CHAIRMAN RIDDLE: Hugh.
MEMBER KARREMAN: Yes.

CHAIRMAN RIDDLE: Bea.
MEMBER JAMES: Yes.

CHAIRMAN RIDDLE: Rigo.
MEMBER DELGADO: Yes.

CHAIRMAN RIDDLE: Dave.
MEMBER CARTER: Yes.

CHAIRMAN RIDDLE: Gerald.
MEMBER DAVIS: Yes.

CHAIRMAN RIDDLE: Nancy.
MEMBER OSTIGUY: Yes.

CHAIRMAN RIDDLE: Kevin.
MEMBER O'RELL: Yes.

CHAIRMAN RIDDLE: Rose.
MEMBER KOENIG: Yes.

CHAIRMAN RIDDLE: Chair yes and so we have

Okay. That concludes it for the Handling
Committee and once again, I thank Kevin and members of
the Handling Committee for your excellent preparation
there. Facilitate a good discussion and good vote.

Okay. We'll go to the Crops Committee.

MEMBER OSTIGUY: Okay. I'm handing around
revisions because there were a fair number of them.
There aren't enough actually for everybody to have
one. There are eight total that are going on both
sides of me. So, somebody is going to have to share.

MEMBER CARTER: Rigo and I can share.

MEMBER OSTIGUY: There are two pages. One
page is back-to-back. The second page is by itself.
601 is the first page. Okay.

CHAIRMAN RIDDLE: All right. Have order
again please?

MEMBER OSTIGUY: What I'd done because
there are revisions, I redid all the categories. So,
all of them are there, but the ones that we moved are
in bold so people notice what we've done.

Okay. Starting with 205.601(a) as
algicides, disinfectants and sanitizers including irrigation system cleaning systems, the Crops Committee recommends the renewal of the following substances: alcohol, ozone gas, periacetic acid, soap-based algicides and delousers. The Crops Committee also recommends the deferral of vote on chlorine materials, hydrogen peroxide and there are no recommendations for not renewing a substance.

CHAIRMAN RIDDLE: Okay. That's a motion. Is there a second?

MEMBER DAVIS: Second.

MEMBER KOENIG: Just a typo. In the committee summary, the committee agrees. Not in your thing, but in the original recommendation. Just -- just to note it so we'll fix it. It says the -- the committee agrees. Agress.

CHAIRMAN RIDDLE: Oh. I see. Okay. Right. Right there. All right. George.
MEMBER SIEMON: I asked this question yesterday. I didn't take very good notes. Why -- why hydrogen peroxide?

MEMBER OSTIGUY: What -- there was mentioned in the -- some of the comments that there is new data available concerning environmental impacts, health effects and most especially potential alternatives and those are the -- those are the questions that we need to address.

The committee is erring on the side of checking to make sure that there's no new information that would alter our decision. It's not in anyway, shape or form an expectation that we will alter it, but we did not have any time to be able to start looking at these things in any kind of detail.

CHAIRMAN RIDDLE: Okay. Any other discussion on this? Seeing none. We'll vote on the committee's recommendation on 601(a) and we will begin with Andrea.

MEMBER CAROE: Yes.

CHAIRMAN RIDDLE: Julie.
MEMBER WEISMAN: Yes.

CHAIRMAN RIDDLE: Mike.

MEMBER LACY: Yes.

CHAIRMAN RIDDLE: Goldie.

MEMBER CAUGHLAN: Yes.

CHAIRMAN RIDDLE: Hugh.

MEMBER KARREMAN: Yes.

CHAIRMAN RIDDLE: Bea.

MEMBER JAMES: Abstain.

CHAIRMAN RIDDLE: Rigo.

MEMBER DELGADO: Yes.

CHAIRMAN RIDDLE: Dave.

MEMBER CARTER: Yes.

CHAIRMAN RIDDLE: Gerald.

MEMBER DAVIS: Yes.

CHAIRMAN RIDDLE: Nancy.

MEMBER OSTIGUY: Yes.

CHAIRMAN RIDDLE: Kevin.

MEMBER O'RELL: Yes.

CHAIRMAN RIDDLE: Rose.

MEMBER KOENIG: Yes.
CHAIRMAN RIDDLE: George.

MEMBER SIEMON: Yes.

CHAIRMAN RIDDLE: Chair yes. So we have 13 yes. Zero no. One abstention.

Nancy.

MEMBER OSTIGUY: Okay. The committee moves under Section 205.601(b) as herbicides, weed barriers as applicable, we recommend the renewal of the following substances: herbicides soap-based, mulches, newspaper, other recycled paper and plastic mulch and covers. There are no materials that are being recommended for deferral or for non-renewal.

CHAIRMAN RIDDLE: Okay. Is there a second?

MEMBER DAVIS: Second.

MEMBER KOENIG: I use plastic mulch. I'm sure, Gerald, do you use it?
CHAIRMAN RIDDLE: And so does Gerald.

MEMBER DAVIS: Our farm uses some plastic mulch.

CHAIRMAN RIDDLE: Okay. So, you're obviously not the only ones. So, it's not a unique interest.

MEMBER CAUGHLAN: Question.

CHAIRMAN RIDDLE: Goldie.

MEMBER CAUGHLAN: You -- you say plastic mulch and covers, but you didn't --

MEMBER OSTIGUY: I -- I did not write down all of the annotations.

MEMBER CAUGHLAN: So, this is the shorthand. Okay.

MEMBER OSTIGUY: Yes, this is the short one. I had to type from scratch to -- to get this ready for us.

MEMBER CAUGHLAN: All right. As long as there's not any intent to change any --

MEMBER CAUGHLAN: Couldn't be. Yes.

Well, good.

CHAIRMAN RIDDLE: And -- and -- and -- yes, and I -- I -- just to follow up on that, a request that -- that the changes that are being adopted will be inserted in the comprehensive.

MEMBER OSTIGUY: Obviously.

CHAIRMAN RIDDLE: Yes, and also Kevin had asked me about this and -- and the process will follow. Will be the committee chairs polish these up and submit them to me as the chair of record for this meeting and then I will review them and put them on those official committee or Board recommendation forms and submit them to the program. So, I ask each of the chairs to get those back in to me first and then I'll turn them into the program. Okay.

So, we're back to 601(b) recommendation.

Any other discussion?

MEMBER CAROE: Just --

CHAIRMAN RIDDLE: Andrea.

MEMBER CAROE: -- just want to -- just
want to clarify the change that was made was the newspaper which was on the deferred based on -- not on comment is now for renewal, for relist.

MEMBER OSTIGUY: Correct. That's why it's in bold.

MEMBER CAROE: Okay. Well, I just want to --

CHAIRMAN RIDDLE: Hugh.

MEMBER KARREMAN: Whatever happened with -- I don't know where it is, but the newspaper with glossy or colored inks? I mean, you know, that's out there. Sorry to bring that in.

MEMBER OSTIGUY: But, we can't use it.

MEMBER KARREMAN: It's just prohibited.

MEMBER OSTIGUY: Right and the original reasoning was the materials that are used -- were used to make the inks.

MEMBER KARREMAN: Back then.

MEMBER OSTIGUY: It may not be applicable anymore because of soy-based inks, but we are not -- we're not dealing with annotations at this time.
So, newspaper and other paper would still need to be on the list because of potentially how it's manufactured, but we might not need that annotation because of the soy-based inks. There's a lot of papers that are available that are soy-based inks.

MEMBER KARREMAN: Standard Sunday papers are that way now?

MEMBER OSTIGUY: Excuse me.

MEMBER KARREMAN: Your standard Sunday papers are that way now?

MEMBER OSTIGUY: Yes.

CHAIRMAN RIDDLE: But, it would take a petition to drive a change to the annotation.

Okay.

CHAIRMAN RIDDLE: Okay. Any other discussion?

MEMBER SIEMON: Call the question.

CHAIRMAN RIDDLE: Okay. We have a committee recommendation on 601(b) and we will vote beginning with Julie.
CHAIRMAN RIDDLE: Julie.

MEMBER WEISMAN: Yes.

CHAIRMAN RIDDLE: Mike.

MEMBER LACY: Yes.

CHAIRMAN RIDDLE: Goldie.

MEMBER CAUGHLAN: Yes.

CHAIRMAN RIDDLE: Hugh.

MEMBER KARREMAN: Yes.

CHAIRMAN RIDDLE: Bea.

MEMBER JAMES: Yes.

CHAIRMAN RIDDLE: Rigo.

MEMBER DELGADO: Yes.

CHAIRMAN RIDDLE: Dave.

MEMBER CARTER: Yes.

CHAIRMAN RIDDLE: Gerald.

MEMBER DAVIS: Yes.

CHAIRMAN RIDDLE: Nancy.

MEMBER OSTIGUY: Yes.

CHAIRMAN RIDDLE: Kevin.

MEMBER O'RELL: Yes.

CHAIRMAN RIDDLE: Rose.
MEMBER KOENIG: Yes.

CHAIRMAN RIDDLE: George.

MEMBER SIEMON: Yes.

CHAIRMAN RIDDLE: Andrea.

MEMBER CAROE: Yes.

CHAIRMAN RIDDLE: Chair votes yes. So we have 14 yes. Zero no.

Okay. Nancy.

MEMBER OSTIGUY: 205.601 as compost feed stocks, the Crops Committee recommends the renewing of newspaper and/or other recycled paper without glossy or colored inks. The Crops Committee has no materials recommended for deferral or non-renewal in this category.

CHAIRMAN RIDDLE: Okay. Second.

MEMBER DAVIS: Second.

CHAIRMAN RIDDLE: Okay. Moved by Nancy. Seconded by Gerald. It's the 601(c) recommendation. Any interest to declare? Seeing none. Any discussion? Seeing none. We'll start the vote with Mike.
MEMBER LACY: Yes.

CHAIRMAN RIDDLE: Goldie.

MEMBER CAUGHLAN: Yes.

CHAIRMAN RIDDLE: Hugh.

MEMBER KARREMAN: Yes.

CHAIRMAN RIDDLE: Bea.

MEMBER JAMES: Yes.

CHAIRMAN RIDDLE: Rigo.

MEMBER DELGADO: Yes.

CHAIRMAN RIDDLE: Dave.

MEMBER CARTER: Yes.

CHAIRMAN RIDDLE: Gerald.

MEMBER DAVIS: Yes.

CHAIRMAN RIDDLE: Nancy.

MEMBER OSTIGUY: Yes.

CHAIRMAN RIDDLE: Kevin.

MEMBER O'RELL: Yes.

CHAIRMAN RIDDLE: Rose.

MEMBER KOENIG: Yes.

CHAIRMAN RIDDLE: George.

MEMBER SIEMON: Yes.
CHAIRMAN RIDDLE: Andrea.

MEMBER CAROE: Yes.

CHAIRMAN RIDDLE: Julie.

MEMBER WEISMAN: Yes.

CHAIRMAN RIDDLE: Chair's yes. Fourteen yes. Zero no.

MEMBER OSTIGUY: Okay. 205.601(d) as animal repellents. The Crops Committee recommends the renewal of soaps ammonium. There are no materials recommended for deferral or non-renewal.

MEMBER DAVIS: Second.

MEMBER CAUGHLAN: Yes.

CHAIRMAN RIDDLE: Hugh.

MEMBER KARREMAN: Yes.

CHAIRMAN RIDDLE: Bea.
MEMBER JAMES: Yes.
CHAIRMAN RIDDLE: Rigo.
MEMBER DELGADO: Yes.
CHAIRMAN RIDDLE: Dave.
MEMBER CARTER: Yes.
CHAIRMAN RIDDLE: Gerald.
MEMBER DAVIS: Yes.
CHAIRMAN RIDDLE: Nancy.
MEMBER OSTIGUY: Yes.
CHAIRMAN RIDDLE: Kevin.
MEMBER O'RELL: Yes.
CHAIRMAN RIDDLE: Rose.
MEMBER KOENIG: Yes.
CHAIRMAN RIDDLE: George.
MEMBER SIEMON: Yes.
CHAIRMAN RIDDLE: Andrea.
MEMBER CAROE: Yes.
CHAIRMAN RIDDLE: Julie.
MEMBER WEISMAN: Yes.
CHAIRMAN RIDDLE: Mike.
MEMBER LACY: Yes.
CHAIRMAN RIDDLE: Chair's yes. Fourteen yes. Zero no.

All right. Next, Nancy.

MEMBER OSTIGUY: 205.601(e) as insecticides. The Crops Committee recommends the renewal of ammonium carbonate, boric acid, elemental sulfur, lime sulfur, soaps insecticidal, sticky traps barriers.

The committee recommends deferral on horticultural oils.

There are no materials being recommended for non-renewal.

CHAIRMAN RIDDLE: Okay.

MEMBER DAVIS: Second.

MEMBER JAMES: I just have a question. I'm -- okay. I'm looking at the -- the updated draft and the -- the updated recommendation is suppose to be
the final. Right? And then what's in here -- this is
going to be merged into this draft. Well, it -- you
mentioned lime sulfur, but it doesn't say lime sulfur
on the page that was -- that was --

MEMBER OSTIGUY: That -- that is a
mistake. It should be on there.

MEMBER JAMES: Okay.

MEMBER OSTIGUY: It's just I left it
off --

MEMBER JAMES: Okay.

MEMBER OSTIGUY: -- inadvertently. So,
yes, lime sulfur is part of that list.

MEMBER JAMES: All right. And I -- I
guess I just -- it's -- it's a little difficult to
follow all of this with the changes and I appreciate
and I understand that sometimes last minute things
happen, but I -- I mean I just -- I don't think that
should be --

MEMBER SIEMON: But, there's only two
changes throughout this. That's the bold.
MEMBER OSTIGUY: That's right.

MEMBER SIEMON: There's only two changes.

CHAIRMAN RIDDLE: Yes.

MEMBER SIEMON: B and then that --

MEMBER JAMES: No, there's three. No, the very next page has the next one J.

CHAIRMAN RIDDLE: Yes, there's three.

MEMBER SIEMON: Oh, I'm sorry. I didn't see that. Yes. Maybe it would be better if you just had those three only and not the other ones. Might have been better, but I -- I --

MEMBER OSTIGUY: And -- and in the past, then I -- then people have wanted the whole thing. So, it's six of one.

MEMBER SIEMON: Appreciate.

CHAIRMAN RIDDLE: All right. But, good catch on the lime sulfur. All right. Any further discussion? Andrea, I'm sorry.

MEMBER CAROE: Could you just restate the -- the comments in the -- that -- that put the oil on the deferred list? What was the concern?
MEMBER OSTIGUY: There were no concerns expressed. What was indicated is that there are now non-synthetic alternatives and so, that's what we want to explore.

MEMBER DAVIS: Mainly efficacious vegetable oils that will do the same thing that are not synthetic.

MEMBER CAROE: Okay. Thank you.

CHAIRMAN RIDDLE: Okay. Any other discussion? All right. Seeing none. We'll go to a vote and we start with Hugh and this is on the committee's recommendation on 601(c).

MEMBER CAUGHLAN: He's absent for a moment.

CHAIRMAN RIDDLE: Absent for a moment. See if he's back by the time we're done.

Then Bea.

MEMBER JAMES: Yes.

CHAIRMAN RIDDLE: Rigo.

MEMBER DELGADO: Yes.

CHAIRMAN RIDDLE: Dave.
MEMBER CARTER: Yes.

CHAIRMAN RIDDLE: Gerald.

MEMBER DAVIS: Yes.

CHAIRMAN RIDDLE: Nancy.

MEMBER OSTIGUY: Yes.

CHAIRMAN RIDDLE: Kevin.

MEMBER O'RELL: Yes.

CHAIRMAN RIDDLE: Rose.

MEMBER KOENIG: Yes.

CHAIRMAN RIDDLE: George.

MEMBER SIEMON: Yes.

CHAIRMAN RIDDLE: Andrea.

MEMBER CAROE: Yes.

CHAIRMAN RIDDLE: Julie.

MEMBER WEISMAN: Yes.

CHAIRMAN RIDDLE: Mike.

MEMBER LACY: Yes.

CHAIRMAN RIDDLE: Goldie.

MEMBER CAUGHLAN: Yes.

CHAIRMAN RIDDLE: Hugh's still absent.

Chair votes yes. So, we have 13 yes. Zero no. One
absent.

All right. Nancy, back to you.

MEMBER OSTIGUY: 205.601(f) as insect management. The Crops Committee recommends the renewal of pheromones. There are no materials recommended for deferral or non-renewal.

MEMBER DAVIS: Second.

CHAIRMAN RIDDLE: Okay. Committee recommendation moved by Nancy, seconded by Gerald on 601(f). Any interest to declare? Discussion? Seeing none. We'll go to the vote and we start with Bea.

MEMBER JAMES: Yes.

CHAIRMAN RIDDLE: Rigo.

MEMBER DELGADO: Yes.

CHAIRMAN RIDDLE: Dave.

MEMBER CARTER: Yes.

CHAIRMAN RIDDLE: Gerald.

MEMBER DAVIS: Yes.

CHAIRMAN RIDDLE: Nancy.

MEMBER OSTIGUY: Yes.
CHAIRMAN RIDDLE: Kevin.

MEMBER O'RELL: Yes.

CHAIRMAN RIDDLE: Rose.

MEMBER KOENIG: Yes.

CHAIRMAN RIDDLE: George.

MEMBER SIEMON: Yes.

CHAIRMAN RIDDLE: Andrea.

MEMBER CAROE: Yes.

CHAIRMAN RIDDLE: Julie.

MEMBER WEISMAN: Yes.

CHAIRMAN RIDDLE: Mike.

MEMBER LACY: Yes.

CHAIRMAN RIDDLE: Goldie.

MEMBER CAUGHLAN: Yes.

All right. All right. Nancy.

MEMBER OSTIGUY: 205.601(g) as rodenticides. The Crops Committee recommends the
renewal of sulfur dioxide and vitamin D3. There are no materials being recommended for deferral or for non-renewal.

MEMBER DAVIS: Second.

CHAIRMAN RIDDLE: Okay. Moved by Nancy. Seconded by Gerald. The committee's recommendation on 601(g). Any interest to declare? Any discussion? Okay. Seeing none. We'll go to the vote and we start with Rigo.

MEMBER DELGADO: Yes.

CHAIRMAN RIDDLE: Dave.

MEMBER CARTER: Yes.

CHAIRMAN RIDDLE: Gerald.

MEMBER DAVIS: Yes.

CHAIRMAN RIDDLE: Nancy.

MEMBER OSTIGUy: Yes.

CHAIRMAN RIDDLE: Kevin.

MEMBER O'RELL: Yes.

CHAIRMAN RIDDLE: Rose.

MEMBER KOENIG: Yes.

CHAIRMAN RIDDLE: George.
MEMBER SIEMON: Yes.

CHAIRMAN RIDDLE: Andrea.

MEMBER CAROE: Yes.

CHAIRMAN RIDDLE: Julie.

MEMBER WEISMAN: Yes.

CHAIRMAN RIDDLE: Mike.

MEMBER LACY: Yes.

CHAIRMAN RIDDLE: Goldie.

MEMBER CAUGHLAN: Yes.

CHAIRMAN RIDDLE: Hugh.

MEMBER KARREMAN: Yes.

CHAIRMAN RIDDLE: Bea.

MEMBER JAMES: Yes.

CHAIRMAN RIDDLE: Chair's yes. So, 14 yes. Zero no.

MEMBER OSTIGUY: Okay. 205.601(h) has no materials. So, we have no vote.

205.601(h) as plant disease control.

There are --

MEMBER KARREMAN: I.

MEMBER OSTIGUY: Excuse me. I. It says
(i). I just reread it.

CHAIRMAN RIDDLE: Yes, that's right. There's one in the transcript to be correct.

MEMBER OSTIGUY: The Crops Committee recommends the renewal of copper fixed, copper sulfate, lime sulfur, periacetic acid, potassium bicarbonate and elemental sulfur.

The Crops Committee recommends deferring horticultural oils and then also recommends deferring based upon inconsistencies with OFPA, hydrated lime, hydrogen peroxide, streptomycin and tetracycline or tetracycline.

MEMBER DAVIS: So, the periacetic acid is -- is --

MEMBER OSTIGUY: That's -- it's currently not moved.

MEMBER DAVIS: Okay.

MEMBER OSTIGUY: Did I -- did I make a mistake?

MEMBER WEISMAN: No.

MEMBER OSTIGUY: Go ahead.
MEMBER WEISMAN: I'm sorry.

CHAIRMAN RIDDLE: Okay. Yes, we -- we got a motion. Is there a second first before discussion?

CHAIRMAN RIDDLE: Well, right now the only thing that's germane would be --

MEMBER LACY: Second.

CHAIRMAN RIDDLE: Okay. Mike seconds. Thank you.

MEMBER WEISMAN: All right. Sorry.

CHAIRMAN RIDDLE: All right.

MEMBER WEISMAN: All right. I didn't understand the order.

CHAIRMAN RIDDLE: Yes. All right. Julie and then Rose.

MEMBER WEISMAN: On the list that I have in front of me where nothing is in bold is different than what Nancy just read. Could -- could I get some clarification on where periacetic acid was yesterday and where it's suppose to be today?
MEMBER OSTIGUY: Oh, periacetic acid is in the same place that it was yesterday.

MEMBER WEISMAN: Okay. You read it as --

MEMBER OSTIGUY: It's in the same place as yesterday.

MEMBER WEISMAN: But, you read it in the list of things to renew.

MEMBER OSTIGUY: Correct and what I'm getting now from the -- from nods from the committee is that I do have it in the wrong place. It belongs over with the list of hydrated lime, hydrogen peroxide, streptomycin and teracycline.

So, I'll -- I'll reread it so that it's clear.

MEMBER WEISMAN: Please. Thank you.

MEMBER OSTIGUY: We are recommending the renewal of copper fixed, copper sulfate, lime sulfur, potassium bicarbonate, elemental sulfur.

Deferral for more information is horticultural oils. Deferral because of inconsistency with OFPA would be hydrated lime, hydrogen peroxide,
periacetic acid, streptomycin and tetracycline.

CHAIRMAN RIDDLE: Okay. Barbara.

MS. ROBINSON: Yesterday, recommended to renew periacetic acid. Today, you've changed.

MEMBER OSTIGUY: It's in two different places. We recommended for disinfectant. That's consistent. That's on (a). Now, we're on (i).

CHAIRMAN RIDDLE: I had Rose. Do you still -- yes, you're in the queue and then Andrea. Okay. Rose.

MEMBER KOENIG: I mean I'll offer an explanation. Is that okay?

Okay. The explanation on horticulture oils is similar to the ones prior to with -- with one comment or also wanting us to look into the alternatives of vegetable oils which we can do by kind of a single question to the TAP contractor.

The other group hydrated lime, hydrogen peroxide, periacetic acid, streptomycin, tetracycline, by the interpretation -- we were given the charge as we understood as finding materials that are not
consistent with OFPA and in this group, these were the ones that we have identified.

So, it's basically we need to talk to NOP and see if that still is our charge in terms of trying to make the list consistent with OFPA and we acknowledge that streptomycin and tetracycline if -- if there's an agreement that toxins from bacteria include antibiotics and that won't -- those two probably could fit within that, but we wanted to discuss that with the NOP before moving forward.

MR. NEAL: Periacetic acid should be -- should be stricken because it was added onto the list in 2003.

CHAIRMAN RIDDLE: Okay.

MR. NEAL: Periacetic acid in general was added in 2003 if I'm not mistaken.

MEMBER OSTIGUY: Then we -- we missed that particular one. There were others that people commented on that also were not under review and this one we happened to miss that didn't belong there.

CHAIRMAN RIDDLE: So --
MEMBER OSTIGUY: So, peracetic acid is removed completely. It is not under -- it's a five-year review. It's listing remains unchanged.

CHAIRMAN RIDDLE: And for the record, that also applies to 205.601(a) listing of peracetic acid and so, the final version of the committee report will reflect that. Okay. On both of those listings. Right?

Now, back to the motion on the floor which is 601(i).

MEMBER CAROE: Discussion.

CHAIRMAN RIDDLE: Yes. Discussion.

Andrea.

MEMBER CAROE: I -- I -- you know, in the spirit of Sunset, we're looking for new information to -- that needs to be considered in the evaluation of these materials. I -- I disagree with looking and trying to fix the list and going against the previous Board's decision to have these materials on other than if there's new information. So, I -- I don't agree with these -- these four materials now that appear as
deferred based on inconsistencies with OFPA.

CHAIRMAN RIDDLE: Nancy.

MEMBER OSTIGUY: My understanding was that we were asked when we were doing the five-year review to look for inconsistencies also.

Now, if that has changed, this may be removed because of that, but we needed to -- to still talk with NOP. So, it may only be sitting there temporarily until we have the conversation. I don't know, but we were asked originally by NOP to look for these.

MEMBER CAROE: Well --

CHAIRMAN RIDDLE: Andrea.

MEMBER CAROE: I agree with that, Nancy. I really do, but I -- I feel it's a separate process. I mean identifying them and dealing with them after Sunset is appropriate, but I don't think it's part of the Sunset --

MEMBER OSTIGUY: Well, and that may be what we do.

MEMBER CAROE: But, I think right now we
should be recommending to -- to relist these materials and dealing with --

CHAIRMAN RIDDLE: And you have the right to that position. Rose and then Arthur, too. Okay. Or first. Arthur.

MR. NEAL: Real brief. I think if I'm not mistaken the committees have streptomycin and tetracycline down because of the whole antibiotic issue and for that, I think that -- that does fall under Sunset as well as the -- not oxytocin, ivermectin issue. Because there -- there wouldn't be a need to renew if we're going to have a general ban on antibiotics in the program. Yes.

CHAIRMAN RIDDLE: So, it's just a discussion that needs some further --

MR. NEAL: Right.

CHAIRMAN RIDDLE: Yes. Information on that.

MEMBER KOENIG: What about --

CHAIRMAN RIDDLE: Rose.

MEMBER KOENIG: I'm sorry.
CHAIRMAN RIDDLE: Speak into the mike.

MEMBER KOENIG: I mean again maybe I misunderstood our charge, but is the program -- you know, are we consistent with the program's desires in terms of finding substances that are not consistent with OFPA categories?

MEMBER OSTIGUY: Yes.

MEMBER KOENIG: Okay. In this process.

MEMBER OSTIGUY: Um-hum.

CHAIRMAN RIDDLE: Okay.

MEMBER CAUGHLAN: It would make a mockery of it if it were not.

CHAIRMAN RIDDLE: Goldie.

MEMBER CAUGHLAN: I just think it would make a mockery of it if we were not including that as part of our --

CHAIRMAN RIDDLE: Okay. Any other --

Andrea.

MEMBER CAROE: So -- so, for the record, this Board thinks that the previous Board did things against OFPA?
CHAIRMAN RIDDLE: Maybe.

MEMBER CAROE: Maybe.

MEMBER KOENIG: Yes.

CHAIRMAN RIDDLE: And we have to correct it.

MEMBER KOENIG: I just think it was ignorance. I don't think it was malicious.

CHAIRMAN RIDDLE: Right.

MEMBER KOENIG: Jim.

CHAIRMAN RIDDLE: Yes. Rose.

MEMBER KOENIG: That was one of the foundations of reorganizing the list to OFPA categories. I don't think it had anything to do with people, you know, consciously making a mistake. It's just when things were categorized by category use rather than OFPA category, it tended people not to think -- go back to that OFPA document and -- and recognize that.

CHAIRMAN RIDDLE: Bea.

MEMBER JAMES: If we know that tetracycline and streptomycin go against OFPA, why are
we deferring them? Why don't we just take them off?

MEMBER OSTIGUY: We don't have that. We don't have that information yet. There's still a discussion going on.

CHAIRMAN RIDDLE: Right. Just a need for the discussion is the reason for deferral. All right. Seeing no further discussion at this time. We'll go with the vote and this is on the committee's recommendation on 601(i) and we start with Dave.

MEMBER CARTER: Aye or yes.

MEMBER DAVIS: Yes.

CHAIRMAN RIDDLE: Nancy.

MEMBER OSTIGUY: Yes.

CHAIRMAN RIDDLE: Kevin.

MEMBER O'ReLL: Yes.

CHAIRMAN RIDDLE: Rose.

MEMBER KOENIG: Yes.

CHAIRMAN RIDDLE: Goldie. I mean George.

MEMBER SIEMON: Abstain.
CHAIRMAN RIDDLE: Andrea.
MEMBER CAROE: No.
CHAIRMAN RIDDLE: Julie.
MEMBER WEISMAN: No.
CHAIRMAN RIDDLE: Mike.
MEMBER LACY: Yes.
CHAIRMAN RIDDLE: Goldie.
MEMBER CAUGHLAN: Yes.
CHAIRMAN RIDDLE: Hugh.
MEMBER KARREMAN: Yes.
CHAIRMAN RIDDLE: Bea.
MEMBER JAMES: Abstain.
CHAIRMAN RIDDLE: Rigo.
MEMBER DELGADO: Yes.
CHAIRMAN RIDDLE: The Chair votes yes.
So, we have what? Eleven -- no ten yes. Two no. Two abstentions. So, the motion carries with the required two-thirds. Okay.
Nancy.
MEMBER OSTIGUY: 205.601(j) as plant soil amendments. The committee did change its
recommendation on this one just to point it out before I do the -- the motion. Liquid fish products has been moved from being deferred over to renewal.

So, the Crops Committee recommends the renewal of elemental sulfur, magnesium sulfate, micronutrients, vitamins B1, C and E, liquid fish products.

The committee recommends the deferral -- deferring the vote on lignin sulfate and then we have recommendations that were not based upon comments received that we are recommending for deferral and that is aquatic plant extracts and humic acid.

MEMBER DAVIS: Second.

MEMBER O'RELL: Nancy, could you explain what went into your thinking for moving liquid fish products from deferred to renewal?

MEMBER DAVIS: Because we -- it was our understanding that the only change that we were
considering that might -- we might want to be talking about was the annotation change. So, it didn't apply to this process of Sunset.

CHAIRMAN RIDDLE: Rose.

MEMBER KOENIG: OFPA prohibits synthetic fertilizers. The exception is they list fish emulsions as an OFPA category. Okay. So, fish emulsions are on the table you know as far as being allowed by OFPA specifically and so, then really all we have is the annotations and we can't change it via this process. So, if there's a disagreement based on any of this acids, it has to come through the regular petition process. But, that is distinct from aquatic plant extracts which are synthetic. Basically, other than hydrolyzed would be synthetic fertilizers and additionally, we want to get more information to see if that -- other than hydrolyzed. You know, it appears that there's some -- perhaps there's natural forms of that, but those are the kinds of questions that we're going to ask. That's the distinction between aquatic plant extracts and fish emulsion.
CHAIRMAN RIDDLE: Okay. Andrea.

MEMBER CAROE: The other two committee deferred items, aquatic plant extracts and humic acid, I have in my notes from yesterday's discussion that those were based on confusing annotations as well. Is that still the case?

MEMBER OSTIGUY: No, what -- not just on confusing annotations because we're not doing annotations, but with humic acid, there is at this time at least it's our understanding we need to -- to verify this information that there are large quantities of humic acid that are water extracted. What the annotation does is it -- it restricts to water and alkali. Water would be acceptable no matter what. So, the reason for even having it on the list really is because it would also be okay if it was alkali and the question is now are there sufficient non-synthetic alternatives, the water extracted, that we no longer need the material at all on the list. So.

MEMBER CAROE: And -- and the aquatic
MEMBER OSTIGUY: And then the aquatic plant extract is again a question of what materials are used in the processing. Do they then render the material synthetic or not? Have we changed the materials that are being used in processing such that they would have been synthetic in the past and it's not now. Rose probably has --

MEMBER KOENIG: Well, basically, I -- I thought I had explained that. That -- that within the -- with OFPA, synthetic fertilizers are prohibited.

Aquatic plant extracts if used as fertilizers -- now, I've been told that they can be used for their growth enhancement like natural cytokinins and such. That would put it in a -- a different -- well, it would be -- again, it depends on our OFPA categories. It could theoretically go into production aids if that was a larger category, but -- so, there's two questions. One is checking with the NOP again with -- with consistency with OFPA, but hydrolyzed is a non-synthetic way of dealing with
aquatic plant extract. So, there is a natural alternative.

So, those are the two major issues that we have to clarify on that. Yes.

CHAIRMAN RIDDLE: Okay. George.

MEMBER SIEMON: Yes, I'm a little confused here. First off, so, you're doing this deferred basically because you don't think it's authorized by OFPA.

MEMBER OSTIGUY: No, we don't know. We -- we need to determine that.

MEMBER SIEMON: Okay.

MEMBER OSTIGUY: We believe there's a --

MEMBER SIEMON: But, if that's the case, then why wouldn't you all -- a lot of these over here in the renewal are also being used as fertilizers and they're synthetic. So, micronutrients, soil division must be documented. It seems like if you're going to have -- the previous said inconsistency with OFPA. If that's your logic here, then I -- I like to see the -- yes, I'm -- I'm not comfortable with this -- the way
this is presented.

MEMBER DAVIS: George.

MEMBER SIEMON: Yes.

MEMBER DAVIS: Your reference to the renewed materials that each of those corresponds to an OFPA category that is specifically mentioned in the legislation.

MEMBER KOENIG: Minerals are --

MEMBER DAVIS: Isn't that true?

MEMBER KOENIG: Mineral. Yes, because minerals are allowed like synthetic micronutrients. You know, so --

MEMBER SIEMON: Synthetic ones.

MEMBER KOENIG: Well, right here you have micronutrients. It's on the list of synthetics.

MEMBER SIEMON: That's right.

MEMBER KOENIG: Yes. But, I'm saying minerals is an OFPA category. Right. Okay.

CHAIRMAN RIDDLE: Mineral fertilizers are allowed or to be considered under OFPA.

MEMBER SIEMON: Okay. Okay. But, still
the -- it's just a little technical. You don't know, but still it's about OFPA is why these are over here, one and two. These --

MEMBER OSTIGUY: Not completely.

MEMBER SIEMON: Not completely. Okay.

MEMBER OSTIGUY: It also has to do with whether or not there are now not synthetics available.

MEMBER CAROE: Let me just -- I just really want to be clear on this before I vote on it.

You're saying that potentially these items don't even need to be on the list because they're informed that they don't have to be listed. They're water extracted. They're ready to go. You don't -- you don't even need them on the list. So, that's why they're being considered.

MEMBER OSTIGUY: That's -- that's -- that's one. Well, both of them.

MEMBER CAROE: An -- an aquatic plant.

MEMBER OSTIGUY: Right.

MEMBER CAROE: Yes.

MEMBER OSTIGUY: Because it can be
MEMBER CAROE: So -- so, both of those materials, it's not a matter of taking them off the list and preventing growers from using them, but they may not need to be on the list anymore because now the way that they're produced is in a way that's --

MEMBER OSTIGUY: Acceptable.

MEMBER CAROE: -- acceptable without --

MEMBER OSTIGUY: Yes, which is -- which is our ultimate goal.

MEMBER CAROE: It's not an aqua thing. It's new information.

MEMBER OSTIGUY: Yes, it is. It can be.

MEMBER CAROE: Two issues. There's two issues.

MEMBER OSTIGUY: It could be. If --

MEMBER CAROE: It seems like there's a change of availability of -- of a material that's an alternative. Instead of having one that's meant to be alkaline extracted, you have one now that's water extracted and availability -- it changes this listing.
It changes this --

MEMBER OSTIGUY: That is true, but in addition to the availability issue, is -- if it is still a synthetic, then there's the question of whether or not there's an off the category under which it fits. We don't know the answer to that.

We know that mineral additions are acceptable. We're not sure if these fit someplace appropriately under OFPA. They may. We need to discuss that with NOP.

CHAIRMAN RIDDLE: Rose. Then George.

MEMBER KOENIG: The -- the -- the way previous Boards have viewed aquatic plant extracts, the -- the way that the annotation reads other than hydrolyzed means that hydrolyzed forms are considered non-synthetic. Okay.

What makes them synthetic based on this definition is that extraction process. Likely, because the -- that -- the solvent for the extraction is still left in the final product. Okay.

Now, again, we need to get this
clarification from the NOP on our OFPA categories and once we understand that we're going to be better able to deal with this, because in reality, the plant extracts aren't synthetic. It's what's used to either make them -- you know, to -- to -- to extract them or to pH adjust them.

So, again, it's -- it's just something we want to get more information on before we just continue this. It doesn't -- it just means that we need to further work on the --

CHAIRMAN RIDDLE: Arthur, do you have a comment?

MR. NEAL: Real quickly. The document that these really will fall under would be that whole OFPA category document.

I don't know if there's going to be a whole lot that's going help you make a decision on Sunset concerning these two. Because the real question is how should it be listed on the national list and we talked about, you know, we got aquatic plant which is a natural aqua allows for extraction.
The question is is it synthetic, is it non-synthetic.

So, that's another issue.

So, I don't know if it's the listing of it. It's just the timing of how you want to really deal with the true issue of it.

CHAIRMAN RIDDLE: Um-hum. So, we aren't going to resolve it today. Obviously, there's a need for some further discussion on it.

George, did you still have anything?

MEMBER SIEMON: I'm still confused. I will pass.

CHAIRMAN RIDDLE: Always a wise decision when confused. Any other discussion? Seeing none.

We have committee recommendation on 601(j) and we start with Gerald.

MEMBER DAVIS: Yes.

CHAIRMAN RIDDLE: Nancy.

MEMBER OSTIGUY: Yes.

CHAIRMAN RIDDLE: Kevin.

MEMBER O'RELL: Yes.

CHAIRMAN RIDDLE: Rose.
MEMBER KOENIG: Yes.

CHAIRMAN RIDDLE: George.

MEMBER SIEMON: Abstain.

CHAIRMAN RIDDLE: Andrea.

MEMBER CAROE: Yes.

CHAIRMAN RIDDLE: Julie.

MEMBER WEISMAN: Yes.

CHAIRMAN RIDDLE: Mike.

MEMBER LACY: Yes.

CHAIRMAN RIDDLE: Goldie.

MEMBER CAUGHLAN: Abstain.

CHAIRMAN RIDDLE: Hugh.

MEMBER KARREMAN: Yes.

CHAIRMAN RIDDLE: Bea.

MEMBER JAMES: Yes.

CHAIRMAN RIDDLE: Rigo.

MEMBER DELGADO: Yes.

CHAIRMAN RIDDLE: Dave.

MEMBER CARTER: Yes.

CHAIRMAN RIDDLE: Chair votes yes. So, we
have 12 yes. Two abstentions. Zero no. Two abstentions. Okay.

Nancy.

MEMBER OSTIGUY: 205.601(k) as plant growth regulators. The Crops Committee recommends the renewal of ethylene gas. There are no materials recommended for deferral or non-renewal.

CHAIRMAN RIDDLE: Is there a second?

MEMBER DAVIS: Second.

Are there any interest to declare?

MEMBER JAMES: One.

CHAIRMAN RIDDLE: Well, you're probably not using it for regulating growth. Are you?

MEMBER JAMES: No, ripening.

CHAIRMAN RIDDLE: Ripening.

MEMBER SIEMON: That pineapple farm.

MEMBER JAMES: We don't have a farm in our --

CHAIRMAN RIDDLE: In Minnesota, right.
Okay. Any discussion? Seeing none. We will vote on
the committee's recommendation on 601(k) and that
begins with Nancy.

    MEMBER OSTIGUY: Yes.

    CHAIRMAN RIDDLE: Kevin.

    MEMBER O'RELL: Yes.

    CHAIRMAN RIDDLE: Rose.

    MEMBER KOENIG: Yes.

    CHAIRMAN RIDDLE: George.

    MEMBER SIEMON: No.

    CHAIRMAN RIDDLE: Andrea.

    MEMBER CAROE: Yes.

    CHAIRMAN RIDDLE: Julie.

    MEMBER WEISMAN: Yes.

    CHAIRMAN RIDDLE: Mike.

    MEMBER LACY: Yes.

    CHAIRMAN RIDDLE: Goldie.

    MEMBER CAUGHLAN: Yes.

    CHAIRMAN RIDDLE: Hugh.

    MEMBER KARREMAN: Yes.

    CHAIRMAN RIDDLE: Bea.
MEMBER JAMES: Yes.

CHAIRMAN RIDDLE: Rigo.

MEMBER DELGADO: Yes.

CHAIRMAN RIDDLE: Dave.

MEMBER CARTER: No.

CHAIRMAN RIDDLE: Gerald.

MEMBER DAVIS: Yes.

CHAIRMAN RIDDLE: Chair votes yes. So, we have 12 yes. Two no. Zero abstentions. All right. Nancy.

MEMBER OSTIGUY: 205.601(l) as floating agents in post-harvest handling. The Crops Committee has no materials recommended for renewal at this time. We are recommending for deferral lignin sulfinate and sodium silicate. There are no materials recommended for non-renewal.

MEMBER DAVIS: Second.

CHAIRMAN RIDDLE: Okay. Nancy moves and Gerald seconds. The committee's recommendation on 601(l). Any interests to declare? Any discussion? Seeing none. We will vote and we being with Kevin.
MEMBER O’RELL: Yes.
CHAIRMAN RIDDLE: Rose.
MEMBER KOENIG: Yes.
CHAIRMAN RIDDLE: George.
MEMBER SIEMON: Yes.
CHAIRMAN RIDDLE: Andrea.
MEMBER CAROE: Yes.
CHAIRMAN RIDDLE: Julie.
MEMBER WEISMAN: Yes.
CHAIRMAN RIDDLE: Mike.
MEMBER LACY: Yes.
CHAIRMAN RIDDLE: Goldie.
MEMBER CAUGHLAN: Yes.
CHAIRMAN RIDDLE: Hugh.
MEMBER KARREMAN: Yes.
CHAIRMAN RIDDLE: Bea.
MEMBER JAMES: Yes.
CHAIRMAN RIDDLE: Rigo.
MEMBER DELGADO: Yes.
CHAIRMAN RIDDLE: Dave.
MEMBER CARTER: Yes.
CHAIRMAN RIDDLE: Gerald.

MEMBER DAVIS: Yes.

CHAIRMAN RIDDLE: Nancy.

MEMBER OSTIGUY: Yes.

CHAIRMAN RIDDLE: Chair is yes. Fourteen yes. Zero no.

Nancy.

MEMBER OSTIGUY: 205.601(m) as synthetics inerts as classified by the EPA. The Crops Committee recommends the renewal of EPA list for inerts of minimal concerns. The Crops Committee has no recommendations for materials to defer or non-renewal.

CHAIRMAN RIDDLE: Any interests? Any discussion? Seeing none. A vote on the committee's recommendation on 601(m) and we start with Rose.

MEMBER KOENIG: Yes.

CHAIRMAN RIDDLE: George.

MEMBER SIEMON: Yes.

CHAIRMAN RIDDLE: Andrea.

MEMBER CAROE: Yes.
CHAIRMAN RIDDLE: Julie.

MEMBER WEISMAN: Yes.

CHAIRMAN RIDDLE: Mike.

MEMBER LACY: Yes.

CHAIRMAN RIDDLE: Goldie.

MEMBER CAUGHLAN: Yes.

CHAIRMAN RIDDLE: Hugh.

MEMBER KARREMAN: Yes.

CHAIRMAN RIDDLE: Bea.

MEMBER JAMES: Yes.

CHAIRMAN RIDDLE: Rigo.

MEMBER DELGADO: Yes.

CHAIRMAN RIDDLE: Dave.

MEMBER CARTER: Yes.

CHAIRMAN RIDDLE: Gerald.

MEMBER DAVIS: Yes.

CHAIRMAN RIDDLE: Nancy.

MEMBER OSTIGUY: Yes.

CHAIRMAN RIDDLE: Kevin.

MEMBER O'RELL: Yes.

CHAIRMAN RIDDLE: Chair votes yes.
Fourteen yes. Zero no.

Nancy.

MEMBER OSTIGUY: 205.602 non-synthetic substances prohibited for use in organic crop production. We have one change from the recommendation that was described yesterday. Potassium chloride is being moved to the renewal list. So, I'll read the recommendation now.

The Crops Committee recommends the renewal of ash from manure burning, arsenic, lead salts, sodium fluoaluminate, strychnine, sodium nitrate, tobacco dust and potassium chloride.

There are no materials recommended for deferral or non-renewal.

CHAIRMAN RIDDLE: Okay. There's a motion. Is there a second?

MEMBER DAVIS: Second.

CHAIRMAN RIDDLE: Moved by Nancy. Seconded by Gerald. Interest to declare?

MEMBER DAVIS: My farms uses some of these --
CHAIRMAN RIDDLE: Gerald.

MEMBER DAVIS: Sodium nitrate.

CHAIRMAN RIDDLE: Okay.

MEMBER DAVIS: The -- the -- what's the word for the --

CHAIRMAN RIDDLE: Annotation.

MEMBER DAVIS: Annotation. That's the word.

CHAIRMAN RIDDLE: By following the annotation.

MEMBER DAVIS: Yes.

CHAIRMAN RIDDLE: You're not a manufacturer. You don't have a sodium nitrate mine.

MEMBER DAVIS: No, have no specific --

CHAIRMAN RIDDLE: Interest. Commercial interest and don't have a unique advantage.

MEMBER DAVIS: Do not.

CHAIRMAN RIDDLE: Okay. Any discussion?

All right. Yes, Hugh.

MEMBER KARREMAN: Your tobacco dust there and it says nicotine sulfate. Nicotine sulfate is a
specific ingredient of tobacco dust. Your -- why do you have both there? Just wondering why has that been listed? Just always have been?

MEMBER OSTIGUY: I couldn't tell you.

Yes.

MEMBER KARREMAN: Okay. All right. I mean they're -- I mean I have a bottle of nicotine sulfate in my office which is not tobacco dust, but --

CHAIRMAN RIDDLE: Right.

MEMBER KARREMAN: You know, there --

there's --

MEMBER OSTIGUY: My -- my guess and I was not on the Board when this was put on. My guess was that they wanted to include the extract and tobacco dust.

MEMBER KARREMAN: The actual leaves. The -- okay.

MEMBER OSTIGUY: Yes.

MEMBER KARREMAN: Yes.

CHAIRMAN RIDDLE: And would you explain why the committee has recommended changing -- not
deferring potassium chloride just briefly?

MEMBER OSTIGUY: Because -- the reason --
initial reason for deferral was based upon the
annotation and we are not doing any changes in
annotation.

CHAIRMAN RIDDLE: There was no new
information then about its status?

MEMBER OSTIGUY: No.

CHAIRMAN RIDDLE: Okay. Okay. Any other
discussion? Seeing none. We'll vote on committee's
recommendation 205.602 and George.

MEMBER SIEMON: Yes.

CHAIRMAN RIDDLE: Andrea.

MEMBER CAROE: Yes.

CHAIRMAN RIDDLE: Julie.

MEMBER WEISMAN: Yes.

CHAIRMAN RIDDLE: Mike.

MEMBER LACY: Yes.

CHAIRMAN RIDDLE: Goldie.

MEMBER CAUGHLAN: Yes.

CHAIRMAN RIDDLE: Hugh.
MEMBER KARREMAN: Yes.

CHAIRMAN RIDDLE: Bea.

MEMBER JAMES: Yes.

CHAIRMAN RIDDLE: Rigo.

MEMBER DELGADO: Yes.

CHAIRMAN RIDDLE: Dave.

MEMBER CARTER: Yes.

CHAIRMAN RIDDLE: Gerald.

MEMBER DAVIS: Yes.

CHAIRMAN RIDDLE: Nancy.

MEMBER OSTIGUY: Yes.

CHAIRMAN RIDDLE: Kevin.

MEMBER O'RELL: Yes.

CHAIRMAN RIDDLE: Rose.

MEMBER KOENIG: Yes.

CHAIRMAN RIDDLE: Chair votes yes. We have fourteen yes. Zero no.

And I would like to once again thank the Crops Committee, Nancy, members of the committee for taking into consideration the comments yesterday and working and revising your recommendation and
presenting it to us as well as the content of the original recommendation. So, thanks for your good work on that once again.

All right. Believe it or not, we're ahead of schedule on the agenda.

I do have a question for the program. If we stay ahead of schedule, is there a problem with beginning the public comment period before 3:00 p.m. as far as you know? We did publish it at 3:00 p.m. We certainly will be taking public comments, but can we begin before that without any problems?

MR. NEAL: The difficulty in doing that is that people may have been planning to arrive at 3:00 p.m. for public comment.

CHAIRMAN RIDDLE: To listen.

MR. NEAL: To listen and to comment.

CHAIRMAN RIDDLE: Yes.

MR. NEAL: They may not.

CHAIRMAN RIDDLE: The commenting won't be a problem. They -- we still will be commenting.

MR. NEAL: Right.
CHAIRMAN RIDDLE: But, the listening, yes.

MR. NEAL: Right. Both.

CHAIRMAN RIDDLE: Yes.

MR. NEAL: So -- so, we need to at 3:00 --

3:00 p.m.

CHAIRMAN RIDDLE: So. Okay. We'll stick
to that. Just wanted -- wanted your opinion on that.

MR. NEAL: And a --

MEMBER DELGADO: Can we allow more people
to comment if we have extra time?

CHAIRMAN RIDDLE: Things don't look good
there. We already have about 20 signed up which is
going to fill the time especially if there are any
questions.

That's why I was just checking. Seems
like that wouldn't be a good idea. George.

MEMBER SIEMON: Well, if that's the case,
then we could just do the schedule next meeting date
before the break.

CHAIRMAN RIDDLE: Yes.

MEMBER SIEMON: And then take a longer
Chairman Riddle: Yes, we'll -- we'll figure that out when it comes. We'll get everything done before the comment period that we can.

Okay. Anything else now?

Member James: I just have one other. It's kind of a little housekeeping issue. A lot of my pages were out of order or missing and the same with Rigo and so, I would like to have all of the submissions resent to me. I don't know about anybody else if their books were out of order, but --

Member Karreman: I have some duplicate pages here also. I mean the same page twice.

Chairman Riddle: Okay. You will be getting the final versions sent to you. Will that be good enough?

Member James: Yes, I think I have an extra book. I have an extra book also.

Chairman Riddle: George.

Member Siemon: I think it would be healthy if we have extra time to kind of discuss the
Sunset process myself. Especially since some of us will be the last time. I think it would be healthy to review the policy and the process. It will --

MEMBER JAMES: I agree.

MEMBER SIEMON: Not to change midstream, but now that we've done this, I think it would be healthy to discuss it.

CHAIRMAN RIDDLE: Okay.

MEMBER SIEMON: That -- I think -- I was -- I was thinking that would fall under the committee work plans anyway.

CHAIRMAN RIDDLE: Yes.

MEMBER SIEMON: I had some comments that -- so, I think it would be good for all of us to think about if we have time to have a good discussion around that.

CHAIRMAN RIDDLE: Yes, because the -- yes, certainly our Sunset process or the Board's Sunset process continues.

MEMBER SIEMON: Yes.

CHAIRMAN RIDDLE: So, that would be
appropriate at that time. All right. Anything else?

We have a choice. We have a little time
before lunch or we could just stop for lunch now.

The agenda has us coming back at 1:30.

Would you like to come back at 1:00?

MEMBER CAUGHLAN: I doubt that we could.

CHAIRMAN RIDDLE: Well, yesterday, we
stopped late and we only had an hour. Today we will
have one hour and 40 minutes for lunch.

Can we have agreement on 1:15? It looks
like -- well, I want an agreement. So.

MEMBER SIEMON: Yes, let's decide.

CHAIRMAN RIDDLE: Sounds like 1:30. Stick
with it the way it is and we may be here --

(Whereupon, the meeting was recessed at
11:49 a.m. to reconvene at 1:30 p.m. this same day.)
CHAIRMAN RIDDLE: Okay. You people in the audience are having too much fun. Ready to reconvene.
All right.

So, back to our agenda if we can have attention please. Next item on the agenda is the election of officers and selection of committee chairs.

So, we'll begin with the election officers and start off with the election of Board Chair. We have three elected officers, chair, vice chair and secretary. So, we'll start with the election of chair.

Are there any nominees for chair? Dave.

MEMBER CARTER: Yes, I would like to put in nomination the name of Kevin O'Rell.

MEMBER CAROE: I'll second.

CHAIRMAN RIDDLE: Okay. Kevin has been nominated and seconded. Actually, I don't think a nomination needs to be seconded, but it's fine to have -- yes, election follows some different rules than a motion.

But, are there other nominees? Then I'll ask one more time. Are there any other nominees?
Hearing none.

I would entertain a motion.

MEMBER CARTER: Mr. Chair, I would move the nominations cease and that the secretary be directed to cast a unanimous ballot for Kevin O'Rell.

MEMBER LACY: Second.

CHAIRMAN RIDDLE: And that does take a second. Thank you, Mike.

Okay. It's moved by Dave, seconded by Mike a unanimous ballot be cast for Kevin as chair.

All in favor say aye.

(Ayes.)

CHAIRMAN RIDDLE: Those opposed? Okay.

Thank you and Kevin, I'll had over the turkey now and that's a stress turkey, a USDA product with the official USDA seal but not the organic seal.

But, if -- if it's okay with you, I'll continue to chair out this meeting.

MEMBER O'RELL: That's -- that's fine and if it's a stress turkey, why isn't it -- it's been pretty -- doesn't look like it's gone through a lot of
stress. I -- I will use it. I will use the --

CHAIRMAN RIDDLE: Okay. So, the floor is
now open for nominees for vice chair. Bea.

MEMBER JAMES: I would like to nominate
Andrea Caroe.

CHAIRMAN RIDDLE: Okay.

MEMBER WEISMAN: I'll second.

CHAIRMAN RIDDLE: All right. Andrea Caroe
has been nominated. Are there any -- Dave.

MEMBER CARTER: I would like to nominate
Nancy Ostiguy.

MEMBER OSTIGUY: Decline.

CHAIRMAN RIDDLE: Okay. Are there any
other nominees? One more time, any other nominees?

Dave, well, I thought I -- would you like to --

MEMBER CARTER: Okay. I will move that
the nominations cease and that the secretary be
directed to cast a unanimous ballot for Andrea Caroe.

MEMBER LACY: Second.

CHAIRMAN RIDDLE: Okay. Dave moves and
Mike seconds a unanimous ballot for Andrea Caroe as
vice chair.

    All in favor say aye.

    (Ayes.)

CHAIRMAN RIDDLE: Those opposed? Okay.

Thank you and the floor's open for nominations for secretary.

MEMBER CAUGHLAN: I --

CHAIRMAN RIDDLE: Goldie.

MEMBER CAUGHLAN: -- I would like to place the name of Bea James --

CHAIRMAN RIDDLE: Okay.

MEMBER CAUGHLAN: -- for secretary.

CHAIRMAN RIDDLE: Okay. Bea has been nominated for secretary. Are there any other nominations? Any other nominations? Hearing none. Dave.

MEMBER CARTER: Mr. Chair, I would move that the nominations cease and that the secretary be directed to cast a unanimous ballot for Bea James.

MEMBER LACY: Second.

CHAIRMAN RIDDLE: Okay. Dave moves, Mike
seconds a unanimous ballot for Bea James as secretary. Those in favor?

(Ayes.)

CHAIRMAN RIDDLE: Those opposed? Okay. Thank you. And good luck to the new officers.

And the committee chair, we have six standing committees of the Board and Livestock is already filled. Andrea and Mike Lacy is Livestock Committee Chair. You're willing to continue in that.

MEMBER CAROE: Am I chair?

CHAIRMAN RIDDLE: No, I -- I was finishing my sentence, but I inserted your name in the middle of my sentence.

MEMBER CAROE: Not even on that committee.

CHAIRMAN RIDDLE: I just realized I wanted to confirm with Mike that and Andrea, you're currently the Certification and Accreditation Compliance Committee Chair. Are you willing to continue in that? Okay. Thanks.

And let's see. Policy Development, Dave, you --
MEMBER CARTER: Yes, we -- Rigo has graciously accepted to step up as Chair of the Policy Development Committee.

CHAIRMAN RIDDLE: Okay.

MEMBER DELGADO: Yes, I do.

CHAIRMAN RIDDLE: You -- you agree to that?

MEMBER DELGADO: I agree.

CHAIRMAN RIDDLE: Okay. Thanks, Rigo. All right. And then Crops. Nancy has been chairing and Gerry, are you -- are you willing to --

MEMBER DAVIS: Yes, I'm willing to -- to be the Chair of the Crops Committee.

CHAIRMAN RIDDLE: Okay. You've been vice chair. All right.

And then we have Handling and your Board Chair but now, Julie, you're willing to take over Chair of the Handling Committee.

MEMBER WEISMAN: Yes.

CHAIRMAN RIDDLE: All right. Thanks. And
Materials. Rose.

MEMBER KOENIG: Nancy.

CHAIRMAN RIDDLE: And, Nancy, are you willing to share the Materials.

MEMBER OSTIGUY: Yes.

CHAIRMAN RIDDLE: Thank you. Okay. Well, it's good to -- is that all? Thank you.

Okay. That's -- that concludes that item and now, we go to the discussion of committee work plans. I hope those committee chair, especially the new ones, no, I -- I think there are, you know, some continuing items on the work plans. So, if you are newly taking over a committee, I fully understand if you, you know, don't have that all lined up right at the moment, but for those of you who do, I'd just like to -- I give you an opportunity to describe what you have planned and, you know, a little estimate of time line or priorities for the things that you got on your work plans.

So, who would like to go first. Mike.

MEMBER LACY: Be glad to. The Livestock
Committee will continue working on the deferred substances under Sunset and bring recommendations forward at the appropriate time.

We will continue to work with NOP in finalizing thoughtful, fair and dependable pasture guidance document and/or rule change and by our next meeting, the Livestock Committee will present a statement on the way that we would recommend that organic poultry respond to the threat avian influenza in the U.S.

We'll move onto -- okay. All right. We'll defer Handling for a moment.

Andrea, are you --

MEMBER CAROE: Oh, sure. The Certification, Accreditation and Compliance Committee has two recommendations that were made at the last meeting that we'll follow through with. One is the
retailer Q&A which we have to -- we'll -- we'll work
with NOP before the next meeting. I think that was
the time line for them responding on those
recommendations.

And secondly, continue to work with NOP on
the comments that the NOSB made in regards to the ANSI
audit or their response to the ANSI audit. So, we'll
continue to work with them based on their time line
there.

We have an open item which is a procedure
for processing peer review and now that we've gone
through the Sunset process and Mike who had taken the
lead on that is -- maybe finds himself with a little
bit more time will continue to work with that item.

And then lastly, the only other item we
have is to work with an NOP staff as they are
attempting to comply with remediation items from the
ANSI report and that will just continue to be as
needed as they -- and I've reiterated that with Mark
Bradley that we are available to assist.

All that's on our plate.
CHAIRMAN RIDDLE: Okay. Any comments from other Board members, questions about that?

Just one other thing that comes to my mind, I know Mark and Bob have a plan for some certifier training. I -- I don't know if -- if there would be an opportunity there or a need for the committee to kind of review anything, but just to keep that open as a possibility to input, be available on the certifier training.

MEMBER CAROE: All right. I'll put that on.

CHAIRMAN RIDDLE: Okay. Rigo, ready. I think you've been handed Dave's computer along with the committee chair.

MEMBER JAMES: And the family pictures.

MEMBER DELGADO: Oh, thank you very much, Mr. Chairman. I would -- would like to appreciate Dave's mentorship and example and I only wish to express that I decided to become only a tenth of what -- the person he is when I grow old. I mean -- nothing to do with --
CHAIRMAN RIDDLE: Is that a committee action? All right.

MEMBER DELGADO: We have four targets to deal with. The first one is to continue working with the Handling Committee to prepare a draft document for the termination of commercial availability criteria under 205.606 --

CHAIRMAN RIDDLE: You got to speak up.

MEMBER DELGADO: -- with a goal of having a committee document ready for posting by December 31st, 2005.

Point number two will be to develop a final recommendation on temporary variances for research and we don't have a date for that yet. So, I'll get back to you with that.

The third item will be revisions to the Board Manual Policy and that would include clarification of deferral.

And the fourth item will be completing the document that we've been calling the Board Member 101.
You know, a document that we want to use to provide better orientation to the new members of the -- of the Board that are coming.

The two items that I haven't mentioned so far include recruiting members to the committee. We are losing two valuable members, like you know. So, the minute we know who -- who's coming aboard, we'll try to recruit them to become part of this committee.

And the last item that I would like to explore with feedback from the committee will be to develop a -- and working with NOP to develop a -- a database that is hosted, word -- password protected that allow us to handle better comments from -- from the public. It's a technical issue if you will, but I think it -- there's the opportunity for us to play with that data better and use it -- and use that database as a reference for discussions and so forth.

Okay. Again, that's an exploratory item.

MEMBER JAMES: So, Rigo, when you -- the
last -- last item that you mentioned --

MEMBER DELGADO: Yes.

MEMBER JAMES: -- that's not actually on
the --

MEMBER DELGADO: Now, it's not.

MEMBER JAMES: --- the working plan? So,
you're proposing that that's something that we add to
the working plan?

MEMBER DELGADO: Yes. Discussion of that.

MEMBER JAMES: Discussion of that.

MEMBER DELGADO: Yes.

MEMBER JAMES: Okay. Okay.

CHAIRMAN RIDDLE: All right.

MEMBER DELGADO: Discuss the technical
feasibility of that.

MEMBER JAMES: Do --

CHAIRMAN RIDDLE: Um-hum.

MEMBER JAMES: -- and also, do we need to
maybe clarify the date that the draft is going to be
ready? Are we -- are we all agreeing that December
31st is for -- for posting on the website or for -- I mean I'm sorry for commercial availability.

CHAIRMAN RIDDLE: Yes, as a target?

MEMBER JAMES: As a target day that -- does everyone agree with that date or are we --

CHAIRMAN RIDDLE: Well, I would hope even before that that a draft would be ready, but Barbara.

MS. ROBINSON: What is it you plan to have by December 31st on commercial availability?

CHAIRMAN RIDDLE: A -- a committee draft for criteria and procedures for the Board's determinations of commercial availability for placement on 606 of petitioned substances.

MS. ROBINSON: Well, I guess what -- what -- I don't -- I don't have any problem with that, but I mean recognize now Congress just changed the law. So -- so, I guess I'm just sort of thinking out loud here. We're going to have to -- we're going to have to do rule making probably to -- to deal with this. I mean we're all going to have to sort of sit down and have a discussion about this. I mean obviously we've
dodged this one for a pretty long time and now, it's landed in our laps and there's not going to be anymore dodging just what is commercial availability.

So, I -- I guess all I'm trying to say is while I don't have any problem with you meeting some December 31st deadline and coming up with something, I don't -- I also don't want you to think and I don't -- I don't want you getting your hopes up that okay, fine, by December 31st, you've gotten some document done and it's posted on the web and you say good, we've got this all figured out. We've done commercial availability and then, you know, we get down the road and we've got to do some rule making --

CHAIRMAN RIDDLE: Right.

MS. ROBINSON: -- and you say oh, no, we already took care of that because we do have to sort of address this and I would hope that this is going to be an NOP/NOSB collaborative deal --

CHAIRMAN RIDDLE: Yes, and I --

MS. ROBINSON: -- and then, you know, to
the extent that rule making is involved, the public is
going to get involved, too and there will be comments
taken and that sort of thing.

CHAIRMAN RIDDLE: Um-hum. Yes, I guess --

MS. ROBINSON: Okay.

CHAIRMAN RIDDLE: -- I -- I -- I think
instead of as you presented it posting to the web by
December 31st to have a draft criteria submitted to
NOP for feedback, for the conversation, for the -- you
know, just --

MS. ROBINSON: That -- that -- that would
be fine. I just -- I just don't want the Board
thinking that once you do this that it's the end of
the conversation.

CHAIRMAN RIDDLE: No. No, not at all.

MS. ROBINSON: Maybe -- maybe the better
way to think of it is great, you've taken the first
step and -- and then we, you know --

MEMBER CARTER: And I -- I think, Mr.
Chair, I think that's exactly where we're at is
realizing now with the court case and the legislative,
I mean we need to take a first step to -- to try and -- and define some things, but it's got to be a collaborative process and that was part of the discussion this morning with -- I mean Bea did a great job in -- in putting together an initial draft that pulls together a lot of the background and -- and stuff that's been done to date.

Arthur was posing a lot of challenging questions this morning and so, we just kind of want to work that forward.

CHAIRMAN RIDDLE: Rose and then George.

MEMBER KOENIG: Just, you know, we had that initial meeting this morning and, you know, I definitely think you should also include the materials, at least the Chair in those conversations because there is overlap between Policy, Handling and certainly Materials because ultimately it has to kind of come into that process.

But, I just wanted to -- you know, after kind of going through this and I've been thinking quite a bit about it, I think you need to maintain...
that perspective that at least for the people that have been on the Board for five years, look how much the Materials process has evolved in five years. Okay. And this is a great challenge. I mean it -- it seems there's just a lot of different issues here and just realize that I just -- it's going to take awhile to figure out how to mechanically get the pieces together, you know, given a certain time constraint, you know, so.

CHAIRMAN RIDDLE: Yes, but at the same time recognizing that substances are being petitioned now.

MEMBER KOENIG: Yes, no, but -- but be fluid and be creative and --

CHAIRMAN RIDDLE: Um-hum.

MEMBER KOENIG: -- you know, we definitely did that at the first meeting.

MEMBER JAMES: So, I would like to -- I don't know if you made those changes. Make them -- you know, make a change to the policy work plan that -- that is not actually a deadline of December 31st...
for the website, but for beginning --

MEMBER CARTER: Here's -- here's -- here's what -- here's what we crafted here was continue to work with the Handling Committee and the Materials Committee Chair to prepare a draft document for determination of commercial availability criteria under 205.606 with the goal of having a committee document ready to -- ready to submit to NOP for feedback by December 31st.

MEMBER SIEMON: I guess I do have a concern. I mean if that's okay with NOP, that's fine, but this is a perfect place to merge NOP and NOSB's work plans and I just don't want us to get out ahead of their -- their input and boundaries.

I think this is a perfect place to work together. It's like a clean sheet of paper timing-wise. So, I don't want to get us ahead and then you -- you had just purely NOSB delivering to NOP. Your wording doesn't sound very collaborative honestly.
MEMBER JAMES: I think that we should probably -- I mean --

CHAIRMAN RIDDLE: Go ahead. Bea.

MEMBER JAMES: I -- I would like to recommend that we perhaps put together some kind of a -- a time line. The Policy Committee will put together some kind of a time line so that we can get collaboration discussions going on over the phone with the two committees. I also thing that Accreditation -- Andrea's on the Accreditation. I mean she's the Chair of that committee, but that's an important component as well, too, because it does involves certifiers.

CHAIRMAN RIDDLE: Yes.

MEMBER JAMES: So, I agree with you, George. I think that everybody needs to be involved in those discussions and I don't think it's going to be, you know, the Policy Committee and the Handling Committee submitting something without the entire Board looking at it and having discussions on it.

CHAIRMAN RIDDLE: Yes, but I think
George's point is that it be done hand-in-hand with NOP and -- and --

MEMBER JAMES: Right. Exactly.

CHAIRMAN RIDDLE: Yes, so, just inserting work with NOP early on in the sentence. Something like that. Yes.

MEMBER SIEMON: NOP. That's what I've gotten.

CHAIRMAN RIDDLE: Yes. All right. Rose.

MEMBER KOENIG: I would also suggest that the committees consider, well, two possible actions with that and one is to put out at least on the maybe website just soliciting voluntarily ingredients that companies are now using that they feel would -- minor ingredients that would have to be on the list so that the committees have a better idea of -- we've heard -- Tom gave us some ideas of -- what did you say? Fifteen hundred. You know, we need actual names so that we can see if there's general categories. So, I think putting that out to the public as soon as possible would be a good amount of data to collect.
prior to getting too involved in this.

And then additionally, I mean maybe Julie can supply that because she's got some handling-types of experience, but not just a limit to the Board. There's issues in terms of -- there's a lot of issues out there, constraints in terms of time and I think if we could just maybe ask that general question what are the -- what is the major issue or something that -- that if you're a handler that you think that we should consider or just so that we kind of up front field some questions to get an idea of the entirety of the issue because I think it's a much larger issue than we -- at least that I can imagine.

CHAIRMAN RIDDLE: Yes, and I -- we are aware that OTA has a task force that has been working on this and gathering -- identifying some of the substances and I hope doing some work on the ideas for criteria and procedures as well. They're not the only people that are also concerned. I think there's others in the public and so, I -- I -- I think it's a point well taken.
Bea.

MEMBER JAMES: Rose, are you proposing that the Handling Committee put something out for that kind of feedback? That they -- or the Materials --

MEMBER KOENIG: You know, either the NOSB/NOP joint. You know, somewhere on the website where sort of like -- where you had new items or --

MEMBER JAMES: Yes, somebody's got to draft up the --

MEMBER KOENIG: Yes.

CHAIRMAN RIDDLE: Yes, and this is getting to the level of committee work at this point.

MEMBER KOENIG: Okay. I'm sorry.

CHAIRMAN RIDDLE: That's fine. Yes.

MEMBER WEISMAN: I just -- I just -- there were one and possibly two people -- can't do it?

CHAIRMAN RIDDLE: No, you go ahead. No. No, Julie. Yes, this is Board work plan discussion. Yes. Thank you.

MEMBER WEISMAN: Okay. I -- I may ask for
some time in a second. Can I do that?

CHAIRMAN RIDDLE: What?

MEMBER WEISMAN: I -- I -- can I confer with someone?

CHAIRMAN RIDDLE: Oh, yes.

MEMBER WEISMAN: And then come back and ask for time?

CHAIRMAN RIDDLE: Or you can -- you can ask that Diane make a -- provide --

MEMBER WEISMAN: Can I -- oh, I can. I thought you were telling me that I'm not allowed.

CHAIRMAN RIDDLE: Yes. No. No. No.

MEMBER WEISMAN: I would like -- I --

CHAIRMAN RIDDLE: I just wasn't recognizing her myself.

MEMBER WEISMAN: -- I -- I would like the Chair to recognize Diane Joy Goodman who --

CHAIRMAN RIDDLE: That's okay.

MEMBER WEISMAN: -- who has something --

CHAIRMAN RIDDLE: Yes, that's fine.
MEMBER WEISMAN: -- pertinent to say about this matter.

CHAIRMAN RIDDLE: Okay. But, I don't want to get into details of actual committee work, but yes, Diane, please approach the mike, identify yourself.

MS. GOODMAN: But, it's important. This is Diane Joy Goodman and I'm Co-chair of the OTA 606 Task Force.

We have had an effort going for the last number of months to try to -- to get information from the industry using the available tools that we have, the OTA flash and frankly, we've gotten very little response. We've had five or six companies respond out of the entire OTA membership to let us know what substances they're currently using that are on 606. Many companies seem to feel that well, they're not using them or they're not taking the question down to their ingredient suppliers.

So, I wanted you to know what we've been up against in thinking about this so that you can take it to your committee work and try to find ways to make
this solicitation much more visible to the industry.

    Thank you.

CHAIRMAN RIDDLE: Thanks. Okay. Let's move on to Crops. Do you have --

MEMBER DAVIS: The Crops Committee on their work plan will be to finish considerations on the Sunset materials that were deferred as far as the vote -- this meeting. Continue working on that as well as any -- the new petitions that are on the slate coming our way and also to continue working on the organic seed availability recommendation to -- to polish that recommendation and perhaps bring it back to the Board again and hopefully start on hydroponics and also work with the Policy Development Committee on the recommendation for temporary research variances.

CHAIRMAN RIDDLE: Any questions, discussion of those? Yes, Rose.

MEMBER KOENIG: Just had a question on the -- because we had passed that commercial availability of seed. Is there new information or re-solicitation that came about? That -- that -- I just wasn't -- I
was just curious that -- I thought we had passed that.

MEMBER OSTIGUY: We did.

CHAIRMAN RIDDLE: We did.

MEMBER KOENIG: Okay. But, there's more.

MEMBER OSTIGUY: There was information submitted that I felt the Crops Committee should consider.

MEMBER KOENIG: Okay. Okay.

MEMBER OSTIGUY: See whether or not it should come back to the Board or not.

MEMBER KOENIG: Okay. Good.

CHAIRMAN RIDDLE: So -- so, just so the program understands. Even though the final recommendation was submitted from our last meeting. Sounds like the committee wants to do some more work on that. So, don't implement it the rule right away. Andrea.

MEMBER CAROE: Could you elaborate on what -- what -- what are you doing with hydroponics? Is it just a --

CHAIRMAN RIDDLE: All right.
MEMBER CAROE: Are we looking at rule change for hydroponic standards or -- I mean or -- or a guidance on how hydroponics are handled or --

MEMBER DAVIS: Help me on this, Nancy.

MEMBER OSTIGUY: Yes, hydroponics has been on the Crops Committee work plan five years. I think the original idea was -- was originally rule change. It might be guidance now. I couldn't tell you.

There was an interest in trying to see how hydroponics meshes with the rule and if there was anything in particular that was needed in order to make it mesh.

But, the committee has not touched it in at least three years. So, it's hard to find exactly where anything would go at this point.

CHAIRMAN RIDDLE: Rose.

MEMBER KOENIG: I mean and again, I'm -- I'm leaving. So, that's kind of good, but -- but I was -- in the beginning and this thing is like over five years.

CHAIRMAN RIDDLE: Okay. Just five years
ago.

MEMBER KOENIG: It's like -- it's like me.

Five years ago. It's like what Nancy said. This thing has been on the work plan. Obviously, I know there is hydroponic operations that are being certified. So, I ask the question.

MEMBER CAUGHLAN: What? What?

MEMBER KOENIG: Yes. Yes. So, I ask the question --

MS. ROBINSON: Names. We want names right now. Give us their names.

MEMBER KOENIG: I'll do it later. I'll write a formal complaint when I get off the Board.

CHAIRMAN RIDDLE: Well --

MEMBER KOENIG: No, but I know there are operations at least that I'm familiar with. Now, I haven't looked at their certificate. I'm not a -- but, anyway I -- I -- I am of the understanding which means somebody out there is already certifying them to the existing reg.

CHAIRMAN RIDDLE: Well, so, it would be
good to contract those certifiers and find out how they are understanding the regulations.

MEMBER KOENIG: Well -- well, and that's what we need to first determine do -- is there really a necessity. Right. So --

CHAIRMAN RIDDLE: Um-hum.

MEMBER KOENIG: -- so, I guess that's the -- I would -- if you guys could figure that out, I think that would be the first step rather than having -- that would be --

MEMBER DAVIS: Is there a necessity to --

MEMBER KOENIG: -- just -- to -- you know, just trying to get the information is are there operations that are being certified and how -- how -- how are meeting the reg. That would be just a great basic question to ask before you even get involved in --

MEMBER DAVIS: And is that proper in the first place would be the question --

MEMBER KOENIG: Well, I wouldn't even ask that. Yes, how are they meeting the regs? Just --
just do kind of a survey and a -- a report back on that. Because, you know, we've had things proposed, but nothing's ever gone anywhere. So, I just see this as one of those issues that just keeps on.

CHAIRMAN RIDDLE: Yes. Okay.

MEMBER DAVIS: Rose, I would welcome any contacts you could -- as far as certifiers that I could ask about this. If you know who was certifying these people as a start.

MEMBER KOENIG: Yes.

CHAIRMAN RIDDLE: Yes, and maybe we could approach the ACA Group or NASOP to see if any of their members would have information. Gerry. Yes, it would also be probably a good idea to contact the ACA, the Accredited Certifier Association and NASOP, the state organic programs to see if any of their members could help provide information on that.

MEMBER OSTIGUY: As far as I know, it's
the five-year review process and any materials that come into be petitioned and then --

CHAIRMAN RIDDLE: So, they're -- I think they're -- yes, when Arthur mentioned the other day kind of the list of things that have come in and then also the Materials has that first crack at reviewing the contractors' reports. Right? The draft. You've had responsibility. That's an ongoing responsibility. Yes.

MEMBER KOENIG: And then just a -- we need to make sure that we get follow-up to the synthetic/non-synthetic document and then make any kind of adjustments and also pending is the OFPA category document and that's really the major. I mean I -- I would -- I'm going to try to write one more thing before I leave.

CHAIRMAN RIDDLE: Oh.

MEMBER KOENIG: So --

CHAIRMAN RIDDLE: Can you be more specific?

MEMBER KOENIG: Well, I -- I -- I still --
I -- I had told Arthur I would do this analysis and we got stuck in Sunset and I couldn't really do it and I started farming again, but there was -- if people remember last -- last meeting, the way that I understood the NOP interprets the national list is that not only the substance is on the list, but it's any combination of those substances and I think that has to be -- yes, and I just think that that has to be really thought out and -- and -- and discussed and it's sort of just a -- more of just a piece of information.

CHAIRMAN RIDDLE: I -- yes.

MEMBER KOENIG: So, that -- I mean I'd be willing to do that if I can. If not, I'll -- when I get off the Board, I'll submit it as public comment.

Kim, the Materials work plan comment.

MS. DIETZ: Kim Dietz. I didn't hear any
of the Chairs put the deferred materials on your work plans and if --

CHAIRMAN RIDDLE: Oh, yes. Yes.

MS. DIETZ: I know, but if you could follow up with the public on any information you're seeking on those materials. Perhaps post on the website questions so that you can start getting industry input.

CHAIRMAN RIDDLE: Yes, that's a good point. Yes, I -- that was the number one item I've heard so far from the committee chairs. Yes, sorry. I'll talk louder. I'm not the one. Andrea.

MEMBER CAROE: Those -- those --

CHAIRMAN RIDDLE: Yes, please use your mikes.

MEMBER CAROE: They're on.

CHAIRMAN RIDDLE: They're not really --

MEMBER CAROE: They're on, but the deferred materials really need to -- to be posted with the rationale of the committee of why those materials were deferred and explaining the -- the information
Chairman Riddle: Um-hum. Yes, right now, you know, they're -- they're going to be coming in in -- kind of buried in each of the committees' recommendations. What I'm hearing you suggest then is the Materials Committee take those and just put them in one document or someone take them in one document.

Member Caroe: I mean that's not what I was suggesting.

Chairman Riddle: No.

Member Caroe: I'm not saying that's a bad idea. I'm just -- I'm just saying that right now the way the recommendations are written, it -- it's clear that when there was comments and -- and received, but it -- I think we got a lot more information here in committees' discussion --

Chairman Riddle: Um-hum.

Member Caroe: -- that would be valuable to -- to make sure is included when those go out. Why those materials were deferred.
CHAIRMAN RIDDLE: Um-hum. Kevin.

MEMBER O'RELL: Well, I think certainly the committees themselves from some of the public comments that have been received and -- and the questions that we have, I mean just would encourage them to reach out to those resources in the industry where they know we can get answers for some of these questions as well as opposed to waiting for -- for input.

CHAIRMAN RIDDLE: George. Rose.

MEMBER KOENIG: Well, what I would suggest is a step further. If people will submit the documents as we voted on them, okay, with our changes and --

CHAIRMAN RIDDLE: Right.

MEMBER KOENIG: -- then what I would like to see is that the committees get together and have an addendum to that. Because that will get posted. All of our recommendations. Correct? Right?

CHAIRMAN RIDDLE: Yes.

MEMBER KOENIG: So, within the addendum,
the addendum will include the list of either -- I mean
if you're going for a full TAP which very few of these
are, you could just write full technical evaluation
based on the stuff, but if there's specific questions
on the material, just put that in the addendum and
then this way folks in the audience can -- you know,
it'll be under the -- the -- the Sunset and then
you'll have the addendum so that you can see the --
the same questions that'll be submitted to the NOP
will be there. So, you'll know what the committees
are asking.

CHAIRMAN RIDDLE: George.

MEMBER SIEMON: Well, it's real important
for me to understand this because this is really a
second step to this whole process is to send out to
the committee what we need. So, is that the way it's
going to happen and what is the timeline? Because
we're -- I had heard yesterday we were going to try to
get this information between now and the next meeting
so we can finalize our decision for the next meeting.

So, there needs to be a pretty -- pretty
tight time line in here. So.

And -- and one of my biggest concerns is -- is how we're finding out about alternatives and so, I really like to see that the question be asked specifically about alternatives for these projects. Since you've chosen to defer them to me, that means the more important ones probably to ask are there alternatives. Because I -- that's part of what I see as missing here is the research and the alternative. So, I'd like to see that asked.

CHAIRMAN RIDDLE: Rose and then --

MEMBER KOENIG: Well, it's just that a number of them were specifically mentioned for the alternatives like the narrow range horticultural oils was an example and as Barbara stated that if we have a -- certainly, that's a very appropriate question to ask the public. That we probably will receive a lot of public input. That probably is appropriate and specific enough to go to the TAP contractors because it could be, you know, maybe researched quickly and get some non-bias, you know, evaluation.
So, those are the two mechanisms that we would use to specifically get those answers.

CHAIRMAN RIDDLE: Okay. Has -- do we have a plan? I'm not sure. We have a need and we have some ideas identified, but I don't know quite yet -- is -- Nancy, is this something -- I know you already did it on the Crops Committee where you've got the questions there. As Materials Chair now, would -- would that be something that your committee would put together, pull from -- from those drafts or should I do it as they come into me? Essentially, what I'm hearing is we just want to identify those substances and those questions and somehow work with NOP to get those posted without somebody having to go through and find them. There should be one consolidated place.

For the -- the -- the deferred materials, but the questions that are being asked. Especially the questions where we need the information from the public and like George was saying about available alternatives for instance.

MS. ROBINSON: Well, it seems as though --
for of all, I mean it's -- it's our experience that
you don't want to overwhelm the public with, you know,
52 questions. A short list of questions. The same
questions it would seem to me -- if -- if it was me
and I was doing it and I'm not going to do it, but if
it was me, I would think of a list and you could all
do this. You could just -- everybody just think of
one question, but I would think of a -- a few
questions and then have the same set of questions, you
know, three, four or five questions for all of the
materials. Why wouldn't you ask the same question for
all of the materials?

Because you're -- you know, maybe the --
okay, maybe there are some particular unique things
about some of them and maybe -- maybe you could do
that, you know, if you -- if there is something unique
about one of them because it's Crops or Livestock or
something like that, but -- but for the most part, you
know, you're going to have the same kind of questions
for all of them. You know, alternatives, something
safer, something like that.
So, you know, but keep them short and keep them fairly simple. The more complicated you make it, the less feedback you're going to get.

MR. NEAL: And I think it'll be better if there is one consolidated document that addresses all of them. I think I wrote them down. There are eight deferred substances and well, some of those don't include the ones that we have already sent TAPs.

The ones that I have listed here that were not identified prior to this meeting is hydrated lime, milk replacers, lecithin bleached, hydrogen peroxide, horticultural oils, lignin sulfinate and sodium silicate. So, we've not request TAPs on those.

And we've not requested a TAP on lecithin unbleached because what has to first happen, committees have to identify, okay, why are we deferring it. What are -- what are the issues we have with these? Is it an alternative issue? Is it a safety issue?

This has got to be thought through first.
CHAIRMAN RIDDLE: Um-hum.

MR. NEAL: Once that's been figured out, you put your document together. Then we can go out to the public with some general questions. I'm assuming most of these deal with alternatives though. Are there alternatives for these substances? So, that's fairly simple.

Even with the chlorine materials, I think it's probably an alternative issue because these things are pretty much regulated as grass materials if I'm not mistaken.

CHAIRMAN RIDDLE: Nancy. Then Bea.

MEMBER OSTIGUY: What I would like and what I'm willing to do as Materials Chair is if each of the chairs of the committees can get me what they're questions are for the materials, I will consolidate it all and hopefully be able to consolidate it into a couple of questions, but I don't necessarily know why the committee wrote or pulled particular things out. So, I don't want to
misrepresent what the committee was doing, but if you get me that information, I will put it together in a document, send it out to everybody, send it back to you to make sure that I haven't misrepresented something that the committee was doing and then I'll be able to send it to NOP.

MEMBER JAMES: What if the response back from the public on the questions is not sufficient enough to be able to make any kind of determination on --

CHAIRMAN RIDDLE: Oh, that's kind of -- okay. Nancy.

MEMBER OSTIGUY: What I envision is that some -- some materials will get responses and some will not. The materials that do not get any response as long as it's a small list, I'll take care of it. I'll try to answer those questions because we can't go out to TAP for everything.

MEMBER KOENIG: But, we can ask them
single questions.

MEMBER OSTIGUY: It -- it depends on the response back. So, if we can do -- if we can do that, that's what we'll do, but I can also do some looking.

But, if you don't want to just work with what I find, I would highly recommend sending us stuff.

CHAIRMAN RIDDLE: Um-hum.

MEMBER OSTIGUY: Because, you know, what I can find might not be what everybody else can find. So, it is better if we get responses from the public.

MEMBER KARREMAN: Jim.

CHAIRMAN RIDDLE: Yes, Hugh.

MEMBER KARREMAN: As far as when the alternatives are listed from the public or whoever, could -- could there be some documentation of functionality or efficacy of those alternatives?

MEMBER OSTIGUY: That would -- that would be a necessary part of it.

MEMBER KARREMAN: For chlorine let's just say because -- okay.
MEMBER OSTIGUY: That would be a necessary part.

CHAIRMAN RIDDLE: Rose.

MEMBER KOENIG: I -- I truly -- you know, and -- and it's not that -- I mean I think it's gracious that -- that Nancy has offered those services, but I mean I think we -- we have the contractors. I think we have the funds. I mean these are -- these are pretty minimal questions and there's not a whole lot of substances. So, I think we should go ahead and have NOP -- hire them to get that information and then Nancy -- I mean once we get that information, we determine it's not sufficient, certainly, the committees need to work and -- and maybe get additional information, but utilize that resource because you have other things on your plate.

CHAIRMAN RIDDLE: Arthur.

MR. NEAL: We talked about the questions. Just an example. I don't know what all lecithin is used for, but if you decide to go to a TAP contractor for a review on lecithin without being specific, you
could have multiple uses for lecithin and TAP contractor not being able to narrow in on what you really want. Right. Multiple forms, multiple practices of manufacturing and stuff. So, you just got to be dead on on what you want because we're wasting time and we're wasting money.

CHAIRMAN RIDDLE: Okay. Point well taken.

Handling.

MEMBER O'RELL: Handling. I'll -- I'll take Handling until I transfer my list over to Julie.

First on Sunset material review process as we've all discussed and move forward on the materials that were deferred from this meeting, evaluate public comments, additional TAP updates, past historical discussions from the Board and present list of any questions that need to be further answered.

Second one is the agriculture/non-agricultural guidelines to continue work on the deferred recommendation from our last meeting and request an expedited full TAP for yeast review as part of this recommendation. Review and consider public
comments and come back with a new recommendation for
the next Board meeting.

Continue to participate in the Pet Food
Task Force meetings. Then in conjunction with the
Policy Development Committee and I'll make sure we get
dave's words, but prepare a draft recommendation on
the determination of commercial availability under
205.606 in cooperation with the Policy Development
Committee, Materials Committee and in collaboration
with the NOP.

New committee members, recruit new
committee members for the committee and an appointment
of a vice chair.

Review petition substances as needed. I
think there are some petitions that are going to be
coming to us and then I put this on here, food contact
substances, somehow get clarity around the issue of
food contact substances and that certainly will be
working in collaboration with -- with the NOP.

CHAIRMAN RIDDLE: Okay. Any comments,
questions on that?
It did remind me of one thing for the Livestock Committee, Mike, and that'll be the Aquaculture Task Force report will be coming to your committee first off. So, you'll need to be prepared to deal with that one way or another.

Anything else for Handling? Okay. Well.

MEMBER KARREMAN: Not on Handling, but something I want to bring up. At least, hopefully, the Livestock chair will agree that we should have input on the research variance that are being developed. Crops Committee said they're specifically going to do that. I think Livestock Committee should, too, if that's okay.

CHAIRMAN RIDDLE: And yes, Rigo's chair of the committee taking the lead and he's on the Livestock Committee and the Crops Committee.

MEMBER DELGADO: That's correct. All three of them. So, either way we'll get it.

CHAIRMAN RIDDLE: So, there's some crossover there, but yes, certainly as it affects livestock research and even in the rule, the variance
mentions handling as well. So, there may be some handling research issues. So. Okay.

The next item on our agenda is -- I mean it did say break, but I think I'd rather finish up the next meeting date discussion and then take the break before public comment.

Barbara.

MS. ROBINSON: Jim, I would actually like to suggest that you not try and schedule the next meeting at this meeting. Since we are going to go out with an ANPR and try and schedule the symposium or the -- you know, the -- the panel of experts to discuss dairy pasture, one of the things we've thought about doing is -- what would be ideal is trying to schedule the first Board meeting with the new members during that time and since we're going to seat six new Board members, we'll have to schedule -- we'll have to also work with their schedules as well.

So, what I -- rather than you guys trying to fix a date at this time, you know, the -- better -- why don't we just do what we've been doing in the past
which is, you know, I send around that electronic calendar and you guys always send it back and say here's when I'm absolutely not available.

We know that -- that the upper-midwest conference will take place -- when did you tell me? The last week in February, Jim?

CHAIRMAN RIDDLE: Yes, February 23rd through 25th.

MS. ROBINSON: Right. So, that week is out as is the week or two leading up to it and we couldn't put together a meeting by then anyway.

CHAIRMAN RIDDLE: Yes.

MS. ROBINSON: So, we're thinking something more like late March probably because we'd like the symposium to occur during the comment period and so, why don't we just do that?

CHAIRMAN RIDDLE: Um-hum.

MS. ROBINSON: Try that and yes.

CHAIRMAN RIDDLE: I got Julie --

MS. ROBINSON: Right and we have -- and Arthur's reminding me. We want to make sure that we
have materials ready --

CHAIRMAN RIDDLE: Right.

MS. ROBINSON: -- because what's the point in having a meeting --

CHAIRMAN RIDDLE: Um-hum.

MS. ROBINSON: -- if we don't have the TAPs back.

CHAIRMAN RIDDLE: And I also -- also assume that it will need a -- allow time for orientation of the new Board members as well.

MS. ROBINSON: Correct. Correct. So, we'd like to be able to do that.

CHAIRMAN RIDDLE: Um-hum.

MS. ROBINSON: And so.

CHAIRMAN RIDDLE: Okay. Julie, did you still want --

MEMBER WEISMAN: I don't know if this is the type of thing that gets taken into consideration, but the Natural Products Expo is in the end of March as well. Once upon a time, these meetings got piggybacked onto that. I know that hasn't be done in
a while. So, either as something to use or something to avoid. I just wanted to throw that out.

CHAIRMAN RIDDLE: Yes.

MEMBER WEISMAN: Yes, the 23rd -- the 23rd through the 26th of March.

CHAIRMAN RIDDLE: And it will be in?

MEMBER WEISMAN: In Anaheim, California.

MEMBER KARREMAN: Yes, as far as when -- when the meeting takes place so that it's within the public comment period, Barbara?

MS. ROBINSON: Um-hum.

MEMBER KARREMAN: I would hope that that symposium teach and listening session takes place kind of -- somewhat earlier in the public comment period than near the end just so people can weigh in, you know, what they've heard and -- and make comment from that and also, I know that when we came on the Board, we didn't have much say in the dates of the meeting. The five of us. So, I think just you got to set it up and --
MS. ROBINSON: I understand that, Hugh, but -- but I also don't want to schedule a meeting and six people can't show up, you know, so and while I realize that we have members going off the Board and it's very common for old members to come back to that first new meeting, it is more or a courtesy. It's certainly not obligatory for the -- for the exiting members to come to the first meeting and they can't vote. So, you know, 14 minus five leaves nine plus or minus six new ones means no vote's going to take place if we don't have a quorum. So, we got to do something. So, I hear you. You're right. We'll drag them in there. Go and get them and --

MEMBER KARREMAN: You got to do that.

MS. ROBINSON: Right. That's right.

CHAIRMAN RIDDLE: All right. I got Gerry. Then Julie.

MEMBER DAVIS: If your question's more pertinent to what they're talking about right now, go ahead.

MEMBER WEISMAN: Okay. Just as a
reminder, there were five seats filled this year and I think all five members had -- were able -- there was no problem with new members attending the meeting.

MEMBER KARREMAN: I think new members are going to attend. I mean because it's their first meeting, they're going to try to be there.

CHAIRMAN RIDDLE: Well, let's -- we don't need to get into details of this. Gerry. Then Andrea.

MEMBER DAVIS: Barbara, I had a question for -- concerning how long it's been since we've had a meeting outside of Washington, D.C., what is the NOP's current thought on when we will schedule something in a location further west for the benefit of the people who live out there?

MS. ROBINSON: Never. Just kidding. I'm just kidding. The reason we have been scheduling meetings in Washington is not to be disagreeable, but because of -- frankly just out of budget constraints. That -- because you see how many people from NOP are here and that even though it is expensive to flight
all of you to Washington and I realize it is expensive
for people to come to Washington, then when you add
all of us to boot and we have to be flown someplace,
you know, it just adds more costs. That's the biggest
reason that we have been having the meetings in
Washington. It really wasn't to just, you know, force
you to spend $8 for a bagel and -- but -- but, I -- I
do hear you. I mean that's one of the reasons that we
want to have the next meeting in, you know, the
northeast, in dairy country and, you know, we'll --
we'll try to have meetings in -- in -- in -- in other
locations.

But, I have to tell you, the fiscal year
2006 budget was flat and then Congress will rescind
our budget by 2 percent, but Congress also gave us a
pay raise which while my staff likes that very much,
they do, they -- they think that's -- yes, they think
-- yes, they all individually think it's very nice,
that pay cost comes right out of the budget. In other
words, it means less money for travel. It means less
money for TAP contracts. It means less money for
other things.

So, and then Congress turns around and takes back another 2 percent. So, in effect, there is a 5.44 percent budget cut in NOP in discretionary spending. That's the way it goes. So.

MEMBER CAROE: Instead of setting a meeting, could we at least attempt to identify a favorable week just because the -- the faster I get it on my calendar, the better chance. I mean not set the meeting necessarily, but tentatively set it.

CHAIRMAN RIDDLE: Well, I think Barbara had a plan for sending out the calendar for you to identify all the dates you're not available. Isn't that enough for now to leave it?

MEMBER CAROE: Are we waiting for the new members before we do that because like too much notice --

CHAIRMAN RIDDLE: So, instead of doing it
now --

MS. ROBINSON: Can you -- if I send something out, can -- that says when are you available for like from mid-March through the end of April, can you -- can you deal with that? Is that what --

MEMBER CAROE: Yes, it'll change. It'll change weekly. That's the thing. I just want to get something on the calendar if I could, but if that's not possible I'll --

CHAIRMAN RIDDLE: Yes, not -- not right now please. I mean --

MEMBER CAROE: Okay.

CHAIRMAN RIDDLE: Sorry.

MS. ROBINSON: Try to block something out as soon as we can.

MEMBER CAROE: Great.

CHAIRMAN RIDDLE: George.

MEMBER SIEMON: So, I'm a little unclear. Is the next NOSB meeting going to be connected to the dairy pasture thing and does that mean it won't be in D.C.?
CHAIRMAN RIDDLE: That's the plan.

MEMBER SIEMON: That's the plan. Great.

Wait until I get off to leave.

CHAIRMAN RIDDLE: You're invited back with expenses. Right?

MEMBER SIEMON: Right.

MEMBER CARTER: Well, I would -- I would think any employee that really loved their job would contribute any pay increase back to help.

CHAIRMAN RIDDLE: Okay. Okay. But, what's that?

PARTICIPANT: I don't -- I don't get the pay increase. I just want you to know that.

CHAIRMAN RIDDLE: Okay. And Kevin, as far as the next executive committee call, you'll just handle that schedule by e-mail?

MEMBER O'RELL: Yes.

CHAIRMAN RIDDLE: Okay. So, committee chairs, you're not aware, as a committee chair, you're now on the executive committee. Okay.

Well, we're at about 2:35 or so and the
next item then is the public comment session and so, we'll have a break until 3:00 I guess.

Is there anything else we need to cover?

Yes, that's a good point. Nancy just said if we're back here in our seats at five until 3:00, then at 3:00, we can start the public comment. Let's not start coming back at 3:00. Let's be in our seats ready to go a little before 3:00.

Okay. Break.

(Whereupon, at 2:34 p.m. off the record until 3:00 p.m.)

CHAIRMAN RIDDLE: I didn't give a warning to who would be up first. So, what I have on the list here is Dr. Juan Velez. I haven't Dr. Velez. Is -- are you here? I haven't either. Okay.

So, then Matt Van Baale or Van Baale. Not here either.

Joe Smille's here, but he switched with Harriet Behar. Okay. So, you will be first. But, take your time because I do want to read through quickly the policy for public comments once again
because there are some people who weren't here for the comment period yesterday.

You must sign up in advance. People have done that. You'll be called on in the order you speak, but if you're not here when your name's called, I'll go back at the end and give you another chance if -- if you're here later.

You'll have five minutes to speak. If you're carrying a proxy or you are using someone else's time, you can have up to ten minutes, but please inform us of that when you start so the timekeeper can set the time accordingly and Goldie will be the timekeeper and she'll hold up a one-minute warning sign, but like I said yesterday, if you don't see it, that's not her problem. So, the -- the clock keeps ticking.

You give your name and affiliation for the record and individuals providing public comment will refrain from any personal attacks or remarks that otherwise impugn on the character of any individual or company.
So, good, respectful, healthy criticism not a problem. No personal attacks.

So, with that, we'll go ahead and just a second. George.

MEMBER SIEMON: Yes, having sat through a lot of sessions to get to the faith about pasture, I'd like to make sure that -- maybe we should read what specifically we've asked for feedback. Because I'd really like to get feedback on those questions. So, I just think it might be healthy for us to read those.

CHAIRMAN RIDDLE: Okay. That was in the NOP request --

MEMBER SIEMON: Specifically -- yes.

CHAIRMAN RIDDLE: -- for this meeting.

MEMBER SIEMON: Because part of our holdback has been to get those answers -- those questions answered. So, I want to be sure we hear testimony that --

CHAIRMAN RIDDLE: Okay.

MEMBER SIEMON: -- and not just that pasture cures everything.
CHAIRMAN RIDDLE: All right. Sure. Would you like to summarize that? What?

MEMBER JAMES: Is -- is that fair to do that during the comment period?

CHAIRMAN RIDDLE: Well, yes, if you'll remember yesterday when I was asking for, you know, what comments are most helpful, those on the Sunset and specifically the deferred blah, blah, blah. Some instructions prior to comment when we have a focused comment which once again the focus of this is pasture. You know, other topics may come up, but we certainly appreciate people to address pasture issues and there were some questions posted. So, George is going to summarize those.

MEMBER SIEMON: And I'm going to read them.

CHAIRMAN RIDDLE: Read them.

MEMBER SIEMON: Specifically, USDA would like to hear public comment on the following topics: growing season, birthing, stage of life versus production, economic implications of imposing further
restrictions on -- on dairy farmers under NOP through specific pasture requirements, how variation, geographic and climate conditions of the United States and other parts of the world that wish to comply with NOP requirements should be accounted for and contemplating changes to access to pasture for dairy animals and whether this change should be imposed on all ruminant livestock not just dairy.

Thank you.

CHAIRMAN RIDDLE: Okay. Thanks, George, and so, Harriett is up and on deck, Dennis Stiffler. Is Dennis here?

MS. BEHAR: I don't know. I just wondered if the other people who had signed up came in first. Yet or -- who were the other two people?

CHAIRMAN RIDDLE: What?

MS. BEHAR: Who are before me?

MS. BEHAR: Thank you, Joe -- Joe Smille for -- for --

CHAIRMAN RIDDLE: Keeper, are you ready?

MS. BEHAR: -- switching with me so I could do this now.

I am Harriett Behar an organic inspector from Wisconsin. I comment Jim for the research and addendums provided with the Livestock Committee recommendation for the NOP rule change detailing the positive environmental, animal and human health effects resulting from the pasturing of ruminant animals.

It is clear that the NOP rule has been lacking in clarity for years and the NOSB has addressed this issue on numerous occasions. I believe the rule change as presented would solve many of the problems. However, I'd like to make this small improvement.

Ruminants over six months of age shall graze pasture at my improvement now providing significant value for at least 120 days per years and
also in the prohibited section adding that significant feed value statement.

The definition of pasture has not been offered as a rule change. So, I add this previously NOSB recommended statement to give a clearer meaning to the word pasture. I have seen the farmers provide insufficient grabs or forbs to offer the significant feed value from grazing that I believe the NOB/NOSB would wish to see the animals receive.

In addition, I have seen farmers allow access to pasture for only an hour or so per day, but if significant feed value were to be provided and mandated, the animals would need to be out on the land for more than just a couple of hours.

As an organic inspector in the dairy state of Wisconsin, I have had the pleasure to visit many organic dairy farms and verify their compliance to the NOP rule. The vast majority of the farms I have visited already meet the rule changes recommended by the Livestock Committee and I believe would welcome these changes.
The farms I have visited that do not currently meet these proposed rule changes in my opinion would not have a significant economic burden put upon them to meet these rules.

It is true the farmers would need to modify their production systems, but this is the case for any operation that would be transitioned from a conventional farming system to organic.

I have heard many reasons for not providing pasture to the -- to organic ruminants. One, the desire to use land close to animal housing for the production of crops and not for grazing. Two, not enough acreage mandated by the farmer to -- managed by the farmer to provide sufficient pasture land for all ruminants over the age of six months. Provision of grain-based diet versus pasture-based diet typically results in higher milk volume per animal in a specific year. Concerns about cost and time to put in a quality fencing and alleyway system to provide cows access to the pasture lands. There could also be more labor to gather cattle twice per
day and bring them to the milking area from the pasture as well as the labor needed to move fences or cattle to various paddocks in an intensive rotational grazing system. Six, the belief that cattle prefer a prepared mix ration and do not like to graze. Seven, healthier, stockier looking animals are raised in a confinement situation.

My responses, but if pasture is made a priority by the farmer, I believe they could develop systems such as rotating pasture with their row crop and hay production, developing intensive rotational grazing systems that provide more forage per acre than permanent pasture situations and match their livestock numbers to their acreage. When the cattle are allowed to feed themselves, this would free up the farmer from preparation and delivering feeds, that the time would be spent working with the pastured cattle.

While grain-based diets can result in higher milk productions, dairy cows who are fed and exercised on pasture tend to live longer. Instead of seeing how many pounds of milk a cow produces for each
lactation to judge the economic viability of an operation, we could judge how many pounds of milk the cow produces over her lifetime.

Confinement animals tend to be culled due to health problems after one or two lactations. While pastured animals, in my experience, tend to average five to eight lactations or more.

It is true that pastured animals may be a little thinner than confined animals, but I have not seen proof that they are not as healthy and the longevity of these pastured animals illustrate that they are.

The only time I have seen cattle not graze pasture when available is when they are offered a ground ration or silage at all time. So, they choose the easier food rather than walking out and eating pasture.

The wording I suggest for significant feed value from pasture would mandate the farmer modify his feeding schedule so the cows would go out on pasture. When they are aware that fresh grass awaits them, I
have seen pastured cattle enthusiastically run to these paddocks.

Lastly, if the land cannot support dairy animals who receive significant feed value from pasture, then perhaps this region is not the best place to site an organic dairy. After all, we do not grow avocados in Wisconsin.

CHAIRMAN RIDDLE: Okay. Thanks.

MS. BEHAR: And I got that 846 words.

CHAIRMAN RIDDLE: I have one comment and then I think Bea has a question.

Yes, I just want to point out you referred to the Livestock Committee recommendation. I just wanted to be clear that even though the Board voted on it, it's a draft.

MS. BEHAR: Yes.

CHAIRMAN RIDDLE: It's a draft recommendation. So, for you or any other commentors, please keep in mind, refer to it in print draft recommendation.

MS. BEHAR: Yes. Okay. It is a draft.
CHAIRMAN RIDDLE: No problem. Yes, and your comments I think would be perfectly appropriate once it gets posted to submit back to us some of the details on how you think it should be changed. So.

MS. BEHAR: Okay. Thank you.

CHAIRMAN RIDDLE: All right. Thanks. All right. Thanks, Harriett. Mark Kastel and then Tom Harding.

MR. KASTEL: You better take Tom before.

Jim, I'm -- I'm sorry. I thought there were a bunch of people before me. Can you take Tom and then I'll come up?

CHAIRMAN RIDDLE: Tom, are you willing to switch there? Thanks, Tom.

MR. HARDING: Musical chairs, I. Good afternoon. Tom Harding, AgriSystems International and I won't repeat everything that I said yesterday that we work with a great number of small, larger and cooperative producers and value-added processors.

Before the new draft using Jim's words came about today, we were prepared and we solicited
all them. You have documents that have been submitted independently supporting our position that we supported the recommendations on the guidance document and we felt that overall it was a -- a good beginning as a guidance document.

Now, that we've seen the new draft and I had managed to call a few of them, they support the new draft in principal with 120 days and there's one concern that a couple of them raised and I put that in my notes and that was the issue of any prescribed percentages of dry matter intake, that we don't get too prescriptive in that area and clearly define what feed value is and that we take it under a serious consideration the ability to analyze anything that looks like prescriptions other than 120 days.

The other thing that was very important is that all of them wanted to make sure we were aware of the geoclimatic differences that are availed in this vast country called the United States of America and that we consider regardless of where those farms are today, they've been there for a long time, and in
deference to my friend who just spoke, some of those farms have been there a long, long time and are very dependent on that region and I say that we have to listen to everybody and make sure we get total input for all geoclimatic conditions.

The other thing that's important to us is that with regards to the issue of how fast we're going to move forward with this document, we encourage you to move as quickly as possible from the draft stage into the -- maybe the advanced proposed rule stage and to get some clarity here.

One of the things that's very concerning to a number of them is the issue of certification. I can promise you that there are a number of certifiers that are quite different when they look at these documents and they actually certify a farm based on records that verify either access to pasture or percentage of pasture time, et cetera, et cetera, et cetera.

I don't think that's the certifier's fault. Again, I think it's the last of clarity in the
whole issue of what really is access to pasture.

   So, the 120 days is a very important
start. It's very important that we take under
consideration that these farmers have been there for a
long time. I'm repeating myself and that we pay
particular attention to moving very quickly and to
getting some clarity for our certification community,
for our producers and for our marketplace because it's
quite confused out there.

   Since I have a couple more minutes, I want
to mention something about TSPP which is tetrasodium
pyrophosphate. Because it was mentioned yesterday
that there was not a ample petition and that it was
not an ample TAP. I don't know where that was coming
from, but I just want to tell you that being part of
that original petition for a client, we did submit a
petition. We felt that it was adequate at the time
and we also felt that there were adequate TAP reviews
on it and that there were two independent Board votes
on that and we encourage you as a Board and as an NOP
to put it back where it belonged and that is the
recommendation that it be for organic products and not just with made as proposed in the most recent rule.

The last point was on wild fish and I'm sorry that Keith is not here.

I work with a number of coastal villages in Alaska and other places. I'm not suggesting and neither are they that fish be -- wild fish be organic. Frankly, in my opinion, it's the only fish that will ever really be organic. But, we're suggesting that wild fish need to be considered and that we need to have that task force put in place and we are ready to submit a number of names that would certainly qualify to give you adequate input on that.

And the last point I want to make is I really appreciated this process this time. I think it's a really important process. The more transparent, the more open, the more dialogue we have, the better it's going to be, but the one thing that I'm walking away with here that I'm a little concerned about is the deference, these materials that you deferred and all the activity that you're going to try
to come to some determination here real quickly.

I think I agree with what I thought George was trying to propose and that's the issue that those who are supporting the continuance of the materials should be the ones defending it and not those who are in the opposite position. So, I think it's really important you consider that as a Board in the future.

I want to thank you and I want to thank you for your good work and Jim and all the rest of you who are leaving the Board, again, I want to thank you for your hard work and I want to thank the NOP, too. Thank you very much.

CHAIRMAN RIDDLE: Thanks, Tom. Okay. Mark, you ready now? And then Gouiri Koneswaran. Is there such a -- okay. Thank you and you'll tell me how it's pronounced later. Okay. Mark.

Hi, my name is Mark Kastel. I am in the senior -- senior farm policy analyst for the Cornucopia Institute based in Cornucopia, Wisconsin.
And I have a proxy here from certified organic crop producer Steve Gells from Gill, Colorado and I'm going to start by reading his brief statement.

You all saw the complaint that we filed based on his testimony in part.

And Steve writes: "I find the issue of organic dairy cows running on grass to be a simple one. For the organic dairyman who have found their nitch in a difficult market, accessing their cattle to grass is their only edge. It was be logistically impossible for a large corporate organic dairy farm to do the same. If you allow the rules to be different for large organic dairies, not -- not only will the term organic become somewhat generic, but also hundreds of small organic dairies won't be able to compete. Since consumer confidence in agriculture is top priority especially in the organic industry, the rules must be the same for everyone."

And he says that he would be happy to field questions from the Board. Will supply his contact information if anybody asks.
Number one, it's very simple. We've been working on this together for five years to close loopholes on a handful of industrial scale farms masquerading as organic. We received a quote from a principal of one of the firms that we filed complaints against. It came in from a member of the press today and again, I'll be willing to share this with members of the Board and maintaining the anonymity of the -- the reporter, but it said one, there's no rule adoption imminent is what this gentleman told the --

Does he know something that you folks don't know? The other thing he said is the guidance is only that. We don't have to -- he didn't use these terms. We don't have to follow. No basis in law. The guidance that was adopted. That's the quote. That's what we're hearing from this "organic producer." That's not what I hear from organic producers I work with. They're gaming the system.

The present rule is enforceable. You heard from our lawyer the other day. If the NOP
doesn't take action on our current complaint and revisit the former complaints, we'll look to a judge to ask them politely to enforce the law. One plus one is three.

Animals must be -- we must promote the natural instinctive behavior of our livestock. Animals must have access to the outdoors. Ruminants have pasture and there's a very sharp definition for pasture there.

I don't know what you folks don't understand. The vast majority of all organic dairy producers understand the way it's written and the vast majority of certifiers understand the way it's written. We're doing all this work over the last five years for a few scofflaws and we can't get the Department funded through our tax dollars to take action. I don't understand.

Based on the astute comments of Hugh, Dave and Rosie, we do need the term growing season in the -- in the -- in the document and we do need a number that you've already adopted in the guidance 30
percent. Otherwise, what we're risking is that these farms that milk three and four times a day, I -- I visited the largest organic dairy farm in Wisconsin, 500 cows. Beautiful pasture, permanent paddocks, waterers. This guy was a great manager.

I said how far is the farthest that your cows have to walk from the barn to get to fresh grass? Five hundred cows, a mile and half. How far are they going to have to walk with 4,000 or 5,000 cows? Or are we going to allow them to just graze a couple of hours a day so that they instead of having the necessary land mass which through our survey is an acre or two -- a cow or two per acre on most organic farms, are they going to have a population density that's much higher because they rotate their cattle during -- in between each milking out there? That would be wrong and it would put family scale farmers at a competitive disadvantage. We can't leave those loopholes open.

Number two, comments directed to the NOP questions. First, we really strongly object to the
development of those questions without consulting the Board. The Chairman of the Board also issued some questions. You folks could have gotten together and come up with one list. I don't know why this communication doesn't take place, but the Inspector General said this is a -- a defect. Mark, we're looking to you as the new leadership here, I know some of this happened before you took over, to really inject a little bit different kind of process.

MEMBER CAUGHLAN: You had a proxy.

MR. KASTEL: Yes, I have a proxy.

MEMBER CAUGHLAN: I'm going to reset it.

MR. KASTEL: Okay. Thank you.

MEMBER CAUGHLAN: Reset it.

MR. KASTEL: Thank you, Goldie. So, growing season, it's simple when forage is available, but this is the operative aspect for these farms in the west. If they spend their money to irrigate cropland, that's the definition of a growing season. That irrigated crop. None of this, well, we're in a drought now because we don't get any rain during these
months of the year. If they irrigate, if they irrigate crops, they should be obligated to irrigate pasture if they're in that kind of environment and can't provide a minimum of 120 days. Minimum of 120 days.

Economic impact of imposing further restrictions, not. There's nothing that changes the dynamic for most dairy producers if this rule's presented. They're not going to change. There are some as Harriett said that might have change management. That's the minority.

I don't understand and we take a great exception to why the NOP didn't promulgate a question that asked what is the economic implications of not enforcing the current regulations on the family farmers who are doing the job now and following the rule. They are at a competitive disadvantage. Already one company has a 55 percent market share. Add in the -- add in Aurora Dairy which is now converting two additional farms that might have five CAFOs within a near short-term period of time. We
know what happens. In every other commodity area of agriculture when one, two or three companies dominate the -- the -- the marketplace, farmers lose. There's -- there's great evidence for that and these family producers built the business.

Variations in geographic climate. A month and a half ago, I visited the Aurora Farm. On one side of their farm, they had 50 late lactation cattle on pasture. They quit milking them three times a day. They were milking them twice a day. They could afford to give up that production on 1 percent or so of their cattle.

On the other side of the highway were 70 dry cows. The land's for sale. I don't know how long they'll have access to that. That was the total amount of cows on pasture out of about 6,000 they control in the Colorado area.

I drove a short distance to the only other certified, maybe I use the word loosely, certified organic dairy producer in Colorado, Meg Kattel who farms with her husband Arlon. They're both
veterinarians. Four hundred cows, irrigated pasture, beautiful grass. Their cows, 100 percent of their cows were out. All of them unless they were calves were out on pasture. They can do it. They can do it in that climate. No one should get a bye here.

And now a couple additional comments directed at -- at Chair Riddle's questions. Do you provide lactation -- lactating animals access to pasture was a question to dairy producers. The answer, Jim, yes.

Our survey which we shared with you at the last meeting said 93 percent right now have no problem with 120 days and -- and -- and 30 percent or they could make minor adjustments. Only 1 percent of dairy producers responding to our survey said that they philosophically objected to what was going on. They are providing grass right now.

How many days per year? All of them over 120 days. We found one -- one very credible organization in Colorado that is at about 90 days. I talked to those folks last week, but they aren't
managing their pasture. It's unmanaged pasture. So, the conjecture is -- in our discussions, the question was if they rotationally grazed, if they added any kind of irrigation, would they be able to meet that?

Thank you, Goldie.

So, I guess in closing, let me just say this is time critical. There's no doubt that there's overwhelming support and I'm just going to read from a letter from the National Association of State Organic Programs. It said this issue is of paramount concern.

I'm excerpting this. Groups have overwhelming supported the recommendations for a rule change and the NASOP hopes that the NOP recognizes the need to clarify the organic pasture rule for ruminants -- for ruminant animals as soon as possible.

So, we applaud the fact that you adopted this. We'd like to make it tighter. If we leave any of those loopholes in -- in there for -- for growing season or no -- no baseline for dry matter intake and the people who are truly grass based, doing rotational grazing are at 80 to 100 percent during the growing
season -- some people are at no grain. We're not trying to turn them into no grain, but if we leave those loopholes open, all the work we've all done in five years will be for naught because they'll seek those out.

CHAIRMAN RIDDLE: Thank you, Mark.

MR. KASTEL: Thank you.

CHAIRMAN RIDDLE: Okay. Gouiri.

MS. KONESWARAN: (Off microphone.) I didn't anticipate for like oral comments today. I've submitted written comments.

CHAIRMAN RIDDLE: Okay.

MS. KONESWARAN: (Off microphone.)

CHAIRMAN RIDDLE: Oh, they're in our book. Yes. Okay. And how -- how do you pronounce your name?

MS. KONESWARAN: (Off microphone.)

CHAIRMAN RIDDLE: Thank you. Thanks for being here and submitting written comments.

Okay. Kelly Shea and then Joe Smille.

MS. SHEA: Hello. My name is Kelly Shea
and I'm with Horizon Organic Dairy.

Horizon Organic has been the leader in organic dairy production since our inception nearly 15 years ago. We were the first national organic brand and we're proud to have helped create today's growing organic dairy marketplace.

I think I'm going to give you a copy of my comments and just read part of them for time.

Our founders worked hand-in-hand with many of you to help establish the national organic standards and the organic seal. The organic standards in the U.S. today are the strictest and most rigorous organic standards in the world, but these standards must improve and evolve as our industry improves and evolves. That's why we at Horizon Organic actively support changes to the organic regulations, clarifying that the requirements for pasture apply to all ruminants including lactating animals.

We also fully support a change that would require active grazing for at least 120 days during the growing season.
It is critical that all organic farmers, including those in the process of transitioning to organic, have certainty versus ambiguity whenever possible.

Having reiterated again our support for rule changes, I just want to take a second to express our growing concern about the tone and tenor of the dialogue that has surrounded this debate. We need to step back and remind ourselves that we share a common vision and that we're all working to support the core values of the organic community of which clarification of the organic standards is clearly a critical component. If we allow this negative dialogue to continue and even worsen, those most responsible for the success of the industry and that's the farmers and the consumers, in my opinion, will end up suffering the consequences. Unless we can find a way to engage in constructive dialogue on the issues that face our organic community, we put its future at risk.

Only our collective success will allow us to continue to grow the industry to support family
farmers, to promote the humane treatment of animals and to improve the local environments in which we all live and work.

I want to thank all of you in this room for your efforts to help the organic community achieve consensus on such an important facet of organic dairy farming and we want to give a special thank you to the members of the Board that are leaving after five years. We really appreciate the time away from your families and your home to do this work on behalf of all of us.

Thank you very much.

CHAIRMAN RIDDLE: Thanks, Kelly. Joe Smille. Then Wendy Swann. Wendy here?

MR. SMILLE: I'm Joe Smille, QAI and some of my staff gave me comments. I'm not that skilled or knowledgeable in -- in dairy and livestock, but I'm definitely familiar with the topic and, of course, as a certification agent, we have a number of concerns here and again, it goes -- harkens back to the same thing I mentioned yesterday. Is -- clarity and
consistency in rule interpretation is essential to industry.

There's been a number of comments made today about different certification agencies having different interpretations and we all agree that we all have to come to that same thing.

In -- in that sense, I -- I -- I understand that you have a very delicate balancing act that you've got to do between providing specific requirements and clarity for, and I'm again speaking just for the certifier not necessarily for the farmer here, but a definite balancing act between specific requirements and going too far into prescriptive regulations. Because going back to the early days of organic, you don't want to tell farmers how to farm and we run that danger as we head into this area and I know you realize it, but again, it's a balancing act and we need to find that balance.

Specifically, we need definitions of feed value. We need specific requirements on exactly what we mean by feed value. I think that as a
certification agent we've got to be clear when you say
that word in a regulation or, I'm sorry, a draft
recommendation that it's backed up.

We also need a -- a change to the terms
defined section and I think we need just a -- a better
definition than we currently have on grazing. Again,
from a certification agent's perspective, I think we
need a better definition there.

Specific numbers regarding the percentage
of diet should be based on research by -- by region
probably and -- and before, you know, we make
decisions on those issues, again, everybody wants to
get speedy clarity -- I mean get clarity to this issue
really quickly, but also I think there still needs to
be more research done to -- to find out what we mean
on the percentage of diets.

A hundred and twenty days, I think is very
doable. I think it's a good one. I think we can go
with that. But, when you get into a percentage of
diet, I think that that needs a bit more work.

So, in spite of the pressure to get this
done quickly, I think we definitely still need some --
some research and some definitions.

Let me stretch a point and talk about fish
pasture for a section. There's not an issue.
Aquaculture allows for the constraint pasturing of the
fish as they graze in their world.

We have a couple of issues. I'm sorry.
It is a joke, but I'm -- I -- my -- my serious point
is that we really need some quick actions on this.
Because as you know, fish oil products are becoming
much more -- more prominent in the food issues and as
a certifier, we really need some clarity and some
direction on how we look at fish oils as they come
into food products and how we -- we -- we deal with
that issue which I don't think I've heard anybody
really talk about and we've ransacked the regulations
to try to figure out how we deal with that issue. So,
just perhaps for a future agenda.

CHAIRMAN RIDDLE: Thanks, Joe. First I
see Barbara. Then Dave.

MS. ROBINSON: Joe, I -- I just had a
question. You -- you mentioned percent of diet --

MR. SMILLE: Right.

MS. ROBINSON: -- related to region of the country. What do you mean by that?

MR. SMILLE: That's what my staff told me to say.

MS. ROBINSON: I was afraid of that.

MR. SMILLE: What -- what is the total percentage of the diet received from pasture? In other words, basically, they're looking for more specific things --

MS. ROBINSON: Okay.

MR. SMILLE: -- on percentage diet related to --

MS. ROBINSON: Okay. For pasture.

MR. SMILLE: -- from the pasture.

MS. ROBINSON: All right.

MR. SMILLE: I'm sorry. Did I not say pasture? Sorry. Pasture.

CHAIRMAN RIDDLE: Now, I'm confused, but it's Dave's turn to be confused first.
MEMBER CARTER: Yes, well, I'm confused a little bit more because -- well, I had two questions. Number one was along that same line. I mean are you talking about carrying capacity in various regions?

MR. SMILLE: No, not carrying capacity. I'm talking about percentage of diet coming from grazing --

MEMBER CARTER: Okay.

MR. SMILLE: -- in various regions.

MEMBER CARTER: Okay.

MR. SMILLE: My staff feels that that, you know, is going to be different.

MEMBER CARTER: Yes.

MR. SMILLE: Rainfall, irrigation, you know, it's --

MEMBER CARTER: Well, see I guess my -- my point would be --

MR. SMILLE: Because there's pasturing and then there's grazing.

MEMBER CARTER: Yes.

MR. SMILLE: You know, they're not
necessarily synonymous.

MEMBER CARTER: Well, there's -- I guess where I'm having trouble with this is you get your percentage is the same, but in some parts of the country, it's two animals per acre. In other parts of the country, it's one animal for every 50 acres. So, you know --

MR. SMILLE: Right.

MEMBER CARTER: -- that's -- that's where I think in -- in looking at this, we'd tend to look at some of the NRCS information on that --

MR. SMILLE: Good.

MEMBER CARTER: -- to -- to bring that in as guidance. So, that's --

MR. SMILLE: Absolutely.

MEMBER CARTER: Okay. That's part of it.

MR. SMILLE: Because remember what -- what sometimes is clear. Like we all thought when we got the -- the law, it was clear. Then we got the regulation. We thought it was clear.

MEMBER CARTER: Right.
MR. SMILLE: Then we got, you know. This is a new one and you're going to ask us to interpret it, all of the certifiers out there and I think I speak for all the certifiers in saying that we've got to sit down and -- and figure out how to do it and from our experience, you know, the -- the clearer it is, the more consistency we can get across the board. So, I just want you to keep us in mind as you start -- as you move through these draft regulations and I know Jim is very skilled and Andrea very skilled at doing that. So, just --

MEMBER CARTER: And then one -- one other -- one other thing and I -- I agree with you completely, Joe, on -- as far as some of the things, definitions, feed value and the like, but I'm --

MR. SMILLE: Right.

MEMBER CARTER: -- wondering if some of that isn't already addressed in AAFCO if there are -- you know, and I don't know the AAFCO book well enough to know if that's the case, but if they have some standardized definitions in there of that or not.
MEMBER KARREMAN: I -- I think that would be the NRC or CAAFCO -- NRC is more agriculturally based.

MEMBER CARTER: Okay.

CHAIRMAN RIDDLE: And I have a -- a comment or question and then Nancy.

I just wanted to point out that that reference to feed value is actually in the definition of pasture. So, that -- you said something about that being in our draft, but that's something that only appears in our draft because the draft contains the existing regulatory definition of pasture.

But, I hear what you're saying as far as providing more guidance on the meaning of feed value, but I am confused about what you're staff told you to say and that is if they're encouraging something like 30 percent or defining the -- okay. So, they're not.

MR. SMILLE: We're not -- we're not --

CHAIRMAN RIDDLE: But, if it's going to be --

MR. SMILLE: -- encouraging or advocating
anything. We're just saying well, whatever you decide we --

CHAIRMAN RIDDLE: It needs to be clear, enforceable --

MR. SMILLE: -- have -- we have to -- we have to enforce it.

MR. SMILLE: Not advocating. We're not -- we're not allowed to do that I don't think.

CHAIRMAN RIDDLE: Well.

MR. SMILLE: That's our interpretation anyhow.

MEMBER OSTIGUY: Could you repeat the words about the feed value that you're staff told you to say so that I get this -- my question clear?

MR. SMILLE: Definition. What is the total percentage of diet received from pasture?

MEMBER OSTIGUY: But, you -- there was something that was said about it being --

MR. SMILLE: Definition of grazing is
needed in the change to the terms defined section. This might answer questions on what is the total percentage of diet received from pasture.

MEMBER OSTIGUY: But, you said something about it being different in different places. Where was the -- the variation?

MR. SMILLE: Yes, specific numbers related to percentage of diet is based -- should be based on research for each region before arbitrarily deciding on the numbers. It has to be fair for all regions.

MEMBER OSTIGUY: So, is your staff stating that depending on what region the animals are in, they will graze different amounts of time?

MR. SMILLE: I think that is their feeling.

MEMBER OSTIGUY: Okay.

MR. SMILLE: Not -- graze -- the value of the pasture in the diet will vary by region. I think that's what they're getting at. I'm not sure. You could probably answer that better than I can.
MEMBER KARREMAN: I think you're going to have different agronomic species out there to graze, but it doesn't mean that they're going to graze any less or more if it's out there for them. Depending how much is out there for them. It might be different plants.

MR. SMILLE: Exactly. Yes.

CHAIRMAN RIDDLE: We aren't going to -- we aren't going to resolve this today.

MR. SMILLE: Oh, no. No, I'm just saying that looking for that kind of specificity without being overly prescriptive. Not going to tell the -- you're not going to tell the farmer what the pasture legume lay mix is going to be, you know. You can't do that.

CHAIRMAN RIDDLE: Without advocating. Okay. George and --

MR. SMILLE: Walking that narrow -- we walk that -- we walk that narrow line ourselves.

CHAIRMAN RIDDLE: George and then if we can wrap. Okay.
MEMBER SIEMON: Since you've gone this far, Joey, I -- you know, I'm not into real specifics a lot, but, you know --

MR. SMILLE: Okay.

MEMBER SIEMON: -- the present definition says that pasture should maintain or improve soil, water and vegetative resources. Now, to me as a certifier, that's pretty clear. You can have a pasture that's terribly overgrazed and say that you're maintaining or improving vegetative resources.

Personally, I think that's something that a certifier ought to be able to go and see and look at the pasture. So --

MR. SMILLE: In that sense, yes.

MEMBER SIEMON: -- I -- I don't know what we're going to do that's going to be any -- so specific that a certifier still shouldn't be able to go out there and see. Pasture is defined. So, I don't know what to do next honestly to answer some of those things. Because we don't support the 30 percent either in the rule, you know, so far.
MR. SMILLE: Okay.

MEMBER SIEMON: But, we need certifiers to do something.

MR. SMILLE: Well, we're worried about the 30 -- we're not worried about the 120 days.

MEMBER SIEMON: Look at this definition.

MR. SMILLE: We're worried about the 30 percent.

MEMBER SIEMON: I know, but with this definition, there's this --

MR. SMILLE: Yes.

MEMBER SIEMON: -- built-in mechanism that is you can look at the pasture and see if you're doing the job right. I don't know what else we need to do for -- for you all to be able to look and see what pasture is. The 30 percent is like throwing a police guard on you to make sure you're doing your job versus to me reading this definition and implementing it.

MR. SMILLE: Yes, well, I have no issue with that.

MEMBER SIEMON: Okay.
MEMBER KARREMAN: The only problem -- the only problem that will happen, I'm sorry, is that, you know, when is the inspector out there? Is it February? Is it May? You know, got to keep that in mind, too.

CHAIRMAN RIDDLE: In the rule, it has language about that, too, when the operation will be observed.

MR. SMILLE: Yes, we don't -- we don't check Vermont pastures in -- in February.

CHAIRMAN RIDDLE: Okay. Thanks, Joe.

MR. SMILLE: Okay.

CHAIRMAN RIDDLE: So, Wendy Swann and then Steve Morrison.

MS. SWANN: Good afternoon. I represent the Animal Welfare Institute, a nonprofit educational organization founded in 1951 to minimize the sum total of pain and fear inflicted on animals by humans and I thank you for the opportunity to speak today.

AWI appreciates the initiative the National Organic Standards Board has taken to insure
integrity of organic production by closing loopholes currently exploited by factory farms that confine thousands of milking animals to small dry lots. We also strongly support the NOSB's formal recommendation to the National Organic Program staff regarding pasture requirements including the tightening of regulatory language and the mandate that ruminant livestock including lactating cows have the opportunity to actually graze pasture.

As we suggested previously to the NOSB on March 3rd and May 20th of this year, AWI continues to respectfully request the Board include the following language in pasture requirements. Doing so will maintain the integrity of organic production and prevent unscrupulous business from undermining the organic program.

First, a few comments about the organic system plan requirements. In order to perform behaviors essential to physiological and psychological health and well being, each animal must have substantial access to pasture she can graze throughout
her lifetime in season and be allowed to graze and
ruminate whenever her physiological condition and
weather conditions and the state of the ground are
suitable.

At all times, access to the outdoors must
be provided as well as significant and consistent
roughage component in the diet through all stages of
an animal's life to ensure and maintain proper
ruminant function. The minimal requirement should be
70 percent long fiber roughage on a dry matter basis.

Breeds adapted to the pasture environment
and a farm's specific climate should be used. Cattle
that have been properly selected for the specific
climate conditions will be voluntarily choose to go
outdoors in all but the most extreme weather
conditions.

To ensure quality grazing, stocking
density per acre must not exceed three lactating dairy
cows and may need to be less as appropriate for soil
and climate.

AWI suggests a modified definition of
pasture. That it mean land managed to maintain or improve soil, water and vegetative resources and provide minimum feed value for -- by growing suitable, edible, nutritious grasses and other forages appropriate to the species from which animals graze plant materials still connected to its roots.

As we had previously submitted, we have some comments on temporary confinement which you see there in front of you. For lack of time, I won't go through all of those and we also have some comments that we've -- we've mentioned in the past on appropriate pasture conditions.

In conclusion, these practical and humane recommendations will help insure the integrity of the pasture requirement for livestock and the organic program in general.

Thank you again for your work and your consideration of these comments.

CHAIRMAN RIDDLE: I just wanted to once again remind you that our draft will be posted for public comments and we look forward to your
Some very thought-out points you have here and then also there will be the ANPR coming out sometime next year. So.

MS. SWANN: Okay.

CHAIRMAN RIDDLE: Thanks.

MS. SWANN: Thank you.

CHAIRMAN RIDDLE: Okay. Steve Morrison and it looks like Kathy Arnold is getting up and I assume that you're carrying a proxy from Steve. So, then Jim --

MS. ARNOLD: Well, I better cut my hair.

CHAIRMAN RIDDLE: -- and Jim Pierce would be next on deck then.

MS. ARNOLD: I'm Kathy Arnold. I'm an organic dairy producer and I'm also here to represent the Northeast Organic Dairy Producers Alliance.

And to begin with, I want to specifically talk about the questions that the NOP asked for feedback on.

Growing season, the growing season is the period of each year -- and this -- what I'm reading
now is the statement from NODPA. The growing season is the period of each year during which plant growth takes place. In reference to pasture, it is the time period or periods when grazable plants will grow in a geographic area because the air temperature is such to allow growth.

Pasture in no way should be viewed as just what happens to grow in a field without any management or input anymore than a crop field should be viewed this way. If a fair site is so arid that irrigation is required to grow machine harvested or stored crops, then irrigation must also be used for growing pasture.

Lack of naturally occurring good quality pasture is no excuse for not providing pasture.

Just as management and inputs are required to grow stored crops, so, too, management and inputs are needed to grow and supply pasture. Pasture is one of the highest if not the highest value crop grown on a dairy farm and must not be relegated to inferior status.

Birthing is the nature process that most
often can happen without human intervention and a
pasture setting is usually the healthiest place for
birthing to occur. However, some farms do have health
issues such as Johne's disease which requires the
immediate separation of the offspring from the mother
to prevent transmission to the newborn. Also, a small
percentage of animals may need human assistance during
birthing and thus temporary confinement for birthing
is a legitimate exemption to a grazing requirement.

Stage of live versus production, NODPA can
support limited stage of exemption to pasture such as
for birthing and the first six months of life, but
sees no -- absolutely no grounds for stage of
production exemptions. The dairy cow as all ruminants
was meant by nature to graze and the fact that a cow
is lactating has no legitimate basis for exemption
from a pasture requirement. Denying pasture to
lactating cows denies the cows multiple health
benefits and denies the consumer of organic milk the
extra nutritional benefits conveyed to milk by fresh
pasture intake.
As far as economic implementations, the economics of requiring pasture is not a relevant question in regards to setting organic standards including clarifying what was intended in the NOP standards by access to pasture. If it was, we should all be feeding conventional grain because it would be so much more economical.

Standards are the specific delineation of the organic production paradigm and are not to be defined by bottom-line economics. That's what convention agriculture's all about.

If the economic implications of having a modest amount of pasture for their livestock are severe for a certain farm, then maybe that farm isn't suited for organic production. Organic certification is a privilege not a right and operations need to make the necessary adjustments on their farms in order to meet the standards not try to bend the standards to fit their operation.

As far as variations in geographic climate, if crops can be grown in a geographic area to
feed stored feeds to dairy animals, then grazing can occur. Virtually any crop that can be grown and harvested as a stored feed crop can be used as a pasture crop including grass, alfalfa, clover and other legumes, corn, small grains, sorghum, et cetera.

If a climate is so harsh that no feeds can be grown for dairy animals and all feed must be imported, then that site is totally inappropriate for organic dairy production. Such a site fails the test of integration of animals and land that is the basis of the organic paradigm.

Whether this change should be imposed on ruminant livestock not just dairy, yes, all ruminants should meet minimum pasture requirements. Pasture in the biologically natural food source for all ruminants and has positive benefits for sheet, goats, beef and other ruminants just as it does for dairy animals in terms of animal health, soil and environment and the food safety and nutritional composition of their food products.

Then Chairman Riddle also asked for a few
questions to be answered by producers and I got responses back from seven of the NODPA Board members and state reps. They all answered positively that they're organic dairy producers.

They all provide lactating dairy animals access to pasture throughout the growing season. They all -- their pasture does all meet the following definition and as far as how many days per year does the average milking in your herd spend on pasture and what part of the country are you located in, two from Maine average 150 to 190 days of grazing a year. One from Vermont averages 180 to 210 days. Two from New York average 150 to 180 days. One from Connecticut averages 180 to 200 days and one from north central PA averages 180 days of grazing on pasture although he also says that he actually keeps his cows on pasture for 350 days a year, but some of those days it's with supplemented feed.

As far as the average number of lactations per cow on your operation, the seven farms range from 4.8 lactations to eight lactations per cow with
average being 5.7 lactations.

I also would like to read just a little bit of a public statement that the NODPA Board issued on October 20th. The Northeast Organic Dairy Producers Alliance supports strong organic dairy standards. We are dedicated to bringing a superior product to the market for the benefit of consumers. The NODPA Board reaffirms our commitment to supplying organic dairy products produced by cows on quality pasture during the growing season, our commitment to requiring that all organic dairy replacement animals be organic from the last third of gestation and our commitment that any animals with life-threatening conditions must be treated with antibiotics or other prohibited medications, but then be removed from organic production.

We are mindful of consumers willingness to pay a premium price for our products and we are willing to uphold and follow the strong standards that they desire.

And then personally, I would like to thank
the NOSB for all your work and effort on the pasture issue and I'm very pleased to hear that the NOP will be issuing an advance notice of proposed rule making on pasture early in 2006 based on the work of the NOSB.

Steps toward concrete progress on this issue are very much appreciated.

I would also like to emphasize the importance of including the requirement that all dairy replacement animals be organic from the last third of gestation when rule rewriting is done in the near future. Allowing young stock to be raised conventionally on an organic dairy farm is contrary to the organic model and is prohibited by the requirement that if an organic animal is removed from organic management, they can never be organic again.

All purchased replacements must also be required to be organic from the last third of gestation. There must be one consistent standard for all dairy replacement animals whether on-farm raised or purchased.
The rule rewriting necessitated by the Harvey Court Ruling and the OFPA amendment is the perfect opportunity to clear up this inconsistency that has existed in regards to dairy replacements and I have heard the concern expressed that organic replacement animals are too expensive, but again economics should not be the point of judgment for setting standards and secondly, here in the east anyway, there has not been much if any premium price on organic animals over conventional and, in fact, I know many organic animals from calves to whole herds have been sold to the conventional market and if there truly were a higher market price for organic animals, that would not be happening.

So, again, thanks for all your work.

CHAIRMAN RIDDLE: Thanks, Kathy. Bea.

MEMBER JAMES: I have a question for you. When you said if a climate is so harsh that no feeds can be grown for dairy animals and all feeds must be imported, then this site is totally inappropriate for organic dairy production, are you suggesting that
dairy cows -- that those farms be limited to areas where the climate is conducive only?

MS. ARNOLD: Well, I just feel that the -- or NODPA feels and the basis of organic production is there should be a good ecological fit for organic operations. If Alaska -- northern Alaska has zero days where they can grow feed for their animals and they have to import all their animal -- all their feed from Washington state up to northern Alaska for 2,000 cows, that makes total no sense for the organic paradigm in terms of sustainability and a fit between the land and the animals.

So, I'm just saying that if an -- if a farm can grow their feeds in the geographic area for their animals, then however they grow their stored feeds that same method can be used for grow their pasture and if no feeds can be grown in an area to feed those animals, then it just doesn't make sense that there be a farm there.

MEMBER JAMES: Okay. Thank you. I -- I -- I mean global -- global climates are subject to
change.

MS. ARNOLD: Unfortunately, yes.

MEMBER JAMES: I had one other question for you.

MS. ARNOLD: Okay.

MEMBER JAMES: And this is just my -- I -- I'm not a dairy farmer. So, it's just a question I have. On this disease that you mentioned that where the separation of the offspring from the mother to prevent transmission to the newborn, are those documented by a veterinarian and kept on file at the farm?

MS. ARNOLD: Well, Johne's -- I -- any well managed farm should know if they Johne's and what animals have it, but I -- I don't know that all farms because it's an expensive -- an expense to test all their animals, you know, not all farms do and I don't know that there is a protocol, but if -- if you're under -- if the farm's being well managed, their animals should all be tested so that they should know what animals are Johne's positive.
Unfortunately, Johne's does not show off until -- an animal has to be at least two years of age to be able to show on a test. So, there's going to be animals that you don't know whether or not -- if you -- if a farm has a Johne's positive herd, you're not going to know for sure until the animals are two years of age or older whether or not they're carrying it. That you have to make sure that that calf does not drink the milk of its mother.

MEMBER JAMES: Sure. I -- I -- I was just inquiring for -- during inspections if --

MS. ARNOLD: As far as organically, I don't think -- there -- there's nothing being asked about Johne's or other diseases like that.

CHAIRMAN RIDDLE: Hugh.

MEMBER KARREMAN: Just in relation to the Johne's, now, I don't want to get in a whole disease aspect of Johne's. You did very well.

MS. ARNOLD: Thanks.

MEMBER KARREMAN: Just that if you're going -- you can still have cows calve on pasture.
Just have two different paddocks. Like you dedicate one paddock for a pasture where the Johne's positive cows would calf in.

MS. ARNOLD: Yes, but then you still do not -- then somebody would have to be there when every birth happens so that the calf did not nurse. Even in confinement, somebody's got to be there to remove the calf from the cow to --

MEMBER KARREMAN: Absolutely. But, then you don't have the box stalls accumulating with the Johne organism.

CHAIRMAN RIDDLE: All right. Thanks. Thanks, Kathy.

MS. ARNOLD: You're welcome.

CHAIRMAN RIDDLE: Okay. Jim Pierce and David Cox, but there's an X next to David's name. Has David left? Okay. And covered his comments then. Okay. Thanks.

MR. PIERCE: I have material to
distribute, but it's not what I'm reading. So, I'll
hand it out at the end here.

Hello again. For the record since I
suspect most of you know this, I'm Jim Pierce, self
appointed certification czar of Organic Valley Crop
Cooperative.

When the notice of public comment of this
meeting went up on the NOP website on September 30th,
my initial reaction along with that of many of my
organic livestock standards policy contemporaries was
disbelief. As in, not again. Haven't we been through
this? Aren't these people listening?

Then I read it again and discovered
something that intrigued me more -- the more I thought
about it. It said "Specifically, USDA would like to
hear public comment on the following topics." This is
new.

As a regular suspect at these meetings, I
have addressed the NOSB nearly a score of times, but
never the NOP directly. I am pleased and honored to
do so now.
You folks sit back and relax. I have no doubt were you as the advisory board stand on the issue of pasture. In fact, it is obvious by looking at several of you now that you'd rather be on pasture with all the outdoor access.

Your position on the other hand -- your intent and position are more opaque however. So, it is well that you request this public comment and it is also wise that you compile testimony. The vast majority of which will be in favor of mandating pasture for ruminants either through existing regulations or through stricter rules.

On record already are the 40 to 50 organic dairy farmer comments presented at the February 2005 meeting. Testimony that day addressed the concerns outlined in your notice. Particularly memorable for me that day were New England dairyman Jack Laser looking for all the world like a hermit logger as he pointed to a two-foot stack of books on pasture and said there's your scientific documentation and Tony Alcevido, California dairyman as he said I'm sure glad
I don't have your job. It's hard.

Your job is hard, but it's your job and do it you must.

205.605, 205 pasture has been defined. In the preamble on page 80571, pasture is intended. In 205.237, pasture is mandated. The October 2001 recommendation by NOSB to require pasture has history.

As Jack Laser so gruffly pointed out in February, the benefits of pasture are documented. What pasture for organic ruminants needs now is to be implemented and enforced.

As a result of the NOSB action at the August 2005 meeting, there is now a pasture guidance document which will be of great value to producers and certifiers once there's regulation in place to shore it up.

For the record and for future reference, I am submitting written comments from Organic Valley Crop Cooperative. On behalf of this 725 member growers, we would like to go on record stating that the inclusion of growing season will create a scale
neutral framework for a pasture standard. That stage
of life applies to pasture better than stage of
production. That the most dramatic economic
implication of the USDA is if they do not enforce
pasture recommendations and the fact that it -- that
-- and the fact that certain geographic regions are
not well suited to the production of organic
ruminants.

In addition to this collective response,
we put the request of the NOP into a questionnaire
form and sent it to our producers. The first 15 or 20
returned responses are in the meeting book for future
reference. Hopefully, additional responses will be
considered as well.

For the record also, it should be noted
that Organic Valley has adopted the NOSB pasture
guidance policy as our cooperatives pasture guidance
policy. All 560 of our organic dairy producers are
either in compliance or working to come into
compliance with that policy. When access to pasture
becomes implemented and enforced, it's adoption by our
client farmers will be seamless.

The Livestock Committee has done the yeoman's work of drafting another draft -- drafting another draft recommendation which is enforced by the Board this morning as a draft. For your part, you have established a plan and timeline to move the process forward and I am confident that you will. That together we will in about a year have implemented enforceable pulpit-pounding pastor regulation.

It is unfortunate that it has taken so long since the delay is unfair to organic consumers and compliant farmers, but particularly for non-compliant producers. Hopefully, the writing on the wall is clear even now. When NOSB says pasture, they mean it.

Thanks to you all for your patience and perseverance that you devoted to this important issue and as usual and in particular to you Jim, Goldie, Rose, Dave and George, the graduating class of 2006, God bless and Godspeed.

Thank you.
CHAIRMAN RIDDLE: Thanks, Jim. Okay. Lisa Engelbert, it looks like Carol King has the proxy. Yes, well, you got three in a row here, but you can only add up to two. There's Lisa, then Kevin Engelbert and then yourself. Oh, you're going to carry one of those. Okay. So, yes, Carol.

MS. KING: I'm speaking on behalf of Open Air Certified Organic LLC. Oh, and I'm Carol King, co-administrator for Open Air Certified Organic LLC and I'm working with a proxy of Lisa Engelbert our other co-administrator.

Currently, Open Air Certified Organic is working with over 125 dairy farms including 18 farms in transition and the question is can you pasture for 120 days? Is it economic viable?

Currently, a majority of our farms have their cows on pasture from April through November. Many of these farms do after-grazing and practice intensive rotational grazing.

They -- many of these farms are also up in our north country which is right on the Canadian
border. So, they have a growing season from about end
of April to the end of August. So, they are
succeeding at that.

Also, someone earlier had mentioned
whether agency's actually look at pasture acreage. We
had done that and we do currently do that. Our
inspectors go out and look at acreage as they are
inspecting the farms and it's also part of our
inspection report.

We also have a guidance of .75 acres per a
thousand pound animal. That's not a realistic number,
but we use it as an estimate.

Pasture is a very important part of
organic dairy farming as has been stated in previous
recommendations. It improves health problems in the
animal and in the herds and I find it very interesting
when I talk to many of our farms that have
transitioned from conventional to organic. A year
after they have transitioned, they have found their
herd -- herd health bills have gone down and their
herds are much healthier. They are not have problems
with foot problems, mastitis. We have one herd that had Johne's. But, the herd health has improved. So, pasture does benefit the animal and the farmer.

And we would like to support and commend the Board's efforts to strengthen the pasture requirement wordings in the standards to eliminate loopholes.

Now, I'd also like to discuss the dairy transition rule. With the recent lawsuit and other changes to the law and regulations, it appears that the last third of gestation clause for dairy replacement animals will be eliminated. It is our opinion that once a dairy farm has completed their one-year transition and becomes certified no matter what transition rules they followed, all animals should be managed organically from the last third of gestation. This creates a closed organic system that is easily monitored.

We as a certifier experience the increasing pressure from many farms trying to use the two-track process. This creates inconsistency and
ties our hands. We have one farm down the road that is, you know, growing -- or raising their own animals or purchasing organic livestock and then have another farm down here that says oh, well, I transitioned before the rule went into effect. So, I can purchase conventional animals. It's not a fair process and it also creates problems as a certifier for documentation and tracking.

A continual state of transition completely invalidates the intent of the rule. It will open up a loophole that will potentially allow the use of prohibited substances and possibly non-organic feed including GMO feed on young stock.

We would like to encourage the Board to look at that aspect of the rule as well and to move forward with proposed lawmaking for the NOSB for replacement animals.

Thirdly, we'd like to discuss the use of antibiotics. The use of antibiotics should be limited to be administered by a licensed veterinarian to save an animal's life, but the treated animal must leave
the farm. We don't find it acceptable for the producer to have the antibiotics on hand because it's too easy to just go ahead and take it. Throw it in there and when our inspector walks in the barn and sees an antibiotic sitting on the shelf, it raises a lot of questions in our committee's minds.

Organic consumers are willing to pay a premium price for organic products and thus expect the product to be produced with no antibiotics or hormones.

An organic production's an integrity-based business. While most organic producers are of the highest integrity which we believe most of our producers are, there are some who aren't. The more cut and dry the standards are, the easier it is for certifiers to enforce them.

These are tough issues facing the NOSB, but it is imperative for the future of organic agriculture in this country to maintain strict enforceable standards and we appreciate all your efforts.
Thank you.

CHAIRMAN RIDDLE: Thanks, Carol. And I --
I'd just like to point out on the last third of
gestation issue and Kathy brought this up as well that
the Board already has adopted a recommendation on that
that the last third be required for all operations
regardless of how they converted to organic. So.

MS. KING: Where -- where --

CHAIRMAN RIDDLE: We don't have a draft on
that because we've already adopted it.

MS. KING: Right.

CHAIRMAN RIDDLE: Yes.

MS. KING: We're looking for it to come --

CHAIRMAN RIDDLE: Yes.

MS. KING: -- through on the lawmaking
process.

CHAIRMAN RIDDLE: The rule making. We
don't want to go to Congress for that. Okay. Yes,
Dave.

MEMBER CARTER: Just -- and I appreciate
your comment on the antibiotics and -- and
philosophically I'm with you on that. It's a little a
difficult. In some instances, the regulation has gone
beyond OFPA where it is right now because OFPA just
disallows sub-therapeutic uses of antibiotics. The
regulation talks about no use of antibiotics and just
making sure, but you're actually wanting to take it
completely off the farm if there's a use. You just
can't put into if you have a split operation?

MS. KING: Right. Right. Well, we have
-- we have split operations. We actually have a lot
of Amish farmers that'll keep it on hand for their
horses.

It just -- it's very hard. Our -- our
certification decisions are made by volunteer
committees and they are -- they are certified dairy
producers themselves whether they're certified by our
agency or other agencies. There -- there is actually
some that are certified by other agencies and -- and
they hold the integrity. They takes these files and
they go through them piece by piece by piece and we've
had auditors, USDA auditors come into our office and
go could you possibly have anymore paperwork. But, we find that it helps in the decision-making process and we've actually had producers come to us and -- and if they were using these antibiotics for their -- their horses or if they're raising pigs for their home use and we said you know what? Get rid of the antibiotics because it's too easy.

We can't enforce that and we know that. Okay. But, they've done it and they come to us and said, you know, we -- we've moved our organic practices onto the rest of our farm.

I think it's really funny when an organic dairy farm comes in. A lot of them are coming in for the -- the -- the bottom-line price on the milk. They come in. They transition. So, they have a little vegetable garden off to the side.

Now, I'll talk to them on the phone and they're scared to take that first step, but when I sit there and tell them, you know, all the success stories that we've had, they take the step and I talk to them a year later or, you know, throughout the course of
things and they say oh, you know, I -- I'm buying organic feed for pigs and all of a sudden, they're adding another production type and they stopped using the Round-Up on the weeds in their driveway. So.

MEMBER CARTER: Well, I -- just I understand what you're saying. We've gone through an experience though where somebody has sued because the regulations were out of compliance in -- in terms of OFPA, in terms of not being strong enough.

I would hate to see us go so strong with antibiotic it would raise somebody to say hey, I'm going to sue --

MS. KING: Another lawsuit.

MEMBER CARTER: -- because OFPA really only disallows sub-therapeutic use. So --

MS. KING: Yes.

MEMBER CARTER: -- a little hesitant to -- to stir the pot.

MS. KING: I understand. Thank you.

CHAIRMAN RIDDLE: All right. Thanks.

Kevin Engelbert. Yes. You have his proxy.
MR. SEGELL: I've got Kevin's. Yes.

MEMBER JAMES: So, you have a proxy.

MR. SEGELL: I have his proxy.

MEMBER JAMES: You do have a proxy.

MR. SEGELL: Yes.

MEMBER JAMES: Correct.

CHAIRMAN RIDDLE: And your name?

MR. SEGELL: I'm -- I'm Rick Segell.

CHAIRMAN RIDDLE: But, you're -- you're not signed up on your --

MR. SEGELL: I didn't sign up.

CHAIRMAN RIDDLE: Okay.

MR. SEGELL: It was e-mailed in, but --

CHAIRMAN RIDDLE: Yes, so, it's five --

MR. SEGELL: -- never got there. Okay.

CHAIRMAN RIDDLE: -- five minutes.

MR. SEGELL: This is for --

CHAIRMAN RIDDLE: Because his name -- his own name isn't on the list. Okay.

MR. SEGELL: This is for Kevin. He says I'd to thank NOP for allowing public comment. I'm
just reading.

CHAIRMAN RIDDLE: Okay. I'm sorry. I just want to be clear.

MEMBER SIEMON: You want to make your own testimony, too, once you do Kevin's. Don't you?

MR. SEGELL: I'd like to.

CHAIRMAN RIDDLE: Okay. And you sent an e-mail?

MR. SEGELL: I can give you the answers to the questions if that's what you'd like.

CHAIRMAN RIDDLE: Yes, and -- yes, I'm -- I was just confused. You did submit an e-mail, but Katherine Benham had been out of the office. So, there were some lost e-mails. So, yes --

MR. SEGELL: Okay.

CHAIRMAN RIDDLE: -- you'd have ten minutes.

MEMBER SIEMON: We'll give you ten minutes. Two -- two in row here.

CHAIRMAN RIDDLE: Your name again for the record.
MR. SEGELL: Rick Segell.

CHAIRMAN RIDDLE: Thank you.

MR. SEGELL: I'd like to quote a statement made by Richard Matthews, former NOP employee during the debate on pasture, February/March 2005 NOSB meeting.

Temporary confinement is still a problem. You have people out there who undoubtedly are taking advantage of the wording of this. For example, the broiler chickens never see the light of day.

I know you don't want that to happen, but it's happening and so, at some point down the road, we need to go back to the issues and look at all angles and try to come up with something that lends more to the concreteness of the issue. So, that -- so, we can eliminate what people are using for loopholes.

Unfortunately, for personal actions, you always write personal rules for the bad guys and all the rest of us suffer for it, but I see that this is being the kind of situation here where you have to write your regulations to prevent the bad guys from
taking advantage of it and it's -- and I'm taking the
turns of just dairy. I'm -- I'm taking the turns of
all animals that are suppose to be provided with
access to the outdoors and pasture.

There's 101 reasons probably even more why
I can't put my animals out today. The NOSB has done
-- done just that. I applaud their efforts. They
have come up with concrete rules and no subject to
interpretations eliminate the loopholes that Mr.
Matthews spoke of once and for all.

To allow the issue to be sidestep any
longer risks its damage to the integrity of organic
agriculture. There cannot be two sets of organic
standards. One which is less restrictive for those
who choose not to meet the original requirements of
organic production. All the organic farmers and
consumers must find function in this -- within the
same rules.

I strongly encourage NOP to join NOSB in
keeping the rules at least as strict as they were
originally intended. USDA organic label has come to
be held in high esteem by organic farmers and consumers alike. To -- to maintain the strict standards will -- not to maintain the strict standards will jeopardize the lawfully position.

Thank you very much, Kevin K. Engelbert.

Going through the -- the questionnaire and I currently have about 115 milk cows totally with dry cows. I have about 160 acres of pasture, about 300 acres of cropland. My cows average around five maybe six lactations. I have some that are over ten.

My pasture -- I put them on pasture in beginning of May and they're still out on pasture now. There's not much there, but they -- they still go out and they -- they eat and -- and they'll have access during the winter daily let-out during -- during the day in the wintertime just to go out and exercise. So, yes, I do allow pasture 180 to 200 days.

How do I find pasture? Adequate vegetation so the cows can get 30 to 35 percent of their dry matter. There are times when I first put
the animals out in the spring of the year they're getting over 50 percent and then there's probably a few days in July where they're -- they're not getting quit 30 percent, but it -- it still averages well over 30 to 35 percent.

Do I confine my calves from birthing? Actually, I have a -- a lot in the summertime that I put my dry cows in that are going to calve which is -- it's a pasture. About a two and half/three acre pasture. I put the close up ones in and their calves -- they're right there. They're right next to the house. So, we -- we're across the barn. So, we can see where they are, but they do -- they're out on pasture for that.

Do I consider lactation a stage of life they should be confined? No. My -- my milk cows I think it's more important for them to be on pasture than the dry cows.

My somatic cell count is down under a 100,000 which is real low.

I used -- I used to be conventional and I
-- I used to spend $700/$800 a month treating cows with mastitis. Now, they're on pasture. I don't see that.

It -- it -- and as far as antibiotics, I haven't used any. I don't really have sick cows. I call for production and just to get the numbers down so that I'm not over populating the pastures.

My growing season, well, it -- like I say, the first frost is -- or the last frost of the -- in the spring is about the 15th of May and the first frost is usually around the first of October. Sometimes before and sometimes like this year was like the end of October.

I think all -- I think all ruminants should be out on pasture. I mean that -- that's the way they were designed and will I have further comments, yes, I hear rumors that Congress is trying to change rules for us and I don't think we should let them do it and I think these boys over here got to go back and rattle a few chains and tell them that ain't going to happen.
CHAIRMAN RIDDLE: Okay. Thanks, Rick.
Bea and then Nancy.

MEMBER JAMES: I just wanted to -- to thank you for taking the precious time off of your farm to come here to lobby so you can continue to do a good job. Thank you.

MR. SEGELL: Well, it gave me a chance to stop off and see my daughter along the way. She lives in Philly. I stayed there last night and I get out of here tonight, I'll stay there tonight and we'll go out to dinner. So.

MEMBER JAMES: Oh, you -- you should have gone with it. You could have made everybody think you came just for that.

CHAIRMAN RIDDLE: All right. One more. Nancy.

MEMBER OSTIGUY: Yes, thank you very much for coming. Your -- your comments I'm assuming to the NOP about convincing Congress to not do something, they really can't do that and we can't as Board...
members. We can do that as individuals.

MR. SEGELL: Yes, but --

MEMBER OSTIGUY: But, the administrative branch --

MR. SEGELL: -- but haven't they tried to pass an amendment or something?

MEMBER SIEMON: Not on pasture.

MEMBER OSTIGUY: No, not on pasture.

MEMBER SIEMON: Not on pasture.

MEMBER OSTIGUY: Not on pasture.

MR. SEGELL: Well.

MEMBER OSTIGUY: And even if they do, it's as members of the public we can say things, but --

MR. SEGELL: Well, I'm sure -- I'm sure the consumers and the --

MEMBER OSTIGUY: -- but the administrative branch can't.

MR. SEGELL: -- dairy farmers will. Thank you.

MEMBER OSTIGUY: Okay.

CHAIRMAN RIDDLE: Thanks so much for
coming. Dave Engel, I think you have Lesley Zook's
time. You traded with her. I'm sorry. I forgot to
give you a warning, but you're next if you're ready.

MR. ENGEL: Yes.

CHAIRMAN RIDDLE: Okay. Good.

MR. ENGEL: I don't have a time.

CHAIRMAN RIDDLE: I just --

MR. ENGEL: It's five minutes for me, too.

CHAIRMAN RIDDLE: I'm sorry. I'm really

losing it. Then Joe Mendelson would be next and then

Emily Brown Rosen and that's it.

MR. ENGEL: Good afternoon. My name is

David Engel. I'm a dairy farmer from Wisconsin.

I've milked cows since 1981. I was one of

the original Crop dairy farmers that started Crop in

1988. I also have been intimately involved with the
dairy standards -- the organic dairy standards and I
too would like to since 1988 -- 1989 actually was when

we took them to OCIA and got them going.

And I too would like to acknowledge
greatly the -- the work of everybody in this room, the
NOP, the NOSB and members of the community that show up.

My main concern as in the past continues to be the numbers. At this point today -- well, let's -- let's back up half a step. Coming from the last meeting in August, there were numbers being put forth, the 120 days, 30 percent into the guidelines. Today, there -- the 120 days has made its way into a proposed draft for the rule.

And I also have worked with the dairy standards as a certifier for 17 years and if you look at the rule, there are a number of numbers in the rule, but there are only six that deal with production. For example, the compost numbers which were problematic. They came out and they raised a huge concern. It was addressed by a task force and basically that task force ended up saying there are other ways to make compost.

Other numbers that are there that have been problematic or are just lines in the sand like the 70 percent, 95 percent, 100 percent. I mean
that's the one year for the dairy, the three years for the land. Those are numbers that are not -- you know, they're appropriate numbers, but when you get down to a crop rotation or a management style on a dairy or square feet for animals in the building, those are not numbers that you want to put in a rule. I cannot stress that enough.

In listening to the public comments today and in the past, they kind of go back and forth, but the one thing that comes out is that they want pasture and I don't think that that's an issue. We all want pasture, but I can tell you from experience, my own experience of milking cows that numbers is not what I want to wake up to during the day, everyday and try to figure out oh, where am I at? This 119 days. Am I at 89 days? It just -- there's -- there's two things happening here. There's two dynamics happening here and the numbers are not in the spirit of the rule and we all -- we -- I mean I've talked with a lot of the farmers that have come here and they -- they admit that it's -- it's a pass that we've come to.
Mr. Segell put it eloquently. I guess he was quoting Kevin Engelbert that we just want the standards to be enforced and that's really the bottom line is enforcement.

It first starts out with a certifier identifying via a farm plan where things are at. They make a decision. I don't know if Joe is still here or not, but there have been several comments concerning interpretation. We just want to be clear what we have to do. Well, every rule regardless of whether it has numbers or not will have to be interpreted and the interpretation is going to vary. It's -- it's inevitable.

You had an exchange, Dave, with the NRCS. That was something that came up at the last -- not the last meeting, the meeting in March I believe and it seems to have faded away, but, you know, there's tools out there to use. We -- I just would really, really caution putting a number in the rule because at that point it's a whole another ball game regulatorily with the certifier. They're going to have to issue a
noncompliance. At that point, it's out of their hands.

You know, another point that I would to Mr. Segell's comments and I'm not sure where he's at on this, but, you know, he admitted that it's a lot easier to put the cows out on pasture than it is the dry cows and you're talking about everything after six months. There's a lot of -- of complexity to a dairy.

CHAIRMAN RIDDLE: That was it.

MR. ENGEL: Okay.

CHAIRMAN RIDDLE: All right. Thanks, Dave.

MR. ENGEL: Thank you.

CHAIRMAN RIDDLE: Joe Mendelson. Then Emily Brown Rosen and then I will call the names of the people from earlier and see if they've arrived.

MR. MENDELSON: No. No, I don't. All set. Good afternoon. My name's Joe Mendelson. I'm with the Center for Food Safety, a nonprofit organization here in Washington, D.C. and with offices also out in San Francisco, California.
Oh, better. That's what you get when you're short. You know, you got to move the microphone.

Again, my name is Joe Mendelson. I'm with the Center for Food Safety. We're a nonprofit organization based here in Washington, D.C.

This is the first time I was able to address the Board at this meeting. I want to thank you again for your hard work and thank the five outgoing members for all their hard work in the program as well.

Just in general, the Center for Food Safety supports the recommendation that you voted out. The draft recommendation you voted out today.

I do want to say a bit on consumer expectation. You know, as an organization that represents mainly consumers, you know, when they purchase an organic product specifically milk, they expect that -- that by purchasing that product they're contributing to the animals ability to enjoy natural behavior. That they are making a significant
contribution to the better welfare treatment of that animal and that means that they would like very clearly a mandatory requirement for access to pasture and to have that clarified to know what they are purchasing. Essentially, what they are supporting.

Without question, I would add that that consumer attitude has been reinforced by the marketing of organic milk. This morning when I got milk, it was -- I believe a Safeway brand organic milk. It was a nice picture of cows and a superimposed photograph of cows out in pasture and I wanted to bring the carton. So, I kept forcing my kids to try and have more cereal to get the milk done, but that didn't quite work. But, you know, you know, you can't have it both ways. If you're marketing an imagine of pasture and you further an expectation of consumer -- of -- of the -- the -- you further an expectation in consumers and you better met that expectation.

I would also just add briefly that there's no question that the -- the word pasture is being
abused. Joe Smille made sort of an offhanded comment, but I have a Washington Post advertisement from the grocery store that advertises a sale for organic shrimp that says pastured in artisan water. So, you know, not only do we need clarity on what it defines, we need enforcement of what it means.

I'm glad to hear, of course, the programs going to an ANPRM that we're going to have a regulation we support as prescriptive a standard in a regulation that's binding not in guidance and I just hope after the ANPRM that we move diligently to a proposed rule and a final rule.

Specifically on the draft, I had a couple of comments. I was looking at the -- the first draft before the Board put it out. Just a couple of things on global warming and climate change were alluded to in that draft. To set the record straight, ammonia is not a -- ammonium is not a greenhouse gas. It's an air pollutant, but it's not a greenhouse gas and sulfite I think was also suggested to be a greenhouse gas. I think it's sulfur dioxide are the greenhouse
gases. But, certainly the diet of any cow affects the
methane emissions and methane is clearly a greenhouse
gas and there's a -- a huge store of literature on the
benefits of carbon dioxide sequestration in pasture of
grasslands and in effect, numerous USDA programs to
promote carbon sequestration through things like
managed pasture.

Okay. Stage of life, I'm not sure what
that means. I turned 40 in February. Some people say
I'm going to be entering a mid-life crisis. That's
certainly a stage of life. I'm not sure if it's more
prescriptive, but certainly, I think what you did is
far as listing in 239(a)(2)1, 2 and 3 is a good step
forward.

As -- as far as 120 days, we support.
Actual numbers I think reference to growing season as
well could be added. We want to see those 120 days
clearly as a minimum and a basement not as the
standard that you'd want.

As far as the dietary feed issue and
number, you know, as a consumer organization, we don't
have the expertise in that. I will say that citing issues because organic has been told to us be an environmental standard, citing issues are well within the realm to consider.

And lastly, on the economic considerations, I -- I do have to agree on that I felt the USDA questioned skewed -- was only half a loaf I should say. I mean there should be consideration to what was the ultimate economic effect if we do not put in these strict standards and how will that affect consumer attitude, hence the market and then farmers.

Thank you.

CHAIRMAN RIDDLE: Thanks, Joe. Emily Brown Rosen and then like I said I'll -- I'll call as she's coming up. Is Dr. Juan Velez? Matt Van Baale? Dennis Stiffler? Okay. None have come.

Emily, you get the last word.

MS. ROSEN: Okay and this is not my word. I'm reading this for Marty Mesh who sent this in. He regrets that due to a family emergency he's not able to be here in person.
So, I just have one thought here and okay.
So, I'm just going to read it. So, it's not me.
Think of Marty. Okay.

CHAIRMAN RIDDLE: Think of Marty.

MS. ROSEN: Okay. Okay. As always these comments are my own and do reflect the official position of any organization that I serve on the board of, but may reflect the position of Florida Organic Growers and our certification program quality of services -- certification services. Okay.

Since the subject of pasture needs to be in my comments, let me request that NOSB and NOP move expeditiously to clarify the issue of pasture requirements. This is needed to maintain consumer confidence and insure consistency in the implementation of the regulation.

The issue has been discussed at length and it is past time for this Board and the NOP to move forward and put to rest the chatter that tries to analyze whether the inaction is a corporate conspiracy or incompetence.
That's Marty.

I want to thank the USDA for their hard work, responsiveness and a renewed commitment to moving the program forward. I would like to know the status of the Aquaculture Task Force given that we've petitioned for expedited rule making approximately 18 months ago. We still stand ready to be part of the task force or aid in moving the process forward toward a proposed rule for pond-raised organic shrimp and talipia.

We hope that the final rule from the September proposed rule will correctly allow the materials to be used in organic -- oh, he means that docket, Federal Register docket. That the final rule that comes out of that will allow the materials to be used in organic products as they were recommended by the Board as opposed to the made-with limitation.

However, the main point I wish to express and I'm saddened that I can't be there in person to make is to say thank you to Jim, Dave, Goldie, George and Rose for the many years of hard work and service.
You have each brought not only your passion to the Board, but considerable competence and integrity.

Rose, I know my credibility may have suffered in your eyes, but just as I told you oh, so many years ago that you would be great for the NOSB and yes, there are a few to attend and well, maybe a little work to do between those meetings, now, that you have some spare time, I have another idea we can talk about when you get home. Really this won't be much work and you're perfect for it. Trust me. Okay.

Seriously, I wish each of you the best of luck in the future and look forward to someone telling each of you that you're time is up for your public comment in the future.

In honor of all your patience and hard work, I give the rest of my time for you to divide up and utilize in the future.

Thank you, Marty.

CHAIRMAN RIDDLE: We won't save it for him.

MS. ROSEN: All right. And I'd like to
express my thanks also personally to all of -- all of you, especially you that are leaving for the really hard work and -- and the incredible dedication and time you've put into it. It's been -- it's been very good.

CHAIRMAN RIDDLE: Okay. Thanks, Emily and thanks to all of you who commented and all of the rest of you who have stuck with us. Yes.

MEMBER O'RELL: If I may.

CHAIRMAN RIDDLE: Yes. We have a few comments. If you're leaving, please do so quietly. We're still in session. So, Kevin and then Barbara.

MEMBER O'RELL: Just before we -- we do wrap things up and -- and close, I just want to say and I know everybody on this Board knows how much hard work is involved in this Board and we have a group that came on together and all five of them have gone through the five years. It's a tremendous amount of work that they have put forth on this Board. I've served with them for four of those five years and it's
just been a -- a good exciting time and a learning experience.

To George, Rosie, Goldie, Dave and Jim, I just want to express on behalf of the full Board thank you so much for all your dedication work and it's a hard act to follow, but we'll keep the ball moving. So, thank you.

MS. ROBINSON: Well, you sort of stole my --

MEMBER O'RELL: I'm sorry, Barbara.

MS. ROBINSON: But, actually, that's all right. Just the applause part. I guess I should identify myself for the record. Barbara Robinson, USDA.

But, Jim, Rose, George, Dave and Goldie, on behalf of USDA and on behalf of the Secretary of Agriculture, but also on behalf of myself and my staff, I want to thank all of you very much for all of your hard work, for your dedication. I know that it's been -- I know how much hard work is involved and you do it without pay. You do it for the passion that you
feel for this industry and for the people in this industry. We know that. We appreciate it and we thank you very, very much for all that you have done.

I started to say especially you, Jim, but I'm not giving you that one.

Anyway, I will say especially you, Jim, because you have probably taught me more than anybody on this Board and it has been quite a learning experience.

CHAIRMAN RIDDLE: Thank you, Barbara. Dave still has something to say.

MEMBER CARTER: Well, I just -- I don't want to go into long swan songs here. I do want to thank Jim for the work that he has given this last year as our chair in addition to all of the four years previous, all of the heavy lifting. Because I think the rest of the class here would say Jim has been the person that has probably rolled up his sleeves and done more work than -- than all of us combined and -- and we appreciate that.

I just want to say I've -- through the
years I had a number of folks ask how the heck did you ever get on the NOSB to me and this is time for true confession. Is that several years ago Farmer's Union decided they wanted to have somebody, a representative on the NOSB. I was working for them at the time. So, they called me up and they said Dave, can you find a farmer to be on there and I called up Paul New down in the San Louise Valley and asked him and he said my Lord, you'd have to be an idiot to want to be on the NOSB and -- and then I called up Andy Grant and he said you'd have to be nuts to be on the NOSB and then I called Pam Roy down in New Mexico and she said you'd have to be crazy to be on the NOSB and so, I asked them to get together and find a consensus candidate and they called back and they said we agreed you'd be the best person to be on there and it's nice to know that sometimes I haven't failed their expectations.

So, anyway, you know, we've thanked -- we've thanked the program and the folks, but I -- I think I'm the class of five here, too. I'd to thank all of you that come to the meetings and have helped
teach all of us and keep us straight as we've gone along.

So, this is a great community and as we transition into different phases of it, we look at still being an active part of the community and as being on the other side of the microphone.

CHAIRMAN RIDDLE: Anyone else? No. Okay. Well, I -- I want to give my own thanks. I guess first to the rest of this class for all of your work and just the spirit, the -- the respect, the honesty that you all bring and the expertise that you lend.

To all the Board and -- and the people I have served with whose terms have already ended, it has taught me a great deal, but the thing that I most am encouraged by is just the attitude of cooperation, collaboration, the engagement that we have with the program now that was absent. I mean it was the opposite of cooperation for awhile there and I see that as the -- the greatest accomplishment that -- that we have made despite, you know, beyond any of the documents, but it's just the -- the attitude.
So, I really appreciate all of you at the program rising to the occasion and just your patience in working with me and -- and tolerating my style. Because it's not probably something you see in the hallways at USDA everyday. So. Okay.

So, with that, I won't go on. Is there a -- a motion --

MEMBER O'RELL: So moved.

CHAIRMAN RIDDLE: -- to adjourn?

MEMBER CARTER: We adjourn.

CHAIRMAN RIDDLE: Okay. Kevin moves we adjourn. Dave seconds. All in favor say aye.

(Ayes.)

CHAIRMAN RIDDLE: All right. Thank you very much.

(Whereupon, the meeting was concluded at 4:42 p.m.)

NATIONAL ORGANIC STANDARDS BOARD
SYMPOSIUM

+ + + + +

Tuesday, April 18, 2006

+ + + + +

The symposium met in the Ramada Conference Center, 1450 South Atherton Street, State College, PA, at 1:00 p.m., Robert Anderson, Facilitator, presiding.

PANEL MEMBERS PRESENT:

ROBERT ANDERSON, Facilitator
JAMES B. CROPPER, USDA Natural Resources Conservation Service
GEORGE KUEPPER, NCAT, ATTRA
CARL POLAN, Dairy Science Department, Virginia Tech
KATHY J. SODER, USDA Agricultural Research Service
LINDA TIKOFSKY, DVM, Cornell University
ANN WELLS, DVM, Springpond Holistic Animal Health
BOARD MEMBERS PRESENT:

KEVIN O'RELL Chair
ANDREA CAROE Vice-Chair
BEA JAMES Secretary
GERALD DAVIS Member
RIGOBERTO DELGADO Member
KEVIN ENGELBERT Member
DAN GIACOMINI Member
JENNIFER HALL Member
HUBERT KARREMAN Member
JEFF MOYER Member
NANCY OSTIGUY Member
JOE SMILLIE Member
JULIE WEISMAN Member

STAFF PRESENT:

BARBARA ROBINSON

(1:08 p.m.)

FACILITATOR ANDERSON:  It is my pleasure to introduce Barbara Robinson.

MS. ROBINSON:  Good afternoon.

All right, that will be the last time you do that.

(Laughter.)

MS. ROBINSON:  I want to welcome everybody to Pennsylvania and to this Dairy Symposium. I'm glad to see that we have managed to get this all organized, but it is in no small way thanks to the National Organic Standards Board, in particular the Livestock Committee and Mike Lacey, who couldn't be here today, the chair, but in his absence, Hugh Karreman is the acting chair of the Livestock Committee, and so without further ado, I want to introduce Hugh to you, so go ahead Hugh.

MEMBER KARREMAN:  Thank you, Barbara. I don't want to take any extra time than needed, but I would certainly like to
introduce Bob Anderson, our moderator for the afternoon, and it is honestly a high honor to introduce Bob.

As a matter of fact, probably my very first contact with organic agriculture was when I was a little suburban kid outside of Philly, and we went up to Walnut Acres back in the late seventies, and I imagine Bob was up there, so I think you have been part of my path in this organic stream, here.

So, in any event, I would like to give a little biographical sketch of Bob Anderson right now. He has been, for over 35 years, hands-on experience in all facets of organic agriculture, organic food production, processing, marketing, and retailing, as well as leadership experience in the development of national organic policy standards and organic certification.

He is the founder of Sustainable Strategies, advisors in food and agriculture, and currently is a strategic advisor to
organic agricultural initiatives and organic industry projects, as well as a USDA farm agricultural service in the United States Department of State.

Until 2002, he was president of Walnut Acres Organic Farms, one of the founding and most respected organic food businesses in the United States. Bob's co-developed a food security program that guides food processors, handlers, and producers through the development of comprehensive food security plans that focuses on crisis prevention, preparation, and protection in the era of international trade and bio-terrorism.

He is a recognized authority on organic farming, organic processing, organic foods, organic certification, and international trade. He served as the United States Secretary of Agriculture as an advisor for organic agriculture and international trade and served as a chairman of the National Organic Standards Board.
Bob is the first organic industry representative appointed to the Foreign Agricultural Service Agriculture Trade Advisory committee and was recently reappointed to the food processing ATAC. He is a former director and past president of the Organic Trade Association.

During the comment periods for the proposed National Organic Rules, he was a primary spokesman for the National Organic Standards board and the organic industry, and I think at that, I will let Bob take the mic.

FACILITATOR ANDERSON: Thank you.

Before I say anything else, that Blackberry -- that Blackberry is not mine. It is one that was found out in the hall, so if somebody is missing their life link, we have it.

(Laughter.)

FACILITATOR ANDERSON: Well, welcome to springtime in Pennsylvania. It doesn't get any more beautiful than today, here, and it is our pleasure to be the hosts
for this Dairy Symposium. It is also very fitting that this symposium is being held here in Pennsylvania.

Pennsylvania is the home to a lot of organic production, especially dairy, and Pennsylvania ranks third in the nation in organic dairy production. This highly-regarded -- this -- and the foundations of U.S. organic agriculture had their beginnings in their rolling valleys with both Rodale and Walnut Acres pioneering the way.

And welcome. I want to welcome you, too, to Penn State, the domain of the Nittany Lion, Joe Paterno, and Penn State University. This highly-regarded land grant university is home to a premier college of agriculture, and Penn State Cooperative Extension is recognized worldwide for its work in agriculture.

I was just recently in Armenia, and I met no less than four Penn State extension agents working there in one way or
another. It is my pleasure to introduce you to Daney Jackson, the director of Penn State University's cooperative extension. Daney?

MR. JACKSON: Thank you, Bob. It's my pleasure to welcome you to Happy Valley. This is, as Bob said, this is a beautiful time of the year in the Happy Valley area, and it is especially great after having a successful football season last fall.

This is my -- I started my fourth year at Penn State, and the first couple of years were not quite as fun in the fall as they were this year, but they have been great this year, and I really learned what it is like to have Nittany Lion pride. I encourage you to get by our campus, visit our campus. It's a beautiful time of year.

There are a lot of things going on with students right now. It's the culmination of the academic year, so we are heading into stressful times for some of them, but it's also a lot of fun times. I encourage you to
go by and visit our creamery, another thing which we are pretty famous for, so I encourage you to get by there.

I want to welcome you here. We are really glad to have you here. We are really glad to have all of you, especially the NOSB. We're glad to have you in the state college area and looking at some of the issues facing organic agriculture in Pennsylvania. We believe that organic agriculture, in particular, is a growth area for Pennsylvania agriculture.

It is an area where we see great promise. We think there is going to be significant growth in the market of opportunities, and also some challenges we have to overcome, but also there is going to be a lot of opportunities there for us when we are innovative and can come up with the answers to some questions that you may have through our research programs and help with our education programs.
We are encouraging our faculty and staff to get educated, to get involved in some of the programs related to organic agriculture as well as other types of -- and value-added programs, looking at community agriculture, community-based agriculture.

We are looking at opportunities for making some investments. It is a difficult time for us to be making investments in new programs, but we do believe that this is an area that we need to be investing in. We have put some investments into the programs over the last few years at a time when we have declining resources and have actually eliminated almost 20% of our permanent workforce over the last five years, so we are challenged, but we are trying to meet some of the challenges.

We have dedicated some of our land resources to some projects. We don't have anything, to my knowledge -- Barry, you may tell me, in organic dairy at all, do we?
Hopefully, that will change sometime soon.

Your support and encouragement for our programs and our faculty to get involved and stay involved in programs that are important to you are very helpful to us in administration to encourage growth in that area, so we encourage you to get involved with our programs and stay engaged and talk about the things that are important to you so that our faculty and our educators do get involved.

We think that there are some great opportunities in the future here. We would like to see that growth in the programs, and hopefully, we want Penn State to be an emerging leader in the area. Bob said we are third in organic dairy, so hopefully we will be number one in organic dairy real soon, so -- and hopefully that will be some great increases in milk production and products for families in Pennsylvania.

So, I want to welcome you here. I apologize for having to leave pretty soon. I
have a -- I'm serving actually on a panel across town of another meeting in a few minutes, with the Ag Bankers Association. I'm not sure why they wanted me on the panel, but I guess I'll find out real soon.

So, welcome to Pennsylvania, welcome to the Happy Valley area, and I hope you have an opportunity to visit our campus. We're excited to have you here, and I hope you have a very fruitful and productive meeting over the next couple of days. Thank you.

FACILITATOR ANDERSON: Thank you, Daney. We will be looking forward to the ribbon-cutting on the organic dairy project. Well, this is the Dairy Symposium. It is two days, and it is a little bit like deja-vu for me, you know, I've been to a lot of these meetings for many, many years, and I think this is one of the more important seminars we've had in a long, long time, and it will be on organic dairy production and the role of pasture for organic livestock, particularly
ruminants, and especially dairy cows.

As you know, USDA has issued and announced an advanced notice of proposed rule-making, which openly asks for information and guidance on many important issues regarding organic dairy. We are here today as part of an information-gathering process, and at the beginning, very much at the beginning of the process.

Today, we will focus on the big picture of pasture and resource-management and livestock health. We've got a table of people very, very experienced, with lots of expertise. The purpose of all of these meetings is to provide the NOSB and the national organic program with information as they consider the issues that are facing us today.

Tomorrow, we will begin with, in the morning, at eight o'clock sharp, with people who are actually working the land, working their farms, herds, and making and
processing organic dairy products. We will follow by certifiers, who are charged with auditing and verifying organic dairy products and practices, and we will conclude with presentations on consumer expectations and perceptions.

It's a little bit about the process so that we are all comfortable with how this is going and how we will go. Under all of this lies the importance of understanding the implications and the impact of pasture regulations on resources, dairy animals, producers, processors, certifiers, and ultimately, the consumer.

We have lots of informed presenters here to address the questions raised in the ANPR. NOSB and NOP are here to listen and broaden their understanding as they weigh the issues and develop recommendations for the Secretary of Agriculture.

This is primarily an NOSB/NOP meeting, so the symposium will occur very much
like an NOSB meeting, with comments and questions coming primarily from the board. However, public input is very important to this whole process, and so, we will -- and the ANPR clearly encourages public comment.

So there are three ways -- we will -- as the -- after the presentations in groups, the board and NOP will have the opportunity to question the and comment to the presenters, and as time permits, we will take questions on written cards, and those will be -- come to queue in the livestock committee, and we will go through that, and they will bring those questions to me.

We will answer as many of those as possible, but I assure you that if -- we will read as many, and if we can't address all the questions, we will read as many as possible, and if we can't answer all of those or address all of those, they will be scanned into the public record. So every question will be a matter of public document.
The other is that it is very important to understand that there is a public input session at the beginning of the National Organic Standards Board meeting tomorrow, and I understand that already, six and a half hours of testimony or presentations are already lined up for tomorrow, and at five minutes a piece, I didn't do the math, but that's a lot of people.

So, it's great that everyone is here and having input. And finally, there is the opportunity to make written comments, and all comments, whether they are written, whether they are oral, whether they are read in, will be a part of the public record, and they will all be weight equally. So, however, we ultimately make our presentations. We will be heard.

Written comments, as a note, on the ANPR, are due on June 12th. However, that is just the beginning of the process because this is the proposed rule-making process, but
if you want to comment on this particular phase of the ANPR, then it is June 12th is the deadline.

And once again, I do want to say that all comments will be weighed equally, no matter how you make that presentation. Ultimately, we are going to focus on three questions, and they come from the scope of the ANPR. And the first question, the USDA is seeking input on the following issues, and I will read these.

Is the current role of pasture in the NOP regulation adequate for dairy livestock under principles of organic livestock management and production? Is the role of pasture adequate for other types of organic livestock? That's question number one.

Number two. If the current rule of pasture as it is described in the NOP regulation is not adequate, in your opinion, explain what factors should be considered to
improve the role of pasture within the NOP regulation. And please provide any available evidence that supports your view.

And three. Which parts of the NOP regulation should be changed to address the role of pasture in organic livestock management? And I won't read the whole thing, but it -- the various sections are cited where those occur, including production, handling, feed, and health care and living condition.

And ultimately, should the organic system plan requirements be changed to introduce a specific means to measure and evaluate compliance with pasture requirements for all producers of dairy or other livestock operation, or should a new standard be developed just for pasture alone?

So those are the overriding questions that we will all be grappling with, but we will start with our presentation. It is really my pleasure to be here, and we are going to first talk about pasture and pasture
as a resource-management, and we have three panelists here now.

George Cooper is the -- has an MS in Agronomy from the University of Wisconsin. He's got -- has over 25 years of experience in sustainable and organic agriculture. His work as a farm manager, research, and educator, primarily in the non-profit sector, and he is currently a program specialist for the National Center for Appropriate Technology, on the ATTRA project and has developed educational and compliance materials for the National Organic Program. George?

PANELIST KUEPPER: Okay. I guess we are supposed to use the microphone, right?

Okay, next slide. Okay. People can hear me, huh? Okay, great. It's a real pleasure to be here. I thought by way of clarification, I am with the National Center for Appropriate Technology, and not many people hear about that, but you do hear about the ATTRA project quite a bit.
ATTRA is a federally-funded project. We are called the National Sustainable Agriculture Information Service, which really defines what we do. We develop and distribute information on sustainable farming, and the organic community is a big consumer of materials that we produce and distribute.

In terms of my presentation today, I mean, I am really a row -- pardon me, a row crops agronomist, and I am going to stick to something, you know, I know a little bit more about, and that is the role of forages, you know, pasture or hay, within the traditional organic system.

To sort of give a little bit of background on that, a little bit of history, if we were looking for kind of a consistent management philosophy for organics that is carried through from the beginning, we would be looking at something called Humus farming, which is an approach to farming that really
coalesced as a single idea around the 19-teens.

It's focused on this idea of returning organic matter to the soil, of building the organic content of the soil and all the organisms and everything that work to make the soil a living organism. That's the basis of fertility.

Around the 1940s, Humus farming in the vernacular became organic farming. That's when Robert Rodale, I mean J.I. Rodale and a few others sort of coined that term and put it into use. The first real study of Humus farming become organic farming was done in the mid-seventies out of Washington University, and one of the former NOSB members here, Willy Lockevetz, was the director of that study, and, you know, I was real fortunate. I happened to be on that team, got hired on there, you know, and it was sort of the high point of my otherwise misspent youth.

(Laughter.)
PANELIST KUEPPER: But yes, it was a great study, ran for about five years. At the time, a million dollars bought a whole lot more than it does today, but we covered a lot of ground. The economic findings were probably the most significant part of this study. Just finding that there was commercial agronomic crop production in the corn belt was a significant finding.

But what really kind of shook everybody was how well these farmers were doing economically. They were doing about as well as their conventional peers, and that was sewing into the conventional market because at that time, the organic market really didn't exist in the mid-west. That was to come later.

You'll note -- I footnoted it there, I'm referring to a study now the results of which are 25 to 30 years old, but I find as new studies of organics are done that basically, they are just confirming the
findings that we had way the heck back, and another reason I refer to the study is it's been the only one that covers as much ground as I hope to cover here.

I want to talk mainly about the environmental impacts of this type of organic system. When we studied it, we found reduced energy consumption. I believe it was two-fifths the amount of fossil fuel energy was used in organic crop productions as used in conventional production.

There was a third less erosion on organic farms, and that was based on the crop mix alone. When we studied those farms, and this is a little bit of a side note, all the organic farms that I visited were using some form of conservation tillage at the time. Either mulch tillage or ridge tillage, and this was almost unseen through the rest of the corn belt.

So really, you know, and to hear the debate these days of no-till versus
organic. Organic is sorely mischaracterized in that debate. I think that's an important thing for people to realize.

Higher carbon sequestration. You know, definitely an issue related to global warming. No depletion of fertility. Again, one of the criticisms of organics is that it mines soil nutrients. Well, we did not find that, and subsequent studies like the ones done by Davis, here -- we are finding this is a regenerative approach to agriculture. That it actually is building soil fertility.

You know, Robert Rodale, I think it was, tried to coin the term "regenerative agriculture." It just didn't catch on, but -- and I'm sorry that it didn't because it really did apply. And another, speaking of Rodale, one that I site up here is the long-term Rodale study.

One of the things that they did that we didn't do is look at nutrient leaching, and again, under an organic system,
you find a lot less nutrient leaching. Again, related to all the ground water contamination issues, and the leach nitrate is the big problem. The Gulf of Mexico Dead Zone, related to this same issue.

I will mention one back thing on that slide. All those environmental benefits for organics, notice that it didn't even mention pesticides yet? We are talking about everything but. What I wanted to tie this to, one of the things that we were asked to reference as speakers, is, you know, what do consumers expect?

Well, they do expect environmental friendliness, and this is something that obviously organic agriculture is capable of delivering on. You know, we are working on something really good the consumers really do want.

Tying that into forages and animals, what I am basically going to say and what the thrust of what I am going to talk
about is that the forages in an organic system are the primary aspect that delivers on these environmental benefits.

This is a real typical rotation. If you are not used to looking at crop rotations, this is the kind that we saw in the corn belt back in the seventies, and it still exists, and they are still very workable today. If you have not looked at them before, imagine a farm with six fields, and one of these crops or crop stages is on each of those fields, and over time, every year, that sequence changes, okay?

Up here I show alfalfa as the forage crop. That could be clover. It could be clover and grass, alfalfa and grass, lespedeza, any mix of legumes and grass. Just think forage where you see alfalfa. In this system, what really drives the system or makes the system work is nitrogen.

Nitrogen is the limiting nutrient in organic systems, just like it is in
conventional systems, only in an organic system, you grow the nitrogen rather than bringing it in as in hydrous ammonia or some derivative of an hydrous. That nitrogen is fixed mostly in that phase, the phase where the forages are out there.

It is the legumes that fix nitrogen in symbiotic relationship with bacteria. That nitrogen then carries over, feeds the corn, even some of the soybeans. You know, soybeans are a legume too. However, in harvest, you remove more nitrogen than you actually fix on a soybean crop, so it does its part in the system, but it's a much smaller part than most people understand.

Livestock here, livestock manure, yes, there is nitrogen in the manure, but where did it come from in the first place? It was fixed over here by the forages. Possibly it went into the corn, and then it went into the livestock, but that -- the livestock are really just recyclers in the system.
I make that point because from here now, we are going to what the environmental benefits actually are, and what the forages contribute. And that starts with the factor of nitrogen and that fixation. When we did the energy analysis on organic farms, if you looked at field consumption, tracked field consumption, organic farms tend to consume more.

The main energy savings comes from the lack of nitrogen fertilizer and the fact that they are growing an enormous amount of fossil fuel energy in the form of natural gas that goes into producing nitrogen fertilizer. That is where the main benefits are coming out. In terms of carbon sequestration, it is during that period of time when you have perennial forages on the field that you are building most of your carbon.

In part because of the longer photosynthetic period, but also because of not tilling it up and burning the carbon out of
the soil. Increased nutrient bio-
availability. Perennial forages, particularly
the taproot of legumes, are drawing nutrients
from the subsoil, bringing it up, making it
more bio-available to subsequent crops.

Reduced erosion. Again, you are
not tilling during this period of time.
That's where most of that benefit comes from.
And reduced leaching. And this is exciting
to me. Perennial crops, just generally, but
particularly in forages, are like an ongoing
catch crop, preventing nutrients from
leaching.

You look at Giles Randall's work,
out of southern Minnesota. When you compare
row crops with perennial crops, he was finding
thirty to fifty times as much leaching of
nitrogen under row crops as under your
perennial forages. That's thirty to fifty
times. That's significant. It makes a lot of
difference.

It kind of goes without saying
that forages and livestock, you know, kind of co-exist. You can see where corn, soybeans, small grains can be grown as food crops or for other purposes, but generally when you are growing forage, you know, with the exception of alfalfa tablets or something like that, you are pretty much growing something that is going to be feed for livestock.

If you take livestock out of this system, the motivation for keeping perennial forages to the degree that we have here, where they are actually part of three seasons on a field, that motivation is reduced, and what I see on farms that are stockless is a tendency to reduce the amount of perennial forage that they have in systems, increased reliance on inputs or annual cover crops, you know, annual legume crops for nitrogen.

And I'm not saying that stockless farms can't be made sustainable and work just fine, but their ability to be as sustainable, to contribute the same degree of environmental
benefit that we brag on is going to be limited. Yes, basically, that is the point that I was trying to get to is this tie between the environmental benefits of organics and the forages in the system.

Seeing it on the farm level, where the crops are produced, probably the issues are not as great as they are where that feed ends up. In concentrated livestock feeding, there are the issues, of course, of manure concentration and all of that. That's not where I was going to go on my presentation, anyway.

I was given the two minute sign. I just want to point out that, on the whole within the ATTRA project, we keep a lot of information on hand. Updated information on forage systems. We consider them among the most sustainable systems, and I'm down to one minute.

And just like, you know, vodka isn't just for breakfast anymore, grazing
isn't just for your ruminants. We have a lot of information on pastured poultry. Our livestock workbook that we developed with NOP funds. First thirty pages of that focuses on pasture because we wanted to keep that tied to livestock production. And on that, I'll conclude. Thank you.

FACILITATOR ANDERSON: Thank you, George. We will just, as a note of housekeeping, there are cards throughout the audience, so as you have them and you have a question, then by all means, hold it up, and Valerie will pick it up.

MS. ROBINSON: I'm the runner, so if you've got questions, if you've got them on your cards, put your hand up and I or someone will walk up and down -- and make sure to gather them up. So -- am I speaking loud enough? Probably not.

I'm the runner for cards. So I passed them out. There's more. If you've got cards you want to make sure get up here, the
livestock committee is going to be processing them. I'll be gathering them. So, you know, make sure I know you've got a card or pass them up to the ends. That will help too.

FACILITATOR ANDERSON: Next speaker is Lisa McCrory. Lisa is from Vermont, NOFA Vermont, and she has been there since 1995, working as an organic dairy and livestock advisor. She has been providing workshops and conferences and actual on-farm technical assistance to farmers interested in organic agriculture and grazing.

So, she helps producers develop or intensify those practices, and prior to her work with NOFA, she was at the University of Vermont and a pasture-management consultant with Pasture Research and Technicians. So Lisa, in addition to being an academic and a student and a teacher, also operates a farm with her husband Carl Russell, where they use draft animals for logging and field work and raise meat and milk products using primarily
pasture and harvested porridge. Lisa?

PANELIST McCORY: So, it's great to be here. I'm going to -- I do not have a Powerpoint presentation. I am not that technologically advanced. This year, though, I promise. I have a visual, though, that will help, and I have a couple of copies of my -- I answered all -- I was given -- all of us were given a bunch of the draft of -- the advance notice of proposed rule-making was passed onto all of us who are speakers, and I decided that I would take it upon myself and answer every single pointed question through the document for good practice.

But, in summary, there are three key questions that they did ask, and so I thought I would just read that out loud so you can know where I'm coming from as a grazing consultant, as somebody who works out of NOFA Vermont with our Vermont producers, based on my experience.

I've worked with organic producers
throughout the northeast and kind of spreading into the west as I've been or was initially very involved with NOFA when it was getting off the ground. So I feel like I'm hearing from a lot of producers, and I sat in on a session this morning and yesterday, really getting feedback from producers to just get a sense of what the realities are within what the National Organic Program should be enforcing.

So the first question about the current role of pasture in the NOP regulations -- is it adequate for dairy and livestock under the principles of the organic livestock management and production. Is the role of pasture adequate for other types of organic livestock?

And I would say no, it's not adequate. At this point, the current role of pasture in the NOP regulations is not adequate for dairy and livestock. The role of pasture needs to be more clearly defined for beef and
The recommendations that I would put forth -- first, I would like to say that I fully support the recommendations that have been submitted by the National Organic Standards Board. They presented a draft document in November of 2005 which was really a compilation of all the recommendations that they have been submitting since 2001 on pasture recommendations.

And my, you know, I was reading all of this information as I was preparing, and the question that just kept hitting me over and over again was we've been giving feedback to the National Organic Program for five years, now, and still nothing has been implemented, so a lot of this is all repetitive.

There are a lot of resources, even within the National Organic Standards Board's draft documentation, there are a lot of references of research documentation as well.
as just good material on the nutritional benefits, the environmental benefits, grazing strategies, the possibilities, and also consumer assurance. What do the people that buy organic milk, what are they expecting when they purchase a carton of milk?

I was seeing some example cartons that have been passed around today and was kind of horrified to see what their testimonial is on the carton, knowing where that milk is coming from, and personally, I would like to see some level of standard guidelines that everybody abides to that can assure the consumer what they are purchasing and allow for a strong integrity to the National Organic Program.

So, today is such an important day. My recommendation is I support the NOSB's recommendations, which are saying that there should be a minimum of 120 days per year that ruminants should be grazing on pasture, and within those 120 days when they are
grazing on pasture, they should be consuming a minimum of 30% of their dry matter needs on pasture. That's just a minimum, and that's for all ruminant stock six months of age and over.

There's been so much evidence to support the need for stricter pasture standards and its associated benefits, soil health, livestock health, energy usage, consumer confidence and assurance, nutritional benefits, that it seems redundant to continue feeding a lot of additional resources and references.

What I'm getting at is I've included within my handout a lot of recommended readings to substantiate the benefits of pasture, but I think all of those recommended readings that I have put forth also was in the NOSB document. There are so many things, and it was great to hear what George had to share with us as well.

So the big thing that we were
talking about is if we are going to recommend a minimum dry matter intake, it needs to be -- in some way, we need to demonstrate that this is do-able. But I think without having a minimum amount of dry matter intake on-pasture, it is going to be really hard, without some sort of measurable thing, the words like "significant."

There are a lot of ambiguous words within the language that we need to replace with a measurable, so my feeling, from my experience as a grazing consultant and a resource person for NOFA has been that the 30% dry matter intake is a measurable and a do-able that we can write into the Organic Systems Program guidelines.

So what I did, with the help of Sara Flack -- I want to make sure that everybody can see this. But we wanted to make an example format that people could start to use if they wanted to estimate the dry matter needs on their farm.
So, this is just one example of how we do it when we're on farms, where, for example, I'm using, for example, a thousand-pound cow producing about fifty pounds of milk. Her average dry matter intake needs are going to be about three percent, and this is based on some literature guidelines that we had, so I'm keeping it nice and simple.

But if this thousand pound animal needed three percent of her -- was consuming three percent of her body weight, simple mass says that she's eating thirty pounds of dry matter a day. Now, out of that thirty pounds a day, we are asking our organic producers to make sure that 30% of that thirty pounds is harvested -- is received by harvesting grass on-pasture.

Do the math, that's nine pounds a cow a day. As fresh pasture, that's more like -- it's four times that number, on average, so you are asking about -- for every animal to eat on average about 36 pounds of grass on-
pasture. So, that's a way to make a simple calculation on a farm to help them estimate.

You know, you figure out how much do their cows weigh, on average, percent of their body weight is such-and-such, and you calculate down. Now, there is another way to make this calculation. We can go backwards, and this is a worksheet that NOFA New York actually has on hand.

Dry matter intake by subtraction, where we would go work with the producer, find out what are you feeding in the wintertime when your animals are in confinement. We convert everything on a dry matter basis and get the total, and then we figure out what are your cows getting when they are on pasture, what is the feed that you are giving in the barn.

We are getting the total from that, and we are subtracting one from the other, and you are going to get the amount of dry matter that they are actually harvesting,
from pasture. So there's two different ways that we could quickly come up with, as a system, that farmers can use as a way of documenting how they are harvesting their dry matter off their pasture.

I know that these are just two simple examples. I think it's really possible for us to create a formula or a worksheet that is included within an inspection manual or within the inspector's report or certification application -- time? I don't have any other flip charts. Those are the only two.

So, I wanted to at least provide that to the audience and to the producers to look at a couple of examples to give us a starting point to create some efficient worksheets so that documentation can take place. And I know there are many resources within our states. Our NRCS agents, our extension agents, the different educational branches of the NOFA's PCO, NOFA Vermont, NOFA New York, Oregon Tilth, MOSA.
I think that we can all work together and find out how we can figure this out with our producers. I think that is within the organic system plan, and within our certification application forms, we are collecting almost all of this information already.

Everything that we're -- we're collecting everything except for asking percent dry matter within our current record-keeping system, so we really aren't asking for much more than what is already -- what already exists in the program, so I just wanted to point that out too.

And I think that is what I have to share. I have more in writing, obviously, and I'm open to receiving questions. I guess one more little thing that I wanted to say is NOFA Vermont, when we started certifying dairies, we started back in the late eighties, and our step into the organic dairy realm was from grass-based farms trying to grapple and get a
premium product, create a premium product that the market was demanding.

We were already coming from a pasture background. Our producers in Vermont are grazing their animals for at least 150 days during the growing season. That's a minimum. And the amount of dry matter that our producers are harvesting off pasture is about 70 pounds of dry matter per day, on average.

So, agreeing to 30% dry matter is really -- we're realizing that not everybody is set up like a lot of the producers in Vermont, that seasons are different from one state to another, precipitation is going to vary from one place to another. We can do 70%, I know producers that do more than that, but not everybody is going to be able to do that.

Thirty percent, I think, is a realistic figure to shoot for that I think can encompass almost any producer within a
reasonable area. And if they get to the point where they are drawing their water sources out of an aquifer, if they are getting to a point where they -- the precipitation falling on their land is less than adequate, then I question whether or not we should be supporting organic systems in those areas.

That does not sound environmentally friendly to me, and it doesn't sound like something that our consumers would support if they were fully informed, which I know, down the road -- they are getting more informed and wanting to know more all the time.

So, we need to let them know that they are supporting something that is moving us in the right direction, and this standard would also help make that happen. So, thank you.

FACILITATOR ANDERSON: Thank you, Lisa. Jim Cropper is a 4-H management specialist with the NRCS, and it is the East
National Technical Center in Greensboro, North Carolina. Jim?

PANELIST CROPPER: Thank you, Bob.

One of the things I wanted to talk about today is the prescribed grazing standard that the NRCS writes. Right now, we have the 2003 wording of the prescribed grazing standard, and since that was incorporated into some of the rules in the rule process of the National Organic Standards Board, I thought I would talk about that specifically and then show some ways that that can be used to document the fact that you are meeting whatever standards you set on how much of the forage or feed that the dairy cow is consuming is as pasture.

I won't make any position on what that percentage ought to be. I think that ought to come from the people that are directly involved in that. As a national agency where we work with all farmers, regardless of whether they are organic or...
national, we have to write our standards in a very broad way so that everybody can be under that umbrella of that particular standard.

Since we are not a regulatory agency but we work with people to better their protection of the natural resources on their farms and ranches, that means also that we don't dictate policy or we don't dictate certain things to happen. We try to work very cooperatively with those people, making them understand that when they take some actions how that impacts their forage supply and how that impacts their animals, the farm resources that are there.

The prescribed grazing standard, we have a national one. Like I said, it was last revised in 2003. When we started working with the Conservation Security Program, we noticed that we had a couple of very key items that we left out of it, and we are currently now revising that standard in 2006. Probably sometime towards the end of the year, the new
One thing I wanted to make clear, in some of the writings of the rules, there was mention of a regional prescribed grazing standard. There is no regional one, only state supplements. That -- those state supplements take the national standards and make them very more specific to the locale of that state, whether it be California, Maine, or Florida.

That's why, on a national level, national standard has to be very broad because we cannot get very specific without being wrong in one part of the country of another. So that's why it starts out very general and then gets more specific as you get down to the state level.

Okay. One of the key elements of the grazing practice I think that come from the standpoint of what you are dealing with today is that when we do a grazing plan for a farm, it is -- we need to take a look at what
those resources are on the place. We have to look at the climate, what do we get for rainfall, how cold does it get in the wintertime, how hot does it get to the summer. That has a big impact on what you are going to be doing in a dairy operation.

The soils, what do we have for soils? How steep are they, what is their water-holding capacity, that is the pH of the soil, a number of things like that that is going to drive that forage production there.

The other thing, then, we need to inventory is the livestock. Do we have adequate land to support that herd of livestock? If we don't, are there ways that we can overcome that, either by increasing the production on the farm, or do we have to go off-site for some additional forage supplies?

That tends to be quite different in some parts of the country than others. Here in the eastern United States, where sometimes you have to have at least the
economy of scale so that you can support your family, unless you work off the farm or something of that sort. So that sometimes becomes an issue.

You have to have a certain number of livestock to make it a good, viable enterprise, yet on the other hand, perhaps you are land-poor. So these things have to -- there are tradeoffs involved when you get into that situation.

Then the other thing we have to look at, then, okay, what forage supplies do we have on the farm? How can we improve them? In some cases, it may mean converting crop land to pasture, and we've had several producers who have converted all of their crop land to pasture. And, in that case, they are able to maximize their herd size, and then they either buy additional feed stuffs and bring it in, or they are able to rent maybe adjacent farms or something like that for their stored forage supplies.
One of the key things in the grazing plan is that forage/livestock balance, and this will be a key point that I will talk about a little bit further in another slide. The grazing plan itself -- what about a drought plan? Do you have a contingency plan if things do dry off, you don't have the feed or pasture, perhaps, out there to feed those animals. We have to consider what we are going to do in that situation.

And then the last thing is the grazing records. Lisa just mentioned a couple of different ways that you can kind of predict what you might need in the way of pasture and how much pasture that would be. Then we also have to have some records that demonstrate that that is actually what is taking place.

Okay, if we talk about that forage/animal balance, a lot of times those lactating dairy cows are supplemental-fed, and there is a big, raging controversy over that; whether it all should come from pasture or a
smaller percentage of it, whether they should feed grain, whether they should feed maybe some dry hay, maybe a partial total mixed ration, a whole number of things in that way.

Again, we don't take positions on that. We help with the farmers to decide if they are going to feed grain, then how much pasture do we need, then, to feed those animals if a certain amount of grain is going to be fed or a certain part of a partial total mixed ration being fed.

That is their ultimate decision. What we do then is try to decide, okay, if you are feeding that much supplemental feed, how much do we need to get from pasture until that grazing plan is then centered around that remainder that is going to be fed as pasture.

There are a lot of different reasons why they are supplemented. Some of it has to do with the fact that, especially in the spring of the year, standing forages are often very low in effective fiber. You can
get a test back from a forage lab, and it's going to say ADF and NDF are high, and yet the animal doesn't know that, but the grass passes through their digestive system too quickly, and sometimes you don't get the nutrients that you thought you were going to based on that.

The other thing is it's also to balance the protein, along with the carbohydrates. A lot of our -- and grass pastures tend to be very high in protein, and if there isn't more of a carbohydrate source there, that will create an imbalance. A lot of that protein will go into the room and not be converted to milk. Instead, it will be urinated instead, and then you can create hot spots in your pasture just from simply having way too much nitrogen versus the carbohydrates in their diet.

So as a result, that forage/animal balance needs to account for all those other feed stuffs before we have a good idea of how much is actually coming from pasture. And we
need to make sure that when we do that, we can calculate, then, just how much pasture will need to be allocated every day.

Okay, so if the percentage of dry matter intake of the total ration from pasture becomes a part of the NOSB final rule, then the forage/livestock balance sheet will be a good way to show what is being planned for consumption from pasture. That can be easy to calculate.

It looks kind of similar to what Lisa was talking about earlier, where we know there is so much grain being fed, maybe a little bit of hay, a little bit of corn silage, something like that. Those get subtracted off, and then the remainder becomes what is going to be the forage that is coming from pasture.

So now we know what is planned. And then, when we are done that, then the grazing records then can confirm what was actually applied. How much pasture did they
consume? One way to do that is to measure that in our rotation of pastures.

When we take -- we are going to take some animals out to a paddock, we measure how much forage is there before they return in. And that can be done either very easily with a rising plate meter, even a pasture stick if it has been properly calibrated to the pasture -- to the species that you have in that pasture.

That's simply nothing more than a yard stick, and then what you do if you don't know for sure whether it has been calibrated for your area of the country, you simply clip a square frame, convert that to pounds to acres, and then you see how many inches that was and record that on a number of occasions until you get a pretty good idea, especially if -- a pasture consultant could do that for you -- determine what an inch of forage being produced out in that pasture, how many pounds does that equate to in acre of ground.
So then, you have that way of doing that record keeping. And then, once the animals are pulled off of that paddock and go to another one, you measure what residual forage is still left out there. There may be an average of two or three inches. Again, you can measure that and get an idea of how much was left behind.

And that difference, the difference between what it was when they returned in and when they were pulled out of that paddock is going to be the amount of forage that they consumed. Then you have a real good hard number to work with. It's not so much guess-work anymore at that point.

Again, it's still an estimate because pastures do vary a lot in their composition and in their thickness of their stand from one area to another, so there might be a little error in that, but it's a lot less error than just trying to wing it based on maybe what they ate in the barn, and you are
just kind of hypothetical thinking, well, maybe they consumed thirty pounds or maybe they consumed forty pounds. Well, you don't know for sure and not quite as much as you do if you measure directly in the field.

I think that last statement is one thing that doesn't have to be overly rigorous, but it does have to be pretty representative of that paddock that you were in. So, that is -- I thought I would directly answer some of the questions based on the prescribed grazing standards, and I would be glad to take some questions when we're done here with the panel.

FACILITATOR ANDERSON: I would just like to open this up to the NOSB and the NOP.

MEMBER KARREMAN: Are we done one panel?

FACILITATOR ANDERSON: Yes, we're done.

MEMBER CAROE: I have a couple of questions for you, Lisa. First off, I was
just wondering how you deal with expansion and
reduction in the herd over a season, and
typically, how much of that -- I mean, what is
the effect. I mean, can you have a 20% increase in the size of a herd, and how does
that affect your calculations?

And also, going further with that,
you average the pounds of forage per cow per
day, but what period of time is that? Is that
over the entire pasturing season, or is that
done for a month, or, you know, what period
are you actually looking at? Because in order
to apply something consistently, you know, we
have to talk about some of those terms as
well.

PANELIST McCRORY: Okay, so I will
-- am I on? I will answer the second question
first. My recommendation is that, when
calculations are made and represented, that it
is on a per-cow, per-day basis, so the amount
of dry matter per cow per day. Does that
answer?
MEMBER CAROE: Yes, but you are not actually measuring how much feed other than forage they are taking in every day, individually, and calculating per day, you are taking it over a period of time, I would imagine. I would imagine that you look at the amount of outside forage -- I mean, outside feed that the herd is taking in over a couple of months as opposed to the same type of period over the winter and subtracting it out and then averaging it per day. You are not doing it every day -- you're not -- farmers aren't calculating every day.

PANELIST McCORY: The farmers aren't calculating every day. They do know that if they've got their group of animals, they -- just like they are creating a feed ration in the wintertime, they are creating more or less a set ration that is going to meet their livestock needs when they are out on pasture, and that might change a little bit if their overall production is -- if they are,
you know, say the average stage of lactation for their herd, say that goes up during the grazing season, they might calibrate that and make sure that they are giving them a little extra pasture to meet those individual needs.

Now, to say that -- just like in the wintertime, farmers are not calculating on a daily basis what each individual cow is getting, but they could tell you what each individual cow is getting, and that's the same routine that they would be doing when they are out on pasture.

MEMBER CAROE: Right. I guess I'm not being very clear, and I apologize, but as I look at your calculations, they make perfect sense to me. I love the fact that they are very quantifiable. However, when you are talking about the subtraction, where you have what you are feeding the cows during the winter months when they are off-pasture, and what you are feeding them outside of pasture and subtracting that off -- I'm trying to
figure out the length of the period that you are calculating.

So, for the winter months, say there are three months that they are indoors for winter, you are looking at all of the feed that you feed them over three months and then calculating them down to a per day basis, correct?

PANELIST McCORY: Right.

MEMBER CAROE: And then you are doing it for the entire season? So you are only really calculating once per season to get that average per day? Is that correct?

PANELIST McCORY: Sure. You could calculate it just once, but like I was saying, if a farmer is going to -- you know, and the goal is that we are trying to demonstrate what the animals are going to get on-pasture for a minimum of 120 days during the growing season.

MEMBER CAROE: So you are looking at a 120-day period?
PANELIST McCORY: Minimum.

MEMBER CAROE: Okay. That's what I needed, that's what I wanted to know. Thank you.

PANELIST McCORY: Okay. And you had a first question.

MEMBER CAROE: It's about the fluctuation in a herd's size. So if a producer has 50 cows and then doubles their herd. You know, brings in a lot of replacement animals and doubles their herd, how do you account for that?

PANELIST McCORY: They would have to calculate the additional dry matter needs and make sure that they have adequate pasture to meet that additional number of animals. And I will say that it's not -- at least in Vermont, I haven't seen that happen all the time. There might be one or two rare occasions when that happens, and we will help them figure out what their pasture needs are and move from there.
And like I said, in Vermont, it's -- we rarely come across situations where the animals are nearing the edge of that 30%, you know, dry matter. They are usually way above 30% dry matter from pasture, and so most of the farms, if they are adding on ten cows, fifteen cows, they've got adequate pasture to stay above that 30% dry matter intake, minimum, for those 120 days.

PANELIST CROPPER: The greatest fluctuation you might get, actually, is, depending on how the cows are freshening -- usually the lactating herd would be separate from the dry cows. And then you could get some fluctuation there, but generally, that's not really very huge.

PANELIST McCORRY: Percentage-wise, you're looking at what? Five percent?

PANELIST CROPPER: Yes. Maybe something like that --

PANELIST McCORRY: Just to give --

I mean, I'm completely --
PANELIST CROPPER: -- if they are freshening a few every month, there might be some bigger fluctuations if they are stressing maybe spring calving or they are stressing fall calving, there may be a much bigger fluctuation than that. It kind of depends on the operation and how they deal with that. Seasonal calving, they are all going to dry off at once, and that is usually at a time of year they are not going to be on-pasture in most cases.

FACILITATOR ANDERSON: Just one comment. As you ask a question, would you please identify yourself for the record? That was Andrea Caroe. Barbara?

MS. ROBINSON: Are the mics on? Barbara Robinson, USDA. I actually have three questions. Two -- Lisa, I lost a number somewhere. You were talking about the 30 pounds per day dry matter, 30% of 30 pounds, roughly nine pounds. Then you got to 36 pounds in total. What -- I missed something
there.

PANELIST McCORY: That's --
that's -- it's nine pounds of pasture on a dry
matter intake basis.

MS. ROBINSON: Right.

PANELIST McCORY: And pasture is
about 80% water, so if you multiply nine by
four, you would get the as-fed -- the actual
weight of the grass that they are harvesting.

MS. ROBINSON: Why am I
multiplying nine by four?

PANELIST McCORY: Nine times four
-- you are adding the -- on a dry-matter
basis, pasture is actually four times heavier
than its dry matter weight.

MS. ROBINSON: Oh, okay. And
then, secondly, you said that in NOFA Vermont,
you are already asking for this information
from your farmers.

PANELIST McCORY: We are
recommending -- we are encouraging farmers to
-- letting them know what the NOSB
recommendations are, and we are encouraging
them to monitor their pasture dry-matter
intake on-pasture to see how that compares
with the NOSB recommendations.

MS. ROBINSON: So do most of them,
would you say -- so they are incorporating
this into their organic systems plan?

PANELIST McCORRY: I would have to
-- when I go onto farms, I'm -- I provide the
education, so I'm not actually an inspector.
I would have to defer to Nicole to see if
that's actually in the inspection form. But
what I do is I help them figure out what they
are feeding their livestock now, what do their
pastures look like, and how much pasture do
they have available for their livestock.

And I help them make -- I help
them make calculations based on the
recommended dry-matter intake on-pasture. So
I would have to defer to Nicole, our
certification administrator, to know whether
or not that is actually in the application
form. I don't think it is.

MS. ROBINSON: Most of your dairy farmers, you believe, are doing this?

PANELIST McCORY: They are. They are way beyond 30%, on average.

MS. ROBINSON: My other question was, Jim, you said the NRCS standard, and I understand this, is a national standard, and there are no regional standards, but then you mentioned that there are state --

PANELIST CROPPER: Yes. Each NRCS state office generally drafts a more specific state standard to be followed in that state.

MS. ROBINSON: Based upon -- they take the national standard --

PANELIST CROPPER: Right. And generally draw it more specific standards within -- they are more -- criteria. They may include tables, for instance, that have the different grasses and legumes that grow in that state and the recommendations on stubble height that should be left once the animals
are taken off that particular pasture and put into another one.

And some -- those things are very specific to that state. They may cross some state boundaries, but as you get into further regions away from that state -- let's say, for interest, Pennsylvania versus Arizona -- you are going to have totally different species and things of that sort, and different requirements for their protection when they are being grazed.

MS. ROBINSON: We have heard in the past that a complaint of the NRCS was that it was based -- it was a standard developed for beef cattle, but I didn't hear you mention anything like that.

PANELIST CROPPER: No, no. In this particular instance, like I said, the national standard is drawn at a very kind of an over-arching way so that it doesn't get specific about any particular animal, and so it'll work with any livestock enterprise that
you have. It's just that you have to get down
to the state level to get into more specifics
than you can at a national level.

MS. ROBINSON: Okay.

PANELIST CROPPER: And again, that
that would be more directed towards the forage
species, what would be needed to keep them
surviving in a pasture setting so that you are
not over-grazing them and then damaging the
soil resource and perhaps the water-quality
resource at the same time.

MS. ROBINSON: Are those all
downloadable from NRCS's website?

PANELIST CROPPER: Yes. They are
actually on the NRCS website, and you can go
and click on the specific state that you are
interested in and get that as a pdf file or an
Adobe Acrobat file.

MS. ROBINSON: When you revised
the 2000 -- when you revised the national
standard for 2006 --

PANELIST CROPPER: Right.
MS. ROBINSON: -- what will that do to the state?

PANELIST CROPPER: Then they will go back and look at it again and have to revise their standard as well, if there is something in there that they don't cover specifically. And the one thing that we would like to include in there, it's one of the shortcomings we found out when we got involved with the Conservation Security Program, is that we don't specifically mention that there should be grazing records kept, and so that will be in the new revision. It was an oversight, basically. Because when it came to program implementation, we have to have some grazing records. It's similar to what you are embarking on --

MS. ROBINSON: Right.

PANELIST CROPPER: -- that you need record keeping to be able to make sure that what is being specified in the rules actually takes place, and so that's why we
found out when we got involved with a program like the Conservation Security Program that we needed to do the same thing. Otherwise, there is no way of knowing whether they are doing a good job.

MS. ROBINSON: Whether there is compliance, right. Do you provide any sample worksheets in there for records?

PANELIST CROPPER: Actually, Pennsylvania's got some little pocket-sized books that do have a suggested one for dairy and also, in particular, they have one for dairy animals, and they have another one that is for beef cattle and sheep and things of that sort. So, they are slightly different in the way they are formatted.

MS. ROBINSON: Thank you.

FACILITATOR ANDERSON: Bea?

MEMBER JAMES: Bea James. I have two questions, and I will give Lisa a break and go to George first. George, what would happen in agriculture if pasture-based lands
for dairy farms were not required to grow feed, and doesn't the grazing matter also act as a natural filter for the land and the wildlife or groundwater inhabiting that land?

PANELIST KUEPPER: I'll start with the last question. Yes, the presence of forages does an amazing number of things. You talk about the filtering effect. That capture of nitrate, I mean, is one example of that filtration. Yes, it does capture a lot, and the environmental benefits, as I was trying to point out, are enormous.

In terms -- did I get your first question right? You're saying what would be the likely trend if organic farms were not growing the --

MEMBER JAMES: Right.

PANELIST KUEPPER: -- grazing land or livestock? Basically, it would have to be, you know, brought in in some form. Now, I'm not a specialist in livestock feeding, but, you know, my understanding is that there would
be definite nutrient issues. As you start shifting, take that example that I showed, that location example.

If you are also shipping that hay off, say, to a distant place, that manure is not likely to be coming back to that land, and that raises sustainability issues. You know, to keep that land regenerative, keep that system regenerative, they are either going to have to bring in some other type of input, either a local source, say, of local CAFO manures or something of that nature, or rock minerals. You know, something that, again, would meet the standard.

So it is going to make the system more dependent on outside inputs, and that will definitely change. In terms of what happens actually at the feeding site, I mean - do those animals get enough forage? I would assume that, you know, a good plan feeding system would allow for that, but it does mess with where the nutrients go in the cycle. It
messes with the sustainability of an organic system.

MEMBER JAMES: Great, thank you. And Lisa, I wanted to ask you -- the model that you showed, the DMI by subtraction?

PANELIST McCRORY: Right.

MEMBER JAMES: Do you have any farms that are currently using that model?

PANELIST McCRORY: That model I actually stole from NOFA New York this morning, and they use it regularly with all of their producers.

MEMBER JAMES: Oh.

PANELIST McCRORY: And from what I've heard, there have been no complaints about doing that. It's been useful. When -- and then, as an individual, when I go on a farm or to co-workers that also do dairy farm visits, we will use that system regularly in helping farmers calculate what they are feeding on pasture, or what the potential that they could feed on pasture could be.
And I'll go -- I'll use one model or the other depending on which concept they are more open to.

MEMBER JAMES: Okay. So that would have to be logged, then, for each cow, as you increase and decrease the herd?

PANELIST McCORY: Right, yes.

MEMBER JAMES: So, how large are the farms that are currently using that system?

PANELIST McCORY: Anywhere from 30 cows to 200 cows, in Vermont. And I guess I would have to defer to NOFA New York to find out what range of livestock farms' sizes are using that current system too. I'm not sure.

MEMBER JAMES: Do you have an estimate? Say, if you have a 500-cow farm, approximately --

PANELIST McCORY: I think this calculation sheet can be used for any number of farms -- for any livestock-size farm. So, whether it is 500, 5,000, or 20, the
calculation sheet should work just as effectively.

MEMBER JAMES: Okay. Thank you.

PANELIST CROPPER: I might add, there is actually a farm in Wisconsin, near Mineral Point, that they've run approximately 1,200 to 1,300 head of cattle on pasture for several years. I don't know that they are organic; I don't think they are, but even so, whether it is organic or not, that's a pretty substantial herd size to run on pasture, and they've been pretty successful.

FACILITATOR ANDERSON: Dan?

MEMBER GIACOMINI: Dan Giacomini, NOSB. A couple of questions. First of all, for George. Can you explain the advantage we have of the cow harvesting the forage and depositing her own nutrients back, recycling, versus man harvesting and man depositing them back in a self-contained facility where the manure and urine would be going back on the farm? And then I have some other number of
PANELIST KUEPPER: Yes, in fact, I had thought about talking a little bit about that because, you know, in theory, yes, you can do that in an operation. It's often done with non-ruminate stock, where all the harvesting is done. Everything is taken, fed, the manure is captured, and it is returned to the land.

In terms of nutrient flows, that's perfectly fine, and in some cases, I could conceive of where it might work better for the system, if you were looking solely at nutrient flows.

I think this is where a lot of the animal health issues come into play of whether, you know, animals are more healthy in a pasture environment, which I tend to believe they are. Again, I'm not the expert in that area.

I think there are also issues of, you know, since we talked about, you know, the
whole range of environmental issues, you know, there are certainly energy issues involved in a system that is dependent entirely upon mechanical harvest and feeding as opposed to animals that, you know, have four legs and can walk out there and harvest a big chunk of it themselves.

So, you know, I think taking the whole picture into account, any degree to which you can turn the system over to a grazing system increases the overall sustainability and benefit environmentally, and I feel, you know, in terms of the health of the animals, that there is definitely a benefit to that. And certainly, my interpretation of standard is more consistent with that.

MEMBER GIACOMINI: Thank you. My second question. Mainly to Lisa and somewhat to Jim. The numbers that you used over in your equations, and mainly in your first example there, I'm interested in the
assumptions you make and the implications of those.

You list 3% dry matter -- 3% of body weight is dry matter intake. There is a tremendous amount -- a tremendous amount of factors that go into dry matter intake, from age of the animal, lactation number, body weight, milk production, stage of lactation, a number of factors in the nutrient requirements for dairy cattle -- dry matter intake is not simply one sentence of 3% of 4% or 4 and a half percent, it's nine pages.

Also, on pasture, I've seen pasture book values anywhere from 18 to 25 percent dry matter. Do you propose that we just use a certain number of set book values, or do you really expect that we or should we actually be working on the individual dairy numbers, where in some cases, for instance, with a large dairy, they have multiple strings.

High-producing string may be
closer to fifty pounds of dry matter, and depending on the dry matter intake pasture, it could be pushing 100 pounds of grass per day. Can you talk a little bit about that -- that kind of an implication and what you see that we should be doing, and sort of, if -- you know, I mean, if somebody is at 4% and we are figuring three, or the other way around, and they end up at 25% instead of 30 of intake, then what do we do to them?

PANELIST McCORY: Well, what I gave on the first flip chart was just an example of one group of animals at an average of 50 pounds of milk production per cow, and I think -- I'm just throwing out some ideas. I know that there are definitely worksheets available so that people can actually calculate, if they have a higher-production herd or if they are grazing their high group -- early lactation cows in one group and their mid-lactation cows might be grazing in another paddock, they can manage their groups in such
a way.

But we could have a chart that producers could utilize to, you know, based on the butterfat, based on the pounds milked, based on the average, you know, body weight of their herd. They might fall under a different percent body weight total percent dry matter — or total dry matter intake based on a different percent of their body weight, based on those factors.

And there are some very handy charts and tables to help people make those calculations. Whether we have, you know, low, medium, high or whether we actually use tables and charts where farmers get more accurate in their total dry matter intake requirements, I'm not sure how detailed we should go with that.

I wanted to at least start off with a baseline, and we can determine what level of record-keeping we would want to enforce for measurable dry matter. But I
think down the line it is ultimately going to be -- I wouldn't expect that it would be totally precise, but I think it would be good. It would be better than where we are today, which doesn't have anything.

MEMBER GIACOMINI: I had one for Jim, but I forget, so.

MEMBER ENGELBERT: Kevin Engelbert. Mr. Kuepper, you spoke about the increased efficiencies of an organic operation versus a conventional, and do you have any figures based on a pasture-based system versus one where the feed is mechanically harvested?

PANELIST KUEPPER: I personally don't at this point in time, no. I have not managed to put that together, but Ann, would you happen to know if they have that at ATTRA, that we can dig that out? Do you remember?

PANELIST WELLS: I'm sure they probably do somewhere, but whether it still exists, I don't know.

PANELIST KUEPPER: Okay, yes. I'm
sorry, I don't have that at this point in time, but it's something that we should be pulling together. I agree on that.

MEMBER KARREMAN: Mr. Karreman -- saying regarding -- I think you were saying you are not sure how the animal health increases or whatnot with the pasture, and a peer review journal article --

(Whereupon, the speaker's microphone cuts out and is restored back to working order.)

MEMBER KARREMAN: Mr. Karreman, I wanted to add onto what George, here, was saying about the health benefits possibly of pasture -- is it picking up? -- in a study I did during veterinary school in the Netherlands, we were checking inflammatory reactions in cattle and seeing if we could come up with a quick test to differentiate cattle that had inflammation or not, and as one of the findings we didn't originally look for, but we found it in the data set, there
was significantly less inflammatory reactions
with cows on pasture compared to cows that
were confined, with P less than .105, and that
was in the veterinary record in 2000, so
that's a published peer review journal.

I just wanted to help you answer
that question. I don't know of any other
journal articles like that yet. Hopefully,
there will be, and I do have a question for
Lisa. You mentioned the issue of
sustainability in that realm and irrigation.

I would imagine, and I think you
were kind of questioning the sustainability of
irrigated organic dairies, if they need that --
correct me if I'm wrong -- but in
California, I would imagine there is a lot of
organic row crop farms that do use irrigation,
so how do we -- I know the irrigation issue is
somewhat embedded in this whole discussion, so
if there is row crop farms that are organic
using irrigation, wouldn't that be okay for
organic dairies, or not, or why not?
Whatever.

PANELIST McCORORY: I am not opposed to irrigation. The times when I start to get concerned is -- it depends on the volume of water being used for different things, and I just think that there -- we need to have a monitoring system in place so that we can have a better sense of how much of our water resources are being used for different practices and put some sort of a limit relative to sustainability on those practices.

I don't think that that would exclude irrigation, but it might exclude the use of irrigation or excessive irrigation in certain areas, and I think it would be worth having some sort of way to monitor that because I think water is quickly going to become a resource that is not that renewable.

It's the next one after peak oil, I think. And we just need to stay on top of that and be able to monitor it.

MEMBER KARREMAN: Just as a
follow-up, I guess, on that and from what George was saying, and I think we all realize that if the cows are out on pasture, they are urinating and they are manuring out on the pasture -- they are kind of returning some of the water back to the pasture. Maybe you might want to answer that or would that ameliorate some of the irrigation unsustainability?

PANELIST McCORY: Well, I've heard that argument that because the animals are out on pasture spreading their own manure and actually urinating that they are, in a sense, doing some level of irrigation that has a value in pasture regrowth, and there is definitely research to document that. And I think that is a valuable point to make on good, well-managed pasture.

FACILITATOR ANDERSON: And if I could just add to that, that is a question outside of organic -- I mean, it's for all agriculture, right. It's not unique to
organic for consideration.

MEMBER KARREMAN: But, Bob, actually, I mean, the issue of sustainability is central to organic, so that does play in, I think.

FACILITATOR ANDERSON: Joe?

MEMBER SMILLIE: Most of my questions were covered, but I would like to give the panel the opportunity to answer one of the issues that was raised in the ANPR, which is should specific animal unit stocking rates per acre be considered? No one addressed -- no one from this panel addressed that, and I wouldn't mind having input because, having some experience with the European regulations and others, that's one of the criteria or points that they have used. I just wondered what the input of the panel is on that specific question. I'm sorry. Joe Smillie, NOSB.

PANELIST CROPPER: I'll take a crack at that. Basically, I don't like the
use of stocking rate. One of the reasons why
I don't, and the major reason, is that you
have to know what the yield is of that forage
crop that is growing on that acre of ground,
and that can vary anywhere from maybe a ton to
six tons, so stocking rate is -- generally,
the way it's given, it's usually just an
animal per unit of area, and that's not a very
adequate way of determining because it is all
going to vary so tremendously on what that
forage production is on that same unit of
area.

PANELIST McCORRY: My two cents is
I personally didn't think that stocking rate
is going to be an effective way of measuring,
as well, because that's going to vary so much
all over the United States. But we could work
with a measurement of dry matter. I thought
that that would be a little easier thing to
account for.

MEMBER KARREMAN: I have a
question regarding the stocking rate or --
last year when we were going over the guidance document, we did play with the idea of three cows per acre as a maximum, and, you know, I guess that's not exactly stocking rate.

Maybe that's density, or -- no, that's stocking rate, but with what everything else is describing within the regulations already and the guidance document, wouldn't that, if we had let's say X amount of cows per acre, aren't we or isn't it already embedded in the guidance and the regulations how that pasture should be growing and whatnot? So couldn't it work, actually? Maybe that's more of a question for the board later on.

PANELIST McCORY: I'll say that if stocking rate was there to compliment dry matter intake measurement, I would be okay with that, but stocking rate alone I don't think it going to hold as much water --

(Laughter.)

PANELIST McCORY: I didn't even plan that!
FACILITATOR ANDERSON: Are there any other questions from NOSB/NOP?

PANELIST McCRORY: Can I make a quick clarification or just add a little for one of the previous questions? You were asking about the first page of that determining dry matter intake, and if that proves to be a more challenging one to do, and people are contentious about -- there's different percents of body weight to determine dry matter depending on the size of the cow, the breed, the stage of lactation, et cetera -- that the back calculation method could, I think, be very effective and easy to do, which is why I gave a couple of examples.

And maybe we are just going to be adopting one methodology, but I also -- we have a couple of ways of doing it, also, because some producers lean -- it's easier for them to wrap their brain around one version versus the other, and that's why we've managed to use one or the other when we work with
producers.

But for the sake of some sort of accountability within the National Organic Program, I would recommend that you just look carefully at both and decide which one would be the easiest or the more effective one to document, and I would assume that the subtraction method would probably be the best one of the two.

PANELIST POLAN: Is it proper for me to come in here?

FACILITATOR ANDERSON: Sure.

PANELIST POLAN: All right. Is this on?

FACILITATOR ANDERSON: Yes.

PANELIST POLAN: Okay, regarding -

FACILITATOR ANDERSON: Say your name?

PANELIST POLAN: For the reporter, Carl Polan speaking, here. Your comment -- you asked her the question about the three
percent; I think that's what your question was. That's sort of a ballpark figure, you know? A reasonable figure, but we know that smaller animals -- and she used a thousand-pound animal. I'll put that in the more or less smaller category -- might even consume more than that. Holsteins will probably consume that.

So, you know, it depends a little bit on that. But on the other hand, you can't be very precise on the intake anyway, and so to use what is a good reasonable estimate for her beginning calculation is probably okay because -- well, you know, for example, if tomorrow is hot and humid, the cow's not going to eat as much.

You know, it varies so much from day to day, so it's very difficult to do that.

One other thing, Lisa, I wanted to ask you -- I don't know if I found a little bit of a flaw in your conversions or not. Did you assume 20% or 20% dry matter in the forage in that
last step of your calculation to come up with
the actual amount of forage consumed?

PANELIST McCORY: Oh, to
determine like the value of the pasture? How
much dry matter is in the grass?

PANELIST POLAN: Yes, in your
conversion into the actual intake of grass.

PANELIST McCORY: I was assuming
that pasture is about 20% dry matter, which I
know is a ballpark as well.

PANELIST POLAN: So, if it is 20%
dry matter, to go back to the actual intake,
you would have to multiply by five, because
twenty percent --

PANELIST McCORY: You're right.

PANELIST POLAN: -- is the dry
weight, and 80% is the wet weight, so you
would have to multiply by five instead of
four. Instead of being 36 --

PANELIST McCORY: It would be --

PANELIST POLAN: -- as you
indicated, that would be 45.
PANELIST McCORY: Thank you.

PANELIST POLAN: That may be unimportant because the total dry matter is what you are looking at anyway, but it seemed like there was a little something wrong there to me.

FACILITATOR ANDERSON: Jim appears to be the -- have a lot of questions that relate to the NRCS standard, and I'm going to try to lump a bunch of them together, Jim, because some of them are related. We've actually got about six questions that relate to this, and first is, "How many states have NRCS supplements or supplemental tables?"

PANELIST CROPPER: Just about every state in the union has got a state supplement. There may be about two or three, maybe four, that do not because they don't have a lot of pasture left in their state. They would be the more urban states, and possibly -- and that would be the reason why they probably haven't bothered to do a state
supplement.

FACILITATOR ANDERSON: Okay, and this -- I'm going to kind of put a couple of things together. First, with regard to your discussions here today, that it is clear -- or would you confirm that this is not a recommendation solely for organic farms but also for traditional farms as well, and in the -- and if so, how do you evaluate based on what the farmer may want to start -- the farmer's prescribed rates and their intentions and their intentions to supplement.

PANELIST CROPPER: Okay, in a situation like that, generally what we are doing is we are hoping that both people have reasonable expectations of what they can get off the land that they own. There are some instances where we may come upon a scene where they have actually way overstocked, and then it is a matter of trying to work with that landowner to see, yes, I am overstocked, and I need to do something about that.
But this is all in the art of friendly persuasion. We try to work with that landowner as much as we can. If there gets to a point in time where we are just not seeing eye to eye on things, sometimes you just have to walk away from a situation like that.

FACILITATOR ANDERSON: There is a recurring theme in all of these questions, and part of it is -- do you believe that NRCS could or should produce a regional standard as opposed to so specific a state scale?

PANELIST CROPPER: That probably will not happen. The agency is -- the way it is set up, we do have a national headquarters in Washington, D.C., but each state -- each state conservationist that is appointed there answer to their congressional delegation, as well as the NRCS chief of the agency.

And as a result, they do have considerable power at that level, and the regional offices, which we really do not have anymore -- that's why we're called the
national office, even though we cover a region of the country -- that was the reason why the agency was reorganized the first time out was that they thought that the four offices, at that time, dictated too much of what the standards ought to be.

So that's why it is now left to the states to do state supplements within the agency.

FACILITATOR ANDERSON: If I didn't do anybody's question justice, it will be scanned in as it was actually written. In terms of calculating this, we might -- both Lisa and Jim -- the 30% value, and some of this will probably come up in the next round in terms of nutrition and all. Given the standard deviation that can occur and what those -- I don't know what they are -- does it make it difficult to prove that amount of productivity or DMI you are getting from the grazing?

PANELIST CROPPER: I wouldn't
think so ordinarily. One of the things I thought maybe possibly a little bit of rewording might be needed is the one statement that says the OSP shall have a goal of providing grazed feed greater than 30% of total dry matter intake.

Here's where I would change it. On an average daily basis, not -- right now it says on a daily basis, and I think there was something mentioned earlier about the fact that it might -- yeah, Carl made the comment that it might be too humid, and they just might go off feed, and that particular day, maybe they stayed back in the shade, maybe they stayed back -- depending on how your farm is set up, maybe they stayed back at the barn.

And you thought it was a good idea to get them out of the heat and the humidity. That day you might feed mostly stored feed, possibly. When you get into especially more southern climates, that gets to be a big concern.
FACILITATOR ANDERSON: And in calculating these or doing any of these calculations, there are several that allude to the fact that there are so many variables and, as you have expressed, but also the need to understand the amount of time that actually goes into milking cows and raising livestock as opposed to keeping records.

So, I think there is a general concern here about that, and if you guys could address that a little bit, it would be helpful.

PANELIST McCORY: Well, I think that any time we are trying to get precise records of what the cows are actually consuming, we are doing our best effort to make good calculations, but I can't say that they are ever precise.

I would like to see this as -- I like the average daily basis. I would like to make sure that it is always as close to the minimum 30% dry matter during those 120 days,
so sure, if a farm on one day is at 25% and another day, they are at 30%, I'm not -- that's not worrying me.

As I was hearing a producer talk this morning, I think the bottom line is that we are getting animals out, and they are having access to pasture, and they are actually able to graze, and we are representing this organic dairy market the way it is intended and the way the consumers are expecting it to be done.

And by having something that is measurable to some degree, without exact precision, I think it's where we need to be.

FACILITATOR ANDERSON: This is a question from the ANPR, and that is -- then what about that other 245 days? Is there -- what's the -- where do we go with that? How do we help create some framework around it?

PANELIST CROPPER: I'm not sure that necessarily -- I'm not sure how much farther you could go with the rules, but
ordinarily, if the person is committed to pasture, they are going to pasture those animals as long as they can.

And in some cases, they even extend the grazing season by planting some cool-season crops like brassicas and winter wheat and things of that sort that they can -- or even annual rye grass and things of that sort that they can graze while past the time that maybe the perennial forage crops that they had were available.

MEMBER KARREMAN: May I ask something? Having read those cards before we sent them over to you, on the dry matter intake -- and a few of them asked, I think, about, like, you know, taking into account the part of lactation, body condition, and whatnot, you know, different kind of parts of lactation the cows are in.

There is nothing -- and now, you know, it might be a little difficult to nail down exact numbers like you had mentioned, you
know, given certain variabilities in each day -- there is nothing in the organic rule, I don't think, that says we have to maximize milk production and feed the cow to maximize it.

We need to optimize -- we can optimize it by using grazing, but we don't have to maximize it. So if we are going to really nitpick the numbers down to making sure that every cow gets its maximum dry matter intake and everything else with it, I'm not sure we actually have to do that. We just need to optimize the conditions for the cows and let them respond to the environment that they are in.

FACILITATOR ANDERSON: George, as far as sustainability and environmental conservation, does it make any difference if -- and you may have already answered this, but it's asked in a different way -- if the forage is harvested or grazed?

PANELIST KUEPPER: Yes, I did deal
with that with a question that a gentleman on the board here asked a few minutes ago. Basically, in terms of nutrient flows, it probably doesn't make a whole lot of difference if you've got a good system for capturing and returning the nutrients. In a system where, you know, all the forages and everything are harvested and fed.

However, that raises the other issues. The energy involved in making a system like that work because it is much more mechanized. Also, the issues of animal health -- having animals that are not out and on pasture; it's -- I'm trying to remember the terms that we referred to. Sort of the natural actions or whatever of animals are really not -- the animals are not being able to exhibit their natural behavior when they are in a highly confined situation.

And that does have implications, as Hugh pointed out, you know, for animal health. That they are a lot more stressed
under that type of environment. So, it's not a matter there so much of nutrients but of those other factors. And I will point out again, going back to the experience that we had back in the seventies, where we were first evaluating farms, organic farms, and it was kind of a unique point in time because the circumstances were not muddied by farmers trying to extract market premiums.

This was before market premiums existed in the Midwest, so they were farming for other reasons. Farming organically for other reasons. And one of the reasons I most often heard cited by farmers, I remember this until today, is that their vet bills dropped like crazy when they fully transitioned to organic systems.

And, you know, that stuck with me, and I was always so sorry at that point in time we weren't able to come up with the funds to pursue that particular issue and get a measure at that point in time, but, you know,
we weren't really talking about these grazing issues at that time, we were talking, you know, impact of organic feed.

    And, you know, not putting these high demands on the producing animals, and that was imparting a lot of help.

    FACILITATOR ANDERSON: We're running -- we're pushing up against three o'clock, and I would ask that there -- I have three questions that I think are very short answers, so if we could just cut right to the core. One of them is whether it's -- the weekly amount of rainfall or the daily amount of rainfall or what happens, too much rain and not enough rain, those kinds of things, over a unique season, and I do recall that you asked for a drought plan.

    But what, if you talk about the 120 days, what does that mean for more temperate climates. What does that mean if it's raining too much, what does it mean if it is not raining enough in any given year
wherever you are.

PANELIST McCORY: Well, within
the -- there is already an allowance for
temporary confinement, which is permitted
during periods of inclement weather such as
severe weather occurring during a period of a
couple of days during the grazing season, conditions
under which the health, safety, or well-being
of an individual animal could be jeopardized,
et cetera.

So I think within the National
Organic Program, we already have something set
up in the case of drought or flooding where a
producer would be able to pull their animals
off the pasture for a limited period of time.

FACILITATOR ANDERSON: Great,
thank you. Yes, Bea?

MEMBER JAMES: Bea James, NOSB. I
need a clarification from Jim on a question
because before we get away from this, I think
it is an important clarification. Somebody
had asked about -- what about the other 145
days. I'm sorry -- 245. And you said, well, once people -- once a farmer starts to pasture, then they are just going to want to pasture all the time.

What about the people who don't want to pasture and want to be able to just utilize that 120 days and only 120 days? So how would that -- what -- how -- I guess I'm asking you to think about the question in terms of not assuming that people want to pasture.

PANELIST CROPPER: Well, if they want to do the bare minimum, I guess that's what they would choose to do. That shouldn't be a problem, necessarily, I just think that if they make the commitment and have enough pasture that they find out that maybe this is easier than hauling manure and feeding a total mixed ration every day. They might decide that maybe they ought to do a little more pasture, and that's -- a lot of times that happens.
Now, if the land base is such that they are going to be really pushed, now that's the instance that you might find a lot of situations, they might be able just to meet that 120 days because that is all the land base that they've got to work with that they can pasture animals on.

In that situation, then you've got a situation where they just can't do any more than what they are doing, and that's -- that could happen in some situations. That could be because maybe they don't have a way to get to some of the farmland that they have under their control.

The dairy barn is situated in such a fashion that you can only do the pasture that's close to the barn. It might be a busy highway they don't have any means of going across it without stopping all the traffic, and they are probably not going to be able to do that. There might be a big river or some other sort of impediment that they just can't
get to some of the land to create as much pasture as they might like to, so those situations arise from time to time.

PANELIST McCRORY: And I just add that for those remaining 245 days, what is typically required right now is that on a daily basis, the animals have turned-out access to -- so they have freedom of movement, access to sunlight. It would be that kind of management that I think would be at least a minimum for those remaining 245 days.

PANELIST CROPPER: Yes, that might be something like a rotational loafing lot. That's something that was kind of developed in Virginia, for instance. An extension agent down there promoted that idea, and that, at least, got them out of the mud. Some of these loafing lots, they are not paved, they don't have a -- maybe a free-stall barn.

They are just kind of out there, and it's okay as long as the weather is reasonably dry, but if it gets very wet and
stays wet for a long period of time, these rotational loafing lots are made so that they are usually planted with something like tall fescue. That's something a dairy cow likes, but at least it gets them out on grass and out of the mud in the winter.

MEMBER JAMES: Okay, thank you. So what I hear you saying is that if a farm sticks to the 120 days, that those other 245 days, that you are suggesting that they should definitely be outside --

PANELIST CROPPER: As long as it is not extremely cold or extremely hot --

MEMBER JAMES: That they shouldn't be in confinement just -- okay, thank you.

FACILITATOR ANDERSON: A few very brief questions for Lisa. How many farms does NOFA Vermont certify?

PANELIST McCORY: We have over 260 producers, but of that, 106 are dairy farmers.

FACILITATOR ANDERSON: Can
certifiers be trained to enforce and implement all aspects of the NRCS document?

   PANELIST McCORORY: I'm not really sure if I can answer that question. I don't have the NRCS document right in front of me. I do know that, through NOFA Vermont, we are working with NRCS, helping them implement grazing plans in Vermont, and I think that has been a really useful tool to help them actually use their templates and see how effective they can -- actual work -- how they can work actually in the trenches, creating grazing plans.

   But this is our first year of actually putting that template to work. So, we're still figuring that out.

   FACILITATOR ANDERSON: Great. And my favorite question of all is -- and it gets right down to the really practical side -- how long does it take a cow to eat 45 pounds of grass in a day?

   (Laughter.)
PANELIST McCORY: Well, how many licks does it take --

PANELIST SODER: Hold that question.

FACILITATOR ANDERSON: All right, okay. This one goes to Kathie.

PANELIST CROPPER: I might just let the audience know that I do have copies of the pasture -- Pennsylvania prescribed grazing standard, here, and that will give you at least an idea of what the state supplemented prescribed grazing standard looks like, and if need be, I can get some more copies run off too.

FACILITATOR ANDERSON: Great. Well, thank you very much. This has been very informative. We are going to break for ten minutes. We will be back at twenty after.

(Whereupon, the matter went off the record briefly.)

FACILITATOR ANDERSON: After all that and all that urging, I can't find my
notes. But we are going to start with herd health, and Ann Wells is going to lead. Ann is a holistic animal health specialist. She has Springpond Holistic Animal Health and is doing a lot of work on pasture and work with animals and also is involved with Heifer International, so Ann?

PANELIST WELLS: Thank you, Bob. I appreciate the opportunity to be here. Ever since raising organic livestock and working with a small Missouri, Arkansas, organic growers association in the mid-eighties, I have been intrigued with how to raise livestock in ways that prevent disease.

I had reached the point in my career that I did not want to treat sick animals anymore, and so in order to do that, I had to figure out how to keep them healthy. I quickly came to the conclusion that nutrition was the key, but while I was raising my livestock on-pasture, I was still feeding them organic hay and grain, and this was not the
solution I was seeking.

In the early nineties, I discovered the research that Jim Garish and Ron Marrow were conducting in Missouri on the use of controlled rotational grazing, and I should just say right here, there are a lot of different terms that you will hear -- controlled rotational grazing, management intensive grazing, prescribed grazing, but they all are talking about the same grazing system plan.

This was the answer that I was looking for. I've spent the last 15 years studying and implementing controlled grazing on my own farm as well as other farms for the purpose of achieving and maintaining the health of ruminants. I was very excited to see that the final rule had access to pasture as a requirement for organic ruminant production.

Naively, I thought that this would increase the number of organic grazers. It
has been my observation that a high availability of quality forage to graze and live on is the best medicine for ruminants. Access to pasture is not adequate, I now realize. There needs to be a controlled rotational grazing component within the OSP.

Even though the definition of pasture -- land used for livestock grazing that is managed to provide feed value and maintain or improve soil, water, and vegetative resources -- implies this, the regulations don't adequately describe how this is to be done.

Access to pasture without a grazing plan too often become access to an over-grazed, wheat-infested, dry or mud lot. This does little to promote animal health. It's very hard for me to pull out animal health from the overall farm system.

This is a slide that I show to all farmers that I speak to. This is their farm, and each part of their farm affects every
other part of the farm. I always start with the animals because I am talking to livestock producers, after all. The animals manure and the urine feeds the soil.

The soil feeds the forages. The forages feed the animals. And the weather is an overriding factor in many cases. And so we have the entire system right here, and animal health is a component of that, but you can't separate it out from all the rest of them.

These are animal wellness goals that I want all of my clients to have. And the first one is to manage the system to keep the animals healthy. This requires a holistic approach or, in other words, looking at the animals and the environment together.

And then the second wellness goal that I want them to have is that to change one part of the system to improve all parts of the system. And oftentimes, that means implementing a grazing plan because as they do that, then all parts of the system will
change, and the health of the whole system will improve.

So once again, pasture is the best medicine, but it requires this high availability of quality forage to graze and live on. Preventive health includes a lot of different things that are different from what many livestock producers tend to think about.

It starts with good animal husbandry practices. Just those common sense things of how do you raise a productive, healthy animal. Sanitation, observation. I spend a lot of time working with producers to teach them how to observe, first of all, what is going on in their farm, and then, what do those observations mean.

And what I have found is that even though we can observe certain things going on in our farm, we still tend to do the same thing as a result or sometimes in spite of the result. So I think that we oftentimes intervene too much with a lot of inputs,
whereas if we just changed our pasture management a little bit, if we just did a little more careful observation and thinking about those observations, we wouldn't be worrying about what can we use to treat a particular disease.

Vaccinations, naturally, are a part of it, and finally, managing that pasture to provide the nutrients as well as animal well-being. We need to remember animal well-being. It's part of the National Organic Program, and pasture management plays a big role in animal well-being.

Herbal leys is a term that was coined back in the early 1900s in the UK. It kind of fell out of favor. It is being revived, not only in the UK but in the United States. This is a mixture of grasses, legumes, and forage that have nutritional and medicinal benefits.

There is a problem with these. They have to be managed carefully because the
forbes, particularly, do not persist unless they are given a long rest period. So a lot of these pastures that a lot of farmers will go, "It's full of weeds," has got a lot of really healthy plants in it.

And these two compounds that I have on this slide, the phenols and the terpines, they have anti-parasite properties to them, and so particularly for organic livestock producers, especially small ruminant producers, these are important compounds to keep in mind and the plants that have those in them.

And this right here is just some data that was gathered in the UK in 2003 showing what some of these forbs, or what a lot of people consider weeds, have in them in the way of mineral content. So you can see that when you have a diverse pasture, and those animals are out there grazing on it, they are going to get a lot of nutrients and minerals that they wouldn't otherwise get if
they weren't out on those pastures without a lot of mineral supplementation.

So what I like my producers to do is to observe the animal and their environment. It all goes together. They've got to anticipate and plan for stresses. That, to me, is the beauty of rotational grazing. It gets these animals outside, it gets them in the fresh air, the sunlight, they are able to handle stress a lot better as a result of that.

Prevention, prevention, prevention. We don't want them treating sick animals. We don't want them to have to think about it, so they've got to prevent it, and that goes back to that list that I talked about earlier. And finally, they must improve their nutritional status through good grazing management.

Because once they do that, then a lot of their health problems just naturally go away. Transitioning does require a certain
time period. The producer has to learn it, and the soil and the plants have to recover, rejuvenate, and become sustainable again.

That can take a period of time. Usually, we consider it about three years. The cattle, on the other hand, are going to change very quickly. They go out there, they have a lot more grass to graze, they've got a lot more forages to eat on, and they are a lot happier, and they improve immensely very quickly.

Oftentimes, we find that it's just the mind set of the producer that is the hardest to change. And so what I like for producers to think about is they've got to be looking at these two things on the bottom of this pyramid. The soil life and balance and the pastures and the grazing management.

I've had the great opportunity of visiting farmers all over the country and speaking with them. I also get calls from farmers all over the country who say, "I'm
thinking about transitioning to organic livestock production. What can I use instead of antibiotics?" And I always tell them that's the last thing they need to be thinking about.

They've got to be thinking about this first. They've got to be thinking about their feeding program. Because antibiotics or any other kinds of treatment -- and it doesn't matter whether it is a conventional treatment or it's an alternative therapy -- it a Band-Aid.

And, in fact, I oftentimes say that once you get beyond water, all of these things are Band-Aids. We do a lot of changing around with these things to try to fix things. And if we spent our time fixing these things right here, we wouldn't have to worry about all of these other things.

Different parts of the country will obviously be dealing with a grazing system in different ways. We have the
different geographic regions, and that's what I just really like about NRCS's prescribed grazing plan. They've got a general federal guideline, and then they have more specific state guidelines.

So every region is going to be different. In Arkansas, there have been years that we could graze 365 days out of the year. That certainly hasn't happened though in the last year. We are in the 13th month of a historic drought. We have only been able to graze 180 in the last 12 months.

However, our animals have been out on pasture, and we have continued to rotate them around. True, there has not been much in some months. We are getting some spring growth now; certainly nothing like we have been in the past, but we are still out there rotating them around so that they get the benefit of being outside.

So, I feel that the areas of the country that can graze the majority of the
year have a big advantage because of the cost savings from feed that goes into this. And that can range anywhere from a dollar per day per cow on a -- as a veterinarian, I know that ruminants that are grazing out there on pasture are going to be healthier.

So therefore, that's also a cost savings. I believe it was George that was talking about how the vet bills go down. The vet bills go down of every person I've ever talked to who does a grazing operation. I've never talked to one who didn't say that happened.

And then, as a consumer, I want my organic milk to have come from cows that have been grazed on pasture. Thank you.

FACILITATOR ANDERSON: Our next speaker is Linda Tikofsky. She is a senior extension veterinarian at Cornell's College of Veterinary Medicine -- great, can you hear me? Linda Tikofsky is a senior extension veterinarian at Cornell's College of
Veterinary Medicine. She works with the Northeast Dairy Farms on issues of udder health and milk quality.

Her research focuses on herd health as it is impacted by the transition from conventional to organic dairying. Linda?

PANELIST TIKOFSKY: Thank you very much, and thank you for inviting me here. I have to say I have one of the best jobs in the world. I get to visit hundreds of dairy farms over the course of the year, at least consult with them, and I don't just deal with organic dairy farms. I deal with them as whatever farm comes into the office in New York, so we can be dealing with a 15-cow organic dairy, we can be dealing with a 60-cow grazing dairy, we can be dealing with a 5,000-cow confined, conventional dairy.

So I get to see kind of the good and the bad of both sides of the coin, and over the past seven or eight years that I have been at Cornell and working at my job, I've
gained an appreciation for the impact of pasture on animal health.

And I would like to just present some of this stuff to you. I have kind of a little literature review that looks at some of our peer-reviewed publications that have come back because -- for those of you who have heard me talk before, Cornell is not really the icon of organic agriculture, at least not as far as the vet school does, so every time I come back and say somebody is healthier on this organic farm, the feed are better on this organic farm, they say show me. So I'm going to show you.

So, just -- I broke this down into just a couple of brief categories. We are going to look at pasture access and its relationship to lameness, mastitis and milk quality, reproduction, young stock health, and also behavior, so I'm just going to touch on these. We're not going to dwell on -- it's not every piece that has ever been published,
but I tried to pull really the best information that is out there and probably the most reliable. It would stand up to the scrutiny of any scientific analysis.

For those of you that, you know, aren't familiar with dairy cattle or what ails them, lameness is one of the biggest problems affecting dairy cattle. It decreases their efficiency of production. It decreases the milk, it decreases their reproductive performance, it causes them pain, it increases treatment, it increases culling, and probably as far as the consumer go, this is the most recognizable animal illness if a farmer was to walk onto a farm.

They may not understand a retained placenta, or they may not understand mastitis, but when they see that cow go limping by, that makes an impact on them, so the next couple of slides will address the impact of pasture and lameness.

Couple of studies. One was done
in Switzerland by Regula in 2004, and they looked at 134 herds with varying amounts of confinement and outdoor exercise. They had tie stalls -- tie stall herds that were allowed out only in the summertime. There were tie stall herds that had outdoor access to pasture and yards year round, and then there were loose housing-type setups that also had year-round access to the outdoors and pasture.

And what they found was that the risk of a cow being lame increased as their exposure to the outdoor. So, the more cows kept inside on hard surfaces, the more lameness we're going to have.

Another group from Chile looked at the incidence of papillomatous digital dermatitis, which is one of our most common foot diseases in dairies and particularly in confinement dairies. A lot of factors go into it from nutrition to cleanliness to other treatments, and they found that cows in loose
housing were about seven times more likely to have digital dermatitis, and cows in free stalls were about three times more likely.

Loose housing was bedded packs kept inside, but as cows went out to pasture, those issues really dropped down. Summers also looked at digital dermatitis in 2,000 -- about 2,000 pastured cows and almost 3,000 confined cows, and they found a similar thing. Cows that had restricted access to pasture were almost twice as likely to have digital dermatitis than pastured cows.

And they were more likely -- they actually found a preventive effect. That if they were out on pasture, cows that, when they were brought in during the winter season, actually were kind of protected against digital dermatitis rather than those that stayed in all year long.

A relatively new study is coming out, and they looked at hock lesions. When cows lie down or get up, they tend to bang
their ankles and all their bony parts that stick out, and so they looked at exercise frequency and duration on the amount of lesions these cows were developing on their ankles and legs.

And cows that had extended exercise period out on pasture and yards had fewer hock lesions, and one of the things they compared it to was they had totally indoor cows, they had cows that went out for an hour a day and just kind of wandered around, and then they had cows that went out and lay down in pasture, and so.

And they actually found that the hock lesions and the ones that went in and out and milled around a little bit for an hour actually had more problems than either the ones that stayed inside or the ones that were going out.

So, just letting them out for an hour to kind of tramp around may not be the most beneficial thing either. It's duration
of time they spend out on pasture. Quickly, just to look at mastitis and milk quality, this is my big thing. We measure that on farms as somatic cell counts that kind of gives us the number of infected udders we might have in a farm.

We look at the bacteria counts in milk before pasteurization and after pasteurization and a couple of tests in between, and then we measure it in terms of clinical mastitis. Clinical mastitis is when a cow has a mammary infection, and we see symptoms of it.

We have swelling, we have redness, we may have abnormal milk. So that's one of the things the farmers can see on a daily basis. They do the milking, and it gives us an idea of what's happening. Much of the mastitis we deal with comes from environmental bacteria that work their way up into the teat and create mastitis.

So the more bacteria we have
presented to the udder and to the teat end, the greater the likelihood that one of those bacteria or a few of them is going to get up there, gain access, and create an infection. That's kind of the five-minute scoop on what is mastitis.

There was a great study done in North Carolina by Steve Washburn and groups, and they actually looked at over four years of study of Holsteins and Jerseys that were out on pasture or out in confinement systems. And the cow -- confinement cows had more clinical mastitis, more mastitis that we saw, than the cows that were out on pasture.

And this is something that I see on a regular basis in my practice. Another group in Norway compared 4,000 first lactations, heifers that had mastitis with 67 that didn't, looked at what is the difference between the management between this heifer with mastitis and this that doesn't that made this one have mastitis.
And they found that heifers that were kept on pasture were at much lower risk for developing udder infections than heifers that were confined and didn't graze. We had another one that was published in the Journal of Dairy Science by Goldberg, and he just looked at the bacteria in bulk milk.

When we milk cows, all the milk goes into a central collecting tank, where it is kept chilled until the milk truck comes and picks it up, and so we look at the bacteria in that as a measure of quality. The less bacteria you have in the milk, the better.

It can be the bacteria that are killed by pasteurization, but we can also have manure-laden bacteria or things that come from that may cause some of the food-borne illnesses: salmonella, e. coli, listeria. So that's another big concern when we do bacteria counts.

Goldberg found that grazed herds had total lower bacteria counts than confined
herds during the grazing season. And they also, although it wasn't significant, the grazing herds had a trend towards better udder health. Less edema, less mastitis, lower cell counts.

Another group compared bulk milk bacteria and somatic cell counts from intensive grazing, those would be the ones that are rotationally grazing and really managed grazing, traditional grazing, where they went out on pasture -- they may not have been getting most of their nutrition from it, but they were out on a wide open space -- and zero grazing herds, where the cows were inside a hundred percent of the time.

They found lower bacteria counts, which we measure as a standard plate count, in the grazing herds, and again, they saw the trend too, that there was better udder health and fewer injuries to udders in the herds that grazed.

This is just a little data we've
collected. We've started kind of playing around with some of our records here at Quality Milk, and we look at the percentage of cows that might have mastitis after they have a calf. And we broke this down by months.

So, we have a year's worth of data up here. Cows that have cell counts greater then 300,000 are more likely -- are statistically more probable of having an intra-mammary infection. And what we can see is during our winter months -- I'll just kind of put -- these are kind of the benchmarks for New York, when we kind of get cows out on pasture. Somewhere at the end of April, beginning of May, and then they come in, depending on the season, October, November.

But if we look at cows that -- this gets kind of complicated, but if we look at cows who were kept inside during their -- the last of their pregnancy, when they are in their rest phase, when they are not milking, that's a high-risk period for getting a new
udder infection. We're not dipping, we're not flushing the teats out by the milking procedure.

So cows that actually were sent into this dry period during the winter months and kept inside, those cows will then have a calf two months later, and the ones that actually calve during the wintertime come in with more intra-mammary infections or more udder infections than the ones that get out there and are calving on-pasture. When they are out in the sun and the fresh air, the chances of them having a mammary infection after calving is much lower.

This is about 500 cows that we've looked at. As far as reproduction, the Washburn study again found that there was no difference, and one thing we hear is that cows out on pasture have lower body condition scores. They are thinner than cows that are kept indoors. They may be more muscle or fit tissue, but one time -- sometimes we use that
as a measure of, you know, what -- how will that impact reproduction on that farm.

And they found that there was no difference in those cows getting pregnant again, even though they had lower -- in the pasture herds -- even though they were thinner than the confinement herds. Another group in the Czech Republic followed herds on two farms, and each herd was split into grazing and then confinement cows, and the fertility on their pasture group, the cows that were out and not confined to the barn, had better fertility by ten percent, and that their calving interval -- the time between having calves -- what we want to aim for is that a cow has a calf every year, so that we keep the milk production up, and so they found that we could reduce the time to getting her pregnant and having another calf again by 15 days.

And finally, another group in Denmark looked at the rate of udder infection -- or uterine infections in dairy herds, and
they found that the larger breed milking herds
that calved in November and April and that
didn't graze had a higher probability of
getting a uterine infection. It probably goes
down to fitness and ease of calving and
potential problems around that.

When we are looking at longevity
and culling, just the little factors, the
average lactation, those are the number of
years that a cow produces milk on a dairy, in
our conventional confinement free stall dairy,
those cows last 2.8 lactations, so maybe 2.8
years, and you've got two years of investment
before you actually start milking that cow
before she actually becomes profitable.

We don't have this data collected
scientifically for organic or grazing herds,
but my suspicion is that our average lactation
on organic herds are probably four or five.
That'll be something interesting to look into.

But, White, who did kind of a
corollary to the Washburn, used some of the
Washburn data, found that culling and death losses were higher in confined herds than in pasture. So the cows were either removed from the herd because they were ill or not profitable, or they died, and those numbers were greater in confined herds.

And they found that Holsteins kind of are lean mean dairy machine kind of cow that, you know, typically we don't think as the premium grazing cow, but cows -- Holsteins that were raised on pasture lived longer than the confined Holsteins.

Little data from Cornell. They do a Cornell dairy farm business summary. Farms voluntarily provide their records for analysis, and they found that, for grazing herds, the cull rate was 22%. For a non-grazing comparably-sized herd, the cull rate for those herds was 29%. Higher is worse.

And also, in a seven-year study that they also did, looking at veterinary and medical expenses across a time, for herds that
grazed, medical -- veterinary expenses were $61 per cow per year. For herds that didn't graze, they were $77 per cow per year.

Young stock pasture, they looked at calves that didn't have colostrum and were raised either inside or on pasture, and the pasture group had a 40% lower mortality and a greater weight gain after weaning. Probably Kathy will talk about behavior, so I'll move past that.

We see a lower incidents of food-borne pathogens and digestive diseases in cows that are on pasture versus confinement. You know, and there's always the question, the flip side, can pasture be detrimental?

We -- I haven't found any studies that actually really address the hazards of pasture. Concerns are fly control, concerns are internal parasites in young stock. We've addressed the issue of inclement weather already. Inadequate nutrition. But I think these issues are things that should be
addressed in the organic system plan and should not preclude cows from going out on pasture.

Thank you.

FACILITATOR ANDERSON: Carl Polan is from Virginia Tech. He is a dairy science specialist and has done a lot of work on animal nutrition, and so, Carl?

PANELIST POLAN: Thank you very much. It was true of some of the others. I'm pleased to be here. I don't have a long tradition with organic products or organic milk. I have a much longer experience with grazing and grazing versus confinement and that sort of thing.

Incidentally, I thought I heard confinement versus pasture here sometimes, and that's probably not a very good term, I guess, because confinement is confinement is not confinement. There is a lot of variation in how animals are dealt with in confinement, so you're kind of generalizing if you are saying
confinement versus pasture, I suppose.

My experience with pasture goes back a long ways, and it has a spotted history. A long ways because I'm getting old, I guess, and she talked about her job being the best, and mine is probably the best. I got retired.

(Laughter.)

PANELIST POLAN: But I've had very limited experience, as I said, with organic milk. As a teenager in the forties, our family produced organic milk. We didn't call it that. And we produced it until the county bought a sprayer and brought in to spray our cows with DDT to eradicate the flies.

Now, when they did that, they sprayed me and everybody else. I had no trouble with pests the rest of that season.

(Laughter.)

PANELIST POLAN: But that was the end of organic standards for us. I have other varied experiences with grazing in the fifties.
as a student working university farms and later as a herd manager before I went on and got some advanced degrees.

I joined Virginia Tech in 1965, and as I look back at that time, some work was published in the mid-sixties about grazing in the Journal of Dairy Science, but little if any was published. There was a big long dry spell until we published an article in 1986, and it was a compilation of studies of eight grazing seasons that we started work with in 1975.

That was a fun thing for me. It wasn't my main line of research, and honestly, there is very little incentive in most universities to do any grazing research. The incentive is not there. The university is run more and more like a business anymore, and let me know where you get funding to do much grazing research outside of what little bit you can scratch up in the university.

I surveyed the Journal of Dairy
Science, what was online, because that's what was easy, and that was probably enough from 1980 on up to the current time, to get a view of what's been done with pasture. And it was very little, actually.

What I looked at was all the papers that mentioned pasture anywhere in them, to get an indication of what I am about to give you here. In 1990, there was one paper. 1995 there was one. 2000, there was ten. And in 2005, there were 67. Now, that one in the main line in the subject, here, you know, that's just somehow in passing, they related to pasture or talking about pasture. Some of them were directly related to pasture.

But however, that shows that there has been some more interest in recent times, and more work has been done in recent times than previously, until you go way back into the fifties and beyond. But a lot of the questions that are asked here today are hard to really document with hard studies.
Now, I appreciate what Linda did here in terms of some of the papers she picked up, because it's pretty good documentation of what she has as far as the mastitis and lameness and so on is concerned. But much of the information we have is not documented but experienced in other ways of realizing and knowing that something is probably true but not being able to document it.

Now, I've got a title here, Pasture Versus Confinement myself, so I already criticized that word. Personally, I prefer grazing as an individual in season for animals if at all possible to be used as much as possible.

It's natural for the animals. The cows -- I heard the word happy. I don't know how you know when a cow is happy, but they seem to do well with it. And it's aesthetically pleasing. We like to see it. You like -- I like to see it. I think most of you like to see it, anyway.
There's enough survey and anecdotal evidence to be convincing that cows produce more lactations when grazed. There's not much -- when they are on that. Grazed cows have less mastitis, that's been documented, and better udder health than confined cows.

It is conceded that less feet and leg problems occur in grazed cows. I think feet and leg problems begin to increase when we did confine cows. If you go back when we first -- in the sixties is when largely, we were moved into more confined situations, some before that, but it really picked up in that period of time, and, you know, it wasn't near so much of a problem.

Over time, we have no doubt bred a different cow. No doubt, we have pushed the cow differently. We know a lot more about nutrition, but we do so much with nutrition sometimes that we probably create problems with nutrition under the circumstances that we
have there.

So, okay, either these -- either foot problems, mastitis problems -- either of these may at times be the result of what is termed hotter rations. Instead of always being in confinement, maybe it's just the ration or the hotter ration that the animal may have.

And fatter cows, a lot of them get fatter in between times. They create health problems around -- or in lactation, so that's a problem that comes up as a result of that.

The milkfat content of grazed cows contains about two-fold levels of conjugated linoleic acid, and that's been documented enough times. I've got some reference in the paper I handed out -- which is considered to be a healthful fatty acid.

That's a plus for milkfat in a grazing animal, but many people consume lower fat milk anyway so it reduces the consumption, probably, when they go that route. On the
other hand, cows on pasture usually have higher urea and nitrogen in the milk and in the blood, and the latter I heard it alluded to earlier, the latter is a cost factor that adversely affects milk production.

Another -- you know, if you don't somehow neutralize some of that nitrogen and it comes from high-protein pasture, it might even cost, you know, three to four pounds of milk and can adversely affect reproduction.

In any event, it utilized the cow's energy resources to get rid of that material rather than to use it for some productive purpose. Often, production in concentrations of milkfat and proteins are less, and if pastures are a big part of the diet, cows become thin, and I've got a little statement here that says that may be healthful. At least in most every animal, being a little thinner is a little healthier, usually. Even with rats, the experiments have been done and that's been shown.
So that may be healthful. Some grazers and some of you know them and some of you are grazers, tend to refer to them as more athletic or cows that are in better shape, and they certainly do appear to be that.

Time on pasture. What scientific evidence is available to indicate the amount of time cows should be on pasture? The evidence doesn't exist in my judgment. I don't think we can document it. We can talk about the anecdotal evidence, but to put a number on time or amount of hours or whatever or how much the animal might consume is a bit of a question, and I'll get to consumption later.

Experiments would have to be designed for that purpose, and I told you there is little incentive for that. They would be large and long. They would involve large numbers of animals, and they would be costly, so they are not likely to get done. Cows are very flexible, in my opinion, and
they can do well under confinement, under the right circumstances.

Pasture and switching from one to the other -- in part of the paper I pulled that's in 1986 showed that animals producing at the levels that we had in those particular studies, it wasn't a problem going from one to the other. The better question may be what is expected by the organic dairy consumer.

To me, that is the bottom line. They may be more concerned about antibiotics, hormones, or herbicide/pesticide residues than the percentage of pasture -- however, at the end of last week, I brought this subject up among graduate students, and one of them told me in no uncertain terms that her mother-in-law bought organic milk because she knew the cows were grazing on pasture.

(Applause.)

PANELIST POLAN: Well, if that's the case -- I really wondered about that, but that's what I learned, right there, you see,
from her, so if that's the case, if that's what's required and that's the market you're looking for, then that's what has to happen, in my opinion. It doesn't matter so much whether I think it makes a difference or don't make a difference in the cow.

On pasture 120 days -- what counts as a day? I think we've partly defined that as we've gone through here today. My judgment is that if a meaningful amount of pasture has been consumed, that would count as a day. Now, if that should be 30%, if somebody decides that should be 30% -- I don't know if it should be 20%, 30%, 40%, or 50%. I can tell you I don't know the answer to that. But if it should be 30%, the producers should strive for it in season.

I was partly confused when I read that and thought maybe 30% of the cows' annual intake for pasture is expected, but that would be far more difficult for the whole year because we've got the problem of all the grain
and stored feed that must be fed the rest of the year, so I'm glad to hear that season will be focused on 120 days, 30% during those 120 days.

Now, of course, we have more difficulty when we talk about the potential of drought and natural disasters. It seems that there would have to be some leniency requirements for such occurrences, and except for very large herds, economic winters, in my opinion -- I've looked at a lot of numbers on this that people have switched from what we are terming here today as confined feeding or conventional feeding to pasture -- that they are, by using their pasture resource as fully as possible, they are coming out of economic winters because it could be the little -- source of protein and other important nutrients.

So I believe that without question. A person could run an exception to that maybe if you get in a situation where it
is hard to get to pasture, but in a situation where pasture can be grown well and cows can do it, I think the economics would surely weigh out in that direction.

How to measure or document intake from pasture. Now, I think part of that, we talked about that a little bit here. Part of that depends on the precision you desire. I'm going to talk about that a little bit. I saw earlier a similar kind of sheet to the one Lisa showed here where you calculate, and I think that's, you know, for practical purposes, that may be a pretty reasonable approach to go that way.

Researchers, people like I and others, have tried a number of techniques to get a measure of pasture intake, but we have had limited success. We're not very good at it at all. Some of these techniques are pretty sophisticated. They require the use of indigestible markers or chemical markers that would not be acceptable for organic milk.
production at all.

Also, they require intense methods and are very costly, so they would not be useful for the purpose that we are talking about here. There are some similar yet cumbersome ways to get estimates of pasture intake. In rotational system, it was mentioned earlier estimating herd -- before and after grazing can do a reasonable job of getting an estimate.

But along with that, that requires a little bit of training. It requires some record-keeping if you want to keep -- if you want to document it. And it requires, depending on how you do that, maybe some calibration of instruments that may be needed.

There may be -- well, I'm going to say I don't know if I'd want to do that. Most people wouldn't want to do that. Maybe. I'm not certain. Another method that might prove easier with the help of maybe a certifying agent or some other qualified person or maybe
the people already know is to estimate feed intake from the energy requirements for production and maintenance.

In other words, what goes in equals what comes out, one way or the other, and in terms of energy or utilizable energy, if you know if a producer records the intake of solid in concentrate for a herd that is being grazed, the calculated energy required for maintenance and production minus the energy supplied by the solid in concentrate equals the energy supplied by pasture.

In other words, by a difference, you can find out eventually -- you can't do it in a given day because you've got weight losses and other things involved. But over time, you could find out if it was happening. This can be converted to estimated feed intake.

Is it worth it? Maybe not, I don't know. Maybe the shortcut version is better for all practical purposes. Those --
the certifying agent certainly is going to know those producers that rely heavily on pasture, because they -- okay, thank you -- because they observe the grain intake and pasture management practices.

Those producers are relying more heavily on storage forages would be the ones that would have more concern about. The factors that affect pasture intake -- some of that has come out already. You know, we certainly want to have it accurately -- and that varies with whether it is a cool season, whether it is alfalfa, whether the sorgum -- or whether it's some cereal grains.

But pasture intake is going to be less on lesser quality pastures. Intake is affected by whether or not these are consumed before feeding, humidity and other things. Should it include forage quality factors? It would certainly help define what's there, but for the purposes of what we have, if a pasture is reasonable, I doubt if forage factors are
worth that much in the overall evaluation.

Would it improve the definition of organic milk is my question. I doubt if it would. So I'm here as dairy cow nutrition with long research interests in confined feeding as well as grazing.

Because of the increased longevity of grazed cows, I have to conclude they must be healthier. What -- which may be due to a number of reasons. Space, concentration and contaminants, and she says thank you, and I thank you.

FACILITATOR ANDERSON: Thank you, Carl. Kathy Soder has 15 years of research and production experience with grazing systems. She is currently a research animal scientist with the USDA agricultural research service here in University Park, Pennsylvania.

Her research involves nutrition and grazing - nutrition and grazing behavior of pasture-based dairy and livestock systems, and Kathy is going to give us the answer to how long it
takes a cow to eat 45 pounds of milk.

PANELIST SODER: You made me sit there and calculate a little bit, so I was doing some calculations. Yes, as I said, I am with the Pasture Systems and Watershed Management Research Unit at University Park located here on the Penn State campus.

We aren't Penn State; we're a USDA facility, and although we don't do direct organic research, we do work with interdisciplinary research and pasture-based dairy and livestock systems, so certainly a lot of what we are doing applies to organic systems.

So we've kind of been skirting the edge of the organic issues, you know, getting pulled in, getting pulled out, so we're kind of on the edge of that but certainly working with a lot of that.

Some of the challenges I've seen, a lot of what I hear you may have heard earlier today, so I may skim over some of it,
but it's good that we are repeating ourselves here because at least we know we are thinking along the same lines and maybe some common threads will come through that may be applied to the revamping of the standard.

But I think some of the challenges in adapting a pasture requirement is, one, the scientific -- sufficient scientific proof. We've all kind of said that, and that's what I was charged with. As a research scientist, I tried to come in with scientific backing for some of these questions that we are asked.

Some of them don't have -- some of them aren't answerable in science. You know, spirit and intent. We can't answer that within science. But some of the other issues, we can get at, and from what limited literature is there, I am going to try to approach some of that from that aspect.

Application of a national standard to all portions of the country, that's been brought out again and again today. That's
going to be a real challenge to put one standard for the entire country. It's going to be a huge challenge.

Enforcability. If we say 30% dry matter, how do we know that they are getting 30% dry matter. I'm going to talk about that a little later on in my talk. Along with that, objectively measuring days on pasture or pasture intake. We've done a lot of discussions of that today as well.

And then I'm going to talk a little bit -- there hasn't been much on milk quality issues. A little bit with mastitis but more of the fatty acids. I have not my data, but I gathered some data on CLAs and some other fatty acids that may be of interest in this discussion.

I am going to skim over this because we've talked about factors affecting dry matter intake. It boils down to the animal, the forage, and the environment. From the animal standpoint, time spent grazing.
The time spent grazing is limited in animals. Not going to eat 24 hours a day.

What limits it? Well, gut fill can limit intake. Usually not an issue on a high-quality pasture. It's usually not gut fill that fills the animal up first. It's usually more physiological indicators or meeting a nutrient requirement, and they are shutting down.

But an animal really, if it is on full pasture, meaning that the animal is consuming pasture and does not get any concentrate in the barn or any other feeds, eight to nine hours is optimum. And they are only going to eat, graze, up to 12 or 13 hours, even if they are not full, even if they have not met their requirements, they are going to shut down.

They've got other things they've got to do during the day. They've got to rest. They've got to ruminate, and they are going to do both of those about eight hours a
day. If you look at some of the behavior data, they prefer to graze eight hours, rest eight hours, ruminate eight hours.

And they do that, you know, in little meals and little bouts throughout the day. And there's other things they do. They have to go drink water, they have to wander around, go look at the neighbor, go socialize.

There's other things that an animal does too that we don't always think about.

So an animal is not going to graze 24 hours a day, and we have to consider that when we are looking as pasture standards as well. And if we look at grazing patterns of an animal, they are going to consume about three to five major meals a day.

Two of the big meals are at dawn and at dusk. So, if we are talking about how we are trying to get -- let's just say 30%, we've been throwing 30% out there -- of their dry matter intake, we can really influence how much those animals consume by the time of day
we turn them out.

    If we turn them out first thing in
the morning, they are hungry, they're going to
go chow. If we turn them out ten o'clock in
the morning, what do they want to go do? They
want to go shade up somewhere and ruminate for
a while, so we can really affect grazing
patterns by the time of day that we turn them
out.

    Here is where you made me do my
calculating. Some of the research has been
done. Some of the studies were -- a lot of
studies have been done in England. I've been
working with a group in England that's done a
lot of grazing behavior research for the last
ten or fifteen years, and some data out of
Penn State and some data that we did on a two-
year grazing study with lactating dairy cows
looking at grazing behavior.

    We have these neat little
recorders that monitor the jaw movement, and
we can distinguish ruminations, grazing; they
can even tell mooing. I can't figure that one out, but they can tell when a cow moos. But anyway, what we look at is it looks at bite rate and time spent grazing or time spent in whichever activity it is.

And then, using these boxes, we can let an animal in -- just to show you how some of this research is done, we can let an animal go -- we weigh the box, let the animal take fifty bites, take the animal out, weigh back the box, divide it by 50, and that's the bite mass.

So that's the way we get that sum of this grazing research because we have no good way of measuring pasture intake, so we have to do it in indirect measures. But an animal, a grazing dairy cow, a lactating dairy cow, will consume about half a gram per bite. And they can take about 45 to 60 bites per minute.

That's going to vary, you know, bigger bites, slower rate, because they have
to chew it more, so it depends on the pasture, the sward availability and the sward structure, and most of this data is showing these cows will consume about 13 to 15 kilos, or about -- what is that, 30 to 35 pounds of dry matter from pasture per day. That would be on an all pasture diet, some of these higher levels. Some of this data is all pasture, some of it is not.

But these cows are taking about 40,000 plus, 40, 45,000 bites a day. Whether that is pasture or whether that is concentrate, so they are taking a lot of bites. And it can be affected by forage.

So the question earlier, what was your question? About how long it would take? Okay, I did a quick calculation taking a half a gram per bite, so right down the middle, times 50 bites per minute, which is 25 grams per minute, times 60 minutes is 1,500 grams per hour, or about three and a third pounds of dry matter per hour.
So in three to three and a half hours, assuming they graze constantly, which they are not -- they are going to chew, they are going to bite, they are going to search, they are going to look up at the neighbor -- three to three and a half hours, minimum, they could consume, potentially, hypothetically consume about ten pounds.

Now, I would recommend leaving them out for that minimum because, like I said, they are going to do some searching, especially as they get fuller. They are going to start looking for the better patches and the forages they prefer. But you asked how long it could take to consume ten pounds of forage, there is your answer.

(Laughter.)

PANELIST SODER: You know, we were talking a lot about this 120-day minimum, and how will a day be defined. You know, that's one way to get at it. Another way is -- grazing until the animals are full, but we can
influence that a lot by what we feed them in the barn before we turn them out.

If we fill them up on TMR and turn them out, they are not going to graze much. If we turn them straight out of the parlor, they are going to go out and eat quite a bit, so we can influence that quite a bit.

A minimum number of hours, we were, you know, shooting there three to four minimum. I would probably put a little bit of fudge factor in there for those other activities that those cows are going to be doing, and especially if pasture quality is lower. If availability -- if it is a short pasture, if it is a sparse pasture, it is going to take them longer to get that ten pounds than it is if it is a very dense, very lush pasture.

And then, you are going -- 30%. If there is a minimum daily intake requirement. Do we set the 120 days, if they meet that 30%? Is that how you do it? I'm
just throwing questions out there. I don't have an answer for it, but some of the things that went through my mind when I saw that requirement -- how do we answer that question.

Other factors that are going to affect pasture dry matter intake, again, are stage of lactation, milk production, body size and condition -- I just wanted to mention these, just for those who may not be quite familiar with how many variables we are dealing with.

We are talking about especially a pastured animal that has a lot of choices out there. When you feed a cow TMR in the barn, they can do some sorting, but they've got a TMR in front of them. We send them out on a pasture, we don't -- we're learning more and more about how many choices there really are for that animal, and that's where a lot of our research is taking us now, with this grazing behavior.

Jim and some others have hit on
this -- the forage factors that can affect dry
matter intake are quality, quantity, how much
is there, how good is it, digestibility can
affect passage rates and gut fills. There's a
lot of factors from the forage standpoint, and
environment. We've talked about these today
as well.

Temperature, humidity, sun
certainly have an effect on how and why an
animal will graze. Time of day,
supplementation -- I've already mentioned
that. When we feed it, how we feed it, what
we are feeding, if we are feeding a high
protein versus low protein supplement, that
can have an effect on grazing behavior and how
those animals perform on pasture.

So pasture dry matter intake is a
complex issue, and I think most people
recognize that, and it is very difficult to
quantify from a research standpoint. So, you
know, we hear different terms thrown around
when we talk about dry matter intake from
pasture. Right now, we can't measure it. We can't truly measure it.

It's not like in the barn where I can dump a garbage can full of whey, a garbage can full of feed, dump it in front of the cow and weigh it back and know how much she ate. We're only doing estimates.

Carl talked about some ways that we do that with indigestible markers, total fecal collections -- it's still only an estimate. We really don't have a good way to measure it, and it can be very subjective and very variable from day to day or depending on what the animal eats.

The best way or actually the most practical way most producers do it on their farm is looking at pre-imposed grazing heights or the rising plate meters, and we discussed them already today.

And one thing that came across to me, and I just kind of stayed quiet until I had my turn here is talking about what -- I'm
sorry, Lisa, with her equations here and Jim's measurements, and you are looking from the pasture standpoint with the pre-imposed grazing, combining those two methods to confirm one versus the other.

If we are saying here that they are eating ten pounds in the pasture, what is it saying out here in the pasture when we measure pre-imposed heights. Is it similar? We don't expect them to be identical. They are not going to be identical. Are they similar?

If one is saying ten and one is saying twenty, which one do we believe? So it's just something to put across to you about it, and, you know, is it enforceable with it being so variable and with an estimate.

You know, I originally asked is it enforceable, but maybe combining some of these methods may be a way to put this across if the pasture requirement is put in place.

Talking about the 30% dry matter
intake from pasture, at face value to say is it feasible for cows to consume 30% dry matter from pasture and produce not maximally but to their optimum, sure. Sure, it is. The research will show that. I am going to talk about -- just mention some here in a minute.

And I had asked -- some of this stuff has been answered for me today already. It was of the average over the grazing season or an absolute daily minimum, and it seems to be the latter that is coming through to me today.

And how to account for drought and weather. You know, I think there does need to be some leniency there for conditions, whether it's, you know, a drought watch is put in, you know, there's way that maybe it could be enforceable to say, okay, this region is in a drought. We are going to have to back off on the restrictions because of this because we can't expect these people to put their cows out there, and they are not going to be able
to consume 30% dry matter. I think then you run into more health problems than you wish for.

So, again, just the drought and the wet weather. Research -- the study that I did a couple of years ago as well as some others from Penn State -- we fed mainly a concentrate pellet. It had some non-forage fiber sources, some citrus pulp and some others in it, but we were getting about 50 to 60% pasture dry matter intake that maintained about 70, 80 pounds of milk.

So, your 30% certainly isn't a maximum. It's not unfeasible, it's not out of this realm. I wouldn't recommend setting it this high; I'm just showing you what we've shown in the research as an example of what we've been able to do. But these were short-term studies, you know, over several three months.

It's not a long-term over the year, what effect does that have on
reproduction and animal health and longevity of the cow. So we do have to consider those factors when we are looking at pasture requirements.

And I keep hammering on type of supplement, but I think there are so many things we don't know about supplementation in grazing and how we can influence grazing behavior, and that's one area that we are headed towards in looking at what type and how we should be supplementing these grazing cows to optimize pasture utilization.

And typically pasture -- we're not really dealing with supplementation today, but pasture dry matter intake tends to be lower with TMR supplementation than with concentrate, but again, that depends on the type and amount that's being fed, and there's a lot of variation out there in that.

And then, milk components, supplementation can help maintain milk components. We want to certainly incorporate
that and utilize that. Linda talked about the Washburn study, so I'm just going to mention that real briefly, but what Steve Washburn showed lower instances of mastitis in pastured cows in North Carolina.

Another -- a couple of other studies that I've picked up, one in Vermont and one in Hungary, showed lower somatic cells on pasture as well, but there are other studies that have shown no difference. You know, it might have been both well-managed herds, confined and pasture. You know, we can't always say pasture good, confinement bad. You could get a really good confined herd and a bad pastured herd. We can fudge the data whichever way you want depending on what you pick up, but it, you know, it's not always a matter of pasture is better.

I just got the two-minute warning, so I've got to speed up a little bit. Usually, total milkfat production decreases on pasture. A study out of North Carolina, Steve
Washburn student, did this study that showed how milkfat decreased, but what I want to emphasize is the CLAs and the Omega-3 and -6's just a little bit.

Factors can affect CLA. We know pasture can increase CLA, but we can increase CLA in the barn too. We can do it through feeding different fatty acids and stuff, so it's not something that's unique to pasture. We just need to keep that in mind.

A study by Tilak Dhiman in Utah State, where he had a controlled, confined herd, a third pasture, two-thirds on total pasture, 100% pasture, and you can see what happened to the CLA. This is compared -- increased compared to the control. So, we doubled the CLA whenever they were consuming a third-pasture. 350% when they were two-thirds, but he had a 500% increase when they were on full pasture. No supplementation, full pasture.

But the other side to this coin is
that what happens whenever those cows went on pasture. The study was also done at Utah State. The cows went on pasture, CLA started to increase, and it took about 25 days to reach the high level. Cows were taken off pasture right here. Look what happened real quick. So consider that 245 period. We lose that benefit real quick.

Something else Tilak -- I found this quote just this morning on the internet and couldn't find the study to substantiate it, but he says, "Older cows produce more CLA than younger cows. Specifically, a cow that has gone through four lactations produces more CLA than she did when she was younger. So there's something to say about, if we have longer longevity in these cows, and we are trying to increase CLA, you guys can add up the fact there.

Omega-3 and Omega-6 really quick.

Again, Tilak Dhiman, a third, two-thirds, and full pasture. Omega-6's were very high when
they were fed a third pasture. If you look at some of the CDC data in that, they want to see about a one-to-one ratio of Omega-3's and Omega-6's in the total diet. Well, that was on a full pasture diet. No supplementation.

Probably not economical, probably not environmentally sound in our system. New Zealand has been doing it, but not necessarily the best for our system, but I don't know if we can necessarily say it's a whole lot better whenever we are feeding if we are doing a third pasture, thirty percent pasture. Omega-6's are pretty darn high, and that's the one that's the bad fat compared to the other two.

So, to sum up real quick here, my last slide, factors to consider. Regulations need to be measurable and enforceable. You know, we can get a lot of subject in measurements, especially when it comes to pasture, but we just need to do it and make sure it's worded properly. Measure versus intake and some of these other things that
we've mentioned today.

We want to make sure stricter regulations don't exclude too much of the population. I know there's a lot of things we want to include, but just make sure that we can maintain that population base to maintain a viable market. And if it is decided that you can't put that in, for some reason, sub-market pasture raised within the organic standard.

I know there are people doing that now, but it's just another thought to throw out there. If it's not across the nation, you know, there are certainly groups that get together, co-ops and market specialty products. There's -- I know there's some co-ops out there doing that already.

And again, we just have to consider what's happening during that non-grazing season, and especially with the CLAs and some of the data and showed. And I'm getting the hi sign over here, so I'm going to
be quiet and sit down. Thank you.

MEMBER GIACOMINI: Dan Giacomini, NOSB. I have a number of questions, and I will try and be as succinct as possible, so how long this will take will depend on you guys, I guess. Can any of you address where the 120/30% came from? Can anyone address where the 120 days/30% came from?

PANELIST SODER: The first I saw it was in this document when it was sent to me, so I don't know.

MEMBER GIACOMINI: Let me see. Linda, if a large part of the country would have to really push to reach the 120 day/30%, would we be increasing the amount of detrimental effects that we see on cows on pasture in those situations?

PANELIST TIKOFSKY: I guess I don't understand your question.

MEMBER GIACOMINI: In the areas of the country --

PANELIST TIKOFSKY: Right.
MEMBER GIACOMINI: -- that would have to really be pushing to achieve 120 days/30% intakes, would we see an increase in the detrimental effects of excessive pasture in those situations? Would we see more cows with really bad body condition? Would we see more cows with low production and reproduction problems?

PANELIST TIKOFSKY: I can't answer that. I'm not a nutritionist, but I think -- I have to tend to agree with Lisa, somewhat, as we have to think about the sustainability of the whole system and what those areas of the country are best suited for. I don't think -- I would like to see cows on pasture, and since I'm not a nutritionist, but I seem to get a sense that 30% is probably doable in most parts of the United States.

You know, I would not be averse to some of the supplementation on pasture. I would like to see cows outside and get the benefits of being, you know, on pasture and in
the fresh air and the sunlight. So, I can't
say if we would see detriment.

PANELIST SODER: Can I jump in on
that, just real briefly?

PANELIST TIKOFSKY: Sure.

PANELIST SODER: Obviously, if
they can't make the 30%, if it's a time of the
year or if it's a drought situation, they are
going to be supplemented. They are going to
be bringing out some stored feeds and feeding
them, and they may not make their 120, but,
you know, nobody is going to starve their cows
to make that 30 -- well, I shouldn't say
nobody. Good managers are not going to starve
their cows to make that 30%.

You know, if that means they don't
make it, they don't make it, but they've got
to look at the animal first, and then the
sustainability of the system as well, but, you
know, unless I misunderstood your question,
you know, people -- if there is no pasture
available, obviously, you are pulling out
stored feed to keep those animals fed.

MEMBER GIACOMINI: Yes, the problem with that is that what is the definition of a minimum requirement for certification, then? That's one of the things we're having to address in passing on to the NOP.

PANELIST POLAN: One comment on that. Obviously, you are going to have to feed cows, and, you know, that may be supplemental hay or supplemental silage, but if they are out on the pasture, out on the open field, it doesn't matter if there is any grass out there or not, they are going to graze and make their rounds. They'll do it. And to me, they almost seem as happy doing that and making that round as if they was eating a lot of grass sometimes, you know? They do do that.

I have some animals of my own. I watch them every day, and, you know, unless there's snow on the ground, even though you've
got a bale of hay out there, and that's really the only feed they have, they still graze that field for whatever it's worth.

MEMBER GIACOMINI: Two real quick ones. Linda, as someone who also works with this on these things every day, I would just like to make the comment that I don't believe that it is always a case where the lower cull rate is better. When you pencil out the numbers on a 100-cow herd, you should be having 135 to 140 calvings a year, and if you are only at a 20% cull rate, I think you need to possibly be looking at reproduction or calf raising problems in those kind of situations, so I think in most cases, I agree with you, but I think there are also other situations.

Also, finally, one of the reasons we are here is because of the situations that everyone considers the abuses of this system. In any of your opinion, even in the first panel, is there a way that we could address this issue differently from what you've
discussed before to eliminate the abuses without maybe setting the benchmark so high in what some areas of the country would be considered too high but are considered viable, good, organic environments?

   PANELLIST SODER: Obviously, you've asked a tough question. It's one that I don't have an answer for. I mean, you are going to have cheaters no matter what. Cheaters or those who stretch the limits, whichever way it turns or both, in any system, and, you know, that's where I kind of struggle with a national standard for the whole country because there is so much variation.

   A lot of these standards seem to be set for northeast Wisconsin, those types of regions. What do we do with the rest of the country, whether it be the deep south, the arid regions? You know, obviously, some of them are not going to be able to make these standards. So how do, if you do accommodate those areas of the country into the National
Organic Standard -- I don't have that answer for you, but it's a question that keeps going around in my mind ever since I started looking at these regulations and the potential changes.

PANELIST CROPPER: I'll just make one comment at least concerning the amount of forage that is actually consumed. I still think you are going to need to somehow come up with a system where it is actually measured in the field. That's harder to cheat. If you've got a two-inch stubble height out there, and that's when they are getting turned in, there's no way they are going to have the capability of consuming 30% of their diet from that pasture that's that short.

They will be taking little, bitty bites, like Kathy talked about earlier. It's not going to be anywhere near what the maximum intake rate, and then they are going to get tired of that because they can't get that much to begin with, and they will do their time,
and once the time is up and they are tired of trying to get what they can out of that pasture, then they are going to have to resort to some other feed, and that's probably back at the barn or feed box.

PANELIST McCRORY: I'll just comment. The 30% dry matter was, to my understanding, was a measurement that was figured out through lots and lots of time discussing, deliberating, between the National Organic Standards Board livestock committee and numerous organic dairy organizations throughout the United States.

There has been talk going on for the last five years. People have chewed it out over and over again. It started off at 50% dry matter minimum. Now it's down to 30%.

I think -- and if you listened at all to the press conference prior to this meeting, you could have heard from a lot of different producers from throughout the United States sharing their input, and I think that 30% has
been a consensus that has been determined by
the producers discussing to the NOSB and
coming to a consensus that seemed reasonable.

So, I think that we should be
listening to our producers, who are also
talking to their consumers, and I'd like to
hold on that number. I think that's a pretty
legitimate number.

MEMBER JAMES: Bea James, NOSB. I
have several questions, and I think to just
tag off of what Lisa commented, my first
question is for Kathy. You talked a lot about
lack of scientific research. Would you
consider the farmer testimony adequate
scientific research or proof?

PANELIST SODER: I couldn't get it
published for that. To be honest with you,
I'll tell you what, it's getting more and more
difficult for me to publish our grazing-based
dairy data in U.S. journals. In the
mainstream U.S. dairy journals. We're having
quite a challenge with that.
We're actually having to go to Europe with some of this. I think the testimonials are great. The problem, from a scientific standpoint, there is so much variation from farm to farm to farm to farm that we don't have a control to say, well, okay, he said this, and this works on his farm, but will it work anywhere else in the world? We don't know.

You know, to go up against it, and the scientist in me says no. It's not -- on a national basis, it's not.

MEMBER JAMES: So in order to have adequate proof, do you look for the science in this particular area, or do you look to the farmer who is actually working in the field and experiencing this particular topic?

PANELIST SODER: I think the science needs to go to the farmer and get farmers to cooperate. You know, I'm not saying they don't, but to find cooperative farmers doing these things because we're not
going to have it happen at the universities. There may be a smattering here and there, a little bit is, but getting the funding for it at the university level and getting someone interested in it at the university level is a real challenge these days.

And I know Carl and I have talked about that, but, you know, there is the possibility of okay, well, we can't designate a dairy herd on this farm to conduct organic research just to set up. The farm as a big obstacle, if there isn't an organic farm available.

But there is no reason we can't go to the farm, the production agriculture, and do our research there. We've done some of that. It's a big challenge, but we can do that, and I think we need to do more of that to get more of these answers.

MEMBER JAMES: Okay, great.

PANELIST TIKOFSKY: Can I make a comment? I think we will start seeing more of
these initiatives and more research coming out. University of New Hampshire has an initiative to start an organic dairy for research for the northeast. State University of New York at Alfred, one of our campuses in western New York, is recently launching an initiative to have an organic dairy along with a regular, conventional dairy so that they can do some comparison studies between those.

College Alfred, which is in Ontario, eastern Ontario, near Montréal, is converting their 50-cow dairy herd to organic production, and actually, they are dedicating the mission of that university to sustainable agriculture. So we may not have it right now, but I think we will be having it very soon in the future.

MEMBER JAMES: Okay. Well, that ties in nicely to my next question, which is for you, Linda. If pasture decreases lameness, decreases digital dermatitis, aids fewer hock lesions, decreases mastitis,
decreases bacteria, and longers lactation periods, and you have actual study of that, what other additional scientific information is needed to reinforce pasture in organic dairy?

PANELIST TIKOFSKY: I think a lot of this was done in, you know, a lot of these studies were done in Europe. We don't have a lot of U.S. studies, and U.S. systems differ from the European, so to have things done here in this country, in our climates and in our environments and our milk regulations, I think is of value.

I don't think -- I think there is enough research that certainly points us in this direction, but like Kathy is, I'm a scientist. I want to see some confirmation. I don't want to rely on one or two studies. I want increased proof. I think we still have to ask those questions.

MEMBER JAMES: Okay. My next question is for Ann. You mentioned that you
think we intervene too much, and that we, "change pasture management. If we change pasture management, we could easily improve the health of the animal." Could you elaborate on what you mean by "change pasture management"?

PANELIST WELLS: I kind of threw that out. A lot of times, it's more -- pasture management is just one aspect of it. But it's management overall. A lot of times, when we have animals that are what we consider not doing as well as we would like them to, then we want to jump in and give them something.

And what I'm saying is that what I'm seeing is that when farmers stop and take a look at these animals and figure out what they can change either in their rotational grazing system, changing their nutrition. Sometimes it does mean additional supplementation beyond pasture. Or doing something that is a management technique
rather than giving them something, these animals improve with that alone.

MEMBER JAMES: Okay, thank you. And that's all the questions that I have, and I just want to make one comment that I really appreciate all of your expertise. It's been very useful and helpful.

(Applause.)

MEMBER KARREMAN: I just want to add on to what Ann was saying, that I find, as a veterinarian that works with grazing herds all the time, that when they are out on pasture, they are not pushed as hard. I mean, their milk production is lower when they are on pasture. I did a study, and it is statistically less. But that when they do get sick, they tend to rebound better with natural treatments that are allowed per the organic program.

And so, you know, getting all that right, you don't need all those Band-Aids, but when you do need a true Band-Aid, you know, to
help heal a sick cow, they tend to work very well because they are not pushed as hard, in general.

The other thing is that you were mentioning, Linda, about cull rates. Another study I did with Lancaster Extension, we did find, actually, significant difference in cull rates from certified organic herds that were grazing versus confinement herds in Lancaster County.

I guess one -- and also, I was -- I drew bulk tank samples from my farmers' herds two years ago by now, and the CLAs were all way high on the grazing herds in May compared to the shelf milk, so I really enjoyed your presentation, Kathy.

One question I guess, in general, is if we are going to be measuring pasture, or whatever we come up with, either with a fleximeter or fat calculations or whatever, let's say we actually go to the field and measure it; how often do we have to measure...
it? Maybe you already answered this, but how often and how many -- what percentage of the paddocks during the year? Can you get some kind of baseline data for years ahead in your pastures?

I mean, how -- I know it's highly variable almost every day every week, but how often should a farmer be checking their pasture intake for the cows if we go to some percent intake or biomass intake?

PANELIST CROPPER: That depends, I guess a lot on how closely you want to manage your operation. Ideally, it should be done at least once a week. Measuring actually not only the paddock that they are currently in, for instance, but also measuring further down the line to get an idea of, okay, what is the growth rate out there right now? How many paddocks am I going to need maybe two weeks from now?

So there are some good reasons to do this just from being a really good manager.
so that you know that maybe at the end of two weeks, I am going to need twenty paddocks, and I've only got maybe ten right now that are there. So now what am I going to do? Well, that either means that I'm going to have to increase, maybe, the level of supplementation in that case.

Maybe bring another field in line.

Maybe I've got a second growth hayfield over here that I could use that as pasture because maybe I don't need this much stored feed now that I've gone to the pasture system, so that you've got some -- you have some idea of where you are going with this thing.

Because a lot of the times, what happens in rotational pastures, we have this thing that we call train wrecks, and that's just not looking ahead, not measuring that forage enough in advance to know that, well, I'm coming to the end of the railroad tracks, and I don't have any way to get out of it now, so what do I do?
MEMBER KARREMAN: Do you think that's -- can you translate that or apply that year to year, or do you really -- because I'm thinking of like, you know, whatever comes out of all this, there is going to be an inspector there once a year. There's, you know, the certifier has got to verify it, so are we going to ask the farmers to do weekly measurements? Because that will drive them nuts.

PANELIST CROPPER: Yes. It could.

(Laughter.)

PANELIST CROPPER: Again, like I said, it depends a lot on the manager and what they are willing to do, and that is probably ultimately going to be a decision on just how much paperwork you want to have involved in this project.

If you say once a month, that will become probably what will happen, and I'm not so sure if that's a good way to manage pastures. I think you really should be doing
it on a more frequent basis just for your own
-- just for your own management and your own
edification of where you're going.

I guess I just have to leave it at
that.

PANELIST POLAN: Yes, I'd like to
comment there a little. I think, ideally,
what he says is right. I wouldn't want to
measure my pasture very often, though. I
think once you do this, and you get
experienced, you know how much pasture is out
there.

Now, if you, say, take a scheme
like this from over here on the chart, and you
feed an animal so much silage, if that's what
you are feeding, and so much grain, and that
provides 65 or 70% of what they need to
produce that milk that day and put them out
there, aren't you going to be sure there is
enough pasture out there for them?

I think you will, if you want to
sell any milk. If you want to produce any
milk. So, if you honestly put that value down and make sure the pasture is there, whether you do it by measuring method or whether you do it by the pole and eyeball method with enough area, you make sure there is enough there. Otherwise, you are going to suffer in the milking parlor.

PANELIST SODER: I also think it's really critical for the farms that are running right on that 30% are limited land base. They may not have that extra hay field, or they don't have that extra, or if they are feeding at 50% pasture, they can cut back to 30 if they need to feed some extra silage or something to get through a low production period.

Especially for new grazers and those running real tight, running right at 30%, really need to watch, budget, their forage. You know, I think what Jim says is probably what somebody needs to do to get that pole and eye before they get started.
PANELIST McCORY: I would also add that, you know, inspections have been once a year, and they don't always happen during the actual growing season. You could be inspecting a dairy farm, and there is snow on the ground, and you are not going to see any regrowth.

So, I think some sort of calculation to verify how they are figuring out the amount of pasture that they need and whether or not it is available -- there could be some sort of check sheet format that a producer could fill out to just kind of verify any changes in ration over the growing season that could be, then, looked at by the inspector as part of the paperwork requirements.

MEMBER CAROE: Andrea Caroe, NOSB.

I have many questions, but I will hold them to two. My first question, and I would like you to elaborate on something that you said regarding it may take three years before the
pasture is truly efficient, or -- I don't want to put words in your mouth. I caught the three-year mark, and I wanted to know what you see happening in that three years in order to reach that optimum point.

PANELIST WELLS: Jim and Carl may want to chime in here because they are more the experts in that area, but what I've seen is that when someone starts dividing up pastures, rotating their animals around and resting the pastures, that first year they just see this explosion of grass growth. And almost everybody says, oh my gosh, I need twice as many animals because I can't keep up with all the grass.

The second year, because they have really started cleaning out some of the less desirable plants because the animals are eating all of them, they tend to open up pastures. You end up having bare areas -- or, I shouldn't say bare areas, but you have a more open pasture because the animals are
grazing everything off.

And so, you get a lot of weeds in there, and the pastures look really rough, they are harder to manage, and a lot of producers go, this isn't worth it. But then, if they will continue on to that third year, then they start to see that pasture stabilize.

They begin to get a lot more desirable plants in there. They will tend to get more clovers in there, they will get more grasses, and it becomes easier to manage. And so, by the time that third year comes, then the pasture tends to have stabilized and is much easier to manage.

But they have to get through that second year, which can be the tough year.

MEMBER CAROE: Well, then, part B of that question, not my second question, but part B of that is, then, is there an opportunity that organic growers may have a hard time meeting a new requirement if it is going to take them three years? Will there be
an economic disadvantage to them implementing pasture for several years?

PANELIST WELLS: Well, I would hope that any current organic farmer right now already is doing at least some limited grazing, at least has some access to pasture, so they are already part-way there.

The beauty of all of this is that for somebody who is transitioning in, if their land has to go through that three-year period, then they are going through everything all at once, because not only are they having to lay off the prohibited substances on the land for three years, it takes three years for that land to stabilize, and it also takes about three years for a person to really learn how to manage a grazing system.

MEMBER CAROE: Okay, then my second question is for anybody on the panel that wants to answer. We are, right now, looking at a minimum of 30% dry matter intake with a minimum of 120 days of pasture. Could
you tell me, is there an advantage of that
over a ten percent dry matter intake over a
total calendar year, on average? And allowing
producers to, you know, give them incentive
for efficient pastures so that they get that
dry matter intake.

PANELIST WELLS: My concern with
the ten percent across the calendar year and
not on a day-by-day is that that rule could be
abused.

MEMBER CAROE: How so? Explain
that. I mean, I'm not advocating one way or
another, but I just want to know how that
could be abused because, you know, 30% over a
third of the year or ten percent over the
entire year -- isn't it a wash?

PANELIST McCRORY: No, I think
that it needs to be clearly defined that it is
30% dry matter per animal per day so that we
know that the management is happening for a
minimum amount of days with a management that
we can all support and understand.
And if it is, say, ten percent over the whole calendar year, ten percent, then there could be, you know, certain batches of the livestock herd that are going to be on 100% pasture where others are going to remain in total confinement, and over the average, it's ten percent or whatever that percentage is.

Now, if you are just saying, you know, ten percent across -- over the year, and still requiring it on an animal by animal basis, I still think that there could be -- that it wouldn't be as -- I think that there are still opportunities where it wouldn't come out as nicely as the day by day management, and I still -- I just think that the 30% dry matter per day is so doable, and if it is ten percent over the whole calendar year -- I don't know, I'm going to have to think about that a little bit more to make some -- to chime in. If anybody has any other comments.

PANELIST SODER: I think in a lot
of areas, particularly here in the north, you
are going to adversely affect animal welfare
if you have those cows out in December or
January. You know, even if it is for a couple
of hours, ten percent -- if you are talking
throughout the calendar year --

MEMBER CAROE: Let me clarify.

PANELIST SODER: Okay.

MEMBER CAROE: What I am saying is
that the producer can determine if 120 days or
150 days --

PANELIST SODER: Okay, I see.

MEMBER CAROE: -- or 180 days,
whatever it takes for them over the year to
get a minimum of ten percent.

PANELIST SODER: An average across
-- an average across an --

MEMBER CAROE: Right. I'm not
suggesting that you turn cows out in January
in Maine.

PANELIST SODER: Okay.

MEMBER CAROE: I mean -- yes, I
can't see -- but, you know, I know that there are going to be some areas that are going to be challenged, or -- again, I claim a little bit of ignorance in this, but it seems that some areas are going to be challenged to get the efficient pasture, and a producer may opt to prolong the pasturing in order to get that ten percent over the year.

It seems to me that there may be a positive on that side, and I may not -- I'm asking because I'm not seeing the negatives, and I'm trying to figure out what those could be.

PANELIST SODER: Okay.

PANELIST POLAN: It seems to me like -- I don't have -- let me first say, you know, I'm not stating one preference over the other, but if you want to control the situation, if you want the control and you want good documentation, I think that the number of days with the number of percent per day is more -- is more worthwhile in terms of
having documentation control over it for the total herd.

PANELIST CROPPER: To me, I think it would be probably easier to document a shorter period of time and have that percentage, whatever it might be. It would seem to me to be much easier to keep track of that than to try to do the average over the whole year. That's just kind of my impression. It just seems like it would be a lot easier for monitoring and actually calculate --

FACILITATOR ANDERSON: What about in terms of the animal's health?

PANELIST CROPPER: I will defer to an animal scientist.

PANELIST SODER: It's going to depend on the management. I mean, you could do it well both ways, and you could do it poorly both ways. I don't think you can answer it that way. I mean --

PANELIST CROPPER: I don't have a
MEMBER KARREMAN: I have a question. Maybe for the two veterinarians. We are talking about how to get the cows out on the pasture and how much and everything, but what specific instances would you think that cows or animals should be allowed to be not on pasture -- not talking about, like, environmental storms and all that -- but within the own -- anyone can answer it, but, you know, for the animals -- the animal itself, its well-being.

When would it be okay for it not to be on pasture? Because there will be exemptions for certain things, and I think we wanted -- one of the main sticking points right now is the perceived loophole that stage of production can be an exemption for being out on pasture, and one thing that we did with the guidance document last year is to change the stage of production exemption to be stage of life.
But I am starting to get the feeling that that's a pretty nebulous term, stage of life. So I'm wondering, you know, when could an animal be kept off pasture for its own good?

PANELIST TIKOFSKY: I think, certainly, in periods of illness, you know, where that animal needs to be observed more closely or treated more frequently. Illness has something to do with it. I do have some concerns, you know, about -- we don't know a lot about yoni's prevalence in organic herds. We certainly know a lot about it in the rest of the world.

But if we have an organic or grazing herd with a high level of yonies that's on a -- you know, that has a management plan that has decided that they are going to enroll in New York State Cattle Health Insurance or have a voluntary yonies control program, perhaps those high-shedder cows, those -- shedder cows should be at least
separated to one area of the pasture or not be allowed to mix, you know, with the general population and have a more limited confinement so that we're not contaminating pasture or young stock or that sort of stuff.

So, I think there may be certain disease states that we have to look at on a case-by-case basis to make that determination.

FACILITATOR ANDERSON: So basically, illness?

PANELIST TIKOFSKY: Yes.

FACILITATOR ANDERSON: Of various shades. Okay.

FACILITATOR ANDERSON: I have a question maybe of Jim but of everybody, and that is -- the one example you gave is, well, you know, there might be a river or a highway or something running through the farm, and if we take out the manure issues of concentration because it goes -- you can run a truck across the highway or the spreader across the highway, is there a difference in CLAs or is
it important that the animals are grazing, not
feed lotted, but could they be in a green
paddock, as it were, and be getting green chop
as opposed to raising?

PANELIST SODER: I just had this
discussion with Larry Muller last week. We
haven't seen evidence of it, but it is the
fresh green forage that is increasing the
CLAs. So if you bring it to the cow or let
the cow go at it, it shouldn't make a
difference from that respect.

FACILITATOR ANDERSON: This is a
question from the audience that says, "Do
dairy cows that graze pastures with soils that
are well balanced have the same problems with
milk urea nitrogen as non-organic grazers just
using urea to grow the grass?" And it goes on
to talk about the management using artificial
-- is there a difference in pastured animals,
the milk urea nitrogen, on a well-balanced
soil as opposed to --

PANELIST POLAN: It totally
depends on the protein level. It doesn't matter which source it would be, it would totally depend on the protein level in the first pasture. Now, protein in dried materials is different than protein in first pasture, but the protein in first pasture is rapidly and readily degraded and ruined, and the ammonia goes in the blood stream very rapidly, and the animal then, when it gets to the liver, converts it to urea, and that's a little bit of what I referred to earlier. And, of course, that ends up being in the milk as a water reservoir, the kidneys as a water reservoir, so it equalizes in the milk until the kidneys empties what it's going to do.

FACILITATOR ANDERSON: Okay, sort of a follow-up on that is it -- to anyone. Is there a breed -- or not a breed, but is there -- are there flavor factors that are going into milk on pastures as opposed to those not on pasture?
PANELIST SODER: I ran into a couple of studies on that, and they were mixed. Some said yes, some said no. I mean, I think if animals get into certain plants, if they get into garlic or something, it's going to impart flavors, but from the basic forage species that seem -- preference tested, and it didn't seem to show a whole lot unless an animal was into something really aromatic.

FACILITATOR ANDERSON: Are there any useful metrics for flavor evaluation? Especially the person on the ground?

PANELIST TIKOFSKY: I think we need a food scientist up here for that.

PANELIST POLAN: We need the man -- what was his name? At Penn State that left a long time ago. He kept up with all of that.

FACILITATOR ANDERSON: There have been many questions, many times people have commented about -- not here, but overall, that Holsteins may not be genetically the most fit for grazing. A, is that true, and B, are
there breeds that are better suited to grazing than that?

PANELIST SODER: From a scientific standpoint, we don't know yet. I mean, I think through genetic selection, you could make any breed more efficient. Now, I'm not going to relate them, you know, one breed to another, but within a breed, I think you could genetically select, and through behavior.

Someone was mentioning it this morning at the press conference about grazing their calves with their -- their newborn calves with their -- the dams. Well, there's a lot of research, most of it is in sheep, but it would certainly apply to cows, from Utah State showing how much that calf or that youngster learns from the dam.

Where to go, what to graze, what to stay away from, how to balance the diet from toxins and secondary compounds. You know, I think there is a lot to be said for that, and if you are buying your heifers out
of a dry lot somewhere, they don't know how to graze.

PANELIST TIKOFSKY: And I think in the Washburn study, if we look at that because they compared the Holsteins to the Jerseys, and the Jerseys were actually more efficient grazers in that particular study. So I think, you know, maybe legs, feet and legs, I think, have a whole lot to do with it.

PANELIST CROPPER: I'll just make one comment on that. I had an opportunity to go to Ireland, and they graze all their dairy cows, and they are probably about 90% Holstein. So, I don't know. It's kind of -- that's kind of some anecdotal evidence that would show that, evidently, they've got Holsteins that know how to graze pretty well.

FACILITATOR ANDERSON: The NOP regulation requires that organic producers accommodate the natural behavior of the animals. What are the natural behaviors of ruminant animals? I think we talked about
them, but if somebody could summarize those quickly?

PANELIST SODER: Natural behaviors that they are going to spend -- they are going to split their day up, given the limitations. I mean, if you don't limit them and make them search for their food real hard, they are going to consume their feed about eight hours a day, whether that's grazing or in confinement.

They are going to rest about -- rest/sleep about eight hours, and they are going to ruminate about eight hours. And there are other activities in there. They have to go drink water, they have to go check out the fence line, they -- there are studies out there coming out looking at socialization within the herd.

You know, they socialize just like we do, so, you know, that's a natural behavior to them, whether it is to go pick on the one at the bottom of the pecking order, or whether
to go try to become top cow or --

(Laughter.)

PANELIST SODER: -- they spend time doing that, so.

FACILITATOR ANDERSON: If consumer expectations can be changed, why regulate according to the current expectation? Rather, why not regulate to the environmental health benefits that may be -- I'm having trouble with this question a little bit. You may have to help me. But -- that may be relatively fixed, and perhaps these outcomes, the health outcomes, should be more the basis for it rather than consumer expectation.

PANELIST POLAN: Health outcomes of what?

FACILITATOR ANDERSON: The health outcome -- the impact on the animal rather than the consumer expectation.

MEMBER KARREMAN: I think that's right. I would say that's how I wrote it.

PANELIST TIKOFSKY: Yes, I think
that -- I think, you know, certainly -- I'm a consumer, you know, and I want my cows on pasture from that standpoint, but animal health and animal welfare is probably overrided.

And then if you look at, you know, if you look at other countries' regulations or so in Denmark, they take animal welfare in a whole different light than we do in the United States, as far as the organic or farming rules go.

I think health should be first in animal welfare. And we will have, you know, that's, you know, that's what the consumer expects, but isn't that just right?

MEMBER HALL: This is a little out of the box, but as I'm thinking about the geographic variation that we've talked about and the ability of producers and talking about this a lot from the producer perspective, I come back to what's on the label and what we're actually able to commit to a consumer
and how that translates, and with -- if we had different state, you know, minimums, based on regional variants, what does a consumer actually -- what can we commit to them? What's their pasture minimum?

And is there an opportunity to maybe use some of the structure that we've set up with dry goods and do an organic and a made with organic and two different grades of it based on what you are able to meet in your area?

PANELIST SODER: I guess the question that raises in my mind -- is the consumer expectation in Arizona the same as that in Florida, the same as that in New York? I don't know. I mean, maybe, say, in Arizona that's not expected, and it's a regional-type label may be applicable. I don't know, but you just thinking, you know, kind of to turn that back. What is -- does the consumer expectation change across the country?
actually, a question that came out of the audience on that is very related. If -- and the gist of this is why don't organic dairy companies market organic pasture-based milk period, and/or seasonally? That's a -- almost a rhetorical question to everyone, but I think it is an important one.

MEMBER KARREMAN: Or the flip-side would be on to what you are saying, Jennifer, would be if there is going to be two different grades, let's just say, that, you know, the one that is not pastured would have to be declared versus the one that is being pastured.

MEMBER JAMES: If I could make a comment on that, also. Bea James, NOSB. I think that without directly saying "pasture-fed milk" on the label, it is implied with the brand of, you know, artwork on the label? So, speaking in pictures but not necessarily in words. And that's one of the reasons why we're all here today.
FACILITATOR ANDERSON: Why are we stuck on a minimum of 120 days compared to 200 days of grazing?

PANELIST SODER: Thinking back to what somebody asked about the standards, again, talking to a couple of folks, it seems to me, and someone correct me if I'm wrong, that the minimum of 120 days was set based on New England grazing seasons? No, it's not? Okay, then I don't know.

PANELIST McCORY: I can answer to that. The minimum 120 days was realistic based on the climate throughout the United States, and the 120 days would be when the pasture is in full season, and the animal can actually get the allotted amount of feed, which was determined to be 30% dry matter. At what point in that growing season can they start getting that ration on a regular basis, and what is the length of time that that will last.

Well, like I said, in Vermont, we
go, you know, it's averaged 150 days and beyond, but it's not that long in some other areas, so the consensus was that everybody could live with 120 days. More than that was too hard for some areas because the season can be variable. Less than that didn't seem like it was the right way to go.

CHAIRMAN O'RELL: Kevin O'Rell, NOSB. You know, just something to consider and ponder, and I don't know the answer to this, but -- and maybe the panel on the consumer retail side of it might be more suited for this response, but as we build up an organic perception for milk with the consumer of all pasture-based, and we are talking about 120 to 150 days, and you do that, and consumers realize there's 215 to 245 days -- what are they doing?

And we have these pictures of cows on green pasture on our cartons 365 days a year. I'm just wondering what is the backlash of that?
PANELIST McCORRY: I think when consumers are traveling to Vermont to see cows on pasture, they are doing it during the growing season, so they are realistically knowing that in the wintertime, there is not much grass to eat, and they are going to be -- the feed is going to be brought to them.

But I think a lot of producers really, you know, the forage is still organically managed, and it is brought to the animals. They are being managed in a certain way that meets the standards. Consumers are buying into not just the grass, but I think consumers -- we can't assume that they are -- we've got to assume that they've got some intelligence to them too and can realistically look at the number of viable days that an animal can be out there grazing.

And 120 is a minimum, you know. Many producers are grazing, have their animals out on pasture, for over 200 days, easily. That's in Vermont. In Pennsylvania, somebody
was saying 225, 250 days. You know, they are
going way beyond. But we are at least setting
a minimum standard, that's all we're doing.

FACILITATOR ANDERSON: And one of
the questions, Kevin, that is a follow-up on
that from the last time that we didn't quite
get to, but what does that really mean for
more temperate climates, and is it doable?

CHAIRMAN O'RELL: Yes, I agree
with what you are saying, it's just -- even if
it's 120-day minimum, that's what I'm getting
to. That's the minimum you can achieve that,
and I think it just raises more awareness with
the consumer that, okay, it's only 120 days,
and I've got this 245 days.

FACILITATOR ANDERSON: If cull
rates on pasture are 20 to 25% and calf loss
is not an issue, why don't we have increasing
herd size in organics?

PANELIST TIKOFSKY: Well, I think
in my well-managed organic herds, they do have
-- well, they have a limit of what they want
to be, what their land base can hold, and what
their barn can house, but we do have -- we may
-- if they were to keep all the calves or all
the heifers, they would have increasing heifer
size, but they have yet another means of
economic opportunity. Because they are well
managed, they have heifers to sell to people
who want organic cows.

FACILITATOR ANDERSON: And one of
the things that really didn't get asked in
this is the economics of converting to pasture
and, you know, is it actually economically an
opportunity, or is it a challenge to be
pasture-based?

PANELIST CROPPER: Well, I think
Linda had mentioned earlier about the Cornell
studies. There's also the Center for Dairy
Profitability at the University of Wisconsin.
Tom Kreigl has done a lot of work looking at
both I think he said confinement, it might be
conventional, but anyway, the difference
between them and grazing farms.
And there is quite a body of work there. That would be -- if that is of interest, I would very highly recommend that you look at his work. There's, oh gosh, at least three to four years of work, and it's not just from Wisconsin, but from a lot of the Great Lakes states.

The farmers -- these are actual records. This is not some scientific model that is going off a number of assumptions. This is actual farm data that is being used to generate them. He shows quite consistently that the grazing farms are much more profitable than the confinement farms.

PANELIST POLAN: The opportunity is there, but it's not going to happen automatically. And some people go into it thinking it will go automatically, but they are not managers for that kind of situation. The ones that have been managers and have been properly dealt with -- Jerry Swisher in Virginia has worked on several, a number of
conversions, and he's got numbers to show the remarkable increase in profitability that has occurred there.

But, I can also give you some examples of people that converted to get themselves out of economic trouble, and they are still in economic trouble.

PANELIST McCORY: And in Vermont and Maine, we are on our second year of collecting economic figures on the costs of organic dairy production, so we're doing a lot of interviews on a lot of farms collecting information that is going to be in peer-reviewed articles, and what we are finding is a lot of producers, you know, once they get established in organic production find that they raise a lot more replacements than they actually need for their farm and develop a second market.

Or, should they choose to grow, some of them are doing that as well, but I could say that a lot of the producers are
happy with the size herds that they have, and oftentimes are just maintaining that herd size. But when we are asking about cull rate, we are actually making sure we're asking about voluntary versus involuntary culls, as well as livestock that are sold for dairy replacements, or as dairy stock.

So, I'm hoping that that information will prove itself to be useful to you guys.

MEMBER ENGELBERT: Kevin Engelbert. I'd like to go back very quickly to the question of the natural behavior of a ruminant. I took that question somewhat differently. I think what the questioner may have been after is what do you think the natural behavior would be, grazing or standing at a feed bunk and consuming forage?

PANELIST SODER: I think that a ruminant was designed to graze, but there is also a lot to do with how that animal was raised and what that animal knows. Because if
you take a confinement herd and open the gate to the pasture, what do they do? They stand at the gate and wait to go back in the barn, at least the first few days or the first year or the first two years.

So, I think there's two sides to that too. I mean, what is instinctive and what -- I mean, any animal knows how to go out and drop its head and sniff around, but if you watch animals, it is a learned behavior as well. And so there's two sides to that coin as well.

MEMBER ENGELBERT: I agree, but eating at a bunk is also a learned behavior, and if an animal, a calf is with its mother out at pasture, it would have to be taught to eat at a bunk.

PANELIST SODER: Sure.

MEMBER ENGELBERT: So, I'm just making the point what do you think is the natural behavior of a ruminant? Which of those two scenarios?
PANELIST SODER: The mouth and rumen were designed to consume forage and graze.

(Applause.)

FACILITATOR ANDERSON: One last question for Kathy and Linda. Given a cow takes 40,000 bites per day, should certifiers be monitoring their dental hygiene?

(Laughter.)

PANELIST TIKOFSKY: It probably depends on the fiber in the grass and how much flossing effect it has.

(Laughter.)

PANELIST SODER: Anybody want to get started on orthodontics for cows? I've seen a lot of them with bad mouths, so.

FACILITATOR ANDERSON: How about a round for this great panel. We will be starting tomorrow morning, eight o'clock sharp, and we are going to separate the morning sessions into three parts. First, growers. Second, certifiers, and third,
consumers.

(Whereupon, at 5:18 p.m., the
foregoing matter was adjourned.)

NATIONAL ORGANIC STANDARDS BOARD
SYMPOSIUM
+ + + + +

WEDNESDAY,
APRIL 19, 2006
+ + + + +

The symposium met in the Ramada
Conference Center, 1450 South Atherton
Street, State College, PA, at 8:00 a.m.,
Robert Anderson, Facilitator, presiding.

PANEL MEMBERS PRESENT:

ROBERT ANDERSON Facilitator
BLAKE ALEXANDRE Humboldt Creamery
KATHIE ARNOLD H.P. Hood
JON BANSEN Organic Valley
BRIAN McELROY CCOF
MARYELLEN MOLYNEAUX NMI Solutions
JOHN STALLEY Oregon Tilth
ROMAN STOLTZFOOS Natural by Nature
ALBERT STRAUS Straus Family Creamery
JUAN S. VELEZ Aurora Organic Dairy
MARGARET WITTEBURG Whole Foods
ED ZIMBA Horizon Organic Dairy
LESLIE ZUCK PA Certified Organic
BOARD MEMBERS PRESENT:

FACILITATOR ANDERSON: Okay. We will get started momentarily. Good morning. Good morning, everyone and welcome to day two of the dairy symposium. We've got some funny feedback here. Is that okay? And this morning especially I think is a great time for us, because we're going to hear from the people who are actually on the land raising the animals, milking the cows, making the products and ultimately the folks who will be most impacted by whatever decisions are made here today.

So I would like to announce an agenda change. We are planning to -- it seemed that these folks many of them traveled halfway or all the way across the country and to have just five minutes just didn't seem right. Now, we don't have an awful lot of time, extra time, but I have modified the agenda a bit this morning. So from 8:00 to
9:15, including questions, will be the farmer presentations.

At 9:15, we will swap. The certifiers will come up from 9:15 to 10:15, including questions. We will take a break, 15 minute break. And then we will come back 10:30 to 11:30 with the consumer section. And at 11:30 to 12:00, we'll just have a wrap-up.

So I can't tell from where I am if you guys can hear me well or not. Okay. Good. Okay.

Well, then without further ado, we have an order here to the agenda and I would like to start with Jon Bansen from Organic Valley.

PANELIST BANSEN: I appreciate the chance to give the farmer point of view on all of the pasture issues. Just a little background on myself. I'm a third generation dairy farmer and a third generation grazer. I would like to say that I'm an organic dairy farmer, because I graze. That's an important part is I'm an organic dairy farm, because I
graze. Not the other way around.

What grazing does is it gives great health benefits for our cows in hoof health, breeding health, reproductive health, low death rate and cull rate. And, you know, I would just like to go on the record to say that I believe that a low cull rate is absolutely vital to what we do. Low cull rate means you have a health bunch of cows and that's what we're in the business to provide a healthy product for healthy consumers. And I fully believe that the healthier cow is going to give you better quality milk.

We rotationally graze 180 to 210 cows over the grazing season. We get six months of full graze where it provides about 75 percent of the cows diet and two other months of the year we get, approximately, 50 percent of the cows diet off of that grazing. We rotate our cows. They are on a 16 day round, so every 16 days it's management intensive grazing, and that's also another
important aspect in grazing is to manage the grass.

You heard talk yesterday about the quality of grass and stubble heights and all that, you know. It's all about the quality of the grass as far as going into those cows keeping those cows healthy. It needs to be vegetative grass, not just grass out there in any various stage.

One of the great benefits we have from the grazing is we always have extra animals to sell off our herd and that in turn aids the bottom line of our farm and this is really all about sustainability and that means economic sustainability as well. And that's a big part of our organic dairy farm.

What has been going on in the pasture issue with organics is a little bit like the duck that walks in to the grocery store and goes up to the clerk and he says you got any duck food? And the clerk looks at him and says no, I don't have any duck food and we
don't serve ducks. Get out of here. And so the next day the same duck in the store he comes. He looks up at the same clerk and says you got any duck food? And the clerk says I told you yesterday we don't have any duck food. We don't serve ducks. Get out of here and if you show up again I'm going to nail your darn little feet to the floor.

Well, the third day the duck shows back up again, looks up at the clerk and says you got any nails? The clerk says no. He says you got any duck food? And you know, really right now, the certifiers don't have any nails, you know, that's what it comes down to. You know, people do not have to dairy -- do not have organic dairy with their cows grazing, because the certifiers do not have nails in their little bag.

It all comes down to intent. You know, intent is the key word here. We all do know what a dairy looks like that grazes their cows. It takes five minutes for any one of us
farmers to walk onto a farm to understand that it's a grass-based dairy and that's a very important aspect. You know, it's about integrity for our consumers, to our consumers, so they understand where their milk is coming from, that it is coming off of a grass-based area and that it is an important factor with the consumers of our products.

It's also about compliance and intent of the dairy farmer. And I hope if you come back with one word from what I say here, the word is intent, because that's what it's really all about. This is not about size. It's not a discussion about scale. I've seen a 6,000 cow dairy before where they had it broken into three 2,000 cow units, each with their own milking parlor where they grazed and grazed heavily.

It's also not about regions. This isn't about hitting east versus west. It's not about irrigation versus non-irrigation. We irrigate on our farm. We irrigate for
about four months out of the year. This also comes to the intent part, because if you live in west of the Rockies, in the arid part, summer arid part of the country, you must have irrigation if you're going to be a grazer.

And if you are going to be an organic dairy farmer and you need to graze, you better have irrigation. That's intent to set up a dairy farm on the west side of the Rockies without irrigation, the intent is not there to be a grazer.

Organic Valley fully supports NOSB recommendations, full supports them, and we would like some clarification on the wording on the stage of production. You know, what's there would really work if it just gave the certifiers some nails. Organic Valley has 568 farmers in 22 states and we feel, every region feels, that we can easily meet those guidelines of the 30 percent in 120 days.

And let me say that 30 percent in 120 days should be a guideline, a minimum
guideline, minimum. You know, once a person has the intent to graze, they will graze more than 120 days. If the intent is there, that's the fuel that fires most all of the organic dairy farms that I know that are successful.

The clarification must be common sense and as simple as possible to be implemented. Certifiers are people too and dairy farmers are people too and if it's too darn difficult, it becomes really a nightmare. We support the three cow maximum per acre and that would be a good way to keep abuses from happening. As we heard yesterday, as far as putting 100 cows on 10 acres, that would be that nail.

I'm not so sure we need the 30 percent and have to do the math every day as far as what our dry matter intake is, because again it's all about intent. I really don't care so much about whether it is 28 percent or 75 percent. We all know what a dairy farm looks like that grazes. If it has feathers,
if it walks like a duck, if it quacks like a duck, it probably is a duck.

And just to finish up, I was going through the airport on my way here, an airport screener said when she say my Organic Valley shirt we struck up a conversation, she said she had seen the article in the newspaper the day before about this issue. Without me prompting, without me saying what I do on my farm, she said she really hoped that the USDA would clarify and tighten the pasture rule. Thank you very much.

(Applause)

FACILITATOR ANDERSON: Jon, where is your farm? Where is your farm? Where is your farm?

PANELIST BANSEN: Oh, my farm is located in Monmouth, Oregon, which is about an hour south of Portland.

FACILITATOR ANDERSON: Great.

Thank you. Next up, Blake Alexandre, Humboldt Creamery.
PANELIST ALEXANDRE: Than you.

First of all, I want to thank everybody. I want to thank whoever asked me to be here. I consider it an honor and a privilege to be here today and to talk to you and be able to talk about what we do and to talk about Humboldt Creamery does. And we have prepared some slides. My wife prepared some slides, so I'm going to go through them with you.

Up there is basically the label that we use at Humboldt Creamery. Humboldt Creamery is in extreme northern California, right on the coast, and that's where I grew up and that's where we dairy. And that picture is generally what we put on all of our organic products, whether it's ice cream or bottled milk or the cartons, but that's the logo, that's the look and that's the image that is very common throughout all natural food stores in the United States. You all know what I'm talking about and you all know that's, I believe, why we're here.
We're going to move on to our dairy. Our dairy is, what we call Alexandre Family Ecodairy Farms, really owned by Stephanie and I, my wife and I and our kids. I've got a background in Ferndale, but we started up north, about 100 miles north in Crescent City or Del Norte County and so we actually dairy in two counties. That's a picture of our cows. We have a mixed herd of cows.

We're going to -- I'm going to give you some statistics, basically, on our herd. We have 4,500 acres of usable organic certified pasture and when I say usable, that's the net acres that we use. Of that, about 3,800 is irrigated and so we generally irrigate everything we have out there. We get a lot of rainfall, but it doesn't come in equal amounts throughout the year. We get it all in the winter and we're over 100 inches already.

We have 3,300 mature organic cows,
counting milking cows and dry cows, and we milk those at three locations or in three barns in the two counties and it tends to work. Of those cows, we take good care of them. We test every cow every year for Johne's. Years ago when we started, we had 4 percent Johne's infection rate and we're at less than a half a percent now.

I'm going to just keep working through this and we have 3,600 organic young stock right now and growing. The reason we have a lot of young stock is because we intend to milk more cows. I don't know how many more, but we're going to get a little larger. There is still a lot of opportunity out there. There is a heck of a milk market and there is a demand for it.

We milk two times a day, because we have learned that three times a day doesn't work with grazing. It's really difficult to get large groups of cows in and out of the pastures. They just don't have time to go to
and from the barn three times a day and to
graze and to socialize and eat and do all
those things they need to do.

We graze on pasture 300 days a
year, approximately. So we are fortunate, we
are blessed with good weather, extremely wet
seasons. This year has been particularly wet
in the winter, but we are in and out all the
time. In terms of our cows go out if it gets
real stormy, we lock them in and we supplement
feed them with grass silage that we have
harvested the year before.

We started last week grazing twice
a day, so we will graze twice a day now for
the next eight months. Of course, the day we
started it rained three inches, so we stopped
the next day. But generally, we depend on
grass. I looked back at what we used to do
and the three X milking, for instance. I went
to college to learn how to be a dairyman and I
went to Cal Poly where they teach us to be a
herdsmen on a large California dairy with an
endless supply of money.

And so I went home and tried to apply those principles and we milked three times a day and we used BST and we did all the high yield production agriculture that we were taught to do. And I have shifted gears from there. About eight years ago I was enlightened and I went a different direction, because that system was going nowhere and I've got a bunch of kids and I want my kids to grow up on a farm in our neighborhood that is a viable option. So when they go away to college and meet their spouse, that coming home to our neighborhood is truly a viable option.

And for me and Stephanie, that's what this is all about. It was really trying to mold our life and our dairy into something that would compete, I guess, with the rest of the dairy industry in the United States, because that's what we're up against. So organic marketing that niche is what we chose
and that's the path that we're on and that's exactly why we're on it.

When I look back at our numbers last year, the 65 -- the 0 to 65 percent, this is how I calculate what we do on our large scale basis and I think I'm within a percent or two and I just did the numbers real quickly. I looked at every -- all the hay we bought last year and all the purchased grain or total purchased feed last year and minerals and did a little math. And what I learned was that we averaged 32 percent for the year on 365 days now of our forage came from pasture and that ranged from 0 to 65 percent. So that's what those numbers are showing us up there.

Last year, we sold or only sold 46 pounds of milk per cow per day. We raised a lot of calves and the calves drink a lot of that milk, so we're short there. We had some low quality silage. Cull rates less that 25 percent. Cull rate is just the cows that have
to leave the herd that I don't want to leave
the herd and they move -- we need to move on.
We're going to run out of time.

The next slide. Humboldt
Creamery, we decided that we support the 120
days pasture minimum. We support the 30
percent dry matter intake and we would also
support some sort of cows per acre parameter
if that's what needs to be.

In simple terms, I would like to
say that we support the rules and the efforts
that have already been made. And, you know,
the guidelines that were set forth last year
in the March meeting in Washington, D.C. are
totally adequate if we could just get the
certifiers to, you know, use the nails and put
them in there. And it's unfortunately that
it's not happening.

Could we go forward? This is a
picture of the Ferndale Valley. I would like
to point that out. That's -- the dairy right
in the center is the dairy that we graze cows
on. My family has for over 80 years and that's our background. That was started by my great grandfather. I'm fourth generation. I own that place and run cows there and we're the first ones to do it organically. And we've been doing management intensive grazing there now for 15 years. And that's the key.

That's -- the key is we've got to manage our soils. To me, when we got into this organic and when I first learned about organics, it's all about the soils. It's mineralizing the soils. It's knowing your biology in the soils and it is working with the biology and it's doing things that support that biology and that life in the soil, because those are the little guys, the little armies out there working for us every day that are taking the nutrients to the plant to grow nutrient dense food, to grow -- to feed to our cows that make better cow health and that, you know, in turn makes better food for us, so that we have better human health.
Let's jump through these slides real quick. Pasture and human health. There's all kinds of statistics. I have attached to the handout that I gave you the supporting data for why milk is better for you in terms of the CLA content, beta-carotene, which I haven't heard mentioned yet yesterday, vitamins A, B12, vitamins E, trans-vaccenic acid, the omega-3s, lutein and cows on grass are actually cleaner and probably freer from E. Coli and there is supporting data in there.

We're going to move on. We need to be in balance with nature. We need to be in balance with our environment and what we have done at our dairy is a lot of work with the wildlife. We've got 20,000 geese that we have been feeding for months and they eat a lot of feed. We've got one more slide I need to get through here.

My favorite saying of this whole talk consumers -- let's move on. The consumers, what rights do they really have
here? Well, I came up with a thought when I was preparing this. The consumers have a right to get what they think they are getting. I think I would sum it up with that. And it's up to us here, it's up to you folks, it's up to you folks over on the left from the NOP to enforce and to give the consumers, you know, the product that they want and the product that they think they are getting.

We have already done the marketing and we just need to support that and follow through with our rules and the enforcement of our rules and those nails that we use to hold their feet to the floor. And final here, I've got that slide there. It's kind of a little famous picture my son took a year ago last February. And that's an example of we can't get them to do everything right. Well, that's not a perfect pasture. It's full of weeds and I couldn't get them to eat those weeds no matter how hungry we got them.

But anyhow, that's just kind of a
neat picture we end with. So thank you very much.

(Applause)

FACILITATOR ANDERSON: Thank you, Blake. Juan Velez.

MS. FRANCES: I just want to remind folks about the cards for asking questions. I passed out white cards today. I meant to mention this earlier. For dairy, for milk and just encourage you to submit your questions and answers and, you know, put your hand up and I'll come running. I enjoy doing it, so, please, ask your questions.

FACILITATOR ANDERSON: Juan is from Aurora Organic Dairy.

PANELIST VELEZ: Thank you. Good morning, I'm Juan Velez, not to be confused with my relative Juan Velez from Columbia, and I want to talk a little bit about the role of organic pasture in animal welfare. What creates animal welfare? We strongly believe that animal welfare is created by the holistic
management of the entire dairy herd, especially across five key areas. Those key areas are the diet and the nutrition, overall cow comfort, the prevention of diseases, and the management skills in animal husbandry of the people interacting with the cows and that beneficial interaction of humans and animals, that over the entire year, 24/7, 365 days.

So a balanced nutrition is key not only during a period of time, but during the entire lactation and dry period of that cow. And a balanced nutrition, a very key factor on the balanced nutrition is the forage content of that diet and that forage can come from several sources, pasture being one of them, alfalfa hay, grass hay, silages, haylages, depending on the area of the country we can have a lot of variation.

But during those periods of time where the forage is not optimum, is not perfect, where the grass is not the most adequate, where we have to balance the total
ration for that animal, according to the different stages of lactation, we have to balance it then for energy, protein, vitamins and minerals and again make sure that there is enough total fiber in the rations of the animal as a ruminant can function correctly.

It's also very important that we take into consideration the total dry matter intake of that animal. The diet could be well balanced, it could have a lot of grass or a lot of forage, but if the animal doesn't like it, if it's not palatable, if you change the moisture content too much, you will not provide it at the right time after milking, etcetera, she may not get enough of the dry matter.

So we look at this slide for a little while. This is just a recent review of the literature by Jesse Goff, Dr. Jesse Goff from the USDA Animal Disease Center in Ames, Iowa. Very, very nice slide of the review of how complicated animal nutrition, especially
dairy nutrition has become. Now, we have asked that cow to do a lot of things that we didn't ask before. The minute that we domesticated that cow and took that calf away from her and started milking her, we changed the whole aspect of how she uses nutrients.

So if we look at the increase in the dry matter intake, especially around calving, it could create a whole cascade of events that jeopardize the well-being of that animal. You know, positive energy balance is going to decrease. A negative energy balance is going to decrease the immune system, is going to lead to mastitis, mastitis is going to decrease dry matter intake even farther.

If we have a lame cow, it's going to eat less, so the interrelationship between all these factors and these balanced nutrients is huge if we want to really think about the well-being of the animal during 365 days a year, not during a short period of time.

So I want to talk about, you know,
how can we measure animal welfare? How measurable is animal welfare? How can we quantify that, especially for area that have been very well documented and have been proposed to be key factors in animal welfare, especially by, you know, Dr. Temple Grandin, body condition score being one of them, locomotion score from a scale of 1 to 5, 1 being normal and 5 being a cow that cannot even walk at all.

The cow comfort looking at the facilities especially we talked about yesterday the way that the cow budget their time during the day as providing the environment for that cow to lay down and chew her cud, ruminate so that she feels comfortable so that we can accommodate also according to the climate. You know, we're in the middle of August in Texas or in the middle of February in Canada, we got to help that cow be comfortable, so that she can perform those functions that we were talking about.
yesterday.

And, of course, somatic cell count. So measures of animal welfare are quantifiable and they can lead to very clear enforceable organic production standards. Aurora Organic Dairy relies on third-party independent audits of animal welfare measurements for our farms and these are done by USDA process verified auditors and ISO approved auditors as well.

Aurora Organic Dairy supports similar metrics and audits for the NOP animal welfare standards across the entire year. How is this done? Create a list of parameters that we believe are very important on -- to measure animal welfare across the board. And the producer could receive numerical scores in every of these key areas and uses those results to monitor ongoing audits and improve the operation and the animal well-being.

The NOP should conduct similar fact-based audits of animal welfare to ensure
certifiability, verification of ongoing compliance and the enforceability of those rules. Obviously, we have heard yesterday, we have heard today, I agree 100 percent that pasture is one of the many important elements contributing to animal welfare and it should be taken into account that a federal production standard must accommodate that viability between farms, geography, climate and also the variability in the pasture and the pasture composition and the quality. A lot of talk about that yesterday. The variation is humongous across -- even across different pastures on the same farm.

So the organic -- the role of the Organic System Plan is unique to each organic operation. We know that there is a need for critical -- the need for those critical decisions about pasture and animal welfare need to be made at the farm level by the farm man and the certifier with the Organic System Plan specifically for that farm.
So pasture, obviously, helps create good animal welfare as one part of the entire Holistic Management Plan. Pasture must be managed for a long-term sustainability in each geography and climate. In summary, I want to say that Aurora Organic Dairy supports an NOP pasture rule in which animal welfare is the highest priority. Measurable indicators are needed to improve verification, enforceability and ensure continual improvement on animal welfare during 365 days a year.

What consumers expect is to know that organic operations raise our animal with high standards of animal care and welfare with pasture being one of the several contributors. In my opinion, that's what really will separate us from -- one other issue that will completely separate us from conventional is making sure that we got certification that are animals are well being taken care of during 365 days a year.
And muchos gracias. I'm very, very, very proud to have been invited to this symposium. I think it is the beginning of a very scientific future for organic agriculture. Thank you.

(Applause)

FACILITATOR ANDERSON: Juan, you're in Colorado, correct? Kathie Arnold from H. P. Hood and New York State.

PANELIST ARNOLD: Hello. First, I would just like to say thank you to Barbara and Mark and all of the NOP staff for issuing the ANPR and for all the work that that entails and for putting on this wonderful symposium, because I know it's a tremendous amount of work and it's just very gratifying to know that with the ANPR out there, that that is a concrete step to move us to rule change relative to pastures. So thank you very much.

And before I start to actually talk about our own operation in central New
York about just a little over four hours northeast of here, I want to address some of the questions that were floating around yesterday that didn't really seem to be fully answered and I'll just attempt to answer them in the way I can.

One is the question about this call for scientific evidence regarding pasture. We must remember that the National Organic Program is not under the wing of the National Academy of Sciences. It's under the auspices of the Agricultural Marketing Services. It's not a science-based program, although many of the standards do indeed have scientific validity, but it's a marketing program. And to be a savvy marketing program, we need to be listening to the wants and desires of our consumers.

Yesterday, George Kuepper's chart that he had listing what organic consumers want showed that rated above environmental concerns was helpfulness at an 80 percent
rating. With pasture-based organic milk products consumers will be getting a more helpful nutritious product.

And in terms of H. P. Hood and the Stonyfield milk, there is an 800 number on the side of the carton and just so far in 2006, 50 of the calls that they have received have had questions or something, comments relative to pasture or grass fed.

And then I also do want to highlight the two nationally representative and independent surveys that just were reported on last week. A survey of 1,011 U.S. adults commissioned by the Center for Food Safety found that 6 out of 10 women who buy organic milk and 5 out of 10 of all organic milk purchasers would no longer do so if they knew that many organic cows were confined to fenced in feed lots and did not graze on pasture for most of their lives.

Second, more than two-thirds of all consumers and 75 percent of women in the
Consumers' Union survey, of 1,485 U.S. online adults, said that the national organic standards should require that animals graze outdoors. And lastly, when asked specifically in the Consumers' Union survey if they would still pay a premium price for organic milk that came from cows that were confined indoors and did not graze, 60 percent said they would not.

There was a reference yesterday to milk urea nitrogen levels being too high in pastured cows and we have tested for that before and our nutritionist found that that was not a case in our herd, even though we use large amounts of pasture in our herds' diet. And it has to be remembered that with the minimum 30 percent requirement, that still allows up to 70 percent feeding of forages and grains other than pasture. If someone can't balance a ration with that kind of allowance for other supplemental feeds, then apparently they don't have the experience and knowledge.
of how to do it, because it is being done time
and time again all across the U.S. with
healthy cows and over one year after another.

A question kept popping up
yesterday about what about the other 245 days?

The suggested requirement for 120 days, like
Jon said, it's a minimum. The NOSB's
recommended guidance on pasture stated that
the 30 percent dry matter intake be for the
growing season, but not less than 120 days.
Our cows on our farm are on pasture for a
minimum of 180 days and often up to 200 or 210
days a year.

The question of geographic
variation came up and whether these minimums
are achievable around the country. I would
like to read this statement from David and
Kayla Roberts from Preston, Idaho. "We are
strongly in favor of maximizing the time and
nutrition that organic cows get on pasture.
Grazing is integral to organic and not just an
optional management practice to be implemented
when there are favorable conditions.

My family and I milk about 170 dairy cows, 200 including dry cows, in southeastern Idaho. Since 1992, our milking cows, dry cows and replacement heifers have been rotationally grazed on, approximately, 300 acres of pasture. In a typical year, we are able to graze our milking herd from mid-April through the first part of November. Other than a two week transition at the beginning and ending of our pasture season when we feed some dry hay, our cows receive 100 percent of their forage from pastures during the growing season.

Before we started pasturing our cows in 1992, they were confined in a free stall facility year round. Our cows are healthier and live much longer than our cows did in confinement. We believe there is enough of an advantage for our cows that we take extra measures to let them access pasture for as much of their lives as we can.
For example, during the growing season, we milk cows in two separate milk barns so we can have enough pasture for every cow for the entire season. This is inefficient from the labor and facility standpoint, but the benefit to the cows makes it worth it for us. Also, our cows per acre ratio is intentionally designed so that all of our cows are able to meet their forage needs during the slowest grass growing times of the year.

We harvest excess grass during the other times. This allows us to have the cows on grass for more days each year. We definitely believe our area of the country is a great place to pasture cows, even though large confinement operations are multiplying rapidly. We also believe that the confusion and lack of clarity about access to pasture had a big opportunity cost for our family dairy. Only recently were we able to secure a market for organic milk for our dairy after
seeking a market for several years.

Lacking the capital to create our own market, we were patient, but often frustrated hearing about growing demand for organic milk being filled in part by some cows without real access to pasture. We believe that specific requirements for pasturing organic dairy cows may prevent the situation from happening to others.” And again, David and Kayla Roberts, Preston, Idaho.

As to the question of whether there does need to be more specificity concerning pasture in the rule, absolutely. The fact that there are now herds of organic cows who do not graze routinely during the growing season shows that the current rule wording is inadequate. But 120 days is not enough. Stocking rate is very variable and difficult to use. It’s variable from season to season, from spring to fall, from farm to farm and even within a farm.

I know on our own farm we have
some land we can get twice as much yield as our poorest land. The only means that seems to me that would work across the board to provide a base level is minimum dry matter intake. As to our own farm, we had two years of confinement in the early '90s and, at that point, we were at a 22,000 pound herd average. We went to management intensive grazing and the four year average we had changed to that production system, we were still at 22,000. So there's no means that grazing is going to reduce your production.

So I had more about my own specific farm, but I thank you very much for your time.

(Applause)

FACILITATOR ANDERSON: Thank you, Kathie.

PANELIST ARNOLD: You're welcome.

FACILITATOR ANDERSON: Now, I'll call on Roman Stoltzfoos, Natural by Nature, Pennsylvania Farming.
PANELIST STOLTZFOOS: Good morning. I thank you for inviting me and I would like to speak on behalf of Natural by Nature, which gets their milk supply from Lancaster Organic Farmers Co-op, of which I'm a member. For myself, we milk 140 cows, my wife and I, and there's 10 children still at home, so we have a pretty good labor supply. We keep and feed 80 heifers and do 8,000 organic turkeys and some laying hens. Everything on the farm is organic.

There is 400 plus acres in the operation. It's definitely a family farm. When we started doing organic milk in 1995, the price was $17 we were getting paid and the regular milk price was $13 to $14.50, in that neighborhood. So you can see the advantage that we enjoy today over the regular milk price is, I believe, because of the perception that the consumer has about organic milk being grass fed.

And we have a motto on our farm
that goes something like this. You give the consumer what they want and they will give you what you want and that's a fair price for the product. And in our co-op discussion my recent price for organic milk was over $31, that's all inclusive, and even at that, you know, costs have gone up dramatically in the last few years, so we are just slightly better than we were back in 1995 with milk at $17 or $18.

But we believe that the organic milk got that way because it was very much in opposition to the conventional supply which had cows on confinement. They were fed all diets and stored feed and other things that a lot of consumers did not trust and I'm concerned that we keep the image that grazing has earned and organic has earned through requiring grazing and I really believe that the 30 percent dry matter and the 120 days is maybe not perfect, but it is somewhere we can start and it's easily doable.
Our cows are on pasture over 340
days a year. I mean, there is only a few days
that they are in and then about two months we
keep them in at night. Most times the gate is
open, they can come in, and you would be
surprised at what kind of weather it takes to
keep them in. I mean, if the gate is open,
they will generally go out sometime during the
day, almost no matter what the weather is.

So and what was said about cull
rates and the science needed, I feel like how
many farmers are good science? I mean, there
is 500 plus farmers in America that have seen
the benefits of organic milk. My veterinarian
is sitting here on the NOSB, Hugh Karreman,
and he could testify that making a living on
cows fed grass is tough, because they are not
sick enough to keep a veterinarian busy.

(Appplause)

PANELIST STOLTZFOOS: So all the
hoopla about animal welfare is that much if
you graze your cows. It depends on what you
need. If you've got them out in pasture, what
better welfare could you offer your cows? If
that's where they want to be and that's what
they do naturally, I can't imagine how you
could improve on that, but I do know that
Whole Foods and some of the larger retailers
are now requiring something that organic
hasn't asked for.

I mean, they want to know exactly
what is being done and how it is being done.
And I'm selling some turkeys to them to this
coming year and you would be interested to
hear some of the questions they ask about
that. And I think it's coming for dairy, too,
so we can stay ahead of them if we keep doing
what we were doing and apply it consistently.

And that's my message. I thank the NOP for
considering this.

(Applause)

FACILITATOR ANDERSON: Thank you,
Roman. Albert Straus, Straus Family Creamery.

PANELIST STRAUS: Thank you. I
just want to talk first, I'm from Marshall, California, which is on the west coast on Highway 1 above San Francisco. I just want to give you a little bit of history. We have -- my father started the farm in 1941. We were the first -- I transitioned the dairy to organic in 1993 and we were the first certified organic dairy and creamery in the western United States.

I feel dwarfed by all the -- my competition. I'm the smallest company represented here. We have three dairies that supply us our own, plus two others, and so compared to the 500 plus dairies and what most of these other people do, and we are 100 percent organic.

We do have tours of our dairy throughout the spring and summer and fall and we have done that probably for 20 or 25 years and we have been very environmentally active to preserve farming in our county. My mother started the first Agricultural Land Trust in
the nation and we preserved about 40,000 acres in perpetuity, they will say in agriculture. Now, we're working on keeping it in productive agriculture and we're having a lot of interest in going organic, and so I think it's a hopeful time.

So anyway, I want to go into my prepared text. I wanted to thank all the NOSB and the NOP for their hard work on this issue and I appreciate my ability to voice my comments on the issue. I'm an organic dairy farmer on the north coast of California. Our farm became certified -- some repetitive. We became certified organic in 1993 and we began processing organic dairy products from the farm in 1994. We have, approximately, 300 cows on 660 acres.

We agree that pasture is an important aspect of dairy nutrition and that dairy animals should have regular access to nutritional pasture and the outdoors, including pasture land that is not productive.
We feel that pasture is not only a nutritional source, but also important for sunlight and exercise in reducing stress in dairy cows.

Even though our farms are green until summer, early summer, our cows have access to them year round, except after heavy rains and when it would cause erosion of the soil. We support the use of the National Resources Conservation Service conservation practice standards for prescribing grazing for proper conservation methods.

Our main concern is in the regards of the text in the NOSB guidance for interpretation of 205.239(a), Organic System Plan. The Organic System Plan shall have the goal of providing grazing feed greater than 30 percent dry matter intake on a daily basis during the growing season, but not less than 120 days. We are concerned that these suggested guidelines for dry matter have not come from on-farmed research, from the very
regions across the country.

For example, on our farm, our area gets, approximately, three to four months of productive pasture each year. The pasture builds, peaks and then drops off by June. We do not irrigate and could not if we wanted to, as our water supply could not sustain it.

NOSB suggested dry matter requirements bring up issues that which must be considered:

1) The amount of suggested dry matter figures are hard to obtain and verify. Different grasses have varied amounts of moisture. Different fields will contain different grasses and different moisture levels, often changing daily with the weather. The amount of rain in each region also affects the amount of grass available. Dry matter contained in each variation is difficult to verify. Suggested calculations on stored feed use per year may not accurate convey dry matter values in pasture.

2) The suggested amounts are not
based on actual nutritional realities or needs of the animal. We need to base these guidelines from on-farm research and real numbers, rather than arbitrate figures based on a single region. We suggest we work on research together with farmers and bovine nutritionists.

3) Be careful that requirements are not counterproductive. The only way to meet pasture requirements in some regions is to irrigate. We would then be supporting an unsustainable system that overuses a limited water resource. We should be careful not to defeat the purpose of having a sustainable agricultural system.

To be able to verify that pasture is a significant part of an organic cows diet, I am suggesting the following: I would have a license or practicing nutritionist balance a rationale for each dairy by groups of cows. We can verify the quantities of feed by requiring an inventory of those feeds grown on
the farm and by those purchased off-farm. In this way, a certifier can verify the amount of pasture that the cows are eating. A certifier will need to determine what a significant amount of pasture is by region.

It is my opinion that a system of feed and pasture accounting will create a workable system. We appreciate the move to clarify the guidelines of pasture and believe this is a positive step. We should just be careful to work logically and not emotionally to create regulations that make sense. Thank you.

(Applause)

PANELIST ZIMBA: Thank you. My name is Ed Zimba and I am an organic dairy and cash crop farmer. And my pasture acres of -- even on being a cash crop farmer as my most profitable acres that we farm on our farm and I also would like to express my appreciation
to the NOSB Board for the time and volunteer
time that you guys put on an effort to
sacrifice to obtain high integrity levels of
this organic industry.

I also would like to thank the NOP
and the USDA for giving us the opportunity
here to come. I would like to thank Horizon
Organic for putting me on this board. I
appreciate that very much.

I've been farming for 25 years. I
got 25 years experience in applied research,
which is better than any Government, college
or scientific research that I come -- I come
from the school of common sense and hard
knocks. Obviously, I'm nervous here. I would
like to say thank you, too, for all the panels
yesterday. I thought they were very good and
they support what we farmers have always been
saying and all the colleges are coming to us
and asking us for information on how to farm
organic and do this thing right.

I heard averages 21,800 pounds.
We done it the other way. Another way don't work. We done it both ways and I think the thing that's missing in this doctrine has never been asked is we got almost twice the age life out of our cows, since we went to grazing and doing everything right. And that's what the consumers are asking for.

I want to -- like I said, I appreciate the document and I kind of want to bring the Board up to-- the new NOSB Board Members up to date here and I also feel the document gives the impression that what would happen if we required pasture? And then some of the questions -- some of the answers, you know, even out of the Board yesterday said well, what do we do here if we allow these farmers to graze?

The definition of pasture in the Western Dictionary it says "Grass, it's pasture grass or other growing plants used as food by grazing animals. Ground suitable for grazing set aside for this. Pasture, put
cattle to graze on pasture; to graze on grass; to provide with pasture; to feed on growing grass."

There has been -- we have been -- that's what we've done our whole life. This is what the organic thing has been all about and now we're sitting here like we're starting all over from ground zero. We're not starting over from ground zero. We've been doing this and this is how this whole thing started and that's what the organic consumers want. In one of your regulations Section 205.237, "The producers of organic livestock operation must provide livestock with a total feed ratio composed of agricultural products, including pasture."

Section 205.238, "The producer must establish and maintain the livestock health care practice, including establishment of appropriate housing pasture conditions."

Section 205.239, "The producer of organic livestock operation must establish and
maintain livestock living condition which accommodate the health and natural behavior of animal, including access to the outdoors and access to pasture."

Section 205.2, "Land use for livestock grazing that has managed to provide feed value maintain improved soil." It says "livestock grazing." This is what it's all about, guys, women, everything.

Okay. Now, to the document.

(Applause)

PANELIST ZIMBA: To the document, are these markets based on other types of research to sustain an exception of consumers that organic milk comes from dairy cows raised on pasture. Look at all the milk cartons out there. The consumers that's what they want and that's what we got to keep giving to them.

And it's sad that we have -- we got a good -- we got a lot of good apples in this whole organic industry, but then we get one or two or whatever it is, we got some bad apples.
And it's very disheartening to all of us, all of my colleagues here, organic dairy farmers, family farms and out there and you got -- and there's these companies out there that are not grazing, and they take us, they take what we stand for and they put their -- our picture on their farms and sell their milk.

If they want to do that, then they should say well, let's let them put their own picture of their farm on their cartons and let's say almost organic. Because the rules have always been there for pasture and the NOSB has always for the last I don't know how many years has been telling the NOP get the job done. It ain't getting done. I appreciate what you guys are doing. Don't get me wrong. And I appreciate you new on the Board and I feel you are going to get it done.

And we need you guys to get it done, because we are here --

(Applause)
PANELIST ZIMBA: -- and every year we come here, but it ain't getting enforced. And if it would have been enforced from the beginning and done right, we wouldn't be here. So now, we're here. Now, we are here and we're trying to -- it's like my colleague and friend, Jim Gardiner, and the rest of my colleagues out here, we are here and now we've got to put speed limit signs up for going down the road, because there's some bad apples in this whole bunch, and we got to tell them, okay, here is the speed limit sign. We can only go so fast.

Okay. So now, we're sitting here trying to say okay, well, the cows can only get this much grass, so many cows per acre, yada de yada da. And then there was questions from the Board yesterday, well, what are you going to do about the consumers if you only tell them you're giving 30 percent dry matter intake? If the law was done right and everybody abide by it and the integrity level,
we wouldn't be here. So we can go through all of this again and we can do all of this again, but if we don't get no action out of it, we're all in the same boat again.

Back to the document. Is this achieve -- is the 30 percent an achievable goal, they are asking. I'm going to read from Dr. Marguerita B. Cattell, D.V.M., and a Dr. Adren J. Nelson, D.V.M., from Windsor, Colorado. We run a 500 organic dairy in an area high plain just east of the Rocky Mountains halfway between the Denver, Colorado and Wyoming border. Our cows graze irrigated pastures, 750 acre adjustment to our farm at a second dairy facility, which release plants and fenced to meet organic certification requirements. We have always believed that the NOP has an enforceable pasture rule and we believe in the following rules in all that we do.

All of the acres are flood irrigation and all are in pasture. Without
irrigation, pasture would be productive for short times each spring. Our cows graze between April 15th and October 15th each year. Mid-1995, NOSB suggested pasture consumption of 30 percent dry matter intake for four months has been our minimum goal. This is very -- in our location we believe anywhere in the country that grows dairy cattle and feed.

During in the low rain fall area that we do -- and low fire that we do, there's no excuse for not having pasture. If you can grow -- if you can grow crops such as vegetables, sugar, beets, beans, sweet corn, grain, alfalfa, you can grow pastures. Colorado farmers grow all these and more in excellent soil, excellent altitude and excellent -- in the front range area of Colorado. All that is needed is good management. Water can grow anything one desires to put in pasture.

As dairy health and nutrition -- there are also dairy health and nutrition
consultants. We have worked around the
country to provide the service to dairy
producers of all sizes currently from 50 cows
to 3,000. It is our intention that any state
in the union with the facility selected design
and managed to meet the organic requirement
can graze to minimum standard. The facility
must be designed to meet the rule not vice-
versa.

What also is missing in this
document is also the pasture -- cows life is
considered. We get-- if you are grazing, your
cows live almost twice as long than anything
else. And to finish up, pasture truly is the
cornerstone of organic dairy farming. And my
Heavenly Father is the cornerstone of my life
and I thank you guys very much.

(Applause)

FACILITATOR ANDERSON: That gets
the speed presentation award. Thank you, Ed.

What we didn't say is Ed's farm is in
Michigan as well. So I want to point out that
on this panel, we have Michigan, Oregon, New
York, Colorado, Pennsylvania, California and
Idaho represented, so we have a cross section
of the country here today.

(Applause)

FACILITATOR ANDERSON: And I would
like to open this up to questions of the NOSB.

Joe?

MEMBER SMILLIE: I'm a newcomer on
the NOSB and I'm not on the Livestock
Committee, so I'm not totally up to speed on
all the issues, but I have heard very clearly
and in my own mind there is very little debate
about the need for -- what? Oh, I'm sorry.

Joe Smillie, NOSB.

I've heard very clearly the need
for specificity in pasture regulations and as
a certifier, specificity is very necessary for
us. The nails argument is a tough one. You
have to make sure you've got a good swing and
a good hammer and make sure you put the nail
in the right place, because if you put it in
the wrong place, it can hurt people.

And I hate to single you out, Albert, but I really have to ask the question. If we adopted what's currently the proposal in front of us, the ANPR of the 30 percent and the 120 days, would you still be able to stay in business with the farm that you are currently operating or what changes would you -- could you be able to make to be in compliance if that became the regulation?

PANELIST STRAUS: You want to put up that spreadsheet?

MEMBER SMILLIE: Yes.

PANELIST STRAUS: Well, I want to address one thing. I have by now, thousands of people, consumers that we have tours and we tell them exactly what we do. They are there when it's dry, when it's wet. Our sales have gone 15-fold since I started. And so I debate that consumers know that 30 percent or they want to have that you are doing a humane treatment of animals. I have more questions
on what happens to bull calves, what happens to the cows when they are not milking any more and how we treat the animals, then how much they are getting off their pasture.

I don't want to belittle pasture as an integral part of organic operation. I think 30 percent -- when I was asked this before, I kind of put thoughts to it and tried to figure out how much dry matter our cows take in. We have two production herds, a high string, a low string. The high string takes in 51 pounds of dry matter a day. I have -- I can document that daily. Actually, I can go on the computer right now and see what the cows are eating on a balanced diet.

What I've done is to see how many days I can do. It would be pushing it, it would be really pushing it and, especially like this year, we have had an extra almost, well, at least 45 or 50 days. We had the wettest March on record. Two years ago we had a very hot spell that dried everything up.
early. I doubt if we're going to even get the four months of pasture this year, productive pasture.

They will be out until November until it rains, but to get this, 30 percent is not going to be feasible in our area. We do not have water to irrigate like all these other people do or summer rains. We do not have that. We're on the coast in California. It's a different climate. And, I mean, even compared to Blake. Does that answer you?

MEMBER SMILLIE: Yes.

FACILITATOR ANDERSON: Gerald?

MEMBER DAVIS: Gerald Davis, NOSB.

Mr. Straus, I'm from California and I follow the weather exhaustively in the line of work that I work in, in farming. In your location, it seems to me that you would typically have a four month period, minimum, of rain fall in pasture, green pasture that would be green. Is that not true?

PANELIST STRAUS: Rains are from
November until usually end of February, middle to end of February where it is dry enough to get on pasture. Right now, we can't put them out at all. We just -- maybe if it stays dry for a few more days, we'll be able to put them out in pasture without destroying the pasture.

MEMBER DAVIS: So you're saying but sometimes you can't put them out on pasture, because it's too wet when the rains do come? Is that correct?

PANELIST STRAUS: Normal years, it dries up in March. We might have a few showers through March and April, but these haven't been typical years. It has been either wet, too wet or too dry. But normal, in our area, we have pasture usually from sometime in February, sometimes beginning March until into June, that's it.

MEMBER DAVIS: So what you are saying is that some years a 120 day period with that amount of dry matter intake would be feasible in the drought years? Where the
rains are a shorter period or too much rain like this year, you might have some difficulty from --

PANELIST STRAUD: I'm saying we have about 120 days optimum of pasture. It's not -- and if we optimize it totally and it was a very optimum year, we might be able to make the 30 percent. It's not a minimum, you know. And, you know, my concern is where this figure comes from. It's not -- I'm doing it -- I'm not driven by market conditions. I'm driven by best management practices on our farm.

What I have heard everybody saying is this is coming from consumers. Consumers have never stated this to me and, you know, I have big problems with -- it's more driven that it seems to be regional preference and not trying to support the industry.

MEMBER DAVIS: Thank you.

MEMBER MOYER: Jeff Moyer, NOSB.

My question is for Juan. Juan, you seemed to
be, like Albert just was, shifting the
discussion a little bit away from pasture and
more towards animal welfare, specifically
aside from pasture. And I was just wondering
on your particular farm how much pasture do
your animals get and then if you could follow-
up with some other answers on what's the
average age of your cows, how many lactations
do you get out of them and what's your cull
rate on your particular herd?

PANELIST VELEZ: Thank you for the
question. The shifting towards animal
welfare, in my opinion, is very critical
because I think we tie it in with consumer
perception of how well we take care of our
animals as a holistic system not only during
the time of their grazing. Also, because
there was a lot of comparisons yesterday about
how much better the animals in grass are.
Nobody argues that animal grazing has better
chance of having better well-being during the
time that they are grazing.
And comparisons were being done between inside, indoors, poor ventilation confinements versus operations with loose housing, where the animal has got access to exercise, sunlight, grooming and social interaction. So the comparisons are very, very specific to two completely extreme systems of management. I bring up the animal welfare issue, because I think that needs to be considered on 365 days a year.

I think that it was brought up yesterday that very well-managed grazing operations, obviously, like the ones that we have represented here have outstanding animal welfare. There's no question about it. But there is many, many others out there that we know of, that everybody knows of that graze 120 days, maybe 50 percent dry matter intake, but also take terrible care of their animal during the wintertime, because they don't have the facilities they should, etcetera, etcetera.
So my point is as a holistic system animal welfare becomes a better point for the organic industry, a better message to deliver to the consumer as a holistic system. I think that what Albert has brought out of his -- the people that he brings on his farm to tour, the question that they ask is the same questions that we have asked. And it may be a very regional thing where the people are -- the tourists are more concerned about other aspects. How do you breed your cows? What do you do with the newborn babies? Where is the bull calves going, et cetera, et cetera.

The specific questions about the farms, how many acres? Depending on the stage of lactation and depending on the farm, we're talking a lot of difference between our Texas location, our Colorado location as far as number of animals that graze per year. During the entire lactation cycle, all of our animals do grazing. I believe that is the documentation on the benefits of grazing
during the dry period and prior to part/region are very, very well-documented.

Not only on the grazing aspect, but on the exercise, because of the beautiful work done in Michigan done by Dr. Dave Biddy where he shows that the cow that exercise more during the dry period have much better metabolic problems at calving. And we believe very strongly on that. During the entire cycle all our cows have access to pasture.

MEMBER MOYER: Are you saying then that while your cows are being milked, they are not on pasture, but when they are dry, they are on pasture?

PANELIST VELEZ: Oh, absolutely all of them when they are dry are on pasture. And many, many of our milking herds are on pasture. Not all of them, many of them are.

MEMBER MOYER: And can you also tell us about your cull rate and your lactation periods? How many lactations do you get out of a cow? What's your average age of
your cow? And what are your cull rates?

PANELIST VELEZ: There is many aspects to take into consideration on the cull rate and one of them is how young the whole herd is. When do you start your herd? What are you bringing in as your start up animal? Do you raise all your replacements or you bought some replacements? That whole thing could shift your cull rate, but I can give you specific numbers right now. Our Texas location has a 27 percent cull rate. Our Colorado location has 26 percent cull rate on a yearly basis.

FACILITATOR ANDERSON: Mark and then Kevin.

MR. BRADLEY: Is that better? Can you hear that? Oh, Mark Bradley, National Organic Program. Some very good discussion coming out here and each of you is bringing up some aspects that are very important to this discussion. I want to thank this panel in particular, because as dairymen, I know that
it's one of the most demanding occupations in 
agriculture and you're taking some time away 
from your farms and your families right now. 
I know this crowd particularly appreciates 
what you are doing here. 

I would also like to thank the 
folks that are staying back home that are 
taking care of the farm, because somebody is 
having to milk the girls today, so we 
appreciate you. 

(Applause) 

MR. BRADLEY: Roman brought up 
some excellent points about full access saying 
that the cows, you know, have needs, too, you 
know, from natural behaviors, you know, and 
I'm sorry that he is going to be going out of 
business, because the cows are going to be so 
healthy. But Carl Polan yesterday said that - 
- he kind of said it best that confinement is 
confinement is not confinement. It's not all 
the same. There is different levels of 
confinement and that's what the access to
pasture is just part of a very complicated scenario that is linked to many parts of the rule that adds, so you'll very aptly point this out.

The one in particular that comes to my mind and it goes straight to the 245 days, you know, the other part of the standard that's not being addressed with this discussion is that cows are to be provided access to outdoors, including access to pasture. And I would like -- I guess I would direct this to Ed. How can the program, the NOP, assure that once someone has met the 120 day, you know, proposed guideline that's being discussed here, how can we be sure that the cows are -- it's not going to be so closely linked to the 120 days that they will still have access to the outdoors, there will still be freedom of movement?

We need to make sure that that part of the reg is not linked. And how would NOP build this into a regulation, so that that
part of the standard is preserved without making the limiting effects of 120 days? In other words, when they are not on pasture, what can we do to make sure that there is freedom of movement, freedom for natural behaviors and those types of things? Can you address that?

PANELIST ZIMBA: Yes. Is this on?

Good. I think it goes back to like what we was saying, if it looks like a duck, it walks like a duck, it's a duck. And the certifying inspector has either got to be educated a little bit more about the data, because I could walk in on any one of these farms out here and tell you what they are doing and that's just a matter of education and how you guys are going to go about that, I don't know.

I don't want to backtrack here, but it seems like we're just -- keep hammering this away and what it is going to take it's just the matter of these certifiers got to have the authority go on these farms and look
things over thoroughly and do what has to be done. And they got to have the power to do that. And you guys got to give them the power.

MR. BRADLEY: What I'm asking is when there is confinement like Dr. Polan was alluding to, should there be prohibitions or something built in the regulations that prohibit confinement to tie stalls or tethering outdoors or something that accounts, you know, or protects the natural behaviors and access to the outdoors when they are not on pasture. I mean, should there be access to loping lots when the pasture is not suitable and it's too wet for cows to go out on it or there is not enough usable forage for them to be out there and it would be damaging to the pasture to run cows on it? Should there be access to loping lots? Should there -- require free stall barns in lieu of tie stalls?

PANELIST ZIMBA: Okay. I think we
have hashed, you know, this out as far as phone conference calls from the east to the west. We lowered our standards down as low as we can do them at 120 days and we feel across the whole nation, the whole United States nation there, everybody should be able to comply to that 120 days and meet that 30 percent dry matter intake, which is only 10 percent of the cows diet for the year.

I just don't see how somebody cannot make that happen. I know we had enough phone conference calls during this thing until we're silly about talking about it. And that's -- these are the rules that we have to come up with in order to make this happen. We're not going to -- I can't wave from that, because we've talked to too many farmers that can do it. And if you've got somebody that can do it, then across the road they can't do it, something just ain't right. And I guess all I can say is 120 days and everybody should be able to comply to it.
PANELIST ALEXANDRE: I would like to step in on this, if I could, please. This is Blake Alexandre. We need to remember here -- I like what everybody said by the way, but Kathie's point earlier about this isn't a science and we've got to quit trying to micromanage this particular rule and this concept. The duck that walked in and asked for duck food, last year I was in Washington, D.C. and the large -- I've got a friend from California, from the Conventional Confinement Herd, who walked in and said gee, USDA. Are you still allowing confinement herds to sell organic milk?

And the answer was not really. So he went home and he didn't build his organic area that he wanted to build. And I consult with these kind of guys all the time, because they know we're one of the larger herds. We are perceived as doing it right and they want to know. And there is a lot of people in this room and a lot of people out there watching
and waiting for this answer.

And what we're trying to do, Mark, is come up with a bare minimum. Let's not worry about what happens beyond this. What we're trying to do is stop zero percent of pasture. We're trying to get off of zero. And I don't really particularly care if the number is 5 percent, 10 percent, 15, all the way up to 30. I really don't care. What we're trying to do is get off of zero.

And Albert has got really good points. I knew that he was a little fuzzy on this issue. Honestly, and I --

FACILITATOR ANDERSON: Fuzzy might not be the word.

PANELIST ALEXANDRE: But Albert has got a situation where his consumers can define that he is not at zero. And his consumers are content and his tours, the people that come out to his ranch are happy. And so that situation works. There is no issues there. You don't need to get involved
in regulating what Albert is doing. That's not what the mission is here. The mission is to get off of zero.

PANELIST STRAUS: Well, since I've been addressed, this is Albert. Well, I do feel threatened by the 30 percent and I -- you know, my reaction is what about all the other practices? And you bring up issues about how we -- you mainly treat the animals the other part of the year. And I think that sort of everybody can have documentation as to which cows are treated which way for the remaining part and have some kind of form that people put together, so that the certifiers can actually see what they are doing, because they're only there one day a year, so it's hard.

You know, I'm sure there are going to be abuses, but I think that there should be a minimum standard for that as well. Yes, I agree.

PANELIST ARNOLD: Can I jump in
here, too, please? To address Mark's question, I mean, the rule does already state that there should be daily outdoor access for all animals over six months of age. And if it comes to light that that is being abused, too, then I think we would all be for more specificity there as well. You know, that isn't something that we organic dairy producers across the country have discussed yet, but if it's something you would like us to discuss, we can put that on the agenda next.

But, you know, we -- I think we all do see welfare standards across the whole year as being of prime importance, not just when they are on grass, but through the whole year. And I would say that there are an awful lot of organic dairy farms that do not just have tie stall facilities for their herds. They have greenhouse barns. They have free stall barns. They have bed pack barns or they may have a combination of a tie stall.
In our situation, we have a combination of a tie stall and free stall. So half the cows are in the tie stall for the day and they are out in the free stall at night and every day they all have access to free roaming in the barnyard. And all of our heifers and dry cows have free access to outdoors/indoors. They can choose when they want to be in, when they want to be out just like Roman's. And I think most organic dairy herds have situations like that. And if they don't, if they are not providing outdoor access, then the certifier ought to come down on them, because that's part of the rule and they should be meeting it.

FACILITATOR ANDERSON: Kevin?

MEMBER ENGELBERT: I have pages of questions. Kevin Engelbert, NOSB. But in the interest of time, I'm going to restrict it to just three and I'll ask them all at once and then they can respond.

Albert or Mr. Straus, if you had
fewer cows or more acres devoted to pasture, could you more easily meet the 30 percent, 120?

Kathie, could you explain one last time for the record how those figures were obtained?

And, Mr. Velez, would you give a little bit more detail on your feeding program and how much pasture you actually feed your lactating animals?

PANELIST STRAUS: I guess I'm first. My mind just went blank. Can you repeat it? I'm sorry.

MEMBER ENGELBERT: Yes. If you had --

PANELIST STRAUS: Oh, had fewer animals. Now, I remember.

MEMBER ENGELBERT: Okay.

PANELIST STRAUS: My quick answer is probably not, because of the length of the growing season. We probably -- I mean, each dairy farm is a different situation, so I
think that, you know, personally I have to be, as an economic model, a certain size and a certain thing, but besides that, I think it's very limited. I mean, as a minimum I think it's going to be very difficult to get anywhere close to 30 percent, you know, for a consistent basis. I mean, every year if you want to make exceptions, you know, as a goal it might be good, but I don't think I can do that at this point.

MEMBER ENGELBERT: I'm just wondering how many cows you have, how many acres of pasture, and if those numbers were different.

PANELIST STRAUS: As I stated --

MEMBER ENGELBERT: And has that changed the ability to meet that minimum.

PANELIST STRAUS: As I stated, we have, approximately, 300 cows on 660 acres.

MEMBER ENGELBERT: So, for example, 100 cows on 660 acres, still for that length of time you couldn't feed them?
PANELIST STRAUS: If I wasn't in business I wouldn't have to worry about it.

MEMBER ENGELBERT: Well, but I think that --

PANELIST STRAUS: No, I'm being facetious, but it's -- if I was a small dairy, I wouldn't be in business. I just -- you know, I have maximized the amount of pasture I can do for our area and for my particular situation. Other dairies that I buy from utilize pastures as much and they maximize the pasture. They don't have any silage. They don't. They just feed alfalfa hay and grain in the barn and they, at most years, have a hard time getting 120 days, I would say.

FACILITATOR ANDERSON: If I could jump in for one second. What I heard was it isn't the number of cows or the amount the pasture, but rather it is the length of your growing season and the variability of it that is your challenge. Is that --
PANELIST STRAUS: The length of the growing season.

FACILITATOR ANDERSON: I'm saying the pasture season because of --

PANELIST STRAUS: I mean, to get the 30 percent over our growing season is very difficult to get.

PANELIST ARNOLD: Okay. Is it on to me? Where does the 30 percent for 120 days come from? Yes, basically, it came from discussions for years over dairy producers, organic dairy producers across the country.

The first I heard about it was, I believe, some farms in Organic Valley came up with that back in 2001, I believe, as a base price or as a base amount that everybody should be able to make and we have just discussed it and discussed it and discussed it. And that is just something that we feel should be achievable everywhere. Is that all you wanted me -- okay.

PANELIST VELEZ: And talk about
our feeding program, I'm going to talk a little bit about the housing condition of the animals for the most part and they are loose housing, access to fresh air, sunlight and expression of natural behaviors by grooming during the entire year, and the cows in the maternity group are brought in so that we can monitor the calving. The fresh cows stayed on one of those loose housing areas where they get a TMR. At, approximately, mid-lactation several of those groups start going out on pasture.

We calculated. Last year we calculated, guesstimated, that our dry matter consumption for some of the lactating cows was around 5 percent in our Texas herd and between 3 and 5 percent in our Colorado herd during the lactating period.

MEMBER KARREMAN: Thanks, Juan. Hugh Karreman, NOSB. Back on the animal welfare issue. Since I'm a veterinarian and that's near and dear to me all the time, I
would say that the issues of animal welfare
and a checklist or something like you
mentioned, Juan, are probably needed and I
think there are some private companies
starting to do that or private kind of extra
certifiers doing that.

But I think that the main -- it
kind of gets back to what Mark was asking
about, what about the rest of the time when
they are not on pasture, and I think we need
to look at that, but I think our main topic
for this conference is pasture and we need to
concentrate on that, but we do need to look at
the other dates.

In my particular area, down in
Lancaster County just a couple of hours south
of here, we do have a lot of tie stall barns
and I would definitely be open to entertaining
the welfare issues of letting the cows out in
the wintertime from the tie stalls so they are
not tied in as long, okay, but that's on a
different day.
And the other thing with the animal welfare part of it, since we're here for pasture, primarily to define what pasture is and what it shall be in at least the minimum somehow or another, when it gets down to the animal welfare it's not just the ruminants, but we have to also look at the hogs and the poultry, so just to keep that separated.

MEMBER GIACOMINI: Dan Giacomini, NOSB. First of all, I just needed to say for full disclosure, as Hugh is the veterinarian for one of our panels, I am the nutritionist at Albert Straus Dairy and I have worked with a number of organic and conventional dairies in the area that Albert is and the area that Blake is.

And as difficult as it would be for Albert to do this, it is very interesting that I was recently at a talk with a major retailer of natural products and organic products and I would be very, very surprised
if the majority of the pasture pictures that were in that talk were not from Albert's geographical area.

The question I had is for Jon and I'm more comfortable asking this after Mark's question. I'm not asking you to become a regulator. Can you give us some ideas on possible terminology and possible points that we can use to put into regulatory terms what a grass-based dairy looks like?

PANELIST BANSEN: Okay. Well, you know, a grass-based dairy is going to have a structure. If you drive onto the yard, in the yard, and there is no fences up or no lanes up, you know that's not a pasture dairy already. You know, it's really not a highly difficult thing to see what a pasture dairy is. It should have terminology like structure, the infrastructure set up for grazing, which means fences and lanes.

You know, we have a very wet weather pattern ourselves where we're at and I
took a page out of my grandfather's book. He
grew up or my grandfather dairied right where
Blake -- down where Blake dairies right now,
and my grandpa poured a cement lane to get his
cows out to the grass and this was 60 years
ago, 70 years ago, something like that.

Growing up as a little kid down
there in Ferndale, I remember walking down to
get the cows down that little skinny cement
lane and then, once we moved up to Oregon and
I bought my own farm and I was having trouble
getting the cows in and out to the grass,
because it's so darn wet there, you know, an
old light came on. I remembered what my
grandpa did and we poured cement lanes.

We have about two miles of lanes,
some cement and some with fabric and rock on
top, so we can get the cows back and forth and
that is really the part about intent. You
know, if you walk onto a dairy and there is no
lanes and there is no fences, you know they
are not a grass-based dairy.
So I really think in the terminology you need something about the infrastructure, so the infrastructure is there, and as well as vegetative pasture. You know, if you have a huge area fenced in that is a rock pile, probably not vegetative pasture. If you have a fenced in green stuff that the cows can graze, probably pasture.

It's really not rocket science here and, you know, this really has to have a common sense approach to it. This is not -- it's not tough to go in a yard and see what they are doing on the farm.

MEMBER DELGADO: Is this on? Yes.

Rigoberto Delgado with NAOS -- NOSB. I always have problems there. A question for Albert. If you were to introduce irrigation to your farm so you can -- assuming it's possible, would you do it and you said no or because it will be a detriment of your ecology and so forth.

But would that put you out of
business or that would -- what would be the economic implications of bringing irrigation to your facility?

PANELIST STRAUS: Irrigation.

MEMBER DELGADO: And allowing to comply with the 30 percent?

PANELIST STRAUS: I understand. We live on a body of water, the Pacific Ocean, in Tomales Bay that is a lot of salt water and if you gave me millions of dollars to do desalinization, I could probably do it. We have drilled wells. In the '76 drought we finally found some water for the dairy after hauling water for nine months. And this year we drilled two more wells and they were dry. There is no water, so I don't have that option. Plain and simple. It's not environmental. It's not anything. I don't have water.

MEMBER DELGADO: My second question is for Jon and Kathie and the rest of you. In the case of Albert, and I know a
number of farmers in Texas and so forth, they have all the intent of allowing to comply with that 30 percent, but they can't.

Does that satisfy, in your perspective, the intent of the 30 percent and access to pasture if people like Albert and people in west Texas or whatever are not able to meet it according to the standards and the possibilities that you have here in this very green and large area of the country?

PANELIST BANSEN: Well, you know -

MEMBER DELGADO: Or should we stop thinking of being organic dairy farmers in west Texas or what is your opinion?

PANELIST BANSEN: Well, you know, like the Billy Joel song says, it's shades of gray. You know, nothing is black and white here. It's all shades of gray. I think what Albert is doing is a whole lot different than the folks that we're here to really discuss, you know, the zero percenters or the 2 or 5
percenters.

You know, that is -- Albert, you know, he has the intent there. You know, he says he usually has four months. You know, I think it's different in a region. If you set up a dairy in a region where you know you have no irrigation and you know the growing season is one month, there is no intent there to meet the pasture. You know, Albert has a dairy where he says on the average year he has four months. That's the 120 days. Seems like the intent is there.

So, you know, we need to make sure exactly what that intent is when you set up the dairy, and that's why it's important to have specific wording in this language to talk about intent, you know, about pasture infrastructure and about what needs to be there, so when new dairies do want to come on to this organic program they know, you know, do they meet that intent or don't they meet that intent. You know, do they need to look
for a different area where they can meet that intent or not?

   PANELIST ARNOLD: Okay. I would just sort of second that and just the fact that in the rules or the way it's considered being written is an allowance for temporary confinement based on weather, on flooding, too much rain, drought. So if Albert says that in a normal year they can meet 120 days, they have got the four months, but he has just had a succession here of very abnormal years, so I would assume that these very abnormal years would meet that exemption requirement.

   And in terms of the 30 percent intake, that is all based on balancing numbers of animals with your land base and in some cases, there will just have to be perhaps a decrease in herd size to make that balance between animal numbers and that pasture land base. And people are doing it all across the country.

   I mean, the number of pasture
acres we have, if, you know, we're at a good number, a good fit now for doing what we want, you know, we can milk 1,000 cows, but, you know, then I could no longer make that 30 percent dry matter intake and you have to balance your cow numbers with your acreage available.

PANELIST VELEZ: I would like to jump in and especially talk about the intent. As you know, the drought, the longest drought, one of the longest droughts in history has been in Texas until recently. Obviously, our intent at that particular farm was based on the land base to graze a lot more and get a lot more dry matter intake than what we actually got.

Also, I want to point out that continuously the plan is evolving towards more and more access to more of the animals around any of the locations that we want to be in, and the new products are designed with a lot more access with a lot more -- with a goal of
having a lot more grazing going on. The intent is -- so I don't think that anybody's intending purposefully not to do it.

Therefore, I want to make sure that everybody understands that the whole program is evolving and that this symposium, that I have learned a lot about a lot of things that can be done and cannot be done. I think that this symposium is the beginning of an evolving process for everybody's intent to grow on several aspects, and I include welfare during the winter months as one of those things that need to be evolving in the whole organic program.

PANELIST ALEXANDRE: I would like to answer to that real quickly. Two things though. First, there is the Animal Humane Association that certifies dairies and when you get certified, you can use the Free Farmed logo and we do that at Humboldt Creamery. Every dairy out there is certified by that for whatever that is worth.
In regards to your specific question about Texas, I have been involved at a dairy in Texas and I own a percentage of an organic dairy farm in Texas that I have helped set up from the beginning, and we pump water that is way down deep and we irrigate in circles underneath the irrigation and it works. And we're only in our second year out there, but it's working real well.

FACILITATOR ANDERSON: There are more questions from the Board and I would ask a question of the Board in general, because I'm charged with the time keeping here. There are also a lot of questions from the Board. Would you like to ask a question? Could I go to some of the public questions or how would you like to proceed?

PARTICIPANT: Are you asking me?

FACILITATOR ANDERSON: Well, I'm asking Bea and Gerald particularly.

MEMBER JAMES: Kevin, do you want to address that?
CHAIRMAN O'RELL: Well, I think we do want to get to some of the public comments and, I think in light of that, I know the Board, if you have a specific question quickly that can be answered, but we do need to move -
-
FACILITATOR ANDERSON: Here's another question. How about if we ask the public questions. If those don't address your questions, we'll come back to you.

MEMBER JAMES: No.

FACILITATOR ANDERSON: Bea? Okay.

MEMBER JAMES: Well, I guess from the communication that we received from the NOP that this is really a symposium for the public, but it's also to really help make sure that the NOSB understands and asks their questions, so that we can get to a conclusion.

So I would say that if there are pressing questions from the NOSB that we can, hopefully, summarize those quickly and then move on to the public questions and if
everyone is okay with that. Sound right, Mark, Barbara?

MS. ROBINSON: Yes, yes, this is -

MEMBER JAMES: Okay. First, thank you, farmers, for coming. I really appreciate the time that you're taking away. Ed, thank you for not passing out when you gave your last part of the speech.

I am going to just like jump to let's say that we instill this regulation, that we have pasture, that we don't sit here and talk about whether or not yes pasture, no pasture, 120 days, 30 percent, that we just make this assumption that we are -- from what I'm hearing, that we want pasture. We're going to figure out how to make this work for farmers.

Pasture means, from what I'm hearing and what I read in the regulation, it doesn't -- it means not just one thing. It means grazing. It means sunlight. It means
fresh air. It means free roaming. It means allowing the animal to express its natural behavior. So it's not just one component of that. It's all of those components.

So I would like to throw out this scenario and ask for your opinion. In the Organic Regulation we have three tiers. We have 100 percent, 95 percent, 70 percent. What would be your opinion if we were to find a way to craft this regulation to meet the diverse type of farming that's going on? We have farmers that are able to have very strong pasture for their farms. We have other farms that have regional weather problems. We have farms that are not complying to the regulations and that need to comply to the regulations.

So with that, I would ask you as farmers to tell me what your thoughts are on having a regulation that would be tiered pasture access for the labeling of organic milk.
PANELIST BANSEN: Well, I just may -- I might be concerned that that might lead to confusion in the consumer market as far as what organic milk is and, you know, they come and there's three different labels and, you know, what does that mean and I'm afraid that might just lead to some consumer confusion.

MEMBER JAMES: But we have three tiers already.

PANELIST BANSEN: Correct. I understand that. When you come to your dairy case, I just -- I think it's a little different than your dry products and those. You know, you come to the dairy case, it's the dairy case and I'm afraid there might be confusion there.

PANELIST ALEXANDRE: The problem I see with that is now you have gotten specific on pastures if that's the only thing that really counts and it's not. It's organic pasture.

So the consumer would immediately
get confused with the conventional pasture label that is coming and that is a huge problem, because this organic pasture is back to the biology of the soil and it's the total package and it's a nutrient-dense package of food that we're trying to get to the consumer. That is why they want pasture, not because it makes them feel good.

MEMBER JAMES: Okay.

PANELIST STRAUS: This is Albert.

MEMBER JAMES: Yes.

PANELIST STRAUS: I just -- I don't see. We have already products that are made with, you know, the different amounts of organic. You're going to explain that it's 75 percent, because it only has so much pasture?

MEMBER JAMES: I'm not necessarily saying that this tier would be exactly the way that it currently exists, that maybe there would be a tier that would be crafted specifically for dairy to help meet the needs of somebody like yourself and still allow you
to be able to sell your milk as organic, but not necessarily -- I think we need to be honest and we need to communicate to the consumers what they are purchasing.

When I buy orange juice that has oranges on the package, I expect there to be orange juice in the package. When I buy milk that has cows on pasture on the label, I expect that that's what I'm purchasing. And so if we find a way to be able to provide the consumer with the different variations that are currently out there, and I'm not saying that there should be a tier that does not allow pasture, I'm just saying that I think that we need to be cognizant of the fact that not every single region is going to have an easy time adhering to 120 days, 30 percent.

PANELIST STRAUS: You know, I market products that don't have additives in it. I don't homogenize. You know, if I don't have as much pasture as these other guys, am I not as organic as them?
MEMBER JAMES: Well --

PANELIST STRAUS: I'm asking. Is that what you're trying to -- you're painting me into a spot that I -- I'm asking, you know.

MEMBER JAMES: I think that's the topic of this whole symposium.

PANELIST STRAUS: Okay. Well, I take offense at it. You know, it's -- I helped develop standards for the last 15 years. I have -- I am a step ahead of almost everything that is out there and we do our best to come up with a clean, 100 percent organic product that we don't -- you know, we have a survey that we put out that had 5,000 consumers of which we got a 22 percent return rate that their concern was additives. Over 90 percent of them were concerned with additives and preservatives in organic foods. It wasn't how much pasture there was.

You know, if this is from the consumers' perspective, we are totally straightforward. You know, we tell exactly
what's in our product. We educate people as to what we're doing and what the message about sustainable farming is, and that is who our consumer is. They aren't saying, oh, you're not as organic as the other guy. You know, so that's my reaction.

PANELIST ARNOLD: I guess it's a whole new idea and it's hard to respond right off the top without having thought about it for awhile but, I mean, I like the idea from a producer's side in that it is going to provide a real incentive for maximizing pasture and it may provide that economic return for reducing cow numbers in a situation where there is a limit to the amount of acres.

So if there was a little bit of premium price attached to a product that had a higher level of grass fed basis, then that premium could go to provide that farm with the economic means to provide that higher pasture base.

PANELIST BANSEN: And I would just
like to reiterate real quick that as Kathie stated before, this 30 percent, 120 day issue really, I do believe it did originate in our Dairy Executive Committee, which has representatives at Organic Valley from all across the nation. You know, we have 568 farmers in 22 regions and it was the consensus after hours and hours meeting and meeting with all the DEC representatives at Organic Valley, all regions can meet this.

You know, we had no input from any of the other -- of any of the regions across the country that couldn't meet this and that is really where that 30 percent really started out to begin with.

PANELIST STRAUS: I'm not in Organic Valley.

PANELIST ALEXANDRE: Albert, I think you have neighbors in your region that say they can meet it.

PANELIST STRAUS: Organic Valley or --
PANELIST ALEXANDRE: No, you have neighboring dairymen in your region that ship milk to --

PANELIST STRAUS: Okay.

PANELIST ALEXANDRE: -- other processors that believe they can meet the regulation.

PANELIST STRAUS: Let's put it down on paper.

(Applause)

MEMBER DAVIS: Robert, Gerald Davis. My question I will save for the certifiers section.

FACILITATOR ANDERSON: Okay. Great.

PARTICIPANT: I have one. Oh, I'm sorry.

MEMBER OSTIGUY: This is a question for Dr. Velez. I'm sorry. This is Nancy Ostiguy from NOSB. How many hours a day are your cows, your milking cows, outside not
free walking inside, but physically outdoors?

PANELIST VELEZ: 24/7.

FACILITATOR ANDERSON: Any more questions from the NOSB? I should have stated early this morning what I said at the beginning of yesterday, and that is that this is primarily a symposium for NOSB and NOP and that while we will entertain public questions that --

MEMBER OSTIGUY: I need to follow-up on that question.

FACILITATOR ANDERSON: I'm sorry, I didn't realize.

MEMBER OSTIGUY: What do you mean by 24/7?

PANELIST VELEZ: I'm sorry?

MEMBER OSTIGUY: How are they outdoors 24 hours a day? Are they inside of a facility that has a roof, but open portions of the wall? I want to know when they don't have any walls surrounding them, when they don't have roofs.
PANELIST VELEZ: Okay. I apologize for my short answer. Our cows are housed in what we call loose housing. There is no walls, that only on one portion of the very large pen where they can walk. They can groom. They have direct sunlight, access to sunlight, fresh air. They have an open shed in which they can select whether to go in if the weather is inclement or stay out if the weather is nice, which is most, around 300 days of the year in the area of Colorado, one of the dairies I'm talking about.

The other one is very similar. I'm talking in general about both of them. It's very similar. The cows can express their natural behavior during all -- during the entire day unless they themselves select to be inside a shed that is well-bedded to protect themselves from the inclement weather. They can express their natural behavior.

MEMBER OSTIGUY: You still haven't answered my question. Do they have a roof
over their head?

PANELIST VELEZ: No, ma'am, only if they choose to go under the shed they have a roof on their head. If not, they don't. Yes?

MEMBER OSTIGUY: They are walking on cement, they are walking on dirt, they are walking on grass?

PANELIST VELEZ: They are walking. When they are not grazing, they are walking on a panel of dirt. There is dirt around it. Yes, ma'am.

FACILITATOR ANDERSON: Any more questions? Yesterday I commented at the beginning that this is primarily a forum for the NOSB and the NOP. I have lots and lots of public questions here and we're not going to be able to address all of them. I want everyone to be aware though that every one of these questions will be scanned into the public record. There is a comment period at the beginning of the National Organic Board
Meeting, Standards Board Meeting today.

There are already six and a half hours of comment there for that and, also, there is the opportunity for written comment to this by June 12th of this year, but that's only on the ANPR. That is not on what will ultimately happen if regulations come.

There is only one question that I would like to -- and not necessarily ask for answers to, but I think that what is being talked about here is getting around the issue and there are recurring questions here about confinement and what is confinement. What is confinement from the standpoint of are the animals indoors or are they outdoors? Are they tied part of the day, none of the day? Are they outside in indoor confinement?

And it really breaks down to indoor confinement with no outside access, indoor confinement in stalls, indoor confinement with free roaming or outdoor access to grass pasture, dirt or whatever.
And it's sort of the underlying issue here that I'm not exactly sure how we even begin to address, but confinement is what we're really -- as we're seeking access to pasture, we're talking about confinement and what we don't --

PANELIST ALEXANDRE: Comments?

FACILITATOR ANDERSON: Sure.

PANELIST ALEXANDRE: My simple answer to that is, again, this is a pasture symposium. We're here talking about access to pasture. The first question that was asked yesterday, is this a current role of the NOP, is the current position on pasture adequate? The answer is no. Everybody has said no, no, no, no. It is pretty much unanimous the way I feel it.

We have got issues where we have rolled into this 30 percent, but again I'm going to remind everybody what is confinement? We're not here to define confinement. Confinement is zero access to pasture. It doesn't matter whether it's Juan's confinement
or something that is happening out here in Pennsylvania or anywhere else in the country. Confinement means no access to pasture and that's why we're here today. So it's really clear in my mind.

(Applause)

FACILITATOR ANDERSON: I believe that -- I want to say one more time, every question that is here, and there are many really good questions, will be scanned into the public record. There is the comment period preceding the NOSB meeting and there is the opportunity to provide written comment by June 10th or June 12th on this ANPR.

I will call for a short break and we'll bring the certifiers up, so that we can talk about whether or not we can put nails in the intent and whether we can -- and what we have to do in terms of regulating. Thank you.

And I would like to especially -- please, everybody, these guys have taken an incredible amount of time.
(Applause)

(Whereupon, at 10:02 a.m. a recess until 10:21 a.m.)

FACILITATOR ANDERSON: We will reconvene this session and we have approached the enforcement, measurement and compliance part of this in a little bit different way, because there were five questions posed directly in the ANPR that were asked of the accredited certifying agents.

So what we're going to do is have one person, one of the certifiers, address each of the questions and then provide an opportunity for the other two certifiers to comment on anything that wasn't added or reinforce that. So we're going to take a total of six minutes for five questions and leaving half an hour of questioning for the NOSB.

So I will just start by saying that we are privileged to have with us Brian McElroy from CCOF, Leslie Zuck from
Pennsylvania Certified Organic and John Stalley from Oregon Tilth.

So I will start first with the question how should an accredited certifying agent measure compliance with specific measures adopted to change the role of pasture? And, for example, if dry matter intake is used as a benchmark, should it be measured as the average or such as a calendar year over 12 months or a week or a day or an hour? Leslie?

PANELIST ZUCK: Is this on?
FACILITATOR ANDERSON: Sure.

PANELIST ZUCK: Can you hear me?
FACILITATOR ANDERSON: Yes.

PANELIST ZUCK: Okay. Well, there are a variety of ways that certifiers can verify compliance and it's one area of the rule where they don't spell out how. They tell us we have to verify compliance with the regulations, but they don't really spell out specifically how to do that, so we have
discretion in that area.

And the types of records that
farmers keep vary greatly, as well. I mean,
they start out as none. That would be the
preferred format for most farmers and we
actually get this. They will say, well, it's
all in my head, you know, I have the records,
but they are all in my head. So that is, you
know, one area that you will find.

Then you have the farmer that
gives you this sophisticated computer
spreadsheet so, you know, it runs the gamut.
And I will say that, you know, it seems that
the best farmers do keep the best records, but
just like the weather they all complain about
it every chance they get. And I think most of
the farmers we certify would rather have all
their teeth pulled out than fill out the
records that we require them to fill out.

But, you know, as far as what you
have to understand from our point of view is
the burden is always on the producer to verify
their compliance and then, in turn, the certifier has to have adequate records in our office and in our files to demonstrate compliance to the NOP auditors. So that is kind of how the chain works.

And with the dry matter intake situation, which is the example in the question in the ANPR, that would be something we would calculate seasonally. Most farmers have their rations kind of figured out different per season. So during the winter season they have a certain ration. During the early spring season they will change the ration as the cows are starting to go out on pasture. During the pasture season it's going to be way different than it would be, you know, during the winter season.

So if we were going to be having to calculate that, it would have to be tied into what is the definition of the growing season and whether it's 120 days or whatever it is that we decide, that's how it will be.
connected with that. And I don't think that, you know, those records would not be difficult.

I mean, in some cases the inspector just goes and has -- great, we have a timekeeper. In some cases we require the farmer to keep records on the farm or another way to do it is when the inspector goes to the farm, they can ask the farmer how do you do this or how many hours are your cows on pasture, you know, tell me what your ration is that you're feeding during the pasture season, and the inspector can write all that down and into the inspection report and it becomes part of the record that way. So there are a variety of ways that we can do that.

FACILITATOR ANDERSON: Brian, same issue.

PANELIST McELROY: What happened there?

FACILITATOR ANDERSON: Same issue. Would you like to comment on that
measurement?

PANELIST McELROY: No, I have nothing to add.

FACILITATOR ANDERSON: Well, then the second question is, and this is to Brian, how should producers and certifying agents verify compliance over time for a herd of cows that are at various stages of growth or have varying states of nutritional needs? Can the producer and certifying agent determine this in the Organic System Plan?

PANELIST McELROY: So I will go backwards through the question. Yes, the certified party can include this in the Organic System Plan, should include it in the Organic System Plan and I think that the certifier should verify it's in the plan.

And I think that, you know, the National Organic Standards Board, one of the things you should take a look at is what do the various Organic System Plans offered by the accredited certification programs look
like, what questions are they are asking, what kind of documentation are they asking, because in the first round of accreditation we have seen a huge variation in what an Organic System Plan looks like.

It goes all the way from a checklist all the way through to, you know, fill in the blank and check the box to very freeform paragraph essays, and these Organic System Plans are extremely varied and I think that can make it hard sometimes at the enforcement level to try to ensure enforcement of the standard.

So the first part of the question then is how should producers and certifying agents verify compliance over time for a herd of cows at various stages of growth and various states of nutritional need and, obviously, we're in here talking about pasture so let's not get distracted about all the other various nutritional issues.

But from what I have seen in
certified operations, the only consistent place that I have seen an operation deny access to pasture to animals for a stage of production that seems justified to me is at the very young stage, various stages of the calf and its maturity, and that denial of access to pasture for those calving stations, in my experience, is pretty short. We're talking about a matter of, you know, weeks to months and that is the only place I have seen a consistent denial of access to pasture that seems reasonably justified.

PANELIST ZUCK: I would agree with that.

FACILITATOR ANDERSON: John?

PANELIST STALLEY: I would also agree with that and I agree with Brian that the System Plan has pretty much everything in it or it should have everything in it that you need to verify compliance and could be used for the 30 percent as well. All that information should be in the plan and it's a
matter of the inspector going out to the farm
and verifying what is in that plan.

FACILITATOR ANDERSON: This
question is to John. What flexibility should
producers have in working with their
certifying agents to verify they have
accomplished the goals of an increased pasture
for livestock?

PANELIST STALLEY: Okay. I was
going to take this in two parts. First of
all, things that I think should be flexible
and I'm going to read what we have put
together as a staff. We met as a staff and
decided.

It has changed since I came to
this meeting, so by listening to everybody, I
came here with an open mind. My heels were
not dug in the sand and I really -- I have
changed our position since I got here. I was
unclear when I got here and I feel like I'm a
little bit clearer, but I'm still pretty
unclear. I don't know how everybody else
feels, but that's how I feel.

And so I'm going to read what we came up with. I will talk pretty quick because I know we're limited for time. "While some had wanted to focus this discussion on the scale or the size of the operation and/or geographic location, Oregon Tilth believes focus is on the integrity and intent of the regulations. The task at hand is to clarify the intent and expectations established in the regulations for organic dairy operations."

Upon providing such clarification, we should allow operations, regardless of their size or location," that is not a factor, "to determine how and if they can comply. The Farm Plan contains information about the location, crops and acreage and pasture and other forage that will be fed. The inspector verifies what has been written in the Farm Plan, so the Reviewing Committee can help the certifier make an assessment of compliance. A complete Farm Plan contains all this necessary
information.

Things that are not flexible. The rule as currently written," and I think we can all agree on this, "has not been sufficient to maintain the original intent of the regulations. Greater consistency is needed among NOP-accredited certifiers," these two others. I think that's very important. Consistency is very important. I think that is something that all of us certifiers need to work on.

One minute. "Oregon Tilth also supports the NOSB's proposed exceptions to the general requirement for pasturing ruminants, for birthing, for dairy animals and up to 6 months of age and for beef animals in the final finishing stage, as well as the NOSB clarification that lactation of dairy animals is not a stage of life that may be used to deny pasture for grazing." That is my favorite sentence right there.

"However, we believe the
clarifying language should be in 205.239(b)," which is a different section, but that is regarding organic livestock operation. That is contemporary confinement. "Also, we support the language that ruminant animals grazing on pasture during the growing season."

I think that's very well-written and that was well thought out. "And by specifying that ruminant animals will be grazing pasture during the growing season, you can accommodate for regional differences." Thank you.

FACILITATOR ANDERSON: Leslie?

PANELIST ZUCK: That sounded like great policy to me. I feel like one of the things that we have discussed is that with us closing those two loopholes, the temporary confinement based on stage of production being changed to stage of life and also requiring the access to pasture be changed to grazing pasture during the growing season, will really go a long way toward our goal of compliance with the intent of pasture, because, you know,
some of the farms that are using those clauses in the rule and interpreting them a little differently than some of the other certification agencies are allowing the interpretation to be -- they do have pasture on their farms and they are pasturing some of their animals.

They are just not pasturing their lactating animals, so they know what pasture is and I feel like at least those two steps would help our compliance problem immensely.

PANELIST McELROY: Yes. You know, somebody who is not here today that had a great quote about the organic community is Keith Jones, whom you all know, and he once said to me, he said, my God, you people can argue about what the meaning of is is. And, you know, it's really true. The regulation is really clear. Organic animals should be consuming pasture during all stages of production.

But somehow through this passive
voice construction of access to pasture, the whole thing has slipped through our fingers and it's really unfortunate and I think really clear, simple terminology, grazing at all stages of production, these things I think can, hopefully, help us go back and enforce. I mean, I am all for whatever gets passed in the regs, what we're going to go enforce. If it's 30 percent dry matter intake, fine, that's where we're going to go.

But things like 30 percent dry matter intake are going to be difficult. It's going to be hard and do you want me to issue a notice of proposed suspension to a dairy on day 199 that they take the animals back in the barn? Do I issue a notice of proposed suspension on 29.5 percent of dry matter intake? Numbers are great. We can all verify them, except I don't know. Dry matter intake, verifying that is going to be a statistical challenge. We're going to end up getting some numerologists in here.
So I think we need to go for the intent and we need to have the intent clear enough that we know we have got the enforcement and, you know, we have to work in unison here. We need an Organic System Plan that lays it out transparently, a rule that we can enforce, and then we need to go to a court for a day and get the interpretation. Thank you. Thanks.

FACILITATOR ANDERSON: Thank you.

Leslie, should the Organic System Plan be the focus of introducing regulatory changes? In other words, should specific requirements for a larger role for pasture be introduced and required in livestock producers’ Organic System Plans, as was suggested by the NOSB in its guidance recommendation?

(Audio loss)

FACILITATOR ANDERSON: Okay. So did you get my question, the question to Leslie?

PANELIST ZUCK: Yes. Could you
just repeat the end of it?

FACILITATOR ANDERSON: It really says should the change occur at the Organic Systems Plan? Should the regulations address it at the Organic Systems Plan and should specific requirements for a larger role for pasture be introduced and required in livestock producers' Organic Systems Plans, as was suggested by the NOSB in its guidance recommendation?

PANELIST McELROY: Well, if your --

PANELIST ZUCK: I'll take -- I'll defer to Brian.

PANELIST McELROY: Well, I guess my answer would be I don't think so. I don't think we can do it here. The regulation says that the Organic System Plan can look like anything, it can be done in any way, shape or form you want to do it. It just has to comply with the regs. The Organic System Plan, all the wording in the regulation about what the
Organic System Plan looks like and how we enforce with it, is pretty soft.

And, you know, Valerie, I hate to make work for you, but I really think the NOSB would do well to have five or six very widely formatted Organic System Plans in front of them so they can see how extremely broad the interpretation of what an Organic System Plan is and what it looks like.

And that is why I don't think the Organic System Plan is the way to try to enforce something like this where it's clear we need some real regulatory backbone, because we shouldn't be here today, but we are, and that points out that this thing is going to be hard and it has got to be specific and it has got to be tough and that is not going to happen in the OSP as far as regulatory.

FACILITATOR ANDERSON: Leslie?

PANELIST ZUCK: I read this question as -- I'm not sure exactly. I wasn't sure exactly what they were asking at first,
but going from there to the next question, I thought maybe they were wondering whether this regulatory change for increased pasture restrictions should be in the part of the rule where it tells you what has to be in an Organic System Plan and/or should it also be a separate standard somewhere else in the regulation that we have to follow.

So I thought that was maybe part of what they were asking here and I don't think it really matters. I think that Brian's point is a good one. Whatever it is, we have to be consistent so that we are going to be verifying compliance with the information that we need. And I think his point was that we should take a look at the Organic System Plans that are out there and how different certifiers are gathering that information.

PANELIST STALLEY: And I would just like to say an important element of the System Plan that hasn't been mentioned is that is the producer's plan. He comes up with that
or she and they decide how they are going to meet the regulations, not the certifier, not the NOP. A producer decides how they are going to comply.

Enforcement at that level, there could be some enforcement at that level. If you look at that System Plan and you review it before you go to an inspection, as you should, some of those issues may be able to be dealt with before the inspection. And then on inspection is another level of enforcement. The inspector is out there to make sure that plan is accurate and everything that they see here and so on is consistent with the plan.

FACILITATOR ANDERSON: Did you want to --

PANELIST ZUCK: I think maybe I would like to give an example that will maybe help people understand it. When we ask people to fill out their forms that actually constitute their Organic System Plans, you know, we could ask them do your cows receive a
minimum of 30 percent dry matter intake from pasture?

We could ask that and the farmer may say yes, then that could be it. And we're like, okay, they do. Okay. Wait, we'll verify it when we get on the farm or they might say I have no idea how to calculate dry matter intake. You know, and that's probably what most of them are going to say, I don't know, or some people do know how to calculate that or what we could do is ask on the Organic System Plan all the information we need in order to calculate that, and that's what most certifiers, I believe, do at this point.

They ask what are your rations, how much have you rationed, how often are your cows out on pasture, how many hours do they go out on pasture, you know, what seasons of the year are they pastured and, you know, ask enough questions about their ration, specific questions, so that then when those forms come into our office, we can make that calculation
and verify it.

So that would be an example of a broad range. The question could be do you do this and the farmer says yes or, you know, give us the information and we'll determine whether you do it.

FACILITATOR ANDERSON: Last question. Should a new standard be developed devoted to addressing a unique role of optimizing pasture in organic ruminant animal production systems?

PANELIST McELROY: Yes, yes. The slight qualification is I don't know if we're -- if optimizing pastures is really what consumers and the constituents to this body want, great, then let's -- we'll go out and enforce the optimizing pasture. But I think we need to get through the first step, which is just we all know the intent of the rule is that organic production systems should include pasture.

It should include pasture at all
stages of production, and so let's just try to get there. Let's just get on that step first and then is optimizing 30 percent, is optimizing 10 percent, is optimizing 100 percent? I don't know. So the optimizing word is the only part of this that causes me a little bit of hesitation.

But it is unfortunate that we're here, because I think the process that we went through 10 years ago and from there until now made it very clear what we were all trying to do, and so I would like to get there.

PANELIST ZUCK: I'm going to agree with that.

PANELIST STALLEY: Yes. And I would just like to say in addition we support those NOSB-proposed rulemaking changes. However, I think there needs to be -- and my question was flexibility, so I'm going to continue on the flexibility issue and I'm primarily addressing the NOP here in that we would need some kind of flexibility and some
kind of time frame for operations who are not currently meeting that.

I think Albert is a good example.

I think it's clear that Albert has the intent. His intent is correct. However, his region can't meet that and in all fairness to him and all the other producers in that position, there should be some period of time where they can bring themselves into compliance. I don't know what that time period should be.

I don't think -- like Brian was saying, do we issue them a notice of proposed suspension? I say no. I say give them a chance to comply.

PANELIST ZUCK: And I will add to that as far as the standard goes, if we were going to be writing, writing a standard for pasture. We need to consider taking a look at the temporary confinement allowance, as well, because certifiers have complete discretion in that area as to determining what is and what
is not temporary confinement, and how temporary is temporary. And, you know, we did get one of those policy statements a number of years ago that says temporary means temporary and so that was a great help.

I have to say though in all seriousness that we have this problem now, and the flexibility that I -- that's the area where we can find the flexibility in the rule.

So that if there is a situation where the farmer can only make 119 days instead of 120 days, and it may be based on some of those factors that's in the temporary confinement section of the rule, but we also need to make sure that it's clear.

And I would like to have something like this added to the temporary confinement section that, you know, something has to happen, that the temporary confinement is only for a period of time that is measured by another factor that you can measure happening, such as if it is because of flood, then at
what point, you know, do the cows have to go out again because what we have seen are animals being allowed to be confined temporarily, but with no end in sight, so to speak.

So we do need to take a look at that. It's going to be really important when we put in these, if we do put in these restrictions, and then say okay, well, you know, you had a problem or it might have been a disease outbreak in your area. You had to confine them. You didn't make your 120 days. You didn't make your 30 percent dry matter. The certifier says that's okay. But, you know, there has got to be some oversight there.

FACILITATOR ANDERSON: Mark, these have been addressed to you. Would you like to comment?

MR. BRADLEY: I would. Mark Bradley, National Organic Program.

I would like to thank you three
particularly for coming in and getting up in
front of this crowd and me of all people, too.

The order of business here is just incredibly
well thought out. It wasn't by me, but to
have all these producers in here coming in and
saying we can do this, we can do this, we can
do this and then to have the certifiers
getting up there saying we see problems, you
know, I tell you, it's very well-taken.

First, Brian, we have had a lot of
people coming in, you know, experts talking,
farmers talking that these programs, these
production systems can be developed in a
sustainable manner that are -- with
sustainability demonstrated in the Organic
Systems Plan using any variety of methods, you
know, NRCS guidelines, proven carrying
capacity of the ground, chews per day.

There is all kinds of ways that
you can get from here to there on an Organic
Systems Plan, setting it up in writing without
ever having to go out and do the certification
work. You know, that downside audit is to verify that. So you're looking at two different strategies here or two different steps and it's just the same thing that you have been doing all along. They have to have an OSP.

Now, are you saying in your comments that you can't, you know, because of the variety of operations and the variety of OSPs, come up with something that demonstrates compliance with that ground or as certifiers, and any of you can answer this, would you prefer to be very flexible on the Organic Systems Plans and then have certified operations keeping copious notes on how many days they keep things out there or how do you propose to verify compliance?

PANELIST McELROY: I got a little lost on the first question, Mark, sorry.

MR. BRADLEY: I did, too.

PANELIST McELROY: Were you addressing specifically the concept of 30
percent dry matter intake or were you talking more about the current system right now, why are we finding it hard to enforce access to pasture during lactation?

MR. BRADLEY: Well, I'm looking more at it as a "to be" scenario because we all know what we have right now.

PANELIST McELROY: Right.

MR. BRADLEY: But they are talking about 30 percent DMI.

PANELIST McELROY: Right.

MR. BRADLEY: 120 days on pasture as a minimum.

PANELIST McELROY: Yes. I mean, we can go out and we can get people to lay out here is my feed rations, here is my plans, here is when they are in the field and we can get them to estimate what the dry matter intake is going to be, and we'll go back out and when the inspector is there -- I mean, we already do audits, how much organic hay did you buy, how much grain did you buy, you know,
what is the rest from pasture, yes, when are they out. We can see that. They can keep logs.

So we can get there, but where it's going to get really crazy is, okay, the dry matter intake of this grass, my pasture, is X during the spring and then it goes to Y during the winter and then we have got three months in the fall where it has gone to X minus.

And, you know, I think from the nutritionists' point of view, this dry matter intake isn't just an off the cuff average calculation. The nutritionists are looking at this as really serious, you know, get down to the specifics and really try to get it right and, you know, varying conditions of pasture.

This guy is letting it get this long and his strategy is to quit here because he avoids parasites. Other guys, you know, we see it all the way down to the last inch and they are back out there every time it grows another
inch.

And so, you know, it's just going to be hard. When somebody wants to take that dry matter intake calculation down to a level of detail, it's going to be really time consuming.

PANELIST ZUCK: May I? Well, I'm pretty sure at PCO we wouldn't probably ask our farmers to count how many bites per minute their cows are getting.

PANELIST McELROY: Yes.

PANELIST ZUCK: We could do that, but we rely very heavily on our inspectors when they go out to a farm and they look at the farm as a whole system and they see the grass, they see the cows, they see the condition of the cows, they see the quality of the feed. You know, they are out there and they see the pastures. They see that there is cow paddies in the pastures and that there are fences in the farm, that the cows are out.

And I believe that, you know, this
will be one suggested way to do it. I'm not going to say we would do it this way, but the inspector would go out there and they could, you know, determine whether this farm appears to be meeting that standard.

And in the situation where there was a question or a borderline case or a very, very minimal overgrazed pasture, then we could require the farmer to keep specific records and make those changes to their plan, you know, their plan to improve their pasture or to require the animals to go out on pasture or a situation where there aren't -- it appears that they are not putting the animals out on pasture, we could require very specific records in their Compliance Plan to prove that they are meeting the standard.

But, you know, in 99 percent of the cases the inspectors are going to go out to Pennsylvania Certified Organic Farms and see these cows out on pasture, know that they are out 365 days a year, know that -- you guys
driving around here, you see there is green
green grass out there and they are not really going
to feel compelled to make the farmer prove it.

PANELIST McELROY: Yes, so why get
out the calculator?

PANELIST ZUCK: Right.

PANELIST McELROY: Yes.

MR. BRADLEY: So you're saying
that you could, when setting up an initial
operation, verify that this farm is capable of
maintaining a sustainable system that meets
the standard without having to keep tons and
tons of, you know, burdensome notes by the
farmer?

PANELIST ZUCK: Yes, sort of. The
third leg to that would be when we have a new
applicant, that's a little different because
when the new applicant fills out their first
Organic System Plan forms, we want to know
beforehand if their plan is going to meet the
requirements.

We want to approve that plan in
our office, so we need the information and the
statistical information at some point before
sending an inspector out there, because we
usually do an approval process before they go
out. But on an ongoing basis, the inspector
would be the first line of compliance. That's
just a suggestion. Don't hold me to it.

MS. ROBINSON: I don't know
whether you do this now or whether you would
consider doing it, but when you're about to
certify a livestock producer, not just a dairy
producer but any livestock producer, is it a
matter of course that all livestock producers
in their OSP have a Pasture Plan and they have
to demonstrate that to you, a defined Pasture
Plan?

PANELIST ZUCK: No, not a defined.

PANELIST McELROY: Yes. No, not a
defined Pasture Plan. We get a lot of
information, but we don't really have a
defined Pasture Plan.

MS. ROBINSON: What about
considering that as, you know, just something --

PANELIST ZUCK: I think the pieces are there in most cases and it could be redeveloped to actually call it that. I mean, we do ask how many acres of pasture do they have, you know, how many hours are the cows out on the pasture, how many hours are they inside. So, I mean, there are pieces of it there.

PANELIST McELROY: Right.

MS. ROBINSON: Right, right.

PANELIST STALLEY: In what level of detail are you thinking? I mean, if you're talking about full implementation of an NRCS Grazing Program, I think that might be overwhelming.

MS. ROBINSON: Well, I'm thinking, obviously if you're a livestock producer, according to this regulation, if you are a livestock producer, you better have pasture, right?
PANELIST STALLEY: Yes.

PANELIST ZUCK: Oh, yes.

PANELIST STALLEY: That should be in the plan.

PANELIST ZUCK: That's already in the reg.

PANELIST STALLEY: That's in the plan.

MS. ROBINSON: That's in? Okay. It's in the reg?

PANELIST ZUCK: Yes.

MS. ROBINSON: And the OSP is a farmer's business plan, correct? Every farmer who wants to be organic has to have an Organic Systems Plan. That is his elemental business plan for how he is going to -- and it has six elements and he or she has to have that that says how they propose to, basically, abide by this regulation, manage their operation, whether they are a producer or a processor, how they are going to meet the regulations, how they are going to monitor their operation,
their goals, their objectives, you know, all
the quantitative whatever. I know, Brian,
some of them are loose and pretty --

PANELIST McELROY: Yes. That's not what I have seen in the Organic System Plans.

MS. ROBINSON: I know, I know.

PANELIST McELROY: Yes.

MS. ROBINSON: But suppose if you're a livestock producer, it would seem to me you could and you should have a managed Pasture Plan within that Organic Systems Plan.

I mean, you have livestock. Therefore, you should also have a Pasture Plan that also says here is how I intend to manage the pasture, its physical description and then how I'm going to manage it to accomplish the standards in the regulation, and so how I would accomplish the goals of grazing my livestock and meeting the access to pasture, meeting all of the parts that are already in the regulation, right?
PANELIST McELROY: It's not the way --

MS. ROBINSON: I guess that's too idealistic, right?

PANELIST McELROY: -- the accreditation implementation has gone.

MS. ROBINSON: But there is an idea. You know, I hear a lot about intent.

PANELIST McELROY: The --

MS. ROBINSON: We can't regulate intent, but we could regulate -- I mean, that's concrete and that would give you something to enforce. You don't have a Pasture Plan, you don't get certified.

PANELIST McELROY: Yes. So then do you have to define what the Pasture Plan looks like? Does the regulatory -- does the USDA then have to lay out here is the 10 questions in the Pasture Plan?

MS. ROBINSON: Well, I don't define what the OSP looks like. I would assume that the farmer comes to you with an
OSP and you say this doesn't cut the mustard or it does cut the mustard.

PANELIST McELROY: Right, but now you have got -- well, we have got 96 accredited certifiers. You have got 96 Organic System Plans that you have got to get in the same format and --

MS. ROBINSON: No, no.

PANELIST McELROY: No?

MS. ROBINSON: No. I mean, that's where your flexibility comes in but, you know, you know the reg. You look at it, but you also say for a livestock producer that comes to you, where is your Pasture Plan? How are you going to meet the regulation?

PANELIST STALLEY: I think a Pasture Plan should be part of an inspection as well. I think a lot of that could be verified on inspection. When the producer fills out their plan, they tell us how many acres of pasture they have. They tell us how many cows they have at each stage of
production. And I think if you look at that, you can see if they are within a ballpark where they can meet that.

And then as far as how they are specifically meeting it, I think a good inspector should, if they are doing their job right, find that out for you and put that in their report and that is almost always the case.

And I think rather than trying to figure out what a producer is going to be doing with his farm for a whole entire another year -- because keep in mind that Farm Plan is for the whole year and I have been on enough farms to know that things go in and out the window as the year goes along and plans change. So I really think that will be something better to be incorporated into the inspection report.

PANELIST McELROY: So can I ask a question based on that? If the Organic System Plan has the Pasture Plan and there is no
change in the reg, it's only enforced through
the Organic System Plan, does the USDA
National Organic Program feel like they have
enough regulation to be able to enforce, you
know, grazing on pasture during lactation?

MS. ROBINSON: Yes. What I hear
you saying basically is enforce --

COURT REPORTER: Microphone,
please. I'm sorry.

MS. ROBINSON: I'm sorry. What I
hear you saying is enforce the regulation.

PANELIST McELROY: Well, yes,
okay.

(Applause)

MR. BRADLEY: What you're saying
is the reason we're here is to see how much
pasture is enough and with the 120 days, we
can enforce 120 days with or without the DMI
requirement. We can enforce a DMI requirement
for as many days as they are out on pasture,
but with a number you can do that. Right now
they have access to pasture and that's the
whole problem. I mean, you can say access to
apasture when they open the door at midnight
and I don't think that reflects the spirit of
the rule.

PANELIST McELROY: Right.

MR. BRADLEY: But with a number
you can do that. 120 days, DMI, those kind of
things, yes. And then, at that point, you can
use all the tools that we have been presented
with today, over the past couple of days, as
to how you're going to get from Point A to
Point B in 100 different combinations of ways
without being too restrictive on the amount of
records that they have to keep, but
demonstrate that they have a sustainable plan
that they are clearly a pasture-based system.

You can do that, but the Organic
Systems Plan is where it has to be. Before
you ever go out there on-site, you have to
have a game plan to do that. You have to have
a business plan and, like John said, you can
look at it and see, tell whether or not it's a
real deal, whether it's sustainable.

I mean, you can work the numbers to demonstrate at least a minimum compliance.

And what I'm hearing from all the farmers that are here, that they go way beyond that. For the most part, the people that have adequate access to pasture are going beyond the DMI requirements, the 120 days. Those are minimum.

MEMBER KARREMAN: Can I ask a question? Hugh Karreman, NOSB. With the OSP, that's kind of like the overarching thing and I'm glad if that's possibly enforceable, but we do have to have some, I think, minimums and that is more in the regulation then, right, where we would insert that.

But I know some people that are pretty well-versed in the industry would say that if we took out that access to pasture and we changed it to shall graze during the growing season or whatever the active verb would be, and we take out the exemption for
stage of production and change it to a specific, like they were saying yesterday, sick cows can be off the pasture or very young stock, would that -- taking those two loopholes out, would we be where we want to be for the certifiers to enforce what we're trying to accomplish here in this symposium?

That is my first question. I have another, but so if we take out those two loopholes and add in the Organic Systems Plan, intent and everything, is that going to be enforceable in a court of law?

PANELIST ZUCK: I would say most certifiers I know are enforcing the pasture standard now.

MEMBER KARREMAN: Then how are some not?

PANELIST ZUCK: Because of the -- it isn't being forced against the certifiers.

PARTICIPANT: That's an NOP question.

PANELIST STALLEY: Yes, that
really is an NOP question, I believe.

MEMBER KARREMAN: Then how is it then that some are not enforcing it? How are some certifiers not enforcing it? Is it because of those two supposed loopholes? I'm just wondering. I want to know.

MR. BRADLEY: Mark Bradley, National Organic Program. The problem comes in when they are interpreting the rules, when they are saying what is access. That is where, you know, the flexibility in their mind comes in. So getting a number would get us to having that.

What you're saying about grazing during the growing season, you may run into problems when you have, you know, very arid climates that, you know, there won't be a real grazing season. They are having to operate strictly on irrigated ground, bringing in fjords, those types of things. And that gets to, you know, what do the people want? What do they want that standard to reflect? And if
it's minimum 120 days, then we can work with that number.

MEMBER KARREMAN: And that kind of goes to the second question. There is a lot of factors or variables we can look at, 120 days, 30 percent. We heard three cows per acre. I tossed out eight hours per day during some deliberations in the Livestock Committee meeting and someone else has mentioned percent biomass to do clippings occasionally.

Now, okay, so that's five factors, that perhaps to take into account different geography of the country that could the certifiers or the NOP allow that if there is like two out of the five or three out of the five that are met, depending on your geography and whatnot, would that be okay or would that be giving loopholes?

So let's say you could make 120 days, eight hours a day, three cows per acre, let's just say three of the five factors I have mentioned here that have been tossed
around, would that be enforceable and would that, you know, ensure customer, you know, assurance that the milk is from cows out on pasture? Do you understand what I'm saying?

Options. That's what I'm asking then. Can there be options to choose from?

PANELIST ZUCK: Well, there's a couple of levels. You're asking about whether something is enforceable and the certifier's role is to verify compliance with that. You know, we would verify compliance with those factors, you know, and whether it is then enforceable comes down to whether that -- if that client were to appeal because we denied certification, then it shifts over to the enforcement arm of this reg, which is over there.

MEMBER KARREMAN: Right. I apologize. I probably should have asked the former group, but I did want to ask it at some point during the symposium. But, you know, basically, can you have two out of five
options, three out of five and make it to be certified an organic dairy?

PANELIST STALLEY: I think that's going to complicate the matter, personally. Who gets certified, the guy that makes two out of five, the guy that makes three out of five?

MEMBER KARREMAN: Oh, no, no, no. You say it's going to be three out of five. You got to meet three of these five things at least.

PANELIST STALLEY: I would rather see where you have to meet all of them.

(Applause)

MEMBER KARREMAN: I mean, it would take into account geographic variability is what I'm trying to help you --

PANELIST ZUCK: Well, also, I think that that is a good point because if there is a pasture standard, there would be a list of factors that the certifier uses to demonstrate compliance to determine whether there is adequate pasture and those things
would be listed there, and the goal should be
to meet them all.

And if we do have a producer who
isn't meeting all of them and there is nine
and they are meeting eight, then that is a
noncompliance and they work toward meeting
that other one in the next round of
certification, the next year or the next three
months or whatever period of time we would
allow them to do that.

I mean, that would be one way that
that could happen, essentially require
compliance with all of those factors that you
named but, you know, at least be able to
certify them if, you know, they have
demonstrated the ability to meet those
requirements even if they are not meeting them
right now.

MEMBER KARREMAN: I guess what I'm
thinking about, let's say like Albert where
his intent is fully there. Everyone is saying
that, right? Okay. Okay. But he is going to
get snagged, let's say, or someone like him
by, you know, just if we look at two factors,
that's it.

Whereas, if there were, you know,
four or five to choose from, he may well make
it and he has the full intent there in the
spirit of law and whatnot, but because of
where he is located, it's a little more
difficult. But, gee whiz, you know, he has
got the intent.

PANELIST ZUCK: I did hear some of
the farmers saying -- I brought that up at one
of the meetings we had, you know, whether we
could do either/or, you know? Some farmers,
it might be easier for them to keep track of
the 120 days, so many hours.

Other farmers might prefer to keep
track of the dry matter intake since it seemed
to me that they were tied together, one sort
of equaled the other, and it was brought up
that, well, you know, you could have 120 days
on pasture and not get anywhere near that
percentage dry matter intake.

You know, so that's not my opinion. That was just something that the farmers felt that they had a serious concern that that might be unfair because it would lower the minimum.

MEMBER KARREMAN: Okay. I will finish on this, but this would be assuming that the current descriptions of the pasture, giving nutritive, you know, value to the cows and whatnot, all the soil erosion stuff and whatnot, are still in place.

PANELIST ZUCK: Right. Oh, yes.

MEMBER KARREMAN: Sorry if I didn't mention that.

PANELIST ZUCK: Yes, and I agree with that, yes. I feel that we could manage with an either/or situation.

MEMBER KARREMAN: Okay.

PANELIST ZUCK: Brian?

MEMBER KARREMAN: I don't know if it goes over there.
MEMBER GIACOMINI: Dan Giacomini, NOSB. In regards to the dry matter intake, I work with this on a daily basis and sometimes it takes me months to determine what dry matter intake is. When you're dealing with a situation of someone saying well, no, my cows aren't 1,000 pound body weight, they are 1,100, no, it's not 3 percent, it's 4 percent, my grass is 18 percent not 20, how do you verify that within the time frame of one inspection?

PANELIST McELROY: No, I don't.

PANELIST ZUCK: Yes.

PANELIST McELROY: I don't. I don't want to. I can't. I'm not qualified. You win.

PARTICIPANT: You can't do that.

PANELIST McELROY: Yes, I know. I mean, I hear you. I mean, I have worked with Dan and I have worked with some of the other nutritionists in the region and they have all come to me with some pretty complex scenarios.
PANELIST ZUCK: Yes, I mean, and if there is a standard and we're asked to verify compliance with that standard and we're told how to verify compliance, we'll do it.

MEMBER MOYER: Jeff Moyer, NOSB. In that same vein of thought, would it -- and that is why Hugh just mentioned the idea of biomass cuts. Would it be possible for producers to take cuts every -- even if it's only every 30 days, so you have some idea of what the cows were in. You would have the number of days they are standing out there. At least you would have some idea of whether they are standing on dirt or whether they are standing on grazable pasture.

PANELIST McELROY: I think we can figure out whether they are standing on dirt or grazable pasture without taking biomass every three months.

MEMBER MOYER: But without some sort of documentable number, we are back where we are today.
PANELIST ZUCK: Well, I --

MEMBER MOYER: Unless you can document that they are standing on something that is grazable and how do you measure that and document it, I don't know.

PANELIST ZUCK: I don't really know much about biomass cuts. I imagine somebody has to do it and analyze it and pay for it and all that, but I do say that, you know, still it would be unfair to the 125 certified organic dairy farmers that clearly have pasture, there's no question about it that those cows are grazing pasture higher, 60, 70 percent dry matter intake for pasture, and be asking them to do those sort of tests to prove it. I don't think that would be fair.

PANELIST STALLEY: I would like to take the middle road here if I may. I think the calculation is doable. I think it could be done in the Farm Plan by the producer. I saw the formula yesterday. Is it still out
there? But it's not that hard to calculate it once for the whole year. You have already got all that information. Throw it into the formula, see where it comes out.

And I wouldn't argue with anybody that that's full of holes and there's all kinds of problems with that. Yes, there is lots of problems with that. There is lots of variables in this, but we need something, some kind of teeth or something, that we can do to make sure that -- and, yes, that is very oversimplifying pasture management, but maybe it's a number. It's better than no number.

And it has got to be something that the producer -- we have got to keep in mind dairy farmers need to -- we need to implement something they can do. They already have trouble with the paperwork. Let's not make it harder for them.

PANELIST ZUCK: And we did have farmers concerned that they really didn't know. They were concerned like they are
certified, they are going through their year and then this pasture standard is going to come up to them and they are not going to even know if they have met it throughout the year. They are nervous about that. They want to comply. They want to make sure they can comply and they don't know if they do. We have to keep their point of view in mind as well.

MEMBER SMILLIE: Following up on the easy tool, and I hate to beat the poor cow to death, but would it be fair to say that what I heard from you guys earlier that a clarification, a definition and a stiffening of temporary confinement and the same thing, clarification, stiffening and defining of grazing pasture at all stages of production, is that the route that you three would prefer to go rather than, let's say, the combination of five factors including the 30 percent and the 120 days?

PANELIST McELROY: You know, we'll
go out and we'll enforce whatever gets passed by law and by regulation.

MEMBER SMILLIE: That's clear. That's clear that you'll -- you know, that's our job.

PANELIST McELROY: Yes.

MEMBER SMILLIE: We enforce regulations, but do you think that we would achieve the intent of the law and the intent of what we have heard for the last two days and for the three years, five years, 10 years previously? Do you think that we could do that, enforce compliance to the intent of the law by cleaning up and stiffening those two sections, temporary confinement and grazing pasture at all stages of production?

PANELIST McELROY: I guess --

PANELIST ZUCK: I think it will help.

PANELIST McELROY: Yes.

PANELIST ZUCK: But it's not going to satisfy the needs of, I think, the farmers
in this room and the consumers who are mostly not in this room. I think it would help greatly and it would get us a huge step forward from where we are, but it's probably not where we want to be yet.

PANELIST STALLEY: And I would just like to say that I really think the language needs to be changed. It's not working the way it is now. You know, just set all that other stuff aside. It needs to be changed.

MEMBER CAROE: Andrea Caroe, NOSB.

My questions -- actually, I would like you to comment on something that I see happening. I see that there is actually two factors at work here. One, we have intent which is reflected in plans or the Organic Systems Plan, but then the other part of this is how you implement the plan, which is what certifiers verify. Is it being implemented and is it working?

And so in your role in verifying that plan, in verifying that it is effective,
what tools or what metrics wouldn't be necessary for you to be able to quantify whether that is effective or not and are you concerned? And I think I heard this from you, Brian, that you're concerned with setting those numbers and really being able to be comfortable with somebody that falls below that benchmark and saying, I'm sorry, you're not certifiable.

PANELIST McELROY: Yes. It is much easier to deal with things like fungicide treated seed. It is prohibited. It's a lot harder to deal with 10 percent fungicide treated seed as allowed. You know, it's -- it would, in my mind, and it is a lot easier to deal with cows will graze. They must graze at all stages of production during the growing season. It seems to me that that is a standard and I think we can enforce it.

But I am concerned with a number that individuals can't meet for some regional issue or some specific thing and, you know, do
we start causing people harm at 25 percent dry
matter intake or 35 percent dry matter intake?
So maybe dry matter intake is a range, you
know. Do you want to give us a range? That's
something that's a little easier to enforce
in. I don't know.

Hitting a specific target, you
know, totally off the topic, I think, the
uniform reg was the biggest mistake we ever
made, because we all have to put on the same
jacket. We all have to get inside the box. A
baseline everybody has to get on the baseline,
it's much easier to enforce. Now, if people
want to go above, to the side, below, fine,
let them go, but everybody gets on the floor.

But because we have got this
uniform reg, if you put a number on it, if you
put a number on a uniform reg, everybody has
got to be there and that's a problem.

PANELIST ZUCK: And the tools that
you were speaking or asking about, Andrea, I
have to continue to say that our biggest and
best tool are the eyes of our inspectors.
They are going out to these farms and they --
there is really no question about compliance
on the huge percentage of the farms. And
where there is questionable is where we would
need to have the numbers. And that's why the
farmers are pushing for it, because we need it
for the questionable areas.

PANELIST McELROY: I mean, Andrea
and Joe, you guys are in certification, too.
You've been involved in certification, so you
are as aware as we are of how did we get here.
I mean, this is a public/private
partnership. The public agrees to be
regulated and the regulation is established
for the public interest. If we all figure out
how to make the regulation not quite work,
because we want to weasel word this or figure
out that, then we go back and we apply more
regulation and the public doesn't like being
over regulated.

So the public/private partnership
here is that if we're going to continue to push the limits of the regulation to get whatever we want whatever way we can, then we're going to get ourselves more regulation that we may or may not want. So, you know, there is 90 percent of the milk going through about five marketing points and, you know, those parties are in control of this thing. And if they want to avoid additional regulation, then they can pretty much solve this problem overnight.

(Applause)

MEMBER JAMES: I know we're running close on time, so I'll just skip to one question, even though I have several. First, thank you for your certification expertise and your presentations. I know you are speaking on behalf of a lot of other certifiers out there who may not necessarily adhere to the same principles that your organization stands for.

I want to go back to the comment
about that John you made regarding the regulations not being quite clear enough and I wanted to just read this 205.237(a), "The producer of an organic livestock operation must provide livestock with a total feed ration composed of agricultural products, including pasture." And so even though I understand that you are saying that the NOP should be responsible for reinforcement, I say that this is ultimately going to be a huge issue for certifiers, no matter how it comes out.

And how did we get to the point where with this being very clear, I mean, you know, I'm not a certifier, but it seems very clear to me that there are operations currently not adhering to this, that's why we're here, so how is it that a certifier would not interpret this and look at the Organic System Plan to be held to this regulation that's documented.

PANELIST STALLEY: That's a very
good question and as far as -- I think it comes down to interpretations and there are some interpretations that when I hear them, I can't believe what I'm hearing, seriously.

Access to pasture. Okay. I cut the hay and I brought it across the road and I threw it -- I gave it to the livestock. I fed it to the livestock. They have access to that pasture.

I'm bringing it to them. Now, that's not the intent. But that's a real life scenario from what I understand.

MEMBER JAMES: Okay. Cell phones that go off, you have to buy everybody a drink.

PARTICIPANT: I'm sorry.

(Applause)

PARTICIPANT: That's his reminder that he has to be on a plane.

PARTICIPANT: I have to get on a plane in about 10 minutes, so I have to keep my clock going. I'm sorry.

MEMBER JAMES: Okay. You know, I
raise this because I think it's really a very, very important question to this particular issue and that we will be going around this gerbil cage forever until we figure out how in the world can we get the certifiers to help adhere to obvious --

PANELIST STALLEY: No, I agree and I've been there. I've gone through it and I feel stupid as hell for it. But it boils down to okay, so I gave them access to pasture. Here it is. You never told me it had to be this much or this big or this tall. Yes, that's right. Okay. You gave them access to pasture, but, you know, I think there could be continuous improvement.

Well, how long are you going to just poke me in the side and tell me continuous improvement? Tell me what I got to do. How many acres do you want? How many cows on how many acres? And, you know, looking through the rule, I don't have it. I can't tell you. Well, then I did it. I'm
done. You know, and I don't feel good about it, but there is how we end up in those situations.

Access to pasture, total feed ration. Is the total feed ration average for the year? Yes, generally, in the Organic System Plan we're talking about a total feed ration description that descriptive of the operation, not just today and not just tomorrow, but through the whole year. So we end up with a total feed ration that describes access to pasture, but then you start digging in to it and you find out the dry cows have a lot of access to pasture, that's through the stage of production of becoming a mature animal that can be pregnant, that can be milked. That's all pasture.

You know, there is great pockets. The system as a whole has great pasture access, but then there are these pockets. There is just none any more. And that's how we end up in these things.
MEMBER JAMES: Would it be helpful if the certifiers, all certifiers had a general outline for the OSP that would basically make it very clear what is expected for the Organic System Plan?

PANELIST STALLEY: Yes, I think a general outline on the Organic System Plan all the way from, you know, identifying the parcels all the way through to the end of the materials you use for growing livestock, production and handling and that's, you know, why I have asked that the National Organic Standards Board at some point just survey some of the OSPs that are being used by the Accredited Certification Programs and ask yourself if that tool is really working the way everybody expects it to work. Because my expectation is no it's not working the way you think it works.

MEMBER JAMES: Okay. And I will just add to the access to pasture example that the enforcement depends on the interpretation
of the program, the program's ability to
enforce that. So in other words, if this
producer comes to us and says what John -- the
scenario that John gave where they are just
clipping the pasture and bringing it over and
we deny certification, we say oh, gosh, that
doesn't wash with PCO, that ain't pasture and
they appeal it, then it's up to them to decide
whether they can go forward with that based on
what's in the rule and what, you know, they
have in their tool box. Am I right?

FACILITATOR ANDERSON: Do you have
a question? I do have one question from the
audience and I remind everyone that all these
questions will be scanned. Sorry. I do have
one question from the audience that I would
like to throw in, because I think it's no less
or no more important than others, but we don't
have time for all of them. And all of these
questions will be scanned into the record.

But the question is do we have any
idea of how many farms operations or whatever
they are operating without meaningful access to pasture? Well, that's the back. That is the back. I mean, the original question was does anyone know who prior to OFPA was certifying dairy without access to pasture and the second part is do we know now how many dairies that don't have pasture being certified?

PANELIST McELROY: Well, prior to OFPA, I do not believe that CCOF standards had a very detailed access to pasture. I think it was a very detailed Pasture Program. It was 100 percent organic feed. That was the real focus of and it's why CCOF didn't certify any dairy until the National Organic Program was implemented. But, no, we did not have a Pasture Program prior to the NOP.

PANELIST ZUCK: No, the same answer.

PARTICIPANT: I can't answer that.

FACILITATOR ANDERSON: And I would add the historical perspective to this is that
all of us who were producing and sitting at
the NOSB in the '90s had no access to organic
labeling in dairy or livestock. And so one of
the reasons we are in the dilemma today is
that this is an evolving process where most of
us didn't have experience. I mean, we had our
own experiences and we knew what we were
doing, but it was -- it is an imperfect
process and it's a perfect process, because
it's always going to be evolving and that's
where we are today.

I would like to take just about a
two minute break to change from regulation --
from certifiers to the consumer and thank
these guys very much for coming up.

(Applause)

FACILITATOR ANDERSON: Order or
there will be no lunches. So those of you who
are interested in having lunch, please, take
your seats. If you are not, please, leave the
room.

(Whereupon, at 11:24 a.m. a recess
until 11:33 a.m.)

FACILITATOR ANDERSON: We're now beginning the session marketing expectations and consumer perceptions. We're going to begin with Margaret Wittenburg from Whole Foods Market.

MS. FRANCES: And just a quick comment, yellow cards for market questions. I'll be passing those out.

PANELIST WITTENBURG: All right. Thank you. It has been great being able to be here with you today. I'm a former NOSB member and have a lot of heartfelt thanks for all of you here. I know how much work it is, but it's very gratifying work and a very much pleasure to be part of the audience as well in this really important symposium.

So what I'm going to talk about is the market expectations perceptions. I mean, obviously, you do all this work, all the farmers do the work to get the product according to the organic standards and then...
you have to sell it and that's where the retailers come in. And I am from Whole Foods Market. I've been with the company for 25 years and had my own store in Wisconsin before that for four years. So this is near and dear to my heart and near and dear to the people that work at Whole Foods Market. Many of us have been here in the industry for 20 plus years.

Okay. So what I'm going be talking about are these three main questions. What are consumer perceptions and expectations about organic? What are consumer perceptions and expectations about organic dairy and pasture? And what are Whole Foods Market's expectations as a retailer regarding pasture and organic dairy?

Okay. Well, for several years Whole Foods Market has done its own organic trend tracker. We check about 1,000 customers who represent the American population each year and asked them about their consumption of
organic and things of change and so forth. This past year, this is the fall of 2005, nearly two-thirds of Americans have tried organic foods and beverages and this is certainly a jump from the last two prior years and from just over half.

In 2005, people were saying that 10 percent of them consumed organic foods several times a week, this up from 7 percent in 2004. And 27 percent said that the consume more organic foods and beverages than they did in 2004.

Now, the awareness of the Organic Seal, many of us were anxious to have the Organic Seal, because that was going to be the demarkation for the consumers that they knew that there were consistent standards throughout the country. And we find that there definitely is an awareness of the USDA's Organic Seal, especially among organic users, but even the general public, the GP means general public, even they are aware of the
organic seal.

The impact has definitely had a positive impact on organic users that has increased their purchases, again, that consistency of knowing that the standards are real and make sense throughout all the country. Now, the perceptions of the term organic, you've probably seen this chart quite a few times and, you know, when people are asking consumers about what they think about organic, these are the typical things that come up: No chemical pesticides, no chemicals, natural ingredients, no additives, no preservatives, artificial flavors, artificial colors, not highly processed, better for the environment and so forth and so on.

I think it's interesting that for the general public the organic consumers and the non-users all are pretty much in sync with this. Different percentages, but as far as what's the most important to them, it goes
down the line. And we have also found that there is a real progression of people going from kind of expanding the organic horizons of what they get into.

Stage 1, dairy is definitely that. People who don't even know much about organic know that there is something different about organic dairy milk and we will get into that and find that is one of the first stages of getting into the buying more organic food. But we found that with the organic dairy demanding growing, there is certainly a lot more outlets and a lot more channels that consumers are able to get into.

So now, supply is very short. The current growth demand per year we're finding is 25 to 30 percent. The projected growth with our new supply of organic milk is 15 to 20 percent giving us a projected shortfall of 10 to 15 percent. And we figured this equals about 100,000 cows per year needing to get into dairy each year. And this isn't even
looking at organic dairy ingredients, such as cheese, milk powder, etcetera.

And the organic price premium is real. This is something we did price check in San Rafael in February of this year and you're looking at quite a significant price premium. Consumers are willing to pay that, because they feel that they are getting something special.

Okay. We know that. We know what organic people are looking for in general about organic, but what about pasture? It's a question that people haven't specifically asked and we felt was really important to ask. Within that, we have the -- you know, consumers' concerns are really growing about their food. Food safety, we know about pesticides, antibiotics and hormones. People are very concerned about that.

Animal welfare is definitely an issue, especially with Whole Foods Market consumers and our Whole Foods Market
leadership. Transparency, the source, people want to know about where their food comes from. It's very important to them to have that connection. And then land management and environmental standards is very important as well, looking at land stewardship and sustainability.

There has been a lot of media on organic in general. And just a snippet on organic dairy and I think this is one of the most interesting ones that was in the New York Times in November and they were saying that the ethos of organic milk, one that has cartons reinforced conjures lush pastures and so forth and so on, things that have been brought up before in these past couple of days.

But I think this was an interesting quote that they said, "But choosing organic milk doesn't guarantee much beyond this. It comes from a cow whose milk production was not prompted by an artificial
growth hormone, whose feed was not grown on pesticides and which had access to pasture, a term so vague it could mean that a cow might spend most of its milk-producing life confined to a feed lot eating grain and not grass." So the question that was out there to the consumers, is what is being portrayed, is that really happening?

So we thought let's ask our consumers. Again, how many people have actually been asked specifically about pasture? We felt let's ask. We have a Fl@vors email newsletter that people can opt into. We have many, many, many thousands of people who have opted into that in our 183 stores that we have.

And so what we did is we can send out a survey to our customers, and we did this on just April 12th, this is quite recent, and here is a question that we asked. We said "When choosing organic milk and choosing other dairy products, what is important to you about
the conditions in which the organic dairy cattle are raised? Check all that apply. Spend more time outdoors than indoors; most of their food is from pasture; have access only to the area outside of the barn; have access to the outdoors only on nice days; raised on pasture all year round; have access to the outdoors when they choose; and have access to pasture a couple hours a day."

So the results, in one day we had 18,450 responses. This is an important issue for people and I haven't read what are the highest answers there. Spend more time outdoors than indoors, 60 percent of these people, most of their food is from pasture, 69 percent, raised on pasture all year round, 42 percent, have access to the outdoors when they choose, 51 percent. These are consumers of organic dairy at Whole Foods Market and giving their opinion, and this is just in a chart form where you can see how all that played out.
So we thought, well, let's ask people who are not our customers, so we did the same question in the same week to 1,000 respondents representative of the U.S. adult population, did this online, and interestingly enough the same issues were highlighted. You know, the percentages were different because these weren't organic consumers, but, again, spend more time outdoors than indoors, most of their food is from pasture, raised on pasture all year round, have access to outdoors when they choose. Those were the highest assumptions of people of what organic milk should be and is.

So bottom line for consumers. Organic dairy is considered the gold standard with high expectations. They are paying a lot. They are expecting a lot. Pasture-based year round not simply access to pasture for animals raised organically along with the pasture supplying much of the animals' nutrition is assumed by most Whole Foods
Market and general public as status quo and few can fathom animals from whom our derived certified organic products would have anything less.

Okay. So now, how about as a retailer, what do we or how do we feel about it? Well, we have been real clear about it. In March of last year we gave testimony to the National Organic Standards Board, said Whole Foods Market supports a national organic standard which requires that all ruminant livestock be grazed on pasture in order to allow that livestock to fulfill its natural behavior as closely as possible and to respect the expectations of organic consumers.

September 2005, we put all of our producers on notice and said we believe that organic consumers expect that organic milk comes from cows which are given access to pasture. We fully expect our organic dairy vendors to meet or exceed the recommendations made by the NOSB with regard to the amount of
pasture provided for animals, percent of dry matter intake from pasture and the percentage of time per animal spent on pasture.

Now, within Whole Foods Market the animal welfare is so important to us, we felt we wanted to highlight the producers who are really doing an outstanding job and really focusing on the animal, and also to push the industry knowing that, one, there was a market for this and also just to really encourage innovation to get this moving a little faster.

So we created our own animal compassionate standards, started this in November of 2004, and it is a further enhancement of our already very strict natural animal standards. And one of the prior folks who was giving his talk here kind of referenced that it’s not very easy getting meat in at Whole Foods Market. My team looks at it. We’re on the farm. We’re in slaughterhouses. We’re really looking and we’re asking some very, very pointed
questions.

And my team goes out there and checks to see what they have written us on their verification form actually is true, so we check it out. So, anyway, we have the natural standards and we also wanted to highlight meat that is even that step above. So we will have animal compassion meat as our producers are able to meet those high standards.

You can look on our website, wholefoodsmarket.com, and you can see the current, the ones that we have already done, which is beef cattle, ducks, pigs, sheep. We're almost done with broiler chickens. We're near completion with turkeys and chicken egg layers and dairy cattle are starting -- are going to be done this year. And we know dairy cattle is going to be a tough one, but we know it can be done and I think a lot of the producers today have said that it can be done.
But what's real important for you
to know that on these -- on all the species
specific standards, pasture-based production
is a given. And it's based on what a clear
definition of what constitutes a pasture.
Barns are considered as places to visit for
temporary shelters.

So our guiding principles, when we
create these animal compassion standards, Goal
A is to maximize the welfare of the animal.
Goal B is to minimize cost and maximize
efficiencies. We know that Goal B cannot be
ignored. You have to have people that are
still in business, but we're making it
subordinate to Goal A.

And the biggest tenets that we
have it's animals can practice their natural
behaviors and maintain highest health in
pasture-based systems. We have what we call
the five people in the airport test. We've
got this from Temple Grandin, who we work with
quite a lot, and she says, and I know Temple
does this, when she is on a plane she has got her pictures and she will say to the people next to her on the plane what is this -- does this look like something that you expect? Is this how you think animals should be raised? And she will show them pictures, all, you know, types of pictures.

And we felt that was a really good way of perception is this what our customers are expecting is happening. So we often refer to that as five people in the airport test when we are creating our standards. And these standards, by the way, are multi-stakeholder group. We have animal advocate groups. There we have the producers, our producers of that particular species we deal with. We have animal welfare scientists, literally from all around the world, and many of us in leadership who are very much involved in this.

Then we also created an animal compassion foundation, because we realized that there is a lot of education and a lot of
sharing of information that needs to be done
and that a lot of producers want to do it, but
really don't know how to do it. So we created
this network to be as a portal and also we are
funding a lot of studies on animal welfare
systems and experiments that people can't get
funding for other places.

So for us the big picture, demand exceeds supply. The market opportunity is
growing. Dairy is definitely a key crossover
item for the organic consumers. The organic
consumer expectations continue to grow
including marketing transparency and most
organic dairy producers now are already
pasture-based. And I think we've got to
remember that.

So what is -- our hope is it's
market bottom line. The integrity of organic
dairy standards including a pasture-based
system as requirement is more important than
watering them down to increase supply or keep
prices down.
(Applause)

PANELIST WITTENBURG: The National Organic Standard should ensure that all our farmers provide optimum conditions for their cows, including a standard for pasture be clearly stated in order to assure consumers that their expectations for organic or dairy are being met. A level playing field benefits farmers and consumers. Anything less will diminish the value of organic.

(Applause)

PANELIST WITTENBURG: So the next step as we see it, really support this public/private partnership with the National Organic Standards Board. You know, again, as being a former member and as our company being a strong supporter, the NOSB is similar to us at Whole Foods Market where we look at our consumers. NOSB is for the USDA to really get that pulse of what the country is looking for for organic and should be listened to.

The USDA's pasture advanced notice
of rulemaking and this symposium is fabulous. It is providing the opportunity for all voices to be heard. We need to keep the process moving and have a defined date for completion.

And then, lastly, we should support an approach to livestock rearing standards, including pasture access, that focuses on the animal and then balances consumer expectations regarding organic integrity with workable standards for farmers.

Thank you.

(Applause)

FACILITATOR ANDERSON: Thank you. Thank you, Margaret. It's my pleasure to welcome Maryellen Molyneaux here. Maryellen is the President of Natural Marketing Institute.

PANELIST MOLYNEAUX: Good morning and thank you for the opportunity to address the symposium. I was asked to do some very specific research around these issues that I'm
going to present this morning, just a little bit of background on the Natural Marketing Institute for those of you who are not familiar with us.

We're a strategic business consulting firm and market research company that specializes in health, wellness and sustainability. What truly differentiates us is our databases. We now have over 300,000 consumers in our databases with very comprehensive information on what they want, what they do, why they act, why they don't, what their needs are, etcetera, within all areas of health and wellness and this one was a particular one that we wanted to go into a little bit deeper after some discussions with USDA and Bob Anderson.

Just to talk about the research itself, which I think is very important to give you a perspective on this this morning, because we have heard a lot of comments about what consumers want and we have seen a little
bit of real research from Whole Foods. And I want to start by saying what the objectives were, to really understand from consumers what their usage levels were of specific organic products and specific organic dairy, what their reasons for use are and what the relative importance of the pasture issues are to consumers.

And I do mean the relative importance. And one of the things that we spent a lot of time in trying to delineate, both with my team, my writers, RPHDs that did the analysis and with USDA, was to have an unbiased survey. This is extremely important because you could do qualitative research in this issue.

Go talk one-on-one with consumers, go do focus groups, go talk to them just without any aided questions, without any multiple choice lists and so forth and ask them why they use organic dairy. And I can tell you that I have done before we started
this and I continue to do it. I have done about 50 one-on-one interviews in the process over the last month. Never once, never once did a consumer address the issue of pasture with me until I brought it up.

Their issue atop of mine in qualitative research were antibiotics and hormones. What we tried to do in this research though was to quantify some of these things, because that is really important. You need to have an unbiased survey that is nationally projectable that is going to give you some numbers. So we started with 1,000 U.S. adult population balanced to Census. We included within the survey the identification of organic product users, their frequency of use and specifically organic milk and other organic dairy products.

It was an online methodology conducted between March 23rd and March 26th of this year. And, as I mentioned before, we wanted to get at the relative importance of
pasture, so we used advanced regression analysis in a classification and regression tree to determine the true drivers of frequent usage and I'm going to show you some of that this morning.

So the data that you're looking at at the 95 percent confidence level is accurate to plus or minus 3 percent. Please, remember the plus or minus 3 percent, as I go through the presentation, I'm going to refer you to this so you can see where the different levels of importance are and how different they truly are.

First of all, when we asked consumers what they use, we went across six different categories and the results of this very much agreed with our national survey and our health and wellness trends data. The fresh fruits and vegetables, 44 percent of the population said that they have used them in the past six months. Packaged foods drops to 28. Dairy and milk, organic dairy milk
products, about one fourth of the population, 24 percent. That is in comparison to the 96 percent of the general population that use any kind of dairy products.

Organic personal care drops to 21. Beverages beyond milk, 20 percent, and clothing and linens in a very emerging category at 7 percent. You net any usage and over half the population, about 53 percent of consumers, have used at least one of these organic product categories within the past six months.

When we look at the specific users of organic dairy other than milk and users of organic milk within the survey, we wanted to see what their usage was and what the cross usage of categories is, because we have seen from our other research that these two categories are very important to all organic categories. So you see the general population usage here in the second column, which is the numbers I just showed you on the previous
chart, and then see the difference on the percentage of users from organic dairy users, organic milk users.

Organic dairy and milk users are significant users of other organic categories. It's extremely important what you're doing here today because these are integrated consumers that can affect the rest of the organic industry. And I may get on my soapbox this morning and I'm going to ask you to excuse me, but I get very upset at emails that go around asking for boycotts. It's ridiculous because it will affect the entire organic industry, not two companies. Be aware of how much they use.

(Applause)

PANELIST MOLYNEAUX: These two groups are significant users of all other organic categories. 88 percent, 89 percent use organic produce. Three-quarters use organic packaged foods. Two-thirds use other beverages. 70 percent of organic dairy users
also use organic milk. The same, three-quarters of organic milk users, the 74 percent use other organic dairy.

Over 50 percent of them use organic personal care and almost a quarter of them use organic clothing and linens. They are two to four times more likely to use all organic categories. It's extremely important that you address their concerns and address them correctly and responsibly.

When we look at the users of all the categories that are here, those two columns in yellow are the ones that I just reviewed with you, you can see that we do have some very high usage, cross usage, across categories. So you have category users going across here. So users of organic produce, about 57 percent of them used packaged foods, about a third of them use organic milk. Okay.

The produce user, about a third of them, 36 percent using organic milk, 38 percent using other organic dairy. As you
look again at these two consumer groups in comparison to other consumers, you have got very high usage in comparison and the only other ones that might be more integrated might be users of organic clothing and linen. New emerging categories will present that way.

We clearly see as we look across here produce as an entry category and then packaged foods, and you can see milk really coming down a little bit. But, again, these consumers that use these categories are integrated users of all.

When we look at their frequency of usage, you can see here that users of organic milk and other organic dairy right in the middle there in the white and that light yellow column, have a frequency of about almost 50 percent that use more than once per week.

So in comparison to personal care, clothing and linens, they use them higher, but that makes sense when you think about the
category. If they are going to buy those products, they are the type of products that they will use every day. But organic dairy products are used more than organic packaged foods and slightly more than fresh fruits and vegetables. So, again, it's an important category that is getting frequent usage.

When we look at the general public, and I'm going to show you information by general population and I'm going to show you the same information by organic users, organic dairy users, and then I'm going to show you information by other organic users that don't use organic dairy so you can see the comparisons.

The first thing that is important here as we look at the charts, this is what is important to them. We asked consumers and gave them a long list of attributes to find out what was important when they thought about organic milk and organic dairy products, what attributes were important. So this is top two
box, extremely, somewhat, out of 5. So out of five levels, these are the top two boxes.

The most important thing were no additives, no artificial ingredients. Next was hormones. Next was humane treatment followed by antibiotics. What I want you to see in the yellow bars is that pasture is here at 55 percent. Yes, it's important, but significantly less important than the issues of ingredients and humane treatment.

So as we asked consumers what is important to them, this is the general population. So just note the ranking here and remember that plus or minus 3 percent difference. That's why I'm showing you that these yellow bars at the top are significantly more important to consumers than these two at the bottom.

When we look at organic dairy users you see the same break. Notice the jump in the percentages. You went from 60 percentiles at the top to 87 percents at the
top. This is among organic dairy users. 87 percent say contain no hormones is important. Then it's about artificial additives. Organic feed is extremely important at 84 percent. Same for no antibiotics and 80 percent that the animals have been treated humanely.

That dotted line break is there for you to see the significant difference break. The two items below, pasture and exercise, are of significantly less importance to these consumers than the rest of it. It doesn't mean it's not important to them. It just means that it's less important. So you have 72 percent of organic dairy users that say that grazing in a pasture is important, but remember 87 said hormones and antibiotics and humane treatment.

When we look at these same numbers, and we're going to separate them now by ingredient issues and treatment of animal issues, and I broke this chart, it may be a
little hard to read in the back of the room, but you have got in the green chart -- in the green bar are organic dairy users. In the yellow bar are users of all other organic products who don't currently use organic dairy.

What you see first is that pretty much they think the same with less intensity, the only difference being where you see this little dotted box on those three measures, additives, antibiotics and organic feed. That is where organic dairy users are significantly different from non-users. So these are consumers that are in the category, in the general organic category, but not using organic dairy.

So we have got -- definitely, as we look at the ranking of numbers, we can see that ingredient issues are more important to consumers than treatment of animals and we have seen this pretty consistently. And, again, it's not to say that it's not important
because you could look at the numbers that are at the bottom, 66 to 75 percent even among non-users, and say, well, that's still a significant number to address. But as we look at where these things lie, what we wanted to try and connect within the regression analysis that you're going to see is what truly drives frequent usage.

We looked at those, their frequency of usage, and broke out three groups, the super-heavy dailies, these are the consumers that drink or use organic dairy more than once a day, heavy users that are using one time a week or more, and light users that are less than once a week, and broke out the attributes by ingredients and also by treatment of animals.

As you look at the super-heavy users and the heavy users you can see much higher numbers, first of all, than the light users, which you would expect. You would expect that heavy users have more knowledge,
which they appear to do. Where you see a small capital letter there, that indicates a significant difference. So amongst the heaviest users, they are more concerned about ingredients, additives, anything artificial being added to organic dairy and much more so than the other two groups.

When we look at pasture specifically, both of the heavy groups, the super-heavy dailies and the heavy users, more than once a week, are more concerned, significantly more concerned, and it's easy to see in that number here, than light users, 81 and 79 compared to 55.

But, again, this high number, 93, was really the most concern and that was about additives, any kind of artificial additives, and these would be concerned with organic dairy such as cheeses and things where they might be concerned about someone using an artificial color or flavor, something like that.
As we again took a look at those numbers and we did some regression analysis against frequency of usage, what was determined in the card analysis -- and you look at this as a relative score. It's not a percentage. It's a relative score. So relative to other measures, antibiotics and organic feed are the most significant drivers of frequent usage of organic dairy products. I will say it again. Relative to other measures, antibiotics and organic feed are the most important predictors of frequent organic milk and dairy usage.

It drops off beyond that to hormones and pasture. They drop off in relative importance. They drop down about 16 percent. Again, it doesn't mean that it's not important, but relative to the frequent usage, and this confirmed for me what I heard in qualitative, that in one-on-one interviews it was about antibiotics and hormones and that consumers automatically think about organic
feed.

If you put the issues of pasture in front of them and start asking them a lot of questions about it and what it is and what it isn't, of course they are going to say that animal is to be treated humanely and that animal needs to be outside and that animal needs to have this and the animal needs to have that. We're all pet lovers in the U.S. today and it's a really strong movement.

However, to do it in an unbiased way you need to put it into perspective of other attributes and do the regression analysis to see what truly is pushing frequent usage. For example, what you see here, humane treatment was at a relative score of only 43. It was less than half as important as no antibiotics and organic feed.

That is a number that you can't argue with and you have to take the qualitative with it. And remember that when you talk to your consumers, you have to talk
to them in an unbiased manner to find out what is really on their mind and we can drive anything that we want. And I'll bet if I did this survey today, just because of the email that is being circulated about boycotts, I'm going to get some different answers. So we need to be responsible in what we're putting out there.

As we then took those consumers, the ones up here that said that pasture was important, had a top two box in score on pasture is important to these, to organic dairy, we asked them what it meant and, clearly, it means to be outside eating grass most days at least. 75 percent, 78 percent say outside every day or outside most days.

You can see that this really doesn't make sense to consumers as you ask it. This was the very last question that they got. It was filtered off only to those who answered that pasture was important. So then we asked them what does that mean, and then
you get a very clear answer that it does mean being outside.

So let's have some conclusions. Almost one-fourth of the population has used organic dairy products in the past year. Organic dairy users are significant users of other organic categories. Therefore, any changes to the rulings must be considered carefully to protect all organic categories not just organic dairy.

Almost half of organic dairy users use these products more than once per week. In general, ingredient issues and humane treatment are more important reasons for usage than grazing among organic dairy users. In general, grazing is more important to the daily and heavy users of organic dairy than to light users.

No antibiotics and the use of organic feed are the highest drivers of frequent use of organic dairy followed by no hormones and grazing. And among those who
thought grazing was important, it means to be outside eating grass.

And now I think we can take some questions. I'm going to stay here in case you want to see a chart. I have a feeling it will come up.

FACILITATOR ANDERSON: Andrea?
Andrea, Dan and Julie.

PARTICIPANT: I don't think it will reach.

MEMBER GIACOMINI: I'll go first, then we'll see if it gets down to Andrea. Dan Giacomini, NOSB, specifically to Margaret and Maryellen can comment, please. In your survey, your one question that you had a significant number on was majority of food from pasture.

Was that in the form of lettuce or de-hy or how much and how much confusion with the consumer do you think -- in our discussions being dry matter intake, as percentage of dry matter intake for the last
two days, where does that fit with your numbers?

PANELIST WITTENBURG: Can you hear me on-- is this working? All right. Okay. Consumers are expecting that pasture is the default, that they only go in when it's inclement weather like very bad weather or when they are being milked. So I think that is the key here, is that, you know, they are not thinking of specific percentages. It's just that the default for pasture, the default for the animal is that pasture would be their living conditions.

Does that tell you enough or did you need more clarification?

MEMBER GIACOMINI: I just wanted clarification on whether -- making sure we're talking apples and apples and not apples and oranges.

PANELIST WITTENBURG: Of what is on a pasture or what?

MEMBER GIACOMINI: As far as your
question of the majority of food from pasture, which is at much less of a feed intake rate for pasture than 30 percent dry matter.

PANELIST WITTENBURG: Like I said, the question to the consumer was asking them how they felt pasture worked within an organic dairy system. They weren't -- they were to consider dry matter intake or whatever. Again, their feeling that dairy cows should be on pasture, should be getting a lot of their nutrient value from pasture, it's not excluding supplemental feed. We didn't ask them that, but they are just saying that that's where they expect a dairy cow to be rather than inside.

MEMBER CAROE: Andrea Caroe, NOSB.

I have two questions. One, Maryellen, if you could just clarify. On one of the last charts that you showed, could you clarify that those drivers, those factors that the -- I think they were from your check all that apply on pasture, if you -- okay, those. Those, the
participants that were in that study, were only those that suggested pasture is important? It's on.

PANELIST MOLYNEAUX: The particular question is at the end of the survey and it's filtered off only to those consumers who thought that pasture was extremely or somewhat important.

MEMBER CAROE: So --

PANELIST MOLYNEAUX: What does that mean?

MEMBER CAROE: So do you have the percentage of the overall survey group then?

PANELIST MOLYNEAUX: I would have to go back and look at it. I don't know it offhand.

MEMBER CAROE: But it would be significantly less than this because it's only a small --

PANELIST MOLYNEAUX: Oh, it would be significantly less, yes.
MEMBER CAROE: Okay. So that was one clarification I just wanted to get. And then the other question I have, it appears from your data that unless pasture was put in front of the consumer, they just assumed that cows are pastured. I mean, I think that Joe and Mary Consumer's view is that cows are on pasture and unless you tell them otherwise, they are not going to bring up the issue.

PANELIST MOLYNEAUX: Unless you tell them otherwise, they don't bring up the issue. And, actually, even in many interviews, even when I was only getting antibiotics and hormones -- excuse me, I have a little bit of a cold. As we only got answers in the interviews that it was all about antibiotics and hormones, as we even took them deeper and said, well, what about the animals and how they were treated, the word pasture never came up.

It just -- you know, it was really about organic feed and just in general humane
treatment. Unless I really kept digging and digging and digging, I didn't get to the pasture issue. So while I think that they have some perception in the back of their mind of what these things are and what they see in advertising and so forth, it's not the real reason why they drink and use organic dairy products.

MEMBER CAROE: Okay. So just to clarify, I mean, I don't think this is -- I think this is across the board, organic or conventional, that folks believe that cows eat grass.

PANELIST MOLYNEAUX: They think that their product is healthier.

MEMBER CAROE: Okay.

PANELIST MOLYNEAUX: But when we ask them what that means, they talk about antibiotics and hormones.

MEMBER CAROE: Okay. Then going to that, I don't know if you have any data on this and I want to ask if you have asked this
question, I think consumers probably expect that when it's snowing out that the cows are inside. You know, I mean, the reason I ask this is California has got a campaign through the Milk Order where, you know, it's egregious to have the cows out in the snow and they all go to California.

I mean, it's a popular campaign because consumers don't like the idea of the cows. Did you ask the questions? Did you drill down a little bit and say if it's between pasture and being out in inclement weather, which would you prefer or if it's between depleting the water supply and having --

PANELIST MOLYNEAUX: That's the answer. That's the way we asked it.

MEMBER CAROE: Okay.

PANELIST MOLYNEAUX: Most days in season. We, in this particular research, did not take this any deeper than that.

MEMBER CAROE: I would be
interested to see.

PANELIST MOLYNEAUX: We can do that for anybody that is interested in paying for it. Big group here, you could all share it. Hey, by the way, you all need to say thank you to USDA because they just provided you some very valuable information.

(Applause)

MEMBER JAMES: Bea James, NOSB. Okay. My question is for you. Do you think that most consumers are educated enough to understand that organic should include pasture? With only 3 percent of the population consuming organic and natural foods, how can we make this assumption that 1,000 people is enough to be able to determine that pasture is not important?

PANELIST MOLYNEAUX: It's not 3 percent. That number is wrong. The number that are consuming organic products using is 56 percent that have used any in the past year and in this one it was 53 percent have used in
the past six months, and a quarter of them have used organic milk and dairy.

MEMBER JAMES: No. What I mean is the grocery industry is a $550 billion industry and of that industry about --

PANELIST MOLYNEAUX: About sales.

MEMBER JAMES: -- 3 percent of those people are consuming organic and natural foods, and your survey is only on --

PANELIST MOLYNEAUX: No, your number is wrong. It's 3 percent of sales not 3 percent of --

MEMBER JAMES: 3 percent of sales.

PANELIST MOLYNEAUX: It's 3 percent of sales, not 3 percent of consumers.

MEMBER JAMES: Okay. I apologize, 3 percent of sales. So with that, I guess I just -- my basic question is do you really feel that 1,000 people is enough to be able to make an assessment?

PANELIST MOLYNEAUX: Yes. The answer is yes, yes, yes, yes, yes. Let me
tell you.

(Applause)

PANELIST MOLYNEAUX: We do a survey of 50,000 consumers every quarter. I get the same answers on 50,000 that I get on 1,000 within the realm of accuracy, plus or minus 3 percent. It's plus or minus 3 percent. 50,000 is plus or minus .4 percent and we're within the same scale.

MEMBER JAMES: So you feel that consumers are --

PANELIST MOLYNEAUX: It absolutely is.

MEMBER JAMES: -- educated and they understand what organic means?

PANELIST MOLYNEAUX: I didn't say that. I can show you other research that we have that will show you where the information on consumers, where it's lacking. You can look at -- for example, we test within our health and wellness trend survey organic regulations and organic perceptions and
desires for products, and you can clearly see that the elements that are regulated still are not perceived correctly by everybody, even by heavy organic users. It's getting better.

That's the good news, that it is getting better. Understanding of what the term organic means is important, but let me give you an example of that. You can ask consumers what's important or not what's important, what they want, and they will answer I want foods that are grown or that are processed without chemical fertilizers, without pesticides, 69 percent.

Then you ask them, they don't want artificial additives and it drops into the 50 percent. And then you can ask them another organic regulation that drops into the 40 percent and then you can ask them do you want organically grown foods and it drops into the 30 percent. And the reason that there is such a difference is they don't connect what organically grown means to the regulated
statements. They don't quite get the connection.

And we have been pounding this for quite awhile and OTA gets upset with us now and then, but it is what it is. And you can look at it among organic devoteds, the heaviest users of the category, and all those numbers go up into the 90 percentile. And look at it among temperates or dabblers and it drops into the 50 and the 30s. So you're bringing people along and educating and that's going to be the same thing that is going to happen here.

MEMBER KARREMAN: Question. Hugh Karreman, NOSB. You have a sliding scale here. If you were to ask organic consumers, I mean, it's kind of like breathing. You don't think about it. You know, I mean, cows are out there. They are grazing. That's -- you have to bring it up. But if you were to say do you think organic cows should be on pasture, yes/no, do you think that would give
a different result here?

PANELIST MOLYNEAUX: This is in a ranked scale order. The question that is asked here is in a ranked scale order of what is important to them when they consider organic dairy products. There really isn't a better measure of ranked importance.

And probably, notice that the pasture number is 72 percent among organic users and hormones is at 87, more than likely you would get a similar answer about pasture. I don't think it's going to be a whole lot different than that and the only purpose here was to put it in perspective.

FACILITATOR ANDERSON: Julie?

MEMBER WEISMAN: This is Julie Weisman, NOSB. I wanted to look at the chart that has the regression analysis that puts them with the top being 100 and then working down.

Can you, please, review for me who does this include? Is this the general
population or are these organic users and if it's the organic users, are they the heavies, the moderates, the lights?

PANELIST MOLYNEAUX: This is among organic users and what regression analysis took into account was all of the attribute measures and how they related to frequency. So it's not just the heavy users, it's all organic. So what you do in the regression analysis, it's almost like it's coding one answer against one person and how frequent they are, one answer in one, and you have to put it through the regression to get to it, to get to the relative score and relative rankings.

MEMBER WEISMAN: Okay. And then I had another piece of question, which may be for the program. How can we have access to this information beyond today?

PANELIST MOLYNEAUX: This data will be posted on the website.

MEMBER WEISMAN: And what about
some --

PANELIST MOLYNEAUX:  Just so you all heard that answer?

FACILITATOR ANDERSON:  No, I didn't.

PANELIST MOLYNEAUX:  This data will be posted on the website.

MEMBER WEISMAN:  Thank you.

PANELIST MOLYNEAUX:  Right, all of it.  Say thank you again.

(Applause)

MEMBER ENGELBERT:  Kevin Engelbert, NOSB.  I would like to know why you differentiated between humane treatment of animals and pasture, because I believe consumers assume they are one and the same.

And I also would like you to comment again on the assumption that consumers have -- because every organic milk carton either states that the cows are pastured or it shows pictures of cows on pasture, that they have already made the assumption that that's
where the cows are and that's why they didn't bring it up.

PANELIST MOLYNEAUX: Again, asking relative importance to why you use organic milk and dairy products and why you consider them, we asked humane treatment and pasture and exercise separately because they were words that were being bantered about, phrases that are being bantered about that are important to consumers, and we wanted to see if there was any difference.

What you see in this particular chart among organic dairy users is that humane treatment overall is significantly more important than being in a pasture. Are they still both important? Yes. I will say it again. They are still both important, but humane treatment, no hormones, no antibiotics, organic feed were more important.

There is a lot of different ways to structure research. You could go back in and retest these consumers and ask a whole
other long slew, but USDA didn't have $50,000
to spend, so we did it as to what was really
important to get at and did the regression
against all these to really determine among
frequent users what was driving the frequent
usage.

It's the best way to get at it in
this type of methodology. Can you do it a lot
of different ways? Sure. I can ask consumers
100 different ways and, you know, on some
issues I'll get some different answers.

FACILITATOR ANDERSON: Joe?

PANELIST MOLYNEAUX: Have I --

MEMBER SMILLIE: Question for
Margaret. Joe Smillie, NOSB. What I want to
delve into a bit here is consumer expectations
in the regulation and, you know, as a veteran
of the Organic Twinkie debate, we can talk a
lot about consumer expectations and whether
they meet the regulation or whether the
regulation should try and meet consumer
expectations or that really a lot of the role
of what we need to do is consumer education.

Whole Foods is a leader in meeting consumer expectations and in educating the consumer and you have played that role very well. And I think on this issue I would like to find out, not only for yourself, but speaking for the retail community, how you would strive to affect that balance.

Again, I didn't want to confuse people about talking about the Organic Twinkie, but there's many consumers who do not feel that organic should be certifying alcohol, tobacco or white sugar or white flour and their expectation is that organic food as a consumer, you know, it's a healthy food. And, yet, the regulation, I think, is clearly based on an agricultural methodology, that it's the way you grew the sugarcane to create the white sugar, what the regulation is pinned on.

So in your position at Whole Foods and also your position as a spokesperson for a
retailer and a previous NOSB member, how would you see the retailing community, the balance between meeting consumer expectations, which may not be always accurate, and educating the consumer as to what organic really stands for in the sense of the regulation?

PANELIST WITTENBURG: Okay. Well, first of all, I think we all have to really remember the other big bottom line here of what is organic and I think, Joe, you said it, organic agriculture, the soil. You know, the soil is a really important part of this, the regeneration of the soil. That is the basis of organic and we can't lose that. And I think part of that is then educating consumers more about organic.

You know, we and all the other retailers, part of our job has been to tell people to really define more for them what does organic really mean and really educate them in all aspects of that. That is part of what we do. And what we don't want to have to
do is have to do our own certification work and go out there and make sure that this meets the standards of what we think the intent of organic should be.

I just loved in the previous, with the farmer/producer group, when they said the intent of organic, the intent of having a pasture is the -- at Whole Foods Market we call it the soul, you know, the soul of organic. It has to be there and that's what we're looking for, and I think that educating the consumers what that means is very, very important.

You know, certainly, you know, any marketing study that we have seen for years and years has shown that, you know, the organic consumer, it's all about me, you know, what is my health and all that, but you have to educate them here's what organic is really about. It's the soul of the soil and it's really important to understand that and then educate them about that.
And then part two on that. When you're getting an animal involved, an animal is not a piece of corn. It's a sentient animal, you know, and we really need to understand that. So we have both the soil and the welfare of the animal and really truly looking at the welfare of the animal. What is in their best interest? What would they do on a natural basis? You know, are they going to want pasture? Of course they are.

You know, so, you know, keeping that in consideration and educating our customers about that, too, that's part of our role as a retailer. I know, you know, there's several retailers of us in this room and would say the very same thing. That's part of what our role is. We don't just sell groceries. We also educate.

(Applause)

MEMBER MOYER: I have one quick question, if I could.

FACILITATOR ANDERSON: I think one
more from NOSB and we're going to have to --

MEMBER MOYER: This is going to be a very short question or a very short answer, I hope. in light of what we're discussing here, this question is to both of you.

For those responders to your surveys who did say pasture was an important issue, would the proposed rule change that we have on the table now satisfy them?

FACILITATOR ANDERSON: 120, 30, is that what you mean?

PANELIST MOLYNEAUX: The consumers --

MEMBER MOYER: Yes.

PANELIST MOLYNEAUX: The consumers in the survey do not understand 120 days.

MEMBER MOYER: Right, but would that --

PANELIST MOLYNEAUX: 30 percent. They don't. They really do not have an understanding of that and I would say, based on other research that we have done about
regulations and so forth, that it would take a long time for them to get it. It doesn't mean it shouldn't be done. It just means it's going to take a long time for consumers to understand it.

MEMBER MOYER: Sure.

PANELIST WITTENBURG: Right. I think there again, the expectation is that the pasture is the basis of the animals' living conditions and I think that's the key thing for the consumer. They don't get the percentages and this and that.

MEMBER MOYER: Sure, I understand that.

PANELIST WITTENBURG: They are just going to -- they are going to assume that that is the default and then expect their certifiers to be able to check to make sure that is being done. You know, I think that's the key.

MEMBER MOYER: Thank you.

FACILITATOR ANDERSON: I'm going
to actually call for a close of this, not because there are no -- there are really a lot of very, very good, excellent questions here, but in order to be able to start the National Organic Standards Board meeting on time at 1:00 and make it possible for as many consumer or public input as possible, I'm going to turn the meeting over the Mark for just a second.

MR. BRADLEY: Yes. We would just like to thank all the participants for the pasture symposium.

(Applause)

MR. BRADLEY: We need to be back here in this meeting room at 1:00, so that we can start some semblance of on time. It's going to make kind of a short lunch break, but we have a lot of public comment and we have just a few notes from NOP and the program to get covered.

FACILITATOR ANDERSON: Well, always being one who wants the last word, I do have a couple of comments and I would like to
-- if I could, just some closing remarks.

These have been really dynamic discussions and it has been an excellent process, and I really want to recognize NOP for having the courage and willingness to really come out and seek the answers. This is a long, deliberative process.

(Applause)

FACILITATOR ANDERSON: Remind everyone that actually NOP won't be the ultimate sole arbiter of what this rule looks like, because it will go to the organic, to the Office of the General Counsel. It will go to Office of Management and Budget. So there is a process way beyond even NOP.

And then, thirdly, I, too, want to thank the participants and particularly the farmers and some who traveled from all over the country. And I want to also mention that one of the farmers who is here, just to give you an idea of the passion and importance of this, traveled the shortest distance under the
hardest conditions and Roman and Lucy Stoltzfus are here and their barn burned down two months ago. So just to let you know this is a big, big issue and is very important to people on the land.

And, finally, I want to, to the NOSB, say thank you and to NOP for getting out of dodge and coming out in the countryside, so that there is access to -- so more people have access to these meetings and you have access to more people on the land, so I would encourage you to do it. We did it a lot in the early days. It was the best part of the process for us.

MR. BRADLEY: And, Bob, thank you very much for your role in this.

PARTICIPANT: Yes.

MR. BRADLEY: Excellent job.

(Appause)

FACILITATOR ANDERSON: Meeting adjourned.

(Whereupon, the symposium was...
concluded at 12:33 p.m.)
UNITED STATES DEPARTMENT OF
AGRICULTURE

NATIONAL ORGANIC STANDARDS BOARD

MEETING

WEDNESDAY
APRIL 19, 2006

The meeting came to order in the Ramada Conference Center, 1450 South Atnerton Street, State College, PA, at 1:00 p.m., Kevin O'Rell, Chairman, presiding.

BOARD MEMBERS PRESENT:
KEVIN O'RELL Chair
ANDREA CAROE Vice-Chair
BEA JAMES Secretary
GERALD DAVIS Member
RIGOBERTO PELGADO Member
KEVIN ENGELBERT Member
DAN GIACOMINI Member
JENNIFER HALL Member
HUBERT KARREMAN Member
JEFF MOYER Member
NANCY OSTIGUY Member
JOE SMILLIE Member
JULIE WEISMAN Member

NOP STAFF PRESENT:
MARK BRADLEY
VALERIE FRANCES
BARBARA ROBINSON
DEMARIS WILSON
ARTHUR NEAL
KATHERINE BENHAM
TONI STROTHERS
J.D. MELVIN
PRESENTERS:
EMILY BROWN-ROSEN
GEORGE LOCKWOOD

ALSO PRESENT:
RICHARD SIEGEL
ED MOLTBY
FRANS WIELEMAKER
DAVE MORRISON
CHARLES BLOOD
TOM HUTCHESON
MARK KASTEL
LIANA HOODES
DAVID DECOU
BRIAN BAKER
JIM GARDINER
GRACE MARROGUIN
JIM PIERCE
SALLY BROWN
ERIC SIDEMAN
JOSEPH KRACZYK
TOM KIMMONS
SARA FLACK
NICOLE DAHNE
JIM RIDDLE
LISA McCORORY
KIM DIETZ
LESLIE ZUCK
BLAKE ALEXANDRE
RICK SEGALLA
KATHIE ARNOLD
STEVE PECHACEK
ZEA SONNABEND
DIANE GOODMAN
JORGE GASKINS
RICHARD MARTIN
LYHNN CLARKSON
BECKY GOLDBURG
KELLY SHEA
PAUL STALLEY
ERIC BREMER
JENNEKE DEJONG
GEORGE WRIGHT
CALL TO ORDER
Remarks: Kevin O'Rell, Chairperson.........4
Introductions ..........................6
Approval of Agenda .....................16

Aquaculture Working Group

NOSB DISCUSSION AND VOTE ON ACCEPTANCE OF
REPORT ........................................157

PRESENTATION ON STATUS OF PET FOOD TASK FORCE
Emily Brown-Rosen .........................158

CONTINUATION OF PUBLIC COMMENT SESSION ....

NOSB DISCUSSION AND Q & A
CHAIR O'RELL: Okay. We would like to call the meeting to order, the NOSB 2006 meeting at 1:20 called to order. I would certainly like to welcome the public to the meeting and thank everybody for the good turnout. Certainly the Pasture Symposium I think everybody was very excited and thought that was well planned.

I thank the USDA and OP for planning that along with the Livestock Committee. Mike Lacey, who is not here today is chair of the Livestock Committee, did a lot with Hugh Karreman running the committee in preparation with the NOP for the symposium that we just had for the last two days so I thank them.

Just a reminder, everybody on cell phones if you have your cell phone, turn it off, please, or turn it on vibrate. Or if it goes off and you want to buy the Board a beer
or drink after the meeting, that would be fine, too.

We have two sign-up sessions for public comment. The public comment for today the sign-up sheet for that is closed. There is a sign-up sheet in the back of the room for Thursday's public comment period. If you did not make it on today's public comment sheet, you have the opportunity to sign up for Thursday.

We have 13 of our 14 members here today at the Board. As I had said, Mike Lacey due to a personal conflict is not available. I would like to welcome the five new members and we will do this formally because we have a little certificate to give them from the NOP so we will call your names out and give you a certificate in a minute.

I would also like to welcome Valerie Frances, our NOSB executive director. You can identify her. She was the card-runner during the symposium.
It's really nice to have Valerie in her position. She has been getting engaged in all of the committee calls and there has just been a deluge of work that has been put on her plate. I just complement her for the way that she has handled that.

I would like to thank the NOP staff for making all of the arrangement and preparing the meeting books. Particularly Katherine and Toni. Thank you very much.

We realize we have a long public comment period today. It could be six hours plus so we are going to try to move things along rather quickly. In terms of introductions, I would like to go around the table. Rigo, we'll start with you and just tell a little bit about who you are, who you represent, what segment you represent on the NOSB and where you're from.

I would ask maybe the new members to go into a little more detail. Give a little bit of background on your organic
experience since this is the first time that you will be coming through introducing from a Board position.

Rigo.

MEMBER DELGADO: Kevin. My name is Rigoberto Delgado. My user-friendly name is Rigo. I'm representing producers. I'm a small farmer in West Texas. We grow cotton, alfalfa, sorghum, and we are being extremely successful with goats lately. We also have some chickens. Thanks.

CHAIR O'RELL: Thank you, Rigo.

MEMBER MOYER: My name is Jeff Moyer. My full-time job is farm manager for the Rodale Institute here in Berks County, Pennsylvania so I didn't have to travel too far to get here. We raise a variety of crops. We are predominately a grain-producing farm and forage. We have no livestock on site. We also produce apples and vegetable crops.

I've been at the Rodale Institute for a little over 30 years now. Most of my
expertise is in weed management, cover cropping systems, and compost facilities. I also have a 17-acre farm at home. There it's mostly horses for my wife and daughter, beef cattle for my son and I, and a lot of work for all of us. It keeps me broke.

MEMBER OSTIGUY: My name is Nancy Ostiguy. I'm probably the person that traveled the shortest distance. I live all of maybe three miles from here. I'm in the entomology at Penn State doing research on honeybees. Some of my students may be running around here. I teach an environmental science course in the spring and they were told that they could get extra credit if they showed up. I told them that the public comment period would probably be the most interesting to them and I told them because I think it's the most interesting.

MEMBER SMILLIE: My name is Joe Smillie. I'm the Senior Vice President at Quality Assurance International which is an
accredited USDA certifier. My seat on the Board is to represent certification agencies. I look forward to doing that. Both private and state certification agencies and state organic programs.

My background, I was a back for the land farmer and I farmed in rural Quebec for 15 years until I went broke. Then I became a compost consultant and ran a small supply company selling liquid seaweed and working on compost. I got involved in organics as an inspector and help found the International Inspector's Association and worked as an inspector for a number of years.

I then got involved with the Organic Trade Association. I was a founder member of the Organic Trade Association and a past president until I became a full-time certification person. I also moved to the United States and live in Vermont and I'm a U.S. citizen. Immigration laws being what they are now I'm glad I'm a citizen now.
Basically my function on the Board is to look at things from the perspective of a certification agency.

The last two days, of course, today and yesterday, were very interesting in that regard as regulations often enforce things that sometimes we don't intend. I think one of my roles here is to really point out that regulations have ramifications and it's really important to think them through before we take them to the lawmaking process.

MEMBER JAMES: Bea James. I'm from Minneapolis, Minnesota and I hold the retailer's seat here on NOSB. The company that I currently work for is called Lunds-Byerly's. They are a gourmet upscale grocery chain.

I'm also currently my first meeting where I'm Acting Secretary and I have big beautiful shoes to fill from Goldie who was nice enough to come to this meeting and who was Secretary before me.
CHAIR O'RELL: I'm Kevin O'Rell and this is my fourth -- completing my fourth and into my fifth year on the Board. I represent the handlers from the seat side of the Board. I have been in the organic industry for over 10 years in product development and regulatory and operations. Recently I had a business change which left me a ski bum and I have spent a lot of time with my family for the last couple of months which has been really good, and doing a lot of NOSB work.

MEMBER CAROE: Hi. I'm Andrea Caroe. I hold the environmental seat. I've been on the Board since 2003 so I have two full years left. I am from San Diego and I am the Certification Director of Protected Harvest which is a best management practice labeling program for crop specific standards in conventional agriculture. I am presently Vice Chair and Chair of the Certification Accreditation and Compliance Committee.
MEMBER DAVIS: My name is Gerald Davis. I'm a grower representative from California. My background is working in organic vegetable production as well as tree fruit production in my past. Currently I work for a large family-owned care and organic vegetable producer in California. I started last year on the Board so I'm pretty new. I look forward to tackling some of these issues that we're working on.

MEMBER GIACOMINI: My name is Daniel Giacomini. This is my first year on the Board. I'm from California in the San Francisco Bay area and I'm on the Board as a consumer in the consumer position. I do work as a nutrition and management consultant for dairy farmers, mostly in northern California. I'm happy to be serving at the pleasure of the Secretary.

MEMBER ENGELBERT: Hi. My name is Kevin Engelbert. I'm from Nichols, New York. I operate a certified organic dairy farm. I
have been farming organically for over 25 years. I served on the NOFA Standards Board for a number of years.

I would like to go on record as thanking my three sons who have agreed to take over the workload necessary for me to be able to serve on this Board. Only those of you that run a dairy farm know just how much that represents. I am very grateful to them. I am very thankful to be appointed to the Board and I'm looking forward to it.

MEMBER KARREMAN: My name is Hubert Karreman, veterinarian down in Lancaster County, Pennsylvania. I'm glad we have three Pennsylvanians here on the Board at this meeting in State College. It will only happen here once. I work with certified organic dairy farmers down there in Lancaster, about 80 of them, and they ship to four different shippers, I think, or processors.

As Roman pointed out earlier, it is quite true that a lot of my herds are quite
healthy and so as my -- I have been in
practice 10 years and as my workload decreases
some, it helps me go out and teach a lot of
natural veterinary medicine to other groups.
I look forward to teaching veterinarians in
other areas of the country now more and more
and that is what I have been gearing up to do.

MEMBER HALL: Hello. I'm Jennifer
Hall. I am grateful to be a new member of the
Board. I serve as executive director for
Chefs Collaborative nationwide which is an
organization, a nonprofit that works with
restaurants to source local and organic
ingredients. I'm serving as a consumer rep
based on educating our population as well as
the diners.

We are interested in what is being
served to them. I've had the good fortune the
past few years to also serve on the advisory
board for Washington State Organic Program and
so have been with Miles and that crew and have
been educated through that process
fortunately. I did also participate in a processor handler certification training a couple of years ago to get myself more educated on the process.

CHAIR O'RELL: Thank you, Jennifer. Sorry, Julie.

MEMBER WEISMAN: No, my fault. I missed my cue. I'm Julie Weisman. This is my second year now on the Board. I am grateful to have survived my first. I have a handler position on the Board. I am the chair now this year of the Handling Committee. I'm from New Jersey where I'm involved in making organic vanilla and other organic flavors. I have been involved in the organic industry for 10 years now. I can't believe it.

CHAIR O'RELL: Thank you, Julie.

In the interest of time, I'm going to go rather quickly but I did want to just point out some -- oh, introductions of NOP for the record.

Introductions.
MS. ROBINSON: Barbara Robinson, Deputy Administrator for Transportation and Marketing Programs, USDA.

MS. WILSON: Demaris Wilson, Assistant Deputy Administrator for transportation and marketing programs, USDA.

MR. BRADLEY: I'm Mark Bradley, Associate Deputy Administrator, National Organic Program.

MR. NEAL: Arthur Neal, Director of Program Administration, National Organic Program.

MS. BENHAM: Katherine Benham, advisory board specialist, USDA.

MS. FRANCES: Valerie Frances, Executive Director, National Organic Standards Board.

MS. STROTHERS: Toni Strothers, Ag Marketing Specialist, USDA National Organic Program.

CHAIR O'RELL: Thank you.

MR. MELVIN: One more. J. D.
Melvin, National Organic Program, USDA.

CHAIR O'RELL: Behind the big computer I couldn't see it.

Just some brief comments on work of progress that the Board has completed since November of 2005 meeting. Certainly the Livestock Committee was very busy in working together to give recommendations, finding panelists, and moving those on recommendations to the NOP for selection for the panelists that you saw at the symposium for the last two days so their work was very busy.

The Board has completed the sunset review of all materials so at this meeting we will conclude and have recommendations, at least from committees going to the full board, of all materials that were needed to be sunset. We have met that timeline and I am sure there are some materials on there.

I know there will be some lively discussion and debate and we will hear from that in public comment. The committees will
have an opportunity after that to absorb that public comment before they make final recommendations to the full Board. That's the good news.

We have interim final report from the Aquaculture Working Group that will be presented, an update from the Pet Food Task Force. We have a recommendation on commercial availability as well as a couple of other discussion items, one along the lines of synthetic/nonsynthetic.

Before we get into the agenda are there any announcements by any other Board members? Okay. Hearing none, let's turn to in our books the agenda. In our agenda, before we have approval of the agenda, we do not have the Secretary's Report in there. That was overlooked so we are making a recommended change that just following this introduction period that we will go right into the Secretary's Report that will be given by Bea so that is a change to the posted agenda.
The only other proposed change but it's to accommodate some six hours of public comment that we have is we will try to stay on track and at 2:00 begin the opening session for public comment. We will take that to 4:00, have a brief break, come back at 4:15 which is the scheduled time for the presentation of the Aquaculture Working Group Report by George Lockwood, and then we'll have NOSB discussion and vote to accept that report. Then we will go into a brief presentation.

Emily Brown-Rosen will lead us through on a status report of the Pet Food Task Force. Then we will go back into finishing up public comments. We have to stick to some of the timelines that we have in the agenda, but yet we want to allow for the public commentors that have signed up. With those agenda changes, I would entertain a motion to approve the agenda.

MEMBER OSTIGUY: So moved.
MEMBER CAROE: I second.

CHAIR O'RELL: It's been moved and seconded. Any discussion? Hearing none, all those in favor aye.

ALL: Aye.

CHAIR O'RELL: Opposed? Okay. We officially accept it. The agenda for this meeting and the next item up then is Bea with the Secretary's Report.

MEMBER JAMES: The Transcripts from the last meeting, November 2005, and August 2005 are posted on the website. They have not been -- the minutes need to be formed from those transcripts for approval and we hope to have that accomplished so that we can officially vote on accepting the minutes for the October meeting.

Executive Committee conference call minutes have been posted and voted on by the Executive Committee for January 10, 2006, February 10, 2006. We have also posted the -- not posted March 11th but the Executive
Committee has voted and passed those minutes. We had Executive Committee call on April 14 and those minutes have not been posted or passed.

CHAIR O'Rell: And that's your report?

MEMBER JAMES: And that's my report.

CHAIR O'Rell: Okay. Thank you, Bea.

Next item on the agenda we would like to welcome the five new members. I think, Barbara, you have some certificates. I don't know how you want to do that, call out their names individually.

MS. ROBINSON: I thought I would recognize the outgoing Board members.

CHAIR O'Rell: Oh, outgoing. Well, I didn't know if you wanted to do in or out first. I'll let you make that decision.

MS. ROBINSON: The outgoing Board members are present. If you wouldn't mind...
coming up front. We have five Board members.

          CHAIR O'RELL: I know Jim was
          here. I saw him. Oh, there he is.

          MS. ROBINSON: So we have plaques.
          Each of them say, "Certificate of
          Appreciation presented to -- they don't all
          say Jim Riddle, by the way. Maybe in your
          case they should -- for five years of
          dedicated services as a member of the USDA's
          National Organic Standards Board, January 2001
          to January 2006."

          MR. RIDDLE: Thank you.

          MS. ROBINSON: Thank you very
          much.
          George, thank you very much. Goldie, thank
          you very much. And David, thank you. Take
          care. Thank you very much. We have one more
          for Rose but she couldn't make it. Oh, we get
          to retire your name plates. There you go.
          That's important. Okay. Thank you very much
          for your years of service.

          PARTICIPANT: It was a privilege.
CHAIR O'ReLL: And thank you from the Board as well. We have appreciated serving with you.

MS. ROBINSON: We have new members of the Board. Oh, the old new members. We have old new members and we have new members. This is a certificate of appointment presented to Rigoberto Delgado with appreciation for accepting the call to serve the nation and the United States Department of Agriculture as a member of the National Organic Standards. It's signed by Secretary of Agriculture Mike Johanns. That's your letter of appointment.

Julie, where are you?

CHAIR O'ReLL: We're a year behind in giving those.

MS. ROBINSON: We are a year behind in getting some of these. These are old new members -- I mean new old members or whatever you are. I'm sorry. Bea, where are you? Thank you very much. And Hugh. There
Now, for the most recent appointments to the Board.

CHAIR O'RELL: Now for the true new members.

MS. ROBINSON: The true new members. Again, with appreciation for accepting the call to serve the nation and the United States Department of Agriculture, Dan Giacomini. Thank you very much. Welcome to the ride of your life. Kevin, where are you? Thank you very much and welcome. Jeff Moyer, welcome aboard. Jennifer Hall. Joe Smillie, thank you very much. Okay. I won't take anymore of your time. You have a full day ahead of you.

CHAIR O'RELL: Thank you Mark and Barbara.

We are going to have a brief update from the NOP Program. I believe, Mark, you're --

MR. BRADLEY: Am I up to bat?
With so much going on we could go on for about 20 or 30 minutes or even a couple of hours about the activity that is happening with the NOP but there's just a few things that have been significant with the staff itself.

We have already done introductions but since there has been a bit of shuffling of activities and responsibilities for the NOP staff, I would like to kind of go down the line and explain who your contacts will be, who the people that will be responsible so that if you call into the program and you need some information or you have some information, you will know who to contact.

Shannon Nally with our Compliance staff was here earlier in the day. She just took off. She was on a pretty short time string but she came in and she was here for the Pasture Symposium. It's an excellent learning process for some of the compliance officers, although she is very knowledgeable in dairy anyway but to see the impact and the
nature of the comments that were taking place was good for her and we are trying to get more NOP staff into the field. That was one of our major focuses on trying to have this meeting outside the beltway to get out into the real world and see what was going on and giving you an opportunity to come in.

Down at the far end of the table, I'll start down on that end, J.D. Melvin, he has recently joined out staff from the Process Products Branch. J.D. has been acting as the accreditation manager and has been fully functional in that position since September. Most of the certifiers that are here have developed a good working relationship with J.D. He is very good at answering questions, very knowledgeable about the program already.

If any certifiers or potential certifiers have questions about what the process is for accreditation, what the status the status of their accreditation is. J.D. would be an appropriate contact on that.
these folks can be reached at the NOP's normal phone number in D.C. It's posted on the Internet.

Next to J.D. is Toni Strothers. Toni has taken on some recent responsibilities, primarily in charge of communications. There is a tremendous amount of reporting that has to be done to the program through the budget process. All of our appropriations reports have to be pretty much handled through a single person who is knowledgeable about the status of any particular part of the NOP activities.

Toni is our most senior person on the NOP staff. We are absolutely thrilled to be able to retain her for as long as we have. She would be a good contact if you have questions about anything concerning regulatory process. Anytime we have reg work that comes through the program she is responsible for putting it in -- checking over the format.

She works with clerical folks to
make sure that everything is in the right spot, that it goes through the right channels, that it gets out on time. Toni was recently recognized for her work in getting the Pasture ANPR out the door, through the process, and making sure everything was available for you to review before we came to this meeting so that was a great job on her part.

Next up to bat is Valerie Frances. Many of you have seen Valerie working around the meeting room. She is the new executive director of the National Organic Standards Board. Her arrival had been long awaited. We were just absolutely thrilled to have her come on the staff, to be able to get someone, steal them fair and square from the Maryland Department of Agriculture.

We specifically looked for someone who is involved in the organic community that had the experience, can relate well with certifiers, is an organic consumer herself. She is a true believer in organics and we are
looking forward to her taking on even more responsibilities and becoming deeply involved in the program so that the liaison between the Organic Standards Board and the program is very efficient and there is always a good place for them to camp their comments or to seek a collaborative effort with the program. She will be our person that is going to be responsible for a lot of the interaction between myself and Barbara and the rest of the program staff and the Board.

Second to my right is Katherine Benham. Most of you know Kat because she's been handling the Board meetings ever since I can remember. She has been doing a great job with them. She is responsible for us getting this great room. It's really proven to be -- her experience has really paid off for the program.

Valerie will be taking on a lot of her responsibilities as far as the coordination with the program. Katherine has
been recently promoted. She will be handling budget analysis for the program and she will be handling all NOSB finances. She is the money person. If anybody owe any money, she is kind of the person you can go to.

Next to my right is Arthur Neal. Arthur has been a mainstay in the program as far as working with the Board and having activities for making sure that the process is followed. Arthur's function for working with the Board will become less apparent as Valerie will be taking over a lot of those responsibilities.

Arthur is a primary contact for work with Codex Alimentarius Commission. He is going to be handling a lot of that with J.D. Melvin. J.D. will also be working with international. I'll be taking some of that responsibility as well so we will have a little bit more depth.

Keith Jones, who is on a temporary detail to Capitol Hill, worked with a
legislative fellows program and is not available to handle the international work for us right now. I know there has been a lot of concern in the organic community who is going to fill those big shoes. J.D. and I with the assistance of Arthur will be the primary contacts for that.

Demaris Wilson is the Associate Deputy Administrator and an indispensable part of the program. She keeps me out of more hot water than I even know I get into. A lot of the work that comes from Barbara comes to me through Demaris. I consider Demaris my boss as well as Barbara. Then there's Barbara.

MS. ROBINSON: Don't go there.

MR. BRADLEY: As far as the NOP update, the only thing of significance, I mean, we have all the regulatory work that's happening. You see that a couple of critical things have been posted. We have the Harvey reg work that is going to be posted as soon as we can get it through the lawyers. That will
be the first thing. Check it closely.

Comment once, comment often.
Actually, I think a lot of the comments that will be handled through the ANPR for pasture and for the Harvey rulemaking will be fairly straightforward. I think we've got a lot of good work that we can do based on the information that we are getting from this meeting and the clear direction we have from the courts on the Harvey regulatory changes and with the changes to OFPA. Those are the things that are right on our front burner.

Another thing that has been -- we have been approached by the program -- by the industry and for many of the certifiers is to start making public compliance actions. These would be final actions that have been through the process when someone has had their certification suspended or revoked and it has gone through the appeals. It's a done deal. At that point we are going to start making that information available to the public and
Another aspect of those types of actions would be certifier actions. We've had some certifiers that have left the fold. They've decided to -- I believe we've had four or five of them that have decided to voluntarily surrender their accreditation. Not so much because they were doing wrong but they were just not administratively able to handle it.

Those types of actions, of course, are available on the website. As for the website itself you will expect to see something probably within the next six weeks. The format changes will be complete for our website. Hopefully it will be more user friendly. I know our webmaster has worked closely with the program and has pursued me often and diligently as far as trying to nail me down to make the recommended changes.

Those are complete and as soon as that process is done for posting it, you will
be able to see a remarkable change in the website and hopefully it will be for the better. If you have any comments or questions from any of us, we will be available for the rest of the week.

One thing that will happen on Friday we are having a certifier meeting billed as a training session. That meeting is strictly for accredited certifiers or applicants for certification. We have also invited the Board members to attend that as part of their learning curve to try to jumpstart their understanding of how we are implementing the regulations. That's this Friday and, again, it's for certifiers only. If you have questions, we'll be floating around. Anything else? We're good. Thanks a lot.

CHAIR O'RELL: There's a couple of questions.

Hugh.

MEMBER KARREMAN: Yeah, I just
have my usual question for the National Organic Program. What is the status of the docket for the beloved troubled 12 livestock materials?

MR. BRADLEY: Those are -- we had some work done with those. We had to do some edits with them based on collaborating with EPA and FDA on that. Those went back to the attorneys. They will be available just anytime really.

MEMBER KARREMAN: Just one quick follow-up. Are they at the actual last stage?

MR. BRADLEY: The last stage of the last stage.

MEMBER KARREMAN: Okay.

MR. BRADLEY: They have been to OGC three or four times just trying to make sure that everything is exactly right with them. I think the notation is in there that we had collaborated both with the EPA and the FDA. We are the last changes that would need to be made.
CHAIR O'RELL: Julie.

MEMBER WEISMAN: I had a question along similar lines as chair of the Handling Committee. I was wondering if you could give us an update on the federal notice for parasitic acid and for activated carbon.

MR. NEAL: That particular docket is in a similar state due to the fact that we've had the ANPR for the past year ruling and we've got the Harvey document. We've got some serious timelines. As we expressed yesterday, we're not the only agency or program area that they are handling so we are hoping that after this meeting they can begin focusing on those dockets again.

MEMBER WEISMAN: Thank you.

CHAIR O'RELL: Any other questions? Thank you, Mark and Arthur. We are going to go into -- we are actually on time, two minutes early. We are going to start the public comment session. Before we do that, I'm going to read from the NOSB
policy manual, the policy for public comment
at NOSB meetings.

All persons wishing to comment at
NOSB meetings during public comment periods
must sign up in advance. Persons will be
called upon to speak in the order they sign
up. Unless otherwise indicated by the Chair,
each person will be given five minutes to
speak. If you are coming to speak for your
five minutes and you have a proxy, will you
please come and tell us you have a proxy at
that time so that Bea when she's keeping your
time can set you for 10 minutes.

Persons must give their names and
affiliations for the record. A person may
submit a written proxy to the NOP or NOSB
requesting that another person speak on his or
her behalf. No person will be allowed to
speak during the public comment period for
more than 10 minutes. Individuals providing
public comment will refrain from any personal
attacks and from remarks that otherwise impugn
the character of any individual.

We'll start off with Richard Siegel and on deck would be Ed Moltby.

MR. SEGALLA: I'm Rick Segalla from Connecticut.

CHAIR O'RELL: No, Richard Siegel. That was close. That was a good try, though.

MR. SIEGEL: At least he's not Steven Segal. I'd be in rough shape.

My name is -- good morning -- good afternoon, ladies and gentlemen. My name is Richard Siegel and I'm a lawyer in Washington, D.C. I have the pleasure of coming before this Board frequently. I'm especially happy to be here today because my hometown is only 30 miles from here, Lewistown, Pennsylvania in Mifflin County. This is a very happy coincidence that the Board is meeting here.

The paper that is being passed out today, and I'm just going to be very brief because it's a very brief paper. The Crops Committee made a recommendation at the August
2005 meeting for a number of measures whereby the program could increase the level of enforcement and scrutiny on organic seed.

As a result of these recommendations, the American Seed Trade Association, which is a 700-member association that represents the entire U.S. seed industry, has adopted a resolution commending and supporting the NOSB in its attempt to propose to the Department some very worthwhile measures for the organic seed requirement.

This is a brief letter which was sent to Mark Bradley on April 11th by the President and CEO of the American Seed Trade Association, Mr. Andrew Levine. I just wanted to make sure that each member of the Board saw this current development and to know that what you do here on organic seed has been recognized and commended and supported by the entire -- a group speaking for the entire seed industry of the United States. This is a very
brief letter. It speaks for itself and I do not have to take anymore of your time but I appreciate the opportunity to bring this to your attention. Thank you.

CHAIR O'ReLL: Thank you, Dick.

Ed Moltby and on deck is Frans Wielemaker. Ed, I believe you have a proxy so you have 10 minutes total.

MR. MOLTBY: My name is Ed Moltby. I'm the Executive Director of the Northeast Organic Dairy Producers Alliance. I would like to introduce the Vice President, Steve Johnson -- Dave Johnson to speak on behalf of Steve Morrison who can't be here because he's busy farming in Maine in some beautiful pasture.

MR. JOHNSON: Thank you, Chairman, Deputy Administrator of the USDA for the privilege of speaking today. My name is Dave Johnson. I'm not Steve Morrison but I am a dairy farmer, organic dairy farmer from here in Pennsylvania.
Steve apologizes for not being able to get all the ducks lined up to be able to get away from the farm and speak this morning. I guess I'll speak both on behalf of him as the President of Northeast Organic Dairy Producers Association of which I am also the Vice President so the second in line to give our official statement. I would also like to just speak as a dairy farmer in general and express some of the concerns and things that we see as important to our industry.

First of all, a little bit about the Northeast Organic Dairy Producers Association. We frequently refer to ourselves as NODPA. It represents about 500 organic dairy farms in the northeast. We also cooperate with some parallel organizations in the midwest and on the west coast.

Our primary purpose is to support consumers and producers who believe that organic milk comes from dairy cows that have
been organic since birth, that have access to quality pasture during the grazing season. We understand and strongly believe that milk that comes from cows that are not advertised as such really fail to fully meet the USDA certified organic standards.

We are aware that the dairy industry has been growing at record rates both in terms of supply and demand for the products. During this period of rapid expansion the National Organic Program was implemented and the USDA took oversight for the certification process. Of course, the thing that we had all hoped for and the goal of this nationalizing of the organic standards was to assure that consumers were getting what they paid for regardless of the state of origin of the product.

It was in an effort to level the playing field for producers and bring all farms up to the same basic standard level of what organicness means, if you will. I guess
in some ways it just hasn't quite worked the way we had envisioned. Otherwise, I don't suspect this symposium would be taking place some better than 10 years after the standards were first written.

Milk from all kinds of farms with and without pasture systems and with various replacement animal programs is being certified as organic and different certifying agencies are interpreting and applying the organic standard quite differently. Some are allowing producers to help keep milk cows in feed lots and replace them with heifers that are started and raised on conventional operations.

Other certifiers are requiring that animals have access to well-managed pasture for dairy cows, all replacement animals, and to be raised organically from trimester of birth. NODPA's primary responsibility is to out farmer members in the northeast and to our organic dairy farmers nationwide. As part of that we have a certain
obligation to deliver a quality product to consumers.

It is in all of our best interests to abide by and maintain the strong standards consumers have come to trust and are currently willing to pay a premium for it. You don't have to look too far on the organic milk labels to see what the consumers are looking for.

Any action that compromises the integrity of the standards or leads to a softening in consumer confidence will be to the long-term detriment of our industry and particularly to our farmers. I guess the tendency would be sort of a knee jerk reaction of an industry at times such as this when the demand is strong and supply is tight to try to remove or relax barriers so that a rapid increase in supply can be met.

It is unfortunate that we lost the 80/20 transition rule as a result of the Harvey lawsuit. However, relaxing the organic
standard with respect to grazing and replacement animals in order to have a counterbalance affect to the loss of the 80/20 rule would be a short-term fix with long-term negative impact for the industry as a whole.

NODPA has responded to a request by the NOP in 2005 for guidance in evaluating compliance with the access to pasture requirement in the organic standard. In the guidance proposed by NODPA access to pasture is quantified in terms of time and dry matter intake we propose a minimum 30 percent dry matter intake for pasture for at least 120 days.

NODPA producers -- I would have to say in our conferences with producers from across the country in the midwest and the west are overwhelmingly supportive of the requirement that once a farm has gone through its one-time transitioning to organic, all dairy animals born and brought into that operation must be raised organically from the
last third of her mother's gestation.

We as producers across the country have learned through doing it that cows can maintain high levels of production on pasture, maintain excellent health and we can achieve well beyond the 30 percent dry matter intake for 120 days even up here in the cold northeast part of the country while exhibiting excellent health and breedability.

We have also learned since 2002 when the national standards came into effect that we can raise all our replacements 100 percent organically from the last one-third of gestation. These practices fulfill the expectations of our organic consumers and NODPA asked the NOP and the NOSB to ensure their application on all organic dairy operations. Our consumers deserve no less.

To speak as a farmer in the northeast and maybe to help dispel some of the rumors or myths that this pasture issue is not attainable, I can typically feed my cows 70 to
80 percent pasture. I can do that for seven to eight, and usually nine months of the year in the area where I have 7,000 heating degree days, a very cold, fierce climate. It's possible to do that and the animals can be out all the time which my animals have access to and, in fact, they live outdoors 360 days of the year in the northeast. They are healthy and breed back very well.

I guess just sort of for an executive summary which I think we always like to hear, what we are really asking for is for some real measurable standards in the pasture requirements and in animal husbandry that can be consistently applied to give us a level playing field for the sake of the integrity of the organic milk market. Thank you.

CHAIR O'ReLL: No questions. Frans Wielemaker and on deck Steve Etka.

MR. WIELEMAKER: Good afternoon. My name is Frans Wielemaker. I traveled here from Costa Rica and Central America and I'm an
agronomist. I represent the Dole Fresh Fruit Company in Central America.

It is the interest of our company and the organic banana growers in Central and South America and the Caribbean to maintain horticultural oil as an approved substance to control diseases and pests in crops. It is important that we keep horticultural oil in the regulations as an approved substance because we need that to control certain diseases like Sigatoka Leaf Spot disease. This is a very serious disease. It affects all plantations. It's a wind-born disease. It comes from neighboring farms. You can't keep it off your plantation.

The horticultural oil actually functions just as a fungistatic. It reduces germination of the spores. It reduces the appressorium formation before the fungus penetrates the leaves. For insect control it controls or introduces the population of white flies, scales, mites, aphids and thrips on the
plantations which are diseases which can become quarantine problems and also transmit viruses.

Horticultural oils are considered safe when used appropriately according to the EPA and are listed on the EPA list No. 3 with the signal word caution. It is presently allowed under the NOP regulations. And also allowed under the Codex IFOAM and EU regulations. In fact, in the original OFPA Act they are expressly mentioned as being exempted from prohibition.

In order to find out what the comments were that the NOSB received to remove horticultural oil from the regulations, it's very hard to search the whole series of documents and find out who and why they had something opposing the use of horticultural oil. I think that's one of the changes that I would recommend in general to see if in the next review these comments could be ordered in a different way so that they can be accessed
with a database search.

In summary I support the NOSB Crops Committee recommendation for the continued use of horticultural oil for disease and insect control. It has been posted on the website so I hope tomorrow we can foresee the positive vote of the Board. Thank you.

CHAIR O'RELL: Thank you, Frans.

I would ask any of the speakers if you have written comments and you have not submitted them to the Board or to the NOP, if you would hand them over to Valerie at the NOP table and she will then have them in the record.

MR. WIELEMAKER: I sent them to Katherine Benham and I sent them to the whole Board.

CHAIR O'RELL: But there are some that aren't in the book so they have asked me if you have comments on you that you have not submitted, there is an opportunity to submit.

MR. WIELEMAKER: As of the day
before yesterday it wasn't listed yet but I hope that will be done.

   MS. BENHAM: But it is in the book.

   MR. WIELEMAKER: Questions?

   MEMBER SMILLIE: Frans, just a quick one. In your professional use do you see nonpetroleum horticultural oils appearing to be as effective or do you still think that development is a little ways away?

   MR. WIELEMAKER: As is explained in the document, we have done various experiments with all sorts of different vegetable oils to see if they would control Black Sigatoka but they really don't. They would function as a vehicle to have synthetic fungicides penetrate into the banana leaf. As a substance by itself vegetable oils do not control the disease.

   MEMBER KARREMAN: One question. Are there any other biological methods that you have been trying to use?
MR. WIELEMAKER: Yes. There is quite a search in fermentation products to see if they would control the disease. There is, of course, sanitation procedures in the farm but, as I explained, it's a wind-born disease. It's not something that you can keep off your plantation. Spores can travel various kilometers and land on your property.

MEMBER DELGADO: I have a question.

CHAIR O'RELL: Rigo.

MEMBER DELGADO: When you mention the label caution in the use of horticultural oils, what are they referring to?

MR. WIELEMAKER: It's on the EPA list No. 3 which has a caution label.

MEMBER DELGADO: Is it referring to the amount used or the way it's applied? What is it referring to specifically?

MR. WIELEMAKER: It's probably based on the reduced toxicity of the product itself. It shows the classification of the
toxicity so it's not a list one or two. It's not considered a very toxic product.

CHAIR O'RELL: Just a point. When we are speaking, Rigo, I think we need to use the microphones more. It's a larger room and they can't hear us in the back. Also the speakers that come up I encourage you to get as close as you can to the microphone because I'm getting the high signs back there so I don't think we are doing the people in the back justice.

MR. WIELEMAKER: In summary I'm trying to support the Crops Committee to keep horticultural oil as an approved substance.

CHAIR O'RELL: Thank you. No further questions? Thank you, Frans.

Steve Etka. On deck will be Troy Bishopp.

MR. ETKA: I have my own testimony but I also have a proxy I think perhaps listed as 14 on your list for Joe Mendelson for the Center for Food Safety so I'm happy to do that
at the same time or at 14, whichever.

CHAIR O'RELL: No, that's fine. If you want to do it now, we'll take it off the list at 14.

MR. ETKA: I'll pass that out as well.

CHAIR O'RELL: Okay.

MR. ETKA: My name is Steve Etka and I'm here representing the National Organic Coalition which is an organization based in Alexandria right outside of Washington, D.C. The National Organic Coalition is a national alliance of organizations working to provide a voice and federal policy for farmers, ranchers, environmentalists, consumers, and others involved in organic agriculture.

Although we are on the brink of adding several new member organizations, the current member organizations of NOC are the Center for Food Safety, the Rural Advancement Foundation International USA, the National Cooperative Grocer's Association, and the
Northeast Organic Farming Association
Interstate Council.

I wanted to welcome the new members of the Board and also to thank the retired members of the Board. As many of you all know, or will soon find out, this is a time-consuming project to be on this Board and often a thankless project so we wanted to thank on behalf of our members you all and to make sure you understand how much the organic community really appreciates your work on this Board.

I also wanted to say how pleased we are that we finally have an Executive Director for the National Organic Standards Board. This is something that our coalition has been pushing for several years because we have been concerned that without the adequate staff resources it is hard for this Board to fulfill its statutory obligations so we are really glad to see that happening as well.

The NOSB meetings have become the
avenue informed for many in the organic community to provide input into the workings of the National Organic Program. The NOSB has done a very good job over the years of listening to these comments from the public and turning those into formal policy recommendations in many cases.

However, one of the perennial frustrations of the organic community has been that the National Organic Program's lack of response and action on those recommendations. Many in the organic community feel that their concerns are not being heard.

Having said that, we are very pleased and encouraged by the new leadership at the NOP and take it as a good sign that the Department has issued an advance notice to the public for proposed rulemaking on the pasture issue for dairy. That is an issue that this Board has heard quite a bit about and has made at least six recommendations over the last five years. We hope the USDA will move
quickly toward a proposed rule on this topic. Five years is a long time.

One quick aside. I think the symposium we just listened to over the last couple days was very helpful. I learned a lot, particularly with regard to the last panel, the Consumer Perception Panel. I thought that Margaret and Mary Ellen did a great job at providing us new data.

One thing that I think would have been even a little more helpful in addition to what we already heard was if we had heard from a consumer group itself and if we had also heard from some of the co-op grocers as well to fully round out that panel because I think they have an important perspective as well.

With regard to some of the details, the members of the NOC, National Organic Coalition, do support rulemaking to create a pasture standard for organic ruminant operations specifying that after the age of six months a ruminant shall receive at least
30 percent of dry matter intake from pasture on a daily basis for at least 120 days a year. We believe that these requirements should be made in the form of a rulemaking so that there's no question at all about its enforceability.

Ultimately it does come down to enforcement because without enforcement of the pasture standard this process that we've all agreed to participate in many times becomes somewhat meaningless. Certainly there is a gray zone and we heard from the certifiers about what happens if you have 119 days or 29.5 percent DMI. I think we would all agree that there needs to be a lot of work and flexibility in trying to get those farmers into compliance.

But there is also a very bright line test when you have certifiers who are sitting down with potential organic dairies and looking at their farm plans and seeing that there is no
intent at all for meaningful pasture and still certifying them. I think those operations have no business being certified and those certifiers have no business certifying those operations and ultimately USDA has a role in accrediting those certifiers.

This is not only an issue of fairness for the overwhelming majority of organic dairy farmers that are providing access to pasture, but it also poses a problem for consumers as well. I think there is concern about loss of the trends that we've seen on increased purchases for organic dairy products.

You will hear later about some survey data from both Consumers Union and Center for Food Safety that have shown very clear evidence that consumers do care about the pasture issue and that many of them would reduce their purchases of organic dairy products if they knew that the milk was produced from cows that do not have access to
pasture. I won't belabor that point more because you'll hear about that from other testimony.

In addition, I do want to support on behalf of our coalition strong standards stating that after the initial conversion to organic all dairy farms raised or brought into an organic dairy farm must be certified as organic from the last third of the mother's gestation. There may also be a need to clarify this one-time conversion to organic should be done on an operation basis and not on a per-herd basis because of concerns about the vagueness of the term herd and how that may be abused by some.

Also, the members of our coalition want to support the NOSB Livestock Committee's recommendations for a rule change with regard to access to outdoors and temporary confinement, to use the term "state of life" as opposed to stage of production. We particularly appreciate the rule change
recommendation stating that the producer of an organic operation must not prevent dairy animals from grazing pasture during lactation except as allowed under 205.239(b).

Also, we agree with many of the statements made in the guidance recommendations by this Board regarding temporary confinement. I think, however, it's important to note while it makes a lot of sense to allow some temporary confinement to protect soil and water resources, we want to make sure that is not abused.

Certainly if there are unique circumstances where the livestock must be confined to protect unusual short-term circumstances, that is just common sense. However, it is important that this not be permitted to become a long-term excuse for livestock confinement on a land base that is not capable of meeting the pasture standard. A farm's land base is not generally capable of meeting that standard. It should not be
certified as an organic livestock operation.

Thanks for allowing me to provide those comments. My second set is on behalf of Joe Mendelson who is the Legal Director for the Center for Food Safety. One thing I just wanted to present here real quickly is the Center for Food Safety did undertake a survey on the question of pasture. The questions that were asked were, first, "How often do you purchase organic milk." Folks were given the chance to answer, frequently seldom, never, don't know, or refused.

The second one is, "If you knew that many organic cows were confined to fenced-in feed lots and did not graze on pasture for most of their lives, would you still purchase organic milk?" The results are that 19 percent of Americans purchase organic milk. The data also presents a clear picture of consumer expectations concerning the pasture requirements for organic milk production.
Some of the results were as follows. A majority of organic milk purchasers, 51 percent, said that they would no longer purchase organic milk if they knew that the organic cows were confined in fenced-in feed lots and did not graze on pasture for most of their lives. Maybe even more significantly almost half of the frequent organic milk purchasers would also alter their purchasing habits.

Forty-four percent of those who frequently purchase organic milk would no longer do so if they knew that many organic cows were confined to fenced-in feed lots and did not graze on pasture for most of their lives.

Moreover, women, the principal family food purchasers, are even more apt to change their organic purchasing habits. Sixty-one percent of women who purchase organic milk either frequently or seldomly would no longer do so if they knew that many
organic cows were confined to fenced-in feed
lots and did not graze.

Finally, the data show that if
organic milk producers hope to grow their
organic milk market by changing seldom
purchasers into frequent purchasers, a strong
pasture requirement should be put into place
because 58 percent of those said that they
would change their habits.

I'm out of time but I would like
to make sure that the full testimony does get
included in the record. Thank you.

CHAIR O'RELL: Thank you.

Questions for Steve?

MR. ETKA: I do have the full set
of data, one set of it that I can leave with
you all from the Center for Food Safety.

CHAIR O'RELL: That would be fine.

Give it to Valerie.

Troy Bishopp and next on deck is
Sam Zeller.

MR. BLOOD: I'm not Troy Bishopp.
I do have a proxy to read his information. My name is Charles Blood. I'm an organic dairy farmer in central New York.

"Dear ladies and gentlemen of the Committee, I apologize for not being present today as the constraints of farming have kept me home. My name is Troy Bishopp. My family, in particular my daughters, are the fifth generation to farm in our community of Deansboro, New York, a small hamlet of Mohawk Valley."

He is the New York Chairman of the Grazing Lands Conversation Initiative. He's a proud member of the Pennsylvania Association for Sustainable Ag and the Northeast Pasture Consortium in the Regional Food and Farm Project.

To sustain our farm over the many years we have always relied heavily on pasture for our animals, surrounding wildlife and our livelihood. At the moment we custom graze 100 percent grass-finished beef for our clients.
and supply meet to several northeast states. Consumers are driving this market towards pasture-based organic products. Supply for these essential foods are critical if we are to move our family farms and future generations forward.

Research has played an important role in substantiating the consumer's mindset for our products. Talik Dhamin from Utah State University, Joe Robinson, and Dr. Artemis Simopoulos of the Omega Diet, and Susan Duckett of the University of Georgia have all contributed greatly through their research and collaborating with the USDA ARS to discover the health benefits to humans of grass-fed animal products.

Can we afford to compromise the consumer's desire and perception of these products by not having a strong unified pasture standard? My comment on the continued use of pasture and the strengthening of the organic standard is quite simple. Ruminant
animals were designed to eat their own forage
and for that work they supply us with milk,
meat, and fiber period.

We as a society have somehow
determined that an animal is just a production
unit capable of turning all sorts of feed
stuffs into products for us to consume. A
significant growing segment of the population
is finding this unacceptable and is choosing a
different paradigm. A paradigm shift towards
organic will need strong leadership as the
conventional forces will want to adopt
practices to access the burgeoning market.

I would find it quite flattering
if we were copied and had all the animals out
grazing instead of on concrete or put in a
barn without access to sunlight. To carry out
this mission I would be comfortable saying a
start would be requiring a minimum of 30
percent dry matter intake for ruminants for at
least 120 days during the growing season.

Regions of the country could most
likely achieve more than this but we should have a minimum to protect the integrity of the industry. The countless research, papers, and projects throughout the country on prescribed grazing practices can easily substantiate the minimums.

The adoption of an increased pasture-based ideology for dairy could, in my opinion, give hope for the next generation. The Cornell Farm Business Summary has shown that from 1996 to 2003 good grazing farms are equal to or better off financially than conventional farms of the same size. Most of the advantage of pasture are on cow comfort, labor, energy, and feed cost during the grazing season.

The down side to the pasture-based farm is a mindset change from practices and a lack of support from the long-lived industries that would have to change also. There will be a keen need for support services for the successful transition to grass farming.
Another point in favor of adoption of stronger pasture standards is the increased benefit to the environment about the social aspects of farming. It brings many folks joy to see a newborn out in the field with its mom while out on a drive in the country or the hunting and fishing aspects that grazing increases.

I am a seasoned farmer with able common sense but I am afraid I may somewhat be naive on the difficult challenges that you all face in the decision making process. I trust you will get more guidance in the days ahead from folks more knowledgeable than I. Thank you for allowing me to comment and remember save gas, let them eat grass. Troy Bishopp."

CHAIR O'RELL: Sam Zeller. On deck was Kyle Stolz. No on both? Surprise. Tom Hutchinson. Surprise. You've just been moved up on the list. Mark Kastel is on deck.

MR. HUTCHESON: Thanks very much.

I'm Tom Hutchinson, Associate Policy Director
with the Organic Trade Association. Of course, first I would like to welcome all the new members who may have discovered over the last couple of days that you may have gotten more than you bargained for, in terms of paperwork anyway.

I would like to speak of several things, none of which is pasture oddly enough. The notes have to do with the commercial availability, definition of synthetic, and aquaculture. Very briefly I would just like to mention that we do have full written comments on each of those.

I'm going to be speaking more today about the commercial availability which is something that is more important that it might seem. It's one of those parts of the rule that you might skip over if you didn't make a special effort to get there. It's small and out of the way. Nonetheless, it's very important. It just had much greater importance put on it by the court ruling in
the Harvey case.

A little bit about the background of 606. The first proposed rule and the second proposed rule both said in that five percent of an organic product it doesn't have to be organic. It can have anything that's in the what's now 605(a) or (b), that's either a nonagricultural natural product or a synthetic product if it was on the list. But if it was an agricultural product, didn't need a TAP review, it could go right on to the -- it could be used.

Didn't have to go on the list. The court ruling changed that and I think you can understand that does represent a significant difference for makers of multi-ingredient products. Also for the growers of spices and other small what are called minor ingredients.

Let me just get myself to my notes now. One important way that the commercial availability clause, which is imbedded in 606,
it says, "You can use the agricultural ingredients so long as no organic sources are available." One of the things that helped tremendously was establishing organic sources of spices and the usual example is cinnamon.

After the majority of private certifiers adopted the commercial availability requirement in the early and mid-'90s sources of these so-called minor ingredients grew healthily to supply the needs of the trade.

I mention this because one of the things we don't want to do is stifle the development of new products which might use a hitherto unfamiliar plant not available yet in organic form but hot in the natural products market. Once tested in the organic market perhaps a new candidate for an organic success story like cinnamon.

NOSB has recommended to USDA criteria for certifiers to use in determining commercial availability or nonavailability. Of course, making this determination is up to
the certifier and the NOP is responsible for ensuring that certifiers make this determination knowledgeably. NOSB is responsible for placing items on the national list, which it should do if a petition makes a reasonable legitimate case that a necessary product may not be commercially available. I will note again with emphasis that this is not the same as determining that some product is commercially unavailable which is the certifier's job. Placing an ingredient on 606 protects product lines that use the minor ingredient from sudden disruption. Many organic minor ingredients are plentiful but we need to be able to develop new products and if they are successful, manufacturers will, as they do now, work to help producers attain certification.

This system works for everybody. Sometimes minor ingredients might not be exotic. One excellent current example if almonds from California which due to recent
weather may not be available for the organic market soon. For those products that use almonds or almond flavoring, trail mixes, etc., these products could completely crash along with the market for the 95 percent of that product that is organic if manufacturers can't avoid product reformulation, changing product lines when orders have already been placed, marketing on tested products, and relabeling, all very real products for food makers. Thank you.

MEMBER CAROE: Tom, just really quickly, are you agreeing or disagreeing with the recommendation that we have on commercial availability because I don't see any difference with what you're saying and what we have said.

MR. HUTCHESON: I want to be sure that the emphasis is on NOSB reviewing any petitions to make sure that they address the criteria for commercial availability that you have proposed for certifiers to use rather
than getting involved in seeing whether or not that petition has actually met those tests.

CHAIR O'RELL: That is the intent of the recommendation.

MR. HUTCHESON: There was some confusion between the earlier and the later draft.

CHAIR O'RELL: I understand.

MR. HUTCHESON: I just wanted to emphasize that this is a matter of great importance.

CHAIR O'RELL: We will try and correct that and get it posted. The current draft that is posted, what is your feeling?

MR. HUTCHESON: In general it's very good. I just want to be sure that it maintains the direction that it got with the new draft because these decisions have to be made sometimes in a very timely way and certifiers are equipped to do that, trained to do it, etc. NOSB should be focusing on whether or not a petition has addressed the...
questions of whether or not it may or may not
be commercially available and let the
certifiers make that determination when that
time comes.

CHAIR O'RELL: That is the intent.

We can discuss that to make sure that it's
perfectly clear but that was the Committee's
intent. Thank you, Tom.

MR. HUTCHESON: Thank you.

MR. KASTEL: Hello.

CHAIR O'RELL: Mark, one second.

MR. KASTEL: Sure.

CHAIR O'RELL: We are going to see
who's on deck. Urvashi Rangan is on deck.

Mark, thank you.

MR. KASTEL: Okay. Thank you.

Good afternoon to the Board. I do have a
proxy from Florence Gordon of Nevada City,
California. Again, good afternoon. My name
is Mark Kastel. I am here representing the
Cornucopia Institute and our 900 members, the
vast majority of whom are organic farmers and
the vast majority organic dairy producers.

Why are we here today? Why is this debate continuing after this Board came up with their first policy ruling in the year 2000? Why are probably upwards of 99 percent of organic dairy producers complying with the pasture requirements that are currently in the rule? They understand the law. Their certifiers understand the law. Why does it still appear that some folks don't understand the law?

Upton Sinclair once said, "It's very hard to convince a man of something when his paycheck depends on him not understanding it." The Pasture Symposium was of great value. Thank you. I think we all learned a lot. I do, however, want to point out to the Board a few areas that were less than perfectly balanced. The farmer panel, and our thanks to all the farmers who participated, very qualified spokespeople. I want to point out the fact that that body was 60 percent
western dairy producers. According to our analysis there are about 5 percent of the nation's organic dairy farmers in the west. 35 percent of that panel today and in their past submitted testimony did not support the predominant proposal that was adopted by this Board and is supported widely by dairy producers.

The last time we did a public testimony analysis in written comments last year to this panel it was 20 to 1 in support. Besides for Roman's 80 cows, the range of scale of operations that were represented were between 130 and 8,500 cows. The average dairy farm, again, according to our analysis, in the country is somewhere between 50 and 70 cows.

The certification panel and, once again, thanks for the knowledgeable presenters. We are at 66 percent western based, the largest certifier of organic dairy farms in this country MOSA based on Wisconsin.

Their executive director was here but not
invited to be on this panel. That's a little plug for the dairy state where we do have more organic farms, organic dairy farms.

And the Market and Expectations Panel. Thank you for very, very qualified presentations and well researched. It was retail and manufacturer driven. The survey was conducted, the last formal survey. We are still looking at those numbers. It was conducted by a firm that works for Agribusiness, Kraft, General Mills, the organics largest trade and lobby group.

My operative question here is where was the Consumers Union? Where was the Organic Consumer's Association? Like Steve I asked the question where was the National Cooperative Grocer's Association?

So our members want to know why it has taken five years? Why have five years gone by without enforcement by the USDA for what we seem in this community to understand?

Why are there just a few folks gaming the
system? Meanwhile there are now 10 to 12 factory farms operating with little or no pasture. Why are investors now spending millions of dollars to transition upwards of reports of 30,000 cows in western states? What do these highrollers know that we don't know?

So we decided to ask. When the USDA rejected the rulemaking language that this body passed last August when they rejected it in August without explanation other than they didn't like the language, we felt at that time they could have collaborated with this Board to change the language if they didn't disagree with the intent. So we have wiped the record clean. We have this new advanced rulemaking notice.

But last August we wanted to know who was the Board talking to. The citizens of this country have the right to ask those questions so we filed a Freedom of Information Request. By law the Department has 20 days to
respond. After numerous requests verbally and
e-mail and over the telephone after seven or
eight months we filed a federal lawsuit two
weeks ago asking for these documents that the
public has a right to scrutinize.

So here we are. That's what we
don't know. Here is what we do know. I'm
going to pass these cartons around. I do want
to get them back. These are organic milk
cartons. They talk about pasture and they
have pictures of cows on beautiful grass and
they talk about biodiversity. They're
beautiful.

The next thing I want to pass
around to the Board is a picture of the farm
they come from. You are going to be hard
pressed to make an adequate comparison there.

My colleague, Will Fantel, back in Wisconsin
says in terms of consumer perception these
marketers know exactly what consumers want,
Safeway and Costco and Woodstock brands, which
is United Natural Foods International. Forget
about that. That's what farmers think are in
organic milk because that's what is on the
label and there is a disconnect there between
that photograph.

So we also know that there is wide
support for the rulemaking that this Board has
historically been supportive of. I'm going to
give you the first installment but we have
hundreds of proxies from organic farms. I
don't have a count because most of them are
back in Wisconsin. They are just being
received now.

But probably the majority of dairy
producers in this country are on record. They
want judicious pasture enforcement. They want
a rule passed with teeth. They want the
existing rule to be enforced. There is little
doubt about that. They have been on the
record for five years now.

And I'm going hand out a sign-on
letter which has 100 institutions on it that
we circulated including the National Farmer's
Association -- National Farmer's Union. I'm sorry. Sierra Club, environmental groups, Eden's Foods, many food co-ops including PCC, the largest food cooperative in the United States, the Wedge Co-Op from Minneapolis, largest Singer store cooperative. These folks are saying the same thing. There is no doubt.

We think pasture is part of this thing and we want the USDA to take action but we are still talking.

Finally, I will bring back up to the front -- I couldn't carry it all -- and distribute the report we just released within recent weeks, "Maintaining the Integrity of Organic Milk" which reviewed all the milk brands, private label. 81 percent of folks participated and were highly rated in that study. There is higher authority than the USDA on this issue, the organic consumer.

So we need you folks to act now before the wheels fall off this thing. I am hearing an increasing buzz from farmers and
consumers and retailers saying, "What is the next label going to be? What is the 'beyond organic label' going to be called?" I have never been supportive of that initiative but I am hearing a lot more from the organic community about it. Our position is that this is worth fighting for so we are not done.

Just in closing I want to say last third of gestation in general real organic farmers don't buy replacement heifers. They sell excess heifers and calves because the health of the herd is so good that their call rates are low enough that is a profit center for them. It is gaining the system for these other large industrial dairies to sell some of them all their calves off at birth and buy one-year-old animals to forego the cost of feeding that expensive organic milk to their calves and feeding organic grains.

Consumers don't want artificial milk replacer in their organic calves that could have had BSE risk blood as a component.
They don't want GMO grains. They don't want antibiotic treated livestock. We owe them to maintain the integrity of the label that they think is inherent. I will pass a couple of these pictures around to the audience. Thank you very much.

CHAIR O'ReLL: Any questions?

MR. KASTEL: Thank you.

CHAIR O'ReLL: Thank you.

MEMBER JAMES: I have one question. Mark.

MR. KASTEL: Bea.

MEMBER JAMES: You mentioned that there are 10 to 12 factory farms operating without pasture reinforcements.

MR. KASTEL: Yeah. Let me actually qualify that and then I'll answer if you a further question. What I usually say is there are 10 to 12 operating right now in the final stages of development. Some of them are shipping. One I know is gearing up for thousands of cows. They are only shipping
from 800 right now while others are in transition. A couple of them are in Texas.

They are predominately out west. One thing is there was some comment from the farmer panel today and a testimony written or read, I think, by Ed from Meg Katel's farm. I visited that farm and I visited the Aurora farm. They are within very short driving distance.

The difference was there was 1 to 2 percent of cattle out on pasture on the Aurora farm the day I was there and there was 100 percent out on Meg Katel's farm which is 400 cows in a dry western state. This is not big farm against small farm. Those are both big farms. And it's not midwest or northeast against the west. This is organic integrity against factory farming. Does that answer your question?

MEMBER JAMES: Um-hum.

MR. KASTEL: Okay. Thank you.

CHAIR O'RELL: Next on deck again
will be Charles Blood.

MS. HOODES: I am not Urvashi Rangan. I'm Liana Hoodes. I have a proxy that I am going to read Urvashi Rangan's testimony.

CHAIR O'RELL: Are you also signed up?

MS. HOODES: I am.

CHAIR O'RELL: So you have 10 minutes.

MS. HOODES: I prefer just to do two separate ones because --

CHAIR O'RELL: Two separate ones?

MS. HOODES: Yeah, because if I run out of time.

CHAIR O'RELL: So five minutes now. Okay. Got it. Thank you.

MS. HOODES: Good afternoon and thank you for the opportunity to give public comment today on behalf of Consumers Union, nonprofit publisher of Consumer Reports magazine submitted by Urvashi Rangan, Ph.D.,
Senior Scientist and Policy Analyst. There are four separate issues that we would like to present. The first concerns the pasture access requirements set in the regulations.

We believe that consumer concerns and expectations are not being adequately addressed at this time. While we appreciate the range of expertise within the panels, there was no consumer representation. As a public program supported by taxpayer dollars, it is imperative that the consumer voice be taken into account. The OTA, retailers, and other industry-based groups do not speak with an independent voice for consumers. The hearing on market expectations only takes one component into account, the retailer and, again, not the consumers. Consumers Union has conducted a nationwide scientific survey of more than 1,400 U.S. consumers in February 2006 asking them directly about their expectations regarding pasture access. When asked specifically if they would still pay a
premium price for organic milk that came from cows that were confined indoors and did not graze outdoors, have access to pasture, only 14 percent agreed that they would. 60 percent disagreed while 25 percent remained neutral.

More than two-thirds of all consumers and 75 percent of women in the Consumers Union survey of 1,485 U.S. online adults said that the national organic standards should require that animals graze outdoors. This survey reflects the public sentiment regarding the expectation of pasture access that is required for organic animals.

While this sentiment has also been expressed over the past two years by the NOSB farmer certifiers and others the USDA and recently issued ANPR and pasture access actually questions the ability of doing so, but the regulations already require access to pasture.

Producers make claims about access and have pictures of cows grazing on grass and
dairy products. Retailers successfully sell these products and consumers buy them and pay more than conventional milk with the full expectation that pasture access is required.

USDA should be working to improve the specificity of this already established standard and make it enforceable. Without that they put the current and future organic milk and meat market in jeopardy. Our colleagues from the Center for Food Safety have also conducted another nationwide survey with the results that concur with these conclusions.

The next issues that we would like to address is the definition of synthetics. Rosy Koenig had submitted a strong document last year defining synthetic ingredients that we believe should be the recommendation of this Board. We strongly disagree with the Organic Trade Association's recent comments that are frankly written without any understanding of chemistry or science.
The notion that a natural ingredient obtained from an agricultural product without any chemical or molecular changes could somehow retain a natural status no matter what other chemical or molecular changes occur is absurd and leaves gaping loopholes for synthetic materials like partially hydrogenated oil to be used in organic food.

Consumers Union's March 2005 survey shows that 85 percent of consumers do not expect artificial synthetic ingredients in products labeled as organic. A weak definition of synthetic and one that is not scientifically founded along with a recent weakening of the law will only serve to further erode the integrity of the label.

We would like to specifically address the review of materials. Streptomycin and tetracycline are now up for review. It is important to keep in mind that consumers do not expect antibiotics to be used in organic
production systems. That includes the use of fruit trees.

Consumers Union strongly encourages the Board to retire these materials as they are not in line with other organic production systems and consumer expectations. We also understand that the Board is considering allowance of all colors without review.

Colors are food additives that should be carefully reviewed based on their origin, chemistry, and overall appropriateness for organic production. Blanket allowances of materials for use in organic production undermine consumer expectations and the statutory authority of the Board. Please do not allow colors to be exempt from NOSB review.

The last issue is the report from the Aquaculture Task Force. Fish stock should ideally be sourced from organic stocks. Only if organic fish stock is new to market and,
hence, not commercially available should producers be able to source nonorganically. Task force definition of organic production for fish beginning no later than 5 percent market weight is arbitrary and prone to loopholes including the use of prohibitive methods. While caught fish fall outside the scope of this task force report and should not be eligible to be labeled organic at this time.

I'll try to run through this. As for option B, consideration for contaminate levels is paramount importance in fish. We commend the task force for taking this into consideration but believe that more standards need to be in place so consumers will not be subject to contaminated organic fish. There's more but I'll leave it at that.

CHAIR O'RELL: Charles Blood and Dave DeCou is on deck.

MR. BLOOD: Good afternoon again.

I'm Charles Blood. One comment I would like
to make in regards to the last speaker was the whole panel and everybody that has been here today is a consumer so maybe they weren't represented as a specific group but they were represented.

One issue that keeps cropping up and part of the reason we're here is that 30 percent dry matter 120 days from pasture for all animals over six months of age I feel that you've got enough information and will probably get more on that today.

In regards to some comments from presentations, access to the outdoors is required and enforced under the NOP. Another issue that came up, and it bothers me that it's even an issue, is animal welfare. No farmer who is going to be profitable and sustainable in agriculture is going to mistreat his animals. He will not be in business so animal welfare to a farmer is number one.

Another point that we really need
and this is as important to me as all of the others put together. If the NOP does not enforce the rules that are in place, we might as well go home today because we have to have the violators prosecuted to the extent of the law so that they do not continue or manipulate the system and come back.

    Being that I was already up here before and expressed a lot of my views, I thank you for your time.

    CHAIR O'RELL:  Dave DeCou and on deck will be Brian Baker.

    MR. DECOU:  Thank you all for the opportunity to speak. My name is David DeCou.

    I'm the Executive Director of the Organic Materials Review Institute otherwise known as OMRI. My associate, Brian Baker, is handing out a copy of two of our publications that we put out on a regular basis. We consider ourselves as a resource to certifiers and producers of information on materials that they might use which may or may not be
appropriate to the organic standards.

There is a copy there of our generic materials list and of our organic products list. The generic materials list we will be updating soon but was last published in 2004 and will be updated on a regular basis as changes occur.

The organic products list is a list of products that we have reviewed against the standards and we provide them to people so that they can use them in their operation. They are divided up into livestock, processing, and crops categories with subcategories underneath that. That is for anybody to use. They obviously have to use it in conjunction with an organic system plan as was mentioned earlier today.

OMRI has a board of directors coming from a wide spectrum of the organic industry including manufacturers, certifiers, farmers. We use experts from widely around the industry to provide clarity on questions
that we have. One of the things that needs to
be emphasized, and those if you who have heard
me before have heard this, we are not a
certifier. We have been accused of that.
People say that what we do is certification
but we are not a certifier. They didn't
accredit us. We didn't ask. But we do review
inputs for organic systems to see if they
would be appropriate.

My comments today derive from the
issues that we have in our work of how do we
decide whether this thing is consistent with
the regulation or not. Usually that is pretty
straightforward. In fact, if it was all
really simple, OMRI wouldn't be needed.
Unfortunately, it's not.

The main issue I would like to
speak to is aquatic plant extracts. The
current recommendation of the Crops Committee
and the current listing in the national list
says that aquatic plant extracts other than
hydrolyzed extraction process is limited to
the use of potassium hydroxide or sodium hydroxide. Solvent amount used is limited to the amount necessary for extraction is allowed as a plant or soil amendment.

What has never been clear to anybody in OMRI is other than hydrolyzed. What does other than hydrolyzed mean? It isn't a clear word. We don't really understand it. The concept of extraction is a deep one. Aquatic plant extracts are normally identified as kelp. Kelp is considered by the American Association of Plant Food Control Officials, AAPFCO, as a pot-ash fertilizer. Potassium hydroxide is used in extraction.

At what point are they extracting and what point are they fortifying? Potassium hydroxide is also a pot-ash fertilizer, a synthetic post-ash fertilizer clearly prohibited in the regulations. We don't have a good way of defining that line where it is extraction and where it is considered fortification.
In fact, in the definition of synthetic that is being talked about later tomorrow, I believe, includes the concept of when you extract something most of the solvent is taken out of the system afterwards. Current information that we have indicates that aquatic plant extracts vary between 2.50 and 6.75 percent pot-ash, whereas the extracted ones, the nonsolvent extracted ones, are 4.50 to 20 percent pot-ash. Somewhere there's a problem.

Our recommendation would be if you can't figure anything else out to force the review of potassium hydroxide, potentially potassium carbonate which is in the queue potentially for being reviewed, although it hasn't come forward, and phosphoric acid which is sometimes associated with aquatic plant extracts because of a letter issued by the National Organic Program.

It does need to be reviewed for specific uses because currently they are
actually listed associated with aquatic plant extracts, not directly with. Thank you.

CHAIR O'RELL: Any questions?

MEMBER DAVIS: I have heard OMRI's position many times about the potassium hydroxide extraction, how much pot-ash it leaves in the product. I have never heard directly from you guys why would a farmer spend quadruple to quintuple the amount for a pot-ash fertilizer than just use potassium sulfate which is an allowed natural? The cost per unit of these aquatic plant extracts are very high if you are considering them a pot-ash fertilizer and are predominately not used as a pot-ash fertilizer no matter what AAPFCO says.

MR. DeCOU: I understand they are not used as a pot-ash fertilizer. They tried to explain that. I don't think it's necessarily understood why these kelp products work and, thus, if they work some and then another one works better, nobody knows quite
why or they suspect why.

My supposition might be that they might be working better because they are often applied and it's because of the pot-ash and not because of the other ingredients that come directly from the kelp. Thus, the manufacturer is getting more of a reaction to their product but if you don't understand why, you don't understand that you could have gotten it by using potassium sulfate.

It's a question of is the farmer understanding what's going on or not. Kelp is widely used, widely respected. When I was an organic farmer I used it but I don't think I understood why. There's a lot of literature about it that isn't scientific.

MEMBER DAVIS: Are you familiar with any relative amounts that potassium as a foliar feed? It's a major nutrient that requires massive amounts more potassium to nutrition a crop than you could ever apply through the foliage of leaves. Is that part
of your understanding and why you guys keep analyzing it this way?

MR. DeCOU: We keep having the question of where do you stop extraction and where do you start because it's probably a logarithmic curve. If you add more, you get a little more. At some point you add a whole lot more and you still get a tiny bit more. Where does extract stop and become fortification? That is really our question. I can't see where you can say where.

If you were to put a ton of potassium hydroxide out there with a pound of the original plant material, you would probably still get a little bit more out of the plant material but you are really not at that point. It's extreme. Where does that line come back to be reasonable? I don't know. That's what we're saying. We don't know and we run into this question over and over again.

MEMBER DAVIS: It seems like a
certifier would be able to spot abuses of that material if they are putting excess potassium hydroxide in intending it to be a fertilizer instead of an aquatic plant extract.

MR. DeCOU: How would the certifier know?

MEMBER DAVIS: Because they would see growers using it --

MR. DeCOU: Not at $6 a pound.

MEMBER DAVIS: -- instead of half a pound per acre.

MR. DeCOU: Oh, I understand but they wouldn't use it at $6 a pound. Typically this is used either early or late in the season when those kind of things make a big difference. They are not used in broad spectrum applications. Kelp almost never is. Although kelp is often an ingredient in some of the mixed fertilizers that we review to the point of significant pot-ash increase in that mixed fertilizer. Why? We can't make that judgment because we don't have any line to
draw the line on. That's really our question.

MEMBER DAVIS: Thank you.

MR. DeCOU: Thank you. Any other questions?

CHAIR O'RELL: Thank you, Dave.

Brian. Next on deck, Ed Zimba.

MR. BAKER: Thank you. Brian Baker, Research Director, OMRI. I'll skip over what Dave covered already about who we are and what we do. I would like to move on to talk about a couple of the proposals that you have before us. The first is the question of synthetic and nonsynthetic. We support the guidance and moving ahead. We think there's been some improvement with the document that the NOP has come back with.

We still see some rough edges that perhaps need a little smoothing but on the whole I think it's much better. It helps to clarify how these decisions can be made. We do see a few things and we have made a few suggestions that we hope you will consider
about reviewing natural sources, what's an input. We need to distinguish between generic materials and formulated products.

What farmers use is not a generic material usually. It's a formulated product. It's something that is a formulated input so just to be a little more clear about that. On the whole OMRI wants to offer its experience and expertise in this area and help the NOSB and look forward to working with you toward implementation.

I also wanted to talk a little bit about the sunset process. This sunset is a necessary part of the nationalist process. I applaud the hard work you've all done, both current and past NOSB, at meeting this tight schedule that you have. The first time through a process is always the hardest. We see some ways that things can be improved.

The sunset should be used as an opportunity to fix glitches that have been identified by members of the community. In
particular, I understand the reasons that
annotations weren't on the table this time.
In the future you might want to consider going
through the whole petition, what the NOSB
recommended, and possibly making adjustments
to annotations in future sunset periods.

We are only asking that one
substance be removed from the national list
and that is natural colors. There are five
reasons that natural colors should be removed
from the national list. They have to do with
there is no standard of identity for natural
colors; the procedural irregularities by which
they were put on the national list; the
difficulty in verifying the colors are, in
fact, nature; the agricultural origin of many
colors that are used; and some health
concerns.

Many of the colors can be produced
either naturally or synthetically. Each color
needs to be reviewed on a case-by-case basis
to see if it is, in fact, natural or
synthetic. The extractants, the solvents, the carriers, the adjuvents all need to be taken into account.

I won't dwell on the procedural irregularities but colors were in petitioned. They were not TAP reviewed. They were not recommended by the NOSB. There was not proper notification in putting them on the national list. This has been a source of confusion between we don't have any real record of what is a natural color.

OMRI has been on record since 2001 calling for a technical correction in having colors removed from the national list. We supported the deferral and hope that the TAP review would address some of the questions in the sunset review. However, unfortunately, the sunset review did not address those questions.

The substantive issues are of greater concern. Many of the colors out there come from agricultural crops that are
familiar, beets, carrots, cotton, grapes. Things that sound natural often aren't and amaranth is a coal-tar derivative for example.

Another is caramel. That comes from sugar.

Indigo can be synthesized or is plant derived.

Carmine has been -- it comes from insects.

It has been associated with allergies, anaphylactic shock, salmonella. There are a lot of unknown health affects. If these substances had received a proper TAP review we would know what those affects are, what they were but they are right now a big gray area. Thank you.

CHAIR O'RELL: Brian, let me just ask you a question. In terms of the synthetic/nonsynthetic document that we are working on, I appreciate, number one, OMRI's willingness to participate and help. I think from your perspective and from the Board's perspective that we both think that the response we got back from the NOP does have a lot of merit and I think it's a good place to
start so we appreciate your offer for guidance through that and will most likely take you up on that.

If that document existed today and was out in terms of the colors and certifiers then being able to have a tool to sort out those synthetic colors that might be on the market, do you think that would be a help?

MR. BAKER: It would help but it wouldn't solve the whole problem. It would get you part of the way there. It wouldn't address the health affects that were identified. It wouldn't address the agricultural/nonagricultural issue. I would like to say the synthetic/nonsynthetic process should be divided into two tracks, one for production and another for processing. The first step in processing should be determining whether its agricultural or nonagricultural. That could be fleshed out a little bit more in the synthetic/nonsynthetic document and perhaps with a case-by-case review of colors
could help with determining what colors are agricultural, what colors are synthetic, what colors are nonsynthetic and then splitting them three ways.

CHAIR O'RELL: As you know, we are working on the document as well for the agricultural/nonagricultural guidance so I think all of these kind of go together. The committee struggled over the recommendation of colors. The original sunset after the Federal Register process there were 30 people who responded in favor for continued use of colors. There were zero that went on record prior to our recommendation against colors.

MR. BAKER: We are on record now as against color. We were on record in 2001 as saying colors were not properly reviewed. We thought it was a technical error that could be corrected, quite frankly, and that appears to not be the case.

CHAIR O'RELL: Hopefully you will hear this is one that we know will have some
debate among the Board and I think it will be
good debate. When the time comes the way we
have public comment structured tomorrow is
that we will give those recommendations, have
an opportunity for public comment, and then be
able to have the committees go off yet for
still some time before final recommendation
back to the full Board. Maybe if you are
around during that time, you could make use of
your expertise.

MR. BAKER: Certainly. Thank you.

MEMBER KARREMAN: Kevin, tomorrow
we are voting on sunset materials. Aren't we?

CHAIR O'RELL: Yes.

MEMBER JAMES: There will be
discussion first.

CHAIR O'RELL: There will be
discussion first. There is a presentation of
the items. Because of the logistics with the
Pasture Symposium we couldn't do what we
normally do which is present them one day and
vote on them the next but we are doing it as
best we can to try to allow the public to comment on our discussions.

MEMBER KARREMAN: One quick question. Amaranth is a plant.

MR. BAKER: Right. Amaranth is a plant and red root was used 100 plus years ago. In 1880 they figured out how to make the same chemical from coal-tar and now it's red dye No. 2 which is banned in the United States but it has a natural sounding name and some people think it's natural.

CHAIR O'RELL: Okay. Thank you, Brian.

Ed Zimba and on deck Grace Marroquin.

MR. GARDINER: I have a proxy here from Ed Zimba. I don't know who I'm supposed to hand this to. My name is Jim Gardiner.

CHAIR O'RELL: Are you also listed as a speaker?

MR. GARDINER: I am not listed as a speaker.
CHAIR O'RELL: Okay. So you just start reading five minutes of comment from Ed Zimba.

MR. GARDINER: Correct.

CHAIR O'RELL: Okay.

MR. GARDINER: The first issue I would like to cover is on the sunset materials. As you pass through this countryside you have seen a lot of the different Amish farms around and a lot of the smaller farmers that are in organics also you will find that when they whitewash their barns for cleanliness it's basically a federal inspection.

Your barn is clean and white and the ingredients they use on that whitewashing material is hydrated lime. Our cows do have the ability after it's done when it's still loose and flaky they do rub up against it. I would like to see that stay in the rule if possible. I realize that is possibly one of the sunset materials that might be reviewed
coming up. It's also used as a topical application to help with pest control on animals. In a lot of cases it is very important in the use especially in dairy farming and other livestock as a preventative for the pests.

I do appreciate all your patience you folks have with being able to sit through all of what you've heard over the last few days. You've done quite a job. And with the people in the NOP also. The next thing I would like to touch on is the pasture.

With having four children that have in some way voiced an opinion of wanting to be in this industry at some point in time, they range in age from 23 on down to 12 years old, I really believe that the decisions that whatever comes out in the rules is going to have an affect on the next generations. It's not just about us and whether or not we can make a living for a short period of time.

It's about also the future of what
organics and organic dairying is about. 
Hopefully short-sightedness won't be employed 
in the rulemaking. When the rules are made, I 
think the emphasis that has been made for 
folks to be able to have the ability to 
enforce the rules and have the chance to have 
backup is very, very important. 

Like Ed, who I'm taking his place 
for, stated that if it was done in the first 
place, we wouldn't be here now talking about 
it and everybody would be enjoying it more 
instead of looking at the dollars. The green 
that seems to be in everybody's eyes now is 
not pasture, it's dollar bills. Thirty 
percent dry matter intake. 

I sat down with many, many farmers 
whether it be on the west coast, the middle of 
the country, or the east coast and shame on us 
if we can't come to that form of equation of 
around 30 percent. That basically equates to 
10 percent of our milk production in organics 
coming from pasture. That is very little. I
mean, if you scored 10 on a score of any kind of exam, I know if I had a surgeon working on me and he scored 10 on his final exams, I probably wouldn't want him to work on me. That does mean that the other 90 percent of what that animal is eating you get to have the ultimate choice to put whatever density you want to put into that animal.

Ten percent of their feed over a year is not a huge amount even in 120 days. We are always looking for the minimum but optimizing. Isn't that what organics is all about, is optimizing the health of this place we live in called earth.

MEMBER KARREMAN: Jim, one question. You just mentioned the 10 percent over the year. Yesterday I think we were asking a few of the panelists is there a difference between 30 percent for 120 days versus 10 percent over the whole year because isn't it all the same in the wash? I think Andrea asked that but it doesn't matter.
Comments?

MR. GARDINER: Sure. The 30 percent on 120 days I realize like even listening to Mr. Straus the implementation on his farm if the desire there to graze and to focus on instead of the benefits of one part of the operation, whoever the farmer may be, is to focus on the whole operation and the 10 percent of that.

Talking about spreading it over the year but when you meet people from Minnesota, say, for instance, and their grazing time, I've chatted with several of them on phone conferences and their concerns are that the 120 days for them is quite a maximum amount of time in their grazing ability. But they do realize that in that period of time there may be 30 days out of that, maybe 45 days of that time they could at 100 percent of their dry matter intake could come from pasture.

Averaged over that 120-day growing
season period they could absolutely meet that criteria going through a farm plan. Yeah, it may not be -- I take from what Mr. Straus said is that optimally on his farm he only had a 90-day to 120-day window to graze. We all shoot for optimal grazing on our farms because we want that.

I'm the first one that would love to have a great milk check every month. To have optimal grazing that doesn't happen all the time but it does happen some of the time. If I had 90 days of grazing optimally on my farm even here in the northeast where everything looks so beautiful like it does now, 90 days is huge.

Our grazing optimal generally runs May and June. After that you have to work at it and that's part of being in this organic industry that we are part of is not only just saying, "I can't do it," but it's looking for optimal even when it's not optimal and learning how to manage what you have.
MEMBER KARREMAN: I guess just the 10 percent over the year, how do you feel about that?

MR. GARDINER: Ten percent over a year? If it was incorporated into the rule, I think it may end up complicating things more because then people are going to start looking at the whole year. You have people who do have lots of snow in their area. If you look at their growing time, the growing season that they have whether they live in a desert or whether they live in Maine or upper Minnesota, that growing season allows them to define that 120 days.

Now, optimally if you live in the desert you should be irrigating and it would be fantastic. I have seen some great irrigation systems that are in areas where nothing grows outside of where they irrigate but when they irrigate they have tremendous abilities. I've had chats even here with folks from Texas that are looking forward to
doing irrigation and they are in an arid area.

That 10 percent I think could cause confusion if it's worded over the full year. I think sticking with a minimum growing season, that's what we find is the minimum growing season in our country in the toughest place not counting Alaska. I haven't interviewed anybody from Alaska but I'm talking northern regions and 120 days seems to be the minimum and then you optimize inside that.

CHAIR O'RELL: Grace Marroquin and then Lou Anderson.

MS. MARROQUIN: Hello, everybody.

My name is Grace Marroquin and I'm President of Marroquin International. My company is based in Santa Cruz, California. We import and distribute organic ingredients to the food industry. I'm here once again to request that the Board support the classification of yeast as an agricultural product.

Yeast is currently listed under
Section 205.605(a) as a nonsynthetic nonagricultural substance. It was nearly 21 months ago on July 30, 2004, that we filed our request with the Board that it recommended that yeast be transferred from 205.605(a) to 205.606 and be listed as an agricultural product. This request is still pending and I'm here again.

As a result of yeast being incorrectly classified as a nonagricultural substance we see processed food products labeled as organic that contain conventional yeast instead of organic yeast. This is because organic yeast cannot be officially recognized as an organic ingredient and be required in products with an organic label. Organic yeast cannot be officially recognized until it is considered an agricultural product so here I am again.

As we have stated in previous meetings, conventional yeast production is far from the standards of organic production in
several ways. It uses ammonia salts. It uses acid such as sulfuric. It uses caustic such as lye. It uses synthetic vitamins and growth substances and synthetic antifoaming agents and the conventional production creates waste water that is difficult and requires special handling.

In contrast organically produced yeast is bread in a wholly organic nutrient solution made from organic grains, pure spring water, and GMO free enzymes. This is done without chemicals and without creating hazardous waste water. In fact, the waste water is used further to make organic products.

Today we will present our most current position to support the reclassification of yeast as an agricultural product. We believe that we will present the Board a clear avenue to resolve this question, I hope, once and for all. Our position is quite simple and direct.
It is based on the legal definition of agricultural product that appears in the Organic Foods Production Act 7 USC 65021 and in the National Organic Regulations as 7 CFR 2052. This legal definition of agricultural product is identical in both the Act and the regulations.

Under this definition yeast qualifies as an agricultural product. The reason why yeast qualifies as an agricultural product is that the definition of agricultural product includes livestock. The definition of livestock appears in the Act as 7 USC 650211 and in regulation 7 CFR 205.2.

Under this definition yeast qualifies as a type of livestock. The definition of livestock in the Act is broad and it includes the following list of living organisms. Cattle, sheep, goats, swine, poultry, fish used for food, equine animals, wild or domesticated game, and finally, and most importantly, other nonplant life.
In the regulations the definition of livestock also extends the meaning of livestock to cover other nonplant life. Yeast is a form of nonplant life. This is why it comes under the definition of livestock.

Yeast is one of the fungi living micro-organisms that have a special category in biology because they are neither animal nor plant. Therefore, the plain wording of the Act and the regulations covers yeast within the definition of livestock.

Under these legal sources yeast qualifies as an agricultural product. These are the legal definitions that govern the operation of the National Organic Program. They are binding on the Department of Agriculture and they are binding on the Board. Yeast is entitled to be treated in all parts of the regulation as an agricultural product.

We said at the start that in the national list section of the regs yeast is listed as a nonagricultural substance in
205.605(a). Since yeast, like mushrooms, qualifies as an agricultural product under the definition in the Act and the definition in the regulations, this means that the existing national list is inconsistent with these definitions.

The national list portion of the regulation needs to be further corrected so that yeast will be listed in the national list as an agricultural product under 205.606. While yeast may be an unusual agricultural product as other fungi such as mushrooms, yeast producers that wish to seek organic certification should also have that opportunity. Thank you.

CHAIR O'RELL: I think there will be some questions, Grace.

Nancy.

MEMBER OSTIGUY: Grace, I have to admit that when we received the letter my first reaction was to laugh loud and rather long.
MS. MARROQUIN: Many people have howled over this idea.

MEMBER OSTIGUY: Yes, yes. It was actually, I though --

MS. MARROQUIN: A howler.

MEMBER OSTIGUY: It was a great way to relieve a whole lot of tension and just improve my day considerably so I thank you for that. But also when I --

MS. MARROQUIN: My pleasure.

MEMBER OSTIGUY: -- stopped laughing I thought, you know, my first reaction to the classification of honeybees as livestock was to laugh so maybe we can get there.

MS. MARROQUIN: That was our hope. That's why we presented it this way.

MEMBER OSTIGUY: So far in the discussion we are planning on looking at that. We have to make sure that we do it in such a way that it doesn't mess up other sorts of categories but, yes, it's worth the
consideration.

MS. MARROQUIN: I really appreciate that. I can understand and appreciate the deliberation that's been taking two years. I know that part of the concern has been how do we treat it because if yeast is considered an agricultural product, then it has its relationship to micro-organisms but it doesn't. I want to remind the Board that the NOP final rule specifically carves out a special status for bacteria cultures declaring that they are nonagricultural.

In fact, this is in the definition of nonagricultural. It's in the definition of a nonagricultural substance in regulation 7 CFR 2052. If you really look at the difference between a bacteria and -- I can never say these right -- eucariotes which is what animals are considered and yeast is considered.

Those are cells that have both a nucleus and a membrane-bounded structure,
whereas the procariotes, which is what bacterias are, they have neither a nucleus or an internal membrane-bounded structure. There are these differences. You have a way to work with that in how they are classified.

MEMBER OSTIGUY: Part of what I think is going to be very challenging and interesting is the access to outdoors.

MS. MARROQUIN: Yes.

MEMBER OSTIGUY: And pasture and I'm not sure but, you know --

MS. MARROQUIN: They get 120 days.

MEMBER OSTIGUY: We'll think about it.

MS. MARROQUIN: It's also part of a handling system, too. I think there are elements of both, the handling system and livestock system and that needs to be taken into consideration. Again, I really appreciate it.

CHAIR O'RELL: Grace, I know you have been very patient throughout this. I
think I have said that maybe two or three meetings before this. Your patience continues to grow.

MS. MARROQUIN: Tenacity, too.

CHAIR O'RELL: Yes. You have given us a very creative way to look at it. The committee has had a meeting on this and we see some substance here for us to work with and to put this to rest before the next meeting.

Joe.

MEMBER SMILLIE: Just a quick one. I'll resist the temptation to go into the livestock joke line but the organic compliance plan, I think what you stated was that the difference between an organic culturing of yeast and a conventional culturing of yeast is very clear and delineated. I think that is one of the key parts of the rule is that we need an organic compliance plan. I think what you presented is really good, too, but I think you could further help your cause by trying to
put an organic compliance plan together.

MS. MARROQUIN: We would gladly try to do that given some hope and some direction on this. That we can do. Thank you.

CHAIR O'ReLL: Thank you, Grace.

Lou Anderson and on deck is Jim Pierce.

MEMBER KARREMAN: I just saw Jim Pierce 10 seconds ago.

CHAIR O'RELL: Next on deck will be Sally Brown. Sally, are you ready? Yes, please. Thank you.

MS. BROWN: I'm actually here speaking for Tony Azevedo but, for those who know him, I definitely don't have a white hat and I'm definitely not from California.

I am an organic dairy farmer from central New York. My husband and I have been farming for 28 years, the last five being organic. I want to thank you and apologize at the same breath. For the few times that I've
been through this process it seems like you hear the same line over and over and over again. I thank you for your patience and apologize, as I said, at the same time.

I think the organic product and whole process is about integrity, commitment, courage to find a new way of doing things, trustworthiness, and mutual respect. That is for our consumers and that's for our animals and that's for the industry we are trying to represent.

I am in support -- as you have heard eloquently presented by many other people, I am definitely in support of the 30 percent dry matter and 120 days in the last third of gestation. I have a lot of frustration because I am a consumer. Going organic has changed our lives considerably. It has been a entire paradigm shift in the way that we live our lives.

I'm looking at the issues that we are dealing with in the product that I
produce, that being milk because of the influences that are coming against it and the progress that is not being made. When I go out to purchase other organic products that says USDA certified organic, I'm starting to really have a question mark. If I know there are issues with my own product, then where is the status on the rest of them? I have some serious questions.

Your mind can really go wild in thinking about all of these things like how much of these large corporation influences are affecting these rulings? There are 99 percent of us trying to do this correctly and giving it everything we've got to do this right. It seems like there's a small percentage with a huge percentage of our product trying to find loopholes to pad their own pockets to make sure that their shareholders get a profit.

This is my future. This is my livelihood. This is generations to come. I'm concerned. I'm very concerned. I know that
this Board has done the very best that it can do over the last five years. You have presented it as well as you can.

I guess I would say I know you all have jobs but if somebody was coming against your livelihood and the way you have committed your life and you are looking at your own financial security and future, wouldn't you be a little bit frustrated if time and time and time again it was presented and you haven't given the people, the certifiers, the meat to do their job wouldn't you be a little frustrated? I've done my job right. Please do yours.

CHAIR O'RELL: Jim, since you were technically only on deck, we are going to let you come back in so you can speak.

MR. PIERCE: There's a couple people not here to know where you are in the rotation.

CHAIR O'RELL: Your excitement is next on deck.
MR. PIERCE: Thank you. Good afternoon. For the record, I'm Jim Pierce, Certification Czar at the 750 farmer-owned organic valley crop cooperative, as well as reigning monarch at the Trout Palace, my family-owned rainbow trout farm. It's been my privilege for nearly seven years to offer precise solutions to NOSB members and NOP staff regardless of the complexity of the issue.

Have you read any good books lately? I have. Thanks to an extra-long layover in Detroit I had a chance to finish Organic, Inc. by Samuel Fromartz, who is here by the way. Without passing judgment, Mr. Fromartz does an admirable job of telling the story of the tumultuous development of the organic food movement.

The tone of each chapter is set with a quote from a great thinker, often someone pivotal to the success of organics. Following timeless nuggets of prophetic wisdom
from Sir Albert Howard, Wendell Barry, and Moses, I found this quote at the beginning of Chapter 6.

"Hard as I try I cannot think of another private sector group being regulated that continually demands tougher regulations being inflicted upon themselves." Isn't that well said? I wrote that. I delivered that line during public comment at May 2003 NOSB meeting in Austin, Texas in a speech I called, "The Cow with Three Little Eyes," a passionate plea to fix the misinterpretation of the post-transition dairy replacement regulation, an issue that is not only still current but even more urgent in light of the Harvey suit and the OFPA amendment that eliminates the 80/20 dairy transition language.

My comment that day also contained this quote, "This interpretation is wrong and needs to be corrected. This horse or cow, the cow with three little eyes as the case may be, is not dead, will not die. In fact, we are
going to beat it until you change this rule to reflect its original never-wavering intent."

Consumer backlash from allowing continuous transition will be worse than from lack of pasture. This allowance erroneously allows calves to be feed nonorganic feed including conventional milk replacer and GMO grain to be medicated with anything for any or for no reason and be exempted from organic living condition requirements and then eventually to be milked as organic.

In addition to domestic consumer backlash it will almost certainly generate criticism from foreign certifiers that the USDA is hypocritically allowing the very practices that they are being criticized for allowing, namely the use of nonorganic feed and antibiotics on an organic dairy.

The 1990 congressional report on OFPA, the American organic standards, comments to both proposed rules, preamble to the final rule, previous NOSB recommendations.
Countless commanders to you are all very clear. Once an entire distinct herd is transitioned, all animals must be managed organically from the last third of gestation.

On to another topic. As a quiet observer on the OTA's task force on commercial availability, I've studied the Materials Committee's recommendation and the OTA's response and endorse both. There has been criticism that this proposal overburdens the certifier. I disagree and think that the certifier is precisely the right person to manage this complex issue.

At Organic Valley we have always formulated products to minimize the reliance on nonorganic material and, thereby, support and encourage organic production. But despite our best efforts we have a short list of ingredients that cannot be sourced organically and so we'll petition items to be added to 606 before 607.

Regarding the pending
recommendations on sunset materials -- you got that. Good. Regarding the pending recommendations on sunset materials, hydrated lime has valuable use in organic fruit and livestock producers. Please don't remove it.

Milk replacer is a more complex issue. The Livestock Committee has proposed its removal but since there is no product that meets current use restriction, the impact appears minimal. However, there are some assumptions in the proposal that I urge you to reconsider before you forever remove milk replacer from the national list.

First is the definition itself. It has been suggested that milk replacer be understood to include milk that is not organic but would otherwise meet the annotated requirement. If so, then its removal will circumvent an otherwise variable tool for producers.

Second is the assumption that there are organic product available to fill
the void. It is not. Anecdotal feedback from Organic Valley producers is that these products are mostly unavailable and sometimes of substandard quality.

Thirdly, and to bring this comment full circle, there is a general consensus that conventional milk replacer with RBGH milk, tallow, blood, and a myriad of synthetic ingredients is inappropriate in an organic system. Yet, if the dairy replacement regulation is not -- the dairy replacement regulation not only allows put expands allowance of nonorganic management of replacements, this is exactly what is going to be fed to an ever-increasing number of organic replacements.

Ladies and gentlemen, there is an elephant in the room, or rather a cow with three little eyes that needs to be dealt with. On behalf of the OV member farmers, I give you our blessings to do so with God's speed. Thank you.
MEMBER KARREMAN: Thanks, Jim. As usual, great. On your milk replacer thing on point 1, could you read that once again because I was having some thoughts about that.

MR. PIERCE: If milk replacer is thought of in terms only of a sack of powder that's mixed with water and fed to calves, then maybe there is nothing right now that can be considered as suitable milk replacer but RBGH free, etc.

If milk replacer could be considered whole milk used in an emergency when there is nothing to be fed to these cows, milk from another farm, an RBGH-free farm, of course, then perhaps milk replacer is available and maybe we just need to broaden the definition of what is milk replacer. What replaces the cow's milk that a farmer would normally feed.

MEMBER KARREMAN: Okay. What if there was to be, just to throw out an idea, a milk replacer, is it always just powder in a
bag? Is it always powder in a bag with fortification or could it actually be natural whole milk? This is something I've thought about when I've been driving around.

What about, let's say, if an animal had been treated on an organic farm with a prohibited material and then she is still fed and managed organically but her milk can never go in the tank. We all know that, but what about having her milk be considered milk replacer for the young stock, the calves?

Then the farmer wouldn't lose total value on the cow for possibly treating that animal in the most humane way by using a prohibited material. The decision wouldn't be as hard to do for the farmer and the cow could still live with her herd mates in an organic way but her milk would be donated to the calves forever. What do you think about that?

MR. PIERCE: That is possible except the way I read the annotation to milk replacer that would only be appropriate in an
emergency and an emergency, I think, is more
dramatic than just having a cow that you can't
put into the tank supplement the other cows.
I'm going to encourage the Livestock Committee
and the NOSB to explore those possibilities
because that's the point of my comment.

If you remove milk replacer from
the national list, the door is closed. There
is nobody using milk replacer according to
that listing now so it's really odd to know if
we are losing anything because there is no
RBGH-free milk replacer. There is very seldom
a certifiable emergency on the farm where they
would want to use it. You could argue that
the only eradication is a suitable use but is
that an emergency? Welcome to the NOSB,
ladies and gentlemen. Enjoy your five-year
term, or sentence as George used to refer to
it.

MEMBER MOYER: Can I ask you a
question?

MEMBER KARREMAN: Yes.
MEMBER MOYER: What sort of emergency situation would arise on a dairy farm where they would not have any milk to feed their calf?

MEMBER KARREMAN: Well, I would say an emergency just as a clinician would be an unplanned event requiring immediate attention so, therefore, I would not think of Yoni's disease as an emergency. Definitely not. It's one of the most chronic diseases in the dairy industry. I would say maybe a barn fire, salmonella outbreak, the cow dies during calving, the calf lives, those kind of immediate --

MEMBER MOYER: But there would be no other milk on the farm at all is what you're saying? No other organic milk?

MEMBER KARREMAN: Well, there usually is. There is usually hospital milk, a very low quality that you wouldn't put in the tank. There would be that possibly. I mean, you know, there usually is but not always.
It's a confusing issue because when I was talking to dairy farmers across the country over the last few months, you know, we asked about the sunset of various products and the milk replacer one came up. Basically everyone was like it can go away.

CHAIR O'RELL: Just so we stay focused to questions specific for Jim and not get into discussions we can have later. Is there another question?

MEMBER JAMES: Jim, why doesn't Organic Valley then make organic milk replacer?

MR. PIERCE: It would be prohibitively expensive. That milk is too valuable as a commodity for human food. We have researched it a number of times. There is also some logistical challenges like to separate the lactose and the waste solids and to formulate a fully suitable milk replacer. What we have done on occasion is provided whole milk power to our producers.
Typically whole milk powder that was no longer sellable for whatever shelf life date was issued. Again, it's quite expensive to the producers. There is potential there. There's just some barriers that need to be ironed out. It's a great opportunity for somebody to fill that void. But an organic milk replacer, of course, would never have to be on the list.

It's organic feed. If it was synthetic milk replacer, nonorganic, it would still only be usable in emergencies in which case there is really no desire to develop that product. There's no buyer. Anybody else? Thank you very much.

CHAIR O'RELL: Thank you, Jim. We are running up against the time but, Eric, you're there so we are going to have you speak and then we are going to take a 15-minute break after Eric's comment.

MR. SIDEMAN: I'm Eric Sideman. I work for the Maine Organic Farmers and
Gardeners Association. I served on NOSB from 1997 to 2002. I served on the first Aquatic Animal Task Force in 2000 and 2001. That task force concluded that while aquatic animals do not reflect the degree of producer management or continuous oversight during production that are characteristic of organic systems so the NOP should not develop standards for wild caught animals.

On the other hand, we did recommend development of aquaculture standards. The new task force, the new Aquaculture Working Group, did a good job of drafting practice standards. I want to make some suggestions on some points of improvement to come up with final standards that are consistent with the high standards that are in the National Organic Program rule.

No. 1, the organic farm plan should designate a specific site, the need to know where the animals are, to know the effect of the surroundings on that animal, or to know
the effect of raising those animals in a particular site. I suggest that within the organic farm plan they designate a specific site for where the production of aquaculture is going to take place. That's not in the report now.

No. 2, in the report they often use the term minimize. I think that almost all aquaculture production facilities should be minimizing the affect on the environment. I'm hoping that in the final report you move up to the stronger language that's in the national rule on organic aquaculture now which is using language such as "does not contribute to contamination."

This is particularly important in the sections that deal with nutrients. A key to organic production that is also reflected in the final rule is the importance of conserving and recycling nutrients within a system. Recycling nutrients should be documented in the farm plan of an aquaculture
system.

No. 3 is feed and I think this is probably most important. The OFPA mandates organic livestock eat organic feed. I'm comfortable that this is possible in an aquaculture system because of the degree of oversight of the site of production by the producer. They know what feed they feed and they can monitor what feed comes into the site.

The NOP rule allows natural nonorganic materials to be feed as supplements in addition to feed to balance the feed. I think a clarification of this is needed. Since OFPA is very clear that feed must be organic, I stress that basic feed groups such as protein, fat, and carbohydrates come from organic feed. Natural supplements or additives may be used to nutritionally balance the feed but they should not be permitted to supply a significant portion of those feed groups.
The report is very fuzzy on this as it offers two different options with respect to feeding fish meal. If fish meal is from wild caught fish, it is not organic and should only be allowed as a supplement. I support option B presented in the report where they talk about not certifying wild caught fish and there needs to be a cap on the use of fish meal as a supplement.

I would like to turn to a different subject now and that is one of the deferred materials aquatic plant extracts. The NOSB and NOP need to reconsider the policy refusing to make changes and annotations during sunset review. Ill-worded or illogical annotations with mistakes need to be corrected and the sunset review period is an ideal time to do that because when the NOSB voted, they voted on the annotation and the material as a couple.

Aquatic plant extract annotation is ill-worded. It seems to state that only
potassium hydroxide or sodium hydroxide are permitted but some certifiers are permitting potassium carbonate. It is so inconsistent among certifiers that a major manufacturer petitioned potassium carbonate in 2002.

There are two major manufacturers of seaweed extraction in Maine who are using potassium carbonate and we as the certifier in Maine are not allowing these products. Furthermore, I want to support OMRI's comments that there is potential fortification using either potassium carbonate or potassium hydroxide because of the potassium being a fertilizer.

My last line, phosphoric acid has never been reviewed by the National Organic Standard Board for the material plant extracts and should not be permitted. Any questions?

MEMBER KARREMAN: Regarding the sunset process with the annotations, and you mentioned it, that material was voted on as the material in the annotation. We have been
told in clear terms that we are not to tinker with annotations during the sunset process. I'm just wondering to the more seasoned members of the Board can we do something within the statute within OFPA to perhaps tinker with annotations at the next sunset review or not? That's to the NOP, I would guess.

CHAIR O'RELL: I'm going to ask Arthur.

MR. NEAL: The issue with sunset is that this happens once every five years. We've got a petition process that is open every day of the year. If anybody wants to change an annotation they've got every day of the year to petition the Board to change an annotation.

Due to the number of materials that are up for review, particularly this sunset, you can have the potential of changing every annotation and then the Board having to justify the reason for why they changed every
annotation. You can have an industry turned upside down overnight because no one had a petition but someone felt like changing an annotation.

But the process is designed to assess the continued need for the use of substances. Why wait until five years before someone asks to change an annotation? That's the question.

MR. SIDEMAN: I support Arthur in that but I would also like to add that I think it's within the power of the NOSB to change an annotation without a petition since they were the drivers of those annotations to begin with. When one is known for five years now is not working in the market place and production arena of farmers, the NOSB has the responsibility to change it.

There is a petition for potassium carbonate submitted in 2002 and it's still sitting there with a little line under NOP review. We have been preventing the use of
two manufacturers in Maine from selling the products they make to certified organic farms in Maine because of the way we interpret the petition -- excuse me, the way we interpret the annotation.

CHAIR O'RELL: I saw Kim is a former Board member from last year. I know we invited the Board members back to make comments. Did you have a comment? Okay. Arthur.

MR. NEAL: One more quick comment. I think it was the August 2005 meeting the Board had recommended to restructure the national list. The NOP is going to take that under advisement. We are going to do that. That will help to resolve this issue concerning aquatic plant extracts because aquatic plant extracts really are naturals. It's the synthetics that are added to them or how it's extracted, the process of synthetic or nonsynthetic decision that is under review right now. The other issue is that the
potassium carbonate petition that you've addressed, I think I mentioned this over the phone, that company, I think, is out of business that submitted that original petition to us. The other issue is that petition is incomplete so we will have to deal with that at the staff level.

MR. SIDEMAN: I knew that already.

I'm not blaming NOP for not dealing with the petition but I think the NOSB has the responsibility because they recognized this as a problem to work with it. The problem is see -- and I don't know if I can go beyond a little bit here but the problem I see with addressing aquatic plant extracts has a natural, I think that may not be true if you adopt the decision tree that separates natural. I think it will fall into the synthetic category when you run it through there and then it will have to be listed.

CHAIR O'ReLL: Thank you.

MR. SIDEMAN: Okay. Thank you.
CHAIR O'RELL: We're going to take a break now for 15 minutes. I guess that like 4:22 we'll come back and we are going to have the presentation of the Aquaculture Working Group report at that time and pick up the agenda as it is posted. We will go through the NOSB agenda and we will pick up again with public comment as soon as we can wrap things up and we'll try to do that quickly for the NOSB business portion. Thank you.

(Whereupon, at 4:00 p.m. off the record until 4:27 p.m.)

CHAIR O'RELL: Board members, please take your seat so we have a quorum. Okay. We are going to convene the meeting. We have a quorum. There is a slight change. There was a little mixup in the public comment list on speakers and somebody got crossed out unintentionally. We have indicated that person. Liana, you will be able to address this. And then following this public comment
immediately into the aquaculture.

MS. HOODES: Kevin, thank you very much for this. I do have to leave before the next comment period. Ready?

My name is Liana Hoodes. I'm the Organic Policy Coordinator of the National Campaign for Substanable Agriculture. The National Campaign is a national network of hundreds of organizations and individuals working towards sustainable federal policy. The Organic Committee, which I head of the National Campaign, has worked since 1997 to advocate for higher organic standards in order to maintain the integrity of organic.

There are about somewhere around 150 members of the organic committee itself. The National Campaign would like to thank the National Organic Standards Board and the National Organic Program for your ongoing work in maintaining the integrity of organic. It's a really hard job. It's getting harder in this period of the sunset review and we thank
you for all this work.

    I would also like to welcome new members to the Board. It's great to have you.

    And welcome to Valerie. We love the NOP for filling this position and we are happy to have Valerie on board.

    For those of you who haven't heard me many times, I have often come up here and asked the Department time and again why aren't you moving the NOSB recommendations to regulations. It was a broken record often and so at this time I would like to thank the Department for beginning that process with the ANPR. It's a real big step and we really appreciate it.

    With regards to pasture, we have a few comments. The National Campaign Organic Committee supports the current regulations on pasture. Currently they require outdoor access. There is a requirement for pasture for ruminants and there is a requirement for living conditions that allow animals to
satisfy their natural behavior patterns.

We believe that the current standards in place are enforceable. To the extent that existing dairy operations provide only dry lot confined feed lots for their dairy animals, it's clear they are in violation of the existing regulations. These are operations that I'm talking about that provide no access to pasture.

We ask the NOP to enforce these existing regulations when it is so clear there is absolutely no pasture. Indeed, the demand for organic milk is high and the current industry is unable to meet it. We can only look to a bright future for organic farmers and future organic farmers if we grow the supply in a sustainable manner. That means keeping the high standards.

There is no question in the minds of consumers who buy organic milk at a premium price. Organic farmers and operators who have committed to the organic system, certifiers,
scientists, and anyone who has been involved in organic agriculture as to the importance of pasture in livestock management systems for virtually all animals in organic agriculture. It speaks to the heart of an agricultural system that seeks to replicate natural systems as closely as possible.

There is no question that a dry lot confined animal dairy feed lot is neither organic nor is in anyway pasture. To explain it away as a temporary situation or that it keeps to the letter of some part of the law is an affront to the meaning and intent of the organic agricultural system.

Yet, obviously it's clear there is somewhere in between that needs to be worked on and that's what we're doing. From the zero, no pasture, to whatever it is. We support the 120 days, 30 percent dry matter. We support the NOSB recommendations, all of them that they've made including changing the term stage of production to stage of life.
Also, we absolutely support the recommendation that after a dairy operation is converted to organic all new animals must be under organic management from the last third of the mother's gestation.

Okay, materials. The NOSB I think should be looking at annotations. I realize this is a hard one this first sunset but I think you need to look at them for the reasons given by Brian and others. Colors also should be reviewed as a class. The numbers from the NMI survey said 63.3 percent organic users find it is important that organic contains no artificial colors.

That's the point here. We don't know which are artificial and which are natural so please look at colors individually and so as a class remove them from the list. There are no clear definitions and OMRI again made the case. Please review them on a case-by-case basis.

Also, we would like more time for
the comments on materials. It's hard for us as advocates because we are not one business that has an interest in one material. We need to look at the whole list so it's really hard to have a short comment time. Very hard for us to follow all the materials.

We also would say once again if TAP reviews are not complete please reject them and defer the decision on the materials if they are not complete. Thank you very much for giving me this time right now.

CHAIR O'RELL: Thank you. Any questions? Okay. Next on the agenda we are going to have George Lockwood who is chairperson for the Aquaculture Working Group and he's going to present a final report from the group to the Board.

MR. LOCKWOOD: Thank you, Mr. Chairman. It is a pleasure to be before the National Organic Standards Board again. I want to express the appreciation I have and my colleagues have for your interest in advancing
It has been a distinct privilege for me to chair the Aquaculture Working Group of the Aquatic Animal Task Force. It truly was and is an outstanding group of people and a broad range of disciplines having to do with aquaculture. We also appreciate having in our work Jim Riddle and Andrea Caroe who contributed greatly as we moved along and Nancy Ostiguy when she was able to be with us. We also received a considerable amount of staff support from Keith Jones. Since Keith has left from Arthur Neal and we are looking forward to working with Valerie Frances in the future.

As a way of background, sir, the National Organic Standards Board first considered aquaculture standards in 1999. The ones that you were considering were not drawn up by people in the aquaculture community. We ask that the effort be stopped until the aquaculture community could get involved.
In the year 2000 we had a conference at the University of Minnesota, about 80 people with environmental and aquaculture backgrounds and organic backgrounds attended the conference. Shortly thereafter you appointed Margaret Wittenburg to head up a crew of about 15 of us to take our first crack at the development of aquaculture standards.

That work was basically around the livestock model as would be applied to fish and shellfish that are farmed. The Wittenburg Report was submitted in 2001 and immediately went to another committee, Aquatic Animal Task Force, that considered a parallel effort having to do with wild fish along with farm-grown fish. Bob Anderson who was here earlier today served as chair of that committee.

Sometime after that the National Organic Program invited the aquaculture community to make a proposal and based upon those two reports and international standards,
the group that called itself the National Organic Aquaculture Working Group, about 85 of us, put together a white paper that was submitted in the year 2000.

The NOAWG, as we call ourselves, basically use the livestock standards, the Wittenburg Report, the Anderson Report, and some 12 international standards. The white paper was then posted on the National Organic Program website and subsequent to that you appointed a new Aquaculture Working Group for another aquatic animal task force. Unfortunately, a wild group that was supposed to organize at the same time never did come to fruition.

As I said earlier, we have 12 outstanding members of our committee plus three overseers from your Board plus Keith Jones and now Arthur Neal and Valerie Frances.

In January of this year we submitted our interim final report. The reason for the term interim is that we did not
include shellfish. We are continuing to work on shellfish. Shellfish has its own set of complexities and, as a result, we didn't want to hold up the submission of the final report that you now have posted.

I would like to point out that our final report, our interim final report, has no minority report. We were able to work through every one of the issues that came up. When they came up and they looked like we were going to have a difficult time, we simply stopped what we were doing and we worked through the issues in good faith with each other and, as a result, we have avoided having a minority report.

In the report you will notice, and it has been commented on here earlier, in feed we have an option A and an option B and I would like to explain briefly the difference between the two. Option A includes the use or certification of wild fish to be used for the production of fish meal and fish oil to be
used in aquaculture.

Option B does not include the certification of wild fish. Because many of the species, perhaps most of the species, in aquaculture do require animal protein in their diets, it is necessary that if we can't use significant quantities of fish meal and fish oil that we may have to petition for synthetic amino acids, specifically methionine and lysine. Those are the basic differences. Option A would be the certification of wild fish by certain standards for use in producing fish meal and fish oil.

Now, there is a major advantage if you look at option A that I would like to point out. There is only one fishery in the world that would qualify at present and that is the Alaska Pollack fishery. Pollack is harvested for fish sticks and things like that.

Sixty percent of the weight of that animal is either thrown overboard if they
are in international waters or is reduced to fish meal and fish oil if on shore. The fish meal goes into the fish meal markets. The fish oil is mixed with fuel oil and burned in boilers or is mixed with diesel fuel and burned in engines.

That is very rich omega-3 fatty acids of which there is only a limited amount available in the world that virtually is being wasted. So as you consider option A we hope that you will consider that this is a wasted resource now and if option A is indeed your choice, the economics would drive the recovery.

There are four major issues that emerge from our work that are really organic issues across the board. I just mentioned wild fish used for producing fish meal and fish oil. There is also the issue of wild fish for producing for direct human consumption.

You have in the standards
provisions for wild game and, of course, you have honeybees that are producing honey that forage in the wild. So we are not adding anything new but this may be one more dimension to the complexities that the organic community has been wrestling with over the years.

A second issue is that of persistent organic compounds, PCBs and the like, that are in fish oil. They are also in other foods and we see this as being an organic issue for all food items, not just fish meal and fish oil and aquaculture.

At first we were going to recommend that we abide by whatever standards you adopt in this area, but we said no, let's go ahead and take the lead. So you have in our proposal standards having to do with minimization in fish oil of persistent organic contaminants.

There is also a section in our report having to do with humane slaughter. We
think we are far ahead of anybody in the world in what we are recommending for any animals in organic certification. We would hope that this would set a standard that might be applied across the board to other forms of livestock.

Finally, the issue of mammalian and poultry byproducts emerges. It has emerged. It is an item that we spent a lot of time talking about and considering because if fish meal isn't allowed, mammalian byproducts and poultry byproducts would allow the amino acids to come in by that route.

The livestock rule now prescribed the use of these meat products. We have gone along with that and we are recommending that they not be allowed. Nevertheless, I think this is a much larger issue that you are going to have to be wrestling with.

In wrapping this up, we have received 48 comments that have been posted on the National Organic website, the program
website. The quality of these comments is excellent. They are focusing on the issues. There is developing balance and we will take all of them very, very seriously.

Our work ahead is we do want to deal with the program and guiding through and digesting and synthesizing and commenting on the public comments. We need to complete if we can the very complex issues of bivalve shellfish. I might point out that there are foreign certified bivalve shellfish now in the United States market place so this puts a certain incentive on to get this very complex subject wrapped up. Finally, we will be working on the national list of compounds that the NOAWG report had a long list of but we think we can shorten it down.

I would be glad, Mr. Chairman, to answer any question if there are any.

CHAIR O'RELL: Are there any questions?

MEMBER SMILLIE: Yeah. In option
A you refer to certification. Currently the one that you mentioned, I think --

MR. LOCKWOOD: Marine Stewardship Council.

MEMBER SMILLIE: Yes, MSC.

MR. LOCKWOOD: What we are recommending is that in terms of sustainability that MSC or some equivalent organization certify the resources being sustainable. The case of Alaska Pollack that I mentioned, that is a resource they have certified as being sustainable.

MEMBER SMILLIE: I was under the impression that particular certification scheme was going fairly rapidly and accepted by a number of people in the seafood industry. I was surprised to hear there was only one fishery.

MR. LOCKWOOD: That we can use. That we can get fish oil and fish meal from.

MEMBER SMILLIE: I see.

MR. LOCKWOOD: When you consider
contaminants and all the criteria we have, it boils down right now there's just one fishery in the world that we can use that fit our criteria. MSC is certifying others.

MEMBER SMILLIE: But that is the only one that would be available.

MR. LOCKWOOD: Alaska Pollack fits our standards, our proposal.

MEMBER SMILLIE: The other question I had, being a real fish enthusiast, was that again some of the documents -- some of the proposed guidelines to become regulations, the comments I've heard is that it's an excellent report but it is species specific because apparently there's like one rule for all and there's quite a few differences. Again, do you see a compromise being reached without going to like 60 or more species specific regulations, but yet not putting all species under one?

MR. LOCKWOOD: We look very carefully whether we want to go species by
species or not. Right now we have about 15
pages of proposed regulations. The livestock
standard now has three pages. Our proposal
will add another 15. If we go species by
species we would easily double that. In the
livestock standards, these are broad
standards, in a few cases for dairy and for
poultry there are specific targeted standards.

We may be able to add something
there but to go species by species would be a
logistic nightmare. We've got five major
species in Commerce in the United States now
and another three that are coming up rapidly.
There's probably another 10 that are in the
development stage and you can't possibly go
through each one. The other thing we don't
want to do is limit innovation. If we write
standards so tight that if they are too tight,
they will limit innovation.

MEMBER JAMES: If I heard you
correctly your preference is for option A?

MR. LOCKWOOD: No. We are not
expressing any --

MEMBER JAMES: You're not expressing any preference?

MR. LOCKWOOD: What we are saying is here are two options. If you can go with the wild A works. If you are not going to go for wild for good reasons, I mean for many reasons, then B will have to do but being mindful that we probably will be knocking on your door for having synthetic amino acids on the national list.

MEMBER JAMES: If option B were to be enforced, how long would it take for organic certified fish in the meal to be ready for this program?

MR. LOCKWOOD: Well, in the case of salmon it's basically a 30-month growing period so it would be 30 months from the day the regulations are adopted and a farm plan is certified. In other species it's a much shorter period of time. Perhaps some less than a year.
MEMBER JAMES: Okay. Thank you.

MR. LOCKWOOD: Shrimp would be less than a year.

MEMBER DAVIS: I have a question. For plan B you mentioned the possible use of other animal by-product proteins but I didn't catch whether you mean that would be considered as part of plan B or just the synthetic methionines.

MR. LOCKWOOD: In plan B we proscribe the use of animal byproducts but that, as I indicated, is an issue that we debated and debated and it's really an organic program issue. Under the livestock standards you have proscribed it. There is also another factor here. Whole Foods, the largest potential customer for organic aquaculture, will not allow mammalian and avian products in their fish. Their customers don't want to have pork by way of salmon.

MEMBER DAVIS: I understand.

MR. LOCKWOOD: Whether that's good
science or not it's a consumer perception.

MEMBER DAVIS: Yeah, I just missed that part.

MEMBER JAMES: One other question for you. Under option A.b, "To the greatest practical extent cultured aquatic animals should be provided their natural foods as closely as possible." Could you explain that a little bit more?

MR. LOCKWOOD: Well, yes. You can take a fish, I'll use salmon as an example, and in nature they eat a lot of other fish including other salmon. They will eat small salmon and eggs. It's not inconceivable that we could grow salmon with an entirely grain-based diet with synthetic amino acids so they would be totally removed from their natural diet. What we are doing here is repeating our perception of organic philosophies that you stay as close to nature as you can.

MEMBER JAMES: Okay. Wording like that with everything that is going on right
now with pasture, we just have to be careful that we are really clear about our intent.

MR. LOCKWOOD: It's these kind of concerns that when we work with the Livestock Committee will come out so we can get good clarification. I must repeat the comments we have gotten from the public, all 48 of them, are really right on target. They are very helpful to us.

They are developing the data on these issues and they are allowing us to focus in where there are ambiguities and not clarity. I must also say that your members that were working on advising our committee all along kept raising red flags, "You've got to be careful how you say this so a certifier in the field can certify."

MEMBER JAMES: Sure. Well, I want to thank you for this work. I appreciate that the Committee crafted a document that isn't just single-minded, that there are options in here for us to think about.
MR. LOCKWOOD: Well, thank you. When Keith Jones was leaving he and I added up how many person hours were involved. It's probably over a 1,000 to get to this point.

MEMBER KARREMAN: So this is an interim report at this time still. Right?

MR. LOCKWOOD: That's right. It's interim because we are still working on shellfish and we hope we can do something there.

MEMBER KARREMAN: All right. I'm really glad there's no minority report. That's nice that you are in unison there. I guess I would like to just say that the Livestock Committee recommends that the full board officially receives the interim final report from the Aquaculture Working Group and the Aquaculture Working Group members are especially commended for the excellent work you have done preparing it.

The Livestock Committee and the NOSB will begin consideration of the
Aquaculture Working Group interim final report immediately and we will continue to be in contact with the group as needed for clarification, advice, and counsel. I would like to, if I may, make a motion to receive the interim report.

MEMBER SMILLIE: Second the motion.

CHAIR O'RELL: And a second. Jim, do I see your hand because I know you participated in this committee if you have a comment, please.

MR. RIDDLE: Do I have to go to the microphone?

CHAIR O'RELL: Yes, you do.

MR. RIDDLE: Jim Riddle. I guess I heard what George said and I want to complement George in the leadership that he showed in making this a very inclusive process, very thoughtful, but I don't want to go on about that too much.

My question is that 44 comments
were received before this. I think George was expressing a willingness for the task force maybe to continue to be engaged. I'm just wondering if the Board receives this does that conclude the work of the task force or do you still keep the task force working on reviewing the comments as well as work on mollusk standards and list of materials?

MEMBER KARREMAN: He still has to work on the bivalves, the shellfish. That's for sure.

CHAIR O'RELL: I think what the Livestock Committee is proposing is we accept this as an interim final report for the work done thus far and the Livestock Committee can begin working on it from their side but the working group is not disbanded as they continue on the shell fish and conserve as a resource for the livestock committee.

MR. RIDDLE: So they could review these comments and provide further input to the Livestock Committee?
CHAIR O'RELL: Absolutely. That's perfectly fine with the NOP so that would be the intent. Thank you, Jim, for clarifying that.

MR. RIDDLE: They're not off the hook.

MR. LOCKWOOD: We would be glad to continue to participate.

CHAIR O'RELL: So we have a motion on the floor to accept this interim report from the Aquaculture Working Group and a second. Is there any discussion? Hearing none, we'll take a vote and start with Rigo.

MEMBER DELGADO: Yes.

CHAIR O'RELL: Oh, thank you, Andrea. Our policy is we will ask first does anybody have any conflict of interest as outlined in our procedures and policy manual on this particular issue?

MEMBER KARREMAN: I'm not sure but my sister is a veterinarian for salmon farmers in Canada and she has shown interest in the
organic program down here.

CHAIR O'RELL: We appreciate you disclosing that. I don't see it as an interest or conflict for this vote. Okay. Rigo.

MEMBER DELGADO: Yes.

CHAIR O'RELL: Jeff.

MEMBER MOYER: Yes.

CHAIR O'RELL: Nancy.

MEMBER OSTIGUY: Yes.

CHAIR O'RELL: Julie.

MEMBER WEISMAN: Yes.

CHAIR O'RELL: Joe.

MEMBER SMILLIE: Yes.

CHAIR O'RELL: Bea.

MEMBER JAMES: Yes.

CHAIR O'RELL: Andrea.

MEMBER CAROE: Yes.

CHAIR O'RELL: Gerald.

MEMBER DAVIS: Yes.

CHAIR O'RELL: Dan.

MEMBER GIACOMINI: Yes.
CHAIR O'RELL:  Kevin E.

MEMBER ENGELBERT:  Yes.

CHAIR O'RELL:  Hugh.

MEMBER KARREMAN:  Yes.

CHAIR O'RELL:  And the Chair votes yes. Twelve yes and no zero and two absent.

Thank you, George.

Next we are going to move on to status report from the Pet Food Task Force. Emily Brown-Rosen is going to present to the Board the status report.

Thank you, Emily.

MS. BROWN-ROSEN:  Thanks, Kevin. It's great to be here. I am the Secretary of the Pet Food Task Force and we have been working since last May when we were appointed on the whole issue of what standards need to be for pet food. We recently posted this document, or got it posted on the agenda so it's been just up for the public look since the last two weeks or so. We just want to present it here today as a discussion item and
then have some feedback from you on how to proceed further with the next step of this.

I would also like to thank Keith Jones who is not here anymore but he was really instrumental in getting us on track and helping us get started, getting the group up and running, sort of giving us our mission statement and clarifying things as we initially met. He was really helpful. Our third, and now Valerie, have been helping us so that's been great, too.

Also a special thanks to Dr. Bill Burkholder who is at FDA who is not on the task force but has been at almost all the meetings. He is like the pet food guy at FDA so that has been really helpful to have someone right there to tell us whether we are doing things right or wrong.

Okay. So what I would like to do is kind of walk through the executive summary for those of you who probably didn't have time to read this since you've got so many other
things going on here. That is perfectly understandable. I think pet food is a lot easier than aquaculture to deal with at this point in time. It's a lot closer to livestock standards and food processing standards already. It's not so hard to put this together.

Although it was a lot of work, a lot of discussion, I think we pretty far along on making this go forward. As a kind of general opening point here, what we had on the task force was two different groups of people basically. We had people from -- well, actually three I should say, the conventional pet food industry, we had people from the organic pet food industry, we had the FDA and state regulatory officials, and then we had people like me, somewhere in the middle of all that.

What we are trying to do is reconcile two different world views. We have what I call two bibles. We have this bible
which is the official publication of the American Feed Control officials that they publish every year. It's got very detailed pet food regulations in here. Then we have our well-known friend here, the USDA Organic Standards with people who are really familiar with each of these sets of rules.

What we are trying to do is merge them so that they can both be applied to pet food that is going to be organic and legal for sale under all the state regulations and keep everybody happy. We had a lot to work with. We had a few conflicts but I think we did pretty well.

Basically NOSB asked to start the task force last year. Part of the issue was that we do have people making pet food and we do have people labeling pet food but there is sort of a variation on how they are interpreting the rules. It kind of fits under the livestock standards and it kind of fits under the human food standards. People kind
of treat their pets like people or kids. They want to feed them really well so actually the industry thought that was a reasonable thing to do.

The conventional industry regulates pet food as livestock feed so we made the determination that it's really a better fit in general in the livestock standards. What we have done in this proposal is graph on a labeling standard that is more similar to processing. What that does is give us the feed ingredient definitions, the allowance for natural materials that are allowed in livestock feed from the livestock standards. We have also set up the labeling classes of 100 percent, 95 percent, 70 percent just like in food processing for the labeling of organic pet food.

I got a little ahead of myself here. We spelled out how we would fit this in exactly to the regulation. We decided we have two tasks here. We did that part of it and
that's how far we've gotten. The next task
that we're going to keep working on is going
back to the AAFCO people and looking at these
regulations because they have whole labeling
guides there that do have some problems as far
as how you would interpret organic beef dog
dinner.

There is some conflict when they
call something with or when they call
something dinner they have these code words in
the pet food regulations that mean a certain
percentage of that adjective. We need to work
through some problems with them and probably
help them write guidance that adjust their
guidance.

That is something that is kind of
beyond the purview of the Board here but that
will continue and we can report back on that,
too. I think in the long run will be to have
some guidance available to organic pet food
producers so how they can meet both sets of
rules and not get in trouble basically.
This document is pretty ready to go. What we would like to discuss with you is the next step. It hasn't been out anywhere. We haven't circulated it amongst the various stakeholders at all. The idea is it really needs some public comment and some feedback. The task force is willing to continue to work on it some more.

If we post it for a certain amount of time, we are saying at least 60 days, then we would look at the comments and we could compile them and get back to you if we thought there needed to be changes. Of if you want to do that, you know, that's fine. You can take it to the next step, too.

We thought if we had a 60-day comment period, then we could wrap it all up and give it to you before the next meeting and then you could decide if it was ready to go or if you wanted to work on a further -- you could work on a recommendation before your next meeting. You talk about it and tell us
how you want us to handle it but we could go
either way on that.

So, with that said, I'll just give
you a couple of key points that are in here.
As I said, we are talking about the livestock
standards. We've added some new definitions.
We have tried to pin down better definitions
on slaughter products because this is an area
in the rule that is not very well defined.

We know slaughter byproducts are
not allowed for livestock feed but there is no
definition of that. Whereas the livestock
officials do have a lot of definitions related
to that so we put that in there to help
identify what are the meat products and what
are the slaughter byproducts so that becomes
more clear.

But we have -- as I say, we have
stuck with the labeling standards so that an
organic claim would have to have 95 percent
organic ingredients. The made with organic
would be 70 percent so that is very
consistent. There was really not much argument about that on the task force so I was happy that was -- I think everybody, even the conventional people, realized the high value of the organic label and they didn't want to see anything that would confuse consumers or make it different than the way food is regulated.

We have proposed a change so that we recognize there's a difference between feeding pets slaughter byproducts. They are allowed to eat mammalian and poultry slaughter products. We did this by just proposing some wording changes. The ones in the rule now that prohibit feeding mammalian or poultry slaughter products that's limited clearly to livestock and pets would not be subject to that. Cats and dogs and carnivores so would allowed to be fed the organic byproducts of the meat industry. That's actually a value added thing for the meat producers.

We do require that when you have
"made with organic products" -- we anticipate there would probably be a pretty big demand for "made with organic" kind of label in pet food but we did include a requirement that you cannot have the same ingredient in both organic and nonorganic form in the "made with organic" claim. This is consistent with what you recommended last year.

But the differences would be based on the actual ingredient name so that's where this AAFCO book is handy because they have exact definitions of what is allowed in feed and in pet food. They could have organic chicken in the product and they could claim it's organic chicken but they also could have nonorganic chicken meal which has a distinct identify of its own. As long as it's clearly identified in the label they could do that. The manufacturers were concerned about that because there's a limited source for some of these chicken meals or chicken products.

I think that's basically it. We
are asking for some comments. A few members of the task force were kind of wanting more feedback on whether nonorganic slaughter products should be allowed at all in organic pet food just out of general concern about nonorganic meat. We didn't include that in the proposal but we are certainly leaving that open for comments.

The discussion on that was if we required no nonorganic meat, that would be a stricter standard than the food organic standard and we didn't really have a good basis to go that far so that got talked out. If you have any questions about this, I think this is pretty ready to go as far as the regulation goes but, of course, whenever you are trying to write regulations, there's always little unintended things that pop up so we need more eyes looking at this for sure.

One other thing I want to point out is the definition of pet is really strict. AAFCO thinks that pet only means dog or cat.
Then they have specialty pets which are all the odd pets which are things that live in cages or tanks but not gerbils, hamsters, canaries, birds, etc. The one point is that it doesn't include things like wild birds.

It doesn't include rabbits. It doesn't include horses. Those animals are livestock and they do have to meet the livestock feed rules. It's easier and better just to follow their whole universe for defining things and then it makes it just real clear cut. Questions?

MEMBER KARREMAN: Just one. Thank you very much. I feel terrible that I haven't been in on the calls. I know I'm part of the committee but I'm overwhelmed with a lot of things. Just a minor clarification. I think horses -- I don't know if they are considered livestock by the USDA. They are not considered agricultural anymore and if they are not pets, I'm not --

MS. BROWN-ROSEN: They are
considered livestock by the state feed regulators.

MEMBER KARREMAN: Are they?

MS. BROWN-ROSEN: Yeah.

MEMBER KARREMAN: Okay. But not agricultural. Well, I don't know if that's going to play in at some point. I know --

MS. BROWN-ROSEN: Probably.

People do eat horses in some places in the world. Right?

MEMBER KARREMAN: Above the border.

MS. BROWN-ROSEN: Joe.

MEMBER SMILLIE: Yeah. I'm not up to speed on this again, Emily. I do apologize for that, but I know in our office and I've overheard a number of conversations at policy meetings that one of the things that I thought was a differentiation that AAFCO implied was the difference between pet food, which is very clearly defined, and a pet treat. Have you continued that or is that not --
MS. BROWN-ROSEN: They have different standards. They do distinguish between food and what can make a complete claim. That's a labeling issue. If they want to claim it's complete and balanced, you know, it has to meet their nutrient profiles. They have them spelled out pretty clearly for dogs and cats.

You can either use theirs or you can give your own proof of how you are meeting a complete diet but you can't call it a complete food if it doesn't meet the basic NRC requirements basically for the animal in question. But that wouldn't affect us because you can have organic pet treats. You wouldn't be able to call it complete and balanced, for example, unless it did meet the AAFCO requirements but if it's 95 percent you could still call it organic pet treats.

MEMBER SMILLIE: Right. So on threats we are moving ahead with our current interpretation. On pet food unless you meet
AAFCO's complete and balanced diet you can't call it organic pet food is my understanding.

MS. BROWN-ROSEN: Well, people are labeling organic pet food now. I think since last summer particularly they clarified after the Dr. Brownell lawsuit memorandum that it was in the scope if you could meet the standards. I think that is part of the issue now that some certifiers have slightly different interpretations of that.

I don't think AAFCO has turned people down. I mean, I know people are labeling. Maybe they haven't gotten to a point of looking at it yet as far as if they are complaining about it. A lot of pet food manufacturers really study this and know those rules very well. They could certainly -- it's just different terminology. You wouldn't call it a complete food. You would call it, you know --

MEMBER SMILLIE: A treat.

MS. BROWN-ROSEN: I think there's
in-between there, too. We can go through it later if you want.

MEMBER KARREMAN: Just wondering since you are referring to the AAFCO rules quite a bit when you are doing this, not all pet food -- I guess we'll just say pet food -- is subject to AAFCO testing. If an organic company wanted to make organic pet food, whatever comes up in the end, do they have to be under the AAFCO labeling?

MS. BROWN-ROSEN: Yeah, they do. I mean, they don't really do testing. What happens is people can put out a label and get it on the market and it might be a couple of years before they pay attention to the labeling requirements for AAFCO. Sooner or later someone will turn it into a feed control official and they will get a letter and they will get some enforcement action. You have to follow the rules for pet food.

MEMBER KARREMAN: But in conventional pet food I don't think all canned
dog food has AAFCO labeling on it.

MS. BROWN-ROSEN: The labeling doesn't say AAFCO on it. There are like certain requirements, you know. You have to have the type of product, you have to have the animal, you have to have the rates, you have to have guaranteed analysis. It's just a specific -- you know, it's nothing that would really jump out at you. In fact, I was very surprised to learn what some of their rules were because I didn't know platter meant 3 percent or dinner meant 25 percent. I mean, how would you know? That's the way it is.

CHAIR O'ReLL: So I have Kevin, Dan, and Jim.

MEMBER ENGELBERT: Would you clarify again why they make the distinction between a food and a treat, Emily?

MS. BROWN-ROSEN: Well, I can't really answer that question. I mean, I could look it up and talk to you later about it. It's one of those arcane rules. Nancy Cook if
she were here she could spell it all out for you. They have different standards as far as nutrient guarantees. They expect people feeding -- part of the reason pet food and livestock feed is more regulated in some ways than human food is that these animals don't have any choice.

They just have to eat what you give them. FDA set it up that we are not starving them. You know, people are going to feed them the same thing everyday out of the bag that they should be nutritionally balanced. Otherwise they can't sell it as a whole food because they are worried about the animals.

CHAIR O'RELL: Dan.

MEMBER GIACOMINI: Yes. On your appendix I believe you list materials for possible petition. How many of those various items do you really think are likely to come up under petition with most of them being synthetic amino acids?
MS. BROWN-ROSEN: Right.

MEMBER GIACOMINI: I know we have torine for cats which is an unusual physiological situation but how many do you think are legitimate possibilities?

MS. BROWN-ROSEN: Well, I mean, they are legitimate in the sense that members pulled these out of what they saw in existing pet food, not necessarily organic pet food but things they would like to use. The question is how many of these could be from natural sources so they would not have to be on the list. I don't know. I think probably three or four of these really.

I mean, I think torine is the No. 1 thing that they want because it's difficult for cats who can't use -- natural forms of torine really aren't available unless it's raw meat so once they process the meet apparently it loses its viability. But of these others there may be alternatives but this is sort of the wish list. I think I would stress to the
group that they would have to file a petition.

I mean, there's room for them on the list but we would have to file a petition.

We also added a section in the rule saying that -- additional piece of criteria for the 205.600 section so one of the criteria if you are evaluating a pet food substance is that it's a required nutrient in the animal profiles for pet food.

CHAIR O'RELL: Jim is former Chair and was the observer during the time of the Pet Food Task Force. I know you wanted to weigh in on a comment and then we need to move along.

MR. RIDDLE: I'll be very quick. I really just also wanted to complement Nancy Cook, the Chair of the task force for driving it forward, but especially Emily for doing the draft writing because it really brought it all together and gave people something to work from.

I did want to point out that under
the definition of livestock in both the rule and the law that equine animals are already included in the organic definition. What I am curious here is if the directive from the Board from this meeting is for the task force to remain intact and the comments that are coming in to go to the task force before they submit a final report that then the Handling Committee would post for comments.

CHAIR O'RELL: Yes, it was my understanding that this was just going to be kind of an update of status report from the task force and the task force then will take the public comments and go back and prepare a final report for the Board.

MR. RIDDLE: After my term on the Board ended I have continued to serve on this task force and am willing to continue to do that.

CHAIR O'RELL: Thank you, Jim. That has been blessed.

MS. BROWN-ROSEN: Good. We'll do
that for the next meeting and we'll just work with Valerie to make sure we get it posted appropriately.

CHAIR O'RELL: Thank you. Thank you for your hard work, Emily.

Okay. We are going to move back to public comment. I have been asked to read several names off and maybe we'll go like the next five names so that people know where they're at. Up first Joseph Krawczyk, Tom Kimmons, Emily Brown-Rosen, Lisa McCrory, Sara Flack, Nicole Dehne and then Lisa Zuck.

MR. KRAWCZYK: Good afternoon. My name is Joe Krawczyk. I am the owner of Field and Forest Products, Inc., in Peshtigo, Wisconsin. We are a supplier of certified organic mushroom spawn and a producer of certified organic shiitake. I am also on the Board of Directors for the Shiitake Growers Association of Wisconsin which currently has about 35 active growers in it.

For you people who are not
familiar with mushroom cultivation, I guess
I'm going to give you the Reader's Digest
version of the two different types of
cultivation methods that are followed for
growing certified organic shiitake in the
United States.

I guess you could say we have
livestock in a bag here. Shiitake is produced
in two different ways. This is the production
of shiitake -- oh, by the way, I do have a
proxy statement to read, too. Sorry.

We do have this bag here which is
certified organic mostly for the production of
shiitake mushrooms. What this is is sawdust
blended with certified organic wheat bran,
certified organic millet, and a mine source
gypsum. It's incubated in this plastic bag
for 40 to 160 days depending upon the
cultivation method being followed.

The traditional way of growing
shiitake mushrooms is based on hardwood logs.

These logs are generally harvested from
timber stand improvement cuts or from logs
gleaned from the tops of threes cut during
timber stand harvest. The input in this log
is certified organic mushroom spawn.

What brings me here today? This past spring one of our growers and customer was being certified as organic for growing shiitake mushrooms on logs. One inspector who was not familiar with this process brought up the question of the use of cheese wax as a sealant for keeping moisture in the spawn and preventing it was drying out.

Not knowing the answer to that question, they approached the program director for the agency and they went to the National Organic Program who came up with the opinion that because this was considered an input, the use of cheese wax being a synthetic could not be -- the process could not be certified organic.

Well, I asked what are the alternatives and we were given quite a list of
alternatives, some of which I will go through in detail here. It was suggested that we use styrofoam caps or plastic plugs to seal spawn into logs. To me that reeks of hypocrisy because it's a petroleum-based product also.

One of the reasons we use cheese wax, there are actually two reasons we use it.

It seals moisture in the logs and, more importantly, it's put on hot so it serves as a surface sterilant to kill any competing organisms that may have alighted on the spawn during inoculation. The alternative was beeswax which I'll discuss in detail in the proxy I have in front of me.

It was also suggested to us that we use wooden plugs to seal the spawn into the logs. Well, consider this. A four-inch diameter log 40 inches in length has approximately 50 holes drilled into it. Those spawn sites all need to be sealed. With wooden plugs currently wholesaling at $12.50 per thousand, then we have people inoculating
5,000 to 6,000 logs, the cost of that alternative would be strictly prohibitive.

It was suggested that we use carnauba wax which is a plant-derived wax. Carnauba wax has its own inherent set of problems. When a shiitake log is cut from the wood lot and eventually ends up in its laying yard, which is I guess in a way pasture because it's out in the forest for 365 days a year, it's handled eight times.

From the time it's cut to the time it's put out in the woods it's handled eight times. Carnauba wax, paraffin wax are too brittle to withstand the handling that is associated with log movement. As a result, wax falls off, spawn dries up, and we lose an inoculation site.

We would like the Board to take a common sense look at this process. Wax is an inert substance. We use a food-grade wax that fungus does not grow into. When a fungus decides to emerge from the log, it is pushing
the wax away. It is not residual on the mushroom. It is not absorbed by the mushroom.

One of the things that we find is that this ruling does affect really a small amount of people but in a very large way. Certified organic log-grown shiitake is something that is niche market. We have a handful of growers that a large part of their income is based on selling this product as certified organic.

We are right now facing intense competition in the fresh market by Chinese imports who are not certified organic. So as a result of this, we were given 90 days to come up with an alternative to cheese wax which, to me, is just way too short of a time frame because we need to get into the field and field test every one of these products to make sure it's going to work. We have been doing this now for over 23 years. We were one of the first cultivators in the state of Wisconsin. We have seen all the alternatives
being used and there is no better alternative.

One of the things that has been brought to my attention, and I would hope the Board would see this, this truly is not an input as much as this bag that holds this block together is not an input. It's part of the process. It has no impact whatsoever on how this mushroom grows. It is not fertilized. It is not pesticides and it has no nutritional value whatsoever.

Well, with that overview I would like to read a proxy letter that I have here from a grower in southern Missouri. This is from Persimmon Hill Farm. The author is Ernie Bohner who has been in this business now for over 20 some years. I'm going to cut it short here because we have lots of public comment.

To whom it may concern. We have been growing shiitake mushrooms in the southwest Missouri Ozarks for over 20 years. During that time the Ozark Organic Growers Association, the Missouri Department of
Agriculture, and most recently One Cert have organically certified us. We have always presented all of our cultural practice to the inspectors who have visited our farm for over those two decades.

None have ever had a concern over the cheese wax that we used in nearly every inoculation effort. Early in the '80s we used paraffin for a year or so. We specifically chose cheese wax as a sealant due to its inert qualities and its well-tested safety record as a food sealant for many years.

The use of cheese wax as an inoculation site sealant has always been analogous to using a plastic sheet on a seed bed to maintain moisture in the germination media. Its contact with growing tissue and especially the fruit of the plant fungus is minimal if at all. I believe that once there is an understanding of how cheese wax is utilized in shiitake cultivation, it will be clear that it should not be considered a
cultural input and, therefore, should be
classified as an allowable practice in
shiitake cultivation.

Suggested alternatives to cheese wax have proved to be either counterproductive
with regard to their purity as in the case of
beeswax, or not economically viable as in the
case of carnauba wax. One thing we have to
keep in mind is that alternatives are
generally running at four to eight times the
cost of cheese wax.

With regard to the purity of
beeswax honeybees are gathered to bring
materials back to the hive from a radius of
about three miles. In order to certify
beeswax as being organic, their entire forage
area would have to be organically certified.
Bees have been used as environmental sampling
techniques by taking samples of hive's pound
wax and other bees and analyzing them for
various substances to estimate their relative
levels of various pollutants within the hives
forage area.

An article published by the University of Montana relates the value of bees as a sentinel for the quality environment. A quote follows. "Using honeybees as environmental sentinels has received wide acceptance in both the scientific and regulatory communities. The National Research Council judged honeybees to be excellent monitors of air pollution and include that other fine insects might be useful."

EPA has classified the use of honeybees as class 1 off-the-shelf in-situ assessment method for monitoring exposures to aerial contaminants at hazardous waste sites. So bees provide integrated samples of three modes in which pollutants may be transported so beeswax is not a very viable alternative.

CHAIR O'RELL: Nancy.

MEMBER OSTIGUY: I will disagree.

We do certify organic honey production,
organic beekeeping. You can get certified organic beeswax.

MR. KRAWCZYK: Okay. At what cost?

MEMBER OSTIGUY: I couldn't tell you in cost. It's not something we are supposed to be considering. I'm sorry.

CHAIR O'RELL: Andrea.

MEMBER CAROE: Joe, I understand that there is another method for propagated shiitakes on composite logs that wouldn't require wax at all. Not in a bag like that but actual logs that are composite material, compressed logs. We have actually seen operations with this. I just wanted to know if you are familiar with it.

Once upon a time I actually, in fact, did a shiitake mushroom operation. Anyways, I would like you to consider that. But also the information that you have provided is the information that this Board considers in the petitioning process for an
allowed input. You may not feel that it's an
input but horticulture oils that are spread on
tree trunks are inputs, you know.

It seems to me that it's a pretty
clear input. The information that you
provided is favorable information for a
positive petition that would get a material
listed. However, this Board would consider
that during that petitioning process.

MR. KRAWCZYK: We do have a
petition written and I would hope that the
Board would consider it shortly because this
is something that is done every year. As a
farm we need to inoculate logs every year so
we need to have a clear decision by next
spring.

MEMBER CAROE: I think it's
appropriate that we consider that when that
petition comes through and this information
will be very helpful.

MR. KRAWCZYK: Okay.

MEMBER KARREMAN: If the oil is
sprayed on the tree and is on the final product perhaps and this cheese wax is not, doesn't that make a difference? You said it's not in the final product. It's more like a canopy or roof over its habitat until it pops through.

MR. KRAWCZYK: Exactly. It's a sealant.

MEMBER KARREMAN: That's the way I heard you saying it.

MEMBER SMILLIE: That's the way I feel, too. I mean, I haven't had any experience in this area but, to me, I would look really long and hard before I would call the covering wax. I thought the analogy of the plastic sheeting for vegetable production is as good as analogies go. I would seriously question whether it really is an input. I don't see it as an input. It's not in the final product so it should make a difference, shouldn't it?

MEMBER CAROE: There is the herd
oil that is on the tree trunk.

MEMBER SMILLIE: Yeah, but the herd oil is there for a specific purpose for smothering dormant insects or for actually active fungicidal issues. This is not being used in this context that I can see.

MEMBER CAROE: He just stated that he's putting on hot to kill competing organisms. That's a pesticide.

MEMBER SMILLIE: It's mechanical. It's not infifthra.

MR. KRAWCZYK: Well, I'll let you guys argue about split hairs.

CHAIR O'RELL: Before we just continue with the discussion, any other questions directed for Joe and his comments? Thank you.

MR. KRAWCZYK: You're welcome.

MR. KIMMONS: I have a proxy. Actually I have six proxies but I'll claim the
one for the time being.

CHAIR O'RELL: We are only going
to let you claim one.

MR. KIMMONS: My name is Tom
Kimmons. I'm here to represent myself, my
organization and place on the record six
proxies as samples of comments from a broad
section of shiitake farmers. I'm the Director
of the shiitake mushroom center in Arkansas
where we grow organically certified log-grown
shiitake on approximately 30,000 logs. It
would take a room of about four of these to
hold our logs.

We began this operation in 1988
and I've been certified organic over the years
by OSFVP, AOCIA, ACO, OCIA, ICO, and for the
past two years under the authority of the new
NOP. During this time I have been a staunch
advocate and promoter of organic certification
and, more importantly, the principles and
values surrounding organic practices and
methods.
I was a founder and original trustee of the Arkansas OCIA, president of Arkansas Certified Organic, as well as founder and trustee and president of the Ozark Shiitake Growers Association, the Arkansas Shiitake Growers Association, and others.

Over the past decade and a half my organization has trained over 600 small family farmers in the techniques and methods of growing organically certifiable mushrooms. To reemphasize Joe's point, these mushrooms here have been grown this way for over 2,000 years. This is an ancient Chinese method that was originally grown on the Shia tree which is very similar in molecular configuration to our White Oaks.

Shiitake is a lignicolous fungus which means it's a fungus that eats lignum have been grown and harvested from hardwood logs for over 2,000 years because the mushroom fruit naturally on fallen logs with no amendments or inputs needed. They do this in
nature, in the wild. When you go out in the
deer woods in the fall and you see all those
white fungi grow in those polypores it's the
same basic methodology. They are lignicolous
fungi that grow on wood.

Shiitake are among the easiest to
inspect and certify as organically grown.
Why? Because there's no inputs because they
grow that way in nature. In order to better
manage and expedite the natural fruiting and
fungal colonization of the hardwood logs a
series of holes are drilled one inch deep into
the log sap wood.

We have special drills that we
drill these holes in these logs. They average
about 30 holes per log. Shiitake spawn, which
is the seed, is then inserted into the hole
and heated cheese wax is painted or dabbed
over the hole in order to hold the moisture in
the inoculation site and to keep contaminants
and competing fungi out of the log.

One of our biggest problems in our
industry is to keep competing fungi out of the log because the locally competing fungi have been in this environment for 150 million years. Shiitake has been here for about 30 so the local fungi will win the battle for the log and that's why we have to protect that internal fungi by coating it. We hold the moisture in and we keep the competing fungi out.

In past generations mud cakes, wet vines, rags, beeswax, etc., were used to hold moisture in the log until colonization was complete. It takes about 10 months for that fungus to grow throughout the log. Once that's done the wax is of no value. I mean, it's not an input. It doesn't grow on the wax. It simply holds the moisture in.

Over the past 30 years in the USA cheese wax has become the moisture sealant of choice for natural shiitake growers because it is more efficient, more affordable, cleaner, and safer than other sealants. Styrofoam plug
Sealants used by some modern growers are scoffed at by organically certified log growers because styrofoam is unseemly, nonbiodegradable, and caustic when incinerated.

Beeswax presents multiple problems. First, it attracts bees and other insects who steal the beeswax from the holes and allow the spawn to dry out and die. Second, it has a low melting point and melts away easily in summer heat. Modern day beeswax contains myticides sprayed to control trachomats in bee populations.

It's also six to eight times more expensive than cheese wax and tends to shrink in extreme temperatures thus loosing effectiveness as a sealant. You can go online and find the most available organic beeswax from Australia. You're talking more like 15 to 20 bucks a pound, whereas cheese wax -- let me show you that.

CHAIR O'RELL: You have to speak
into the microphone.

MR. KIMMONS: This is a sample of the cheese wax we use which you will notice -- okay. I don't need to move anymore. You can see, I am passing right behind the cheese wax we use which is FDA approved for use on, around, and in cheese. I'm passing behind there some organically certified.

You will notice the organic label on there of a cheese that has been sealed in cheese wax. This is approved, OCI approved. Some cheese makers use plastic, some use cheese wax, some use both but this is an example of a cheese wax that has been used on cheese and you are going to eat that cheese. You are not going to eat this log unless you're hungrier than I am.

So cheese wax. Cheese wax has been around for centuries either by use or by design to seal moisture in various cheeses and/or to keep undesirable molds and fungi from growing on finished cheese. If you
didn't seal that cheese in that wax it would turn green very quickly.

The cheese wax used by modern shiitake growers is the same cheese wax used by cheese makers and essentially for the same reasons, namely, it is used in hold in moisture and keep out contaminants. Cheese wax is neither an input in cheese making, nor in log-grown shiitake making. Cheese milk doesn't grow on wax and shiitake spawn doesn't grow on wax. Wax is not an input in either cheese making or shiitake growing.

What I want to offer to the NOSB in this session are five reasons why food-grade cheese wax has been, is now, and should continue to be approved for use in growing organically certified log-grown shiitake.

One, virtually every certified log-grown shiitake producer that has grown shiitake in the USA since the early 1980s has used food-grade cheese wax to seal the inoculation sites. That's 25-plus years of
precedence for an accepted organic practice
and, as far as I know, without question.

There is a legal cannon in the
U.S. system of justice known as starry decises
which states that traditions matter to
societies and ways of doing things over time
and require respect and consideration because
they become a part of the fabric of civil
life. If new evidence comes forward to
challenge a tradition that shows it to be
harmful or dangerous to consumers, then it can
and should be challenged. The secondary use
of this wax is in chewing gum, FDA approved.

In that respect if the NOP or the
NOSB has analytical proof or new science that
shows the tradition of using food trade cheese
wax to be harmful, then it should be presented
in all petroleum-based products be they cheese
wax, plastic, or any petrol-based coatings for
shiitake logs, cheeses, wax-coated shipping
containers, polybag produced containers,
wrappings, etc. need be inspected and
potentially prohibited in organic production.

Two, existing rules. The most current published organic growers that we have a record of for growing the use of cheese wax, the using of cheese wax in organic shiitake production, not only allows cheese wax but requires cheese wax for sealing inoculation sites.

If you refer to my handout, my attachment No. 1, it's the fourth page, attachment No. 1, you will notice it says, "Organic Crop Improvement Association International Certification Standards 2003." These were the standards we've been given to live by and have lived by.

If you'll notice on the back side of that under shiitake and oyster mushrooms, log and spawn site coatings used to prevent moisture loss must be food-grade paraffin, cheese wax, mineral oil, or beeswax. Those were the laws we were given as the International Certification Standards by OCIA.
Three, the certification of the quality of food-grade cheese wax used by log-grown shiitake growers comes from the U.S. Food and Drug Administration. See attachment 2. If you will notice the attachment just behind there, the wax we use states, "This product meets the FDA requirements set forth in 21 CFR for use in nonfood articles in contact with food and 21 CFR 172 for use in the food."

I've been cut off so I'll be done.

Thank you.

CHAIR O'RELL: Thank you, Tom. Stick around. We've got some questions.

MEMBER MOYER: I have a question, Tom. So what you're saying is that this wax is currently used to wrap certified organic cheese.

MR. KIMMONS: Absolutely.

MEMBER MOYER: The difference is that in your instance it's being classified as an input as opposed to a --
MR. KIMMONS: It's not being classified. There are no rules and regulations. This judgment came out of NOP as an assertion, as a position stated. I don't think you all ever considered this. The only laws that we have governing our industry are what you just read there from the OCI standards.

MEMBER KARREMAN: Then why were you told you couldn't use it if it's right here in black and white?

MR. KIMMONS: I don't know the answer to that. My certification agent sent me a letter saying, "This has been questioned. It is up for review and you need to state why you have used it and why you want to use it and why you should use it." That's why I'm here.

MEMBER KARREMAN: So you don't use OCIA as your certification agent?

MR. KIMMONS: I changed. I used to. That's the law I was under for years and
years and years but I have a new certifier now.

MEMBER KARREMAN: Switch back.

MR. KIMMONS: A lot of people do.

MEMBER DELGADO: Have you appealed that decision?

MR. KIMMONS: What decision?

MEMBER DELGADO: Well, the fact that you are not allowed to have cheese wax?

MR. KIMMONS: That's basically what I'm doing today. I brought a petition with me.

MEMBER DELGADO: Give it to those guys.

MR. KIMMONS: I was told that you guys set the standards.

MEMBER KARREMAN: Yeah, but if you want to appeal something, you have to deal with the regulators.

MR. KIMMONS: Well, I've never received notice from NOP about anything. I received a notice from my certifier that this
has been questioned. I have a petition prepared and I will be glad to leave a copy for all of you all.

MEMBER SMILLIE: But your first step -- I'm really happy you brought it up and I'm sure you will get some action on it, but your first step is to appeal to the NOP that the decision made by your certification agent was out of line and your first step is to appeal to NOP.

MR. KIMMONS: Pardon me, I misstated. My certification agent never questioned this. My certification agent thinks we are perfectly within the law that we've been living under. It's another certification agency in another state and this was brought up because one inexperienced inspector questioned this, passed it on up. It went on up and it came back down that "you can't do this." This has not been done by any sort of protocol or any sort of rational order. This has been done by opinion and
innuendo as far as I know.

CHAIR O'RELL: Arthur.

MR. NEAL: I've not been involved in this particular situation but listening to the testimony that has been provided, it appears that it involves the use of a synthetic substance. Mushrooms are considered to be under crop production. The OFPA section 6517 requires that the National Organic Standards Board review these production aids so I think this is why he is before you right now. There may be some question that this is a synthetic substance used in crop production and the National Organics Standards Board has to look at synthetics in crop production.

CHAIR O'RELL: And, Tom, you indicated you have a petition that you are going to file?

MR. KIMMONS: Yes, I do. I thought --

CHAIR O'RELL: From the NOP website a petition?
MR. KIMMONS: Yes. I thought if I wasn't persuasive enough and you all just didn't agree with me --

CHAIR O'RELL: Unfortunately we have a process.

MR. KIMMONS: Okay.

CHAIR O'RELL: You've got a lot of nice props and we would really like to just say it's a good thing to do.

MR. KIMMONS: Yes, I have a petition.

CHAIR O'RELL: Yes. And that is the process so if you would file that petition with the NOP.

MR. KIMMONS: I appreciate that.

CHAIR O'RELL: That will come to this Board and will go to the appropriate committee.

MR. KIMMONS: And I have you a copy. Everything I have is written.

CHAIR O'RELL: Then the committee will act on it and bring it into the full
Board and a recommendation.

MR. KIMMONS: Please appreciate what Joe said. We are small farmers and when we do this work -- now, this is only one-fourth of the log but when we do this work, we do it every year. This is not something we do and then live on it for years. We have to go out in a pickup with a chainsaw and cut these trees, drill holes, inoculate them every January and I do like 5,000 a year so this is pressing. Plus, I already have all kinds of this cheese wax already on hand. I have 35,000 logs that are already part of the organic system so your decision affects more than just me. There's probably 5,000 small growers that use this method.

CHAIR O'RELL: I understand. We appreciate that. You are on the right road.

MR. KIMMONS: Okay.

CHAIR O'RELL: The petition process will get the system going.

MR. KIMMONS: Okay.
CHAIR O'RELL: Thank you.

MR. KIMMONS: I appreciate your comments, Mr. Smillie.

CHAIR O'RELL: Emily Brown-Rosen and next Lisa McCrory.

MS. BROWN-ROSEN: Hi. My name is Emily Brown-Rosen. I was just here. I think you remember. I'm here representing Pennsylvania Certified Organic. We are a USDA accredited certification agency right here in Center Hall, PA. My role here is as a materials review manager. So I'm going to talk about sunset here. Oh, I also have a proxy from Jess Greenplatt, one of the other PCO people signed up.

I have sent you some pretty detailed comments. I think they are in your books and I'm going to try to hit the highlights of those. I do want to comment a little bit about the process like a few others have. I really appreciate it. I know you had a huge amount of work on your place,
especially the new members who came in here and got handed all this stuff from the outgoing Board and we have a very short timeline here. Sunset has been a challenge and I recognize that.

I do hope that when the dust settles on this you can take a little time and evaluate how the process went and how we can work on it next time around and how we can get started on it a little sooner next time around because we had some stuff added to the list in 2003. That is going to be up in 2008 so the sooner we can get a Federal Register notice out and get those things out for comment, the sooner we can get started on this.

Part of the problem was last summer we had a 30-day comment on the whole list and the whole industry was scrambling and we didn't get some -- we got a lot of comments but not time to do thoughtful comments or dig up more research or do it in a way that would be better. Part of this is because we have
the big lump at once. The sooner the better and I hope we can keep improving this. I think there's lots of room.

I also feel that this policy of not changing annotations, I understand the time limit and maybe that made it really difficult to even look at that this time but I wouldn't rule it out in the future. I looked over the list and I commented on 10 of the materials and basically we supported all the other recommendations except for these 10. I don't know if I said that in here but that's what I meant.

Of the 10 that I commented on, basically all the problems are due to language of the annotations, some confusing interpretations that have been made about some of these categories of materials, and also some poorly worded language in the way it's listed itself. All these things are almost like technical fixes.

Some of them have been subject of
previous Board recommendations. You already
recommended to fix these things. It's like
how many more times do we have to kick this
down the road before we make these changes.
This would ideally be a good time to do that
so I just wouldn't rule it out in the future.

Okay. Getting to the list.
Starting with crops, aquatic plant extracts.
You've heard a couple of comments. This is a
really confusing listing. It has always been
a confusing listing. We've had a hard time
enforcing it. Now it's troubling because we
thought there were several petitions in the
works on extracting materials.

An issue had been raised about
what does it mean other than hydrolyzed. Then
also it says the process is limited to the use
of just these two solvents, potassium
hydroxide or sodium hydroxide. I don't know
what other than hydrolyzed means. I
understand that, you know, it wasn't exactly
what the NOSB thought.
It ended up in the minutes but no one really knows what it means. We have no guidance on what is necessary for extraction so we have products with no extractants on the market. We have products that end up with a 20 percent of potassium K2O guarantee on the label. Obviously for different products some is necessary and some is not. There are different obvious effects of these products but we don't have a good understanding of how to enforce this annotation.

And also a compounding problem is NOP has issued a letter saying that what they think this annotation means is not that only potassium hydroxide and sodium hydroxide are allowed but that anything else can be allowed as long as it's not mentioned as prohibited. They have interpreted to mean that any amount of phosphoric acid could be used in an aquatic plant product.

We have kelp manufacturers who are arguing that they can put phosphoric acid in
there because of this letter which is posted
on the petition substance database still. If
you don't do anything else, I would really
hope you could clarify what this annotation is
supposed to mean to us now because I think the
original Board had one idea what it means.
NOP isn't saying that this category listing
means that all kinds of things could be in
there as long as they are not spelled out.
It's just backwards. We need clarification
and this would be a real good time to do it.

Hydrated lime for crop disease
control. CCOF has filed some really good
comments on this. I think there is a lot of
use for hydrated lime in crop protection. We
don't have very many materials for use as
fungicides in crop protection. It is very
important to the tree fruit industry, to the
wine grape industry.

I don't really see a valid
justification for taking it off at this point.

You could call it a mineral as an off the
category. I don't think there is a real conflict with it being on the list. This was one that was kind of skewed up originally as listed. The original annotation said something about copper because originally the Board proposed this as being part of bordeaux mix so you could tank mix your own bordeaux mix which is hydrated lime plus copper sulfate.

   It was important to have both those elements on the list. I'm not sure why the committee wanted to take it off but I think it's really highly needed and you should check in with some of the tree fruit people about the lack of alternatives.

   Now, chlorine I have comments about on all three areas, in crops, livestock, and production. As I mentioned, there was a report done and a recommendation done in May 2003 where you have a detailed recommendation on chlorine. At this time the Board recognized that the language is confusing.
Words were left out in the original rule writing. It's not clear that water in contact with crops is supposed to be at this safe drinking water level and so the Board proposed this language. I don't see why now is not a good time to look at that to make that correction. You have already commissioned a TAP report. You already made the recommendation. I think you should take all that into advice.

Right now we have very widely inconsistent ways of applying the chlorine restriction by different certifiers. Some people because of NOP interpretation are testing the waste water that is going into the ground. Some people are testing the water that is going under the crops. The Board recommended they test the water after the final rinse so they could use chlorine but they would have to rinse it. Let's just get it standardized because it's really all over the map right now and I think this would be an
excellent time to do that.

I did recommend some adjustments under the livestock and processing section because we do have some conflicts with state laws on dairy sanitation where they can't rinse the chlorine after it's in a milk pipeline. I think there should be an exemption for when a state law requires that you can't rinse it and just leave it at that and that would make a lot -- basically I think certifiers are looking the other way now. People are not rinsing chlorine and dairy lines because they can't. There is a question whether those laws would preempt federal but let's just make this clear so people are doing the same thing.

Okay. Let's see. Next on the list would be moving onto livestock materials. I pointed out that iramecton you had also recommended a change in the annotation back in November of 2000 that was sort of lost in the midst of time but that was due to some
concerns that were brought up at the meeting after the material was originally recommended that the slow release formulations are persistent in the manure and the dung and that they would be harmful to the soil. Those type of slow release bolus formulations should be prohibited. That never got in.

Skipping on, hydrodated lime as an external treatment. We have PCO growers that are using hydrodated lime as a topical treatment for hoof rot and hairy heel wart. I've quoted some literature on that. I think this is a valid consideration. We have dairy farmers using it.

We also have reviewed a synthetic milk replacer that we found is compliant with the rules and recommend that it still be on the list. I agree that we can talk about what the emergencies are. It would be very rare that you would allow that use and we would require direct approval before we allow it but there are products out there.
It could use clarification of what synthetics are allowed in the milk replacer because we have made decisions that things like animal fats and amino acids wouldn't be allowed but if it had the normal types of electrolytes and other things allowed in organic, it would be allowed.

Okay, I talked about chlorine. Processing, flavors and colors. I support the OMRI statement and I also support what Gwendel Ward has written, some very good comments on flavors. The problem with colors as a certifier is if you just put it back on, we don't know what a color is, I mean, what a natural color is.

There is no definition. If we have to do a case-by-case review of every color and do a decision chart, it is extremely problematic. Also, the fact that it's on the list as a category is very problematic because NOP keeps saying that things there on is a category include everything that is used to
formulate them.

You know, under FDA definitions of these colors there's all kinds of solvents, extractants, etc., that are allowed in the formulation. We need more guidance on do you really want to allow all those solvents and carriers and synthetics in with the so-called natural colors? We don't know how to read that. We rely on the NOSB TAP reviews and decisions to help us identify what we are allowing and not allowing. My time is up.

Oh, one other thing. I'm going to hand in this comment from the National Lime Association who faxed this to me when they read my comments. They are in support of lime. Another point I would like to make from here is they point out that there is no EPA registration of hydrated lime as an external parasiticide so that is like a technical correction that should probably not be listed as an external parasiticide in the livestock section. Any questions?
CHAIR O'RELL: Andrea.

MEMBER CAROE: Well, I actually have a comment. I would kind of like to get a comment from the program. My understanding of sunsetting a regulation is considering it for continuation. Nowhere in my understanding of sunset does it consider any alterations of the regulation. Clearly I think what we had posted in the federal register was the sunsetting of these materials as is listed.

Also, I would like to consider if we were to make alterations to annotations at this time, I don't really feel like we are giving fair notice that is being done and we are not asking for any comments. If this Board were to consider tomorrow voting on an annotation change, we have not given any notice that is coming and that is not appropriate, I feel, in the regulatory world.

Maybe, Toni, you're the best one as a regulatory writer to address this.

However, the one thing I do want
to say is that anytime we can consider a petition for removal of a material, and they do have priority over adding a material, that is not a process that has ever gone.

MS. BROWN-ROSEN: I know there are several petitions in there on aquatic plant products. We would have thought they all would have been considered at this time but it didn't happen, you know.

MEMBER CAROE: It's not that it's not going to be considered. It's just not part of this sunset process. It's not that it shouldn't be considered. Yes, I understand and I agree with you completely that some of the annotations are poorly worded and could be better and maybe are antiquated. However, I don't feel that is part of sunset and I'm pretty vehement about that. In our process we are looking at the continuation of a regulation as it is written.

MS. BROWN-ROSEN: I read the Federal Register notice pretty carefully.
There is nothing in there that said annotations couldn't be addressed.

MEMBER CAROE: But it does say sunset and sunset implies that.

MS. BROWN-ROSEN: Sunset is described as a review by the NOSB of all exemptions and prohibitions as found on the national list. Now, I consider the whole listing as an exemption, you know. The exemption is not just chlorine. It's chlorine used in such and such and such and such. It was voted on together as a whole. The Board wouldn't have approved some of these things if they didn't have those restrictions.

If you are voting to review the exemption that allows something, you really need to look at the whole thing. Maybe there's various legal interpretations here. I understand now it's kind of late in the game but I just don't want to rule it out in the future.

CHAIR O'RELL: Arthur wanted to
respond and then Kim.

MR. NEAL: I'm referring back to the recommendation that the Board made concerning reordering or restructuring the national list. That is going to impact aquatic plant extracts allowed on the other list. To act on aquatic plant extracts, as I know some of the comments have stated, it really would be premature at this point, especially depending on what that particular recommendation is suggesting. It is suggesting listing individual synthetics that are used in the manufacturing of that product.

MS. BROWN-ROSEN: How about the chlorine where you already have a standing recommendation? I mean, there has been plenty of comment on that.

MR. NEAL: What will probably have to happen is NOP will have to respond because that particular -- the way the chlorine is listed in the final rule today it had actually gone through rulemaking, both proposals.
NOP's position had never changed throughout that rulemaking process.

The issue that people have expressed concerning is, I think, reducing the amount of chlorine that can come in contact with the food to four parts per million. That is addressing the preamble of the final rule so we are going to have to respond to that.

MS. BROWN-ROSEN: Okay. Thank you.

MEMBER GIACOMINI: Question, Mr. Chairman, a clarification for Arthur. Would it be possible in the structure, granted I'm new at this and I haven't seen even a full year's worth of the process of what goes on in the Board, but it seems like a tremendous amount of time and displacing of other work is done in the sunset process.

In the restructuring of the national list would it be possible to jockey to sort of break up the national list like we do in appointing Board members so that it
wouldn't be quite as much of one workload at one period of time?

MR. NEAL: That process will actually be handled by an OP because the recommendation has already come forth through the National Organics Standards Board as a recommendation to the Secretary. The program would have to take that recommendation and then begin drafting a proposed regulation to deal with it. We would probably consult with you as we are doing.

MS. DIETZ: Hi. I'm Kim Dietz. I serve as materials chair for three or four years. I'm a past NOSB member from 2000 to 2005. I was going to say this as part of my public comment but after Emily's passionate speech about annotations, this Board has a document out there somewhere. It's a material review process for the sunset and we spent at least two years on this document in collaboration with the NOP.

I believe it's about three or four
pages long and exactly what should happen and
shouldn't happen through the sunset process.
The issue of annotations was discussed many,
many, many times. As past materials chair
every time I got to open my mouth I would say
if people want to change an annotation they
need to petition to change it.

I think that this Board should
stay consistent with that message. There is a
process. You can do it at any time and
anybody can petition to change an annotation
or to move a material and it has been
discussed so I encourage you to pull out that
document, read it, alter it where necessary
but the issue of annotations shouldn't be
changed in the sense that you are going to bog
it down. It is a one-year process to move a
lot of materials through. If you start
looking at changing or moving them around,
it's just going to bog it down even more.

CHAIR O'RELL: Yes. Thank you,
Kim. Those past Board members and the current
ones that were on the Board at that time knows
we went through that debate and the rules of
engagement and had those discussions and it
was clear from the Board's perspective that we
were not dealing with changes of annotations
and we have encouraged the public at times
when they have these issues please file a
petition.

MEMBER KARREMAN:  Just one minor
thing. I think the slow release of the
ivormectin is no longer on the market so I
wouldn't worry about that too much, Emily.
Then just as far as the chlorine in the wash
water in the milk room for dairy, you know,
which would be the more strict law, the
federal one or the state one with the public
health implications?

MR. NEAL:  You're asking which
restriction is the most?

MEMBER KARREMAN:  Yes, because
doesn't it usually go whichever is the most
strict wins?
MR. NEAL: No.

MEMBER KARREMAN: I mean, a state law can be stricter than a federal law, right? It's something to think about.

MR. NEAL: Let's think about that offline.

CHAIR O'RELL: I would really like to get us to understand how many more -- we're halfway through our public comment period so we have a long ways to go. We are going to be here late at night so I would just encourage the Board let's get through public comment.

Let's ask specific relevant questions of the speakers. If we have debate within ourself for discussion, this is not the time and place so we really need to move forward. We are going to take a break here after a couple of speakers. It will be about two hours since we convened from the last break.

Lisa McCrory and then Sara Flack would be on deck.
MS. McCORY: Hi. My name is Lisa McCrory and I'm a dairy and livestock technical advisor with NOFA Vermont. I want to thank you for this opportunity to speak today. I want to thank the NOP and the NOSB for making this happen. I think the pasture symposium over the last day has been fantastic. It has been nice to hear all these wonderful speakers, resources coming all in one room and sharing their experience so thank you very much for giving us this opportunity.

I am a dairy and livestock technical advisor for NOFA Vermont representing a membership of 1,053 of which over 600 of these are farmers. I have been working with farmers for over 15 years helping them to develop and improve their grass-based systems providing technical assistance for those farms interested in transitioning to organic dairy production and providing ongoing technical support to existing organic dairy producers as they continually strive to
improve their systems.

NOFA Vermont fully supports the NOSB recommendation that states that all ruminants over six months of age should harvest or graze 30 percent of their dry matter needs from pasture for a minimum of 120 days per year.

The NOSB recommendation also clarifies that the producer of an organic operation may provide temporary confinement for an animal because the animal's stage of life and that the producer of an organic operation must not prevent dairy animals from grazing pasture during lactation. Is it possible for the NOP to implement a measurable minimum dry matter intake requirement from pasture?

The way that this minimum requirement is to be measured should be up to the certifiers, farmers, and other resource individuals in the field. We know how to do it. The NOP in its accreditation process can
verify that the dry matter intake requirement is being met.

The OFPA established the NOSB to provide guidance and recommendations regarding the implementation of the NOP rule and in evaluating substances for inclusion on the national list. Farmers in Vermont trust this 15-member Board because of their expertise and experience in organic farming. The NOSB continues to create reasonable guidance documents that are not acted on by the NOP.

As we have done in the past NOFA Vermont would like to restate our support for the NOSB's role in providing these guidance documents and ask the NOP to act on these recommendations in a timely manner.

I would like to read to you a few of the NOP final rule citations relevant to pasture supporting the fact that it has always been the intent of the NOP that organic dairy products should come from farms raising their cows in edible pasture.
205.2 pasture, land use for livestock grazing that has managed to provide feed value and maintain or improve soil, water, and vegetative resources. 205.203, soil fertility and crop nutrient management practice standard. (a) "The producer must select an implement tillage and cultivation practices that maintain or improve the physical, chemical, and biological condition of soil and minimize soil erosion."

205.237(a) under livestock feed, "The producer of an organic livestock operation must provide livestock with a total feed ration composed of agricultural products including pasture and forage that are organic produced and, if applicable, organically handled."

205.239 under livestock living conditions, (a), "The producer of an organic livestock operation must establish and maintain livestock living conditions which accommodate the health and natural behavior of
animals including Part 2, access to pasture for ruminants."

Lastly, the presentation Market Expectations and Perceptions by the Natural Marketing Institute was presented unfairly in reference to pasture and its importance to consumers of organic dairy products.

When one looks at most organic milk cartons, as Mark Kastel had passed around to everybody, in bold print one often sees statements saying, and I'm paraphrasing, contains milk from cows raised without hormones or antibiotics. Those are all big, bold words that we as human can remember that word and burp it right back.

The other thing that goes on the cartons are visual images of cows grazing on pasture. Now, if I was asked to repeat exactly what I saw, I don't have a word that immediately pops to mind because pictorially we are all going to have our own impressions.

As consumers what they are thinking they are
going to repeat what they read on the cartons, "No antibiotics, no hormones," blah, blah, blah.

But there is rarely any information that says, "raised on pasture," or "pasture raised." If there is anywhere in the carton, it's in very minute print. It doesn't compare so I think that was very unfairly represented. I feel that this representation of what is or is not done on an organic farm determines how this information is retained in the minds of our consumer audience.

For this reason, the fact that questions pertaining to pasture and its importance to organic milk production were not asked was a disservice to the USDA in its attempt to learn what is really important to its consumer market. Thank you.

MEMBER KARREMAN: One question. Is that okay?

CHAIR O'ReLL: Okay.

MEMBER KARREMAN: Regarding the
120 days, 30 percent, and then I brought up three other options that I asked the certifiers like to accommodate different geographic areas in the country. How do you feel about that like if you had to choose? Since there's two right now, you are going to have to use 120 and 30 percent, let's just say. What if there is a choice of two out of five just so it accommodates people in other areas of the country?

MS. McCORY: I don't understand what those two out of five would be.

MEMBER KARREMAN: Okay. The only one would be cows are out on pasture eight hours a day. The next one would be a percent biomass. The other one would be cows per acre. Okay? Now, so the question would be, you know, could people pick a minimum amount of them to fit their region because what if they have full intent but it's like really hard to get that 30 percent, let's just say?

MS. McCORY: Personally, I think
that unless everybody is following exactly the same thing, which is what we are telling our consumers and what the whole intention of the National Organic Program was, if we are saying pick two out of five, pick three out of five, but not everybody is following all five, then I think that misrepresents the intent of the standards.

I think we've got to keep it simple to the best of our abilities and it should be a standard that's measurable that everybody follows. These are minimum standards. Obviously you've heard from many people that are going way beyond the minimum threshold that we are recommending.

MEMBER KARREMAN: Thank you.

CHAIR O'RELL: Sara Flack. Next up Nicole Dehne.

MS. FLACK: Thank you for the opportunity to speak today. I'm Sara Flack with NOFA Vermont and speaking on behalf of over 1,000 members of NOFA Vermont. With our
NOFA Vermont's Organic Dairy Technical Assistance Program we work with over 110 -- it's actually approximately 110. They are certifying so fast it's hard to count.

As far as I know we have 110 certified organic dairies in the state right now and there are 30 who are in transition who will complete their transition by the end of this year. We are providing technical assistance to them as well as a whole lot more who are thinking about going organic.

I've got over 15 years of experience helping farmers set up grazing systems and transitioned organic and about 10 years of doing organic inspections.

So at this time with the rapidly increasing interest from farmers wanting to go organic and demand from processors, it is becoming really important for us to have clarity on two issues that I want to address today. One is the definition of pasture and the other is the origin of livestock on
organic dairy farms.

I'll address pasture first and if I have time, I'll get to the origin of livestock. NOFA Vermont supports the NOSB recommendation on all animals over 6 months being 120 days on pasture where they are getting 30 percent of their daily dry matter intake. I think this is a measurable and also minimal standard to be met.

Within this requirement I want to say additional clarity is needed that the lactation is not a stage of production. A large majority of organic dairy farms are already meeting this standard. Certainly everyone in Vermont is.

I think this standard of 30 percent of daily average dry matter intake on pasture during 120 days can easily be verified by an inspector using at least two different methods of calculations based on daily average dry matter intake for a group of animals. These methods of calculations are already
commonly in use and not just in Vermont.

In Vermont on our organic system plan that all of the farmers have to fill out, much of this information is already collected. VOF, the certifier in Vermont, now asks farmers for their field records which includes how much forage is harvested as well as purchased feed records for all of the grain and forage that's harvested.

Then also information on the average pounds of feed fed of each of these different types of feed during the winter months and during the summer months to the whole group. Sometimes it will be multiple groups but it's done on an average group basis.

So this is not a complex individual animal record keeping system for feeding. It's just average pounds of feed per day per cow to whole groups. There is not going to be a large additional record keeping burden for either the certifier or for the
farmer. This allows the inspector before they get to the farm to calculate the percent of dry matter from pasture during the summer just by using a simple subtraction method.

Then this can be confirmed by the inspector if they feel that they need to once they get to the farm if they feel like the farmer is not meeting the 30 percent during the 120 days. Then they can go to one of the additional methods which would be more complicated as part of the audit process.

So I'm going to quickly go to the second item that needs clarification which is on the origin of livestock. NOFA Vermont supports a clear requirement that all dairy animals need to be organic from the last third of gestation once the farm has completed its one-time whole herd conversion. And that the allowance for the conversion of nonorganic animals should be permitted only for that one initial per farm initial herd conversion, not for continuously bringing in transitioned
animals.

If farms are permitted to buy nonorganic animals, then the young stock may potentially be fed GMO feed or other materials that consumers will object to. In summary, at this time clarity on these two issues, both the definition of pasture and the origin of livestock, are really urgently needed and they are not currently provided in the National Organic Standards.

I think this clarification is needed in order to protect the continued growth of the organic dairy industry by maintaining consistency from certifier to certifier and assuring consumer trust and the integrity of organic foods. Thank you.

CHAIR O'ReLL: Thank you.

Questions?

MEMBER KARREMAN: Regarding the origin of livestock because that is the next hot issue right alongside with the pasture because of the Harvey case, there was a farmer
in Idaho. I think he just got certified with 200 or 300 cows. He had an idea and I just want to see what you think about this.

Everything has to be from last third gestation once you are certified organic, but to have just a little bit of flexibility but to keep the intent of the last third of gestation but to have some flexibility you could have, let’s say, five or 10 percent in a year coming from other cattle so they are managed for the last 12 months before they milk.

I thought that was kind of an interesting option because 90 or 95 percent would have to come from the last third but you would have that little room for genetic improvement or if you had some horrible disease outbreak you could replace animals quickly or more quickly. Any thought on that?

I just popped it on you.

MEMBER GIACOMINI: Just for a statement since we have a minute, I believe
that would be similar to what is listed in IFOAM where they have a maximum expansion standard.

MEMBER KARREMAN: Okay.

MS. FLACK: My official answer to that question is I'm really hesitant to create anymore kind of gray areas and loopholes in the standards. I feel like this one really needs to get cleared up right away. I think certainly in the northeast I'm not seeing a shortage of organic heifers or calves. I mean, it's quite the opposite.

They are all going out on the conventional market. I think if we can really hold to this rule that it may be tough for a few producers for a few years. I don't see it as a huge obstacle. I actually see what it will do is create a big market for all of these dairy farmers now who are selling really nice organic genetics who can't find a premium price for it to start getting a premium price for that. I think it will just help the
overall industry as a whole. I wouldn't support any sort of exclusion or loophole there.

CHAIR O'RELL: Thank you. Nicole and after Nicole speaks we're going to take a break and on deck Leslie Zuck is on deck, Blake Alexandre, Erin James. We are going to have a short break, I think, if the Board agrees, 10 minutes and then get back.

MS. DEHNE: Okay. Great. I want to thank the NOP and the NOSB for the opportunity to speak today. I am Nicole Dehne, the certification administrator for Vermont Organic Farmers, or VOF, which is a USDA accredited certification agency. I am speaking on behalf of 366 certified producers, 110 of whom are dairy producers and 56 of whom are livestock producers. There are several points I would like to comment on today.

The first is to reiterate what Lisa was saying, that the Organic Food Production Act established the NOSB to provide...
guidance and recommendations regarding the implementation of the NOP rule and in evaluating substances for inclusion on the national list.

Farmers in Vermont trust this 15-member Board because of their expertise and experience in organic farming and in the organic industry. The National Organic Standards Board continues to create reasonable guidance documents that are not acted on by the NOP. As we have done in the past VOF would like to restate our support for the NOSB's role in providing these guidance documents and ask the NOP to act on these recommendations in a timely manner.

The Court-ordered changes stemming from the Harvey vs. Veneman lawsuit have presented the organic community with an opportunity to clarify the NOP regulations concerning dairy herd conversion and origin of livestock. VOF believes that the allowance for conversion of nonorganic dairy animals
should be permitted only as a one-time whole-
herd transition. After the transition all
certified operations need to manage their
animals organically starting from the last
third of gestation.

Currently all of 110 certified
dairy farmers are abiding by the standard in
Vermont. The preamble to the rule clearly
states that this was the intent of the law.
If farms are permitted to buy inorganic young
stock or to continually transition in stock to
organic, this allows animals under 12 months
of age to potentially be fed GMO feed, feed
treated with hormones or antibiotics, or fed
slaughter byproducts. This is in, as you
know, direct contradiction to the NOP rule for
livestock fed and healthcare.

To clarify that, the NOP rule
requires that animals brought into a certified
operation must be raised organically starting
from the last third of gestation would provide
consistency among producers and certifiers.
It would not require a significant change in management as is currently the practice for a large majority of organic producers.

Lastly, I would like to comment on the role of pasture in the NOP rule. Additional clarity is needed on the definition of pasture. The NOSB recommendations provide this clarity and give producers and certifiers a clear and enforceable rule. VOF supports the NOSB recommendation that all dairy animals over six months of age need to meet a minimum requirement of 120 days on pasture and 30 percent dry matter intake per cow per day.

This recommendation as a minimum requirement is a standard that has been agreed upon by producers from around the country as we heard today.

Some of the certifiers on the panel today talked about the fact that they did not have dairy standards prior to the NOP. Vermont began certifying dairies in 1988 and our dairy standards included pasture
regulations that required ruminants including
dairy animals to harvest 50 percent of their
dry matter intake from pasture. That gives us
an historical context.

It is important to remember that
the flexibility to temporarily confine animals
from going out on pasture due to inclement
weather, stage of production, and health,
safety, or well being of the animal, a risk to
soil and water quality already exist in the
rural and provide producers with the leeway to
make management decisions about when to
confine.

However, it must be made clear
that lactation does not qualify as a stage of
production. The clarification of these issues
is urgently needed. By doing so the NOP will
establish consistency and fairness amongst
producers, strengthen the consumer trust in
the organic label, and return integrity to the
organic standards. Thank you.

CHAIR O'RELL: Thank you. Any
questions?

Leslie, we were going to -- oh.
Okay. It's timely? Okay. We can accept
that.

MS. ZUCK: Hello. I'm Leslie Zuck
and I'm -- try again? I'm Leslie Zuck,
Director of Pennsylvania Certified Organic and
I really want to officially welcome everyone
here and we are really honored to have you.
I'm going to defer my comments until tomorrow
but I did want to make an announcement that we
have a few activities going on out in the
lobby. Sam Fromartz is signing is book,
"Organic, Inc." and Jim Pierce is going to be there. He's quoted in the book. I'm not
going to tell you what his quote is. You will
have to read it. It's on page 188 but he's
going to be playing his guitar.

CHAIR O'RELL: He already read it.

He gave it to us.

MS. ZUCK: Oh, he read it? Okay.

I missed that part. Anyway, some of you are
in the book so you really ought to read it just to see what he said about you. Right now at the break we are going to lead -- since everybody has been sitting around all day people who aren't on the Board and can get away, we are going to lead a hike up Mt. Nittany and get some exercise. We are going to leave at 6:30 immediately after my announcement here from the lobby. Everybody is going to leave and you guys can stay. We could bring you some pizza back or something.

I just wanted to point out that we have this list of restaurants and local food places, places you can buy local organic food to eat to take home with you, souvenirs. It's on the desk outside in the lobby. Please make use of that and we are here to answer your questions or anything else you have need for.

Just let us know.

CHAIR O'RELL: When are you bringing the pizza?

MS. ZUCK: When we come back from
the hike. Thanks.

CHAIR O'RELL: Thank you, Leslie.

Okay. We'll take a break for 10 minutes and then let's get back and get going. We've got a lot to do.

(Whereupon, at 6:26 p.m. off the record until 6:43 p.m.)

CHAIR O'RELL: We have a quorum. We are back. Blake Alexandre. Probably not too many people are going to hear this because most people are still out there but what I was going to do is just ask people, plead with people that if there is any way they can kind of abbreviate their comments. We are not going to try to limit comments to three minutes but we would like if voluntarily you can make your point and help us out.

Otherwise, we are going to be here for a long period of time. If somebody else has already made comments very close to what you want to do, just give it support and if you can be concise, we would appreciate it...
because we do want to accommodate everybody.

Blake, Jim Riddle, Kathie Arnold are the next up. Blake.

MR. ALEXANDRE: Okay. Again, thank you. I will try to just cut to the chase here. I said most of my stuff this morning. The words and some terms I haven't heard today in regards to the pasture issue. Again, I'm speaking on behalf of the dairy and the pasture and supporting the 30 percent and supporting the 120 days.

I'm supporting it based on the organic principles and the original intent of what I believe organic is supposed to be. I mentioned it this morning and I want to reiterate that. And I look for something to some out of this. I started participating in this process a year ago in Washington, D.C.

I thought that we made headway there. I thought that the NOP responded, the Board responded. We ended up with some rules and some guidelines. I hope that's the path
that we're going down. I want to see those guidelines become rules that are enforceable.

The issue I want to bring up right now is in California where I'm from we've got issues where certifiers need to be backed up. We need to implement and enforce the rules that are currently on the books and those guidelines and we have discrepancies. I don't know the answer and I don't know the direction that we need to go but I think it's going to fall on the NOP.

I'm here to say that it is a problem out there. I function under a different set of rules than my neighbors do and the certifiers are going to the state of California or somebody is kind of coming in the back door and the state of California is allowing something that my certifier won't allow and my certifier's hands are kind of tied. Then there are other certifiers that are interpreting the rules differently and allowing other things to happen. It's a real
mess and I hope that we can get that resolved eventually.

Along those lines, Hugh, one of those comments you mentioned that the exemption for cattle coming into the herds, I'm certified under the IFOAM or international laws and we have a 10 percent loophole where we can bring in supplemental heifers. That already exist on that side. I don't know if I agree with it or not. It has worked for me to grow. I won't need it next year and it probably won't matter in the future. I don't know what to say about that. That is my personal opinion on it. Any questions?

CHAIR O'RELL: Thank you very much. Appreciate your comments.

Jim Riddle and then Rick Segalla. Let's see.

MR. RIDDLE: Yeah, Jim Riddle and Valerie has my written comments. There's two different documents that she'll be passing out. I do have a proxy. I am the Organic
Outreach Coordinator at the University of Minnesota. In that capacity I would like to invite you all to the first ever IFOAM international conference on animals and organic production. You will be getting a registration form in the things that are being passed out.

I have also officially invited Mark Bradley to be on a panel talking about standards. I am very excited. One of our keynote speakers is Dr. Temple Grandin who is just a dynamite speaker. Yesterday was the close of the abstracts being submitted and we have papers coming in from all over the world so it is really going to be truly a landmark event in August at the St. Paul campus.

I am a recent graduate of the NOSB. I really appreciate the opportunity to serve but it feels great to be on this side of the microphone. You all have something to look forward to in life even though some of you are just starting your term. The
remainder of my comments will reflect my own positions as well as those of Joyce Ford, my wife and President of the Board of the Midwest Organic and Sustainable Education Services.

I have already submitted written comments by e-mail on April 10th. Those should be in your packets. I'm not going to go through those but I will summarize those. In particular the issue of natural colors. I will try to be even briefer than what I have on paper because other people have mentioned it, but it is important to note that the Board never recommended natural colors be added to the list. There was never a petition, never a TAP review until this combined supplemental for the sunset process. The evaluation criteria even now have still not been completed and posted to show how natural colors comply with all of the criteria in the law and the rule and so I think this is not the proper process or procedures.

There is no standard of identity
for natural colors. As has been mentioned, they can contain any number of synthetic substances such as hexane and I encourage the Board to either defer the substance and fill out those evaluation criteria properly or reject it and let it be sunnetted.

On chlorine there's been quite a bit of talk about annotations being changed. I want to point out that the annotations currently in all of the listings, 601, 603, and 605, are different from those that were originally recommended by the Board. This has caused confusion and inconsistency and one of the purposes of the Act is to have a consistent standard and this is undermining that very purpose.

The Board, all of us, already voted in 2003 to correct those annotations. That was not a sunset, that was more of a sunrise recommendation because they just became official in October 2002 and we already in May of 2003 recommended to correct those.
I do think that is one item that is fair came for changing in this process because we already have a standing recommendation that needs to be responded to from the NOP.

We had never gotten an official response to that. On commercial availability I see that as the most significant item on your agenda for action at this meeting. I think your draft is good but it does still need to be improved.

In the information to be included in a petition, and I will read this, because your recommendation currently says that, "When petitioning for inclusion on the national list of nonorganically produced agricultural products, the petition must state why the product should be permitted in production or handling of an organic product.

Specifically the petition must include current industry information regarding availability of and history of nonavailability of an organic form of the product and all
factors that may present a challenge to a consistent organic supply. That's it. That's vague. If I'm a petitioner I don't know what that's asking for.

I think there should be a precise list of the information that you need to have submitted to you because it's this Board that makes the determination that something is eligible and should be placed on the 606 list. Yeah, you've got good recommendations about what the certifier has to do on a case-by-case basis and I support those but I do think more precise instructions are needed to petitioners on exactly what they have to submit.

The earlier draft and the comments I submitted by e-mail have a list of those. I think they are clear. They are not burdensome. Any petitioner should be able to follow those and submit that information to give you the kind of information you need to make an informed recommendation to the program.
Then I encourage just a small change in what the Board would need to do with that information, that you would validate the petitioner's information in part of your review. You are looking at the form, quality, and quantity but I would advise that while you are setting this up that you establish some criteria for what is meant by form, what is meant by quality, what is meant by quantity in your eyes so that you and all future Boards can make consistent predictable determinations that carryover from substance to substance and petitioner to petitioner.

On synthetic substances NOP has done a really good job of responding to the NOSB's previous draft on synthetic/nonsynthetics but there is one part in there that really bothers me and I think you need to respond to that. That is it states that a formulated substance is not synthetic if it contains only synthetic substances on the national list.
Now, I don't get that. I don't know how you can take synthetic substances and magically have them be nonsynthetic just because they are on the national list. I think that is mixing up the materials review process with the process of certification of a processed organic food. I think these are two totally different topics and that needs to be corrected so your nonsynthetics are only formed of nonsynthetics, not synthetics.

On future rulemaking issues there will be some new rulewriting in the short term coming out, especially from the court ruling and the change to OFPA last fall. On the issue of synthetic ingredients, you need to be aware that Section 6504 of OFPA requires that organic products shall have been produced and handled without the use of synthetic chemicals except as otherwise provided in this title.

Now the amendment allows the use of synthetic ingredients on the national list but not synthetic processing aids and other
synthetic substances. I think that's a bit of a problem because approximately half of the substances currently on 605(b) are processing aids, they are not ingredients. I think that has to be addressed.

In dairy conversion you'll have the last third transitional feed farm raised now being allowed but there needs to be a verification of transition of the status of that feed because now it will be fed to organic animals so it needs to be inspected and certified during that third year of transition so that needs to be accounted for.

You've already heard comments on the replacement stock. I think that also has to be addressed at this time. It's a huge issue and if you are allowing conventional replacement stock on a continuous basis, you are allowing young stock that have been fed GMOs, slaughter byproducts such as blood, serum, fats, may be treated with antibiotics and hormones.
As you saw on the marketing survey, antibiotics and hormones are at the top of the list of what people are buying organic dairy products from according to that one survey. It also undermines the market for organic young stock totally. Why would anybody raise organic young stock if there is no market?

Last, on the pasture requirements I want to thank NOP for putting up the ANPR and holding the pasture symposium. I think it's clear from the speakers that there are numerous health benefits for the animals and that grazing is the natural behavior of ruminants. These are both requirements of 205.239(a) of the regulation.

Pasture is a keystone issue when it comes to integrity, when it comes to confidence, and people buying other products. We don't want to kill the golden calf to mix metaphors here. You need to look at the principles of organic production and handling
that the Board has already adopted. The rule already has numerous quantifiable numbers so this would not be anything unique or unusual.

I give examples of that. I'm not going to repeat it. I just encourage it to be dealt with in a timely manner. Thank you.

CHAIR O'RELL: Thank you, Jim. I think we have a couple questions.

MR. RIDDLE: Okay.

CHAIR O'RELL: Andrea.

MEMBER CAROE: Just a quick comment on the commercial availability language that we propose. You need to look at the rest of that document because that information for petition also addresses petitions for other lists. That level of detail is consistent if not more detailed than the information that is requested for a material to be listed. In order to fit into that document, we propose language that is similar. We did have language that was a lot more detailed. It was not appropriate in that
MR. RIDDLE: I understand and I have done that. Some of it is redundant or it would have been redundant, kind of the name, rank, serial number type things. There are others in our earlier draft that are unique information for commercial availability determinations that I think the petitioner needs to know because other the Board in the future could be accused of making arbitrary and inconsistent decisions unless you've got better information feeding into the process.

MEMBER CAROE: My point is that when we are considering a material for crop input the level of information that is requested in that document, information for petitioning, is just as brief, yet we do consider a lot more information in the petition process.

That document has a very brief description of information to be provided. That does not mean that is all the information
we would look at. There may be a further-on
document that spells that out but it was not
appropriate in this document to lay all that
out when for other lists, which we look at
with the same level of scrutiny. It wasn't
laid out in that detail.

MR. RIDDLE: And the Board already
has made a recommendation to improve that
petition instruction document to get more
information and more consistent information
for all of these inputs.

MEMBER CAROE: At that time that
would be a good place and we have that
information.

MR. RIDDLE: I think now is the
time myself.

MEMBER CAROE: There's a lot going
on.

MR. RIDDLE: Now it is being
rewritten to be implemented and to me now is
the time to get it right.

CHAIR O'ReLL: Jim, thanks for
your comments. On the colors issue there was
the evaluation -- the evaluation forms, the
criteria forms, were completed. We are just
looking online. They are not posted.

MS. FRANCES: They are at the end
of sunset review. They are there.

CHAIR O'RELL: They are there.

MS. FRANCES: Actually they are
there right now.

CHAIR O'RELL: But they are at the
end. Okay. They are where?

MS. FRANCES: Because we didn't
have a special line for it in the agenda
because of the
way --

CHAIR O'RELL: They are at the end
of this document.

MS. FRANCES: They are at the end
of the actual technical review for colors.

MR. RIDDLE: Attached to that
supplemental tab?

MS. FRANCES: Yes. If you
continue on, it's there.

MR. RIDDLE: That's a unique place for them.

MS. FRANCES: It was because of the way --

MR. RIDDLE: I'm sorry then. I stand corrected.

MS. FRANCES: It's because of the way the agenda was done ahead of time and that wasn't included at that time. We couldn't just change it so we had to add it in somewhere.

MR. RIDDLE: Okay. Yeah, it would have been nice if they would have been somehow added to the recommendation.

CHAIR O'RELL: I agree they are a little obscure because we were looking here for ourselves to find them because we knew that they were filled in.

MR. RIDDLE: Okay. I would like to take a look at them.

CHAIR O'RELL: There were some
last-minute things that were being put together with the agenda to get them ready.

MR. RIDDLE: I know what it's like to do last-minute things for the NOSB meeting.

CHAIR O'RELL: I apologize for the confusion but, yes, they had been addressed. I know that doesn't fully address your concerns but at least during discussion here we will have that for a Board discussion to go through that criteria. I want to make sure that we have those at least printed out in our books for the Board.

Julie, we can talk about that when we break to make sure.

MS. FRANCES: I'm doing that right now.

CHAIR O'RELL: Thank you, Valerie.

MS. FRANCES: I'll have everything up on the screen tomorrow so I'm downloading everything right this minute. Everything will be on the screen.

CHAIR O'RELL: I want to make sure
that all the Board members have it and have seen it as well.

MS. FRANCES: I'm going to print out all that stuff to make sure that everybody has it.

CHAIR O'RELL: Thank you.

On the chlorine, I certainly think going back and reviewing and looking at the 2003 recommendation and I believe that recommendation is the correct recommendation. I think maybe we need to take that up as a work issue with the NOP as to why there hasn't been action on that recommendation as opposed to tying it up and trying to change an annotation on sunset.

MR. RIDDLE: Yeah. Like I said, it's a pre-sunset. It's more of a sunrise.

CHAIR O'RELL: Okay. Oh, I'm sorry. Bea was next.

MEMBER KARREMAN: Go right ahead.

MEMBER JAMES: Thank you, Jim, for your comments on so many different topics. We
appreciate that. I wanted to ask you since you are affiliated with IOIA your opinion as to why Mark Kastel mentioned that there were 10 to 12 farms that were currently not practicing pasture grazing. With 205.237 in place, how is it that an inspector could allow certification if they are not practicing grazing with pasture?

MR. RIDDLE: Yeah. Well, first, just to correct one thing, the inspector doesn't allow anything. The inspectors, the fact-finder reports.

MEMBER JAMES: Or not noticed.

MR. RIDDLE: Well, I don't know that the inspector did or did not report on the findings in the amount of pasture available and assessed whether that complies with the rule. Not all inspectors are IOIA members or attend IOIA training, especially a number of state employee inspectors because they work for a different hierarchy. I can't answer that.
I can offer, though, that whatever comes out of this pasture discussion, rule changes, that IOIA will be an active partner in helping train inspectors if they need to understand how to do 30 percent DMI calculations. That is quite doable, especially on an average annual basis.

Then I did have one other comment related to that and there was a discussion earlier today about standardized organic system plans. For the new members on the Board, you should know that the Board already has adopted standardized templates for OSPs for crops and processing. ATTRA has been commissioned and is in the final drafting of a standardized OSP for livestock that will be gathering the necessary information about pasture.

MEMBER JAMES: Thank you.

MEMBER KARREMAN: Just real briefly, Jim, when you mention that with the new rule for feeding livestock maybe in the
third year you said that the feed needs to be transitioned. The transitional feed needs to be verified because it's being fed to organic cattle.

MR. RIDDLE: Right. Right.

MEMBER KARREMAN: They are not organic yet.

MR. RIDDLE: Right.

MEMBER KARREMAN: There should be like a preinspection like a year beforehand?

MR. RIDDLE: I think that would be a very good practice. With this new change in the law that feed is going to be fed during that entire year and at the end of that year that milk will be qualified as organic and if those farms are getting that preinspection, there is going to be a lot more confidence that the operators following the rules during that third-year transitional time period.

MEMBER KARREMAN: That's a good idea. Good luck with your first IFOAM Congress.
MR. RIDDLE: Yeah. Hope you make it. Thanks.

MR. SEGALLA: My name is Rick Segalla. I'm a dairyman from Connecticut. I have approximately 100 certified milkers milking every day. I've been here before. I've spoke before you twice so far. Over the past few months I've taken the initiative to go across the country and I attended a meeting in Wisconsin and I went to the west coast to the Humboldt meeting. It was enlightening.

We listened to the certifiers out there and they had no clue how to really enforce the dairy pasture rule because somebody said they didn't have to do it. I think that's because of the fact that we have big dairies out there that aren't doing it and they are saying, "They're doing it and they are getting away with it and people know it and they are not enforcing it."
I really think that they should be given a letter of noncompliance as of now because, as you saw today, when Juan got up here all he did was skirt the issue of whether there was pasture provided for these animals. He came up with all kinds of excuses why they didn't have pasture but none to the fact that they were trying to work towards pasture. They have no intentions of doing the pasture unless they are forced to do it.

I listened to people coming around and stuff like that and they said, "Wait until the end of June. The rules are going to drop and you will be able to do this and be able to do that and the other thing that you can't do now." We are here to build a better system and not take down the one we have. I was amazed when I went out there and started to hear about this replacement issue.

I mean, coming from the northeast that is one of the basics for organic production. Once you start that transition,
every cow in your herd is in your herd and, yes, you are going to do 100 percent transition but animals in your herd are in your herd so when they turn a year of age they start doing the transition, too. It works right back to the calves. Those calves aren't going to be considered organic to start over until that mother is in the last third of gestation. I don't know where the confusion is on this. I mean, it's there. I mean, the northeast has read these rules and this is the way they have interpreted them. I come out here and everybody -- it isn't that the laws aren't there.

They are just finding loopholes to them. The lack of authority over here to give them a letter of noncompliance so they start working towards it. I mean, they can appeal the letter of noncompliance but they haven't even done that. You talk about integrity and there's none.

I mean, as I went around I could
see there was always this little loophole that they were trying to exploit. Those aren't the true organic producers. We talked about the Straus farm. He's got enough acres and touring around the country I saw a lot of creative ways to making the 30 percent of dry matter.

I think he could work towards it. Maybe he might get a letter of noncompliance for a year or two until he got the system worked out but he has to work towards it. I mean, you've got all these family farms that are dependent on the system to work. We can't let the ones with money that rule the roost here. Thank you.

CHAIR O'RELL: Nancy.

MEMBER OSTIGUY: I want to thank you for coming back again. I know you have been very discouraged with how slow this process is.

MR. SEGALLA: I'll be back again probably.
MEMBER OSTIGUY: That's good because, unfortunately, democracy is very messy but persistence wins. I think we're getting there. Thank you for coming again.

MR. SEGALLA: Thank you.

CHAIR O'RELL: I actually missed a name because it was crossed out and scribbled on the side so Kathie Arnold. I'm sorry and I apologize. Are you ready? Okay.

MS. ARNOLD: I carry a proxy for Gerald Snyder who actually is on the list probably sometime later but he had to leave so he left me a little bit of a statement.

My name is Kathie Arnold. I'm an organic dairy producer in central New York State and also the Policy Committee Chair for NODPA. I'm putting on my Gerald Snyder hat who is an organic dairy producer from Alfred, New York. He says, "I appreciate very much the attitudes and spirit of cooperation as well as a sense of humor that has been evident these past two days of interaction between the
NOSB, the NOP, and all people participating in
the symposium.

    Thank you to every person who has
made these two days possible. I support the
30 percent dry matter intake for 120 days per
year and want to see all dairy animals raised
organically from the last third of gestation."

    Gerald also wanted to point out
that on one of Mary Ellen charts up there
where it showed a concern with organic feed
was No. 2, he just wanted to remind people
that pasture is part of that organic feed.
That's at No. 2.

    I was also asked by -- okay,
Gerald Snyder off, Richard Swartzentruber on.
    He is the Co-Chair of the Northeast Pasture
Research and Extension Consortium. He asked
me to read a letter from the Consortium and
the Consortium is a public/private partnership
of Land Grant University Research and
Extension people, USDA Agriculture Research
Service, USDA/NRCS representatives, dairy
beef, sheep, goat, and horse producers, NGOs and agribusiness suppliers in the northeast. I won't read that letter but just say that basically they are supporting inclusion of specific numbers, 30 percent, 120 days in the rule.

Ned Arthur, statement from him. I'll just put it in the record. Then I personally would like to say ditto to all that's been heard about putting specific numbers in for pasture and the need for dairy replacements being organic from the last third of gestation.

I just want to clarify one thing a little bit more as to where the 30 percent, 120 day figure came from. Our discussion this morning on the panel may have left the impression that it was totally in Organic Valley initiative which is not the case. It may have originated with Organic Valley and their process, their nationwide process of farmers being involved in that decision.
In the fall of 2004 when H. P. Hood was readying to enter the organic milk market under the Stoneyfield Farms label, H. P. Hood's Vice President of Operations communicated that it would be very helpful to have guidance on what constitutes an appropriate base level of pasturing to require such for all their supplying farms, him knowing that pasture was an issue.

At that time NODPA started the extension discussion among farmers in the northeast and drew in NODPA and producers from the west as well. These producers were shipping across the spectrum of processors from Horizon, Humboldt, Organic Valley, H. P. Hood, and Natural by Nature out of which came the agreement that the 30 percent, 120 days was agreed to by the vast majority of farmers.

Then finally I would just like to say thanks to the NOP for commissioning and Mary Ellen Molyneux for doing the research on
pasture and organic dairy. What that highlighted to me was that organic dairy as in all organic production is a whole package. It's not just one or two traits. Thank goodness our sector has the top one or two concerns of antibiotics and hormones under our belt and down right and we don't have to work on those issues.

Even though pasture is a concern of organic dairy consumers was deemed statistically significantly lower in concern, still pasture being a concern of 72 percent of consumers in my book is a very significant majority of those consumers. Thank you.

CHAIR O'ReLL: Thank you, Kathie.

Any questions?

MR. PECHACEK: My name is Steve Pechacek. I am from Mondovia, Wisconsin and I
am President of the Midwest Organic Dairy Producer's Association, or MODPA. And also Organic Choice Milk Procurement which has more than 50 small certified organic dairy farms.

I would like to thank you for the opportunity to be here today. I would also like to thank you, the speakers, who spoke yesterday who basically confirmed what small certified organic dairy farmers who graze have known for years, and that is that cows are healthier in their natural environment and doing what they are created to do, graze pasture.

We have heard a lot about intent and intentions. I would just like to remind everyone of the old saying, "The road to hell is paved with good intentions." We have to be careful not to let individual who would take advantage of this privilege.

How will small family organic dairy farms who are legitimately grazing and following the standards continue to compete in
the future if new organic dairies are allowed
to say they have the intent to follow the
organic standards then choose or come from
regions of the country where it is well known
that a grass-space farm or pasture
requirements cannot be met.

In 1948 there were 148 thousand
dairy farms in Wisconsin. Today there are
about 15,000. For many small family dairy
farms organic farming is their last chance to
survive. It is truly unfair for farmers who
may have been on the land for five generations
to compete with new organic dairies not
following same standards that they have abided
by for years. We just want a level playing
field.

On behalf of the Midwest Dairy
Producers Association and Organic Choice Milk
Procurement we support and endorse cattle
grazing on a minimum of 120 days on grass
during the growing season and a minimum of 30
percent of their dry matter intake to come
from grass.

We also support all replacements being raised organic since the last third of gestation. This is being proposed as a minimal standard so that all regions of the country could comply. There has been a general consensus from NODPA, MODPA, and WODPA that the proposed is reasonable and possible.

Yesterday we heard calculated evidence from Kathy Sutter, Lisa McCrory, and others that said this proposal is achievable citing evidence of enough time in the day and even byte rates and byte mass. There are also other scientific reasons why we support these criteria.

The first reason is chlorophyll. Chlorophyll has been said to be the most powerful cleansing and purifying agent in nature. It detoxifies the liver in the bloodstream. Chlorophyll is known as concentrated sunlight. Because it is almost identical to blood, and I have submitted a molecular chart,
chlorophyll is also known as the blood of plants. The only difference between blood and chlorophyll is that the molecular structure of hemoglobin is centered around iron and chlorophyll is centered around magnesium.

Chlorophyll is the substance that fuels all life on earth and helps deliver more oxygen to the body. Without chlorophyll there would be no plants, no oxygen, or humans. We've all heard the expressions "grass green" or "green as grass." Grass contains one of the highest amounts of chlorophyll of all plant species. Chlorophyll also has the ability to buffer acidity and stabilize pH levels. Low pH or increased acidity in the blood and body is a contributing factor to many diseases in both cattle and humans.

There is a very well explained book called, "The Battle for Health is Over pH" by Greg Ciola and Gary Tunsky. Diets of dairy cattle that contain large amounts of grains, concentrates, or famedifids, or even
stress can make the body acid causing a breakdown of the immune system and disease.

There are reports from dairy farmers who graze that have individual cows living to 20 years of age. It was reported by a speaker yesterday that the average lactation for a cow in confinement is 2.8. Many cows in confinement today are like people and do not get enough exercise. With more exercise cattle are also better able to oxygenate their bodies. Oxygen is required for such things as healthy cell regeneration, assimilation of nutrients into the cells, metabolic function, immune function, hormone function, digestion, and respiration.

There are also other things in milk from grazing like conjugated lentil lake acid which is beneficial to human diet. This is why I feel most consumers are buying organic milk. We live in a world today controlled by governments and laws. If you break a law, you pay the price. Many people
forget that there are also laws of nature that cannot be compromised. Every time man tries to cheat the system of nature and thinks he can create something better or greater, there are serious repercussions.

I could go on but for the purpose of time I'll stop. Thank you.

CHAIR O'RELL: Thank you. Zea Sonnabend and next is Brian -- okay.

MS. SONNABEND: Hi. I'm Zea Sonnabend with California Certified Organic Farmers. We represent more than 1,200 growers, ranchers, and handlers mostly in California but throughout the country.

I am going to take Nancy comment to heart that persistence often wins and I'm going to try -- I'm sorry to have to give you technical comments so late in the day but I have been here many times before and I'm going to try and focus my comments on things that not everybody has commented on like CCOF does support pasture things and we support
commercial availability. I am going to stick with some things that haven't been brought up for my comments.

I was invited to come to the second NOSB meeting in 1992 to give an introductory primer to the new NOSB members about materials which we in California had already been reviewing for some years before there was any federal regulation.

At that time myself and Lynne Cody, who is here but not here right now, talked to the incoming members and we said this is a great start in OFPA but this synthetic definition needs a little more work still. We need to hear some more definitions to distinguish formulation from substance and to define extraction better and talk about the parameters that really comes with synthetics.

I have been persistent and I have been bringing this back up now since 1992 and I'm glad to see that you are still working on it because for a long time it just lapsed and
I'm glad it got brought back again. You have now what I think is a good start. I really like the way that Valerie and whoever helped restructure the document called "The Recommended Framework to Clarify Synthetic and Nonsynthetic."

I have a few suggestions and then this will sort of apply to a lot of my comments about the renewal of the sunset materials. I am very concerned with what has been commented on previously about the nonsynthetic substance being on the list with synthetic additives and, therefore, the original NOSB decided the chemical change had occurred to call it synthetic. Arthur is saying in restructuring the list these things like fish and aquatic plants are going to be reclassified as nonsynthetic.

Well, that raises a number of issues and, in particular, in your document that you are looking at, your framework in Section 3.3 where it deals with formulation,
it does state that a formulated substance can
be nonsynthetic if it contains a nonsynthetic
substance and any synthetic substance from the
national list.

This is not complete. It's saying
the synthetic substances on the national list
for that purpose of being added to the
nonsynthetic substance. Just because
phosphoric acid is on there as an
equipment cleaner and handling does not mean
that it can be used in an aquatic plant
product that is called nonsynthetic. There is
still work to be done on this. I would
suggest adding to 3.3 that the synthetic
substance on the list must be on there for the
purpose of being combined with a nonsynthetic
substance.

Another thing that came up in
previous NOSB deliberations was the issue of
combustion and whether combustion was a
natural or not natural process in the end
result. This is not dealt with at all in the
synthetic document right now. There is an old NOSB definition that includes combustion of minerals is considered to be a synthetic process.

We all pretty much would agree that combustion of plant residue, i.e., wood or things like that leading to ash is nonsynthetic. But when you do the same thing to limestone and your end result is calcium oxide or hydrated lime, that level of heat and combustion considered combustion of minerals is what classically we have determined to be synthetic, the difference between this natural mineral and the synthetic mineral.

I would like to see 3.6 used. In 3.6 of your document the combustion of minerals is one of the types of chemical changes that would be considered when you review synthetic and nonsynthetic determinations.

So that being said, we in California have worked really long and hard
with you. I was the original TAP contractor who helped get a lot of things on the list in the first place. In this course of doing so we always insisted on good process, good evidence, as good as we good have at the time which, granted, has improved over time a lot, and a transparent process.

Therefore, we were happy that the sunset provision gave the people the opportunity to bring forward new evidence of anything they wanted to have removed from the list. However, we are very concerned when something was recommended for removal from the list without having any such evidence presented to you of why it should be harmful.

Therefore, we are strongly opposed to removing hydralated lime from the list both in a crop use and a livestock use. We did not see any evidence come forward in public comment. We did not see any evidence in the posted recommendation from the committee of why the decision was made to not renew it.
The whole document started out stating how it was made and how it was considered and what they talked about. Then it just said, "Move to not renew," and no reason.

So in my written comments, which I have submitted and you all have in your notebook, I have given you some detailed reasoning about how growers are using hydrated lime, why they couldn't submit written comments to you themselves because of a two-and-a-half-week notice for written comment period when in California it's been raining every day. I tried to talk to a few of our growers and they said, "Please, members of the NOSB, call them on their cell phones. They are out in their field trying to keep the disease at bay on their sprayer because every day it rains and the disease is going wild. We are going to have a severe impact on organic fruit anyway, even with these materials this year. To remove them without allowing these growers the opportunity to
speak up about it they don't feel is very fair or a good process.

If there is something that you really are thinking about deferring, at least postpone your vote until the next meeting or something so that everyone would have a chance to weigh in on the meeting -- on the issue. Now, I'm not going to reiterate my detailed comments about how hydrated lime is used but I do encourage you to use them -- to read them in your notebooks.

I have with me similar type information for the antibiotic product streptomycin and terramycin. I got some of this originally for the NOP. I was very disappointed it didn't get into the TAP review because the information was there.

It talks a lot about resistance and how resistance is not likely to cure from plant applications of streptomycin because the resistant organism Erwinia, which is the flower blight organism, would have to
conjugate with the human pathogen organism to create a resistant strain in humans and the conditions that each thrive under are pretty much the exact opposite. That is fairly germane to the lack of any evidence so far that plant applied antibiotics have not led to any known cases of human resistance to antibiotics.

So, anyway, you are able in your discussions on some of the crops materials to call on people from the audience and, as I say, I have lots of the supplemental information with me on the antibiotics on the hydrated lime, on the lignosulphanate on the aquatic plant products. I'm happy to speak further on it so that I don't like bore you with all the absolute details tonight.

I have brought with me a few support letters from CCOF members in support of the hydrogen peroxide retention, the hydrated lime retention, and the streptomycin retention. We do hope that you
will consider these as time allows and thank
you very much.

CHAIR O'RELL: Thank you, Zea.

Any questions?

MS. SONNABEND: Everyone is glazed
over. I probably won't be around for the vote
for I will be around at least until about 2:30
tomorrow, 3:00 so I am happy to talk to anyone
about the details.

CHAIR O'RELL: Okay. Thank you
very much.

Diane Goodman. This is the one
you're speaking on for Stephen Clark? Jorge
Gaskins is up next on deck, please.

MS. GOODMAN: Okay. Hi, folks.

Thanks for --

CHAIR O'RELL: You're only five
minutes. Is that correct?

MS. GOODMAN: I'm five minutes.

This one is five minutes, yes. Okay. I'm
Stephen Clark right now. Thank you very much
for allowing me to speak on his behalf. I'm
sorry also that this is so late in the day and we are all a little glazed over.

Stephen Clark is Director of Industrial Research and Development for Florida Crystals Food Corporation. Good afternoon -- good evening. Florida Crystals offers a warm welcome to the new NOSB members and offers our support, experience, and input in anyway that will be of value to you during your years ahead on the Board. Thank you to the NOP and the full NOSB for the opportunity to comment today.

Our written comment goes into greater detail of what I will summarize and emphasize now and that's what you have in your hands. Our comment focuses on the effort to further clarify the definition of synthetic and nonsynthetic for defining substances placed on the national list. We sincerely appreciate the consulting that was sought by NOP for technical expertise to help the Board in this determination. My comments address
three substantial issues under consideration.

First, we notice the question is repeatedly asked about the NOSB's intent and purpose. This needs to be clearly explained for any definition to be considered in the proper context and must be addressed before any further deliberation should move forward.

We believe, and I can safely assume, that most of the organic industry and consumer market place agrees that there is no room in organic production or handling for petroleum derived toxic persistent chemicals.

The existing criteria for the evaluation of substances to be placed on the national list already qualifies many of those concerns. We trust the NOSB to use all necessary caution needed to avoid any jeopardy of organic integrity and to protect consumer expectations.

We strongly suggest that the NOSB consider any substances that are produced entirely from natural sources without any
prohibited materials, without the inclusion of any petroleum-based compounds, without any diversion from OFPA criteria whether by extraction, formulation, manufacturing, or by processes that are naturally biologically occurring or already permitted as processes to produce final products as food not be considered synthetic for the purposes of this definition.

The second point in response to the recommended definition of substance, we disagree that a substance be defined as a compound or element that has a distinct identity such as a separate CAS number. This is a little bit unusual but it was an observation that was made.

If you'll notice, the national list section 205.605(a) already lists three substances that are available in three separate forms each with a different CAS number. They are calcium sulphate and hydrous calcium sulphate, calcium sulphate,
hemihydrate, and calcium sulphate dihydrate. The same can be said of the three forms of magnesium sulfate and sodium carbonate, all on the (a) list and all available in three forms with separate CAS numbers.

This presents an obvious ambiguity in which the intended substance on the national list is a nonsynthetic which in another form could be a synthetic depending on its origin, form, and, if appropriate, method of manufacturing simply because it has a separate CAS number.

My third point is the relationship of the terms formulating, manufacturing, and processing as they relate to chemical change.

I want to point out that the process of formulation as a synonym for manufacturing cannot be solely related to the use of the term in the OFPA definition of synthetic since OFPA also references manufacturing in the definition of processing.

It reads, "Processing as defined
means cooking, baking, heating, drying, etc., or otherwise manufacturing." This leads to the interpretation that manufacturing, and it would follow formulation as well, would include the methods defined as processing in OFPA. So I'm going to wrap this up as fast as I can.

So if a processing method is allowed to manufacture ingredients into food, it reasonably cannot be disallowed for the manufacturing of the naturally occurring sources of those ingredients or processing aids that unlike ingredients do not even remain in the final product. We suggest that the new proposed definition of formulation (manufacturing) include the methods allowed for processing as defined in OFPA.

In closing, I'll just wrap this up, we want to briefly mention the support for our customers who may use nonorganic agricultural substances that now need to be placed on the national list Section 205.606.
and urge you to come to a clear and expeditious process for the approval of petitions for those substances, give clear guidance regarding commercial availability to the certifiers, and be as flexible as possible to an approval process that will avoid any disruption in the market place.

Thank you very much for your time and consideration.

CHAIR O'RELL: Thank you, Diane. Any questions for Diane?

MS. GOODMAN: Thank you.

CHAIR O'RELL: Jorge Gaskins. Do I have that correct?

MR. GASKINS: Yes.

CHAIR O'RELL: Next up is Richard Martin and then following is Michael McNichols. You have the proxy for Michael McNichols so 10 minutes.

MR. GASKINS: It will probably be shorter than that, sir.

CHAIR O'RELL: Thank you.
MR. GASKINS: Let me speak first for Michael McNichols who had to flee to catch a plane. I'll read his statement to you.

"My name is Michael McNichols and I am founder and managing director of Sustainable Seafoods, LLC. I'm a marketer of certified organic seafood since 2001. I thank the NOSB for accepting the report, the interim final report, and do exhort the livestock committee to move with all speed.

I confirm to you based on my actual experiences that there is a very strong market for organic seafood. The consumer is concerned about foreign substances in food and the consumer is concerned about fraudulent claims. This is supported by a report from the New Jersey Department of Agriculture and Rutgers University over the past three years where they compiled research of the U.S. market for organic seafood.

The top findings of this report included that 72 percent of consumers would
buy organic seafood if available. The largest concerns include chemicals, antibiotics, hormones, and the last concern was sustainability.

I urge the Board to move expeditiously in order to bring in to create credible U.S. standards that bring a halt to fraudulent claims that hasten consumer access to product that they clearly want and bring the United States in line with other parts of the world and allow U.S. producers to meet domestic demand with domestic product. Michael McNichols.

Good evening. Thank you also for the opportunity of speaking this evening. My name is Jorge Gaskins and I am President of the 8th Sea Organic Seafood Company which is a Puerto Rican corporation.

Our company has only dedicated to organic production systems operations and special agricultural feed rations and the production of the entire life cycle, all the
different stages of talapia fish from hatchery to harvest and the processing for local sales in Brazil and exports of both fresh and frozen products.

Briefly, our company's agricultural operations are located in Parana State in the southwestern part of Brazil, some two hours north of the great waterfalls of Iguazu along the Parana River which serves as a boundary between Brazil and Paraguay. Our production is fresh water, pond based, and certified by Natural Land of Germany and a pending application has been made to Quality Assurance International here in the United States.

8th Sea is also a founding member of the Organic Seafood Council. 8th Sea supports the acceptance of the interim final report of the Agricultural Working Group by the NOSB and we recognize and appreciate the hard work and thoughtful analysis that has gone into the report and all of the work that
has gone into agriculture and organic
standards previous to the last working group.

8th Sea believes that the report
is a good starting place in creating an NOP
standard for aquaculture. The production of
this standard is an effort that we commend,
support, and urge to be pushed forward as
quickly, yet as diligently as possible. 8th
Sea is proud of the NOSB and NOP disposition
and commitment that they show to tackle the
creation of an organic standard for the last
major food product category without one,
seafood.

Our company is now one of the
leading producers of talapia employing organic
methods in the world. Talapia is the most
cultivated fish in the world and from its Nile
origin talapia is now raised in different
cultivation systems in over 60 countries.

Talapia is a domesticated fish and
in the tombs of the pharaoh there are
depiction of talapia being raised both in
cages as well as being harvested by nets. So it's been around for a long time and it probably is as different from wild talapia as a broiler today would be to wild chickens or the original chickens in the South Pacific.

From our particular perspective in reviewing the interim final report, we recognize the need to be more specific in many of the subsections of the report and of the future standards, although we don't support a standard for each species which George Lockwood declared impossible.

We do recognize that the following classifications would be helpful in making the proposed standards to be more effective and measurable. Fresh water estuary zones in south water cultures are different and require different characteristics and facilities, citing, location, etc. Ponds, nets, cages, and stationary culture systems, herbivores, carnivores, and omnivorous, cold water, warm water, fin fish, crustations and mollusks are
all more specific classifications that would fit into the different subsections.

The OFPA and established organic practices are clear and expectations for preserving health and welfare of the aquatic animals under our care and the intent of providing for facilities and conditions and diet that supports the natural behavior of the aquatic animals.

The interim final report diligently outlines the framework of addressing these concerns. Again, we believe that by implementing more classification of aquatic species, this framework can be more meaningful. Specifically, 8th Sea supports the specific stocking densities being established by classification within the final standards to the total prohibition of hormone use as a growth enhancer or for sex reversal in both fish destined for human consumption as well as fish for brood stock. Three, the total prohibition of the use of antibiotics in
8th Sea supports the Organic Seafood Council's comments including the possible use of wild-caught fish from verifiable fisheries as a feed ration ingredient in order to better assure natural diets. We would support this for a sunset period of five years.

8th Sea is a producer of organic fish meal and fish oil. We recognize that overall production of fish meal and fish oil is far less than the emerging organic seafood industry would require at this moment in order to really launch itself into the world markets.

Five, we do not support the use of synthetic amino acids or poultry or meat byproducts in agricultural feed rations because we don't feel that the consumer is going to accept them. Many of the organic consumers eat seafood as their only nonvegetarian source and to eat poultry
byproducts via the seafood we think is shooting ourselves in the foot and shooting the industry in the foot.

I thank you for the opportunity of addressing you today. I thank you for your commitment to embark on yet another slippery slope of organic certification and standards writing. Courage. Onward.

CHAIR O'RELL: Questions.

MEMBER JAMES: I apologize, NOSB members, but I just have to ask this question.

Okay. In the proposal from the aquatics task force it says, "Aquaculture facilities shall be designed and operated to minimize the release of nutrients and waste into the environment. I understand that you operate pool ponds for the development of talapia. How do you -- how are you currently managing the waste from that?

MR. GASKINS: We operate almost 3,000 hectares of ponds both under our direct ownership under rental arrangements and under
supervision of third party associated growers so we have very many different systems operating. Basically they come down to two. One is the use of the solids in the pond. Talapia when you harvest you empty the pond. The pond is left empty between harvest for about two weeks and then it's filled again with water. That's an opportunity of removing organic solids at the bottom of the pond to be used for agricultural purposes which happens in our region quite a bit. I would say it's probably the No. 1 way of dealing with the solids left over from the production.

The second system is under the Parana state environmental laws in the state of Parana. Very good compared to many places in production of talapia around the world. A water reservoir wetland system is required. If the water itself is not going to be used for irrigation purposes. If it's going to be used for irrigation purposes, then you have to show that the application area is large enough
to take the organic matter suspended in the water.

For the reservoir systems artificial wetlands are created or wetlands are restored before the water can go back into the superficial water system which eventually will go back into the Parana river basin. They are very precise in measurements. The water quality is monitored not only by the grower but also the reports are monitored by the Environmental Protection Agency of the State of Parana.

MEMBER JAMES: Okay. Thank you. One other question.

MR. GASKINS: You know, there's many agricultural systems, of course, where that's not an issue because -- well, it's a different issue because if you are raising in net cages in a waterway, then the waste becomes part of the ecosystem where you are producing so that's a different type of system.
This is a beautiful illustration of why the final standards have to take into consideration the different culture systems because that is very important for talapia culture as far as the nutrient fluent control.

A net cage system is also very important but they are just two different types of systems.

MEMBER JAMES: Sure. Okay. One other question. You currently are practicing feed components that consist of soybean, corn, and millet. Correct?

MR. GASKINS: No. Soybean, corn, wheat, and sorghum.

MEMBER JAMES: Okay. I was just reading off of the bullet points from your website.

MR. GASKINS: That was probably true at one time.

MEMBER JAMES: What I want to ask you is that if you could purchase organic fish meal, would that be a preference?

MR. GASKINS: We're sitting on a
mountain of it ourselves at the moment, organic fish meal and organic fish oil as well. Unfortunately, we cannot use it for our own species which we think also is absurd. Mad fish is not an issue and talapia eats talapia. It's an omnivore.

Talapia eats larva and eggs as well so we feel that really there is not a reason why talapia fish meal cannot be used in talapia feed rations considering that we only use 5 percent of the total diet of the talapia as fish meal anyway and that is primarily so we do not use synthetic amino acids.

MEMBER JAMES: Okay. Thank you.

MEMBER SMILLIE: I won't apologize. I have a quick question.

MR. GASKINS: Don't apologize.

MEMBER SMILLIE: I'm not going to. I said I wasn't going to.

MR. GASKINS: Okay.

MEMBER SMILLIE: George said that you couldn't go into specie specific
standards. I certainly understand it. Yet, we can't have one size fits all as you have just illustrated. What was your -- what is a reasonable number? You started flashing a whole bunch of things like fresh water --

MR. GASKINS: The Organic --

MEMBER SMILLIE: How many?

MR. GASKINS: The Organic Seafood Council recommends, I think, we have 10 classifications. Some of them are based on type of -- you know, separating the crustations from the warm water and the cold water fin fish and the others are based on the culture systems, net cages versus ponds versus ponds and raceways put together. I think there are 10 on the comments that were posted. Something like that might be more manageable. Just some are more important under some subsections than others would be. Any other questions? Once again, I say courage. Onward.

CHAIR O'ReLL: Richard Martin,
Diane Goodman. Are you up as Diane Goodman?

MR. MARTIN: I'm Richard Martin. I'm President of Martin International Corporation. I'm involved, or have been involved, in the aquaculture world in production, sales, and marketing as an import/export company for 26 years encompassing four continents in 11 countries. At age 51 that is exactly over half of my life.

I'll be as quick in trying to get to the points as best I can. We support and encourage the acceptance of the interim final report as the basis of a final rule that contains modifications and adaptations to conform with the Organic Food Production Act that specifically addresses the biological requirements of aquatic species.

George Lockwood brought up a couple of points in the interim final report. I think there's a couple of keystone points that we all agree are essential to be
addressed. I noticed when George started talking about the feed issue, option A or option B, everyone kind of perked up and there was a noticeable concern on all your faces from my vantage point.

Areas of concern within the Organic Food Production Act in our estimation under the item 6506 in general requirements, "Farmer field area to be certified has distinct boundaries and a buffer zone separating the land being operated through the use of organic methods from land that is not being operated through the use of such methods can be applied in the aquaculture setting."

You can define, as we have. You've made the perfect slide here with the cattle out on the field a boundary which you also can do in aquaculture. In aquaculture aquatic species in open net pen structures and systems are raised with the intent to provide a system in which species are able to exhibit as natural behavior as possible within limits
of aquatic systems in the sea. The established organic rules provide for systems that maintain densities in environment conditions that are as close to those found in nature as possible.

People have a difficulty. Aquaculture intimidates for some reason because people aren't familiar with it. They are familiar with seeing a cattle farm. They are familiar with seeing a fence and a pasture but they are not familiar with seeing what happens in the sea. For some reason the atmosphere is not equivalent to the ocean and people can't draw those conclusions. I urge you to think about that and the parallels because they are more apparent than not.

The other item of concern, the organic food production act, is item 6509(c) No. 1, "Shall feed such livestock organically produced feed that meets requirements of this chapter." That is probably the keystone issue with an aquatic standard. Where that goes to
the interim report and they look at A or B, we recommend the adoption of A.

I want to remind you that in considering A what people get shaky about is when they talk about certifying a wild fish. Immediately right there everyone stops. You are certifying a feed and in the E model they have specific requirements for harvesting fish from biologically safe capture fisheries that is very well vetted out over the last 10 years. There's a lot of science behind it.

Then it has certain controls such as requirement for using awful trimmings as a protein base and taking 100 percent waste and converting that into consumable fish which would be a psalmody for example. They also have requirements on limiting PPTs. The feed input in an aquatic system can be measured, quantified, you know where it came from, and it's no less wild than the grass on the prairie and it can be certified if it's taken in the context of certifying the feed and not
the fish that is plucked from the sea.

    I think the differences are obvious but they are not insurmountable. The reason why we don't advise option B in the interim final report is that we are also trying to provide an animal in the end to the consumer that provides nutritional basis that the consumer is seeking.

    If we start to look at adding synthetic amino acids and vegetable matter to a carnivore, you are really getting into manipulation of a creature and in the end you may be even reducing the available nutritional content of that animal to a consumer. Having dealt with the consumer for almost 30 years I can tell you that their No. 1 issue is lack of chemicals, No. 2 what do they get food benefit-wise out of this animal, and then, down the road, environment and so forth.

    If you adopt option B and you ram soy protein into a salmon, for example, they will grow slowly but they will also counteract
any of your environmental benefit because they will pass much more waste into the sea as they dump the feed. Questions?

CHAIR O'ReLL: Questions?

MR. MARTIN: I may add one little tiny bit. We also approve of the sunset provision in coming up with a feed certification process.

MEMBER GIACOMINI: I have a question. Do you know if there is any data on whether the change in diet would change the fatty acid profile in the fish meal?

MR. MARTIN: I would probably go to the Harvard School of Public Health who has done a lot of fatty acid analysis. You can pretty much put anything into a salmon. You can put soybean protein and lard and the animal will use the lard as an energy basis and that will change the omega 3 fatty acid profile of that animal. I can't quote a scientific entry in that put I could certainly dig that up.
CHAIR O'RELL:  Rigo and then Nancy.

MEMBER DELGADO:  I have a question.  If you feed your fish chicken byproducts and so forth, would I get a chicken fish at the end of the day or am I dealing with a completely animal fish?

MR. MARTIN:  There's two parts.  There's consumer perception there which I think would really run afoul. The industry wouldn't benefit and the consumer would reject it if they knew that I believe. There is a good resource there that is unfortunately the case. There's a fantastic resource in taking children awful and making it into salmon feed or some other fish feed.

I think the other concern is how the fish bio-incorporates that. When you are thinking about the environmental impact that these fish have, and that is a major concern with those that don't want to see aquaculture expanded, if you start putting feed into the
animal that does not bio-incorporate efficiently, it ends up as waste.

If it's waste, it's environmental impact. If you give it the feed that it really biologically would go after or obtain in the wild, it's going to bio-incorporate that in a much more efficient manner. It's going to build muscle rather than making waste. I think there are potentially other options to explore and that is why we are asking for a sunset provision because we only have so many models now and there might be some other angles to take on this.

A carnivorous animal needs to do what it is supposed to do and the perception might run askew if you start putting other ingredients in. I know for example in the industry where in certain areas they use a lot of corn oil to boost protein or to mitigate expense. That ends up as being corn oil in the final product.

When you cook that product you can
see corn oil leach out of the product. You can also taste it. You don't taste corn and say, "This salmon taste like corn," but it does have a bitter aftertaste which is all attributed to corn. The U model tries to keep the feed that goes into -- the fish meal that goes into the feed as close to what that fish would find in nature even to the point of doing indigenous type of profiles for the feed in that region with the intent of that animal is being raised as close to what it would be if it wasn't in a cage.

CHAIR O'RELL: Nancy.

MEMBER OSTIGUY: Just real briefly. There's a lot of data about how the nutritional value of fish changes when they are not fed close to their natural feed. There is a tremendous amount of data about how the health changes.

MR. MARTIN: I don't think that would be a hard challenge to find that data. It's readily available.
MEMBER OSTIGUY: Oh, no. I have some of it. It's readily available.

CHAIR O'RELL: Thank you very much. Diane Goodman. Ten minutes.

MS. GOODMAN: I won't need that long.

CHAIR O'RELL: John Stalley is on board.

MS. GOODMAN: Okay. George first.

Thank you on behalf of George for his ability to comment to you. This is about commercial availability and proactive sourcing. This is a concept that George ran by a few of us the other day and thought it was worthwhile that he present it to you. Commercial availability is missing one component which is a proactive approach to either contract for an organic ingredient or commitment to the development of a new organic ingredient.

As a supplier of ingredients I have companies call me looking for organic ingredients that without a contract that
ingredient is not available. This scenario plays out every few months so the company can document that the ingredient is not available to the certifier. An exemption should be granted only if the company has a contract for further delivery of the exempted organic ingredient.

If a company knows an ingredient that they are formulating will require more of the specific ingredient than is currently available, the company should be required in their organic plan to show steps they are taking to make sure the ingredient will be produced for them during the next crop cycle taking into account worldwide sourcing.

We are seeing an upswing of companies moving to conventional ingredients as orders for their organic products increase rapidly. This emergency situation should not be used to replace organic ingredients permanently.

Creating an organic analog of
conventional ingredients is a vital step to increasing consumer confidence in organics and the intent of OFPA. Companies that use conventional ingredients in the five percent category should take steps to use products that contain organic ingredients in an effort to promote further development of these conventional alternatives.

As an example, there's baking powder that contains organic ingredients. Allowing the use of conventional baking powder without organic components serves to diminish the development of organic alternatives. If functionality is the same, then there should be a requirement for the use of these "made with" ingredients.

I have been told on more than one occasion that my suggestions are already part of the existing rule. If that is true, there needs to be a clarification to the organic community. However, if proactive sourcing is not specifically covered, then it should be
1 codified into the rule. Thank you very much for your consideration of this important issue. Sorry I wouldn't be able to answer any questions on behalf of George but I'm sure you can contact him and he will be glad to help you.

2 Now my comment. This is on my own. I'm just going to read it and I'm sorry I don't have it written out for you but I'll make sure it gets e-mailed to Valerie and she will distribute it to you for the record.

3 Welcome on my behalf to all of the new members of the NOSB. Anything you need that any of us can help you with, we are all here to help you. Thank you for the kind opportunity to comment today. As many of my comments have been made or will be made in other statements written and spoken, my intention is only to emphasize a few high points to jog your memory when they arise elsewhere.

4 First in your consideration of the
clarification for the definition of synthetic. Please keep in mind the clear intent and objective of any recommendation put forward by the Board and what it is this clarification will serve as it relates to consumer expectation of how organic processed food in particular is made.

A point was driven home during the dairy symposium that responding to consumer expectation that organic dairy animals should be paramount to science-based dairying, I found that was interesting that another comment on the issue of the definition of synthetic stresses the need for science. How does that relate then to consumer expectation about what should be allowed in organic foods. I hope you understand what that analogy was for me. It's kind of contradictory.

Please keep in mind also the need to avoid any further ambiguity in the use of the term synthetic that may come up in any new definition of the term substance and chemical
change. Finally on this point please note what appears to be the synonymous relationship between formulating, manufacturing, and processing.

Then regarding the relationship -- excuse me, the recommendation of the Joint Handling and Policy Development Committee on Commercial Availability. I point out that according to the language of the court order all nonorganic agricultural substances must be placed on the national list Section 205.606 and then determined by the certification body if based on the organic handling of plants submitted by a certified entity that the substance is, in fact, commercially unavailable in organic form.

I encourage you to provide clear and complete guidance to the ACAs to uniformly facilitate that determination. Furthermore, and this is a new suggestion not reiterated anywhere else, please consider approving petitions for similar substances such as all
dried leaves of green herbs. If all are produced identically, one petition may cover approval of dried oregano, dried sweet basil, dried marjoram, etc. This may close potential loopholes of categorical petitions, yet expedite approvals of very similar agricultural substances all produced identically.

Finally, in your consideration of acceptance of the Aquaculture Working Group interim final report, please give serious consideration of the need for any standard for aquaculture production to comply with OFPA, especially the requirement for all organic livestock including fish to be fed organic feed, the suggestion supported by the Organic Seafood Council to allow a five-year sunset period during which time organic aquaculture products may be fed some percentage of nonorganic feed will follow precedent implemented before in other instances such as the temporary allowance of methionine for
poultry. This will also give the aquaculture industry time to develop feed stocks that will comply with OFPA while providing a superior product in the market place and filling the ever-growing demand for organic products of all kinds.

Thank you very much for your consideration of my comments and I look forward to the rest of an exciting and productive meeting with you all.

CHAIR O'RELL: Thank you, Diane. Questions? Thank you.

John Stalley, on board Lynn Clarkson.

PARTICIPANT: He's not here.

CHAIR O'RELL: Okay. Lynn Clarkson, Becky Goldburg.

MR. CLARKSON: For those of you still awake, my name is Lynn Clarkson. I have a concise and personal applause for your Handling Committee on the subject of organic lecithin. I'm General Manager of a company
that has been making organic lecithin, 100 percent organic lecithin, and 95 percent organic lecithin for three years.

You have tackled a troubling area of organics and I think come out with a very good balanced policy. You have decided that bleached lecithin is really lecithin and an agricultural product that something has been done to later so you have removed that door that some people have been using.

You have not come up with a draconian policy forcing anybody to do anything but left certifiers, at least in your recommendation, in charge of deciding whether the organic product will meet anybody's needs. Now, of all the lecithins that are out in the world, which given the custom formulations probably run something like 180 versions, organic is today able to take care of 80 percent of the needs.

There will be a few that we don't know how to make. There will be a few that we
are not able to make yet but that, too, is an evolving process. I think you have a balanced situation here where you basically said the organic evolution has carried the burden of proof and now it's up to people who are putting organic labels on products and using conventional lessons to prove that organic won't work. Without that kind of push the evaluation of ingredients in organic will be awfully slow. This is the kind of push we need. To the best of my knowledge the National Organic Program is administering this rule already in keeping with what your recommendation to the full Board is.

Thank you very much. I'm a processor in this field. If you have any questions, I'll be happy to try and answer them.

CHAIR O'RELL: First, I want to thank you, Lynn, for staying around so late in the evening to give us some congratulations that we did something right. That's always
good to hear.

Jim.

MEMBER SMILLIE: Lynn, what is the percentage of bleached lecithin organic and, if you know, the conventional industry versus unbleached like usage wise?

MR. CLARKSON: In a conventional lecithin world it's probably no more than 10 percent. In the organic world it's almost zero. The only people that I know that have a serious interest in bleached lecithin for the conventional organic would be those fighting a color problem, those with white chocolate, for instance, that didn't want to have a collision between some other ingredients and wanted to have a particular color score. It is distinctly a minority product in the world of lecithin.

MEMBER SMILLIE: Thank you very much.

CHAIR O'RELL: Becky and then Kathie Arnold with a proxy. Or is that done?
Okay. Thank you. Kelly Shea is up on deck.
Becky.

MS. GOLDBURG: Okay. I'll start.

Thanks very much. My name is Becky Goldburg. I'm a biologist with Environmental Defense, a national nonprofit organization. I'm also a former member of the NOSB and a current member of the NOP's Aquaculture Working Group. I want to thank you very much for your endurance so that I can have my five minutes of fame up here.

I'm going to comment today on two matters. One is the interim report of the Aquaculture Working Group and the second is sunset reviews of streptomycin and tetracycline. First, I'm delighted that the interim report of the Aquaculture Working Group is being presented to the NOSB and that the Livestock Committee had recommended that the NOSB receive the report and that you did so.

I strongly support the
establishment of organic standards for wild fish and believe the report will be very helpful to the NOSB. Like others I want to draw the NOSB's attention to the two options in the report concerning feed. Standards for organic fish feed are controversial since many farm fish are naturally omnivorous or carnivores and are fed diets containing substantial quantities of fish meal and oil made from wild-caught fish.

The significant concerns about the ecological impacts of so-called reduction fisheries used for fish meal and fish oil, as well as the health affects of environmental contaminants such as PCVs and dioxin that are sometimes found in fish meal and oil at very high levels. Moreover, the use of wild fish as feed ingredients would result in feeds that are not 100 percent organic is now required for organic livestock.

As you have heard about the two options for feed, option A would allow the use
of wild fish and aquaculture feeds, while option B would maintain the current requirement for organic livestock that feed ingredients be 100 percent organic and thus prohibit the use of wild fish as feed ingredients.

Under option B, which I personally strongly favor, wild fish could still be used as a feed supplement presumably as a small fraction of a fish diet but to present essential nutrients. I believe it would be possible to create healthy feeds for many fish without the use of synthetic amino acids.

I also want to ask that the NOSB in coming months pay special attention to the inside's concerns and opinions about the draft aquaculture standards from others in the NGO community including those who work on marine conservation issues and have not in the past participated in NOSB deliberations. I was the only representative of an NGO, environmental or consumer, on the Aquaculture Working Group.
I simply wasn't capable of representing all my colleagues who have much to offer to the discussion. In the second part of my comments I would like to address the sunset reviews of streptomycin and tetracycline which, of course, are used to control bacterial blights on fruit trees. My comments in this case are made on behalf of the Keep the Antibiotics Working Coalition, a coalition of health, consumer, agriculture, environmental, humane, and other organizations including my own Environmental Defense that together have about 9 million members.

We have two distinct concerns about continued use of streptomycin and tetracycline in organic food production. First, as I detail in my written comments and won't go over right now, the use of antibiotics on fruit trees likely makes at least a small contribution to the growing crisis of antibiotic resistance in human
medicine.

Although the technical materials prepared for the Board dismiss this concern, you should know that it has been strongly echoed by health agencies and experts. For example, in 1994 a company applied to EPA to register another antibiotic, gentamicin, as a pesticide to control fire blight on apples and pears.

The Centers for Disease Control and Prevention, the Food and Drug Administration, and the American Society for Microbiology all express their strong disapproval of the proposed registration because gentamicin is an important human drug and they were concerned about the potential for gentamicin resistance as a major health problem.

The result was that the company withdrew its application for approval of gentamicin in 1999. Particular relevant CDC's comments to EPA on gentamicin, which are
attached to my comments, also argue that consideration should also be given to the reduction and eventual elimination of pesticidal use of oxytetracycline. In other words, CDC thinks that using these antibiotics as pesticides is probably pretty bad for human health.

Second, antibiotic use in organic food production is inconsistent with consumer expectations. We expect that organic consumers no more want apples or pears from antibiotic-treated trees than they want milk or hamburgers from antibiotic treated cows. The upshot is a continued use of streptomycin and tetracycline in organic food production is not compatible with principles of organic reduction or consumer expectation.

We recognize, however, that streptomycin and tetracycline are useful chemicals for fruit growers to control fire blight. The NOSB may wish to consider whether it can phase out use of these drugs if it
feels it would be an undue burden to end their use immediately. That said, we urge the NOSB not to give an unqualified approval to continued use of these antibiotics. Thanks a lot.

CHAIR O'RELL: Thank you, Becky. Any questions?

MEMBER JAMES: First of all, Rebecca, excellent. I am really glad that you stuck around and you gave this presentation. I just want to make sure that I summarize what you're saying about the antibiotic use. Basically what you're saying is that consumers do not feel comfortable in your opinion with the idea of using antibiotics in organic production in any form.

MS. GOLDBURG: I think so. I think most of them are entirely unaware that they are used on fruit trees but I expect that the same consumer who buy organic animal products without antibiotics does not want the organic apple to be treated with antibiotics.
MEMBER JAMES: Okay. Excellent.

Thank you.

CHAIR O'RELL: Gerald.

MEMBER DAVIS: Would you be willing to consider that the data that was presented about consumer concerns about pesticides, antibiotics in their food and so forth, they are more concerned about the antibiotic presence in the food they are consuming than the use of the antibiotics themselves.

MS. GOLDBURG: I have to confess I did not attend that presentation this morning. I think it is true that most consumers when they think of problems with antibiotics do think about residues but I think there are really two sets of concerns. One is residues but the other scientifically is antimicrobial resistance.

If you turn to anybody in the medical community and ask them what is one of the major public health crisis today, and the
Federal Government has used that term, public health crisis, they will say its antimicrobial resistance. That stems in part from use of antibiotics in agriculture. Obviously much more from use of antibiotics and conventional animal production than for anything to do with fruit production but fruit production probably makes a small contribution.

MEMBER DAVIS: Do you think that the technical reports characterization of the minimal impact of the use of antibiotics in this way at the timings that the fruit tree growers use them does pose a very minimal chance of causing microbial resistance?

MS. GOLDBURG: I wouldn't use the term minimal. I would say that the chance that in any one case, and this is in my comments, that if you spray a tree it's going to result in a resistant bug that reaches a human being is minimal. The fact is that bacteria are present in vast incomprehensible numbers in our environment and when it comes
to bacteria highly improbable events become quite likely simply because of the sheer numbers of the bugs. There probably is some contribution.

I must say that I found the technical reports overly dismissive of the concerns. I looked at them and the materials they dated were from 1992. That is well before the development of a lot of the molecular tools that are now commonly used to track resistance genes and various genetic constructs in the environment. I frankly think they are out of date.

CHAIR O'ReLL: Nancy.

MEMBER OSTIGUY: I want to thank you, Rebecca, for bringing this up because the public health concerns are actually quite important and we are interested in food safety on a variety of levels. As you have stated, bacteria are virtually everywhere and just because we are starting with a plant does not mean that it won't move between species.
We have mosquitoes that are infected by malaria and humans so we can jump species quite far. There is some work that we're doing where we believe there is a reasonable possibility that a virus that we are researching in honeybees originated from plants so it does jump.

MS. GOLDBURG: Genes move around.

MEMBER OSTIGUY: Thank you.

CHAIR O'RELL: Thank you, Rebecca.

Kelly Shea, Eric Bremer next on deck if he's here.

MS. SHEA: Hi, you guys. Kelly Shea with Horizon Organics. Since most of what I was going to say has already been said and in the interest of time, I'll probably just take about 30 seconds to touch on some material things, turn my comments in, and then Paul Stalley was much later on the list so I'll give the rest of my time to him to finish up in the interest of shortening things.

We want to go on the record again
reiterating that Horizon Organic has been and continues to be fully supportive of changes to the organic regulations that clarify that the requirements for pasture apply to all ruminants including lactating animals. It's really critical I think as we've heard today that organic farmers today and conventional farmers that are thinking about making the change to organic dairying really have certainty versus ambiguity whenever possible. So to that end we probably have only about 10 or 15 percent of the farmers that ship milk to us on the Internet so we were going to mail out about 500 copies of the ANPR with envelopes addressed to the USDA. Hopefully all those farmers will have a chance to get their comments in also.

As far as materials I want to echo what Zea and some other people had said about hydrated lime. That was in one of the materials that we had sent out to producers for comment because I think it kind of came up
late in the process. If the Board has found that there are other materials that work as well and have as great an efficacy, if you could let people know about that or at least defer it so you can get some more comments in on it.

We were also going to support the removal of milk replacers from the list. If you have a bulk tank of organic milk, it seems to serve the purpose. In view of some of my colleagues' comments feeling that it is still needed, I guess we would be willing to sit back and see what other people say and maybe you want to get some more information on that.

I pretty much figured that everyone was on the same place about being okay with it going but it sounds like not maybe.

I want to thank Arthur Neal for letting me attack him at breakfast this morning and try to figure out where the heck that livestock docket was that we have been waiting for for so long. Arthur in his very
articulate manner said we can expect it any day. When that comes I think there will be a petition coming in to remove ivermectin because we know moxidectin is a lot less harmful to dung beetles and other members of the insect and microbial world.

With that I will just turn this in and let Paul use the rest of my time.

CHAIR O'RELL: Thank you.

MR. STALLEY: Hello. My name is Paul Stalley. I am a bit nervous. I would much rather be back at home at the farm but I think this is an important issue to be here and I appreciate to have this chance to speak.

I'm an organic dairy farmer from Oregon. We ship our milk to Horizon Organic and have for about five years. I'm a third generation on our farm and some of my fondest memories are seeing my grandfather and helping him work on the farm feeding calves. We still have his 30/20 John Deere that is going strong every day. Not a lot of things have changed
since he was there.

We used to pasture the cows. That wasn't an intent of grazing but when we started -- we did stop pasturing the cows for a while and when we restarted it was nice to see how much happier and healthier the cows were.

I guess I'm here to say that I would like to see things on a level playing field. The regulations have to have a bite so that some people that are not pasturing will get the feeling. What I don't want to do is for some regulations you don't need to be a rocket scientist to figure some of these things out. I think we need flexibility in the regulations as I see it. Farming revolves around mother nature and sometimes mother nature can throw a curve ball that takes a little bit of waiting out.

We have about 320 cows on 320 acres and 120 of that we intensively graze. Our cows are on pasture the whole growing
season and we have lots of folks coming by to look at our cows out on the grass. People love to see the cows and we get lots of comments about that. I will say that no one has ever asked me how much grass the cows are eating and what their dry matter intake is.

I hope we can get done with this soon. It's not helping any of us to have the rules be unclear. I hope we can also get this done without a lot of mud slinging and I hope it's okay to disagree. Everybody has their own opinion but we are all in this together and we should act just that way. Thank you.

CHAIR O'RELL: Thank you. Eric Bremer. Before you get started, one of the Board members would like to address Paul.

MEMBER JAMES: Paul, you don't need to get up. I just wanted to thank you for coming all the way from Oregon to speak. I was going to give you another three minutes just because in all fairness I know you made a big trek to get here. Thank you.
CHAIR O'RELL: Thank you. Eric.

MR. BREMER: Okay. My name is Eric Bremer. I'm with the New Jersey Department of Agriculture and I'm before you tonight to make comment on the aquaculture interim final report. The New Jersey Department of Agriculture appreciates this opportunity to provide the following comments on the interim final report of the Aquaculture Working Group.

The first portion of these comments provides insights into consumer interest and the ability to purchase a certified organic seafood product. The second deals with considerations related to feed composition and appropriate systems.

In a recent study completed by the New Jersey Department of Agriculture and Rutgers University consumers expressed a strong desire to purchase organic aquatic products. Many consumers were concerned about the possible presence of antibiotics and
hormones in farm-raised fish and felt
strongly, 77 percent, that certified organic
aquatic products would be free of these
compounds.

50 percent of the respondents
expressed such a strong commitment to the
purchase of organic aquatic products that they
were willing to change their shopping location
to purchase them. Further information about
the survey can be found at
www.jerseyseafood.nj.gov.

Currently the USDA allows aquatic
products certified under standards separate
from the NOP regulation to be labeled as
organic and sold within the United States.
This is a competitive disadvantage for U.S.
producers who are working with certification
agents that do not have standards for organic
aquaculture certification.

Adding aquatic species
requirements to the NOP regulation would help
to level the playing field with other protein
choices and imported organic aquatic products entering the United States bearing markets from foreign certifiers.

Comments on 205.252 aquaculture feed. Use of a high-quality feed that allows for an efficient feed conversion ratio and does not result in the production of excess waste products that may result in environmental degradation should be a cornerstone of organic aquaculture standards.

From a farm management standpoint production of excessive waste would place stress on aquatic organisms that would result in poor growth and possible disease. For these reasons the appropriate feed composition will be species specific and should mimic as closely as possible the natural feed of the species under cultivation.

For pisciverous species a feed composition that allows for only 5 percent fish meal and oil may not be adequate. Use of plant protein substitutes in the production of
these species may result in a poor feed conversion ratio and the production of excess waste and stunted growth of the farmed animals.

In this report the task force proposed two feed options. Option A allows for the use of wild fish and other wild seafood to produce fish meal and fish oils for organic aquaculture livestock feeds provided the use of such wildfish and wild seafood cannot exceed one pound of wild fish harvested for every pound of aquatic organisms cultured.

This one-to-one ratio may be unrealistic for some species given the high water content of the harvested fish that is lost during the reduction process. Most often wild fish species such as menhaden are used in the production of fish meal do not have a high intrinsic value as human food.

The New Jersey Department of Agriculture believes that scraps from the processing of food fish intended for human
consumption should be allowed for the manufacture of fish meal and oil in feed for organic aquaculture because it maximizes the use of the resource reducing potential stresses on wild populations that may be used to make aquaculture feeds for organic production.

NOSB's option A proposes the requirement that levels of unavoided residual environmental contaminants in the resulting fish meals and oils be comparable to the lowest levels. Thank you. I'm going to skip ahead here then.

The language in option A that would allow for wild caught to be labeled as organic is problematic in that historically organic certification has been a certification of process and not of product. In the explanation section following the feed options in the aquaculture report it is proposed that option A be adopted in the final rule so the USDA establish that wild fish are an
appropriate source.

The New Jersey Department of Agriculture favors the use of wild fish and other wild seafood along with listed byproducts from processing human consumption fish and seafood. However, the Department does not agree that labeling wild fish or other wild seafood as organic is appropriate.

The interim report contains provisions for aquatic aquaculture in open waters. Certification of animals in open waters presents some of the same challenges as certifying wild-caught species. These concerns include verification of feed sources and lack of control over the species' environment which could lead to exposures to prohibited materials.

We hope that if open water allowances become a point of contention that would slow the development and inclusion of closed-system aquaculture into the National Organic Program that the allowance is left out
of any proposed recommendation from NOSB until the issue is resolved within the industry.

The full comments have been turned in. I hope you folks get a chance to read them. Thank you very much.

MEMBER SMILLIE: Eric, in your support for option A you didn't mention that the only wild fish stocks that would be able to be used under the proposal in option A are MSC certified. Do you support that or are you just looking --

MR. BREMER: I scratched that part out in the interest of time but, yes. Quickly let me read what my counterparts had to say at the Department. Give me one second here.

"Sustainability of wild fish and other wild aquatic stocks harvested in U.S. waters should be determined in cooperation with the National Oceanic and Atmospheric Administration Office of Sustainable Fisheries under Sustainable
Fisheries Act PL 104-297."

MEMBER SMILLIE: Is that a certification program?

MR. BREMER: I would be fibbing to you if I told you I could answer that question. I didn't know what the basis meant until I read the first draft.

MEMBER SMILLIE: George's report cites MSC but it says "or equivalent" so I presume we'll just --

MR. BREMER: I would presume that would be an equivalent, yes. I can say that the folks I work with at the Department felt strongly about including that cite of National Oceanic and Atmospheric Administration Office of Sustainable Fisheries under the Sustainable Fisheries Act. They wanted that in there. I'm assuming they had a very good reason for that and that they recognize that as a good benchmark to go with.

MEMBER GIACOMINI: Kevin.

CHAIR O'RELL: Dan.
MEMBER GIACOMINI: Yes. You may or may not be the right person to ask this question but you drew the short straw because I just thought of it. As a nutritional source for fish, is all fish meal fish meal? Is all of it essentially universally similar enough in its composition and nutrient values for various uses?

MR. BREMER: I'm sorry but I have nowhere near the background to be able to answer that with confidence.

MEMBER KARREMAN: If I may, I would just kind of liken it -- I don't know much about aquaculture but I would liken it that if you are feeding fish meal to carnivorous fish, that would be analogous to feeding grass to cows. It is appropriate for the species.

CHAIR O'RELL: Thank you, Eric.

The next name I have on the list I think he left, Tom Harding. I think he was going to sign up for tomorrow. I thought he
told me that but I didn't want to -- okay, he's gone.

Jacob Zuck.

PARTICIPANT: He's gone.

CHAIR O'ReLL: Okay. This one I'm going to slaughter the name so I apologize. Jeneke Dejong. I apologize.

MS. DEJONG: My name is Jeneke Dejong and I want to thank everybody for staying this late and this long. I thought only dairymen worked this hard but you guys do too. Thank you very much.

In the interest of time I'm going to be really short. My husband and I own and operate a dairy farm in Bonanza, eastern Oregon. I will submit my speech to Valerie so you can read all the details about our farm and our family later. I just want to get to the pasture part. We believe in pasture. Pasture is great. It belongs, it's important, and it's part of what makes organic for the consumer.
We don't believe, however, that the consumer is set on a certain percentage of intake from pasture and hard numbers like 30 percent intake are difficult to enforce. A certain amount of cows per acre for certain amount of days or during growing season could be a workable solution. Given the regional differences, details are going to be a dairy-by-dairy decision. That was the it of what I wanted to say. Thank you very much for the opportunity.

CHAIR O'RELL: Thank you very much for your comments. Thank you for staying.

Kim Dietz. On deck, I don't know if he's here, George Siemon.

PARTICIPANT: No, that's for tomorrow.

CHAIR O'RELL: Okay. George is gone. Kim Kietz, you are on twice. You have a proxy?

MS. DIETZ: No.

CHAIR O'RELL: Well, you're on
twice. GMA? Are you on with GMA? No, just one? We can take off the one with GMA. Thank you. George Wright would be on deck if he's here.

MS. DIETZ: Okay, NOSBers, this is a record meeting. I just want you to know that. It is. I can't quite remember going this late that often. This is not setting precedence, let's hope.

Okay. My name is Kim Dietz and I have been involved in the organic industry for many years. I served on the NOSB from 2000 to 2005 as handler representative and during my appointment chaired the Materials Committee and acted as Board secretary. I've also been actively involved in OTA and chaired numerous task forces and committees over the years.

I am currently employed by Smucker Quality Beverages for 22 years. They are the manufacturers of Knudson Juice, Santa Cruz Organic, and a couple of other brands.

Today I would like to share with
you my personal comments and not those of my employer. They reflect an historical perspective on the issues before this Board. Please feel free to ask me any questions -- not today, maybe tomorrow -- during my comments or anytime over the next few days. It's late.

Sunset materials, I was the materials girl. That's near and dear to my heart. It always will be. My comments reflect my opinion on that. I congratulate the current Board members, past Board members, and NOP staff for making the first sunset process a success.

A few years ago I was in your role voting on materials and spending endless hours in collaboration with the NOP and public drafting guidance documents for the future of this Board. One of those documents, the Sunset Review Process, provided the details of how the first sunset process should work. I encourage all of you to read that document,
follow its procedures, refine it where necessary, it's a working paper, and pass it on to future Board members.

The key point to remember, use the sunset review document for reference on how the process should work. We spent a lot of time and sweat into that document. Materials do not need to go through an entire review process to be recommended to remain on the national list. I'm going to ad hoc some of this. They do have to go through a pretty detailed process to be removed so remember that as you recommend materials for removal.

Anyone at anytime can petition the material -- and I'm going to add annotations into that -- to be removed from the national list. The sunset is not the place to change annotations or move things. I do not agree with prior public comment on that issue. You guys have a lot of hard work. You are going to have a lot of stuff in front of you and if you start changing the sunset right now, I
think you're in for trouble. Remember this is an annual event. Another one is coming right around the corner.

Key learnings and recommendations to the process. I put on here, "Do not defer materials." By that I mean initially we had the committees identify materials that we thought were going to be contentious in the process and we defer those on purpose. I think, in my opinion, we erred on that side. I believe that it slowed down the process and it resulted in inconsistent reviews of materials.

Let the public tell you in the future what materials need to be deferred and what materials need further work. I encourage the chair of the materials committee to take a look at that in the document, future materials. Let them go through the process. If there are negative comments, defer them and address those at that time but don't do it ahead of time.
Flavors. I'll be here tomorrow when you discuss flavors but, bottom line, I'll be the first one to petition to remove flavors when they are commercially available for use in the industry. There's hundreds of them out there that are being used right now but they are not readily available in all products so please feel free to make comments.

Finally, recommendation framework on the synthetic document. I have put a lot of comments in here. I'm just going to summarize it. I think the document is a well-written document. One of the major areas of concern I have is the term "functional properties," where this came from.

I can tell you that in the last five years of my term on the Board we never put functional properties anywhere in the definition of synthetic. Look at that. I think if it stays in there you're in trouble with synthetic. Also, it's not clear that all materials don't go through this process. If
you look at pasteurization right now and you put pasteurization through that flow chart, it would be deemed synthetic because it does change the functional properties of a finished product. I would suggest, and I know that OMRI also suggested, just striking that out. Otherwise, I have recommended some language on here. I think that's it. Oh, can I just finish real quick? Commercial availability. I agree that you guys have done a good job with that and the way that it's written.

MEMBER CAROE: You could only finished because you were complementing.

MS. DIETZ: Oh, thanks.

CHAIR O'RELL: Kim, just one question on flavors. I agree with your approach that at one point I think a petition needs to be filed for flavors.

MS. DIETZ: Are you talking colors or flavors?

CHAIR O'RELL: I'm going back to
flavors.

   MS. DIETZ: Okay.

CHAIR O'RELL: You're talking about the removal of flavors from the list but are you talking about the addition of flavors under 606?

   MS. DIETZ: I don't think it needs to go under 606. I think that there's going to be enough organic flavors out there in the very near future that it won't need to go in 606. We are very close to that time. I would petition to remove flavors from 605(a) and have them as an organic commodity. I think we are very close to that.

CHAIR O'RELL: Or to petition for 606 now since it's close.

   MS. DIETZ: Yes, you could do that.

CHAIR O'RELL: And let the industry --

   MS. DIETZ: But, then again, you've got individual flavors. Cherry flavor
is one of them. There's a handful of flavors out there. I know you will hear from flavor producers tomorrow that we can't make them. We are struggling with it.

MEMBER WEISMAN: I also don't -- I mean, partly depending on how things end up with the definition of synthetic and nonsynthetic, I personally find it unlikely that everything that is currently out there being used in the category of natural flavors can be defined as an agricultural product. I don't think it can just be taken from where it is and en mass be put under 606. It will need to be parsed out.

MS. DIETZ: And if somebody would like to ask me my opinion on colors, I'll tell you.

MEMBER WEISMAN: Kim, what's your opinion on colors?

MS. DIETZ: I wasn't going to comment but it seems to be the topic. From an historical perspective the NOSB at one time asked to have colors removed as a technical
correction. That is in your documents, I believe, that in 2002 we asked that they be removed so that should be considered by this Board.

I think probably what should happen with colors is that you defer that, once again I hate to say that, and somebody petition so that you have a complete package for review. There has been past precedence set where Board members have petitioned. You just have to recuse yourself.

That means you don't get to vote but you can petition. You recuse yourself and at least then you have the complete process together. I'm not sure that it's worth a fight in this industry right now to not have colors reviewed thoroughly. That is one of the only materials on the list.

It has been used for five years, I understand that, but also you can go back to all the minutes and see where I have been saying, "Somebody needs to petition colors
because they are going to come up on sunset," and nobody did. I think the industry is going to feel the pain because they haven't been proactive with colors.

CHAIR O'RELL: Kim, what is your thought on -- we've heard earlier comments in saying that colors as a group shouldn't be allowed to be petitioned but it should be those individual colors that want to be used.

MS. DIETZ: Colors are on the national list right now as a group. I think the only way that you can individualize them would be to let them fall off under sunset and let somebody petition individual colors. Right now if you want to salvage what you've got, you have the ability to defer and review colors as a group and let somebody petition to remove them if they feel they need to be removed and there is that process. That's my personal opinion.

MEMBER CAROE: You said defer and then petition to remove but if we don't
complete the sunset process by the deadline it's gone.

CHAIR O'RELL: They're gone.

MEMBER CAROE: It's off. No action means they're gone.

MS. DIETZ: Right, but you could vote the next meeting one way or the other on colors and have a recommendation out there before the 2007 deadline.

CHAIR O'RELL: And then see how long it takes to get into a docket to get approved and you do run the risk of having a period of time when colors would not be allowed.

MS. DIETZ: Hey, we've got materials from 2002 that still aren't on the national list that we voted on so I think that's one -- if you want the process to be thorough and you want it to go right, you probably should do that.

And then, George, before you go we have reached the end of the list but there were four or five people that we called names earlier and they didn't respond so I'm not going to go back and read those names but if you are in this room and you were on the list, raise your hand after George is done. Otherwise, you run the risk then of missing your turn.

Thank you, George.

MR. WRIGHT: Thank you. I'm George Wright, an organic dairy farmer from upstate New York. I thought I was nuts but I see I have lots of company here tonight. I'm going to cut this short. Just wanted to let you know that I support the pasture policy. Everybody knows that.

Also the last-third of gestation rule. I think that needs to be a given. I would like to see any of the stuff that used in the dairy industry right now on the sunsetting list stay on the list for another
five years until there are better things out there to work with.

This thing about perception of the -- we touched on today the surveys the lady put on this morning about consumer perception on pasture. It's not just an organic perception. The reason why there is not a lot of discussion about it, I think personally, is all people, even in conventional America, everybody thinks cows are on pasture.

It's not necessarily an organic thing. I mean, everything that's advertised. There's pictures of cows in pasture. Look at all the happy cow commercial from California. That's one reason why it hasn't been a hot button issue with the consumers yet because they all just assume that they are all on pasture.

They don't know any different. But when they find out they are going to be pissed and I'm going to tell them. One of the biggest reasons I'm really pulling for this is
I'm a firm believer that the confinement dairy system is what has destroyed the conventional America.

I mean, look at the milk prices this year. Right in my county there has been 10 auctions already this month. We figure since the first of the year within a 50-mile radius of my farm there has been between 3,000 and 4,000 cows have left the area.

I mean, do we want to do the same thing to organic? We've got a chance to make something good here. Let's keep it good and not try to ruin it with all this confinement dairy and factory farming type stuff. You've just got to back off on it. Thank you.

CHAIR O'RELL: Thank you, George.

Questions of George? George, a question.

MEMBER OSTIGUY: That's fine. I just wanted to thank you for a comment about what public perception probably includes conventional as being out on pasture. I think the same thing is true about chickens. We
don't think that our conventional chickens are
in those little tiny cages.

MR. WRIGHT: It just dawned on me
this morning when I was seeing all these
surveys and I kind of got the impression they
had to ask people about pasture to get any
response from it. I just went through this
with my sister-in-law a month or so ago. She
came out and I took her to a confinement
dairy, some real good friends of mine and we
always talked about them all the time.

They do one hell of a job for a
confinement dairy. The call rate is like
minimum. Never buy replacements, never. They
have gone from 200 cows to 400 cows in the
last four years and never bought a
replacement. They've got it down pat. I was
showing her that and I've got a stanchion barn
and I'm proud of it. In the winter time we
have to keep them tied up most of the time
because the snow is too deep and we have ice
problems. Of course, 20 below zero and 50-
mile-an-hour wind.

But we were down there and she was walking around looking at that and she said, "Oh, I like this style of barn." She said, "It's a lot nicer than yours because the cows get to walk around and eat." I said, "Yeah. To be truthful with you, I like this type of barn, too." So we were leaving.

We had been there for a few hours and stuff. She turned to me --and this is the God's honest truth, no prompting or anything from me. She turned around to me and my wife and said, "Where do they go to pasture?" I said, "Honey, they live and they die right here. They don't ever go outdoors." She was really upset about that. True story.

CHAIR O'ReLL: Thank you, George.

Last call for anybody who may have been on this list and was missed earlier. If I don't see any hands, I'm going to ask for a motion to recess.

MEMBER OSTIGUY: Motion to recess.
MEMBER KARREMAN: I second.

CHAIR O'RELL: Seconded. All those in favor?

ALL: Aye.

CHAIR O'RELL: Okay. Until tomorrow at 8:00. Until tomorrow at 8:00. Thank you all for hanging with us.

(Whereupon, at 8:54 p.m. the hearing was adjourned.)
DEPARTMENT OF AGRICULTURE
NATIONAL ORGANIC STANDARDS BOARD

MEETING

THURSDAY, APRIL 20, 2006

The National Organic Standards Board convened in the Ramada Conference Center, 1450 South Atherton Street, State College, Pennsylvania, at 8:14 a.m., Kevin O'Rell, Chairman, presiding.

8:14 a.m.

CHAIRMAN O'RELL: Call to order the continuation of the NOSB meeting. If everybody would either take their seat or take their conversation outside, please.

Okay today, this morning, we're going to start off with the presentation of each committee of their action items and discussion items. Because of the logistical issue we had with the pastor symposium, we normally would do this one day and then the next day come back and vote on items.

What we wanted to do was to have an opportunity for public comment after our discussion prior to our votes. So we'll be going through each committee with the presentation and discussion items, and then we will go into public comment.

Then we have an extended break for lunch period, which is designed to give committee chairs a chance to get their
committees together if need be for any conversation, to discuss the public comment that may change any of the recommendations that have been presented in the morning.

Then we'll come back in the afternoon, and the committees will go through and re-present any updated or current recommendations, and then we will have discussion and vote.

So this morning, we're going to start off with the Crops Committee. Gerald?

Crops Committee Report

MEMBER DAVIS: Thank you. The Crops Committee had a long list of deferred sunset materials to go over, and it took an extensive amount of time to wade through the public comment and submitted information.

The first materials as a group would be the chlorine materials that are listed as calcium hypochloride, chlorine dioxide, sodium hypochloride. The category of uses, as algicides, disinfectants and
sanitizers.

I'll read part of this committee summary, because it's fairly extensive, and would probably eat up too much time to read the whole thing.

"Many public comments were received by the NOP supporting the continued allowance of the use of the chlorine materials in this category. The most common reason given for the continued use was for food safety concerns, over the potential contamination of organic produce by food-borne pathogens.

"A big concern is that the negative public reaction to potential outbreaks of illness associated with organically produced food would be catastrophic to the industry.

"Compliance with FDA and other health regulatory agency regulations and guidelines was another common concern.

"Some comments express concern about
the application of chlorine materials to organic product in excess of the NOP standard listed in the rule.

"These comments stated that chlorine concentrations well in excess of the NOP standard are used in some instances with the assumption that the material would be degraded or diluted at some later point in the handling process of the product, or at least before the produce reached the consumer.

Two of these comments, one from a vegetable sprout producer and a consumer association, specifically stated that the residual chlorine levels in solution must not exceed the NOP rule guideline, at the point at which the treatment solution is drained from the food being treated."

The Crops Committee agrees with the comments that more specific guidelines for the use of chlorine materials in organic crop applications are needed, but the committee also acknowledges that such a recommendation
to add further addenda to the regulation is not the purview of this sunset document.

We're told a petition addressing those addenda changes for these materials would be more appropriate.

One commenter proposed peroxyacetic acid, which is a hydrogen peroxide acetic acid combination as a safer alternative disinfectant to chlorine. This comment also acknowledged that peracetic acid is currently not an allowed replacement for some of the chlorine application uses.

One comment objected the use of any synthetics in organic crop production, but failed to demonstrate how it violated OFPA.

I'll skip over some of the review of the technical evaluation report. Probably the new information in that concerns THMs or trihalomethane contaminants that can be present on crop surfaces when chlorine is applied to them.

It's kind of a metabolite or
something, once you use chlorine and it comes in contact with organic materials that may be on the produce.

That's the new information that some of the commenters mentioned, and the technical evaluation report mentioned.

Although it was noted by some that if the addendum to the use of these materials was corrected, to make sure that there are guidelines to control the amount of chlorine being used and limit it to precisely what the guidelines say in the NOP regulations, then that would minimize the risk of those THMs being produced, because you'd be using the proper amount of chlorine.

Skipping down to some of the other substitute materials that were presented as alternatives to chlorine, thus stating the case why they are not needed any more, citric acid or other acids such as acetic or ascorbic were mentioned as wholly natural substitute products that could be substituted for
chlorine materials as irrigation line cleaners and equipment sanitizers.

No information on the effectiveness of these materials in crop wash water was offered in the report. One commentator offered an example of acetic acid use in the meat industry as a carcass wash for surface sanitation.

In that particular instance, the wash water is amended to pH-3 to attain surface sanitation. Extrapolating this information to crop wash water, maintaining this low of a pH would take substantial and continual additions of acid, which would be corrosive to the handling equipment, corrosive to the workers in the operation, and the crop as well in any cases.

Other allowed substitute materials listed in the report include hydrogen peroxide, ozone, peracetic acid, vitreous alcohols, copper sulfate and salt-based algicides. Steam sterilization and UV
radiation were mentioned as alternative practices that might make the use of chlorine materials unnecessary. In the opinion of the Crops Committee, of the materials, the peracetic acid appears to hold the most promise as a safer alternative to chlorine and crop wash water applications.

It requires at least 50-fold lower concentration than hydrogen peroxide for sanitation efficacy in crop wash water, and would eliminate the bleaching or oxidizer effect problem associated with hydrogen peroxide use as a crop wash.

Peracetic acid was recommended for approval for this purpose by a previous NOSB, but has not cleared the NOP rulemaking process as yet.

Ozone, as mentioned by the report, has a strong tendency to off-gas from wash water and causes serious headaches and health problems in workers exposed to it. UV light from special lamps has been shown to be
effective in some limited applications.

In conclusion, due to overriding food safety and regulatory issues, the Crops Committee recommends the renewal of these chlorine materials. Discussion?

MEMBER KARREMAN: I just think you guys really did a thorough checking into the alternatives here. I appreciate that.

MEMBER DAVIS: Thank you.

CHAIRMAN O'ReLL: Nancy?

MEMBER OSTIGUY: I don't think we have an alternative, but to approve this, because of food safety issues. I would like to go on record as encouraging continued research to find alternatives.

I haven't quite decided, purely because of that, whether or not I will vote in favor or against renewal, purely as a message that we need to work on alternatives.

But so I just wanted to -- whichever way I end up finally voting on this, we absolutely do need to continue to do research
on alternatives.

MEMBER DAVIS: Of the peroxyacetic or peracetic acid alternative, which has a much better profile with it as far as effects on the environment or possible negative environmental or health concerns.

I had a question for Arthur and the program. Arthur, on that NOSB recommendation that's been kind of hung up, I guess it was in FDA for a while and now it's at OGC; is that correct?

Is there -- do you see any, in your understanding of the process that you've watched so far, is there any reason to expect that it would not come through the process now that it's been there this long?

MR. NEAL: It should be okay.

MEMBER DAVIS: Okay. So maybe perhaps soon we'll be seeing some movement on that as a good alternative.

MEMBER OSTIGUY: Some alternatives.

Yes, and there's going to be a while, I would
assume, between alternatives coming up and our eventual ability to do something about chlorine.

We may never be able to remove it, because there will be some uses that we will need it for food safety. But alternatives are a grand goal.

MEMBER DAVIS: Okay. Moving on, the next category of use as plant disease control. No, I'm missing one. As insecticides and as plant disease control, the horticultural oils.

Pertaining to horticultural oils, comments were received saying that natural alternatives were available as replacements. Vegetable oils were mentioned as the natural product replacement, but were questioned to see if these are appropriate and effective.

According to a representative of one organic certifier, all the vegetable oil formulations for crop protection use have synthetic emulsifiers in them. Without the emulsifier, the oils would not work as a spray
material for crops.

I mean the oils would be oils, but they wouldn't be able to be mixed in a water solution to spray on a crop, to give the efficacy. It could be argued that these products would not be wholly natural substitutes.

Further comments were received, stating that multi-year grower comparative tests between vegetable oil products and the petroleum-derived oils showed that the vegetable oils did not control certain target pests adequately.

I want to thank Franz for your input of that written comments that you provided; they were helpful in showing us at least one example of where yes, we really would like to use vegetable oils if they would work for our disease in our situation.

Research data that could verify the claim that the vegetable oil alternatives are truly adequate as a replacement is needed.
The committee recommendation, based on comments received, we recommend that we renew this material in these categories of uses. Discussion?

CHAIRMAN O'RELL: Gerald, I see that the committee vote was 3 to 1. So there was one opposed?

MEMBER ENGELBERT: Yes. That was me.

CHAIRMAN O'RELL: Can we hear from the minority?

MEMBER ENGELBERT: Basically, it's the same logic that Nancy used with chlorine. I'm just going to vote no, because I think there needs to be a better alternative, not because I want to handicap any growers today, but just to make a statement.

CHAIRMAN O'RELL: Nancy.

MEMBER OSTIGUY: One of the things that I would like to encourage some specific research to be done on in this area is why the vegetable oils would not be as efficacious, if
it turns out that that's accurate.

   It's supposed to a suffocating kind of process for insects, and in that case, oils should be oil. I'm just curious why petroleum-based product would be better than the vegetable oil, if we're supposed to be covering that insect with oil to block its sphericals?

   It's just curious. Why doesn't it work, and if we understood why, then we may be able to come up with a more natural substance.

MEMBER DAVIS: Yes. The theory that they should work makes sense.

MEMBER MOYER: That's why they were tried.

MEMBER DAVIS: But I struggled to find data, research data that showed that -- to back that up.

MEMBER OSTIGUY: Right, and I'm not disagreeing that the data are not there to show that it works. But why, and then if we could figure out why, it's a research area.
Why is it not working to suffocate, because if it's covering the sphericals, that's where all the air comes from?

MEMBER MOYER: Well then there was also the question of the synthetic emulsifiers that are used in that process with the vegetable oils as well.

MEMBER OSTIGUY: Right.

MEMBER DAVIS: That's fairly problematic.

MEMBER MOYER: Right. We don't want to just trade one for the other.

MEMBER OSTIGUY: Uh-huh, uh-huh.

MEMBER DAVIS: Because they're all petroleum-derived.

MEMBER MOYER: Right.

MEMBER DAVIS: Emulsifiers. So we're not really taking any big step forward, other than maybe the amount of material you're putting on an emulsifier versus the oil itself.

MEMBER OSTIGUY: It has to do with
oil hitting $70 a barrel. We may have a lot of incentive for research for alternatives.

MEMBER MOYER: That's a good point.

MEMBER DAVIS: Any other discussion?

I'll move on to the next material. Hydrated lime as plant disease control. The renewal of hydrated lime was deferred for two reasons.

First, the Crops Committee thought that more information and public comment was needed. Second, because of concern that there was no OFPA category that specifically allows its use.

I think the second concern that there was no OFPA category that we could fit this into was really the main objection and reason for deferring it for further consideration.

Most people who are familiar with it know that if this is produced by heating, you know, regular ground limestone to very high temperatures and then adding water to make hydrated lime or calcium hydroxide.
It's been produced for a long time, and it's used on a lot of things. Some of the environmental concerns are listed in this committee summary. It just summarizes basically concerns about the manufacturer and mining of the material, more than environmental or health concerns based on the intended use.

Most of the public comments were in favor of keeping hydrated lime on the national list. Although not that many people specifically mentioned it, they just included it in their -- yes, we'd like this and their wish list of all the materials.

The manufacturer of lime sulphur, which many commentators said that they could not form organically without, requires the use of hydrated lime, as does the production of Bordeaux mixture, which is a copper-containing compound.

Lime sulphur is used to control fungus, mites and insects in apples, grapes,
blueberries, cherries and other tree and vine crops.

Some commentators made the point that lime sulphur has been used for many years with no recorded loss of effectiveness. One commentator stated that no synthetic substances should be allowed in organic, but failed to show how these materials violate OFPA.

In the opinion of this committee, hydrated lime should be considered a production aid insofar as it is vital to the production of two exempted sulphur or copper-containing materials, in order to make these materials more non-biotoxic to plants.

On a split vote, the committee recommended not renewing the material to the national list, mainly for the lack of an OFPA category for it. Discussion?

MEMBER WEISMAN: Yeah, Joe. We've already mentioned a couple of times that one of the tasks that we haven't accomplished yet
but that is on our work plans is realigning
the list to conform to OFPA categories.

If that were already accomplished,
would that have changed? Is it possible that
that might have changed your vote?

MEMBER DAVIS: Well, realigning the
list to match the -- to fit them into the
categories is that discussion and the stream
of thought is what brought up th problem in
the first place, that where do we put this
material?

It comes down to the suggested, the
best places that have been suggested. One
would be to lump it in the production aid
category, which personally I think is that
production aid category designation for
material sprayed to crops, is kind of a
slippery slope thing that we could enter into,
where all kinds of synthetic materials could
be suggested.

"Well, let's call them a production
aid and put them in there," although the
program NOP did mention that, you know, that
is a possible way of doing it, and could be
supported legally, from their opinion.

The other thing, one commenter
yesterday mentioned to me that it could fall
into that exemption category of vitamins or
minerals, because it is a calcium mineral,
which is great for the one use.

But for hydrated lime, it's more of
a problem because the use of it is for plant
disease control, and it's not being used as a
mineral. So it's a stretch either way in my
opinion, although in my opinion personally,
the material is really not a threat to an
environment as used.

It's very important to many growers.
I didn't realize that in our discussions with
the committee, that there were a tree fruit
growers that use the material straight.

MEMBER MOYER: Yeah. That didn't
really come out in our initial discussions.

MEMBER DAVIS: No. We didn't have
that information.

MEMBER MOYER: As follow-up discussions, you know, through these meetings and through e-mails, I think that that's become more apparent to the committee.

MEMBER DAVIS: So for the limited amount of materials that an organic tree fruit grower has to control diseases, it is perceived now that it would be a severe impact for those growers to remove this material, over something a simple as "Well, we don't have an OFPA category for it."

MEMBER WEISMAN: Can I also make one more comment about the lack of OFPA categories, which might make your dilemma feel a little less difficult.

The lack of -- there is no OFPA category for allowed naturals, or allowed agricultural products, but those categories do exist on the list. There is some precedent for their being categories.

MEMBER DAVIS: The allowed category
-- we summarize that when we say is there an OFPA category. It refers to exempted synthetics. Is there a category of exempted synthetics that this fits into, and that's where we're struggling.

Although, you know, I feel for the growers that, you know, I have tree fruit growing in my background, and I don't currently do that right now.

But I know that there's not a lot of material that they have to use to control fungus diseases and things like stone fruit, peaches and apricots.

This is one of their mainstays which we didn't realize as a committee, as part of our thinking process. That's only come to light now at this meeting in some of the comments that we received subsequent to the recommendation.

MEMBER OSTIGUY: One question that I would have, which will also come up a little bit later, I know more about that particular
item. Is there a way for the particular
diseases that they are attempting to control
with the hydrated lime, for that to be
addressed by species selection, variety
selection of the stone fruits?

You know, there are more and less
susceptible varieties. Sometimes that applies
for a particular product that we're using,
that if we selected a less susceptible variety
we'd be better off.

That is supposed to be something we
do up front, in order to reduce the need for
things like this, and that's actually my
question, is do we have any information about
whether or not variety selection could reduce
the need?

CHAIRMAN O'ReLL: Angie?

MEMBER CAROE: Well, the only
comment I would have about that is that we're
looking at sunset. We're looking at growers
that have trees in the ground. You're talking
about three years before a peach tree starts
producing again, a new tree is going to start producing.

So it's three years without our grade of peaches if we do that.

MEMBER OSTIGUY: I mean, I understand that, but if you're not -- you're not going to eliminate or even reduce the use of this material, if you just continue to renew it on the list.

MEMBER CAROE: My point is well, unless you were to get a petition and re-list it with an annotation or --

MEMBER OSTIGUY: But there are wholly natural alternatives. That's part of my point. If, and I'm not saying -- I don't know this. I don't know if there are varieties that can address this.

CHAIRMAN O'RELL: Jeff and then Joe.

MEMBER MOYER: Yes. In many cases, Nancy, there are varieties that are less susceptible. The committee talked about that, and as Andrea mentioned, there is this time
delay, particularly with perennial tree fruit
crops, where you have a three to five year
time delay between when you plant the tree and
when you can begin to harvest fruit.

But we also understood your dilemma
that, as long as this is on the list, it
discourages folks from seeking out either the
varieties that do exist or pursuing the
development of new varieties.

So that it is a difficult situation
for us, with these fruits that take so long to
come to fruition. And also with a lot of the
tree fruits, for better or for worse,
consumers tend to buy by name, and a lot of
the varieties that they're asking for are not
on the list of disease-resistant cultivars.

CHAIRMAN O'RELL: Joe?

MEMBER SMILLIE: Yeah, I've had a
lot of experience with scab-resistant apple
trees, and it takes years and years of
breeding and development, and then --

It takes years of breeding and
development, and then oftentimes you'll breed an apple tree that will be scab-resistant, which is a big, big problem on the East Coast for organic apples.

You'll get a scab-resistant tree. It will get out into trials, and they'll find out that well, it's more susceptible to cedar rust than it was to apple scabs. So it takes years and years of breeding and development, and then oftentimes other problems occur.

Fungus is a really difficult issue to deal with, especially in wet climates. I know East Coast growers are just -- that's a continual battle, to deal with the various different fungus problems.

Colorado, though, has got a better break. Usually California's doing well, but when it rains a lot in California, then they have the same problem.

It is a long-term solution to work for disease-resistant trees, but it's just that it takes a lot of time because of the
perennial nature and things like that.

I can tell you this: No tree fruit grower likes spraying this stuff. This is --
I mean, if they can find solutions, they will grab at them, because this is nasty stuff to live with. It corrodes your equipment. It's a real pain.

MEMBER MOYER: Well, not only that. There's no residuals, so you have to spray.

MEMBER SMILLIE: You've just got to be out there all th time.

CHAIRMAN O'RELL: You need to be recognized, because we have -- if you're going to speak, put your hand up, because otherwise we've got Arthur here and then we have Hugh would like to make a comment. So Arthur, Hugh and then Jeff, I'll come back to you if you want. Arthur?

MR. NEAL: Arthur Neal, National Organic Program. I also just want to remind everyone that as part of the Advanced Notice of Proposed Rulemaking for this sunset
process, one of the key items that we stressed we needed was economic impact data.

Because you've got an industry that used this for five years that's now relying on it. In order for us to get this rulemaking done in time, we have to know the impact that this is going to have on their particular sector that has used this material for the past five years.

This particular material has come through properly. The comments say "Let's renew it." We've got a recommendation to not renew it, but we don't have any data to support not renewing it.

So I just want to remind you that economic impact data was requested in that Advanced Notice of Proposed Rulemaking, because we have to justify every decision that we make thoroughly.

That's why this sunset process is so complex, because it entails other areas just - other than the technical side.
CHAIRMAN O'RELL: Hugh, then Kevin.

MEMBER KARREMAN: This hydrated lime is an interesting thing, because we're going to talk about it in livestock too when we get to it, but part of the problem in livestock, just momentarily, is that you cannot apply it to the ground, certified organic ground.

And yet now we're also considering applying it to trees for whatever the problem is. There's some inconsistency here.

CHAIRMAN O'RELL: Kevin?

MEMBER ENGELBERT: I agree, Hugh. That's another point that I was going to make.

But I also want to respond to Arthur. We looked for economic impact data, and like Jeff said, we found very little comment, very little information to go on.

It's just been a problem for us to know what to do with it. It's a mined substance, it's a mineral, but it's heated to a thousand degrees and processed. We're unsure about the heavy metal content of it,
and we just weren't sure what to do with it.

We didn't want to open up another can of worms by putting it some place it shouldn't be.

CHAIRMAN O'RELL: Gerald.

MEMBER DAVIS: In response to Nancy and your resistant variety question, now in every tree fruit variety I've ever seen, when they talk about resistance, it's never complete resistance. It's just a matter of degrees.

The other thing is that for peach and apricot, you know, stone fruit growers, they grow a multitude of varieties, from early to mid- to late-season varieties, to give them as long of a season as possible.

You know, it's a lot of varieties in some cases. So to find a variety that's resistant enough to resist the disease in all time slots, it gets pretty complicated to tell them "Well, just find the resistant varieties," when the resistance is not
complete anyway for things like brown rot, you
know, which basically either rots the blossoms
off before they ever make a fruit, or later
on, rots the fruit so it's unmarketable.

MEMBER OSTIGUY: Uh-huh, uh-huh.

CHAIRMAN O'RELL: Any other
comments?

MEMBER GIACOMINI: I was just
wondering if Gerald -- Gerald?

MEMBER DAVIS: Yes.

MEMBER GIACOMINI: Could you discuss
or do you have anything to say regarding
Hugh's statement on applying it on cropland?

MEMBER DAVIS: I'm not sure I
understand your question.

MEMBER GIACOMINI: The statement
that Hugh made regarding not being able to
apply hydrated lime on cropland. Is there any
implications in, that you could discuss on
that in this regard?

MEMBER DAVIS: The information
provided to us from some comments point out
information that pertains to that, Hugh, where
they mention that the use rates of hydrated
lime for plant disease control is typically
ten pounds per acre applied several times,
maybe three, four times, during the infection
periods for the disease.

They add up to only, you know, 30,
40 pounds per acre per season, whereas a soil
application rate, which is not allowed, would
be much -- many orders of magnitude greater
than that, to provide any change or economic
benefit to the grower.

MEMBER KARREMAN: Why is it not
allowed for soil amendment in general?

MEMBER DAVIS: Because of its
reactivity and synthetic nature, you know. It
has to be a specific reason for allowing it
for exempted reasons, and because it's a
synthetic and it is reactive in the soil
environment, it has too many things going
against it, I guess, for having it on the list
in general as a fertilizer. That would be my
opinion, at least.

CHAIRMAN O'RELL:  Gerald, did the committee, looking at the comments that came in from PCO and they had talked about the -- well one, that they said the removal of one of the very few limited options should not be made without further consideration and input from organic fruit growers.

They also addressed the concern that you had for the OFPA category, and did you read that comment there?

MEMBER DAVIS:  I had not read that yet.

CHAIRMAN O'RELL:  I would suggest that the committee certainly consider that, and have their point of view on the record.

MEMBER DAVIS:  CCOF, that certifier also provided an extensive comment on hydrated lime, that covers those areas too. But I didn't read this particular one.

CHAIRMAN O'RELL:  Okay. I guess my concern is that the majority of commenters
were in favor of continued use, and it seems to be that it's hung up in the committee, mostly because of categorizing from OFPA.

It seems to be that there is a recognized need out there, from what I'm hearing from public comments. So I'm concerned that do we have enough from the committee to justify not renewing this product?

MEMBER DAVIS: In my opinion, now that the additional input has come in, I don't think we have enough justification to not renew it. I haven't heard from you on that, Jeff, but --

MEMBER MOYER: No, I agree. If we were to have this vote today, this vote would not come out this way within our committee.

MEMBER KARREMAN: Are we having this vote today?

CHAIRMAN O'RELL: Well, we're going to have the vote this afternoon. So, and that's the purpose of the discussion. So am I
hearing now that there's a committee thought of changing the recommendation or a --

    MEMBER MOYER: I can only speak for myself, but in my -- as a member of that committee, I would vote to renew it today, having heard all those comments which weren't available to us when we did this.

    CHAIRMAN O'RELL: Okay, and that's all part of the process, which is good.

    MEMBER DAVIS: So we will need to, as a committee, convene to craft the changes in the recommendation, and see how the vote comes before the full board.

    You know, based on that recommendation, I think there's enough evidence that it's probably the more likely way it will turn out, is that it will be renewed rather than not renewed.

    Okay. Next substance category of uses, algicides, disinfectants and sanitizers, including irrigation system cleaners, and as plant disease control, hydrogen peroxide.
This is similar to the hydrated lime question. The biggest thing is where do we fit this in in a synthetic exemption category within OFPA, which is why it was deferred.

The technical evaluation report for hydrogen peroxide shows that the substance does not occur naturally, but poses no true threat to the environment because it easily breaks down into water and oxygen, or hydrogen and hydroxol (ph), depending on pH.

The potential uses of this material are many. The concentrated material is quite caustic to people handling it, but as used in the field and its effect in the environment, it's considered relatively innocuous material, because of its -- it breaks down to just totally natural materials very, very quickly.

There are no known cases of hydrogen peroxide causing environmental contamination.

All public comments except one were in favor of keeping hydrogen peroxide on the national list.
This was a lone dissenter that again was against synthetics in general, but didn't really justify their position and how it violated OFPA. Most commentators agree that there are no known adverse impacts on humans or the environment from either the use or manufacture of hydrogen peroxide.

Most of the commenters stated that there are no other similar products available that are more compatible with organic crop production practices, and that the availability of hydrogen peroxide probably lessens damage to the environment and harm to humans, by lowering the amount of toxic substances used as alternative measures.

Regarding whether the OFPA provides an exemption category that would permit hydrogen peroxide to be considered for inclusion on the national list, the NOP provided feedback to the NOSB that hydrogen peroxide could be considered a production aid under Section 6517 of the OFPA.
As a result, hydrogen peroxide would be eligible for continued use in organic production. The committee recommendation was to renew the material. Any discussion?

Kevin?

MEMBER ENGELBERT: I'd just like to go on record as saying I think it's one of the most underused, invaluable resources that organic farmers have, in not just crop production but also in livestock and sanitation.

MEMBER DAVIS: Okay. The next material, as plant disease control, streptomycin and oxytetracycline for fire blight control in apples and pears.

Several commenters were proponents of keeping the materials on the list. Upon subsequent Crops Committee contacts with these commentators, as well as several organic pear growers and crop consultants in Washington and California, is it clear that there is extensive support for the continuation of
these materials on the list.

The fire blight disease is deadly to pear trees, and all of the growers and consultants surveyed had tested the alternative materials listed in the technical evaluation report.

All had the opinion that the alternative materials mentioned were very much below the efficacy of streptomycin and tetracycline, and did not prevent fire blight to a high enough degree to keep trees from succumbing to the disease.

One commenter noted streptomycin and oxytetracycline for removal from the list, mentioning two of the alternative materials alluded to above, which would be Blight Ban or Serenade as viable control options.

Some commenters objected to any synthetics being used in organic production.

Reviewing the technical evaluation reports for these two materials shows that both materials are created by streptomyces
soil bacteria, through natural processes, and are produced in commercial quantities through a fermentation process, with subsequent chemical processes to isolate and purify the substance produced by the bacteria.

Tetracycline is presumed to undergo a chemical change from the natural oxytetracycline to calcium oxytetracycline. It was unclear to the reviewer if streptomycin undergoes a chemical change during the manufacturing process.

I won't read all the summary of the environmental effects, although the usual concern with this material involves the concern about this, these materials being sprayed in the environment on plants might have a crossover effect of causing cross resistance in bacteria that can be transferred to bacteria that infects humans, which would therefore render these antibiotics no longer useful for use in humans for disease prevention.
Some of the EPA data mentioned in the technical evaluation report pointed out that as far as human consumption of these antibiotics on fruit, that there has never been any detectable residues found. Probably they attribute that to the fact that it's always used during bloom, you know, many, many days pre-harvest, and not used throughout the season to where there could be a chance of residue left on the fruit.

In actual practice, you know, the pre-harvest intervals are 30 days on pears and 50 days on apples, as far as the EPA regulations, what they're allowed.

But in actual practice, in Washington state the usual interval between the last application at bloom time of oxytetracycline and calcium on organic pears, the usual interval is 90 plus days, depending on the variety.

The information provided in the report and subsequent information from
commenters gave ample documentation that the materials are in the environment very briefly, and degrade from UV light exposure very quickly, in the order of one to three days, depending on the material.

A wholly natural substitute product mentioned in the report is noted above, along with one other that was noted by a commenter. Other already-allowed substances that could be substituted are peracetic acid and copper materials, such as Bordeaux mix.

The tendency for fruit scarring and cracked from copper use on apples and pears, especially Bosque pear, is well-documented, and is avoided by growers by using it at pre-bloom only, whereas the bloom period is the usual time of fire blight infection.

No known crop label formulation of peracetic acid is available at this time.

The comments that I received, and I say "I" because I wrote the recommendation and gathered a lot of the information, but the
comments were submitted in writing subsequently from a couple of sources.

Talk about just how devastating it would be to the growers if we removed these materials, and there seems to be a lot of passion on both sides, as far as those who say antibiotics in organic production is a no-no, should never happen, and they have a philosophical position against it.

Whereas the economic impact to these growers would be extreme, and you know, as a former tree fruit grower myself, I can testify that I have watched trees die, my own trees die from this disease. It is dreadful, a dreadful, dreadful disease.

So I can appreciate the passion with which the growers come and try to support the continued use of it, because pears are -- particularly pears, but even apples, are very, very difficult to control this disease.

Discussion?

CHAIRMAN O'RELL: Bea?
MEMBER JAMES: First of all, thank you Crops Committee for all your work on all of these different substances. I just want to ask if you could elaborate a little bit, so that I can understand how there's a justifiable argument for the use of antibiotics in crops, when there is not a justifiable argument for the use of antibiotics in livestock?

MEMBER DAVIS: Some of the data that was given to us, and some of it just recently, just yesterday actually, point out two studies that talk about antibiotic use in livestock, you know, for meat production.

There has been documented cases of crossover contamination in the environment, however you call it, to where they can track antibiotic usage in livestock production to antibiotic resistance in humans, because of that use in livestock.

Because it's in the meat, it's consumed by humans and it's much more direct
contact to provide that change. I don't know. I'm losing the words. But in this case, used this way on plants, it is never been supported or documented that this is a way that is likely to happen.

MEMBER JAMES: The followup on that.

CHAIRMAN O'RELL: Followup, and then Nancy.

MEMBER JAMES: Okay. However, I think with just the spirit of organic, that the use of antibiotics, whether it's directly with animals or whether it's on soil, or in the air, I think that the concern that I've heard, especially from Rebecca yesterday, was that it goes against the basic fundamental principles of organic practices.

MEMBER DAVIS: A lot of -- one comment I had that I've noticed in this is a lot of this is in semantics and what we call these materials. On a technical basis, these materials have an OFPA exemption category as toxins derived from bacteria.
We call them antibiotics because they are used in animals, in humans, ingested and they provide systemic control of diseases in us.

This use is truly a topical application on apples, far removed from that whole environment of problems that are associated with antibiotic use in livestock and humans.

So it's because of the wording that's used, they're called antibiotics. In my opinion, these materials get lumped in a different category than some of the other biological materials we use already that are well-accepted, like BT materials, the other biological control materials, which are all toxins derived from bacteria.

Why we don't call those antibiotics is because they're not used in humans or livestock, and ingested for controlling diseases, in my opinion.

CHAIRMAN O'RELL: Nancy.
MEMBER OSTIGUY: I actually don't have a philosophical objection to the use of antibiotics in organics. What I do object to strongly is the prophylactic use of any antibiotic.

We don't allow any in animals because of the residue. Those residues that we know, you know, that are measurable, that we can do that tracking of antibiotics used in animals and then antibiotic resistance showing up in humans, is with prophylactic use, or use for growth promotion.

This particular use is prophylactic. It is used prior to disease demonstrating itself. When Zee and I were talking about this, she was saying "Well, if you had it last year, you're going to have it this year, but it hasn't shown up this year."

Disease, as we defined it, it has to have symptoms that are showing today, versus at subclinical levels. We all have in our bodies -- it would be very doubtful that it
would be impossible to extract from any one of us at any particular time anthrax spores.

But we don't have enough anthrax spores in us to cause disease. So the presence of the disease organism is not sufficient, in my mind, to say that we should use an antibiotic. So you don't use it until you have a disease.

Now I will fully grant you that in this particular instance, once the disease presents itself, it's too late. But philosophically, what we have going on here is the prophylactic use of an antibiotic, and in the same way that we can get antibiotic resistance as a result of the abuse of antibiotics in livestock animals, we can see the same kind of resistance occurring with bacteria because of the spread of this in the environment.

MEMBER DAVIS: Can I respond to her comment?

CHAIRMAN O'RELL: You respond, and
then I have Jeff.

MEMBER DAVIS: Growers and professionals working in the, you know, university and other professionals working in the tree fruit industry would challenge that it's a prophylactic use.

Prophylactic use would be to apply it every three days during the entire bloom period, to protect against the infection, whether it's going to happen or not. What they do is they use disease prediction models, various names in Maryland. I think it's called marablight, and in Washington I think they call it cougar blight.

They're very specific disease modeling prediction models that tell the grower the conditions are now right for infection; go spray.

So instead of 10 to 15 applications stretched out every three days to keep a prophylactic coverage, which they can't really afford to do anyway, they are able to limit
their sprays to, in comments I received, was
two to three in a usual year; in a bad year
maybe four to five.

It's all based on these prediction
models that say when there is potential,
because again, they cannot wait until they see
it. By then, it is in the tree.

It moves systemically and you have
varying degrees of damage; in some varieties
as much as complete tree death eventually. It
doesn't happen that year but it just continues
and continues until the branches wilt down and
die.

MEMBER OSTIGUY: I'd like to respond
to that.

CHAIRMAN O'RELL: Yes Nancy.

MEMBER OSTIGUY: I disagree with you
that that's not prophylactic use. That is
actually the definition of prophylactic use,
is you predict when you need it and you use it
before you see the symptoms.

I fully agree, that in this
situation, you can't wait to see the symptoms if you're going to actually have anything efficacious.

But it is still prophylactic use. You still have a situation where you are putting antibiotics out into the environment that are used to control human health diseases, and you can look at or you can get cross-resistance.

Then these particular, and we're having trouble with these two particular antibiotics with human diseases. We're unable to use them. The CDC has gone on record as opposing the use of streptomycin and oxytetracycline in conventional crop production. Why should we be different in organic crop production?

CHAIRMAN O'ReLL: Jeff?

MEMBER MOYER: Yes. I would say the issues that are coming up are exactly --

CHAIRMAN O'ReLL: Hugh, then Arthur.

MEMBER MOYER: --what we struggled
with on the committee. I mean there were many
of us, or several of us, that wished the
materials had never been on the list in the
first place.

But now that they are on there, you
know, the economic impact, the data that we
were getting from the growers was that they
could not survive at all without this. So
that's what we were responding to.

MEMBER KARREMAN: I'd just like go
on record as agreeing completely with Nancy
Ostiguy on this, and that on the whole topic
of antibiotic use in organic agriculture,
especially prophylactically, is prohibited.

How I wish we could use antibiotics
occasionally therapeutically in livestock. I
realize we're talking about crops, but you
know, if there's CDC data saying there's
cross-resistance or whatever, I just don't --

I just can't vote to allow it or to
continue to allow it, Because in livestock,
one of my main things, and I'm fascinated by
it, is to come up with natural treatments for
diseases in living creatures, so I don't have
to use an antibiotic.

I think that's a lot harder and a
lot more demanding than for crops, in a sense,
I mean for living creatures.

So I would think that if I'd been
challenged and I can come up to a point where
I hardly ever use an antibiotic for an animal
-- I will occasionally -- that animal has to
be removed.

I would think that in the Agronomy
Departments of all the land grants in this
country, they could come up with alternatives
to these two substances for use.

MEMBER DAVIS: But they haven't.

MEMBER KARREMAN: Well, they haven't
and you know, they haven't technically in
livestock either, but I'm trying, and I
imagine there would be good, you know, people
who have organic in their heart that will try
to find alternatives.
If this stays on the list, that is -- the incentive to find alternatives is not there. I have no alternatives for antibiotics. Therefore, the incentive is there for me to study and practice with natural treatments.

CHAIRMAN O'ReLL: Arthur, I think you wanted to make a comment, and then the --

MR. NEAL: I just wanted to add, for your own knowledge, that when you make these type of decisions, always try to make sure that we ground ourselves in OFPA as well, because if I'm not mistaken, OFPA mentions antibiotic use, Particularly in livestock production.

Not so with crop production, and even in its restriction of antibiotic use in livestock production, it references growth promotion and also some therapeutic use.

So I just wanted to add that to the record for your thoughts and consideration.

MEMBER DAVIS: Thank you, Arthur.
Bea?

MEMBER JAMES: Well, first of all, I just have to point out that yesterday we were talking about yeast as a form of livestock, so I think that it's pretty broad when we say that application to tree to deal with a fungus is, for some reason, a specialized case, as opposed to livestock.

Then also I wanted to say that my understanding of prophylactic use does not mean that it necessarily has to be a three-day application. The concentrations can be so significant that the application stays on for up to two weeks.

Therefore, you have your prophylactic application, according to your argument, Jerry. But I do -- I think that people also would be -- I mean we've talked a lot about consumer perception at this meeting, and I think that people, we have to take into consideration.

But if the public knew that we were
applying antibiotics to crops, that that would not be well-received.

MEMBER DAVIS: Can I respond to that?

CHAIRMAN O'RELL: Gerald can respond, and then Andrea and then Dan.

MEMBER DAVIS: The statement there about using high enough rates to make it last up to two weeks is not accurate. These growers are constrained to application rates at a certain rate, and they're only allowed to use that much, and it's very, very expensive material.

To just put it on at three to four X rates to make it last longer is illegal and prohibitively expensive. But I do have, within the comments handed to me at the meeting, a statement about the cross-resistance of antibiotics -- to antibiotics, from a Ph.D. plant pathologist.

If I could read it, it would be useful, I think. First, they point out that
there are 50 million pounds of antibiotics used annually in the U.S., according to this statement, used in humans and/or livestock.

Of that, the amount of antibiotic used on these plants is 0.1 percent of that 50 million pounds. "Resistance in three human pathogens -- campylobacter (ph), salmonella and e.coli has been directly linked to use of antibiotics in the production of animal products.

"Despite more than 30 years of use in plant agriculture, there has been no documentation of resistance development in pathogens of humans from plant use.

"The major concern regarding plant use of antibiotics is that organisms exposed to antibiotics in the orchard and field environment will transfer antibiotic resistance to pathogens of humans.

"However, it is well-known by microbiologists that for successful bacterial conjugation to take place, both species of
bacteria must successfully co-exist in a similar environment.

"Conjugation between bacterial species endemic in the outdoor ecosystem and human pathogens is unlikely. Because conditions suited to the survival of each species ensures the destruction of the other.

"Bacteria that live on fruit and vegetables surfaces are quickly destroyed in the gastric environment. Conversely, with the possible exception of some strains of salmonella in protected microenvironments, human pathogens are quickly destroyed when exposed to the outdoor environment.

"Additionally, antibiotics in the outdoor environment are quickly photo-oxidized. Efficacy of antibiotics against plant pathogens persist for less than 72 hours post-application, because of rapid degeneration in the field environment."

That is from Roberta Spitko, Ph.D., Plant Pathologist, New England Fruit
Consultants, Montague, Massachusetts. It was submitted to the program as comments in 2000, shortly after the materials were added to the list the last time.

CHAIRMAN O'RELL: Andrea.

MEMBER CAROE: I just want to point out in the TAP review it clearly states that there are no reason to believe that there's any antibiotic residues on the fruit. So it's not going to transfer.

It also clearly states that line 320 of the streptomycin that EPA has found no data indicating that streptomycin pesticide residues remaining in food supply would have a significant or even measurable potential for increasing resistance to that drug through oral exposure.

It goes on further to say that EPA recognizes that there's a potential risk to agricultural workers developing antibiotic resistance, but then goes on and says that this is lessened by the re-entry time on the
This is all according to label use, and organic growers are not exempt from label use requirements, and I want to reiterate, you know, my dealing with growers, and I do deal with growers on a daily basis, you know, smart growers that stay in business don't use these things unless they have to, because it's money out the door. It's the profit margin disappearing.

CHAIRMAN O'RELL: Okay. I have Dan, Kevin and then Nancy.

MEMBER GIACOMINI: In looking at these issues, and in looking at how I would evaluate them, two things that came to me was reasonableness and consistency.

On the reasonableness side, I am very conscious and aware of the implications to the growers to lose these items, and it would bother me very much to do that.

On the other hand, in spite of even the information that Andrea just read, on the
consistency side, when we look from the livestock perspective, if we're prohibited from giving a shot of antibiotics to a day-old calf on the perception that has some effect on the milk two years later, I have a hard time with the consistency, you know, in continuing to allow the product.

This will be -- I have no idea right now how I'm going to vote. This will certainly be something I will be ruminating on over lunch.

CHAIRMAN O'RELL: Kevin.

MEMBER ENGELBERT: I just wanted to add one other thing to the things that Nancy and Bea and Hugh and Jeff has said, that hasn't been mentioned.

One of the reasons that I was the "no" vote, I'm not convinced that even though the EPA said there's no detectable residues, that that is actually the case. The human body is sensitive to substances in levels of parts per trillion, and we are unable to
measure that.

I'm not convinced that these materials aren't absorbed by the tree, and do end in the fruit. I do have the philosophical problem with using antibiotics in organic production. A thorn by any other name is still a thorn.

CHAIRMAN O'ReLL: Thank you, Kevin. Nancy?

MEMBER OSTIGUY: Well, and I actually don't have that philosophical disagreement.

MEMBER ENGELBERT: I do.

MEMBER OSTIGUY: I fully agree that the EPA has not found and probably would not find antibiotic residues on the fruit. That is not my concern.

My concern is antibiotic resistance that develops within the environment, and we do have examples of that. The CDC has gone on record, that this is not a minor issue.

When we start -- unfortunately,
we're taking different disciplines' viewpoints and putting them -- and crossing over into fields where individuals have more and less information.

If we want to know about resistance that is going to show up to human pathogens, talking to a plant pathologist, with all due respect, that's not the group of people that we want to talk to.

We want to talk to physicians, public health people more importantly. Those are the ones that if we're looking at the resistance issue to human pathogens, that's where we go, and the CDC has gone on record being concerned about the use of tetracycline and streptomycin in conventional agriculture.

Using it in organic agriculture, in exactly the same way that we would use it in conventional agriculture, albeit a smaller use. Animals are the bigger issue. It's still a concern.

The CDC was specifically talking
about antibiotic use as a pesticide. They were not talking about it in animal use when they expressed their concern.

CHAIRMAN O'RELL: Could anybody with the access get something off the web, off of what their statement is?

MEMBER OSTIGUY: We actually have it.

CHAIRMAN O'RELL: Oh, we do.

MEMBER OSTIGUY: It's from the material that Rebecca gave us.

CHAIRMAN O'RELL: I've got Andrea and then to --

MEMBER KARREMAN: All right, that's fine. That's only a technicality.

CHAIRMAN O'RELL: Then Hugh. Andrea?

MEMBER CAROE: I just -- I agree Nancy, that if we were looking at this material for the first time, talking to CDC and considering that, that would be very important.
But this is sunset, and I think the plant path people have a lot to do with whether, what the impact is on taking this material off the list.

MEMBER OSTIGUY: And I agree with that. In terms of the impact, it's severe.

MEMBER CAROE: And that's, you know, I mean I think it takes a lot to handicap this part of the industry, and the plant path people, if they have no alternatives and this is death to stone fruit.

MEMBER KARREMAN: Yes, pears. Just a technicality here. It says that this -- to renew this on the committee report it has Kevin Engelbert moving to renew it, and it doesn't sound like you --

MEMBER ENGELBERT: No. I moved to vote.

MEMBER OSTIGUY: Yeah. That's different.

MEMBER KARREMAN: I'm sorry.

CHAIRMAN O'RELL: Okay. Bea?
MEMBER JAMES: Okay. This is just -- I just finished my first year on the board.

Just for clarification, is our role to be the gatekeepers of the organic integrity for the sake of organic integrity, or for the sake of the economy? Can somebody answer that question?

MEMBER DELGADO: I think it's both. It's a balancing act, and what I would like to suggest, if our mandate allows it, is to adopt an aggressive or an active position, to recommend to the research institutions around the country or the world, to develop specific alternatives for the items in the list that we think are the ones that are creating the most problems.

But I don't think we should eliminate these products right now, because we believe they're -- they have a certain degree of risk, just on those grounds. We have to weigh in the importance to the economy, and the benefit of the farmers in the short term.
In the long term, we should be looking for other options. I mean, how do we encourage those? That's my question.

CHAIRMAN O'RELL: Kevin.

MEMBER OSTIGUY: We do have a mechanism for that.

MEMBER ENGELBERT: I'd be responding to an earlier comment.

CHAIRMAN O'RELL: I have Andrea.

MEMBER CAROE: Okay. I just want to respond to you, Bea. I think the role is different in sunset. I really -- I think that acting on the concerns are much more important in sunset than they are in the initial consideration of a material.

So I don't feel that we're on the same ground as this board has looked at materials in the past. At this point, we have absolutely got to consider economic and availability of these products, and continue to keep them on the market, Because the effect is enormous.
So I don't feel it's a compromise to organic integrity, but it is a shift a bit, when we're considering continuation of a material on the list.

CHAIRMAN O'ReLL: Hugh?

MEMBER KARREMAN: To answer Rigo, I think we've already done that with methionine for poultry. There's been a kind of mandate set up by I forget what date, but there's active research going on because of what the NOSB has, you know, decided to ask the community to do.

CHAIRMAN O'ReLL: That was, you know, that during not a sunset, but that was during the approval of a petitioned substance in terms. If we are, as Andrea said, if we're -- it is different from sunset to reviewing a petition for a substance to be allowed or prohibited to the national list.

MEMBER OSTIGUY: But we don't need to tie it to the sunset, to say --

CHAIRMAN O'ReLL: Correct.
MEMBER OSTIGUY: --the board has a recommendation that we need to get more research done in this area.

CHAIRMAN O'RELL: Absolutely.

MEMBER OSTIGUY: And I think we probably should do that, at an absolute minimum.

CHAIRMAN O'RELL: We can go on record with that. Yes, I agree.

MEMBER SMILLIE: I agree with that, and I just checked with Miles McEvoy from Washington State, and their recommendation there, and they're one of the states with the most knowledge and experience with this.

The recommendation is to continue it, but they're actively looking at new biologicals, that hopefully we'll be able to replace it. So I think everybody's comments are coming to the same thing. We want to put a real tether on this one.

We're going to renew it for sunset, but we're going to serve serious notice that
it's on its way out and we need to develop the replacements for it.

CHAIRMAN O'RELL: Hugh and Bea.

MEMBER KARREMAN: Still -- okay.

CHAIRMAN O'RELL: I think he had you.

MEMBER KARREMAN: Yes. But the nature of the topic, that word "antibiotic," is a ball and chain to whatever substance is declared an antibiotic for whatever reason, even if it's a misnomer.

We saw all the charts yesterday up there, and the number one reason consumers buy organic is the lack of antibiotics used in assumably the system --

MEMBER SMILLIE: In the product.

MEMBER OSTIGUY: In the product.

(Simultaneous discussion.)

MEMBER KARREMAN: I'm just saying it's a loaded word.

CHAIRMAN O'RELL: And just a point.

I think that Hugh, if we were looking at
these items today as petitioned items to go on
the national list, all of those things would
be valid.

We have a substance that's been in
use for five years. We have concerns about
it, and those concerns should be stated in the
record and addressed. But we're hearing from
growers there is tremendous economic impact at
this time not to renew.

MEMBER KARREMAN: What if, though,
there were residues found upon the fruit in
the next two years?

CHAIRMAN O'RELL: That's different.

MEMBER KARREMAN: And we renew this.

CHAIRMAN O'RELL: Somebody can
petition with new evidence --

MEMBER KARREMAN: No, in media, in
the press, in the public, and we renew it now.

MEMBER OSTIGUY: What if you found
out that glycerine is a carcinogen?

CHAIRMAN O'RELL: Okay. Bea.

MEMBER JAMES: Okay. I guess my
concern is that yes, I understand that this is a part of sunset. Sunset comes around every five years. So we're renewing it for five years, and this is a question for the NOP.

Is it possible to put forth a recommendation that we would like to have it taken off of the list within two years?

MEMBER OSTIGUY: That's an annotation.

MEMBER SMILLIE: That's an annotation.

MEMBER OSTIGUY: Arthur.

MEMBER SMILLIE: We can't --

CHAIRMAN O'RELL: Arthur, do you know?

MR. NEAL: Okay. With any substance, you can renew for sunset and clarify, deal with later. Anybody can petition it the day after it's renewed, to get it off the list.

MEMBER JAMES: I think I would like -- I think that that needs to be written into
this recommendation.

    MR. NEAL: Well, the thing -- I mean the thing to clarify, you don't want to put it in the recommendation.

    The thing that we really want everybody to understand is that sunset, though it has the potential for the substance being on the list for five years, doesn't mean that it's going to stay on the list for five years.

    I mean the board may find an issue with it, and ask somebody to petition to have it removed. You know, it's a process of assessing the continued need for the use of a substance.

    CHAIRMAN O'ReLL: Is there any additional conversation, discussion along this line, or should we move on? I think we've --

    MEMBER OSTIGUY: Beat it to death?

    MEMBER DAVIS: I did have something I wanted to read as far as stating towards the economic impact.

    CHAIRMAN O'ReLL: Okay.
MEMBER DAVIS: Material that was submitted to the NOSB previously. This references some losses of trees and economic losses in recent history.

In 1998, apple and pear growers in Washington and Northern Oregon suffered an estimated $68 million in losses due to outbreaks of fire blight caused by the organism.

Since 1997, approximately 500,000 pear trees have been destroyed in the Po Valley of Italy, which is the major pear production area of the world, in an effort to eradicate fire blight.

These are all, you know, have footnotes as far as where these references are coming from.

Another 580,000 pear and apple trees were destroyed in Romania between 1993 to 1997, and 340,000 pear and apple trees were destroyed in Croatia since 1995, in efforts to halt the spread of fire blight in those
countries.

This is a year 2000 article. So they're referencing stuff between the mid-1990's through 2000, as far as losses.

CHAIRMAN O'RELL: Move on.

MEMBER DAVIS: Moving on. To finish this, the committee did recommend to renew the materials at this point, on a split vote obviously.

Okay. As plant or soil amendments, aquatic plant extracts, the alkali extraction of aquatic plant extracts.

They were deferred because there were questions that were raised, which included what are the manufacturing processes, what do the extractants and stabilizers do to the product, and are there non-synthetic aquatic plant products available.

Seaweed extracts can be produced from live, fresh plants using potassium hydroxide or sodium hydroxide, which are called alkalis in general. Potassium
hydroxide is the more preferred material due to concerns about the possible negative effects of sodium on the intended crops.

The raw plant parts are digested in the presence of the alkali, to break open the cell walls of the plants. Some manufacturers use pressure in this part of the process; some do not.

It is claimed that the high pressure environment allows the extraction of the cell contents of the kelp with less alkali, without the reduced yield of vital plant compounds that occurs by raising the temperature of the process, which is another way of aiding in the extraction.

After extraction, the insoluble fraction of the mixture is filtered out, and the liquid is either stabilized with an acid such as phosphoric, or dried to form a soluble powder, without acid stabilization.

Liquid formulations would be overtaken with bacterial growth if the pH were
not lowered to around 3.5. Natural acids such as citric are not able to accomplish this in the high pH alkali-type extracts.

The alkali extraction process does produce some chemical reactions in the raw material, although the complexity of the chemical mixtures found naturally in the plant material would make it almost impossible to quantify all of the chemical changes. This is according to the technical evaluation report.

Clearly, the extraction and stabilization of liquid kelp extracts in the alkali process does change the amount of potassium in the finished product, versus the raw plant, and would change the amount of phosphorous if a liquid material were allowed.

One manufacturer commented that their process does not use more alkali than necessary to produce the proper consistency of extract, and no more phosphoric acid than necessary to lower the pH of the extract to the exact point they need.
They contend that the recommended use rates for their material is considerably less than one percent of the typical crop's nutritional need would be supplied.

To go beyond their use rates in order to obtain a fertilizer benefit from the material would be cost-prohibitive to the grower, and possibly detrimental the crop, due to the natural amount of sodium found in kelp and/or seaweed.

Their comments are in response to concerns that fortification with synthetic nutrients might be occurring, rather than simply extraction and stabilization of the product.

In answer to the question about are there non-synthetic aquatic plant products available, there is a product that would involve mechanical or physical disruption or pulverization of the seaweed. The liquid extracts are separated from the solids and stabilized with natural acids, and/or acetic.
As described by the manufacturers, these materials would be considered non-synthetic. The component of plant growth substances in these products is said to be somewhat different than the alkali-extracted products.

I won't go on with that. The aquatic plant extracts used in organic crop production are completely unique in some of their beneficial attributes for crops.

There are no substitute products that provide the same benefits to growers. They are somewhat unique even when comparing the benefits of alkali extracts versus the non-alkali extracts.

The Crops Committee recommends the renewal of the material aquatic plant extracts, other than hydrolyzed extraction processes, limited to the use of potassium hydroxide or sodium hydroxide solvent use is limited to that amount necessary for extraction. Discussion?
MEMBER JAMES: Gerry, I have a question. I know that Armory has made several attempts to communicate their position. I was wondering if you could give your reaction to their comments regarding aquatic plant extracts?

MEMBER DAVIS: Yes. I responded to them in writing on their concerns. I wish I had brought that statement, to sort of be a little more complete. But the gist of it was that I appreciate their concern, that we need to have a delineation of what amount of extraction is allowed.

So we just don't have high amounts of potassium and hydroxide being used to produce a, you know, a potassium fertilizer that's synthetic, for use in organic production.

The materials are used -- I pointed out to them that the materials are used as a use rate of half a pound to a pound per acre per treatment, and that to get a true
fertilizer response from that potassium, you would have use it in the order of probably 15 to 20 pounds to get a true benefit.

At the cost of the material, that would be close to $100 per acre per application. That would have to be done multiple times to fertilize the crop for potassium.

Whereas there's potassium sulfate is an allowed natural that is far, far cheaper than that. That's what growers would use if they needed to supplement for potassium.

I appreciate their concern that there's not funny stuff going on with the amount of extractant used, and that we should put a limit on it, and that's something that could be annotated by petition, to get specific guidelines in place.

But it wouldn't be our place to throw out the material and take off the alkali extracted products from the organic list in sunset. You know, they should address their
concerns through petition and annotation, rather than let's drop it from the list because of that concern.

MEMBER SMILLIE: No, I agree with Gerry. I've had a lot of experience using the material, and you don't fully apply potassium anyhow.

I don't think the fear there that we're using an artificial fertilizer, sneaking in an artificial fertilizer, is justified on any grounds at all. So I agree with you Jerry, and the recommendation of the committee.

Obviously, we need to tighten up and have more knowledge of the manufacturing process, which is continually evolving. There's a lot of different ways and there's new materials being used, like potassium carbonate, and that one gets petitioned.

So I think we can deal with the more knowledge on the material through the petitioning process.
MEMBER DAVIS: Are we done? Getting down there. Another material as a plant or soil amendment, humic acids.

Many commentators requested to keep humic acids on the national list. Two specific comments expressed concern about losing their ability to use water-extracted humic acids in their products that they make and sell to growers.

They were concerned that their water-extracted humic acid would be dropped from the list, along with alkali-extracted versions. This would not be the case, since a true water-extracted humic acid from a natural source, with no synthetic ingredients added, would by definition be allowed and would not need to be on the list.

The NOSB deferred the vote from the November 2005 meeting on humic acids in this form, the alkali extracts, until further information is obtained concerning the availability of water-extracted humic acids,
which would be a wholly natural substitute.

A technical evaluation report was provided to the NOSB, in order to arrive at an appropriate recommendation.

The report described the manufacturing processes of alkali-extracted humic/folic acid, folic being a component of the material, as well as the uses and benefits of the substances.

The report gave no evidence of any harmful or adverse effects to the environment, agro-ecosystem or human health. No water extracted humic acid materials were described in the report.

Search of the scientific literature on humic acid and comments elicited from four separate humic acid producers suggests that leonardite coal, typically used to make humic acids, will not solubulize in water to any significant degree without adding the alkali materials for extraction purposes.

Subsequent Crops Committee contact
was made with the commentators mentioned above, to seek more information on their water-extracted product. The Colorado-produced water-extracted humic acid explained that their product is extracted from peat.

When asked about the humic acid content of their product, they provided analytical lab test results of the material. Unfortunately, the submitted lab result document did not contain any statement as to the humic and/or folic acid content of the material, but merely listed the fertilizer content, such as NP&K (ph).

When asked about the absent data, the producer said they have not been tested for humic or folic acids, but only plant food content. This producer further explained that their product is marketed as a blended component of several products, and that it also includes ingredients, other materials such as glucose and enzymes.

The amount of humic substance
applied as a component of their products is typically about three ounces per acre, and are intended to improve soil health through enhancement of soil biology, but not as the soil amendment use as listed in the technical evaluation report.

By comparison, the typical crop application rates of humic acid of the alkali-extracted sort range from one to five gallons per acre for soils, and one to two pints per acre for folic use.

The Crops Committee makes no statement as to the validity of this product or other possible water-extracted humic acids.

This discussion is offered only in order to show that this particular water-extracted humic acid product available to the marketplace does not represent a functional replacement material for the alkali-extracted humic acid.

Further comments are welcome by the committee as to the availability of any water-
extracted humic acids that may be functionally equivalent, wholly natural substitutes for the alkali-extract materials.

Based on the comments received and the subsequent checking on the true nature of the water extracted humic acids that were alluded to, the Crops Committee recommends the renewal of the following substance: humic acids, naturally occurring deposits, water and alkali extracts only. Discussion?

CHAIRMAN O'RELL: Can we hear from the minority?

MEMBER ENGELBERT: That would be Mr. No again.

MEMBER OSTIGUY: Kevin, you can't be Mr. No, because those are my initials.

(Laughter.)

MEMBER ENGELBERT: You're Mrs. No.

MEMBER CAROE: You're married.

MEMBER OSTIGUY: No, no. I am Dr. No.

(Laughter.)
MEMBER ENGELBERT: Word play here. We had so much to go over that I wasn't comfortable with this. It didn't seem like an essential material for organic production. I just wanted to be sure there was Discussion about it, because I think I still need to learn a lot about it.

In my research, I couldn't find any farmer that used it that thought it was absolutely essential for organic production, and I just couldn't learn enough about it in the short length of time I had to work on it.

CHAIRMAN O'RELL: Was there anything that was brought up to light in the public comments that caused any concern in your thinking?

MEMBER ENGELBERT: I have misplaced my notes. I thought I brought them with me, and so I don't remember that there was.

CHAIRMAN O'RELL: Gerald, was there anything in the public comments that would --

MEMBER DAVIS: I think on this
issue, the reason we deferred it was because in looking at the public comments, we picked up these references to water-extracted humic acids.

So really the reason they were deferred is to investigate well, these commenters are referring to these water-extracted humic acids. We'd better check on them and see is there a wholly natural substitute, and that's really the only -- there was no negative reason for taking that vote.

MEMBER OSTIGUY: I have the same recollection, that it was purely because of the mention of the water extracted, and what that would have meant is we could have taken it off the list, because then it would have been a natural process, etcetera. So that was the direction. It was not an interest in changing the annotation.

CHAIRMAN O'RELL: Okay, thank you. Any other Discussion?
Hearing none.

MEMBER DAVIS: Moving on. Category of use as plant or soil amendments, and also as flotation agents in post-harvest handling, lignin sulfonates.

The question of whether there are non-synthetic alternatives to lignin sulfonates as plant or soil amendments as an issue during the sunset process consideration.

Lignin sulfonates are used extensively as a key leading agent for micronutrients in liquid fertilizer formulations approved for use in organic crops.

However, no information was supplied in the public comment to suggest any non-synthetic alternatives for this very common use of the material. Citric acid is a non-synthetic material that is considered to have a weak, kelating effect when used for this purpose, but is not directly comparable to the level achieved with the lignin sulfonates.
The lignin -- on that side, the lignin sulfonates are also used as dust suppressants on roadways and can be used that way on organic farms, which in arid regions of the country like California, they are facing more and more regulations, environmental regulation on minimizing dust and the particulate counts in the air.

So farmers are targeted as producers of dust. So it would have a possible regulatory effect on organic growers in those areas, where they face dust control regulations.

Regarding floating agents in post-harvest handling, the use for that purpose, a comment was received suggesting that physical agitation, bubblers, etcetera, could work as an alternative practice to the lignin sulfonate use.

Subsequent comments received, after checking on this, received, disputed that the use of physical agitation works in the
handling of pears, which is the significant use of the flotation agent.

Part of this is pears are heavier than water and they add a couple of different materials to the water to make the pears float, so they can get them onto their packing lines.

The committee recommendation, the Crops Committee recommends renewing the following material to the following categories of use: As plant or soil amendment, and as being lignin sulfonate as a kelating agent, dust suppressant, flotation agent, and also as floating agents in post-harvest handling. The committee vote was 3 to 1.

CHAIRMAN O'RELL: Joe?

MEMBER SMILLIE: Yes. Again, I would agree with that. There's more uses than that. It's also used as a seed coat a lot in the Midwest.

I would like to point out one of the issues with it is not a U.S. issue, but it is
a Codex issue. It's not allowed in Codex and under the arrangement with Japan, U.S. producers are not allowed to ship products to Japan that have used lignin sulfonate.

It's one of the three items on the "no go" to Japan list. So not that that needs an annotation or anything, but it's just an awareness thing, that U.S. producers who do use it would not be allowed under the TM-11 export arrangement or under JAS certification to use that material.

CHAIRMAN O'ReLL: Did you want to weigh in, Kevin?

MEMBER ENGELBERT: Yes. I was the dissenting "no" vote again, for the same reasons as before. As Jeff and I talked, we want to keep organic and in some respects, we wish all these materials were off the list and had to be petitioned to be brought back on.

So we had more time to learn more about them, because they just don't seem essential to organic production, and I don't
see how allowing them differentiates organic production and processing from conventional.

I think we're maybe betraying the public's trust with some of these substances, and I just wasn't comfortable rubber-stamping them or giving them an approval without some discussion from the whole board.

CHAIRMAN O'RELL: Andrea.

MEMBER CAROE: Just a kind of overview statement about this. It isn't our job in sunset to reconsider -- we have to respect the previous board's decision. Acting on new information is one thing. Overturning a previous board's decision is not what we're about.

So I'm all in favor of considering any alternatives that have been approached, any new information that's come to light in the last five years.

But overturning a previous board's decision I think it's really disrespectful of the previous board members, and I don't want
to do that.

CHAIRMAN O'RELL: Nancy.

MEMBER OSTIGUY: My question is actually to Joe. If they use the lignin sulfonate as a dust suppressant so it's not on the crop, would that affect it, their ability to export?

MEMBER SMILLIE: Good question. I'd have to look --

MEMBER DAVIS: Depending on the buffer zone Joe, wouldn't it?

MEMBER SMILLIE: Yeah, I guess. Japanese regulations are whole different kettle of fish.

MEMBER OSTIGUY: Okay. I was just asking.

MEMBER SMILLIE: Maybe it's a different approach to it. I think the objection was primarily because they went to Codex, and for whatever reasons, Codex didn't allow it.

I can't remember the history of it,
but it just came up as a "we'll accept
everything you do, but not these three
things." We go "Okay, fine." These three
things aren't allowed. So I can find out more
about the history, but --

CHAIRMAN O'RELL: Jeff.

MEMBER MOYER: I just wanted to go
on record as saying I supported what Kevin was
saying, and in our discussions in the
committee, we both really want to keep organic
organic, and have the --

If these materials were coming up,
being petitioned to be put on the list, I
would have voted no to not put it on the list.

But in support of what Andrea is
saying, we do respect what form of words have
done, and the fact that there was no new
information, coming up to say it had to be
removed.

I voted to, in this initial
document, to keep it on the list, but do very
much support what Kevin is saying.
MEMBER ENGELBERT: That's where we're coming from. We just wanted to --

MEMBER MOYER: Plus Kevin and I were also very short on the learning curve when Gerry dumped this on us. It was like --

MEMBER OSTIGUY: And you guys are doing great.

CHAIRMAN O'RELL: Yeah. You guys absolutely did --

MEMBER MOYER: It was a lot of material to read in a very short period of time, so it really was trial by fire.

CHAIRMAN O'RELL: For each of you, as new board members, and I've seen board members over the last five years, and I can say that you guys have been participating up at a par that exceeds past experience. So that's very welcome.

MEMBER SMILLIE: We appreciate that.

MEMBER ENGELBERT: Yes. Thank you.

MEMBER DAVIS: And I feel pretty new too.
(Laughter; simultaneous discussion.)

MEMBER DAVIS: It's not that we've structured our role, but there was method to our madness, so to speak. We just want to make sure we were handling things properly.

CHAIRMAN O'RELL: That's fine. I appreciate that for the record. Hugh?

MEMBER KARREMAN: I guess I just want to say that we do need to respect the past board's decisions. We need to have continuity. We need to know the history of the board.

But I certainly do not feel bound to not overturn a previous board decision. I just want to put that on the record.

CHAIRMAN O'RELL: Well, and I'm not going to speak for Andrea, but I think what Andrea is saying that without information, we're here for the public, and during the sunset process, that's when the public input comes in.

So if there's no new public
information and the public supports an item, and there's nothing new out there to say we shouldn't go forward with it, then I do think there's some credence to the past.

MEMBER KARREMAN: In this context, yes. But I mean in general, there could be policy decisions made three years ago that are going to change each year.

CHAIRMAN O'RELL: No, no, no. Things always change and evolve. I think her comments were related to sunset.

MEMBER KARREMAN: Agreed.

CHAIRMAN O'RELL: Okay. Last material.

MEMBER KARREMAN: You've still got one?

MEMBER DAVIS: Last one.

CHAIRMAN O'RELL: Okay.

MEMBER DAVIS: Category of use as another flotation agent in post-harvest handling, sodium silicate.

The only comment on sodium silicate
received during the sunset comment period in
August 2005, a question of whether the
material was being used by anyone any more.

The commentator, a certifier from
the upper Midwest, stated that they had never
been asked about the material by any fruit
growers, and suggested that it may be removed
from the list. The material was deferred in
order to find out if the material is still
used by any organic operations.

Subsequent Crops Committee contact
with the Washington State Organic Program, the
certifier in the largest tree fruit growing
region in the U.S., discovered that it is used
as a flotation agent by approximately two-
thirds of their certified growers, who use
these type of materials.

The other one-third is currently
using lignin sulfonate. The actual number of
growers in their program that are using either
material was not disclosed. The contact at
the Washington program stated that these
growers would like to continue using the materials, which are used to float pears.

Some public comment was received by the committee, verbal comments from subsequent contacts with some of these growers that the Washington program alerted us to, and they repeated the same feeling that "Yeah, we need a flotation agent. We'd like them to keep being on the list."

So the Crops Committee recommended renewing the following material to the use category as floating agents in post-harvest handling, sodium silicate. Discussion?

CHAIRMAN O'RELL: So in this case, Gerry, do I understand that we have two substances that do the same thing?

MEMBER DAVIS: Yeah.

CHAIRMAN O'RELL: Is there a distinction between the people who are using sodium silicate and those who couldn't use lignin sulfonate?

MEMBER DAVIS: I didn't pick up on
that at all. I think possibly. I mean I could be speaking out of turn, but it did seem to me --

CHAIRMAN O'RELL: I mean, to me this is a case where maybe you have two items that do the same function. But I'm not sure if we have that level of knowledge here to make that decision. But that would be my concern.

MEMBER DAVIS: And I don't know if there are any of the tree fruit growers from the West Coast here, that would use these kind of materials. That might be kind of a longshot, because it's pretty specialized usage.

Perhaps the fact that the lignin sulfonate has so many more uses, and could be used as a flotation agent. That might cause the board to lean towards removing it. But we'd have to change it, a lot of things.

CHAIRMAN O'RELL: Well for me, it's just a question, because I'm not going to shoot from the hip on something. But it just
seems like we have two materials that do the same thing, and it sounds like if they don't use one, they could use the other, and it's just a question. Joe?

MEMBER SMILLIE: I might have some more information after lunch. I've, you know, contacted WSDA and hopefully we might be able to answer that, we can get some information on that before we vote.

CHAIRMAN O'RELL: I think that would be helpful to know.

MEMBER SMILLIE: Yes.

MEMBER DAVIS: We'll get that.

CHAIRMAN O'RELL: Hugh?

MEMBER KARREMAN: At voting time, do we still have some discussion? Like when the motion is made --

CHAIRMAN O'RELL: Yes. There will be a motion, it will be seconded, discussion, vote.

MEMBER KARREMAN: Okay, good.

MEMBER DAVIS: That's all I have.
CHAIRMAN O'ReLL: Gerald?

MEMBER DAVIS: That concludes the Crops Discussion, yes.

CHAIRMAN O'ReLL: Thank you.

MEMBER OSTIGUY: Good job.

CHAIRMAN O'ReLL: Good job.

MEMBER KARREMAN: Very good job.

(Applause.)

CHAIRMAN O'ReLL: Got to get back to my agenda, to see who's on the hot seat.

MEMBER MOYER: Livestock.

CHAIRMAN O'ReLL: Livestock. Hugh?

MEMBER KARREMAN: I'd put you on the hot seat, Gerald, so now it's my turn.

MEMBER DAVIS: I'll go easy on you.

MEMBER KARREMAN: Hey, whatever it takes.

MEMBER DAVIS: Feedback.

Livestock Committee Report

MEMBER KARREMAN: Okay. As acting chair for Livestock right now, since Chairman Lacy (ph) is not here, I've been asked to
present these materials for consideration and discussion at this point.

So the first one is the -- we're looking at synthetic substances allowed for use in organic livestock production under the category use as feed supplements, 205.603(c), 2(c). We're looking at milk replacers.

Okay, committee summary. Several commenters supported the continued listing of milk replacers. One commenter requested the continued listing of non-organic milk replacers, since organic milk replacers or their equivalent are available.

The Livestock Committee agrees with the commenter, who indicated organic milk replacers or their equivalent are available, and thus non-organic milk replacers no longer need to be on the national list.

The Livestock Committee believe milk replacers can be removed from the list without adversely affecting organic livestock production.
So the committee recommendation, based upon the comments received, we recommend to not renew milk replacers with their annotation, or should I just say milk replacers, since we're not doing annotations?

MEMBER CAROE: The listing.

MEMBER KARREMAN: The list, leave it as is?

CHAIRMAN O'RELL: As listed.

MEMBER CAROE: As listed.

MEMBER KARREMAN: As listed, okay.

The vote was 4 to 0 and one abstention. Discussion?

CHAIRMAN O'RELL: Andrea?

MEMBER CAROE: There seemed to be a lot of public comment on this. Did that bring any new light to your consideration? I mean, I did hear public comment on it, and truthfully, I hadn't been up to speed on your recommendation at that point.

But did the commenters that gave public testimony give you any new information
or any reason to reconsider your committee decision?

MEMBER KARREMAN: I don't think so. I can tell you that some comments that were received by me at farmer's meetings across the country clearly indicated that there was no need for it.

That's directly from dairy farmers, overwhelmingly like because regular milk, kind of waste milk, is used for calves on organic dairy farms.

MEMBER CAROE: Okay. Well, I guess --

MEMBER KARREMAN: Yes, okay. I saw you Nancy.

CHAIRMAN O'RELL: Nancy.

MEMBER OSTIGUY: At least my understanding of the comments was "Well gosh, don't take it off the list because we might need it, maybe. I'm not sure though."

That seemed to be what Jim was saying, and then the subsequent comments were
"Well yeah, we were going to say it was okay to take it off the list. But since Jim said maybe we should keep it, we'll go long with that."

So there really didn't seem to be much information, other than "Well, should we take it off the list, because if we do, then if we need it, we won't have it," and it didn't seem to have a use.

CHAIRMAN O'RELL: I've got Julie, Dan, Joe.

MEMBER WEISMAN: It was PCO, Pennsylvania Certified Organic, did address this issue in their comments that were read yesterday, and it seems like they do continue to receive requests for the emergency use of milk replacer and approve it when they agree that it's necessary. They say that there are not organic equivalents available in their region.

MEMBER KARREMAN: I would ask -- I would like to know and maybe Leslie in here,
what --

MEMBER WEISMAN: Actually, I think Emily signed this comment.

MEMBER KARREMAN: Well whoever from PCO --

MEMBER WEISMAN: Could Emily speak to this?

MEMBER KARREMAN: --what the emergency uses were for, because to -- like I mentioned yesterday, emergency is an unplanned event requiring immediate attention. Usually, when you have to go to certifier and ask things, it takes a little while.

So I'm kind of wondering what the emergency use was. Someone from PCO in here?

EB: Yes.

MEMBER WEISMAN: Yes. Emily's coming.

CHAIRMAN O'ReLL: We'll ask Emily to come up to respond to that, but before -- as you're coming up, Dan?

MEMBER GIACOMINI: Being on the
Livestock Committee, my feeling was uncertain at first. I did go along with the vote. In the public comment that did ask for it to be retained, PCO and also Kelly Shea, I believe, requested that it stay on.

The discussions in the committee was that we couldn't see an emergency use that justified it, so why not take it off? In light of the public comment, I go kind of back to my original feeling. Whereas since it does have such a restricted annotation, there's no harm in having it on there.

For the emergency situation, even if it's a case where the power went out for three hours in the morning and the truck came before the guy could get the calf milk out of the tank, and something else was going on and they couldn't -- didn't feed the calves in time that day, I know there are --

The vast majority of commercial milk replacers on the market probably do contain BST, but I know there are communities and
markets where the processor restricts and does not allow the use of BST.

A lot of those do offer their producers the opportunity of buying whole milk powder, and that would not have BST in it. So in light of all that information, I'll be changing my vote this afternoon.

MEMBER KARREMAN: However, that's milk powder. That's not necessarily milk replacer, and maybe we need to have a definition of what milk replacer is.

Because milk powder -- I mean milk replacer is, you know, can be conjured up in many different ways.

MEMBER WEISMAN: Right.

MEMBER KARREMAN: But milk powder is different. I mean that's just powder with -- milk power and water. I don't know if that's really replacer or not.

(Simultaneous Discussion.)

CHAIRMAN O'RELL: Emily, for the record.
MS. BROWN-ROSEN: Oh, my name?

Emily Brown-Rosen from Pennsylvania Certified Organic. I put this comment in because we do get requests from farmers, and we are asked to review products that are milk replacers.

For a long time, there was never one that was acceptable that was identified. But we recently identified one that is, and the ingredients seemed to be acceptable.

So I agree, it would be a very rare use that would be -- that they wouldn't be able to use organic milk. There would have to be some extreme situation. So we allow it on a case by case -- you know, they have to individually get approval every time they want to use it, and we have to document the emergency.

So what I had put in here was such things as mother dies during birth, somehow there's no other milk available, some kind of big disease outbreak, rabies, fires, you know.

It would be real extreme that would be the
emergency.

MEMBER KARREMAN: Just quick. Do they -- is it usually, do they ask before they use it or after they use it?

MS. BROWN-ROSEN: They're supposed to ask before. Yeah, if they used something afterwards --

MEMBER KARREMAN: That's what they're supposed to do.

MS. BROWN-ROSEN: Yeah, yeah. Joe?

MEMBER SMILLIE: Well, I need clarification on a couple of points. If we approve the continued use of milk replacer, can we put these restrictions on, that it doesn't contain all of the things that we heard so much about the last two days from the dairy community, that they want a real strong organic law and walk the extra mile and all that stuff we heard.

Then we're going to allow a milk replacer that contravenes it because it has a number of ingredients that are --
MS. BROWN-ROSEN: Yes, but why is it synthetic is the question? I mean, you know, we looked at this. On the list is the synthetic, and what do we do? I review products.

You know, so we've seen some that come in with animal fat, blood, amino acids and I've said no. But you know, the other ones we've had -- but there's not real clear guidance for that, other than that they're otherwise prohibited in the rule, you know.

MEMBER SMILLIE: But we can't vote on that. We can only vote to continue allowing that material that you just quoted with all the no-nos in it, or nothing, right? Is that correct?

MEMBER KARREMAN: That's correct.

CHAIRMAN O'RELL: Or if it's continued, you can come back, somebody can file a petition for an annotation, and then these can be addressed in committee.

MEMBER SMILLIE: My second question
is milk from the tank considered milk replacer instead of powdered milk?

MEMBER KARREMAN: Well that's interesting. I mean no. I mean that's milk from a tank. That's organic milk, and that's actually what the farmers I was talking to across the country, they all either use hospital milk or milk they wouldn't put in the tank for whatever reason, or tank milk basically.

MEMBER SMILLIE: Wouldn't be more available on an organic dairy farm than a synthetic milk replacer?

MEMBER KARREMAN: Except in the conditions that Emily had just stated, like salmonella, barn fire, whatever.

CHAIRMAN O'RELL: Kevin?

MEMBER ENGELBERT: Yes. The reason Hugh had that response from all the farmers in the country is because there is no need for milk replacer in an organic dairy. The OFPA requires organic feed from the last third of
gestation.

If a farmer has a problem with a death at birth, there's always organic milk available on a dairy farm. You milk at least twice a day, and there's no reason milk can't be taken out of the tank.

If an animal dies at birth, we always keep frozen colostrum on hand. We can thaw out and feed that animal, and there's just no way to say that there is an emergency need for milk replacer on an organic dairy.

It just -- it won't happen. You'd have to -- you know, if you are fighting a disease on your dairy farm, you can pasteurize the milk simply by doing it on your kitchen stove. You don't need to purchase any major piece of equipment.

You can -- if you have a disease outbreak, you'll be testing your animals, segregating those cows that do have that disease that can be transmitted to the cows, and you will also have other organic milk
available to feed.

You can go to a neighboring organic farm if need be and get milk, buy milk from them. But conventional milk replacers simply have no need or no place on an organic dairy farm, period.

CHAIRMAN O'RELL: Bea and Nancy, and then Emily.

MEMBER JAMES: I have a question. What percentage -- I mean it's probably such a minuscule percentage -- what percentage over a year would a dairy farm, and maybe Jim Pierce might be able to answer this or somebody else, would somebody actually use a milk replacer? I mean --

MEMBER OSTIGUY: Kevin could answer that. It's like six weeks or seven, less than that, if you were going to use a milk replacer?

MEMBER ENGELBERT: Like what, for standard, bringing up a calf?

MEMBER OSTIGUY: For a calf, yes.
MEMBER JAMES: Yes.

MEMBER ENGELBERT: Well, wait a second. This is only for emergencies. This is not for regular like feeding calves.

MEMBER JAMES: Right. So I mean how much milk replacer, how many emergency situations are there where a dairy would actually -- I mean, there will probably be years that could go by that you wouldn't even need to use it?

MEMBER KARREMAN: Can I just answer once here Kevin?

MEMBER ENGELBERT: Sure.

MEMBER KARREMAN: I get onto 80 certified farms down in Lancaster County. I never see bags of milk replacer.

CHAIRMAN O'RELL: Nancy.

MEMBER OSTIGUY: Kevin, this is a question for you. You said that there's never a reason, and I'm ignorant about dairy farms. Would the barn fire be a situation where you might end up needing something, or would there
still be other options?

MEMBER ENGELBERT: You will still be milking your cows somewhere.

MEMBER OSTIGUY: Okay.

MEMBER ENGELBERT: That's a hardship, there's no question about it. But you're still going to have organic milk available from your herd.

MEMBER OSTIGUY: And it's true. You've got to milk those cows.

MEMBER ENGELBERT: And you hope you don't lose the cow. And if you do, you're done or you go to a neighboring farm. You know, and then you'll have to develop a plan. But there is no reason for it.

CHAIRMAN O'RELL: While Emily is here, are there any other comments, questions for Emily, or Emily, do you have anything in final?

MS. BROWN-ROSEN: The only point I would like to make is we do get requests because of Johnes disease, and I know that,
you know, we've struggled with that. I know Hugh doesn't think that's a valid excuse, because it's such a long-term disease to have to fight.

You have to have a long management plan to gradually reduce it. So if you have Johnes without severe restriction, you would be continually feeding.

MEMBER KARREMAN: Right. Can I add to that?

MS. BROWN-ROSEN: So that -- but I think that's what some farmers would like it for.

MEMBER KARREMAN: Okay. Is that the main reason that they ask you?

MS. BROWN-ROSEN: But I think that's probably the main reason they're asking, but we haven't granted it for that.

MEMBER KARREMAN: Okay. Not to talk about Johnes too much, but they should be testing their herds, and just simply not feeding calves milk from those cows that are
positive for Johnes. That's part of the management.

MEMBER ENGELBERT: Right, and to add to that, we've had two farms in New York State that have had severe outbreaks of Johnes. Their certifier did not allow them to purchase milk replacer, and they have beaten the disease without it, just by careful management, testing their cows, segregating that milk and being very careful how they do things. They did not have to have milk replacer to get a handle on that disease.

CHAIRMAN O'RELL: Okay. Thank you, Emily. I think that's been discussed. Thank you, Hugh. Next.

MEMBER KARREMAN: One down, three to go. I think. There's one on the back. One's hiding, okay. The next one is for chlorine under 205.603, synthetic substances allowed for use in organic livestock production, category use (a) as disinfectant, sanitizer and medical treatments as applicable.
CHAIRMAN O'RELL: Hydrated lime?

MEMBER KARREMAN: No. Oh, I'm sorry.

CHAIRMAN O'RELL: Actually, I'm just keeping the order of the sunset.

(Pause.)

MEMBER KARREMAN: Okay. You raised that from the record, I guess. No, okay. We'll start over for hydrated lime, sorry.

Under 205.603, synthetic substances allowed for use in organic livestock production, category use (b) as topical treatment, external parasiticide or local anesthetic, as a --

Okay. This is for hydrated lime. The committee summary was that several commentators supported the continued listing of hydrated lime.

One commentator objected to the continued listing of hydrated lime, stating it is too harsh of a chemical to allow for direct contact with animals, as pest control agent,
and it is hazardous to the humans who handle it.

The committee agrees with the commentator recommending that removal of hydrated lime from the national list. The Livestock Committee believes that there are alternatives to hydrated lime, and that the substance can be removed from the list without adversely impacting organic livestock production.

Therefore, the committee recommendation was that the committee recommends not renewing the following substance of lime, hydrated, as listed. It was a vote of 6 to remove it, zero to keep it.

Discussion?

CHAIRMAN O'RELL: Just --

MEMBER KARREMAN: I'm sorry. Go ahead.

CHAIRMAN O'RELL: A question. in terms of we had a lot of public comment yesterday, discussing the need for hydrated
lime, one, what are the alternatives and do they address the public comment concerns for taking it off the list --

MEMBER KARREMAN: Well, I agree. There was a lot of public comment, and as the listening body to the public as the NOSB, we have to take that into account. I certainly have and we need to discuss this topic, I think at lunch time as the Livestock Committee.

One of the alternatives would be simply regular old lime that's not hydrated lime. I was asked by Mike Lacy to ask veterinarians, just in an open question, what's hydrated lime used for, so we would get a take on it as far as for health type and welfare considerations.

It was an open question to 1,700 veterinarians on my list serve. I think I got 35 replies or so, and basically, hydrated lime is used as a pH adjustment for the bedding of livestock, generally near the udder, to adjust
the pH so microbes find it not so good to live in the bedding and therefore reduce mastitis potential.

You could use regular lime as well, but the pH adjustment is not as radical or as strong. That would be an alternative, regular calcium oxide from the field, or quarried lime like that.

I don't think it's as efficacious, but I think part of the problem with the hydrated lime -- well, not part of the problem, but I think one of the reasons it's synthetic is because of the way it's produced.

In its production, there are certain toxic substances that would be harmful to the workers that are producing it. I think that's under one of the OFPA considerations of the seven points to look at a synthetic.

However, listening to the board today, we are not here to re-review the material in its entirety; just to see if it's truly to be needed in production. So we can
go to Jeff. How's that?

CHAIRMAN O'RELL: Nancy?

MEMBER KARREMAN: Or I'm sorry, Nancy.

CHAIRMAN O'RELL: Nancy, then Arthur, and then Jeff.

MEMBER OSTIGUY: One of the commenters yesterday mentioned hydrated lime being in the material that the barns are painted with?

MEMBER KARREMAN: Whitewash.

MEMBER SMILLIE: That's what I was going to bring up.

MEMBER OSTIGUY: What, and I'm assuming from what his description was this was a public health issue and required. If we took it off the list, does that work?

MEMBER KARREMAN: As I said, I think from the public comments yesterday, we need to discuss this at lunch, and I do agree that there's public health ramifications that we need to strongly consider that. I didn't know
it was used in whitewash.

CHAIRMAN O'RELL: Arthur?

MR. NEAL: Looking at the recommendation, I think we'd have some concerns over the justification. It lists that the committee agrees with the commenter recommending removal of hydrated lime from the national list.

One of the questions that I would have is why does the committee agree with the commenter? If we're going to remove it, what are going to be the alternatives in place of it, because we do have the procedure that was published in the Federal Register, that says that if we're going to remove something, we're definitely going to have to identify the alternative that replaces it, because we need that for the record.

Just to comment on re-reviewing the substance, I mean what are you all doing? You're already re-reviewing a substance. The only difference is that in -- if you renew the...
substance, you would not change the way that
the substance is listed through this process.

If you remove -- you could
potentially remove a substance. That is re-
reviewing a substance. But in renewing a
substance, you would not change annotation or
the way that it was listed.

Just as you are recommending in this
particular recommendation to remove it, that
is re-reviewing a substance. If you remove
the substance, you really do have to justify
why you're removing it, in terms of
alternatives, why you agree with the
commenters and things of that nature.

CHAIRMAN O'RELL: I have Jeff and
then Dan.

MEMBER MOYER: Yeah. I was just
going to say in terms of the barn
whitewashing, I don't think that that's
relevant in terms of the way this is defined
as being used, Because don't as a board
dictate what they paint their barn with or
anything else.

    That barn treatment is strictly --
if we're going to get into that, then we have
to look at what other substitutes that we use
for whitewashing, even if it's an oil-based
paint or something with a thin --

    I mean as a committee, we don't have
jurisdiction over what they paint their barn
with on the inside.

    MEMBER KARREMAN: I guess you could
say cattle could rub up against the walls, and
therefore it's a topical as it is mentioned in
here. But you know, that's hit and miss.

    MEMBER GIACOMINI: One of the things
that did come up in our discussion that I just
noticed that it wasn't in there, I believe
last night when I was looking at this again,
was a discussion of a contamination of the
hydrated lime in the manure and the
complications that that creates in putting
that manure out on the fields.

    In light of what Gerald said
earlier, I'm not sure that the general amount and concentration of that hydrated lime in the manure would be enough to violate the problem of putting that manure out.

So that was one -- that was part of our discussion, Arthur, that didn't quite make it into the recommendation.

CHAIRMAN O'RELL: Bea?

MEMBER JAMES: Yes. Going back to the whitewash. However, it's stated, Starr Curtis mentioned that the whitewash was used as an antibacterial, to help reduce pests on walls and so wouldn't that be something that would be taken into consideration?

Because if we look at how they clean their barns and how they deal with disinfecting --

MEMBER MOYER: Can I comment?

MEMBER KARREMAN: Yes.

MEMBER MOYER: I mean they used whitewash because it's cheap. It's really inexpensive. They have to paint the barn with
something in order to keep it clean and sanitized. That's true. So what he was saying is absolutely correct. They tend to use whitewash because it's very inexpensive.

They do have to recoat the barn -- it's easier to recoat the barn with this periodically than it is to repaint the barn, because you have to do it fairly often because barns get flies and other things that make it dirty. So it's inexpensive to do every two or three years.

CHAIRMAN O'RELL: Bea?

MEMBER JAMES: The comment was also that using an alternative would be more toxic to the animals.

MEMBER MOYER: Well, that's what I'm saying. We're not in the -- this doesn't stop you from using it on your barn. If we took it off the list here as a topical treatment on cattle, it does not preclude you from using it to treat the barn. They could still do that.

That's my understanding, but I've been
looking for clarification.

CHAIRMAN O'RELL: Arthur.

MR. NEAL: That's what I was going to comment on. This listing is as a topical treatment, external parasiticide or local anesthetic. This is not facility or pest management.

MEMBER MOYER: Right.

MEMBER KARREMAN: Okay. So then if it's used in the bedding, that's in the -- that's not a topical treatment either.

MR. NEAL: Well, what I heard earlier was whitewashing a barn.

MEMBER KARREMAN: Right.

MEMBER MOYER: To get rid of animal waste.

MR. NEAL: If we're talking about, let's see, external pest control for the bedding. Yes, that would matter.

MEMBER KARREMAN: Well, Kevin.

MEMBER GIACOMINI: Why is that Arthur? I mean, the main use of this as a
deodorizer, deodorizing animal waste is often in, as I've seen it used, in tie stall barns and things where they put a pretty good coat of it behind the cows, to try and keep the overall ammonia levels down.

The use that we're discussing would be putting it at the back of a free stall, to alter the pH, to have a bacterial effect on the cow getting mastitis. Is that a difference?

MEMBER KARREMAN: Just for the record, Dan, in the tie stalls it's used for the exact same way as in the free stalls for the bedding. I've never seen farmers use it to deodorize animal waste, okay.

As a matter of fact, the only two things I've ever seen, the hydrated lime used for, as a practitioner out there is in the bedding, you know, behind the cow for the mastitis control, or in a box as a powder, where they walk through a topical treatment for the hoof.
You know, I don't see where it ever is under external parasiticide or the other, local anesthetic. But that's the only two things I've ever seen hydrated lime used for, and I guess whitewash.

MEMBER GIACOMINI: That's what I'm asking Arthur. Is, granted that use in the box is topical treatment and that's covered. Is the use in the bedding covered in this?

MR. NEAL: The way that I'm looking at it is that if you're trying to prevent pest infestation of the animal through the bedding, and it is an external application. It may not be applying it directly to the animal, but you're externally trying to prevent pest infestation of that animal from the bedding.

MEMBER KARREMAN: I would, Arthur, look at that as a -- I would take that literally when I see topical treatment as a veterinarian. I see that applied directly to the animal, not just in its environment.

I would say that in the bedding
wouldn't be a topical treatment technically.

CHAIRMAN O'RELL: Emily, would you like to come up and make a comment. I know you were the one that submitted comments on the topical hoof treatment and --

MS. BROWN-ROSEN: Thanks. This is Emily Brown-Rosen again. Yes, Pennsylvania farmers do use it as a hoof treatment, as a walk-through box. We don't allow it -- it's not allowed in bedding because then the bedding commonly gets used in the ground, and then it has synthetic fertilizer and it would be prohibited.

That, I believe, was the reason for the original NOSB annotation, not to be used to deodorize manure because then it would be in the manure and being applied the soil somewhere. So that, I think, was the intent of that whole use.

It's not registered as a pesticide, so we didn't find anyone -- no one's requested to use it as a parasiticide. But it is used
just for the hoof treatment. It's an alternative to copper sulfate.

Copper is, you know, a heavy metal and so in that sense it's more benign in the environment than copper would be. Then you also have situations in the winter where copper sulfate is a supplied liquid, where that might be tricky to apply.

But so we do have it -- we're using it for foot rot and hairy hoof work.

CHAIRMAN O'RELL: Okay. From your earlier conversation, you wanted to take this back in committee?

MEMBER KARREMAN: Yes.

CHAIRMAN O'RELL: And have you had enough discussion here or are there other questions from the committee?

MEMBER ENGELBERT: I have one question. Have any of those farms used just plain lime, powdered lime, and what have the results been/

MS. BROWN-ROSEN: Well, it's been on
the list, so we've allowed it. The literature shows it's more effective, you know, as an antibacterial drying agent. But you know, you could use that. I don't know its effectiveness.

MEMBER KARREMAN: And one last thing, as far as it being applied to the land, I do believe an organic farmer is allowed to buy in conventional manure and apply it to the land.

So I can't see why, you know, a little bit of hydrated lime. It kind of gets to some other discussions we were having previously, but I don't see how that would affect --

MS. BROWN-ROSEN: But a little bit of pesticide too. I mean, you --

MEMBER KARREMAN: Okay, okay, okay.

(Laughter.)

CHAIRMAN O'RELL: Okay. Thank you, Emily. Hugh, you want to move on?

MEMBER KARREMAN: Yep, sure. Okay.
Where are we on two? Which one? Chlorine. I have like two -- I've got three different chlorines. It's all repetitive. Okay. Oh, I see. Okay.

We had to review chlorine for three different -- no, I'm just -- okay, sorry. For 205.603, synthetic substances allowed for use in organic livestock production, category use (a) as disinfectant, sanitizer, medical treatments as applicable, we looked at chlorine.

The committee summary was -- we looked at a lot of some specific comments, and several commenters say that chlorine materials, such as calcium hypochloride and chlorine dioxide and sodium hypochloride should remain on the list.

Some commenters stated that the chlorine materials just mentioned should be removed from the list. The Livestock Committee agrees with the commenters who supported the renewal of chlorine materials,
calcium hypochloride, chlorine dioxide and sodium hypochloride because their use is considered essential for organic livestock production. They can be used in a way compatible with organic production practices.

So based upon the comments received, we recommended the renewal of chlorine materials as listed, and the vote was 6 in favor and 0 opposed. Discussion?

(Pause.)

MEMBER KARREMAN: Do I say it? Okay, I don't see any discussion, so should we move on? Okay. Got it. Okay.

The next one for 205.603 synthetic substances allowed for use in organic livestock production, category use (a) as disinfectant, sanitizer and medical treatments as applicable, we looked at oxytocin, and we received, you know, comments on it.

Several commenters stated that oxytocin should remain on the list. Some commenters stated oxytocin should be removed.
The committee agrees with the commenters who supported the renewal of oxytocin, because it is -- its use is considered not harmful to humans or the environment.

It is considered essential in assuring the health and welfare of organic livestock, and it can be used in a way compatible with organic production practices.

So based on the comments received we, as a committee, recommended the renewal of oxytocin as listed, and the vote was 5 in favor of renewal, zero opposed, and one abstention. Discussion?

(Pause.)

MEMBER DAVIS: I had a question.

MEMBER KARREMAN: Yes.

MEMBER DAVIS: This usage, where it says "use in post-parturition therapeutic applications," is it used for just certain individual cows that seem to have a problem and need to have --

MEMBER KARREMAN: Yes. It's
definitely only allowed in this -- well first, that's an annotation. But to explain it, how it's used, only for emergency use and it would be used by veterinarians when called in to -- for an emergency, which is a serious emergency when the uterus of the cow comes out after the calf does, and you have to put the uterus back in. It's a major procedure.

Then you would give a shot of oxytocin, about 5 cc's, to reduce or contract the uterus rapidly, so it will not just flop out again. Oxytocin is a nine amino acid sequence, and it degrades in about 30 seconds.

So you would use it one time, maybe two times in the first day or two after calving.

MEMBER DAVIS: Thanks. Thanks for the background.

MEMBER ENGELBERT: And I abstained because it can only be used with a vet's recommendation, and the vet has to be there to administer. It's not something a farmer has
on hand and can just randomly give to his cows.

Otherwise, I would have voted against it as not necessary or essential. But there may be a case every now and then where you have to call in a vet and it has to be administered to save that cow.

MEMBER GIACOMINI: The problem is that it is a hormone.

HH Right. That's the problem. However, under OFPA the subtherapeutic use of antibiotics and hormones for growth promotion are prohibited, and this is absolutely not such a use. It's a therapeutic use in emergency situations to relieve pain and suffering for animal welfare. Jeff?

MEMBER MOYER: Hugh, can you in 30 seconds or so tell us what happens to the milk of that cow then, just for the record?

MEMBER KARREMAN: Well actually, on a conventional farm there is no withholding time for oxytocin Because of the rapid
breakdown, and because all mammals produce oxytocin. The synthetic version available in a bottle for therapeutic application has zero withholding time required for meter milk by the FDA, Center for Veterinary Medicine.

You know, first of all, when it's used on the first day of lactation or at calving like that, legally farmers have to hold the milk out for, I believe it's five to six days.

Most farmers don't do that, but so you'd be holding the milk out for a few days anyway, even though there's zero withholding time.

Any more discussion or questions?

MEMBER JAMES: Hugh, what would happen -- I mean besides this, what are the chances of a cow dying without it?

MEMBER KARREMAN: Well, it depends what it would be used for. If it's for a prolapsed uterus and you put it back in and you want to give oxytocin to get rapid
contraction of the uterus and you don't, it
could flop back out and that's not good if it
comes out again, externally of the body.
That's a no-brainer. It's no good the first
time.

We did have a TAP review on this. I
think was this a new TAP review, Arthur or --

MR. NEAL: Yes, yes.

MEMBER KARREMAN: And there were no
good alternatives for it in the alternative
realm. Another reason you might use it is for
a uterine hemorrhage, if there is a rip in the
uterus and there's a vessel that's cut and I
can't stitch it.

It would be used for that purpose as
well. So at that point, the animal could
actually die by not using it.

MEMBER GIACOMINI: I think if you
didn't use it in the other case, the essential
effect would be death also.

MEMBER KARREMAN: Oh yes, yes. That
would be malpractice.
MEMBER JAMES: Yes.

MEMBER KARREMAN: All right. Moving along.

CHAIRMAN O'RELL: Movin' along.

MEMBER KARREMAN: Movin' along, okay. Ivermectin. There we are. Okay. 205.603, synthetic substances allowed for use in organic livestock production, category use (a) as disinfectant, sanitizer and medical treatments as applicable.

We looked Ivermectin and a number of commenters stated that Ivermectin should remain on the list. Some commenters stated that it should be removed.

The Livestock Committee agreed with the commenters who supported the renewal, because its use is considered essential for the health and welfare of organic livestock at this time, and can be used in a way compatible with organic production practices.

Based upon comments received, the Livestock Committee recommends the renewal of
the following substance. Parasiticides, Ivermectin as listed. The committee vote was 5 in favor, 1 opposed, no abstentions.

MEMBER WEISMAN: Can we hear the minority?

MEMBER ENGELBERT: Yes, you may. I think that it is an unnecessary product for organic production.

I think that if a farm has a severe infestation of parasites, that's an indication that there's a severe problem with their operation, and there are other available substances, such as Moxidectin and other products that could be used.

But the studies still are inconclusive about their total effectiveness. But I just -- I'm against this type of substance being allowed in organic practice.

CHAIRMAN O'RELL: Hugh.

MEMBER KARREMAN: This is only to be used as an emergency for a condition diagnosed by a veterinarian.
It cannot be used, you know, routinely, and on the farms that I'm working with for the last ten years, you know, you have young stock, ages between like just past weaning up to about ten months old that seem to be the ones that get potentially infested.

We certainly do run fecal samples on them, and it's only the two out of ten animals that would receive the Ivermectin treatment, and it is only used one time. It's somewhat like the thing with the oxytocin we just talked about.

It's kind of a one-time treatment, and I truly believe it is for the health and welfare of those animals, and without a doubt, at least in my practice, I always educate the farmers on management practices that will reduce the need for it later.

I would say also that because of all the prohibitions in the organic industry, I do a lot of studying for alternative substances for prohibited materials, and there is a lot
of research coming out now regarding in vitro
and some in vivo studies with botanical
treatments against parasites.

They're based in mainly in sheep and
goats, but you could extrapolate cattle.
Regarding diatomaceous earth, I've never seen
it work in an actual infestation. It may work
for keeping things in equilibrium.

So I would say that, you know,
Ivermectin is used so infrequently, at least
it should be by the annotation, that I don't
see it as a problem to the environment as
such, and I -- anyway. Go ahead, Bea.

MEMBER JAMES: What about the
comments from Emily regarding Ivermectin being
persistent in the manure and having an impact
on soil?

MEMBER KARREMAN: Yes, but keep --
in the context of what I was just saying, if I
treat two animals, I'll just say, out of ten,
which would be on average, just from my
experience, that's two animals, two little
calves out of ten out of a herd of, I don't
know, maybe 80 animals on that farm.

I don't believe that the manure from
those two little animals, that little amount,
will affect the environment, compared the 88
other animals or whatever. And it's a one-
time treatment.

MEMBER JAMES: What about two little
animals all over everywhere, on lots of
different farms over time?

MEMBER KARREMAN: That's a good
point. However, it is not being used
routinely. I think that's where I make the
distinction.

CHAIRMAN O'ReLL: Nancy.

MEMBER OSTIGUY: We've actually had
a lot of discussion about Ivermectin,
especially when Moxidectin came up.
Moxidectin is in comparison a much safer
parasiticide to use, certainly in terms of
manure and such and its impact on the soils.

One of the things that I have this
vague memory of, and maybe someone can recall better than I do, there were some questions at one point about a material that was on the list, that we were using in a way that has not been approved by FDA. Was this Ivermectin? Is it Ivermectin?

MEMBER KARREMAN: It could be a lot of things.

MEMBER OSTIGUY: But Actually Arthur can answer probably.

MR. NEAL: He already knows what the issue is. The issue is not that there was -- it's being used inappropriately from FDA perspective.

The issue is that I think in October 2004 or 2003, I can't remember the exact date, the NOSB requested that the NOP take a position that antibiotics cannot be used in livestock production.

Ivermectin, as well as Moxidectin, are technically classified as macroantibiotics, though they function as
parasiticides.

As I write up this particular material, let's say if it is renewed, when I write it up, I'm going to give this description. In this description it will say it is a macroantibiotic.

I'll also talk about how it functions as a parasiticide, however.

My concern is that USDA has taken a position that antibiotics are prohibited. How does this recommendation coincide or correlate to our position?

If it is going to be renewed, the only thing that I ask is either the NOSB provide us some type of justification as to how this relates to our current position, and how this substance is different.

CHAIRMAN O'ReLL: Andrea?

MEMBER CAROE: Well, I don't want to take us off track, but going back to the comment about the persistence in the soil, it seems to me that Emily's comment for PCO was
related to the slowly-released formulas, which
I believe you said is not available. The
formulas are not even available any more?

MEMBER KARREMAN: That's correct.

MEMBER CAROE: So the persistence in
the environment is not a big issue, as big an
issue as it was when this was first listed
anyways?

MEMBER KARREMAN: May I answer that,
Kevin?

CHAIRMAN O'ReLL: Yes.

MEMBER KARREMAN: The slow release
formulation has been taken off the market. It
was not a profitable item for whichever
company. That was, however, strictly
prohibited I believe, somewhere in the
annotation, if I remember. If I'm wrong, it
doesn't matter. It's not on the market.

Now as far as -- I know that we will
have a public comment at some point by a
veterinarian who's here. He will discuss this
antibiotic, you know, aspect of the product
we're talking about.

I do believe we also have to consider perhaps using the term "anthomentic" for this product, rather than anything else, because that is functionally what it is.

Okay, you know, the fine print on the company label might say it's a microcyclic lactone antibiotic in fine print, but I guarantee you in veterinary school, no one learns that. That is not discussed. That's a pure, very purist chemical interpretation or whatever. Go ahead, Nancy.

MEMBER OSTIGUY: I actually agree with Arthur a lot, that we do need to have a discussion at some point about the substances that are chemically antibiotic, and do we wish to say no antibiotic use at all, and then in that case, we may not have a choice but to include things like Ivermectin and Moxidectin.

MEMBER KARREMAN: Moxidectin.

MEMBER OSTIGUY: Moxidectin, and a material that I'm interested in potentially
for beekeeping, naturally derived, technically an antibiotic, used as a fungicide. It's called Fumidil.

But the question then comes, and then also that includes using antibiotics on plants, you know, to go back to the discussion earlier, we need to decide where we stand on that.

Are we talking about therapeutic purposes; are we talking about prophylactic use? Do we want to draw he line with just no, if it chemically is defined as an antibiotic, then we don't even go anywhere near it, or are we okay to use it similarly to how we use it in humans?

CHAIRMAN O'RELL: Kevin.

MEMBER ENGELBERT: I think one of the issues there is that antibiotic simply comes down to an issue of definition, and when you start getting to the definition of antibiotic, you start getting into the slippery slope of all the products with
antibiotic-type effects.

I think that's a very, very slippery slope for us to get into, and I think it's very important for us to deal with this issue in a timely basis, to resolve some of these issues.

CHAIRMAN O'RELL: Nancy, respond and then Hugh.

MEMBER OSTIGUY: Real quickly back.

I agree. We need to have the discussion. We're already on that slippery slope, in that that is exactly -- antibiotic use is exactly what all the chlorine materials are. We are killing bacteria.

MEMBER KARREMAN: I think we need to maybe have definitions drawn up and officially recognized and received regarding terms such as "germicide," "antimicrobial," "antibacterial," "antiseptic," "antibiotic." We need to have them for the record to use in our deliberations in the future. Peroxide would be included too.
MEMBER OSTIGUY: Right. All of those.

CHAIRMAN O'RELL: I think that's a very good point, Hugh. Does that end your presentation from Livestock?

MEMBER KARREMAN: I hope so. I think so.

(Applause.)

CHAIRMAN O'RELL: As everybody in the room can see, we're a little off schedule. The public comment period that was scheduled for 11:00, the purpose of that public comment period is to follow our discussion, which we haven't concluded.

So we're going to continue with our discussion, and then the public comment period will follow. We had to wait for you all yesterday, so now you're going to wait for us today, as we get our work done.

So but we do need to take a break, so I'd like to take a ten minute break if we can, and get back here and get back to the
Handling Committee report. Thank you.

(Whereupon, a short recess was taken.)

CHAIRMAN O'RELL: The board will continue its business, so if you could either take the conversations outside or be seated please. Thank you.

(Pause.)

CHAIRMAN O'RELL: Okay. We're going to pick up with the Handling Committee report. Julie?

Handling Committee Report

MEMBER WEISMAN: Yes. We had several materials that had been deferred, that we made recommendations on. So I'll take it from the top.

We actually have, I have the recommendation for Section 205.605(a), which is non-agricultural, non-organic substances allowed as ingredients in or on processed products labeled as organic or made with organic specified ingredients or food groups.
These are for non-synthetics that are allowed. This recommendations creates colors and flavors.

You're not going to see this on the screen, but my previous chairs gave reasons for the initial deferrals in their recommendations, which is not included.

So I just want to briefly mention that these two items were deferred because they were identified by the Handling Committee as items which might prove contentious.

They were not deferred initially on the basis of a public identification, any identification in public comments.

However, after the request for public comment was made prior to the August meeting, many comments recommending the continued allowance of non-synthetic colors and flavors in organic handling were made.

The Federal Register notice asked the public to provide evidence and address concerns for any substance that they believe
should be discontinued, and there were no
comments specific to these two substances at
that time, against the continuation of either
colors or flavors on the list.

There was one comment at that time,
expressing concern that colors and flavors had
been added to the list without technical
review by the NOSB, and Because of this
comment, the handling Committee requested and
received from the NOP a technical overview of
food and color additives on October 14th of
2005, in time to write the recommendation for
this meeting.

The technical review that was given
to us offered no information that would
suggest that either non-synthetic colors or
flavors are inconsistent with organic
practices.

This is a summary of the information
that was contained in those reviews. The use
of flavoring substances is regulated by the
FDA. All flavoring substances, non-synthetic,
fall into one of two categories.

    They are either GRAS, which means generally recognized as safe, and that is for flavor materials. That's a designation that's granted by a panel of technical experts, whose authority is accepted by the FDA.

    Or they're considered food additives, and in that case they have been reviewed and approved by the FDA directly. On the color side, there are no GRAS -- there's no system of designating things GRAS for color additives in the same way.

    For color additives to obtain approval from the FDA, the manufacturer has to submit a petition to the FDA demonstrating safety of the substance with information including the manufacturing process, stability data, safety studies, toxicity data, all the types of things that we normally ask for in a petition.

    So consequently, as a result of the information that we had at the time that this
vote was taken, all synthetic flavoring substances and -- I skipped a sentence, sorry.

We determined that all synthetic flavoring substances and colors are subject to pre-market approval requirements by reviewing bodies.

So based on this information, the Handling Committee recommends the renewal of the following substances in this use category as published in the final rule. A motion was made by Kevin O'Rell, second by Joe Smillie. The committee voted unanimously to renew these substances.

Now all that being said, we've received since the publication of this recommendation lots of public comment on both colors and flavors. I'm going to ask the chair's help in guiding me if this is not appropriate at this time.

But I wanted to briefly summarize the comments. I did a survey of the comments that we have received since this
recommendation --

CHAIRMAN O'RELL: Since the recommendation has been posted.

MEMBER WEISMAN: Was posted.

CHAIRMAN O'RELL: Yes.

MEMBER WEISMAN: Because I think it's pertinent.

CHAIRMAN O'RELL: Yes.

MEMBER WEISMAN: On flavors, 13 additional comments have been received. Of these 13, six support the continued listing of flavors, non-synthetic on 205.605(a). Seven of the comments recommend that they not be relisted.

I want to say that in six of the seven comments recommending that they not be continued, those also included a recommendation that they be moved to 606.

Now we have had much conversation in the last day and a half already in this room about the fact that during sunset process, there is not going be any petitioning of items...
onto a section of the national list other than
the one that they appear on now.

So I believe that the commenters who
-- those six commenters who recommended not
renewing colors were assuming that they would
appear elsewhere, colors and flavors -- I'm
sorry. We're just talking about flavors --
this is my first time making this
presentation, so I'm sorry.

The six people who recommended
against the continuation of flavors on 605(a),
I believe that they clearly did not appreciate
that they could not be added simultaneously to
another list.

I am hesitant to interpret their
recommendations against relisting as a request
for flavors, non-synthetic to disappear from
the list altogether. I don't think that was
adequately understood by those commenters.

I also -- one of the comments that
was against relisting made mention of the fact
that flavors were added to the list by the --
that flavors were not reviewed, and I wanted
to mention that we -- that this is erroneous,
that flavors are on the list because there was
a recommendation by the NOSB and I think it
was on October 31st of '95 in Austin, Texas.

CHAIRMAN O'RELL: That's correct.

MEMBER WEISMAN: And it was put up
for public comment, and a technical review at
that time, and I know that at least -- I can't
see today, but I know yesterday several of the
people that were on that technical review
panel were in this room, at least yesterday.

So that was the -- that's the
additional information I wanted to give, based
on the public comment on flavors, okay. We
have also received numerous comments on
colors, since this recommendation was posted
on February 1st.

Out of 13 clear comments that were
received, five support and eight oppose the
continued listing of colors on 205.605(a). Of
the eight opposing comments, three comments
included recommending relisting on 606. So I include -- I think of those comments in the same way as I thought of them for flavors.

However, the other five cite the fact that colors were never recommended by the NOSB to be listed in the first place, did not have TAPs or go through public comment. It is these comments that I find troubling, particularly since their -- I have not been able to find any historical evidence in the form of past recommendations, meeting minutes, to counter those assertions as I could for flavors.

If these assertions are correct, it seems -- well, maybe I should -- should I stop here or should I -- this is the time to propose to the committee?

CHAIRMAN O'RELL: Do you want to open for Discussion --

MEMBER WEISMAN: Those are the facts on colors, and I think at this point I want to open it up for Discussion.
CHAIRMAN O'RELL: That's fine.

MEMBER WEISMAN: Kevin.

CHAIRMAN O'RELL: Andrea?

MEMBER CAROE: I just want to -- I have the Federal Register notice for sunset in front of me, for comments that do not support the continuation of an existing exemption or a listed item. The commenters were asked to demonstrate that the substance was found to be "(1) Not harmful to human health or the environment, (2) necessary because unavailability of wholly non-synthetic alternative, and (3) consistent and compatible with organic practices."

It also asked for the commenter to provide viable alternatives, such as practices and other substances, and then also to include the manufacturers of these substances and availability.

I don't think that we've gotten that level of detail from any of the commenters and, you know, again, as we've
heard from the program, in order for these things to go up and be taken off the list, they have to have this level of detail in the justification.

That's clear in the Federal Register notice that was -- the commenters were asked to provide this information. I just don't see that it's come to us in this format.

MEMBER WEISMAN: I'm curious if anybody on the board had a chance to read AMRI's comments on colors.

CHAIRMAN O'RELL: Yes.

MEMBER WEISMAN: Okay, because I think that that did include quite an impressive amount of detail in terms of breaking down the category of colors and the different types of colors that are manufactured and the practices that are used.

CHAIRMAN O'RELL: And it is inherent in the problem with having a listing of a generic or general classification of substances, because when you're talking about
colors, you're talking about a lot of things out there.

It would certainly help if we had a synthetic non-synthetic document, a guidance document on the table today, because then that could alleviate some of the concerns that were addressed in the AMRI letter.

But there's -- that's one of the things that we have to wrestle with, and I know there have been statements made that they should be individually petitioned. You know, that's quite a list of petition for items that would have to come up.

We have the same issue with flavors, although I don't want to lump them together. But it is again a general category with a lot of compounds that are put together to make flavoring materials. So Bea?

MEMBER JAMES: Julie, I wonder if maybe you could just give comment on what you think about AMRI's point on addressing colors and flavors separately.
MEMBER WEISMAN: I think they should be addressed separately.

CHAIRMAN O'RELL: Yes, they were. Andrea.

MEMBER CAROE: Just a reminder that this material is on 205.605(a), as a non-synthetic, non-agricultural material. I mean in its placement, we're talking about — you know, we're not talking about the Concord grade essence here, Because that would be agricultural.

Again, this all tied into our non-synthetic versus synthetic, and our agricultural versus non-agricultural arguments. But in its placement, we're not talking about synthetic forms, and we're not talking about agricultural forms of flavors and/or colors.

CHAIRMAN O'RELL: Nancy.

MEMBER OSTIGUY: I still am curious about the assertion that this was put on the list without a vote of the NOSB. I don't
know, I don't have any information one way or
the other. How was it put on?

CHAIRMAN O'RELL: Arthur, do you
want to respond to that?

MR. NEAL: To my recollection, this
material was on the 1997 proposed rule in the
-- I wasn't there at the time, so I really
don't know how it got added on. It did not
appear on the March 2000 proposed rule. It
reappeared later.

There were no discussions in the
preamble concerning it. So obviously there
had been some type of history behind it. I
don't exactly know all of it, and I can't
explain how it was added to the national list,
particularly -- I see Valerie has her hand up.

MS. FRANCES: You know, Tony's out
of the room right now, but she was there for
all this, and she said it was a mistake it got
left out of the 2000 proposed rule. But there
was really no comment one way or the other in
the preamble addressing it in any way, and
then there was nothing addressing it as a mistake either in the final rule.

MR. NEAL: Right.

MS. FRANCES: And having it reappear.

MR. NEAL: And the other thing is that there was no -- I don't recall the public comment generated as a result of it being on the list at that time.

CHAIRMAN O'RELL: Zea?

MS. SONNEBAND: Thank you for recognizing me. Zea Sonneband, CCOF and the original contractor who got the national list together.

Colors was, and flavors were both on the list of materials that were referred by the original NOSB, to go through the TAP process. We had 162 things to take up all at once.

So we did them in stages over a period of years, and it involved finding enough scientists who would do the TAP
procedure on the different materials as to how fast they got done.

We never could find enough scientists to look at the colors. So there was no TAP review done during the period that I was responsible for the list, which was through 1996 more or less. So to my knowledge, no TAP review has ever been done.

CHAIRMAN O'RELL: But they were put on by a recommendation from --

MS. SONNEBAND: The NOSB did not discuss it, to my knowledge. I think it came somehow from NOP. Now I haven't been to every single meeting, but I don't remember a conversation about the colors.

CHAIRMAN O'RELL: Kim?

MS. DIETZ: Kim Dietz, past NOSB Materials Chair Handling rep. I believe in 2002, when colors did go on the national list, like I said yesterday, there was a recommendation by the board to remove them because they had never gone through a TAP and
never gone through a board review.

There was a technical recommendation to remove them. They did not get taken off in 2002. So there's no history with colors whatsoever from the NOSB.

CHAIRMAN O'RELL: Thank you, Kim.

MEMBER OSTIGUY: I guess my next question is how do we deal with this then? If we never actually took a vote, is it a technical correction to remove it and then we have to look at it? Do we have to vote on renewal and petition it? It seems awfully odd to have to do the latter, since we never voted to put it there in the first place.

MEMBER SMILLIE: Well, we inherited that sin. It's like original sin. I think we've got it, whether we deserve it or not.

So to me, the only and because of the really incredible economic impact that non-renewal would have, I think that basically the procedure would take is to renew it now and immediately start to, you know, get our
work done, with a petition immediately following renewal.

MEMBER CAROE: It did have a TAP.

MEMBER SMILLIE: It was an abbreviated TAP, and from the TAP we did request a technical review. It's not a full TAP that addressed all of the regulation criteria. But we did attempt to fill out the evaluation forms, based on the information we had.

We, in filling out those forms, we recognized there were areas where we didn't have answers, and we didn't have answers for several issues on the review form, which does bother me.

MS. FRANCES: I'm sorry you don't have the form. I was working with a youngster at the desk last night to print things off, and that, I don't think, got printed off.

CHAIRMAN O'RELL: Well, we have it.

MS. FRANCES: You have it? I did give it to you?
CHAIRMAN O'RELL: We have it.

MS. FRANCES: Okay. Somehow I didn't get it then.

MEMBER KARREMAN: Overview.

MS. FRANCES: I'm glad you have it.

CHAIRMAN O'RELL: Yeah, we have the criteria forms here in front of us. But it does show that there are areas that we recognize we don't have the information on, and part of it is in trying to review such a broad class of materials. It's very complex.

Then to Joe's point, these are in wide use. They've been on the list for five years. That's why they're coming up for sunset, and they have been used widely in a number of products that are currently on the market.

So there is a tremendous economic impact to the industry if it doesn't go forward. But yet we do have a dilemma. Nancy?

MEMBER OSTIGUY: Could I make a
motion to -- maybe we should do this this afternoon, but what I'm thinking -- I'll tell you what I'm thinking and then we can figure out how to do this.

I'm a bit uncomfortable with reviewing them as a group, because there are such apples and oranges there. If we do that, there may be then, in the process of reviewing, some things that we think are actually problematic, and we would review all of that negatively. It would not actually meet the OFPA criteria.

We wouldn't want to have that be held as the standard for the things that would be okay. So would it be possible to, instead of looking at each individual color, because that of course also would be -- might lead to the wrong conclusion that we're after, which is being able to get through this and still allow the industry to continue.

First off yes, we renew. But the recommendation would be then to break up that
list of colors into similar groupings, so that we could review groups of colors that the answers to the OFPA questions are likely to come out similar, so that we could -- you know, you're not excluding certain things because there's one bad apple in that particular grouping.

CHAIRMAN O'RELL: Andrea, and then Julie.

MEMBER CAROE: I agree first that we need to move this as a sunset item, and then what I would suggest in moving forward, and obviously --

CHAIRMAN O'RELL: Did you say move or remove? I just wanted --

MEMBER CAROE: Move forward with the sunset process. But afterwards, and the next step is going to be largely impacted by our decisions on ag versus non-ag and synthetic versus non-synthetic.

So I would hold off making any work plan yet, and then also I would suggest that
we try to elicit some petition from the public, as far as you know, folks that are using these.

They can actually come up with these categories and petition those color categories, probably a lot better than anybody on this board, with the exception of Julie, who has some understanding in this area.

But you know, I would suggest that we entertain or put as a priority to entertain working on this, based on comments received.

CHAIRMAN O'RELL: Julie, and then Nancy.

MEMBER WEISMAN: Yes, I wanted to add to that, that I think that a petition -- if someone would petition colors to be moved to 606, that process would serve exactly the function that you're asking for Nancy, in terms of parsing out what exactly are the colors that are manufactured and how are they manufactured, and which ones qualify as agricultural products and which ones do not
and why don't they.

We will -- I think we have access to much better information now than the board had in 1997 or whenever that was.

CHAIRMAN O'RELL: Nancy.

MEMBER OSTIGUY: I'm fine with that, as long as there actually is no delay in us starting the process, and it may not be that we hear it immediately, and it may be that, you know, our first action is to ask the community to start getting the petitions together.

But I don't want to delay it, since it's already -- it's almost been ten years that this process started, and it's been five years that they've been used without a board review.

So I don't want to delay. I realize we don't make a decision until we have some of the other things in place.

CHAIRMAN O'RELL: I think that it would be very easy to get the public to file a
petition to remove colors from 605(a) and put
it on 606, which is really this committee has
talked about it, that that's probably the
place that they belong, and that would
eliminate most of the issues we have today.

But we do have to recognize the fact
that they're in use today. They're in a lot
of products, and the annotation is for
naturally-derived.

MEMBER OSTIGUY: It's duplicate.

CHAIRMAN O'RELL: So we could have a
plan to move forward to get resolution, and
recognizing the public comment that it wasn't
initially recommended by the board. But as
Joe said, we've caught the original sin.
We're here dealing with it now.

MEMBER GIACOMINI: Question?

CHAIRMAN O'RELL: Yes, Dan.

MEMBER GIACOMINI: Just for
clarification, will we be voting on this, both
of them together or individually flavors
versus colors?
CHAIRMAN O'RELL: We had grouped -- the recommendations were grouped by the categories in 205.605(a), 205.605(b) and then 606. So since both of these items appear --

MEMBER GIACOMINI: Even though there seems to be different issues, and to a certain extent especially revolving around --

CHAIRMAN O'RELL: Well, when we have discussion, we'll have discussion of those items, and somebody could split it. Somebody could have a motion to split.

MEMBER GIACOMINI: Could I have some additional input then from those more in the know, on the financial impact of removing colors?

MEMBER SMILLIE: Well, I can't give you any numbers, but a lot, a great deal, I would say probably 50 percent of processed foods would probably be utilizing these two things. Kevin, what do you think?

CHAIRMAN O'RELL: Yeah, and particularly in the dairy industry, there's
widespread use, a lot of manufacturers. We had a public comment from Stony Field Farms, indicating that they use a lot of those colors in their yogurts. There's organic Colby cheese on the market that uses anado.

MEMBER GIACOMINI: But this comes down to a desire in the marketing to meet a consumer perception of what a product should look like, not the type of thing of there won't be any more pears next year. I'm just trying to understand.

I see in my mind a very big difference between those two things, and I don't see a huge -- I'm not sure that I understand a huge impact of not putting a color in a particular item.

CHAIRMAN O'RELL: Are you going to respond to that question? Okay Bea, and then I'll take it.

MEMBER JAMES: For all the things that we do to make sure that we put forth a product that meets consumer expectation,
whether it's a pear and the things that we have done to try to protect the crops industry, so that they have good-looking pears on the market that will sell, as well as you know, milk that is -- meets the expectations of the consumer, I think that you could apply that same principle to how cherry yogurt should, you know, is expected to look in the case by the consumer.

MEMBER SMILLIE: Yeah, and furthermore I don't want to color this argument too deeply, but --

(Laughter.)

MEMBER SMILLIE: The current reality is that manufacturers do understand that there's a lot of pressure and commercial availability to move towards organic colors and flavors. That is happening. It's not as if, you know, that movement isn't taking place right now.

As a certification agent, we're continually challenging the manufacturer, if
you must use this material rather than a certified organic, give us your justification for it.

So I think we've received public testimony from both Smucker Quality Beverages and Stony Field on this issue, and both of them come back with the same thing, is that they support the continued use.

They do understand that they've got to move away from it, and they report in detail on how successful they have been in gradually shifting towards certified organic flavors and colors.

But at this point in time, it's still not -- for some flavors and some colors, they're still not available, those materials that they can use.

So therefore there is a big impact, but again, not to -- I mean we are being successful in moving away from the use of these and towards certified organic colors and flavors.
CHAIRMAN O'ReLL: The direction is towards more organic flavors and organic certified colors. So it's because of their placement again on the list. If they're placed on 605(a), there isn't that carrot out there, for them to want to use organic colors.

If it's on 606, again, with our commercial availability and the criteria guidelines, that the certifiers will ask those questions of manufacturers, why aren't you using an organic color that's available.

MEMBER GIACOMINI: It just seems to me that this conversation would have been conducted with much more detail when the NOSB voted to have them removed from the list, and that I can understand someone voting to have them not be renewed, in support of what was probably then a more detailed discussion than we're having very briefly now. But that may be incorrect.

MEMBER WEISMAN: Kevin, I just want to -- what you just referred -- are you
referring to the reference that was made to an earlier recommendation that they be removed from the list, like we're talking like several years ago? Is that --

MEMBER GIACOMINI: Yes.

MEMBER WEISMAN: Okay. At that time, there were virtually no organic flavors. So I just, as a point that --

MEMBER GIACOMINI: I'm referring to colors in this one.

MEMBER WEISMAN: Or colors. There were no organic any of those being produced at that time. So I agree with your point, but the discussion at that time, there were no alternatives at that time. So it wouldn't have been that no organic alternatives at that time.

CHAIRMAN O'RELL: Bea?

MEMBER JAMES: Dan, I think -- I mean I understand that it's important to have natural colors, and that's, you know, as a lot of people here have suggested, that's where
the industry is working towards.

But to not renew them means that a consumer that is accustomed to buying a product and having it look a certain way, and then all of the sudden opening that product and having it be brown, would be completely devastating to the industry.

We have to allow the manufacturers the time to be able to find a suitable natural replacement, so that they can keep their product consistent with what the consumer's been used to over the years.

MEMBER GIACOMINI: Well, if we take it off the list, natural flavors, it would have to be organic for suitable replacement.

MEMBER WEISMAN: Well, we're talking about colors.

MEMBER JAMES: Yes, yes.

MEMBER GIACOMINI: Things take a lot of time to go through the process, and that's not saying anybody's slow or not acting, but they take a lot of time.
If the NOSB acted years ago to request that they be removed, and it's obvious in the subsequent time that you didn't want they removed, why didn't the NOSB ever take action to stop NOP from progressing on that, if that action had been taken?

MEMBER OSTIGUY: Well actually, how it sort of seems to have proceeded was that it showed up in the National Register notice on the list, and then you'd have to go through the -- it's complicated. That's all I can say at the moment. I'm not going to be able to explain.

CHAIRMAN O'RELL: Andrea?

MEMBER CAROE: Just, you know, this Discussion, I think, is our next meeting discussion when we look at the petitions for these materials. Right now, this is sunset. We've got a lot of things to go over today.

MEMBER OSTIGUY: Yeah, we do. We do have a lot more stuff to do.

MEMBER CAROE: You know, you want to
know economic impact. Anybody that's using colors right now just in packaging and shelf-slotting that they'll lose, it's huge. It's huge.

I mean if they have packaging that says they've got colors on it and you want to take colors away, they have to redo all of their packaging. That's a big expense, just for one manufacturer.

Fifty percent of the products on the market are using color. So you know, right now for sunset, I don't think we have any other choice but to renew it. Let's get the petitions, have this detailed discussion next meeting. My recommendation.

CHAIRMAN O'RELL: Is there any further discussion on these two items? Otherwise, we'll go on. And again, we'll have time to hear public comment and input before we make our votes.

MEMBER WEISMAN: Okay. In that case, I'd like to move on to Section 605(b),
which for this committee just involves chlorine materials and lecithin-bleached.

So this is for chlorine materials and for lecithin-bleached, to be used as allowed synthetics in non-agricultural substances, allowed as ingredients in or on processed products labeled as organic or made with organic.

The Federal Register notice regarding the sunset review asked the public to provide evidence and address concerns for any substances they believe should be discontinued. Of the many comments that -- many comments were received recommending the continued allowance of chlorine materials in organic handling, and there were no comments specifically against the continuation of chlorine materials on the national list for this purpose.

In addition, the NOSB had requested that a technical evaluation report be conducted reviewing chlorine use and organic
handling, and we received this technical report from the program, from the NOP on January 6 of 2006, and that report favorably answered the criteria questions for substances to be used in organic handling.

The technical review did not indicate that there was any new information about chlorine materials since its original petition, that would make it inconsistent with organic practices.

So based on public comments from sunset review an the technical report, the handling committee does recommend the continued use of chlorine materials in this category.

With regard to lecithin-bleached, many comments were received recommending the continued allowance of lecithin-bleached. There were also comments opposed to the continuation of the substance.

During the November NOSB meeting, a manufacturer of organic lecithin announced
that they could produce an organic bleached lecithin to meet the current organic market needs.

So as part of our due diligence, the Handling Committee contacted this manufacturer, while considering this recommendation, to verify the commercial availability as organic of this substance. The manufacturer did confirm its availability as organic.

So therefore, based on the public comment that there is an organic alternative available to replace a synthetic on the national list, the Handling Committee is recommending not to renew lecithin-bleached.

I would just like to point out that we did hear comment yesterday evening from Lynne Clarkson (ph), who is a manufacturer of lecithin, who agreed with this recommendation.

So therefore, the Handling Committee recommends the renewal of the following substance in this use category as published in
the final rule, Part 205.605(b), chlorine materials, disinfecting and sanitizing food contact surfaces, and then as-listed.

In addition, the Handling Committee recommends deferring a vote, not in this category. The Handling Committee recommends not renewing the following substances in this use category: lecithin-bleached.

This recommendation was moved by Kevin O'Rell, seconded by Andrea Caroe, and was voted unanimously to move forward.

CHAIRMAN O'RELL: And I just might add on the chlorine, the committee was aware of and discussed that there is a processing committee recommendation from April 30th, 2003 that went to the NOP for clarification of the annotations associated with chlorine.

We still feel that this is relevant, but it is separate from sunset, because we are not going to be changing annotations. But as part of our work plan, it is to go back and to address this processing committee
recommendation from 2003 back to the NOP, to find out where, why it hasn't gone forward.

Because it does summarize the original intent in the initial recommendation back in, I think, 1995 for chlorine. Discussion?

(Pause.)

CHAIRMAN O'ReLL: Okay.

MEMBER WEISMAN: So we are moving on to Section 606, which is non-organically produced agricultural products allowed as ingredients in or on processed products labeled as organic or made with organic.

We are considering lecithin unbleached for renewal in this section. The committee summary is as follows:

Many comments were received reporting the retention of materials, including lecithin unbleached, currently listed in Section 205.606. One commenter who generally appeared to object to the entire national list opposed the relisting, along
with everything else of this material.

However, detailed information as to why lecithin-unbleached was not compatible with organic practices, as specified in the Federal Register, was not provided in that comment.

Another commenter noted that organic forms of lecithin are available and had concerns that there will be no market for the organically-produced material if the non-organically produced material remains on the list.

However, some commenters also noted that the organic form is either insufficient in quantity or inadequate in some functionality.

Comments were received from a manufacturer or organic lecithin-unbleached, who indicated that organic lecithin unbleached can be manufactured in sufficient quantity to meet demand.

However, this manufacturer also
clearly stated that organic forms of every formulation of lecithin-unbleached that are currently being used do not yet exist.

The Handling Committee agrees, based on compelling evidence given by a manufacturer of organic lecithin-unbleached, that every use of lecithin bleached can in fact not adequately be filled by the forms currently available.

Therefore, the Handling Committee recommends the renewal of lecithin-unbleached in this use category. There were, for deferral there were none in that category and for not renewing. There were none at this time in this category.

The recommendation was moved by Andrea Caroe, seconded by Kevin O'Rell, and the committee voted unanimously to move forward with this recommendation.

CHAIRMAN O'RELL: And again yesterday late, we heard from that manufacturer, who submitted public comments
supporting our recommendation and supporting, in effect, that we were removing the bleached lecithin from the list, but maintaining the lecithin-unbleached as an agricultural product. Because recognizing there were not all sorts --

There were not organic lecithins available that would meet possibly all applications. But in light -- that, in conjunction with our commercial availability recommendation, that now puts criteria out there for the ACAs to ask questions of, we felt that would be enough to move along those people who don't want to use organic lecithin totally based on cost.

They would have to have a justification by the criteria we propose. So Andrea?

MEMBER CAROE: Just really quick. Valerie, I think this is probably for you. It's a small technical correction. The title of this recommendation is a typo. It's
205.606. There's no (b).

CHAIRMAN O'RELL: A new category.

MEMBER CAROE: So we just probably should reflect, as posted right now on the website, it says 606(b), and there's no such animal.

CHAIRMAN O'RELL: Yes, okay. Thank you, Andrea. Any discussion?

(Pause.)

CHAIRMAN O'RELL: Okay.

MEMBER WEISMAN: Right. There is one other pretty brief item that is on the Handling Committee's agenda for this meeting. As Discussion item only, and that is agricultural versus non -- the definition of agricultural versus non-agricultural.

So I just want to make a brief statement about that, which is really more of an update. This is an item on the Handling Committee's work plan, which has over the past year also included participation from the Materials Chair, to take advantage of
additional technical expertise.

A comment was heard yesterday regarding a proposed request that yeast be considered as livestock.

So I just wanted to reiterate, in case it was not clear yesterday, that the committee is entertaining this approach, and to that extent, we have expanded the working group to formally include the full Materials Committee, not just the chair, although it will still be led by the Handling Committee.

If we do move forward with this idea of yeast as livestock, there are additional considerations which we may have to address, such as perhaps a rule change modifying the definition of agricultural product that would exclude only minerals, because at present it does exclude microbial organisms. We would have to look at that.

We would also have to ask, start asking the questions how, you know, I'm still -- I'm coming off of Passover, and part of the
ritual was how is this night different from all other nights. So the question here is how is this livestock different from all other livestock?

(Laughter.)

MEMBER OSTIGUY: We had original sin, and now we have --

MEMBER WEISMAN: Nancy says it has no legs. So we might -- in addition, we might need to look at things like deleting things like living conditions and access to pasture, as considerations. We would have to look at things like 100 percent organic feed.

Then alternately, to consider yeast as livestock, we are also -- might have to consider whether OFPA will allow a rule change to create some other category of non-plant life. That was also a possibility that was discussed.

So this will now be an item on the work plans of a Joint Materials and Handling Committee going forward.
CHAIRMAN O'RELL: And the hope would be to have that recommendation for the next meeting.

MEMBER WEISMAN: I think --

CHAIRMAN O'RELL: That concludes the Handling Committee's agenda.

MEMBER WEISMAN: The Handling Committee's agenda item.

MEMBER OSTIGUY: Good job, Julie.

CHAIRMAN O'RELL: Thank you, Julie.

(Applause.)

CHAIRMAN O'RELL: Synthetic, Non-synthetic. Nancy?

Joint Materials and Handling Committee Report

MEMBER OSTIGUY: Well, we'll deal with this all in one fell swoop and we'll see how long the discussion goes. I'm going to read what we put together.

It's a Joint Materials and Handling Committee response to the NOP documents, dated March 9th, 2006, the evaluation of the NOSB recommendations on the definition of synthetic
and recommended framework for further clarify the definition of synthetic.

The Handling Committee and Materials Committee have received the NOP documents dated March 9th, 2006, "Evaluation of the NOSB Recommendation on the Definition of Synthetic, and Recommended Framework to Further Clarify the Definition of Synthetic," as well as the decision tree to distinguish synthetic and non-synthetic substances.

In general, we find great merit in the comments contained these documents. The documents reflect an attempt to preserve the spirit of our intent, and place them in a form that will pass regulatory muster.

We do not see revealed in them any major ideological differences, but rather constructive and useful criticism given in the spirit of collaboration. We agree with the observation that the recommendation, clarification of the definition of synthetic, adopted on August 17th, 2005, needs to be
organized in a logical sequence with the explanation for its need clearly stated at the outset, and which terms are more clearly defined and separated from policy interpretations, and which makes more concise recommendations.

We are appreciative of the point-by-point responses corresponding to the numbered items in the NOPB recommendation, which reflect a thorough and thoughtful analysis of our original document.

In addition to the NOP's evaluation, we've received a number of public comments which reflect rigorous analysis of both our original recommendation and the NOP's evaluation of it.

These public comments will be taken into account as well. The press of equally urgent issues to be considered and acted upon in advance of this meeting did not allow us to draft a revised recommendation for the definition of synthetic, in time to be
discussed here.

However, we have devised a detailed outline and proposed a time line for incorporating the suggestions contained in the NOP documents, into a revised recommendation, that could be discussed and perhaps even voted on at the next NOSB meeting.

In summary, the Joint Materials and Handling Committee find that the two NOP documents produced in response to the NOSB recommendation on the definition of synthetic on August 17th, 2005, contain valuable feedback which the Joint Committee will be able to use effectively to sharpen our recommendations concerning the definition of synthetic.

The NOP suggestions, along with the recently-received public comment, will be used to propose a revised recommendation on this subject, which will be posted well in advance of the fall meeting allowing for a 30-day public comment period, and perhaps a vote in the fall meeting.
We again thank everyone at the National Organic Program responsible for producing the thoughtful -- the thorough and thoughtful comments contained in these documents.

CHAIRMAN O'RELL: Thank you, Nancy.

Any questions or discussion?

(Pause.)

CHAIRMAN O'RELL: Okay. Thank you, Nancy. Rigo is going to take the lead on our next item, which will be a recommendation. So we'll have a presentation and discussion on Commercial Availability, and then this afternoon we'll be taking a vote on that document. Rigo?

Commercial Availability Committee Report

MEMBER DELGADO: Thank you, Kevin. First of all, I want and appreciate all the work that Julie put into this document and rest of the two committees. It was fantastic work and it was incredible to do over long distance. It's just a lot of things.
Essentially what we're recommending is a document on establishment of commercial availability criteria. The goal was to come up with some acceptable criteria, to determine what's commercially available or not.

Going straight to the recommendation, we have essentially two, three points. The first one involves the applicant, and we're providing information on the -- that should be included on the information to be included in the petition that is posted on the web page of the NOP.

It essentially provides information to the petitioner of what materials or what information must be included in that petition.

Point B talks about how the NOSB is going to review those materials, highlighting the point that we will be reviewing and not so much evaluating the data.

In Point C, the third and last, it's mainly a list of items that should be followed by the ACAs, and describes in detail the
different steps and points that ACAs should follow to evaluate, validate and come up with a decision.

The conclusion is the following: It is the opinion of the NOSB members that the three recommendations listed provide the acceptable criteria and procedures to determine commercial availability.

The recommendations provide for timing determinations regarding commercial availability. The recommendation from the committee was moved by Andrea Caroe, seconded by Mike Lacy. It was approved by 6 votes, only one absent person, and that is my conclusion of the summary.

We received a number of comments, most of them positive. We only received probably a couple negative, commenting on the fact that perhaps the detail on the -- the detail presented on Point B, referring to the work of the NOSB, is not as much as should be, and otherwise, very good reviews from most of
the comments.

CHAIRMAN O'RELL: Thank you, Rigo. Discussion and questions? No, no. We're not voting on it now.

MEMBER CAROE: I know. But I mean is this going to be a vote item or a discussion item?

CHAIRMAN O'RELL: This will be a vote this afternoon.

MEMBER CAROE: Then I do want to kind of fill in some more background then.

CHAIRMAN O'RELL: Andrea?

MEMBER CAROE: This particular recommendation went through quite a few elaborate drafts. A lot of detail was put in and then pulled out, and some of it put back in. We really, really balanced with this for quite a while.

The challenge for us with this was to be efficient with the present petitioning process, and allow for, you know, to try to integrate into the processes that already
exist, and also maintain the flexibility of the certifier -- not the flexibility -- the ability for the certifier to do their job and act quickly on this particular requirement.

So there was detail taken out. Again, as I responded to Jim Riddle, who commented on this the other day, our recommendation for the adjustment to the petition process is consistent with that document.

I do respect the fact that Jim suggests that there should be more detail, and I feel that might be a follow-on item in the entire petition process, in looking at the detail that a petitioner needs to provide, not only for this type of petition but for petitions for other lists as well.

I consider that a separate item. At this point, we need to quickly act on commercial availability, so that we can move forward, especially based on the changes that
will be made due to the lawsuit.

Also, we had a tremendous amount of
detail included as far as the work of the
board and the work of the certifier. A lot of
that detail was also removed.

However, I can say that in working
with the certifiers, the Certification,
Accreditation and Compliance Committee is
going to collaborate with the program, and be
able to provide that level or that standard of
performance at the certifier training.

Guidance doesn't mean as much as if
we can actually integrate into the training
sessions, and establish that standards of
performance, so that the enforcement of this
would be in the accreditation process.

So that's just a little bit of
background, and this was a very work-intensive
recommendation. That's really all.

CHAIRMAN O'RELL: Thank you, Andrea.

Joe?

MEMBER SMILLIE: Yes. I think
Andrea summed it up very accurately and succinctly. The key here is that the NOSB does have a responsibility to be part of the process, and what we've tried to do is keep our role as minimal as possible, and really put the role of the certification agent as primary in determining this.

But again, it's got to be a balance between the NOP, the NOSB and the certification agent. This is going to be an extremely, extremely important issue, and that we're really looking forward to a really specific training in this.

Because it's one of those areas out there that I think I find particularly contentious, and that's the inconsistency of interpretation by ACAs of commercial availability. So it's going to be a real focus of the program, and hopefully we'll aid that focus, to make sure that manufacturers and producers and everyone in the community is judged evenly as far as commercial
availability goes.

CHAIRMAN O'RELL: And I think this goes really a long ways in terms of putting out consistent criteria for the ACAs to apply evenly, so that everybody's asking the same questions, looking for the same bit of information.

The other Part B in terms of the board's role, and the board does have the responsibility from OFPA in recommending materials to the national list, for inclusion on the national list.

But that's a public process. So when materials come up, after the board reviews them, their agricultural components, they check the petitioner's petition for completeness and make sure that there is some credibility there for a case of commercial availability.

That recommendation would be put to the public, posted to the public for input. So if people out there in the public know of
this ingredient or material is available organically, I mean that's the kind of information, that's kind of the check that we're looking for to bring that to the board, before the board would vote on an item.

MEMBER MOYER: I have one question, Kevin. In Section C, Item No. 3, where we're asking -- I guess my question is are we asking the ACAs to develop those lists and then supply them to the applicant or the operator?

Is that any undue pressure on them?

Because the word just says "if they have it." Does that mean we're inferring that we're going to develop those lists, or if they happen to have them they give them?

CHAIRMAN O'RELL: Joe?

MEMBER SMILLIE: I'd like to ask the NOP to comment first before I did, because it is one of the intentions to create some fairly quick database access for that, and I'm just wondering where --

MEMBER MOYER: In which case the
applicant would have direct access to that data, but not through the ACA.

MEMBER SMILLIE: Yes, because right now, certification agents are -- well, it's a complicated issue, because we're not allowed to consult, in any way, shape or form or favor one source over another.

So as certification is, we have to be very removed from that process. At the same time, we're judged with determining whether that is available or not.

So sometimes we have confidential business information that we know it's available, but we're not allowed to see it.

So the ultimate answer, I think, on this one is going to rest with the NOP database.

MEMBER MOYER: This is inferring that you're going to make that available.

MEMBER CAROE: Not particularly.

MEMBER SMILLIE: No, we really can't.
MEMBER MOYER: I'm sorry. Maybe I read it wrong.

MEMBER CAROE: Notify them of sources of information.

MEMBER SMILLIE: Which list?

MEMBER MOYER: Which list?

MEMBER SMILLIE: And right now --

MEMBER MOYER: The available -- list the available ingredients, if the ACA happens to have that list.

MEMBER SMILLIE: Correct, and well speaking frankly --

MEMBER MOYER: That seems like strange language to me. That's all.

MEMBER SMILLIE: Well speaking -- well, the only two sources that I -- and again, I don't want to flavor the conversation too much, but the only two sources I currently think of is all of the web sites of the ACAs, which list all of their clients and their products, which is required in the regulation, and the Organic Trade Association, the Yellow
Pages.

Now I'm sure there are many others out there, but right now, you know, it just depends on your own specific knowledge of those availabilities. Again, I don't want to answer. I want to hear on the NOP on what their answer is to this.

MR. BRADLEY: Mark Bradley, National Organic Program. We've been wrestling around with this as well, as far as how that information would be made available to certifiers.

A lot of people want to keep that confidential, as confidential business information. Sources of organic products, of course, is contentious at best at some point.

I don't know that we're going to be able to maintain that list at NOP just because of, you know, the work requirements. So that's something that's still up in the air. How's that, Joe?

MEMBER SMILLIE: I don't think I'm
really particularly fond of the answer, but let's get more money available for the National Organic Program, because it's really -- I really believe that they have to be repository of that kind of database.

CHAIRMAN O'RELL: Let Andrea go first.

MEMBER CAROE: Okay. I just want to give an example of the type of situation that we're talking about.

If I'm a manufacturer of a complicated product, and I want to use an organic ingredient that's not available necessarily on the market; nobody's selling that particular ingredient as organic, I may contract somebody to make that ingredient for me, and pay for their certification. That's done all the time.

But I don't want anybody, any of my competitors to know that that company can make that organic ingredient. It's my niche. That is a situation where I don't want that company
identified with that organic product.

We get into, you know, business strategy as well. So you know, this whole issue becomes very complex. Using lists like the trade association lists or, you know, the certifier list, is a very safe way to make these available without pointing out that "Gee, I know that there is, you know, organic cherry flavor, you know. Here's the name of the guy that sells it." We can't -- certifiers can't do that, so that's --

MEMBER MOYER: That's why I'm concerned about this language.

MEMBER CAROE: It's saying "the list," making the lists available if you know of them. Just that's all we can do.

MEMBER MOYER: I mean, it's saying that if somebody applies to use a product, and the certifier is saying that they know that something else is available, are they obligated to make that available?

If they know that you're doing it,
how do they get that information to somebody else without --

 MEMBER CAROE: Because you refer them to a list. That's what the language of this, of number three. It says that "You notify the certification applicant or operator of the sources of information which list available organic ingredients. You don't notify them of the source of the organic ingredient. You notify them of the source of the list."

 MEMBER MOYER: Of the list, if you have it.

 MEMBER CAROE: Right. It's too hard to tie down and be any proscriptive than that. And as Joe mentioned, we have talked to the program for a long time about the prospect of this massive database. At that time, it will be, you know, --

 MEMBER MOYER: That would make it easier.

 MEMBER CAROE: It would make it
easy. It would make a lot of things that certifiers do easy, like their annual reporting. But it's not there yet.

You know, I just have just gone through doing a database for my company, and I can't imagine the challenges that they have with this sized database. But some day.

MEMBER MOYER: Thank you.

CHAIRMAN O'RELL: Bea?

MEMBER JAMES: Andrea, this is kind of a philosophical question. Does that seem somewhat unethical to you, that a manufacturer would try to be secretive and exclusive with their organic ingredient, and maybe potentially force another manufacturer to move to 70 percent or 95 percent because they can't find that ingredient?

MEMBER CAROE: I absolutely don't. I think manufacturers have a lot of trade secrets. Their formulas are trade secrets. They don't want anybody to know what those are. It's business. I know, it's not
unethical.

MEMBER JAMES: I just ask that at a point in history when the organic industry is trying to grow.

MEMBER CAROE: You know, it's not that warm and fuzzy. This is about making money.

MEMBER JAMES: That's just too bad.

MEMBER CAROE: Kevin.

CHAIRMAN O'RELL: Julie.

MEMBER WEISMAN: Also Bea, I just wanted to clarify that not knowing that the organic ingredient is available would not necessarily move that product into a "made with" category.

It means that the certifier would agree that they've done their due diligence, and that they will have an allowance to use the non-organic agricultural product under that situation.

CHAIRMAN O'RELL: Rigo?

MEMBER DELGADO: Well, I just want
to emphasize the point that Andrea brought up, that we do need to develop some sort of criterion, especially with regards to Point B.

I still think that we should have a consistent approach to evaluating these materials, not only from material to material, but year to year, and that's probably one item that we should concentrate on.

CHAIRMAN O'RELL: Andrea?

MEMBER CAROE: This is just the start. You know, look at our review process and our evaluation forms. We don't even have evaluation forms for these materials yet. That level of detail is coming.

MEMBER DELGADO: I agree. I'm just saying this is probably an action item for us, for the work plan.

MEMBER CAROE: Absolutely.

CHAIRMAN O'RELL: Okay. Thank you, Rigo. I guess we were schedule to go from 11:00 to 1:00, and it's 12:20, with public comment. So we need to start public comment.
What I'd like to request is that we take absolute no more than a ten minute break, just to get set up for public comment. We'll get the list and -- do we have the list here, or is it still --

MS. FRANCES: It's out there on the --

CHAIRMAN O'RELL: Okay, because otherwise I would announce the first two speakers. I don't even know who that is.

MS. FRANCES: Kastel. Mark Kastel.

CHAIRMAN O'RELL: Mark Kastel will be the first speaker when we come back at 12:30 sharp. Thank you.

(Whereupon, a short recess was taken.)

Public Comment

CHAIRMAN O'RELL: We're going to start the public comment session. We have a lot of people signed up. This isn't a requirement, but this is a plea from the board, that if you can, keep your comments
If you can keep them to three minutes or less, it's really going to help us get through this, because we have work to do, and we have some people that are going to be leaving here at the end of the day because we scheduled an adjournment.

If we don't get to vote on these action items, this is not going to be good for the public. So I know it's not a requirement. We can't cut public comment speaking time, but I implore you to please help us out, because we've got to get to our work.

We want to hear from the public. Particularly we want to hear about the issues that we've been debating this morning. That would be the most helpful for us.

Let me read the NOSB policy for public comments at NOSB meetings. All persons wishing to comment at NOSB meetings during public comment periods must sign up in advance.
Persons will be called upon to speak in the order they sign up. Unless otherwise indicated by the chair, each person will be given five minutes to speak.

Persons must give their names and affiliations for the record. A person may submit a written proxy for -- to the NOP or NOSB requesting that another person speak on his or her behalf.

No person will be allowed to speak during the public comment period for more than ten minutes. We really hope we don't have a lot of ten minutes. But if you have a proxy, let us know.

Individuals providing public comment will refrain from any personal attacks and from remarks that otherwise impugn the character of an individual. Thank you.

Our first speaker is Mark Kastel. On deck, George Siemon. Third, Albert Straus.

MR. KASTEL: Good afternoon. Is this working? Yes. I'm Mark Kastel. I'm
here again representing the Cornucopia
Institute based on Cornucopia, Wisconsin. I
do have a proxy. We probably won't need that.

I'm going to really respect, Mr. Chairman, your comments and requests, but I
have to say that this may be the last
opportunity we have to talk about origin of
livestock before court-mandated adjustments
are made. So particularly --

CHAIRMAN O'RELL: I understand.

We're not trying to --

MR. KASTEL: Right. But we also
respect your needs. So I want to tell you,
and we'll have a couple of brief comments on
materials.

A tale of two farms, to illustrate
where we're at here. I interviewed a farmer
in New York, who's milking about 100 cows on
pasture. He manages his calves from birth
organically.

He feeds his bottle calves 100
percent organic milk, the same quality of milk
that he and his family market and that is available on the store shelves.

He estimated his investment in the milk alone at 15 to 17 thousand dollars per year to raise 40 calves. He raises all his animals when they're weaned on organic pasture, hay, grain. He buys some of his feed, and we know what organic commodities are selling for today.

The story on the second farm, which I visited last fall. I'm sorry. Strike that from the record. This was not a farm I visited last fall.

Second farm. I visited with the officers of this corporation twice in the last couple of months. A minimal amount of their cows are on pasture. They sell 100 percent of their calves at birth. They buy 100 percent of their replacement heifers at 700 pounds or approximately one year of age.

These heifers were most likely raised with conventional milk replacer. We
were discussing the intricacies of organically approved milk replacer. But this milk replacer likely contained dried blood, a BSE risk, and was likely produced from milk that had supplemental bovine somatotropin.

The feed crops or excuse me, also these cattle might very well have been administered antibiotics, and prohibited parasiticides, and other prohibited pharmaceuticals.

The feed grain is most likely coming from genetically engineered crops. They are fed feed that was raised with toxic pesticides, herbicides and fungicides, and again most likely in feed lot conditions.

That particular farm, Farm No. 2, did not have an expense for lost milk. Instead, they marketed probably 600 to 800 thousand dollars per year of extra milk that that first farmer didn't have the same market avenues for.

Both of these farms label their
products as organic in the marketplace.

Very quickly, two other examples. One I'll call a shell game. Farmer A -- I've heard this story more than once from Western farms, on Western farms.

Farmer A, organic certified dairy producer. Sells all his calves off or transfers them in some form to Farmer B, who's a conventional heifer ranch. They're raised using all those conventional management tools that we discussed.

At one year of age, that animal is transferred to Farmer C, who's a conventional heifer operation. Now they're under -- now they're transitioned under organic management for one year of time.

At the end of that time, they are distributed back organic farms, and there is a strict prohibition in the current regulations about rotating animals in and out of organic management. They're breaking the current law on some of these farms.
Last example. There are some farmers who've decided and some certifiers that it's okay to use antibiotics on young stock on certified organic farms. So during the first period of life for these animals, they could receive a myriad of different prohibited materials, and then as long as --

In their interpretation, as long as they're managed organically for the last year before they go into organic production, it's okay. It might be a split operation that has organic and conventional cattle, so they might just transfer them around on the farm.

But again, is this rotating in and out of organic management, is it breaking the current law? We need very much of a tightening of the current regulations that are being abused, and this is a great opportunity with the court ruling to address this.

Very quickly, on two of the materials you discussed, and this is for information. We're not taking a position at
the Cornucopia Institute, but let me tell you. We've heard a lot of discussion from our producers that are concerned that they won't be able to whitewash their barns.

So if that is off the table, we don't have to be concerned about it. But the minute amount of incidental contact that might occur, they're not whitewashing the feed troughs, and it just, you know, I need you to balance that, and if it needs to be qualified so that that's an exempt operation using that material.

We're not, I don't think, reviewing other materials that are used to paint the barn or the milkhouse. There are other FDA and state regulations, and we should leave that open.

And oxytocin, again for information. That was one of the questions we asked when we interviewed the 68 different private label and name brand marketing entities that were a part of our maintaining the organic integrity
of milk study.

We found a very high percentage, if not a majority -- I have not done the analysis -- of people who say we don't use any of it. I think one of the real reasons behind that was that it's very consuming to the consumer, that these marketing entities want to say no antibiotics, no hormones. Not a little asterisk saying "Well, no hormones, well but maybe for therapeutic purposes."

Consumers can't kind of cope with that. One safeguard obviously would be to have a vet like Hugh say that it's only applicable treatment if it's coordinated through a veterinarian.

So I'm going to close by just saying a big thank you for your patience yesterday, and your courtesy. This board really showed respect for the farmers that showed up here from around the country, and I know they greatly appreciated that, and they left with a very positive feeling.
MEMBER KARREMAN: Thank you, Mark, I just want to thank you for keeping grazing front and center in the organic community over the last couple of years. As far as oxytocin goes, I think -- I don't know what the annotation is right now, but it is -- the intent is only for an emergency purpose, hopefully veterinary administered.

Maybe we can do that annotation, you know, after the sunset process, and just for the record with the whitewash, you were referring to hydrated lime and you did not mention it.

MR. KASTEL: I'm sorry. Thank you, and you probably are well aware that on conventional farms, there is a potential for abuse of oxytocin as a production tool, and that's what we're concerned with.

It's just like having antibiotics in the milk house. If they're there, how do we really know how well they're controlled. That's why I would trust you, as being a
practitioner, rather than just having it available free for all. Thank you very much.

CHAIRMAN O'RELL: Thank you, Mark. George, and Albert Straus on deck. Tony Moore following that.

MR. SIEMON: Hello, I'm glad to be here. George Siemon for the record. I kind of just felt like addressing you all because I missed orientation a little bit.

I really appreciate the experience to be in the NOSB, from all the parties involved, and it's a great sense of a growth that we're all part of. I think it's admiring the dedication. But I think it's also very important to remember how unique the NOSB is in the national government.

It's the only thing like it, and I think it's so important that we keep this up like we are, and I appreciate all of you all doing it. I also am so glad to see Valerie on board, and I've constantly given the advice of how important staff support is, to marry the
work plans of the NOP and NOSB.

So I think one thing that NOSB needs to ask for is how can we dovetail with your work plans, when we're working on things that are common plain, instead of this just differences.

I think everybody's working together real well and I appreciate that.

My biggest concern about the whole process is -- one of my biggest concerns is the loss of the farm plan in the certification process. It used to be our foundation, and now I'm finding it to be almost irrelevant in the certification process.

So one of my challenges is how do we get back to using the farm plan, and that's a very difficult one, because the farm plan -- we're kind of moving to an absolutism, where the standard's this. There's no grey areas because we're afraid the certifiers aren't going to implement it equally.

So there's this move away from the
farm plan that really concerns me. If we heard the comments yesterday about intent, intent, intent, intent, that's about the farm plan, and how do you do that unless you have some leveraging.

So I'm really interested in how we take the guidance documents and develop this kind of intent, and then how do we get the certifiers to be out there by applying the pressure. I heard the word "continued improvement." I really think that was a foundation of organics.

This move to only absolute standards, the way I understand, it really is covering up for a lack of evenhandedness amongst the certifiers. I think that's a real issue that Accreditation has to deal with.

You know, I think we need to have a way that the certifiers know that there's all this variation out there. I think we need to have a way where they can report that to the NOP and there's some response.
I know this brings up the peer review question, because that was the whole idea. I found a committee working the other day, applying the peer review model to certifying organizations that will ensure a high degree of integrity and consistency amongst the certifying agents.

This is a big, big deal now, is how do we get it more even out there, and how do we get you all's guidance into the farm plan. I think it's a major issue.

Another thing that I've really got to remind you all is that I hear a lot about science and organics, and if we were only about science, we wouldn't be able to prohibit any of the materials we've already prohibited. They're already scientifically proven safe.

So we've got to watch out for this "science" word. This is about organic principles, and whether they're consumers or farmers, it's all the same about organic principles.
So science is a bit of a trap for us, because we're already defying the bulk of the scientific community with their risk assessment that this is safe. We're now saying "No, we're not going to allow it, you know, and whether it's safe or principles it doesn't matter." Science is touchy stuff.

For those of you all who are new on the board, I just want to remind you that out here in this crowd is an incredible support staff out here, people that are just unbelievably experienced that have sat at these meetings for 15, 10 years now, 13 years, and who have a lot of experience.

I'd go back to what was said earlier about the sunset thing. I think it's really important that you all, at least the chairpeople, have either the e-mail network of previous chairpeople and reach out and ask "What's the history here?"

I think there's a lot of history being lost here, and I wouldn't agree with
Andrea that we should not challenge the previous work. There was some shoddy work done in the early days, and I was part of it, and it was not good work.

We have to -- I know the sunset has its own process, but we have to challenge things. There's a lot that has changed in this industry from '95 to now that's phenomenal in the knowledge base.

Specifically, oxytocin. I really am surprised at your recommendation. Oxytocin may technically not be a hormone, but it's active like a hormone, it's understood as a hormone. We've prohibited in our crops since it was allowed by the USDA; we've never allowed it.

I think it's really dangerous to make decisions on the rare animal that's going to need that. You know, things don't go perfect on organic farms. That's what we have conventional markets for.

You know, we don't allow sprays on a
crop when the crop's challenged. You know, we have to keep the marketing label. Allowing oxytocin for that rare use to me is not the right move. It's the wrong direction, with the kind of scrutiny we have now. We've not allowed it for 11 years, and we've not had any, that I'm aware of, any real issues there.

So to me, livestock's different than crops. You have the opportunity to treat them. We have the standard and the rule that says you must treat, and then we have the conventional market. So thank you very much.

(Applause.)

CHAIRMAN O'RELL: Thank you, George. Albert. Tony Moore is on deck.

MR. STRAUS: Yeah, hi. I'm Albert Straus from Straus Family Creamery, Marshall, California. I have a few of the sunset materials I want to talk about, and other things.

I'm kind of shocked that after all
this time, that we still have chlorine on the list. I've never used chlorine as a sanitizer in either a creamery or a dairy. I think it's a carcinogen. It doesn't have a place in organic, and I never thought it did.

Hydrated lime, I think that we use it for -- on bedding for preventing mastitis, as well as foot baths, instead of copper sulfate, because copper -- we don't want to the copper on our land.

So I would encourage that it stay on the list for now. I don't know if lime by itself or oyster shells isn't as effective, because it doesn't have the pH level.

Oxytocin, it's a hormone. It's being abused. It's being abused in conventional dairies, and in split dual operations, I have high concerns that it's being abused, and I don't think it's being tracked.

I don't think that certifiers are finding out, getting receipts of medications.
of dual operations, as well as organic operations are using, and preventing illegitimate use of it.

You know, I haven't had a prolapsed cow in probably a decade or more. So, you know, I'm not -- I know you like the tools but you know, we do with a lot less tools these days.

Milk replacer, I have no problem getting rid of that. I think I haven't used milk replacer in quite a few years. You know, emergency for milk replacers like, you know, if you have to wait a couple of hour to feed a calf or you know, find a cow to put it on, I just -- I don't know.

It's just, you know, go out and hand milk a cow if you need to. But I don't see the use for a milk replacer in an organic system.

Ivermectin, I don't feel that that should be on the list for milking cows or cows -- anything above, over a year old. I know
that most of the problems are with the younger heifers. They'd have to document the cases.

    Let's see. That kind of ties into my comments about replacement animals. What I would encourage to get to one system really, and I didn't think I talked that long --

    One system is to have organic from birth, and then have allowances, under veterinary supervision or prescription, to be able to treat calves with dewormer or an antibiotic, within the first year of life, and then have that year before production. Then conventional replacements limited to five or ten percent of a herd on an ongoing basis.

    The only other thing I have is that I have a pet peeve about treated sewage on organic crops, tertiary treated and secondary treated crops. I mean secondary treatment on organic crops, I think, is ludicrous, and I put it in a petition a couple of years ago, but nothing ever happened, or complained, excuse me. I guess I'll give up the minute.
CHAIRMAN O'ReLL: Thank you. A question.

MEMBER WEISMAN: When you say "treated sewage," is that something different than sewage sludge, which is absolutely not allowed?

MR. STRAUS: In my looking up what sewage sludge is, it says any form of sewage, liquid, solids, and treated sewage, in my mind, whether it's test secondary or tertiary, is sewage sludge.

MEMBER WEISMAN: So it shouldn't be allowed. What's the --

MR. STRAUS: Should be allowed?

MEMBER WEISMAN: Should not, should not.

MR. STRAUS: It's being used readily.

MEMBER KARREMAN: It's prohibited. It's one of the big three that's prohibited.

MR. STRAUS: Well, tell the certifiers. Tell --
MEMBER GIACOMINI: In my experience with most certifiers, they're interpreting sewage sludge as solids, and in the areas when there's secondary and tertiary sewer water, they're allowing that on crops.

MEMBER WEISMAN: So they're using the effluent?

MEMBER KARREMAN: That's not --

MEMBER GIACOMINI: We think that a lot of people have thought so, but that seems to be where -- and it's coming from somewhere. I mean, I don't know that they've thought about it themselves.

MEMBER KARREMAN: I mean to make a point, it's not even allowed for the use on conventional product within the 30 percent of a "made with" product.

MR. STRAUS: Well, it's being used.

MEMBER WEISMAN: Are we talking about effluent, the water effluent? What portion of the water are we talking about?

MR. STRAUS: When you treat sewage,
you treat it in different --

MEMBER WEISMAN: I'm quite familiar with it.

MR. STRAUS: And they're using it -- actually in Central Valley, California, cities are putting that into irrigation systems, and so that it gets irrigated onto organic as well as conventional crops.

MEMBER WEISMAN: Now I'm trying to understand. Are they putting out the water effluent, or are they putting out water that still contains sewage?

MEMBER OSTIGUY: Water effluent.

MR. STRAUS: It's the effluent that --

MEMBER WEISMAN: Out of the treatment plants.

MR. STRAUS: They separate the solids, they aerate it and then they spray it on the fields.

MEMBER WEISMAN: I can't see how they are doing it.
MEMBER ENGELBERT: And you're saying, Albert, that certifiers are aware of this and are allowing it?

MR. STRAUS: Definitely.

CHAIRMAN O'RELL: Is that the only question?

MEMBER OSTIGUY: Can I make a comment on that? What we're dealing with, and it is going to happen more in the West than it would in the East, and it's something that is absolutely true of Europe, it depends on what you want to define as effluent, and at what point it stops being effluent.

Because what we currently do is we treat minimum secondary in the United States, very few tertiary facilities, and that effluent, the water. So after we have gone through the trickling water filters or whatever it is to remove up to 95 percent of the biologically active materials, which is not necessarily stuff you see floating. That's always gone.
But there's still biological materials left in there. That leftover water portion is dumped into your rivers. Depending on how close you are from where that is released into a river, you could be drinking effluent.

MR. STRAUS: There are concerns about heavy metals, viruses --

MEMBER OSTIGUY: I know what the concerns are. But it depends -- you know, where are we going to draw the line then, Because if I as a sewage treatment facility dump that water into the river, and there's a farmer a quarter mile downstream, that's effluent also.

If you're in Europe, there is not a stream that isn't primarily effluent, somebody else's sewage treatment water that has been put into the stream.

There are too many people. There are very few rivers in the United States in that shape, but the ones in the West are going
to have higher concentrations. There's one river near Las Vegas that is primarily effluent.

CHAIRMAN O'RELL: Kevin?

MEMBER ENGELBERT: That's not in our jurisdiction. That's out of our scope.

MEMBER OSTIGUY: Well, I understand that. But if we're going to start talking about effluent, the water being an issue, we need to then decide when is it sewage and when is it not in our minds.

MEMBER CAROE: Right. That's what she's getting at.

MEMBER OSTIGUY: It's a gray area.

CHAIRMAN O'RELL: I'll take one more comment on this, and then we're going to move on. Bea?

MEMBER JAMES: I would like to ask the NOP to address their opinion on that situation.

MR. BRADLEY: We'll take a look at this. This is Mark Bradley from the National
Organic Program. This situation's new to us, and we need to look at it, but we will. Albert, if you could file a complaint. I mean I'm not --

MR. STRAUS: I did a couple of years ago.

MR. BRADLEY: Okay. I know.

MR. STRAUS: I'll follow up with that.

MR. BRADLEY: We'll check into this.

MR. STRAUS: Okay, thank you.

CHAIRMAN O'ReLL: Okay. Before we get to our next speaker, I've just been asked to make an announcement, that the restaurant here, if somebody's planning to eat, closes at 2:00. So just so you know that.

Tony, Bill Clymer is next.

MR. MOORE: Well, given the food, I'll make it really short. My name is Tony Moore. I work for a company called Moore Ingredients. I'm a certified flavor chemist.

We manufacture and create certified organic
flavors and certified organic ingredients, using them as flavors.

Thanks to all the board members today. It's been really informative to me, watching this whole stuff take place. It leaves me with a lot of concerns and confused me a little bit as well.

But the only thing I'd really like to ask is that the topic of organic flavors be explored more deeply, and be debated a little more before any decision is made.

As probably everyone here is aware, organic flavors and flavors in general are very complex mixtures. Very rarely do they constitute, you know, 100 percent ag except for botanical isolates.

But flavors are generally mixtures of ag and non-ag. They'll contain organic solvents, organic fruit juices, organic concentrates, acidulents (ph), and as well some non-ag products.

Also, just be aware of decisions
made to continue the creation, the continuation of markets of organic products. You know, in 1980, there was no natural aromatics market. Consumers wanted natural products, and the flavor industry rose to that, and by 1990, natural flavors were our fastest-growing category in the flavor industry.

Also in 1990, it was thought that we couldn't create complex organic flavors. Here we are, 15, 16 years later and there's more than several companies offering, creating and selling organic products.

So please be aware of the decisions you made and how they can create new markets in the organic ingredients industry. Thank you.

CHAIRMAN O'RELL: Thank you, Tony. Did you have -- actually I did have a question, Tony. Sorry. The points you're making, could you give me some kind of quantifying on the ag/non-ag part?
Because one of the things we're talking about is moving flavors to ag, to 606.

MR. MOORE: Sure. How about I give a very brief description of a formula, a good organic flavor formula. Let's pick -- pick your berry. Usually can constitute a solvent, usually 30 to 40 percent, which is going to be alcohol, which is I would consider that agriculture.

You're usually going to have something of a named source. If it's a berry, you're going to have blueberry juice concentrate, ag source, correct? We may or may have an acidulent, which could be citric acid, which there is debatable. Right now it's non-organic.

The biggest problem we have in creating organic flavors in natural aromatics. I've kind of put a little outline of some aromatics on my comments. But there are some aromatics, and I'm using -- that's a kind word essentially for natural aroma chemicals.
Some things can be completely derived physically from name products. Like in my description I had talked about anathol (ph) being derived from anasoil (ph). You could also see citrol from lemon oil. The list goes on and on.

But there are also products that are made from completely natural sources, completely natural products that will not be considered ag because they've either been manipulated by simple list aerification (ph), that don't exist in that, you know, state in the natural product.

That's our big problem in flavors. So you essentially, just like maybe, you know, commercial organic food and beverage products, we have a complex mixture. It's not one singular product you can make one decision on.

Does that answer your question? Okay.

CHAIRMAN O'RELL: Bill Clymer and Kim Dietz on deck.

MR. CLYMER: My name is Bill Clymer.
I'm the parasitologist for Fort Dodge Animal Health. I call Amarillo, Texas home.

I'm going to start out by saying that I'm here representing Fort Dodge, but I'm also here representing a number of organic livestock producers, that asked me to get involved a little bit in this fray as far as antibiotic definitions are concerned.

Internal parasites can and do reach clinical levels in our livestock. Parasites can result in reduced production and even death. Organic producers need product or products that can be used to eliminate clinical parasite problems.

When I say the word "clinical," I'm talking about those that are at risk, and still be kind to a non-target organism such as the dung beetle.

I will refer to Moxidectin during my discussion, but my comments will apply to the rest of the microcylic lactones and a general term, and be Ivermectin, Vectomax (ph),
Eprinex, as well as Cydectin.

The medically and regulatory accepted -- okay. The medically and regulatory accepted definition of an antibiotic is an agent with anamicrobial or anabacterial activity.

Moxidectin is an antiparasitic, which includes the helmuts (ph) and insects, but not anamicrobial activity and therefore is not an antibiotic.

The structure of a compound is not a predictor of its activity. An example provided is erythromycin, a macrolide antibiotic is anabacterial, not antihelumetic (ph) or antiparasitic, if you prefer to use that term.

It also works via an entirely different mechanism of action. Therefore, classifying molecules in a class via common structure is inappropriate and misleading.

The next comment is taken from the book Food and Drug Dictionary: Official
Regulatory Terms, Government Institute's Research Group. C. Adams was the editor.

From the preface of this book and I read "It is important to keep in mind that this dictionary is not just a collection of absolute definitions, but is also a resource to identify basic regulatory concepts.

"There may be other means for many of the terms, but the definitions included in this dictionary reflect use of the term in a specific regulatory or statutory context.

"Each term carries a citation to place the term in that context for the reader."

Antibiotic drug. Any drug composed wholly or partly of any kind of penicillin, streptomycin, chlorotetracycline, chloroanphenotrol or bacitracin (ph), or any other drug intended for human use containing any quantity of any chemical substance which is produced by a microorganism and which has the capacity to inhibit or destroy
microorganisms in dilute solution or any derivative thereof.

The actual quotation is listed at the bottom of that slide.

Moxidectin or f-Alpha, as it was first known when it first started being tested for anabacterial activity, was found to have none of these activities. Antibiotic clearly refers to anamicrobial or anabacterial activity, and is separate from antiparasitic.

Antihelumetics, an agent that is destructive to worms. This is all still quotes from this book that I cited earlier.

Another book, Pharmacological Basis of Therapeutics, 8th edition, is taken from Section 11, "Chemotherapy of Microbial Diseases"; Chapter 44, "Anamicrobial Agents," and this is considered the bible for pharmacologists all over the world.

Dr. Goodman and Gilman were the editors. Dr. Gilman won the Nobel Prize for Medicine in the mid-90's, so these guys are
not amateurs.

"Antibiotics are chemical substances produced by various species of microorganisms, i.e., bacteria, fungi, acetomycetes (ph), that suppress the growth of other microorganisms and may eventually destroy them.

"When antibiotics are used," and this is still quoting, "When antibiotics are used to treat an infection, a favorable therapeutic outcome is influenced by numerous factors. However, in simple terms, success is dependent on achieving a level of anabacterial activity as the site of infection that is sufficient to inhibit the bacteria that tips the balance in favor of the host."

Looking at erythromycin, what I would consider a true antibiotic, looking at the mechanism of action, erythromycin and other macrolide antibiotics inhibit protein synthesis by binding reversibly to 50-S ribosomal subunits of sensitive microorganisms.
Erythromycin and Moxidectin are in the same structural class. However, erythromycin is an antibiotic; Moxidectin is an antiparasitic. They have different mechanisms of action and target. The structural properties of any compound are not predictive of activity or mode of action.

"Moxidectin was tested for anabacterial activity and was found to have none." Thank you.

MEMBER JAMES: I have a question for you.

MR. CLYMER: Yes ma'am.

MEMBER JAMES: Do you have a conclusion to your presentation? A very, short quick-like in summary what you really --

MR. CLYMER: In summary, what I'm saying is that the microcyclic lactones, this would be Ivermec, Vectomax, Eprinomectin (ph), Cydectin and then some other generic look-alike type products, are not classified to those of us in the medical profession and in
the livestock profession as antibiotics.

They are classified as antiparasitics. The antihelumetics refer to just the worms, but when we say "antiparasitics" we're talking about internal and external.

All four of these products, the microyclic lactones, are called endectocides. That means I actually have activity, I guess, against both internal parasites, such as the worms, and some external parasites such as lice, mites and that sort of thing.

So in summation, I would say that antibiotics and antiparasitics, even though they may be all in the macrolide group, they actually have different activity, different mode of action, different targets and therefore I do not think they should be classified as an antibiotic.

CHAIRMAN O'ReLL: Hugh.

MEMBER KARREMAN: Thank you for clarifying this for us. We'll take it
definitely into our consideration.

CHAIRMAN O'RELL: Yes ma'am.

MEMBER OSTIGUY: Would you say that the similarity in structure is used initially to try and select for which chemicals to evaluate for similar activity, but from there, they may or may not, as you're explaining, it's not active. So then the structure no longer --

MR. CLYMER: I'd say that's a very good assumption, Because most of the companies involved in development, and I spent 23 years as a private consultant and a contract researcher and then was on the Texas A&M staff prior to that.

So I haven't spent but a very small portion of my adult life working for an industry, or working for industry specifically. They have a screening program, and they're looking --

When they go through a screen, they look at bacterial, fungi, insects, helmuts,
all these different things. So any compound 
that they find, if it has activity, say, 
against a disease, then it goes in the vet 
development program.

So they do start out looking for 
similar structures. I was fortunate enough to 
be the first one to inject Ivermec in a cow in 
1976 as a researcher.

That product was actually found on a 
golf course in Japan, and I think maybe some 
executives were out trying to justify playing 
golf. But anyhow, but that's where that 
molecule actually came from. Any other 
comments? I appreciate very much your time. 
Thank you.

CHAIRMAN O'RELL: Thank you. Kim 
Dietz, followed by David Hiltz.

MS. DIETZ: Kim Dietz, past NOSB 
member. I'm going to comment on commercial 
availability, kind of rubber meets the road 
with this. I agree that the document is a 
great document. I'm concerned with a couple
of things.

One, again from a historical standpoint, the NOSB has made a recommendation on commercial availability, and in this document, it says that there's no standardized criteria to the ACAs.

I know the board has a recommendation out there, and that some certifiers, I hope most of them, are using that recommendation. I know that our certifiers are requiring us to follow those guidelines, and we submit our background on why some things aren't commercially available.

So I'd encourage you to go back and look at that. I think Jim Riddle gave Rigoberto a copy of that yesterday.

The rubber meets the road. I'm concerned that this document is vague and that you're going to have a lot of materials coming in to be petitioned under 606.

I'm on the OTA task force for 606, and I know that we've been kind of waiting for
this document to come out, so we know exactly what we need to petition and how, so that the petitions don't get rejected. So you should start seeing a number of petitions coming your way.

I'm primarily concerned with under the Recommendation No. 2, it says "When petitioning for inclusion on the national list of non-organically produced agricultural products, the petition must state why the product should be permitted, and the production or handling of the organic product.

"Specifically, the petition must include current industry information." What is current industry information? The past board recommendation said that you must show three sources that you've tried to seek out that organic alternative, and you must have that documented.

So that past historical perspective should be in there somewhere, that a minimum of three vendors should be provided. You guys
should ask for that, because it's currently hopefully being used. So that's the one area.

The other one is under (c)(2). "The certifier must validate" or "shall," it says "shall validate that the applicant or operator has documentation proving that the ingredient is not commercially available in an organic form."

Again, what is that documentation? How much of it do you like? Is one person going to submit one letter from a supplier saying they don't have it, and some others submit ten? You need to be, I think, a little more specific with that. The minimum of three has been the industry standard.

Then also in order for an accredited certifying agent to allow this, it says that the organic form may be allowed once they've reviewed "a credible, available information listing, known sources of organic ingredients."

That doesn't exist, and is that
going to bog down materials being allowed under 606. So that's my -- I'll just conclude with that. But I think that -- I know we need it. But again, I'm concerned that there's not going to be consistency out there.

CHAIRMAN O'RELL: Andrea?

MEMBER CAROE: I just want to reiterate that what we did with this document is this document is related to including materials on 606 open to commercial availability.

Those previous recommendations and how the certifier determines commercial availability comes as a second process. They're still intact, but they can't even do that process unless the material's on 606.

MS. DIETZ: Right, Right.

MEMBER CAROE: So this, you know, I feel that level of detail needs to remain, but it's a separate process than what we're discussing.
MS. DIETZ: Okay. I just -- you know, from a certifier's standpoint, and that's your expertise there. But is a certifier going to say "Well, I don't have this database, so therefore I don't know if it's available in other places."

So there's just -- it seems a little vague to me, and there's no list out there. So you may -- it says they shall do it, and that's shall use "they must." So you may want to give them some options in this document.

MEMBER CAROE: And they can. There is a list on OTA's website open to anybody right now. So there's no reason why they can't.

MS. DIETZ: All right. As long as it's there. I heard earlier that there was no list, and I know it's not -- you know, you're using one source, a trade association, and that's only going to list people's ingredients that they ask to be put on that.

MEMBER SMILLIE: Well, by the
regulation also there is a list of products on
each of the accredited certifiers'
association lists or websites.

MS. DIETZ: Okay. That's not as
much a concern as making sure that the handler
validates the minimum of three suppliers, and
right now you don't have any numbers in there.
That was more of my concern than the list.

CHAIRMAN O'RELL: David Hiltz, and
do you have a proxy?

MR. HILTZ: Natalia Milo (ph) was
signed up behind me, and actually she's agreed
to allow me to use her time if necessary. So
I don't think I'll need that. I'm going to
cut my comments down in lieu of your earlier
statement.

CHAIRMAN O'RELL: So you have ten
minutes.

MR. HILTZ: I do have ten minutes,
but I don't think I'm going to use it, given
that --

CHAIRMAN O'RELL: Okay.
MR. HILTZ: Well, good afternoon everybody. Many thanks to the NOP and the NOSB for continuing to allow us to provide public comment on organic issues, and welcome to the new board members who I have not met before, and we appreciate your commitment that you've put in for the next five years.

My name is Dave Hiltz. I'm a research scientist with Acadian Sea Plants. Acadian Sea Plants is one of the largest manufacturers of aquatic plant extracts in the world.

We're located in Nova Scotia, Canada, and our company has supplied both kelp meal and the synthetic aquatic plant extracts to growers for use in both organic and conventional agriculture for the past 15 years. We certainly continue to hope to continue to do so in the future.

I come before you today to comment on your ongoing sunset process for the existing national list, and specifically the
recommendation of the Crops Committee for the
renewal of aquatic plant extracts under
205.601(j).

Acadian Sea Plants mostly agrees
with the findings of the committee, and also
of the TAP review panel, and we're pleased
with the recommendation of the committee to
review aquatic plant extracts.

The majority of the comments that I
have today are going to focus on the
discussion of some of the points that have
been contained in some of the earlier public
comments, and again give Acadian Sea Plants'
opinions on some of the comments that you've
heard.

One of the big issues that continues
to arise seems to be the issue of the
potential for aquatic plant extract
manufacturers to somehow fortify their
extracts with potassium, through the excess
use of alkali during the extraction process.

I certainly can't speak for all
companies, but I will again reiterate what I've said at all the meetings that I've attended, that for our company that simply is not a possibility.

The extraction process that we use was developed in conjunction with research scientists at the National Research Council of Canada, and it is very sensitive to the amount of alkali that we use.

If we put in too much alkali, it causes us major production problems. If we put in too little alkali, it causes us major production problems. So we spend a lot of time within the company, in our quality control process, to make sure that we use only the minimal amount that is required with our established process to produce a quality product.

One of the things I've also heard stated is that these products, if you look on the Armory list, for example, you'll see that the potassium level varies more between two
and 20 percent.

What no one has mentioned is the fact that those products also vary in solids content widely. Some of those are very, very dilute liquids; some of those are dry soluble powders.

If you were to actually put the potassium content in context of the actual dry matter of all those products, you would find that any of them that are alkali-extracted made with potassium are all going to come in at almost the same level.

The fact that one of them is a ten percent solution, of course it's going to lower the potassium level down. So that's where some of the confusion comes in there.

But the suggestion that alkali extraction allows us to market potassium fertilizers at an elevated price is simply without merit.

These products, as Gerald pointed out this morning, are applied at the level of
ounces and maybe pounds per acre, and the agronomic impact of applying that to a crop is simply insignificant.

At the recommended application guidelines, our products would supply considerably less than one percent of the required potassium for a field crop. Given the cost factors involved, it simply is not going to be economically feasible for a farmer to over-apply that.

Even if they did try to do that, aquatic plant extracts made from marine plants contain a natural level of sodium that is about one-third of what the level of potassium is in the final product.

So even if you did try to over-apply that, you would end up, if you tried to, for example, apply 20 pounds of potassium through over-applying aquatic plant extract, you would inadvertently apply six or seven pounds of sodium. You could see that very quickly it's going to run into causing a salinity issue.
So we just don't feel that that is a viable possibility that anybody could do that.

A number of commenters have also commented on the use of potassium carbonate as an appropriate alkali to use. Indeed, a number of our competitors do use that product now.

Acadian Sea Plants has no comment one way or the other on that. It certainly is a viable alkali to also use. The one thing I will point out is that in our opinion, in our experience, anybody that is using potassium carbonate is doing it using a pressurized extraction process, whether instead of extract --

For example, our company extracts at an ambient temperature and pressure. With the use of the carbonate, which is not as strong of an alkali, you have to account for that by usually using high pressure and high temperatures, usually on the order of 300 to
350 degrees Fahrenheit.

So there isn't -- that process is viable, but it is a different process than what we do, and certainly we wanted to point that out to the board as well.

One of the other issues that we've talked about is the existence of some of these non-synthetic type extracts. Indeed, the study that Armory had commissioned had looked at the viability of whether or not alkali extracts were needed.

In that -- some people have concluded that from that report, that there's a statement that or there's a conclusion that the alkali extracts are not needed.

It's unclear to us how they could come to that conclusion, given that on page four in the statements, there's an ambiguous statement where they say that, I quote here, "Both alkali and non-alkali extracts may have some value in crop treatments, although it is clear that the latter" --
"It is not clear that the latter," which would be the non-alkali extracts, can provide responses comparable to alkali extracts.

Yet later in the same statement, they say it is possible to establish -- it's not possible to establish the necessity of alkali potassium hydroxide in the making of extracts.

Well, if there's no clear evidence that the non-alkali extracts work as well as the alkali extracts, how can you conclude that the non-alkali extracts, that alkali is not required? That's very, you know, confusing to us.

And also the other thing I would point out is the fact that some of these non-alkaline extracts, which you would think would be totally natural and non-synthetic, we don't disagree that there are processes out there that will allow for the manufacture of a non-synthetic extract.
The problem then becomes is the same problem that all of us have, is trying to bottle that into something that's shelf-life stable. You can certainly use pressurized, differential pressures, freezing, thawing.

But at the end of that, you'll end up with a seaweed suspension usually, that again is going to be -- if you can't find some way to preserve it or stabilize it, it's going to be susceptible to microbial action.

So some of these products that are on the marketplace, even though they say well, we don't use alkali, we don't use any synthetic chemicals in the extraction process. "No, you don't." But a lot of them do, then subsequently add synthetic micronutrients or synthetic preservatives to stabilize their products.

So even though it looks like it's non-synthetic, it may not really be.

So in closing, I just, you know, I just want to again thank the board for their
continued work on this, and we again thank you for your proposal that for the renewal of aquatic plant extracts as they're currently listed.

Given that a number of us, the manufacturers produce these products in such different ways, with respect to the question of trying to limit the amount of alkali or set some number for the amount of alkali, we would suggest that would be a difficult process.

We certainly will work with the board, if that's something they choose to do. But we'll warn you that that is -- again, given all the different types of manufacturing of the alkali extracts out there, it would be very difficult to establish one of those as being an official process, so to speak. So I thank you very much for your time.

CHAIRMAN O'RELL: Kevin.

MEMBER ENGELBERT: Thank you, David. On the very -- the last line on the very first page of your presentation, I want to
make sure I understand what you're saying. Is there a typo? Are you trying to say "thus rendering them synthetic, despite the lack of chemicals used"?

Should that be "Instead, they are often mixed with synthetic micronutrients."

Is this what I'm reading?

MR. HILTZ: Yes.

MEMBER ENGELBERT: This is where --

MR. HILTZ: Yes. It says they're often mixed with synthetic micronutrients or preservatives that produce a shelf-stable product, thus rendering them non-synthetic" -- yes. That's kind of what I was saying before.

MEMBER ENGELBERT: It should say "synthetic"?

MR. HILTZ: Yes. I apologize. Yes, you're right. That should be "synthetic."

MEMBER ENGELBERT: Thank you.

CHAIRMAN O'RELL: Thank you. Lou Anderson is up next, and I've been asked to make an announcement. It's hotel policy not
to bring food into this room for eating. So I'm sorry. I'm making the announcement.

MR. ANDERSON: I'm Lou Anderson. I represent Idaho Organic Feed Growers Association. I apologize, but I need to talk about the pasture issue again.

I represent a group of 60 plus organic farmers, all family farmers in Idaho. We produce organic feed for organic dairies. We're in an area that's kind of unique. We can produce organic feed there very efficiently and in a very sustainable, friendly manner.

Because of the elevation and the moisture that we get there, and the growing conditions, the short growing season, we take generally just one cutting of hay. Our barley yields, we can only grow short season grains because of the climate.

Our barley yields are usually 20 to 30 bushels per acre. So the natural calcification or natural state of the soil
pretty much takes care of our soil fertility.

We don't have a lot of weed problems there, we don't have a lot of insect problems there, so it's just a natural place for that to happen. Unfortunately, that's about the only crop that we can grow there. We don't have a lot of crop choices.

This is my first experience at one of these meetings, and it's been very enlightening. All of you guys on the board, on the NOP, I really appreciate your patience in what you do, because it's at times certainly it's not much fun.

We support pasture for organic dairies. Our concern is that prescribed amounts of pasture may put unnecessary economic burdens on some of the Western dairies.

We would support focusing more on the overall animal health and welfare than on whether the only feed those animals get is pasture.
Our concern is that if this takes place, these dairies may not be able to operate financially and would go out of business, and we have established over the last ten years a market for about 60,000 acres' worth of organic feed.

We produce in the neighborhood of 100,000 tons of organic feed every year, which we're able to market at this time. It injects in the neighborhood of 15 to 20 million dollars a year into the economy of our area.

A number of the farmers that I represent, probably half would tell you that if it was not for the organic industry and for their ability to farm organically and produce and sell organically that they would not be farming now.

It's a problem in our area that the land values have become so high that sometimes it's easier to sell than it is to continue farming. Because of organics and because of organic feed production, we have been able to
keep most of these farmers on the land.

I'm a fourth generation Idaho farmer. Most of the people I came here today to talk for are second, third and fourth generation Idaho farmers. We just feel that maybe we haven't been heard or people don't know who we are.

So they sent me out here to introduce myself and introduce us to you guys. Like I said, we feel that what we do that we're very strongly supportive of the organic program and the organic rules.

We feel we produce a very organic, very nutritious product something, like I said, in a very friendly, earth friendly, very sustainable manner, and we'd like you to consider our position in this in the dairy question, that we may continue to do that and may continue to grow that industry as the organic dairy industry goes in our area.

I think it's important that organic dairy products are produced in a manner that
are affordable to the general public. I see that happening now. I'd like to see that stay the same way if we can do that.

I appreciate your time. Thank you.

Yes sir.

CHAIRMAN O'ReLL: Thank you, Lou.

MEMBER DAVIS: What part of Idaho are you located in?

MR. ANDERSON: We're in South Central Idaho.

MEMBER DAVIS: Name some cities.

MR. ANDERSON: We're about 50 miles west of Sun Valley.

MEMBER DAVIS: Okay. So you're between --

MR. ANDERSON: We're north of Twin Falls.

MEMBER DAVIS: Okay, between --

MR. ANDERSON: Between Boise in the north. Actually, we have growers that go from the Boise Valley to the Teton Valley, and from Snowville, Utah the other way.
MEMBER DAVIS: Okay. So you're all across that broad patch of land?

MR. ANDERSON: All across that broad band, yes sir. Yes.

MEMBER KARREMAN: Thank you very much for coming in and taking your time out. All I can say is there's a lot of Eastern organic dairy farms that love Western hay. It certainly would be nice to see some of -- or more of your hay come into the East.

MR. ANDERSON: I've been contacted by a number of people. Unfortunately at this point, the freight is -- seems to be prohibitive.

MEMBER KARREMAN: Yes, but still, the organic farmers right here in Pennsylvania will buy hay from -- organic hay from Nebraska and what-not. So please keep us in mind on this end of the country.

MR. ANDERSON: That's what we do for a living. We'd be glad to bring it any place we can.
(Laughter.)

MEMBER KARREMAN: Well, there's been a shortage, this year especially. You've got another question.

MEMBER SMILLIE: One cut, because that's the length of the season or --

MR. ANDERSON: Because that's the length of the season and the moisture we have. We have maybe 18 or 19 inches of moisture, but most of it comes in the form of snow in the winter.

During the last ten years of drought, we've gotten about half a cutting. So the organic has made that so we could still continue to survive. If not for that, I'm sure we'da been out of business.

MEMBER SMILLIE: Is that irrigated or natural?

MR. ANDERSON: Most of the acres are natural, non-irrigated. There is some irrigation, but most of it's natural non-irrigated.
CHAIRMAN O'RELL: Thank you.

MEMBER KARREMAN: Thank you, Lou.

CHAIRMAN O'RELL: Cayse Warf is up, and next on deck, Gwendolyn Ward.

MR. WARF: Good day. My name is Cayse Warf. I work with EcoLab. I have special interest in daily cow health and welfare through teat dips and hair hoof wart treatments, and also food safety assurance during processing through the use of food contact antimicrobials, and efficacious applications of oxidants for cleaning and sanitizing.

I really appreciate the work for the NOSB and the NOP, especially you guys that are volunteering. Keep going. However, I have a couple of concerns and some suggestions I would like to share with you this morning.

Similar in some ways, I think that the process is kind of like the reproduction of elephants. After the initial courtship rituals, it takes about two years to get a
product. So let's work on that.

It seems -- well, I won't even go into that. Where is our Federal Register publication for peracetic acid? I think I know the answer right now. I've talked with Arthur and some others in there.

But you've already made your recommendations. Now is it going to take two years before we get a publication, so that we can go ahead and start using that? It should not be that way.

A couple of things that I'd like to mention too is the inconsistency in our certifiers. Yesterday, it was very interesting to me to see the Shiitake mushroom presentation here, that they had been using the process for years and years, okay, with multiple certifiers, okay.

No problem with at all. You come up with one certifier that says "Well, that's an input," instead of a plastic bag and whatever else. It should not be that way. It should
not be that way, that certifiers can be willy-nilly in their certification or what they're requiring.

Another example is recently, we had a customer using a material on poultry processing for chicken carcasses. One certifier had no problem at all, seeing that it was under an advisement letter from USDA, that it was a food contact substance.

Another certifier in another state says "No, it's not. We disagree with that. We don't go along with the recommendations from USDA," and they would not certify it. It should not be that way, that one certifier can allow it and another should not. That needs to be fixed.

So I called on the NOP quickly to address food contact substances, and quickly rule that they are not under the jurisdiction of the NOSB.

Or I propose that the NOP create a new category called "Food safety
antimicrobials," including all substances
codified in 21 C.F.R. 173, which is secondary,
direct food additives, and legislate that
their automatic inclusion by reference in the
NOP list, and not require them to go through
the listing process on the NOP.

I understand that the NOP is a
marketing program, so it should not trump food
safety in any aspect at all. Organic
consumers expect and deserve that the organic
labeled meat, poultry, fish, fruits and
vegetables are as safe from pathogens as non-
organically processed food. Right now, that
is not 100 percent certain. Thank you.

CHAIRMAN O'RELL: Thank you. Any
questions? Gwendolyn. I'd just remind
everybody we still have 90 minutes of public
comment to go, and the board needs to do some
deliberation on these action items.

MS. WYARD: Good afternoon, Mr.
Chairman, members of the NOSB, NOP staff and
ladies and gentlemen of the gallery. My name
is Gwendolyn Wyard. I'm the primary processing program reviewer at Oregon Tilth, representing 744 members and 411 certified processors.

I'm pleased to be here today and provide comments regarding the retention of flavors. My comments were submitted on April 10th, so hopefully you have those in your book.

While the committee recommendation refers to both flavors and colors, I am going to focus my comments today on flavors, keeping in mind that most of my comments also apply to agricultural colors.

Oregon Tilth does not support the retention of the current listing of flavors, but rather supports transition to a defined inclusion of non-agricultural flavors, as per the 205.605 heading.

I'd like to recognize and emphasize right here from the starting gate that complete elimination of flavors from 205.605 would be premature. I agree with that,
because non-agricultural, non-synthetic flavors, they arguably exist.

However, many flavors are agricultural by current rule definition, and would be more appropriately listed under 205.606, if not commercially available in organic form.

So the current listing of flavors is too broad, and I think we agree. We agree with that. The FDA definition of natural flavor ranges from simple botanical extracts or essential oils such as peppermint extract, lemon oil to the aroma chemicals that Tony Moore from Moore Ingredients mentioned earlier, 6-3-hexanol (ph), acetic acid, etcetera, etcetera, to protein hydrolyzates (ph) and fermentation products. Then there's the complex mixtures of agricultural and non-agricultural.

So the crux of the situation is this: I want to use peppermint extract as an example. It's a simple botanical extract.
They're generally accepted as agricultural. It does not meet the definition of non-agricultural, and it's readily available in organic form.

However, because peppermint extract meets the broad FDA definition of natural flavor, and flavors are listed under 205.605 as non-agricultural, the peppermint extract is regarded as non-agricultural, and the non-organic form is consequently allowed in organic products.

The manufacturer of the organic product is neither required to source or use organic peppermint extract.

So while one company is required to spend considerable money and resources to secure a consistent supply or organic guar gum (ph) or organic mustard brand, another organic product manufacturer may use non-organic peppermint oil as a flavor, regardless of its organic availability. This does not support the production of organic ingredients.
I wanted to mention or comment, you mentioned earlier, Joe, that efforts are being made to encourage manufacturers to use organic flavors. I honestly don't know how we can do that.

A clarification came from the NOP on the form of a letter from Richard Matthews to Richard Segal, when Grace Merriquen (ph) was requesting that manufacturer be required to use organic yeast.

That letter clearly stated that if manufacturers were going to be required to use organic yeast, it would need to be reclassified as agricultural. I'm sifting and sorting through formulations every day, and I'm seeing rosemary oil and peppermint extracts.

I would like to do a case-by-case determination and say "Well, the heading here is non-agricultural. This here is an agricultural flavor." But if the operator comes to me and submits it as natural flavor,
and points to 605, legally I feel like my hands are tied.

So what I'd like to recommend is that once again, we support the transition to a listing of non-agricultural flavors. A thorough investigation into flavor composition and manufacturing practices should inform the determination and long-term retention of solely non-agricultural, non-synthetic flavors.

Organic status should be required for agricultural flavors unless petitioned under 205.606, and during the interim that a broad category of flavors remains on 605.

Guidance distinguishing agricultural flavor from non-agricultural flavors should be operative to aid and evaluation of 205.606 flavor petitions, and create consistent verification among accredited certifiers.

I spend a lot of time calling up certifiers and asking them how they're dealing with flavors, and it's across the board. So
thank you very much for this opportunity.

CHAIRMAN O'RELL: Gwendolyn, yes. So really, I guess what you're saying is that there's a need for flavors to be in both locations?

MS. WYARD: I think so, absolutely, absolutely, and I think that the heading --

CHAIRMAN O'RELL: And I think there are people on this board that agree with that.

So that would help us if somebody filed a petition for 606 for flavors.

MS. WYARD: Joe?

MEMBER SMILLIE: Yes. Two things. Number one, we didn't get your paper. So if you could just make sure whatever, resubmit it or whatever we have to do, Because I would like to have it.

I absolutely agree with you. We're in a legal bind. I think a position that certifiers take is to still, in spite of that legal definition, to still push for organic flavors. I think manufacturers also, even
though not legally required to move towards more and more organic flavors, do so also for marketing reasons.

If they can find something acceptable, I think it aids their process. So you're absolutely right. We have no legal authority to make them comply with commercial availability Because of that issue.

But nonetheless, I think we have moral suasion and I know that there's also some -- there are some marketing benefits to moving towards flavors. But I absolutely agree with every word you said. It was accurate and that's the way we have to move.

MS. WYARD: Okay, thank you.

CHAIRMAN O'RELL: Thank you, Gwendolyn. Tina -- pardon me?

MEMBER OSTIGUY: Make sure you send us your document so it gets into the meeting book. But I'm sure we have it just for the record.

CHAIRMAN O'RELL: Okay. Tina Ellor,
and I'm going to make an announcement that this will be the last speaker we have, and the board is going to break, because I'm going to have mutiny here if I don't let everybody get out and get something to eat.

So we're going to take, and I don't know what, 30 minutes, 40 minutes. They're reserving a spot for us at the salad bar in the restaurant.

So I'm assuming 40 minutes or so, and then we're going to come back and then pick up with public comment, and that will be with Leslie Zuck. So thank you.

MEMBER OSTIGUY: Then you're going to break again for a working discussion? After you hear the public comment, then you'll stop again for your working --

CHAIRMAN O'RELL: I think we need to talk when we're having lunch for the committees, what they may need, if there's still additional public comment that comes afterwards where we need to do it. So we'll
kind of make that determination. Yes Eric?

MR. SIDEMAN: Those of us who are going to come up for comment, because of your break can we send in written comments?

CHAIRMAN O'RELL: Well, I'm not cutting anybody off.

MR. SIDEMAN: Because I have to leave to make a plane by 3:00.

MS. ELLOR: You want to take my spot?

CHAIRMAN O'RELL: That's perfectly acceptable if --

MR. SIDEMAN: Can I do it barefoot?

CHAIRMAN O'RELL: Oh yeah.

MEMBER OSTIGUY: It's organic.

(Laughter.)

MEMBER OSTIGUY: Barefoot is preferred.

CHAIRMAN O'RELL: Tina, thank you. You'll be first up then when we come back.

MEMBER OSTIGUY: That was very nice.

CHAIRMAN O'RELL: Thank you, Tina.
MR. SIDEMAN: My name's Eric Sideman, Maine Organic Farmers and Gardeners Association. I just want to make a quick comment about seaweed extracts.

There have been a number of comments about these, and one thing that has not been considered and I think should be and put into the records, is that phosphoric acid has never been reviewed, petitioned or approved by the NOSB for use in this material.

There are a number of companies across the country that are using it. Most companies are not using it, and I think that needs to be addressed. Not during the sunset review, but soon.

CHAIRMAN O'RELL: Was it allowed in the fish?

MR. SIDEMAN: Yes. That's the only -- and that has something to do with the way that NOP is reorganizing the list. If they reorganize the list so extractants and stabilizers are listed individually, then
phosphoric acid can be listed.

But again, it can't be listed with annotation allowing it for seaweed, because it's never been approved for that use. It's a stabilizer. It lowers the pH so the containers don't explode from microbial activity. Questions?

CHAIRMAN O'RELL: That was it?

Thank you, Eric.

MR. SIDEMAN: That's it. Thanks.

CHAIRMAN O'RELL: Thank you.

MEMBER DAVIS: Eric, is your organization, would they be able to provide a petition to get that on our plate?

MR. SIDEMAN: I'm a little reluctant that our organization provide petitions, because of conflict of interest. Even though we've separated out our technical services from our certification agency, I'd just really rather stay away.

But I may be able to get some other people to file petitions. In addition to
that, we'll be working with somebody to file a petition for potassium carbonate.

As the gentleman from Acadian Sea Plant pointed out, a lot of the major companies across this country are using potassium carbonate, and that too is not on the list.

Again, the person who pointed out the inconsistency of certifiers across the country, this is an area where some certifiers are allowing the seaweed extracts made with potassium carbonate, and others are not, and this is not fair to the companies who are using it, two of which are in Maine, and we don't allow it for use in Maine.

So it's a little bit of hostility at our ag shows.

CHAIRMAN O'RELL: Kevin?

MEMBER ENGELBERT: Very quickly. Eric, why are all those companies being allowed to use phosphoric acid if it's not --

MR. SIDEMAN: It's an interpretation
-- actually, it's a tiny bit complicated. If you take calcium carbonate and put it in water, you actually will get some potassium hydroxide.

So I think that's what some certifiers are thinking, that you're making potassium hydroxide. So potassium hydroxide's on the list, so it's okay. But that's not the way the list was meant to work. Potassium carbonate is a different synthetic material. If it's to be used in organic production, it should be listed.

MEMBER ENGELBERT: Do you know what that means? Okay.

CHAIRMAN O'RELL: Arthur?

MR. NEAL: This issue goes back to just how the list was constructed and interpreted. As we mentioned yesterday, we're going to undertake rulemaking to reorganize the national list.

We do have a petition for the use of phosphoric acid as a pH adjuster in aquatic
plant extracts. Depending on how this whole rulemaking process works out, that petition may just reenter, be resurrected and come before the board for the petition, for the use in which it was petitioned.

That way, that whole annotation issue would be addressed, and hopefully the whole potassium carbonate issue can get worked on at the same time.

MR. SIDEMAN: Yes. I think that's essentially all I'm asking, is that petitions for potassium carbonate and phosphoric acid for the use in plant extracts be moved forward.

CHAIRMAN O'RELL: Thank you, Eric.

MR. SIDEMAN: Thanks.

CHAIRMAN O'RELL: Okay. We're going to take a break and we're going to try for -- to be back here at 2:30.

(Whereupon, at 1:50 p.m., a luncheon recess was taken.)

CHAIRMAN O'RELL: Tina, you will be
in the public record, and I'm sure people will be coming in while you speak, if you don't mind.

MS. ELLOR: It's okay. I'll be very, very brief. I'm not even going to read my comment. My name is Tina Ellor.

I'm from Phillips Mushroom Farms, and also with the Organic Working Committee of the American Mushroom Institute, and there's a couple of issues I'd like to bring up very quickly.

Number one, yeast as livestock. I'm not real comfortable with that, because there are five kingdoms. We classify all of life into five kingdoms. Plant and animal are just two. There are three more. I'd be more comfortable with an additional category of "Other" or something like that.

Those classifications, of course, are based on a lot of different things, and that information's very useful. But I'd like to just mention that if you start putting, you
know, different organisms into different kingdoms than where they belong, than what's to say now mushrooms aren't livestock, and will have trouble with pasture access.

But also we've finally gotten comfortable certifying under the crop standard. Now we had a mushroom standard very far into progress, and the NOP decided not to go forward with it.

If you guys decide to go with a mushroom standard, I still have all the work we did on that originally. So if that comes up on your docket, I'll dig those files out and maybe save us all a lot of time.

The second issue is hydrated lime, and that came up on a number of different things. But we use hydrated lime as pest control in mushroom cultivation, and it's very critical to control green mold, *trichoderma harzianum*, of which has caused massive losses in the mushroom industry.

I won't bore you with the nuts and
bolts, but if it comes up later and you want to know how we use it and why, I'll be here.

The third thing is just a brief word for those mushroom growers who use cheesewax on their Shiitake logs. You couldn't ask for -- and I understand the issue, but you couldn't ask for better people making a better product.

If you line up all the Shiitakes grown in the world, you know, those would be the best. Shiitake comes in massive quantities from Asia. Often it goes through Japan. The lentinen is extracted to use for cancer therapy. The mushrooms are dried and sold here.

Now those people are competing against that kind of product and just massive amounts of imports coming in. What they have is a product that's grown outside in the sun, which is different from what we do. We grow everything inside under lights.

Their product is actually more
nutritious and better quality, and that organic certification means a lot to them. So if there's some way, you know, that we could work with this, I think it would be greatly appreciated.

The last thing I'd like to say is I'm sure a lot of us got that little card in the mail that said there are openings on the NOSB and did not respond, as I didn't, because of the huge commitment you guys make. I just want to tell you how much I appreciate that.

CHAIRMAN O'RELL: Thank you. Questions?

MEMBER ENGELBERT: Could you very quickly go through how you use hydrated lime, just real --

MS. ELLOR: Sure. Hydrated lime is used to adjust the pH of the casing material, because the weed mold, *trichoderma harzianum*, green mold likes very acidic conditions, as most fungi do.

We need to raise the pH quickly, and
to a pretty high point, to have the Agericus, the Portobellas white mushrooms, compete against that green mold. Conventional growers use fungicide in the compost, in the casing, and to coat the spawn.

Of course, you know, we don't have that option and we wouldn't use it even if we did.

MEMBER ENGELBERT: And why hydrated lime and not conventional ground limestone?

MS. ELLOR: Because you have to use so much conventional ground limestone to raise the pH that it changes the structure of the casing soil, and it doesn't function nearly as well. That's what we've used up until like 1954, just a whole lot of crushed limestone.

But these new virulent strains of trichoderma came in in the early 80's and just completely wiped out huge amounts of crops. So I just wanted to mention that.

MEMBER ENGELBERT: Thank you.

CHAIRMAN O'RELL: Thank you. Leslie

MS. BROWN-ROSEN: Hi. I'll try to make this really quick. I just wanted to -- I know this is not directly on agenda, but this issue on the replacement stock. I just you wanted to know -- I think this is in your packet.

A number of certifiers sent a letter a couple of weeks ago to the NOP. We've got Pennsylvania Certified Organic, Vermont Organic Farmers, Midwest Organic Services, NOFA New York, MOFCA, Steller, which is Demeter (ph), and Oregon Tilth, plus several NOBTA, MODPA, a couple of other farm groups, really asking NOP to look carefully at this upcoming opportunity when they have to rewrite the regs.

I mean, the certifiers have been concerned because we had no warning or guidance or proposed rule or what's going to happen, ad our understanding is the rule needs
to be changed by June 9th Because of the court case.

So at that point, animals can -- any 12-month old transition animal being brought onto any organic farm, or do we have a two-track system like we currently unfortunately do, or can we fix this once and for all?

So hopefully there will be an opportunity to comment soon when the NOP does post whatever they're going to do, and I hope you keep it on your work plan to respond promptly and hopefully support your previous positions on this, because this is a real opportunity to fix a problem that's been dragging on for a long time, and we need to do it now and not perpetuate this two-track thing.

So take a look at the letter if you need. We've given specific suggestions on how we thought the wording should look. I think it's not hard to fix. So thank you.

CHAIRMAN O'RELL: Thank you, Emily.
There's a question from Hugh.

MEMBER KARREMAN: Well, I was just kind of wondering could the NOP give us any inkling right now what's going to happen? I mean we're in April right now, and it's going to be June 9th comes around, we're not going to have to another major decisionmaking time.

Do you -- I mean, you know, it's less than two months away when this all changes. Could you give us an idea of what we should expect?

MR. BRADLEY: Mark Bradley with the NOP. We can't comment on that right now, but you'll know very soon.

MEMBER KARREMAN: Okay. Before June 9th?

MR. BRADLEY: Yes.

MS. BROWN-ROSEN: Okay, thank you.

MEMBER KARREMAN: All right.

CHAIRMAN O'RELL: Yeah. I think Hugh it needs then to be, you know, it's a work plan item on the Livestock Committee.
Yes, that as soon as that new ruling comes out, then be prepared for any comments or whatever we need to do.

MEMBER KARREMAN: Absolutely.

CHAIRMAN O'RELL: Yes. Did Leslie come back? Leslie? You're up. You pass? Well thank you. That doesn't mean we don't love to hear from you. Okay. Tom Hutchinson, and next on deck, Diane Goodman.

MR. HUTCHINSON: Tom Hutchinson, Organic Trade Association. Thanks very much. On commercial availability, thank you very much for clarifying your discussion on the role of NOSB's reviewing, rather than evaluating information about commercial availability.

This should lead to new insights about how commercial availability is being used, and we look forward to getting those petitions moving.

OTA supports strict criteria for certifiers to determine commercial
availability plus training, and of course NOP
attention to the issue as necessary.

    We all support Kim Dietz's comments,
especially returning to the previous NOSB
recommendation, recommending three attempts to
find -- a minimum of three attempts to find a
product.

Please also review ag versus non-ag
status, and see our written comments for yet
another reason to include yeast and
microorganisms as agricultural product. Even
if yeast is not livestock, it is non-plant
life. So there is precedent in the rule for
some consideration.

On the framework for clarifying the
definition of synthetic, OTA supports the
framework and has suggested two tweaks,
including having fungi and microorganisms in
the definition of "natural source."

As always, please look at our
written comments, and you can see what OTA's
comment really are, as opposed to uninformed
rumors. On our website, when we get them up probably in about a week, ota.com, under "Public Policy," available to the public for inspection. Thanks.

CHAIRMAN O'RELL: Thank you, Tom.

MS. GOODMAN: Hi again. Just as a clarification on a comment that I made yesterday, I'd like to offer the clarification to the comment I made, and that while my comment yesterday reflected the comment of Florida Crystals, today I would like my comment to be reflected in their comment.

My separate -- my previous comment referred to -- you understand what I meant, right? I said it wrong. My comment yesterday --

CHAIRMAN O'RELL: When you come up, you're a different person. So I'm sorry.

MEMBER KARREMAN: You are you today.

CHAIRMAN O'RELL: Oh, he's confused.

MS. GOODMAN: I'm Diane Goodman, and yesterday I read a comment from Steve Clark
from Florida Crystals, and I made a comment as well.

In both of those comments and in the comment you received and I handed you from Florida Crystals, the comment I made to you personally yesterday reflected the comment that was submitted by Florida Crystals and Steve Clark.

So in this comment, I would like you to take these words now and reflect them back on those comments, because I'm not commenting on behalf of Steve Clark or Florida Crystals.

CHAIRMAN O'RELL: And you do not have a proxy?

MS. GOODMAN: And I don't have a proxy, not even for me. So you understand now?

CHAIRMAN O'RELL: Yes.

MS. GOODMAN: All right. My previous comment referred to a disagreement that we held, with the suggestion that in the clarification documents for the definition of
synthetic that a substance be defined as a compound or element that had a distinct identity, such as a separate CAS number.

In the context of defining a synthetic as a substance that is created by chemical change, that produces a separate and entirely new substance, that all synthetics may be distinct compounds or elements, we'd like to keep in mind that while all substances are --

While all synthetics may be distinct compounds or elements, all compounds or elements may not be synthetic, simply because they are created by chemical change. Do you all understand what I'm trying to say?

MEMBER OSTIGUY: Uh-huh.

MS. GOODMAN: And Kevin, I wonder if you -- and thank you for that. My apologies for the convoluted and confused nature of that.

Can you clarify something you said right before we broke, and that was you said
you urged people to get a petition in for colors or flavors, I think you said, a petition in for flavors.

    I think you might have meant to get petitions in for flavors.

    MEMBER ENGELBERT: Yes.

    MS. GOODMAN: Correct?

    MEMBER ENGELBERT: Yes.

    MS. GOODMAN: Okay, great. Thank you very much. Any questions about what I said? Okay, thank you.

    CHAIRMAN O'RELL: Thank you, Diane.

    Miles McEvoy? On deck --

    MEMBER OSTIGUY: Scheide.

    CHAIRMAN O'RELL: I don't know.

    MR. McEVOY: Hello. I'm Miles McEvoy with the Washington State Department of Agriculture. Thanks for sticking in there and listening to all the comments.

    I have some prepared comments that I gave to Valerie, that you'll get a copy of, and okay. So let's get through -- I'm going
to talk about some tree fruit here.

The Washington State Department of Agriculture certified over 550 organic crop producers last year, and nearly half of these producers are growing organic tree fruit, mostly apples and pears, cherries, a lot of peaches, nectarines and apricots as well.

Washington State produces 58 percent of the U.S. apple crop, and over 50 percent of the U.S. pear crop. In 2003, organic tree fruit comprised 4.7 percent of the state's apple acreage, and over six percent of the pear acreage.

So it's a very significant part of the state's organic production, and the tree fruit industry in the state is very excited about organic growing. Because of the strong market, there are thousands of acres of tree fruit that are in transition to organic production.

The environment benefits of organic food production are widely recognized. An
additional benefit of organic production is
that organic farms are laboratories of new
pest control techniques.

Pest control methods such as mating
disruption were pioneered on organic farms,
and are now the standard for pest management
of coddling moth (ph) in conventional tree
fruit operations as well.

The tree fruit industry, the
conventional tree fruit industry has
significantly reduced the amount of organic
phosphates, carbonomates (ph) and organic
chlorine pesticides due to the pest control
advances pioneered by organic growers.

I'm going to specifically talk about
streptomycin and tetracycline. Fire blight is
a common and very destructive bacterial
disease of apples and pears. The disease is
so named because infected leaves will suddenly
turn brown, appearing as though they have been
scorched by fire.

Pears are very susceptible to fire
blight as well as certain apple varieties such as Braeburn, Pink Lady, Fuji and Gala. Older varieties such as Red Delicious are fairly resistant.

So if fire blight is not controlled, it can lead to the death of a tree, with significant financial loss due to loss of production and need to replace the tree.

Cultural practices can reduce fire blight pressures. Biologicals such as Blight Ban can help reduce fire blight occurrence, but do not completely eliminate the danger. New biologicals are being developed and look promising and may be commercial available within the next few years.

Streptomycin and tetracycline are needed to protect organic tree fruit orchards during severe fire blight outbreaks, especially when there's a lot of moisture. This year is going to be one of those times. We're having a very wet winter.

Over the next few years, viable
alternatives should be available that could eliminate the continued need of these materials in both organic and conventional tree fruit production.

Moving on floating agents, pear floats that are used in post-harvest handling. Pears are heavy and they need a floating agent in order to raise the specific gravity to enable the pears to float. Lignin sulfonate was the preferred floating agent in the mid-90's.

Dr. Eugene Kupferman (ph) conducted a survey of packing sheds in 1997, and found that sheds were using 68 percent lignin sulfonate, 16 percent sodium silicate, and 16 percent sodium sulfate.

In 2005, Organic packing sheds, which is about ten years, were using two-thirds of organic packing sheds were using sodium silicate, and that's due to increased restrictions on the use of lignin sulfonate by waste treatment plants.
The waste treatment plants don't like the lignin sulfonate because it blocks sunlight and decreases the efficacy of the waste water treatment practices.

An alternative to pear floats are packing lines that use floatless dumpers. Floatless dumpers are the standard in Europe, but they're just recently starting to be adopted in the U.S.

But there's a large capital investment. The larger packing sheds can certainly afford that and they're moving in that direction. But there's a lot of smaller organic packing sheds that are going to find it difficult to have the capital to rebuild their packing lines.

So WSDA supports the continued allowance of lignin sulfonate and sodium silicate for floating tree fruit, and also the tetracycline and the streptomycin.

We also support the continued allowance of sodium hypochloride, chlorine
dioxide, horticultural oils for insect and disease control, hydrated lime, hydrogen peroxide for disinfectant and disease control, streptomycin, tetracycline, humic acids, lignin sulfonate and also for livestock the continued listing of hydrated lime.

We also support the NOP to enforce the pasture standard. I don't like the 30 percent DMI 120-day requirement. I think there's other ways to get the to enforce the access to pasture, that a pasture-based management for livestock. So thank you.

CHAIRMAN O'RELL: Andrea?

MEMBER CAROE: Miles, how would it affect your growers in Washington if sodium silicate was retained, but lignin sulfonate was not?

MR. McEVOY: They'd probably all switch to sodium silicate.

MEMBER CAROE: But there's no reason why they wouldn't be able --

MR. McEVOY: They prefer the lignin
sulfonate, from what I understand. But because of the waste treatment plants that don't like it, so they've been shifting over to sodium silicate.

MEMBER CAROE: So environmentally, there would be a preference if they switched over? I mean you're saying there's a water quality issue with lignin sulfonate?

MR. McEVOY: It's not -- apparently the waste, as I understand it, the waste treatment plants, it's not a water quality thing, but it affects the biological activity in the waste treatment plans, because it blocks the sunlight.

So in those packing sheds that release their water to a municipality, to a municipal waste treatment plant, they're required not to use lignin sulfonate. So they have to use alternatives like sodium silicate.

MEMBER ENGELBERT: What is the end result then of, in those treatment plants, of using that?
MR. McEVOY: What's the end result of sodium silicate?

MEMBER ENGELBERT: No, the one that's blocking out --

MR. McEVOY: The lignin sulfonate?

MEMBER ENGELBERT: Yes.

MR. McEVOY: Well, they used to accept lignin sulfonate, as I understand it. But it decreased the biological activity. So now they're restricting the -- what happened to the lignin sulfonate? I don't --

MEMBER ENGELBERT: The decrease in biological activity resulted in?

MR. McEVOY: Less efficient process in their water treatment, Because it would block the sunlight to increase the biological activity that they wanted, in terms of treating the water.

MEMBER OSTIGUY: Basically what happens is in the secondary treatment, the use of microorganisms to extract the nutrients out of the water.
If you have sunlight being blocked, then that extraction of the nutrients out of the water is not occurring. So you end up with more nutrients in your effluent that's eventually dumped into your stream, which obviously is -- produces algae and grasses.

MEMBER ENGELBERT: That's what I wanted to make sure of.

MEMBER SMILLIE: Could you give us some sort of -- your projection, your best guesstimate of how many years you think that we need to rely on streptomycin and tetracycline? What's it look like? Do people realize there's pressure on those?

MR. McEVOY: Yes. It's both the conventional and organic growers that are trying to find alternatives, because for export markets, there's some restrictions on the use of Microshield in particular.

So growers only use it when they have to use it, and that's when they're going to lose their orchard. There's a lot of
things you can do. Even if you have a little bit of fire blight, you can go in with cultural practices and cut it out.

You can use Blight Ban, which is a competitive inhibitor, and apparently there's a new competitive inhibitor that goes into the infection sites of the -- where the fire blight organism attacks the blossom in the tree, and that one's supposed to be very effective. There were some very good results last year. How many years --

I think there's going to be a commercial product available next year.

MEMBER SMILLIE: Will it be acceptable for use in organic?

MR. McEVOY: It should be, yes. They're formulating it so it's supposedly -- it hasn't been registered with Armory or WSDA, but apparently that's what they're aiming for.

It's a biological, and they would want to get it registered for use in organics.

MEMBER SMILLIE: Do you think it
would be fair to organic growers to say in five years there will be a phase-out of the use of streptomycin? I realize it depends on the results of these tests, but if --

MR. McEVOY: Right. The initial research trials look good. On a broad scale, to see how it works, we'll see over the next few years on how effective it is.

There's a lot of pressure to find an alternative, not just from the organic community but also from other buyers, yes.

CHAIRMAN O'RELL: Hugh?

MEMBER KARREMAN: Joe got my question. Thanks.

CHAIRMAN O'RELL: Bea?

MEMBER JAMES: So what I hear you saying is both the conventional and the organic farmers are using streptomycin and tetracycline?

MR. McEVOY: Yeah. I think it's the oxytetracycline that they use primarily. Microshield is the material.
MEMBER JAMES: Okay. Did you submit your comments in writing?

MR. McEVOY: Yeah.

MEMBER DAVIS: So the material that you reference that's being tested, I gather that it would be at the university level of research at this point. So we can't say that it's on the market now?

MR. McEVOY: No. It's not on the market now. It hasn't been EPA-registered. They're working on the registration, as I understand it, and they're hoping to have a commercially available product for distribution next year.

There's actually a few products that are being worked on. The one that everybody's talking about, of being the most efficacious, is Blossom something, Blossom Ban, something like that.

MEMBER JAMES: So both the commercial and the organic farms would use this alternative? I'm sorry.
MEMBER DAVIS: Conventional.

MEMBER JAMES: At retail, we say.

MR. McEVOY: Yes. The conventional farms also do not want to use Microshield or the tetracycline or the streptomycin. They would prefer not to.

They would prefer to use a biological, because the whole tree fruit industry in the Northwest is moving to an integrated approach, using biologicals as much as possible, so that you don't disrupt the system.

The streptomycin and the tetracycline are going to disrupt the system, moreso than a biological, which is a competitive inhibitor at the -- in the orchard.

MEMBER JAMES: However, there's no way to -- or, I should ask. Would there be a way, if these antibiotics were prohibited in organic production, and an alternative came about, would there be a way to enforce that
with the commercial or conventional apple farms or no?

MR. McEVOY: No, no. If it's a registered pesticide, then they can use it as per label directions, and it's their choice. But they're going to usually make the choice that's best for their operation.

CHAIRMAN O'RELL: Rigo.

MEMBER DELGADO: Yes. The testing of these new materials, you said it's still at the research level. Have they done any commercial level testing? In other words, I'm trying to get a feel of what the risk is of not coming with a new product in the next two or three years?

MR. McEVOY: I think there's a lot of risk. There's a lot of people that are very excited about the research trials. I don't know the details of those research trials, but they were on a more of -- they were research trials on a commercial basis, on experimental use permits.
They're not -- they're beyond the university level. They're beyond the lab level or the university research plots. They have been tested on a few commercial orchards. Not organic orchards, but commercial orchards.

CHAIRMAN O'RELL: Hugh?

MEMBER KARREMAN: I have a hard time wrapping my arms around using the antibiotics in the crops, because of the prohibitions in other places in the program.

MR. McEVOY: Right.

MEMBER KARREMAN: I'm just wondering do you know the research, how it's going yourself, or you just know it's happening?

MR. McEVOY: I know it's happening. I'm not intimately familiar with it, no.

MEMBER KARREMAN: Well, one of the things I always think about when I'm studying natural treatments for dairy cows and what-not, like the parasites, you know, you have to kind of hit them in various stages of the life
cycle, you know.

   It's not just like input substitution, because if you start getting more foundation pillar effect, a multi-prong approach to the problem, what a professor might want to see is a total 100 percent equivalent compared to the streptomycin or tetracycline that's out there, whereas maybe in a product that doesn't need to be 100 percent equivalency but maybe 75 percent or something like that, it still might work with other biological management in place. Do you understand what I'm saying?

   Because someone might say in a paper "This new research product we're working on is just not as good. Sorry, we need the streptomycin and tetracycline still."

   MR. McEVOY: Yes.

   MEMBER KARREMAN: But hopefully they're taking into account other management factors with that biological. So it's not just plain input substitution.
MR. McEVOY: Yes, and I think the organic growers are doing that at the current time. A lot of them choose not to use Microshield. For instance, if you use the antibiotic, the tetracycline, you lose your access to the European market because it's not allowed under European standards.

So the organic growers have a lot of pressure to not use the material, and for conventional growers, it's the same. It's an expensive material. If you can use -- there's already a biological on the market.

If you use cultural practices, which are both cleaning out any of the fire blight that occurs in the orchard, and also having an open orchard, appropriate pruning to keep the air flow, you can use wind machines to help with the air flow.

You can do a lot of things to try to minimize the amount of fire blight that you have. But if it gets to be that you're having a lot of flagging, a lot of occurrence, and
you're going to choose between losing your orchard or treating, then the grower, organic grower or conventional grower is going to go in there and use the Microshield.

MEMBER DAVIS: Well, you referenced the organic growers that are trying to pursue the European market, where the antibiotics are not allowed on fruit.

MR. McEVOY: Right.

MEMBER DAVIS: How long of a history are you familiar with, with how they're doing in their control measures on blight, using -- totally not using the antibiotics? Have they been doing this very long or is this new?

MR. McEVOY: It's going to depend on your location, because there's areas of our state that are wetter than others, and so those wetter areas are going to have higher fire blight pressure.

It's going to depend on your isolation from other orchards. But they're certainly orchards that have never used
tetracycline to protect them from fire blight.
So it's -- and there's others that use it occasionally.

I don't know, you know, we'd have to do some background checks, but I doubt there's organic orchards that use it year after year after year. It's only when the fire blight pressure is extreme, and you have the choice between losing your orchard or losing a bunch of trees and saving your crop.

MEMBER DAVIS: So are you familiar with growers who have been participating in a program that allows them to market to the EU with their fruit, and not using it for long periods of time?

MR. McEVOY: Right, and then I'm also familiar with growers that have been in the EU program for many years, and last year was also a heavy fire blight pressure year, and they had to take some of the blocks out of the program because of fire blight pressure.

MEMBER DAVIS: Thank you.
CHAIRMAN O'RELL: Thank you.

MR. McEVOY: Okay, thanks.

CHAIRMAN O'RELL: Steffen Scheide.

I'm sure I got that wrong, and Dave Carter's on deck.

MR. SCHEIDE: Hi. Good afternoon. Thank you for this opportunity to speaking before you this afternoon. I'm Steffen Scheide. I'm affiliated with Summit Hill Flavors, an organic certified manufacturer of flavoring.

This afternoon, I'd like to speak out for colors, and I urge this board to retain colors exactly the way they are under 205.605(a). The reason is the interrelationship between FDA and USDA rules and regulations.

Colors are regulated by the FDA. The reason for colors being regulated and defined by the FDA is because of their functionality in food; in other words, any material whose significant function in food
ingredient is color in that food is a color.

Now I'm a product developer, and when I take non-organic-certified colors in my practice development, organic caramel color has become available recently. If it had not been for 605(a), that product would not have ever been in the marketplace.

Organic turmeric is a colorant. It is a 100 percent organic color. But here is my dilemma. With the exception of meat and egg products, the vast majority of food products in the marketplace are FDA-regulated.

Henceforth, I am using a colorant, because I use turmeric as a color. However, if there is no congruency between the NOP and FDA rules and regulations, because the NOP is a positive list for me; if it is not expressly on that list, the FDA tells me turmeric is a color. The NOP tells me I cannot use colorants. Henceforth, I cannot use turmeric in organic products.

That is really why it should remain
under 205.605(a). Now I know it may sound complex, but I'd like to give you an example of where FDA and what we do in agriculture is a little bit different.

Let us take a look at coffee. Coffee is an agricultural product, but it is not a food because green coffee is not fit and suitable for human consumption.

It is a process of physical change through roasting which changes a green coffee bean into a raw material, which I then grind and I actually extract it.

Those of us who have had coffee this morning have had a food ingredient or a beverage. However, if you spill that coffee on your shirt and you eat your shirt, you're eating a food color.

If that coffee had become cold and I put it into a teramusu (ph), its primary function is flavoring, and I am actually consuming a flavor. The same item under FDA has three purposes.
Now you see why there is a lot of confusion, but I think there's a lot of understanding of what these ingredients are, because the FDA has definitions of these products.

So again, thank you for this time, and I strongly urge you to keep colors on the national list. Thank you.

CHAIRMAN O'RELL: I have a question for you. I must be slow here today. You're going to have to this one by me. Tumeric, which would be considered a color additive in a food product, you can't add that because of the NOP regulations --

MR. SCHEIDE: If you remove it. The NOP defines color and the FDA defines color. In other words, in food products I am allowed to use colors, non-synthetic, as they appear on --

CHAIRMAN O'RELL: Color additives.

MR. SCHEIDE: Exactly, and organic tumeric is exactly that, because in FDA food
products, the FDA determines that tumeric is a color. Is that understandable? The usage basis of colors in organic certified foods is FDA, because FDA regulates the overall food product.

CHAIRMAN O'RELL: It allows you to use tumeric in an organic product?

MR. SCHEIDE: Yes, exactly. In FDA products, but that are also organically certified. Absolutely.

CHAIRMAN O'RELL: Okay. So if you have organic tumeric, you can use it in, let's say, egg nog?

MR. SCHEIDE: Yeah, because of the way the regulations read right now.

CHAIRMAN O'RELL: Right. So there's not a problem?

MR. SCHEIDE: Yes.

CHAIRMAN O'RELL: Okay.

MEMBER SMILLIE: Unless you change the regulations.

CHAIRMAN O'RELL: Excuse me?
MEMBER SMILLIE: Unless it's taken off --

MR. SCHEIDE: Yes, unless it's taken off. Then NOP tells me --

CHAIRMAN O'RELL: Well, if it's taken off, then all colors, color additives cannot be used in organic products unless you would petition for the use specifically of turmeric or if it was available organically, an agricultural product available organically.

MR. SCHEIDE: And you'd almost have to make an annotation as you're saying "turmeric" as a spice and as a colorant.

CHAIRMAN O'RELL: Okay. Thank you. Dave. Rick Segalla is next, on deck.

MR. CARTER: Dave Carter, National Bison Association, National Pet Nutrition, itinerant consultant and NOSB survivor. First of all, congratulations to the new appointees. You've got a wonderful and frustrating five years ahead of you, and I think you'll enjoy the experience.
I apologize for not being at the orientation the other day like the other former members. Some of us were under the impression that this was just for the new members. So I'm going to impart a few things here towards the end.

I also want to recognize Valerie Francis. I think one of the things as we left the board, having the new executive director come on is a great step forward for not only the NOSB but for the organic program.

And I also want to congratulate Mark Bradley and the NOP for the new spirit of collaboration and engagement with the NOSB. Plus it's kind of fun to deal with a guy that looks a lot like Billy Bob Thornton.

(Laughter.)

MR. CARTER: Now, just a couple of specific comments on some of the materials.

CHAIRMAN O'RELL: Was that derogatory?

MR. CARTER: Not at all, not at all.
On the items this morning, first of all, I really appreciate the depth in which you're trying to sort through the streptomycin and tetracycline issue. I think there are a number of reasons to be concerned.

I would caution you though, not to aim all your ammunition at the antibiotic issue, because not only as Arthur said does OFPA relegate antibiotics to livestock; the rule as well compartmentalizes it there.

So it's not really a valid issue to use in terms of crops, although there are a lot of concerns about that. Ivermectin, I would like to see it disappear from the list.

I think there are other alternatives that are coming about and I would encourage you to keep your eye on the whole issue of parasiticides, because I think there's some developments there that will continue to make improvement.

Now let me just -- I have about six things from a 30,000 foot view, that there are things I'd like to say that there are items I
wished I would have remembered to remember when I was on the board, on just some general guidance from an old geezer.

Number one is remember, and this is for the new board members particularly, remember that organics is about organics. We like to get involved in discussion about scale. Myself, I tend to be a big advocate of small farms.

But when it comes to interpreting a federal regulation, you determine the organic regulations based upon organics. You neither to raise the bar to try and prevent big producers from coming in, nor lower it to try and make it easier for them to come in.

Secondly, I would not hesitate -- I want to encourage the new board members -- do not hesitate to be an activist board. The organic community is best served when there's a healthy tension between the NOP and the NOSB.

It's not a tension about
personalities; it's a tension about the issue and working together to try and solve problems and bring different perspectives.

Third, if you have to make a choice of where to invest your time, invest your time at the committee level. The more work you do in your committees to really dissect things through, is less time that you have to spend doing committee work at the board level.

I would encourage you to trust your committees when they bring those things forward that they have done that work, and to rely on their judgment.

Use the board policy manual. It's a good tool, and make sure that you not only use it, but you continue to work on it and improve it, and use the past board members and their expertise. All of us are willing and able and very eager to work with you.

Then finally the last two things is that number one, if you have to say something very controversial, do your best to try and
create a diversion ahead of time to get Dennis Blank out of the room.

(Laughter.)

MR. CARTER: And then finally, and you may want to take a pen and write this one down. This is a very important guidance, is that any time before you get on a conference call, make sure you understand how the mute button works on your telephone.

(Laughter; applause.)

CHAIRMAN O'RELL: Yes. We will always remember that, Dave. Thank you. Rick Segalla and Adam Eidinger.

MR. SEGALLA: My name's Rick Segalla. I'm an organic farmer from Connecticut. My words today are on the last third of gestation rule. I think that's very important.

The other, after having discussion on this 30 percent of pasture and 120 days, I still believe we need that because there's talk about putting a number of acres per cow.
Well, that rewards some and takes away from others, because it's not fair to the guy that's really trying to produce a good organic pasture by keeping his cows out there and improving his soil in that manner, where he can put four or five cows to the acre on there and obtain that 30 percent dry matter, where another guy puts two cows to the acre out there, only because that's the acre requirement and feeds them in the barn and does nothing to improve the soils.

It has to be the 30 percent. If you put just a number of acres out there, it isn't going to work because there are guys out there that can put four cows to the acre and obtain that 30 percent.

But there are guys out there that don't have the right quality land to put four cows an acre out there, and they might not even get that kind of return on a cow to the acre.

If the farm's in the wrong place,
they're going to have to size it to what they have. I feel that's the only way that it would be fair, and we have Lisa McCrory and Sarah Flack, who have given you examples of how they do it. Sarah said she'd be glad to go help certifiers learn how to do it, and I'm sure Lisa would too.

It's being done in the Northeast, and it can be done any place else in the country. Thank you.

MEMBER JAMES: I just want to compliment you. Although we like to have written submission, I'm just impressed you always come up and you just speak without any paper in front of you.

MR. SEGALLA: I can't read when I'm nervous.

(Laughter.)

CHAIRMAN O'RELL: Adam and Dave Engel.

MR. EIDINGER: Good afternoon. My name is Adam Eidinger. I'm the Washington
representative for the Organic Consumers Association.

It's very nice to be here today, and I apologize that our group was not here earlier this week. We would have liked to have been, but we had some major scheduling problems.

Today, I'm going to present a petition that is our comment on behalf of our members. It was signed by over 17,500 people on line. I have a CD-ROM here with a printout of the petition and all the names and addresses of everyone who's signed it, from all 50 states.

The petition reads as follows: "We, the undersigned organic consumers, are shocked and outraged that so-called organic factory farm feedlot dairies are importing milk calves from conventional farms and then raising these animals in crowded, inhumane conditions, with little or no access to pasture, and then labeling the milk and dairy products produced..."
on these feed lots as `USDA Organic.'

"We call on the National Organic Program of the USDA to put an end to these practices immediately. We also ask the USDA to call on Congress to allocate adequate funds to help thousands of American farmers and ranchers make the transition to organic, so we can meet the nation's growing demand for organic foods, without lowering organic standards or importing billions of dollars in organic products unnecessarily from overseas."

I realize the chair asked that we comment on some of the topics discussed earlier today. I don't have a comment on everything, but I do want to mention just a couple of things that we've been very concerned about, and were concerned about earlier this year.

This NOSB panel is -- can always call on the Organic Consumers Association to participate in any discussions you have at these meetings. We'd very much like to be
part of the official discussion that takes place.

Consumer groups need to be part of the process, and I realize we're not industry players, but we are talking to consumers all the time and we're getting a lot of feedback from consumers.

Pasture is an important issue, contrary to much that was presented on the panel yesterday, and I got the report on that. This is an important issue. It can't be put aside. Antibiotics, that's an important issue too. We saw the survey.

But we're hearing that pasture is very important, and there are 17,500 plus people on this database who think it's important, and we want that to be emphasized.

We also don't think that industry consultants should be sitting on this board in the seats that are reserved for consumer or public interest groups. We'd very much like to see the vacancy that's currently open.
filled with a true consumer representative.

I'm not saying that we haven't had — all of the representatives haven't been from consumer groups, but obviously we know about the resignation that happened, which we were pleased by that.

So that's about it. As far as, I guess, as far as some of these sunetted synthetics, you know, I'd be happy to try to answer our position on them if you're interested, but I did not come prepared to give the line by line answer on each one. Do you have any questions?

CHAIRMAN O'RELL: Thank you.

MR. EIDINGER: Thank you.

CHAIRMAN O'RELL: Dave Engel. On deck, Lisa Engelbert.

MR. ENGEL: Good afternoon. My name is David Engel. I'm a certified organic dairy farmer since 1988, and an organic certification agency representative since 1989.
I have three things I'd like to cover, one to the board and then two to the NOP. To the board on the sunset materials, if I were you, I would tend to allow all sunset materials to come back on, unless very clearly, unambiguously, unequivocally, there are a unanimous effort to do it otherwise.

I really appreciated Andrea's common sense and reasonable approach to handling sunset materials. They've already been through a very rigorous process to get there to begin with, and you guys, I think, are doing a good job.

Then to the NOP, since it is my understanding that both the last third and the pasture issue are something that the NOP will be dealing with, rather than look in your direction I'm going to look this way and speak into the mike. But these are directed to you.

So these comments on organic livestock standards are addressed primarily to the NOP, as they are about access to pasture,
which the NOP will be working on soon, and the
last third, very simply, I think it needs to
be.

If not, if the NOP is not inclined, then I would suggest that they consider commercial availability, the commercial availability mechanism in the last third issue.

So with all due respect to my fellow dairy farmers, many but not all of whom want stricter pasture standards, and with all due respect to my fellow certifiers, many but perhaps not all, of whom appear to feel inadequately empowered to enforce the current standards regarding pasture, I believe current pasture standards provide extremely adequate recourse and ability, empowerment if you will, to verify compliance of an organic livestock operator with ruminants, as regards access to pasture.

I'm going to emphasize some of these words continuously through here. A certifier
does not have to look for ducks, does not have
to listen for ducks, and does not have to even
talk with ducks to accomplish this
verification of compliance.

The pasture standard states the
producer of an organic livestock operation
must establish and maintain livestock living
conditions, including access to pasture for
ruminants. "Must" means has to, is required
to, very simple and legally significant.

Access means the ruminant is able to
go somewhere, and pasture is where the critter
goes. Means, according to the legal
definition in the rule, land use for livestock
grazing that is managed -- emphasis added --
to provide feed value and maintain or improve
soil, water and vegetative resources.

Thus, when an organic inspector goes
to a ruminant livestock farm, there must be
access to pasture, based on those three words
and what I just said. If there are ducks,
you're great and hopefully the milk inspector
won't see them, or if he/she does, they won't be bothered by them.

However, if the organic inspector does not see access to pasture, then that will have to be documented, and the certifier will have to consider that documentation.

The current pasture standard provides the certifier with the ability to determine not only the compliance with access to pasture for a ruminants requirement, but also the ability to determine the amount of pasture needed in that operation.

The words in the pasture definition and remember, ruminants must have access to pasture, state that the pasture is land that is managed, and again I emphasize that word, to provide feed value and maintain or improve soil, water and vegetative resources.

"To manage" reflects and is management, the sum and substance of the organic system plan. George's comments this morning were extremely well-put. Just as one
manages many things on a farm, cow comfort, health, feeding and milking schedules and so on, on an ongoing basis, so too is pasture to be managed on an ongoing basis.

There will be situations where the amount of pasture is not enough, and this must be worked out between the certifier and the operator on a continuous improvement basis, just as many other management requirements and recommendations are handled between a certifier and operator; for example, recordkeeping, machinery maintenance, buffers, facilities, crop rotations, organic seed compliance and so on.

In sum, large or small herds with or without sufficient pasture management in place are required to have sufficient management, pasture management in place, and all herd must be brought to that point on a continuous improvement basis, in a reasonable and mutually-agreed upon time frame, that the certifier and operator determine via the
organic system plan.

To paraphrase, and I have just one line left.

CHAIRMAN O'RELL: You can finish your thought.

MR. ENGEL: To paraphrase a great song sung by many great singers, Johnny Cash, etcetera, Merle Haggard, "And if that ain't access to country pasture, I'll kiss my" -- and I don't remember that last word in the song.

(Laughter.)

CHAIRMAN O'RELL: Thank you, Dave.

MEMBER KARREMAN: Dave, just a question. Thank you. I thought you were going to break into a song again like you did a few years ago, the whole thing. So then what's the problem right now? I mean, you know, we hear there's some loopholes that are not being enforced by certain certifiers.

And as I mentioned yesterday, I mean some people in the industry like yourself say
there is, you know, pasture is described and it's there as it is. But then why are we having the problems as we are, and why did we have this wonderful symposium that we did?

MR. ENGEL: Well, I'll just address the first part. The problems stem from the certifier not interpreting the rule, and working at applying it correctly.

MEMBER KARREMAN: Do you have any specific spots, perhaps in the rule, that certifiers are very good at --

MR. ENGEL: No. I just, I read very specifically. I quoted the words. Those words that the certifier has to apply correctly, and that will take care of scale, you know, all herds, amount of pasture that they do or do not have, a certifier can figure it out via the farm plan.

MEMBER KARREMAN: I just think it needs some more teeth, such as the exemption for stage of production.

That seems to be what people think
is a loophole right now, and actually the term access to pasture is kind of passive and "shall graze" would give a more firm meaning, wouldn't it?

    MR. ENGEL: You know, I don't really care. I mean my mother was an English major, and she taught me to know all that stuff too. But passive, active the words are there.

    There is some legal teeth in at least two of them. There's a definition "must." Those two things have legal teeth in them, and if a certifier can't handle it then they just don't know ducks.

    MEMBER SMILLIE: Dave, what state are you from?

    MR. ENGEL: Pardon?

    MEMBER SMILLIE: What state do you dairy in?

    MR. ENGEL: Wisconsin.

    MEMBER SMILLIE: Wisconsin.

    CHAIRMAN O'RELL: Thank you, Dave. Lisa, and I think this last name, I'm having a
hard time reading it, Scott Williams, it could
from -- well.

MEMBER OSTIGUY: McManus?

CHAIRMAN O'RELL: No. From USDA
Office of Budget and Program something.

MEMBER KARREMAN: OMB?

CHAIRMAN O'RELL: No. It's not OMB.

It's another -- okay. Lisa.

MS. ENGELBERT: Good afternoon. My
name's Lisa Engelbert. I'm am co-
administrator with NOFA New York certified
organic in Binghamton, New York. I work
primarily with the dairy farms in our
organization. We're currently certifying 120
dairy farms and we've got well, last count, 25
more in transition. That seems to change
every day.

I'd like to first thank the NOSB and
the NOP for the incredible amount of time that
you put into this program. I'm kind of seeing
firsthand how much that really is. Thank you.

(Laughter.)
MS. ENGELBERT: Organic certification is a privilege, not a right. It has to be earned. A producer that wants to get their farm certified organic needs to bring their operation into compliance with the rule, not try to get the rule changed or interpreted to fit their farm. We need to all remember that.

I would like to reiterate NOFA New York support for the proposed pasture policy, of a minimum of 120 days and 30 percent dry matter. I'm not going to beat it to death. We've all heard it. We all know what everyone said.

Public testimony has shown, excuse me, over the last two days that the vast majority of farms of all sizes all across the country agree that we need definitive pasture standards. We'll never reach 100 percent consensus on this or any other issue. But the majority of the farms in the country do agree with this.
We agree with Jim Riddle's comments yesterday about conducting an inspection at the beginning of the one-year herd transition, to verify field status, feed on the farm, and animal health care practices.

We are currently doing that at NOFA New York. We have -- we work with our producers in transition for the entire year. They apply at the beginning of transition.

They have an inspection and review at the beginning, within the first three or four months of transition, depending on weather situations, and then they have a second.

They update their information and they have a second inspection and review in about the last 90 days. So it works really well, and it identifies problems at the beginning, not at the end.

We fully support the last third of gestation, once the farm's made the transition to organic production and has become
certified.

It needs to be clarified that this is a one-time distinct whole herd conversion, and it is a one-time opportunity for conventional dairy farm to transition their herd to organic production.

It's clearly not the intent of the rule to allow a continual state of transition. Continual transition of animals for 12 months prior to producing organic milk will allow animals that have been treated with a prohibited substance, fed GMO feed and slaughter byproducts.

We do see them in feed rations coming in, with these new dairies coming in, for the first half of their life, to enter the organic system. Think of what will happen if an organic cow tests positive for mad cow down the road. The implications could be huge.

I would like to comment on tetracycline and streptomycin in crop production. I should say I'm putting my
consumer hat on now, not certifier hat. We eat 90 to 95 percent organic food in our household. If we can find an organic, we buy it.

I think if organic consumers knew that antibiotics were being used on fruit or on crops, I think they'd likely change their buying habits. If substances like these continue to be allowed, what true incentive do growers and manufacturers have to develop effective alternatives.

Milk replacer. We agree with removing it from the national list. We had a Yoni situation on a farm, I think it was three years ago. We actually talked to the NOP, because they couldn't locate and we couldn't locate any non-BST (ph) milk replacer.

The NOP said "Well, because of the annotation, it can't be allowed," so we went back and said Sorry. They bought a pasteurizer. This is a bigger farm. This is the biggest farm we certified. This isn't a
little ten-cow dairy. This is a 350-cow operation.

Pasteurized all of their milk, and they have Yonis under control on their farm. They're going a really good job.

Oxytocin, if this is kept on the list, there needs to be clear annotation that it has to be administered by a licensed vet. I think there really is some abuse going on with this product out in the field, the way it's annotated right now.

Lastly, I would like to encourage the NOP to start prosecuting and imposing fines on farms found to be in willful violation and subsequently revoked. A clear message needs to be sent to the organic community, that blatant, willful violations will not be tolerated.

A five-year revocation is not enough. Thank you.

CHAIRMAN O'RELL: Thank you.

MEMBER CAROE: Just a quick question
for you, Lisa. Do you require all of your producers to participate in a transition inspection, as well as their certification inspection?

    MS. ENGELBERT: We do. That's the way we handle our transition program.

    MEMBER CAROE: And what has the accreditation folks said during your accreditation visits, since that's not a requirement of the --

    MS. ENGELBERT: They said that that is not part of certification. That's our own internal policy and it's fine. We're ISO-65 accredited. We're looked at every year.

    MEMBER CAROE: Right, I know the ISO 65. But I mean I'm referring to the accreditation under the program. So nobody's had any problem with you hiring an extra -- something beyond the regulation.

    MS. ENGELBERT: Well, we don't feel it's beyond the regulation, because we're working with the producer for the entire year.
They're required to transition for a year, and we're verifying their practices at the beginning of the year, which I think should be required across the board.

MEMBER KARREMAN: On that, just --

CHAIRMAN O'RELL: Bea was next.

MEMBER KARREMAN: Okay.

MEMBER JAMES: Thank you for your comments, and for your patience as you endure two second halves term. I'm just going to make kind of a statement, opinion, and then I wanted to ask you a question.

You know, some branches of protection have mottos such as to protect and to serve, and I know that certifiers are not officers, but I do believe that it is their job to reinforce the rules, make sure people are following the rules to inspect and ensure, and just like I asked Jim Riddle, I'm just perplexed at how some farms could be given an organic certificate if they're not following the organic regulations, and I wanted to ask
your opinion on that.

MS. ENGELBERT: I agree wholeheartedly with you. I don't really understand how that's happening. I agree with Dave that the current rules should be enough. I mean, the majority of the certifiers in the country are doing it.

Unfortunately, obviously it's not enough, because there are abuses occurring, and I think because of those abuses, we do need descriptive pasture standards, unfortunately.

CHAIRMAN O'RELL: Hugh?

MEMBER KARREMAN: Just a follow-up to what Andrea was saying, or I should say that I think PCO does the same thing NOFA New York does. No? Leslie? Because I thought there's like a pre-inspection, and I just want to say it does really help the farmers.

It really kicks them into gear, starting them thinking about things before it is too late. So it is a very good thing. I
would agree with that, and I hope it gets instituted.

MS. ENGELBERT: It allows any potential non-compliances to be noticed right up front, you know.

If you wait until the last four or five or three or four months of transition to do an inspection and look at their paper work and look everything over and go on their farm, if there's a major non-compliance there that didn't show up prior to that, that farmer's really in deep trouble. They've lost a lot of -- yeah, I had to think about that word.

(Laughter.)

MS. ENGELBERT: I do live on a farm, after all. But they may have lost, you know, three quarters of a year at that point if you don't do that, you know.

MEMBER KARREMAN: I've seen that happen.

MS. ENGELBERT: Yeah. I've heard horror stories about that happening. So
anyone else? Thank you very much.

    CHAIRMAN O'RELL: Thank you. I'm going to try it again. Scott Williams? Is that -- from the USDA? If there is nobody there, we will go on. David DeCou, and last, Brian Baker.

    MR. DECOU: I'm speaking for Brian Baker. He just blew away.

    CHAIRMAN O'RELL: Then you are last.

    Do you have a proxy then?

    Thank you guys for all that you do. You've been thanked many times, but it won't be enough. You know, I've been in the organic industry for way too long, but not long enough.

    And, you know, the work you do, now that I've stumbled into Armory over the years, the work that you do is -- I know how
complicated it is, because we end up having to try to figure some of it out later too.

Brian put a question out to me about colors, because they were talked about earlier, and he noted that one of you, and I don't remember who, mentioned that some colors are both non-synthetic and non-agricultural. He was wondering if anybody could identify any colors that are both non-synthetic and non-agricultural?

And I can't. You know, I think the point is that colors pretty much are agricultural, but --

MEMBER OSTIGUY: Well, you're not doing --

CHAIRMAN O'RELL: Julie?

MEMBER WEISMAN: It is not my area of expertise, contrary to -- I don't do colors. But I'm sorry. It's not -- colors are not my business, but I do know that some colors are mineral, which would make them non-agricultural and non-synthetic.
I think also some of the comments that Tony Moore made about the non-agricultural and non-synthetic ingredients in flavors, non-synthetic.

He was specifically -- he was talking about what we sometimes refer to as natural aromatics or natural aroma chemicals. We don't like to use the word "chemicals," but that is what they are.

I think that colors also include those types -- colors, non-synthetic do include those types of substances.

MR. DeCOU: As I said, it was a question from Brian and I hope he hears what you said.

MEMBER WEISMAN: I'll tell him.

MR. DeCOU: Brian also expressed a concern that with the evidence that this sunset process, a major significant part of it is a concern about economic effect of any possible change to the list.

He wanted to point out a
consideration that is not always brought up, but that a continued listing of colors in 605 is a dis-economic incentive for producers of organic crops that might be used for colors. So there's an economic effect in another direction that is often not remembered.

As a former organic farmer, I used to grow beets, and even in the early to mid-90's, I know some of them were dried and sold for coloring. Exactly how after they were dried, they left my purview and I don't really know.

Another point, and this is a personal statement, not from Armory but myself, but as a 20-year organic farmer, it always strikes me, and I just have to say this; I don't quite understand it. It always strikes me as surprising that the handling sector --

I guess the picture is an organic farmer does the best they can to produce the best food they can, the cleanest food they
can, in the manner they can.

It always strikes me as important that the handling sector and on through keeps it clean, doesn't add anything to it, and it always -- when I start hearing some of the terminology of flavors and other things, colors, I can't help but wonder, you know, it's not where we started.

I can't -- I don't know how to grapple with that. I understand how the industry has evolved, but I think we always need to take that perspective back, and how are we nurturing the whole system to keep it as what it originally was. It doesn't address any particular product, but it's one of those concerns.

I just get -- somehow it gets lost in the "making the industry grow" question, and I think that's one we shouldn't ever forget. You know, it all comes off the farms. Without the farms, there's nothing.

I've heard over and over again a
concern about antibiotics in crops. I've also
heard people -- Julie mentioned aromatic
chemicals, as if "uh-oh, I used the word
`chemical.'"

This terminology -- both the
terminology and the concept of what actually
happens on the farm, the vast majority of the
population doesn't know what goes on on farms,
would be shocked about a lot of things that
are regularly done on farms, that aren't
really bad; they're just surprising.

I think it's a little scary to hear
people trying to make decisions about what
might be happening on a farm from that
perspective, when they don't really know
what's going on. Because they've been
protected from the world of agriculture most
of their lives, they won't understand why.

It's just very difficult as a former
farmer, one with a bad back, that those kinds
of thought processes might make a difference
in how your decisions are made, because it's
important decisions that affect a lot of people. Thank you for all you do.

(Applause.)

CHAIRMAN O'RELL: Thank you, Dave. I think there's a question, Dave, before you--

MEMBER JAMES: I appreciate your comments. Can you please explain to me--I've not been a farmer--how tetracycline and streptomycin in crops is okay?

MR. DeCOU: I guess the question for me is why is it not okay? At some point, it's a very hard issue. There's a reason why that there's no organic pears or essentially no organic pears grown on the East Coast or the Midwest, because of the climate.

So basically, you push everything to an edge and you just push it off. If you eliminate this tool, within a few years there would probably be no organic pears, period. That's acceptable or not.

I don't know how--it's one of
those things that sulphur is a widely-used fungicide. It's pretty nasty stuff. It's not fun to use. I've used plenty of it in growing tree fruit for about seven years at one point.

You know, if you took it out to the consumer and showed it to them, they wouldn't want to ever know it was on their food. You know, I don't know what the damage to the system is of using it or not, and that's where it kind of gets really complicated, because as Miles was pointing out, in WSDA they're trying to go to --

Not in WSDA but in Washington, all fruit growers are going to a very integrated system, trying to minimize -- tweak their system so it protects itself, which -- instead of doing drastic interventions.

That's why they don't want to use tetracycline or whatever. But I don't know how you make that judgment. It's very, very difficult.
MEMBER JAMES: Has there -- do you know of any long-term studies that have been done to prove that those two applications are safe?

MR. DeCOU: I don't know. I can use the sarcastic comment "That's what you've been eating for a long time." But that's a sarcastic comment. But I don't have any -- I don't know of any long-term scientific studies, no.

CHAIRMAN O'RELL: Arthur?

MR. NEAL: This is more of a comment as you consider what you're going to do about the streptomycin and the tetracycline.

There are three comments that you have to consider. How does this substance -- a previous board said that this meets the OFPA criteria. Now we have to consider how does this violate the OFPA criteria?

If we're saying this no longer is consistent with organic principles and practices, then that will be the case for the
next five years for any material that could resemble any type of activity those materials exhibit.

MR. DeCOU: If somebody petitioned it, if it was removed, it would be off for five years. They couldn't be petitioned in the meantime?

MR. NEAL: What I'm saying is that if this board, through the sunset process, says that we're not going to renew it, there's got to be a justification.

Either it has some type of harmful impact on human health or the environment, it's not consistent with organic principles or practices, or there's some other issues related to the OFPA criteria.

That means that based on that decision, that material comes off the national list -- may come off the national list through rulemaking, and for somebody to petition otherwise, it's going to be hard for this board to say it now meets OFPA criteria, when
they sat it through this sunset process in such a rapid fashion that it does not meet OFPA criteria.

MR. DeCOU: I'd also like to point out on the CDC comment about antibiotics to be considered at this point.

I was struck by something that -- Hugh made a comment about hydrated lime and whether it was used or not, and nobody used it, was sort of sense I got from what he said, and he's obviously an expert in a certain area.

It was quickly acknowledged that it is widely used in there. When the CDC says something, it's a question of how broad or narrow your expertise is at times.

Are they really understanding how it's being used in certain circumstances or not? I don't really know.

MEMBER KARREMAN: Can I just answer that, Dave. The list serve of 1,700 that about 35 answered, I don't know how valid a
survey that is. But you know, that's how it went. I won't get into the results again.

CHAIRMAN O'ReLL: Nancy?

MEMBER OSTIGUY: I think the question of narrow perspective goes both ways.

MR. DeCOU: Oh, I understand that fully, and I know. That's why you get the hard decisions and I get to comment.

MEMBER OSTIGUY: Just in a closing remark, I want to say that I highly respect the work that your organization does, and Organic Materials Review Institute, perhaps the whole issue of antibiotics on crops is something that you could look into, and I would certainly appreciate that research.

MR. DeCOU: I would love to, but we don't do that much research itself. I mean, we research materials that come at us and not ones that we don't have.

That's why we didn't comment on a whole lot of things here, because it's not our purview to make the decisions you have to make.
or influence them, other than around procedural technical issues, which is why we spoke to only two materials.

So it's a little hard for us to grapple with the plus funding, you know. We're a not-for-profit. It means it doesn't have extra money laying around. I would love to look at things if we could, and Brian would like to.

CHAIRMAN O'RELL: Hugh, to wrap this up.

MEMBER KARREMAN: I don't have your generic list in front of me, but do you have any of what you guys consider regulated substances for fire blight on the Armory generic list?

MR. DeCOU: I don't have that in my head. I have a copy back there.

MEMBER KARREMAN: You had a copy or two around here yesterday.

MEMBER OSTIGUY: Hugh, what's your question?
MEMBER KARREMAN: Well, I mean Armory is wonderful for listing of ingredients that are prohibited or not, and they also have like a restricted category. So it's like we're not sure what the NOP thinks about it.

But obviously it's been petitioned to Armory to look at, and usually those substances are, in my opinion from livestock, they're fairly efficacious. Maybe not all the science behind them, but they're in the contention for, you know --

MEMBER KARREMAN: Well, they're in --

CHAIRMAN O'RELL: Hugh.

MR. DeCOU: Their job is just to interpret the regulations.

MEMBER KARREMAN: Right. But they're only brought materials to them, if people want to pay the process to get them reviewed, which is not cheap. So I was just wondering if there's some --

MR. DeCOU: Our restricted or
regulated category is not quite as you identified it. It is a category in which additional concerns have to be met before you use it. Every pesticide that's on there, natural and they're all acceptable on the national list.

But they need to work with their certifier, and make them sure that they've already done all the management options prior to that, and they already know it isn't going to work and they have to use this tool.

They can't just use it as a first stop, and that's often what that "R" stands for, is you can't just step in, and I'm sure you have other things --

CHAIRMAN O'RELL: Yeah. I'm really going to have to cut this off.

MEMBER OSTIGUY: Thank you. I can answer the question very quickly. Both of the materials are on the Armory list that were discussed as substitutes for tetracycline and streptomycin.
CHAIRMAN O'RELL: Thank you, Nancy.

MS. FRANCES: Kevin? Over here, Valerie Frances. There's a woman here that did not make it on the sign-up list, and she is requesting an opportunity to address the board right now, if that would be permitted. Bonnie Wideman? Wideman with NOSA.

CHAIRMAN O'RELL: Concerning something that we --

MS. WIDEMAN: Pasture?

CHAIRMAN O'RELL: Okay, come on.

MS. FRANCES: Please spell your name for the record?

We are perhaps the largest dairy certifier in the country, so I did feel that I should make a comment, because other certifiers have. We certify perhaps 350 dairies at this time, with maybe 50 more in
transition.

Though I do, would like to -- I wish the current pasture regulation were sufficient, but since it is not and since all cows are not receiving access to pasture under the current rule, I feel that we could verify 30 percent and 120 days, and that it may not be that our producers are meeting this now.

But if we have the flexibility to work with them, I think we can. I would also like to just register our opinion that since milk replacer is not allowable for Yonis, since it's not an emergency, we see no use for it.

Also, it would be better if oxytocin were off the list, since most of our milk producers cannot use it because of their milk buyer. So that's it.

CHAIRMAN O'RELL: Thank you.

MS. FRANCES: Thank you.

CHAIRMAN O'RELL: Yes. What we're going to do now is I know that when we took
our break at lunch at 2:00, the Handling Committee had an opportunity to meet and take care of some committee business, based on input from public comments.

The Livestock Committee, I believe, is set and ready for recommendations, again taking the input from public comment that we've had. But Gerald, the Crops Committee, do you need a few minutes?

MEMBER DAVIS: Yes.

CHAIRMAN O'RELL: Okay. So what I'm going to suggest is what, 15 minutes or you tell me what works, because we did have time planned for this. We tried to squeeze it in there, but because there were people on both committees, it didn't work. So --

MEMBER DAVIS: If we are wanting to craft a change to the hydrated lime recommendation, that has to be physically typed up and --

CHAIRMAN O'RELL: No, no, no. You can just do --
MEMBER DAVIS: Ten minutes is probably plenty.

CHAIRMAN O'RELL: Fine. So let's take 15 minutes we'll give you. Then we'll come back, take a break. When we come back, we're going to start doing the recommendations for sunset and other recommendations by committees, and we'll be voting on those action items. Thank you.

(Whereupon, a short recess was taken.)

CHAIRMAN O'RELL: I'd ask the board members to be seated. We're all here?

(Pause.)

Board Vote on Committee Recommendations

CHAIRMAN O'RELL: Okay. We've been able to have the Crops Committee breakaway, and do some discussion at the committee level, and we will start with -- we're going through the recommendations for items that we'll be voting on.

We'll do this by Committee, and
Gerald, we'll start with the Crops Committee.

MEMBER DAVIS: Okay. Find the papers. The Crops Committee -- I guess we'll bring up the materials one at a time. I've got them all out of order again here somehow.

Excuse me. There we go.

Kevin, our intent now is just to represent the recommendation and ask for any more discussion before vote. Yes. Just to read --

CHAIRMAN O'RELL: To read the recommendation, and we've already had some background information.

So I don't think you need to go into that. Read the recommendation. We'll do one at a time, and then we will enter that as a motion, and then if it's seconded, we'll have for Discussion. Yes Hugh?

MEMBER KARREMAN: When we're doing this, if there was discussion at lunch in an officially convened committee meeting, should we say what we were -- in case --
CHAIRMAN O'ReLL: If you've changed a recommendation based on committee work today, then you would indicate what that change was and then I would have a brief discussion as to the rationale, as to why you changed your recommendation from the earlier.

MEMBER KARREMAN: I understand. But let's say there was also another discussion -- no, okay.

CHAIRMAN O'ReLL: No.

Crops Committee Recommendations

MEMBER DAVIS: Synthetic substances allowed for use in organic production. Section 205.601(a), as algicides, disinfectants and sanitizers.

The Crops Committee recommendation, based on comments received, is that for chlorine materials, calcium hypochloride, sodium hypochloride and chlorine dioxide, the Crops Committee recommends renewal of these materials for use in this category.

Discussion?
MEMBER OSTIGUY: Second. You needed a second. I did it.

MEMBER DAVIS: Okay.

CHAIRMAN O'RELL: So it was moved and seconded. Discussion?

(Pause.)

MEMBER JAMES: I only have one point of discussion, and that is for the new members, to be sure that you review on the recommendation exactly how that committee is recommending it, because I'm speaking from experience.

But on my first meeting, it's confusing sometimes whether you're voting yes on a no or no on a yes. So you just want to make sure that you look at that before you make your vote.

MEMBER CAROE: Call the question.

MEMBER DAVIS: Call the question if we're going to take the vote.

CHAIRMAN O'ReLL: I'm trying to get the paper work here. I'm sorry. We're a
little behind in getting the paper work. So this is 205.601(a).

MEMBER DAVIS: And the category is the Crops Committee recommends the renewal of the following materials to the use category, Section 2, "Chlorine Materials," except that residual chlorine materials in the water shall not exceed the maximum residual disinfectant limit under the Safe Drinking Water Act.

Number one, calcium hypochloride; two, sodium hypochloride; three, chlorine dioxide.

CHAIRMAN O'RELL: So if everybody's clear, if you're voting "yes," it is to renew these items.

A "no" would be not to renew them on the list, and you have the option of abstaining, and just to point out that if you abstain from a vote, it goes with the majority. It's tallied in the majority. Okay. We'll start with Jeff.

MEMBER OSTIGUY: Conflicts?
CHAIRMAN O'ReLL: Thank you. Are there any conflicts on the board with this recommendation of materials?

(No response.)

CHAIRMAN O'ReLL: Okay. Hearing none, Jeff?

MEMBER MOYER: I vote yes.

CHAIRMAN O'ReLL: Nancy?

MEMBER OSTIGUY: No.

CHAIRMAN O'ReLL: Julie?

MEMBER WEISMAN: Yes.

CHAIRMAN O'ReLL: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN O'ReLL: Bea?

MEMBER JAMES: Yes.

CHAIRMAN O'ReLL: Andrea?

MEMBER CAROE: Yes.

CHAIRMAN O'ReLL: Gerald?

MEMBER DAVIS: Yes.

CHAIRMAN O'ReLL: Dan?

MEMBER GIACOMINI: Yes.

CHAIRMAN O'ReLL: Kevin?
MEMBER ENGELBERT: No.

CHAIRMAN O'RELL: Hugh?

MEMBER KARREMAN: Yes.

CHAIRMAN O'RELL: And the chair votes yes.

MEMBER KARREMAN: Rigo?

CHAIRMAN O'RELL: I'm sorry, Rigo?

MEMBER DELGADO: Yes.

CHAIRMAN O'RELL: I've got to remember to go to the top of the list.

MEMBER CAROE: And the chair votes yes?

CHAIRMAN O'RELL: And the chair votes yes.

MEMBER CAROE: 10-2-0-2.

CHAIRMAN O'RELL: Ten yes, two no, two absent. So that motion passes.

MEMBER DAVIS: On the list, 205.601, synthetic substances allowed for use in organic crop production. Two, category of use, (e) as insecticides, including acaracides (ph) or mite control; (i) as plant disease control,
horticultural oils.

The Crops Committee recommends the renewal of the following material in these categories of uses: (e) as insecticides, including acaricides or mite control; (6) oils, horticultural, narrow range oils as dormant, suffocating and summer oils; (i) as plant disease control, oils, horticultural, narrow range oils as dormant, suffocating and summer oils.

MEMBER OSTIGUY: Second.

CHAIRMAN O'RELL: You entered that as a form of a motion?

MEMBER DAVIS: Okay, yes.

CHAIRMAN O'RELL: Seconded. It's been moved and seconded. Discussion?

(No response.)

CHAIRMAN O'RELL: Hearing no discussion, we'll take the vote. Any conflicts?

(No response.)

CHAIRMAN O'RELL: No conflicts.
Nancy?

MEMBER OSTIGUY: Yes.

CHAIRMAN O'RELL: Julie?

MEMBER WEISMAN: Yes.

CHAIRMAN O'RELL: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN O'RELL: Bea?

MEMBER JAMES: No.

CHAIRMAN O'RELL: Andrea?

MEMBER CAROE: Yes.

CHAIRMAN O'RELL: Gerald?

MEMBER DAVIS: Yes.

CHAIRMAN O'RELL: Dan?

MEMBER GIACOMINI: Yes.

CHAIRMAN O'RELL: Kevin?

MEMBER ENGELBERT: No.

CHAIRMAN O'RELL: Hugh?

MEMBER KARREMAN: No.

CHAIRMAN O'RELL: Rigo?

MEMBER DELGADO: Yes.

CHAIRMAN O'RELL: Jeff?

MEMBER MOYER: Yes.
CHAIRMAN O'RELL: And the chair votes yes.

MEMBER CAROE: 9-3-0-2.

CHAIRMAN O'RELL: Nine yes, three no, zero abstentions, two absent, and two-thirds. We need eight to pass, so that motion carries.

MEMBER DAVIS: The Crops Committee reconvened before, a few minutes ago that is, and reconsidered the topic of hydrated lime as plant disease control.

We decided as a committee, voting 5 to 0, to change the recommendation as has been posted to that the Crops Committee recommends renewing the following material to the national list:

(i) As plant disease control, Item 3, hydrated lime.

MEMBER OSTIGUY: Second.

CHAIRMAN O'RELL: It's been moved and seconded. Any Discussion? Any conflicts?

(No response.)
CHAIRMAN O'ReLL: Hearing none, Julie?

MEMBER WEISMAN: Yes.

CHAIRMAN O'ReLL: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN O'ReLL: Bea?

MEMBER JAMES: Yes.

CHAIRMAN O'ReLL: Andrea?

MEMBER CAROE: Yes.

CHAIRMAN O'ReLL: Gerald?

MEMBER DAVIS: Yes.

CHAIRMAN O'ReLL: Dan?

MEMBER GIACOMINI: Yes.

CHAIRMAN O'ReLL: Kevin?

MEMBER ENGELBERT: Yes.

CHAIRMAN O'ReLL: Hugh?

MEMBER KARREMAN: Yes.

CHAIRMAN O'ReLL: Rigo?

MEMBER DELGADO: Yes.

CHAIRMAN O'ReLL: Jeff?

MEMBER MOYER: Yes.

CHAIRMAN O'ReLL: Nancy?
MEMBER OSTIGUY: Yes.

CHAIRMAN O'RELL: And the chair votes yes.

MEMBER CAROE: 12-0-0-2.

CHAIRMAN O'RELL: Twelve yes, zero no, no abstentions, two absent. The motion carries.

MEMBER DAVIS: I'm not sure of the wording on how this goes, but concerning hydrogen peroxide. The Crops Committee recommends renewal of the following material in this use category:

(a) as algicide, disinfectants and sanitizers, including irrigation system cleaners, for hydrogen peroxide. Section (i) as plant disease control, Item 4, hydrogen peroxide.

MEMBER OSTIGUY: Second.

CHAIRMAN O'RELL: It's been moved and seconded. Any Discussion?

(No response.)

MEMBER CAROE: Who seconded?
CHAIRMAN O'RELL: Nancy. Any conflicts?

(No response.)

CHAIRMAN O'RELL: We'll take the vote, starting with Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN O'RELL: Bea?

MEMBER JAMES: Yes.

CHAIRMAN O'RELL: Andrea?

MEMBER CAROE: Yes.

CHAIRMAN O'RELL: Gerald?

MEMBER DAVIS: Yes.

CHAIRMAN O'RELL: Dan?

MEMBER GIACOMINI: Yes.

CHAIRMAN O'RELL: Kevin?

MEMBER ENGELBERT: Yes.

CHAIRMAN O'RELL: Hugh?

MEMBER KARREMAN: Yes.

CHAIRMAN O'RELL: Rigo?

MEMBER DELGADO: Yes.

CHAIRMAN O'RELL: Jeff?

MEMBER MOYER: Yes.
CHAIRMAN O'RELL: Nancy?

MEMBER OSTIGUY: Yes.

CHAIRMAN O'RELL: Julie?

MEMBER WEISMAN: Yes.

CHAIRMAN O'RELL: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN O'RELL: And the chair votes yes. 12-0-0-2. Motion carries.

MEMBER DAVIS: On the list, 205.601, category of use Section (i) as plant disease control. Streptomycin and tetracycline for fire blight control in apples and pears.

The Crops Committee recommends renewing the materials listed in Section (i) as plant disease control, Item No. 10, streptomycin for fire blight control in apples and pears only. Item 11, tetracycline, oxytetracycline calcium complex for fire blight control only.

MEMBER OSTIGUY: Second. I'm sorry, is it both materials we're voting on?

MEMBER DAVIS: Yes. It's both
materials. Any discussion?

(No response.)

MEMBER DAVIS: I did have a comment. There's been a lot of debate both ways on these materials. People feel pretty strongly about it in general.

As the Crops Committee discussed that in our meeting this afternoon, just a few minutes ago, and decided that upon listening to the testimony and then talking about the sunset process in general, that we should, even though we may have personal objections to the materials and the way they're used, but that we should stick to the strict intention of the sunset process and vote that way, rather than necessarily only on our philosophy or our personal feelings, but how we are obligated to abide by the rules and the process of the sunset process. Anyone else have anything to add to that?

CHAIRMAN O'RELL: No. I think that was well-said. I think that certainly my
sentiments are I would rather not be here, but a previous board did go through the diligence of approving that, and there wasn't anything really brought forward, other than a philosophical point, which I'd have to side with.

But in the effort of the sunset process, I would have to agree with your comments.

MEMBER DAVIS: Barring any other discussion, I can call the question.

CHAIRMAN O'RELL: Any conflicts?

(No response.)

CHAIRMAN O'RELL: Hearing none, Bea?

MEMBER JAMES: No.

CHAIRMAN O'RELL: Andrea?

MEMBER CAROE: Yes.

CHAIRMAN O'RELL: Gerald?

MEMBER DAVIS: Yes.

CHAIRMAN O'RELL: Dan?

MEMBER GIACOMINI: Yes.

CHAIRMAN O'RELL: Kevin?
MEMBER ENGELBERT: No.

CHAIRMAN O'RELL: Hugh?

MEMBER KARREMAN: Abstain.

CHAIRMAN O'RELL: Rigo?

MEMBER DELGADO: Yes.

CHAIRMAN O'RELL: Jeff?

MEMBER MOYER: No.

CHAIRMAN O'RELL: Nancy?

MEMBER OSTIGUY: No.

CHAIRMAN O'RELL: Julie?

MEMBER WEISMAN: Yes.

CHAIRMAN O'RELL: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN O'RELL: And the chair votes yes.

MEMBER CAROE: 8 to 4 -- 7 to 4-1-2.

It passes.

MEMBER JAMES: Sorry, I didn't hear that.

MEMBER CAROE: Seven yeas, four no's, one abstention, two absent. The motion passes.
CHAIRMAN O'RELL: So it passes.

MEMBER DAVIS: The Crops Committee recommends the renewal of the following:
205.601, Section (j) as plant or soil amendments.

Item 1, aquatic plant extracts other than hydrolyzed. Extraction process is limited to the use of potassium hydroxide or sodium hydroxide. Solvent used is limited to that amount necessary for extraction.

MEMBER OSTIGUY: Second.

CHAIRMAN O'RELL: It's been moved and seconded. Is there any discussion?

(No response.)

CHAIRMAN O'RELL: Any conflicts?

(No response.)

CHAIRMAN O'RELL: Start with Andrea.

MEMBER CAROE: Yes.

CHAIRMAN O'RELL: Gerald.

MEMBER DAVIS: Yes.

CHAIRMAN O'RELL: Dan?

MEMBER GIACOMINI: Yes.
CHAIRMAN O'RELL: Kevin?
MEMBER ENGELBERT: Yes.
CHAIRMAN O'ReLL: Hugh?
MEMBER KARREMAN: Yes.
CHAIRMAN O'RELL: Rigo?
MEMBER DELGADO: Yes.
CHAIRMAN O'RELL: Jeff?
MEMBER MOYER: Yes.
CHAIRMAN O'RELL: Nancy?
MEMBER OSTIGUY: Yes.
CHAIRMAN O'RELL: Julie?
MEMBER WEISMAN: Yes.
CHAIRMAN O'RELL: Joe?
MEMBER SMILLIE: Yes.
CHAIRMAN O'RELL: Bea?
MEMBER JAMES: Yes.
CHAIRMAN O'RELL: And the chair votes yes.
MEMBER CAROE: 12-0-0-2.
CHAIRMAN O'RELL: 12-0-0 carries, 0-2.
MEMBER DAVIS: For humic acids,
205.601(j) as planter soil amendments. The Corps Committee recommends the renewal of the following substances in this use category:

Item 3, humic acids, naturally occurring deposits, water and alkali extracts only.

MEMBER OSTIGUY: Second.

CHAIRMAN O'RELL: It's been moved and seconded.

MEMBER CAROE: By Nancy.

CHAIRMAN O'RELL: It's been moved and seconded. Any discussion?

(No response.)

CHAIRMAN O'RELL: Any conflicts?

(No response.)

CHAIRMAN O'RELL: Start with Gerald?

MEMBER DAVIS: Yes.

CHAIRMAN O'RELL: Dan?

MEMBER GIANCOMINI: Yes.

CHAIRMAN O'RELL: Kevin?

MEMBER ENGELBERT: No.

CHAIRMAN O'RELL: Hugh?

MEMBER KARREMAN: Yes.
CHAIRMAN O'RELL: Rigo?
MEMBER DELGADO: Yes.
CHAIRMAN O'RELL: Jeff?
MEMBER MOYER: Yes.
CHAIRMAN O'RELL: Nancy?
MEMBER OSTIGUY: Yes.
CHAIRMAN O'RELL: Julie?
MEMBER WEISMAN: Yes.
CHAIRMAN O'RELL: Joe?
MEMBER SMILLIE: Yes.
CHAIRMAN O'RELL: Bea?
MEMBER JAMES: Yes.
CHAIRMAN O'RELL: Andrea?
MEMBER CAROE: Yes.
CHAIRMAN O'RELL: And the chair votes yes.
MEMBER CAROE: 11-1-0-2.
CHAIRMAN O'RELL: 11 yes, one no, zero abstentions, two absent.
MEMBER DAVIS: Section 205.601, synthetic substance allowed for use in organic crop production. Category of use, Section (j)
as plant or soil amendments, Item 4, lignin sulfonate as a key leading agent, dust suppressant, floatation agent, and also as a floatation agent in post-harvest handling, Section (l), Item 1, lignin sulfonate.

MEMBER OSTIGUY: Second.

CHAIRMAN O'RELL: It's been moved and seconded. Discussion? I have a question. If lignin sulfonate is available, and we talked before about sodium silicate doing the same function, is there a belief that we need two, or if we don't, which was it?

MEMBER DAVIS: Based on the testimony we received from the Washington state program, being that there is a limitation on the lignin sulfonate for some producers, on where they can for their waste water, the one to drop if you were going to drop one would be the lignin sulfonate.

MEMBER OSTIGUY: It was lignin sulfonate that we would drop, Because that's the one that would block --
(Simultaneous discussion.)

MEMBER SMILLIE: But only as a flotation.

MEMBER OSTIGUY: Right.

MEMBER MOYER: The other material was a dust suppressant as well, which is what --

MEMBER OSTIGUY: Right, right.

MEMBER SMILLIE: Right.

MEMBER MOYER: And the other material doesn't do that.

MEMBER DAVIS: Can we split them, that apart?

CHAIRMAN O'RELL: I'm just wondering if there's merit into limiting the use of it, and not having it for -- oh yes. We can't do annotations. This is right. Okay. All right, I tried.

MEMBER GIACOMINI: So you can't use -- hoist it on your own.

(Simultaneous discussion.)

CHAIRMAN O'RELL: Jim Riddle is
giving me the thumbs down.

(Laughter.)

CHAIRMAN O'RELL: I learn from you, Jim.

MEMBER KARREMAN: That explains it.

MEMBER OSTIGUY: We didn't say that. He did.

MEMBER DAVIS: Can I call the question?

CHAIRMAN O'RELL: Any other discussion? Any conflicts?

(No response.)

CHAIRMAN O'RELL: Start the voting with Dan.

MEMBER GIACOMINI: Yes.

CHAIRMAN O'RELL: Kevin?

MEMBER ENGELBERT: No.

CHAIRMAN O'RELL: Hugh?

MEMBER KARREMAN: Yes.

CHAIRMAN O'RELL: Rigo?

MEMBER DELGADO: Yes.

CHAIRMAN O'RELL: Jeff?
MEMBER MOYER: Yes.
CHAIRMAN O'RELL: Nancy?
MEMBER OSTIGUY: Yes.
CHAIRMAN O'RELL: Julie?
MEMBER WEISMAN: Yes.
CHAIRMAN O'RELL: Joe?
MEMBER SMILLIE: Yes.
CHAIRMAN O'RELL: Bea?
MEMBER JAMES: Abstain.
CHAIRMAN O'RELL: Andrea?
MEMBER CAROE: No.
CHAIRMAN O'RELL: Gerald?
MEMBER DAVIS: Yes.
CHAIRMAN O'RELL: The chair will abstain.
MEMBER CAROE: 8-2-2-2. That just made it too.

The Crops Committee recommends
renewing the following material to the use in this category, as floating agents in post-harvest handling, sodium silicate.

MEMBER OSTIGUY: Second.

CHAIRMAN O'RELL: It's been moved and seconded. Any discussion?

MEMBER KARREMAN: So would this substance replicate one of the two functions of lignin sulfonate that we just renewed?

CHAIRMAN O'RELL: Andrea.

MEMBER CAROE: Since lignin sulfonate is not allowed for organic production going over to Japan, it would not solve the problem for those growers shipping Organic product to Japan.

CHAIRMAN O'RELL: Nancy?

MEMBER OSTIGUY: Additionally, it's been disallowed in certain areas in the U.S. in their sewer systems.

MEMBER KARREMAN: The lignin?

MEMBER OSTIGUY: Yes, the lignin.

MEMBER KARREMAN: But not the sodium
silicate?

MEMBER OSTIGUY: Correct.

MEMBER KARREMAN: Okay.

CHAIRMAN O'RELL: Joe, did you have --

MEMBER SMILLIE: Same point.

CHAIRMAN O'RELL: Same point. Any other Discussion?

MEMBER KARREMAN: Maybe the person from Washington state already talked about this, but would a grower be using both on one operation, or do they normally just pick one or the other, because --

MEMBER SMILLIE: It would depend how their water was treated, number one. If their water went to a municipal water system, they'd have to use the sodium silicate. But they could be using the lignin sulfonate for other uses, kelating agents or --

But as far as flotation goes, it depends on how their water is treated. If they dispose of their own water, they could
choose between the two. But if it went into a
municipal water system, they have no choice
but to use sodium silicate.

CHAIRMAN O'RELL: Other discussion?

We have a motion that's been seconded. No
more Discussion. Any conflicts?

(No response.)

CHAIRMAN O'RELL: Start with Kevin?

MEMBER ENGELBERT: No.

CHAIRMAN O'RELL: Hugh?

MEMBER KARREMAN: Yes.

CHAIRMAN O'RELL: Rigo?

MEMBER DELGADO: Yes.

CHAIRMAN O'RELL: Jeff?

MEMBER MOYER: Yes.

CHAIRMAN O'RELL: Nancy?

MEMBER OSTIGUY: Yes.

CHAIRMAN O'RELL: Julie?

MEMBER WEISMAN: Yes.

CHAIRMAN O'RELL: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN O'RELL: Bea?
MEMBER JAMES: Abstain.

CHAIRMAN O'RELL: Andrea?

MEMBER CAROE: Yes.

CHAIRMAN O'RELL: Gerald?

MEMBER DAVIS: Yes.

CHAIRMAN O'RELL: Dan?

MEMBER GIACOMINI: Yes.

CHAIRMAN O'RELL: The chair votes yes.

MEMBER CAROE: 10-1-1-2.

CHAIRMAN O'RELL: The motion carries.

MEMBER CAROE: Okay. I'll move the mike closer. That was 10-1-1-2.

CHAIRMAN O'RELL: Are there any others that you want us to read off?

PARTICIPANT: The one for lignin sulfonate.

CHAIRMAN O'RELL: 8-2-2-2. Eight yes, two no, two abstentions, two absent.

MEMBER DAVIS: That concludes the Crops Committee list.
CHAIRMAN O'RELL: Thank you, Gerald.

Okay, Hugh.

Livestock Committee Recommendations

MEMBER KARREMAN: Okay, Livestock. The first item is 205.603, category of use (c), as feed supplements. I forget. Do I say what the committee -- okay.

The Committee recommended to not renew milk replacers as listed.

MEMBER OSTIGUY: Second.

CHAIRMAN O'RELL: So it's been moved and seconded. Discussion?

MEMBER SMILLIE: That means if we vote "yes," we're voting not to renew it.

CHAIRMAN O'RELL: The vote for "yes" is a vote not to renew the item. That's correct. Any discussion?

MEMBER CAROE: Yes.

CHAIRMAN O'RELL: Andrea?

MEMBER CAROE: I think when we make recommendations to not renew, it should be clearly stated which of the three criteria
were not met, because it's very clear in the
Federal Register that it's either human
health, wholly met -- what is it?

 Non-synthetic alternative, or not consistent with OFPA.

 MEMBER KARREMAN: I would say it's a non-synthetic alternative is available would be the reason.

 MEMBER CAROE: And that's based on testimony that --

 MEMBER KARREMAN: It's based on the testimony of a few hundred people and farmers.

 CHAIRMAN O'RELL: Okay. Any other discussion? Any conflicts?

 (No response.)

 CHAIRMAN O'RELL: I've just got to catch up with the paper work.

 MEMBER KARREMAN: No problem.

 CHAIRMAN O'RELL: The motion has been made and seconded. The vote for yes is not renew, so everybody's clear, starting with Hugh?
MEMBER KARREMAN: Yes.
CHAIRMAN O'RELL: Rigo?
MEMBER DELGADO: Yes.
CHAIRMAN O'RELL: Jeff?
MEMBER MOYER: Yes.
CHAIRMAN O'RELL: Nancy.
MEMBER OSTIGUY: Yes.
CHAIRMAN O'RELL: Julie.
MEMBER WEISMAN: Yes.
CHAIRMAN O'RELL: Joe?
MEMBER SMILLIE: Yes.
CHAIRMAN O'RELL: Bea?
MEMBER JAMES: Yes.
CHAIRMAN O'RELL: Andrea.
MEMBER CAROE: Yes.
CHAIRMAN O'RELL: Gerald.
MEMBER DAVIS: Yes.
CHAIRMAN O'RELL: Dan?
MEMBER GIACOMINI: No.
CHAIRMAN O'RELL: Kevin?
MEMBER ENGELBERT: Yes.
CHAIRMAN O'RELL: The chair votes
yes.

MEMBER CAROE: 11-1-0-2.

CHAIRMAN O'RELL: Which means the motion passes to remove milk replacers from the list of synthetics.

MEMBER KARREMAN: okay. The next item is hydrated lime, and the Livestock Committee had a meeting during lunch, and we certainly have taken into account the public opinion.

There was a motion to retain hydrated lime on the list for livestock production. That motion passed at the committee meeting at lunch. So the official vote now.

CHAIRMAN O'RELL: So the motion from --

MEMBER KARREMAN: The motion to renew passed, to renew it. So the Livestock Committee is renewing -- is recommending to renew hydrated lime.

MEMBER SMILLIE: Was that a vote?
CHAIRMAN O'RELL: It's a motion.

MEMBER CAROE: We're not in discussion yet. We need a second.

MEMBER OSTIGUY: I'll second.

MEMBER KARREMAN: Okay.

CHAIRMAN O'RELL: It's been motioned and seconded. Any discussion? Any conflicts?

(No response.)

MEMBER DAVIS: Is that a unanimous Committee vote at lunch?

MEMBER KARREMAN: Yes, it was. Yes.

Shall I read the official listing then for the vote now? I didn't do that yet.

CHAIRMAN O'RELL: The official?

MEMBER KARREMAN: Well, the category use and all that.

CHAIRMAN O'RELL: Sure.

MEMBER KARREMAN: I should right?

CHAIRMAN O'RELL: Put it in the form of a motion, yes.

MEMBER KARREMAN: So the Livestock Committee recommends and makes a motion that
under 205.603, category use (b) as topical
treatment, external parasiticide or local
anesthetic as applicable, to renew lime,
hydrated as listed.

MEMBER DAVIS: Second.

CHAIRMAN O'RELL: Moved and
seconded. Discussion? Any conflicts?

(No response.)

CHAIRMAN O'RELL: Start the voting
with Rigo?

MEMBER DELGADO: Yes.

CHAIRMAN O'RELL: Jeff.

MEMBER MOYER: Yes.

CHAIRMAN O'RELL: Nancy?

MEMBER OSTIGUY: Yes.

CHAIRMAN O'RELL: Julie?

MEMBER WEISMAN: Yes.

CHAIRMAN O'RELL: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN O'RELL: Bea?

MEMBER JAMES: Yes.

CHAIRMAN O'RELL: Andrea?
MEMBER CAROE: Yes.

CHAIRMAN O'RELL: Gerald?

MEMBER DAVIS: Yes.

CHAIRMAN O'RELL: Dan?

MEMBER GIACOMINI: Yes.

CHAIRMAN O'RELL: Kevin?

MEMBER ENGELBERT: Yes.

CHAIRMAN O'RELL: Hugh?

MEMBER KARREMAN: Yes.

CHAIRMAN O'RELL: The chair votes yes.

MEMBER CAROE: 12-0-0-2.

MEMBER KARREMAN: Okay. The next item is 205.603, category use (a) as disinfectants, sanitizer and medical treatments as applicable. Chlorine materials, all three, the calcium hypochloride, calcium dioxide, sodium hypochloride. The Livestock Committee recommends to renew them on the list.

MEMBER CAROE: Is there a second?

MEMBER ENGELBERT: Second.
CHAIRMAN O'RELL: Second, Kevin E.

Discussion? Any conflicts?

(No response.)

CHAIRMAN O'RELL: Start the voting with Jeff.

MEMBER MOYER: I vote yes.

CHAIRMAN O'RELL: Nancy.

MEMBER OSTIGUY: No.

CHAIRMAN O'RELL: Julie?

MEMBER WEISMAN: Yes.

CHAIRMAN O'RELL: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN O'RELL: Bea?

MEMBER JAMES: Yes.

CHAIRMAN O'RELL: Andrea?

MEMBER CAROE: Yes.

CHAIRMAN O'RELL: Gerald?

MEMBER DAVIS: Yes.

CHAIRMAN O'RELL: Dan?

MEMBER GIACOMINI: Yes.

CHAIRMAN O'RELL: Kevin?

MEMBER ENGELBERT: Yes.
CHAIRMAN O'ReLL: Hugh?

MEMBER KARREMAN: Yes.

CHAIRMAN O'ReLL: The chair votes yes.

MEMBER CAROE: There's one missing.

CHAIRMAN O'ReLL: Rigo?

MEMBER DELGADO: Yes.

CHAIRMAN O'ReLL: Thank you.

MEMBER CAROE: That's 11-1-0-2.

CHAIRMAN O'ReLL: So the motion carries.

MEMBER KARREMAN: Okay, next item?

CHAIRMAN O'ReLL: Yes.

MEMBER KARREMAN: The next item is under 205.603, category use (a) as disinfectants, sanitizer and medical treatments as applicable.

The Livestock Committee recommends renewing oxytocin as listed.

MEMBER OSTIGUY: Second.

CHAIRMAN O'ReLL: It's been moved and seconded. Discussion?
MEMBER KARREMAN: Yes. We did have discussion about this at lunch, and I think there was the consensus that if it gets renewed now, that the annotation should change at the minimum, so that it's only administered by a veterinarian.

MEMBER CAROE: So --

MEMBER KARREMAN: This is discussion. We're not voting on an annotation change. I'm just saying that's what we were talking about.

MEMBER ENGELBERT: We did vote again at the committee level. It did pass again.

CHAIRMAN O'RELL: And it was unanimous at the committee level?

MEMBER KARREMAN: There was a motion to not renew it and that failed. Therefore, the motion stands to renew it. We also had discussion that it should only be administered by a veterinarian. At some point we need to take that up. But we can't do that here during sunset.
CHAIRMAN O'RELL: But the intent of the Livestock Committee is to take that up as an issue?

MEMBER KARREMAN: Absolutely.

MEMBER ENGELBERT: Part of our work plan.

CHAIRMAN O'RELL: Part of the work plan?

MEMBER KARREMAN: Yes.

MEMBER CAROE: Well then I would say we need a petition in order to do that. So it should be on the record and spread from here on out, that that's what we're looking for, is those folks that commented to petition for a change of annotation.

MEMBER GIACOMINI: There was Discussion in the Committee, with a number of people who were not necessarily in favor of having it on the list, but not having the justification within the three items that we are specified to deal with, to justify taking it off at this time.
CHAIRMAN O'RELL: Right, okay.

Further discussion? Any conflicts?

MEMBER KARREMAN: I guess I probably make about $200 a year off that product from sales.

CHAIRMAN O'RELL: Well, it's disclosure.

MEMBER KARREMAN: Okay. I don't know if that's a conflict.

CHAIRMAN O'RELL: I wouldn't feel that you'd have to recuse yourself for -- I know your ethics are beyond $200.

(Laughter.)

MEMBER SMILLIE: It's $250, Hugh.

MEMBER CAROE: You treat those animals, whether they stay in the organic herd or not, so I can't see that you're going to make any less money if this comes off the list than if it stays on the list. So I see that as absolutely no conflict.

CHAIRMAN O'RELL: Okay. That was a better answer than the one I gave.
(Laughter.)

CHAIRMAN O'RELL: Nancy?
MEMBER OSTIGUY: No.

CHAIRMAN O'RELL: Julie?
MEMBER WEISMAN: Yes.

CHAIRMAN O'RELL: Joe?
MEMBER MOYER: Abstain.

CHAIRMAN O'RELL: Bea?
MEMBER JAMES: Yes.

CHAIRMAN O'RELL: Andrea?
MEMBER CAROE: Yes.

CHAIRMAN O'RELL: Gerald?
MEMBER DAVIS: Abstain.

CHAIRMAN O'RELL: Dan.
MEMBER GIACOMINI: Yes.

CHAIRMAN O'RELL: Kevin?
MEMBER ENGELBERT: No.

CHAIRMAN O'RELL: Hugh?
MEMBER KARREMAN: Yes.

CHAIRMAN O'RELL: Rigo?
MEMBER DELGADO: Yes.

CHAIRMAN O'RELL: Jeff?
MEMBER SMILLIE: Yes.

CHAIRMAN O'RELL: And the chair votes yes.

MEMBER CAROE: 8-2-2-2, passes.

MEMBER KARREMAN: Okay. Last item is 205.603, category use (a), as disinfectant, sanitizer and medical treatments as applicable. Number 13, parasiticides, Ivermectin, as listed. The Committee recommended to renew it.

MEMBER OSTIGUY: Second.

CHAIRMAN O'RELL: Second by Nancy. Discussion? Was that -- what was the Committee's -- was that unanimous from the Committee?

MEMBER KARREMAN: We didn't discuss it today, but on the Committee vote previously, it was 5 yes and 1 no.

CHAIRMAN O'RELL: So it's the same from our discussion before, that you had expressed. Andrea?

MEMBER CAROE: Just any
reconsideration due to public comment? I mean you didn't vote on it. You kept your original recommendation. Was there any further discussion?

MEMBER KARREMAN: no.

MEMBER GIACOMINI: Again, given the parameters that we have to work within, we couldn't come to a conclusion that, other than what we did.

CHAIRMAN O'RELL: For the sunset process?

MEMBER GIACOMINI: Correct, given the sunset process.

MEMBER CAROE: Is there any need to ask commenters to petition for any changes? I mean anything the Committee felt might have been a preferable course of action if we had it available to us?

MEMBER KARREMAN: This is still -- whatever we -- if we renew it here, it will still be considered by the regulators, due to the antibiotic structure property on paper.
CHAIRMAN O'RELL: Nancy?

MEMBER OSTIGUY: At least among some of us, there is also the opinion that assuming Moxidectin actually goes through, we would like to request that a petition be submitted to remove this from the list.

But based on the sunset criteria, the recommendation was to put it forward.

MEMBER CAROE: Can I make just a quick comment?

CHAIRMAN O'RELL: Yes Andrea.

MEMBER CAROE: Just a reminder to anybody that would petition to remove, petitions to remove have priority to any petition to add. So that would be -- I hesitate to say, but a quicker process than adding. Cautiously say it.

CHAIRMAN O'RELL: Any further discussion? Any conflict?

MEMBER KARREMAN: I saw even less of this than I did the oxytocin.

(Laughter.)
CHAIRMAN O'RELL: Thank you, Hugh.

We'll start then with Julie.

MEMBER WEISMAN: Yes.

CHAIRMAN O'RELL: Joe?

MEMBER SMILLIE: Abstain.

CHAIRMAN O'RELL: Bea?

MEMBER JAMES: No.

CHAIRMAN O'RELL: Andrea.

MEMBER CAROE: I'll abstain.

CHAIRMAN O'RELL: Gerald?

MEMBER DAVIS: Yes.

CHAIRMAN O'RELL: Dan?

MEMBER GIACOMINI: Yes.

CHAIRMAN O'RELL: Kevin?

MEMBER ENGELBERT: No.

CHAIRMAN O'RELL: Hugh?

MEMBER KARREMAN: Yes.

CHAIRMAN O'RELL: Rigo?

MEMBER DELGADO: Yes.

CHAIRMAN O'RELL: Jeff?

MEMBER MOYER: Yes.

CHAIRMAN O'RELL: Nancy?
MEMBER OSTIGUY: No.

CHAIRMAN O'RELL: The chair votes no.

MEMBER CAROE: 7-3-2-2. The motion passes.

CHAIRMAN O'RELL: Six yes.

MEMBER CAROE: Six yes. I apologize.

CHAIRMAN O'RELL: Two abstentions. The vote carries.

MEMBER CAROE: No, it's not possible. It's 7-3-3-2. There's 14 members on this board.

MEMBER GIACOMINI: It's only 12 -- how many are here?

MEMBER OSTIGUY: Only 12 are voting.

MEMBER CAROE: Twelve voting with two absent. There's 14 members on this board. It's 7-3-2-2.

MEMBER JAMES: The vote was 6-4.

MEMBER KARREMAN: We have four no's over there.
(Simultaneous Discussion.)

MEMBER CAROE: I only had three no's.

CHAIRMAN O'ReLL: No, we have four no's. We have four no's recorded. We have six yes, four no's, two abstentions, two absent.

MEMBER CAROE: Okay, so it passes. 6-4-2-2, passes. Abstentions go with the majority.

CHAIRMAN O'ReLL: Thank you, Hugh. Handling. Julie.

(Simultaneous discussion.)

Handling Committee Recommendations

(Pause.)

MEMBER WEISMAN: Okay. The Handling Committee met during lunch, and voted to amend the existing recommendation for 205.605(a), non-synthetics allowed. The amendment, the recommended amendment was to move colors from renewal to the deferred category on this recommendation.
The motion was made by Kevin, seconded by Bea. The Committee vote to amend was 5 yes, 0 no, no abstentions. It was unanimous.

So a "yes" vote on this recommendation will be to renew colors on 205.605(a), and to defer -- did I just say colors?

To renew flavors, I'm sorry, on 205.605(a), and to defer colors. We've got to vote on both at one time.

CHAIRMAN O'RELL: Or we could --

MEMBER WEISMAN: In other words, we amended the recommendation by moving colors from --

MEMBER ENGELBERT: We could put a motion through, and I think it would be more clear on this instance if we did that. So if we took a separate motion for flavors first, and then go to colors or however you want.

MEMBER WEISMAN: Sure.

MEMBER KARREMAN: I move that we
vote on the items separately, with flavors first and then colors after that.

MEMBER WEISMAN: Okay.

MEMBER OSTIGUY: Second.

CHAIRMAN O'RELL: Well, we don't have the motion yet.

MEMBER CAROE: Well, he's motioning to change --

MEMBER GIACOMINI: He's motioning to split the vote.

CHAIRMAN O'RELL: Oh. That's something the Committee -- the Committee can just make the determination on how they want to present it. That's fine.

MEMBER WEISMAN: So do we need a motion right now.

MEMBER CAROE: Which motion is being voted on? Which material?

MEMBER WEISMAN: Okay. Right now, the Committee is recommending that flavors, non-synthetic sources only and must not be produced using synthetic solvents and carrier
systems or any artificial preservative, be renewed on 205.605(a), non-synthetics allowed.

CHAIRMAN O'RELL: OKAY. That is the motion.

MEMBER OSTIGUY: Second.

CHAIRMAN O'RELL: Nancy seconds it.

So you have a motion to renew flavors under 205.605(a). Discussion?

MEMBER CAROE: I mean once again, this is to complete the sunset process for this material. However, based on all of the comments received, we would welcome petitions for specific flavor types, and potentially listing them on different national list categories or sections.

CHAIRMAN O'RELL: And I'm sure we're going to get some. But that will trigger then TAP reviews and we'll be able to go through the process of determining how these stack up to the OFPA criteria, as well as whether they're agricultural or natural, for specific groups. Hearing no Discussion, any conflicts?
MEMBER WEISMAN: Kevin, I am involved in manufacturing both non-synthetic flavors and organic flavors.

MEMBER CAROE: I would have to say that I would suggest that Julie recuse herself from this vote.

MEMBER WEISMAN: I recuse myself.

CHAIRMAN O'RELL: I think a recusal on this would be accepted, yes. So Julie, I'll mark you as a recusal. Any further discussion, and any additional conflicts?

MEMBER CAROE: Point of procedure. Can Julie make this motion if she's recused herself?

MEMBER WEISMAN: Oh. This happened to me once before.

CHAIRMAN O'RELL: No, no.

MEMBER CAROE: I don't believe that she can.

MEMBER OSTIGUY: I will move that the renewal of flavors, non-synthetic sources only, and must not be produced using synthetic...
solvents and carriers.

MEMBER CAROE: I'll second.

CHAIRMAN O'RELL: For the renewal, it's been moved and seconded by Andrea. Okay.

MEMBER CAROE: Sorry about that.

MEMBER WEISMAN: No. That's good.

CHAIRMAN O'RELL: Any additional discussion? Conflicts?

(No response.)

CHAIRMAN O'RELL: Okay. Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN O'RELL: Bea?

MEMBER JAMES: Yes.

CHAIRMAN O'RELL: Andrea?

MEMBER CAROE: Yes.

CHAIRMAN O'RELL: Gerald?

MEMBER DAVIS: Yes.

CHAIRMAN O'RELL: Dan?

MEMBER GIACOMINI: Yes.

CHAIRMAN O'RELL: Kevin?

MEMBER ENGELBERT: Yes.

CHAIRMAN O'RELL: Hugh?
MEMBER KARRMAN: Yes.
CHAIRMAN O'RELL: Rigo?
MEMBER DELGADO: Yes.
CHAIRMAN O'RELL: Jeff?
MEMBER MOYER: Yes.
CHAIRMAN O'RELL: Nancy.
MEMBER OSTIGUY: Yes.
CHAIRMAN O'RELL: The chair votes yes.
MEMBER CAROE: 11-0-0-2, one recusal.
CHAIRMAN O'RELL: So the motion passes on flavors.
MEMBER WEISMAN: Okay. I am not involved in the manufacture of colors.
CHAIRMAN O'RELL: Okay. I'm glad we got that up front.
MEMBER WEISMAN: So may I make a motion?
CHAIRMAN O'RELL: You may.
MEMBER WEISMAN: Okay. I move that we -- that colors, non-synthetic sources only,
be deferred from a decision on renewing on 205.605(a). I'm sorry. It's getting late.

MEMBER OSTIGUY: I'll second that.

CHAIRMAN O'RELL: Nancy seconds. So I think we probably want to explain some of the Committee thinking, in terms of changing this recommendation from renewal to a deferral, and a large part of it is based on public comment that happened over the last two days.

MEMBER WEISMAN: Right, and I did mention some of it this morning, but I will certainly -- it bears repeating, that on this round of public comment, that happened after the decision to defer in August, we had a lot of comments opposing the relisting of colors.

Many of them cited the fact that they had not -- they weren't -- the fact that they're even on the list was not because of a recommendation from the NOSB, that in fact there had been recommendations to remove it by the NOSB that had not been acted upon.
There's sufficient controversy around its existence on the list now that we felt that we could not recommend renewal at this time, because of these procedural irregularities. Is that fair?

CHAIRMAN O'ReLL: Yes. The procedural issues around colors, and hearing from the historical perspective of not being recommended by the board, and at one time the board had recommended the removal of colors and at one time and the technical correction that didn't take place.

Certainly that leaves us in a position that this will sunset unless there's further action in October, but still runs the risk of sunset at October 2007.

We would encourage the public to file petitions for specific colors that are being used, anado tumeric as a color if it's not available.

If it's an agricultural component and not available organically, then for
recommendation to 606. But this has got us in a quandary, and right now we feel that the only thing we can do is defer it.

We might request a full TAP on colors as well, and that will be in the Handling Committee work plan, do further evaluation on this as to how we move forward. Andrea?

MEMBER CAROE: Well, also we would request petitions for color types. It would help us with our TAP reviews if we could have those.

Based on the comments heard, that we could categorize these colors into manufacturing techniques that would make the TAP relevant to all the materials in that group.

CHAIRMAN O'RELL: Arthur's been waiting in the deck.

MR. NEAL: And if a petition will be sent into the board for consideration of this particular material, colors, we advise you to
please supply manufacturers information, so that the contractor can contact the manufacturer, to find out more about manufacturing processes, and that information will be kept confidential.

But that the contractor can provide the board with adequate information that Would resolve some of the questions that exist in the industry concerning color types.

CHAIRMAN O'RELL: Dan?

MEMBER GIACOMINI: I would just like some clarification from the Committee as to why they chose to defer and the time line, or what they envision happening, as opposed to voting and recommending for removal?

MEMBER CAROE: I can answer that. The deferral is because we don't have the complete TAP. We don't have any evidence to indicate it doesn't meet one of those three criteria for sunsetting the material.

But we don't have the information that was originally needed to put this
material on the list and a board vote. So it's lack of information.

There's not -- in order for us to recommend to allow this material to sunset, we have to have -- define clear evidence that it doesn't meet one of those three requirements.

CHAIRMAN O'RELL: And the existing evaluation criteria that we did fill out for colors left, has a lot of holes in it, and we knew that. Jeff?

MEMBER MOYER: I just have a process question that sort of follows on to what maybe Dan was asking.

As a new person on the board, it's my understanding that if no action is taken today or at the next meeting, more than likely this material drops off the list automatically; is that correct?

CHAIRMAN O'RELL: That's true. If no action is taken by the October meeting, then this would fall off the list. October of this year.
MEMBER MOYER:  That's correct.

CHAIRMAN O'RELL:  '06, '07 for sunset.

MEMBER MOYER:  And the action that needs to be taken would need to be taken by the general public, in the form of a petition.

CHAIRMAN O'RELL:  For a petition for specific colors that are in use today in industry.

MEMBER MOYER:  You could ask for a full TAP report, and then bring this up for a vote again at the October meeting.

MEMBER CAROE:  We could ask for a TAP report.

CHAIRMAN O'RELL:  Go ahead.  No, go ahead.

MEMBER CAROE:  We could ask for a TAP report, but based on the comments that we were receiving, the category in itself is problematic.  We need those public commenters to petition for the types of colors that they're using, so that we can have this listed
appropriately.

MEMBER MOYER: Then my question would be is there enough time between now and then for them to petition and have those petitions accepted so they would not have a lapse in color use? That was just a question. I don't know.

MEMBER CAROE: And we actually talked to the program about this, and they have suggested that they will handle this as expedited as possible in order for us to accomplish that. That was our concern as well.

CHAIRMAN O'RELL: Recognizing that there is an economic impact to people who are in the marketplace with those colors now.

But those people now who are using those colors need to get those petitions in, so that we can get the appropriate TAPs on not just the broad category of colors, but on the specific anato tumeric, carmine if somebody wants, whatever. I will recognize Kim if it's
MS. DIETZ: I think there could be some action on this board, and one would be to prepare the TAP contractors that there will be a TAP coming. They can start the TAP.

Also, you need to somehow seek the public to start petitioning, and perhaps that's through the trade association or something else. But somehow that communication needs to get out there on those colors.

You can request the TAP now. It just may take a little longer for them to finish it, because they won't have everything.

CHAIRMAN O'RELL: Well, and I think we'll have a discussion with this in committee, because I think just having a TAP on a general colors doesn't work. We're going to have to identify specific colors that are of interest out there, and start working in that direction, yes.

MS. DIETZ: We have done category
TAPs, but you still need specifics for the ingredients. But generally, they're all going to be made the same way and that sort of thing, I would think.

MEMBER JAMES: This is a question for Valerie. How quickly do you think we could turn around and get this request posted?

MS. FRANCES: Request for a petition?

MEMBER JAMES: Well, announcement, request for public input on the --

MS. FRANCES: Do you want to recommend a format for that, or provide --

CHAIRMAN O'RELL: Yes, Arthur. Defer to Arthur please.

MR. NEAL: It's all going to really be based on how fast we can get information, because our meeting concluded in November last year, and we had TAPs ready, I guess, in February of this year, for you all to review for this meeting.

This is a different story with
colors, because it's such -- it covers so many different materials. The problem that the contractor had is that we don't -- we don't have any manufacturing processes.

So if there are particular colors that you know are of interest, we need to know what those colors are. We need to know the names of manufacturers so that the contractor can contact them, to give you proper information and proper perspective on what you're dealing with.

We can turn that around. This is what -- this is April. We can probably have it if we get the information, you know mid-month, by August.

CHAIRMAN O'RELL: And I see, I know we have representatives, OTA in the audience. We have suppliers in the audience.

We have, I think, somebody representing GMA in the audience to get out words through trade associations, etcetera, that we're looking for this input. Yes, Rigo?
MEMBER DELGADO: Just a question, and I'm concerned about getting the word out. I know there's a number of organizations represented here, but what other channels of communications do we have available to, you know, publish this request or this need of ours?

MEMBER WEISMAN: What occurs to me, we got a -- we had a comment on colors from the American Association of Colors -- there's a trade association of color manufacturers.

I don't think they had any representatives here at this meeting, and when they learn that colors has not been voted to renew at this meeting, I imagine they're going to get very busy. I don't know what the politics are of us informing them sooner rather than later that that's been the outcome.

I don't know. Is that appropriate? Can we call them, for someone on -- for me, as the chair of the Handling Committee, to
call them and inform them?

CHAIRMAN O'RELL: Well, I think that anybody who submitted comments we should reply. So if somebody submitted a comment and it's on record that they were in favor of colors, I think that it would be fair to notify them that colors are being deferred.

MEMBER WEISMAN: That's a good suggestion.

CHAIRMAN O'RELL: So that at least you've covered those people who have expressed an interest, and then you have trade associations. You have suppliers. I think that's about all that I know to get the word out. Yes Diane?

MS. GOODMAN: Very quick question.

MEMBER CAROE: Can you come up to the microphone, Diane?

MS. GOODMAN: Diane Goodman. In my role as co-chair of the OTA Committee on 606, the OTA task force on 606. Can you give us a date specific by when we would have to have
petitions submitted, so that they could meet this deadline?

CHAIRMAN O'RELL: As soon as possible.

MS. GOODMAN: Well, I understand. But up until when? It really will help in the communication if we tell people that it has to be by June 1st or it has to be by July 1st. Can you give us a date?

CHAIRMAN O'RELL: Arthur?

MR. NEAL: Rough estimate I'd say third week in May is the best drop dead date, because there are approximately eight petitions for substances waiting for October.

So we don't want to press them too hard. These petitions have been waiting until December, because of sunset. So if we get it early enough to get it to the contractors, they can put enough people on it.

CHAIRMAN O'RELL: Okay. If there's no further discussion, we'll take the vote. This is a vote. The motion has been made.
MEMBER CAROE: Has it been seconded?

CHAIRMAN O'RELL: Yes, for deferring colors.

MEMBER CAROE: Any conflicts?

CHAIRMAN O'RELL: Any conflicts?

(No response.)

CHAIRMAN O'RELL: Bea?

MEMBER JAMES: Yes.

CHAIRMAN O'RELL: Andrea.

MEMBER CAROE: Yes.

CHAIRMAN O'RELL: Gerald?

MEMBER DAVIS: Yes.

CHAIRMAN O'RELL: Dan?

MEMBER GIACOMINI: No.

CHAIRMAN O'RELL: Kevin?

MEMBER ENGELBERT: Yes.

CHAIRMAN O'RELL: Hugh?

MEMBER KARREMAN: Yes.

CHAIRMAN O'RELL: Rigo?

MEMBER DELGADO: Yes.

CHAIRMAN O'RELL: Jeff?

MEMBER MOYER: Yes.
CHAIRMAN O'RELL: Nancy?

MEMBER OSTIGUY: Yes.

CHAIRMAN O'RELL: Julie?

MEMBER WEISMAN: Yes.

CHAIRMAN O'RELL: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN O'RELL: The chair votes yes.

MEMBER CAROE: What about Bea? Did you vote?

MEMBER JAMES: He started with me.

MEMBER CAROE: Oh, I'm sorry. 11-1-0-2.

CHAIRMAN O'RELL: Did you hear that in the audience?

PARTICIPANT: Yes.

CHAIRMAN O'RELL: So colors, the motion passed, will be deferred.

MEMBER WEISMAN: Okay. Moving right along to 605(b). We had made a recommendation, which we discussed earlier today, that is unchanged.
This Handling -- we are -- make a motion that we renew the following substances in the use category, 205.605(b), chlorine materials, disinfecting and sanitizing food contact surfaces, except that residual chlorine levels in the water shall not exceed the maximum residual disinfectant limit under the Safe Drinking Water Act.

Part of this recommendation also includes not renewing lecithin-bleached.

MEMBER OSTIGUY: Second.

CHAIRMAN O'RELL: Is there a need to -- do we need to separate this?

MEMBER CAROE: Yes.

MEMBER KARREMAN: Why were they bunched together?

MEMBER WEISMAN: Okay. Forget about lecithin. We are recommending the renewal of chlorine materials.

MEMBER OSTIGUY: Second.

MEMBER CAROE: Nancy, you seconded?

CHAIRMAN O'RELL: All right. So
moved and seconded. Discussion? I think --

MEMBER WEISMAN: Kevin, I do have a question. I realize we already did it, but it's only procedural. I don't recall seeing this done before, where we voted separately on items in one recommendation. Anybody have any -- we have? Okay. I'm sorry. Okay, right. Okay.

CHAIRMAN O'RELL: Because we're splitting when something not going to be -- it's going to be deferred. So in order just to --

MEMBER WEISMAN: To have an accurate, a fair and --

CHAIRMAN O'RELL: Not to be confused for the voting and for the public, we could take them as individual items. I think it's the best to do at this point.

I know when we did the initial rounds of these and we had the lots of them, we put those through. But at this point, I think we're doing the right thing.
And in terms of discussion, just once again going back to recognizing and putting on the Handling Committee work plan the previous chlorine recommendation for the change of annotation that recommended back in 2003, I believe.

But I think we need to put that on the work plan and go back, because the terminology in the annotation is still confusing. It's not correct. But we're not addressing this at sunset. But I do want this for the record to say we are going to look at that. Any further discussion? Any conflicts?

(No response.)

CHAIRMAN O'RELL: Do we have a motion that's been moved and seconded for chlorine for renewal, starting with Andrea?

MEMBER CAROE: Yes.

CHAIRMAN O'RELL: Gerald?

MEMBER DAVIS: Yes.

CHAIRMAN O'RELL: Dan?

MEMBER GIACOMINI: Yes.
CHAIRMAN O'RELL: Kevin.
MEMBER ENGELBERT: Yes.
CHAIRMAN O'RELL: Hugh.
MEMBER KARREMAN: Yes.
CHAIRMAN O'RELL: Rigo?
MEMBER DELGADO: Yes.
CHAIRMAN O'RELL: Jeff?
MEMBER MOYER: Yes.
CHAIRMAN O'RELL: Nancy?
MEMBER OSTIGUY: Yes.
CHAIRMAN O'RELL: Julie?
MEMBER WEISMAN: Yes.
CHAIRMAN O'RELL: Joe?
MEMBER SMILLIE: Yes.
CHAIRMAN O'RELL: Bea.
MEMBER JAMES: Yes.
CHAIRMAN O'RELL: And the chair votes yes.
MEMBER CAROE: 12-0-0-2.
MEMBER WEISMAN: Okay, and now I have a motion that lecithin-bleached not be renewed on 205.605(a).
MEMBER OSTIGUY: Second.

CHAIRMAN O'RELL: It's been moved and seconded. Any discussion? This is consistent with the Discussion from this morning? Andrea?

MEMBER CAROE: Can you state the specific reason for it?

MEMBER WEISMAN: Because there are non-synthetic alternatives available.

MEMBER CAROE: Thank you.

CHAIRMAN O'RELL: Any further discussion? Any conflicts?

(No response.)

CHAIRMAN O'RELL: Hearing none, this is a vote yes to not renew. Gerald?

MEMBER DAVIS: Yes.

CHAIRMAN O'RELL: Dan?

MEMBER GIACOMINI: Yes.

CHAIRMAN O'RELL: Kevin?

MEMBER ENGELBERT: Yes.

CHAIRMAN O'RELL: Hugh?

MEMBER KARREMAN: Yes.
CHAIRMAN O'RELL: Rigo?

MEMBER DELGADO: Yes.

CHAIRMAN O'RELL: Jeff?

MEMBER MOYER: Yes.

CHAIRMAN O'RELL: Nancy?

MEMBER OSTIGUY: Yes.

CHAIRMAN O'RELL: Julie?

MEMBER WEISMAN: Yes.

CHAIRMAN O'RELL: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN O'RELL: Bea.

MEMBER JAMES: Yes.

CHAIRMAN O'RELL: Andrea.

MEMBER CAROE: Yes.

CHAIRMAN O'RELL: The chair votes yes.

MEMBER CAROE: 12-0-0-2.

CHAIRMAN O'RELL: So the motion carries and lecithin will be dropped form the list.

MEMBER CAROE: Lecithin-bleached.

CHAIRMAN O'RELL: Lecithin-bleached.
Thank you.

MEMBER WEISMAN: Okay. We're now moving on to Section 606, 205.606, which is non-organically produced agricultural products allowed in ingredients in or on processed products labeled as organic or made with organic.

The Committee recommends the renewal of lecithin-unbleached in this use category.

MEMBER OSTIGUY: Second.

CHAIRMAN O'RELL: It's been moved and seconded. Any discussion?

MEMBER KARREMAN: Didn't Lynn Clarkson say that they make an organic version of this?

CHAIRMAN O'RELL: Yes. Go ahead, Joe.

MEMBER SMILLIE: They do, but there's so many uses of lecithin throughout the industry that at the current time, they don't make as many lecithins that would fit those uses.
So he couldn't nor could anyone else say that they could provide a non-synthetic alternative for all uses of lecithin in the manufacturing processing sector.

MEMBER KARREMAN: But that would expand the incentive to have more of the organic than he has, or they have, I should say.

MEMBER SMILLIE: The incentive is there.

MEMBER CAROE: It's still -- it's 606. There is still a commercial availability requirement on this Section.

MEMBER KARREMAN: Right.

CHAIRMAN O'RELL: Okay.

MEMBER MOYER: If I heard him right, he did say that he had, what 120 out of 180 or something already done. So they are moving in the right direction I assume.

CHAIRMAN O'RELL: Yes. He felt that he could handle most of the needs that are in the marketplace, but admittedly he said that
there may be some very specialized cases where at this point he can't, and he felt with this, the accompanying commercial availability criteria for the ACAs, that that would go a long towards improving organic lecithin usage in the industry.

MEMBER MOYER: So he was supportive of this.

CHAIRMAN O'RELL: He was very supportive of this, yes.

MEMBER MOYER: I just want to make sure I got him right.

CHAIRMAN O'RELL: Yes. He in fact stayed late just to make that comment last night. Hearing no further Discussion, we'll start the vote.

MEMBER CAROE: Conflicts?

CHAIRMAN O'RELL: Conflicts? Anybody have any conflicts with lecithin?

(No response.)

CHAIRMAN O'RELL: Dan.

MEMBER GIACOMINI: Yes.
CHAIRMAN O'RELL: Kevin?
MEMBER ENGELBERT: Yes.
CHAIRMAN O'RELL: Hugh?
MEMBER KARREMAN: Yes.
CHAIRMAN O'RELL: Rigo?
MEMBER DELGADO: Yes.
CHAIRMAN O'RELL: Nancy?
MEMBER OSTIGUY: Yes.
CHAIRMAN O'RELL: Julie.
MEMBER WEISMAN: Yes.
CHAIRMAN O'RELL: Joe?
MEMBER SMILLIE: Yes.
CHAIRMAN O'RELL: Bea.
MEMBER JAMES: Yes.
CHAIRMAN O'RELL: Andrea?
MEMBER CAROE: Yes.
CHAIRMAN O'RELL: Gerald?
MEMBER DAVIS: Yes.
CHAIRMAN O'RELL: And the chair votes yes.
MEMBER CAROE: 12-0-0-2.
CHAIRMAN O'RELL: The motion carries
retaining Lecithin on 606.

MEMBER WEISMAN: I have one more.

MEMBER OSTIGUY: Which one?

MEMBER WEISMAN: Commercial availability. Commercial availability is subsumed in the Handling Committee.

CHAIRMAN O'RELL: A big one.

MEMBER WEISMAN: So can I just make a motion, that we accept the recommendation that was discussed this morning?

CHAIRMAN O'RELL: Yeah. I'd read through the full recommendation.

MEMBER WEISMAN: Okay.

MEMBER SMILLIE: You mean the whole four pages?

CHAIRMAN O'RELL: No. The recommendation part.

MEMBER SMILLIE: The conclusion.

(Simultaneous Discussion.)

MEMBER MOYER: The conclusion.

MEMBER WEISMAN: The conclusion?

Okay.
CHAIRMAN O'RELL: No.

MEMBER MOYER: Page three.

MEMBER WEISMAN: Oh, okay. Sorry, okay. I get it. It's getting late. Sorry. The recommendation of the Joint Handling and Policy Development Committee for --

CHAIRMAN O'RELL: Do we have it up?

MEMBER WEISMAN: Yeah. Can we do that?

CHAIRMAN O'RELL: Do we have it up, because it is lengthy? But so the public can see. This is the same as what was in -- what was posted. There were some changes, but -- Joint Handling and Policy Development Committee

MEMBER WEISMAN: This document, this is what was posted on the website dated March 30th.

CHAIRMAN O'RELL: Okay. So it's the --

MEMBER WEISMAN: But mistakenly in the books yesterday was a version that says
March 13th, but that was replaced today. Everyone got a copy of the final.

CHAIRMAN O'RELL: Okay. So this is the March 30th posting recommendation.

MEMBER WEISMAN: That's the March 30th up on there.

MEMBER CAROE: Which part did you want up there? It is the part -- I just put part of the recommendation.

MEMBER WEISMAN: Okay. We want recommendation (a).

MEMBER CAROE: At the bottom?

MEMBER WEISMAN: Which is where you are. No, no, no. You were in the right place.

MEMBER CAROE: Okay. Here we go.

MEMBER WEISMAN: "The NOSB recommends using the procedures currently in place for petitioning materials onto 205.606, meaning those currently in place for petitioning in general also be used for petitioning materials onto 205.606."
"The document entitled "Information to be included in a petition" that's shown on the NOP website, should be amended to include a description of the information needed for the determination of commercial availability of non-organically produced agricultural products.

"The following additions to this document are recommended:

"(1) We have to add the following bullet to Item A, which right now only gives a check off for allowed synthetics and prohibited non-synthetics. Agricultural (non-organic substance) allowed in or on processed product labeled as organic.

"(2) Add the following two bullets to Item (b)(12). When petitioning for the inclusion on the national list of non-organically produced agricultural products, the petition must state why the product should be permitted in the production or Handling of an organic product.
"Specifically, the petition must include current industry information regarding availability of and history of non-availability of an organic form of the product, and all factors that may present a challenge to a consistent organic supply.

Second bullet. "When petitioning for the removal from the national list of non-organically produced agricultural products, the petition must state why the product should be prohibited from use in a non-organic form.

"Any information acquired since the original petition to add the material to the national list should be provided.

A is the recommendations that have to do with what petitioners will provide. B refers to what the NOSB's role will then be.

"In recommending that an agricultural ingredient should be placed on 205.606, the National Organic Standards Board shall review the petitioner's claim that no organic substitutes are commercially available
in the appropriate form, quality or quantity needed to fulfill an essential function in a system of organic handling.

Now C then refers "Once an item has been petitioned and recommended by the NOSB and is now on Section 606, it must be on 606. This is then what the accredited certifying agents' role will be.

"The accredited certifying agent, in granting a determination that an agricultural ingredient on 205.606 is not commercially available in an organic form shall (1) Evaluate the applicant or certified operator's documented claim that no organic substitutes are commercially available in the form, quality or quantity needed by the operation to fulfill the required function, including test data demonstrating that organic forms of the ingredient do not meet the functional requirements for the form or quality necessary to the operation.

"Number two. Validate that the
applicant or operator has documentation proving that the ingredient is not commercially available in an organic form, by reviewing credible, available information listing known sources of organic ingredients.

"Number three. Notify the certification applicant or certified operator of sources of information which list available organic ingredients."

I'd like to clarify here that it is not asking the certifier to list for the applicant sources of the ingredient; only sources of information which list ingredients.

"If the certifying agent finds that such ingredients exist, or maintain and submit to the National Organic Program annually an up-to-date list of ingredients that have been granted allowances in non-organic form.

"The list shall maintain the confidentiality of ingredient suppliers and parties granted allowances. The reporting requirements shall be implemented through the
accreditation process by providing ACAs ample notification and time to adapt data management systems.

"Five. Require certified operators to update commercial availability information in each organic system plan update. That means annually.

"Number six. Acknowledge all complaints concerning allowances granted, and provide rationale for determinations. If the investigation of a complaint provides significant new information, then the certifying agent must revisit the allowance."

I'm not sure why that "and" is there. I think that's a typo.

MEMBER CAROE: And is that the motion, Julie?

MEMBER WEISMAN: And that's the motion.

MEMBER OSTIGUY: Second.

MEMBER CAROE: Call the question.

CHAIRMAN O'RELL: It's been moved
and seconded. Discussion. Andrea.

MEMBER CAROE: I just want to make note that based on comments received and I think it should be very clear that the policy work plan should include working in collaboration with the program on the document that is "Information for a Petition to Add Detail to that Document."

Secondly, that perhaps the Handling Committee work plan in collaboration with the program, should develop the evaluation forms that will be used by the board in evaluating 606 petition materials.

MEMBER JAMES: That would go on the work plan.

CHAIRMAN O'RELL: Jeff.

MEMBER MOYER: I have a question for the Handling Committee and how they addressed the concern that came up today regarding the number of sources that are contacted in Section (c)(2).

MEMBER SMILLIE: Again, it's a good
point and it can be worked on. Remember, we've got -- this is the general recommendation, and it can be fine-tuned and detail can be added.

One of the things I was going to add, that the Committee also would work with the NOP during their presentation to the ACAs, of how this is going to be implemented and things like that could be.

Specifically about the three, it's a good number and it's a good general reference. But you know, we had a couple of submissions. One was entitled "Gaming the Commercial Availability Rule." There are many ways, you know, the flexibility that's allowed certification agents can be played with.

What we're trying to do is put a general recommendation forward to end that, and to really put a consistent level playing field into how certification agents deal with commercial availability.

My feeling is this is a good start,
but details can be added. It's not written in stone, and I think that really where the rubber hits the road on this is the two forms that Andrea talked about, but also how the NOP will roll this out in a training to the ACAs.

MEMBER CAROE: Thanks, Joe. I edited everybody else's work plan except my own. I wonder how that happened?

(Laughter.)

CHAIRMAN O'RELL: Yes.

MEMBER GIACOMINI: I have to admit I'm totally not up to speed on this issue, and it creates a lot of confusion for me. I do have one question. Are we saying that in order to implement the commercial availability and the three alternative issues that something has to be on 606?

MEMBER WEISMAN: That actually is the result of a court ruling. That's something that occurred outside of the activities of this board. So what we're trying to do is implement criteria and
procedures, so that the whole organic world can comply with the court order.

MEMBER GIACOMINI: So in the situations that I've experienced this kind of a situation, if someone's in a particular microclimate and needs 72-day corn, and they look and it's not available, corn seed would have to be on 606? I mean what is 606?

MEMBER WEISMAN: Well, 606 only refers to handling. Seed is a crops issue.

MEMBER GIACOMINI: Okay, thank you. That clarifies it. Okay.

CHAIRMAN O'RELL: Yes Andrea.

MEMBER CAROE: Just, you know, the background section of this I think clearly explains that commercial availability has been part of this regulation since the day it was implemented.

But the interpretation on how that is implemented drastically changed, and was refocused based on the court ruling. So this is the start of implementing those necessary
changes, based on the court ruling.

If you take an opportunity to read the background, hopefully that will explain it if you have further questions.

MEMBER GIACOMINI: One of the things I -- while having read the rule, I certainly have not memorized all the numbers yet.

CHAIRMAN O'RELL: Julie, I know there was some public comment given, in terms of some people thinking that there should be additional information put on Section B. Maybe you'd like to address that and what some of the Committee thoughts were along that line.

MEMBER WEISMAN: Yes. Well, that was actually -- that was a reference to an earlier draft, an even earlier draft of this, the many earlier drafts of this recommendation.

Section B, what the NOSB would be doing, was laid out in -- with separate numbered sections for the NOSB considering
form, considering functionality. Also, the
language of it in the earlier draft was that
we would evaluate during the petitioning
process those claims.

The feeling of the Committee was
that we would not be in a position to evaluate
all the many manufacturers that might use an
item for many different functions, that that
has something that historically has been done
by the certifiers on a case-by-case basis.

It should continue to be done that
way, while recognizing that we needed to
continue to work on how certifiers were going
to have more guidance as to how to tighten up
and make the process more rigorous concerning
allowances for non-organic agricultural
products.

CHAIRMAN O'RELL: So if a person
petitions an item through this process and
gets it on 606, ultimately they're going to be
accountable for the ACA criteria that is in
Part C.
MEMBER CAROE: And they'll be held by their certifier to the requirements under C.

CHAIRMAN O'RELL: Right. Rigo?

MEMBER DELGADO: One of the concerns as well was to make sure that the applicant knew exactly what is it that ACA was going to request on that.

MEMBER CAROE: What the ACA was going to request, or the petition?

MEMBER DELGADO: Or the petition.

MEMBER CAROE: And that's why adding to the work plan for policy, to work with the program and revise the information for petition document.

Because right now, the recommendation that we've made is consistent with the language in the document now, knowing that further detail needs to be put in not only for List 606, but for 601, 602, 603.

CHAIRMAN O'RELL: So the petition, the current petition process is going to
undergo a change, with listing of additional
criteria on the petition process itself, and
this will go in conjunction with that.

MEMBER ENGELBERT: One quick
question for the Committee. Who will
determine essential function in Part B?
That's the only gray area that I see, that I'm
concerned about.

CHAIRMAN O'RELL: Well, maybe Joe,
as a certifier, you might want to go through
the answer to Kevin's question, in terms of
how you would approach the function?

MEMBER ENGELBERT: An essential
function.

MEMBER SMILLIE: Of the material?
Could you just repeat it Kevin?

MEMBER ENGELBERT: The last sentence
in B about -- yes. Who needed to fulfill an
essential function and is that just a given,
or is that something that needs to be
determined at the time this material is
petitioned?
MEMBER SMILLIE: Well again, if it's B Section, that's something the NOSB has to do. The C section is what the accredited certification agent has to do.

MEMBER ENGELBERT: Okay.

MEMBER SMILLIE: So that will be an NOSB rule to determine.

MEMBER WEISMAN: But we will be doing that on the basis of information that's been included in the petitions.

For instance, some information that would be included by a petitioner would be that they have already had allowances from their certifier, to use the non-organic form of this product based on that nothing was commercially available to fulfill that question.

That's one of the types of information that we will have available to us when we are making this determination. We would want to see, at the very least, that there's a history that is verified already by
ACA.

MEMBER ENGELBERT: Okay.

MEMBER DELGADO: But again, we would need as board members some sort of template, if you will, or a list of criteria that includes, yes, not only that it passed the certifier's point of view, but also look into specific areas like what Kevin was pointing out. We need to define those.

I think that's why the importance of defining, or the work that Andrea was pointing out, comes into play. We need those specific elements that will standardize.

MEMBER WEISMAN: Well, can I make -- I will suggest that we're going to -- after we finish voting on this item, we're going to be talking about our work plans, and that it would probably --

It would be appropriate if the Handling Committee, possibly in conjunction with the Policy Development Committee, add to the work plan the development of any changes
or additions to the current evaluation criteria checklist that we have, to make it appropriate for this purpose.

MEMBER JAMES: I just want to clarify that this recommendation will evolve over time, as more input and more information comes back to us about things that need to be clarified, things that need to be further defined, and that by putting it on the work plan is part of that process.

CHAIRMAN O'RELL: I will recognize Kim quickly.

MS. DIETZ: I just want to go on the record that you're going to have a lot of petitions coming in. So even though this could be an evolving work plan and we could redefine it, that it doesn't stop the process of those petitions being received and reviewed.

If you guys aren't ready for them and they're coming in, they need to go through, because within a year, they're going
to -- they need to be on the national list.

    So you know, as long as you can keep working on it. But it doesn't stop a petition for being incomplete, or you don't have the criteria together. You guys need to start working on these. This is the other train wreck.

    You know, we had the sunset and now we have 606. I would also encourage the board to get the rest of the group up to speed on 606, because there potentially could be hundreds of materials out there coming your way.

    MEMBER JAMES: Kim, I agree with you 100 percent. I don't think that there's any way that this document could be further and further and further crafted, to not evolve once the petitions come in, because the petitions are going to be basically information for us, on how it needs to be further defined.

    MS. DIETZ: Right, and it's going to
be you're kind of learning as you go. But you have a foundation, but as long as it doesn't stop the process, because you will have to develop that criteria.

CHAIRMAN O'RELL: No. I truly view this as a foundation that we need to build upon. I think we're going to learn from this that --

MEMBER OSTIGUY: It's a living thing.

MS. DIETZ: Well, but in the past -- I'll just tell you from past chair experience, if a petition isn't complete, it stops with them. If they don't have the information that you want, then it's not going to go the board, and then you're going to bog the system down.

If you don't have your criteria set, you're not going to be able to vote on it. So it is pretty important to get that stuff figured out before you start reviewing materials, and they're coming.

MS. FRANCES: Valerie Francis. I'm
going to do my best to work with this process, to make sure things don't become a train wreck. So you haven't had me before, so I hope I can be helpful.

CHAIRMAN O'RELL: Okay. Thank you, Valerie. All right. I think we're ready to vote. We're voting on the recommendation of commercial availability, to set the recommendation. Hugh?

MEMBER KARREMAN: Yes.

CHAIRMAN O'RELL: Rigo?

MEMBER DELGADO: Yes.

CHAIRMAN O'RELL: Nancy, before she left hearing the discussion, left a "yes" for me with a proxy. Julie?

MEMBER WEISMAN: Yes.

CHAIRMAN O'RELL: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN O'RELL: Bea?

MEMBER JAMES: Yes.

CHAIRMAN O'RELL: Andrea?

MEMBER CAROE: Yes.
CHAIRMAN O'RELL: Gerald?
MEMBER DAVIS: Yes.
CHAIRMAN O'RELL: Dan?
MEMBER GIACOMINI: Abstain.
CHAIRMAN O'RELL: And the chair votes yes.
MEMBER CAROE: 11-0-1-2.
CHAIRMAN O'RELL: Okay. That concludes the work and action items for the Committee. The last thing on the agenda was to present Committee work plans. You take five? Asking for five. Okay.
I'll take five, but five, so we can get back and just wrap up with the Committee work. Andrea, did you say you wanted to start?

**Presentation of Committee Work Plans**

MEMBER CAROE: If you don't mind. It's very short. The CAC has three items on work plan. Outstanding item is to collaborate with the NOP on a peer review procedure for the continuation of a peer review at the
program level.

The second item is to collaborate with the NOP again on response items to the previous peer review through ANSI.

The third item is once again to collaborate with the NOP on ACA training, specifically in regards to application of commercial availability.

CHAIRMAN O'RELL: Okay. Any questions of Andrea? The one thing I would ask is that all of the committee chairs, let's point out who in your committee is the vice chair.

MEMBER CAROE: Vice chair for our committee is Joe Smillie.

CHAIRMAN O'RELL: Joe Smillie. We want to get this on the record, so Joe Smillie is vice chair. Who's next? Who wants to go?

MEMBER KARREMAN: I'll go.

CHAIRMAN O'RELL: Hugh?

MEMBER KARREMAN: Actually, this is for Livestock and I am the vice chair but
acting chair, so I'm both. But no. Technically I'm vice chair, just for the record, and Mike Lacy is chair.

When I talked to him on Monday before coming up here, basically two things that he mentioned were to work on the last third of gestation or the livestock replacement clause, because of things that are happening after June 9th. That's the first thing.

The other thing is to, now that we've received the aquiculture report, to you know, consider that and work on that.

Okay. In terms of the aquiculture -- what did I say? Aquiculture. Yes. In terms of the aquiculture report, George Lockwood is expecting Mike Lacy to contact him, to have a discussion, so that they can get on the same page in terms of further direction, what plans can be done internally.

Since that working group has not been disbanded, what other things they might
be able to help out and what is the time line
and continuation of the shellfish part of that
recommendation that needs to come in a report
form. Yes Andrea?

MEMBER CAROE: George approached me,
and asked the board to consider an ad hoc
group to deal with aquiculture, since it's not
a direct fit with livestock. It's been stuck
with livestock because it's a better fit than
any other committee.

But perhaps an ad hoc committee,
where maybe there's a variety of different
talents to that group.

CHAIRMAN O'RELL: So you want an ad
hoc committee composed of, within our board?

MEMBER CAROE: Of committee members
-- board members, yes.

CHAIRMAN O'RELL: Okay, okay. Maybe
Mike can discuss that.

MEMBER JAMES: Maybe some kind of
Joint Committee?

MEMBER CAROE: Not necessarily a
joint committee. Just an ad hoc committee. It could be members from any one of the different committees.

CHAIRMAN O'RELL: There are some other people on the board that have an interest in being involved in that activity. Okay.

MEMBER KARREMAN: These aren't necessarily in the order that, you know, they're just on the work plan. Also of course keep dealing with the pasture issue with the NOP. Keep going back and forth with them, work with them as we can from our symposium here.

Then I think from the public comments and what we said right before the votes today, I think on the work plan would be to -- and we could do this from within the NOSB I guess, change the annotations on oxytocin and perhaps Ivermectin. I'm not certain on that.

But there are two materials that we
need -- because of the votes and public comment, we need to kind of keep on the burner.

CHAIRMAN O'RELL: Okay.

MEMBER JAMES: I have a question. Can I ask you something Hugh?

MEMBER KARREMAN: Yes.

MEMBER JAMES: There was a comment that there's an organic system plan for livestock, as far as dairy operations and pasture. I was wondering if you guys were going to look into that and see if that outline -- Jim, you had mentioned something about that, and if --

MEMBER KARREMAN: What George had mentioned as the farm system, the old farm plan? He wants that reemphasized? No? Go ahead.

MR. RIDDLE: Yes. Jim Riddle. Yeah, ATRA has been commissioned by NOP to work on system plans, and has the livestock plan template. It's not just for dairy or
pasture, but it includes those.

So yes, I think that would be good for the Livestock Committee, to be ready to review that, because my understanding of it, George Kipper will soon be submitting it.

MEMBER KARREMAN: Yeah, great. So we will be looking at ATRA checklist.

CHAIRMAN O'RELL: Good. Thank you. Rigo?

MEMBER DELGADO: The PDC has four items on the table. The first one is to make sure that we finish finally the new guide, the guide for new members, 101. The second one is elements that we've been working on since our last meeting.

The second point includes revision of the board policy manual, specifically concentrating on the clarification of deferral.

The third item will be review potentially separation of mineral source supplements from ag source supplements.
The final one is work together with Crops Committee to define the temporary variances for research. Bea is my vice chair.

MEMBER JAMES: There's pain in us all.

CHAIRMAN O'RELL: Okay. For the record, Bea is the vice chair.

MEMBER DELGADO: Yes, and I also should mention that I'm going to be working closely with NOP, to make sure we come up with a nice new guide that is suitable for everyone.

CHAIRMAN O'RELL: New guidelines?

MEMBER JAMES: The new member guide.

MEMBER DELGADO: No, the new member guide.

CHAIRMAN O'RELL: The new member guidelines. Okay, thank you.

MEMBER CAROE: What was the third item, Rigo? Mineral supplements?

MEMBER DELGADO: Yeah. Review potential separation of mineral source
supplements from ag source supplements.

MEMBER JAMES: I also just want to clarify that the policy and procedure manual is actually under the leadership of the vice chair.

So that as we go forward with the notes on things that need to be changed in the policy and procedure manual, that the Policy Committee will be working with Andrea on that.

CHAIRMAN O'RELL: Rigo, going back to that separation, I'm confused.

MEMBER DELGADO: Me too.

CHAIRMAN O'RELL: Okay.

MEMBER DELGADO: Let me -- as I said, I inherited these points from the previous chair.

CHAIRMAN O'RELL: Who was?

MEMBER DELGADO: Who was Dave Carter.

CHAIRMAN O'RELL: And I just saw Dave leave the room. He knew you were going to say that. He hightailed it out.
(Laughter.)

MEMBER SMILLIE: He had his own distractions.

MEMBER DELGADO: If you remember, we managed to clarify what Point 4 was, temporary variances. But let me have that as my assignment, and I promise --

CHAIRMAN O'RELL: Contact Dave and find out what his intent was.

MEMBER DELGADO: I'll find out the details.

CHAIRMAN O'RELL: Because I don't understand it.

MEMBER DELGADO: I apologize for that.

CHAIRMAN O'RELL: Do you Jim?

MR. RIDDLE: No.

CHAIRMAN O'RELL: Okay. Then I don't feel so bad.

MEMBER DELGADO: But I think I do.

(Laughter.)

CHAIRMAN O'RELL: All right, thank
you, Rigo. Tried to slide it by. You felt
his voice lowered, but it was a --

(Laughter; simultaneous Discussion.)

MEMBER CAROE: Shall we move along?

CHAIRMAN O'RELL: Handling Committee, moving on. Yes, go.

MEMBER WEISMAN: Okay, all right. I've got to say I was really looking forward to just crossing sunset materials off the list, but we do have one deferral. So we will be requesting a TAP on colors and seeking petitions on specific colors. We'll still be doing that.

Next on our work plan is to continue to work on the ag/non-ag question, in conjunction -- as a joint venture with the full Materials Committee, especially in light of the new request for consideration of yeast as either livestock or non-plant life.

CHAIRMAN O'RELL: Non-plant life, a part of its definition of livestock.

MEMBER WEISMAN: All right.
Pasture, no. We will also -- actually Bea had prepared, although it didn't get attached, a very detailed step-by-step plan, including a time line, for how we are now going to incorporate into a revised recommendation on synthetic versus non-synthetic, a definition of synthetic that incorporates all of the wonderful feedback we got from the program, as well as some other public comments that were very thorough and insightful. We will also be working on that jointly with the Materials Committee.

We will continue to participate in the Pet Food Task Force work, which I participate in, and I can continue to do that until such point that it becomes an item that the full committee will need to consider.

CHAIRMAN O'ReLL: And your vice chair?

MEMBER WEISMAN: I don't have a vice chair.

CHAIRMAN O'ReLL: Because it's
important, because the vice chairs of the Handling Committee and the Livestock Committee and the Crops Committee will be the liaison on the Materials Committee for petition review.

MEMBER WEISMAN: Right.

CHAIRMAN O'RELL: So we need to -- if you don't have one now, you need to -- maybe in the first committee meeting that we have, we need to get one and have it on record, so that we have a vice chair.

MEMBER WEISMAN: Right. I'm going to have to hone my arts of persuasion.

CHAIRMAN O'RELL: So nobody will be answering your e-mails or phone calls.

MEMBER CAROE: Julie, you have one other item?

MEMBER WEISMAN: Yes. We're not -- yes, I'm not finished. I'm not finished.

CHAIRMAN O'RELL: Oh, sorry.

MEMBER WEISMAN: We went a long way to getting commercial availability off this list. However, even with today's, passing of
today's recommendation, we will continue now to have to work with the program about what kind of guidance to add for ACAs, in determining commercial availability.

Also, that we will need to work on how to amend the evaluation criteria checklists, so that we know that we've gotten the information that we need from petitioners, in order to make an adequate recommendation. Kevin?

MEMBER CAROE: Dealing with commercial availability with the ACAs is right now on CAC work plan, but you're welcome to have it.

MEMBER WEISMAN: How generous of you, Andrea.

MEMBER CAROE: I'm just, you know. I'll share the love.

MEMBER WEISMAN: We'll continue to work on the A and B things, and you can have C.

CHAIRMAN O'RELL: Yes, yes. There's
enough on the plate.

    MEMBER WEISMAN: Right, okay.

    CHAIRMAN O'RELL: Julie's ambitious.

    MEMBER WEISMAN: Wait. I'm not done. Review petition substances as needed. That's going to include the avalanche of 606 petitions that are going to come in, and then we also have this --

    MEMBER SMILLIE: Isn't that an entire board function? That's not a Handling Committee function.

    MEMBER WEISMAN: Well, 606 is --

    CHAIRMAN O'RELL: No. It goes to the specific committee.

    MEMBER WEISMAN: It goes to Handling first.

    CHAIRMAN O'RELL: And then the committees make recommendations to the full board. That's how --

    MEMBER JAMES: Jim's laughing at her.

    CHAIRMAN O'RELL: Jim, you're
enjoying this.

(Laughter.)

MEMBER WEISMAN: And we have some new petitions that we didn't even have to consider, because of the sunset process, such as jelling gum, and I'm sorry I don't have the complete list. But we do have --

CHAIRMAN O'RELL: We have back petitions that -- yes.

MEMBER WEISMAN: We have petitions that need to be reviewed. And then --

MS. FRANCES: You will be getting stuff next week.

MEMBER WEISMAN: Oh, thank you Valerie.

MEMBER CAROE: Thanks. You're not going to even give us a week?

MS. FRANCES: I've put it off three, actually.

MEMBER WEISMAN: Food contact substances was on the work plan, okay.

CHAIRMAN O'RELL: We've got -- I
don't think -- between now and October. I mean really, I mean it could be back burnered on the work plan, but between now and October are the items that we need to address here now, so that the public knows that we'll be moving forward with those for the October meeting.

MEMBER WEISMAN: And respond to Q&As as needed. Is that --

CHAIRMAN O'RELL: Sure.

MEMBER WEISMAN: Okay. That's it.

CHAIRMAN O'RELL: Okay.

MEMBER KARREMAN: Question for Kevin. You mentioned that the vice chairs of each committee are the liaison for petitions to the Materials Committee.

How do you mean? That the vice chair what, shepherds it through the whole process until it gets to the Materials Committee or what?

CHAIRMAN O'RELL: It's in the policy manual.
MEMBER KARREMAN: I should read it.

(Laughter.)

MEMBER CAROE: That welcome letter that said you were supposed to read that before you showed up.

MEMBER KARREMAN: Yep. I got that too.

(Simultaneous Discussion.)

CHAIRMAN O'RELL: Pardon me?

PARTICIPANT: Materials Committee work plan?

CHAIRMAN O'RELL: The number one item on the Materials Committee is the synthetic/non-synthetic document, and then I need to confer with Nancy, to get her list, and get it in the record.

PARTICIPANT: Do we know what -- (not on mike).

CHAIRMAN O'RELL: No, we don't.

MEMBER CAROE: I've got to go. Sorry, Kevin. I've got to go.

MR. NEAL: They're all updated on
CHAIRMAN O'RELL: They're on the website, but --

MR. NEAL: I don't have them off the top of my head.

CHAIRMAN O'RELL: I don't have them on the top of my head. They're on the website. Gerald?

MEMBER DAVIS: Crops Committee work plan. New petitions, lime mud, sulphuric acid in manures, and any other new ones that might come in. I hear there are some.

Two older ones, cyprotein isolate and ammonium bicarbonate. I'm assuming we're still hung up with those, waiting for the synthetic/non-synthetic recommendation to be completed, because those too have issues that we felt were unanswerable until we get that one done.

Finish the compost heap recommendation, which the two parts left to finish on that is the compost heap itself and
dehydrated manures, as part of that, and some vermiculture stuff too.

   Commercial availability of seed.
   Look at the August `05 recommendation and possibly improve the recommendation concerning the national database that was suggested in that, as well as comments that came from certifiers about the workload and the ramifications of that, what that would mean for them.

   Hydroponics is still on the list. Gather information and fact-finding on how and if hydroponics should have or could have standards, organic standards.

   CHAIRMAN O'RELL: And your vice chair? You need to appoint one. Did you appoint one?

   MEMBER DAVIS: No. I just said we need to pick one.

   CHAIRMAN O'RELL: Okay. I thought he was looking at you. Everyone was looking at you. So okay.
(Simultaneous discussion.)

MEMBER JAMES: That's how Joe got appointed.

MEMBER DAVIS: I looked at Kevin too.

(Simultaneous discussion; laughter.)

CHAIRMAN O'RELL: Okay. So that concludes the --

MEMBER DAVIS: If either one of you are available and interested.

MEMBER MOYER: I can do it if you want me to.

MEMBER JAMES: Oh, stepping up.

CHAIRMAN O'RELL: Okay, Jeff.

MEMBER DAVIS: Kevin said yes too. Okay. Kevin's deferring to Jeff.

CHAIRMAN O'RELL: I'll let you guys work it out, just as long as we have one. Okay. Just some quick closing comments, because I know everybody wants to get out of here. We're running late again.

So I'd like to certainly thank the
public for all their participation, especially the few souls that are sticking with us to the very end. Thank you.

But there was a lot of good input from the public during this meeting. I'd certainly like to thank the NOP and staff for all the hard work that was done in preparation for this meeting.

(Applause.)

CHAIRMAN O'RELL: In recognizing Valerie, this has been a new thing with us to have the executive director.

(Applause.)

CHAIRMAN O'RELL: It really has been a lot of help on committee calls and getting things together and organized.

I'd like to thank the Livestock Committee, working in conjunction with the NOP and pulling off a very good pasture symposium.

I think we had a lot of good feedback that I've heard from a lot of farmers and people who traveled here to listen to it. So thanks
for everybody's participation in that.

    I'd like to thank the board for supporting past board members. I'd like to thank those that are still here as past board members for their help. The current board, thank you so much for getting me through my first experience here as chair.

    (Applause.)

    CHAIRMAN O'RELL: And the new members, because I really think the new members came out of the chute just alive and kicking, and it's really good. You've been -- the participation has been there.

    (Applause.)

    CHAIRMAN O'RELL: No, it's been really good. On the committee participation level, and even at the committee level, there's been a lot of good participation with the new members. So with that --

    MEMBER CAROE: Motion to adjourn.

    MEMBER SMILLIE: I'd like to thank the philosophy major who kept everybody
speaking into the microphones.

(Applause.)

CHAIRMAN O'RELL: I would accept a motion to adjourn.

CHAIRMAN O'RELL: Oh Kevin.

MEMBER ENGELBERT: I'd just like to thank all NOSB members, past and present, and the NOP, for making this such a seamless transition for me to come onto the board. I'm very appreciative of all your help.

CHAIRMAN O'RELL: Thank you, and Mark, sorry. You wanted to address us.

MR. BRADLEY: Just very briefly, you know. Thank everybody of course for your perseverance through all of this, and the excellent support that we've had from our court reporter and audiovisual person.

(Applause.)

MR. BRADLEY: I would also like to comment on, again, echoing Kevin's seamless
transition is due in no small part to their jumping in with both feet and attacking all these issues.

They acted just like senior board members, and we're looking forward to an excellent spirit of cooperation with them, the program, and we'll use -- expect a lot out of our new executive director, Valerie, and she's just doing great. Thank you. Thank you all very much.

CHAIRMAN O'RELL: Thank you, Mark. Just one quick comment before I ask for an adjournment. There's a photographer here that would like to get a picture of the board, whatever's left of us.

So well, he'd like to get what's left, okay. So we promised him -- he's been hanging around to do this, so we're going to go do it. I don't want to hear "camera shy."

I will accept a motion to adjourn.

MEMBER SMILLIE: I move for adjournment.
MEMBER DAVIS: Second.

CHAIRMAN O'RELL: All those in favor?

(Chorus of ayes.)

CHAIRMAN O'RELL: Thank you.

(Whereupon, at 6:31 p.m., the meeting was adjourned.)
UNITED STATES DEPARTMENT OF AGRICULTURE

NATIONAL ORGANIC STANDARDS BOARD

MEETING

TUESDAY,
OCTOBER 17, 2006

The meeting was held in Salons 1 and 2 of
the Radisson Hotel Reagan National Airport,
2020 Jefferson Davis Highway, Arlington,
Virginia, at 9:00 a.m.,
Kevin R. O’Rell, Chair, presiding.

BOARD MEMBERS PRESENT:

KEVIN R. O’RELL Chair
ANDREA CAROE Vice Chair
BEA E. JAMES Secretary
GERALD A. DAVIS Member
RIGOBERTO I. DELGADO Member
KEVIN ENGELBERT Member
DANIEL G. GIACOMINI Member
JENNIFER M. HALL Member
HUBERT J. KARREMAN Member
MICHAEL P. LACY Member
JEFFREY W. MOYER Member
NANCY M. OSTIGUY Member
JOSEPH SMILLIE Member
JULIE S. WEISMAN Member

NOP STAFF PRESENT:

Closing.................................  390
CHAIR O'RELL: Okay. I'd like to officially call to order the October 2006 NOSB meeting. We are -- oh, we have another Board member. Good. One more will be coming. Oh, Nancy.

So the only board member who is not here is Rigo, he is going to arrive a little later today. He's traveling today out of Texas. Hopefully, the weather will allow him to get up here but I think he's planning on arriving about 2:00.

I'd like to welcome everybody in the audience to the meeting. I'd like to welcome the NOP and fellow board members.

Just a reminder, and that was just my cell phone went off just so it could prompt me to remind everybody, I had that set, for everybody to turn off your cell phones or please put them to vibrate because now the rule is in effect. If your cell phone does go off, you will by the board a drink. And since this is my last meeting, I
will take people up on drink offers. I will make sure that's enforced.

Approval of Agenda

The first thing we'd like to do is to approve the agenda. Has everybody had a chance to look at the agenda? Is there any discussion or a request for anything to be changed?

(No response.)

CHAIR O'RELL: Hearing none, I would accept a motion to approve the October 2006 NOSB agenda.

MEMBER CAROE: So moved.

MEMBER KARREMAN: Second.

CHAIR O'RELL: It's been moved and seconded. Any discussion?

(No response.)

CHAIR O'RELL: All those in favor?

(Chorus of ayes.)

CHAIR O'RELL: Opposed? Same sign.

(No response.)

CHAIR O'RELL: The motion carries. The agenda is approved.
From the agenda, we have two public sign up sessions that are available for Tuesday afternoon and one for tomorrow afternoon. And I believe the sign-up books are just right outside the hall and they will be left there during the morning for anybody to sign up for this afternoon's session.

As has been our practice in the past, we are having these public sign-up sessions so that we can hear from the public and get comments about some of the discussion and recommendations that we have posted. This is a very important process, part of the process, where we come out with our recommendations and we really, really encourage and want to hear from the public. Because I know there are a couple of recommendations that I'm sure we will hear from the public. And that's part of the process. It's a good thing. As we deliberate on that discussion, we can ask questions of public commenters. But we also take in that information and we digest that before we come out with final
recommendations and it may or may not influence us in the direction that we go for certain recommendations and voting. So the public process here is very important for the comment section.

I'd like to begin by just going -- well, first, I'd like to ask are there any other, any board announcements that people might have? Any announcements from the board?

(No response.)

CHAIR O'RELL: Hearing none, I'd like to now have introductions from board members. Start with Mike, if you can tell a little bit about where you're from, what segment you represent and maybe just a little bit about why you're here.

MEMBER LACY: Okay. Mike Lacy. I am the science representative -- I'm sorry. Thank you.

Mike Lacy from Athens, Georgia. I'm the science representative on the board and this is my fifth year on the board. I serve as the chair of the Livestock Committee. And I have enjoyed very much my
five years and looking forward to this meeting.

MEMBER KARREMAN: Hubert Karreman. I am one of the environmentalist seats. I'm from Lancaster County, Bart Township, which was in the news lately. I'm a dairy practitioner. I work with about 80 certified organic dairy farms locally. And I'm in my, what is it, second year now.

MEMBER DAVIS: Gerald Davis, grower representative on the board. This is my second year. I'm the Crops Committee chair and I work out of Arvin, California for a large organic vegetable farm, actually the largest single grower in the country. And I'm looking forward to this meeting, too. Thanks.

MEMBER SMILLIE: My name is Joe Smillie, I live in Burlington, Vermont and I'm the certifier representative on the board. It's my first year. I participate in the Certification and Accreditation Committee and the Handling Committee and am a longtime organic proponent.

MEMBER JAMES: Bea James. I am
currently the secretary NOSB. I hold the retailer seat on the board and I am Vice Chair of the Policy Committee and I also serve on the Accreditation and Certification Committee and I'm excited to be here.

CHAIR O'RELL: Kevin O'Rell from Boulder, Colorado and I represent the handlers on the board. This is my final meeting as a NOSB member. I'm looking forward to getting to the other side, like Jim Riddle, where I can sit and look, and stare at the board, and make faces when we say the wrong thing.

I've been in the organic industry a little over ten years in product development, operations, and regulatory affairs.

MEMBER CAROE: I'm Andrea Caroe. I hold an environmental seat. I am presently the Vice Chair of the board. I chair the CAC and I sit on handling, policy, Aquaculture Task Force. I think that's it.

CHAIR O'RELL: Do you want more to do?

MEMBER CAROE: No. In my private
life, I work for a sustainable certification firm as the director of operations.

MEMBER WEISMAN: I'm Julie Weisman. I hold one of the handler positions on the board. This is my second year. I'm chairman of the Handling Committee and in addition to that, I am on the Certification Accreditation, which -- what am I missing? And Compliance Committee and also on materials. I'm from Tenafly, New Jersey, which is North Jersey. And I've been an organic consumer for my whole adult life but I've been involved in the industry for the last ten years. My company makes organic flavor ingredients, among other things. And yesterday was my daughter's seventh birthday.

MEMBER OSTIGUY: Nancy Ostiguy. I'm an environmental rep. I've been, this is my fifth year, so last meeting. I've been on the Livestock Committee, the Materials Committee and Crops Committee.

MEMBER HALL: I'm Jennifer Hall. It's my first years as a consumer representative. I reside in Spokane,
Washington and I work for Chefs Collaborative, which is a nationwide, nonprofit, dedicated to educating chefs in the culinary community about sustainable foods. I've been a longtime organic consumer myself and so I'm very interested in the integrity of what we're doing. I serve on the Livestock, and the Accreditation, and Compliance Committees.

MEMBER MOYER: I'm Jeff Moyer. First year on the board representing the growers' side of things. I'm on the Crops Committee, Vice Chairman there. I'm on the Livestock Committee and Farm Manager for the Rodale Institute. I've been there for 30 years. And I've been involved with organic a long time.

MEMBER ENGELBERT: I'm Kevin Engelbert. I'm a dairy farmer from Nickols, New York. I represent one of the grower seats. I'd like to publicly thank my sons again for taking over the slack that's created by my being on the board. Their position has changed somewhat. They think it should be a paid position because I've
put a lot of time into this and I want to thank them again for take up the slack.

MEMBER GIACOMINI: My name is Dan Giacomini. I'm from California. I have one of the consumer seats on the board. I serve on -- I'm chair of the Materials Committee. I also serve on Livestock and I've helped out quite a bit this last six months on Aquaculture.

CHAIR O'RELL: Thank you, Dan. I'd like to have NOP introductions. If we could go around the room starting with Mark. I'm sorry, Mark, did I catch -- just to introduce at the table for the NOP for the audience.

MR. BRADLEY: I was going to do that in my remarks, but we can do that now. I'm Mark Bradley. I'm the Associate Deputy Administrator and this is my boss, Barbara Robinson, she's the Deputy Administrator for transportation marketing programs for AMS. Demaris Wilson, the Assistant Associate, or Assistant Deputy Administrator, the title gets me every time, Assistant Deputy Administrator. Katherine
Benham, who works for the National Organic Program staff and she is tasked with managing all of the board activities as far as, she's a board specialist. But she does a lot more with the NOP in terms of handling our budget and she is the administrator for the list of accredited certified operations. So she has a huge job.

Going down the line, Toni Struther. Say hi to everybody, Toni.

MS. STRUTHER: Hi everybody.

MR. BRADLEY: Most of you that are regulars at this meeting know Toni. She does a lot of work for the program and she is in charge with a lot of the communications that happen with the NOP right now. She also is one of our ramrods for the regulatory process. She knows the process better than really anyone on the NOP staff, so I depend on her to keep the process flowing. And we'll talk a little bit more about what she does in a little bit.

Next to her is Jonathan Melvin.
JD is our accreditation manager. JD is very busy right now because we have a whole flood of new applications coming for the renewal.

Next to him is Bob Pooler, across the isle. Bob is our materials expert, has been on the staff for seven, eight years now. Seven years.

And of course you know our new, well not new anymore, I guess she's been around for a while, NOSB Executive Director, Valerie Frances.

And who else? Francine Torres. Francine's out at the front desk. Francine is the secretary for the program and she is really the one that keeps my life straight and keeps things moving in the programs. She's responsible for the quality control of the documents that go out the door and schedules everything, does travel, really does a great job for the program.

Not present here today, Mary Lu Lusby. She was going to come. She's been out of the office for about a week, so she's trying to catch up on all the applications for accreditation that have come in in her
absence.

But I think that's pretty much it for the NOP staff.

CHAIR O'RELL: Thank you, Mark.

I just, I want to caution board members that all of these microphones up here are live all the time. Normally we have buttons where we can control them. So, conversations that you might have are going to be transcribed into the public record. So, just be aware of that.

Kevin mentioned the fact that there's a lot of time put in by board members here. There certainly is. I asked Valerie just to kind of give me a count since the last meeting on how many committee calls we've had. There's been a total of 62 committee calls since the last meeting. In the month of August alone, there were 23 calls and totaling 33 hours. So, and that's for one month. And that might have been the high point but July and September were also very active in preparation for this meeting. So, --

MEMBER CAROE: Does that include
Aquatic Task Force?

CHAIR O'RELL: The question, does that include Aquatic Task Force?

MS. FRANCES: Yes.

CHAIR O'RELL: Yes. So, everybody's included. You want her to run up the numbers?

MEMBER CAROE: No, I just assumed it was a lot more than that.

CHAIR O'RELL: I know. It does seem like a lot more than that. But that is the number. It doesn't count email and time. That's just phone time and the preparation time.

So there is just an incredible amount of work that this board undertakes and certainly, between now and our next meeting, we know we have another mountain to climb because materials are mounting and we absolutely need to get to those and that's going to be a priority we talk about at this meeting.

I'd like to now turn over to Bea and have her give us the Secretary's Report.

Secretary's Report
MEMBER JAMES: Okay. So, I have my script here. My bachelor's degree is in acting and so I just can't do anything without a script.

I'd like to give an update on Executive Committee minutes. This is something that often times we do vote on at the board meetings. Executive Committee conference call minutes will be approved by the Executive Committee as part of the conference call agenda. The Executive Committee will discuss the role of EC minutes at the board at our next call. And, at this time, Mr. Chair, we do not have Executive Committee minutes to approve. This will become a process of our calls internally within the board. And Executive Committee minutes are posted, if anybody wants that information, it's available on the website.

CHAIR O'RELL: But just to be clear, this has been part of our process and it's something that has been continuing.

MEMBER JAMES: Right. And next, I'd like to talk about the policy on meeting
Minutes, in the past, have been extrapolated from transcripts. That's something that the NOP has provided for us. Due to labor reasons, we will no longer be receiving minutes extrapolated from the transcripts. However, transcripts are available for viewing on the website. This changes currently and we're going to experiment with the role of the secretary, the NOSB secretary and we'll be taking very brief minutes based on the agenda items during these meetings. And that will be our internal information on the minutes and we'll see how this process goes and we'll vote on minutes that the Secretary takes on the NOSB board meetings. But we will no longer be receiving minutes from the NOP transcribed out of the transcriptions.

And if anybody has any questions or discussion on that, we can open that.

(No response.)

MEMBER JAMES: Okay. So, with that, we will also be voting on transcripts at the board meeting. And I would like to
move to accept the transcripts that have been received by the NOP from the August 2005, November 2005, and April 2006 NOSB board meetings and that these transcripts now serve as official record from those meetings, and that we have received those from the NOP.

CHAIR O'RELL: And that is a motion?

MEMBER JAMES: Motion.

CHAIR O'RELL: Is there a second?

MEMBER KARREMAN: Second.

CHAIR O'RELL: Hugh seconds. Any discussion?

MEMBER CAROE: I just want to clarify that we are voting to accept the minutes, we are not voting to approve -- I mean the --

MEMBER JAMES: The transcripts.

MEMBER CAROE: -- transcripts.

We're voting to accept them and not approve them because they're not up for discussion for change. They are just being accepted into the record. They are what they are. There is no debate.
MEMBER JAMES: Okay. So, do we want to --

CHAIR O'RELL: Any more discussion?

(No response.)

CHAIR O'RELL: It's been moved and seconded. All those in favor?

(Chorus of ayes.)

CHAIR O'RELL: Opposed?

(No response.)

CHAIR O'RELL: The motion carries.

Is that, that is the Secretary's Report?

MEMBER JAMES: And that is the Secretary's Report.

CHAIR O'RELL: Okay. We're going to call on Valerie from the Program to go through a little public training session on the transcripts, so people have a better understanding, if you haven't been there. There's a lot of document there, obviously, from two and a half to three days of meetings. So, Valerie's going to go through some tips on searching through the
transcripts to try to find information that might be relevant to what your concerns are.

Public Training on Searching NOSB Meeting Transcripts

MS. FRANCES: And this is just for the record. Probably many of you known how to search PDF files but I get a lot of calls on the phone and requests for, oh, I didn't know you could search a PDF file. And, of course, you can only search those files that are converted from an original word document. If they've been scanned in, you can't search those because they're kind of more in as a photograph. But these are, these transcripts are converted from a word document and so they are searchable.

And so all you do, you look at the top of your tool bar in any Adobe Acrobat PDF. You'll see a little pair of binoculars and you click on that and that's how you search in a document. And it's actually a very handy tool, if you've never done this.

And I'm just curious. In the audience, how many people have searched a
PDF file and found what they needed? Have folks tried to search the transcripts and found what they needed to find?

It is a lovely tool. And so, just for the record, for people out there that may want to look at this, you just click on the search tool and then you decide what you want to search for. And I won't put the word pasture in because this is from the last meeting and pasture comes up a lot. So, but I can put in some other word or a name, you can also identify a person.

And actually, in my searching, because I had just gotten off the phone with Brian Baker, I searched for Brian and I found him in there, a number of times. I can do that. You see, Brian comes up a number of times. And you can click on each place and you can find, you know, people who have actually spoken during the event.

You can refer to the agenda and identify approximately when the topic that were interested in is being covered and then, you know, basically walk through each page by page, looking for the comments. It
refers you to the page number that you can find the information you want. You can then go and print that page of the document and then you can refer to it more easily that way, if you don't like looking at the screen.

So, that is intended for a little guidance on how to do this. And question?

MR. RIDDLE: Yes, without official minutes now, the really critical thing is finding the motions and the votes.

MS. FRANCES: We don't have a microphone --

CHAIR O'RELL: If you have a question, Jim --

MR. RIDDLE: Could you just summarize? I mean --

MS. FRANCES: Okay. Repeat what you were just saying and I'll try and summarize.

MR. RIDDLE: Yes. How to find motions and votes, because that's really the critical information.

MS. FRANCES: Well, I guess you would --
CHAIR O'RELL: Repeat the question.

MS. FRANCES: Jim is wanting to know how to find motions and votes, as that is critical information.

Obviously, you would look on the agenda to see the day that they were voting. And we've been trying to separate out committee presentations from actual voting time. And so you would know from the agenda what day things were voted on. So that would be certainly one way to approach it. And you would understand when the committee met during that time frame. On the transcripts, you could do it certainly that way.

I don't know about being able to pull up and easily, I guess you could plug in motion. We could look at the second day's transcripts, because I pulled up the first day's. We can pull and maybe trigger motion and see how many motions come up, because that should have come up in the transcripts, I would say. Why don't I do that?
CHAIR O'RELL: Valerie, if we could have Bea respond to that? Because we are trying to address that issue, Jim, so --

MS. FRANCES: Okay. And I'll look at the document.

MEMBER JAMES: One of the things that the Secretary will try to do that we're trying now is that as we take minutes based off the agenda, we'll also be recording questions that people ask in these minutes that the Secretary records. We'll also be, we'll also take information on the votes and who motioned and who seconded and how the votes came about within the minutes that the secretary takes.

I also wanted to mention that at our next Executive Committee conference call, we are going to be talking about making this more official policy, if it works, and looking at possibly adding this description into the board policy manual for the Secretary's role so that there's not confusion around whether or not we talk about Executive Committee minutes at a meeting. We do, we don't. Some meetings
there has been discussion on it, some meetings there haven't been. And we want to make sure that we go forward with a consistent policy around that. And I also, part of the reason Valerie is showing how to use this search mechanism is because we're not having the minutes summarized anymore. So this will help make that easier and we will be able to look at brief summary minutes that the Secretary puts together as well.

CHAIR O'RELL: Andrea, did you have a comment?

MEMBER CAROE: Yes. Also with regards to the motions and votes, those are all going to be, as has been done in the past, put onto the final recommendations. So you can always reference the final recommendation that should post shortly after the meeting with who motioned, who seconded, and what the votes were.

MS. FRANCES: Just in a review, I pulled up Thursday's transcript from the last meeting and that was during the day that all the votes were made. And you can
see motion, when I just plugged in the word "motion," it comes up quite often. I pulled up one. It was a motion and it shows who voted and states, you know, how they voted. And also, when you use a word like "motion," I noticed that "promotion" comes up. So, obviously, words that are components of other words are going to come up as well but not with any great frequency, I would say. Motion is what has come up, it looks like at least 20, 25, times there, or no, 50 times. So you can spend your day looking through.

But obviously, I would think recommendations themselves, the final recommendations are going to be the best place on the website to look for those votes.

Is this helpful? It's okay? We're good?

CHAIR O'RELL: And I think, if I can just add on to what Valerie and Bea have indicated is that we are trying to put together, at this meeting, a format. Bea is trying, as secretary, to have highlighted minutes in accordance with the agenda items,
so that there will be reference notes with the agenda items. And if it is a vote, at that time, we will put down the motion, who second, who brought the motion to the floor, who seconded that motion, and the vote, the recorded vote. So that will be in the minutes. In going forward, we're trying to get better with that process.

So I think Valerie's demonstration here was just to give those people an idea that if they want to get to the meat of it, the meat of it is in the transcripts and you can, it is searchable, you can go back there and try to find out and dig up specifics that you might be concerned about in terms of the discussion. But the minutes that Bea is working on now as we speak, and will throughout the meeting, will reflect highlighted minutes in coordination with the agenda, but then will be published and then approved at our next meeting.

Are there any questions from board members?

(No response.)
CHAIR O'RELL: We're a little ahead of schedule, but Mark, I think we'd like to go into the National Organic Program update and --

MR. BRADLEY: Barbara's going to be first.

CHAIR O'RELL: Barbara?

National Organic Program Update

Before I hand over the NOP Update to Mark, I thought I should address the board and the audience, in particular the audience, just to tell you a few things, just to give you a little update since we last met in April in Pennsylvania.

At that time, we had a dairy symposium and we made a commitment to the organic community that we would, we had just published an advance notice of a proposal we were making on pasture, dairy pasture. And we made a commitment that we would have a regulation out on access to pasture, an enhanced role for pasture for ruminant
animals. And here it is October 16th, October 17th, and as you can all tell, we don't have a regulation published, a proposed rule published. And so I thought it only fair that we give you an explanation why that is the case.

Now, Mark has introduced to you the staff and, as you can tell, I come to you, you know, just about every year. The staff doesn't seem to change size. So here we are again.

We did get 80,000 comments on the ANPR. Now that, you know, sounds like a lot and we're used to getting that number of comments when we put anything out for comment. But a lot of them were very similar. That was okay. And we were happy to get that number of comments and we were in the throws of drafting a pasture, a proposed rule on pasture, and we were going along pretty well and then some things happened that.

You know, my analogy for this program is that we get on a train and we sort of chug down the road and down the
tracks and we're doing pretty well. We were very dedicated in this commitment. I can't stress how committed we are to this pasture regulation. However, some really serious things happened.

You remember last year that we were sued by Mr. Harvey. Well, he decided to sue us again. And this lawsuit is every bit as serious as the lawsuit of last year, at least the ramifications of this lawsuit would be just as serious as the one of last year.

We also received some pretty significant FOIAs, Freedom of Information Act requests, totaling over 400,000 records that were requested of us. And these were significant enough that though we tried to get the parties to narrow their searches. We said we would be more than cooperative in giving them exactly what they wanted. What the requests were for us to simply open the drawers, open the files, and provide access to all of the records that all of our agents also collect.

Now, we ask that our agents hold
their records in confidentiality because those are the records of your businesses and that's what it says in the regulations. But we are have some serious discussions within the Agency with our attorneys as to whether or not the Agency is going to be held by that same standard of confidentiality and we are very troubled by that.

And people in the media and people in other groups disagree and they believe that they should just be able to come in at their leisure or their convenience and disrupt business, in my opinion, and sit down and just look through all of the records.

Now, I also am bound to uphold the privacy laws of the United States and so, I've had many long conversations on the telephone with people from the press and with other groups. And then I'm threatened with lawsuits on top of that, if I don't timely answer those requests. And so when you have lawsuits and then you have FOIA requests, these things are fires that have to be put out.
In other words, no matter how much I want to write a pasture regulation, those issues, when they happen, have time constraints on them. Twenty days, you know, 15 days to prepare a brief, to get it back to a court, something like that. So everyone has to get off the train that was going down the track while we were working on a pasture reg and we just, it's all hands on deck and we have to stop what we were doing and then start working on, you know, dumping out all of the emails or trying to decide what is confidentiality and whose records are privileged, whose records can be held as confidential.

So, and then we get complaints that are serious complaints that demand full investigations immediately and those sorts of things. So, it's with my personal and my professional and my Agency and my Program's apologies that I don't have a pasture regulation that's proposed and put in the Federal Register right now. It is in draft form. I'm not telling you that there's been nothing on it. A pasture regulation is
being drafted. But then, in addition to it, because it is a major change in the regulations, it requires a lot of clearance. There are agencies that want to look at it. The Office of Management and Budget wants to look at it. The General Counsel's Office wants to look at it. There are several other people that will want to review this. And so, and then there's all sorts of ancillary documents, we have to do economic impact analysis to go along with this.

So, every time we get these things that come into the agency and say, well, now we want to know all about this, you know, it changes our priorities.

And I'm terribly sorry to say this to you because I thought that this industry really wanted the pasture regulation as its number one priority. That's what I heard. That's what I heard in April. That's what I've been hearing for the last year, since we met in November, that that was the number one priority. But it's not.

And quite frankly, you know, the
more we continue this mistrust and the more we continue this infighting, and the more we continue this, you know, just frankly, lack of trust, the less progress we make because you're looking at the staff. There's only this number of people. I can't make them work 24/7.

I now work 95 percent of my time on the National Organic Program. I no longer work on transportation and I no longer work on marketing. I write the draft proposed rule for pasture. I'm trying to figure out an economic impact analysis. And I'm sorry if I sound like I'm losing patience, but every day someone calls me up and says where's the pasture reg? Well, I'm still trying to figure out how to, you know, answer FOIA requests for 400,000 pieces of paper that, you know, I don't think I should be answering.

At any rate, that's why we don't have it but I am still trying very hard. I want to get it out this year. I'm committed to it, fully committed to it and that is what I'm working on, in my spare time. And
that's what I want to do. I heard you in April. That's what I believe in and that's what I think we should be doing. That's what I think our number one priority should be.

And I think the FOIAs and the rest of it is not your priority and I don't think it's my priority. It's just something that derails me and that's what I have to go and do.

Now, I mentioned the Harvey lawsuit. We do have another lawsuit. We have answered all the briefs and the motions and it is in District Court. I checked last night with the attorneys to see if there had been any response from the judge and there had not. I will check again today but, so far, I have heard nothing back from District Court. So that means that we are still in litigation.

So, that means two things. I can't discuss the case with you. And it also means that, Kevin, as you and I chatted last night, I have asked the board -- you wanted to discuss a definition of synthetic
versus non-synthetic. And I have asked the board to postpone that discussion, at this time, because the court case involves, it will bear on that definition of synthetic.

And it is not that we are in disagreement with you or that we are rejecting it or any of that. But we think it is prudent, at this time, to simply postpone that until we get the court litigation resolved and we get further information from the court, so that we all have full information and then we can decide. You know, would that change your recommendation at all, would that change our feedback to you? And then go from there. And we can do that. In between meetings we can still work on that.

And hopefully, we'll be hearing something from the court soon. Like I said, I pressed the attorneys yesterday and I'll press them again today.

And the last thing, before I hand over to Mark is the, we did get a very good set of NOSB nominees. We got, I think, 40 some applications, 40 applications. That
package is making its way across the street to the Secretary. I am very very pleased at the caliber of the qualifications of the nominees that we got this year. So whomever the Secretary selects is going to be a good addition. I'm not sure that they can replace Kevin and Nancy and Mike, as well as, you know, the three of you have performed over the last several years, but there's just a good group of people out there. I think, you know, as this board matures and this industry matures, people are getting more interested in participating. So that's good. But I'm just really pleased with the candidates that applied for the board.

So, again, my apologies that we don't have a pasture reg to propose to you but that's still my number one priority.

Now, I'll let Mark get going on the --

CHAIR O'RELL: Barbara, just a question on timing in terms of the nominees. The Secretary will be making choices early January would be the expectation?
MS. ROBINSON: Well, I hope he makes them before then, Kevin.

CHAIR O'RELL: Okay.

MS. ROBINSON: He certainly does not have to announce them until January, but he normally announces them in December or something. If I recall, I think they were announced last year in December.

CHAIR O'RELL: They were December last year.

MS. ROBINSON: So I would expect that he will do that. Bear in mind, it's an election year. That tends to throw schedules off. It tends to just make people, everything piles in. I also don't know, there are many other boards in the department with nominations that come due. And I don't know what their schedules are. Sometimes, it just depends on who stacks up and what's going on. So, but I wouldn't expect that there would be any real, you know, problem in getting them announced at the normal time.

CHAIR O'RELL: Okay.

MS. ROBINSON: Any other
questions?

CHAIR O'RELL: Thank you, Barbara. Any other questions?

(No response.)

MS. ROBINSON: Thank you.

CHAIR O'RELL: Thank you, Barbara.

MR. BRADLEY: Let me deal with a little technology here for a second.

Kevin, thank you very much. I just want to provide just a brief rundown of what the Program has been up to last year, what we're going to be doing this year. But first I'd like to welcome everybody. It's always nice to be able to get together like this, with the board especially, and with the regular list of suspects that come to these meetings, and also some new folks that I know have not been here before. Welcome. We appreciate your taking time out of your busy lives and businesses and coming here to share your thoughts and to participate in this program.

The NOP has been busy this past year, as Barbara plainly said, we have a lot
of things on our plate. There's a lot of things that we are intending to do that we have not got done yet, but we have them on our work plan.

Just for a few highlights of what's been going on for the past year with NOP, for some personnel notes, as most of you know, Keith Jones, who is the Director of Program Development for the NOP, has been on a detail, on a congressional fellowship. That is going to last through January. And we're looking forward to having Keith back and available for service. He's a big producer for the Program and an important part of our policy development, has an institutional knowledge that is critical for NOP. And he has been missed and we're looking forward to having him back.

Arthur Neal, right now, Arthur is Acting Associate Deputy Administrator of Transportation Programs. His skills were needed with other parts of the Program. So he's on loan for about 120 days, I think, to go down until they can hire a permanent position down there. So, as thin as we are,
we're a little bit thinner than usual, but we'll work with that.

Valerie Frances, as you know, is the new NOSB Executive Director, settling into her duties very well. We're very pleased with the way that she's settled into the program and we will continue to fine tune her responsibilities. We will be very interested in how the board has viewed her performance. Not so much her performance, but how her duties have met your expectations over the past year. We would entertain comments on that, in writing offline, anything you're willing to offer up in terms of how we can meet your needs with her position because here position was established to serve the board. So we want to make that that's being done. But so far, were very pleased. She's been a tremendous help.

And from a technical standpoint, it's always good to have someone with her level of experience and field expertise to come into Washington, to be willing to drive into D.C. instead of living out in beautiful
Maryland. She can still live out there, but now she comes into the ivory tower and we're welcoming this level of involvement.

And Katherine Benham was promoted this year. Katherine, most of you know, is our board specialist. Katherine was promoted this year and has taken on some new responsibilities in addition logistics and contracts that she has done before. She is also, as I mentioned, dealing with our budget. As complicated as our budget is, it's only $1.24 million but we're hoping for much more. We're waiting on our appropriations to see what happens with that.

But Katherine has also taken responsibility for managing the list of certified operations. Right now, there's roughly 20,000 NOP certified operations. And keeping track of that list on an annual basis and trying to keep the database in a searchable format is what she's been working on right now, doing a great job and it's been a valuable tool already. We're looking for more great things there as well.
Some of the docket work that we have going on. There's a crops and processing document we got a final rule out of NOP this year. It was cause for celebration. I know that it's a frustrating, long, bureaucratic task to get things from the point where someone in the public says we would like for you to do this, and provides us with the information, and gets it to a point where it's gone through all the filters and checks and balances, and finally publishes the final rule. So, we have the crops and processing document is part of the law now, as of September 11. And that, those, the board has been provided with new copies of the rule and the new rule is posted on the website for the public's access.

We've also got a 06-04, which was a proposed rule for crops and livestock. This was mostly involved with sucrose octanoate esters. That's a proposed rule. We received a whopping 12 comments on that. We can work with that level of information. We're working on a final rule right now and
it shouldn't be, you know, five years before that's out. It should be something we can get through very quickly. Sucrose octanoate esters would appear on two areas of the national list for crops and for livestock for mite control.

Let's see, I missed one, though. That's the one that Hugh's going to jump on. Do you want to hold that until the end, that discussion?

MEMBER KARREMAN: Sure.

MR. BRADLEY: Okay. Just so I can get through this and we --

(Simultaneous speaking.)

MR. BRADLEY: There is a proposed rule that closed, it was published July 17th, closed September 15th for the livestock materials. It's a very much needed proposed rule. It needs to be finaled as soon as possible. When it came out, we got over 100 comments. I believe, as of last week, those are finally posted on the website. We're looking at that. It's going to take us a while to process that information.
There were some serious comments on this. The Program worked with FDA to come up with what was available option-wise as far as what we could do for particularly some of the annotations that were included in that proposed rule. We realize that these are, there is confusion on this, a lot of frustration. We're willing to maintain a conversation on that and find out exactly what we can do, as far as allowing those substances to be published as close as possible to what has been recommended by the board.

A lot of angry comments on this. Of course, we get comments ranging from why don't you just do what the board tells you to do, to some very clearly and concisely written comments that provide, you know, exact issues as far as what has been said as far as precedence, what FDA requires, what the federal law requires. And there is some discussion that can be had with this. This is one of the heavier things on a regulatory plate.

Last but certainly not least is
the access to pasture docket. Again, as Barbara said, we hope to have this out. We would have liked to have had this out about three months ago. It's an important piece of work that we have in front of us and this is just the first of a few regulatory pieces that we need to get in place to get everything settled out as far as dairy, in particular, goes. And it's good that we've got the expertise on the board to deal with the opinions that we're going to have on this. When we get the proposed rule out, we'll have a significant comment period. And we're hoping that we'll have a lot of very carefully thought out, useful comments.

We expect volume. We expect that there will be 100,000 comments and, you know, 95,000 of them will be form letters, you know, where people are weighing in an expressing their concern.

We agree that there's value in the quantity and quality of comments. And while this is out for a proposed rule, when it comes out, we would like for the
community to very carefully, and the board as well, to consider what the impact of what we will be proposing will be on their businesses, so that we can give this serious consideration. Once it comes out, we've heard that there's talk in the community, that once this comes out as a proposed rule, that it's actually a done deal and that's not the case. We're hoping for substantive comment on this.

We're going to get it as close as we can. It's been a tough reg to write. It's very invasive as far as how the industry operates. It would be a big change for not just large producers, small producers, but it's going to impact everyone. The level of involvement is going to be significant, so we need substantive comment on this.

So, we're looking forward to getting that out and then we're looking forward to hearing what you all think about it.

Other regulatory activity. Of course we have sunset going on and it looks
like we may get this done on schedule. The sunset docket is at OGC right now. It's moving through. We've got a meeting set up to discuss it as soon as we get done with the board meeting. So, we'll keep you all apprised as far what the status is on that.

There's also a docket that's been published, it's an information collection burden. It comes out every two or three years and this is something we have to do every so often to explain all the paperwork that we require of the industry. I think we got one comment on it the last time that this went out. And I think that was of the nature that says, well, it's too much paperwork. If you have any ideas on how we can reduce the document burden on the industry and on government or, you know, the certifiers, we're always welcome to hear ideas on that. So, take a look at it. Give it just a reality check.

For other highlights for 2006, we did a lot of training this year. I come from a training background and I realize the value of, you know, for standardizing
procedures. It's important that everyone knows what the rules are, how the Program is applying regulations, what the procedures are for accreditation and certification.

So we've trained, held trainings around the world. We did a training at Eco Farm last year and we're going to be doing another one this year at All Things Organic in Chicago. We trained at the Upper Midwest Organic Farming Conference. It was very well attended. At the international level, we went to BioFach over in Nuremberg, Germany and had a training session over there.

And then, in conjunction with the pasture symposium in the NOSB meeting, of course, we had the training session at State College and that one was opened up to the board members. Any time any of the board would like to sit in on these training sessions, if there's one near you, just come on down. Let us know that you're coming and we'll get you set up with some materials.

Also for 2006, we had 6 new certifiers. ASCO, out in California, Primus
Labs, Yolo County, Kentucky Department of Agriculture, and AGRECO, a German certification company, all joined our ranks. Oh, and Certimex as well, our first Mexican certification company. We have other certifiers that are operating in Mexico, but Certimex is the first one that's based there.

Now, on the way out of NOP, five certifiers leave NOP. QC&I surrendered. Stichting Skal surrendered their accreditation. Stichting Skal has Skal International branch, sister organizations that it wasn't worthwhile for them to stay afloat with the level of document burden that was attached to one of them. So, Skal International is remaining.

And, of course, American Food Safety Institute was the first to have their accreditation revoked for cause. Something we don't take particular joy in doing but it's one of the things as a regulating body
that happens sometimes.

For recognition agreements, we have two new recognition agreements this year. First was with India. APEDA, Agricultural and Processed Foods Export Development Authority is their accreditation body. They have a dozen certifiers that are already operating over there, some of which were already accredited with the national organic program directly.

A recognition agreement is not equivalence. All it does is gives a sovereign government the authority to accredit certifiers based on our same protocols, to apply our standards to export products to the United States. There is no reciprocity with it. It's not equivalence. It does not change our standards. They are applying our standard in their country.

The benefits for us on this is that it allows us to focus our efforts on the directly accredited certifying agents. Then we can just work on a one-to-one, sovereign-to-sovereign basis with the governments there. And we are, we'll be --
I'll talk a little bit about a trip that we have set up to go to India to service this agreement.

Also with Israel, we have a recognition agreement that was just issued within the last couple weeks. Their Plant Protection and Inspection Services, which is their regulatory body for this type of function over there. They were, they had, that discussion had gone from a request for equivalence to a request for accreditation as a certifying body and finally, they settled on the most expeditious format for them would be for them to accredit certifiers in their countries, so that they can act as a government body on our behalf over there.

This is particularly advantageous for us because travel in the Middle East is, you know, to say the least, it can be dangerous. There are travel advisories for federal employees in that area. So we were glad to let them handle that one at home.

We have, I guess that gives us eight recognition agreements now. We have
three in Canada. We have the United Kingdom, Denmark, Israel, India, and New Zealand. This gives us a good scattering across the world when you pair this up with some of the direct accreditations that we provide.

For audit activity, we can now say that we have all the initial on sites completed for everyone that was certified with the initial round back in 2002. It was a big job. The internationals, getting the outstanding foreign audits completed was the biggest job. Most of that was from the standpoint of trying to make it, you know, financially possible to get these people down on a cost-effective basis.

The little audits down in, some of the audits down in Bolivia and foreign travel countries that are not, that have travel advisories, have been a problem but we're working with that.

And all of the 2006 annual updates, which were due to be completed this fiscal year, have been completed. The certifiers are doing a very good job.
They're much more responsive now. They're kind of into the groove of, you know, providing their documents on time.

So this was part of our USDA's performance evaluation, is whether or not our industries are performing as required. So it was a very good thing for us to see these things come through on time.

Eighty-seven percent of our certifiers, I'm very proud to say, were in compliance when they sent in their annual updates. Only 13 percent had any major noncompliances and most of these were issues of absences of a required element, something where they administratively not provided as required. Just a very few of them were issues that had to be dealt with seriously. Of course, then you have the folks that were resigned.

One of the surrenders that we had was the result of an onsite audit where they just kind of threw their hands up and said, okay, we see where this is going. We'd like to call it quits, we were asked to leave. And they submitted their resignation. There
was never an action against them. But it was a result of the oversight process. So this is an example of where the system is working and how we're learning a lot as we go along.

The more compliance work, the more inside information we learn to deal with. We've learned the capabilities of these audits and learned their limitations, too. So, we're learning. The learning curve is still pretty steep for us but we're getting there, I think.

With the international audits, as I said, there's a good scattering. There's some, we're working on four or five continents right now. Australia was one of the first on sites that we did, of course. We worked extensively in Europe, North and South America.

One area that has conspicuously not been traveled to yet is China. China's been in the news. We know this. We know that there is a lot of concern about, or unknown issues, about what's coming out of China. We have not really received, we
received two complaints that had been, that come based on Chinese products. Really, the level of complaints that we've had has not been nearly as much as what we've got from other countries or even within the United States.

But our concern with China is that we don't have any certification bodies that are directly accredited in China. So all of our accreditations are, it's like there's four major certifiers that operate in China, IMO, BCS, Ecocert, and OCIA, have major significant numbers of clients over there. We know that this is an international program. We realize that we haven't been there and we're remedying that, hopefully, to get there before the end of the year.

I would think that if we had the accreditation process, what we're wanting to do with that, -- this a time line where certified operations have to, or accredited certifiers have to have their renewals done. And as part of that renewal process, we are going to go to China. We are going to go to
all the countries, not just China, where certifying agencies have significant activity.

The four certifiers that are doing business in China will help foot the bill for NOP to travel there as part of their re-accreditation audit. Those applications are due the 29th of October. Okay, today is the 17th so they have, roughly, two weeks. And out of the 30 some applications that we're expecting, we have two. So, we're expecting a lot of last minute renewal applications. Of course they're not going to submit them early. No one does. It's like turning in your homework. No one does that early. But once we have those applications, then we can make final plans to go to the places where people are stating that they do business. When we did the first round of accreditation, we focused on the home country where they were doing business. We had to spend a lot of time in the office. We did some site visits that were close by. We didn't travel internationally to a great extent, except in
Europe, possibly.

But this year, we're going to be going to all the places where they do business, or most of the places, and China's going to be one of them. And that's the first thing on our agenda, is to get over there so that we can come back with some kind of definitive description of what the controls are and to identify any weaknesses that may need to be addressed. So, we're looking forward to going over there.

We're also going to tie that in with the recognition agreement with India. I'm scheduled to go over there with one of the, the head of the of the audit review and compliance staff the week before Christmas. So it's, yes, they go ahead and schedule things for that part of the holidays because Christmas is not a real big issue over there, so we can travel over there. It's a big issue with my family, so I'm a little bit in the doghouse, but they're pretty used to me being on the road.

For our Program priorities for next year, sunset is the biggest thing.
It's something we have to do. It's regulatory, it's got a time line attached to it. The pasture regulations are right up there. There is nothing more important, in my mind, than getting that resolved and getting an A in PR and getting the process started for dairy herd replacement as well.

606 procedures are also critical. They have to happen very quickly. To get there, we have to have something done with Ag versus Non-ag descriptions so that we're talking about, know what the Non-ag or agriculture going into 606 are. And we need to talk about commercial availability. We're looking for great things to come out of the board, as far as guidance on that or some kind of collaborative decision there.

Dairy herd replacement, I mentioned that. Grower group certification issues. We're hearing lots of concern about that, lost of talk around the list serves that are going around, so we'll be talking about that.

Identification of certifiers on the labels, retail certifications, dealing
with co-packing arrangements, those types of issues are out in front of us and we're going to look at that. Certifier accreditation renewal will be something that's going to be a big focus for us over the next year.

And also, the NOP quality management system. This goes back to the two big things that were presented to the Program. The ANSI audit was a very complete and detailed quality system audit. It identified a lot of work that the NOP needs to do, it's direct for us, it's input from the industry, as far as the things we need to do to have our processes more fully defined. We've, in our minds, addressed them from the standpoint that we've found where the pieces and parts are. But I don't think any responsible program manager can say that we're ever done with that. Quality management is a continuous improvement process and, with adequate funding, we would like to hire a full-time person that will be responsible for quality system management at NOP. We're looking for that. Again I
mentioned that our appropriation hasn't come through yet. We're operating on a continuing resolution but there's some hope that there may be significant increase in funding for NOP and that would be very welcome.

Coming training events, just for dates. I'm going to be meeting with audit review and compliance staff and seven of their key people that will be doing the renewal accreditation audits in Fredericksburg November first and second. This is going to be two days of putting our heads together, setting up game plans, finaling up audit schedules, making sure it's cost effective and making sure all the auditors are aware of who they're going to be dealing with this round of accreditation. We've learned a lot with the last round and we're going to make sure that everyone has taken advantage of that learning curve.

Again, I mentioned I'm going to India. Part of that is going to be training their accreditation body in New Delhi. That trip is set up fro December 18th through
22nd. We will be touring around and spending some time with each of certifying bodies hopefully in the meeting, and with the accrediting body to make sure they fully understand their responsibilities and really answer some questions. There's only so much that you can do by email and teleconference. And this face-to-face is going to be an important part of ensuring that they understand the Program, what their responsibilities are, and what our expectations are, and what the public's expectations are of products coming out of there and the traceability requirements.

Eco Farm. We're set up with NASOP, the National Association of State Organic Programs, to do some training at Asilomar this year. I always try to find an excuse to go out there. It's a great conference. I'm going to try to drag some of the staff out there with me. That training, that conference is set up for the 24th through 27th of next January. I'm thinking the training is probably going to be, it's usually the first day, try to work
it in there, but the exact date will be announced.

Then, of course, we'll be making another trip to BioFach. This is a good place for us to meet with the international certifiers. It's a party that everybody comes to. We generally have about 25 certifying agents, international certifiers represented there. That's set up. Organic Trade Association is hosting that for us, we appreciate that. And that will February 15th. That's already on our dance card.

And that's what I have as far as structured comments. Are there questions that I may be qualified to answer, or Barbara? And she's not here.

CHAIR O'RELL: Yes. Thank you, Mark. I think we have some questions. Joe?

The training sessions, certifier training sessions. Those aren't mandatory in any way, shape, or form, or do they count as part of accreditation? Do people get points for going to them and participating?
Because sometimes the people who don't need to go are always there and the people who kind of do need to go, we don't see them. So I'm just wondering how you deal with participation in the trainings?

MR. BRADLEY: We -- thank you. That's a good question. We don't have the regulatory authority that we've identified to make attendance mandatory. I think that if we said that you have to come to one of those things, it would be like one of those unfunded mandates. If we wanted to pay everybody's way and have them come and pay their travel and put them up in hotels and do that, I think we could say, you know thou shalt come, and they probably would.

The way that we presented this is that we said it's really to your benefit to come. There will be information there you will get no where else, there is networking that is very beneficial. And it's just like you said, some of the folks that come, the ones that really need to be there, that we would really like to visit with, don't necessarily come. They are still
responsible for the information that we present.

There's nothing new that comes at the training sessions. It's clarifications, it's case studies, it's answering frequently asked questions, it's hot topics. We have a lot of fun. There's a lot of good discussion that comes to the program as well.

We're actually kind of billing them as more certifier meetings than training. They don't really get points or credit for it. Like I said, there's nothing mandatory but it does lead us to a conclusion. For those that do come, we know that they heard the information. We take attendance. And if you're there, you're bound by the information that was presented. If you're not there, you're still bound by the information insofar as that it's part of our regulations. So it's not required but we would really like it to be. And if the board wants to make a recommendation like that, I'm just, I'm all ears.

CHAIR O'RELL: Okay.
MR. BRADLEY: I think it would require some kind of funding to make it mandatory.

MEMBER SMILLIE: The second question has to do with oversight of the government recognition agreements. I'm a little fuzzy on that. It looks like your program for India is clear and outlined and I think that that's wonderful. Does that mean that you've done the same for each of the other recognition agreements?

MR. BRADLEY: We have not. We have not traveled to these countries that have recognition agreements. It's been done in the past on a sovereign-to-sovereign basis, where we recognize them as a sovereign government with the regulatory authority to act. But, and new sheriff in town, I've had some different ideas on this. And that's why we're going to go to India and we're going to go everywhere else as well.

I think there's -- training has to happen. There needs to be a question and answer dialogue going on between the
recognition bodies. We see questions coming out of the products or the producers of products that are produced under these recognition agreements frequently get deferred to the National Organic Program. We would like for all of the recognition agreements, all the accrediting bodies that are acting on our behalf, to be so knowledgeable and so well schooled in NOP, through open dialogue and a closer relationship, that the questions that come to us are more obscure, they're really things that are not basic, very basic issues.

And then this is, again, something that's going to cost some money. We do not charge for trips on recognition agreements. There's no funding, there's no requirement for audits. Maybe this is something we need to change, but this is something on NOP's ticket. And this is one of the things that, if we get additional funding, will absolutely happen. We've made the commitment for India because that's going to be the new drill, is once we get
your recognition agreement in place, we schedule a visit and we make sure that you understand your responsibilities and that you're really truly qualified, just like we do for a certifier. We'll allow him a little time to operate and to identify who their certifiers are, but there has to be close monitoring. And I don't know why it hadn't been done in the past. It's probably funding, it's time, it was just trying to get the program in place. I'm thinking we'll do a lot more detailed or a lot smarter type of accreditation audits as well for our certifiers.

CHAIR O'RELL: Andrea?

MEMBER CAROE: Mark, actually Joe asked my question, but I have a follow-up on that.

For those products that are coming in certified by an operation that is accredited to an organization that is recognized by the program, the enforcement on those, if those products come into question, what is the procedure? I mean, would you be investigating that certified
operation? Would you be investigating the accrediting body? Would you be investigating the certifier? I mean, how, what is the line of authority in those agreements in how you actually, you know, enforce, these regulations of this standard on those bodies?

MR. BRADLEY: The authority that's assigned, it is as though we have taken NOP, the National Organic Program, with its accessory compliance staffs and auditing staffs, and planted them into the U.K. or Denmark, or Israel, and wherever. And that's what we look at when we do a recognition agreement. It's ISO, well, it's a 17011 now, assessment system where they have to have those processes and authorities to do exactly what we do in their country, for their certifiers that are operating in that country. So they have to have the same compliance mechanisms in place.

MEMBER CAROE: But I'm not talking about the investigation into whether the agreement should be set. But I'm saying if a product is identified on the market for
being questioned as far as its compliance, how does that investigation happen? Barbara's got her hand up.

MR. BRADLEY: That's why I'm saying, this has, they have the same authority as NOP in that country and they do the investigations and they do the enforcement.

CHAIR O'RELL: Barbara, did you want to --

MS. ROBINSON: The sovereign body is supposed to do the investigation. The sovereign body that we've recognized does not do the investigation as we would. And what Mark is saying is that then we start having discussions with the sovereign body and say, why aren't you doing what we would do in following through on the investigations?

MEMBER CAROE: So, if a U.S. consumer calls into question a product, they should wage their complaint to that agreement -- to that accreditation body and not the program. Is that what --

MS. ROBINSON: It works no
differently than it does here. You know, you start with a certifying agent and work your way up to the accrediting body, just as it would here. And in this case, you know, we would probably be the liaison with the sovereign body and help out in that regard. But first, it just starts with a certifying agent --

MEMBER CAROE: Okay.

MS. ROBINSON: -- as it does here. You know, we contact a certifying agent and say what's going on.

MR. BRADLEY: That's what I was saying, Andrea. They have to have the mechanisms in place before we would grant them recognition as an accrediting body.

CHAIR O'ReLL: Nancy?

MEMBER OSTIGUY: I'm going to go back to the beginning of you remarks. And thank you very much for getting things through that very long process onto the National Register. We're all very appreciative, I'm sure.

What I also want to say is that while it's a very long process, I much
prefer the one that we have than what we would have if we weren't a democracy. And the fact that it takes so long is because we all have to be able to have our says. And that's okay by me because I wouldn't want it to be otherwise.

So, thank you very much. And it's okay that it takes that long because you have to listen to us.

MR. BRADLEY: Well, thank you. We'll try to expedite it to every extent possible, though.

MEMBER OSTIGUY: Well, yes but you do have to listen to us, so that takes time.

CHAIR O'RELL: Hugh?

MEMBER KARREMAN: Yes, I'd like to just add on to what Nancy said, but also specifically thank Toni Struther and Arthur Neal for shepherding the livestock materials through the FDA process. And now that they're on the ANPR in the form that they are, I believe that the industry and the animals will be better served and hopefully, there is a final rule proposed soon.
So thanks again for doing that for four years, I think, it took of your time. But like Nancy said, you know, there are processes, checks and balances that we have to respect and go through.

Then I just wanted to ask Barbara, from what you were saying with your comments, is there anything we can do as an organic community to get more funding for the NOP? I mean, the organic industry is growing at 20 percent a year and regular conventional agriculture is generally a flat line growth. So you'd think that the USDA would put more resources into the organic program. Is there -- what can we do as a community? Is there anything we can do?

MS. ROBINSON: Well, as board members, you can't. You know, we've explained that to you before. As board members, you can't lobby, obviously. And as federal employees, neither can we. We're bound by the President's budget. This is the first year we were able to get a budget increase in the President's budget and we were very excited about that.
Now, we do have a budget increase on the Hill. Unfortunately, we're stalled in a continuing resolution. There has been an effort underway to divert part of that increase away to cost share. And we're hopeful that that doesn't occur because, frankly, the states, according our bookkeeping, our records, the states barely use 40, at the most, have only used 40 percent of the money that we have given to them for cost share. So, we don't think that's necessarily the best use of the budget increase. We would rather see Congress come up with additional money for cost share, if that's what they want to do. But, and we are hopeful that the House will restore that money. I think the Senate was where they tried to take the $500,000 out of the $1 million increase. And even at that, we're not talking about sizably increasing this budget.

Yes, sure. If the organic community is so inclined, yes, I guess the organic community can go and lobby Congress. I have gone to the House and the Senate and
explained our resources and explained what it is we try to do. And, you know, I don't know how I can make it any plainer, without saying we need more money, which I'm forbidden to do. You have a trade association. The trade association, in my understanding, often makes this case to Congress. But we also live in a world, understand, it's a pay-as-you-go Congress these days. Whatever they give to one program, they have to take away from something else.

So, you know, I hear you, Hugh, and it boggles my mind every single day. I don't understand it anymore than you do. And you know, I don't know. But you're the industry. You know, you have go and do it. We can't do it. You can't do it as board members. So, you know, you can get organized. I mean, I've seen you do it. So, --

(Laughter.)

CHAIR O'RELL: Now, just to be clear. As board members, you can't do that but as private citizens you can do that.
UNIDENTIFIED SPEAKER: What, get organized?

(Laughter.)

CHAIR O'RELL: Lobby for funds.

Bea, did you have a comment?

MEMBER JAMES: Yes, I just wanted to make a comment on Hugh's question. I think part of the problem is, also, that you're talking about a very very large industry of conventional products that generally take up most of the industry. So, when you're talking about organic sales, that's still a single digit percentage of the overall $550 billion industry of retail food.

So the more money that we, I believe, that the more this industry grows, than the larger it speaks to probably capturing that funding.

MR. BRADLEY: Anything else? Any other questions for me or Barbra?

(No response.)

MR. BRADLEY: Thank you.

CHAIR O'RELL: Thank you, Mark.

And thank you, Barbara.
We are exactly on time. That is good. We're scheduled for a break now. So we're going to have a 30 minute break. What time -- 15, sorry. That was wishful thinking on my part. A 15 minute break and then we'll be back here to take up the Pet Food Task Force. Thank you.

(Whereupon a short recess was taken.)

CHAIR O'RELL: Okay. We'd like to resume with the National Organic Standards Board meeting. Next up on the agenda was a Pet Food Task Force update and discussion that was going to be led by Nancy Cook. But I don't believe Nancy is here. Is that correct?

(No response.)

CHAIR O'RELL: And Emily has graciously accepted and offered to step in, at the last minute, and give us an update and report. Emily?

Pet Food Task Force Report Update and Discussion

MS. ROSEN: Hi, I'm Emily Brown Rosen. I'm the Secretary of the Pet Food
Task Force and I gave a little update, I guess it was, one of these last meetings. April? It seems like a long time ago.

Yes, I guess -- I'm sorry Nancy's not here. I'm not sure what happened. So I didn't really have anything major prepared, but I can talk for a few minutes about where we're at.

The Pet Food Task Force have been meeting for like a year and a half. We came up with a draft proposal on revising the regulations to accommodate pet food more specifically and that's been since last April and was provided to you at the last meeting. Since then, we've left it open for comment and there's only been about four or five comments filed on the document.

The task force also worked further to develop a labeling guide that is now also posted on the website that talks about, gives examples of labeling categories and helps to combine the proposed organic labeling categories, along with the existing, conventional pet food labeling rules. So, it's a little complicated but
that was a little bit of a work of art to try and lay those things over each other so that they can be used by industry. But we're -- that's up now also for any feedback and further comment.

But our plan right now is, we've had another meeting this summer and gone over the weight of the comments that we received. And what we're going to do is revise that draft and leave it in revision mode with the comments that people have made and then hand it back to you. And I actually have that mostly done, but I haven't gotten to it yet. But I'll try and get that to you in the next couple weeks and then it will be the board's job to take this one and decide what to do with it. You know, go for it, not go for it, make changes, etcetera. So, we're basically done and we're willing, you know, to sort of stay around as a virtual task force, but and you know, if you need more help with it. But at this point, I think it's pretty much ready to go and it's up to you to move it forward.

So, yes, and it's been a really
good group. We've had really good meetings and there's been a lot of contribution from different parts of the organic and nonorganic pet food world.

So I don't think it's really hit the fan yet in the sense of the wider world recognizing or paying attention. So that's going to be important to get more press for it. I did give a presentation this summer at the AAFCO meetings to walk them through it and explain the whole thing. And there was a lot of pet food people in the audience and there were a lot of questions. And I think there's a lot of interest, too.

Julie?

MEMBER WEISMAN: Can you tell people what AAFCO is? Because it's a lot of acronyms.

MS. ROSEN: Oh, yes. Okay. AAFCO is the Association of American Feed Control Officials. They are the body that is charged with regulating pet food. It's regulated as a sort of subset of livestock feed in the real world and, other than the organic world, and so this is not done
federally, it's done at the state level.

And they have an annual meeting where all the state appropriate officials get together and argue about their rules, because they have a set of model rules that they publish. And then that gets adopted by each state, more or less. So, it's another whole bureaucracy that's out there we need to fit in with.

I think that's it. As I say, we're going to give you one more draft that includes some of these comments that were mostly good suggestions and we are, I think there needs to be some more outreach to get more people in the pet food world paying attention.

I mean the other point is, that there are certified organic pet food products on the market now already and there's getting to be more of them. So it would be good to move kind of promptly on this before a whole lot more products out there that might end up being mislabeled and that sort of thing. Because this really kind of pins down what they can and can't
say on the labels and what the content is like.

There is going to need to be a couple of items petitioned, particularly taurine, I think is the one that we need to encourage the manufacturers to petition because it's an amino acid that's pretty essential for cats and apparently there's reasons why they can't find a natural form. So, that's not on the list yet, so that's going to be probably the first one you'll see. I've been trying to tell them that they need to petition, but you know, it's slow to get that to happen.

Okay. Anything else?

CHAIR O'RELL: Julie?

MEMBER WEISMAN: Yes. I just wanted to make one comment to Emily, as the proxy stand-in for the rest of the task force that it's quite an impressive amount of work that was done. And I came into it a little bit, you know, late in the game for a part that I though was just incredibly complicated. That whole business with the labeling and how to make all the different
scenarios. You know, if people have a chance to read that part of it, it's quite complicated and you guys did a pretty amazing job of like distilling it down to, you know, understandable scenarios.

So I just, I think the task force is really to be commended for having been able to pull that off.

MS. ROSEN: Well, thanks. Actually, it was hard because, you know, there's not really two people that understand both organic and AAFCO. And I tried to do that but it was like speaking two languages. But hopefully, it will be useful to everyone who reads that. Okay.

CHAIR O'RELL: Joe?

MEMBER SMILLIE: Yes. Again, that's important work what you're doing.

I also, my question is more directed to Mark on what the current position of the NOP is versus on the certification of pet food. Again, we're not talking pet treats, but pet food. Where does the program stand on the proliferation of certified product on the marketplace, the
pet food marketplace, in the marketplace?

MR. BRADLEY: As far as what the standards are for that?

MEMBER SMILLIE: Yes.

MR. BRADLEY: The same standards as everything else. The August 23rd memo.

MEMBER SMILLIE: Okay.

MR. BRADLEY: Now, are you talking about the difference between that and livestock feed?

MS. ROSEN: Well, we did have a conversation with Keith Jones when the task force was underway about that. And his message, I think to the manufacturers, was that, you know, we're working through this. In the meantime, if you can do it, you can do it. It's certified and it's okay to have the label on it in the current time period. Because that was, you know, we had members on the task force with certified products and the message was, you know, we're not going after you individually now. We're going to talk about this. This is in process. And then the August memo came out after that. So that's basically what
certifiers are doing.

I'm not sure exactly what parts of the rules certifiers are using, but they're doing it and it hasn't been contested. And so there's product out there. I think mostly, they're following processing rules. But it's not clear altogether. So, --

MS. ROBINSON: Okay. Pet food isn't livestock feed. Pet food is -- people buy pet food. I mean, pet food is --

MS. ROSEN: True.

MS. ROBINSON: -- a consumable product. Pet food is covered under the August 23rd memo.

MS. ROBINSON: That's all.

MS. ROSEN: Uh-huh.

MS. ROBINSON: So, if it meets the standards, and it's eligible by content to be labeled, then it can be labeled.

MS. ROSEN: The question comes up when there are some things allowed on the livestock list that are not on the processing list, or vice versa, which
materials can you use. So that's where I think there's been a little, probably, give in what people are in enforcing.

But we are classifying it as, in the conventional world, it's regulated as livestock feed. It's a subset of livestock. It's FDA statutes of identity are all part of the livestock feed standards. So that's why we've chosen to go that route as far as crafting the regulations, but with adding the labeling components as per human food.

And we've also proposed that everything on 605, provided it's suitable for animals, can be fed to pets. And everything on 603. So, we've kind of said the best, you know, we've identified specifically which parts of the rule apply. So that should help.

MS. ROBINSON: Remember too, at the bottom of that memo that is says that if there are additional standards that need to be proposed and developed, those would be incorporated under the regs. So, you know, if that has to happen, then we would get to that, too.
But in the interim, you know, you just meet the standards.

CHAIR O'RELL: Bea?

MEMBER JAMES: I have two questions for you, Emily.

During your work on this summary, did you discuss the fact that a lot of people and I know this may seem humorous but it's the truth, a lot of people consider pets almost like children and that they really don't like to feed their pets anything that they really wouldn't consume themselves and the consumer perception around some of the decisions that you made and how that might be perceived?

MS. ROSEN: Right. That came up, I think, in a discussion of slaughter byproducts, feeding animal products in general. I mean, there was quite a bit of discussion about, you know, allowing them at all or limiting the types that could be allowed, or, you know, something more restrictive.

And there was talk about the consumer interest in that and basically, the
way that there was too much objection to putting that in. There was a feeling that that could be market driven. People can make additional claims that no slaughter byproducts, if they don't want slaughter, or only pure organic chicken, or whatever they're going to make on there, that that would be unduly restrictive on the formulation.

So, but certainly we expected public comments on that. We really haven't gotten any to that effect. So, it might be good if you, if that wants to go out to more the consumer point of view, to get more feedback on that.

MEMBER JAMES: Okay. And then my second question was on page seven, subpart B, 205.105.

MS. ROSEN: Okay. I'll find it in a minute here.

MEMBER JAMES: You have allowed and prohibited substances, methods, and ingredients in organic production and handling. And you list, A, synthetic substances and ingredients, except as
provided in 205.601, 205.603, and then you list it again under E and it's underlined, so it would be a new addition.

MS. ROSEN: The underlines are new, yes.

MEMBER JAMES: And I was wondering if you could explain, you know, how those two really are different and why you couldn't just go with A?

MS. ROSEN: I'm going to have to look at that. I don't have it front of me. But I'll go over it with you, if you want. I didn't come prepared to look at that.

Oh, I now, there was one other point I wanted to make on the slaughter byproducts, which was, if we prohibited -- well, I guess the other argument, not argument but discussion we had was on some restrictions which we felt would be more restrictive than the food rules. I mean, we basically stayed within the paradigm of the way food is regulated, too. So, you know, there's all kinds of meat products in human food and we're talking about organic meat byproducts.
MEMBER JAMES: Right.

MS. ROSEN: They're not restricted in human food.

MEMBER JAMES: Sure.

MS. ROSEN: So we didn't feel like the pets should be more restrictive than the human food.

MEMBER JAMES: Right, I understand that. I just know, as a retailer, that the consumer that generally buys organic pet food has pretty high standards about their pets.

MS. ROSEN: Right. Yes, I can believe that. Okay.

CHAIR O'RELL: Dan has a question.

MEMBER GIACOMINI: This may be more for the Program, so Mark, a large part of this document included the aspects of made with organic. But I notice that on the item for public comment, it refers that to the regulations do not allow a made with organic label claim. Is that, how do those two fit? Is this something we can -- is that the current regulation and this is
something we could possibly modify through NOSB or is, what is it going to be? Is there a potential problem with a made with organic claim for pet food?

MR. BRADLEY: Our regulations don't allow made with organic?

MEMBER GIACOMINI: I'm looking at the item for public comment document that went out. I don't have a date on it.

MS. ROSEN: I could maybe address that, if you want. I think what that was referring to is the fact that livestock rules don't allow for a made with organic product. So, if we're applying, that's why we needed to do the job here. If we're going to reconcile livestock and processing standards, there was clearly a need for made with organic pet food category.

But some of the other things about livestock rules fit better than the food rules. So that's why those three labeling categories are in the proposed pet food and it does take a regulation change to make that clear.

MEMBER GIACOMINI: So, we would
need a regulation change --

MS. ROSEN: Yes.

MEMBER GIACOMINI: -- to allow for that within pet food?

MS. ROSEN: Right. I mean, well, as Barbara says, you could certify it as if it could meet the processed food standards, that's the alternative, and not make those other changes. But we feel, overall, if it's better --

MEMBER GIACOMINI: Well, that would just have a huge impact on what we need to be looking at adding on the national list, if, whether we can, the made with organic is a viable alternative.

MS. ROSEN: It certainly is. I mean, I think it's going to be probably the major category for a while.

All right. Valerie asked me to remind you, too, that when people are formulating pet food, companies are manufacturing pet food, they have almost a higher standard than human food, in that if they're going to make a claim for a complete and balance food, it has to meet the total
animal nutrition requirements. So that's why it's important to have the regs clearly adapted for, you know, identifying the materials and you know, what's allowed, not allowed, agricultural, nonagricultural, that sort of thing. Because they don't have, you know, they have to still total nutrition requirements. I'm sure you're aware of that.

So that makes it, all the ingredients have to be approved by AAFCO, have to be listed, or an FDA oversight on them. You know, they can't just add stuff that's not already approved. And there's a whole big regulatory scheme set up already for that. So we just have to fit into that and add on to it, the organic flare. And that's why we thought really hard about where to put it in the regs.

CHAIR O'RELL: Andrea?

MEMBER CAROE: Really quick, Emily, I see that you've referenced both 205.603 and 605, --

MS. ROSEN: Right.

MEMBER CAROE: -- as allowed
materials in the nonorganic portion. It seems to me that 603 does not apply. These aren't livestock. These animals are not livestock. As an alternate solution, knowing that these things are needed for animals, was there any consideration during the task force of recommending that these things be included on 605, these items that are on 603 right now, being petitioned and put on 605 for use in --

MS. ROSEN: It could be done that way.

MEMBER CAROE: -- pet food?

MS. ROSEN: It seems like a bulky way to do it. If we can just say, these are universe of what's allowed. I mean, I know NOSB, years ago, recommended that all items on 605 should be allowed for a livestock feed, too, provided they meet FDA requirements for livestock, and that hasn't gone anywhere. But we thought we'd try it this way.

I would disagree with you. They are appropriate for, feed additives used in livestock are the same feed additives used
in pet food. Pet food standard of identity, as in the AAFCO publication, is all, they all have to be in that book and they have to be reviewed by the, you know, the FDA has oversight on that.

So there is, you know, there's a lot of those additives that are used to formulate products as carriers, additives, etcetera, rosemary, etcetera. There is a lot of reasons why the livestock list should apply. Also, the fact that the assumption is that Naturals are allowed in pet food. Naturals that are not on the national list. Whereas, for processing, all the Naturals have to be specifically listed. So, that's another reason to go with the livestock structure on the list and say Naturals are allowed without all having to appear.

MEMBER CAROE: I agree with you that it is an easier solution. I just don't know that it is as well grounded in the regulation. I mean, we do have things listed on two separate lists that are the identical material.

MS. ROSEN: Well, I mean, this is
a path to choose in the future, too, for other sectors, too. I mean, is it easier to have, I mean, we could have done it that way, just have a whole separate section of the rule, with these are the livestock standards, this is the livestock list and repeat all that stuff. I thought it was better to try and blend it in to the existing regs. You know, it could have been done the other way.

MEMBER CAROE: Well, I'm not suggesting that you disregard 605. I'm suggesting that you disregard 603 when you're talking about pet food because it is processed food. And so 605 and 606 become, clearly, applicable. But I think that 603 just kind of confuses the matters a little bit because as the Program has stated in their memo, that it's not livestock. And I want to come up with eloquent solutions --

MS. ROSEN: I don't think they stated that.

MEMBER CAROE: -- in order to accomplish what you're trying to do. You know what I'm saying? So, I just put that
out there to see if you had considered it, or if you, you know, feel that there would be any, other than ease and --

MS. ROSEN: Well, I think that the premise from the committee was we'd start with livestock and then we thought we would add in the bonus of also considering the food additives and such that are already listed, because those, you know, that are appropriate. I mean, there is going to need to be -- well, maybe or maybe not. It would good to screen the list and make sure that everything that's eligible for livestock and pet food is identified that's on 605 and everything, you know.

But pet food manufacturers have to comply with FDA anyway. So they will know that, too. But, you know, it would be good as far as certifier training and that sort of things. And that's another thing. We're going to need, I think, certifiers and the pet food officials that are regulating labels. Because they actually can do us a very good service because they look at labels all the time. So there will be
another, once this gets finalized, there will be another set of eyes out there looking at products and calling to the attention of certifiers if stuff is mislabeled or whatever. So, it would be helpful to have some training sessions with the state officials and also with the certifiers, once we get further down the road here, to help, whichever path we end up choosing.

CHAIR O'RELL: Thank you, Emily. We appreciate you standing in at the last minute.

Public Comment on NOSB Action and Discussion Items

CHAIR O'RELL: We're going to begin our public comment period. Let me just read from our policy manual, the NOSB Policy for Public Comment at NOSB Meetings.

"All persons wishing to comment at NOSB meetings during public comment meetings must sign up in advance. Persons will be called upon to speak in the order they sign up. Unless otherwise indicated by the chair, each person will be given five
minutes to speak."

And I would appreciate if you come up, if you have a proxy for an additional five minutes, at that time please let us know. Bea will be keeping the time, the five minute time and she will give you a one minute warning. And if you do not see the one minute warning, it is not her fault. The five minute period will end at five minutes.

"Persons must give their names and affiliations for the record. A person may submit a written proxy to the NOP or NOSB requesting that another person speak on his or her behalf. No person will be allowed to speak during the public comment period for more than ten minutes." That's with the proxy.

"Individuals providing public input will refrain from any personal attacks and remarks that otherwise impugn the character of any individual."

The first up for public comment session will be Brian Baker. And Brian will be followed by Jim Riddle. We're going with
the big guns right off the bat.

MR. BAKER: Hello. I'm Brian Baker, Research Director of the Organic Materials Review Institute. I should have a proxy from Dave DeCou, Executive Director of the Organic Materials Review Institute.

I really appreciate all the work you've been doing and know you have a tough job. We want to do what we can to make it easier.

First I'd like to thank you very much for your work on the petitions. We support your recommendations from the Crop Committee to not add lime mud, sodium lauryl sulfate and sulfuric acid to the national list.

We also support maintaining the current annotation of calcium chloride. And we strongly support and really thank you for the sunset of colors that were not recommended by the NOSB in the first place and look forward to a case-by-case review of those as agricultural or nonagricultural, as appropriate for the individual colors.

So, moving on to this question of
the clarification of the definition of materials, understand that much of this is driven by the misunderstandings or confusion, call it what you will, about whether things are agricultural or nonagricultural and whether they belong on the list of nonagricultural or the list of agricultural substances allowed in processing. We see these questions as not just isolated in processing, but would like to see consistency and also hope that this is an opportunity to get some clarity on the issue of food contact substances. We get questions from our subscribing certifiers, from the public, from processors, vendors, suppliers, all the time about this and really don't know where in the regulation they fit or how that is all, how that all fits together with the past NOSB recommendations and what's in the rule.

We're concerned that the decision making process on synthetic and non-synthetic is not going forward at this meeting. We see the question of what's synthetic and what's non-synthetic as
related also to what's agricultural and nonagricultural, and also the clarification of the definitions. And we hope that this is just a short delay. We hope that it moves in but we ask that you not address agricultural or nonagricultural until after you've worked out what's synthetic and what's non-synthetic because we see that the two are very much related to one another. We think it's oxymoronic to have something that's synthetic and agricultural. It just, that's the way -- the NOSB has set its precedence on making these decisions. We understand that processing is different in that you have a definition of processing and that things that are chemically changed by cooking, baking, and so forth are non-synthetic, but we also understand that there are chemical reactions that take place that are synthetic that have agricultural precursors and that would open a huge Pandora's box that I don't think we're prepared to close right now.

This whole question of classifying single-celled organisms as
agricultural, we think is premature and really needs further discussion and explorations on what the ramifications would be to reclassify. For example, yeast or dairy cultures as agricultural, especially so soon after the September 11, 2006 addition of microorganisms to the national list. I really thank the NOP for getting that on the national list and for everything else that was on that docket, by the way. And it affirms that the system works. It might take a while, but things eventually end up where they're supposed to be.

Having gotten it there, it would, a hasty change would have implications in crops and livestock that really need to be explored. And this whole question of what is an organic microorganism, every organic farmer out there knows that microorganisms are part of the agricultural system. That's not what the problem is. You've got rhizobial bacteria and things like that.

So, is it microorganisms that come from soil that's been managed organically for three years, for example? I
mean, can we take streptomycetes from an organic field, culture it on an organic media and then have organic antibiotics? The implications need to be explored seriously.

And also, we'd like to see what farmers think. I mean, what do farmers think about organic microorganisms. So, --

(Timer sounds.)

CHAIR O'RELL: You had a proxy, so, is what you indicated. Is that correct, Brian?

MR. BAKER: That's correct.

MEMBER JAMES: You have another five minutes.

CHAIR O'RELL: So, you have another five minutes. MR. BAKER: And if I need to get a physical piece of paper that says I have a proxy --

CHAIR O'RELL: No, no.

MR. BAKER: -- I'll have to do that after --

MEMBER JAMES: No, my timer was pre-set.

CHAIR O'RELL: That's fine. It's
just the timer was set for five minutes.

MR. BAKER: Okay. Moving on to commercial availability. Most of our work with commercial availability is in the seed world. And we are developing, we have online live.seeds.omri.org and we're hoping that that will become a platform for certifiers in the industry to find out what seed sources are available organically. Rich Theurer will talk tomorrow about the prospect of using that as a prototype to move into the agricultural ingredients world.

And we support the intentions to grow in the organic industry but we're concerned that getting too many things on 606 will have the opposite effect. So the whole petition process is very important to see that things are not added to 606 that will have adverse affects on the growth, the organic sector.

And at the same time, the criteria being used to evaluate, we're concerned that the proposal will just make it too difficult to screen these out
quickly. They need to be addressed quickly. We don't see it as the NOSB's role to prescreen commercial availability. We'd like to see the criteria that are in the Act used and, also, would like to know what's happened to the two, I know it's not the NOSB's, but ask the NOP what's happened to the two agricultural ingredients that were recommended to be added to 606, gelatin, and shellac. And if those have, if there are good reasons for those not to be proposed or moved forward, I think that needs to be communicated to the NOSB, the technical reviewers, and the public, in order that we can understand better how to move ahead with other agricultural ingredients.

With respect to manure management, we're really pleased to see that that's on the agenda, that's moving ahead. We understand that pathogen reduction is very much in the public's mind. We want to see that the standards help protect the public, without adding undue burden to farmers, that they really achieve what they can to improve food safety. Concerned that
there's not data to support what some of the specific recommendations are but we're not prepared, at this point, to come up with another alternative. We just see this as a work in process that's going to need continued research and continued vigilance.

I think that we can't -- I mean, to talk about the synthetic substances in the Compost Tea Proposal, only those synthetic substances that are on 601 should be allowed for use in sanitizing disinfecting the equipment. So, you've got chlorine, you've got hydrogen peroxide. But we don't want to see aqua ammonia or things like that introduced that could potentially be used to fortify compost tea products.

And with that, I ask if anyone has questions?

CHAIR O'RELL: Brian, thank you for your comments. Just a couple of comments from me and then I'll see if there's other board members that have questions.

Certainly, in relation to putting forth a recommendation of synthetic/non-
synthetic with Ag/Non-ag would have been our ideal situation as well. I think you were here this morning and heard the comments from the Program and why that didn't take place.

MR. BAKER: I understand.

CHAIR O'RELL: But we certainly do agree with that track. It makes sense.

And as far as food contact substances, that is something that's a priority with the Handling Committee. It was, in part, to be addressed with the synthetic/non-synthetic issue at that time, as well. So, it's there. We recognize it. I just want you to know that it's something that is high on our priority list to come out with some thought and recommendations for.

Are there any questions? Barbara?

MS. ROBINSON: On the two materials that you asked about, Brian, they were never put through for 606 commercial availability. So, we didn't reject them. And because of the first Harvey case, they
actually still can be used up until next year, until June 2007. They need to be re-petitioned to be put back on 606.

MR. BAKER: Have the petitioners been informed of this?

MS. ROBINSON: That I don't know.

CHAIR O’RELL: For the record, Kim --

MS. ROBINSON: They were voted on, they were recommended, we did not dismiss the recommendations. Go ahead, Arthur.

MR. NEAL: Arthur Neal, for the record, National Organic Program. We recognize the fact that those two substances were recommended by the board for inclusion on the national list, I think it was 2003, if I'm not mistaken. And you have to realize, at that time, there was no 606 petition process, nor was there a commercial availability assessment done because those were considered to be agricultural.

And so, for the petition process to be complete, we recognize at Program level, if you're going to affirmatively add
those materials onto 606 themselves, they need to go through a separate review process. Those particular materials came through under the synthetic review process. there was no assessment conducted based on commercial availability and things of that nature which we are discussing today.

So that's why you did not see them affirmatively listed there in 606. However, we did not preclude anybody from using those substances. For anybody who is going to use them in the future after 2007, they will need to be petitioned so that they can be positively listed on 606.

CHAIR O'RELL: Thank you, Arthur. Okay. Thank you, Brian. Jim --

MEMBER GIACOMINI: Mr. Chairman? Just in case he has to slip out, I would like to recognize and welcome Arthur Neal at our meeting, since he wasn't here this morning.

CHAIR O'RELL: Yes, welcome Arthur.

Jim Riddle is up next and following Jim will be Grace Marroquin.
MR. RIDDLE: And I have a proxy from Alexis Baden-Mayer and I gave it, in writing, to Valerie.

CHAIR O'RELL: Thank you, Jim.

MR. RIDDLE: Yes. My name is Jim Riddle. I am Organic Outreach Coordinator for University of Minnesota and would like to invite everyone to visit our new organic website, organicecology.umn.edu. I've been an organic inspector for 20 years and recently graduated from the NOSB academy. And I speak today on my own behalf.

It's a pleasure to be here and I would like to commend the NOSB members and all of the task forces and the NOP staff for all of your hard work over the past several months. I am genuinely impressed with the level of work that you've done. And I'm pleased that you're maintaining and continuing to improve the board policies and procedures manual. And the new member guide looks to be an excellent and helpful resource for new appointees and I encourage that any future Federal Register notices for applicants for board include a link to that
and to the board policy manual so that people have a good idea what they're signing up for.

I do endorse all of the NOSB's materials recommendations on your agenda. The organic seed discussion document and the Pet Food Task Force report, with no changes to any of those.

On the draft recommendation for commercial availability criteria, I see that as a significant improvement over the version that was presented in April. It provides more clarity on the type of information that's needed by the board to make commercial availability determination. And I encourage its adoption.

I further urge that the entire document information needed on a petition be posted in the Federal Register notice as final rule. It's still operating only as a proposed rule. The entire information needed on a petition has never been finalized.

On compost and compost tea, I really appreciate the work of the Crops
Committee to merge those two task force reports into one recommendation. I have a few suggested changes. And in the third sentence of item number four, you have the word "should" and I think it should be changed to "must", to read that "compost tea must be made with compliant compost and/or vermicompost" etcetera, etcetera. The use of compliant compost for compost tea should not be optional.

In the third paragraph of item four, discussion of raw manure extracts or teas says that they can be applied to the soil. But in the rule in 205.203(c), it requires that raw animal manure be incorporated into the soil so I suggested the text be changed to match up with the regulation for the use of raw animal manure.

And I don't understand, in the very last paragraph, why compost extracts may be applied without any restrictions. And I would suggest that the same restrictions that apply to compost tea also apply to compost extracts.

On hydroponics, I support
surveying the ACAs regarding the certification of hydroponic operations. But I think that all ACAs should answer question number six on your draft, not just those that are currently certifying hydroponics. In addition, I think that you should ask ACAs that do certify hydroponics to provide the citation numbers from the rule that they apply when they're reviewing hydroponic operations and any specific guidance or interpretations that they've developed for hydroponics. And also, to request copies of the organic system plans and inspection report forms that they use for these type of certifications.

The information on certificates, I say bravo on recommending that expiration dates be required on organic certificates. As you may recall, it's been a contentious issue ever since the former program manager interpreted the rule as prohibiting the inclusion of expiration dates.

I have one request. I would like your rationale section to be expanded to state that expiration dates are also
important for organic farmers in order to receive crop insurance because that is issued for a set period of time. Also, it's important for the certification cost shares, where states are looking for verification of a set period of certification and when someone is applying for a research grant, that same information is needed.

I offer several changes to your standardized certificate recommendation. The new item number five really should read "the organic crops and/or products produced by the operation." As you know, organic certification is a process based, not a product based certification. While I agree that it's important to list the products, I think it's important that the wording reflect that type of certification. I think there should be a new category added and that is the labeling category for the organic products produced by the operation, in other words, whether it's 100 percent organic organic or made with organic. Critical information for compliance and purchasing purposes.
Concerning that new proposed item C that says what size the paper needs to be and with three inches left at the bottom, I think that's overly prescriptive and should be removed. Almost half of the USDA certifiers and all of them under recognition agreements, are located outside the U.S. We live in a metric world. Eight and one-half by eleven inch paper and three inch margins are not world-wide standards. And I can imagine some paperwork reduction act requirement problems implementing this.

If addendums are used as part of a certificate, I think it's important that the master front page be required to make reference to the existence of those addendums.

So those are a few. And then I urge you, as you continue to work, to merge both of these recommendations about certificates into one document.

On Ag/Non-ag or NAG, I have some serious problems with this draft. While I don't disagree that the definition of nonagricultural substance is contradictory
and unclear, I feel that the proposed changes need a lot more work before final consideration. I do think that the proposed decision tree is helpful, but it needs to be routed in the definition and in some regulatory text. You can't have a decision tree just hanging out there without roots.

So, I propose some changes to the definition that you have proposed, so that it connects to the decision tree, so that a nonagricultural substance would be defined as a substance that is not a product of agriculture, such as a mineral, that used as an ingredient in an agricultural product or an agricultural product that has been processed to the extent that it's chemical structure has been changed, unless the chemical change is a result of a biological, mechanical, or physical process. So that takes some of the concepts from the decision tree and merges them into the proposed definition change.

On the third item of your proposal there, moving dairy cultures and yeast to 205.606, you simply can't do this.
These are not technical corrections. They are changing an entire class of products from one part of the list to another. And we learned during the whole sunset process that you can't make even simple common sense changes to annotations without a petition. These substances have not yet been petitioned. They need to be petitioned, TAP reviews commissioned, proposed for public comment, follow the processes that work well and are transparent and protect yourself from any charges of arbitrary and capricious changes to the list. And you need the input from the manufacturers and consumers of dairy products, fermented beverages, baked goods and others to be engaged. This is happening way too fast.

And then also, it has implications for similar classes of substances currently on 605(a), including microorganisms, animal enzymes, carrageenan enzymes, natural flavors, waxes, they could all be considered agricultural. Yeast and dairy cultures should not be singled out without consideration of applicable, of...
other similar substances.

I'm really concerned that the kind of linkage here is those words or other non-plant life and the definition of livestock to then open the door to bacteria and all these other microorganisms. I think that raises the possibility of undermining the credibility of the whole organic claim. When people see that kind of thin rationale, it's also putting the cart before the horse. There need to be standards proposed, maybe a task force on microorganisms or kingdoms currently undefined by the rule.

But there need to be standards first, regulatory impact needs to be done and you need to move forward with the current known agricultural products, get them onto 606 before opening the door to all of these totally new classes of products.

Thank you.

CHAIR O'RELL: Thank you, Jim.

Any questions for Jim?

MEMBER JAMES: In regards to hydroponics, under terms defined in the regulation, organic production, I'm just
looking for your comment on how you see hydroponics contributing to promote ecological balance and conserve biodiversity.

MR. RIDDLE: Yes. Well, I think if the plant is a naturally aquatic plant, like watercress or something like that, it makes perfect sense. But when you're taking a terrestrial plant and growing it in an unnatural medium, it would have to be approved materials, yes, I do have a hard time seeing how that fits the definition of organic production in promoting biodiversity, etcetera.

Yes, I think we need to be very thoughtful and look at what categories of crops really fit with the definition of organic production and can be produced organically and what certifiers are currently doing, is a good place to start.

MEMBER JAMES: So, are you suggesting that with hydroponics, only certain categories would be allowed under that type of production?

MR. RIDDLE: Well, I'm just
saying what I'm comfortable with. And that is, plants that are naturally hydroponic are a perfect fit. The others may be, you know, I'm not closed to the idea, but it's a stretch and I think that is, would be defendable as a place to draw a line.

CHAIR O'RELL: Joe?

MEMBER SMILLIE: Thanks for your comments and your support on commercial availability. And I think your comments on the certificates are well taken. Obviously, we got a bit more work to do about that. But I am especially pleased that that is moving forward and glad to have your support.

Your comments on Non-ag and Ag are noted. We've got, obviously, a lot of work to do. Again, just so that everyone is clear, basically, we felt that there was some inconsistencies in what was happening with materials and we really felt that we needed to place all of the materials, not just agricultural materials, but some of the ones that were not considered agricultural materials, and start to put some pressure...
and start to probe to see how organic we could get some of these cultures and other things.

Now that microorganisms are on 605(a), I think we have the time. When we started this process, they weren't on it and we had no sure, you know, it wasn't a surety that they were going to be on it. And I saw that there would be a lot of products out in the marketplace that may not be allowed to be produced organically because of that situation.

I think having now microorganisms on 605 doesn't take away, I still think, the need for us to pursue, as you have mentioned, some in-depth discussion of these materials, and I think that that's what we will do. I think eventually, though, that we will see that a lot of these cultures and things that we're talking about, it was broad array of things, could be a lot more organic than they currently are. And that was the intention of the community. But now, I think we do have the time to start to pursue this and I think that we will.
And thanks for your comments and some of the directions that you think we should have.

MR. RIDDLE: If I could just, you know, quickly respond, I don't want the Ag/Non-ag clarification guidance bogged down, though. You know, I think you need to divorce those microbes. You've opened up a whole new can of microbes by proposing that dairy cultures and yeast be moved in relation to this clarification on Ag/Non-ag. To stay focused on that, it empowers the whole rest of the work that needs to be done.

CHAIR O'RELL: Jim, Andrea has a question.

MEMBER CAROE: First off, let me say, I'm so surprised that you're in support of expiration dates. But good.

(Laughter.)

MEMBER CAROE: But anyways, in regards to your last comment on information and certificates where you suggest that we combine those two recommendations, information on certificates and standard
format, originally, we did consider this as a committee to put them together. We split them apart just for the sake of being nimble and actually getting these things implemented. By putting them together, if there was a problem with either one of them, they would stop. So, you know, I don't see any reason to put them together, at this time. I see reasons that that could hamper them getting implemented. So, I think we're going to continue with them separate, unless I hear --

    MR. RIDDLE:  Whatever.

    MEMBER CAROE:  -- for some other reason.

    MR. RIDDLE:  Whatever works.

    MEMBER CAROE:  You have mellowed out since you've been off this board.

    CHAIR O'RELL:  Thank you, Jim.

Grace Marroquin, to be followed by Dick Siegel.

    MS. MARROQUIN:  Here I am again. My name is Grace Marroquin and I'm president of Marroquin International Organic Commodities Services, Inc. My company is
based in Santa Cruz and we import and broker ingredients for the natural products industry.

I'm here, once again, to support the classification of yeast on a national list as an agricultural product. Yeast is currently listed under 205.605(a), as a non-synthetic, nonagricultural substance. At this meeting, you'll hear a joint recommendation of the Handling Committee and the Material Committee that yeast and dairy cultures are agricultural products and thus, should be listed instead on 205.606 as an agricultural product.

I commend the two committees for this recommendation and I respectfully request that the full board adopt it as well.

For several years, and I mean several years, it has been a technical legal error to classify yeast as nonagricultural. We submitted our first formal proposal to change the classification of yeast more than two years ago and I would like to add that we have also petitioned.
The Handling Committee and Material Committee agree that this error should be corrected as part of their overall joint recommendation on defining agricultural versus Non-ag. I want to give the two committees credit for all the heard work that it took to get to the bottom of this issue. And I believe that they've come up with a sensible result. I know how much time and effort went into this. And I know how much time the committees have devoted to deal with this difficult subject and I admire their patience and fortitude.

I am speaking not only of the committee's recommendation of yeast, but the entire recommendation on agricultural versus Non-ag. When it comes to ingredients and a national list that are nonagricultural, manufacturers are free to use nonagricultural ingredients listed on the national list in their processed products. As long as they do not exceed five percent, the nonagricultural ingredients listed on the national list are always allowed. Until now, yeast has been listed as a
nonagricultural. This is to ensure that manufacturers would always use traditional conventional yeast in the nonorganic five percent. And I'll explain a little bit further why I strongly feel that this is wrong.

Certifiers have no way to require them to use the organic yeast alternative. Changing the classification of yeast to agricultural will make a critical difference. Once an ingredient is listed on a national list as agricultural, then in order to use that ingredient in the five percent, it must be organic, unless an organic version is not commercially available. When yeast is reclassified as agricultural, the organic industry will have to supply organic yeast as a normal organic agricultural ingredient required in the five percent. And in my 15 years, almost, in the organic industry of helping providing ingredients, there needs to be this kind of motivation for ingredients to become available.

Before I leave the subject of
yeast, I have just a word about why organic yeast is superior to conventional yeast and should be used when commercially available. Organic yeast is grown on a substrate of organically produced grains. Furthermore, the process of growing organic yeast avoids the chemicals that are used in the production of conventional yeast. And this is really important and this is why I'm here, because I feel very strong that this is something, you know, that's been -- it's an error.

You know, conventional yeast right now uses ammonia. It uses sulfuric acid. It uses caustic soda lyes. It uses synthetic vitamins and synthetic anti-foaming agents. And while the waste water from conventional yeast production must be treated and have special licenses for its disposal to avoid pollution, the waste water from the organic yeast is raw material used for further organic products.

Because of the various chemicals that have been used in producing conventional yeast, the view developed in
Europe that these chemicals were not compatible with organic farming or food processing. This is why, in 1980, a German manufacturer, Agrano, based on Riegel, Germany, began its pioneering work to develop an organic production method for yeast. In 1995, Agrano began commercial marketing of its Bioreal, organically produced yeast. Our firm has been importing Bioreal since 2002.

I would like, as I just mentioned about how these ingredients are, I would like that this be dealt as, the technical questions that may arise, should be handled on a case-by-case on the certifier level. And I would like to conclude by thanking the Handling Committee for the other recommendations in their proposal.

(Timer sounds.)

CHAIR O'RELL: You can finish your thought, if that was a through.

MS. MARROQUIN: Well, it was a thought. It was just saying, again, I know how much went into this. It's a difficult question and I want to thank you all for
putting the thought to it and I really hope that you can build on that thought.

CHAIR O'RELL: Thank you, Grace. Any questions for -- Joe?

MEMBER SMILLIE: Without getting into all the politics of 605 and 606, I just wanted to understand that you have petitioned.

MS. MARROQUIN: Yes, we have, about two months ago. It took awhile because we were told, at one point, it's a technical question. You just needed to make corrections. But we have put a formal petition in, yes.

MEMBER SMILLIE: Okay. It's not on our list but I take it that that will be added. Okay.

MS. MARROQUIN: From 605(a) to put it onto 606.

CHAIR O'RELL: Valerie, do you want to address, for the record? Barbara?

MS. ROBINSON: Grace, is organic yeast being used in products here in the United States?

MS. MARROQUIN: Yes, it is.
MS. ROBINSON: Substantially?

MS. MARROQUIN: Not substantially yet, because of the way it sits on the national list, but yeast, it's being used.

MS. ROBINSON: So now it's an economic incentive?

MS. MARROQUIN: It's being used by folks when it's over five percent. And there seems to be an agreement that you can't use nonorganic yeast in cases where it goes over five percent. So it is being used. It's not being used by companies, primarily, that would use it under five percent.

MS. ROBINSON: So what's it used in?

MS. MARROQUIN: Soup bases. Right now, presently, flavors, where again, the percentage is much higher. And it's being acknowledged, recognized, and accepted that way.

MS. ROBINSON: Okay.

MS. MARROQUIN: It's an odd fellow, this yeast.

MS. ROBINSON: I know.
MS. MARROQUIN: I agree.

MS. ROBINSON: It troubles me very much.

MS. MARROQUIN: Very puzzling.

CHAIR O'RELL: Dick, if you're --

MR. SIEGEL: Hi, Richard Siegel, I'm counsel to Grace Marroquin. Where a manufacturer has an incentive to try to reach the 95 percent threshold and they can put yeast in to get them into the 95 percent, then they're buying organic yeast. It's the people that don't have to use more than five percent yeast who are not being required to use it and are using conventional.

MS. MARROQUIN: And I'd like to add that what it's done, for those people that have been able to use it over five percent, is to bring a new, it raises the bar. So now we have organic savory flavors, we have organic soup bases, that then are used to make further organic products and it's because they were able to use it that way.

Any other questions?
CHAIR O'RELL: I think Dan has a question and then Joe.

MEMBER GIACOMINI: Yes, Grace, like you say, yeast is a strange beast and yeast --

MS. MARROQUIN: Yeasty beast.

MR. GIACOMINI: -- yeast is not yeast. We have different substrates, different uses. What kind of yeast are you importing as organic and is the generic term yeast going to be, going to have a problem in its specificity when we deal with all the issues of DNA fingerprinting, and vintner's yeast and baker's yeast and brewer's yeast, and is any of that that's used in livestock feed, is just a generic yeast on the list, in one place or another, going to cause problems down the road?

MS. MARROQUIN: I think that -- okay, what we're importing, to answer the first question, is we're bringing in a yeast extract paste, a yeast extract powder. We bring in active yeast and we bring in various kinds of yeast flakes, and these are also used to provide some organic vitamins.
They're using it as a feeding medium to help create organic vitamins. And those wouldn't be available in the marketplace either if these companies weren't using yeast for those purposes.

As far as how it will affect the feed industry, I have to be honest, I'm not technically savvy enough to be able -- I don't know which ones are using right now, so I don't know if I can answer it. But I think, as far as using a generic yeast, I think once it gets into the 606 category, that still leaves companies the options that if the yeast does not perform, and this is the case with every single ingredient that sits on that agricultural classification, they have to prove why something doesn't work for them and, if they do, then they can use -- if they prove that it doesn't work for them because it doesn't meet the specific criteria, then they're allowed to use the nonorganic. So I think with -- that was the reason why we put it there so that knowing that it will not always address everybody's specific needs, so it wasn't to
penalize anybody, it was just to put it where it ought to be. Because it's grown using organic rice, organic potato, organic wheat, and corn. So, I mean, it's all the way through. It's an organic product.

CHAIR O'RELL: Joe?

MEMBER SMILLIE: Yes, I think my question may be more of a lead-in for Mr. Siegel than it is a question for your, Grace.

MS. MARROQUIN: Good.

MEMBER SMILLIE: And that is, I missed yeast on the report because basically, you've petitioned to remove it from 605, not add it to 606. And then asterisk says that our recommendation of moving yeast to 605 is a technical correction as part of the thing. So, perhaps you can address your political strategy on this petition, Mr. Siegel.

I presume that's --

CHAIR O'RELL: I believe it was, the petition was to remove it and to put it on 606.

MR. SIEGEL: Remove from 605 and
CHAIR O'RELL: And put it on 606.

MR. SIEGEL: And put it on 606.

CHAIR O'RELL: We're looking at cryptic notes on the -- it should be clarified on our list.

MEMBER SMILLIE: Well, that's why I missed it, because I was looking for it on 606 and it's on 605.

MS. MARROQUIN: That's right. This is what we're asking for.

CHAIR O'RELL: Barbara?

MS. ROBINSON: I don't know whether this is a question or just a comment. All right. So, the stuff I buy in the grocery store to make my bread comes in a jar, it's yeast. So, we're saying this isn't agricultural. So far, that's what we've been saying. Right?

CHAIR O'RELL: By its placement on 205.605(a).

MS. ROBINSON: We've been saying its synthetic?

CHAIR O'RELL: No. Not --

MS. ROBINSON: Oh, just
nonagricultural.

CHAIR O'RELL: Nonagricultural, because of its placement on the list.

MS. ROBINSON: Okay. We've been saying it's nonagricultural but we grow it. Grace, we grow it, like we grow mushrooms?

MS. MARROQUIN: Exactly.

MS. ROBINSON: On a substrate?

MS. MARROQUIN: Yes.

MS. ROBINSON: Okay. That's all I wanted to know.

MS. MARROQUIN: That answers it all, really.

CHAIR O'RELL: Does the board have any other questions for Grace?

(No response.)

CHAIR O'RELL: If not, we're going to proceed with Dick, with your public comment, because it ties in with Grace. And then following that we're going to recess for lunch. We'll see what time that is, we'll take an hour and come back.

MS. MARROQUIN: Thank you.

CHAIR O'RELL: And then that will be Diane Goodman will be next up after
lunch. Just so she's aware to be here on time because we're going to try to start on time.

And there's one question. Bea?

MEMBER JAMES: No, I just wanted to thank Grace for her perseverance. Good for you.

CHAIR O'RELL: Dick?

MR. SIEGEL: Although I'm very happy to appear, at this point, my comments are not about organic yeast. They're about organic seed.

CHAIR O'RELL: Oh, well then we should go to lunch.

(Laughter.)

CHAIR O'RELL: I'm sorry, Dick. Go ahead.

MR. SIEGEL: My name is Richard Siegel. I'm an attorney in private practice in Washington and I'm pleased to come before the board. I'm representing a group of companies in the private seed industry that produce and distribute organically grown seed. And there is a list of these ten companies. They're located in various parts
of the country. And the list is moving around with the beginning of my statement.

As you know, under the National Organic Program, organically grown seed must be used to grown an organic crop except when a "equivalent" organic variety is "not commercially available." This requirement has three purposes.

First, it's to ensure that organic integrity starts with the seed in the ground. A second is to stimulate an organic seed market, with opportunities for organic growers to serve that market. And third and finally, this requirement can encourage seed breeders to develop organically grown varieties that are tailored to organic growing conditions and, therefore, can offer superior performance for the needs of organic growers.

Now we've had four years now under the NOP final rule and, unfortunately, organically grown seed is still the exception, rather than the rule. The seed industry, organic seed suppliers, are working all the time to have an adequate and
representative supply. But a major stumbling block is the regulation itself because it allows growers to use conventional seed whenever they cannot find an equivalent organic variety.

Until now, it's been fairly easy for growers to meet with certifiers and convince them there's no organic variety that's equivalent. So many certifiers have been allowing growers to use conventional seed on a widespread basis and this has cut into the sales of organic varieties that are actually on the market.

So what we have is a soft market and uncertain demands for organic seed. So the industry is hesitant to move forward. So there aren't as many varieties that are going to be supplied, so there aren't as many equivalent varieties, so it's a vicious circle. And we want to stop this vicious circle as soon and as well as we can.

But I want to now go on to some good news and that is, a number of items of good news.

First, OMRI has now introduced
the first interactive internet database for available organic seeds. This database has just been completed. Dave DeCou of OMRI has done a great job to set it up. The companies in our group of private organic seed companies have contributed, I don't want to say seed money, but up-front financing to get this thing started so that it could, a reputable organization could start to put an organic seed database together. And it's, I've given you the web address for it. It's also, you can go to the OMRI website and follow the links to organic seed and you'll see how it works.

Until now, there's been an information gap. Growers and certifiers have just not known where to turn to a central source for what organic seed is available. And now only will this database give them that information, but it will also suggest which organic varieties that are available are equivalent to conventional varieties. So this is the connection we want to make with this database, so that certifiers will look at a list of organic
varieties, they'll see what they're related to and what they're able to be equivalent to in the conventional market. And that is, we hope to get over a lot of this hurdle with compliance by doing that, by putting the information out there.

We want to thank the board for its work. We thank the Crop Committee for holding on to the information requirement which we think is very very important.

And we also want to thank Mark Bradley for the interest he has shown in the database and in the future compliance. Mark's great forte is compliance and in our talks with him, we found him to very understanding and very sympathetic about what we need to fix the organic seed requirement. So I thank you very much.

(Timer sounds.)

CHAIR O'RELL: Thank you, Dick. Any questions for Dick?

Dick, I believe there's a question Bea has.

MEMBER JAMES: I'm not sure if you're able to answer this question or not
but what criteria, maybe OMRI would be better at answering this, what criteria is OMRI using to determine the validity of organic seed company. I mean, are they testing every one of these seeds?

MR. SIEGEL: Well the organic, every organic seed has to be from a -- every organic seed company is certified. OMRI will not list any seed unless it comes from a certified organic supplier.

Now the question of what is equivalency is still a difficult question. And the suppliers that say our organic seed is equivalent to the following varieties of conventional seed, this is, of course, a matter of judgment. It's matter of professional judgment. And it may not be the ultimate answer for every grower that's looking for an organic seed, but at least it will put the information out there and at least it will put the grower to a requirement of explaining to his certifier why a certain seed is not going to meet his needs, his or her needs.

CHAIR O'RELL: Hugh?
MEMBER KARREMAN: I think it's excellent that OMRI has that interactive website for that but I'm just thinking, in my local area, that is for farmers to look at. Right?

MR. SIEGEL: It's for everybody.

MEMBER KARREMAN: For everybody. Well, --

MR. SIEGEL: That's farmers and certifiers alike.

MEMBER KARREMAN: In my local area, people don't even use electricity. So, how would farmers in that particular, you know, area, get all this good information.

MR. SIEGEL: Well, can they come to their extension agent and ask the extension agent to show them online what's -- I mean, certainly they can go to a public or USDA office that has a computer for them.

MEMBER KARREMAN: Okay.

CHAIR O'RELL: Okay. Thank you, Dick.

MR. SIEGEL: Thank you.

CHAIR O'RELL: We are going to
recess for lunch. And I'm asking board members to be back at 1:15. And we will begin to pick up public comment at 1:15. Diane Goodman will be first up.

    Thank you.

    (Whereupon at 12:10 p.m. a luncheon recess was taken.)

A-F-T-E-R-N-O-O-N  S-E-S-S-I-O-N

1:36 p.m.

CHAIR O'RELL: We have, the Program is with us, so we are going to continue with the public comment session. First up will be Diane Goodman, followed by Sean Taylor. Diane, do you have a proxy?

    MS. GOODMAN: Yes, I do.

    CHAIR O'RELL: A written proxy?

    MS. GOODMAN: Yes.

    CHAIR O'RELL: Thank you. So, ten minutes.
MS. GOODMAN: And yes, I also have for you folks to read along -- start counting in a minute.

CHAIR O'RELL: We won't start until you are properly positioned.

MS. GOODMAN: Thank you. Okay. Oh, I have a lot more for you here, wait a minute. Great.

Hi. I'm Diane Goodman. I'm a consultant to the organic industry and I'm here to speak on behalf of the Hain Celestial Group.

Thank you very much to the National Organic Program and to the National Organic Standards Board for the Opportunity to comment on the recommendations of the committees of the board to be presented at this meeting. Hain Celestial Group, Incorporated extends appreciation and thanks to all members of the NOSB and NOP staff for the diligence and time and energy that was necessary to develop these recommendations. Our comments address the Joint Materials and Handling Committee recommendation for agricultural/non-agricultural determinations.
and the Handling Committee recommendation for commercial availability criteria.

What you have in front of you, by the way, the first section is the comment itself and the second is your recommendation in the format in which you wrote it for establishing commercial availability with edits that we have made to it, so that you could actually cut and paste if you found any of them valuable and informative. You'll find our comments in bold italics. Unfortunately, I didn't make enough color copies because of the expense. So the bold italics will be the changes, the additions and the deletions.

Okay. For the Joint Materials and Handling Committee recommendation for Ag/Non-Ag determinations, we support recommendation number one to change the current definition of agricultural substance and believe it will help eliminate inconsistencies. While we understand the need to clarify this distinction, our interpretation of recommendations two and three, leads to further confusion and some
questions. We appreciate the Joint Committee's acknowledgment of the decision tree, that it is a working document and may still need further revision.

In that spirit, we pose the following questions. Since it has been determined that yeast is a microorganism which would imply other microorganisms as well, is justified as an agricultural substance, since it fits the definition of livestock, how will such substances need to comply with livestock standards?

The decision tree, as proposed, includes criteria which is also included as the yet undetermined clarification for the definition of synthetic/non-synthetic. When a board recommendation is put forward to address synthetic/non-synthetic definitions, how then can the decision tree be crafted to be flexible enough to adapt to a new definition of chemical change?

How will the decision tree determine agricultural substances that have been manufactured with nonagricultural substances, consistent with the national
list? Agriculturally derived flavors and colors, for example, that will eventually become ingredients in finished organic products. This is questions to help you see the impact that we see in the definition of Ag/Non-Ag, as it's written.

We also question the Joint Committee's example of yeast and dairy cultures as qualified to move from 605 to 606, based on the new classification as Ag substances, without also considering other 605(a) substances, such as lactic acid, citric acid, some vitamins, flavors, enzymes, and will they have to be petitioned to be moved or can they be included in this recommendation as well?

The implications of recommendations two and three have far reaching effect and we're concerned about a broad reclassification of many substances currently allowed under 605(a). At the same time, the movement of only yeast and dairy cultures creates an uncertain precedent for other agricultural substances now considered non-synthetic.
Placing these substances on 606, while raising the bar to prove commercial unavailability of organic forms of those substances, places their current use in a precarious vulnerability, considering that the board and NOP have not agreed upon criteria to evaluate 606 petitions at this time, and that there is a court order that will result in noncompliance by manufacturers using those nonagricultural substances that are not on 606 come June of 2007.

Okay. The Handling Committee recommendation for commercial availability criteria. The Hain Celestial Group truly appreciates the detail and thoughtfulness that went into this recommendation, as well as the need for urgency to meet the court ordered date, by which time the industry must comply with new regulations. We encourage the department to explore all the possibilities with respect to the court order compliance deadline. Without NOP approval of recommendations for the definition of Ag/Non-ag and synthetic/non-
synthetic, it may be difficult to implement this criteria and result in unforeseen expensive revisions later. I'll repeat this that we encourage the department to explore all the possibilities with respect to the court order compliance deadline.

That said, here are a few specific comments to the recommendation and, as an attachment, the actual text of the recommendation with changes in italics reflecting these suggestions.

Section A, revise procedures for petitioning materials onto 606. We suggest including the requirement that the petitioner substantiate that the substance is, in fact, agricultural, according to the pending clarification or the final determination of the clarification of Ag/Non-ag. We also suggested information needed to assist in the determination of commercial availability be removed from this section, as it is the responsibility of the certifier to make that determination, based on information provided by the operation to the certifier, rather than the
responsibility of the petitioner to justify this to the NOSB. Instead, we believe it would be appropriate for the specified current industry information to be included in Section C.

Now Section B. The NOSB and the NOP role in the review of petitions. We agree that the role of the NOSB is to consider the petitioner's claims and reasons why the materials should be permitted in the production or handling of an organic product. We would also like the role of the NOSB to include conferring with NOP for the publication of procedures and guidance for certifiers in making commercial availability determinations. We would like emphasis in this section that the determination of commercial availability of organic forms of petitioned substances be the sole responsibility of the ACAs.

Now for Section C, the ACA's role. We agree with the recommendations listed and offer the suggestion to move the criteria originally listed in Section A to this list, with the caveat that this
information may include but not be limited to any of the sources listed. We also ask the board to consider an evaluation of the effort of the petitioner to demonstrate due diligence to contract for future organic production of a substance that is not commercially available in organic form.

Finally, we would like to comment on the fast approaching date by which the organic industry must be in compliance with the court order in the Harvey v. Johanns lawsuit of June 2007, less than a year away.

Understanding the obstacles facing the NOSB in finalizing recommendations, the approval of recommendations, the adoption of resulting policy and procedures by the industry and certifiers, we urge the NOSB and NOP to consider the amended provision passed in November, allowing the Secretary to develop emergency petitions, expedited petitions, excuse me, for commercially unavailable Ag products. This would allow the board, the department and the industry the time necessary to complete the work of policy
making that will enable smooth transition to the new requirements for 606.

The year allowed by the court has not proved to be enough time and is placing a difficult burden on the current stream of commerce. We're all aware that emergency procedures exist for producers and handlers who experience all manner of unanticipated events and would incur huge losses if windows of relief were not available. In cases of emergencies, disasters, or shortages, emergency permits are often obtained rather quickly. Such procedures are necessary to support business and to feed families on both ends of the chain of organic commerce.

In conclusion, we urge the NOSB to recommend and develop emergency procedures, allowing speedy temporary allowances for commercial unavailable substances to be placed on 606.

The Hain Celestial Group thanks the board for its consideration of our comments and supports you in all of your good work.
CHAIR O'RELL: Thank you, Diane. Andrea?

MEMBER CAROE: In regards to your recommendation on Section A, Diane, you are suggesting that we don't consider any historic shortages or potential shortages of an agricultural material before listing it on 606. So, are you suggesting that the only criteria this board would use, in order to recommend that a material be listed on 606 is whether it's agricultural or not?

MS. GOODMAN: No, not exactly. Because in the petition justification section, Section 12, there could very well be the requirement that people justify that as part of the reason they believe the petition should be approved.

I don't think that we can necessarily exclude, we don't necessarily need to exclude all commercial availability history or projections but I believe that it is not the role of the NOSB to approve the petitions based on that determination. So, if there was a way of keeping, in a petition justification statement, you can talk about
the fact that the presence or absence of that product has, historically, been available organically, or not available organically, or available in a particular form. And it can be part of the justification statement. But as far as requirements being itemized of what should be included in the petition, as fodder for commercial availability determination, I think it needs to be clarified and separated out.

MEMBER CAROE: I guess I'm not -- I don't --

MS. GOODMAN: I understand your question.

MEMBER CAROE: -- track with what you're saying because, you know, we have to have a transparent criteria --

MS. GOODMAN: Right.

MEMBER CAROE: -- for how we're evaluating and this was one of the criteria that we were looking at. You know, is it reasonable that this may not be in supply in organic and, potentially, should be considered by a certifier under an
applicant's claim that it's not available. So, by making it part of the justification, just makes it, you know, information that isn't part of the criteria. I'm not quite sure what the purpose of that would be.

MS. GOODMAN: Well, maybe there's a way of taking the questions that were proposed in this question in Section A and I proposed to move to Section C. If there was a way of filtering them, perhaps, some that would be more appropriate and perhaps less of a burden, or give people a framework, because to actually specify how you have to prove commercial availability, I think is something that goes beyond the scope of a petition's requirement.

Am I not making sense to you?

MEMBER CAROE: Well, I just, that wasn't the intention of the recommendation. The recommendation was that the NOSB would look at these materials in a broad scope of potential shortages and past history but that the on-the-ground justification would happen with the certifier in real time. We never intended to do the work of a
certifier. In fact, I thought we were pretty clear in our recommendation to split those out. This is just looking at it, overall classification, is this a, you know, do a risk assessment, basically, of this material, as opposed to actually doing that detail level work that the certifier is expected to do.

CHAIR O'RELL: Julie?

MEMBER WEISMAN: Yes, there's another really important reason for that to stay in A. There is an important information collecting function that gets served by having that be submitted as part of the petition, which helps ensure that this is a -- it makes that a matter of public matter. And we've been hearing, you know, many many comments which emphasize the fact that unlike what is currently started by OMRI for seeds, there is no database and we don't really know where that database is going to be. So it's very helpful if this is part of the public record that's maintained, these petitions, you know, people have access to that, and that will be
very helpful in encouraging the development of new organic ingredients.

MS. GOODMAN: I think that that would probably be a workable solution, as long as it is very clear that it is not the NOSB that's making the determination about -- that's much more of our concern, that the NOSB is not making that determination about commercial availability. But I do support the concept of having it as historical public information. That's why it would be put into, that would be, whatever it is the petitioner would want to use that way, would be included in their petition justification statement.

CHAIR O'ReLL: Thank you, Diane.

MS. GOODMAN: Thank you.

CHAIR O'ReLL: Bea, just before I call the next speak up, I just wanted to, for the record, recognize that Rigo as joined us and made his travels through from wind and rain, I guess.

MEMBER DELGADO: That's correct, Mr. Chairman. I appreciate the recognition and I appreciate your patience as well.
CHAIR O'RELL: No problem. Thank you, Rigo. Sean Taylor and Gwendolyn would be, is up next.

MR. TAYLOR: My name is Sean Taylor. I'm the Scientific Director for the International Association of Color Manufacturers. On behalf of the International Association of Color Manufacturers, I would like to briefly discuss our thoughts concerning the situation created by not renewing colors non-synthetic sources onto the national list under section 205.605(a).

IACM, International Association of Color Manufacturers, is a trade association that represents the manufacturers and end users of food colors. Our members have strong working relationships with companies involved in the production of organic or made with organic foods. We submit these comments with the request that the NOSB consider a conditional renewal of colors non-synthetic sources only.

In our understanding of the
current situation, colors were initially placed on the national list at the discretion of the National Organic Program and without a recommendation by the NOSB. Because of this, the NOSB Handling Committee has recommended that colors be removed from the national list and that food colors that will be added must go through the standard petition process.

The members of IACM, as well as other companies involved in food color production, are pleased to have the opportunity to file petitions to the NOSB for the addition of individual food colors to the national list. We feel strongly that this remedy process will bring the listing of colors in line with other food additives that can be used in organic and made with organic products. However, we are concerned that there are impediments to this remedy process that will cause unnecessary delays that are harmful to both the food color and the organic industry.

First, the current situation prevents a timely review of petitions filed
for addition of individual food colors. As a result of ongoing litigation, critical distinctions that are especially relevant to the consideration of food color petitions have not been addressed and we feel that this has left the NOP and the NOSB without a proper mechanism to consider our petitions. Specifically, the adoption of final recommendations and decision trees for determinations of synthetic versus non-synthetic substances and the thorough consideration of the role of solvents used in food color production as food contact substances have been delayed.

Much of the food color industry has one foot in chemistry and another in agriculture. And without explicit definitions of and distinctions between synthetic, non-synthetic, nonagricultural, chemical change, chemical form and other terms, we believe that our petitions cannot be fully and fairly evaluated. Factoring in the amount of time for rule making, we believe that no food colors can be added to the national list prior to the sunset date.
Second, the renewal of colors without the addition of individual food colors, will have a strongly negative impact on the food color and organic foods production industries. Without a sufficient petition evaluation process for individual colors, the food color industry will be harmed through the loss of sales, as organic consumer products companies will be forced to remove these colors from their products. We strongly believe that this will have a deleterious effect on the sale of organic and made with organic products and a serious financial impact on organic foods companies due to re-labeling requirements and necessary reformulations.

On a personal level, as a consumer of organic products, I feel strongly that the NOSB and the NOP should support the organic industry, and has supported the organic industry, and I believe that any actions that would have the potential to reduce consumer interest in and loyalty to organic products is against the best interests of the organic movement.
Third, we believe there is a precedent for conditional listing materials to a positive list. For example, the procedure for provisional listing of foods colors was outlined by the Food and Drug Administration in the Color Additives Amendment in 1960. This allowed food colors that were already in commerce to remain in commerce while safety testing was planned and conducted. Colors that were not adequately tested by a certain time or that were found to be potentially harmful, were then de-listed and not allowed for use in foods. This is a procedural example of the regulatory process making necessary allowances to prevent the disruption of commerce while issues related to that process are decided and it indicates a clear precedent for the temporary listing of materials for use in foods.

Based on these arguments, we request that the NOSB continue the deferral of the vote to renew or not renew colors non-synthetic sources only until the next official meeting in Spring 2007. We ask
that the NOSB provide us with 30 days in which to file a petition for an annotation that would provide a conditional one year extension to the scheduled sunset date. This extension would provide the NOP with the necessary time to develop the proper clarifications essential to a thorough evaluation of food color petitions.

The conditional extension petition will further detail the arguments briefly described here and will provide the NOSB with further opportunity to consider the difficulty we face in filing petitions for individual colors, given the current lack of clear guidelines.

Our organization would like to thank the entire NOSB, the Handling and Materials Committees, and the NOP staff for their ongoing and future guidance to manufacturers of food coloring substances in the petitioning process. We strongly believe that the eventual successful petitioning of our colors will provide organic and made with organic producers with affordable, safe, and attractive options for
adding color to their products and we look forward to working with the NOP staff and the NOSB throughout the petitioning process.

Thank you.

CHAIR O'RELL: Thank you, Sean.

Any questions? Julie?

MEMBER WEISMAN: Yes, I actually do have a question with regard to this issue of I don't believe right now we're in a position to defer for a year because sunset officially, I think, the sunset period if October 22nd, like it's coming up the beginning of next week. And I don't know is the --

MR. TAYLOR: I'm sorry. This is October 22, 2007. So one year from now.

MEMBER WEISMAN: Right. Okay. So beyond that, -- okay, I see what you're saying.

But in terms of extending beyond that, I think that OFPA is pretty, I think that the statute is very clear about five years. It cannot be extended. You can't have like a one year extension to the sunset, I don't believe.
MR. TAYLOR: I think our position is two-fold. One is for now, what we're actually requesting is a deferral at this meeting, specifically, that you don't consider this recommendation until the next meeting. That will give us time, this 30 days that we're asking to fill a petition, to request an annotation that will go into more detail concerning that issue.

I think secondly, we feel that there is precedent for this sort of temporary conditional listing of food additives onto a list while issues are worked out, essentially.

CHAIR O'RELL: Sean, I guess I'm trying to understand what the deferral to the next meeting would accomplish because we still have the door closing on October 2007. So, what will that buy time for?

MR. TAYLOR: What we, our feeling at the moment is that this will give us time to fill out a full petition requesting an annotation for a one year conditional listing.

MEMBER WEISMAN: You know what?
I think I can clarify something. I think that the decision not to renew colors at sunset doesn't mean, correct me if I'm wrong, someone, that it's off the list. It means that we will allow it to sunset.

CHAIR O'RELL: It will sunset in October --

MEMBER WEISMAN: It will sunset. In other words, the use of --

MEMBER WEISMAN: -- the use of the colors on 605(a) will cease as of October of 2007. So there is still, you do have that time.

MR. TAYLOR: Essentially, one year is what we have.

CHAIR O'RELL: Yes.

MEMBER WEISMAN: Exactly.

MR. TAYLOR: What we are arguing, at this point, is we don't believe that one year is sufficient time to allow a petition to be considered fairly, to be evaluated by the NOSB and then to actually go through the rule making process and to be added to the national list.
CHAIR O'RELL: And we certainly sympathize with that because we find ourselves in the dilemma of the process of trying to get through this list of petitions for 606, which I know a large extent of those are colors. There's 34, 35 on the list. Those materials will have to be dealt with prior to the sunset or there will be issues. In the sunset process, it is our understanding is, we have been back and forth with the Program, is that we don't have the authority under the sunset review to add annotations or to put an additional — it's either on the list for another five years, or it's not. We don't have that authority. And maybe if the Program wants to clarify that?

MEMBER CAROE: The definition of sunset is the reconsideration of a regulation for its continuance. So, as is written in the regulation, will it continue or will it not? That's it. There's no new regulation writing that shows up in there. So, conditional listing or listing with an annotation is not an option for sunset.
However, at any time, we can entertain new petitions.

CHAIR O'RELL: Right.

MEMBER WEISMAN: But that is a different process. It can't be --- you know, I know there's been some frustration through this sunset process that we haven't been able to, you know, correct things that we would like a little bit differently or would be a little more clear but, just based on the function of what sunset is, that's not a possibility. That's out of the realm of this activity.

CHAIR O'RELL: I'd like to recognize Arthur Neal. Are you coming up to address this issue?

MR. NEAL: Arthur Neal, National Organic Program.

You mentioned sunset being used to address this particular issue. And if I'm not mistaken, at the last meeting in Pennsylvania, the reason why, or one of the reasons you deferred was to allow someone to petition the board to review colors.

CHAIR O'RELL: Right.
MR. NEAL: No one did that. So, you're just going ahead and you're closing out the sunset process so that nothing is lingering and we can go ahead and move forward with finalizing the sunset proposed rule.

There's still an open window for individuals, companies, whomever, to petition the National Organic Standards Board to review colors for inclusion on a national list. That window has not been closed.

So, the sunset process, based on this meeting, will officially probably be closed based on your determinations and recommendations here today. The issue with colors lies in the fact that there was not a board recommendation. So, you are provided that opportunity to petition. No one took you up on that before this meeting, so you're just taking final action. That's the way we see it.

MR. TAYLOR: And just to stress again, essentially what we're asking for is for you to defer on that action, at this
time. So, thank you.

CHAIR O'RELL: Nancy?

MEMBER OSTIGUY: Can I ask why there was no action taken after our last board meeting?

MR. TAYLOR: Actually, since the last board meeting, there have been, at least to the best of my knowledge, one of our members has filed six petitions for individual colors to be listed onto the national list. I don't think that I'm really capable or qualified to comment on specific issues related to those petitions. I think that probably should be taken up by the National Organic Program, at this point.

MEMBER OSTIGUY: I'm not asking about the specific petitions. I'm asking about what you're asking for right now.

MR. TAYLOR: Well, at this point, I think that, since the last board meeting, this is what we've been working on. We've been working on individual petitions. We've come to the conclusion that we actually can't file solid petitions that we feel will make it through the process because there
aren't really specific determinations about what is a synthetic substance, what is a non-synthetic substance, what is an agricultural product, what is a non-agricultural product, what is the definition of chemical change, what is the definition of chemical form, what is the definition of functional property. And as we began to try to work through these proposed decision trees, we found ourselves in a situation where we didn't really know where or petitions would be evaluated, whether we should try to put them on 606 or 605(a) and how we would proceed from there.

Does that answer your question?

MEMBER OSTIGUY: Yes and no, but that's okay.

MR. TAYLOR: Well, and I guess just maybe to follow up then, where that's left us with is we don't feel that we have sufficient time for our individual petitions to be considered and added to the national list without a significant break in the flow of commerce and that leaves in the position where we feel that separate action needs to
be taken.

CHAIR O'RELL: Andrea will follow-up.

MEMBER CAROE: Just one more comment to try to wrap this up. But one, if we defer and this board makes no determination before sunset, it will sunset. If there is no action by this board, we'll take it off the list. So, deferring does you nothing. So, I would caution you to that.

And one of the things we said when we deferred is we have no information on these materials. We cannot evaluate them for continuance. So, until those petitions arrive, our decision can't change, we can't finish our process without those petitions. So, I see no merit whatsoever in deferring. I mean, the fact that of the matter is is that we can't evaluate without that information. So, we urge the manufacturers of these colors to come out and put those petitions in front of us and that we would do our due diligence to get those reviewed as quickly as we possibly can and get them
in a recommendation to be listed if they were appropriate. That's the best that this board can do. If we defer, we do nothing for you.

MR. TAYLOR: Well again, just, I ask that you consider the deferral and thank you for your time.

CHAIR O'RELL: Okay. Thank you, Sean. Gwendolyn? Following will be Lynn Coody.

MS. WYARD: Good afternoon. My name is Gwendolyn Wyard. I am the Processing Program Reviewer at Oregon Tilth. Good afternoon to the NOP staff and ladies and gentlemen of the gallery, NOSB members.

First and foremost, Oregon Tilth would like to thank the NOSB for your continued efforts on the complicated topic of agricultural versus non-agricultural determinations. This is a top that has personally provided me with endless hours of mental gymnastics.

To begin, I would like to generally say that we do not support the retention of food ingredients on 205.605
that can be produced organically to the NOP standards. Therefore, I would really like to see yeast reclassified as agricultural so that it may be removed from the 605 shield which protects substances from the commercial availability requirements. And I single out yeast because, to the best of my knowledge, yeast is the only microorganism that I know of that's on the market as organic. Certainly products of microorganisms, but a microorganism per se. However, Oregon Tilth has concerns about the approach we're taking toe get there and the implications that the three recommendations may have on various sectors of the industry.

Our major concerns are as follows. What standards should certifiers evaluate yeast, dairy cultures and other microorganisms to? If they're deemed agricultural because they are livestock, they meet the definition of livestock, one would assume that we would use the livestock standards. I'm very familiar with the production of the yeast and other microorganisms and I do not think the
livestock standards are appropriate logic and experience would tell me to go to the processing standards, yet they're defined as livestock. So, this is something that needs to be very clear so certifiers can proceed.

Concern number two, classification of yeast and bacteria as agricultural could have a huge impact on the livestock sector. Unlike its listing on 205.606 where commercial availability would apply, if we call yeast agricultural, then organic yeast would have to be used when fed to livestock. Agricultural must be organic.

Concern number three, this has been brought up a couple times today, so I'll move quickly through it. But we're concerned about the technical move. We feel that there should be a petition process that the criteria, the petition criteria that we're voting on during this meeting for petitioning substances onto 606, that yeast, dairy cultures and any other substance that's taken off of 605 would need to be petitioned and that procedure followed.

And then of course, the
inconsistency, according to the proposed definition and decision tree, microorganisms, enzymes, malic acid, L-malic acid, citric acid, lactic acid, these are all either microorganisms or products thereof and they should also be moved. So, if you take two, then you should take the rest, otherwise, our efforts for consistency have left us with even more inconsistency.

And finally, I've passed around a decision tree. I submitted comments by October 6th and I mentioned that I would bring in some examples of further development that I took a crack at. There are two, they are identical. One has plants, animals and fungi, the other says plants, animals and microorganisms. And I just want to highlight a couple changes that I made. I broke out the boxes. I have a box that says, is the substance in question derived from plant or animal? Now, I have broken out a separate box that says is the substance in question derived from microorganisms in one, the other says derived from fungi. The important part of
this box goes on to say grown on substrate produced from plants and animals.

I think this gets to the heart of the matter. We're considering yeast as agricultural not because view them as livestock, but because they have a history of use in food and their production relies primarily on agricultural ingredients, the kind of agricultural ingredients that we recognize as agricultural, corn, molasses, wheat, etcetera. Accordingly, by virtue of their agricultural content, their organic agricultural content, they become eligible for certification and this is why Grace keeps coming to these meetings.

So I ask, is it necessary to classify yeast or other microorganisms as livestock, rather than viewing them as agricultural products, with emphasis on the word products, that need to be petitioned and evaluated one by one to 205.606? And in this evaluation, a great question to constantly keep asking yourself is, can it be produced organically? Because it has been the working thought of OFPA and the
current rule, that if it can be produced organically, then it is agricultural.

So, once again, I'd like to thank you for your ongoing work and your commitment to the organic industry and hearing me out today.

Any questions?

CHAIR O'RELL: Gwendolyn, before questions, just a comment. I appreciate the information and appreciate what you're telling us to the board, but most particularly the fact that you've submitted some --

(Whereupon the Radisson Hotel audio system shut off for approximately 58 seconds.)

CHAIR O'RELL: -- for the public concern for what a recommendation should be on the board. And thank you for that.

MEMBER SMILLIE: I'm not going to let you go without explaining. And again, thanks for this work. It's great. You've been very helpful to the Committee and continue to be so.

I'm sorry. Can you hear me now?
CHAIR O'RELL: No, we need to wait until. It's okay now? It seems to be? Okay.

MEMBER SMILLIE: Will you just take a couple minutes and walk us through?

The first question is why two diagrams? I'm looking really quickly and I can't see the difference in the charts between the fungi and the microorganisms.

MS. WYARD: Right. If you were to change the definition of nonagricultural and change it so that you would retain the example of mineral or bacterial culture. So, one is an approach saying let's just deal with fungi right now and not extend it on to all microorganisms. Let's just take it one at a time and we've got an existing rule that says bacterial cultures are nonagricultural, let's go with fungi grown on agricultural substrate.

Minor differences. The other just says, let's go for it, all microorganisms.

Did you want any more walking through?
MEMBER SMILLIE: Just one question. Where does Aspergillus oryzae, where would you, how would you walk this one, how would you, where would you start it walking to? Because we've got a petition for koji mold on our docket --

MS. WYARD: Right.

MEMBER SMILLIE: -- that we will have to consider.

MS. WYARD: Right. Well, it would be a product of a microorganism, derived from. So that would be agricultural. If it goes on then to meet the rest of the criteria, the chemical change. And then I've also added a couple boxes because the question is, if any other ingredients have been added to the substance in question. And where that might be a typical material review process for certifiers to look at those other ingredients, I don't think that's always happening and, if you have a decision tree out there, some certifiers may just take that at blank value and not go on to ask additional questions as to other carriers and preservatives that might be
added to the substance afterwards.

MEMBER SMILLIE: So box five has been added to see if those materials would be on 605(a)?

MS. WYARD: Exactly. Exactly. Or 606, if that product is going into an organic product. If you have an agricultural that an agricultural carrier has been added to, then it would need to go on 606.

MEMBER SMILLIE: Thank you.

CHAIR O'RELL: Dan?

MEMBER GIACOMINI: Hi, Gwen.

MS. WYARD: Hi.

MEMBER GIACOMINI: I've been part of the discussions among our groups on, with the same concern, on the feed additive side. How, and I guess more of a clarification question, how do you, as a certifier, look at something being on the list as yeast when yeast is not yeast and there's a dozen different kinds? Would you look at it as just a generic single thing or how specific would you look at commercial availability issue, as far as different types of yeast?
MS. WYARD: Well, the annotation for yeast goes on to list out yeast tolosate, nutritional yeast, baker's yeast, brewer's yeast. So there is more specificity than just general classification. So and my understanding is that yeast, as well as that annotation, including the cannot be grown on petrochemicals, and that whole thing would be moved to 606.

MEMBER SMILLIE: And you don't think that would be enough of an annotation to allow for the traditional, the commonly used yeast additive, feed additives that are in the feed industry now?

MS. WYARD: Do differentiate between?

MEMBER SMILLIE: Yes.

MS. WYARD: It could be. And that falls out of my area of expertise in that I don't do any livestock work. So, looking at those particular, the yeast additives, I'm not really familiar. I haven't done that analysis.

CHAIR O'RELL: Gwendolyn, you
have two charts and one of them just carves out the fungi. And believe me, as a committee, we wrestled with this, because that seemed like to be the easy choice to go. And the other one is the full-blown microorganisms. In your mind and thinking, what rationale would you have for drawing that line there?

MS. WYARD: I don't know that I can come up with one, but I'm looking. Because I think it --

CHAIR O'RELL: Because we tried.

MS. WYARD: -- would simplify.

CHAIR O'RELL: We tried very hard and that's --

MS. WYARD: No, I find that if you bring yeast in, then you bring the rest in, because the next, pardon me, but the next Grace will show up wanting to put microorganism. It's just, it's going to go that way because will be able to --

CHAIR O'RELL: You were listening in to our committee conversations, then because that's very much where we were at.

MS. WYARD: Right.
CHAIR O'RELL: Thank you.

MEMBER CAROE: Just one other.

Gwendolyn, as you look at this, if your first concern is what would be the standard for these microorganisms to be certified as organic, if we continued with the recommendation, maybe not at this meeting, but say this recommendation passed and we had Ag versus Non-ag settled and the line was drawn between, you know, basically things with DNA and things without DNA; however, if we included in our recommendation language that would suggest that these microorganisms wouldn't or a classification of microorganisms may not be available until such time that there are requirements within the rule that play that out, give the requirements for, you know, livestock handling and now microorganism production, would that be a solution that may work for us? That we can draw that line but basically put in an exemption until such time as we've classified or clearly laid out the requirements for organic microorganism?

MS. WYARD: Right. Because Emily
will be done with the Pet Food Task Force --

(Laughter.)

MS. WYARD: -- and we'll put her on the Microorganism Task Force and we'll go from there.

And I think so. I think that the lack of standards, lack of information is a huge part of what we fear, how to go forward. If you could say, you know, if you bring them in saying it meets the definition of livestock so it's agricultural, yet, since it's a processed product being labeled according to the composition standards of 301, that, make that leap. You know, forget the livestock standards and go right to your handling, organic handling requirements.

If you could work that in there, that would be fine. Personally, I'm comfortable with certifying yeast to 301(b). I think it can be done. I have no idea how to do it to the livestock standards.

MEMBER CAROE: Right. I mean, I think that clarification. I think what I'm hearing for the last week from folks is that there is a level of discomfort with not
knowing that part of that, as we look at this part of it.

MS. WYARD: Right.

MEMBER CAROE: So, I'm just wondering if there's a way we can proceed, get past Ag versus Non-ag so we can deal with 606 and, at the same time, put something in place that allows us to deal with the rest of this issue at a later date. And just kind of, it's spinning plates. You know, we've got a lot of them in the air and we can't let anything crash. So, I'm just—okay.

Thank you.

MS. WYARD: Thank you.

CHAIR O'RELL: Thank you.

Lynn? And next is Katherine DiMatteo.

MS. COODY: Kevin, I have a proxy from Leanna Hoods, which is written on your list there. She's a little bit further down than I was.

CHAIR O'RELL: Okay.

MS. COODY: Okay?

CHAIR O'RELL: So we'll be taking
her off and you have her proxy?

    MS. COODY: Yes, that's exactly right.

    CHAIR O'RELL: Thank you.

    MS. COODY: Hi everyone. I'm Lynn Coody. My company name is Organic Ag Systems Consulting from Eugene, Oregon. And I specialize in issues that are related to certification and accreditation.

    Today I'm presenting testimony from the Organic Producers Wholesalers Coalition, who asked me to help them write and deliver their comments to you, since they're really busy selling produce at home. So, these comments are from them today.

    I did submit my comments earlier, and they're posted on your website. So, I hope you can refer to those, as I'm going along, if you'd like to. I'm presenting a shortened version today.

    The Organic Produce Wholesalers Coalition is comprised of 11 businesses that distribute fresh organic produce to retail stores, restaurants and other customers located across the United States and
internationally. Many of our businesses were early participants in the organic community and we have continued to play an active role in shaping the infrastructure of the organic industry. Our combined for sales last year were $357 million and this year, we estimate a 21 percent increase to $434 million.

In the course of our daily work, we receive certificates generated by many NOP accredited certifiers, both domestic and international. These certificates are essential to other businesses because we use them to verify the organic claims of the products we purchase and later represent as organic to our customers.

In our sector of the organic market, fresh produce, crops must be harvested within a very short time frame, shelf life is measured in days. As a result, we are keenly aware of the importance of having reliable and comprehensive information on certificates. Information that is unclear, incomplete or difficult to read, may mean the difference
between our ability to move a farmer's product into the wholesale market or having it rot in a field, warehouse, or port. In this comment, I will be presenting the reasons for the Organic Produce Wholesalers support of the Compliance Accreditation and Certification Committee's recent recommendations on expiration dates on certificates of organic operation and on standardized certificates.

So, first I'll address the expiration date issue. Prior to the implementation of the National Organic Program, the certificates used by the U.S. organic certifiers, routinely contained an expiration date. That was used to determine whether an operation's certification was current. However, once certification agents were required to comply with the provisions of the NOP, expiration dates on certificates were no longer permitted. Instead, recognizing the practical need for some indication of the current certification status, certifiers used procedures such as dating the signature on the certificate,
including the date of an operation's last inspection, or issuing dated letters of compliance. In effect, implementation of the NOP transformed a system that was elegantly functional with regard to representing the date of expiration on a certificate into one in which this information had to be represented indirectly, in order for certification agents to comply with the NOP regulations.

The Organic Produce Wholesalers Coalition asked the NOP to support the CAC Committee's recommendation to require certification agents to include an indication of current certification status. Specifically, we ask that the NOP regulation require certificates of organic certification to display the date of initial certification for new applicant's certification or the date of continuing certification for operations that have renewed their certification. So that's their recommendation on that.

So, I'll move on to standardized certificates. Every day, the people who
staff our businesses receive certificates that have a confounding diversity in their formats and the types of information they contain. It is commonplace to receive copies of certificates that have variable formats, print too small to read after being blurred by a fax machine, and text written in a variety of languages. As these certificates are crucially important to us, we must devote valuable time and effort to decipher their contents.

To further complicate matters, when our buyers must contend with certificates that contain inadequate information to provide certainty that the product is legitimately certified organic, we are left with no option but to contact the certifier of record to determine whether the operations certificate is still valid. Unfortunately, the process of contacting the appropriate certification staffer, waiting for them to find time to research the matter, and finally receiving the needed information, can easily take longer than the shelf life of the fresh produce that passes
through our warehouses and shipping systems. This is a really practical concern.

We ask that the following items should be added to the NOP's requirements for the contents of certificates and the CAC's recommendations. Certificates indicating compliance with the NOP should, and these are, this is specifically what they're asking for, one, be written in English or, if written in another language, contain an English translation of their contents; include the certifier's official seal, because they've had trouble with falsification of certificates in the industry; be designed for readability, especially when faxed or scanned into a computer, and by that they mean no small or complicated fonts. These are really specific. For producers and processors contain a clear and complete listing of the individual products covered by the certificate; for handlers other processors, contain categorical listings that describe the type or range of the products they trade; and finally, the certificate should
include complete information about the facilities used in the certifications. So, for example, for farms, a list of the certified fields associated with the addresses of the relevant farm or ranch, or for handlers, the addresses of all facilities covered by the certification. In other words, not just the legal address of where they're located.

Okay. And the last thing that these folks would like to comment on is making certification information available. To further support the need for accurate and complete information about the certification status of operations supplying product in the organic marketplace, we asked the NOSB to advocate for implementation of a notification system that would make such information easily accessible to the public because these folks are members of the public in their daily trade.

Currently, the NOP regulation requires each accredited certifier to provide information about certification status of the parties it certifies but, in
our experience, the information is not sufficiently current to allow its use as a tool for verifying the certification status of products as they move through the marketplace.

As mentioned in the CAC's recent document, NOP's effort to develop a publicly accessible database has been unavoidably delayed. In place of the planned NOP managed database, we suggest that the NOP require each accredited certifier as well as parties authorized to issue certificates of compliance with NOP standards under recognition agreements with foreign governments, to maintain a publicly accessible website containing its list of certified operations. In addition, we ask the NOSB to advocate for a system that requires accredited certifiers to update these lists frequently enough to allow their use in real time to verify operators certification claims. We believe the availability of such information will not only assist sellers and buyers of organic products, but also be useful to the NOP in
carrying out compliance actions.

The Organic Producers Coalition appreciates the opportunity to comment on the recommendations of the NOSB. Please feel free to contact us if you would like any additional information on the points raised in these comments. And then there's a list of the 11 members of the coalition that have contributed to the comments.

Thank you very much for listening to the comments.

CHAIR O'RELL: Thank you, Lynn.

Joe?

MEMBER SMILLIE: Lynn, on recommendation number five, crops or products certified, I'd love to get your group's input as to how much detail do we go into with crops? Do we want to go as far down as like varieties of broccoli, do we want to go as high as Cruciferae? Where do your people think, how much detail do they want to be subjected to to put on their certificates when they're shipping?

MS. COODY: Yes.

MEMBER SMILLIE: How much detail
do they want for those products that they've got to deliver to retailers?

MS. COODY: Well that's a really critical question and we've spent quite a bit of time talking about that, amongst the people who are participating in this coalition.

The bottom line was that they felt like they needed enough information to make sure that what's in the box is really coming from that farm. So, for example, for split operations, practically, they need more information than they need from a totally organic operation. So, we feel like the idea that the old IFOAM idea of visual distinctness of whether a product can be visually discerned to be different than anything else on the farm, could be one way to make that cut about what should be on the certificate. They generally did not feel like it needed to be varietal. And actually, a lot of these folks are associated with growers who hold that as confidential information. So they didn't feel like it needed to be that level of
difficulty, of specificity, but they felt like they needed to have, if you could say, like Delicious applies versus Gala apples, that was helpful to them. But they don't need to have super specific, like curled leaf parsley versus flat leaf parsley, just having parsley was good enough for them. Especially, if they were able to combine it with the information they also requested about the parcels on the farm, then they have enough experience and understanding of their market to be able to assure of what's going on.

MEMBER SMILLIE: Yes, that's the one that bothered me, the parcels on the certificate.

MS. COODY. Yes, I know.

MEMBER SMILLIE: I remember those days, man.

MS. COODY: Yes.

MEMBER SMILLIE: That's still done.

CHAIR O'RELL: I have Andrea, Dan, and then Barbara.

MEMBER CAROE: I have two issues
for you. One is the facilities used. I have an overlapping issue with our recommendation on private labelers --

   MS. COODY: Right.
   
MEMBER CAROE: -- and not disclosing their manufacturer and the confidential information there. So, I'm not sure how to finesse that to allow for what you're looking for, which is the facilities. So, that's going to be an issue there. And for that reason, it may not end up on this rendition of the document, but something we'd consider in the future, if we can work that out.

   And then the second thing, the last recommendation about requiring the certifiers to provide a publicly accessible database, I think the economic impact of that is going to prevent that from ever happening, because the small certifier that can comply with the regulation and provide their annual information to the program, it may be cost prohibitive to have such a site available, if they are a small certifier in, you know, Wyoming, doing local farms within
a hundred mile radius.

MS. COODY: Well, then you realize that they wouldn't have to update it very often. For example, a small certifier in Wyoming only updates, well, quite a few of them in that area of the country, they have one specific time where they take in applications and they basically to them in a batch because over the wintertime, they're really not certifying much farm work. So they can -- it doesn't take updating every day, if it's a really small certifier. And, you know, in contrast to a $10,000 fee for accreditation, which is, you know, some of the estimates of the accreditation fees going up so much, it seems like it's really not all that much difficult, when you're already having to make sure that you're stable enough to be able to, as a certifier, to maintain your accreditation.

MEMBER CAROE: The issue is not with the maintenance --

MS. COODY: Okay.

MEMBER CAROE: it's with the infrastructure of having a database, a
publicly accessible database.

MS. COODY: Well, you realize that it doesn't require that they have a database under the rule, but it does require that they make publicly accessible for three years, all of their certified parties for three years. They have to have some way to do that anyway.

Currently, they may be, every time they get a request they have to make copies and send it all out. These, the certifiers, in this group are currently going to the certifiers and asking them, they have long lists, you can imagine how many people they represent, they're going and asking for documentation on that stuff. This seems to be the most cost effective way to do it, in my mind. We saw it as a quick and easy way to provide it to all of the public, not just this slice.

CHAIR O'RELL: Dan?

MEMBER GIACOMINI: She, Andrea, covered it well enough.

CHAIR O'RELL: Okay. Barbara?

MS. ROBINSON: You know, I was
probably one of the people who wasn't really in favor of expiration dates on certificates because, when the Program started, you know, there were lots of concerns about certifying agents being able to update in a timely fashion and that sort of thing.

I have a couple of comments. One is that I've, just because of compliance issues and several other issues that have evolved over time, I'm sort of coming around to seeing things a little differently. But I think there may be a compromise position here Mark and I have been talking about that and that is that, as we know, in the regulations, certification persists, certification exists until surrendered, revoked or suspended. That's just the regs. However, a certificate itself, under just, in document control, a certificate, a piece of paper, could possibly expire or need to be updated. Now, this might certainly help certifying agents who are trying to collect their fees or correct noncompliances. And I can see where somebody would say, well show us your certificate and somebody saying,
well, I am still certified, I just don't have my updated certificate. Well, why not? Well, I just, you know, the check's in the mail, something like that.

At any rate, we're just sort of kicking this around but this may be some way to get where you want to go, without even perhaps without having to amend the regulation.

Now, my second concern, Lynn, though, when you start getting knee-deep, hip-deep, neck-deep in what you put on that certificate, I do get a little concerned with how far we go. Well, let me back up half a click.

As far as certifying agents making information available, the regulation already provides they are obliged make lists of their clients available. And they may charge a reasonable fee for that.

MS. COODY: That's right.

MS. ROBINSON: So that is already there, in the regulations. And we very -- we still do want to get to this electronic database, you know, it's the same old, same
old excuse we always have. Not enough money, not enough people and all that stuff. I don't know that requiring them to do it will make it happen nor do I think we'll be able to do it just because I think you're going to jeopardize or information collection burden again. And we're going to go to OMB and say now we're going to make everybody do this, we're going to force them to publish it on their own. And OMB's going to say, yes, but they already have the authority to do it, all anybody has to do is ask for it. And not only that, but if they're small guys, particularly, they can charge and recover the costs. So what are you making them do it for publicly, maintain a website, blah, blah, blah. So, that might be a nonstarter. I don't know.

Now, my last comment is just simply, once you start getting into things, getting beyond, I produce parsley to I produce curly leaf versus flat leaf, what worries me there is now we start forcing, I'm the producer, you know, my flat leaf parsley didn't grow this year, so now I want
to switch to curly leaf. I'm still a certified organic parsley producer and that's my business. Do I have to call the certifying agent up and go through all this? Now, I grant you, if I want to switch from parsley to potatoes, you've got a legitimate issue. But I don't think Joe Smillie deserves to make another dollar, excuse me Joe, my certifying agent --

MEMBER SMILLIE: No offense taken.

MS. ROBINSON: -- deserves to make another dollar just because I switched from flat leaf to curly leaf because one didn't work or the market shifted on me and my supplier wants something different, and that's not on my certificate and I can't produce it, and somebody says, ah-ha, you know, this could be fraudulent.

So I worry about how much detail we get into on the certificates. I understand what you're saying and again, just recently, from questions we get asked, I wish we had, we all wish we had more information. But it's sort of a be careful
what you ask for because you also can run into problems on the other side of that.

So, it's a two-edged sword with information. So --

MS. COODY: Well, I recognize that there are difficulties in finding out where the line is but you know that the rule does require if there's a change that affects the organic plan, that those people, the operators have to provide that information to the certifier has to make an amended certificate. So there's already a --

MS. ROBINSON: Not on the certificate.

MS. COODY: If there's a change to the --

MS. ROBINSON: Not an amended certificate. The plan has to be updated, the agent has to be notified. But if you say that that certificate is no longer valid, what concerns me is that now somebody's standing there saying, you know, if the agent can't get out there within the six and the agent says, you know, I don't
need to come out and --

MS. COODY: No, they don't have to reinspect. They can just, they just can say, okay, this is all done under your same exact farm plan, it's just you changed carrots for parsley. They don't have to go out and re-inspect. They just do, well, under ISO, it's called, there's a whole procedure for amending the scope of certification.

MS. ROBINSON: Well, now we're back to -- all I'm saying is let's, can we take some baby steps here?

MS. COODY: Yes.

MS. ROBINSON: I mean, I'm willing to -- we're willing to --

MS. COODY: Baby steps are fine.

MS. ROBINSON: -- go. It's just let's proceed cautiously because the more information we load up on the certificate, the more I worry that we could, we start trapping people and then we get the opposite affect. People start calling us up, saying, you know, what did I do wrong here?

MS. COODY; Well, the problem
these folks are in, just to put it in perspective is, when I was working on this project for them, they all submitted to me all the certificates that were of concern to them. I saw fraudulent certificates. I saw things that had been doctored up on Photoshop. You know, all kinds of things.

These folks, as I said, they go through, their product cycle is very quick. So they are, basically, doing self-monitoring compliance actions based solely on certificates. And by that I mean, if they think something is fraudulent, they don't buy the product. They just say no. And that creates a big problem for the farmer who, he may be fine, it may just be a funky certificate that's in the way of the sale.

So, these produce operators have a very specific need in that they have to be able to function quickly. And that's why they need all the information they can get as quickly as possible. That's their bottom line point. So any way you can get that to them, they will be greatly happy for it.
CHAIR O'RELL: Okay. I have questions from Bea, and then Mark, and then Gerry, quickly.

MEMBER JAMES: Okay. I want to know, how does OPWC handle new items from, sometimes it's not just a grower that they're getting the certificate from, a grower might be a broker. And that broker is buying from a lot of other different --

MS. COODY: Right.

MEMBER JAMES: -- growers and they decide to substitute Braeburn apples from one organic farm from another organic farm. So then there's always these new item updates and I'm wondering how they handle new items as they're updated and is there a way that we might be able to, on the certificate, make that process easier, so that there's not this continued --

Like the way that I know some retailers do it, they document new items as they come in and then send that information into the certifying agency so that they can see that they're keeping tack of new items as they come in. And that, so that is a
very lengthy process.

MS. COODY: Oh, yes.

MEMBER JAMES: Basically, you have to have someone solely devoted just to certificates --

MS. COODY: Yes, they have people --

MEMBER JAMES: -- so that you can buy --

MS. COODY: -- they do have people solely devoted just to certificates and they're tracking the certificates and all the products that they're buying and reselling.

MEMBER JAMES: Right. So maybe, Lynn, that's something that you would go back and ask them, how they handle new items as they come in. I'm very curious.

MS. COODY: Okay.

MEMBER JAMES: And if there's ideas on how that process might be simplified in the tracking of certificates. And then the other question that I had was expiration dates. Every different grower has a different time that they have
been granted their certification.

MS. COODY: Right.

MEMBER JAMES: So, how -- if a certifier says okay, now all your certificates need to be up-to-date by this date, but that particular grower is still in compliance with being -- it's not that date, do you know what I'm saying, for their inspection to come up?

MS. COODY: For the inspection of the handler?

MEMBER JAMES: Yes. So there's this grace period between saying you need to have your certificate updated and perhaps that date is not, is before they actually are due for their inspection.

MS. COODY: Well they, I think I'm understanding your question. You're asking me about the certification of the handler themselves and then you're asking how are they tracking the --

MEMBER JAMES: Because if we say okay, we want to have expiration dates on certificates, then all of the sudden, there's going to be, you're going to have to
get a certificate from every single person that OPWC is purchasing from that --

MS. COODY: That's what they keep. They keep all those certificates.

MEMBER JAMES: -- that is currently from this day where, let's say, NOP says all right. You're on. It's got to be --

MS. COODY: Well, I think I see what the problem is. If a system like this were implemented, it could be implemented a year out. So that, within that year, everything would then, they would have all the certificates in their files that have expiration dates on them.

And by the way, remember, we didn't ask for expiration dates on it. We're asking for not the date it's expiring, but the date that is actually issued or becoming, the operation is certified and then they're extrapolating from that, a year out. Because expiration dates we were afraid to ask for because the certification couldn't expire. So we didn't want to go into that. So we're asking for a little bit
of a different thing.

Okay. Is that it?

CHAIR O'RELL: Okay. Gerry, for the final question.

MEMBER DAVIS: Then the group you're representing, are they, and pardon me if I missed this in your comments, are they suggesting going down to the, I know commodity level, you know, not flat leaf versus curly leaf parsley, but they want commodity as well as parcel level information for the operation?

MS. COODY: Commodity is like broccoli versus apples?

MEMBER DAVIS: Cauliflower. You know, broccoli versus cauliflower.

MS. COODY: Yes.

MEMBER DAVIS: But as far as where that is grown. Are they asking --

MS. COODY: Oh, no, they're not.

MEMBER DAVIS: Back to the old days when we used to have to put every single parcel on the certificate?

MS. COODY: No. What they were trying to get to is they recently dealt with
a case where they were together able to pool their knowledge to say wait a minute, that guy is selling way too much broccoli on the market than he has land for. Because they, basically, between all of these, have, basically, a corner on the wholesale market. So, if they put their information together, they can extrapolate and see if somebody is maybe bringing in conventional product and sticking it on the wholesale produce market. So that's why they want to know how many parcels people have. That's literally what they're doing. They want to know how much land do you have.

MEMBER DAVIS: So, not specifically itemizing the parcels, but they want to know acreage of this commodity on the certificate?

MS. COODY: We didn't specifically ask for that. They would love to have that, but I told them that was asking for too much. I felt like that was just not, that was going to be, having putting out, potentially information that was held confidential by growers and it
wasn't going to fly. So, we backed off from that position.

CHAIR O'RELL: Okay.

MS. COODY: Oh boy. I'll tell you, next time I'm making my comments on accreditation because you never ask me questions on that.

(Laughter.)

CHAIR O'RELL: Thank you, Lynn.

MS. COODY: Thank you. Thanks everyone.

CHAIR O'RELL: Next, Katherine DiMatteo and then Rebecca Goldburg is up next. And I just remind the board, we've just completed page one of public comments.

UNIDENTIFIED SPEAKER: Doesn't it say Rebecca switched to Wednesday?

CHAIR O'RELL: Did Rebecca -- oh, I'm sorry. Rebecca moved to Wednesday. Oh, that's good. Okay.

Katherine, did you have a proxy? Is that what you're giving -- you are a proxy? So, five minutes.

MS. DiMATTEO: My name is Katherine DiMatteo and I, actually, I'm
reading this for Nancy Hirshberg. So, I've just cut my hair, so you've got to pretend I still have long hair and I could look a little bit like Nancy Hirshberg, or at least the same size.

I also want to say that I didn't write this testimony nor advise on the contents of it. So I am, literally, reading this for Nancy Hirshberg of Stonyfield Farm. She extends her apologies for not being able to be here in person to read this. She had planned on doing so, but last minute things forced her to stay in New Hampshire. So, don't ask me any questions at the end.

CHAIR O'RELL: Did you hear that board?

(Laughter.)

MS. DiMATTEO: Thank you for the opportunity to comment on your recommendation regarding agricultural and nonagricultural substances for national list consideration.

As makers of organic yogurts and smoothies, this issue has enormous impact on our business. We recognize the challenging
task before the board to address this highly complex and technical issue and greatly appreciate your commitment to a clear, consistent and strong National Organic Standard.

A fundamental principle of the National Organic Standard is that even with a five percent nonorganic allowance, if an ingredient of material is available organically, it must be used. This will stimulate the development of new products as organic and it is an essential part of the process of continuous improvement which is vital to the organic community. It is why at Stonyfield Farm we use a nonorganic agricultural ingredient that is not available commercially. We take our responsibility to find an organic alternative very seriously. We don't simply make a few calls throughout the year to casually see if we can find an organic version of the ingredient. We believe it is our responsibility to work with our ingredient suppliers to develop an organic version.
Over the past decade, we have helped suppliers, we have helped bring to market numerous organic ingredients in the United States by being the first to use an organic version from juice concentrates to spices and flavors.

Stonyfield farm purchases dairy cultures from a variety of suppliers. The culture originates from beneficial bacteria in nature. The seed bacteria. The beneficial bacteria are isolated and purified to make what is called an inoculum. The inoculum is then used to seed a commercial scale fermentation, thereby allowing the production of greater volumes of the concentrated pure bacteria. Each grown step involves the use of various nutrients required for growth of the bacteria. Most of the nutrients are consumed by the cells during the fermentation. The unused nutrients are subsequently removed by concentration, to be sure that the finished culture contains as high a cell concentration as possible. The suppliers then ship us a small can, bag, or
bottle of the culture in a frozen or freeze-dried form. In most cases, we add the culture to organic milk to grow a bulk culture which is then added to milk to make yogurt. In a few rare products, we add the culture directly to the Stonyfield product, where it will grow without first making a bulk culture.

The challenge with defining dairy cultures as an agricultural ingredient is that there is an inherent assumption that they can in fact be grown organically. Logically, it would follow, as it does, for all plants and animals that since the bacteria grow, they should be able to be grown organically. The reality, however, is that the sterile conditions and exacting specifications required for bacterial culture production, which have not been reviewed by the National Organic Standards Board, have specific media requirements, including nutrient level, PH buffers, etcetera. These require much more study to evaluate, if an organic production system is even remotely possible.
If dairy cultures can, in fact, be grown to the National Organic Program crop, livestock, wild harvest, or handling requirements, then they must be agricultural. But if they cannot ever be an organic cultural product because of the specific growing requirements, then they should not be listed as agricultural and should remain on 205.605(a) as a microorganism.

Organisms such as yeast that have been documented that they can be grown organically, should be moved to 606. This approach would be consistent with the European Union Regulation EEC 2092/91 and the Food and Agricultural Organization World Health Organization Codex Alimentarius Guidelines for Organic Production, which consider microorganisms to be nonagricultural and permitted, provided they are not from genetically engineered sources.

Reclassifying dairy cultures as agricultural materials raises several challenges. At what point do bacteria become organic? The seed bacteria in nature
would not be organic. At Stonyfield Farm, we add the culture to organic milk. At the point the cultures are added to the soon to be yogurt, they represent .002 percent of the organic product. Is that where the bacteria becomes organic?

Finally, the new definition of nonagricultural would impact other materials on 205.605(a), in addition to yeast and dairy cultures. Enzymes, citric acid, and natural flavors, all will be impacted. Why should dairy cultures and yeast be the only materials identified for movement to 205.606.

In summary, while we greatly appreciate the National Organic Standards Board's positive intentions and hard work on this challenging topic, we believe that broadly redefining dairy cultures as agricultural ingredients, in conflict with Codex and European Union Standards, is not the prudent direction. We recommend the decision tree be modified so that if a microorganism, such as dairy cultures, cannot be grown organically, it remain on
205.605(a). More research is needed on the potential of dairy cultures to be grown organically and where in the production process the bacteria could become organic.

Thank you for considering these comments and for your countless and often thankless hours devoted to maintaining strong organic standards.

And I will try to make copies of this so that you all have that.

CHAIR O'RELL: Thank you. That would be helpful. Thank you.

MS. DiMATTEO: Thank you.

CHAIR O'RELL: Andrea Kavanagh and then up next would be George Kuepper.

Andrea? So she wants to be moved to tomorrow? Okay. So Andrea moves to tomorrow. George. Lorette Picciano, I probably got that wrong, but hopefully you know who you are.

George?

MR. KUEPPER: Good afternoon. There's some handouts coming around. I heard that you didn't get enough paper to handle and read and I wanted to do my part...
to rectify that.

I'm George Kuepper with National Center for Appropriate Technology. We run the ATTRA project. And for those of you not that familiar with ATTRA, we develop and disseminate information on sustainable farming, a lot of which is directed specifically to the organic community and that's what I'm here to talk about.

Back in 2005, early 2005, I spoke to this group about some of the group that we were doing under specific contract with the National Organic Program. It's kind of an update and I'm kind of here to update the update. Sort of a, guess it's half a public service announcement, I guess.

Of the documents that I distributed to you, there's one that reads organic market farm documentation forms. That's actually a spin-off of the first contract that we did with the NOP. The documentation forms are basically tools that the producers and handlers can use to demonstrate their compliance with regulation and, you know, how well they are following
the organic system plans. They are record keeping tools, basically.

And we found when we did the first rounds of these that materials that we were finding were developing were very appropriate for the larger scale operations but the small, bio-intensive farms, the small horticultural operations, they really just weren't appropriate for their circumstances. So, this is trying to fill that gap. And I hope you'll let certifiers and others know that these are available.

Under the current contract, we've developed a compliance checklist for handlers. And basically what this is is sort of a reorganization and rewriting of the regulation into a checklist form. The one that we had developed for producers was rally widely used and we felt, you know, one for handlers was now appropriate and we're hoping to do more development work for handling operations in the future.

We've also done a lot on this contract with organic system plans. As you know, you all have, as a guidance document,
some templates for farm system plans and for handling plans. What was missing was a livestock template and the program asked us to put one of those together and they are reviewing our work right now. Hopefully, before the end of this year, that will be generally available, along with the other updated templates, the ones that you worked on last year. Also, there will be some guides for system plans. We've taken and developed some examples with explanations, particularly for transitional farmers who, you know, are seeing these system plans for the first time. They don't know exactly what's wanted or why it's wanted. So we're suggesting language and ways that they can develop their plans to facilitate their application process.

And I'd just like to express appreciation to the people that help us on this. We feel it's real important to have a stakeholder team from the organic community. And if you look on the inside of that checklist, you'll see some of the folks that we have. They include Nancy Ostiguy and Jim
Riddle, who is a past member of this board. And also, thanks to Barbara and Mark for supporting us in doing this work. And I'll mention Bob Pooler, too, he's been doing the reviews for us.

So that's all I have to say, formally.

CHAIR O'RELL: Thank you, George.

MR. KUEPPER: I appreciate it.

CHAIR O'RELL: Thank you. Any question for George?

MEMBER SMILLIE: Well, just a quick comment. I think it's great work because one of the problems as a certification agent, that certification agents have, is that a lot of times, they'll get applications in, it will say, what do you mean, how do I do this? And we're not allowed, as certification agents of USDA, to help them. So, having this resource, we can direct a lot of our applicants to your website. So I think you need to get this popularized among the certifiers because it will really help them help their clients, because they're not to do so directly.
One of the common questions we get is, can you send me like a sample of how I -- who is buying drinks -- you know, how can I, give me an example of how I fill out a compliance plan.

MR. KUEPPER: Joes, yes, that's exactly what we've done with these guides.

MEMBER SMILLIE: Right.

MR. KUEPPER: There's one designed for large cropping operations, one for small, and then for livestock.

MEMBER SMILLIE: Part of the ACA training.

MR. KUEPPER: Yes.

CHAIR O'RELL: George, this looks really good for a checklist for handlers and I'll be anxious to go through it. But thank you very much for your hard work.

MR. KUEPPER: Thank you.

CHAIR O'RELL: Lorette Picciano?

(No response.)

CHAIR O'RELL: Okay. Bill Wolf?

MEMBER CAROE: Welcome back, Bill.

MR. WOLF: I thought I was three
back in cue. Wow.

I really first want to say thank you all for your hard work and your efforts. I know you've heard this before, but this comes from someone who has seen the work that you all have to do. And seeing how the NOSB has been evolving and taking on the harder and harder details of the process.

The first time that I spoke at an NOSB meeting, there were four people in the audience. That was in 1992 and I haven't been to one in five years and I'm really impressed with the discipline and the thoroughness with which you're looking at really getting into the harder and harder issues that you guys have to face.

I'm speaking today for Wolf & Associates and for a client that will be speaking after me. And I really want to talk about Aspergillus oryzae and about microorganisms and talk about that in context, as you've been hearing the ideas of are microorganisms possible to be certified organic.

I need to step back for a second
and talk about the fact that really organic
is a philosophy, it is not a science and
that there are certain basic principles that
I hope we all support. But like most
philosophies, there are differences in
opinion about interpretations and that I
think that is at he heart of the issues you
are now facing.

A few common principles I believe
are important to the long-term integrity of
organic. One of them is the principle of
continuous improvement, that whatever we do
in building these regulations and in
refining them is based on the principle that
we are pushing the edges and the frontiers
all the time. And a second principle that
comes into play here is organic preference.
We've been forced to face organic preference
a little differently as a result of the
requirement to have all materials on 606 by
next June. And that has driven a
reevaluation of it by a number of
manufacturers of their certification
compliance.

In the case of Aspergillus oryzae
and koji mold, it was being allowed as, by a number of certifiers, as a non-commercially available organic and agricultural ingredient but that determination was not specified in the national list. It was simply the methodology that certifiers, in reviewing the production methods, determined that certain products were allowed.

The use of microorganisms and especially Aspergillus oryzae, has been in food production as a long and honorable history, literally for hundreds, if not thousands of years. And I think that's part of this pictures. It is possible to make these cultures organically and it is possible to grow them organically. And with that in mind, we need to be taking the high road. It think it's also possible to identify the difference between the spore and the grown out culture. And that, over time, may be one of the answers that you have to dice in the process.

In fact, in looking at all of the ways that different certifiers and products have been certified, we identified a couple
of products that were differentiating that way. One was a miso product that lists their rice koji as organic but their koji spores themselves that they receive and bring into the facility as nonorganic.

Briefly, what I need to say is that the important thing is that you look at that long-term view of where we want to be in the industry and that the solutions and improvements come from creating the platform that allows for that innovation to proceed, that we do have the concepts of the standards, we will figure out how to comply. Mushrooms are a good example.

And right now, microorganisms are on 605(a). They were placed there as the result of a petition by Kikkoman, that's what drove them to that location. There is currently a petition on your list for koji mold to be placed on 606. It has been misstated on your list as being desired to be on 605(a). A shoyu company from Japan, Higashimaru, specifically requested that it be on 606 because they saw the opportunity
and they saw that that's where it belonged.

The fact is that San-J, who will be speaking next, we advised them that they had solved the problem of their current certification because microorganism were being placed on 605(a) but they took the high road and said, no we want to see koji mold identified as agricultural. And I think that, with that in mind, we support the Materials and Handling Committee recommendations of the Ag/Non-ag position.

CHAIR O'RELL: Thank you, Bill.
MR. WOLF: It's the right thing to do.

CHAIR O'RELL: Thank you, Bill.
MR. WOLF: Thank you.
CHAIR O'RELL: Are there any questions for Bill? Nancy?

MEMBER OSTIGUY: You implied that there's a difference between spores and the vegetative growth of a microorganism. Could you explain why you have split that in your mind?

MR. WOLF: Well, I think it's, the real comparison is like a vegetable
seed, versus the growing out of the plant. The spore is produced by isolating the seed itself and then the fermentation process is just like growing a plant. And those two things are separate in the process. And if you look at the process of making sake or tamari or shoyu or even natto, those two steps are normally quite separate in the fermentation and in the agricultural process.

MEMBER OSTIGUY: But in the same way that we have a requirement to use organic seed, if it's available, would that not also apply to the situation that you are looking at?

MR. WOLF: That is what I believe is the correct the long-term approach to this issue, that we should have an organic preference and be moving and changing the regulatory structure. And the Ag/Non-ag recommendation moves us in that direction. That is what I was trying to say.

CHAIR O'RELL: Bea?

MEMBER JAMES: I don't know if you know the answer to this, would Kambucha
fall into the same category as the other fermented products that you mentioned?

MR. WOLF: I believe it uses a different organism, but it is the same conceptual process. I've got some data in this file. I could look it up and answer you in more detail.

CHAIR O'RELL: Andrea, did you have a --

MEMBER CAROE: Just really quickly, Bill. We're hearing some concerns, well, we're hearing lots of concerns that there are not clear standards for the propagating of organic single-cell organisms within the regulation. You, I think you're of the same mind as me in that those, we can extrapolate that from the existing regulations and what is applicable. Do you see, though that there is a necessity to clearly define those extrapolated requirements prior to categorizing these as agricultural? I mean that's what we're hearing, a lot of concern is that --

MR. WOLF: Right. I think that that -- I think that we should just move
forward and that the framework for certification is there. The certifiers have the capacity now to certify microbial products. I don't think we have -- it's just like mushrooms. We have certified organic mushrooms and we have a framework in the standards already outlined for making these decisions. The substrate would need to be organic. The process would need to be verified and compliant throughout the rule.

And I think the issue of livestock versus plant life is a tough one and that is something that has to be worked out.

MEMBER CAROE: Okay. Thank you, Bill.

MR. WOLF: Thank you. CHAIR O'RELL: Thank you, Bill.

Well, we are, I am reminded, we are scheduled for a break now. I'd like to ask the board to take truly 15 minutes and come back. Because we do want to recess somewhat on time this evening. So, please take 15 minutes.

When we come back, Rachel Snoddy
would be up next. Following her will be Leslie Zuck.

    Thank you.

    (Whereupon a short recess was taken.)

    CHAIR O'RELL: Can I get everybody to take their seats, please?

    We are going to resume with the public comments. Rachel Snoddy. Rachel?

    MS. SNODDY: Good afternoon. My name is Rachel Snoddy and I am from San-J International.

    I would like to take this opportunity to thank the National Organic Standards members for your diligent work and your consideration of the complex issues of organic production and processing. I would also like to thank the National Organic Program staff for their work to ensure that the U.S. organic regulation is implemented efficiently and effectively within the constraints of their limited budget.

    I am the Production Quality Control Coordinator at San-J International, Incorporated located in Richmond, Virginia
since 1987. Our founding company is San-Jirushi Corporation in Japan, which is now owned by Yamasa Shoyu Corporation. We are the producers of soy sauce and related products.

Our founder, Mr. Sato, started San-Jirushi to fulfill his dream of providing natural miso and shoyu using traditional methods or production. Our products are sold throughout the United States and in a number of countries around the world, including Japan, Australia, New Zealand, and Canada, and throughout Europe.

1989, San-J introduced organic tamari and shoyu soy sauces. Organic sales currently represent 50 percent of our overall sales and have increased five times since 1990. We have introduced one new organic product in the past two years and have a strong commitment to increase the number of organic products and amount of organic ingredients in our products. Yamasa Shoyu Corporation also produces organic products in Japan.

San-J International supports the
recommendation of the NOSB Joint Materials and Handling Committee regarding the definition of agricultural and non-agricultural. In particular, we agree that microorganisms that are traditionally used in the manufacturing and preparation of foods should be considered agricultural.

The committee's recommendation supports both the organic foods production act that includes non-plant life within the scope of the law and the 2002 technical advisory panel review of microorganisms used in organic processed foods. The TAP review includes a recommendation from the organic materials review institute that "another alternative would be to consider, in the future, recognition of such cultures as agricultural commodities."

In the committee's recommendation, the determination of an agricultural product is based on whether the non-plant life grows on plant products, is consumed whole as part of the finished product, and has a history of use in food. Let me explain how koji mold is produced, in
order to illustrate how koji mold meets these requirements and, therefore, why this substrate should be considered agricultural.

Koji mold also known as seed mold or seed koji is produced by inoculating an agricultural substrate, such as rice or barley, with Aspergillus oryzae, a microorganism currently allowed for use under Section 205.605 of the National Organic Program Rules. This begins a growth process to produce spores that are dried, collected, and blended with a carrier, such as cornstarch. At this stage, this is koji mold. Organic soy is then inoculated with the mold and fermented to produce products such as soy sauce and miso. This six month natural fermentation process has been used for over 200 years. In our opinion, koji mold and other non-plant life grown in a similar process clearly is an agricultural product.

Although koji mold is currently not available in an organic form, it is possible that an organic form could be produced in the future. Although this may
take time to develop, organic production should be pursued in order to continually expand the use of organic ingredients in organic processed products.

In our company, taking this as a fundamental responsibility has begun to talk to our suppliers about the possibility. I urge all of the members of the National Organic Standards Board to vote in favor of the recommendation for the definition of agricultural and non-agricultural that the Joint Material and Handling Committee has recommended.

Thank you.

CHAIR O'RELL: Thank you, Rachel. Any questions?

(No response.)

CHAIR O'RELL: Thank you very much.

Tina Ellor and next on deck is Emily Brown Rosen.

MS. ELLOR: Hi. I'm Tina Ellor from Phillips Mushroom Farms. It's so good to see all this fungus being talked about for a change.
(Laughter.)

MS. ELLOR: I am, by professional, a mycologist and you know, I've always assumed mushrooms to be agricultural products, I'd like to say that up front, but certainly not livestock. And I have to say that part worried me a bit.

As you know, we certify under the crops standard. And so far, it's been working well. We would rather, of course, have our own mushroom standard. Just another -- I always plug for that and I will forever until we get one. If there's a task force to be done, I'll take it on.

I'd like us to remember that we're not an island. We live within a larger framework and a lot of this terminology is well established. And I don't, what really worried me, when I saw the recommendation, if it's not a plant, it must be an animal, which, of course, is not true. I brought my son's biology book and there actually are six kingdoms and, you know, they're split into that classification for various reasons. But this an ever-
changing organization and I've addressed this organization countless times.

And before I go any further, and not to start a brawl, but as a true token of respect, I'd just like to give you a little bow because I know the amount of work and the amount of material that you guy must have to learn about, you know, to make these determinations.

I have no problem with the agricultural/non-agricultural determination but I'd like to make sure that we live within established nomenclature, so to speak. So, if it's not a plant, that doesn't make it animal.

And also, a microorganism is anything that you can't see with your eye. That's the definition. So not all fungi are microorganisms. Not all microorganisms, of course, are fungi either.

So, I'd like if we could keep in mind the established nomenclature for these things because, of course, mushrooms are always grouped with fruits and vegetables. You always find them in the produce section,
not in the meat section. And the very idea of certifying mushrooms under a livestock certification, I had the cold sweats all night last night. So, I just, you know, I'd like you to keep that in mind. And if you want a boring lesson on the classification system, I'm your woman.

Thank you very much.

CHAIR O'RELL: Thank you very much.

Tina, if you want to learn about the approach to non-ag/ag on the classification of kingdoms, we've been down that route.

MS. ELLOR: Right. I figured you had.

CHAIR O'RELL: That's our previous ones.

MS. ELLOR: I figured you had.

CHAIR O'RELL: Yes.

MS. ELLOR: But the way it came through in, you know, that one paragraph, I didn't bring it up with me was that, you know since it's not --

CHAIR O'RELL: No, I appreciate
the comment in that regard but --

MS. ELLOR: And this is an ever changing group of people. And down the road, you know, I don't want another group to say hey, wait a minute, you know, yeast are certified as livestock, why shouldn't mushrooms be?

So, I'd like to see us have our own standards, mushroom standards. Microbial standards certainly would over it. Keep in mind, you can't make it single-celled, because there are many, as the Aspergillus, of course, is a filamentous fungi with many cells. So even be careful how you use that term. And of course, there are many filamentous yeast as well. And I'm a mycologist, I'm a geek, I admit it.

CHAIR O'RELL: Andrea, then Joe.

MEMBER CAROE: Just really quickly, one of the things that we were challenged with when we were going down that kingdom route and trying to distinguish, and we have very distinguished scientists on the board to help us out with this, --

MS. ELLOR: Right.
MEMBER CAROE: -- is not a scientific challenge as much as a regulatory challenge in that, you know, we must make our justifications based on information that's provided to us in the OFPA, the statute and the regulation to a lesser degree. But it was very hard to justify carving out and, essentially, reverse engineering what we've done, what the past boards have done to get to that point.

So, if you have suggestions in that area, arena, that's really, you know, I think we're in agreement where we want to go, but how to get there --

MS. ELLOR: Right.

MEMBER CAROE: -- is not an easy --

MS. ELLOR: Right.

MEMBER CAROE: -- task when it comes to getting this recommendation --

MS. ELLOR: But I think for us to start reclassify life is not, I don't know how to put this well, it's not very credible. There's this existing framework that's recognized throughout the world and
not just in the scientific community. This is my seventh grader's biology book, you know? We have to do it within a framework so that, and also within other, I mean certainly mushrooms have always been considered agricultural and never been considered livestock, the FDA certainly puts them with fruits and vegetables, the USDA does. You know, I just don't think it's credible to sort of reclassify life for regulatory convenience. You know?

CHAIR O'RELL: Nancy and then Joe. Sorry. Sorry, Joe. Sorry, Nancy.

MEMBER OSTIGUY: First off, Tina, I agree with you, that there are different kingdoms. But the difficulty does come in with regulations and laws. One of the problems I run in to all the time is explaining to my students how runoff from an agricultural field is a non-point source of water pollution. They keep saying, but I can point to where it's coming from. And they're right, but it's defined legally as a non-point source. So, I'm not coming down on one side or another but I'm just saying
that the law actually frequently does not pay attention to biology and science in general.

MS. ELLOR: Yes, this is pretty fundamental, though.

MEMBER OSTIGUY: I know. It's basic.

MS. ELLOR: This is pretty frustrating.

MEMBER GIACOMINI: There aren't very many soybean cows though either and it's on the dairy case. So --

MS. ELLOR: But we are going to do for outdoor --

(Laughter.)

MS. ELLOR: Yes, how are we going to get those mushrooms outside? They just don't move very fast.

CHAIR O'RELL: Okay. I have Joe for a question.

MEMBER SMILLIE: Well, basically, the point I was going to make, Andrea and Nancy made it, is again we're getting beat up about the livestock issue. But the reason why that came up at all is if we
would have used common sense, we could deal with this issue and deal with it very appropriately, quickly and efficiently. We lack a regulatory base to do so. We know what the right thing to do is. We have to justify it via the regulation. And, as Nancy said, regulation doesn't always follow common sense or science, in some cases.

So, that's why the whole livestock issue came up. Obviously, we -- the regulatory basis by which we felt we could proceed from. That's the only reason why it's there. We don't intend to pasture them or anything.

MS. ELLOR: But from the beginning, I mean, if we could start properly from the beginning. And you know, we had a mushroom standard that was recommended by the NOSB that got dropped for various reasons. And the same with, you know, we're always trying to put round pegs into square holes. We need a mushroom standard, possibly we need a microbial standard because it is very different. And certainly how you grow yeast is much more
akin to how you grow bacteria than how you grow mushrooms. And of course, growing mushrooms is much more akin to a field crop, although it's pretty distant, than say, you know, cattle or dairy or whatever.

So, anyway, thank you very, very much.

CHAIR O'RELL: Bea?

MEMBER JAMES: I just want to make sure that what I hear you asking is that you're saying you would rather see a new standard made for the classification of mushrooms instead of having it grandfathered inappropriately into livestock, where it doesn't really fit.

MS. ELLOR: Absolutely. Absolutely. And now we certify under crops which we made work. It's not an exact fit and there's a lot of inconsistency, you know. So, a mushroom standard wouldn't be too hard to come up with. There are certainly lots of people who could do that.

CHAIR O'RELL: Thank you. Emily?

Emily Brown Rosen and then following Emily is Will Daniels.
MS. ROSEN: Yes, I have a proxy from Harriet Behar for an extra five minutes.

CHAIR O'RELL: Harriet is --

MS. ROSEN: Are you signed up also?

CHAIR O'RELL: Harriet is on the list.

MS. ROSEN: Yes.

CHAIR O'RELL: So, you're taking that place? Okay got it, thank you.

MS. ROSEN: For myself and Harriet. We're passing out some copies of my comments here for you.

My name is Emily Brown Rosen and I've been up here before. Many of you know me. Right now I'm working as the Materials Review Manager for Pennsylvania Certified Organic, so my comments are on behalf of PCO today.

I'd like to talk about three of the recommendations. First I'm going to talk a little about commercial availability, the guidance for a listing of certifying agents names on labels and then agricultural
and nonagricultural. So I'll start off with the shorter document first, it's on two sides.

And basically, commercial availability, we do support this recommendation and especially the intent of this recommendation as far as helping establish more criteria and review of the substances petitioned for 606. In fact, we think that the additional information requested about availability of sources is useful. It will be helpful to NOSB in evaluating the petitions and we also support the role of NOSB in making an initial determination on commercial availability. We think that's an important first job for materials that are petitioned and that that's not something you should shirk from doing. That's part of the whole national list process.

Then further down the line, the certifiers will have to do the more nuts and bolts to get more specific on the commercial availability determinations but it's helpful if they're screened first on the list and we
know, you know, the universe of things to work with. So, we do support that.

In Part C, the role of accredited agencies, we think you've gotten a little close to the line under point three there, where you've recommended or required that certifiers notify clients of sources of information of commercial availability. As you know, certifiers are not allowed to consult or give direct advice to clients that will overcome barriers to certification. So we feel this really is, if not crossing the line, very close and it's not really certifiers' jobs to help processors source ingredients. We feel that should be left out.

Under point four, we don't object. We can see the value of filing these notification reports to NOP about any exemptions provided but we would like to seen an additional point in that document stating that the NOP's role, in this case, is to gather this information and publish it and make it available. We don't want to be burdened with collecting all this
information, updating it regularly, sending it to the NOP and not having it publicly available, having it in a box, or really inaccessible. So, you know, we'd be happy to do it, but it needs to go somewhere once we do do it.

We do, in general, recognize this as a really hard part of the rule. And good luck. It's going to be a big job coming up here. And we're also very supportive of any private sector development of databases that are more interactive, that can be more useful for the industry. So, maybe that's something, you know, that would be an easy thing to say, there's a database out there, go check it and we can work with it. But, it's not there yet and I think we should all be scratching our heads and figure out a way to make that happen.

As far as certifying agents' names on the labels, we think it's great that you're working with NOP on Q and A's on this. It's always a confusing part of the rule to explain to people and also, you know, what has to be on the label. We've
seen a lot of different problems with that. But I think the questions that you were given to work with are a little narrow and don't really cover the scope of the types of problems that are out there. So, I've taken the liberty of writing six new questions, sort of similar to the ones that you have. I'm not going to read them all but it does, I think, cover the turf a little better and I think it helps with who has to be certified, whose name is on the label. And you can, I won't read them all out loud, but you can look through them. I mean, for example, I added a new one here. I mean, because it's not just the retail level, it's also the manufacturing level, when a manufacturer who is certified has a lot of co-packers. We need to cover that base too.

So, my last question here is, what if a certified manufacturer uses more than one processing facility to manufacture a product and the facilities are certified by different agencies? Do all agencies need to be on the label? And the answer is no.
The agency that certifies the manufacturer whose name is on the label can be listed for all the products. The manufacturer, in that case, is responsible for the audit trail and acts as the final handler. So it's like clarifying who is the final handler. And I think this will help. So, I hope you can take a look at that.

Okay. Moving on. Agricultural and nonagricultural substances. I want to give a lot of support for Oregon Tilth and the work they've done on this. Gwendolyn and I have been trading emails like crazy the last two weeks in trying to sort this whole thing out. And her concerns, she listed four major concerns, are really all my concerns, they're all in this document, too. They're in a different number of order, but they're pretty much the same ones, plus I added another one but we are concerned.

You know, our number one concern is probably the impact on the other sectors, and particularly livestock. We certify a lot of livestock in Pennsylvania and dairy
farmers, particularly fond of adding, what is termed by AAFCO as direct fed microorganisms to the animals' diet. It's generally a bacillus, lacto bacillus, various different bacteria. It can be a combination of bacteria and fungi. It's just standard good practice. And my concern is that if you're coming up with this new process for determining agricultural and microorganisms, I mean, it's hard to see how yeast and not bacteria or some organisms are and some aren't agricultural. But if they become agricultural in general, are we going to have a different rule to describe agricultural for the purposes of feed as for the purposes of food? It seems like you'd want one method of doing that for across the board here.

And secondly, in livestock, we don't have a commercial availability clause. If something is agricultural for livestock feed, it's supposed to be organic. So, we'd have a little bit of a conundrum here where you've called them agricultural, they're not available organically, what are they...
supposed to do? So, I don't have a good answer for that, other than, I don't think you should move these things at this point. I don't think it works.

The other industries that haven't been consulted are the brewers and the wine makers and, you know, we've head from one dairy processor, but I think there's a lot of other cheese and dairy people that really might have more to say on this. So, I don't think it's, I mean, it's an idea. I think it's good to think for the future, but I think we need to look at this a little more carefully and think about it a little bit more.

The second main concern is consistency, as Gwendolyn noted. There is, if we're going to do this, you know, in the name of making the definition more consistent with the list, we're ending up with microorganisms as non-synthetic allowed and yeast as requiring to be organic when available and whose to say when we're using it as an organism and when we're calling it yeast. There's going to be total confusion
to move some and not all. So, I think, you know, plus also if you're going to go that route, then we have enzymes that are products of organisms, vitamins can be products of organisms. Are we going to go through this and do this all consistently? I think that's what's needed. So, I can, I have to agree with Gwendolyn, it's sort of all or nothing. And I'm sort of falling on the nothing side, at this point, I hate to say.

And the third reason which we've all heard is that, is we don't know how to do it. Okay? We don't have standards. What do we start with?

If we're going to continually need a laboratory sterile inoculant for your dairy culture and then you're going to grow it one small vat and grow it bigger and bigger and bigger. But there's very prescribed systems. Where does the nonorganic part come from? Is that okay, to be nonorganic forever? When does it become organic? It's really we're talking more like processing function not really, you
know, you can say cultivating, it's growing, but it's sort of more like making a food product. You know, you're taking something and growing it out to make it a bigger food product. But still, we're not clear how to, you know, what is laboratory source organisms? You know, how you would calculate percentage of the weight of the substrate when they're going through five different batches? How would get 95 percent?

There's really no, there hasn't been a lot of thought about this and, you know, I don't know how to do it. We'd like to see guidance and rules before we're suddenly put into that position.

Okay. And fourth, I agree, this is not a technical correction. You have a process. We've been told over and over again, we need petitions. I believe the OPFA says there needs to be a TAP review. There's an old review from 11 years ago that doesn't really cut it on dairy cultures, at this point. So, I really think you need to gather that information.
We've used information in TAP reviews to help us with further certification decisions down the road. We look back at those TAP reviews to say, oh yes, this farm was decided synthetic, this wasn't. This is the manufacturing process that was reviewed and allowed. And that helps us to set these standards.

So, I think if we go through it now, you've got a petition on yeast, if you go through your normal process, that will help you, you know, figure out which way to go, and which type of products and what the rules are. So I really encourage you to stick with the process like you always do. And it might take a little longer, but we'll have a good process.

(Timer sounds.)

MS. ROSEN: Okay. I guess I'll -- that was ten minutes, right? Okay.

CHAIR O'ReLL: That was.

MS. ROSEN: I could go longer but that's okay.

CHAIR O'RELL: We know you could.

MS. ROSEN: Any questions?
CHAIR O'RELL: Thank you, Emily.

MS. ROSEN: Okay.

CHAIR O'RELL: Any questions for Emily? Joe?

MEMBER SMILLIE: On point three, and the role of accredited certification agencies, representing certifiers, I agree. Point three is sensitive. You're absolutely correct. Certifiers are not allowed to help prospective people who are being certified. But, at the same time, we're where the rubber hits the road. You know, it's the certifiers that have to deal with, you know, well, you say it's available, you know, where, how, why? And obviously we can't say, well go to so and so and so. But I think we do need the power to point out, and the wording was carefully chosen, it's sources of information, not direct information. So, what we're looking for is organizations like OTA and then we just heard ATTRA and others who stepped forward to provide those data banks, that manufacturers that create these products that are available in form quality and quantity, you know, we can get the
people who want to get certified to those sources. So, I do want to keep the role of certification agents. I do realize it's a very sensitive point and it has to be clearly understood by certification agents how they far they can go in providing support and help.

MS. ROSEN: I wasn't clear if you were, you know, you're proposal is like a guidance to what the certifier's role should be, right? So you're not saying they're required to do this?

MEMBER SMILLIE: No.

MS. ROSEN: I mean, you know, that's fine. I mean, we always provide general information to people on all kinds of topics. That's applied to all fairly.

MEMBER SMILLIE: Right. And I think eventually it will come down to the ACA training and we'll get guidance on exactly what we can say and can't say. And again, relying on organizations like OTA and ATTRA to promote their role in OMRI, in making these sources available. It's going to be critical because really, when you're
dealing with people who are getting certified for the first time, it's a new world for a lot of these producers and handlers. They don't know how to find organic stuff. They've been buying from the same supplier for like 20 years, now they've got to do organic.

You know, so we do need to, as conduits, we need to be able to get them to the information without breaking our role.

CHAIR O'RELL: Bea?

MEMBER JAMES: Thank you for putting together your easier to read version of the retailer Q & A. And I just want to make sure because when I go through and I read this, it just seems like you're not really saying anything outside of what we had already put into the recommendation.

MS. ROSEN: No, I just tried to expand it a little.

MEMBER JAMES: You're just trying to clarify it more. It's not that you're disagreeing with the way --

MS. ROSEN: No. No, there's no disagreement.
MEMBER JAMES: Right.

MS. ROSEN: Okay.

CHAIR O'RELL: Thank you, Emily.

MS. ROSEN: Thanks.

CHAIR O'RELL: Will Daniels? And then on deck is Suren Mishra.

MR. DANIELS: Thank you. Will Daniels, Chairman of the Board of CCOF. And I'd like to thank the NOSB as well the NOP for allowing me the time to speak today.

My comments today are really nothing more than echoing many of the comments that were already said today, so I will be brief.

With regards to TAP reviews, CCOF supports the conclusions of the TAP reviews and we'd like to express our desire to keep those TAP reviews moving forward, especially those that blur the line between materials and a process.

With respect to Ag versus Non-ag, CCOF has concern for the agricultural versus nonagricultural proposal. While we appreciate the points raised in the recommendation, we're not sure if a
technical correction is feasible. And further guidance is needed on how to certify microorganisms.

With respect to private labels, private label certification is an integral of our organic system. CCOF certifies private labels and they must adhere to the same standards of certification, providing detailed records for auditing, oversight over labeling, certified suppliers, etcetera. Requiring the company to list each co-packer may be too costly and, therefore, we don't recommend it.

Regarding standardized certificates, standardized certificates, including an indication of some sort of an expiration, are important and needed. However, overly prescriptive requirements regarding fonts, spacing and the like, are unnecessary.

I think that's it for today. Thank you. Any questions?

UNIDENTIFIED SPEAKER: We appreciate your brevity.

(Laughter.)
CHAIR O'RELL: Thank you for being so to the point, yes.

Suren Mishra? Anthony Pavel is on deck.

MR. MISHRA: I am Suren Mishra from TETRA Technologies. I am a business development manager for the company and I also manage intellectual properties. This is the first time I am coming to you. I had opportunity to interact with patent and trademark office, convincing my case. So let me see if I can convince you here.

I heard Bill Wolf made a statement philosophy or science. When science becomes sophisticated, it becomes philosophy. And when it is further upgraded, it becomes art. So, I will try to stay at the scientific level. I am not a philosopher, I am a scientist.

I am addressing the issue of calcium chloride being still put in the prohibition list of NOSB. It is well established for long time that both calcium and chloride are nutrients applied foliar, as well as in soil. Calcium chloride has
been used for a long time, at least for over 20 years in the agriculture industry. TETRA alone, I don't quote the exact figure, but would be hundreds of thousands of tons of calcium chloride have been sold in agriculture market, both for soil applications, as well as for foliar applications.

   It is also an excellent source of calcium for soil amendment and I'm sure we go around the world and you go around the United States, there is very large percentage, a significant percentage of soil is affected by salt. And calcium chloride we are selling into that market for soil amendment. It is not restricted only to the crops. Fruits, vegetables as well. So, we are selling into that market.

   It has got a role to play, as it has got readily available calcium. It works very instantaneously, very rapidly, as compared to less soluble calcium source which traditionally has been applied in the industry for a long time.

   What we are concerned about is
calcium chloride has been classified organic for foliar applications but not for soil applications. And principally, what is happening is the chloride issue. One of my colleagues is sitting in the back, Charles Sandler, he always reported that people have that chlorophobia. Sure, people have concern about chloride ions and for that I have attached with this list of various soils from different parts of United States and if you look at the chloride content, they are pretty reasonable. In fact, in many areas, very deficient in chloride content. So, chlorophobia is not an issue, if it is applied properly.

On the other hand, what we have noted that potassium chloride is being classified both for organic, for foliar and soil applications. Why the difference? As a matter of fact, there is a proviso with the potassium chloride and that is, it must be applied with care so that chloride build-up doesn't take place. That's genuine concern. Potassium is a monovalent ion, it can disburse the soil, if it is added in
excessive amount and it will entrap chloride species in there. On the other hand, calcium being divalent, it tends to flocculate and so, chloride species will not stay there. It gets down away from the root zone. So, from that point of view, calcium chloride should be preferable over potassium chloride, as far as chloride sources concerned, which is a nutrient.

Potassium chloride is used all the way up to thousand pounds per acre. On the other hand, calcium chloride is in the range of ten to thirty gallons. That's equivalent to something like 100 pounds per acre, which is much more reasonable, as compared to what you see in case of potassium chloride.

(Timer sounds.)

MR. MISHRA: I will request potassium chloride and calcium chloride should be given equal treatment. And I am open to questions.

CHAIR O'RELL: Thank you. Any questions?

MEMBER DAVIS: I have a question.

CHAIR O'RELL: Gerry?
MEMBER DAVIS: Suren, the chloride concentration of -- I think you make a good point when you talk about potassium chloride and calcium chloride. Why would one be not restricted for soil use, as in the potassium chloride, and the calcium chloride would be restricted? We grappled with that in our discussions on the committee and didn't -- I'll have to give you that one. We didn't approve the potassium chloride.

But you're right, the chloride is the issue and using it as a soil application, it's perceived that yes, it's soluble and yes, it's not going to stay in the profile, it's going to leech through. And that brings up the issue of possible environmental contamination. Not that it would have a high parts per million concentration per application, but if you're continually adding more and more, what are we doing underneath? I mean, that was the issue that we grappled with, as far as one of the criteria for does it pass or not.

Your information showed that your
company would like to have it applied for salt remediation because it's better than, you know, to go into alkaline soils. And it seems counterintuitive, to me at least, to apply a salt to an alkaline soil to remediate salt. I know it, I understand the science behind it and what it does, it just kind of goes against the philosophy of organic a little bit. And I think that's what you're struggling with.

MR. MISHRA: Well, let me answer your question.

MEMBER DAVIS: Okay.

MR. MISHRA: The first instance regarding the chloride level, if you are to compare potassium versus calcium, potassium application is much much higher than calcium application, in general in soil, number one. For soil remediation, now what are you trying to do? It is, you're not -- we have got data available --

MEMBER DAVIS: No, I understand. I know potassium chloride would not be for soil remediation, that is something specific to your --
MR. MISHRA: No, I understand. I'm not talking about -- that's one answer. Another one is for soil remediation, you have said the chloride is an issue. Right? As a matter of fact, if you go and look at soil, affected soil, which will have higher chloride content, then once it has been remediated with calcium chloride, because it is taken out of the system, it is entrapped. Because soil is disbursed, so chloride is trapped into the soil physical structure. Once calcium replaces sodium, it flocculates the soil, it makes it permeable. Chloride gets out of the root zone. It removes the toxicity of sodium, as well as chloride.

CHAIR O'RELL: Nancy, I have a question. Go ahead.

MEMBER OSTIGUY: You still didn't answer the question of where the chloride goes.

MR. MISHRA: Sure.

MEMBER OSTIGUY: Because if it's going beyond the root zone --

MR. MISHRA: It will go down.
MEMBER OSTIGUY: -- it still does
--

MR. MISHRA: Sure. Ultimately, it will go down. Sure.

MEMBER OSTIGUY: Right.

MR. MISHRA: It will flow down.

MEMBER OSTIGUY: In reality, we are dealing with philosophy rather than science. Potassium chloride is prohibited, unless it's from a mine source. The law allows that material to be used because it is non-synthetic. Your material is synthetic.

MR. MISHRA: No, it is not. It is mine source.

MEMBER OSTIGUY: Then why are we even considering --

UNIDENTIFIED SPEAKER: Okay for use.

MR. MISHRA: Yes, that is right. Then it is okay for use.

UNIDENTIFIED SPEAKER: Then what are we talking about?

MEMBER DAVIS: The TAP was a bit confusing and I see where you probably got
the idea, because there are, TAP talked a lot about synthetic ways of producing calcium chloride. But their mine, their process, is not synthetic.

MEMBER OSTIGUY: Then it doesn't need to be petitioned, does it?

UNIDENTIFIED SPEAKER: Even if it is petitioned, that one is still good.

MEMBER WEISMAN: But is petitioned, it was originally petitioned to be prohibited, except for a particular use. So what he's advocating is that it no longer -- I think the issue here is advocating that it no longer be prohibited, that --

MEMBER DAVIS: Change the annotation.

MEMBER WEISMAN: Or no, actually it shouldn't be -- you're saying that it should not be a prohibited item anymore.

MR. MISHRA: Correct. Because it is also, it is produced similar way as potassium chloride is.

MEMBER OSTIGUY: Well, but you were comparing calcium chloride to potassium chloride.
MR. MISHRA: Correct.

MEMBER OSTIGUY: That comparison, they are two separate materials.

MR. MISHRA: I understand.

MEMBER OSTIGUY: Okay. They are two separate materials.

CHAIR O'RELL: Julie?

MR. MISHRA: My argument is both are produced in similar fashion. Both are mined, pumped from underground, processed as -- we have submitted to you the whole process or system of how we produce it. So you should be consider it like potassium chloride is considered.

CHAIR O'RELL: I have Julie, then Hugh.

MEMBER WEISMAN: Okay. I'm asking questions as crops is not my field of expertise. I'm just curious what percentage of agricultural land in this country is, would you say is salt affected?

MR. MISHRA: If you ask me about, it would be about 15 to 20 percent.

MEMBER WEISMAN: Okay. All right. Because I guess I'm wondering, I
take it this is common practice in conventional agriculture, is to add this to the soil so that it can be, so that salt affected soil becomes arable?

MR. MISHRA: Yes.

MEMBER WEISMAN: But there's not rule that says, I mean, no one here is preventing conventional crops from being grown in this way. We're just saying that organic crops need not. Just the same way there is an issue about whether, you know, if there's not enough rainfall in an area to produce adequate pasture, then the issue has been raised, then maybe cattle shouldn't be grazed there. Maybe that is not a good place for cattle, organic cattle production.

MR. MISHRA: Julie?

MEMBER WEISMAN: So that --

MR. MISHRA: What I'm asking for is to be fairness here. If potassium chloride has been allowed to be considered organic for soil applications, why shouldn't it be for calcium chloride? That's the only fair thing.

CHAIR O'RELL: Hugh?
MEMBER KARREMAN: One suggestion, it just kind of reminds me of the ivermectin and moxidectin. If moxidectin is better than the ivermectin for environmental reasons, maybe someone should petition that potassium chloride comes off and calcium chloride comes on. Or if it's natural anyway, I don't see what the petition process was all for.

MEMBER DAVIS: They're different. They're used for different purposes. One would be mainly a potassium supplement, the other is mainly a calcium supplement. But they both contain the chloride ion which is, in my opinion, the bad guy that he mentions about. Everyone's got chlorophobia because they're wondering where is all that ion going, what's the long-term ramifications of continuing leeching through chloride and is that sustainable and is that organic? And that's the, I think the real crux of the issue. It's hard to determine.

MEMBER KARREMAN: Well, I could say that moxidectin actually acts on different parasites than ivermectin does.
MEMBER DAVIS: Well, okay.

MEMBER KARREMAN: No, no. I mean, it's the same parallel argument there.

MEMBER ENGELBERT: Suren, there are two other points of view that we have taken on this. And one is that we weren't sure that potassium chloride should be allowed. And we didn't think that two rights make a wrong. The other thing we thought was that the calcium chloride could be applied foliarly in sufficient quantities to correct the plant deficiencies. And we were extremely concerned about the leaching of that chloride down through the soil into the water table. And we didn't want to add to that problem that may already be exacerbated by potassium chloride being allowed. That's part of where we're coming from, besides what else has been mentioned.

MR. MISHRA: Well, I heard that if, you know, potassium chloride, this isn't what you took, was wrong, it doesn't suggest that this isn't what you take for calcium chloride. So we don't as well.

But calcium chloride soil
applications is being practiced in other areas in nonorganic crops. Right? And that has never been a problem. I mean, it is commercially sold. So I'm intrigued that why shouldn't it be used in organic applications, if chloride is the only issue.

What percentage of land is being used for organic production? Very small percentage.

CHAIR O'RELL: Okay. I'm going to ask the board, does the board have any specific questions?

MEMBER DAVIS: I don't have any more, myself.

CHAIR O'RELL: Okay. Thank you.

MEMBER DAVIS: I wanted to give him an opportunity to air -- we finally --

CHAIR O'RELL: I understand.

MEMBER DAVIS: -- worked our way around to the core issue.

CHAIR O'RELL: So, is the board satisfied with -- Rigo?

MEMBER DELGADO: Just one question. In that, one of the other factors that we took into account is the actual
harmful effect to human health. What is your opinion on that?

MR. MISHRA: Well, harmful effect means, I mean it is any of the high concentration salt. If you are exposed to it, it will hurt, it will affect you. Right?

As far as toxicity is concerned, it is very comparable to salt. So, it is not toxic. And again, MSDS is always applied with them, people who are using it, they operate it. The more fertilizers, the more additives used in the agriculture industry, much more dangerous than calcium chloride.

MEMBER OSTIGUY: But we're not, we're organic, not conventional.

MR. MISHRA: I understand that. I understand that. And again, it is a philosophy. You are considering it organic. So, I'm requesting that simply consider it on par with potassium chloride. That's what I'm requesting.

CHAIR O'RELL: Okay.

MR. MISHRA: Thank you.
CHAIR O'RELL: Thank you. Thank you for your request.

Anthony Pavel? And Jim Pierce is on deck next.

Did you also sign up? Your name is on here twice, once under Tony --

MR. PAVEL: Oh, yes.

CHAIR O'RELL: So it's the same person?

MR. PAVEL: Yes, same person.

CHAIR O'RELL: You're not trying to pull a fast one on us?

MR. PAVEL: No, sir. Just five minutes, please. Do I look like that much of a lawyer, just looking at me?

(Laughter.)

MR. PAVEL: No, just one.

CHAIR O'RELL: Okay. Thank you.

MR. PAVEL: Okay. As you know, I'm a lawyer.

(Laughter.)

MR. PAVEL: My name is Tony Pavel. I actually work with a private firm here in town called Kirkpatrick and Lockhart.
I'm here on behalf of a client called DSM Food Specialties USA, Inc. On behalf of my client and myself, we would first like to thank you all for your hard work.

Briefly, DSM Food Specialties is a leading producer of value added ingredients in the international food, feed and beverage industry. It produces, the products are enzyme systems, specialty yeast for a number of industries, including baking, beer, wine and fruit processing. So guess what I'm here to talk about?

We have -- all the issues that I want to talk about have been touched on already today, so I'm going to try to be brief and just add what I think hasn't been addressed yet.

We basically have three primary concerns. The first one is the movement of dairy cultures and yeast to 606 as a technical amendment or a technical change. We believe that is, quite frankly, a violation of both the Organic Food Productions Act, as well as the
Administrative Procedures Act. To briefly explain, under the Organic Food Productions Act in Section 6517, it states that before establishing the national list or before making any amendments to the national list, the Secretary shall seek public comment on the proposals. We think this is particularly relevant because under the Administrative Procedures Act, you are bound to do that anyway and the drafters found it necessary to put this into the Act again.

Secondly, moving on to the Administrative Procedures Act, under the APA, a federal agency just doesn't have inherent power to correct technical errors in a regulation and they must comply with notice and comment requirements of the APA. Therefore, an administrative rule, it cannot be, under the guise of an interpretation, be modified, revised, amended, or rewritten. And from our perspective, that appears to be what is happening here. There is a new interpretation of yeast as livestock. And because of that, we are making, I'm
assuming, this is the logic that's going on, is that because we have, our new position on how we're classifying this product, we are now moving it and it's just a correction, it's not an amendment.

    Well, under the established case law, it is an amendment and it is subject to notice and comment rule making.

    Next, along those lines, the companies we represent, we work with DSM and we also work with a lot of, a number of enzyme manufacturers, as well as their main trade association, the enzyme technical association. And part of the reason and the purpose behind the administrative procedures act, is to make sure all the stakeholders get a say in changes and amendments to legislative rules. And what is happening here, if we move this as a technical amendment, there were less than 20 days to submit written comments before the October 6th deadline. I brought comments on behalf of my clients today, but you know, our trade association certainly, we haven't been able to get a unanimous review and consider all
the issues on this proposal in this 30 day span. And what this is doing is cutting out a large number of stakeholders who are involved in supplying these products and are a part of this industry.

My last point. And this has been covered in many different angles today, so I'll try to be quick. We also have an issue with the definition of yeast as livestock. It is pretty much outside all other conventional definitions.

I'll tell you briefly. My wife grew up on a natural been farm in North Carolina. It was all grass-fed beef. It wasn't quite organic yet, but it was natural. And I ran this by her. I said, honey, what do you think of this? The organic program is moving yeast and they're going to call it livestock. And she looked at me and she said, honey, if I can't castrate it, it's not livestock.

(Laughter.)

MR. PAVEL: So, I'm obviously a very well-behaved husband.

That is all I have to add. Thank
you very much for your time and allowing us to speak.

MEMBER OSTIGUY: Kevin?

CHAIR O'RELL: Thank you. Nancy?

MEMBER OSTIGUY: I wanted to say that I actually agree with you, some of the stretching that we've done with livestock. I do research on honey bees. They're considered livestock. I would go along with your wife's definition.

MR. PAVEL: Actually, I brought up chickens to her. I said what about chickens, honey? She said, if it has legs, I can castrate it. So, bees, I guess, they technically have legs, so I'd give it a shot.

MEMBER OSTIGUY: It would be an interesting challenge for her, I'd like to see her do it.

(Laughter.)

MR. PAVEL: I actually have a masters in zoology and one of the professors I worked with, he actually also specialized in bees at the University of Western Ontario, there's a big research center up
there. So, I do know a little bit.

CHAIR O'ReLL: Joe?

MEMBER SMILLIE: I appreciate your legal opinion. That's -- we'll take notice of that.

What I'd like, if you could, to take back to your trade association, is to let them know that that's where we're headed. We don't know how we're going to get there, but that's where we want to go and certainly, we're going to give time and due consideration and due process to this process.

But if you could take back to them the fact that that's where we're going with this and we hope to get their support in helping us to figure out a way to actually help them enter a profitable marketplace and seek ways for their associations and their manufacturers to help us create standards, so that we can have organic products from that trade association and DSM, in particular.

MR. PAVEL: Thank you. And we have, basically, we have advised them that
this is going to happen and, you know, generally speaking, quite frankly, they're onboard with it. And their objection really is the procedural that we cannot come up with organic yeast in 26 or 20 days. And they understand that there is going to be a demand and this is the direction that it's moving and they just want the ability to provide their input and their industry expertise into how these products are going to be developed and marketed.

CHAIR O'RELL: Thank you.

MR. PAVEL: Thank you very much.

CHAIR O'RELL: Thank you.

Jim Pierce? And next up would be Leslie, Leslie Zuck.

MR. PIERCE: Thanks, Tony for warming them up. I raise fish and I'm not sure I can castrate them.

MEMBER OSTIGUY: They don't have legs.

MR. PIERCE: They don't have legs.

For the record, I'm Jim Pierce, Certification Czar at Organic Valley and
it's my great pleasure to represent my 875 farmer owner bosses and offer you this public comment to partake in this most American tradition in this, our nation's capitol.

For the nearly half score of years of these offerings, I have become known, for better or worse, for blending humor, even sarcasm, with what I've always liked to believe was wisdom, insight, and criticism, always constructive. Today, I will offer you several comments on several topics pertaining to your posted recommendations, offer you kudos where you hit the target, and solutions were you are amiss.

For a change, I'm not going to talk about access to pasture or dairy replacement. I'm not going to discuss this recently posted animal, dairy animal acquisition table or what we finally referred to as the eight-track dairy replacement table. Most of us are old enough to remember eight tracks and they were inferior even when they were state-of-
MR. PIERCE: I still have a few eight tracks around and I don't use them. This is Abbott and Costello silly. And if the consequences weren't so dramatic, it would be a lot funnier. No, you didn't write, no you don't agree with it in principle or in practice, but you are guarding the gate and you must do something about it. But I'm not going to talk about that.

On the topic of Ag versus Non-ag, thank you for biting off this mouthful. Your proposal is a great start, but only that and I suspect you realize that by the comments. Keep the iron hot, forging away.

With the addition of microorganisms to 605, the technical correction might be to remove dairy cultures and yeast, since they are redundant. Not that there isn't plenty of redundancy in the NOP and in Washington.

If you decide it appropriate to move items from 605 to 606, consider all the
possibilities and consequences, heed the advice of your peers, Gwendolyn Wyard from OTCO and Emily Rosen Brown from PCO, in particular, have offered excellent feedback.

Regarding commercial availability, I don't want to pressure you, but June is eight months away and this is huge. I find it interesting that the Handling Committee puts a minor role on the NOSB and NOP in determining commercial availability and the Crops Committee states, "The NOP does not have the obligation to maintain a list."

I agree with the Crops Committee. It's your responsibility to get everything added to the list soon. It's the certifiers' responsibility to make sure that their clients are sourcing organic when it's available. The Certification Accreditation and Compliance Committee have three recommendations pertaining to certificates.

Thank you for continuing work on these important, if not world-changing issues if, for no other reason, that it's one that I have strong opinions on.
Being Czar isn't all glamorous, you know. In my spacious, mahogany-lined office, on the top floor, next to George's office, overlooking the moat, I'm responsible for maintaining over 1,000 organic certificates as current. So, it's with shower drain clogging experience that I agree that organic certificates do need to be standardized.

You're almost perfect in your recommendations. Let me suggest that as part of your proposed rule change, you publish a template that certifiers can follow. The most successful certificates for us have certified entity information followed by product listing. For larger, more diverse operations, they are typically listed as an addendum.

This recommendation proposed standardizing production terms, or product terms. No easy task. We see essentially useless certificates listing cheese or vegetables and, at the same time, we see manifesto certificates listing every herb in every form known to man. I suggest linking
the list to actual labels, whenever possible. Certificates also need to show the category 100 percent organic or made with, in order to have real value. Good luck figuring out how to list dairy cows for resale.

The proposal to put expiration dates back on certificates concerns me. I'm not sure your recommendation adequately dovetails an expiration date with certification is continuous until surrendered, suspended or revoked. As you wrestle with that, think of me collecting 1,000 certificates every year and then saving them for five years. Right now, today, we document the vast majority of those 1,000 certificates as current through ACA databases. The panaceic wave of the wand solution is that certifiers web databases and the long-promised NOP E-cert database compliment each other like Fred and Ginger, giving me more time to study the view.

The proposal regarding the USDA's private label questions is solid and
workable. My only concern is that the recommendation admits that the identity of the co-packer may become invisible to the consumer. Since some day I hope to see a thesaurus link between organic and transparent, this runs counter to that goal.

Five minutes mercifully limits comments to general and not specific. So, let me extend an invitation to explore the dirty details anytime. You can call me in cubicle in the basement.

(Timer sounds.)

MR. PIERCE: Thank you.

CHAIR O'RELL: Thank you, Jim.

Any questions?

MEMBER DAVIS: I have a question.

CHAIR O'RELL: Gerry.

MEMBER DAVIS: The last comment you made about the co-packer or the grower, you know, like ala Earthbound, where they have a lot of growers sending their product to a large packer, not being able to trace it back down to where it came from and so forth, when they have a problem, how did we get there, as far as leaving that vital
information off of the label?

MR. PIERCE: I think that's an inevitable development of market, of markets and production as it expands. We do a lot of private labeling as well and I know we do private labeling for companies that also source the same product from other manufacturers. So, a consumer looks at it and doesn't know for sure if it's from east coast or west coast or what. If this proposal, however, is solid in that if a consumer wants to look into it and call that certifier, the final certifier, whether it's the handler or the certified retailer merchandiser, they can ferret that information out. Date coding and such will lead them back. I mean, the really concerned consumer will get an answer, I believe. So, you're all right with that.

CHAIR O'RELL: Yes, Kevin?

MEMBER ENGELBERT: As the Certification Czar, Jim, and your concern about expiration dates on certificates, we've also heard that they're needed to verify that they're valid and up-to-date.
What's your opinion on a different type of date, like --

MR. PIERCE: I heard that as well.

MEMBER ENGELBERT: -- a renewal date or an effective date or something like that, that doesn't technically expire. It just lets the person looking at the certificate know that there is a yearly inspection and date and when it's renewed?

MR. PIERCE: Well, a couple of comments and then I'm sure you'll wrestle with this as you deal with those recommendations.

You're hearing a lot from inspectors and trainers that dates are more needed but you're not hearing that so much from the accredited certifiers and the end users like myself. It took us quite a while to get used to not having dates on a certificate. At first, it was very awkward, but we really have come up with a very workable system to work with the certifiers and make sure that everything's current.

Now, another thing that you're
also hearing is that, what if we, if the certificates are issued fraudulently, in other words, if they're not current and they're still represented as current, well that's fraud. You have rules for that. That's not right. You know, or if they're modified or worked in Photoshop or something. That cannot be.

We still collect a lot of paper every year but there is a lot of opportunity in those 1,000 certificates where hundreds of them at one time can be verified as current, or those few that are suspended or facing suspension can be weeded out quickly and isolated and the rest of them, basically rubber stamped, documented in good standing until we hear otherwise.

Does that help?

MEMBER ENGELBERT: Yes.

MR. PIERCE: Probably not.

MEMBER ENGELBERT: Well, I'm concerned about just, for example, a small farmer's market where someone has certified their products. They post their certification but there's no date on it.
And if they don't reapply for certification and the consumer comes up, sees their certificate and says, well, they're certified, buys their product, and this goes on and on.

But if there isn't some type of date on there of some sort, I'm concerned about that.

MR. PIERCE: Yes, well if they're showing that certificate at a farmer's market, it better be current, or it's fraud. And if the consumer again, you know, really needs to know it, they can check either with a website or a phone call and find out that they're current and in good standing.

MEMBER ENGELBERT: Most consumers won't do that.

MR. PIERCE: No, most won't. They're going to take it at face value and it has to be offered legitimately at face value.

I'll let you move on, unless there's other questions.

CHAIR O'RELL: Bea?

MEMBER JAMES: Jim, your comments
are, I enjoy even the humor. You know, I get the substance in between all of that and I could not find your comments posted on the website. They're not under accreditation. Did you submit your --

MR. PIERCE: No, the comments that I just read, I gave one copy for the record. Otherwise, I don't want to distract you with paper, you know.

CHAIR O'RELL: That's smart because we're all a little ADD up here, so --

MR. PIERCE: Yes, I didn't put them up on the website, the more detailed ones.

MEMBER JAMES: Okay.

MR. PIERCE: But probably following the discussions here, there will be more specific recommendations put up.

MEMBER JAMES: Okay.

CHAIR O'RELL: Okay. Thank you, Jim.

MR. PIECE: All right.

CHAIR O'RELL: Leslie? And Erin James is next on deck.
MS. ZUCK: I'm going to be speaking for Erin, so I'll have --

CHAIR O'RELL: Oh, so you have ten minutes. Okay. Thank you.

MS. ZUCK: I'll have some of the same things to say as Jim did, but not as humorously, unfortunately.

I'm Leslie Zuck, Executive Director of Pennsylvania Certified Organic. And I'm commenting on the recommendations from the Certification, Accreditation and Compliance Committee regarding standardized certificates and expiration dates.

I agree that there are many types of certificates and styles. I agree that the content claim to which a product is certified must be listed on the certificate. I agree that approved foreign certification, foreign accreditation programs, must specify that the operation complies with the NOP standards, which we have to do, too.

So, I do not agree that individual products, fields, etcetera should be listed on the certificate. I believe this is best handled by a separate document,
for a variety of reasons. In some operations, the list could be several pages long and it changes on a monthly basis. Many certifiers have -- sorry. I can't see my paper because this thing is in the way.

May certifiers have a fairly rigid process for processing certificates and they often have to be signed by the CEO of the organization or in state programs, they have to go through the Secretary of Agriculture. So, every time you change the certificate, you have to send it up to the top and somebody's got to take the time to make sure that the whole process has been followed properly. So, you know, that's one of the reasons we have the separate document, which is a little more flexible, but still works to provide all the information necessary.

You know, having to issue five, ten, or 50 new certificates throughout the year is cumbersome, burdensome, and confusing. It's really not uncommon for a distributor of organic packaged products to actually change their product line weekly.
And some cooperatives and feed mills do the same thing. So, a separate controlled document that can be issued by the certification program, when requested by the client, works much more smoothly. And we've had no problems with the system in the seven years we've been using it.

It also solves the expiration date problem, as a separate organic product verification form includes a specific effective period on that. So the producer gets one of those. We call it organic product verification form, or OPV, every year.

I also am concerned that it will be nearly impossible to have a list of standardized terms to cover all the diverse products in the vast organic marketplace. I question how specific you would like us to be. You know, we talked about that. Is the word vegetables enough? Can we say kale or do we need to say red Russian kale? And you know, we've kind of come up with a solution to this problem, too. You know, we've noticed that a lot of the growers that have
many varieties and we could have some that would have 20 page certificates. And if it's on the certificate, every time they change that, we're going to have to change that 20 pages and print it out again out of the printer. And my staff reminds me that the certificate paper is very expensive. So, here we are in the paperwork justification issue that Mark Bradley was talking about earlier.

And you know, it turns out that really, that specific information isn't really necessary for the vast majority of our producers. If they're feeding all their crops to their dairy cows, they don't have to have their certificate changed if they decide to plant spelt instead of wheat, because it's just going to be fed to their cows. The same thing with the farmer's market producers. You know, they're selling all their stuff retail at the farmer's market. Does it really matter if their certificate says Austrian crescent fingerling potatoes or Yukon gold potatoes?

But, on the other hand, we can
provide that information through our organic product verification form because it's very flexible. So, if a producer tells us that their buyer needs a certificate to say, you know, red raspberry jam, instead of raspberry jam, we can put it on there for them. And that works really well.

So, you know, in some cases, we put the whole line of brand names on there for people who need to have that on there. And that's a document that's generated from our system, it comes right out of our database, it's signed by the certification director and faxed over, sort of like a TC, whenever somebody needs it, to close a transaction. So, it works real great and we have had no problems with it. Our producers seem to appreciate it.

So, and I agree with Lynn Coody that the certificates should be in English. It's really hard to find translators in some of our rural offices out there in the Hinterlands.

And so, also, about the standardized forms. The form itself, I feel
like, you know, going into the, you want to add Section C(2) and (3) and, you know, I think those requirements are way too specific, the eight and a half by eleven paper, again, is not something that internationally is really recognized and you say you want things listed in a certain order, but it just says in order. We don't know if that means left to right, or top to bottom, or right to left if you're writing in Hebrew, or something like that.

So, we could solve some of those problems, I think, by having an actual, I mean, if you want a standardized certificate, let's do it for real. Let's have a form that is a federally, you know, a federal program form, like we do for export certificates. They're instantly recognized, they're completely uniform. We just fill in the boxes and it's done. And we can have one for the certificate and one for the product verification. And if a certifier would also like to have their own certificate as sort of a marketing thing, they could still do that. I mean, you could
have a piece of paper that has the trademark or something of the certifier, that they could hang on their wall that, you know, looks nice and in color and all that.

But I'm in favor, if we really want to do this for real, we should do it for real. Just give us these forms, we'll fill them out and, you know, go on with the rest o four business instead of having to figure out how to comply with all the restrictions and three inches at the bottom of the page and such and we could just go forward and talk about other things.

The expiration dates. I had a board meeting on Monday, board of directors meeting and they said, what's going on with expiration dates? I thought we had that all solved. And you know, seven years ago, we all screamed and yelled and begged to the Program to please let us put expiration dates on the certificates because, you know, people need to know when they expired. It just seemed really simple. And they told us no way.

And now seven years later, we've
finally gotten all of our clients to understand that they're getting their certificate for life and please put it in a safe place because you're not going to get another -- our letter actually says that, you know. Please keep this, hold on to this. It's the only one you're ever going to get. And so, to turn around now and tell them, whoops, make sure you get a new certificate every year because we changed our mind about that.

You know, so it seems to me rather than reversing that mind-set of both certifiers and clients and having to go down that road, maybe we could just ask the Program to reverse their interpretation of the rule. Because the rule language doesn't prohibit us from having an expiration date on a certificate. So, if they could just sort of reinterpret it and say, okay, certifiers, you can put an expiration date on the certificate if you want to. And you can put an effective date on the certificate if you want to. If that works in your program and that's the way you want to do it
then, you know, go ahead. We've given you
the -- we're allowing you to do that now.

So, that's really all I have to say. Any questions?

CHAIR O'RELL: Thank you, Leslie.

Bea?

MEMBER JAMES: Leslie, explain to me what, you know, what is the main point of having, I mean I know, but I just want to hear it from you, what is the main point for having an expiration date on a certificate?

MS. ZUCK: This is a test.

MEMBER JAMES: Of all the different types of certification that there is out there and the different types of categories of certificates that you give out, farm, handler, processor, what is the main benefit of having that expiration date on the certificate?

MS. ZUCK: Well, when Jim Pierce calls us up and says, I need to know if this list of people who produce milk and ship it to Organic Valley are currently certified by your agency, then we fax over the organic product verifications and he looks at them
and he sees how close they are to expiring or how, you know, how long they're good for. And they're good for a year, usually -- actually, which is another question I have for you, about the recommendation on the standardized certificates, or is that on the expiration date ones? It says that it should have an effective date on the certificate, but it doesn't say whether that has to be a year or it can be less than a year or more than a year or whether the effective period can be anything. Because right now, sometimes, people do get a short-term organic product verification that's only for a few months because they have to send in additional documents before they can get a -- to certify another field or something like that. So, that was unclear to me as to whether it's supposed to be for a year or --

MEMBER JAMES: Okay. I'll let Andrea address that or Joe.

But I just want to, I want to understand. So, Organic Valley then would benefit from having an optional expiration
date? You know, that say they have to, say somebody has to go out and try to figure out whether something has expired or it's not expired. Wouldn't it be easier to have it be one way, so you know what the protocol was for how to handle the expiration of a certificate?

MS. ZUCK: Well, that's why I was thinking, advocating having a real standardized certificate. But Organic Valley and other certifiers who also ask for, we ask for certificates amongst ourselves too, you know -- well, actually, we look for certificates from people who have sourced product, that's certified by another certifier, so we need to find out that, or as our client does. And they don't really care if it's on the certificate, or if it's on a separate document, or if it's, you know, -- we tried to get away from the letter of compliance because you have this letter that's actually in letter form and you had to read down through it and see all what they were trying to say. So we kind of, our organic product verification, it
looks like a certificate, it kind of acts like a certificate but it's just more flexible than a standardized certificate. We can put lots of things on it or not a lot of things on it.

MEMBER JAMES: So, I could just, you know, get into philosophical discussion about this forever, but I'll just let it go. I guess the point I'm trying to make is that I don't really see the benefit of having a wishy-washy determination that is just made, you can put the expiration date on there if you want to, or if you don't want to, you don't have to. So, that's the point I'm trying to make.

MS. ZUCK: Oh, I see. I mean, the certifiers all do that, because if they didn't do that, if they didn't have something on something somewhere on some document, their clients aren't going to want to get certified by them because they can't show to their market that they are in good standing. So if a certifier is not willing to produce that on a document, --

MEMBER JAMES: Right. And they
are out there.

The other thing that I was going to ask is, is it possible for you to submit what that form would look like that you would want the NOP to come up with?

MS. ZUCK: Oh, I think we would be really happy to work on that. Because we would rather kind of help produce that and draft that than to have it sort of, you know, posted and have to figure it out after the fact. So, I think that most of us, certifiers and ACA would really be happy to look at a draft or help figure out what should be on there and what's too much and what isn't enough. And just to make sure the boxes are big enough to put in everything we need to put in, which is sometimes a problem with federal forms.

CHAIR O'RELL: Are there any other questions for -- Hugh?

MEMBER KARREMAN: Just a comment. I want to say that I think the industry really needs those standardized forms with expiration dates. Because a first-hand experience a few weeks ago at the organic
consignment sale we had, with the livestock and dairy --

MS. ZUCK: I wish I could have been there.

MEMBER KARREMAN: It was fun. But it was a really major headache for the auctioneer, and myself, and the farmer and one of the other people involved, to look at, I think it was five or six different certifiers certification papers. And we had to just look all over the paper and just find, you know --

MS. ZUCK: Which box it was in.

MEMBER KARREMAN: -- it should be like my eyes should go there to see, you know. We've got to have standardization and expiration dates. Because that was a major headache, as a first-time user. Now, Jim Pierce might now exactly where to look on all of them, but not for us in the field.

CHAIR O'RELL: Any other questions? Thank you, Leslie.

MS. ZUCK: Thank you guys.

CHAIR O'RELL: Judy Ellis is up.

And next on deck is Kim Dietz.
Judy Ellis? Oh, okay. Sorry, we didn't give you an on deck one because Leslie had a proxy, so it knocked a name off.

MS. ELLIS: Oh, okay. Originally I had been listening to you. I have no corporate affiliation. I've been listening about the microorganisms and redefining them from Sections 605 to 606 and I think I'm beginning to understand.

It sounds like that it would be in the best interest of the land, and the animals, and people for yeast and certain microorganisms to be moved into that category of 606, because then you'd be able to use organically grown yeast for the livestock and -- do I understand correctly?

It also sound like it's not possibly in the best interest of some companies for it to move, for maybe financial reasons, I don't know.

Because the question that I had was would it be possible to create a subcategory in Section 606 that would, oh, I have it written down, that would accommodate
organically grown microorganisms as agricultural, because they're not animals, they're not livestock, and they're not plant.

So, I just wondered if that's a possibility. Did I ask that well?

CHAIR O'RELL: That's fine, Judy. Certainly, you know, part of the process in moving forward, the board spends a lot of time wrestling with evaluations. A lot of these questions that are coming up from the public forum today in discussion are things we've discussed among ourselves on the committee level. We make a recommendation to get something out in the public. We wish this one would have had a little more time, posted for a longer time to have more public input, but I think we're getting the gist of public input now and we'll be digesting that and looking towards a recommendation and trying to see how we craft something going forward that takes into consideration a lot of the points that have been brought up today. So yes, it could go to a point where you add a different provision in the
standards for handling all microorganisms. We have discussed that as a possibility as well.

So, your point is well taken with the board. We do think that we have some work in the committee level for that recommendation.

MS. ELLIS: Also, I would like to thank you all for doing this. As a consumer, I really appreciate your thought and your effort to try to make the organic movement as pure as possible.

CHAIR O'RELL: Well, thank you. And one of the goals in crafting a recommendation was moving forward to try and pioneer new ground and extend organic agriculture to other fields to have additional organic agriculture use.

So, thank you for your compliment.

MS. ELLIS: Thank you.

CHAIR O'RELL: Kim, oh yes.

Okay.

MS. DIETZ: Here I am.

CHAIR O'RELL: On deck is Brian
Cricket Rikita.

Kim, do you have a proxy or are you just five minutes?

MS. DIETZ: I'm just me.

CHAIR O'RELL: Oh, thank you.

MS. DIETZ: Okay. And my comments are not written, but I will certainly submit them to you so you can get them into the board.

Good afternoon. My name is Kim Dietz and I'm here today giving you public comment as an individual and not those of my employer. I served on the NOSB from 2000 to 2005, as a handler representative, three of which were as materials chair and my final year as secretary on the board.

I will be giving comments today on the handling recommendations and materials, along with general observations as an industry leader.

Colors. At the last NOSB meeting, I stood before you giving you a historical background on colors and pleading with you for a recommendation on a deferral are not materials so that the proper process
could be followed and the procedures for petitioning and the board voting on that material. I agree and support your recommendation not to renew colors under the sunset provision. I think you did the right thing.

That being said, I'm very concerned that there are several petitions for colors currently under NOP review, all of which are for inclusion under 205.606. I urge you to quickly review these petitions, send them back, if they're not sufficient, then make sure those materials are brought before this board, prior to the removal of colors under the sunset provision. I also urge the NOP to immediately notify these petitioners of any proposed changes to the petition process so that there is not disruption to this industry. The goal of all of you, NOP and NOSB, should be a smooth transition for removing colors under sunset and try to possibly reclassify under the petition process.

Agriculture/non-agriculture. You heard a lot of comment today, I've cut and
pasted all morning and afternoon.

Basically, as you know, this has been a project that this board and previous boards have struggled with for years and years. I thank you for attempting to bring a recommendation to the table.

I do not agree and cannot support the use of the decision tree to assist in determining the Ag and Non-ag. I think it needs some work, as you've heard all morning. Specifically, I suggest in step three, the words result of a mechanical or physical be deleted. We have a definition of processing. Processes are allowed. Heating is a process, baking is a process, all of which result in a chemical change. So, be sure to protect that.

Lastly, several ingredients have been identified in the background information of this recommendation that could have potential conflict with the definitions. If this is the case, then I urge you to reconsider these recommendations until the ramifications of the decisions are fully understood. Please do not push
through a recommendation unless it is well understood by all parties.

Commercial availability. I agree with this document. I urge you to expedite those petitions currently under review for 205.606 and contact the petition so they may include the new information to devote on it, under the petition process. We all know that the deadline of June 9, 2007 is rapidly approaching. I recommend the USDA schedule another NOSB meeting as soon as possible, to ensure timely review of these materials. As we all know, materials can take two to five years to be placed on the national list.

I urge you to keep this process simple under 606, don't bog it down by incorporating unnecessary steps, look at how you reviewed with the sunset materials, try to streamline the process and don't include anything that you don't need to do in the reviewing of these materials.

I don't have an opinion, either way, on the addition of including current industry information regarding availability. This information is currently required by
handlers, we have to provide it to our certification agencies.

I will say that prior board members have discussed this issue and we felt that we would not need to see industry information because one, we didn't feel it was the role of the NOSB to validate supplier information and two, nobody's mentioned this all day, I'm surprised, you have confidential business information, folks. I'm not sure many handlers are going to want you to know who their vendors, or more specifically, the public. So, there's some confidential business information that may or may not even be accessible to the board. We have had those deleted from petitions in the past.

So, don't expect handlers to freely supply you with their supplier information, especially if it's a tight market for raw material.

Lastly, I acknowledge the amount of time and work that this board has done since the last NOSB meeting --

(Timer sounds.)
CHAIR O'RELL: You can finish your thought. Especially, since it started out good.

(Laughter.)

MS. DIETZ: As a past member, and more importantly, as past materials chair, I need to express my concern that the materials review process is behind schedule. This is no reflection on the current materials chair, rather as a result of a high NOSB turnover rate, Harvey, and a mentoring program that has failed.

When I was materials chair, I stepped aside so that I could mentor the next chair in my final year on the board. I did this because I believed in training and supporting my successor. Several times, I discussed this recommendation to formally include the succession plan in the board policy manual. I was discouraged to formally put it in writing, but I encourage you to do that. I think it's very difficult for new chairs to step in and have never had done the process.

And lastly -- I'm just doing to -
CHAIR O'RELL: Well --

MS. DIETZ: I have some kudos. It's for you. I wanted to thank you and Nancy and Mike for your service on the board. I know that the last five years, we've had our ups and downs and there's times when you just want to walk away from it. But I think you for your perseverance because I really think you guys have really done a great job.

CHAIR O'RELL: Thank you, Kim.

MS. DIETZ: You're welcome.

CHAIR O'RELL: And you know, we are going to take you up on your offer to help us a little bit on the material issue. And thank you for that.

Andrea?

MEMBER CAROE: Just a real quick clarification. On our recommendation for 606 petitioning, what the board function is is not to assess whether it's commercially available or not but to do a risk assessment of the possibility that this might become unavailable. So, as far as confidential
business information, I don't suspect we'll be seeing any of that. We'll seeing information about crop failures, global supply, more broader.

And again, in order for us to do our due diligence in putting the material on the list, we felt we needed to do that type of risk assessment. And then that detailed confidential business information would be assessed at the certifier level, much like you're already doing today.

MS. DIETZ: Yes, I thought I just heard earlier the comment that you could now develop a list and, you know, who's got what and that sort of thing. And I don't think it will happen at that level.

MEMBER CAROE: No, that is not our intention.

MS. DIETZ: Yes, like I said, I'm not attached to either one, but there will be confidential business that people are not willing to share.

CHAIR O'RELL: Thank you, Kim.

Brian? And then last on deck is Patricia Kane.
MR. RIKITA: Hello. My name is Brian Rikita. Folks generally call me Cricket. I work for the Carolina Farm Stewardship Association and I coordinate organic seed projects in the southeast and a number of other things I'm going to talk about.

The first thing I want to say is that I believe that the time is coming when the rules, I believe that the time can be seen when the rules on using nonorganic seed can be tightened up. I think that the seeds are available. There are still some quality issues, particularly with genopods I've seen and a few other things. But I think that those are quickly being taken care of right now, I believe. And I believe that organic growers can use organic seed, from what I've seen. I haven't worked in all regions of the country. I'm southeast.

One thing I'd like to talk about, we've set up a program that's kind of an alternative to the OMRI organic seed list and I'd like to just let you folks know what we have available on our list. It's folks
give us a list, we call them the seed wish lists that they're looking for. They generally do it through our website. Very often they call me directly or mail me or fax me and they let me know what types of seeds they're looking for, sort of in organic form. And we get back to them with a document that has a complete list of all of the organic -- we maintain a database of all of the organic dealers, seed dealers, very complete and I do a lot of research on it, as opposed to OMRI's list which only lists the dealers that find them and choose to be paid. I seek people out, get their information, anyone that has it publicly available. And I'm not going to say it's complete, but I work hard to keep it as close to that as possible.

And then also we, as of January first, we're going to also be introducing the commercial equivalents to what we do, where we just ask the dealers to list what they believe these varieties may be commercially equivalent to. It's their opinions, but that may be helpful to some
growers who are looking for something. When a grower comes to us with their organic seed wish list, then we reply to them with a list of all the companies that we've searched, so that they can see it was a diligent list. And then we also give them a list of the seeds that we were able to find and from where we were able to find them. And if we were not able to find something that they were looking for, we'd give them that information as well.

Yes, and the generally, we generally turn these lists around to folks in two days. It's not as quick as the OMRI list. What I do, very often, I'll open the books, like the catalogues, and actually look. Folks will ask me, well, I need a field corn that's ripe in fewer than 90 days that, you know, that is bi-color, or white, or whatever they're looking for. And if I don't have it exactly categorized the way they ask me in the database, I actually open the books and go into that.

And that's available to anybody in the world, really. I'll do that service
for them. I track all the seeds that I'm able to find organically available in this country.

So, I wanted to let you all know that that service is out there to help folks find the organic seeds that they're looking for. And I can say that when I do this work, I generally am able to find people more seeds than they expected I was able to find them. And I think that if folks are at least willing to try growing the seeds that are available organically, they'll find that in a very short time, they can transition to using organic seeds. Which I think, both for the open pollinated and for the hybrid world of seed production, is very important because I believe that --

I mean, I'm a seedsman by training. And that's what I do. And I've been organic since before it was a law. But one of the things that I believe is important for organic seeds, yes I'll hurry up, is that the seeds be selected for in an organic environment, and ideally, in a microclimate similar to that they're going
to be intended to be grown in. Well, that's a separate issue though, but in an organic environment for seeds that will do well in an organic environment, the selection is my religion, basically.

So, anyhow, that's all I have to talk to you all about, but if you have any questions, or if you don't, or whichever.

CHAIR O'RELL: Thank you, Brian. Gerry?

MEMBER DAVIS: What's your website?

MR. RIKITA: Okay. Right now -- the website is going to move very soon. Right now it's at www.savingourseed.org but on January first or sometime shortly before, it will move to www.organicseedsourcing.com. You go to savingourseed.org and click on the sourcing link.

MEMBER DAVIS: You're going commercial.

MR. RIKITA: Well, the way we're keeping this service free is that we're selling, when we give people these documents back, as I said, we actually send them back
a document that has all the documentation in it, and we're selling advertising in those documents, in order to fund it.

CHAIR O'RELL: Any other questions?

Thank you, Brian. I appreciate your comments.

MR. RIKITA: Yes. You all have a good day.

CHAIR O'RELL: Thank you.

Patricia Kane?

MS. KANE: Good afternoon. My name is Patricia Kane. I'm the coordinator of the Accredited Certifiers Association. It's an association of 29 accredited certifying agencies and we would like to thank the certification accreditation and compliance committee of the National Organic Standards Board for their work in bringing forward the issue of expiration dates on organic certificates.

The ACA supports the concept of a dated organic certificate which allows for determination that a certificate is in good standing. Our members, however, do not
support the use of an expiration date. Our members do support the use of terminology such as annual update or current certificate issue date, which provides information that the certificate is a current valid certificate. Along with the addition of language supporting a current date on the certificate, a definition of this term should also be included. The term current certificate issue date could be defined to mean that the annual update of the certified party has been submitted, the certifying agent has reviewed the updated information, the inspection has been completed, the certification agent has determined that the applicant is complying with the Act, and the date would reflect the date of certifier determination that the applicant is complying with the Act.

The use of such a date in definition would provide confidence to all that the certificate is a current, valid certificate. The lack of this information on an organic certificate is problematic for certification agencies, organic inspectors,
and the purchasing departments of companies seeking to source organic ingredients.

A rule change to require the use of letters of continuation is not necessary, as the annual update is already required and no expiration date will be listed. Certifiers have existing systems to address timely annual review and must complete inspection and the approval within 18 months of the annual date of renewal.

We thank the National Organic Standards Board for the opportunity to comment on this recommendation.

I would also like to comment on standardized certificates. The ACA supports the concept of standardizing the information contained in an organic certificate, as this will provide information necessary to conduct a review of the document. ACA members do not support the requirement for the listing of crops and products certified, as the recommendation did not provide enough detail regarding the specifics of this requirement.

Our members feel that this
requirement should be left to the discretion of the producers, in consultation with the certification agent. Some producers may need a detailed list of crops or products for their markets. Others may sell at farmers markets or through community supported agriculture plans, where they do not need the detailed list of crops.

Our members also feel that Section C of recommendation dealing with paper sizes and margins is too prescriptive and cannot apply to all producers, due to the amount and type of products being produced. Larger producers requiring a complete crop listing, will require one, possibly two, more pages for the certificate. The use of addendum pages to certificates is a current practice by certifiers.

In the case of multiple page certificates, it should be permitted to add the following statement to the first page of the certificate. "See attached addendum for additional information." The addition of this statement will indicate to reviewers or
product purchasers that additional information is included in the certificate.

We thank the National Organic Standards Board for the opportunity to comment on this recommendation.

CHAIR O'RELL: Thank you, Patricia.

Hugh has a comment or a question. A question, I hope.

MEMBER KARREMAN: Just a question. Why are you not in favor of the expiration date?

Just back to this organic cattle auction we had, it would have been very, very helpful to have an expiration date because we had to call some certifiers to see if the person who sent in the cattle was still certified and it just went on and on. But why wouldn't you want expiration dates?

MS. KANE: Our members were in favor of a date but not necessarily expiration date.

MEMBER KARREMAN: But then the problem was, you know, there was a date let's say a year and a half ago, --
MS. KANE: Well, it would be --

MEMBER KARREMAN: -- you're assuming it's a year long, annual update, that's the assumption.

MS. KANE: It would be, the current certificate issue date would be an annual date.

MEMBER KARREMAN: Is that the same as an organic product verification type paper?

MS. KANE: It could be, yes.

MEMBER KARREMAN: I like expiration dates.

CHAIR O'RELL: Joe?

MEMBER SMILLIE: It says ACA members do not support the requirement for the listing of crops and products certified. Is that what you mean or do you mean that --

MS. KANE: Because there was a lack of specificity in the requirement of how detailed it was to be.

MEMBER SMILLIE: But then you go on to say that some people need real specific stuff --

MS. KANE: That's correct --
MEMBER SMILLIE: -- and other people --

MS. KANE: -- but it should be left to the discretion of the producer and the certifier.

MEMBER SMILLIE: But there should be some listing of crops and products.

MS. KANE: Correct, yes.

CHAIR O'RELL: Bea?

MEMBER JAMES: Okay. You support the concept of a dated organic certificate. Explain to me what that would look like on the certificate.

MS. KANE: It could either be the terminology annual update or, as we included here, the current certificate issue date. It wouldn't -- it's just the term expiration date would not be used.

MEMBER JAMES: Okay. So, the issue date could be three years old?

MS. KANE: No, it would be tied to the annual update of the producer. The current certificate issue date.

MEMBER JAMES: Okay.

MEMBER DAVIS: Is that because
it's understood that there's an annual renewal, --

MS. KANE: Right.

MEMBER DAVIS -- it's just built into the regulations and everything. Right?

MS. KANE: That's where the definitions of A, B, C and D need come in.

MEMBER KARREMAN: But someone said there might be a certificate for two or three months. Didn't someone say that, in a previous presentation, and then how would you know, how would --

MS. KANE: The date would change.

That date would change.

MEMBER KARREMAN: It seems confusing.

MEMBER JAMES: So every year, you send out a new certificate. Is that what you're saying?

CHAIR O'RELL: Andrea?

MEMBER CAROE: Well, in order to do that, in order for that issue date to be effective, then we would have to have a rule
change that requires that a certificate be printed every year because that's now part of the regulation right now. So, I mean, and then it doesn't get to Jim Pierce's dilemma that he would have to replace certificates on file.

So, I'm not sure that this gets us any closer. I don't, I'm trying to see the benefit of not using the word expiration. What difference does it make? I mean we're still -- you know, the issues that I'm hearing come up don't get resolved by this solution. So --

MS. KANE: Well, the issue of expiration, what came directly from the prohibition from using the word, using the expiration date on the certificate. And these were other scenarios to get around that.

MEMBER CAROE: I mean, I was there with you and everybody else commenting on those early days when expiration dates we were told, you know, they were verboten. But we have been approached by the Program because of the inability to, in any time
soon, put in this master database to provide this as a tool that's necessary, in order to show some recent compliance, you know, it's not real-time, but it is recent compliance.

So, you know, this is a revisiting. This is, I agree, it's a change of heart. But to get to the crux of what we need to do --

MS. KANE: Well, these are two variations on what certifiers are currently doing. And those systems seem to work, to some degree.

MEMBER JAMES: I wasn't there in those early days. So explain to me, what is the skull and cross bone around expiration dates? Why is that, what is the problem with that?

UNIDENTIFIED SPEAKER: The Program said no.

MEMBER JAMES: I know, but --

MS. KANE: Because certification doesn't expire until suspended, revoked, or surrendered. So, you couldn't use the word expire.

CHAIR O'ReLL: Mark?
MR. BRADLEY: I wasn't here then either, but I asked the question and I was one that was in support of having an expiration date, just because of the compliance issues that we were running into, lots of fraud, using certificates that were produced several years ago and then they just don't expire and they show up in the Middle East in loads of product that had never been certified.

But the way I understand it, the problem was that if certifiers are not able to administratively handle this annual update that's required from certification certificates that expire, then they run into the problem where they haven't administratively removed certification, they haven't done anything wrong, but the certifier wasn't able to keep up with it. So that is the thing that the program had in place when they said that, you know, it's certification for life, until you take it away.

CHAIR O'RELL: Thank you. Thank you, Patricia.
Yes, we're going to recess. We don't need a motion for recess.

We kept pretty much on time. Thank you very much. I appreciate the public comments, people who signed up today. I don't think we missed anybody's name on the list. There was one individual that didn't come up but I haven't heard from them. So, we'll reconvene tomorrow at 8:00 in the morning, where we will start the committee work in terms of discussion items and presentation of those items that will be either discussed or voted on on Thursday. There will be another public comment period after, Wednesday afternoon, so there's another chance to have a public comment period based on our dialogue and discussion here, prior to any votes that might take place on Thursday.

So, I thank everybody.

(Whereupon, the meeting was adjourned at 5:17 p.m., to reconvene on Wednesday, October 18, 2006 at 8:00 a.m.)
The meeting was held in Salons 1 and 2 of the Radisson Hotel Reagan National Airport, 2020 Jefferson Davis Highway, Arlington, Virginia, at 8:00 a.m.,

Kevin R. O’Rell, Chair, presiding.

CHAIRMAN O'RELL: (presiding) If I could ask everybody to please take your seat, we are going to call to order the second day of the NOSB October meetings with the business session today.

We are going to begin this morning with the Policy Development Committee.

Rigo, would you like to lead us?

MR. DELGADO: Yes, sir. Thank you.

Good morning to all.

The Policy Development Committee has been working essentially on two points. The first one is revisions to the Policy and Procedures Manual.

Up there on the screen, you have the summary of the changes. I will just walk you through those.

In the second item we will
present to you the new Board Member Guide. I will ask Bea to give us a brief summary of that.

So going back to the updates to the Policy and Procedures Manual, we updated the format, not very substantial, but essentially in three points.

We formatted the entire document to make sure that it had a consistent layout, making sure the points and the different paragraphs match, and so forth.

Subsection formats were activated. So every time we update the document, the table of contents will be activated as well.

Then we included a nice, what I think is a sexier, cover page; looking at Valerie's cover page for the book, it is not nearly as nice as her work.

Going on to the specific updates involving the content, Section II, we introduce an introductory paragraph.
Section III, we did the same.

Section III, page 14, also page 13, we included the description of the Executive's role.

In Section V, page 19 -- and I realize this document that was printed does not have the page numbers, but bear with me -- in Section V, the description of the Committee Vice Chair role was added.

In Section VIII, we included also an introduction to that section. There's a typo there in point No. 6. It should be Section VIII, page 51.

We updated the Committee recommendations. It is essentially a description on sunset that was added to the subsection on Committee recommendations.

Finally, we created a formal appendices and resources section. You will see that we kept the same components of what was called before the appendix and we relabeled with specific letters A through E.
Okay, so those are the updates to the Policy and Procedures Manual.

Bea, if you will be kind enough to give us the update on the NOSB New Member Guide?

MS. JAMES: Okay.

CHAIRMAN O'RELL: I guess, first, Rigo, are there any questions by any of the Board members on any of the material that Rigo has talked about or addressed?

MR. KARREMAN: Actually, Kevin, I am wondering, is this in our folder? I didn't see it in Section III there.

CHAIRMAN O'RELL: Yes, it is.

MR. KARREMAN: I was reading it off there.

CHAIRMAN O'RELL: It is in Section II.

MR. DELGADO: The numbers are a little off.

CHAIRMAN O'RELL: Any other questions?
Okay, Bea.

MS. JAMES: In Section II, you will also find a new document draft. It is called a New Member Guide, NOSB New Member Guide.

As we all know, the amount of information that needs to be learned by NOSB members is a mess, particularly through the eyes of a new member at their first Board meeting.

Many of the NOSB members that come in for the first time are quite knowledgeable and might even actually have had a hand in helping to develop many of the regulations that we have. However, that is not always the case.

Many members that are newly appointed are unprepared, and not by any fault of their own, but by the lack of guidance that the NOSB has provided as an introduction for new members.
The Policy Committee has developed a draft for new members called the NOSB New Member Guide. This draft is meant to provide basic guidance in preparing new members for their first official Board meeting.

The Guide will be used as an accompaniment to the NOSB Policy and Procedures Manual as well as specific information that can be obtained on the NOP website that is listed in the manual.

Briefly, some of the content of the Guide provides valuable information such as "Read!!!" with three exclamation points after it, and what to read, where to find it, dress code, what to do first, what to do second, what to pack, brief descriptions of the NOP, NOSB, OFPA, and the final rule.

The Guide also gives suggestions on how to organize paperwork, emails, as well as how to keep up with reading and writing materials, travel information,
agencies, supporting organizations in the industry, as well as many other suggested best practices.

The Policy Committee will oversee the New Member Guide and update as needed.

We would like to propose this draft for discussion for this meeting and hope to have this draft as a final document at the next Board meeting for a vote to accept it as an official training material for new members.

Now I open to any discussion or questions on the New Member Guide, which I wish I would have had when I had my first meeting.

(Laughter.)

CHAIRMAN O'RELL: I wish my kids would have had this when they went to school for the first time because it would have been very thorough.

(Laughter.)

Bea, I thank you very much. I
think this is going to be very helpful for new members.

Jim Riddle and I had a conversation the other day, and we talked about how this would even, I think, serve a purpose for people who are considering and putting nominations in for submission for consideration to be on the Board, give an expectation of what is required, because there is a lot of work required. People knowing it upfront would give them a better understanding of putting in a nomination.

I like Jim's suggestion of having a link on it for the nomination process once it has become an official document.

So is there any discussion?

MR. DELGADO: We have a question there.

CHAIRMAN O'RELL: Yes, Nancy?

MS. OSTIGUY: Actually, it is a document, I guess, that is never done. Under E on the New Member Guide, it says
that all airline reservations must be made through the FedTraveler. All reservations, because those of us that have gone by train or rented a car, we may not have done it the right way initially and we were informed of a different way of doing it.

MS. JAMES: Okay, good. Thank you.

MR. DELGADO: Just for the record, what is the page number and section, please?

MS. OSTIGUY: Page 4, Section E. The second paragraph of Section E.

MR. DELGADO: Thank you.

Any other questions? Yes, Bea?

MS. JAMES: Originally, we had collaborated with Valerie on this document. There was some really valuable regulatory information that we actually pulled out of the document.

I would like to propose that we re-evaluate that information as possible
submission to the Policy and Procedure Manual because it is more technical. I just wanted to open that for discussion.

I am not sure if many of you saw the first round that came out on the New Member Guide and if you had a chance to look at that, but I found it to be extremely useful information.

So I am just asking maybe Mark and NOP also how they feel about putting that on the agenda for the Policy Committee to look at inserting into the Policy and Procedure Manual.

CHAIRMAN O'RELL: Is that a question to the program?

(Laughter.)

MS. JAMES: Do you have a problem with it?

MR. BRADLEY: We don't have a problem with that at all, if you want to look at that.

MS. JAMES: Okay.
MR. DELGADO: I guess I would like to clarify that this is a working document, and we should be updating that probably on a yearly basis, like we should be doing the same with the other Policy and Procedures Manuals. It is not complete, but I do want to recognize Bea's work on this, on developing the first pass. It was essential, and Bea has been definitely, no question, the leading light behind the New Member Guide.

MS. JAMES: See, from being so lost, you can actually have positives. (Laughter.)

MR. DELGADO: Yes.

Any other comments? Questions?

CHAIRMAN O'RELL: Just so everybody's clear, then the revisions that you discussed first this morning will be voted on tomorrow.

MR. DELGADO: That is correct.

CHAIRMAN O'RELL: And what Bea
presented for the New Member Guide was just a discussion item, and at the next meeting—we plan to make a change or two, and then at the next meeting it will an action item.

MR. DELGADO: Right. That is correct.

CHAIRMAN O'RELL: Does that conclude the discussion?

MR. DELGADO: That concludes the Policy Development discussion, yes.

CHAIRMAN O'RELL: Thank you. You’re still on, I guess.

MR. DELGADO: I’m still on, yes.

CHAIRMAN O'RELL: We are going to move to you and Gerald for the Joint --

MR. DELGADO: That’s right. I also want to appreciate all the work that has gone into developing, working on the temporary variances for research. Gerry and the Crops Committee and the PDC members have been generally busy all the time.

But at this point, what we would
like to do is give you an update on what is happening with research variances, our guidance for them.

CHAIRMAN O’RELL: It is Tab 3 in our books.

MR. DELGADO: That’s correct.

We, essentially, prepared the letter; just to give you that update, I will read from that. You can see that. It is on the screen.

The update is the following:

“For the past year, the Crops and Policy Development Committees have been working to provide recommendations for temporary variances for the purpose of conducting research.

“One topic of discussion concerns research involving prohibited materials and practices, particularly such research that must be conducted on transitional or certified organic land due to funding stipulations.
“Because NOP rule Section 205.290(e) specifically forbids temporary variances involving practices, materials, or procedures prohibited under 205.105, the Committees are attempting to find ways to accommodate this type of research under the current rule framework.

“The Committees have been working on a document recently that we named ‘Guidance for Certification of Operations Participating in Research,’ COPR.

“Ongoing work on the COPR document will attempt to outline the procedures to request, maintain, document, and control distinct plots used for such comparative research within the confines of the Certified Organic Farm Plan of a research operation.

“Another major discussion point on temporary variances questions the validity of allowing certifiers to grant variances, acting in place of the NOP
Administrator, that is. This idea has been proposed as a way to streamline the temporary variance process.

“After close scrutiny of the NOP rule, the Committees determined that the Administrator must be the one to grant any variances. The Committees will be discussing ways to streamline the approval process of temporary research variances as part of the work-in-progress on the COPR document.

“This update on the work-in-progress on this topic seeks to inform the public and to stimulate continued input from all concerned parties.”

Thank you, and that is signed by both Gerry and myself.

CHAIRMAN O’RELL: Any comments, Gerry?

MR. DAVIS: No. I think that gives an adequate status report of what we’re grappling with and why there is no
document for vote.

CHAIRMAN O’RELL: Any questions from any of the Board members? Andrea?

MS. CAROE: It is not a question, but being part of this process, I just wanted to say that we actually did a lot of consideration. We kind of went full circle with this recommendation.

We got very, very complex, and then we brought it back to a very, very safe area. Then we realized that we really didn’t have any there and got stuck.

Temporary variances is a very tricky area for us because a variance is a compromise. It is a compromise on the rules in order to promote the technology and the advancement of the industry. That is a very tough call for this Committee to make, for this Board to make.

We will struggle with that as we move forward, finding out where we are willing to let organic food on the market in
small amounts that don’t meet every piece of the regulation, yet they are providing something back to the industry that will actually take it further along.

So I appreciate all the work that Rigo and Gerry did on this. It was an amazing effort.

Seeing this document, you may not understand, actually, all the work that got to where we are, but I think we’ve got a better understanding, and moving forward, I think it is going to be a very good recommendation that you come up with.

So I appreciate the work that you guys did on this.

CHAIRMAN O’RELL: Hue?

MR. KARREMAN: Actually, Andrea, maybe I’m under the wrong impression, but product made under a variance, I thought that will not be sold as organic, but perhaps that plot, or whatever that it said in here, could come back into production.
But during the examination of a practice or product for a crop, let’s say, that particular crop that season would not be sold as organic, isn’t that correct?

MS. CAROE: Well, there is an opportunity that you could preserve the transition and, in other words, not sell the crop, but sell the following crop as organic.

MR. KARREMAN: Sure.

MS. CAROE: That’s one type of variance. The other type of variance is to allow it to be sold as organic.

So, you know, this would be considered by the Committee in granting a variance. So maybe it is a practice, or I’m not even sure which part of the regulation would be varianced. That is the tough part.

But looking at that and moving forward is the issue. But the world is the gamut on this. It is balancing the benefit versus the detriment, the variance. That is
what is ahead.

    I think Rigo and Gerry are very good at putting that in perspective.

    CHAIRMAN O’RELL: Yes, Hue?

    MR. KARREMAN: Another point: I don’t see anything in this document here -- it is not a document, just a progress update, I guess -- regarding livestock. I think livestock has to be addressed.

    MR. DELGADO: You are absolutely right. This is a working document. We have addressed just these specific points so far.

    So the next step will be to continue with questions like, where does livestock fall into all this? So we are not done with this work at all.

    CHAIRMAN O’RELL: This remains on the work plan?

    MR. DELGADO: Absolutely, yes.

    MR. KARREMAN: One last thing: As the Crops and Policy Development Committees -- and I was just wondering if it
is going to include livestock, shouldn’t it be the Livestock Committee as well or should it just be the Policy Committee itself, not just Policy and Crops?

Do you know what I’m saying? Should it be just Policy because it is overarching over the whole Board and everything to do with organic research or should it be Policy plus the Crops Committee, the Livestock Committee, and whatever all else, just to be fair to Livestock, I guess, and other groups?

MR. DELGADO: My immediate response is, yes, we should be including Livestock in that sense. I don’t know if you have any objections.

MR. DAVIS: I don’t disagree with that, no.

CHAIRMAN O’RELL: Well, I would agree. Policy will be the leading driver. So they would have the primary function to make sure that the roles are carried out
through Crops and Livestock.

So if we wanted to add Livestock to that as part, under the umbrella of the Policy Committee --

MR. DAVIS: That’s fine.

CHAIRMAN O’RELL: Andrea?

MS. CAROE: I would make a suggestion that you consider developing an ad hoc committee to deal with this that includes Crops, Livestock, a couple of people from each area, instead of trying to get all of these committees together; you’ll never get a quorum.

So if you actually get a couple of people that can represent each area, form an ad hoc committee, it will be a lot easier and a lot more tenable to actually get work done.

MR. DELGADO: No, I agree. That will make us a lot more productive, too. Thank you.

MR. MOYER: Kevin?
CHAIRMAN O’RELL: Yes?

MR. MOYER: In fairness to Rigo, there are some of us that sit on Crops and the Livestock Committee. So livestock was discussed from the very beginning of this policy statement right on through. We never separated crops and livestock in the actual discussions.

MR. KARREMAN: The only reason I’m bringing it up, I don’t see anything about livestock per se in this update here.

MR. MOYER: Right, not in this update. In the actual document that we -- we originally had written a document and livestock wasn’t there; we had a lot of problems, not just with livestock, but with the whole thing.

As we re-evaluated it, we just stumbled along and we started to actually regress in our discussion, but livestock was included.

CHAIRMAN O’RELL: Livestock was
definitely included in the -- yes.

MR. KARREMAN: I was part of those discussions.

CHAIRMAN O’RELL: Yes.

(Laughter.)

MR. DELGADO: And, also, Mike Lacy was participating in that. So we did have -- we just have to make it official, I suppose, include the three committees or the ad hoc committee.

CHAIRMAN O’RELL: So I think that is a very good suggestion that Andrea made. So, Rigo, if you would look at putting together an ad hoc committee --

MR. DELGADO: Will do.

CHAIRMAN O’RELL: -- under the Policy umbrella to continue with this, to have representatives of livestock and crops?

MR. DELGADO: Will do, yes.

CHAIRMAN O’RELL: Any other questions or comments?

(No response.)
Okay, Gerald, let’s move on to the Crops Committee rundown of the recommendations that will be presented tomorrow for vote. We have two discussion items, I think, as well.

MR. DAVIS: What’s the best way to structure that, Kevin? I present the petition, then open it up for discussion amongst the Board?

CHAIRMAN O’RELL: Yes.

MR. DAVIS: And that’s as far as we take it for each material?

CHAIRMAN O’RELL: For each material, yes.

MR. DAVIS: Thank you.

CHAIRMAN O’RELL: Just to give some background information and what the recommendation is coming from the Committee for each of the individual materials.

MR. DAVIS: Okay.

CHAIRMAN O’RELL: Then we’ll have discussion.
MR. DAVIS: The first material on the agenda is lime mud, which would be a limestone recovery type of material from various industrial processes. The petitioner is requesting that it be approved for organic use as a liming material. It is calcium carbonate. It is just the problem is that we had with it was that it is industrial byproduct.

The material is synthetic. I mean it begins as a mined material, but it doesn’t stay that way.

So, as far as the criteria, we checked off that it failed all three criteria.

As far as impact on humans and environment, the first criteria, we felt that the lime mud term was very generic and not specific enough.

The petitioner, with their specific version of that recovery-type lime mud, they were presenting that it had
minimal contaminants as far as heavy metals, and so forth, but the term to approve lime mud would open up the door to all sorts of grades of these types of materials that could have vastly different quantities of impurities and heavy metals, and so forth.

Even the material as petitioned, their version of it, it does have some contaminants in it. We felt that, even though they were reasonably low by conventional agricultural standards, that in organic that is not really one of the principles we follow of trying to decide what is an adequate loading rate of heavy metals, and so forth, that should be applied to organic land.

So we thought the potential loading rate of contaminants would be too high with lime muds in general for organic to be compatible -- well, let’s say that, compatibility. It could have an impact on the environment. So it failed that
As far as the availability criteria, are there other materials available? There are. You know, mined limestone is generally available and is effective. There is no perceived need for this type of a limestone material because there are no other sources.

I mean limestone is very available in most areas of the country. It is already an approved natural.

The third category, and we felt it failed also, as far as compatibility and consistency with organic agriculture. The rule prohibits the use of material made in lime kilns. So we thought this was related to that and was a problem area.

Again, the loading rate of heavy metals, accumulation over time, repeated use of this, we didn’t think it was compatible with organic agriculture. So we rejected it on that criteria also.
So we voted to deny the petition. The vote was five members yes and zero members no, no abstentions.

Is there any discussion? Andrea?

MS. CAROE: I just have a question. You are evaluating this as a synthetic. Is this not like a byproduct of a grinding process? I mean, how is this synthetic? Is this actually manufactured?

MR. DAVIS: Nancy, can you take a stab at that? I am blanking here on what determination we used on deciding it was synthetic.

MS. OSTIGUY: I am not remembering the petition at the moment. So I really can’t pull that up.

MS. CAROE: I don’t think it changes anything. I think your evaluation is quite complete. I just was curious about the categorization because it just seems like it is a byproduct of some other type of application or grinding or --
MR. DAVIS: I’ll have to check the petition and see if I can put together why we determined that.

MR. MOYER: Gerry, my recollection was that what we discussed was that, through the process of the creation of the lime mud, as a byproduct of something else, it actually changed the material through the heating process. So it becomes -- you start out with something mined, but through the process, it actually becomes synthetic because there’s so many other contaminants mixed in with it.

MS. CAROE: Oh, so it is like it is binding with metals and things like that in the process?

MR. MOYER: Yes, all sorts of things, right.

MS. CAROE: Okay.

MR. DAVIS: Yes, changing the calcium oxide at one point --

MR. MOYER: Right. Got it.
MR. DAVIS: -- and back and forth in various forms.

MR. MOYER: It actually changes, chemically changes it.

MS. CAROE: Thank you so much.

MR. MOYER: Sort of like taking phosphorous and turning it into triple super phosphate, it becomes a synthetic by the process.

MS. CAROE: I understand.

MR. DAVIS: Seeing no other hands, I guess we will move on to the next material.

CHAIRMAN O’RELL: Yes.

MR. DAVIS: Nancy, do you want to take the sodium lauryl sulfate?

MS. OSTIGUY: Sure. Sodium lauryl sulfate was petitioned for use as part of a material that was to be an herbicide. In our evaluation, adverse impacts on humans and the environment were unlikely.
Sodium lauryl sulfate is, in essence, a soap. So while it can have negative impacts on living organisms, it is relatively benign in that fair quantities are needed.

Primary areas where it is problematic in the environment is near aquatic ecosystems.

So the substance is also biodegradable. It is a food additive. It is grass, so relatively nontoxic.

Like any soap, if you ingest it, it will cause diarrhea.

Category 2, on the question of wholly natural substitute products, there are corn gluten, prevents sprouting of seeds from developing normal roots; acidic acid is considered a natural herbicide. There are also other lists for minimal risk inerts that can also be used such as sunflower oil and citric acid.

Again, on alternative substances,
List 4 minimal risk inerts are available that are natural.

Other practices: cultivation, et cetera, crop rotation, allelopathic plants, et cetera, can be used in place of an herbicide.

So it failed Category 2. It also failed Category 3. The intended use was felt to be beyond the intent of the regulation because the material would be used in crops.

The section under the regulation where this material would be listed is herbicides, soap-based, for use in farmstead maintenance, roadways, ditches, right-of-way, building perimeters, and ornamental crops. That was not the stated intended use.

We felt that it was compatible with sustainable agriculture, with the maintenance as following the regulations as they currently stand, but not for crop
production.

We did find a place for it, if we had wanted to add it to the list, because it is a soap.

The Committee voted that this material was synthetic and that we reject it for listing on the National List because it would violate current regulations in terms of if you look at Category 3, question 2, other materials are also available that are consistent with organic production.

CHAIRMAN O’RELL: Any questions for Nancy?

(No response.)

Okay, Gerald?

MR. DAVIS: Hearing none, the next material is the petition to add sulfuric acid to the National List with the annotation “for use only to stabilize animal manures” in processing of those animal manures.

The first category, the
evaluation criteria, impact on humans and the environment, a lot of the discussion talked about the basic idea that sulfuric acid is a very commonly-manufactured material used in a lot of things.

Different sulfur compounds getting into the air as air pollution and causing acid rain was discussed. Although it is not directly pertinent to this material and its use, the material as petitioned for use would not cause acid rain. The commenter, the petitioner sent in public comments posted on the website stating that. I would have to acknowledge that, that, yes, the material as used would not cause acid rain.

So perhaps we got a little bit off the track on that particular tact.

MS. OSTIGUY: Gerry, can I interrupt?

MR. DAVIS: Yes, please.

MS. OSTIGUY: One of the things
that the Committee was doing, and we did the same thing with sodium lauryl sulfate, is when we list a material, it is listed for any use. So while this particular use doesn’t have an acid rain component, a lot of things that were mentioned in terms of its environmental impact probably do not apply for this particular use. That is not what we are doing when we put something on the National List. It could be used in other processes.

So that was the context of our responses for Category 1, was if it was on the National List, what are the possible consequences?

MR. DAVIS: Right. I was going to discuss that in the compatibility area also.

On the availability criteria -- well, first of all, going back to the first criteria on impact on humans and the environment, we felt that the material did
not satisfy that criteria. So we marked it as no.

The second criteria, availability of natural substitutes or practices that would substitute for this, we felt it failed on that also because there are other ways to stabilize animal manures with other materials such as using citric acid, lactic acid, bacteria, or clay or peat materials, various zeolite materials that tend to absorb free ammonia when they are present in the manure or the compost piles.

There’s also just regular composting of animal manures is a practice that would not keep the volatilization of ammonia. I mean that would happen in composting. It would go into the air and, yes, it would be there, but it is still an alternative practice that is commonly used. This we didn’t feel was necessarily needed for the overall organic agriculture fertilizer need situation.
So we felt there were other available materials and practices. So we voted no on that also.

Criteria 3, compatibility and consistency, we also checked that off as a no answer. As Nancy mentioned a minute ago, when we approve, if we were to approve sulfuric acid for use in animal manures to stabilize them in their processing of them, it would open up the door to many other uses that would go beyond the intent of this particular petitioner.

They stress over and over again the small quantity of sulfuric acid it takes in their process on a hog operation to stabilize the manure in their manufacturing process in making pelletized manure for availability to the organic growers.

But if we approve it, it could be used for many, many things. It is a synthetic. Putting it in the manures results in formation of synthetically-formed
sulfate fertilizer.

The principles of organic agriculture in the rule and the original act state that we are not to be allowing synthetic fertilizers for general use in organic agriculture.

So although the amount they put in this particular process is small and it might seem inconsequential, it would open the door to anyone else desiring to use large quantities of sulfuric acid in compost piles or manures for various reasons to get various effects, all in a synthetic fashion.

So, for that reason, we voted no on the compatibility and consistency with organic agriculture and voted five to zero to not grant the petition.

Any questions or comments?

CHAIRMAN O’RELL: Yes, Dan.

MR. GIACOMINI: I would just like a little clarification on you said a couple of times that putting this item on the list
for this use would allow its use in other cases. OFPA, under National List, says, “The list established under Subsection A shall contain an itemization by specific use or application.”

How would putting it on the list for this use allow its use in other cases?

MR. DAVIS: I didn’t say “other cases,” but within the case of manure stabilization, you know, stabilization of ammonia within manures, it is conceivable it could be used in much greater quantities, let’s say in a composting operation, to where they could go beyond just mainly stabilization and would be actually fortifying compost or manure sources with large amounts of sulfate.

MS. OSTIGUY: Yes. Not only that, so even within this use category, it could go to the point that it would be a synthetic fertilizer.

The way in which, at least in my
five years on the Board, materials have been added to the list, the preference by the program has been to not have annotations. We would have to put fairly restrictive annotations in this case.

So while, yes, OFPA allows annotations, in practice they really have not been the primary way that this has proceeded.

MR. GIACOMINI: I see Gerald’s point on amounts and volumes. I don’t quite see your point on annotation since we put it into a specific category for as use.

MS. OSTIGUY: Once it is in one category, it is opened up for justification for additional categories.

MR. DAVIS: And we have another item on the agenda that will demonstrate that in a few minutes here -- I will point it out when we get to it -- where a material has a very specific addendum, annotation -- excuse me -- and is now being petitioned for
expanded use to change that annotation to give it more usages. So it does happen. It is very routine that that does happen. Putting it on in a small way tends to lead to more usage that we definitely wouldn’t be interested in.

CHAIRMAN O’RELL: Andrea?

MS. CAROE: I think that you’re overly worried about an annotation when you have such a clear reason, because if a particular use presents no risk and you are allowing that use with an annotation for that use, and you are very particular about how this recommendation is written, any petitioner that comes after is going to have to reference the previous Board decision. Clearly, in your decision it will say that it was allowed specifically for this use because there were minimal risks because of the method used for application.

So, I mean, you could do that. However, in this case, looking at this
material, it seems like you have a whole lot of alternatives.

So, I mean, I think the point may be moot in that, why go to that level of -- you would do that if you really needed this material for this reason. If you had no other reason, no other alternative to adjust the PH, then I could see doing that.

But to kind of go between, Dan, it can be done, and you would do it if you needed to, but I don’t think you need to. I don’t think this material has -- or the petitioner has proven that they absolutely need this material.

CHAIRMAN O’RELL: Nancy?

MS. OSTIGUY: I would also argue that this material for this use could, while this petitioner has stressed how small amounts are necessary in their process, it could be used, it could be abused by other individuals.

I am not sure you could write an
annotation that says that you must use the most minimal amount possible, and then how are you going to police that? How are you going to follow that in terms of enforcement?

So we are stuck with a quantity issue anyway.

CHAIRMAN O’RELL: Right, but the rejection of the material is not based on the sole fact that it could be used.

MS. OSTIGUY: No.

CHAIRMAN O’RELL: I mean there are clear criteria for rejecting the material beyond the philosophical point that it could be used in other applications or abused or further --

MR. GIACOMINI: Right, and my comment wasn’t as an argument to your decision on this substance. It was just, you know, clarification on the specificity in OFPA of how we are required to put items on that list for specific use. I mean there
are some items that end up being on the list a number of times for different uses.

In some cases, an item has been on the list, resubmitted for a second use, and that second use has been rejected, but it still stays on the list for the additional use.

MR. DAVIS: Right, and the overarching point that we try to always remember is, if we are going to add synthetics to the National List, we need to make sure they are truly, truly needed and there are no good alternatives. We just felt it really failed that category of criteria.

CHAIRMAN O’RELL: That’s the clear basis for --

MR. DAVIS: That’s the clear basis, that there are other ways to go about this and this is not a justification for adding a synthetic for use that way.

CHAIRMAN O’RELL: Hue?
MR. KARREMAN: I was just going to say this is totally new to me, using something like a synthetic for manure preservation. I don’t know many farmers in the Northeast at least that would use anything for cow manure, poultry manure except drying it out naturally and whatnot. It seems kind of odd.

MR. DAVIS: Right. In the natural drying and handling of manure, there is always a nitrogen loss.

MR. KARREMAN: Right, sure.

MR. DAVIS: If you choose to use a sulfuric acid to add it to the manure pile, the compost pile, it drops the PH of the overall pile or the manure to a level where ammonia gas does not form. It stays in the ammonium form and it stays there, rather than volatilizing off.

Any other questions?

(No response.)

So did I finish? The vote was
also five to zero on the sulfuric acid in manure to reject the petition.

Calcium chloride currently has the status of it is nonsynthetic, at least in this form. Synthetic forms of calcium chloride do exist and they are made.

This particular petitioner produces a calcium chloride that their company sells from a natural brine process. So we determined that it is not synthetic.

Calcium chloride exists on the list right now as a prohibited natural with the annotation “for use only to supply calcium as a nutrient in instances of limited calcium uptake in certain crops.”

Checking the history on it, it was primarily added based on a need that apple growers had for a way to treat for a physiological disorder called bitter pit or -- well, bitter pit, where it makes the fruit unsalable due to a late-season calcium deficiency that is not able to be supplied;
the calcium isn’t able to be supplied through soil-applied methods or many foliar-applied methods of other materials.

The petitioner is requesting that the annotation be changed to allow for soil usage of this material, to broaden the usage of it. So we had to evaluate it on that basis.

So Criteria No. 1, impact on humans and environment, the chloride content of the material seemed to be the central issue. Yes, you can leach the chloride out of the soil profile, and it is not in proper soil conditions for where the chloride would not build up in the soil profile where the crops are grown.

You can eliminate environmental contamination in that zone, but the question always remains, where does that chloride go and what are we doing with long-term usage as far as surface and groundwater contamination from the chloride being
leached through the soil layers?

The material is a salt. Everyone knows that salts are dangerous for certain handling by people. It can’t get in your eyes. You know, it is corrosive to the skin, and so forth.

But the main issue on impact on humans and the environment was the chloride issue and the leaching into the lower profiles of the soil.

So the Committee voted on that criteria that it fails, based on that part of it.

Criteria No. 2, the availability of natural alternatives or practices, for soil remediation in the alkaline soils, mainly in the West and Southwest, gypsum is a very, very effective low-solubility material for reclamation of alkaline soils with sodium and/or chloride problems.

So there is already a mined natural on the list that is routinely used
for that purpose.

Limestone is available as a calcium supplement in other areas, acid soil areas, where you would want an alkalizing material.

As a chloride supplement, a separate issue from the calcium, potassium chloride is on the list already as a chloride supplement.

Also, Brian Baker pointed out to me yesterday, reminding me that table salt, sodium chloride, is a natural and has no restrictions at all and could be used as a chloride source, although not desirable.

(Laughter.)

In situations where you need chloride, it is tiny amounts that you need to put on the soil. So a sodium chloride application at very low rates would be adequate.

But the question is, do these materials -- so we answered yes and no on,
are there alternative materials, because in situations, certain phases of crop growth, soil-applied calcium does not translocate to the problem areas of the plant like an apple with a physiological problem or tends to growing-point problems where you have distorted foliage or fruit that don’t have enough calcium.

The limestone and gypsum materials applied to soil tend to break down at some point. So there is often a desire to put on a foliar source of calcium, which was probably why it was originally added as a prohibited natural with the annotation “for foliar use only to correct calcium-deficiency disorders.”

There are other alternatives, calcium supplement sources for foliar use there were pointed out in the TAP. Calcium chelated with humic acids was mentioned. From my experience on our farm, calciums chelated with various amino acid natural
protein derivatives is very effective at correcting these calcium deficiencies.

So we felt there are other available materials. So we voted no on, did it meet that availability criteria?

Criteria No. 3, compatibility and consistency with organic agriculture, we also voted no on that, based on it is a material of high solubility and that is a principle at least contained in the rule. I don’t see it listed in OFPA itself, but it has been stressed. There seems to be a precedent stressing preferably that we use materials of low solubility to eliminate some of the environmental problems associated with high solubility of materials.

What was the other criteria that we talked about? I am blanking a little bit. Jeff, Nancy, anything on that, other criteria that we were -- Kevin?

MR. MOYER: Well, you hit the
important ones.

MR. DAVIS: okay. So we voted no, that it failed the compatibility and consistency with organic agriculture and voted five to zero to reject the petition to change the annotation to allow for soil use. Any questions?

CHAIRMAN O’RELL: So there were two absent for this vote?

MR. DAVIS: Yes. Yes, we didn’t mark that down, but the day that we did this there were only three members present. I believe Nancy and Jeff were absent for this vote, as I remember.

MS. OSTIGUY: Yes, if you add my vote, it is the same as the Committee’s.

MR. DAVIS: Joe?

MR. SMILLIE: Yes, I agree with the Committee’s decision. But I remember in the old days as a fertilizer dealer that we never allowed potassium chloride, for all of the reasons you have cited.
I just think that it is just a crying shame that we’ve got this process in place now to deny calcium chloride, but we are sitting there with muriated potash, which to me should never have been on the list. So I think it is organic history rather than science and that we are saddled with it, but I just wanted to note that I just think that is a crying shame.

MS. OSTIGUY: Joe, the Committee did talk about that. We agree with you. But we have to work with the petitions that are in front of us.

MR. SMILLIE: I agree.

MS. OSTIGUY: We felt frustrated, but that was the state of things.

MR. MOYER: Someone could petition to take it off, but they haven’t.

MR. ENGELBERT: But that is kind of the message we are hoping to send. We couldn’t justify this because of a wrong that was done, in our opinion, that was done
in the past.

MR. KARREMAN: If potassium chloride was petitioned to be removed, you guys think, with the calcium chloride sitting in the wings, that there might be a switch, let’s say? I mean if KCl was not available --

MR. GIACOMINI: The petition would be to change the annotation?

MR. KARREMAN: Yes.

MR. GIACOMINI: Yes.

MR. KARREMAN: Do you think the annotation could change then if potassium chloride was taken off?

MS. OSTIGUY: Well, they could petition to change the annotation or we could choose, if it was petitioned to remove, change the annotation. That argument would have to be made.

There are other wholly natural sources.

MR. DAVIS: Right.
MS. OSTIGUY: So that would be one of the main things that the Crops Committee would have to evaluate before coming with a recommendation to the Board.

CHAIRMAN O’RELL: Andrea?

MS. CAROE: Did that material go through sunset process?

MR. DAVIS: Potassium chloride? No, I think it was added later than that first batch.

MS. CAROE: It was added later. So it is going to be sunset, right? There will be a sunset on it?

Do we know how long it has been on the list and when that sunset is?

MS. OSTIGUY: I don’t remember.

MS. CAROE: Okay.

MS. FRANCES: But we’ll know soon.

MS. CAROE: I’m sorry.

MS. FRANCES: We’re pulling that information together to make sure that we
are on top of the sunset materials.

MS. CAROE: Okay. It may be a message to send to this petitioner that at that time may be the best time to petition an alternative, if it is necessary.

I don’t pretend to know the technical information.

MR. DAVIS: I believe it would still fail on the availability criteria at least and the environmental criteria.

CHAIRMAN O’RELL: Emily, can you provide some insight?

MS. ROSEN: My recollection is at your meeting you talked about changing potassium chloride. Or, actually, it was talked in Committee. But in order to take it off the list during the sunset, that would have been a change in the annotation. You felt like you couldn’t take it off the list or it couldn’t be considered for that.

There was an initial recommendation, I believe, from the Crops
Committee to consider sunsetting it, but then -- so it seems to me a prohibited natural can never be sunresetted, the way you have set up your rules, which is not good, I don’t think.

MR. KARREMAN: Strychnine -- oh, no, that was different. That remained on as a prohibited natural that stayed on.

MS. ROSEN: That stayed on, uh-hum.

MR. KARREMAN: Yes, okay.

CHAIRMAN O’RELL: Thank you, Emily.

MR. DAVIS: It probably would have to be petitioned because of that process, Andrea, of not being able to change the annotation.

MS. CAROE: I understand, yes.

MR. KARREMAN: Also, Gerry, you’re saying there are other available products out there besides calcium chloride, but it is a natural product. You guys have
said that, correct?

MR. DAVIS: Right, yes. This process produces a natural, yes.

So I mean the debate could go on of whether we should be in the business of prohibiting naturals that don’t have very, very distinct problems with them, such as strychnine or arsenic and stuff like that.

The argument could be made, is calcium chloride to that level to where we really need to tell organic farmers, no, you can’t use this material because it is that bad?

MR. ENGELBERT: But it does have an annotation for use that we think is sufficient.

MR. DAVIS: Right. The annotation for use does mitigate the environmental issues that it has. By restricting it to that level of use, you still have a calcium supplement; you still have a chloride supplement for use certain
ways. You just can’t use it in larger quantities in soil.

CHAIRMAN O’RELL: Any other comments or questions?

(No response.)

Thank you, Gerald. Do you want to go on to compost tea?

MR. DAVIS: Do I want to?

(Laughter.)

CHAIRMAN O’RELL: Do you want to?

No, I guess that wasn’t a question.

(Laughter.)

Would you go on to compost tea?

MR. DAVIS: Okay. Compost, vermicompost process manures and compost teas, this one has been on the agenda many, many times for years now, starting with the Compost Task Force years ago and then the subsequent Compost Tea Task Force.

What we attempted to do was to look at those Task Force reports and come up with a guidance document that, rather than
just adopt everything that is in those Task Force reports as what we should do for these materials, I could see myself inconsistencies in some of the material contained in particularly the Compost Task Force document, the older document, that I thought were problematic and didn’t want to.

So we put directly in there that this is the guidance document. The Task Force documents are for background and history. They are not guidance in themselves.

How are we doing on time?

CHAIRMAN O’RELL: We’re fine.

MR. DAVIS: Okay. I think I had better read this.

“National Organic Standards Board Crops Committee recommendation for guidance for use of compost, vermicompost, processed manure, and compost teas.

“Introduction. Section 205.203(c) of the Soil Fertility and Crop
Nutrient Management Practice Standard in the USDA NOP rule sets forth the fundamental requirement for processing and applying plant and animal materials. The section states that the producer must manage plant and animal materials to maintain or improve soil organic matter content in a manner that does not contribute to contamination of crops, soil, or water by plant nutrients, pathogenic organisms, heavy metals, or residues of prohibited substances.

“Subsequently, Section 205.203(c) states that plant and animal materials include raw animal manure, composted plant and animal materials, and uncomposted plant materials.

“The rule in this section also contains management restrictions for crops on which raw manure has been applied and also specifies the composting conditions that must be maintained to produce compost.

“Certain types of compost and
manure-based inputs commonly used in organic farming were not directly addressed in the rule, such that additional information and rule clarification was needed.

“Two different task forces were commissioned to make recommendations on these materials. In April 2002, the Compost Task Force recommendation was presented to the NOSB and subsequently accepted as a recommendation to the NOP.

“In October 2004, a separate report and recommendation was presented to the NOSB by the Compost Tea Task Force. That document was also accepted by the NOSB, and the Crops Committee was directed by the Board to determine the necessary work that needed to be done to clarify these documents to the public.

“The intent of this current document is to point out and summarize the recommendations contained within both reports. So to summarize the information
that are relevant to clear, concise guidance on the production and use of the compost manure materials listed above, the complete reports of the Task Forces are included with this NOSB recommendation as supporting information only in Addendum A and Addendum B."

Definitions -- some of these are directly from the Task Force reports. Some of them are excerpts with very minor changes.

We added a definition for compost because neither of them actually defined compost.

So “Composting is a process in which organic matter of plant and/or animal origin is managed to promote aerobic decomposition and an increase in temperature in order to enhance its physical and nutritive properties as a soil amendment while minimizing pathogenic organisms.”

“Compost is the product of the
composting process defined here.”

“Compost Tea, a water extract of compost produced to transfer microbial biomass, fine particulate organic matter, and soluble chemical components of the compost into an aqueous phase, intending to maintain or increase the living beneficial microorganisms extracted from the compost.”

“Process manure, manures that have been treated by heating and drying to reduce pathogenic organisms.”

There were some comments made that we should call these dehydrated manures. I don’t feel that is specific enough because it is not just the drying that is included in the manures; it is the heating. So we had to come up with a term that could be all-inclusive of both processes, not just the dehydration.

“Vermicomposting, a managed process of worms digesting organic matter to transform the material into a beneficial
soil amendment.”

“Additional definitions of words used in this document, see glossary and definitions section of Addendum B,” which is the Compost Tea Task Force report.

Our recommendation: “Producers of any agricultural commodity or product certified as organic under the National Organic Program, NOP, must meet the fundamental requirements for processing and applying plant and animal materials for soil fertility and crop nutrient management practices, as described in Section 205.203(c) of the final regulation.

“Examples of plant and animal materials are described in Section 205.203(c) (i) through (iii).

“This recommendation denotes other materials and practices that would be acceptable under 205.203(c)(ii) which applies to plant and/or animal material mixes.
“One, compost, in addition to that described in Section 205.203(c)(ii), is acceptable if, one, made from only allowed feedstock materials with incidental residues, are allowed only if they will not lead to contamination.

“Two, the compost pile is mixed or managed to ensure that all of the feedstock heats to the minimum of 131 degrees Fahrenheit, 55 degrees Centigrade, for the minimum time of three days.”

That section is not intended to mean that we have shortened the amount of time from 15 days for what the rule states to three days. That is just saying that every part of that compost pile needs to be turned, so that every last bit of it has at least three days of heating.

“The monitoring of the above parameters must be documented in the organic system plan submitted by the producer and verified during the site visit. An
explanation of compliance with Section 205.203(c) should also be presented in the plan.

“Two, vermicompost is acceptable if, one, made only from allowed feedstock materials, except for incidental residues that will not lead to contamination.

“Two, aerobicity is maintained by regular additions of thin layers of organic material at one- to three-day intervals.

“Three, moisture is maintained at 70 to 90 percent.

“And, four, duration of vermicomposting is at least 12 months for outdoor windrows, four months for indoor container systems, four months for angled wedge systems, or 60 days for continuous flow reactors.”

There was one or two public comments mentioning that we should define angled wedge systems. We did not do that, probably because we don’t have any experts,
the expertise to look that up at the time.

“No. 3, processed manure materials must be made from manure that has been heated to a temperature in excess of 150 degrees Fahrenheit or 65 degrees C for one hour or more and dried to a moisture level of 12 percent or less or an equivalent heating and drying process that produces a product that tests negative for pathogenic contamination by Salmonella and fecal coliform organisms.

“Since processed manures have been treated to reduce pathogenic organisms, applications are not subject to the restrictions placed on raw animal manure applications in Section 205.203(c)(i) -- what’s that? -- (i), (ii), and (iii).”

I don’t know how you say those “i” numbers.

“To prevent regrowth of pathogens in processed manures, post planting use on crops whose edible portion contacts the soil
must be limited to below-soil-surface applications only.”

“No. 4, compost teas must be made with potable water. Equipment used to prepare compost tea must be sanitized before use with a sanitizing agent as defined by 21 CFR 178.1010.”

Public comment on that was received stating that we should add a phrase to there stating that it has to be a material on the National List, not just materials listed from that CFR section. So we can discuss that.

“Compost tea should be made with compliant compost or vermicompost.” Comment was taken on should be changed from “should be made” to “must be made.” I think that is a very important point.

“So compost tea should be made with compliant compost or vermicompost using the NOSB recommendation for compost and vermicompost mentioned above and as defined
in Section 205.203(c)(ii) of the NOP rule for compost tea.

“This applies to 100 percent plant feedstock materials in addition to manure feedstocks because non-manure compost feedstock may harbor high levels of fecal bacteria.

“Compost tea made without compost tea additives can be applied without restriction. Compost tea made with compost tea additives can be applied without restriction if the compost tea production system, the same compost batch additives and equipment has been pretested to produce compost tea that meets the EPA-recommended recreational water quality guidelines for a bacterial indicator of fecal contamination, US/EPA 2000.

“These indicators and the passing criteria are Escherichia” -- however you say that -- “E coli 126 CFU/100ml or enterococci 3 CFU/100ml.
“At least two compost tea batches must be tested using accepted methodology.”

I think some of the public comment really objected to the two tests for the compost tea, but they misinterpreted that they had to test their compost, two compost tests each batch.

“At least two compost tea batches must be tested using accepted methodology” -- and I let the readers read that, the citation -- “with the average population of indicator bacteria across compost tea batches used as the measurement of passing.

“Each new batch of compost would require that the system quality assurance pretest be conducted again as indicated. After it passes again, compost tea from the system can be used without restriction, provided that an annual retest is completed.”

The Committee added that last statement, “providing that an annual retest
is completed.” We thought it was prudent just for the operator, for their own liability purposes, if there’s ever a problem such as the one that has occurred with the spinach and lettuce, and so forth.

I mean there are elements of the conventional agricultural world that really disagree with compost tea and immediately point the finger at these sort of organic practices as the culprits for these types of incidents or the potential for these types of problems with using compost tea.

So we felt that an annual retest would just be due diligence to prove that what we are producing is safe, that it is not subjective, like what we are producing in our compost tea has never been a problem and it has always worked for us. We thought in this current environment, this situation, with organic agriculture being scrutinized by conventional ag and every little misstep that they think we are taking is pointed
out, this would be an area we needed to tighten the restrictions a little bit to give us better footing to withstand criticism.

“If compost tea made with compost tea additives has not been pretested for indicator bacteria, its use on food crops is restricted to the 90/120-day preharvest interval,” as raw manure would be.

“Crops not intended for human consumption, ornamental plants, and grain crops intended for human consumption are exempt from the bacterial testing requirement and 90/120-day preharvest interval restrictions.

“Raw manure extracts or teas may be applied to the soil with a 90-to-120-day preharvest restriction. Foliar applications of raw manure extracts or teas are prohibited.

“Compost leachate may be applied to the soil with a 90-to-120-day preharvest
restriction. Foliar applications of compost leachate are prohibited.

“Compost extracts resulting from any mixture of compost, water, additives, and agents that are not held for more than one hour before use may be applied without restriction.

“Compost tea or compost extracts are not allowed for the production of edible seed sprouts.”

The Committee vote was five to zero yes, no abstentions or absents.

Discussion?

CHAIRMAN O’RELL: Andrea?

MS. CAROE: I have three things. First, under definition of composting, it says, “to promote aerobic decomposition.” Is it to promote or is it required that, in order to be considered composting, you’re in aerobic decomposition?

I mean my understanding of composting is you have to be aerobic in
order for it to be composting. “Promote” makes it sound like, you know, you’re making an effort, but you may not get there, not reaching the temperatures, not reaching -- I just was wondering if there should be a word change and not “promote,” but maybe to elicit or something is more defined that it actually is happening.

MR. DAVIS: Right. Well --

MS. CAROE: That’s just a suggestion --

MR. DAVIS: Okay.

MS. CAROE: -- to consider by the Committee.

Then the other thing, two other things: One, what is your final recommendation? Are you looking for a rule change or this is a guidance document only?

MR. DAVIS: This is a guidance document.

MS. CAROE: Okay. Okay, that answers that.
The next thing is, in several areas, you say -- and this gets the little hairs on the back of my neck from being a certifier -- “will not lead to contamination.” What does that mean?

I mean, as a certifier, if I were looking at using this guidance or I was trying to not allow this practice, a practice where there is contamination happening, being that that is not defined, it doesn’t really mean anything. Do you know what I’m saying?

So is there a level of contamination? I mean zero tolerance for contamination? Contamination is what? I don’t know what that means.

MR. DAVIS: I see your point. Point well taken.

Jeff?

MR. MOYER: In answer to your one question about the definition, we pulled most of that definition out of the document
that was approved from 2002. So we took that language sort of the way it was.

Then your point on contamination, what we wanted to do was we were thinking about it in terms of a compost site or facility on a farm becomes a point source for contamination. So it is something that can be tested and is generally regulated by either DEP or EPA or some other federal agency that actually looks at that contamination.

So if you’ve got surface water nearby, they are not going to let you put this site there anyway. That is regulated by a whole other organization.

If you do put a site somewhere and contaminate the groundwater, then it is DEP.

MS. CAROE: So it doesn’t even need to be in here. It is already covered under existing regulation?

MR. MOYER: Well, it is, but we
wanted to make sure that we stated that fact that that is a consideration that a composter needs to consider.

MS. CAROE: I would reword it then because it makes it look like organic is going to start looking at other regulatory requirements. I would suggest rewording that and make it a note that you still must comply with existing regulations about contamination or something of that nature.

MR. MOYER: That’s a good point.

MS. CAROE: It is just not written correctly.

CHAIRMAN O’RELL: Hue?

MR. KARREMAN: I’m a little confused on the compost tea. That is obviously not a leachate because that is defined differently. It is not just a little runoff from a compost.

But why is compost tea without additives or treated differently than with
additives if it is a byproduct of the final compost? Am I thinking that right, that compost tea is a byproduct of the final compost?

MR. DAVIS: Right. You would have to read the Compost Tea Task Force document.

MR. KARREMAN: Okay.

MR. DAVIS: And they spent a lot of time talking about the history of compost tea making and testing data that they had showing that, basically, the only time they would run into the bad guy contaminants in compost tea making was if they added these carbohydrate additives. That would allow the pathogenic organisms that might be there in tiny, tiny little fractions to proliferate and grow.

MR. KARREMAN: So then the additives -- I worked on a biodynamic farm originally, and getting an organic agriculture, it is not like biodynamic-type
compost.

It is not the biodynamic preps you are talking about as additives? It is some kind of other -- do you know what I mean on that?

MS. OSTIGUY: The additives that at least were discussed when the report was accepted by the Board are various sugars.

MR. KARREMAN: Okay.

MS. OSTIGUY: Molasses is the primary one, yes.

MR. KARREMAN: It is not the biodynamic preps, okay.

MS. OSTIGUY: And the only microorganism that really increases in a number, if you have just water present, would be E. coli -- well, not E. coli -- cholera. But once you add the molasses, you have the substrate for all of them because now they’ve got a major sugar source.

MR. KARREMAN: Okay. Thanks.

CHAIRMAN O’RELL: Yes, Bea?
MS. JAMES: I know you guys put a lot of work into this, and it is very well-organized. I also realized, as I was reading it, that I don’t think I would have been able to find the document useful if I hadn’t had read the recommendation from 2002 and the report from 2004.

So I am confused about this could be submitted as a recommendation for guidance with these two attachments not --

MR. DAVIS: They are being submitted with the attachments.

MS. JAMES: They would be submitted as part of --

MR. DAVIS: Oh, yes.

MS. JAMES: Okay.

MR. DAVIS: They’re there for backup. We put that statement in as far as what the purpose of those two addendum were, so certifiers wouldn’t think they had to read through all those addendum and start applying each little thing that was
mentioned in those Task Force reports as guidance. But they are very necessary to understand the final recommendation, definitely.

CHAIRMAN O’RELL: Dan?

MR. GIACOMINI: In light of the recent events with spinach and lettuce and various things, I don’t remember the exact calendar in my head of the date of this document versus the date of those events, but do you still think that only an annual retest is adequate?

MR. DAVIS: Well, there are many, many people in the organic movement that make compost tea that are adamantly against the testing part of it. They think it is onerous and that they shouldn’t need to, that compost tea has a good track record when made properly.

So we put in that annual retest before the E. coli scare came on. We had already decided that, and it was a done deal
before that came up in the media.

I know larger compost tea producers that sell to many growers, it is not a big deal for them to take routine tests, and most of them do, just to document that they are doing a good job.

MR. GIACOMINI: Is compost tea sort of a continuous batch mix or is it separate batching generally?

MR. DAVIS: The tea itself is separate batching. Many times the compost heap that they are using for the inoculant is used repeatedly. They will make a batch of compost and hold onto that for a period of time, and many batches are made from that same compost source before they need to start another pile for their inoculant.

CHAIRMAN O’RELL: I have Andrea and then Bea.

MS. CAROE: Gerry, just asking a question here about, you keep on tying what this work has done in reference to recent
outbreaks of E. coli. From my understanding and uneducated eye, watching the situation, that was a situation of a contaminated irrigation water.

MR. DAVIS: Oh, I understand.

MS. CAROE: I look at this as a controlled system. I mean the manufacturing of compost or the managing of compost and compost tea would seem to be a least-likely contributor to E. coli contamination since it is under control, whereas this irrigation water seemed to be a completely unknown source of contamination that is still under investigation from what I understand.

MR. DAVIS: Right.

MS. CAROE: But I don’t see the tie between the two.

MR. DAVIS: All our work was done prior to that coming up.

MS. CAROE: Yes, I know, but, I mean, when we keep on talking about this, I just don’t see the tie. I don’t see the
necessity of even --

MR. DAVIS: The reason I bring it up is because I think we would be foolish to ignore the opposition that we face from conventional agriculture. They, in many cases, do not appreciate our movement at all. There are paid institutes that have websites that hammer on us all day long with distorted information, trying to, in their view, probably cripple the organic movement and stop the movement.

I think this is an area where the perceived risk is greater than the actual risk, but we have to deal with that perceived risk.

MR. GIACOMINI: Would that irrigation water have qualified as potable?

MR. DAVIS: I’m not familiar with the situation, Dan.

MS. OSTIGUY: I don’t believe so. If what I have read is accurate, I do not believe so.
One of the reasons why it has taken so long for this recommendation to come forward to the Board is because of the concerns that Gerry is mentioning. While the risk is low, it still is there. The last thing the organic industry needs is to have a major recall because, oops, this particular batch had a little bit of a problem.

So this is to try to prevent that from occurring. Now it won’t absolutely keep it from occurring, but, hopefully, it will make the chance much more rare.

CHAIRMAN O’RELL: I just want to get back on track. Andrea, following her question, I had Bea for a question. So just a point of order, if we can keep the rotation and raise our hands.

MS. JAMES: Jeff, I just want to make sure I understand. It is kind of a clarification of some of the questions that Andrea was asking.
So I am still uncertain, how do you require pretesting? That is part of some other regulatory body that would take place that would require pretesting of the compost tea batches?

The certifier -- so this would be something that certifiers would have to --

MR. MOYER: Yes, I understood Andrea’s question to be about composting, not the compost tea. Compost tea is done in batches in brewer. So that’s a different thing. That is what we would be testing, pretesting that material.

Then we also have, more importantly, the sanitizing of the equipment, which is where most of the contamination would take place, and then an annual testing of the actual tea.

MS. JAMES: The certifier does that?

MR. MOYER: Well, the process, the farmer of the process or whoever is
doing it would do that, and the certifier would --

MS. JAMES: The certifier requires that?

MR. MOYER: Exactly. Exactly.

MS. JAMES: Okay. Do certification agencies have the expertise to look at those kind of microbial reports on --

MR. MOYER: Probably no more than or less than they would looking at water samples or soil samples which are already required as part of the testing on farms. We require that they test water now. So if they can analyze or at least look at that, they should be able to look at this as well.

Generally, when you get reports back, they highlight problems. So it would be pointed out to you.

MS. JAMES: Would certifiers, then they would look at the facilities that is actually making compost tea, and they
would also look at farms that are using compost tea on their crops?

MR. MOYER: In most cases, it is one and the same because the compost tea can’t be -- it is not like you make compost tea and put it on the shelf and sell it to somebody. It has got to be made and used right away.

So it would be made on the farm. There would be records kept of your sanitizing process, just like you would of any other process that would take place on the farm.

MS. JAMES: Okay. I am just trying to follow this paper trial.

MR. MOYER: Sure.

MS. JAMES: That a certifier goes to a farm. They use compost tea. They require paperwork from that source that they purchase the compost tea from, and then they look to make sure that those reports are, indeed, passed for --
MR. MOYER: If it were purchased, that is correct. If it is made on the farm, then they would have all those records right there on hand.

MS. JAMES: Okay.

CHAIRMAN O’RELL: Andrea?

MS. CAROE: I caution you saying “require.” This isn’t rule change; this is guidance. There is no requirement.

MR. MOYER: I understand. I’m sorry. Thank you. Good point.

CHAIRMAN O’RELL: Thank you.

Yes, Kevin.

MR. ENGELBERT: Gerry needs to be recognized for the amount of work that he did on this project. When we looked at our work schedule, we decided we couldn’t do it, and a day or two later, lo and behold, I got a call and Gerry said, “We’re going to do this.” He is the one that deserves -- you know, he did a tremendous amount of time into this compost tea issue.
CHAIRMAN O’RELL: Thank you, Kevin, and thank you, Gerald. I know that this has been something that has been an issue on this Board since I came onboard five years ago or started before it. So thank you very much for getting this recommendation to the floor.

MR. DAVIS: There were a lot of comments from the public stressing, “We need to get this done.”

CHAIRMAN O’RELL: Absolutely.

MR. DAVIS: I was just responding to that.

CHAIRMAN O’RELL: Thank you.

Any other questions or does that wrap up the compost tea discussion?

(No response.)

Gerald, before we go on, I just want to let the Board members know we are a little bit behind on a break, but that is okay. But Katherine has provided all of these at your seats for a menu, that if you
choose to order something from the bistro, she will collect these at 10 o’clock and get them over there, so that your order will be pre-ordered, and at least Board members will be able to expedite lunch and be back on time for continuing with the public comments.

So if you wouldn’t mind filling these out kind of as we are having discussion, and then, Katherine, why don’t you give us 10 minutes and you can come by or we can just funnel them down, start passing them down here and get them over to Mike. Mike, you can give them to Katherine, so that we get these out of the way.

It would probably be a good idea to put your name on it. So if everybody has one, just do that as a little bit of housekeeping here, so we can keep going.

MR. DAVIS: Next item?

CHAIRMAN O’RELL: Yes, Gerald.

MR. DAVIS: The next item is
pertaining to organic seed availability.

CHAIRMAN O’RELL: This is just a discussion update?

MR. DAVIS: Discussion item update discussing response to comments received following the August of 2005 organic seed availability document.

The National Organic Standards Board Crops Committee’s response to public comment concerning commercial availability of organic seed recommendation, which was adopted by the NOSB August 16th, 2005.

Background: “The NOSB issued a formal recommendation regarding commercial availability of organic seed on August 17th, 2005 in the form of a guidance statement. The Crops Committee agreed to reassess the recommendation in response to additional public comment on certain sections of the document.

“The issues raised were the validity of maintaining a database
containing a list of non-organic crop varieties permitted by certification agencies.

“Two, certification agencies have objected to the amount of additional burden placed on them to collect, maintain, and report the information required by the recommendation.

“And, three, the final recommendation did not include a previous requirement stating that a producer who did not meet the commercial availability requirements for organic seed could not be certified organic.”

“Crops Committee conclusions: The National Organic Program may lack the capacity and does not have the obligation to maintain a list of non-organic crop varieties permitted by certification agencies. If so, an alternative clearinghouse for the information would need to be identified, preferably a non-fee
public benefit entity.

“Two, the Crops Committee agrees that the additional time and expense invested by certifiers to collect and report the known organic seed information would be substantial. The producers using non-organic seed varieties should bear the cost of any such requirement,” through, I guess, additional fees assessed to them by their certifier.

“Three, the statement that an operation did not meet commercial availability requirements for organic seed, could not be certified organic, was not included in the final guidance statement because it was deemed by the Board to be a restatement of what is already required in the rule.” I’m referring to the NOSB meeting transcript from August 16th, 2005.

“Discussion: The Crops Committee does not believe that recent public comments warrant changes in the NOSB recommendation
regarding commercial availability of organic seed. The Committee believes that the guidance document states clearly under what circumstances non-organic untreated seeds may be used and the procedures and documentation required.

“While the Crops Committee understands the concern of the industry over the apparent slow growth of the organic seed market, we believe that care must be taken when trying to influence commerce with the writing of rules.

“A primary goal is to encourage the growth and development of the organic seed industry without harming organic producers. Organic certification remains an integrity-based endeavor, and accountability among growers at the local level is a key element in encouraging adherence to the rules.

“All producers are encouraged to report instances of abuse of the organic
seed requirement to their certifier so that appropriate enforcement action may be taken.

“The guidance statement on the commercial availability of organic seed seeks to influence producers to use organically-grown seed. The sourcing of organic seed remains the responsibility of the producer. Availability and quality disparities between conventionally- and organically-grown seeds should shrink as the knowledge and growing skill of organic seed producers increases, minimizing the incentive for producers to choose non-organically-grown seed.”

The Committee vote was four yes, zero no, one absence.

Discussion?

(No response.)

Seeing none, we also wanted to give an update on the hydroponics issue. We have a proposal to send out a bit of survey, I guess you might call it, to get an
information search on what certifiers are doing with hydroponics in general. Are they certifying hydroponics, are they not, and various questions to give us more information, so we know how we might proceed.

The proposed correspondence would read, “The National Organic Standards Board Crops Committee is seeking input from USDA-accredited certifiers of organic producers regarding the certification of hydroponics operations. Specifically, the NOSB wishes to survey all organic certifiers regarding their policies and interpretations of the NOP rule for hydroponics operation. This is an opportunity for certifiers to provide their input to help shape any NOSB recommendation to the NOP for rulemaking on hydroponics.

“Your response to this survey is greatly appreciated.”

We have a spot for name and title
of the agency or name and title of the person -- excuse me -- filling out the form, the certification agency they represent, and their region of operations.

Question one: “How many hydroponics operations do you currently certify?” I think we have a typo there. “How many hydroponics operations do you currently certify?” The word “any” should not be in there. “If any,” is that the problem? “If any,” okay. So we are missing the words “if any.”

“Do you currently certify, if any, as organic? If none, why not?”

That gives the certifier the opportunity to state, if they are not doing it, justification why don’t they do it, which I think is one of the most important parts of the whole survey.

Question Two: “Do you think that organic certification of hydroponics is appropriate?” Again, another opportunity to
answer that same question.

No. 3: “In your opinion, where is clarification in the NOP rule needed pertaining to practices used in hydroponics operations?”

“If you answered no to Question No. 2, you may skip Questions 4 through 6. This is not questions for operations that do not certify any hydroponics operations.”

No. 4: “Do you maintain a list of allowed/prohibited substances for use in hydroponics?”

No. 5: “In general terms, what are the main fertilizer inputs that hydroponics operations use?”

No. 6: “Please list any potential certification issues with hydroponics that could arise in the future and should be addressed in any proposed guidelines?”

“Thank you for your participation in developing organic standards for
hydroponics.

“Sincerely, Gerald Davis, NOSB Crops Committee Chair.”

We voted four yes, zero no, and one absence to approve the correspondence.

Discussion?

CHAIRMAN O’RELL: Dan?

MR. GIACOMINI: I believe we had a question yesterday regarding adding the crops that were being approved. Would that be a reasonable thing to list, to include on the list?

MR. DAVIS: It would be interesting, but I am not sure that it would be necessary to get after the foundational information we are trying to get which is, do we make guidelines or not, or do we decide maybe that hydroponics are outside the scope of organic agriculture and should not be there?

One certifier has already answered the questionnaire ahead of time
because they are coming from the viewpoint that it shouldn’t be; it does not belong.

CHAIRMAN O’RELL: Andrea?

MS. CAROE: One of the things that I would suggest, as you move forward in this, is define what you are talking about when you say, “hydroponics,” because there are a lot of sprouting operations. I don’t think people generally consider that hydroponics because it is just using the nutrient from the seed to create the initial sprout.

MR. DAVIS: Right.

MS. CAROE: But when you are talking about hydroponics, you are talking about sustaining growth through inputs of nutrients, and that is a whole different situation.

I was curious why the question about, do you maintain a list of allowed and prohibiteds? Because the National List lists allowed/prohibiteds. I mean, do you
feel certifiers are out there kind of creating their own standard for hydroponics?

MR. DAVIS: No, that was based on -- I mean there is always a little bit of interpretation. An agency like OMRI would look at the -- they would take the National List information and apply that information to products.

MS. CAROE: So formulated products and branded products are --

MR. DAVIS: Yes. Maybe that could be more clear on what we meant by that.

CHAIRMAN O’RELL: Yes, Jennifer?

MS. HALL: On Questions 4 through 6 where it says, if you answered no to Question 2, you can skip those, it doesn’t quite follow for me in the sense that whether or not you think it is appropriate doesn’t mean you may not be certifying it at
this time and should go ahead and --

MR. DAVIS: Oh, no, that’s a typo. It should be Question 1.

MS. HALL: Okay.

MR. DAVIS: Thank you. Because if you don’t certify any organic hydroponic operations, you wouldn’t need to answer these other questions.

CHAIRMAN O’RELL: Yes, Joe?

MR. SMILLIE: I commend you. I think this is a really good place to start. I think it is really important that we get the database before we move forward. I think that as much pressure as we can bring to bear on ACAs to answer this fully is important.

Also, I think it is really important that state organic programs are also involved in this loop because there are certain states that have already made noises about this and are setting up their own systems of enforcement and interpretation.
So we would definitely want to bring our dear brethren in the state agencies in this discussion.

It is going to be a complicated one, and it is going to be a very interesting one. I think, basically, what our current interpretation is that, if we are going to consider hydroponics, then the idea is it is not a materials issue. The technical difficulty in hydroponics is being able to qualify under the current regulations as far as materials go. This is really a materials-driven industry.

That is becoming more and more possible through technology. In the early days of hydroponics, they couldn’t meet the current NOP regulations as far as fertilizer inputs. But now technology is improving, and we are seeing operations that are able to meet the specific material input fertilizer situation.

But the organic plan and the
improvement of soil and all of those issues are going to be where the crux of the issue is. Because as the regulation -- you know, it is clearly a soil-based agricultural system, and this is without soil. So we have a contradiction to deal with.

So I think this is a perfect way to start. Rather than coming out with a recommendation, I think let’s go and gather the information about what is currently happening now, and ACAs and state organic programs are the place to go for that information.

So I really support this approach and look forward to participating.

CHAIRMAN O’RELL: Okay, thank you, Joe.

I have Nancy with a question, then Bea, and then Kevin. Nancy?

MS. OSTIGUY: I remember in the Committee discussions of this, I believe I was the one to suggest that Questions 4, 5,
and 6 be placed where they are because that way some people could skip them.

Looking at it again, I am wondering if Question 6, “Please list any potential certification issues with hydroponics that could arise in the future and should be addressed in any proposed guidelines,” if that shouldn’t be open, more clearly open, to anybody who answers the survey, whether they currently register or currently certify hydroponic or not.

Because if you are not, you still may have information that we might be very interested in that you would get through Question 6.

MR. DAVIS: I think the Question 2 and 3 would tend to elicit the response that we are looking for. Certifiers that choose not to certify hydroponics operations would answer those, and their objections would include the same information.

What I thought Question 6 applies
more to is certifiers that are already certifying certain operations, but they have a problem with -- philosophically, they don’t object to it; they are doing it, but the mechanics of this area is a problem, for example.

That is a little bit different slant on the question than Question 2 and 3.

MS. OSTIGUY: No, and I agree that one is more of a philosophical response and the other one is more practical, but those that are not certifying hydroponics might have pertinent information about practical.

CHAIRMAN O’RELL: I think, Jeff, do you want to respond to Nancy’s question?

MR. MOYER: Yes, just to help answer that question, when we wrote the survey, we really felt that most certifiers would read the entire survey and fill out whatever they wanted. But some certifiers may feel yet another survey. So we wanted
to give them an easy out if they wanted it.
That was the only reason for that.

CHAIRMAN O’RELL: Bea?

MS. JAMES: Would you consider adding another question? I think it would be valuable to have a question in here asking, what these surveys -- what the people that read this consider to be the definition of hydroponics.

Because there are certain products that grow naturally in water, and then there’s controlled products that are grown in hydroponics. I think that we are going to have to come out with a definition just because of the way OFPA is written. So it would be useful, I believe, to include in the survey.

MR. DAVIS: The opportunity at least to give their definition.

MS. JAMES: To get feedback on what they consider to be the definition of hydroponics.
MR. DAVIS: Does someone want to make a motion on that idea?

CHAIRMAN O’RELL: Well, I think it is a Committee document. So you can take these suggestions back to your Committee --

MR. DAVIS: All right.

CHAIRMAN O’RELL: -- and vote on them there and put forth a recommendation.

MR. DAVIS: Okay.

CHAIRMAN O’RELL: Because it is just a Committee recommendation to the program for a survey.

MR. DAVIS: Right.

CHAIRMAN O’RELL: Kevin?

MR. ENGELBERT: Yes, Joe’s comments reminded me that we are also looking for input from other NOSB members, your thoughts on this entire situation. I don’t know how we proceed.

CHAIRMAN O’RELL: Any further discussion on the survey?

(No response.)
MR. DAVIS: Seeing none, that is all the Crops Committee has.

CHAIRMAN O’RELL: Thank you, Gerald.

We are not too bad on time. In looking at the agenda, I think there are areas here where we will catch up after the break.

It is just about 10 o’clock now. I would ask Board members to be back at 10:15. We will take a short break and then we will continue with the Joint Materials and Handling Committee discussion.

Thank you.

(Whereupon, the foregoing matter went off the record at 10:02 a.m. and went back on the record at 10:24 a.m.)

CHAIRMAN O’RELL: Board members, please take their seats. I would ask the audience to please take your conversations outside or take your seats.

Before we get moving with the
agenda, I would like to throw something out for consideration by the Board. In the public comments, we had the public comments signup sheet out yesterday for most of the day, I think all day. We had it there very early this morning. I think it was pulled off maybe a little before 8:00 or eight o’clock.

We have 36 people signed up. During the break I have had a couple of people come up to me, and they really have legitimate comments that they want to make concerning materials and recommendations that we are voting on tomorrow.

My feeling is, and I know the Board had a function this evening for a dinner together, but I really think we are here for -- I bought drinks last night; I will buy them again tonight.

(Laughter.)

Even though we have a function planned this evening, my feeling is we are
here for -- I hear the sighs of the Board -- but we are here for the public. I really don’t want people who have traveled here and have things to say that are relevant to our agenda not be able to have the time to do it.

I think most of us would agree we are here committed to hear them. So what I am going to do is, Valerie, if you would take the signup sheets, and we will put them outside for one hour. If you want to sign up, sign up, and that will be, after an hour, they will be taken away.

MS. CAROE: Just remember it is our dinner you’re making us miss.

(Laughter.)

CHAIRMAN O’RELL: Yes, please make your comments on pertinent issues that we are voting on. If you have something, you know, information that you want us to consider in the future, we will take those in writing. I promise that we will review
them at Committee level.

MR. SMILLIE: And my understanding, Kevin, is a working dinner. We have work to do at dinner.

CHAIRMAN O’RELL: Yes. Yes, it is a working dinner. It is not a total social event. But we work until late into the night, I guess.

Next on our agenda is the Joint Materials and Handling Committee report. In the agenda books, in the agenda, you will see a bullet point which is “National List: Clarification of Definition of Materials.” I would just like to give a brief explanation of that.

That was our placeholder for synthetics/non-synthetics that we were hoping that there may have been something back from the court, and that we would have been able to proceed. As Barbara Robinson discussed yesterday in the NOP update, because of the pending court ruling, the
program has advised us that we really couldn’t move forward on synthetic/non-synthetic material issues. That was the placeholder in that agenda, just to explain that item.

So we are going to go on to the ag/non-ag recommendation with Dan and Julie.

Julie, would you like to begin?

MS. WEISMAN: This, as most of you know, has been an ongoing project of the Handling Committee and various other committees on the Board for a long time. Its need is as urgent as ever.

We have heard a lot of comment on it in the last day, and I imagine we will be hearing some more. But I am going to forge on and present it as we wrote it.

The purpose, of course, is the need for clarity and consistency about what are agricultural and what are nonagricultural substances.

In this document, as a companion
to the text, we have also presented a decision tree, proposed a decision tree, to aid in deciding on the classification of substances as agricultural or nonagricultural.

In regards to determination and classification of substances as agricultural or nonagricultural, the definitions found in the NOP final rule can be vague and sometimes even conflicting. Also, the rule does not provide a definition for agriculture.

The net result of this has been inconsistent application and possible -- well, not even possible. We have seen misclassification of substances incorrectly either as agricultural or nonagricultural.

The distinction between agricultural and nonagricultural originated with the NOSB. The Organic Food Production Act was approved by Congress as part of the 1990 farm bill. USDA published the first
proposed rule in 1997.

Between OFPA becoming law and the first proposed rule being published, the NOSB was organized, functioning, and by 1994 already developed the first proposed National List.

It was at that time -- oh, my God, that’s 12 years ago -- that the NOSB introduced the distinction between agricultural products and nonagricultural substances.

The NOSB adopted this distinction based on its understanding of OFPA requirements; specifically, that inclusion on the National List was required for any substance that is used in handling and is non-synthetic but is not organically produced.

The NOSB did not believe it was necessary to send materials for a Technical Advisory Panel review that were merely non-organic agricultural products. Therefore,
the NOSB recommended that non-organic agricultural products appear on the National List as a general category rather than requiring TAP reviews for each specific agricultural product.

NOSB also recommended that non-synthetic ingredients that were nonagricultural did not need to appear on the National List, although this was later refuted, as explained by the NOP in the preamble to the second proposed rule of March of 2000.

I have a question. Should I read all the background?

CHAIRMAN O’RELL: Just a summary maybe.

MS. WEISMAN: Yes, I think, in the interest of time, I am going to -- I think people are aware; I am going to skip to the actual recommendations that we have made.

There are three recommendations.
One is a rule change for the definition of a nonagricultural substance.

So I have to find a place in the rule. Yes, we are skipping down there. Good. Okay.

The second is going to be assistance in defining nonagricultural substance by use of a decision tree. The goal of these recommendations are for a more uniform, transparent system for decisionmaking related to agricultural or nonagricultural determinations.

Then the third part of this recommendation is a technical correction, the idea being that dairy cultures and yeast were examples of things whose classifications are now no longer what they were. They would be moved from 605(a) to 606, and that non-organically-produced agricultural products allowed as ingredients in or on processed products labeled as organic or made with organic ingredients.
So the text that gets changed in Section 205.2, “Terms Defined,” where it lists nonagricultural substance: “A substance that is not a product of agriculture such as a mineral” -- and then striking out “or a bacterial culture” -- “that is used as an ingredient in an agricultural product.”

The rest of that definition would also be struck, the part that reads, “For the purposes of this part, a nonagricultural ingredient also includes any substance such as gum, citric acid, or pectin that is extracted from, isolated from, or a fraction of an agricultural product, so that the identity of the agricultural product is unrecognizable in the extract, isolate, or fraction.”

There are many products that have been -- I am thinking organic alcohol, for instance, which is certainly, if it was distilled from corn, is not recognized from
corn, but I don’t know that anybody has questioned that that product should be sold as an agricultural product and organic when it is produced that way.

Recommendation No. 2: “The Joint Handling Committee and Materials Committee recommends the adoption of the attached decision tree as a guidance in determining a substance’s agricultural or nonagricultural status.”

This is a practical solution which could work with both the current or a modified definition of nonagricultural substance. The decision tree should be used in conjunction with NOSB clarification regarding the definitions of synthetic and non-synthetic which are currently in development.

Do we need to skip to the decision tree? Okay.

“The Joint Handling Committee and Materials Committee recommends the moving of
dairy cultures and yeast from 205.606(a) to 205.606 as non-organically-produced agricultural products that are allowed as ingredients in or on processed products labeled as organic or made with organic ingredients.”

Our conclusion: “The organic industry is an innovative industry with continued opportunities for growth and change. The modification of the definition of nonagricultural substance and providing guidance for what is agricultural will provide greater consistency and clarity in application, and will allow the final rule to accurately serve this growing and innovative industry without compromising effectiveness of the definition.

“The decision tree will be used as a tool to help strengthen the consistency of the National Organic Standards in regards to nonagricultural substances, and it will provide a basis for certifying agencies,
certified entities, and the NOSB to verify a substance’s agricultural or nonagricultural status.”

Now I did do a tally of the comments that have been received during the comment period and heard so far in this meeting. By my count, I have seen 16 comments in support of this recommendation and 10 comments opposing it, for a variety of reasons.

I think that although we had more comments in support, that the issues raised in the opposing comments had a great deal of merit, particularly the issue about yeast being moved, that you move things from one list to another as a technical correction.

So, with that, I guess I open this for comment.

CHAIRMAN O’RELL: Andrea?

MS. CAROE: I think this is a good recommendation in a lot of ways. I definitely think it is time to put a fence
around this.

Prior Boards from 1992 to present day have kind of felt around in the dark on this issue. Because of that, we do have some conflicts within the document.

However, even though this Committee’s work was done in time for a sufficient posting, or a 30-day posting, the required posting, for whatever logistical reasons and challenges, it did not get posted allowing for 30 days’ comment. I don’t think that we can ignore that.

Also, the issue of yeast in feed and the challenges that presents is one that was not addressed by this Committee and I think needs to be investigated into -- and I don’t feel that this is a challenge that can’t be met with a good solution. I think the recommendation should be expanded to perhaps allow some real changed language that would address that challenge.

Also, as we have heard here,
there is a demand from the commenters that we provide some guidance on standards for non-plant life/non-animal life requirements. So I think addressing when that will happen and giving some clarification to what happens in the interim is important.

The technical corrections, I think we need some advice from the program and from the departments on whether we are within our rights to do that or whether we need to elicit some industry petitions to have those materials listed on 606, and also making sure that that list is complete.

The Committee did know towards the end that we had inadvertently missed microorganisms, which was in the process of getting put on the list as we were considering this, and it was an oversight. So that was one, but, obviously, there’s others that were brought up in this meeting that this Committee needs to understand.

Further, I believe that we have
gotten fabulous input from the industry. I thank everybody that made comments on that.

I think this was a very productive discussion, and I would like to continue that with the trades and get some organized input and good solutions from the folks that are going to be using this.

So, for that reason -- and I know that sounds long-winded -- for those reasons, I motion that we defer the vote on this to take this back to Committee for further work and further input from industry.

MR. KARREMAN: Second.

CHAIRMAN O’RELL: We have a motion from Andrea to defer this recommendation back to Committee for further work, with a second by Hue. So we have this motion on the Board. We will entertain discussion.

Joe?

MR. SMILLIE: Andrea, you summed
it up very, very well. That is, I think, a very good and complete listing of the issues we need to face with this.

I think that in a certain sense we have achieved the purpose of the recommendation, which is twofold: to elicit more comment and flesh out and put some meaning behind the direction we are heading.

I think, also, we have communicated where this Board, or at least our Committee at this point in time, wants to head with this, to really encourage the organic production of these materials.

One question I have is -- and we haven’t prediscussed this, so tell me if I am out of order -- but would it be possible to move forward with Recommendation No. 1 and refer 2 and 3 back to Committee? Is that a possibility?

MS. CAROE: That would be creating a new recommendation. At this point, I don’t see the merit to that, Joe.
MR. SMILLIE: Okay.

MS. CAROE: I just see that it is too mixed. I’m sorry, I kind of jumped in.

CHAIRMAN O’RELL: No, Joe, we’ve entertained that discussion in some sidebar comments. I think to pull something out of this, even though there certainly is a justification to do that, I think this is so important going forward as a full piece of an ag/non-ag recommendation, and needs to be tied together and woven a little bit more with some of the input that we are receiving from the public, that my feeling would be that it would be better to keep this intact and put it back in Committee as one than to piecemeal it. But that is one opinion.

MR. SMILLIE: I have no problem accepting that.

CHAIRMAN O’RELL: Dan and then Julie.

MR. GIACOMINI: I agree with Andrea’s comments. I do just want to make
one slight correction.

While there were a tremendous number of conference calls and email exchanges and things that went on in putting this document together, just for the record and the public, there was -- maybe it was a call that Andrea could not have made, did not make, but there was a tremendous, fairly good discussion of the feed issue part of this document, the relevance to it with yeast on the feed issue. That was discussed fairly well.

CHAIRMAN O’RELL: Julie?

MS. WEISMAN: Yes, I also do agree with Andrea and I do agree that this, obviously, needs some more work. But I also, along the lines of Joe’s question, wanted to point out that the one piece of this recommendation on which there was no comment, negative or positive, was the change in the terms defined.

I understand what you say. I do
understand the idea of having things woven. But I just did want to also point out that was a piece of the recommendation that was apparently not controversial.

CHAIRMAN O’RELL: Is there any other discussion?

(No response.)

MS. CAROE: Call the question.

CHAIRMAN O’RELL: The question has been called. We will have a vote.

This is a vote to defer the ag/non-ag recommendation that was proposed by the Joint Handling and Materials Committee back to the committees for further work.

MS. CAROE: Is it appropriate to be doing this today or tomorrow? Did I just jump over procedure?

CHAIRMAN O’RELL: That is a point of order on that. The question has just been asked to me if it is appropriate to have this vote now or to defer.
MS. JAMES: I don’t think it is. I think we should wait until tomorrow.

MS. CAROE: I rescind the motion.

MS. JAMES: I think that we should do it tomorrow because there still is public comment and there might be some really good issues.

CHAIRMAN O’RELL: That is a good point.

MS. CAROE: I rescind the motion.

CHAIRMAN O’RELL: There’s the procedural guy back there who is nodding his head.

MR. GIACOMINI: Kevin, I don’t know that the motion is out of order at this time. It is just a matter of when the vote is taken.

CHAIRMAN O’RELL: Yes.

MS. WEISMAN: You don’t finish the motion until you vote.

CHAIRMAN O’RELL: Andrea has rescinded the motion.
Hue?

MR. KARREMAN: Fine.

CHAIRMAN O’RELL: Okay. So I guess the public is well aware of the direction we are thinking at this time.

(Laughter.)

Did we show our hand or what?

Is there any further discussion on this? I know we are going to get some additional public comment directed to this issue. I think that is a good time for us, then, to be able to really have a dialog with those individuals who bring up points again for consideration. Again, we are looking for constructive input and direction as to how we can proceed with this recommendation.

So Kevin?

MR. ENGELBERT: It’s a moot point, but on Recommendation 3 you have a typo, 205.605(a).

CHAIRMAN O’RELL: Okay, thank
Okay, we made up a lot of time on the agenda.

(Laughter.)

Let’s move on, then, to the Handling Committee report. Julie, will you take us through the Committee reports?

MS. WEISMAN: Yes. I think in the interest of time, I am going to skip some of the more detailed background.

“By way of introduction, although the issue of commercial availability is another one that has been kicked around for a long time, the urgency of it became heightened in light of the June 9th, 2005 court final order and judgment arising from Harvey v. Johanns.

“The NOSB has been asked to review petition procedures for adding materials to 205.606 of the National List. In particular, the NOSB is proposing further clarifications to the terms of commercial
availability as it will be used by the NOSB, certifying agents, and the industry to assist in the petition for placement or removal of materials on or from Section 205.606 of the National List.”

Now the regulatory citations background is as follows:

Section 205.2 -- and I’m skipping down to the next page -- “Commercial availability defined. That is the ability to obtain a production input in an appropriate form, quality, or quantity to fulfill an essential function in a system of organic production or handling, as determined by the certifying agent in the course of reviewing the organic plan.”

And also Section 205.201(a)(ii), “The producer or handler of a production or handling operation, except as exempt or excluded under Section 205.101, intending to sell, label, or represent agricultural products as 100 percent organic, organic, or
made with organic specified ingredients or food groups must develop an organic production or handling system plan that is agreed to by the producer or handler and an accredited certifying agent.

"An organic system plan must meet the requirements set for in this Section for organic production or handling. An organic production or handling system plan must include" -- and (ii) is "a list of each substance to be used as a production or handling input indicating its composition, source, location or locations where it will be used, and documentation of commercial availability as applicable."

The statutory background that is relevant is from OFPA Section 2119 regarding the National Organic Standards Board and Subheading (k), the responsibilities of the Board is that (ii) “The National List. The Board shall develop the proposed National List or proposed amendments to the National
List for submission to the Secretary in accordance with Section 2118.”

“To add or remove substance from 205.606, any person may submit a petition to the NOP and NOSB. The NOP will review the petition for completeness before the petition is considered by the NOSB.

“Complete petitions will be posted on the Petition Substances Database and submitted to the NOSB for consideration. The NOSB will review the petition and all supporting information and make a draft recommendation which will be posted for public comment prior to the next scheduled NOSB meeting.

“The NOSB will consider the petition, all supporting documentation, and all public comments and then make a recommendation to USDA regarding the status of the substance. If the substance is to be added to or removed from 205.606, the USDA will issue a proposed rule in The Federal
Register, receive public comments, and issue a final rule in The Federal Register to establish legal status of the substance.

“Section (c) of the recommendation below proposes standardized criteria to be used by ACAs when making commercial availability determinations for substances on 205.606.”

Does that make sense? Okay.

This is the recommendation: We felt that the petition that is currently posted and recommended for use needed a little amending in order to accommodate having agricultural products be petitioned.

So, therefore, the petitioning process needed to be revised in the following way. Under information to be included in a petition, the following additions to this document are recommended:

No. 1, to add the following bullet into Item A, “an agricultural (non-organic) materials allowed in or on
processed products labeled as organic.” That is adding a new category to Item A.

No. 2, adding the following bullets to Item B(12), “When petitioning for the inclusion of the National List of non-organically-produced agricultural material, the petition must state why the material should be permitted in the production or handling of an organic product.

“Specifically, the petition must include current industry information regarding availability of and history of unavailability of an organic form of the material.

“Industry information includes but is not limited to the following: regions of production, including factors such as climate and number of regions; number of suppliers and amount produced; current and historical supplies related to weather events” — that would be events such as hurricanes, floods, droughts — “that
temporarily halt production or destroy crops or supplies; trade-related issues — examples would be war, trade barriers, civil unrest, evidence of hoarding — “that may temporarily restrict supplies, and any other issues which may present a challenge to consistent supply.”

As a note, we felt it important to emphasize that in this case the global market is the universe supply. Commercial availability does not depend on local market conditions, except in the specific instances that were already addressed in those bullet points.

Another addition under B(12) is that, “When petitioning for the removal from the National List of non-organically-produced agricultural materials, the petition must state why the materials should be prohibited from use in an organic form. Any information acquired since the original petition to add the material to the National
List should be provided.”

Now the second part of this recommendation describes the NOSB and the NOP’s role in reviewing these petitions.

“In recommending that an agricultural material should be placed on 205.606, the NOSB shall review the petitioner’s claim that no organic substitutes are commercially available in the appropriate form, quality, or quantity needed to fulfill an essential function in a system of organic handling.”

I don’t know if this is the appropriate place to clarify. I think it may be because I think there’s been a lot of confusion.

We are collecting the additional information that I described in those bullet points that will be added to B(12). We will be reviewing it.

We will not be making decisions about whether those are commercially
available. The purpose is not to -- well, we will review the information as more of a risk assessment to look at, where do we see possibility that this item, even though it may be available or it may be being used organically in certain specific forms and specific places, now what are the possibilities that the supply could disappear?

I think there’s been a little bit of misunderstanding that the NOSB is not going to replace the role of the ACAs in making commercial availability decisions for specific products and uses that we (a) do not have the technical expertise to make and (b) I cannot imagine the amount of time it would take for this Board -- it would just simply not be appropriate. That is the feeling of the Handling Committee so far on this.

Would that be accurate?

CHAIRMAN O’RELL: Yes.
MS. WEISMAN: Okay. So, with that said, “The NOSB and appropriate committee -- Livestock, Handling, whatever -- would confer with the NOP regarding any modification to the NOP procedures that are made necessary as a result of this recommendation and throughout the petition process for any nonagricultural products that are petitioned for 606.”

The third part of this recommendation describes the ACA’s role in determining commercial availability. This will sound very familiar to you all.

“The ACA, in determining that an agricultural material that is on 205.606 is not commercially available in the organic form, shall, one, evaluate the applicant or certified operator’s documented claim that no organic substitutes are commercially available in the form, quality, or quantity needed by the operation to fulfill the required function, including test data
demonstrating that organic forms of the material do not meet functional requirements for the form or quality necessary to the operation.”

Again, we are noting that the global market is the universe of supply.

“The ACA will validate that the applicant or operator has credible documentation that the material is not commercially available in an organic form by reviewing available information listing known sources of organic materials.”

I know there was a comment on this next point.

“Notify the certification applicant or certified operator of sources of information” -- I’m emphasizing it is the sources of information that the ACA would notify the applicant -- “which list available organic materials, if the certifying agent finds that such materials exist.”
So we are not asking the ACAs to tell people who to go to to buy the organic ingredient. We want to refer them to whatever databases do exist where the applicant can find the information.

And, five, “Require that certified operators update commercial availability information in each organic system plan update.”

Oh, I’m sorry, I skipped something, four.

“The ACA will maintain and submit to the NOP annually an up-to-date list of materials that have been granted allowances in non-organic form.”

This is a list that will be maintained -- it will maintain the confidentiality of material suppliers and parties granted allowances.

“The reporting requirement shall be implemented through the accreditation process by providing ACAs ample notification
and time to adapt data management systems.”

I think the idea with all of this is not to impose a burden, but I think part of the value of having agricultural products listed on 606 is that they are going to serve as kind of a to-do list for the industry, as to what organic ingredients are required.

By having ACAs provide information regularly about what organic materials allowances have been granted to use the non-organic ingredient will, I think, aid in that process.

In conclusion, “The NOSB recommends the above three modifications to petition procedures to be adopted to establish acceptable criteria and procedures to determine commercial availability.”

Then, just quickly, I made a summary of the comments that have come in during the comment period, including yesterday. There were five comments in
support of this recommendation and two opposing.

I want to note that one of those opposing was opposing it because the commenter thought that we were recommending that the Board make commercial availability determinations and replace the ACA’s role, and that is not the case. So that opposing comment, actually, I count as a support comment in favor because we agree with what they were saying.

So any discussion? Are we up to that?

CHAIRMAN O’RELL: Andrea?

MS. CAROE: I think that, again, this is another area where we received excellent comments from the public.

I think, for me, there were two areas that were pointed out that this recommendation needs wording changes. I don’t think that they can’t be done at this meeting. I think it is imperative that we
have this in place, based on the impending deadline of June 2007.

First, in the (B) section, I think the Committee needs to take this back and reword it so that it is very clear that we are assessing risk of supply, and that is the only function of the NOSB at this point, is that we are reviewing the information provided by the petitioner and assessing vulnerability in that supply chain. That’s it, and that the detail work is happening on the certifier level.

So I don’t have wording right now to suggest for including there, but I think we can have it by tomorrow.

CHAIRMAN O’RELL: We will have the Committee work this evening.

MS. CAROE: Then, secondly, in Section (C), and I think there is a valid point, (C)(iii) may be crossing the line of what a certifier can do.

I do have a suggestion that in
(iii) we reword this to say, “make available sources of information which list available organic materials,” period, and just make that requirement that certifiers do have something across the board that they make available to all their entities that provide sources of available information, whether that is from the trades or private entities or whatnot.

CHAIRMAN O’RELL: Bea?

MS. JAMES: First of all, I have to say great job, Julie, on both this and the other recommendations that you worked on. You put a lot of work into it.

(C)(iv), my concern is not so much with what you are recommending here, but the NOP’s ability to be able to staff at the hours needed to help keep this information updated. I would imagine it would be a lot of paperwork that would be coming into the NOP. So I am just pointing that out.
MS. CAROE: Well, I thought we were tying this to the annual reporting requirements that the certifier has. There is already a requirement that certifiers provide information to the program. This would just be information they would be providing at that time. Certifiers are doing that in a variety of different ways at this point.

CHAIRMAN O’RELL: Nancy?

MS. OSTIGUY: Actually, if it was a large amount of information specifically on the number of substances that are not organically-produced, that would actually be very important information to know that it was a large volume. I am not sure it is, but --

CHAIRMAN O’RELL: Julie?

MS. WEISMAN: I will tell you that it is.

MS. OSTIGUY: Okay.

MS. WEISMAN: I will tell you
that it is.

MS. OSTIGUY: That is important information.

CHAIRMAN O’RELL: Andrea?

MS. CAROE: Well, also, this information collection, at this point we may not be able to access the information the way we would want to for commercial availability function, but we are still hopeful that E-cert is on the horizon somewhere, maybe in the distance. But this information would feed into some tool in the future to perpetuate where there is supply problems and where there is an opportunity for an enterprising organic producer to create these things.

But, you know, it is really not looking at the present day, but three steps ahead of where we are at and how we want to set ourselves up.

CHAIRMAN O’RELL: Bea?

MS. JAMES: Okay. C(2),
“Validate that the applicant or operator has credible documentation,” I think that we open a possible interpretation for credibility based on whoever is submitting the document.

So I am wondering if there is some way that we could clarify what we mean by credibility.

CHAIRMAN O’RELL: Joe?

MR. SMILLIE: Yes, I would like to answer that.

I think that, as far as our job in creating this recommendation, I think that is appropriate. I don’t want to go any farther.

I think at that point I would defer to the NOP ACA Training Program to really put into place a very clear list of criteria by which all ACAs must do that, perform that function.

Trying to define it now in a recommendation, I don’t think is our role.
I think that I would rather place that in the hands of the NOP.

There’s going to have to be -- and maybe this should be in the recommendation; I’m not sure -- that clear and consistent application of this by ACAs is the role of the NOP Training Program.

CHAIRMAN O’RELL: Bea?

MS. JAMES: I just want to respond to that, since Joe is delegating to the NOP. I understand the timeliness of this issue, but I do think that it is very important to make sure that the credibility issue is explained expeditiously, so that -- expeditiously. Yes, I sound like George Bush up here.

(Laughter.)

Strike that from the record.

(Laughter.)

I think it is very important to make sure that we define the credibility issue because I see down the road, if we
don’t, the possibility of then looking at problems that we would have because the credibility issue is not defined.

CHAIRMAN O’RELL: Andrea?

MS. CAROE: I just want to point out that certifiers are doing this right now. The only difference is that these things aren’t on the list.

Also, in how a certifier does its work, I don’t think it is for us to prescribe. I think it is for the ARC Branch through their accreditation process to look at how they do their work. I really feel this is inappropriate for us to dictate that level of detail on the performance of certifiers.

CHAIRMAN O’RELL: Barbara, did you want to weigh-in?

MS. ROBINSON: Well, haven’t you already touched on this somewhat in your criteria?

CHAIRMAN O’RELL: Yes.
MS. ROBINSON: So isn’t that -- I mean I thought this was what we kind of discussed. It would seem to me that anybody who is doing the due diligence is going to go back to things like the numbers of suppliers and the amount produced. They are going to come up with, if they are doing due diligence, the credible documentation is going to be solid business information and the lack thereof. That is what an ACA is going to evaluate. That is what they are going to make their decision based upon.

I mean I don’t know that you are necessarily going to say, “Hey, I know that the civil war in Madagascar is going to last for the next 18 months and, therefore, vanilla won’t be available.” But, you know, they are going to say, “I’ve checked the supplies, and because of this event, I know that such-and-such commodity won’t be available.”

You’ve got the criteria already.
I guess I don’t understand why you’re getting hung up on this credible documentation when you’ve already built the criteria over here in the first place.

CHAIRMAN O’RELL: I agree.

Julie?

MS. WEISMAN: Yes, I’m kind of a little bit reiterating, but I’m going to try not to repeat. But I just want to point out that, actually, certifiers, because of this, will now have better documentation and more credible documentation than they have had before. Because by collecting this information as part of the petition process, that information is now a matter -- everyone knows where to find it; whereas, up until now, it was really depending on what particular certifiers happen to know or not know, because we don’t have a database.

So this will actually make -- this is already built into this. It is going to make for much more consistent
decisionmaking than has been possible in the past.

CHAIRMAN O’RELL: Anything further? Rigo?

MR. DELGADO: I just have a question. So the role of the NOSB is to validate that the work of the ACAs was correct?

MS. WEISMAN: Uh-uh.

MR. DELGADO: You’re saying it is evaluating the risk. So what would be --

MS. WEISMAN: We are evaluating the information that is being included in these petitions that describes what are the potential threats to a supply. Some of these products, there may not be organic -- they may not be produced organically. Then that is a clear issue.

In other cases, there may be some organic available, and maybe right now there is a sufficient supply, so exemptions wouldn’t be granted. But if we see that it
only comes from a certain part of the world that is prone to typhoons, then there’s a risk that that supply could be cut off that no one has any control over. So it is really assessing the risk that a currently-available supply could be cut off.

MR. DELGADO: And if it is cut off --

CHAIRMAN O’RELL: Barbara to respond, and then I have Andrea.

MS. ROBINSON: I don’t know that you necessarily would call it a risk. You were doing what you always do with materials. What you are doing here, it seems to me, is refining the petition process in the case of materials you want to put on 606 related to commercial availability.

So you are just asking people to flesh out -- you are fleshing out the petition in this particular case and asking people to do better jobs of coming before
you with a petition or coming to us with a petition, with more detail.

In this case, I mean people aren’t going to be able to assess risk, and neither are you, neither are we. But they are going to be asked to do better homework about variability in supply, what it is subject to. You are going to be given just, you know, more robust evidence to look at and then be able to make a determination of whether or not a material or a commodity, in this case perhaps, should be placed on 606.

Then, from time to time, that material may become commercially unavailable. An ACA will be able to have the discretion to determine that, based on business conditions or trade conditions, as you have described, weather conditions, political conditions as they may arise, that cause a trade disruption, something like that.

That is basically the way I read
this recommendation, is that you have put a more robust set of petition procedures in place. That is what you are recommending, right?

CHAIRMAN O’RELL: Yes.

MS. ROBINSON: That’s it.

You are asking people to do a better job before you come before this Board of asking us to put something -- before we put something on 606. We are giving you good guidelines to do it.

CHAIRMAN O’RELL: Andrea?

MS. CAROE: Rigo, I just want to clarify something. Maybe you know this, but I just want to make sure you do.

A certifier will not be able to consider any material for commercial non-availability unless it has been listed. So our work is the preliminary work to just look at whether there is vulnerability in supply. Then the detail work happens after.

We are not actually looking at
what the certifier is going to do, but they can’t do their work unless we have done ours and put it on that list. So we are not double-checking them, as you had indicated.

CHAIRMAN O’RELL: And, Rigo, there is another part to the process, which is the public comment period. Because this is asking the petitioner to do their due diligence to put enough information in a petition to justify the rationale for putting it on 606.

The Board will review that justification. If they decide to go forward with a recommendation for a material on 606, it will come to a Board meeting. It will be given public comment. That is when the public can input and say why they would object to something being on 606 because it is commercially available.

Then we get that information in a public forum before we make our final decision on putting it on 606.
MR. DELGADO: So in the case of vanilla, for example, if we get that petition and there is enough evidence to show that vanilla does have cyclical problems, then it will go on and be listed.

So when the case comes --

CHAIRMAN O’RELL: It could be considered for listing.

MR. DELGADO: It could be considered for listing, and so forth.

So that is approved and the process takes place?

CHAIRMAN O’RELL: The process takes place. It would be considered for listing. If it did come on a list, then that is where it would come to the public forum for comments as to why Madagascar vanilla, there is not going to be another hurricane prediction in the future. You know, for whatever reason, we listen to the public, and then we make that decision.

MR. DELGADO: I am just trying to
move --

CHAIRMAN O’RELL: Yes, understandable.

MR. DELGADO: So if all this is approved, the material is listed, and so forth, and that typhoon takes place, and so forth, the producer or the handler, or whoever is using that material, will simply report that to the ACA correctly? Is that the whole idea?

MS. CAROE: Yes, they’ll --

MR. DELGADO: Because this material has been listed as potentially facing those cycles?

CHAIRMAN O’RELL: Yes. Then the challenge would be on the certified handler wanting to use the material to work with their certifier to justify, for the reasons we have listed -- and we have given the criteria -- to fulfill that criteria needs, that they can use a non-organic form of that material.
MR. DELGADO: Okay, thanks.

CHAIRMAN O’RELL: Any other questions? Oh, I’m sorry, Dan.

MR. GIACOMINI: On Item C, should we, once an item has been included on 606, an event has happened, and a certifier has issued, has allowed it to be used according to 606, should it be included in C or is that mechanism somewhere else that specifies the frequency of reconsideration on when a certified entity operation has to go back, and has to go back and use an organic form?

CHAIRMAN O’RELL: Andrea?

MS. CAROE: It is innate in the regulation that annually you update your organic system plan. Every year they will have to show this kind of information, as they do right now.

MR. GIACOMINI: Okay.

MS. CAROE: This is not out of order from what the standard operation --

MR. GIACOMINI: As long as it is
somewhere. I just wanted to make sure that that would be something that they would be re-reviewing.

MS. CAROE: Every year.

MR. GIANCOMINI: At least annually.

CHAIRMAN O’RELL: Julie? Is there any further discussion or questions, or are you ready to move to the next --

MS. WEISMAN: We are ready to move on, I think.

CHAIRMAN O’RELL: Thank you.

MS. WEISMAN: Yes. So I believe that the next item up for the Handling Committee is a recommendation that we made regarding the interim report of the Pet Food Task Force.

It is more for formality. The bulk of their report was given at the April meeting. This is just the lag time.

Although, on behalf of the Pet Food Task Force, Emily Brown Rosen did
present a description of some additional work that had been added to the report since the April meeting, those are all posted.

Therefore, our recommendation of the Handling Committee is that the NOSB, as a full Board, officially receive the interim report from the Pet Food Task Force of April 7th of 2006.

The Pet Food Task Force did an unbelievable amount of work and are really to be commended for the excellent work that is reflected in the document they produced.

Therefore, the Handling Committee, this will now be handed to the Handling Committee’s work plan to begin to consider this document and to prepare it for the NOSB to consider it fully.

We would like the Pet Food Task Force to continue to be available as needed for clarification, advice, and counsel, as we consider their proposal.

CHAIRMAN O’RELL: Any discussion?
(No response.)

Just as a point I would like to make for the record, Nancy Cook did come yesterday. She missed the slot. She had some traffic issues. She apologizes for not being able to be here to give the update, but certainly knows that it was handled well by Emily.

The one thing she did want to add and make sure that the Board and the public knows that she really gave kudos to the Task Force and the work that they have done to progress to this point, to be able to give us a report, to go on forward for further Board action.

Julie?

MS. WEISMAN: I think if there’s no other discussion on the Pet Food Task Force report, then we can move on to sunset materials. We are down to two.

Do you want me to wait until you get it up?
We are going to look at the final recommendation for colors, non-synthetic. I think that is next on the agenda.

This was deferred at the April meeting. So this is a recommendation for colors that have been listed under 205.605(a) as allowed non-synthetics, as ingredients in or on processed products labeled as organic, made with organic.

The Committee is this: There were many comments recommending the continued allowance of non-synthetic colors in organic handling.

The Federal Register notice regarding sunset review asked the public to provide evidence and address concerns for any substance they believe should be discontinued.

There was a comment addressing the concern that colors and flavors were added to the National List without a technical review by the NOSB. The Handling
Committee requested and received a technical overview of food color additives on October 14th of 2005. This technical review did not offer any information that would suggest that non-synthetic colors are inconsistent with organic practices, but this was also not a full TAP, which would not be possible on a broad group that contains many, many, many different specific substances.

There were also numerous comments opposing renewing the listing of non-synthetic colors. A few commenters requested that they be moved to 205.606, an action which cannot be taken as part of sunset, but we will be looking later -- we actually have quite a few petitions, but I guess I am getting ahead of myself.

Several commenters cited that non-synthetic colors have been placed on the National List without ever being petitioned and without the recommendation of the NOSB.

The Board finds merit in this
observation. Colors, non-synthetic, can’t be renewed through the sunset process because there was never an NOSB recommendation for its placement on the National List. This is just the facts.

So, therefore, the Handling Committee recommends not renewing the following substance in this use category, effective the sunset date of October 22nd, 2007, colors, non-synthetic sources only.

The Board vote was yes. There were no no votes. There was one absent.

Is there any discussion?

CHAIRMAN O’RELL: Hue?

MR. KARREMAN: Just a thought: If we can’t renew them, how can we sunset them? I mean, if we can’t take action to renew them, how can we let them go?

I mean, how can we take action? If we can’t take action to renew them, if we never had the TAPs, how can we take any action on them whatsoever?
CHAIRMAN O’RELL: Well, they are on the list. They were put on the list. As being put on the list, they will sunset in five years unless we were to renew them.

The justification is that we would -- if we did nothing, they would sunset. We are making a formal request, because of the rationale that they were put on the list without the NOSB recommendation. It is a formal process to say we want it to sunset.

I understand the technical question you are asking, but because they are on the list, we can take action to sunset them, to allow them to by taking no action.

MS. WEISMAN: I also wanted to point out to you that there’s nothing to stop the industry from submitting a petition now that would, obviously, have to be TAP reviewed, although given the number of 606 petitions that have been -- I think a third
of the 606 petitions that we have received already are for colors as agricultural products.

So I predict that it would be moot. I predict that if someone were to -- well, maybe this is not my place to say right now. I will just leave it at that.

CHAIRMAN O’RELL: Andrea?

MS. CAROE: Part of our original reason for deferring this was to elicit that type of response. The industry did step up and submit those petitions. So, again, I feel this has been successful in the actions that we have taken. Now it is just time to put it to bed.

The Committee is recommending that we don’t allow this to renew or sunset -- that we allow it to sunset.

CHAIRMAN O’RELL: We got it. We allow it to sunset.

MS. WEISMAN: Any other questions?
CHAIRMAN O’RELL: Okay, I think we move on.

MS. WEISMAN: Okay. The next item on our agenda for the Handling Committee is lecithin, bleached. It was brought to the attention of the NOSB Handling Committee around the time of the April meeting that -- we had already voted to not renew lecithin, bleached, on 605(b), a synthetic. It was brought to our attention that in our summary in April of that decision that we had overlooked comments that had been made before the August 2005 meeting that opposed the sunset of this product.

So the Handling also became aware that liquid forms of lecithin, bleached, are available as certified organic. However, as the commenters stated, there are no dry forms of this organic ingredient available at this time.
The commenters suggested that these available liquid forms are not appropriate for dry products. As a result of this comment, the Handling Committee investigated these organic alternatives through consultation with food manufacturers.

In doing this, it has come to the attention of the Committee that the organic liquid forms can be used in dry products. Therefore, the Committee confirms its original recommendation of the 20th of April, 2006.

The Handling Committee continues to recommend the removal of the following substance in this use category as published in the final rule: lecithin, bleached.

We have received a lot of comment during the public comment period on this point of clarification. There were two in support, and there were six opposing.

I want to open this up for
discussion because I think that, since even the time that this point of clarification was written, there’s been a lot of discussion, a lot of information presented to various members of the Committee, either individually or as a group.

So anyone?

CHAIRMAN O’RELL: Just to be clear on this, this is a sunset material that in the last meeting we voted not to renew, as a Board. There was question about some material and comments that were made that the Committee consider those.

This has gone back to Committee. The Committee has said, yes, we’ve looked at those. The recommendation coming forward is that we stay with -- it is just a recommendation for clarification that we did consider all aspects of comments that were made to the Board. So that is what Julie is proposing and asking for any additional comments and discussion.
Joe?

MR. SMILLIE: Yes, it is a real tough issue because what we would have liked to have done would have been to create an annotation which would have clarified what could be available in this area and what couldn’t be available. It would have been a very elegant solution to solve the problem.

However, because it is a sunset material, special rules apply and we couldn’t create what we considered a compromise solution to the issue. So we were sort of handcuffed by the fact that it is a sunset material and you can’t have an annotation to a sunset material.

CHAIRMAN O’RELL: Nancy?

MS. OSTIGUY: You mentioned that liquid forms can be used in dry products. Has there been additional information saying that that is not the case sometimes or?

MS. WEISMAN: We had comments that came in during the comment period from
manufacturers. I think this is really actually a demonstration of why this is a good process, because it elicited -- what we really needed to hear from was not a manufacturer of synthetic bleached lecithin and a manufacturer of organic lecithin. We needed to hear from manufacturers who use these products.

What did come back to us were several different uses of dry, de-oiled, synthetic bleached lecithin for a number of uses having to do with making dried fruit, organic dried fruit. I am not remembering right now, but there were manufacturers who came forward and said, “We need this.”

I think the reason why Joe was suggesting this elegant solution is that there’s plenty of liquid lecithin out there, organic and non-synthetic. So from the point of view of liquid lecithin, there is no need for synthetic bleached liquid lecithin.
It is also another demonstration where you’ve got something on the list, and people come forward and they make alternatives; they make non-synthetic alternatives. Then they make organic alternatives.

I think that is a demonstration of how putting something on the list doesn’t cut off the development of new alternatives. It actually stimulates that development. This is a really great example of it.

But I do have concern about those particular manufacturers who need dry, de-oiled, bleached lecithin. I think they do have a legitimate problem.

There is a little bit of a quandary at how to handle it as part of sunset.

MR. SMILLIE: There were some options presented for the use of liquid that would be -- and, again, I am not a food scientist, so correct me if I am wrong --
but you could use the liquid and mix it with a dry material, thereby creating a dry bleached organic lecithin. But, once again, the manufacturers pointed out that the substrates, or whatever that material you would be mixing with, wouldn’t be appropriate to their type of manufacture.

We did get very in-depth reviews of the material. Once again, the ideal solution would have been to say, okay, we’re sunsetting liquid bleached lecithin, but still allowing an annotation for powdered, dry bleached lecithin, but we are not allowed to do that under the constriction. I personally think that we will eventually have that available.

One of the problems with the dry unbleached lecithin is that it is a fairly chemical process because it has to be de-oiled, and we get our old friend hexane showing up again in that process. We are really uncomfortable with hexane, and it is
needed to de-oil. To create a dry bleached lecithin, it has to be de-oiled.

In the future we will see technologies that can create the product without the use of hexane and other solvents. So we are still somewhat reluctant to change our recommendation, even though we believe that these manufacturers — and, again, the manufacturers who are using dry bleached lecithin do have a case that they don’t have anything else they can use to create organic products.

They have a case, but the question is, what’s the greater good, short-term suffering and pain for a few manufacturers in organic products and the farmers who sell to those manufacturers or really pushing this industry to create the product that we would all feel comfortable without the solvent extraction for de-oiling?

I think that is as close as I can
come to it anyhow.

CHAIRMANN O’RELL: Any other comments or discussion?

MS. WEISMAN: I want to float an idea. I can’t believe that I am doing it because I really liked our point of clarification.

But -- oh, God, I can’t believe I’m doing this (laughter) -- it seems like for the manufacturers for whom this is the only alternative, we would have to renew the old kit and kaboodle. I guess my fantasy is that someone in the industry would come forward immediately and petition for an annotation that only dry forms of synthetic bleached lecithin be used.

Is that something that anybody on this Board could live with or think would be possible or reasonable?

CHAIRMANN O’RELL: Nancy?

MS. OSTIGUY: Well, we certainly have precedence for putting it on the list.
One could assume that we have sufficient information, that we wouldn’t have to go through the full TAP process. So it would be a shorter process.

So it actually might be a very reasonable solution that could be fast, as fast as bureaucracy can run. But since it would not include a TAP, that probably would drop six months off of it.

CHAIRMAN O’RELL: The Chair would like to recognize Kim Dietz, as former Materials Chair of the NOSB, for maybe some point of clarification.

MS. DIETZ: I’m going to help Julie out here. You were right on.

CHAIRMAN O’RELL: To help her get her fantasy?

(Laughter.)

MS. DIETZ: Yes. Go back to your flowchart on sunset. You have comments that give valid reasons not to remove it. So you need to consider that, and your
recommendation to probably keep it on is the right thing to do, and then urge a petition for somebody to take it off or change the annotation. Because you really shouldn’t remove a material for sunset if you have commentary to keep it on, and there is no evidence enough to support it to take it off with the annotation that currently exists.

Does that make sense to you? I mean so the right thing to do is for somebody to keep it on, petition to remove it or to change the annotation for only the certain type of -- that is the thing that you need.

CHAIRMAN O’RELL: It doesn’t currently have an annotation.

MS. DIETZ: Correct.

CHAIRMAN O’RELL: Yes, okay. Kim, if you want to stay here, because there may be a followup?

But I would like to recognize Arthur.
MR. NEAL: Arthur Neal.

The difficulty that I am hearing now -- and I wasn’t under this assumption from the last meeting. The last meeting I was under the assumption that there was an alternative to this product. But if there is no alternative for this product, which is part of the sunset review criteria, then we’ve got an issue.

MS. WEISMAN: Yes, I think the problem that we have -- oh, I’m sorry.

CHAIRMAN O’RELL: No, it’s fine, Julie.

MS. WEISMAN: The problem we have, Arthur, is that the information that has come in, the quality of it has been excellent, and it should not continue all bleached lecithin. There are plentiful substitutes for liquid bleached lecithin. It is only the dry form for which the problem exists.

But we don’t have the opportunity
during sunset to make an annotation and sunset the liquid but allow the dry, do we? I don’t know. I don’t think so.

CHAIRMAN O’RELL: No. No, we don’t, but Arthur’s point, I mean Arthur is saying that, part of sunset, if there are legitimate -- there are people who are commercially using it, that this would be a problem that could be an issue under the sunset.

MR. NEAL: And the option that was explored or that was expressed earlier about renewing it, petition to restrict the annotation, is still viable.

MS. WEISMAN: Would it be equally viable to let it sunset and encourage a petition to -- no. Okay.

CHAIRMAN O’RELL: Barbara?

MS. ROBINSON: The less costly way to do it to the industry would be to let it continue, but what you should do is get a petition to remove -- is it lecithin or
“leckithin”? --

CHAIRMAN O’RELL: Lecithin.

MS. ROBINSON: -- lecithin; I hate this word (laughter). Get a petition to remove the one you don’t want.

MS. WEISMAN: Right now it is listed as one thing, bleached lecithin.

MS. ROBINSON: I know. I know.

MS. WEISMAN: Oh, okay.

MS. ROBINSON: So under sunset, let it continue, but get a petition to restrict going separately, okay, but let sunset -- don’t kill it under sunset because then you are harming the industry. So just continue it under sunset because you have a valid reason. In other words, don’t throw out the baby with the bath water.

But you know that you have a problem, that you know you do have substitutes available for -- which is it, the dry?

MS. WEISMAN: The liquid.
MS. ROBINSON: The liquid, all right. So get a petition going so that you can write an annotation to restrict on the liquid, so that you will only have dry.

CHAIRMAN O’RELL: Andrea and then back to Arthur, and then Gerry.

MS. CAROE: Originally, as I was looking at this on Committee, I was under the understanding that only the liquid was available, but the liquid could be used where dry lecithin is being used, in which case we wouldn’t have had that availability issue because you could use it in everything.

Since then, and with the very detailed comments that we have received for this meeting, that is not the case.

Now I think, to Julie’s point, by taking it off, the industry is motivated to get it on in the right way. However, I agree that that causes an economic impact to the manufacturers that are using the dry
form and cannot use the liquid form.

So I guess what I am saying is that the information that I was working under, and I think the Committee was working under, has changed since then, and that we should reconsider based on the information or based on the criteria, as Arthur has pointed out.

CHAIRMAN O’RELL: Arthur?

MR. NEAL: And just from a procedural standpoint, to let you know, while we are really concerned, if you cannot justify the reasoning for dismissing this argument, OMB is really going to come down on us hard, and that docket may not move in enough time to make our date, because they read and assess all of the comments that we receive to see how we have addressed those comments.

CHAIRMAN O’RELL: Okay. I have Gerald and then, Kim, if you want a follow-up comment.
MR. DAVIS: How would one -- if the idea is proposed, like Joe mentioned in your comments, that hexane-processed dry lecithin is inappropriate for use in organic products, how do you ever get rid of it? I’m hearing like, whoa, leave it on sunset and then change it around, but am I hearing it wrong, that that does allow the continuation of something that maybe doesn’t fit organic --

CHAIRMAN O’RELL: Kim?

MS. DIETZ: The first thing is the supplier, the person who’s got a vested interest in the liquid lecithin, should petition to remove the liquid lecithin. So if anybody is out there, that’s probably what I would suggest that you do. That is my personal opinion.

That will then cause an issue for this Board, which will request a TAP review. Supposedly, the people who want the dry lecithin could then input their comments,
and you could request the TAP for the dry lecithin.

It is at that time when your questions are going to get answered and your concerns are going to get answered, and you are going to have to put it through TAP review. Then you vote and decide whether or not you should continue its use for the National List.

CHAIRMAN O’RELL: The issue, Gerald, is that this is not a material that is up for consideration for being put on the list. It is a material that is on the list that is going through sunset.

MR. DAVIS: I understand, but the question is, do we get so tied up in the process that there is no way to remove a material once it has been on there, even though people are saying, “Hey, there’s a problem with this material.”?

We went through that with some of the crops materials and people wanted them
off.

CHAIRMAN O’RELL: Okay, I have Joe, then Andrea, then Arthur. If you can make your points brief and to the point?

MR. SMILLIE: I agree with Kim, and I do have faith that, once we go through that process with the annotation, that we will see shortly thereafter an organic dry product appear, at which point in time we move again to sunset.

CHAIRMAN O’RELL: Andrea?

MS. CAROE: You know, I think this has come up so many times and frustration in this sunset process. But, again, sunset is considering the existing regulation for continuance.

In our sunset document that Kim worked on, we are talking about new information about the product. This isn’t new. The Board that put this on the list considered these things. We are not here to reinvent or revert that decision.
So if you had a problem with their decision, you had to be there at that date making that comment to that Board, but it is on the list.

Unless there are alternatives available, which would be a change to what existed when that was put on the list, or the technology for creating that material changed, it is not for review during sunset.

CHAIRMAN O’RELL: Arthur?

MR. NEAL: Well, it can be reviewed, but it has to be reviewed against a criteria which we all agree. Is it harmful to the environment? Is it not consistent with organic principles and practices, and things of this nature?

You have to look at the manufacturing process to see; with this material, you don’t have a petition. So you really don’t know how it is manufactured about which to make a decision on.

So you would be making a decision
based on people’s feelings, which is what we do not do, to codify. So we want to base our decisions on actual research.

Comments may be fueled by some feelings, but we want that to support the data that we have looked at. We did not have that for this particular material.

CHAIRMAN O’RELL: Nancy?

MS. OSTIGUY: Pass.

CHAIRMAN O’RELL: Thank you, Kim.

MS. WEISMAN: I just have a question. From a procedural point of view —

CHAIRMAN O’RELL: This can go back to Committee for discussion, and the Handling Committee will be meeting this evening.

MS. WEISMAN: Okay. So, in other words, we could be on track to vote on something tomorrow, to revise our recommendation and vote tomorrow?

CHAIRMAN O’RELL: Absolutely. We
could come -- the Handling Committee can come with a revised recommendation to the Board tomorrow for vote, based on discussion. That is the purpose of today.

MS. WEISMAN: All right, last but not least is --

CHAIRMAN O’RELL: Do you have anything that is less controversial?

(Laughter.)

MS. WEISMAN: I don’t know. I don’t know. This Committee is pretty much a hotbed of controversial things.

I just want to review petition substances, if I can find my summary.

Now I believe the list that was circulated to the Board yesterday is an internal list.

MS. FRANCES: Yes, it is based on what’s on the website.

MS. WEISMAN: Right. So it’s okay if I summarize what was on that list?

MS. FRANCES: Yes.
MS. WEISMAN: Okay. There is a very long list of items that are petition substances under the purvey of the Handling Committee. That would be for Sections 605(a), 605(b), or 606.

There are three items that were previously recommended for listing on 606 by the full Board, but have not yet been published. Those would be the de-waxed flake shellac, the gelatin from fish, and the konjac flour.

Does anyone at the program want to -- are those ag/non-ag? Are they being held up for other decisions to be made or do we know?

MR. NEAL: If I am not mistaken, Julie -- Arthur Neal -- that will be a 606 issue. The konjac flour, right?

MS. WEISMAN: Uh-hum.

MR. NEAL: What was the other?

MS. WEISMAN: The gelatin from fish.
MR. NEAL: 606.

MS. WEISMAN: And the shellac, the de-waxed --

MR. NEAL: 606.

MS. WEISMAN: Okay.

MR. NEAL: And as we explained yesterday, when those recommendations were made, the petitions were submitted under the assumption that these materials were synthetic.

Then the Board, in the midst of the review, said this doesn’t appear to be synthetic; it’s agricultural.

So they made a declaration. We did not at that time have a process by which to amend 606. So we did not.

So the industry operated with the assumption that those things are agricultural and could be used. Then the Harvey case came; 606 procedures changed.

In addition to that, we had to come up with a 606 process.
So now those three have to go through the 606 process to be listed on the National List.

MS. WEISMAN: So once we have voted on the previous recommendations about commercial availability, we will have in place the tools that we need, and then these come back to the Handling Committee? They come back to the Board? Is that correct?

MR. NEAL: Right. Right. Right.

MS. WEISMAN: Okay. So we have three items that are about to come back to the NOSB for the Handling Committee’s work plan.

We also have three items that were petitioned for listing on 605 that have been reviewed by the NOP and are currently on the Handling Committee working plan. These are carbon dioxide, magnesium carbonate, and natamycin. But they were not considered -- there was not time spent on these because we were -- I don’t know, I
feel terrible saying this, but we really felt like we had our hands full with commercial availability and ag/non-ag and the crisis that was created regarding materials for 606 as a result of the Harvey suit. But those are definitely on our work plan as well, those three.

There were also two recent petitions that are under review by NOP right now, sea salt for listing on 605(a). I am really glad to hear that that is at the OGC right now because I think that is where it belongs.

I’m obviously getting more relaxed in this role because comments are coming out of my mouth now that I realize like I shouldn’t be saying these things. I’m sorry.

(Laughter.)

Can they be stricken from the record?

The other recent petition for
605(a) is for the removal of yeast.

We also have one item that was out for TAP, fructooligosaccharides. The TAP that was requested is complete. So that is now going to move back onto the Handling Committee work plan.

Finally, there were 32 petitions received since May for materials to go onto 606. I know that this Board probably feels like that is an overwhelming number of materials, but I assure you that it is the tip of the iceberg.

(Laughter.)

Twenty-one of these petitions are under review by the NOP and 11 of them have already been returned; the petitioners have been notified for additional information. So 11 of those have been returned to petitioners asking for additional information.

Now I also wanted to point out that, of those 32 petitions, nine are for
colors. I really think that the industry is to be congratulated because when we knew that we could not renew colors as part of sunset, we encouraged the industry, please, please, please, you know, petition your agricultural colors onto 606. I’m sure there’s more to come, but I was very glad to see these here.

Also, there are three petitions for flavors. Three of those 32 were for flavors. I am wondering if the program can give an opinion about not only with regard to flavors, but also sea salt. If something is already on 605(a), why would we be considering it for 606?

CHAIRMAN O’RELL: A question, first, to the program; Arthur and then Joe and then Andrea.

MR. NEAL: For flavors, if there is a company out there that wants to have their flavor on 606, they want to clearly define that my product is agricultural.
You would look at those, particularly as well, because of the issue that many have expressed through the sunset process, just because of manufacturing processes, clearly delineate which flavors are agricultural and which ones are not. Because we’ve got that group called flavors on 605(a). Which ones are synthetic, which ones could be non-synthetic. So this clarifies that as well.

It also gives clarity to the certifying agent so that they know exactly what it is that is approved for use and they don’t have to search for it.

CHAIRMAN O’RELL: Joe and then Andrea.

MR. SMILLIE: Yes, a couple of technical questions. No. 1, I see a number of materials, three or four, that say 205.605 or 205.606. Whose role is it to clarify where they are going? I can’t see how you can have it in both categories.
CHAIRMAN O’RELL: Arthur, you can respond.

MR. NEAL: Arthur Neal.

I think this may be set up that way because it is going to depend upon the outcome of our discussions on synthetic versus non-synthetic, ag versus non-ag. So we did not pre-determine what the outcome would be for these things, but we are saying it would really depend upon what’s the outcome of the Board’s discussions.

MR. SMILLIE: A followup: Also, when the same material is petitioned twice, is that dealt with -- how do you deal with that?

MR. NEAL: We deal with it in one fell swoop. You have to acknowledge the fact that two people did petition the same substance.

MR. SMILLIE: Right.

MR. NEAL: But that substance will only be dealt with one time.
MR. SMILLIE: So you will take both petitions into account at the same time?

MR. NEAL: Right, because each petition may present different information.

MR. SMILLIE: Okay, good.

CHAIRMAN O’RELL: Andrea?

MS. CAROE: With regard to flavors being on 605(a), the heading for that category is nonagricultural/non-synthetic. So nonagricultural/non-synthetic flavors are allowed.

Agricultural flavors are not listed, which is why it is important that if concord grape essence gets deemed agricultural, and somebody wants to use it, it is not listed for use. It is an agricultural material, not a nonagricultural material.

MS. WEISMAN: I would argue that orange essence is not the same thing as orange flavor. Orange essence is an
agricultural product.

MS. CAROE: Exactly, and that is the point. That is the point why we need to look at it as both the agricultural and the nonagricultural.

So those folks that are moving ahead and certifiers that are approving agricultural materials as allowed, agricultural flavors as allowed, are actually not completely correct because it is the nonagricultural flavors that are allowed, unless they are organic, and then it is a different situation.

CHAIRMAN O’RELL: Joe?

MR. SMILLIE: Yes, point of clarification. One of the tools that can be used is how they are claimed on the label. In other words, you could have the exact same material claimed differently on a label. One manufacturer could claim it as a flavor; another manufacturer could claim it as an extract, for example.
Orange is a good example. One manufacturer using the identical materials could claim it as orange flavor, and another manufacturer could claim it as an orange extract.

So I agree we need to move it on both lists.

MS. WEISMAN: I want to also throw out a practical consideration. I feel like at this point it would be appropriate to identify the fact that I am involved in manufacturing flavors.

We have to think very carefully about whether we want to entertain petitions for every individual formulation that every single flavor manufacturer has to put out there as an agricultural product, because if we suspect that there’s a huge volume of materials to go on 606 without those, that is going to be a whole other order of magnitude.

I would like to ask people to
consider the idea that, given what we are up against in terms of working through the 606 process quickly enough, so that we do not have a train wreck in the processed foods industry, that things that already have a home elsewhere on the list could be not the first things considered perhaps.

CHAIRMAN O’RELL: Well, I think that that certainly could be handled between the Handling and the Materials Committee on setting prioritization to this long list of materials, one of the points to consider, not the only point.

Dan?

MR. GIACOMINI: Just for clarification, I don’t know if this is Valerie’s question or someone else on the program. On the 606 list, Item 23, natural colors, there’s a 15 there that looks like a footnote item, but yet there is no footnote. Is that a reference to anything?

MS. FRANCES: It could be a typo
of mine.

MS. WEISMAN: Or it could mean that there are 15 colors that this manufacturer is petitioning --

MS. FRANCES: Oh, okay.

MS. WEISMAN: -- which actually goes to my point about flavors as well.

MS. CAROE: Bob is giving thumbs up.

MS. FRANCES: Right, okay.

MR. GIACOMINI: So there’s 15 colors on that list?

CHAIRMAN O’RELL: Contained in that petition.

MR. GIACOMINI: In that petition, okay.

CHAIRMAN O’RELL: As Julie said, it is the tip of the iceberg.

Thank you, Julie.

We are going to stay on program here and continue before lunch break with the Livestock Committee report. Michael?
MR. LACY: Thank you, Kevin. We will move quickly on this. We will condense a 45-minute report into five minutes for the good of the cause here.

(Laughter.)

I would like to, first of all, say if the Livestock Committee could sort of sit together at lunch today, we will discuss a few items of business, assuming that we don’t have other business that is going to be done at lunch.

CHAIRMAN O’RELL: That’s fine.

MR. LACY: Okay, great.

I want to thank Barbara for bringing us up-to-date on where we stand on the pasture process yesterday. We really appreciate NOP’s efforts in bringing the pasture issue to an appropriate conclusion. We certainly understand the difficult circumstances that have been imposed upon NOP.

I just want to say that the
pasture issue remains a very high priority for the Livestock Committee, one of our highest priorities. We will continue to offer any and all assistance to NOP as they work on that issue.

The acquisition of dairy livestock also continues to be one of our highest priorities. We are committed to doing our part to bringing logic and fairness to that issue.

Almost all of our efforts since the April meeting have gone toward analyzing the Aquaculture Working Group interim final report and beginning to draft an organic aquaculture standard.

Although the entire Livestock Committee has been engaged in that work, along with a few additional NOSB members -- Joe and Andrea and Bea -- Dan, Andrea, and Joe have taken on the task of taking the Aquaculture Working Group’s report and rewriting it into a standard.
The input on the aquaculture draft proposed standards has been intense, voluminous, passionate, incredible. That is a compliment, a very sincere and high compliment, to those that have been interested in the organic aquaculture issue, and especially to those that have served on the Aquaculture Working Group Task Force.

I know that we thanked them at the April meeting, but I would like to do that again today. Their work continues, and their professionalism, thoroughness just really continues to be exceptional.

I would like to talk a little bit about where we stand now. In our deliberations, we came across about a half dozen issues that were either contentious or there were varying opinions or we weren’t just sure how to move forward.

Technically, the Aquaculture Working Group’s report was extremely thorough. These were more philosophical
questions. We have requested or invited some additional public comment. We have received some very thorough and excellent comments related to that invitation.

I think, in the interest of time, I will just briefly go over the six questions that we asked and then also ask that, if there is still time for additional comment to be turned in on those, we will continue to look at that.

The six things that we asked for or invited input on were specific sections of the interim final report that might require species or production method-specific standards.

No. 2 was how organic aquaculture might meet the requirement of maintaining or improving the environment, including the use of integrated net pen systems.

No. 3 was expectations and explanations of the differences between organic aquaculture and conventional
aquaculture methods and products.

No. 4 was further input on feed ingredients for organic sources of fish oil and fishmeal, and whether it would be possible to develop alternatives to that within the timeframe that had been suggested by the Livestock Committee.

No. 5, we asked for suggestions for appropriate sustainable criteria for sources of fishmeal and fish oil and methods to verify that those sources met such criteria.

And, No. 6, should byproducts from processing of terrestrial organic livestock now prohibited in feeds for organic terrestrial mammals and poultry be allowed as ingredients in organic aquaculture feeds? It is similar to how fishmeal is allowed in poultry diets, in particular.

As I said, we have received good input on that and would like additional
input, if there are still folks out there that would like to respond to that.

I want to say quickly that we want to continue to move forward on this in drafting the standards. I am very optimistic -- very optimistic -- that Joe, Andrea, and Dan will have those ready by our spring meeting.

These standards will be for fin fish only. The Aquaculture Working Group continues to work on recommendations for shellfish and bivalves.

Kevin, I will turn it over to you for whatever questions we might have time for.

CHAIRMAN O’RELL: We have time for any questions the Board will entertain.

(No response.)

Apparently, they’re hungry.

(Laughter.)

Joe?

MR. SMILLIE: I just really feel
I want to second Mike’s remarks in that the Aquaculture Working Group that we work with is an absolutely amazing group of people. All function very well as a group with a real divergence of opinion and position, but work very well together. We have been really privileged in working with the Aquaculture Working Group and their work.

It is one of the more complex issues that I have ever really had to deal with. It is very complicated. But we have boiled it down. We think we’ve got the differences down.

Now with the further round of public comment, we are going to have to make some tough choices and come up with a recommendation for a standard. But if any group of people deserve to get a standard, I think it is this group. They have really bit the bullet and they have really come down and worked in the spirit of compromise to come up with something that will be good
for an entire new industry.

I also believe it is a very important industry in the organic field that we are going to have to get clarification on because these people have also suffered some prohibitions on their ability to market their product now in certain states.

It really behooves us to get this recommendation to the NOP as quickly as possible. We look forward to everyone’s support and comment on these issues.

CHAIRMAN O’RELL: Thank you, Joe. Andrea?

MS. CAROE: I just want to say, from working both with the Livestock Committee on this and the Task Force, and these set of questions that were put out there to elicit some information, the balance and the challenge right now is between -- we are faced with two challenges.

One, to maintain the integrity of the organic label, and, two, to allow for
reasonable capacity-building within this new industry, within this new segment of the organic industry.

So, as you look at the questions that we pose, we are trying to get input from the industry to help us draw that line.

But I think that the work that has been done, I mean the description that Mike gave, I think the word that I always use is “overwhelming.” I mean I probably on my work on the Board spend two-thirds of my time on aquaculture, and I am on quite a few committees.

It is just these folks are engaged and they are on two, three conference calls a week and copious emails with big attachments, and kudos to every one of them. I mean it is just amazing the work that has been done.

CHAIRMAN O’RELL: Dan?

MR. GIACOMINI: I just want to reiterate my support for this group, which
has been incredible. I appreciate Mike’s optimism in our projection to have this ready for a spring meeting.

I just would also like to note that, in addition to the interim report, the Aquaculture Working Group also presented for posting their comments in relation to these questions. I think as much as the interim report and these questions, a lot of additional public comment -- we would be very well-served for you to review those documents in consideration when putting your public comment together. I think that would be a very positive step.

CHAIRMAN O’RELL: Any additional comments, questions?

(No response.)

Mike, thank you for your report. I know the Aquaculture Task Force has done an amazing job. I have seen all the emails and read all the correspondence, and it was certainly a very good conversation, debate
back and forth on a number of issues. So we thank those individuals on the record for their strong effort and support.

MR. LACY: Kevin, we probably do need to name one individual in particular. That is George Lockwood.

CHAIRMAN O’RELL: Yes. Yes, thank you, Mike.

Okay, we are going to recess for lunch. It is 12:07. I would ask 1:10, let’s try. We are not too bad on time. So 1:10.

Thank you.

(Whereupon, the foregoing matter went off the record at 12:11 p.m. for lunch and went back on the record at 1:24 p.m.)
Compliance, Accreditation, and Certification Committee report on the recommendation items and discussion items. Andrea is Chair.

MS. CAROE: Yes, we have three items for recommendation at this time and one discussion item.

The first item for recommendation, just to frame this out, is a somewhat old item that was brought to us by the program over some confusion and work with private labelers and with retailers acting as private labelers.

We were presented with questions for Q&A to answer. So we have been working on fulfilling a recommendation or a guidance document to the program addressing these Q&A.

This was a bit of a challenge because, as we delved into the issue a little bit, the questions don’t reflect the full scope of the issue. So this was a little bit difficult in that it would have
been better if we were able to create our own questions to put the answers and really fully get at the issue. Be that as it may, we did the best with what we could.

I am going to ask Bea James to present that recommendation at this time. Bea?

MS. JAMES: Okay. All right. In 2004, the NOP received a question or several questions listed as one paragraph question.

Before I get started, I want to thank Emily Brown Rosen for trying to make sense of those questions in the comments that she had yesterday. They were very useful.

So they basically ask what accredited certification agency should be identified on the label of a co-packed or commissioned or private label product. To briefly summarize the recommendation, I would like to point out that, as stated in 205.100, all processing operations that
manufacture organic products must be certified as a processor. As a processor, the accredited certification agency’s name would be revealed on the label of any certified organic product. This includes products that might be commissioned as private label products.

In the case of a commissioned merchant or retail establishment that has obtained voluntary certification as a handler, Section 205.100(a)(ii) of the rule states, “A handling operation that is a retail food establishment or portion of a retail food establishment that handles organically-produced agricultural products but does not process them is exempt from the requirement of this part."

However, voluntary certification can apply to retail establishments and is vaguely described in The Federal Register as follows:

“This regulation establishes
several categories of exempt or excluded operations. An exempt or excluded operation does not need to be certified. However, operations that qualify as exempt or excluded can voluntarily choose certification.

“Therefore, the Accreditation and Certification Committee concludes in its guidance document the following clarification which summarizes the answer to the submitted question.”

It is a long document, and that is a summary of the document. I am going to page 3, the bottom of page 3 of the four-page clarification.

Our guidance is, “The Committee wants to emphasize the statements above,” which I’ll read shortly, “which clarify that the voluntary certified handler or private labeler uses the name of its certification agent on the package and, therefore, it assumes responsibility for the product.”
Otherwise, the manufacturer or processor of any final said product is the responsible party and assumes all liability for compliance with the regulation.

“A retailer that is not involved in the processing of the final product is not required to undergo mandatory certification as a processor or voluntary certification as a handler. If the retailer who commissions the organic product chooses not to be certified, then the co-packer or processor would become the entity responsible for compliance with the regulation in full, and their certifier’s name would be indicated on the final product and would also be the first point of contact in the event of an investigation.”

That concludes the summary of the retailer Q&A, and I open it for question or comment.

CHAIRMAN O’RELL: Andrea?

MS. CAROE: At this time, I want
to point out to the Board that there is an existing recommendation that was approved by this Board in July of 2007.

(Laughter.)

CHAIRMAN O’RELL: That’s okay.

MS. CAROE: It is a little time warp thing I did.

(Laughter.)

CHAIRMAN O’RELL: Fast forward.

MS. CAROE: That’s bad.

In 2001, July, this Board did pass a recommendation that is contradicted by this guidance document. That was a rule change document that requested the insertion of the word “certified” in the regulation where it declares the name of the processor.

Part of the regulation that says that the manufacturer and the certifier need to be named, the word “certified” was put in there. So, essentially, a co-packer would
be recognized on private labels.

It is not very clear what I just said.

However, the Committee considered this recommendation, and the Committee did not agree with this prior Board recommendation. It has not been presented to this Board. So we can’t take action today on that recommendation, but the consensus of the Committee is that in the next meeting we will be presenting a recommendation to rescind that prior recommendation, so that we can move forward on this guidance document.

At this time, we will not be able to move forward and accept this recommendation because we didn’t dot that “i”. So as far as the content of that recommendation, I wouldn’t worry about. We are going to provide it to everybody, give the Board ample time to look at that with the recommendation that it is rescind.
CHAIRMAN O’RELL: And back to the Committee for rework, I guess.

MS. CAROE: Yes.

CHAIRMAN O’RELL: Joe?

MR. SMILLIE: I would still like to have a discussion on our document today.

CHAIRMAN O’RELL: Perfectly, it is on the table; you can have discussion around that document or the previous document since it is for discussion.

MR. SMILLIE: Andrea, would you like me to explain the difference between the two?

MS. CAROE: Yes, because I fumbled all over it. Please, Joe.

MR. SMILLIE: Our document is very similar to the 2001 document in most respects. The respects in which it differs is that in the 2001 NOSB recommendation it states that, if the private labeler -- I’ll call it that -- the commissioned merchant chooses not to be certified, then the name
of the certified co-packer has to be on the label, not the name of the certification agent of the co-packer, but the actual name of the co-packer. The company that produced the product would have to be on the label.

Our recommendation says that the name of the certification agent of the co-packer would have to be on the label. There is a difference there. It is a difference that we don’t feel we can move forward with our recommendation unless we deal with the previous recommendation, which required the name of the handler on the label.

That is the difference between the 2001 document and our document. If the commissioned merchant or private labeler chooses to be certified, then there is no difference between the documents. The voluntary certification is regarded as full and complete with all the rights and responsibilities of a mandatory certification, but there is a difference
between the two documents as to what is listed on the label in the case that the commissioned merchant/private labeler chooses not to be certified, which is their right. They don’t have to be certified under the regulation.

CHAIRMAN O’RELL: I would like to ask a question to the program, to Mark. Mark, sorry. I would just like to address the program in terms of this recommendation for a rule change that was adopted by the Board in 2001 and submitted to the program. What is the status of that with the program?

MR. NEAL: If I recall correctly, the program has not responded on that. In order for us to do so, we would probably -- we will have to consult with OGC.

There are a number of issues with it. This is the one for requiring the name of the handler.

No. 1, it is not required by OFPA.
No. 2, it is not required by FDA.

No. 3, you are going to have to have OMB review it because it is going to be another burden on the handling operation.

So there are going to be a number of hurdles to go through, to jump over, before we can accept that one. I will let you know that upfront.

Do you want to rescind it?

MS. CAROE: Yes.

MR. NEAL: That is not an issue.

(Laughter.)

MS. CAROE: Well, that is not an issue.

MR. NEAL: No, that is not an issue. You’ve got to remember I walked in halfway between the discussion.

MS. CAROE: That will teach you to be late.

(Laughter.)

CHAIRMAN O’RELL: Bea has a comment. Did you have a comment?
MS. JAMES: I think we still need some clarification.

MR. GIACOMINI: I don’t understand that’s not an issue.

CHAIRMAN O’RELL: I would like to recognize Jim Riddle, who is past Chair of the NOSB, to come up because I know he is familiar with the issue, just to get it out on the table, so we can understand.

MR. RIDDLE: Yes, I was on the Board and actually was the author of this recommendation that was adopted unanimously by the Board at the urging of Joe Smillie and the Organic Trade Association in 2001.

What it was was an attempt, or is, and I think quite an elegant solution to the issue that you are continuing to wrestle with and really I don’t think your recommendation addresses.

Because it would basically just continue the way things are, which requires the name of the certifier to be on the
label, and that can then be on a label of an operation that they did not certify. That is the current situation.

So a commissioned merchant/private labeler, the co-packer has to be certified. That doesn’t change. But the name of that certifier appears on a label connected to an operation, then, that is not certified. That is the current status.

With that, the audit trail can easily be broken because oftentimes that private labeler buys ingredients and actually manages the sale, manages the formulation, but yet they are not inspected; they are not part of the audit review.

This was a way to let the free market decide who is going to be identified on the label. The private labeler could choose to be certified, and then the name of their certifier would be identified and they wouldn’t reveal who the co-packers are, but,
yet, the audit trail would be complete. Or they could choose to reveal the name of the co-packer, identify the co-packer, along with the certifier of the co-packer, which is already required -- that wouldn’t change at all -- if that is their choice.

It allows the free market to decide, but it maintains the audit trail, just by simply inserting the word “certified” in front of the handler or distributor who is identified on the product.

CHAIRMAN O’RELL: I have Andrea and then Joe.

MS. CAROE: Just a point of information on here: It is required in the organic system plan that manufacturers that are applying for certification have their labels as part of their organic system plan.

So if a manufacturer is labeling under a private label, that is part of their organic system plan. Their certifier should
be able to reference the fact that they are packing in that label. So the audit trail is there. I would dispute that.

MR. RIDDLE: Well, reviewing labels is not reviewing the audit trail. You have to look at the ingredient purchases and the product sales.

The co-packer will have quantities delivered, but will not have the information necessarily on sales and purchases. It is just simply not the case.

I inspected many such operations where the co-packer is paid for doing a custom fee, and that’s it. They don’t control anything.

I agree that they should have copies of the certificates, but oftentimes they don’t even have those because those go to the private labeler who purchased the raw ingredients.

MS. CAROE: So you are making a case for the private labelers -- this
recommendation that we have today in front of us, you just made our case.

MR. RIDDLE: Yes, I don’t think they are inconsistent whatsoever. I think this actually addresses and solves the problem in the long-term.

CHAIRMAN O’RELL: Joe?

MR. RIDDLE: The 2001 recommendation gets to the heart of the matter.

MR. SMILLIE: Well, Jim and I have already debated this, as you might have guessed. So we will replay in public the debate.

My response is that there’s a couple of issues at stake here.

The first issue is, is there a break in the audit trail? I don’t believe that there is a break in the audit trail because I believe that that co-packer that produces that product for a private label must -- not should, and if they don’t,
they’re out of compliance -- must have those certificates for those ingredients.

Regardless of who purchased the ingredients, the person that made the product must have those documents. And if it means also having the complete purchase information, if we believe that to be required, then they must get it. That would be the responsibility of the commissioned merchant to provide those documents. But that is the responsibility of the co-packer to have those documents. Otherwise, they are out of compliance.

To say that they don’t have them, I’m not disputing that may have been the case or it may still be the case, but, clearly, they are out of compliance if that is the case. It is not the responsibility of anyone else other than that co-packer regardless of whether they are the total processor. Whether they purchase their ingredients themselves, or got them from the
commissioned merchant, they still are responsible for it, period. So I don’t believe that there is a break in the audit trail.

No. 2 is it is a commercial issue, in my mind, not a regulatory issue. By forcing, with the implementation of the 2001 document, it would give the private labeler three choices.

The first choice, which I believe is the correct choice, but it is not my decision, is to get certified themselves. That way, they are on top of their own business. There’s a lot of benefits other than packaging benefits.

I think most private labelers are seeing that it is really wise to get certified because they don’t have to go through patching nightmares. Also, in the process of certification, they discover, hey, I'm getting more on top of my organic business, which is where they should be in
the first place.

That is the best choice. We both agree with that. The documents don't differ in that area.

The second choice is, then, if they decide not to be certified, then they are forced to put the name of the co-packer on the label, which they are just not going to do it. It is just not an industry practice. Whether it should be or not, I can't get into that debate, but they are not going to do it because, basically, it is their commercial interest not to.

So then I think they are forced between two positions: either get certified or don't come out with an organic product. I think our job is to convince the food industry and agriculture to go as organic as possible. So I believe that their insistence on -- this is what I have seen anyhow, that they are not going to put the name of the co-packer on their product.
They are just not going to do that.

So if that forces them not to go organic, I believe that that is not our position because I don't think the countervailing argument that there's no audit trail is accurate.

CHAIRMAN O'ReLL: I will allow Jim to give a brief response, if you have one.

(Laughter.)

Then we are going to take a question from Bea, and then I think we need to sum up where we are at, if there is no other comments.

MR. RIDDLE: Well, yes, and I disagree with Joe, that the audit trail is broken in many instances. I think that it is very difficult to have the enforcement capability in the rule without this change that you and others advocated.

We listened to the stakeholders at that time. But the other thing -- and
this was a compelling argument at that time -- was that the certifier's name is being used on a product that they did not certify, on a label of a company that they did not certify.

I believe that is a bit of an exposure issue, that any certifier's name is appearing on a product of a company that was not certified by that.

The thing about revealing the co-packer, as we discussed, in the dairy industry that is standard practice, that the plant number has to appear on a product for any dairy, and that can be tracked without much difficulty at all. So there already is a precedent for revealing co-packers in the dairy sector.

Thank you.

CHAIRMAN O'RELL: Thank you, Jim.

Thank you for the input.

The Board will have the last word, I guess.
MR. SMILLIE: I'm on the Board and you're not.

MR. SMILLIE: It's not personal.

MR. SMILLIE: As Michael Corleone said, this is not personal; it is just business.

The label that that co-packer packs for, their name is going on that label. They have to submit that label to their certification agent for approval. They are connected with that product. There is no divorce there. They are connected with that product.
I still believe that the audit trail is intact and that it is a doable project.

CHAIRMAN O'RELL: Bea?

MS. JAMES: Okay. I want to make a comment about the idea of the co-packer's information being on the final product. I am speaking on behalf of the retailer sector, that the reason it is called private label is because it is private.

This is an opportunity for a retailer to brand an organic product that represents their particular company, so that they can have that privacy of searching out that product, having it branded underneath their name, and being able to represent that to consumers.

If we were forced to put co-packing information -- and I'll just use Trader Joe's as an example -- that that would disclose a lot of what they have built their business on, and I think it would
really hurt the retail industry if we did that.

I also think that private label is called private label for a reason. It is a program that was built by the retail industry so that they could have a marketing opportunity for products that they feel brands their name.

Secondly, I just want to point out that there is another piece of the audit trail that we haven't really discussed that is not even a part of what we have to -- I mean the USDA doesn't regulate, and that has to do with the FDA regulation 21 CFR 101.5. It is listed in this document.

Labeling regulations clearly state that food labels must list the name and address of the manufacturer, packer, or distributor. So the name of that retailer or private label co-packer is also going to be on that final product to help with the audit trail.
I can speak from experience that there is no private label organic product that the company I work for has been able to move forward with without getting that label signed off on by our certification agency that we work with. That is just part of the protocol, that our co-packer has to have approval from their certification agency that the label is acceptable as part of the audit trail.

CHAIRMAN O'RELL: Okay, thank you, Bea.

I think where we are at, to sum it up, is that the particular recommendation that was passed in 2001 was considered at the Committee level during the discussion of this recommendation. Perhaps it didn't dot the "i's" and cross the "t's" and address that recommendation in the text and background information of that recommendation, which will go back to Committee, and that will be done. There
will be a new recommendation coming out for the next meeting.

So thank you.

MS. CAROE: Moving on to the next recommendation that we have, it is standard format for certificates. I am not going to read through this entire document. Based on the comments that we received, you folks actually did. So thank you for that.

(Laughter.)

We were approached by the program based on questions that they have received. So this document was created in order to assist and facilitate the certification process, commerce of organic products, and improvement of compliance and enforcement. It is the Wild West of certificates out there.

We all know that the regulation has few requirements for these documents. Our recommendation does reference those requirements. It does reference where the
establishment of a certificate is in the regulation.

However, it has become increasingly difficult for operations, especially processing operations that use many different ingredients, to keep track of these certificates and was the product, indeed, certified to the National Organic Program Standard. Who was the entity? Who is the certifier? The information is all over these, and especially with so many foreign certifiers now accredited, it has become very difficult.

So we did make a recommendation. Skipping to page 3 of the recommendation, Section B, we included that this certificate must say that the products are in compliance with the USDA Organic Standard.

To just frame out why this is important is we do have foreign certifiers that are certifying to other standards. They are accredited to the USDA, but it
needs to be very clear that the operation that received the certificate did receive it for this standard and not the other standards that that certification agent does issue certificates for.

We also included that the crops and products should be included on that certificate. We have heard many comments about the vagueness of what is a crop and what is a product and how detailed you get.

But at this point, that is the way the language is. Without consulting my Committee, my opinion is that we let the industry figure out what that means, let the certifiers determine what best works for their entities. Many certifiers are including this information on the certificates.

But, indeed, for a buyer and for a manufacturer that is trying to maintain their own certificate, having a verification that the product they're buying is included
in the scope of that certification is of value.

We have received some recommendations from industry on changes to that terminology. We can consider those as well.

Also, one of the other things that was suggested that we add, we actually had two suggestions. One, that the certificate be in English. I have no problem with making that addition. That was, again, valuable input, and I think the Board should consider that addition.

Also is the categories of certification, whether that is 100 percent organic and made with organic product. That, too, is a very important addition to this recommendation that I believe we should consider.

The next part of our recommendation was the C Section, which also elicited robust comments in our attempt to
structure what this standardized format may or may not look like.

We have heard many comments saying the suggestion that an 8.5x11 paper and the requirements for margins are too prescriptive. We've heard that message.

At the same time, interestingly enough, we've gotten the message that industry wants a template, which to me seems more prescriptive, but I understand that there would be merit to that.

So this Committee should consider perhaps coming up with a block format or something for this information to make it easy reference for these new certificates.

The Board did vote on this recommendation. It was seven in favor, none opposed, no abstaining, and none absent on this vote. We had no minority opinion on this recommendation.

Based on the fact that we have received so much information, there is the
opportunity, and we should consider tomorrow deferring this because it is not immediately needed in order to satisfy the industry or other actions moving forward. So just putting that ahead, that that is an option. That is a real option for this recommendation because there is no apparent immediate need.

With that, I open for discussion.

CHAIRMAN O'ReLL: Any questions, comments from the Board?

Nancy?

MS. OSTIGUY: I have a question about -- and this would be for the program. Do we, when we interact with other countries, have a requirement that anything that they send us is in English? Is that ever done?

MR. BRADLEY: Mark Bradley.

We have not required that they submit documents in English unless they want us to work on them.
(Laughter.)

We can charge for the processing of documents that they have sent over, and that would include a translation fee. So we have been very successful in saying that, if you would like for us to work on this right away, that we will require that they be in English.

The certificates, I think we could require that they at least have National Organic Program written in English, so that would be clear.

But as far as the whole document being in English, we have required that the certifiers translate those for us, if we request them for clarification.

Does that answer your question?

MS. OSTIGUY: Uh-hum.

CHAIRMAN O'ReLL: Joe and then Andrea.

MR. SMILLIE: Yes, I agree with Andrea on this document, that the phrase
"certified" is compliant with USDA's National Organic Program, as required. That is one of the really confusing issues in the organic industry because oftentimes we will see certificates from accredited certifiers, and the people say, "No, my certifier is accredited by the USDA." We have to continually say, "Yes, we do understand that, but the certificate itself has to say `in compliance with the USDA.'" That has been a big issue.

At one point in time it was complicated because the program did say they could not require under the regulation that compliance statement. So I take it that you are in agreement with the fact that it is within our -- you know, that we can require that on a certificate.

CHAIRMAN O'ReLL: Andrea?

MS. CAROE: I'll just pass on my comment at this point.

CHAIRMAN O'ReLL: Okay. Hearing
no further discussion, let's move to the next item.

MS. CAROE: Okay. The next item is expiration dates on certificates for organic operations.

Again, when this rule was first implemented, there were numerous comments on the need for expiration dates on certificates, which was the standard method that certifiers were users prior to the implementation of the rule.

The program advised us on the life of a certificate or certification, and that this is likened to a license. Unless it is taken away, it is in good standing, and that expiration dates were not appropriate.

Also, the program was very optimistic that there would be at some point a real-time tool in order to maintain a verification that certificates were good.

Because of numerous logistical
challenges, that is not going to be a reality anytime soon. Until there is some type of tool, it is very difficult for operations that are purchasing organic ingredients to easily and comfortably show that they are in compliance with what they are, indeed, purchasing.

For that reason, the program has come to us and suggested that perhaps an expiration date should be investigated. We do know that the certification does not expire. However, we don't know necessarily that the certificate, the document that expresses the certification is in good standing, can't expire.

I will say that we have made this recommendation for expiration dates to be added to the list of required information on certificates. We have also offered an allowance for letters from certifiers to extend in periods of -- you know, where the certifier can't finish the evaluation
process, which is allowed under the regulation. It is allowed that you could slip, depending on the stage of production for a particular farm or various other issues. So there is in the recommendation allowances to have that time slip.

We also have addressed that, if it isn't an extension or renewal of that certification process, an annual renewal, if it actually is a re-entry into organic, that it would be looked at as a new certification.

We have heard comment on it. It has been interesting. We have heard comment from everything from Jim giving us a big "Yahoo" on that to some of the original testimony folks that wanted this in the beginning saying, "You know what? We got really comfortable without it."

However, I do believe we should move forward with this recommendation. I think it is a service to the processors that
are using these ingredients to have some verification that these products and their vendors have done what they were supposed to do to maintain their certification.

I think this is very important. I see at some point in the future, when the program has bandwidth to create that real-time tool, that we will be offering rule change to pull this back. But at this time, I think this is an important piece in compliance and enforcement. For that reason, we will, hopefully, be voting on this document tomorrow.

CHAIRMAN O'RELL: Discussion?

MS. WEISMAN: Just one point.

CHAIRMAN O'RELL: Yes.

MS. WEISMAN: Clarification: that when Andrea was talking about it, in our recommendation we actually didn't change; the allowance for continuation already existed, that what we are recommending that is new is that there would
be an issuance of a letter to state that allowance.

MS. CAROE: Correct.

MS. WEISMAN: So just that.

MS. CAROE: Just for the extensions, you are talking about?

MS. WEISMAN: Right.

MS. CAROE: Uh-hum.

MS. WEISMAN: That the opportunity already existed.

CHAIRMAN O'RELL: Thank you.

Okay?

MS. CAROE: Okay.

MR. KARREMAN: One other thing on that: Rigo and I were just talking about it a little bit. How about like an update sticker, you know, like you get for your license plate up in the corner?

(Laughter.)

Seriously. Less paperwork.

MS. CAROE: Where were you six months ago, Hue?
(Laughter.)

You know, that is another tool that could be used. I believe that this is something that certifiers are familiar with. They were using this as a tool before. I mean that is a possibility.

CHAIRMAN O'RELL: Bea?

MS. JAMES: Andrea, I think one of the problems that you might face with that is people peeling off the sticker. That, unfortunately -- I just don't see how that -- that's the reality, you know. Peel it off and stick it on something else.

CHAIRMAN O'RELL: Stick it on something else.

MS. JAMES: A good idea though.

MS. CAROE: That's thinking out of the box or out of the pasture.

MR. KARREMAN: It was Rigo's idea, actually.

MS. CAROE: All right, so hearing no more discussion --
CHAIRMAN O'RELL: Yes, move on.

MS. CAROE: Okay, moving on to our last item, which is a discussion item, just to frame this out, I am going to give this to Joe Smillie who has worked on this for the Committee.

Joe graciously took up the charge of working in collaboration with the program to create or to work on a procedure, a standard procedure for satisfying peer review requirements.

Michael Lacy did work on this for us in the past, but with the onset of the Aquaculture Task Force, Michael's time was at a premium. So Joe took this up for us.

So having that, I will turn this over to Joe.

MR. SMILLIE: Well, the Compliance, Accreditation and Certification Committee is now in the exploration phase of looking at options for the Organic Food Production Act mandated Peer Review Panel.
The establishment of a Peer Review Panel allows the formal participation of the organic community in the auditing of the NOP accreditation system.

There is a long, if not recent, history of real concern about this issue in the organic community. In fact, if I recall -- and Lynn Coody will serve as institutional memory on this for me, I trust, and for the NOSB -- that was one of the absolute hottest issues coming from OFPA and the regulation. I mean I remember the stir it caused, the debate, and the insistence of some of the pioneers of the organic movement in that Peer Review Panel.

Since then, it has sort of run a course. Let's start at the beginning, and, basically, the citation from the Organic Food Production Act of 1990 is Section 21.17, which isn't that long, so I will read it in full.

It is Section 21.17, "Peer Review
of Certifying Agents.

"(A) Peer Review. In determining whether to approve an application for accreditation submitted under Section 21.15, the Secretary shall consider a report concerning such applicant that shall be prepared by a Peer Review Panel established under Subsection (B).

"(B) Peer Review Panel. To assist the Secretary in evaluating applications under Section 21.15, the Secretary may establish a panel of not less than three persons who have expertise in organic farming and handling methods to evaluate the state governing official or private person that is seeking accreditation as a certifying agent under such section. Not less than two members of such Panel shall be persons who are not employees of the Department of Agriculture or of the applicable state government."

Then we move along to the
regulation, the regulatory text, which is Section 25, you know, 7 CFR, Part 205.509, Peer Review Panel.

"The Administrator shall establish a Peer Review Panel pursuant to the Federal Advisory Committee Act, FACA, 5 USC AP2 and sequential. The Peer Review Panel shall be composed of not less than three members who shall annually evaluate the National Organic Program's adherence to the accreditation procedures in this Subpart (F) and ISO/IEC Guide 61," although I believe that is Guide 17.11 now, "General Requirements for the Assessment and Accreditation of Certification/Registration Bodies and the National Organic Program's accreditation decisions.

"This shall be accomplished through the review of accreditation procedures, document review, and site evaluation reports, and accreditation decision documents or documentation. The
Peer Review Panel shall report its finding in writing to the National Organic Programs Program Manager."

Those are the two legal interpretations. That is where we are now.

The recent work that was done on this was commissioned to ANSI, who added to their professional auditing staff a person well-versed in organic regulations and in ISO 61.

I think, in general, the community was satisfied by the results of that audit. It certainly was -- you know, it pointed out a number of deficiencies in the program, to which the program has responded and is correcting.

So, my opinion only, but I don't think there was a great concern or discomfort in the community that this function wasn't done properly, that the evaluation of the accreditation was thorough and rigorous, but that the process whereby
it was done may or may not have been in line with what was mandated in OFPA.

So we are at the point now of looking at what was mandated in OFPA, what the regulation says, and where we want to go to, I guess, bring back the original concept of the Peer Review Panel, which our Committee feels is important to the organic community, that it is time to move along and institute the Peer Review Panel which was mandated by OFPA.

So in notifying my fellow Board members that we are embarking on this, we are looking for any input you have. If we do enable the CAC Committee to pass the previous three recommendations, this, then, will become, as far as I can see, Andrea, our top-priority item for the Committee in the future and will be on our work plan.

CHAIRMAN O'RELL: Thank you, Joe.

MS. CAROE: That's all for CAC unless there is discussion.
CHAIRMAN O'ReLL: Any discussion on Joe's comments?

(No response.)

Hearing none, thank you very much, Andrea, for the CAC Committee presentation.

Valerie, you are looking at me like I am supposed to do something now.

MS. FRANCES: I have this little message here for someone in the room.

CHAIRMAN O'ReLL: For someone in the room.

MS. FRANCES: And I can't guarantee the spelling or the pronunciation. Is there a Ms. Kua Ellen? You're supposed to call your office.

(Laughter.)

CHAIRMAN O'ReLL: Okay, good.

It is 2:06. We are not too far behind schedule. At 1:45 we were going to get into public comment. We will start public comment now at 2:06.
I will just let everybody know that everybody will have just five minutes. There may be some proxies in here. No questions from the Board.

(Laughter.)

I'm not saying the Board can't ask questions. That is, obviously, not what I am saying.

(Laughter.)

But it is four-and-a-half hours. So we are here for four-and-a-half hours of public comment without questions.

So what I would ask the public commenters, because we have indicated that we want to accept the time here to open up and not have anybody say that they didn't get to give their just do. So we are here; that is what we are here for. We welcome the public comment.

If somebody has previously stated everything that you want to say, you might get up there and just kind of back their
recommendation and maybe be a little more succinct in your comments to help us along the way. But, obviously, you will get your full five minutes. We are not cutting anybody's time short.

With that, before I begin public comment, let me again address the NOSB policy for public comment at NOSB meetings while we are getting the stage set.

All persons wishing to comment at NOSB meetings during public comment periods must sign up in advance. That has taken place.

Persons will be called upon to speak in the order that they sign up. Unless otherwise indicated by the Chair, each person will be given five minutes to speak. Persons must give their names and affiliations for the record.

A person may submit a written proxy as a written proxy to the NOP or NOSB requesting that another person speak on his
or her behalf.

No person will be allowed to speak during the public comment period for more than 10 minutes.

Individuals providing public comment will refrain from any personal attacks and from remarks that otherwise impugn the character of any individual.

With that, I will ask if we are set up. We're set.

Our first commenter will be David Cox, followed by Richard Vento. David?

Just if there are any new commenters, Bea will be timing you. She will hold up the one-minute sign. But, again, it is not her obligation that you see it. You will hear the buzzer go off.

No David Cox?

Okay, we will go to Richard Vento. On deck, Jim Riddle.

MR. VENTO: My name is Richard Vento. I'm affiliated with St. Gabriel
Laboratories in Orange, Virginia. I am the petitioner for asking sodium lauryl sulf ate to be listed on the National List as an herbicide.

I believe that when NOP regulations were written, that they could not be all-inclusive. Although sodium lauryl sulf ate is listed as a soap and falls under a category of ornamentals and roadways, I believe that the Board has discretion of extending the usage for those materials.

The petition that I filed, and confirmed by the TAP report, indicates that sodium lauryl sulf ate is unlikely to cause harm to humans, animals, and environment.

I am going to kind of paraphrase and kind of go a little quickly there in the comments.

Sodium lauryl sulf ate is unlikely to cause environmental contamination. It is rapidly degraded. It is not expected to
persist in the environment when applied as an herbicide. When applied according to the petitioned use, it is unlikely to cause harmful environmental effects. Breakdown of sodium lauryl sulfate is not surface active or toxic, and it is unlikely that it will cause adverse health or environmental problems.

Sodium lauryl sulfate is a very safe ingredient. It is recognized by the FDA as a grass, generally accepted as safe, and is used in marshmallow manufacturing, soda manufacturing, drug capsules, shampoo, toothpaste, and a whole bunch of other things.

It also has an exemption from tolerance from the FDA. It has an exemption from tolerance from the EPA.

So when used as an other ingredient, it not only can be sprayed near crops, it can be sprayed on crops.

The NOP reports -- sodium lauryl
sulfate is much safer than a lot of other ingredients that are allowed. For example, vinegar, sulfuric acid, sodium hydroxide, pine oil are all on the 4(b) list. Also, careful application of manure as a fertilizer allowed.

The CDC lists 24 causative agents that can be found in that substance. Other references list 40 or more specific causative agents.

The NOSB Committee response to one of the questions was that 4(a) inerts like citric acid and safflower oil could be used. This comment is actually a strong case for allowing sodium lauryl sulfate. Seeing that the NOSB does not discriminate between 4(a) and 4(b), the comment that is in the report that they make is actually a strong indication that you should approve it.

If sodium lauryl sulfate were listed as an other ingredient on a label and
not an active ingredient, it already would be allowed.

The product that we sell is an herbicide called Burnout. If sodium lauryl sulfate were listed as an other ingredient and not as an active ingredient, it already would be allowed. So, intuitively, it is hard to figure out why it makes sense that being listed in one place on the label, it shouldn't be allowed in another place, that it should be denied.

As far as comments from the Committee on aquatic organisms, I concur with the comments, and there should be some concern. The product we sell called Burnout II has on it environmental hazards, "avoid spraying directly into water."

I would suggest that the Committee accept the substance for the National List and possibly as on the front page, listed as herbicides with a restriction that it not be used in lakes,
streams, ponds, and other bodies of water.

Thank you. Any questions?

CHAIRMAN O'RELL: Thank you.

Any questions from Board members? Hue?

MR. KARREMAN: So right now it is allowed as like an incipient in formulations, is that right?

MR. VENTO: It is allowed as an other ingredient.

MR. KARREMAN: As an active ingredient or an incipient?

MR. VENTO: Oh, we have active ingredients and --

MR. KARREMAN: Or whatever the other --

MR. VENTO: -- other are inerts. The EPA has actually asked that the inerts be changed to other. So when listed as an other ingredient, it is acceptable because it is on the 4(b) list.

So I don't know; it doesn't make
sense that it is listed in one place and not another; that it should be okay.

Again, the Committee recommendation to use other ingredients that are on the 4(a) list is tantamount to saying that it is all right to use ingredients that are on the 4(b) list.

So I am not sure what you are saying.

CHAIRMAN O'RELL: Yes, Gerald?

MR. DAVIS: The main difference between the two, when you say citric acid, vinegar, safflower oil, is these four ingredients -- why is SLS different? The difference between those three and SLS is SLS is synthetic and those are naturals. Yes, they are all on list 4, but that's the difference. That is where the distinction is being made.

CHAIRMAN O'RELL: Barbara?

MS. ROBINSON: This is a list 4 inert?
MR. VENTO: Yes, that's correct.

MS. ROBINSON: A list 4? Why are you prohibiting this? Those are allowed.

MS. OSTIGUY: We are not prohibiting it. We are not prohibiting it.

MS. ROBINSON: So what is the problem? I guess I'm confused.

MS. OSTIGUY: We are not going to list it. We are not prohibiting it. It is a synthetic.

MS. ROBINSON: But they are already allowed, aren't they?

MS. OSTIGUY: No, no.

MR. VENTO: Excuse me. We use it as an active ingredient, not as an other ingredient.

MS. ROBINSON: Right.

MR. VENTO: If we put it on the label as an other ingredient, it would be acceptable.

MS. ROBINSON: Oh, so you want it petitioned as an active, correct?
MR. VENTO: Yes.

MS. ROBINSON: I get it. And it is okay to use it as an inert?

MR. VENTO: Yes.

MS. ROBINSON: I see.

MS. OSTIGUY: It's one of the problems --

MS. ROBINSON: Another one of those confusions?

MS. OSTIGUY: Yes. It is one of the problems that many of us had.

MS. ROBINSON: It is okay to have it as an inert, but it is not okay to have it as an active.

MS. OSTIGUY: It is one of the problems that many of us had with that particular solution for dealing with inerts and just doing a categorical listing.

MR. VENTO: You know, the original founders of the rules I think did a good job. They can't think of everything. I would ask that reason prevail and you
accept this substance.

Thank you.

CHAIRMAN O'RELL: Thank you.

Jim Riddle. On deck will be Tom Hutcheson.

MR. RIDDLE: Jim Riddle here, and I have no handouts and no proxies, although I did have offers.

(Laughter.)

And I still agree with everything I said yesterday, so I won't repeat any of that.

But I would like to address a couple of things that did come up yesterday, in particular, about some budget issues. Barbara Robinson made a statement that the states have only spent 40 percent of their cost-share funds. An analysis of the states' dollars from figures provided by the NOP shows otherwise, and Liana Hoodes is going to provide details on that. So I would like to pre-endorse the comments that
she will be offering later.

But the thing that really concerns me is kind of pitting the cost-share against the NOP and compliance budget. We shouldn't be fighting for crumbs. Both are vary valuable and deserve full and adequate funding. So I just really want that message to be heard.

I am also concerned about the TAP contract money because I understand that we are out of TAP contract money or TAP dollars. Last year, when I was on the Board, there was about $200,000 to $300,000 for TAP contracts, and there haven't been that many TAP reviews done.

I don't know where the money is, but, hopefully, there will be money in the next budget cycle for all of the TAP reviews. I would just request that the Board receive a budget report from the NOP at least annually. That used to happen in the early days.
If that information is out there, it really helps all of us, supporters of organic agriculture, to be able to go to the Hill and lobby and request adequate funding, if we know the money that is being received and how it is being spent.

On the dairy issues, just a few comments. One thing that concerns me was another statement that Barbara made, saying that the requirement for pasture would be a significant change to the regulation.

It is my understanding that the pasture is required for ruminants, to accommodate their natural behavior of the species, in the regulation right now. It is just a matter of clarifying how much pasture is adequate.

So I don't see it as a significant change. I see it as a refinement of the current requirements.

The Board has made numerous recommendations to resolve this issue. I
just urge you to stay engaged and to have a plan in order to submit comments on behalf of the Board when a proposed rule is issued.

Likewise, the two-track, or now the seven- or eight-track, dairy replacement situation is really out of hand. It contradicts two of the three purposes of OFPA, which are to establish a consistent standard -- this is an inconsistent standard -- and to facilitate trade in organic products.

As Hue knows, it is certainly an impediment to the trade of organic dairy animals not knowing who can buy what.

So, once again, I remind you the Board has a very simple recommendation -- it has already been adopted -- to require one track, one standard, regardless of how an operation originally converts and gets certified, and to stay engaged and be prepared to comment on that.

I would like to inform you of a
couple of developments. Nationwide Extension Service has an electronic initiative, E-Extension, and now there is an E-Organic team that I am a part of to develop electronic information through Extension offices nationwide to support and inform/educate on organic. So I wanted you to be aware of that.

Also, a new research initiative that the University of Minnesota is just engaging in is development of alternative crops, to expand crop rotations with a focus at looking at methionine content in these alternative crops.

I know that the methionine, the synthetic methionine allowance is set to expire in 2008 to stimulate research. I just wanted to let you know that is a three-year research that we are just now starting on the next crop year.

I wanted to end by saying thank you to Nancy and Kevin and Michael. I
really enjoyed getting to know each of you and to work with you.

It is quite a sacrifice of time/effort that you have put in. Just keep going on.

(Laughter.)

Yes, keep it coming. But it has been a pleasure to work with you, and I really appreciate all of your efforts. So thank you.

CHAIRMAN O'RELL: Thank you very much, Jim.

Certainly, on the work plan items for the Livestock Committee going forward, the response to a proposed rule will be a high priority as well as the origin of livestock. That has been discussed.

MR. RIDDLE: Uh-hum.

CHAIRMAN O'RELL: That wasn't the primary focus here, waiting for it; we had hoped that there would have been a proposed rule published prior to this meeting, but --
MR. RIDDLE: Yes, and the challenge for the Board, to act as a Board, you have to take actions at a public meeting. Oftentimes these proposed rules aren't in play.

But what we had done in the past, and I encourage the future Board to consider, is to compile comments and then send it as a letter from the Chair.

CHAIRMAN O'RELL: Absolutely. If the comment period is open during a portion when we can't meet in public, we will do that, yes.

MR. RIDDLE: Yes, okay, great.

CHAIRMAN O'RELL: Thank you.

MR. RIDDLE: Thanks.

CHAIRMAN O'RELL: Tom Hutcheson, and next up, Joe Mendelson.

MR. HUTCHESON: Hello. Tom Hutcheson with the Organic Trade Association.

It is nice to have been bumped to
the second day because now I can include all the collective wisdom from the first day in our own comments and have them be a little bit more polished that way.

That said, it, of course, does not include our reflections on the discussion this morning. I would like to speak a little bit about that.

First, we would like to inform the Board that in the next few weeks OTA will launch a pilot ingredients commercial list for OTA members. This follows extensive work with our ingredient suppliers and our Council, and we will keep the Board informed of our experience with this list-serv as we go forward.

In our written comments, you will notice that we do comment on a number of the items before you: the Pet Food Task Force, compost, hydroponics, agricultural and nonagricultural, commercial availability, aquaculture, and the recommendations of the
CAC Committee. I am just going to focus on a few of these for now.

First, agricultural and nonagricultural, we do appreciate the very deep work that went into the recommendations. However, while the recommendations point towards a desirable end, it is evident that we may not be ready for all parts of the recommendation to move forward.

While OTA supports the designation of yeast as agricultural, and we now do understand there are issues with livestock, it is apparent that the trade is not ready for all microbials, including bacteria, currently to be designated as agricultural.

Therefore, we do not support the deletion of the words "or a bacterial culture" from Recommendation No. 1, but we do support the other deletion in the definition of nonagricultural substance and
see no reason why that cannot move forward expeditiously.

In Recommendation No. 3, we do support the expeditious inclusion of yeast as soon as the other issues are solved. We feel that dairy cultures are not yet ready, as questions do remain regarding appropriate standards for organic dairy cultures.

We would also support moving yeast to 606 once animal feed questions are resolved, if it can be done as a technical correction, which it might be considered if the definition of nonagricultural changes, as you have proposed.

Regarding commercial availability criteria, some of the information requested consists largely of subjective market assessments which require considerable speculation. For example, regarding evidence of hoarding, how might a small handler substantiate the very real concern that a few large manufacturers could force
out their competition by buying up all available organic supplies of a critical minor ingredient?

A closely-related issue is that identification of sources or product or ingredients is usually confidential business information, which has been pointed out. We must protect the identity of these sources as confidential or risk having commonly-available organic product bought out by perhaps even one large buyer, which would force small businesses to drop product lines, a situation from which it would be extremely difficult to recover.

Regarding the NOSB and NOP role in review of petitions, we suggest implementing a process that involves posting all petitions for inclusion on 606 for public comment prior to NOSB review in order to permit potential suppliers of a petitioned product to come forward. This, I think, would complement what you are looking
for in a review of risk assessment for commercial availability.

Again, I do urge you to read the full written comments. There are other points to be made.

Regarding the issuance of certificates, including both issuance and renewal dates on a certificate should satisfy buyers' needs for current information. We understand that initial certification is not necessarily for a year and renewal dates would be in terms of a year in terms of the annual review.

Thank you very much.

CHAIRMAN O'RELL: Thank you, Tom. Just one note in your comments about yeast and being able to be moved with a technical correction, and I know that is kind of a shaky area. But there is a petition that has been filed for requesting removal of yeast from 605(a) and being placed on 606.

MR. HUTCHESON: And we do hope
that all of those 606 petitions, including any petitions for flavors, can be reviewed expeditiously. We have been urging members to submit petitions for 606 as much as we can --

CHAIRMAN O'RELL: And they have.

MR. HUTCHESON: -- and we are going to continue to do that.

CHAIRMAN O'RELL: And I believe that.

(Laughter.)

And we will try to get to them as timely as we can because we understand the urgent need for the industry with the June 7th, 2007 deadline approaching.

MR. HUTCHESON: Thank you very much.

CHAIRMAN O'RELL: Thank you.

Any questions for Tom?

(No response.)

Thank you.

Joe Mendelson, and next up is
Neil Sims.

Joe, I believe you have a proxy.

MR. MENDELSON: I do have a proxy from Steve Gilman of NOFA-Interstate.

CHAIRMAN O'RELL: So we will take him off the list and you have his time.

MR. MENDELSON: I will try not to use it all.

CHAIRMAN O'RELL: Ten minutes.

MR. MENDELSON: Good afternoon. My name is Joe Mendelson. I'm with the Center for Food Safety and the National Organic Coalition.

As always, I want to thank the program and the Board for all their hard work.

I do want to state for the record, to my knowledge, I don't have any outstanding FOIAs with the agency at this point.

(Laughter.)

So I would like that duly noted
in the record.

Briefly, yesterday there was some discussion about whether organic is a philosophy or a science, and I would proffer that it is both. It is the best of ecological science and it is a philosophy. It is not either/or.

In that context, I would like to talk about aquaculture. I have submitted comments on the recent questions. It is not up on the website yet, but copies are going around right now.

First, a little context: The Center for Food Safety recognizes that there's benefits of applying organic practices to aquaculture, but I think qualification for the organic label depends largely on the systems that are used.

Frankly, a system that puts an Atlantic salmon in an open-water net pen in the Pacific Ocean and feeds it fishmeal derived from wild-caught forage fish should
never be considered to be organic. We think such a system is antithetical to the ecological principles that underlie what organic was or how organic was developed and why Congress passed the OFPA. It is contrary to consumer expectation as to what a label on organic fish would mean, and, frankly, it is also, I think, contrary to both the OFPA and the implementing regulations.

First, on the ecological principles, there's no question that organic is focused on environmental protection. The history of developing the regulations and the law all reflect this, going back from the original 1980 study of organic that the USDA did to the 1990 passage of the OFPA, and what Congress was saying about organic at that time, the 2000 regulations, and more recently, in 2005, what the Board did to amend farm plans to greater incorporate production of biodiversity.
I would remind you that the organic regulations define at 205.2 organic production as promoting ecological diversity and conserving biodiversity. Well, the questions that were offered or asked for responses that might allow up to 12 percent fishmeal derived from wild-caught forage fish and open-water net pens I think violate this principle.

I will go briefly. I know a number of colleagues of mine from the environmental community will be speaking on these issues.

But escapees from net pens are directly looked or have been linked to loss of native biodiversity. The concentration of fish that are in these open-water pens has been linked to spreading of diseases that transfer to native populations. The concentration of waste from these facilities has been linked to toxic algal blooms and other environmental harms. The use of wild-
caught fish from forage fish, frankly, would be supporting an unsustainable practice of harvesting forage fish in many fisheries.

In fact, as more ecological science comes down, we are finding that forage fish form a basis for marine ecosystems. So impacts on those from fishmeal production really need to be further looked at, and I don't think can be considered at this point to be consistent with an ecological principle, especially when you are taking more forage fish out than the protein you are getting out ultimately from some of these systems.

Consumer expectation, there is one poll or focus group that I know of that is done by the New Jersey Department of Agriculture. Consistent with this environmental issue, just under 60 percent of consumers say they expect fish that have an organic label to be produced through systems that reflect environmental
soundness.

Second, the poll says that 95 percent of consumers expect that the fish that they would be buying with organic labeling would have less contaminants or no contaminants in it.

The fishmeal issue, that impacts directly on the fishmeal issue. We know that fishmeal derived from wild-caught forage fish has been linked to concentrating environmental contaminants such as PCBs and dioxin into that fishmeal.

When you combine that fishmeal being fed to, say, a salmon that is normally a migratory fish, but is confined to a net pen, that fish will be fatter. In that fat, it will have higher levels of PCBs and dioxins.

The farm fish, compared to a wild-caught fish, will, indeed, have increased contaminant levels. My comments reflect citations to scientific reports to
that effect.

That would be in direct contradiction of what consumers expect. They would not expect a farmed organic fish to have actually higher levels of contaminants.

Last, I would like to talk about the potential violations of OFPA. Allowing up to 12 percent fishmeal, I think falls in direct contradiction with the Harvey case. We know the Harvey decision says that organic livestock requires feed rations to be 100 percent organic feed. Right now, fishmeal derived from wild fish cannot be considered to be a feed that is organic. Essentially, allowing up to 12 percent would mean you have an 88 percent organic feed ration, not 100 percent feed ration.

I don't think you can say levels of 12 percent fishmeal are a feed additive or a supplement. I just don't think that washes.
Also, I would remind the Board that 205.239 -- and we have had discussions of this in the dairy issue -- requires producers or organic operators to establish and maintain livestock in living conditions that accommodate their health and natural behaviors. I think the Board needs to look very hard at whether using a migratory fish such as a salmon in a net pen kind of facility can be consistent with that standard.

Two other brief comments: One is on enforcement with this issue. I know there has been a lot of talk between industry, our organizations, a program about better enforcement. Well, right now there are products out there that are labeling their product as organic fish. There are no standards. The regulations don't even define fish as livestock because of the specific issue of not having standards.

Congress was clear that, when the
OFPA was passed, that USDA had jurisdiction and should enforce against any product that is labeled organic and implies that it is meeting the USDA standards but does not. I think it is time and consumers deserve to know what they are buying, and with organically-labeled fish at this particular time, they don't know.

Lastly, there was brief mention of the Peer Review Panel. I think Joe properly characterized what happened with the ANSI report, but I would also remind the Board that, back in October of 2002, our organization petitioned the Department of Agriculture, the Organic Program, to establish a Peer Review Panel based on the May 2001 NOSB recommendation for a Peer Review Panel. That legal petition is still pending. We have not received an answer to it.

We certainly appreciate the ANSI audit, but we do not feel that that was a
legal response to our petition. I would encourage the Board to look back at that recommendation and also our petition.

Thank you.

CHAIRMAN O'RELL: Thank you, Joe.

Any questions for Joe? Bea?

MS. JAMES: Is it feasible to assume that perhaps it might be just too difficult to certify fish as organic, wild-caught?

MR. MENDELSON: To certify wild-caught fish as organic, I am not sure how a certifier could certify vast ecosystems where fish is produced as somehow being consistent with organic.

I don't think we should feel that that's bad or unfortunate. I think there are a lot of folks who are looking at wild-caught systems and marketing their fish as wild-caught. Maybe that is the top of the pyramid, if we have sustainable wild-caught fisheries and then move on to organic.
Sometimes maybe we can't do the whole ball of wax. In my mind and in our organization's mind, that is fine.

CHAIRMAN O'RELL: Mike?

MR. LACY: Joe, I just wanted to be sure that we have been clear enough in our questions. The 12 percent fishmeal and fish oil thing was a temporary --

MR. MENDELSON: Yes.

MR. LACY: Okay. I just wanted to be sure.

MR. MENDELSON: We understand it is a temporary, but I still think that we have seen temporary, and you know, just the discussion on sunset, temporary doesn't always mean temporary once you have had it there for seven years. So that is a concern to us.

I would say one thing I did forget: that as far as consumer opinion, we did go out to our 40,000-member true food network to get their opinions on what they
viewed an organic label for fish would mean. We are still in the process of collating that information. Once we do have it, we will, of course, forward it to the Board.

CHAIRMAN O'RELL: Dan?

MR. GIACOMINI: Without having had an opportunity to look at your entire comments, you specifically mention problems with open pen, with the 12 percent fishmeal violating Harvey, with aspects of migratory fish being in a natural setting. Not meaning to sound flippant or anything, do you see any potential for organic farmed fishing, aquaculture?

MR. MENDELSON: I think we do. Like I said, it is system-dependent. I think closed systems, maybe some land-based systems, systems that are not initially based on fishmeal.

So maybe you are looking at herbivoric species or fish species that don't feed on fishmeal. That, in fact,
could be a basis for developing organic fishmeal down the line.

So I don't think we rule out organic aquaculture. We certainly understand that there's a history of using aquatic animals in farm systems for centuries. So I don't think aquaculture is per se inconsistent with organic.

CHAIRMAN O'RELL: Any other questions? Bea?

MS. JAMES: I am just trying to get my head around this idea of the netted-off pens that are in the ocean, having that be certified when the ocean water is the same as the wild-caught, whereas in crops, agriculture, you have to have your land go through a period of three years. The ocean never changes. It is what it is.

So I'm just confused how we could have netted-off pen systems as a possibility for organic fish.

MR. MENDELSON: Well, as my
comments reflect, I agree. I hadn't looked at it, considered the difference between certifying a land-based system over a three-year transition and water sources versus the actual water sources.

I think, just based on an ecological principle, and what we know happens to net pens and the escapes, the fish, and what that means to the environment, that it is inconsistent.

CHAIRMAN O'RELL: Thank you, Joe.

Neil Sims, and then next up is Dom Repta.

MR. Sims: Aloha. My name is Neil Anthony Sims. I am the President and Co-Founder of Kona Blue Water Farms.

There was an insert, I believe, in your folders to this effect, which I would like you all to refer to, if you can, as I go through.

I am also a representative of the Organic Seafood Council. The Organic
Seafood Council is an industry association of producers, brokers, wholesalers, certifiers, and other industry entities that have come together to allow us to speak with one voice on issues that concern us.

These deliberations of your Board are of tremendous importance to our Council and to the future of organic seafood.

Kona Blue is the first integrated open-ocean fish farm and marine fish hatchery in the U.S. We are growing a sashimi grade Kona Kampachi in waters over 200-feet deep, using innovative hatchery techniques and advanced ocean engineering.

We are committed to environmentally-sound aquaculture, and we believe that open-ocean fish farming can and should be able to be organic. Our fish deserve it; the environment deserves, and American consumers deserve it.

The principles of organic production lie at the core of our company.
Our company's mission is to expand the environmentally-sound production of the ocean's finest fish. Our company's core values are sustainability, product quality, and consumer health, all of which are fundamental organic principles and essentials of organic consumers' aspirations.

Just as an aside, and additionally actually, our Chairman, Mr. Tom McCloskey, was formerly the lead investor and Chairman of Horizon Organic Dairy, one of the largest organic success stories in the world.

I respond in the following pages here to the specific questions that were delineated in the September 8th invitation for comment.

However, firstly, I would like to address that which I believe is a wide misapprehension, that fish farming is inconsistent with organic principles. This
perspective has been deliberately fostered by some of the prior testimony to this Board, testimony that is at best ill-informed and at worst broadly slanderous.

The best way to address these untruths is through transparency. I, therefore, issue an open invitation to you all as a Board or as individuals to come to Kona and to visit our offshore fish farm site and our hatchery operation.

There you will see the waters in which we culture our fish, some of the cleanest waters on earth. You can snorkel around our cages and see that the water quality upcurrent from our fish cages is, indeed, indistinguishable from the water quality downcurrent of the cages.

You will see how we rear our fish, native fish, in the hatchery using algae that we grow ourselves to feed to the zooplankton, which, in turn, feeds our larval fish.
You will see the innovative submersible cages that we have deployed, which reduce the likelihood of escapes and minimize the impact on the view plane.

You will see us humanely harvest our Kona Kampachi, a fish that in the wild is considered unsalable, but which we, through our rigorous commitment to quality in our hatchery and grow-out procedures, we are able to render into a high-end sashimi-grade product that is prized by the top chefs throughout the country.

I realize that it is difficult for you all with your busy schedules to travel to Hawaii, much as you might wish. So I have inserted here amongst the text of this submission photographs of our fish and fish farm that should help to inform your thinking.

I would also recommend you to our website, where we have video footage of our fish offshore and details of our
comprehensive permit process and the ongoing monitoring. In the interest of complete transparency with our community and with our customers, we have water quality data from our ongoing water quality sampling program, www.kona-blue.com.

I hope that this will help you to understand that, while fish farming is often framed as a pejorative, we believe that it can and should be conducted in an environmentally-sound manner, in strict accordance with ecological and organic principles.

Certainly, there are additional costs that we must bear to ensure that our fish farm meets the standards which we have already independently set for ourselves, but we also hope that organic certification can provide recompense for what we have accomplished so far and can further spur us and other fish farmers like us towards continuing improvements in our farming
methods.

This is what organic certification has done for dairy, beef, poultry, and crop production. This is what it should also do -- no, this is what it must do -- for seafood.

Thank you.

CHAIRMAN O'RELL: Thank you, Neil.

Nancy?

MS. OSTIGUY: Just to clarify, do you use any fishmeal?

MR. SIMS: Yes, we do. About 50 percent of our feed is a combination of fishmeal and fish oil.

We were originally feeding our fish what is called an organic diet. It is produced in British Columbia, but it is organic in European standards. But this is primarily based on Peruvian anchovies, which was to prove that an anchovy fishery is sustainable in its current sense; it is not
scalable. If we are going to go and build an industry around open-ocean aquaculture, we want to find a more broadly-sustainable solution in the long term.

So this organic fish feed, we recognized ourselves, wasn't what we would like to embrace as a company. So we worked with the feed company, and we said, "We need to include more sustainable ingredients in here," primarily those of agricultural origin.

So we have been able to replace 50 percent of the fishmeal and 25 percent of the fish oil with agricultural grains. We can't do this with an organic feed now because there are not the organic grains available in the quantities that we would need.

We would also hope to find -- I'm sorry, you're looking -- we're talking primarily about Canola, which is the main replacement for the fish oil. There is not
organic Canola available, so I am given to understand.

We also aspire towards more replacement of the Peruvian anchovy by use of fishmeals and fish oils from byproducts from edible seafood processing, such as the Alaskan pollock or the salmon.

One comment that I would have on the questions that you have here, it is not really clear to me the delineation that is drawn between fishmeal and fish oil from reduction fisheries, such as the Peruvian anchovy, and fishmeal and fish oil from processing byproducts of what are otherwise edible seafoods.

I think an organic principle would say that we should embrace the recycling of these byproducts, and so we shouldn't restrict fishmeal and fish oil from these edible seafood processing byproducts. Perhaps you may wish to limit fishmeal and fish oil from Peruvian
anchovies and like fisheries, although they do come from incredibly clean waters in a very well-managed fishery, but the other byproducts I think we should encourage, just as the fundamental organic principle of recycling and good use.

MS. OSTIGUY: A followup: My question actually has to do with whether or not the feed is organic, and you're saying no, is what I am hearing.

MR. SIMS: Organic by what standards, please?

MS. OSTIGUY: By our standards.

MR. SIMS: By the standards of the 12 percent, as it is drafted in here?

MS. OSTIGUY: No, no, no. As it exists right now, the organic standards that animals and plant production are currently held to by OFPA and the rule.

MR. SIMS: No, the fish feed that we are using at the moment is not because the grains that are included in there do not
come from organic sources. We would love to have organic Canola available to be able to include that.

The other thing is fishmeal, I am a little unclear about the status of fishmeal because somebody had mentioned earlier today that fishmeal is included in organic poultry feed. Could somebody perhaps -- is that correct?

MS. OSTIGUY: No. No.

MR. SIMS: There is some confusion. And if it is, I would wonder why are we drawing a delineation between what we feed the chickens and what we feed the fish.

Perhaps the same question might be asked of fish oil, if fish oils are included in any agricultural, any other feeds for other agricultural animals.

MR. KARREMAN: I believe there's some soluble fish oils that some of my dairy farmers have used in the organic -- they're certified organic.
MR. SIMS: Okay. Please remember this is a sustainable fishery for these forage fish in the Peruvian anchovies, which is the prime source for what we use. But we, ourselves, recognize we don't want to be wholly reliant on this. We want to move towards something that is more broadly sustainable, as we are building a larger industry out there.

CHAIRMAN O'RELL: Joe?

MR. SMILLIE: I hesitate, Chairman, because of the time constrictions, to open up the full-scale aquaculture debate, which we will have.

CHAIRMAN O'RELL: Right, which is not on the agenda to be a general vote item.

MR. SMILLIE: It is not on the agenda for a vote.

So having participated in the Aquaculture Task Force, as Kevin has also, I think this is a large, complex issue. Neil has brought a number of very important
points. Again, it is going to be one of those issues on what goal do we want to achieve.

Do we want to bring in organic aquaculture or do we not want to? What compromises are we willing to make to do so?

It is going to be a long one and, I am sure, a contentious one, but I just don't think we can start it today. But I really thank you for your comments and sort of putting it out there, because we will be dealing with it in great detail.

MR. GIACOMINI: And we will work on taking you up on your offer.

(Laughter.)

MR. SIMS: Bring your sunscreens and your mask and snorkel.

CHAIRMAN O'RELL: Just make sure you read your conflict-of-interest guidelines before you head to Hawaii.

(Laughter.)

However, as an outgoing member of
NOSB, I could certainly be talked into going there.

(Laughter.)

MR. GIACOMINI: We all must be properly educated before making a decision.

CHAIRMAN O'RELL: Just remember it is sashimi grade.

MR. DAVIS: A quick question.

CHAIRMAN O'RELL: Gerald?

MR. DAVIS: I'm not sure if it is in here somewhere. This species of fish, is it carnivorous or --

MR. SIMS: Yes, it is carnivorous.

MR. DAVIS: In its natural native -- okay.

MR. SIMS: Yes.

MR. ENGELBERT: Kevin, real quick?

CHAIRMAN O'RELL: Yes, Kevin.

MR. ENGELBERT: Do you have any plans for any other species of fish, to try
to raise in the methods you're using right now, for those types of pens, that location, that water depth? Any other plans anywhere else of any type of diversity?

MR. SIMS: Not immediately. This one fish distinguishes itself so well with feed conversion ratios and its growth rates and its presentability, both as a sashimi product or in the white tablecloth restaurant.

It is a tremendous fish to be growing. I am really proud to be growing it. I would love to be growing it organically.

CHAIRMAN O'RELL: Thank you, Neil.

Dom Repta and Amy Nankivil.

MR. REPTA: Good afternoon. My name is Don Repta. I'm from the Coastal Alliance for Aquaculture Reform. From the name, you should be able to figure out what I'm going to be talking about, aquaculture.
I have come from British Columbia. This issue of organic aquaculture is extremely important to us, in reference to the NOSB, in that British Columbia is the largest supplier of farm salmon to the United States. Seventy-seven percent of our production ends up in the United States market, which recent data shows is about 50,000 metric tons of farmed salmon end up into the U.S. market.

I am here to say that we do commend the Committee on taking on this pretty contentious issue of aquaculture. We have been working as a group for somewhat two decades now on salmon farming issues. So you might be there in 20 years as well.

We do not support open-net cage carnivorous species for organic standards. We would support herbivores in these standards.

We think that it is imperative that the production method in the
carnivorous species such as salmon, which most of my experience is with, be considered separately, and even considered whether or not it will ever fit into the framework of organic principles.

The basis of this is basically 15 years of peer-reviewed published science that I have included into the written submission I have made, six pages of peer-reviewed published science, which I think is really important to mention, that it shows that actually open-net cage systems cannot uphold the ecological integrity of the surrounding environment. It can't even maintain the ecological integrity of the surrounding environment. In fact, open-net cage carnivorous farms in British Columbia are showing to decrease the ecological integrity of the surrounding environment.

Most recently, you probably have heard the really hot issue in British Columbia is the issue of sea lice impacting
wild salmon. Wild salmon are pretty much a foundation of the entire coastal ecosystem up and down the West Coast, extremely important in British Columbia.

Right now, we just had a report come out of the University of Edmonton, co-written by the University of Victoria, Princeton, and Hawaii, showing that migrating juvenile wild salmon that pass salmon farms are having up to 95 percent mortality rates from sea lice. This is an astronomical impact on the foundation of the coast.

We are seeing escapes of farm salmon globally. We have partners in Chile, Norway, Ireland, Scotland. It is fair to say right now that the standards for conventional farm salmon do address this. They do say that production facilities must minimize escapes. Yet, we have over a million escapes a year globally.

In 2004, in British Columbia, we
had 40,000. I know in Europe they have had incidences, single incidences, of over half a million farmed fish, farm salmon.

We do have the issue of waste. I did take note that in the standards, the draft recommendations, waste is actually categorized as a metabolic product, which I find quite odd.

This is the waste; we are talking about large-scale farms here. We are also talking about a product that has a cultural impact in British Columbia. We have First Nations territories, First Nations populations who are dependent on species that exist around salmon farms. We are seeing that their rockfish populations are being contaminated, and we are seeing major impacts on their clam beds.

So there is a cultural aspect to these standards as well that I think is missing in the draft recommendations, especially if we are getting area-specific
to British Columbia.

We also have predator impacts. Again, already in the conventional industry they are supposed to minimize or eliminate impacts on predators. There are a couple of farms in British Columbia that are operating under what they would call organic principles. Yet, in May of this year, we had 1300 sea lions drown in one net. That was pretty significant impact. Again, we are seeing these impacts consistently through the last 30 years.

Okay, some things that I will get to: The solution is closed containment. We have been working for that for a long time. However, closed containment technology in the marine environment still does not adhere to organic principles.

It is not allow the innate behavior of the salmon. They are a migratory species.

And on the feed issue, even if we
decrease or allow 12 percent feed to be used, we are still talking about a feed conversion efficiency rate of 1.5 to 1. If we assume that organics is going to grow in the next seven years to 25 percent of production of BC farm salmon to the U.S. market, we have a net loss protein of 8500 metric tons of wild fish still. Highly inefficient, does not adhere to organic principles.

Also, we are at a point now where I think consumers really have clarity on what organic means. We have a system that is really supportive of organics. To introduce a species that is so contentious with, you know, we have environmental groups that will be sending a different message than somewhat that the organic producers will be, I think it muddies the water on what organic means.

Please ask me questions -- lots.

(Laughter.)
I came all the way -- this was an expensive 300 seconds I just had.

(Laughter.)

CHAIRMAN O'RELL: Well, you gave us a lot of information here, though, in the handout, which is great.

MR. REPTA: Yes.

CHAIRMAN O'RELL: And we appreciate that because it will be information for us to consider in discussion, further discussions on the topic.

Any specific questions at this time? Nancy?

MS. OSTIGUY: A similar question that was asked to others: Are there any types of seafood operations that your group would find acceptable within an organic system?

MR. REPTA: Yes, for sure. We would find species much lower on the trophic level. We would find herbivores acceptable.
The real issues are raised in carnivores. I mean I believe this would be the first time in North America that USDA and OCB would allow the farming of a carnivore to be called organic.

So I am not sure -- I think I'm correct in saying that. But we can't see how it fits into the kind of organic paradigm.

I must say there are a lot of global initiatives working right now to reform the salmon farm industry. There are partnerships with industry, environmental groups, academics, scientists, retailers. So this work is being done already.

I think we can get it to a place that goes beyond the organic scope and actually see organic certification of carnivores, actually, take us a step backwards from where we already are.

CHAIRMAN O'RELL: Yes, Gerry?

MR. DAVIS: I'm very ignorant on
I do not sit on the Task Force.

A quick question though: Your organization is against net pens and net type of culture. How do you farm salmon?

MR. REPTA: Well, currently, in British Columbia the only technology used is open-net pen systems. We have been working to reform the industry for a number of years now.

We are at a point now where we are at the table with governments and industry, and really looking at the economic feasibility of closed containment systems. We are comparing the economic feasibility. In that comparison, we will look at actually right now what the industry can just put off as externalities, including that into the cost of open-net systems.

There is a trial project that is supposed to be happening in this upcoming year of a closed containment system. We
have worked very hard on getting the funding going for this. So we are committed to reforming the industry, not shutting it down. But we believe it can be brought to a place that resembles sustainability in some form.

CHAIRMAN O'ReLL: Nancy?

MS. OSTIGUY: These reforms that you are trying to negotiate, one of my questions has to do with the innate behavior of, let's say, specifically salmon. Is there a way to do a confined system that actually accommodates their innate behavior?

Part of the reason why I'm asking is that how we choose to do the aquatic standards has a lot of influence on other species, including one that I'm most familiar with, which is honey bees, accommodating natural behavior and forage being very important.

MR. REPTA: Short answer: No, which is why we believe that this falls
outside the realm of organic standards. I mean it is not to say that we shouldn't keep pushing for reform.

We have gone through this process in British Columbia. For two years, we had the Certified Organic Association of British Columbia looking at aquatic species.

One of their main reasons for denying organic certification was that it would not allow the innate behavior, open-net cage systems and closed-net cage systems, which is one of the reasons why I think that basically salmon farming or carnivores can't be classified organic. It can be classified as something, whether it is more sustainable, whether it has a different kind of stamp on it, but I really think the push for organics is just a push for marketplace.

CHAIRMAN O'RELL: Any other questions?

(No response.)
Thank you very much.

MR. REPTA: Okay, thank you.

CHAIRMAN O'RELL: We appreciate your comments.

Amy, I think that we are going to take a break, if that is okay with you, and you will be first up. I appreciate that.

Oh, we have a 3:15 break. I thought it was 3:00. Okay, all right. I just did a time check. I thought it was 3:15.

Corey Peet is next on deck then.

Thank you.

MS. NANKIVIL: Hi. I'm Amy Nankivil, and I am with Northland Organic Foods and Northland Seed and Grain, based in St. Paul, Minnesota.

Thank you for the opportunity to speak today. I would like to make a few comments regarding the Handling Committee's recommendation not to renew bleached lecithin as an allowed substance on the
National List under 606.5.

Much of what I prepared to say today was discussed earlier this morning, and I am in agreement with most of the ideas presented. Therefore, I will move through quickly to get to break.

There seemed to be some confusion surrounding the use of lecithin and the forms in which it is available for food, cosmetic, and nutraceutical uses. There are essentially two primary forms of lecithin used today, a fluid form and a powdered form. Within each of these two forms, there are many different versions or specifications. I believe one commenter suggested up to 165 forms.

Lecithin, bleached, has been listed by the NOP under 605(b) and primarily referred to powdered lecithin, which is considered a nonagricultural product.

Unbleached lecithin, on the other hand, has been listed under 606 and covers
fluid lecithin that is unbleached and is considered an agricultural product.

I brought two samples to show the difference between fluid and powdered lecithin. One is a typical bleached fluid lecithin; the other is a typical bleached powdered lecithin.

As you can see, they have very different physical appearances. As you can imagine, they have very different functional properties.

While fluid lecithin is primarily used in margarine and chocolate manufacturing, the powdered form is used in dry bakery and beverage mixes, cookies, pretzels, dried fruit, powders, instant infant formula powder, cosmetics, and anywhere else that a liquid with high soy oil content cannot be used.

At Northland, we produce and sell both fluid and powdered lecithin as conventional non-GMO products. Northland
and others have worked with experts in the oil and lecithin fields to develop certified organic dry lecithin. It has comparable characteristics and properties to the conventional counterparts.

As of today, we have been unsuccessful. We and others continue to work and hope to have something acceptable in the future.

While fluid organic lecithin works for certain limited uses in chocolate and margarine production, it does not function well for most other applications, particularly where a powder form is required. This can be confirmed by the many organic food manufacturers who have tried the fluid organic version and who have submitted letters to the NOSB recommending to renew both bleached and unbleached lecithin. In fact, there were 20 companies that originally petitioned to specifically keep bleached lecithin on the list.
The NOSB Handling Committee made a final recommendation for 606 lecithin, unbleached, on April 20th, 2006 to renew the substance, saying, quote, "The Handling Committee agrees, based on compelling evidence given by a manufacturer of organic lecithin, unbleached, that every use of lecithin, unbleached, cannot be adequately filled by the organic forms that are currently available."

It follows, then, if unbleached fluid lecithin does not work for all applications, then certainly the same fluid product that is bleached will not work either.

It is even more clear that the fluid form of lecithin will not work to replace the powdered form.

Commercial availability is defined as, quote, "the ability to obtain a production input in an appropriate form, quality, or quantity to fulfill an essential
function in a system of organic production or handling, as determined by the certifying agent in the course of reviewing the organic plan," end quote.

Organic bleached lecithin powder is not available in an appropriate form, quality, or quantity to warrant having it removed from the National List, nor will the fluid form work as a replacement.

While it is the goal of everyone here today to work diligently to replace non-organic ingredients with certified organic counterparts, we must be sure that the organic versions are readily available in the form, quality, and quantity before removing the non-organic counterparts from the National List.

Therefore, based on the information that Northland and many others have submitted, I would like to ask the NOSB Handling Committee to strongly reconsider and renew lecithin, bleached, as published
in the final rule 205.605(b).

Thank you very much for considering my comments and your hard work on this particular ingredient.

CHAIRMAN O'RELL: Thank you, Amy.

Any questions?

(No response.)

Thank you.

MS. NANKIVIL: Thank you.

CHAIRMAN O'RELL: Corey -- oh, Rebecca. I needed my glasses.

MS. GOLDBURG: I'm pretending to be Corey.

CHAIRMAN O'RELL: Okay.

MS. GOLDBURG: As you can tell, I am not Corey Peet. I'm Becky Goldburg. But Corey couldn't be here today, and he asked me to read his comments and I agreed to do so.

CHAIRMAN O'RELL: Okay. You are also signed up --

MS. GOLDBURG: I am signed up to
offer my own comments.

CHAIRMAN O'RELL: Okay, so this is just --

MS. GOLDBURG: These comments are on behalf of the Monterey Bay Aquarium.

CHAIRMAN O'RELL: So it is not a proxy. It is five minutes.

MS. GOLDBURG: It's five minutes.

CHAIRMAN O'RELL: Thank you, Rebecca.

MS. GOLDBURG: Well, first of all, I want to thank you for the opportunity to offer these comments. Please accept these comments on behalf of the Seafood Watch Program of the Monterey Bay Aquarium.

"Since its inception in 1984, the mission of the Monterey Bay Aquarium has been to inspire conservation of the oceans. For the last six years, the Seafood Watch Program has been working to foster consumer and business awareness and action for sustainable seafood. Over this time, we
have distributed over 8 million easy-to-use pocket guides to consumers throughout the United States.

"We have submitted comments to your questions and summarized them here today.

"Overall, we are in support of organic aquaculture, especially for low food chain species such as shellfish and odiferous fish grown in systems where inputs and outputs can be carefully controlled.

"At present, we have considerable reservations about the concept of organic production for carnivores species, such as salmon and other emerging species grown in open-net pen systems, as these species and systems are currently inconsistent with the principles of organic production.

"In addition, these pose considerable sustainability concerns regarding the protection of wild ecosystems, human health, and feed procurement."
"The scientifically-documented environmental impacts associated with open-net pen production of carnivores includes the high use of marine resources for feed, contaminants, escapes, disease and parasite transfer, the release of chemicals, and impacts on local predators.

"Many of these issues result from the use of open-net pen technology, which is dependent on a free flow of water from the cages to the surrounding marine environment. This lack of control over inputs and outputs means that open pens are simply not consistent with the current principles of organic production which requires careful control over inputs and farm exports. As such, we do not support products grown under these conditions as being labeled organic at this time.

"In addition, we suggest that certifying the use of wild fish as organic feed input is a direct contradiction of
organic principles and a requirement of control at all levels of production.

"In addition, the reduction and complete elimination of fishmeal and fish oil is also not consistent with organic principles, which state that species must be fed a diet consistent with their natural diet. While it is likely that alternatives to fishmeal and fish oil will be developed, the numerous scientifically-documented environmental concerns with farming of carnivores, the inconsistency of these alternative diets with organic production principles, and the inconsistency of using wild fish as feed with organic principles call into question the suitability of carnivores as being labeled organic at this time.

"An additional serious issue for the farming of carnivorous fin fish involves the high use of fishmeal and fish oil in their diets. Leading scientists have warned
about the inherent unsustainability of farming of the food web because of the relative inefficient use of marine resources.

"Additionally, although it has been argued that some reduction fisheries are sustainable or well-managed, present fisheries science models give little consideration to the importance of small pelagic fish in the wider ecosystem.

"The ecosystem sustainability of reduction fisheries must be resolved before specifies heavily dependent on these feed inputs can be certified as either sustainable or organic.

"We firmly believe that organic production should represent the gold standard for human health and sustainable production. The statement `good for you and good for the earth' is widely believed to be the consumer expectation of organic products."
"The USDA organic label is an established and trusted name to consumers, and USDA should seize the opportunity to set a gold standard for sustainable organic aquaculture.

"Given the range of issues associated with production of carnivores fin fish and the numerous ways that farming carnivores are incongruent with organic production principles, we conclude that trying to certify farmed carnivores at this stage could erode the high standing that the USDA organic label has with consumers.

"Given the confusion in the marketplace over what is sustainable and healthy, it is very important that the USDA organic label remain true to its principles and lead the marketplace in setting a high bar for healthy and sustainable products.

"Thank you for the opportunity to comment, Corey Peet, Aquaculture Analyst, and George Leonard, Science Manager, for the
Seafood Watch Program at the Monterey Bay Aquarium."

And I understand that the Aquarium also submitted, and I have seen them on the web actually, much longer comments for the Board.

CHAIRMAN O'RELL: Yes. Thank you, Rebecca.

MS. GOLDBURG: Okay, thank you.

CHAIRMAN O'RELL: The next person on the list, I think I got a note to take this individual off. So I just want to check with the audience. It was Sue Ann McAvoy. She's not here. Okay. So we can take her off the list. I didn't want to pass anybody up.

It is 3:15 now, and we do have a scheduled break. So I would like to take a 15-minute break.

When we come back, Diane, you are up, and Lynn Clarkson will be following Diane.
We are going to start promptly at 3:30.

Thank you.

(Whereupon, the foregoing matter went off the record at 3:19 p.m. and went back on the record at 3:40 p.m.)

CHAIRMAN O'RELL: Diane, I see you are ready to go. How about that?

MS. GOODMAN: No time to lose, guys.

CHAIRMAN O'RELL: Thank you.

Lynn Clarkson is following Diane.

MS. GOODMAN: I would really like to wait for Julie to be here. Is that possible?

CHAIRMAN O'RELL: Wait for who?

MS. GOODMAN: Julie. I could switch.

CHAIRMAN O'RELL: If you want to switch, because we have a quorum here, and I apologize that there is a member missing, but -- she's Handling Committee. Lynn is
related to Handling Committee as well.

MR. CLARKSON: My name is Lynn Clarkson. I am one of the Managing Directors of Clarkson Soy Products. We have what might be called a vested interest in organic lecithin.

I have submitted some materials being passed around to you, giving a cover letter, sort of a processor's state of the industry, followed by a couple of recommendations for you, followed by market segmentation.

We are offering you the best information we can get in the world. We are not relying only on our own opinions. We have gone out and found the leading expert, at least we think the leading expert, in the world, and tried to make sure that we are providing you very valid information.

Since I do not like to read to people who can read better than I, let me just encapsulate what we are offering here.
First of all, there are some research and development projects going right now that will moot much of your discussions today. I read all the comments that you received, and the language that we are using with respect to lecithin might be misleading.

There are really two families of lecithin, fluid and de-oiled. Under the de-oiled world, you run into powdered and granular.

So if I could walk you through a process, typically, lecithin starts with a soybean. It comes in and you extract oil. The conventional world uses hexane to extract the oil.

From the oil, you try to extract lecithin, but that carries quite a bit of oil with it. The conventional world then uses acetone to de-oil the lecithin.

So for any conventional lecithin today being used in an organic product, we
are using hexane, which is No. 80, 88, on the National Pollution Index, and we are using acetone, which is even worse. Most people aren't aware of that, but acetone is probably No. 20 on the National Pollution Index for bad things.

Okay, if we switch over to the organic world today, we start with an organic soybean. We do not use hexane. We extract the oil physically. We extract the lecithin with a combination of temperature and pressure and certain mechanical procedures.

If we then want a bleached version, we apply hydrogen peroxide; you have a bleached version.

Now if you want a de-oiled version today, you would need some solvent to extract the remaining oil residue with the lecithin. That is not available today.

But in our R&D labs, we have done that. But the conversion from an R&D
project to a commercially-available project will typically take about 16 months to 18 months. So within something like, at the low end, 12 months, at the tail end two years, there should be powdered, de-oiled, organic lecithin without any changes in the rules today. So I look forward to that day.

A suggestion for you: If there is at any time in the future a lecithin formulation that the organic world can't meet, you are in a position, I would hope, with the sufficient sophistication, to at least require that those folks providing it start with an organic soybean.

We are not facing a limitation of organic raw materials here. We are facing some process limitations.

If you would do that, then you would reduce the tendency to play games with the system, to reduce the cost of an ingredient. So we would like to see that.

When I appeared before you
before, I told you that roughly 165 formulations -- really, I perhaps confused you with that. It doesn't mean there are 165 different families. There aren't really significant differences.

There might be 165 versions of fluid lecithin, but the variations are largely on viscosity, and almost every variation there can be taken care of, be fully addressed today, inside the organic system.

So, in summary, the organic system is working the way I think you and we want it to work. It is making progress. R&D is happening. More organic products are going to become available in the ingredient line.

Secondly, we have roughly 80 to 85 percent of the current omnibus market for lecithin covered by organic lecithin, and we have some additional work to do on some things. As of today, not every usage of
lecithin can be met by an organic lecithin. It has been expressed to you by other people; it is absolutely true, but we see that changing.

So thank you for your time. Questions?

CHAIRMAN O'RELL: Thank you, Lynn.

Any questions for Lynn? Andrea?

MS. CAROE: Lynn, have you considered petitioning to have lecithin removed or the annotation on lecithin changed that would require organic soybeans be used for the listed material?

MR. CLARKSON: Yes, I began considering that earlier today.

(Laughter.)

MS. CAROE: Just to follow up on that, it is good to know that at a bench level we can do this without the synthetic solvents. However, until that is commercially available, I don't know that we
can even consider it.

MR. CLARKSON: Sure.

MS. CAROE: I mean it is nice to know, and I hope that we will receive a petition to have it taken off the list at that time, but --

MR. CLARKSON: Well, my question, let me phrase a question to you. Would you prefer we do this incrementally or would you like for us to wait the roughly 12 to 16 months and just proceed in a general way to petition for the removal of lecithin, or would you like to see us promptly submit a petition to remove fluid lecithin?

I think I understand.

CHAIRMAN O'RELL: Andrea?

MS. CAROE: I don't think it is up for us to decide that. We are going to react to what you do. I mean it is our business to serve the community --

MR. CLARKSON: Sure.

MS. CAROE: -- but we don't put
the petitions out there. When they are out there, we are going to service them the best way possible.

MR. CLARKSON: Well, these are somewhat sophisticated procedures in our community. They take a lot of your time. They take a lot of the time of the people here in the room.

So my question really was a more practical one. Should we do this twice or should I just wait and only take your time once? But I am guessing I am going to take your time twice.

(Laughter.)

MS. CAROE: We're anxious to find out what you decide.

(Laughter.)

MR. CLARKSON: Any other questions?

(No response.)

Thank you very much.

CHAIRMAN O'RELL: Thank you very
much, Lynn. We appreciate it.

Diane? Next up would be Andrianna Natsoulas.

MS. GOODMAN: Thank you. I am Diane Goodman. I am consultant to the organic industry, primarily for regulatory compliance.

This is my second comment to you. Thank you again to the Board and to NOP for the opportunity to comment today. Especially thank you to Kevin and to Nancy and to Mike for the past five years of patience and humor and diligent work.

Many of my comments were included in previous comments by me as well as others. So I promise to make this one different.

Regarding your recommendation for commercial availability information requested to add substances to 606, I got it that the Board and the Department want to see justification from the petitioner that
there is enough evidence, historical, current, and futuristic, to prove that 606 is the appropriate section for their agricultural substance and that there is the reality or likelihood that it may one day not be available in organic form.

It sounds a little vague, but we've got a lot of experience with vague. So at least we are on familiar ground.

I think the combined comments about concerns over commercial availability are all valid. I understand the explanation from those of you on the Board who I have had this conversation with, that everyone now gets it, that the NOSB is not going to make commercial availability determinations. I hear you that all the NOSB will do is evaluate a potential risk.

And I am still not convinced that there is a whole lot of difference, substantive or implied, between having the NOSB review this justification and not call
it making it a determination, since this will be new criteria and petitions will be determined for recommendation based on this decision.

Now that said, we need to take this process out for a test drive, see how it goes, and we will all know if it runs smoothly.

Please do schedule more meetings exclusively for materials review and put your recommendations forward. This will create the precedent and confidence that we need to move ahead so we can trust and confidently refine a process that will work for the Department, for the Board, and for the industry.

About colors, maybe I'm being obstinate or stubborn or obsessive or just spoiled and wanting my own way, but I still don't see why it is not possible to petition for an annotation for a substance already on the National List. It doesn't matter how it
got there, and it doesn't matter that it may sunset in a year, because right now on the list is where colors are.

While most of the substances, if not all others, that are going to end up on 606 aren't on the list anywhere, at least colors have the distinction of being there. There is an advantage to that in that in this time of no time to get this work to done, buying time to review colors in all their glorious and potentially non-synthetic use doesn't sound to me like such a bad idea.

It is not as if there aren't already more than 32 petitions in the queue and one-third of them have been returned, compounding the time necessary for petitioners to revise, correct, and make them complete, and then resubmit them to NOP.

Arthur Neal made interesting points earlier today in the discussion about
recommendations to sunset lecithin, bleached, that if there is no viable alternative, it should continue to be allowed on the National List. Robinson followed by adding that killing it would cause harm to the industry.

Needless to say, colors have no viable alternatives, and killing them will cause harm to the industry.

Arthur went on to say that the NOSB needs to base its decisions to remove a substance during sunset against criteria developed and agreed upon for sunset review.

In the case of lecithin, bleached, there never was a petition. It would follow, then, that a decision to remove it would still need to be based on the same sunset criteria.

In the case of colors, there never was a petition or a recommendation. I looked into this history and ended up in a conversation with a former NOP staff person,
Ted Rogers, who worked on the earliest version of the regulations. I knew Ted in those days, and we had a recent good conversation.

I asked him if he knew or remembered anything about how colors got on the list. He replied, yes, he put them there, and he did so based on SOOPAH, which was the System of Organic Farming and Handling, the current thinking of the day.

It seems to me, and I really hesitate to say this, that some responsibility for colors being on the list lies with the Department. So, in closing, perhaps some of the alternatives presented would offer solutions to the dilemma we have over colors. Perhaps reviewing the category against petition criteria that applies to 605(a), using the TAP review received earlier this year, perhaps considering a petition now for annotation that colors non-synthetic be approved only for one year, and
we have a precedent for this with methionine, where we have a limited amount of time that that material would be allowed for use.

Please do reconsider some kind of alternative, some kind of out-of-the-box thinking, that might not be terrible, might even be legal; just a little cushion between one category of substances at risk and some others. And if none of these suggestions are acceptable in good conscious and according to law and regulations, maybe, hopefully, you may have another idea that will.

Thank you again for all your work and commitment. I look forward, as always, to what the future holds. Thank you.

CHAIRMAN O'RELL: Thank you, Diane.

Any questions for Diane?

Diane, the methionine issue was not a sunset.
MS. GOODMAN: I understand.

CHAIRMAN O'RELL: So the precedent there --

MS. GOODMAN: It is a tricky precedent, but it is something that was annotated with an extension and then another extension to allow it on the list for a limited period of time.

CHAIRMAN O'RELL: But it has been specific, I think, in working with the program in terms of changing annotations.

MS. GOODMAN: I know, but I had to bring it up.

(Laughter.)

CHAIRMAN O'RELL: I appreciate that, and you brought up some other food for thought, I guess.

MS. GOODMAN: I hope so.

CHAIRMAN O'RELL: Color for thought. So we appreciate that. Thank you.

MS. GOODMAN: Thanks.

CHAIRMAN O'RELL: Okay.
Andrianna Natsoulas, and next up, Rhonda Belluso.

MS. NATSOULAS: Thank you. My name is Andrianna Natsoulas, and I am representing Food and Water Watch. We are a national nonprofit consumer advocacy organization based here in Washington, D.C. We seek to ensure the health, nutritional and environmental integrity of our food and water.

Food and Water Watch is pleased to have the opportunity to comment further on the interim final report to the Aquaculture Working Group. On October 6th, we already submitted comments. So, hopefully, many of you have already had the opportunity to take a look at those comments. I am just going to shorten them, make them very brief, and pull out specific points.

We urge the Livestock Committee to carefully develop the standards for farm-
raised seafood, taking into consideration consumer health and the health of the environment.

First of all, and most importantly, fishmeal and fish oil from wild fish should not be allowed in organically-certificated farm-raised seafood. A variety of scientific studies have found that farmed fish have high concentrations of persistent organic pollutants such as dioxins, dioxin-like PCBs, and organo chlorine pesticides due to high concentrations of these contaminants in the wild fish they are fed.

Furthermore, using wild fish to feed organic farm-raised seafood would, in fact, compromise the integrity of our environment. The UN Food and Agricultural Organization has identified 75 percent of wild fish populations are either overfished, approaching an overfish condition, or already depleted.

In addition, any fish that were
to be used to feed these organic farm-raised fish should come themselves from organic farms. So they should themselves be organically-certified.

Furthermore, third-party certification of sustainable fisheries in general, whether it be farmed or wild, should not be allowed, as third-party certification does not allow any accountability or transparency.

Three, only closed inland aquaculture facilities should be certified organic. Those inland ponds must not harm this running environment. They must be closed containment, so as no waste harms the surrounding terrestrial lands, and they must be a certain distance to prevent any contamination of natural ponds, lakes, rivers, or oceans.

Fourth, producers of organic seafood, organic certified seafood, must not kill, harm, or harass predators and other
wild species. This often is a problem with birds. Oftentimes with inland farms the birds are attracted to these ponds, and there have been cases where farm owners, the producers, will kill them to deal with that situation. So there should be absolutely no harassment or killing of any wild species when it comes to certifying farm-raised seafood.

Fifth, Food and Water Watch opposes the use of byproducts from the slaughter of terrestrial animals in organic aquaculture feed that could compromise consumer confidence in the organic standards, because many consumers do consume seafood, but they do not consume terrestrial animals -- chicken, hogs, cows.

So we thank you for the opportunity to comment on the aquaculture standard. I would also like to just make one comment on the avian flu.

Food and Water Watch urges you to
define procedures to exempt growers from allowing flocks access to pasture when threatened by disease, particularly avian influenza. We understand the need to protect flocks in the case of an avian influenza outbreak, but there needs to be evidence of such a threat, and certifiers need to be informed in how an exemption is granted. So that should be taken into future consideration.

Again, Food and Water Watch thanks you for allowing us to publicly comment, in addition to our written comments, which we have already submitted. We do have confidence in you that you will protect the integrity of organic standards and protect consumer confidence.

Thank you. Are there any questions?

CHAIRMAN O'RELL: Thank you very much.

Any questions?
MR. KARREMAN: One comment regarding the avian influenza. If there was an emergency and there was some declaration made, there are mechanisms within the regulations for exemptions to happen due to emergencies.

MS. NATSOULAS: They are already in?

MR. KARREMAN: Yes.

MS. NATSOULAS: Okay, thank you.

CHAIRMAN O'RELL: Dan?

MR. GIACOMINI: Yes, one of the issues that we have grappled with in this discussion is, and that is where the compromise of the seven-year and 12 percent and those things came from, is sort of a Catch-22: How do we create the organic fish to be used as the source of fishmeal and fish oil if we don't have anything to feed them that is considered organic?

MS. NATSOULAS: Right, uh-hum. So the idea is that, after seven years, then
there would be a way to feed them fully organic. Well, that indicates that it may not be time right now to be certifying carnivorous fish. That precisely may indicate that there needs to -- maybe in seven years come up with an organic standard, and during those seven years develop alternatives, so wild fish doesn't need to be used.

But that does indicate that maybe we just are not at the point now to certify carnivorous fin fish.

Anything else?

(No response.)

CHAIRMAN O'RELL: Thank you.

MS. NATSOULAS: Thank you.

CHAIRMAN O'RELL: Rhonda Belluso.

Dave Townsend is next.

MS. BELLUSO: Hi. Good afternoon. Thank you very much.

As you said, my name is Rhonda Belluso. I am presenting the comments of
the Pure Salmon Campaign. Our Director Andrea Kavanagh was originally scheduled. She apologizes; she is a bit under the weather today.

The Pure Salmon Campaign is a project of the National Environmental Trust. Pure Salmon is a partnership of over 30 organizations from across the globe with a common goal of raising the environmental and health standards of farm-raised fish.

We believe that carnivorous fin fish, specifically salmon, can be farmed safely with minimal ecological damage if the industry adopts standards that protect the environment, consumers, and local communities.

In our perspective, this means replacing open-net cages with enclosed tanks equipped with proper water filtration systems for waste and developing ecologically-sustainable forms of food to replace the current fish feed.
Pure Salmon Campaign fully supports organic aquaculture for herbivorous fin fish such as tilapia and catfish and other low food chain species such as shellfish that are produced in controlled environments. However, we do not support organic aquaculture for carnivorous fin fish, especially those farmed in open-net cages or integrated net pen systems.

While we support containment technology as a solution to many of the environmental impacts of carnivorous fin fish farming, we believe that the natural dependence of carnivorous fin fish on wild fish feed makes carnivorous fin fish inherently incompatible with organic standards.

We are here today to urge the National Organic Standards Board to omit carnivorous fin fish aquaculture, specifically the open-net pen systems, from consideration for a USDA organic label.
The Pure Salmon Campaign believes that the production of carnivorous fin fish in an open-net cage is inconsistent with organic productions on several fronts. The four main areas are:

One, there is a lack of a physical barrier between farm fish and wild fish. Therefore, the producers lack control over the inputs and outputs of the aquaculture system.

Two, carnivorous fin fish in open-net cage production uses non-organic wild fish for feed, which, according to the standard, organic livestock, including fish, must be fed 100 percent organic feed. As no wild fish are currently certified as organic, carnivorous fish farmers would not be able to meet the requirements of 100 percent organic feed if they rely only on wild fishmeal and fish oil.

Three, this type of production does not improve, and in many cases
degradates the genetic and biological diversity of the surrounding environment.

There are over 40 peer-reviewed science studies that support this statement. Dom Repta from CAAR gave you, I think, six pages' worth of some of the same studies.

Many of these studies clearly point to main examples of negative impacts. The first is escapes, and the second is disease and parasite transfers.

Fourth, farming migratory fin fish such as salmon ignores the species' natural behavioral needs, as discussed earlier.

As you have noted, there were specific questions asked to those for the public to comment upon. In our written comments submitted last week and posted on the NOSB website, we provided detailed responses to the Livestock Committee's request. So I urge you to look at those. I am just going to give a brief summary to try
to keep within my time limit here.

To start, we strongly urge the Livestock Committee to consider only those species which by their nature could comply with the current definition of organic.

In response to the second question regarding impacts on soil and the environment, we believe that the farming of low food chain species in controlled environments could well maintain the soil and environment surrounding the farms. However, we look to a large and growing body of peer-reviewed research that again demonstrates the varied and significant degradation of the marine environment, and that can result from farming carnivorous fin fish in open-net cages.

On consumer perceptions of the differences between organic and conventional aquaculture, it seemed unlikely to the Pure Salmon Campaign that organic consumers would expect organic seafood would be produced in
the manner that uses open-net cage with little control over inputs, provides little to no protection for the transmission of disease and parasites, lacks of full treatment of waste, poses potential competition with wild fish for feed, and has the potential for lethal impacts on marine mammals and other marine organisms, uses wild fish for feed, contains unhealthy levels of PCBs and other contaminants, and is fed livestock byproducts such as poultry bones and feathers.

To determine U.S. consumer perceptions of organic seafood, we conducted a national omnibus poll of approximately 700 U.S. consumers.

CHAIRMAN O’RELL: You can finish your thought.

MS. BELLUSO: Yes, thank you.

Of that number, of that close to 700, 60.5 percent questioned said they would not expect USDA organic farm fish to contain
contaminants or be farmed in a way that is harmful to marine wildlife and does not allow fish to follow their natural behaviors.

CHAIRMAN O'RELL: Thank you, Rhonda.

Any questions?

(No response.)

MS. BELLUSO: Thanks.

CHAIRMAN O'RELL: Thank you. We appreciate your comments.

Dave Townsend. Next, Jim Pierce.

MR. TOWNSEND: My name is Dave Townsend. I am with Crystal Peak Environmental. We were the petitioner on the sulfuric acid addition to the livestock waste.

I will get into why that was in a little bit. Some of you may be wondering. It has been an interesting learning process for us.

We filed the petition several
years ago, and since that time, we have learned quite a bit about the organic rules. Since the Crops Committee has issued their recommendation a few weeks ago, and in considering their recommendation, we have learned more. Then today, this morning, listening to the report of the Crop Committee, we learned quite a bit about the interpretation of the rules.

Based on what we have learned and what we have heard, I would like to make a request today. I would like to request that the Board defer any final decision on our petition until we have had a little more time to research the Crop Committee's recommendations, specifically, with respect to citric acid, an alternative to the sulfuric. That is one of the things that we really have learned a lot about.

Honestly, getting into this a few years ago, it seemed simple. It seemed that sulfuric acid was already on the list for
fish and aquatic products. We'll give sulfuric a try. It worked well. Let's do a petition.

Well, we have learned since that it is not so simple. This is a complicated process, and there's a lot of history.

Citric, similarly, I thought sort of fell into that same category, that it is on the list for use with fish and aquatic fertilizers, and therefore, it must be synthetic; it must need to go through the same petition process.

Honestly, right now, today, I don't know the answer to that. That is one of the things I would like some time to look at. I would like some time to look at whether citric acid will actually work for us, whether we need to file a new petition, whether it is a natural substance, and we don't need to do a petition.

So among other things, there is a lot of research and homework that we would
like to have a bit of an opportunity to do on that aspect of the Committee's recommendations before a final decision is made on our petition.

Another part of the Committee's comments dealt with compost. While compost is not typically done with liquid animal waste, such as in the swine industry that I work within, it is something that I would like to take a little bit of time to reconsider.

We have some legitimate concerns about the comment that it is an available alternative, because it is not available everywhere. It tends to be available where there is poultry and turkey production. But where we are in the Midwest, there are some organic producers; there could be more. The ones that are there have trouble getting compost, and then in other areas of the country, where I have talked with producers, organic producers, where they can get
compost, they have difficulty with quality and quality control.

We had a process that we worked on for six or seven years that produces a very nice, pelleted, odor-free, dust-free, pathogen-free product. We did use sulfuric acid in the pilot plant, and it made a nice product. It prevented the emissions of the ammonia during the production. We think that there is a possibility citric might do the same, but we would like a little more time to figure out that, as well as consider the regulatory aspects of the rule.

So, based on the things we learned, we request that the NOSB defer on final action on our application.

CHAIRMAN O'RELL: Okay. Dave, we appreciate your comments. This is something that we can do to vote, to defer based on the petitioner's request to update a petition or time for additional tests to be able to supply answers or questions
regarding the TAP that was done from the petition process.

So are there any specific questions for Dave?

MS. CAROE: Just one.

CHAIRMAN O'RELL: Andrea?

MS. CAROE: Just to make a point to the Board: By us doing this, since the material is being petitioned to add on the list, this doesn't hamper our decision in any way. It is not putting it on the list. It is just asking for time before we make our consideration. So I think tabling it is appropriate, and I am very interested in what you find out as far as the alternatives identified by the Committee.

MR. TOWNSEND: Thank you.

CHAIRMAN O'RELL: Joe?

MR. SMILLIE: I do agree with it, but if the question is to reform their petition on sulfuric, I see tabling it. If it is to give them time to come up with
citric, it would have to be a new petition.

CHAIRMAN O'RELL: No. No, it is to test -- in the TAP they had talked about that as an alternative.

MR. SMILLIE: Oh, okay.

CHAIRMAN O'RELL: And they want time to be able to test that as an alternative --

MR. SMILLIE: Right.

CHAIRMAN O'RELL: -- which it's their petition; it is certainly procedurally fine for us to table the vote until the petitioner comes back with additional information.

Okay, thank you.

MR. TOWNSEND: Thank you.

CHAIRMAN O'RELL: That's fine.

Okay.

MR. TOWNSEND: Thanks.

CHAIRMAN O'RELL: And committees will meeting this evening to adjust recommendations for tomorrow morning.
Hue?

MR. KARREMAN: Just a question: How long is a TAP good for? I mean, what if they come back in two, three, four years? Let's just say, is this current TAP going to be okay at that point?

CHAIRMAN O'RELL: Well, we've used past TAPs in the sunset review process which was five years later. So I think it is just -- we have to go back to the TAP itself and see if there's any information that we feel is no longer relevant or needs to be updated. But that is a case-by-case determination.

George Kalogridis is following Jim. Thank you.

MR. PIERCE: Thank you. I am Jim Pierce. I am going to be speaking comments without a script but with some outline from both Organic Valley and from my other life as a trout farmer in Wisconsin, so on behalf of the Wisconsin Aquaculture Association.
Great work. I am seeing excellent interaction between Board, program, audience, and having been a regular suspect at these things for years, I have seen some stinkers.

(Laughter.)

I think, honestly, Mike and Kevin and Nancy, you are leaving things in good hands.

Case in point: We were talking about commercial availability. A consumer rep speaks up and says, "How are we going to guarantee credible documentation of commercial availability?" A certifier rep speaks up and says, "Well, this is our plan to do just exactly that." I really like that. You guys are wearing your hats well, and you're working well together.

George, when he was on the Board, George Siemon, of course, was retired from the Board with Jim Riddle, he used to ask in all these discussions, "Who dies?" So I
want to ask you now, "Who dies?"

On these crop materials, I think the collateral damage might be minimal, but the precedent is a little bit concerning. I am wondering if it might be time for my standard tools lecture.

Anybody who has heard me give these speeches knows that I am a staunch conservative when it comes to standards, but I am considerably more liberal when it comes to materials. If the material can go through the petition and TAP process and be shown to be a viable tool in organic agriculture, I think it should be listed. Even if there is another tool there that may be as appropriate, or in some cases more appropriate, there is woefully few tools on the list, and to add whatever is appropriate for farmers, I think should be done.

A case in point is this calcium. I just dealt with a case this week where the guy was very close to a sugar beet
processing. So he had access to sugar beet lime, which is a great source of calcium, but guess what, it's synthetic and not allowed. So he is importing calcium from who knows how far, mined calcium, that, by the way, doesn't absorb as fast in the soil. It is just the balance. That seemed counter to organic principles, to have to truck in mined lime when he had a resource right there.

On colors, you ask the question, "Who dies," and I think there's going to be a line of bodies. I think it is going to be from the processors, from the consumers possibly, and it is going to lead right back to farms supplying the raw materials. So be very careful with that determination. I wish I could stand here and give you the silver bullet, but there's not one.

I do think, though, that it is a much more complicated issue as to what is a color and what is not, and how those things
all come together.

A lot of your recommendations on the table today, you are asking for rule changes. That's fine. That's fine to ask for rule changes, but we know how long rule changes can take. We also know how much of a workload the NOP is working under.

So maybe at the same time as you ask for them, you will give them some prioritization in their procedure to take them through. Because, otherwise, it is still going to be the Wild West for another five years, which wouldn't be at all unusual.

On private label -- and then we will switch to aquaculture -- on private label, your proposal on the table works for me. It works for Organic Valley.

We do 10 or 12 private label agreements, some of which are done with other manufacturers as well. I'm confident that that audit trail is not broken. Just
from a simple HACCP and recall procedure, that's there. Any consumer, any date-coded product can be tracked back. So, respectfully, I agree with Joe.

(Laughter.)

On to aquaculture, I was heartened to hear that you are still accepting comments. So answers to those six questions from the Wisconsin Aquaculture Association will be forthcoming.

A couple of quick points that I would say is: I would like to see someone from the aquaculture industry appointed to the NOSB, just as you have a handler on the Board who happens to have a lot of expertise with colors and flavors, and you have a farmer on the Board who happens to be very well-steeped in the dairy issue, as you struggle with difficult dairy issues, I think that's good.

I have heard the conversations on net pens and appropriate systems. I say you
set the systems and let the entrepreneurs figure out if they can do it. If someone can figure out how to do salmon in a net pen that is not environmentally or accumulatively, whatever, detrimental, let them try to do it.

You saw an excellent example from Mr. Sims how net pen systems can work in certain situations.

The consumers will take care of the rest. I honestly think, if domestic protein is an issue in feed, although it is certified organic, it will work it out.

The last comment: If Mr. Sims can make it here from Kona for a five-minute comment, you guys can make it to Kona. So I will just end by saying, "Aloha."

(Laughter.)

CHAIRMAN O'RELL: Thank you, Jim.
Any questions for Jim? Did you have a question, Julie?

MS. WEISMAN: No, no. I was
saying I'm volunteering to go to Hawaii.

CHAIRMAN O'RELL: Oh, you're volunteering to go, okay.

(Whereupon, the foregoing matter went off the record at 4:20 p.m. and went back on the record at 4:22 p.m.)

CHAIRMAN O'RELL: George, you have our attention.

MR. KALOGRIDIS: My name is George Kalogridis. I own George's Organics, which is an organic sourcing company. We have been dealing with commercial availability for about 20 years.

I want to depart from my prepared remarks quickly to talk about the expiration date on certificates. I think that that will be problematic for stream-of-commerce items as well as aged products, miso, wine, cheeses, where something is laid down for two or three years before it goes out into the stream of commerce and continues in the stream of commerce for quite some time. You
are talking about having to have addendums to the certificate every year on something that won't make it into the marketplace for three or four years.

So I think the expiration dates work very, very well, and would suggest that you take another look at expiration, which is going to be renewal dates. I'm sorry.

I am here today to talk about additional language to commercial availability for a proactive plan. Early this year I submitted a proposal to have proactive language included into the recommendation for commercial availability. The current NOSB recommendation does not address this language.

There is a general consensus among organic ingredient suppliers that, without proactive language, we will continue to revisit this important issue over and over again for the coming years. If there is not a plan, nothing will move forward.
When there is a request, it is a very simple proposal that works within the framework of the organic certification. When there is a request for an organic ingredient exemption, the petitioners must attach a proactive plan detailing how they will either create an organic analog or resolve the organic ingredient shortage situation. This plan would automatically become part of the organic handling plan of either the petitioner or the company that is using the non-organic ingredient and would be subject to annual review by the organic certifier.

If you view an exemption as a privilege and not a right, the addition of a proactive plan is a logical resolution to the issue of commercial availability.

Any questions?

MS. CAROE: Yes.

CHAIRMAN O'RELL: Andrea?

MS. CAROE: You're not really
meaning petitioner; you're meaning organic certified applicant?

MR. KALOGRIDIS: No, I am talking about when a person files a petition for a non-organic ingredient, at that time they also put in a proactive plan to be able to find an organic analog for that product.

MS. CAROE: Are you sure you're talking about petition and not the certificate?

MR. KALOGRIDIS: I'm talking about both. I'm talking about both. Anybody making a petition to say, "I want to have an exemption from organic" should also have in their hand a plan of how I'm going to create the organic product as well. Then that proactive plan would then attach to their organic certification of anybody using that product.

So we would always be in front of them; you would always have the certifier inspector asking them, what's being done
about this?

So the idea is to make it a front-burner issue so that we can actually come up with solutions. I have been involved in two projects where there wasn't an organic ingredient. I have to tell you that the process of petitioning to remove something and get people to accept it from a financial standpoint has been hellish. It really hasn't worked like it is supposed to, and there needs to be another way to approach it.

CHAIRMAN O'ReLL: Yes, Joe?

MR. SMILLIE: I'm having the same issue. You are talking about a petition to put something on 606?

MR. KALOGRIDIS: Uh-hum.

MR. SMILLIE: So you want that plan to be part of that petition, not just part of the justification of non-availability as executed by the certifier?

MR. KALOGRIDIS: Absolutely.
MR. SMILLIE: Okay.

MR. KALOGRIDIS: I mean the organic community is allowing you the privilege to operate in our industry. For you to just say, well, here it is and I'm not going to try to find something else, I don't think is acceptable.

MR. SMILLIE: And you don't find it adequate enough that on the second level -- let's suppose something is placed on 606, that you don't find that your idea isn't adequate if it is just placed on the person that says, okay, it's on 606; I'm requesting that I can use conventional because it isn't available. Then what you are saying is, indeed, the certifier's role in determining what they plan to --

MR. KALOGRIDIS: Exactly. It is a dual track.

MR. SMILLIE: It is not enough. You want both?

MR. KALOGRIDIS: I want both. It
is a dual track, because they are asking for an exemption from our industry.

Yes?

MS. CAROE: I need to be recognized by the Chair.

MR. KALOGRIDIS: Oh, I'm sorry.

CHAIRMAN O'RELL: Andrea? George can recognize you.

(Laughter.)

MS. CAROE: Yes. You know, what is different, though, and the climate is changing from where we were, is that just by placement of these materials on 606, there is proactive movement. By them being placed on the list, organizations like yours, George, are saying, okay, well, people are wanting to use this and they consider this not available; how do I fill that gap?

That has not been the situation. Nobody knows the depth of what ingredients are being used in that less than 5 percent as a non-organic component at this time.
There is, just by us changing our procedure and using 606 in this way, there is a proactive movement to move those towards organic and --

MR. KALOGRIDIS: It is not a proactive; it is an identification. Identification is not proactive.

MS. CAROE: Well, I don't want to argue, but --

MR. KALOGRIDIS: Oh, come on.

(Laughter.)

MS. CAROE: I'll get you afterwards.

CHAIRMAN O'RELL: But, George, I see that being proactive from two standpoints -- if you are a supplier, you have the capability to proactively go out and maybe see how you would manufacture something to comply with the regulations. If you are a user, what type of proactive plan could you have other than telling people you need this material?
MR. KALOGRIDIS: The proactive plan would be to go to their supplier and say, "What are you doing to resolve this?" There are many products on these lists right now which are natural or non-GMO, or whatever they may be. There's never been any effort by the supplier of that ingredient to come up with the organic analog.

MS. CAROE: You know, if --

CHAIRMAN O'RELL: Go ahead, Andrea.

MS. CAROE: I'm sorry. You know, say I'm a manufacturer of curry, you know, a frozen dish.

MR. KALOGRIDIS: Uh-hum.

MS. CAROE: Or something that includes saffron, okay? And say there's no organic saffron available. Nobody is doing it. I petition to have it put on 606, and I show that there's just not production of this. It is a high-value item, and the
suppliers are just not interested in supplying to the small organic industry for the amount of saffron that this industry uses.

So I show that it is not available, and I am working with my certifier to prove that I am not finding it. If saffron is on that list, and I'm a supplier of spices to the industry, I look at that and say, "Hey, if I make that available, they're going to have to use it, and I can show that it's available," that is motivation.

I think this opens it up for the suppliers to fill those gaps. I really feel that it is there.

I think by placing it on the list, that is the plan. That is the plan. I am placing it, I'm identifying it to the industry that this is in shortage.

MR. KALOGRIDIS: I can tell you right now that there are companies out there
that game this system very, very well. They do it by saying, "This is not available."

The way they say it is not available is they never plan in the future to make it available. We have had people that will come up, and we have gone to them and said, "If you sit down with us and you work with us, we can do contracts, and we can have this product for you within a year to 18 months." They never do it, and they won't do it until there's something to happen.

It is really a problem.

MS. CAROE: I agree right now, but I don't think that is going to happen in the future. I don't think it can.

MR. KALOGRIDIS: Well, let's ask the question he brought up, "Who dies if we follow this plan?" Nobody.

MS. CAROE: The expansion of the organic industry. The expansion of the available --
MR. KALOGRIDIS: No, no, I'm saying if you adopt a proactive plan, who dies? Nobody.

CHAIRMAN O'RELL: Julie?

MS. WEISMAN: I would have a concern that if this becomes -- one thing that I think would happen is that I think that this would bog down the 606 petition, against which we have a very tight time -- the 606 process.

So I think a big piece of the organic processed food industry dies.

MR. KALOGRIDIS: It isn't bogging anything down because there is not time limit on it. It simply says --

MS. WEISMAN: But it will complicate the process of evaluating petitions. Listen, I'm on both sides. I supply an ingredient, and I also have to try and continuing to source ingredients for my 95 percent products that are not currently available organically. I run into what
Andrea describes. My use is not big enough to make it interesting to the people who currently manufacture the products in the form that I need them.

You know, I could try to make them in my own facility, but I don't really have that expertise.

MR. KALOGRIDIS: And you could identify those as part -- it is just like an organic handling plan. You have to identify where the problems are and then say, "How am I going to solve it?"

It is just a basic -- if you look at a five-year forecast or seven-year -- you know, it doesn't make any difference to me as long as there is a proactive plan to resolve the problem.

MS. WEISMAN: I'm not sure how substantive that necessarily -- just because it is on the petition doesn't mean that it is any more substantial than having the materials be listed on 606 now.
I need a little more convincing.

MR. KALOGRIDIS: Have you got the time?

(Laughter.)

CHAIRMAN O'RELL: Okay, thank you, George.

MR. KALOGRIDIS: Thank you for the time.

CHAIRMAN O'RELL: Thank you.

Katherine?

Steffan Hake is up next.

MS. DiMATTEO: Hi, and today I am Katherine DiMatteo.

It has been a long time since I've actually been to an NOSB meeting. Probably from the time Tom Hutcheson joined the Organic Trade Association, I have sent him as my emissary or our emissary, OTA, to these meetings.

I have to say I came reluctantly to the meeting today because of the 10 years I have spent going to the meetings, but I
want to thank you all and commend you on your really dedicated work and the good meeting facilitation, the preparations for the meeting, NOP being here, the interaction. Again, I guess I will join Jim in noticing the interaction, the good interaction, between the Board and the industry, the community that is here, each other, and the staff.

I have to say that, very much like many of the very early meetings of the NOSB -- I don't want to take up all my time, but I felt that I had to make note of that and to let you know, as you sit there towards the end of this very long day, that your good work and your good intentions and your commitment are recognized.

I am commenting today or I am bringing back a comment on agricultural and nonagricultural, and the written recommendation I am changing -- the written comment that you just received, I'm going to
