a complaint log, have complaint procedures, get back to the person who submitted the complaint, let them know what the resolution was, whether
the complaint was found to be frivolous and without merit or if it's then been referred to the Compliance Division, those kinds of things. So that step clearly needs more work.

MS. ROBINSON: We do have drafted brochures, which I think we may even have in handout form, at the booth at OTA for what to do if you have a disagreement either as a certifying agent, if you've been questioned and you want to appeal the decision, or as a grower or a processor, if you have a problem with the certifying agent.

So we have two different brochures. They're written in very user friendly, What do you do? I mean, first of all, if someone takes action against you, why are they taking action, you know, what form is it, what do you do if you disagree? And then we go through the entire process.

And so we'll be handing those out. And to the extent that we get comments back, you know, from people saying, We don't get it, or, You forgot this or that, it's not too late for us to make revisions to those. So we do have something in the works for that.

MR. RIDDEL: Any questions about that?

(No response.)

MR. RIDDLE: Okay. Then, I'll move right on to the last item, and that is certifying agent issues.

And I did a survey a while back or circulated
some questions to all the state and private certifiers, and this was before the accreditation list was announced.

But one thing you'll be glad to hear is that I think -- yes -- all certifiers who responded were pleased at that point with the service that they had gotten from the Audit Review Branch and their desk audits and felt that the communication was clear.

However, in my --

(General laughter.)

MR. CARTER:  It seems to be a mandatory word in all of these.

MR. RIDDLE:  Right.  In my never-ending attempts to be popular with the NOP, I'll list a few of the issues that certifiers have.  You've heard a few of them in the comments earlier today.

But I heard numerous times that there are concerns with the varying interpretations or directives, both to certifiers and to producers.

And just a few of the quotes, this one from a state program: "USDA response to our request for rule interpretation has been slow and noncommittal."  I'm sure that's changed.

"Questions relating to administrative matters and clarification of certification requirements have not been addressed."
So there's been an ongoing frustration, I would say, with some of the interpretations, and I think that's no surprise to hear that.

There also still is a need for a program manual from the NOP that does incorporate this various guidance to the rule, that the NOP itself, or the NOS as it's being called, is a very rudimentary or it's not the level of detail that a certification standard typically has been.

And to bring consistency in those interpretations, ultimately some kind of a program manual should be put together to consolidate these guidance.

There's -- you heard it mentioned I think by one or two commenters this morning that it is a real problem that not all the requirements of ISO 65 are incorporated in the rule.

And so maintaining that two lists, that if a certifier wants to get into Europe, they have to get accredited by the NOP to operate in this country, but also then the fee for service of paying for the ISO 65 accreditation that the USDA also offers, with the same people doing the evaluations. So it's like dual accreditation from the same agency.

I think that calls to mind the need for some the Accreditation Committee to work with both the NOP and the ARC to marry those two, to merge those. And that may take
some hard work and some rule change.

But fortunately a lot of those differences already have been identified so that the background work has been done, but now we need to take it forward and get it so that one accreditation does the trick instead of two accreditations. That's a problem.

Another problem for some of the certifiers on the list of accredited certifiers, nine of them, to be exact, is with their organizational structure does not meet the conflict of interest requirements under the rule.

Well, the Web site probably still has some language saying that NOP will be posting examples of organizational structures that meet the rule.

Well, clearly 33 out of 42 applicants submitted acceptable structures, and there were no examples posted to help provide guidance to those certifiers. They're still looking for that.

And I'm also hearing now, just since I have arrived, that 120 days, which is the time requirement being given to certifiers to make all these changes, is unreasonable, especially on the organizational changes.

Because whether you're a membership-based certifier or a state program, you can't just make this change because the Executive Director says so. You have to change your bylaws, you have to go to the membership at an
annual meeting, or you have to go to the legislature and change statutes. So some of this may take more flexibility than the 120 days that's been given.

And then, you heard the concern about the NOP serving as an accreditor, as a writer of standards, an interpreter of standards on a one-to-one basis, and then as an appeals body.

As much as possible the NOP needs to, you know, be the writer of standards and the interpreter in a very general way, but not to get hands-on involved in that one-to-one decision-making process of the accredited certifier.

Let them do their job and then be ready to stand back as an appeals body.

There is also -- I'm almost done -- a need for an enforcement plan. What happens when there is fraud? Who is going to be out there from the AMS?

We haven't ever had a presentation from the Compliance Division. I think we need -- it's time now, with October 21 looming, to really have a good, solid enforcement plan in place and know who is going to do it.

The states that are becoming SOPs already have that, they have doing it for a while. But the USDA hasn't yet been enforcing, and I think we need to address that.

The other issue is just some of the implications of this JAZ [phonetic] arrangement with Japan where three

Heritage Reporting Corporation
(202) 628-4888
materials, lignin sulfonate, humic acid, and potassium bicarbonate, are not allowed for products going to Japan. Well, that verification of that has to start at the farm level. The farmer has to know it in advance. They don't often know where their products are going to be sold. So that has to be verified. The inspector has to know it, the certifier has to know it.

And so there's just a need for some more guidance on how to get products certified under our rule that also meet these three JAZ requirements at the same time.

That's it.

MR. CARTER: All right. Questions?

(No response.)

MR. CARTER: Okay. The last item, our International Committee, our equivalency standards. Willie?

MR. LOCKERETZ: Well, I see I'm in the slightly awkward position of having talked past my deadline before even opening my mouth.

(General laughter.)

VOICE: Thank you, Willie. Does that mean you're not going to say anything? No?

VOICE: Yes. What does that mean?

(General laughter.)

MR. CARTER: I don't think that means he's not going to say anything.
Go ahead.

MR. LOCKERETZ: We're the new kids on the block, the International Committee. We've only been working since early spring, and this is the first item to come out from our effort.

It was actually written mainly by Jim, so I'll say a little by way of introduction, and Jim will add whatever he feels is necessary, as well as both take your questions.

The International Committee got off to a late start because too much else was happening. It originally was Mark King, Jim and me, but now fortunately we're at full strength with Becky and Dennis newly added to the committee, so we're ready to take on the world, so to speak.

This document came out of a discussion that the committee and Keith Jones had a few weeks back in which we asked him, What are the major areas of action in the international scene that we should be concerned with? And we talked about that for quite a while, and out of that came this little document.

But in retrospect, I realize I was kind of negligent, because although when we talked in the conference call this sort of thing was the kind of thing we talked about, when we narrowed it down to this to be the one and only thing we would work on for now, I really should have
checked back with him and asked him whether this is, you
know, timely and appropriate.

Maybe Rick and Barbara can make up for my not
having talked further with Keith. Is this basically is
equivalency between U.S. and European Union on the table?

MS. ROBINSON: Yes, it is, Willie. FAS was
meeting with USTR, the Office of the Special Trade
Representative, last week. And USTR is always kind of vague
until they finally come to some decision. But the word that
we got back was it was a positive meeting. So, yes. It's
still on the table. And we'll see where it goes.

MR. LOCKERETZ: Fine. Good to hear that.

This subject of equivalency is explained in the
document.

It's a relationship between government to
government, or government to 15 governments in the case of
the EU, to say, We regard your standards, although they are
not exactly the same as ours, we regard them as being close
enough to fulfill the same purposes as ours. And so an
agreement is made that it will go even though there are a
few little differences in the standards.

But this turns out to be a very complicated
business, because if we are very lenient concerning European
exports to the U.S., that could put our farmers at a
competitive disadvantage through no fault of their own,
because they are working towards a higher standard.

On the other hand, if we're very tough on it, these are usually reciprocal arrangements, and, you be tough to us, we will be tough to you.

So some delicate balance has to be found as far as what we can regard as waivable, and, even though it's not strictly the same as our standards, first is what we regard as absolutes that we will insist on no matter what.

So Jim puts forth not the details of a possible equivalency agreement, but rather the criteria that should govern how you think about equivalency when you go into negotiations.

At the bottom of page 3, that's really the new content in this document. The other pages are mostly taken out of other things -- oh -- well, with one great exception that I should certainly not skip.

Jim and others, Lynn -- is Lynn still here -- there you are -- had gone through the EU regulations and the U.S. regulations in great detail and wrote up a table of where we're more stringent than Europe and, conversely, where Europe is more stringent than us. This is a factual background to this whole discussion, that five pages.

The original part is III, Recommended Criteria for Establishing Equivalency. And we have put forth basically questions the negotiators should have in their

Heritage Reporting Corporation
(202) 628-4888
mind when they look at various standards and decide whether to insist on our way or to be lenient and accept something else. These are the questions they should be asking themselves.

This is not a recommendation. It's too early for that. We've just really worked on this in the past several weeks. It's more for the purpose of getting the Board to start to think about the international aspects of the rule and OFPA and all that.

So it's to give you some material to familiarize yourself with the issue and an area of judgement which we've put forth as, you know, what should govern equivalency negotiations?

So there is no vote or anything to be taken here. It's simply to, as I said, to get you started to think about the international implications.

And so comments on any of this back to us would be very welcome, freeform comments, whatever your reaction to it is, to help us move it to a document that basically takes us further along in the process.

So, Jim, if you would like to add anything to that.

MR. RIDDLE: I thought I was getting cut off there.

Yes. It is my understanding, though, that we do
want it posted to the Web site for public comment. Correct?

After this meeting.

MR. LOCKERETZ: Yes. But not even labeled as an

International Committee recommendation, because that's a

think piece.

MR. RIDDLE: But seeking --

MR. LOCKERETZ: Seeking discussion. Absolutely.

MR. RIDDLE: Yes. Seeking discussion. Okay.

MR. LOCKERETZ: But they need to say that,
because this is at a very preliminary stage.

MR. RIDDLE: Right.

MR. LOCKERETZ: It's not even a formal committee

recommendation yet.

MR. RIDDLE: Okay. Right. Well, I just wanted
to summarize what I think is the heart of the matter.

You mentioned the criteria, and I actually want
to read through those, because this would be the guidance

that, if it's supported by the Board and by the public in

the comments, that we actually would ultimately recommend.

And that is when the negotiators are evaluating

another set of regulations to look at whether the regulation

is consistent with U.S. objectives. And whenever you're
talking equivalency, you're really talking objectives, not

compliance, not verbatim, but, does it meet the fundamental

objectives?
And typically objectives are stated in a statement of principles, principles and objectives. And our rule and OFPA didn't have such. There is a purpose of OFPA, but it's very narrow. It doesn't lay out kind of the fundamental principles. And so we reference here, Is it consistent with U.S. objectives as stated in the NOSB principles?

Now, Europe, in the EU regulation, has a lengthy statement of principles. The Codex document has a statement of principles. And so this is the most similar thing that we have.

Would recognition of the regulation as equivalent have any negative impacts on domestic producers, and would it have any negative impacts on domestic handlers?

Does the foreign regulation meet the expectations of domestic consumers?

Does the foreign regulation adequately address food safety issues?

And does the foreign regulation contain equivalent management requirements unique to the exporting country which are not relevant in the United States?

So those would just be some of the criteria. There certainly could be others added to this. But this is the initial stab at setting some criteria or some guidance for that.
MR. LOCKERETZ: I must say, though, when I look at these questions, which I think are excellent questions, I think they're the right ones that we should be asking, but I found it very difficult to apply them to most of the items on this table of equivalency of the EU and U.S.

It's a tough business. And that's why we're getting it out for comment this early, because the earlier the better.

We'd like you to not comment on the recommended criteria, but maybe give it a try to apply those criteria to some of the differences listed on the next four or five pages, and see what you come up with. We can learn by example, I think.

MR. RIDDLE: And also, if you're aware of other differences that you don't feel that we adequately address, we'd like to hear about that, as well, specifically on some of the materials, because this is not all of the differences. This is like the top list.

So if you feel there are some other deal-breaker type issues out there, give us some comments on that, as well.

MR. LOCKERETZ: Is it Kim down there who has her hand up?

MS. BURTON: Yes, I did. Then I closed my page.

Sorry. Some of the handling materials or the non-organic
agricultural items that we've been discussing, how does the EU address those? Because I've circled about six of them on that list that would be allowed with the change of 606. Do you know?

MR. RIDDLE: Yes. The EU has positive lists for one thing, so everything has to be on their lists. And in addition -- and that's just in general for processing ingredients, materials of nonagricultural. But if they are agricultural, they also are maintaining a commercially unavailable list in the EU.

So, yes. They are maintaining that, and that's one thing we're wanting to move away from and just base it on the criteria of commercial availability.

I don't know if that answers your question.

MS. BURTON: Yes.

MR. RIDDLE: Okay.

MS. BURTON: Yes.

MS. ROBINSON: I just want to add what -- one thing to add to what Willie and Jim are saying is that as you read through this, I mean, Willie is absolutely right, it's extremely difficult to go through all these criteria and then try to apply them.

But even if you did, if you do this just sort of pretend you are the negotiator and that sort of thing and try to decide what you're willing to give up, what you're
willing to hold fast to --

VOICE: That's fantasy land for us.

MS. ROBINSON: But the mere fact that there would be something on there that's a deal breaker, as you put it, or that you come to the end and you say, Gee, I don't think we could grant equivalency to the EU, we couldn't live with that, it does not mean trade cannot occur between the U.S. and the EU.

That is something to keep in mind, because there are other avenues that are step-downs from equivalency. Equivalency is the best of all possible worlds, so there's other things --

I mean, I don't want you to look at it like, Oh, God, if we can't find something here, then we'll never get any product into the EU because we'll never let them in here.

MR. LOCKERETZ: Yes. Remember it is a two-way process. And there are other ways for exporters of Europe, say, to send product to us, which is for them to be accredited by the U.S., probably the main mechanism that's going to govern most trade.

MR. CARTER: Okay. If that is it, before we recess here this afternoon, just three quick things.

Number one, I forgot to mention this at the beginning, but for everyone in the audience, we've talked a
couple of times today about the September meeting. That meeting is scheduled for the 17th and 18th of September in D.C. And that will be the meeting where we deal specifically with the 47,000 materials that will be coming in by then.

As well as, then we are looking at having a meeting in conjunction with the roll-out, the implementation of the program in October.

Secondly, for tomorrow morning if there is a way that we could arrange these tables a little bit so it's a little bit more of a V. I think everybody's neck is pretty sore today because of this straight line thing. And if we could have it so it's a little easier to make some eye contact.

Third, I'd just like to meet with Rick and George and Willie after the meeting here for a few minutes.

And finally, we're back at eight o'clock.

Yes?

MS. KOENIG: Something I was going to suggest is that if maybe people could type up their motions so that the motions are put forth typed, in front of us, so we can read them rather than --

MR. CARTER: Yes. Committee chairs, please, tonight, you know, prepare the motions that you are going to be bringing forward so that we're all very clear on what we
will be looking at.

    VOICE:  Who has a printer?

    MR. CARTER:  Jim does.  Jim has everything.  He even has a Power Point projector that you can use.

    Okay.  We're recessed.

    (Whereupon, the meeting was recessed, to reconvene on Tuesday, May 7, 2002, at 8:00 a.m.)
CERTIFICATE

IN RE: National Organic Standards Board

LOCATION: Austin, Texas

DATE: May 6, 2002

I do hereby certify that the foregoing pages, numbers 1 through 399, inclusive, are the true, accurate, and complete transcript prepared from the verbal recording made by electronic recording by Penny Bynum before the U.S. Department of Agriculture National Organic Standards Board.

MR. CARTER: We're ready to resume our meeting.
I would like to begin with just a couple of
announcements. Number one -- let's see where we're at on
the -- okay. First of all, number one, I'm just going to
turn it over to Willie to --

MR. LOCKERETZ: To make a cravenly self-serving
promotional announcement. Now that I got your interest,
the word ecolabels came up a lot yesterday, and I'm the
chairperson for a conference on ecolabels to take place at
Tufts University, which is where I work on my time off
from NOSB -- November 7 through 9, on all aspects of
ecolabels, which includes but is not limited to organic
and other ecolabels intending to show that a product was
raised with particular attention to resource conservation,
environmental benefits, and so forth.

There still is a little time for you to submit
an abstract for presentation at this conference, but even
if you don't want to do that, you may be interested in
attending it. I have this little notice. I'll put a pile
of them up on that front table explaining what the
conference is all about and explaining what to do if you
want to submit an abstract.

There's also a Web address which you can check
from time to time for the latest information. I also
wanted to give you a sign-up sheet except I can't find --
a sign-up sheet if you want to be kept informed
electronically.

Ah, this is it. If you want to be kept
informed electronically about information about the
conference, you can just sign up and I'll put you on our
list.

Organic is sort of the granddaddy of all
ecolabels, but this conference will be covering the
concept of ecolabels in its full generality.

MR. CARTER: Okay. Thank you, Willie.

Then on just a procedural thing, if -- the
Livestock Committee met this morning and they have looked
at some wording changes and some recommendations. So
there will be a couple of items brought up under the
Livestock Committee this afternoon that will be presented.

The agenda does not call -- Monday does note
that there's any vote on -- or not Monday; on Wednesday --
any voting, but the recommendation is to bring the items
up for discussion this afternoon and then we will bring
them back up for a vote -- yes, we can vote on the one
item that will be brought up, but the accessed outdoors
for poultry and the dairy replacement issues will be
brought up, reviewed this afternoon, and then will be brought up tomorrow morning for action. So that is a change. Please note that on the agenda.

Okay. Rick has got an announcement.

MR. MATHEWS: Yesterday during the Livestock Committee report, I was a little -- well, I was harsh in my comments about the product that was presented forward on a couple of the items.

And, George, I want to apologize for being so harsh.

MR. SIEMON: Oh, you already did that privately. And I apologize for not being more prepared. [indiscernible] said that but if we could vote today and people are satisfied it might help tomorrow's schedule. I don't know if we have to be bound by that. I'd rather be flexible, but that's up to you.

MR. CARTER: Well, I think 24 hours does not make that much difference, and I think just procedurally what we've talked about is that on these major items, we like to bring them up one day, have a chance to ruminate on it -- excuse my bovine analogies here in a poultry issue, but -- and then bring it up for action.

So any other before we launch right into this morning?
And I appreciate that. I think that -- you know, the whole idea that the -- and let me just make a statement. I mean, the whole idea of the NOSB and NOP is that there's always going to be kind of a healthy tension between the two as we go forward and because of the passions that are involved in this work.

But, you know, everybody around this table and in this room, whether they're part of NOP or the NOSB or whether they're just a participant in the discussions, has a very strong concern about organic agriculture and a very strong desire to make sure that it moves forward successfully. So we all have to keep that in mind.

Okay. Let's go on in then. We'll turn it over -- we talked about the policy manual yesterday for discussion. We wanted to bring that back up for action today.

So, Jim.

MR. Riddle: Yes, Mr. Chair. I'd like to begin by following Robert's Rules of Order and move the policy manual for adoption.

MS. OSTIGUY: Second.

MR. CARTER: Okay. Jim made the motion. I will announce the seconds. Okay. Nancy has seconded -- just to avoid some confusion here. Okay. Now, is the
motion on the whole manual or just those items that were not changed. Did you make the changes?

MR. RIDDLE: Well, I'm making the motion --

MR. CARTER: Go ahead -- okay. Explain --

MR. RIDDLE: -- to open it up for consideration.

MR. CARTER: Okay.

MR. RIDDLE: So yes, when we met on Sunday informally just to go through a review of the draft, there were a few items that we highlighted for setting aside. And so the manual that we'll be voting on is everything except those items.

And I do have them up on the screen, and I'm going to see if I can move it from here.

(Pause.)

MR. RIDDLE: Okay. Will you be able to hear me from here? Am I projected enough? So if I can do it from here -- I know I can do it.

So I would just like to run through it very quickly. We aren't going to need near the amount of time that's allotted on the agenda. As I pointed out to the board the other day that the electronic version of this is linked so that when you hit on a section in the table of contents, it opens up that section, so it's easy to move
around.

So, as I described yesterday, it has the duties of the board, which you got to read quick, but here's -- and yes. I'm really just going to focus the items that we're setting aside, because we walked through it otherwise.

So two of the items we're setting aside for now is the issue of keeping confidential predecision information not made available to the public through open meetings or the NOP Website. That certainly is an important consideration as a board member, but we just felt that there is need to rework that language. It's not that it's being deleted as such.

The same thing with the consideration about the board members speaking with one voice and our ability to -- if we did not support a recommendation of the board and we voted against it, we still can state that but to support the process, the decision-making process, so that we're speaking with one voice in terms of the integrity of the process. So we just need a little reworking of that section.

The conflict of interest -- there were no changes there, but there is a need for further development of one issue and that is if a board member was a
petitioner on a material -- right now our policy has been
or is that if a board member was a petitioner, they
automatically must recuse themselves.

However, we now have board committees
petitioning materials for the sake of a larger industry,
the need to get a material reviewed. And so that is a
different situation than if you're a petitioner on behalf
of your company to get a material reviewed, and we haven't
really developed the language to sort that out; what the
ramifications of board members petitioning as a board
member on behalf of the larger organic industry. So we'll
be adding some language there in the coming months.

We also had a -- under the votes we really talk
only about the decisive votes, the two-thirds majority of
the quorum needed to pass a final recommendation or to
including the status of materials. But there also are
times when we just follow a majority vote and that's not
addressed, so that's another issue we earmarked for
further development, so that I'm really talking about the
text that's not there.

Okay. Now here, a little rewording on the
responsibilities of the secretary that -- to make it clear
that the secretary doesn't physically do all these things
but is responsible for them getting done. So just a fine-
tuning of the wording there.

And here, I think we've already agreed to add
the highlighted words there, but the executive committee,
being's we operate on behalf of the board under FACA
responsibilities, there must be participation of the NOP
staff any time there's an executive call. And, We shall
meet monthly or as needed. We're adding some language
there.

And, Executives shall not take action on any
recommendation to the secretary, including status of
materials. So that -- we've already done the development
work, but I earmarked it just because it's new.

And we went through all the responsibilities of
the different committees. We made a couple changes to the
peer review appointment plan and we informally agreed to
those. But to make sure that the -- at least one member
in the alternate shall be NOSB members, and I had some
very awkward wording about the lowest vote-getter, and I
changed that to the person receiving the fewest votes.

Otherwise, let's see. Oh, I think we needed to
add some language on the committee chairs, that the
committee chairs are appointed by the chair of the board,
too. And we have notes -- I'm not going to go through
those, I guess, but -- because I've already hit on most of
them as we've gone along.

But we have made notes of the things we need to add -- Goldie did. And then a lot of the content is the materials review process, and that follows along with what Kim presented yesterday in great detail, and there's an example of a statement of work that a contractor, a TAP review contractor would have, and that's what this is.

And the only other change being proposed is to move away from using these voting forms that we have been using to some procedures following Robert's Rules of Order. Every time that a material is being considered, there'll be a motion from the committee chair to open the discussion. It will need to be seconded by any member.

The committee chair will summarize the recommendation from the committee, and then we will proceed with discussion. And that's the process we'll be following today, and it's all laid out there in writing and it's highlighted, but I guess -- we can leave it highlighted, but we are going to be following it, correct?

Is there no problem with that? And so that -- I think that --

MS. CAUGHLAN: Jim, it was also noted that we will be adding, for the benefit of those of us who are not Robert's Rules of Order-aware, those of us who are
challenged, there's going to be a --

MR. CARTER: A primer, or a Cliff Notes version of this.

MS. CAUGHLAN: -- Cliff Notes version.

MR. RIDDLE: Right. An abridged version of Robert's Rules of Order will be added as an addendum to the manual. Right. Thank you.

MR. CARTER: One thing, Jim, and this is just a -- I don't think it's a major action, but under the section where we talked about the executive committee and the like, do you use -- we use the word secretary in the same page both to refer to the Secretary of Agriculture as well as the board secretary, and I think when we're talking about the board secretary, we probably ought to put in the word board and when you talk about the Secretary of Agriculture, we ought to so designate.

So I think most of us understand that, but it could lead -- yes. So --

MR. CARTER: Good point.

MS. BURTON: We'd also talked about adding the flow chart into this, the material review flow chart.

MS. CAUGHLAN: That's a nice thing.

MR. RIDDLE: Well -- yes, I don't think I did that. Sorry. Forgot about that. So I just wanted to
back up a second. There's the policy on presenters invited by committees, and that has already been adopted but it is a policy so it's in this manual. And as we have -- as we develop a policy for guidelines for how to write a recommendation, that will go under this miscellaneous policy section as well.

MS. BURTON: And question. I see this as a working document. In other words, like the material review process or the petition process. As things change, we can automatically update this without getting the whole board to vote on it. Is that correct?

MR. CARTER: Well, that's why I was wondering if the motion that came forward was a motion to adopt the policy with the understanding that additional items will be added.

MR. RIDDLE: Yes, certainly. It's my understanding --

MR. CARTER: I think that's what I heard you say --

MR. RIDDLE: -- this is a living document --

MR. CARTER: -- when you made your motion.

MR. RIDDLE: Yes. Pardon?

MR. CARTER: I think that's what I heard you say when you made the motion.
MR. RIDDLE: Yes. Well, if not, I accept as friendly meant.

MR. CARTER: Okay.

MR. RIDDLE: Okay. And then there's the addendum of the NOSB principles of organic production and handling, and then the abridged notes version of the FACA facts, explaining just what a federal advisory committee is and how it's appointed and what the duties of the FACA, designated FACA officer are as relates to the committee.

So any other --

MS. CAUGHLAN: Question. Are these actually excerpted directly or are these your --

MR. RIDDLE: Did I make them up or did they --

MS. CAUGHLAN: No. I'm asking whether or not these are rephrased or are they --

MR. RIDDLE: Well, they were provided to me by NOP. I don't know -- I think Catherine e-mailed them to me. I pretty much pasted them in to you.

MR. MATHEWS: And they're prepared by the faculty.

MS. CAUGHLAN: Thank you.

MR. RIDDLE: Yes. It's not creative writing on my part. Okay.

MR. CARTER: Okay. Is there any other
questions or discussion?

    Yes. Willie.

    MR. LOCKERETZ: Procedural question. The sections that we're not dealing with now -- how do they get dealt with? Are they voted separately by the board or are we voting to say, We give you the authority to implement these changes; that we agree with them in principle, but go ahead and write them?

    MR. RIDDLE: Well, what I would prefer is they're being referred back to the board policy task force, and we will do a little work on them between ourselves and then re-present them back to the board for formal approval.

    I would just like to follow that for any changes to the policy manual. But in the interim if there's a need for a policy and the executive committee has met and gives interim approval, this is going to be what we follow until it's formally adopted by the full board. I'd like to have that understanding.

    MR. CARTER: Okay. That sounds good to me.

Okay. So if approved, then we will start following this document. The task force will rework the language. The executive committee will review that in the interim and we will make note that at the next board meeting we will
bring those items back up for final approval.

Okay. So we'll have that noted for next meeting's agenda.

Does everybody understand then what's on the table? Is there any other discussion?

If you're ready to vote, all in favor say aye.

(A chorus of ayes.)

MR. CARTER: Opposed, same sign.

(No audible response.)

MR. CARTER: Motion carries.

Which then gives us a 15-minute jump start on our next, which I think we will need for our materials review and action.

So Kim.

MS. BURTON: Okay. How we work this is we go again in order of crops, livestock, processing. The crop materials that we will be discussing, reviewing today, calcium oxide, calcium hydroxide, potassium sorbate, sodium propionate, and sodium nitrate.

So I will now turn it over to the crops chair.

MR. BANDELE: I'm passing out the motion to -- material that we can deal with.

The first is calcium oxide. I'm making a motion that calcium oxide is a synthetic material which
should be added to the National List with the following annotations. Must be source from lime kilns. To be used only when documented soil tests indicate sufficient or excess magnesium. To be applied in a form that yields less than a one degree Fahrenheit temperature increase when equal volumes of the product and water are mixed.

Do I hear a second?

MS. OSTIGUY: Second.

MR. CARTER: Okay. Then it's been moved by Owusu and seconded by Nancy. It's on the table for discussion.

MS. BURTON: Question. The documented soil tests -- what kind of impact is that going to have on the farmers to actually conduct the soil tests as far as cost and feasibility?

MR. BANDELE: Well, in most instances, like regular soil tests already include magnesium levels. In Louisiana, for example, I'm only aware of the cost there. It's a $4 test, Kim, which would include calcium, magnesium, potassium, phosphorus, et cetera.

MS. KOENIG: Owusu, can you indicate the votes of the committee?

MR. BANDELE: Oh, yes. The vote on that item was four in favor of the motion and one opposed. In other
words, the opposed person did not feel that this should be added to the National List.

MR. SIEMON: Are we -- this annotation, I mean, is this -- I hate to have this much of an annotation on it. I agree wholeheartedly with a, but I just don't know about the b and c.

MR. BANDELE: Well, let me elaborate on b and c. As far as b is concerned, there are oftentimes when magnesium is already at a sufficient or excess level. In a lot of those cases, the only readily available source to many farmers would be dolomitic lime, which includes magnesium.

So if we're talking about maintaining soil health, et cetera, it doesn't really make a lot of sense to add additional magnesium when you only really need the calcium. And as was indicated yesterday by some of the presenters, a lot of times the magnesium would have detrimental effects on uptake of other nutrients.

I should also point out that this was a very, very difficult decision for us. We kind of went back and forth on it. But there are some -- we feel, some unique features about this product and we certainly don't want to open up to a lot of synthetics.

But in this case, number one, the reason why it
is seen as being synthetic is the burning process, and that's unlike some of the other synthetics. For example, if you're talking about triple superphosphate, that ingredient is treated with phosphoric acid, so there's a difference there.

Secondly, it is our understanding that the source of the calcium oxide is like a byproduct of the process of retaining lime. So this byproduct then is utilized, and we kind of felt that that was also a sustainable practice in that we're using materials that otherwise may not be used.

MR. CARTER: Rose.

MS. KOENIG: I was on the committee and I guess I was the dissenting vote. And it's not that I don't feel that the product is safe or that it has value in agriculture production.

The thing that I want to caution, or my voting for the dissension is, A, in 1995 the NOSB defined synthetic as -- you know, and it's in the TAP -- as combustion of minerals, any combustion of minerals to be synthetic.

And then the product, at least calcium hydroxide -- I'm not sure about calcium oxide -- yes, both I guess, were -- well, calcium hydroxide, which you have
to have from calcium oxide, was a component of Bordeaux mixture and lime sulphur for fungicide use, but it did not approve the use of the soil amendment.

So this thing has come forth before the board before, and certainly, we've got five new members that might not know the history of some of these issues in terms of mine minerals and, you know, synthetic processes. But I think we -- you know, I'd like to caution those new members and those members that have been here only a year or two that it's important to look at that history and understand why these products were not allowed.

And again, not to say that upon reading the TAP, again, I thoroughly view it as a safe agriculture input. But really, the distinction is does it belong in organic systems? And what I see as the big problem is that there's a slough of other mine minerals that you could make the exact same argument for.

We looked at triple superphosphate before and we did not approve that product. The petitioner who was here was not -- I mean, we're looking at calcium oxide, and I'll also speak about calcium hydroxide at the same time because they're both products within the petitioner's brand name product.

And we heard testimony on the benefits of that
brand name product, but we don't know the benefits --
we're not looking at that brand name products. We're
looking at the individual component, mine minerals, of
that product, so we have no proof to say that those
benefits came from those individual mine minerals.

We only have testimony that they say good
effects from that brand name product, which these are only
components of.

What else do I want to say. I'd just again
would just -- the other most important criteria in my mind
as far as when we're making these decision is are there
alternatives available and are they viable. And in the
TAP report, we saw limestone, gypsum, rock phosphate.

We approved calcium chloride in terms of foliar
application for calcium deficiency in plants during the
last TAP review process. Wood ash and poultry manure, all
sources of calcium. They're not as readily available --
I'll certainly admit that -- and perhaps don't provide
that quick fix that the growers are seeking, but there are
products available and I would caution the board, adding
synthetic products to our list where we do have natural
alternatives available.

MR. CARTER: Go ahead.

MR. BANDELE: Yes. On the third item, George,
that was -- I failed to address that issue, and that was a kind of added lastly based on the testimony that was held yesterday and the fact that the petitioners felt that that would be a good -- both the petitioners and one of the TAP reviewers suggested that.

I appreciate and fully understand Rose's concerns. However, as pointed out, even though there are some alternatives, to me, as far as when we're talking about sustainability, we do have to take into account regional situations as well as the overall picture.

Now, if you say that limestone is -- for example, if you say that dolomitic lime is a readily available source, my contention would be that in those cases where there's high magnesium that it's not really a readily available source. I understand that the others are available as well.

MS. KOENIG: I would just like to speak to that. When we're approving -- number one, and I must agree with George on this -- is that when we have a list of annotations, it becomes burdensome not only for a group like OMRI who does materials review of these products, but just individual farmers.

They cannot access that information to make sure that it's from kiln sources only, and we know that
probably the largest source of it doesn't come from that area, so certainly, farmers in the area where Biocal [phonetic] or whatever brand name is produced, it's very easy for them to source that material.

But for you perhaps down in Louisiana, you may not have full knowledge about the source of your product, and you could easily be using a prohibited substance. So I don't think -- based on the fact that we can't enforce labelling of many of these products, we could be leading farmers down the wrong road by approving something that would never be clearly labeled and we have no enforcement of that.

And again, it's a very burdensome task to put on certifiers when you have three or four annotations. My question is if you need so many annotations, is it really a product that we want to list?

Additionally, as far as your, I guess, magnesium situation, again, there are alternatives. Again, not quick-fix alternatives as this product, but again, we are adding is a clearly synthetic product that we're putting onto a list, and one of those criteria is are there organic equivalent alternatives.

Additionally I'd like to note that no other certifier has allowed calcium oxide or calcium hydroxide
historically.

    MR. BANDELE: No other --
    MS. KOENIG: No other --
    VOICE: That's not true.
    MR. CARTER: Okay. First of all Willie and then George.
    MR. LOCKERETZ: No other than which one?
    MS. KOENIG: Well, I -- maybe all the ones that were listed in the tab. Perhaps there is an organization in that local area that might have added it.
    MR. CARTER: Okay. George, did you have --
    MR. SIEMON: Well, Jim, do you know -- I heard yesterday --
    MR. CARTER: Jim.
    MR. RIDDLE: Yes. Well, the TAP has a list which shows that currently, certifiers do not allow it because they have shifted to the National List, as they rightly should. But historically, it has been allowed by certifiers, but they took it off of their list to comply with the National List.

So it has been used on certified organic farms in the past. At least in the Midwest it certainly has.

    MR. CARTER: Okay. Other discussion? I fail to look down at this end of the table from time to time.
MS. KOENIG: Is there a possibility to get clarification from the TAP reviewers, because according to my TAP review, and I was only speaking to the TAP, in that section, the status among U.S. certifiers, is that just current status or was there historical -- I mean, I'd like to get clarification on that.

MR. CARTER: Yes, I suppose -- I mean, we can get clarification from the TAP reviewers. It's hard to -- because that delays --

VOICE: Well, there's people in this room that know.

MS. KOENIG: Or the manufacturer. I mean, I just want to know what --

VOICE: Who reviews this one.

MR. CARTER: Okay. So -- yes.

Emily, can you speak to this?

Okay. And then while she's coming forward, did you have something or do you want to wait till we finish with this?

MR. MATHEWS: Well, I'd need to say something on annotations. We've got -- from our perspective, we have two problems with the annotations, and I'm not attacking this particular one. I'm just stating the fact that when we take a material to the rulemaking process,
the attorneys are looking for any annotation to be very short, and they have given -- historically have given us problems over annotations.

We have another problem with annotations, and that's through CODX. CODX, from my understanding, would prefer that you either say it is approved or that it isn't approved and forget the annotations. And Keith can say more to that, if he's still around.

You got anything to add to that, Keith?

MR. CARTER: You need to come to the mic.

We're disciplining everybody here.

MR. SIEMON: About annotations, from kiln -- lime kilns, though, that's a source. That's a method of production. I mean, to me, saying calcium oxide from lime kilns is one continuous source. I mean, to me, that's not like b and c or a different level of annotation.

MR. MATHEWS: Yes, and I have --

MR. SIEMON: B and c are conditions, kind of like.

MR. MATHEWS: Yes, and there's -- that was part of what I also wanted to say about this. You raised the same concern that I'm raising -- that the annotation is too long. And for one thing, I have a question on c is why?
I mean, isn't that important? And so if we're going to go with annotations, we need them to be as minimal as possible, but I also want Keith to talk about the aspect of the international side of this with annotations.

MR. CARTER: Okay. So we have two -- Keith, if you'd come forward, and then we'll have OMRI.

VOICE: OMRI?

MR. CARTER: OMRI. Hey, I've only had four cups of coffee this morning. Actually, that's --

MR. JONES: I've only got two comments about annotations. One, I think annotations are a problem from an audit standpoint. You have essentially allowed the material, okay. But then you've got this contingent on here that, from an oversight and audit standpoint, makes it very difficult.

In fact, one of the discussion points that came up at CODX this time is do certifiers worldwide really audit the annotations or just exactly what is the process, and it's unclear that anybody is really auditing at the annotation level. So that's just a practical matter of an audit standpoint.

The second thing, though, is that as we begin to kind of look to CODX to provide some harmonization in
lists, it's going to be really important to make sure that if there is an annotation, it is succinct, it is clear, because these things have to be translated through languages worldwide.

And if you get an annotation that's six or seven, you know, sentences long, particularly with the French, it loses something in the translation. And so it's just a pure fact question that you need to make them succinct and from my bias working with CODX, I'd like to see no annotations at all.

MR. SIEMON: But in this case, there seems to be quite a bit of difference between the lime kiln production and other production, so source from lime kiln production -- is that too much of annotation?

MR. JONES: Well, that's -- I can't tell you, George, what to do on a material, okay. That's a decision of the board. I can tell you that a shorter annotation is easier to work with than a longer annotation, and no annotation is easier to work with than a shorter annotation.

So that's my -- thanks.

MR. CARTER: Okay.

MS. KOENIG: The question was before the national rule, what was the historical status of the
product?

MR. ZIMMER: Historically, we -- I think in 1985 or so, for organic farms we started using the product called Biocal, which was --

MS. KOENIG: I'm talking about -- I don't want to know testimonial about individual farms.

MR. ZIMMER: No, I mean --

MS. KOENIG: The specific question is what certify -- if you have knowledge of the certifiers that allowed it. If not --

MR. ZIMMER: Yes.

MS. KOENIG: -- maybe somebody else can speak to it.

MR. ZIMMER: Yes. No, obviously, I was on OCA board for awhile, and it was accepted by OCA, although certifying agencies were accepting hydrated or kiln dust or whatever we called it at that time. I think that really a red flag came up when they started using kiln, cement kilns, to burn toxic materials.

Then all of a sudden people started throwing up red flags, and that's why lime kilns became so valuable.

MS. KOENIG: Right. I'm not -- I don't want testimony --

MR. CARTER: Yes. Okay. All we need --
MS. KOENIG: CCOF --

MR. CARTER: The question is -- and this is not a point for public testimony --

MS. KOENIG: CCOF, Oregon Tilth: What were the status in those agencies?

MR. ZIMMER: All were acceptable. It was used by --

MR. CARTER: Okay. Could I have -- okay. Let me have -- I'd like to have Emily --

MR. ZIMMER: It was taken off. About three years ago it was taken away.

MR. CARTER: Okay. I'd like to have Emily just -- okay.

MS. BROWN: I did put the current status in here because I assume that's what the board wants, but if you want us to continue to dig into old past, we could do that, too. But as far as I could find out, basically, and as far as my knowledge was, a number of chapters of OCA had always approved Biocal basically in the Midwest, and it was not a national OCA decision either.

And then when OCA got more organized on materials, it changed there. So as far as I know, the California-Oregon till East Coast there was -- has never been allowed.
I want to make one other point on this proposed annotation about the heat of solution. If you look at the TAP reviewer 3's comments -- can I do that?

MS. KOENIG: No. It's not fair.

MS. BROWN: Okay. Because -- all right. Well, I'll just tell you --

MS. KOENIG: Okay. We know that we've read the TAP review. It's not fair.

MR. CARTER: All right. Owusu.

MR. BANDELE: Yes. One other point on the annotations. The problem with it, and I appreciate what Keith has said, the problem, though, is that oftentimes without the annotations, the material would not be allowed. Without annotations, I would not vote for calcium oxide. So that's the dilemma that we're in.

However, Dave, I'm not sure in terms of parliamentary procedure, but as far as striking c, I would -- if someone wanted to make that --

MR. CARTER: Okay. If someone -- the table is open for any amendments at this point, so if anybody wants to make an amendment.

Kim.

VOICE: He can make the amendment.

MR. CARTER: Yes. That's fine. Kim has got
her hand up.

    MS. BURTON: I was going to make an amendment
to strike b and c and have the annotation, Must be source
from lime kilns only.

    MR. CARTER: Okay. So there is an amendment
made by Kim, seconded by George, to strike the language in
b and c, leaving then only the annotation in a.

    Discussion on the amendment? Okay. Jim.

    MR. RIDDLE: Well, I'm looking at the
annotation for micronutrients in the rule.
Micronutrients -- not to be used as a defoliant,
herbicide, or desiccant. Those made from nitrates or
chlorides are not allowed. Soil deficiency must be
documented by testing.

    There's an example of a standing annotation. I
think it is important to document deficiency, and that is
something that's clearly auditable. The inspectors do
look at that whenever micronutrients are being used
currently, and it would be a reasonable thing to audit for
any use of this material.

    So I guess I oppose the amendment specifically
striking b. I'd like to retain the requirement for soil
testing in this annotation.

    MR. CARTER: You can add an amendment to the
amendment.

MR. RIDDLE: Well, it would be contrary to --
yes. Well --

MS. KOENIG: The only reason for soil testing,
as far as I can understand, is I guess to really address
specific farmers' problems, and I'm not saying that
they're, again, I'm not saying anything against addressing
specific farmers' problems.

But it's because they don't want to use
dolomitic forms -- there's other forms such as poultry
manure, wood ash, that you wouldn't have that -- gypsum,
that you wouldn't have that magnesium requirement. It's
just that they're slower released forms of calcium.

MR. CARTER: Jim.

MR. RIDDLE: Well, I do question if wood ash is
available in any commercial quantities. Certainly for a
home gardener that has a wood stove, yes.

MS. KOENIG: Well, I'm not saying -- but their
poultry manure and crushed limestone and gypsum is
definitely available.

MR. RIDDLE: Yes. To me, the two sources are
gypsum and calcium carbonate that are commercially
available from natural sources, and that's the thing that
I'm really still weighing here, because those are fully
compatible with the rule and with the principles and they are available, but they don't serve exactly the same function.

But I look at this material, and I don't -- I see that it is also compatible with the very fundamental principle of soil ecology. It doesn't have negative impacts on the soil micro-organisms.

MS. KOENIG: That's not necessarily the case. You may feel a case from maybe the brand name product, but if you read the TAP review you're adding the -- you're altering pH, which can affect soil microbes. I mean, it's a liming product, and if you allow it and you don't specify -- again, depending on the annotation, people can use it as a liming product also.

I mean, the problem is is when you have testimony in a brand name use, but you're not listing that brand name product. You're listing the components of that product. So once you open that up, it can be used for whatever purpose by any organic grower in any region.

MR. BANDELE: I would suggest that we address the amendments.

MR. CARTER: Yes. This is strictly discussion on the amendment. Strictly on the amendment. I'm sorry -- I was -- Owusu, go ahead.
MR. BANDELE: I would like to maybe offer -- I would like to see that the annotation is voted on separately, so I suppose a friendly amendment would do that in terms of just --

MR. CARTER: The chair will accept that as a friendly amendment that we vote separately on each annotation and then on the motion as a whole. Okay. Is that acceptable to the board?

MS. KOENIG: It's not acceptable to me. I mean, I like to know what I'm voting for, because it's the package we're voting on. So I suggest a motion be in the form of what the committee chair feels is the -- I mean, it's very basic.

He can make an opinion on his own, because it's not a committee decision at this point. But --

MR. CARTER: Okay. What the procedure would be, though, Rose, is we vote on each amendment. Then we bring the whole motion up as a whole with whatever annotations then are left in or taken out. Okay?

Okay. Is that acceptable?

MS. KOENIG: I guess.

MR. CARTER: Okay. It's like a new car -- we're taking it for a test drive here.

Okay. Now, Rick has also had some thoughts
about where this might fit, too, just before we vote on that.

MR. MATHEWS: I would think that the annotation b that deals with the magnesium is probably already adequately addressed in 205.203(d), and the board may want to take a look at that and make their own decision as to whether or not that section already covers the annotation.

MS. KOENIG: Can you just read it?

MR. MATHEWS: Sure. D says, A producer may manage crop nutrients and soil fertility to maintain or improve soil organic matter content in a manner that does not contribute to contamination of crops, soil, or water by plant nutrients, pathogenic organisms, heavy metals, or residues of prohibited substances by applying: one, crop nutrient or soil amendment included on the National List of synthetic substances allowed for use in organic crop production.

Number two, a mine substance of low solubility.

Three, a mine substance of high solubility, provided that the substance is used in compliance with the conditions established in the National List of nonsynthetic materials prohibited for crop production.

Do you want me to keep going, because there's a number four and a number five and -- I mean, that's the
point.

MS. CAUGHLAN: This is a synthetic or would be a synthetic --

MR. CARTER: Turn on your microphone, Goldie.

MS. CAUGHLAN: It doesn't apply, as I read it, because this -- if we, as we vote on this as a synthetic, what you just -- what we're looking at here is -- applies to nonsynthetics.

MS. BURTON: Is that on the National List?

MS. CAUGHLAN: No, it says here --

MR. MATHEWS: Read number one. It says, A crop nutrient or soil amendment included on the National List of synthetic substances allowed for use in organic crop production.

MS. CAUGHLAN: But as you read, as we read, that the substance is used in compliance with the condition -- oh, okay. Established on the National List of nonsynthetics, so -- okay.

MR. SIEMON: Are we on the annotations now?

MR. CARTER: Yes. We're on the annotations.

Okay. The amendment was made -- yes.

VOICE: Turn on the microphone.

MR. CARTER: Okay. Just to keep this procedurally -- so that we know, okay. The amendment that
is made is -- first of all, let's just do the amendment
that we vote on each of these individually, okay.

Is there a second to that amendment? This is
just a procedural thing. Is there a second that we vote
on each of these --

MR. HOLBROOK: I second it.

MR. CARTER: Okay. Who did that?

MR. HOLBROOK: I did.

MR. CARTER: Dennis seconded that. Okay. So
the amendment that is on the table is that we vote on each
of these individually. All in favor of that process, say
aye.

(A chorus of ayes.)

MR. CARTER: Opposed? Okay. That process
carries. So we then take amendment -- or we take
Annotation A, Must be source from lime kilns.

Discussion on that? Are you ready to vote?

All in --

MS. KOENIG: The only discussion I have on that
is who will figure that out? Who -- you know, other than
if it doesn't get -- if it goes to an OMRI process, you
know, that could -- the brand could be or could not be,
and how are growers going to figure out that information
from a manufacturer?
MR. CARTER: Okay. Owusu.

MR. BANDELE: You could say the same for Chilean nitrate, which is already allowed. They are both synthetic and naturally occurring. So the same argument could be said for things that already exist.

MR. CARTER: Okay. Kim.

MS. BURTON: We looked at a document yesterday that was an affidavit that farmers, suppliers, anybody could use that would validate that a material has been used according to annotation, so it's an affidavit they could sign and say -- put this annotation on it and send it to the supplier and they'd have the documentation,

MR. CARTER: Okay. Other discussion? If you're ready to vote, all in favor of Annotation A, leaving that in, signify by saying aye.

(A chorus of ayes.)

MS. KOENIG: Aye.

MR. CARTER: Opposed, same sign. Okay. It carries on a vote of -- let's see, we're 14. I guess we're one short -- 14 to one -- or 13 to one, excuse me, with Rose voting nay.

Okay. Second, the annotation to be used only when documented soil test indicates sufficient or excess magnesium. Discussion on that?
Yes. Kim and then Owusu.

MS. BURTON: I would just suggest that you change that to say, Soil tests must indicate insufficient or excess magnesium.

MR. CARTER: Okay.

MS. BURTON: An amendment.

MR. RIDDLE: I second.

MR. CARTER: Okay. So read your language again.

MS. BURTON: Strike, To be used only when documented, and so it would read, Soil tests must indicate sufficient or excess magnesium.

MR. CARTER: Okay. So what's on the table is to change that language, Soil tests must indicate sufficient or excess -- yes. Rose.

MS. KOENIG: I guess again, I would caution the board of writing or even approving a product that's based on a soil test for a totally different mineral than what you're adding. I mean, you're really -- again, what are we doing here? We're basically writing a rule to meet a very specific application. Is that what we want to do?

MR. CARTER: Okay. Other discussion?

MR. SIEMON: Just to make the point that -- just to follow that up, I think we're -- there's a lot of
different theories of the relationship of calcium to magnesium, and we're trying to say, Whose theory are we saying is the correct theory in this kind of annotation, and I don't think that's our role.

I think the guidelines that Rick read give us enough guidance as to the use of minerals.

MR. CARTER: Okay. Owusu.

MR. BANDELE: I don't agree with Rick that that -- first of all, it says the producer may do these things, what you just said, so they're not really bound by that. And secondly, I think irregardless of theory, if, for example, most agencies that are in the soil testing arena find that there's excess magnesium, to me, it makes to sense to add additional magnesium. So to me, that's not as theoretic as it may appear.

MR. RIDDLE: I guess I am uncomfortable with inclusion of the word sufficient in this. In my mind it should read, Soil tests must indicate excess magnesium as a condition for years.

MR. CARTER: Well, the only way -- we're so far down the line, the only way that that can be accepted right now is if that's agreeable to the maker of the amendment. So that change is made.
Rose.

MS. KOENIG: Again, I'd like to remind the --

the product you're approving is not adding magnesium to

the soil. You know, what you're saying is that because

they don't want to add dolomitic limestone, then you can

add -- you have to use this product.

MR. RIDDLE: No.

MS. KOENIG: Yes, you are, because the product

has no magnesium in it. There's no reason why you

shouldn't be able to use a product whether there's

magnesium or not.

MR. CARTER: Jim.

MR. RIDDLE: You're saying what we'd be saying

is you may use this product; not that you have to use this

product. You still could use calcium carbonate. You

still could use gypsum, but you also have this option.

That's what it would be saying.

MS. KOENIG: Yes, but Jim, think about -- just

sit down and think about what that -- you are sitting, but

I could see if you are adding a product that had magnesium

in it, right, and you didn't want to overload your soil

with magnesium, so you said, Okay, you got to check to

make sure there's not a high amount of magnesium in your

soil, because you don't want to apply this product that's
going to override your magnesium.

But what you're saying is you have to check to
see if magnesium is in your soil, and if it's high, then
you're allowed to use this, even though you're not adding
any more magnesium to it, because we think that this is
better than a natural product, one of the natural
alternatives.

Again, you're customizing a rule for a very
specific soil type and purpose, and I would caution you
against it.

MR. CARTER: Okay. Owusu.

MR. BANDELE: Yes. That's really not the
intent of that annotation. The annotation is really
saying that, you know, in the sense that if your magnesium
is low that you want to use a natural product. You want
to -- you know, I mean, that's implying that you can use
dolomitic lime.

But in cases where it's -- I would say
sufficient or excess, because if you have a case where you
have sufficient magnesium, adding dolomitic lime will
probably push that into the excess earlier.

MS. KOENIG: Then use gypsum. Use crushed
limestone. Use the other alternatives. There's not one
alternative here that's natural. Why don't we say on it
then -- yes, again, if there's no natural alternatives, I buy your argument.

But we're not -- you know, there's a list of other sources that don't include that magnesium. So justify it in your annotation. Don't write an annotation that makes absolutely no sense.

MR. CARTER: The question has been called that we vote. What we are voting on at this point is simply to change the language in Annotation B from the original language there to new language that would say, Soil tests must indicate excess magnesium.

There will be a separate vote if this passes on whether or not to include that language. So this is only a motion to change the language. Whether or not you like the annotation, this is a motion on whether you like the new language better than you like the old language, okay? Everybody understand? Okay.

MS. CAUGHLAN: Restate the language then.

MR. CARTER: So the new language being proposed under the amendment is, Soil tests must indicate excess magnesium, period. Okay. All in favor of that wording change, indicate by saying aye.

(A chorus of ayes.)

MR. CARTER: Opposed, same sign.
(A chorus of nays.)

MR. CARTER: Okay. So would the nays hold up their hands. Okay. It passed, with nays being Dennis, Owusu, and Rose.

MR. RIDDLE: Mr. Chair --

MR. CARTER: Okay. We're back now to the motion -- to the amendment to pass. Okay.

MR. RIDDLE: No. Yes, just a point of order. Just to ask for abstentions on whatever you vote.

MR. CARTER: Oh, that's true. Yes. Not only ask for abstentions, but I should have before we began this starting asking if anybody needs to state a conflict of interest on this particular issue. The chair apologizes. How's that? Okay.

MR. SIDEMAN: David, may I ask you one thing?

MR. CARTER: Okay. Just if it's a point of order.

MR. SIDEMAN: Well, it's sort of a point of order. It's a point of personal --

MR. CARTER: Okay. Yes.

MR. SIDEMAN: OFPA makes provisions for allowing synthetic materials, and that list of provisions I don't think allows for synthetic sources of macronutrients. So I don't think this could actually be
permitted under OFPA. Calcium is one of the six macronutrients.

VOICE: That's testimony.

MR. CARTER: That's testimony. Yes. So everybody's instructed to forget what Eric just said.

MS. KOENIG: I would like to point out, though, due to the fact that we had committee member -- excuse me -- we had committee members coming onto our committee that didn't even vote that are present at this table. Eric was still officially on the NOSB.

Now, I'm not saying that he can vote today, but I'm saying he was voting in the committee reports before the committee members attended.

MR. CARTER: Okay. I'll accept that. Okay. The language, though, now what is -- yes?

MR. BANDELE: See, I always wanted a clarification on this point, because to me, I understand OFPA saying that, but it's my understanding that if a petitioner petitions for a synthetic, then if it's added to the National List it's allowed.

But if the point that Eric made is true, then this whole discussion is moot.

MR. RIDDLE: Yes, I'd like that citation.

MS. BROWN: [indiscernible]
MR. CARTER: Slow down.

(Pause.)

MR. CARTER: Okay. Please take your seat.

Okay. It's covered by the TAP review, okay. So we will proceed here, okay. So the discussion that is acceptable at this point is we are only voting now on whether or not to include Annotation B, which now reads, Soil tests must indicate excess magnesium. Okay?

VOICE: No.

MR. CARTER: No? We only voted to change the language. We didn't vote to accept. So this is what we're voting to accept this annotation. All in favor, say aye.

(A chorus of ayes.)

MR. CARTER: Opposed, same sign. Raise your hand so we can note. Okay. So we have Kim, Rose, George.

That fails, because there was -- if we got 13 -- okay, so we got 14. We got five -- yes, we needed nine. Yes, we still needed ten.

Okay. The vote for. All those that were for it, raise your hand. Let me just -- it's easier for me to -- okay. Raise them high. Okay. Nine voted aye, being less than the -- was it two-thirds?
MR. LOCKERETZ: Well, it's a two-thirds voting.

No, there were two abstentions.

MR. CARTER: There were two abstentions.

You're right. Okay. So that does carry.

Procedural. Yes, it's only -- you're right.

Okay. It's only if you're recused, so an abstention is in effect a vote. Yes. Okay? So that fails. This annotation is not included.

MR. LOCKERETZ: Mr. Chairman, I wasn't aware that an abstention would count as a no vote, so I would like to be able to change my vote from abstention.

VOICE: I move to reconsider.

MR. CARTER: Yes, you have to -- somebody that voted on the prevailing side of this, which is the no side, the abstentions have to vote for a motion to reconsider.

MR. LOCKERETZ: I move a motion to reconsider.

MR. CARTER: Is there a second?

MR. KING: Second.

MR. CARTER: Okay. It's nondebatable. All those in favor of --

VOICE: Wait. Willie was the one who abstained. Correct?

MR. CARTER: Yes.
VOICE: Then how can he -- he can't make the motion.

MS. BRICKERY: No, he cannot. An abstention counts for purposes of people present voting but not for this purpose.

MR. CARTER: Okay. Carolyn will be the official parliamentarian here. Okay. So that is -- okay. Is there anybody that voted no that is willing to make a motion for reconsideration?

MR. LOCKERETZ: Well, since abstentions are counted as no, is there a difference here?

VOICE: They're not counted as a yes or no.

MR. SIEMON: Yes. I'll make that motion.

MR. CARTER: Okay. George voting -- and you voted no. Right? Okay. So George, having voted on the prevailing side, making the motion. Is there a second?

MR. BANDELE: From anybody?

MR. CARTER: Yes.

MR. BANDELE: I'll second.

MR. CARTER: Okay. The motion to reconsider is back on the table. All in favor of reconsidering this motion, say aye.

(A chorus of ayes.)

MR. CARTER: Opposed, same sign.
(No audible response.)

MR. CARTER: Okay. There was one no. Okay.

So the motion that is back on the table to be voted on is including Annotation B, Soil tests must indicate excess magnesium. All in favor, say aye.

(A chorus of ayes.)

MR. CARTER: Opposed, same sign. Okay. Just four -- okay. High -- no's, hold them high. Be proud of -- okay. Three no's. Abstentions? No abstentions. Okay. So the motion then carries. This is included.

Okay. We are now down to the third one. To e applied in a form that yields less than one degree Fahrenheit temperature increase when equal volumes of the product and water are mixed.

All of those in favor of including this annotation, say ayes.

(A chorus of ayes.)

MR. CARTER: Okay. All those opposed, nay. Hold them high.

(A chorus of nays.)

Okay. So this annotation is removed.

We are now voting on the motion as amended
which, at this point, says, Calcium oxide is a synthetic material which should be added to the National List with the following annotations: (a) must be source from lime kilns, and (b) soil tests must indicate excess magnesium.

Are you ready to vote on the motion as amended?

Owusu.

MR. BANDELE: Yes. I don't understand -- the point that I raised earlier. The answer was it's already in the TAP. But to me, I didn't get an answer. So my question is: Can a synthetic fertilizer be added to the National List and still be in the spirit of the Act? Because if that's not true, you know, it's moot.

MR. CARTER: Jim.

MR. RIDDLE: Well, they certainly can be petitioned and considered, in my mind. But I may seem schizophrenic on this one, but I was supporting the annotations because I think if it is going to be approved, there do need to be some tight restrictions on the source and the justification documentation.

But in looking back at OFPA, I think the section above the one that was referenced is really the relevant one, and that is, Is necessary to the production or handling of the agricultural product because of unavailability of wholly-natural substitute products.
And I'm -- and clearly, this material does have wholly-natural substitute products which provide the same nutrient.

MR. SIEMON: I disagree.

MR. RIDDLE: You disagree. Well, you --

MR. SIEMON: On the availability --

MR. CARTER: Turn on your mic, George.

MR. SIEMON: Not on the same availability basis.

MS. KOENIG: George, triple superphosphate also, which we did not vote for, it also has more availability. There's a lot of things that are a hell of a lot easier to use and a lot quicker sources, but they're not organic. Remember why we're here.

MR. CARTER: Okay. Kim.

MS. BURTON: Just a comment. When OFPA was written, there was quite a few -- even as far as processing goes, there was some synthetics that weren't allowed in processing, so we are allowing other materials on the National List in the processing arena that aren't provided for by OFPA.

So OFPA, even though it's the bible, it was written quite awhile ago. I just want to put that point of order in.
MR. CARTER: Okay. George and then we'll --

MR. SIEMON: Yes. My whole concern about this is first of all it's a definition of synthetic. This is a burn product. You know, a natural product that's burned -- that makes a synthetic. But you know, our goal is to raise nutritious feed.

This afternoon we got a proposal to allow the same item as a feed additive. Okay. So what we're saying is if this afternoon works, we're going to allow it as a feed additive but we're not going to allow -- and yes, it is a quick fix because of the one year to get the calcium level up in that feed to avoid that final feed additive.

It's a balanced thing. I think the synthetic is debatable, and I'm not sure why we don't want to raise nutritious feed.

MR. CARTER: Okay. Rose.

MS. KOENIG: I think that you don't have to look at it. They're not one and the same. We're looking at this as a soil amendment. We've approved it in crops, in Bordeaux mixture, and other components for fungicide use.

You get into the soil and soil amendments and fertilizers in soil use, it's a whole different animal, and I think you can separate those issues. You should
separate those issues. We're looking at each specific
product for their intended use.

MR. SIEMON: Yes, but the goal is to get as
close to the soil as possible. This is getting close to
the soil rather than adding it in the feed later on.
That's the purpose of this.

MR. CARTER: Okay. The question has been
called. So the motion that is on the table at this point
is voting strictly on, Calcium oxide is a synthetic
material which should be added to the National List with
the following annotations: A, must be sourced from lime
kilns, and B, soil tests must indicate excess magnesium.

All those in favor of including this signify by
saying aye.

VOICE: Let's do a hand vote here.

MR. CARTER: Okay. Hand vote. All those in
favor, say aye. Okay. Hold them high. Yes. One, two,
three, four, five, six.

Okay. All those opposed? Seven.

Abstentions? One.

Okay. So the motion fails.

MS. BRICKERY: Dave.

MR. CARTER: Yes? Parliamentary privilege.

You have to push on your mic.
MS. BRICKERY: I thought the level of debate on this was great. I loved it. We never had debates like this when I was chair. There must be a reason for that.

MR. CARTER: Do you want to get back on?

MS. BRICKERY: I want to get back on. Rose, you were great. However, I have a very serious point to make, which is I really think you've got to look at each of these materials on its own merits and not get hung up on these annotations.

There are legal problems with doing these annotations. We were told that the day I came on the board. The Office of General Counsel has a lot of trouble with these annotations. And picture yourself defending the material you just voted on with these annotations if you're Rick. It's going to be tough.

I mean, you know, it's convoluted. The reviewers are going to say, Well, how do we even know how you can find out what these sources are. It gets the group confused because you end up focusing on the tail rather than the dog. I don't mean anything pejorative about this material in saying that, but, I mean, that's the fact.

So I really urge you to look at these materials as a material and decide whether or not you think it ought
to be approved. Then and only then look at whether there's any kind of very specific limited restriction that you want to put on it.

You want to use it only for, you know, carrots. You want to use it only under conditions that won't allow some toxic thing to happen. I mean, really be selective about the criteria that you're looking at, and make sure they can be enforced.

MR. CARTER: Well, and I agree with that, Carolyn, but the whole idea is if a recommendation comes forward with this number of annotations, someone may or may not support the whole thing as a whole. But it still gives them an opportunity to go through there and weed out the ones and get it down to the number of annotations and then look at that package as a whole.

MS. BRICKERY: But Mr. Chairman, I respectfully point out that you have hundreds of these things to do. You are not going to be able to spend the time you just spent on each one of them --

MR. CARTER: Absolutely.

MS. BRICKERY: -- plus all the time that the committee spent in its very respectful and thorough deliberations and all the time the TAP reviewers spent. So don't rely on these annotations to determine whether or
not you're going to approve a material or not.

Look at the material, then take a position on whether there should be a very, very tightly limited annotation.

MR. CARTER: We'll take that under advisement.

MS. BRICKERY: Thank you.

MR. MATHEWS: She did miss one thing -- all the time we're going to have to take justifying it.

MR. CARTER: Okay.

MR. BANDELE: On the second motion, change calcium oxide to calcium hydroxide.

MR. CARTER: Okay. Proceed.

MR. BANDELE: I'm making the motion that calcium hydroxide synthetic be used -- should be added to the National List with the following annotations: Must be sourced from lime kilns, to be used only when documented soil test indicates reasonable or excessive magnesium; to be applied in a form that yields less than a one-degree Fahrenheit temperature increase when equal volumes of the product and water are mixed.

MR. CARTER: Okay. There's been a motion on the table. Is there a second?

MS. OSTIGUY: Second.

MR. CARTER: Okay. It's been seconded. Okay,
the seconder was Nancy.

Okay. Discussion on this motion?

MS. CAUGHLAN: What was the vote within the committee on this? I'd like to know that.

MR. BANDELE: The vote was the same. Four in favor, one opposing.

MR. CARTER: Okay. Rose.

MS. KOENIG: I'm not sure how much we have to discuss it. I think the arguments are exactly the same as the previous product.

MR. SIEMON: The same with d and e and f?

MR. CARTER: This is all just the same. This has been the proposed language. I think procedurally, everybody here understands that we're going through -- essentially, we don't want to go through all of the same debate we did on the previous one.

MR. SIEMON: So the same annotations as for oxide?

MR. CARTER: No. This is just this language -- this here. Okay?

MS. CAUGHLAN: Point. I'm assuming -- just a
correction here -- that you're meaning a, b, and c.
You're not meaning d, e and f?

    MR. CARTER: Kim.

    MS. BURTON: Instead of just going through a
lot of time and effort here, can I just make a motion that
we vote on calcium hydroxide with the same annotations as
the previous material, calcium oxide?

    MS. OSTIGUY: Second.

    MR. CARTER: Okay. It's been moved and
seconded by Nancy that we just change all of this to the
same language as the previous only before we dispense with
this one. Okay? Understand that. Just changing the
language.

    Okay. All those in favor, signify by saying
aye.

    (A chorus of ayes.)

    MR. CARTER: Opposed, same sign.

    (No audible response.)

    MR. CARTER: Okay. That carries. So we're
esentially voting on the substitute language, which is
the same language that we defeated in the previous one.

    All of those -- we're ready to vote, as I
understand -- all of those in favor of calcium hydroxide
reworded to the previous language, signify by saying aye.
(A chorus of ayes.)

MR. CARTER: Okay. Hold your hands up. Okay.

Two.

All of those opposed? Hold them up high.

Nine.

Abstentions? One abstention.

The motion fails.

MR. BANDELE: Sir, the potassium sorbate is a synthetic material that should not be added to the National List. That's a motion.

MS. OSTIGUY: Second.

MR. CARTER: Okay. I'm sorry. Motion was made to potassium sorbate synthetic material should not be added to the National List. It was seconded by Nancy. Okay. Discussion on the motion.

George.

MR. SIEMON: Just to point out the livestock committee has put the same material forward for use in herd health items, medications. So I just don't know what the relationship. I guess that's going to be whole other TAP review is what that will boil down to? I just want to make the point because it's just coming forward right now.

MR. CARTER: It's for a separate purpose, so yes. If you're ready to vote --
MR. BANDELE: I just want to add that in this particular petition, as you are probably aware, it was recommended as a seed treatment in an organic seed treatment compound which was not actually spelled out, so no one really knew what the substance was that they were adding this to.

So the reviewers felt that there was not even enough information to make an intelligent decision on that basically and the committee felt the same.

MR. CARTER: Okay. Kim.

MS. BURTON: Owusu, can you tell me how the committee voted on this?

MR. BANDELE: Oh. Sorry, Kim. That was unanimous -- five to zero.

MR. CARTER: All right. Ready to vote? Okay. Does anybody have a conflict of interest on this? Okay. I see none.

All those in favor of the motion that this material not be added to the National List, signify by saying aye.

(A chorus of ayes.)

MR. CARTER: Opposed, same sign.

(No audible response.)

MR. CARTER: That carries unanimously.
Next item. Oh, I'm sorry. Abstentions.

(No audible response.)

MR. CARTER: Okay. We'll all get it right eventually.

MR. BANDELE: Motion that sodium propionate is a synthetic material that should not be added to the National List.

MS. OSTIGUY: Second.

MR. CARTER: Okay. It's been moved by Owusu, seconded by Nancy, that it not be added to the National List. Discussion?

MR. BANDELE: The vote on that, Kim, was five to zero.

MS. BURTON: Thank you.

MR. CARTER: By God, we'll get this down. Okay. Seeing no hands up for discussion, you're ready to vote.

All those in favor of the motion that this should not be added to the National List, signify by saying aye.

(A chorus of ayes.)

MR. CARTER: Opposed, same sign.

(No audible response.)

MR. CARTER: Abstentions.
(No audible response.)

MR. CARTER: Okay. The motion carries. And we even did our procedure right.

MR. BANDELE: Next motion is to postpone consideration --

MR. CARTER: Turn on your mic, Owusu.

MR. BANDELE: Next motion, by five to zero vote, is to postpone consideration of the two petitions involving sodium nitrate until the September NOSB meeting.

MS. CAUGHLAN: Second.

MR. CARTER: Okay. It's been moved, this time Goldie seconded, that it be postponed until the September meeting on sodium nitrate. Okay. Discussion on the motion.

Owusu.

MR. BANDELE: Just clarification. I think many people are aware that there were some folks who supported the use of sodium nitrate, felt that there was not enough forewarning in terms of this petition to give them adequate time to respond.

On the other hand, we did have a petition pending involving the use of sodium nitrate in spirulina. That petition involved exceeding the 20 percent restriction. We felt that the petition had been in place
for so long that it really would not be fair to the petitioner if we delayed that decision, but at the same time, it was best to consider both at the same time.

So Kim, as chair of the materials committee, contacted the petitioners and they in fact -- that is the spirulina petitioners -- and they in fact stated that they had no problem with the September delay. In fact, they would favor that.

So with that in mind, the committee voted five to zero to postpone.

MR. CARTER: Okay. Discussion on the motion? Willie.

MR. LOCKERETZ: Question for Rick. If we acted in September on this, it would still be included in that interim final rule that's being developed?

MR. MATHEWS: The September meeting will go into a separate rulemaking docket. We are intending to put it forward as a second interim final rule. The timing on it, I'm not really sure, and of course we also have to get cooperation from OGC as a interim final rule.

So I can't tell you that it will happen before October 21.

MR. LOCKERETZ: Okay. Thank you.

MR. CARTER: Okay. Rose.
MS. KOENIG: Question. Clarification for Rick. We voted during the last meeting that things that we made decisionwise -- I mean, it was a recommendation that certifiers be able to use that as a working kind of document, and I'm not sure where that went, and it'd probably be informative to let us and everyone else know.

MR. MATHEWS: That's still an issue to be resolved with the attorneys, but the approach that we are taking is similar to what we have taken for the interim final rule, which is that the secretary really doesn't have a say in putting something onto the list, so we would argue that the board has already indicated its pleasure and that we would just be carrying out the process.

So we will be asking the attorneys for permission to say that it's okay, go ahead. But no guarantees.

MR. CARTER: Okay. Seeing no one else ready to speak, we'll proceed to vote.

All of those in favor of the motion, Postpone consideration of two petitions involving sodium nitrate until the September NOSB meeting, signify by saying aye.

(A chorus of ayes.)

MR. CARTER: Opposed, same sign.

(No audible response.)
MR. CARTER: Abstentions.

(No audible response.)

MR. CARTER: Okay.

MS. BURTON: Mr. Chair, the final motion from crops is that spinosad is a nonsynthetic material that should not be added to the National List.

MR. CARTER: Okay. Motion. Is there a second?

MR. HOLBROOK: I second the motion.

MR. CARTER: Okay. Seconded by Dennis. Okay.

Discussion. Okay. Let's start off with Owusu to explain the motion. Then going to Rose.

MR. BANDELE: Yes. Point of clarification.

When we say that it should not be added to the National List, that in effect says that it's a naturally-occurring substance and it can be used. It is a byproduct of a living organism.

The committee was concerned about certain detrimental environmental potential conditions, namely, damage to nontarget species like bees and other pollinators and also to some aquatic life. However, we did not add the annotation -- I'm sure some people were glad that we did not -- because we felt that that's already implied.

And in fact, the pesticides are to be used only
as a last resort already, and products such as rotenone, which I know is another whole ballgame, has serious concerns and people have to take those precautions.

So we felt that the precautions were already spelled out, so we recommended this use without annotation.

MR. CARTER: Willie next.

MR. LOCKERETZ: Just to clarify something. If it's been called nonsynthetic, then to say it won't be added to the list, National List, means it won't be added to the list of prohibited nonsynthetics? The sense of the -- I want to make sure we get the sense of the motion. So a vote would -- their recommendation is not to explicitly exclude it?

VOICES: Yes. Right.

MR. LOCKERETZ: Okay.

MR. CARTER: Wait a second. Wait a second. Kim is next and then George. No, wait a second -- Rose is next. I'm sorry.

MS. KOENIG: No, I just had wanted to point that out.

MR. CARTER: Okay. Kim.

MS. BURTON: One question. This was petitioned also for livestock, so I just want to clarify that this
would also be the vote for both crops and livestock. Just for clarification.

MR. RIDDLE: So there won't be a separate vote?

MS. BURTON: I don't -- I suppose -- I don't know -- George, did you work on this through livestock?

MR. SIEMON: No. We did not.

MS. BURTON: I just want to make sure that we get it under both categories, and I'm not quite finished yet. Rick is asking, just so that we make sure that we do have this right, that the recommendation should read, Spinosad is a nonsynthetic material that should be not added to the National List of prohibited materials.

MR. CARTER: Okay. Is that an amendment?

MS. BURTON: Yes.

MR. CARTER: Okay. Kim has made the amendment, George has seconded, to add the words, of prohibited substances, after the word List. Just discussion on this amendment now.

Okay. All in favor of the amendment, signify by saying aye.

(A chorus of ayes.)

MR. CARTER: Opposed, same sign.

(No audible response.)

MR. CARTER: Okay. So we're back to the
original -- on abstention, Jim abstains. Okay. So we're back to the motion as amended, and I had next on my list George.

MR. SIEMON: That's what I want to do.

MR. CARTER: Okay. Other discussion? Jim.

MR. RIDDLE: Yes. I have some problems with this material, and I'd like to just quote some of the things from the TAP review that I highlighted, which at the very best I think should lead to some annotation, some restrictions on the use of the material.

A repeated application could lead to some buildup of spinosans. The soil microbes degrade spinosad into other spinosans which are more persistent and biologically active, so its breakdown products remain toxic in the soil.

When it's applied to water, very little hydrolysis occurs. The substance can be persistent. In the absence of sunlight, the half-life appears to be at least 200 days. There are many insects, including ants and springtails, that could be impacted by the insecticidal activity of spinosad.

It's broad spectrum. It's not selective. Has a tendency to accumulate in fat and milk, if we're considering it for livestock use. There are other
alternatives to the product that currently exist, and a number of those are listed in the TAP review.

It can have negative impact on parasitoid populations, negative impact on pollinators. I think these are very serious ramifications as documented toxicity to fish and aquatic invertebrates.

I just have -- highly toxic, highly toxic, to marine mollusks. Just because we've allowed Rodenon as another natural doesn't mean we should make the mistake again. There are problems with Rodenon and were held up by organic industry is criticized because of the use of Rodenon which has some of these exact same toxicity, especially the aquatic toxicity, and that -- you know, making one mistake once doesn't mean we should repeat that mistake.

At the very best, I'd like to see some language, and I mentioned that yesterday, some annotation developed so that it would be actually placed on the list of prohibited natural materials with some very tight restrictions on its use.

MR. CARTER: Okay. Nancy.

MS. OSTIGUY: The committee discussed the possibility of annotations, and we basically came to the conclusion that they would be incredibly difficult to
enforce. And in addition, as pesticides of any sort are supposed to be items of last resort and to the organic farmer, the specific problems with the hymenoptera and the lepidoptera and the parasitories are -- the point -- if you are going to be farming organically, to adversely impact your hymenopteras, your pollinators -- whether we're talking honeybees or the native pollinators -- you would be shooting yourself in the foot if you used this material inappropriately.

The same thing with the parasitories. The last thing you want to do is decrease your parasitory population. And the committee did discuss this quite extensively. I was initially in favor of putting restrictions on.

It became clear very quickly that it would be incredibly difficult to enforce.

MR. CARTER: Okay. Kevin.

MR. O'RELL: What was the committee vote on this?

MR. BANDELE: Committee vote was five-zero.

MR. CARTER: Okay. Other discussion? Rose.

MS. KOENIG: I just want to reiterate what Nancy said and acknowledge to Jim, everything you pointed
out was -- it's definitely of concern and it's not something we're saying, This is a great tool. Go spray it every day.

We're feeling that through the certification process that those checks and balances should be there. Now, you're more of a person that might be able to enlighten us if we -- if you feel that there needs to be in law those prohibitions so that you make sure.

But we felt like a good inspection and a good farm plan, it would become very obvious if somebody was just using it as a preventative method each week as they were spraying. So that's -- I mean, I would defer that opinion to you because you seem to have more experience and you weren't there when we were discussing this.

MR. CARTER: Jim.

MR. RIDDLE: Well, yes, it's true that the rule does require that in the organic plan that any pesticide materials be used as the last resort; that they have to implement all of the preventative measures in terms of selection of varieties, cultural practices, encouraging beneficials and all those sorts of things.

And, you know, I hear what Nancy's saying on that, too. A person would be shooting themselves in the foot. But on the other hand, we got to think about all of
the conventional farmers that are converting to organic
production, and they want to know, What can I use? What
is allowed, because of the recipe mentality, the input
mentality.

And so now, this is a broad spectrum tool, and
as an inspector, there's no guidance being given except
what's in the rule to get down to using Rodenon or now
spinosad. There's nothing to have any additional
considerations because of the toxicity and the persistence
of this material.

And especially, I mean, if this is going to be
wide open to livestock use, I don't think we've considered
those impacts at all, especially the fact that it can
accumulate in fats and milk.

MR. CARTER: Okay. Rose, then George, then I
have a question, then Mark.

MS. KOENIG: Well, again, the crops committee
did just look at it for crop application. We did have an
indication that livestock was going to listen to our
recommendation and then make perhaps a recommendation
following that, but we specifically looked at it in terms
of crop issues.

And there may be separate issues in livestocks
where you might want to prohibit it for livestock use. Or
what I'm suggesting to you, Jim, is we're open to listen to an annotation. When we started thinking of the annotations again, it became this cumbersome list of things and we thought, Hey, you know, those things any qualified inspector should know -- should be checking when somebody's spraying.

And so come up with a suggested annotation and we would welcome that.

MS. BURTON: It seems to me that sometimes when --

MR. CARTER: Just a second. Just a second. George.

MR. SIEMON: Well, I just wanted to ask Jim. You're referring to 316.317 when it was fed to the cattle that there was absorption rate in fat and not that -- this isn't for that purpose, so was that just an experiment they did to see what the result was, because we're talking about a surface application of this, as far as I know, from what I can read in here.

MR. RIDDLE: There's no annotation that it would be restricted to surface. If it's a natural material, it could be found.

MR. SIEMON: Yes. I agree. I'm just -- but it says they applied for the use as an external parasiticide,
it says, the petitioner did. I know we're not putting a restriction on it.

MR. RIDDLE: Right.

MR. SIEMON: What was the feeding about. Do you know? Just an experiment or another way to use it or --

VOICE: Probably did it for EPA.

MR. SIEMON: EPA? Yes. I don't understand the -- because it says external parasiticide.

MR. CARTER: Okay. I'll hold off on my question till we get done with this discussion. Mark.

MR. KING: Yes. Two quick things. One, to speak to Jim's concern about new people coming into the industry, I think that is a concern in terms of people migrating to organic, because they're ramping up very quickly.

And while I personally don't have any major issues with this particular material, I guess the question is how can we best communicate, you know, the philosophy and really the principles in terms of how a material like this would be used.

So -- and I don't know, I'm not -- you know, don't have an answer for the annotation part of it, but it
seems that maybe that's the direction for us to go.

MR. CARTER: Goldie.

MS. CAUGHLAN: Pass.

MR. CARTER: Kim.

MS. BURTON: Just to comment. Looking at the status among certifiers, it doesn't appear that many certifiers have had annotations with this material. So I agree with the committee that there should be no annotations.

MR. CARTER: Nancy.

MS. OSTIGUY: I actually do agree with Jim's concern about animal application. We did not consider that, and since it is a fat-soluble substance, it can absorb through the skin. So the fact that it is a topical application, the intent does not prevent accumulation in the fat.

MS. KOENIG: I was just going to address Mark's question. I think there's two approaches as far as, you know, how do you train or what do you provide for transitional growers. I mean, one way is to place it within the rule if we feel like it's a very -- you know, if that's necessary.

The other thing is if ATRA is developing these checksheet tools for growers that those kinds of policies
or informational guidance could be provided in that form also, or you may want to do both.

MR. CARTER: Owusu.

MR. BANDELE: Yes. Nancy, I appreciate your comments, but I don't think that would be a consideration as we're considering it today, because we only looking at it for crop use right here. Is that not right?

MR. CARTER: Okay. Kim.

MS. BURTON: Although it was petitioned for crops and livestock, this review does focus on crops, so we'll either have to review it at a separate time for livestock, and I have go back and look at the actual petition because this specifically says it was for crop, unless OMRI has a comment about that.

MR. SIEMON: But just a point. No action is an action, because it is at this time allowed on livestock, because it's a natural. Right? We'd have to -- best something that put annotations on it to do it.

MR. CARTER: Okay. Point of information from OMRI.

MR. BAKER: Brian Baker, Organic Materials Review Institute, for those of you I have not met. The petitioner was requesting for evaluation to both crops and livestock. However, it was determined that we should find
out whether or not the material is synthetic or
nonsynthetic and conduct the evaluation and act
appropriately from there.

To make most efficient use of limited
resources, we focused on crop production where most of the
use is concentrated. And the -- so again, that's the
reason we chose to review it. We did look at livestock,
as you can see from the TAP review.

And to respond to George's question, the
residue studies were based upon application to crops and
the contamination levels found in crops that were treated.
I don't have a copy of the Rutherford study with me, but
the methodology used was not direct feeding of the active
ingredient. It was crop residue and how crop residues
translated into residues in these food products.

MR. RIDDLE: I need clarification on that.
I've got several --

MR. CARTER: Go ahead.

MR. RIDDLE: Yes. A followup question, Brian.
Want to make sure I heard you correct that the ingestion
of the livestock was from consuming crop residues that had
been treated with spinosad --

MR. BAKER: Feed treated with spinosad.

MR. RIDDLE: Feed treated --
MR. BAKER: Foodstuffs, yes.

MR. RIDDLE: Right. And then it was showing up in the fat and milk?

MR. BAKER: Correct.

MR. RIDDLE: I have problems.

MR. BANDELE: Brian, question on that.

MR. CARTER: Just one -- okay. Go ahead, Owusu.

MR. BANDELE: Yes. In that study where the recommended rates use are a much higher rate?

MR. BAKER: Again, I don't have the methodology of the study with me. I can see if I can dig it up or if one of you has a copy of the study with you. Again, forgive my memory.

MR. CARTER: Let me -- before we go on with it, let me interject my question here. In, I think it was '98, OMRI looked at this and suggested to the manufacturer that they reformulate. Is this -- was this petition a different formulation of the substance than was done recently?

MR. BAKER: Those are two separate issues. The manufacturer applied to OMRI to have a brand name product reviewed. OMRI made the determination at that time, that the material was nonsynthetic and in OMRI's opinion, it
was the active itself was allowed under the Organic Foods Production Act.

And it was the inert ingredients that were found to be prohibited under the Organic Foods Production Act so that -- and in order to have our work cross-checked and to avoid conflicts, no OMRI employee was the investigator.

We contracted with the Biointegral Resource Center of Berkeley, California, to be the investigator on this TAP review, and the review was done by Dr. William Quarles.

MR. CARTER: Okay. George, you had a question?

MR. SIEMON: No. I was just going to make a comment that just -- it's in 317.320 is what we're talking about -- this livestock use, and it says, Feed fed continue up to 10 parts per million, and I have no idea what that relates to in -- from crop residue.

MR. CARTER: Okay. We have a petitioner here -- yes. You can come forward with --

MR. ROBERTSON: My name is Sterrett Robertson. I'm with Diver [phonetic] Sciences. I thought I at least would identify myself. Some of these questions that we can, I think, answer. There was just a second ago I think was simple, and I think the question about the
formulations. Pardon?

    MR. CARTER: Get a little closer to the mic.

    MR. ROBERTSON: Oh. Sorry. And --

    MR. CARTER: The mic was made for short folks like me.

    MR. ROBERTSON: Yes. Right. The formulation -- there was a component that was of concern in the '98 review is my understanding. I'm fairly new to this action myself. That has been removed and is in the confidential statement of formula is in the process of being reviewed right now.

    The formulations that are intended for use in this particular business is an 80 percent wettable powder and the GF-120, which is a fruit fly bait, and both of those would meet all the organic guidelines. So --

    MR. LOCKERETZ: There was a change in the wording about adding to the National List to make it clear. I think also it should be added which piece of the National List we're adding it to so that the sense of motion be absolutely clear.

    We're adding it to -- the question is whether to add it to the list of nonsynthetic substances
prohibited for use in organic crop production.

MS. BURTON: [inaudible].

MR. LOCKERETZ: Okay. But the list is question is that list, so I think that --

MR. CARTER: Yes. The motion that is on the table at this point is, Spinosad is a nonsynthetic material that should not be added to the National List of prohibited substances.

MR. LOCKERETZ: And if you want to put a Number 205.602 to make it --

MR. CARTER: Okay. Is that -- I mean, can we do that?

MR. LOCKERETZ: That's a friendly amendment.

MR. CARTER: That's just -- I mean, yes, that's where -- is there any -- yes. Okay.

MR. KING: Well, I think that's --

MR. CARTER: Okay. So we will just add that above. Yes.

Okay. Jim. And let's start to prepare to vote.

MR. RIDDLE: Yes. Well, I'm going to offer an unfriendly amendment, and that is to change the recommendation to add it to that very list for -- with the exception for crop use only. So to add spinosad to the
list of prohibited nonsynthetic substances with the number that Willie just had, except for crop use only, because I don't think we should be adding it for broad livestock use when we really haven't fully considered it.

    MR. CARTER: Okay. First, do I hear a second?
    Okay. It's dying for a lack of second. Okay. Now --
    MS. CAUGHLAN: Second.
    MR. CARTER: Okay. Go ahead.
    MR. RIDDLE: Yes. Rick just pointed out that that actually was the net effect of Willie's motion. Yes. Right. Right. So I would withdraw the amendment, but then I think we should look at adding it then to List 604 as a prohibited natural under 604, because we haven't considered it for livestock, unless we're going -- well. But anyway, I withdraw that motion and let's just look at it for 602.
    MR. CARTER: Okay. Kim.
    MS. BURTON: Just a comment regarding the livestock. Unless the livestock committee has done a thorough job of evaluating this material, I suggest we just not even discuss the livestock at this point. If somebody wants to bring it back to the livestock committee.
    If they have a recommendation the September
meeting, then they bring it forth then.

    MR. SIEMON: Well, I just need to understand.
If we just add this to -- that it's not going to be added
    to 602, are we taking for granted that means it's not
added for the other ones also? Isn't that leaving a vague
hole?

    MR. CARTER: Yes.

    MR. SIEMON: I mean, I don't quite understand.
This product was petitioned for both uses. And I just
heard that we didn't do it for the one, and now we're
trying to make a decision based on just a teeny bit of
information towards livestock.

    MR. CARTER: Right. And my understanding of
this that with the wording change is we are addressing
this only in the crops. Livestock is a decision that has
to be for another day.

    Kim and then Owusu.

    MS. BURTON: It was my understanding that this
was petitioned for crops and livestock. It's been on all
of our documentation to be reviewed by livestock. It's
even on the agenda to review for livestock. If the
livestock committee is not ready to review it and have not
put work into it, then we have to review it at the next
meeting.
MR. BANDELE: Yes. I was going to say --

MR. CARTER: Owusu.

MR. BANDELE: -- I agreed with what you said, Dave. It seems to me that the way we traditionally do things, we're dealing with the crops here so we should not confuse that because the crops committee did not take into consideration the uses for livestock.

So I think that should just be bored up during the livestock segment if that in fact is what's going to be done.

MR. CARTER: Okay. Are we ready to vote?

Okay. The motion that is on the table is, Spinosad is a nonsynthetic material that should not be added to the National List of prohibited substances under 205.02.

MS. CAUGHLAN: Ask for a conflict of interest.

MR. CARTER: Oh. Thank you, Goldie. Yes. Is there anyone here who has a conflict of interest on this issue?

(No audible response.)

MR. CARTER: Okay. All those in favor of the motion, say aye.

(A chorus of ayes.)

MR. CARTER: Opposed?

VOICE: Voice.
MR. CARTER: Okay. One, two, three. Okay.

Three opposed.

Abstentions?

(No audible response.)

MR. CARTER: Okay. So on a vote of eleven to three, the motion carries.

Okay. Does that conclude our crops?

Thank you, Owusu, for bringing this. I think this was helpful.

Let's go to a break then, and ten minutes and we will be back.

(Whereupon, a short recess was taken.)

MR. CARTER: Okay. Let's get in here and get started. If you haven't finished your conversation, take it in the hall. If it's a really juicy conversation, fill me in on it later.

Okay. Let's move on now with the processing committee.

MS. BURTON: Well, we actually -- the livestock is next, but as we discussed earlier with the one material, we're going to bring that back up in September.

So we'll move on to processing. We have five materials under processing: gelatin, dewaxed flake shellac, calcium stearates, diethylaminoethanol, DEAE, and glycerol
I wanted to make one comment as materials chair on the gelatin material. We were reviewing this actually for two separate petitions. One, for gelatin and then one for capsules, and the petition for capsules came in and in reality, it was a brand name review.

So we are just looking for -- we're looking at gelatin, specifically as an ingredient or as a material, so if there's any of the gelatin folks in the audience, that's how we work this process -- or the capsule folks.

We work this process is that we do single materials only, and I know that there was some concern and some comments to the board as to why we're not actually be approving the caps, but it's just the components of that.

So -- Mark.

MR. KING: Thanks, Kim.

Yes. As Kim said, the first one up is gelatin, and it was petitioned primarily in this case as a processing aid used to clarify teas and different beverages. It's also used as a fining agent in wine. It's a stabilizer, thickener, and a texturizer in a range of products within the industry.

So it can also be used as a processing aid or an ingredient. Background on this, gelatin, essentially
as the committee explored it, we found that it can be made from different sources of collagen. It can be prepared in ways that are more like cooking or in ways that could render it as synthetic.

The TAP reviewers recommended that gelatin be added to the National List. One recommended that it be prohibited for use in organic processing and handling, in this particular case.

After a lot of discussion, the committee came up with the following recommendation, and I move that the board accept this recommendation. And as you're reading, as members of the board, I'd like to make one point of clarification in the recommendation.

I have -- we, as a committee, have typed gelatin to be listed in 205.606. And really what we're saying is gelatin is applicable in this case to 205.606, so I want to make that point of clarity for everyone.

So the recommendation reads, Gelatin -- and we'll put in this case reads -- to be listed in 205.606, nonorganically produced agricultural products allowed as ingredients in or on processed products labeled as organic or made with organic.

At the committee level this was approved five to zero in this particular case, so it was unanimous. And
concluding this, I think --

MR. CARTER: Just saying if you made that as a motion, is there a second?

MR. KING: Oh. Sorry.

MR. O'RELL: Second.

MR. CARTER: Okay. It's been seconded by Kevin.

Okay. Go ahead.

MR. KING: Okay. Sorry. And so in concluding this, this recommendation really determines gelatin to be a nonorganically produced agricultural product that would be included in 205.606 for products labeled as organic and nonorganic.

MS. BURTON: [indiscernible]

MR. KING: Oh. Sorry. Yes. Thank you.

MR. CARTER: Okay. Is there discussion on the motion then?

Okay. Rose.

MS. KOENIG: We're discussing the issue.

Right? How did the committee feel about some of the allergic comments, I guess, on fish and -- I mean, there was some -- you know, and then the potential for mad cow contamination of -- from -- I know these are, you know, risk factors that weren't -- that are unknown that right
now we -- but what were your discussions?

I'd just like to hear what your rationale was on those.

MR. KING: Okay. I'll give a quick answer and then Kim has a point to make, too. In looking at this, we really looked at what the material is, and we do share those concerns and then some of those were pointed out with different risk factors.

But we looked at the material as well as what the process of making the material was and found that as did, you know, many of the -- much of the information in the TAP as well as the reviewers that it was a natural, in this case.

So that's how we came to that conclusion. But we do share those concerns.

Kim.

MS. BURTON: We discussed that fully, because especially in processing, you know, we're going to come up against this quite often that food safety and organic, and our conclusion and our strong conclusion, at least, the processor reps is that food safety is handled by different means and from allergens to all kinds of different areas.

So in this case, we are confident that the processors are required to follow good manufacturing
practices and that these would be handled under that arena.

MR. CARTER: Okay. Further discussion on the motion? Okay. If we're ready to vote, the motion on the table then is, Gelatin to be listed in 205.606 nonorganically --

MS. CAUGHLAN: Call for conflict of interest --

MR. CARTER: Just a second. I'm reading the motion here. Produced agricultural products allowed as ingredients in or on processed products labeled as organic or made with organic. Okay.

Does anybody have a conflict of interest?

MS. BURTON: I have a comment.

MR. CARTER: Okay.

MS. BURTON: Although it is for beverages, to the best of my knowledge we do not use gelatin in any of our products.

MR. CARTER: Any others? Okay. You ready to vote?

All of those in favor, say aye.

(A chorus of ayes.)

MR. CARTER: Opposed, same sign.

(No audible response.)

MR. CARTER: Motion carries unanimously.
MR. KING: Okay. Next up is orange shellac, unbleached. Essentially in this particular case, it's primarily petitioned as a coating agent. It's also used in a number of other ways, as a color diluent, in this case, a surface finishing agent, perhaps glazing and polishing agents for use in confectionery and also in food supplement tablets and as well as chewing gum.

What we found in this is that essentially, shellac, as you may know, is derived from the hardened secretion of the lac insect. The TAP reviewers were split on this in the information that we reviewed, two categorizing it as nonsynthetic, one as synthetic.

However, the reviewer determining orange shellac, unbleached, as synthetic did state that impure shellac appeared to be a natural product and that a strong argument could be made for its compatibility with organic handling principles.

So the committee looked at that and felt that that was, you know, quote, unquote, almost unanimous. And after reviewing the information determined that in this case, shellac -- orange shellac, unbleached, is a nonsynthetic agricultural material.

And I move that the board consider the following recommendation. And again, I'll point out that
I have said to be listed in 205.606, and I just want to clarify that what we're really saying here is that it's applicable to 205.606.

So the recommendation -- move that the recommendation be considered by the board is, Orange shellac, unbleached, to be listed in 205.606 nonorganically produced agricultural products allowed as ingredients in or on processed products labeled as organic or made with organic.

MR. CARTER: Okay. The motion is -- actually, that the board approved the following language is -- well, his is that we consider this language. But what you're saying is you want us to approve this language?

MR. KING: Yes. Yes. Okay.

MR. O'DELL: Second.

VOICE: Would you clarify what this new motion is, please?

MR. CARTER: No, all it is is his motion that we consider the language. To consider something doesn't say that to approve it or not approve it. What the motion actually was, I mean --

MR. KING: Okay. I'm sorry. I'm sorry.

MR. CARTER: -- I was just clarifying his is that we approve this language.
VOICE: So we approve the motion?

MR. CARTER: Yes, we approve that.

MR. KING: Approve the motion, yes.

MR. CARTER: Yes. Then it's seconded by Kim.

Okay. Discussion.

Okay. Rose.

MS. KOENIG: I just had a question of -- I guess, number one, the TAP review put it under processing where to me, it looked almost like a crops type issue because it was for oranges. So the recommendations were kind of based on 95 percent made with organic products and -- or, you know 70 percent -- or made with organic or 95 percent organic.

So I just didn't understand why the product first came under processing if it really was for fruit application, which I understand is a post-harvest application, but it's not necessarily in my opinion a processing issue.

MS. BURTON: Well, it's very similar to waxes on apples or what-have-you, and that does fall under the processing category of 605.

MR. CARTER: Okay. Further discussion?

MR. RIDDLE: Yes.

MR. CARTER: Jim.
MR. RIDDLE: Yes. Mark, twice now you've mentioned the phrase, is applicable to 606. And maybe you should explain -- or maybe I can try and then you and Kim can correct me. But we'll be voting on another recommendation later on a policy or a rule change essentially to remove the list itself from 606, so the 606 language just pertains to nonorganic agricultural products must be -- well, in an organic form if they're commercially available.

So I think that's why you pointed out that right now, we're recommending that they be listed, but later we're going to be recommending that the list be deleted itself as a list. So that's probably why you're saying it's applicable to that.

It would fall under the requirements of commercial availability. Correct?

MR. KING: Yes. That's absolutely correct. And thank you for clarifying that, Jim.

MR. CARTER: Okay. Further discussion? Seeing none, we'll proceed to vote.

MR. BANDELE: I have a question. I notice that it said that the former NOSB board voted not to allow it but at that time it was not determined to be bleached or unbleached. So was that -- historically, was that the
major point by the former board found it to be not compatible?

MS. BURTON: Yes. The former board voted against this material in the bleached form. There was also an inert ingredient that was on List 3 that they reformulated to List 4. So it's a different product.

MR. CARTER: You look dazed and confused.

MS. KOENIG: Well, I just don't understand what you're saying. Is that list -- aren't we just looking at the product, unbleached shellac?

MR. KING: Yes. Yes.

MS. KOENIG: We're not looking at a brand name?

MR. KING: No.

MS. BURTON: No.

MR. CARTER: Okay. As we proceed to vote, is there anybody that has -- oh. Dennis.

MR. HOLBROOK: I just want to mention that I may have a conflict of interest here since I'm currently using a wax on my citrus that contains shellac.

MR. CARTER: Okay.

MR. KING: Thanks, Dennis.

MR. CARTER: Thanks, Dennis. It's up to the individual to decide.

Yes. Owusu.
MR. BANDELE: So one further clarification.

All right. So if this -- this will be approved for both processed as well as the applications that Dennis is speaking of in terms of fruit as well when we're approving it. We're approving it for both or just for the processed? Or is post-harvest considered processed?

MR. KING: That is -- yes. That is what it was petitioned for. Yes.

MR. CARTER: Okay. Are we ready to vote?

Okay. The language on the table, Orange shellac, unbleached, to be listed in 205.206, nonorganically produced agricultural products allowed as ingredients in or on processed products labeled as "organic" or "made with organic."

All those in favor, say aye.

(A chorus of ayes.)

MR. CARTER: Opposed, same sign.

(No audible response.)

MR. CARTER: Abstentions. One abstention. The motion carries.

MR. SIEMON: Just -- I'm sorry. I just missed what just happened with Dennis. Is -- did we -- is this allowed for using on fruit -- what we just passed -- or is it just processed food?
MS. BURTON: Going under 605. Or I mean 606.

MR. SIEMON: But it says in or on processed food. Is orange a processed food? I just want to make sure.

MR. KING: Well, there's been -- I mean, it's a post-harvest handling issue, but it has fallen under that historically. Okay? All right.

MR. CARTER: Okay. Kim.

MS. BURTON: One comment. He recused himself, and that should not be an abstention. It should be recused so that it does not count in the vote.

MR. CARTER: Okay. Good point.

MR. BANDELE: Dave, I just -- I'm just really unclear about that, even though I understand what you're saying about the fruit. But the TAP reviews came in like 95 percent organic and 70 percent organic. So to me, they're implying a further processed food rather than just the fruit use.

MR. CARTER: Okay. These are questions that should have been clarified before the vote. So we will only have limited discussion on this.

Kim.

MS. BURTON: We deem this as a nonorganic agricultural item, so it would fall under crops as that
category or under livestock -- or under processing in the
under 5 percent.

MR. CARTER: Okay. All right. Proceed.

MR. KING: Thank you. Next up, calcium
stearate is petitioned for use in the production of
organic food. So the background here is brief. The
processing committee voted unanimously to send the TAP
review back to the contractor for additional information.

So I move that the board vote on the language
or recommendation, TAP review for calcium stearate be sent
back to the contractor for additional information and be
deferred for consideration at the September 2002 National
Organic Standards Board meeting.

MR. CARTER: Okay. Who seconded?

MS. CAUGHLAN: Second.

MR. CARTER: Goldie seconded. Okay. It's on
the table for discussion.

MR. KING: And quickly, I'll just add the
committee vote in this case was four approved, zero
disapproved, and one absent. And what we found, to give
you a little bit more detail in this particular TAP
review, is that it simply was really inadequate in a lot
of areas.

An example would be that reviewers were citing
the actual petitioners provided information instead of
like industry documents, things of that nature. So
anyway, the committee felt unanimously that this should be
defered until September.

MR. CARTER: Okay. Further discussion.

Jim.

MR. RIDDLE: Yes. It's my understanding that
if we support sending it back to the reviewer that Kim
would be communicating with them. And I would just
suggest that any board members who have any observations
about deficiencies of this TAP review, could they get
those to you, Kim, to help direct that communication?

MS. BURTON: Yes.

MR. CARTER: Okay. Other discussion? Seeing
no hands raised, we'll proceed to vote.

Okay. Conflict of interest on this issue?
Seeing none, the motion on the table is to approve the
language, TAP review for calcium stearate be sent back to
the contractor for additional information and be deferred
for consideration at the September 2002 National Organic
Standards Board meeting.

All those in favor of the motion, signify by
saying aye.

(A chorus of ayes.)
MR. CARTER: Opposed, same sign.

(No audible response.)

MR. CARTER: Abstentions?

(No audible response.)

MR. CARTER: Motion carries unanimously. Okay.

MR. KING: Okay. Next is diethylaminoethanol, or DEAE. And this is a petition for use in boiler chemical systems, and there's a lot of history here. This was presented to the board initially in Buena Park, California, in 2001.

There's been a lot of work done on volatile amines in general, DEAE being one of those. Steve Parker has been involved in this a lot from the beginning as former chair of the processing committee, and so I'd like to recognize Steve at this time and have him come forward and give the new board members as well as those who are not familiar with this process some history and background on what we're talking about.

MR. HARPER: Thanks, Mark. Okay. Actually, this started before the 2001 Buena Park meeting, but because of the historical confusion, I'll start way back. The historical confusion regarding volatile amines among certifiers -- there's a need to get these volatile amines petitioned and reviewed by the NOSB to get some
clarification on it.

The OTA MPPL committee basically agreed to help out getting these in there. A number of industry members stepped forward, and all of the four volatile amines were petitioned, along with ammonium hydroxide, which is used in a similar method to volatile amines in dairy plant operations.

So they were all petitioned as a group, because that's sort of the universe of volatile amines that are used in processing plant applications.

I will tell -- let's see. Following that, there was a TAP review done by OMRI, and this was in 2000, and I can't remember all the exact dates back in 2000. But TAP reviews were done on all of the materials at the same time, as well as an excellent steam paper that was done by OMRI, put together by OMRI.

Then at the 2001 meeting, the Buena Park 2001 meeting, I requested that a technical expert be brought -- or I brought in a technical expert and gave a presentation to the board at that point on the use of volatile means in food processing environment, because most of the board members did not have a good understanding of what we were even discussing and be able to understand that.

So subsequent to that, we also requested more
information -- so they were deferred at that point. FOIA information was requested -- Freedom of Information was requested from the FDA on all these materials, and all that information did come through from the FDA except on diethylaminoethanol.

So with those -- and at the same time, two other things were done. Jim did a survey of -- or requested information from certifiers on their historical standards on these volatile amines. And then we also went out and did a survey of processors to gather information on use of these volatile amines to give us more information on what was going on in the industry.

So all of that information was all collected, and then finally at the -- at last -- the meeting last fall, we voted on ammonium hydroxide, octadecylamine, cyclohexylamine, and morpholine. Ammonium hydroxide was allowed as a volatile amine to be used.

Cyclohexylamine was used for sanitizing -- or sterilization, packaging sterilization purposes only. I should say the ammonium hydroxide had a sunset clause of three years from the time of the implementation of the rule.

Octadecylamine also had the same annotation for use in packaging sterilization purposes only. And then
morphyline was outright rejected by the board. And DEAE, or diethylaminoethanol, was deferred because we had not received back the FOIA information from the FDA. And so then today we have received that back, and so that's where we are at today.

Any questions about that? Or anybody have a different recollection of sort of the history? Okay. Thanks.

MR. KING: Thank you, Steve.

As an introduction concerning committee discussion in this, essentially what we found is that DEAE is petitioned for use in boiler chemical systems, specifically to prevent carbonic acid corrosion in return lines.

It can inhibit the corrosion by neutralizing carbonic acid and steam condensates and by scavenging free oxygen. So as Steve just explained to you, DEAE is a volatile amine that's designed to travel, okay, with boiler steam, all right.

In this case, boiler steam that can be used to sterilize product packaging, to steam food, and to also steam, for example, livestock feed products. While very few processors, as we found in reviewing the information, have migrated to modern technologies such as reverse
osmosis, stainless steel systems -- all these are things or examples that would eliminate the need for volatile amines.

Some of the processors continue to use volatile amines such as DEAE essentially to maintain the integrity of their boiler systems; something that would be a large capital expense in this case.

Some background. In order for a substance to be in or on, we're talking about essentially -- I won't go over it verbatim -- 205.605 here, so that's what we're talking about. So with that in mind, several companies within the industry saw a need essentially to petition for volatile amines, such as DEAE, in this case.

And we'll go into a little bit of that later.

As a couple members of the committee, because of that we're, you know, recused from voting. So general information here concerning boiler systems is that we've talked about the integrity and that, as Steve has indicated, this has really been on the table for awhile and we've accumulated a lot of data.

So we've learned that some of the more recent information in this case that some currently certified processors have chosen to invest, as we've talked about, in modern technologies such as reverse osmosis and
stainless steel systems, which essentially alleviates the use, all right, of volatile amines such as DEAE.

Some of the information provided, without going into a great deal of detail here, is that there was a survey done and Steve was part of this survey. There were many processors who responded to this, as I understand it. That as many as 25 to 30 percent still use DEAE on a regular basis, so to give you some indication of kind of where we're at with that.

Further, some of these processors indicated they did not use volatile amines through turning them off during organic product runs. So that was indicated by some, not all, some processors as an option for them in processing organic products.

The TAP reviewers unanimously in this case found DEAE to be synthetic and also unanimously recommended the material be prohibited for use in products labeled as organic. The FOIA information provided as part of the TAP review was really unclear as to the GRAS status of DEAE, so I think that's probably the more accurate way of us depicting that.

So further, in reviewing both the TAP and the FOIA information, the processing committee agreed with the TAP review findings that DEAE does not meet the criteria
established by OFPA in the final rule.

One note or point of clarity I would make here is that one of the criteria, Is there a natural alternative? And the reviewers found that there was not. You need to know that, okay. But as far as the rest of the criteria, they felt that it didn't meet the criteria established by OFPA in the final rule.

So the committee also received substantial industry input depicting the need for DEAE. Specifically, the entities providing input expressing concern that prohibition in this case will present challenges for certain processors in the organic industry, okay, and requested the processing committee and the NOSB consider the current need for the use of DEAE as a processing aid.

And there was a lot of this information that came in through, you know, from several companies within the organic industry. So after a lot of consideration and looking at the industry information submitted, the current need for DEAE by some processors operating within the industry, the processing community in this case concluded, as did the TAP review, that DEAE is not compatible with the criteria set forth in OFPA in the final rule.

Having said that, there's the however. The committee also diligently considered some of the input,
all right, from industry experts, companies with products in the industry, and looked at, considered, the immediate impact of this substance essentially going away.

So with all this in mind, I move that the board consider or vote on the following recommendation. DEAE, and you'll see above that is the section listed 205.605(b), Synthetics allowed. Diethylaminoethanol for use as a boiler water additive for packaging sterilization only. For use as a boiler water additive in agricultural products labeled made with organic until October 21, 2005. For use as a boiler water additive in livestock feed until October 21, 2005.

MS. CAUGHLAN: Second.

MR. CARTER: Okay. The motion has been made and is seconded by Goldie. Okay. Discussion.

Kim.

MS. BURTON: Okay. Call me Rosie for this one. Couple of things. We've heard pleas of concern from the livestock industry and materials, medicines, incipients, all that sort of thing. We've heard pleas from certifiers as far as giving us another 120 days on restructuring our organizations.

This is one of those materials for processing. We've put a lot of time and effort into it. We recognize
that there's a problem out there. We have a lot of very small processors who are doing contract packing who manufacture maybe 1 percent of their manufacturing for organics, and they use this material.

We have made the recommendation -- a few of us -- to allow this for use until 2005 so that the industry can be prepared to eliminate this material from organic processing.

I should also note that the few of us who have to recuse ourselves were the ones, because we did submit the petition, and do not solely agree with this recommendation for this reason. Of course, we want it for packaging sterilization. That's not a problem.

The uses of boiler water additive for made with organic products only has a problem and it has a big problem. If this committee and this board -- I take it back to like a single ingredient. For example, look at frozen peas that are going to be packaged as a finished good, as a product, and you're going to have a single item ingredient out there that's going to have a made with label on it. It's going to be very confusing to the consumer.

How do you have a made with peas with peas, if that makes any sense to you. It does not make sense to
me. However, at the same time, I see this as a
compromise. It's not a good compromise and I don't agree
with it.

I would much rather see that we have a sunset
period for the time period until 2005 to allow this as a
boiler water additive so that the industry can correct the
problem and put our capital investments into it and try to
seek out some of the alternatives for this material.

So with that, I would like to make a
recommendation for a change in the annotation.

MR. CARTER: Is this an amendment?

MS. BURTON: Amendment.

MR. CARTER: Okay.

MR. RIDDLE: Point of order. If a person is
recusing themselves, can they make motions? I think not.
Isn't that true? If they can't vote, they can't make
motions. They can offer information.

MS. BURTON: Well, then I don't feel I should
recuse myself as the petitioner of this and somebody who
feels very strongly of making the recommendation of a
change of the sanitation.

MR. CARTER: Okay. First of all, let me ask --
is there anyone else that would make that amendment?

Okay.
Now, are you not recusing yourself?

MS. BURTON: No.

MR. CARTER: You're not? Not recusing yourself?

MS. BURTON: Well, let me make a statement. A group of people got together to petition this material. Smucker's is one of them. We do not use boiler water additives in our processing. All of our facilities are geographically located to where either we do not need this material or we shut it off because we have a very small volume.

But again, it's confusing. And primarily I would want to change this because I really think that made with label is going to confuse the organic industry out there. So --

MS. CAUGHLAN: Kim, do you have any co-packers who would be affected by this?

MS. BURTON: No.

MS. CAUGHLAN: At this time?

MS. BURTON: Not at this time.

MR. CARTER: Okay.

MR. SIEMON: Are we going to deal with this conflict of interest, because I'm right in with Kim. Same story. So I think we need to settle this issue.
MR. CARTER: Okay. Let me make a comment here, too. But I can't -- okay. I do -- you know, personally I believe -- and this is where we get into gray areas in this conflict of interest. I do believe personally -- this is my assessment of this -- that there is a difference when somebody brings a company that is part of one of the members of this board.

If one of its members of this board works for a company that directly brings a petition, to me that's a no-brainer. That's a conflict of interest. If, however, a petition comes in from a trade association or industry group of which a member of this board also serves as a part of this, and it's my understanding that this petition came in from the OTA processing.

MS. BURTON: There was a group of people that were all MPPO representatives that got together to submit this petition.

MR. CARTER: A task force.

MS. BURTON: A task force.

MS. KOENIG: You're the materials chair. How was it actually written as a petitioner's because I would think if it was actually OTA committee that would, in my mind, be who would petition or -- I mean, so let's look at the facts. That's the paperwork.
MS. BURTON: When we submitted this petition, I tried to figure out what was the most proper way to submit this petition. And at the time, we put the company names of those of us, because if you look under the criteria for submitting a petition on how you prioritize reviewing a material, the more industry input you have the higher weight that petition is going to get.

So we made the choice to put our names on there -- Smucker's, Horizon, and George's Organic Valley -- hoping that that would push weight and show that this industry that it's a serious material that we needed to consider.

In hindsight, now that we've gone through this process, you know, I have recused myself because of that. But again, I do not agree with this annotation, and as far -- if we go back to Dave's comments about why I should recuse myself, I don't use this.

I was a petitioner, but this is not a material that I'm going to have financial gain over.

MR. CARTER: Okay. Mark and then Kevin.

MR. KING: I was just recognizing.

MR. CARTER: Okay. Mark recognizing Kevin.

MR. O'RELL: Thank you, Mark. Well, again, I'm in the situation of the same -- the same situation that
Kim is in. Our company participated in the petition process only because there was a need in the industry, as it originated out of the MPPL. We do not use this ingredient in our company.

None of our co-packers use this ingredient, so I don't feel that under what we're saying now that what's been disclosed, I don't feel I have a conflict of interest.

MR. CARTER: Okay. The chair will rule that there is a difference, though, in declaring a conflicting interest and having that impair your right to vote, and that's -- it's very clear that in many organizations, you can declare a conflict of interest. It can be up to the board to determine whether that conflict of interest is sufficient enough to impair your ability to cast a reasonable vote on this.

So this may be one of those cases where we will leave it up to the board to -- I would entertain a motion then, just to put it in the form of a formal thing, that those folks that have declared themselves having a conflict of interest should recuse themselves from voting on this particular material. We'll take this procedural, okay?

MR. BANDELE: So move.
MR. CARTER: Okay. Owusu moves. Is there a second to that?

MS. OSTIGUY: Second.

MR. CARTER: Okay. Nancy seconds. Okay. Now, this is just a procedural vote. If you feel that the folks that have declared a conflict of interest should recuse themselves of voting, you would vote aye on this motion.

If you feel that they ought to be allowed to vote on this material, you would vote no on this motion.

George.

MR. SIEMON: Yes. Jim said earlier the difficult position that we're getting in now where committees are now recommending materials.

MR. CARTER: Right.

MR. SIEMON: And I'm putting forth 17 materials as the livestock chair.

MR. CARTER: Yes. That's a --

MR. SIEMON: Well, I don't see that that's different personally.

MR. CARTER: That is a committee of this board rather than an external committee, so that is -- okay.

MR. SIEMON: Okay.

MR. CARTER: So we will vote, and this is a
procedural vote requiring only a simple majority; not a
two-thirds, okay. All of those in favor of the motion to
require those folks with a conflict of interest to recuse
themselves, signify by saying aye.

(A chorus of ayes.)

MR. CARTER: Okay. Raise your hand. Okay.

One, two, three, four.

All of those opposed, same sign. Two, three,
four, five.

MS. BURTON: I'm a little confused.

VOICE: I don't think you can vote, Kim.

MR. CARTER: Yes. I would say on this one, you
would not. You know, just don't vote. This is -- yes.
Okay. So raise them high again -- those -- okay. One,
two, three, four, five, six, seven.

Okay. The motion fails. Those folks that have
declared a conflict of interest are not required to recuse
themselves.

Proceed.

MS. BURTON: Okay. Therefore, I make a
recommendation --

MR. CARTER: An amendment.

MS. BURTON: -- an amendment to change the
annotation to read: DEAE for use as a boiler water
additive for packaging sterilization only, for use as a boiler water additive until October 21, 2005, for use as a boiler water additive in livestock feed until October 21, 2005.

MS. OSTIGUY: Second.

MR. CARTER: Okay. Who seconded? Okay. Nancy seconded. Okay. So the amendment on the table then is that -- excuse me. I was diverted here. So you're just striking --

MS. BURTON: Striking, For agricultural products labeled made with organic specific ingredients or food groups.

VOICE: Are we striking --

VOICE: So it could be used in any product for anything.

MR. CARTER: Yes. Could be used -- the upshot of the amendment is that it could be used in products labeled as organic until October 21, 2005. Okay.

Mark.

MR. KING: I'm a little confused, because I think you said, and just point of clarity if this is what you're trying to do. Did you still say packaging sterilization only in that? So it's not clear to me what we're --
MS. BURTON: Okay. I'm sorry.

MR. CARTER: Okay. The maker of the amendment would clarify.

MS. BURTON: For use as a boiler water additive for packaging sterilization or -- period. For use as a boiler water additive till October 21, 2005, for use as a boiler water additive in livestock feed until October 21, 2005.

MR. CARTER: Okay. Is that agreeable with the seconder?

MR. KING: Again, point of clarity. If --

MS. BURTON: Strike only.

MR. KING: -- if it's on that, okay. If the way it reads, then for uses of boiler water additive for packaged sterilization would be indefinite.

MS. BURTON: Correct. That's how we have the other boiler volatile amines that we've approved. It's the exact language.

MR. CARTER: Okay. I'm still looking to the seconder if that's --

MS. OSTIGUY: Actually, the wording still is not clear, because we're talking boiler water additive in both of the second sentences. One has the caveat of in livestock. The second one -- the first one does not have
a caveat. We took out the in agricultural products, so do we want to put back in, in agricultural products, or we delete the second sentence, which I don't know what you prefer.

MS. BURTON: Delete the second sentence. You are correct. Shall I read it again?

MR. CARTER: Okay. The amendment is emerging.

MS. BURTON: Sorry.

MR. CARTER: That's okay.

MS. BURTON: The amendment is, For use as a boiler water additive for packaging sterilization. For use as a boiler water additive until October 21, 2005.

MR. CARTER: Okay. Is there a second to that?

MS. OSTIGUY: Yes.

Okay. Discussion on the amendment itself. Again, procedurally, there'll be two votes now. We will just have a vote on amending this language as a substitute the original. If this amendment would fail, we would be back to the original language, okay?

Willie.

MR. LOCKERETZ: I still don't get the relationship between the first and the second sentence. The first sentence doesn't restrict it. The second
sentence -- I mean, the first sentence restricts it to sterilization. The second sentence does not, and I don't under the relation between these two.

MS. CAUGHLAN: Contact with the food product. The sterilization is noncontact. The other would permit it.

MR. CARTER: Okay. Kim.

MS. BURTON: Willie, when we looked at the other boiler water additives, we approved two others that were allowed for packaging sterilization only, and we approved those indefinitely. When we approved the ammonium hydroxide at the last meeting, we did set a sunset period because we wanted to stress to the industry that this material would no longer be allowed after that date for contact with food.

MR. LOCKERETZ: To follow up, would it be compatible with your intent to say -- to strike the first sentence and to rework the second sentence to be, For use as a boiler water additive for packagings sterilization, and then the rest of the sentence as it reads?

MS. BURTON: I would suggest we just leave it as is.

MR. CARTER: Okay. Jim and then George.

MR. RIDDLE: Well, first I have a question.
Then I'll have some comments. I just want to be clear that Kim, George, and Kevin's companies don't use this material for packaging sterilization. Is that true?

   MS. BURTON: That's not true. We use it for packaging sterilization. We do not use it for direct food contact.

   MR. O'RELL: We do not use it for packaging sterilization or direct food contact.

   MR. CARTER: All right.

   MR. RIDDLE: Okay. I'd like to make some comments now. I didn't --

   MR. CARTER: Is it to the amendment?

   MR. RIDDLE: Yes, exactly. Finally.

   MR. CARTER: Okay. As long as they're to the amendment.

   MR. RIDDLE: Yes. It's exactly to the amendment. I oppose the amendment. I sit on the processing committee and supported the -- painfully supported the language that we did approve and felt that that was a stretch, and certainly a compromise language based on all of the information we'd received.

   I'd like to point out that the TAP reviewers unanimously recommended that the material be prohibited.

   The TAP reviews were re-reviewed by another party who
confirmed the validity of the original TAP reviews. This is a toxic material. That's undeniable.

And it is directly injected into food products. But under the FDA, it's not required that it be labeled as such, so consumers are not informed if they may be consuming the material. But it clearly is being directly injected into the products.

And it's currently prohibited -- it's not on the list, so processors should already be moving away from it with the October 21 deadline, and the accredited certifiers should be enforcing this already. But there has been a chemical dependency situation develop where a couple of certifiers have been allowing use of the material, and so there's situations where processors are using the material.

So there is some grounds for a phase-out, similar to the methionine situation [phonetic] and the ammonium hydroxide. That was a stretch to come to that position, believe me. And on the issue of the organic peas that Kim brought up, the single ingredient type package, there are options.

Those peas would have to be produced without use of the material. That can be done either by going through a processing facility that does not use the
material or by shutting DEAE off when those peas are processed.

So you wouldn't have to have organic -- or peas made with organic peas. As a label claim, that's totally avoidable. I don't see that as a problem. What this does is allow the major company that we heard from that submitted compelling information about their dependency on use of the material was a multi-ingredient manufacturer who does made-with type labeling products.

The rest of it was a lot of conjecture, but we received some compelling information. So I urge the board to oppose this amendment and go back to the original language.

Thanks.

MR. CARTER: Okay. Rose.

MS. KOENIG: Are we just speaking to that amendment now?

MR. CARTER: Just to the amendment.

MS. KOENIG: Okay. I concur with Jim, but -- I concur. I agree with him.

MR. CARTER: Okay. Further discussion on the amendment? Okay. The amendment that is on the table right now is simply to add the substitute language, and please read that again because I've --
MS. BURTON: For use as a boiler water additive for packaging sterilization. For use as a boiler water additive till October 21, 2005.

MR. CARTER: Okay.

MR. SIEMON: The second part is for all other uses. That's right. Just -- I don't know if we shouldn't add that to make sure we are clear, but that's fine. As long as that's -- we're all understanding the intent.

MR. CARTER: Okay. Rick is saying that it would help if that is clarified, so it's --

MS. BURTON: Okay. For use as a boiler water additive for packaging sterilization. For all other uses as a boiler water additive until October 21, 2005.

Now, just -- if you support the original language, you vote against this amendment to vote for the original language. If you think this is better but you still oppose the whole concept, you can vote for this amendment and if it passes you vote -- okay.

Okay. All in favor of the amendment then signify by saying aye. Okay. Hold your hands up.

Okay. All of those opposed.

So the motion carries.
VOICE: It fails.

MR. CARTER: Oh, I mean, excuse me. It fails.

(Pause.)

MR. CARTER: Two, ten and two. Okay. So the recommendation then under the original language is on the table. DEAE for use as a boiler water additive for packaging and sterilization. Only for use as a boiler water additive in agricultural products labeled made with organic until October 21 and for use as a boiler water additive in livestock feed until October 21, 2005. Both cases. Sorry. I'm rushing through here and -- okay.

Discussion on the motion now. Owusu.

MR. BANDELE: Yes. I had a concern that all the reviewers found this to be incompatible. And I think Mark mentioned that there were no alternatives, but I thought the TAP said that many organic -- I don't think; I see it here -- many organic food processors have already adopted viable and practical ways to address corrosion without the use of the DEAE.

And that being said, I would have to vote -- I would have to not vote for this motion.

MR. CARTER: Okay. Rose.

MR. KING: Could I -- if I could just address that very quickly. In fact, what we found is not many,
okay. I think is the term you used processors, but a few.

In fact, some have said very few. Okay. A, because of the capital investment. B, because of the time that it would take to actually build a new system, so on and so forth.

So while your statement is true, okay, it is not by any means a large percent of the processing community, as we found through the surveys and the information presented to us.

Having said that, there are examples of the new technology, and as Jim had stated, there are examples where plants, you know, have turned them off while processing organic products. So anyway, but we still found that in much of the industry, there would be a very large impact for processors.

Much as Kim pointed out with crops, livestock, all of the other people within the organic community who are really trying to come up to speed as quickly as possible without absolutely destroying the marketplace, so to speak.

So anyway, I hope maybe that helps provide some clarity.

Rose.

MS. KOENIG: I don't think though that we can
look at this product in a vacuum. In fact, last meeting we approved ammonium hydroxide as an alternative, so I think we can add that to the list of alternatives that are out there.

I know you're going to say, Well, that doesn't do at all or, you know. But yes. And I know that there are, but if you then give the alternative of that, perhaps to that 25 percent, you may be narrowing down the number even more.

But more importantly, again, it's the same issue as calcium oxide. Once you put that on the list, whether a small number of people use it now, you're opening it up to that 70 percent. There's nothing now preventing the other people who have changed or there was an incentive to change to go back for the next three years to that product, because it's now listed.

So although I understand the intentions of the committee, and I applaud them to try to come up with some kind of reasonable compromise, again, look at the greater impact of the statements and what you're voting for, because what you do with your good intentions is put something on a list that then can be used in the industry, even for a sunset period, by the other 75 percent who say that they don't use it.
MR. CARTER: I just -- chairman's prerogative to make a comment on this one, that I really think that the committee has done a successful job on splitting the baby on this one in that it still makes a differentiation. Those folks that are going with reverse osmosis and the like at this point can use -- can label their products as organic.

Those folks that are still using this -- you know, it's this cumbersome thing of having peas made with organic peas type of thing. So it's not quite as -- it's sending a message that this needs to be phased out.

You know, from the standpoint of small growers and coops that are trying to get into processing products, most times that's going to be done under a co-packing arrangement, and it's difficult enough to find companies willing to process your products without requiring them to make this big change in their boiler water system.

And so I think as much as we can to encourage the industry to start making some changes, but let's not just close the spigot off now. I think that this moves in that direction.

Okay. With that, I will call on Mark and then Kim.

MR. KING: Just a quick comment and then we'll
let Kim, and if I could just add to Dave's comment. We're not talking about just in this case impacting processors. We're talking about processors who buy from growers and impacting their ability to operate perhaps on a daily basis, which can then affect other areas of the industry if they're purchasing from growers.

So I just wanted to make -- just make that clear.

Kim.

MS. BURTON: Just some clarification. Out of the survey, there was really only one or two people that are using the reverse osmosis, and I believe that was only one out of the 56 plants that were surveyed.

The ammonium hydroxide -- Rosie, the nature of that chemical is that it's very short-lived. In other words, it won't travel very far through the processing lines, and sometimes you're looking at, you know, thousands and thousands of feet of stainless -- or of tubing in a production facility where you'd have to actually inject the ammonium hydroxide in very, very different levels and different products.

So it really isn't applicable to some -- all processors. Although it is an alternative, I would say that it's not even being used at all in any processing
facilities, with the exception of dairy, because that's the only approved material allowed in dairy.

And we as processors are required to have handling plans and to show why or why not -- why we are or why we are not using a material on the National List. And I would think that people aren't just going to all of a sudden start using it because it's allowed.

Those of us who have not used it for that direct application I doubt will start using it again. I mean, there is that possibility. There's always a possibility of cheating the system or changing.

MR. CARTER: Okay. Further discussion? We'd like to start moving towards a vote here soon.

Rose.

MS. KOENIG: I just persist, in terms of further discussion, simply because we're dealing with a product that is -- I mean, I'm on record from the last meeting on these products, too, these volatile amines. I, you know, philosophically have a great deal of problems with these types of substances because I think they are totally not in the spirit of the organic movement.

And I understand and I am totally sympathetic, again, to individual processors and problems. I'm sympathetic to growers to have the same problems. They
may not be large, but it does affect their living. But it really is in the spirit of the rule and the spirit of the movement for people to come to the plate and do what they have to do in the industry to make it.

These products were not allowed by a lot of certifiers before, so it's not like we're drastically changing things for the majority of individuals. I think we need to look at the facts. I mean, we can ask in terms of the TAP again how many of these were approved prior to the rule.

But I have a problem. I'm very proud of Dennis who used the shellac wax that did the abstaining for his product. He has -- you know, he's a farmer, and I think that's the way that board members need to conduct themselves.

And I just feel that if each individual board members really looks at that product, it is not consistent with organic practices.

MR. CARTER: Okay. Let's continue -- okay.

George has got a question.

MR. SIEMON: Just to ask Jim.

Jim, earlier you said about that one manufacturer, the made with. These products will not be allowed to be called organic if they're used on direct
contact, and so they still wouldn't be able to call made
with organic, because they're not organic because they use
this material to process the organic component. Is that
correct?

You had said earlier they would be able to
still use that. I don't think that's correct.

MR. RIDDLE: Well, we have a number of
materials already on the National List that have that as
an annotation -- that only for use in made with organics.

MR. SIEMON: So --

MR. RIDDLE: So this is not precedent-setting.
That already exists as an annotation.

MR. SIEMON: Well, I don't see that added here
is what I'm getting at. Right?

MR. RIDDLE: Huh? That is what the annotation
is.

MR. CARTER: Willie.

MR. LOCKERETZ: Question for Richard. This
time limitation issue came up with synthetic methionine,
and at the time you said there was some uncertainty or you
had some doubts as to whether such a time limitation would
be legally binding.

Same issue here. What has happened on that
question?
MR. MATHEWS: The methionine will have the expiration date that you had set in the interim final rule. So the answer is you can set an expiration date.

MR. LOCKERETZ: Thank you.

MR. CARTER: Okay.

MS. CAUGHLAN: Excuse me. Richard, is that in particular because we're dealing with materials, and materials fall more to our Don't touch it when we say it?

MR. MATHEWS: I don't know that we looked at it quite that way. We only asked the question of the attorneys, Can the board have a sunset date on the National List for any or all materials, and the answer was yes.

MS. CAUGHLAN: Well, that doesn't answer it then. We are speaking about it specifically when it comes to materials that we allow or disallow. Thank you.

MR. MATHEWS: That's all we ask for.

MR. RIDDLE: I hate to prolong it. I just want to also be clear that the ammonium hydroxide recommendation with that same sunset will be in the interim final rule with that language as well?

MR. MATHEWS: All recommendations with a sunset date will be in the final rule.

MR. RIDDLE: And I just want to come back to
one final point that came to mind when Rose was making her
comments, and that is looking at the situation with the
calcium oxide and calcium hydroxide that had been allowed
by certifiers, but they and the farmers saw that it was
not on the list and made the change to remove it.

The same thing has not been done here by two
certifiers. All other certifiers prohibit this material
right now.

MR. CARTER: Okay. Are you ready to vote?

Okay. Let me get the language here. We are back then --
an aye vote is a vote for the language, For use as a
boiler additive for packaging sterilization only. For use
as a boiler water additive in agricultural products
labeled as made with organic until October 21, 2005. For
use as boiler water additive in livestock feed until
October 21, 2005.

Okay. All those in favor, signify by saying
aye.

(A chorus of ayes.)

MR. CARTER: Opposed, same sign. Let's do it
by a show of hands. Okay. First of all, all of those in
favor, raise your hand. One, two, three, four, five, six,
seven, eight. Eight ayes.

Opposed? One, two, three, four, five, six --
six opposed.

Abstentions? Okay. The motion fails.

Okay. Rose.

MS. KOENIG: I make a motion to label it synthetic and prohibit its use in organic production.

MR. CARTER: You need to turn on your mic.

MS. KOENIG: Oh. Sorry. I make a motion to, as a synthetic, prohibit it for use in organic use production.

MR. CARTER: Okay. The motion has been made to -- as a synthetic, to prohibit its use in organic production. Is there a second? It's been --

VOICE: Wait a minute. It's already prohibited. It's not on the list.

MR. CARTER: It's not on the list. Yes. Okay.

MS. KOENIG: Okay. That's fine. Well, it didn't pass, so there's no motion on the table at this point. So we're back to Mark now to continue.

MS. OSTIGUY: I'd like to make a motion.

MR. CARTER: Okay.

MS. OSTIGUY: I'd like to make a motion to -- basically, for the first sentence, produce as boiler water additive for packaging sterilization only.

MR. CARTER: Okay. A motion has been made to
approve the language, DEAE for use as boiler water additive for packaging sterilization only, period.

Second? Is there a second? Is there a second?

(No audible response.)

MR. CARTER: Motion dies for lack of second.

MS. BURTON: Can I just comment on that?

MR. CARTER: Yes.

MS. BURTON: We deferred this material because it was one of the safest among the other two that we allowed for packaging sterilization only. This material is quite often used in conjunction with the other two that we did allow on the National List.

They come together in a brand name material. They come together oftentimes from the supplier as a package product. In other words, you're adding a combination of the three materials to overall do the best job that is possible.

So by voting this material down, you are really hindering the industry on packaging sterilization, and you also have already approved two materials that really were -- they function in a whole different capacity than this material.

So I just want you to be aware of the motion that was just passed. You are hindering this industry
tremendously by not allowing it for packaging sterilization at the minimum.

MR. CARTER: And just a point of clarification, Kim, that's -- the motion that was just made died for lack of second. Okay. As a prerogative, I will allow the maker of the motion to make that again if there was confusion. Okay. So Nancy.

MS. OSTIGUY: I'd like to move that DEAE is a synthetic allowed for use as a boiler water additive for packaging sterilization only.

MR. O'RELL: Second.

(No audible response.)

MR. CARTER: Okay. Are you ready to vote then just on this -- okay, Rose.

MS. KOENIG: No. I'm not ready to vote. Back in the meeting in Washington when we voted on the other two materials, it really was the prerogative of the committee to take this material back rather than going forward with the vote at that time.

That was your recommendation. However, having said that, there are two alternatives on there, and I
understand that it may be packaged in a way that has three of them. But I felt that the board was more than lenient in allowance of those two materials.

What we're doing here is we're not even putting a sunset clause on that use as it exists right now in the National Rule. So you are in fact allowing yet another boiler water volatile amine on the list with no sunset clause for packaging and sterilization, and I feel that we've got two there; that that is the alternative.

MR. CARTER: Okay. You can certainly make an amendment, too, for a sunset clause. That's appropriate.

Okay. Jim.

MR. RIDDLE: Yes. I view this packaging sterilization only as truly incidental contact. This is not being directly injected into the product, and I can support this limitation. So I do just want to express, though, in all due respect and admiration, Kim, I am uncomfortable with the fact that not only were you the petitioner but also your company is using it for this purpose, and you're choosing not to recuse yourself.

But that is your choice here, but I do -- just felt a need to say that to clear my own conscience. But I do support and will vote for this allowance of the material.
MR. CARTER: Okay. Yes.

MS. BURTON: Steam -- this comes down to steam is used in every processing plant, and if I can't vote -- I understand I was the petitioner in this, and I had recused myself all along on these materials. When it came to making an amendment to the annotation, I chose not to do that, so --

MR. CARTER: Okay. There will be no more discussion on that issue because the board voted formally to allow these folks to participate. This was a board action, so that is a settled issue.

Let's vote now on the motion. Proceed to vote.

The motion is, DEAE for use as boiler water additive packaging sterilization only, period. All of those in favor, signify by saying aye.

(A chorus of ayes.)

MR. CARTER: Opposed, same sign.

Okay. Let's do the count. Okay. Lower your hands. All of those in favor, raise your hand. One, two, three, four, five, six, seven, eight, nine.

Okay. Opposed? One, two, three, four.

Okay. Abstain? Okay. What was the -- yes. We're short -- ten, four. Okay. So it carries.

Okay. Mark.
MR. SIEMON: I'm not done yet.

MR. KING: We're done with that material.

MR. SIEMON: Yes. I want to make the motion to allow it in feed -- livestock feed but to sunset.

MR. CARTER: Okay. A motion has been made -- I put my paper away here -- okay -- to allow DEAE for use as a boiler water additive in livestock feed until October 21, 2005. Is there a second?

MR. LOCKERETZ: I second.

MR. CARTER: It's been seconded. Okay.

Willie, out of curiosity, seconds the amendment -- or the motion, excuse me. Okay.

Okay. Explain your --

MR. SIEMON: I think Kim's got a more information context we had, but we're now going to be requiring that young baby calves are treated organically from day of birth, and pelletization of feed is a big part of that and it's a real immature part of the industry, and I have no idea honestly of the availability to have any of it made without this material.

I have to admit I'm a little on the gray area, but that's what sunset clauses are for. This isn't a mature part that's been going on ten years. This is something that's just beginning, and I don't see any
reason for livestock feed to restrict it at this time.

MR. CARTER: Okay. Further discussion?

MR. LOCKERETZ: Would you explain how it --

what kinds of feeds and how it [inaudible]?

MR. SIEMON: Just in pelletization. When they
pelletize feed is when it's used. And it's used more than
calves, but I know calves specifically is an issue that's
coming up right now.

Kim, I would ask what information in --

MR. CARTER: Okay. Mark and then Kim.

MR. KING: Yes. I'd like to comment on it from
two points. One, having grown up on a farm and raising
ruminant animals as well as swine and purchasing quite a
lot of pelletized feed, so there will be dependence upon
that, and I think George is correct in stating that there
are, and we've heard from many people in the industry,
that there can be some supply issues in terms of livestock
feed.

So having said that, Kim.

MS. BURTON: George, there was one petition
that came in after the original petition for this material
and it was from a livestock feed company for the use, and
that's why it actually got brought up. So there was
another additional petition.
MR. SIEMON: I've never seen that petition.

MS. BURTON: It should be -- it was part of the processing committee's review.

MR. RIDDLE: Yes. The processing committee sought input from the livestock sector on the need for the material and received none. We received extensive information from the food processing sector, and we've, you know, had to weigh all that but we sought more information from the livestock feed sector and really didn't receive, so we don't have a justification in my mind for the compelling need for continued use of the material.

So I have a real problem supporting it. I'm sorry.

MS. KOENIG: I mean, is there a possibility -- again, the TAP review wasn't -- didn't cover livestock use, so we don't know what the implication is, you know, in animals or what-have-you. But basically, it wasn't written to that use, and I don't feel comfortable making a decision where I have no information provided to me. Just
sort of we think that industry may need it.

MR. CARTER: Further discussion? Willie.

MR. LOCKERETZ: Question for those who know.

Is the --

VOICE: Turn your mic on, Willie.

MR. LOCKERETZ: Sorry. The kinds of processes for which steam would be used in livestock feed manufacture -- how do they compare to the kinds of processes used in manufacture of foods? Are we talking about basically similar sets of equipment, similar processes; just the one is ending up with the animal, the other ending up with humans, or are there bigger differences between the two?

MR. SIEMON: Far as I know, it's much the same because it's all about the steam and the protection of the line, so I don't know there'd be any difference, and this is all of course, human food approved. And now we're down to livestock approved.

MR. CARTER: Further discussion?

MR. LACY: I was going to say I'm not an expert in the pelleting process. I do know that it does provide some sterilization of the feed, antibacterial killing of microbes that could be of importance in a food safety kind of issue.
I guess that's where George is coming from. Is
that right, George, with the dairy calves?

MR. SIEMON: Well, more so for whatever reason,
the pelletized food is more used in calves, and I don't
quite know the major reason for that. The other thing
that's part of this is some hauling -- there's a lot of
transportation of organic feed, and pelletizing can save a
lot on the space requirement for it, too. That's another
issue, but that's not the main one.

MR. CARTER: Okay. Further discussion?

MR. HARPER: I just wanted a clarification at
the -- the steam is used to help -- to take the different
feed ingredients to -- that are put under pressure and
heat from the steam to condition and to form the pellets,
and then the -- or the DEAE or other volatile means comes
along with the steam.

So even -- I mean, the product is already
sterilized or cooked, whether it has the volatile amine in
it or not. But that's what the steam is used for. I
mean, that's the primary use of that product.

MR. CARTER: Okay. Rose.

MS. KOENIG: So Steve, can you come back there?

So are you -- again, I still don't feel like we have
enough information on this to make a decision. But are
you saying that so the DEAE is actually going into that pellet?

    I mean, there's going to be -- do you feel that there's going to be a larger concentration, say, in that type of application versus a food-type system where you're just putting it through the lines and there may be some incidental dropping?

    MR. HARPER: The estimation of the amount of the volatile amine that ends up in the final, like, a final pellet, I have not seen any data from the livestock industry in -- I know in the cereal industry, the estimation is that it's in there at about .14 to .5 ppm as a finished product -- in the finished product. That's the approximate level that it's there at.

    MR. CARTER: Steve, while you're there, just a question of are you aware of alternatives to this --

    MR. HARPER: I mean --

    MR. CARTER: I mean, what are the alternatives?

    MR. HARPER: -- it is exactly the same -- it's exactly the same equipment that's used in food processing systems. You don't have all the blanch, you know, the heating of water with blanch -- the blanch water with steam and those kind of applications that you do have in the other food industry.
This is a strictly -- this is a stripped application of steam, direct injection of the steam into the pelletization. It serves exactly the same purpose of protecting the steam lines, and you have the same type of strategies to prevent deterioration of piping that you'd have in the human food conditions.

MR. CARTER: Okay. Rose and then --

MS. KOENIG: So, but when you're pelletizing something, you're trying to create a structure. Correct?

MR. HARPER: That's correct.

MS. KOENIG: I mean, you're taking a product and forming a pellet. So is that steam more integral to actually creating that pellet? I mean, is the steam helping form that pellet, because if it is, that's a very different application again than some kind of, you know, incidental background DEAE that falls -- may fall into the food.

MR. HARPER: Steam is -- yes, steam is integral to that because you can't inject water -- steam brings a lot of energy with it, at the same time not adding a lot of moisture to the pellet because they don't want to be hauling around moisture and having to -- you know, having to add the moisture and then dry the pellets back out.

So it cooks it with the maximum amount of
energy versus using hot water, where you have much less energy. Then you've got to dry all that material out.

MS. KOENIG: I just have one more point then for the board. I just feel like this is a very different process than what we've had the TAP review on, and I am definitely not comfortable in making a --

MR. HARPER: It's identical. It's --

MS. KOENIG: I know the process is identical in terms of what it's used for in those lines, but you are saying that that steam is helping in changing the physical properties or creating the physical properties of that pellet, which to me has got to have some different implications, and I don't think we have that information in terms of voting on it.

MR. CARTER: Okay. Mark.

MR. KING: Yes, and Steve, if you want to come back up that's fine, but I just want to make a point. What I heard Steve say is the systems are, in terms of the integrity, okay, of the boiler system, are pretty much the same in livestock and food.

And so how -- I guess my question to you, Steve, is how or are there any differences between direct food contact, okay, of steam and the pelletization of livestock feed? Is that -- I may be asking the same
question in a different way, but just that simple
comparison might help provide clarity.

    MR. HARPER: This is one -- the pelletization
of feed is similar to one application in human food when
you're making pellets that are then made into, say, flake
cereal. You form pellets first and then the flakes are
formed, and then you've got drying that's going on.

    There are many other -- there are other kinds
of steam applications in human food production. Does that
clarify? So -- but it's exactly the same. It's exactly
the same process that's used in, say, forming any kind of
cereal type products in human food.

    MR. LOCKERETZ: Are the same facilities likely
to be used for human food or not?

    MR. HARPER: No. Absolutely not. Absolutely
not. Completely separate.

    MR. LOCKERETZ: So the impact of accepting or
not accepting this position, there would be no crossover
impact?

    MR. HARPER: No.

    MR. BANDELE: Steve, so in that situation where
you have pellets and then the cereal, the flakes, would
there be more or less of the DEAE in the pellet or the
flake?
MR. LOCKERETZ: You're speaking of the human scene?

MR. BANDELE: Yes.

MR. HARPER: Most of the DEAE volatizes off before it even goes into the pellet or as it's cooked, so it's not even actually in the final product. Like I said, you know, .2, .3 ppm level.

MR. CARTER: Okay. Further discussion? George.

MR. SIEMON: Just one comment -- that the livestock industry is the last place you'll see the use of these physical alternative methods, because they're such crude, old -- compared to the modern food ones that are investing in the stainless steel and all, this is a different level of production capacity or facilities.

MR. CARTER: Okay. Further discussion? Seeing none, we're going to proceed to vote.

Okay. The motion that's on the table is simply to approve the word, DEAE for use as boiler water additive in livestock feed until October 21, 2005.

All of those in favor, signify by raising their hand.

Okay. Opposed?

Arthur, I'll leave it to you to announce the --

MR. NEAL: Got eight in favor, three opposed, three abstained.

MR. CARTER: Okay. So the motion fails.

And Ann, I need to have you raise your hand real high. You're down so low it's hard to -- no, it's two-thirds. Yes. Okay. All right.

MR. KING: Are we officially done with DEAE?

Okay. Off we go. Yes.

The next and -- yes?

MR. LOCKERETZ: Are we sure that an abstention counts as a no? I don't want my abstention to change the result. I want a true --

MR. CARTER: I'm deferring to the parliamentarian, Carolyn Brickery.

MS. BRICKERY: It's like you're present and voting. An abstention means you're present and voting.

MR. LOCKERETZ: So therefore [inaudible]

MR. MATHEWS: I think basically an abstention says that you're willing to go with whatever the vote comes out to be. I will go get some Robert's Rules of Order.

MR. CARTER: Okay. Rose.

MS. KOENIG: Well, I was going to make --
entertain another motion. My motion would be to review --
send the TAP back to OMRI solely for looking at livestock
systems. I'm willing to consider that motion, but not
without some information.

MR. CARTER: Okay. So I think where you
stopped making your motion was at the point where the
motion is to send this back to OMRI for consideration
as -- strictly as livestock. Okay. Is there a second to
that motion?

MR. KING: Second.

MR. CARTER: Okay. Discussion on the motion?

Seeing none, all --

VOICE: Wait, wait.

MR. CARTER: Okay. Kim.

MS. BURTON: As Jim alluded to, we heard from
one person in the livestock industry and they knew that
this material was up for a vote and they chose not to
comment on it. So to waste our dollars and reserves on
doing a TAP review on a material that really, we've had
one person in the industry come forth with, I think is
kind of a --

MS. KOENIG: I would say --

MS. BURTON: I would suggest that perhaps OMRI,
in the interest of the industry, might be willing to just
add a small section, free of charge, to our group.

MR. CARTER: Okay. Brian, did you have a point of order just from OMRI to -- I'll call on the OMRI representative to make that offer.

MR. BAKER: I'm sorry. I greatly appreciate everybody's patience with this material and appreciate, above all, Rose's concerns. But this has been -- this discussion has been going on since 1995. We did receive the McGreary [phonetic] Grain petition.

We did incorporate it into the materials that were passed on; that I did discuss it with the individual reviewers. The reviewers saw nothing in the review that would change the recommendation that it is synthetic and that it be prohibited for use, all use, in organic processing.

I don't think that you would get any different result from another review.

MR. CARTER: Okay. So the motion --

MS. KOENIG: I will rescind my motion.

MR. CARTER: Okay. The motion has been withdrawn. Okay.

Mark.

MR. KING: Does this mean we're officially moving on? That is, do we need to vote on that? Okay.
MR. CARTER: It means that my thoughts of crowing about how far ahead of schedule we were just disappeared.

MR. KING: Yes, well, no surprise there.

Okay. Next and last for the processing committee materials today is glycerol monooleate. And glycerol monooleate has been petitioned for use as an antifoam agent used in processing. It's our understanding in reviewing the information that it's a commonly used antifoam agent in processing.

Anyway, therefore, the petition has been received for inclusion on the National List. However, in this case, it's been brought to the attention of the processing committee that studies are currently under way testing the effectiveness of organic antifoams. In other words, alternatives, if you will.

Further, the committee has been informed that the results of these studies are expected prior to the September 2002 National Organic Standards Board meeting. Therefore, I move that the board vote on the following recommendation, which is that glycerol monooleate be deferred for consideration at the September 2002 National Organic Standards Board meeting.

MS. OSTIGUY: Second.
MR. CARTER: Okay. It's been moved, Nancy seconded. Discussion on this. As you can see on this one that this was approved in committee three to nothing, with one recused, one absent. Okay. Discussion on the motion to defer it?

(No audible response.)

MR. CARTER: Seeing none, assuming that we're ready to vote -- point of information?

MR. BAKER: Point of information. Would there be any instructions to the TAP reviewers that would go with this motion? Is there any additional work or any further review needed?

MR. KING: I do have the letter. We can -- have to find it.

MR. CARTER: Okay. While he is looking for the letter, let me just ask the question if there's anyone who has a conflict of interest on this issue?

MR. O'RELL: I do. I would declare a conflict.

MS. BURTON: I do, too.

MR. CARTER: Okay. Kevin and Kim both declare a conflict.

MR. KING: Here's a copy of the letter which I'll just read. Hopefully this will help, Brian.

Dear NOP/NOSB, Please accept this letter of
formal request from the petitioners duly named as, as you know in this case, Markers, Horizon, and Cyanotech to defer the vote on glycerol monooleate. As you know, the vote on this material was deferred from the previous NOSB meeting, could be conducted on alternative materials that were recommended in the TAP review.

Such alternatives included organic vegetable oil, lecithin, beeswax, and other materials on the National List. So there are three there, if that helps. Vegetable oil, lecithin, and beeswax -- right. So the petitioners have identified two and possibly three separate vendors who have developed organic antifoam agents using some of those materials identified in the TAP review.

In this case, both Smucker's and Cyanotech have had very successful test runs using one of the organic antifoam alternatives. Horizon is scheduled for a test run the end of May. Until the alternatives prove viable for all petitioners, we must request it for the following reasons: complete testing of the alternative material at the Horizon processing facility, work with vendors to apply for organic certification of antifoam agents, and then third, identify/petition vegetable fatty acids for inclusion into 205.606.
So that's -- does that help or provide some clarity? Okay.

MR. CARTER: Okay.

VOICE: No. We won't -- I don't think we'll be needing any further assistance.

MR. CARTER: Okay. So the motion to defer is on the table for action. Okay. All those -- oh, let's see. I already asked for a conflict of interest. All of those in favor of the motion to defer this material for consideration at the September 2002 NOSB meeting, signify by saying aye.

(A chorus of ayes.)

MR. CARTER: Opposed, same sign.

(No audible response.)

MR. CARTER: The motion carries 12 to zero. Twelve to zero, two recusals. Okay.

MR. KING: That's our last material, Sir Chair.

MR. CARTER: Okay. Thank you.

With that, we will take a break for lunch. I understand the livestock committee is meeting during lunch. And we will resume again at one o'clock.

(Whereupon, the hearing was adjourned, to reconvene this same day, Tuesday, May 7, 2002, at 1:00 p.m.)
MR. CARTER: I apologize that we're running behind on our lunch schedule, although I have to say that Eric Sideman told us that there was a good Mexican restaurant that was only a ten-minute walk away, and I forgot that ten minutes is a lot longer in Maine, so --

VOICE: Or with Eric's legs.

MR. CARTER: Or with Eric's legs. So we're still ahead of schedule here. Okay. So we've got items being distributed here, but I would like to call on George, then, for the livestock committee.

MR. SIEMON: Okay. Just we're handing out what we're going to vote on today on the issues we have. We're definitely going to vote on the feed ingredient issue, which is the first two-page document. This is in your Tab 5 that has more detail about all these issues.

So I'm going to move to the first one, which is about the vitamins and minerals. The purpose of this clause is to clarify what is meant in the rule when it says FDA-approved vitamins and minerals. As it works out, that is not an adequate terminology because of the dependency on AAFCO for the acceptance of vitamins and minerals.
So -- and AAFCO is a semi-private organization that works with states to approve vitamins and minerals, so FDA-approved is not enough. We have to go further. So the whole purpose is to broaden that FDA-approved to include AAFCO materials.

So does everybody understand the basic problem here? Okay. And that's under -- if you want to look in the law, that's under 603(d)(1) and (2) is where you'll find the basic problem. So we've handed out here the acceptance of those AAFCO materials with the following exceptions.

The only exceptions that we've included here at this time are those that are already prohibited in the rule, and those are the mammalian and poultry slaughter byproducts. And we did add hydrolyzed fat, the ones with those numbers there, and -- because one of our commentors pointed out that we'd missed that.

So that's the only addition there in that section from the original -- what we sent out for public comment. In addition to that, we did receive public comment about concerns about other materials, and we're recognizing the need to review those filing materials and that we recommend a review by the TAP process to determine if these materials should be prohibited.
Now, to clarify -- the last part's the confusing part, so maybe I should ask before we get to the last part if there's any --

MR. CARTER: Well, why don't you read this. Then go ahead and make a motion.

MR. SIEMON: Read the whole out loud?

MR. CARTER: Yes. Read the language of it.

MR. SIEMON: Okay. The NOSB recommends that the allowance for synthetic vitamins and minerals contained in Section 603(d)(1) and (2) be broadened to include materials either listed in CFR or in Section 57 or 90 on the AAFCO official publication with the following exceptions.

Mammalian and poultry slaughter byproducts -- bone ash, bone charcoal, bone phosphate, bone charcoal-spent, bone meal steamed, and bone meal-cooked, and hydrolyzed fats, Section 33.3, 33.4, 33.5, and 33.15.

NOSB recognizes the need to review the following materials and recommends a review by a TAP process to determine if these materials should be prohibited. And I couldn't pronounce all these words, so if I had to read them I would, but basically, it's the list that OMRI gave us, and that's a consolidation of the list of AAFCO that seemed that we should review.
If you want me to, I can try to pronounce them.

MR. CARTER: Okay. I'll spare you the agony here. That's a motion?

MR. SIEMON: Yes.

MS. OSTIGUY: Second.

MR. CARTER: It's been seconded. Okay. So this is on the table for discussion.

MR. SIEMON: Okay. I just want to clarify that the second list of materials will be allowed until they are reviewed. We just didn't feel we had the technical knowledge to just reject them right out, but we are defining that they are the appointed ones in our public comment our research needed to be reviewed.

We just didn't feel we had the technical knowledge to back that up right now.

MR. CARTER: Okay. Kim.

MS. BURTON: Just a comment, George. We're out of TAP money, so I don't know when this will happen. We'll have to address that with NOP. At least at this point, it doesn't look like we'll get these for September.

MR. SIEMON: Thus they'll be allowed.

MS. BURTON: Thus they'll be allowed.

MR. SIEMON: And that we understood that risk, but we still want to identify them as a point for future
MR. CARTER: Okay. Other discussion? More discussion?

Jim.

MR. RIDDLE: Wasn't urea on that list, too?

That was mentioned in the report yesterday, but these are under --

MR. SIEMON: These are nitrogen-based organisms -- I mean, materials, and urea is in the actual OFPA.

MR. RIDDLE: Yes, as prohibited. Yes. Would there be any -- I guess just first time seeing this, my initial reaction would be more comfortable if they were being prohibited where -- you know, on the list up above until they've been petitioned and reviewed.

Do you know the status? I mean, are these being used or are they, you know, commonly used in organic feeds now or feed supplements now or are we just opening up a bunch of things that really may not be appropriate that, just because of a lack of a review having been done.

Wouldn't it be better to keep them in kind of a holding pattern as being prohibited until they've been reviewed? Just my reaction.

MR. SIEMON: Well, we were there before, too,
make them prohibited. But then we just didn't know how
long that would be and felt like we were doing it based on
just one input from one group rather than -- and that's a
little unfair to anybody else that might have put in a
whole list of things, and where would it stop and start.
So we just did the things that we knew were
prohibited by the law. Yes, it's a vulnerability.

MR. CARTER: Okay. Nancy, then Rose.

MS. OSTIGUY: Some of the things on the list,
and I don't recall off the top of my head which they were,
Emily was mentioning at least one of them is currently
used in feed. I don't know if Emily is around. She
could --

MR. SIEMON: Emily, just come up here and help us out.

MS. BROWN: There's quite a few different
chelated by using amino acids, and they're called chelates
or proteinates, and they could be various different forms.
There's other forms available of all these minerals, but
if the question is are they in feed now? Yes, because
certifiers have not distinguished the different forms of
the minerals, like copper manganese, zinc, particularly.
So they're readily used in those forms. There
are alternatives, though.
MR. RIDDLE: Which ones? Not all of these materials?

MS. BROWN: The metal amino acid complex, metal (specific amino acid) complex, metal amino acid chelate, metal proteinate -- those ones, I would say, are in.

MR. SIEMON: We need to clarify that each of those might have ten or 15 materials underneath them.

MS. BROWN: Right. Right. They could be copper, they could be zinc, they could be manganese. You know, instead of metal substitute, a mineral. So those are groups.

Your question about urea -- they're in a different section of AAFCO. It's non -- what are they called -- it's called nonprotein nitrogen, so that wouldn't be included.

MR. CARTER: Okay. Rose.

MS. KOENIG: I guess for Emily. So within that list of materials that would be reviewed, they were picked out because of potential toxicological --

MS. BROWN: The reason we requested -- in our comments, the reason we pulled these out is because they're all synthetic forms of nitrogen. We feel like there's salt and mine natural sources available in all these cases and that it's not -- and there also is not a
good standard of identity, even with AAFCO for some of these chelated protein compounds, so they could be abused and they might be -- we just felt like they needed a more thorough review rather than being lumped in and allowed from the beginning.

MR. CARTER: Okay. Further discussion?

And George, you didn't explain what the vote was --

MR. SIEMON: Yes, I did, and I just want to say all the issues relating to feed ingredients were 5-0 in our committee. So just all the way through these two pages here are 5-0 votes.

MR. CARTER: Okay.

MR. LOCKERETZ: He gave us a lot of rules.

MR. SIEMON: And the other thing about, just to make sure, there is -- one of the other concerns about chelateds was the use of those in -- for medical purposes, and there's a fine line between feeding it for health purposes and feeding it as feed additives, and that was another reason why we were concerned about automatically limiting these without going through the whole herd health part of it yet.

MR. CARTER: That's right.

MR. SIEMON: Because this is strictly in the
feed.

MR. RIDDLE: Yes. I just want to be clear on what we're doing here. I thought I had heard you say, Dave, this morning that this would be presented and we'd have overnight to think about it and then we'd actually vote on it tomorrow?

MR. CARTER: No. We actually said that this one would be brought up for action today. The intent was to have the access to outdoors for poultry and the dairy herd replacement brought up today and then voted on tomorrow.

MR. SIEMON: And effectively, this is what went out for public comment except for that we went further now and identified some that we think need review.

MS. BURTON: The ones that need review -- would we be putting that out for public comment so that we don't just automatically do TAP reviews on those? I mean, that's what I would recommend to see if there's anybody really actually using them out there or if there is any prior recommendations or what-have-you.

MR. SIEMON: I agree with that.

MR. RIDDLE: Yes. Would there be any problem with holding our vote tomorrow on these and just giving us a little more time to think about it? I guess I would propose that. I would prefer that myself. Does that need to be a motion?

MR. CARTER: A request has been made to defer the vote until tomorrow. Let me just ask if there is any objection to that.

MR. SIEMON: Well, you're going to put all the work off tomorrow. It's not even on the agenda. You're the boss about the agenda tomorrow, so we're going to put three big votes on tomorrow. We're offloading a lot of our work till tomorrow. So you tell me about your agenda.

This has been out. There's been no change in the intent here at all from what we went to public comment. We put more caution in, if anything, by identifying the things we're concerned about.

MR. CARTER: That's correct. And I mean, we do have time on the agenda in the morning. My intent is that on these particular items, if those items for action tomorrow would be to take those up first thing. If we have to delay the review of committee work plans until the end of the meeting, we will.

We obviously have to leave ample time for
public comment, but we've got two hours of time allocated there for the review of the work plans. So I would like to begin by taking up these action items first thing. I know Nancy has to leave by nine o'clock, and so just to make sure we have as many folks here as possible.

Okay. So it sounds as -- yes. So I guess there's not unanimous consent, so if you want to delay this until tomorrow, that would have to be in the form of a motion.

MR. RIDDLE: Never mind.

MR. CARTER: Okay.

MR. SIEMON: Is there any other discussion?

MR. CARTER: Any other questions, comments?

Okay. The motion before you then is to recommend adoption of the language that was read by George. I won't go over all of this.

Anybody have a conflict of interest on this issue? None being stated, we'll proceed to vote.

All in favor, raise your right hand.

Opposed, same sign.

Abstention? One abstention.

So it is 13 to one -- 13 to zero to one.

MR. SIEMON: Okay. The next issue is the incidentals in feed additives, and the recommendation is
NOSB recommends the allowance of incidental additives as defined by CFR -- incidental additives used in livestock feed ingredients.

The CFR incidental definition, somewhat condensed, Incidental are present at insignificant levels and do not have any technical or functional effect in the feed. Incidents are exempt from the feed ingredient labeling requirement. And this is 5-0 also.

MR. CARTER: That is a motion. Is there a second?

MR. SIEMON: I move.

MS. OSTIGUY: Second.

MR. CARTER: Okay. It's been moved. Nancy seconded. Discussion?

Okay. Kim.

MS. BURTON: Can we list which CFR for clarification that this would fall under? Does anybody know?

MR. SIEMON: Someone from OMRI or anybody know what the CFR -- that's what went out. That's the original. Let's see -- it's right here.

VOICE: 21, Part 57, .100(a)(3).

MR. SIEMON: So that's a friendly amendment. That's fine.
MR. CARTER: Okay. That being added, okay.

Any further discussion?

Jim.

MR. RIDDLE: Yes. Can you just give some examples of these incidentals just to help us understand?

MR. SIEMON: Boy, I might just rather OMRI help us out. You know, I'm not technical, but this is a supportive material to keep a vitamin so that it can be -- go all the way to the feed mill and still be viable and then be put into the feed.

It's a supportive for the main functional nutrient that there is. And again, it's not required to be in the final feed. And that's part of the -- part of this recommendation is the fact that farmers and other people are not going to be able to even know that there's incidentals.

Emily, you got it -- that was my crude attempt.

Did you have --

MR. CARTER: Yes. Been asked to have Emily Rosen Brown come forward again and give an example of --

MR. SIEMON: An example of an incidental, and I said a supportive material in a vitamin pack.

MS. BROWN: Okay. What we're talking about is two levels of additives in carriers, so an incidental
would be -- see, what happened was an original version
that was put out in January, it said, you know, there's a
problem with some carriers and ingredient that are in feed
that are not on the label.

FDA sent a comment back to NOB saying, Not
true. Everything has to be on the label except, of
course, if we call it an incidental additive. And an
incidental additive is something that has no technical --
what it says here -- functional effect.

It's the same as for in processing, the same
definition they use in processing. But in this case, an
incidental additive would be something that's in a
secondary ingredient. So say you have a vitamin. You
have a vitamin D. You get it -- what the farmer would buy
is a mixture of, you know, D, whole bunch of A's, C's,
plus minerals, all in a package and it's like called a
vitamin and mineral mix. And --

MR. RIDDLE: Yes. With a carrier that would be
on it.

MS. BROWN: -- and it will say on it, like,
wheat middlings or rice or something like that. So the
point is that the carrier has to be organic, but the tiny
incidental stuff that's in with those vitamins, such as --
it could be a preservative. It could be starch or sucrose
that you may or may not ever know if there was some kind of genetically-engineered crop and whether it would be -- it's one of those -- so they're saying, Don't count those incidentals, but do count them when they're directly added into the mixture and identified on the label.

MR. CARTER: Okay. Kim and then Mark.

MS. BURTON: Emily, could these be, like, synthetic solvents for extracting or anything like that, like in processing? Are we looking at -- I mean, I know there's probably preservatives, but what would you say?

VOICE: Yes. Yes.

MS. BURTON: Cindy, come up here. Yes. The answer is yes.

Cindy reviews these products for OMRI and has looked at a lot of these MSCS's and stuff.

Well, then just a comment that we, you know, were pretty specific in the processing arena with how these can be manufactured and in some of our materials. So if we don't know, then I suggested that we find out or make a motion to carte blanche it, but I'm a little uncomfortable with that.

MS. BROWN: That is a good point that some of these same vitamin, hyperformulations would be, you know, a question for processed food, too, as far as
preservatives and vitamins.

MR. CARTER: Okay.

MR. SIEMON: I just want to make sure about the clarification that we have separated carriers out. So everybody's clear -- this is not at all about any articles or products.

MR. CARTER: Okay. Mark.

MR. KING: Just a simple question. Could you elaborate just a little bit on insignificant levels? I mean, just in your experience?

MS. BROWN: Yes. It's a hard thing to say, but basically, it's -- they call it incidental when it's an ingredient in one product and a noningredient is used in another product. So while it's required to be on the label of the first product, if it comes along and it has a technical functional effect, it will still be small.

It's not just -- it's not necessarily an amount threshold level. But it's like the old example from canned tomatoes. You had citric acid in it. Then you used the canned tomatoes in another tomato sauce, but they don't have to list that original citric acid in the secondary product.

At that point, it's an incidental secondary ingredient. So that that's -- it's not necessarily a
measurement. It's kind of the chain of use. Make sense?

MR. CARTER: Okay. Rose.

MS. KOENIG: But I guess by approving the recommendation, that doesn't stop someone from petitioning a product that could be used as an incidental if somebody decided or found out that there was something they felt should be prohibited, even as an incidental.

That could come before the board, I assume, and be looked at as a material. So this again --

MS. BROWN: Yes. Yes. This is still --

MS. KOENIG: -- as I understand --

MS. BROWN: -- a guidance document, right, basically. So yes, if somebody wanted to come forward and prohibit a specific preservative in vitamin formulations or whatever.

MS. KOENIG: And when I -- as I understand from yesterday, George, was that these are lots of things that we're not going to be able to accomplish. They're in such small quantities that you're feeling that we need this policy?

MR. SIEMON: Right now, timing-wise, the TAP review money, the time, October 21 is an insignificant part of it.

MR. CARTER: Oh. Yes. Okay. Sorry.
MR. RIDDLE: Mr. Chair.

MR. CARTER: I was --

MR. RIDDLE: I was looking for recognition by Emily.

MS. BROWN: I'll do that. Sure.

MR. RIDDLE: Always, I guess. I'm just thinking about ethoxyquin, and reading on the next sheet that we'll get to, I think that would be covered there as a nonincidental preservative, if it's being added directly to the livestock feed or the feed supplement as a preservative directly.

But if it were used as a preservative in the vitamin concentrate that then is used in the feed supplement, that would be incidental in that instance. Correct?

MS. BROWN: Correct.

MR. RIDDLE: Am I on the right track now?

MS. BROWN: Yes.

MR. RIDDLE: Okay. Thank you.

MS. BROWN: It's in vitamin formulations.

MR. CARTER: Jim was referring to the next page where we have nonincidental preservatives, so we broke these issues out to get them as clear. Carriers was debatable -- we took that out. We took anything out that
wasn't kind of the unknown world of incidentals here.

MS. BURTON: So just for clarification, this is just going to be a guidance document? It's not actually going to be something you're requesting to amend the National List with. Just incidentals as a blanket.

MR. SIEMON: I don't know about the final rule, but this is more than guidance. That's the intent here is to clarify what the role of these are in livestock feeds.

So our --

MS. BURTON: I just heard Emily say a guidance document earlier.

MR. CARTER: Okay. Other discussion? Okay. If not, we'll proceed to vote -- oh, yes.

MS. BURTON: I'm sorry to be like this.

MR. CARTER: That's okay.

MS. BURTON: Under OFPA, if we're recommending to add something to the National List, we are supposed to have a technical scientific evaluation, and that's according to OFPA. So I'm a little uncomfortable just adding this to the National List without that kind of review; or at least a more formal recommendation by what's actually in this.

And not to stall the process, but just so we're consistent.
MR. SIEMON: Just tell me. What's the relationship to this to inerts? We didn't --

MR. CARTER: Okay. Technical advice here.

MS. BROWN: Now, I would say this -- what the idea, the intent here was to clarify the rule where it says, Approved by FDA. So that's just all this is, is these things are, except where we had to exclude the slaughter byproducts, and with these other ones we're saying are okay for now, but we would like to review eventually because we're not sure.

MR. CARTER: Okay. Are you ready to vote?

MR. O'RELL: Dave.

MR. CARTER: Yes.

MR. O'RELL: Just again for clarification, then we're saying this is a guidance document?

MS. CAUGHLAN: Clarification.

MR. O'RELL: For clarification. It's not for rulemaking?

MS. CAUGHLAN: Couldn't be.

MR. CARTER: Okay. Mark.

MR. KING: Just a quick question. Did you just say, And this would just further clarify at the statement, As ruled by FDA, essentially?

MR. SIEMON: Yes.

MR. LOCKERETZ: Could someone explain exactly what a guidance document is for me? What can we put under it and what the significance is of putting out one. Is it mandatory, is it suggesting, or what is it?

MR. CARTER: I'll take that as a point of order for a quick response.

MR. MATHEWS: A guidance document -- the guidance document will tell people what they need to do in order to comply with the regulations.

MR. LOCKERETZ: What they need to do; that's the key word?

MR. MATHEWS: Yes. What they have to do in order to comply with the regulations.

MR. CARTER: Okay.

MR. MATHEWS: Well, could be may, not, shall

MR. SIEMON: Just so we're clear.

MR. MATHEWS: It is a document that is not regulation, but it could have two different purposes. It could be one that tells people exactly what they have to do to comply with the regulation. Another one might give them just some guidance on it.

But it depends on the nature of the lab -- of the document that comes out. The bottom line is the whole
-purpose is to give people the direction that they need to
follow in order to comply with the rule. It does not
create new rules. It only tells them how to comply with
existing rules.

      MR. LOCKERETZ: Well, how does one decide
whether a particular change appropriately can be done by a
guidance document or appropriately could be done by a
rules change.

      MR. CARTER: Okay. Well, we have two hands up
there for clarification from -- okay, Barbara, Arthur.

      MS. ROBINSON: Rick, I think you need to
explain whether or not a guidance document, whatever it's
explaining, whether or not it's enforceable.

      MR. MATHEWS: Okay. Well, the guidance
document itself is not enforceable. The regulations are
what are enforceable. The idea of the guidance document
is to tell people how to comply. If they can comply
without using the guidance document, if they end up at the
same point, then that's okay.

      But the whole purpose of the guidance document
is to give people guidance on how to comply. I guess my
abilities in the English language are too limited to say
anything else. I mean, we've got regulations, and
regulations are what people have to comply with.
What you're trying to do is provide guidance on how to comply with the regulation. The bottom line is the guidance is not regulation. It's an interpretation of the regulations and how to comply with it. So if you can find a way to comply with the regulation without complying with the guidance document, you're okay.

Bottom line is you got to comply with the regulation. And I'm sure that confuses it even worse.

MR. CARTER: Okay. Stop. The gallery over there is saying stop, but Arthur has got his -- okay.

MR. MATHEWS: Art.

MR. CARTER: Okay. Arthur wants to point at Keith. Okay.

MR. MATHEWS: Keith, want to try to explain it?

MR. CARTER: Please identify yourself for the Reporter.

MR. JONES: Okay. I'm Keith Jones, and I'm here to help, so -- guidance documents can be put out by the program to assist people in interpreting the rule, okay. When you do that, though, it is indeed guidance. We do not enforce against guidance. We enforce against the regulation.

So if you adopt this as guidance, which is certainly your prerogative to do so, if you adopt it as
guidance, it would simply go into an explanatory document.

But when it came down to certification, we could not bind this language on anybody, and it appears to me though that that's what you do want to do.

You would want to bind this as a permissive part of the regulation as it exists. So it's my belief that in order to go where you want to go with this language, you would actually need to make this as a recommendation to modify the rule.

MR. CARTER: Okay. Thank you. Just to move this along, the chair would accept that the motion included that this is a formal recommendation to the rule.

Is that --

MR. SIEMON: And the one before as well, then.

Now, I thought that would be NOP's choice -- which route they channels this. But that's fine.

MR. CARTER: Okay. So this is -- okay.

MS. BURTON: Can I have one --

MR. CARTER: Okay. Kim is --

MS. BURTON: I don't know.

MR. CARTER: We've got someone looking for --

Yes. Go ahead, Rose.

MS. KOENIG: I found that comment very helpful, and that's the kind of input I think as a board member we
need to know, and I think that goes back to some of maybe
Willie's frustrations.

I guess you're frustrated at times.

But I think -- but I know sitting up and not
necessarily understanding all the functionings of the
federal government, it really is helpful when we get to
these points and we're doing our work that we know where
we're going with the information that we're presenting,
because that's where some of this communication is
breaking down in terms of Willie's question, what are
we -- you know, what have we done for the past two years.

So if you guys could continue that kind of
input, it would be really helpful.

MR. CARTER: Okay. Let's get back to the
motion. Here, I'll accept the -- okay.

MR. SIEMON: I just wanted to say that that's
why we had called the second group of things guidelines
and the first one, so we -- this whole front page is
things that are rule changes. Just so we're all clear.

MR. CARTER: Okay. I just -- I'm delaying
here, because I have two people flipping through,
determining whether or not we can make this as a
recommendation, so -- yes.

MR. BANDELE: And that's part of my question,
that if in fact we're changing this from a guidance
document to a rulemaking, would not in fact some
modification be in order before it's put forth?

MR. CARTER: Yes.

MS. BURTON: Okay. Shall I read this section?

MR. CARTER: Yes. Go ahead.

MS. BURTON: Okay. Section 2119, National
Organic Standards Board, page 33 of -- actually, it's page
35 of the OFPA, 2119(k)(3), technical advisory panels.
The board shall convene technical advisory panels to
provide scientific evaluation of the materials considered
for inclusion in the National List.

Such panels may include experts in agronomy,
entomology, health science, and other relevant
disciplines.

MR. CARTER: Yes, I don't know that -- okay.

Go ahead, because I --

MS. BURTON: Well, I guess what I'm asking is
can this board make a recommendation to add a material to
the National List without having a scientific evaluation
of a material, and I did not believe that we could just
make a recommendation to add something without some kind
of an evaluation.

MR. CARTER: Yes. Mark.
MR. KING: I think this is a question for someone in the program, and I brought this up on a call the other day, and the answer wasn't clear to any of us. And the question is this: If we consider something prior to sending it to a full TAP, is that acceptable?

MS. ROBINSON: I was going to answer her question first.

MR. KING: I'm asking you a question, but.

MR. CARTER: Let's get an answer to this question first.

MR. KING: Okay. The question is, in this case, if like what we -- the document we have in front of us which includes these specific materials that are listed, and then Kim has read language from OFPA, okay, concerning the technical advisory panel.

So my question is this: Does everything have to go for a full TAP, because it was my understanding you must consider first if indeed it requires a full TAP. Is that correct, and if so, how can we deal with this particular situation?

MS. ROBINSON: This particular situation --

MR. CARTER: Come to the mic, please. Any mic.
MS. ROBINSON: Any mic. In this particular situation, since AAFCO and FDA are reasonably considered to be expert bodies, you could consider AAFCO and FDA to have been the technical reviewers of these materials.

MR. CARTER: Okay. That's helpful. So we are authorized then to go ahead and move forward with this.

Okay. Are you ready to vote?

MS. BURTON: Yes.

MR. CARTER: Okay. Is there a conflict of interest? Seeing none, all in favor of the motion as presented, the language as presented, indicate by raising your right hand.

MR. LOCKERETZ: What words are in front of it -- a recommendation that the rule be modified or record of what status are we [inaudible].

MR. CARTER: Okay. This is an amendment to the National List.

VOICE: Prohibited or -- [inaudible] prohibited slaughter byproducts?

MS. BROWN: We're on incidentals.

MR. CARTER: No. No. We're on incidentals.

Okay. Okay. Everybody understand?

MR. SIEMON: Is there wording needed to clarify that this is a change? That's Emily's question.
MR. CARTER: Well, in your motion, as you make it as the motion, please restate the motion that your motion is to add to the National List -- bingo. Okay?
And that is the motion.

MR. SIEMON: NOSB recommends to add to the National List the allowance of incidental additives as defined by CFR 21, Part 570.100(a)(3) and used in livestock feed ingredients.

MR. CARTER: Okay. Everybody understand now?
If you support it, raise your right hand.

Opposed, same sign.

Abstentions? Okay. One abstention.

Okay. So it's 13 to zero to one. Okay.

George?

MR. SIEMON: Do we need to go back now on our first vote to make sure that we -- that that is an addition or a change?

MR. CARTER: Yes. Let's go back and clarify and make sure that everybody understands the first vote.

MS. ROBINSON: I move to reconsider the vote on vitamins and minerals.

MR. CARTER: Okay. Motion to reconsider. Is there a second?

MR. KING: Second.
MR. CARTER: The maker of the motion having voted on the prevailing side, it's in order. All in favor, say aye.

(A chorus of ayes.)

MR. SIEMON: We just want to add the same words that we just did, which -- I'd just rather we had it read back if we could, but the NOSB --

MR. CARTER: Okay. We recommend --

MR. SIEMON: -- recommends the following additions --

MR. CARTER: -- to the National List.

MR. SIEMON: -- following addition to the National List that the -- then.

MR. CARTER: Okay. So everybody understand the motion at this point?

MS. BURTON: Yes. It's the same motion but --

MR. CARTER: Okay. Read exactly what it's going to say. Make your motion and read the language so everybody understands.

MR. SIEMON: The NOSB recommends the following additions to the National List -- well --

MS. BURTON: That doesn't -- you can't
recommend that. That's not a -- just that stuff.

MR. SIEMON: Well, I'm trying to get the -- the following allowance or to the National List or -- I'm not -- I lost --

MS. BURTON: Recommendation to change the annotation.

MR. SIEMON: All right. Recommends the change to -- well, that's what it says later on there. Contained in -- it's really kind of in there in Section 205, isn't it?

MS. BURTON: He asked you to read --

MR. SIEMON: Read the whole thing? All right.

The way it sits right now, The NOSB recommends that the allowance for synthetic vitamins and minerals contained in Section 603(d)(1) and (2) be broadened to include material. So do we need to revisit this? It says already the number and it says to be broadened to visit it.

MR. LOCKERETZ: The revisiting was what -- the nature of what we're putting forth here, and it's been made explicit -- this is basically a change in the list. But that was not clear the first go-around.

MR. CARTER: So just -- your language needs to say that we're officially recommending this for a change in the National List for an allowance for synthetic
vitamins and minerals contained, and continue on with the
rest of the language.

MR. SIEMON: The NOSB recommends a change in
the National List for the allowance --

MR. LOCKERETZ: As follows.

MR. CARTER: Yes. As follows.

MR. SIEMON: -- for the allowance.

MR. CARTER: Okay. Colon, capital T, The
allowance for synthetic vitamins and minerals -- okay.

MR. SIEMON: Okay. Read what you have so I'm
with you. The NOSB recommends a change to the National
List --

MR. CARTER: As follows, colon.

MR. SIEMON: As follows, colon.

MR. CARTER: The allowance for synthetic
vitamins and minerals contained in Section 205.603(d)(1)
and (2), and continue on with the rest of the language to
the end. Okay?

MS. KOENIG: Except you won't be able to say
NOSB recognizes. You have to stop at hydrolyzed fat.

MR. SIEMON: And then we'll have another motion
about requesting a review on those.

MR. CARTER: Yes.

MR. SIEMON: Okay.
MS. BURTON: May I try it?

MR. CARTER: Yes.

MR. SIEMON: We're going to end at --

MR. CARTER: Okay. Kim is going to jump in here and --

MR. SIEMON: -- hydrolyzed fat.

MR. CARTER: -- help us out.

MS. BURTON: Okay. We're looking at recommending a change to the annotation on vitamins under Section 205.603(d)(2), this is the current wording: Vitamins used for enrichment or fortification when FDA-approved, comma, or CFR -- we'll need the CFR -- okay. Or in Sections 57 and 90 on the AAFCO -- or Sections 57 and 90, according to AAFCO.

MR. CARTER: Okay.

MS. BURTON: For livestock.

MS. KOENIG: I would vote on the spirit of what's in the rule. Let the program develop the legalized documentation to fit our spirit, as long as it's in the spirit of what we're writing, and I think it's pretty clear in the content.

MR. CARTER: Okay.

MR. SIEMON: Okay. So the motion we have right now is that to just add the words, A change to the
National List as follows, colon, and then to not attach this last paragraph of NOSB recognizes to that motion. Those are the two changes we have, and I make that motion.

MR. CARTER: Okay. Is there a second to that?

MS. OSTIGUY: Second.

MR. CARTER: Okay. The official motion that is on the table now is that the NOSB recommends the -- well, you have the language.

MR. SIEMON: A change to the National List as follows, colon -- or semi -- or colon, the allowance for, and then go right into the wording, The allowance for.

MR. CARTER: Okay. And finish. What's the last --

MR. SIEMON: The last part is to not include the paragraph starting with, NOSB recognizes in this motion.

MR. CARTER: Okay. So the last word in this particular motion would be --

MR. SIEMON: Hydrolyzed fat.

MR. CARTER: -- hydrolyzed fat. Okay. So this motion continues on, okay. There is a period after the end of the parentheses on 15. Okay. Does everybody understand that?

Okay. Do the minute -- notekeepers understand
that?

Okay. Are you ready to vote? Okay. We're ready to vote. All those in favor, signify by raising your hand.

Opposed, same sign.

Abstentions. One abstention, so it's 13 to zero to one.

Okay. Continue.

MR. RIDDLE: I'd like to make a motion -- the paragraph after this is a standalone motion. NOSB recognizes the need to review the following materials and recommends a review by TAP process to determine if these materials should be prohibited.

MR. CARTER: And then continue with that list of materials.

MR. RIDDLE: That's right.

MR. CARTER: Okay. As written.

MR. RIDDLE: As written.

MR. CARTER: Okay. Is there a second to that?

MS. KOENIG: Second.

MR. CARTER: Okay. It's been moved and seconded. So the motion is that this is, Recognizing the need to review the remaining materials and going through that list, okay, Tony and Catherine, you with us down
there?

MR. RIDDLE: The only thing the committee had asked me to do was put all the numbers besides these unreadables. And so we do -- that is in the OMRI, you know, so we do want to add that in the reference number that OMRI has according to all these.

MR. CARTER: Okay.

VOICE: So you'll provide that to --

MR. RIDDLE: I'll provide that.

MR. CARTER: Okay. You ready to vote?

MS. BURTON: Just one question. I hate to commit to TAP reviews, should comments come back that for some reason we don't want to -- don't support it. So just wanted to make that clarified, please.

MR. CARTER: I believe that was the intent of this whole thing is just to get it out there for people to look at.

Okay. Jim.

MR. RIDDLE: On the almost the third to the -- fourth to the last word, is that complex instead of comples?

MR. SIEMON: That's what the spelling was in the comments. I looked at it several times, so it's either --
VOICE: It should be an X.

MR. RIDDLE: Okay. All right.

MR. CARTER: Yes. Okay. Let's proceed to vote. All those in favor, raise your hand.

Opposed, same sign.

Okay. Let's move on to materials approved as ingredients.

MR. SIEMON: Yes. The issue came up that is it materials that are approved to be used in processed foods, shouldn't they also be allowed in livestock feed is the issue, and NOSB recommends the addition -- I just put this in the context of a new 205.603(g). I think NOP can decide if that's the right approach.

And then that says, All materials in 205.605 can be used in organic feed, subject to FDA or AAFCO regulations.

MR. CARTER: Okay. Is there a second?

MS. OSTIGUY: Second.

MR. CARTER: Okay. Nancy seconded.

Discussion?

MR. RIDDLE: Well, I guess we need to add --

MS. BURTON: I was going to -- we should add, according to the annotations, also somewhere in this
language, because you don't just want to blanket the allowance for food without -- feed without the annotations also.

MR. SIEMON: What annotation? The annotations that are in 605, right?

MS. BURTON: 205.605.

MR. SIEMON: Okay.

MR. CARTER: Okay. Acceptable to the maker of the motion?

MR. RIDDLE: Sure.

MR. CARTER: Okay. All right. Rose.

MS. KOENIG: I just -- I mean, this is new, so I just kind of wanted to get the thinking that was behind this. Not -- I don't know if I agree or disagree with it. Just why did you come about with this? Is there any potential problems with that blanket allowance?

MR. SIEMON: Well, you first have the obvious. If it's acceptable for human food, wouldn't it be acceptable for livestock. But then we've thrown in the whole restriction that it has to be subject to FDA or AAFCO, because some of these materials are not allowed to be fed to animals.

After that, calcium carbonate -- things that we're dealing with them almost in a second, are in here.
So I mean the first thing we passed, so I guess it's just a broader picture.

MR. CARTER: Okay. Kim.

MS. BURTON: And just from a materials standpoint to support that, there certainly are current petitions in right now that we would be able to defer because of this motion.

MR. CARTER: Jeff.

MR. RIDDLE: Yes. The original recommendation on this mentioned that NOSB reiterates its recommendation. Was there a previous recommendation to this effect and do you know when?

MR. MATHEWS: No, I don't.

MR. LOCKERETZ: Question for someone who knows about it.

MR. CARTER: Yes. Willie.

MR. LOCKERETZ: These things are generally approved qualitatively, but substances used in a minor amount in processed food for humans, is it that same substance might be used in a much higher amount for livestock feed and at an amount that FDA would not have approved in human food?

So there's something about the -- the quantities have to be comparable. Otherwise, I'd be
reluctant to take over the FDA guidelines and apply them just qualitatively to feeds.

MR. SIEMON: Well, again, you have the FDA and AAFCO regulations, and then we have 237 in the rule that has clear guidelines about the use of feed and how they can be used. So you have the whole qualifier of 237 of how feed can be used.

Whether it does the job you want or not, Willie, but there's two qualifiers here. The FDA, AAFCO, and then 237. Whether they answer all the questions -- I think they do.

MR. CARTER: Discussion?

MR. LOCKERETZ: A tiny point of language. I believe it should be, Subject to FDA and AAFCO regulations. That is to say, if either one -- it's a no-no for either one, it's a no-no for livestock feed.

MR. CARTER: Okay.

MR. LOCKERETZ: That's offered as a friendly amendment.

MS. BROWN: [indiscernible]

MR. CARTER: Okay. Is there a technical reason? I mean --

MS. BROWN: Yes.

MR. CARTER: Okay.
MS. BROWN: The reason for that is that a lot of these items on the list, if they're -- I think that pulled them out -- there's several calcium sources and stuff that are already on the processing list. They're AAFCO approved.

FDA has given discretion to AAFCO, but it's not on 21 CFR, but it's clearly recognized for livestock feed. So the idea was if either is on the official 21 CFR list or it's approved for livestock feed in the AAFCO book and it's on the processing list, it's FDA or AAFCO, and you've already approved it for food. That's the idea.

MR. LOCKERETZ: FDA or AAFCO -- is that prohibition or allowance?

MS. BROWN: Allowance.

MR. LOCKERETZ: So if either one allows it --

MS. BROWN: Right.

MR. LOCKERETZ: But I'm suggesting that we want both of them to allow it or --

MS. BROWN: They won't.

MR. LOCKERETZ: -- not to prohibit it.

MS. BROWN: One, FDA will not allow it and then -- or it will not prohibit it if AAFCO allows it. FDA always sanctions AAFCO to allow things, so they won't disagree. I mean, it's just that there's more scrutiny if
it's on the 21 CFR list. It's a different procedure to get it approved there.

MR. CARTER: Okay. So no change in the -- okay. George.

MR. SIEMON: Well, two points. First off, I don't think we need to do about changing the list, because it refers directly to the numbers, or do we need to also say change in list? I think we're okay -- yes.

So the second one is just about the as-annotated. I'm looking through the annotated list here, and it says, For use only in made-with products. We're talking about annotations that -- we're not talking about that kind of annotation, so I'm a little worried now about the addition of as-annotated, because it's -- it has a lot related to --

MS. BURTON: As annotated as appropriate.

MR. CARTER: Okay. Kim.

MS. BURTON: A specific example would be like glycerin produced by hydrolysis of fats and oils. That's a specific manufacturing method of this material that would be applicable to a livestock feed.

MR. CARTER: Okay. Further discussion? We'll proceed to vote.

MR. SIEMON: The motion is that NOSB recommends
addition of a new 205.603(g). All materials as annotated in 205.605 can be used in organic feeds subject to FDA or AAFCO regulations.

MR. CARTER: Okay. Is there anybody that wants to state a conflict of interest on this?

Seeing none, all of those in favor, say aye or raise your right hand. Sorry.

MR. SIEMON: We can do either one?

MR. CARTER: Yes. Opposed, same sign.

Abstentions? Motion carries.

MR. SIEMON: Okay. The next series are just ones that really are -- we feel are cared for already, but just points of clarification since issues have come up. The first is carriers. Carriers are defined as edible material, agricultural material, that -- I'm sorry, I just thought of it -- to which ingredients are added to facilitate uniform incorporation of the latter into the feeds.

They are an edible and agricultural product, and so we're recommending that they must be -- satisfy all the requirements in Section 205.237, which means in planning lists, they've got to be organic.

So Committee, you had asked me to put some wording in here I think I failed to do. You had asked me
to put in, Carriers that are agricultural products.

   MR. SIDEMAN: Carriers used in food additives.

   VOICE: Agricultural carriers.

   MR. SIEMON: I don't know why I missed that, but I just realized it when I was reading that. What was it, Eric, we had said?

   MR. SIDEMAN: Agricultural carriers used in feed additives. [indiscernible]

   MR. SIEMON: Boy, am I looking at the right one? I haven't been looking at the wrong one.

   MS. KOENIG: No. Right here. Agricultural carriers. Right here. And then shall instead of must.

   MR. SIEMON: Okay. Agricultural needs to be added in front of carriers. I'm sorry, I missed this. And then must -- shall. Well, we had shall. Okay. Must -- shall.

   MR. CARTER: Okay. So please state the motion.

   MR. SIEMON: Okay. NOSB recommends that agricultural carriers used in feed additives shall satisfy all requirements in Section 205.237.

   MR. CARTER: Okay. Is there a second?

   MS. KOENIG: I'll second it.

   MR. CARTER: Okay. Rose seconded it. Okay.

Discussion?
MR. SIEMON: As the top says, these are just clarifications. Did not really change this.

MR. RIDDLE: I just prefer the word must there, if that's not a problem. Sorry.

MR. SIEMON: Whatever the -- actually, I think we're just going from shall to must back to shall, so --

MR. CARTER: Just as a technical, there's -- shall is --

MR. RIDDLE: Is the strongest?

MR. CARTER: Yes.

MR. RIDDLE: Okay.

MR. CARTER: And legally, shall is you got to do it.

MR. RIDDLE: Okay. I didn't learn that from my mother.

MR. CARTER: Okay. Well --

VOICE: Let's move through this.

All in favor, raise your right hand.

Opposed, same sign.

MR. SIEMON: The next issue is again another
clarification that preservatives that are not incidental, that they must go through the whole TAP review process. So NOSB recommends that all synthetic nonincidental preservatives used in livestock feed must be approved and listed in 205.603. Again, a clarification.

MS. OSTIGUY: Second.

MR. CARTER: Okay. It's been seconded by Nancy. Okay. Discussion.

(No audible response.)

MR. CARTER: I see no one move forward to discuss this. We'll proceed to vote.

Any conflicts? Seeing none, all in favor of the motion, indicate by raising their hand, whichever one you want to raise.

Opposed, same sign.

Abstentions. Okay. The motion carries, 14-0.

MR. SIEMON: And again, on the next one is enzymes. The motion reads, NOSB recommends enzymes as allowed nonsynthetic feed additive, provided they are not derived from excluded methods. That's a little awkward English, I feel, but it gets the message across because again, it's just an obvious clarification.

MR. CARTER: Okay. Is there a second?

MS. OSTIGUY: Second.
MR. CARTER: Nancy seconded. Discussion?

Kim.

MS. BURTON: Enzymes are currently under 205.605(a)(8), with an annotation, and so I think this is unnecessary if you just recommended that anything be used for feed under 605.

MR. SIEMON: Just took care of that. All right?

MR. CARTER: Okay. So you withdraw the motion?

MR. SIEMON: I do.

MR. CARTER: Okay. Seconder withdraws?

MS. OSTIGUY: Yes.

MR. CARTER: Okay. Proceed.

MR. SIEMON: Okay. The last one, again, is just another clarification about the word probiotics, which was originally what was passed in NO. Okay. This was passed, I believe, in '95 about the allowance of probiotics, but it's not the right term.

So the motion says, NOSB has previously determined that probiotics are nonsynthetics, thus allowed, but NOSB recognizes that the approved feed ingredient label is direct fed microorganisms. So just a clarification.

The issue's come up. I don't even know if we
need a motion on it, honestly, but these are issues that have come up we were asked to clarify. So I make the motion.

MR. CARTER: Is there a second?

MS. OSTIGUY: Second.

MR. CARTER: Okay. Discussion?

MS. CAUGHLAN: Yes. Would this not be a technical correction rather?

MR. SIEMON: Sure. But that's -- it's not on the list.

MS. CAUGHLAN: Oh.

MR. SIEMON: But the question came up. You know, we were asked to address it, so this is what we have.

MR. CARTER: Okay. Any other discussion? Mark.

MR. KING: Sorry, I'm really confused. This is or is not currently on the list? Is that what you're saying?

MR. SIEMON: The natural is not on the list.

MR. KING: Oh. So it's not prohibited. Okay, okay, okay. All right.

MR. SIEMON: It's just a point of clarification.
MR. KING: Thank you.

MS. CAUGHLAN: Before the record, the language that --

MR. CARTER: Your mic, please.

MS. CAUGHLAN: It would seem that for the record to go back, you know, that we might want -- since what we're doing is attempting to correct the language of a previous NOSB determination that we would want to treat it. Just correct the record.

Pardon?

MS. BURTON: It's not on the National List.

MS. CAUGHLAN: I understand that. But the language is there, and it's incorrect.

MR. CARTER: Okay. George.

MR. SIEMON: I don't think we need to add anything about the excluded methods. It's the only thing I realize that's not clearly -- the law takes care of that overall. I don't think we need to address that, so I think is just a simple clarification, so I made the motion. Do we want to --

MR. CARTER: Is there a second?

MR. SIEMON: -- is there a second?

MS. OSTIGUY: I seconded.

MR. CARTER: Oh, there was a second? Okay.
MR. SIEMON: Let's call the vote then.

MR. CARTER: Yes. It's on the table. So -- okay. Proceed to vote.

MR. NEAL: I've got a question.

MR. NEAL: What are we moving? I mean, this is a statement.

MR. SIEMON: Yes. It's just a statement.

MR. CARTER: This is just a statement on behalf of the board.

MR. SIEMON: It can be from the livestock committee or it can be from the whole board, whatever's needed. This is one of the things we were asked to clarify.

MR. CARTER: Okay. Just clarification. Yes. Okay. This is painless, because -- yes.

MR. SIEMON: Let's practice. Yes.

MR. CARTER: Okay. All in favor, raise your hand.

Opposed, same sign.

Okay. Abstentions? Motion carries unanimously.
MR. SIEMON: Okay. There's two other issues that are quite big issues that we wanted to address, but we're going to put off the vote till tomorrow. One is the access to the outdoors for poultry, which we do hope to vote on tomorrow, and the other is the replacement for dairy, which we hope to vote just to place for public comment.

So that's the process we're at now. I've passed the two documents out. Again, both these were in the -- we'll go through access to outdoors first for poultry. That was in your book also, and we have made some additions. So I'll read it as it stands for the public. Is that all right? Okay.

NOSB recommends the following clarification of the final rules requirement that poultry should have access to outdoors. Access to outdoors for poultry. It says, Organically-managed poultry must have access to outdoors during the month when feasible.

This is a new line, the next one that we added. Organic livestock facilities must give poultry the ability to choose to be in the house or outside in the open air and direct sunshine. The producers of organic system plan must illustrate how the producer will maximize and encourage access to the outdoors.
Number 2, the producer of organic-managed poultry may, when justified in the organic system plan, provide temporary confinement because of inclement weather, A. B, the stage of production -- and we did change this from the original five weeks to sufficient feather and to prevent health problems caused by outside exposure.

C, conditions under which the health, safety, or well-being of the poultry could be jeopardized. And D, risks of soil or water quality. So we have changed two things here. We were asked to be more specific and the five weeks had some issues, so we went to the physiological side that OTA had recommended, sufficient feathering.

And then the addition that, no matter what the conditions are, the livestock plan and the livestock facility must give the poultry the ability to choose. So there's no confusion, no matter what, they'd have to have a system that shows and is able to do that.

MR. CARTER: Okay. This is the recommended. We are not voting on this today. We want to just present this and have some discussion?

MR. SIEMON: Yes. So the only -- to take up Rick's question the other day, what are we giving? I
think we're identifying that the farm plan of the
facilities must have the ability to choose, and then we're
doing the physiological things.

We actually aren't that unhappy with the
present wording, but some have been trying to determine.
That present wording in the rule says they can bring the
outdoors inside, which still baffles me, but that's still
some of the question marks that have been had, so we're
trying to make clear the point is the bird actually has to have the choice to step outside.

MR. CARTER: Okay. All right.

MR. RIDDLE: So are we going to discuss this?

MR. SIEMON: Yes. We're going to discuss it now.

MR. CARTER: It's on the table for discussion.

MS. CAUGHLAN: No --

MR. CARTER: Okay. Jim first and then Goldie.

MR. RIDDLE: Yes. Just one change that I'll likely propose when we actually discuss it for real, and that is --

VOICE: Do it now.

MR. RIDDLE: Yes. That the first sentence, that during the months when feasible, I just think's redundant when you've already got the temporary exceptions
down below -- inclement weather, risk to soil and water quality. So I think it's unnecessary language myself.

MR. CARTER: Okay. We'll consider that. And this is discussion for real. We're aren't just pretending to have a discussion.

Okay. Goldie was next. Oh --

MR. SIEMON: Well, can I respond to Jim?

MR. CARTER: Yes.

MR. SIEMON: So you're saying the whole inclement weather would take care of all the winter things and that kind of thing. Right? That's pretty obvious, but that's what you're saying -- the temporary confinement is what takes care of that?

MR. RIDDLE: Yes.

MR. SIEMON: During the -- I agree.

MR. RIDDLE: That's my understanding. You can have inclement weather for several months on end, as we know.

MS. CAUGHLAN: So you're leaving up to the organic system plan the broader issue of quantification of space per bird, as it applies to each individual form of poultry that would be covered, and you're leaving to the
organic plan whether or not it would be bare or cement or pasture?

    MR. SIEMON: Yes. Like I said yesterday, we've kind of picked the middle of the road here, compared to requiring pasturing or not requiring outside. We feel the rule clearly says outside, so we've not gone as far as we could have to require a pasture system.

    MR. CARTER: Okay. Kim.

    MS. BURTON: We just heard before that the word shall has more strength in recommendations than must, so I would suggest we change all the musts to shall.

    MR. CARTER: Okay. So we don't want a musty recommendation here. I'm sorry, that's -- okay.

    MR. SIEMON: Or moldy?

    MR. CARTER: Okay. So change every must to shall. Okay. In the language, the recommendation is that, you know, must shall be shall. Okay. Okay.

    VOICE: The rule says shall.

    MR. CARTER: Okay. Rose.

    MS. KOENIG: I just wanted, I guess, a clarification from Rick as the way I interpret the rule. I was sympathetic to some of the disease problems that could occur, frankly, in any kind of operation. Most of the cases were in conventional operations.
All of the cases, I guess, that we were looking at were more conventional operations. But in the event that there was some kind of a quarantine -- state-enforced quarantine, that would override our rule. So we are protecting -- you know, putting ourselves in a protective and conservative fashion, I guess, because that rule does allow for state quarantines to override the programs rules during that time. Correct?

MR. MATHEWS: Actually, if, for example, the state of Virginia, because of the outbreaks they've got now, said that you couldn't have free-range chickens, then we wouldn't be able to have free-range chickens.

MS. KOENIG: In that state.

MR. MATHEWS: In that state.

MR. CARTER: Okay. Other discussion?

Mike.

MR. LACY: Thank you. Listening to some of the input yesterday and also some of the input that the board received, I can't disagree that the rule does state that a producer of organic livestock must establish and maintain livestock living conditions, including access to outdoors, shade, shelter, et cetera, et cetera, suitable to the species.

And I'd just like to comment on the four things
that seem to be at issue here: the disease issue, the welfare issue, what I think may be the most important -- a food safety issue, and also the custom or expectation issue.

I think that organic producers are going to be between a rock and a hard place when you look at 205.238 that states that a producer must establish and maintain preventative livestock health care practices, including establishment of proper housing, pasture conditions and sanitation practices to minimize the occurrence and spread of disease and parasites.

And certainly, the expert avian veterinary opinions that were provided to NOSB indicates that outdoor access will in fact increase the exposure and likelihood of occurrence and spread of serious poultry diseases. And that would be an impact to both organic and commercial producers.

One serious concern I have is that most often, and this is certainly the case with the avian influenza situation in Virginia and North Carolina right now, the disease was actually spread before the clinical symptoms of the disease appeared.

So you could have birds that looked perfectly healthy and have farmers that are doing their normal,
everyday chores and associating at church or whatever, and that disease could be spread before you realize that avian influenza has infected flocks. And that's really how the problem got out of control so quickly in Virginia.

There's been some input about factory farms, and I just want to say that in Georgia, there are about 4,000 small poultry farmers that make their living from contract poultry production. And although they have never had an avian influenza outbreak, they are going to great expense and great effort to try to protect their flocks as well as their neighbors' flocks.

So I think there's more at stake here than just factory farming. There are small farmers, both organic and commercial farmers, that -- whose livelihoods are at stake.

Let me talk about the animal welfare thing. That's something that is near and dear to my heart. The scientific input provided on this issue indicates that all natural behaviors known to be critical to poultry welfare can be and are routinely exhibited in poultry housed in barns, houses, sheds, et cetera.

And since shelter is a requirement in 205.239, it's pretty much a given that appropriate housing systems are not inherently a detriment to poultry welfare.
The food safety issue, I said, is to me very compelling. There's no question that rodents are a source, if not the source, of Salmonella enteritidis in egg-laying flocks. Poultry producers, organic and otherwise, have been encouraged to eliminate exposure to rodents, and I believe that organic customers have an expectation that organic producers will do everything in their power to enhance food safety.

And while we're talking about customer expectation issue, the only data to come to the board from -- in this regard was from Mr. Bass yesterday, and his survey certainly wasn't, quote, unquote, scientific, but was focused at actual organic egg consumers, and his finding that 80 percent of his respondents believed that his housing system, with no direct access for his birds, was okay or preferable, seems to refute the notion that well-informed organic customers are adamant about outdoor access.

I will -- as I said, I cannot disagree that the law says that the rule says that outdoor access is a necessity, but I hope that we would take into consideration the welfare of the birds and also the livelihood of poultry producers.

MR. CARTER: Okay. Goldie.
MS. CAUGHLAN: Yes. What, Mike, when you're referring to the small poultry producers that are in George, can you talk about what is meant by small or --

MR. LACY: I'm talking about small farms where poultry producers may have anywhere from two to six poultry houses and would contract with an integrated -- vertically-integrated poultry company.

MS. CAUGHLAN: And a poultry house is -- what; about 10,000?

MR. LACY: Usually somewhere in the 15- to 25,000 bird range.

MS. CAUGHLAN: So a small producer, by that description, would be four times 20- to 25,000?

MR. LACY: Correct. Two to six times that. That's correct.

MR. CARTER: Okay. Rose.

MS. KOENIG: I just have a comment in terms of -- I'm not an animal pathologist but I'm a plant pathologist, and again, I certainly have sympathy and -- and you know, I understand the implications of any type of disease outbreak.

But I think there is an analogy to the avian influenza, and it's -- there's analogies in plant diseases, such as citrus canker, and we have a citrus
grower right here on the -- sitting on the board.

So -- but we don't compromise the organic principles in the plant arena for citrus canker. We deal with it on a state-by-state basis, so if Dennis Holbrook has citrus canker on his farm, the state of Texas is going to probably implement some kind of a program such as what might happen in Virginia, and our rule allows that.

So I do think that there are precautionary, and there are things in the rule -- there are parts of the rule that do cover outbreaks, and I don't think that we're being negligent by allowing access to outdoors because of diseases.

I think that, again, we're adhering to the principles of the rule, and we have those -- we have safeguards in the rule to account for disease outbreaks, whether it is in animal production or plant production.

MR. CARTER: Okay. Just as a point of clarification, too. As far as the terms of access to outdoors, that's a nondebatable one under the rule, because that's in the rule. So, you know, what we're doing here is trying to put in the guidance.

So -- okay. Mike.

MR. LACY: Sorry. Just to respond to that. It's really the preventative. I'm coming from a
preventative standpoint. Once you've got the disease outbreak, it's too late. The horse is out of the barn.

MR. CARTER: Okay. Thanks.

Okay. Jim.

MR. RIDDLE: Yes. Before we move on, George, I just want to get back to the language of the text that you've proposed here. Number two, I would like to delete the word an, so it doesn't read, The producer of an organically-managed poultry. We want producers to be able to have more than one poultry.

So I would just -- so just, The producer of organically-managed poultry.

MR. SIEMON: Good.

MR. CARTER: Okay. All right. Okay. Other discussion on this before we move on?

Okay. Willie and then Rose.

MR. LOCKERETZ: I'm bemused by the language about ability to choose to be in the housing or outside. On a real cold day, the farmer says, Sorry, guys, got to close the door. And they say, Cluck, cluck, cluck, we want to go outside.

MS. CAUGHLAN: I think we're all -- I'm pro-choice. I don't know --

MR. CARTER: Okay. Rose.
MS. KOENIG: So is there -- do you have a -- is there a grammatical change there?

MR. LOCKERETZ: No, it's the content. Not the language.

MR. SIEMON: Actually, it brings up an issue, and that's the last line is, The producer will maximize and encourage access to outdoors, because chickens are creatures of habit, and there are things you can do to encourage them to get outside.

So they're actually -- we hope the last line is the one that carries it further to maximizing.

MR. CARTER: And I hope they're more effective than they are in my 14-year-old son. He likes to sit in front of the TV, so -- okay. Rose.

MS. KOENIG: I would like to ask George to put together the grammatical corrections that have been presented, and I make a motion to approve the recommendation of the committee today, because a couple of us will not be here to vote tomorrow.

MR. CARTER: Okay. Just a second. There's a motion that's been made. Is there a second to the motion, and it is to make the changes right now and to vote on the language.

Is there a second to that?
MR. LOCKERETZ: I second it.

MR. CARTER: Okay. It's been seconded.

Okay. Rick would like to make a comment.

MR. MATHEWS: Well, I guess this is perfect, because you're asking for discussion on the motion. The way I would read this is that you could have a dirt area of no specified size on the outside of the barn. You could have a concrete area of no specified size outside the barn.

You could have a roof. You may not have a roof. You -- on days when it's too cold they don't have to go out. On days when it's too hot they don't have to go out. If it just rained they don't have to go out. The chickens that lay eggs, if the farmer wants to keep them inside to lay the eggs inside, he can wait until All My Children comes on.

And if he has to go home at five o'clock to have dinner and he doesn't want the predators to get at his chickens or his eggs, he closes the doors at five o'clock. So in reality, what you're allowing is maybe from one o'clock to five o'clock on those days when it's not too hot, not too cold, not too wet.

Is that really what you want? Just asking.

MR. CARTER: Okay. Owusu.
MR. BANDELE: Yes. I was concerned about chickens being between a rock and a cement place, too. But I think, though, if you go to the rule, the rule says that it has to be establishment of an appropriate housing, pasture conditions, and sanitary practices --

Wait a minute. Is that the one?

VOICE: Yes.

MR. BANDELE: Yes. So to me, this does not supersede the rule. So they would still have to follow those other requirements in the rule itself.

MR. MATHEWS: In essence, what this has done is that it's said, You don't have to have pasture. You definitely can't have outdoors indoors, but you satisfy the requirement by allowing them to have that little sun porch to do their natural thing. And that's the way I would interpret it.

MR. SIEMON: Well, both your examples are the minimum, which is in fact -- but we're hoping that the farm plan, as it says, maximize and encourage -- we're hoping. The farm plan is always the tool in organics that pushes people further and further into complying with organic principles. We're not -- you know --

MR. CARTER: But I think the analysis is correct. This is the minimum standard. Yes. Okay.
Okay. Willie.

MR. LOCKERETZ: Of all the things Rick said which, remarkably, I agree, completely agree with, one of the --

MR. CARTER: Let the minutes reflect --

MR. LOCKERETZ: -- the one about what the floor is made of is pretty serious, and I think we -- I hadn't thought of this when we were drafting these things, but I think some statement to the effect of the acceptable type floor, acceptable type area, is very important. Otherwise, it could be as bad as Rick projects.

MR. CARTER: Do you want to make that in the form of a motion?

MR. LOCKERETZ: Well, I don't know exactly how to phrase it. I mean, something more positive than concrete doesn't count.

MR. SIEMON: But isn't this what -- the comment was earlier about appropriate housing in the other parts of the rule covers some of those things. I agree there's --

MR. LOCKERETZ: I looked for that but could not find it.

MR. SIEMON: Well, under 238, you have all the different things about appropriate housing and establish
appropriate housing, sanitation, pasture conditions, environmental-effective manure. There's a lot of other things that add up to this. I agree -- this is vague.

MR. LOCKERETZ: But density -- that is, number of chickens per area. That's pretty important. And what the floor is made out of. So I don't have a suggestion, but I do think it's something worth specifying instead of leaving it in this generic language.

MR. CARTER: Okay.

MS. CAUGHLAN: I think we need to also again talk about it from the point of view of -- we talked about the first day that we were here prior to the public, when we were talking about public consumer misunderstanding of what is and is not organic, and I think nowhere is there more controversy perhaps.

And when it comes to -- just take the term, the ecolabel of free-range. The concept of free-range already has the consumer envisioning trotting across a field of pasture and that there is a much higher, be it appropriate or not, there is a much higher expectation on the part of the consumer.

When it comes to ramping it up and paying more for their organic chicken that is -- that has access to outdoors, I think we're really opening ourselves up,
unless we give some much more explicit language.

MR. CARTER: Okay. The chair is going to declare -- there are a couple of folks in the process of drafting some amending language here, so I'm going to declare, for personal reasons, a five-minute recess. And we will come back and entertain any amendment.

(Whereupon, a short recess was taken.)

MR. CARTER: Okay. Mr. Riddle. Waiting for, I think, someone who was involved in some preparatory language to come back in the room, otherwise known as Jim Riddle. Okay.

MR. RIDDLE: What -- did you say my name?

MR. CARTER: Yes, I did. Okay. Was there language being prepared?

MR. RIDDLE: Yes, but Mike Lacy came up with it and he was going to talk to you.

MR. SIEMON: The amendment is about just adding a minimum square feet for outside. And there's two issues that we could add for specification, and that is about the square feet outside, and the discussion about dirt or not dirt.

Those are the two issues. And when we discussed this, we left it up to the farm plan, and depending on the rest of the rule that the farm plan would
be where you would apply the pressure to make sure there was not manure contamination and all the different things.

So we had purposely left it a little bit flexible so the farm plan would be the vehicle that you would use. But the suggestion's been the minimum of two square feet. As far as the square footage thing, that's pretty small, but that's one of the suggestions that was put forth here.

I don't -- we have to decide if we want to go to that specificity. So we -- the committee had elected not to.

MR. CARTER: Yes. But I think given this, if there's some language being prepared, we will take this now back to the committee this evening and bring up then the final language for action --

MR. SIEMON: Okay. I suggest we move on then.

MR. CARTER: Okay.

MR. SIEMON: Except for -- no, no. Wait a minute, wait, wait --

MR. CARTER: Wait a second. Wait a second. There is a motion on the table --

MR. SIEMON: There was a motion to vote.

MR. CARTER: -- to vote on this.

MR. LOCKERETZ: Not as amended?
MR. CARTER: There was -- either the motion can be withdrawn or an amendment can be added or we can vote on the language as it's been presented. Okay. The motion that's on the table right now is to vote on the language as presented.

If we move forward with a vote, we vote this up or down, okay.

MR. LOCKERETZ: Without amending --

MR. CARTER: Unless there's an amendment that's offered --

MS. KOENIG: I made the motion. I'm willing to rescind the motion, and I would ask that -- no, we can move on to other committees' reports and perhaps before the end of the day, if you have time, come back with something. If not, tomorrow.

MR. SIEMON: But then we would need instructions that we want, for example, to be more specific. Is that the will of the board? Otherwise -- I mean, the committee's recommended the farm plan approach.

MR. CARTER: Yes. I'm sensing that there's a desire by the board to have some additional guidance in this document, and I think we can take that. We don't need a formal motion on that.

The motion to vote on this has been withdrawn,
okay, with the understanding that this will be brought up later. It's not a motion to table. And we will bring forward some additional clarifying language in this.

Okay. Owusu.

MR. BANDELE: Yes. Before we move on, just want to make one point. I know, for example, under certain scenarios, like in the pastured poultry, some of those pens would be like eight by eight, which would be 64 square feet, and they would have, like, over 40 birds in there.

So that's just -- I mean, just for consideration, and that would come out to less than two square feet. Now, how that's dealt with I don't know, but I'm just saying that's the reality of it.

MR. CARTER: That's correct. Okay. So we're going to move on then at this point.

Mike, you were out of the room. What we've done is the maker of the motion to vote on this right now has withdrawn that with the understanding that we're going to add some additional language here and bring it back for a vote if not later today, first thing in the morning.

Okay? Okay.

MR. SIEMON: Well, okay. Let's move on to the dairy replacements. Just to try to bring some
understanding about why this is an issue, first off, dairy is very confusing, but we have two forms of entering into the organic dairy business in the present rule.

One is the whole herd conversion where a dairy herd has been part of a farm converting to organics, and they have a specific clause in the rule about how they enter organic dairy.

The second method is for a herd of cattle that are not part of a farm converting that they're able to feed 100 percent organic feed for one year and all the other aspects and enter into organic dairy. There's two ways to enter into organic dairy.

The confusion over the replacement dairy is that the rule in number two and two -- three, whatever, three i's -- what is it -- I guess it's -- yes, two -- or three i's -- there's a conflict between where you would read that the herds that came with entry clause would have to have all the replacements be the last third of gestation forward, and some could say the herds that came in through the one year would be able to bring replacement animals with the one year.

So there's a basic conflict, and then if you read the preamble it adds more confusion. So we're trying to clarify strictly the replacement herd clause and try to
equalize it between these two different methods of entering. That's the basic problem that we're trying to wrestle with.

So all we've written is about replacement dairy animals. So you all have got this in front of you. What we're hoping to do is to put this up on the Web. Even though the community would love for us to make a vote, it did not get on the Web, and we'd like to put it up for public comment and vote on it in September.

So that's the due process part. The community really wants to know, so I think it would be good rather than the livestock committee put it on the Web. Then if we all discuss it enough for the board to put it on the Web so that it shows a little bit more maturity than just a committee moving forward. Just to give a message to the industry.

Is that okay? Everybody --

MR. CARTER: Read the language. And I know -- I see some furrowed brows here, because there's -- and we talked about this over lunch with the committee -- that you really don't want to have as precedent that we have to have board action to put things on the Web.

But George's feeling is that we, because of the importance of this issue, we want to have the sense of the
board of where we're headed with this. So --

    MR. SIEMON: Well, we got it settled by

September is the main thing, so -- okay.

    NOSB recommends the following clarification for

organic dairy replacement standards. Number one, organic
dairy replacement dairy animals must be raised organically
from the last third of gestation unless -- and then i. I
don't know where i came from, but -- i. Organic
replacement animals are not commercially available, in
which case the producer may add replacement animals from
nonorganic sources, but those animals shall be under
continuous organic management upon entry to the organic
operations but no less than one year prior to the sale of
organic milk.

    This is more or less what was set out as our

earlier proposal, but we removed the part on the
medications for the first six months for one major reason,
and that is that that's truly a rule change. And we were
trying to stay in the world of clarification, and that if
the antibiotics issue is an issue, it needs to be applied
in a different petition process.

    And number two, there was debate whether that

was the right thing to do in the first place. So this
basically is going to the last third and then a
commercially available basis for organic replacements,
with the one year as a minimum.

The one year, just so everybody remembers, is
what is said in OFPA, and it is the foundation of this
whole discussion.

MR. CARTER:  Okay.  Discussion?  So you have a
motion to recommend this language on the Web.

MR. SIEMON:  I wouldn't mind -- I'd like to
vote for it, but I'm trying to respect the process.

MR. CARTER:  [inaudible], yes.

MR. SIEMON:  Yes.  Okay.

MR. CARTER:  So let's -- yes.  Is there a
second?

MR. RIDDLE:  Second.

MR. CARTER:  Okay.  It's been seconded.  So
this language has been moved and seconded for
recommendation to go on the Web for public comment.

Jim Riddle.  I'm sorry, ma'am.

Okay.  Discussion?  Yes.

MR. RIDDLE:  Yes.  Just one question, George.

When it says commercially available, under seeds when it
talks about commercial availability, it talks about
equivalent variety.  And so I'm assuming that for
livestock, that would be equivalent breed could be if a
producer wants to switch breeds and there aren't any breeds available in organic form, that that would be one justification for commercial availability to kick in.

Is that correct? It's not just numbers. It's not any dairy cow, but it could be a specified breed similar to a specified variety.

MR. SIEMON: Yes. And of course the quality, too, so it's not very far from the commercially available. We would maybe need to look over what we passed earlier to see if there's any modification, but I think that's something NOP can do for the -- but we could look at that, too.

MR. RIDDLE: Yes. The definition of commercial availability says form, quality, and quantity already, so that's covered. But then it has this specific qualifier for seeds of equivalent variety, and I'm assuming that that's --

VOICE: Equivalent species --

MR. RIDDLE: -- equivalent breed -- yes.

VOICE: -- breed. Breed, excuse me.

MR. RIDDLE: So yes. Maybe that should be added -- in an equivalent entity, equivalent breed or something.

MR. CARTER: Is that an amendment?
MR. SIEMON: It's in the definition --
commercially available and --

MR. RIDDLE: No.

MR. SIEMON: -- equivalent breed. Yes, that's fine.

MR. CARTER: Can we accept that as a friendly amendment, okay, without having to vote on it? Any objection?

Okay. Willie.

MR. LOCKERETZ: Question. What's typical for the age of replacement heifers when they're bought from another farm?

MR. CARTER: George.

MR. SIEMON: It varies all over the map, and honestly, it's usually right close to their first calving and not earlier, but it can go all over. But six month -- well, it can be any time from two weeks of age to right before they calve.

MR. CARTER: Okay. Kevin, also, if you have some information also --

MR. SIEMON: But in the dairy world, the one year has been in place for a long time. So in the organic dairy world, people have been buying the replacements prior, if they didn't have enough farm raised. We'd never
had a commercially available position, so now we have a stricter.

The calves have to be -- this is very stricter than what we've been so far, and most of the standards, the calves have to be raised organically now all the way through, and then you have to buy organic if they're available.

So we've added two strict new things that weren't in the previous -- most of the standards, at least.

MR. CARTER: Okay.

MR. O'RELL: I know you're looking to me, but I'm really waiting to see when we get this published and get some public comment on the issue.

MR. CARTER: And I would just -- to Willie's question about the specifics, the timing. So -- okay.

Comment from Rick.

MR. MATHEWS: George, it's not just replacement animals that we're concerned with. We're also concerned with animals that are brought onto a farm to increase the size, whether they're born on the farm or brought from another source.

And the regulatory language doesn't address it as replacement versus entry. It just addresses it as
animals. So what are your thoughts on the entry issue?

MR. SIEMON: Well, first I'd like -- you're

talking about expansion, for example. Replacement is once

you're in production, how do you bring new animals in.

Expansion or replacement is the way I'm trying to read

that.

So I think it's -- this carries over and covers
what you are calling expansion. But going back to my
initial response, the initial entry -- you can bring
animals in to enter dairy with the one year, you know, but
this is more about once you're shipping organic milk, how
can you expand or replace.

I don't know. To me, it's the one year is your
backup always in new positions, and this is still a backup
here; behind the commercially available is still the one
year as a backup. So I don't know how to clarify it more
than that, Rick.

MR. CARTER: Rick, you still look puzzled.

MR. SIEMON: What's the puzzlement? Jim might
help me out here.

MR. MATHEWS: Well, I guess my problem is still
with the word replacement, because replacement implies to
me that you've got 100 animals, five of them are coming
off, so you put five more in so you still have 100
animals.

It doesn't answer the question for the farm where they take, say, five off and bring ten on and go to 105.

MR. SIEMON: Okay. So you'd like to have replacement and expansion --

MR. RIDDLE: Yes. I would suggest just a leading replacement. It's organic dairy animals. Does that cover? And how does it read without the word replacement? Let's just try that before I make a motion.

MR. SIEMON: Well, I think if you have to have a title that once a farm -- once you're a producer of organic milk. Then you can go there. You have to have that qualifier at the top, I would think, since they don't interfere with the other entry clauses.

MR. RIDDLE: Yes.

MR. SIEMON: But I think --

MR. RIDDLE: But if you -- yes. If you add to the introduction --

MR. SIEMON: That's right. Then it would work.

MR. RIDDLE: Okay, because I think that would certainly read a lot better than saying replacement and/or expansion animals or something.
MR. SIEMON: I was just starting to read once an organic -- you know, I was starting to go there but I didn't quite -- so I agree with you. Let's remove the word replacement and put a qualifier --

MR. CARTER: Turn on your mic, please.

MR. SIEMON: Let's remove the word replacement and put a qualifier statement over it that this is about once you're in and shipping organic milk. I think that would help clarify what Rick's bringing up.

MR. CARTER: Okay. Rick, let me just ask here.

MR. MATHEWS: Let me ask this. The current language says in a -- you know, of 236 that the livestock have to be under continuous organic management from last third of gestation except in the case of dairy animals, milk or milk products must be from animals that have been under continuous organic management, beginning no later than one year prior to the production of the milk.

I'm a little confused, because it almost sounds like you don't want to change that statement; that you want this other statement to be something in addition to that.

MR. SIEMON: Yes. That's correct. And -- well, I don't see it here in this final rule. That dates back to NOSB had previously -- and I admit it's not in
here -- had always had the foundation that once an animal enters a farm, it had to be treated organically from that point forward.

That was always part of some of the earlier recommendations, and I really -- I looked through it last night. I really don't see that in the rule now, but that was one of the premises that we were working on; that once you were on the farm, you had to be treated organically rather than having animals being treated conventional and then switch to organic so they can enter an organic dairy.

Once they're on the farm, they had to be organic dairy. So that is the foundation to why that number two becomes the minimum that these other things are building on. So you are correct.

MR. CARTER: Follow-up?

MR. MATHEWS: Then George, let me ask you this.

The dairy is organic, and it's been organic for, say, five years. The dairy farmer suddenly decides they want to add 20 cows that they're going to then use one year later to produce.

Does the language that currently exists in the regulation still apply -- that any cow, any age, any source, can come on in any number and go through the one-year period?
MR. CARTER: George.

MR. SIEMON: It does stand, but we've added the first step that they have to look for organic heifers on a commercially available basis, and that's the marriage between three i and two that we're trying to do. We are trying to make a level playing field between those that came in the entry herd clause to those that came in this other way. So we're trying to bridge between the two.

MR. MATHEWS: So --

MR. SIEMON: It's going above the present number two is what it is. But so does three i go way above it.

MR. MATHEWS: So it's supposed to go -- you would have the single i, then this new entry, and then the double i and then the triple i?

MR. SIEMON: Well, I --

MS. BURTON: Please call the question, please.

MR. CARTER: Well, there's confusion here, so we --

MR. SIEMON: See, I was trying to avoid rewriting this because that's -- I was trying to clarify the rule. But the right way for this rule to be written is there's two ways to enter and then replacement, and separate the two issues.
You know, that's the correct way to deal with it to avoid the confusion. Right now we're mixing up subjects, so clarify how you can enter organic dairy, then clarify once you're in organic dairy how you would expand or replace animals that you needed to.

Those are the two clarification points. So I -- the i, how to work the i's in here, I guess I would make the entry herd, you know, like a number A, and then B the replacements. Something like that, I guess, if I had to just work with this wording right here, and then eliminate number three i, because three i is the one that's making all the confusion.

We'll work on it, bring it back tomorrow, and otherwise, the livestock committee will send it forward as it --

MR. RIDDLE: But this is just what's going to be posted.

MR. SIEMON: Yes. This is just the posting. Yes.

MR. CARTER: So you want to withdraw your motion at this point to pass this, and then we'll --

MR. SIEMON: Sure. We'll get the qualifier and we'll take out the word replacement is what I've heard here and add commercially available and equivalent breed.
Those are the changes we've had here so far.

MR. CARTER: Okay. Good. That's -- which I thought would be a helpful process in the beginning.

MR. SIEMON: That's all that we --

MR. CARTER: Talk about it one day and come back the next, so --

MR. SIEMON: That's all that the livestock committee has.

MR. CARTER: I just want the record to note that we're back to the process that I recommended in the beginning, so --

MR. SIEMON: Except for we may still try to do the outdoors if we could. Okay. Besides further working on the access to outdoors, that's all we have for today. Maybe we'll get back to that.

MR. CARTER: Okay. Yes. Back to the agenda, whatever it is. Okay. Are you done?

MR. SIEMON: Yes.

MR. CARTER: Okay. Then let's move on to materials. Kim.

MS. BURTON: Okay. What I'm passing out is Draft 5 of the clarification of Section 205.606. When I presented the draft yesterday, there was some language that I left out per request of Jim Riddle, so I've added
that back in.

I will go ahead and tell you the areas of the language. On the first page, last sentence, In addition, once the material is placed on the list as not being commercially available in an organic form, the industry no longer has an incentive to develop organics versus of the material. So that's an addition.

MR. SIEMON: Would you define this issue, please?

MS. BURTON: We discussed it yesterday.

MR. SIEMON: Okay. Fine. All right.

MS. BURTON: On page 2, I guess the second paragraph from the bottom, just for reference, last sentence, A guidance document on commercially availability still needs to be completed and posted. So those were the two recommendations that I accidentally deleted or left off yesterday's recommendation.

There's another area that was brought to my attention by Steve Harper. In the original recommendation, we were recommending that all the materials on that 205.606 just be deleted because they were nonorganic agricultural products, when in fact I was in error.

There are strict annotations to two of those
materials, one being gums, water-extracted only, and kelp for use as a thickener. So we really don't want to delete those. We're going to suggest that they be moved over to 205.605(a).

Again, if someone has a problem, they can petition to remove, but that's -- this is the correct document right now.

MR. CARTER: So is there a motion?

MS. BURTON: I make the motion to approve this document as is version Draft 5, clarification of 205.606.

MR. CARTER: The motion is on the table to approve Draft 5, clarification of 205.206. Who was the second and who was the --

MR. RIDDLE: I will.

MR. CARTER: Okay. You can take your choice. Jim or Goldie, so -- okay. Discussion.

MS. BURTON: Kevin.

MR. O'RELL: In moving the gums with the annotation, water-extracted only, and having those gums listed, does that then exclude any other water-extracted gums that aren't on that list, because I know when we were talking in committee, we had deleted that because we didn't want to create lists.

Now we're moving lists, and the annotation,
water-extracted only, is fine, but do we need it by those specific examples or does that exclude all the other water-extracted?

MS. BURTON: Well, I guess we would have to go back to the original TAP and were these just references or were these specific gums we were -- I can't answer that question. Looks like I can't answer the question so --

MR. CARTER: Is there somebody that --

MS. BURTON: I would suggest that we leave it as is, and if somebody -- either we come back and make a suggested annotation change or we actually have people to petition to verify the water-extraction method.

MR. CARTER: Technical information only.

MS. FRANCES: Greetings to the committee. I'm with the Maryland Department of Agriculture, the organic certification director, Valerie Frances.

Just wanted to mention that we do have a company in our state that is in -- they're certified for gums, acacia gum, and they're working on locust bean gum. I understand usually the gums are sold as a blend. I think they're missing one of the gums, but that's -- working towards it, sure.

MR. CARTER: Okay. Thank you.

MS. BURTON: We can take gums back as the
processing committee and come back with the recommendation. But for now, this is going to clarify 606.

MR. CARTER: Okay. Further discussion?

MS. BURTON: Oh. Steve has a problem.

MR. HARPER: I'm not sure what the original NOSB recommendation was in regards to -- whether these are just examples or not, because I just can't remember. But if you take it off of here, then you've sort of nullified the intent of the previous NOSB, even -- no matter what the intent was, whether it was an example or a -- I mean, if you just delete it, just strictly it, and that's why I'm suggesting leaving it on there.

MS. BURTON: He was saying just to leave Arabic [inaudible] like as --

MR. HARPER: No. No, I'm just saying if you had deleted the whole thing off of 606, you would have in effect been nullifying the previous decision by NOSB -- the previous recommendation by NOSB on a specific annotation.

MR. RIDDLE: Yes, but if this is -- if the gums, for instance, are moved to 605, then does a processor still have to try to source for organic? Does
commercial availability still apply once it's put on the
605 list?

MS. BURTON: It's my understanding anything on
the 605 list, if it's --

MR. RIDDLE: Any ingredient in a product
labeled organic. Correct, if it's an agricultural
ingredient, because it still has to try to source
commercially available organic?

MR. HARPER: Not if it's not 606.

MR. RIDDLE: Yes. So that's the problem with
moving it to 605 if there indeed are organic sources being
developed.

MR. HARPER: So you've got sort of a conflict
of --

MS. BURTON: Yes. Well, we have work to do on
605 also. At least for this time being, I think this is
the correct move to make. If somebody wants to petition
to remove it because there is an organic source available,
they can certainly do that.

That's the way it is right now with the
cornstarch, for example.

MR. CARTER: Okay. Any further discussion?

Yes. Kevin.

MR. O'RELL: Yes. Just for point of
clarification, we're saying to move the gums, water-
extracted, only in examples to 605?

MS. BURTON: Correct.

MR. O'RELL: But yet, we're leaving them in the
wording now of 205.606. We didn't strike those.

MS. BURTON: We didn't want to strike the --
that's just -- this is just for your reference. We
actually requested that they be moved, if you look at the
paragraph below.

MR. O'RELL: So is it requested they're moved
out of 606?

MS. BURTON: Correct.

MR. SIEMON: There won't be any materials left.

MR. CARTER: Okay. Further discussion?

(No audible response.)

MR. CARTER: Okay. We'll proceed to vote.

Is there any conflicts?

Okay. All of those in favor of the motion as
presented signify by raising your right hand.

Opposed, same sign.

Abstentions? Two abstentions. Okay. Which
would make us a 12 to 2 and the motion carries.

MR. SIEMON: 12-0-2.

MR. CARTER: Twelve-0-2, excuse me. Thank you.
MS. BURTON: There was one other topic under materials, and that's the Konjac flour, and I mainly put this into the book as a reference for us to look at as a material that would actually fall under a nonorganic agricultural item.

And it's on Tab 6. I believe it's the second tab under 6. And I included just the basic manufacturing methods, so you see that it's just -- it's the third page of manufacturing. It just describes the Konjac tubers, slicing, drying, milling, washing, drying. So that would be an example of the material that would now fall under 205.606.

Okay. And there's no action needed; just a reference.

MR. RIDDLE: Was there a petition? I'm sorry, I missed -- I was spacing out there for a minute or something -- was there a petition submitted for Konjac flour. Shouldn't there be a recommendation? I mean, we did on a couple of other things that we determined were agricultural and commercial availability applied, but --

MS. BURTON: We did on materials that were currently on the list. I would think that if we passed the recommendation, although it's not part of the Act, this would now be an example of the filing of 606.
We did not have a technical review of this material or anything, so --

MR. RIDDLE: Oh, okay. Yes.

MS. BURTON: -- I think until that really becomes final, we can't review that material.

MR. RIDDLE: Okay. I just forgot where it fell in the process. It was weeded out earlier on. Then going through the TAPs --

MS. BURTON: It never went through a TAP.

MR. RIDDLE: -- to a committee and all that.

Okay. Thanks.

MR. CARTER: Okay. Anything else?

Kim.

MS. BURTON: That's it.

MR. CARTER: Okay. Thank you very much.

Okay. Let's move on to processing. Couple of items and then we'll have a point of clarification over some action that was taken this morning, so --

MR. KING: Yes, and as I understand, where this -- this whole session will be points of clarification. Yesterday -- and I'll just read this quickly to let you know, and this, as I understand it, doesn't need a vote but I want you to know that it's just moving forward as an example of something that can be used
in the industry and will be posted on the NOP Website, and that is an ingredient affidavit.

So members of the organic community have just expressed a need for guidance concerning the documentation of ingredients. So the processing committee recommends that the following ingredient affidavit just simply be submitted the national organic program for -- as guidance, essentially.

MR. LOCKERETZ: Is that in our book?

MR. KING: No, but you will get copies of it.

Sorry, Willie. Thanks.

MR. LOCKERETZ: That's all right.

MR. KING: And thus, did you want to bring up the earlier point as --

MR. CARTER: Yes. Okay. There was confusion over how Robert's Rules of Order handles abstentions and went and got a copy of language from Robert's Rules of Order and just parliamentary procedures.

Abstentions. When a vote is needed and a member does not feel that he/she has enough information to vote on the matter in an appropriate fashion, he/she can abstain. This indicates neither or no vote. All abstentions will be recorded as such. However, they will be tallied with the majority vote.
Okay. So in this issue, the language then regarding, under DEAE, the motion that was on the table, For use as boiler water additive in livestock -- oh, I'm sorry.

Okay. The motion that was voted on, DEAE for use as a boiler water additive in livestock feed until October 21, 2005, was voted on. The margin was eight in favor, three opposed, and three abstention. That -- according to the rules, then, that motion does carry because the three abstentions go with the prevailing side, effectively making that an eight to three vote. Okay.

MS. KOENIG: Can that be reconsidered, though, based on the fact that --

MR. CARTER: Eleven to three vote. Excuse me. So if there is a desire from someone voting on the prevailing side, which has to be one of the eight or one of the abstainers, a motion to reconsider.

MS. KOENIG: I'll move that motion to reconsider.

MR. CARTER: Okay. There's a motion to reconsider. Is there a second? Is there a second to the motion to reconsider?

VOICE: Who is eligible to second?

MR. CARTER: Anybody's eligible to second.
MR. LOCKERETZ: I second.

MR. CARTER: Okay. All of those in favor of reconsideration, signify by saying aye.

(A chorus of ayes.)

MR. CARTER: Opposed, same sign.

(No audible response.)

MR. CARTER: Okay. So -- now, the motion has to be made again. Somebody make the motion, and the motion that was on the table was that, DEAE for use as a boiler water additive in livestock feed until October 21, 2005. Does somebody want to make that motion?

MR. SIEMON: I make that motion.

MR. CARTER: Is there a second?

MS. KOENIG: I'll second it.

MR. CARTER: Okay. George made the motion, Rose seconded it. Okay.

MR. HOLBROOK: Point of order.

MR. CARTER: Yes.

MR. HOLBROOK: If we've already voted on it and now we have a ruling of what it is, then why are we voting on it again, because it already passed?

VOICE: It changed the status.

MR. HOLBROOK: It changed the status?

MR. CARTER: Yes. It changed the outcome of
the vote. Okay. Previously, the chair had ruled that the motion failed. This being the case, that meant the motion carried. So I really want to bring this back up so that everyone who's voting on it, we know exactly --

MR. HOLBROOK: Okay. All right.

MR. CARTER: Okay. So -- okay. The motion to reconsider was made by Rose.

MS. KOENIG: No.

MR. CARTER: Oh, excuse me.

MS. KOENIG: Oh, the motion to reconsider?

MR. CARTER: Yes. The motion to reconsider was made by Rose and seconded by Willie. Okay. That's a nondebatable motion and it was just put to a vote and carried. Okay -- unanimously. Okay. The motion then to adopt the language that DEAE for use as boiler water additive in livestock feed until October 21, 2005, was made by George and seconded by Rose.

MS. KOENIG: There were [indiscernible] of boiler water additive added to the packaging sterilization.

MR. MATHEWS: That one's not it.

MR. CARTER: Okay. Discussion on this motion, then?

MS. KOENIG: I'm sorry; I'm confused. Read it
again. What will --

MR. CARTER: Okay. The wording that we were
voting on is that DEAE for use as boiler water additive in
livestock feed until October 21, 2005.

MR. SIEMON: Shall be allowed.

MR. CARTER: Shall be allowed, yes. Okay. All
in favor, say aye.

(A chorus of ayes.)

MR. CARTER: Opposed, same sign.

(A chorus of ayes.)

MR. CARTER: Okay. Let's -- okay. Show of
hands. All in favor, say aye -- raise your hand.

VOICE: In favor?

MR. CARTER: Yes. All in favor. Okay. One,
two, three, four, five, six, seven, eight in favor again.

Okay. Opposed? One, two, three, four, five.
Okay.

And abstentions? One abstention. So it
effectively makes the vote nine to five. Eight-five-one
is nine to five, effectively, for purposes of counting the
vote, and someone who knows math is -- it's got to be ten.

So it still fails. Okay.

Okay. I apologize for the confusion on that.

The language explaining how abstentions will be handled
will be included in the board policy manual. Okay.

MS. CAUGHLAN: Point.

MR. CARTER: Yes.

MS. CAUGHLAN: The abstainer was Willie?

MR. LOCKERETZ: Yes.

MR. CARTER: Yes.

MR. BANDELE: Mr. Chair, that was the only case in which the abstentions --

MR. CARTER: That's the only one in which the abstentions would have changed the outcome of the vote. Okay.

Then let's move on to crops.

Yes, Owusu.

MR. BANDELE: Yes. I'm passing out the material, Dave.

MR. CARTER: Okay.

MS. KOENIG: Do you want me to do the transplant?

MR. BANDELE: Yes, go ahead. Yes, that would be good.

MR. CARTER: Okay. Rosie.

MS. KOENIG: I'll just go ahead and do the transplant, because as far as I recall, there were no changes in that statement of clarification. So it's
under -- it's 8 and sandwiched under -- between some of 
those orange sheets.

It reads, Crops committee statement on planting 
stock for perennial crops grown as annuals. You all saw 
it yesterday. No changes. Basically, defining 
strawberries or other perennials that are grown as annuals 
should be interpreted as annuals and fall in Sections 
205.204(1) and (2) rather than those -- rather than 
looking at them as perennial planting stock.

After we vote on this, then I'll provide that 
clarification on the question we had yesterday.

MR. CARTER: Okay. So is this a motion to 
adopt this language?

MS. KOENIG: It's a motion to adopt the 
language.

MR. CARTER: Okay. The motion is on the table 
to adopt the language. It's included under Tab 8.

MS. OSTIGUY: Second.

MR. CARTER: It's been seconded by Nancy.

Okay. Discussion.

(No audible response.)

MR. CARTER: Okay. Seeing no discussion, 
assuming that we're ready to vote, all of those in favor 
of this language, signify by saying aye.
(A chorus of ayes.)

MR. CARTER: Opposed, same sign. The motion carries.

Abstentions? The motion carries unanimously.

MS. KOENIG: The only other comment that I just want to make sure got into the minutes was that Rick reviewed the question that I had yesterday, which I had posed regarding clarification on annual transplants, just to really clarify whether planting stock and also seeds, if they're treated prior to --

Eric, please help me on this. You're better at it. It's so confusing.

But basically, we were discussing whether if you pick up a transplant from a commercial grower that has done it conventionally and has sprayed with prohibited materials, would that be allowed under 205.204(1).

And Rick said as long as it was preharvest in terms of seed and pre-obtaining in your arms -- it was a pretreatment rather than a post-treatment -- so if you pick up a transplant and before you leave the greenhouse they say, Let me dip this in a little bit of Captan here for your drive, that would not be allowed.

So I just want to state for the record for certifiers that that is how it is interpreted; that people
can purchase commercial transplants if they are not commercially available in organic form.

MR. SIDEMAN: Rosie, what are transplants?

I'm sorry.

VOICE: [inaudible] prohibited?

MS. KOENIG: No, they -- go ahead, Rick. Yes, please.

MR. CARTER: Okay. Microphone on, please, if you're going to talk.

MR. MATHEWS: Okay. Here's the way it works. Under 204, you must use organically-grown seeds and planting stock. That's the number one requirement, which means no prohibited substances, except that nonorganically produced untreated seeds and planting stock may be used to produce an organic crop.

What this means is that the crop may be grown using prohibited substances, because it's a conventional product or conventional plant. You can do that. What you cannot do under that one is to pluck it out of the ground and dip it into something to treat it or to spray something on it to treat it.

So basically, if it's preharvest, the addition of the substance is okay. If it's post-harvest, it is
not. The item two addresses that post-harvest treatment of the plant or the seed. There, if you do that, you have to have a substance that is on the National List.

MR. CARTER: Yes. Owusu, though, has --

MR. BANDELE: Yes. So there's still some concerns, as I appreciate, with strawberry folks who post-harvest. It could be treated, but I suppose that if that's required by law that that would take care of that if it's a -- am I right, Rick?

MR. MATHEWS: Yes. If it's a final sanitary issue that's under some state or federal law, you would still have to comply with that law and it would not necessarily knock you -- it would not knock you out of organic status.

MR. BANDELE: Okay. Then my second question has to deal with, okay, this is dealing with planting stock and not transplants. Okay. So I'm interpreting Irish potatoes, the tubers, the sweet potatoes, and all those other vegetatively propagated vegetables. Is that correct?

MR. MATHEWS: You're talking about treating the tuber?

MR. BANDELE: No. In other words, once it's harvested. Once the tuber is harvested or, like, for
example, in sweet potatoes, a lot of times the bed is treated and then they get the slips from that -- from those mother plants, so to speak.

But your interpretation is stating that even though that bed is treated, as long as those -- and they do call them transplants, but let's call them slips. That's the other word and to avoid that confusion -- that as long as they're not treated after they're taken from that treated bed, then that's okay because they're planting stock and not transplants?

MR. MATHEWS: So you're talking about the treatment was already in the soil at the time that they were growing?

MR. BANDELE: Yes.

MR. MATHEWS: But you're going to grow them in that soil. Correct?

MR. BANDELE: Oh, no, no. In other words, this would be like an organic grower who did not have access to sweet potatoes, who bought them from a farm that did this, but he's planting that -- or she is planting that on their organically-certified operation.

MR. MATHEWS: But the soil that he's planting it into is a treated soil?

MR. BANDELE: No. It's going from a treated
soil where the slips -- where the planting stock was
produced to an organic farm that has not been treated.

MR. MATHEWS: All right. So there's a stop in
between the time that it was plucked from the ground and
the time that it made to the organic farm. If it goes
from the conventional farm and then is plucked -- is put
back into the ground, I would interpret that as a
treatment.

MR. BANDELE: No, no. I think you're missing
something here.

MR. CARTER: Barbara, to a mic.

MR. MATHEWS: Yes. I guess I'm not following
Owusu.

MS. ROBINSON: Owusu's the organic grower.
He's getting the yams, the tubers, from another supplier
and then he's taking them back some place else.

MR. BANDELE: Not the tubers.

MS. ROBINSON: It's the slip is the plant that
comes from the tuber, just like -- and you can use it,
it's analogous to the strawberry situation because that's
why I was asking. Typically, it's plug production now.
It's not just grabbing that plant.

You go to a commercial plug operation. They're
taking the daughter plants and then growing them -- or the
tips -- and they're growing them as plugs in a greenhouse in a commercial soil mix on those commercial conventional farms and being treated.

MR. CARTER: Okay. Barbara, continue, though.

MS. ROBINSON: Why wouldn't you treat that then analogous to seeds? You're talking about something that actually comes from the root -- from the plant.

MR. CARTER: Okay. Jim and then Eric, if you have some --

MR. MATHEWS: It seems to me that what you're really saying is that it's still coming from a conventional source, and I've already said that if it's on a conventional source and then it is removed from the soil and then taken to the organic, as long as from the time that it was removed from the soil to put it onto the organic, as long as the treatment was only with an allowed substance, you're okay. Did --

MS. KOENIG: We're going to have to go back on this, Rick. There's

MR. CARTER: Okay. Eric, explanation, and then Jim.

MR. SIDEMAN: Okay. What that first section is referring to is allowing planting stock and seeds, because there are some annual crops that are raised from planting
stock instead of seeds, and these include things like garlic, regular white potatoes, sweet potatoes. And what we've tried to do with this, we've also added strawberry plugs.

MS. KOENIG: And they are planting stock.

MR. SIDEMAN: That's right. They are planting stock. What we're trying to do is get them to -- we've been trying to get them, even though sometimes they're raised as perennials, if they're raised as annuals, we're trying to get them to be considered under that section. I think the number's one there.

Okay. So what this is allowing is that you have to use organic production until organic planting stock or seeds are not available. Then you can turn to conventional production. And essentially what you're talking about is however those particular planting stocks are produced, conventionally, we're going to allow them, if you can demonstrate to your certifier that you can't find organic ones.

And in potatoes, it's just harvesting the tuber. In sweet potatoes, it's harvesting the slip. In strawberries, the conventional production is actually the raising of the strawberry plug from a daughter plant. And so that makes it a little bit confusing, but it's still --
the conventional production is raising it in a tray under
a misting system.

As long -- and I think I'm getting to where
you're saying -- as long as after you harvest it from that
tray, then you can no longer treat it with a prohibited
substance. But they can treat it any way that is
permitted under conventional production systems before you
take it from the tray or harvest the potato or --

And it's the exact same thing with seeds. If
you're buying a bean seed or a pea seed or whatever those
are, it doesn't matter how they raise them. If you've
demonstrated commercial unavailability, then you can buy
conventionally-raised pea seed.

What you can't do is buy that conventionally-
raised pea seed and then treat it with Captan.

MR. MATHEWS: And I would say you just said the
exact same thing I meant, only you said it better. Thank
you.

MR. CARTER: Jim.

MR. RIDDLE: Yes, and you said what I was going
to say, only you said it better. But -- no. The only
thing I wanted to add was just -- and I think it helps
answer the question -- is just to read the definition of
planting stock.
Any plant or plant tissue other than annual seedlings but including rhizomes, shoots, leaf or stem cuttings, roots, or tubers used in plant production or propagation. So that definitely covers your sweet potato slips.

MR. CARTER: Okay. Kim first and then Owusu.

MS. BURTON: Just an observation regarding commercial availability. We have a mechanism, or at least the industry is trying to develop through OMRI, this bank of commercial availability seeds. We also, in the processing arena, are trying to develop some way to have this commercial availability processing ingredients.

And one, I'm curious how this is going to be handled in the crops area. I see this as, you know, if it could be mismanaged, you know, somebody's just going to say these strawberry plants aren't commercially available, so I'm going to go and plug in these to my soil with prohibited substances.

So that's an observation to try to look at the big picture of this. I believe in commercial availability, but I also believe that a farmer should have to try just as hard as a processor or anybody else to seek alternative methods.

MR. BANDELE: Yes, and I agree, Kim, and I
think earlier on the crops committee submitted the recommendations in terms of commercial availability and documentation for those types of shortages.

I just had a couple other clarifying points. This still states, though, that -- it doesn't state, but you're still bound by the GMO issue when dealing with these materials, number one. Secondly, this would take care of the tissue culture thing, because all that's preharvest.

So tissue culture in which some additives would be added to the stock solution would be allowable, because that's preharvest. My only other concern -- and this is kind of a technicality -- but let's say someone may be trying to get around that.

You can in fact produce tomatoes from cuttings. So in that case, would that be allowed, even though traditionally, everybody's going to do planting stock -- but I mean as a transplant. But if you're trying to get around the system, you could in fact take cuttings from tomatoes and treat that as planting stock.

Rick.

MS. KOENIG: Owusu, I would say on the tomato issue is that -- I mean, that would really be looked upon, I guess, by a certifier. If those seeds were available
and they felt it -- well, I mean, if those seeds were available organically, then they would be obliged to purchase them organically versus getting cuttings from maybe a neighborhood farm.

So I think it's solved through the commercial availability issue.

MR. BANDELE: Yes. The other thing, I think the confusion, as I've went back and read that section, is that 205 -- 204, I believe that the untreated word went just with the seeds. Untreated seeds. In other words, seeds not -- in which a fungicide was not applied so -- because in that case, Rick, you couldn't get those -- you still can't get treated seed from that conventional farm, as I appreciate.

But I don't think that that untreated word went with the planting stock. Now, I could be wrong on that, but that to me is my interpretation, Jim, regardless of that frown on your brow.

MR. MATHEWS: I disagree with that interpretation.

MR. CARTER: Okay. So unless there's action here, then we will move on.

MS. KOENIG: We [inaudible] the action. We just have clarification.
MR. KING: Could I just make a simple point.

MR. CARTER: Yes.

MR. KING: I think you're calling this annual planting stock, and do you mean annual seedling?

MS. KOENIG: No.

MR. KING: But I don't see annual planting stock listed in the rule.

MS. KOENIG: It's defined under planting stock, and then planting stock is referred in that section.

MR. KING: Okay.

MS. KOENIG: And then there's an annual seedling.

MR. CARTER: Okay. We're ready to move on, now that Rose's clarification has left everybody dazed and confused.

MR. BANDELE: No, but that -- this action really took care of a lot of stuff.

MR. CARTER: Yes. Okay. Owusu.

MR. BANDELE: Composting. The document that Eric presented yesterday is basically the same as presented today with the exception of under the process manure materials. There was a recommendation for a change.

We took out the frozen and we also was added,
Process manure products should be negative with salmonella and less than 1,000 mpn of fecal coliform for 4 grams dry weight material. Other than that, it's the same as was presented yesterday with the exception of Eric also -- and I apologize; they don't quite match up, but we had different sources.

So the only thing that you need to look at on the page with the conclusion is the process manure materials. Everything else would be the same as is found in the document.

And then secondly, I also included the -- a copy of the definitions that Eric submitted, which were not a part of the package yesterday. So those are the only changes to the composting recommendations. So I make a motion that the NOSB adopt the task force recommendations.

MR. HOLBROOK: I second it.

MR. CARTER: Okay. The motion has been made by Owusu and seconded by Dennis to adopt the language as presented.

Discussion? Seeing none, are you ready to vote?

All of those in favor, say aye.

(A chorus of ayes.)
MR. CARTER: Opposed, same sign.

(No audible response.)

MR. CARTER: The motion carries.

MR. BANDELE: One further question. In the tradition of the strawberries, Rick, where does this sit in terms of -- in other words, as Eric interpreted, it would be -- the CN that be prescriptive, C and N ratio nor the three turnings would be mandatory if their recommendations are adopted.

Now, come October 21, what will the situation be in light of the recommendations that were just passed?

MR. MATHEWS: You're asking does this document change the regulatory text?

MR. BANDELE: In other words, the interpretation of the regulatory text.

MR. MATHEWS: You're going to have to give me some more time to look at it.

MR. CARTER: Okay. Rose.

MS. KOENIG: Just to follow up. What Owusu is -- I mean, we know we didn't go for a rule change. We assumed that your stance as stated before on these -- what do you call them; clarifications or non-rule change but explanations -- that they would be guidance documents as to other ways that you could meet the standard to
certifiers.

So in fact, as I understood these guidances, if sanctioned by the NOP would be these alternative ways of performing the functions that are written in the rule.

MR. BANDELE: Eric, point of clarification. To follow up on Rose's point --

MR. SIDEMAN: I missed that entirely, Owusu.

MR. BANDELE: Okay. We're talking about the implications of the compost being recommendations. And I'm sorry Barbara left without -- I thought I recalled an earlier discussion in which Barbara pointed out that the points raised here were one way of dealing with it but not necessarily the only way, and that in fact, if these recommendations are adopted as a guidance, then the producers would not be bound to the five turns and the C and N ratio.

MR. MATHEWS: Let me ask you this, Owusu. You were -- are you talking about the method that is specified in the regulations as they exist today, or are you talking about how we would deal with the carbon nitrogen and the turning for other types of soil amendments?

MR. BANDELE: Okay. Trying to avoid the C word, the compost word, but the thing is, as defined in the document, those other amendments would in fact be
compost, as I appreciate it. You may want to comment as chair.

MR. SIDEMAN: Formerly known as compost. I hate to say this without Barbara here, but she and I have been e-mailing back and forth, and my understanding -- and I have e-mails of this -- is that she has agreed for me and Zea and Will Brinton and Pat Millner to put together a document that is essentially going to take the high points out of this compost task force report and put it into the forum of essentially a practice standard.

And that would be turned over to NOP to review, and then we would work together. And at that point, I don't think that -- what I do think is that other materials besides those in 205.203(c) would be allowed. And so yes, you could make compost without meeting those carbon to nitrogen ratios, once that's accepted by NOP.

MR. MATHEWS: So I think the original remarks is you're going to give me more time to study it was right.

MR. CARTER: Okay. And just a point of clarification, because there's two actions in a row in which we've adopted a motion, passed a motion adopting a report, and then had the discussion on that particular issue after the motion was adopted. That is not the way
we're going to do things.

   We need to have the discussion, because
sometimes this type of discussion will affect the way
people vote on it. It's a closed issue now. It's been
adopted, so please -- let's have the discussion before the
vote.

   VOICE: I have to say something.

   MR. MATHEWS: Wait, wait. Let me go first
here.

   David, point well taken, but we had that same
exact discussion yesterday, actually.

   MS. KOENIG: So I'd like to make another
motion. And my motion would be I do realize that in
September, we have a materials meeting. But I would like
to be able to motion to bring this special issue up in
terms of an update either from Eric or some representative
from NOP so that growers know by September what that
situation's going to be, because I think it is a very
important issue.

   MR. BANDELE: I second that.

   MR. SIDEMAN: And my hope is to have it done
before September and give a report on how well we
succeeded by September.

   MR. CARTER: Okay. So the motion is
essentially that the report of the compost -- give me --
that was a rather lengthy motion.

MS. KOENIG: The motion is, is that we would
place an agenda item on the next meeting that we have been
told is exclusively for materials that would be the
accepted update what NOP's position is going to be on
this.

Regardless of what your report says, we want
NOP's position on this issue by the September meeting.

MR. CARTER: Okay. So the motion is to put on
the agenda the report on NOP's position on the compost
ing thing. Is that -- the seconder. Who seconded? Okay.
Owusu seconded it.

Okay. Made by Rose, seconded by Owusu.

Discussion on the motion?

Kim.

MS. BURTON: Just one comment. We just now
have two days that I imagine at the conclusion of this
meeting we're going to discuss our meeting for September.
We might have to increase that to three days. We're now
to 31 materials.

MR. CARTER: The chair has already thought
about that, and we've had some discussions. So -- okay.

Discussion on the motion?
All in favor, say aye.

(A chorus of ayes.)

MR. CARTER: Opposed, same sign.

(No audible response.)

MR. CARTER: The motion carries unanimously.

Abstentions? Motion carries unanimously.

Jim.

MR. RIDDLE: Just a request, Eric. As this smaller group gets close to submitting that recommendation to the NOP, would it be possible to circulate it to other members of the NOSB just for any final feedback?

MR. SIDEMAN: I'm going to leave that up to Owusu. I still feel the task force is operating under the crops committee, so it would definitely go to crops committee.

MR. RIDDLE: Okay. Thanks. No need for a motion.

MR. CARTER: Emotion or a motion?

MR. RIDDLE: A motion, yes.

MR. CARTER: Okay.

MR. BANDELE: Moving on to the transitional --

MR. CARTER: Okay. I'm sorry. Continue. Yes.

That was spacing out.

MR. RIDDLE: All right. Yes. As we discussed
this yesterday, the transitional product recommendation --
I made the changes that were suggested by incorporating
some introductory language rationale and then reshaping
the recommendation.

So for members, you haven't read this yet, and
for members of the public here, let me just read through
how it currently is drafted.

The NOSB provides the following guidance to
producers, certifying agents, and state and federal
governments on the labeling of transitional products. The
NOSB recognizes that the Organic Foods Production Act
regulates organic products but that products labeled as
transitional are beyond the scope of OFPA and the final
rule. The recommendation is offered for guidance and
clarification purposes.

Rationale. Numerous products are currently
labeled and sold as transitional. Several states set
regulations defining transitional labeling, and several
accredited certifying agents conduct transitional
certification.

There are differences between existing
transitional certification requirements. The
recommendation is offered to bring consistency to these
requirements. In addition, in at least three states, the
USDA's Natural Resource Conservation Service is offering incentive payments to transitional operations.

This recommendation will provide guidance to the NRCS for requirements governing those transitional incentive programs. It is anticipated that producers who enter transitional certification and/or incentive programs will have a more complete understanding of the requirements of the final rule when they qualify for full organic certification.

This will lead to a higher degree of compliance for such producers. It will also -- no, that's wrong. Allow such producers to receive market-driven consumer recognition for their production practices rather than having to sell their crops for conventional prices.

And then the recommendation itself remains presented in the book and on the Web, only the section numbers from the rule have been deleted. And so I changed the word in that final paragraph I read to -- it will also -- no, it's right. I just read it wrong. Never mind.

MR. CARTER: Okay. So a motion?

MR. RIDDLE: Yes. So I move that the board pass this recommendation.

MR. CARTER: Okay. Motion to approve the
transitional product recommendation. Is there a second?
Owusu seconds. Jim made the motion. Owusu seconds.

Discussion? Willie.

MR. LOCKERETZ: I'm going to propose something that I think will make life easier for our good friends at NOP and the higher-ups above them, which is that USDA has no authority over the word transition. It doesn't want authority over the word transition.

We don't have authority over it. NOP doesn't have authority over it. The Secretary of Agriculture does not, and I don't understand proposing a recommendation in an area that we simply have nothing to do with.

Who is this addressed to and -- or why is it being considered by the NOSB which has no jurisdiction over the word transition? I oppose this because it doesn't seem to fit into what we do. And I don't know -- we don't put out recommendations in areas that we're not dealing with under legislative authority.

MR. CARTER: Okay. I hope everybody's sitting down. I'm going to call on Rick first.

MR. MATHEWS: I'm sorry, I have to agree with Willie. This is twice today. Willie and I are doing good on our relationship today. The bottom line is this. We are not going to regulate transition, and we will not
enforce transition.

And I have seen e-mails that have already been traveling around on the Internet that are saying, USDA rules for transition. I have to say the USDA has only one rule for transition. We don't regulate it. We won't regulate it, and you can't use the word organic on it.

So basically, I agree with Willie. I know what Jim's trying to accomplish. If we did anything with it, it would be to post it on the board's portion of the Web with a disclaimer.

MR. CARTER: Okay. Goldie.

MS. CAUGHLAN: Just -- Willie, you're the one that's very much involved in ecolabeling, and to me, the concept of transitional really is getting very close to being another form of ecolabel. I wish personally to say that I believe that it's unfortunate that we don't have jurisdiction to regulate transitional coming from the state of Washington, where we have long recognized and regulated transitional and where we feel it's been very important.

But it simply is not -- I agree. It's not covered by OFPA, but it does seem to me you have a conference coming up on ecolabeling, and it seems to me that one aspect of this is that transitional might be
something that comes under your ecolabeling.

MR. CARTER: Just a second, because I thought Mark had his -- okay.

MR. KING: Yes. Just a quick suggestion, Jim, small, and then a small example. In the first sentence, we're talking about, Provide the following guidance producers, certifying agency, federal governments. Consider please retailers in that because they are labeling it, and I think it's important to be consistent to the consumer.

And then secondly, we used to actually label retail products -- or excuse me; transitional products in a retail environment and found that it did help in a lot of senses in terms of not just the producer but also to provide additional clarity to the consumer. So I do support this.

And I side with Willie as well. There is some question in terms of what will happen, if anything at all ever, from a regulatory standpoint. But I think it stands on its own merit as guidance, and I support it.

MR. MATHEWS: I guess my only question is why
wouldn't the industry actually turn to OTA for this kind of guidance? And the other comment that I would make is that the Act in no way prevents accredited certified agents from having this additional certification ability.

MR. CARTER: Okay. Owusu.

MR. BANDELE: Yes. I just want to reiterate the point that we're not really watering -- I think I made this point before -- we're not really watering down organic standards. In fact, we're attempting to suggest guidance in making those transitional programs having similarity.

Secondly, I think that in some instances where the board can step forth it should, and I know that, for example, we really have no real bound in terms of philosophy of organics, but we did address that issue. So I don't think we're really stepping beyond our bounds to do this.

Again, it's just offering guidance. My preference was to have it as a part of the rule, so this is kind of like a compromise position, as far as I'm concerned, on my account.

MR. CARTER: Okay. Somebody's -- the question's been called. If there's no objection --

MR. RIDDLE: I have.
MR. CARTER: Okay.

MR. RIDDLE: You had said I would be recognized next --

MR. RIDDLE: -- for closing comments. I wanted to respond to Mark that I accept as a friendly amendment inserting after the word certifying agent in the first sentence, retailers, comma, consumers, comma -- to insert those words in the draft as presented.

And I would like to point out that the USDA, in the form of the NRCS, does have practice standards for the incentive payments to transitional producers. And these are consistent with those, and I have been working with NRCS on the development of those.

And as far as looking to guidance from the OTA, this language is taken directly from the OTA's American Organic Standards, so it is -- we've certainly looked to guidance from OTA for that.

So it -- the goal is to bring consistency. Products are out there. They are -- it's a commitment to organic production methods. It just doesn't have the three-year pedigree, so it does have a direct linkage.

We're not entering into other ecolabels here at all. This is an important role, and I'm glad to hear Rick
say that it could posted to the NOSB's page of the Website. Thanks -- with a disclaimer.

MR. CARTER: Okay. If you're ready to vote, then we will proceed to vote.

All of those in favor -- let's raise our hands on this -- all those in favor, raise your hand.

Okay. All of those opposed?

Okay. So 13 to one, it carries. Understanding that this will probably be something that will be posted on the NOSB's section of the new Website with an appropriate disclaimer.

Moving on here, okay. Rose.

MS. KOENIG: I'd like to make a motion just to come back to the poultry issue.

MR. BANDELE: I think we had one more issue, and that was the farm -- the organic farm plan template.

Jim, do you want to address that again?

MR. RIDDLE: Oh, I didn't know we needed to.

It doesn't take a vote of the board. That's coming from the committee to post to the Website --

MR. BANDELE: Okay. Good enough.

MR. RIDDLE: -- and for comment.

MR. BANDELE: Then in that case, that concludes crops.
VOICE: Hydroponics?

MR. BANDELE: Hydroponic -- based on a discussion yesterday, the crops committee will reconsider that it was pointed out by Rick that hydroponics is already covered as far as the existing rule is concerned. So what the crops committee will do is try to provide some -- a guidance document, whatever that means, to the hydroponic situation at a later date.

MR. LOCKERETZ: So no vote on the standards for hydroponic production? We're postponing that?

MR. BANDELE: Right.

MR. CARTER: Okay. Any other business then under the crop? Okay. All right.

Rose.

MS. KOENIG: I would just like to make a motion -- well, just ask to go back to the livestock issue.

MR. CARTER: Okay. Doesn't take a formal motion to go back to the livestock and bring that up. Want to just check first, because we do have a couple other things titled here, but there was no business. They are accreditation [inaudible.]

VOICE: I believe under reservation is where the agenda [inaudible].
MR. CARTER: For national and I believe under international [inaudible].

Okay. Then it would be appropriate at this point if we're ready to go back to the access to out-of-doors for poultry. And is there a motion that would come forward now on the adoption of this provision, the recommendation?

We will come to the chair of the livestock committee.

MR. SIEMON: Well, we have the motion that we improved earlier, but I was asked -- or I was told somebody else was, but I ended up with the task of maybe putting some more specifics to it. So my motion is to the original recommendation earlier. That would be my first motion. But then we could have the amendment with this new wording. I don't know how you want to go about that.

MR. CARTER: Okay. If you want to make the motion of the language that was forwarded by the livestock committee, will you send us --

MR. SIEMON: As -- and improved by the group earlier. I'd make that motion.

MR. CARTER: Okay. Is there a second?

MR. LOCKERETZ: Second.

MR. CARTER: Okay. It's been moved and
seconded to have the language up to the point of our final modification. Okay.

MR. SIEMON: So now we're going to consider an amendment. And again, I didn't get a lot of help from this.

MR. CARTER: I'm sorry. George moved and Willie seconded. Okay.

MR. SIEMON: I didn't get a lot of help, but I just wrote that there was a requirement that we get specifics, so I wrote down, The area provided outdoors should be a minimum of two square feet per bird, and then just to clarify, I wrote, And that area shall be managed in compliance of all requirements of this rule.

To deal with the manure, the organic land qualification, the living condition aspects, just to make sure that it's clear that that has to satisfy all the other requirements. I don't know if you need that last part, but I put it in there to make sure.

So again, all I did was, The area provided outdoors shall be a minimum of two square feet per bird, and that area shall be managed in compliance with all requirements of this rule.

MR. CARTER: Okay.

MR. SIEMON: And you're out of ink almost.
You're almost out of ink.

MR. CARTER: Okay. So the motion is -- repeat.

MR. SIEMON: The amendment to be added to our previous work is, The area provided outdoors should be a minimum of two square feet per bird, and that area shall be managed in compliance of all requirements of this rule.

MR. BANDELE: I didn't hear the last part.

After the two square feet.

MR. SIEMON: And that area shall be managed in compliance of all the requirements of this rule. And I don't know if that's necessary or not, but I was trying to deal with the whole manure management aspect of it.

MR. CARTER: Okay. So it's been moved and seconded. Discussion just on the --

MR. SIEMON: I know that we had a second. Did we on the amendment?

MR. CARTER: Yes. Willie seconded it.

MR. BANDELE: I still have some concerns about the point I raised, George, before you considered, and that is in those pasturate poultry situations, I think it's less than two square feet. I would like to get further clarification from folks from the pastured poultry industry after the interpretation on that.

MR. CARTER: Okay.
MR. SIEMON: But that would turn on this motion would help. That amendment is how you do that.

VOICE: Someone on the audience.

MR. SIEMON: Is there someone that can give feedback on pasture poultry?

MR. CARTER: Okay. Somebody responding to pasture --

MR. SIEMON: No. Pasture poultry only.

MR. CARTER: -- pasture poultry only.

MR. SIEMON: This is the movable hutches that have the animals quite tight so they can move from area to area.

MR. CARTER: Okay. Anybody that's engaged in pasture poultry?

MR. SIEMON: There were people yesterday --

MS. BRICKERY: Whether or not, let me answer this question.

MR. CARTER: Okay.

MS. BRICKERY: If the board feels that it needs more clarification on the implications, please do not -- sorry. If the board feels you need more clarification on the implications of what you're doing, please do not vote on this today at five o'clock. This is not good process.

And I obviously have no opinion one way or the
other about whether two feet is the right number or any number is the right number. I'm just giving you some friendly political advice. I just don't think that's what you want to do.

MR. SIEMON: Okay. We're on the amendment only right now.

MR. CARTER: Okay. Rick has got a comment.

MR. MATHEWS: The two square feet per bird would be a recommendation, as I understand it, or as guidance. But because it is, it would be unenforceable.

MR. SIEMON: I'd be glad to take away my amendment and go back to the original proposal.

MR. CARTER: Okay. Kim. Then Mark.

MS. BURTON: I had -- actually had my hand raised before Carolyn. I feel like we're just pushing some of this stuff so fast, I don't even have the copy in front of me any more. I just can't support moving this forward right now. Thank you.

MR. KING: Second, basically.

MR. CARTER: Okay. And the chair -- and I can appreciate that some folks have to leave. But this meeting was announced. We're scheduled to be here for two and a half days, and this is an issue that requires some time.
And I would have to agree that, you know, in order to make bad policy just to have as many people here making that bad policy is not a good thing. So it would be the recommendation of the chair that we withdraw the amendment; that we again -- it appears increasingly that we're not ready to act on this.

MR. SIEMON: Okay. But then I need direction, Kim, what else we need. You have in your hand what's in front of us right.

MS. BURTON: Don't have anything more.

MR. SIEMON: Yes, you do. That was what we passed out earlier.

MS. BURTON: Bring it up tomorrow. I think -- sorry.

MR. SIEMON: Okay. All right.

VOICE: You packed up too early.

MS. BURTON: It may be here somewhere, but I can't vote on something --

MR. CARTER: We're shuffling too much paper.

MS. BURTON: -- it's just too frantic. Sorry.

MR. CARTER: Okay. So amendment withdrawn?

MR. SIEMON: Okay.

MR. CARTER: Okay. Motion is still is still the motion --
MR. SIEMON: No. The amendment was withdrawn.

MR. CARTER: Yes, the amendment was withdrawn, but there's still then the original motion that was made at this point with the language.

MR. SIEMON: No. That was what was being told to not make any decision. That's amendment plus drop the subject right now.

MR. CARTER: Okay. So we're just delaying everything, okay, until time uncertain at this point. Okay?

MR. RIDDLE: Till tomorrow morning.

MR. CARTER: Well, okay, but it will -- okay. Again, I would go back to it was the intent of the chair originally to discuss this today and vote on it tomorrow. Okay? I'm not right very often, okay, so I'd like to -- I got to flaunt it, you know.

VOICE: You're like the Cleo of organic.

MR. CARTER: Okay. So -- yes. And we will have this in writing tomorrow. Okay.

Okay. Now there are just a couple of announcements then. And doggone it, I wish I could remember what they were. Okay. Tomorrow we will come back then and discuss this issue, but the other thing, tomorrow morning before we get to the public comment, we
are scheduled to spend time reviewing committee work plans.

I do want the committees, release the committee chairs to sit down and to really have preferably a written report summarizing what your work plan is between now and September, okay, so that we can have this -- so we can all know what we're working on between now and then.

I think that -- and Kim's comment is exactly right. I think tonight informally we ought to discuss a little bit some of the logistics for September, because I think it's increasingly obvious that we may need a three-day meeting.

Nancy has requested that if we do have a three-day meeting that it be the Tuesday, Wednesday, Thursday; not the Monday, Tuesday, Wednesday, simply because she has teaching obligations on Monday, Wednesday and Friday. We won't act on that, but I just want us to decide then tomorrow some things on the meeting.

I think it's important, with the number of materials that we have to look at in September, that we give ourselves adequate time to do that. And I understand budget implications and the like, so we have to balance all of that, but -- okay. Okay. We got the money. All right. Show me the money.
Okay. Willie.

MR. LOCKERETZ: Concerning tomorrow's schedule, this record is only one hour for public comment?

MR. CARTER: We will continue the public comment as long as people want to weigh in with public comment. Okay.

MR. LOCKERETZ: But that means other business could be pushed to after the adjournment --

MR. CARTER: Okay.

MR. LOCKERETZ: Not okay, because we have planes to catch.

MR. CARTER: Okay. Are there other items then that need to come onto the agenda tomorrow?

MR. LOCKERETZ: Some votes.

MR. CARTER: Yes. Some votes. Well, we will bring up the poultry first. That will come on -- if we're ready to go with the recommendation, that will come up for a vote first thing tomorrow. Okay.

MR. SIEMON: Could I request the livestock committee sit for a minute after --

MR. CARTER: If the livestock committee would sit for a minute, okay, after we recess.

Okay. By golly, it's five o'clock.

Okay. Carolyn.
MS. BRICKERY: Could you just review the agenda for tomorrow so we know what's --

MR. CARTER: Okay. The agenda for tomorrow is that we will come in, we will -- if there is a written report from the livestock committee, come back with the poultry access to pasture. Okay.

Then we will move into a review of committee work plans. Then promptly at ten o'clock, we will begin public comment, which public comment will continue on as long as we have public commentors. And then other business.

Now, if there's other business that needs to be taken care of before people leave to catch a plane, I would request or entertain any requests that we do that before the public comment.

Okay. Everybody understand?

MS. CAUGHLAN: What if we kicked everything at least a half-hour earlier? What if we started at 7:30?

Oh, stop it. Don't wimp. Like we don't anyway.

MR. CARTER: Okay. We were -- you know, we were encouraged to be here or authorized to be here until Thursday so, you know, we need to factor that in on the meetings. And again, my admonishment is September, pack
an extra pair of underwear. Okay?

Okay. We are recessed, except for the livestock committee.

(Whereupon, at 5:00 p.m., the hearing was recessed.)
CERTIFICATE

IN RE:          National Organic Standards Board

LOCATION:      Austin, Texas

DATE:      May 7, 2002

I do hereby certify that the foregoing pages, numbers 1 through 695, inclusive, are the true, accurate, and complete transcript prepared from the verbal recording made by electronic recording by Penny Bynum before the U.S. Department of Agriculture National Organic Standards Board.

CLOSE OF PUBLIC COMMENT 837
Clarification:
Access to Outdoors for Poultry 837
September meeting 839
October meeting 840
MR. CARTER: Okay. We'll reconvene the meeting, just starting off with some announcements. It was brought to my attention yesterday that there were some conversations going on out here that were somewhat distracting, and so if you do have some conversations, I know that NOSB business, as a spectator sport, can be boring sometimes, but if you do need to say something, please go out in the hall.

We'll also, this morning -- during the public comment on Monday, Marty Mesh asked some questions to Rick, and Rick asked Marty to find some answers, and apparently Marty has found some answers, so we'll ask him to come up and give a brief report on the certified organic labeling issue.

MR. MATHEWS: I think you can do it during your five minutes, Marty.

MR. CARTER: See, I feel so guilty that I skipped over him on Monday, I'm trying to make amends here.

I'm sort of stalling around because we're waiting for some copies to get back to George. So that being the case, Marty, why don't come up and give us -- (Pause.)
MR. CARTER: So as we said, yesterday, now we are delaying -- or we have held over the action, again, on the issues of poultry access to the outdoors and the dairy herd replacement issue, so I'll call on George, chair of the Livestock Committee.

MR. SIEMON: Okay. Well, we're handing out the latest draft of the access to outdoors that we did last night. I did not italicize the changes, which I should have, but really all we did was add a consideration of time to come in compliance with access to outdoors, just to clarify, since there's been such a debate here, to give people a reasonable amount of time to come in full compliance.

And that's -- I'll read what we added; then I'll read the whole thing, but, "A producer shall demonstrate reasonable progress in efforts to comply with this provision; full compliance shall be completed no later than 18 months from October 21, 2002," which is April 21, 2004.

Okay. And then I can read the whole thing.

Nancy, we did just a few modifications to your language afterwards.

Unfortunately, they don't have any overhead things here; otherwise I would have done it for the crowd.
You want me to read the whole thing now?

MR. CARTER: Please.

MR. SIEMON: Okay. The motion is "NOSB recommends the following clarification to the final rule's requirement that poultry shall have access to outdoors:

"1. Organically managed poultry must have access to outdoors. Organic livestock facilities shall give poultry the ability to choose to be in the housing or outside in the open air and direct sunshine. The producer's organic system plan shall illustrate how the producer will maximize and encourage access to the outdoors. A producer shall demonstrate reasonable progress in efforts to comply with this provision; full compliance shall be completed no later than 18 months from October 21, 2002 (April 21, 2004).

"2. The producer of organically managed poultry may, when justified in the organic system plan, provide temporary confinement because of:

"a. Inclement weather;

"b. The stage of production, sufficient feathering to prevent health problems caused by outside exposure;

"c. Conditions under which the health safety or well being of the poultry could be jeopardized;
"d. Risk to soil or water quality."

MR. CARTER: Okay. That is the motion. Is there a second?

MS. OSTIGUY: Second.

MR. CARTER: Okay. Nancy seconded.

Okay. It's on the table for discussion.

MR. SIEMON: Just no matter how we try to discuss this, it's really clear that the rule says access to outdoors, so we're just trying to put some clarification to it. There's not much debate in the committee, at least, about that. This is a 4-1 vote by the committee, but we do acknowledge that we really feel it's clear in the rule, and we're just trying to see how many times we can say the word "outdoors."

Well, is there any discussion?

MR. BANDELE: Yes. What was the nature of the dissenting vote? What was the reason for that?

MR. SIEMON: Just the basic premise that being outdoors is not necessarily the best for the welfare of the bird, and that's just basically arguing, again, with the basic fact whether it's in the rule or not, but still that was the question.

Mike might want to make one comment.

MR. LACY: I was the dissenting vote, and I
think I explained it as best I could yesterday, that in my opinion, the science does not back up that access to outdoors is in the best interest of the bird from a health and welfare standpoint or in the interest of the consumer from a food safety standpoint.

MR. CARTER: Okay. Goldie?

MS. CAUGHLAN: I'm, I guess, surprised that there's still no language in here concerning material on the -- underneath the feet of the birds. In other words, it's totally left blank, and I had thought that there would at least be some indication.

What is the thinking of the majority in that regard?

MR. SIEMON: This is just one aspect of the whole rule, so the rest of the rule has to think about manure management, living conditions, since we're trying to depend on the rest of that, but the reason that we didn't go to the whole issue of pasture or dirt and that kind of thing, which is really the question -- do you do square feet, is one question, which we fairly don't feel is the way to go because of variations between different types of poultry, of laying hens, broilers, turkeys, ducks, all the different things.

And the other one is about dirt, grass, or
concrete. The reality is out there there's lots of houses
that are going to be very difficult to have access to what
would be called an ideal pasture situation. That's just
the reality out there.

So it was just our feelings that even if people
had a concrete area outdoors, there's ways they can even
make that so it has value, and that is by having a manure
compost pile out there and letting the chickens scratch
and deal with that and still have complete containment for
manure runoff, because the issue is complete containment
for manure runoff; it's one of the things we've heard from
the people here.

And so doing the dirt would require -- you
know, for a 10,000-bird house, it would require at least
six acres of pasture land around to have a decent dirt
system, and not every facility can do that.

So we were really trying to deal with the
outdoors, not the nutrition and not the earth; it's a very
debatable part.

MS. CAUGHLAN: I understand that, but I'm
asking, no kind of litter, no kind of -- nothing under
feet? I'm not expecting necessarily pasture. I think
that that at this stage of development is highly unlikely
and not in the interest of the growth of the organic
poultry industry.

But I think that consumers, in particular, are expecting some form of wording that does give indication that the intent -- I understand this is not, as Rick has reminded us, regulatory language, but that the intent, the guidance given to these certifiers, to these producers -- I'm not comfortable that there's not at least any kind of indication.

MR. CARTER: Okay. Rick has got a comment, and then Willie's got a comment then.

Go ahead.

MR. MATHEWS: This provision, at least in part, would clarify that accesses to the outdoors means the bird has to go outdoors, and that is what we would enforce, and it would be enforceable.

So from that standpoint, it is not just guidance; it is a clarification of the regulation, which states they have to go outside the building.

MS. CAUGHLAN: Right. I understand that. I never needed it clarified. I knew from the reading of the rule that it said "outdoors," and outdoors means outdoors.

But outdoors, in some kind of guidance that tells us what outdoors -- the minimum of what outdoors means is what I would at least expect.
MR. CARTER: Okay. Willie?

MR. LOCKERETZ: I have to say that I quite agree with Goldie. I voted "yes" on this proposal when the choice was yes or no; I voted "yes." But I argued for but didn't get some minimum standards as far as the material and the area per bird and so forth. I thought it left too much to the certifiers, and there was no meaningful floor below which people couldn't go, not in the literal sense.

So I agree with Goldie, despite -- but I ended up, when the choice was this or nothing, I went with this.

MR. CARTER: Okay. Nancy.

MS. OSTIGUY: I also voted for the recommendation as it stands; was very uncomfortable with putting numbers to any of this, because, while a new board member, this was the first that I'd really dealt with this, and if we're going to put numbers to something, in my opinion, I need to know what I'm talking about.

And I was the one that brought up that we'd have to have different area requirements for different species, potentially different breeds. I don't know enough about poultry to have done that from when I arrived here till today.

If the board wishes to direct the Livestock
Committee to go back and find out that information to come back with a recommendation that would then be more specific on area scratch, et cetera, we could do that.

MS. CAUGHLAN: Viewing this as a starting point and building from that.

MS. OSTIGUY: Yes.

MS. CAUGHLAN: I could support something of that nature.

MR. CARTER: Okay. Other discussion?

MR. SIEMON: Well, just that was kind of the job given to us yesterday afternoon, about coming up with some more specificity, and we just weren't able to weave our way through.

We tried the square foot; that seemed to not be the way to go, so -- if we were to go -- let's use this as a foundation, and then I'd like some more clarity as to what we're after.

MR. CARTER: Jim.

MR. RIDDLE: Yes. I would like to move forward with a vote on this as well, and I just want to point out one thing in the rule that we haven't really mentioned on this, and that is under the Livestock Health Care Practice Standard, that the item number 4, under (a)(4), Provision of conditions which allow for exercise, freedom of
movement, and reduction of stress appropriate to the species -- and for poultry, that reduction of stress would include the ability to scratch.

And birds on concrete would have to have some kind of a natural material, whether it's sawdust or compost or something to be able to perform their natural behavior; they get pretty stressed trying to just scratch concrete, I would think.

So that, as an inspector, is one thing I would look at in a poultry operation: Is there some scratching material provided for the birds, even if there's concrete under it to contain any runoff or leaching.

So that's one thing, and I also wanted to come back to the language itself and just reiterate that the "temporary" means temporary, and that already is in the rule that the system itself must be structured to provide access. And temporary cannot be six months out of the year, or the entire year is not temporary. The system has to provide access.

And I just wanted to emphasize that point as well.

MS. CAUGHLAN: Yes. I went back and looked at that, also, and what I was seeing was that the intent is very clear that you, as an inspector -- whoever comes
through as an inspector must be able to see that the producer can demonstrate that in fact they have the full access in place when they're asking for the temporary -- it can't be used as a dodge.

So if you're in there, if you're inspecting, Jim, if you come to a facility and you're inspecting it and there's bare concrete -- let's say there appears to be plenty of room for the bird to move around; there's some degree of access to sunshine, but one of these indicators -- the fact that it's on a completely bare situation, giving the bird no ability to scratch, pick, whatever, how would you, as a certifier, work with that?

MR. CARTER: Jim?

MR. RIDDLE: Yes. Well, as an inspector, that would be one of the concerns I would identify during the inspection, mention it at the time that I observe the situation, then mention it in the exit interview at the conclusion of the inspection.

It would go in the report, identified as a potential noncompliance, and as the certifier makes the decision, they would have to way that in relation to other issues for the operation in whether the operation can be certified.

If that was the only minor noncompliance, it
could be something that they're given a certain length of time -- three months or whatever -- to correct. So they could be certified but with the requirement that that be corrected for the certain reasons cited in the rule, but then related to that site-specific situation.

MS. CAUGHLAN: Follow-up.

MR. RIDDLE: But it couldn't -- they couldn't be just continually certified without addressing that noncompliance.

MS. CAUGHLAN: Right. Follow-up.

MR. CARTER: Okay. Goldie.

MS. CAUGHLAN: As we continue to watch this -- as we continue, then, let's just say, as the -- as we see more and more operations bringing online larger and ever larger facilities with more and more concrete, would it not be safe to assume that that kind of diligent observation on the part of inspectors might fall farther and farther behind, because it becomes more of the norm that, after all, all of the other operations have the bare concrete as well.

And I believe that that is exactly the direction that this kind of timidity that we're showing, in terms of placing a little bit more structure, is going to lead us.
MR. CARTER: Go ahead, Jim.

MR. RIDDLE: Well, I see several checks in that. I mean, that's one reason for inspector training being a requirement under the rule, so that inspectors know what to be looking for, and they're consistently understanding and applying the standard in their work, the same the certifiers -- that's the reason for this kind of a guidance document, is to help certifiers make those final decisions.

And if the certifiers are ignoring the requirements, then that -- the final check would be their accreditation. When their files are reviewed and it becomes apparent to the evaluators that they're certifying bare-concrete operations where the chickens are stressed and are not able to exercise their natural behavior, then they would be endangering their accreditation.

Those are the checks that I see --

MS. CAUGHLAN: I'm just suggesting we're setting up a norm, and once we set up a norm, it's going to be very difficult to see them being judged against that as being out of any kind of compliance.

MR. CARTER: Owusu.

MR. BANDELE: Yes. I wouldn't have any problem at all with Jim, as the certifier, making those kinds of
observations and recommendations.

   My problem is with maybe certifiers without
that historical background and also without that
commitment to outdoors, and that's why I think that even
though this draft is a good starting point, it really
needs further clarification on that point, or the
situations that Goldie is pointing out I think will in
fact become the norm.

     MR. CARTER: Okay. Willie.

     MR. LOCKERETZ: To come back to Jim's answer
about telling the operator that it's noncompliance; it's
not noncompliant. There's nothing here that says a bare
cement floor is not allowed.

     And to say that the mechanism for enforcing an
unwritten requirement is first the inspector and, if that
doesn't work, the certifying agent and, if that doesn't
work, the accreditation comes into doubt, that's a very
indirect and three stages removed from the original
problem.

     If bare concrete is automatically considered
noncompliant, then why don't you say so in this language
so that the operator can make a good-faith effort to come
into compliance?

     Somehow implicit in this is bare concrete is
not acceptable, but if that's the view, then it should be
written into the language itself, instead of keep people
guessing as to what is or is not compliant.

MR. CARTER: An amendment regarding prohibition
against bare concrete would certainly be germane at this
point, so if someone cares to --

MS. CAUGHLAN: I'll make such an amendment.
I'll offer such an amendment.

MR. CARTER: And remember, just as important,
it will also require some rulemaking on something like
that.

MS. CAUGHLAN: Explain why at this point.
There's other broadening or widening of the language, as
we've just indicated. Why bother with a guidance thing?
As I said, I have no problem reading the language which
tells me that outdoors is outdoors, and yet we're offering
here something that we're calling a guidance document.

If it is indeed a guidance document that it's
necessary to talk about outdoors is outdoors, then why is
it not appropriate, in this language, not requiring
rulemaking at this juncture, to go ahead and specify that
the intent of this is not bare --

MR. CARTER: Okay. Mike?

MR. LACY: If you are going to encourage birds
to go outside, the concrete is not going to stay there for any significant length of time, and I think this whole discussion is moot.

MR. SIEMON: Historically the farm plan has elevated the standard, leaving it up to the certification farm plan. I know that doesn't mean it will happen in the future, but historically it has been an effective tool to push farmers into better and better organic practices.

It has been effective, and we never want to underestimate the power of competition and peer pressure, you know, because that's part of what will be here also, this sensitive subject.

MR. CARTER: Okay. Jim, and then I'm going to ask Rick to weigh in on --

MR. RIDDLE: Yes. I would just like to add one more thing from the rule itself, which tells me this is clarification of the existing rule, and that is that the -- under the livestock living conditions: "Must provide living conditions which accommodate the natural behavior of animals."

So it's not just reduction of stress in one section, but also natural behavior, and the behavior of a chicken is to scratch, so there's got to be something for them to scratch; it's not just going to be bare concrete.
And, you know, Mike is saying that, well, if they're out there, yes, there's going to be chicken manure after a very short time for them to scratch in, but, you know, I would like to see some sawdust or something in addition to that, some bedding to help capture those nutrients in the manure and be a little more sanitary conditions, or disease suppression, possibly; not just scratching the manure itself.

MS. CAUGHLAN: That manure is not waste, and it needs to be captured.

MR. CARTER: I'd asked Rick to --

MR. MATHEWS: Yes. Actually Jim is right. If it was any kind of a wood surface, a metal surface, a concrete surface, if the bird isn't able to do the natural things that are required within the standards, then to come out and say you can't have those surfaces is correct, and that would not be rulemaking.

MS. CAUGHLAN: Thank you.

MR. CARTER: Okay. Mike.

MR. LACY: It's interesting that our discussion has gotten to health of birds. And I'll go back -- I'm sorry to repeat myself, but I'll go back one last time, that if you're interested in the health of birds, then I'm not sure that we're headed in the right direction.
MR. CARTER: Okay. I'm looking up and down the table --

MS. CAUGHLAN: We're back to the business of the amendment -- I mean, of adding wording to the language of this document that would specify that bare surfaces of concrete, metal, and such are not meeting the intent; something to that effect.

MR. CARTER: Okay. Is that an amendment?

MS. CAUGHLAN: Yes, if that's what we want --

MR. CARTER: Can you phrase it how you want it to read?

MR. SIEMON: Goldie, I just wonder. You just said you want us to do further work. Is this the place to do it, versus coming up with some checklist of things to look for when inspectors go through? -- because we just -- if you --

MS. CAUGHLAN: If you want a meaningful vote today, George, that sends any kind of a meaningful message, I think what we have just discussed needs to be incorporated.

MR. SIEMON: All right.

MS. CAUGHLAN: Sure; it's awkward for me to sit here and try to come up with something right now. It's been awkward all along.
MR. SIEMON: The second line is where they have about facilities. I was just trying to see how to fit something in there, but I can't quite --

VOICE: Is there an amendment on the floor?

MR. CARTER: She's contemplating; there's an amendment being contemplated at this point. Contemplate does not -- okay; I'm not seeing an amendment being offered at this point, so I will move on. There's a separate item of discussion.

Rick?

MR. MATHEWS: I was there for part of this discussion last night, and upon further reflection, I need to point out something.

The last sentence in number 1 I would find unacceptable, and I'll tell you why. Certified operations must commence compliance by their anniversary date, as we have said all along, and so the way it works is that the certifying agent would be expected to tell their clients where they're in noncompliance; they would have to -- according to the grandfather clause that we've been discussing for quite some time, would have up to and not beyond their anniversary date.

That is going to put a tougher restriction on some people than others, but I would hold that this rule
has been out since December of 2000, and people have had adequate time to start to come into compliance.

They've also -- you know, the proposed rule was out in March of 2000; there was another proposed rule in December of '97. This is not new news. So those who are not currently in compliance should be held to the grandfather clause of coming into compliance by their anniversary date.

Now, having said that, I understand that there are still problems with the fact that somebody who may have their anniversary date a week from now, a month from now, two months from now, may have problems with their local jurisdiction in the area of permits.

I think it's reasonable for certifying agents in those cases to work with those producers as far as their coming into compliance. They have to show due diligence. I would accept their going beyond the anniversary date, but only under the condition that they have to meet the state and local laws regarding permits for any construction that would have to be done.

MR. CARTER: Okay. So a suggestion has been made that we strike that sentence regarding a phase-in period. Is there anyone who wants to formally offer that as an amendment?
MS. OSTIGUY: I'd so move.

MR. CARTER: Nancy has moved. Is there a second?

MR. RIDDLE: Second.

MR. CARTER: Jim has seconded. Is there discussion on the amendment?

MS. CAUGHLAN: A question: Is this -- this is to strike the last line of paragraph 1?

MR. CARTER: First paragraph, so --

MS. CAUGHLAN: Yes. I --

MR. CARTER: The sentence reads, beginning, "A producer shall demonstrate reasonable progress" -- and continuing on through "2004)."

Okay. Willie?

MR. LOCKERETZ: To get back to Rick's comment, besides the possibility of delay because of having to meet various zoning and other local and environmental requirements, there's also the problem that here we're talking about capital investment, not changes in daily operations, and it takes time to build the building, not only -- maybe not as much time as to get permission to build it, but that's a factor that will -- I think that the producers are entitled to a reasonable amount of time to get all these things done.
Now, it's true that something wording like this was out there since December of 2000, but this kind of slightly more specific version or what I hope will become a more specific version has only been at the level of proposals and drafts and so forth, and I couldn't blame a producer who didn't act on the basis of draft recommendations, and when it becomes the real thing, then the clock should start to tick.

MR. CARTER: Okay. Jim, then George, then Goldie.

MR. RIDDLE: I would just like to point out -- I mean, I understand what you're saying, Willie -- that organic is really -- no one forces you to go organic; you're making a choice, a voluntary choice to enter the organic market.

And in doing so, then you're agreeing to comply with all the rules, but this isn't a regulation that applies to every agricultural operator; these are only to those who choose to use the organic claim, and then they agree to follow the rules that are set out.

So, yes, they need to plan ahead. If they're planning to go organic, they should be getting those registrations that are needed, acquiring the capital, doing the construction to fit the rule, and whatever time
it takes, they need to do that before they apply for certification.

If they're already certified and are needing to make some of those changes to remain in compliance, then that is an issue of their organic plan and the certifier, but no one is forcing anyone to go organic.

MR. LOCKERETZ: Let me just answer. You used the phrase, to meet the rule, but it isn't rule. It's language, drafts, recommendations, proposals. It's not the rule until we make it the rule.

MR. MATHEWS: Willie, I have to disagree. The rule they have was published on December 21, 2000. The preamble clearly says they have to go outside. There were discussions as to whether or not people could meet those requirements by bringing the outside in.

The preamble I think has always been pretty clear that the intent was that the birds go outside. People were looking for another interpretation, and you -- this body has attempted to clarify that even further, and therefore it is no different, really, than what's already been there for about two and a half years.

MR. LOCKERETZ: Then there's no need to vote on it.

MR. CARTER: Okay. Then George and Goldie.
MR. SIEMON: Well, I just wanted to support what Rick -- this motion to drop this last line, because our concern was, first off, to make sure there was an end to it, and also to acknowledge there's complications.

What I just heard Rick said shows to me the farm plan system will and his accreditation anniversary will answer the concerns we had here, so I support this motion. I'd like to see us move on.

MR. CARTER: Okay. Then Goldie, and then let's start to move toward a vote on this.

MS. CAUGHLAN: All right. So back to the issue of surface --

MR. CARTER: No. That's not germane to this discussion. We're discussing the amendment that's on the table, which is to delete the timing.

MS. CAUGHLAN: Okay. I waive.

MR. SIEMON: Can we call the question?

MR. CARTER: Okay. The question, if you're ready to vote -- okay; first of all, on any of these votes does anybody have a conflict of interest in this issue? Having commercial chicken operations.

MR. SIEMON: I have chickens.

MR. CARTER: Okay. You have chickens. Okay.

(General laughter.)
MR. KING: But are they chickens in the closet?

(General laughter.)

MR. CARTER: And I have to confess I've got some in the freezer.

(General laughter.)

MR. CARTER: Okay. All of those in favor of the amendment, which is to strike the language -- the last sentence of item number 1, "A producer shall demonstrate reasonable progress in efforts to comply with this provision; full compliance shall be completed no later than 18 months from October 21, 2002" -- all those in favor signify by raising your hand.

(A show of hands.)

MR. CARTER: Opposed, same sign.

(Mr. Lockeretz raised his hand.)

MR. CARTER: Abstentions.

(No response.)

MR. CARTER: Okay. Let's see. We're now at 13, so it's 12 to one.

The amendment carries.

Now we're back open for the other discussion, Goldie.

MS. CAUGHLAN: Thank you. All right. So we'll try this one; add it as a number 3 to the current access
to outdoors for poultry recommendation; number 3 to read,
Bare surfaces -- e.g., metal, cement, wood -- do not meet
the intent of the rule.

Mr. Carter: Can you repeat that one more time.

Ms. Cauglan: Bare surfaces -- e.g., metal,
cement, wood -- do not meet the intent of the rule.

Mr. Carter: Okay. Is there a second to the
amendment?

Ms. Ostiguy: Second.

Mr. Carter: Okay. It's been seconded by
Nancy. Okay. Discussion? Mike?

Well, first of all, Goldie is presenting the
amendment. Do you want to explain it at all? You still
have your mike on; that's why I'm --

Okay. Then, Mike, go ahead.

Mr. Lacy: So are you saying that concrete is
not an acceptable surface?

Ms. Cauglan: It's bare.

Mr. Lacy: So do you need to define what's not
bare?

Ms. Cauglan: Bare is bare.

Mr. Lacy: So once the chickens are out on the
concrete for a day or two, the concrete is no longer bare,
and if that's the case, why do we need this?
MR. CARTER: Okay. Goldie?

MS. CAUGHLAN: If these are natural chickens, as I'm assuming they are, I sure as hell hope that that cement or whatever that they'd be put on wouldn't be bare after a few hours, because that material is good material; it's not waste material.

I think the intent is pretty obvious in what I'm putting forth, which is that a system be in place that if in fact the underpinning is cement or metal or whatever, that there be a means of catching the droppings of the chicken, which are not waste but which are good and which need to be respected as material.

MR. CARTER: Okay. Jim and then George.

MR. RIDDLE: Yes. Back to the rule.

205.239(a)(3): Producer must provide appropriate clean, dry bedding. That's another requirement, so in a way, what Mike is saying, yes, that bedding is already a requirement under the rule, so bare surfaces in and of themselves wouldn't be allowed, but we're offering clarifications here.

MS. CAUGHLAN: But my chickens didn't ever sleep out in those areas; they had their bedding in their nests.

MR. RIDDLE: We're offering clarification that
adds to -- that complements the language that's already in
the rule, and I see no harm in stating this as an
amendment to the motion, so I'll support it. But it's
fully consistent with rule language already.

MR. CARTER: Mike?

MS. CAUGHLAN: See, it's this other information
that's --

MR. CARTER: Mike first.

MR. LACY: Jim, I'm not as familiar with the
rule yet as you are, but I would assume that that clean,
dry bedding would have to apply to inside bedding, because
the first time it rains, that bedding is not going to be
dry, and does that mean that you're going to require that
that bedding be replaced outdoors?

MR. CARTER: Okay. Question directed to Jim.

MS. CAUGHLAN: The word "outdoors" -- the
scratch outdoors is not bedding.

MR. CARTER: Okay. The question has been
called. And for members of the audience, when somebody
calls the question, that's an informal -- that's not a
direct motion; it's just indicating that some members want
to vote.

So the question has been called on this. If
there is no further discussion, we'll proceed to vote.
All of those --

MR. LOCKERETZ: Could you read the amendment again.

MR. CARTER: Okay. The amendment is -- please read the amendment, Goldie.

MS. CAUGHLAN: Three --

MR. CARTER: With your mike on.

MS. CAUGHLAN: Three: Bare surfaces -- e.g., metal, cement, wood -- do not meet the intent of the rule.

MR. CARTER: Okay.

MR. BANDELE: A question, though, Goldie -- like you could have a bare soil type situation, so what are you -- so would bare soil also be not allowed?

MS. CAUGHLAN: Shall we say bare nonagricultural --

(General laughter.)

MS. CAUGHLAN: I mean --

MR. CARTER: How about just removing the "e.g."?

MS. CAUGHLAN: All right. I'll accept that as a friendly --

MR. LOCKERETZ: Then think for a minute about all the ones that you want to add to the --

MS. CAUGHLAN: I also don't want plastic. How
about that? I mean, let's get serious?

VOICE: What about fiberglass?

MS. CAUGHLAN: Fiberglass.

VOICE: We could be here all day.

MR. BANDELE: Would man-made surfaces -- would that help?

MR. SIEMON: No. The issue is not about concrete or not; the issue is we don't want bare concrete. That's what you're trying to fix here. Right? So I'm --

MR. CARTER: Okay. Just as a clarification to this, or a suggestion from the chair: bare, man-made surfaces?

MS. CAUGHLAN: Well, what about wood?

MR. CARTER: It's still man-made if it's processed.

MS. CAUGHLAN: All right. Bare, man-made surfaces -- how about woman-made?

MR. CARTER: This is a chance in the amendment, so it needs to be --

MS. CAUGHLAN: Bare, human-made, to satisfy the libbers of us.

MR. CARTER: Okay.

MS. CAUGHLAN: Bare, human-made surfaces; e.g., metal, cement, wood, plastic --
VOICE: Wood's not human-made, but it's processed.

MS. CAUGHLAN: -- do not meet the intent of the rule.

MR. CARTER: Okay. We're having a little discussion here on just formulating this amendment. I apologize. But what we're really trying to get at is surfaces other than soil, so why don't we say --

MS. CAUGHLAN: Surfaces other than bare soil -- bare surfaces other than bare soil do not meet the intent of the rule.

MR. CARTER: Yes. Bare surfaces other than soil do not meet the intent of this rule.

Is that what I heard you say, Goldie?

MS. CAUGHLAN: Yes, it is.

MR. CARTER: Okay. Is that an amendment?

MR. BANDELE: Only problem there is bare surfaces -- even bare soil is not really sustainable in terms of erosion and that type of thing, so -- I mean, that's just point.

VOICE: That's covered under --

MS. CAUGHLAN: That is covered under the other parts --

MR. CARTER: Yes. That's covered under other
parts of the rule. Okay. So that is -- now, the maker of the original amendment has changed her amendment. Is that okay with the seconder?

Nancy continues to second that. Okay.

Now, are we ready to vote on the language that says --

MR. BANDELE: One final point: It seems to me that the amendment would be better placed as 2 as opposed to 3, because it's still in conjunction with point 1.

MR. CARTER: Okay. Friendly amendment. So you're still prepared -- are we prepared to vote?

Everybody understand what we're voting on?

Mike?

MR. LACY: I do not.

MR. CARTER: Okay.

MR. LACY: A bare surface with sawdust is not a bare surface? Is that correct? Is that the intent?

MR. CARTER: That's correct.

MR. RIDDLE: It's no longer bare.

MR. CARTER: It's no longer bare.

MR. LACY: Thank you.

MR. CARTER: All right. We will proceed to
vote. All of those in favor of the amendment, signify by 
raising your hand.

(A show of hands.)

MR. CARTER: Opposed, same sign.

(Mr. Lacy raised his hand.)

MR. CARTER: The motion carries with -- oh, 
abstentions?

(No response.)

MR. CARTER: Okay. The motion carries 12 to 
one to zero.

VOICE: Can you repeat the amendment?

MR. CARTER: Okay. Goldie, please repeat the 
amendment.

MS. CAUGHLAN: Well, at this point it would 
take position number 2 if you have --

MR. CARTER: With your microphone on.

MS. CAUGHLAN: And it would read, Bare 
surfaces -- I'm sorry. I've lost it.

MR. SIEMON: Bare surfaces other than soil do 
not meet the intent of this rule.

MS. CAUGHLAN: Right. Thank you. I'm glad 
somebody was awake.

MR. CARTER: Okay. Now, we are back to the 
original motion as amended.
Is there further discussion on the motion as amended, which is to adopt the access to outdoors for poultry provision.

(No response.)

MR. CARTER: All of those in favor of the motion as amended indicate by raising your hand.

(A show of hands.)

MR. CARTER: Opposed, same sign.

(Mr. Lacy raised his hand.)

MR. CARTER: Okay. Abstentions?

(No response.)

MR. CARTER: Okay. It carries 12 to one to zero.

Thank you, George.

MR. SIEMON: Then I think the dairy replacement we should just put forward from the committee and not take the NOSB at this time.

MR. CARTER: Okay. So we will move forward language on dairy herd replacement to be posted on the web for comment and action at the September meeting.

MR. SIEMON: And just before we go on that, Rick, maybe we should sit down and talk and see if you want to write a comprehensive one or just this replacement; you know, what we want to do to clarify it.
So something we can do in private or maybe on a phone conference.

MR. MATHEWS: Yes. I think that you and I -- and we'll pull Bob Pooler into it -- really need to start to communicating on this. And we'll also pull Arthur into it.

I see Arthur's hand up.

MR. NEAL: We've got a question for the record on the last vote.

MR. CARTER: Yes.

MR. NEAL: Was this intended for mandatory language [inaudible], or is this for guidance [inaudible]?

MR. MATHEWS: It's just guidance, Arthur.

MR. NEAL: Okay.

MR. CARTER: All right. Then we will -- okay.

I was promised that, if Marty Mesh came forward and gave his response to the questions that he was asked to clarify on Monday, that he would not take long; that being -- the issue was raised about the prohibition of wording regarding "certified organic" on a label.

MR. MESH: Our homework assignment: Why is there a need to say "certified" on a label when everything is certified?

Not everyone is certified who can use the term
"organic." Less than 5000 --

MR. RIDDLE: Slow down. We're not in a hurry.

Just let us listen.

MR. MESH: For a change.

(General laughter.)

MR. MESH: Sorry. Off the record.

(General laughter.)

MR. MESH: The question that Rick posed: Why is there a need to say "certified" on a label when everything is certified. And with the help of Consumers Union representing millions of consumers, not everyone is certified who can use the term organic, especially less than $5000 retail preparation: organic lasagne versus certified organic lasagne.

Consumers don't know the difference between certified and not certified unless it's on the label.

There is some confusion in the marketplace with other labels that certify some users but not other users of the term; i.e., dolphin-safe.

Conventional agriculture uses obvious label claims: No hormones administered in poultry would be an example, when federal clearly prohibits the use of hormones in poultry.

In Section 205.310(a)(2), the rule states that
product from an exempt or excluded operation must not "be represented as a certified organic product or a certified organic ingredient to any buyer."

This implies that a product from a nonexempt operation could be represented as certified organic.

In 205.303(b)(2), the use of the phrase "certified organic by" is mandated. If the same words are both mandated and prohibited on the same label, then there seems to be some confusion.

And then the last one: Under OFPA, the word "organic" is regulated; the word "certified," like the word "transitional," is outside the scope of the National Organic Program if it is used in a truthful labeling claim.

Your second question that you posed -- are there any questions about the first one?

(No response.)

MR. MESH: The second one: What is the potential economic impact on those who don't use "certified" because they don't have room on the label?

That one was a tricky one. The loss -- and you all have economic researchers to do this type of data, but the loss of current market recognition of the phrase "certified organic" could cause economic impact on many
operations currently certified. The changing of labels alone could be prohibitively expensive.

And our rhetorical question: What is the potential negative economic impact for those who are certified versus those who aren't but still can use the term "organic"?

MR. MATHEWS: Thank you very much, Marty, because -- and I'm serious on this -- because what Marty has done is more fully explain his question, his ideas on the question, and it will make our job a lot easier when we go to answer his question.

Many times the problem with answering questions is that we really don't know what the person asking the question is really thinking. Sometimes the questions that come in and the answers we give are not complete.

So this helps us better understand what the issue is for Marty, which means that we can do a better job of giving an answer. We have found that sometimes people aren't totally up front with what their real objective is with their question, whether that's knowingly or unknowingly, and then we end up giving out answers that turn out to be maybe not the best answer we could have given.

So kind of take this as a lesson that the more
you can give us, the better.

    Thank you, Marty.

    MR. CARTER: Okay, Kim?

    MS. BURTON: I just want to support Marty in this. I think that it is important that if producers want to put "certified" on their label that they be able to do that.

    MR. MESH: And we were going to put it on the Frequently Asked Questions.

    MS. CAUGHLAN: I can tell you that it's what we've been telling consumers for a long time: "certified organic." We've been hammering that at consumers in writing, in talking. Certification is what it's about. And to then not be able to go back to those consumers and tell them that they can indeed expect to see certified organic as distinct from sorta organic, which has been out there, in some respects, for a long time, would be a disservice to consumers, an extreme disservice.

    MR. MATHEWS: The only issue -- and I don't have an answer for you right this moment, but the initial reaction was that every product produced on a certified operation already had to carry the identification of the certifying agent.

    So the information was available or is
available to all consumers, and only certified operations
can carry that information, and only certified operations
that are producing organic products could carry the USDA
seal.

MS. CAUGHLAN: Point: follow-up.

MR. CARTER: Very quick point; then we're going
to move on.

MS. CAUGHLAN: All right. At retail we now
will be able to sell the small less-than-5000-gross
producers' goods, and we hope to do that, as many
retailers do, in terms of encouraging the bringing along
of the small producers.

However, those will not be listed as certified
organic, but rather they'll be in our produce sections or
whatever labeled "organic." And it would be disingenuous
not to have the other product certified organic if that is
chosen to be listed that way.

MR. MATHEWS: We understood the question more
to be packaged goods, not the individual items in the
retail section. So that in itself gives us an idea how
information provided by Marty can be more valuable.

MS. CAUGHLAN: Right. But an additional factor
is what I'm pointing out.

MR. CARTER: Mark?
MR. KING: Just a quick point. I think it's obvious to everyone in this room we understand that if you are indeed using the term "organic" that you're certified, but that many consumers will not clearly understand that, and they do look to that term as an added sort of clarification that indeed this operation maybe has been inspected, certified, obviously, so on.

So I do think it's important.

MS. CAUGHLAN: But, Mark, remember; you go to the farmer's market and there's organic product there that is not certified organic product.

MR. CARTER: Less than 5000. Okay. Let's move on.

MR. LOCKERETZ: What's the current status of the phrase -- Rick, this is for you: What is the current status of the phrase "certified organic" as of October 21? Is that phrase not allowed? Is it --

MR. MATHEWS: That's the one we're going to answer, Willie. That's the one we're going to answer.

MR. LOCKERETZ: Sorry. I didn't hear the answer.

MR. MATHEWS: That's the question that Marty has asked us to answer.

MR. CARTER: They will be answering that,
Willie. Marty has given them some guidance as to how it should be answered. Okay?

And, Marty, if you'd please turn off your cell phone.

MR. MESH: I don't know how.

(General laughter.)

MR. RIDDLE: And we accredited him.

(General laughter.)

MR. CARTER: We will now move into committee reports of their work plans.

And so George will start off with livestock.

MR. SIEMON: Okay. Well, we -- first we were dealing with this replacement clause, as we've just said here today, and we hope to get that posted on the web as soon as possible and have a final vote by September on that.

Nancy just left, and she is going to take on the job of developing some sort of a checklist for poultry inspections on these issues, some suggestions. So whether that's in this committee or outside, she -- it's suddenly related to what we just did now.

One of the bigger issues we want to deal with is about excipients in medication, which is just a lot like incipients in feed additives or inerts in pesticides.
and that kind of thing; it's an issue that we really have
to address, and I hoped to get it before this meeting.

I do have an early draft I've handed out, I
think, to all the Livestock Committee. If not -- if
anybody else -- I've got plenty of copies here -- would
like to see about excipients.

And then the big task, of course, is materials.
The Livestock Committee has taken some -- I guess the
first time this ever happened, Kim; I don't know, but we
were given the privilege to put forth priority livestock
materials that we thought needed to be dealt with before
October 21, so we've put forth a list -- initially 14 and
now it's 17.

And, Kim, I guess we were supposed to get
together and talk about the prioritization of that, but
it's a big task, and what we did was then just do a single
page backup behind the petition for each one of these.

So we've gone through and done a lot of work to
get what the materials are we're concerned about and just
a single page, because we just weren't getting the
petitions in for materials that we felt had to be dealt
with.

So that's a big job yet in the TAP, and
hopefully by September meeting. So those are the big four
we're dealing with right now -- or these three.

MR. CARTER: Okay. Kim?

MS. BURTON: Just a comment on the 17 materials. Those have been prioritized, and I worked with Jim Pierce and Kelly Shea. There was actually some industry surveys that went out, and they had them prioritize them, number them one, two, three, four, five, so those have been submitted to the contractors, and they are starting to work on those, and in that order, so that we make sure that we have those TAPs provided by September.

MR. CARTER: Okay. Questions on -- extra stuff you want to add to that?

(No response.)

MR. CARTER: Okay. Then, Kim, while you have the floor, let's talk about materials.

MS. BURTON: And then, George, just -- my only other comment: We passed a recommendation yesterday on perhaps limiting some materials according to the CAR AAFCO, and if we could just make sure we follow up with those in the comment, make sure those are posted, and if we need to get TAPs done, we get that moving along, too.

MR. SIEMON: I didn't catch that. I'm sorry.

MS. BURTON: We'll talk off line.
Okay. Materials: The list is short and sweet, although it is a lot of work. Managing the material review process will be our primary focus from now and ongoing.

We do have the largest quantity -- we've got 31 so far right now -- scheduled for September, and I would imagine there will be a few more trickling in here, so managing that.

We also, as a committee, would like to present for the September meeting a draft document identifying ways to improve the communications when a petition is submitted for removal of a material from the National List.

So we're actually going to come up with some recommendations, not only from the board, but also hopefully help in the industry so we can get the word out that a material is being considered for removal.

Third, a draft recommendation will be presented in September for a proposal to review materials currently on the National List. In October, when we have that final date, we've got five years to review all the materials that are on the National List, so our tasks are never-ending here.

So we will come up with a proposal how to
prioritize those materials, and get that moving along.

MR. CARTER: Okay. Questions or comments for Kim?

(No response.)

MR. CARTER: Okay. Let's go on with the Processing Committee.

MR. KING: Yes. We have, as every other committee here does, several materials to review for the next meeting, and then a couple other things.

One, we're going to make continued development of the document technologies in which the NOSB would actually review a lot of work that's been done on this document by Steve Harper. Historically we've had some good comments from individuals as well as organizations like OMRI, so we'll continue development of that document between now and September, and hope to put a recommendation forward at that time.

Secondly, the Processing Committee will be forwarding cultures for a petition, so we'll be looking at those, and so that will comprise a lot of our work as well, and that's it.

MR. CARTER: Okay. Thank you.

Questions, comments for Mark?

(No response.)
MR. CARTER: Owusu? Crops Committee.

MR. BANDELE: Yes. The Composting Practicing Standard will be one of our projects in the upcoming months. I think Eric mentioned that yesterday. The Compost Task Force recommendations were accepted and endorsed by the board yesterday, as you know, and from that point the document will be a little more specific in terms of actual practices.

Guidance on the hydroponics, recognizing now that it's already covered -- we will be coming forth with a refined document in that area.

Based on yesterday's discussion, we will have also a guidance document on planting stock, because there's still a lot of confusion among farmers, particularly those using the vegetatively propagated planting materials, so we'll try to clarify that through a document; and then, of course, the materials review.

Two questions: In the past Mark Keating had recommended the committee coming forth with a list of materials that are allowable, as opposed to the National List, which is materials that are not allowable.
