For example, speaking ahead of what we've got here, somebody said, "Well, what if we give the antibiotic to the breeder stock in the last third of gestation?"

Well, if we said you can apply it to -- administer it to the animal before the last third of gestation and the calf is still organic, if we say that, then it really means that if you do it in the last third of gestation, it's not organic.

And I guess -- it seems to me that it's almost like we're going to have to say both sides of the coin every time we go out with something, but I'm going to try and explain these things as we go along.

MS. KOENIG: Okay. I'll wait till then.

MR. SIEMON: I just want to clarify, because there's a lot of -- a lot of questions about these documents. Are we going to go through a discussion now about these documents?

MR. MATTHEWS: I'm going to give you the dos and the --

MR. SIEMON: We are going to?

UNIDENTIFIED FEMALE VOICE: We are.

MR. MATTHEWS: -- what they do and what they don't do. Okay?

MR. SIEMON: I'm glad for that.
CHAIRMAN KING: Okay, and Jim, just one quick comment --

MR. RIDDLE: Yeah, before you get to the specifics of the documents. Barbara addressed the public comment limitations or non-existence but didn't -- you didn't really respond to Dave's question about the role of the Board, where we're charged under OFPA to provide advice to the Secretary on implementation, and I look back --

UNIDENTIFIED FEMALE VOICE: And this is already being implemented [phonetic] --

MR. MATTHEWS: This is already implemented.

MR. RIDDLE: Well, it's implemented continuously. That's why you have to --

MR. MATTHEWS: Well, it's --

MR. RIDDLE: -- give guidances on an ongoing implementation.

MR. MATTHEWS: These sections of the regs have already been implemented. What we are finding is inconsistent application across certifying agents.

MR. RIDDLE: Right.

MR. MATTHEWS: And so what we have done is taken what we know to be inconsistent practices by certifying agents and tried to bring uniformity to these issues.

MR. RIDDLE: But, if I could continue, I look
back at a policy, what probably would be considered now a directive, that was developed a while back in collaboration with the Board, and that was how to calculate percent organic ingredients and the role of added water, and I see that as a model example where the Board was consulted, drawn into the process, and came up with a directive which has not been open to criticism, it's really stood. People understand it, and it's the best example that I can think of where the Board was drawn in, we were able to exercise our responsibility, and the end product then has the support of the Board and the public.

So, you know, I just hope we can use that as an example and move in that direction more than, you know, this blindsiding or catching us by surprise, where -- it's just not a healthy situation.

CHAIRMAN KING: And simply put, just to follow up on Dave and Jim's comments, I think it's safe to say that the Board really would like to be involved in the process, we feel we're here to assist and advise, and if there's something that we can do to help that process improve, then we're certainly open to that. So --

MR. MATTHEWS: Okay, we hear that. The next slide, please. Okay, we're going to start with program scope. What does the program scope do? It identifies
product categories not covered by OFPA. Those include personal-care products, body-care products, cosmetics, dietary supplements, over-the-counter medications, health aids, fertilizers, soil amendments, manure.

It also identifies product categories covered by OFPA for which we have not engaged in rulemaking. Those two areas are: aquatic animals and pet food. We just have not done rulemaking, and we can't require, we can't enforce, our standards on industries that have not been afforded the opportunities of the Administrative Procedures Act, which requires formal rulemaking in order to bring them into the fold.

Again, what the directive does, it states that the products not covered by OFPA cannot be certified to the National Organics Program. It states that aquatic animals and pet foods, in the absence of standards, cannot be certified to the NOP. It does not mean that they will never be covered by the NOP; it's just that there are no standards, and in the absence of standards, you cannot be certified to the NOP.

It states that products that cannot be certified to the NOP cannot carry the USDA seal. That's both for those that are not covered by OFPA as well as those that are covered by OFPA, that have not yet had rulemaking.
performed.

    Now, what the directive does not do, it does not
prohibit certification of such products to other standards.
    You'll recall in the preamble to the Final Rule we say
that certifying agents who want to certify products that
are not -- that are not covered by the NOP standards may do
so, so this means that Dave Engel's group can go ahead and
create standards for cosmetics, if that's what they want to
do.

    MR. RIDDLE: For organic cosmetics.
    MR. MATTHEWS: For organic cosmetics. They can
do that if they want. We have not said that certifying
agents cannot create their own standards for the products
not covered by OFPA.

    This directive does not allow the identification
of non-organic agricultural ingredients as organic. As the
directive clearly states, all agricultural products
produced and handled in the United States must be certified
to the National Organics Program to carry the word
"organic." Okay, so we're not saying that you can use
conventional products in these products as an ingredient
and call it organic unless it is an organic ingredient.

    MS. CAROE: Excuse me.
    MR. MATTHEWS: Yes.
MS. CAROE: So that's the enforcement of the ingredient deck of these products that are outside of OFPA?

MR. MATTHEWS: The entire labeling of those products is outside of OFPA, but if they're going to say that an agricultural ingredient within that product is organic, then it has to be organic, it has to be a truthful label claim.

MS. CAROE: So does that --

UNIDENTIFIED MALE VOICE: That --

MS. CAROE: Let me finish that. So does that mean that NOP compliance could actually enforce that if --

MR. MATTHEWS: No. We would probably turn that over to Commerce.

MS. CAROE: Okay.

UNIDENTIFIED FEMALE VOICE: Justice.

CHAIRMAN KING: Okay, I think George had -- okay, Kim.

MS. DIETZ: One of the questions we're hearing out there is the use of the word "certified." We'll have USDA-certified agricultural products and we will have QAI-certified or, you know, Joe Smith-certified. Will they be able to use the word "Certified Organic"?

MR. MATTHEWS: Yeah. Yes.

MS. DIETZ: Thank you.
MR. MATTHEWS: They can --

MS. DIETZ: As long as it's truthful labeling.

MR. MATTHEWS: -- make any truthful claim. What they cannot do is represent it to be USDA/NOP-certified.

MS. DIETZ: That's a question out there, that people are asking.

MR. MATTHEWS: That's right. It does not prohibit identifying organic agricultural ingredients as organic, as I said, it does not prohibit labeling such products as organic.

UNIDENTIFIED MALE VOICE: And it doesn't matter what standard.

MR. MATTHEWS: It doesn't matter what standard. Because cosmetics are not covered, for example, by the Organic Foods Production Act. We cover agricultural products, and a cosmetic's not an agricultural product.

CHAIRMAN KING: Barbara.

MS. ROBINSON: Just to add to what Rick is explaining there, just to make it perfectly clear to people, in case you don't realize:

USDA is given its authority by the Congress. USDA cannot unilaterally wake up one day and decide that it now has jurisdiction over another agency's regulated entities. Those products that are not covered by OFPA
because of Congress are covered by the FDA, and we have no
authority to change that, we cannot enforce against
products over which we have no jurisdiction.

If you have issues with that, you must take it up
with the Congress. You cannot ask USDA to do it
differently; they have no authority to. It's just a simple
fact of government.

CHAIRMAN KING: Dave, then Becky.

MR. CARTER: What, if any, discussions have been
held with other agencies, such as FDA, that if entities
under their jurisdiction are going to use the term
"organic," that there is some sort of consistency with the
USDA Organic Rules, has there been formal discussions or
informal discussions with those agencies on that issue?

MS. ROBINSON: I think we've probably had a few
informal discussions, but nothing of any seriousness, and
frankly, given that we do not have the enforcement
authority for those areas, we expect those industries to do
just as this industry did. USDA is not going to propose
standards and we're not going to propose regulatory
behavior to the FDA. We expect the industry to come
forward and -- Keith -- Keith can add to this.

MR. JONES: Dave, that's actually an excellent
question, because we're required to consult, we actually
have consulted with FDA, we've consulted with FDA
extensively on this. I just had a conversation with FDA
last week.

FDA is not certain -- and I can't speak for FDA
and wouldn't speak for FDA. They're not certainly exactly
what they're -- what they're going to do. FDA has been
quite clear in all of the discussions that it has had with
USDA and with industry that our rendering is correct. You
know, laws have limits, the Organic Foods Production Act
has limits, and these areas that we're talking about are
squarely within FDA's purview for their labeling, okay?

So we've been very diligent in making sure that
FDA has been involved in the process and that FDA concurs
with where we're at in this.

CHAIRMAN KING: Hold on, I've got people ahead of
you, Andrea. Becky and George.

MS. GOLDBURG: Barbara or Keith. I'd like to
better understand the limits of this directive when you're
dealing with agricultural products. I understand what
you're saying about cosmetics and so on not being covered
by the law, but let's take fish or pet foods. I'm not --

MR. MATTHEWS: That's the next slide, I'm going
to address fish and pet food on the next slide.

MS. GOLDBURG: Okay.
MR. SIEMON: Same question here.

MS. GOLDBURG: Well, can I ask my question --

MR. MATTHEWS: Sure.

MS. GOLDBURG: -- and then you can tell me it's on the next slide. I want to understand what the limits of the certification of those types of products outside the USDA program are. For example, how does part of the statute and the regs that deal with prohibited methods apply to, say, salmon? Could we have organic transgenic salmon? I guess I'm trying to jive in my mind how --

UNIDENTIFIED FEMALE VOICE: That's a (inaudible), that's a totally different issue, Becky.

MS. GOLDBURG: Well, I --

UNIDENTIFIED FEMALE VOICE: We don't have standards, so they can't be certified.

MS. GOLDBURG: I know. So basically --

UNIDENTIFIED FEMALE VOICE: There is no certified organic salmon to the USDA standard.

MS. GOLDBURG: I know. I know. But that's my question. I understand that. So in other words, outside -- certifiers can certify to their own standards --

UNIDENTIFIED FEMALE VOICE: Right.

MS. GOLDBURG: -- that they create.

UNIDENTIFIED FEMALE VOICE: Right.
MS. GOLDBURG: And I'm not -- I don't (inaudible) any certifiers about to do this, but I want to understand how open the scope of potential organic certification for agricultural products is.

UNIDENTIFIED MALE VOICE: It's open.

MS. GOLDBURG: Is it entirely open, is it partially constrained by --

UNIDENTIFIED FEMALE VOICE: What do you mean by open, what do you mean is it open?

MS. DIETZ: I think what the question is, and this is where the industry was 20 years ago, whether it's OTA developing standards or whether a private entity develops standards, they're going to be allowed to do that, as long as they certify to a standard. There's no -- USDA is not going to step in and say "those are approved" or "not approved." It's going to be --

MS. ROBINSON: Industry can bring us standards for those -- what you're going to see from Rick on the next slide, pet food can come forward, fish can come forward, they -- as you saw in the previous slide, they are covered by OFPA, but we have no standards. Ergo, if the industry brings us standards, we go into our rulemaking mode, we publish them, we ask for comment, we take the comment, we work with it, we publish a Final Rule, boom, they're
covered. From that point on, any private standards go away.

MS. DIETZ: But until that point --

MS. GOLDBURG: But until that point, when there are only private standards, they can be highly variable --

MS. ROBINSON: That is true.

MS. GOLDBURG: -- and my question is: are there constraints on what those private standards can say?

MS. ROBINSON: No.

UNIDENTIFIED FEMALE VOICE: No.

UNIDENTIFIED MALE VOICE: No.

MS. ROBINSON: No.

MS. GOLDBURG: So, for example, prohibited methods are not prohibited from the private standards --

MS. ROBINSON: It is pre-October 21, 2002, for those commodities. That's what you have to go back to.

MS. GOLDBURG: Okay. Thank you.

MR. SIEMON: I'd rather see the slide, but -- it just fits in so well. So we couldn't have just said: since we don't have standards, we're going to use livestock feed for pet food, or something like that, you couldn't have had that discretion is what you're saying, until we developed standards?

MR. MATTHEWS: We -- in order to fully comply
with the Administrative Procedures Act, we have to go
to through rulemaking that involves the pet food industry.
Okay? Let's move on to the next slide, Katherine.

CHAIRMAN KING: Andrea, did you have -- Keith,
then Andrea, then Rick.

MR. JONES: Let me walk you guys through this,
because I think there's -- I think there's a disconnect,
there's a serious disconnect between what certain parties
believe that USDA can do under its authority and what we've
actually done.

Through the Organic Foods Production Act,
essentially what you had, through the promulgation of the
Final Rule, was a federalization of standards for certain
products, okay, so this -- the point that I'm trying to
make here, folks, is that this is not anything new. What
we are finally setting out in writing is in fact
100-percent consistent with what USDA has done since day
one under the authority that is vested in it by the Organic
Foods Production Act. We have in no way, okay, changed
the process.

As we go through notice and comment rulemaking,
which is the only way we can promulgate standards, we
cannot assent to voluntary standards and then somehow say
that they're under the Rule and you can carry the seal.
The only way that we can have standards which carry the USDA seal is to go through notice and comment rulemaking. There are areas, which we spell out in this directive, where that has not happened.

There's also, in the case of pet food, a cross-jurisdictional issue, pet food is regulated by the Food & Drug Administration, so not only have we not only gone through no notice and comment rulemaking for the sake of pet food, there will be additional consultation that will have to occur with FDA to ensure that they want us to essentially reach into their labeling protocols and regulate the labeling of pet food when the modifier "organic" is attached to it. Okay.

Now, in certain cases -- and again, this is quite consistent with what we have set out from day one, is that we regulate up to farm gate, okay? We do this with cotton. Cotton has always been regulated under the regulations as they're written, up to and including the farm gate. We have no textile standards; we have said that. We have no processing standards for textiles; we've said that.

Therefore, the ability for cotton, once it is spun and woven into fabric, that is essentially unregulated by OFPA, okay? And so what we've said, in an analogous way, is that there are certain products that -- if you want
to use this to get your head around -- that are like
cotton, that we simply either, one, do not have the
authority to regulate, nor have we gone through the process
that we are required to go through to promulgate standards.

So what I want to leave you with is this single
notion, and if there's a lack of clarity, I want to stay up
here until we get this, okay, because this is no different,
we have done nothing different in this directive that is
inconsistent with anything that we have said in terms of
the concept and how we regulate things, this kind of march
of federalization, if you want to call it that, and the
notion that our limit -- that our authority sometimes is
limited to farm gate certification.

So those are the two things that you really need
to take away from this presentation, is that there's an
authority question and there's a process question. Okay.

CHAIRMAN KING: Okay, I have Andrea, Jim, then
Rose.

MS. CAROE: Okay, I just want to clarify
something in my own mind. The relationship and the
arrangement that the program has with BATF and alcoholic
beverages, is that possible only because alcoholic
beverages fall within OFPA but outside the labeling
authority of the program?
MR. JONES: Well, that relationship is actually codified through a memorandum of understanding, okay, so there has been consultation, BATF's -- which is now -- what is it -- TTB, their attorneys sat down with our attorneys and said, "Okay, we think we can play in the same sandbox with you, okay?" That's how that piece of the puzzle got put together, is because there was a meeting of the legal minds in terms of the respective authorities that are contained in various statutes, and then there was an MOU that was put together that linked those various authorities. Okay.

MR. NEAL: Also, there are legal responsibilities -- Arthur Neal. There are legal responsibilities that USDA/NOP has that TTB cannot perform on behalf of USDA regarding their products, so TTB does not have the legal authority to say whether or not -- if an organic claim on a wine product is legal, because USDA has not granted them that authority, and it would be the same instance if USDA tried to say that an organic claim on an FDA-regulated product was compliant, because FDA has not granted us that authority.

MS. CAROE: My question is really geared at why this relationship couldn't be duplicated with other products.
MR. MATTHEWS: Let me answer that. Let me answer that. The issue of alcohol beverage was always contemplated to be covered, for example the sulfites issue, and as -- you'll recall that originally all the sulfites were prohibited from any wine product, and the industry went to Congress and was able to get Congress to agree to saying that sulfites can be used as long as that wine product is only labeled as a "made with." So in that case, the alcohol beverages were always included in the original rulemaking. The pet food has not. That's the difference. Okay?

CHAIRMAN KING: Okay, I have Jim, then Rose, then George.

MR. RIDDLE: Yeah. You know, Keith, when you were talking about the march of federalization and this is a part of a continuum, I guess some of the confusion that's happening out there is, you know, people read the May 2002 Scope policy, which said these sectors are eligible, and they proceeded to set up systems which followed the regulations, certifiers certified to that, they made major investments, and now that's been turned on its head for certain sectors. And I understand what you're saying in that -- you know, like pet food, I've talked about this, you can make pet food to the human food standards, label it
to the human food standards, but it's just packaged for pets. Why can't you continue to do that, and what I'm hearing, and correct me if I'm wrong, is that there is a need for an MOU with FDA, something like that, because they have code jurisdiction or they have jurisdiction over --

UNIDENTIFIED FEMALE VOICE: They have jurisdiction --

MR. RIDDLE: -- pet food labeling, that NOP doesn't have.

MR. JONES: Right.

MR. RIDDLE: So that's standing in the way, even though it can be produced and --

UNIDENTIFIED FEMALE VOICE: Yes.

MR. JONES: Yes.

MR. RIDDLE: -- and certified --

MR. JONES: Yes.

UNIDENTIFIED FEMALE VOICE: That is a labeling issue (inaudible).

MR. JONES: Yeah. And Jim, let me respond to the last point first, and then I'll get into the March policy statement.

This is a labeling authority issue, okay, and FDA has the labeling authority, full stop, for the products that we have delineated in that scope direction. Full
stop, okay, they have the authority.

Now, this in -- the knitting together of NOP and FDA authority I think is much more -- personally, this is a personal opinion, don't take it as gospel from USDA, but it is my personal opinion, in looking at the authorities, that the knitting together of those authorities is much more complex than sitting putting an MOU, okay?

Now, it may not be so, we are in continuing consultation with FDA and will be in consultation with FDA on these issues for the foreseeable future, okay? Because one of the things that you've got to understand is that we desire the same thing that you desire, okay, and that is, we want clarity in labeling, we want consumers protected, okay, we want consumers to understand what they're buying, but we also want people to understand that our authority is limited.

I know this is hard to believe, but we are not the all-knowing, all-seeing individuals that you think we are, okay? We're limited, okay? We're limited as to where we can go, and that's something you're just going to have to get your arms around, okay?

Now, in terms of the March policy statement, okay: in hindsight, it is unfortunate that that document was written the way that it was, okay, but let me say this,
Jim: It wouldn't matter if we had published that statement 40 times or one time, we cannot give authority we don't have, okay?

So that's what you need to keep in mind, is that we cannot give authority where we have not been delegated that authority by Congress. So it is unfortunate, again, that that statement was written the way it was, you know, we recognize that people made some decisions on that, that's why we think we've been kind of recognizing that, you know, in this -- in this -- but we can't give authority -- no matter how much you would force us to do something, short of notice and comment rulemaking and short of FDA saying, "Yes, we're going to allow you to regulate the labeling of this product when 'organic' is attached to it," we just don't have the authority to give, okay, and that's straight up.

CHAIRMAN KING: Okay. We'll have Rose, George, then Dave.

MS. KOENIG: So -- and that's, I think, the sense of confusion, because I know I've (chuckles) -- I've been to so many presentations where they say, "The only difference now is that the USDA owns the word 'organic.'" So what you are saying is, is that if you -- if it's an agricultural product within your authority, yes,
you do own that word in the sense, but you don't own the
word in things that are not -- beyond the -- your
authority.

MR. JONES: Right, and --

MS. KOENIG: So -- and that's where this -- and
that's why on these body-care products, if it's an agricul-
tural product, you still -- you may not -- you know, you
may send it to a different office, but you -- it is still
under -- within our regs if it's agricultural organic --

MR. JONES: Well, but --

MS. KOENIG: -- but anything else, body-care
products, things outside of that, you don't own the word,
anybody can own the word.

MR. JONES: Yeah, and let me -- let me pick up on
that. I think that's -- if I understand you right, Rose --

MS. KOENIG: I know what you're saying.

MR. JONES: -- that's a correct rendering of
where we're at. Now, when -- and I was guilty early on of
saying we own the word "organic" --

MS. KOENIG: Yes, you did, and that's why -- and
that's why I'm saying that the communication has been
always "we own the word" and that's what --

MR. JONES: We own the word organic, for the
products we own the word --
MS. KOENIG: Organic on.

MR. JONES: -- organic on --

MS. KOENIG: Exactly.

MR. JONES: -- okay, and --

MS. KOENIG: But we've taken that all the way, as: you own the word and that, you know, the word is -- you know, and there's going to be regs, so --

UNIDENTIFIED MALE VOICE: First there was the word --.

(Laughter.)

MR. JONES: Yeah. And I guess in response, there should -- there should have been some sort of understanding that the term "organic" when it's applied to chemistry is not regulated by the Organic Foods Production Act.

Okay, so there are certain -- there are certain uses of the modifier "organic" that we don't regulate. So despite my inarticulate nature, you should have picked up on the fact that: well, okay, well, I think I kind of know what he's talking about here, even though -- if he's not exactly using the right words. Fair enough?

MS. KOENIG: That's fair. But I think that sense of confusion -- I mean, I take things literally, and I think most people that are not accustomed to this regulatory arena and the way the federal government works
in terms of departments -- I mean, half of the confusion among the Board is -- you know, and I was telling somebody, you know, the learning curve in this, you know, as far as people being on the Board, is incredible. I mean, we don't -- we don't function on a day-to-day level, so it just seems, you know, in some ways incredibly inefficient, but I understand what you're saying. I think it's just going to be a process of us trying to --

MR. JONES: Well, and one of the things that we're --

MS. KOENIG: So give us time.

MR. JONES: One of the things that we're trying to do, we're trying to do exactly what you're asking us to do, and that is: speak with clarity, you know, don't use shorthand, and we're guilty of that, we're guilty in assuming that you just know what we're talking about, okay, and I -- I own that, okay.

So what we're doing, I think, now for -- for -- perhaps better than we've ever done before is we're saying in our writing and in our speech: okay, this is really where it's at, this is where you draw the lines, okay?

MS. KOENIG: Just one thing, and I'm just going to make this assumption, it's a statement. I think -- and maybe -- this is my observation, and I don't know if it's
true, but it seems like there's a learning curve even within your agency, as far as how you're extending to these other agencies, and I think the alcohol was a good example, that there are some groups that are easier to kind of mesh your programs with but there are others that are also bogged down in bureaucratic and regulatory language that is not such an easy fit, and those are the ones where you're not -- where we're seeing this kind of -- there may never be an agreement. So I'm reading into that that --

MS. ROBINSON: You're right, Rose, but let me just say, this is not in defense of the Department at all, but there probably has not been a new program created in USDA for probably 35 years, so -- and this is -- this is brand-new, it's

MS. KOENIG: And what --

MS. ROBINSON: -- it's from the ground up --

MS. KOENIG: So I think that the way that the industry sees these directives is: aha, they knew this all the time, and now they're finally -- you know, it's -- I am understanding that it's a learning process for you, it's not something that you've decided to just change the playing field midstream or anything like that, and so -- okay, I understand.

MS. ROBINSON: Okay.
CHAIRMAN KING: Okay, all right.

MS. ROBINSON: I think we should try and get back on track here.

CHAIRMAN KING: So how's that next slide coming, Rick?

MR. MATTHEWS: Yeah, it's -- yeah, we really do need to get back on track because --

CHAIRMAN KING: Hold on, hold on, I do have a couple other people with comments, but Rose, you're done on this one.

MR. MATTHEWS: Okay, but let me just say this one thing. There's still 43 percent of the presentation yet to go.

CHAIRMAN KING: And it is near 2:30, so -- we appreciate the math on that. I have George, then Dave, then Jim.

MR. SIEMON: Just a point of clarification, then, because I'm concerned for the pet food industry. They can now go to a certifier, get them to adopt standards that are -- they can't say they're equal or -- to NOP standards, but they could do them equal to NOP standards and use the word "organic" on the front of -- the labels, so they can go forward without the USDA seal and we can avoid most of the disruption, but they can't imply that it equals NOP
standards, even though they do.

    MS. ROBINSON: The products that we don't cover, George, are still bound, as all products in the United States are, by truth-in-labeling clauses.

    MR. SIEMON: I know, but it's truthful if they meet the human standards for NOP, it's truthful.

    MS. ROBINSON: If it's truthful, they can say it.

    MR. SIEMON: But it says right in your document they may not imply --

    MR. MATTHEWS: Okay, hold on a second, hold on a second. What we have said is that pet food, like fish, can be certified to any standard that is out there, with the exception of the NOP.

    MS. ROBINSON: Right. Right.

    MR. SIEMON: I don't understand that [phonetic], but okay --

    MR. MATTHEWS: Okay. Now, the ingredients in that pet food, the corn, the beef, the rice, whatever, if it's produced here in the United States, it has to be produced to the NOP. We're regulating the labeling. The only reason why we're not covering labeling at this time is that we have not gone through the rulemaking for that process, when it comes to pet food, that --

    MR. SIEMON: But there's no reason why all those
MR. MATTHEWS: That's -- they --
MR. SIEMON: -- and complies with all USDA things.
MR. MATTHEWS: -- they can make all truthful --
MR. SIEMON: I mean, we've got to help these people here.
MR. MATTHEWS: They can make all truthful label claims, they can say the rice was produced to the National Organic Standards. They can say the beef was produced to the National Organic Standards. They cannot say that this dog food --
MR. SIEMON: I understand.
MR. MATTHEWS: -- was produced to the National Organic Standards.
MS. ROBINSON: And just for sake -- you know, the pet food folks, they -- one of the reasons we haven't brought them under is they have their own labeling guidelines, they have -- you know, AFCO has its own labeling. They did come to USDA before implementation and they asked us to change our labeling regs to accommodate them, and we said no, we were not going to change the labeling regulations in this program to accommodate the pet
food industry, we thought that there had to be another way
to work this out and that we wanted to see some activity on
their part, so --

MR. MATTHEWS: Okay, let's kind of slide on to
the next slide.

CHAIRMAN KING: Well, hold on, I've got Dave,
Jim, and then we're moving on, and it is approaching 2:30,
I'll remind the Board of that.

MS. DIETZ: Five minutes each?

CHAIRMAN KING: Yeah.

MR. CARTER: I recognize there's 43 percent, but
that's not 43 percent by weight. This is really one of the
heaviest issues in this presentation.

(Laughter and applause.)

MR. MATTHEWS: I don't know that that is true.
You haven't seen the rest yet.

(Laughter.)

UNIDENTIFIED MALE VOICE: I think we're just
warming up.

MR. CARTER: And also, just let me put into the
record, I'm going to try and avoid entering into
discussions pertaining specifically with pet food, because
I am involved in a pet food project that is not organic but
is at least familiar enough to know that there's a lot of
folks out there playing fast and loose with definitions on pet food.

The question, though -- I guess the comment that I would make is to encourage -- and I recognize, Keith, that it's more difficult than just doing a memorandum of understanding with FDA on some things, but that would sure be a great place to start, is to enter into a memorandum of understanding as a first step.

MR. RIDDLE: And my question --

CHAIRMAN KING: Yes, go ahead, Jim. Next and last.

MR. RIDDLE: I just want to make clear that an accredited certifier can have this other certification to any standard and still have their name, you know, similar, same basic claim, "certified by," you know, who they are, X-Y-Z certifier, that would appear on an NOP product, they don't have to set up a separate entity or something. You know, as far as what the consumer would read would be the same name of the same certifier that's certifying an NOP/USDA organic product. Correct?

MR. MATTHEWS: That's what we've said.

MR. RIDDLE: Okay, yeah. All right. Then I just -- I also have a suggestion that I think might bring some comfort, and that is: if there was information posted

R & S TYPING SERVICE - (903) 725-3343

5485 S. LIVE OAK, GILMER, TX 75644
about how to file a complaint with the Justice Department, if you have concerns about truth in labeling or untruthful labeling, you file a complaint to us when it's something we regulate, you've already got that, but here's where you go and how you do it --

UNIDENTIFIED FEMALE VOICE: We can put the link over to FTC's Truth in Labeling, and they have that right on their website, how to file a complaint.

MR. RIDDLE: Uh-huh, yeah.

UNIDENTIFIED FEMALE VOICE: And they will also tell you how to go to your state attorney generals.

MR. RIDDLE: Right.

UNIDENTIFIED FEMALE VOICE: We can put the link on, that's not a problem.

CHAIRMAN KING: Rick, next slide.

MR. MATTHEWS: All right. What do we need for aquatic animals and pet food to be certified to the National Organic Program? We need industry submission of proposed standards. In reality, we need three things: we need a proposed standard; we need them to tell us why this particular standard; and they need to provide us with information about the industry to be regulated. Okay.

You know, we recognize that pet food is something that probably doesn't take an awful lot of changes to the
regulations to make pet food possible under the NOP. The problem is, we haven't done the rulemaking. Okay.

I can tell you that there's three areas of concern. Labeling is number one. Number two, are they using any kind of synthetics that the rest of the food industry doesn't do. I don't know the answer to that. The other thing is that in .237, livestock feed, we talk about by-products. How many of these by-products are being fed to mammals. Dogs and cats are mammals. So you'll have to take a look at that section as well.

But other than that, it looks like it's pretty -- pretty easy for this Board or the pet food industry, or this Board and the pet food industry, or even a consultant for the pet food industry, and I know there's a couple of you on this Board, that if you want to throw together some standards and submit them, we'll start the rulemaking process.

MR. SIEMON: Is that a livestock committee process?

MR. MATTHEWS: The livestock committee can work on it.

MR. SIEMON: I don't know, I'm just asking.

UNIDENTIFIED MALE VOICE: Or a pet food task force.
(Laughter.)

MR. MATTHEWS: The bottom line is, you guys can work on that, and will we take that from you? Of course we will.

CHAIRMAN KING: Okay, and we can talk about that later.

MR. MATTHEWS: Now let's move on to the next slide, Katherine.

CHAIRMAN KING: All right, next slide.

MR. MATTHEWS: There's also been some questions about whether or not we'll extend the October 21st, 2005, deadline for using up existing supplies. When it comes to those products that are not covered by OFPA -- again, those being cosmetics, body-care products, fertilizers, things like that -- the answer is: no, because we're -- we're not regulating those areas, so no, we won't extend that deadline.

But when it comes to fish -- aquatic animals actually, because there's more to it than just fish, but -- aquatic animals or pet food, the answer is: possibly. It really depends on what's happening within the industry as far as creating standards that we can then put through the rulemaking process.

MS. CAROE: Rick?
MR. MATTHEWS: Yes.

MS. CAROE: So the only thing that's non-compliant about those labels is if they actually have the USDA seal or represented as USDA organic certified?

MR. MATTHEWS: That's correct.

MS. CAROE: So if they say organic and they have a certifier's name, that label's still complying as long as the certifier has something they're certifying to --

MR. MATTHEWS: That's correct.

MS. CAROE: -- and it does meet it.

MR. MATTHEWS: The ones that have to be changed are those that are using the USDA seal or say "certified to the NOP" or something to that effect.

MR. MATTHEWS: Does that affect a lot of people? It'll affect some. Some people will run out of the labels before the deadline, and what they'll have to do is get new plates printed up, or made up, so that they can get new packaging printed without those claims. Otherwise they'll still in business for making organic cat and dog food.

MS. CAROE: Now, some of these things have really long shelf lives, that are on the shelves. They're not going to -- they're not going to have to do recall or anything, those --

MR. MATTHEWS: It's going to be --
MS. CAROE: It's in commerce --

MR. MATTHEWS: It's going to be another one of these old product deals.

MS. CAROE: Okay.

MR. RIDDLE: And the thing about animal by-product use, that would really be applicable if you were going to certify the pets.

(Laughter.)

MR. RIDDLE: I mean, that's prohibited, if you wanted to certify the pets -- I'm not trying to be cute, I --

MR. MATTHEWS: What I'm saying is that some people have raised that issue and I'm saying take a look at it to see if it's a problem.

MR. RIDDLE: Right.

MR. MATTHEWS: I've heard people from both sides of it saying, "Well, that's not a problem," other people say it is a problem, so I'm saying that's one area to look at for determining whether or not it's a problem. Okay? Other than that, the only things I've heard about is: well, is that particular paragraph a problem, yes or no; what about materials; and what about the proper labeling scheme for pet food. So that's -- that seems to be the challenge for the pet food industry. Okay.
Let's move on to the List 3 inerts. See, Dave, this one's going to be probably more than 43 percent.

(Laughter.)

MR. MATTHEWS: It reminds producers and ACAs that pesticides can only be used when pest-management practices fail, and that's something that everyone has to keep in mind. You have pest-management practices within the standards. Those come first. Just because something is on the National List doesn't give you carte blanche to just use it, it has to be a part of the organic systems plan.

Use of List 3 inerts is prohibited. You cannot knowingly use a List 3 inert. The producers and the accredited certifying agents must try to determine what List 3s are in the pesticide product that the producer is proposing to use. Okay. They have to try.

The pesticide use must be listed in the organic systems plan, and the organic systems plan must be negotiated, enacted, and amended through dialogue between the certifying agent and the producer. None of those requirements have changed. Okay.

This directive acknowledges that List 3 inerts are not listed on the pesticide label. The farmer has no way -- when he goes into the farm supply store and picks up a container of a pesticide that has an approved ingredient...
listed, the approved active is listed on the product, he has no way of knowing what's in there, with the exception of the List 3, which EPA requires to be listed. Okay. So he's got to be able to -- he has to then try to find out what is the inert in that product, unless it's listed someplace else, for example an OMRI listing, or maybe the certifying agents have been able to find out what it is and maybe this new certifying agents organization can help us pull together a listing of all products that may not be on OMRI'S list but certifying agents know whether or not they contain List 3s. So that's work to be done.

Now, the producers and the ACAs may not be able to find out what is in that product. We're looking for them to contact the manufacturer, we're looking to them to contact the EPA, we're looking to them to contact other ACAs in order to try to find that out, but it's very likely they're not going to be able to get that information.

What this directive does is it says that after due diligence the ACA will approve the use of pesticides with unidentified inerts. Okay. Due diligence means contacting the manufacturer, contacting EPA, and contacting other ACAs.

This directive also requires that the producer be informed of the requirement to immediately stop the use of
this product should it come to the attention of the
certifying agent that that product does indeed contain a
List 3 inert. They have -- the certifying agent should be
telling the producer that up front. Once that is
identified as a problem, then they have to tell them again,
okay, "We have since found out that it has a List 3, you
have to stop." Okay.

They also need to document this notification,
both times, document it when they first tell them, "Okay,
we're going to approve the plan with this material," and
also when they tell them to stop using it. They would take
no adverse action on the producer that used one of those
products that was later found to have a List 3 inert.

Now, if the producer used something that was
later found out to have been prohibited, they would have to
stop immediately. If they chose to use it again after
having received written notification to stop, then the
certifying agent must initiate procedures to revoke
certification. There's only one way of correcting a
non-compliance for use of a prohibited substance on your
acreage, and that is to go through a whole new period,
which is a minimum of three years.

So in the case of somebody who willingly used it,
knowingly, willfully used it, they're going to get revoked
for 3 -- for 5 years. Now, that's -- that's just the way
it's going to be. Yes, Rose.

MS. KOENIG: Now, this, to me, is an example of
sort of what -- I guess Jim's example of the -- what was
the process -- the water, going back to the percent water.
I under- -- you know, I'm not -- so the question is not to
the -- to what you're saying there, it's more of an
alternative that I think is a more responsible approach.

MR. MATTHEWS: What is?

MS. KOENIG: My approach.

(Laughter.)

MR. MATTHEWS: All right. What's your approach?

MS. KOENIG: I mean, EPA -- I mean, everything
that is a pesticide has to be registered with EPA, okay.

MR. MATTHEWS: Right.

MS. KOENIG: You can take the active and you
could probably -- I'm assuming it has a database, you could
get a list of every active that we've approved, natural and
things on the List, and EPA could pretty easily -- maybe
not tell us what the List 3 is, but they could probably go
through all of those and tell us which are List -- which
have List 4 inerts and which have List 3 or List 1 or
List 2 --

MR. MATTHEWS: If that was --
MS. KOENIG: -- and we could provide that information so that you could avoid even having that loophole, because -- I don't want to call it necessarily a loophole, because it isn't a loophole if in fact the procedures are followed that way, but I think that the information is there, there's two federal agencies involved. We had Bob Tourlet [phonetic] come, they made that proposal as far as the alternative voluntary labeling scheme, that I know that that's not required, but it seems like there should be some interagency communication that you guys could facilitate and provide that information to your certifiers, that would provide that information, and we wouldn't need this directive.

MR. MATTHEWS: There's no requirement for the manufacturer to give up that information, and in many cases EPA doesn't have that information. So it's not an easy matter for the certifying agent just to call them up and say, "Does it have a List 3?" Now, that is the key way to do it, is you don't say, "Tell me what's in the product," but you can ask them, "Your inerts, are they on a List 3 or a List 4 or a List 2 or a List 1?"

MS. KOENIG: That's what I'm saying, I'm not saying -- no, I'm not saying to disclose a particular inert, but doesn't the -- can the EPA just inform the ones
that are compliant and the ones that aren't compliant by
brand name? You know --

MR. MATTHEWS: I don't know that they can.

MS. KOENIG: Well, that, to me, is the question.

I mean, that seems like --

MR. MATTHEWS: Well, right now we can't get that
information.

MS. KOENIG: Well, then I -- you know -- okay.

MR. MATTHEWS: That's what this problem with the
List 3 is all about.

MS. KOENIG: But we --

MR. MATTHEWS: What you have done is you have
prohibited the use of a product that farmers in many cases
have no way of knowing whether or not they're in
compliance.

MS. KOENIG: But I'll go back -- again -- you
know, because -- I was on the List, the inerts task force,
and I will argue that this example, whether it's inerts or
formulated -- formulations of natural fertilizers, it's the
same issue. Things that are not -- there's things that
don't require -- again, it's a labeling issue, that growers
may, you know, purchase, that they then find, even though
it says, you know, organic manure or organic stuff, that --
and they don't really realize that there's other --
UNIDENTIFIED MALE VOICE: Correct.

MS. KOENIG: -- other examples. Like for example, a good example of it is soil mixes, okay, a lot of -- metromix. It says metromix, you're buying metromix, it doesn't tell you necessarily that there's 10-10-10 piters [phonetic] in those things. Growers have to find that information out through using Organic Materials Review Institute or working through their certifiers.

So this issue is not unique, necessarily, to List 3 inerts. I think the solution is easier with List 3 inerts because we actually have a federal agency that regulates it and that does somehow have that information, that perhaps could be, you know, conveyed to us in a format that would be acceptable to them as an agency. So I'm just putting that out.

CHAIRMAN KING: I think what Rose is asking is: could we explore that, in your opinion, and you don't have to answer that now; please take it into consideration.

MR. MATTHEWS: Okay.

CHAIRMAN KING: Goldie, then Jim.

MS. CAUGHLAN: Help me understand, Richard, how we can come to this position of saying we -- we can't find out whether it's in there or not. I mean, I was reading that thing and I thought, you know, it was leading to say
therefore not being able to find a disclosure, therefore
not being able to find out would lead us to assume: okay,
you can't use it, which is precautionary principle. How in
the hell can we come to this opposite -- how do I go and
talk to consumers? I don't -- it's -- I'm sorry: it's
nuts. That is so backasswards.

(Laughter.)

MR. RIDDLE: Yeah. Well, I'll say that in a
different way.

(Laughter.)

MR. RIDDLE: It's my understanding that, you
know, the burden of proof is on an applicant to demonstrate
compliance and the use of approved materials when they
enter the process, but now it -- as I understand this, it's
rewarding producers and manufacturers for withholding
information, and this applies not just to List 3 but also
List 2 inerts.

UNIDENTIFIED FEMALE VOICE: And List 1.

MR. RIDDLE: Well, List 1s are required to be
labeled by EPA, is my understanding. So that information
is revealed. But List 2s and 3s are not, and 4s. So it
could fall anywhere there, so it's not just List 3s.

I guess, you know, I'm assuming that you develop
this in consultation with EPA, and I'm just wondering what
their opinion has been, because I know they do have a lot
of this information and have that pesticide, you know,
labeling program that this impacts, cross-jurisdictional,
like we were talking about before. I'm just wondering what
they've said about this to you, to help move this forward.

MR. MATTHEWS: When it comes to this program,
they defer to us.

MR. RIDDLE: But have you talked -- I mean did
they review this, did they review this --

MR. MATTHEWS: No, they did not review this.

MR. RIDDLE: Okay.

CHAIRMAN KING: Other comments? We have just
one, Zea, quick comment.

MS. SONNABEND: Can I just make a really quick
comment?

CHAIRMAN KING: Yes; very quick, please.

MS. SONNABEND: You said at the beginning that
these directives were things about the way the Rule always
was, and this is not what you've been saying to us up until
this point. In fact, you know, I know on several phone
calls you said, "You can't use it if you don't know what's
in it." So now we've been going along and -- you know,
California, the materials capital of the world,
practically, right? So we've got our growers all trained
now, we're issuing these -- I forget what you call them, we call them cease-and-desist orders: you stop using it if you can't find out what's in it, we get them 30 days. Now we have them all trained. This is a step backwards now, we have to retrain them.

The directive gives no phase-in, it says it's effective instantaneously. We don't have internal process developed for this new thing. You know, it's not guidance, it's -- it throws us into a tizzy about it.

CHAIRMAN KING: Thank you. Go ahead.

MR. MATTHEWS: Okay, let's move on. What the directive does not do, we do not see it as allowing List 3 inerts. It's recognized -- what we are doing is -- and why we have taken this position is that we recognize that the farmer doesn't know, and in many cases the certifying agent doesn't know. Okay? They can't identify this stuff. Without this ruling, it's: when in doubt, go without. In other words, anyone who uses that substance is going to be out of organic for 5 years.

UNIDENTIFIED MALE VOICE: When in doubt?

MR. MATTHEWS: When -- well, if you don't know what it is and you're -- part of the problem is that certifying agents are all over the map on this one. What you have to remember is that when a prohibited substance is
applied to your land, you're out of organic production for 5 years. You're revoked.

CHAIRMAN KING: Knowingly.

MR. MATTHEWS: That's your revocation.

CHAIRMAN KING: Knowingly.

MR. MATTHEWS: That's when you knowingly do it.

Okay. So the only option is, the only other option that we see, is to go out there and tell people: yes, the active is allowed, but no, you can't use the product, and not through any fault of your own, but because manufacturers won't give you the information.

CHAIRMAN KING: Kevin.

MR. O'RELL: Rick, the directives, as I understand it, are based off of legal substance, so what -- in this case of this interpretation, this is based off of legal advice, legal counsel, with the USDA, or is this --

MR. MATTHEWS: It becomes an enforcement issue, how do we enforce this thing.

MS. CAUGHLAN: You have to know.

UNIDENTIFIED FEMALE VOICE: You have to know where you don't use it.

UNIDENTIFIED FEMALE VOICE: "When in doubt, do without."

CHAIRMAN KING: Rose?
MR. MATTHEWS: How about some certifying agents, any certifying agents want to weigh in on this?

MS. DIETZ: I think we need to --

(Rapping.)

MS. DIETZ: It's 3 o'clock, and we haven't started even our agenda yet.

MR. MATTHEWS: That's right.

CHAIRMAN KING: Yes, that's right. Very quick question, not a statement, I have Rose, then you, Kim.

MS. KOENIG: I just want to reiterate, I guess, what Jim said, that your policy directive talks about List 3, but List 2 falls into the same category --

UNIDENTIFIED FEMALE VOICE: Same thing.

MS. KOENIG: -- which is an area -- okay, 3 is of unknown toxicology, and again, we feel that that issue, once EPA goes through those, is going to be resolved, but we still have the same issue that none of the -- you know, the List 2s aren't also. So the directive, Number 1, what about List 2s? So if we find out that it's a List 2, then they've lost it for 5 years? So the directive, if you're going to go for this, needs to cover -- you know, and I don't recommend it, because I don't agree with it, but it probably needs to entail also List 2 inerts because they're subject to the same concern, if that's the way you're
thinking.

Again, I am not proposing that, because I don't agree with the directive, but again, I would just -- you know, "when in doubt, go without." I feel, as a producer, okay, and I'm a user, okay, forget the certifiers, you know, I live -- this is my living, you know, this -- the program -- and that's what I always says, "You are my servants" (chuckles), "I am your stakeholder, the program is to serve me, and I am just one producer," but that is my job, just like it's your job to manage a program. My job -- if I want to get certification, I have to come to the plate, I have to find the information out, I have a serviced called the Organic Materials Review Institute that I utilize, I utilize my certifier, I do that due diligence, and if I can't find the information, I do without, I don't risk it.

MS. DIETZ: It's 3:00. They should do public comments on Friday.

CHAIRMAN KING: Yeah. Sorry, we have to keep moving forward. So Kim, did you have a quick comment, or no?

MR. MATTHEWS: Do you want to keep going or do you want to --

CHAIRMAN KING: I do want to keep going. I just
want to say one quick thing, and I understand that this is a heavy issue, if you will, but let's focus on one thing that Rick just commented on, and I think you may have caught it, and that is: this is an enforcement issue. So if we have suggestions, ideas, so on and so forth, in the future, not at this particular moment, perhaps you would want to focus on that. Rick.

MR. MATTHEWS: Okay, let's move on to the antibiotic hot button. Again, what the directive does, this one reminds producers and ACAs that sub-therapeutic antibiotic doses are strictly prohibited under the Organic Foods Production Act.

The use of antibiotics is allowed to treat illness when preventive practices and veterinary biologics fail. Okay. They are -- it is allowed, to use. The problem is that there are effects from doing that.

So the next slide provides that this directive identifies the effects of using antibiotics. An animal that has been treated with an antibiotic can never be sold, labeled, represented as organic. Products from slaughter animals cannot be sold, labeled, or represented as organic. Dairy animals must be managed organically for 12 months before milk can be sold, labeled, or represented as organic. Breeder stock treated prior to the last third of
gestation can give birth to an organic animal. Okay.

Again, what the directive does, it clarifies that OFPA and the regulations do not prohibit dairy farmers from treating sick dairy animals with antibiotics, and I repeat from what we had said just at the last slide, treated dairy animals must be managed organically for 12 months following treatment before milk can be sold, labeled, or represented as organic.

Now, when we say "managed organically," that means 100-percent managed organically. Okay. George?

MR. SIEMON: You know, my biggest question about -- I don't know what's my biggest question, but this of course brings up the whole issue of all prohibited medications, not limited to antibiotics.

UNIDENTIFIED FEMALE VOICE: Correct.

MR. SIEMON: If I read this correctly, any medication can be used now as long as you have the 12-month window prior.

MR. MATTHEWS: We're only talking antibiotics here. We're only talking antibiotics. That was the issue that was of contention between certifying agents and what is the issue that we have addressed.

MR. SIEMON: But this is a clarification of the law, as you've said.
MR. MATTHEWS: For antibiotics.

MR. SIEMON: So I can't take this logic and not see that this applies itself equally to all medication, this whole document as well.

MR. MATTHEWS: We've only addressed the issue of antibiotics --

MR. SIEMON: Okay.

MR. MATTHEWS: -- with this directive.

MR. SIEMON: So then for right now the -- since you've only addressed that, the understanding of the community should be: this is only for antibiotics and not for any other forms of prohibited medication.

MR. MATTHEWS: Yes.

MR. SIEMON: Should that be the understanding of the community?

MR. MATTHEWS: Until we review it for other things. We've only reviewed it for antibiotics.

MR. SIEMON: Okay.

MR. MATTHEWS: That was the issue that was put to us. Okay.

What this directive does not do: it does not allow sub-therapeutic doses; it does not permit milk from treated animals to be fed to organic animals; it does not permit milk from treated animals to be sold, labeled, or
represented as organic; it does not allow treated animals
to be sold, labeled, represented as organic slaughter
stock; it does not allow the feeding of non-organic feed,
in any quantity, to treated animals.

And that's where I said on the last slide:
managed organically. You can give this animal that is ill
a dose of an antibiotic; if that animal was an organic
animal, it loses organic status for meat. That animal then
has to go through organic management for 12 months from the
date of the last administering of that antibiotic, for the
purpose of saving that animal's life, before it can produce
organic milk.

MR. SIEMON: I'm so glad you brought that up too,
because that was my next question, about the feed, because
it really brings open the whole feed issue. But just so
I'm clear about the 12 months: is that managed organically
for 12 months? If you give that calf an antibiotic 16
months prior to milking, what -- I just need clarification
on the whole organic feed on the certain class of dairy
animals, we have two classes of dairy herds --

MR. MATTHEWS: We have changed nothing. We have
only clarified that a dairy animal can receive an
antibiotic and go through a 12-month management organically
and still be able to produce organic milk. We have changed
nothing related to origin of livestock.

MR. SIEMON: So if it's 16 months -- I have two questions. If it's at 16 months, they've still got to be fed organically all the way through --

MR. MATTHEWS: Oh, yes.

MR. SIEMON: -- and the 12 months not relevant.

MR. MATTHEWS: Yes. You cannot -- you cannot manage that animal organic- -- as a conventional animal after giving that dose and still have it become organic again, you have to continue to manage that animal organically, with this one exception, that you could give it a shot or a suppository, whatever, you know, to correct the animal's illness at that point. It's really a humane issue, in my mind, you're taking a very sick animal, you have a choice, you can take it off your farm or you can treat the animal. Now, where -- in real terms, where is this going to be important? It's going to be important for young stock, because the farmer already is faced with a 24-month period before that animal is going to be productive, okay. So if you're treating it within the first three months, it's still got to go through the same organic management that it would have, but that animal has lost its meat status as organic. You still have to manage him organically all the way through.
Now, is it practical to think that a farmer is going to treat a mature animal and then keep it on its farm for a year? I doubt it. They're going to get rid of that animal. Okay?

MR. SIEMON: And by your chart, this is -- we have two streams of dairy animals, in the dairy world, and this chart shows that this is for all streams, and so I have another question that's kind of a broader question. Are we real clear that those in the dairy stream that come in with the 12-month have to feed their calves organically from day of birth, last third of gestation forward? I'm not clear on that. But this -- if I'm to follow this conversation and read this chart, we're all clear that no matter what stream you come in, you must raise your calves organically, feed and everything else, besides for this antibiotic exception now, from the day of birth. That is not the case in the field right now. We need to address that.

MR. MATTHEWS: George, go ahead and run that by me again. I missed it. I was getting corrected on a point that I made before.

MR. SIEMON: No matter how you come into the dairy program, this is a little off-subject, but it's very relevant. How you come into the dairy program, we know
there's two streams, no matter what stream you come
through, you must raise your calves, that are born on your
farm, organically.

MR. MATTHEWS: Right.

MR. SIEMON: And you can't take them off the farm
in any way or bring them back, and I'm just referring to
your chart here.

MR. MATTHEWS: Yeah. And --

MR. SIEMON: And then I'm informing you that is
not the present enforcement out there in the field right
now, our understanding. That's maybe another clarification
we --

MR. MATTHEWS: And there may be -- the document
itself may have created a bit of misunderstanding, because
you're -- we're not really contemplating that you take the
thing off the farm and then bring it back a day later, or a
year later, or anything like that, you treat the animal,
you mark it, and then you manage it organically without
using any of that milk, to either be sold to consumers or
even used as feed for other -- for young stock, for
example.

And George, a technical correction a previous
statement.

MR. SIEMON: Okay.
MR. MATTHEWS: Yes, the only question posed to us was antibiotics, but by extension it would apply to other medications.

MR. SIEMON: I think so too.

MR. MATTHEWS: Okay. Becky.

CHAIRMAN KING: Becky.

MS. GOLDBURG: I'm curious whether the NOP has a definition of sub-therapeutic antibiotic use pertinent to this directive. As I understand it, there is no widely-accepted definition of sub-therapeutic, there are a variety of definitions. I know that FDA has no definition. So I'm curious whether -- how you're making the distinction between sub-therapeutic and therapeutic antibiotic use.

MR. MATTHEWS: To me, and the way we mean it --

UNIDENTIFIED MALE VOICE: That's in the Act.

MS. GOLDBURG: It is actually in the Act?

UNIDENTIFIED MALE VOICE: Yes. That's (inaudible) statutory --

MR. MATTHEWS: Sub-therapeutic is a requirement within the Act.

MS. GOLDBURG: Yeah, but I don't think it's defined.

UNIDENTIFIED MALE VOICE: And I think that's covered in FDA as well.
MS. GOLDBURG: No, there is no FDA definition.

UNIDENTIFIED MALE VOICE: Sub-therapeutic?

MS. GOLDBURG: There is not.

MR. MATTHEWS: Okay. But basically what we're saying is that in the presence of illness that would dictate that you have to bring -- that you have to use an antibiotic in order to save that animal's life, or -- if you're a veterinarian -- basically it's an issue call by a veterinarian. If your animal is so sick that it has to have an antibiotic, or I suppose even if it had gone through a surgery and you needed to have an antibiotic to prevent an infection, this is where the humane part of it comes in, you can go ahead and do it, but there are costs for having treated your animal in a humane way. One of those is that you lose the organic status of that animal for meat purposes.

MS. GOLDBURG: Yeah, I understand that, but just --

MR. MATTHEWS: And this only applies, really, to dairy animals, okay?

MS. GOLDBURG: Yeah.

MR. MATTHEWS: Any other animal, it loses its meat status, it's out of the organic anyway.

CHAIRMAN KING: Jim, then Andrea.
MR. RIDDLE: Yeah. You've said -- and you have it stated up there -- that this does not permit milk from treated animals to be sold/labeled as organic --

MR. MATTHEWS: Right.

MR. RIDDLE: -- but yet I've heard you say verbally that yes, an animal can be treated with an antibiotic and 12 months later its milk sold/labeled as organic. So it does allow --

MR. MATTHEWS: Well, but it doesn't allow it during the 12-month period.

MR. RIDDLE: Yeah, but it was a treated animal. So it does allow the milk from a treated animal to be --

MR. MATTHEWS: After 12 --

MR. RIDDLE: Yeah, with conditions.

MR. MATTHEWS: -- months of organic management.

MR. RIDDLE: Okay. So I just want to address that. And then what I -- this correction you've made about: it applies to other medications --

MR. MATTHEWS: Uh-huh.

MR. RIDDLE: -- so that would include hormones as well. So there --

MR. MATTHEWS: No. Hormones are specific --

MR. RIDDLE: If they're used for therapeutic purposes --
MR. MATTHEWS: This is for illness.

MR. RIDDLE: -- treatment -- yes.

UNIDENTIFIED FEMALE VOICE: Illness.

MR. RIDDLE: Yes. I mean, I don't see the line. It applies to other medications of any category --

UNIDENTIFIED FEMALE VOICE: I'm not a livestock expert, but do you give hormones for illnesses?

UNIDENTIFIED MALE VOICE: Yeah.

UNIDENTIFIED FEMALE VOICE: Yeah.

UNIDENTIFIED MALE VOICE: Sure you do.

MR. SIEMON: Just breeding problems.

MR. RIDDLE: Breeding problems.

CHAIRMAN KING: Next example, Barbara.

UNIDENTIFIED MALE VOICE: Viagra?

UNIDENTIFIED MALE VOICE: Menopause.

(Laughter.)

UNIDENTIFIED MALE VOICE: Just to support -- we have to remember, in the dairy, which is so complex, in the new herd clauses, those animals coming into the program could have previously had antibiotics, could have previously had hormones.

UNIDENTIFIED MALE VOICE: Right.

UNIDENTIFIED MALE VOICE: So we have to be somewhat even here about this because some understand. Not
that I agree with the document, don't anybody misunderstand me, but still, I can agree (inaudible) --

MR. MATTHEWS: But it does -- but it does address in some respect the concerns of dairy farmers of the unlevel playing field with regard to health care for the young stock that they have on their farm, that are organic.

MR. RIDDLE: Okay, so that's the --

MR. MATTHEWS: But we're not -- but we're really not --

MR. RIDDLE: The origin of stock allows prior treatment in an animal's life, before it comes into the organic program; then the livestock health care practice must be followed, and it says a producer must not sell, label, or represent as organic any animal or edible product derived from any animal treated with antibiotics. It doesn't say within a year; it says "must not." So I just -- I --

MS. CAUGHLAN: So where does this come from?

MR. RIDDLE: Yeah, where does this come from? I think -- you know, what's driving this?

UNIDENTIFIED FEMALE VOICE: What about the level playing field for the consumer?

MR. RIDDLE: Edible product --

MR. NEAL: In Section 236 -- Arthur Neal is my
CHAIRMAN KING: Arthur.

MR. NEAL: In Section 236 there is no -- what happens, it says that organic animals must be managed continuously for 12 months. Those animals can be considered to -- the milk from those animals can be sold as organic. It says that --

MR. NEAL: It doesn't say "unless treated with a prohibited substance." It can't -- that's under "Origin."

MR. RIDDLE: Right.

MR. SIEMON: Then how come you're requiring the feed -- a 100% organic feed on the second stream, then?

UNIDENTIFIED MALE VOICE: What was that?

MR. SIEMON: Then why would you require a 100-percent organic feed on that one stream of dairy that you're requiring --

MR. NEAL: Because it must continuously be managed organically.

MR. MATTHEWS: The exception to the 100-percent organic feed is only found for whole herd conversion, it is not found for any other situation.

MR. SIEMON: But it -- so you're differentiating between feed and medication at that time.
MR. MATTHEWS: Yeah, we're differentiating between feed and medication.

MR. SIEMON: Except for replacements.

MR. MATTHEWS: One heals, the other one keeps them nourished.

MR. SIEMON: Except for replacements on the one stream. That's another subject.

CHAIRMAN KING: Andrea.

MS. CAROE: Okay, I just wanted -- I really don't have a question but I just -- I want to make a comment on two things that are kind of a by-product of this directive, and one is that an unenforceable section of this rule has been: we have never been able to identify a farmer that's withholding treatment of a sick animal, and this will hopefully prevent some of that from happening, because that's -- that's in the regulation, you can't withhold treatment from an animal that's sick, but if a certifier goes a year later, after the animal's died, they have no idea that that happened that way. So that -- I just want to put that in the mind, because I really think that's an important thing, that we've never been able to address.

And then the other thing is, there is a discrepancy between buying a replacement animal at a sale barn and transitioning them and somebody that's growing
their own.

UNIDENTIFIED MALE VOICE: Speak up, Andrea.

UNIDENTIFIED MALE VOICE: We can't hear you.

MS. CAROE: I don't think which mic works.

MS. ROBINSON: I don't think it is working.

MS. CAROE: I'll speak loudly. Now, the other
issue was the discrepancy between somebody that's raising
their young on their farm and buying from a sales barn and
transitioning, because those animals could have been
treated and fed, and anything could have happened to them.

It almost -- it's almost counter-productive to promoting
growing the young animals on the farm, if it's easier to
buy them from the sale barn and transition them, than to
deal with a young animal that is more susceptible to
disease.

MR. SIEMON: They just clearly said that all
those people that qualify for that have to raise their
calves and keep their heifers rather than go out and buy
other heifers as a shortcome, they just clarified that -- I
hope all the ACAs hear that so they can do it.

UNIDENTIFIED MALE VOICE: What was that?

UNIDENTIFIED FEMALE VOICE: I didn't hear that.

CHAIRMAN KING: I think we all missed that one,
George.
MR. SIEMON: They just said about the two streams of dairy, the ones that qualify for the 12 month, they must raise their heifers organically and cannot be selling them and buying back heifers elsewhere as some way to get around and cheapen the cost of replacements, which you were just referring to.

MR. MATTHEWS: That's always been in there, we haven't changed that regulation.

MS. CAROE: I'm missing something.

MR. MATTHEWS: We have not changed any standards related to the origin of livestock. We have simply addressed whether or not a dairy animal can receive treatment for illness and still remain on the organic farm, and the answer is: yes, you can treat it, you can stay on the organic farm, it can never be used as organic meat, it cannot be used for the production of organic milk for 12 full months, and during that full 12 months it must be managed organically.

UNIDENTIFIED MALE VOICE: And longer.

MS. CAROE: Well, let me just say this, I mean --

MR. MATTHEWS: And it could be longer if you treated a two-day-old calf.

MS. CAROE: Okay. But if -- I understand that origin of livestock has not changed by this directive, but
if a farmer had an animal born on their farm, two-day-old baby, that gets pneumonia, okay --

MR. MATTHEWS: Right. And it was born as an organic animal.

MS. CAROE: It was born as an organic cow.

MR. MATTHEWS: All right.

MS. CAROE: They treat that animal, they sell the animal, they cull it out. Another organic farm --

MR. MATTHEWS: That is sold as a conventional animal.

MS. CAROE: Sold as a conventional animal.

MR. MATTHEWS: Right.

MS. CAROE: Another --

MR. MATTHEWS: Cannot come back.

MS. CAROE: -- organic farmer is looking for a replacement animal, buys one at a sale barn, which is not required to have any lineage on that animal, buys that animal, unknowing that it was an organic animal that's gone conventional, bring it in, transition it for 12 months, in effect they're doing exactly what the directive is saying.

MR. MATTHEWS: Well, yes, that -- there is always the risk that an animal that was born organic was treated and then culled from the herd, went into the conventional market. There is the possibility that if the -- if the
buyer of that animal, who is organic, did not do due
diligence of trying to find out the history of that animal,
you might possibly have that animal come back onto the
farm.

MS. CAROE: So --

MR. MATTHEWS: Under the regulations, it's not
allowed to come, but it is possible that one would.

MS. CAROE: Right, and that was my point. My
point is that it allows it to stay on the farm and it
doesn't weaken it in any way.

MR. MATTHEWS: Right. That's right. This option
actually would create an opportunity where that is less
likely to happen, hopefully. You're more confused?

MR. RIDDLE: Just --

MR. MATTHEWS: Then we should have just left it
the way it was, Jim (chuckles).

MR. SIEMON: But again, I made an assumption
earlier, but after listening to this, I've got to go back
-- assumptions, always gotta worry about them. If you
bring in through the one-time exception, you're still
qualified for this same use of antibiotics.

MR. MATTHEWS: Yes.

MR. SIEMON: Okay.

MR. MATTHEWS: You're -- the animal that you're
bringing in is converted. Now, again, the likelihood of
treating a mature animal --

    MR. SIEMON: I'm talking about calves, I'm
talking about a calf.

    MR. MATTHEWS: -- and keeping it on the farm is
pretty slim.

    MR. SIEMON: I'm talking about calves.

    MR. MATTHEWS: Okay.

    MR. SIEMON: Because we have two different
replacement clauses for dairy, and it doesn't matter which
one you're in, all of them qualify for this antibiotic use.

    UNIDENTIFIED FEMALE VOICE: Yeah, that's right.

    CHAIRMAN KING: That's a true statement.

    MR. MATTHEWS: Yes. Remember --

    MR. SIEMON: It's not totally logical, but --

    MR. MATTHEWS: Remember that the 80/20 rule for
feed is only available to a whole herd conversion.

    MR. RIDDLE: During the conversion process.

    UNIDENTIFIED FEMALE VOICE: Right.

    MR. RIDDLE: Once they've converted --

    MR. MATTHEWS: During the conversion process.

    MR. RIDDLE: -- all animals must be organic from
the last third of gestation. If someone comes in through
the 1-year clause -- I'm really confused, coming out of
this -- what about those calves? They're fed organic?

It's required that they have to be fed organic?

MR. MATTHEWS: Yes.

UNIDENTIFIED MALE VOICE: Yes.

MR. MATTHEWS: Yes. Yes.

MR. RIDDLE: But that's contrary to your --

MR. MATTHEWS: Managed 100-percent.

MR. RIDDLE: And that's contrary to your prior policy statement on the two herds, where you had that chart?

MR. MATTHEWS: No, it isn't. No, it isn't. We are not addressing the origin of livestock at all.

MR. SIEMON: Jim, that previous one was replacements, bought replacements. But I hope NOP is hearing: there's a lot of confusion about raising those on those farms that qualify for the 12-month. You need to hear that. There's a lot of confusion.

UNIDENTIFIED MALE VOICE: They're being fed conventional.

MR. SIEMON: Because that's the shadow here -- it's not even the subject we're on, but that's the shadow that's still confusing us.

UNIDENTIFIED MALE VOICE: Yeah.

MR. SIEMON: That document on replacement says

R & S TYPING SERVICE - (903) 725-3343

5485 S. LIVE OAK, GILMER, TX 75644
brought in replacements, bought, they're saying no matter which way you come in, you have to raise your calves organically, organic feed and all, until we come up with this new exception here, and you can't sell your calves off and buy heifers back for the one year, which is going on right now.

UNIDENTIFIED MALE VOICE: Totally.

MR. SIEMON: So we need to deal with this, it's going on, it's --

UNIDENTIFIED MALE VOICE: That's what the chart says.

UNIDENTIFIED MALE VOICE: Yeah, that's what your prior chart says.

MR. SIEMON: You need to deal with this, so you all need to hear it. There's a lot of -- we need a directive on this one.

CHAIRMAN KING: But this is -- but, yeah, that's -- so that's another issue that we need to clarify --

MR. MATTHEWS: That's a different issue.

CHAIRMAN KING: -- clearly. I think I need to be heavily medicated right now, I don't know about you.

(Laughter.)

UNIDENTIFIED FEMALE VOICE: Don't ask for directives (chuckles).
MR. SIEMON: Let's move on. Let's move on.

UNIDENTIFIED FEMALE VOICE: Life's like a breakout issue.

CHAIRMAN KING: Yeah, there you go. All right. So Rick, how close are we to --

MR. MATTHEWS: Oh, we're getting a lot closer.

CHAIRMAN KING: Well --

UNIDENTIFIED FEMALE VOICE: We'll move on.

MR. MATTHEWS: I'm not sure that it's going to be any quicker. Now, we can cut it off --

CHAIRMAN KING: I'm just wondering if at some point people would need to go to the bathroom and take a break, so let's --

MR. MATTHEWS: The only thing left is fishmeal and the materials review process.

CHAIRMAN KING: Let's get through antibiotics, at least. Are we done?

MR. SIEMON: We're done. Let's move on.

MR. MATTHEWS: Antibiotics, we're done.

CHAIRMAN KING: What's the will of the Board, do you want to take a quick break now or do you want to finish --

UNIDENTIFIED MALE VOICE: I think we're so off schedule we ought to keep moving, myself.
UNIDENTIFIED MALE VOICE: Let's just finish NOP.

CHAIRMAN KING: I'm hearing "Let's finish NOP."

Rick, if you have to go to the bathroom, tough luck.

(Laughter.)

MS. ROBINSON: We've got seven more slides.

UNIDENTIFIED MALE VOICE: Do you want to try to define "sub-therapeutic"?

UNIDENTIFIED FEMALE VOICE: No, not now.

UNIDENTIFIED FEMALE VOICE: Not right now.

UNIDENTIFIED MALE VOICE: Not right now.

(Laughter.)

UNIDENTIFIED FEMALE VOICE: And whether it's --

(Pause.)

CHAIRMAN KING: Okay, Rick, I guess you're off and running on the next subject.

MR. MATTHEWS: All right, now we're on to fishmeal. Go ahead and click again, right button.

What the directive does: reminds producers and ACAs that Section 205.237(a) allows the use of non-synthetic feed additives and supplements in organic production. Fishmeal is an allowed protein supplement. It's neither organic -- it's natural.

What if the fishmeal contains a synthetic substance? Fishmeal is a natural. All naturals are
allowed unless prohibited. Fishmeal is not organic. How much fishmeal constitutes a supplement?

MR. SIEMON: No, no, no, no, go back.

UNIDENTIFIED FEMALE VOICE: Go back.

UNIDENTIFIED FEMALE VOICE: Go back.

UNIDENTIFIED FEMALE VOICE: Put it back on.

UNIDENTIFIED MALE VOICE: Back up.

MR. SIEMON: You had a good question but there wasn't the answer. Synthetic is defined in our rule that if a substance is formulated or manufactured by a chemical --

MR. MATTHEWS: Fishmeal has never been determined by this Board to be a synthetic product.

MR. SIEMON: But it has synthetic ingredients.

MR. MATTHEWS: It doesn't have synthetic ingredients.

UNIDENTIFIED FEMALE VOICE: Yes, it does.

MR. MATTHEWS: It may have a synthetic ingredient.

UNIDENTIFIED MALE VOICE: Fish emulsion is listed --

MR. SIEMON: The question is: what if it contains synthetic --

MR. MATTHEWS: But fishmeal it --
MR. SIEMON: What if it contains a synthetic substance? That's your question up there.

MR. MATTHEWS: It has never been ruled to be a synthetic substance by this Board.

UNIDENTIFIED MALE VOICE: What if it contains a synthetic substance?

UNIDENTIFIED FEMALE VOICE: Yeah.

UNIDENTIFIED FEMALE VOICE: Yeah.

MR. MATTHEWS: It doesn't matter.

UNIDENTIFIED FEMALE VOICE: Why?

MR. MATTHEWS: It doesn't matter. It's a natural product.

(Cross-talk.)

MR. SIEMON: So if they would --

MR. MATTHEWS: Okay, we're not going to meet -- or meeting of the mind on this, and it's -- under --

MR. SIEMON: Okay, so the answer should be --

MR. MATTHEWS: -- under the rulemaking that has already been done, if you go to the preamble, it says that fishmeal is allowed, and all we're doing is reiterating the fact that a determination has already been made that fishmeal is allowed, and there's no criteria put on that fishmeal.

MR. SIEMON: So as long as it's an FDA product,
it doesn't matter what's involved in the fishmeal, if they want to put amino acids in there or something like that and it still be called fishmeal, fortified fishmeal --

MR. MATTHEWS: As long as it meets the definition of what a fishmeal is.

MR. SIEMON: By the FDA.

MR. MATTHEWS: Right.

MR. SIEMON: This is based on the determination of synthetic, and you said it's never been determined to be synthetic, so in order to be determined synthetic, someone would have to go through the TAP review process, to have it declared as a prohibited material, right, prohibited natural?

MR. NEAL: That's right. That's right, because fishmeal -- fishmeal has not been prohibited, because all naturals are allowed unless prohibited.

MR. SIEMON: But all of us thought that if a natural had a synthetic in it --

MR. MATTHEWS: But you have to remember that all naturals, including naturals that are used in an organic food, the natural, if it was created using synthetics, it doesn't matter, it's allowed, in the last 5 percent of human food.

UNIDENTIFIED MALE VOICE: It's got to be on the
List.

UNIDENTIFIED MALE VOICE: Only if it's on the List and we've reviewed it.

MR. MATTHEWS: The same thing doesn't -- no.

MR. SIEMON: Okay, next --

MR. MATTHEWS: No, naturals are allowed unless prohibited under crops and livestock.

MR. SIEMON: So if an FDA-approved additive has a prohibited material in it, that's on our list, then clearly it's not allowed? If an FDA-approved additive has in it a synthetic -- prohibited synthetic that's on the NOP list, then clearly wouldn't that mean it wouldn't be allowed?

MR. MATTHEWS: I'm still not following the question.

MS. KOENIG: I have an explanation, I think I have clarity.

CHAIRMAN KING: Rose, go ahead.

MS. KOENIG: I think fish -- it's like aquatic -- it's like fish emulsion or aquatic plants, that in reality, if it's a processed product that involves a synthetic substance, that it -- I -- this is my personal opinion, so -- I mean, this is not -- I'm not speaking from a regulatory view, but I view fishmeal as -- what people are saying, if it's -- if there's anything -- if it's, you
know, processed in some way, it may in fact have to be petitioned, because similar to aquatic plants or similar to fish emulsion, there may be a procedure, to get to the finished product, that would require it to be petitioned and then perhaps annotated.

MR. MATTHEWS: Yeah. Now, to confuse it even more: If there were fish standards in place, the fish would have to be organic and then it would have to have gone through the process, but it's -- right now fish are outside our scope, and it's a natural, and so it's allowed.

UNIDENTIFIED MALE VOICE: Even if adulterated?
UNIDENTIFIED FEMALE VOICE: Yeah, but fish --

CHAIRMAN KING: Jim, then George, then Becky.

MR. RIDDLE: I'm going to come back to that preamble that I read earlier today and ask you how it squares with that when it says "Synthetic ingredients in any formulated products used as organic production inputs, including pesticides, fertilizers, animal drug and feeds, must be included on the National List," and feed supplement is defined as "feeds." So to me, when it says "feeds," that's a broad category. And so here, you're saying that it doesn't matter if it has synthetic ingredients, where you said earlier that they must be on the National List.
MR. MATTHEWS: .237 allows non-synthetic substances to be used as a supplement in organic feed.

MR. RIDDLE: Well, yeah, I have no problem with that. Fishmeal without synthetics. But once you've added a synthetic --

UNIDENTIFIED FEMALE VOICE: Right.

UNIDENTIFIED FEMALE VOICE: -- then you've got a different --

MR. RIDDLE: It's a different issue.

MS. DIETZ: It sounds like a certifier issue to validate that there are no synthetics in that --

UNIDENTIFIED FEMALE VOICE: But not if they're given a directive that doesn't call for that.

CHAIRMAN KING: Hold on, let's stay on track.

MS. KOENIG: But fishmeal becomes fish emulsion, it's a natural that is changed once it's -- unless the fish -- if the fishmeal is purely fishmeal, then I agree with that, but what that question begs is: if it contains a synthetic substance, it then -- that's what I'm saying, then it becomes fish emulsion and it has to go through the process of going -- it's a natural that now has been altered and it gets reviewed.

MR. MATTHEWS: Well, fish emulsion would. We're not talking about fish emulsion, we're talking about
fishmeal.

MS. KOENIG: No, but --

MR. NEAL: Just a second, guys, just a second.

CHAIRMAN KING: Point of clarity?

MR. NEAL: Yeah.

CHAIRMAN KING: We're looking for that.

MR. NEAL: There are a lot of issues, that are trying to be hashed out right now, that are a point of contention, and it all revolves around what can and cannot be reviewed by the Board. What does the Act allow to be included on the National List. If you turn to 6517 of the Act, this is the issue that we face. But it's in there. You go -- it's on the right-hand column of the page, 21-18.

CHAIRMAN KING: 21-18 or 6517, same thing.

MR. NEAL: Okay, (c)(1)(b).

CHAIRMAN KING: Okay.

MR. NEAL: It says -- and let's read --

CHAIRMAN KING: Where are we starting?

MR. NEAL: This says that -- (c)(1) says "The National List may provide for the use of substances in an organic farming or handling operation that are otherwise prohibited under this title only if: (b) the substance is used in production and contains an active synthetic ingredient in the following categories: copper and sulfur
compounds, toxins derived from bacteria, pheromones, soaps, horticultural oils, fish emulsions, treated seed, vitamin and minerals, livestock parasiticides and medicines, and production aids."

Now, this is -- what was that, Nancy?

CHAIRMAN KING: Never mind, move on.

MR. NEAL: This talks about active synthetic ingredients.

Now, it sounds like we're back at a phosphoric acid issue, where there may be a preservative used that's not an active ingredient. Well, how do you petition the Board to include a non-active ingredient in a feed formulation for inclusion on the National List if there's no entry point for it by the Act? Because the Act says "active synthetic ingredients."

CHAIRMAN KING: Nancy, then Rose.

MS. OSTIGUY: Am I understanding you correctly that your reading of this says that we can -- and there's part of this I wouldn't have a problem with. The only things that go on the List are things that are in the category that you just read, and it must be inactive, otherwise it's prohibited?

MR. NEAL: No.

MS. OSTIGUY: So you are saying that if it's not
an active, then it's okay even if it otherwise would be prohibited if it was active?

MR. NEAL: Correct.

MR. SIEMON: Then why did we go through all that about the aloe preservatives?

MR. NEAL: I don't know.

MR. SIEMON: You don't know. Good, I'm glad you said that.

(Laughter.)

MR. SIEMON: No, I'm agreeing with you, I don't know either.

MR. NEAL: Now, listen, listen, and if you think I'm wrong --

MS. OSTIGUY: Why did we do anything with inerts, then? They're not actives.

MR. NEAL: Inerts is specifically identified in Paragraph 2. Now, if you'll take a look at vitamins that are allowed, on the National List, there are I'm sure some carriers invited that are not on the National List. The Act did not envision for every inert -- well, I won't say inert -- inactive ingredient that's used in a feed formulation or any other product to be considered by the Board because it's too expansive. That means that there are products that are on the market right now that could
potentially be in violation under the standards.

UNIDENTIFIED MALE VOICE: You're missing something in the law right now, I'll tell you what it is --

CHAIRMAN KING: Hold on.

MR. SIEMON: You've got to be recognized.

CHAIRMAN KING: Friday, please, public comment can go forth --

UNIDENTIFIED MALE VOICE: I can help you --

CHAIRMAN KING: Hold on.

UNIDENTIFIED MALE VOICE: -- out immensely on this right now.

CHAIRMAN KING: Not right now.

MR. SIEMON: I've got a new question, just -- because I can see we're really going to be (inaudible) about this. This -- just like my question about antibiotics -- then covers crabmeal and any non-synthetic, non-agricultural material, whether it's got synthetics or not, as long as it's FDA-approved, anything, any and all?

MR. MATTHEWS: Yes. And all of those marine products would change if there were standards for aquatic animals.

CHAIRMAN KING: Rose.

MS. KOENIG: Can you clarify that, Richard. I assume most -- it would change if there were standards for
wild aquatic animals, since all fishmeal at the moment is
made from -- or virtually all, I should say -- from wild
fish.

MR. MATTHEWS: Well, yeah, it's -- I guess -- I
say that if we had standards, I'm a little -- I don't know
the correct word. Let's say that I fail to see at this
point -- and I could be convinced differently, but I fail
to see how you're going to be able to open this up to all
aquaculture without a source of organic fishmeal, okay,
because there are -- you're going to have to be feeding
carnivores fish, and so --

MS. GOLDBURG: Right. But that's assuming that
you need -- want to or need to open it up to all
aquaculture.

MR. MATTHEWS: Well, that's assuming that it was
all opened up.

MS. GOLDBURG: Right.

MR. MATTHEWS: Now, I guess, to use Keith's
phrase, I should be a little more precise in the wording,
that if there were standards in place, then the -- and it
included wild-caught or even aquaculture-raised fish that
was available for the production of fishmeal, then that
fishmeal would have to be organic, okay.

The real problem is, right now, in the organic

R & S TYPING SERVICE - (903) 725-3343
5485 S. LIVE OAK, GILMER, TX 75644
system, you wouldn't be able to turn a carnivore into an herbivore, so they're going to have to have a source of food for your aquatic animals that are carnivores, if -- if you went to --

MS. GOLDBURG: If you decided that you need organic carnivores.

MR. MATTHEWS: That's right, if you went to the stage of having carnivores covered by the standards. But right now there are no standards for any aquatic animals.

I'm just saying that the position that we take now is subject to change should there be rulemaking done in the future that would affect this position, okay?

CHAIRMAN KING: Okay, I have Rose, Kevin, George.

MS. KOENIG: I've had -- this is back to Arthur's statement, and I've had time to kind of think about this and rethink about it, and then the other day I was looking through the preamble of the Rule on Page 8612, and it's Subpart (g), administrative, where it talks about -- and the interpretation or the -- you know, how the National List of Allowed and Prohibited Substances -- descriptions of regulations, okay?

You go into the second column, looks like the second paragraph, where it starts "In this Final Rule," talks about only -- the EPA lists four inerts in that
section, but if you go down midway, and I'll read it,
"Synthetic ingredients in any formulated products used as
organic production inputs, including pesticides,
fertilizer, animal drugs and feeds, must be included on the
National List. As sanctioned by OFPA, synthetic substances
can be used in organic production and handling as long as
they appear on the National List."

But again, synthetic ingredients is not the same
as active, it's all, and they talk about formulations of.

MR. NEAL: And I truly do understand the
confusion of that text, of that language, but when you go
back to the Act, this is the authority, this is what we can
and cannot look at. The window that's opened are for
active synthetic ingredients.

UNIDENTIFIED FEMALE VOICE: Where?

MR. NEAL: (c)(1)(b)(i).

MR. RIDDLE: And everything else is prohibited --

UNIDENTIFIED FEMALE VOICE: No. He's saying --

MR. RIDDLE: -- every other synthetic --

MR. MATTHEWS: No.

MR. RIDDLE: I know. You're turning it on his
head from what we've understood before: synthetics are
prohibited unless they're on the List, but what I'm hearing
you say is synthetics are allowed, but only this category

R & S TYPING SERVICE - (903) 725-3343

5485 S. LIVE OAK, GILMER, TX 75644
needs to be reviewed.

MR. NEAL: Watch [phonetic] the acknowledgement of the Act, it says, "the substance" --

MS. OSTIGUY: Where are you reading?

MR. NEAL: This is (c)(1)(b)(i). "The substance is used in production" and does what? -- "and contains an active synthetic ingredient." It does not say "the substance is used in production and it contains itself," there's something else in with this active synthetic ingredient that's being considered, "it contains," "the substance contains an active synthetic ingredient."

MR. MATTHEWS: Mark, you've still got a full afternoon of material to go.

CHAIRMAN KING: Yeah, I know. I know. It just seems -- okay.

UNIDENTIFIED MALE VOICE: You've already wasted a half an hour I could have saved you.

CHAIRMAN KING: Okay. Friday you can do public comment. We need to come back, but thank you.

MR. SIEMON: Can I ask one more question that's a new subject on this one? Just so I understand, of course we all know there's limitations of fish, and I hope there's no other fishmeals out there, but there's no limit on the percent that can be fed here --
MR. MATTHEWS: That's the next slide.

CHAIRMAN KING: Next slide.

MR. SIEMON: I just (inaudible), Rick, trying to help you out the best I can.

MR. MATTHEWS: Next slide.

(Laughter.)

MR. MATTHEWS: The regulation defines what a supplement is. I've included in brackets there as a supplement to help clarify what that statement is. Clearly it's really intended as something to supplement the feed, it's not meant to be a wholesale replacement of, say, a grain, it's not meant to be fed at an 80-percent level. 80 percent of a protein is no longer a supplement, it's feed. So it's -- it's what is there as a supplement, and you really need to be going back to AFCO and what they regulate for putting together a feed.

And you also have to remember too that fishmeal is going to have an impact on the quality of the meat or the ags or whatever, so your farmer is not going to be -- is not going to be feeding levels that are going to destroy his market.

MS. GOLDBURG: Can I ask you a question, Richard?

MR. MATTHEWS: Yes.

MS. GOLDBURG: Earlier you made a statement about
the need for fishmeal if you're going to farm carnivores, particularly aquatic carnivores, but here you're allowing fishmeal as a supplement, and I'm arguing that there should be a limit on how much of a -- what percentage of the feed it could be in order to be considered a supplement. Is there an implication there for farming of aquatic carnivores?

MR. MATTHEWS: There I don't see -- for example, feeding fishmeal to salmon, I don't see that as a supplement.

MS. GOLDBURG: Okay. If it's 45 percent of the feed.

MR. MATTHEWS: That is their main -- that's one of their main ingredients for their feed.

MS. GOLDBURG: Okay.

MR. MATTHEWS: Okay? You know, when it comes to feeding fish fish, that's -- that's what they eat, that's not a dietary supplement. But again, they're outside the current scope.

MS. GOLDBURG: Right, I understand that.

MR. MATTHEWS: Okay, let's go on to materials review. This one will probably be no less a debate.

There are currently the following stages to a materials review: a petition is received, the NOP reviews
the petition, there's a scientific review and reporting on that, there's a requirement for a technical advisory panel to be involved in the process, the NOSB committee will review and make a recommendation to the full board, and the full board will review and then make a recommendation to the Secretary, and then the NOSB -- I mean the NOP -- goes through the rulemaking process. So those are the things that are happening under a materials review.

Let's go to the next slide, please.

UNIDENTIFIED FEMALE VOICE: Wait a minute, wait a minute.

MR. MATTHEWS: Go back.

UNIDENTIFIED FEMALE VOICE: Go back. Are these going to be available --

CHAIRMAN KING: Could we just get copies of this, these slides printed out, posted, something?

MS. DIETZ: Are the slides going to be posted on the website?

CHAIRMAN KING: Knowing that we're sort of moving along --?

MR. MATTHEWS: Well, the -- yeah, we could probably make -- yeah, we could make the slides available. I'm not sure that out of context they'll always be clear.

MS. DIETZ: But at least so we can --
CHAIRMAN KING: Well, we can put a disclaimer on the top.

MR. MATTHEWS: But this just says the different things that a material goes through in order to be added to the National List.

CHAIRMAN KING: Yeah.

MR. MATTHEWS: Okay.

CHAIRMAN KING: The identified stages.

MR. MATTHEWS: Right.

CHAIRMAN KING: Okay.

MR. MATTHEWS: You had a question, Goldie?

MS. CAUGHLAN: (No audible response.)

MR. MATTHEWS: Okay. NOP is working diligently to redesign the materials review process. We recognize, just as the Board recognizes, that there are a lot of problems with the way the materials review process is working. All too often petitions have been deficient or the report has been deficient, there's been questions about whether or not there's enough in the report to satisfy the needs of the Board in making a determination as to whether something should be recommended or not.

So we're seeing all kinds of problems with this, we're seeing problems with things getting sent forward for review that probably should have never been sent forward.
So we're -- we're really doing an evaluation of the entire review process and we're trying to work through some changes.

We're taking a global approach to this, and the ultimate product is going to be a materials review manual that'll be published up on the website.

The first step in this was the checksheets that we created for the Board's use in the review of materials. We are currently working on NOP procedures, a standard operating procedure for how the NOP reviews a material from the time it's reviewed -- or from the time it's received as a petition until the time that it moves on to the scientists for analysis.

So we're really developing a standard operating procedure for us. We had hoped to have this for the Board before the meeting, but putting it in print has made it a whole lot bigger than we ever thought it was, and it hasn't been fine-tuned to our satisfaction yet, so we're not quite ready to share it with the Board.

We are also at the same time working on developing procedures for scientific review and reporting. We will be sharing this with the Board and seeking their input, because this is essentially the document that is going to be -- these procedures will help the reviewers
create the document that you're going to be receiving and then using, in company with your checksheets, to create your recommendation. So we see that as a critical part of this process. We're getting that started; we will share it with you.

Okay. Next one is that we're taking a look at the way the technical panel has been working, we think that there are rooms -- or that there is room for improvement on that as well, and we are proposing a new technical advisory panel approach which would increase the NOSB's involvement in the review process.

We're looking at this as probably being a five-member panel. The materials committee chair would definitely be a member of that, and then two of the following, which would be the livestock crop or handling, would also serve on that panel.

So you would have at all times three board members a part of the TAP review panel, and instead of the TAP review being done in conjunction with the report from the scientists, it would actually occur after the scientists have put together their report.

This panel would also include somebody from the Environmental Protection Agency and somebody from the Food & Drug Administration, the idea being that this new stage
in the review process would enable representatives of the Board to review the report at an early stage, to give feedback to the scientific organization, to say, "This just doesn't cut it and we need you to go back and work on this," or you might find that what they did was fine and the panel may vote to move it forward -- with a recommendation, maybe -- to the committee that the material appropriately belongs with. So then the next stage is to go to a committee of the Board.

Now, we're also looking for that committee --

CHAIRMAN KING: Wait, I think back up a second. Could we back up real quick, Barbara. Thank you.

MR. MATTHEWS: Okay, so you've got -- that's your committee, okay?

MS. DIETZ: So that the petition has been forwarded for a TAP review, the TAP review's in process, there's a time period --

MR. MATTHEWS: We would change the title of that from TAP review to -- it's been sent --

MS. DIETZ: -- scientific --

MR. MATTHEWS: -- forward for scientific analysis, so they would take and where the petition leaves off create the scientific background that is needed now for this new panel to then review it and then to make
recommendation over to the Board.

    MS. DIETZ: So we are in a sense --

    MR. MATTHEWS: Or to send it back to the scientists to gather more information.

    CHAIRMAN KING: Did you mean to say "to the committee"?

    MR. MATTHEWS: To the committee, yes.

    CHAIRMAN KING: Thank you.

    UNIDENTIFIED FEMALE VOICE: Well, this panel will get it sooner, but it really might stretch out the review process longer --

    MR. MATTHEWS: It might, or it might shorten it. The idea is to do away with the problem of deficient reports --

    UNIDENTIFIED FEMALE VOICE: Deferred TAPS.

    MR. MATTHEWS: -- and deferred TAPS, and what we're thinking is that if we change -- if we create essentially a new statement of work for the scientists and they follow that procedure and then it comes to this body of five and that body of five then analyzes that report for its sufficiency, then it can go on to the committee of the Board, whether it be the crops committee, the livestock committee, or the handling committee, and then that committee would do essentially what it already does. It
may want to do something else, I don't know, but it would then go to that committee.

But if it wasn't ready to go to that committee, then this panel would tell these people "this isn't ready to come to the Board, and therefore this is what you need to do to make this report ready to come to the Board."

MR. RIDDLE: So, yeah, just to be clear, so this five-member panel would replace the three-member TAP reviewers right now --

MR. MATTHEWS: Probably so.

MR. RIDDLE: -- in the stages, is that --

MR. MATTHEWS: Probably so.

MR. RIDDLE: -- what you're thinking, you're proposing?

MR. MATTHEWS: Yeah, that's what we're thinking, that it would actually be the Board that would take over that function, they would do it after the scientific information was gathered. This technical advisory panel would then advise the scientists on whether or not they did an adequate job. If they didn't, it would go back to the scientists, they would fill in the gaps, then it would come back to this panel, and then the panel would then make its determination and send it on to the committee of the Board, for them to do their review, okay, and then that committee
of the Board has already got a member from the technical advisory panel on it, that would also be able to speak intelligently as to what transpired at the technical advisory panel.

CHAIRMAN KING: Well, and clearly there are a lot of things that can be worked on in terms of the format of the report as it comes to the panel --

MR. MATTHEWS: Oh, yeah.

CHAIRMAN KING: -- those are not things we're going to deal with at this moment --

MR. MATTHEWS: Right.

CHAIRMAN KING: -- but we understand that that's kind of work in progress. I have Rose and Andrea next.

MS. KOENIG: And this is from experience, it's just my gut reaction, because it's -- again: in my opinion, the problem has never been with the outside reviewers. You're saying doing away -- as I understand, and maybe I'm not correct. I'm understanding you're saying that you do away with those three external reviewers and you replace them with this five-member panel.

MR. MATTHEWS: That's what we're saying, yeah.

MS. KOENIG: And what I am --

MR. MATTHEWS: In other words, it would go through a true technical advisory panel.
MS. KOENIG: Well -- but what I am -- what I would argue is that if you have three competent industry-focused and true experts looking at that scientific evaluation, they are much -- and I'm not trying to insult anyone on this Board, but they --

UNIDENTIFIED MALE VOICE: Just everyone.

(Laughter.)

MS. KOENIG: Yeah, just everyone, including myself.

(Laughter.)

MS. KOENIG: -- but I think that they theoretically have much more expertise than -- than any single board member. Because we -- we face this when we're looking at it, that we -- I really personally rely sometimes more heavily on those three outside reviewers than I do on the technical report, depending on the -- you know, the competency of the person who has filled out that review.

So I don't think -- and again, this is my personal opinion: this just makes our process more internal, there's no doubt in that, but I don't -- the problem is not: we need more involvement at that level. What we're doing is internalizing things and not -- we're bypassing getting even more information, which that three-
panel discussion really allows.

I think the best part of the whole process now is that external evaluation by those three individuals, other than the board members. So I would argue that -- that this does not increase the breadth of the program.

CHAIRMAN KING: Okay, Andrea, and then Jim.

MS. CAROE: Well, just -- I've got two things now, because I'm going to talk a little bit about what Rose just said and --

I agree that there are technical expertise that we get from those outside reviewers, but I also think that there are times that we read what the technical reviewers have written and realize that they don't have a full grasp of organic, and so it flips both ways sometimes. So that was something we would replace. I don't know if -- you know, it's just something we weigh out.

But my question to you, Rick, is: The two positions that you have, the environmental -- the EPA person and the FDA person, do you see these as a couple of people that are identified for working on this or randomly people that would be interchanging? I'm just worried about the efficiency of -- you know, if we get a different EPA person every time, it might be difficult.

MR. MATTHEWS: Well, we haven't worked out all...
the details, obviously, because I'm trying to tell you, in
advance, of what we're thinking as possible ways to solve
the problems that have cropped up over the last several
years from doing materials review, and so the idea is that
these would be experts in the areas of the materials that
are under review. Okay?

So that when the three Board members are sitting
there and they -- the scientists would also be there to
answer the questions -- the people that put together the
report would be there to answer the questions of the Board,
but also you could have EPA and FDA people there to help
answer questions of the three panel members from the Board,
so that in essence you're getting --

MS. CAROE: I guess my question was more --

MR. MATTHEWS: -- you're getting the Board
involved in the scientific information at an earlier stage
and at a stage where they've got access to the people who
have done the report, as well as people who regulate the
products.

MS. CAROE: I guess my question was more in
matter of reporting that information that the committee is
going to see and the procedures that eventually we'll have,
you know, that -- the check -- the check form that we have,
the first time we used it, we weren't very efficient at
it --

    MR. MATTHEWS: Right.

    MS. CAROE: -- and we got better at it --

    MR. MATTHEWS: Right.

    MS. CAROE: -- you know, and I don't know if
you're kind of thinking we're going to be going through the
learning curve constantly or if there's some way that we
 can kind of alleviate that a little bit.

    MR. MATTHEWS: We're two -- this is the danger
with putting out any proposal while it's -- while it's
still very -- very young, you know. I mean, the egg has
just been inseminated on this one.

    MS. CAROE: Well, just take it, then, as
something to consider in going forward.

    CHAIRMAN KING: Jim, then Dave.

    MR. RIDDLE: Yeah. Well, I appreciate being part
of a discussion that's predecisional.

    (Laughter.)

    MR. RIDDLE: I mean, it's what we've been
wanting, so here we are.

    (Laughter.)

    CHAIRMAN KING: So be nice.

    MR. RIDDLE: Yeah. For better or for worse.

    (Laughter.)
MR. RIDDLE: I guess, you know, I would like to just propose that this composition -- which I really like this composition, having somebody from EPA and FDA -- that
that --

MR. MATTHEWS: It's good to hear you like that, Jim.

MR. RIDDLE: Yeah. -- be applied at the review of the petition, because, you know, OFPA says that someone shall petition the Board and the Board shall convene a TAP. You know, so the Board has authority at that stage, and if we have expertise from FDA and EPA helping screen those petitions, they can give the expert advice on legality, as they regulate a lot of these substances, and then also the NOSB members on there can help direct the TAP on -- specific to that material, help customize it: "Okay, from our experience, organic experts, here are some things to look at."

So, you know, it could really lead to a higher-quality TAP, which has been a big problem, that scientific review. So I would just like to suggest that we apply this concept at that first step and maybe come back to the people to rescreen the scientific work --

MR. MATTHEWS: So you would like this step to be used in two different places.
MR. RIDDLE: Yeah. I'm just -- just thinking --
this is a lot to think about, but --

MR. MATTHEWS: Yeah.

CHAIRMAN KING: But just a quick proposal --

UNIDENTIFIED FEMALE VOICE: It gives continuity
to the flow (inaudible).

CHAIRMAN KING: Yeah. Dave, and then Kim.

MR. CARTER: I just want to build on that,
because I think -- you're right, Rick, you talk about the
danger of announcing this, but this is what -- I think if
we really think this through and what we're trying to
accomplish, you know, this -- this has got a lot of merit
to it. I don't want to see completely doing away with the
external reviewers, I think they have some value too, so if
we can -- if we can keep them as a part of the process but
continue this, I think this makes this a really good
process.

MR. MATTHEWS: Right. Well, and the reason why
we're bringing it up now is because we know that the Board
has been kind of antsy as to: what is it that the
Department is doing with regard to materials review, and
what we're trying to tell you is that we're not doing
anything secret, what we're really doing is sitting back
and saying, "Where are the problems, and what are the

R & S TYPING SERVICE - (903) 725-3343
5485 S. LIVE OAK, GILMER, TX 75644
different things that we think we need to do in order to
address these problems?", and there is a role in here for
the Board in helping us to address the problems.

Now if we could -- if there's no other
questions --

CHAIRMAN KING: Kim had one quick question, and
then we'll move on.

MS. DIETZ: Jim, when you had talked about having
EPA and FDA involved at a step when we review the petition:
actually, that's the way it's currently --

UNIDENTIFIED FEMALE VOICE: It's supposed to be
going that way.

MS. DIETZ: -- supposed to be, is that --

UNIDENTIFIED MALE VOICE: Well --

MS. DIETZ: Let me finish. -- that before a
petition gets forwarded to the chair of the committee, that
it has already passed that screen; in other words, whatever
they're recommending has been already passed by EPA or FDA
or allowed for its petitioned use. So now you're actually
really saying three places in the petition process, but
that's just minutiae.

MR. MATTHEWS: Yeah. Well --

MS. DIETZ: And then my other comment is: This
is the first time that I've seen this, and earlier I had
mentioned about a potential conflict of a certifier reviewing the materials, I see this kind of opening up a little bit for conflict of interest for Board members in that, you know, they have -- they'll be the first ones to see a petition. So I'm just -- I'm a little leery there, that if you have Board members reviewing materials and making recommendations versus outside reviewers, that it could be perceived as a conflict. So that's a first gut instinct that I think we need to just develop.

MR. MATTHEWS: Right. Well, conflict of interest is definitely something that we would have to take into consideration when --

MS. DIETZ: (Inaudible) perception --

MR. MATTHEWS: -- appointing people to that TAP review committee.

MS. ROBINSON: For example, it might be the case that it's not necessarily the chair of the committee that sits on that panel.

UNIDENTIFIED MALE VOICE: Right.

UNIDENTIFIED FEMALE VOICE: (Inaudible.)

CHAIRMAN KING: Okay. So --

MR. MATTHEWS: No. But it's true, especially let's say that it was a material that -- let's say Ann's organization wanted to have a material reviewed and Ann was
involved in it and she happened to be the chair of the committee that would have responsibility for it, so obviously procedures would have to be in place that Ann would not be the one participating; even though she's the chair of the committee, somebody else on the committee would have to be involved in it.

So -- I mean -- but you're bringing up things that we haven't reached yet.

CHAIRMAN KING: Yeah.

MR. MATTHEWS: I mean, this is just, really, bare bones of an idea that we have and just an acknowledgment of the fact that we're looking at every single stage of the review process, to bring a much better product to the Board so that they have the tools that they need in order to make the recommendation that they're charged with making, okay, and that's all we're trying to do right now.

CHAIRMAN KING: And in general terms, I think you're aware, Rick, that the comments we're making are simply -- this is the first time we've seen the document --

MR. MATTHEWS: Right. Right.

CHAIRMAN KING: -- in general terms, we like it; however, what about this, let's think out loud, let's try to improve the process.

MR. MATTHEWS: Yeah. But I guess I'm not -- I'm
not trying to shut off the debate, I'm just saying that --

CHAIRMAN KING: No, I understand.

MR. MATTHEWS: -- this probably isn't the time --

CHAIRMAN KING: It's 4 o'clock.

MR. MATTHEWS: -- to be doing the debate.

CHAIRMAN KING: It's 4 o'clock, and you were

supposed to be done before lunch, pal.

MR. MATTHEWS: Yeah.

(Laughter.)

MR. RIDDLE: Yeah. 15 minutes, I think, I

remember.

UNIDENTIFIED FEMALE VOICE: You asked for the

whole thing.

MR. MATTHEWS: I was prepared to give you 30

minutes. You asked for it. I guess NASOP's [phonetic] in

trouble for theirs on Saturday, because they get the same

presentation.

Okay, last slide, I believe. No, second-to-last

slide. We're also going to be asking the Board, as a part

of this global approach, to develop a standard operating

procedure for what it is that the committee does when it

does its review and recommendation.

Now, I know you've already got some stuff written

up, but the idea is to put it into a standard operating
procedure format, and we would be asking the full Board to do the same thing, take what it is you do, put it into a standard operating procedure.

Then those two pieces would then come in to us, okay, and it would become a part of this manual that we're planning to publish on the web.

We're also planning, under this process, to do a standard operating procedure within the NOP on how we go about the rulemaking process. Now, keep in mind that if the scientific -- if the analysis of the scientific work that creates the work product creates an impact on the petition, we would then also have to go back and amend the petition procedures themselves.

So in essence, what we have done so far is we have said: okay, these are the -- here -- these are the checksheets that the Board needs to use to document the decisions that it is making. We're looking to go back a step and say: this is what the scientific community needs to put together for the Board to complete those checksheets. Then we're going to go back to the petitioner and say: this is what you need to supply to the scientific community, for them to do the job that they need to do, so that the Board can do the job that it needs to do, so that it can provide a recommendation to the Secretary for
publication in the Federal Register. Okay?

CHAIRMAN KING: Jim.

MR. RIDDLE: Yeah, and I just -- I really appreciate this and see it as collaborative process, and I just want to come back to OFPA, where it says: The Board shall establish procedures under which persons may petition the Board for the purpose of evaluating substances." So I --

MR. MATTHEWS: The petition procedures are out there, and what we're going to do is we're going to be working together --

MR. RIDDLE: Right.

MR. MATTHEWS: -- to figure out: is there a need for the change in the petition procedures?

MR. RIDDLE: Agree [phonetic].

MR. MATTHEWS: Okay. And the end result on all of these standard operating procedures and statements of work for each of the different stages will come together in the end as a manual for materials review, which would be published on the web, which then says, to the entire world: petitioner, this is what you have to do, this is what your material is going to go through, this is what you can expect.

So now the petitioner is no longer in the dark as
to what really happens once they submit a petition, and right now, they're in the dark more than anybody else.

CHAIRMAN KING: Rose.

MS. KOENIG: I would -- I just want -- as the materials chair, I want to, you know, I guess put in the public record that I feel that as you're going through this process, that the materials committee should be fully engaged from this day on in this process as a cooperative approach to this. I mean, you know, we've been asking for this for a few months, and I -- you know, I hope this move is -- this directive is -- not directive, I better not use that word -- that this is, you know, going towards that, you know, and I'd love to put it on our work plan as -- as something that we can do, but we need to work together, because things can be done a lot more efficiently if we're working together.

CHAIRMAN KING: Yeah, and I think we -- we recognize we're going to do that.

MR. MATTHEWS: Well, but, you know, all we were saying is that, you know, just be calm, let us work through what it is that we think we're going to need to do and where we're going to need the assistance of the Board, and, you know, really we were trying to identify things, and so now we're telling you exactly what we're thinking, and now
you can tell us what you think.

CHAIRMAN KING: Well, okay.

MR. SIEMON: Good work.

CHAIRMAN KING: Yes. That's it.

MR. MATTHEWS: That's it. That is the longest 30

minutes of my life.

CHAIRMAN KING: We do need a break. It's 3 --
especially 4 o'clock. Be back by 4:15, please.

(Off the record and reconvened.)

CHAIRMAN KING: I'm going to reconvene the

meeting. We're going to start with Rose, who's going to do

a presentation on the materials review process. This is a

presentation on where we currently are.

MS. KOENIG: And I'm going to do it -- I was

requested to do it really quickly, so I'm -- instead of

bypassing it, I'm going to go through it quickly and just

-- just highlight -- okay, so this is the materials process

update.

UNIDENTIFIED FEMALE VOICE: Today.

MS. KOENIG: Today. Go ahead, Ann, next. And

that's basically what I'm going to talk about next. Go

ahead. Okay, so as many people said, that a lot -- and I

wanted to put it in perspective, because I know many of you

have sat through these procedures, but a lot have not, and
I think it's really important to set the foundation of why we're here and what we're doing and how these decisions are made.

So basically, again, the Organic Food Production Act provided the National List of Approved and Prohibited Substances, it established the guideline for the substances on the List, and it outlined the role of the NOSB in the procedure of publishing and amending the National List. Go ahead, next.

And then just for people -- the -- Section 205.600 of the Organic Rule describes the criteria that shall be used in the evaluation of substances or ingredients in the organic production and handling sections of the National List, and basically it's the -- we deal with the synthetic and non-synthetic substances that are either allowed or prohibited. Go ahead, next.

If you go back to OFPA, the 6517, that's come up a number of times, there's guidelines for prohibitions or exemptions, and basically that is what we're doing. The National List is an exemption. It's not a given. The National List may provide the use of substances in an organic farming or handling operation that are otherwise prohibited under this title, okay, if the Secretary determines basically that it's safe, with other agencies,
it's necessarily to the production or handling of the agricultural product because of an unavailability of a wholly-natural substitute product and is consistent with organic farming and handling. Next.

(B), again, "The substance" -- this is what Arthur was saying -- "contains an active synthetic ingredient in the following categories," and it lists them. These categories are found in the National List section of the Rule.

Again, I look at these as the categories upon which we base our things. The NOP has taken a strict definition of "active" in this case. Next.

It is used in the production and contains synthetic inert ingredients that are not classified by the administrator of the EPA as inerts of toxilogical concern or is used in the handling and is non-synthetic but is not organically produced and a specific exemption is developed using procedures described in Subsection (d). Next.

And then there's things -- again, the National List can prohibit natural substances, and we discussed that earlier. Next.

And then the Secretary basically has to consult, again, in that section, to determine if it's harmful to the health of the environment, is inconsistent with organic
farming or handling and the purposes of this title. And then the specific prohibition is developed using the procedures again defined in Subsection (b). Next.

Subsection (d) is now what they refer to. These are the procedures for establishing the List. Next.

There can be no additions except for those that are proposed by the NOSB or amendments. Prohibited substances in no instances can be included, which are prohibited by the FDA or other federal regulatory bodies. Next.

And then notice and comment, this -- again, as the Department says, there is a procedure which they need to follow in terms of publishing the proposed National List and getting public comment and then doing the final. Next, Ann.

And then this just talks about how a publication has to be proceeded through by the NOP. Next.

And then this section outlines what we'll be discussing in a moment about the Sunset Provision, it tells what our authority is, and we'll be talking about a proposal that the materials committee has come up with to satisfy the Sunset Provision. Next.

And now these are the requirements, and the requirements are kind of embodied in that petition process
that we were talking about earlier in that -- what the NOP is looking at.

Basically, if you look at the petition process, we already are supposed to be reviewing the available information from -- I've got some tables -- the EPA, the -- you know, the departments of health and such, and looking for, you know, other agencies for these types of information. Next.

We have to work with manufacturers to find out how they're made and if they contain inert materials that are synthetically produced. Next.

And then it has to be submitted to the Secretary, along with the proposed National List, or any amendments such, after we convene a technical advisory panel as what to be considered for the National List. Next.

And then evaluation, and the evaluation procedure is basically the procedure that we're going to be following through the meeting.

When we look at these materials, we're not pulling things out of the air. Within OFPA, there are specific questions that have to be satisfied in order for us to place this on the National List, and one -- you can go, next -- basically -- go ahead, skip.

But these are -- again, if you go in reference to
this, for the sake of time, these are the things that we will be discussing. Compatibility with the system of sustainable ag, this is a documentation that we're going to be discussing again. Next.

And then in addition to the criteria set forth in the Act, there's sections of the Rule that look at processing aids or adjuvants and processing criteria that wasn't necessarily spelled out in the Act, and these are the criteria that we look at in terms of processed products.

Go ahead, next. So you can find that again in Section 205. I'm not going to go through it, but I just want to highlight again: there are parts of the Rule that you need to look at, and these are what we're going to be looking at in terms of some of the petitions, like the tetra sodium pyrophosphate and such.

Next. Next. Next. Next. Sorry, guys. So crops, just want to call the attention, the categories of the Rule that we'll be adding, may, or may amend during this meeting would be either 205.601, which are synthetic substances allowed for the use in organic production, and there's a number of items that we're going to consider for this category. None of the materials during this meeting will be considered for the category 205.602. Next.
Similar, livestock has a category 205.603, one of the -- the two that we're looking at in livestock are petitioned for that section of the Rule. Next.

Same with the processing, the 205.605 and .606. Next.

So the National List update, this is -- Rick would probably be better at explaining this, but when I spoke with him before I made the slide, basically, the Federal Register of May 22nd, 2003, contained the handling materials; the Federal Register as of April 16th, 2003, included the crops materials and technical corrections; and the Final Rule, everyone knows, of 2000 contained the recommendations. As of when I made the slides in February, that was the last update, the livestock materials had not gone to the docket. Next.

So the stuff that -- oh, actually, excuse me. Materials finalized May 22nd, 2003. As of March 10th, 2003, there were two draft dockets containing the materials of everything the NOSB approved prior to April of 2004 meeting of the NOP. Next.

Then so as far as the petition status -- okay, next. These are the materials that we're going to be looking for in the handling committee during this meeting. Next.
Two from the livestock, the moxidectin and the proteinated tea chelates. Next. And then these four substances for the crops committee will be reviewed during this meeting. Next.

These four have been sent for technical review by the NOP, and I just wanted to make people aware that those four did not follow the materials procedure that is outlined following this (indiscernible). They have been sent by the NOP directly to the TAP contractor. Next.

These two substances are under NOP review, they've come, and there is one additional petition, I don't think Arthur's here, but he had told me there was only one other one, and he can update us on that, because he left a message on my phone machine last week. Next.

And then petitions and other status, the potassium silicate was a petition that we looked at, the crops committee wanted to consider it as a pest control, fungal control, for crops, but it's not currently registered under EPA for that, so we're waiting on the manufacturer, as far as the fate of that.

And then the cryolite has been determined from the committee not to be forwarded for a TAP because there was no new additional information, the product had -- substance had been reviewed, it had been repetitioned, but
there was no new information to indicate that it needed further technical review. Next.

This is the materials process. I know Rick talked about this new procedure, but this is the materials process that currently the Board has been following, although there has been some deviations from that.

Basically, the minimum time frame for the National Material Review List is 145 days. In reality, if you look at -- you know, there's some that have been -- like soy protein isolate, as Kim said, that's been on the record since 2001. So there is some problems in terms of the timing on some of the materials for -- for various reasons. Next.

Day one through fourteen. Really the NOP staff has evolved at this point, they're supposed to take the petition for completeness, they are supposed to liaison at this point with the FDA or the EPA or any other federal agency that might be involved in a specific material, and make sure that that material is consistent with that other agency, federal agency. So that is the procedure. Next.

After that -- this is -- the materials chairperson should be sending a copy of that -- the materials chairperson should receive a copy of that petition, that petition should then go to the vice chair of
the materials committee and the vice chair of the designated NOSB committee, such as the crops, livestock, or handling.

And then really the vice chair of those committees convenes that committee, and they vote, basically, if that petition should go on for a technical review and -- at that point or if they feel right at that point that they can make a determination that it does not need to go, and make a recommendation at that point.

Again, this step has not been followed with some of the current materials, so I just wanted to make, I guess, the public aware that the NOP has -- on those four materials that I indicated previously, has gone ahead and set those for a TAP, bypassing that process. Next.

60 days prior to the NOSB meeting we should receive copies of the review from the NOP, and then our committees come together and we start reviewing that report and -- to get to a decision. Next.

30 days, by that time we've made a decision, we've now filled out these evaluation forms, and you should be able to access that through the website. Next.

And then, again, if you need to petition for documents, you can go to the NOP website. Next.

The work that we have pending as far as our
committee is: we've submitted -- which I'll review next -- the draft for the Sunset Provision, and within our Sunset Provision we have guidance documents to come up with how we're going to prioritize substances for Sunset Review, and also that we need to produce some guidance documents for defining what constitutes a review process for the Sunset Provision.

So, basically, those two -- somebody had asked: well, why don't you have those guidance documents? Well, partly because we need to buy into our process before we go through the painful agony of kind of developing these guidance documents, so the first step is really to buy into our concept of the process, and at that point, if there is agreements, the committee would then go forth and do that work. And then as you can see, through the conversation we had earlier, we'll probably be more engaged in redefining the materials process. Next.

Okay. Hopefully that was -- I'm sorry it was rush, but -- I did intend to do the full Kim Burton-style presentation, but I didn't get the opportunity at this meeting.

CHAIRMAN KING: Well, and just a quick point. I want to thank Rose for all of her hard work, and Rose, I apologize for the fact that you did have to rush, because I
know you put a lot of time in this.

MS. KOENIG: It's okay.
CHAIRMAN KING: It's important work, and it's ongoing work.

MS. KOENIG: Right.
CHAIRMAN KING: So thank you for your commitment to that.

MS. KOENIG: So did you want me to go through the Sunset Proposal?
CHAIRMAN KING: Yeah, I think we're now on to Sunset Provision.

MS. KOENIG: Okay. So as set forth, as I explained, in OFPA Section -- and I ask the Board I guess to refer to the section, your tab will say "Sunset Provision Report." For those who -- it was on the web almost a month before this meeting, so hopefully people have had the opportunity to look at it.

I will review it in as much detail as time permits. But basically, in our background information, we just said that this is the reason why we're going through this: because OFPA has told us that we need to come up with a policy for the provision.

And first the committee said to date -- this is the work -- you know, this is what we have in front of us.
Basically, if you look at all the sections within the National List, going from 205.601 to 205.606, there -- my count was approximately 154 substances currently on the National List.

This number is not the same that NOP comes up with, because I went through, and if one material was in multiple categories, I counted it as one rather than three. Assuming that if a review was to be done, say, on chlorine materials that are listed, that that review would cover all uses. So anyway, that's where my 154 come from.

And then basically we have, according to the OFPA, 5 years of -- when the National List has become fully implemented, to do some kind of review of these materials.

So what our committee came up with, and this was proposed as an internal policy and procedure for the review of substances in accordance with 7 USC 6517(e), that basically the National Organic Standards Board and the NOP shall compile and manage a materials database for exemptions and prohibitions, including an official Sunset date for each substance on the National List.

According to the NOP, they are in the process of developing and have already a working database. We have kind of our own working database. So this is something that we feel could be easily achieved.
All materials appearing on the National List as published in the Federal Register Final Rule dated October 21st, 2002, must be reviewed by October 21st, 2007. There are materials, as my slides show, that were amended after that date in other dockets, and those would have to be reviewed 5 years from their final Federal Register notice.

So based on the number of materials in any given 5-year period, the NOSB would select approximately one-fifth of the National List for review, you know, each meeting, under -- to comply with that section of Sunset Provision.

Upon the National Organic Standards' approval of the Sunset Provision -- and we're not going to be able to vote on approval this meeting because this document was not into the NOP 30 days prior to the meeting, so this is just for discussion -- the NOP will publish the entire list of materials, 605.601 to .606 inclusive, which shall be reviewed by October 21st, 2007, in the Federal Register and request public comments on the prioritization of materials for review.

So basically the committee decided that in terms of public transparency, that, you know, upon approval we would say okay, all 156 of these are going to be reviewed in the next 5 years, you, public, give us some input in
terms of how you think priorities should occur. Okay.

Then the -- after that public comment period would end, then the livestock, crop, and handling committees would choose approximately one-fifth of the substances from each applicable section of the National List each year for review. Committees will consider public comments regarding prioritization of materials for review.

In addition, the materials committee shall provide guidance documents to the committees on how to prioritize materials for review. The materials representative for each committee will be responsible for providing the list of substances that are proposed for review during the calendar year to the materials chairs persons, who will maintain the database. Each committee will work with their representative to the materials committee to determine which of the substances will require supplemental technical information, as set forth in 7 USC 6518(k)(3).

Substances that have adequate technical information provided by prior reviews, petitions, or other documentation may be reviewed based on that information. So this is -- again, the committees would determine if on-hand we have enough technical information to do our review.

The materials committee will provide guidance

R & S TYPING SERVICE - (903) 725-3343

5485 S. LIVE OAK, GILMER, TX 75644
documents on what is adequate technical information, so
upon, again, agreement that this is the procedure, we as
the materials committee would come up with a guidance
document, a working document, basically, for the committee,
to give guidance as to, you know, "Do you have a TAP that
was adequate?", for example.

Requests for supplemental technical review will
be provided in writing by the committee's representative to
the materials committee -- to the materials chairperson.
Then the materials chairperson is responsible for
communicating the status and supplemental review needs, if
applicable, of materials to the NOP representative to the
materials committee.

Now, that's a little wordy, but basically, this
allows -- if the committee determines that there's not
enough technical information, it allows the NOSB to again
go to an outside review process to gain more technical
information on some substances. And as Zea commented
earlier, there were many substances earlier on in the
process that may have only had one sheet of information, in
terms of their technical review, whereas substances today
that are being reviewed, we're getting a lot more
information and they're following the OFPA criteria, we
have good form.
So certainly the workload is going to be heavier on materials that just don't have adequate information, and it was the materials committee's opinion that we wanted to reserve the right, based on review, to ought to have a TAP performed on materials that we felt were insufficient, in terms of providing scientific evaluation of materials.

So the NOP is responsible for requesting technical reviews and communicating the needs of the NOSB to their contractor, and, when necessary, the materials chairperson may interact directly with the contractor regarding the status of a substance review. However -- I should say however, but the NOP representative is responsible for making contact arrangements and communicating in the communication.

In other words, in this provision we wanted the materials chairperson to have the ability to talk to the TAP contractor but we also respect the right of the NOP and actually require them to be engaged in the process and participate in those phone calls so that, you know, there's consistency with what the NOSB is doing and what the NOP requires in terms of their contract with the contractor.

Okay, 60 days prior to the NOSB meeting the list of substances that will be reviewed for the Sunset Provision will be published in the Federal Register for
public comment. Committee recommendations for the 
substances to be reviewed for the Sunset Provision will be 
posted on the NOP website 30 days prior to the NOSB 
meeting, and substances that have been -- have specific 
expiration dates will not be included in the selection 
process.

So in other words, there are materials, I guess 
such as methionine, on the List that have a Sunset, within 
the National List, that stops their use, and those would 
not be subject to Sunset Provision Review. They're 
basically off the List.

Recommendation --

MS. CAUGHLAN: Rose, did you count how many of 
those, actually?

MS. KOENIG: I didn't. There are not many, but I 
haven't sat down and counted them, but we just wanted to 
acknowledge --

MS. CAUGHLAN: Was the Sunsetting commonly done 
prior to this last few years?

CHAIRMAN KING: Accelerated you mean?

MS. KOENIG: There's just a few, I think --

CHAIRMAN KING: I think there are five or so.

MS. KOENIG: Yeah. Like spirulina --

MS. CAUGHLAN: Right.

R & S TYPING SERVICE - (903) 725-3343
5485 S. LIVE OAK, GILMER, TX 75644
MS. KOENIG: -- there was a provision for the use of chilean nitrate, I think --

MS. CAUGHLAN: Boiler chemicals.

MS. KOENIG: So there's a few -- boiler chemicals. So there's a few, not many. But I guess what we wanted to acknowledge, it was that the intent of the Board was to Sunset and end those but -- the meaning of their provision on the List.

Okay, so the third recommendation was on public communication. The NOSB recommends that the NOP post a Federal Register notice on an annual basis, beginning in 2005, amending those materials that have passed through the Sunset process. This is intended to result in requiring future boards to have to review fewer substances in a given year and to facilitate the work of future boards.

In other words, we wanted to acknowledge that this workload for the next 5 years, it's going to be tremendous, because everything -- all 156 or so materials are on -- became official, I guess, October 21st, 2002, but what we're saying in this recommendation is that as we go through the first one-fifth of the List, once we proceed, we want the NOP to engage in rulemaking on those so that the workload then gets spread out over time and future boards would then not have to deal with such a large amount
of materials at one time. So it's an effort, again, to just look towards the future and look at workloads and make things a little bit more doable. And it can be achieved through the rulemaking process. We just have more dockets over time.

Committee recommendations. So basically we recommend the adoption of procedures set forth in this document to meet the requires of the 7 USC 6517(e) of the Organic Foods Production Act, which requires us, again, to review each substance on the National List within three years of its publication, and then materials committee shall write guidance documents to provide a framework for committees on how to effectively and efficiently manage the process. The procedures outlined above may be modified by future boards to more efficiently manage the process, just acknowledging that you can write a lot of things down and have a great plan, but as people go through the process, there may have to be changes in the provision to really -- to meet obstacles that may come forth, that we just can't perceive at this point in time.

That's it.

CHAIRMAN KING: Thank you very much, Rose. I'll remind everyone tomorrow we'll actually be voting on recommendations in the afternoon. Does anyone have
questions or comments?

MS. DIETZ: This one we can't vote on because it wasn't --

MR. RIDDLE: We're not voting on this one.

MS. KOENIG: We can't -- we're not -- this is --

MR. RIDDLE: Yeah, I would like to address that, because, you know, we set up the 60-day window as a goal, and this, what, came in about 57 days out. So it certainly has been posted for a good long time. We also have a 30-day window for the materials committee recommendations, and the ones from the crops committee did not meet that. Those are goals. Those are targets. But the intent is to have it posted for public comment and for the Board to be able to have plenty of time to consider it.

So I think this is a very important and timely topic and we need to have a sense of the Board, so I would like to have us vote on accepting -- not at this moment, right now, but tomorrow, vote on accepting the committee's report so that we officially go on record as accepting the committee's report.

MS. KOENIG: Starting with those deadlines of time, Richard Matthews, on the phone, you know, as I spoke with him, indicated that he didn't have a problem with us kind of voting on it as a working document and then

R & S TYPING SERVICE - (903) 725-3343

5485 S. LIVE OAK, GILMER, TX 75644
officially voting on it during the next meeting, so there
is that provision and we should consider that.

However, on -- I was out of town, so it was
sometime last week, when I got home I had received an
e-mail from Arthur Neal, indicating their position on the
Sunset Provision, which is -- it's pretty different from
our position. So we need to come to terms with where we're
at on this policy, we need to communicate kind of that --
where that -- and my question to Arthur -- I'm not sure if
he's here, oh, there he is -- was I -- and I didn't get a
chance to correspond with you because I was out of town,
and then -- I still haven't, again, you know, digested all
of what you had corresponded to me, but my question, I
guess, to you was: I assume that your correspondence to me
was your recommendation on a policy, kind of your
alternative. I just don't know where we are. I understand
from OFPA that it is pretty clear that we establish our
procedures, so I'm not sure how you wanted us to process
the information that was in your correspondence to me.

MR. NEAL: The e-mail that we sent to you all was
a very well-vetted document with senior management at USDA.
We took you guys' recommendation that you sent and we built
upon it, to take into consideration the federal process
that has to take place to reestablish these materials that
have exemptions under the National Organic Program. We did reject your recommendation, we actually accepted the majority of it, but we had to tailor it to fit the federal process, because, as noted, it takes about, what, three years to finish it?

CHAIRMAN KING: A little over, yeah.

MR. NEAL: Yeah, over three years to finish the process. Because there's going to be a Federal Register notice that states what's about to take place, then there's going to be public comment, then there's going to be the development of a proposed rule, then there's going to be more public comment, that helps the NOSB to prioritize the materials that need to be reviewed, that the public is saying: okay, there's no longer a need for this exemption, for the use of this particular synthetic substance, under the National Organic Program, and it gives the NOSB time to also make the recommendations to the Department in regards to which materials should be considered for inclusion on the National Organic -- I mean the National List.

But it also takes into consideration, you know, legal review by the Office of General Counsel, Office of Management & Budget, the departmental and administrative review, it -- there's a lot of time that is integrated into the particular proposal that we sent to you.
MS. DIETZ: I think the question was what do we do with our document, because we had prepared a document, just as a working draft for the Sunset --

MR. NEAL: Uh-huh.

MS. DIETZ: -- and I didn't think we could vote on it, with the timeline, but -- I mean, we could take it as a committee recommendation and give it formally to the NOP. And then this week we received your Sunset Review. So I think from a materials standpoint we're not really prepared to move forward on the recommendation that you brought to us.

MR. NEAL: Well --

MS. DIETZ: We could acknowledge both of them, Rosie, I think we formally acknowledge --

MS. KOENIG: Yeah. No, I --

MS. DIETZ: -- them and take it back to the group, but to vote on our docket, I don't feel comfortable doing that.

MS. KOENIG: No, I'm not recommending kind of a vote -- I feel that --

MS. DIETZ: We need to look at them, we haven't had time --

MS. KOENIG: Yeah, we need to really sit down and meet as a committee, and maybe we'll have an opportunity at
that time --

MR. NEAL: Well, the issue with that document is that that's the Department's position on Sunset --

UNIDENTIFIED FEMALE VOICE: Sure, we understand that, that's understood.

MS. DIETZ: But the question is -- and I guess maybe Barbara or you -- how do you define your position versus what the policy -- I mean, your position I do think incorporated a lot of our -- you know, the spirit of, I guess, our proposal. There were some, I think, substantial differences in -- and again, I mean, I haven't thoroughly processed what you had written, but what I gleaned from that was that things would automatically be just allowed unless there was substantial documentation from the public or, you know, some entity came forth with new information regarding the OFPA criteria.

So -- and what I didn't understand in your document -- I mean, our -- our document allows for public comment but it gives the Board the power to convene TAPs based on the fact that there's some -- let me go back.

Your document assumes that all TAPs were adequate, it pretty strongly stated that, and as I state my position again, and this is my opinion, I'm not speaking for the Board, my position, and what we heard from some of
the public today, was that in fact many of the substances that came on very early did not have adequate technical information, and that is the largest concern, I think, certainly of myself personally and of the materials committee, is that we feel there are many substances that were added on early, some of them that probably will remain on the List, but we want to, you know, for the future of the industry, the future of the process, be able to have adequate technical information for everything that's on that list so that we can kind of defend --

MS. DIETZ: I think they address that in the document, because there is a section that says -- and again, I didn't think we would be reviewing this today --

UNIDENTIFIED FEMALE VOICE: Right.

MS. DIETZ: -- but it does say, "Based on public comments received, the NOSB may decide that certain substances warrant a more in-depth review, requiring additional information or research that considers new scientific data and technological and market advances," so I think they've left that open, and I don't know if we want to waste all our discussion time on a document that we've had two days to review, so --

CHAIRMAN KING: In fact, I think we should acknowledge it's a work in progress, it's not perfect, that
there will be ongoing dialogue with the Department --

MS. DIETZ: But there's urgency.

CHAIRMAN KING: There is urgency, and this does need to happen. And so I guess what we're -- the last thing here is just to see -- that we can work with you on this document, knowing that there is a sense of urgency to get this process started, and move forward with our agenda today and (inaudible).

MR. NEAL: I don't know about the document portion, because the process has to begin.

MS. DIETZ: It does have to begin.

MR. NEAL: It has to begin.

CHAIRMAN KING: Uh-huh.

MR. NEAL: I don't foresee any changes to that document. I don't. I don't foresee any changes to that document, because it acknowledges the fact that the Board may want additional information on materials. I don't know what else there would be --

MS. KOENIG: Well, what I'll suggest, I will convene a meeting of the materials committee, we will discuss the document, and hopefully before the end of the meeting we'll provide at least a position on it, and maybe we can resolve -- we'll make a recommendation on how we can proceed, after we discuss it, by the materials committee.
So let's just leave it at that, because, again, we can work with you guys and try to work this out.

CHAIRMAN KING: Okay.

MR. NEAL: One of the things I want to leave you with is that the process should be driven by the comments, because you want to take into consideration that that particular process helps the process to be unarbitrary and uncapricious, non-capricious, and it's fully transparent to the entire public, and it has to fit within a federal process.

MR. RIDDLE: Yeah. And as I read both of these drafts, that's something I see in common.

MR. NEAL: Uh-huh.

CHAIRMAN KING: All right. Next, Andrea, accreditation.

MS. CAROE: Okay. Jim, do you have the copies?

MR. RIDDLE: Yes.

MS. CAROE: In the meeting books is version 7, or draft 7, of the accreditation certification agent compliance procedure for a minor non-compliance. We actually have version 8, or draft 8, and there are minor changes, they've been left in track mode so you can see the changes. They are based on comments, and the back section of this document does discuss each of the comments that we
We received comments from one commenter only, but I did address every portion of those comments, so you can see -- and this was sent to the committee, and Jim made some additional changes to it, and there was none further.

But this has been voted on by the committee. It's been sitting around for a long time. I hope to vote on this tomorrow. I think we've all seen this document quite a bit. I mean, it actually was authored before I was even on the Board, let alone the committee. So, you know, I'm going to defer to Jim a lot on some of the history questions here because I just -- you know. I commented on this outside the Board, so that's, you know, where I started with it.

I don't know that we need to waste a lot of time on this, based on our schedule, other than, you know, take a look at it and -- unless any of these -- there's very few changes, there's some definitions and title changes, and we did hear one commenter this morning ask for the word "major" to be used, and I talked to Jim a little bit about this, I have not had a chance to talk to Michael and Rebecca about this, but there is an opportunity, I think, for a hybrid, where we can put "major" in parens so that we keep the integrity of the language that's used in the Rule
but perhaps more clarifying to the users of this document.

CHAIRMAN KING: Okay, Jim.

MR. RIDDLE: Yeah. And in the draft that I just passed around, where you'll really see the most changes is on Page 7, which is the addendum section, and that's where what Andrea was saying about the definitions and the use of the word "major" non-compliance in parentheses there, to clarify the difference between minor non-compliances and major non-compliances. And then there are also some changes to the headings of the tables that have been recommended by the commenter. But that's basically the substantive changes.

CHAIRMAN KING: Questions, comments?

(No response.)

CHAIRMAN KING: Thank you. Crops committee, Nancy.

MS. OSTIGUY: We don't have anything at this point. The only thing the crops committee will be bringing up actually comes up later, on the compost tea. That's on Friday, I guess.

CHAIRMAN KING: All right. Thank you. Kevin, handling committee.

MR. O'RELL: Handling committee, we have an update on materials used as food contact substances. This
was submitted on April 15th, so, again, it wasn't published for 30 days. I think it's our intent to acknowledge food contact substances and give a quick update and then move on in our work plan, essentially, without going in -- I know we're pressed for time, without going into a lot of details on the background information on food contact substances, other than to state that the NOP did acknowledge that food contact substances were outside of the scope of the NOP, or the NOSB, for material review.

The NOSB has recommended the materials from past meetings to be added to the National List, and there were six materials: activated carbon and periacetic acid and four boiler water additives: ammonium hydroxide, cyclohexlamine, diethylaminoethanol, and octadecylamine. These materials may be considered as food contact substances.

It's the handling committee's recommendation that since these materials were previously petitioned and approved, that the NOSB would place them on the National List. We understand there's still a lot of confusion in the industry regarding food contact substances, and as part of our action of the handling committee, we will be prioritizing our work plan to clarify the qualification of materials for the food contact substance list. This is the
quick version.

CHAIRMAN KING: Yes, I understand, and thank all
of your patience. I know it's difficult to do some of
these justice in the limited amount of time. Did you have
a comment?

MR. RIDDLE: A question. I mean, once again,
what are we going to do with this?

MS. DIETZ: I think the -- the intent of it was
that there's -- the confusion out there is twofold: one,
there's confusions on the materials that we did make a
recommendation for, and those were the only materials that
never appeared on a docket.

So, as a handler rep, I kept receiving calls from
people, saying, "Well, I know you have periacetic acid, but
my certifier's saying I can't use it," and I'm saying,
"Well, it's a food contact substance," and people don't
know how to read that list. So until we understand how to
read the List, and the public understands, this
recommendation was at least put forth so we acknowledge
those materials were recommended at one point and that they
be placed back on the -- or that they be placed on the
National List.

So, again, it's mainly just an acknowledgment,
and then the committee is going to go forward and try to
hash out exactly how to interpret food contact substance list for handlers, because there's great confusion about that. Does that satisfy you?

MR. RIDDLE: Well, kind of, I mean it gives me more basis for the rationale, but it still doesn't tell me what we're going to do, if we're going to vote to accept this as a committee report or, you know --

MS. DIETZ: It was not sent to the committee in time for that.

MR. RIDDLE: To the NOP?

MS. DIETZ: To the NOP.

MR. O'RELL: To the NOP. I mean, that's -- otherwise, it was our intent to vote on it as a committee recommendation, so then the Board would vote for the --

MR. RIDDLE: You know, I really appreciate the confusion that this attempts to clarify as far as the status of those six substances, because that whole food contact substance list, it's like a square peg in a round hole, it really doesn't fit our needs, and we've reviewed these, on the food contact substance list they have different names or they're combined with other ingredients, they're more a formulated product for a specific use, whereas here, this is generic substance that fits the rest of our format for the National List.
So I support moving that part of it forward.

MR. O'RELL: If it's possible for us to do a vote on that, maybe we can discuss that with the NOP. We certainly would be in favor, on the handling committee, to put this up for a vote with the NOSB full committee.

MR. RIDDLE: It's not a change, exactly, we're not --

MR. O'RELL: No, it's not a change, it's a clarification --

MS. DIETZ: It's an acknowledgement.

MR. O'RELL: -- and continuing to say that our recommendation for these materials, which we all voted on and approved at previous meetings, that we still have that position: that these should be placed on the National List.

CHAIRMAN KING: And it's connecting it to the food contact substance aspect of it.

MR. O'RELL: And it's recognizing the fact that these could also be considered as food contact substances, but there needs to be a lot of clarification on food contact substances as far as the pre-market notification with the FDA on food contact substances, the definition of it.

CHAIRMAN KING: I think it would be difficult to
argue with clarity at this point, Kevin, so --

(Laughter.)

CHAIRMAN KING: Questions or concerns?

(No response.)

CHAIRMAN KING: Okay. Livestock.

MR. SIEMON: We have no non-materials standards, so really -- so livestock's so clear we didn't need to clarify anything.

(Laughter.)

CHAIRMAN KING: Policy development committee, Mr. Carter.

MR. CARTER: Okay. We have two items. Number one is our Board policy manual, which is a living document, that gets addressed as new policies come down the pike. We have two things that have come forward for that in our changes being incorporated, proposed incorporated, in our Board policy manual.

One of them has specifically to do with confidentiality procedures, and particularly with non-public information, confidential business information, and how the Board handles that.

The second is the incorporation or the substitution now of the new materials review forms based upon the forms that NOP developed, that we utilized at our
last meeting, so we'll be bringing those forward for your consideration.

Then you're getting circulated around the draft of the statement on compatibility with organic production and handling. The process on that is that NOP had requested a recommendation on the following question, which is:

What are the factors (reasons, issues, parameters, strictures, limitations) and constraints that the National Organic Standards Board should use to determine a substance's compatibility with a system of sustainable agriculture and its consistency with organic farming and handling?

As of the last meeting, we had developed criteria, which is listed in the book. That was posted for public comment. There were six public comments that were received. All of those public comments suggested that we drop the 13th item, which was Item M, which is: does the substance facilitate the development of new organic products? There was a lot of discussion saying that that really was not a good criteria, you could use that as justification to approve a lot of items just because they would spur the development of other organic things. So that was dropped, and that is the only change that is in,
then, the draft that was just distributed around. Seeing as how there were 13 and one was dropped, we now have a 12-step program for organic compatibility, I guess.

UNIDENTIFIED FEMALE VOICE: Is that in our book or did you pass it around?

MR. CARTER: I circulated -- it must have gone this way and not -- I'm sorry, I thought you split them in half.

MR. RIDDLE: No, I gave it all to you.

MR. CARTER: All to me, okay.

MR. RIDDLE: Yeah. I didn't want (inaudible).

(Pause.)

MR. RIDDLE: I just want to add that it also, in the draft that is getting passed around now, explains there on Page 2 and 3 how the comments were dealt with, so it summarizes what comments were received and then how they were addressed. It's less than 22 pages in length.

(Laughter.)

CHAIRMAN KING: And we thank you for that. Okay, additional comments, questions?

(No response.)

CHAIRMAN KING: Okay, great. Now we're on to presentation -- we're on to the 2 o'clock slot, "Presentation of Materials Recommendations," crops
committee, and --

MS. DIETZ: Since it's after 5, can you inform the public of what you're going to do, because we're past the agenda time. Are we going to keep going?

CHAIRMAN KING: I think we should present the agenda items, and certainly if there are suggestions from the Board I'm willing to entertain those, but I see no reason not to present the materials recommendations. We may not have as extensive a discussion as we would have had we started at 2 o'clock. So we'll go through that.

Tomorrow we do have a time slot allotted in the breakout session for additional work, if that comes up, for any recommendations in the morning, and then of course we'll be voting on recommendations in the afternoon.

So at this time, I mean, if you have a specific question, a concern, a point about the recommendation at hand, then certainly make it, recognizing that we're asking everyone here who may have family, friends, plans, things of that nature, to stay over. So let's do it justice but do it effectively and efficiently.

UNIDENTIFIED FEMALE VOICE: A life?

MR. RIDDLE: Yeah, before we go to those
materials recommendations, I would just like to hand out
the current draft on the 606 Task Force, the commercial
availability, and I'll be making that presentation tomorrow
morning.

    CHAIRMAN KING: Okay.

    MR. RIDDLE: But that way people will have it in
hand, and it's highlighted with nice hot pink, that shows
the changes.

    CHAIRMAN KING: Okay.

    MR. RIDDLE: Okay.

    CHAIRMAN KING: I think you need to talk about
the recommendation and if there are questions or concerns
and --

    UNIDENTIFIED MALE VOICE: Do you want any quick
background information?

    CHAIRMAN KING: I think that in the past -- and
I'm just -- in the past -- and please bear with us, this is
the first time we've used the checksheets, so Nancy's
question is: how are we going to do a quick overview.

    In the past we had an introduction, a background,
what the issue was, what the committee recommendation was,
and we would present it in that format, and I see no reason
why we can't have a similar format based on the information
in front of you, with some chair discretion, Nancy, so --
MS. OSTIGUY: There's going to need to be (chuckles).

MS. DIETZ: Let me, for a minute -- the checklist forms, if you have not seen them, I think they vastly have improved our process, and I think every one of us have agreed on that. The back sheet really is the one that has the recommendation on it, so if that's what they're going to be going to, if you have copies --

MR. RIDDLE: Yeah, that's the problem. I understood they'd be in the meeting book, and they aren't, so --

MS. DIETZ: So the committee does not have them?

MR. RIDDLE: I didn't print them out, I don't have them.

MS. CAROE: Because they were on the website (inaudible) --

MR. RIDDLE: Right, they were on the website, in the meeting book, so I assumed they'd be in the physical meeting book once we got here.

UNIDENTIFIED FEMALE VOICE: And they're not.

CHAIRMAN KING: Katherine, do you have any copies available that we could share, at least, from a board standpoint? I have a copy here, so I can certainly --

MS. DIETZ: I have a copy.
CHAIRMAN KING: -- and Kim has a copy, so --

UNIDENTIFIED MALE VOICE: I have a copy.

CHAIRMAN KING: Okay. So I think we can get through this. Those who don't have copies or need a copy, raise your hand and --

UNIDENTIFIED FEMALE VOICE: We'll share.

CHAIRMAN KING: We can have a shared experience.

MR. RIDDLE: I do have another question about the process, and -- as I understand it, you know, the draft we have -- or don't have -- is from the committee, but really what we submit to NOP is from the Board, not just the voting form but the actual evaluation form.

So the whole thing is open for consideration. If we feel that, you know, the committee is recommending that something be a yes but we think it should be a no and there's additional comments, that should be amended, or open for amendment, per se, so that we come up with a composite from the Board.

MS. OSTIGUY: Right, that is my view also.

MS. DIETZ: And then a point of clarification: Who's making those amendments, is it the committee chairs, is it the Secretary who's doing that, or would it be --

MS. OSTIGUY: Well, I would hope it's the committee chairs.
MS. DIETZ: Okay.

CHAIRMAN KING: Committee chairs, yeah.

MS. DIETZ: Okay.

UNIDENTIFIED MALE VOICE: Anyone can make them, but then they record them.

MS. DIETZ: They would record them and turn them in, okay.

UNIDENTIFIED MALE VOICE: That'd be good.

MS. OSTIGUY: I don't know if the rest of the Board -- I have no idea how much my comments, my mumblings here, have been out, but what I indicated is I thought the committee chair should do it, partly because we know what's going on, and it's too much work for the Secretary to try and put it all together.

MS. DIETZ: Thank you.

CHAIRMAN KING: I think, yes, that's what we'll be doing. Jim's point is just that people can make a motion to amend, so --

MS. OSTIGUY: Correct. Yeah, that would make sense.

CHAIRMAN KING: But the recording part will be the responsibility of the committee chair.

MS. BENHAM: Mark, I have an extra copy here that somebody from (inaudible) printed themself, their own self.

R & S TYPING SERVICE – (903) 725-3343

5485 S. LIVE OAK, GILMER, TX 75644
MS. CAROE: I think the vice chair is the materials person, so they're really the one, it wouldn't be the chair of the committee but the vice chair.

MS. OSTIGUY: Yeah, that's fine.

CHAIRMAN KING: It's the chair's discretion at the committee level on how it gets recorded. We do know it must be recorded. Nancy.

MS. OSTIGUY: We'll try again?

CHAIRMAN KING: Yes.

MS. OSTIGUY: Okay. So we're going to start with -- as the agenda has -- with the order for the agenda, even though I love alphabetical and it's not.

Soy protein isolate is the one we're starting with, petitioned for use as a fertilizer. The committee's recommendation was to reject the TAP because it did not address the use of the material as a soil amendment, it was focused on food, so we were recommending a deferral.

Do you want any more detail than that or --

CHAIRMAN KING: Do you give a vote --

MS. OSTIGUY: Oh, I'm sorry, you can give the vote, yes. I can do that. The vote was 3 yes, zero no, zero abstained, on that one.

MR. SIEMON: And is that genuinely because we needed this information to make a decision obviously or was
it just kind of an irritation that TAP couldn't get it straight?

MS. OSTIGUY: No, it was not an irritation. Yes, there was irritation, but no, we weren't making a point (chuckles).

MR. SIEMON: Okay.

MS. OSTIGUY: The part of it -- some of the questions we had did get answered this morning, so there was supplemental information, so in our breakout section tomorrow morning the committee will talk about it again and we may change our recommendation at that time. I don't know. It depends on what everybody says. But I'm presenting what we decided, and we didn't have any of the information that was presented this morning, and we felt we needed that, to give it a fair hearing, because the response was: if we were going to do it based upon the TAP as it stood, the recommendation was going to be No, and that didn't seem right.

CHAIRMAN KING: Kim.

MS. DIETZ: Again, I commented this morning on this material, being somewhat involved with it as past chair, I'd like -- I'd like to see if perhaps Arthur and Bob and I could join your committee, because I want to just make sure we have some resolution to -- to this material
and what the direction is we need to go with it, whether we vote on it this week or defer it on specific reasons.

And then I also had a problem with this TAP, that, again, that third reviewer was a certified entity. So if we're going to defer it, then I think we need to ask for a third reviewer to re-review it.

CHAIRMAN KING: Jim.

MR. RIDDLE: I just -- I don't understand what your concern is, Kim. I mean --

MS. DIETZ: My concern with -- if I look at -- and this is a blanket concern on the TAP reports, but if I -- reviewer number 3, I think, on most of these materials is a USDA-accredited certifier from the Midwest, and I don't know whether NOP has a comment on that, but to me, I don't know if that's the place for an accredited certifier to be, a reviewer, because they could be -- they could have a biased opinion innately because their material isn't from that region or --

UNIDENTIFIED MALE VOICE: Certifying the person (inaudible) --

MS. DIETZ: -- or they could certify it -- I -- it just -- it strikes me as very awkward, so I question it. I don't know if it's right or wrong, but I would question an accredited certifier being a reviewer of a TAP report.
MS. KOENIG: I would just -- I think that it -- as long as it's fully disclosed, which, you know, we know that they're an accredited certifier -- I mean, I think it's analogous -- I mean, there's an accredited certifier on the -- well, I guess nobody is right now an accredited certifier, on the Board, but we all -- we all vote on things and we represent sections of the industry too, so we actually have, probably, more impact, but we do do conflict of interest, and I think as long as it's disclosed and -- so the answer, to me, lies in the contractor -- how the contractor screens those and makes sure that if they do have a conflict of --

MS. DIETZ: But the same one reviewed like six TAPs, so -- I just question it.

MS. CAROE: Yeah, it just --

CHAIRMAN KING: Andrea.

MS. CAROE: They should have --

CHAIRMAN KING: Rose --

MS. CAROE: -- a conflict-of-interest policy (inaudible) --

CHAIRMAN KING: Okay. Thank you. Andrea.

UNIDENTIFIED FEMALE VOICE: (Inaudible) the contractor.

MS. CAROE: I just -- I think there's a big
difference between being a stakeholder and being a reviewer of petitions. You know, innately this group of stakeholders all have a conflict, at one time or another we all have a conflict, that's why we're here, we represent that facet, that's why we're one vote of 15, or 14 at the present time. But providing information in this way, in order to make decisions, can -- if the person truly does have a conflict, can sway the entire vote of the Board because of the information that is selected to be included on this report.

I don't know for sure if I -- if I agree, but I -- as -- in my past life as an accredited certifier, I could see that certain materials being put on the List were advantageous to me, as a certifier, and promoted business.

So there very well may be that conflict, I don't know --

CHAIRMAN KING: Guys, I don't really want to cut this off, but I'm going to in the sense that I see this as a policy or procedure issue in terms of how the review process happens, unless -- does one individual or one individual from a specific sector of the industry have any more of a conflict than anyone else, so let's move on.

MS. OSTIGUY: Okay, the second item on the List was 6-benzyladenine.

And I think I know why I'm doing so many of the
materials: is because I can pronounce chemical names.
(Laughter.)

UNIDENTIFIED MALE VOICE: Amen.

MR. RIDDLE: I wasn't -- I had a few points I wanted the committee -- you're going to be meeting again on soy protein isolate, right?

MS. OSTIGUY: Yes.

MR. RIDDLE: In the morning.

CHAIRMAN KING: Yeah, breakout session.

MR. RIDDLE: Yeah, I was -- I mean, we got distracted on the whole discussion of conflict of interest of a reviewer, but I had a few points I just wanted to bring to -- I'm not on the committee, so now is my chance, unless I come to that breakout.

MS. OSTIGUY: Some points on --?

MR. RIDDLE: Yes, on the --

CHAIRMAN KING: Soy protein isolate.

MR. RIDDLE: -- soy protein isolate itself. Now that we've learned that it is hexane-extracted, you know, I'd like to add -- if it is deferred and questions about the environmental impact of that -- the only thing that the TAP says is that it's done in full compliance with environmental regulations. Well, of course it is. But I want some science on how the effluent or -- whatever, what
the environmental impacts of that, now that we know what
the extraction process is, and if we are deferring it, also
like to have more of a whole-systems approach reflected;
this is not just input substitution, we're talking about a
source of nitrogen, and nitrogen should come from legumes
in a mandatory crop rotation, and I'd like to see that
addressed in the TAP.

So I just wanted to make those points for the
committee to take.

MS. OSTIGUY: Any others?
(No audible response.)

MS. OSTIGUY: Okay. On to 6-benzyladenine, the
-- this material is petitioned for use as an apple fruit
thinner. What it does is cause you to lose a certain
portion of the fruit on the apple trees, eventually
enhancing production.

The committee's conclusions on this material was
that it was agricultural, synthetic, and voted to reject
the material because hand pruning is an alternative
practice that is available and currently used. One of the
quotes from the TAP that we used was: "Switching to
chemical solutions as an alternative to farmers working in
the field is not an example of sustainability, regardless
of economic profitability."
The vote on this was 4 yes, zero no, zero abstained. To reject, yes. Failed on Criteria 2 and 3.

CHAIRMAN KING: Comments, questions?

MR. SIEMON: You said that hand thinning is presently commercially being --

MS. OSTIGUY: Oh, yes. It is the only thing that is used.

UNIDENTIFIED FEMALE VOICE: Organic, yes.

MS. CAROE: Nancy, we had a commenter this morning from Valent BioScience that had apparently sent in a comment on this, and have you considered that comment, that came in late? Have you even seen it?

MS. OSTIGUY: That one I am not sure, but again, you know, the crops committee will be meeting in the morning and we will take into account all comments that have been made.

MS. CAROE: Okay. Because it sounded like there was quite a bit of substance in that document that should be considered.

MS. CAUGHLAN: And Rose indicated that there was an OMRI-approved source -- formulation, with a natural source of this substance.

MR. RIDDLE: I did have a question about how the committee came up with the answers yes and no to the
question about it being consistent with organic farming, "No," and I understand the rationale, and then --

MS. OSTIGUY: Okay, where are you?

MR. RIDDLE: Yeah, I'm sorry. Category 3, on the table there.

MS. OSTIGUY: 2 and 3?

MR. RIDDLE: Yeah.

MS. OSTIGUY: Uh-huh.

MR. RIDDLE: Yeah, 2 and 3. -- that it's not consistent, but yes, it is compatible. That doesn't quite seem consistent to me (chuckles).

(Laughter.)

UNIDENTIFIED MALE VOICE: No, but it is compatible.

MR. RIDDLE: But it is compatible (chuckles).

MS. OSTIGUY: Yes, but it is compatible. I think some of the logic here was that it does reduce production costs so it might increase [sic.] the economic liability of the farm, so that would increase sustainability. So there were -- the difficulty on this one was that there were aspects that made it sustainable and aspects that made it non-sustainable.

MR. RIDDLE: Okay. Yeah. And I can --

MS. OSTIGUY: And we're forced to do a yes or no.
MR. RIDDLE: Yeah, I understand it better, where you came up --

MS. OSTIGUY: So that's --

MR. RIDDLE: Okay.

(Pause.)

MS. OSTIGUY: Anything else?

(No response.)

MS. OSTIGUY: Okay, the next one was urea. Urea was petitioned for use as an insect fruit fly attractant. Contrary to what it says on the agenda, the committee actually had finished its work. What we had been told after the TAP was completed was that the material is not approved for the petitioned use, so we can't approve or not approve it because it doesn't meet EPA's criteria.

So as far as I can tell, we don't do anything on this one. Anybody have an alternative view, that we're supposed to do something?

CHAIRMAN KING: It was my understanding that it didn't meet -- it wasn't a legal label claim --

MS. OSTIGUY: Right.

CHAIRMAN KING: -- the petitioned use and therefore --

MS. OSTIGUY: -- we couldn't --

CHAIRMAN KING: -- we couldn't move it forward.
Rick?

MS. OSTIGUY: So I don't know if we officially reject or what we do with it, but --

CHAIRMAN KING: Do you need us to officially reject a material that does -- the petitioned use does not have a legal label claim?

MS. DIETZ: Can I comment?

CHAIRMAN KING: (Nods head.)

MS. DIETZ: In the past, something similar to this has happened and they've withdrawn the petition versus reject the material, so if you could -- if there's no EPA allowance for it, it's up to petitioner to do that, I suppose, but from a committee standpoint --

MR. MATTHEWS: If there's no EPA allowance, we don't take action.

MS. OSTIGUY: That was my assumption.

CHAIRMAN KING: So we'll just move on with that.

MS. OSTIGUY: Yes.

CHAIRMAN KING: Okay.

MS. OSTIGUY: So --

CHAIRMAN KING: Quick comment?

MS. DIETZ: Again, this is not -- this is, I guess, intended for the public to understand the process: you know, we're all human, we all make mistakes, and I
think --

UNIDENTIFIED MALE VOICE: Speak up.

MS. DIETZ: I said we're all human and we all make mistakes. Unfortunately, this -- in our procedure, as we follow it -- and I explained, between zero -- days one and fourteen the NOP is supposed to review the -- you review the petition for the intended use. In this case, it was urea as the active ingredient in a pheromone, and the petitioner was from a different country, it wasn't a US country, and we assumed when the committee got it the first time that that -- that they had looked at -- that NOP had actually done that research.

Somewhere in the process, it wasn't done. This should never have -- we shouldn't be here even looking at this. So this normally should not have occurred. I don't want people to think that this is how procedures occur, because it shouldn't have gone to this process, but it has, it's unfortunate, and that's where the committee stands on it.

MS. OSTIGUY: It actually sounds like a reasonably good idea, so maybe somebody should talk to EPA.

Anyway: Hydrogen chloride, this was petitioned for use in cotton seed de-linting process. The committee
voted that the material was agricultural, synthetic, and to reject it, indicated that the criteria -- both -- well, Criteria 1, 2, and 3 caused the failure of this chemical because of its extreme corrosivity, very reactive; if released, very damaging to soil and plant life; and, as we heard this morning, this is not true, that alternative organic acids may be used.

The vote was 4 yes to reject, zero no, zero abstained. And, again, we will be talking about this one in the morning.

CHAIRMAN KING: Rose, go ahead.

MS. KOENIG: I just want to say: I think it was the spirit of this vote -- again, I think you need to go into that a little bit -- was that we acknowledged the -- you know, the two criteria. Our biggest question as a committee, when we voted on it, was whether there was alternative substitutes.

Based on that TAP report, the TAP report indicated that. We voted based on that information. So this will be one that -- I think that we will definitely reconsider, because we did get the public comment that we thought we would get, so -- that's just -- all I wanted to say.

MS. DIETZ: I would like to request that crops
committee reviews this material that -- take into these things [sic.] for the following consideration.

   Number 2, on category 1, where "Is there environmental contamination during manufacture?", you have very good justification that there is, but at the same time, this is a grass material and that -- GMPs should be followed, and that's why we have GMPs, so that potentially things don't happen.

   So I think this is one where there is, but you also need to acknowledge that in the TAP it does say that as long as Good Manufacturing Practices are followed, as every material has those, that -- that are considered potentially dangerous. So that was number 2.

   On number 3, "Is the substance harmful to the environment?" On the TAP, Page 6, it's specifically stated that there was no residue left on the seed, and so I would like to see that added, even though it is -- the substance is harmful, that they do acknowledge that there's -- it's a pH neutral by the time they receive a seed.

   MS. OSTIGUY: Uh-huh.

   MS. DIETZ: Same thing on number 5, "Is there potential for detrimental chemical interaction?", as long as Good Manufacturing Practices are followed, you know, that -- that's your deterrent there. And that also this
material is considered a food sanitizer, so I would have
also included it in that section.

MS. OSTIGUY: In number 5.

MS. DIETZ: In number 5. Next page, under
category 2, "Is there a wholly-natural substitute
product?", yes, there are products that identify --

MS. OSTIGUY: Oh, this isn't applicable.

MS. DIETZ: Pardon me?

MS. OSTIGUY: It's not applicable.

MS. DIETZ: Right. Number 4 says yes --

MS. OSTIGUY: Oh, number 2, okay. Number 2.

MS. DIETZ: Number 4 --

MS. OSTIGUY: Okay.

MS. DIETZ: -- you say, "Yes, there are
substitutes" --

MS. OSTIGUY: Uh-huh.

MS. DIETZ: -- whereas the --

MS. OSTIGUY: Yeah.

MS. DIETZ: -- TAPs said they might not be
applicable; and also in your comments that you received
from the petitioner, they said they were not.

MR. SIEMON: And lactic and acetic acid is
considered wholly-natural? Am I wrong?

MS. OSTIGUY: It's an organic acid.
MS. DIETZ: And then the only -- the only other comments I had, in the handling committee, if there's alternatives mentioned, then we would have gone forth and asked the -- before we checked new material, we would have gone and asked to have a response from the petitioner, whether or not they've tested those alternatives, so I don't see anywhere in here where we've tried to see whether they've really tested the alternatives. Those are my only comments.

(Pause.)

MR. RIDDLE: This is a tough one for me, I mean as -- if people haven't figured out by now, I'm kind of a conservative when it comes to synthetic substances and didn't think I supported this, but hearing what I heard today has certainly opened my mind to change, and I think as the committee revisits it, it's really going to hinge on annotation; if you do move it forward, there's got to be a very limited use, you know, for --

UNIDENTIFIED FEMALE VOICE: De-linting.

MR. RIDDLE: Yeah. -- for de-linting cotton seed for use in planting. We're not talking about for livestock feed or something like this. This is to be planted. So that's basically it, for me.

CHAIRMAN KING: Other comments?
CHAIRMAN KING: Anything else, Nancy?

MS. OSTIGUY: No. I think that's all four of them.

CHAIRMAN KING: Okay, great. Now we're supposed to have a break.

(Laughter.)

CHAIRMAN KING: Kevin.

MR. O'RELL: Nitrous oxide was petitioned for use as a whipping propellant for food-grade aerosols, and I know that you want the condensed version of all this, so I'll try to make it condense.

Most of the concern was around the environmental aspects of nitrous oxide and the fact that it is a potent greenhouse gas and has a half-life of 120 years. Also considered -- we answered Question Number 1, adverse effects, yes, but we also considered a magazine article which said that it was an infinitesimal amount, 2 parts per million for total production, but we still felt -- that was answered yes on most of the environmental questions.

It is a grass item, and harmful effects on human health, mostly resulting from the misuse of the product, so we answered yes, but -- from inhalation of laughing gas --

UNIDENTIFIED FEMALE VOICE: Which we all thought
we needed at the time we got finished with this.

(Laughter.)

MR. O'RELL: I think we're there now.

VOICES: Yeah.

(Laughter.)

MR. O'RELL: "Is there a natural source?" Not that's practical for commercial availability. It naturally occurs -- nitrous oxide naturally occurs due to the action of soil bacteria. Jim, this is one I'm going to answer before you get to, but on question number 3, we put yes and no, so I know you'll probably ask us that. And that is the substance essential for organic -- for handling of organically-produced agricultural products.

In the petition there were stated uses -- alternatives using already-approved materials but there was some dispute from the petitioner on the effectiveness of these substances to yield a product that's acceptable for the consumer, so we tried to recognize both aspects of it since there was conflicting information.

However, the petitioner did say he was unaware of any tests that have been done on a gas mixture of nitrogen and CO2.

On alternative substances, again we answered yes/no, and under the same conflict: that the TAP had
indicated there were but the petitioner said that they were not acceptable to produce a product for consumer quality.

I'm trying to see any other questions that people might have, but maybe we'll just go right to the committee recommendation.

That was first -- we had voted on synthetic non-agricultural, and that was yes 5 votes, with zero nos, zero abstentions, and 1 absent. And then there was a motion to allow nitrous oxide for addition to 205.6, and there were zero yeses, 5 nos, no abstentions, and 1 absence, so the material was voted not to be allowed.

I don't know if there's any questions on that.

MR. RIDDLE: I just had one, and that is, on Criteria -- in category 3, number 6, the whole thing about "Is primary purpose to recreate or improve flavors, colors, textures," et cetera, you explained why you said no as far as recreating texture, because it creates the texture --

MR. O'RELL: That's correct.

MR. RIDDLE: -- but I would say that it should be answered yes on improving the texture, that it does -- its purpose is to --

MR. O'RELL: Do you want us to go yes/no on this one?

MR. RIDDLE: Well, you can do that, yeah, sure,
we can be schizophrenic and --

(Laughter.)

MR. O'RELL: We discussed that aspect, Jim --

MR. RIDDLE: Uh-huh.

MR. O'RELL: -- but -- you know, I guess it's how

you -- you know, I'm not going to say is, is, but the -- we

actually felt that it creates the texture and that's not

improving it because there is no texture without it.

MR. RIDDLE: Well, it's -- it's a liquid --

MR. O'RELL: It's a liquid.

MR. RIDDLE: -- so it has texture, but now you

pump in the gas, and now it's a whipped liquid.

MR. O'RELL: And that's creating a whipped

texture, from a liquid.

MR. RIDDLE: But it's improving it compared to if

you just kind of squeeze the can and this liquid came

out --

(Laughter.)

MR. O'RELL: Okay.

MR. RIDDLE: -- people wouldn't be very

impressed.

UNIDENTIFIED VOICE: (Inaudible.)

(Laughter.)

MR. RIDDLE: It makes it much more sale-able.

R & S TYPING SERVICE - (903) 725-3343

5485 S. LIVE OAK, GILMER, TX 75644
MR. O'RELL: Duly noted.

MS. DIETZ: Well, I think our -- our dilemma was, is that does it create or recreate, and it does neither --

MR. RIDDLE: Yeah, I understand.

MS. DIETZ: -- and so that was -- that was one of the sticklers that we (inaudible), but you could note that, that could be noted on the comments (inaudible).

UNIDENTIFIED MALE VOICE: Thank you.

MR. O'RELL: We could note that on the comments.

MS. DIETZ: It's a tough one. I had one comment, that this committee also -- we had a lot of -- we put a lot of time and effort into this petition, we reviewed it the first time, we did not take any vote on it, we decided at that time we needed further contact with the petitioner, we graciously -- with Arthur Neal and Kevin we set up a series of questions ahead of time, we sent those to the petitioner, we got a conference call, we got our questions answered, and -- so I think that we can really say that we did a very thorough review of this material.

The one area -- that I do want to go on record -- that we struggled with was setting precedents for this material, because a lot of the discussion was around the ozone gas and the environmental aspects of it. There are materials on the National List currently that do the same
thing, and CO2 is one of those. So when we go to re-review materials, we need to look at that, and I will tell you that one of the primary reasons this was rejected was because it was for such a specific use, it was really for one use, and we didn't want to open up the world to having everything as a propellant for one specific use. So I just want to put that on the record, it is -- the greenhouse effect is a detrimental aspect, but there are other materials on the National List that are currently doing that.

MR. O'RELL: And we did recognize that in the comments on the TAP, particularly when we were doing the "substance consistent with organic farming and handling," noting that other greenhouse gases, such as CO2, are on the National List.

Next, tetra sodium pyrophosphate, TSPP, tetra sodium phosphate was petitioned a specific use as a pH buffer and dough conditioner for use in organic meat-alternative products.

This is a substance that we had reviewed and voted on at our last meeting and had voted to approve as a committee, the NOSB Board voted to approve TSPP, and it came back from the NOP with the request that we re-review this not only with the new forms that were given to us but
addressing a specific issue, which is the reason why I'm not going to go into the full explanation of all of the other factors, because we spent a lot of time on TSPP, so I'll focus it around the specific issues which were alternative substances, which we have gotten additional information and determined that there may be alternative substances but we had indicated that these would produce, from information we got from the petitioner, an undesirable product in terms of quality, functionality, unwanted discoloration, undesirable odor, and foul taste.

The other issue primarily centered around this -- the product used to recreate texture, and after consulting with the petitioner and understanding, as we heard today in public comments, the intended use of this as a pH buffer and dough conditioner, that it actually is working too as a processing aid to condition the dough through the extrusion process. The actual texture is being formed by a thermomechanical process, as opposed to the sole use of tetra sodium phosphate.

So we put this through its review again, and the committee recommendation to a motion to allow under 205.605(b), the committee vote was 4 yes, zero no, no abstentions, and 2 absent, and it's synthetic, non-agricultural.
MR. SIEMON: I just need to understand once again: why was this brought back to us? I mean, I had it clear [phonetic] the first time, but --
(Laughter.)

MR. SIEMON: I'm serious, I don't understand.

MR. O'RELL: It's my understanding -- and if NOP would -- wants to -- maybe Rick would be the best to -- let's not take my understanding. Rick is going to come up and address specifically why.

CHAIRMAN KING: Ladies and gentlemen, Rick Matthews.

MR. MATTHEWS: For the record, Richard Matthews.

This material, the first time that you approved it, we included it in a rulemaking action, to add it to the National List. Commenters came back, and about half of the commenters were opposed to adding it to the National List and basically they said that it violated one of the criteria, and it's the criteria that Kevin has been going over, about creating the texture.

So we, in reviewing the record, were unable to support the Board's position, so we did not submit it to the Final Rule, okay, so it has been referred back to the Board to address the issues that the commenters had raised during the rulemaking process the first time around.
So you're being asked at this time: Is this what you want to do? -- and if so, you need to justify why you're doing it to a greater extent than was done the first time. Okay?

And this is not only affecting this material, but it's also affecting the rulemaking that we're doing now on other materials, we're being challenged more and more to put in better justification for the actions of the Board, and that's why we went to these sheets.

Any other questions on this?

MR. SIEMON: So the bulk of what we're gaining, really, is this form, the category 1, 2, 3, with the explanations there, that's the bulk of --

MR. MATTHEWS: Yeah. Well, what'll happen is that in the future, when somebody comes forward and challenges one of your decisions, we'll have these forms to go back to in order to try and respond to the commenter in the Final Rule, explaining why you went ahead and did something that the commenter thinks is contrary to the Act.

CHAIRMAN KING: Kim, then Rose.

MS. DIETZ: The specific comment, like Richard said, was that the -- they felt that the primary use of the material was as a texture -- to alter the texture, and so we went back through and revised these materials.
I also just need to put another thing on the record, because this -- this section of criteria was originally drafted by Joan Gasau [phonetic] in Nineteen Ninety -- actually, 1998. I was asked to help her draft this language for this criteria.

And I want to read to this group the exact language that we wrote, because it's a little bit different than what's in the Rule, a little it's almost -- similar, and we -- Joan had been asked to work with the MPPL committee, which is OTA's manufacturing committee, on this criteria, and we had said that the material has to be reviewed and it may be used if -- and you would have to go through these principles, but its primary use or its primary purpose is not as a preservative or used only to recreate improved flavors, colors, textures, or nutritive value lost during processing, so there's key words in there, except that the latter case is required by law.

So our intent was that, one, the material's primary purpose is not: to recreate any of those categories or recreate something that's lost during processing.

So we really focused on this language when we reviewed because, one, we -- the comments that we have -- and we have a lot of public comments and comments from the
petitioner, that its primary use is a pH adjuster, okay, so we focused on that, and yes, it is a dough conditioner and yes, it does alter the texture, but its primary use is: a pH adjuster, and that that is something that wasn't lost during processing, it was actually -- the purpose of the material was to aid in that flow.

So we felt that we covered this criteria very well, if that makes sense to everybody. But you're going to come up against this as you re-review a lot of processing materials, so I really urge -- you know, I'm going to be off the Board, but I urge the handling committee and this Board to really look at how that reads, because it says "primary purpose," and another criteria is "lost during processing." So you have to have both of those to reject a material based on this criteria, in my opinion, as one of the original authors.

UNIDENTIFIED MALE VOICE: Thank you.

CHAIRMAN KING: Rose, then Jim.

MS. KOENIG: I had -- I have a question on the process the committee went through in terms of exploring the alternatives and the additional information that you received. And, again, it's really to question the process, not necessarily the information that you obtained, just to kind of think about how we go about those things.
So you went to the petitioner to get -- collect the data, or how was that -- refresh me again, you know, because --

MS. DIETZ: We actually pulled all of the public minutes from the last meeting, where we interrogated them, and they provided public testimony, and they provided us with documentation, so we really went back and said -- and re-reviewed it at that point. So that's what we did to -- to validate things had been tested, and you can see where the comments are.

MS. KOENIG: The question I have, again, and -- you know, and it's -- again, you know, I'm not picking on this particular product, but I think we need to be careful in terms of kind of the data or the information sources that we use. I mean, the petitioners, you know, have a vested interest, in many ways, if it's on the List, so we --

MS. DIETZ: But we'd already voted on this, so we felt we didn't need to focus on that, our focus was: --

MR. O'RELL: Right.

MS. DIETZ: -- was its primary purpose a textured product, and so we -- we just went back as justification, we didn't go back and re-review the material, because we'd already voted on it once; we just put the justification to

R & S TYPING SERVICE - (903) 725-3343
5485 S. LIVE OAK, GILMER, TX 75644
it.

MR. O'ReLL: And we went back and reviewed the Board's comments at the time during this discussion for approval of this -- this substance. So that was just a re-review of everything, with new information where -- in dealing with the one point, that threw it back from the NOP to us.

CHAIRMAN KING: Jim.

MR. RIDDLE: Yeah, I will. I guess I'm uncomfortable with the Board's document, if we are to just accept the committee's form here, stating, as it does in several places, all of these organic products have high consumer acceptance and are certified by responsible accredited certifiers, when the substance is being used and is not on the National List. I mean, that -- that's a bit awkward, to me, for the Board to be putting in a document, which becomes permanent record, that we acknowledge that a violation is occurring by responsible accredited certifiers, you know, the use of a non-listed substance.

I really don't want the Board to go on record with that --

MS. OSTIGUY: But do we know that? Because what -- because being certified doesn't meant that --

MR. RIDDLE: Well, I assume if we put it in our
document, that we've verified that it's true.

Mr. O'Rell: What page are you looking at?

Mr. Riddle: Well, it's category 3, three one, three three. I mean, I have to accept that that is a true statement.

Mr. O'Rell: Well, it was statements taken from public comment.

Mr. Riddle: Yeah.

Ms. Dietz: Do you have a suggestion, should we just remove it, is that --

Mr. Siemon: It's a compliance --

Mr. Riddle: I don't --

Ms. Dietz: I mean, I don't -- it's not really relevant to what we're doing.

Ms. Caroe: But --

Unidentified Male Voice: We're --

Ms. Caroe: Hold on one second. Sodium phosphates -- sodium phosphates is on the List, and some can interpret that to say all sodium phosphates. Tetra sodium phosphate is a sodium phosphate. I don't agree with the argument, I'm just saying that I've heard it.

Chairman King: -- it could be made. All right.

Mr. O'Rell: It has been brought up that there is confusion as to whether -- if you go back to the actual
approval of sodium phosphate, it specifically indicates it was for the orthophosphates and not for classes of pyro- or polyphosphates; however, that --

MS. CAROE: The way it's in the List, in the regulation --

MR. O'RELL: -- there is confusion -- there is confusion in the industry, but --

MS. CAROE: -- you could justify it.

MR. RIDDLE: Your Honor, I would be much more comfortable --

MR. O'RELL: -- if we strike --

MR. RIDDLE: -- if those boxes contain the findings of the committee rather than the opinion of a public commenter, who also is the petitioner.

MS. DIETZ: Well, I --

CHAIRMAN KING: Is this work that can be accomplished tomorrow during the breakout session?

MS. DIETZ: I think public --

MR. O'RELL: Yeah, we can do this at the breakout session. We'll review that --

MR. RIDDLE: Yeah. It's just -- I would just be --

MR. O'RELL: It's just for cleaning up --

MS. DIETZ: Public comment is important.
MR. RIDDLE: Well, I understand, but it should be -- I think you get my point.

MS. DIETZ: I do.

MR. RIDDLE: And then it does --

MR. O'RELL: We can -- we will review those references on our breakout session.

MR. RIDDLE: Yeah. And then I have the same comment about improving texture. I mean, we heard this morning in the testimony that it's a combination of the substance and temperature and pressure but temperature and pressure alone do not get the resultant texture that they want, and these other materials they tried don't get the texture. This substance get the texture, it improves the texture. Those meat analogs would not have the consumer appeal, they would not be improved without this substance, so --

MS. CAROE: I disagree --

MR. RIDDLE: I do think that -- there should be an answer of maybe yes and no in explaining it, but I do think it improves the texture of this substance, just in all honesty.

MS. CAROE: No, I --

CHAIRMAN KING: Andrea.

MS. CAROE: I actually disagree with that,
because I do believe that the temperature and pressure does
create the texture. The material is facilitating that
process, but it doesn't create the texture.

MR. RIDDLE: I'm not talking about creating; I'm
talking about improving. It says --

MS. CAROE: Improve --

MR. RIDDLE: -- recreate or improve, and I think
on improve, the honest answer is yes.

MS. CAROE: I don't believe so, because it's heat
and pressure that's improving the texture. It's not doing
anything to the texture other than allowing it to use the
equipment.

MS. DIETZ: In number 6 it is addressed, and
you'll see it there, that yes, the TAPs indicate that it is
used for texture, but it is not stated to recreate the
texture, and as I went -- and as I tried to explain, that
this category says the primary use, and everywhere in the
TAP and everywhere in public comment, and the fact that we
already approved this based on this material's primary use
as a pH adjuster we felt was very relevant, and I think it
is put in there.

If you would like us to put something else, I
think we certainly can put it in there, but its primary use
is not to recreate or create texture. So the committee --
at least -- I can't speak for everybody, but we went round
and round on this and made sure we had the right answer, so
I'm -- I'm not willing to redo this form, so --

MR. O'RELL: I think --

MR. RIDDLE: I just think acknowledgment that a
function is to improve texture and then explanation that
maybe primary purpose, these others, as you've said.

MR. O'RELL: I think we can add some language in
that, recognizing that, Jim, that --

MS. CAUGHLAN: It facilitates extrusion --

UNIDENTIFIED FEMALE VOICE: Yeah.

MS. CAUGHLAN: -- and by facilitating extrusion
it does --

UNIDENTIFIED FEMALE VOICE: Yes.

UNIDENTIFIED MALE VOICE: -- improve the --
creating it.

MS. CAUGHLAN: But it seems like a secondary --
(Pause.)

CHAIRMAN KING: Rose.

MS. KOENIG: I just I guess had a question on the
voting. Is there any way -- and again, I didn't look at
the minutes to -- to find out. The original vote was what
on this, during the --

MS. DIETZ: Actually, I have the original vote.
MS. KOENIG: And can you give us who -- the individuals, what we voted (chuckles), how we stood, because --

UNIDENTIFIED MALE VOICE: What? Tell us how we voted last time?

MS. KOENIG: -- I mean, I'm saying there's --

MR. SIEMON: (Inaudible) tell me how we voted last time.

(Laughter.)

MS. KOENIG: There may be a reason why there's a few people that are not comfortable with it, because there was some -- I'm just trying to recall.

MS. DIETZ: We actually had a lot of different votes on this one, different amendments.

UNIDENTIFIED MALE VOICE: Yeah.

MS. DIETZ: But -- and some withdraws, this was a very painful material, as everybody remembers, but the -- it was -- a motion was made to allow TSPP as a synthetic under 205.605(b) for use only in textured meat-analog products. The vote was 8 favored, 3 opposed, 2 absent, 1 abstained.

MS. KOENIG: Do you know the recording of those individuals' --

UNIDENTIFIED MALE VOICE: I'm sure (audible)
voted against it.

MS. KOENIG: No, I mean, I'm just -- do you know how the -- do you know the individual votes, just -- I'll just try to get that later.

MS. DIETZ: But if you want to look at all the minutes, I have them, you're more than welcome to take them.

CHAIRMAN KING: George.

MR. SIEMON: Andrea brought up the issue about broadening the present phosphate sodium policy. I'd just like to know, did the committee even discuss that, or -- you know, whether to go back and look at that, the annotation that we have, did you all look at that?

MR. O'RELL: Well, it was discussed in the committee, but, again, you know, the specific petition was for a specific use, and although we acknowledged that the orthophosphates are approved for dairy applications only, at one point they were asked -- petitioned for expansion for soy products. That was voted down.

That's before I was on the Board. I don't know the exact discussion that went into that, but we were trying to address the specific use of tetra sodium pyrophosphate for its specific application it was petitioned for. Because we felt that that was following up
from the vote that we had had as a committee, or as a board, at the last meeting. I didn't think we wanted to muddy up the issue.

MR. RIDDLE: But the committee's recommendation doesn't have any annotation; correct?

UNIDENTIFIED FEMALE VOICE: No.

UNIDENTIFIED MALE VOICE: No.

MR. RIDDLE: So even though you only considered it for this one use, it's not being --

MR. SIEMON: -- limited.

MR. RIDDLE: -- limited, yeah, there's no annotation. Did you talk about that?

MR. O'RELL: Unfortunately, in the final vote, I was one of the absent, so I will defer to Kim.

UNIDENTIFIED FEMALE VOICE: I know we didn't.

MS. CAROE: Well, actually, I think we did. I think, in discussion, the -- the annotation was one of the things that flagged this as a texturizer, because of the ways that that was written, and we -- as I remember, and Kim, refresh my memory, but I believe we talked about what other possible uses and would any of those be -- we looked at all the uses that were in the TAP and would any of those be a problem for us, and it didn't appear to be, so we just took the annotation out, for clarity, to simplify,
simplification.

MS. DIETZ: Yeah, and, again, the original annotation was for use only in textured meat-analog products, and the comments were specifically against the word "textured meat," and since it -- again, since the primary use of the material is a pH adjuster, we did not want to turn this back around and say -- and confuse it even more, so we just made the recommendation that you have in front of you.

MS. KOENIG: So the implications of that is that if we put it on without annotation, it can be used in processing of any product, for any use, even though what you just said, as far as your research --

MS. DIETZ: Yeah.

MS. KOENIG: -- in terms of pH, you know, that --

MS. DIETZ: The other reason that we didn't put an annotation is that we have gone through phosphates four or five times and put four or five different phosphates on the National List, and every one has been for a specific use, and if we're -- either we're going to allow phosphates or we're not going to allow them, and we said, look, you know, if this keeps coming back because we're being very restrictive with annotations and then somebody comes back and says, "Well, it's for dairy" or "it's for this," either
we want them or we don't, and this committee said: we're
going to put it forth without an annotation.

    So the Board has -- you know, they can make a
recommendation, but this committee's was: no annotation.

    MR. RIDDLE: Yeah. I think the more we learn,
the more we know how important annotations are, the more we
learn about how broadly the List is being interpreted. And
so, to me, the lesson is: just like OFPA says, petition
for a specific use, and that -- I would support an
annotation, and maybe you can talk about that, see if the
committee wants to bring anything forward, but somebody
else probably will.

    MR. O'RELL: We'll revisit it as a committee.

    MS. DIETZ: We could bring the original
annotation back, but we've done the justification that we
were asked to do.

    UNIDENTIFIED MALE VOICE: All right. Thanks.

    CHAIRMAN KING: Kevin, is that --

    MR. O'RELL: (Nods head.)

    CHAIRMAN KING: Okay. I don't know if George or
Nancy is doing livestock.

    MS. OSTIGUY: I am.

    MR. SIEMON: Since I can't pronounce any of the
words, Nancy's going to.
MS. OSTIGUY: The first one on the livestock list is moxidectin, which is used as a -- it's a topically-applied broad-spectrum parasiticide effective against both internal and external parasites.

We actually considered this one a couple of marketings [phonetic], at least it feels like it. The committee recommended that it was agricultural, synthetic, and that it be allowed -- is that correct? Yes. -- with an annotation for control of internal parasites only.

This was despite the fact that it, in our opinion, failed on Criteria 1, and that was the reason for the proposed annotation: because of concern about the half-life of the material and impact on soil organisms.

We recognized that it is also less problematic than a material that's currently on the list, ivermectin, but the annotation was to respond to the issue of its half-life and soil-organism impact. Much less chance of any kind of contamination if it was for internal parasites versus external.

Go ahead, Jim.

MR. RIDDLE: Yeah, I missed the call, I'm on the livestock committee, so I apologize, but I just had a question. As I recall, this substance is applied as a
pour-on, a (indiscernible) external application.

MS. OSTIGUY: Correct.

MR. RIDDLE: And so -- and it does provide external parasite control as well.

MS. OSTIGUY: Correct.

MR. RIDDLE: So as an inspector, you know, and you have this annotation: it's only for control of internals --

MS. OSTIGUY: Uh-huh.

MR. RIDDLE: -- but it's applied to the external, and it controls externals --

MS. OSTIGUY: Uh-huh.

MR. RIDDLE: -- how can that be --

MS. OSTIGUY: Well, the reason for the -- that very instruction to use the material is because of internal parasites only.

MR. RIDDLE: Okay. So someone would have -- the inspector -- I mean the farmer would have to keep records showing that that is the reason, and still not routine use, it has to be --

MS. OSTIGUY: Oh, yeah.

MR. RIDDLE: Yeah, all these other conditions that are already in the Rule.

MS. OSTIGUY: Right.
MR. RIDDLE: So they'd have to have --

MS. OSTIGUY: There should --

MR. RIDDLE: -- documentation --

MS. OSTIGUY: One would hope that there would be records for the animal, of why they were treated, and so the records would indicate that it was for internal parasites.

MR. RIDDLE: Uh-huh.

MS. OSTIGUY: Because then you avoid also dip operations and that sort of thing.

MS. KOENIG: A question. Isn't -- I know it was petitioned for an anti-parasitic, it's a parasiticide (chuckles), but, you know, when I went back and looked at it again, the executive summary, I notice that it's a by-product of, actually, an antibiotic. I just wanted to clarify that -- is it in fact an antibiotic or is it a parasiticide?

UNIDENTIFIED MALE VOICE: Can I address that?

MR. RIDDLE: We went through all that.

MS. OSTIGUY: It's an antibi- -- it's a parasiticide.

UNIDENTIFIED FEMALE VOICE: Yeah.

MS. OSTIGUY: It's not an antibiotic. I know that we talked about that before. And the petitioner is
here also, if you want to ask him --

UNIDENTIFIED MALE VOICE: That was not responsive to the TAP committee (inaudible).

MR. SIEMON: That's why we delayed it (inaudible).

MS. OSTIGUY: Well, and I remember we asked that and you gave --

MS. KOENIG: Right.

MS. OSTIGUY: -- you got us that information about it too, so that was last time around that we'd asked that question and then checked up on it.

But it is not an antibiotic, it is actually a parasiticide, and I just don't have that piece of paper with me that indicates that.

MS. KOENIG: You know, it's just one of those that has been around and --

MS. OSTIGUY: Yes.

MS. KOENIG: -- I just was trying to clarify that, because I'm not --

MS. OSTIGUY: Around and around.

Any other --?

(No response.)

MS. OSTIGUY: Okay, the last one was the proteinated and chelated mineral complexes, used as a
supplement in livestock. The committee voted that it was
synthetic, allowed, non-agricultural. The vote was 4 yes,
zero no, zero abstained.

There was some concern about copper and zinc, on
the effect in soil and on soil organisms, but we didn't
feel that an annotation was reasonable, so -- so the --
voted for approval.

MS. KOENIG: Is there an annotation? I didn't
get that thing that you said --

MS. OSTIGUY: No, no annotation.

MR. RIDDLE: Once again, that was the same call I
missed, and I do have a concern about the source of the
protein, and I do have documentation here, Dr. Alfred
Walker, who's looked at some of the background on this, and
it is a possibility that the protein source could be an
animal -- of animal origin, and, you know, I don't know if
the committee's going to meet in the morning on breakout or
not; if so, I'd just hold this discussion for the livestock
committee; but if not, I will like to suggest an annotation
that protein source must be -- must not be of animal
origin.

And then there is the issue of excluded methods
as well. If it's a soy source, it's possible that it would
be a product of excluded methods.
MS. OSTIGUY: Right, but those aren't allowed.
MR. RIDDLE: Yeah. The animal by-products,
though, I do think needs to be specified.
UNIDENTIFIED FEMALE VOICE: Is that available,
commercially available?
MR. RIDDLE: Yes. It's commercially available
from non-animal, non-GMO protein sources, so, yeah, it
shouldn't be a problem.
MR. SIEMON: We are meeting tomorrow.
MR. RIDDLE: Yeah, okay.
MS. KOENIG: I have a question on -- getting back
to Jim's point, it's a question for Rick.
Is that your interpretation of the excluded
method as far as GMO when we place that on there, that
that's something that the NOP regulates, on these
materials?
UNIDENTIFIED MALE VOICE: (Inaudible) the use of
(inaudible).
MS. KOENIG: Well, GMO-derived, for --
MR. NEAL: What's the particular issue, though?
MS. OSTIGUY: The issue is: whether or not, as a
-- if you have a non-animal protein, your primary source is
probably going to be soybeans. Soybeans are going to most
typically beRoundup-ready, which is GMO. Could they use a
GMO material for the proteinated chelates, and would that meet the Rule, or does the Rule exclude it because GMOs are prohibited.

MR. NEAL: I won't answer that right off the top of my head. There's a question that I've got for you, though. When you think about this type of annotation, how do you enforce it, how does a certifying agent enforce it, and where do they get their information from?

MS. OSTIGUY: The sourcing from the person manufacturing it.

MR. NEAL: So everybody will provide all of this information for --

MS. OSTIGUY: Well, you'd know your source.

MR. NEAL: I'm just asking, because that's going to be -- that's going to be an issue, is enforcement.

MR. SIEMON: The average farmer won't have a clue.

MS. OSTIGUY: Well, the farmer won't --

UNIDENTIFIED FEMALE VOICE: But the agent.

MR. NEAL: I'm just asking a question.

MS. OSTIGUY: -- but the manufacturing source would know.

MR. NEAL: Okay. Because what could end up happening is that you eventually have an issue where some
farmers may not know, some will, and so you've got another
enforcement and compliance issue that you've got to
address. That's all I'm -- that's all I'm -- I mean, that's the only question that I've really got.

MS. KOENIG: I guess that that -- I mean -- and it's been on my radar screen for a while, and that's why I'm asking it, and you don't have to answer it now, but the question is, is: again, when NOP looks at those excluded methods, do they just simply look at "no GMO seed," or do they take it to the step of materials, both natural and things that are on the List, such as even soybean meal, are you checking to see -- or like the soybean isolate, are they from non-GMO sources, when it comes to that -- that --

MR. NEAL: There -- we say that manure from non-organic operations may be used as a soil amendment. We say the crop residues from non-organic operations can be used as a soil amendment. These could be -- I mean, these are soil amendments.

MR. NEAL: Those are naturals. Those are crop -- those are agricultural products we're talking about, those are not synthetics.

MR. SIEMON: Even if they're GMO, is what you're saying.
MR. NEAL: I'm applying it to my soil as a soil amendment, and we acknowledge that.

MS. CAROE: There is nowhere in the Rule that it specifies that a crop input has to be non-GMO, it's not in there. In fact, the cover crop can be GMO. It's not in there.

MR. NEAL: Well, the seeds --

MS. CAROE: The rotation can include a GMO crop that's not sold as organic.

MR. NEAL: Seeds could not be GMO.

MS. KOENIG: Well, that -- that's -- I really --
you know, as we especially look at these protein issues, and soy, you know, and we're getting into the National List of these products, I think there's a lack of -- you know, I don't know if it needs to be in a directive, but there certainly is a lack of clarity in terms of what -- how you view your GMO policy, because contrary to what Andrea's saying -- I mean, I would assume the cover crop in an organic-production practice could not be GMO seed.

MS. CAROE: It's not in the Rule.

MS. KOENIG: So I don't -- and that does have some implications, because, again, I think, personally, when I'm putting something on the List, I'm assuming that if it is a soy protein isolate, or if it's a protein
chelate, in this case, I assume that the GMO policy is covering the materials list, and if it isn't, I think we need clarity on that.

CHAIRMAN KING: Goldie has a comment, then Andrea, then Jim.

MS. CAUGHLAN: I mean, that's the whole point, is that if in fact this is a learning experience, just as the whole program is revealing itself as we go, it seems like moment by moment, and the fact of the matter is: we all know that GMOs are becoming a far bigger problem in terms of every aspect of the conventional manure and the conventional crop more and more and more. I mean, it flags everything.

So to me it's an issue of: how do we fix it, how do we make bloody sure that those aspects do get incorporated, whether it means additional call for rulemaking, in the interim directives, advisories to the - - but we have to fix it, we cannot just accept it.

MR. NEAL: I'd note that there may be a need for clarification on: how far do you go back, in the process, in terms of this "excluded methods" definition.

CHAIRMAN KING: Andrea.

MS. CAROE: To answer the question you asked first, about enforcing annotations: I can't speak from the
crop inputs as much as I can speak from non-organic ingredients in processed products, in which case you do run into a situation where a vendor of an ingredient has no idea what that original carrier corn was grown and whether it was GMO or not, so it is being enforced in -- the best possible, but incomplete, at best, because the information's not there.

Now, I don't know, every time you buy a feed supplement, if you're not buying it from a distributor that may not have that information because he's, you know, several points away from the growing of that.

CHAIRMAN KING: Jim.

MR. RIDDLE: Yeah. Well, the burden of proof is always on the person who wants to use the substance, to make sure they use approved materials, and I look at the List currently, under feed supplements, and I see it as very similar to the milk replacer, where there's annotation there: without antibiotics, emergency use only, no non-milk products or products from BST-treated animals. So there the GMO issue has been singled out, and so I think it would be appropriate for that to be part of the annotation.

And then the animal-origin issue would be another one that I think we would be very wise to include, and they are commercially available, the source is available,
according to the petitioner -- I don't have it in writing, but verbally -- and so I think it makes sense, verifiable.

MS. CAUGHLAN: I remember we had a discussion two or three meetings ago specifically on pulling back from so many annotations, and Keith spoke to this issue, saying that we were creating, by these extra annotations, more problems, but I think if -- you know, in -- that that is not necessarily it, and I think I would rather have it be redundant to the state that we state it every single time, "non-GMO" or "non-excluded methods," rather than to assume that it's somehow going to magically (inaudible).

UNIDENTIFIED FEMALE VOICE: Yeah.

MR. JONES: Let me just address this. As you know, annotations are one of my passions, okay --

(Laughter.)

MR. JONES: -- and the reason they're one of my passions is because -- I think, in many cases, they make you feel good, but they mean nothing in the field, okay? In other words, you walk away thinking you've done the right thing, but unless there's a data set out there you can capture, unless you have a verifiable annotation, you have created a lot of nice language without any regulatory impact, okay?

So you need to be very careful that when you use...
an annotation to prohibit a practice, that the data set
that you're going to rest on exists, okay, and: it's
readily available, in other words you can pick up the phone
and call your supplier and they will know whether or not X,
Y, or Z exists.

That's my only caveat: just be very careful.

MS. CAUGHLAN: Well, we should be much closer to
that now, given our greater development of databases having
to do with --

MR. JONES: You would think so, Goldie. Maybe,
or maybe not. I mean, one of the things I think -- it's
still amazing: out there, when you pick up the phone to
some of these folks, they don't have a clue and don't have
any way actually to even know --

MS. CAUGHLAN: Well, if we're not punching it
home all the time, they're not even going to create that or
look for it.

MR. JONES: Fair enough. But all I'm saying is
that: don't just add language for the sake of adding
language; make sure that you know, and that you've
consulted with certifiers who are certain that they can
verify the point that you want verified, because if you
can't do that, then you have just created a lot of nice
language.
CHAIRMAN KING: Another quick question, then Becky, then Andrea.

But please stay here for a moment, Keith. I understand what you're saying, and I think this message has been clear for a while. From your perspective -- and I -- as it pertains to this specific issue, "excluded methods": Do you feel, in your opinion, there is another path, to ensure that what we're trying to accomplish in this particular case is realistic?

MR. JONES: Well, let me give you my best professional judgment on where you're wanting to go. You have the ability to add annotation and say: we don't want this product being derived from excluded methods; but when you do that, you have created a dichotomy within your own regulation, okay, because now you're saying: well, in some areas we don't want this to happen, but in other areas --

In other words, if I go -- let's say I want to soybean meal as a nitrogen source for organic production, and I go down to Southern states, or wherever, and get ten 50-pound bags of soybean meal: I have no idea of knowing where that soybean has come from; and, further, there is nothing in the regulation that prevents me from using that soybean meal as a nitrogen source for fertility.

So just be careful, just be care- -- because
soybean meal is a natural, naturals are unregulated, okay,
we can't get at 'em, okay?

So be careful, as you're thinking through this,
that you're not creating this huge dichotomy in your own
regulation, where you're being quite schizophrenic as to
what you want to -- what you want to do.

CHAIRMAN KING: Becky, Andrea, Dave, then Rose.

MS. GOLDBURG: I just wanted to make a point,
which Keith partially made. I worry about singling out
products for no GMO and implying that others -- therefore
GMO is okay? and I think we really need consistent policy
on it. I don't know, do we need a task force, do we need
some directive from the NOP, do we need the policy
development committee, or whatever, to consider the issue,
but this is not something to deal with scattershot.

CHAIRMAN KING: Andrea.

MS. CAROE: Yes. I just want to remind this
Board that these materials on the list are not organic,
they're conventional materials, they were manufactured in
conventional facilities, for conventional production, and,
you know, going back and asking for this: yes, you'll get
a supplier that says, "Yeah, it's non-GMO, we never use
GMO," they'll say that, they may not -- the information
that you're getting is questionable, and I think that kind
of talks to Keith's data set: there is not hard -- we're
relying on affidavits and comfort language instead of hard
facts on it, and taking that back too far into the
conventional world, where there is no regulation and the
distributor of that product doesn't have to have that
information, it makes it very difficult.

I do understand what you're saying, Jim, the onus
is on the user of that material to justify it, but, you
know, that -- that is a bit of an issue, and this industry
is still, you know, 2 percent, 2 percent, and more likely,
if you're going to be a pain in the butt to a vendor to try
to get them to track it back all the way to the farm,
they're going to say, you know, "forget it, take your
business elsewhere," because that five pounds of soybean
meal doesn't really mean anything to them.

CHAIRMAN KING: Dave.

MR. CARTER: Yeah. I'm a little more concerned
on the -- and I agree with Rebecca on the GMO issue, but on
the other one, that Jim brought up, about the animal
source, I think that's something where we need to be very
specific, because I think, you know, if FDA is moving
forward and saying that they're prohibiting animal by-
products in feed, you know, there are some things -- and
I've been concerned for some time -- that there are some
things, such as Vitamin E12 and some other things, that ranchers and farmers routinely use, that they don't know are -- come from animal base, and so I think we need to flag that on this, that there has to be a distinction, that we're putting the stake in the ground on that, to make sure that we're not going to cross that line.

CHAIRMAN KING: Rose.

MS. KOENIG: And, you know, just to Keith, I guess, although he sat down: You know, I only beg the question because I think it's an area that -- I know, again, OMRI is not NOP, I'm not implying that, but when they look through their technical review of brand names, that is one of the questions that they -- they're posing for -- for inputs, so that it can be in compliance, you know, with the NOP.

So I think there is either a misunderstanding or non-clarity out there in the industry as far as: how far do you take those excluded methods, is it just simply seed source at the farm, you know, does it go to medications that might be derived from GMOs? I mean, there's so many processes now that involve it, and -- and if the NOP's position is it just ends at seeds, that's -- that's your position, but I think it just needs to be clear, so that -- again, you know, this "equal playing field" concept, that
everybody has a clear understanding towards that policy.

    CHAIRMAN KING: George.

    MR. SIEMON: No (laughs).

    CHAIRMAN KING: I just wanted to wake you up.

    Kim.

    MS. DIETZ: Maybe just a recommendation. Becky's already suggested maybe a task force be formed, and I know there's GMO decision trees out there, and there's lots of data and worksheets that we could certainly bring together (inaudible) --

    MS. KOENIG: But, Kim, I would like -- I mean, I think the directive is much more clear, to the point, because if there is -- it sounds like there -- there is already a thought process and a way that NOP is viewing it. So I don't want to go through a whole task force to come up with a recommendation --

    MS. DIETZ: My point was, there's information out there, that you need to look at it, before we have a lengthy discussion like this.

    CHAIRMAN KING: Yeah. Okay, so where were we?

    MS. OSTIGUY: We're done.

    CHAIRMAN KING: You're done.

    UNIDENTIFIED MALE VOICE: Yeah.

    CHAIRMAN KING: Okay. Well, let's officially
recess, and we will reconvene tomorrow at 8 a.m. Please be here promptly as we have lots of work to do again tomorrow. Thank you all very much for your patience.

(Whereupon, at 6:30 p.m., the meeting was recessed, to reconvene at 8:00 a.m. on Thursday, April 29, 2004, in the same place.)

CONTRACTOR (NOT PRESENT): R & S TYPING SERVICE
(903) 663-9567
CHAIRMAN KING: I'd like to call to order the Meeting of the National Organic Standards Board.

First off I'd like to thank everyone for their patience and persistence in your input yesterday; I think it was really valuable.

This morning the first thing we're going to start with is the .606 Task Force report, or the Jim & Kim Show, if you will.

A quick reminder for everyone: please put your cell phones to vibrate; if you have a comment, conversation, so on and so forth, take it out in the hallway, please; and then also, there's a sign-up sheet for Friday public input. I would remind everyone that we have two hours allotted for public input, so please sign up early, if you have comments, because we certainly want you to be a part of that.

So without further ado, I'll turn it over to Mr. Jim Riddle.

MR. RIDDLE: Okay. Good morning, and we're still getting the technology set up, but --

Yesterday afternoon I passed out the current draft from the task force, and this task force is for commercial availability, recommended rule changes, and just
a little background, while you're digging out that report:

It came to the Executive Committee attention early this year, I guess in January, that, you know, there remain issues on commercial availability and the need for consistency and how it's being interpreted in the field, and this was actually -- when the Final Rule was published in 2000, there was a request for comments at that time and recognition of the need for further rulemaking on commercial availability, and so it's -- it's remained an open issue.

There were comments originally submitted, including comments from the Board, and then further recommendations on the -- from the Board as it relates to the agricultural ingredients on the list, 205.606.

And so that was really the basis of the work, the starting point, of this task force, and the objective was: to establish acceptable practices to be followed by certification applicants, certified operators, and certifiers, for consistent, transparent, and predictable determinations of commercial availability that provide regulatory certainty, and commercial availability, really, applies to two different sections of the Rule, the one being seeds, where a producer can use non-organic seeds if it's documented that organic seeds are not commercially available in the equivalent variety and form, quality, and
quantity needed by the operation; and then it also applies to minor agricultural ingredients used in processed products, where a handler must attempt to source organic ingredients if the product is to be labeled as organic, they must attempt to source organic ingredients for everything agricultural in that product, and if it's documented that an ingredient is not available in an organic form, is not commercially available, then the certifier can allow a non-organic form of the ingredient, but there's been no further guidance to provide consistency in how those determinations are being made or to spell out the requirements for the operators to meet in order to state their case.

So that was the background for our discussion, and in the recommendation from the task force, you see a fairly length introduction section, and then background section, which has the definition of "commercial availability," some citations from the regulation and from the preamble, and I'm not going to read through that at all, that's all been posted on the web, and -- yes, George.

MR. SIEMON: Jim, is there an extra one of the handouts? I can't seem to find mine from yesterday.

(Document handed Mr. Siemon.)

MR. SIEMON: Thank you.

MR. RIDDLE: In case it's not commercially
available, we will get you another one.

(Laughter.)

MR. RIDDLE: Okay. So skipping down now to Recommendation 1a, which is found on Page 3. So, Ann, if you can scroll down a ways. All the Board members have this in front of you; I wanted to put it up on the screen so that members of the public could follow along.

I'm not seeing how that -- okay, so the first part of our recommendation was simply reaffirmation of a recommendation the Board made in May 2002 concerning the really the title and heading, the paragraph, in 205.606, and part of that is to remove the words "as ingredients," which don't appear in this recommendation, they do appear in the Rule currently, as written, and it's redundant, because when it says "allowed in or on agricultural processed products," "in or on" includes ingredients. So it's not to remove ingredients from consideration.

And then also this section only applies to organic products. "Made with organic" products can include conventional ingredients.

MS. DIETZ: And the other reason that we had originally recommended that we take "as ingredients" off is that materials on 205.606, in processing and ingredients, is defined as something that's put on the label, and processing aids are not ingredients, so there was some
confusion on whether or not people needed to have processing aids, and it's our everything that everything needs to be on the list, so we wanted to take away that confusion and basically state processing aids or anything used in or on must appear on the National List.

MR. RIDDLE: Right. So that really, 1a, was an affirmation of the prior standing recommendation of the Board, and then there's some new rationale which has been added to this version, and all of the new language is underlined in the Board's text and the language to be deleted has strikethrough.

Okay, moving to Recommendation 1b, and this is where this new draft is recommending some changes to the previous draft from the task force, and this is in response to comments submitted to the web posting, and here we are -- would be -- you know, if the Board supports this recommendation, we would be calling for replacement of the current Section 205.606 with a new Section 205.606, which would be entitled:

Non-organically-produced agricultural substances prohibited or restricted for use in or on processed products labeled as "organic" or "made with organic."

And, I'm not sure, maybe that "made with" should be deleted. Yeah. That's an oversight there. So --

MS. CAROE: Well, wait a second, do you want to
delete it, because you're talking about processing aids as well, and you would want it -- processing aids --

MR. RIDDLE: Okay, no -- yeah. I'm sorry. Yeah, that's -- Andrea. We would leave this in this section. I'm confused. I was -- because the intent --

UNIDENTIFIED FEMALE VOICE: (Inaudible.)

MR. RIDDLE: Yeah. Just to explain first, the intent of this new section would be similar to crop inputs and livestock inputs, where there's a category for prohibited naturals.

There may be certain agricultural ingredients which, after a petition, rulemaking, recommendation, that the Board may recommend are inappropriate for use in organic or should have some restrictions. There's no place on the current 205.605 List for such substances to be addressed. This -- especially the prohibition of agricultural materials.

So this would create a placeholder -- we don't have any specific substances in mind right now, but it would create a placeholder in order to address either prohibited naturals or agricultural substances that need very specific restrictions on their use, and that would apply to a product that's labeled "organic" or "made with."

Okay. And then, you know, it just follows with the language of the text for that section, which basically
repeats the title.

Any other questions or comments on that?

MS. DIETZ: Just a comment. The further rationale for doing this is that the current materials listed under 205.606 were confusing the industry there. There were materials on there that people were considering okay to use even though organic substances were out there in the area, so they were using them as a commercial availability list, and that was not the intent of 205.606. Again, the intent was to put materials on there that the Board wanted to restrict in some way.

MR. SIEMON: Jim?

MR. RIDDLE: Yeah.

MR. SIEMON: I'm sorry, I'm confused. 1a and -- 1b is building on 1a? These aren't alternatives, are they?

MR. RIDDLE: Well, yeah --

MR. SIEMON: Because you're talking about the same .606 in both of them.

MR. RIDDLE: Right.

MR. SIEMON: I'm confused, as usual, so --

MR. RIDDLE: Good (chuckles), and I was reading back through it this morning, and I felt the same way:

they are contradictory to one another.

In the first instance we were reaffirming an existing recommendation, but now that we have altered 1b --
originally lb, as you can see, was written to call for a
new Subsection .607, but that's really unnecessary. It
really should just replace .606 and --

MR. SIEMON: So if we've got lb, we don't do la?
MR. RIDDLE: Right.
MR. SIEMON: I wasn't clear.
MR. RIDDLE: Yeah. And I think the task force
should meet briefly during the break outside session to
address that, and maybe we'll just scrap the whole
discussion of la and focus on lb, so --

MR. SIEMON: Well, and we get to lc, I'll ask
about that one too.

MR. RIDDLE: Well, yeah, I'm ready to go there,
if you are. But yeah, thanks for -- thanks for pointing
that out, George. I did want to mention that.

MS. DIETZ: Yeah. It could just be wordsmithing,
where we say "prior recommendation NOSB May 2002" and just
take away that Recommendation la.

MR. RIDDLE: Yeah, just as part of the
background.

MR. SIEMON: Yeah.

MS. DIETZ: Because it's not really a
recommendation.

MR. RIDDLE: Okay. lc. Now, this one is an
try to deal with the substances that are currently on
.606 and two substances that the Board has reviewed and recommended be added to .606, gelatin and shellac, and our recommendation is that the Board look at those substances again, we use the words "review," but we're not talking about another TAP review or anything to that extent, we're talking about -- the Board has already completed the work on these substances, but now to run them through the choices of A, B, C, or D to determine where they should fall on the National List.

Since there will no longer be that list of commercially-unavailable agricultural ingredients under our recommendation, something needs to be done with each of those substances, they either need to be removed totally from the National List and just fall under the ACA authority of determining commercial availability for that material; or we might choose to recommend some kind of restriction or prohibition on any one of those substances, I'm not prejudging where they should go. Kim, then Rose.

MS. DIETZ: Yeah. I mean, an example is, you know, on the gums, there's an annotation: using water extraction only, and that might -- that would certainly be one that would -- could stay under .606, because it has a restricted annotation.

MR. RIDDLE: Okay. Rose --

MR. SIEMON: But you're recommending --
MR. RIDDLE: Rose.

MR. SIEMON: Sorry.

MS. KOENIG: So the handling committee would then -- I'm just looking at the process. So the handling committee would then make that recommendation based on, you know, some just small process, or -- I mean, how would we get that form of recommendation?

MS. DIETZ: Well, we know that -- I mean, this board, this existing board, has reviewed gelatin and shellac, so those -- I think those are ones that we could easily say, "This is how we recommended originally, this is where they should go," and then bring the others back forward and give some type of background and review as to why we feel that they should be moved, in what place, bring it back to the Board as a formal recommendation and have the Board vote on it.

MR. RIDDLE: But, yeah, it would be the handling committee --

MS. DIETZ: Yes.

MR. RIDDLE: This is kind of a work order for the handling committee.

UNIDENTIFIED MALE VOICE: (Inaudible.)

(Laughter.)

MR. RIDDLE: George, did you have --

MR. SIEMON: So the basis of this one is to have

R & S TYPING SERVICE - (903) 725-3343

5485 S. LIVE OAK, GILMER, TX 75644
three sections under .606 and divide it up into three
different categories of what the real recommendation is
here?

MR. RIDDLE: I'm sorry --

UNIDENTIFIED FEMALE VOICE: Just one --

MR. SIEMON: You have 3a, b, c, and d --

MS. DIETZ: You'll have 205.605(a), .605(b), and
.606.

MR. SIEMON: All right, I'm looking (inaudible).

MR. RIDDLE: Well, yeah, if you're just looking
at a through d in this document, that's not where we're
recommending changing to the Rule, that's just the way that
the task force divided this up as the choices.

MR. SIEMON: Okay. I --

MR. RIDDLE: Yeah. You see a is actually
205.605(a), and then b is to place it on .605(b), c would
be the new .606, and d would be removal from the list.

MR. SIEMON: I didn't catch the five [phonetic].

I see.

MR. RIDDLE: Yeah. Okay. Any other questions or
comments on that part?

(No audible response.)

MR. RIDDLE: Okay, so that's really the substance
of the recommendation from the Board on how to address some
changes to the National List.
The next, Recommendation Number 2, is how to bring consistency and predictability to the commercial availability process, procedures to be followed by producers, handlers, and certifiers, so we just repeat the definition of "commercial availability" from the Rule and then go through determination procedures, and a change in this draft is that those procedures would fall under Subpart (e), Certification section of the Rule. We're not saying what number or creating a new number; we're just saying that it belongs in Certification Subpart (e). So that's a change here based on comments received.

Okay, at the top of the next page: A) "The applicant or certified operator must submit a written report to the certifying agent as part of the Organic System Plan or Organic System Plan Update that provides," and I am going to read through these:

Number 1) "A description of the ingredient and the required technical specifications of the ingredient, including form and quality";

"Estimate of the quantity of the ingredient needed within the specified time period if this is a factor in the requested allowance of a non-organic ingredient," and then in parens: "Quantity, quality, form, and function may be considered for individual product requirements and not for total business requirements for all potential
product lines."

And, Number 3) "Explanation of how the ingredient is used to fulfill an essential function."

So that's the information that the operator must include in the Organic System Plan.

And then, 4) "During the inspection, the application or certified operator must provide information concerning known sources of the ingredient and organic status thereof and provide written evidence of efforts to locate sources of organic ingredients, including the dates when potential supplies of applicable organic ingredient suppliers were contacted."

"Written evidence may include letters, faxes, e-mail correspondence, or phone logs of discussions with potential suppliers. A minimum of three potential suppliers shall have been contacted during the previous 12 months."

Rose.

MS. KOENIG: My question is in terms of kind of the way the Rule is presented, I mean --

MR. RIDDLE: If you can speak up, please, or closer.

MS. KOENIG: I'm sorry. I just don't see any section of the Rule that has this kind of descriptive requirements, so --
MS. CAUGHLAN: Proscriptive is really -- quite proscriptive.

MS. KOENIG: -- so I don't know if this is really -- you want them in the Rule or do you want a directive or I mean, this seems more like -- I mean, I appreciate the spirit of what you're trying to achieve, I have no qualms with, kind of, what's written; it's just placement in the Rule just seems a little inconsistent, I guess, to me, that there --

UNIDENTIFIED MALE VOICE: Well, I don't --

MS. KOENIG: It seems like there should be a format where you explain those things, whether it's a definition or a directive or --

MR. SIEMON: Should be a guidance (inaudible) --

MR. RIDDLE: Yeah, and I -- I didn't read through all of the background and citations from the Rule, to save some time, but some of that's explained there, and the language at the top, "Applicant must submit a written report to the certifying agent as part of the Organic System Plan on commercial availability," that fits with the Rule.

And we aren't saying what specific number or how it would fit, we leave that to the NOP, but we just recognize or acknowledge that it is the certification section, it's not the materials list section that needs
changed here, and maybe it can be addressed with a
directive or policy guidance, but it's a certification
issue and not a materials list issue.

Andrea, then Kim.

MS. CAROE: Well, I have somewhat the similar
concern as Rose on this, is that the Rule doesn't state
that you have to call three suppliers, and I think once you
say three suppliers, that's all you'll ever get, and a lot
of folks out there are doing a lot more to find those
organic ingredients, and I think it might be
counterproductive.

And also, telling the certifiers that the
inspector has to look at this, instead of them looking at
it through the application process, I think is getting into
their business; I think it should be broader and say that
"this should be evaluated by the certifier during their
certification process," but telling them to do it at the
inspection with the inspector I think is -- is: getting
into their business.

So some of this, I -- I agree that this is
founded in the Rule and that the Rule specifically states
that you have to -- as a user of a non-organic ingredient,
you have to justify the use of that ingredient with a
search for the organic ingredient, but this has gone a
little bit past that, and although it's great -- guidance
are a great -- a set expectation, perhaps, but I don't
think that we can say three suppliers and evaluate at
inspection and -- some of that is -- the detail may be too
much.

MR. RIDDLE: Kim.

MS. DIETZ: Just a bit of background on this.

These recommendations, really, have been in the industry
for probably the last three or four years and -- as a kind
of -- not written that you have follow this, but people
somewhat have been following it.

So the -- let me try to -- there were so many
things that you said, that I wanted to comment on.

So that I don't necessarily agree that this isn't
going to work, because as -- first of all, as a handler,
you're required to have in your handling plan a commercial
availability process, okay, so right now, if people don't
have what they do, they could, really, be in violation of
the Act. So that's the first thing. So this, I think, is
very fair for the handling/ processing groups out there to
follow, and we have been following it, in some sense.

The other thing is that you have to understand
that when you're out there sourcing ingredients, you don't
know you're going to be doing that when you submit your
application, this is something that's going to happen in
the field, so to speak, so you have to document what you've
got, you've got to have a system, and then you've got to follow the system. And so to me, having the inspector actually validate that you've done it is the right place to do that.

So those are my comments.

MR. RIDDLE: Mark, then Rose, then Andrea.

MR. KING: Yeah, I've been somewhat a part of this task force, and first of all, thanks for all the work, because I know a lot of time has gone into this, but one of the things you mentioned, Jim, that sort of caught my attention is Subpart (e), "We're not sure where this should go but we know it should go in the Certification section," and it seems to me that what we're attempting to do, in small part at least, is verify information through the inspection process.

So I don't know if at some point in the future we would want to consider that section verification of information, integrate commercial availability into that, I don't think that section totally does this document justice, but perhaps, as we talk about the inspection process, it could be inserted in there.

MR. RIDDLE: And the inspection process is part of Subpart (e) as --

MR. KING: Yes, in Section 403.

MR. RIDDLE: Right. So we're -- yeah.

R & S TYPING SERVICE - (903) 725-3343
5485 S. LIVE OAK, GILMER, TX 75644
Basically, we're wanting to hand something to the NOP and --

UNIDENTIFIED FEMALE VOICE: Let them determine where it fits.

MR. RIDDLE: Yeah, from the Board. Let's see, Rose.

MS. KOENIG: So I guess just clarify on this Section (a), so is this for all ingredients, would a potential person have to --

MR. RIDDLE: All agricultural ingredients.

MS. KOENIG: All agricultural -- whether they're using organic or non-organic ingredients or all ingredients?

MR. RIDDLE: All ingredients used in a product labeled "organic."

MS. CAROE: The non-organic, this is for the non-organic, this is supporting the non-organic --

MR. RIDDLE: It's all agricultural ingredients used in a product labeled "organic."

MS. KOENIG: So even if it's -- even if you're finding organic sources, you would have to document --

MS. CAROE: No. No, not for the organic ingredients, not for ingredients that you find organic --

MR. RIDDLE: Oh. Well, no, you've got a certificate, you've got organic, you've bypassed this, it's
not applicable then, because you've already exceeded it. It's only -- yeah, it kicks in when you want to use a non-organic, but applies to all agricultural ingredients used in a product labeled "organic," not in a product labeled "made with," and of course not in one "100% either, it's irrelevant there, so --

Andrea, did you have something else?

MS. CAROE: Yes, I do. I just want to point out that ingredients are -- can be very specific. Say you were making a product that included spirulina as an ingredient, right now there's two manufacturers that I know of that do organic spirulina, just two. If you called both those manufacturers and they didn't have it available, would you not be in compliance because you didn't call three?

I mean, I think by setting a number, you're not understanding the scope of searching for ingredients. Sometimes the ingredients are quite available, other times they're very narrow, you know, you may be looking for a chocolate that freezes, for an ice cream bar, that's very specific, you know, I mean it's -- it's not necessarily -- I just -- I think the three -- I think once you use that on a certification level, that's -- it's just -- it's not always applicable.

And the other thing I want to say is that the Rule specifically states that a certifier must have enough
evidence, before they send an inspector in, that says this operation can possibly be certified, and the certification agency has the right to say, "We want to see that document for the sourcing of that ingredient" before they go in.

Now, if you -- you know, yes, it is the obligation of the on-site inspection to verify the information that was received in the claims that that operation is making, but you're specifically stating here that this is how the certification operation -- certification agent is going to operate, and I -- I just don't believe that we have the right to tell them how they're going to operate. You can tell them what needs to be done and what -- through the process, what you need to get out of it, but where it needs to be done, I think it's inappropriate.

MR. RIDDLE: Well, yeah, and I'd like to respond to that. The first point, on the minimum of three potential suppliers being contacted: that's not being changed in this draft; that was already something that the task force had agreed to in the prior draft. So we're not looking to change that, you know, right now.

And the intent is to bring predictability, so that you know if you have contacted at least three, it doesn't limit it to three, but at least three, then you have fulfilled a standard, that the certifier can't, you
know, change the rules on you at that point. It's to
provide consistency and predictability.

And yeah, maybe it's not appropriate/adequate in
all instances, but as a rule of thumb, that's what we're
trying to establish.

And on the -- yeah, on the other one, which is a
change being proposed in this draft, Number 4 there, that
was in response to comments, that the -- that this really
happens during the inspection, and I hear what you're
saying, that the applicant should submit the information on
the known sources of the ingredient and organic status
thereof in their organic system plan, and that should be
reviewed in advance of the inspection.

That's what we originally had recommended. And
then the commenter was saying no, that that really should
occur during the inspection, and on further thought, you
know, I'm thinking that maybe -- that during -- the
inspection, you know, part, should only apply to Number 5,
that that's when the inspector reviews the written
evidence, that -- that's something that happens on a daily
basis and can't be submitted as part of the organic system
plan, that's, you know, an ongoing process, the attempts to
source. It's not something that you do one day out of the
year, send in your plan, and you're done.

So I think that is appropriate that that be
directed to the inspection process, but Number 4, submitting information on the known sources of the ingredient and organic status, I think is appropriate to keep in the organic system plan.

So when the task force meets, I think we can talk about a change there. Mark, then --

CHAIRMAN KING: I was just going to say, I think this is really good dialogue and this is a good piece in front of us. It sounds like what we're really talking about here, if I may, is the difference between review of application and verification of information throughout the inspection process, and there are -- there are some ways to accomplish the same end through that.

So I appreciate the comments, and in about five minutes I'd like to wrap this up to stay on schedule, so --

MR. RIDDLE: Okay. Okay, so I think we'll continue that discussion in the breakout session.

B, which is really the steps that the certifier would need to follow in making these determinations, and, once again, to bring predictability and consistency to the process, so:

Evaluate the applicant or certified operator's claim that no organic substitutes are commercially available in form/quality/quantity needed by the operation to fill the required function;
2) Verify that the applicant or certified operator has made a good-faith effort to source organic ingredients;

3) Verify that the ingredient is not commercially available in organic form by reviewing the best-available information, listing known sources of organic ingredients;

4) Notify the certification applicant or certified operator of sources information which lists available organic ingredients if the certifying agent finds that such ingredients exist;

And then we're recommending in this draft to delete Number 5;

And then, moving on: Maintain and annually submit to the NOP an up-to-date list of ingredients that have been granted allowances in non-organic form, and then in parentheses: The list shall maintain the confidentiality of ingredients, suppliers, and parties granted allowances.

"The reporting requirement shall be implemented through the accreditation process by providing ACAs ample notification and time to adopt data-management systems," and that's a recognition that not all certifiers have the data-management systems currently in place. This is -- would be a new reporting requirement that will take some time to implement.
And then the rest of this remains as it came out of the task force: Require certified operators to update commercial availability information in each organic system plan update;

Acknowledge all complaints concerning allowances granted and provide rationale for determinations. If the investigation of a complaint provides significant new information, then the certifying agent must revisit the allowance; and

Require that products without sufficient documentation not be labeled "organic." Such products may be labeled "made with organic ingredients" if they meet all applicable labeling and product-content requirements for that category.

Any comments, questions on that part? -- and this is the last part. Andrea.

MS. CAROE: I -- as I voiced previously with this task force, I think Number 3 changes the intent of what the certification agent's role is. The certification agent isn't to take on the liability of the product. They are to verify that the justification provided by the applicant is appropriate. I don't feel that the certification agent's job is to verify that that ingredient is not available. They're verifying that the effort was due diligent but not that it's not available.
So -- I mean, I've said that before, and I really can't see that certification agents should take on that role.

MS. DIETZ: I think the same intent, she -- well, I think you're --

MR. RIDDLE: Kim?

MS. DIETZ: I think you're meaning the same intent that we are. We're not --

CHAIRMAN KING: Yeah.

MS. DIETZ: We're not saying you need to go out and verify that those are commercially available, saying verify the documentation --

MS. CAROE: But that's not --

MS. DIETZ: -- that's provided to you.

MS. CAROE: I mean, that's -- the one before that, Number 2, says "verify the good-faith effort."

I believe that is accurate.

MS. DIETZ: Right.

MS. CAROE: The next one says "verify that it's not commercially available." I don't agree with that. So I would suggest, once again, to strike Number 3.

MR. RIDDLE: Well -- yeah, and you're on the task force, and --

MS. CAROE: I know. I've said it before, though.

MR. RIDDLE: -- we have considered striking that,
and it's in the draft now, and in -- my sense is that in
order to determine if an operation is in compliance, the
certifier needs to assess not only the effort but also the
facts of whether those substances are at all available in
an organic form.

MS. CAROE: I disagree. I don't think that's
(inaudible).

MR. RIDDLE: This is an attempt to bring
consistency, and yes, there is a need for more information
on commercially-available organic minor ingredients to give
certifiers better tools to make those assessments, but they
need to actually perform some due diligence to determine if
the operation complies or not, besides just: whether they
made a good effort. Rose.

MS. KOENIG: Yeah, I hear Andrea's point. You
know, I look at this -- you know, there -- I guess it's
sort of like -- you know, not to go back to the List 3
inerts, but I will go back to them.

There's probably some ways in the future -- some
ways that the industry can develop these databases for
either -- you know, in this case it's manufacturers,
another case might be pesticides.

So I don't know if you want to -- you know, I
think maybe our efforts might be better placed: rather
than requiring this, is: working on and trying to
establish those kinds of lists and sources for certifiers
and acknowledge that people who are accredited certifiers
should be doing those kinds of things.

You know, I -- I think what Andrea's saying is
not that she opposes necessarily that -- you know, the
intent, I guess; it's just she thinks -- and I guess I tend
to agree -- that the format that it's in -- I think 3
probably does cover it.

MS. DIETZ: And we acknowledge that there is
really no place out there right now that has commercial
availability lists, so --

MS. KOENIG: Yeah. So, I don't know, I'm just
putting forth that it seems like in many cases that we're
showing that there has to be some kind of databases, I mean
similar to like what OMRI does in brand names, I mean there
should be databases used for reference. It's not a
requirement, again, but references so that people can get
those sources of information via -- I don't know -- NOP
website or what have you, so that there is tracking, and I
think that the USDA -- I mean, it's not their mandate to do
this kind of stuff, but they do have data-collection kinds
of things all the time, that maybe there could be some kind
of tracking --

MR. RIDDLE: Right.

MS. KOENIG: -- of the marketplace and what's
available.

MR. RIDDLE: Yeah. And I think --

MS. KOENIG: Not only, you know -- as a source
not only to help, you know, conventional, but also, if
there is organic, that really would be a great service.

MR. RIDDLE: I'd like to wrap this up, and the
task force will be meeting during breakout for just
fine-tuning this recommendation.

I did just want to point out that the rest of the
document explains -- summarizes some of the comments that
were submitted and how they have been addressed in this
draft.

And I also want to just point out: one of the
commenters said something in quite detail, that I encourage
you to read, and essentially advocating the removal of
commercial availability considerations altogether from the
Rule for minor ingredients, and if someone cannot find
organic ingredients in significant quantity and they can't
meet that 95-percent threshold, then the products be
labeled "made with organic," but just to take it totally
out, but that was contrary to the recommendation of the
task force, but I did feel obligated to mention that that
is another option and something which should be considered
and is addressed in these comments.

MS. DIETZ: And in closing, remember that we --
we have to have truth in labeling, so most of this is going
to happen in those minor ingredients, where if you have
something that's under 5 percent that you just can't source
-- take organic vanilla, for example, that's just right now
not available, or something like that, you're not -- and
you're going to label properly, whether it's a "made with"
label or an "organic" label (inaudible).

MS. COOPER: It's not like we're trying to cheat
the system, but --

MR. RIDDLE: Thanks, Ann.

CHAIRMAN KING: We thank all of you for helping
us stay on schedule, I appreciate that.

The next item on the agenda is new for this Board
in that it's a breakout session. The intent for the first
hour is to have three committees in a breakout, which would
be crops, livestock, and handling, those committees dealing
with materials.

It is at the chairs' -- the committee chairs'
discretion in terms of how they want to involve the public.

The ongoing goal here is to increase the level of
transparency and when we're reviewing it also confirm for
you that we do consider public input and that we do take
your comments when we deliberate and make decisions on
materials.

So I think at this point --
MS. DIETZ: I --

CHAIRMAN KING: Let me finish, one second. So it's at the chairs' discretion. In other words, the public perhaps may just simply observe and then at the end we could have a quick question-and-answer. We'll do this for one hour, then -- if the chair so desires, and then we'll do a quick break. Kim?

MS. DIETZ: A point of clarification with NOP. A number of the committees have to go back and actually make recommendations on materials. Is that something that we can have the public involved in, in deliberating and making recommendations --

CHAIRMAN KING: Observing.

MS. DIETZ: -- and observing? I mean, you know, we've got some materials that we have to take back, soy protein isolates and TSPP.

MR. MATTHEWS: Richard Matthews, National Organics Program. That's really up to the committee.

MS. DIETZ: Okay.

MR. MATTHEWS: The idea is that the committee would get together, go over the written public comment that was submitted prior to this meeting, plus what you heard yesterday during the public session, and that you would then rework your current position if you believe that there is a need for reworking, or you may come back and say,
"We're not making any changes."

Whether or not you take additional feedback from the public is really up to you.

MS. DIETZ: I just wanted to make sure we weren't violating anything.

MR. RIDDLE: Yeah. No, that's an important thing.

MS. KOENIG: I would suggest, though, in terms of process, that -- that the committee would formally recognize or ask somebody if that information is needed, that it's not the arena -- because it's really not fair, this is not -- this is not a section for public comment. If there's clarification, I think that, you know, it has to be a real specific issue, but certainly people can observe and listen.

CHAIRMAN KING: No, I think that's a really good point, and actually, I think primarily it is for you to observe. Occasionally if the chair wants to recognize someone or you have a pertinent point that deals specifically with that topic, you can make that point specifically, then that's fine, and it's at the chair's discretion.

MS. KOENIG: And then the only thing -- also, if the public is involved and the actual petitioner is there, I think that it -- well --
CHAIRMAN KING: This is at the chair's discretion, Rose, we'll let them decide that.

MS. KOENIG: Yeah, but I think there needs to be disclosure of anyone who is presenting -- who is -- if they are called upon, who they represent, because I think it's really important that we have some kind of process so that the committee understands who those individuals are.

CHAIRMAN KING: Okay, duly noted. Well, I want to see what Katherine -- then we'll go to Jim. Katherine, is that the sign-up sheet or the --

MS. BENHAM: The sign-in book -- that's for public comment, this is the sign-up book, so everybody needs to make sure that they sign in.

CHAIRMAN KING: This is sign in for today, as --

UNIDENTIFIED MALE VOICE: Attendance.

CHAIRMAN KING: -- as in "I've attended."

MS. BENHAM: Yes.

CHAIRMAN KING: Yeah. And you don't want to be on her bad list, so sign in now.

(Laughter.)

UNIDENTIFIED MALE VOICE: Is the sign-up sheet for public comments --

MS. BENHAM: Public comments out there too.

UNIDENTIFIED MALE VOICE: Out there too, okay, for tomorrow morning.
CHAIRMAN KING: Okay, and Jim, you had a comment.

MR. RIDDLE: Yeah. As I understand it, we're going to -- the crops, livestock, and handling committees are going to break out now, during this first session, before the break, and then after the break I'd like to meet with the 606 Task Force --

MR. CARTER: I'd like to meet with the policy development committee.

MS. COOPER: And I would like to meet with materials.

CHAIRMAN KING: Okay. So essentially -- it's almost 9 o'clock. This first session will go approximately 60 minutes, and then we'll take a break and come back and do the other stuff.

MR. MATTHEWS: For the record, Richard Matthews. I just want to clarify one thing. What I meant by: it was up to the committee chair is not that -- this is not a new opportunity for public comment; it would be strictly for maybe a clarification, somebody who had made a public comment, if you're wanting clarification you could ask for clarification, if the petitioner's there you could ask for clarification on something. This is not an opportunity for more public input.

MR. CARTER: So when Marty hands a yellow sheet of paper, is that public comment or clarification?
(Laughter.)

MR. MATTHEWS: That's probably public comment.

(Laughter.)

CHAIRMAN KING: Yeah, and I think Rick brings up a really good point. There is work to do during this session, so please keep that in mind and respect the interests of the committee.

So at this time let's go ahead and break out.

(Off the record and reconvened.)

CHAIRMAN KING: Welcome, hope you had a nice break, and thanks for your help during the breakout session.

We're going to start this off with Keith Jones, who's going to do a presentation, or an update, if you will, on the ECERT Program. ECERT, not Easter, Katherine.

(Laughter.)

CHAIRMAN KING: So if you could take your seats and get prepared, we'll get started here.

(Long pause.)

CHAIRMAN KING: Keith, it's all yours.

MR. JONES: Imagine, if you will --

UNIDENTIFIED FEMALE VOICE: You need to get near a microphone.

(Pause.)

MR. JONES: Folks, I apologize that our system's

R & S TYPING SERVICE - (903) 725-3343

5485 S. LIVE OAK, GILMER, TX 75644
not going to let me be on the record. There's nothing that I'm going to say that's going to be of any sort of regulatory consequence, it's totally educational, you can take good notes, you can talk to me afterwards, you know, we'll make sure that you have the information you need, so --

UNIDENTIFIED FEMALE VOICE: Can you please get near a microphone? It's pretty hard to hear.

CHAIRMAN KING: Yeah, we couldn't --

MR. JONES: I can talk louder, how about that?

CHAIRMAN KING: Thank you, yes.

MR. JONES: All right. From the diaphragm, okay.

Okay, let's start over.

Imagine, if you will, a product supplier in Belgium wanting to source NOP product, an accredited certifying agent in California entering data real-time on producers and processors, and Item-S compliance, tracking also in real-time, compliance data related to non-compliances and trim lines in those non-compliances that are going on around the world. That's the vision of what I'm about to share with you this morning.

Multiple users entering data into a common database that would capture both regulatory information and compliance information for use on a real-time basis. Okay.

That is the NOP ECERT project, and I'm hoping that I can run this thing. Katherine? Okay, tell you
what, let me go back to the tried and true. Our vision is simply this: to supplement a secure, integrated web-based system for electronic collection, use, and dissemination of information that is required to be submitted under the National Organic Program regulations. Okay.

Real-time submission, access worldwide through a web-based interface, and utilizing data that we're required to collect anyway. Okay.

Now, we have designed this system with our first-line interface in mind, and our first-line interface, folks, is the accredited certifying agents, so we've designed this system with their needs in mind, and also AMS compliance. So that is the two primary user interfaces that the system's designed for.

Now, flowing out of that, because we're capturing this data, will be trade uses as well, which means that that purchaser in Belgium can eventually go online, source through our web-based source, and have access to every NOP product that is certified around the world. No other system will be able to combine both trade, product, and regulatory information.

Now, part of this will be proprietary, only USDA and accredited certifying agents will, obviously, have access to certain information related in the primary
interface. Okay.

The public side will be the trade side, where you, as an individual, can go in, type in a keyword, "potatoes," "corn," "soybeans," whatever, and outflow from that database will be a list of products that are certified with the NOP standards around the world.

One of the features that we are considering building into the system will be a distance measurer, because we know that people are very concerned about sourcing product as close as the location of their processing facilities, so one of the things that we're considering is doing, at least on the US side, a ZIP code search, where I, as a processor, could put in a ZIP code that says -- and my ZIP code in Virginia is 20121, I type that in, I click on "give me 150-mile radius," and then it spits out, based on ZIP code searches, products within 150-mile radius of my personal ZIP code. Okay.

Now, what I'm about to show you today represents the first build of this system, and let me tell you how we're putting this together. This system is designed to be modular in approach, we have contracted with a software developer, and what we are building is functionality over time. So what I'm about to show you today will not have all the features in it that I have just described, but I can walk you through what we can do today once we have the
system fully operational and then what our future builds will be.

Now, one of the things that you need to understand too is that one of the things that's going on in the federal government right now is a complete integration in US Customs departments' international trade data systems, and for some of you I had talked to about this project before, we actually expected to have it fully up and running this summer. That's probably not going to happen, because what has happened at AMS is that we have been tasked with ensuring that everything we do relating to software, data collection, and things like that, can integrate and interface with Customs ITDS project, okay.

ITDS, International Trade Data Systems, was kicked off back in 1995. It's designed to integrate all of the trade flow data and make more efficient clearing products through Customs. It has taken on an enormous urgency for Homeland Security, and so I, along with other AMS staff, are involved in looking at our systems to make sure that they integrate with ITDS, and that perhaps will slow down the full implementation of the project, so you just need to be aware of that. But regardless, what I'm about to demonstrate and show to you will be where we will be going, okay.

Now, as I said, the primary user — the primary
interface that we've designed is for ACA. ACAs are our eyes and ears on the ground. And I know you guys don't like to hear this, you are our agents on the ground, okay. You're the first line of defense.

So what we've done is designed this system for you, we've designed it to help you submit your data to us in an electronic common format, where you're not going to have to send paper to us anymore. We've also designed it and will design it to assist you in reporting non-compliances to us on a real-time basis so that we can begin to track trim lines related to various sectors of the Rule. Okay. So for the ACAs in the audience: this is really designed for you in mind. Okay.

Now, you will come to a site entry screen like this, and unfortunately, as I copied it off the website, we've got a number of marvelously gorgeous graphics that just didn't show up, okay, so there's some graphics up there, it's got AMS's logo, a little bar that says "National Organic Program Online Services," which is kind of what we're calling this.

So you're going to have a username and password. Marty, what do you want your username to be?

MR. MESH: I forgot my password.

(Laughter.)

(Cross-talk.)
MR. JONES: I'll tell you what I'm going to do, we're going to use Marty as a guinea pig and I'm going to -- for his username consider this: "I Cause Trouble Every Day," okay? That's his username, all right?

(Laughter.)

MR. JONES: And Marty, you'll have to pick out your own password.

UNIDENTIFIED FEMALE VOICE: (Inaudible.)

MR. JONES: Backing away from the facetiousness: An ACA will have a unique username that they'll set up, they actually go into the system and set that up. They also set the password up, and then that password can be shared by any person on staff that they feel like needs to have access to the system. We're not going to be dogmatic about security at that level, we feel like you need to make decisions on your staff as to who needs access to the system, okay? But you'll come to the system, you'll identify a username, and you'll be into the system. Okay.

You'll come -- as you come into the system, then, you will enter your data, okay? Now, we're going to have much of this data, address and phone numbers, so you will be able to say if it's a corrected address, a corrected phone number, in other words you'll be able to enter to us the latest information, because one of the things that we're noticing is that addresses and phone numbers...
obviously change over time, the address and phone number
that you gave us at the time of your accreditation may not
be necessarily the address and phone numbers that you're
using today. In most cases -- in fact, I can't think of a
case where you didn't update it, but you'll be able to
provide the latest information to us.

Now, I don't know how many of you can see the
bottom of the screen, but down in this area, this will be
information for USDA, so once -- and this actually,
unfortunately, says "certified" instead of "accredited," so
instead of "accredited," that's actually an error that the
contractor is going to have to go back and correct.

But we will verify this data, make sure it is
accurate, and then we will go into the system and make sure
that -- and in this case, this hypothetical case, this
individual's authorized for TM11 issuance [phonetic],
shipping to Japan [phonetic], they've been accredited for
crops, livestock, wild crops, and processed products.
Okay. So that sets the database parameters. Okay.

And then also it's got the creation of the file
date, any modifications in the date of accreditation.
Okay. That way we can keep track and determine
(inaudible).

Okay, now let's go to the certifying [phonetic]
client screen, and this is probably the most -- I think the
most interesting screen, and also it's going to be long-term the most useful. This will be the screen that the ACAs will use to update -- and I say update -- their client list.

Marty, let's assume you certified Tom, you signed off yesterday, you come to this system and you enter in X-Y-Z Organic, Tom Hutchison, address, information, and then one of the things too that the system will do is assign a unique identifier number to this client, okay? That way we'll be able to track the client throughout the system.

Now, I can't tell you what that unique identifier number is going to be yet, we're still going back and forth the contractor as to what makes sense in terms of using the identifier screen, whether it needs to be an alphanumeric screen, whether it needs to be something related to the certifier's name so that we can immediately identify it, we're still going back and forth as to what it's going to look like, but it will assign a unique identifier number.

Then you will click on -- and unfortunately, folks, we don't have web access today, so I can't show you a lot of the functionality, but you'll click on the status of Tom's operations, which at this point will be certified, you'll click on the operation type -- crops, livestock, whatever, there's a drop-down box there, that you can click
on what is being certified for, any -- or, I'm sorry, this
is processor and handler here, so this would be certified
producer and processor here, and then what the operation is
certified for, we just click boxes down in here.

UNIDENTIFIED MALE VOICE: I have a question.

MR. JONES: I'd like to hold -- the way I talk is
I'd like to hold questions till the end. I can go back
and --

UNIDENTIFIED MALE VOICE: I retract that last
question.

MR. JONES: I understand.

(Laughter.)

MR. JONES: I can go back and run through any of
these slides, and, you know, I'm here as long as I need to
be, I know you guys are on a schedule you need to stay to,
I've got this loaded on my system, if we want to gather up
afterwards and walk through it in more detail, I'm happy to
do that. So I'm here at your disposal, within reason.

(Laughter.)

MR. JONES: And then there's, of course, a date
creation, a modified date, and certification date, and
status change date. This status drop-down box here is
where you will go in and identify -- let's say you've
identified a non-compliance. There will be a drop-down
box, and this will be in the next build, it'll probably be

R & S TYPING SERVICE - (903) 725-3343
5485 S. LIVE OAK, GILMER, TX  75644
over here somewhere, there'll be a drop-down box that says
"non-compliance," and then there'll be a drop-down box on
every section of the Rule, 205.404 (inaudible), whatever,
okay, and you can click on that, as the non-compliance, and
that will, when you click on that, autopopulate a common
non-compliance letter, that you will have the choice -- and
one of the things I do want some feedback on is whether or
not you would like to have this e-mailed automatically to
your client, if your client has e-mail access.

So essentially what you would do is you would go
to this screen, populate this on a real-time basis with
whatever data needs to be populated in the case that we're
just talking about, it's a non-compliance 205, let's say
.406, for whatever reason we want to use that. That will
autopopulate and bring you to another screen that will be a
common non-compliance letter, it'll have boilerplate
language in it that we have passed muster at OGC, and then
you will insert any applicable information that you feel
necessary, and then that letter can be sent either through
e-mail or you can print off and send it through regular
mail.

But we are considering the e-mail option. We're
trying to make this as electronic-focused as possible, as
paperless as possible, okay. Now, that doesn't mean you
couldn't get into the system and print off the letter for a
hard copy or something like that, but you would have the
ability to send a non-compliance letter by e-mail.

Another thing that the second build will do is
that once this screen is finished and completed, it will
autopopulate a common format certificate with standardized
language on it, okay. You can print that off at your desk.
So you fill this out, it will collect the information out
of the various fields, autopopulate into the common
certificate format, and you can print that out right at
your desk. Okay.

And really, as I summarize, what we're trying to
do, folks, is develop, as I said, an electronic system that
is the window to the NOP world, for regulators, for
traders, for ACAs. Okay. And we believe that within
relatively a short period of time, with -- hopefully within
the next six or eight months, we will have this system live
and operational, with the functionality that I just
described. Okay.

Now, software development within the federal
government is always a long and kind of laborious process
and it has taken on -- I want to share with you that it's
taken on a different kind of flavor now that we have an
emphasis on Homeland Security, because we have to integrate
with so many systems now, so you just need to be aware of
that.
But I hope what you can do, in walking away from this presentation today, is really two things: one, recognizing that we are -- and I know you guys don't believe this -- we are trying to make your life easier, okay, and we're trying to make it more efficient, the process more succinct, and the results more consistent.

And think, if you would, what this means for us in terms of enforcement, where we can look in a database that has non-compliances that's being inputted on a real-time basis, think what that does to us for our enforcement capabilities. We can begin to identify trim lines -- I go back to the 205.406 example. Let's say that over time we're seeing an enormous amount of non-compliances on this section. Well, that gives us some tips, either, one, nobody understands the section; two, it's poorly written, I mean there's reasons that nobody understands it; three, we haven't done an effective enough job in training on that particular section; or, four, maybe it's just not working on the ground, I mean maybe it's just -- there's just a disconnect with what's going on on the ground and the regulation, okay.

But can you see how having that data will help us make better management decisions and better enforcement compliances, and that's really where we want to be, is that we want to operate, folks, not on supposition, we want to...
operate on data.

And with that, I conclude my presentation.

Katherine, I don't know if I've got another slide in there or not. Yeah, just my contact information.

I'm happy to take questions, walk you through anything you don't understand. Thank you very much.

UNIDENTIFIED FEMALE VOICE: A question.

MR. JONES: Yeah.

UNIDENTIFIED FEMALE VOICE: Okay. Before that one where the non-compliance letter goes out --?

MR. JONES: Uh-huh.

UNIDENTIFIED FEMALE VOICE: -- directly, if it's a non-compliance letter that somebody's supposed to get information in within 30 days, if somebody in real-time, you know, sees this person is noncompliant but the real -- or certification process really isn't completed, it kind of almost puts like a black mark on this person. I'm not sure exactly what non-compliances you're talking about, minor ones as well as major --

MR. JONES: Well, you have to report non-compliances, okay --

UNIDENTIFIED FEMALE VOICE: And this is only major ones that --

MR. JONES: Yeah.

UNIDENTIFIED FEMALE VOICE: -- (inaudible)
suspension or (inaudible)?

MR. JONES: Yeah, ones that haven't been resolved, ones that you've tried resolving, hasn't been resolved. Now, keep in mind, folks, this is ACA data only. The world's not going to see this. That particular -- that particular screen -- that's why I said it's password-protected.

Now, what I didn't show you is that -- if we go back to -- if we go back to the trade side, what you will do on the trade side -- and this is not at all what it's going to look like, but you will just go in and say, "I'm looking for corn," and that would be a publicly-accessible data site [phonetic], okay (inaudible).

The ACA information that I've just described to you in the other screen, the only way that you get to that is through a password, which you will have, so the public's not going to see that. That's going to be ACA data, that's going to be USDA data.

I've got a lots of questions (inaudible).

UNIDENTIFIED FEMALE VOICE: I've got a question.

How would someone know if the client is currently certified, would it be that it creates a modified date? I mean, this is a continuation, they're certified in October 2003, then they get recertified again in November 2004. As an inspector, I have seen numerous times where someone has
been waiting six, eight months past when their annual inspection date is supposed to be, and still selling current product, switching certifiers. This also doesn't, you know, have anything to do with that either. There's -- the problem now with certificates is not really what's currently certified.

MR. JONES: Okay. Folks, certificates are good until suspended or revoked, okay? That's the way the regulation reads. They are good until suspended or revoked.

Now, the way you're going to keep track will be with the certification date, okay? This will change over time. The screen will also have a modification date, and every time you go and make a change to this screen, the database records the date that it is modified, okay? So we'll know, we'll know, we'll know every time an ACA makes a change (inaudible).

MS. SONNABEND: Is that modified date on the certificate that's automatically printing out?

MR. JONES: No. It'd be the certificate date.

MS. SONNABEND: Only that. So we wouldn't know if it's current, if they had had their annual inspection --

MR. JONES: A certificate is good until suspended or revoked, okay?

MS. SONNABEND: Are you going to be able to
MR. JONES: Yes. Great question, I'm glad somebody asked me. I'm ready for it. Okay.

The question is: are we going to be able to accept imported data? -- and the answer is yes. That was one of the first questions I asked the contractor, is: are we going to make certifying agents go back and recreate their lists? No. Okay.

And let me tell you what we're doing on that. You submitted to us 2003 data. You were required to do so. We have that. We've got it in lots of different formats. Okay, so what we're doing is we're going back and we are -- the program is taking that information that you sent to us and putting it into a Microsoft Access database.

In the not-too-distant future, probably sometime this summer, you will be receiving a letter from the program, that says: you will submit all data to us related to 205.400, .404, in this format, which will be a Microsoft Access database format, it will have the fields laid out, how we want the fields, because what we're going to do then is just take and capture that data when you send it to us and import it into the system.

So what you're going to be doing, Zea, is essentially you're going to be using this screen to update at the margins, okay?
MS. SONNABEND: If you're going to already take our list and give us our list back --

MR. JONES: Yeah. We're going to take the 2003 data that you've sent us, okay, and, like I said, this summer we're going to send you -- it'll be an Access file, we'll actually send you the file, and say -- and say to you: we want the data imported into this system, okay, so you will -- if everything works the way I hope it does, we will already have 2003 data in place, you will then send us the difference at the margins between the 2003 data and the 2004 data. Everybody understand what I'm saying? The marginal difference between the baseline database and then the database that exists at the end of calendar year 2004.

UNIDENTIFIED FEMALE VOICE: I see a field up here that says "Notes," but I don't see a field that's specifically designated for the crops or the products that are being certified.

MR. JONES: Excellent question. Excellent question. The next build that we will do is these will have drop-down boxes, okay? The reason that build number one didn't have drop-down boxes is that we -- I confess to you, folks on the crops and livestock side, it's pretty easy to come up with the nomenclature for certain products, okay, you can use census data nomenclature and things like that.
The difficulty, and the reason -- (inaudible), that's an excellent question. The reason we -- at the time that we made build one, it just didn't have any drop-down boxes, is that that actually forms the basis of the searchable database. So whatever you use as a search screen -- or a word here, okay, impacts how you'll be able to search, and it's particularly -- one of the things that we're still wrestling with, and I will tell you that both our software developers and myself don't have good answers for, is what we do on processed products [phonetic], because we've got accredited certifying agents that are certifying clients that have got 3,000 SKUs for processed products, 3,000 SKUs for processed product, okay, and I don't -- neither the software developer nor I have been able to come up with what would be the appropriate drop-down box there for somebody that might have 3,000 (inaudible), okay.

So there's a data question there that we're still wrestling with. I think we've got -- we've got the crops, livestock, and wild crops nailed, because I think we (inaudible), okay, but the process -- nobody's -- nobody's ever really tried to track products at this kind of level [phonetic], so (inaudible). (Inaudible)?

UNIDENTIFIED MALE VOICE: You said that the USDA and the federal certifiers [phonetic] will be the only

R & S TYPING SERVICE - (903) 725-3343

5485 S. LIVE OAK, GILMER, TX 75644
people that have access (inaudible) because of your relationship (inaudible), if the National Security Agency or IRS comes to you and says, "I'm investigating Marty Mesh" (inaudible), you'll have to make that data available?

MR. JONES: Sure. I mean, this data -- when I say this is between the USDA and the ACAs, obviously any other federal agency would have access to it too, so that if there was a criminal investigation or something like that, we would share that. My point, then, is that this screen, these screens, are not available to the general public.

UNIDENTIFIED MALE VOICE: How much did you pay for the software?

MR. JONES: Well, the first bill was 25,000.

UNIDENTIFIED FEMALE VOICE: (Inaudible)?

MR. JONES: I actually don't know. Folks, now -- I mean, keep in mind, folks, software is a (inaudible), it's based on functionality, okay, and -- and one of the things too is that we were able to build it as cheap as we were, as they were, build it, is because we took a lot of the source code -- (inaudible) you can understand this -- we took a lot of the source code that existed for a program that AMS Fruit & Vegetable had and modified the existing source codes. So the fact that we only spent 25,000 on this first bill is solely related to the fact that we're...
using multiple -- or we're using a common source code for multiple functionality, and so we're trying to build it as cheap as possible.

But when you look at software, each additional function has a cost, and some (inaudible) as you go up in functionality, you know, and of course I'd love to have all the bells and whistles you can possibly put on it, with software development, the marginal cost actually increases with functionality. In other words, I can build the first module for 25,000; the next module, because I want to add additional functionality, it may take me $45,000 to build the next module -- and that's just hypothetical, I mean that's not -- I don't know what we're going to spend, but what I want you to understand is that as you build functionality, costs increase.

So we're still figuring out what's the best bang for the buck so that we don't go overboard in functionality but that we deliver the kind of services that you -- that you expect and need.

UNIDENTIFIED MALE VOICE: (Inaudible) things we've discussed in other contexts, been discussed here at the Board, is that when a certifier -- when a certifier permits a client to use a non-organic ingredient because an organic ingredient is apparently not commercially available, or if a certifier lets a grower use a non-
organic seed because that equivalent variety is apparently not commercially available, we've been talking about the benefit of having this data come in, and a certifier records this, "on such and such a day I allowed a grower to use X-Y-Z seed because organic was not commercially available," same thing with an ingredient. Is this the kind of thing that you envision coming into this system? It seems to me this would be an excellent conduit to (inaudible).

MR. JONES: It actually is, Dick, and I'm glad you brought that point up, because we actually think that over time, if the ACAs are doing their job and are updating this on a real-time basis, then you can go onto the public side, and let's say you want to see if, I don't know, a spice is available, or an ingredient, or something like that; if the ACAs are doing their job on a real-time basis, you ought to be able to find whether or not that particular ingredient is indeed available, you know, NOP (inaudible), okay.

So the seed side, Dick, is a little bit more difficult, because I think when we have -- and I'm not saying we wouldn't do this, but I think we might have to build another screen in for commercial availability issue related to seed, but on the ingredient side, maybe not, because the ACAs would actually -- if it's a seed producer,
they could put that information in, and so if I was looking for a variety of a seed -- I'm thinking off the top of my head here -- I'll think about it, but it's a good point.

UNIDENTIFIED MALE VOICE: And what you said was that if the ACAs are keeping track of all the things they've certified --

MR. JONES: Yeah.

UNIDENTIFIED MALE VOICE: -- then there would be a list of what's available --

MR. JONES: That's my bottom-line point, is that if the ACAs are doing their part and updating this on a timely basis, then this database that outflows from this data collection should be the most accurate information available about the universe of NOP-certified products anytime, in the world.

UNIDENTIFIED MALE VOICE: What about if a supplier thinks that people are using a non-organic version -- an inorganic ingredient, then what's to know who is allowing the non-organic version to be used, or is it being allowed (inaudible)?

MR. JONES: That's a level of complexity -- I'd have to think about that. I mean, that gets in -- as you can see, you can sit for the next 20 minutes and think out all kinds of functionality you'd like to see in this thing, and, okay, I can, you know, do this and I can make this
data go this way and things like that, because functionality and -- sometimes the cost of functionality increases, we're going to have to decide how best to handle some of those issues, but your point's well-taken. We've identified the system as a way to get to some of those issues.

Let me get to Leslie, she's had her hand up for hours [phonetic].

MS. ZUCK: Thank you. You (inaudible) categories, and a lot of us have our (inaudible) PRS [phonetic] categories, is that what you were talking about, PRS, is that organic (inaudible)?

MR. JONES: Yeah, Kathy and I have actually -- Kathy and I talked about this. To put everybody's mind at rest: I actually do talk to a lot of people within the government. (Laughter.)

MR. JONES: And Kathy and I have consulted closely on this --

MS. ZUCK: (Inaudible.)

MR. JONES: Yeah. And one of the things that -- in fact, Kathy and I had a meeting just the other day, and let me tell you what the problem is, Leslie, in terms --

MS. ZUCK: Because you're dropping a drop-down box. A drop-down box, you can only (inaudible) --
MR. JONES: That's right. And if those categories are too broad -- I mean, Kathy and I have talked about this: if the categories are too broad, then Kathy doesn't get the stratification that she needs to sort out --

MS. ZUCK: (Inaudible.)

MR. JONES: -- and I don't think a trader would either.

MS. ZUCK: (Inaudible.)

MR. JONES: Okay. I mean, a trader needs very precise stratification, okay, and that's -- that's the big dilemma with process side, is: what is this -- what is this dividing line between the right amount of stratification -- you know, giving enough data to traders where they can make a trade decision based on a product (inaudible) see if it's really available -- as opposed to just having, you know, a list of products a mile long and somebody's got to scroll through (inaudible).

MS. ZUCK: Well, my most important question is -- (Laughter.)

MS. ZUCK: Has it come up at all that -- where -- I -- the Rule doesn't require us to report individual process (inaudible), it requires us to report whether we certify (inaudible), products, but I guess handling, I'd like (inaudible) --
MR. JONES: Here's what we think's going to happen on that. I mean, if we --

MS. ZUCK: I mean, I'll do it, I just --

MR. JONES: Well, and here's what we -- here's what we think's going to happen. I personally believe:

why (inaudible).

MS. ZUCK: Well, some people might not, and that's what I'm saying.

MR. JONES: Okay.

MS. ZUCK: And you're saying it's a required field, we have to fill it out, but it's an ACA -- and some ACAs are saying, "I don't want to fill this out."

MR. JONES: But here's what we're going to do, okay? We want this system to work, and if we need to make a reg -- we don't want to have a heavy-handed approach to this, but if we need to make a reg change to get the quality of data that we believe is needed, we would look at that, okay.

MS. ZUCK: (Inaudible) not required.

MR. JONES: No, it's a fair -- it's a fair (inaudible).

UNIDENTIFIED MALE VOICE: This is less of a question, more of a request or a comment, from a certifying agent's perspective, where I think we can -- as certifying agents, we all have our own current data systems, and what
you're trying to do is standardize the way we, as
certifying agents, track document data (inaudible) certify,
which I think is a great role [phonetic], but (inaudible)
common nomenclature and what fields are being defined.

That's really important for us in terms of being
able to easily import our data from our existing systems
into yours. So I request that as you guys, working with
your software developer, pin down, "these are the fields we
know we are going to request of you guys, and this is the
nomenclature we are going to want you to use," let us know
so we can kind of develop our system to --

MR. JONES: I have got -- if it would be useful,
I have actually got -- it would have to go out as draft,
because it's still a discussion document between myself and
the software developer, but I could give you a draft of
what we believe the database fields will look like at the
current time, and that would be useful. If I could get
that to you -- it'll be the middle of May by the time I get
back to the office, but I can get that to you, if that'd be
(inaudible).

UNIDENTIFIED MALE VOICE: What would be most
useful is once you've made a decision: this is what it's
going to be, so that then we've (inaudible).

MR. JONES: Well, I can tell -- I mean, when I
send that draft out, I can tell you that that is the result
of the best professional judgment of both myself and the software developer on (inaudible). Now, we have not gone back to the software developer and said, "Okay, build this into the system," we haven't made that decision yet.

UNIDENTIFIED MALE VOICE: You're selling this program very much to us as a service-oriented approach for traders and not only to identify certified products but also availability, which is another feature in the program, and what I not hear about [phonetic]: will that be mandatory, for ACAs to use that program? -- because what you said, this is a service offered for you to work with and lend the service of (inaudible), but on the other hand, I understand that the Custom authorities will have the possibility to check, you want to get the data out of it, you want to check. So will it be mandatory, then, at the end?

MR. JONES: Well, this system is what we will be requiring ACAs to use. This will be (inaudible) --

UNIDENTIFIED FEMALE VOICE: (Inaudible.)

MR. JONES: Yeah. I mean, if you're a USDA -- if you're a USDA-accredited certifier -- and the reason for that is exactly the issue that was brought up, okay. We are required -- I mean -- and let me -- let me tell you what we went through -- I know you guys have got your hand up, and I'll get to you in just a second.
We went through a very sophisticated process, kind of wrestling with the service side of what we were going to do, and as I sat down with the -- with the software developer, it became very apparent that we could never write software programs to input un-data [phonetic] for uncommon systems [phonetic], that what we had to do is to build a system, essentially build it around a Microsoft Access database -- and assuming everybody's used Microsoft Access -- build it around a Microsoft Access database and then say: this is indeed the system, okay, this is what we're [phonetic] going to have to use.

Now, we believe that there's so many benefits around it, in terms of real-time data submission, trade availability, not only for that but also just for our ability to track -- track compliance issues related to it, that at the end of the day, everybody is going to be using the system without a lot of grumbling and complaining and that kind of thing.

I mean, I have -- I have not demonstrated -- those of you who might have been in the (inaudible) in February, I actually demonstrated the program to folks there. I haven't been in a setting where people didn't walk away saying, you know, "this thing's really slick," "this is really going to make our life easier," okay, "you guys are doing good work," you know.
So I hope that that's the sentiment that we continue to find, because, like I said, the presentation that I made before, that was (inaudible). Merrill?

MS. CLARK: (Inaudible) and certifiers (inaudible). Are producers going to be (inaudible)?

MR. JONES: Producers won't even need to get into this system.

MS. CLARK: They don't need to get in.

MR. JONES: They don't even need to get in it.

UNIDENTIFIED MALE VOICE: I don't know why they would even want to get in it.

MS. CLARK: (Inaudible) for certifiers' information (inaudible) --

MR. JONES: Well, but keep in mind, Merrill, this is going to -- this is going to be used -- this is going to be used for enforcement functions, okay? In other words, we couldn't let certifiers have access to the system because they could go in and click and -- you know, a certifier could write up a non-compliance, a producer could go in and click and say: no, non-compliance doesn't exist, you know.

(Laughter.)

MR. JONES: Okay? I mean, that's not going to work. Okay. So I cannot envision any scenario where you would want a producer in the system.
UNIDENTIFIED MALE VOICE:  (Inaudible.)

MR. JONES:  Maybe.

CHAIRMAN KING:  Well, Keith, and what about if a producer is trying to select a certifier?

MR. JONES:  Can I --

UNIDENTIFIED FEMALE VOICE:  Keith, I -- and maybe you haven't thought about this, but we have a number of producers who would not want their -- they wouldn't mind their name and address being listed in the (inaudible), but they're growing crops under contract, they're doing all direct marketing, they don't want to have their crop mix and stuff like that go into a trade source --

MR. JONES:  Public release of that information will be optional. As an ACA, you will need to require, okay, or you will need to ascertain from your clients: do they want their name, address, and phone number showing up (inaudible). If they don't, that's their choice, okay, because they've made it. They may say, "My trade" (inaudible) "are just fine, I'm happy" (inaudible), and so (inaudible). So that would be your interface with the ACA.

Marty.

MR. MESH:  The -- multiple users can log on.

Will there be a record -- (inaudible) logged on (inaudible) the data on our system, who that was? I'm concerned that --
MR. JONES: So you would want to track it at the staff level?

MR. MESH: Well, I'm asking if that's an option (inaudible) --

MR. JONES: Yeah, we can --

MR. MESH: (Inaudible) our staff entered in --

MR. JONES: Yeah, we could build -- we could build a build -- I mean, if that -- if you thought that was useful, that wouldn't [phonetic] be hard to do, is to build a field for staffing issues as we modify the data set [phonetic], okay, and that might be useful -- I don't know that that's useful for us, because the only thing that we want to know is: you came into the system on April 29th, 2004, and you modified it. Okay. Now, at your management level --

MR. MESH: We want to know who wrote that (inaudible).

MR. JONES: -- you might want to know who (inaudible).

MR. MESH: And then my other follow-up question -- boy, is this slick. (Laughter.)

MR. MESH: -- is: on the drop-down field for certification, you said you can choose one, but many times (inaudible) crops, livestock (inaudible), handling all on
the same operation?

MR. JONES: You can choose multiple [phonetic],
the way that's going to work. In other words, if they're
both producers and processors, yeah (inaudible). We've
actually thought about some of this stuff.

MR. MESH: Boy, are you good in making our life
easy.

(Laughter.)

MR. MESH: If we could only [phonetic] read this
and some of your directives (inaudible).

(Laughter.)

MR. MESH: We could even keep it organic.

(Laughter.)

MR. JONES: Okay, I know we probably need to wrap
up, so --

UNIDENTIFIED FEMALE VOICE: Thanks, Marty.

MR. JONES: -- Mark, you had a question?

CHAIRMAN KING: No, I was just going to follow
up, I was saying if a producer was going to actually choose
a certifier -- I understand why they wouldn't have total
access to the system, but could they go in and find out:
oh, by the way, there are now 72 accredited certifiers in
North America -- I'm just using an arbitrary number -- and
then, you know, similar to what you were talking about in
terms of close proximity geographically in terms of
sourcing something, could they look at that? I mean --

MR. JONES: Yeah, I suppose. I mean, once we --
it's a database question, Mark, but we could create a list
of accredited certifying agents and do a ZIP code distance
comparison, at least with domestic producers. So I could
put in my ZIP code, 20121, and come up with a list of
certifying agents 150 miles from my location, okay. We --
that's doable, you know, and I -- if people have got ideas,
I'm -- I want to hear ideas, if you've got ideas that.

Again, I also want to make sure people understand
that, you know, software development is not inexpensive, we
did this very cheaply, very cost-effective, but the reason
we did it is because we're sharing source code. When you
have to go out and write new source code, it becomes fairly
expensive, okay?

But I don't want to lose good ideas, that's why
I'm making this presentation this morning, is that if you
guys have got ideas, I want to be able to record those and
then kind of sift through those, as to what might make
sense in terms of the next build.

Okay, folks, I appreciate it. I'll be around
later on, if you've got other questions, I'm happy to sit
down and talk to you. Thank you.

CHAIRMAN KING: Thank you, Keith. Thank you very
much. In light of the fact we're a little bit behind

R & S TYPING SERVICE - (903) 725-3343

5485 S. LIVE OAK, GILMER, TX 75644
schedule, I think what we'll do in order to give sufficient
time for the compost tea task force report, we'll move that
till after lunch, we'll go ahead and recess for lunch,
starting promptly at 1:30, so please be back here
accordingly.

(Off the record at 11:45 a.m. and reconvened at 1:11 p.m.)

CHAIRMAN KING: I'd like to officially reconvene
the meeting of the National Organic Standards Board.

We'll deal with the morning agenda item of
presentation of the compost tea task force. Rose Koenig
will have it up on the screen, and we'll discuss that.

And if you'll note in your agenda, there is not a
specific order in terms of the committee recommendations
noted, so I'd just like to read into the record:

We'll be taking the following committee order
this afternoon, for those of you who are interested:

We'll begin with the materials committee, which
will just include discussions of the reports there.

Then Andrea's committee, accreditation and
compliance will follow.

Then we'll go into crops committee, handling
committee, followed by the livestock committee, and then
we'll finish up with the policy development committee. So
that's sort of --

UNIDENTIFIED MALE VOICE: 606 Task Force, where
would that fit? (Inaudible)?

CHAIRMAN KING: Yeah. It was policy, handling, compost. So the 606 Task Force report will be presented under the policy development committee.

Rose, it's your baby.

MS. KOENIG: Okay. This time I don't have to do 40 slides in five minutes, so I get to shine. Actually, I'm going to -- why I'm standing up here --

The task force went through many changes of authority over time. Eric Sideman, who was a past NOSB member, co-chaired the committee with Dennis Holbrook, and myself and Owusu were the individuals that -- from the Board that were actually on the committee, Owusu taking -- Dennis Holbrook being the other co-chair, and then Owusu being the crops chair, both kind of played major roles; and then Dennis resigned from the Board, so I became, at the last moment, able to get some credit, becoming new chair. I guess that's the best chair you want to be, is at the last moment, after all the work is done, you get to gain a new title (chuckles). So now I'm co-chair.

And then Owusu was supposed to do this first half of the presentation today, and he could not make the meeting, so I've asked Zea to kind of be my sidekick, because she was a member of the compost tea task force, and I've indicated to her that, you know, if there -- comes to
a point, especially in the sections that Owusu was going to
cover, if she can help me, if there's any questions or
things that I'm missing, she may come up to the podium and
kind of add some additional information, so just to get you
understanding kind of the process and why we're doing it in
that order.

So, Ann, the -- it's actually tea 2, t-e-a 2. I
can kind of go into the general information too, as we're
getting started. You can go to the next slide. Okay.

Now, the Board all has a copy of the
documentation, and I'm going to summarize kind of that
documentation, but I do encourage everyone to actually go
through and read the finer details, because a lot of the
literature that's cited -- I mean, I'm going to talk about
some of the implications of the literature, but I'm not
going to go into them, but the citations are there.

And then for those who are even extremely more
interested in the subject, you could actually -- there's a
bibliography and you could actually get some of the
publications.

And additionally, to those in the audience: the
complete copy of the report came onto the website a little
bit late, but it is there, so you can access that.

So one of the first questions: why did -- you
know, why do we have a compost tea task force? Well, one
of the things that was recognized, that there was --
there's a wide usage of compost tea by organic growers but
there is a lack of uniformity in the regulation of compost
tea by certifying agents and the Board felt there was a
need to clarify regulations regarding the use of compost
tea, and if we all remember -- next slide, sorry, Ann --
when the original compost tea task force looked at a number
of issues involved around compost, including making
recommendations of alternative methodologies for making
compost, almost vermicomposting, and there was a section on
compost tea that could not really be resolved, so the
compost tea task force was initiated to really do further
investigation of compost tea, and that's why the task force
was -- was extended: to really look more specifically at
the implications of compost tea.

So there was a need to investigate scientific
data regarding human pathogen issues, and many certifiers
and organic farmers expressed concern about the restrictive
natures of the NOP's ruling of treating compost tea as a
raw manure.

So in other words, you know, practitioners out
there utilize compost tea for a multiple of uses, including
nutrients, plant pathological properties, pest control, and
they felt that following the 90-120-day restriction on raw
manure would really not produce -- you know, not enable
them to use compost tea for the properties that they're using it for. So next slide.

Some of the compost tea task force members -- well, Eric Sideman, again, was the chair. He was the next NOSB member. Dennis Holbrook was the co-chair, but he has resigned. Owusu Bandele is an NOSB member. Will Brinton from the Woodin [phonetic] Research Lab; Esper Chandler, Texas Plant & Soil Lab; Steve Diver was a representative at ATRA and he has expertise in compost tea; Clive Edwards was from the Ohio State University. Next slide.

Elaine Ingham, Soft Food Web [phonetic], Incorporated. Myself, member of the National Organic Standards Board. Fred Magdoff, University of Vermont. Pat Milner, USDA, the ARS division. Steve Scheuerell is from Oregon State University. Zea Sonnabend represents CCOF, California Certified Organic Farmers. And Larry Zibilisk, I don't know -- I'm not sure what his -- USDA, ARS. Next.

And we just want to have special recognition to Eric for chairing, and also Dennis, the compost tea task force, in keeping the committee on target, Eric really did a great job; and Steve Scheuerell for the massive amount of work, he really took the lion's share of work to prepare the document and do all the editings of the drafts and completing the final document. Next.

So the areas of expertise that the task force
covered was organic farming practices and certification, some of the members had expertise in compost, some had expertise in compost tea production and analysis, some had plant pathology backgrounds, horticultural and soil science, some of our members had EPA pathogen regulation expertise, food safety, and environmental microbiology.

So basically we felt that, you know, one of the great things about the task force was the diversity and the -- really, the high levels of expertise that the task force members had, and one of the challenges, I think, was the fact that we had people with such, you know, expertise and really were committed, because there definitely were different viewpoints, especially when it came to the human pathogen aspects of the studies, and some of our recommendations you'll see at the end reflected kind of a -- I think -- a learning process and a collaborative effort to try to take diverse views and really fuse them into a regulation that we all could agree with.

And I think it's noted on a further slide that Owusu (inaudible) but I can let you know that 11 of the 12 members supported the compost tea task force report as you see it. There was one member who did not vote in favor of the task force report. That member agreed with the recommendations but did not agree with some of the scientific data and scientific analysis that was expressed.
in the report, and that individual has been encouraged to
do public comment to the Board on that minority opinion, so
you will be likely seeing that.

The member requested that I kind of forward that
information to the NOP prior to the meeting, but I just did
not feel it was my role to do that. So because we're not
voting on this report at this meeting, I will encourage
that member to put it in a format that they're comfortable
with and take more time to kind of detail that information,
but we look forward to seeing that minority opinion.

MR. RIDDLE: Did that person vote against or
abstain or do you have --

MS. KOENIG: It was against --

MR. RIDDLE: Against, okay.

MS. KOENIG: -- the report as it stood.

MR. RIDDLE: Okay. Thanks.

MS. KOENIG: Okay. So if you go through the
report, there are some definitions, to give you a frame of
reference in terms of the information that's in the report,
and I'm just going to highlight some of those definitions
today. Well, actually, Owusu was going to highlight those.
These are the ones he picked out, that he thought was
important for you to develop a framework for this
presentation.

So "composing" is: A managed process in which
organic materials, including animal manure and other residues -- I guess -- are decomposed aerobically by microbial action.

"Thermophyllic composting" refers to: A time-limited self-heating process in which heat generated by microbial respiration is retained in the mass of a pile or (inaudible) such that vulnerable pathogenic microorganisms are destroyed. Next.

And we just wanted to acknowledge that "compost" is defined by the NOSB task force, and this was presented in the 2002 Task Force Report that was submitted to the NOSB from the original compost task force, of which some of the members overlapped to this compost tea task force.

They define "compost" -- in addition to that described in Section 205.203(c), so we're not saying it replaced it, but it was a broadening recommendation of the definition of "compost" -- as "Acceptable if it's made only from allowed feedstock materials, except for incidental residues that will not lead to contamination; 2) the compost undergoes an increase in temperature, to at least 131 degrees Fahrenheit, and remains there for a minimum of three days; and 3) the compost pile is managed to ensure that all feedstocks heats to the minimum temperature."

The reason why I included that definition was that the report -- in other words, when it speaks of...
compost, it -- the recommendations are not only based on
the "compost" definition that's in the Rule but also on the
compost task force recommendation for the broadened
definition of "compost."

So here in the report, and as I'm doing the
presentation, again, we're considering a broad definition
of "compost."

Okay. "Compost extract" is: Any mixture of
compost and water, additives, and adjuvants that is not
held for more than one hour before use. Compost extracts
lack sufficient holding time for microorganisms to multiply
and grow significantly."

So in other words, if you, you know, take a
handful of compost, throw it in a bucket of water, mix it
up, and spray it before -- in that holding time period,
less than an hour -- no more than one hour before use, it's
defined as "compost extract."

"Compost leachate" is: Liquid that has leached
through a compost pile and collects on the ground, compost
pad, or collective" [phonetic] "dishes, puddles, and
ponds." It doesn't sound like a very good thing. Okay,
next.

"Composting additives" are: "Materials separate
from compost and water, that are added in the process of
making compost tea, that are presumed to sustain and enrich

R & S TYPING SERVICE - (903) 725-3343
5485 S. LIVE OAK, GILMER, TX 75644
microbial growth. These are distinct from spray adjuvants, that are tank-mixed immediately prior to application of compost tea.

Examples include, but are not limited to, the following: molasses (inaudible) extract, fish-based products, kelp, and green plant tissue. Next.

And then a "manure extract" is: Water suspension containing raw, non-disinfected manure when the suspension is maintained for several hours or more, is sometimes referred to as "manure tea."

So in other words, when we talked about the compost extract: the manure is grabbed, thrown in a jug of water, and basically made into a soluble form. Next.

A "pathogen" is: A microorganism capable of causing disease or injury, used to refer to plant or human pathogens. Next.

And then "spray adjuvants" are: Any material added to compost tea immediately prior to application of compost tea. These may include materials that are designed for wetting and sticking agents, plant nutrients, and those materials that sustain and enrich microbial growth but, because of short time frame between addition and application, there is a very low probability of multiplying undesirable microorganisms in the spray tank. Next.

And then "vermicomposting," as it's defined and
used in the document, is: A process of worms digesting organic matter to transform the material into a beneficial soil amendment. And basically, if you look in the compost task force report, again, there are different time intervals, which I'm not going to read off the slide, and temperature and methodologies that must be met to meet the vermicomposting standard. Next.

So, you know, the environment that we were working in, in terms of the task force, was that compost tea practitioners have developed a wide array of compost tea production practices for both -- the majority for plant disease and/or fertility management.

However, there are relatively few peer-reviewed studies that exist for compost tea production and use, and this is where the compost tea task force had to, you know, deal with looking at what literature there was available and also what experiments that had been conducted but hadn't yet been written up in peer-reviewed publications, to again come together with that information, to present a recommendation that would satisfy the requirements of our task. Next.

The original, again, compost tea task force recommended that compost tea be allowed but no sweeteners, which means molasses, and those other additives, were to be added.
The National Organic Program ruled that compost tea should be treated as raw manure regarding the 90- to 120-day waiting period, and I explained that earlier.

And then a number of organic farmers and certifiers believe that this interpretation was too restrictive in terms of how practitioners were using it and their real reliance and perceived need of this material in their organic farming system. Next.

So we approved the establishment of this task force at the November 2002 meeting. Our -- the membership of that task force was determined by the original -- you know, Eric and the chairs at that time and was set on May 1st, 2003. The initial conference call was held on May 9th of 2003, and -- actually, Owusu made a mistake in this -- the final draft was approved on April 6, 2004, with 11 in favor, 1 opposed, and 1 unavailable, and I explained that issue just prior. Next.

In our report, the compost tea task force attempted to distinguish between the practitioner-based knowledge -- in other words the practice and what farmers are seeing, usually anecdotal information -- versus scientific knowledges, that is supported by controlled replicated experiments.

And, again, because like many, I guess, inputs and aspects of organic farming systems, a lot -- there
hasn't been a whole lot of funding given to land grant
institutions to this type of research, so we want as a
group to acknowledge kind of the practitioners, the
observations and, you know, kind of hands-on science that
farmers are doing, but also we needed to balance that with
whatever scientific data that we could obtain.

A major concern of the compost tea task force -- and if you look at the -- you know, read the whole document -- was the potential for human pathogen contamination of edible plants, as regulated by the Final Rule, Section 205.203, and this really was the impetus and the reasoning of why there had to be, you know, concern about this product. You know, if there wasn't a human pathogen issue, I wouldn't be standing here doing this presentation today, it would have been something that the Board could have probably wrestled with more -- a year ago.

So, basically, a lot of the discussion and the presentation of the research focused on the human pathogen component or issue involved in compost and compost teas. Next.

So I want to go a little bit through the methods of production, just in case people are not familiar with it, but basically, methods do vary, because there's farmers who are making their own setups on their farm, and -- and then there's -- companies are actually selling units
[phonetic], so the technology is very diverse. But water is the primary component, and the compost that's used is the next largest component. Compost tea can differ regarding that water/compost ratio. It also can differ based on whether somebody's putting in supplemental nutrients, or, like I said, molasses or those -- those additives, and also the level of dissolved oxygen, whether -- to what degree it's aerated, if it's aerated at all, those types of issues.

And there are -- again, commercial and homemade brewers are used, so, again, there's a great variability of the methodologies, the inputs that are used into the tea, and the recommendation needs to kind of encompass all that variability. Next.

Typically the ratio is 1 part compost to 10 to 50 parts water. A porous container is used, aeration is achieved via a direct air injection or recirculation of water for 2 to -- 12 to 24 hours, and often compost tea additives are used to enhance the microbial proliferation, and typical additives include molasses, yeast extract, and algal powders. Next.

There are also passive aerated systems, which usually are 1 part compost/3 to 10 parts of water, they're done in open containers, from 1 to 3 weeks, and they can be done with or without stirring, and compost additives are.
used infrequently in these types of systems. Next.

Again, the purpose of these compost tea additives
is they encourage microbial growth, which means -- you
know, most -- especially if you're using it for pest
management or fungal control or microbial control on a
plant, you're trying to encourage the beneficials, but it
also -- it's non-selective, that kind of growth, so if you
do have any kind of human pathogen contamination in your
tea, they can also grow, because you have now these compost
tea additives.

So basically -- there has, however -- and that
was an important point that some of the members wanted to
bring out: that although, theoretically, you could
possibly support human pathogens if present in small
numbers -- because these -- again, the additives increase
that growth -- we know of no documented cases of foodborne
illnesses from the use of compost tea.

However, the studies -- you know, theoretical
studies done in the laboratory, you can -- we saw mixed
results, some of them which did not necessarily show
microbial growth, but there were studies that did show
microbial growth.

So the data -- the data showed -- you know,
different researchers, depending on different
methodologies, showed different results, but, again, some
members felt that it was really important to bring out that no documented causes [sic.] of foodborne illnesses have been recorded, to our knowledge, from compost tea use. Next.

How is it, basically, used on the farm. Well, it can be foliar-sprayed or applied through an irrigation system, you know, it would be an overhead irrigation system, or a sprayer. You can have -- it's used sometime as a stubble digester or a green manure inoculant. In other words, it's applied to crop residue or cover crops, usually after mowing and before incorporation into the soil. Next.

It can also be applied through irrigation systems or sprayers on -- directly to the soil. It can be applied through a drip-irrigation system, you know, because it's water -- you know, basically it's a water-soluble product.

And you can use it with a soil-less media, it's used to moisten media before planting or as a post-plant drench. Next.

You can -- some growers use it to pre-soak seed or vegetative planting material before planting. And then some people apply it to suppress -- manure collection points -- to suppress the odor of compost piles, additionally. Next.
Again, the plant growth responses to compost tea is largely anecdotal; in other words, it's: growers have been using it and they've reported yield increases by their sight, but there's been no replicated -- or few replicated studies to prove that it does in fact show plant growth.

But the postulated mechanisms is that you're providing nutrients and/or the microbes may be producing phytohormones, to help increase plant growth.

There's also postulated indirect mechanisms, including, you know: affecting the soil structure; or creating, you know, a microbial-beneficial population around the rise of sphere -- around that root, that can increase or, you know, provide more nutrients; and in terms of plant pathogens, they may be -- those same microorganisms may be producing compounds that are deleterious to other microbes in the soil. Next.

And basically -- and, again, that's where the disease management reports come in, again, a lot of anecdotal reports citing less severe foliar diseases and root diseases using the products.

There have been some scientific studies showing both, again, significant and non-significant results regarding disease suppression, and the variability in compost tea composition has been cited, basically, for these inconsistencies.
In other words, because you have so many different systems operating, you have different quality composts, you have different methodologies and additives going in, it's really hard to produce -- unless you're doing a lot of, lot of, studies -- replicated experiments that are going to give you consistent results. So next.

Again, there were microbial hazards that were considered by the task force, primarily centered around human pathogens. The compost tea task force recognized that this was an area where there was significant data gaps. But basically the task force considered the types of variables potentially associated with the deleterious microbial contamination from a human perspective.

In other words, we looked at kind of the whole environment of a cropping system and we tried to pinpoint areas of risk, and then we tried to gather data to suggest whether these in fact were -- were true. Next.

So the reasoning -- there's things about compost tea production that should be considered if you're considering human pathogen populations or you have concerns about human pathogens.

One of them is that in some of the compost teas, you may be using manure, and manure has a high potential of contamination.

So, again, if you're composting it according to
the Rule, this should reduce it, but there still is an
associated risk.

Another aspect, where there's not much data
available, is compost stability, but the relationship
between compost stability and human pathogen levels is
really -- has not been determined, but the task force did
want to acknowledge that the area of compost stability was
a potential area of research. Next.

Other areas of concern was -- was water quality,
and basically the task force acknowledged that you want to
have clean water to start with.

Sanitation, you want to make sure you're clean,
your machines, effectively, to reduce pathogen populations,
but, you know, the machines and how you handle those in an
operation are an avenue where you could have
multiplications of microorganisms.

Vector access, you know, if these machines are
set up on farms or areas where you have any kind of
rodents, they could potentially contamination a batch of
compost.

Brew time and temperature, depending on how long
it's being brewed and the temperature levels that is
reached could have effects on microbial populations. We
acknowledge that compost tea additives -- and within the
report there are a lot of literature citings that I would
want to call to your attention.

The only peer-reviewed article that the committee could find was that of Duffy, that was just recently published, and in that there were -- again, you know, I'm kind of doing this from the top of my head, but he looked at, I think, salmonella and different levels of molasses, and it indicated that at lower levels of molasses, there were no multiplications of salmonella, but as you increase the concentration of molasses you could get an increased concentration of salmonella.

A lot of the researchers, however, had opinions on this type of research, and I think they are -- some of the criticisms are valid, because this type of research is done under a laboratory setting, where you're putting a known amount of inoculant in an environment that is usually conducive to pathogen growth, and their argument was that these -- this may not be analogous to what happens in the field.

So just a caution that much of the experimentation that has been done thus far, that is either done, the one study, in a peer-reviewed journal is a laboratory-based analysis.

And then some of the research that was presented by, actually, members of the compost tea task force, where they did similar studies with e-coli and replicated it in...
two different labs, it was the same phenomenon, where they incorporated a certain amount of pathogens to start with, added a molasses kind of solution, and then quantitatively looked at the growth of microbial populations.

The compost tea task force acknowledged that there are crop and environmental factors that could affect microorganisms, and some of that includes plant architecture, things like lettuce and apples, there's some evidence to suggest that those types of crops, because of their architecture and the shapes of leaves and the gaps that exist there, that those plants create an environment that may be conducive to the growth of these pathogens.

So we just want to acknowledge that there's certain crops that may have, you know, higher risk factors.

Additionally, there was some -- some thought about, you know, distinguishing between crops that are typically edible, or typically cooked, or typically eaten raw, as maybe ways that a regulation could be written, but there really was no consensus on how that could be formulated into a recommendation.

And, additionally, environmental factors, because we're -- we're trying to create recommendations that can be used throughout the -- you know, the country, you know, UV radiation from the sun, temperature factors, they can all affect microbial growth, so there was just an
acknowledgment that this is an area of -- of interest and
where research needs to be done. Next.

Another factor: if there are actual pathogens
present, the contaminant levels of compost teas, you know,
if there already are some, they can certainly be a problem
with human pathogen associations.

And I'm not sure, Zea, if you have anything else
to -- to say about those areas, because as I'm standing
here, I'm not necessarily recalling those subcategories, so
if you have anything to --

MS. SONNABEND: No (inaudible).

MS. KOENIG: Okay. And then pathogen, again,
pathogen survival, a lot has to do with, again, crop
architecture, environment, and post-harvest intervals, and
that was something that -- actually, pre-harvest interval,
and what they were -- what we acknowledged in the report,
that there -- perhaps as research was developed, there may
be regulations that could be developed based on time from
application to the time you harvest.

And then, additionally, there may be post-harvest
treatments, such as disinfectants, that could be used to
reduce microbial populations. Next.

The data gaps that the committee wanted to
acknowledge, and there are lots of them, there really was
no information in the literature on cost benefit analysis,
very little literature -- informational literature on the ecology of human pathogens, again, pre-harvest application intervals, compost stability, different feedstocks, phytotoxic reaction to compost teas, and dissolved oxygen content. So these were areas that the compost tea task force felt like they had to acknowledge that they felt that data really was needed in these areas, to develop a good recommendation. Next.

Okay, so now what we've all been waiting for, da-da-da-da-da, "the recommendations."

So the recommendations from the task force is that:

Potable water must be used to make compost tea and for any dilution before application. So in other words, a clean source of water to start with.

Equipment used to prepare compost teas must be sanitized before use with a sanitizing agent as defined by CFR 178.1010. Next.

Compost tea should be made with compliant compost or vermicompost, using the NOSB Compost Task Force Guidelines set forth on April 18th, 2002, for thermal compost and vermicompost or compost as defined in Section 205.203(c)(2).

For compost tea, this applies to -- even -- and this is the distinction and the important point, I guess on
this recommendation: for compost tea, this applies to 100-percent plant feedstock materials in addition to manure feedstock, which may harbor high levels of fecal bacteria because of non-manure compost.

In other words, if you remember the compost reg, the 90-120 days exists for compost that has manure incorporated into it, whereas plant-based compost, there's no waiting period.

But in our recommendation, there is evidence that even plant-based materials, starting materials, can harbor human pathogens. So it's a more restrictive, I guess, guideline for compost tea, compared to compost. Next.

Compost tea made without compost tea additives, so compliant, in other words compost tea can be applied without restrictions. Next.

Okay, this one's a little mouthful, and I think it's a little tricky, but: compost tea that's made with compost tea additives can be applied without restriction if the compost tea production system -- in other words, the same compost batch, the additives, and the equipment -- has been pre-tested to produce compost tea that meets the EPA-recommended recreational water quality guidelines for a bacterial indicator of fecal contamination, and this is based on the US EPA recommendations of 2000, and these indicators and the passing criteria are --, and it gives
you the two numbers for e-coli and enterococci. Next.

And then -- now, after you've done that pre-test, at least two compost tea batches must be tested, using the accepted methodology, with the average population of indicator bacteria, cross-compost tea batch is used as the measure of passing, and then each new batch of compost -- that means any -- so you test your compost twice, and you can use that compost in that aerator continually, but if you go to another compost pile, that would require that the system quality-assurance pre-test be conducted again, as indicated, and after it passes again, compost tea from the system can be used, with that restriction.

This, again, is a recommendation I think that was a compromise and eventually accepted, 11 of the 12 members of the task force, and the -- I guess the victory here is that there was -- you know, a compromise reached by all parties, saying that -- you know, that we recognize the additives -- the issues with additives but we feel that there can be testing protocols developed and there are standards out there that the group -- you know, the compost task force recommends, that the teas then therefore can be regulated with -- with a reduced, you know, risk factor in terms of human populations. Next.

If a compost tea made with compost tea additives has not pre-tested for indicator bacteria, its use on food
crops is restricted to the 90- to 120-day pre-harvest interval restrictions, and that's similar to what, you know, compost -- raw manure is in the Rule.

In the view of the task force, educating producers about the potential for contamination and its impact on public health and marketing, as well as how this recommended quality-assurance testing system would avoid potential contamination, will provide compelling incentives for producers to follow the rules. Next.

"Compost extracts," oh, "any mixture of compost, water, additives, and adjuvants that is not held for more than one hour before use, may be applied without restriction." So if a grower just makes a compost extract, it's used before one hour, it could be used with that restriction, and this is based on the feeling from the task force that you would not have a proliferation of growth in that -- in that time period, that would be of any concern.

And then raw manure extracts or teas may be applied to the soil with a 90- to 120-day pre-harvest restriction, but foliar applications are prohibited. Next.

Compost leachate may be applied to the soil with a 90- to 120-day pre-harvest restriction, foliar applications are prohibited, and compost tea is not allowed for the production of edible sprouts. Next.

And then, finally, and I think a very important
recommendation follows:

"The emerging acceptance of compost teas as a biologically-based crop-production tool by organic as well as conventional growers clearly indicates the need for further scientific investigation to validate the benefits and concerns of compost tea.

"The Task Force unanimously urges USDA and its agencies to strongly support additional research on the potential for crop contamination and plant disease, pest control by compost tea.

"There is an urgent national need to address critical data gaps, uncertainties, and variability in existing data that limited the evaluation of potential crop contamination by the current Task Force." Next. Next.

And then, Zea, I'm just going to let you -- I don't know if there were some --

MS. SONNABEND: Yeah.

MS. KOENIG: -- just points that you wanted to state.

MS. SONNABEND: Yes. I just really have two points to make, in addition to what Rose has said.

I think that this task force was very well-appointed on your part, the Department and the NOSB, in that it did start out with people with widely-divergent opinions as well as expertise, and, like any group of
scientists getting together, there is quite a bit of scientific bickering over every single fine point in this recommendation, and so it really is much more of a victory than it looks, for us to have achieved a recommendation and a report with this degree of information in it and this degree of concrete recommendations.

And then the other point, in relation to that, is: You know, from the practical certifier/inspector side, is this a recommendation that is really enforceable for organics? -- and I think it is, which is why I supported the recommendation.

Although it sounds like a big mouthful, with the testing protocol for pre-testing and batches and all that, that we've explained, the benefits of being able to use the compost tea so far outweigh the relatively small cost of the testing and the relatively small additional burden that it puts on growers, that I think it will be welcomed as a procedure, as opposed to not having the compost tea at all.

So I do think that it is verifiable, that certifiers, you know, are able to work with this, that inspectors can see it in the field, and that growers can achieve this, for the most part. You know, having to do pre-testing will be -- would be burdensome on really small growers who stir their compost tea in a bucket, but those are really the people who need the pre-testing the most.
(chuckles), because they're not using very sophisticated equipment.

So that's all I wanted to say about that.

MS. KOENIG: And then if you guys had any questions, I mean, we can answer them, I guess. Becky.

MS. GOLDBURG: I was curious about the feasibility of doing the testing for indicator bacteria. Are there some quick tests, Scrip [phonetic] tests or whatever, that -- something farmers can use, or do you have to have a microbiology lab to test?

MS. KOENIG: I mean, I gather that it would actually require a laboratory.

MS. SONNABEND: You do have to take it to a lab, but it's probably a 24-hour, you know, result, and not really very expensive.

MS. KOENIG: And, you know, again, the -- one of the scientists at the USDA, the -- really the food-safety individual who signed off on the report, I think the fact that this testing protocol was there really enabled that individual to have a comfort level with the recommendation.

So although it is cumbersome and there would be a cost associated with it, it does allow at least businesses that are involved in compost tea to continue to market to organic producers, and I think what Zea says is true, I mean the technology is there for rapid testing and other
areas, it's just a function of, you know, how much demand there is.

So I -- you know, in the future, if compost tea is the next best thing (chuckles), compared to other inputs, then, you know, perhaps that'll occur. Jim.

MR. RIDDLE: Yeah. I'm really impressed with this report, I think the Task Force has done excellent work. I had a couple specific questions on the recommendations.

On Number 5, the second paragraph, the compost tea, with compost tea additives that's not been pre-tested, and you're recommending that that would be allowed for grain crops intended for human consumption, with no restrictions. Correct?

MS. SONNABEND: 90-to 120-day --

MR. RIDDLE: Oh, it still would be?

MS. SONNABEND: Yeah.

MR. RIDDLE: I'm reading it wrong, then.

MS. SONNABEND: Right. The second line --

CHAIRMAN KING: It's "not intended."

MR. RIDDLE: "Crops not intended for human consumption, ornamental plants, and grain crops are exempt from the bacterial testing and 90-/120-day" (inaudible) --

MS. KOENIG: Yeah, but the concept on that -- and, again, remember how I had said that there was a lot --
considerable discussion on plant, plant species, literature that indicated that there could be certain plant types that harbored bacteria because of their architecture, or the fact that they're eaten raw, you know, such as lettuce and apples.

MR. RIDDLE: Yeah.

MS. KOENIG: The general consensus of the group was that grain crops are mostly -- you know, are processed and that they felt assured that they would be cooked, you know, in terms of human consumption.

UNIDENTIFIED FEMALE VOICE: Right.

MS. KOENIG: And ornamentals are not consumed by humans, but there are -- there is an industry out there that, you know, may -- or, in fact, is producing ornamental crops. So it just allowed for the use of two kind of specific plants that we all could agree upon.

MS. KOENIG: I mean, there was -- again, there was a proposal during the process of many different reviews that there was a USDA list of most-edible crops that are cooked versus ones that are eaten raw, but we kind of acknowledged as a committee that -- that, you know, we have a natural -- you know, a lot of people are natural food eaters, in the organic community, so what the average American eats cooked (chuckles), a lot of our consumers eat...
raw --

MR. RIDDLE: Uh-huh.

MS. KOENIG: -- and a lot of us didn't feel comfortable about using that list as a guidance. So this, again, was the agreement --

MS. SONNABEND: It's prohibited for sprouted grains, below.

MR. RIDDLE: Okay, right. And then I also had a question on 7 and 8, on the raw manure extracts. There 90- or 120-day would apply, but it says "foliar applications are prohibited." That's a strong word, "prohibited." So even if there's more than 120 days, foliar application -- I don't -- what's the basis for that?

MS. KOENIG: You know, again, a lot of the -- you know, the basis of all the restriction -- the (inaudible) of the task force was human pathogens, and again, because of the composition of that task force, there were individuals on -- you know, you had individuals that had a great comfort level with compost teas, and then there were individuals that had no comfort level --

MR. RIDDLE: Yeah.

MS. KOENIG: -- and this basically was -- you know, that -- coming together of those two groups. Most people -- you know, it's similar to the 90/120 day, why is there 120 and why is there 90?
MR. RIDDLE: Right.

MS. KOENIG: Well, it's an extension of that, they just felt that foliar application -- to be safe, at this point in time, again --

MR. RIDDLE: So it's really: an abundance of caution.

MS. KOENIG: It's abundance again.

MR. RIDDLE: Yeah.

MS. KOENIG: And again, it's based on the data available today -- well, actually, April 6th, 2004 --

MS. SONNABEND: Or lack of data available to --

MR. RIDDLE: And lack of data, okay. I just wondered --

MS. KOENIG: So lack of data available.

MR. RIDDLE: -- if there was something I was missing on that --

MS. SONNABEND: Right. No.

MS. KOENIG: It's the precautionary principle (inaudible) --

MR. RIDDLE: No, it's "prohibited," "foliar application of manure tea prohibited," period.

MS. KOENIG: Goldie.

(No audible response.)

MS. KOENIG: Goldie. I'm sorry, Mark, do you want to call on her?
MS. CAUGHLAN: No, that's fine, I forgot --
CHAIRMAN KING: Well, it's --
UNIDENTIFIED MALE VOICE: Goldie's (inaudible).
MS. CAUGHLAN: Well, I was just going to point
out that wheat and barley are both used for juicing, sprout
and then juice.

MS. SONNABEND: Prohibited for sprouting.
MS. CAUGHLAN: However, it is isn't -- but I
think that's another step. In other words, I take that
indicator to mean you couldn't use -- the way that read, to
me, was: meaning you don't do alfalfa sprouts in a liquid
tea, soak, or something like that, I mean -- before they
sprout, but where you're taking a mature grain crop and
then you're making a wheat sprout and then you're juicing
it, that's a direct --

MS. KOENIG: I think that that is a good point --
MS. SONNABEND: Well --
MS. KOENIG: -- and what we can do is -- you
know, we're not voting on this during this meeting, we're
just presenting.

MS. SONNABEND: I also think that, you know,
while it might be a concern, the chance of anyone using
compost tea on a grain crop, economically, is like -- so
minimal that I don't think it realistically is going to
(inaudible).
MS. GOLDBURG:  Sure, but if you're writing a standard, you don't write it to that.

MS. KOENIG:  Right.

MS. SONNABEND:  Right.

MS. KOENIG:  And I think that that's a valid point, Goldie, so what we can do is, you know, make note of that and then just kind of look over the recommendation and see where -- see --

MS. GOLDBURG:  I mean, it's also true that commercial --

MS. KOENIG:  I think --

MS. GOLDBURG:  -- commercial growers can use --

MS. KOENIG:  Right.

MS. GOLDBURG:  -- compost tea to their heart's delight.

MS. KOENIG:  And I think that the intent of the--

MS. GOLDBURG:  With no safety standards, so --

MS. KOENIG:  -- the intent of kind of that sprout, we probably thought that we were covering it underneath that, but it's really not defined, so it's a pretty -- I think it's a valid -- a valid point.

MS. GOLDBURG:  Conventionally [phonetic].

MS. KOENIG:  Thank you. Anything else?

(No audible response.)

MS. KOENIG:  Thanks.

R & S TYPING SERVICE - (903) 725-3343

5485 S. LIVE OAK, GILMER, TX 75644
CHAIRMAN KING: Thank you very much for all your hard work. That was fantastic. I know it took a lot of time and there were some challenges, so --

MR. SIEMON: I'd like to make a motion of no task forces over five people.

(Laughter.)

CHAIRMAN KING: Rose may accept that.

(Laughter.)

MR. RIDDLE: I have a question about the process.

CHAIRMAN KING: Quick comment.

MR. RIDDLE: I know we're not voting on this as a recommendation, but should the Board go on record as accepting this report? I mean --

UNIDENTIFIED MALE VOICE: Yes.

MR. RIDDLE: Well, I'd move that we accept the Compost Tea Task Force report.

CHAIRMAN KING: Is there a second?

MS. COOPER: Second.

UNIDENTIFIED FEMALE VOICE: Second it.

CHAIRMAN KING: I'll take Ann, I saw her first. It's been moved and seconded, moved by Jim Riddle, seconded by Ann Cooper, that we accept the Compost Tea Task Force report.

All those in favor say aye.

BOARD MEMBERS: Aye.

R & S TYPING SERVICE - (903) 725-3343
5485 S. LIVE OAK, GILMER, TX 75644
CHAIRMAN KING: Opposed, same sign.

(No audible response.)

CHAIRMAN KING: Motion carries.

MS. KOENIG: Mark, just --

CHAIRMAN KING: Yes.

MS. KOENIG: So a point of process too, is that -- so this'll -- it's on the web, we'll accept public comment, it'll be posted, we'll be taking public comment on the recommendations, and then --

CHAIRMAN KING: Is that your desire?

MS. KOENIG: Yeah.

CHAIRMAN KING: Okay.

MS. KOENIG: Because we need to vote on it in the next -- at the next meeting.

CHAIRMAN KING: Okay.

MS. KOENIG: So we will officially be -- so it'll be posted for the public to comment on, and then we'll be voting next meeting on it.

CHAIRMAN KING: Okay. Now we're to the point in the agenda where we'll actually be voting on committee recommendations, and we're going to start with materials committee, that of course doesn't have any materials but has a couple recommendations.

MS. KOENIG: Okay, the Sunset Proposal, Provision, that was posted on the web, and that we
discussed earlier, again, it wasn't up and submitted in
time to make a formal vote, so we're not asking for a
formal note.

Additionally, the National Organic Program sent
us some documentation last week, with what they believe is
a better version of our -- you know, they've taken our
Sunset Provision, they've reviewed it, they've considered
things such as the whole federal rulemaking process, that I
think that we considered but, in our naivete of the
process, I don't think we really understood the full
implications of a 5-year sunset and what that meant in
terms of the time frame of how we have to proceed in this
process to get it all done by 2007.

I've thought long and hard, and, you know, I've
been -- people say, "Oh, you look horrible" (chuckles) at
the end of the day, there's many reasons why you do, but,
you know, I take this -- you know, this role very
seriously, and I take the Sunset Provision and materials
quite seriously, and I certainly want to do -- you know,
represent the growers that I represent and what's in the
best interests of the industry.

Having said that, and thinking about the process,
I've asked Arthur Neal to come and give him an opportunity
to really fully explain the proposal that they've worked
with, the modifications that they have made, and we've met
as a committee and talked about a few areas that we suggested needed a little more thought, and -- so, you know, I don't know if he had time to digest that information.

But the one thing that I think I always come back to, and I think we all have to come back to, in this process -- well, there's two things: one is what our concept of Sunset Provision is, and partly I think it's kind of in a misinterpretation of what a sunset provision is, by the Board. Many times, as we're doing our work, we've always thought about the sunset, you know, and I've heard it many times, "Well, we don't have" -- you know, "we'll put it on, and in 5 years we're going to be reviewing everything anyway."

So we've looked at it, and we've kind of -- at least myself personally -- have kind of, you know, identified it as a time for full review. However, you know, again, because I'm naive to what a sunset is in a regulatory sense, I think we need to listen and understand what sunset means, you know, as -- as far as regulatory aspects, and that was explained in the letter that -- and the documents that we received prior to the meeting and hopefully the NOP is going to share with us.

So I think we need to be open-minded with the concept of what sunset means in a regulatory perspective,
and then, more importantly, the one thing I always have to remind myself is that the sunset is just mechanism, you know, one kind of safeguard in the system, to review. There always is the opportunity to question things that are on the list, okay, and that -- you know, we always have to go back to that point, that at any time anyone has the opportunity to put in a petition to remove something from that list -- and really, that's for the community to understand.

So the sunset we thought was -- you know, again, some of us thought as "the mechanism," but I think we need to really rethink what the sunset mechanism is and, again, just acknowledge that there are -- there is a second mechanism for the public to address materials that -- that may need to be considered to either be -- you know, be considered on the list.

So, with that introduction, Arthur -- or I'm not sure who in the NOP was going to --

MS. ROBINSON: Mind if I be Arthur [phonetic]?

CHAIRMAN KING: You can be whoever you want, Barbara.

(Laughter.)

MS. ROBINSON: Do I have to identify myself again? Barbara Robinson, Deputy Administrator, Transportation & Marketing Programs.
Thanks for all your remarks, Rose, that you just made, because a lot of those we are certainly in agreement with, and hopefully then it'll just make our presentation a little bit briefer.

MS. KOENIG: No, don't make it briefer.
(Laughter.)

MS. ROBINSON: We do thank the Board for the recommendation on sunset, we appreciate it very much, and we understood the amount of time and thought that went into it. While you were at work on your recommendation, we also were doing research on our end, about what is a sunset, because we had many of the same questions that you had, and so we did that kind of research, we looked at legislation.

Sunset is not unique to this program, it does happen with many laws or many regulations, and what we found was the following, and I believe most of this we explained to you, but the public probably doesn't know this.

Sunset is not -- is typically an expiration that would occur -- it's a call for a review of the conditions that warranted the law or the regulation in the first place.

In the case of this program, sunset is: a call to review the conditions that warranted putting a material on the National List in the first place.
So try and think about this -- and Rose brought up a very good point. If you have trouble getting your arms around that, that we're asking the public and the Board to review the conditions, not the material, if you have trouble getting your arms around that, remember: since this program has been implemented, only two petitions have been submitted to the Department to remove a material from the National List. One was for cornstarch, on the basis that there was apparently an organic supply of cornstarch available, the Board considered that and rejected that and left cornstarch on the list; the second was sodium nitrate, and the Board again took public comments on that and the Board decided to leave sodium nitrate on the list.

But that provision is available to any person at any time, so that -- if you want to think of that as the trap door, another mechanism, a failsafe provision, however you want to think of that: that is always there.

Now, from our perspective, sunset is a public process. It's facilitated by rulemaking through the National Organic Standards Board's mechanisms. You are the integral part of this process. The reason that we believe that this must be done with rulemaking, aside from the fact that our lawyers will stand there and tell us "that's the only way you're going to do it," but there's a good reason.
for that, and I'm going to use these words that you've
heard us use, and then I'm going to say something about
them:

The reason we do this through rulemaking, with
the public fully engaged, is that in that way we pretty
much ensure -- not altogether, but pretty much -- we ensure
that neither the Department -- and it's important that you
understand this, neither we nor you would appear to be
arbitrary, or capricious.

Now, we use the words all the time, and, you
know, it strikes me that they have a very negative
connotation, it makes it sound like you willy-nilly pick
things out of the air and decide what to do and, you know,
reward your friends and punish your enemies, and that's not
what those words mean.

It just means: unintentionally or not, because
we all come to the table with biases, doing it in an open
rulemaking process is a way to minimize that from
occurring.

So the important thing to remember about this,
and this is important for the people who are sitting in
this room today, two points: if the public does not weigh
in -- explicitly, everybody, you can't just think it, you
must communicate, in writing, however that is -- to the
Board through the Department -- whether you believe there
is still a continued need for these materials on the National List, if you do not do that, if we receive no comment on material X, on October 21, 2007, regardless of what the Board thinks, the material goes away. It will not be available for use. If it is a prohibited material, it will be available for use. Okay?

So the public must get engaged in this.

MR. RIDDLE: I missed that last part.

MS. ROBINSON: If there is no public comment, if the public is silent -- let's just pick a material. Sodium nitrate. I don't care. Pick anything.

UNIDENTIFIED MALE VOICE: No, that's not a good one.

MR. RIDDLE: No, I just meant --

MS. ROBINSON: Whatever. Material X.

MR. RIDDLE: The part about if it's prohibited --

MS. ROBINSON: If it is -- if it's a material for which there is an exemption, it's an allowed synthetic, and there is nothing from the world at large that yes, this need -- a need continues to exist for this material, then we can only conclude the need no longer exists; therefore, it will no longer be allowed.

If it is a prohibited material and we hear nothing, then we will conclude that it must be okay, and it will then become allowed to be used.
MR. RIDDLE: You mean a prohibited natural.
MS. ROBINSON: Yes.
MR. RIDDLE: Okay.
MS. ROBINSON: Yes.
MR. RIDDLE: Okay, good.
MS. ROBINSON: What did I say?
MR. RIDDLE: That's what threw me.
MS. ROBINSON: Did I say prohibited synthetic?
CHAIRMAN KING: No, you just said prohibited.
MS. ROBINSON: Oh, okay.
UNIDENTIFIED MALE VOICE: You can imagine
(inaudible).
MS. KOENIG: Barbara, I just wanted -- because I see alarmed faces and I just wanted to -- because I also was -- the state of shock. The -- what Keith had explained to me, you don't -- in the sense of something that's on the list in either category, you don't have to provide additional information, it's simply a letter stating that -- you know --
MS. ROBINSON: It can be as simple as --
MS. KOENIG: -- Farmer A, "I use" --
MS. ROBINSON: Yes.
MS. KOENIG: -- "X-Y-Z" --
MS. ROBINSON: Yes.
MS. KOENIG: -- "A-B-C-D, E-F-G," I could list
MS. ROBINSON: Yeah.

MS. KOENIG: -- and say "I need all of these."

MS. ROBINSON: That's --

MS. KOENIG: That's public comment, it stays on.

MS. ROBINSON: All you need to do is put a placemaker down, okay?

MS. KOENIG: Okay.

MS. ROBINSON: Write us a letter: you need this material, the need still exists for this material --

UNIDENTIFIED FEMALE VOICE: So it's not a petition.

MS. ROBINSON: No. In fact, that's one thing the sunset review is not: it is not a petition process.

MS. KOENIG: Okay. So trade organizations --

MS. ROBINSON: Like I said at the beginning -- yeah. Anybody --

MS. KOENIG: -- organizations, individuals --

MS. ROBINSON: Yeah.

MS. KOENIG: -- as long as it's submitted --

MS. ROBINSON: Yeah.

MS. KOENIG: -- then it stays --

MS. ROBINSON: Anybody.

MS. KOENIG: -- everything is status quo.

MR. RIDDLE: And there doesn't have to be any
evidence, just a statement.

MS. KOENIG: No.

MS. ROBINSON: No, not -- not --

MS. KOENIG: Status quo.

MS. ROBINSON: No, you're just going to tell us
-- all we want to know is: do you believe that there is a
continued need for the material? Just write us a letter
and say, "We need it." That's good enough, to keep this
process going.

MR. ARTHUR NEAL: Arthur Neal, National Organic
Program. And what Barbara's talking about is at -- the
advance notice of public rulemaking level, because there
are three -- and she hasn't gotten there yet, but there are
three different levels: advance notice of public
rulemaking; proposed rule; and final rule.

MS. ROBINSON: Right. So we will publish an
advance notice of proposed rulemaking, and the guts of that
will be the document that you already have, the sunset
review process, because we tried to develop -- think of it
almost like a preamble, okay, what is this process about;
for everyone else, this is -- is this on our website yet?
(No audible response.)

MS. ROBINSON: It will be? So that everyone else
can read what the Board has been sent.

Now, another point I want to make, before we get
to the process a little bit, I want everyone to understand: there's sort of a feeling and people sense: okay, sunset, it's an event. Sunset is not an event. From now on, sunset is an annual activity that will take place. You understand that.

Every year that you add materials, 5 years later someone is reviewing the need for those materials to continue. This is the first board that will initiate a sunset process, but some of you won't even be on the board by the time sunset -- this sunset occurs. But understand that in 2012 -- if we all are still here --

(Laughter.)

MS. ROBINSON: -- in 2012, this big clump, okay, the one that became active October 21, '02, this whole big clump of materials has to go through it again, plus any materials added by the Board through rulemaking in 2007.

Therefore, what you want to realize is that sunset is a growing activity, it will become a bigger and bigger job every year, assuming boards continue to add materials to the list. Because it never is just a one-time review to see if it's okay; it goes on in perpetuity.

And that's one reason, that's a very important reason, why the process that we laid out for you through rulemaking, it must withstand this annual action by the Board and participation by the public.
So we could not write procedures for a sunset as if it was a one-time event, we have to put something in place, because what -- again, what you're doing is -- like we've talked about before, here we go creating the process again, for future boards.

So, as Arthur started to say -- do you want me to go through these three stages real quick?

MS. KOENIG: I -- one -- because -- I think it's important, and one of the questions that I had, in terms of the advance rulemaking:

When it goes to public comment, even on the process -- because what I'm assuming is that we also -- there's going to be public comment on this process? You said it would be on the NOP website, but the first rulemaking is rulemaking of the process; correct?

MS. ROBINSON: No. No. An advance notice of proposed rulemaking is the Department's way of saying to the public at large: we are about to engage in rulemaking, heads up. Now, the public is certainly -- the public is always free to comment to us, Rose, the public can write to us and, you know, windows don't close, we don't say, "We don't care, we don't want to hear from you," we never say that. Sometimes we take what you give us and we think about it, but, you know, we don't take it, but we will always take input.
So the ANPR -- what?

MR. RIDDLE:  George had a question.

MS. ROBINSON:  Oh, I'm sorry, George.

MR. SIEMON:  I had several questions here. So if those conditions are established, question one is: who establishes that condition, one letter is enough, or is it -- somebody makes a judgment that the condition still is needed?

MS. ROBINSON:  Well, let me walk through that.

MR. SIEMON:  All right.

MS. ROBINSON:  Okay? We put out the ANPR and we tell the public -- and we do, in the ANPR --

MS. KOENIG:  No acronyms.

MS. ROBINSON:  Huh?

MS. KOENIG:  No acronyms.

MR. RIDDLE:  Advance notice of public rulemaking.

MS. ROBINSON:  Oh, I'm sorry. I'm sorry. ANPR means advance notice of proposed rulemaking. Forgive me, I shouldn't do that. That's the heads-up I was just talking about.

Now, remember back to when this rule itself was being created, there was a Proposed Rule, and then there was a Re-Proposed Rule, but there's -- normally there's a proposed rule, everyone is free to comment, the Department takes the comments, Department digests the comments, the...
Department is obliged to answer the comments through rulemaking, it does so when it publishes the final rule, and then there's even usually some -- well, very often there's still a comment period that's allowed after the final rule.

But what we will do is we'll publish the advance notice of proposed rulemaking and we will tell the public: here's what you need to do, and all that you need to do is communicate to us in writing, and we'll probably allow electronic, but let us know whether or not you believe a continued need exists for any or all of these materials, and that's all they have to do, at first.

That then triggers sort of the universe of materials that the Board is going to look at, and it will also trigger -- hopefully not, but it will trigger a subset, which we haven't heard anything, from anybody about.

Now, before -- I don't want to -- Arthur's much better at going through all the particular details of what's going to be involved in the proposed rule, so I'm going to let him walk you through that process, but then we'll take any questions that you have.

MR. NEAL: In the proposed rule, what happens is that the Board has now formulated their recommendation in terms of -- they've assessed all of the public comments
generated through the advance notice of proposed rulemaking -- yes, ma'am.

MS. KOENIG: Okay, I think there was a step left out.

MR. NEAL: Uh-huh.

MS. KOENIG: According to your documentation. So Barbara made it sound like it was simply a little letter, that said yea or nay, and what in fact your policy says is that if something affirms something on the list, then you, as an individual, can say: yes, we need this, that's all the documentation that's necessary. Or -- step one.

UNIDENTIFIED FEMALE VOICE: An ANPR step (phonetic).

MS. KOENIG: Okay. But the other -- isn't this step one at ANPR stage if you say -- you say: hey, there's something on there I don't want --

MR. NEAL: Right.

MS. KOENIG: -- and you said -- sorry, I don't want to say "you," because I'm assuming --

MR. NEAL: Right.

MS. KOENIG: Isn't -- based on your document, a set of information and data that you must then provide, that requires more than just a letter at that stage --

MR. NEAL: Let me explain --

MS. KOENIG: -- and that's an important point,
that I think needs to be explained.

MR. NEAL: -- a little more to you. You've got
to take into consideration this big picture. There have
been years of activity taking place to put materials onto
the National List.

When you take into consideration how materials
have made it onto the List, they've gone through scientific
research, they've gone through public comment, and final
rulemaking, so the data that supports materials that are
currently listed on the list already have a foundation
established.

Now, through the ANPR, you can't tell a commenter
what they cannot say. They can say, "We want the
material," they can say, "We don't want the material."
However, there is a reverse consequence for saying, "We
don't want the material," because the same way that a
material was recommended for inclusion onto the National
List is the exact same way a material has to be pulled off
of the National List, which means that if the
recommendation is made that "We do not want the material
any longer, there's no longer a need," that has to be
justified. That need no longer has to be justified -- I
mean that need has to be justified.

MR. RIDDLE: I'm confused, then, because I
thought things automatically expire unless someone says
they're needed --

MR. NEAL: I'm not finished.

MR. RIDDLE: Okay.

MR. NEAL: Now, the Board has the opportunity, because the Board assesses the comments -- because you're going to get comments that say, "We want it," you're going to get some comments that say, "We don't want it." The Board can either attempt to justify the fact that there's no longer a need for the material or just rest in the fact that this material has already been vetted by prior boards --

MS. CAUGHLAN: Has what?

MR. NEAL: -- already been vetted by prior boards and recommended for inclusion onto the National List and there is a need that has been established, in formulating their recommendation.

Do we understand?

MR. RIDDLE: Yeah, so far.

CHAIRMAN KING: We're hoping there's more.

MR. NEAL: Okay.

CHAIRMAN KING: Okay.

MR. RIDDLE: -- to follow [phonetic].

MR. NEAL: If the Board decides that there is no longer a need for the continued use of a substance, then that need -- the need has to be justified to no longer
exist, and what Rose is talking about is how you document the non-existent need for the use of a material, and that -- that entails that the material has a negative -- what is it --

MS. KOENIG: It's the three points in OFPA that we used for -- during the petition process and evaluation. It's the environmental -- there's a -- you know, detrimental environmental impacts, a wholly natural substance is available, and -- give me the third one.

MR. NEAL: And that it's not consistent with organic farming and handling.

MS. KOENIG: That's not -- okay.

MR. NEAL: So the needs to this [phonetic] -- you'd have to document the substance is harmful to human health or the environment, the substance is not necessary to the production of agricultural products because there is an available wholly-non-synthetic substitute product, and the substance is not consistent with organic farming and handling. Kim.

MS. DIETZ: When we had talked earlier from the materials committee, is it the public that's providing us with this information or is the Board who's having to provide this information?

MR. NEAL: Both. It all depends on who's trying to justify that the need no longer exists. So if the
public makes that statement, that the need no longer exists, and you've got competing interests, you've got people out there saying, "There is a need for it" and you've got somebody saying, "There is no need for it," somebody's got to justify the position. And the position has already been laid for it to be on the list. The position that has not been lain is the one to take it off. That's why there is a process by which we say -- a petition process to remove a substance from the National List.

UNIDENTIFIED FEMALE VOICE: (Inaudible.)

MR. NEAL: Well, I know, that's why -- that's why we do not invite that type of activity.

MS. DIETZ: So this board may receive positive letters and negative letters and then it's the due diligence of the Board to say: okay, if there is not a need, then we need to document it with these factors that you're providing.

MR. NEAL: If there is not a need for it, right, correct. Yes, Rose.

MS. KOENIG: So -- and again, I had the privilege of looking at it, so I kind of processed it a little bit more, and what our -- again, you know, the points are again: the letter, keeping things on as a simple letter, again, making a change is the one where the burden -- I...
don't want to say the burden -- it's really the burden of proof, because that's the only way I can think of it in my feeble mind, is: the burden of proof is on the person who wants to remove something from the List, that exists, and this burden of proof that the NOP has suggested and has offered in their final Sunset Provision is acceptable to me because it's based on the OFPA criteria.

We're not pulling things out of the hat, we're not asking people to jump through new hoops, they're basically taking those three OFPA criteria, and additionally, there -- but there is two differences that I could pick out, and I just wanted to pinpoint -- you know, point those out.

One is, there is a greater emphasis on the -- because you're asking -- there's a request to really prove that there are alternatives, with data more than just what we're getting in some of these TAPs, like -- you know, I'll give an example of hydrochloric acid, that lactic acid and acetic acid is available.

The data would have to be provided that the form, the function -- there's a supply of those things, that there's readily-available alternatives and they work. And then -- so that's one difference.

And then the second difference is that there is an econom-- --
MR. NEAL: An industry impact.

MS. KOENIG: -- an industry impact statement, in addition to the OFPA criteria, that is written into the language of this final Sunset Provision, and that is the other, second point that I picked out that is distinct and different from what you're seeing in a regular petition process, and I think it would make sense to justify -- Keith did a great job -- understanding why the Office of Management & Budget requires that. So if you can --

MS. ROBINSON: Two points I just want to keep making here, for the folks in the audience. You understand now what we're asking, that when we public the advance notice of proposed rulemaking, a simple one-line, two-line communication to the Department is sufficient for, you know, putting your placeholder down. That is all that's required.

When we get to the proposed rulemaking stage and someone wants to argue to allow the use of a material to expire, we are asking -- as you just heard Rose: that burden of evidence is on the commenter and it will not be sufficient to simply go back and find whatever the Board did, you know, 5 years earlier, or whatever their debates were, and go get out that argument and restate it, because the Board, in its deliberations in previous years, had already determined, regardless -- you know, taking the
totality of evidence it had at the time, it determined that
that material met the criteria of OFPA.

So you must be able to show that the material no
longer meets the criteria, and the only way to do that,
that I can figure in my little brain, is: you must have
some new evidence that we don't know about, and that's what
the Board will then have to weigh.

MS. DIETZ: And you said this was during the
proposed rulemaking?

MS. ROBINSON: Yes.
MS. DIETZ: Okay.
MS. ROBINSON: I mean, you're free to submit --
UNIDENTIFIED FEMALE VOICE: Right.
MS. ROBINSON: -- all of that to us during the
advance notice of proposed rulemaking; we're just not
requiring that.

MS. KOENIG: And that is the note -- you know,
and after thinking about the process, something -- this is
to the Board and to the public: if there are materials
that you -- you know, you now know are going through
sunset, this is the time to start gathering data and
getting that information in as soon as possible, because
there's going to be a very short window of opportunity,
unfortunately, unless we can figure out a way to extend it,
that we, as a board, are going to be able to handle
anything that would contradict -- and I'm saying what
exists, you know, any of those second line --

MS. ROBINSON: Right. That's -- yeah.

MS. KOENIG: -- of products, things where we're
going to have to really evaluate, and it appears to me --
you know, and that -- that's the question I have for you.

There was this assumption that there could be
additional -- you know, there is -- and in your provision,
they allow for additional technical information to be
obtained, but in reality, the way things are going in terms
of our petition process, it's not a speedy, immediate
response.

MS. ROBINSON: That's one --

MS. KOENIG: So one of the challenges --

MS. ROBINSON: Right.

MS. KOENIG: -- and I'm asking you, I mean,
because I see this as kind of the area where we could get
caught up, is: how -- and I don't know if you've thought
about it: how can we get access to information quickly,
technical information, if we need it? Because we have,
based on what we were talking about, 90 days --

MS. ROBINSON: That's right.

MS. KOENIG: -- to come up with --

MS. ROBINSON: That's the other thing, is we --

included in the document that we have given to the Board is

R & S TYPING SERVICE - (903) 725-3343

5485 S. LIVE OAK, GILMER, TX 75644
a very detailed timetable that lays out this whole process from start to finish, and if you go through -- I think if you actually add up all the time in there, I think it actually adds to 41 months. That's why we're starting now.

The clock has already begun to tick, from our perspective in the Department. We know what we're up against in terms of OMB, we consider -- we are assuming the Office of Management & Budget will designate this to be a major rule. That has certain significance in the government. Once -- once it is determined that you are engaged in major rulemaking, which means you have a significant economic impact on businesses, of X number of dollars, and once you trip that switch, you trip multiple clearance and review levels throughout government, and you top it all off with Congress getting 60 days to review it themselves.

But it is such a laborious process to get through, that we -- we believe that it must be started immediately.

MR. RIDDLE: I've got two questions. It sounds like if somebody wants something to expire, or be removed, it's very similar to submitting a petition to remove, they've got to -- the burden of proof, the evidence, with new information, you know, is on that petitioner.

But you mentioned that you received two petitions

R & S TYPING SERVICE - (903) 725-3343
5485 S. LIVE OAK, GILMER, TX 75644
to remove and cornstarch was one of them, and do you know
from the records when that happened? -- because I can't
find when the Board voted on that.

   MS. ROBINSON: I honestly don't know, Jim.

   UNIDENTIFIED MALE VOICE: That's inside
   (inaudible).

   MR. RIDDLE: It hasn't been since I have, and I
can't find it in the records. I just wondered -- since you
said it, I figured you knew when that happened.

   UNIDENTIFIED FEMALE VOICE: We're in our fourth
   year, so --

   MS. ROBINSON: I just made it up.

   (Laughter.)

   MR. RIDDLE: Well, I didn't know.

   MS. ROBINSON: No, I'm just kidding.

   MR. RIDDLE: I mean, if you could say what year,
   I could look back at the minutes --

   UNIDENTIFIED MALE VOICE: (Inaudible.)

   MR. NEAL: I can't recall.

   MS. ROBINSON: The other --

   MR. RIDDLE: But the other -- the question is
   about the 90 days for the Board to review. Is --

   MS. ROBINSON: Right. And before you get to your
   question, let me just address the last part -- something
   that Rose asked, and that is: whether or not there could
be some sort of extension here. I know that we -- you
know, that's been talked about, "Well, if the Board is
working on it, if the Board is recommending it," you know,
"isn't that good enough, can't this keep" -- "go on?" The
answer is, unfortunately, no, and it's not because you're
in a regulation, it's because you are bound by your law.
The law is what will cause the lights to go out here. If
it was a matter of just, you know, adjusting the
regulation, we probably could figure out a way to do it,
but since it's a law, you know, that's the brick wall. So
we can't do that.

MS. KOENIG: Right. But worst-case scenario,
okay, let's just play hypothetical, because I think -- this
is just an issue for me. Worst-case scenario, say
product A, there's no -- there is a letter of support for
it, and then there's another letter, against it, with
evidence, okay, and we get this, and the points are really
valid, we find that there's enough OFPA criteria, but it
was one of those early-on petitions that did not have an
adequate TAP, in our opinion, we need to seek additional
technical information. That -- and I know you like to have
a really big docket, but hypothetically (chuckles) --

MS. ROBINSON: That's not our preference.

MS. KOENIG: Well, but -- I mean, hypothetically,
that product could be held back. I mean, the worst-case
scenario is: by doing that, you would trigger it off the list. Correct?

MS. ROBINSON: Yes. Are you asking if the rest of the list could move forward without --

MS. KOENIG: Yeah. The rest of the list could.

MS. ROBINSON: Yes. Yes.

MS. KOENIG: Okay.

MS. ROBINSON: Of course.

MS. KOENIG: So we are -- we're tied -- so there are ways, it's just --

MS. ROBINSON: Whoever is affected by that one material --

MS. KOENIG: -- will be mad [phonetic], right.

MS. ROBINSON: -- are the affected parties, yeah, and you might be hearing from them.

MS. KOENIG: Right.

MS. ROBINSON: But -- yes, but -- now -- and we will do our best to work with the scientific experts, you know -- we do have in AMS a scientific program area, food scientists, microbiological folks. We can consult with them. They have contacts in EPA and FDA. We will do our best to work to make sure that as much technical information as is necessary for the Board -- that we can make it available.

But remember what you're -- you will have to
weigh the evidence that is given to you, and there will have to be a -- I don't really want to stand here and say "compelling," but I would assume, if I was in your shoes, it should be pretty compelling evidence why it no longer meets the criteria that you determined it already met.

MR. NEAL: Well, it's really the need.

MS. ROBINSON: Yeah.

MR. NEAL: (Inaudible) there's no need.

MS. ROBINSON: Right. So -- okay.

CHAIRMAN KING: I have a quick question. I know we're talking about the process and procedures which we'll go through here, and I wanted to know the timeline that's listed, as --

MS. ROBINSON: Yes (inaudible).

CHAIRMAN KING: -- I'm guessing, sort of a -- somewhat of a draft, if you will, in this document, and I have been numerically challenged in the past, so correct me if I'm wrong, but it appears we have 41 months until the deadline --

MS. ROBINSON: That's right.

CHAIRMAN KING: -- from -- give or take a few days from today. As I add this up, there are a minimum of 32 months in the process.

MS. ROBINSON: Right.

CHAIRMAN KING: Now, that's not a big window.
MS. ROBINSON: No, it's not.

CHAIRMAN KING: But as we look at this as a board, 90 days clearly --

MS. ROBINSON: Yeah.

CHAIRMAN KING: -- is kind of "a train wreck waiting to happen" --

MS. ROBINSON: And that -- that's right.

CHAIRMAN KING: -- and so recognizing this difference between 41 and 32, perhaps that's an area we could --

MS. ROBINSON: Well, let's -- you know, I mean, we put down what we conservatively estimate --

CHAIRMAN KING: I understand.

MS. ROBINSON: -- everybody will want to have their hands on this thing and take a look at it.

CHAIRMAN KING: I understand.

MS. ROBINSON: And yes, one of the reasons we did it like this -- and it does look like it's cutting it close, that there's a little bit of a window.

A couple of things you want to keep in mind: This year is an election year. You know, I'm sorry to bring up politics, but it's a fact of life where we live, and when there is going to be a congressional election or a presidential election, people get a little bit more reticent, they get much more cautious about regulations.
that any agency -- not just us, but any agency -- is working on, and so there's -- you know, that just tends to slow the process down a little bit more.

To the extent that we can, if there are places we can save time, give the Board an extra 30 days, take 30 from us, something like that, we'll do it. We're not going to let this train wreck, Mark.

CHAIRMAN KING: I understand.

MS. ROBINSON: That's what the Board and importantly that's what this industry needs to understand: the Department takes it very seriously that this -- you didn't start this industry just to grind it to a halt 5 years later. That's not going to happen. So we'll get there. Andrea.

MS. CAROE: I actually have two questions. My first one is kind of basic and remedial, but tell me: when this -- when we go through the sunset, we do this procedure, are we putting something back on the list for 5 years or are we keeping it on the list for another 5 years?

MS. ROBINSON: You are renewing its exemption. If it's an allowed synthetic, you're saying: we've looked at it, we've considered all the evidence, we are renewing the exemption for this allowed synthetic for an additional 5 years, and that 5-year date will be the effective date of
publication of the Final Rule, and that will start the
clock over again, and it should be October 21, 2012, or
earlier, if a miracle occurred and we actually got this
done, you know, in the summer of 2007.

MS. CAROE: Okay. My next question, and this is
-- not to be the big black cloud over this, but: what
happens if, somewhere along this process, while somebody's
reviewing this, including, and not limited to, Congress,
somebody says "No" or "We don't like this" or "We want more
information" or "We want you to do something different,"
what happens to the --

MS. ROBINSON: Somebody -- who, like someone in
Congress says they want you to look at more?

MS. CAROE: You know, any -- OMB, OGC, anybody
along this path kicks [phonetic] this.

MS. ROBINSON: Well, the Department has to work
with its federal partners. Now, as far as telling you that
you need -- no one from Congress is going to come and tell
you, "Well, I want that material and you need to rethink
this." That is the Board's authority: to weigh the
evidence before it and make that determination. That is
your statutory authority: to renew this exemption.

MS. CAROE: I don't think anybody -- I'm not
talking about a technical issue as far as whether the
material's fit for organic or not, but I'm talking more of
a procedural issue or if they wanted something else done.

MR. NEAL: One of the things -- we've taken that into consideration, but that's captured in the timeline, because something could happen where they say, "No, this won't cut it," because it happened to us when we -- when we were developing the proposal, re-proposal, and final, they send it back, and they can take as much time as they need.

So that's why the timeline is such, because those things happen, and if we cut into the timeline, we cut into the opportunity to meet the deadline.

MS. CAROE: And then what happens?

MR. NEAL: We'll have to find out.

MS. CAROE: Okay. I just -- you know, I don't -- I don't know how these things work, and I know you guys go through this stuff all the time, but, you know, obviously business doesn't come to a screeching halt, there's got to be something -- you know.

MS. KOENIG: I had a question, maybe -- you know, and I think it's a good question to ask at this point. There's a number of annotations, okay, so on the proposal that you showed us, there was just two choices, it either stays on or it comes off. There may be cases where somebody wants it to stay on but they want the annotation removed, maybe they want an annotation that's not there.

Is this the point where those changes can be made in the
process, Keith, do you know that?

MR. NEAL: It really gets you into --

MS. KOENIG: Because there may be cases where people, you know, write a comment, not necessarily that any of the economics have changed but no -- you know, "this annotation is too small," and they can provide data, but is this the point where they would do that, where there could be made to changes --

MR. NEAL: I will not say straight up no, somebody cannot do that. However, I will say this. That gets you into a petition-type deal and not the continued need for the substance, because after the review process is over, they still can petition to modify an annotation.

See, what happens is that your workload -- you start to conflict your work, you start to conflict sunset review with petition process --

MS. KOENIG: So -- but that's the question. So it's not the forum for doing that, or --

MR. NEAL: No.

MS. KOENIG: Well, that's -- I think it's a valid question, because we need to know, and the public needs to know.

CHAIRMAN KING: Let's just -- there's a lot to discuss here, clearly, and Keith, you've got a comment, but I want to make one point first, and that is that we need to
wrap this up, literally, in the next minute. We've got petitioners here, materials to vote on. So if we could just wrap this up. And one more point before, Keith, you make your comment, is that this will be ongoing dialogue, so you need to understand this isn't the end here, it's just sort of opening it up and asking questions. So Keith. Thank you.

MR. JONES: Okay, I'll take a minute.

Rosie, I think you have to understand, is that once we get into rulemaking -- Arthur made a very good point -- we can't constrain the public to comment, okay, and the public may comment and say, "We want annotation X taken off," "we want Y annotation added." They're free to comment. That's what public comment is about, it's what notice and comment rulemaking is about.

I think as we analyze that set of comments, we're going to be reluctant, though, to accept those comments because we believe that that really is outside of the scope of the sunset process, and let me tell you why we believe that.

We can conclude sunset and then the Board has in its possession public comments, on a range of issues, that it can then take and look at and say, "You know, this is a pretty compelling comment for the removal of this annotation on X material," or Y -- or whatever, you know,
whatever the comment is, and then take an appropriate action straight up on that issue, and I think because of the workload you're going to be facing, it would be more prudent on your part to stay as narrowly focused as you possibly could in the material review process.

CHAIRMAN KING: Okay, I just want to make a quick thank you, Rose, for your questions and thought process on this and thank the Department for your comments.

A quick agenda adjustment, I'm going to move the handling committee up and we'll discuss those materials now, and then we'll come back with crops after the break, then livestock following that.

MR. O'RELL: So, Mark, are you ready to --
UNIDENTIFIED FEMALE VOICE: Same order?
MR. O'RELL: Tetra sodium pyrophosphate?
UNIDENTIFIED FEMALE VOICE: Well, nitrous oxide was first.
MR. O'RELL: Well, we were asked to make an adjustment in the order.
UNIDENTIFIED FEMALE VOICE: That's fine.
MR. RIDDLE: What's going on?
MR. SIEMON: We're trying to get (inaudible)
before our break.
CHAIRMAN KING: And there's some people who need to catch flights, and clearly we're a little bit behind, so
I want to get to materials, just so you understand.

MR. RIDDLE: Yeah, I appreciate it.

CHAIRMAN KING: It's not a coup, Jim, we're --

MR. RIDDLE: No, I just like to know (inaudible), because I thought we had a process.

MR. O'RELL: If everybody's comfortable with the change in the agenda now: tetra sodium pyrophosphate, as we discussed yesterday, was petitioned for the use as a pH adjuster and dough conditioner.

Following our report yesterday on tetra sodium pyrophosphate with our handling committee recommendation, we had discussion on the Board. We've incorporated -- when we had our breakout session we incorporated some of the comments from the Board, we also considered public comment that was made yesterday, and let me just go -- because we did this and we don't have copies for everybody --

CHAIRMAN KING: Arthur's going to try to pull it up for --

UNIDENTIFIED FEMALE VOICE: Just the voting form.

MR. RIDDLE: Yeah, that's just a blank.

MR. O'RELL: Just the voting form. But let's just go through and note the changes we did make, starting with Category 3.

UNIDENTIFIED FEMALE VOICE: Category 2.

MR. O'RELL: Okay, Category 2, yes. We did make
an addition on Category 2, Question Number 2, "Is there an organic substitute?", we had marked "Yes," but in our documentation and comments we also noted that this -- that what the petition stated with organic lecithin as an emulsifier was not applicable in this situation, it was confirmed by public comment and some other information that we had received prior to the meeting.

So we've marked "yes/no." Okay, Jim.

MR. RIDDLE: Yeah, I'm sorry, but I don't see anything to follow, but I'm trying --

MR. O'RELL: You don't have the sheet?

MR. RIDDLE: No.

MR. SIEMON: (Inaudible) your regular sheet.

MR. RIDDLE: Yeah, I thought they'd be in the meeting book.

MR. O'RELL: Okay, moving on now to Category 3, and when the committee met in its breakout session, we considered the comments that were made regarding the public testimony that we had put in the documentation column, which we agree we do not want as a board or a committee to endorse a product that may be on the marketplace or recognize products on the marketplace that shouldn't be.

So we are striking, in Question Number 1, under "Documentation," the -- starting with Public Testimony 91902, Dr. Bossy, "There are products currently labeled
'Certified Organic' in the marketplace."

We are leaving in Public Testimony 91902, Page 84, Tom Harding, "All these organic products have high consumer acceptance," period.

We are striking "and are certified by responsible accredited certifiers."

Any questions on --

(No audible response.)

MR. O'RELL: Number 2, "Is the substance consistent with organic farming and handling?" We had marked originally, as a committee, "Not applicable." We are changing that --

UNIDENTIFIED FEMALE VOICE: It was an error.

MR. O'RELL: It was an error, typo. -- to "Yes."

MR. SIEMON: Was it supposed to be "Yes" all along?

MR. O'RELL: It was supposed to be "Yes." It was a typo. And then we are striking again the same verbiage, Public Testimony 91902, Dr. Bossy, "There are no" -- "There are products currently labeled 'Certified Organic' in the marketplace."

And then the final comment on the Public Testimony by Tom Harding, "and are certified by responsible accredited certifiers," striking that sentence, that half of the sentence, leaving in "All these organic products
have high consumer acceptance."

Number 3, "Is the substance compatible with a system of sustainable agriculture?" We had marked "N/A," so we're striking all documentation in that column.

Now, Number 6, "Is the primary use to recreate or improve flavors, colors, or nutritive values lost in processing?" We have added three sections. The first one is a note from the TAP, tetra sodium pyrophosphate, TSPP, on Page 2, "The specific use petitioned is as a pH buffer and dough conditioner for use in organic meat-alternative products."

We are also including, from public comments made yesterday, testimony from Dr. Garish Ganjyal and Steve Ham, MGP Ingredients, quote: "Currently no alternatives exist for the functional properties displayed by TSPP when used in small amounts in this proprietary process. Extrusion processing is used in this proprietary process, which involves high-temperature and high-pressure cooking for a short duration. TSPP is unique because it has a high melting temperature and thus withstands the extrusion-processing conditions while maintaining its functionality."

We are also adding a quote from an e-mail that was sent on behalf of the petitioner to the handling committee, stating: "Texturization in the finished ingredient is the primary result of the thermomechanical
process during the actual extrusion process; i.e., pressure
heat shear at the die plate, forming heads, et cetera."

Now we go to the handling committee
recommendation to the full board. We had discussion based
on new information -- or public comment and information
from the Board, and we have -- we took a second vote, there
was a motion by Kim, seconded by Andrea, and let me just
pull this up and read this from the computer.

(Pause.)

MR. O'RELL: The motion was to allow TSPP under
205.605(b), with annotation, in quotes, "for use in meat-
analog products."

This is going back to the original annotation
that was voted on on the last Board meeting and striking
the word "texture." That vote was 6 yes, zero no, zero
abstentions, zero absent.

CHAIRMAN KING: Discussion?

MR. SIEMON: I guess I'd just like to know if
that annotation causes any trouble whatsoever for the use
of the product, I wouldn't think it would, so --

UNIDENTIFIED FEMALE VOICE: We -- no.

MR. SIEMON: Okay. Great.

CHAIRMAN KING: Andrea.

MS. CAROE: I just wanted to comment on that. We
had relooked at the not using an annotation and the concern
that this would be used --

    UNIDENTIFIED MALE VOICE: Andrea? I'm sorry.

    MS. CAROE: The concern was that if there was no
annotation, that it could open it up, actually, to improved
texture in other products, specifically meat. So that's
the reason we came up with an annotation that broadly
covered the petitioned request but didn't expand it to
where it would not meet criterias -- the criteria for
inclusion on the list.

    MR. RIDDLE: Yeah, I just want to express
appreciation for the work of the committee.

    MR. SIEMON: You going to do that with a motion?

    MR. RIDDLE: Yeah, I --

    MR. O'RELL: Should do that with a motion?

    MR. RIDDLE: Yeah, sure, I'd move approval -- no,
I'm not, I am not going to move the approval.

    UNIDENTIFIED FEMALE VOICE: It dies because of
lack of second.

    MR. RIDDLE: You guys almost tricked me.

    (Laughter.)

    MS. DIETZ: I'll make the same motion: to add
tetra sodium pyrophosphate on 205.605(b) as a synthetic,
with the annotation as a meat-analog --

    UNIDENTIFIED FEMALE VOICE: For use in.

    MR. O'RELL: For use in meat-analog products.
MS. CAROE: I'll second.
UNIDENTIFIED MALE VOICE: Jim, you could second it.
MR. RIDDLE: It already was.
CHAIRMAN KING: It has been? Who seconded?
MR. RIDDLE: Andrea.
CHAIRMAN KING: Andrea seconded. All right, so it's been moved and seconded that we consider the addition of TSPP to .605(a). Correct?
UNIDENTIFIED FEMALE VOICE: .605(b).
CHAIRMAN KING: .605(b), sorry, with the following annotation: "for use in meat-analog products."
Is there any discussion?
MS. GOLDBURG: I'm going to raise one point, because I think I'm going to vote against this material, and that is, I think that when we do vote, we ought to consider whether we need organic meat-analog products.
MR. CARTER: Yeah, I have the same concern.
UNIDENTIFIED FEMALE VOICE: (Inaudible) discussions (inaudible)?
CHAIRMAN KING: Okay. Further discussion?
MR. SIEMON: Well, if we're going to go that far, my concern always is, if you do that, then you have a "made with" product and you'll still have it out there -- instead
of being 95-percent organic, you're going to have it 70-percent organic, and we've actually done a disservice, because the market will always go to that lower one if they -- if that's what you're enforcing [phonetic], so to me, that's really important.

MS. CAUGHLAN: I think that's a very valid --

CHAIRMAN KING: Goldie, go ahead.

MS. CAUGHLAN: No, I said I think that's a very valid rationale.

MS. KOENIG: Can you elaborate on it a little bit, what you're --

MR. SIEMON: Well, if we prohibit this material, then they'll just put a "made with organic" claim and it'll be 70-percent organic, if we allow it, then people are able to make a meat analog, whether we need it or not, at 95. You're not going to stop the product from being on the marketplace and trying to go out to the organic consumer. Now it's a choice of enabling that to be 95 or we limit it to the 70.

CHAIRMAN KING: Kim.

MS. DIETZ: This same discussion we went into detail about 20 pages of the original time we voted on this material, and remember, if this material is also considered a processing aid, it does not need to be on the label. So on a "made with" product, you may have one ingredient and
it'll be a hundred-percent grain and on a "made with" label. So there is confusion out there to the consumer, and that's why we did not originally recommend a "made with" label.

CHAIRMAN KING: And I just -- I actually voted for this recommendation, I had a similar concern with George and I made the point of the "made with" category, and I guess one of the things that helped me to support it is: understanding, as I walk into a grocery store, that there are lots of consumers who -- vegetarians, primarily -- who do consume this product and who are supporting it.

And the second was that -- and I could be wrong on the math here, but it was .5 percent of TSPP in the actual ingredient that then goes into the final product, so I think we're --

MR. O'RELL: 10 percent in the final product.

CHAIRMAN KING: So we're talking about a pretty small percent. Dave.

MR. CARTER: Well, I just -- one of the things I'd like to ask too is just -- on the Category 1, down there under Number 10, the documentation says "as noted, tetra sodium pyrophosphate has been linked to kidney damage; however, all reviewers shared the consensus that the levels used in food manufacture should not pose a serious risk for most consumers," that's --
(Laughter.)

MR. CARTER: That doesn't give me a lot of confidence, that it "should not for most consumers."
That --

MS. DIETZ: That's what is written in the TAP, that's verbatim.

MR. CARTER: Okay.

MR. O'RELL: Yeah. I mean, the problem with that, that is exactly -- it's verbatim language from the TAP, but the fact is that if you look at the GRAS standing [phonetic] and everything else associated with the safety, it's not considered at these levels for a food additive, it's really not a concern.

CHAIRMAN KING: So if I'm hearing you correctly, Kevin, that science was based on much higher usage.

MS. DIETZ: There was another reference in the TAP where it said that most of the health risks were related to the medical industry, not food.

MR. SIEMON: Should we add that?

MS. DIETZ: It's in there, it's on our notes.

MS. CAUGHLAN: I'm just realizing that in our annotation we say "for use in meat-analog products," but this is really for use in meat-analog processing aid or ingredient that goes into the final -- you understand what I'm saying? There's a step there.
MS. DIETZ: (Inaudible) as a processing aid in meat analog --

MS. CAUGHLAN: Right. It's actually --

MS. DIETZ: (Inaudible.)

MS. CAUGHLAN: Pardon?

MS. DIETZ: That was the original annotation, and so we just felt that was the best one, but whether it's a process or a product, it ultimately is the final product.

MS. CAUGHLAN: And it's in there.

MS. DIETZ: And it's in there.

MR. O'RELL: Mark.

CHAIRMAN KING: Yeah.

MR. O'RELL: Can I address the kidney damage? If we're reading from the TAP, "extrapolation from rat models may overestimate kidney damage from sodium pyrophosphate as a food additive," and then it says, "but, overall, phosphate consumption may be more relevant because sodium pyrophosphate readily converts to orthophosphates," and orthophosphates we do have on the National List for approval --

UNIDENTIFIED FEMALE VOICE: For use in dairy.

MR. O'RELL: -- in dairy foods.

MS. KOENIG: And this wasn't -- it's not a comment to this product, it's just a general comment, because -- I mean, we heard it yesterday, and I guess I --
after thinking about it, I was a little uncomfortable with this notion that because something is GRAS or the idea of Good Manufacturing Practices makes something okay, because if that was the -- you know, that is the assumption, I mean that's why you have GRAS, that's why you have FDA, that's why you have testing, but in the -- in the OFPA sense, I mean, if that was the case, then there would never have been a criteria to ask the question.

You know, so the question -- somebody begged the question, because even though in that world, you know, there is that assumption, I don't think that we're supposed to put that in every category, that with Good Manufacturing Practices things should be okay.

I think that category acknowledges -- should acknowledge the data that is out there, and it can say with -- you know, "with GRAS it is" thing, but I don't think that we should just always just go over that and say, "Oh, of course," because we could answer that for everything, you know, pesticide use is fine as long as you're wearing applicators, but -- but we know in reality, as practitioners, that that's not always the case, and to me, that's why the criteria was -- is there, so that's all I wanted to say.

MR. O'RELL: Right. But I think that's only one factor that we're considering; we're not basing the whole
thing on the fact it's GRAS. In addition, the substance, in terms of anything linked in damage to human health, is very sketchy in the TAP.

MS. KOENIG: No, (inaudible), I'm not talking about this product, I'm just saying as we go through these forms, there's a reason why those questions are there, and the answer to everything is not "because it's GRAS," you know, you're supposed to think more about it, in terms of a more holistic concept.

MR. O'RELL: I agree. I think we did for this review.

MS. KOENIG: Okay.

MR. SIEMON: Call the question [phonetic].

UNIDENTIFIED FEMALE VOICE: Call the question.

CHAIRMAN KING: The question's been called.

MR. SIEMON: Twice.

CHAIRMAN KING: "Twice," George says. Okay, so, again, we're voting on tetra sodium pyrophosphate to be added to 205.605(a), with the following annotation: "for use in meat-analog products." All those in favor say aye.

MR. O'RELL: Wait, we've got to take a motion.

CHAIRMAN KING: We do, sorry. All right.

MR. SIEMON: It seemed so easy.

(Laughter.)

CHAIRMAN KING: I know. So we'll start --

R & S TYPING SERVICE - (903) 725-3343

5485 S. LIVE OAK, GILMER, TX 75644
UNIDENTIFIED MALE VOICE: Rookie mistake.
CHAIRMAN KING: It is a rookie mistake.
(Laughter.)
MR. SIEMON: Dave always did it in a different order each time, so --
CHAIRMAN KING: Yeah.
UNIDENTIFIED FEMALE VOICE: Katherine, are you going to be calling the vote, were you wanting to record?
CHAIRMAN KING: Are you recording the vote?
UNIDENTIFIED FEMALE VOICE: Just total.
CHAIRMAN KING: Huh?
UNIDENTIFIED FEMALE VOICE: Just total.
UNIDENTIFIED FEMALE VOICE: Do you want me to record the vote?
CHAIRMAN KING: Please.
UNIDENTIFIED FEMALE VOICE: (Inaudible) the yeas and nays and abstain --
CHAIRMAN KING: Hold on.
UNIDENTIFIED FEMALE VOICE: Give me a minute to put everyone's name down.
CHAIRMAN KING: All right. All right, we'll start over here, and we won't go the same way every time, okay, but we are going to start with Ann this time.
MS. COOPER: Yes.
CHAIRMAN KING: Ann says "Yes." Rose?
MS. DIETZ: Yes.

MS. COOPER: Yes.

MS. KOENIG: Yes.

MS. CAROE: Yes.

MR. SIEMON: Yes.

MR. CARTER: No.

CHAIRMAN KING: Andrea's "Yes," George is "Yes," Dave is "No."

MR. RIDDLE: A reluctant yes, hesitant, a slow yes.

(Laughter.)

CHAIRMAN KING: Mark, yes.

MS. DIETZ: Kim, yes.

MS. OSTIGUY: No.

MR. O'RELL: Yes.

MS. CAUGHLAN: Yes.

MR. LACY: Mike, yes.

MS. GOLDBERG: Becky, no.

CHAIRMAN KING: Okay, so we have 3 no's out of 13, so we have -- we have 10 yes votes, 10 yes, 3 no's.

UNIDENTIFIED FEMALE VOICE: 10 yes, 3 no's.

CHAIRMAN KING: 1 absent. Okay.

MR. CARTER: You forgot to ask if anybody has a conflict.

CHAIRMAN KING: Oh, yeah. Dave just noted I
forgot to ask: Does anyone have a conflict they'd like to disclose? Sorry. That's my second rookie mistake.

MR. SIEMON: I'm in the meat business.

(Laughter.)

CHAIRMAN KING: Just for the record: George is in the meat business.

(Laughter.)

MR. SIEMON: That's why. I have five heifers (laughs).

CHAIRMAN KING: All right, motion carries. Okay, Kevin, it's yours once again.

UNIDENTIFIED FEMALE VOICE: Is the next one nitrous oxide?

MR. O'RELL: It is, if I can find it.

(Pause.)

MR. O'RELL: Okay. Second material from the handling committee is nitrous oxide. We presented that yesterday, indicated that it is petitioned for use as a propellant, talked about some of the environmental concerns and the greenhouse effect. I know -- in the interest of time, I'm not going to go through all of that.

The committee recommendation: there was no change, there was no public comment given, and there was no discussion from the Board. So the committee, on the vote to allow nitrous oxide for addition to 205.6 failed, in a
vote: yes, zero; no, 5; no abstentions; and 1 absent.

That was as synthetic non-agricultural.

That was rejected, and that is still the handling committee recommendation to the Board.

CHAIRMAN KING: Discussion?

(No audible response.)

CHAIRMAN KING: Is there a motion to consider the recommendation?

MS. CAUGHLAN: I move.

CHAIRMAN KING: Goldie moves we consider the recommendation. Second?

MS. OSTIGUY: Second.

CHAIRMAN KING: Nancy.

UNIDENTIFIED FEMALE VOICE: Who did the motion?

MR. O'RELL: Goldie did a motion.

MR. RIDDLE: What's the exact wording, what's the wording of the motion?

MR. O'RELL: It's: to allow nitrous oxide for addition to 205.6, synthetic non-agricultural product.

UNIDENTIFIED MALE VOICE: To allow?

UNIDENTIFIED FEMALE VOICE: You have to vote to allow.

MR. O'RELL: The motion is to allow.

(Pause.)

CHAIRMAN KING: Okay, does everyone understand
the motion?

(No audible response.)

CHAIRMAN KING: All right. Here we go. Any refusals, any conflicts?

MR. SIEMON: Oh, yeah, I want to start thinking about whip cream.

(Laughter.)

CHAIRMAN KING: Yeah. You're not in the whip cream business, okay.

(Laughter.)

CHAIRMAN KING: Okay. We'll start with Becky.

MS. GOLDBURG: No.

UNIDENTIFIED FEMALE VOICE: The motion is --

CHAIRMAN KING: The motion is to allow, so a "No" vote means you will not allow it, we understand.

VOICES: Right.

CHAIRMAN KING: Okay. Mike.

MR. LACY: No.

CHAIRMAN KING: No.

MS. CAUGHLAN: Goldie, no.

MR. O'RELL: No.

MS. OSTIGUY: No.

MS. DIETZ: No.

CHAIRMAN KING: No.

MR. RIDDLE: No.
MR. CARTER: No.

MR. SIEMON: No.

MS. CAROE: No.

MS. KOENIG: No.

MS. COOPER: No.

CHAIRMAN KING: That's 13 no's, zero yeses, 1 absent.

Do you have anything else?

(No audible response.)

CHAIRMAN KING: Okay, I think we'll take a quick break, 15-minute break. My watch shows about 3:15, we come back at 3:30, and we will start with crops.

(Off the record at 3:15 p.m. and reconvened at 3:30 p.m.)

CHAIRMAN KING: Just real quick, as a board, finish up one quick order of business with the processing committee and then we'll move on.

MR. O'RELL: Yesterday we -- the handling committee submitted a written report, which was an update on materials used as food contact substances.

Unfortunately, this report did not get the 30-day published, so we can't vote officially on the recommendation, but what we'd like to do is to propose that we have a Board vote to accept this document, and then at least it will be posted again on the website and we can take future action.
From the handling committee, we are going to be working more on food contact substances and we'd like to recognize these six ingredients -- or six materials that we have formally approved for addition to the National List.

CHAIRMAN KING: Is there a motion to accept the report?

MS. DIETZ: I'll make the motion.

MS. CAUGHLAN: I'll second.

CHAIRMAN KING: Kim Burton moved that we accept the food contact substance report, and Goldie Caughlan seconded.

Discussion?

(No audible response.)

CHAIRMAN KING: I don't think we need an individual vote on this. All those in favor say aye.

BOARD MEMBERS: Aye.

CHAIRMAN KING: Opposed, same sign.

(No audible response.)

CHAIRMAN KING: Motion carries. Anything else?

MR. O'RELL: That's it from the handling committee.

CHAIRMAN KING: Thank you, Kevin. We'll move on to the crops committee now.

MS. OSTIGUY: Starting with soy protein isolate, the committee met this morning and discussed the comments...
that we received and the public testimony yesterday, and
the motion was to reject the TAP and request information
that does address the material used as a soil amendment.

The vote for rejecting the TAP was 4 yes, zero
no, and zero abstentions.

CHAIRMAN KING: Discussion? Andrea?

MS. CAROE: In the TAP, on the first page, in the
first paragraph, the last sentence, it says, "No informa-
tion concerning its use in either conventional non-organic
or organic plant fertilizer was found," so they looked for
it and they didn't find it.

I guess I'm asking: if you're sending it back,
what are you expecting them to find in the second look that
-- because clearly they looked for it, they just -- there's
no information there. We're sending it back for more
information, but they have acknowledged that there is none.
(Pause.)

MS. OSTIGUY: I'm not quite sure how to put this
nicely. I'm not sure how -- and this is nothing about you,
this has to do with the reviewer.
(Laughter.)

MS. OSTIGUY: I'm sorry. I saw the --

MS. CAROE: (Inaudible.)

MS. OSTIGUY: I saw the look on your face and was
like "Oh my God." No.
MS. CAROE: "Did I ask the wrong thing?"

MS. OSTIGUY: No, no, no. This is the -- the TAP contractor again.

This particular TAP reminded me of the original ones before they started doing some decent ones. I believe, based upon notes that I've taken and such, that there are some questions that they didn't attempt to answer. One does not need specific details about soy protein isolate specifically to be able to answer the concepts of what happens when you use these kinds of materials, which are some of what we want to know about, use in soil, it's not -- you know, you don't have to know -- the studies don't have to have been done specifically on soy protein isolate only, but anything that is similar to it, and I do not have the impression, based upon this TAP or our prior experience with this TAP contractor, that they would have asked questions in that context. I would at the very least like to know that. But --

MS. CAROE: Okay. Well, as I understand soy protein isolates, they are an extracted piece of a plant, not changed or synthesized in any way but just a sophisticated pull-out of that one piece, and I'm pretty familiar with the process from my lab background. That material is already in a plant. How different is using this material as using a green manure of soybeans? As far
as -- as far as the interaction in the soil --

    MS. OSTIGUY: There can be tremendous differences
with the bacterial interactions when you have extracted all
the other parts of a green manure from it.

    MS. KOENIG: It's the C-to-N ratio.

    MS. OSTIGUY: Excuse me?

    MS. KOENIG: It's the C-to-N ratio. In a green
manure --

    MS. OSTIGUY: I can't hear you.

    MS. KOENIG: In a green manure you have carbon in
association with nitrogen, and part of that nitrogen is --
part of the carbon is broken down by some of that nitrogen.

    In a product where you just have solely nitrogen, it's a
more quick release. And we're not saying that, you know,
that's either good or bad, but we're just saying that
there's implications in terms of that use of nitrogen
versus of other types of nitrogen in the system and we want
that to be -- to be comprehensively covered.

    And additionally -- and I'm sorry, Nancy, I don't
want to pull -- the discussion that we had after we
relooked over the definition of "synthetic" and -- there
was some discussion, you know, whether this in fact was a
natural, which was different than what the commenters said,
so there was kind of a change in position among the members
in our committee as far as the way we were looking at that.
But that said the processing, the hexane extraction process, was not covered in the TAP, and because manufacturing of the soy protein isolate is one of the OFPA criteria, we felt that we needed additional information about the manufacturing process in the sense of using hexane as an extraction material. We wanted to specifically know the environmental consequences and properties of that hexane and, really, whether there are alternatives to that in -- in just the criteria of manufacturing.

MS. OSTIGUY: Kim.

MS. DIETZ: So my question is, because we have deferred materials in the past and not given really good guidance on -- well, that's not true. We've not got back what we asked for.

So when we revised these forms, I was the one that recommended that if we defer, that we be specific in what we believe.

So all I ask this committee is to make sure that you are specific, if we're going to defer this material, so that we get what we need, so that this gentleman does not go on six years [phonetic] without voting on this material.

So I can support that, because I want this to have a very thorough review with this material and make sure we're doing the right decision, so that's just what I
would request and that -- you know, that we give a detailed
guideline to the TAP contractors.

    MS. OSTIGUY:  Jim.

    MR. RIDDLE:  Yeah.  Yeah, I think there are a lot
of detailed questions here, and I would like to add to it.
Rose just mentioned about the environmental effects of
hexane, and I don't see that in the list yet, because we
didn't know --

    MS. OSTIGUY:  It's in my notes.

    MR. RIDDLE:  Okay.  -- because we didn't know
that was part of the manufacturing process for sure.

    MS. DIETZ:  That's not true.  It was in the
original petition, and it was in the flowchart supplied to
the contractors, so I don't know what --

    MR. RIDDLE:  Okay.  Well, the TAP acted like they
didn't know.

    MS. OSTIGUY:  We didn't look at the material.

    MR. RIDDLE:  So I guess I was misled by reading
the TAP.

    UNIDENTIFIED FEMALE VOICE:  Yes.

    MR. RIDDLE:  And then also the role of legumes in
the crop rotation, the whole systems-type questions.  And
then I just have a question about what you mean, what the
committee means, the -- in your questions there, the fourth
line from the bottom, it starts:  Answer, Category 1,
Question A, "Is soy protein isolate persistence?", I imagine "persistent," but then, "can in concentrate"?

MS. OSTIGUY: Yeah.

MR. RIDDLE: What does that -- do you know what that --

MS. OSTIGUY: It -- in --

MR. RIDDLE: Oh, "can 'it' concentrate," okay.

Okay.

MS. OSTIGUY: Some of these, I know the answer.

They didn't answer the question.

MR. RIDDLE: Uh-huh.

MS. OSTIGUY: I can provide information.

MR. RIDDLE: Yeah. Well, you're not being paid $4,000.

UNIDENTIFIED FEMALE VOICE: We're board members.

(Laughter.)

MS. OSTIGUY: But I also want to make it clear that we aren't clueless about what the answers are.

MR. RIDDLE: Uh-huh.

MS. OSTIGUY: I --

MR. RIDDLE: Yeah.

MS. OSTIGUY: You know, I can do some of this off the top of my head without a problem.

MR. RIDDLE: You know, and I can support deferring it; I just don't have a lot of confidence in this
particular -- you know, our contractor to follow through.

    MS. OSTIGUY: Well, they have been done -- doing
a much better job generally and a much better job when we
ask for information when it's been incomplete.

    MR. RIDDLE: Yeah, but I look at the -- yeah.
Some of these others, the urea one is not very helpful
either.

    MS. OSTIGUY: Yeah. They have -- they have,
though, improved. And it may be that this is actually a
non-synthetic, you know, that -- it may be that
fundamentally inaccurate of a TAP.

    MR. SIEMON: That was my question.

    MS. OSTIGUY: Yeah.

    MR. SIEMON: You were not able to determine that
this is a synthetic?

    MS. OSTIGUY: Well, that was where we went around
and around in the conversation this morning, was: is it a
synthetic? is it a non-synthetic?

    MR. SIEMON: Okay. Then we're stuck.

    MS. CAROE: Well -- I mean, logically, it's -- to
me, it's a non-synthetic, because it's --

    MS. OSTIGUY: After hexane extraction?

    MS. CAROE: It's not molecularly changed. The
extraction is simply a method in order to take out a piece
of the original plant. It's not changed.
MS. OSTIGUY: Andrea, there was disagreement,
that's all I can tell you.

MS. CAROE: Well, I can tell you I believe it's
non-agricultural. I mean, it's been manipulated in a way
that it is -- no longer has its agricultural identity, but
it's not synthetic.

MS. OSTIGUY: Andrea -- yes, I hear what you're
saying. We had -- there were people that were -- stated
your opinion, there were people that stated others. There
was no conclusion that we were able to reach, as a
committee. Richard?

MR. MATTHEWS: Yeah. I need a bit of a
clarification on something. This is Richard Matthews,
Program Manager, National Organics Program.
I'm not sure I heard correctly a few moments ago
when there was discussion about the fact that there was a
question written onto the sheet and Nancy says she knows
the answer?

MS. OSTIGUY: I know the answer, but I -- I could
not -- this is not a test for them, but I'm not the one
that's supposed to be supplying everybody with the answer.
Now, I could write those out.

MR. MATTHEWS: Then I think you should, because
this Board has the responsibility for reviewing the
material, this Board is appointed --
MS. OSTIGUY: This --
MR. MATTHEWS: Wait a minute.
MS. OSTIGUY: This is not --
MR. MATTHEWS: Let me finish.
MS. OSTIGUY: -- going to finish the questions, though.
MR. MATTHEWS: That's okay. Let me speak my piece.

This Board is appointed because of expertise that they have, and I have serious problems with a board that would take the attitude that they know the answer to the question that wasn't answered by the scientists but they're not going to answer the question because they're not paid $4,000 to do TAP, and that is exactly what was said.

MS. OSTIGUY: That is not what I said.

MR. MATTHEWS: So, folks, if you know the answer to something fill in the blank, if there's something you don't know the answer to you can't fill in the blank, then send it back, but don't send it back, because you don't want to fill in the blank.

MS. OSTIGUY: That is not what was said, Richard. The reason for sending it back was lack of information. There are some things in here that they did not answer, that yes, I can't answer, and I would be willing to write those down.
CHAIRMAN KING: I would entertain a motion to consider.

UNIDENTIFIED FEMALE VOICE: Specifically what's the information that's --

UNIDENTIFIED FEMALE VOICE: There is a motion on the table.

VOICES: No.

UNIDENTIFIED FEMALE VOICE: Oh. No, okay.

MS. KOENIG: May I just say one thing, you know, as a comment to Richard and Nancy. I think -- you know, and I understand Nancy's point, and I don't -- I think -- I guess what we want to say is that we can supply information, but part of a technical review is actually to review the literature. I mean, it may be my opinion, and it may be Nancy's opinion. I mean, I have had basic bio- -- you know, we both have Ph.D. shift in sciences, but I'm not going to write down "Rose says" -- you know.

In order for me to document that and do it as a scientist, I would have to do a literature review and do a comprehensive analysis of those things, and I think what Nancy is saying is that she knows, you know, based on her scientific background -- just like I said, carbon-to-nitrogen ratio -- but, you know, to be -- to do a scientific evaluation, as a scientist, it's our job to go into the literature and referee publications and document...
that fact. That's part of the scientific process.

So Richard, we will do our job and we will supplement information, but in order for us to do a literature review on things, it's a considerable amount of time, and what we're saying is that we can look at data -- I mean, to me, our role -- and correct me if I'm wrong -- is to use our expertise to analyze documentation, to see if we can support it or not support it.

If there's areas that we don't support, then we need to confirm that. But I think what's Nancy's saying is it's -- you know, if we have time, we can do some literature review, but the idea of contracting out that information is for a contractor to actually gather that information and do literature review.

So -- that's just my comment.

CHAIRMAN KING: Is there a motion to consider?

UNIDENTIFIED FEMALE VOICE: Let George have his (inaudible).

MR. SIEMON: I just had a basic question, that maybe is too basic, but: If it was synthetic, is it possible for you to consider this as a fertilizer? Because one of the TAP reviewers says no, you can't, if it's -- so I just need that clarification.

MR. RIDDLE: Well, that's --

MR. SIEMON: If it was declared synthetic, is it
possible to consider it as a fertilizer? I just need an --
I don't -- that's the basic -- I've read the law here,
under what they refer to as -- 6508(b); I just need to know
what ya'll -- I need some help.

MS. KOENIG: Can I -- just from the basics of the
committee, if it was a synthetic, if it stays within that
category -- and again, this is my opinion after sitting on
conference calls and getting kind of a general feeling of
the group -- it would end up being synthetic, not allowed,
because there's plenty of natural sources of nitrogen out
there. Okay?

All the reviewers said it was synthetic. You
know. So if we use the documentation provided to us by the
contractor, then we would go the route of: synthetic, not
allowed.

What we're saying, as a committee, is: hey, this
may actually in fact be a natural, and we may not even have
to go there, but from the information that was provided, we
see there is an extraction method involved in that, and we
place -- there is some concern that there perhaps are other
materials that could be used in an extraction process that
may warrant us to look at it as a non-synthetic but,
however, may stick it in a "prohibited" category, with an
annotation only allowing certain extraction methodologies.

So that is really, you know, kind of where the

R & S TYPING SERVICE - (903) 725-3343

5485 S. LIVE OAK, GILMER, TX 75644
committee stands in terms of thinking at this point, but none of us were comfortable based on the lack of information and not having the ability to go into textbooks, at this point, to make a decision at that point, we did not think that that was, you know, in the best interests of the industry or the petitioner.

MR. RIDDLE: I move we defer.

MR. SIEMON: Second.

CHAIRMAN KING: It's been moved and seconded that we defer, moved to Jim Riddle, seconded by George Siemon.

Further discussion?

(No audible response.)

CHAIRMAN KING: Hearing none, for a vote, we'll start with you, Ann, this time.

MS. COOPER: Yes.

MS. KOENIG: Yes.

CHAIRMAN KING: Andrea?

MS. CAROE: I'm going to abstain.

MR. SIEMON: Yes.

MR. CARTER: Dave, yes.

MR. RIDDLE: Yes.

CHAIRMAN KING: Mark, yes.

MS. DIETZ: Yes.

MS. OSTIGUY: Nancy, yes.

MR. O'RELL: Kevin, yes.
MS. CAUGHLAN: Goldie, yes.
MR. LACY: Mike, yes.
MS. GOLDBURG: Becky, yes.

UNIDENTIFIED FEMALE VOICE: That's 12 yeses, 1 abstention, and 1 absence.

UNIDENTIFIED FEMALE VOICE: 12 yes and 1 --
UNIDENTIFIED FEMALE VOICE: -- 1 abstention, 1 absence.

UNIDENTIFIED FEMALE VOICE: Why was it deferred?
UNIDENTIFIED FEMALE VOICE: Inadequate TAP.
MS. OSTIGUY: Additional material.
MR. RIDDLE: It's in the committee's report.
CHAIRMAN KING: "Additional information needed."
MR. RIDDLE: "Details to be provided by committee."

MS. OSTIGUY: Okay, 6-benzyladenine. Is everybody ready? Okay. The committee discussed the public testimony that was presented yesterday. After the discussion the committee voted that the material was synthetic and rejected its addition to -- its addition to the National List because hand pruning is an alternative practice that is currently available and currently used.

The vote to reject -- or the vote to add was: zero to add, 4 no's, and zero abstentions. Discussion?

MR. SIEMON: I just -- is there anyone that can
confirm that people already hand-thinning? I heard yesterday that was the only way. Is that -- it is? Rose.

MS. KOENIG: One of the -- you know, again, in committee discussion, the -- the alternative hand thinning came up as a discussion item, that we thoroughly discussed, and one of the benefits of placing this on the web was we were hoping we were going to get public comment from farmers who felt that this was erroneous, but it over-- you know, a tax [phonetic] that was just too much, that they really needed these things.

The only public comment that we received was that of the petitioner, which really was a repeat of the same reasonings for including it.

So based on the fact that there was no public comment from farmers and producers stating they needed this, we assumed our -- that that alternative was not needed.

MS. OSTIGUY: Jim?

MR. RIDDLE: Yeah. In order to have a vote, I move that it be added to the List.

CHAIRMAN KING: Is there a second?

MS. CAUGHLAN: In order to have a vote I'll second it.

(Laughter.)

CHAIRMAN KING: It's been moved by Jim Riddle
that we add 6-benzyladenine to the List, and seconded by
Goldie Caughlan. Discussion, further discussion?
(No audible response.)

CHAIRMAN KING: Hearing none, we'll proceed to
vote, beginning with Becky.

UNIDENTIFIED FEMALE VOICE: That doesn't work.

Start with Rose. Just alternate.

CHAIRMAN KING: All right, we'll start with her.

MS. KOENIG: No.

CHAIRMAN KING: Rose says "No."

MS. GOLDBURG: No.

MR. LACY: No.

MR. RIDDLE: No.

CHAIRMAN KING: No.

MS. CAUGHLAN: Goldie, no.

MR. O'RELL: No.

MS. OSTIGUY: No.

MS. DIETZ: No.

MR. CARTER: No.

MR. SIEMON: No.

MS. CAROE: No.

UNIDENTIFIED FEMALE VOICE: 13 no's, 1
abstention.

CHAIRMAN KING: 1 absence.

UNIDENTIFIED FEMALE VOICE: Absence, I'm sorry.
MS. OSTIGUY: The next one was urea. Urea, the committee discussed, there was no additional information that was presented. Urea was petitioned for a use that doesn't exist with EPA, so we really can't even consider it.

MR. SIEMON: And this, used in a trap, is required for EPA clearance?

MS. OSTIGUY: Yes, it is. As an attractant, it does have to be listed. Now, it's probably not a difficult listing to do, but somebody would have to go through that process; and if somebody did, we have all the materials, then, to add it to the List at that time.

MS. DIETZ: Yeah. And this -- historically, we've done this before, we just archive the petition and archive all the information, that if it does come back up, then we can re-review the material, but it's just considered archived.

MS. KOENIG: I make a motion to archive it.

MS. DIETZ: I'll second.

MS. OSTIGUY: Okay.

MR. SIEMON: Do we need to vote on it?

MS. DIETZ: Yeah, I guess we do have to vote.

MR. RIDDLE: Well, it's clear, it's in the record --

CHAIRMAN KING: And I would entertain a motion to
add to that that we're accepting the committee's findings, so if we could --

MR. RIDDLE: You accept that as a friendly amendment?

UNIDENTIFIED FEMALE VOICE: Yes.

CHAIRMAN KING: So it's been moved that we archive the information on urea and accept the committee's findings. I'm not sure who made the motion. Rose made the motion.

UNIDENTIFIED FEMALE VOICE: Archive what?

UNIDENTIFIED FEMALE VOICE: Archive the petition and the TAP report.

CHAIRMAN KING: And accept the committee findings. Do we need an individual vote on this?

UNIDENTIFIED FEMALE VOICE: And who made the motion?

CHAIRMAN KING: Rose.

MS. OSTIGUY: Rose, seconded by Kim. Question, when you say you're accepting the committee findings, you're referring to the committee findings that it is not EPA-approved?

CHAIRMAN KING: Yes.

UNIDENTIFIED FEMALE VOICE: The whole review and everything.

UNIDENTIFIED FEMALE VOICE: We haven't really
detailed it.

UNIDENTIFIED FEMALE VOICE: We have not, no, received a report on their actual findings beyond (inaudible).

CHAIRMAN KING: My understanding is we're accepting the finding that it's not a legal EPA label claim.

UNIDENTIFIED FEMALE VOICE: That's correct.

UNIDENTIFIED FEMALE VOICE: That's what I wanted to clarify.

UNIDENTIFIED FEMALE VOICE: And it's -- basically, the committee recommended for deferred, so deferred and we're archiving it.

CHAIRMAN KING: Okay. We're going to start with Andrea this time.

MS. CAROE: Yes.

MS. GOLDBURG: Yes.

MR. LACY: Yes.

MR. RIDDLE: Yes.

CHAIRMAN KING: Yes.

MS. CAUGHLAN: Yes.

MR. O'RELL: Yes.

MS. OSTIGUY: Yes.

MS. DIETZ: Yes.

MR. CARTER: Yes.
MR. SIEMON: Yes.

MS. KOENIG: Yes.

MS. OSTIGUY: Last one, for crops --

UNIDENTIFIED FEMALE VOICE: What's the vote, please?

MS. OSTIGUY: 13 yes, zero no, no abstentions, 1 absence.

MS. CAUGHLAN: No, it's 12, 1, and 1. I mean --

CHAIRMAN KING: No, 13 --

MS. CAUGHLAN: You're right. I'm sorry.

MS. OSTIGUY: 13 yeses, zero no's, 1 absence, no abstentions.

(Pause.)

MS. DIETZ: Come on, girlfriend (inaudible).

(Laughter.)

UNIDENTIFIED FEMALE VOICE: Oh, but our table's not ergonomically correct.

CHAIRMAN KING: Pressure. Pressure.

(Laughter.)

MS. OSTIGUY: Okay, the committee considered the information that was provided yesterday during public testimony, and also the public comments that were received on hydrogen chloride's use for de-linting cotton seed.

A motion was made -- I believe by Rose, I don't remember who seconded it now -- to add hydrogen chloride to
the National List, with the annotation "for de-linting cotton seed for planting."

The vote was 4 yes, zero no, zero abstentions.

MS. DIETZ: I just want to make sure that you incorporated my changes into the original document, that I asked.

MS. OSTIGUY: Yes, it'll be going in. Any other comments?

MR. SIEMON: This hydrogen chloride is the same thing that was with the soy product; right?

MS. DIETZ: No.

MS. OSTIGUY: No.

MR. SIEMON: No?

MS. OSTIGUY: Are you thinking of hexane?

MR. SIEMON: Well, okay --

MR. RIDDLE: It's one of the materials, yeah.

UNIDENTIFIED FEMALE VOICE: It's one of the two materials in the extraction process, yes.

MR. SIEMON: That's what I mean.

MR. RIDDLE: After the hexane, then the other steps. Yeah, you're right.

CHAIRMAN KING: Okay.

(Pause.)

MS. OSTIGUY: Is there a motion?

MR. RIDDLE: I move approval, with the annotation
as stated by the committee.

UNIDENTIFIED FEMALE VOICE: I'll second it.

UNIDENTIFIED FEMALE VOICE: Can you read the annotation again, please.

MS. OSTIGUY: "For de-linting cotton seed for planting."

CHAIRMAN KING: Okay, it's been moved and seconded, and we're voting on hydrogen chloride, with the following annotation: "for de-linting cotton seed for planting." So we'll start with George.

MR. SIEMON: Yeah -- yes.

UNIDENTIFIED MALE VOICE: Was that two votes or--

(Laughter.)

MR. SIEMON: Well, I'm trying.

UNIDENTIFIED MALE VOICE: You're here in Chicago; you never know.

(Laughter.)

UNIDENTIFIED MALE VOICE: Yes.

UNIDENTIFIED MALE VOICE: Yes.

CHAIRMAN KING: Yes.

UNIDENTIFIED FEMALE VOICE: Yes.

UNIDENTIFIED FEMALE VOICE: Yes.

UNIDENTIFIED MALE VOICE: Yes.

MS. OSTIGUY: Yes.

UNIDENTIFIED MALE VOICE: Yes.

R & S TYPING SERVICE - (903) 725-3343

5485 S. LIVE OAK, GILMER, TX 75644
UNIDENTIFIED FEMALE VOICE: Yes.
UNIDENTIFIED FEMALE VOICE: Yes.
UNIDENTIFIED FEMALE VOICE: Yes.
UNIDENTIFIED FEMALE VOICE: And yes.

MS. DIETZ: I just want to commend that process on that material, because that was one that -- I think we remember it was originally a "No," we got public comment, and thank the committee for taking that back, that was --

MR. RIDDLE: And what about your comments on the language, that's just between -- the rest of us don't need to review that?

MS. OSTIGUY: Yeah, we've done that. GRAS. There was just comments --

UNIDENTIFIED MALE VOICE: Not now, you voted on it.

MR. RIDDLE: I know, we already voted, and (inaudible) --

UNIDENTIFIED FEMALE VOICE: I trust that (inaudible).

MR. RIDDLE: Okay.

CHAIRMAN KING: Okay.

MR. RIDDLE: Yeah.

CHAIRMAN KING: Is there anything else from you?

MS. OSTIGUY: No.

CHAIRMAN KING: Okay. That concludes crop.
committee materials. And next is livestock.

   MS. OSTIGUY: I get to do more.

   CHAIRMAN KING: Yeah. It's just a little

marathon, Nancy.

   MS. OSTIGUY: Yes. Yes. Well, yeah, when you

let Kevin go first, I was wondering if I'd lose my voice.

   The first one on the list is moxidectin. I have

a couple of changes on the evaluation criteria, I have no

idea how the errors came up, but they -- I made them. All

I can say is that they happen on occasion.

   On Category 1, Number 3, the documentation has

that the half-life of moxidectin is up to 6 months; actual-

ly the citation in the TAP, on Pages 5 and 6, is 2 months.

   So that shows up again in Question 8, Category 1, and

Question 9, Category 1.

   In addition -- well, no, it does have "binding

tightly to the soil," so it -- it basically doesn't go

anywhere.

   The committee, when evaluating this material,

found that it was synthetic and voted to add the -- and in

the vote to add the National List, the vote was 5 yes, zero

no, zero abstain, with the annotation: "control of

internal parasites only." Comments.

(No audible response.)

   MS. OSTIGUY: Motion. The annotation, again, was
"control of internal parasites only."

CHAIRMAN KING: Is there a motion to consider?

MS. GOLDBURG: I so move.

CHAIRMAN KING: It's been moved by Becky.

Second?

MS. COOPER: Second.

CHAIRMAN KING: Seconded by Ann.

UNIDENTIFIED FEMALE VOICE: And the annotation again --? I just want to make sure (inaudible).

MS. OSTIGUY: "Control of internal parasites only."

CHAIRMAN KING: Dave, you're on the hot seat.

MR. CARTER: Okay. And starting off let me just say, this one causes me more trouble than any, just --

CHAIRMAN KING: Oh, this discussion.

MR. CARTER: -- the whole parasiticide -- no, this is about -- this is just explaining my vote, but --

The fact that ivermectin is allowed kind of shades everything else, so I will vote Yes.

MR. RIDDLE: Yeah, I'm torn on this one too and, yeah, share Dave's concern that ivermectin is on the list.

From all that I've read, gathered, this is a more environmentally sound substance than ivermectin, but I do still have some concerns about its environmental impacts and also just the cultural practices that we really base
organic livestock production on, I don't think we've done
ear enough to prevent parasites, and I don't -- that
hasn't been discussed at length in the TAP, I don't think.
And, yeah, I've come to the very firm conclusion that I'm
going to abstain on this.

(Laughter.)

MR. RIDDLE: I'm not going to oppose it, but I
just can't bring myself to support it.

CHAIRMAN KING: Well, I'd like to thank Jim for
having the longest recorded in history (inaudible) --

MR. RIDDLE: (Laughs) To abstain.

CHAIRMAN KING: Yeah.

MR. RIDDLE: Non-vote.

CHAIRMAN KING: Yeah, non-vote, exactly.

UNIDENTIFIED FEMALE VOICE: It's a vote with the
majority.

UNIDENTIFIED FEMALE VOICE: Yeah.

CHAIRMAN KING: Okay, I'll vote no.

MR. RIDDLE: We're not voting yet, are we?

CHAIRMAN KING: Yes.

MR. RIDDLE: Oh, that was the vote. I abstained.

I thought we were just still discussing.

MR. CARTER: It seemed like it.

(Laughter.)

CHAIRMAN KING: If someone wants to move to
reconsider, that's fine.

MR. RIDDLE: No, no. I abstained.

CHAIRMAN KING: All right. So: no.

MS. DIETZ: Kim, yes.

MS. OSTIGUY: Yes.

UNIDENTIFIED MALE VOICE: Yes.

UNIDENTIFIED FEMALE VOICE: Yes.

UNIDENTIFIED MALE VOICE: Yes.

UNIDENTIFIED FEMALE VOICE: Yes.

UNIDENTIFIED FEMALE VOICE: Yes.

UNIDENTIFIED MALE VOICE: Yes.

UNIDENTIFIED FEMALE VOICE: Yes.

UNIDENTIFIED FEMALE VOICE: Yes.

UNIDENTIFIED FEMALE VOICE: Yes.

UNIDENTIFIED MALE VOICE: Yes.

UNIDENTIFIED FEMALE VOICE: 11 yes, 1 abstention, 1 absence, and 1 no.

MS. OSTIGUY: Okay. Last one is proteinated chelates, and there was some additional discussion this morning, when I was busy with the crops committee, so I do not know what happened with this one.

MR. SIEMON: We added an annotation, but otherwise everything remains the same.

MS. OSTIGUY: Well, I don't even know what the annotation is, so somebody's got to do this --

MR. SIEMON: I can tell you what the annotation was: protein source must be of mammalian or poultry
UNIDENTIFIED FEMALE VOICE: I can't hear a word you're saying.

MR. SIEMON: Okay, Nancy's going to lead us through this, but we did add an annotation today that said: the protein source must not be of mammalian or poultry origin.

MS. OSTIGUY: Okay, I can finish up that. Okay, what the committee recommended was that chelated minerals be added to the list, that it is a synthetic, with the annotation: "Protein sources must not be of mammalian or" --

(Pause.)

UNIDENTIFIED MALE VOICE: -- "poultry origin."

MS. OSTIGUY: -- "poultry origin." The vote -- George, do you know what the vote was? -- because I wasn't there.

MR. SIEMON: It was 4-0, in favor.

MS. OSTIGUY: And the committee vote was 4 yes, zero no, zero abstentions. Discussion? Kim.

MR. SIEMON: It was 5-0, excuse me.

MS. OSTIGUY: Oh, 5-0?

MR. SIEMON: I'm sorry. We didn't -- we had 2, then 3. It was 5-0, committee.

MS. DIETZ: My question, as the same as yesterday: is this material commercially available for all
farmers with this restrictive of an annotation? -- and I'm not a livestock expert, but -- I mean, I assume you're having to supply a bunch of farmers or livestock people with this material, and is it commercially available, do we know that for sure, with this restrictive of an annotation?

MR. SIEMON: We had the same concern, but we had a document from someone who did research and said it was, so it's not like two -- two sources, but we had one written source that there was, so -- it's a good challenged.

MS. OSTIGUY: Jim first, and then Andrea.

MR. RIDDLE: And it --

MS. DIETZ: Nationwide? I mean, I hate to --

MR. RIDDLE: Well, it -- yeah, and from the information that was provided, the animal-origin sources would be very rare, that's not what's typically out there, so what is available is the vegetative sources of protein, but for cautionary purposes we are saying that the animal-origin sources would not be allowed. So it's not like we're taking something away.

MS. OSTIGUY: Andrea.

MS. CAROE: My question is: Is it easily identifiable, which materials don't contain --, I mean is that information that the vendor of the product will have, or -- I mean, you're saying that the protein generally doesn't come from them, but is it all -- I mean is it --
does anybody know where that is and where that isn't? I
mean, if you can't identify -- if you can't justify that
you're within the restriction, then you can't use it
because you --

MS. CAUGHLAN: I don't (inaudible).
MS. CAROE: I'm just asking. I could see that
that might be a problem, for people to actually get the
documentation that verifies that they are working within
that restriction.

MR. RIDDLE: Well, I'd just respond, you know,
that that's always a problem with any material, just --
making sure that it is from allowed substrates or allowed
ingredients. So I don't see the burden of proof here any
different than for other synthetic substances that are on
the list currently.

UNIDENTIFIED FEMALE VOICE: With annotations.
MR. RIDDLE: Yeah, with annotations.
MS. CAROE: With annotations. But that doesn't
always mean that this is going to be -- I mean, just
because we've always done it before, I don't know if
it's --

MR. RIDDLE: Well, yes --
MS. CAROE: Especially --
MR. RIDDLE: -- from -- the information from the
petitioner is that yes, that information is available.
Whether that is available -- or the information is readily available for everyone in the industry, I really can't answer that, but it is for the petitioner, and therefore, once it becomes an annotation, it is something which can be complied with.

MS. CAROE: The reason that I'm asking is because if you're saying it's rare that it would be from those sources and it's difficult to find, how much are we gaining by putting people through that extra rigorous step, to -- do you see what I'm saying?

MR. RIDDLE: Yeah. Well, it's a precautionary --

UNIDENTIFIED MALE VOICE: Yeah.

MS. OSTIGUY: Kim.

MS. DIETZ: I'm going to wait (inaudible).

MS. OSTIGUY: Dave.

MR. CARTER: On this particular issue, yeah, I think the precautionary principle is prudent for us to follow. And I think that on the area of animal-source products in any feed or feed supplement is going to be more -- there's more and more pressure on FDA and the like to start getting into that and to go into things that ranchers and farmers have normally assumed were not sourced from animal sources and to begin looking at that, and so I think we need to establish where we're going to -- where we're going to draw the line on that, because -- I think from the
standpoint of the integrity of the system, and particularly, the organic consumer out there expects that we are not going to be using anything from animal sources in feed.

MR. SIEMON: I hope -- I don't think it's been said already, but I just want to make sure everybody's clear that these -- these materials are actually presently allowed, and we -- we thought we ought to review them to see, because of the FDA, so we went through them, to see, and we're actually continuing to allow them except now we're offering this annotation. It's a little bit different, but it's already allowed.

MS. OSTIGUY: Kim.

MS. DIETZ: I just sense a lot of restlessness in the audience when we gave that annotation, and I am really uncomfortable voting on an annotation on a material we already allow unless I'm really confident that that's available to everybody. So if it's currently allowed, then -- I'm just not convinced that that -- that's true, and I -- we had people coming up here, we had everybody chit-chatting, and I just am not comfortable knowing that that's really the proper annotation, with that much restlessness, and without hearing the public comment on it, so I don't -- I don't understand that. There's not a motion on the table yet, obviously, so if someone wants to make a motion --

MR. RIDDLE: Yeah. Well, I move that proteinated
chelates be placed on the list, with the annotation:
"Protein sources must not be of mammalian or poultry origin."

MR. CARTER: I'll second it.

MR. SIEMON: Is that the right motion -- just so we're really clear -- since it's already allowed through the one --

UNIDENTIFIED FEMALE VOICE: I think you're just adding an annotation.

CHAIRMAN KING: So the specific motion is only to add the annotation?

MR. RIDDLE: Well, no, it's to -- it would be to add it to the list under the feed supplements section.

CHAIRMAN KING: Okay.

MR. SIEMON: Yeah, because it would be added, to be annotated.

MS. KOENIG: I guess I'm -- I'm confused. So you're saying that we voted on -- this was one that we voted on prior? No.

MR. RIDDLE: No, no.

CHAIRMAN KING: No, no. That's what I was clarifying.

MS. KOENIG: So why are you saying that it's already on the List, then?

MR. SIEMON: Because it's an FDA vitamin and
mineral allowed under the Rule. It's already (inaudible).

UNIDENTIFIED FEMALE VOICE: It's implied, you say, by -- because it's under a category that's --

MR. SIEMON: Yeah. A broad category. So my interpretation of this vote is really about adding the annotation or not. If it fails, it's still allowed, it's just not allowed -- I mean, we need to clarify it, because we could get in trouble here.

CHAIRMAN KING: That's right.

UNIDENTIFIED FEMALE VOICE: Well, what --

MR. SIEMON: We should vote on the annotation, in my opinion, so we don't get in any confusion here that a "No" vote means it's not allowed at all.

MS. DIETZ: Right. If I really had the right intention, I would have made the motion without the annotation, we'd have voted on it. So right now we have a motion on the table, with the annotation.

MR. SIEMON: Okay. So -- then if this gets voted down, then we'll have another vote going the other way, no problem.

CHAIRMAN KING: So let's review the motion, once again, please. Jim, if you could.

MR. RIDDLE: Yeah. Well, the motion would be to place it on the National List, with the annotation:

"Protein sources must not be of mammalian or poultry..."
UNIDENTIFIED FEMALE VOICE: And who was the seconded vote?

UNIDENTIFIED MALE VOICE: Dave.

MR. CARTER: Second.

MR. SIEMON: Maybe before we vote: Is there anybody in the audience that knows anything about the availability? -- because I hear a lot of cautions here about non- -- according to what we're doing here. Dave?

MR. ENGEL: Thank you for asking. I don't know anything about availability --

MR. RIDDLE: Identify --

MR. ENGEL: Oh. I'm David Engel, dairy farmer from Wisconsin.

I don't know anything about availability, but I want to repeat the question that I asked the committee earlier, in maybe a little bit different context.

Chelated proteins are so prevalent in the industry that I -- and I asked you specifically, when you quoted, Jim, Mr. Walker as a proof that there was availability of non-animal-sourced chelated proteins, that it was -- you could get them. I don't know. You guys don't know. Be really careful with this.

UNIDENTIFIED FEMALE VOICE: Right.

CHAIRMAN KING: Okay.

R & S TYPING SERVICE - (903) 725-3343

5485 S. LIVE OAK, GILMER, TX 75644
MR. SIEMON: Okay.

UNIDENTIFIED FEMALE VOICE: Kelli.

CHAIRMAN KING: Kelli.

MR. SIEMON: I would have called that an opinion versus information, myself, but --

MS. SHEA: Kelli Shea. Thanks for asking for input.

Because I don't believe we really addressed varying sources of this product, I really think it's a good idea to look at the annotation like you are, but I don't believe you have the information to do it.

Because this product is currently allowed for use, did you consider deferring the vote until you could get additional information on whether or not it is available in the preferred source you're discussing? It would not cause harm to farmers because it currently is available, you would be able to do due diligence, get the information you need, to make the wise choice.

UNIDENTIFIED FEMALE VOICE: Time to vote?

CHAIRMAN KING: Is there a motion to strike?

There's a motion on the table, there's a motion on the table that's been seconded.

MR. RIDDLE: Well, yeah, I just want to respond to those comments, because, you know, I think there's no way we want to be allowing animal-origin supplements here.
anyway. I mean, this -- this petition has been before us for quite a long time, and I think, in an abundance of caution, in today's environment, we do have a reason to move forward.

So I call the question and go to a vote.

UNIDENTIFIED FEMALE VOICE: It starts with you.

MR. RIDDLE: That's right. I vote yes.

UNIDENTIFIED FEMALE VOICE: Who did the second on this?

MR. CARTER: I did.

CHAIRMAN KING: Dave Carter did.

UNIDENTIFIED FEMALE VOICE: All right. Okay, go ahead.

CHAIRMAN KING: I abstain.

UNIDENTIFIED FEMALE VOICE: No.

UNIDENTIFIED FEMALE VOICE: No.

UNIDENTIFIED MALE VOICE: No.

MS. OSTIGUY: Yes.

UNIDENTIFIED MALE VOICE: No.

UNIDENTIFIED FEMALE VOICE: Yes.

UNIDENTIFIED FEMALE VOICE: Yes.

UNIDENTIFIED FEMALE VOICE: Okay, wait, wait one second.

MS. COOPER: Yes.

UNIDENTIFIED FEMALE VOICE: Wait one second,
please. I've got to go up. So Ann, yes. Rose?

MS. KOENIG: Yes.

UNIDENTIFIED FEMALE VOICE: Yes.

UNIDENTIFIED FEMALE VOICE: Andrea?

MS. CAROE: No.

UNIDENTIFIED FEMALE VOICE: George?

MR. SIEMON: Yes.

UNIDENTIFIED FEMALE VOICE: Dave?

MR. COOPER: Yes.

UNIDENTIFIED FEMALE VOICE: 7 yeses, 5 no's, 1 abstention.

MR. SIEMON: Chair, what's the vote required?

CHAIRMAN KING: Two-thirds, I believe, or --

UNIDENTIFIED FEMALE VOICE: It doesn't pass, because it's 8 to 5. Abstention goes majority.

CHAIRMAN KING: Let me pull out the calculator. We need a two-thirds.

UNIDENTIFIED MALE VOICE: Two-thirds of 13.

CHAIRMAN KING: Yeah. Motion fails. Seven comes out at 53 percent. We had 7 yeses.

MR. RIDDLE: And the abstain goes with the majority.

CHAIRMAN KING: Abstain does go with the majority.

MR. SIEMON: Yeah.
UNIDENTIFIED FEMALE VOICE: Yes, it does.
UNIDENTIFIED MALE VOICE: Did you count that, eight?
CHAIRMAN KING: No, I did not.
UNIDENTIFIED MALE VOICE: Yeah, it's still 62 percent.
CHAIRMAN KING: Yeah, still not enough. We needed nine.
UNIDENTIFIED FEMALE VOICE: Motion fails.
MR. SIEMON: Okay, is there another motion?
MR. RIDDLE: Well, I move to --
UNIDENTIFIED FEMALE VOICE: (Inaudible).
CHAIRMAN KING: Hold on.
UNIDENTIFIED FEMALE VOICE: Can you summarize what's going on, please?
CHAIRMAN KING: The votes were -- it was 8 to 5--
UNIDENTIFIED FEMALE VOICE: It was 7 yeses --
CHAIRMAN KING: 1 abstention. Go ahead.
UNIDENTIFIED FEMALE VOICE: 7 yeses, 5 no's, 1 abstention, 1 absence.
UNIDENTIFIED FEMALE VOICE: Okay.
CHAIRMAN KING: The motion does not carry.
MR. SIEMON: And I'm looking for a new motion.
MS. KOENIG: I'll make a motion to defer the material.
MR. CARTER: I will second it.

CHAIRMAN KING: Rose has made the motion to defer the material, Dave Carter has seconded. Discussion.

UNIDENTIFIED FEMALE VOICE: Are we going to defer based on request for more information?

UNIDENTIFIED FEMALE VOICE: Well, that's what we're going to discuss.

UNIDENTIFIED FEMALE VOICE: Motion to defer, second by Dave.

CHAIRMAN KING: Correct. Is there discussion?

Rose.

MS. DIETZ: Yeah. I based the deferral on gathering information on the commercial availability of plant -- non-mammalian sources of -- of the protein, proteinated chelates.

CHAIRMAN KING: So Rose is specifically saying the deferral is to gather more information concerning the sources indicated.

(Pause.)

CHAIRMAN KING: Is there discussion?

MR. RIDDLE: Yeah. So who's going to do this gathering, and how -- I mean, this is not to send it back to the TAP contractor, correct, this is for the Board to solicit the information?

MR. SIEMON: (Inaudible) two confirmations, I
MS. DIETZ: If we -- this is just going off the top of my head, but if we go back through and put this on the recommendation sheet for the next meeting, that the motion was to defer based on information on commercial availability, then we see what kind of public comments that we get, and we could use that information.

So I urge the community and the livestock industry to comment and to find out whether or not you have commercial availability sources based on that original annotation, and let's be specific in the document from the livestock committee.

CHAIRMAN KING: Rose.

MS. KOENIG: But I would also urge the committee to do just minimal research (inaudible), you had one source, you said, try to get, you know, that three sources, just in case public comment doesn't come in, so we can proceed.

CHAIRMAN KING: Are you agreeing to do minimal research, Jim?

MR. RIDDLE: No, I'm just agreeing with what she was saying.

CHAIRMAN KING: I'm just kidding.

(Laughter.)

UNIDENTIFIED MALE VOICE: (Inaudible.)
UNIDENTIFIED FEMALE VOICE: Okay, I'm ready.

File the motion.

MR. SIEMON: We'll seek public comment.

CHAIRMAN KING: Okay. Question's been called.

We begin with me. The motion is to defer. "Yes."

UNIDENTIFIED FEMALE VOICE: Yes.

MS. OSTIGUY: Yes.

UNIDENTIFIED MALE VOICE: Yes.

UNIDENTIFIED FEMALE VOICE: Yes.

UNIDENTIFIED MALE VOICE: Yes.

UNIDENTIFIED FEMALE VOICE: Yes.

UNIDENTIFIED MALE VOICE: Yes.

UNIDENTIFIED FEMALE VOICE: Yes.

UNIDENTIFIED MALE VOICE: Yes.

MR. CARTER: Yes.

UNIDENTIFIED MALE VOICE: Yes.

UNIDENTIFIED FEMALE VOICE: 13 yeses, no no's, 1 absence.

MR. SIEMON: Mark, it was the committee's will to make a statement about the antibiotic directives, so is this the time to bring that up? -- I was told.

CHAIRMAN KING: Sure.

UNIDENTIFIED FEMALE VOICE: It is?

MR. SIEMON: I don't know.
UNIDENTIFIED FEMALE VOICE: (Inaudible) voting?

UNIDENTIFIED FEMALE VOICE: On the recommendations.

MR. SIEMON: I'm --

UNIDENTIFIED FEMALE VOICE: Are we on committee reports, or where are we at?

UNIDENTIFIED MALE VOICE: Yeah, it's still committee reports.

CHAIRMAN KING: We're on livestock.

MR. SIEMON: Okay.

UNIDENTIFIED FEMALE VOICE: Is this it for materials?

CHAIRMAN KING: No, no, no. We still have more materials; we're just finishing up livestock.

MR. SIEMON: This just a resolution the committee put forward --

UNIDENTIFIED MALE VOICE: Actually, we're done with materials.

UNIDENTIFIED MALE VOICE: We're done with materials.

CHAIRMAN KING: Oh, we are, that's right.

UNIDENTIFIED MALE VOICE: That's right, we're done with materials.

UNIDENTIFIED FEMALE VOICE: Unless there's a policy material.
CHAIRMAN KING: A policy material?

(Laughter.)

CHAIRMAN KING: Dave, do you --

(Laughter.)

MR. SIEMON: Okay, the committee put forth a resolution, a simple paragraph, to revisit this, which I'll be glad to read, and then a series of background, why they felt this was proper to send this message forth. So I'll read the paragraph; even though you all have it, I'll read it for the audience.

"The National Organic Standards Board respectfully requests that USDA National Organic Program withdraw the 41304 Antibiotic Guidance Statement and work collaboratively with the NOSB to develop policy guidance with is consistent with the Livestock Healthcare Practice standard, statements made by the NOP in their preamble, "NOSB Recommendations, Consumer Expectations, and the Principles of Organic Livestock Production."

MS. DIETZ: A question on process. I haven't seen this document --

MR. SIEMON: Yeah.

MS. DIETZ: -- and you're asking the Board to vote on something that we've never seen and it's just been put forward in front of us, so -- again, I'm a stickler for giving me time to read (inaudible) --
MR. SIEMON: I agree.

MS. DIETZ: So I can't support it.

MR. SIEMON: That was my concern, about process, too, but --

MS. DIETZ: Yeah.

MR. SIEMON: -- but it is just a paragraph that we're putting forth, but --

MS. DIETZ: It just goes to -- you know, we're asking the NOP to give us time and -- to look at things and to look at policies and to follow process, and we're not doing it; I just disagree. Not that I disagree with the contents, that I'm aware of [phonetic].

CHAIRMAN KING: So, point of clarity: George, you're just forwarding the paragraph, the resolution, with the statement you just read; correct?

MR. SIEMON: Correct.

CHAIRMAN KING: The rest is background information, supporting information.

MR. SIEMON: Uh-huh.

CHAIRMAN KING: So technically that's what we would be voting on.

MR. SIEMON: I believe that was the committee's vote, uh-huh.

CHAIRMAN KING: Okay. Rose, then Dave.
sending this, you're not sending the whole thing?

MR. SIEMON: Well, we are sending the whole thing, but the -- what we need to vote on is the resolution, again, because of the time to look at it. Now, we could wait to tomorrow, I guess. I don't know how to deal with this, this just --

MS. KOENIG: Well, I think that the spirit of the intent is good, you know, and I think that there's more than one directive out there. I think it's the role of the Board to look at all of the directives and compose a letter really fully commenting on them, in a constructive way.

So it's not that I'm not -- you know, again, I agree with the spirit of it; I just don't think that this is the process by which we want to communicate and I think it's something that we could handle, you know, perhaps in an executive committee meeting and people could work on the ways to compose a document and then put it forth with more thoughtful ways of addressing the issue.

So my -- again, I -- I'm -- I guess I move to -- to just -- to keep -- the issues are there, and we're all aware of them, but, really, think about the process by which we want to address it.

MR. SIEMON: I don't know if we need a movement -- I mean, a motion, do we need a motion or not, just -- to not --
CHAIRMAN KING: Did you move to consider the resolution?

MR. SIEMON: No, I (inaudible).

CHAIRMAN KING: Rose, are you moving that we consider this an executive committee call?

MS. KOENIG: I'm moving to accept the document as a point of reference for the entire Board, but any action should be taken at a later point, through the executive committee process, to really consider, you know, what -- how we want to deal with the policy directive.

CHAIRMAN KING: Second?

MR. RIDDLE: Could you restate your motion, before I can second it? I'll second it, I think.

MS. KOENIG: All right, let me clarify.

CHAIRMAN KING: Perhaps in ten words or less.

MS. KOENIG: Yeah. I'm asking -- basically, the motion is: to defer the issues to the -- to defer the issues at this meeting and allow the executive committee to process all the policy statements and come up with a format to address the issues.

MS. DIETZ: I'll second that.

CHAIRMAN KING: Does anybody have this motion down? We're going to ask you a third time, Rose. Is the spirit of the motion -- and Nancy, could you say that, I think you've succinctly --
MS. OSTIGUY: Move to defer the motion and send it to the executive committee for consideration.

MS. KOENIG: I'm saying to --

MR. SIEMON: Well, there wasn't a motion that you can defer.

MS. OSTIGUY: Or move the resolution, whatever, the topic, issue.

MR. RIDDLE: As I first understood Rose, what I heard her saying was to -- the Board to vote to accept the committee's resolution and forward it to the executive committee for action.

MS. KOENIG: What I'm saying is that: accept the document --

MR. RIDDLE: Yeah. Okay.

MS. KOENIG: -- we're accepting the submittal of the document, similar to: we accept a task force --

MR. RIDDLE: Right.

MS. KOENIG: -- as an internal document, or as a document --

CHAIRMAN KING: Do you consider this --

MS. KOENIG: -- but it's not a policy, it's not our view on policy.

CHAIRMAN KING: Do you consider this a friendly amendment to your motion?

MS. DIETZ: I don't, as a seconder, I'm going to
take back my second on that motion. It's not what I
thought, so --

CHAIRMAN KING: The second has been withdrawn.

Could we restate the motion. Are you sorry you made the
motion?
(Laughter.)

MS. KOENIG: What I'm saying is -- I mean, I
think it's --

CHAIRMAN KING: Do you want to withdraw the
motion and --

MS. KOENIG: Okay, I'll restate the motion.

MR. SIEMON: Are we saying we want to defer any
response to the --

MS. KOENIG: Yeah, it's not --

CHAIRMAN KING: Hold on, hold on. I'm asking,
are you restating the motion --

MS. KOENIG: My motion is to -- I guess the
motion is for the executive committee to respond to the
directives from the NOP and formulate a process and a
response based on available information, based on input.

MS. CAUGHLAN: What I heard you say was all of
the recent directives.

MS. KOENIG: Yeah, that they need to analyze it--

MS. CAUGHLAN: This does not relate to that --

MS. KOENIG: Exactly.
MS. CAUGHLAN: -- and just now I didn't hear a plural.

MS. KOENIG: I'm saying all directives.

CHAIRMAN KING: Hold on, hold on.

MS. DIETZ: Here was the motion --

CHAIRMAN KING: This is the --

MS. DIETZ: -- for the executive committee to respond to the directives from the NOP and formulate a process and response based on information.

MR. SIEMON: Input, maybe.

MS. DIETZ: Inputting information, which includes this kind of stuff.

CHAIRMAN KING: Goldie, are you proposing a friendly amendment?

MS. CAUGHLAN: I was trying to clarify, and she just clarified.

CHAIRMAN KING: Okay. Is there a second? We have a motion on the table, and the motion reads: for the executive committee to respond to the directives from the National Organic Program and formulate a process and response based upon input information. Is there a second?

UNIDENTIFIED FEMALE VOICE: Based in input information from whom?

CHAIRMAN KING: I'll entertain friendly amendments, but first we need a second to have the actual
motion considered. Is there a second?

    UNIDENTIFIED MALE VOICE: Rose is the first?

    MR. CARTER: I will --

    CHAIRMAN KING: Is it a second?

    MR. CARTER: No, it's not a second. If that's going to tie, I will make a --

    CHAIRMAN KING: Motion fails.

    MR. CARTER: I will make a new motion: that we direct the policy development committee to bring forward to the executive committee a statement expressing the sense of the Board on the directives that have been issued by NOP.

    MS. KOENIG: I'll second that.

    (Laughter.)

    CHAIRMAN KING: Dave. Remember, she's typing this in, so --

    MS. DIETZ: Yeah, I'm fast, but I ain't that fast.

    CHAIRMAN KING: Yeah.

    MS. DIETZ: Say that again, please.

    MR. CARTER: Okay. That this Board directs the policy development committee to bring forward to the executive committee for consideration a resolution concerning the sense of the NOSB on the policy directives issued by the National Organic Program.

    UNIDENTIFIED FEMALE VOICE: Did you get a second?
CHAIRMAN KING: Yeah, seconded by Rose. So it's been moved and seconded that --

MS. DIETZ: That the policy committee -- direct the policy committee to bring forth to the executive committee for consideration a resolution of policy directive issues by the NOSB.

CHAIRMAN KING: Issued by the NOP.

MR. CARTER: Let's do -- bring forward to the executive committee a resolution concerning the sense of the NOSB --

MR. SIEMON: Sense?

MR. CARTER: -- regarding the policy directives issued by the National Organic Program.

(Pause.)

CHAIRMAN KING: Do you want to read it back.

MS. DIETZ: Okay, I'll try it again. Direct the policy committee to bring forth to the executive committee for consideration a resolution concerning the sense of the NOSB regarding the NOP policy directives. I hope that's good enough.

MR. SIEMON: Is the word "sense" (inaudible)?

CHAIRMAN KING: Are you okay with that?

MR. RIDDLE: Yeah, sense of the Board.

MR. RIDDLE: Yeah. Dave, you know, this
resolution that the livestock committee has brought forward was passed, I believe unanimously, by the committee, and I'm just wondering if your motion would account for or allow this resolution to be fed into the policy committee's considerations.

MR. CARTER: Absolutely. No, I think that we would look at this -- the policy development -- I mean, as a point of information, the policy development committee this morning began to draft up a statement along this line but we didn't have all of our committees there so we were hesitant to bring it forward until we at least got it out, because three of our members were in other meetings.

So I think this resolution, as well as the one that we were working on, we would bring together to address the sequence of directives that were issued over the last couple of weeks.

MR. RIDDLE: Okay.

CHAIRMAN KING: Goldie.

MS. CAUGHLAN: Point of information. So the executive is going to put this together and, to use the USDA word, vet it (inaudible) rest of it to the Board?

MR. CARTER: My thought is that the policy committee would bring this forward to the executive committee. The executive committee is the only committee that is authorized to act in the absence of the full board,
so the executive committee, you know, can act on it. What
I thought is for the executive committee -- the role of the
policy committee is to do some of that detail work on the
policy issues and bring them forward, then, to the
appropriate committees or to the full board for
consideration. In this instance it would come to the
executive committee.

MS. DIETZ: Dave has made the motion. We don't
have a second.

MR. RIDDLE: Rose did right away.
MS. KOENIG: I seconded.
MS. DIETZ: I didn't hear that. Okay. That's
fine. My only comment, again, is to -- if this board would
please give all its members adequate time to review
documents and -- so that we make sure we have a very good
process and it's consistent.

CHAIRMAN KING: Duly noted, but I think in this
case it was practically unavoidable, so I do appreciate the
work of the committee. Is there further discussion?
(No audible response.)

CHAIRMAN KING: Hearing none, we'll proceed to
vote on the motion, beginning with --

MR. CARTER: We don't need a roll call on this,
this could be --

CHAIRMAN KING: All those in favor signify by
R & S TYPING SERVICE - (903) 725-3343
5485 S. LIVE OAK, GILMER, TX 75644
saying aye.

BOARD MEMBERS:  Aye.

(No audible response.)

CHAIRMAN KING:  Motion carries.  Okay, I think that's everything for livestock.  Is that correct?

MR. SIEMON:  Yeah.

CHAIRMAN KING:  Dave, you're still on the hot seat, policy development committee.  Is there anything to--

MR. CARTER:  Oh, gosh.  Yes.  Policy development committee this morning met and reviewed two issues.  The first one are the amendments to the Board policy manual.  Two areas of change were made and posted for comment, that being, specifically, the confidentiality requirements in the Board policy manual; and the second one, to address the change in the materials approvals forms that we've been used, to incorporate those and substitute them for the ones that we previously had in the policy manual.

So I would move that we amend the policy manual as recommended by the policy committee.

MR. RIDDLE:  I'll second.

MS. OSTIGUY:  Second.

CHAIRMAN KING:  We've got a tie second.  We'll take Goldie.
MS. CAUGHLAN: I think it was Nancy.

CHAIRMAN KING: Oh, I'm sorry, Nancy. Moved to Dave, seconded. Okay, it's been moved and seconded that we accept the proposed amendments to the Board policy manual. Is there discussion?

MR. RIDDLE: Yeah, I do want to just point out that Dave said there's just the two changes, but actually there's a few more than that, there's deleting the whole peer-review section, there's changing the name of the processing committee to "handling," and there's a whole bunch of things that were pending because we didn't deal with any non-material issues in October, so just to be clear, but it's all there in your meeting book, so it's -- it's pretty comprehensive changes.

CHAIRMAN KING: And just a point of information, it's my understanding this has been on the -- posted on the web for quite some time, so --

MR. CARTER: It's not only been posted on the web, it's been color-coordinated on the web.

UNIDENTIFIED FEMALE VOICE: Yeah, it has.

CHAIRMAN KING: Yes. Yes. The most colorful document.

MR. CARTER: Yes, sir.

UNIDENTIFIED FEMALE VOICE: Call the question.

CHAIRMAN KING: The question's been called. All
those in favor of accepting the proposed amendments signify by saying aye.

      BOARD MEMBERS: Aye.
      CHAIRMAN KING: Opposed, same sign.
      (No audible response.)
      CHAIRMAN KING: Motion carries.
      MR. RIDDLE: Yeah, and it just -- I'll follow through with sending a cleaned-up copy to the NOP, that actually deletes those green things and adds the yellow things, as they should be, and moves the colors and saves them for another day.
      (Laughter.)
      CHAIRMAN KING: It's a colorful comment.
      (Laughter.)
      MR. CARTER: Okay, the second item is the compatibility with organic production and handling, and before we go into the consideration of this formally, I just want to recognize that Jim particularly has done an incredible amount of work on this, he has carried 95 percent of the workload on this, including developing 22- and 23-page drafts of material with background, and I want to acknowledge that.

      This was posted. There were six public comments that were received. All of the public comments recommended that we drop from there Section M, which read "Does the R & S TYPING SERVICE - (903) 725-3343
      5485 S. LIVE OAK, GILMER, TX 75644
substance facilitate the development of new organic products?", so the policy development committee has recommended, then, that we move forward the statement of "compatibility with organic production and handling," with the deletion of Section M, and I would so move.

MR. SIEMON: I'd second.

CHAIRMAN KING: Moved by Dave, seconded by George.

MR. RIDDLE: And the revised version was handed out yesterday --

UNIDENTIFIED MALE VOICE: Yes, draft 5.

MR. RIDDLE: Right, draft 5.

CHAIRMAN KING: Okay. So it's been moved and seconded that we accept the report, omitting Section M; right?

UNIDENTIFIED MALE VOICE: Well, it's not to accept the report, it's a recommendation.

MR. CARTER: Yeah, it's a recommendation.

CHAIRMAN KING: Okay. Discussion?

MS. KOENIG: I just had kind of a question. This is on the OFPA criterias that we use in the materials process, so I was just wondering if there -- do you have any ideas of how we might be able to incorporate these concepts into that, either as an appendix or -- I mean, because we're voting on it here today and kind of gone
through this process, but how do we translate that to those sheets or get to that information? Kim?

MS. DIETZ: I think that when -- at least originally, when we were drafting this document, we said that it would be used as a guidance document in the material review process, under compatibility, and -- so that was my understanding of where this would be used, and I think -- and that's why we all supported it, and we've been using it in handling, specifically annotating what sections, so --

MS. KOENIG: So you're saying -- so just keep it in the Board policy manual, with the --

MS. DIETZ: Yes, as a guidance document.

MS. KOENIG: Okay, that's just --

CHAIRMAN KING: Jim and Dave.

MR. RIDDLE: Yeah, and that's one thing I was going to suggest, if this passes, that I'll add it to the version of the Board policy manual that I submit, and then it also should be provided to TAP contractor and reviewers so that they have it handy, and then committees should use it when they -- questions come up about compatibility.

CHAIRMAN KING: Okay.

MS. KOENIG: So I guess -- how would we notify -- or do you want the materials chair to notify the -- I mean, do we have -- you know, we have to somehow move to get that through this process, but how do we translate that to those sheets or get to that information? Kim?

MS. DIETZ: I think that when -- at least originally, when we were drafting this document, we said that it would be used as a guidance document in the material review process, under compatibility, and -- so that was my understanding of where this would be used, and I think -- and that's why we all supported it, and we've been using it in handling, specifically annotating what sections, so --

MS. KOENIG: So you're saying -- so just keep it in the Board policy manual, with the --

MS. DIETZ: Yes, as a guidance document.

MS. KOENIG: Okay, that's just --

CHAIRMAN KING: Jim and Dave.

MR. RIDDLE: Yeah, and that's one thing I was going to suggest, if this passes, that I'll add it to the version of the Board policy manual that I submit, and then it also should be provided to TAP contractor and reviewers so that they have it handy, and then committees should use it when they -- questions come up about compatibility.

CHAIRMAN KING: Okay.

MS. KOENIG: So I guess -- how would we notify -- or do you want the materials chair to notify the -- I mean, do we have -- you know, we have to somehow move to get that through this process, but how do we translate that to those sheets or get to that information? Kim?

MS. DIETZ: I think that when -- at least originally, when we were drafting this document, we said that it would be used as a guidance document in the material review process, under compatibility, and -- so that was my understanding of where this would be used, and I think -- and that's why we all supported it, and we've been using it in handling, specifically annotating what sections, so --

MS. KOENIG: So you're saying -- so just keep it in the Board policy manual, with the --

MS. DIETZ: Yes, as a guidance document.

MS. KOENIG: Okay, that's just --

CHAIRMAN KING: Jim and Dave.

MR. RIDDLE: Yeah, and that's one thing I was going to suggest, if this passes, that I'll add it to the version of the Board policy manual that I submit, and then it also should be provided to TAP contractor and reviewers so that they have it handy, and then committees should use it when they -- questions come up about compatibility.

CHAIRMAN KING: Okay.

MS. KOENIG: So I guess -- how would we notify -- or do you want the materials chair to notify the -- I mean, do we have -- you know, we have to somehow move to get that
-- not a motion, but how do you see --

MR. RIDDLE: Uh-huh, take action.

MS. KOENIG: Who do you want to get it to NOP to make sure that --

CHAIRMAN KING: Is there --

MR. RIDDLE: I think the offer from the materials chair would be --

MS. KOENIG: Okay, I'll do it.

MR. RIDDLE: I remember when they testified in October it was a question they had --

MS. KOENIG: Right.

MR. RIDDLE: -- "What do you mean by compatibility?"

MS. KOENIG: Okay, I'll --

CHAIRMAN KING: Let's limit discussion to the actual motion to accept the recommendation. Is there further discussion?

(No audible response.)

CHAIRMAN KING: No.

MR. SIEMON: Call the question.

CHAIRMAN KING: The question's been called.

Voting on the recommendation, compatibility with organic production and handling. All those in favor signify by saying aye.

BOARD MEMBERS: Aye.

(No audible response.)

CHAIRMAN KING: Motion carries.

MR. CARTER: That's all for policy.

CHAIRMAN KING: Okay. All right.

UNIDENTIFIED MALE VOICE: And then the 606 Task Force --

CHAIRMAN KING: Yeah, we'll do -- I was going to do Andrea real quick, and then we'll come back.

MR. SIEMON: That's fine.

CHAIRMAN KING: Andrea, I think you had a quick item that --

MS. CAROE: Yes. We have draft 8 of the compliance procedures for minor non-compliance, and it's a vote to accept that guidance, and I put that in that -- in that frame because this is a guidance, this is educational information for certifiers, okay, it's --

MR. SIEMON: And that's not in here, is it, not in --

MS. CAROE: No. It was handed out yesterday. Right?

MR. RIDDLE: Yes.

CHAIRMAN KING: Yes.

MR. RIDDLE: Yeah, and there have been no changes to that version that was handed out.
MS. CAROE: There's been no changes from that version, and that version had very few changes from draft 7, which has been up on the web. Received one public comment, and there were -- those few changes that were made were based on the public comment.

MR. RIDDLE: So I move the approval --

MR. SIEMON: I second.

MR. RIDDLE: -- of draft 8, I guess it is.

MS. CAROE: Draft 8.

UNIDENTIFIED MALE VOICE: Hard work.

CHAIRMAN KING: Moved by Jim, seconded by George, I believe.

MR. SIEMON: Yes.

CHAIRMAN KING: Okay. Is there discussion?

(No audible response.)

CHAIRMAN KING: Hearing none, we'll proceed to vote. All those in favor signify by saying aye.

BOARD MEMBERS: Aye.

CHAIRMAN KING: Opposed, same sign.

(No audible response.)

CHAIRMAN KING: Motion carries.

MS. CAROE: Just shows you how sexy a certification is [phonetic].

CHAIRMAN KING: Actually, you get the ribbon for most efficient today, Andrea.
CHAIRMAN KING: Jim, I believe you have a document from the 606 Task Force.

MR. RIDDLE: Yeah. Well, I made the presentation this morning, there was good robust discussion, and some --

UNIDENTIFIED MALE VOICE: (Inaudible.)

(Laughter.)

MR. RIDDLE: -- and there had -- some public comments as well as Board comments, so there was a need for the task force to meet during the breakout session, and we did some changes, which the members there in attendance all approved, and I redrafted and printed it out and got it copied, and it's less than 22 pages, and it's here for your consideration, and I'll just highlight what changes have been made, very quickly.

And it's not page-numbered, I apologize for that, but on the fourth page, there's a change, in the middle of the page, which is the end of the "Background" section, and some information that was previously Recommendation 1a has been moved into "Background Information," where it was a discussion of some previous NOSB recommendations.

UNIDENTIFIED FEMALE VOICE: What? I'm lost.

MR. RIDDLE: Okay. The fourth page, you see where it says Recommendation 1a?

UNIDENTIFIED FEMALE VOICE: Yeah.

R & S TYPING SERVICE - (903) 725-3343

5485 S. LIVE OAK, GILMER, TX 75644
MR. RIDDLE: The two paragraphs right above that used to be in 1a, in a former life; now they have been downgraded to "Background Information," because they are, really, historical. So they're not part of our new recommendation.

UNIDENTIFIED FEMALE VOICE: And that is fair [phonetic].

MR. RIDDLE: Okay. Then in -- 1a is what used to be 1b, but it hasn't changed content-wise.

Okay, then on the current 1b, the only change there is on the opening paragraph, second sentence, where it says, "In order to be consistent and transparent with the material review process, each substance currently located in 205.606 shall be reviewed for reclassification by the handling committee to determine if the substance" blah blah blah.

So it's just that -- this is not a re-review, not a TAP review, it's just reclassification, and it's a directive or request to the handling committee.

Okay. Recommendation 2, no changes to the first two paragraphs, and there's a change to the large A heading paragraph, to read: "For a non-organic agricultural ingredient used in a processed product labeled as 'organic' to be determined as not commercially available, the applicant or certified operator shall submit," and the rest
of that remains the same, but just that lead-in to the sentence was something that had been brought up this morning, so that's been added.

And then Item Number 4 was changed from "during the inspection" to "during the certification evaluation," so that gives the certifier flexibility. Some of this may happen at inspection, some of it may happen in the office.

So that was in consideration of comments.

MS. DIETZ: Just one question.

MR. RIDDLE: Yes.

MS. DIETZ: And I'm not sure if this covers it or not, you can tell me if it does, but if -- if -- not during the certification evaluation but in mid-year a material becomes -- it's not available organically -- I mean, we have due diligence to contact the certifier and say, "This is what I'm going to do." Is that acceptable in this, is it covered during --

MR. RIDDLE: Yeah. My understanding would be --

UNIDENTIFIED FEMALE VOICE: It's part of evaluation at that point, but the --

MR. RIDDLE: Yeah.

MS. DIETZ: Okay.

MR. RIDDLE: Evaluation is ongoing on something like --

MS. DIETZ: Okay. All right. It is considered
ongoing from a certifier/handler relationship.

MR. RIDDLE: Right.

MS. DIETZ: Okay.

MR. RIDDLE: Whenever there's a change in the
organic system plan --

MS. DIETZ: Okay, they have to -- okay.

MR. RIDDLE: -- you have to notify --

MS. DIETZ: Okay. That's fine.

MR. RIDDLE: -- be updating your plan.

Number 5, at the very last line there, we added
amongst -- "The written evidence may include ingredient
evaluation reports," so it says: "Written evidence may
include letters, faxes, e-mail, correspondence, ingredient
evaluation reports." That could include like certificate
of analysis about an ingredient of whatever. So a little
more flexibility.

And then also, at the top of the next page, the
words "as applicable" were added, "a minimum of three
potential suppliers shall have been contacted."

Okay. Then under B-2, there was 2 -- there was
-- previous 2 and 3 have been merged into 1, which now
reads -- I mean, you've got to -- in the context: "The
certifier shall validate that the applicant or operator has
documented that the ingredient is not commercially
available in an organic form by reviewing best available
information, listing known source of organic ingredients."
So it really puts the focus on the certifier to validate
the operator's documentation.

And then the last change is to add a post-script
-- I couldn't think of a better word --

UNIDENTIFIED MALE VOICE: Epilogue.

(Laughter.)

MR. RIDDLE: That is new language, and that is:

"The 606 Task Force acknowledges that this recom-
mendation does not apply to organic seed determinations.
The Task Force recommendations that the crop committee
and/or policy development committee develop a draft organic
seed recommendation which is consistent with this
recommendation." So we just don't want any confusion.

And then a similar sentence is added at the very
very end, under "Conclusion": "A comparable and consistent
recommendation is needed to address organic seed issues."

So those are the changes, trying to incorporate
as many of the comments as we could. So I move its
adoption.

CHAIRMAN KING: Is there a second?

MS. CAROE: I'll second.

CHAIRMAN KING: Moved by Jim, seconded by Andrea.

Discussion? Nancy.

MS. OSTIGUY: I don't understand why Recommend-

R & S TYPING SERVICE - (903) 725-3343

5485 S. LIVE OAK, GILMER, TX  75644
tion 2a, Number 5, the top of the next page, where you have
added "as applicable," could you explain what this means.

MR. RIDDLE: Andrea, could you explain what this
means.

MS. CAROE: Sure. This is to accommodate
situations where the ingredient is very specific and two --
three reasonable sources are available, so it is a
guideline that three is a reasonable or a typical number
but there may be situations that require more or less than
that.

MS. DIETZ: I have to agree with that -- I just
see that as weak, I don't know where -- are the certifiers
able to determine if it's applicable for three potential
suppliers, and -- and that would be after the fact, so --

MS. CAROE: Well, I guess -- I would have to say:
in the negotiation between an applicant and certifier,
that is a discussion that they would have, as far as the
applicant coming to them and explaining the challenge.

MS. DIETZ: Yeah, I -- I guess, as a handler, if
I have "as applicable" in my handling plan, I can always
make justification as to why I only chose one and try to
get that through, so I -- but at the same time, I can
understand that if there's not three suppliers, at least I
tried for three, you know, and the -- and again, I feel
that the industry has somewhat supported a minimum of three
sources, and so I -- I just -- I think that's too weak and I'm not sure I support it, but I --

CHAIRMAN KING: Is there a motion?
MS. DIETZ: We have a motion on the table.
MR. RIDDLE: Well, yeah, and that can be amended to delete if someone --
MR. CARTER: We could strike that.
MR. RIDDLE: Yeah, to strike --
MS. DIETZ: I would like to make a motion to strike "as applicable" and just put in "minimum of three," and at least you can document where you've tried three different sources and you've only gotten one.
MR. O'RELL: I would second it.
CHAIRMAN KING: So moved to Kim to strike the words "as applicable," and seconded by Kevin. Discussion on that motion?
MS. OSTIGUY: Kim and I had, I think, different reasons for questioning that one.
(Laughter.)
MS. OSTIGUY: I was actually wondering more about what you were saying earlier, Andrea, about how if you only require three, then that's all that folks are going to do. Kim's amendment doesn't address that issue.
CHAIRMAN KING: So you don't support --
MS. DIETZ: Well, I can just tell you that we've
historically, again -- from the processing group, we have agreed, through our MPPL committees and through lots of different trade -- through the trade organization and through the handling committee, that a minimum of three has been something that our industry could live with, and so that's why we said a minimum of three.

CHAIRMAN KING: Is there --

MS. DIETZ: You have to have a number, if you want somebody to do something, so that's -- that was the magic number that we all said we could live with.

CHAIRMAN KING: Is there additional discussion on the motion on the table to strike the words "as applicable"?

MS. DIETZ: There's a motion and a second.

MR. RIDDLE: Yeah, there's a motion and a second to strike. Yeah, I'd just like to comment on it.

Essentially, it's here as an attempt to compromise, and, you know, that's the role I was playing in chairing this task force. You know, certainly the will of the Board, you know, will be determined here, so -- you know, I think it does -- you know, my personal opinion is that it does weaken it and make it less predictable for both certifiers and operators. That's my personal opinion.

Kevin?

MR. O'RELL: My only comment, to support Jim, is
that yeah, I think we added it in there as a compromise.
I'm not sure I personally was comfortable with it at that
time, and reviewing it, I do agree that I think it's weak,
and I think a minimum of three is reasonable for processors
who are trying to locate organic sources of materials.

MS. CAUGHLAN: Good-faith effort, is that a --
making a good-faith effort is really what we're saying.
What about putting that kind of language in there?

MR. RIDDLE: Well, we're trying to quantify what
a good-faith effort is. When is it good enough?

MS. DIETZ: Okay, call the question.

CHAIRMAN KING: The question's been called.
We're just voting to strike the words "as applicable." All
those in favor signify by saying aye.

BOARD MEMBERS: Aye.

CHAIRMAN KING: Opposed, same sign.

UNIDENTIFIED FEMALE VOICE: Aye.

UNIDENTIFIED MALE VOICE: Aye.

CHAIRMAN KING: Okay, 12 yeses, and -- you want a
head count or --

UNIDENTIFIED FEMALE VOICE: Do a hand count.

CHAIRMAN KING: Let's do a quick hand count. We
had two no's, I think, is that correct? All those in
favor, signify by raising your -- one of your hands.

MR. SIEMON: I'm abstaining.
CHAIRMAN KING: We have 1 abstention and 2 no's.
Okay, so now we're back to the original --
MR. RIDDLE: Yeah. As amended.
CHAIRMAN KING: -- motion to accept the report, the recommendation, as amended. Is there discussion?
(No audible response.)
CHAIRMAN KING: Hearing none, we'll proceed to vote. All those in favor signify by saying aye.
BOARD MEMBERS: Aye.
CHAIRMAN KING: Opposed, same sign.
(No audible response.)
CHAIRMAN KING: Motion carries.
MR. RIDDLE: Wow, and that task force is disbanded.
(Laughter.)
UNIDENTIFIED MALE VOICE: Which means they buy beer tonight.
CHAIRMAN KING: That's right. Does anyone have anything else?
I would entertain a motion to recess.
MR. CARTER: So moved.
MR. O'RELL: Second.
CHAIRMAN KING: It's been moved and seconded. We recess. Thank you all very much.
(Whereupon, at 5:05 p.m., the meeting was recessed,

CHAIRMAN KING: I'd like to officially reconvene the meeting of the National Organic Standards Board.

The first thing we have on the agenda today is public input, but before we get started on that, Dave has indicated to me that he has a quick announcement, and I think it's important that we hear this before public input so you have an idea of what we're thinking.  Dave.

MR. CARTER: Okay, thank you, Mr. Chairman.

I asked Mark this morning for a point of personal privilege, I usually don't wake up unprovoked by something other than an alarm clock, but this morning I got to thinking that I really think that it's important that this Board makes some sort of statement before we leave Chicago today in regard to some of the policy directives that have occurred, and I -- I know we did some things yesterday that talk about taking some things forward from policy development to the executive committee, but I can't help but think that it's important for us to make some sort of statement at this meeting, so I just wanted to announce my intent, before we adjourn this morning, to offer up a very short resolution that would just express the disappointment and concern of this Board over the lack of advance notice or consultation by NOP in the issuance of certain policy
directives. So I just want to announce my intent to offer that before we adjourn so that it's not a surprise to the Board members and we can be thinking about that. Thank you, Mr. Chairman.

CHAIRMAN KING: Thank you, Mr. Carter. Just a quick -- some housekeeping issues with public input. We have 35 signed up. We've allotted approximately 2 hours, 2 hours and 15 minutes, on the agenda. Several Board members have expressed to me today we clearly understand the importance of public input, therefore will extend the public input, to the best of our ability.

However, we have posted 5 minutes, I would ask you to understand that you have 5 minutes, stick to that, get your message to us in an efficient and effective fashion, and we appreciate that.

The court recorder has asked -- clearly we have a full room today. Your comment is extremely important to this process. In order to get this on tape, we ask that any conversations you have, please take those out in the hallway, that don't relate specifically to what's happening at that time.

Also, if you have cell phones, pagers, things of that nature, please turn to vibrate, turn them off.

And without further ado -- hold on. Jim Riddle.

MR. RIDDLE: Yeah, just a few things to add to
that, Mark. In case -- I just want to say that if you haven't signed up, you still can sign up, and that's on the back table -- or it's up here right now. And also, if you do have a proxy, under the Board's rules, you can carry one proxy, which gives you 5 additional minutes to speak, and if that's the case, please announce that when you start your comments.

And Kim is the timekeeper and has a sign for 1 minute, to give you a warning, but if you don't see her sign, your 5 minutes still elapses, but that's just politeness on our part. And if you did comment on Wednesday, you can still offer additional comments today.

So just wanted to be clear about all of that for everyone.

CHAIRMAN KING: Okay, the first person I have signed up, who registered in advance, is Mark Kastell.

MR. KASTELL: Good morning. My name is Mark Kastell, and I'm a hired man. I work for farmers. I'm here today representing the Cornucopia Institute, based in Cornucopia, Wisconsin, and I'm here today to send a clear message to United States Department of Agriculture Secretary Ann Veneman.

In the emerging battle between organic consumers and family-scale farmers, who literally have built the organic industry from the ground up, and in this battle
against the forces of evil, the corporations who have shown they are willing to compromise organic integrity in the pursuit of profit. The USDA's National Organic Program has taken sides in this fight, the wrong side.

As we started to connect the dots, it soon became obvious that in virtually every instance -- maybe this is what Mr. Carter was referring to -- the NOP has been willing to water down the organic standards. That evidence is so overwhelming that there are no longer any discernible dots left to connect, and left with a black page.

Many of the NOP directives have made it possible to organic factory farms. I wouldn't call these farms. This is dumbing down the organic standards. However, our customers are not dumb. Organic consumers are not dumb. They understand that God created cows and other ruminants to eat grass. Circumventing the pasture requirement is just flatly wrong.

They understand that livestock needs access to outdoors in order to encourage their natural behaviors and to ensure good health and longevity. Furthermore, they understand that the law and federal regulations require this access, and they are demanding proper enforcement.

They understand that the need by factory farms to bring in cheap replacement cattle from conventional operations is proof positive that these farms are not
creating the healthy environment for livestock that is
required by the law that we're trying to respect here
today.

We are at the precipice of a very tall cliff, and
economically, let me tell you on behalf of the farmers that
I'm here representing today, it is a long, long way down.
We are running the risk of destroying the credibility of
organic agricultural in the eyes of the consumer.

Consumers Union, publisher of Consumer Reports
magazine, has taken the responsibility of monitoring eco
label claims. It is incredibly distressing that because of
corporate abuse and the actions or inactions of the NOP
staff, because of this, they have felt it necessary to
question the value of the "organic" label, especially on
imports.

One other subject matter that I'd like to bring
up is imports and the question of the credibility. I got
an e-mail yesterday from one of the CEOs from one of the
most respected processors and marketers of organic food.
He's incredibly concerned about the lax oversight by the
NOP on foreign certifiers, some domestic certifiers, we now
see farmers and processors shopping from certifiers, we see
organic food from name-brand companies from Guatemala,
Chile, Mexico. Here's broccoli from China. Can we trust
that the same way we can trust our indigenous farmers and
our good certifiers here?

At any rate, in closing: We have lost confidence in the ability of the USDA's National Organic Program to protect the integrity of organic agricultural. We call on Secretary Veneman to execute regime change at the National Organic Program. We need management and staff at the NOP who are qualified, have a strong background in organic agricultural, and respect the organic community. More importantly, we need folks at the NOP who respect the organic community, and our leadership as represented by this Board and the power that you hold by federal law, by virtue of federal law.

And I thank you very much for your comments -- I thank you very much for the opportunity to elicit these comments. Thank you.

(Laughter.)

CHAIRMAN KING: Jim.

MR. RIDDLE: Yeah. Mark, just a question, or, actually, a clarification.

MR. KASTEL: I'm sorry --

MR. RIDDLE: You mentioned a concern about the imported products, and under the regulation, they have to meet the same regulation, and any foreign certifiers have to be accredited by USDA, and this issue came up, I think it was Wednesday, about the site visits of foreign
certifiers, because there is major concern that the
domestic certifiers have been visited but foreign ones have
not, and the response to questions -- and I just wanted to
inform you, since you weren't here, and other members of
the audience, is that that process of visiting the -- I
think it's -- nearly 40 foreign certifiers is to begin in
June.

MR. KASTELL: Yes, that's -- that is the concern
that I was articulating here, and -- but furthermore, even
within our domestic infrastructure here for certification,
Jim, I have anecdotal reports from both processors and
farmers that if -- in fact, a very intimate experience with
one, who's a member of a cooperative, I've worked with,
where the farmer was -- his farm plan was turned down by an
IFOM-accredited [phonetic], very responsible organization,
and he simply shopped for a different certifier and he's
now delivering organic product.

So this is happening on all levels. Again, one
of the problems is we've created this ceiling, rather than
the floor, in the marketplace, we can't create a higher
level of respect for some certifiers, and these are usually
the farm-based -- farmer-based organizations that helped
build this industry, there's no way for them to communicate
with their customers that they're really doing the right
job and add value to some of these products that are being
responsibly produced. So those are the two basis -- basics.

MR. RIDDLE: And I did have a question also about the pasture. You made a very strong statement there about the need for access to pasture, and the Rule requires access to pasture, and "pasture" is well-defined in the Rule. Are you aware of livestock operations that are actually not providing pasture, say to their milking herd, or something like that?

MR. KASTELL: Jim, I -- my concerns in that area are twofold: one, reports of, you know, a dryland dairy with a muddy feed lot, to me, compared to my farm, that's not pasture.

And secondarily, although there are some dairy producers in this country that have pasture-based operations with larger herds, that's an aberration. Most of these confinement outfits, the -- really, the logistical constraints of trying to move a thousand to 3,000 to 5,000 cattle onto fresh paddocks in a true environment where they're going to gain any reasonable amount of their feed intake from pasture, it's a very dubious concept, and I want -- and the farmers that I represent, who can produce with 50, 70, a hundred cows, the kind of milk, if you're using milk as an example, that consumers want.

I do not want these folks who are working so hard...
to be at a competitive disadvantage. There has to be
strict oversight and enforcement, and I'm not confident
that's happening right now, Jim.

MR. RIDDLE: Well, we need to move on, but if you
have actual evidence, that would be very helpful, to bring
that to the livestock committee. Thanks.

MR. KASTELL: Okay. Thank you.

CHAIRMAN KING: Thank you. The next person is
Kelly Casper.

UNIDENTIFIED MALE VOICE: And on deck --?
CHAIRMAN KING: Marty Mesh. Thank you for
reminding me (inaudible).

MS. KASPER: Hi. My name is Kelly Casper. I'll
be reading mine, as well as I have a proxy from a farmer.
It is --

UNIDENTIFIED MALE VOICE: So that's 10 minutes.

MS. KASPER: Alice Rules [phonetic], executive
director of Georgia Organics. This is Eddie [phonetic].

"I am the mother of a 2-year-old child and a
strong believer in supplying my family with healthy organic
foods. I've spent a great deal of time and energy
receiving the benefits of organic foods and other natural
products, such as cleaning supplies, shampoos, et cetera.

"I am well aware of the problems that have
occurred due to pesticides, the overuse of antibiotics, and
factory farming in general. Due to my findings, I have chosen to supply my family with organic natural products whenever possible. This has been an extremely expensive proposition, but it is something that both my husband and I strongly believe in. We believe that spending extra for a gallon of organic milk is not only allowing us to have a product free from growth hormones and antibiotics, it is also allowing us to support what we believe in with our money.

"In essence, each time we spend a little extra for an organic product, we are voting for that company and industry, hence Horizon Organic."

"It is very saddening to me to discover that the 'organic' label is being bastardized in front of our very eyes. I realize that money makes the world, and especially this country, go round, but in the instance of the 'organic' label, I hope that the big-money corporations are not allowed to push out the small farmers, who started the organic movement by doing things the right way."

"I have been a supporter and investor for Horizon Organic. My family has access to their milk at all times. However, it is very disappointing to discover that this company is held to a different and less-demanding standard than the small farmers out there."

I personally am a vegetarian; however, my husband
and my child both eat chicken. I am fully supportive of
them, and one of their favorite items that I buy is the
Applegate Farm chicken sausages. Now I have learned that
the preservatives, which were legally approved, have been
added to their products.

"As a consumer, I am at the mercy of the
companies which I have put my faith in. They in turn are
held to a certain standard by this board. If that standard
is lowered, without the consumer being duly informed, an
injustice is being done.

"That is why I am here today. I want my voice to
be heard. This is something I strongly believe in, and
when I buy something that is labeled as 'organic,' I hope
that the label actually means something. If the powers
that be have their way, enough loopholes will be added that
the label will be nothing but a way to increase their
profit by charging a higher price for something that is
marginally different than the conventional product.

"I'm here today in the hopes that this Board will
hold true to the mission of organic farming and not be
swayed to institute shortcuts and loopholes by companies
chasing an almighty dollar at the expense of consumers,
such as myself and my family. Thank you."

And then the proxy by the farmer. "George
Organics, a non-profit organization promoting organic and
sustainable growing for the health of Georgia's land and people, is writing in response to concerns about the weakening of organic standards in our country.

"Georgia Organics is a membership-based organization of farmers, consumers, gardeners, and agricultural professionals who are committed to healthy farming and food.

"The National Organic Standards Board bears the responsibility of maintaining the integrity of our organic rules and policies and remembering the values that brought forth these rules in the first place. We recognize this is a tremendous job and one that endures enormous pressure from a variety of external influences. The Board must regard public trust of the organic standards as tantamount, superseding corporate or individual interest.

"Equally important is the commitment of organic farmers to public and environmental health. These two audiences should not be forgotten in the interests of third-party profits and politics. Georgia Organics urges the National Organic Standards Board to not fear from its mission in ensuring high-quality products and standards that respect farmers and consumers.

"If the Board continues to allow the loopholes that are becoming more and more apparent, then the Board very well may be the architect of its own demise as farmers
and consumers gradually abandon the process for something better. We remain hopeful that the future of organics holds more promise than current predictions."

Thank you very much.

CHAIRMAN KING: Thank you. Jim.

MR. RIDDLE: Yeah, I would just like to respond. Kelly, thanks for your comments.

You mentioned especially in the proxy about the Board allowing loopholes, and I feel obligated to go on the record to state that -- especially with the preservatives in ready-to-eat meat products, that that was not an action of the Board, it was done with no knowledge of the Board, substances were interpreted to be allowed as preservatives in these products, these are new compounds, they're not on the National List, they have --

The company was following the rules petitioned to the Board to have those substances reviewed, and the decision was made to allow them, without consultation of the Board, so I just want to be clear what the record is on that.

MS. KASPER: And make clarification that I don't think I was stating this board, it was the -- there's another board that was there.

MR. SIEMON: NOP.

CHAIRMAN KING: The program.
MS. KASPER: I'm sorry, I think I -- yes, so it wasn't -- I'm sorry, I mis- -- I did not explain myself very correctly, but it was important to GO so --

MR. RIDDLE: That's why I felt a need to clarify.

MS. KASPER: Thank you. Good. I'm kind of new at this. I appreciate it, thanks.

CHAIRMAN KING: Thank you. Next is Marty Mesh, on deck is Urvashi.

MR. MESH: While USDA -- Marty Mesh, Executive Director of Florida Organic Growers and Quality Certification Services.

While USDA has done many things right and I would like to give them more "atta boys" and positive reinforcement, the ever-ticking clock causes me to focus more on the discussions in the areas of concern. It does not mean (inaudible) things are not appreciated, and I'm sorry that USDA higher-up program staff aren't here to hear my positive comments and issues of concern to consumers.

I also want to express thanks on behalf of organic cotton growers, those of us who buy organic cotton products, and supporters of a more ecologically-sound production systems to the crops committee for considering public input and changing the recommendation in the entire board for the decision which affects cotton seed -- organic cotton seed for planting.
As an organic farmer for over 25 years and being involved in the community and the industry for over 30 years, I'm concerned about the confidence that consumers may lose in the "organic" label. This loss of confidence has been the result of some of USDA's actions, the process or lack thereof, and most recently by the directives. Even the name, "the directives," brings to mind the old Soviet Union and Eastern European countries, where a directive would be issued from party officials and blind obedience was mandated, without comment, without revision, and without representation.

We again urge the NOSB to weigh in and the NOP to reconsider some or all of the recent directives. NOP acknowledged that a mistake was made in the title, and now we would like -- the NOP must acknowledge a mistake may be made in substance. How possibly could fishmeal, fortified with prohibited materials or containing prohibited materials be considered natural and not up for certification program to question the use of any amount.

As a board member of the Organic Trade Association, and my comments do not reflect the official position of the Organic Trade Association --

(Laughter.)

MR. MESH: -- I urge the NOP to improve its communication with the Organic Trade Association, which
would result in less and less problems, more positive
reinforcement, and consumers that maintain confidence in
the "organic" label. It is in the industry's best
interests to maintain confidence in the National Organic
Program and organic products in the marketplace.

The recent directives play right into the hands
of those who attack organic agricultural at every
opportunity, for now we can't maintain that materials are
reviewed before they were put on the National List and used
in the field.

While I think that some flexibility to a degree
is reasonable and Florida organic growers used to have a
policy on unintended applications which would result not in
the loss of certification for 3 years, the current policy
-- I mean guidance -- I mean directive, goes too far in
potentially allowing multiple uses in applications of inert
ingredients that will make consumers wonder and facilitate
attacks on the organic industry.

This seems contrary to the Organic Foods
Production Act purposes, along with the other directives.
Remember uniform standards, consumer confidence, and an
increase in trade, the basic purposes of the Organic Foods
Production Act.

I have to comment on the livestock variance which
was put in the Rule, recognizing that disasters will
happen. It is in the Rule, and the USDA will set themselves up for possible legal action if some process is not implemented to deal with the valid request based upon the livestock variance on feed when a natural disaster happens.

At the recent meeting at Beoflock [phonetic] with internal certifiers, it was very easy to see that many, many, many of the certifiers who have been accredited by USDA were totally or basically unfamiliar with the regulation. These accredited foreign certifiers still have not had a site visit, and USDA should verify that its accredited certifiers are at least demonstrating that they are getting it right most of the time.

My compliments to the compost task force. I have a question. I thought I saw in yesterday's presentation that after two tests and a follow-up test, that it meant that the system would no longer need to be tested. Maybe I misunderstood. So I just -- on the record, I finished early, and I will designate my remaining time for the good of the cause.

UNIDENTIFIED MALE VOICE: For previous infractions.

(Laughter.)

MR. MESH: "We'll credit it against your account."
CHAIRMAN KING: As always, thank you, Marty.

Urvashi's up next, and I believe it's Bart Reid after that, on deck.

MS. RANGAN: So I believe I'm taking Angela's proxy time, that's from Florida Organic Growers, so Consumers Union would like to thank them for their time.

Good morning. It's really been quite a few days for all of you and for all of us out here, and my heart's pounding, so -- I think there's a lot of anger in this room. People in this room deserve what's been happening the last few days, you deserve more.

We're all spending a lot of money and a lot of time coming to these meetings, and the goal of these meetings is supposed to be to improve the standards, and ever since the implementation of this program, I know we at Consumers Union an a number of these folks back here have been doing nothing but watchdogging what the National Organic Program is doing, and it's really a travesty to consumers, to farmers, to certifiers, to inspectors, and it's very rare to find an industry where you actually see all of those stakeholders sitting on one side of the fence, saying, "Please maintain high standards."

It was enlightening to hear the National Organic Program's presentation, and it was enlightening to learn how they arrived at some of these directives. It's also
enlightening to know that they think that there aren't any significant changes and that the public has no right to comment on these directives. That is bull honky, and we have a right to comment on these, this is a public program, and so I'm going to continue to do that.

The goal of this program is not, as one of the NOP staff said, to level the playing field. The goal of this program is to create a consistent and meaningful label for consumers, that adds true value over conventional production, because that's why consumers are buying organic, because it adds a premium to the product.

At the very least we expect those standards to be maintained. At the very best, we hope that there'll be improvements in the standards over time.

As director of the eco labels program for Consumer Reports magazine, I'll tell you that there are other label programs, that are running up right behind organic, that are doing a pretty good job of maintaining standards and improving them over time. It's a lesson that can be learned by this program, which set the precedent for all of them.

Things of particular concern -- and I'm submitted for the public record our press release that we did yesterday, and I'll give that to Katherine, the fact that the USDA is drastically cheapening the meaning of organic.
These directives actually, even though this isn't a safety program, start to undermine the public health implications of this program, which is somewhat remarkable.

I want to go back to pesticides for a minute. I know I spent my whole time talking about it before, but it's worth mentioning again. I got a lot of questions, even from people here: What are EPA inerts? What is List 3 and List 2? Why do we keep throwing these things around?

I want to say for the public record what List 3 inerts are. Inerts are not benign ingredients, inerts are not the active ingredient in formulations. Really heavy-duty synthetic formulations require a carrier that's also heavy-duty synthetic to carry it into the system.

List 2 -- List 3 ingredients, it's 56 pages, if you care to go to EPA's website, of ingredients. It includes ingredients of unknown toxicity. We don't know what the toxicity is of the ingredients, and according to EPA, an inert ingredient was placed on List 3 if there were no basis for listing it on any of the other lists; that is, it wasn't toxic and it wasn't non-toxic, so it needed to go on this list.

The agency will continue to evaluate these chemical substances, as additional information becomes available, to reclassify as List 1, 2, or 4. List 3 is unknown, and it's prohibited in the OFPA and it's...
prohibited in the regulations.

List 2, potentially toxic inert ingredients, high priority for testing inerts. Many List 2 ingredients are structurally similar to chemicals known to be toxic. Some have data suggesting a concern. There's a reason why these lists exist, there's a reason why the OFPA prohibits them, and there's a reason why the regulations, even though they never said "before use," mean that you can't use these things and you have to determine what's in them before you use them. That's what the public expects.

The fact that now prohibited pesticides can easily be used on these things is ridiculous. That's zylene, toluene, formaldehyde, here's some others, ethylbenzene, succinonitrile, methylisobutylketone, naphtha, toluene trichloroethane, these are all on List 2.

There is no way that the public is going to fly for these ingredients being used on crops, especially unknowingly.

Who's responsible for that? Who's responsible, if we find those pesticide residues on the food? Are the certifiers responsible? Is that what the NOP is doing? Are the farmers responsible? Because there's going to be liability issues that arise from that, and so someone needs to take those under consideration.

The next thing I want to turn to is fishmeal. I heard Richard Matthews say that there's no need to regulate
-- there's no need to review fishmeal because it's a natural ingredient. Wow. Consumer Reports just came out with 12 natural ingredients in dietary supplements that are incredibly dangerous, we'd like the FDA to get them out. Ephedra is a natural ingredient. It's not okay, it's not safe. We know that fish contains ingredients that are not safe for consumers. Despite the fact that we learned that you could mix in synthetic preservatives and that those didn't need to be reviewed, and that was just absolutely amazing, on top of the fact that we've got tuna, the most common fish that's eaten in this country, laden with mercury.

The fact that an organic label can now be used on a can of tuna and not mean anything, including the NOP's lack of testing for it or requiring for it or even needing the NOP program, I want to take a little bit of time to talk about what FDA considers to be the public health concerns with fish right now, and especially tuna.

For a 22-pound toddler, the weekly reference dose is 7 micrograms of mercury. Two ounces of canned tuna provides a dose of 20 micrograms of mercury. A 44-pound 5-year-old, the weekly reference dose is 14 micrograms of mercury. A 6-ounce sandwich, that's what a sandwich is, of tuna, would provide that child 61 micrograms of mercury. That is more than four times the recommended reference
dose, or the reference dose allowable.

For a 132-pound woman, the reference dose is 42 micrograms of mercury, and you get it again, a 6-ounce can of tuna is still the same reference dose for that woman, it's 61 micrograms of mercury. That woman, if she ate a tuna sandwich a week, would exceed the reference dose by 50 percent.

If we don't test fishmeal for mercury and we start allowing this to not only be fed to fish but to cattle, which -- incidentally, cattle don't eat fish, but --

(Laughter.)

MS. RANGAN: -- what are we doing? This is not what consumers expect out of this program. If a consumer sees an organic label on a fish, they're going to expect more than this, and the fact that we're going to feed it to our cattle does not get around this issue. Mercury doesn't really go away, it's a metal.

The last issue to deal with today is that Consumers Union believes that USDA is on a very slippery slope of allowing drug use in organic production. It is of particular concern when we heard clarifications to the fact that it isn't just antibiotics that could apply on the dairy farm but any drug, including growth hormones? You're going to have a lot of explaining to do to consumers by the
time we get there.

So my advice is: the answers are very simple, to address these problems, that's the good news. There's a lot of bad news today, but the good news is, how do we find out what's in pesticide formulations? Take EPA up on their program for their pesticide registration list. EPA has offered to review pesticide formulations and crack the code for manufacturers, to allow them to list it as appropriate for the National Organic Program and without violating confidential business information.

It seems like a more logical way to go to get these pesticide formulations approved, so we know what's in them, so we know it's appropriate for use, before we use them. What about the fish? Fish is food. The NOP does authority over food. So don't allow the use of any organic label on fish until the standards come out properly, and get moving, because the advice has been conflicting from the National Organic Program, they -- these are significant changes to what they have said before, so they have an obligation to get those standards ironed out, to work with the National Organic Standards Board and get those out for public comment. Let's get on with it, let's do it, let's test for mercury. These aren't difficult things to figure out.

On the antibiotic issue, the OFPA says no
antibiotics. We already started with the slippery slope on herd replacement and that a herd can be one cow, and now we're at the point of: any cow can come out of organic production at any time and receive any drug to treat illness? I'm going to be going back and looking up to see what growth hormones do over that year, are there any last implications? do you give a shrink hormone after a growth hormone?

(Laughter.)

MS. RANGAN: We appreciate your time. Thank you very much for your hard work.

CHAIRMAN KING: Rose, then Andrea.

MS. KOENIG: Thanks for your comments. I mean, one solution to the fishmeal, for those out in the audience, would be to petition it as a natural prohibited, and if you could, you know, go through the website and go through that process, that's one way. If in fact, you know, there are high levels of these heavy metals, it's the logical way to go about that issue.

MS. RANGAN: Thanks, Rose, we'll do that.

MS. KOENIG: As far as the -- you know, the List 3 and List 2, I mean, we had a task force that had a different recommendation than that -- of what is in the directive. You know, we'll work our best to try to see -- see what can be achieved.
MS. RANGAN: Thank you.

CHAIRMAN KING: Andrea.

MS. CAROE: Rose made my comment, so --

CHAIRMAN KING: Jim.

MR. RIDDLE: Yeah. I appreciate your concerns and share your concerns and just once again want to make it very clear that none of these directives were developed in consultation with the advisory board, even though our charge under statute is to advise the Secretary on implementation of the Act, and implementation is a process, it's not an event that happened October 21st, 2002.

I was especially astounded to learn that this pesticide policy was developed with no consultation of EPA, when EPA controls pesticides and has the organic registration program. What would you advise the Board that we do or what do you see our next steps, not just for the Board, that should be done in response to these developments?

MS. RANGAN: Jim, thank you for that. Your point's well-taken, and I think that since the National Organic Program can't seem to consult with the EPA on pesticide registration, I recall this board a few years ago brought in someone from the EPA. I believe that's how this pesticide registration program got started. He seemed very willing to help out with the NOSB, they seemed very willing
to sit down with you and crack codes and make this program work.

So I would say you're going to meet with a pretty helpful EPA on that level, and that would be my recommendation. In my first public comment: what Consumers Union would like to see is we'd like you to make a recommendation to mandate this organic pesticide registration program for pesticide formulations. It's a voluntary program for manufacturers.

If you're a pesticide manufacturer, you don't have to do it, and if you don't want to do it, it's -- like you're a farmer and you don't want to be certified organic, then you don't have to be organic, you can make your pesticide formulation and go along the conventional production route.

But if you want that added value, if you want to add a premium to your product, then let's get it straight that you actually have value added in your product and that it's appropriate for organic production.

CHAIRMAN KING: Rose.

MS. KOENIG: Just a clarification. And I think -- it sounds like you understand. As far as my recollection on that program, it is a voluntary for -- you know, and it doesn't allow List 3, it basically allows only those formulations that contain List 4 --
MS. RANGAN: That's correct.

MS. KOENIG: -- and it's a dual label. So it still does not eliminate this List 3 directive issue. I mean, that would identify those formulations that are in contact compliant. So we could, you know, through that again develop a database of knowledge for those products, which I think is the way to go, those -- you know, we need to inform people, you know, the information's out there, so you don't have this, you know, difficulty in identifying. That is, to me, the cautious way of going about it. But the labeling program is not the answer to this List 3 issue.

MS. RANGAN: It's one way of solving the problem.

MS. KOENIG: It doesn't solve the problem of that directive, it doesn't solve the problem, because if that directive is still out there, you could still have this labeling program and those things could be listed.

MS. RANGAN: You're correct. The directive itself needs to be rescinded. I'm sorry if that goes without saying, but --

(Laughter.)

MS. RANGAN: I mean, the directive itself can't stand while you mandate that. I understand implementing two contradictory programs, but --

MS. KOENIG: No, but I'm just saying I don't -- I
think it -- you know, that's not -- what I'm trying to say is that's not the solution.

MS. RANGAN: Yeah. That's fair enough. I'm just saying that I'm looking at these directives, and in picking up the phone and calling EPA before I got here: EPA's not going to give that information to farmers, they're not going to give it to certifiers. It would be an illegal violation, I guess that's redundant, of confidential business information. They're not going to do it. So this whole "You try, and if you can, great, and if you can't, go ahead and use it" is not -- is not a policy.

MR. RIDDLE: Yeah, I was just -- I wanted to add that it's -- their labeling program is not solution for the List 3s and List 2s, but the mechanism is a door for a conversation to solve it, and the phone call hasn't even been made.

CHAIRMAN KING: Thank you very much.

MS. RANGAN: Thank you.

CHAIRMAN KING: Next up is Bart Reid, with Brian Condon on deck.

MS. KOENIG: Just one comment on the List 3. We -- I believe we have a process, which is the petition process, which we've already proved -- we've added one List 3 inert -- actually, two List 3 inerts on my tenure on the board. That process has been established, and I think
that that is the process that should be followed, because we then can review those List 3 inerts. It doesn't allow any List 2 inerts, that I know of. I mean, I guess they could be petitioned. But there is a process; the process has worked.

For those farmers who have had formulations, they've come forth to the Board, they've petitioned, and we've solved the problem for those producers, and I have not heard, in the last couple of meetings, of any farmers who have come forth and told us there is a problem that exists on this issue.

CHAIRMAN KING: Thank you. Rose. Sorry about that. Bart, we are now ready.

MR. CONDON: Howdy. My name's Brian Condon, and I'm actually up next. Of course, I'm not Bart. Bart is in Texas right now.

CHAIRMAN KING: So Bart is up, all right.

MR. CONDON: Yeah.

UNIDENTIFIED MALE VOICE: We have a statement from Bart.

MR. CONDON: Yeah.

CHAIRMAN KING: Oh, so you're reading both.

MR. CONDON: Yeah.

CHAIRMAN KING: All right.

MR. CONDON: So really I guess I could be up here
for 10 minutes.

CHAIRMANN KING: 10 minutes, that's right. Okay.

MR. CONDON: We'll try to not do that. In any case, the first thing I'm going to do here is read a letter that Bart wrote to the USDA in response to the April guidance statement having to do with the scope of the NOP. And just so you know, Bart is a certified organic shrimp producer in the state of Texas, and he feels that the directive did a certain amount of damage to him. So here goes Bart's letter to the NOP.

"Dear Mr. Jones: I would like to petition you, the NOP, and the USDA to initiate immediate rulemaking concerning the status of organic seafood, and particularly previously certified organic farm-raised seafood, shrimp in my case, that was certified by the USDA/NOP-accredited third-party certifier, Quality Certification Services.

"The Permian Sea Shrimp Company has spent considerable sums of money to obtain an organic certification and the latest guidance statement from the NOP totally usurps all our efforts and leaves us in financial jeopardy as a business. We have product in the market with the NOP seal as organic, and we have many customers that are purchased and are in negotiation with us to purchase our shrimp due primarily to the fact that we have obtained this certification via the NOP rules."
"The USDA recognizes fish and aquatic animals as livestock. In all programs that USDA offers, like the non-insured crop disaster program and Farm Service Agency loan programs, aquatic animals are listed as livestock. Most all 50 states' agricultural departments recognize fish and aquatic animals as livestock. It is only appropriate and logical for the NOP, a USDA division, to recognize aquatic animals as livestock.

"The organic rules have a base of rules and procedures that are suitable for any livestock regardless of specificity for specific breeds or species. There are parameters within these rules for feed, stocking densities, and ranging requires, water, health, welfare, and processing that can be applied universally to any livestock and used universally to certify any livestock.

"We recognize that specific rules can and should be appropriate in the long term, but initially there are enough basic rules that apply to all livestock that certification is possible. The certification using basic rules is a starting point, and the individual companies that obtain certification can provide additional information to develop species-specific rules in the future.

"There is no way to develop rules for every individual animal and plant that a producer may wish to
produce for the organic market, and to separate aquatic
animals out from livestock is equivalent to separating out
rice from terrestrial crops because it grows in water.

"The market definitely respects the USDA's NOP
certification, and that is why we have sought and obtained
this certification and why our market is using this very
certification to develop confidence within their markets.
The latest guidance statement erodes this confidence and
will cause a significant burden on Permian Sea Shrimp
Company and its customers, who have purchased our shrimp
under the confidence that the certification was real and
backed up by the NOP.

"Specifically, Permian Sea Shrimp Company will be
financially and materially harmed and devastated by the new
position of the NOP, and we ask that you initiate immediate
rulemaking to clarify and alleviate this situation for us,
our customers, and the organic retail community.

"We realize that organic seafood in general is a
complicated situation, but farm-raised seafood, livestock,
has a place in the organic market and is in the scope of
the current NOP rules.

"We certainly will be willing to assist in
developing any specific rules that are needed in the future
but insist that the basic livestock rules are sufficient to
allow the certification of our shrimp and other conforming
fish and aquatic animal operations under the NOP and using the NOP seal.

"Permian Sea Shrimp Company asks that you initiate rulemaking on this and consider our petition to maintain our certification and NOP's authority to support our certification in the marketplace. This not only will avoid financial ruin for us but instill confidence in the market for NOP's program and reputation and continue to develop a consumer confidence and awareness for organic farm-raised seafood. Sincerely, Bart Reid, Owner, Permian Sea Shrimp & Seafood Company."

So that was the letter from Bart. This is just an excerpt of a letter that QCS had sent to the USDA last week, responding to the guidance statements back in April. I'm just going to read the last paragraph or two.

"In summary, we request that the USDA honor the simple statements that the NOP has issued previously via three concrete actions: 1) engage in immediate rulemaking to establish standards for aquatic animals; 2) allow beyond the current 18-month provision those aquaculture producers meeting current NOP standards to use the USDA 'Organic' seal in the marketing of their product; and 3) protect consumer confidence and organic producers by disallowing the use of the 'Organic' label on aquaculture products that do not meet NOP standards, products that also undercut the
price of those that do meet the standards.

"This lack of clarity on the issue in the past has gotten the organic industry into the current conundrum, and we hope that the NOP will act decisively, publicly, and promptly on the matter in order to restore order and confidence in the organic marketplace."

And that's all I've got for now.

CHAIRMAN KING: Thank you, Dave.

MR. CARTER: I'm sorry, what was number 2 that you just said?

MR. CONDON: Number 1 was: engage in immediate rulemaking. Number 2 was: to allow the use of the USDA/NOP seal beyond the 18 months, as provided in the guidance statement.

MR. CARTER: And also, just -- while I know you refer to them as guidance, and when they were they posted they were issued as -- or they were listed as guidance, but we were informed earlier this week that those were directives, and that is an additional level of concern that many of us have.

MR. CONDON: Okay.

CHAIRMAN KING: Thank you, Brian. Next is Brian Leahy, and Liana is on deck.

MR. LEAHY: I'm Brian Leahy. I'm President of California Certified Organic Farmers. We are a trade
I'm here mainly today to talk about one of our lines of products, I would suppose, best represented by, say, Traditional Medicinals, a tea company --

UNIDENTIFIED FEMALE VOICE: What?
CHAIRMAN KING: Can you say that again.
MR. LEAHY: Can you hear? Traditional Medicinals is a tea company that's been in company since 1974. I'm not sure if they were here Wednesday or not. I have something written, that I'll submit afterwards, from them.

The recent guidance/directive that -- on the Scope just destroyed a long-term existing organic line, which is the supplemental teas. In Traditional Medicinals' case, they have a simple tea, it's peppermint, and they make a claim, they say it may promote digestion. Because of that claim, it then falls under FDA's regulations, and USDA is now saying that they cannot regulate -- they can't use that organic claim any longer, which we think is creating real confusion in the marketplace, it's really destroying a traditional organic line.

This is exactly why we came to USDA, was to establish, you know, standards so that we can market organic products and everyone's on the same level. USDA's now saying that because of this claim, they are thrown into
the world of "consumer beware."

So we think it's a real problem, and I think it -- it brings up three real problems with this program right now. One is the communications. It would have been very easy for USDA/NOP to have told the regulated community that "we are considering this change, is there a way we can talk about this first and maybe come up with some solutions," and we think there are solutions, we think this could be as simple -- something as simple as an MOU between FDA and the NOP and just take care of this problem. We just think it's -- they opted out of a long-standing category of organic goods. So I think that is -- that is probably "the" biggest problem here, is simply the communications between the regulated community and the program itself.

I think that's really -- that's what we had to say, is -- and I know it's not your -- this board's problem, but it's your problem to communicate to this -- to our regulator and say, you know, this -- we did not establish the National rule to destroy organic trade, we set it up to facilitate it. So thank you. Is there any questions on this?

CHAIRMAN KING: Dave.

MR. CARTER: Thank you, Brian, and I think your point is excellent, because when you take a look at some of the interpretations that are made, it's not only just USDA
having jurisdiction over organic and that doesn't then
involve FDA or EPA or, you know, whatever, but even within
USDA, the fact that it's -- that NOP is within the
Agricultural Marketing Service, and so therefore it doesn't
relate to NRCS or whatever, that the importance of at least
developing some memorandums of understanding, inter-agency
and intra-agency, so that there is consistency, I think is
something that is doable, you know, even if there's no
legislative changes or new rulemaking down the road, that
that would at least be a good set, and I appreciate you
bringing that forward.

   MR. CONDON:  You know, if they didn't -- if USDA
backed out of every product that some state regulation also
talked about, or federal regulation, it'd be just about
everything, we've got this many rules, you know, coverage
everything, so -- this one just seems like it's -- it's a
cop-out, to be perfectly honest.

   CHAIRMAN KING:  Andrea.

   MS. CAROE:  Brian, the Traditional Medicinals
products, are they making a structure function [phonetic]
claim (inaudible)?

   MR. CONDON:  Yeah, and they claims they -- in
peppermint is:  it may promote digestion.

   MS. CAROE:  So that's what puts it as a dietary
supplement?
MR. CONDON: Yeah. And then they have -- on their box, then, that the consumer sees, they have to have the FDA dietary supplement label on the back.

MS. CAROE: Now, could you -- I don't know if you know this or not, but I'm not -- I'm trying to figure this out. Functional foods, where do they fit in and are they not making a structure function claim and would they then fall as a food -- I mean, there seems to be several different shades of gray between food and dietary supplement.

MR. CONDON: There are, I mean -- and -- you know, the Rule -- the organic Rule, it's very clear, it says -- it does -- agricultural products meant for human consumption, agricultural -- you know, herbal teas definitely fall within that, and they have since the very beginning of organic, it's just -- you know. So -- and, yeah, I don't know -- right now there's a turf war between FDA/USDA on, you know, "what do we regulate?", and in the industry right now, one of the hottest fads in food is to make all kinds of dietary supplements and just all kinds of claims. I mean, I sold kiwis because they were an aphrodisiac back in the '70s.

(Laughter.)

MR. CONDON: And the Farmers Market in San Francisco, they sold pot for a while.
MR. CARTER: Did you say kiwis?

(Laughter.)

MR. CONDON: You know. But does that fall under FDA? I -- you know, there -- I don't know, but it's -- it's -- as soon as they start opting out of long-term existing businesses because some other regulatory agency has some claim in it, what kind of business alliance [phonetic] is that? We had -- one of our prospective clients was working with our processing person, Jane [phonetic] Kennedy, two days after this came out, she called, crying, on the phone, you know, "This has destroyed" -- "My life savings have been aiming at going into this particular business, USDA" -- "I had every reason to believe that it was part of this regulated scheme, and now, out of the blue, comes this directive," and that's -- I mean, that is also one of the main problems, is communications, you know, let's talk about these. Existing businesses, that's -- it seems like a kind of a basic, you know, sense of dignity, is to talk to each other first.

CHAIRMAN KING: Andrea.

MS. CAROE: As a certifier, Brian? I mean, the USDA has kind of kept this open, that certifiers could have their own standards and certify to them and do them -- I don't know, basically, organic 5 years ago (inaudible).

MR. CONDON: Yeah.
MS. CAROE: As a certifier, do you see that that's something that would be attractive? I mean, is that --

MR. CONDON: Yeah.

MS. CAROE: -- you would do or -- I mean, it's really tough for you answer, I (inaudible) --

MR. CONDON: No, I think it's an excellent question, because when this directive came out, you know, there's all kinds of categories in here, and some of them make a lot of sense, they -- in my mind, to make organic cosmetics is kind of goofy, I mean you -- it's just -- it's not food, you know. Our standards were agricultural based, you know, and unless -- and if other industries, like cosmetics, pet food, right now, those make perfectly good sense to have, you know, different standards, non-USDA standards, but this one, peppermint tea, I mean that is -- that's food, you know, and that's why we set up this regulatory scheme.

So I don't -- we have no problems doing other standards, we think that the marketplace will be there, but we also remember the confusion, you know, people were -- even under the California act, you could have 2 percent organic ingredients in that thing and then the whole label said nothing but "organic." It was very confusing and very misleading. And the herbal tea people, dietary...
supplements, I mean, they fit under the program, and they just think that it's going to be a race to the bottom and a lot of confusion.

CHAIRMAN KING: Thank you, Brian. Liana's up next, and Harriett is on deck.

MS. HOODES: Good morning, all. This is Liana Hoodes. I'm the Organic Policy Coordinator for the National Campaign for Sustainable Agriculture, Organic Committee.

As always, I'm going to really stick a lot to process here, and so -- I'm going to jump around a little bit at first, though, and make a few comments on some of the directives, guidances, whatever they are, and our comments on them. Mainly we have a comment on the whole damn process, that's broke.

(Laughter.)

MS. HOODES: So -- but I would like to say: in terms of the antibiotics in livestock, we would like to state unequivocally: this decision is about protecting management styles and not about animal health care. It's always been possible to raise healthy animals without the use of antibiotics, in general -- there are specific cases it's needed -- in an organic system, but it is probably not possible in a factory farm setting, and that -- this change is clearly catering toward factory farm settings, and that
is a problem, in addition to the process to get to that
guidance or directive.

Similarly, inerts, the issue of the allowance of
inerts if you don't know you have them is a real big
problem in terms of this label and the consumers' expecta-
tions about not having this in their -- in the organic
system at all, and it seems to go way out of the -- what
was normally expected, those normal decisions we wanted you
as a board to have to make. This is way beyond any of
that.

On the sunset provision, I just would like to
make a comment. Our pressing for a couple years for you
folks to be able to hire an executive director, this is
directly related to that. This is coming up on some
massive work that you folks have to do, and if -- you're
amazing -- I didn't even start by thanking you.

You are an amazing volunteer board that has done
incredible amount of work, and the least that we, as in
representatives of our government, and our government could
do for you is to get you an executive director that -- to
staff out some of this massive work that you have already
and that is coming up on you.

I do want to thank you for this forum, I want to
thank you for my being able to speak to you, and also for
us all to listen to all of the comments. We appreciate
that in an ongoing way.

We, as National Campaign Organic Committee, continue to object to the treatment of this OFPA-mandated board by the Department. We specifically refer to the NOP's refusal to move the recommendations of the board through a regulatory process and their increasing usurpation of the statutorily-defined role of the NOSB.

Where are those years of recommendations, and what is the process used to determination which ones will become regulation? You folks could join in the refrain, since you have heard it from me for years now, those exact words.

In addition, we object to the practice of the NOSB -- of the NOP making materials decisions without the NOSB or without public notice and comment, and we question severely their authority to do so. In this the NOP has crossed the line. The responsibility to review and make recommendations to the Secretary regarding National List as outlined in OFPA is the most important statutory role of the NOSB.

So here we know that the NOP's move from the issuance of policy statements, that were sort of Q & As on the website, to what on the surface may appear a more formal process of what were guidances, and may still be guidances on the web but are now directives, is confusing.
Those statements have gone through no more rigorous notice and comment, and while nominally welcoming input, really offers directives that materialize on the web and appear to be effective immediately.

We encourage you as a board to become much more active on your own behalf in supporting those pierces of process that you need to move through. We will as a community support you in standing up for not accepting these directives, these guidances, that violate the law and violate your statutory role.

We will be proposing some language that we think the NOP should go to rulemaking, defining guidances, directives, regulations, and your role. That has never been done. Many other agencies have those clear-cut lines so everybody knows which is which. None of us in this room know what a guidance or a directive is, and we all deserve to at least know that process.

CHAIRMAN KING: Jim.

MR. RIDDLE: Thanks, Liona, for your words of support and encouragement and your marching orders for our future lives.

(Laughter.)

MR. RIDDLE: I was thinking last night, you know, about the past two days and the Board here, and -- I mean, it's -- it's what keeps me going on the Board, the fact
that people came so well-prepared, and we've dealt with a myriad of issues, and done it in a very thoughtful manner and a respectful manner and an inclusive manner, trying to take into account public comments and the comments of diverging views on the Board. So I'm very pleased and proud of our process.

I want to comment on the executive director issue. Some of us have worked very hard to get that in the legislation, the appropriations, $100,000 for NOSB executive director, additional funds for peer review and for TAP reviews, and that money was appropriated by Congress.

When we've asked about that, we really haven't gotten information from the program, but it's my understanding that a couple weeks ago, Undersecretary Hawks was asked by Senator Herb Cole a question about these three items, and Undersecretary Hawk responded that the NOP was just about to hire an executive director for the Board.

We don't know anything about that, and you'd think that the Board, according to OFPA, has the power to hire an executive director and we'd have a role in establishing the job description and reviewing candidates, and I think we need to follow through with that. The money's there, and we need to take action, the Board needs to get more assertive on that.
I also want to inform you and other members of the audience that in the last couple months, leadership of the Board has written two letters, the last one went in last week, signed by 11 members of the Board, expressing our concerns, particularly about the materials review process and how we are not able to exercise our statutory authority the way things have been going for the past four months, with petitions being submitted and materials being allowed, which are not on the list, and going to TAP reviews without our screening.

This is very disconcerting to the Board, so we share your concerns and have been trying to take some actions and will continue to take actions.

MS. HOODES: And I in no way meant to imply that you weren't taking actions --

MR. RIDDLE: No, you clearly said we were.

(Laughter.)

MS. HOODES: And I do hope that you know that we are going on the Hill specifically on those issues, those three questions have been asked several times of the Department, about the director and the TAP review and the peer review panel, and I note that in OFPA the quote is "requires the Secretary to" -- quote -- "authorize the Board to hire a staff director," is the exact language that -- in OFPA. And yes, we need to continue to push Congress
on these issues for you, on behalf of you, because you do
work so well on behalf of us. Thank you.

CHAIRMAN KING: Liana, thank you for your
comments and support. Thank you very much. Harriett. On
deer is John Clark.

MS. BEHAR: Okay, my name is Harriett Behar. I'm
a full-time organic inspector, a grower of organic
vegetables since 1973, and certified organic since 1988.
I'm also an avid organic consumer.

I'm concerned that the NOP is not going through
the OFPA-mandated process of NOSB review and public comment
on many of their directives and materials issues. The
"organic" label is a privilege. It appears that the NOP,
through their most recent directives, are allowing access
to the organic market that is not based on a whole-systems
approach of promoting soil, plant, and animal health but,
instead, eroding the fundamental regulatory framework
supporting that "organic" label.

I urge the NOSB to exert their OFPA authority,
both as the materials list guardians and as the statutory
advisory counsel to the NOP, to be even more proactive in
fulfilling their role in the public private [phonetic]
partnership given to them under the OFPA when guidance,
directive, or other NOP provisions are put forth, and I'm
extremely disappointed that the NOP process does not
consult the NOSB and the broad expertise and stakeholder
support that you represent.

I'm concerned that the recent NOP directives set
many dangerous precedents. The inerts and pesticides, as a
precedent, this directive allows producers to use possibly
prohibited products as long as they are unaware of the
toxic List 2 or 3 inerts. This encourages manufacturers to
hold back information in order to have access to the
organic producer input marketplace.

In the future, fertilizer manufacturers,
processed ingredients suppliers, et cetera, could choose
not to release information as a way to gain access to the
organic market. This is the precedent. Future NOP
personnel and NOSB boards could use this precedent that
permits this type of secrecy in order to just allow use of
unknown materials.

Consumers wish the precautionary principle to be
in place when putting their trust in organic products, and
this allowance of unknown products seriously compromises
their trust.

Lastly, this puts a significant burden on both
inspectors and certifiers to work on obtaining information
from suppliers, when the producers should prove themselves
that their organic system plan meets the Rule, not that
they do not know what they are using and therefore it
should just be allowed.  

Antibiotics to be used in animals that are at least one year prior to organic milk production: first, I believe this directly contradicts of the OFPA and the NOP rule, which does not allow antibiotic use in organic animals or edible products from organic animals.

It is a human health concern that overuse of antibiotics, both directly admitted to humans and animals, are causing antibiotic-resistant bacterial strains to develop. During inspections it would be difficult to track that all uses of the allowed and present antibiotics are meeting the specific requirements of this directive.

The temptation to use antibiotics for problems in animals less than one year from organic milk production is great. This also substitutes an input use for a preventative proactive approach that mandates that farmers develop healthy living environments for their animals, that promote health. The use of antibiotics to routinely control pneumonia in calves does not encourage the producer to improve the sanitation, ventilation, and stocking rates in the calf barn.

I understand the need for humane treatment for young animals, and if the NOP feels this is absolutely necessary, I would feel much more comfortable, although not in complete support, with this allowance if it was mandated.
that a veterinarian verify that the antibiotic was needed and that they administered it. This opens the door to any type of animal health product to be used in animals one year from organic dairy production.

Fishmeal. The precedent here allows any secondary ingredient to be included in a non-synthetic product that is fed as a supplement. The allowed use of ethoxyquin, a prohibited preservative, embedded in this "natural" fishmeal opens the door for other items to be bundled into any "natural" products, such as synthetic amino acids, mammalian and poultry by-products, or other non-allowed materials.

In addition, this directive allows fishmeal as a livestock supplement, and this includes cattle, who do not naturally choose to eat fish.

Scope. I believe this directive sets the precedent allowing the use of the "organic" label on products that are outside the scope, whether they are certified or not, and this will confuse the consumers if organic throughout the marketplace truly does not have a meaning.

The word "organic" should be reserved only for those products that are certified by an accredited certifier, not those who just want to gain financially from the "organic" label, with no certification.
I urge the NOP to expedite work on standards for the areas mentioned in the Scope document in order to close this dangerous loophole.

Finally: I'm concerned that consumer confidence in the "organic" label will be eroded based on these directives.

MR. SIEMON: You know we've taken a stand about the antibiotics and a lot of these issues, we've -- we've taken a stand once, twice, thrice, you know. So do you all -- I'd like to ask you and even several others: are we to the point of wanting to open up the Rule again and rewrite the Rule?

MS. BEHAR: Well, the Rule says that animals should be -- for emergency use, to preserve the animal's life, that antibiotics can be used, but the Rule is very clear that antibiotics are not allowed in animal products or edible products from organic animals.

So I believe that the Rule is very clear that antibiotics are not allowed.

MR. SIEMON: But the USDA lawyers say it's not clear, and they've interpreted it that way, so the only thing left is to either do rulemaking or the lawsuit-type thing, so --

MS. BEHAR: I believe, yes, that the consumers
and many organic supporters believe that if the Rule needs to be opened, to strengthen, that statement that I just said, then we should open the Rule.

CHAIRMAN KING: Thank you, Harriett. Dr. Clark, and Jonathan Landeck is on deck.

DR. CLARK: Thank you. My name is John Bill Clark, Cassopolis, Michigan. I'm a certified organic farmer. I have a proxy from another organic farmer in my neighborhood, name is Roger Outlaw, Niles, Michigan. Strange name, on this morning, I guess.

CHAIRMAN KING: I was going to ask you about that.

DR. CLARK: I wish to second the idea of regime change, and I would illustrate that by asking how many members of the NOP staff are here in this room at this very moment?

I count -- how many? One -- she may not even be considered a member of NOP, I'm not sure.

CHAIRMAN KING: No, she's very much a member, and she works very hard, and we do appreciate the fact that Katherine's here, so I will make that clear.

MS. BENHAM: Thank you, Mark.

(Laughter.)

DR. CLARK: But when she has any function in --

CHAIRMAN KING: You don't want to be on her bad
side, so --
(Laughter.)

DR. CLARK: -- in directives, I -- I don't think I want to blame her for the directives.

I don't disagree with anything that's been said so far except that it's always a puzzle to me, why do we even bring up List 2, List 3, List 4 inerts, because pesticide use is incompatible with organics paradigm.

We've been farming livestock, fruit, fish, honey, vegetables. Livestock includes beef cattle and sheep, and now we're getting into some birds and hogs. But we've never seen any need for antibiotics or parasiticides, not even for the sheep.

So you have just approved a parasiticide which is also considered insecticidal and antibiotic, and I will state my -- my favorite way of putting the organic paradigm: pesticides cause pesticide -- pest problems, and when you stop using them, the pest problems go away, usually. And that's not limited to herbicides or insecticides, it goes to the full spectrum, -icides of all kinds.

Bear with me for a careful reading of 6517(c)(1), Part A must precede Part B for every material and note that after A-B-3 is for non-synthetic, non-organically-produced materials that have survived A-2 and A-3. That leaves no
place for synthetics in handling. They are strictly
forbidden by 6510(a)(1). There's no place on the National
List for these. If used, products are remanded to the
"made from" label.

Congress was very clear and specific about this.
That's why they created the "made from" category.
Handlers, and only handlers, are entitled to use this
category and the 5-percent non-synthetic National List-
listed ingredients for making their products.

Certifiers are not entitled nor responsible for
certifying "made partly from" products. They certify only
95 to a hundred products without synthetics, and certified
ingredients on the ingredient panels, neither their seal
nor USDA's "organic" seal is permitted by statute on these
products. Certifiers who defy this are risking lawsuits by
consumers, producers, and handlers, who have every right to
use the "made partly from" label down to 50 percent.

Now that percent organic labels are permitted,
this is not a demeaning of a "94-percent organic" label.
70 percent for certain exports doesn't mean that 50 to
70-percent "made from" products should be prohibited.

Do you realize how many minor ingredient
producers, like Trout Lake Farms in Oregon, have been put
out of the organic business? Why do you persist -- and I'm
talking to NOP now -- in this liability risk-laden practice
of permitting synthetic ingredients and brow-beating handlers who have a statutory right to use these materials, if products are labeled properly?

Congress never intended for NOSB or certifiers to bear the burden of relisting/rehashing the FDA GRAS List. That's why they provided the "made partly with" label. They also designed the three-tiered labeling regime to avoid misleading consumers. That's also why the ludicrous attempt by NOSB to squeeze synthetic ingredients into the review process, that was never intended to include them, has been so difficult and convoluted.

A texturizing synthetic, TSPP, in a one-ingredient product, with no disclosure on the ingredient panel?: How low can you get? People buy that product, who are on low-salt diets, or maybe sensitive to synthetics, and they don't get any disclosure that it's in the product? The annotation at least should include a requirement to put that on the ingredient panel. It's half a percent? -- I heard yesterday.

Okay. All feed -- oh. The 5-percent allowance for non-organic ingredients does not translocate to feed. All feed must be 100-percent organic. Evasions of this by pretending that mineral supplements -- mineral supplement concentrates are not feed is clearly not conforming to the statute. No synthetics here either. Complete feed should
be made complete by using diverse organically-produced crops, not with some short of chelated proteins or synthetic amino acids.

Okay, slightly more here. Compatibility with organic resides primarily with alternatives, both practices and materials. The Secretary hasn't determined -- when I brought this up, tried to bring this up, yesterday, about 6517(a) and (b), it has to be (a) and (b), not just (b) without (a), and George came back, he came over to see what I was thrashing around about, George came back and looked at what I said, he brought it to you, and then he came back with: the Secretary hasn't determined that it's harmful to human health, and go through the other two categories and that.

What has NOP been doing for the last 14 years? Policy -- policing any attempt to deal with the food safety and residue testing in 6518(k)(5) and 6511(c)(2)(b)? Those things are part of the law, and they've been totally ignored by NOP.

I would second the idea that you need an -- you have the right and the need for an executive director, whatever you call it, that would be selected not by USDA, and the process for appointing members of the Board should be also controlled by the organic community at least, if not you.
I found out from Dennis Blank [phonetic] yesterday, or the day before, I can't remember which, he FOIA'd certain documents from USDA and found out that the three red herrings in the Original Proposed Rule, radiation, sewage sludge, genetically-engineered things, he FOIA'd letters that showed that those insertions into the Original Proposed Rule, came from higher up and outside -- well, higher up in USDA and from outside corporations.

I hope I haven't violated confidentiality with Dennis, but I thought that should be public knowledge, if it isn't already. So thank you very much, again. Any questions?

(No audible response.)

MR. LANDECK: Thank you very much. I'm Jonathan Landeck, from the Organic Farming Research Foundation. This is imply a statement to acknowledge the diligent work of the NOSB and an encouragement to continue this work, and especially to echo the comments made by several of us, to be a bit more assertive in your role, in your interactions with the NOP, and to pursue further clarification of your role and scope of responsibilities. Again, thank you very much for your -- for your fine work.

CHAIRMAN KING: Thank you.
UNIDENTIFIED MALE VOICE: And he had offered that
time to me (inaudible) --
(Laughter.)

CHAIRMAN KING: And I saw several Board members
wanting to support him in his statements.
(Laughter.)

CHAIRMAN KING: This is Richard Wood, and we have
Merrill Clark on deck.

MR. WOOD: I'm Richard Wood, the Executive
Director of Food Animal Concerns Trust, or FACT. FACT is a
non-profit organization that advocates for humane and
sustainable farming practices to improve the safety of
meat, milk, and eggs, and to promote humane and sustainable
animal husbandry. Our formal comments are being passed
around.

Kathy Seus, FACTS Farm Program Manager, presented
comments to you on Wednesday on NOP's overall role and
problems with that role. I thank you today for the
opportunity to provide brief comments specifically focused
on the issue of antibiotics, antibiotic use, with dairy
livestock, as described in the Guidance Document issued on
April 13th, or the Directive, however we want to refer to
that.

FACT acknowledges that Section 205.236 of the
Organic Rule addresses the origin of livestock. This
section defines how livestock can be moved into an organic herd and, even though the meat from these cows cannot be marketed as organic, how after 12 months the milk or milk products can be so labeled.

Some organic dairy farmers have asked for a clarification on this section. Kathy on Wednesday addressed our concerns with this section as well. However, this concern and this entire section of the Rule deals specifically with the origin of livestock and nothing else, and a number of dairy producers have been faithfully following this protocol.

FACT also strongly supports Section 205.238, stipulating that organic livestock producers must not, quote, "sell, label, or represent as organic any animal or edible product derived from any animal treated with antibiotics," unquote.

It is our understanding that organic dairy producers have been carefully following this protocol when marketing both meat and milk and dairy products. This prohibition is central to what it means for a product to be organic as we all understand, and in our view it is a basic assumption that consumers make as they go to the dairy cooler in the grocery store.

FACT also strongly affirms that a sick animal must be treated with therapeutic drugs, including
antibiotics, even though the animal is under organic
management. The Preamble to the Organic Rule states
clearly that the producer must not withhold medical
treatment from a sick animal to maintain its organic
status.

However, the Rule also states that if livestock
are treated with antibiotics or any synthetic substance not
included in the National List, then the product cannot be
labeled as organic. We all understand that.

FACT believes that the Guidance document, or the
Directive, on livestock health care undercuts the intent of
the Preamble and the substance of the Organic Rule itself.
The Guidance Statement pieces together portions of 205.236
and 205.238 to come up with a seemingly new section in the
Rule altogether.

The Guidance document takes the provision of
.236, that milk can be marketed as organic after 12 months,
and pastes that provision into .238, so that now the
"origin" provisions apply to antibiotic use as well.

FACT opposes this "cut and paste" approach to
implementing the Organic Rule. We believe this revision
undermines the integrity of the "organic" label as meaning
"no antibiotics." It goes against the current practice of
organic farmers, dairy farmers, and will undercut consumer
confidence in organically-produced products of all kinds.
FACT is joined in opposition to this position, or this -- to this guidance, our opposition is joined by the Union of Concerned Scientists, the Center for Science in the Public Interest, Environmental Defense, and the Institute for Agricultural and Trade Policy.

This new Guidance is a major change to the organic standards. During the NOSB meeting on Wednesday, and probably yesterday as well, I wasn't there, though, there's already been much debate and a large amount of confusion about the meaning and intent of this document. However, there is an established procedure for making significant changes that allow for a well-informed public debate where all stakeholders have the opportunity to respond. That procedure is the rulemaking process. This Guidance should be withdrawn by the NOP and submitted for public debate as a proposed modification to the organic rule. The Campaign to Keep Antibiotics Working, or KAW, is submitted a letter to USDA Secretary Veneman to ask that this step be taken. FACT is a member of KAW, which has a combined total of more than 8 million supporters.

We see this Guidance Statement as a significant change that deserves full and formal scrutiny by the NSOB -- by the NOSB --

(Laughter.)

MR. WOOD: -- and by all stakeholders. Sorry
about that.

(Laughter.)

UNIDENTIFIED MALE VOICE: It's a Freudian slip.

(Laughter.)

MR. WOOD: We want all stakeholders, regardless of their name, to be involved in this, organic farmers, processors, suppliers, the consuming public, and we ask that this Guidance be withdrawn and submitted to rulemaking. Thank you very much.

CHAIRMAN KING: Questions.

MR. RIDDLE: No question, but I want to just thank you for that statement.

MR. WOOD: You betcha.

CHAIRMAN KING: Thank you.

MR. SIEMON: They've been called worse.

(Laughter.)

CHAIRMAN KING: Primarily by you.

(Laughter.)

CHAIRMAN KING: Next is Merrill Clark, and Carol King is on deck.

MS. CLARK: Thank you. My name is Merrill Clark, Roseland Organic Farms. We are primarily producers of organic livestock, and I was a charter member of the NOSB back in '92 to '96.

Actually, I view the role of this particular NOSB
to be particularly challenging, obviously, and that's been noted this week. Difficulty as it was for me to wade through the waters of the charter NOSB and try to figure out things like what elementare [phonetic] is before anything else was even discussed, plus becoming a livestock committee chair and consumer rep, this board has to leap other -- other hurdles, policy development criteria. Much improved, however, material review procedures, and a way of accommodating each other's special concerns that I find particularly refreshing, so congratulations on that. But you have this other hurdle, of dealing with the directives that have already been mentioned. We did not have anything like that in the original board I can tell you. You also -- actually, we didn't have enough, it was kind of a little laid back with the NOP at that point.

At the very least, I was known as one who never met a synthetic I could vote for --

(Laughter.)

MS. CLARK: -- many of the votes were 5 to 1, 6 to 1, and, well, there goes Merrill again.
(Laughter.)

MS. CLARK: I'm still that way (chuckles). Which brings me, of course, to antibiotics, ivermectin, moxidectin, and fishmeal, plus the pesticides and inerts and everything that are popping up, that no one would ever
think would ever really be coming up, both by NOP and, unfortunately, some NOSB activity that I can't agree with. The cut-and-paste, however, is certainly going on, and the paste jars at NOP must be quite large at this point.

We'll be petitioning, actually, talking about it ourselves, to remove ivermectin as a synthetic pesticide, which is what a parasiticide is, and an antibiotic, they're nothing but synthetic pesticides, let's realize that, with maybe moxidectin, after that, advertised as a, quote, "better" parasiticide, don't like it, not to mention a response to that antibiotic directive.

It's clear pasture -- non-confined, organic animals, such as ours, and many others out there, in the organic stream are never particularly threatened by parasites to the extent that they have to have a synthetic pour-on parasite poison for internal use, when alternative animal lifestyles and management practices, including outdoor pasturing, are included and are available and in place.

Parasiticides, antibiotics, whatever you want to call them, mean nothing but a deterrent to animals, and, again, as somebody mentioned, the huge potential for parasite resistance. Why do we want to trap an animal in a situation that they're being diminished, not enhanced. Pesticides are doing that.
I agree with Kathy Seus, who spoke yesterday, or Wednesday, suggesting that the NOSB work on animal husbandry standards a little bit more completely. I know you have the problems with the varying parts of the country, but to me -- I remember what Bill Welsh used to say: I can't grow pineapples in Iowa. If we can't sufficiently grow or raise a dairy animal someplace in boggy, wet Arkansas, okay; should we throw in materials to kind of make it work? I don't think so. That's where you kind of go a little bit to -- downhill, let people bloom where they're planted, and keep stuff wherever they are, that works with where they are, work with the earth.

Can both NOP be doing -- can the NOP really be doing more, actually, to discredit organic production in the eyes of consumers and the producers, who resort to none of the aforementioned synthetics?

Why are consumers demanding organic meat and milk? We've heard it before: no pesticides, no anti-biotics, no parasiticides. What's going on here between where I was and where we are now, lots of good things, but these are really troubling.

A quick look at materials criteria, for moxidectin, for instance, which was just voted unanimously and -- on the Board just yesterday. Harmful to the environment? Yes. Adverse biological chemical
interactions? None that have been found. Thank you, but how could they not have harmful interaction in an organic farm system? Binds to the soil? Yes. Adverse on non-target species? Yes. Sounds adverse to me. How many criteria not satisfied needed to kick a material off the list I've never understood. Some people have said, you know, you have to comply with all of them. Well, it doesn't matter. If one's good, it doesn't matter if the -- all the -- aren't other [sic.], it's -- antibiotics and paracides don't even pass the first three qualifications, that talk about "Consistent with organic? No," "Not harmful to the environment? No," and "Are there substitute practices? Yes."

I heard on TV last night a headline that was stated, said what they were starting to do -- "What are they starting to do with your food?" Thank goodness they weren't referring to organic food at this time. But, you know, somebody else out there will be starting a challenge, the liability, if we don't -- if we aren't really careful with what we're starting to allow. Thank you.

CHAIRMAN KING: Jim.

MR. RIDDLE: Thanks, Merrill. I just want to clarify a couple things, and that is: I think I heard you say that our vote on moxidectin was unanimous, and there were --
MS. CLARK: Maybe not --

MR. RIDDLE: -- I think 3 votes against and 1 abstained --

MS. CLARK: I'm sorry.

MR. RIDDLE: -- with a lengthy disclaimer.

(Laughter.)

MR. RIDDLE: As I recall. But also, then, after we received, at the end of the day, a couple different people asked me about the annotation on moxidectin, because it's quite short, what we passed, "internal parasites only," and you look at the annotation on ivermectin and it's quite lengthy. But I just want to clarify that that lengthy annotation on ivermectin is really a restating of the section in 205.238, and so it's redundant, and that same restrictions apply to moxidectin, it cannot be used for slaughter stock at all, ever. The only allowance is for breeder stock when used prior to last third of gestation and not during lactation, for breeder stock; and dairy stock, when a minimum 90 days prior to the production of organic milk. So those override both of those parasiticides.

So I just wanted to make that clear to everybody, that this wasn't an allowance for slaughter stock or a more liberal annotation than ivermectin.

MS. CLARK: I get it, but it's still squeezing in
something --

MR. RIDDLE: No, I --

MS. CLARK: -- that begins to start the ball rolling downhill.

MR. RIDDLE: I understand your concerns, and that's why some people voted against.

MS. DIETZ: I'll tell you what the official vote was: 11 yes, 1 no, 1 abstention, 1 absence.

MR. SIEMON: I just wanted to make a statement about -- you said petitioning for materials. You know, after hearing what we heard yesterday about the sunset clause, it's rather obvious that we need the organic community now to start petitioning materials that are becoming more and more obvious they don't belong on the List --

MS. CLARK: I was hoping there was a petition form right here, that we could pick up and start doing it.

MR. SIEMON: -- because, first off, when you and I were together in '92 and '93, things have changed so dramatically in our knowledge, there's materials that we put on there in good faith, that really now, to us, seem obviously the wrong decisions, and maybe --

MS. CLARK: So you all --

MR. SIEMON: Maybe we're still making wrong decisions, but --
MS. CLARK: Somebody has to petition, you don't stimulate that; is that right?

MR. SIEMON: We can't do that. We need the organic community to help us, because there are materials that in the past were wrongly put on there, to come forward now and to start -- trigger that process.

CHAIRMAN KING: Dave.

MR. CARTER: And just to follow up on that, because that's -- as I said prior to my vote -- and the second-most-lengthy, I think, disclaimer. But, you know, given the fact that ivermectin is on there, then you start to phrase things -- as long as that's on there, then let's have something that's less egregious than ivermectin, but if, you know, the community wants to step forward and petition both of those things off of there, I don't think many of us on this board would have any problem with that.

MR. RIDDLE: Right. And those petition forms and instructions are on the NOP website, and you basically follow the same procedures as you petition to add something, well, you petition to remove it, but then you need to address the criteria and your specific objections need to be in the context of the criteria.

MS. CLARK: Yeah, we need to definitely be doing more of that.

MR. SIEMON: But I would do that material by
material and not lump things together.

MS. CLARK: Okay.

CHAIRMAN KING: Yeah, good point, George. Thank you, Merrill. Annie Kristo [phonetic] is up next, and Tom Harding is on deck. Wait, I'm sorry, you're right. It's Carol King. I apologize. Annie, you're on deck.

MS. KING: Actually, I have Amy's vote [phonetic] by proxy, and I am losing my voice, I apologize. We would first like to thank the Board for all your hard work, and I understand we're probably beating a dead horse here, but I do have a statement regarding the dairy replacement and the antibiotic use that I would like to read.

The contradictions in the National Rule referring to the organic dairy production must be corrected. In reference to the guidance document, which is now going to be issued as a direction, posted on the NOP website on 4/14/04, Nova New York Certified Organic (indiscernible) would like to make the following statement.

Section 205.238(c)(1) says: "A dairy animal treated with antibiotics cannot be sold, labeled, or represented as organic."

Section 205.236(a)(2) says: "Milk or milk products must be from animals under continuous organic management beginning no later than one year prior to the production of the milk or milk products that are to be
sold, labeled, or represented as organic."

The meaning of these sections is clear: an animal treated with antibiotic or other prohibited substance must leave the herd and can never be considered organic again. Allowing treatment with antibiotics does not comply with this section of the Rule for "continuous organic management." By definition, continuous means without interruption.

To allow a dairy producer to treat a cow with antibiotic or other prohibited substances, then keep her on the farm and manage her organically for a full year, is problematic. Who's going to monitor that animal and be sure her milk is not sold as organic or fed to organic calves? This is going to encourage some dairy producers to cheat. There's no way a certifier can monitor what happens on a dairy farm day to day.

It is essentially allowing a continual state of transition, which was clearly not the intent of the Rule. The contradictory nature of this guidance goes hand in hand with the origin of the livestock Guidance issued on April 11th, 2003, and I know that's a dead horse too, but we're still trying.

Section 205.236(a)(2) is clearly referring to a one-time whole-herd transition, and the last paragraph of that section states that once an entire distinct herd has
been converted to organic production, all dairy animals shall be under organic management from the last third of gestation. The intent of the Rule is clear, after dairy transitions of the herd to organic production, from that point on all animals must be managed organically from the last third of gestation.

The Guidance documents of 4/11 and 4/14, which we have now been told will be referred to as directives, leave the interpretation wide open. To correct this inequity to dairy producers is simple. If the intent of the Rule is followed, once any operation transitions their herd to organic production, all animals must be managed organically from the last third of gestation.

There can be no distinction between dairy farms that transition before or after the NOP went into effect or whether they transitioned with 100-percent organic feed or used the feed exemption. It is discriminatory to new farms and detrimental to the organic dairy industry as a whole. Once a farm is certified for dairy, all animals must be managed organically from the last third of gestation. This includes any replacement heifers purchased and brought onto the farm.

Requiring all animals to be managed organically from the last third of gestation was the clear intent of the Preamble. It is the interpretation that is fair to all
producers. It is the interpretation that maintains the integrity of the organic dairy industry, and it is the interpretation that consumers expect, are willing to pay for, and deserve. Thank you.

CHAIRMAN KING: Next is Tom Harding, and I believe it's John Cleary on deck.

MR. HARDING: Did you skip somebody, I thought, or --

UNIDENTIFIED MALE VOICE: No, she spoke --

CHAIRMAN KING: She spoke for Amy.

MR. SIEMON: We were so eager to hear you talk.

(Laughter.)

MR. HARDING: Thanks, George. Well, good morning to everyone.

I just want to start off by saying that this process is incredible, and the work you're doing is incredible, and I don't think we say that enough, and I want to thank not only all of you on the NOSB now, I mean, I've seen an enormous improvement in processes and the way you're looking at it, and we're going back and correcting a lot of work that was, of course, in some cases a mistake in the past, but that's an imperfect world that we live in, and that's the nature of it, but I want to thank you very much for it.

Knowing that it's not [sic.] imperfect world, I
want to thank the NOP, because they've also laid some very
important documents no the table, continue to raise the
hair on the back of our necks, to make sure that we're
focused on some very important issues.

(Laughter.)

MR. HARDING: We've asked for this document, by
the way, for two years. Now we've got it and we don't like
it. Now we have to do something about it, if we don't.
But I want to tell you there are some pieces in these
documents that are very important to us.

But I want to remind you that the work you're
doing is critically important, I want you to focus on
history, because there's a lot of history in this room,
some we like and some we don't, there's a big industry out
there who would like to see us -- perhaps either be part of
us or see us fail, and I think it might be that they want
to be part of us. We've got to make sure that the level
playing field is very high and the consumers are always
engaged in this process.

So don't give up this important work, continue to
push hard, and even when we disagree, Jim, it's okay with
me. I think it's very important, the process that I saw
for the last two and a half days, it's an excellent
process, you've done an enormous job to improve it, and
that includes the people in the NOP, both those who were in
the room earlier and not in this room now.

The other thing I want to say is that it's very important that we recognize where we are today, because 25 years ago, when there was no OMRI, there were certifiers running around the country, who were barely making the standards survive at farm level, who were organizing materials and evaluating them.

I was involved in one of them. We never approved ivermectin. George knows that. I look over here, Dave. We never approved it. We brought in the best of experts.

The fact is, is that we do have materials on the list. They're there for a reason. Some view those as tools, others as weapons and hazards to the industry, and I remind you that the rules were twice the withdrawal of the label for the use of antibiotics on dairy herds and in meats, up until we got the law.

So we need to fix this problem. We have not, with this new document, now called the Directive. We are still unclear, you just heard from this lady before me, we still have problems understanding where the dairy herd is.

I was operating with -- a lot of my dairymen were -- we were certified no antibiotics, 12-month transition, when all around me there were other dairymen being certified who were using antibiotics and who were not waiting 12 months. So we do need to put this consistency
[sic.] and fix the inconsistency right now.

The other things that are very important, for me anyway, the new directives are on the table, so what, let's go at 'em, let's be proactive, and let's camp on the Hill.

The other thing that's very important is the materials process. I think you've improved it enormously, but let me tell you, there's a lot of work on the table yet, and I want to remind you again that we want to grow the industry, and there are some needs for what I would call environmentally less-hazardous materials to be put in this process, you put a few on the List yesterday, in the livestock, in the soils, and also in processing. These are important things. But make sure we continue to manage the bar very high.

Our main objective is to grow the industry at a very high level.

Supplements in fishmeal, I would just like to know what the hell a supplement is and how much a supplement constitutes in the feeding of an animal, any kind of an animal. I want to remind you there are people working on organic fishmeal, and so we don't want to discourage that work by opening up the store, but at the same time, we're using fishmeal, let's quantify it. Let's quantify, at least some guidance, what a supplement is.

I've already said enough about antibiotics, but
whether you believe it or not, there's probably a bunch of farmers out there saying, "Woo, I am really happy about this," and there's a bunch of people in this room that are sad, and some consumers very confused. So we need to fix it.

The other thing that's really important is to change. The scope of work that came out, that's now -- it went from a guidance to a directive, I'll tell you, there's some pretty meaty stuff in there, and I would encourage us to put the flag and plant it high. We don't want to lose the word "organic."

We don't want to lose any part of this industry that can grow, whether it be a tea or a supplement or a pet food or a fish. Everyone knows that I think wild fish are better than farm fish, but that's another whole discussion, and I stand by that.

Let's plant this flag and let's not let the FDA or any other department within the government take the word "organic" from us, and you need to be [phonetic] damn mad and damn correct to make sure that doesn't happen.

The other thing that's truly important is that we don't give up. In fact, we should never give up. We might abuse one another, and we might fight like hell, but we do stand for a common set of objectives, that's: to build an organic industry with integrity.
The other thing that's very important to me is that we look at the communications, you open this in transparency.

MS. DIETZ: Time.

MR. HARDING: You have made this process. I encourage you to continue to do that, and I want to encourage you, as I close, absolutely build this partnership, this public-private partnership, with the USDA, don't let anybody off the hook, and hang in there, because there's no other partnership like it in the world. There's none in Europe, there's none in Japan, no consumers at those tables, no industry at those tables, they just make the laws. Thank you very much.

MR. RIDDLE: Yeah, Tom, thanks for your comments, and I wanted to ask, when you said "camp on the Hill," I just want to be clear: you're saying that members of the industry, community, consumers, take their concerns to Congress over some of these issues, that's what you're saying as one option?

MR. HARDING: Absolutely.

MR. RIDDLE: And then you also said something about, you know, some farmers out there being happy about the antibiotic directive --

MR. HARDING: Uh-huh.

MR. RIDDLE: -- possibly. We haven't heard from
them. We have heard from farmers and veterinarians about some missing tools in their toolbox --

MR. HARDING: Right.

MR. RIDDLE: -- never antibiotics, and those --

MR. HARDING: I agree.

MR. RIDDLE: -- have been petitioned, have been considered, and have been recommended by the Board, and they have never appeared on the National List --

MR. HARDING: Absolutely right.

MR. RIDDLE: -- where we are still missing the livestock materials that the Board's recommended, and I think if we had those tools we wouldn't be in the predicament that we find ourselves in now, and, once again, I don't know if there's anybody to ask, but that's a question of mine.

MR. HARDING: You're right, Jim, you're right.

MR. RIDDLE: What's happened with those livestock materials?

MR. HARDING: And we need to find out where they are and why they aren't on the table and why they haven't been voted on and why aren't they put on there. What I said about the antibiotics, I can tell you, there are people in this room, there are people not in this room, that feel very different about antibiotics than perhaps you and I do, and I can promise you that if we ask most
consumers, the perception is: no antibiotics, yet that's not the case in some cases.

I would strongly ask the Board to move those issues back to the table, those materials that we have recommended and do need, and get them back on the plate, and I'm not sure that the course of action we have with the antibiotics, no matter who we make happy, is going to be good for the industry as a whole, but I think whatever we do, there must be a level playing field, and all certifiers must be playing under the same set of rules and interpreting those rules the same consistent way for consumers.

Anything else?

(No audible response.)

MR. HARDING: Thank you all very much again.

CHAIRMAN KING: Thank you, Tom.

MR. SIEMON: I think we ought to give additional time for praises for us, every -- a half minute, instead of praising us, they get a half-minute longer, I really do.

(Laughter.)

CHAIRMAN KING: Thanks for setting a precedent, Tom.

(Laughter.)

CHAIRMAN KING: John Cleary is up next, and Eric Bremmer is on deck.
MR. BREMMER: Mr. Chairman, Eric Bremmer, from (inaudible), New Jersey, I'm going to proxy my time to John Cleary. I just want to additionally state that (inaudible) appreciate the quality of the composition and the work of the NOSB, and thank you very much.

CHAIRMAN KING: Thank you.

UNIDENTIFIED MALE VOICE: You have ten and a half minutes.

CHAIRMAN KING: Because of the kind comment, of course.

(Laughter.)

MR. CLEARY: And I'll -- I'll still try to be concise. My name is John Cleary, an accredited certifier from Vermont Organic Farmers, which is the certification program owned by Nova Vermont. We certify about 300 operations in Vermont. Nova Vermont also represents another -- a thousand organic consumers that are Nova members.

I want to thank the NOSB for the incredible work that you all do, and also to thank the National Organic Program.

There's been a lot of concern and criticism here today of some things about the National Organic Program, and I want to, as a certifier, make sure that I acknowledge that, you know, we highly respect both the individuals and
the regulatory role of the National Organic Program and
sincerely look to having a positive constructive
relationship to build this public and private partnership,
that is, the National Organic Program.

The key thing in having this partnership be
successful really is this Board, and at the risk of being
redundant, I have to say some of these things, because the
farmers that we represent at our last annual meeting gave
me a mandate to come here to affirm the role of this Board
as the advisory committee that continues to work on these
interpretation issues.

So I know you all know that, we can't say it
enough, but this Board is critical to the success of this
program, because in order for the National Organic Program
to be successful, we need to have transparency, we need to
have public participation, and we need to have organic
expertise. Those are three things that this Board
provides, in an excellent format, and we can't lose those
things.

One key thing about the lack of process in
interpreting the standards, and I'll be honest about this,
as a certifier, certifiers are nervous about asking the NOP
questions, because we're scared that we're going to get an
answer that has been developed without any consultation
from the organic community, without any consultation from
As a result, we found -- just the things that people have mentioned -- inconsistent interpretations among certifiers, farmers who don't know what the rules are because they hear different things from different people, and certifiers, like myself, kind of stuck in a strange place where we're truly trying to do the right thing, truly trying to follow the regulation, but getting conflicting messages.

Even when we do get clarification from the NOP, in terms of guidance documents or directives, and as we look at those things as compared to the guidance that we receive through NOSB recommendations, we're not clear how we're supposed to use that information that we get, and we're not clear what process was followed to come to those conclusions. And as a certifier, that's a real problem for us.

One key thing that will help, that's been mentioned before, is hiring an executive director. I just encourage you all to keep pushing on that, and I encourage the NOP to make sure that the NOSB is a major player in the hiring of that person.

I'm going to move on to a few specifics. Regarding the antibiotic Guidance document, I'll say it's something we've been very sensitive to in Vermont and in
the Northeast, in determining: what do our farmers need, and this document came out, actually, just in time before our recent meeting of our livestock and dairy advisory committee, and we talked about this quite a bit, and we've gone out, we've asked our farmers -- we have a dairy tech program that works closely with our transitioning producers and our existing organic producers, and we've heard from the farmers, they're saying, "You know what? When we transitioned, we thought that this was going to be a really big deal and we were going to need these antibiotics for our calves and for our young stock, but we found out that we don't," and we have not heard from our farmers that there is a need for increased use of antibiotics in organic production. So I wanted to put that out there.

In addition, a major concern for us and for the farmers that we represent on the dairy side is this 12-month conversion, continuous conversion, process. Nowhere else in federal regulations have I seen parallel and unequal standards that are applied arbitrarily, depending on the time frame or your method of transition.

Clearly this does not maintain to the standards, and I know you all have worked a lot on this, but I feel like the antibiotic issue and the transition issue will both be solved by pushing, in any ways we can, for Rule change, to clarify that the 12-month conversion was only
meant to be for a whole-herd conversion and not as a continuous conversion.

So I'd just encourage you to keep working on that.

MS. DIETZ: Time.

MR. CLEARY: I can continue on to the proxy time, is that true?

CHAIRMAN KING: Yes, you have a proxy, five more minutes, yes.

MR. CLEARY: The next thing -- again, just to reiterate, the NOSB livestock medications that were approved, our farmers need those things, it's really critical, and as a certifier, I'm in a really tough position, to have to say either -- to tell farmers "either you have to sell this animal or you can't treat it in the human way that's required," even though we know those materials are allowed.

Just encourage you and to ask if we could get a response at some point today, maybe from the NOP, about the status of those in relationship to FDA.

Last thing, a separate topic, but also something that I haven't heard anything -- haven't heard much about today is this issue about National List products, multi-ingredient products that are on the National List, phosphoric acid, you know, fish emulsion, or seaweed issue,
and it also kind of brings in the fishmeal/ethoxyquin issue, is we need to clarify, and it may take some changes to the National List, this issue of adding synthetics to other natural materials and what effect that has.

My recommendation is that the National List should only have single-ingredient things, rather than multi-ingredient formulations, and that all ingredients have to be reviewed, rather than just saying, "Well, if it's on the list as an allowed synthetic," any synthetic -- the example is that you could add, you know, urea to -- or another synthetic fertilizer to a fish emulsion, and under the Guidance that we've received through various letters, that would now be allowed, because, you know, fish emulsion is an allowed synthetic.

The other thing I wanted to point out about that: The only way that certifiers, like us, know about this phosphoric acid issue is because these letters kind of bounce around on the internet, you know, one letter goes to a certifier here, from the NOP, someone else hears about it somewhere else, and, you know, we're calling each other and -- so this a lack of communication between the certifiers and the NOP is a real problem.

One thing I'd like to present, people have talked about a little bit, a number of certifiers in this room have organized a new organization of accredited certifiers.
to work on these communication issues, and we sincerely
look forward to working closely with the NOP and the NOSB
to clarify some of these issues.

So that's all I have. Thank you very much for
your time.

CHAIRMAN KING: Thank you. At this time we have
a break scheduled, and when we come back, I have Eddie
Daniel, with Angela -- and I can't pronounce --

UNIDENTIFIED MALE VOICE: Cadell [phonetic].

CHAIRMAN KING: -- Cadell on deck. So we'll take
a 15-minute break.

(Off the record at 10:00 a.m. and reconvened at 10:17 a.m.)

CHAIRMAN KING: Thank you for allowing us to take
a break, and one quick comment.

I want to thank everyone for their well-thought-out public comments, they are very important, we take them
very seriously, and we will be adjusting the agenda
accordingly. However, I will remind everyone that there
are a couple factors out of our control.

One is that there is an ACA training this
afternoon in this room, which means that we cannot be out
of here any later than 12 o'clock. At our current rate,
it's going to be challenging to accomplish that, so I would
just suggest -- you do rightfully have five minutes;
however, if you can keep your comments a little bit
shorter, that will allow us to get everyone's comments in.

And at this time, one -- another issue. It was mentioned earlier that the Board has responded with an official letter concerning process, that being materials review among that, among those processes, and because of the lack of time, that sort of thing, I was literally forced, as chair, to distribute this letter, asking Board members to review and support the letter in 24 hours or less.

As you might imagine, considering we all travel, and we have professional endeavors and, believe it or not, other lives as well, that was difficult to do, and in that case I know Kim was out of her office and had -- you know, basically managing multiple priorities, and at this time I wanted to just give Kim some time for a brief acknowledgement.

MS. DIETZ: Thank you. I'll time myself, two minutes.

I had told this Board that I would formally acknowledge that letter, so I'm going to do so for the record. I'd like to formally acknowledge the dedication and hard work of this Board. As representatives of this industry, it is very important that we work together to protect the word "organic."

As mentioned earlier, the NOSB drafted a letter
to the NOP with regards to the materials review process. I did not sign the letter prior to its submission because of the short time frame we were asked to review it.

   As promised, I will formally go on the record to say that I support the letter's directive on the materials review process.

   As past materials chair, I can tell you that it is essential that we have a full understanding of the process and our roles in that process.

   I also plead with the NOP and this Board to respect the fact that each and every one of us deserves to have an adequate time period to review documents. I will continue to object to any policy or recommendation on something where -- he's telling me --

   MR. MESH: One minute.

   MS. DIETZ: One minute.

   (Laughter.)

   MS. DIETZ: I will continue to object to any policy or recommendation unless given an adequate time period to fully understand what I am reviewing. It is disrespectful to each of us to push things through the process. Thank you very much.

   CHAIRMAN KING: Thank you, Kim. Next we have Eddie Daniel, and Angela, you are on deck.

   MR. DANIEL: My name is Ed Daniel, I'm Vice
President of Bushinboy [phonetic] Farms. We grow Pacific white shrimp in Florida, in fresh water, and we are currently certified antibiotic-free, alum-free [phonetic], and specific chemical-free. The board of directors of the company made a decision, based on sales and marketing, to go a hundred-percent organic. This is two years ago. So the chairman asked me, "What do we have to do," and I told him, "Well, we can be certified based on the NOP rule, but there's one problem," because I had -- at a conference, I had a talk with Richard Matthews, and the NOP's stand [phonetic] was that you couldn't certify shrimp because you would have -- you needed to have certified organic fishmeal, and as long as you have certified organic fishmeal, then you could certify your shrimp organic. So I asked the board for a million and a half dollars, so I got a million bucks, plus we bought Tilapia [phonetic] Farm and we contracted for certified organic feed for the -- Tilapia, and we also are building a processing plant to process the fishmeal so we'll have certified organic fishmeal. Then with my certified organic fishmeal, I should be able to have my certified organic shrimp.

But then later on there was a guidance, some ruling, that, well, shrimp can be certified under livestock, and livestock doesn't require to have certified organic fishmeal. So I said wow, that's good, we're still
going to continue with our program of providing a certified organic fishmeal, and we can be certified organic, USDA organic shrimp, based on the livestock regulations, and -- so we sent a formula to the feed manufacturer, using conventional fishmeal, of course excluding any material that would be prohibited, and we promise our customers, because they're the ones who ask us, "We want organic shrimp," so this year we're producing 2 million pounds of shrimp, that should be -- should be organic.

Recently, as you all know, there is another Guidance, statement that came out, saying that we cannot have our certified shrimp. My only question is -- I don't want -- I'm not asking for any favors, I just want: what do I have to do to have my certified organic shrimp, that my customers are requesting? We are willing to follow any regulations and do whatever has to be done and spend the money that has to be spent to do it, but what are the rules? -- and we would appreciate if they can't keep changing the rules while we're doing it, and all I do, the board of the company, I just ask them for what I want and they give me what I want, because they tell me what they want. So I can't keep (chuckles) -- you know, "What's going on here?"

Also I'm helping change company -- a shrimp processor in Ecuador also, and they are certified organic.
by Nature Land, and they don't even have to use certified
organic feed, they can use conventional grain, also
fishmeal, as long as it doesn't have any prohibited
material.

Now, I stopped them from doing this last year, 
even though they could, I told them, "No, we'll get you
certified organic by the USDA." Now they're telling me,
"What we gonna do?" And apparently they are going to be
sending in shrimp that are certified by Nature Land, which
is an accredited agency, by the USDA.

Now, they wanted me to market that product for
them, but I refused, because I don't want to market any
shrimp that's not USDA-certified organic. And they also
would like to do that, they can produce up to 10 million
pounds of shrimp a year, that's certified organic.

So, again, my purpose for being here, just to ask
the NOP, "Tell me what I have to do," and I'll do it. And
I would like an answer somehow from them --

(Laughter.)

MR. DANIEL: -- sometime this week, or I give
them a few more days next week.

(Laughter.)

MR. DANIEL: Because I don't want a refund from
the USDA, okay, I don't want the million and a half back, I
just want to know what to do. Thank you.
CHAIRMAN KING: Thank you.

(Applause.)

CHAIRMAN KING: Angela is up next, and Ray Green is on deck.

MR. MESH: We designated her time for Urvashi earlier.

CHAIRMAN KING: Oh. Thank you, Marty.

MR. MESH: I'm being forthright and honest.

CHAIRMAN KING: Ray, you're on. I see Ray's on his cell phone. Ray, do you want to -- okay, no, he's hanging up.

MR. GREEN: Good morning, NOSB Board members, and I have to say "dittos" for all of the quality work that you're all doing, and I know a good portion of that comes from the California delegation. You can't hear me?

UNIDENTIFIED MALE VOICE: Not quite. Get a little closer, just in case.

UNIDENTIFIED MALE VOICE: Speak up, Ray.

MR. GREEN: Okay. So "dittos," and special thanks to the California contingent.

I'm here representing over 3,000 companies in California that are engaged in the production and processing of organic products, and I want to introduce perhaps something that the NOSB Board, as well as the NOP, possibly have not considered, which is: the activities,
To save time, I'm going to read just a short, short paragraph and then enter into the record here just a two-page excerpt from the California Administrative Procedures Act of 2002.

"No state agency shall issue, utilize, enforce, or attempt to enforce any guideline, criterion, bulletin, manual, instruction, order, standard or general application, or other rule which is a regulation as defined in Section 11.342 unless the same has been adopted as a regulation."

So some of the guidance documents and directives that come are possibly not enforceable, and since we are going to be funding all of the appeals for administrative law judges, the guidance documents and directives and policy statements that are being issued may not have the force of law in some states, that have to actually follow an administrative procedures act.

So as you're making some of these, please consider the implications and the effect that it could have on state organic programs, and I'll give this to Katherine to enter into the record and I'll stop there.
CHAIRMAN KING: Thank you, Ray. Questions?
(No audible response.)
CHAIRMAN KING: Okay. Moving on, Cissy Bowman, and Mack Devin is on deck.
MS. BOWMAN: Hello. I'm Cissy Bowman. I'm president and owner of Indiana Certified Organic, an accredited private certifying agency. I also have the proxy for Jay Feldman, of the National Coalition Against the Misuse of Pesticides, although I'm signed up in two places, so do you want me to speak all at once?
CHAIRMAN KING: Yes.
MS. BOWMAN: Okay. I'm going to start with the incamps [phonetic] statement. We would like to address compliance -- the compliance and enforcement directive on pesticide use, and because it directly impinges on the statutory authority of the National Organic Standards Board under the Organic Foods Production Act and its responsibility to ensure compliance with the standards of the Act. As we understand this directive from the National Organic Program on allowable inert ingredients and pesticide products used in organic production, we believe it is in violation of the law. This directive does not ensure that the materials introduced into organic production are in compliance with the standards set forth in the process of review.
This failure to comply with the statute goes to the very heart of the law, that is intended to establish reasonable production practices and consumer confidence that organically-labeled products are held to a clear standard of review distinct from other laws and programs.

The directive as we understand it would allow inert ingredients listed by EPA as List 2 or 3 inerts to be used in certified organic production if the certifying agent and producer, after a reasonable effort contacting a manufacturer, EPA, and other USDA-accredited certifying agents, are unable to ascertain whether inerts in a pesticide are allowed under the NOP.

This approach erodes the clear standard of the Act and allows hazardous and potentially hazardous substances to be added to organic production.

As the NOP knows, OFPA mandates that only the NOSB may propose substances for inclusion on the National List of synthetic substances permitted in the production of organic products.

By its action USDA fails to understand the purpose of the National List. OFPA Section 21.18 requires that the List contain an itemization by specific use or application of each synthetic substance permitted. It also states: "The National List may provide for the use of substances in an organic farming or handling operation that
are otherwise prohibited under this title only if the Secretary determines, in consultation with the Secretary of Health & Human Services and the Administrator of the Environmental Protection Agency, that the use of such substance would not be harmful health and the environment, is necessary to the production or handling of the agricultural product because of unavailability of wholly-natural substitute products, and is consistent with organic farming and handling."

Use of the language "only if" mandates the Secretary to determine that each requirement identified in Section 21.18(c)(a)(i), (ii), and (iii), is met before a synthetic substance is considered for inclusion on the National List.

Thus the National List cannot be a list of synthetic substances just generally recognized as safe or registered by EPA or under review and can only be considered if identified in Section 21.18(c)(b)(i) for use in farm production or as a synthetic inert, Section 21.18(c)(b)(ii), in an approved pesticide, and must be based on a case-by-case determination of safety, need, and consistency with organic methods.

As designated by OFPA, the NOSB and the Secretary are directed to consider only three classes of substances for inclusion on the National List. The managers of the
Senate House Committee [phonetic] report on OFPA stated that:

"The National List may include exemptions for substances otherwise prohibited but which the National Organic Standards Board and the Secretary determine are harmless to human health and the environment, are necessary because of the unavailability of wholly-natural substitute products, and are determined to be consistent with organic farming practices. Such exemptions, however, must meet one of the three following criteria: the substance is used in production and contains a synthetic active ingredient in the following categories." I will not waste time by reading all of this to you, because I'm assuming by now you guys already know it, but -- you know that section, I'm assuming.

Why is this inert issue important for organic growers and consumers? The organic industry is successful because of the trust that exists between the industry and consumers. Consumers are willing to pay a premium price for organic food in order to provide healthy food for themselves and their families and to support sustainable agricultural practices.

In order to maintain this trust, consumers must feel confident that practices and materials used by organic growers and processors adhere to the highest standard and
provide labeling disclosure when that is not possible.

The standards and the National List, however, need to remain strong in order to maintain consumer trust, on which the organic industry is based and thrives. Thank you.

And I also want to say I am aware that some of my comments, and this comment, is really directed at these directives and not at the NOSB, I understand that you guys are not responsible for those directives.

Okay. I'm going to -- I have a very scattered public input because I've had so many thoughts, so I'm going to be jumping around between NOP and NOSB, and I hope you'll bear with me.

With regard to this pesticide List 2 and 3 issue -- or this inerts 2 and 3 issue: as a certifier, we've developed a process for trying to identify what's in -- what are the ingredients, and what we do is when we have a farmer that wants to use a product, an input, and we don't have an ingredients list on it, we contact the manufacturer, we have a letter that we send to them, we have forms that we have them fill out, we offer them confidentiality statement, and in that process, in over a dozen cases, we have never had one manufacturer refuse to provide us, under confidentiality, with the ingredients, including inerts, for these materials.
On the plane here I had the interesting experience of riding with almost an entire planeful -- it was a small plane -- of people from Cargill, and I noticed all of these Cargill things and said, you know, "What are you guys going to Chicago for?", and they said that they had a meeting, and I said, "Well," you know, "could I talk to you about" -- you know, "that you sell inputs to farmers," and they said yes.

And so I said, you know, "Well, if like one of my organic farmers wanted to use soybean meal, or something like that, could you give me verification that it's identity-preserved" [phonetic] "GMO-free?" They said, "No problem."

They also told me that they would release to me inert ingredients in any of their materials. I have the guy's card. Okay. I think that this is something that can be done. We've been doing it. And quite frankly, I'm not very interested in going backwards on this and saying if we don't know, then it's okay. Now, this -- that's, again, an NLP issue.

This is an NOSB issue. With regard to your committees, in the past -- and I know George remembers this -- committees used to have members of the public come, they would meet and have members of the public come and help discuss things with them. I think with regard to materials
review, having some members of the public maybe be on there as like a task force, when you're dealing -- wouldn't it have been great to have some organic cotton growers, you know, when you were working on hydrochloric acid?

So I suggest to you that maybe you should find a way, or try to find a way, to bring members of the public with experience in before we get to the point of the meeting here; you might have a lot more clarification on what's really happening out in the field. And it was done in the past, so I don't know why it can't be done again.

GMOs. Gosh, yesterday, I got upset when I started hearing, "Oh, well, is that only about seed?"

There is no difference between planting a roundup-ready soybean in the ground and grinding it up and putting it on the ground. I'm sorry. Consumers -- when they said no GMOs, they didn't mean just no GMO seed, they meant no GMOs. I'm a grandmother. I raised my kids on organic food. They didn't have GMOs back then. But when my grandchildren were born, I told my kids, "I don't want them eating GMOs." This is the first generation of children that are being raised on food that's genetically manipulated. If GMOs are going to be in organic food, I guess I'm just going to have to make sure I feed them stuff I grow myself, because there is no way I'm going to let those little boys be eating GMOs.
Yesterday there was some discussion about a database. I just want to bring up one point about that. I certify a lot of Amish farmers, and I think that if they knew their names were going to be in a database that was shared with every agency in the government, they're probably going to get out of organics.

It's going to affect the dairy industry greatly, there's a lot of transitioning Amish farmers, but I can tell you right now, if I go back to my Amish farmers and my Amish grower groups and tell them that's going to happen, their bishops are going to tell them "We're not going to be part of this anymore."

They didn't even get certified, a lot of them, until it was required by law, and I think that this infringes on their freedom of religion, and -- so it's just something I think that needs to be taken into consideration.

I also want to talk about antibiotics. My daughter was just in the hospital for 14 days, in intensive care, with an antibiotic-resistant staph infection. She is on four months of oral antibiotics, it's a new formula they hope will work. Before that they were talking about four months of a permanent IV of antibiotics, meaning that she could not work, someone had to take care of her. She's 29 years old. The antibiotics issue is huge. It's not just
about whether or not we're getting them.

I also want to speak to you from my heart: I've been a proponent of this program for a long time, but I'm after some of the things I've been hearing with these directives and with regard to the GMOs, I'm getting kind of ashamed, I really am. I've told a lot of people that this made a difference. We've got to make sure it continues to make a difference, we really do. Thank you for your time, and for all of your hard work, you guys are great.

CHAIRMAN KING: Andrea.

MS. CAROE: Cissy, it's my understanding from the presentation yesterday on ECERT that there would be an opportunity to remain confidential as far as your listing. I may have picked that up wrong, I think we have to clarify that, but --

MS. BOWMAN: I know there are a lot of questions.

MS. CAROE: Well, I mean -- and I think there is for them too, that it's in development, and I think we were -- we were presented with something that is in process, but I -- I believe that question was asked, regarding confidentiality, and specifically, I believe that anybody that's listed will have to sign a release with their certifier, is the way I remember that.

MR. SIEMON: Yeah, that's what I heard too.

MS. CAROE: So just to ease your mind on that one
little issue, is I think we will have some protection --

MS. BOWMAN: I just have to speak for my Amish farmers because they're not going to come here and speak to the government for themselves.

MS. CAROE: And, you know, there's a variety of reasons why I think people would want to keep their names or their addresses or their products somewhat confidential, so -- I do believe that protection is going to be in there, and I believe the program has heard the concerns on that, so hopefully we'll be able to deal with that issue.

CHAIRMAN KING: Kim.

MS. DIETZ: Cissy, I wanted to comment on the materials process (inaudible) this, but the process that we went through with this group of materials I think was the best that we've ever done this far --

MS. BOWMAN: I agree.

MS. DIETZ: -- so it builds into that, that the committees have to have recommendations posted on the web 30 days prior to a meeting, and that's the opportunity for people to comment and to submit written comments and to tell the Board what you think of that recommendation, and then we take those and then come back to the meeting with them.

So I agree that we need public input, but I'm not sure how we -- how or if we could even go about getting
people involved during the material process.

    MS. BOWMAN: I wasn't necessarily talking just during the materials process, but in committee discussions. George could tell you how it was done in the past.

    MS. DIETZ: Okay.

    CHAIRMAN KING: Jim, then Dave.

    MR. RIDDLE: Yeah, I just wanted to follow up on that too, because I think it is -- you know, a valuable suggestion is more public involvement in the materials process, but I think the responsibility does rest here with members of the public, because we certainly would be open to accusations of favoritism, you know, who do we leave in? who do we leave out? kind of thing, and that's why we've tried to, you know, make sure that whatever's been petitioned is available on the database right from the get-go, so people know what's even entering the pipeline, and then all the way through our recommendations, so that that can be commented on. So I just wanted to, you know, say that.

    Where I do see the expertise being drawn in is in our task force process, such as the compost tea task force and other task forces we've done, that that's very valuable. So I just wanted to say that.

    MS. BOWMAN: I don't think I've used all of my 10 minutes. Could I just say a couple more things?
MS. DIETZ: You know, and I stopped the clock, so
I --

MR. RIDDLE: Well, you can always respond to
comments -- I mean questions.

MS. BOWMAN: I just have one more very -- really
short thing to say, and that is that it seems like USDA is
making my job a lot harder, as a certifier, and if I am
really a government regulatory agent and they're going to
tell me what to do and make this job this hard, I think I
should be on the payroll.

(Laughter.)

MS. BOWMAN: And I also want to add --

MR. RIDDLE: You're an agent.

UNIDENTIFIED MALE VOICE: Go, woo, woo.

(Laughter.)

MS. BOWMAN: I also want to add that if I were to
change OFPA today, I would say that you guys should be
compensated for loss of productivity and for the time that
you spend. I think that that was one of the worst parts of
the law, is the fact that you guys don't get anything for
the hard work that you do.

UNIDENTIFIED FEMALE VOICE: Yes.

MR. CARTER: Did that get in the record?

CHAIRMAN KING: Yeah, can you say that again.

(Laughter.)
CHAIRMAN KING: Dave had a question, then Nancy.

MR. CARTER: No, Kim and Jim covered mine, as far as the public input.

CHAIRMAN KING: Nancy.

MS. OSTIGUY: I actually do, though, want to second what Jim was saying about the difficulty of pulling in individuals in the committee meetings, who gets included and who doesn't, I don't want to get accused of favoritism, so what I happen to like about our new process is the fact that it's posted, anybody can comment, anybody can call me up, call a board member up, write us, tell us what they think, rather than me, as the chair of the crops committee, saying, "Oh, I would like so and so to tell me about this."

MS. BOWMAN: But not every farmer has access to the web.

MS. OSTIGUY: That's true. But it is a whole lot better in terms of broad public participation than me requesting specific information from a specific person.

MS. BOWMAN: I know, I've -- I've personally called with regard to issues, I just -- and I don't have to be their certifier, I call farmers and just say, "What are you doing," you know, "What's happening," and maybe that -- I just ask for -- you know, "Who do you know that's doing" blah, you know.

But, again, you know, I can tell you right now
there aren't that many farmers who use the web, and they're not going to start. And there used to be a mailing that went out from NOP, you could sign a postcard and get a mailing, and I don't think that exists anymore.

UNIDENTIFIED FEMALE VOICE: It's too expensive.

MR. RIDDLE: Nothing about this, I just am concerned about kind of our schedule, I know you --

CHAIRMAN KING: Right, (inaudible) people --

MR. RIDDLE: -- but we've still got a lot of people signed up, and we have never cut off public comment. I mean, we represent the public, it's important for us to hear, and I'd just like to suggest that if there's a need for another room, that NOP should start making arrangements for the afternoon, because I think we need to hear public comment, and that's the top priority, people have spent their time and money to come, and we're not going to cut that off.

CHAIRMAN KING: Duly noted. I think if we stay on schedule and everyone considers the time, that we can be done in an efficient manner.

MR. RIDDLE: Okay.

CHAIRMAN KING: So let's please try to stay on track. Next up is Mack Devin; Lynn Coody is on deck.

MR. SIEMON: No more praise.

(Laughter.)
CHAIRMAN KING: Right. Just get straight to the issue. Mack's not here. Lynn, you're up.

MS. COODY: Hello again. I'm Lynn Coody from Organic Ag Systems Consulting, in Eugene, Oregon, and my consulting practice is focused on assisting certifiers in meeting the accreditation requirements of the NOP.

I consider the policy directives recently released by the NOP to be stunning in the sense that I've been thinking about them for days and I've had a hard time figuring out just what to say at public comment about them, but luckily I did recover enough this morning in order to write down a few thoughts in order to give public comment and break my -- and not break my commitment to talking to the NOSB.

To me, the most disturbing aspect of these directives is that they were devised and promulgated without the consultation with the NOSB. Although it may be the NOP's legal right to make some interpretations of the Final Rule, it is not the NOP's right to make drastic changes to the organic standards without careful consultation with the NOSB and with the public. That's part of the Organic Foods Production Act.

Not only is it not right, it's counterproductive, and at the end -- and the end result is unacceptable in that it created a regulatory environment that is untenable.
For example, the inerts directive forces certifiers to act in violation of the Organic Foods Production Act by allowing synthetic materials that are on the EPA inerts List 2 and 3, which have not been reviewed by the NOSB, and certainly not been approved, this is clearly in violation of the NOP and it puts certifiers in a very difficult position, possibly even a legally untenable position.

The fishmeal directive allows farmers to feed livestock a toxic preservative, ethoxyquin, which is commonly known to be in the commercially available supplies of fishmeal, with -- basically using fishmeal as a carrier for an unapproved material. This could be extended to other synthetic materials easily if you take the NOP's directive further.

The antibiotics directive results in organic dairy products derived from cows who may have been treated with antibiotics, a situation that has been vigorously protested by consumers since before the NOP was even established.

Simply put: These directives are not right. I have been involved with writing industry standards, laws, and policies for over two decades, including having had the honor of representing farmers and certifiers during the negotiations and drafting of the Organic Foods Production
I know what the intent of these provisions in the OFPA mean, I know what it means when we put in there that the NOSB must approve and recommend to the NOP about the use of synthetics materials. This simply has not been followed in some of these directives.

Since the time of the drafting of OFPA, the voices of farmers and certifiers, and even the NOSB itself, have been tuned out by the NOP. What I see now is that NOP directives to certifiers twist both the intent and the plain reading of the law, creating a system of regulation that forces certifiers and producers to act against their own better judgment and the long-held understanding of the elements of organic production systems.

During this NOSB meeting, I've been very grateful to see wonderful examples of the NOSB listening carefully to public comment and reconsidering their positions, mostly on materials, which has been a major focus of this long meeting we've just been through, and in light of the ideas of the public, they -- the positions have been changed.

Although I -- I've thought hard to try to remember even one example of the NOP responding to public comment in recent times. I have been unable to think of even one example.

I urge the NOSB to continue and amplify its
effort to uphold the organic standards as we understood
them back in the days when we were writing OFPA and
specifically to work to get the NOP to reconsider the
contents of the policy directives.

Thank you once again.

CHAIRMAN KING: Thank you, Lynn.

MR. RIDDLE: A very quick comment, I said this
before, but Barbara wasn't in the room and --

Yesterday, Barbara, when we were talking about
sunset, said that it's a process, not an event, and clearly
implementation is a process, not an event, it's something
that happens every day.

CHAIRMAN KING: Thank you, Jim. Next up is
Weenonah, I can't make out the last name, and she has a
proxy from James Christianson. On deck is Richard Kanak.

MS. BRATTSET: Thank you. My name is Weenonah
Brattset. My family and I own and operate a 250-acre beef
and grain farm in southeastern Wisconsin. For many years
my husband and I employed sustainable farming practices
because we believed we had an obligation to treat the land
with respect.

Several years ago, at the urging of friends and
neighbors, we decided to begin the process to become
certified organic. At first, the many rules and
regulations governing organic certification seemed
overwhelming. However, as we studied and learned more about these rules, we were continually impressed with how sensible they were and how, as we became more involved in the process, these rules and regulations made more and more sense.

My husband recently passed away, and now my adult children have helped pick up the work which he did. They too are committed to organic agriculture. We are willing and eager to abide by the rules governing organic production because they make our way of life sustainable. We have found that our products are sought after by people eager to find healthy food.

For small arms, like ours, being organic makes the difference between barely getting by and being able to command a fair price for the food we produce.

Unfortunately, we're seeing an effort on the part of the National Organic Program staff at the USDA to weaken organic standards for the benefit of corporate agricultural. This is shameful. It's also somewhat enlightening. Can it be that mega-dairies and huge chicken farms need to steal the label "organic" to be profitable? -- because that's precisely what the NOP is allowing them to do when they bypass the rules which honest organic farmers follow and respect; or is it that these corporate farms see organic agricultural as a threat and wish to make the
"organic" label meaningless?

I've included with this letter a list of issues which are of concern to those of us who truly value organic agricultural, and I won't read them, but they're attached, for the record.

It's past time for a change at the USDA's National Organic Program. It's time for Secretary Veneman to respond to the concerns of organic farmers and consumers. We need leadership which is respected and trusted. We need transparency in all of the NOP's actions.

We need accountability from USDA and the NOP. And we have no intention of settling for any less.

And I would like to tell you people all thank you so much for your volunteer work, and I know what volunteerism is and how time-consuming it is, and I and all the people that I know in this organic movement really appreciate your efforts.

And now I'll read a letter from Jim Christianson, who is my next-door neighbor and a dairy farmer and, for obvious reasons, couldn't get up at 3 o'clock and come with me this morning, so (chuckles) --.

Jim Christianson is a third-generation dairyman from Jefferson, Wisconsin, area. The land he farms has been in the family since 1955. In 1999, when conventional milk prices dropped $6.50 overnight, Jim decided to become
certified organic with OTCO.

The changes were mostly on paper since the land and herd had always been managed biologically. He began selling organic milk to Organic Valley in 2001 and has never looked back. The following are his comments to the NOSB and the NOP:

"Organic has been a Godsend to my family and me. There is little doubt that I would have gone out of business when milk prices dropped in the '90s, just as I watched many of my neighbors do. Now our farm is thriving and my cows have never been healthier.

"I want you all to know that I am very concerned about the future of organics when I hear about some of the recent decisions that have been passed out. I am also worried about how long it seems to take to change and enforce organic rules. My cows go outside and graze pasture. It's not only the way God meant cows to eat, it's the law with organic.

"I understand that there are organic dairies that do not pasture their cows or that have too little pasture for the size herd they are managing. You need to do whatever it takes to make sure that the requirement for pasture is enforced uniformly for all organic dairymen.

"As a fairly small producer, with a closed herd, I often have certified-organic replacement heifers for
sale, but I usually have to sell them at the conventional auction, because the way the Rule is being enforced, many larger producers are allowed to use conventional heifers.

"I have written letters, filled out surveys, and signed petitions in favor of closing this loophole, but nothing seems to be happening. The extra premium that I would get from selling organic heifers would make a big difference on our farm.

"Please enforce the Rule that says that once a farm is converted to organic, all the calves must be organic from the last trimester. In fact, the situation seems to be getting worse, since now I understand that organic dairymen can not only buy conventional heifers, with unknown background, but they can even give antibiotics and conventional feed to their calves born on the organic farm. Antibiotics have no place on an organic dairy, not even with calves. If you start allowing antibiotics on dairy farms, customers will abandon organic milk in droves.

"The last thing on my mind has to do with health-care medications that have been approved for use in organics but are still not allowed because they have not been finalized into law. Organic dairy farmers need these tools to treat our cows. Particularly important for me is to be allowed to use aloe vera, which I used to use, and propylene glycol to take care of milk fever. We need to be
able to use something as soon after it is voted to be
allowed as possible. To have to wait two or three years is
ridiculous.

"My neighbors often ask me, 'What is the most
difficult thing to deal with when changing to organic?' My
answer is always: 'Good information.'" Gradually, over
the years, there's been more and more information available
to us.

"Therefore, when the USDA changes the rules on
what we can use and what we can do, it causes a lot of
confusion. We end up not knowing what we can and cannot
do. We have a very good thing going, with organic. Please
don't mess with it just to make it easier. The consumer
won't believe that organic is any better than conventional.

Thank you." From "James Christianson."

I thank you very much.

CHAIRMAN KING: Thank you.

MR. RIDDLE: I have a request. I mean, this
subject has come up a couple times now, at least, about the
materials, livestock materials, that the Board has reviewed
and approved, and I just have a request that before we
adjourn, that we could have an update from the staff on the
status of that.

MR. SIEMON: That'd be great.

CHAIRMAN KING: Next is Richard Kanak, and
I believe it's John Chernis on deck.

MR. KANAK: Hi. My name is Richard Kanak. I'm an organic consumer. I have two proxies I'd like to read, plus my own statement, if that's okay.

CHAIRMAN KING: Only one proxy allowed, you get a maximum of ten minutes.

MR. RIDDLE: A total of ten minutes, one way or the other.

MR. KANAK: That's pressure, then, right?

CHAIRMAN KING: Yeah.

MR. KANAK: Okay.

CHAIRMAN KING: We're confident you can do it.

MR. KANAK: Well, I'm going to start with the easiest one first. This is from an Amish farmer, received over the internet, and it's a little difficult to read because sometimes -- the way it was written. But anyway, here it goes.

This is from Rufus Yoder, in Belleville, Pennsylvania. This is his statement:

"We are a certified organic from PCO. We are a dairy farmer and have 20 cows and about 70 acres of land. We put a big effort to this farm. But the problem is that the NOP, without the approval of the NOSB, decided to allow the large organic dairy farms, like Horizon and others, to purchase conventional heifers and then phase them into
organic production. This clearly puts sustainable farmers, like us, who make extra efforts to care for their animals, at a competitive disadvantage, and we do not want this to happen. We need to draw the line in the sand where it belongs. We want the rules to be kept the same. We very badly need better or new management in the NOP." This is signed "Sincerely, Rufus Yoder."

I'm going to read my own statement, and then if I have next time I'll read the next proxy.

The organic standards must be such that we consumers do not have to be concerned that there are degrees of organics. Purchases are made because of what is not in or not on the item. I once read a statement attributed to Warren Porter, a toxicologist from the University of Wisconsin, and this is a quote: "There are more than 77,000 pesticides out there right now. Not a single one of them that's been registered has been tested for neurological, hormonal, or immune function or impact on those functions. People need to understand that just because a pesticide is registered, that does not necessarily mean that it has no biological activity." That was the end of the quote.

It is very a difficult and time-consuming task to keep up with this ever-changing world. It is very difficult to read the fine print of ingredients on the
labels of all too many items. It would be a full-time just
to be searching that all the -- what all the ingredients
are, let alone knowing the reason for the inclusion in the
package.

The simple solution should be: looking for the
USDA "organics product of the USDA" on the label, but this
is not the case. The New York Times of Wednesday, February
26, 2003, highlighted several issues of questionable
practices which were accepted as organic by the USDA:
organic livestocks being fed non-organic feed; and uneven
enforcement of the outdoor grazing requirements. Would the
NOP have made a different decision if there were not so
many questionable areas in the standards? The NOSB must
take steps so the USDA organics label is not under constant
pressure to be revised to accept as organic: questionable
practices.

Mad cow disease is an example of the results of
questionable practices. Is not the rule that allows non-
organic dairy cows to be converted to organic production
also a questionable practice?

Do I have time for my next proxy?

MS. DIETZ: You have 7 minutes left.

MR. KANAK: A lot of time. I can slow down,
right? I'm just too nervous, that's all.

This is a proxy before the National -- I'm sorry.
It's from the Churches' Center for Land & People. It's from Tony Ends, and I begin:

"My name is Tony Ends. I offer testimony regarding organic farm policy from several vantage points. With my wife Della and family I've worked for ten years to establish a direct-market-approach produce enterprise and small-scale livestock farm in southern Wisconsin. As such, I live and work in a farm community and care deeply about my neighbors and countryside.

"I've written on farming and farm issues for daily newspapers and agricultural publications. I worked full-time at an institute for sustainable agricultural research and education for four years, helping agronomic soil scientists and farmers design and fund on-farm research projects in Iowa, Illinois, and Wisconsin.

"I presently lead a USDA small business innovation research project that is establishing a yield and marketing cooperative in Wisconsin. In July 2003 I was appointed part-time director of Churches' Center for Land & People. This ecumenical effort for farming people promotes justice, earth stewardship, and community. The Center was organized during the 1980s farm crisis and has been active in Iowa, Illinois, and Wisconsin, expanding services to Minnesota last year. People of Lutheran, Catholic, Episcopal, United Methodist, United Church of Christ,
Presbyterian, and Quaker faiths support our work.

"From long-standing experience, I address you with a sense of urgency. Trends that have driven agriculture to consolidate and specialize in endlessly large scale are well-documented. Over the past 60 years they've almost completely undermined local infrastructures and support for farming communities across our region.

"In shackling our farmers to federal subsidies and excessive reliance on fossil fuels, they have also placed US food security in jeopardy. In the past 15 years, direct marketing, premium production, and value-added enterprises have brought some relief from oppressive consequences of agricultural industrialization.

"Sustainably integrated and organic farming practices that spawn these new trends have benefited many thousands of alternative growers and producers. If National Organic standards, however, bring industrial practices to these new areas of farm and food production, neither the people nor the land will benefit. Young farmers and farm couples will not have a chance to enter agricultural. Local economies will not regain the ground they lost to global and corporate interests in conventional food and farm production.

"The rural revival of our nation desperately needs to happen, for food safety, food security,
sustainability will never take place. I ask you to broaden your board membership and to ensure representation of these interests in ongoing development and implementation of National Organic standards. I ask you to help save organic farming from being lost to the same trends that have caused conventional agricultural production to cannibalize itself. I ask you quite simply to oppose genuinely free market and fair trade practices in your policies and rules for the common good of the democratic majority instead of the private gain of a very few."

CHAIRMAN KING: Thank you. Yes, Kevin.

MR. O'RELL: Mr. Chairman, I would just like to go on record of saying that I'm disappointed today to hear that people are coming to use public comment period for making public and personal attacks to companies. I don't feel that that's what public comment is for in this forum. It's for commenting about organic standards, commenting about the National Organic Standards Board and the National Organic Program, and it's not -- in my opinion, it is not a place for public attacks and personal attacks on companies or individuals. I would just like to urge the public not to use this tact.

CHAIRMAN KING: Thank you, Kevin.

MR. SIEMON: As well as positive. Just don't use any brand names or company names. We're talking about
policies here, doesn't matter, positive or negative, just
don't do it.

CHAIRMAN KING: This is clearly your time to
express your thoughts and feelings, and we appreciate that,
just try to keep them somewhat generic and don't refer to
specifics. We may not have all the facts. Do you have a
comment?

MR. RIDDLE: No. I just -- I -- well, yes, then.
(Laughter.)

MR. RIDDLE: No, I'm uncomfortable as well, and I
just second what Kevin is saying. I think it's one thing
to talk about scale issue or systems issues, but I'm
uncomfortable and really don't think it's appropriate to be
singling out companies or individuals, but anyone is free
to speak as well, so --

MR. O'RELL: I recognize that. Thank you.

CHAIRMAN KING: Thank you, Kevin. Next is John,
I believe it's Chernis, and on deck is Michelle Wander.

MR. CHERNIS: No, that's okay. Sorry I don't
have papers to hand to you, I decided last night at
8 o'clock to come. I'm a certified organic farmer. I farm
5 acres of vegetable crops in central Illinois, and I wish
there were more growers here, I think they might have been
able to make it had the timing been a little bit different,
it's -- it's hard to get here at prime planting season.
I guess I have two comments, and I'm afraid that we're losing the small grower under the present setup. I'm one of the few growers in our market that's certified, but I'm among many that have farmed organically for 15, 20 years, and they're leaving primarily -- or they're not becoming certified primarily for two reasons:

One, what seems to them -- who -- they sell the produce primarily locally, that the rules are overly burdensome in terms of recordkeeping, they just don't fit their scale of operation, the detail needed. You can still come on these farms and track what happened, but just the transferring of records to meet the certification standards are quite time-consuming, and I think that if some thought would be put into it, we could get at this and reduce this load.

Secondly, they also point to the fact that NOP is consistently changing the rules, and without good process, and -- so they really feel that -- as if it's become to mean nothing, and if we lose them, if they no longer use the term "organic" to describe themselves, we'll lose their consumers, and their consumers are the ones that primarily have helped made this whole thing become a word, it helped make the definition, "promote organic" and why it ended up becoming a word that USDA has now defined.

So I guess, in the end, you know, I urge you to,
one, try to get back this local small grower, and small
isn't really below $5,000, small is -- can be pretty big
and still just sell in your local area, and 5 acres can
become -- we have 600 -- my yearly activity log has 600
line items. My harvest log has another 6-, 700 items.
It's really burdensome, and it really would help no
inspector get to what happened.

So -- and also just redefining and having good
process, it takes time to get the rules right, and they're
ever going to -- they're going to be ever-changing, but you
guys need to be supported. Thanks.

CHAIRMAN KING: Thank you.

MR. CARTER: Two things. Number one, obviously I
support completely what you say about the disruption and
the changing of the rules in midstream, it is an evolving
process, but we have to have some consistency, and that I
think is what this Board is trying to push for.

In terms of the scale issue and the small
growers, I think that one of the things that is the
strength of the Rule today is that it doesn't prohibit
additional labeling claims on there, and I think that those
of us that work in those areas, those are some things that
we need to continue to work on, is to get some parameters
around areas, such as locally produced or certified GRAS
finished [phonetic] or those type of things, that can be
brought in as additional claims.

I think the computer is getting more savvy as they go forward, to read what's in there, and we need to make sure that there's some integrity on those additional claims as we go forward.

MR. CHERNIS: But you're forcing growers to move away from a term that they wholly support, because it's being redefined in the marketplace.

CHAIRMAN KING: Jim.

MR. RIDDLE: I also wanted to just very quickly respond to your concerns about the burdensome recordkeeping, and the Rule does allow for a lot of flexibility, that the records be appropriate to the operation, so a small grower can have, you know, records that are appropriate, that meet the lot numbering or something, of a different operation.

And I also wanted to point out that there are some standardized templates for vegetable growers, that are on the ATRA website (inaudible) tools --

MR. CHERNIS: Sure. I have -- my spreadsheet's a little bit better than that one, and it's a total line item on Excel as well, but -- I mean, I -- I guess my point being that -- is that we've worked really hard to keep the records that we're being asked for, and we're not being told, "Oh, you don't need any of that," we're being asked
that we need -- that they want to be able to track it, and so more clarification -- and some examples -- I guess a specific example would be: so we write things in notepads and then we process them to the -- to a computer, or we transfer them to computer. That process I don't think really helps anyone. Just having those data sheets in a pile for our type of operation should be sufficient. If an inspector asks me, what happened on this date, I could find that information.

But having to transfer all that to -- and we have a computer -- I put a computer in our barns so we could facilitate this, but it's really -- takes my employee an hour a day to input everyone's -- what they did that day. It's overly cumbersome when you could still get at the -- I could simply have a list of -- a materials list of what we use. Do you really need to know which crop I sprayed on it? You need to know what day, but do you need to know which crop and which field? I have five acres, "I sprayed it out there." I mean, I could tell you -- I could answer the question, and if you decided to -- I mean, the only caveat I would see is: let's say you then banned that product, or I was using a product that wasn't approved for use, so all the -- so the grower would risk, if they didn't want to keep that record, that they -- well, their whole crop would be uncertified, and they should be allowed to
take that -- that risk, but --

CHAIRMAN KING: I encourage you to work with your certifier. Thank you. We have another question, Andrea, and then Rose, did you --

MS. DIETZ: I don't.

MS. CAROE: I just want to point out that if you truly feel you're meeting the intent of the Rule and your certifier disagrees, there is a process for an appeal, and that process is in there as an education to both you and the certifier and the community at large, and it shouldn't be looked at in a negative way but in a way that we get further clarification, we bring these issues out, we talk about them, and so I encourage you, if you really feel that what you're doing, your manual methods of maintaining the data --

MR. CHERNIS: Uh-huh.

MS. CAROE: -- are sufficient to meet the intent of the Rule, then you have that right to ask for --

MR. CHERNIS: Yeah. I think my point here would be that for me, certification -- being certified was an easy step. I didn't want to lose control over the term, and we can -- we can handle the recordkeeping, but five other growers at our market have said, "To hell with it," so how do I convince them that "No, it's not so burdensome" and so forth, because the way it reads and the thing they
get confronted with, you know, everybody's up in arms over, you know, seed, you know, how can I prove to them that I got -- you know, these are really -- getting more instruction on that and showing examples of flexibility -- "Well, you could do this" -- would really help these growers make that move and say, "Okay, I can do that, I can make" -- "I can give them that information."

MS. CAROE: Yes. Commercial availability is an issue we are spending a lot of time on. We're starting with minor ingredients, but as our Guidance has suggested, we are talking about further taking that into the seed commercial availability. We see this as one of those growing areas where we're constantly filling in the detail as we go. So we hope to be able to do that for you, we do understand that's a huge challenge, and please understand that, you know, it's not unheard, it just is going to take some time to work out the sophisticated details of that..

MR. CHERNIS: Just more clarification on it to help growers --

CHAIRMAN KING: Thank you, sir, I'm sorry, but we have too many --

MR. CHERNIS: Sure.

CHAIRMAN KING: I really, truly am. Thank you for your input. I'm just trying to work everyone in.

MR. CHERNIS: No, no, I didn't want to be here
anyway.

CHAIRMAN KING: All right. Thank you. Michelle, and then Rachel is up next.

MS. WANDER: Hi. I am a professor at the University of Illinois, I'm a soil scientist.

MR. RIDDLE: If you could state your name, please.

MS. WANDER: This is Michelle Wander. -- and I have a proxy for Lloyd and Deanna Shaffer [phonetic] from Elkman [phonetic], Wisconsin, and, being an educator, I'm -- really thank you all and the people who have spoken today for the education that I have already gotten, and I'm sort of I guess catching up with realizing how much of a communication and education role that you all play, and you need to maybe do better, and I know that's ridiculous to ask a group of people that's volunteering all their time, but it seems like this organic discussion of the concept and the intent is of critical importance, I hope that --

UNIDENTIFIED MALE VOICE: It's a little hard to hear.

MS. WANDER: I have to be that close, wow. Okay. And I -- so I hope that the comments -- and I know they will be taken seriously by you. As I said, I'm an academic, so I go to a lot of committee meetings, and I realize that very often the meeting is not heard, and
that's because the level above can either just check off
that meeting was held and they proceed with their
assumptions and their conclusions already, so I know that
-- my hope is that our testimonies today will help you get
done some things that I suspect you want to get done.

I'm a person who's been interested in organic for
a long time, for nearly 20 years, I've been working on this
topic, studying soil organic matter, which is believed to
be one of the critical aspects of well-managed organic
systems.

People who are certified use lots of practices
that are intended to improve and basically enhance the
characteristics of organic matter so we achieve efficient
nutrient cycling and on and on, and I've had the luxury,
really, of using say big science and lots of fancy tools so
that I could prove or understand what was different about
organic systems than conventionally-managed systems.

I have to confess to you today that my work
hasn't done any or very much good for practical managers to
do a better job at being organic stewards, and that's
because the basic caveats or philosophy of organic
management is pretty good, it's basically common sense
systems management, and this goes for crops and livestock
systems, as we've heard many people attest to today, and
the standards that were negotiated socially within
communities within context were very, very reactive and intelligent, easy to inform and to maintain checks and balances.

Now that we've gone to a system that's regulated at a higher level, this puts a lot of very good things that were in place at jeopardy. I have a colleague who's a legal scholar and he talks really about how when you go to rules, how they become actually vulnerable and in a way how science serves as a handmaiden to undo social goals, and I heard his comments, they were about fisheries in Africa, but I really heard them having a lot of meaning for what I see is going on in organic.

There are a lot of things that -- even though I said a moment ago that the science that I've engaged in, I think there's a lot of things that scientists can and need to do that will help with the standards, will help with some of the discussion, but I think by getting engaged in these sort of technical small points, in some ways you get off of the -- off balance when you get -- are engaged in this discussion of organic, because it really is -- people use terms that are not -- as a scientist I don't regularly use, about philosophy and values, that are subjective, but they're shared and they're common in this community, and these are the things that, yes, while you should use scientific input, you really need to go back to your base
and your community to have these discussions and have
process that lets this be negotiated, and I know you all
try to do that, and you're getting undercut.

And I guess the reason I'm motivated to come here
and talk to you about this is that I hear students who I
see as a critical future, and I know some of you, as former
students, where really this is important that the public
and these students who care very much buy in, they're
walking away from organic, they're reviewing it with
skepticism, and they're choosing between growers at local
markets and who's got the best local face or commitment
that they hear, and this is really a tragedy for, I see,
the people who have done the really heavy lifting, and I
know many of you have done that heavy lifting.

So I'm very concerned about that, and I guess
it's this really -- you know, I have some specific cases
where I think the stewardship aspects that are specifically
managed, that science will help you with, are one
territory, and I think that the work that people like
myself do, we can go in and help organic do it better, but
the truth is, a lot of what we learn and publish will be
immediately adopted, sometimes be more effective at the
stewardship component of organic production. Right?

We saw in the Nature article on organic nature
being given -- organic being suggested to be less
sustainable than no-till when you include a cover crop. Right? So organic is going to be pounded and pressed to make that case over and over.

Where organic will always hold the upper hand in the cards will be the broader goal set of sustainability if they hold onto that. If you trade away care about social goals, about health and these larger, more subjective, difficult-to-grapple-with concepts, organic should, in many ways, lose the strong competitive edge that it should have, and this is really where people involved in trade, you know, corporate partners, need to protect the brand, and if they're smart, they will -- they will retain their traditional base.

And I guess that's really my main message, and I think that some of the issues, say in GMs, are really instructive, where we could talk about how BT toxin doesn't persist in soil so it must be safe, another person: well, is this specific case an allergen or not?

Don't get caught up in the petty small pieces, you know. It's the philosophy and multiple sets of goals that you have to go through that really will keep you safe, and that's really by entertaining it, you know, and I encourage the NOP to use the Board as the shepherds of the philosophy, you know, and that's: as a citizen.

And I guess -- because there were so many
engaging ideas, I'll try to contain myself here. The comments of Lloyd and Deanne Shaffer from Elkman, Wisconsin, submitted on April 28th, which I do appreciate the date because I know this time of year is very stressful on producers.

"We have a small family dairy farm with 50 cows. We have been shipping organic" --

UNIDENTIFIED FEMALE VOICE: Louder, please.

MS. WANDER: "We have been shipping organic milk for approximately one and a half years. We abide by strict rules set out by our certifying agency. We were under the impression that the NOP was set up to make sure that certifying agencies were all uniform, that they will and have the same rules. What is the NOP doing by changing the rules? They should be enforcing the strict standards that the certifying agencies have set forth. The Secretary of Agriculture should only be appointing people that are devoted to the organic" -- or "devoted to organic agricultural and to the NOSB. We are organic farmers because we believe in what we are doing. NOP is making a mockery of the organic farmer. They are taking organic out of "organic." Everyone should have to follow the strict standards in this country and in others. We feel that the organic industry is doing fine before the governments decided to get involved. Now they are," and then the word
got cut off, c-h, unless that means something to somebody.

Thank you.

CHAIRMAN KING: Thanks. Next is Rachel, and then Jane Brandley is on deck.

RACHEL: Good morning, or afternoon now, I suppose. My name's Rachel, and I live in Chicago, and I'm a third-generation Chicagoan. I've been a vegetarian for 12 years, and I'm involved locally with organic gardening clubs and Organic Farmers Market, which is held in West Humboldt [phonetic] Park, if any of you are familiar with the Chicagoan area. I'm also a chef.

So for this reason, and many other reasons, I am concerned about the direction of the word "organic." I am concerned when it comes to the federal government getting involved in regulating such a thing. I think that organic by itself is a manifestation of natural processes of Mother Earth and can in and of itself not necessarily be regulated.

But, of course, we work with corporations and we work with the global economy, so we have the government stepping in and trying to mandate it, and I become very scrupulous [sic.] and very weary of their intentions, because most of the time the government is working hand in hand with the corporations because they're the ones that pocket the money to them for their campaign funds or
whatever else.

So that's where you get things like the EPA petitioning for toxic sludge to be considered organic, that's where you get Lists 1, 2, and 3, with synthetic chemicals that nobody's even heard of and -- so I am impressed that everybody here volunteers, and I'm sure that you guys all have a very committed self to organics.

But I'm also here on a proxy, so I'll just read that.

CHAIRMAN KING: Unfortunately, I need to announce: we have official Board policy for written proxy, so I'll give you the full five minutes, I'm forced to enforce it today, and I apologize for that, due to time constraints.

RACHEL: Written? I don't understand what you're saying.

CHAIRMAN KING: You didn't provide a written proxy. Do you have a written proxy?

RACHEL: I have a proxy written, yeah.

CHAIRMAN KING: Thank you, you're fine.

Continue. Never mind.

RACHEL: Oh, you turn it in, and after I cross my e-mail off.

Okay, the testimony's from Nathan Hetterick [phonetic] before the National Organic Standards Board
today. "My father and uncle are the president and co-

president and owners of Village Edge Farms, LTD, a
certified organic dairy farm and a member of the Organic
Choice Co-Op. Village Edge Farms is located next to the
little village of Nelson in the area of west-central
Wisconsin, along the Mississippi River. The farm was
homesteaded in 1865 by David Hetterick and has been owned
and operated by six generations of the Hetterick Family.
Brothers Greg and Dennis, along with their families, now
operate the family farm.

"One of the family highlights has been the
process of becoming an environmentally safe certified
organic dairy farm. In 1991 the Hetterick Family went away
from the chemical and commercial fertilizers that pollute
the air, soil, and water. By 1997 the farm was partially
certified organic, then two years later the cows and all
the land that was farmed was certified organic. In the
year 2000 Greg and Dennis met together with other
sustainable and organic farmers to start the formation of
Organic Choice, with the dream to market their own dairy
products.

"Our farm and families are our biggest pride and
joy. The Hetterick Family is very proud to work hard
together to provide a better product for the consumer. The
family is also proud to provide a healthier environment for
the next generation to come.

"One of our concerns is the use of GMO contamination in organic crops. While we typically support new technology, we are very suspicious of the push for GMO crops. Now only have they not been adequately tested, but they are being forced upon farmers by market pressures and not simply offered as one choice of many.

"We do not believe that GMOs offer any benefit to any creature that consumes them, and we do not want cross-contamination of GMO crops with our certified organic crops. Please keep the concerns about GMOs and organic farmers in mind.

"We support strong standards for organic farming. While no farmer would attest to enjoying the red tape and paperwork necessary to become certified organic, we truly believe that we offer a product that is superior to conventional farming techniques.

"We strongly urge you to support the need for standards for organic personal-care products, fiber, fish, and seafood and pet food, the need for an ongoing peer-review panel as mandated by the OFPA in the Final Rule to oversee the USDA's accreditation program, the need to conduct on-site evaluations of foreign certification agencies approved by the USDA, the need for an NOSB executive director staffed to asset the 15 volunteers.
onboard, the need for a technical advisory panel, contract
announcements to be publicly posted, and for bids to be
solicited in an equitable and transparent manner.

"The need for NOP enforcement actions, including
suspensions and revocations of certification to be publicly
posted. Currently there is no public record of NOP
enforcement actions.

"We, along with the members of Organic Choice,
oppose recent action by the USDA's NOP to allow companies
to use substances not on the National List, sodium lactate
and potassium lactate as processed-meat preservatives and
phosphoric acid to fortify aquatic plant extract
fertilizers. These actions were taken with no consultation
of the NOSB, who has authority under the OFPA over the
National List, actions by the NOP to undermine the NOSB's
statutory authority over review of petitioned substances
and the National List. NOP's two-track [phonetic] dairy
herd interpretation, which requires family farms that
convert their entire herd to organic production, to raise
all replacement heifers as organic from the last third of
gestation while allowing factory-style operations to
continually introduce conventional heifers so long as they
are managed organically for one year prior to milk
production.

"This is wrong and undermines the effort of
farmers like us, who are still family farmers, lack of outdoor access for poultry, as evidenced by actions of the NOP to mandate certification of the country hen, the lack of NOP implementation of over 50 NOSB policy recommendations.

"In closing, I also wish to say that we need a management change, regime change, at the USDA's National Organic Program. We want someone who has extensive experience in organic agricultural and is universally respected by organic farmers and consumers. We have lost confidence in the present management and do not believe they are working towards the best interests of the organic farmers, who are truly farmers of integrity and care about the environment.

"We do not want people who are only concerned for those enterprising and greedy farmers who only enter the organic market for the money. Please keep standards high and farmers accountable. We work very hard to ensure the consumer gets the highest-quality organic product we can provide. Keep the standards high so other farmers can do the same. Thank you for your time. Nathan Hetterick."

CHAIRMAN KING: Thank you. Next is Jane Brandley, and on deck is Dave Engel.

MS. BRANDLEY: Yes, I'm Jane Brandley, and I'm here to read my own statement as well as a proxy statement,
and I'll start with the proxy, if you don't mind.

This is from O Farm [phonetic], John Bobbi [phonetic], Executive Director, and they are in Brussels, Wisconsin. This statement is to the National Organic Standards Board for submission to the National Organic Program, from John Bobbi, Organic Farmers Agency for Relationship Marketing, Executive Director.

"The Organic Farmers Agency for Relationship Marketing is a farmer marketing agent in Cummin."

[phonetic] "We represent organic field crop cooperatives and farmer marketing associations in a region that spans the major grain-producing areas of the United States, over an 18-state area and Ontario, Canada. A number of our member organizations market their farmers' grain into the world market. In addition, O Farm members, organization farmers, produce organic milk and livestock.

"We wish to bring to your attention the following points of concern to our farmer members in maintaining the integrity of the organic industry: 1) The integrity of organic feed and grains must be continued to be maintained and the standards strictly forced. Weather conditions are already stressing crops over a large part of the US, pointing to another tight year of feed and grain supplies, especially for livestock. Significant amounts of grain may be important. Organic standards and certification
requirements need to be strictly enforced.

"2) Dairy heifers should be raised according to organic standards from the pregnant cow on through to the freshening animal. Organic dairy producers should not be allowed to bring conventional dairy heifers into their herd at any point.

"3) The pasture requirement standards should be uniformly interpreted and strictly enforced.

"And 4) The NOP has matters before it that were brought for resolution up to two years ago. NOP's inaction in deciding these matters has the potential to compromise the integrity of organic to farmers, consumers, and the entire industries. Matters before it should be decided and acted upon in a timely manner.

"We respectfully request for NOP to act upon matters before it and take necessary steps to protect the integrity of organic grain, dairy, and livestock producers, because their livelihoods and incomes depend upon it," and he thanks you "for your consideration, John Bobbi."

My statement, I'll begin by saying I am just a consumer, and I'm probably more confused than I was before, about what organic is. I live in Lake Geneva, Wisconsin. I've had a college education. I have my own small business. I raised four children, and I have a grandchild. I make this trip here today because eating
organic is a way of life for me. I gladly spend three to four times what one would spend for conventional food because I believe it affords me the best opportunity of a long and healthy life. However, I am not happy to spend that kind of money on food that is labeled "organic" but has been adulterated by the use of unapproved additives, chemicals, or other so-called safe items.

What I'm hearing is that factory farms are to be allowed to call themselves organic. There is no way that factory farms and "organic" can be synonymous. In the face of a mad cow disease outbreak, the USDA lied about the amount of testing done. That lie not enough, they tried to strong-arm other countries into reducing the amount of their testing. How can we trust an agency that lies to the public? How can we trust an agency that appears to be bent on destroying the public trust in organic labels?

The agency is being asked today to fund a director and to maintain the integrity of the "organic" label. Those are legitimate and reasonable requests. If the USDA and NOP continue to erode the integrity of the "organic" label, it will be up to the individual to research each and every bit of food they eat, every item they put on their body. It will be up to organic organizations to investigate every item that calls itself organic and make that information available to the public.
Presently I do my best not to buy so-called organic products that are put out by large food producers, and I won't mention any names here. I do not trust that these large producers are totally honest about their organic ingredients.

I no longer donate to my representatives because they do not hear me. No one in the government seems to be listening. My giving goes to organizations that I believe will preserve organic food sources, will encourage the intelligent use of our land and resources, will disseminate the information we need to make safe choices in food and other products we use in our ordinary daily lives.

Organic has become a thriving business. It will continue to grow and prosper because we cannot trust our conventional food sources. Company who want to get into the organic business should recognize the reasons behind the lack of trust in conventional foods and understand they will not win a share of the market without garnering the public trust.

I would just like to add that this has been an eye-opener for me today, because I am just a consumer, I do read labels, I try very -- to be very careful about what I eat and what I feed my children, even what I feed my dog. I don't eat meat. I'm concerned now about the fish.

We out there in the public who buy these products
want to know that there is someone who is being honest and
honorable about this "organic" label, and while you all are
volunteers, you all seem to have our best interests at
heart, the truth of the matter is: you are a board, and
someone in the government someplace is really pulling the
strings and making the decisions, and it's discouraging to
the average public, but I thank you for your time and
effort.

CHAIRMAN KING: Goldie.

MS. GOLDBURG: I just want to respond that I
heard you twice refer to yourself as "just a consumer."
Don't ever do that.

MS. BRANDLEY: Well, but I'm not in the trenches
(chuckles), I just buy.

MS. GOLDBURG: Well, I would urge you also not to
-- not to stop having faith in the "organic" label,
recognize that it is a process, recognize that we all have
to guard against many forms of attack, not the least of
which is the expansion of genetically-engineered crops,
which is a very -- and other such technical situations,
continue to believe in this, you have four grandkids, I
have five, and I'm interested in my own health, but I'm
much more interested in the future and in maintaining a
future that we can all see our children going into, so
please don't lose faith in this process. Thank you.
MS. BRANDLEY: Well, I continue to buy organic, because I certainly can't buy conventional.

(Laughter.)

MS. BRANDLEY: But I would like to know that when the label says "organic," it is what I believe organic to be, and I don't want to -- I don't want to see any of that other stuff in it.

MS. GOLDBURG: Your participation is very much a part of that process of maintaining integrity. Thank you.

CHAIRMAN KING: One quick comment. Coming from the retail background, like Goldie, what I would add to that is that: yes, you are in the trenches, you're the front line, you're the end user, and what you think and care about matters, and we need to hear that message and we need to respond to that message, so thank you very much, seriously, for coming here today.

MS. BRANDLEY: Thank you.

(Applause.)

CHAIRMAN KING: Kim.

MS. DIETZ: On behalf of someone who works for a large corporation and one of the first acquisitions in the organic industry, we have been leaders in this industry, we follow all the rules, each and every one of us have been instrumental in implementing these standards, so while organic foods is a personal choice and I will always stand
behind that, I do take offense to the daggers and
everything being thrown against large corporations, because
we too are just as invested as each and every one of you in
this audience, and it's not fair to say stuff like that.

Thank you.

CHAIRMAN KING: Okay, next is Dave Engel, on deck
is Leslie Zuck. We have approximately 15 minutes and we
have five people, that's all I'll say.

MR. ENGEL: David Engel, a dairy farmer from
Wisconsin, and the Executive Director of the Midwest
Organic Services Association.

I too want to provide great encouragement and
thanks to the Board, to the National Organic Program and
their staff, and to all the pieces that I referred to in my
last public comment two days ago, because we're all working
together. I think, you know, in the interest of time, I
would just like to make one observation, and I don't think
Marty will mind my using him as an example, but all of the
comments that have been made today have been, I think,
good, they have a context, tomorrow is another day, we have
to go forward and practically and considerately take things
into consideration in our own spheres on our daily work
lives, our personal lives, and as the collective here, but,
you know, the organic industry, when it started -- the
reason we're here now is because we wanted to be here now.
The minor, relatively minor, intensities that have come up these last few days are all part of a process that we're going through, and, you know, Marty got up and said some very fine words about the directives, et cetera, how we need to change them, but on the other hand, you know, he was part of an effort to approve a very specific product for a very specific industry, and I think we all need to have that kind of leeway, that kind of honor and respect from everybody, because we're all in it together, and what was good for one person may not be of interest to another person, but in the sum of things, a lot of what we're talking about here today needs to be taken in a larger context. I don't think we're "going to hell in a hand basket," but we need to keep working together.

CHAIRMAN KING: Thank you, Dave. Leslie, and then Jean Zanzaville.

MS. ZUCK: Leslie Zuck, Pennsylvania Certified Organic, an accredited certifying agent, in Pennsylvania, and I have to say that I agree with everything that everyone has said about all the wonderful work that the Board has done, how's that for a collective compliment.

CHAIRMAN KING: We'll take that.

UNIDENTIFIED FEMALE VOICE: You still just have five minutes.

(Laughter.)
MS. ZUCK: Our farmers in Pennsylvania are, however, very upset about the antibiotic directive, and they say to me that they work very hard to raise their animals organically and now they see the door being opened to those farmers who do not make those efforts and who may now resort to antibiotics, especially for their young stock.

The farmers who manage their farms organically do provide humane treatment to their animals, they will administer a prohibited medication to an animal to save its life or to reduce suffering, and we know this, because they -- they call us and they ask us what do they do now with that animal, and we -- we do tell them that the treated animal would have to be a non-organic animal and so forth, and this happens occasionally, and it's usually a few calves, maybe as many as five or six, and, you know, with this new directive, the farmer would be allowed to keep the calves in the herd, and that's not necessarily a bad thing, and I think the farmer would agree that he would like to continue to be able to do that.

However, the consequences are also that it would be increasing the practice of treating animals with antibiotics, parasiticides, et cetera, et cetera, and our farmers do consider this a significant weakening of organic integrity.
Because once these materials are on the farm, they're ready available and they will be regularly used. Essentially, calves and heifers will be managed no differently than conventional calves and heifers, including perhaps medicated milk replacer or calf feed.

Okay. As an accredited certifying agent, we are being directed to allow this practice, in violation of the Organic Foods Production Act, which prohibits the use of antibiotics and other prohibited materials. If we as a certifying agent -- if a certifying agent doesn't follow the directive to allow antibiotics in violation of the Act, the certifying agent will have its accreditation revoked.

The same goes for pesticides with unknown inerts: if we allow them, we violate the Act; if we prohibit them, we violate the directive. Same goes for the fishmeal, preserved with ethoxyquin: if we allow it, we violate the Act; if we prohibit it, we violate the directive.

I'm not sure how much longer we can go on in this schizophrenic state or how much longer the organic community can really put up with it, and I don't know the answer, but I do know that there are a lot of really smart people in this room and we need to put our heads together and figure out something very soon, because this is very urgent. Maybe we need to march on Washington, I don't know.
At the very least, I think that we need to have an implementation period for the certifying agents and producers to swallow these directives, you know. We can't be expected to implement them instantaneously, and that's a real -- a difficult burden, especially on the producer. It's like we told them yesterday they were supposed to be doing this, and now tomorrow they have to be doing that. So that's a problem.

And I have an announcement to make: any accredited certifying agents who would like to join the new certifying agents organization, or are thinking about joining, to meet us in the lobby at 7:30, at this hotel, and we're going to have an informational dinner meeting at 8 tonight. If anyone would like to attend that and has already done so, let myself or Dave Engel or Valerie Francis know so we can put you on the reservation list.

CHAIRMAN KING: Andrea.

MS. CAROE: Leslie, you had mentioned that in regards to the antibiotic directive that came out, that -- I guess you're not satisfied but you do see some benefit to this -- that it might be a good thing if they could keep those few animals on the farm.

In that vein, do you see that there is any suggestion that you or the community can make for how this could be implemented with some restrictions or something
that would alleviate your concern that this would initiate
overuse of these materials?

MS. ZUCK: Whenever this issue has come up
before, in the exact vein, you know, "should we allow
antibiotics up to 6 months," or any of those kind of
exceptions, our farmers have been adamant and said that
they've done -- you know, for them, the cost benefit
analysis don't allow it at all, because they're doing that
now, for the most part, and if they have to sell a calf or
so, they don't mind. They feel that it's more important
that we have strict standards.

MS. CAROE: That wasn't my question. My question
was: Could this be implemented with something attached to
it, something more, that would prevent it from being
overused? I mean, I understand you're saying if it's in or
out, you prefer out, because you think it (inaudible) --

MS. ZUCK: Well, the my answer is: No.

CHAIRMAN KING: Thank you. Next is Jean, then
Steve LaFayette, and Kelly Shea will be our last comment
today.

MS. ZAZADIL: Hi. I'm Jean Zazadil, I'm a
consumer and interested or concerned citizen. I'm not
going to read my own comment, because everything has been
said more eloquently before, but I do want to comment on
the praise for the Board as well as the statements of
Thomas Harding.

I am reading the proxy of Jim Cone [phonetic] of Almar [phonetic] Orchards in Flushing, Michigan:

"My wife, five children, and myself, along with four full-time and many seasonal part-time workers grow 40,000 bushels of organic apples on our 250-acre farm. We used to grow with conventional methods and almost went broke because of the cost of chemicals, low market prices, and cheap foreign imports. Seven years ago we started transitioning to certified organic production, and now, as an organic grower, I can make a decent living for my family and afford to hire other people that went to spend their life growing food for others.

"Our farm is more sustainable now that we do organic production because it has less reliance on costly chemicals that damage my soil and negatively impact the environment.

"Almar Orchards now grows in harmony with Mother Nature, letting her do most of the work in controlling the pests, insects, and diseases. We use very friendly chemicals like hot pepper juice, soap, garlic, vinegar, and Neem [phonetic] oil, molasses, liquefied fish and seaweed, insect mating disruption, diatomite herb [phonetic], and kaolin clay.

"Our farm is now teeming with wildlife because of
the absence of harsh chemicals. I only wish that I had
started growing organically 25 years ago, before my wife
and I started rearing our children on the farm.

"Organic farming is part science and part
religion. Probably only other organic farmers truly
comprehend that statement. One cannot be close to God if
you are out there poisoning His Earth. Organic farming
takes a lot more labor, a greater understanding of the
complexities of life that is interacting in and on the
land. It is a proactive approach instead of the
conventional reactive method of spraying a chemical to fix
a problem that shouldn't have occurred because it could
have been prevented.

"The conventional apple-growing industry is going
t broke, without government support dollars. Look at the
hundreds of millions of dollars that were given to growers
the last three years, and yet 23 percent of them still went
under, according to the Michigan Department of Agriculture,
here in Michigan in the last three years. If you lower the
standards for organic certification or change the rules to
make it easier to grow organically, you'll substitute man-
power and brain-power for chemical-power.

"Factory farms and corporations will overpower
the family organic family operations. If consumers become
confused about what organically-grown food really is, or
lose faith in the certification process and enforcement, or
think for one minute that government is manipulating the
system and the rules to help big business may get another
buck, then the increasing demand for organic food will
shrive and die. My farm and most of my other pioneer
organic farms of the 21st Century will also die. They will
probably be resurrected as housing projects.

"Please don't listen to big business, but
instead, listen to the simple little organic farmer, for he
is the meek of this Earth."

Thank you.

CHAIRMAN KING: Thank you. Steve LaFayette, and
then Kelly, you're on deck.

MR. LAFAYETTE: Good afternoon. Thanks for your
time and the opportunity to speak with you. I am going to
forego my own personal statements, I've given copies, on
organic acid-free paper, and I'm just going to read the
proxy statements of two other farmers, but quickly try to
just make the connection that I am here as a consumer, I'm
-- I know we're all consumers, but I'm not affiliated with
any organization, I'm not a member of an organization, I
don't farm; I shop.

But I am here to speak for a few farmers that I
have a great admiration for, who grow things that -- you
know, I try and grow these same foods and I kill 'em half
the time, so I have a --

(Laughter.)

MR. LAFAYETTE: I have a great appreciation for what they do. And one of the main other reasons why I'm also here to make the connection is that I have health issues, I have allergic reactions to certain foods, which you can read about in my statement, but it speaks directly to my concerns, that have been already voiced and articulated regarding organic labeling and to the larger issue of organic marketing.

So just to just straight into the proxy statement here, of Jeff Webster, he wants to make some comments regarding the federal program of organic certification.

"My name is Jeff Webster, and I'm Secretary of the Sierra Club National Agricultural Committee. I'm speaking for myself and not for the committee at this time. I'm concerned about means testing regarding organic production and processing of our food. I'm also concerned about the possibility of the federal certification process not checking with producers and processors regarding compliance of set-forth organic standards.

"I would hope that at least an annual inspection be done by certified federal inspectors regarding the use or misuse of chemicals introduced into the process, that should not be there. Also there should be a soil test done
each year of any land that is certified to be organic. There should be an annual test run on all food crops on farm that are part of the organic program, to ensure that they meet the strictest standards of organic purity, in addition to the above monthly checks at random, an unannounced should be conducted at any processing facility preparing organic foods for human consumption. The organic food in question should be checked at every step of the processing and packaging process.

"If any of the above checks are not done or if they fail organic standards set forth" -- "set forth, the land, grower, and procedures should be held liable for not meeting these standards and put on non-producer or -processor status for a period of six consecutive months for the failure. At the end of the six-month period, the system in question is checked again, and, if in compliance, will be allowed into the organic chain of food production for humans again.

"The entire process of organic food production should be very transparent and open to public inspection. Federal organic standards should be at least as rigid as the traditional organic certification processes and was. The health of our nation and its food supply is an issue of the highest importance."

And again, because of, you know, my own food
allergies to specific foods, you know, I clearly understand how, you know, even -- you know, how our health is inextricably connected to the food we eat.

The other proxy statement here is from Larry Gilbertson.

"The testimony" -- no. As Larry: "I farm a small certified organic dairy in central Wisconsin. This farm has been certified nearly three years and has been farmed that way at least three years prior to certification. Milk from about 40 cows is sold organic, and all herd replacements are from on-farm births. It has been a closed herd for many years, well before being involved with organics. All winter forage and summer grazing come from this farm. No split conventional crop or livestock production is done on the farm.

"I have deep concerns for organic food and the people who look to the USDA "organic" label. They want to feel assured that what they are buying and paying a premium for truly meets organic standards and that those standards are consistent for all production.

"There is little need for a National Organic standard if favoritism and exemptions are granted to large influential deep-pocket farm operations that do not want to or can not follow the standards set by the National Organic Rule."
"When stories of these exemptions come out in the press, it destroys the whole organic program for everyone, save perhaps only the few getting the favors, at least in the short term. Those consumers looking for food produced in more earthly friendly way and the small producer following the rules are directly affected. The small producer feels his work is in vain and the consumer trusts nothing. Those on the outside, looking in, the conventional producers scoff at the whole organic movement and label it all as" -- "and label it all as. They are only in it for the money.

"This is real unfair to the people who have worked hard in the cause and believe in what they do. The National Organic Program needs people who understand organics and have a passion for this alternative type of food production in this country.

"If the present leadership of the National Organic Program is only really versed in conventional production methods and maybe feel there is really no difference, then this leadership should stay in the conventional USDA community and not be in a position where exemptions can be granted to rules for a select few, rules such as: poultry outside access; or being able to feed non-organic feedstuff because organic costs too much; or replacement heifers slipped into large operations, that
were not raised organic due to limited supply, and waiting
to cash in quick on the rising organic market, and a whole
host of other shortcuts.

"With organic sales increasing annually, there
are many who wish to destroy this whole thing and make it
go away. Companies producing GMO crops do not like the
organic community, suggesting there may be consequences to
using their products, and they don't like the complaints
about contamination with pollen drift or production
mix-ups.

"Conventional food production is threatened with
loss of market share. When bad press comes out regarding
some organic rule that was suspended in favor of large
production and the almighty dollar, those who wish to
destroy the whole organic movement are just smiling."

So I'd just like -- and as far as this last
sentence, I'd just like to include myself. You know, Larry
and I would wish and request upon the Board to appoint
people to the National Organic Program that will protect
the integrity of the program.

So thank you for your time.

CHAIRMAN KING: Thank you very much.

MR. LAFAYETTE: And Larry and Jeff, thank you for
your time.

CHAIRMAN KING: Thank you. Kelly.
MS. OSTIGUY: Before you start, Kelly: I need to leave, Rose is going to leave, this is not -- the public comment has been absolutely wonderful; we have a plane to catch, so I apologize.

MS. SHEA: I'm not even going to be two minutes, okay? This is Kelly Shea, with Horizon Organic Dairy. I had no prepared statements for today, but in light of what I've heard in this room since this morning, I really felt that I needed to stand up and speak, and not only to the NOSB but to this audience also.

I'm appalled by what I saw here today. I really believe in activism and in bringing people together to effect change, but when it's based on untruth, I cannot support it. I spoke to the consumer today who stood up here -- great lady with the little boy -- and said it's very disappointing to discover that Horizon Organic is held to a different, less-demanding standard than the small farmers out there.

Who is Horizon Organic? We are a dairy marketing company, with 260 to 300 independent family farmers supplying milk to us. We are held, our company and our farmers, to the same standards as everyone else. And when I asked this lovely lady where she got her information from, she pointed to another person in this room and said that actually she was a consumer of Horizon Organic.
products and was shocked to learn from this person that we employed these type of practices.

Horizon Organic, since its inception in 1991, has fought for organic foods produced without growth hormones, antibiotics, or dangerous inputs, and if you really want to talk about the truth, you should talk about that. If you want to talk about the truth, you should talk about the fact that Horizon Organic just gave all of its producers a voluntary raise, but that kind of good news is not brought up here. Untruths are brought up here. And if there is an enemy to the organic industry, it is not from without, it is from within, and I suggest we get ourselves together. Thank you.

CHAIRMAN KING: Thank you all for your public comment, it's a very important part of the process, we appreciate it, it is considered, and we appreciate you taking time out of your busy schedules and lives to come here, to help this program.

Unfortunately, we have to move very quickly --

MR. CARTER: Mr. Chairman.

CHAIRMAN KING: Yes, Dave.

MR. CARTER: If you would formally close the public comment period, I have a motion that I would like to make very quickly, while we're --

CHAIRMAN KING: Thank you. The public comment
period is formally closed.

MR. ANDERSON: As I mentioned this morning during a point of personal privilege, I would like to offer for the Board's consideration a resolution that simply says:

The National Organic Standards Board expresses its strong opposition to and concern with the National Organic Program's issuance of significant policy directives without consultation with or advance notice to the NOSB. I would so move that resolution.

MR. RIDDLE: Second.

UNIDENTIFIED FEMALE VOICE: Do you have that in writing, for the record, so that I don't have to remember what you said?

MR. CARTER: Yes.

CHAIRMAN KING: Okay, moved and seconded.

Discussion.

(No audible response.)

MR. CARTER: This does not do anything to change the motion -- the motion yesterday directs the policy development committee to bring forward some further, but I just -- as I mentioned this morning, I thought it was important for this Board to make a statement before we leave Chicago.

CHAIRMAN KING: So it's your intent that it's read into the record.
MR. CARTER: Right. Moved and seconded, this was a formal motion.

CHAIRMAN KING: Discussion?

(No audible response.)

CHAIRMAN KING: All those in favor, signify by saying aye.

BOARD MEMBERS: Aye.

CHAIRMAN KING: Opposed, same sign.

MS. DIETZ: I'm going to abstain.

CHAIRMAN KING: 1 abstention.

MR. SIEMON: Can we do our work plans offline?

CHAIRMAN KING: I would suggest by next Friday just submit your work plans, and then any unfinished business concerning recommendations, information, and the like, please have that to Katherine by next Friday, if at all possible. That's May 7. Next meeting.

(Off the record and reconvened.)

CHAIRMAN KING: All right.

MR. RIDDLE: An update on the status of the livestock materials that the Board's recommended, and we heard from the FDA in October, and we've heard it come up from several public commenters, the need to move that forward, so I just wanted people to know, on the record, where that's at.

MR. JONES: The document has been completed, it
is at Office of General Counsel, they've raised a number of questions about the document, they have significant concerns about the level of documentation associated with the materials. We are going back in consultation with OGC and attempting to answer their concerns. But that's where it's at, and it won't move forward until those concerns get answered.

MS. DIETZ: Keith, are any of those materials on the docket that we have re-reviewed from the May meeting or are these all --

MR. JONES: The docket contains everything through May 2003.

CHAIRMAN KING: Any questions, comments?

MR. RIDDLE: No, that's all. I just wanted to know and have it in the record where it was at, so -- some things may get kicked back to the Board if there's clarifications on kind of our language or --

MR. JONES: I actually don't think it's -- you know, and this is what I know at this point, and I am drafting that docket, it is in my control, okay, so my conversation with OGC at this point leads me to believe that it is a drafting process, that the information that we have is sufficient, it's a question of getting it in the docket. I do not anticipate that we'll need to come back to the Board.
We have gone through the consultation process with FDA on all of those materials. Some of the materials I think that were mentioned in public testimony this morning, as many of you know, are off-label use and will not be included in the docket. Propylene glycol for the use of treatment of milk fever is an off-label use for that material, and that will not be included in the docket.

CHAIRMAN KING: Other questions?

MR. RIDDLE: Thanks, Keith.

CHAIRMAN KING: Thank you very much. Quickly, at our last meeting we had tentatively said we would like to have an NOSB meeting in conjunction with Expo East. I believe the proposed dates were October 12, 13, and 14, so if people could confirm that on their calendars quickly.

MS. CAUGHLAN: Is the 12th, 13th, and 14th the date of --

CHAIRMAN KING: -- the meeting. Expo would follow.

MS. CAUGHLAN: Expo would follow it, as it is this time.

CHAIRMAN KING: Correct. It's my understanding it begins on the 15th, Expo.

MR. O'RELL: You know, Mark, the only thing that I would raise is a question -- for those people who have to be there for the full length of Expo, like we have to be
for the full length of OTA, this is for seven days that
we're out on the road, and for people who travel all the
time, it's really tough.

CHAIRMAN KING: Yeah.

MS. CAUGHLAN: But it's important, for a lot of
us, to be able to combine those two.

MR. O'RELL: Then hold them overlapping somehow,
to cut the time, if that can be done.

MR. SIEMON: As much as I agree with Kevin,
because I'm going to be here nine days, it also brings a
lot more public commenters, the other side of the coin.

MS. CAUGHLAN: Yes, and that's very important.

MR. SIEMON: The other side of the coin. So it
really is a toss-up -- it's a tear, it really is. And
Goldie, they're proposing that we meet Tuesday, Wednesday,
and Thursday, and then Expo starts on Friday, is the
proposal.

MS. CAUGHLAN: Right.

MR. SIEMON: So it's a little better than this,
where we've got a day lag in here.

CHAIRMAN KING: Right. Right.

MS. CAUGHLAN: Or a day of recovery, no matter
how you -- depending upon how you look at it.

MR. RIDDLE: Just one other factor, and Rose is
gone, but, you know, there's that whole sunset proposal or
process out there, and there -- if that does kick in, there's a certain period where the Board would have to meet, and so that may impact or we need to kind of coordinate or think about that in our meeting schedule, but for now let's set it at this --

CHAIRMAN KING: Well, thank you, Jim, that is an important point, we may need to adjust based on the sunset provision, but for now, if we could agree on October 12, 13, and 14, that's Tuesday, Wednesday, Thursday, we'll just move forward with that.

MR. RIDDLE: Okay. As far as our next executive, will you just send -- executive committee meeting, will you just send something around?

CHAIRMAN KING: Yeah, I'll send an email.

MR. RIDDLE: Yeah.

CHAIRMAN KING: Okay. Thank you. Any other business?

MR. SIEMON: I move to close.

MR. CARTER: I second.

CHAIRMAN KING: It's been moved and seconded that we adjourn. The meeting of the National Organic Standards Board is officially adjourned. Thank you.

(Whereupon, at 12:08 p.m., the meeting was adjourned.)

R & S TYPING SERVICE - (903) 725-3343
5485 S. LIVE OAK, GILMER, TEXAS 75644
The National Organic Standards Board (NOSB) meeting of October 12-14, 2004, was attended by 13 members:

**NOSB Members Present:**

- Mark King, Chair
- Rebecca Goldburg
- Goldie Caughlan
- Nancy Ostiguy
- David Carter
- Andrea Caroe
- Owusu Bandele

- Jim Riddle, Vice Chair
- Michael Lacy
- Kevin O’Rell
- Kim Dietz, Secretary
- George Siemon
- Rosalie Koenig

**Absent Member:** Ann Cooper

**National Organic Program (NOP) Staff:**

Barbara C. Robinson, Agricultural Marketing Service Deputy Administrator; Richard H. Mathews, NOP Associate Deputy Administrator; Katherine Benham, Arthur Neal, Keith Jones, Mark Bradley, and Demaris Wilson.

Mark King thanked and welcomed everyone to the meeting and had each member introduce him/herself. Mr. King stated that the Board would have some interesting topics to discuss and deliberate over the next few days and appreciated everyone’s positive focus and input.

**OPEN SESSION – October 12, 2004, 8:00 a.m. - 5:00 p.m.**

**Approval of the Meeting Agenda:**

The Board reviewed the meeting agenda, and Mr. King moved for approval; Mr. Carter seconded. The agenda was unanimously approved.

**Approval of April 2004 Meeting Minutes Summary:**

Mr. King directed the Board members to the April 2004 meeting minutes located in the meeting book, and asked if there were any proposed changes or amendments. Mr. Mathews stated that he received and reviewed the minutes on Friday, and submitted four proposed changes. The Board reviewed the proposed changes; Mr. Mathews moved to accept the minutes with the four changes, and Ms. Caughlan seconded. The Board unanimously approved the April 2004 meeting summary minutes. For more information, see discussion document.

**Executive Committee Conference Call Minutes:**

Mr. King reported that with the exception of September, June, July and August committee conference call minutes are posted on the website. Mr. Riddle stated that the August minutes are still in draft format and will need committee approval. The Board recognized and approved the June and July minutes posted on the website for review and informational purposes. For more information, see discussion documents.

**NOP AND NOSB DISCUSSIONS:** For more information, see the meeting transcripts

**Update on the Status of Recommended Materials:** (Pg. 9)

Mr. Neal reported that NOP submitted to the Office of General Counsel (OGC) for review the NOSB materials and committee recommendations docket. NOP is expecting a quick turnaround from OGC, and as soon as they get their
response or comments on the docket, NOP will know whether or not it will go straight to the Federal Register or if more changes are needed.

**Livestock Materials:** (Pgs. 9-44) For more information, see meeting transcripts.

Mr. Neal reported that NOP have been in a very lengthy consultation process with FDA regarding the Board’s livestock materials recommendations. Out of the materials recommended by the Board, NOP is having problems with six that are sold as over-the-counter medications. The materials are calcium borogulconate, calcium propionate; activate charcoal, kaolin pectin, mineral oil, and potassium sorbate. The materials were not approved through FDA’s new animal drug application process or its new drug application for human foods. They were review through an over-the-counter review that is much different from prescribed medications.

Four out of the six drugs were marketed under monographs which is a process that FDA implemented historically, and serves as a recipe in terms of how to manufacture the drug, but not formally approved for use in animals. NOP has gone through a consultation process and it seems that the six materials are going to be problematic in terms of being included in the docket, and on the National List. Therefore, NOP will move forward with the ones that can be listed on the National List, which was recommended by the NOSB. The food contact substances docket - the processing docket is completed and is at OGC. NOP is waiting for OGC to give the approval to move into the Federal Register.

Mr. Neal also stated that FDA looked at many of the substances that will be listed without an annotation. He suggested not closing the door on those six materials, but move forward with the other ones that are approve, and continue to work with FDA in terms of their placement on the National List. NOP is planning to move forward with the recommended materials that are approve by FDA to be included on the National List. NOP will also move forward with the six that are problems, and work with the Board in terms of developing some type of way to list them on the National List with agreement from FDA.

Ms. Goldburg suggested that the Board should look into the Minor Use, Minor Species Bill that Congress passed and signed by the President. The Bill created some expedited review procedures for certain types of drugs used in animal production and it might be worth pursuing with FDA getting organic agriculture considered a minor use. It might provide some avenues for drug indexing and drug approvals that are helpful to the Board. Ms. Koenig motioned to consider legislation and look into the I-R4 program because it’s another example within the Federal government where minor uses are allowed. Mr. Riddle stated that as part of a Memorandum of Understanding (MOU), there should be some kind of resolution or recommendation from the Board because this is a priority to support the need to move this forward to a higher level, and suggested making this part of the Livestock Committee work plan.

Ms. Robinson suggested identifying four options, and then NOP will work with the Board to refine it. This will substantiate the Board and NOP sitting down and having a discussion with FDA on the possibility of creating a category called Alternative Medicines on the National List. There will be a posted guidance from the Board that will confirm the alternative medicines that the Board recognizes for use”. The second option is the negative over-the-counter drug option, and the one problem with that is how it will fit with the OFPA language. The third option to consider is a category of production aids with no reference to the specific use of the material, and the fourth option would be to explore through EPA’s program or through the recent action by Congress, that organic could be considered in Minor Use category and therefore get some relief from the labeling approvals of regulatory agencies. With those four options, we could develop a talking paper, and then have some things to sit down and explore with the senior policy officials at USDA, which always helps to have a dialog with another agency.

Mr. King asked the Board to consider the four categories to be included on the Policy Development committee’s work plan to accomplish this in the next couple of days. Mr. Riddle agreed that the Policy Development committee should take on for consideration by the Executive Committee to keep it moving and not having to wait until the next full Board meeting. He also stated that an introductory paragraph should stressed the need for the policy work at the highest levels to have the support develop that builds on the support that Arthur did.
Ms. Robinson will write the front end of the working paper that lays out the issue associated with the National List and the organic program; and make a request to the Secretary, detailing the need for a conversation with the Commissioner of FDA and then lay out the options. She will forward the working paper to the Board for review, and fill out the options with the possibility of breaking it down into two memos to the Secretary with an option paper attached. Ms. Koenig agreed to do the research on the I-R4 program.

Mr. Neal also apologized for not mentioning earlier that three or four crop materials have been lump into the processing docket. Mr. Mathews explained that the docket is already in the clearance channels, and it contains everything except for the livestock materials, which includes everything mentioned at last April’s meeting.

Discussion of NOSB Recommendations Concerning Compatibility, Commercial Availability, and Non-Compliances: (Pgs. 45-49) For more information, see discussion documents and meeting transcripts.

Ms. Koenig stated that compatibility with the system of sustainable agriculture is one of the Board’s criteria, and thought the Board had already adopted it. She also suggested incorporating it into the materials process because it clearly addresses an area where they have authority. The work plan is to make sure that it goes into the new petition notice and incorporated under that criterion.

Mr. King stated that the document was review and approved at the April meeting, and wanted to know if NOP had a problem with it being a part of the process. Ms. Robinson stated that they might have a few comments and questions for clarification. However, the decision process, and the authority to determine compatibility with the system of sustainable and organic production is the Board’s authority. Mr. Riddle also stated that the compatibility policy was incorporated into the Board policy manual, and will need to go to the TAP contractors and reviewers so that they understand our understanding of compatibility as well as the petitioners. Ms. Dietz stated that the Board has been using the document for the material review criteria, and incorporated how they define compatibility. Finally, Ms. Robinson stated that NOP didn’t have a problem with the TAP contractors having a list of what the Board defines to be compatible measures, but reminded the Board it was their decision to make. It is not up to a TAP contractor reviewer to tell the Board whether a material is compatible with sustainable agriculture. However, according to her understanding, the Board wanted the TAP contractors to have that to understand what it is they’re looking for and it’s the Board’s decision.

Minor Non-Compliances: (Pgs. 49-52) For more information, see discussion document

Mr. Mathews stated he still has reservations on the document since the first draft, and that it now has gone through eight different drafts. However, NOP hired Mark Bradley, Accreditation Manager, who will be working closely with him and the ARC branch on a number of issues; and the issue of minor versus major non-compliance is an area of responsibility for developing guidance within our operating manual. We will take all of the recommendations in the document into consideration during the discussion.

He also reminded everyone that every minor at some point becomes a major and we have to make sure that it’s fully acknowledge, because there are certain things in the Act and in the regulations that will constitute majors, and it will need to be made clear for certifying agents that minors do become majors. He appreciated the work that the Board did, and that NOP acknowledge that it’s a problem area, however, they will have to be very cautious as they move forward so that minor non-compliances that should it occurred, at some point becomes major, don’t end up into perpetuity.

Commercial Availability Task Force Report: (Pg. 52)

Mr. Mathews stated that it’s a complex issue, and NOP was not prepared to address at the meeting, and will provide a comment later.
Ms. Robinson reported that NOP issued statements at the April meeting obviously caused a lot of consternation in the organic industry and as a result, NOSB Policy Development Committee, USDA staff, and folks from the organic industry met in Washington, D.C., on June 9. A more collaborative relationship was needed in order for a relationship to continue to coexist. Since the meeting, the Board agreed to go back and develop feedback on the issue papers that were posted. Because of the collaboration, formal actions on issues will have to take place in an open meeting, and when recommendations are propose that require rule making, we will go through a second reiteration of public involvement.

Since the meeting, a list of issues was worked on, and NOP collaborated with the Board on how they intend to operate in the future. A letter was sent to OMRI agreeing to provide a review of the OMRI Generic Materials List, and OMRI and NOP agreed to ensure that the OMRI list of generic materials and the National List of Materials are coordinated and there are no inconsistencies. Provided prior to the Board’s input, the letter was posted and forwarded to all certifying agents. Drafted was a statement of work that explained the expectations of contractors who want to perform technical advisory panel reviews on materials petition for inclusion on the N.L. NOP will provide copies of the statement of work to the Board.

- **Petitions Procedures and Petitions:** The procedures were discussed with the Board for input and approval. All petitions will now be forwarded to the Board prior to submission for TAP reviews. A compliance questions was submitted to NOP regarding the organic status of seedlings and transplants, and prior to answering the question of the certifying agent, the generic questions was posed to the Board and got their feedback and then NOP answered the certifying agent’s questions.

- **Sunset of the National List:** NOP will continue to take the Board’s feedback on discussions about naturals versus synthetic materials. Materials have arisen and cause NOP to contact the Board, and the issue is how to define a material as natural versus synthetic. Hopefully, there will be some guidelines that can be agreed upon that are useful for resolving these determinations in the future because they pose problems when materials are petitioned for the N.L.

- **Review of the Board Policy Manual:** Ms. Robinson worked on the manual and provided the Board with copies for review. The Department received comments from the Board on the issue papers regarding fishmeal, antibiotics, and the scope document that will stimulate good dialog to discuss where to go based upon the Board’s input. (See discussion document)

Mr. Riddle stated that at the June 9 meeting, NOSB presented a framework document that built on NOP’s decision-making procedures. The Board tried to build in some feedback loops for consideration in the program manual referencing staff changes, and Board members change on policies. He wanted to know NOP’s reaction to the document that was presented, and will it continue to move forward.

Ms. Robinson stated that according to the way the document was written, it’s too rigid and implies that every time an issue comes up that this is exactly what we’re doing, we’re collaborating with you, and we’re coming to you with the issues. It came across that NOP needed NOSB’s approval to do the work, and while not averse to having something written that says, that NOP will commit to a consultative and collaborative role. She told the Board that after discussing the staff director’s position, it will become more evident that’s how the consultative role will be manifested because it will be part of the staff’s director duties to provide that link. Ms. Robinson will go back and take the drafted framework for collaboration document, respond to it in writing, and make edits. She also suggested doing some negotiating on the framework of collaboration words, put it in writing and see if that helps.

Mr. Riddle mentioned that during the public comment period, this is an open public comment period and people are not limited to the list of suggested topics on the agenda. He also wanted to clarify that the docket is at OGC for a final round of review and approval, and it contains all of the materials that the Board has recommended including the livestock
NATIONAL ORGANIC STANDARDS BOARD MEETING SUMMARY
October 12-14, 2004 - The Washington Marriott, Washington, DC
Page 5 of 17

materials. However, according to his understanding, they are included in that docket and currently six are problematic, and are describe in the docket as well.

Mr. Mathews clarified that there are two dockets and one is the livestock materials. Everything that the Board has made a recommendation on and previously acted on with the two amendments were done last fall. All of the livestock materials will be mention in the docket because the six that we’re not able to put onto the list obviously will not be propose for addition. The other docket takes everything except for the livestock material. There are two dockets, and once they are completed, everything the Board has acted on will be taken care of including the materials from last April.

NOSB Executive Director: (Pgs. 72-102) For more information, see meeting transcripts

Ms. Robinson provided a background description on the establishment of the Board, its activities and spending are under the Federal Advisory Committee Act (FACA). She stated that in the past, Congress provided an allowance of $90,000, and that was sufficient to cover expenditures associated with the activities of the Board. Last year the appropriation was increased and the report language urged the Secretary to authorize the hiring of the staff director, which meant that Agricultural Marketing Services (AMS) went back to the Department request and increase in the spending budget to be charge to NOSB activities. According to the Office of General Counsel (OGC), the staff director/executive director had to be considered within the FAC allowance. The Department also requested the Secretary’s approval to increase our ability to hire a staff director and the allowance, and unofficially, it was approved and increased by $100,000.

Mr. King asked if there’s a need for the Board to have an action item that describes some of the KSAs that would be involved. Ms. Robinson stated that it would be helpful; however, she’ll talk to personnel and draft something up. She doesn’t want to send a job announcement forward that doesn’t meet the Board’s expectations, and their input would be very valuable. Mr. King stated that Ms. Dietz will take the lead, and will attach a very brief addendum to the original document regarding the skill set they hope to receive. She will forward the addendum to the Board for review and finalize at the next executive committee meeting.

Materials Review Process: (Pgs. 102-104) For more information, see the meeting transcripts

Mr. King stated that Ms. Robinson mentioned in her description that petitions would be forwarded to the Board. Hopefully, we are improving this ongoing process and aware of the forms that will be used and how that will help the process.

Mr. Neal stated that over the course of the past four to five months there have been improvements in the Materials Review Process. NOP worked closely with the Materials Committee in discussing issues concerning the petitions process. Petitions were sent out to the whole board for comment to find out if the petitions met the categories of exemption under OFPA, and if there are any outstanding issues that needed to be addressed by the TAP contractors. For the future, we would like to ensure that we get a full TAP on petitions and will receive Board input on the petitions. The petitions will be review by the respective committee to see if there are areas of that petitions that will need further elaboration, and those questions will be supply to the TAP contractor for further scientific information.

The new element of the review process will be to supply the TAP reviews to the committees to review sufficiency, whether or not if those TAPs have addressed the questions and the OFPA criteria adequately. If the TAP is sufficient, it’ll be publicized, and then the process will begin for review of that material for a decision at the next meeting.

Update on TAP Contractor Final Statement of Work: (Pgs. 107-122) (For more information, see discussion document, and meeting transcripts)

Mr. Neal reported that the Board received a copy of the Final Statement of Work that was used in seeking out TAP contractors for this fiscal year. When seeking TAP contractors, the process is mainly handled out in Minneapolis field service office. The funds that we had to operate with were $300,000 and from the outset, we were seeking to attain multiple contracts for conducting TAP reviews for the NOSB.
Additionally, NOP sought bids for the work that needed to be completed, but due to time constraints, Minneapolis chose to initiate a Sources Sought Notice. The Notice sought interest in the specific work that was identified as needed to have been done by the NOP on behalf of the NOSB. The Sources Sought Notice was used to cut time, and to seek bids on the particular work may have cost us the ability to allocate the funds within the specific timeframe. Additionally, a list of respondents was generated, and after assessing all of the respondents that had the best qualifications for conducting the work, there were only two that were chosen based upon experience and the fact that they appeared on the GSA list, meaning that they have accounts and performed government work in the specific area. They have a limitation of $100,000 that each contractor will receive, that meant $200,000 is allocated, and a balance of $100,000. They were not able to find a respondent from the all Source Sought Notice that was used to perform the work to the level expected. Therefore, Virginia Tech’s $100,000 contract was extended because of the type of work that needed to be performed. The other contractor’s name is Woven Egg Consulting, out of Latham, New York and Denver, Colorado, and ICF Consulting, Fairfax, VA. Both have been identified as highly reputable companies that specialized in performing the types of scientific reviews on substances for EPA, FDA and other federal agencies.

Only three petitions can move forward, and we are thinking about forwarding them to all three TAP contractors to monitor the type of work product and how they perform under the new Statement of Work. This is a benchmarking procedure or process that’s use to assist in improving where we are currently.

Mr. Neal stated that an orientation session to bring all of the contractors together was discussed, and he didn’t see a problem with the Materials Chair having a role in the orientation process.

**Letter of Understanding with OMRI:** (Pgs. 122-132)

Ms. Robinson stated that in Chicago, NOP was approached by OMRI regarding the complete synchronization of the Generic Materials List and the National List. We agreed, because of problems with the auditors out on sites with certifying agents who have said their reference for approving materials used by operations is the OMRI list. The Generic Materials List is more user-friendly, it’s been there longer than the National List, and it’s what certifying agents are used to, comfortable with and it’s what they turn to. Neither OMRI nor USDA wants conflicting information out there, and we need an auditable process whereby accredited certifying agents are referencing the National List as the source of their information about approved materials. We have no problems with certifying agents using OMRI’s Generic List, but the source and the last word is the National List.

NOP also agreed to look at OMRI’s Generic Materials List and put it in a shared letter with the Board before sending it to certifying agents. NOP talked with OMRI, and agreed to let them select the priorities, the materials that they thought they had some questions about that they wanted to be sure that they described their use, their approval status, and their generic list was agreeable with the interpretation on the National List. There are a couple of materials on the agenda for discussion that will have to go back to the Board. There wasn’t a call in September, because we wanted to commit to sitting down and looking through the whole OMRI Generic Materials List and picking out materials and it didn’t get done. It was made clear to OMRI that there are questions that cannot be clearly answer based on the information that was received from the Board that we are not going to answer.

**OTHER NOP ITEMS**

**Nomination for New Board Members:** (Pgs. 132-133)

Ms. Robinson reported that there are 70 nominee applications submitted; the package is not finished being vetted through departmental agencies, the Office of the General Counsel, and have not gone to the Secretary. The appointments don’t expire until January 24, 2005. A widespread outreach was conducted this year, and as a result, we received the largest package of nominee applications that’s ever been received.
Audit Report from American National Standards Institute (ANSI): (Pgs. 133-137)

An e-mail was sent to the Board regarding receipt of a draft audit final report of our accreditation process from ANSI on October 5. ANSI provided a draft final report of their findings, and NOP will review the results and will have the opportunity to respond to the findings of the audit. ANSI will then take the response and determine whether it satisfactorily meets the findings that they had issued or still fails to meet the findings that were issued. They will then issue a final report of what they found during the audit, what was reported to USDA, here’s how it will be addressed, and here is ANSI’s response to USDA’s review of the audit findings. We will not wait to get the final; once we have our review and our response is finished. Hopefully, we will get it to you roughly by the third week in November. The content of the findings focused on three areas: (1) documentation of procedural manuals; our documentation and accreditation is lacking; (2) the second area deals with communication of our procedure, primarily to certifying agents; and (3) focusing on the actual audit and accreditation-related activities performed by the staff. In that category, the audit rated the staff exemplary in every case, highly professional, understanding of the tasks that they were performing, their interactions with the clients and their responses. The ANSI audit report and our response to the audit findings will be published on our web site and the future game plan will be to institutionalize this process.

List of Nominees for Membership to the Board: (Pgs. 139-140)

Mr. Riddle asked about the list of nominee being provided at the October meeting. Ms. Robinson stated a list will not be handed out at the meeting. The candidates’ background information are still being vetted by the Department’s White House Liaison office. She also stated that if they have someone to nominate, people could still write letters supporting and recommending individuals as members of the Board.

Mr. Riddle wanted to know after the investigation of the candidates, would the list be released at that point. Ms. Robinson stated that it’s not her decision; it’s the Secretary call whether or not to give out the list of nominees prior to her selection.

NOP STAFF AND FULL BOARD WORKING SESSION

NOP Directives: (Pgs. 142-147)

Mr. King stated that there needed to be points of clarity on where they are with the status of the Directives. They were publicized and rescinded, and there is some confusion out there in the industry.

Ms. Robinson reported that we’ve been ask the same questions; received letters asking and saying that there’s confusion and nobody knows what the status of the Directives. Our reply is that we’ve been waiting for feedback from the Board and have taken no compliance actions with regard to those issue papers. We were under the impression that we were going to resolve the uncertainty at the Board meeting with an open discussion based on the recommendations and the papers that was drafted. What was agreed to in June, we were going to work this out and figure out what we’ve got to do to make sure that there is no ambiguity and that everyone hears the same thing. This would be done in a public forum where the meeting is transcribed, the public will hear it, and come to a resolution.

LUNCH BREAK: 12:15 p.m.

LIVESTOCK COMMITTEE - George Siemon and Rebecca Goldburg

Antibiotics: (Pgs. 149 –172) For more information, see discussion document, and meeting transcripts

Mr. Riddle stated as a point of reinforcement for 205-238, the directive was limited to antibiotics and to strengthen it or for further clarification, he suggested inserting a few more words that would read NOP needs to issue a clarification statement that antibiotics and other prohibited substances are not allowed for organic animals. Any growth hormones or therapeutic hormones, or any other prohibited animal drugs are not allowed, not just prohibited.
Ms. Robinson responded that the Department concurs. Mr. King wanted to know if the process for the recommendation would be posted on the website for public comment. Ms. Robinson stated that we could say that no prohibited materials shall be given to livestock and still preserves their organic status, unless you approve the prohibited material. The Origin of Livestock will take a regulatory change—we’ll proceed with rulemaking.

Mr. Siemon stated that there was another issue in Chicago on the clarification statement regarding animals born and raised on organic farms, and there was some confusion about those animals that are raised organically and it was confirmed that it was part of the organic program. He would like to see that in the statement as well.

**Fishmeal: (Pgs. 173-178) For more information, see discussion document**

The NOP stated that fishmeal can be used as a protein supplement in feeding organic livestock without regard to the source or apparently the preservatives that might be used in the fishmeal.

In response to the report provided by Mr. Siemon and Ms. Goldburg, Ms. Robinson stated that the Department concurs, and complimented them on how well the statements were articulated and appreciated the hard work. She also stated that we have the same understanding, and the bottom line is that any synthetic added to fishmeal must go through the petition process and be approved by the Board in order for fishmeal with a synthetic to be used in livestock feed. Fishmeal is a natural, you concur. It’s nonsynthetic and fishmeal with a natural preservative or an approved substances is allowed.

We are in agreement with the two recommendations that deal with organic aquaculture, and believe that those rightfully belong to the task force that should be created on organic aquaculture. The last three, we believe that the NOSB should draft recommendations for the Department, and the Board needs to have this discussion on what turns a natural into a synthetic and come up with some clear fence posts on that.

Mr. Neal commented that when a synthetic substance is added to a natural, you need take into consideration how does one petition the term synthetic active because it’s not defined in OFPA. That needs to be defined because how does one petition a nonactive substance to be included on the National List, as a preservative. A preservative is not delivering the intended effect to the animal. These recommendations are will impact a host of other materials that are already on the National List.

Ms. Robinson stated that we can put a statement on the web site that fishmeal is a recognized feed supplement, a nonsynthetic. If fishmeal contains a synthetic substance, that synthetic substance must have been petitioned and approved by the Board and amend to the National List.

After much discussion regarding the differences between feed, feed additives and feed supplements, Mr. Riddle suggested writing a draft that will help with clarification when looking at the current definitions and how they are used in the Rule should be included on the Livestock Committee work plan.

**MATERIALS AND CROPS COMMITTEES – Rose Koenig**

**Working Draft Guidance on Inert Ingredients in Pesticide Formulation: (Pgs. 187-193) For more information, see discussion document and meeting transcripts**

The certifying agent and producer, after reasonable effort of contacting the manufacturer, EPA and other USDA-accredited certifying agents are unable to ascertain whether inerts in a pesticide allowed under the NOP. The certifying agent will approve that part of the organic production system plan.

In response to the report provided by Ms. Koenig, Ms. Robinson stated that the Department concurs, and will post a statement on the web site.
POLICY DEVELOPMENT COMMITTEE – Dave Carter

NOP Scope Document – Draft: (Pgs. 193-231) For more information, see discussion document and meeting transcripts

Mr. Carter provided the report summary on the Scope Directive that was issued in April 2004 on the following issues:

1) Personal Care Products, Body Care Products, and Cosmetics, 2) Dietary supplements, Over-The-Counter (OTC) medicines or health aids, 3) Fertilizers, soil amendments, manure, 4) Fish and Seafood, Farm-Raised or Wild-Caught, 5) Pet Food, and 6) Mushrooms, Apiculture and Honey, Greenhouse Operations, and Greenhouse Products, and Hydroponics Agriculture.

Mr. Riddle stated that in the second paragraph, page 4, under the NOSB consideration where they took the position and which agrees with prior statements from NOP, that the word “organic” is used to identify an agricultural product or ingredient. The context should state that the agricultural product or ingredient must have been produced and handled in accordance with the Act and the Regulation. The one issue that the committee should have tackled was the use of the word, “organic” on the principle display panel of these categories of products. The directive did set a deadline for such use for removal of such claims, and therefore, it is our position that we concur with that portion of the directive.

Mr. Carter stated that he didn’t want to speak for the whole committee, however, under the previous Scope Document, it was that if you could certify a process in which you complied with either the 70 percent, the 95 or the 100%, that you would be allowed to use it.

Mr. Riddle proposed an amendment to add a sentence that would follow the sentence that was read, which talked about the ingredients or agricultural products, and then specifically say if the word, “organic” is used on a principle display panel. The label claim must comply with Sub-part D of the regulation, which regulates the use of the 100% organic and made with organic claim. If it’s going to be on the front panel, it has to be consistent product content to other organic products. Mr. King stated that the amendment was moved by Mr. Riddle, and seconded by Mr. Carter and without further discussion, the Board agreed not to vote on the amendment, but to add it as an addition to the sentence.

At the conclusion of the report, Mr. Carter stated that the provision that was brought to the Policy Development Committee doesn’t list what the vote was, but the vote was unanimous. There were two members absent, so the vote was four in favor, and zero against, and two abstentions.

In response to the report provided by Mr. Carter, Ms. Robinson stated that the Department concurs.

PUBLIC COMMENT SESSION – October 12, 2004:

The following individuals presented public comments. Each person’s comments were recorded and transcribed for the record; and some individuals presented written comments. Transcribed comments, and where applicable written comments can be found at DESIGNATED ATTACHMENTS.

REGISTRATION SHEET (Attachment A)
SIGN-IN SHEET (Attachment B)

Debra Brister, Research Fellow, University of Minnesota, [Pgs. 213-217, Attachment 1]
George Lockwood, proxy for Richard Nelson, [Pgs. 217-223, Attachment 2]
Dr. Owen Keene, Heritage Poultry Management Service, [Pgs. 223-228, Attachment 3]
Dave Garforth, Green Harvest, [Pgs. 229-233]
William Jackson, AG-Rox-02, [Pgs. 233-236, Attachment 4]
Tom Hutchinson, OTA, [Pgs. 237-238, Attachment 5]
Mark Kastel, The Cornucopia Institute, [Pgs. 239-244]
OPEN SESSION – October 13, 2004, 8:00 a.m. - 5:00 p.m.

MATERIALS COMMITTEE – Rose Koenig

Sunset and the National List of Allowed and Prohibited Substances: (Pgs. 3-41) For more information, see discussion document and meeting transcripts.

Ms. Koenig reported that prior to the meeting; a document was posted on the website that reflected the board’s discussion. However, when they got to the meeting, NOP reviewed and presented their concepts of Sunset in the final document. The committee met on a conference call to discuss the Sunset provision, and how to mesh what the committee had suggested and what NOP suggested based on some of the constraints regarding federal regulation and having to go through rulemaking procedures.

Ms. Koenig stated that the Executive Committee voted on the draft document with the assumption that they would come back to the full Board. They wanted to let NOP know and confirm that the changes have been made, and that the Board is comfortable with it. Therefore, Ms. Koenig made a motion to approve the document, with the stated changes discussed for acceptance as the Sunset Policy. Ms. Dietz seconded. Mr. King stated that it’s been moved and seconded, and that the Board accepts the Materials Committee draft of the Sunset and National List of Allowed and Prohibited Substances. The document was unanimously approved.

Interpretation of OFPA and the National List – Analysis of Materials Provisions of the Act – Action Plan: (Pgs. 43-78) For more information, see discussion document and meeting transcripts.

Ms. Koenig provided background information on the report on interpretation of OFPA. She also talked about how she went through the Draft 1 addendum of the National List, looked at the List, used those OFPA categories and made some changes so that it’s a functioning list for the Board to ensure consistency with OFPA. Her primary goal was to fix the concept of interpretation of where those fillers, carriers, and agivents fit. She solicited discussion and input from the Board and NOP regarding the kind of institutional buy-in that OFPA really didn’t intend those agivents, fillers, and things like phosphoric acid, when it was petitioned to be placed on the List. Because the industry didn’t have the ability to understand the process, they have experienced a lot of heartache.

After discussion, Mr. Riddle stated that if there are no changes to the substances, or changes to the annotations, but rather just a change to the structure of the List so that it rearranges it in these categories, could that be done as part of the Sunset, republishing? On the other hand, what’s the target to move this kind of structure forward? Mr. Mathews stated it could be done at Sunset or at any possible time, and once it’s done to where you want it to be; it can be done section by section. You don’t have to wait for Sunset; it can be piecemeal and work through it. As you finish up with one part, we can move
to another part. There’s plenty of flexibility to work continuously on the National List. Ms. Robinson stated that the downside to rearranging the National List during the Sunset could cause public confusion. It’s a good idea to change it, that’s what we wanted to do. However, hold it for discussion later. Mr. Neal stated that it’s not a good idea to lump it in with Sunset, because industry people may not like the layout and start commenting on the way the List is structured. Then the docket will have to be rewritten to address the way the List is structured in addition to the Sunset materials.

Ms. Koenig concluded that the Materials committee would take the document and come up with a more formal process.

**HANDLING COMMITTEE – Kevin O’Rell**

**Materials Approved as Food Contact Substances – Update:** (Pgs. 79-81) For more information, see meeting transcripts.

Mr. O’Rell reported that at the April meeting, the Board voted to accept the Handling Committee’s report, to update the materials that are used as food contact substances. Additionally, it was also recommended that six materials that were considered as food contacted substances, previously voted on and approved by the Board would be added to the National List. He also stated because there was some confusion in the industry, it was the committee’s recommendation that the updated report be formally accepted, voted on and published on the website. It was the committee’s hope that the materials to be published in the next docket; however, according to the NOP’s update, that a docket was in the process for rulemaking with all processing materials, including the six materials, which were five boiler water additives, and four boiler water additives, activated charcoal, and parasitic acid.

In the April report, it recognized that the December 12th NOP policy statement clarified synthetic substances used as ingredients are subject to review by the NOSB. These synthetic substances would be classified either as an ingredient, which then would have to be on the National List, or as a food contact substances, which then would require the proper documentation for supporting that it is a food contact substance.

Mr. Mathews stated that they’ll go on there for a few months, but then will come off October 21, 2005.

**Organic Yeast/Agricultural vs. Non-Agricultural Substances – Action Plan:** (Pgs. 81-86) For more information, see meeting transcripts.

Mr. O’Rell reported that it was the purpose of the committee to provide an update and an action plan. The committee recognized a concern in the organic community regarding the flagged materials for yeast. The committee will form a task force to look into this issue and make recommendation to the full Board. The task force will include NOSB members and qualified individuals from the organic community. The decision will be to look at the issue of agricultural vs. non-agricultural, as opposed to just taking the yeast in question, because there are a number of substances that are on the National List under 205605(a) that could also be affected by a decision that would be made for yeast.

The task force will have a full review of the materials on 205605(a), look at reclassifying them, and from the criteria to further the definition of agriculture and non-agricultural. They will also interact with the task force that’s involved with synthetic-non-synthetic, because there will be some areas that will cross over or relate to that subject. Finally, the Board previously made recommendations for change in 205605.

Ms. Dietz also stated that at the meeting, the committee made a recommendation on commercial availability and had to restructure 205.605 to remove some materials. The new task force will do the same type thing, will go through and make recommendations on materials that are currently on the National List, and come up with a more user-friendly structure of the National List.

Mr. O’Rell concluded that there’s some high interest with this particular issue in the industry and would like to have it resolved to make a recommendation to the full Board at the next meeting.
Pet Food Standards – Action Plan: Materials, Labeling and Feed Provisions: (Pgs. 86-94) For more information, see meeting transcripts.

Mr. O’Rell reported that the committee recognized that there has been a lot of work done in the industry and were challenged to look at the work, assess what was completed, bring it to the committee for digestion, and then make a recommendation to the full Board at the next meeting. This is not a task force, this would involved a work plan for the committee to review, assess what is currently out there with OTA and AAFCO. Try to come to an agreement and draft a recommendation for presentation to the full Board at the next meeting.

It was determined that Keith Jones will work with the Handling Committee on the task force to specifically work on the Pet Food issue.

REPORT PRESENTATION (Pgs. 94-123)

PRESENTATION OF COMMITTEE DISCUSSION ITEMS (continued)

LIVESTOCK COMMITTEE – George Siemon

Wild Caught and Aquaculture Standards – Formation of Task Force: (Pgs. 123-) For more information, see discussion document and meeting transcript.

Mr. Siemon reported that this is a longstanding issue with two recent developments regarding the scope directive, which brought up the labeling of seafood products and wild seafood. Therefore, the committee proposed the formation of a task force to deal with these issues. The idea is to get approval for the formation of a task force, and then come back with the recommendations of who would be on the task force. He is willing to work straightforward on it and make it a priority to have the recommendations ready. Ms. Goldburg also stated that it’s important to move forward with this task force so that they can implement the new provisions of the Board policy manual.

COMMENTS FROM A. J. YATES, AMS ADMINISTRATOR – (Pg. 130-131)

Mr. Yates thanked and expressed his appreciation for all the hard work that everyone was doing. He also stated that their work goes beyond the days of meeting with USDA because of having to deal with issues on a daily basis, and looking at the regulations to make this industry successful, takes a tremendous amount of time. He expressed his support and wants to see the industry to continue to grow and profit, because as a farmer, he’s knows how important it is that we only can stay in business if we can have a profitable venture.

Wild Caught and Aquaculture Standards – Formation of Task Force (continued) (Pg. 132-134) For more information see discussion document and meeting transcripts.

Mr. King asked if the committee will create two task forces, one for aquaculture standards and one for wild caught standards, or dealt with those issues separately.

Mr. Siemon stated that there would be one task force for two working groups. He admitted talking to the group to understand the difference between the two programs, but that’s what been proposed, and it’s still two distinct subjects, and we’ll put them together. It doesn’t mean that the other will hold one back; if it’s ready, it should move forward and not held back by the other.
Mr. Riddle stated that because we don’t have anything in place, what he would like to see happen is that they will need to put out the call, on how and where people will submit their application. The committee will also need to talk about who makes the decision of whose selected or who serves on the task force. A description of the task force should be posted on the website, instructions on how to submit a CV or resume, and then have the Executive Committee to make the final selection. Then task force will be seated and ready for work.

MATERIALS COMMITTEE – Rose Koenig

Revised Federal Register Notice for Petitioned Substances – Draft 1: (135-139) For more information, see discussion document and meeting transcripts.

Ms. Koenig reported that the committee took a stab at revising the actual notice and updated some the names and dates, and took out sections that are no longer appropriate. The original notice came in 2000, and now it’s almost 2005, so you can expect some changes because the process has gone forward. NOP asked the committee to review the notice in order to modify it to improve the materials review process. The draft document was presented to begin a discussion to revise and finalize the petition notice for posting.

NOSB and NOP need to modify the petition notification instructions to petitioners and the petition process. This will improve the ability of the TAP contractor to evaluate and provide consistent information on each petition substance. It will also assist the TAP analysis of whether or not a substance is synthetic or non-synthetic based on NOP definitions and NOSB clarification of the definitions. Additionally, the information provided in the petition clearly needs to address all applicable OFPA criteria. The committee took the notice and did a preliminary analysis and recommendation; and the suggested ideas and recommended form for specific changes are in bold, and the original notification is not in bold.

Materials Review – Refining the Process and Presentation: (Pgs. 140-163) For more information, see discussion document and meeting transcripts.

Ms. Dietz stated that the Materials Committee did not discuss the document and suggested that Ms. Koenig provide only a summary of the report for presentation at the next meeting.

Mr. Neal stated that the document would replace the Federal Register Notice that is currently on the website and in the Federal Register, so it would have to go back through the process. Mr. Riddle suggested running it through the Materials Committee to make sure that they have a clean copy of the correct draft before they waste any of their time.

Ms. Koenig suggested orientation and training on the new system for the new TAP contractors. She also wanted to know if the Executive Committee could vote on that if they get to another draft stage, and would this be viewed as a working document in a sense of training petitioners. Ms. Dietz stated that the last orientation book was drafted but never approved by the Board. The Executive committee looked at it, but the Board never formally adopted it.

Mr. Neal stated that the petitioner would need to have a document that has gone through the formal clearance process for them to use and submit that information to NOP. We can’t operate off a draft. If there’s additional information that we need, and if it’s going to help them provide the information that needed by the Board to make a decision on their substance. It was concluded that the report will be a part of the Materials Committee work plan.

Ms. Koenig gave a slide presentation on the Materials Process Update. The text of this presentation can be found with the meeting transcripts. For more information, see the Materials Process Update Slide Presentation.

POLICY DEVELOPMENT COMMITTEE – Dave Carter

Policy for Scheduling NOSB Meetings – Committee Draft – Vote: (Pgs. 177-186) For more information, see discussion document and meeting transcripts.
Mr. Carter provided a preliminary report regarding the committee working draft document. He stated that Ms. Caroe requested establishing a more formalized procedure for scheduling meetings for the Board and various committees; therefore, she drafted a proposal for meeting protocols. Ms. Caroe stated that it’s a working document for consideration and for inclusion into the policy manual to assist with establishing respect for each other as members of the volunteer Board.

**Board Policy Manual Revision – Update:** (Pgs. 187-198) For more information, see discussion document and meeting transcripts.

Mr. Carter stated that on June 9, members of the Policy Development Committee met with NOP to discuss the framework for collaboration and other ways to improve the working relationship between NOP and NOSB. Ms. Robinson offered to review the Board’s policy manual and provide the committee with some advice and guidance to make sure that everything that is in the manual conforms, not only with OFPA and the Final Rule, but also with FACA and the illustrious Paperwork Reduction Act. She also circulated a document titled, Policy and Procedure, and Mr. Carter provided a report summary of the document for Board discussion. No action taken.

**Scope Document:** (Pgs. 199-201) For more information, see discussion document and meeting transcripts.

Mr. Carter stated that per their discussion on the previous day, he incorporated some technical corrections and changes to the scope document. After discussion, Mr. Carter made a motion to move the document forward for posting. Mr. Siemon seconded. The Board unanimously approved to post the document for public comments. 1 Absent.

**ACCREDITATION, CERTIFICATION AND COMPLIANCE COMMITTEE – Andrea Caroe**
(Pgs. 206-207) For more information, see meeting transcripts.

Mr. King stated that Ms. Caroe indicated that the committee did not have anything to bring forth at that time. Ms. Caroe commented that the committee took a back to other committees working and responding to the directives, therefore, they will submit their items at another date. Mr. Riddle stated that during public comment, a certifier commented that an issue about the information on certificates and the fact that compliance with NOP standards or regulations is not required. The committee started a draft 1 document and the committee didn’t follow through with it; therefore, he requested reconsideration to be included on the committee’s work plan.

**CROPS COMMITTEE – Nancy Ostiguy**

**Extraction Methods – Consistency with the National List and Natural Materials and Discussion on Potassium Carbonate and Hydrolyzed Extracts:** (Pgs. 208-211)

Ms. Koenig stated that originally when that agenda item came up, they were thinking of this paper on extraction, which became the synthetic versus non-synthetic documents. Therefore, in terms of the report, there is nothing to report. However, Arthur Neal provided an explanation and update on the recent correspondence that he received regarding extractants.

**Soy Protein Isolate Material Review – Vote:** (Pgs. 212-215)

Ms. Koenig reported that the committee met, reviewed the material information, and voted to defer the substance. The committee would like to seek additional information on the extraction process to determine: (1) whether or not the substance is chemically changed during the extraction process; (2) whether the substance is chemically changed after it is extracted to make it more functional for its intended use or uses; (3) what happens (chemical reactions) during the neutralization step in the extraction process; and (4) whether there is a presence of additional substances after extraction of the petitioned substances.
The committee thought it was important for the Board to clarify the definition of synthetic and non-synthetic so that this substance could be evaluated and be consistent with the intent of OFPA for inclusion on the National List. The committee submitted a draft document to begin the discussion on the further clarification of the definition of synthetic for the October 24 meeting, and that’s the one they discussed earlier.

The committee used three sources to obtain further information regarding the issues stated, the petitioner, the TAP contractor and an expert on soy bean manufacturing from Kansas State University provided additional information to the Board that will be considered in addition to the petition and the original TAP report o this substance. The committee will also consider public comments when making the recommendation because they have all the information, and will be able to make a decision on the substance.

Mr. Neal ask the committee to submit to the program the committee recommendations (Soy Protein Isolate) form that was provided to the Board so that NOP can officially post that on the website as a current update to the deferral. The documents are posted on the website; however, the only one that’s not posted is the one from Kansas State.

Compost Tea Task Force Report Recommendation – Vote: (Pgs. 215-222)

Ms. Koenig stated that there was public comment that came to the committee regarding the product. Two of them concern a question on the testing protocol that was suggested within the document, and they felt that it was expensive. They also felt uncomfortable and it wasn’t doable for the farmer. The second comment regarding the recommendation in the document that allowed for food contact disinfectant, like all materials on that list, suggested that they do have on the List disinfectants that are part of that larger list. She also stated that the first two comments expressed concern for many of the members on the task force. The way that we got buy-in from all members was specifically because we outlined a detailed protocol as far as testing of the machinery. They need to think more about those testing protocols and an alternate or come up with another proposal on that aspect of the document. Those who endorse the document probably would not endorse it if we made significant changes to that area. Finally, the second one is a good suggestion with good justification, and should be supported by members of the committee, even though it was an oversight. They need to make sure that any materials that are recommended for cleaning out the equipment should be consistent with the list. The comments should be incorporated and considered when voting on the report.

Ms. Koenig spoke to Eric Sideman about how originally there was a Compost Task Force, and Tea was supposed to be consider within that task force. Then it was broken off and additionally studied; and now they have two documents on very similar issues. Mr. Sideman recommended merging the two documents in terms of the recommendations in some format so that they’re accessible to people who need to look at them.

After discussion, Ms. Ostiguy motioned the Board to accept the Compost Tea Task Force report, and direct the Crops Committee to take the recommendations from this report and put them forward, which may or may not include all the recommendations from each of the reports. Mr. Bandele seconded. The Board unanimously accepted the report.

Inerts Directive – (Pgs. 222-231)

Ms. Koenig reported that the final request was to go back to the inerts directive document, and have it posted on the web. Mr. Siemon made a motion to have all the drafts posted. Mr. Bandele seconded. Ms. Dietz stated that the Materials Committee did not review the documents; however, she didn’t have a problem with posting them, but felt that there wasn’t a need to have a motion for posting. She also stated that the committee discussed taking them back for review and having drafts ready for the next meeting. Mr. Mathews asked for clarification if the committee would vote to have the document posted or just to have it posted. Ms. Koenig motion to have the document posted and Ms. Ostiguy seconded.

After discussion, Mr. King called the motion for all those in favor of recognizing the inerts document and forward for posting on the NOP website. Vote to recognize and post as an NOSB document: 7 Agreed; 4 Abstained, and 2 Absent.
Ms. Robinson recommended posting the Board’s statement and the Department’s draft guidance statements. Before publishing on the website, submit the documents to OGC and the Board for review, and the Board and NOP will submit their feedback. Mr. King stated that the Board created some feedback and will forward that to NOP.

**Origin of Dairy Livestock** – (Pgs. 231-233)

Mr. Siemon made a motion to accept two changes to the directive for Origin of Dairy Livestock document and Mr. Lacy seconded. Vote: 11 Favored, 1 Absent, and 1 Opposed.

**Fishmeal Document** – (Pgs. 233-238)

Mr. Siemon stated that there were no changes to the document, however, the committee noted in their recommendations that there are recommendations related directly to the directive, and some related to future work plans. Mr. Siemon motion to accept and Mr. Lacy seconded.

After discussion, Mr. Siemon accepted the friendly amended to the document. Mr. King read the friendly amendment to consider the Livestock Committee directive for fishmeal and forward for posting. Vote: 11 Favored, 1 Abstained, 1 Absent

**Election of Officers** – (Pgs. 239-244)

Mr. Jim Riddle, Chair
Mr. Kevin O’Relly, Vice Chair
Ms. Goldie Caughlan, Secretary

**OPEN SESSION – October 14, 2004, 8:00 a.m. – 12:15 p.m.**

**PRESENTATION OF COMMITTEE WORK PLANS** – (Pgs. 3-34)

Mr. Riddle opened up and asked each committee to provide a summary of upcoming work plans. For more information, see discussion document and meeting transcripts.

**NEXT MEETING** – (Pgs. 34-39)

February 28 through March 3, 2005

**PUBLIC COMMENT SESSION – October 14, 2004: (Continues)**

The following individuals presented public comments. Each person’s comments were recorded and transcribed for the record, and some individuals presented written comments. Transcribed comments, and where applicable written comments can be found at **DESIGNATED ATTACHMENTS**.

Lisa Donwhite, proxy for Leslie Zuck, PCO and Northeast Organic Dairy Producers Alliance, [Pgs. 48-52, Attachment 1]
Jo Ann Baumgartner, Wild Farm Alliance, [Pgs. 53-57, Attachment 2-A, 2-B, and 2-C]
George Lockwood, National Organic Aquaculture Working Group (NOAWG), [Pgs. 58-68]
Maury Johnson, NC+ Organics, [Pgs. 68-79]
Grace Marroquin, Marroquin International Organic Commodities Services, [Pgs. 80-87, Attachment 3]
Gwendolyn Wyard, Oregon Tilth Certified Organic (OTCO), [Pgs. 87-91, Attachment 4]
Richard Siegel, Lawyer, Private Practice, proxy for 15 Companies Supplying Organic Ingredients, [Pgs. 91-96, Attachment 5]
Mike Norman, Association of American Plant Food Control Officials, (AAPFCO), [Pgs. 96-103]
Brian Baker, Organic Materials Review Institute, (OMRI), [Pgs. 103-106]
Sharon Sherman, Pet Guard Company, [Pgs. 113-116]
Earl Louviere, Omega Protein, [Pgs. 116-118, Attachment 7]
Emily Brown-Rosen, proxy for Eric Sideman, [Pgs. 119-124]
Emily Brown-Rosen, proxy for Brendan O’Neill and Bill Mott, [Pgs. 124-129, Attachment 8]
Drake Sadler, Traditional Medicinal, [Pgs. 129-140, Attachment 9]
Joe Mendelsohn, Center for Food Safety, [Pgs. 140-150]
Susan Prolman, The Union of Concerned Scientists and Coalition to Keep Antibiotics Working, [Pgs. 150-153, Attachment 10]
Urvashi Rangan, Consumers Union, [Pgs. 153-155]
Michael Sligh, [Pgs. 155-157]

ADJOURNED:

October 14, 2004 – 12:15 p.m.
UNITED STATES DEPARTMENT OF AGRICULTURE

IN RE: NATIONAL ORGANIC STANDARDS BOARD MEETING

Meeting held on the 12th day of October, 2004
at 8:00 a.m.
The Washington Marriott Hotel
1221 22nd Street, NW, Salon E
Washington, D.C.

TRANSCRIPT OF PROCEEDINGS

10-12-04 NOSB Meeting Participants

Chair: Mark King

NOSB Members: Owusu A. Bandele
Rosalie L. Koenig
George Siemon
Kim M. Dietz
Kevin O'Rell
David Carter
Goldie Caughlan
Andrea Caroe
Rebecca J. Goldberg
Nancy Ostiguy
Michael P. Lacy
James A. Riddle

NOP Staff: Richard Mathews
Arthur Neal
Barbara Robinson
Katherine E. Benham

Public Comment: Debra Brister
George Lockwood

York Stenographic Services, Inc.

Sebastian Belle
PROCEEDINGS

October 12, 2004

CHAIRPERSON KING: -- opposed, same sign.
Motion carried. Are there any announcements? I'd like it to be noted this is the first meeting that Jim Riddle has not had an announcement. Seriously, we wanted to move into introductions. We can start to my right and move left. Please just give your name and position on the Board.

MS. KOENIG: Rose Koenig, Producer [ph] on the Board.

MR. BANDELE: Owusu Bandele, Producer.

MR. LACY: Mike Lacy, Science Rep.

CHAIRPERSON KING: Mark King, Retail Representative.

MR. RIDDLE: My mike doesn't come on. I'm going to have to change mikes. Jim Riddle, Certifier Rep from Minnesota.

MR. O'RELL: Kevin O'Rell, Handler Rep.

MS. GOLDBURG: Becky Goldburg, Environmental Representative.

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077

MR. MATHEWS:  Richard Mathews, Associate Deputy Administrator, for National Organic Program.

MR. NEAL:  Arthur Neal, National Organic Program.

MS. ROBINSON:  Barb Robinson, National Organic Program.

CHAIRPERSON KING:  Thank you all very much.

Next, we have approval of the April, 2004, meeting. That is the meeting that was held in Chicago. Are there comments or discussion on those?

MR. MATHEWS:  Yeah, Mark. We just got them, I think, Friday. I finally did get some time to go through then and do have four changes I would like to propose. So those are in Tab 2 of our meeting book, and of the -- on page two, second paragraph down at the end there where it says Nancy Ostiguy -- we agreed to step in and take over where Mr. Holbrook [ph] left off with crops. I just wanted to clarify that meant crops committee and sharing crops committee. And page nine, Compost Tea Task Force report, second paragraph and referenced in the second sentence says "after the initial Compost Tea Task Force, well, that was the Compost Task Force. The first task force was just
Compost Task Force, so I just wanted to strike the word Tea there, so it's -- so it's correct and -- Jim, yes?

MR. RIDDLE: Would you also scratch "initial"?

MR. MATHEWS: Sure, yeah.

CHAIRPERSON KING: So it will read Compost Task Force.

MR. MATHEWS: Yeah, after "the Compost Task Force presented its findings." Okay. And then page 10 -- on this one, third paragraph down, it's accurate that Barbara presented information about two petitions to remove substances, but it was in our discussion that it was determined that the one on corn starch never did go to the Full Board, so I don't have exactly the language to correct that, but the Board did not take action on a petition to remove corn starch and -- so I guess -- yeah.

CHAIRPERSON KING: I was just going to say if you want to go ahead and go on and if we need to craft some language on that, I think is what you're saying.

MR. MATHEWS: Right. Yeah, it's really -- yeah. My lights aren't working, either. The -- maybe what we should do is change it from "Board" to "the committee."

MS. DIETZ: Yeah, I believe it was the Handling Committee, that you took that through the
Handling Committee.

MR. MATHEWS: Uh-huh.

MS. DIETZ: We can go back and look at the minutes, but I think it was a Handling Committee recommendation.

MR. RIDDLE: I have no problem with changing it to Handling Committee. It would still be the same result.

MR. MATHEWS: Yeah, I think that would be accurate, then. So really just changing where it says "the Board" after that dash, yeah, "the Handling Committee considered that and rejected it." Good. And the last one is page 14 at the very bottom of the page, last paragraph, "Mr. Carter felt that it was important for him to make some sort of statement before they left Chicago." I believe it was, "Mr. Carter felt that it was important for the Board to make some sort of statement before they left Chicago," so if we can just change "him" to "the Board." Would that be accurate, Dave?

MR. CARTER: Yes, yes.

MR. MATTHEW: Okay.

MS. CAUGHLAN: Board or the Policy Committee? Because we didn't have a Board recommendation. I think that's --
MR. CARTER: No, the actual comment, though, was that it -- we thought it was important for the Board to make a statement before we left the Chicago meeting.

MR. MATHEWS: Okay. Okay, so those are the changes I propose and I would move that we accept the minutes with those four changes.

CHAIRPERSON KING: Is there a second?

MS. CAUGHLAN: Second.

MR. MATHEWS: Are there any other changes?

CHAIRPERSON KING: Are there any other proposed changes or discussion? Okay, it's been moved and seconded. Do we approve the April, 2004 meeting minutes as amended? All those in favor signify with saying aye.

BOARD MEMBERS: Aye.

CHAIRPERSON KING: Opposed, same sign. Motion carries. Next, we have a review of Executive Committee Conference Call minutes. I believe all, with the exception of September, have now been posted on the web site?

MS. DIETZ: Yeah, we have June, July and August minutes.

CHAIRPERSON KING: Okay.

MS. DIETZ: Which changes have gone through after each call, so I'm not sure if anybody has any

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
changes to those or not.

MR. RIDDLE: Yeah, the August ones are still
draft and have not been accepted by the -- or approved
by the -- but they are posted for review.

CHAIRPERSON KING: So we need to recognize
June and July.

MR. RIDDLE: Well no, we did -- we just --

CHAIRPERSON KING: It's just there for
reference.

MR. RIDDLE: Right.

CHAIRPERSON KING: Okay. Okay, next up we
have NOP discussion with NOSB and we have several topics
listed here on the agenda. I'll just go in order as
they are listed and we, of course, can talk about some
other items, too, but the first item we have up is just
kind of the status of previously recommended materials.
I know there's been a lot of hard work in that area and
there have been some challenging issues as we all learn
how to use annotations and where to place things on the
National List, so our goal here is just to have kind of
a sharing of information and discussion with NOP on some
of these issues and so we'll give you a chance to give
us a quick update on those, Rick or Barbara.

MS. ROBINSON: I'm just going to handle
materials.

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
CHAIRPERSON KING: Okay. Good morning,

Barbara.

MS. ROBINSON: Good morning.

MR. NEAL: Good morning, Arthur Neal. Update
on the status of recommended materials. In regards to
the processing materials that have been recommended by
the National Organic Standards Board, those materials
and recommendations have been placed in a docket. That
docket is right now in the Office of General Counsel for
review. We are anticipating a turnaround from them. As
soon as we get their response or their comments on that
docket, we will be able to know whether or not we're
going to be able to either go straight to the Federal
Register or if we're going to have to make some more
changes. We're hoping that we have to make no more
changes to the docket. We've made all the changes thus
far that they've suggested and we're awaiting their
response on that particular docket.

In response to livestock materials that have
been recommended by the National Organic Standards
Board, we have been in a very lengthy process,
consultation process with FDA concerning those
recommendations. Out of the materials that were
recommended by the National Organic Standards Board,
we're having a problem with six in particular and those
six are the six that are -- you can find sold over-the-counter medications, in particular. We got them -- they are calcium borogluconate, calcium proprianate, activated charcoal, kaolin pectin, mineral oil, potassium sorbate. What we found out about these particular materials is that they have not been approved through FDA's new animal drug application process nor its new drug application for human foods, either. They have gone -- they have been reviewed through an over-the-counter review, which is much different than prescribed medications, the type of review that they go through.

These particular drugs, well, four out of the six of these drugs are marketed under monographs, which is a process that FDA had implemented historically and it serves as sort of like a recipe in terms of how you are to manufacture this particular drug, but it has not been formally approved for use in animals. So we've gone through this consultation process and it seems to be these six materials are going to be problematic in terms of being included in the docket in terms of a positive listing on the National List. So what we're going to do is move forward with the ones that we have, that we can list on a national list and not hold this up any longer. And I think those are all of the materials

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
that have been recommended by the National Organics
Standard Board. If you guys got any questions, you can
raise those now.

CHAIRPERSON KING:  Kevin.

MR. O'RELL:  Arthur, is that for the Handling
Committee materials, is that the materials that were
considered as food contact substances, as well?

MR. NEAL:  No, the food contact substances
docket, which is what I'm calling the processing docket,
is at OGC. It has been completed and we're just waiting
for them to give us the okay to move for it in the
Federal Register.

CHAIRPERSON KING:  Andrea.

MS. CAROE:  Do you have an estimated time line
on those -- that processing docket? I mean, I know it's
in OGC's hands, but do you have any idea of how long
that's going to take?

MR. NEAL:  I don't have a specific time line.
I know that they're receiving some pressure to go ahead
and get that back to us ASAP.

MS. ROBINSON:  When did we give it to them?

MR. NEAL:  We gave that to them two months
ago.

MS. ROBINSON:  We will make it a point to
check with OGC and ask them about their clearance,
estimated clearance time.

MR. MATHEWS: The thing that we're concerned about is that this actually the second time it has gone. The first time they sent it back because there wasn't enough description as to what it was the Board was trying to achieve in the docket itself, in the preamble language. We hope that we have captured the essence of what it was the Board was trying to achieve in approving the materials and then put it into the dockets. And for your information, this is something we're going to have to do with all materials. In other words, the bottom line is the bar has been raised on us for getting things into the National List and so we have to be much more specific in what it is we're trying to accomplish and that's we've wrestled with for this docket. It's also what you're going to be wrestling with in the future in order to satisfy us because we have to set aside the attorneys.

MS. ROBINSON: And I will say that we were -- we weren't expecting that kind of reaction from OGC, so it did take us aback a little bit because it's probably the first time that they've sent a materials docket back asking for the kind of detail that they were asking for, so we just didn't expect it and so that's what's really caused the delay on our part.
CHAIRPERSON KING: Kim.

MS. DIETZ: Most of those materials were ones that have been in the pipeline for quite some time, so I would assume that now that we've got this new material review process and we've got the compatibility dockets and we're going through those, the criteria that that should help the process, correct?

MR. MATHEWS: Immensely.

MS. ROBINSON: It will help, yes. The key will be to be as detailed as possible. We also hope that -- and we'll talk about this later, of course, that with the more detailed requirements that we'll be expecting from TAP reviewers. We hope that that'll help quite a bit, too, so -- and the new petition procedures, so we do expect that this will be smoother. We have alerted OGC to the fact that, you know, Sunset will also be coming and so we're all going to try and do whatever it takes to make this run a little more smoothly. As I said, we were taken aback because this is the first time they've ever come back to us with these kinds of questions, so -- but we do expect that the new procedures we're putting in place will prevent this kind of delay, at least when it gets to the lawyers, in the future.

CHAIRPERSON KING: Jim.
MR. RIDDLE: Yeah, a comment and a question and I just want to say that, you know, when you do get those kind of questions from OGC about what was the Board's intent, they need clarification, you know, feel free to communicate that to the Board and --

MS. ROBINSON: As we will.

MR. RIDDLE: -- you know, let us --

MS. ROBINSON: Without a doubt, Jim.

MR. RIDDLE: -- help sort that out.

MS. ROBINSON: Right.

MR. RIDDLE: I'm sure we're willing to pitch in to get that clarified and help move them forward. On the livestock materials, I just want to make I understand this, that those six, or at least five of six, the potassium sorbate, I think, is a little different issue; it's not a direct medication, but the others are over-the-counter medications, correct? That's how FDA kind of regulates them or classifies them, so any livestock producer can use them and they don't object or -- that's why I need to understand.

MR. NEAL: FDA has looked at our request. Our request was very specific to accommodate the request of the Board, the recommendations of the Board. Based on their review, the use of those substances as a livestock medication do not meet FDA's regulations because they
are not FDA-approved drugs, animal drugs, that is. And as a result of our consultations, what we're finding out is more of an enforcement issue for FDA, just as it is for us, materials that are used in organic agriculture have to be on our National List. We have to enforce that all materials that are used are on the National List, the same with FDA. Materials that they have approved for use in animals have to be recognized as such. We could not find these in the FDA regulations anywhere as approved for use in animals.

MR. RIDDLE: Yeah --

MS. ROBINSON: Let me -- okay.

MR. RIDDLE: Okay.

MS. ROBINSON: Let me try and explain something here that -- and we've had this discussion before about the difference between FDA's regulatory process and -- excuse me -- and our regulatory process. USDA's regulatory process tends to be a proactive -- let's take the case of the organic standards. We set up the standards and then we say if you can meet these standards, you can use this label. FDA -- the best way to explain their regulatory process is it's almost a mirror image of the way we regulate. What they do, in fact, is allow certain labels to be used on products and you know, pet food's a classic example, where they say
they reserve the right to enter the market place and
then regulate against the use of something for health or
safety reasons. In the case of these livestock
medications, I will say, too, that we -- Arthur spent an
-- a huge amount of time going back and forth with FDA
even asking all right, how about if we put them on the
list with the annotation that they can be used when
prescribed by a licensed veterinarian and they said no
to that, as well. The problem that we're facing is that
since they have no drug approvals -- and to get a drug
approval, you understand what that would take, right?

MR. RIDDLE: Um-hum.

MS. ROBINSON: The company would have to do
drug trials and submit that to the FDA for approval.
Now, you're asking the manufacturer of Pepto-Bismol to
invest in the research -- I'm not saying it's not
legitimate, but from the company's perspective, I think
this is what's happening, is why go to all the trouble
to do the drug trials to demonstrate that Pepto-Bismol
is safe for use in livestock; there's no return for the
company to do that, hence they don't submit the drug
trial research to FDA, so FDA will not grant it an
approval status.

If we put it on our list, in effect, we have
codified what FDA refuses to codify and since we --
we do that, they will take action against us. I mean, we will have then attempted to one-up them by putting something in the Federal Register -- even though this industry would look at it as something just for you and FDA is well aware that these medications are used by livestock producers everywhere, but they're not going to allow them to be published in a Federal Register that to the world is a -- says the government has sanctioned the use of these materials.

What does it mean? It means -- my assumption is that there are, unfortunately for livestock producers, there are prescription medications that will accomplish the same purpose. My assumption is that this means that livestock producers will pay a higher price to obtain prescribed medications to accomplish the same purpose that these over-the-counter medications would accomplish and so they will have to incur the costs. The only other alternative that I can think of is petitioning the manufacturers to submit the drug trials to FDA to obtain the approval status by FDA for use in livestock production.

Now, I don't think this is anything specifically peculiar to organic. It is -- because FDA does not -- that's not their response to us. It's livestock production, period, not organic. And we know
that they're used by conventional producers, as well.

MR. RIDDLE: Well, I appreciate the
predicament and I think I understand and I really
appreciate the work that you all have put in, especially
Arthur, trying to move these forward. I mean, it just
-- to me, these are the most benign of the medications
that we reviewed and I look at the, you know, comparable
things that are on the list like aspirin. It falls in
the same category, right? It's something where they're
allowing any livestock, conventional, whatever to buy
large boluses of aspirin to reduce pain and that's not
an FDA-registered drug.

So I just, you know, I understand that they're
kind of turning a blind eye on these things. They know
that livestock producer -- I can go into any farm supply
store and buy these products and you know, there doesn't
have to be a veterinary prescription or anything like
that and as I recall, the presentation we heard a year
ago from FDA, they were telling us at that time it was
kind of a green light, but it sounds like things have
changed as it got more kind of down to the nuts and
bolts of putting them on our list and I understand that
putting them on our list would be an official, federal
registration, per se, of something that they haven't
registered. I -- but you know, we -- certifiers
certainly can't be put in a predicament of turning a
blind eye.

That's not something that we want to
courage, but at the same time, it's just -- there's
got to be some common sense here and how can we move
these forward? I heard two options, I think, either use
the high-priced veterinary drugs -- and some of them
don't achieve the same results as some of these -- or
try and get the manufacturers of these benign substances
to go through the expense and years of registration.
Neither of those seem very satisfactory. I just -- I'm
not ready to give up on it yet and I -- I hope we can
find a way to move them forward so they can be
officially used by organic livestock producers because
they are used by conventional producers.

MR. MATHEWS: I fully understand your
frustration, Jim, and we have tried to turn this thing
every which way. Arthur has put in a lot of time,
talked to many people at FDA. He is presented numerous
options and we're as frustrated as you are that we can't
get them there, but I guess it just comes to the fact
that the statute and the regulations say that if a
synthetic is going to be used, it has to be on the
National List. The FDA doesn't recognize the use that
the Board has recommended as being acceptable,
therefore, we can't put it on the list and if it's not on the list, the producer can't use it.

So while we all recognize that it's probably perfectly acceptable, but even there we have to recognize that it's the people sitting here and throughout the world who would really render an opinion as to whether or not these materials are even acceptable to them, so -- I mean, we would still have to go through the rule-making process and there's no guarantee that they would even have made the list going through the rule-making process. I think Barbara's right. The only way is for those who have an interest in getting these materials onto our National List to approach the FDA to get a recognition that they can be used in livestock and until that is accomplished, we're kind of caught between a rock and a hard place for achieving that fully.

CHAIRPERSON KING: Rose and then Dave.

MS. KOENIG: Again, this would be -- you'd have to re-review the materials, but could we put them under the off-the-category of production aids and have a preventative kind of annotation so that it would be alluded to in terms of the annotation but in terms of preventative health rather than a specific prescribed use? And would that be considered by FDA to not fringe upon their area of regulation?
MR. NEAL: I'm not quite sure, Rose. I understand where you're going. We've thought about it already. Can we put this substance on a national list without it having any type of connotation or reference to livestock?

MS. KOENIG: Well livestock, yes, because it would go under the livestock list, but --

MR. NEAL: But that --

MS. KOENIG: But medicine is the question, huh?

MR. NEAL: But that's the issue, though.

MS. ROBINSON: No, you don't want to go under livestock.

MR. NEAL: That's the issue, because how else would you use kaolin pectin under livestock even without an annotation? FDA has actually looked at these materials for us and attempting to see, you know, how could these things fit for -- and make it work for us. Matter of fact, one guy who we spoke with actually worked with alternative medicines and he says based on FDA regulations, there's just no way we can list them on our list as -- for use in livestock without them having some type of approval because the normal use for these substances would be for use as a livestock medication.

MS. ROBINSON: Let me ask you a --
MS. KOENIG: I had one other question, too, before -- I know for -- there's a thing in the -- at least for pesticide labeling, IR-4 looks at minor uses of pesticides on crops that typically wouldn't be labeled for and there's a process by which you can get minor uses in addition to labels and it's to address these very problems because companies won't make that investment into minor crops. Is there an analogous program in FDA similar to IR-4 in --

MR. NEAL: I'm not sure.

MS. KOENIG: Okay. Because that -- there may be -- I don't know, but that's how they do it with pesticides when you have minor use categories for crops.

MS. ROBINSON: Can I -- let me pose a question. It's really to my staff, but one thing I don't know -- and there's risks with this, but Rose, you mentioned -- Arthur, you mentioned alternative medicines and I'm just wondering sort of aloud -- we can't settle this here today, obviously, but maybe we need to think about if there's a way that we could create a category in the list that is alternative -- that the actual category is alternative medicines that -- then you don't list on the list kaolin pectate [ph]. Now the risk, of course, is that somehow -- I mean, you don't want people out there using stuff that you don't know about or that
you wouldn't approve, but I'm just wondering if there are some -- if there's some other way that we could -- we want to do this legitimately and we want to do it through rule-making, but if there's a way that we could introduce a category that allows some of these things to be used; they're not specifically listed with an annotation, they are -- the -- what you would see in the Register is a category of alternative medicines.

MR. NEAL: The way that many of these substances will be listed will be without annotation. FDA has already looked at that. The one option that I would place forth would be not close the door on those six materials, but we need to move forward with the other ones that are already given the okay by FDA and continue, maybe, to work with FDA in terms of their placement on our National List, looking at other methods of listing them, working with the Board on that issue may be one way to explore. But I guess to sum it all up, we're planning to move forward with the recommended materials that are already blessed by FDA to be listed on our national list. Those six are the ones that we're having problems with, so we're going to move forward with those and we can work with the Board in terms of maybe developing some type of way to list them on a national list with agreement from FDA.
CHAIRPERSON KING: Okay, I had Dave and then Andrea.

MR. CARTER: Well, mine was similar to Rose's thoughts in that I know for example, in the bison industry, there's nothing that's really been tested or approved. Everything's off-label use, which you're allowed to do to save the life or health of an animal and if there couldn't be some sort of a parallel strategy.

MR. NEAL: Dave, that's actually the approach that we took. That's the exact approach that we took. Only problem with our approach is we've got to federalize everything. We've got to codify it. Bison industry does not have to codify; we do. So you know, that option has been explored, it has actually been the one that has been chosen; we've just got to work on how do we get these six resolved.

CHAIRPERSON KING: Andrea.

MS. CAROE: Is there a possibility of allowing over-the-counter drugs as a general category unless prohibited and create a negative list of over-the-counter drugs that are prohibited for organic use?

MR. NEAL: I think that may be an option we can talk about as we negotiate on these six materials, so my recommendation would be to write that down for us.
and let's discuss that throughout the course of the
meeting.

MR. MATHEWS: The one comment on that; if you
-- it sounds to me, Andrea, that what you're saying is
that you would create a line item within the livestock
provision, 603, that all synthetics that are over-the-
counter medications would be allowed unless you
prohibited them and I think that's really a
determination the Board's going to have to make because
there's going to be a whole lot of stuff there and the
question is will the public agree with such a
determination for all over-the-counter medications?

MR. NEAL: Also, like I said, these are over-
the-counter medications, four out of the six, and FDA
told us no to these, so we would still have an uphill
battle in terms of FDA granting us that permission.

CHAIRPERSON KING: George, do you have a
question?

MR. SIEMON: Yeah. So going to the question
you are bringing up, there -- I want to just repeat
about just a title like Production Aids. If you left
the word livestock off, then how would -- what would the
answer from FDA be? If you left off the word livestock,
just Production Aid?

MR. NEAL: Don't know, George. That's an
option that we can definitely explore. But it's going
to have to be in context with the entire National List.

MR. SIEMON: Yeah. And you -- it was said
that we have to rely on prescriptions now and I'm a
little confused about that. You're talking about new
drugs into the process, materials that -- approving new
materials that would be alternatives to these
alternatives and -- because they have to be on the
National List in order to be used, these prescribed
drugs, and they're not on the list now, so we're talking
about another two or three years out there and as a
farmer rep, you know, this is obviously a big issue.

MR. MATHEWS: That's precisely the issue, that
the fact that these can't be used, what Arthur was
saying is that you would have to find something that FDA
or -- yeah, that FDA recognizes as allowable to achieve
the same purpose that you were trying to achieve and if
that isn't already on the National List, George, you're
correct. It would have to petitioned and then approved
by the Board, then it would have to go through the rule-
making process to find out what the public would say
about it and then it may end up on the National List.

MR. SIEMON: And in the course that the real
obvious thing is this should threaten a whole lot of
materials that are already on the list. And what is
there -- we already have done this and what's their response to that and what's going to be the result of that?

MR. MATHEWS: Are you -- what do you mean it threatens materials on the list?

MR. SIEMON: Well, there's some materials in here already that would have -- would follow along the same way.

MR. MATHEWS: We haven't researched that to see if that is true. If it is true, then it clearly was an oversight by all the reviewers prior to creating this thing as a final rule, which -- including the FDA, because everybody had a crack at it, so the particular reviewer for FDA looked at it, may have missed it.

MR. SIEMON: Um-hum.

MR. MATHEWS: That then may mean, if what you're saying is true, then it could be a problem come 2007 when the material sunsets. That, however, is a hypothesis right now. We'd have to look and see what the true status is of those materials.

MR. SIEMON: Um-hum. So you know, this is just a long-standing thing with the alternative medicine, the FDA problem, so to me, you know -- and when some of the other guidance documents that came out there, it came out about developing a better
relationship, the FDA memorandum understanding, because this is not going to go away. Basically, this is -- all the alternatives that we've built this industry on in the long, long run if you were to go all the way down this line. So what's being done -- I mean, I heard a little defeatness [ph] in you all's presentation, which I know, it's frustrating, but what's being done to develop a real bigger, broader memorandum of understanding with the FDA and the USDA so that we don't fight little battles everyone along the way and we get to some bigger understanding here?

MR. NEAL: Well, this has been the first time that this has been identified, so at this junction, nothing has been done because we're just finding out that this is a problem.

MR. SIEMON: Um-hum.

MR. NEAL: So now we have to work towards finding out how do we make -- what the objective is for the National Organic program merging and having some synergy with what FDA is doing in terms of enforcing the use of animal drugs.

MR. MATHEWS: But Barbara, isn't that going to take some real ladder-climbing to get some kind of relationship between USDA and the FDA on this subject? I know it's -- there's tension always, anyway,
relatively. I kind of take exception to a word that
Arthur used that nothing has been done and I guess, from
the angle that he was discussing that's true, but in
reality a lot has been done. I sent Arthur to FDA to
work for FDA for 60 days. That has helped us to
understand how FDA operates. It has created contacts
for us in FDA.

Arthur, during that 60-day period, learned a
lot and made a lot of good contacts and it's these
contacts that have been enabling us to explore the
various avenues for solving the problems with these six
materials. It's not so much that you create an MOU
between a sister agency and yourself in order to
communicate. What we have done, and I can't emphasize
this enough, is that we have sent somebody to FDA to
work for two months; actually, it was more like three
months because it was 60 work days and not calendar
days. So -- I mean, we have made the in-roads. They
know who we are, they know what we're doing. We have
learned who can help us and who can't and so we've
already done that outreach to FDA. The problem is that
the answers that we want, we just can't get, okay?
We've made tremendous progress on all the other
materials that you wanted, it's just these six we have
just been unable to make it work. But there is a great

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
working relationship between FDA and the NOP.

MS. ROBINSON: Let me just follow up. George, you're correct. There needs to be a policy discussion and it really needs to take place above my level; it needs to take place with the administrator of FDA, the Commissioner or you know, one of the deputy commissioners and probably best -- at a minimum, the administrator of AMS, but more appropriately, I'd like to see it happen at the Under Secretary or the Secretary level. So you know, we're going to have to basically do some decision memo, briefing memo, explain the catastrophe that will be the outcome unless there is some fairly high-level policy discussion that takes place between FDA and USDA to figure out -- I mean, there's got to be a way to figure this out. There's got to be a way to come to something, the works, you know.

MR. SIEMON: Um-hum. First of all, I'm going to acknowledge -- I'm sure Arthur's laid the foundation for this development. That's probably the best step in the first place, to get in and see what the issues are. So would it be helpful, then, if we sent some directive this way to develop such a thing in the long run? Is that going to be -- help you get the attention of the people above you, Barbara?

MS. ROBINSON: It would never hurt.
MR. SIEMON: Okay.

MS. ROBINSON: We always welcome your communications and that will help us actually write the briefing memo, the info memo, whatever it is we need to do to go through channels to get the right folks sitting down at a table.

CHAIRPERSON KING: And so -- just -- I had a quick question, then Becky, then Jim. So concerning our discussion later today on the materials process, I mean, do you see this as something we can include in that in terms of trying to forward a recommendation from the Board that would help you --

MS. ROBINSON: Surely.

CHAIRPERSON KING: -- with your ongoing relations with other agencies and that sort?

MS. ROBINSON: Yeah.

CHAIRPERSON KING: Okay. Becky.

MS. CAROE: I just want to make two quick points. One was that I was intrigued by Andrea's proposal about -- allowing all over-the-counter drugs in organic agriculture, but I think it's an innovative idea but I wanted to point out that there are many antibiotics in our stats that are allowed over the counter and so we may create some more problems for ourselves if we take that route. Secondly, a suggestion

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
-- I don't think it's a panacea, but Congress has passed something called the Minor Use, Minor Species Bill which was signed by the president and it creates some expedited review procedures for certain types of drugs used in animal production and it might be worth pursuing with FDA getting organic agriculture considered a minor use. It might, at least in some cases, provide some avenues for drug indexing and drug approvals that are helpful to us.

MR. RIDDLE: And I just wanted to come back to a comment, I think, Barbara said about the impact on the sunset review because I'm looking at the 603 list and besides aspirin, I see glucose, electrolytes, hydrogen peroxide, magnesium sulphate and a number of similar-type products that are on our list and yeah, maybe it was an oversight by past Boards or past reviewers or FDA when they reviewed, but nobody caught it and I think maybe common sense ruled the day then and now it's gotten a little lost and now it's more kind of a regulatory mindset and I understand that evolution. But I think that this really does need to be a priority because if we can it ironed out before we face the sunset, then we're not going to have that additional fear hanging over us that some of these benign
substances that we want to encourage the use of, not
discourage the use of, would disappear because of a
technicality.

        MR. MATHEWS:  I would caution the Board about
assuming that hydrogen peroxide, glucose, aspirin would
not have been allowed, okay, if people had taken a
closer look because there are substance that you've
recommended that I think would still probably fit into
the same category that are going to make it.  So I'm not
-- I guess what I'm saying is don't automatically assume
that materials that are on the National List now are on
a par with those six that we're saying that we can't get
on, okay, because we don't know that.  We haven't taken
and looked at them specifically to determine whether or
not there is a current problem with the National List,
okay?  So I wouldn't make the assumption that we've
got --

        MS. ROBINSON:  Don't hit the panic button yet.

        MR. MATHEWS:  Yeah, don't -- yeah, don't hit
the panic button yet.  I mean, they may be perfectly
okay.  Just because you think they fit into the same
category --

        MR. NEAL:  Right.

        MR. MATHEWS:  -- doesn't mean that they're not
allowed, okay?
MR. NEAL: What Rick is saying --

Pepto-Bismol's an over-the-counter medication, but it's also approved as a medication through the new drug application process. So just because it's an over-the-drug -- over-the-counter medication does not mean that it's not approved as a drug.

MS. ROBINSON: You lost me on that one.

MR. MATHEWS: I think you lost me on that one, too. I -- but let's not try and beat this horse any longer. It's already on the ground. The bottom line is don't assume, please, that you've got a problem with the list because you've got a problem with these six materials. We welcome, Jim -- if you would, or the Board, would like to identify materials that you have questions on that we could then present the question to FDA. We can do that and we probably should in light of the sunset provisions.

MR. SIEMON: Sounds like don't ask --

[Simultaneous comments]

CHAIRPERSON KING: I think we got enough right now, Rick.

MR. MATHEWS: All right. Well then, stop sweating it.

CHAIRPERSON KING: Okay. Yeah, Rose.

MS. KOENIG: I would like a -- I don't if we
can make a motion, but I would like to -- because I'd like to get it down; there's two action items that I think, from the conversation as far as what we can do. I think we also, in -- at -- you know, in unison with the NOP should look at what Becky mentioned as far as legislation and again, I stress the I-R4 program because I think it's another example within the federal government where minor uses are allowed.

CHAIRPERSON KING: Um-hum.

MS. KOENIG: And someone needs to take that on as a task because if we can at least come up and do some of that research, also, I think those are the, kind of the pathways to showing models where such systems exist.

CHAIRPERSON KING: Would that someone be the Materials Chair? No, but seriously I mean, we need -- and livestocks involved, too, so --

MS. KOENIG: Okay.

CHAIRPERSON KING: As well as Handling, so I don't I know how you want to approach this, but I think it's a good idea. I did make note of both the I-R4 and the Minor Use, Minor Species Act, I think you called it, Becky. So is there further discussion on an action plan real quick while we're on the topic? Go ahead, Jim.

MR. RIDDLE: Yeah. Just the MOU, the whole resolution or some kind of recommendation from the Board
that this is a priority and to try and help support the need for moving this forward, you know, at whatever higher level. I think that was another thing that was discussed.

CHAIRPERSON KING: Um-hum.

MR. RIDDLE: And so maybe if these could be kind of made note of by Livestock Committee for a work plan.

MR. SIEMON: Isn't that a policy committee because it goes to the bigger -- the pet food and I mean a lot of different issues there. Isn't that -- and is there any way we can get that done this meeting?

CHAIRPERSON KING: I think the resolution or a recommendation just reinforcing the need to move these to whatever level it takes to get resolution is something we could draft in, you know, have 24 hours to consider and get it put forward at this meeting.

MS. ROBINSON: Can I make a suggestion? I've taken notes on four options that you have listed and what I would suggest is whomever does it, I would prefer that the Board take a crack at at least identifying the options and then we'll work with you to refine it, but the options are one, would it be possible -- and then this will give us something to actually sit down and have a discussion with FDA about. Is there a
possibility that we could create a category called
Alternative Medicines on the National List? And that --
you know, we can develop that option as, you know, under
there there would be guidance specifically from the
Board that would be posted on the web that says here are
the alternative medicines that, you know, blah, blah,
blah, that are -- that the Board recognizes for use.
Let's stay away from the word approval.

Second option was proposed by Andrea, the --
sort of the negative over-the-counter drug option. That
one, I think, the one problem -- and sort of look at
pros and cons of each of these. One problem you may
have with that option is OFPA. I just don't know how
that would fit with the language of OFPA.

The third option, suppose there is a category
of production aids with no reference to the specific use
of the material and fourth would be to explore, through
EPA's programs or through the recent action by Congress,
that organic could be considered in Minor Use category
and therefore get some relief from the labeling
approvals of regulatory agencies. And if we had those
four options with a -- you know, then we can develop
them, we can go back and forth with you and develop a
talking paper, basically. Then I think, you know, we've
got some things to just sit down and explore with --
first of all, with the senior policy officials at USDA and that always helps, then, when you want to have a
dialog with another agency. So that's my suggestion.

CHAIRPERSON KING: Other comments?

MR. SIEMON: Well, if we do do something around this MOU, I really think we should include NOP in
the drafting so it really serves your purpose if we do anything about that, so -- so I'm clear -- are we going
to try using -- about this? Jim, you were saying Livestock Committee; I'm not resistant to doing it, I just thought it was such an over-arching issue that it would be better for the Policy Committee to come up with such a recommendation.

CHAIRPERSON KING: Rose.

MS. KOENIG: What I hear from what Barbara's saying, I think that, you know -- again, I'm not going to second-guess how federal agencies work. I mean, I think a lot does get done if you can identify key individuals in agencies and get your work done that way. Developing an MOU for the long-term would perhaps be a great long-term plan, but I think to immediately fix the situation, our time is best spent kind of exploring these four areas and see where we can get in the short-term because they're easily researchable and we can present a working document. You know, if the Policy
Committee or the Livestock Committee wants to look at long-term, you know, this concept of MOU, I think that's going to take a considerable amount of time. There may be some possibilities, I think, but -- you know, it sounds like you've got contact in the FDA, let's work with those and identify these four items and get to work.

MS. ROBINSON: I don't -- I'm puzzled by this -- I keep hearing this MOU that you think we need with FDA and I'm puzzled, why do you think we need an MOU?

MR. SIEMON: I thought that's exactly what you told us in Chicago concerning the directives on the fish meal -- I mean, you know, fish meal, pet food. I thought -- you know, you -- I thought I that's -- I heard you say clearly there that until we have that, you have to make these determinations because you don't have an understanding with them on these different things.

MS. ROBINSON: Well, what occurred before the Final Rule was published was very long, protracted conversations and negotiations with FDA because they have the jurisdictional authority for food labeling and so USDA had to have those discussions with FDA in order to basically introduce an organic label for food products. Now -- I'm not questioning and I'm not criticizing when I hear you say MOU, I'm just saying I
don't know that we necessarily need an MOU to get the job done with FDA. What we need is a conversation and we need a conversation at policy official level so that those of us at the staff level, you know, have got the support to say all right, let's brainstorm this and figure out a way to solve this problem without compromising either FDA's regulatory authority or the needs of the organic industry.

And that's why I'm thinking that the, you know, a working paper with some suggestions that would serve as a basis to sit down and have a dialog would be the way to go. I mean, I -- you know, MOUs are fine and everything, but I'd rather just solve the problem and of course, we can -- we'll ask FDA, you know, do we need an MOU to have this kind of relationship or can we not just simply work together as sister agencies to try and you know, figure this out.

CHAIRPERSON KING: Dave.

MR. CARTER: Well, I think -- and I'm probably the person that has beat the drum the hardest with the use of the word MOU or the phrase MOU and the MOU, I mean, is just a catchword for the vehicle. It's not really the end-all. The point of the story is to get some equivalency and some compatibility between how USDA and FDA, you know, handle these, whether it's done
through an MOU or a secret handshake or you know, whatever. I don't care what the vehicle is, it's the point is to try to get the end result, to have some equivalency.

MS. ROBINSON: We need a password.

CHAIRPERSON KING: Owusu.

MR. BANDELE: Yeah, I think it's a good suggestion that Barbara made in terms of those options, however, with one exception. I don't really think that the -- allowing all over-the-counters except the ones listed is a viable solution to the problem. I think it's much too broad.

MS. ROBINSON: That's okay, that's okay. You can trash your own proposals. The idea is that you have all the proposals and then we say well, here's the advantage and the disadvantage of these and we can even say which are the strongest and you know, which are the weakest, which we would prefer and which are the least preferable. I take you point, Owusu, and I -- in fact, I think you may have the most problems with that one, but nevertheless, it is an option. It may be the straw man you set up and knock down, but it's an option to put on the table.

MR. MATHEWS: It's also an option that you list your pros and cons on and that you look at the
different options within that option and you may create restrictions on that option. I mean, for example, you've already allowed certain materials as a blanket unless otherwise prohibited, so you may be able to come up with even another version of -- Becky raises the issue that some of them have antibiotics, so all of them are okay except for those that contain antibiotics or those that contain something else or those that are used in this way. So I mean I wouldn't, as Barbara said, just totally drop it right out of hand right now because it is an option we can explore and then you look at your options within the option.

MS. ROBINSON: Right. I mean, over-the-counter drugs are also classified into categories, you know -- aids and what-not. I mean, I'm not a pharmaceutical expert except when I get my prescriptions, but I'm sure that there are categories of over-the-counter drugs that you could -- so Rick's right. Even though it may be your weakest option, it is -- there's possibilities that you could construct something that says, you know, all over-the-counter medicines are allowed except for nine out of the ten categories. So you've limited everything except the one you want.

CHAIRPERSON KING: Yeah. Jim -- but hold on
one second. I wanted to summarize this quickly and kind
of finish this up and make sure we take away an action
plan here. So it's my understanding, and correct me if
I'm wrong, we're going to consider these four categories
and Dave, I think if you agree to put this on the work
plan for policy development -- what's not clear to me is
are we going to try to accomplish this in the next
couple of days or is this an on-going work plan? It
sounds like some on-going work.

MR. RIDDLE: Yeah, and that's what I was going
to suggest is the Policy Committee take this on for
consideration by the Executive Committee, you know, in
order to keep it moving, keep the ball rolling and not
have to wait until the next Full Board meeting but that
it also, besides, you know, the four options that have
been mentioned, any other brainstorming that we can up
with, as well. But then with an introductory paragraph
stressing the need for the policy work at the highest
levels, as well; to have the support developed there
that builds on the support that Arthur did by that work,
but -- so yeah, I think we -- and we don't need a motion
on that. We already have agreement to put that on the
work plan.

MS. ROBINSON: Mark?

MR. RIDDLE: And -- yeah. Then I have another
question.

MS. ROBINSON: Can I -- well, let me make the
-- in the interest good collaboration, I'll take the
first crack. I will write the front end of the working
paper that lays out the issue associated with the
National List and the organic program as if we were
going to send this memo say, to the Secretary, you know,
saying what we need is a conversation with the
Commissioner of FDA or something like that and then lay
out the options. And then I'll send it to you and so
that you -- it's usually easier to add and I can crank
out something fairly quickly on the front end of it and
then you fill it on these options as much as you can.
We may have to break this thing down into a short memo
to the Secretary with an options paper behind it, but we
can do that.

CHAIRPERSON KING: Um-hum.

MS. ROBINSON: And I can get you something.
Unfortunately, I'm sort of -- well, actually, I can --
I'll do something over the next week or so while I'm at
home.

CHAIRPERSON KING: Great. Rose --

MS. KOENIG: I agree. I'll do the I-R4
research. I'll take that and within the same amount of
time and look into that.
CHAIRPERSON KING: Okay. Sounds good. All right.

MR. RIDDLE: Yeah. Then I had a question. We heard about the processing docket or processing materials and livestock; were there some crop materials, too, or what's the status of them?

MR. NEAL: Apologize. Those crops materials have been lumped into that processing docket. There are only, what, three? About three or four of them. So they've been lumped into that processing docket. I apologize for that oversight.

MR. MATHEWS: Yeah, the docket that is already in clearance channels contains everything except for the livestock materials. Everything that's outstanding, including what was brought up at last April's meeting.

MR. RIDDLE: But not the boiler additives of the activated charcoal or it does?

MR. MATHEWS: Everything.

MR. RIDDLE: Okay, great.

MR. MATHEWS: Everything.

CHAIRPERSON KING: All right. If there are no further questions, we'll move to the next agenda item which is discussion of the recommendations concerning compatibility, commercial availability and non-compliances, so if we want to take those in order, I
believe Barbara or excuse me, Catherine [ph] has been kind enough to make copies and they're in the yellow folder, so if you want to pull those out for the purposes of discussion and -- and I guess we're just hoping to have some dialog here with NOP to make sure we're sort of on the right page, that you feel these are useful documents. If so, why? And if not, how can we improve on them?

MS. ROBINSON: Can I beg the court's indulgence? Can I ask the Board can we flip-flop here for a minute? Can we go to the framework for collaboration and then come back to these? Would you mind? Because I can -- I can't address your -- I didn't read your -- I'm sorry, I didn't do my homework on these. And I --

CHAIRPERSON KING: We appreciate your honesty. Does anyone have a problem jumping ahead and then coming back?

MS. ROBINSON: And I think that we have had -- the staff has been working on the issues in the yellow folder.

CHAIRPERSON KING: Yeah, Rose.

MS. KOENIG: I just wanted to state what -- you know, again, this is my opinion, but as far as the compatibility with the system of sustainable
agriculture, because that's one of our criteria that we look at materials --

   CHAIRPERSON KING: Um-hum.

   MS. KOENIG: -- I think that we can go ahead, as a Board, if this -- if we've already adopted it --

   CHAIRPERSON KING: Um-hum.

   MS. KOENIG: -- just incorporate that into our materials process because it clearly addresses an area where we have authority.

   MS. ROBINSON: That's true. That is your -- that's your purview. That's your decision, that is your opportunity to put your imprimatur on the materials approval process and we really -- unless I was to hear something that I haven't heard yet, we don't expect to contradict your definition of what is compatible with the system of organic production and processing.

   MS. KOENIG: So I really just think the work plan on that is as we go through this materials process to make sure that that goes into the new -- you know, if we're going to put out a new petition notice, that that gets incorporated under that criteria, but we've approved of that.

   CHAIRPERSON KING: Right.

   MS. KOENIG: I don't think we need NOP approval on that area.

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
CHAIRPERSON KING: Well, we actually reviewed, voted on and approved this at the April meeting, so if NOP doesn't have a problem with this being part of that process, we --

MS. ROBINSON: We may have a few comments and questions for clarification, but like I said, the decision process, the authority to determine compatibility with the system of sustainable and organic production is the Board's authority. Now, actually --

CHAIRPERSON KING: Okay.

MS. ROBINSON: -- Rick tells me that he's willing to -- he has done his homework and so we don't have to interrupt the agenda and he'll address the minor non-compliance.

CHAIRPERSON KING: Sounds good.

MR. RIDDLE: And just on the compatibility, I wanted to point out that it now is incorporated in the Board policy manual, as well, but it does need to, you know, go to TAP [ph] contractors, reviewers, so that they understand our understanding of compatibility as well as petitioners.

CHAIRPERSON KING: Kim.

MS. DIETZ: And then we have been using this document when we have the material review criteria, so we just incorporate in as this document is how we define
compatibility.

MS. ROBINSON: The only -- we don't have any problem with the TAP contractors having a list of what you define to be compatible measures --

MR. RIDDLE: Um-hum.

MS. ROBINSON: -- but we again remind the Board that is your determination to make.

MR. RIDDLE: Right.

MS. ROBINSON: That is not up to a TAP reviewer to tell you whether a material is compatible with sustainable agriculture. You must determine. But we -- my understanding is that you wanted the TAP contractors to have that to understand what it is you're looking for. Just so we're clear about this. It's your decision, not theirs.

MR. RIDDLE: Right.

MS. ROBINSON: Okay.

MR. MATHEWS: Now on the Minor Non-Compliances document, I still have reservations on that document. I've had reservations of that document since draft one and I think it went through like eight different drafts? The -- one of the things that we have done within the NOP is we have hired Mark Bradley to come in and work with us and he is our accreditation manager. He's working closely with the ARC [ph] branch; he's working
closely with me on a number of issues and the issue of 
minor versus major non-compliance is an area of 
responsibility that has been given to Mark for 
developing guidance within our operating manual. Mark 
is the one that is trying to get that manual through. 
He will be working on that very issue. We will take all 
of the recommendations in this document that we're 
discussing right now into consideration.

Again, though, I remind everyone that every 
minor at some point becomes a major and so we have to 
make sure that that is fully acknowledged. There are 
certain things that are in the Act and in the 
regulations that will constitute majors. We need to 
make that clear for certifying agents. We also have to 
make, as I -- and I'm going to repeat myself. We have 
to make clear that minors do become majors. Let me give 
you an example and maybe you won't agree that it's a 
minor, but let's just give it in example, okay?

We had a case -- and this person has been 
revoked, by the way, by the USDA. The person did some 
physical alterations. The certifying agent told him 
you're not allowed to do physical alterations. They got 
a signed statement from the person saying they would 
ever do another physical alteration. So they looked at 
the physical alteration as being minor because they
could correct the problem for future and that it didn't
in any way impair the organic nature of what it was
that, you know, the meat or milk or whatever else
products are coming from that animal. So they
classified that as a minor. The guy signed off on a
document saying I shall never do this again. Well, he
did. So the USDA looked at that as a major. He had
been told not to do it, he acknowledged the fact that he
wouldn't do it again, he did do it; it became one of the
two counts against this person for revocation. So it
was elevated quite rapidly once it became a willful,
okay.

So there's a -- there's probably hundreds of
elements like that, so we are being very cautious when
it comes to this idea of laying out minor/major. I
mean, it's a no-brainer if you're using a prohibited
substance, it's major. It becomes a question of whether
or not it was willful or not, but you will always have
to put your land through a new three-year transition
even if the land was contaminated at the hands of
somebody that you employed to do that. So -- I mean,
that is always going to be a major. Because there's
only one way to fix the problem and that's a new three-
year transition for the acreage.

So these are the kinds of issues that Mark is
going to be working on. We appreciate what the Board
has done in putting this together, especially you, Jim,
and we acknowledge that it is a problem area but we have
to be very cautious as we move forward so that minor
non-compliances that should it, at some point, become
major, don't end up into perpetuity.

MR. RIDDLE: Um-hum.

MR. MATHEWS: Okay?

CHAIRPERSON KING: Okay. Thanks, Rick. Rick,
do you want to continue with Commercial Availability
Task Force report or shall we move on to --

MR. MATHEWS: We need some more time on that
one. We're not prepared --

CHAIRPERSON KING: That's fine.

MR. MATHEWS: -- to address that at this
meeting.

CHAIRPERSON KING: That's fine.

MR. MATHEWS: It's a complex issue.

CHAIRPERSON KING: Yeah, okay. I understand.

Well, we're actually a bit ahead of schedule for -- I
think for the first time.

MR. MATHEWS: Well, you can't help that.

CHAIRPERSON KING: I'm not sure what to do.

MR. MATHEWS: Well, you do want to talk
framework, right?
CHAIRPERSON KING: We do want to talk framework.

MR. MATHEWS: Yeah. Okay, well that's the next item.

CHAIRPERSON KING: And we don't have a break scheduled until 10:00 so let's go ahead and --

MS. ROBINSON: Well, let's go ahead. All right. I'll edit -- I'm going to address my remarks to the folks in the room as well as the Board. As many of you know, as most of you know, we issued statements earlier this April that obviously caused a lot of consternation in the organic industry and as a result, we had a meeting on June 9 in Washington, D.C. The members of -- members of the Board attended that meeting. I believe it was the members of the Policy Development Committee.

In addition, OTA was at that meeting; Michael Sligh was at the meeting and Kathleen Merigan [ph] was at the meeting representing the organic industry; A.J. Yates, the administrator of AMS; Kim Clayton, the associate administrator; myself were there from the Department and the Secretary did stop in very briefly on her way to another meeting, but at that meeting the Board as well as the other folks in the room made it abundantly clear that a more collaborative
relationship was needed in order for our relationship to continue to coexist. I think we heard a number of times during that meeting that we'd all rather not get divorced but we were all in dire need of counseling at that point.

And since that meeting -- and we developed some takeaways and among those was we expressly asked and the Board committed to going back and developing feedback on the issue papers that we had posted. We'll discuss those at this meeting. I do want to say briefly, at this point, my compliments to the Board on the feedback that you did develop. It's excellent and we appreciate it very much. But in any event, we decided, we committed at that meeting to have a more collaborative relationship and we believe that since June 9 that's exactly what we have done. I don't think that the program has taken an issue without having a discussion with the Board.

Now, formal actions on issues, because of this collaboration are -- will have to take place in an open public meeting. I don't think you, the public, want us to just pick up the phone, talk to the Board and make -- get the Board's input and make decisions without going through the public meeting process and so -- and there's actually two rounds of that. One is the public meeting.
that you're sitting in right now and the second is when
recommendations are proposed and they require rule-
making, we go through a second iteration of public
involvement.

So let me give you an example -- not an
example, let me give you a list of the issues that we've
worked on since June 9 that we have collaborated with
the Board on and this is how we intend to operate in the
future. We sent a letter to OMRI agreeing to provide a
review of the OMRI Generic Materials List. OMRI asked
NOP in Chicago if we would consider doing that so that
we can make sure that the OMRI list of generic materials
and the National List of Materials are in sync and that
there are not any inconsistencies. We agreed. We
drafted a letter; we sent the letter to the Board prior
to -- to get their input, which they did provide and
then that letter was -- it should be posted on our
website. We also sent it to all the certifying agents,
as well.

A statement of work was drafted to explain the
expectations of contractors who want to perform
technical advisory panel reviews on materials petition
for inclusion on the National List. We'll provide the
Board with copies of that statement of work. But we did
give the Board the copy of the statement of work prior
to sending it to Minneapolis and sending it out for TAP reviewers to apply. Actually, in that case, I'll be honest with you. We found out after we sent it to you that we weren't supposed to because it puts you into -- puts you in the potential position of, you know, influencing the contractual process. Nevertheless, we did it. I was told I created a criminal act in the Department and I forget what law it was I broke, but I had to go upstairs and get yelled at.

Petition procedures and petitions. We -- our procedures have been discussed with the Board for your input and approval. All petitions will now be forwarded to the Board prior to submission for TAP reviews. A compliance question that was submitted to us regarding the organic status of seedlings and transplants, prior to us answering the question of the certifying agent, we posed the question, the generic question to the Board and got their feedback and then we answered the certifying agent's question.

Sunset of the National List, as you know, we've been iteratively back and forth on that. We will continue to do that, taking the Board's feedback.

Discussions on naturals versus synthetic materials. I don't know that we could necessarily say we've had this, you know, all-in-caps heading, a discussion of naturals
versus synthetics, but materials have arisen and we --
and has caused us to contact the Board and what the
issue boils down to is how do we define a material as
natural versus synthetic? And so we have been having
those sorts of conversations and hopefully, we'll get
some guidelines that we can all agree on that are useful
for resolving these determinations in the future because
they do pose problems when materials are petitioned for
the National List.

So we intend to continue this collaborative
engagement. As I said, in many cases the file
resolution of the collaborative efforts require that a
public meeting will have to take place, you know, that
will slow us down but it will assure that the Board is
engaged with the Department and that your advisory role
to the Department is recognized. So I figured that just
giving you an action plan telling you what we've done
and this is how we intend to continue to operate.

Now, some other things, you know, that are on
the agenda for discussion later; you asked for a review
of the Board Policy Manual and I did that. The staff
isn't to be blamed for that, but I do have a policy
manual for you, I just haven't made all the copies yet,
but I'm happy to go over edits with you on that. As I
said, you've provided considerable to the Department on

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
the issue papers; on fishmeal, on antibiotics and on
scope [ph] that we think we're going to be able to have
a really good conversation with you on and discuss where
to go from here based on your input.

And I know that there are, you know, several
other things. I don't know, do you want me to --
they're on the agenda for after the break so do you want
me to just wait and we'll just take them up then, but --

CHAIRPERSON KING: Well --

MS. ROBINSON: But I wanted you to know that,
I guess, our interpretation of the framework of
collaboration is do it, not just write you papers about
it, do it. And so we think that since June 9 we've done
it.

CHAIRPERSON KING: Well, I have one quick
comment and then Dave, then Jim. And I just wanted to
thank, you know, the staff for the last few months when
I've picked the phone up and called, I mean, you've been
there, been available or returned my call very quickly
and I know that you work very hard on a lot of these
issues and we appreciate that. And so it's been nice to
know that something did become, you know, productive for
all of us involved in the June 9 meeting and that
ongoing, I think you're right, Barbara. It's more of a
how do we do things not how do we send a "report card"
but at the end of the day we all need to know, you included, of course, that you know, that we've accomplished something and that we've moved this industry forward in a positive fashion including public input, including stakeholder interest, including you know, advisement from the NOP and the Board. So thank you for that. And Dave, did you -- okay, I was just trying to wake you up. Just kidding. Jim, I know, has a comment and George.

MR. RIDDLE: Yeah, I really appreciate the collaboration in reality as you described and I think the atmosphere has definitely more conducive to that and I look forward to building on that and it's quite encouraging to hear your comments about the drafts that we have on the table on the issue papers, as well. One comment, I -- and I've been traveling and I may have missed a discussion of the planting stock, that letter about the onion, you know, onion plants. I just thought at the end of the day -- I didn't know the Board had a, you know, consultation on that.

But I guess the question I have is about, you know, at that June 9 meeting we did present a framework document that built on your decision-making procedures and tried to, you know, build in some feedback loops for you to consider, you know, probably in your program.
manual that you reference there so that would be some
predictability, some, you know, and staff changes, Board
members change but policies, you know, stand until
intentionally changed and I'm just wondering what your
reaction is to the document that we presented there and
if that has any legs, if we can continue to move that
forward so that there's something that lives beyond us,
in a way. I mean, you know --

MS. ROBINSON: Well, let me be honest with
you, Jim. I -- well, I said I'll be honest. I don't
like the document because I thought if put in place,
rigid sort of loops -- it implied and maybe it was just
the way that it was written, that every time an issue
comes up -- even though we -- this is exactly what we're
doing, we're collaborating with you, we're coming to you
with the issues. The way that it came across to me was
that we had to get your approval, you know, to do work
and while I'm not adverse to having something written
that says that we, you know, commit to a consultative
and collaborative role --

MR. RIDDLE: Um-hum.

MS. ROBINSON: -- the detail in that document
didn't -- it just didn't punch my buttons. I would much
rather -- and when we discuss the staff director
position, I think it will become more evident that how
that consultative role is manifested because it will be part of the staff director's duties to provide that link.

   MR. RIDDLE: Um-hum.

   MS. ROBINSON: And in reality, Jim, as you know, as we all know -- I mean, surely you're not going to suggest that you're the least bit worried that we'd put something up on the web without talking to you. I mean, I think it's been demonstrated quite clearly that the checks and balances are in place --

   MR. RIDDLE: Uh-huh.

   MS. ROBINSON: -- and you know, so I don't see that -- you know, if you're concerned -- if what I'm hearing is gee, how do we trust you, how do we keep you from doing this again, I mean, I think you're on public record and I think you've demonstrated that, you know, ignoring the Board or ignoring the input or failing to get the input prior to taking significant actions, we would be doing at our own peril. Now, that is not to say that we will always agree with you, nor do we have to. And I think you agree with that statement, you know. What we're after is consensus, what we're after is a productive relationship that spurs this industry forward, that keeps it growing and maintains its integrity. So we heard you and you know, do we need...
something -- if having something on paper is going to make you feel better, maybe there's a place in the policy manual to do it, but I just -- the specificity in that framework paper just didn't do anything for me. Sorry.

CHAIRPERSON KING: Dave then Kim.

MR. CARTER: Barbara, I appreciate that. I don't know that we, you know, the level of specificity, I can completely appreciate your concern there. I think what we were trying to bring forward, though, with that whole process was somehow how to quantify and establish a procedure that we could use. And I think perhaps some of the specificity in there was in trying to utilize the decision tree process and those types of things that the program had brought to the Board previously in how to make decisions and as a first step of that. And how do we, you know, how do we integrate our decision-making process or how do we integrate our communication with the program as a part of the decision tree process that the program has said that it would like to use already. So I think that's where some of that got in.

Now, I would prefer, at the end of the day, to see a document that is very brief and gives some guidelines and some flexibility on that, but I do think it is helpful to have some sort of a written procedure.
CHAIRPERSON KING: Kim.

MR. CARTER: I think Barbara's --

MS. ROBINSON: I appreciate that, Dave, and I -- what I guess I'd rather see, if I -- and I'm just sort of brainstorming here by myself, but -- so it should be short, right, but I -- what I'd rather see is, you know, let's divide it into sort of the major activities or products like okay, what are we -- how are we going to handle things that arise on materials; how are we going to handle compliance issues; how are we going to handle, you know, standards, development issues, those sorts of things? I'd rather approach it from that way because then there will be some questions that arise that basically we need -- we almost need to just kind of like to be able to alert the Board quickly, you know, this is happening.

I mean, I can't off the top of my head think of an issue, but suppose there was one. Now, do I want to take a week to develop a decision tree and tell you, you know, the dire consequences that will happen if we don't answer this question today, da-da, da-da, da-da. I want to be able to get to you, say this is an issue, here's where we believe we need to go but you need to know about this. You need the heads up and you know, and tell us right now if there's something we don't know.
about this issue. I want a mechanism that allows us the
most flexibility that we can have and still have a
productive relationship.

CHAIRPERSON KING: Kim.

MS. DIETZ: I think you have a very talented
group of people up here that are good at writing
policies and procedures so we could certainly come up
with something that's going to achieve our goals. I
also want to remind everybody that at one point we had a
mission statement and we sat down as a group in a
working session for a few days and came up with mission
statement, that we revisit that mission statement and
perhaps somewhere in there we can put some new language
with this collaboration and it's short and concise and
that's between the Board and the NOP, so we should go
back and visit that.

CHAIRPERSON KING: Rose.

MS. KOENIG: I just wanted to mention to the
Board and it's something I talked to some individuals
about that no matter what, you know, you can write down
-- I sort of with Barbara in a lot of ways. You know,
you can have great plans but you still -- you know, the
bottom line is do you follow through with them. And I
think one of our issues that we need to struggle with is
we need to figure out in the next few years -- we're
going to have a big transition off of this Board and our
-- we need to orient new members so that they understand
these linkages and the relationships that are there or
no matter what we write down, there's going to be a non-
functioning relationship, so somehow as we bring on
these new members and then the following year, as the
next group comes in, people not only have to understand
what their role is but how this collaboration works so
that they can get to work and make sure the system
works. So that's something that we need to work with
NOP in figuring out how do we get oriented, you know,
how do new members get oriented to the system so that
they don't lose year, you know, of non-productivity.

CHAIRPERSON KING: I do recall at the June 9
meeting that one of the commenters said, you know, if
everything were running smoothly we wouldn't be having
this meeting and I think that's true and in large part
since that time, things have been pretty smooth and I do
understand the concern of Board members and people in
the industry who would want something in writing, not
necessarily that's incredibly rigid and says, you know,
you must call before you make a cup of coffee kind of
thing, but so that there is some sort of institutional
memory here and a foundation for ongoing relationships
that really are beyond us and beyond you, should you
choose another endeavor. But I recognize what you're saying, Barbara, that there does need to be some flexibility and you have to be able to call upon the Board as needed and not feel like there's a policy and a procedure for, you know, rearranging your desk before you do so, so --

MS. ROBINSON: Well, I'm more than willing to go back and take the framework for collaboration that you did draft and you know, see what -- respond to it in writing, kind of edit it, see if I can up with something that's a -- you know. I mean, let's just negotiate the framework of collaboration, the words. We'll go back and forth with that. That's not a problem. If that is what you -- if having something in writing, you know, really matters and that helps you, then that's what we'll do.

CHAIRPERSON KING: And I guess -- if I could just follow up on that -- I don't know necessarily that "it must be a document." It could be part of our Board policy manual and your standard operating procedures.

MS. ROBINSON: Sure.

CHAIRPERSON KING: I mean, if that accomplishes that, then I think that would be fine, so I don't think we're no -- necessarily married to the document format, but I think what we're saying here is
that we do want to know, ongoing, that the relationships will -- and you know, the policies and procedures will be there to make sure that we have good outcomes.

MS. ROBINSON: Kind of like an MOU.

CHAIRPERSON KING: The acronym for the meeting, right? Jim then Rosie.

MS. KOENIG: And again, I think it's very important -- I don't --

CHAIRPERSON KING: Rose then Jim.

MR. RIDDLE: Okay.

MS. KOENIG: Okay. Sorry, Jim. But you know, I don't -- I think the Board needs to take some responsibility because it is, in fact, a collaboration and we need to write job descriptions, you know, for the -- you know, if you're a Materials Committee chair, what are your roles, you know, so that when new people come in and they're stepping into a position they understand what their responsibilities are when they take that and then who the contact person is and also, you know, maybe some general -- we know -- I think through our experience on the Board, as we're leaving, you know, we know probably more effective ways of getting the job done in terms of, you know -- because I know what Arthur's been saying and I think it's true and when we have these conference calls we need to get a piece of
paper so that, you know, or the agenda or whatever, so I think that's part of that collaboration is what our responsibilities are, to fulfill that as well as the NOP's responsibilities.

CHAIRPERSON KING: Rose, I mean Jim.

MR. RIDDLE: Thanks, Rick. Yeah, I totally agree that as it's most important how we live, not what we say or what we write down, but -- and in our Board policy manual, we do still have the vision statement, admission statement and committee descriptions there already and we need to make sure that those are always up-to-date and build on those because those do carry on from Board to Board, but I -- in Barbara's kind of hierarchy approach of different, you know, types of issues, I really like that.

I think that is more tangible than the document that we put on the table and so if you're going to go back, don't, as far as I'm concerned, feel constrained to edit this, you know. Throw it out. Come up with something that works for you and let us respond to how it might work for us. But what we need is some kind of framework and like Dave said, it doesn't have to be long, doesn't have to be detailed, it shouldn't constrict you from conducting business, but it should also ensure that we're used to extent, a maximum, you
know, extent possible to really fulfill our mission
under OFPA, you know, advising the --

  MS. ROBINSON:  When I give you the edited
policy manual, I -- one of my suggestions was that you
break it into policy and procedures and so you would
have a section in the manual that is devoted to
procedures and this might be a perfect place to put
something like that, is the procedures that -- kind of
the rules of engagement between NOP and NOSB, something
like that.

  CHAIRPERSON KING:  Goldie.

  MS. CAUGHLAN:  Thank you. I've been trying to
figure out how I wanted to frame this, because certainly
we are pleased that we've been able to improve as
between the Board and NOP in understanding and a working
relationship and I think that that is good and that it
will continue to move forward. But I wanted to just, as
a consumer rep, particularly point to the fact that I
think a great deal that might be taken, particularly, to
NOP is that we're doing a lot of talking up here about
the relationship that -- as between the working
relationship between the Board, per se, and the program.
I think the public, the consumers, the other
stakeholders; I think it's very important and I feel
like I just want to state this for the record and to
NOP, that a great deal of the fallout that has come not
only at the April meeting, but at previous meetings has
resulted from the public feeling as though they are not
heard.

And I think when we have public meetings it
certainly isn't a good feeling that people have when
members of the NOP staff are not in the room when the
public is giving testimony. And that was the case
during much of the April meeting and much of the
feedback that I have read and heard has had to do with
this sense of being dist, that when you speak to
someone, particularly when you speak to what it feels
like this large and is, this huge entity of USDA or of
any agency. It's extremely important that the
representatives of that agency be present in a non-
defensive, listening mode.

And I know that you have taken very, very
seriously public testimony. I do not question that, but
I think it is very important that -- to keep in mind as
we move forward in this new spirit of collaboration that
the public testimony that we'll be hearing again this
time and the public who comes to these meetings, travels
at great expense, gives their time, their energy;
there's been a real frustration. And I would hope that
we can work on that specifically and have members of the

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
staff be present both in fact and in spirit listening to public testimony, non-defensively, in a sense of moving forward. Because yes, I do believe that we all have the best interests of keeping organic organic as we go forward. Thank you.

MS. ROBINSON: Thanks, Goldie, and we fully accept those remarks.

CHAIRPERSON KING: Thank you, Goldie. Well, we have a break scheduled for 10:00. If everyone's okay with that, we'll be back here by 10:15, please.

***

[Off the record]

[On the record]

***

CHAIRPERSON KING: Rick, are you prepared to represent everyone at the federal level at this point?

MR. MATHEWS: Authorized to.

CHAIRPERSON KING: Well, yes. We want to continue our discussion with NOP ongoing, but we'll give a chance to round them up. There's Barbara, so good job, Rick.

***

[Off the record]

[On the record]

***

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
CHAIRPERSON KING: Well, I'd like to get started again and continue our discussion with NOP and the next item up is a discussion of an executive director position. Jim has informed me, has asked a couple questions at break and he wanted to make a couple quick points first.

MR. RIDDLE: Yeah, first someone asked me about the public comment period this afternoon and there -- on our agenda, there's a list of some kind of suggested topics that the Board and NOP was seeking comments on and -- but people are not limited to those topics. As always, it's an open public comment we can't control and we don't want to. We like new ideas and so we just wanted to clarify that, it's not limited to just that list.

And then also, there was a question about on this docket that is at OGC, hopefully for the final round of review and approval, that that does contain, like Rick said, all of the materials the Board has recommended, including the livestock materials because we got, you know, bogged down in the whole discussion back and forth, FDA and the status of those. Those are included on that docket and there will -- even the six that are currently problematic, they will be described in the docket, as well, is my understanding.
MR. MATHEWS: There are two dockets; one is livestock materials only. Everything that the Board has made a recommendation on that has not been previously acted on with the two amendments that were done last fall, all of those livestock materials will be at least mentioned in this docket, okay? And I say "at least mentioned" because the six that we're not able to put onto the list obviously won't be proposed for addition. The other docket takes everything except for the livestock material. So there's two dockets. Once they're both done, everything the Board has acted on will be taken care of, including the material from last April.

CHAIRPERSON KING: Thank you, Rick. George, go ahead.

MR. SIEMON: Yeah, I stepped out of the room when we did the compatibility -- did I miss the commercially available conversation, as well?

CHAIRPERSON KING: No, they're going to comment at a later date on that, so you didn't miss anything there.

MR. SIEMON: Are we going to talk about it in this meeting here or not? These next few days?

CHAIRPERSON KING: It was my understanding that NOP had requested additional time to comment --
MR. SIEMON: Okay.

CHAIRPERSON KING: -- in the future at some point.

MR. SIEMON: All right. I'm sorry. I missed that conversation. Thank you.

CHAIRPERSON KING: Okay. Okay, if there's no further discussion on materials, or a quick review, we just wanted to briefly talk about -- you know, some have called this position executive director, others have said it's somebody who will act as a liaison to the Board, so I don't want to, you know, limit it just to that title, but we did want to discuss ongoing how we could perhaps have an individual that would assist the Board in their efforts.

MS. ROBINSON: Okay. I'm very happy to report to you on that. A little background. As you know, you are created -- although you are created in statute, you are subject to the Federal Advisory Committee Act. And therefore, spending for this Board, for its activities, comes under what's called a FACA, FACA's the abbreviation of the Federal Advisory Committee Act. It comes under a FACA allowance that is -- this is going to sound a little weird, Congress both puts one foot on the brakes and one foot on the gas.

The Department of Agriculture, as every
federal agency, is given an allowance by the Congress as to how much money in total the federal agency can spend on any advisory committees that it forms. In the past, our allowance to spend on the NOSB has been $90,000 and that has been sufficient to cover the expenditures associated with the activities of the Board. Even though Congress increased our appropriation last year and the report language urged the Secretary to authorize the hiring of the staff director, we still had to -- because that would be charged to the FACA allowance, we had to go back and ask the Department for permission to increase the spending within our own budget and charge that to NOSB activities. We went to the Office of General Counsel and asked if the staff director or the executive director, whatever you call it, had to be considered within the FACA allowance and the answer came back absolutely.

So we petitioned the Department, the Under Secretary for Administration of the Department, and we asked the Secretary, herself, to approve -- it's at her discretion -- to approve an increase in our ability to spend money to hire a staff director. What I was told last week, unofficially, is the answer is yes, we may now increase our allowance by $100,000 so -- in order to hire a staff director. Now, that's -- I say that's...
unofficial. Congress has not yet acted on an appropriations bill for the Department of Agriculture. We're under a continuing resolution by law until November -- I don't know what date it is. It's early in November. I am limited to obligating something less than 14 percent of our budget.

Now, we are assuming, and we believe it's a safe assumption, that Congress is going to cut our budget this year. We'll get the same budget for NOP that we received last year. Therefore, there are sufficient funds to hire a staff director. So with that background -- I mean, that's kind of a long answer to get to -- the answer to the question is yes, we will hire a staff director for the NOSB. Now, that's the good news. The staff director must be a federal employee, so -- I'm going to say this and before you all get upset with me, just let me keep going a little bit.

The bad news is as a federal employee, they must be supervised by a federal employee, okay? They cannot work at the direction of the Board. Now, I know that doesn't sound good, but hang on a second. We want a staff director -- excuse me -- to fulfill the Board's expectations. This staff director, the duties and the responsibilities of this staff member will be to work with the Board. Now, we have your draft position.
description that you sent to us. We also have a
position description for a Board specialist, the staff
director, if you will. What we need to do now is go to
Human Resources, that's our personnel folks, and they
draft up the actual position announcement.

It's our intention to request a 30-day -- we
could go less, but we believe that we need to go 30-day
announcement. All sources at the GS-9, 11, 12 pay
grade. That means that, you know, you might get someone
who comes in and you know, they're just a shining star,
but their qualifications or their education says they
can only start at a Grade 9 or a Grade 11, but they've
got promotion potential up to -- the 9, 11, 12 means
that they can -- if they qualify, they can come in at a
12, but they -- if they only qualify at a 9, they can
come in and they get promotion potential up to a Grade
12. So that's what we're going to do.

Now, the -- I thought about this because I
know you're going to want -- you know, as an advisory
commitee, I can't -- you can't select the person, okay?
The most likely consequence of that will be some sort of
discrimination complaint or some -- believe me, we'll
have problems. We have to go through USDA's personnel
selection process. So what I want to ask the personnel
folks is if there is a way -- if I can ask applicants to
submit short biographies, things that I can give you by way of introduction of the candidates.

I'm also going to ask if there's a way, you know -- very often if I was interviewing someone on my staff or someone to be a member of my staff in one of my program areas, after I interview them, it wouldn't be unusual at all for me to say I want you to come and meet the rest of the staff and you know, then get the staff feedback on the candidate just, you know, because it's good information. You may find out the chemistry isn't there or you know, what I see, they may not see; that sort of thing. So I -- I also want to ask the personnel folks how can I -- once I get a list of candidates, how can we facilitate some sort of -- I don't even know what to call it, but informal introduction or interview with you.

This person is going to have to work closely with the Board, so it makes sense, from my point of view, that you -- even though you can't select the individual, that you say -- you may meet a candidate and you're totally turned off by him. I mean, I -- what's the point of us hiring somebody that, you know -- it just doesn't work. But I haven't asked personnel those questions. I will. And what we will -- it also means the individual that is hired, you won't do their

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
performance evaluation, okay, but your feedback to us
will critically influence the performance evaluation of
the individual. So we will do that.

    I anticipate, given the way our personnel
procedures are, although they are trying very hard to
streamline their process, I can tell you there's not a
manager in USDA that isn't frustrated with the personnel
services that we get, but nevertheless, I'm hopeful that
we'll have something out and announced this fall and
then it will take a 30-day announcement period. Then
typically, the process is you give the mail a little
time to clear, although we will try to do this as much
electronically as possible. And once the announcement
is ready, of course, we will notify you. We do
typically -- it goes up on the USA jobs listing, but
we'll definitely notify the Board, because you know
people out there that you may wish to encourage to apply
for this position. So that's where we're going with it.

    CHAIRPERSON KING: If I could suggest perhaps
a test of character would be to provide them with every
TAP review to date and see what the reaction is in the
interview process, but --

    MS. ROBINSON: You do want candidates, don't
you?

    CHAIRPERSON KING: Yeah, exactly. For those
who are not savvy to the whole government format of
employee, can you explain the 9, 11, 12 thing a little
bit?

MS. ROBINSON: Sure. Typically, you know,
when you advertise this will be a -- the category is
called a marketing specialist. We may actually have a
position in the books that's called an advisory board
specialist and if we do, that's what will be used. But
personnel will tell you that certain jobs, there are
limits to the grades. 9, 11, 12 is your salary,
basically. A 9 is -- I don't know, I believe it starts
somewhere in the low 40's. My guess is a GS-12 is -- I
don't -- I have the numbers right in front of me, but
it's low 60's, maybe.

As a federal employee, of course, the
individual will receive all the benefits that a full-
time federal employee would get, so we estimate that at
a GS-12 level, the cost to hire a staff director is
approximately $100,000 and that's what we asked the
Department to spend. So very often, you know, if you
come into the Department, you've applied for a position
and let's say you have a bachelor's degree, you don't
have a graduate degree, but you have a B.S. or a B.A. in
some field and -- or you have the equivalent in terms of
work experience that the government says is equivalent
to a B.S., you may only qualify at a 9, okay? We just can't get you the 11.

You work for a year, provided your performance is fully satisfactory or better and your performance evaluations reflect that, you can be promoted immediately to a Grade 11. And then, again, you could be promoted within one year to a Grade 12. After that, then of course, in the federal system there are 10 steps associated with each grade.

You start at 1 -- the first three years with a fully satisfactory performance evaluation, you get what we call a within grade increase, which means -- so first three years you can go 12 Step 1, then Step 2, then Step 3. Then the government makes you wait 104 weeks to get your next within grade. And then you get up to Step 7 and then the government makes you wait, I think, three years to get your next step increase, so we try to make it as, you know, complicated and you know, non-motivating as possible, I guess, from what I hear from a number of people that -- does that answer your question, Mark?

CHAIRPERSON KING: Well, sure. And maybe even more than I wanted to know, but --

MS. ROBINSON: Yeah, probably.

CHAIRPERSON KING: But Dave, I think you had a
quick question?

MR. CARTER: Well, just a comment, Barbara. I don't know that anything you said that we would differ with or it comes as any surprise as far as this being a federal employee. I think everybody on the Board recognizes that this is going to be hired as a federal employee and there are, you know, certain accountability and review folks. And I think as we were developing the draft, the job description, at one point we put in there that the Board recognizes that the executive director will be an employee of USDA and as such will be governed under all applicable federal employment regulations but to the greatest extent possible, however, the executive director will report to the NOSB chair for day-to-day activities.

And you know, I know that in the private sector you have folks that have certain supervisory responsibilities but they can delegate, you know, certain portions of that and we don't need an MOU on this but, you know, part of the secret handshake, you know, procedures that we've got -- talk about delegating some of the things. Because really what this person is to be responsible for is to be working for the NOSB, with the NOSB chair and you know, to the greatest extent that that can be delegated on a day-to-day basis, I
think is what we're looking for.

MS. ROBINSON: Well, again, I -- you know, I
come back to my earlier statement; we will do it, Dave,
but it can't be written down that way.

MR. CARTER: Right.

MS. ROBINSON: There's just no way for a
federal employee to be supervised by a non-federal
employee, but the job description will reflect and what
I would envision a staff director doing is a staff
director is at every one of these meetings and when you
are developing your work plans and your priorities, that
staff director's working hand-in-hand and that's sort of
dictating the subsequent work priorities for that
individual.

MR. CARTER: But we could delineate, though,
in some aspects -- I mean, if this person's
responsibility is to work with the NOSB or the NOSB
chair, that deputy administrator, when performing the
annual review would gather input from --

MS. ROBINSON: Absolutely, absolutely.

CHAIRPERSON KING: Okay. Do you have a
question?

MR. RIDDLE: Yeah, you said -- yeah, you have,
you know, our job -- draft job description that we
submitted and then you have a job description for a
board specialist and that are moving, you know, towards this, you know, final announcement in the job description that'll actually be announced. I'm just wondering if you're going -- if your plan is to, you know, seek any further input from the Board before, you know, in the drafting of that final announcement and job description.

MS. ROBINSON: To the extent that I can, I will, but understand that personnel has a lot to do with this. They write up the announcement and they have very -- I don't even understand it, Jim. We'll give them -- in fact, we have a draft position description and what I want to do, as I said, I want to talk to personnel and when I find out how much sharing and how much interaction can we do with you to make sure that the right person gets this job and that, you know, that we get where you want to go. And I think -- in fact, you know, the draft position description that we have is quite detailed, is quite comprehensive and quite challenging.

So I -- all I need to do is find out, you know, does anybody in the Department have a problem -- because I don't want to taint the selection process from the get-go, so I need to find out can I share this job description with you and show you, you know, here's what...
we're asking for. Believe me, I have no problem with
getting your input, but you just can't believe that if
you dot your i or cross your t the wrong way, that folks
out there can make -- just make it really difficult in a
selection process and you know, I just don't want to
goof that up.

CHAIRPERSON KING: Kim then Goldie.

MS. DIETZ: I was one of the drafters of the
document, the executive director job description and I
did exactly that. I went onto the USDA web site and
pulled up job descriptions and being that I'm an HR
manager, I'm quite familiar with job descriptions and
processes, so what we gave you we tried to mimic as
closely as we could and in fact, we could go on their
web site and look up this marketing specialist and
probably have a pretty good idea of the job
responsibilities, so we have the information in front of
us if we want to get it.

One of the things in the job description,
Barbara, just for clarification since we're on this, we
weren't sure whether or not this employee would have to
be housed in Washington, D.C. or whether it could be
somebody that's in the industry working out of their
home, so I want to pose that question because it's going
to come up --
MS. ROBINSON: I know.

MS. DIETZ: -- and it's going to have a huge impact on members of the industry applying for this job.

MS. ROBINSON: My preference, Kim, and my great concern about this -- I have thought about this and -- but I believe that in order for someone to serve you well, I believe the person should work in Washington because I believe that person -- in order to serve you well; let's face it, many of the discussions and many of the disagreements that we have had over the past few years have been because we don't understand each other's systems because understanding how the government works is sometimes, you know, something of a mystery to folks who don't work in government.

I definitely believe that the learning curve of the processes of government is steep enough that you can't learn them when you are sitting in your house in Iowa or California. I believe you need to be in Washington and you need to work with, directly with the NOP staff. Now, that may change in the future, if this person, you know, stays with the position and over time it's -- you know, it's -- I've learned never to say never, but at the get-go, I would argue strenuously that that person needs to be in Washington. And I realize that will make a difference in the applicants, but I
just think it's important, to be part of this process, to be part of this program office and you know, to understand how does OGC work, how does the Office of Management and Budget operate, how does our budget get done? I -- you know, all of the things, you know, understanding how other agencies work, it's just -- you can't learn it outside of D.C. or at least, it's very difficult to do.

CHAIRPERSON KING: Can we at least get him a window? Goldie had a comment and then George and then Rose.

MS. CAUGHLAN: Well, several of the things that I was going to inquire about have already been addressed in the last exchange, but I'm wondering, Barbara, in the past when we've discussed the placement of the whatever we call it, executive for the Board, how we've generally discussed it, it's been indicated that although this was mandated by OFPA, that this was unique, is that the viewpoint, is that, in fact, true? Are there any other FACA boards where any similar relationship -- I mean, you've mentioned here board specialist, you've mentioned --

MS. ROBINSON: It is not uncommon for advisory boards to have executive directors, no, that's not uncommon. The executive director -- and by the way,
what do you want this person to be called, a staff
director or an executive director? I've heard you use
both, you know, the act says staff director, you guys
have called it an executive -- what do you want? Let's
settle on this.

MS. DIETZ: Executive.

MS. ROBINSON: Executive director?

MS. DIETZ: Executive director.

MS. ROBINSON: All right.

CHAIRPERSON KING: Yeah, that's what's in our
description, anyway.

MS. ROBINSON: All right. Then to go on,
Goldie. I was once an executive director to Secretary
Glickman's advisory committee on Concentration in
Agriculture and I was a federal employee. The executive
director is typically a federal employee, housed in a
federal agency, the agency that hosts the advisory
committee. There are rare cases of -- we don't even
call them advisory committees in the Department, we
actually call them corporations. The CCC is an example
of a corporation, Commodity Credit Corporation. The
Federal Crop Insurance Corporation, the Rural Utilities
-- it's not the exact name of it, but there is also a
corporation there, that are created by the Congress.

They actually have both private citizens -- I may have
explained this to you once before -- they have some private citizens on the board, as well as federal -- federal employees. For example, the Commodity Credit Corporation, the Board of Directors are all of the Under Secretaries of specific agencies or mission areas in USDA.

Those corporations may often have private staffs, but those are uniquely created by the Congress. The Commission on Agriculture, the 21st Commission on Agriculture you may have heard of that Barry Flinchbaugh was heading up, that was a commission. Again, it was created by the Congress; its authority was delegated to USDA. It actually had its own budget and it had a private staff, but you don't. You have -- you are just simply subject to FACA within USDA and so your advisory -- your executive director has to be federal. But no, it's not unusual at all to have executive directors for boards.

CHAIRPERSON KING: George then Rose.

MR. SIEMON: I was just going to ask a question about the interaction with the committees, you know, in the spirit of collaboration I think it's really important that whoever in the Department's working on issues like livestock work with a livestock committee. Is it envisioned that that will continue or is it
envisioned that this new person will be the only committee support person?

    MS. ROBINSON: Well, that person would probably have to work 36 hours a day --
    MR. SIEMON: I know.
    MS. ROBINSON: -- if he was going to serve all of the functions that the NOP staff have tried to serve, so I don't -- you know, I see that -- I see a primary task of this person to assist the Board and the materials process to making sure that there is the most rigorous process to making sure that you have the information that you need, that the petitions are done right, that the TAP reviews come back, you know, satisfactorily, that -- you know, because that is a major function of your Board.

    But -- and while I see that person also working closely with the Board on its various other activities, you know, I don't see this -- I don't know that it would work to just, okay, well the NOP staff says okay, we hired a staff director, that's it. You go deal with the Board and we're off to do other things.

    Well, now we've just destroyed the spirit of collaboration and probably thrown a wrench into any other types of efficiency that we were going to gain, you know, again the idea would be that we would add
another resource who rather than, you know, the whole staff trying to say deal, you know, pick up -- they're trying to backstop each other and do various -- we would have a person identified who is speaking with the Board and then speaking with the staff and we would have a more efficient communication and working relationship with this person. But again, I guess I see this as something that, you know, we'll -- we'll work it out, we'll -- you'll talk to us. Once this person is hired, you know, we sit down and there will be the development of that person's work plan for the fiscal year and you know, and we'll go from there.

MS. KOENIG: Which, I guess, that brings me to my point in terms of the USDA hiring -- as I understand, when it goes through the -- the personnel takes that job description and what you say the qualifications are, they do that screen so even if you had somebody in mind, unless that description had a qualification that met their qualifications, they would never even reach you, so that's what I understand in terms of the process.

So as I look at that job description in terms of qualification, it's my opinion that I would emphasize probably that chemistry or ag background and drop the administrative qualifications if, in fact, the Board deems materials as an essential function or the function.
that maybe is not, you know, well-represented right now in the NOP staff, if that's the qualifications that are the most important because the way I read the description -- I guess that's my question to you, how would personnel, given those qualifications that you're looking at, how would they do that pre-screen? Because you have administrative and chemistry so would the person have to have all of those qualifications to reach you or do they -- would they only have one?

MS. ROBINSON: No. There's -- the way the job description is -- will be posted -- we'll probably do this through our, what we call our pair [ph] system, it's an electronic system and there will be a set of general questions that each applicant will have to address, you know, and they'll have to say, you know, whether they -- things that run the gamut of, you know, have you ever been convicted of a felony, you know, what's your educational background, where have you worked before, you know, have you ever been a federal employee? Those sorts of things. There'll be a series of general questions and then there'll be these questions we used to refer to them as the KSAs and we used to have our own interpretation of what that stood for, but it's knowledge, skills and ability, is what that means. And what we'll do is you -- there's where
you put in your specific things that you want an applicant to really pay attention to.

For example, very often we'll put in a KSA that says, you know, understanding of organic marketing or you know, or the Ag Marketing Service, so we'll say understanding of marketing systems within the United States for agriculture. In this case, maybe we'd have a KSA that says familiarity or expertise in basic food chemistry or plant biology or something of that nature.

What happens is the person will be able to electronically say yes, I have some experience and then they'll be given the opportunity to elaborate on that, to write in for however many pages electronically they want to tell us about their qualifications in that area. Personnel then gets all these and they actually score them. I don't know exactly how they do it, but they score them and then they will present us a list of the folks who meet the minimum scoring and maybe like 80 out of a hundred points. So then we'll get that list and then we'll go through them all and then, you know, decide, you know, you sometimes -- sometimes you see the person that you think is the ideal candidate, you see them right there and call them up and offer them the job. More often, though, you call them all up and schedule interviews and bring them all in.

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
MS. KOENIG: So that -- and -- so that knowledge base area's really where -- that's what I was saying, that the determination is made. I mean, I think that the job description that was provided kind of is a nice descriptive, but it seems like the input that we really need to provide is more in that knowledge base area or maybe we can't provide those, I don't know, but that's where you kind of -- you further define the qualifications you need --

MS. ROBINSON: Yeah, that's exactly right.

MS. KOENIG: So that's where the Board needs to --

MS. ROBINSON: Right.

MS. KOENIG: -- address it because just having a nice -- the other stuff is all kind of nice after the fact, it's --

MS. ROBINSON: Well, it's all teachable.

MS. KOENIG: Right.

MS. ROBINSON: It's all teachable without those specialized degrees. It's like the conversation you and I were having the other day over the e-mail system that I really regret -- well, I don't regret, but obviously my education is deficient because I skipped a lot of chemistry and biology courses and where I could. And now I realize, you know, I could've learned
something, I guess. So yeah, you would like to -- there are things that are easily taught on the job. Chemistry is not one of those things, so if that's a specific emphasis that you want -- and we have some folks in our science programs that can probably help us draft a KSA geared toward that, but we strongly suggest if you've got some specific language you want to see, send it in, because we'll use it.

MS. KOENIG: Yeah, and I think that's really an important point because thinking about candidates that may be scanning the AMS kind of web site, they're not typically necessarily going to be your science individual, so I don't know -- or maybe people just do a general job search, but --

MS. ROBINSON: Well, you never know. I mean, there are -- there's maybe folks from FDA or EPA who are looking for different job opportunities. There are science-based agencies throughout the government, so there are -- there's a candidate of pool -- I'm sorry -- a pool of candidatures, I'm sure, within the federal government and then, you know, you hope that there are folks, you know, graduate students coming out of universities, people at universities. Somebody who, you know, is interested enough in the topic area and has the expertise that, you know, we get some candidates to take
CHAIRPERSON KING: Quick follow-up and then Kim. Obviously you have the document we forwarded that's been approved by the Board concerning what we're calling the job description for executive director. In hearing this, you know, what you're calling knowledge, skills and ability, is there a need for the Board to have an action item that describes some of these KSAs, if you will, for lack of a better term, that would be involved in this?

MS. ROBINSON: It would probably be helpful. Again, we'll -- you know, I'll talk to personnel and I'll try to draft something up, but I also don't want to send a job announcement forward that doesn't meet your expectations, so I guess what I'm saying is yes, your input would be very valuable, but at the same time don't wait, okay?

CHAIRPERSON KING: Well, I'm just thinking this could be an addendum, if you will, to the original document, just as an attachment, very brief describing --

MS. ROBINSON: Sure.

CHAIRPERSON KING: -- the skill set that we hope to receive.

MS. ROBINSON: Sure. Okay.
CHAIRPERSON KING: Okay, Kim.

MS. DIETZ: Just for those in the public, I just wanted to read to you our qualifications. These were the things that we said we wanted to see in this job description and if we need to put it in a different format we can do that and I'd be happy to take that task on and pass it by the Board and put in the KSA -- but usually, when you draft job descriptions you want your requirements and required skills and desired skills.

And we put required as the education and training that we wanted a B.S. or B.A. or higher in management administration, agriculture, food technology, chemistry or related fields. And so typically you don't limit yourself, you look for the most well-rounded individual that you can in all those areas.

Granted, it's tough to get somebody who's highly -- who's got high administrative skills with high science skills. Typically, you don't find both of those. Experience is experience managing professionals in a highly technical, regulatory and public service-type organization. Proven ability to write and do public speaking; good computer skills; we desired qualifications knowledge in OFPA and NOP regulations so if somebody in their application had actually been involved in the industry and knew OPFA and knew NOP...
regulations, that would be an added plus. Experience in organic agriculture and/or organic food handling and then knowledge of organic certification and accreditation. So that was our little wish list in the person who's going to be getting this position. So we could certainly take that and put it in that KSA format somehow.

MS. ROBINSON: Okay.

CHAIRPERSON KING: Owusu.

MR. BANDELE: Yeah. I have two points. I think I see some problems in that required qualifications. Often times when you're putting out job descriptions, the fields are relatively related; agriculture, organic horticulture [ph] or related fields, whereas this one, it's really hard to tell where we are prioritizing those skills. I think, maybe, as we work in the draft more we have to maybe refine that because otherwise, it's a whole range of things lumped together as I see it. And second, I have a question, Barbara. I know like in academia sometimes if a position is open, there are informal situations whereby -- like students and other people who are not really decision-makers get a chance to interact with the applicants. Do you envision that type of scenario with maybe the Board chair?
MS. ROBINSON: You mean prior to the selection?

MR. BANDELE: Yes.

MS. ROBINSON: That's what I'm going to ask personnel about, Owusu, is how can we get some information of the candidates to the Board so that we can make sure that you're as involved as you can be within the law for the selection, whether we -- that's why I said one thought I had was, you know, asking the applicants to submit short biographies as a way of introduction, you know, something that I can actually send to you so you can read them. You know, very often -- I'll be honest with you. When I read applications how -- even though I haven't met a person, how they put themselves forward on paper says a lot to me.

I mean, I have some certain pet peeves. Somebody can't bothered to use spell check or complete their sentences and in my program areas I require the ability to communicate well and do writing and so, you know, they don't generally fare well on my first reaction list. But I do believe that the way people communicate about themselves on paper is very valuable.

So that was one thought I had and then the second part is that I will ask personnel how do we get a group of candidates, how do -- you know, your schedules
are impossible to deal with, so that's the other thing, is even if personnel says okay, yeah, you can do this, you can have a little tête-à-tête with the Board, it may be that you will have to say, you know, you're going to have to trust a group of you, a subgroup of you, some subset of you to, you know, whose schedules permit to come in and sit down and spend a day meeting with the candidates. I -- you know, I don't know. Again, those are the details, you know, the devil's always in them, but we can work through those; those are feasible. But we'll do what we can to get you the information and get you introduced to the candidates.

CHAIRPERSON KING: Thank you. I mean, that helps a lot, the update was very thorough and I appreciate that, but before we move on I have a quick question concerning the action on this for the Board based on Kim's reading of our current document. It sounds like we've covered a lot of the skill sets that you had mentioned.

MS. KOENIG: I think -- well, personally, I think you need to be pretty specific and you need to do some -- again, those -- the way that that knowledge area is going to eliminate -- is where the elimination occurs, you know, the first cut occurs, so I think that you need to really be pretty specific in that --
CHAIRPERSON KING: So my question is this, do we want to re-format that and --

MS. KOENIG: Yes.

CHAIRPERSON KING: -- and forward it on to NOP or --

MS. DIETZ: Yes, we can do an addendum to it.

CHAIRPERSON KING: Okay. So we have agreed to do an addendum. And Kim will take the lead.

MS. DIETZ: Yeah, I'll do that. Just one comment on the -- Owusu, on the variety of qualifications, you know, whether it's science or administrative. We really didn't want to limit ourself [sic]. Our intention was to hope to try to get somebody from the industry to fill this position, so by limiting that means you're going to knock out a candidate, so we just need to keep that in mind, too, that not everybody has science degrees or food science or agriculture. There might be somebody with a degree in psychology or something that -- yet, they have a lot of experience in the industry, so it's certainly the will of the Board but we didn't, at the same time, want it -- narrow it down so much that we couldn't see candidates.

CHAIRPERSON KING: Go ahead, Jim.

MR. RIDDLE: Yeah, just one more detail, then. Kim, does it work for you to redraft that, get
something around to us and us to finalize it at our next executive committee meeting? Will that work for you?
So that's one month we're setting for ourselves, then.
Okay.

CHAIRPERSON KING: Whoops. Okay, our next agenda item is the Materials Review Process and looking at how we're collaborating with NOP and how we're part of that, so I know earlier, I believe, Barbara, you had mentioned in your description of our sort-of ongoing working together, if you will, that petitions will be forwarded to the Board and then so on and so forth, so I want to throw that out as an example of how we're hopefully improving this process ongoing and of course, we're all aware of the forms that we use now and how that's helped the process, so I just throw that out to hopefully set the stage for a discussion on how we can further improve this process.

MR. NEAL: I think that over the course of the past four to five months, we've seen an improvement in the Materials Review Process. We've worked very closely with the Materials Committee and discussing petitions, issues concerning petitions. Matter of fact, we've even sent out all of the petitions to the whole Board for comment on those petitions to find out how such petitions met the categories of exemption under OFPA,
any outstanding issues that the Board may have felt that
needed to have been addressed by TAP contractors.

What we plan on doing in the future is making
sure that to make -- to ensure that we get a full TAP on
petitions, that we receive Board input on the petitions
first. And if the Board is reviewing the petition in
the respective committees, they see that there are areas
of that petition that need to be further elaborated
upon, that they will give us those questions in their
specificity and we will supply those questions to the
TAP contractor so that the TAP contractor can provide
further scientific information on those particular
questions so that the Board can have the information,
the necessary information to make a well-informed
decision.

The new, I think, element of the review
process that we're going to implement is that once we
receive the TAP reviews, we're going to supply those
reviews to the committees and to the Board for a review
of sufficiency, whether or not if those TAPS have
addressed the questions adequately, the OFPA criteria
adequately because we don't want to continue a situation
where we come to a Board meeting and the comment's made
well, you know, the TAP wasn't good, so we're going to
defer on the material. We're going to try to address
this up front. If the TAPs aren't sufficient, we want the Board to comment on it, on that up front. And we supply the TAP contractor with the information that needs to be further elaborated on. And that gives them the opportunity to make sure that the Board has the type of product that they need in order to make that well-informed decision.

After we're satisfied with that TAP, then we're going to make that publicly available and then the process is going to begin for the review of that material for a decision at the next meeting. I think that in terms of the Materials Review Process, that is mainly one of -- that's one of the main hang-ups. The other one is, I think, the issues surrounding what is synthetic, what is natural; the types of substances that can be reviewed under OFPA and those are discussions that are on the agenda for the next two days, two and a half days.

CHAIRPERSON KING: So am I hearing the need for another form? I'm kidding. But actually, I think you're right, that up front we need to know right away, do we actually have sufficient information to move forward and although I said that jokingly, I guess that -- that is a sincere question. I mean, do we need a check list? Is that the sort of thing we're looking for.
and do we think that would be helpful?

MR. NEAL: That -- let Kim address, first.

MS. DIETZ: Well, that was the first thing that came to my mind. I'm assuming Rosie has already thought of this, but really part of the TAP process in the past was that you can't just have subjective comments. If you're going to ask for feedback from this Board, you want it to be relevant, it should be relevant to OFPA, it should be relevant to what we're looking for in a TAP and not biased opinions. So we need to have some kind of document review form so that there is consistency. So we need to start working on that, it sounds like.

MR. NEAL: Sounds like a work plan item to me. And just to comment on that, too, though. Based on soy protein isolate from the last meeting, the Board had developed specific questions concerning that TAP. We supplied those questions to the TAP contractor, the contractor responded to those questions. As the committee reviewed the supplemental information, they saw further information that needed to have been identified. So we sent more questions to the TAP contractor; they supplied information with that. All of them were very objective, not subjective. And I do believe that the committee's satisfied with the
information that they have received, but in response to your item, Kim, a check list probably should be developed.

CHAIRPERSON KING: Jim.

MR. RIDDLE: I think this sounds like some good improvements, especially this opportunity to kind of defer a TAP before it comes up at a meeting, the inadequacies, but that is dependent on that arriving in time for the Board to be able to really give it a thorough review or the committee to give it a thorough review.

There's been times, of course, when we've gotten them right before a meeting and then we find out these just are inadequate and -- the other concern of mine and I don't think it's addressed in the, you know, upcoming agenda item, per se, and that is the, you know, the Board submitted a couple letters earlier in the year about the Materials Review Process and in particular some concerns about the, you know, new compounds made from, you know, synthetic substances on the list and allowance of those compounds without going through the petition process. And I don't think that that's been resolved yet, that issue. So -- and I don't think we can or will resolve it right now. I'm just bringing it up as a placeholder and the same thing on that
phosphoric acid and aquatic plant extracts issue. We
just don't want to drop those, you know, from this
consideration.

MR. NEAL: Those have not been forgotten.
Those issues were raised. We're well aware of them and
I think that for -- to a certain extent, they're going
to be touched upon in this agenda item because the
Materials Committee's looking at extraction processes.
When does something -- when does a material become
synthetic? And Rose's discussion she supplied about the
synthetic process.

MR. RIDDLE: Um-hum.

MR. NEAL: You know, these are types of
things -- does combining two materials render it having
to be petitioned? These are things that are probably
going to come out of the discussions that are going to
be held here this week.

CHAIRPERSON KING: All right. Okay, if there
aren't any other questions in a related matter, or if we
could talk a little bit about the TAP Contractor
Statement of Work, where we're at with that, that sort
of thing.

MS. ROBINSON: We got presents.

CHAIRPERSON KING: Thank you.

MR. NEAL: What you're going to be receiving
now is the Final Statement of Work that was used in seeking out TAP contractors for this year's fiscal, for this fiscal year. As you guys know that we -- you know, we've talked about the process and we've tried to engage in the process as much as possible. We inform you that in seeking TAP contractors, the process is mainly handled out in Minneapolis by our Field Service offices. The funds that we had to operate with were $300,000 and from the outset we were seeking to attain multiple contracts for conducting TAP reviews for the National Organic Standards Board.

Initially, we set out to, I guess, seek bids for the work that needed to have been completed, but due to the time constraints that we had, Minneapolis chose to initiate a Sources Sought Notice. And what that notice did is it sought interest in the -- in the specific work that was identified as needed to have been done by -- for the National Organic Program on behalf of the National Organic Standards Board. They chose to use this Sources Sought Notice to cut time. For us to go out and seek bids on the particular work may have cost us the ability to allocate the funds within the specified time frame. So in conducting this Sources Sought Notice, the generated a list of respondents and through these respondents they assessed the experience
that all of the respondents had based on the Statement of Work that we provided to them.

After assessing all of the respondents, they identified respondents that had the best qualifications for conducting the work that we needed to have conducted. Out of the list of respondents that they had, there were two that they chose and they chose those two based on their experience and the fact that they appeared on the General Service Administration's list, meaning that they already had accounts to perform work for the government in the area specified. So what they did is they had a limitation of $100,000 that each one of those contractors could receive. So with the two respondents that they had chosen, that meant that $200,000 had been allocated, so that left $100,000 outstanding.

Based on a list of respondents that they had, they were not able to find a respondent from the all sources notice that they had used. They were not able to find a respondent that could perform the work to the level expected, so what they did is that they extended a $100,000 contract to Virginia Tech, because Virginia Tech was already performing the type of work that we needed to perform. So that pretty much sums up the process in terms of the TAP contractors that we have.

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
Oh, by the way, for one contractor, the name of the contractor is Woven Egg Consulting out of Latham, New York and Denver, Colorado.

CHAIRPERSON KING: Could you repeat that --

MR. NEAL: Woven Egg Consulting. Woven Egg --

UNIDENTIFIED SPEAKER 1: W-O-V-E-N?

MR. NEAL: Woven, right. W-O-V-E-N.

UNIDENTIFIED SPEAKER 2: Woven Egg?

MR. NEAL: Woven Egg.

CHAIRPERSON KING: Egg.

UNIDENTIFIED SPEAKER 2: Consulting?

MR. NEAL: Consulting.

MS. ROBINSON: Don't worry about the company name. It's the qualification, so --

MR. NEAL: Yeah, well.

MR. RIDDLE: From New York and Denver?

MR. NEAL: Latham, New York and Denver, Colorado. And ICF Consulting out of Fairfax, Virginia. Both of these have been identified as highly reputable companies that are specialized in performing the types of scientific reviews on substances for EPA, FDA and other federal agencies. Are there any questions concerning the process?

MR. RIDDLE: Yeah, but we don't know what they are yet. We just have to --
CHAIRPERSON KING: So when will these two new entities begin reviewing?

MR. NEAL: We have, based on the collaborative process and the Board's input on the List of Materials petitions that we received -- there are only really three that can move forward. What we're thinking about doing and we haven't finalized this yet, but sending all three to all three TAP contractors to see the type of work product that we receive from each, since we've not used two of them before and we have used Virginia Tech before, but that would give us a litmus test in terms of how they perform under the new Statement of Work that we have.

MS. ROBINSON: It does mean spending a little bit more money in the short run, but we really feel that it's time to -- we need some gauge, we need to able to get information back from these folks and these are all, of course, performance-based contracts and so we want to be able to know very early on in the game are we going to get the kind of performance out of these contractors that is satisfactory, so we figure what better way than to see how well they do, you know, up against each other for the same materials and -- okay.

MR. RIDDLE: We're also hoping that this would help in developing a model for all report so we would be

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
looking to take the best from all three to create the
model for how all three vendors would do it in the
future. And of course, we would be looking to you for
input on that, as well.

CHAIRPERSON KING: Rose.

MS. KOENIG: One is just kind of a financial
kind of question and then I was going to -- I'll ask the
question later because I need to think about it, but as
far as when you give that -- when you get a hundred
thousand dollar award, what happens if it's not
utilized? Are we wasting $12,000 by -- I mean, it seems
-- I guess out of the experience of researching soy
protein isolate -- it's not rocket science, this stuff.
I mean --

MS. ROBINSON: You're right, Rose.

MS. KOENIG: -- if you understand the
categories --

MS. ROBINSON: It shouldn't be rocket science.

MS. KOENIG: What?

MS. ROBINSON: I totally agree with you. It
should not be rocket science. I don't understand why
the quality of the TAP reviews has been of the quality
that it's been and you know, I read the Statement of
Work and I'm not, I don't have a scientific background,
but it seems to me that, you know, what we're asking for
is rigorous research and a good letter to review and an understanding and comprehension of these materials and if you've got that kind of expertise you ought to be able to do it. Are we wasting money? I don't think so. We would've wasted the money had we not awarded the contracts. We had to -- you must obligate the funding by the end of the fiscal year; it simply reverts back to the Treasury. We don't get to save it for the next year. If the services are not paid for until they are rendered, if we have a bad contractor in the mix, they just won't get any future materials. There'll be nothing for them to bill against and -- you know, we're not going to throw good money after bad if the performance isn't there.

MS. KOENIG: I guess, you know, one suggestion rather than giving the same material to three contractors would be -- especially with the two new individuals and it probably wouldn't hurt with Virginia Tech and I don't know if it's -- if you would consider it kind of being too much Board input, but I would be happy, kind of, to work as the chair. And I know you don't like that direct relationship, you know, because it's caused issues in the past, so -- you know, as far as -- but I think that the relationship would be in terms of performing that work, not my opinion on a
product.

MS. ROBINSON: You mean contacting the contractor directly?

MS. KOENIG: Well -- I don't want to contact -- I would like to see the -- you know, as people work on those criteria, that there can be some kind of quality check before we get that final product and that we can, you know, maybe through Arthur, look at those at some point so that, you know, in this first TAP contract you have little bars where you have to -- once a section comes, let us look at it and kind of critique it before they get too involved and finally have the final product. You know, so I think that would be a better way of going about it than giving the same contractor all the stuff because it's guidance it appears that people need if they have the technical background, it's just performance on -- and what -- the product we want rather than --

MR. MATHEWS: We -- I believe the Board and NOP, in the past year and a half have come a long ways with regard to Materials Review. And I say that because we have had problems with the quality of petitions, the quality of the reviews and I'm not prepared to say that this is the fault of a vendor or the fault of the person who filed the petition. I think this is something that
can be shared by all of us. And I've spoken repeatedly over the last couple years about a global approach to the entire Materials Review Process. And I think we've made leaps and bounds in gains on that over the course of the last year and a half.

For example, we now have the check sheets that you use; we're developing where there's a better description of reasoning that you've made. Those check sheets then are what gets passed back to the vendor so the vendor now looks at this from the standpoint of well, this is what the Board needs so that helps them understand how to put the report together. And I think that works all the way back to the person who is filing the petition. So we've made a lot of progress in that area. The Statement of Work is another example of where we have enhanced previous work products to make it easier for the TAP reviewers to understand what is expected of them.

The comments that Arthur made earlier of well, we'll start sending the petitions out to you to look at it to see what you think about the petition, itself. Is the information that is needed there? Is there something about this product that you think is unique, that maybe something that isn't in the Statement of Work needs to be added in. I can also envision that we would
send the petition back to the petitioner and ask them
for more information. One of things that you're working
on at this Board meeting is a document that is going to
help us receive better petitions.

So I think we're making leaps and bounds. I
think that I kind of favor the idea of putting the
reviewers to the test. So we take one, two, three,
whatever and send it out to them and say take your best
shot at this and tell us, you know, do what you would do
for us. We look at that and maybe we wasted some money,
maybe they all come back with reports that are
identical; I doubt it. But at least then we can look at
what we're getting as work product. We'll know where we
need to work with each of the vendors to bring them up
to your expectations, to bring them up to our
expectations.

If we give them each a different material to
do, the problem I see with that is that each material
has unique characteristics that one might find but
another one not; but if we give them all the same
material, they're all working with the same issues and
hopefully, they'll all be picking up on the same things.
Am I explaining myself clearly on that? I just think
that if we're giving them all the same test, then we
know whether or not they've met our expectations and
whether they don't. That's where we help them do a
better job for us.

MR. NEAL: And just to comment real quickly,
it's more of a benchmarking procedure or process that
we're using. This is common, very common amongst many
industries. We're trying to set a benchmark so that we
can improve on where we are currently.

CHAIRPERSON KING: Jim then Kim.

MR. RIDDLE: Yeah, I really appreciate you,
you know, expediting the process and you know, having it
as a priority and not losing that money, so I -- and I
don't see this kind of test that you've set up as a
waste of money. I think it could really avoid wasting
money in the long run. So I -- you know, I think it's
innovative and I think it could really help, you know,
weed out or improve the -- at any rate, improve the
quality of the work products. So I think that's a good
idea. But I did want to come back to what Rose was
saying as far as the Materials Chair, providing some
input or direction. I know that when U.C. Davis and
Virginia Tech first came on several years ago, that I
think it was Kim had put together kind of an orientation
packet for them. I'm assuming that you put together
something along those lines this time, you know. I
mean, you've improved the Statement of Work, we've got,
you know, the forms. I mean, things are just better to
go in that packet, but I would like more of a response
or a clearer response to whether, you know, the
Materials Chair has a role in that orientation, as well.

MR. NEAL: We have discussed bringing all the
contractors together so that we can have an orientation
and I don't see a problem with the Materials Chair
having a role in that orientation process.

MR. RIDDLE: Um-hum.

CHAIRPERSON KING: Kim.

MS. DIETZ: Thanks. I also was just going to
reiterate; I know that as past chair it takes a
tremendous amount of effort to manage that process and
it is an evolution and has been for quite some time. I
also just want to remind everybody that with Virginia
Tech we actually hired Richard Thore [ph] as a
consultant to go in there and work side-by-side with
them to get these TAP contracts correct and it still
wasn't adequate enough. It's not just easy enough to
put on a piece of paper, so whatever we can do to ensure
success and not failure on this, whether it's, you know,
Rosie's input or the Materials Committee ahead of time,
I think is certainly worthwhile.

CHAIRPERSON KING: Rose.

MS. KOENIG: Yeah. I would just -- you know,
I'd just like the, I guess, the Materials Committee to have an opportunity to think about, you know, these pros and cons about, you know, whether the three -- I mean, it may be a good model, but let's -- let us think about it and give you that input as far as, you know, does that make sense, is that the appropriate approach. Because, I guess -- you know, and I need to think it over in my mind, but to me, my gut is is that no matter whether material X, Y or Z, you can assess quality. You don't have to necessarily be doing the same -- you know, it's just like an exam. You give students the same question, you know, many of them have the right answers. So it -- and I understand that approach.

We have a pretty descriptive idea and I think, you know, quality is something you can judge no matter what you give. But let us think about that a little bit. I guess it's my economic -- farmer. I just -- it seems like an awful lot of money to spend on one thing, you know. But anyway, let me think about that.

MR. MATHEWS: And we appreciate that. The whole idea behind this is to -- it's not a pass/fail type situation. What it is is that we're trying to identify where we may have weaknesses and I can envision that we'd have weaknesses from all three, where they don't -- where none of the people would totally meet all

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
of our expectations and they would probably be different reasons. And what we're looking for is a way to early on in the process identify areas where we might have concern so that we could work with these people early on so that in the future the TAP -- the report would come in to us and we would send it out to the Board and the Board would say it looks good, let's go for it, rather than having the Board say well, they didn't answer this or I've got concerns about the way this was put together. So then we go back to them again. So I'm not saying that'll never happen, but what we're trying to do is identify ways up front so that we can make sure that we always receive a quality work product from all three vendors.

MS. ROBINSON: And I'd just like to add one more point on this before we move on or answer more of your questions. You make a very good point, Rose, but I guess our thoughts are that this is actually an investment that we're making, not an expense and when I look back over the past few years of the expense that we have incurred for work that you've been greatly dissatisfied with, I guess I would rather make this expenditure, this investment now and find out before we just, you know, go down the same path.

MS. KOENIG: I guess -- you know, as a

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
scientist, again -- the thing that's wrong with --
what's flawed with your theory is that it assumes that
the controls are always going to be the same in
repetitive action, okay. So if you're using the same
personnel and under the same conditions, yes, you
probably could get a repeat but we're dealing with
companies that may hire graduate student and then they
hire a different graduate student. So you know, that's
why the -- to me, the stop gap is at the quality
control. What quality control do those contractors have
so that they internally make sure that they, themselves,
are doing that. I mean, I think it's great that the
committee does a second quality control -- feedback at
that, but that's, to me, the quality control at the
company level is the most important because the
variables change in companies. So -- and that's why I
think that your theory is flawed, but again, I'll think
about it. With due respect, but --

CHAIRPERSON KING: Dave.

MS. ROBINSON: Okay.

CHAIRPERSON KING: And then we'll wrap
this up.

MR. CARTER: Yeah, just briefly. I guess,
Barbara, I'll take a differing view because I actually
think that that is a good upfront investment and I think
yeah, Rose, you're right, you do have different controls. But I think when you do something upfront, you can get a pretty good sense of where the strengths and the weaknesses are and use that as some forward decision-making and save money in the long run.

CHAIRPERSON KING: And for what it's worth, I like your proposal and think that it would be a good indicator, at least to start from. So also -- we can wrap this up? Good. Next up -- and you mentioned this earlier, so we may not have a lot to talk to about, but a lot of people have talked about the letter of understanding, if you will, with OMRI and how that's moved forward and so it is on the agenda and we wanted to briefly touch on that.

MS. ROBINSON: I don't really have too much more to add than what I said earlier this morning and that is that in Chicago OMRI approached us and said, you know, we need to make sure, we'd like to make sure that the Generic Materials List and the National List are in complete synchronization. We agreed because we also know that we've had problems, we've had auditors out on sites with certifying agents who have said their reference for approving materials used by operations is the OMRI list.

And we fully recognize that it's a far more
user-friendly list than the National List. It's certainly been there longer than the National List and it is what certifying agents are used to, comfortable with and it's what they turn to. But neither OMRI nor USDA want there to be conflicting information out there and we also want a process, an auditable process whereby accredited certifying agents are referencing the National List as the source of their information about approved materials. Again, we have no problem with certifying agents using OMRI's Generic List, but the Bible, the source, the last word on the matter is the National List.

So we agreed that probably what needed to be done is that we need to take a look at OMRI's Generic Materials List and -- so we just agreed to do it and we said we would put it in a letter and that was the letter we shared with you before we sent it to certifying agents. And since we've done that, we've had a couple of phone calls with OMRI and the way it's been working was they would -- we let them select the priorities, the materials that they thought they had some questions about that they wanted to be sure that they were the way they described their use and their approval status and their generic list was copasetic with, you know, our interpretation on the National List. So we have gone
through those.

Unfortunately for OMRI, basically, in a couple of the materials we said sorry, guys, we're just going to have to go back to the Board. And those are on the agenda, I believe, to be discussed. So -- and so we had a call -- I think the last call, actually, that we had was in late August. We did not have a call in September because we were going to commit to sitting down and actually looking through the whole OMRI Generic Materials List and picking out materials and we just frankly didn't get it done. So we postponed our September call.

But at any rate, that is the -- that's sort of the informal working relationship that we're trying to do and we made it very clear to OMRI that where there are questions that we cannot clearly answer based on the information that we've gotten from the Board, that we're bouncing them right back to the Board, that we are not giving them out an answer.

CHAIRPERSON KING: Jim then Kim.

MR. RIDDLE: Yeah, I don't disagree with anything you said and totally understand that the National List is what should be cited in inspection reports and in certification decision letters, or must be, you know, and not the OMRI Generic List. But the
issue that's not being addressed here and I put this in my comments back on the draft letter is the status of the OMRI Brand Names List for formulated inputs and ingredients and there's, I think 46 accredited certifiers that essentially subcontract to OMRI to perform that service.

You know, each certifier has to, end of the day, make a determination if a formulated substance meets all the requirements of the National List and OMRI performs that service and I know that, you know, it's a big issue and you've got to get the Generic List squared away first, but what's really going to be helpful to farmers, processors, inspectors and certifiers is to know what the official status of a formulated product is once it has been placed on OMRI Brand Names List. So I don't know, you know -- interested in your comments on that.

MS. ROBINSON: I don't disagree with you, Jim. I think -- and I don't dispute the importance of it. We simply haven't got those resources right now to do that. And -- but we -- and we fully expect that OMRI is doing the due diligence in making sure that when they put a brand of product on their approval list that it does, indeed, meet the National List.

The questions -- and in fact, you know,
they're not asking us to review materials on the Generic Materials List that are, you know, clearly there they are on the National List. They're talking about in many cases, kind of, they're not even materials. They may actually be a practice or something -- and they want to know that the way they've written it up, there -- it's not causing any confusion either with the regulatory language or with the Board's recognized recommendations or with the rule, the regulations, themselves.

So sometimes it's not -- I don't mean to imply that when we said we're going to review their list that we're okay, they've got hydrogen peroxide; do we allow that on the list? Well, we look on the list, yes, we do. So it's not that, it's more, you know, the types of things that are in the OMRI list, yeah, and annotations. And frankly, I just -- you know, I just don't envision us getting to that brand name review any time soon.

It's not -- I don't -- like I said, Jim, I don't disagree with you that it's important, but it -- you know, unless you tell us that that's like a number one priority for us to redirect resources to, I think you have to rely on, you know, the integrity of OMRI's review process and their desire to serve the organic community as we do and as you do and you know, go from there.
MR. MATHEWS: One of the other things you have to keep in mind though, Jim, is that while OMRI has a wonderful list of branded products, not all branded products that would qualify are on their list and so certifying agents need to keep that in mind, that they can't deny a branded product because it's not on the OMRI list, they have to be able to demonstrate that it doesn't comply with the NOP. So if the branded product is not on the OMRI list, it may still be eligible and it's incumbent upon the certified operation and the certifying agent to work together to verify whether or not that branded product that's not on the OMRI list does indeed meet the NOP. If it does, then it can be used. If it doesn't, well then obviously it cannot be used.

MS. DIETZ: I'm going to take just a brief moment. I was one of the original founders of OMRI. There were five of us that sat around a room, I can't tell you how many years ago. Girls -- Brian and Emily in the back there will remember. But I think it's just a great achievement this industry is finally, you know, coming to this point where we're working with OMRI. Our intention, originally, was to merge them together and for OMRI to provide a tool to the industry where the NOP couldn't. So I think that's the goal. I want to
acknowledge Brian Baker and Emily back there, along with Lynn Coody and a lot of people that have spent a lot of years working on -- with OMRI; for them, with them and other different fashions and I think it's great that we're finally merging the two together.

CHAIRPERSON KING: Rose, did you have a comment?

MS. KOENIG: Yeah. And I guess that the-- more in terms of, you know-- the question comes down to OMRI has never stated that it's an inclusive list, that's never been an assumption of OMRI. It's a, you know, a volunteer kind of-- but what farmers need to know and I think what certifiers need to know is that they have used that list as a form of documentation, you know, when they go through the certification process. It's sort of that burden of proof. It's-- you know, they've used that as sort of like what Kim said. It was envisioned to be the tool to say okay, I've utilized this list. Someone has reviewed it because I, as a farmer, can't call every single brand name, you know, individual. And then it's up to me, if I decide not to use something on that list and I go and try to do that research on my own, but-- so what I think growers need to know and certifiers need to know and I don't think that that was necessarily clear in the letter, although...
I don't remember exactly everything that was in the letter, is that is -- do you recognize that? And that's what, I think OMRI is seeking, is recognition that that list is consistent with -- and it's a tool that the NOP recognizes as meeting the regulation.

MS. ROBINSON: Yes, but the problem that we saw happening, Rose, and the one thing that we said in the letter and that we still continue to say -- and I think it's been alluded to here, because OMRI's list is not inclusive -- what we saw happening on occasion was a certifying agent saying to an operation oh, I'm sorry, you can't use that material because it's not in OMRI's list.

And while that's not sufficient, it's possible that the material is on the National List or the material is allowed or the practice was allowed but simply because it wasn't on OMRI's list, the certifying agent was saying sorry, no dice, you can't use it.

Well, we didn't want -- and the whole idea of this working relationship is to send out the same message. Again, it's the same message to both certifying agents and to the operations. The OMRI list is compatible, it is in sync, it is perfectly consistent with the National List and it may be the tool that you do turn to, but it is not sufficient for a certifying agent to deny the use
of something simply because he couldn't find it on OMRI's list without also -- I mean, that's why I came back to the statement that the source of approval or disapproval is the National List.

MS. KOENIG: And I guess the confusion, though, again is, you know, and it comes down to what Jim was saying that the National List is a generic list. What farmers use are brand names, they don't use generic, so you know, I think the message -- you know, and again, I think that has always been clear, from what I understand, that certifiers tell farmers or even when I do trainings, that just because a product isn't listed on the OMRI list doesn't mean it's not allowed, but the burden of proof, then, is on you. It's your responsibility to find out. If they haven't voluntarily gone to that service, then you need to be proactive and find the information out.

MS. ROBINSON: That's right.

MS. KOENIG: But it doesn't discredit the list, but I think it's important for growers to know and the industry to know that that list is consistent because they are relying on that. And I think that's what OMRI was seeking and that the issue of other things is not really an OMRI issue, it's more of a communication issue between certifiers and your program,
as far as what -- about these other products. But that
is a different issue than whether the OMRI process is
reflective and you know, I don't want to use the MOU
idea again, because we've used Memorandum of
Understanding, but that the NOP recognize it as being
consistent with the Generic List.

MR. MATHEWS: We've issued the letter and what
you're saying does not differ from what we're saying. I
mean, the thing to keep in mind is that we are working
with OMRI, slowly as it may be, but we are working with
them, going through the Generic List. We're not
expecting to find anything on the Generic List that
isn't also on our list. What we do find, however, is
that annotations on their list may throw a question our
way that ends up in your lap with regard to their
particular annotation.

So we're going to be working with them, where
they've annotated something that isn't annotated on our
National List, okay? There are annotations in their
list that don't match up with our annotations. And so
what we have to do is we have to work through those
issues. Where there are unresolveable [ph] issues, they
definitely will come to your plate and it'll be --
that'll be the point at which you get involved in
helping us reconcile the discrepancy that appears to be
on OMRI's list. That, in itself, has a tendency to affect what is on the branded product list. I'm not expecting to find where products were allowed that shouldn't have been. I'm expecting more likely that we'll find products that should've been allowed or that may be able to be allowed in the future that might be blocked because of as to what the intentions of the Board are, which have led to an annotation on OMRI's list that, you know, might be rail [ph] material. And so it's those kinds of issues that we have to work with at this time and we are working with OMRI and you will be receiving some issues from us in concert with OMRI asking for you to resolve the differences.

CHAIRPERSON KING: Okay, I'm just looking at the time and the agenda. We have other NOP items listed. I'd like to cover that very quickly and then Barbara has a comment and then we'll take a quick recess for lunch and come back and talk about the directives and one question that's been asked of me by several individuals and Rick, I know you and I talked about this briefly on the phone, that is concerning the nominees for new Board members. And I understand that there are 71 or 2, some odd nominees and so I wanted to just touch on that and find out sort of where we're at in the process.
MS. ROBINSON: I was going to finish up with
the -- these are the last of the NOP items to bring to
your attention. So let's do the nominees. You're
right, we have over 70 nominees, applications that have
been submitted. The package is not finished being
vetted through departmental agencies, the Office of the
Inspector General, so the package hasn't gone to the
Secretary yet. And as you know, the appointments don't
expire until sometime in January, so she still has time
to make those selections, but in any event, we did quite
a wide outreach this year and as a result, probably got
the largest package of nominee applications that's ever
been received. So it's a lot of material to go through.

And the last item to update you on is I sent
you an e-mail last week. On October 5 we received a
draft final report, audit report from ANSI, that's the
American National Standards Institute. That is the
audit of our accreditation process. And as is a normal
course of an audit that's done within the Department,
ANSI provided us with a draft final report of their
findings, so -- now, we will review the findings and we
have an opportunity to respond to the findings of the
audit. ANSI will then take our response and determine
whether our response satisfactorily meets the findings
that they had issued or still fails to meet the findings
that they have issued. And then they will issue a final report that says here's what they found when they audited, here's what they reported to USDA, here's how USDA addressed it and here is ANSI's response to USDA's review of the audit findings. We're not going to wait until we get to the final final, we hope that once we have our review and our response finished, we're hoping -- I think I said to you by roughly the third week in November, we will publish the ANSI audit report and our response to the audit findings on our web site and our future game plan, then, is to institutionalize this process.

Now, it may not be with ANSI. There are other audit bodies out there who, you know, maybe would do a superior job or I don't know, but what we want to do is work with the Board to figure out what's the right kind of game plan here. My thoughts are that we don't do an audit every year because that we would do something more like a biennial type of audit. And the reason I suggest that is simply that by the time you do -- you'll never get out of the cycle. You do the audit, you get the findings; the agency needs to -- presumably, the audit will find some things we need to correct, you know, you'll -- you try to get your corrections done and then you're right back into the audit. So I would think
something like on the order of a minimum of 18 months, but a biennial type of audit process makes the most sense, giving the agency time to put its corrections in place and then the auditor to come back again and say you either got it right or, you know, well, you fixed that but now we've found something else.

Now, I have not read the entire audit report thoroughly. I have quickly read it and so let me give you the summary of the three kinds of -- the content that covers three areas and what they said. The content of the findings focus on three activities; documentation of procedures, basically. Do we have our procedures written down? Do we have the procedures manuals that we need? The audit found that our documentation and accreditation is lacking in several areas.

The second area of findings deals with communication of our procedure, primarily to our certifying agents. Again, the audit found the agency could do more in the area of communication with certifying agents. And the third area, the final area of the audit findings focuses on the actual audit and accreditation-related activities performed by the staff. And in that category the audit rated the staff exemplary in every case, highly professional, understanding of the tasks that they were performing, their interactions with

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
the clients and their responses.

Now, the fact that the audit findings find that our documentation procedures are lacking is not an insignificant finding, by any means, but it is also not unusual. I certainly don't want to make light of it, but it is not an unusual finding in new programs because in the first place, you know, a new program and you're -- you know, you're trying to get up to speed quickly. But more importantly, I think, you don't have procedures written down for everything because you haven't confronted all of the situations, you know, that's where the real life experiences occur and you need to come back to the office and you need to sit down and write procedures for okay, how do we handle this? You can try to anticipate -- nevertheless, that's going to be the significant task at hand.

And as Rick has said to you earlier, we did hire Mark Bradley earlier this summer. For those of you who don't know him, Mark has a long history in the agency in the Ag Marketing Service. Mark Bradley actually introduced AMS to ISO 9000. I've known Mark since I was the Associate Deputy Administrator for the agency and I'm just thrilled that he's on the staff. He brings a tremendous amount of expertise to auditing processes, to documentation, to standard operating
procedures. What we like about Mark is that he thinks
like an auditor, he works like an auditor, but he lives
like a regular guy. So -- no offense to any auditors in
the audience. But anyway -- so we're really happy to
have him on board and we're -- he's going to -- and Mark
has a considerable previous experience in the Livestock
and Seed Program area of AMS, which is performing the
accreditation work for us, so he's quite familiar with
it. As I said, he introduced the agency back many, many
years ago, came to my office and said it's all about
ISO. What is that? So we're confident in his abilities
and that we'll move through this pretty well. So that's
the update on the audit. And that --

CHAIRPERSON KING: Thank you.

MS. ROBINSON: -- concludes the NOP update.

CHAIRPERSON KING: Jim has a quick question.

MR. RIDDLE: Yeah.

CHAIRPERSON KING: Not quite yet, Barbara.

MR. RIDDLE: Yeah, real quick. Just want to
make sure I'm clear that the ANSI audit only reviewed
the accreditation program, it didn't look into Materials
Review -- any of that other stuff that keeps NOP very
busy, right? Is that -- I mean, it was a narrow focus
on --

MS. ROBINSON: It was an audit on the
accreditation procedures.

MR. RIDDLE: Yeah.

MS. ROBINSON: Now, to the extent that any of the standard operating procedures that we must have in place are linked to things like delegations of authority and they are; you know, they would look at that and say, you know, have we done a good job there? Do we have the right documentation? But yes, Jim, it was --

MR. RIDDLE: Um-hum, yeah.

MS. ROBINSON: -- we contracted to do an audit of the accreditation procedure.

MR. RIDDLE: Um-hum.

MS. ROBINSON: And we want future audits to focus on that.

MR. RIDDLE: Um-hum.

MS. ROBINSON: Don't worry, there are all kinds of people out there ready, willing and able to do investigative audits of federal programs and --

MR. RIDDLE: Um-hum.

MS. ROBINSON: -- they do them all the time.

MR. RIDDLE: Yeah, and I understand what you're saying as far as wanting it to be a biennial process because of, you know, certifiers, especially the ones under the ISO 65 Program are in that continual audit review update cycle and it's like a treadmill;

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
they'd never catch up. But I don't know if that is
fully consistent with ISO Guide 61 to have a biennial
process, you know, it's just something to talk about.
But I did have a different question and that is on the
list of applicants, it wasn't clear to me -- I know I
asked about it a couple months ago and we were told
during executive call that the list would be handed out
at this, at the October meeting like it has in the past
and just -- I'm not clear where that's at.

MS. ROBINSON: There won't be any list handed
out at this meeting.

MR. RIDDLE: At this meeting?

MS. ROBINSON: No.

MR. RIDDLE: So it's still being vetted, make
sure they're all --

MS. ROBINSON: Yeah, you know, people can
apply to be a nominee, to be selected for this Board as
they can for, you know, lots of advisory committees and
you know, you want to make sure that, for example, if
they're a producer, that they don't have an outstanding
loan with the Department; it's those sorts of vetting
procedures that you go through, that they're in good
standing with the Department and with respect to all of
its programs. That process hasn't been completed.

MR. RIDDLE: Um-hum.
MS. ROBINSON: There's a White House Office of Liaison that -- I think I said that, right? That has to go through -- does a vetting of all these folks. So it's -- it is premature. Now, we -- that doesn't mean you can't write in letters supporting individuals, recommending individuals, as members of the Board.

MR. RIDDLE: But how do I know who they are?

MS. ROBINSON: I don't know.

MR. RIDDLE: I just want to be clear, all right, will that list be provided once the vetting is complete?

MS. ROBINSON: I don't know. That decision is not made by me.

MR. RIDDLE: Uh-huh.

MS. ROBINSON: These are the Secretary's appointments, it is her call whether or not to give out the list of nominees prior to her selection.

MR. RIDDLE: But she approved that in the past? I mean, it was provided, has been provided in the past --

MS. ROBINSON: She gets -- I'm not going to -- the Secretary gets to do what she wants and make up her mind every year. It would be really inappropriate for me to speak for her.

MR. RIDDLE: Right.
CHAIRPERSON KING: George, quick comment and then we want to move --

MR. SIEMON: Well, I just want to go back to my commercially available -- I'm sorry, you all said you were going to review that document? I'd just like to -- in that review if we could get some feedback about the possibility of using other parts of the rule. I know it would take a real revision, but I'd just like to get your feedback on that because there's some issues that people have suggested that might be the solution, so I'd just like to add that, too. Because this deals strictly with processed food and I'm asking a question about the capacity -- move it beyond that.

MR. MATHEWS: And elaborate a little more on feedback on what?

MR. SIEMON: On using commercially available in the place that there was some discussion outside of NOP's process about using it, for example, to dairy replacements.

MS. ROBINSON: You just lost me. Say it again.

MR. SIEMON: Well, we all feel there's a need to clarify and unify the dairy replacements clause and so the question was could we use commercially available in that context?
MR. MATHEWS: Oh, so in addition to clarifying issues on when is seed commercially available and when is -- or when is an agricultural product to be used in an organic product not commercially available, you want to add in additional commercial availability options for other things such as dairy.

MR. SIEMON: Um-hum. Don't we have enough problems with commercial availability?

CHAIRPERSON KING: You bet. It's never ending.

MR. SIEMON: We have an equal amount of problems in the dairy world, too.

CHAIRPERSON KING: If we could move on. First of all, I want to thank the Board members for being prepared for the discussion and NOP especially providing us as thorough information as possible and I think it's important to have that dialog. It's been brought to my attention -- I'm sure it's no surprise to anyone here. And first, I just want to recognize that we need to, you know, be cognizant of the fact that it is a public meeting and there are many people here to hear our conversations and dialog about the directives. And one of the points of clarity, I think, that many people are seeking, myself included, in our travels and conversations with people out there is, is exactly where...
are we at with the directives and what I'd like to do is
just if we could have a -- just a brief conversation
about this one issue, then we will recess for lunch and
come back and perhaps have specific conversations about
the directives after lunch. But that is what is the
status of the directives? They were publicized and then
they were rescinded and there's some confusion in the
industry and so I think if we can sort of talk about
that, that would be helpful for the industry.

MS. ROBINSON: Well, I -- you know, I'm --
we've gotten the same questions, obviously. We've
gotten letters asking, you know, saying that there's
confusion and there's -- nobody knows what the status
is. And the reply that we have given is that we have
been awaiting the feedback from the Board and we have
taken no compliance actions with regard to those issue
papers and what we were under the impression that we
were going to do was resolve the uncertainty at this
Board meeting with an open discussion based on the
recommendations and the papers that you drafted. We
thought that's what this was going to do.

CHAIRPERSON KING: Well, we certainly don't
object to that.

MS. ROBINSON: Okay.

CHAIRPERSON KING: I was just putting that out
for those -- because there have been a lot of questions in the in-stream.

MS. ROBINSON: I know. I realize that.

CHAIRPERSON KING: How do we look at this from enforcement standpoint and what does this mean and so that's why you're --

MS. ROBINSON: Understandable.

CHAIRPERSON KING: -- hearing that question.

MS. ROBINSON: Understandable.

CHAIRPERSON KING: Not because we're confused about the process --

MS. ROBINSON: Okay. But see now, for this point right now, it doesn't matter. Anything that's been said between the time they were rescinded and today, because now we're all in the same room. I don't mean to say that those comments have no meaning, but here we are. Now we are at the point where we're going to have this conversation at -- beginning after lunch and this is where I thought -- this is what I thought we agreed to in June, that we were going to work this out and figure out all right, what've we got to do to make sure that there is no ambiguity and that everybody hears the same thing. And we would do that in a public forum where this meeting is transcribed and everyone who is interested from the public will hear it and we would
come to a resolution. Now, it may be that in order to
effect what we agree upon, we may have to do some rule-
making changes, but we knew that going into this. But
we're going to have that discussion today.

CHAIRPERSON KING: Sounds good.

MS. ROBINSON: Okay?

CHAIRPERSON KING: Thank you. Well, make it
quick, Rose.

MS. KOENIG: Yeah, on that note, then, as far
as our procedures or our process, because -- since I'm
the first up in terms of the discussion after lunch; so
the committees have presented these -- you know, our
recommendations in terms, you know, address the
directives and the recommendations, so do you envision
you would want us to vote, you know, discuss, you know,
present what our recommendations are and then
eventually, by the end of the meeting vote on what our
recommendations are and then what's the next step? Then
would you incorporate those or do you look them over or
are we supposed to be conversing and then we come to a
final agreement here? And so just for the public to
understand and for me to understand what the process is
after we go through this discussion.

MS. ROBINSON: Okay. You've drafted a
statement on each of these issues and you sent them to
us -- I've read them all, I presume the staff has read them all, too. As I said earlier, I thought that they were really good, constructive statements about each of the issues. So what I was assuming we would do -- and I don't really want to, you know, we can be flexible here. What I was assuming would happen is they -- whoever was responsible for the particular issue was going to be the spokesperson, would present that, present what you've written and your recommendations and then we just sort of have -- we'd have a give and take. And we would tell you okay, where we may have questions or where we may have some disagreement, but that we would just -- we would -- this is a working session; we would do this and we would do this now.

Let's not waste an opportunity to, you know, get these things settled once and for all. And maybe that say, you get all done and we decide okay, what we'll probably have to do is go back and write a proposed rule and that's exactly what we'll do and we'll be asking you to help us write that proposed rule, no doubt; help us, you know, with parts of it to the best that we can. But I thought that's what we were -- that's kind of the process we were going to go through. You talk to us, we talk back to you; we just thrash it out and we come to a resolution.
CHAIRPERSON KING: You mean actually communicate?

MS. ROBINSON: Something like that, yeah.

CHAIRPERSON KING: Say, that sounds great. I think we need food and --

MS. KOENIG: One statement. Because what's confusing me is on the proposed rule aspect of it and maybe I haven't researched all of the directives to the capacity that I should have, but when I looked at those directives, I thought those were interpretations of policy, you know, how you're taking the rule and interpreting it. I didn't -- I never looked at them as proposals for rules change and I never saw them --

MS. ROBINSON: They weren't, they weren't. But what I'm saying is in some of your statements, what you -- your recommendation would say -- and in fact, in some of the statements it actually says change the rules so that this is very clear. So that's what I'm talking about proposed rules.

MS. KOENIG: Okay, okay.

MS. ROBINSON: I'm not talking about the statements that were rescinded in April. I'm talking about your recommendations to take an action.

CHAIRPERSON KING: Okay. It's now 12:15.

MS. ROBINSON: Lunch time.
CHAIRPERSON KING: It is lunch time and we said be back at 1:15, so we will start again -- be back here at 1:20. I'll give you five extra minutes.

UNIDENTIFIED SPEAKER 1: Is this room going to be locked? For computers?

UNIDENTIFIED SPEAKER 2: Yeah.

***

[Off the record]

[On the record]

***

CHAIRPERSON KING: Thank you all for at least attempting to get back here in a timely fashion. I'd like to get started again and I apologize for being a bit behind on the agenda. Our first item up, which was originally scheduled just prior to lunch -- we'll begin a discussion of the committee drafts concerning the directives and I think that in this particular case, Rose was the primary author of the Inert document and I don't see her here, so we might actually jump to the next document because George is here.

MR. SIEMON: Becky's not here, either. She was going to do the Fishmeal, so do you want me --

CHAIRPERSON KING: Are you prepared to do antibiotics?

MR. SIEMON: I'm prepared to do antibiotics.
CHAIRPERSON KING: Well then, let's start there.

MR. SIEMON: Okay. I think it would be good for you all to talk about the assignment we were given.

UNIDENTIFIED SPEAKER: Use your mike, George.

CHAIRPERSON KING: Use you mike.

MR. SIEMON: Yeah, I'm sorry. The Policy Committee gave the different committees the assignment to go through and look at these directives and define what the issue was, compile any previous Board recommendations that are relevant to the directive and provide a recommendation for solving those issues. So it was a very clear assignment that we all went through and so the livestock document, the antibiotics is the first one and it -- that we're going to talk about -- and it was on both -- it was titled -- oh, I've got to find that now. It was titled about antibiotics and the --

CHAIRPERSON KING: Here's fishmeal.

MR. SIEMON: -- the origin of livestock. I'm sorry, I can't find it now. Can you guys help me?

MS. ROBINSON: The second tab on Tab 6, George.

MR. SIEMON: No, I was just trying to -- it's "Livestock Healthcare Practice Standard Origin of Dairy
Livestock." So it really was a little bit about both those subjects because it related to that, so -- are we going -- is it going to be up there on the board or are we going to --

CHAIRPERSON KING: Yeah, we had the Inerts --
MR. SIEMON: Do you want me to go through this, the different --
CHAIRPERSON KING: -- was initially scheduled, but can you -- yeah, she's got it up, so we're set, George.
MR. SIEMON: Okay. The issue was that the guidance docket came out allowing antibiotics when preventative practices and the other approved substances failed, as long as there was a one-year continuous organic -- prior to the sale of organic milk. That was the issue, that's what we're responding to. It's our opinion that that conflicts directly with 238C1, obviously the NOP differed with that. We felt that the same argument could've been used and we use the work misconstrue because it certainly wasn't the intent of NOP to allow other medications, which I think even -- and came out that was possible, as well as possibly other feed sources. So that was another of the issues that came out of it.

To us, one of the primary things is the York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
confusion is linked to the dual-track dairy replacement interpretation, which those of us that are involved in Livestock Committee and the dairy industry, feels a foundation -- concern here with this dual-track and then -- I'm going to jump through -- and then, of course, we -- the -- we talked about the -- what NOP has decided about that in our recommendation, which are all listed down below here. And we just felt there was a real conflict between the 238, which prohibits producers from using antibiotics and 236. So the foundation is we just felt that 238C1 was violated by the guidance document that came out. You know, you want me to go through all the recommendations, the previous recommendations all the way down?

CHAIRPERSON KING: Well, whatever you think would be most helpful to sort of frame the discussion, is what we're hoping for.

MR. SIEMON: Well, NOSB has been very -- pretty clear in all its recommendations. We just have here 98-4, but there's ones before that where we've always felt that there should be a unified standard for replacement and that antibiotic use is not to be used for animals on organic farms. We acknowledge that there was a problem with baby calves, there's still -- it's a debate in the industry about the antibiotic use there.
and so a couple of years ago we started a task force
trying to get people to put forward materials that were
alternatives to antibiotics that might be needed to deal
with that issue.

I think there's been a lot advancement in the
organic dairy trade to get away from antibiotics and the
dependency on them for calves. So I don't know, you can
read through that on here. You can see the different
recommendations that have been done that pretty much
have been for unified dairy standard and a pretty strict
no-antibiotic use. It gets really confused because it
-- this replacement clause mixes up with the livestock
health on -- for animals raised on a farm. And so you
end up with having two standards.

It gets very confusing, because for example,
calves -- if you're going to allow calves from outside
to come on organic farms, those calves might have had
antibiotics, but then you're not allowing antibiotics on
organic farms. So you get into a lot of different,
what's called two track of a -- two tracks for dairy
replacements and two different standards. So there --
it really ties in with the origin of livestock. Our
recommendations were fairly simple. We just think that
238C1 overrides the logic that was used and that once a
farmer is certified organic, all the animals must be

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
treated organically and that they cannot use antibiotics
and if they do, they must remove them from the farm.

That's -- and so we said that's our
recommendation, to issue a clarifying statement -- have
you all got that up there? You need to enlarge that, if
you can, too. It's under Recommendations. So we had
three recommendations. One's to write a -- clarify a
statement that antibiotics are not allowed for once a
producer's certified organic. Number two was to work on
whether -- and we understand it might take a rule change
-- the unification of the organic dairy standards and
once they've entered that from then on that they're all
treated the same. And number three, that we make
livestock materials a priority. We all know there's
some frustration about livestock materials moving very,
very slow and we talked about that earlier.

So those are the three recommendations we
came up; it's no real rocket science here and mostly, it
goes on this 238C1, it's our interpretation of that
versus what was put out in the directive. But the big
issue to us is this getting to -- livestock. So
Barbara, you said earlier that some of these are going
to be rule changes. I'd like to identify that as one of
the top issues we need to deal with because there's a
lot of misconception that there's two standards out

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
there, which in part, there are. And so we need to unify those standards once they're in the program.

I don't -- none of us mind that there's two ways to enter organic dairy production, but certainly the issue after that continues is inequitable. Anybody else on Livestock Committee? I went through that pretty fast, trying to get to the recommendation. We all went to the same restaurant, so we're all equally late here.

CHAIRPERSON KING: Jim reluctantly would like to comment.

MR. RIDDLE: Yeah, George, on the recommendation, I think, yeah, the first one is really important because of the confusion that occurred with the directive and then the retraction of it, that there be clarification that antibiotics are not allowed for organic animals or edible organic products once a producer's certified organic.

It's really reinforcing that 205-238 requirement and yesterday I took part in a day-long meeting of a [sic] organic committee of a campaign versus sustainable ag and there were broad stakeholder representation there and we went through all of these various recommendations and one suggestion to help clarify that first point, you mentioned about whether or not that directive was limited to antibiotics and it
might strengthen it or further clarify if we were to
insert a few more words and that would read NOP needs to
issue a clarification statement that antibiotics and
other prohibited substances are not allowed for organic
animals just to make it clear that, you know, any growth
hormones or therapeutic hormones or any other prohibited
animal drugs are not allowed, not just antibiotics.

So just a suggestion there to help clarify
that language. I think it's really important that a
statement be issued by the program on this topic and
that doesn't take a rule change.

MR. SIEMON: Another issue that I don't think
we caught, too, was the fact -- just a foundation issue,
is the federal rule -- the rule has a stricter standard
than OFPA for certain parts and so that's always -- when
you get down to this new legalistic world, you get into
a challenge how -- what the relationship is between a
rule that has a stricter stand than OFPA and so that was
a question I know was brought up, too, by the Department
is that the foundation rule is only the 12 months versus
-- the foundation law is 12 months and the rule has the
life of the animal for some of the people and 12 months
for some of the others. I think that's one of the
reasons why they fell back to this 12 month rule in this
antibiotic ruling.
But we still felt that disagreed with 238C1, which -- I don't know if we need to read that or not. Would anybody like me to read that? It's listed here, isn't it, somewheres [sic]? 238C1, "The organic livestock operation must not sell, label or represent as organic any animal or edible product derived from any animal treated with antibiotics. Any substance that contains a synthetic substance not allowed under 603 or any substance that includes a nonsynthetic substance prohibited in 604. Any edible product derived from any animal treated with antibiotics, organic livestock operation must not" -- to us, those are pretty clear wordings and even though we can see the confusion over the 12 months, we just feel they stand alone and should stand still.

CHAIRPERSON KING: Yeah, Barbara.

MS. ROBINSON: So do you want the Department's response?

MR. SIEMON: Sure.

MS. ROBINSON: Okay, the Department concurs.

MR. SIEMON: Okay. Now, that's on that one. Thank you.

CHAIRPERSON KING: Wait, hold on. Department then Andrea.

MR. SIEMON: The Department concurs, she said,
which I think means agrees.

CHAIRPERSON KING: Well, just --

MS. ROBINSON: That means agrees.

MR. SIEMON: Okay.

CHAIRPERSON KING: Just a question about the process, then. Will this be put on the web site for public comment?

MS. ROBINSON: I don't think -- you want public comment on the guidance statement?

CHAIRPERSON KING: On the recommendation.

MS. ROBINSON: That no prohibited materials can be given to livestock unless they are approved by the Board?

CHAIRPERSON KING: No. But what I was trying to do is understand George's -- or Livestock Committee's process on the recommendation, on these recommendations. If we're -- on number two, where we're talking about technical correction or a rule change.

MR. SIEMON: No, that would take all public -- I mean, it --

MS. ROBINSON: Now, the origin of livestock. Changing the origin of livestock --

MR. SIEMON: We're going to go there next.

CHAIRPERSON KING: That's -- okay, I thought --
[Simultaneous comments]

MR. SIEMON: I was going to go to the number two point next.

MS. ROBINSON: We can issue a statement that says no prohibited materials shall be given to livestock and still preserve their organic status. I mean, unless you approve the prohibited material. In other words, we agree with your statement.

MR. SIEMON: Well -- but then we still have the second part of the -- and --

MS. ROBINSON: Origin of livestock will take a rule change. That takes a regulatory change.

MR. SIEMON: And so you said earlier that's what may come out of this, so --

MS. ROBINSON: And that's what we'll do.

MR. SIEMON: So --

MS. ROBINSON: We'll proceed with rulemaking --

MR. SIEMON: -- you know, we would very much like to see this, it's been such a thorny subject --

MS. ROBINSON: Right.

MR. SIEMON: -- that we take this as a priority.

MS. ROBINSON: Right.

MR. SIEMON: Another issue that came up in
Chicago which I -- we didn't write in here about --
clarification statement was that these are for animals
born and raised on organic farms that we're talking
about here and there was some confusion about those
animals must be raised organically and you all confirmed
that was part of the organic program.

MS. ROBINSON: Correct.

MR. SIEMON: And I'd like to see that in a
statement, as well, because there's still a lot of
confusion about that our there.

CHAIRPERSON KING: George, if I could, Kevin
had a quick question.

MR. SIEMON: Oh, I'm sorry.

MR. O'RELL: It was just to clarify -- George,
my concern was on the second recommendation where the
Livestock Committee is requesting this as either a
technical correction or a rule change and I thought I'd
heard before that the NOP said specifically that this
requires a rule change and if that's the case, then
would we want to not say a technical correction?

MS. ROBINSON: It's not a technical
correction.

MR. O'RELL: Correct.

MS. ROBINSON: It's --

MR. O'RELL: It is a rule change.
MS. ROBINSON: It is a rule change and we'll have to go out and public comment will be invited on that. What you want to do, my understanding is you want to break that to tiers. You want to break that apart.

MR. SIEMON: After they enter the organic dairy, we'd like to have a unified standard.

MS. ROBINSON: Right. That will take a rule change. We'll have to write that up and then take public comment.

MR. SIEMON: Kevin, if you're suggesting that we take out as either a technical correction preferred, preferable -- you know, we just haven't necessarily agreed that it wasn't a technical correction. There's just been disagreeance [sic] amongst the NOP, at least in myself, so we can take that out -- I just feel like we need to fix it, whatever's the best way to fix it and public comment is -- can be part of that, so -- I don't know we're passing this, we're just --

MS. ROBINSON: Right, you're not --

MR. SIEMON: We're pointing to Harold Ford [ph].

MS. ROBINSON: Yeah, you're not voting on this at this point.

MR. SIEMON: Yeah.

MS. ROBINSON: You're telling us -- my
understanding is that you -- this dialog is you
communicating to us what you would like to see --

    MR. SIEMON: Um-hum.

    MS. ROBINSON: -- have happen, what your
preferred outcome would be. And we are -- we're
agreeing with you. I know you expected us not to, so
that's maybe causing some problems here, but --

    MR. SIEMON: No.

    MS. ROBINSON: -- we're agreeing, so we'll
work towards that. But the reason it -- I just want to
say, a technical correction is something that you do
when there, you know, it's clear that there was a, you
know, a mistake in the rule, you know, a word out of
place or you know, something --

    MR. SIEMON: Wrong with letter order --

    MS. ROBINSON: Yeah --

    MR. SIEMON: -- number order.

    MS. ROBINSON: -- I mean, something -- but a
rule change that has economic impacts on businesses is
not a technical correction. You're talking about a
substantive change to the rule and so you know, you
can't slip it into one of the materials dockets as if it
was a technical correction and say okay, we took care of
that little problem.

    CHAIRPERSON KING: Andrea was up next and

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
then Jim.

MS. CAROE: I have two questions, George, one on the second sub-bullet for the second point. You indicate that the dairy producers and the certifiers have endorsed this recommendation. I was wondering if you have any data on that to show what kind of buy-in you've got from industry on this?

MR. SIEMON: I don't have any data on that. I just know from all the discussion -- there's been a lot discussed about this --

MS. CAROE: So --

MR. SIEMON: -- you know, so I -- that's hearsay, I guess, if you want to say it. I mean, it's pretty well-known how it fell out, but there's some dairy producers don't agree and there's some ACAs that don't agree, but the vast majority of them do.

MS. CAROE: So do you have -- I mean, I guess I was trying to get -- is this like a no-brainer, that everybody wants this or are we seeing a split decision somewhere or -- you know, is there a minority opinion on this or --

MR. SIEMON: There's definitely a minority opinion, I believe. I'm not -- I'd have to ask around, but I think the statement's correct, the vast majority. I don't know what vast majority means, 70, 80, 90
percent.

MS. CAROE: I think endorse was the word that kind of threw me as I thought when you used the word endorse that perhaps that you had some --

MR. SIEMON: No. There's been no --

MS. CAROE: -- more formalized data on that.

MR. SIEMON: Not unless -- not that I'm aware of, so no, I'd say that's just the feedback we've got.

MS. CAROE: The other question I have is in regarding to the sequencing of these recommendations. You indicated that calf hood medications are an issue, but that's like the very last item on here. If you don't deal with that first and then you take away allowances, is there going to be a problem? I mean, how widespread is this and are you --

MR. SIEMON: Well --

MS. CAROE: What I'm asking is do you have a recommendation of how these things would fall into place so that nobody gets stuck in a hole and -- without the tools they need in order to --

MR. SIEMON: Um-hum.

MS. CAROE: -- stay in organic production?

MR. SIEMON: Yeah. It's a good question. First off, a couple years ago we addressed this issue both in OTA and NOSB and we really put the word out
there what medications are needed that are on the list, let's make them a priority, this is a problem and we really got very little response. So some we've already done the last bullet. And the first bullet was referring to the frustration that we got -- talked about today about the materials not coming out that we have passed.

So I think both of those are in play right now and I'm not aware of that many calf-hood medications out there that haven't been brought forward, but we've called for them and if they're out there, we'd like to see them come forward and put through the process. So no, I don't think there's any -- this is a standard people are already working under right now, relatively. If you talk to the people in the community. I mean, there's a difference in the ACA, how they're endorsing this. But most of them are still not allowing antibiotics in young stock.

CHAIRPERSON KING: Jim.

MR. RIDDLE: Yeah, well first, I would like to respond to Andrea's question there because we've had drafts posted for both of the recommendations that the Board adopted. The first was for requesting an interpretation to support the, you know, one herd applies to both once they've been converted and then
when we adopted that, then we were told that it would
really take a rule change to address this, so then we
redrafted as proposed rule change language; that was
posted for public comment and then adopted by the Board
and in both of those rounds of public comment, we
received written comments and we received verbal
comments, which are part of the transcript public record
and we did not receive one comment in support of -- or
you know, opposition.

So I think it is accurate to say vast majority
based on the public comments that the Board received.
But it's still going to go out and I'm hearing a
commitment to pursue rulemaking on this issue and it's
going to go out for a public comment again in the
Federal Register. That will generate comments and if
there are concerns or opposition, that would be, you
know, the time to speak, to provide that data and the
issue of calf-hood medications, I think, would be a
logical concern to be raised in response to that
proposed rule.

So I think, based on all of the information we
have been provided, we do have support for this position
and it's still going to go through a big filter to
assess the impact. I guess in consideration of that, I
would ask whether it would be the intent of NOP to
publish as proposed rule or as interim Final Rule. I think this is a big issue. It's been an issue; we'd all love to see it get resolved. And it is creating disharmony, consumer confusion and I was just talking with a certifier over lunch who has, you know, some operations under both standards and the farther this goes, the harder it is to manage when you've got two standards being applied and in consideration, then, it certainly might warrant proceeding as an interim Final Rule.

MS. ROBINSON: Well, we would always prefer the most, you know, to get to the finish line quickly, too, Jim. But the Office of Management and Budget, which has to approve any rulemaking that we do has already told us that any rulemaking we do will be considered major and it will start as a proposed rule, so we tried that course and got our answer.

MR. SIEMON: I just want to clarify that, you know, what we're recommending is the May 14, 2003, as a starting place because the -- it says -- I'm just finding a fault with this writing here. "This will unify and clarify the standard for dairy herd conversion." It's not the conversion that we're trying to deal with here, it's about after they've converted -- about dairy replacements, so I think the May 2003.
stands, but Jim, I find that wording to be a little bit confusing talking about conversion. It's about the organic dairy replacement is the primary issue here.

MR. RIDDLE: I agree. It's kind of a post-conversion.

MR. SIEMON: Yeah, it's just not quite written right. Okay. I'm eager to talk about a rule change and the timing of the next steps, because I know it's a long process. Is it going to have to be tied to other rule changes or can we go alone on this, just this alone?

MS. ROBINSON: As soon as we get it written, we can go. But I'm not promising you that you're going to get a rule change in, you know, a month.

MR. SIEMON: Yeah, I know. It's a long process.

MS. ROBINSON: But there's no need to -- in fact, I would recommend not tying this rule change to other rule changes because, you know, why -- because if you get conflicts in one area, it holds up the whole thing, so I think you're really better off to proceed --

MR. SIEMON: I agree with that.

MS. ROBINSON: -- with a single issue per rule change.

MR. SIEMON: I agree with that. Okay.

MR. MATHEWS: Are you contemplating providing...
us with some economic impact data that we were -- that we will need in order to make this rule change?

MR. SIEMON: Well, if you tell us what you need, we'll try.

MR. MATHEWS: Well --

MR. SIEMON: Make an assessment of it, so --

MR. MATHEWS: It's the kind of --

MR. SIEMON: It depends on which way the Final Rule's going to go.

MR. MATHEWS: Right.

MR. SIEMON: Now we've got the May 2003 as where we're starting from, you know, it's -- we want to unify standards, the primary thing here. If it goes one way, it's less of a burden, if it goes the other way, it's more of a burden for -- you know, so this standard is more of a burden for a certain group of people.

MR. MATHEWS: Right. I guess I would refer back to the decision tree that we've got, that you use, we use that would help by working through what it is that is the real problem, why it's a problem, who is the problem for, what are the different options for solving it, what is the option that you've selected. And then try and provide us with some economic information as to what is the impact on the farmers for taking this action of changing this rule because we're going to be held to
a pretty high benchmark for making this rule change, not
only by ourselves, but by the Office of General Counsel,
by the Office of Personnel Management, so --

MR. SIEMON: But --

MR. MATHEWS: That's going to want us to be
able to fully justify this, so we're going to be looking
to you to help us fill in those blanks.

MR. SIEMON: Well, you know, the problem I'm
having though is was that done -- and when you have
these two standards, one group is disadvantaged over
another group at this time. Did you do the economic the
first time we did the rule? Because this is a real
disadvantage.

MR. MATHEWS: The first time the rule was done
there was an economic impact statement and there were
discussions with other federal agencies, including ONB
and we're going to have to go through the whole same
process again, so we're going to be relying heavily on
you for that information.

MR. SIEMON: If I could see the first work
that was done -- because those are the -- usually, the
smaller farmers are more impacted in anything that were
affected previously, so yeah, I know that needs to be --
and we'll look at the decision tree. And I'd like to
have the Livestock Committee revisit their

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
recommendation and see if this is their -- still this recommendation. Even though we put it forward, it's good to start to all over and make sure we're -- got fresh eyes on it.

CHAIRPERSON KING: Jim then Rose.

MR. RIDDLE: I guess -- I think we have a standing recommendation to work from as far as the language goes that's already been adopted by the Board. I don't see a need there to, you know, delay on that. I can see providing some assistance or input on some of the impacts of it, but at the same time, you know, we are volunteers. If we had an executive director, that would be a great thing for that person to work on, but you know, we do have public employees who have the expertise to do some of this analysis, so I think if there's somebody who's leading the charge, who's getting paid and then says, as advisors, can you help us with this or that, great. But I don't think it's fair or realistic to expect us to do that as part of the analysis.

MS. ROBINSON: Well --

MR. RIDDLE: And I don't think that the original regulatory impact statement in the Final Rule approached the impact of a dual standard for dairy conversion or dairy herd replacement stock. So we
really don't have anything to work from there.

MS. ROBINSON: Well, we will have to do a reg
impact analysis, that's true. And when the Final Rule
was promulgated and the reg impact analysis was done,
you know, the data that was available at the time is far
less than it is today, even as skimpy as we still think
the data is today. But we do have better knowledge of
the numbers of dairy operations out there that are
certified. We can and we will contact all of our
certifying agents and we will try to get -- gather as
much information in terms of average sizes of operations
and that sort of thing.

It -- the issue, the -- when you do the reg
impact analysis, if you are weakening the rule, relaxing
the rule, in other words -- I shouldn't use the word
weaken in this room. But if you're relaxing a rule,
such as mending the National List, we consider that to
be a relaxation of the rule because you are adding more
options for producers. The burden to show the
regulatory impact analysis is far less because you're
not clamping down on people's businesses, you're giving
them more options and so the burden of showing an
adverse versus a beneficial impact is easier to do when
you're relaxing the rule. In this case, you know, I
can't conceive of this being a rule change that most
people would not believe is a tightening of the rule. You're making the rule stricter by what is you want. So in that case, in tightening up the rule, we'll have to be able to demonstrate that the benefits of tightening up the rule, the benefits of the change that we are proposing exceed the costs that the change will impose. And we'll look to, you know, we'll look for ERS date, we'll look for industry data, we'll -- we will come to you if you, you know, can help provide sources. There are many research organizations out there; we're not going to hold up a rule change because you do or don't get us the economic data that we want. But if you can be helpful, we would appreciate it. Yeah, it would speed up the process.

CHAIRPERSON KING: I think -- I just wanted to say something real quick, George. It's important to understand what our role is and so we appreciate that feedback and understand where we need to go with this and one of the things my hope is that comes out of the conversations today is takeaways, action plan, how are we going to approach this, are we on the same page? With that in mind, we, as usual, have limited time and we are scheduled for public input at 3:00 p.m., so we've got three other documents and so George, if you have some closing remarks, please feel free to set an action
plan in place. I think we need to at least complete the
circle here.

MR. SIEMON: Well, I think we're through with
this one. Ready to move to the fishmeal? I mean,
there's a lot to talk about the first one, but is that
all right? Okay, well I've asked Becky to present on
the fishmeal. She's kind of been our local -- or
livestock fish expert.

MS. GOLDBERG: Okay. So the Fishmeal
Livestock Committee recommendation is in the book under
the same tab, just on the other side of the orange sheet
of paper and the committee recommendation is obviously
in response to the directive issued by the NOP
concerning the use of fishmeal in livestock feed. The
NOP said that fishmeal can be used as a protein
supplement in feeding organic livestock without regard
to the source or apparently the preservatives that might
be used in the fishmeal. I will run through the
introduction to our recommendation.

The committee acknowledges that fishmeal is a
valuable source of protein and specific amino acids,
clearly methionine in poultry feeds is a particular
case. It's our view that fishmeal by itself, that is
before any preservatives are added, is nonsynthetic. We
also acknowledge that there's confusion about when a
natural substance becomes a synthetic. We had a lot of
discussion about this in the committee. NOP brought to
us some examples of substances; well, they're not say
natural substances, but substances where preservatives
are added, for example, in vitamins and whatnot and we
don't take them into account.

We know that fishmeal is highly perishable,
it's also combustible and therefore usually contains
preservatives, many of which are synthetic substances
and therefore not approved for organic livestock
production according to the relevant sections of the
rule. We know that the OFPA allows for the use of a
substance if it would not be harmful to human health or
the environment. We know that conventional fishmeal
can, at least in some instances, be produced from fish
harvested unsustainably and there certainly are some
data sets indicating that at least some fishmeal can
have contaminants such as PCBs, dioxins and so on and so
forth.

We state that organic fishmeal will not be
available unless standards for wild caught organic fish
and/or organic aquaculture are developed, in other words
so that there are fish -- organic fish available to make
organic fishmeal. And finally, we acknowledge there
remains confusion as to when a feed supplement or
additive becomes a feed to -- a 237A, requires a use of organic feed, but allows the use of nonsynthetic substances and substances listed on 205-603 as feed additives and supplements.

The definitions of feed, feed additive and feed supplement do provide definitive guidance as to the types of nutrients, carbohydrates, proteins, fats, amino acids, vitamins or minerals that are considered under each, nor do they establish limits on quantities allowed in feed rations. And we think this is a very important point. I'm not going to go through all the background statements in the recommendation. We reference an NOSB 1994 livestock feed standard recommendation, a number of sections of the rule and of the OFPA, and some definitions from AAFCO and the Association of Plant Food Control Officials concerning definitions of natural and natural organic fertilizer.

I'd like to then move on to going through the recommendations and if necessary, we can go back to the background statements and to questions later. First of all, as we said in our introductory statements -- it's a little bit duplicative, but the Livestock Committee believes that fishmeal by itself in nonsynthetic. We also believe that fishmeal with synthetic substances is synthetic. We find that fishmeal preserved with natural

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
substances and that would not be harmful to human health or the environment should be allowed as a feed additive or feed supplement for organic production in accordance with various relevant sections of the rule. We find that the use of fishmeal must comply with all applicable requirements of the Federal Food, Drug and Cosmetic Act is required by the rule.

Natural preservative ingredients are allowed in fishmeal, used in organic production. Synthetic preservative ingredients used in fishmeal must be petitioned, reviewed and placed on the National List in order to be allowed according to 205-105A. The status of fishmeal for use in organic aquaculture as opposed to livestock production will be considered during the development of NOP aquaculture standards and issues to be considered should include the sustainability of fisheries exploited for fishmeal and possible contaminants in fishmeal.

If NOP standards and definitions are developed for the production of organic fishmeal, then organic fishmeal must be used as a feed, feed supplement or feed additive for any organic livestock in accordance with 205-237A, which requires the use of organic feed. Finally, and there are three items here that have more to do with general NOP policy and regulation rather than...
fishmeal itself. A clear, predictable policy needs to be developed concerning what incidental substances and livestock and crop production materials make an otherwise natural substance a synthetic; to clarify the distinction between natural and synthetic substances, the Livestock Committee recommends that the current definition of nonsynthetic or natural in the Final Rule will be revised. The definition's in the background section.

The AAFCO definition of natural and the EFCO [ph] definition of natural organic fertilizer should be considered in the revision process. We realize this is asking for a rule change and you know, that's a lot of work. Nevertheless, additional clarity, even by policy would be useful in helping people understand the difference between a natural and a synthetic. Finally, to clarify the differences between feed, feed additives and feed supplements, the NOP and NOSB should provide guidance concerning the types of nutrients, carbohydrates, proteins, fats, amino acids, vitamins or minerals allowed in each category and if there should be limits set on the quantities of nonorganic feed additives or supplements allowed in organic feed rations.

In other words, we think it's problematic if
feed additives and supplements are used in large quantities. We can't really tell then whether they're really feed rather than say, feed supplements. So that's a lot of recommendations and as I said, some of them deal with fishmeal specifically and some of them are more general matters of policy to do with the difference between natural and synthetic and the differences in meaning of feed, feed additives and feed supplements.

MR. SIEMON: It's really the first six bullets is recommendation on fishmeal and I would think that the two on aquaculture needs to be forwarded just to the task force that we're forming. And really, the next one, a clear predictable policy is really one of the bigger ones that I think is a Material Committee charge, but that seems to be the underlying issue here is when does a natural become a synthetic, so I think that's something that the Material Committee needs to take on. So really, it's the first six that are recommendations here for the --

MS. GOLDBERG: That are specifically in response --

MR. SIEMON: To this directive.

MS. GOLDBERG: -- to the directive. And the others are issues we had to grapple with in considering

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
this recommendations and we spent a lot of time on this recommendation, but we wanted to raise them for consideration.

MS. ROBINSON: Okay.

MR. SIEMON: Um-hum.

MS. ROBINSON: Ready for the Department's reaction?

MR. SIEMON: Sure.

MS. ROBINSON: Okay, the Department concurs. In fact, in reading your -- again, I do want to compliment you. These are well, though-out, well-articulated statements and we appreciate the hard work that you all put into putting these together. We certainly appreciate the fact that with respect to fishmeal, your understanding is similar to ours. The bottom line is that any synthetic added to fishmeal must go through the petition process and be approved by the Board in order for fishmeal with a synthetic to be used in livestock feed. Fishmeal is a natural, you concur.

It is nonsynthetic and fishmeal with a natural preservative or an approved -- otherwise approved substance is allowed. So the Department concurs. On the two recommendations that deal with organic aquaculture, we agree with George. We believe that those rightfully belong to the task force that should be
created on organic aquaculture. And the last three, as we've discussed, we believe the NOSB should draft recommendations for the Department and we believe that the Board needs to have this discussion on what turns a natural into a synthetic and come up with some clear fence posts on that. But as far as the recommendations on fishmeal, we're fine.

MR. SIEMON: And then would -- are we going to take a statement to come out along that line or what's the process forward?

MR. NEAL: We have an additional comment. In considering when a synthetic substance is added to a natural, you need to take into consideration how does one petition -- and I guess at the same token, the term synthetic active is not defined in OFPA. And that needs to be defined because how does one petition a nonactive substance to be included on the National List, such as a preservative? A preservative is not delivering the effect, the intended effect to the animal. So this is one of the issues that Rose is going to be discussing, so these recommendations are going to impact a host of other materials that are already on the National List, so -- but it's going to impact a host of other substances on the National List, so these are some things that you want to think about.
MR. SIEMON: And this is an entry that's come up irregardless of the fishmeal, is about this active synthetic.

MR. NEAL: Right.

MS. ROBINSON: But in response to your question, George, we can put a statement on the web site that says fishmeal is a recognized feed supplement, a nonsynthetic. If fishmeal contains a synthetic substance, that synthetic substance must have been petitioned and approved by the Board and amended to the National List.

MR. SIEMON: Great. Thank you.

CHAIRPERSON KING: I think Rose and then Andrea had a question.

MR. SIEMON: Okay.

MS. KOENIG: It's not really a question, it's more to what Arthur was saying that one of the drafts that we'll look at in terms of -- it's called Interpretation of OFPA and the National List, does address that, you know, question that you all have already posed to us in terms of OFPA categories, you know, within that proposal and we'll get -- I don't want to spend a whole lot of time on it, but you know, the proposal suggests that the production aid category would be the category where that would fit rather than going...
back and you know, that there is actually a category
with an OFPA that we should consider placing these
because even though they're -- you know, I agree with
your argument that, you know, the preservative is not
the fishmeal active, but it does serve an active,
functional role as a preservative. So it is -- it's not
this concept of an inert. It is another additional
agreement that has a function, so that's whey we
considered the production aid category.

CHAIRPERSON KING: Okay, Andrea. Quick
question.

MS. CAROE: Yes. So I guess I'm -- you said
that there's some confusion between supplements versus
feed and clearly, the way I look at this, it's -- the
fishmeal's being treated as feed, is it not? Because
you're saying that at the point that we have aquaculture
standards and there's organic fish, that you have to use
organic fish for the meal, which would mean it would be
a feed, not a supplement. And as far as I know, we are
not petitioning all of the incipients in vitamins and
other supplements, so is it a supplement or is it feed
and are we following that on track? And the next thing
I want to add before you answer that is if it is a
supplement, shouldn't it be handled somewhat similar to
the way we handle vitamins in processed foods which has
levels that are appropriate for supplementing?

MS. GOLDBERG: Well, I think what you're getting at, Andrea, is something we highlight at the end of the differences between feed, feed additives and feed supplements are not defined and so it becomes very confusing what's what. In the context of livestock production, we are looking at fishmeal as a feed supplement. In other words, it's used to add amino acids or highly-digestible protein to feed typically at relatively low levels in an animal's diet. But it is legitimate to ask, particularly in the case of aquaculture standards, at what point does it actually become a feed, you know, if fishmeal is say, 30 percent of an animal's diet, that doesn't seem like a feed supplement anymore.

MR. SIEMON: It's not. So it's the level of feeding and of course, the rule that we're dealing with is 237A. This is being called the nonsynthetic substances and may be used as feed additive and supplements. It doesn't say -- anything to do with feed, so that's why if it is to be used as a feed, as in aquaculture, it's going to have to organic. But again, that's jumping the gun to our task force.

MS. GOLDBERG: We are just dealing with the livestock standards here and that's really important to
recognize.

MR. SIEMON: That's right. These other ones --

MS. CAROE: Okay, so your bullet point that says it will be required to be organic when we have aquaculture really doesn't apply because it's not a feed, it's a supplement.

MS. GOLDBERG: I don't see actually a bullet --

MS. CAROE: The one that starts, "If NOP standards and definitions are developed" --

MS. GOLDBERG: Right.

MS. CAROE: -- "which required the use of organic feed."

MS. GOLDBERG: If NOP standards and definitions are developed for the production of organic fishmeal, then organic fishmeal must be used as a feed, feed supplement or feed additive for any organic livestock. If there was organic fishmeal, then you could use it --

MR. SIEMON: Okay, I --

MS. GOLDBERG: But we don't have it at the moment.

MS. CAROE: But you said -- but you say it's required?
MS. ROBINSON: I would suggest you delay this until you have the task force on --

CHAIRPERSON KING: Yeah, this is --

MS. ROBINSON: -- aquaculture and wild caught.

MR. SIEMON: No, actually, I was wrong. This is the standard that says, "In the future, if there is organic fishmeal" -- this is almost is a commercially available situation, then you would have to use this, is what they're saying. So really, this is a distinct -- I didn't quite catch that earlier -- this is a distinct -- another standard. But again, I don't think that's -- just what we're dealing with today is the directive that came out about fishmeal and so I agree. This isn't about aquaculture, this is about a future -- when there is organic fishmeal, how does that relate to the use fishmeal for all feed uses?

MS. ROBINSON: You will have to change -- if you go down that row when you deal with livestock feed supplements, you're going to have to go back and change the rule again and say that oh, by the way, whatever we said about feed supplements, vitamins, minerals and all those things, now if they're organic, we're not going to let you just use natural, available substances. But I would really urge that you -- before you have that discussion now that maybe you'd wait and cross that
bridge when you get to that bridge.

CHAIRPERSON KING: Yes. Thank you. I'm just being cognizant of the time and we just have about 15, 20 minutes --

MR. SIEMON: Okay.

CHAIRPERSON KING: -- for two more documents.

MR. SIEMON: So I think the last thing is -- because everything got -- from the NOP is we have to develop this policy on when does a natural become synthetic, so is that going to become the Material's duty now?

CHAIRPERSON KING: Well, I know that Rose has done some preliminary work on looking at when -- looking at synthetic versus nonsynthetic --

MR. SIEMON: You feel that's in play now, that's in --

CHAIRPERSON KING: I think the process has started. I think we have a lot of work to do. So it, you know -- and God forbid the two committees actually work together on an issue, but -- and I say that because we've just started to do that, I think, more and more and it's a really good thing, so anyway -- what did you --

MR. O'RELL: It could be three committees, too.
CHAIRPERSON KING: It could be three committees. I think, Kevin, your point is valid. I mean, it could be the entire Board. Jim.

MR. RIDDLE: Yeah, the very last point. The differences between feed, feed additives and feed supplements is something, I think, that the Livestock Committee should keep on the work plan and maybe we can up with a draft to help clarify that, you know, looking at the current definitions and how they're used in the rule, so that would be one to, you know, we're not changing anything like that, but I think we should keep that on the Livestock Committee work plan.

CHAIRPERSON KING: Rose, you're up. Inerts Document.

MS. KOENIG: Okay. Sorry that I was late. We were trying to -- we had just gotten our food when it hit 1:30, so -- so thanks, George, for going ahead on the agenda. I just want to briefly discuss the Inert Ingredients draft, particularly the background was at the directive stated it -- "The certifying agent and producer, after reasonable effort, contacting the manufacturer, EPA and other USDA-accredited certifying agents are unable to ascertain whether inerts in a pesticide are allowed under the NOP, the certifying agent will approve that part of the organic production..."
system plan."

And that, essentially -- that statement or that kind of -- to me, it's more like an internal policy that was being directed in that directive, was the one that was the most trouble, some statement, I guess, for the committee. And we relied on, in terms of the background information, a lot of the OFPA and rule comments and sections of the rules that were appropriate in terms of dividing our -- devising a recommendation. And that document has been on the web site and it's in front of you, so I -- and in an effort to save time, I would just recommend that people look at that background information.

And we also had an Inerts Task Force in 2003 look at, essentially, the same issue in terms of the, you know, the discussion issue regarding List 2 and well, specifically, List 3 Inerts. The recommendations that the committee came up with -- there was four and I'll just, I'll read those and then we can do the discussion from that. Number one, the NOSB encourages pesticide manufacturers who want to market their products for organic production to take advantage of the EPA Organic Labeling Program. They are encouraged to disclose all product ingredients on the pesticide label including inert or other ingredients as advised by the
EPA.

And then two, pesticide manufacturers with products that contain allowed active ingredients and List 3 inert ingredients are encouraged to reformulate to comply with the existing regulation. Other options are to notify EPA of a need for expedited review and to petition the NOSB for review of that specific inert, List 3 inert. And note that petitions to the NOSB may take up to three years for regulatory action. However, we have looked at a couple, actually three different inert ingredients which are now -- have been recommended for inclusion on the list. So that has been a mechanism which manufacturers have taken advantage of, is going through the petition process.

Number three, since the EPA regulates the use claims, directions for use and composition of a pesticide product as a pre-market condition, the NOP should establish a functional line of communication with the EPA in order to provide EPA consistent information about organic standards and updates to the National List and to obtain advice from EPA on the status of petition materials. And some of that work has been done previously. Bob Torla [ph] has come forth to the NOSB and given presentations about kind of the programs that they have proposed.
And then finally -- and then this basically, Statement 4 kind of addresses that -- the directive, at least the problematic statement which we picked out in the directive. "Certified agents who find that producers are reporting use of pesticide products with unknown inert ingredients should instruct producers to discontinue use immediately unless the ingredients can be verified as complying with NOP regulation. Discontinuation of use will be considered sufficient corrective action for use of pesticide products with approved, active an unknown inert ingredients."

So really, the concept is -- you know, the difference, I guess, in our position versus the original directive is that the original directive said that there was a problem, there's an unknown and you can continue to use that unknown until we find out information. And that once we find out the information that there's a List 3 in there, then you have to stop and our recommendation says if there's an unknown and you can't determine it, that's when you stop. You don't allow in a farm plan continual use. So you do not approve in the farm plan.

MS. ROBINSON: In other words, this is when in doubt, go without.

MS. KOENIG: Exactly.
MS. ROBINSON: The Department concurs. That will only require a statement on the web site, as well. In case you were going to ask.

MS. DIETZ: Just to comment. Rose, you just -- clarification that the Materials Committee didn't -- these things came out without the Materials Committee discussing them and so Rosie's done a tremendous job on drafting lots of documents in the midst of a hurricane, two, three, four hurricanes, and -- but the committee's -- we haven't actually discussed them and that's why you see on our committee vote minority opinion and conclusion, there aren't any because we just haven't discussed them, but she's done a great job with the documents.

CHAIRPERSON KING: Other comments?

MR. SIEMON: Yeah, I'm just wanting to make sure because remember two years ago we had the apple people here talking about how hard it was to get what inerts were in the substances, so I guess that's what Barbara just said, so if they can't find out what's in it, they can't use it.

MS. ROBINSON: That's right.

MR. SIEMON: That's what I just heard you say, so I just want to -- because we heard from public testimony that they can't get this information, so I'd
like to hear what are we going to tell the farmers, then, when they can't get this information, don't use it or find some other one?

MS. KOENIG: Yeah, and I think, George, if you look at the -- well, the regulatory background and then the discussion -- it really -- the discussion elaborates on kind of the ways in which there has been some action taken to help address the situation, so although maybe all systems aren't perfect, there are mechanisms in place and resources that growers can utilize now and hopefully, the progress that has been demonstrated, you know, by EPA, by manufacturers who already have chose to reformulate, by people who have petitioned to get inert ingredients.

I mean, we've shown and we've demonstrated as a Board that we will consider selectively adding -- if we review them. So you know, I just think in this point of time and I think through the discussion items, we've clearly indicated that there are actions that have been taken since those, you know, initial issues that are moving in the right direction and that this policy reflects those recent actions and it really encourages those who have reformulated, it encourages agencies such as the appropriate technology transfer and the check sheet tools that hopefully we're supposed to, you know,
improve communication and grower knowledge, so you know, I just think that if you read that discussion, hopefully it will be helpful in understanding the justification.

CHAIRPERSON KING: Other comments? All right, next we're up with the Scope Document, Dave.

MR. CARTER: Okay, the Scope Document, the policy development committee went through the Scope directive that was issued in April and particularly some of the areas where there's overlap with other committees, we attempted to work that through and dissect that a little bit, so let me summarize here briefly, there is one error in this document that I noticed as I was reviewing it, but on the background side, when it talks about the areas where the Scope Document addressed the -- where we went through and I've got it summarized on here.

Scroll down just a little bit there. In those areas there where we have five areas listed, there are actually six. The one that's omitted from there is pet food, but the areas that the Scope, the April 13 Scope Document addressed are personal care, body care products, cosmetics; secondly, dietary supplements, over-the-counter; third, fertilizers, soil amendments, manure and related products; fourth, fish and seafood farm-raised or wild-caught and then the fifth area was
pet food and the sixth area was mushroom, apiculture, honey, greenhouse operations, green house products, et cetera. So what we tried to do was go through them and look at these in terms of each category. Again, as the others have done going through OFPA, the regulatory language, the preamble language, and trying to draw that through.

So the first two that we put together were the areas of number one, personal care products, body care products, cosmetics and other related products and number two, dietary supplements, over-the-counter medications, health aids and other related products. The areas from the April directive that where the program had kind of laid down their rationale is that number one, that these were areas that were under the jurisdiction of FDA and also affected by applicable state laws that accordingly, then, the products listed above may not display the USDA Organics seal or imply that they're produced or handled to USDA/NOP standards and that anybody using the seal would have until October 21, 2005 to use existing labels and packaging. There's also on this one been some extensive input from the industry, particularly OTA and others, who made the observations that the -- remember first of all, the -- let's see, you can go on down, Katherine -- I'm sorry,
I'm giving the cliff notes version of this. Go on down a little bit further. Yeah, okay.

   The OTA and others had specifically laid out three areas that number one is recognizing that it can be a complex task to develop, to apply standards that were developed for crops, livestock and food products to other ancillary areas. Number two, that given that first one, still that there is clear authority in OFPA over again a -- produced agricultural products that are included in those and that that authority should be the overarching factor to use in determining the scope of the organic program. And then the third, the absence of specific standards for such products such as personal care and cosmetics should not become a reason for allowing the organic claim to be used, to be made for such products and that until such standards are developed, USDA should not allow the organic claim to be made regarding these products.

   What the Policy Development Committee then had put out for consideration is that NOSB and the industry groups, consumer groups, affected industry and other stakeholders solicit information concerning the certification, regulation and labeling of organic personal care, cosmetic, dietary supplements and specifically recommended that there be two of the
following -- two questions be addressed; those being first, number one, should legislation be adopted and rules written to regulate the labeling of organic personal care, cosmetic and dietary supplements and number two, should legislation be adopted to prohibit the use of the word organic on products not covered by OFPA, including those areas. So trying to not only draw a fence around what could be labeled and how those would be handled, but also to create some clear boundaries to prohibit the use of organic in areas outside the scope. And let me just talk because I'm going to go through each of these and see questions or comments, feedback on that particular -- yeah, Jim.

MR. RIDDLE: Yeah, Dave. One thing you didn't mention there is the second paragraph under the NOSB consideration where we took the position and this agrees with prior statements from NOP, that if the word organic is used to identify an agricultural product or ingredient, then the agricultural product or ingredient must have been produced and handled in accordance with the Act and the regulation. So that's just kind of stating the obvious, but it needs to be stated here in this context.

MR. SIEMON: And that's in agreeance [ph] with the directive?
MR. RIDDLE: Yeah. But the one issue that we really didn't tackle here in this part of the document is that use of the word organic on the principle display panel of these categories of products. The directive did and set a deadline for such use for removal of such claims. Is our -- is it our position, then, that we concur with that portion of the directive? I mean, I was asked about this yesterday during discussions and I do think we can't just ignore the issue.

MR. CARTER: No, that's a good question. I don't want to speak for the entire committee, but you know, I think the sense of the committee was -- and under the previous Scope Document, it was that if you could certify a process in which you either complied with the 70 percent, the 95 or the hundred, you know, the hundred percent, that you would be allowed to use it and that was, I think, the major change, so --

MR. RIDDLE: So I would -- I'll just propose this. I guess I'll move that we add a sentence that would follow that, sentence that I did just read, which talked about the ingredients or agricultural products, but -- and then specifically say if the word organic is used on a principle display panel, the label claim must comply with Sub-part D of the regulations which regulates that use of the hundred percent organic and
made with organic claim. If it's going to be on the
front panel, it has to be consistent product content to
other organic products. So just propose that as an
addition to this.

MR. CARTER: Okay. Been proposed. Mark, do
you want to go ahead since there's something that's been
moved?

CHAIRPERSON KING: Yeah, is there a second?

MR. CARTER: I would second.

CHAIRPERSON KING: Second.

MR. CARTER: Yeah.

CHAIRPERSON KING: It's been moved and
seconded. Is there a discussion concerning Jim's
amendment? Kim.

MS. DIETZ: Jim, I'm just -- I'm a little
confused because the directive says that you cannot use
the USDA seal. We all know that that's what the
directive says, but currently, none of these products
have to be certified, so if you put on there that they
must comply with the labeling on the front panel, I
mean, who's going to check that? I mean, it's just --
that's a new concept. I would not discuss it, at least
that I've ever seen from this group. Not that I'm in
disagreement with it, but I'm just questioning -- you
can say all you want, but if these products wouldn't
have to be certified organic, then who's going to regulate that? It doesn't make sense to me.

MR. RIDDLE: Yeah, I'm just talking about product content. I'm not saying that they would have to be certified or not, it's just that the consumer sees those claims, hundred percent organic, organic or made with, that they match up with the same product content requirements as required for certified organic foods.

MS. DIETZ: Yeah. Again, just who's going to check it? I mean, we could say that, but it's not enforceable.

MR. RIDDLE: And we're not calling for a rule change or rule writing or legislation, we're throwing that out to the industry to take the lead in gathering that information, it's just our opinion that -- is that the label and product content should be consistent from aisle two to aisle four. Yeah.

MS. DIETZ: If they're honest, right?

CHAIRPERSON KING: Andrea.

MS. CAROE: Well, I think that is the final outcome that we all hope for, but I don't think it has place in this document. I think this document was about gathering the information and hopefully industry will work with the appropriate regulatory body of that PDP [ph] to reach that outcome, but I don't feel that it's
necessary here, I don't think it's appropriate here. I think that is our goal and that's why we've done this exercise, but it's -- you know, it has no place in this document.

MS. DIETZ: Just one other comment. I've been involved in some other industries who are working on these standards and some of them are actually considering adopting different levels for their use. In other words, not 70 percent, it might be 50 percent or it might be 20 percent, so for us to limit ourselves, some of the standards that we -- that might come forward might make different label recommendations. I think that's what Tom's raising his hand about. So I wouldn't want to limit ourselves with that. I think that that's a given, but we might see standards that are different from what the food standard composition is.

CHAIRPERSON KING: Dave, go ahead.

MR. CARTER: Okay, speaking in favor of the motion, I think, though, the reason that I believe that this would fit within the document is it does establish a goal of what we want. Just because there are other things floating around in other areas as to what would qualify under made with organic or -- I think what this Board wants to do is say that our goal is that any other area that comes along ought to be consistent with the
food standards.

CHAIRPERSON KING: All right, do we want to vote on this amendment? We need to be cognizant of the time.

MR. SIEMON: You know, I'm just a little confused about this whole -- there's a lot of -- should we deal with this one at a time, like personal care and this is an overarching statement that you're talking about now? This clause here. I mean, we're voting on just this -- the amendment to this paragraph or voting on the whole section here? I'm just a little confused by what we're voting on.

CHAIRPERSON KING: Jim, if you want to clarify exactly where you're going to insert this amendment we're voting on and then we're going to call the vote.

MR. RIDDLE: Yeah. And yeah, this vote would be just on the amendment that I proposed and I -- it's just a way of getting a clear sense of the Board is why I propose it as an amendment and exactly, it would fit under "NOSB consideration" on page four of this Scope recommendation, after the second paragraph. So there's some language that's in bold there --

MR. SIEMON: Um-hum.

MR. RIDDLE: -- and it would be inserted after that and it would read, "If the word 'organic' is used
on a principle display panel, the label claim must comply with Subpart D of the Final Rule." It's just for consistent product content and that's just a sense of the Board.

MS. ROBINSON: It's also the sense of the NOP. The NOP has consistently made that statement.

MR. RIDDLE: All right, then it does make sense.

MS. ROBINSON: If it is an agricultural product and you are manufacturing a product that we do not cover the labeling of and you try to represent the agricultural ingredient as organic, as you've heard us say, it had better be certified organic, to these standards.

MR. RIDDLE: Um-hum.

CHAIRPERSON KING: Should we vote?

MS. DIETZ: I just want a point of clarification. Because we're not voting on this document, so do we even need to vote on your recommendation change? I mean, you're just --

MR. RIDDLE: Well, if everybody accepts it, we don't.

MS. DIETZ: I mean your Policy Committee could make the change and then bring it back and we actually formally vote on this recommendation, so I just don't
want to confuse people that we've voted on one little sentence in a 15-page document and not on the whole document.

CHAIRPERSON KING: It's the will of -- what would you like to do, Dave, as PDC chair? How would you --

MR. CARTER: As PDC chair, no, I can take it as a consensus addition. That's fine.

MR. CARTER: Okay. It's been --

CHAIRPERSON KING: Is anyone opposed to adding it at this time? Just as a committee document? Okay.

MR. CARTER: So the third area was the fertilizer soil amendments, manure and related products. Again, very similar; the -- they're regulated by applicable state laws that they may not display USDA Organic seal and that they have until October 21, 2005 and that anything that is organic has to be labeled in accordance to USDA standards. The area here where a related group has been looking at this is the Association of American Plant Food Control Officers or AAPFCO, I guess. And they, in August, had -- have under consideration the following amendment to its model regulation and that would set up two specific groups, T-63 [ph] for organic production and SUIP-28 [ph] that would then define how they would begin to look at the --
at these particular materials or these fertilizer. This
is not a final action by AAPFCO, but it's been referred
to their labeling committee for further consideration.
The Policy Development Committee recommends that the
Board endorse a draft of that labeling definition for
organic production as presented above. Comment on that
particular --

MR. BANDELE: I just have one question.

Failure to comply with this requirement may result in
enforcement action, but currently though, that -- I
mean, USDA could not do that, is that not right?
Because it falls under state.

MS. ROBINSON: Right, but my understanding of
this is that the applicable state organizations are
going to do something that -- and we've actually had
conversations with them about this that they would
recognize a label that could go on these products that
say, in effect, suitable for use in organic production.
Now, is there an enforcement issue? Well, yeah, there's
probably an enforcement issue in just about everything.
If a certifying agent or an operation, you know, and
then the certifying agent discovers that even though the
product -- I mean, let's face it. There are producers
out there, products, and they'll mislabel. You know,
again it is up to the certifying agent and the certified
operation to ensure that the products that they use do indeed comply with the National Organic Standards so that they're not putting on a product, a fertilizer or a soil amendment that's full of heavy metals or you know, whatever and hopefully, that there's also an enforcement action through the state regulatory agency, as well. And there generally is, folks. They are usually quite aggressive about fraudulent labeling in their respective states. And we've had this conversation before, so -- so both AAFCO and AAPFCO would probably look into it, as would we.

MR. BANDELE: No, but I don't think the statement was aimed at like farm operators, it was aimed at the manufacturers and that was my point, that --

MS. ROBINSON: We would not take an enforcement action against a manufacturer, but again, I believe that the state attorney generals office and the state regulatory agencies would. They have a vested interest in protecting their industry.

CHAIRPERSON KING: Jim.

MR. RIDDLE: Yeah. And if accept this -- I guess we're going to, you know, take the whole thing as a package once we're done here at some point; but I just want to make sure that, you know, part of this recommendation is endorsing the term "for organic
production" that's being considered by AAPFCO's labeling committee and so if the Board endorses that term, we will need to follow up with a letter and work with NOP on that, hopefully, that you know, that we're on the same page and think they're headed in the right direction.

MR. CARTER: Okay. Did you have a question or --

MS. KOENIG: It's not really a question, it's I guess a statement, just something to think about or ponder. You know, as EPA -- this is sort of analogous in some ways to this EPA proposal on Inerts, you know, where you have another agency that kind of oversees an area and you're kind of working or liaisoning [ph] with them for this kind of labeling. I guess what I'm wondering, and I don't want to bring it up, I'm just again just saying is this any different than OMRI's kind of -- it's the same concept where you're entrusting an agency, whether it's private or public, to kind of take your regulation and utilize it. So my question is if there's a problem with the way a private entity -- you know, if we're going to examine how a private entity looks at our regulation, isn't it our job to look at how state organizations would look at the regulation? So that's my question.
MR. CARTER: I think you're right on that. I think what this is attempting to do, though, is to work with those entities that are already addressing these areas and just trying to develop some consistency with that rather than trying to develop a whole new framework, so -- okay, let me move on, then, to the fourth area, one of our favorite topics, which is Fish and Seafood, Farm Raised or Wild-Caught. Again, from the April directive that although off the provided coverage for organic aquatic animal standards, NOP has not developed standards. The products cannot use the USDA Organic seal and may not imply that they were produced or handled to USDA/NOP standards at this time. Operations producing products listed above had until April 21 to -- of 2005 to use existing labels and packaging.

This is an area, then, where the Policy Development Committee wanted to transfer or delegate or plead and cajole another committee to take this on, specifically that in working with the Livestock Committee to endorse at least their recommendation to establish a new task force on standards for wild-caught and farmed aquatic animals. And just like the old, the previous task force, it would be structured into two working groups, one on wild-caught, one on farm species.
and these groups will develop recommendations for considerations by the full task force which will, in turn, issue recommendations to NOSB.

The new task force will be directed to take into consideration the report issued by the previous aquatic animals task force and subsequent NOSB recommendations and that we will try and make sure the task force, the committee, excuse me, will try and make sure the task force has expertise drawn from NOSB and throughout the industry and we'll take it from there. So this is something that will be brought forward here at this meeting to establish that task force.

The fifth area, which is the area of pet foods, a similar approach, although OFPA provides coverage for organic pet food standards, there are not any standards proposed for public comment at this time. The products, pet food products may not display USDA Organic seal, but any operations doing that at this time have until October 21, 2005 to use up their current stock. The discussions was that pet food is currently regulated by state laws and largely under AAFCO guidance. There's been suggestions that the NOP livestock feed regulations be applied to pet foods, but the NOP organic livestock feed regulations do not contain a provision for made-with-organic-ingredients.
labeling claims and do not permit certain amino acids commonly used in pet foods. Organic livestock feed regulations also prohibit mammalian or poultry products fed to mammals. The third area under the discussion is the pet food could be alternately certified and labeled under NOP requirements for human food products, but this would limit the use of additives and processing aids to natural substance approved for human foods and synthetics currently listed at 205-605B.

So what the NOSB Policy Development Committee recommends that we solicit comments for organic pet food and that we further recommend that the NOSB Handling Committee convene a pet food task force, again a task force that would include members of the Board as well as members of the public representing the organic trade pet food industry, feed control officials, academics and accredited certifying agents.

Comments or -- and then the sixth area, which was mushrooms, apiculture and honey, greenhouse operations and greenhouse products, hydroponic agriculture; these are areas that the NOSB has had -- has addressed. These products from the April directive, the products may be certified to the existing NOP regulations which will be amended in future rulemaking to cover any unique production and handling.
requirements. NOSB has provided recommendations and the
NOP is saying they'll publish at the earliest possible
date through notice and comment rulemaking any
additional standards needed for these commodities.

So the Policy Development Committee recommends
that the NOSB agree with the NOP for a position that
mushrooms, apiculture and greenhouse operations can be
certified organic and the products, as such, can be
labeled as organic and carry the USDA Organic logo. We
point out that the NOSB adopted the support of an April
25, 1995 greenhouse recommendation, a section entitled
"Specialized Standards for Hydroponic Production in
Soil-less Media" and that their recommendations stated,
"Hydroponic production and soil-less media to be labeled
organically produced shall be allowed if all provisions
of OFPA have been met."

And though the issue has been discussed, the
NOSB has not yet submitted a recommendation on
hydroponic standards since a Final Rule was released, so
we request that the Crops Committee place the item on
its work plan and that rulemaking standards should not
proceed until the NOSB has submitted a final
recommendation. So these are the provisions that were
brought to the Policy Development Committee and it
doesn't list here what the vote was, but the vote was
unanimous. I think there were two members absent at
that time, so the vote was four in favor, zero against
and two abstentions, so --

CHAIRPERSON KING: Thank you, Dave, and thank
the committee. That's an extensive document and we
appreciate that. Barbara, did you have a quick comment?
I saw your little light come on. Anyway, Kim, looking
at the agenda; we're going to take a quick break. We
were scheduled from 3:00 to 5:00 for public input so we
will start in 15 minutes. And what do we have? Let's
synchronize our watches. Four after 3:00, so -- hold
on, Jim. We'll be here at 3:20.

MR. SIEMON: I'm confused. Aren't we ending
this exercise?

CHAIRPERSON KING: Can we get the NOP response
in the morning?

MS. ROBINSON: The Department concurs with
what you've written in your Scope response, yes.

CHAIRPERSON KING: The Department concurs.

MS. ROBINSON: The Department concurs.

CHAIRPERSON KING: So hold on. Before
everyone leaves, one quick thing and then -- wait a
second. Concerning public input; we scheduled it until
5:00, we will extend it until 5:30 considering we're
starting late. There are 35 plus people signed up. I
would encourage some of you to perhaps consider, if you would, please consider moving to the second public input session as we only have five people signed up. So anyone willing to do that, we would greatly appreciate that. A number of people have industry commitments tonight and need to depart by 5:30 but we are willing to extend it until 5:30, so thank you. We'll be back here in 15 minutes.

***

[Off the record]
[On the record]

***

CHAIRPERSON KING: While we're looking for the lost Board members here, I would like to offer another opportunity for those signed up for public input to actually not give your input today and do it on the public input session number two, which is Thursday morning. If there are volunteers and you would like to come forward at this time, I would greatly appreciate that. Okay. So now that we've recovered from that stampede, I have no other choice at this point but to limit your comment time to three minutes. We have 38 people signed up and there are a lot of industry commitments tonight, so it would be mathematically impossible to do the five minutes, so you have three
minutes -- yes, a quick question.

MS. WIRE: I'll go on Thursday.

CHAIRPERSON KING: Okay. And what's your name?

MS. WIRE: Gwendolyn Wire [ph].

MR. RIDDLE: You get the full five minutes on Thursday.

MS. WIRE: That's right. If I can't do it --

CHAIRPERSON KING: We may even be able to give you more than five on Thursday and we might even serve coffee.

MS. DIETZ: Just for protocol, I do have a timer and I'll set it for three minutes so everybody ensures they get the same amount of time and that at one minute you'll see a one minute sign and you'll have one minute to finish up. Okay?

***

[Off the record]

[On the record]

***

CHAIRPERSON KING: Okay, thank you all very much. We've had a few people move. We're still going to stick to the three minutes. We had four move. That still puts us at 34, but I appreciate that, so first up is Debra Brister.
MS. BRISTER: Okay. Good afternoon. I'd like to thank the Board for allowing me the opportunity to speak to you today. We were going to give a PowerPoint presentation. I was informed that we were unable to do that, so did we make photocopies of the PowerPoint presentation for each of you that should -- you should each have one of those copies. Additionally, you should have a National Organic Aquaculture Work Group participant list and finally, another handout is the National Aquaculture Act of 1980. So I'm going to go through the PowerPoint presentation. You may take a look at your handouts as I go through it.

My name is Debra Brister and I'm a research fellow at the University of Minnesota's Institute for Social, Economic and Ecological Sustainability. As some of you know, I've been involved in the process of developing standards for organic aquaculture for some years now. I've convened national and international workshops on organic aquaculture and served on the first NOSB Aquatic Task Force Aquaculture Work Group. I come before you today as a co-chair of the recently formed National Organic Aquaculture Work Group, or NOAWG, and would like to provide the Board with some brief information about our work group, who its participants are, how it can assist the NOSB and provides some
initial recommendations as you consider the reformation of the -- of another NOSB Aquatic Task Force.

The National Organic Aquaculture Work Group represents an alliance of approximately 80 aquaculture professionals, related parties with a strong interest and goal to assist in developing workable, science-based organic standards for aquaculture production and handling practices. Our work is aimed at proposing organic aquaculture standards for rulemaking procedures under the Organic Food Production Act that are consistent with the NOSB principles of organic production and handling. We believe it's important to develop science-based standards that are appropriate for aquaculture. Adequate sound science exists for many areas, however there are gaps that require further research. NOAWG is best suited to integrate sound science into the standards development process and identify priority areas for further research.

To provide a little background information, I'd like to talk about some seafood trends, global aquaculture production and global organic aquaculture production that exists today. I will quickly say that imports are playing an ever-increasing role to meet the demand for seafood in the United States. The table you have before you was prepared with data from the National...
Fisheries Service and it shows slight increases in exports and huge increases in imports. Note especially the increase in imported seafood from 1970, when the U.S. imported one billion dollars in fishery products to 2003, when the U.S. imported over 21 billion dollars worth. Global aquaculture production is the fastest growing food production sector in the world, growing at an average of nine percent per year compared to terrestrial livestock and 2.9 percent and captured fishery use at 1.3 percent.

There are no official statistics on organic aquaculture production yet, but in 2003 global production is estimated between 7,500 metric tons and 8,400 metric tons. This includes roughly 5,000 tons of salmon, 1,500 tons of shrimp, 500 tons of carp and trout, 500 tons of other species. Currently, approximately 20 to 25 certification bodies have standards for organic aquaculture and are certifying products used in different criteria. We know that there are organic aquaculture products entering into the U.S. market even though we have no national standards yet for organic aquaculture. This begs the question, should other countries define what organic aquaculture products are for U.S. consumers? If yes, this could impact the confidence of other organic labeled livestock products.
Anything of lower or non-compliance with the NOP could be bad for anything citified organic.

We know that there are tough issues that must be addressed thoroughly by standard-setting bodies. These include challenges with shellfish and other open-water operations; traceability; hatcheries and sources of stock; chemical and contaminant drift; aquatic feeds including fishmeal and oil, additives and supplements; proactive healthcare management; conversion periods; growing systems and more. Therefore NOAWG was created to assist, support and facilitate a nationally coordinated systematic approach to propose aquaculture standards to the NOSB and NOP using diverse stakeholder input, participation and mobilization of national expertise to use sound science. I'd like to turn the podium over to my fellow co-chair, George Lockwood, who will continue the presentation and also speak on behalf of Richard Nelson, our other co-chair who could not be with us today. Thank you very much.

MR. LOCKWOOD: Thank you, Debra. Thank you, Mr. Chairman, for the pleasure -- the privilege of speaking to you today. As Mrs. Brister has said to you, the national organic working group is a large and diverse group of experts in aquaculture. Altogether there are over 70 of us from a wide range of
livelihoods.

We have organic fish -- we have fish farmers as well as people who are in agriculture, producing organic products. We have academicians [ph], we have trade associations, we have people from federal and state agencies and we have a very interesting group of international participants. We operate by way of teleconferences, so we use a list-over [ph] which is a very effective way of communicating and we've had meetings, one meeting so far in Honolulu at the World Aquaculture Society Meeting and another one coming up in New Orleans in the year 2005. It is our intention to work closely with the National Organic Standards Board and the National Organic Program to come up with meaningful standards for development of aquaculture.

We anticipate that we'll have our work done within the next year. We will have some clarification issues which we want to bring to you sometime in the future, that we do hope to have most of our work done with recommendations for you within one year. So far, we have recruited our membership. We have begun to identify issues. We have begun working on fishmeal constraints. We have initiated a shellfish sub-group, which is really quite a different type of proposed standards. We've worked with the National Organic Standards Board.
Program on clarification issues and we have submitted grants to the USDA and others for possible assistance in various areas.

I'd like to add briefly to something that Debra just said. On the internet today there is a comment from Nature Land in Europe that they expect aquaculture, in the next year or the next several years, to reach 400 million dollars of organic products. In other words, the Europeans are moving ahead very, very rapidly. We have several recommendations for you that come out of what Mr. Carter has recommended earlier.

First of all, that wild be treated different than aquaculture, that the task force not deal with both, that they be split and handled separately. We ask that our work at the National Organic Aquaculture Work Group be integrated and be your arm to deal with aquaculture and be integrated directly with you. As for the task force, as recommended, we ask that this be delayed until we have an opportunity to make our reports to you and if at that time you believe that a task force is helpful and essential, that you deal with that issue at that time and not now. And that the -- our work group be able to report directly to you rather than through a bureaucratic intermediary.

MS. DIETZ: Time.
MR. LOCKWOOD: Should you wish to proceed, we ask that 50 percent of the members be appointed by us and that the 2001 Aquatic Animal Task Force not be the basis for your -- our future work; that it be resource, yes, but not a basis. Also, you have a definition of aquaculture we gave to you from the 1980 National Aquaculture Act. We would hope that you would codify it. Thank you very much.

CHAIRPERSON KING: Thank you very much.

MS. GOLDBERG: I wanted to offer a comment, perhaps ask a question. I think it's terrific that there's so many people in the aquaculture community who are interested in organic production and have in the past been a supporter of organic aquaculture standards. With that said, one of the things I think is really important about the National Organics Standards Board is represents a range of views. It includes consumer and environmental interests along with industry and certifiers and so on. And when I and one of my colleagues in the conservation community have approached this group about including consumer and environmental representation, we have been at least gently rebuffed and I'm curious why the group does not have a broader range of participants.
MR. LOCKWOOD: Well, first of all, Becky, 10 of our 72 members do come, one way or another, are connected to the organic community. Either being in an organic association or one way or the other. Secondly, nobody's been rebuffed. If for some reason you submitted names of people that aren't on our list -- it's an open list. You have the list directly before you; Debra handed it out. If you want people added, we'll be more than happy to have them.

MS. GOLDBERG: And can I ask another question, Mark?

CHAIRPERSON KING: Sure.

MS. GOLDBERG: My second question had to do with written comments you submitted along with Debra and Richard Nelson, and they seem to be the basis for your not -- urging that we not rely on the earlier aquatic species task force report, which I thought was a good first step. And part of the rationale seemed to be that there weren't adequate aquaculture representation in the group and b) that there was an adequate public comment and I just want to offer the observation that by my count, seven of the ten people of the aquaculture working group in the last Aquatic Species Task Force represented aquaculture interests in some way and also that the report was put out in -- of the task force in
the spring meeting of the NOSB, I guess, in 2001 and not voted on until the fall meeting and therefore there was a full summer for public comment.

MR. LOCKWOOD: There were two reports, you recall. One was from the working group, was correctly included, a number of aquaculture professionals. And there was a six-member task force that didn't include anybody from aquaculture that met in-camera and never once was an opportunity for anybody from aquaculture to comment on the report. So we really think it was not representative and it also contains significant errors. We certainly think it should be resourced because it represented some of your thinking, but it certainly should not be a definitive, basic document. We urge that it not be that.

CHAIRPERSON KING: Owusu and then Kim.

MR. BANDELE: Yeah, I'd just like to know when the organization was founded and also, in light of Becky's comments, what are your criteria for membership?

MR. LOCKWOOD: Just to express an interest in joining, is the second question. The first one, we began working about a year ago, sir.

MS. DIETZ: A point of clarification. If you have a proxy, if you could -- say you got a proxy when you come to the mike, that way I know in case Mark

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
forgets to tell me. And then --

MR. LOCKWOOD: I have a proxy, ma'am.

MS. DIETZ: Okay, thanks. And then if you're
a second speaker, you'll need to also tell me that
because the confusion was the first speaker had a proxy
and you are second speaker, so that -- hence, the long
time period.

MR. LOCKWOOD: Thank you very much.

CHAIRPERSON KING: Okay. Next up is
Dr. Owen Keane and on-deck is Dave Garforth. And if you
could please repeat your name, who you are and where
you're from for the purposes of the court reporter, I
would greatly appreciate that. Thank you.

MR. KEANE: Okay. I'd like to thank the Board
for allowing me to -- these few minutes to address you.
My name is Dr. Owen Keane. I'm a poultry nutritionist.
I work for Heritage Poultry Management Service in
Annville, Pennsylvania. I've been doing this now for
approximately 15 years. Before that, I did work at Penn
State University as the nutrition, Poultry Nutrition
Extension Specialist. Before you, I think, Chris had
passed out a number of -- a couple of documents there
that -- the first one is Methionine Deficiency in
Organic Poultry and the second one is some comments that
I had jotted down before and was also presented to the
Board, I think, at a previous meeting. I didn't present them, somebody else probably did. Methionine is an amino acid which is one of the 10 essential amino acids needed to produce tissue proteins.

In poultry, methionine is unique because it is used to produce feathers. Since feathers are protein and a lack of feathering results in protein deficiency, feathers are very important to a chicken because it helps them regulate their normal body temperature of 107 to 108 degrees Fahrenheit. Bird in general have higher body temperatures than mammals. Chickens and turkeys will replace their feathers at least three times before they are sexually mature. If you count the downy feathers, or the feathers which they have -- which they were -- have had when they're hatched, then it would be four times. Other deficiency systems are noticeable. There are increases in nervousness, flightiness, wildness, hypertension.

This usually occurs in the first week or two after hatching. After two or three weeks, litter eating to feather picking will occur. Finally, the birds would begin to cannibalize each other, causing morbidity and mortality. When they reach this stage, there's very little that can be done to break the habit of the picking. Even adequate amounts of methionine at this
particular time will not solve the problem. So they must -- the methionine levels must be started at day one of age. The average feed consumption of a young chicken during the first week of age is about seven to ten grams per day and if you want to relate that to something that you see every day, it's probably about one teaspoonful, so it's not very much. In addition to that, in addition to the methionine, there needs to be another 40 plus --

MS. DIETZ: Time.

MR. KEANE: -- nutrients supplied to the seven to ten grams of feed in adequate amounts to maintain life.

CHAIRPERSON KING: Are there questions concerning his input?

MR. KEANE: I though a -- yeah.

MR. LACY: I know that we sort of cut you off, Dr. Keane.

MR. KEANE: Sure, that's all right.

MR. LACY: But maybe you -- I'm sure you had sort of a bottom line of summary. If you'd like to give us the bottom line of what you're presentation was going to be?

MR. KEANE: Okay. The bottom line is, basically, that methionine should be included in the poultry feeds. Now, methionine can be added in not,
perhaps maybe methionine, per se, but other feed ingredients that high amounts of methionine. I have no problem with that, if that's what the -- that's what you're considering a bottom line, this is what I consider a bottom line here, at least anyway, because they do need it and they have -- it is really what the -- well, all the nutritionists know is that it is the first limiting amino acid in a poultry feed. The other thing I wanted to explore with you, also --

MS. DIETZ:  Sir --

CHAIRPERSON KING:  Sir, this is question and answer.

MS. DIETZ:  -- we get to ask you some questions now.

MR. KEANE:  Sure, okay.

MS. DIETZ:  Mine's just more a comment.

MR. KEANE:  This doesn't take my three minutes, does it?

MS. DIETZ:  You've gone past the three minutes. It's a pretty fast three minutes, isn't it?

This Board has already reviewed methionine is --

MR. KEANE:  Sure.

MS. DIETZ:  -- as a material to be added on the National List.

MR. KEANE:  Yes.
MS. DIETZ: We added it with the Sunset Provision that it be removed, I believe, next year.

MR. KEANE: Two years from now.

MS. DIETZ: Okay. Our charge was that the industry needed to bring us alternatives, so I -- that's what I plead with you that you should read, maybe even go back to the minutes of that meeting and see what we've done. We've already gone through all this information.

MR. KEANE: I don't see them coming down the road.

MS. DIETZ: This was a statement, not a question for you.

MR. KEANE: Okay.

MS. DIETZ: So I encourage you to go back and encourage your industry to bring us alternatives. That's what we asked for, but otherwise, that material is going to be coming off the National List.

MR. KEANE: When is that coming out?

CHAIRPERSON KING: October of 2005.

MR. KEANE: Pardon?

CHAIRPERSON KING: October of 2005.

MR. KEANE: That's -- okay.

CHAIRPERSON KING: That would be a year from now.
MR. KEANE: That's a year from now.

CHAIRPERSON KING: Yeah.

MR. KEANE: That's fine, okay. But I don't see it right now and I'm formulating feeds for about a quarter of a million organic hands right now. So I -- I mean, I would use them right now if they were available. Now, some of the research that goes on in academia, because I'm quite familiar with academia, too. It doesn't get out there, you know, the -- to the ones that are out here that are doing all the formulation and feed formulations why, for about maybe four or five years. So this is what I'm really concerned about, more or less, than anything else.

CHAIRPERSON KING: Well, yeah. We appreciate your concern and it's been noted and in fact, Mike and I talked on the phone the other day that --

MR. KEANE: Good.

CHAIRPERSON KING: -- you know, I mean ongoing research needs to be done, looking at alternatives and certainly what's happening in the industry right now is always a concern, but as Kim said, our hope is to receive more information concerning alternatives with methionine, so thank you very much for your input.

MR. KEANE: Okay, very good. Thank you.

CHAIRPERSON KING: Yeah. Let's see,
Dave Garforth and on deck is William Jackson.

MR. GARFORTH: Thank you, Mr. Chairman.

Again, I'd like to thank the Board for giving us the opportunity to make some public representation today. As I said, my name's Dave Garforth. I'm representing Green Harvest, summer farming activities in Ireland and also Spreting [ph], which is a feed company which is affiliated to Green Harvest which obviously supplies the feed. I'm going to get my picture out, first of all, so you know where I'm coming from.

Okay, we hold the view that farming of viscivorous [ph] species, carnivorous species of fish under aquaculture can be a sustainable activity and can be brought under organic management. So that's really my principle guiding statement I want to make to everybody today. Just to fill you in on the background, we've been growing organic salmon in Ireland since 1996 under a variety of different certification agencies, natural -- being one of the formal ones, but also the Irish Organic Farmers and Growers Association, Bio-Swiss Standards, the French B.O. Standard and there's probably others if I could remember, but -- Soil Association in the U.K. and companies affiliated through there, as well. Aquaculture products including those derived from aquaculture -- I'm just going to read here, are traded
internationally.

Since the U.S. is an extremely important market for seafood on the one and organic products on the other, decisions taken at this level here by the NOP, the USDA and by the NOSB obviously have a huge potential to impact some global aquaculture and the trade and also the development of organic aquaculture globally. So I'd like to make that statement, as well. That's vis-à-vis policy, vis-à-vis labeling, vis-à-vis any standards which are set representing the missions for fishmeal, the missions for additives, you name it, diet, stocking -- we feel that the existing fish farming operations we have in Ireland can make a valuable contribution to the developments here and we'd like to try and support you in that.

We ask, therefore, if the following could be taken into consideration, first of all. And these are just something I've noted over the last, I suppose -- this morning, really, since we came to this meeting. Probably people that are aware there are several organic established activities operating globally. These cover a lot of species; salmon, trout, sea bass -- carps, other species, as well. Eels, I believe, shrimp, as well. These are operating -- some of these products have been operating for more than 10 years. So
obviously standards have been set in other areas. These will create new awareness in the marketplace and also achieve market exemptions.

Obviously -- and I think the NOSB Aquatic Task Force should be commended on this. Setting standards isn't easy; making recommendations isn't easy, so certainly I'd like to commend you on your first draft attempts at setting standards. It's clearly the most difficult thing to do and I think it's a great document and a good basis and starting point to move forward with those standards, as well. I like particularly some of your comments which you've made and it's interesting how closely they resemble the similar position we were in 10 years ago --

MS. DIETZ: Time.

MR. GARFORTH: -- and -- okay. I think that's about it.

CHAIRPERSON KING: Does anyone have a question for --

MS. CAUGHLAN: I'd like to just follow up. What was the position 10 years ago?

MR. GARFORTH: Our position 10 years ago. We began working principally with -- as an industry, with Nature Land, a certification agency. We wanted -- we saw a role to play in -- in the development of organic
aquaculture, so we approached, actually, Nature Land in the first instance. We approached other agencies, as well, which were involved in private certifications in Europe.

I should explain still in Europe, the activities in organic in terms of regulation for livestock and for aquaculture in particular, aren't dissimilar from where they are in the U.S. At this point in time there is an E.U. organic regulation, but there's no annex for aquaculture. So all the private standards survive just as private labels. They follow, basically, IFOAM, the International Federation of Organic Agriculture Movements guidelines, but in many respects, we're still at the same place as where you are, even though all these agencies have moved forward and developed their own standards, which have been recognized.

And I think that activity has helped a lot and certainly at this point in time, the E.U. is now trying to harmonize all these standards in Europe to come out with a common regulation or an annex to the E.U. regulation which will support, obviously, a more harmonized process for development of aquaculture in Europe. And perhaps -- I don't know if that's the driving force in the U.S., I think perhaps it might be
different. I don't know.

CHAIRPERSON KING: Jim.

MR. RIDDLE: Yeah, just quickly. We heard earlier a suggestion that we delay seating an aquaculture task force. What's your position? Should we move ahead at this time?

MR. GARFORTH: Well, I think certainly moving ahead in terms of the process of developing further recommendations and even setting draft standards is a positive move forward.

MR. RIDDLE: Okay, thanks.

MR. GARFORTH: It has to be done at some point, yeah.

CHAIRPERSON KING: Thank you. Next is William Jackson and let's see, on deck -- I have to skip down. Tom Hutchison.

MR. JACKSON: I'm burning up my three minutes.

MS. DIETZ: Oh no, you're not.

CHAIRPERSON KING: You haven't started yet.

MS. DIETZ: I'll wait until you start.

MR. JACKSON: All right. What I am excited about today is to share with you technology out of Japan that we've negotiated with on sanitizing and cleaning with water that has been charged so that when it comes out, it comes out, half of it, approximately, is on the
alkaline side, the other half is on the acid side. I'd like for you to turn to Tab Number 1, the back side of that page will give you the agency approvals that are already in existence.

Tab 2 talks about how it works by using tap water, a small amount of salt and electricity, a chemical change transforms these common ingredients into one of the most effective cleaning means of cleaning with a strong anti-bacterial effect, proven effective at removing bacteria by creating both alkaline and acid water and with the combination water, we're able to wash and sanitize without the use of harsh chemicals.

On the back of that page it shows how it occurs and on page four, or Tab 4, the chemical changes that take place and if you are thinking about the amount of salt, it is less than half the amount that we use for seasoning our food, so the amount is very, very minimal and the charge -- for example, what you're taking is the combination of the sodium and the chlorite. In that small amount with that charge, you end up with approximately 80 times the strength of the chlorite which immediately then -- thank you. Then -- the sixth one talks about very quickly, the different kinds of water, the pH of one is 11.3, one is 2.7. The different universities are on 7 and the number 8, we'll go down...
through a number of the bacteria and on page or Tab 11, there are questions and answers, but on the back of that there are university studies and some of you are as keen on that as I am and we have here -- I have two notebooks of just university studies here in the United States already completed on some of the main questions that we have. On page 12, I consider this --

MS. DIETZ: Time.

MR. JACKSON: -- to probably be the -- 12 is the most important page and that will give you the bacteria and viruses already proven effective.

CHAIRPERSON KING: Rose.

MS. KOENIG: Are you aware that you need to petition that if it's a substance, you know, you indicated -- it sounds like there's a synthetic reaction going on and you have a substance that is generated by your process.

MR. JACKSON: Yes, there are two ways to do it. Number one, you have to remember this is very --

MS. KOENIG: I don't want to get into that, but what I'm suggesting is that we have a process; if it's an actual substance that you want us to look at in terms of seeking approval for the National List -- because it sounds like it would have to be added to the National List, then you need to address that through the
petition process. And that's what I suggest you kind of look into and if you need some additional information, we'd be happy to provide that.

MR. JACKSON: There's a combination of answers to that, but I'll accept your request for doing a petition.

MS. CAUGHLAN: So the substance is electrolyzed -- oxidizing water?

MR. JACKSON: That's correct and --

MS. CAUGHLAN: And you're here presenting us with a brand name, that's the point.

MR. JACKSON: Yes.

MS. CAUGHLAN: You need to --

MR. JACKSON: Well, not a brand name. I'm just introducing the subject.

MS. CAUGHLAN: Right, concept.

MR. JACKSON: And I knew it was going to be a short period of time so I gave you 60 pages to look and then the following will be a presentation --

MS. CAUGHLAN: We invite your petition.

MR. JACKSON: -- of our request. It will include table salt and it will include that I want to put water in a bottle. Any other question? Thank you.

CHAIRPERSON KING: Mr. Hutchison, you're next and Pete Gonzalez is on deck.

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
MR. HUTCHISON: Thank you. Tom Hutchison, Organic Trade Association. Please find in our written comments a draft of an OTA paper on organic pet food standards and an OTA position on a very important issue, the allowance of both organic and nonorganic forms of the same ingredient and made with foods, regarding which OTA requests an NOSB recommendation for rule change supporting OTA's position.

OTA does not usually take positions on specific materials, but we do have a task force on alternatives to synthetic methionine not yet ready to report, though I understand several people here will report independently on that. Studies have just been funded that will take several years to complete, so OTA would appreciate an additional period of allowance. A material sunset, please publish the entire National List in the Federal Register for comment as soon as possible to assess whether there's any new information available. If no new information is available, OTA urges NOSB to recommend continuing the current status of the material.

I see the attached for the pet food, proposed pet food standard. And they're full of comments in the written version. On aquatic animals, the Board must ensure that any aquatic animals standards it creates do not lower consumer confidence in the organic label. The
organic standard must not only meet any related existing standard, it must take into account and exemplify the ecological principles on which organic agriculture and its appeal to consumers is based. On policy development matters, thank you, Policy Development Committee.

There is a possible misinterpretation of an OTA position, though. OTA has been quoted in a passage meant to refer only to products that do not meet the NOP Final Rule, which should read the opposite way of the way it has been read, that being, "The absence of specific standards for such products should not become a reason for allowing the organic claim for such products if they do not meet the NOP rule. Until standards are developed, USDA should not allow the organic claim to be made regarding these products if they do not meet the NOP rule." For the directives, OTA supports the NOSB positions on fishmeal and unknown NRT [ph] pesticides.

On the Scope, our position's always been that if a product meets the rule, it is by definition in organically produced agricultural product and therefore should fall under the scope of the National Organic Program. OTA supports the comments of the American Herbal Products Association. On specialty crops, OTA agrees the NOSB recommendations should be published as proposed rules. Thank you very much.
CHAIRPERSON KING: Impressive, Tom.

Questions? Thank you very much. Pete Gonzalez and on
deck is Mark Kastel and it appears Mark has previously
-- has a proxy for Ann Lazor.

MR. GONZALEZ: Pete Gonzalez representing 670
or so members of Oregon Tilth, mostly in Oregon but also
across the country. We'd like to yield our time for
comments and the next commenter in light of your
schedule today.

CHAIRPERSON KING: Thank you.

MR. KASTEL: Do I have three minutes or five
minutes, Mark?

CHAIRPERSON KING: Six.

MR. KASTEL: Six minutes. Okay, thank you. I
have a proxy, as you know. Okay, I'm pleased to see
that our staff is here today --

CHAIRPERSON KING: Your name for the record,
please.

MR. KASTEL: I'm sorry.

CHAIRPERSON KING: Your name for the record.

MR. KASTEL: I'm going to get to that. It's
in the text. Mark Kastel, thank you. This is a
representation of respect for our Board and for the
organic community and we've seen what appears to be some
nuance changes today and so I'm hopeful. And even
though I'm from -- I live in Wisconsin, I'm from Missouri, so in six months we'll see. I hope we'll see.

My name's Mark Kastel. I'm here today representing the Cornucopia Institute based in Cornucopia, Wisconsin. I have a proxy in my possession from Ms. Ann Lazor, one of our board members and a Vermont dairy producer, who along with her husband, Jack, and their employees milk 45 Jersey cows and market the nicest organic yogurt or some of the nicest yogurt in the country under the banner Butterworks Farms.

In Chicago, the Cornucopia Institute, along with many other farmers, consumers and NGOs called for the equivalent for a regime change at the National Organic Program. The reward for our efforts was to have the past manager of the NOP promoted with a raise and salary. He was replaced by a young career bureaucrat demonstrably more respectful to the people involved in the process, but unfortunately, once again lacking a professional background in organic agriculture.

CHAIRPERSON KING: Sir, I would have your comments be objective and not personal attacks on character or anything. We will not stand for that.

MR. KASTEL: I --

CHAIRPERSON KING: I'm asking you one time, do not have personal attacks on individuals on this Board.
or the National Organic Program. If you have some constructive information to share with this Board, please do so.

MR. KASTEL: Okay. I'm hoping we're not taking time out of my testimony here. Mark, I was -- I do not know any of the staff members personally and I --

CHAIRPERSON KING: Please continue with some constructive comments.

MR. KASTEL: I'd like to respond to your comments, if I may.

CHAIRPERSON KING: No. Please continue with some constructive comments.

MR. KASTEL: I object to the characterization that there was something personal in nature regarding my testimony. More importantly, a by-product of the unprecedented volume of testimony in Chicago was understandable reaction to the guideline documents. In the press they were generated -- I'm sorry, you know, Mark, I want to respond to your comments. I think it's a --

CHAIRPERSON KING: Please continue with constructive comment. I'm not going to ask again. Thank you.

MR. KASTEL: In Chicago we objectively critiqued the fact that not only was our organization

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
but others in the organic community unhappy with the fact that there was a lack of professional pedigree and technical experience on -- represented by the NOP staff. We still object to the fact that universally respected and creditable people with a production agriculture background or academic background that would be applicable to those duties are not represented on the staff.

That was the nature of the comments I made and I'm sorry that, you know, I'm probably not going to be able to present my testimony that I presented a week ago. I'm not a professional public speaker. The Cornucopia Institute is here today because of the wholesale expansion of factory farming into the organic dairy, poultry and beef production sectors. Although I'm quite comfortable with the fact that we do not have a limitation on scale in terms of organic certification, the law most definitely puts limitations on organic farmers of animal husbandry practices. The law calls for pasture being an integral part and component of feed intake for ruminants.

Why do we need to file lawsuits against our own government to enforce the law? You cannot milk 3,000 cows, 4,000 cows, 5,000 cows, milking them, in some instances, three times a day and provide them with...
real access to pasture. You can provide them with dry
lots and call that pasture, but that does not make it
pasture, nor does it comply with the law. Furthermore,
the claim by some farms and the willingness of the USDA
and certain certifying organizations to approve
confinement livestock because of the "stage of
production exemptions" disregards the tenor and spirit
of the law and rules.

This is disrespectful and a slap in the face
to Ann and Jack Lazor and the hundreds of other
hardworking dairy families who jump through the hoops to
produce real organic milk. Some would like to say that
we should move to the next label and abandon organics.
We are not ready to give up. There are too many good
people who have worked to long, including members of
this panel --

MS. DIETZ: Time.

MR. KASTEL: -- to abandon the hope that
organic farming has brought to rural America.

CHAIRPERSON KING: Thank you. Questions,
comments? Thank you.

MR. KASTEL: I'll say in closing, Mark, and I
assume you'll gavel me down again, that this is supposed
to be a democratic process. I --

CHAIRPERSON KING: This is a democratic
York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
process for asking --

MR. KASTEL: And though you might not agree
with my language --

CHAIRPERSON KING: Sir.

MR. KASTEL: -- in most venues, we have free
speech in this country and I --

CHAIRPERSON KING: Yes, you do. Yes, you do.
I'm just asking no personal character attacks. Thank
you for your comments. Next up is Herbert [sic]
Karreman. On deck is Jim Pierce, Organic Valley.

MR. KARREMAN: Hello. Hubert Karreman,
veterinarian, Pennsylvania. I just wanted to talk about
perhaps some things for your TAP reviews you do in the
future. I've had some confusion or problems with
various certifiers throughout the country on certain
treatments that have been used on dairy cows in
emergency situations and some of it comes down to
nomenclature, so the first thing I'd ask is that -- and
maybe this already done, but please, I guess, make it
more publicly known to the certifiers when something is
TAP reviewed and allowed.

But that when you're doing the TAP reviews,
please take all known commercial trade names that
included that TAP material, you know, make that
widespread known. How many -- what kind of and how many
commercial products are out there containing, let's say, calcium borogluconate, okay? Because certifiers will say if I put on my bill a specific trade name and they don't know that trade name, so they've got to review that whole product, even though it is calcium borogluconate. And it causes a lot of headaches for the farmer.

And also, if when you're reviewing a TAP material, if you could show if it's in the United States Pharmacopeia or the National Formulary since the FDA looks at that, well, they recognize that as the official compendium [ph] in the United States. Also, if you could show all chemical synonyms known for that TAP reviewed material, that would be helpful. I had a long drawn-out discussion with one certifier about calcium borogluconate because in a trade name it's called -- it has its name Borol Esters of Gluconic Acid. They had no idea what that was, so it was an educational process.

So basically, when you're doing a TAP review, please have as many different synonyms or -- and products with that active ingredient named so that in the end, if it does become allowed, that certifiers will have a nice list to choose from or if they see it come through. And also, I hope that when you're looking at TAP reviews before like in the front end -- you know, if
something's an electrolyte, that you don't do a TAP review on it, because calcium borogluconate is an electrolyte. I was on that TAP review as an OMRI reviewer back in 2000 and right now today, from what I hear this morning -- I wasn't there. I was late, but calcium borogluconate is being just jettisoned off to the side now because the FDA triggering what-not and yet, it's an electrolyte. So isn't it allowed?

MS. DIETZ: Time.

MS. KOENIG: We'll be discussing, I guess, tomorrow the revision of a petition form, which is what petitioners need to provide to the NOP and eventually to the TAP contractor and one of our suggestions or one of our changes is in addition to, you know, in addition to whatever generic you're applying for or petitioning for, what formulations exist out there so that the TAPs are kind of a much more wide scope, because that's -- it's -- the intention is you're putting a generic on not one specific brand name. But please look through that document. It's on the web. And perhaps you'll be here during that discussion or jot down some of your comments specifically and get them to me if you have specific -- because it sounds like you're really suggesting, you know, alterations in that process, so those are welcome.
changes. They're welcome suggestions.

MR. KARREMAN: Okay.

CHAIRPERSON KING: Jim and Kim.

MR. RIDDLE: Yeah, and just to follow up on that; this draft is just being introduced at this meeting so you will have time to review it and get input. It's not like we're going to take final action on it tomorrow.

MR. KARREMAN: Good. Okay.

MS. DIETZ: One of the things we've been tossing around -- I think Rosie said was CAS numbers and those numbers identify individual materials. Sometimes materials can have 20 or 30 different synonyms, so we need to be creative in thinking. MSDS sheets would list all the different names of materials and we have tried to incorporate those in the TAP reviews, but I don't know if we're going to be able to list 20 different alternatives of the same product on the National List, but certainly give us your feedback.

MR. KARREMAN: I think you should because, you know, if a product is used and it's technically the same thing, there's no reason to cause headaches and confusion for the farmer. That's it. Thanks.

CHAIRPERSON KING: Thank you. Next I have Jim Pierce and Ann, excuse me, Fanatco.
UNIDENTIFIED SPEAKER: Fanatico.

CHAIRPERSON KING: Fanatico.

MR. PIERCE: Mr. Chairman, I'm going to cede my time to my good friend Tony Azevebo and you can scratch his name from the list. He's several pages further.

CHAIRPERSON KING: Okay. Thank you.

MR. AZEVEBO: My name is Tony Azevebo. I'm sorry I don't have any pamphlets or anything to hand out.

CHAIRPERSON KING: For the reporter, could you please spell that? I know he needs to get that down. Thank you.

MR. AZEVEBO: A-Z-E-V-E-B-O. Tony. I'm a dairy farmer from California from the San Joaquin Valley and I'm very proud to be here and have this opportunity to express my feelings. I wouldn't want to do what you folks do and I'm glad that somebody else -- this is boring as hell. I -- that was not a bad comment about putting people down or anything, but --

CHAIRPERSON KING: No, I understand, I understand.

MS. KOENIG: So I guess we can assume you're not one of the 70 people who want to become a Board member.
MR. AZEVEBO: No, no.

MS. KOENIG: Okay.

MR. AZEVEBO: You're eating up my three minutes, don't laugh, okay. The San Joaquin Valley is a truly remarkable valley. It feeds over half of the United States and I grew up there. And I watched all the small farmers, you would call them family farmers, I call them hands-on farmers. I've watched them basically disappear for the animal factories that have taken over and now we have air quality problems, water quality problems and about eight years ago I was -- got into organics and it was truly a breath of fresh air. And I've also helped other producers come into organics and I'm not here to tell you what to do, but I'm just here to tell you what not to do.

Please don't let this go the same way that the conventional world went. That's the first thing. When you're doing -- when you're making a decision on anything, just ask yourself what's best for that organic consumer? Because I guarantee you, that's the best thing for an organic farmer. Just watch out for them. They're paying the premium; they're concerned if we allow this to be watered down, it's gone. For example, there's a large demand for organics now.

What do we do? Well, I'm from California, the

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
land of the fine wines. If we want more fine wine, we
don't add water to it. It takes time to produce good
quality organic products and that comes with time, not
lowering the standards so more farmers to get in, but
educating farmers so that they can get in. So please
keep doing the job that you're doing and the other thing
we need to clear up. Everybody's calling this an
industry. Maybe it is on your level, but as a farmer,
the guy that fixes my heater gets 35 bucks an hour. I
don't get 35 bucks an hour and all he produces is hot
air and I produce food. I farm because I love to farm,
that's what I do. And organics has allowed me to stay
in farming.

So please keep doing what you're doing, I
appreciate your efforts but I'm noticing we're getting
-- it's not rocket science. I think this lady said
that; it's not. When you're making a decision, what
does the organic consumer want? It's simple. I'm not
up yet? That's all I got to say. Any questions?

MS. DIETZ: They said six minutes, he deferred
that to you.

MR. AZEVEBO: Oh, okay. Well, there is a
couple of other items that we can go into. Just
recently I allowed my farm to be used for the National
Center for Appropriate Technology and this is an
organization that invited NCRA individuals from the Farm Advisory Boards throughout the state to educate them on organics and sustainable farming, and they did this last Thursday and Friday. And so we had all these people from the Farm Advisory Office come out there and what was unique was they had been told two years ago don't pay attention to organics, it's kind of a fading -- it's a hippie-dippie type of a thing and now with the influx of farmers in California wanting to get in organics, they cannot -- they don't have the tools to educate them.

So we did two days of workshops, had other organic farmers talk to these people to help new farmers to get into the system. So my goal is not to keep anyone out. My goal is to try to bring and try to save more farmers. We also are working very active with -- oh, the water conservation outfit; I can't think -- what's the name, George? Bobby Kennedy's into.

MR. SIEMON: Oh, the Water Keepers.

MR. AZEVEBO: They found out that pasture is an excellent way to filter water and that's -- one of my primary crops, as we went back to pasteurizing and found out that it's not only beneficial for the animal, that's what the consumer wants, but we can commingle manure water and brackish water and what comes out the other
end on the pasture, it's good water, so pasture is an intricate part of sustainable agriculture.

And even though I agree that when we start putting large concentrations of animals in one group it's not good, I don't feel we should keep anyone out. If it's a level playing field, if they can get them out cows out on pasture, then I think we -- but we need to hold strong, strong rules. And also, one last thing, zero pasture for a lactating cow does not constitute a pastural. You need to make that clear. You might want to write that down. Zero pasture for a lactating cow does not constitute pasture. And thank you very much.

CHAIRPERSON KING: Questions?

MR. AZEVEBO: Are there any questions?

CHAIRPERSON KING: I guess not. Thank you very much for your input. Let's see. Ann, you're up and on deck is Joe Smiley.

MS. FANATICO: My name is Ann Fanatico and I'm a graduate student at the University of Arkansas and I'm finishing a Ph.D. in natural poultry production. And I want to inform the NOSB and organic community about upcoming research at University of Arkansas focused --

UNIDENTIFIED SPEAKER: Spell your name, please.

MS. FANATICO: Spell my name?
F as in Frank-A-N-A-T-I-C-O.

MR. RIDDLE: And could you pull the mike down a little closer?

MS. FANATICO: Sure.

MR. RIDDLE: Great.

MS. FANATICO: I want to inform the NOSB about upcoming research at the University of Arkansas focused on eliminating the use of supplemental methionine in organic poultry diets. The phase-out of synthetic methionine in organic production is a critical issue since it's added to nearly all broiler diets, organic and nonorganic to support the fast growth of broilers. In addition to feeding strategies, another possible solution with the elimination of methionine, synthetic methionine is the use of slow-growing birds, which slow-growing birds require, may require less methionine in the diet because they have a slower rate of growth and are less muscled than the fast-growing broilers.

Although the yield and efficiency of slow-growing broilers is worse than fast-growing broilers, slow-growing broilers may present a market opportunity because of potential meat quality and sensory attributes. The objectives of the Arkansas work are to determine the methionine assisting requirements of slow-growing broilers. We'll actually be looking at slow,
medium and fast-growing broilers and to evaluate the impact of feeding strategies with slow-growing broilers. Feeding trials will be conducted to validate the determined methionine requirements under various conditions. Target requirements at 80, 100 and 120 percent will help inform whether the requirements are overestimated, correct or underestimated.

The experiment will be repeated with outdoor treatments. The University of Arkansas has a portable, free-range research facility. Meat quality will be investigated, pH, color, tenderness, nutrient content and own-farm field trials will be conducted to verify that the resulting strategies on a working organic farm at West Virginia University. They will test the organic diets on their integrated sheep and poultry farm and they sell organic poultry to a local market. Economics will be analyzed and lastly, to disseminate research findings to the organic and scientific communities. Along with university extension activities, the National Center for Appropriate Technology will disseminate producer-friendly information about this. And this is a project that has a four-year work plan. Thank you.

CHAIRPERSON KING: Dave.

MR. CARTER: Yeah, thank you, Ann. Just a question. When you talk about slow-growing poultry,
what's your definition of slow-growing?

MS. FANATICO: Well, we're looking at birds that take more like 12 weeks to grow out as opposed to seven weeks, which is common for broilers.

MR. CARTER: Okay. And are you looking at alternative sources of methionine?

MS. FANATICO: We'll also be trying to tie into some of the feeding research that's going on with the task force and also some other projects, so we'll look at some alternative feeding strategies, as well.

CHAIRPERSON KING: Mike and then Rose.

MR. LACY: Just one quick question, Ann. You said a four-year work plan, so the results of this will be reported in --

MS. FANATICO: Well, we'll report results as we go along because the project is in multi stages, so there will be some information, but the project, you know, to complete the entire project will take four years.

MR. LACY: Thank you.

MS. KOENING: Can I ask you what the source of funding for the project?

MS. FANATICO: It's USDA Integrated Organic Program.

MS. KOENING: And did you -- as you heard, I
guess, hopefully here during the discussion that economic analysis is sometimes critical in this -- for methionine, since it's sunsetted [ph], it may not be an issue, but even given so, is there an economic analysis --

MS. FANATICO: Yes, I thought I mentioned that, but the National Center for Appropriate Technology is supplying a program specialist to analyze the economics, so we're going to compare economics.

CHAIRPERSON KING: And did I hear you mention that you're going to be comparing and contrasting meat quality, as well?

MS. FANATICO: Yes.

CHAIRPERSON KING: Okay. Thank you.

Joe Smiley and Lynn Coody is up -- on deck.

MR. SMILEY: Joe Smiley, Senior Vice President of Quality Assurance International and one of the accredited certifiers of the USDA. Thanks for the opportunity to speak at this meeting. I really enjoy the tenor of this meeting and I really would like to thank all the NOSB and NOP staff for really doing a great job for organics. I think that we are moving forward, I think things, mostly in a very positive light; we're working through a lot of problems that have taken years and I think we all need to just be patient.
with the process and trust in each other's good
judgment. So on to the points. This is a simple one
but it's a really major one for a working stiff on the
front lines of certification and that is certificates.

We really didn't expect to see a lot of
certificates coming into our agency that don't specify
in compliance to the NOP. Many certification agents are
accredited by the USDA, but they accredit to a number of
standards and a lot of times the certificates don't
specify what standard is -- they're accredited to. We
pursue that and say this -- we have to make sure that
this certificate is in compliance with the NOP, not some
other organic standard because as good as it may be,
this has got to be an NOP certificate.

We really want to see more focus from the NOP
and support from the NOSB on somehow hopefully avoiding
rule change, which I'm not really that excited about,
but getting a change in there so that certificates are
specific in citing in compliance to the NOP. After all,
that is the purpose or one of the main purposes of the
reg, so I just want to bring everybody's attention to
that. It's out there; there are certificates floating
around and it leads me to my next point, is we all want
a level playing field, whether it's for dairy farmers or
certifiers, we need a level playing field for everyone
and it's going to take time to get there.

We need -- it takes time to get a consistent interpretation of the regulation by all certifiers and I think we all -- and I'm sorry that Andrea isn't here because maybe some of my comments are directed to her committee, but it really takes a lot of work to get that team together and to get that consistent. Two ways we can do it is by more publications of decisions or of leanings that are being made by either the NOSB or the NOP on a web site; on-site visits to all accredited certification agents are important. I don't have time to comment on the Scope Documents, but I think you're all on the right track. I was very pleased with the comments this morning, so I'll pass on that.

The last irritant I have is something -- I mean, we argued about everything in the Organic Standards industry back in the '70s, '80s, '90s, but we never argued about the fact that you could use an organic in a conventional ingredient, the same ingredient in a product. I think OTA brought it up before. That's -- we didn't even argue about that. That was a slam dunk and we argued about everything, so I'd really like to see a correction to the current interpretation that there's a legal basis to allow an organic and a conventional ingredient in a made-with

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
product, because once the industry, you know -- and I do use the word industry -- starts hearing that --

MS. DIETZ: Time.

MR. SMILEY: -- you're going to start seeing those products and I think we've got to nip that one in the bud.

MR. RIDDLE: Yeah, it's more of a comment, Joe. Thanks for your comments and I just wanted to let you know that back in 2003 the Certification Accreditation Compliance Committee did draft a recommendation and the first item there would be to require all certificates issued by accredited certifying agents verifying compliance with the NOP contained the phrase "Certified as compliant with USDA's National Organic Program" and you, as an accredited certifier, must verify that all ingredients being used by the operations you certify are indeed certified to this regulation, not some other regulation, but you're right, the rule does not require that in the section about information about on certificates and we were encouraged to kind of drop this issue. I'm hearing that it remains a concern and maybe the committee should take it back up.

MR. SMILEY: Absolutely. You have to. It's
happening. I mean, there's a lot of ingredients floating around that are certified by accredited certifiers, but aren't necessarily certified to the reg and there's no legal language, as I understand it, that forces them to put that on the certificate. So we don't know. So we have to do a lot of extra work and I'm just presuming all of my colleagues and competitors are doing the same amount of work. And that's a tough assumption to make some days.

CHAIRPERSON KING: George.

MR. SIEMON: You're the second one that's brought up this double ingredients. I'm sorry, I'm out of the loop. Is there --

MR. SMILEY: Let me be real clear, I --

MR. SIEMON: Is there some directive or something, something I'm not aware of?

MR. SMILEY: Dick can give you the numbers. Basically, there can be a legal interpretation that in the made-with label, you can have an organic and a conventional same ingredient in a made-with label because of the regulatory writing. Dick, you'll have to back me up on this.

MR. SIEMON: Is that now something that the ACAs are interpreting or is that something the NOP stated or made an opinion on?
MR. SMILEY: An ACA interpreted it and allowed the product to come out; we just said oh, they made a mistake, this ain't going to happen and apparently, it can. I would really -- if you don't -- Dick can --

MR. SIEMON: No, no. That's enough.

MR. SMILEY: Okay. Anyhow, right now -- let me be clear. This is not the NOP's fault, the NOP --

UNIDENTIFIED SPEAKER: I'm starting to run my meter.

MR. SMILEY: Yeah. This is not -- this is a -- it's a case that a legal opinion can be made; that can be allowed. And from what I understand and if the NOP wants to make a comment, I would love to hear it, but from what I can understand, it wasn't the intention of the rule; nobody intended that. But because of the nature of the regulatory writing in that section, it's defensible. Reprehensible, but defensible.

CHAIRPERSON KING: Thank you very much, Joe. Lynn, you're up and Joe Mendelson is on deck.

MS. COODY: Hi, my name is Lynn Coody. It's spelled C-O-O-D-Y and I am Principle Consultant of Organic Ag Systems Consultants located in Eugene, Oregon. My business focuses on providing accreditation to domestic -- assistance to domestic and international certification agencies in meeting the requirements of

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
the NOP and ISO Guide 65. That means I work with
accreditation requirements of ISO and NOP on a daily
basis. I'm also the chair of the OTA Accreditation
Sub-Committee and I am very thankful to present my ideas
to you today.

I'd like to talk about three topics today,
which I'm going to list right now just in case I don't
get to them all. The first one is the role of ANSI
evaluation of the NOP's accreditation program; the
second is site audits of NOP-accredited certifiers and
the ability of NOP accreditation program to meet the
requirements of ISO Guide 61. But before I start, and
this is why I might not get into my whole testimony, I'd
like to say how pleased I am to have Mark Bradley as
part of the NOP as the accreditation manager. Those who
attended the trainings that Mark conducted on ISO Guide
65 a few years ago know that Mark has a depth of
knowledge about accreditation and is quite sincere in
his interest in the organic field and I should know
because I attended three of those trainings, myself.

So I'd like to get now to my first topic about
the ANSI evaluation. I'm sure we're all happy to hear
that the report is -- will be out soon in, hopefully in
-- sometime in November and I certainly look forward to
seeing that. I am also happy to hear that the

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
Department is intending to implement a regular internal auditing program similar to the one just conducted by ANSI, but I'd like to remind you of another related responsibility for oversight which wasn't mentioned today and that is the role of the famous PIER Review Panel, which is referenced in the rule.

Yesterday I attended a meeting of the National Campaign for Sustainable Ag and presented a model that shows the different interactions about oversight of the accreditation program, which I'd be happy to share with the NOSB Accreditation Committee and I hope you'll tell Andrea, since she's not here. I also want to briefly mention the site audits of NOP-accredited certifiers have not been done as promised.

Last -- at the last NOSB meeting they said they would start them last summer and to my knowledge, none of them have been done for the foreign certifiers, which I feel creates an uneven playing field between foreign and domestic certifiers. And finally, just briefly, I'd like to emphasize the importance of the NOP's accreditation program with meeting the internationally accepted requirements of ISO Guide 61 and I will --

MS. DIETZ: Time.

MS. COODY: -- stop right there. I always

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
have a lot to say about ISO Guide 61, so if you want to
know more, you can ask me. Thanks a lot.

CHAIRPERSON KING: Thank you very much, Lynn.

Joe, you're up and Emily Brown-Rosen is on deck.

MR. MENDELSON: Thanks. My name is
Joe Mendelson. I'm the Legal Director of the Center for
Food Safety. I do want to note that I have a proxy from
Liana Hoodes of the National Campaign for Sustainable
Agriculture. First, I'd like to thank both the Board
and the Program for all their hard work. We know it's a
lot that you have on your plate and we do appreciate it
and appreciate the spirit of this meeting.

First, I'd like to do my Tom Hutchison
imitation. We support the NOSB's paper on organic
livestock; we support the paper on fishmeal; we support
the paper on Inerts. I'd like to lend my support for
comments in a proposal made the Wild Farm Alliance
concerning amending the model organic farm plan to
consider bio-diversity and I also would like to note my
appreciation to Rose for the paper on revamping the
materials list. I think that would be helpful and it
certainly would be helpful to those of us in the
consumer and I guess, nontechnical material field in, I
think, understanding the list in classifying it that
way.
More specifically, consumers expect and need clarity, I think, on when the term "organic" is used in a principle display panel and unfortunately, I think in the discussion of the Scope paper, we really didn't get that clarity today and unfortunately, we didn't really have time to hear from the Program about what they -- how they view that issue. It was certainly a part of the directives and I think needs clarity and I hope at least we can revisit that later in the meeting. I think it's important to consider, though, in the Scope issue that there's a split in the authority or the scope of authority to set standards and the scope of authority to enforce. And by that I mean the scope to set standards in the Act clearly goes to agricultural products. And so, you know, follow that there's also -- I think I have six minutes, so Kim, so I have a --

MS. DIETZ: I didn't hear you say proxy.

MR. MENDELSON: Proxy. There is authority to enforce the term "organic", I'd say not the seal on agricultural products. The misuse of label goes to the term "organic", not the use of the seal. But if you play that out, you have specific standards that we might need on agricultural product that are not yet in place. It's been identified. Fish, for example; it's certainly our feeling that at that situation those standards

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
haven't been set, that a label "organic" or the term "organic" should not be used on that product. That's a misuse of the term "organic" and there's clearly authority to enforce the misuse of that term "organic." Pulling the seal off isn't enough. The 65-19A goes to the term "organic." Consumers look to the term "organic" more than the seal, unfortunately. I think that needs to be clarified.

If you then go to nonagricultural products, I think it's clear that the Act does not provide the Department authority to set standards. So there may be some nonagricultural products like cosmetics standards are not -- the authority's not under the Act. They may have to go to other places like FDA. But if you look at enforcement as far as the term, use of the term "organic", the Act says you get -- the Department can enforce use of the term "organic" on a product, not an agricultural product, a product. It's a much broader term.

So the question becomes then, what is the scope or what -- how far does the USDA want to take its enforcement discretion in enforcing the use of the term "organic" on a label? I think that's a question that clearly needs to be addressed. I think one thing, it goes to resources on how far the Department wants to
extend that enforcement discretion. I think there also
might be some proxies on other ways to enforce that
enforcement -- you could look to the FTC, which enforces
all sorts of label claims. They've done it on "ozone-
friendly" and things like that. They could certainly do
it on organic, on nonagricultural products that are
organic.

I should add quickly that you'll hear from my
colleague at Consumers Union, that both Consumers Union
and Center for Food Safety have a joint position; a
recommendation or thought we'd like to put forward on
some of the cosmetic and personal body care products.
Real quickly, I would like to get to the Sunset
document. The law 65-17E requires full review
consistent with the provisions of that statute. That
includes looking at health and environmental issues
incompatibility issues. Unfortunately, the document
that's presented says we need to look at this general
concept of sunsets. Well, the real question is what is
the sunset within a concept of the Organic Food
Production Act? It's not generally how we look at
sunsets and it's not -- that doesn't give us some type
of justification on how other sunsets kind of truncate
the review of the statute specific.

Sunset review in -- under the OFPA means you

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
have to look at materials consistent with 65-17 and that means you don't just look at whether it's continued use, you look at its health and environmental and organic compatibility. The list was designed to be -- in our -- consumer's mind, I think, diminishing, not entitlement to stay status quo by just looking at continued use. I also think you can't put a paper out there saying we're only going to look at continued use and not compatibility when the Board just put forward recommendations on what organic compatibility means out there.

Certainly, materials that have been reviewed in the past haven't necessarily been looked at that compatibility standard, so you know, I think it's unfortunate. I realize there's a serious burden of work, but the law says what it does. I think you'd be short-changing consumers' expectations about diminishing materials, about creating a list that diminishes materials, not create entitlements and I would ask that that document be revisited. Thanks.

CHAIRPERSON KING: Questions? Thank you, Joe. Wait, Rose has a question. Joe, Rose has a question. Sorry.

MS. KOENIG: On that -- back to the Sunset, because that is a document that's up there being

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
considered for a policy or vote. Can you elaborate a little bit more in terms of your -- you are a lawyer, correct?

MR. MENDELSON: I try not to admit that.

MS. KOENIG: But -- because you didn't state that. But your legal interpretation of that -- because we -- our original document, our original proposal had a much more thorough review process. It was quite different, although the final document was a kind of bringing together of some aspects, but some of the points that you raised were in fact raised by the committee as we were trying to bring these two documents together. So if you could elaborate on that concept, especially the first part, that review of Sunset was something that the NOP had constructed or argued --

MR. MENDELSON: Well, I --

MS. KOENIG: -- you know, from a legal point of view and unfortunately, we're not lawyers, so --

MR. MENDELSON: Yeah, I just -- in reading over the document, there's this general discussion about what a sunset is and it sort of mishes-mashes statutes that may sunset, in general, the whole statute or the authority under the statute versus what the OFPA says specifically. The sunset only goes to the materials, so it's really, I think, disingenuous to look at other laws.
and other sunset provisions to give some type of gloss on how we can interpret Sunset provisions, generally. I mean, the sunset provision in the OFPA has to specifically be interpreted to be consistent with 6517. I mean, that's what it says. And if you'll look at 6517 -- I'm sorry, I don't have the subsection, I mean, it's -- you know, the three characteristics. So you know, I don't think you can look at statutes that have sunset provisions that don't related to organic and somehow say well, that allows us to eliminate two of the three criteria that we needed -- that, you know, that the OFPA says we've got to look at. I mean, that just -- that's just not -- is that clear?

MS. KOENIG: Yes, it is. And I had one more question. Taking advantage of some legal opinion. The one other question I had is that we -- and again, this may be more of a program area, so I'm just posing it to you and it's not to disrespect the NOP position on it, so I want to be clear on that. But we, as a committee, had questioned whether if we started the process, if we put through the Federal Register a notice that these materials were going to be up for sunset and if we went through kind of due diligence to complete the work, however, we didn't finish the work. We were -- and I don't want to quote because I'm not sure, but it was my
impression, I guess, that if we didn't finish the job
then the whole list would be nullified, that we were
kind of creating a train wreck for the industry and you
know, is that your understanding of how the Federal
Register process works?

MR. MENDELSON: Well, I think that the
question really is whether it's a five-year time frame,
the question is when that five years hits, does it
affect everything on the list and all the materials?
That's a tough question. I think, as I remember the
statute, it goes to materials, so if you have completed
them for specific materials, I think those materials
would have been met and then there would be other
materials that if you didn't get the job done in five
years, then those would fall off. I think there's
separability [ph] there in that sense. I would say
that's my interpretation and if you really want to rely
on that, you might want to have your own lawyer to be
under retainer to --

MS. KOENIG: Thanks. Thank you.

UNIDENTIFIED SPEAKER: You got what you paid
for.

CHAIRPERSON KING: Yeah. Thank you, Joe.

Emily's up and Brian Baker is on deck.

MS. BROWN-ROSEN: Good afternoon. I'm
York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
Emily Brown-Rosen and I am now with the Organic Research Associates. I had to think about that. I was going to comment also on the sunset process. Joe just made a lot of my points, so I won't belabor that too much other than I do have some specific surgical fixes, just a few words could be changed in that document and I think it would help protect the ability of the Board to review products and protect, you know, the material standards from certain problems that might come along and I think that is your duty when — under the sunset, is to review the list according to OFPA.

So his main point is that 6517 has three overarching criteria; substances should not be harmful to human health and the environment; the substance is consistent with organic farming and handling and there is an absence of wholly natural substitute products. So those are three criteria that it takes with other sub-criteria for you to review a product or a material to get it on the National List. So when you take it off, any of those three criteria, failing to meet that is a reason to take it off. The way the document is worded, there's an "and" there that a petitioner would have to prove that all three of those things didn't apply, there should be an "or." And there's several places in the document where it says that, so if someone
came in with compelling evidence that a substance had, say it was suddenly found to be carcinogenic, endocrine disrupter, that would be a good reason to re-look at it, maybe do another TAP review. So I'll give you those in writing so you can look at that when you work on the document.

My other comments are about some -- the draft proposal that the Materials chair has put forth on talking about the concept of the National List categories and how to review, you know, this whole concept of what is an active ingredient or is NOSB limited to only putting items on the list that are in those active ingredient categories mentioned in OPFA. And I'm really glad you're working on this. I think it's really important because we have different interpretations right now on the structure of the list as has been proposed by NOSB and what NOP has been saying in a few different instances.

So historically, we -- we've always considered that all synthetic ingredients need to be on the National List when used in production and there's -- in the case of some of these incidental ingredients, we've facilitated this by having certain categories on the list like aquatic plant products, liquid fish products which when -- as a category have synthetics in them and
got put on the list as a synthetic. If this is no
longer the understanding of how this can be, then this
other option that Rose has proposed outlining a new
definition or a new category of production aid and
separately listing some of these incidental ingredients
that may be permitted. And I think -- I would prefer
the old way, but if the new way is the only way to do
it, I have a definition here that I've worked on on
production aid and I'd be happy to share it with you.
If someone wants --

CHAIRPERSON KING: Could you please --

MS. BROWN-ROSEN: -- to ask me a question.

CHAIRPERSON KING: Yeah, you're time's up.

Could you please share that with us?

MS. BROWN-ROSEN: Okay. So based on what the
OFPA language is I would propose production aid includes
netting, tree wraps and seals, insect traps, sticky
barriers, roll covers and other equipment used in crop
and livestock production. It also includes substances
such as equipment cleanser, carriers, stabilizers,
agivants [ph], extractants [ph], excipients and solvents
that are necessary for formulation of fertilizers, soil
amendments, livestock feed and livestock medications. I
think that kind of covers all the bases, but you know,
we certainly could talk more about it. Thanks. Any
more questions?

CHAIRPERSON KING: Kim.

MS. DIETZ: Just a comment, Emily, because when we get to that discussion I just want to make sure that we have a definition in the NOP for processing aid and that we don't confuse the two because they are very separate.

MS. BROWN-ROSEN: No, no. In the --

MS. DIETZ: And so --

MS. BROWN-ROSEN: Oh, sorry. Go ahead.

MS. DIETZ: Yeah, so I just want to make sure that we look at that and that's why I bring it up now. It's been on my list, but it could be confusing; production aid, processing aid.

MS. BROWN-ROSEN: Right. Well, it's just in a different section. It's under Crop and Livestock and there's this next criteria is if used in handling, it must be blah, blah, blah. So there -- it's two distinct areas there. So I think you can differentiate based on that, so --

CHAIRPERSON KING: And are you going to forward that little statement to us in writing?

MS. BROWN-ROSEN: Yeah.

CHAIRPERSON KING: Okay. Thanks.

MS. BROWN-ROSEN: I'll get my extra copy.

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
CHAIRPERSON KING: Brian Baker and Michael Sligh is on deck.

MR. BAKER: Brian Baker, Organic Materials Review Institute out of respect for the request for the chair, I cede my time and respectfully request the opportunity to speak to you on Thursday. Thank you.

CHAIRPERSON KING: Thank you very much.

Mr. Michael Sligh.

MR. SLIGH: Good afternoon. I am Michael Sligh with the Rural Advancement Foundation International based in Pittsboro, North Carolina. I rise to applaud the NOSB and the NOP for this demonstration of a new spirit of cooperation. We're looking for this to be a blossoming of a more trustful and generous atmosphere. I think one way that maybe you can build on this new spirit is to while here at this meeting, to mutually agree on some clear deadlines that you can hold each other accountable to.

For instance, the concurrence of the Department is some key confusion that was generated by the April statements would be very important to ensure that that gets up on the web site and goes out to certifiers as soon as possible and that you mutually hold each other to these kinds of deadlines. Similarly, the meeting that I attended in June with the Secretary...
and the Department, this -- procedures for cooperation
and collaboration between the Department and the NOSB,
this too needs a deadline for that to be resolved. This
would be a very useful contribution to future Boards and
would avoid a lot of future machination, I believe. So
I urge you to lock in those deadlines while here
together at this meeting. I think that will be a good
team-building exercise. I certainly support the
comments of Lynn and Joe that have already come forward.

I was looking to hear something about the
criteria of the TAP review contracts that spoke to the
qualifications for demonstrative expertise in
sustainable and organic agriculture and production and
processing. I think that the scientific criteria is
important, but I've seen a gap in some of the previous
TAP contracts because of their lack of understanding of
this particular approach to agriculture, so I just urge
the -- it may be there, but I didn't hear it.

The issue of the sunset, I want to stress that
the founding Board made many of our decisions about the
materials based on the promise that future Boards would
indeed meet the OFPA requirement of the re-review in
meeting the legal sunset. So we urge you to keep that
promise and to understand that we also voted those
materials with specific annotations and we would not
have voted those materials and in many cases the votes were very tight. And so it was in our view that the annotations and the requirement of the sunset were part of the deal maker of how we got to here and it's your role to keep that deal going forward, so thank you much.

CHAIRPERSON KING: Questions for Michael?

Rose.

MS. KOENIG: From the historical perspective on that sunset issue -- just to enlighten me, I guess, so when you envisioned a review was it as extensive of a TAP review as -- well, let's not go to the original ones because I know some of those -- that was not an extensive review --

MR. SLIGH: Well --

MS. KOENIG: -- so I guess what I want to do is speak to the ones that your Board, you know, the first Board put in and then perhaps speak to the ones that we're now looking at that we have contractors that have been assigned that have provided us with more information. I mean, do you expect the same kind of review of all or you know, what kind of ideas can you provide?

MR. SLIGH: Well, I think the OFPA was clear and that you should just go to the OFPA guidelines and follow that. It also has to be consistent. The bar for
putting material onto the list can't be lower than the bar for taking it off the list. There has to be consistency across that. You can't make it a higher burden to take it off than it was to put it on there. It needs to be consistent in both a positive and negative perspective and that the OFPA -- that language of sunset was very deliberate and it was a deal maker in the passage of the legislation and it was there to provide this accountability, part of the public/private partnership.

CHAIRPERSON KING: Dave.

MR. CARTER: Yeah, Michael. Emily just laid out three kind of criteria on the sunset. What's your thoughts on those specific ones as --

MR. SLIGH: They seem sound to me.

MR. CARTER: Okay.

MS. KOENIG: One other question. Because again, this is an area of kind of confusion where we get kind of advice from a lot of different individuals as we try to go forth and make these policies and again, the original policy that the Board came up with was quite different from the one that's on the web currently.

MR. SLIGH: Yes, it is.

MS. KOENIG: Speaking to the idea in rulemaking, I guess, that Barbara explained, you know, I
just don't know where that -- you know, again, not
having that legal expertise -- I think the idea, again,
as she stated earlier with once something's there, the
burden of proof to getting it off is higher, so that
idea of an equal bar, although it might've been the
intention, did you actually research that when you --
you know, I guess I'm having a hard time grasping with
what ideas that were out there and I think the concepts
and we all understand those, but now that we're in this
idea of what we have to do to satisfy the legal entities
within USDA, sometimes what we want and we have are two
different things, so that's just the situation.

MR. SLIGH: Well, if that's a question, I
think that -- I think the idea was that we weren't
creating a spiraling list of materials that would send
agriculture toward this product substitution, that
organic was not about just finding additional more and
more materials to meet an endless need, but that it was
based on the principles of organic agriculture and that
if new science comes forward or new information on a
positive light about something that we omitted, then
that's an opportunity during that comprehensive review
to reconsider. But it's also an opportunity if new
light comes to the fact that hey, you know, we really
don't need this anymore based on those criteria or other
sound reasons to take it off. We were counting on that as the check at the end of the day. That's the stop, that's the backstop. And if we lose the backstop, then we're concerned that we're into a spiral where there's not a conclusion.

MS. KOENIG: But I guess -- and I agree and I think that the policy -- now, maybe there's -- maybe you're speaking more to the issue of there may be an undue burden on the person who wants to take that off and that's a very different issue because I think the policy does state that, you know, new information would have to be there, so I don't think there's a difference in that, that it's not arbitrary.

Are you speaking to the concept that perhaps there's not enough time for individuals to do that, perhaps the Board doesn't have enough authority to extend time or to do more technical review, you know, what specifically are you talking about because within that policy that is a criteria for taking, you know, for considering not renewing something, so I don't think that there's a difference of opinions. Now, I also have reservations in that policy as far as is it too large of a burden, is it not enough time given for that because we have a certain, you know, deadline and I think that that's a different issue, so maybe if you could think
about that a little bit more and we can talk.

MR. SLIGH: Yeah, I'd be glad to think about it and give you some more careful advice. Thank you.

CHAIRPERSON KING: Kim, I think, had a quick comment and they we're going to -- or --

MS. DIETZ: Dave's light's on.

CHAIRPERSON KING: Oh.

MS. DIETZ: Michael, we've been talking about this, the quality of TAPS from the original 1995 recommendations to now and they are very, very different. I also know that we have -- we've had a sunset provision on the table for almost two meetings now and we're still without anything in the Federal Register and we have to do something, so I would encourage everybody to, you know, if you have public comments on those documents, do them fairly quickly. I don't know if they've been posted already. I believe they have. But we have to make some decisions pretty quick for the Register, it's got to go out because we have to start reviewing materials or -- I'm off the Board, but this Board does have to start reviewing materials, otherwise --

MR. SLIGH: We're more than anxious to help you meet your deadline and we want to do everything to avoid a possible crash at the end of the deadline.
That's not our intent.

CHAIRPERSON KING: Thank you. Next up is John Cleary, on deck is Susan Ulery.

MR. CLEARY: Hi, folks. My name is John Cleary from Vermont Organic Farmers and NOFA-Vermont. We are an accredited certifier representing 350 certified operations and about a thousand consumer members. I'm also here as a board member of the Accredited Certifiers Association/National Association of USDA Accredited Certifiers. The Accredited Certifiers Association really looks forward to working in a positive way with the NOP and the NOSB in the future. Thanks for the hard work that all of you all do. I'm going to hit a number of points and try to be quick about it.

The first one regarding the framework for collaboration between the NOSB and the NOP that was discussed this morning, I hadn't seen any -- you know, the information that you all have shared between each other about some of these feedback loops -- so maybe some of this was covered in that, but I'll give you real quickly some suggestions from my point of view as a certifier. Number one, when a certifier or producer asks the NOP for clarification or interpretation of a standard, it's my recommendation that before the NOP
provides an answer to that, that number one, they check to see if there is an NOSB recommendation on that topic. If there is an NOSB recommendation on that topic, then I would recommend that the NOP either defer to the recommendation or if the NOP disagrees with it, to publicly let certifiers and the NOSB know that they disagree with that so that topic could come back to the Board for re-review and that certifiers would know what to use for guidance. So before answers are sent from the NOP back to a certifier or an individual operation at that, feedback to previous NOSB recommendations is done.

And if there is not an NOSB recommendation on that interpretation and topic, I would suggest that the NOP bring that issue to the NOSB prior to providing an answer if it is an interpretation issue that's going to be setting a precedent for the future. And basically, certifiers need to know what is the status of these recommendations.

Really quickly, also I was informed a while back that the livestock docket may -- was possibly going to include an NOSB recommendation that would allow all excipients in health care products for livestock. That's something we strongly support; I know the NOSB's recommended it. I don't know if that is included in the

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
livestock docket that the NOP said is in the process, but it would be great if we could have an answer on that. The last thing is I don't know if people in the room are aware that the pasture issue has sort of reared its ugly head once again and it appears that there are farms that are now being certified who are not providing pasture for lactating cows and I know the NOSB has provided some guidance on that in the past --

MS. DIETZ: Time.

MR. CLEARY: Okay. If I could just say, I don't if the NOP has -- there's rumors that there's been some clarification to a certifier that the NOP can't strictly enforce the pasture requirement. I don't know if that's true or not, if there are any comments about that. Thank you.

CHAIRPERSON KING: Rick.

MR. MATHEWS: That comment is not true.

MR. CLEARY: Great. I'm glad to hear that.

Thank you.

MR. MATHEWS: The pasture requirements are as published.

CHAIRPERSON KING: Jim.

MR. RIDDLE: Yeah, and John brought up another good question and that is about the status of our recommendation on the excipients, is that included in
that docket?

MR. MATHEWS: It's in the docket.

MR. RIDDLE: Okay. Thanks.

MR. CLEARY: Could I just pass out one thing from the Northeast Dairy Producers Alliance regarding strengthening the pasture standard to you all?

CHAIRPERSON KING: Thank you. Susan Ulery and on deck is Urvashi.

MS. ULERY: Good evening and thanks for giving us a chance to hang in here for the light in the day. My name is Susan Ulery. I am the Director of Regulatory Affairs for the Synergy Company, which is a dietary supplement manufacturer, the outcast child now.

UNIDENTIFIED SPEAKER: Could you spell your name?

MS. ULERY: U-L-E-R-Y. And I'm here today, however, speaking on behalf of OFPA because we're also members of the American Herbal Products Association and my topic is, I said on form Scope, but in sitting here I've been thinking well, maybe I should've said my topic is for prevarication. No, that sounds like John Kerry. Maybe I should say the topic is flip-flopping, but that makes me sound like I'm using a branded Republican term, so I wouldn't go there. The problem for us is the use of organic labels; it appears to be completely up in the
air for our industry. We've made tremendous commitments
in the supplement and herbal industry to the organic
program.

We support some four billion dollars worth of
herb sales go through the dietary supplement industry
that dietary supplements are maybe 18 to 20 billion.
Did I say -- it's four billion for herbs. Of those,
there are some 200 herb farms that are certified organic
right now who are members of OFPA and nobody, I think,
ever explained to us that dietary supplements weren't
considered food because under FDA regulations they most
certainly are. I refer you to 21 CFR, section 321(ff)
and so when -- I was talking with Mr. Mathews during the
break and I said I'm suffering from this illogical
condition here.

We think we're food; we know we're food
because FDA regulating us as food. We have to comply
with all food labeling unless Dushay [ph] creates an
exception for supplements. So how come you all are
trying to throw us out? And his logic -- and I'm
presuming this came from legal staff that, you know --
consulted is that well, the dietary supplement industry
wasn't specifically consulted when OFPA regs were
adopted, therefore you can't be regulated. And I think
we all thought we were consulted. We've thought all

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
along we were part of the plan and so it's very
distressing to be thinking that we have to throw out all
our labels again.

You know, we threw them all out when NOP came
on line and we wanted NOP compliant labels and we got
ourselves certified and oh, those are gone; now maybe
we'll have a private standard. But then you have Joe
Mendelson saying absolutely not. You cannot use the
word, the term "organic." We want to support organic
farming and organic products for consumers and we need a
way to do that. We need your help. This is really sad.
Thank you. Do you have any questions? I gave a handout
which I hope all of you got.

CHAIRPERSON KING: Dave.

MR. CARTER: Yeah. Just a question. In terms
of dietary supplements, though, in regard to structure
or function claims, I mean --

MS. ULERY: Right.

MR. CARTER: You know, that does bring you,
then, under FDA --

MS. ULERY: We're under FDA to begin with and
so is food. For instance, the processed food can make
certain nutritional claims like a health food claim like
Omega 3 or some cholesterol-related heart healthy type
of claim. You know, you can even see that on breakfast
cereals, et cetera. And dietary supplements have a
corollary, which is the structure function claim and
those are -- both are regulated by FDA. So we see no
reason to distinguish ourselves in using an organic
label. If we can qualify and meet all the requirements,
we're there. We're already there and we want to stay
there. We don't -- we understand that -- my certifier's
rep is here and they think this is a great marketing
opportunity for a new organic label, but we kind of like
the one we have.

CHAIRPERSON KING: Jim. Jim has a question,
also.

MR. RIDDLE: Yeah, well you've taken a look at
the Scope policy, obviously, and that --

MS. ULERY: Many times.

MR. RIDDLE: -- particular section -- yes.
And I would be most interested in, you know, surgical
corrections to our draft, you know, that if you can
provide us specific language that would meet your goals
but still be consistent with the rest of the draft;
maybe we made a mistake by lumping the cosmetics and you
know, dietary supplements. So there's one to pull apart
right there and then let's deal --

MS. ULERY: That's what that letter that we
just handed out summarizes.
MR. RIDDLE: Yeah, but I don't see the revision language proposed and that's what I'm asking --

MS. ULERY: Okay.

MR. RIDDLE: -- not right now, but for you to work on and provide to us.

MS. ULERY: Basically, we don't think a revision is needed because we're there. We're food. I think that's the -- really the basic strain that underlies our thinking and it has all along. We are food under the CFRs. And then there are additional provisions we have to meet as supplements. But we figure if we meet the food requirements of FDA and of NOP, we're labeling correctly and we're in the game. But I'd be happy to dialog about that. If you guys think you need more from us, we would really like the opportunity to present it, so we'll be in touch. Thank you.

CHAIRPERSON KING: Urvashi, you're up and Marty Mesh on deck.

MR. ENGLE: Mark, I will give my three minutes to Urvashi. David Engle.

CHAIRPERSON KING: Oh, thank you.

MS. RANGAN: Thank you. My name's Urvashi Rangan. I'm an environmental health scientist with Consumers Union, we're the nonprofit publisher of York Stenographic Services, Inc.

34 North George St., York, PA 17401 - (717) 854-0077
Consumer Reports magazine. Good afternoon and thank you all very much. Consumers Union would like to thank the Board for all of your hard work on getting your inputs on these directives together. Really, for the most part, we agree with all of them. We have a few comments to make on them.

We'd like to thank the National Organic Program staff for their careful consideration of those inputs and for reconsidering those directives that were issued that really shouldn't have been issued in the first place and while we're relieved, we don't want these issues to be quietly revisited again. Part of the confusion that happened over the summer was a lack of getting our questions answered, which we found particularly frustrating, as well reviewing minutes from meetings where it wasn't clear whether these directives were in practice or not and that is why we were staying on top of this and so while we are relieved, we don't want additional clarification posted on your web site and I'll get into that a little bit more in a minute.

I have a question about the antibiotic input that you gave today on livestock and it's unclear to me, Barbara, when you said that you concurred whether you concurred that all of the recommendations need to be proposed or whether indeed antibiotics right now cannot...
be used on the dairy farm. I'd like some clarification
to that question and whether it's all of that
recommendation that's going to need to go under proposed
rule or half of it for the replacement conversion
factor. I'm unclear on that.

As I mentioned before, I do think
clarifications do need to be made. This summer we found
an erroneous posting on the NOP site which was not dated
which had clarifications to the clarifications of the
clarifications and it was very confusing for us, it's
confusing for consumers, it's confusing for farmers. We
need things that are posted on that site to be dated and
we would like all of your answers to the NOSB input
today to be posted on that web site. We would also like
our questions that we asked you in our letter this
summer to be posted in the Q&A and we would like answers
to those questions so that we can have closure to all of
this and so that consumers and farmers and certifiers
alike are all on the same page.

On to some of the recommendations. Just -- we
have additional concerns about fish and fishmeal which
are addressed as in part in the fishmeal recommendation.
We think it's very good that synthetics used in fishmeal
are now going to be required to be reviewed and put on
the National List, but we do have concerns about
contamination issues in fishmeal, whether it's used as a supplement or whether it's sold as fish, there are still PCB and mercury contamination issues, as well as environmental impact of over-fishing that need to be addressed and while we appreciate that there's been a lot of progress made on the fishmeal recommendation, Consumers Union certainly thinks that it needs to go a step further and deal with those contamination and environmental issues.

I'd like to also reiterate what Joe Mendelson said about labeling. This program does have statutory authority over labeling on food and it's -- the lines have become blurred between personal care products and pet food and fish and pet food is food and fish is food and those things should not be carrying any organic claim until the standards are made that they can follow. When consumers see those claims on those products, they assume that the same standards are being followed for food. So please, we requestfully [ph] urge you to actually prohibit the use of the organic term on those food products until standards are made.

As far as the nonfood products, I want to make a comment on dietary supplements. For the record, Consumers Union actually has a big problem with the organic label on dietary supplements. We recently
published an article -- and I'm going to get a copy and bring it in tomorrow for all of you -- on a lot of safety problems with dietary supplements. We do not think that FDA is doing an effective job monitoring the safety of dietary supplements.

We do not actually agree with the law changes that equated dietary supplements with food and so to say that a dietary supplement is organic or nonorganic isn't necessarily offering consumers any additional value and consumers shouldn't assume that those supplements are any more safe.

Finally, on personal care products, we've got a huge product category out there carrying the organic label and we need to fix it now because consumers are buying these products and paying more money for some products which may be truthful and some products which may not be. Agricultural ingredients are used in personal care products. If you have a Shea butter and that's all you have in it, you have presumably a hundred percent organic product if you've grown it in accordance with the NOP standards.

So it shouldn't be rocket science to figure out that that can follow the labeling tiers. We need personal care product labeling to come in line with food labeling and if it's less than 70 percent organic you
just shouldn't be able to use the organic claim on the
front of a package. Twenty percent organic in personal
care products shouldn't be allowed. It's not allowed in
food. Thank you.

MS. KOENIG: The -- as far as the going back
to the fish, I think you should consider petitioning --
if there's -- the problem with -- it's -- you know, if
it's considered a natural, which the committee stated,
they believe it's a natural, if there are contaminants
in that natural, the only way that we can regulate it is
be petitioning it to be a prohibited natural. Now, that
could be annotated in the sense that if it is a
prohibited natural, those that contain a certain amount
of residues would be the ones that would be -- so it
could be annotated prohibited natural, but that's the
way to get about those things and it's the only way.

MS. RANGAN: Thanks, Rose. And we will work
on that. Thank you.

CHAIRPERSON KING: Yeah, Barbara.

MS. ROBINSON: Let me just -- Urvashi, you
asked about the antibiotics and the materials versus the
origin of livestock. The origin of livestock change is
a rulemaking change. We will issue a statement that
says that all prohibited materials can't be used in
livestock; that includes specifically antibiotics,
unless the materials have been petitioned and approved
by the Board and they have been published on the
National List.

MS. RANGAN: Thank you, Barbara.

MS. ROBINSON: And Rose is quite correct.

Petition fishmeal to be a prohibited natural if you
don't want it on the list or if you want it on the list
in that way. And as far as statements about who should
get the standards and who should not, we have actually
dialogued with OTA and suggested to OTA that for
products for which USDA does not cover the labeling,
that OTA can work with the industry to develop
standards, be the keeper of those standards, develop a
logo and then, of course, there's a considerable
consumer outreach that would have to be done.

It would be very parallel to what USDA went
through with the Board to develop the National Organic
Standards that might address some of these issues and
give consumers that comfort level, that those products
that we don't regulate, that want to communicate some
standard of performance to organic practices, there is a
-- you know, there is a recognized set of standards that
are published, they're accessible and they are, you
know, agreed upon by the industry.
MS. RANGAN: Barbara, I appreciate those comments, but I guess having the OTA take the lead on that seems in conflict with having an independent label program and there's other stakeholders who are involved, including consumers and others who just aren't members of the OTA and were not part of that process.

The Federal Trade Commission does exist to deal with truthful and misleading claims and one thing I didn't get to, but we strongly agree with Joe Mendelson and the Center for Food Safety is that perhaps the FTC needs to be brought in in this case to investigate the truthful and nonmisleading use of a non-USDA organic claim because it may be that the FTC doesn't find that to be at all useful. They don't find those unfriendly. They've prohibited that claim, they've prohibited "green," they've prohibited "environmentally friendly" because there just aren't standards and it is confusing and misleading to consumers and I think the FTC needs to be brought in to --

MS. ROBINSON: Well, we'll check on that, Urvashi, because I think for truthful labeling when it relates to these types of products, it might actually be FDA that administers that part of the truthful labeling. I think there may actually be a joint, shared authority for truthful labeling between those agencies.
MS. RANGAN: There is a shared, but it -- the
FTC has published guidance on green claims and organic
could easily be included in that for a non-USDA organic
claim. Thank you.

CHAIRPERSON KING: Thank you. Next up,
Marty Mesh; on deck is Bob Buresh.

MR. MESH: I have a proxy. So my name's
Marty Mesh, the executive director of Florida Organic
Growers and a certification program, Quality
Certification Services, a board member of the OTA,
although as always, these are my personal comments and
should not be reflected upon the OTA. Concerning
earlier comments, I have been called a troublemaker by
the staff of the National Organic Program and while some
may have thought it was a personal attack, I prefer to
reserve judgment since at that time it may have been
accurate, but however, since I've cut my hair and beard
I just am here to say to thank you for all your hard
work, for the change in the tone of the meeting and I
appreciate it.

However, since I do have a few extra minutes,
I will address a few -- couple of things. If USDA is
successful in moving audits to biannual basis, we would
be interested, as well, in moving our ISO audits to the
same type of schedule. I understand that on-site audits
for foreign certifiers are not being done and have not
been done. I made the same comments at the last meeting
talking about an un-level standard or playing field for
certifiers and I would urge that to be rectified, either
outsource accreditation audits to -- of foreign
certifiers or get them done. I requested cost share
information from the National Organic Program and
received totals but not the breakdown of the data that
we really need to further along.

I urge a resolution to the dairy materials
that came up earlier to suggest to move materials to a
more expensive and more toxic materials instead of a
material that has been petitioned and reviewed with a
positive outcome. It's just totally unacceptable to me.
I seem to remember FDA was here at a meeting saying that
organic is your program and really talking to the Board
at that time, addressing the Board, that organic is your
program and FDA has no interest in -- when it was asked
about materials, so it seems to me as though there's got
to be a way to figure it out.

We -- Quality Certification Services have
petitioned the Department for -- to engage in formal
rulemaking on behalf certified organic shrimp producers
and I somewhat disagree with my colleagues, Joe and
Urvashi, and I'm sure they misspoke, is the problem.
Shrimp that is currently produced in accordance with the National Organic Program regulation and was done so with a great investment and commitment on the part of producers now competing in the market with shrimp that is not produced and not produced even using certified organic feed, a great market disadvantage for those organic shrimp producers that really pioneered the way and I believe the just resolution at this point is to bar product on the shelf that doesn't meet the National Organic Program regulation. The Department even through the directive that is now withdrawn, so there's still confusion, gave 18 months to use up the labels.

Rosie's comments that "unfortunately, we're not lawyers", don't ever apologize for not being a lawyer is a -- I echo the earlier comments from the dairy producer about the most important thing is maintaining consumer confidence. I, as an organic farmer, you know, starting in 1976 and just, you know, I don't actively farm anymore, but again, the maintaining of consumer confidence is really the backbone of this whole program and if we lose it, it's really down the drain for organic producers. And with that I'd like it noted in the record that I finished early and --

MS. DIETZ: Three minutes.
MR. MESH: -- maybe it's the new look or
something that caused me to do that. Thank you.

CHAIRPERSON KING: I think Dave has a comment
or question or --

MR. CARTER: Marty, I couldn't help notice
when you're walking away, is there a bulge in the back
of your jacket?

CHAIRPERSON KING: Next up is Bob Buresh and
Bob, I believe you have a proxy, so you're in for six
minutes and on deck is Leslie Zook [ph].

MR. BURESH: Yes, I'm going to be speaking on
my behalf and then on Jackie Jacob, who is the other
co-chair of the task force. Thank you, Mr. Chairman,
NOSB and NOP staff. I'm Bob Buresh, Director of Poultry
Nutrition for Tyson Foods, Nature's Farm and I'm
co-chair of the Organic Trade Association's Methionine
Alternatives Task Force. The following are comments
presented on behalf of the task force only and not the
OTA, since the Livestock Committee has not met to
sanction our report yet.

Supplemental methionine was added to the
National List for use in October, until October of 2005.
No one is more aware of that deadline than we are. When
that sunset was implemented, it was understood that
there was a lot of work to be done to either find
suitable alternatives in time or to present an airtight

case for continued allowance. At the same time as the

sunset, we are being affected by our own success. With

the advent of the National Standards, the organic meat

sector is blossoming while the organic egg consumption,

with exponential growth, is best described as screaming.

As a result, the organic feed supply is struggling to

keep up with demand and is expected to remain fairly
tight for the next year, in the least.

As much as I'd love to stand here and tell you

that the organic broiler, egg and turkey industries will

be prepared to do without synthetic methionine in

October, I or we, as a task force, at this time, are not

that optimistic. With a year remaining, it looks like

the U.S. organic poultry producers are not yet able to

eliminate supplemental methionine. To do so, without

sufficient alternatives, would rock us to our

foundation. I expect that we will be discussing another

temporary extension or an experimental use allowance for

nonorganic feedstuff, subject to commercial

availability.

The intent of this group is not to prove that

our industry cannot survive without supplemental

methionine. My goal today is to convince you that we're

taking this work seriously and we will supply you with
the information necessary to reassess the position of
the supplemental methionine on the National List. At
the same time, I hope to stimulate discussion that will
focus on exactly what you expect and when you expect it
in order to make a decision.

I call your attention to the report I handed
out dated October 9. The report does not lay out our
progress so far as such that the information would be
insufficient to make good decisions. What it hopefully
does is articulate our work plant sufficiently to put
methionine on the agenda again at the next NOSB meeting.
We've delegated the responsibilities among the best
qualified members of the task force with the intent of
providing a supplemental information petition, authored
by the respective researchers and submitted to the NOSB
in time for discussion and decision at your next
meeting.

The good news is that we have an able group of
people dedicated to finding a way to comply with the
standards. We have done some testing and research and
we're trying to do much more. It's taken us a while to
get off the ground, longer than we anticipated and
certainly longer than we're comfortable with and -- but
we are making progress. You've heard already from
Ann Fanatico on the studies at the University of
Arkansas. Dr. Joe Moritz, who we hoped was going to be here, has some ongoing studies with pastured poultry at West Virginia. The University of Minnesota is scheduled to study the methionine content of natural forages next spring under the direction of task force co-chair, Dr. Jackie Jacob.

The European community has, to varying degrees, eliminated synthetic methionine from organic poultry production. Part of our research is to discover the successes and challenges that they have encountered. And while it's understood that cost and price are not the deciding factors in the allowance of a synthetic substance, they are factors to be weighed. We will analyze our findings and report on their impact on producers and the consumers.

I would like to end my comments with the challenge that if we, the task force, deliver to you, the Board, sufficient information next April to reconsider the status of synthetic methionine, can the NOP consider and the NOP deliver any changes before the October sunset? Hopefully, this question is rhetorical and the answer is yes, in which case I encourage you to advise and guide us today. If the answer is no, we need to dramatically redirect our efforts to manage the consequences. I thank you for your time and

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
consideration and if there's any questions, myself or hopefully anyone from the task force here present might be able to help me.

CHAIRPERSON KING: Well, it sounds like you have a strategy in place and I guess my question is, I mean, is what he's asking, I think, is it realistic to consider that over the course of the next year if we find -- in other words, if there are no alternatives, that methionine would not come off the list, potentially, in October of 2005.

MR. MATHEWS: The challenge will be getting through both the proposed rule and a final rule in the time required. If it goes through as a single item, possible, but I'm not going to guarantee it.

CHAIRPERSON KING: Kim.

MS. DIETZ: I guess I would -- we've heard a lot of comments and I know this probably one material that has a huge impact and is a big concern. So I would ask the Livestock Committee, I guess, to put on your work plan and to really come up with some kind of recommendation or to work on this task force. Somehow the Livestock Committee should take this back, I would think, and at least keep abreast of what's going on and what our alternatives are, if we have any at all.

MR. MATHEWS: I would second what Kim has said.
because you need to start working on it now if you're going to be doing it.

MR. BURESH: And one of the challenges we saw, like Ann said, I mean she might have started her funding request for research years ago and it's now just coming to fruition and now we've got a four-year study and that's the same with the work at West Virginia and I think at Minnesota, as well. It's very slow in getting funding. We hoped we'd have had these answers by now, but it seems to be much slower in getting generated than what we'd even expected.

MS. DIETZ: And I know that when we discussed this material, one of the pitfalls of adding a sunset provision was, you know, we were hoping the industry would start going right then and there and they didn't and --

MR. BURESH: They didn't and yeah, it was -- we --

MS. DIETZ: It's kind of like we're going to give you the hard-nose petition and material tactic, but --

MR. BURESH: Um-hum.

MS. DIETZ: -- I mean, we did what we could do and I think the Livestock Committee --

MR. BURESH: As an organized group, right, we
did not get started as quickly as we probably should
have.

CHAIRPERSON KING: Jim and then Owusu and then
Rose.

MR. RIDDLE: I pass. Kim --

CHAIRPERSON KING: Okay, so Owusu then Rose.

MR. BANDELE: Did I hear you say that the
European community has eliminated methionine?

MR. BURESH: Yes.

MR. BANDELE: If so, could you say a little
more about that?

MR. BURESH: Yeah, just quickly. I spent -- I
just got back yesterday after two weeks over there and
it's hard to real quickly say what they're doing in
Europe because it seemed like each member country has a
little different twist, but basically, they've taken the
reverse approach. They banned synthetic methionine from
the start, but in most of those countries they have a
transition clause for nonorganic ingredients. Most of
the countries right now have an 80 percent organic
ingredient requirement. So they can feed other
nonorganic ingredients that still meet the regulations.

They can't feed animal proteins and they can't
feed all -- anything that would be against the organic
regulations, but they can feed some vegetable protein,
some high protein like the corn gluten meals and some of the ingredients on the list as long -- even if they're not strictly organic. So they're kind of in limbo between -- they've gone it from the back way. They said we'll ban it from the start, but in the meantime, we'll allow you nonorganic ingredients to help supply, not just methionine, but other requirements. It wasn't strictly for methionine's purpose.

But no, they have banned them and I assume in most countries or at least the ones in Western Europe, to the best of my information, yeah. But they do have -- sorry. They do have a deadline of like sometime in fall of 2005 that they're supposed to go to a hundred percent organic and they're struggling with they don't think they can do that, either. And they're trying to figure out what to do at the same time.

CHAIRPERSON KING: I think Rose had a question, then Mike.

MS. KOENIG: I want to -- I mean, I want to commend those who have put forth the effort to do the research and to kind of do the analysis and that was one of the, you know, when we had the discussion, that was sort of what the advice was, start doing the research so that people don't get, you know, caught in the last hour, you know, without the material.
Having said that, you know, we do have a, you know, it's listed in a specific way and based on the rulemaking process. It doesn't appear that that could be changed, to my knowledge, even if, you know, I was thinking well, maybe you could put in a petition again for reconsideration, but even if that was case, it still would be a gap between when it would come off.

I'd like to explore that and I think I heard you right and it was -- it's an area of the regulation that has never been quite clear and it's always been my intention to work on it, although I never have, and that is that research exemption section of the regulation which gives the Secretary the authority, you know, for research purposes to grant certain exemptions. Very vague area. I think it could be explored -- you know, and I'm not saying this is the way, because I think, again, I think it has to be weighed. I would hate to see this as kind of the loophole that's used to create exemptions upon exemptions on materials, but because you have the intent and it sounds like you do have research ongoing, I think it might be an area to explore because I think that might create perhaps a small window of opportunity. But that's really going to be for Richard and Barbara to consider.

MR. BURESH: Right. Until we at least have
some more solid answers.

MS. KOENIG: I don't know. I mean, that's something for those guys to really consider, but I don't see through the materials process how it could be expedited.

MR. MATHEWS: The research provisions do not provide for the use of prohibited substances. In fact, I think it's paragraph C that specifically says that you can't use a prohibited substance. So --

MS. KOENIG: But in the case, if the exemption was granted during a time when -- currently it is not a prohibited substance.

MR. MATHEWS: Well, right now it's not a prohibited substance.

MS. KOENIG: Right. So what I'm saying is is there, in any way, a way to use that exemption -- I mean, just think about it, that's all I'm saying.

MR. MATHEWS: As long as it's allowed, you can conduct research using it, but it's at the point that it becomes no longer allowed that you can't use it anymore.

MS. KOENIG: Well, then I --

MR. MATHEWS: And the material is slated to come off the list on October 21, 2005.

MS. KOENIG: I guess I never quite -- and
that's what I said, you know, Tuesday I don't quite understand, then, what that research exemption is about, but that's just my nonexperience, I guess, in federal regulation.

CHAIRPERSON KING: Well, I think it's worthy of exploration and I just -- I want to recognize both Becky -- oh, Mike then Becky then George. and we have three individuals yet to comment and we're past 5:30, so just throw that out as recognition of time. But Mike, please go ahead.

MR. LACY: I'll just be very quick. Appreciate the Methionine Task Force, you know, fessing up that they maybe didn't work as quickly as they could, but I also need to fess up being part of a university that it takes forever to get research done. Ann mentioned that it's going to take her four years to get her project done at Arkansas. Even if she had started three years ago, we'd still be a year away from getting her information.

CHAIRPERSON KING: Becky and George.

MS. GOLDBERG: While we have someone here who's on the task force, I've been thinking about all these issues and as a Livestock Committee member, I thought it would be really useful to know what the range is of inclusion rates for these various methionine
sources and diets. In other words, if we were to somehow encourage the use of nonorganic corn gluten or field peas or whatever as a substitute for methionine, you know, how much would be required? What's the range from substance to substance?

MR. BURESH: Well, that would -- it would really depend on the ingredient.

MS. GOLDBERG: Right.

MR. BURESH: I mean, limitations on fishmeal -- fishmeal, crabmeal, would be strictly due to the upper limits on -- so we don't get fishy tasting eggs and meat. I mean, you've only got a couple percent you're allowed or that you realistically can use before you start passing on the fishy flavor. Some of the proteins, corn gluten we can use fairly high levels of it. I mean, you could probably use 15, 20 percent of a diet.

MS. GOLDBERG: But how much at minimum would you need to supply sufficient --

MR. BURESH: Oh, that I can't -- I don't have that number in front of me. That's something we could get -- could come up with fairly quickly because these are known ingredients with known methionine -- or content. So that's just a --

MS. GOLDBERG: Do you have a sense of the
range, obviously with the fishmeal it's at the low end. What's the top end?

MR. BURESH: As far as the high inclusion rate?

MS. GOLDBERG: Yeah.

MR. BURESH: You're probably looking at the things that we could probably include at higher inclusion rates and not have other incurring problems would be things like the corn gluten meal is something that's a standard, conventional ingredient that's used at fairly high levels already. A lot of these ingredients, sunflower meal, some of them have other high fiber, other detrimental effects when you feed them over several percent of the diet. So it would just -- we would just have to ingredient to ingredient and just -- we can come up with that fairly --

MR. SIEMON: I think what she's saying if we're allowed conventional feed, would we end up with a 90 percent organic ration and 10 percent conventional if we're allowed these uses purely as methionine supplements? Additive, excuse me.

MR. BURESH: I think -- the visit -- when we were talking with some of the people in Europe and they were really concerned whether they could get to a hundred percent organic, as well. And we were visiting...
and we kind of came out with the idea of somewhere --
but we think between -- and this is strictly my opinion,
without any really sound research, is somewhere between
90 and 95 percent of the requirement -- I mean, if we
could get to -- we could probably go 90 to 95 percent
organic and then we -- with just our corn and soy. We
just can't get -- we still need something else in there.
And so it's just not going to be there. The fishmeals
-- I mean, we're not sure about those, but again, we can
only use several percent of the fishmeals because of the
flavor issue.

CHAIRPERSON KING: Okay. George, is there
more?

MR. SIEMON: Yeah, I just want to respond to
saying that there's been a lot of good progress.
Really, there was quite a bit of progress, initially.
There was all kind of unofficial trials that went on and
they all failed. And people kind of got a little
befuddled, you know, then there was visits to Europe
where the saw lots of failures as well as successes, but
you know, again, this conventional feed's a pretty big
deal. And I think now the task force -- my
understanding -- because there was quite a few trials,
initially. It's now turned into we need official help,
we need to really research this.
So I think there's -- to say there's not been progress, I know our company did quite a few trials.
It's more so that this -- there wasn't any success and now we're saying let's look at it from a bigger perspective.

MR. BURESH: Some of those initial trials were done by several of the companies and we just kind of said well, let's go out there and try to make some manipulations and it just doesn't work, but it's not scientific. The chicken -- you know, we had small pens, you know, we didn't have a lot of data and that kind of thing, but we just kind of put together some things, but it wasn't going to give us, you know, some good scientific answers.

CHAIRPERSON KING: Well, thanks. We appreciate your input and --

MR. BURESH: Okay. We'll keep you informed.

CHAIRPERSON KING: Thank you. Thank you. We have three people left. Leslie Zook is next, Lisa Dawn White is on deck and then our last commenter today is Sebastian -- and I can't read the last name.

MS. ZOOK: Mark, in the interest of time, I'll defer and Lisa Dawn White will also cede.

CHAIRPERSON KING: All right. Thank you very much. That was easy. Sebastian, and I apologize. I
can't --

MR. BELLE: I apologize for my poor penmanship. It's Belle.

CHAIRPERSON KING: Okay, I'm -- it's B-E-L-L --

MR. BELLE: E.

CHAIRPERSON KING: E.

MR. BELLE: I will make my comments brief. I have sat on a number of public committees like this and have gone through what you're going through. I commend you. I think you're very patient and conducting yourself very professionally and I don't envy you at all. I stand before you today as the Executive Director for the Maine Aquaculture Association. We represent both fin fish and shellfish growers. And I'm also a board member of a group called the Salmon of the Americas. And I'm also a member of the National Organic Aquaculture Work Group that referred to earlier today. And I would like to just make three brief comments.

One is we do support the development of national standards and I think this group deserves a great deal of credit for being willing to go back and deal with A word again. I know it was a rough tour on the first go-round and I'm hoping that it will be not quite as contentious on the second go-round, but it may
be and if so, then you certainly deserve credit for it.

I'd like to support the comments that Dr. Brister and George Lockwood and in particular make the point that there is a group out there which has been working on these issues for some time and I would hope that you take their work seriously and make -- I guess I'll make one comment on what my Irish colleague said earlier, which is -- I'm not sure that he understood the question.

One of you asked the question about would you delay the process and I think he didn't understand what was meant by that comment and I would ask him to correct me if I'm wrong, but I would view the process -- if there's pre-existing group out there which has already been working for a year, then the embracement of that group would seem to be me not a delay, but in fact, a way of accelerating the process and so I would hope that that would be viewed the same way by the Board.

If the Board determines that they are unwilling to allow that group to do work ahead of time and to be their kind of expert group as it were on the issues and they determine to form their own task force, then I would like to volunteer my group's services as a producer group to participate in that exercise and hope that we would be welcomed.
Finally, I would hope that any standards that are produced for aquaculture, be they shellfish or finfish, would be of the same high level of integrity and linkage to good science that have occurred in other organic standards that are being produced and if aquaculture is singled out and held to a higher standard, then I would hope sincerely that both the USDA and the Organic Standards Board would be willing to go back and revisit the standards in other producer groups and ensure that there is consistency across those groups. Thank you very much.

CHAIRPERSON KING: Perfect timing. Jim. We have a couple of comments.

MR. RIDDLE: Just to -- yeah. Quick comment. I'm the one who asked that question because I had understood the -- Mr. Lockwood -- one of the options he was laying out was for us to delay forming an NOSB task force until the work of the NOAWG is competed and in no way would I want to see us discard that work. I see the work that's occurred thus far as a way to jumpstart this public process. That's, you know, an industry-driven group and I'm hearing conflicts about -- how open it is. I take, you know, the comments that it is open to heart, but we're accountable to the public. We're a USDA advisory board and we have to be open, so I see...
this as a way of guaranteeing a transparent broad stakeholder participation public review that leads to official regulations and you know, rule writing process. So I certainly hope we can have both membership of the task force from that group and yours, whoever -- and to also use the work as a jump start in addition to the work that the previous task force did.

MR. BELLE: I wonder if I could just briefly respond to that. I agree with you. My concern is that you have parallel processes that particularly in a field like aquaculture where there are very few technical experts worldwide, let alone nationally, that some of the folks who were engaged in the existing process may become disillusioned and I think it would be a shame to lose those people. So that was my only concern. But I completely agree with you that yours is a process which is obviously much more transparent and public. I don't believe that anybody has been excluded from that group and in fact, I know there have been times when I have been quite -- as an industry representative, I have been quite uncomfortable with some of the participants in the group because they have had a history of criticizing my industry. On the other hand, I've learned a lot as part of the process.

CHAIRPERSON KING: Thank you very much. Well,
that concludes public input and our agenda for today.

Thank you all very much for your patience and your input. We start tomorrow at 8:00 a.m.

CERTIFICATE OF REPORTER, TRANSCRIBER AND PROOFREADER

IN RE: National Organic Standards Board Meeting

HELD AT: Washington, D.C.

DATE: October 12, 2004

We, the undersigned, do hereby certify that the foregoing pages, numbered 1 through 321, inclusive, are the true, accurate and complete transcript prepared from the reporting by the reporter in attendance at the above identified hearing, in accordance with applicable provisions of the current USDA contract, and have verified the accuracy of the transcript by (1) comparing the typewritten transcript against the reporting or recording accomplished at the hearings, and (2) comparing the final proofed typewritten transcript against the reporting or recording accomplished at the hearing.

NATIONAL ORGANIC STANDARDS BOARD MEETING

Hearing held on the 13th day of October, 2004
at 8:00 a.m.

The Marriot Washington Hotel
1221 22nd Street, NW, Salon E
Washington, D.C.

TRANSCRIPT OF PROCEEDINGS

10-13-04 NOSB Meeting Participants

Chair: Mark King

NOSB Members:

Owusu A. Bandele
Rosalie L. Koenig
George Siemon
Kim M. Dietz
Kevin O'Rell
David Carter
Goldie Caughlan
Andrea Caroe
Rebecca J. Goldberg
Nancy Ostiguy
Michael P. Lacy
James R. Riddle

NOP Members:

Arthur Neal, Jr.
Barbara Robinson
Richard Mathews
Katherine E. Benham

Guest Speaker:

Tom Bewick, USDA/CSREES
Other Appearances:

A.J. Yates
Brian Baker

INDEX

Proceedings - page 3
CHAIRPERSON KING: Welcome to day two. Thank you all for being here. Thanks for your patience and input yesterday. We very greatly appreciate that. Today is a mix of working drafts and action plans and strategic plans. And so we'll start of with materials discussion presentation of committee items. Rose is going to head us off with the Materials Committee to talk about a couple documents. Thank you.

MS. KOENIG: Okay. And then throughout the day, there's various sections where we're going to be talking about different types of issues and different documents. So what we're starting with this morning is the sunset and the National List of Aradin [ph] prohibited substances. So it's the sunset procedural document. And as far as the background or history on this, while Kim was materials chair and I was a member of the committee, we started talking about the process of sunset, and had numerous conferences calls, just trying to get our hands -- our arms, I guess, around the whole concept of a sunset review. And, you know, people came at it from different angles and had different concepts as to what sunset review really entails. And
like a number of subject matters within the OFPA, it
does state that a review has to be conducted, but again,
review really isn't defined. Although, as Michael Sligh
kind of mentioned yesterday, and some of the public
comments yesterday, that there are those three criteria
within OFPA that need and have to be considered when you
go through sunset.

So the Materials Committee, prior to the last
meeting, had a document that was on the web, posted,
that reflected kind of our discussion on the subject.
And when we got to the meeting, the NOP presented us,
after reviewing our document, with their concepts of
sunset, many of those ideas which are in this final
draft. But after the presentation of the draft, the
committee met on a conference call prior to June -- I
think it was in May -- really just to discuss the sunset
 provision and provide further input into that document
of -- that the NOP presented to us. So at that point is
where we kind of tried to mesh -- you know, create this
hybrid document between sort of the philosophical basis
of what the committee had suggested, and then what NOP
suggested based on some of the constraints that go along
with having a federal regulation and having to go
through rulemaking procedures.

After public comment yesterday -- I guess, let
me step back one moment. On all these documents that I'm presenting today, I just want to let the public know that, you know, I think myself as well as many other members of the Board spend considerable time -- you know, we have dreams at night. You know, we discuss it with our families, who get very bored with these subject matters, and all of our friends, so, you know, I tend to be pretty obsessive-compulsive when it comes to some of these things. So I just want to make the public aware, and hopefully they feel confident in the fact that we do review these things. You know, there's some members on this Board that, you know, nitpick at a lot of things, more so than I would. But I think all that input is really good information and, you know, it's really needed in this kind of process, although sometimes it feels like it's -- drags the process down. So what I'd like to say is, I went back into this document yesterday, because I felt like maybe we didn't communicate something right, or maybe it wasn't presented right, or -- you know, so looking at what seemed like the public didn't understand and what I thought was fairly clear in the document. And, you know, again, maybe it's because I've looked at so many times and I feel like I fully understand it. I will admit that there's probably a few errors in terms of
ands and ors, but in terms of content and what the
ultimate outcome of the procedures are, I feel confident
in the fact that I think this does get us to where we
need to be, and it is a practical way of looking at the
task. And I think that for those who do have concerns,
if after this presentation you still have those
concerns, please feel free to come up and we can work it
out and try to see if there are other ways that we can
verbalize or communicate with the public so that it
really reflects, you know, the true intent of the
document.

Okay, so having said that, I'm not going to go
through the whole document, but I wanted to just point
out a few things. In the first page -- and I think
Katherine is going to have that document up, and it was
on the web, and we all have a copy. But on the first
page in the section of overview of the National List's
sunset process, I just wanted to note, in the second
paragraph there, it basically outlines the three steps
that we're proposing. And one is the process begins
with a notice to the public that sunset will occur, and
we felt that this was very important. Again, the public
needs to be able to have a transparent process where
they can provide input. So at the get go, there's a
public notice that sunset will occur. And at that point
is when the public needs to say both whether they support the material, or if they don't support the material they have to say they don't support it and provide information. So it's -- if nobody writes even that they're going to support the material, then the Board has to consider it -- removal on that. So, you know, you have to provide input on all materials.

Second, it's followed by a review by the National Organic Standards Board of the conditions warranting the existing exemptions and prohibitions. So some of the concerns, I know, yesterday were -- you know, the NOSB isn't going to be looking at everything. No, in fact, we are looking and we have to vote on every material that is on that list. It's not that we're exempting any. Everything will be voted on. Everything will be reviewed. The difference is to the extent of how in depth each review will be is where it's going perhaps differ for different materials, okay? And then the process concludes with the secretary using public notice and comment rulemaking to renew the exemptions and prohibitions that were reviewed and recommended for continuation by the NOSB. So again, in that final process is another transparent step where public can provide input.

A lot of the other aspects of the document
talks about kind of the process that went -- the
committees and the National Organic Program went through
in terms of the different kinds of models that could've
been proposed. And, you know, many which I'm sure, when
the individuals who wrote OFPA probably thought some of
these models -- and perhaps picked a different model
than what we're proposing now. But I think as we all
understand now as we're implementing the rule, that when
OFPA was written, some of the ideas and concepts I think
we're really great, and they really had some great
intentions for the community. But I'm not sure if
everybody was fully aware, nor -- sometimes I feel like
I'm not fully aware sitting on the Board -- of how
government functions in terms of processes. You know,
I'm a private businessperson. When I want to do
something, I go out and do it. I don't check. I don't
have to do public comment. I don't have to check with
the secretary of agriculture. I just grow my crops. So
even though I did do some research and I actually
checked with another USDA person yesterday, you know, in
a conversation just in terms of that -- you know,
talking about economic analysis and some of the things
that we were told yesterday, I'd like to confirm that
other people in other departments have confirmed what
the NOP has said in terms of the economic analysis that
is required when you are trying to make something more restrictive. So it is a truthful statement and it's just the realities again of what we're dealing with when we're dealing with federal rulemaking.

So basically the sunset that is proposed by the committee, and hopefully that we're going to vote on and accept as a Board, with perhaps some technical corrections that Jim has and will provide, is within this document. And again, I'm not going to spend all of the time going through every single step. But specifically we will engage in rulemaking process. There will be a Federal Register notice on the materials that will be up for sunset. Not all of them on the list currently are going to come through this round, because some of them were placed in effect after the -- will come, I guess, subsequently in other sunsets. There is a substantial -- and again, when I spoke with Michael yesterday during comment, one of my concerns is really going to be in the implementation of this, how the Board is going to look at information, because there is a substantial amount of information that people who want to change something on the regulation has to provide. I am in full agreement that it can't be an arbitrary decision; I just don't like that material. You do have to provide data and some economic analysis and an
analysis of the alternatives. One of the things that --
I think that the Board has provided as, I think, a very
positive comment in this last draft of the document, is
that we encourage the NOP to show that alternatives are
not just other synthetic ingredients. Alternatives are
natural. They may be other things that are currently on
the list that are, you know, either environmentally safe
or maybe safe for human health, or they can be
management practices. So, you know, alternatives -- I
think we really broaden the concept and the
understanding of NOP in terms of what alternatives are,
and I think that that really is an important addition to
this document.

I guess what I'd like to do is move to Jim,
because he had some suggestions, or anybody on the
committee, if they have any suggestions in terms of
things that might -- they might want to consider or
change, or at this point, we can kind of debate, you
know, as a board, you know, some of the issues. You all
heard some public comment. If anybody wants to bring up
those issues, feel free to do so.

MR. RIDDLE: Yeah, thanks, Rose. And Rose
made a comment about some Board members being pickier
than her, and I won't take that as a personal attack,
and I have no idea who she could've been talking about,
Mr. Chair. But I do have a few changes I'd like to propose. And I guess I would propose them as friendly amendments to the draft that's being presented here, so we don't have to, you know, vote on each one, if Rose would accept them. And the first is on page two at the very top, the first sentence under "What does not occur during sunset." And it says, "The sunset process is not used to petition to add new substances to the National List, nor is it used to change an existing annotation."

And our intent there is that the -- this process is not used to expand the use by changing an annotation or to remove annotations. But there's a small oversight in that, if there are some technical errors in some annotations, it would be a chance to clean those up. So I would just add at the end of that sentence, just accept to correct technical errors. And I don't have any in mind right now, but I know, like, the last -- well, the first Final Rule, National List, had hydrated lime. You know, substance must be used in a manner that minimizes accumulation of copper in the soil. Well, hydrated lime doesn't contain copper. That was a technical error, and that was corrected in the current version. And there may be some others that need to be corrected. I don't know, but let's just keep that door open. And then the next -- and maybe on each one if --
Rose, if you could just say if you accept that.

MS. KOENIG: Yeah, I accept. But the only thing is that we may -- and again, this may be too nitpicky, but we probably need to define what a technical correction is. Rather than just saying technical correction, if you could just provide maybe -- could you say not to change an existing annotation?

MR. RIDDLE: Right.

MS. KOENIG: So, I think maybe if we explain that you can't -- just like you had said, we can't add additional uses nor take away -- and that's the discussion, what constitutes a technical -- either that or just define what technical correction is. If it's something that is -- was wrong in terms of --

MR. RIDDLE: Well, the language that I'm proposing is accept to correct technical errors.

CHAIRPERSON KING: Kim had a quick question, too.

MS. DIETZ: When we went through the Final Rule, the initial Final Rule that came out, there were technical corrections on that Final Rule, because there were some materials that were posted on the Preliminary Rule, got published on the Final Rule, and they were different. So that was a technical correction. That's what we were told at the time. And all the committees...
went through the National List and made their technical corrections and made recommendations. So we did -- we have cleaned up the lists in the past, and we have made recommendations on technical corrections, but they were changes that had changed from one rule to the other and somehow got missed. So they actually have to be rule changes in some -- at least that's from a historical standpoint.

CHAIRPERSON KING: Well, and I just want to speak in support of Jim's amendment. I think if we look at the sentence, it says that it's not used to petition or add new substances, nor is it used to change an existing annotation. That pretty well covers everything else, except to correct a technical -- or to make a technical correction, so -- George.

MR. SIEMON: I just -- I guess I got some bigger questions here. So this whole sentence -- I mean, and are you all done with that part?

CHAIRPERSON KING: We're waiting for Rose to say, yes, it's a friendly amendment, basically.

MR. SIEMON: Yeah.

MS. KOENIG: As far as the technical correction.

MR. SIEMON: Yeah. Is that a friendly amendment? Do you just accept that?
MS. KOENIG: I would -- again, I accept the concept. I just think that it would be important to just explain what you mean. Because, again, I don't -- I mean, what I think we end -- what ends up occurring when it comes to materials, if things aren't defined -- what we understand as this Board, you know, we're all sitting here, but when we leave -- the idea of technical, some people may say, well, technical could've meant, you know --

CHAIRPERSON KING: Scientific.

MS. KOENIG: -- scientific, you know, that kind of thing. So if it's the spelling -- you know, all I can say is expand on that definition, and we don't have to do it now, but if you could provide perhaps some definition to the word technical, imbibing the spirit of what we're saying here.

MR. RIDDLE: Sure. I think that's maybe something that the Policy Committee working with the NOP could provide some guidance. You know, what does NOP see as the bare -- you know, fence post for technical corrections?

MR. SIEMON: Yeah, I think that's the department --

MR. RIDDLE: Yeah.

MR. SIEMON: -- definition.
MR. RIDDLE: I mean, but just so we know. But -- so we get it maybe in the Board policy manual in a long run, so that future boards know what a technical correction is, as defined by the department. Is that sufficient? Okay, then we are done with that, George.

MR. SIEMON: All right. I got a couple questions here, and I'm just trying to catch up. So this means -- this first sentence means that it's kind of up or down, there's no changing anything, right, that's what this is all about, no -- so, I mean, and that's in the name of simplicity?

MS. KOENIG: It's in the name of what a review -- if you want to actually change an annotation, then you need to through the materials petition process, okay? You're saying you either accept what's there or you reject what's there, it's not that you can change what's there, because you decided that you need a different use or an extended use or a reduced use. If you need to do that, then you would have to --

MR. SIEMON: But --

MS. KOENIG: -- repetition.

MR. SIEMON: But we can eliminate materials without another TAP review.

MS. KOENIG: No. The -- if you --

MR. SIEMON: Yeah.
MS. KOENIG: -- read through the document --
and this is where I think there was a misunderstanding,
perhaps, in the communication. Although, again, I read
through it and maybe my eyes or the fact that I've been
so involved in the process, that I'm not understanding
that it's not communicated well. And what I suggest,
George, if you get to that section and you read through
it and it's not communicated properly, give me some
suggestions, okay. So I'm not --

MR. SIEMON: Okay.

MS. KOENIG: -- doubting that there could be
communication problems within the document, but the way
that -- I think it's written clear that everything will
be put on the Federal Register notice, and there will be
a review. If we want to -- if the public identifies
through public comment that there are materials that
they feel, you know, there's sufficient data out there,
and they've looked at the OFPA criteria and have
provided us with some foundation as -- and the
foundation is described into the -- in the document as
to what is legitimate foundation. We as a board have
the ability to set aside certain materials to do more
extensive review on. And, you know, can that review
process end up removing substances from the list? Yes.
Can that review process also hold up those few materials
from going through the sunset? Yes, because the TAP process is a lengthy one. So what's envisioned is that -- at least what I see in my mind, that as we go through sunset, a good majority of the materials will be fairly easy to get through. We will not have to necessarily do technical -- additional TAPs on, but I do hope that the Board looks these over and discusses, at least within the committee, each one of the substances, because certainly within OFPA that is our obligation, to provide a review. Those large lists of vastly uncontroversional materials would then go through the federal rulemaking process. There may be some that we want to perform TAPs and that -- as I understand it, maybe Richard can confirm or not confirm this, that there may be a separate docket that would have to wait for things that are going to require further technical review. Is that correct?

MR. MATHEWS: We would try to work with you in any way to make sure that materials that are already approved by the Board get into the notice and comment rulemaking process. The only problem or down side I see with that is the confusion that could be raised by virtue of the fact that some materials appear in the docket and others don't. And so we would have to work closely with you to make sure that the public understood...
that there were going to be two rulemaking actions. But we'll work with you to try and make sure that what can get done gets done in time.

MS. KOENIG: Does that clarify stuff, George?

MR. SIEMON: Let me ask a different question. If I'm in the -- if I want to eliminate any material, I have two options, wait for the sunset, and when you put out the list, then I simply make a comment that I think this one needs to be reviewed with good reasoning, and then the Board decides to follow up on that?

MS. KOENIG: There may be -- you know, there perhaps will be individuals or groups that will be able to provide enough technical information, and we may be able to go back to our archives of TAPs and just supplement those TAPs with this additional information. Plus, we all have the responsibility of going beyond just the TAP. I mean, if we have information or growers or, you know, all information, if it can be backed up with data or substantial facts that are valid, whether it's the TAP contract or a scientist at a university that isn't the contractor, it's our idea to kind of find that information out. So those are kind of the -- you know, the mechanism is that some people may provide that information and we may not have to go through the TAP, but --
MR. SIEMON: Um-hum.

MS. KOENIG: So we rely on all of our resources available.

MR. SIEMON: And the other way, of course, is they can petition now to get a material off.

MS. KOENIG: Yeah. And that is -- you know, and I always -- I think that that is sort of what convinced me and what I had to get through my thick skull during the last meeting, was that this is not the only process by removing a material from the list, that you can always petition to remove something.

MR. SIEMON: So would it be better if there was some obvious things to get off the list, for people do that sooner than waiting for the sunset process?

MS. KOENIG: Yeah. I mean -- you know, again, I think what the NOP stated, and I think, you know -- you know, whether the public likes it or not, or whether I personally like it as a farmer, the facts are we've only had one petition to ever remove something. You know, so you only can base -- you know, when you've got that, that's the only case of evidence. So what we're going on now is it seems like, at least in terms of the petition, you know, the way -- the formal means for doing that, that people haven't utilized that. Now, again, I still acknowledge that perhaps it's because
that process is difficult for people to do and that
also could be a reasoning, but --

CHAIRPERSON KING: Yeah. Owusu, I think you
had a question --

MR. BANDELE: Yeah.

CHAIRPERSON KING: -- and then Rick and
Barbara and --

MR. BANDELE: I just had a question that was
in terms of the all or nothing approach. You know, like
a situation would come up where something is really
useful, but there's a minor problem that was noted
before. And I just wanted -- could you speak to the
legal basis for not being able to change the annotation?

MS. KOENIG: I'm not a lawyer, so the legal
basis, you know, I would defer to probably Barbara,
although she's not a lawyer, either, but she probably
talks to them more often than I do. So I'll probably
defer to that, but I think -- you know, and again, in my
feeble knowledge of some these things, that -- again,
that this not -- a sunset is a very different process
than -- you know, it's to take something that's there
and either concur with it or reject it, but not
necessarily change it, but --

MR. NEAL: Also, to comment on that particular
question, it's the same -- similar question as George

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
raised about, I guess, people waiting until sunset before they say we want to change this, we want to change that. The intent of sunset was to review all of the substances that have been on the National List for five years, not just tinker with this -- the annotations that may be linked to a substance. So we don't -- legally, you don't want to confuse processes. We've already got a process that's set aside for amending annotations, for amending the National List by adding a new substance or removing substances. And they could've done that five years ago -- well, two years ago.

MS. KOENIG: They can do it now.

MR. NEAL: Yeah. And they can still do it. But the intent for sunset, we want to keep it focused on the review of the materials and not just an opportunity for people to come in and tinker with this and that, because they have an opportunity to do so. It may be easier for them in their opinion, but actually, it's set up the same way in terms -- you have to show the same evidence to get something off as you do to put it on.

MR. MATHEWS: Yeah. Let me address the concern about whether or not TAP reviews will be able to be done. As we mentioned yesterday, we just put a new $300,000 into TAP reviews. What --

MS. ROBINSON: Of last year's money.
MR. MATHEWS: Of last year's money. If we get our budget this year in a reasonable time, we should be able to add some more money into it. We are looking for that to be earmarked in large part to the sunset process. We don't have that many petitions in now. They're not coming in very fast. So really we've got a good chunk of change for the first time that can be used for materials, and we see that as -- in reality, what the Board will do is identify what materials are of most interest to the Board, based on feedback from the organic community or whomever, and that you would then let us know, and then we can go ahead and have some TAP reviews done early on in the process, that could then be provided to you to supplement the process of sunset itself, as outlined in this document. So figure on identifying some materials you want reviewed, we'll get them to the TAP reviewers, and hopefully that will help solve the problem on the ones that your nervous about at this point.

MS. DIETZ: I just want to remind people that we've looked at this draft a few times and we do need to get it going and voted on. But, George, on -- I'm sure Rosie will go through this. But there are certain steps that someone would have to take to recommend to remove a material. It's not just asking -- saying that you don't
like it, but you have to actually provide data, and like Rosie said, some economic information and alternatives.
So, I mean, the --

MR. SIEMON: And either process.

MS. DIETZ: Yeah, and the process.

MR. SIEMON: And either process. We've already heard sunset's the same --

MS. DIETZ: Right.

MR. SIEMON: -- in the documentation.

MS. DIETZ: Right. And it's a very good document. We spent a lot of time on it, and it'll work. And -- but as long as people take that responsibility, and that the industry goes out there and really -- it's time for us to do our homework, and here we are again. So I would also urge everybody to look at this seriously, you know, go back to OTA, go back to our committees and start working on the sunset.

MS. ROBINSON: Okay. Wait a minute, my brain's kicking in slowly here. You know, there's no reason -- if you already know of materials on this list that you feel that you've got problems with, or that you know from previous boards, you know that the documentation that's supported there, being put on the list, you know, you question it or you're not certain of it. Don't wait. If there's something right now, I
mean, that you can identify, something that you want a closer look taken, you know, I urge you to communicate that to us as soon as you can and we can -- and let's get started on it. Whatever we can do to make this process, you know, methodical and -- you know, and really, we don't want to wait until the last minute. I mean, that's why we're pushing you on it now. But by all means, the more that we can do to make it a better process, you know, we're willing to do that. So if you already know of something, you know, let us know that.

CHAIRPERSON KING: Don't wait for the sun to go down.

MS. ROBINSON: Correct. And Jim knows one already.

CHAIRPERSON KING: Yes, he does.

MS. ROBINSON: He was putting his hand up.

MS. GOLDBERG: I wanted to move on to the next section and ask a question about the alternatives.

MS. KOENIG: Okay.

MS. GOLDBERG: Is that appropriate at this time?

MS. KOENIG: Yeah. And -- yeah. Rather than -- again, since it's been on the web and you all have seen -- this was one of the documents that you actually had quite early, so that's why I haven't painstakingly
gone through each item. So if there are specifics, I think it's really appropriate.

CHAIRPERSON KING: Well, I think -- Becky, one minute. We're not quite done yet.

MS. GOLDBERG: Okay.

CHAIRPERSON KING: You have a quick correction on this section and then we'll vote.

MR. RIDDLE: I didn't say quick.

CHAIRPERSON KING: We're hoping, Jim.

MR. RIDDLE: Yeah, I hope it's accepted quickly. But, yeah -- and this is based on our public comments we received yesterday, and also other comments from the campaign meeting, when we went through this document. And it's in that -- it's also in that first paragraph, what does not occur during sunset. The last two sentences there. "NOSB has determined, based on scientific evaluations, consideration of public comment, that substances currently on the National List are already compatible and consistent with OFPA and its implementing regulations." I propose no changes. Leave that sentence in tact. That really says it all. But then I propose deleting the next sentence. "Since the substances have already been found to be compatible and consistent with OFPA and its implementing regulations, through petition process, sunset review should focus on
continued need of these substances in organic agricultural production and handling." Well, first, that is redundant, the bulk of the sentence, and I find it misleading in that it focuses only on one of the criteria under OFPA. And really, a substance needs to continue to meet all of the criteria in 6517 and 6518, and that's explained later in the document, and I just think it's misleading to focus solely on that one criteria in this paragraph.

MS. ROBINSON: Okay. How about if it -- if what it says is, give your -- leave your sentence that you wanted to leave alone --

MR. RIDDLE: Yeah.

MS. ROBINSON: -- alone. Then the last sentence simply says, therefore the sunset review should focus on the continued need for, and the rest of that sentence. And that is what sunset is doing, is focusing on the continued need for the substances in organic production and handling, right?

MS. KOENIG: Whether it's positive or negative.

MR. RIDDLE: Right.

MS. KOENIG: It doesn't --

CHAIRPERSON KING: Could you make reference at all --
MR. RIDDLE: Yeah.

CHAIRPERSON KING: -- on this?

MR. RIDDLE: Yeah. It removes the redundancy. In some way it's -- well --

MS. ROBINSON: And it eliminates the singular focus that I heard you say was troubling, that it's all -- the only focus is on whether it's compatible. So all we're saying is, okay, so sunset focuses on the continued need for the substance.

MR. RIDDLE: Uh-huh.

MS. ROBINSON: And the continued need, then, is based on all of the criteria.

MR. RIDDLE: I have no problem with that. I think that's fine.

MS. ROBINSON: Okay.

MR. RIDDLE: And -- yeah. Because it is linked to all the --

MS. ROBINSON: Right.

MR. RIDDLE: -- criteria.

MS. ROBINSON: Right.

MR. RIDDLE: And it's not just the availability of alternatives. There was, you know, a strong emphasis on that in that earlier draft, and I just didn't want it to lead just to that. I thought that was -- so --
MR. RIDDLE: Did you -- you caught that?

MS. KOENIG: Yes. Well, I kind of caught it.

MR. RIDDLE: Okay.

MS. KOENIG: Hopefully other people are taking notes, too, but, yes.

MR. RIDDLE: Okay, then it's acceptable. All right. Then I'll hold off on a couple other sections.

CHAIRPERSON KING: Okay, Becky, if you want to go ahead.

MS. GOLDBERG: Okay, thank you, Mark. My issue is on page four, under alternatives to allowed substances must be available. And the first sentence says that "All recommendations to discontinue the use of allowed substances require the availability of viable alternatives," and it explains what that means. And, you know, I generally agree with this principle, but it strikes me that it's a little bit too absolute, that there are conceivably situations where really new scientific information becomes available that a substance is, say, toxic to wildlife or whatever, and that we really wouldn't want it whether or not there are alternatives. And so I would love it if this was written in a way that was little less absolute. But so -- you know, something like, in general, our recommendations to discontinue the use of allowed substances.
substances require the availability of viable alternatives, you know, and then maybe having some allowance if there's unusually compelling evidence that a substance is incompatible. You know, demonstrate an alternative be available, something like that. It just troubles me that we in organic agriculture don't always insist that there be an alternative to everything, because sometimes we just don't find the substance acceptable.

CHAIRPERSON KING: Yeah. And I guess, do you want to propose an amendment to this section? I think Jim's got some notes, as well.

MR. RIDDLE: Right.

CHAIRPERSON KING: Maybe if we want to craft that --

MS. GOLDBERG: Yeah.

CHAIRPERSON KING: -- together. But your concern is that there could be other reasons to not have a material on the list, other than just saying that you want to discontinue the use of.

MS. GOLDBERG: Well, I'm arguing that sometimes -- you know, in a five-year sunset process, sometimes a new body of information really does become available that something is toxic or whatever, it's incompatible.
MS. DIETZ: And I agree, Becky, because, generally, when we review a material, we're looking at it globally. We're not just looking at -- specifically at alternatives, we're looking at, you know, carcinogens or what have you. So, I mean, I agree with that, and I think that future boards aren't just going to look at the alternatives and make a decision, they're going to look at criteria, hopefully, that are established when reviewing these materials, and we have a good process for that. So, I mean, we'll see what Jim recommends. But if we generalize that, I think it's important and we have to have it from a legal standpoint, but it's also part of the big picture.

MR. RIDDLE: Yeah. I think the earlier sections do emphasize that it must continue to meet all three of those criteria, you know, harmful to human health, the environment, necessary and consistency. And on this particular section, which is on page four, two-thirds of the way down, "Alternatives to allowed substances must be available." I guess the two changes I would propose, one is just in the title, to strike the words "must be available," because this section of the recommendation is really a description of alternatives being allowed. It's already stated that they must be available, but I just would like that removed from the
title. And then to change the first sentence, so that by deleting "All," and then changing "require" to should describe, so that it reads, Recommendations to discontinue the use of allowed substances should describe the availability of viable alternatives. And then leave the rest of it the same, where it talks about the evidence that must be provided to show that these things are indeed available, et cetera. So just a little modification there.

MS. KOENIG: Becky, do you think that that is --

MS. GOLDBERG: I think that's acceptable.

MS. KOENIG: Okay. And so do I, so --

UNIDENTIFIED SPEAKER: How about --

MS. GOLDBERG: Yeah.

MS. KOENIG: Okay.

MR. RIDDLE: Okay. Now on the title, striking the words "must be available." And then the first sentence, strike the first word, "All," and strike "require" and insert in it's place, should describe, so that it reads, Recommendations to discontinue the use of allowed substances should describe the availability of viable alternatives.

MS. DIETZ: A question for NOP. When we had originally drafted this document, we talked about the
people, if they want to take something off the list, they have to give alternatives. Is this going to weaken that in any way if it says, if you should describe something, does that mean, if somebody doesn't submit something, what are we going to do?

MR. NEAL: We talked about this on a call. The information, you know, what you guys have to digest is for your benefit. Because if someone comments with a single sentence and says we don't like X and they don't provide any of the data, it doesn't give you much to work with. Asking for this information up front gives you as much information as you need in order to make decisions with. I think the changes can work. Whether or not people follow it, even it said must require or should require, you're still -- you know, a 50-50 chance of getting what you ask for.

MS. ROBINSON: Yeah. Remember, too, that when you're doing rulemaking, even though we can provide structural guidance to people out there and say here's what we'd like you to comment on, you cannot -- you can't reject -- you can't tell people, here's how you must comment. They can write whatever they want. So the best you can do is to encourage through this document what information is going to be the most helpful to you in making a decision.
CHAIRPERSON KING: Jim, then Rose.

MR. RIDDLE: And elsewhere -- I mean, the whole rest of that paragraph remains the same, and it uses the word should, evidence should be presented, commenters should include literature, all of that. You know, so these are instructions.

MS. KOENIG: I guess that's -- well, actually that is very encouraging, because I know some of the stuff that was less digestible for me, and I think for others, was -- the first impression, I think, upon reading the document when we got it last time was that I just saw all these people trying to jump through all these hoops, and unless they got through all the hoops, they wouldn't be considered. But what I think I'm hearing you saying is that the document is an attempt to explain all the hoops that we love everybody to jump through. But they may not jump through all those hoops, but it's still our obligation to look at what they provide, and then we determine, have enough of those hoops been jumped through for our comfort level? And if they have, even though not all of them have been jumped through, then that is enough evidence -- they provide enough evidence for us to non-arbitrarily start looking at materials. Is that correct?

MS. ROBINSON: Correct.
MS. KOENIG: Okay.

CHAIRPERSON KING: Nancy.

MS. OSTIGUY: Hopefully what people will understand is that it's to their advantage to provide this information, because they may see a material in a particular way, and if we don't intuitively see it the same way, without their evidence, we won't get there. So it is to people's advantage to do as much of this as they possibly can.

MR. MATHEWS: I also have a proposed change to this paragraph. I've already talked with Arthur about this. We've -- we're working on the docket, so as soon as you guys finish up what you're doing, we're going to finalize the docket and get it into the clearance process. And what I have suggested is that the table be removed and not a part of the docket. And the reason for that is that I'm concerned that, if you look at the sentence just before the table -- it's the last sentence of that first paragraph -- the following chart illustrates the types of alternatives that must be recommended. I look at that chart and I start asking, well, are there other options? And I think one jumps out really quickly, unless I'm wrong, but you take the second crop and livestock row, it says, "Synthetic inert pesticide." Then a recommended alternative must be
nonsynthetic. I would say that that's not true. Let's look at ivermectin and moxidectin -- I guess that's the way it is. You know, there's two synthetics, and the Board has already debated previously whether or not one synthetic is better than another synthetic. So I'm concerned that putting a table like this, we miss something, okay? It doesn't say including but not limited to, it says you must do this. So take that for what it's worth, but I -- if it was me, I'd remove it.

CHAIRPERSON KING: So you're proposing a less prescriptive approach, which does have some alternatives? And I think you're right.

MR. MATHEWS: That's exactly what I'm proposing.

CHAIRPERSON KING: Rose?

MR. MATHEWS: So I would take out that last sentence and the table.

CHAIRPERSON KING: Okay. Thank you, Rose -- I mean, Rick.

MR. MATHEWS: Easily -- easy --

CHAIRPERSON KING: I'm just so --

MS. KOENIG: I had a sneaky suspicion that that wasn't corrected. I can't imagine that we would've missed that, because we discussed that. So I have a funny feeling that we did have other alternative listed
there. I mean, the one question, should we change the
must to a may? I mean, the thing is, I like the intent
of the chart, because I think it's very clear that we're
saying that -- that there's not -- that there's
nonsynthetic alternatives, there may be an allowed
synthetic, and that there are management practices. So
could the must say may? You didn't answer, but it's
okay. Just like my husband, he doesn't listen to me.

MR. MATHEWS: I mean, if you've got another
alternative -- if you've got another alternative, that's
fine. I guess I took the easy route of just dropping
that. But if you want to go in and say should include
and here are some examples, and change the must to may,
that's fine. I don't have a problem with that. I'm
just a little concerned that we box ourselves in, and
that's really where I was coming from.

MR. RIDDLE: Yeah, I think Rick makes a really
good point there, and I would suggest changing that must
to may, but then also adding in that box that he
identified, which is the right-hand column, the second
one under crops and livestock synthetic inerts, to add
or an allowed synthetic inert.

MS. KOENIG: That's what we did with handling
in the one above.

UNIDENTIFIED SPEAKER: Yeah, I think it was --
MS. KOENIG: Yes.

MR. RIDDLE: A technical error.

MS. KOENIG: That is exactly what a technical error is.

MR. RIDDLE: Yeah. Because there are list fours, and there's a few list threes we've approved, so --

CHAIRPERSON KING: Okay, do we have other comments? Yes, Nancy.

MS. OSTIGUY: That we still did not do a correction of the sentence above. There's still the must in there, at least I read that -- may.

CHAIRPERSON KING: Yeah. Well, I propose -- yeah.

MS. OSTIGUY: Okay, thank you.

CHAIRPERSON KING: To may.

MR. RIDDLE: Yeah. Then I have one more, and it's in way the smallest, but probably the most significant, and that is on that same page, in both the first paragraph and the third paragraph, there is the numbers one, two, and three, and they're connected by an and.

MS. KOENIG: Right.

MR. RIDDLE: And that really should be changed to an or. A substance must meet all three of those to
get on the list, which means it must continue to meet all three. So if it doesn't meet one of them, it could be removed. So in this usage it should be an or there. So changing and to or in front of the number three in paragraph one and paragraph three on page four.

MS. KOENIG: Can you elaborate to the public? You say it's the most significant. I understand what you're saying, but just for the explanation to the public so that they understand --

MR. RIDDLE: Sure.

MS. KOENIG: -- the difference between and, and or.

MR. RIDDLE: Well, I don't know if I can do that. The difference between and, and or in this use. Well, yeah, I tried to do it using very few words. It wasn't enough, I guess. Well, to repeat, under OFPA, in order for a substance to get on the list, it has to meet all three of these criteria, the harmful, or not be harmful to human health, the environment, not -- well, that it would be necessary and that it be consistent to get on the list. So when something is being removed, it still has to meet all three, but how we're using it in this sentence is that any one of those could be a reason to remove, so it should be or here on how the three are connected. I think I made it more confusing.
UNIDENTIFIED SPEAKER: No --

MR. RIDDLE: Oh, good.

MS. DIETZ: Can we look at that section in OFPA, because I see and?

MR. RIDDLE: Yeah, yeah, yeah. And is used in OFPA.

UNIDENTIFIED SPEAKER: Yeah, in OFPA -- get when you review it. You have to make sure it meets all those.

MS. KOENIG: So only one can keep it off.

UNIDENTIFIED SPEAKER: One keeps it off of the sunset, because --

MR. RIDDLE: You're mike's not on. No, you were going to do it, and I just wanted --

MS. KOENIG: Oh, gee thanks, Jim. What Jim is saying -- and I'll just restate it in my voice. But what he's saying is, in OFPA, in order to get something, you have to jump through all those hoops, okay? So there's an assumption that once it's on there that it jumped through all those hoops. Okay, in order to pull it off, you going to have to jump through the -- all of the hoops, because you've done that already -- because you're triggering one of those -- because now prove that it doesn't no longer meet those -- jump through those three hoops. All right. I think that -- got to get
those hooping now.

MR. RIDDLE: Those are the only changes I have.

CHAIRPERSON KING: Comments? Questions?

MS. KOENIG: Now, the Executive Committee had voted on a draft of this document, with the assumption that we were going to come back to the full Board, because we weren't comfortable as an executive committee, but we wanted to let the NOP know that, in the spirit, there was -- you know, we assumed there'd be some minor changes, but we thought that the general intent of the document would fly, which it -- so -- but we what want to do at this meeting is confirm with the changes that have been made, that the Board is comfortable with it. So I would appreciate a motion.

MR. RIDDLE: You may make a motion.

MS. KOENIG: I can make a motion?

MR. RIDDLE: Yeah, yeah, yeah.

MS. KOENIG: Okay. I would motion to approve the document, with the stated changes that we've discussed to that for acceptance as the sunset policy.

MS. DIETZ: Second.

CHAIRPERSON KING: It's been moved and seconded that we accept the Materials Committee draft of the sunset and National List of allowed and prohibited...
substances. Is there discussion?

***

[No response]

***

CHAIRPERSON KING: Seeing none, all those in favor signify by saying aye.

BOARD MEMBERS: Aye.

CHAIRPERSON KING: Opposed, same sign.

***

[No response]

***

CHAIRPERSON KING: Motion carries. Rose, you're still in the hot seat.

MS. KOENIG: I felt like I was -- people are going to get very sick of me during this meeting. Okay, now I'm going to move onto these other drafts. And I think -- as I stated with the sunset draft, I think it was pretty evident by the way that it was entitled and how I explained the process, that it truly was a committee document. Some of the documents that are -- that we're going to be viewing today have my name on it as the materials chair, and it's on there as the chair, because it reflects the fact that the committee really did not discuss this at all. We ran out of time. We had a lot of personal issues that we were dealing with,
professional issues, and then hurricanes didn't help the situation. So -- and the committee -- you know, I try to communicate with the committee, and I think people are comfortable with the decision I made to kind of just put my name on it and that, you know, this meeting was really a meeting of discussion, not necessarily final decision making. So that's why the document has my name on it.

However, you know, for the record, I do want to state that through the minutes -- because I spent a lot of time -- especially on this document that we're discussing now -- that I felt like I had a lot of individuals -- ghosts of individuals in the room as I was writing, because I pulled a lot of the old '94 and '95 minutes from previous National Organic Standards Board. And then I took advantage of the fact that I actually knew some of these individuals who had -- you know, whose names appeared in those minutes, and had conversations with individuals that were kind of instrumental in -- you know, having input into this concept of a national list. So I'd like to recognize Brian Baker and Emily, and also Jim Riddle helped me, because he just volunteered, you know, to get these documents processed, to just kind of help with the process in any way possible. So I thank those
individuals, and I just wanted to put that forth to the public so people realize that it just wasn't my thoughts.

So with that, we have a draft now in front of us. And I'll go a little bit more in detail with these documents, because, again, they were ones that came later on to the website, so I fully understand if people didn't have enough time to really digest or go over these documents. So the gist of -- and, Mark, how much time do we have, because I don't want to --

CHAIRPERSON KING: We're going to go until about ten o'clock and then --

MS. KOENIG: Okay.

CHAIRPERSON KING: -- take a break, so --

MS. KOENIG: Oh, good. Okay.

CHAIRPERSON KING: But it's okay if we take a break a little bit early.

MS. KOENIG: Okay. But -- so the justification -- and I think it's important. I think this one is a really important document, so I'm going to just read it, because there's no better way of kind of going through than kind of going through the document. It basically says that 6517 of OFPA outlines the procedures that shall be followed for the development and the implementation of the National List. It

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
provides the guidelines for inclusion of substances on
the list, procedures and criteria that must be followed,
and outlines the authority of the secretary and NOSB.
The NOP had requested the NOSB Materials Committee to
review the petition substances within the context of
7 U.S.C. 6517.

The specific issues that need to be addressed
in this section in the National List are the guidelines
for prohibitions or exemptions -- places limits on the
types of substances that can be included on the list.
And I basically provide the historical background of
that section OFPA. And the real issue is number B, that
states what substances can be included on the list. And
if you look at that section, you know, here comes that
word that we're going around on, it states that there's
active synthetic ingredients in the following
categories. And again, this is for crops and livestock.
So those are the categories that OFPA had provided. And
then it also stated, you know, this section, synthetic
inerts reviewed by the EPA. That was bullet point two.
And then three is use and handling and is nonsynthetic,
but is not organically produced.

The production categories that are defined for
active synthetic ingredients were intentionally included
in OFPA to limit the scope of the National List, and the
use of synthetic substances in organic production systems. Now, I didn't come up with this idea. This is not my opinion. Again, within the document you can refer to some of the minutes. These things were stated in the minutes. They were stated in the Senate committee reports that came with OFPA. So really, again, that was the philosophy of the National List. Many of the materials decisions and procedures were established by the early members of the NOSB through consultation with the NOP, the organic industry, private and state certification organizations, and through public interest and input. The first proposed National List decisions were made primarily during the NOSB meetings between 1994 and 1996. Now having said that and having the opportunity to have Michael Sligh in the room, who was chair for some of those -- during that time, you know, you can understand sort of what he was explaining, even though it was written that way, you know, it was controversial. You know, it was a negotiation. It was an industry in its infancy and -- so maybe perhaps things are done to the type of procedures we're doing today. But no matter what, the situation is, there were things put on that list, and now we have to figure out how to deal with them in our policymaking, as we have evolved.
The NOP is currently interpreting the National List, and its existing annotations, with certifiers. One certifier is need clarification on materials described in the farm plan, and the petitioner submits substances for review for inclusion on the National List. In 2004, the NOP made two material interpretation, and these were phosphoric acid to stabilize aquatic plant extracts, and potassium lactate and sodium lactate for meat processing, for which the NOSB requested a formal clarification in an effort to understand the manner in which the NOP interprets the National List. Members of the NOSP -- NOSB have argued that the combination of generic substances on the list resulting in a synthetic reaction requires additional review of the new substance. And again, that was, for example, sodium lactate and potassium lactate. Such a substance is prohibited unless it is reviewed by the NOSB and recommended to be added to the National List. To suggest otherwise removes a key decision from the authority of the NOSB, as described in OFPA. But all synthetic substances used in production and handling must appear on the National List, which has been recommended by the NOSB.

Based on conversations with NOP staff, their current position is that once an active substance is...
listed, they're active, meaning that a synthetic substance falling into one of the production categories in 6517(c)(1)(B)(i), then all additives to the active are allowed unless restricted in the annotation that may accompany a substance. And -- you know, and I state that -- and again, I hope I'm not -- I hope when I wrote this that I wasn't misunderstanding what I've understood. So if I have -- if I am and it's erroneous, I would ask the NOP to explain -- you know, to explain my misunderstanding of it. And again, you know, the purpose of this document is to seek clarification, to really put down in writing -- which is something that we don't do very often, which I think is probably one our biggest mistakes as a functioning board. We have a lot of conversations, but we don't express our ideas in a way that's backed up with the regulation. You know, but -- so it's -- I think this document is important to start the communication, and that's the purpose of it, not necessarily to lay blame, although it probably sounds like it is.

So anyway, this is inconsistent with both the philosophy of what annotations were used for when they accompanied a substance on the list, and with the historical view of what needed to be petitioned to the list. And I've referenced minutes from Orlando and
Santa Fe, when these types of things were discussed. The annotations that accompany many of the substances on the list were utilized to narrow the use of a substance within organic systems, and I gave some examples of hydrated lime, which Jim just told me was not even a proper annotation -- lignin sulfonate and lidocaine or liedocaine [ph]. For substances extracted from plants, animals, or mineral sources, they were added to distinguish the synthetic forms from the nonsynthetic forms. And Keith and I discussed this kind of yesterday, and perhaps the way that they were added at that point really was not consistent with the way a regulatory agency looks at it, and he's not here today, but if we need to discuss that -- he was talking to Becky and I in terms of fish -- the fish meal. You know, the way it's read is I know what the intent was when it was placed on the list, but you don't -- his argument is it's either a nonsynthetic or a synthetic. And if something is a nonsynthetic, you don't add it to the list because there's synthetic ingredients in it. You add those synthetic -- the things that are synthetic in it and annotate it, you know, not in hydrolyzed -- one example is, like, aquatic plants or the fish emulsions, okay? So again, I thinks it's just probably not an in-depth understanding of what was occurring.
Not that anybody had any -- you know, anything other than a misunderstanding that went on there.

For substances extracted from plants -- okay, I'll go over that, probably. Extracted from plants, animals, or mineral sources, they were added to distinguish the synthetic forms from the nonsynthetic forms. They were not used to place restrictions on formulations of a substance when used in a brand name product or other commercial formulations. In other words, this is not a brand name list, it's a generic list. In the preambles to the second proposed rule in the Final Rule, the NOP concurred with members within the organic industry in their recognition that the National List would include all the ingredients in agricultural inputs and formulated products, and detail how the primary role of the NOSB would be to review -- the review of substances in the development of the National List. So the potential solution to resolve the issues that I came up with -- and I think that's what we need to discuss today with the NOP, and perhaps then the Materials Committee or the Crops Committee could come back with a formal recommendation -- is that one category identified in OFPA, 6517(c)(B)(i), stipulates that the substance is used in production and contains an active ingredient as a production aid, including
netting, tree wraps, seals, insect traps, sticky barriers, row covers, and equipment cleaners. The NOSB should explore the production aid category as the appropriate section to include substances such as carriers, stabilizers, agivents, fillers, extractants, excipients, and solvents, but do not have an active function in the formulation of foreign production that do -- sorry -- that do have an active function in the formulations of foreign production aids such as fertilizers, soil amendments, compost inoculants, sanitizers, aquatic plant extracts, and fish emulsions. Some of these substances are used in the formulation of brand name products, while others may be used after a substance is extracted to put it in the form that is functional for on-farm utilization. The Materials Committee should work with the NOP to explore this possible solution, or determine other ways to resolve this important issue. However, the NOP should recognize that such substance are intentionally used for a specific purpose, and therefore are active for the purposes of the regulation.

And then I kind of explored the idea of making the National List more consistent with OFPA, so it would be clear when boards add something to the list, that they are keeping those substances within the OFPA.
categories, okay? So as a kind of -- I'll read that
section now. "The following provides a brief analysis
of the current National List in relationship to the OFPA
categories. Section 205601, synthetic substances
allowed for the use of organic crop protection, and
Section 205603, synthetic substances allowed for the use
of livestock production, are not consistent with the
OFPA categories." These -- the categories that are
included in these sections are related to use
restrictions for the substances. For example,
205601(i), disease control, lists the synthetic
substances that may be used for disease control -- for
disease problems. To be more consistent with OFPA, the
category should read, copper and sulfur compound, and
list annotated uses, i.e. for disease control, followed
by the substances that contain copper and/or sulfur.
This would eliminate most of the categories on the list
such as rodenticides, herbicides, and compost feed
stocks. Appendix one provides a revised view of Section
205601, using an ordering system that utilizes the OFPA
categories as a first order in the hierarchy. It also
demonstrates in the production aid category how
substances such as stabilizers, fillers, and agivents
could be included. And I just say see category H in
that appendix. And then, Katherine, if you could bring
up that appendix, I would appreciate it.

Most of the substances in Section 205601 fit within the OFPA categories, which is the good -- I think that's a great -- that was just really pleasing to me, because I started worrying, thinking oh my goodness, have we been adding things and not really doing our due diligence, because we weren't using necessarily the same recording mechanisms that we're using today? And I think the ones that we have now clearly forces us to look at OFPA. But prior to that, I don't think we were as conscious of it.

So the good news is they do -- most of them do fit in it. There are, however, a few substances that don't appear to fall into the OFPA categories, and most of them are used in disease control. The NOSB needs to resolve how to include these substances or remove them from the list. The livestock section of the rule should also be revised to determine if the substances meet OFPA. The handling section of the list is not limited to the categories in OFPA, and the Handling Committee has proposed alternations to better accommodate the OFPA distinction between agricultural and nonagricultural substances.

And then finally I just suggested in the last section that there -- that the NOSB should consider
serving farmers and certifiers on the resources that
they utilize to determine whether or not inputs used on
the farm are compliant with the National Organic
Standards. There is a notion on the part of NOP that
growers may lose their certification because of the use
of materials that are not listed on product label. The
NOP has identified the pesticide formulations as a major
concern because of -- that inerts are not specifically
listed on the label. However, many inputs utilized in
farming operations are not specifically labeled. The
operator must obtain information about their inputs by
contacting manufacturings directing -- directly working
with certifiers who obtain information, and utilizing
resources such as OMRI list and information provided
from the U.S. Land Grant, colleges, USDA, and ATRA [ph].
The NOP has issued directives -- and directed
specifically that we're in an attempt in part to solve
the perceived problem of a lack of grower information on
materials. The Materials Committee may want to develop
a survey tool to determine the growers' knowledge on
materials, and determine how and where growers obtain
information about the National Organic Standards.

So if we can pull up that appendix, Katherine,
and just so that -- again, you know, that was sort of
the -- and maybe I -- maybe it wasn't what I was out to

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
do, but I thought it was what I was out to do, to kind of go through that list and see where things fell. And, you know, in that process I decided, well, let's just maybe look at the list totally differently and use those OFPA categories. You know, one consideration -- you know, I asked Arthur this question the other day, was that if we determine that, functionally for the Board -- and again, I say this is more of a functional correction or a functional way for the Board -- and I think it'll help the Board. You know, will it -- is it more clear to growers this way? You know, I would argue, probably not. I think that, you know, perhaps the way that it exists in the regulation is more functional for growers, because it neatly says you can use this for this disease. And, you know, the big problem is that's what -- even if it wasn't comfortable for growers or for other individuals in the past, they've learned to utilize it. So to change it now, there may be some difficulties. However, I think, you know, our big priority and I think the most important thing is, you know, whatever -- if we decide not to change it, you know, this may be a way to just maybe have two -- you know, this is a functioning list for us so that we know we're consistent with OFPA. I don't know. So those are the kinds of things that I think we need to discuss.
MR. MATHEWS: At the risk of sounding too warm and fuzzy, I want to say that I think that Rose did a great job on this. And one of the things that we heard back during the second proposed rule was that people did not like the way the National List was laid out, and they wanted some changes, and we put into the preamble that, you know, we're at a stage where that would require additional rulemaking in order to make the kinds of changes that people were suggesting. So we've always wanted to see some kind of a change made. And so I encourage you to keep moving forward on this, because it's a giant step forward, I believe, for the people who are trying to use our list.

CHAIRPERSON KING: I just want to thank Rose and those individuals who helped Rose, because I think Rick is exactly right. This is a tremendous start to something that's been needed for a long, long time. And, Rose, I know you were challenged by a lot of things in the last few months, but this is a lot of work and I really, really appreciate your effort on this.

MS. KOENIG: You know, to me the -- you know, I -- again, you know, thank you. And the -- you know, this I think fundamentally is the easy part of it. You know, I think the most important -- you know, if we can, I guess -- you know, somebody -- I said to myself, or I

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
said to my husband, you know, to be honest, sometimes I leave the farm and I come here and I get very frustrated, you know, because the stuff doesn't get done and I feel like I haven't been very productive and I'm a very productive-oriented person. So, you know, I came out with certain goals that I'd like to see that comes out of these documents. And, you know, I think that, you know, this consideration is -- was one of the goals, but I think my primary goal was really to fix this concept of interpretation of where these fillers, carriers, agivents fit. So I would really like to hear some discussion and maybe some input on the NOP, as far as -- you know, and I don't want to say, do you buy into it? But that really is the best words I can come up with, is there kind of this institutional buy-in that OFPA really didn't intend those agivents and fillers and things like phosphoric acid, when it was petitioned, to be placed on the list? Because I think that's really, in a policy way, really what's causing the industry a lot of heartache and just not an ability to understand what the process is.

MR. NEAL: I want to commend Rose again. We've worked pretty hard on it, me feeding Rose ideas and Rose, really, she just digested it and putting it all down on paper. Thank you, Rose, for the hard work.

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
I got a question, because I do understand where you want to go. You want to be able to review everything that's used in the production of a material to be used in organic agriculture. But the question I have for you is, how far do you go back? How far in the production of a production material do you go back in the processing or the manufacture of that material in terms of including substances on this list? I do not believe that that was the intent of the act, because even in the new category that you've got here, production aids, you got vitamin -- D-3 I think is on there. What is in vitamin D-3, and if there's a preservative in it, does that preservative have to be on the National List --

those types of questions.

MS. KOENIG: Yeah. And I think, you know, some of the conversation, I guess, as we go through some of these other documents, they go hand in hand in this decision making process, because I agree, there has to be some kind of consensus as to, you know, when you're doing the review, exactly what are you reviewing? What is the substance, okay? And once you've identified that substance, what makes these additional things not part of that substance? So that's to me where the -- defining the nonsynthetic and the synthetic is really important, and getting to understand -- an understanding
of what the generic is, you know, what is consider a
generic. And once you have a generic, if it -- if
something -- you know, a good example -- and I think
it's on some of the more difficult things to grasp,
which is these extracted naturals, you know, like the
aquatic plants. I went back -- and again, we'll discuss
this, I think, when we go through the synthetic and
nonsynthetic paper. There is a point where -- when you
do the review of materials, and if you look at what the
definition of synthetic is, you're basically approving
the extracted product, okay? And that's what has to be
defined, I think, and pretty well understood by the
Board when they're doing that, and the TAP contractors,
specifically. Once you have that extracted product, you
know, it's there. If then you have to add a stabilizer,
or you have to add a preservative, you know, to make it
functional on the farm, or make it functional in way to
make it formulated into a brand name, all those agivents
and those fillers, those are the things that are not
part of that original substance. Those are additional
synthetics that are there for other functional reasons,
but they weren't -- they shouldn't be that extracted
generic.

And I don't know -- you know, and perhaps
maybe Emily or Brian can put it in better words if I'm
not explaining it. And again, I only refer to them, because I appreciate the fact -- and I think with a lot of this material stuff, it's almost like you have to do it 24/7 to really understand the complexities of really what -- you know, and I think we all think we know and we all -- and I -- you know, as I went through this process, it was a very rude awakening, that perhaps I assumed I knew a little bit too much.

MS. DIETZ: I agree with you, Rose, as the materials chair, it's your life. From a historical standpoint, when we've review materials, the reason we ask for a manufacturing process is that there might be something added to adjust the pH. There might be something added in the extraction method. And I'm just going based on my past five years on this Board, that if something is used in that initial process of that material, then you are approving that material all inclusive. You don't have --

MS. KOENIG: Right.

MS. DIETZ: -- to go back and add that. If that pH adjuster isn't on the National List, you're actually reviewing that material in its entirety. So I don't want to lose that concept, and I heard a little bit of that --

MS. KOENIG: Well -- and I'm sorry if I --
MS. DIETZ: Okay.

MS. KOENIG: -- misspoke. And I think, again, some of the documents, as we're going to see later, the improvement of the forms --

MS. DIETZ: Right.

MS. KOENIG: I think one of the things that's misleading on these -- on that petition notice -- and again, we'll get to it and speak to it in more depth in a little while. You know, the petition notice asks the petitioner to provide information on -- it almost sounds like on their product, and I think what petitioners are doing and what TAP contractors are doing is that they're looking at substances as substances for that particular brand or that particular use. But in reality, when you do a technical review, it needs to be very broad. You need to be encompassing all -- and that's kind of some of the discussion on soy protein isolate. It doesn't matter who petitions it, the job of the Board and the job of the TAP contractor is to look at all the ways that soy protein isolate -- because once it gets on the list, you're buying into that manufacturing process, okay? But once that generic gets on the list, that doesn't mean that you're buying into all the formulations of soy protein isolate as it appears in the marketplace. You know, so if a manufacture, you know,
feels that soy protein isolate needs to be looked at, because they feel it's a synthetic, or they want to determine whether the Board thinks it's synthetic, that's one question. Okay, if they know, in their formulation, that they're using a preservative or something post-extraction, then it's their obligation to put those substances on the list. That also is subject to a petition process. But they're separate issues, they're not the same. So I don't know if that explains it.

MS. DIETZ: That does. Yeah. I just wanted -- somehow we need to -- I mean, this question keeps coming up. How far back do you go, and we need to, at some point as a Board, you know, in all areas, whether it's handling or livestock or crops, go back and define that, because we keep getting asked that same question. So -- and then I have more, so I'll wait.

MR. NEAL: I've got a --

CHAIRPERSON KING: Arthur and then --

MR. NEAL: I was lost on a statement. Once -- say for instance, let's use soy protein isolate as an example. Once the process is approved, and I've identified everything that I'm using in my process, and it's placed on the list, the generic is okay for use, but it doesn't mean that all -- what was the term,
all --

MS. ROBINSON: All formulations.

MR. NEAL: -- all formulations of soy protein isolate are allowed. But if my formulation meets the generic process --

MS. KOENIG: You know, and there may be some cases. If your generic is, in fact, your brand -- you know, if you take that isolate and you don't -- you know, you take the extracted product, whatever it is, and you can make a brand name from that, by god, do it and there is no problem with it, you know. But, you know, if you take that soy protein isolate -- and again, it's really important for the Board to be very clear as to what -- and that's why we have to define synthetic or nonsynthetic. But -- you know, so that extracted product that we either -- you know, is a synthetic or a natural, whatever we draw that line on, that's fine. But post that, if a manufacturer uses anything post that -- wherever you've drawn the line, then there may be additional things that need to be added to the list.

MR. NEAL: This is the legal problem that we've got. Soy protein isolate on the list -- let's use a real example. Lignin sulfonates on the list, different versions of lignin sulfonate. And I think the proper term is lignin sulfonic acid. That's the term
that should be used. But lignin sulfonate is on the list. There's ammonium lignin sulfonate, I think different -- about five or six types. And the issue is that when a farmer looks a lignin sulfonate, they buy something that says lignin sulfonate, and they assume that I can use this, because there's nothing else contextually associated with that term that tells them they cannot. So legally we're having problems with interpretation. I mean, we do understand the intent, maybe, philosophically, but legally we cannot tell them, no, you cannot. Because if you look at the historical paperwork, all of these forms were listed in the TAP.

CHAIRPERSON KING: Jim and then Nancy.

MR. RIDDLE: Okay. Yeah. Sorry. Well, just on that, Arthur, I think that points back to the improvement that we're looking at in, you know, starting with the petition process all the way through of identifying synonyms and using the CAS or INS numbers, being very precise as exactly what is on the National List, what that means. So -- and I did also want to compliment and thank Rose for the efforts. This was kind of a last minute, late night-type push to get something in here, and it is real good, a very thoughtful document. But it is draft one, and it doesn't, you know, do the analysis of how do the

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
livestock substances add up to this kind of structure of
the list. And then, how does this apply to the handling
materials, which really are under a totally different
paradigm? I think this is focused on the production --
materials used in production. But we also have to look
at the other side of it down the road. So, you know, we
aren't going to vote on anything today. I think just
taking the comments and for the committee to continue
the work on this, but I think it's a great start. The
one thing -- the question I have, I guess, for Rick,
Barbara, Arthur, if there's no changes to the
substances, or changes to the annotations, but rather
just a change to the structure of the list so that it
rearranges it in these categories, could that be done as
part of the sunset, you know, republishing? Or how can
-- what's our target here to move this kind of structure
forward, if it has legs?

MR. MATHEWS: Are you saying that you just
want to do this at the sunset?

MR. RIDDLE: Well, I don't know. Should we be
thinking that it's possible, or is this really a very
different issue? And I just --

MR. MATHEWS: This would be possible to do at
any time, and once you get down to where you want to be
-- I mean, we could even do it section by section. I
mean, you will note that, in last fall's rulemaking, we
did make some structural changes to the way the sections
were laid out. And so we could be working on that as we
go along. As you get a new substance for 601, then we
can go ahead and propose some changes at that time.

MR. RIDDLE: Okay.

MR. MATHEWS: So, I mean, this is something
you wouldn't have to wait for sunset for, we could do it
piecemeal and work our way through it. As you finish up
with one part, we can move to another part. I mean,
there's plenty of flexibility there, because we're going
to be doing rulemaking pretty continuously on the
National List. Every time we have a board meeting, we
add something new. We can work -- we can work other
magic with that section, as well.

MR. RIDDLE: Okay, great.

MS. ROBINSON: There is one downside to doing
it in sunset, Jim, and that is that sunset, itself, will
be -- you know, because it's all of the materials that
are on the list, it will be sort of a major event and
it's -- I could foresee that, you know, rearranging the
National List -- I could just see the opportunity for
people to say, well, so is it still there or not? I
mean, just public confusion. But it's a good idea to
change it. This is what we've wanted to do, but, you
know, let's talk about it. Let's not make the decision right here.

MR. NEAL: Also, I don't think you want to lump it in with sunset, because if you get some people in the industry who don't like the layout and start commenting on the way that the list is structured. Then you have to rewrite this docket to address the way that the list has been structured, in addition to the sunset materials. Right.

MR. RIDDLE: And that's something else. I did just want to mention -- yeah, this just came to the Board at the last minute. It's had no public comment, no review, and I think we really need to solicit that, you know, for the committees, you know, for their work.

MR. MATHEWS: The bottom line is, it's a good step forward, and as you work through it section by section, we can, at the time of updates of the National List, go ahead and propose this section by section and get our comment on that at that time.

MS. DIETZ: Just one comment on extraction processes and then -- because I don't want to lose that. We have put restrictions and annotations to specifically identify a process or certain areas of a process that we want to focus on. So we just need to keep light of that. And then, Rose, just a comment on the document
and I'm sure -- well, I know we'll go through it in the Materials Committee. On the last page you talked about providing decision making tools, and I question the NOSB's role in seeking out, you know, what farmers are using, or that -- you know, and advising farmers that they shouldn't be using something. I think that's the role of the certifier. So that's just a little -- I'm a little uncomfortable with that section.

MS. KOENIG: Well, really this -- and maybe it's not again written clearly, or maybe I didn't explain it clearly. And I think what the text says is that -- you know, I said the NOSB should consider surveying, so --

MS. DIETZ: Okay.

MS. KOENIG: And I'm just saying the survey is really to understand how people access information. And to be honest, you know -- you know, I put that idea out there, because I do think there's more appropriate organizations. I mean, if you want to do a survey, you know, I have enough of scientific background to know that there's proper ways to do surveys and there's not -- you know, so if we're going to engage in that, I think that we actually --

MS. DIETZ: Right.

MS. KOENIG: -- want to do it and maybe
contract out if possible. And I don't know if -- you know, and that's something that Richard and Barbara would know in terms of budgeting and funding. But, you know, if this concept of a survey has a direct impact on materials, although it's not a material per se, is that something that -- in the TAP contracting money -- and I'm not saying we want the TAP contractor to do the survey, but could they take some of their funds and then subcontract to somebody else to do this work? So is there a mechanism, maybe indirect at best, to utilize some of those funds to get at this question? And then the second question is -- that's I think also very important, is there ways of utilizing that TAP contract money to address these issues, sort of like the extraction process issues rather than particular materials? So substantive research or data collecting or review, similar to the synthetic or nonsynthetic document that I attempted, could that be done through also -- as an option by a TAP contractor?

MS. DIETZ: Well, we have in the past asked for boiler [ph] chemicals, who asked for an additional analysis. I think that's certainly within our purview. They can answer that. But again, I just question a survey to the farmers, when really it's the certifiers' role to know what they're using and their inputs, and it...
just might not be areas that we can or should go to. And then let me just finish with my comment and then everybody can go. You also -- we also mention in here utilizing resources such as OMRI, but I know there's other people out there doing brand name, and I hate to keep focusing on one company, and I think that's not fair in the industry. So we should change that and say utilizing resources such as other brand name material lists, because it's just a little competitive advantage. I think that that -- we need to be cognizant of that.

MR. CARTER: Well, mine was similar to Kim's, because what struck me is going through there -- in going through this whole process, and then the last thing with the survey seemed to be a little bit -- I understand, you know, encouraging, doing a survey, the thing. I'm wondering, this task is fairly monumental as it is. You know, the issue that comes up on a survey is, in structuring it, if you go out there and survey farmers about how they get their information and what they're using, is there a potential, then, that they're going to be concerned that's going to lead to some sort of enforcement action against them? You know, I mean, how do we do all of that? So that seems to be a separate stand-alone task to try and surround.

UNIDENTIFIED SPEAKER: Somebody's locked in
the bathroom.

CHAIRPERSON KING: He must be locked in the bathroom, yeah. Someone wants in, Dave. Yeah, I think the survey's a good idea, but maybe as a separate project, it seems like. But we know that this is a first draft, Rose, and we very much appreciate your effort. And, Barbra --

MS. ROBINSON: Well, I just -- on the survey, I mean, you want information. You want to know what growers are using out there. But in the first place, you don't want to do a survey. I don't -- and I hate to be the -- you know, the wet blanket from the bureaucracy here, but if you want to go out and do a survey, we're going to have to go ask OMB for permission to do this thing, and because -- what?

MR. CARTER: He said, I didn't even go down that road.

MS. ROBINSON: Oh. There's ways to get information. We have our ways. There are probably ways that we could get information, and we could certainly talk to certifying agents, who get this information -- they should be getting this information from the growers that they certify, and there are probably ways to do a cooperative agreement or some sort of a contract with an organization out there who can talk to the certifying agents.
agents and gather this sort of information. But I don't think you really want to go out and do a survey of farmers.

MS. KOENIG: And that's fine. I mean, somebody had told me you'd probably take that part out, and they were right. See, I learned -- so anyway, but --

CHAIRPERSON KING: But by that time it was --

MS. KOENIG: But I thought it was -- you know, sometimes you just have to stick it in. So anyway --

CHAIRPERSON KING: But it was midnight at that point, right?

MS. KOENIG: That's right. So it tells you not to be stubborn. But I think the point is -- you know, and I think -- and that was the reason why I kept it in, was that the idea is out now to the public and there -- you know, if -- you know, Organic Farming Research Foundation or, you know, there's these grant monies out there, I mean, it's -- you know, hopefully we planted an idea into somebody's head and that -- it's sufficient to me that -- you know, that it's been on the website. Somebody can take that thing and run. But, you know, we can drop that. That's -- you know, it's not near and dear to my heart.

CHAIRPERSON KING: George.
MR. SIEMON: Well, this brings up a lot of serious issues, and especially the restrictions that OFPA gives us to the categories we can consider. So I just wanted to ask about your use of production aids. It seems that that is one category that has some room to be broadly interpreted to allow different materials in. So when I look at your appendix one and how you divided these things out, you've put in -- put things into the production aids such as ethylene gas and that kind of thing, and so I'm following what you're doing. But then when I get to the substances that do not fit into OFPA categories, I wanted to ask you why minerals used for disease control could not be also a production aid, and why that didn't fit into that same broad thing, and I don't follow the logic there?

MS. KOENIG: Well, yeah. And, you know, again, and I wanted to say, my objective was to think broadly, to not think narrowly, and try to justify things as best I could. So, you know, again, this was just a first attempt, you know, with some logic behind. So I tried to broad that -- you know, I was trying to fit as much things on as I could. The one issue -- and I think it is something that the Board is going to have to wrestle with. I still think if we're going to broaden the production aids category, which I think is

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
there's some good justification in doing so, I think we have to -- it has to be a broadening that is terminated, because, you know, again -- you know, the production aid category should not be the loophole now that exists so that everything can fit into a list, you know, because that is definitely not within the spirit of OFPA. But I think that we need to be conservatively looking at the issues, which I think I've done, you know, that are popping up, that have continually persisted, you know, within the minutes and within the evolution of this -- you know, this regulation, and broaden to encompass those and then close it. So, you know, why the disease didn't fit in --

MR. SIEMON: Yeah, yeah.

MS. KOENIG: -- because -- and that -- you know, here I am a plant pathologist. Maybe again, it's something that is too near and dear to my heart.

MR. SIEMON: And you got --

MS. KOENIG: You know, as a plant pathologist the only thing -- you know, when you say coppers and sulfurs, I mean, that to me -- you know, and I don't think it was a smart idea, but the OFPA category for coppers and sulfurs were -- to me specifically dealt with the disease control, you know, category. And if you -- a production aid, I don't consider -- these
production aids I guess that were listed, you know, ethylene and fillers and agivents, and really more importantly, the ones that were specified such as -- you know, they were physical structures like barriers and --
what were the original ones? You know, sticky -- sticky --

MR. SIEMON: Tree wraps.

MS. KOENIG: Well, tree wraps. Most of them really alluded to a physical purpose. You know, so I guess --

MR. SIEMON: But your list goes beyond that.

MS. KOENIG: I know, because I was trying to --

MR. SIEMON: So --

MS. KOENIG: -- get in things that were listed, okay, like compost feedstock. But then when I started thinking of disease control materials, that is so broad, I just -- I couldn't personally do it, but maybe somebody else can. I just -- in my mind, it just didn't fit, so, you know, I just -- that was just more of a personal decision.

MR. SIEMON: Okay.

CHAIRPERSON KING: Jim.

MR. SIEMON: I'm not finished.

MR. RIDDLE: Well, can I just -- can I comment
on this and then you pick it back up? And that is, we heard in public comment yesterday a proposed definition for production aids, and I think, if the Materials Committee would take that under consideration, because I do think that should be a part of this document, if we're kind of broadening the scope of production aids beyond those ones that are just listed, and it's meaning that includes but is not limited to, there still needs to be, you know, some restrictions on what is a production aid. There needs to be a definition. So I would just ask the Materials Committee to consider that definition that was proposed yesterday, and maybe that can help George out.

MR. SIEMON: That does help. So I guess I would just like to ask the NOP what they feel about this concept of broadening the production aid, in a legal -- could you have dealt with this? You all talked about it and it is a real issue.

MR. NEAL: I think we'll let the discussions continue. No, seriously, though, for most of you, this is the first time you had an opportunity to look at this document. There are things that you need to digest. I think broadening the scope of production aids is a possibility. I do believe that it's going to pose some challenges to you. So for right now, you know, we're
going to assist you as you discuss this matter further, and evaluate whether or not if what's on the table is going to be the best options for you.

CHAIRPERSON KING: I'll just ask a quick question. Do you see better options other than opening that up?

MR. NEAL: No, not really. I mean, the issue at hand -- I mean, you guys have got a monumental task in front of you, and you're wrestling with two big beasts. One, the OFPA criteria -- the categories. Two, this whole synthetic versus nonsynthetic. Well, there's three. How far do you go back in the production of -- production input -- in the manufacture of a production input? Those are three big bears you've got to wrestle with. So we're going to be here to assist you as you, you know, consult with the public and the industry in terms of what it is the desires of the organic industry would be.

MS. KOENIG: I guess I had just one comment --

CHAIRPERSON KING: Okay.

MS. KOENIG: -- for George on the production aid category, too. I will admit that the other idea that I explored, but I shot down, was the inerts, that little double i, you know, I thought, well, you know, because -- you know, there's active and there's inert,
and people like calling them inerts and, you know, you
went through OFPA and some people referred to them as
inerts and -- you know, because again, a lot of the
language was muddled in there, you know, in terms of
public comment and meetings and Board members. But I
looked and, you know, I examined OFPA and it was pretty
clear the way that it was, you know, written, because it
really specified FIFRA [ph] and pesticides, that inerts,
in their view, meant pesticides, and also the Board
discussed that in, you know, '94 and '95, and that was
really what inerts -- that little section was. So
that's why I went back to the production aid category
and didn't explore too much further the idea of
broadening the concept of inerts. But I think that is
just going to cause confusion if we go there. I think
production aids is a little bit cleaner.

CHAIRPERSON KING: Well, thanks --

MR. SIEMON: Okay, just for processing. So we
are going to be developing this production aid as a
definition and coming back to the Board sometime in the
future.

MS. KOENIG: Well, I think that the committee
is going to take this document, at least the materials,
and then, you know, giving -- listening to the input,
you know, and come up with a more -- you know, start a
formal process. Whether it's in three phases or one phase or two phases, you know, we'll just get to work on it.

CHAIRPERSON KING: Well, and as we discussed earlier, George, and I think your concern is well up wind, how do we shape the bullet list going into the future? This is a first draft. It's a really good start, and thank you again, Rose, for all your effort. But, yeah, ongoing, these are a lot of the questions, and certainly Arthur, I think, summed it up pretty well. I had a quick announcement concerning a couple people on the Board, actually several Board members who approached me last night concerning draft documents from yesterday, our responses, Board input, if you will, to the initially and then retracted directives, and their concern is that we just vote on our drafts as they are as a board to recognize them. And so at break -- we're actually ahead of schedule a few minutes. So we're going to take about 20 minutes, come back at 10:15, but I'll leave at the discretion of the committee chairs at this time, if you would so like to bring those documents forward, and your committee concurs, then all it will be is just to vote to recognize those documents. So I think it's a good idea, and we could do that later this afternoon, first thing after break. If there is any
discussion over lunch, that sort of thing, it'll give you time. So we'll look to vote on that mid-afternoon today.

MR. SIEMON: Yeah, I missed something. What are we going to do when we come back? You said --

CHAIRPERSON KING: You can do it during the break, okay? I just want to know from the committee chairs who drafted the documents concerning the directives, do you want to bring those forward for a formal vote? That's all, okay? Yeah, that's all.

MR. RIDDLE: Yeah.

CHAIRPERSON KING: Just --

MR. RIDDLE: So we can have it on the record.

CHAIRPERSON KING: On the record, that's all.

Okay, so let's be back at 10:15.

***

[Off the Record]

[On the Record]

***

CHAIRPERSON KING: Again, thank you all for your participation and hard work. And at this time we'd like to move to the Handling Committee and Kevin O'Rell, who has some issues to discuss.

MR. O'RELL: The first thing that's on the agenda for the Handling Committee is the materials
approved as food contact substances, an update. In the last April meeting, the Board voted to accept the Handling Committee report, which was an update on the materials that are used as food contact substances. In that report there was a recommendation that six materials that were previously voted on and approved by this Board be added to the National List. These were materials that were also considered to be food contact substances. Seeing that there was some confusion in the industry, it was the committee's recommendation that this update report be formally accepted by the Board, and it was voted on, accepted, and it was published on the website. It was our hope to have these materials published in the next docket, and as we heard in the NOP update yesterday, that there is a docket that's in process for rulemaking with all processing materials, including these six materials, which were five boiler water additives and -- or four boiler water additives, activated charcoal, and parasitic acid [ph].

Also in that April report, it recognized that the December 12 NOP policy statement clarifying synthetic substances used as ingredients are subject to review by the NOSB, and that these synthetic substances would either be classified as an ingredient, which then would have to be on the National List, or as a food

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
contact substance, which then would require the proper
documentation for supporting that it is a food contact
substance. I don't know if the Board has any comments
or questions.

MS. DIETZ: I guess I have one comment. On
the boiler water additives, we had sunset on those
materials, and it looks they'll be put on and then taken
off fairly quickly again. But we just wanted to follow
through with that process, and at least have the public
know that there is a sunset, and if anybody's got
issues, they need to bring those forward.

MR. RIDDLE: Well, as I recall, there were
some specific annotations in addition to that, as far as
the type of use for packaging, I forget the exact
language, but it'll contain those annotations, correct
-- yeah, as well?

MR. MATHEWS: It'll contain exactly what you
would propose, the -- what is -- as Kim says, they'll go
on, but then they'll come off October 21 of 2005. I
believe that. Yeah, October 21, 2005. So they'll only
be on there for very few months.

MR. O'RELL: Okay. The next issue for the
Handling Committee was organic yeast agriculture versus
nonagricultural substances. And it was our purpose here
to report and update on an action plan. The Handling
Committee, recognizing that is a concern, particular --
in the organic community, there are some particular
materials that have been flagged for concern with this
issue, yeast particularly, and we will be forming from
the Handling Committee a task force to look into this
issue and make recommendations to the full Board. This
task force will include NOSB members and qualified
individuals from the organic community, which we will be
actively soliciting very soon. It was decided to look
at this as an issue of agriculture versus
nonagricultural, as opposed to just taking the yeast in
question, because there are number of substances that
are on the National List under 205605(a) that will --
could also be affected by a decision that would be made
for yeast. So there's definitely a determination into
looking at the criteria that was used in placing these
substances on 205605. Some other examples are dairy
cultures. There are colors that could be derived from
vegetable sources. So I think what this task force will
need to do is to have a full review of the materials on
205605(a), and classify them -- look at reclassifying
them and, from criteria, of further defining the
definition of agriculture and nonagricultural. This
task force would have interaction with the task force
that's involved with synthetic-nonsynthetic, as well,
since I think there will be some areas that will cross
over or relate to that subject. And the Board
previously made recommendations for change in 205606.
Maybe, Kim, if you want to comment further on those at
this time,
but --

MS. DIETZ: At the meeting, we made a
recommendation on commercial availability and really had
asked to restructure 205606 and take some of those
materials off. And I see this new task force doing the
same type of a thing, where we'll go through and make
recommendations on materials that are currently on the
National List, and we might even -- well, take the
opportunity to do similarly to what Rose just did with
the crops National List and just do it all at once, and
try to come up with some more user-friendly structure of
the National List, so --

MR. O'RELL: Thank you, Kim. So it would
be --

MS. KOENIG: I didn't realize it was on all
the time. There's no more light there. The -- because
I notice that -- I mean, I guess I want to just make a
-- I guess state a question. The concern I have with
the concept of task force is, do we really want a task
force? I mean, do want to bring outdoor -- you know,
outside individuals in an a formal way, or do we want to work through committees and get the job done by consulting with individuals as we meet them? Because, you know, one of the issues I have on the task force is that -- you know, just to try to get conference calls with Board members is difficult at best, and then when you try to bring a lot of other individuals in that formal process -- and if we do go the route of task force. And I think it's really important for us to set goals as to when we want to get this stuff accomplished and -- you know, instead of just -- we discussed that at length, too, and I -- because I'm going off the Board, I'd assume, at some point -- within the next year, maybe. You can't never know. We need to have historical input at the same time, and so we decided to form a task force. We also talked in length about confidentiality and how, you know, there's also a risk with forming a task force, that you bring public in. So although we're not, you know, set on a task force, we do need to make sure we have people like Steven Harper [ph], who've had recommendations on the ag versus nonag and synthetic versus nonsynthetic, so that we can get this done right this time, and not just put the demand on the task force -- or on the Board. If there's ways to bring past Board members in without calling it a task
force, I think that's also something that we could look at.

MR. CARTER: I think the task force -- I guess my interpretation when I saw this task force is really trying to pull together, you know, a group among the Handling Committee and the Materials Committee, and if you look at our Board policy manual, task forces don't require outside people to be -- they can be included. But I think this was an endeavor to try and coordinate some efforts between those to committees, have a single assignment, and then you dismiss that group when that particular assignment is done.

MR. O'RELL: Well, I think -- you know, officially, whether it's the word of a task force, what we do want to do is what Kim said. We talked about bringing in some historical perspective on how some of these materials were classified, we go back in time. Some of the criteria that we're using today is detailed, and we don't have that from some of the past materials that were voted in. So if it's a matter of consulting with them, I think it's going to be a limited group. We're going to try to get this done and expedite it. It's going to be on a fast track, it's not something that we're going to try to get such a working group that it's -- it gets stuck in the mud. We recognize that
this -- there's some high interest with this particular issue in the industry and we want to get resolution quickly. Our hope would be to be able to make a recommendation to the full Board at the next Board meeting. I told you that we'd get you back on time, Mark.

The last issue is pet food standards. We had a lot of public comment and input yesterday and I'm sure we may have some more tomorrow. This is a case where the Handling Committee recognizes that there has been a lot of work that has been done in the industry, and what we are challenged to do is to look at this work, assess what has been done, and bring it into the committee, digest this, then make a recommendation again to the full Board at the next meeting. This -- we discussed this. This would not be a task force, this would be a work plan involved with the Handling Committee to go over and review, assess what is currently out there with OTA, with AAFCO, and then try to come to a [sic] agreement and get a draft recommendation to this full Board for the next Board meeting.

MR. RIDDLE: Yeah. In the scope draft that we talked about yesterday, there was a section on pet food in there, the policy. The Development Committee was asking the Handling Committee to form a task force, and
I don't have, you know, any problem if you choose to do it within committee instead of a task force. But a couple of things that I would like to, you know, just bring back up, and that is the need for outside input, expertise of, you know, both kind of pet food industry, but also pet food control officials, to solicit information from them. And then the -- that scope document had a few questions, issues, and I just ask the Handling Committee to kind of take that on, even if you're not forming a task force.

MR. O'RELL: Yes, Jim, that's -- our intent is to certainly look outside and consult with all those individuals and information that's available out there.

CHAIRPERSON KING: Yeah, I just -- I had a quick question, and this may be for NOP or you, Kevin. On the agenda we listed action plan for pet food standards, and as part of that we put materials labeling feed provisions and the like. Perhaps just as initial guidance, that was my understanding, for a task force or the -- to start to look at those areas, and I guess I'm perhaps looking for some input from NOP. Is that the direction we should go in? Do you feel that's sufficient? How would you approach it?

MR. MATHEWS: For starters, that's right, it's just the starting point, that, you know, one of the
things that has to be addressed, are there materials
unique to pet food that aren't addressed elsewhere for
in -- say, in the food 605? The labeling issue needs to
be addressed. Is it going to be to label just like
food, or is it going to have a uniqueness of its own?
The feed provisions, obviously you've got to revisit
those, because there is a prohibition about feeding back
animal byproducts, and obviously dogs eat animal
byproducts. So you need to address those kinds of
areas. Those are the things that jump out to me, that
the livestock feed provisions, they need to be addressed
from the angle of pet food, the labeling needs to
addressed from the angle of pet food, the materials need
to be addressed from the angle of pet food. The -- to
me -- I mean, the growing of the crops is already taken
care of. The handling of the product is already taken
care of. You're just looking for what is unique for pet
food, and then including the pet food industry in the
rulemaking process.

MR. O'RELL: And we took that as some
guidelines. Certainly on the labeling issues, I think
that, you know, we're in agreement there. I'm not so
sure on the feed provisions. It's something we'd have
to discuss, because we're not certifying the pet, it's
-- so I'm not sure where that is, but that certainly is
something that we can discuss.

MS. ROBINSON: I think if it was me, what I would start off with is, sort of get square in your minds, do you consider pet food essentially a food? Then that would -- I mean, Rick's talking about the livestock feed provisions, and that's fine if you want to go down that road. A better road maybe to go down is it's, you know, people buy pet food, not animals, and it is considered a food product. That gets you out of the mammalian byproduct provision. But the biggest -- and it seems to me the biggest issue that you are going to grapple with is the labeling, and that is because, as you've probably already found out, that AAFCO has a different labeling scheme for pet foods than you have. And as I think we've told you before, they came to us before we implemented the standards, and they asked us to accommodate their labeling scheme within the NOP. And we said, no, that we wouldn't change the NOP labeling to accommodate their labeling scheme, because it is different. And then they have apparently a restriction on the use of the word organic, as they do with other quality labels, and that's the way they view it. For example, they don't allow -- it's my understanding they don't allow a pet food manufacturer to use AMS's standards for meat such as choice or prime,
to refer, you know, to the grade of the meat that's in
the product. So that was also a problem they had, was
they wouldn't allow organic to go in the ingredient
listing as a qualifier. So I think that's where you're
going to have your big issues, is just on determining --
you know, getting the labeling in sync without
compromising these labeling standards, getting it in
sync with the pet food industry folks and what they will
allow.

MR. CARTER: Well, I just was going to say, I
know that AAFCO, though, last year, at their meeting in
Denver, has under consideration some proposed -- and,
Jim, help me out -- amendment to the model regs to bring
the organic definition for pet food into compliance or
consistent with the USDA rules. So I think bringing
them -- you know, working with some of the feed control
officers -- officials in this process will be helpful.

MS. DIETZ: I guess I would ask that we have
somebody assigned to the Handling Committee with us on
this task force from the NOP office and who's going to
specifically work on this with us so that we know what
you know, about the pet food.

MS. ROBINSON: That would be your executive
director.

MS. DIETZ: Then I guess we won't have a
Proposal for the next meeting.

MS. ROBINSON: No, Keith will work with you.

MS. KOENIG: And that -- it's just kind of a housekeeping concept here. You know, we were having a -- you know, a number of people are moving off this year and next year, so, you know, I don't know how long this process is going to take, but I think we need to -- before we start these projects, we need to kind of map out and strategically plan so that we have some memory, or things are written down, you know, in various forms, so whoever ends up taking over -- and, you know, this could be a -- it doesn't sound like all this stuff is going to get down in the next meeting, and half -- a number of people are gone, unless they're somehow incorporated in the task force. So just thinking about, you know, how do we continue this process? I mean, the chair -- I think the chair, whoever that will be, should -- I just think needs to consider kind of those types of --

MR. O'RELL: Well, I think on the onset of the project from the Handling Committee chair position, that we'll make sure that we have clear guidelines set forth, and clear objectives as to what we need to accomplish, so that if there is a change in that chair position, that at least they have the road map to where somebody
at one time intended to get to.

MR. RIDDLE: Yeah. And also on -- in response to Rose, historically, at least since I've been on the Board, when there has been a rotation, people going off, those individual Board members have been invited back, and, I think, expenses paid for that next Board meeting. So there is some continuity and, yeah, they don't sit at the table, but they are invited specifically to be in the audience, and when there are issues that they've been working on, we've been very happy to recognize them and have their input. So hopefully that tradition can continue.

MS. KOENIG: You know, that was an issue that came up with the Compost Task Force and that's why I bring it up, you know, because -- you know, Eric was on that and he was the chair and, you know, because of funding they couldn't -- he couldn't come to that meeting. So don't assume that, and make sure that the chair is somebody that consistently is going to be present, because even though that -- and I remember during the Aquatic Task Force, that was the situation. And maybe funding is different now, but that's what we need to be clear, because as you make these assignments, it's really critical to have that, you know, representative there, because I felt at a loss when I
had to take over Eric's position, because I was involved, but not really as involved as I would have if I'd known I was going to become the chair at the last moment, so --

MR. O'RELL: Well, one of the things -- I hope that when we're assigning committee chairs and we're looking for people who are going to be on the Board for at least the next two years to have some continuity, and this is something that I wouldn't envision being done before that two-year period of time, so --

MS. DIETZ: Just to --

MR. O'RELL: Kim.

MS. DIETZ: -- comment while we're on that discussion, I know we have, in the policy manual, procedures for elections and that sort of thing, and I'd like to see that somewhere in the policy manual, that the current chair is at least on a board for the following year, so that we can transition and training. We have a lot of movement on this Board in the next few years, and like we did last year, I stepped down from materials so Rosie could be on it for another year. And next year's going to be the biggest challenge, because you only got really five Board members -- four, I think, that are going to be on here.

MS. KOENIG: No, if that's --
MS. DIETZ: So we need to think about that --

MS. KOENIG: Yeah.

MS. DIETZ: -- for future Board members, if we could put that in the policy manual.

MS. KOENIG: But, you know, if that was the case, then I'd have to step off as chair now, because I am off next year.

MS. DIETZ: Yeah. And I think we got to discuss what's the best for the Board as we -- you know, but in reality, yeah, that's true, is that the best thing for the Board? I'm not so sure. But to train the next person in materials, you know it takes a lot of work, or whether it's handling or whether it's livestock. So it's just something that we need to think about.

MR. O'RELL: Well, I think that concludes the Handling Committee report.

CHAIRPERSON KING: Thank you, Kevin. At this time I'll defer to Jim Riddle, who will introduce our presenter.

MR. RIDDLE: Yeah, well, it's really a privilege to have the opportunity to introduce Tom Bewick. I had asked to have a guest speaker here at this meeting, and we've followed our procedures that we have in the Board policy manual, and the Executive
Committee approved in advance, and Tom is the program
director of Plant and Animal Systems at USDA's
Cooperative State Research, Education, and Extension
Service. Yeah, yeah, the stakes have raised. Yeah,
anyway, as I was saying, Tom is director at the USDA
Cooperative State Research, Education, and Extension
Service, and CSREES, as I shorten it, has been empowered
under legislation to implement two different organic
research grant programs, and they're pooled together in
what's called the Integrated Organic Program. And so
Tom is going to give us a report on the recent round of
grants and the future for that program. So welcome,
Tom. Thanks for coming.

MR. BEWICK: Thanks, Jim. It's a privilege to
be here. It's a privilege to think that you're
privileged to introduce me. But I really do appreciate
the opportunity to come and talk with the Board and also
with the audience. We're trying to heighten the
awareness of this program, and once we get it up and
going, I can't talk without my pictures to remind me of
what I'm supposed to be saying. Hopefully it's plugged
in, because otherwise the power goes down and then -- as
Jim said, I work for the USDA. I'm with the Cooperative
State Research, Education, and Extension Service. I'm a
national program leader, specifically with

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
responsibilities involving horticulture, but I do a lot of other things, as well.

And the Integrated Organic Program is what we call in integrated research and extension grants program, and this is what we mean at USDA, or at least within our agency, by integrated; they're multifunctional projects. And one of the things I should say is, our agency is the federal partner in the Land-Grant University System. So we have a number of funding conduits which we give money to the universities around the country to do research, education, and extension. And so multifunctional to us means just that, we want projects that emphasize research and extension and education -- higher education, so formal classroom instruction, graduate training, and also post-doctoral training.

Multi-disciplinary is another component of our integrated program, so we don't want single disciplinary -- we want to have interdisciplinary teams. And then we also like multi-state or multi-institutional projects. Within the Land-Grant University System, we have a 116 partners. Some of those partners are what we call the 1890 schools, that are traditional black colleges and universities. Some are 1994s, which are American-Indian universities. And so we like to see teams put together.
that cut across all of the partnership, so that we get, you know, really robust projects.

In the past we had a grant program called the Initiative for Future Ag and Food Systems, and that -- IFAFS is the moniker we put on that. That was -- and it still is authorized in the Farm Bill, but it's not being appropriated, and so we don't offer it anymore. But we try to take the concepts that we developed in that grant program and we're trying to apply them in the Integrated Organic Program. And one of those that's really important to us is the stakeholder advisory group that's formed before the project goals are outlined. So we don't want a researcher to go, well, I know what these folks need, and then he comes up with a -- he or she comes up with a project, and then goes and gets somebody to put their stamp of approval on it. We want these stakeholder groups to have input into what are the program objectives going to be, what's the methodology we're going to use. We want to see a measurable outcome-oriented plan for disseminating the information. So it has to have the extension component built right into it. And we like to see the stakeholders at either -- stakeholders that are part of the advisory board, or other stakeholders be involved in evaluating the project, not only the research end of it, but also the
outreach. Is it being meaningful, is being delivered in appropriate ways? And then we expect progress reports back that demonstrate the impacts of the programs that we're funding. And this -- again, this helps us when we get inquiries from Congress or if we get inquiries from the secretary's office, you know, how good is this program, and we can -- we have data that helps indicate that.

As Jim mentioned, the Integrated Organic Program is actually two congressional authorizations. One is the Organic Transitions Program, which was authorized in the 1998 Arera Act [ph]. And the second is the Organic Research and Extension Initiative, which was authorized in the 2002 Farm Bill. I'll go through a little bit of how these programs differ and are the same. How they differ, you can read it yourself. One is mandatory, $3 million for five years, 15 million total, the other is appropriated annually, so it's -- you know, it depends on how our friends in Congress, how successfully they are. The Organic Research and Extension Initiative has a very broad eligibility that includes basically anybody that can get the work done, whereas the Organic Transitions Program is limited to degree institutions. The higher ed function is not specifically mentioned in the newer legislation, and the
program goals are much broader. They include economic and consumer issues, whereas the Organic Transition Program focuses primarily on production issues.

If we -- at CSREES, we have teamed with other agencies -- go to the next one -- and so we have sort of a long history of collaborating to offer grant programs with other agencies that are larger than either agency could offer alone. And a couple of examples our microbial genetics program, which we offer with NSF, and also our precision ag and geospatial technology program, which we offered with NASA. NASA put up 5 million and we put of 3 million, so we had an $8 million program rather than a 5 million and a 3 million. So it works out really well. Since both of these authorizations are within the same agency, I just made the assumption it would be easy to combine them into a single program, and that didn't turn out to be the case, but we got it done anyway. What it does for us is it provides us with flexibility in funding a single project from multiple sources. It also -- it allows us to compete both programs at the same time using a single panel, which cuts down on the panel costs, and that allows us to put more money into projects rather than spending money on travel and food and that sort of thing. And then also it makes it easier for the applicants, because they
don't have to decide, well, am I eligible, or should I apply to this program or another program? We do all that internally. We decide where -- you know, who gets funded out of what pot of money, and it makes it easier for the applicants.

In 2004, this was the first year that we offered this combined program. We had a total of $4.7 million available for awards. We actually had 111 proposals submitted, 105 of those were considered to be eligible for consideration. Those 105 proposals requested over $47 million. So you can see that, even those 4.7 is a lot of money for USDA to spend on organic agriculture, it's not -- it's the tip of the iceberg. Eighty-six proposals were deemed by our peer review panel to be fundable, and those 86 proposals requested just over $42 million. So again, we only have about 10 percent of the money we need to get the job done. The panel recommended 11 proposals for funding. That represents 10 percent of all those that we received, and 13 percent of those were that were considered to be fundable.

We did a little analysis of the program based on priority and region of the country. These are not specific priorities, they're just sort of broad-based categories. So we have the priorities on the left,
crops, animals, economics, improvements, and organic standards, and then the other category, which takes into account a lot of things. And you could see there in the columns the amount request, the amount funded, and that the number indicates there are 73 proposals that dealt with crops. Of those 73 proposals, seven were funded. That equals about 10 percent of all the proposals that were submitted for crops were funded. And so you can see the percentages.

On the next slide we broke it down, and I saw some statistics a couple years ago, where 85 percent of all organic products sold were fresh fruits and vegetables. So we sort of made the assumption that we would get a lot of proposals for horticultural products, and that we would fund a lot of those, and what you can see is that we actually go more proposals for agronomic crops, and a lot of that had to do with animal feed issues and things like that, and we actually funded a higher percentage of those that dealt with agronomic issues. And so it was a little bit unexpected, but I think it points to the need, you know, there's a demand out there for information on those sorts of systems. We looked at it also by region of the country, and you can see that the northeast region and the western region were particular successful. They got nine -- those two
regions accounted for nine of the eleven proposals. They also got a higher percentage of the proposals, and there are some reasons for that, which I'll go into in a little detail in the next slide, and I'll go back to this IFAFS model.

In the northeast, a lot to the teams that were awarded grants had stakeholder groups that were already in place. In fact, one of the proposals that we funded in the northeast was a former IFAFS program that was running out of funds and wanted to continue its work. And so they had this measurable outcome-oriented plan. The other things, if you look at -- say, if you look at the sustainable ag research and extension website in the northeast, they have a lot of training in organic agriculture, both for producers and for extension specialists. And so they've made a commitment of resources to promoting organic -- service to the organic industry, and I think it was represented in that. And in the west, three of the awards -- three of the four awards went to the University of California, so two to UC Davis, one to UC Santa Cruz, and again, they have this long history -- a 20-year history of service to the organic industry. And so that as -- what this analysis will allow us to do is we'll say, okay, well, in the southern region, maybe there's a huge need to get some

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
research and extension out there. We're not getting the
kind of proposals we want, so let's do a workshop.
Let's go down there to, say, you know, the University of
Georgia or someplace like that, and hold a two or three-
day workshop to help these folks get up to speed and be
more successful.

And the next slide, just to talk about the
programs for 2005 a little bit. In both the House and
Senate markup of our appropriations, which may or may
not come, we don't know, but it was marked at 1.88
million, which is the same level that was marked in
2004. We plan to get the 2005 RFA published at the
beginning of December. I've been told that this will
not be a problem. Last year, because it was a new
program, we had to submit the RFA to -- that was the
request for applications -- to the Office of the General
Counsel. By law they have 90 days to respond. If they
don't respond, you can go ahead and publish it anyway,
but if you do and they want to make changes, you get
into a lot of trouble. So we waited and waited and
waited, and by the time we were able to publish the RFA,
we only had 60 days to allow the community -- the
research and extension community to respond to the RFA.
Having said that, working with our friends at the
Organic Farming Research Foundation, we did get 111

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
proposals. Some of them could've been better written. I think people had to hurry up a little bit. So what we're going to try to do this year -- and I'm still working with some of our leadership in the awards management branch -- we're going to publish the RFA in December, and we're going to give people until May. So that's, I forget, 120 days or something like that. So they have more time, take their proposals, rework them and put them into better shape so they'll be more competitive.

Again, the panel will meet in July. One of the things that we like to do with our panel is we like to have some producers on the panel, so people that are actually farming. So we picked July because, in most areas of the country, you know, the crops are at lay-by, and we can get farmers out of their fields at that time of year a lot more easily than we can in the spring or early summer. What we plan to do for 2006 is we're going to publish the RFA in October -- that will be announced in the 2005 RFA -- and then we'll hold the panel in February. Now anybody who's tried to travel into Washington, D.C. in February knows that can be pretty dicey. And I remember we were supposed to have a meeting last -- not last Presidents' Day, but the one before, we got what, 20 inches of snow that day? These
meetings can get canceled kind of easily in February, but at least that way we can again attract some producers and handlers to the panel so that we have that expertise to help guide us.

The last thing I wanted to say is we are currently recruiting an IPA to help provide leadership for the Integrated Organic Program. And what we're hoping is that we will be able to attract someone from a university. We'll provide 50 percent of their salary for a 12-month assignment. We provide them with a housing stipend and a per diem, and they also -- because they are temporary federal employee, they would be eligible for a transit subsidy. So it would be ideal for someone who's looking to do a sabbatical and get involved in policy leadership. There's my e-mail address. If you know someone that fits those descriptions, please have them contact me and we'll get them a letter describing the position and what we hope to accomplish with it. So that's all I have formally to present. I'll be glad to answer any questions. Yes, sir.

MR. SIEMON: For starters, what's an IPA?
MR. BEWICK: It's an interagency personnel agreement.

MR. SIEMON: Okay.

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
MR. BEWICK: You see, I knew that wouldn't mean anything to you, either, so I didn't spell it out.

MR. SIEMON: All right. For seconds, you know, this sounds great and we're real excited to see this come in, but of course, it's obvious we need a lot more money.

MR. BEWICK: Yeah.

MR. SIEMON: So obviously that comes from Congress relatively, but how about inside your department? You've got quite a few grant processes is what I'm gathering. Is there a chance to gather some of those resources, too?

MR. BEWICK: We have two other grant programs that fund research in organic agriculture, but they're not specifically targeted to organic agriculture. The SARE program, the Sustainable Ag Research and Extension Program, funds a lot of projects on organics. And also our Managed Ecosystems Programs within the National Research Initiative funds -- research that deals with organic. And a lot of their research is comparing organic and traditionally managed systems, or conventionally managed systems, since organic is really the traditional system. But again, they're not specific for the needs of the organic community.

MR. SIEMON: And when you all made your
decisions -- I know this hard -- are you aware of other 
grants being given out, either through those programs or 
outside to avoid duplicity? Because I saw a little -- 
some of the reports I saw, I saw a little duplicity with 
some other grants. I just wondered -- because there's 
so little money here --

MR. BEWICK: Yeah.

MR. SIEMON: -- and so much work to be done.

MR. BEWICK: What -- in our application 
material, you're supposed to list all the grants that 
you currently have and all the grants that you've 
applied for. And we fund -- we don't -- we fund 
objectives. And so if you have a grant that has already 
been funded and it's covering the same material, we 
can't -- even though you might have the best proposal, 
we cannot fund you twice. It's actually against the 
law. And I know some people do it. If they get caught, 
you know, they'd be in a lot of trouble, one would 
assume.

MS. KOENIG: A couple of things. I have a 
couple of things. I mean, have you considered -- I'm 
coming back to the multi-regional aspect of it, you 
know, the fact that some regions didn't have 
representation. And since I'm from the south I was a 
little concerned. And I think that is similar to other,
you know, kind of projects where the same concerns arise. And I would suggest looking at the -- again, they have those national initiatives which are quite different, and I'm not proposing a national initiative, but the spirit of them is that certain projects function better and have a much more, you know, overlap -- it's a national problem rather than a specific regional problem. So they acknowledge that it's important to get by and cooperation from different regions. But you might want to consider a special category for multi-regional -- just like you have multi-institutional -- the multi, multi, multi.

MR. BEWICK: Um-hum.

MS. KOENIG: Is that another multi?

MR. BEWICK: Um-hum.

MS. KOENIG: And be multi-regional and then have that separate pool so that they are considered in some way, if that is a goal of your project.

MR. BEWICK: Yeah.

MS. KOENIG: But I think that's more effective than -- I think the training is good, but I think that's a much more effective way, because even if people, say, in the southern region or the central region don't themselves initiate the project, there are individuals in those regions that might say, hey, this puts me in a
different category area. My project does have multi-regional components, and I want to be looked at specially, and I'm willing to work or identify those institutions and kind of bring them with me --

MR. BEWICK: Um-hum.

MS. KOENIG: -- rather than having them initiate their own proposals. So --

MR. BEWICK: Yeah.

MS. KOENIG: -- a suggestion. And then -- and I don't know how, again, the -- I mean, I read it, but it was -- you know, it was quite detailed. But the one thing in the -- that I think is really important in the call is to somehow -- and maybe you already have it -- is linking the project to the regulation. Because I think one thing that researchers don't -- well, in my experience, they're not necessarily aware of is -- you know, they're functioning and they're doing their research and they think everything is applicable. But because organic is unique in the fact that they have to operate in a very different kind of system, I think it's really important for them to understand the regulation, understand what they're proposing, to make sure that, yes, this is a valid question. It also would encourage them to kind of understand really what issues are important on a research level here, because we discuss
you know, we actually had presenters, and I was happy
to find out that you had funded one of the projects on
methionine, because that was something that we
identified, you know, through our process that there was
an issue there. But I'm not sure if that was because
some people just happened to have known that. It would
be nice to have a way to really direct all researchers
to that information.

MR. BEWICK: Well, we -- certainly, if you
have a website where those things are listed, we can
include URLs in a request for application and that --
you know, it's kind of interesting. You know, we have
-- there are national lists of priorities for research
and extension, and we had some researchers that used
those national lists. And what the -- the peer review
panel actually criticized them because they didn't tie
it back to their stakeholders. They said, yeah, this
issue is really important nationally. And they said,
well, yeah, but is it an issue for your folks? So, yeah
-- you know, you think globally and act locally, right?
I mean, it's that kind of an approach. We do some of
those things like -- which you suggested, in the
National Research Initiative. But they got a $180
million. We have 4.7. And so it's kind of hard. You
know, we have some projects proposed that were multi-
regional, but you get a lot of investigators involved and they all have grad students and they all have post-docs, and all of a sudden, the budget's like 1.2, $1.4 million, and we'll fund those, but they have to be really, really good. And if they're not real tight, you can't justify the budget.

MS. KOENIG: Right.

MR. BEWICK: So we would do it. But to set aside a chunk -- you know, we'd have to set aside 25 percent of our budget and say, okay, we're going to fund one multi-regional project. And then if we don't get real good one --

MS. KOENIG: Yeah. But you guys did that in some ways with your systems projects. I mean, you identify those as ones that you would consider kind of -- you had the special category, if I remember, the call, that kind of distinguished systems --

MR. BEWICK: Oh, yeah, long-term research.

MS. KOENIG: Yeah.

MR. BEWICK: Yeah.

MS. KOENIG: Yeah. So, I mean, you --

MR. BEWICK: But we didn't fund any long-term --

MS. KOENIG: Yeah. And that's fine. I mean, what I'm saying is, if that's really your priority area
-- you know, there may not be people who can meet your
expectations, but --

MR. BEWICK: Right.

MS. KOENIG: I mean, as an agency, if that's
your priority, I just think that that might be a model
to explore rather than just doing presentations in
southern regions --

MR. BEWICK: Oh.

MS. KOENIG: -- with administrators or
researchers. Because, you know, building that capacity
is difficult at best.

MR. BEWICK: I agree. And we've tried to do
that. You know, we encourage people to collaborate with
1890s, as an example. You know, you can encourage all
you want. If they don't it, you know, you can't require
it. So -- but I agree with you. I think that's a
worthwhile goal, and that would be one of our strategies
to help increase the capacity in some of these
underrepresented regions. Yes, sir.

MR. BANDELE: I'm from the south, also, and I
think, in a sense, it's a built-in bias in terms of the
selection project, and by that I mean, naturally, in
areas like the northeast and California, which have a
longer history in organic production, they would have
more organic farmer stakeholders than the south, where
it hasn't taken as great a hold. And I don't know how
that could be corrected, but there's a great need there,
because the growing seasons are there, you know, the
farmers are there, but the organic thing has not caught
onto the extent. But if the criteria is established
stakeholder groups, then that's always going to be a
problem.

MR. BEWICK: Um-hum. Yeah. We recognize that
because of the way the program is set up, it tends to
favor certain types of proposals. And we're trying to
think of ways -- one way we could do it is we could have
a new investigator award. We could take a moderate
amount of money, set it aside and say -- and put it in
the request for applications that, you know, we'll give
money to an investigator who's interested in starting a
program in organic agriculture. It's be, like, maybe
$100,000 to allow them to put together an advisory
committee, to get some preliminary data that would make
them, you know, ultra-competitive in the overall
process. And we've done that in other grant programs,
and we're considering doing some of that with the
Integrated Organic Program. Yeah.

MR. RIDDLE: Yeah, Tom, a comment and then a
couple questions. I wanted to thank you for your
presentation and coming over here today, but also to
just thank you for your leadership on this and your vision. I had served on that review panel, and it was 26 members on it, and four solid days. And you talk about NOSB meetings being intense and exhausting, that was really intense, especially when, you know, about 20 out of the 26 are academics. But I do have -- I wrote an article on it that's supposed to -- that Rodale's newfarm.org website, that mirrors some of the information that Tom gave. I wanted to ask about this upcoming cycle for 2005. You mentioned that, you know, you still don't have the ORG funds that's -- it's part of the budget, or the appropriate request.

MR. BEWICK: Right.

MR. RIDDLE: So what happens if that --

MR. BEWICK: Well, we have a continuing resolution, so it's funded at the same level as last year.

MR. RIDDLE: Oh, okay. So that already is secured --

MR. BEWICK: Well --

MR. RIDDLE: -- for this round?

MR. BEWICK: They're probably not going to change it. I mean, it's always -- it might fluctuate.

The program will be there, but it --

MR. RIDDLE: Yeah.
MR. BEWICK: -- might -- the total dollar amount might fluctuate slightly.

MR. RIDDLE: Okay.

MR. BEWICK: Hopefully it'll go up.

MR. RIDDLE: Uh-huh. And then I did want to point out, in response to this last discussion, that all of the projects which are not funded received very extensive evaluations, and they're welcome to rewrite based on those comments and resubmit.

MR. BEWICK: That's correct, yeah.

MR. RIDDLE: And it's quite common that -- so that's another mechanism for improving the quality of those and the likelihood of getting funded. Then my other question is about kind of the opportunity for input from this Board or Board members, as far as, you know, priorities that we identify and the work that we do, either -- you know, there was a category for standards development, but also some of the production issues like the methionine or Chilean nitrate use and impacts, just some of the, you know, bigger issues that we run into. How can they be communicated and reflected in future RFAs?

MR. BEWICK: Well, you have my -- I'll give you a card. You know, if the Board wants to communicate with me -- right now I'm the program director for the

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
Integrated Organic Program. If you communicate with me directly, then I write the RFAs, so I will see that those things are included. And I can -- like I said, I can include websites where people can go and get additional information. So I want to work closely with the National Organic Program, with the Board, and so I welcome that input. I mean, it is an open process. And in fact, in the RFA, there's a e-mail address. Anybody can send comments on the content of the RFA, on the -- you know, the process that we're using. And we take all those comments very seriously. So I would welcome it.

MS. ROBINSON: Tom, don't go away. In Tom's mission area, the mission area that includes CSREES, also includes ARS, the Agricultural Research Service. And, Jim, the reason I mention this is your comment about methionine. You know, ARS's job -- it's certainly part of their job -- they do the basic research for U.S. agriculture, the types of public research that private companies, you know, have no -- really, they don't have the incentive to undertake. And so -- and ARS -- I don't know what their exact mechanism is. I know that in the past, for example, agencies have been asked to communicate their research -- any kind of research priorities that they might have -- to ARS, and then ARS can take a look at it. But there's probably ways that
we can get those messages to the REE mission area -- and that stands for research, education, and economics -- so that it's not only CSREES, but the other agencies in USDA could take a look at it.

MS. OSTIGUY: Barbara, I have a follow-up question, except it just disappeared.

MR. BEWICK: I have those moments, too.

MS. OSTIGUY: It's a senior moment.

MS. KOENIG: Well, you know, I was going to state that I think that, you know, the organic community through the Organic Farming and Research Foundation, when they publish, they're searching for the O word. I mean, I think that really helped, because it really looked a the USDA's database. So I think that, in part, that was kind of a proactive way of addressing those issues. You know, I just -- I mean, I just have more hope in these specialized programs. I think there are individuals in the Land-Grant institutions, and in ARS, that can kind of craft a good argument that -- and a good proposal, but it's these types of things that are very specific to the industry that are unique. And so, you know, I see what you're saying, in that you shouldn't disregard other avenues. But certainly, you know, in terms of -- you know, and this is more for the citizens out there. You know, as far as putting our
energy into advocating for programs -- and that's a bad word, I know, when you're talking in a government forum, but those to me are the programs you really need to -- because they really center on our industry.

MR. BEWICK: I know the methionine issue was important because -- I mean, that exemption is going to lapse very shortly. And in a lot of cases, ARS is a lot more effective in solving problems short-term than our process is. I mean, because it takes, you know, us months and months and months to get the money out the door, and then the research has to get geared up, and it might be years before you get an answer. So, you know, I would encourage the Board to investigate how they might dialogue with ARS. I know they have -- ARS puts on listing workshops, stakeholder workshops. You can find out who's the -- would be associate deputy administrator for animal systems. They have one for plant systems. Call them up and talk to them. And they're like us, you know, we work for the people. So we take input from anybody that wants to give it to us, and I would encourage you to do that. And also in our mission area is the economic research service. And so if there are specific things that need to be done on economics, we could put out calls for proposals and we may not get any -- you know, any applications that fit.
that. So if you have something very specific that needs to be done, you know, immediately, deal with -- you know, Susan Ofitts [ph], the administrator, she'd send you down the line to talk to somebody else. But -- and I'm sure you know Kathy Green [ph] works a lot with organic systems. And so we take that input very seriously.

MR. BANDELE: The methionine research was mentioned yesterday. Could you give us a few samples on the plant-side of couple of the projects that were funded?

MR. BEWICK: Well, actually, I have a press release in my bag and I'll leave it out on the tail and provide it. It lists all the projects that were funded. That was one of the things that the mission area advisory board suggested we do to publicize the program was put out a press release. So that was -- that came out last week, I think.

MS. ROBINSON: Right. That's also available on the USDA --

MR. BEWICK: Yeah. I have copies, so --

MS. ROBINSON: Right, right. Just go to the recent news releases and you'll see it. I would also remind you that, one other program that I manage, it's called the FSMIP program, the Federal-State Marketing

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
Improvement Program. It's a very small grant program. The total amount of the grants -- the total amount for funding grants is about $1.35 million. And the grant proposals must come through your state departments of agriculture. Now -- and the idea is to conduct research on marketing challenges faced by producers, and the emphasis is generally on small producers. And we have funded very, very many organic projects in the past couple of years. But that's just something to -- you know, the stage department of agriculture usually doesn't do the research, because as you know -- you know, sometimes there's maybe two or three people in the state department of agriculture, and there's certainly not a lot of people that are specializing in, you know, doing research. But then they'll work with a cooperator and the cooperator may be a Land-Grant university in the state. It can also be a non-for-profit -- it can sometimes be just, you know, individuals with particular expertise. It's a matching program, so that means that the state has to match dollar for dollar what we fund. The sizes of the grants are -- you know, they're small. They're typically around 30, $40,000, although we have funded projects as much as $100,000 on occasion. We'll be putting out a call for proposals this fall, and generally speaking, those are due into the department by
February sometime, and then the grants are released -- we try to do it in July. So that's just another thing to put out there.

Also I will tell you this, although it's very much in its infancy stage. And Tom, A.J. Dyer [ph] was at this meeting. The department is trying to take a look, forming kind of a working group, an interagency group, to take a look at its programs throughout the department, to ensure that there are not inconsistencies within or across agencies in the programs that they do have that are related to organic. For example, you don't want -- RMA now offers -- that's the Risk Management Agency -- offers crop insurance for crops -- for organic crops. You don't want the way that RMA delivers its programs to be at cross-purposes, for example, from the Farm Services Agency, which may have a disaster payments program. So there was a meeting held about a week or so ago which A.J. and I attended. You know, there was this sort of inclination to say, well -- okay, well, we have the NOP and you guys ought to take the lead on it, and quite frankly we said, thanks, but no thanks. We don't need another thing on our plate. But we did sort of kibbutz at this meeting and talk about -- you know, first let's take inventory of all the things that USDA does do related to organic, whether
formally or informally, and let's, you know, just take
the inventory and see -- make sure that we don't have
some inconsistencies. But it would also provide kind of
a gap analysis, too. It would be a way for us to find
out within the department, you know, what isn't being
done or, you know, is there something that kind of
glaringly jumps out at us.

So I didn't mention it in the NOP update,
because like I said, it just -- we just had a meeting
and it's very, very much at the infancy-type stage, you
know, just trying to get some folks together in a room.
But I also will be giving my feedback, which is that out
of the REE mission area, only ERS and A.J. from CSREES
were there. I thought, you now, we should have someone
from ARS. We didn't have anybody from APHIS, the Animal
and Plant Health Inspection Service, at that meeting.

So that will be one of my recommendations. But at this
point all we're being asked to do is try to put together
-- to contribute to a while paper on what kinds of
programs do we have and what do we do within our
respective agencies about anything that deals with
organic agriculture.

MR. BEWICK: I do know that Carolee Bull [ph]
from ARS, she's a scientist out in Salinas, she did a
detailed -- she spent six months searching ARS -- all
the ARS and CSREES, and she put together a list of all the researchers that are involved, you know, doing research along organic issues and what portions of their CSREES -- and it's a detailed report that she has available, so --

MS. ROBINSON: Is the report available?

MR. BEWICK: I'm not sure. I can give you Carolee's e-mail address.

MS. ROBINSON: Okay.

MR. BEWICK: I'm sure she'd make it available to you.

MS. ROBINSON: Oh, that would probably be really helpful to a lot of people. Okay, great.

MR. BEWICK: I guess that's it. Thank you very much.

CHAIRPERSON KING: Thank you very much, Tom. It was very informative, and we appreciate your time. We know you're very busy. It looks like we're actually on schedule. I think, George, I believe you're up next.

MR. SIEMON: Yeah. The next agenda item is about the formation of the task force for on the standards for aquatic animals. This is a longstanding issue, and the recent -- two recent developments, the scope directive, which brought up the labeling of seafood products, and then the Stevens [ph] writer about
wild seafood, and it brought us to the fact that we've got to work on these standards. So we're proposing to -- livestock is going to be the center of this, and that we form a task force to go ahead with this. So, you know, we are not -- I guess the idea is to get approval of that task force and then come back with the recommendation of who would be on that task force -- I guess the Executive Committee for approval of that task force. I think that's the process. So it's -- I don't know if we need to go through the document. It's pretty straightforward to me, so --

CHAIRPERSON KING: Do you have a time line in mind about how long it might take to form the task force? Do you expect -- you know, perhaps the next Executive Committee meeting we would talk about this -- two meetings? I mean, I'm just trying to get a general sense.

MR. SIEMON: I'm willing to work straightforward on it, so I don't know when the next meeting is. If it's next week, no, but if it's a few weeks away, yeah. I would like to make it a priority, so -- and then certainly I appreciate the public input we've had today -- I mean, yesterday, about the fish. And I guess -- I think since a lot of those people here, my own personal opinion is that I just like how our
interaction with OTA, that we certainly wouldn't endorse
some other group be in that task force, because we
haven't done that, as far as I'm aware of, with any
other groups. But we certainly will look to their
leadership and what they've done, and certainly would
like to see those people involved, as well. That's just
my own opinion, so we haven't met as a Livestock Task
Force on that yet. And -- yeah. And then in our
document we've got written down the responsibilities and
the conduct of the task force, which is on our policy
that we've written here. This is all -- and I certainly
would -- well, the 2001 -- we've already got a Board
motion that says that's to be guidance. I certainly, in
my proceeding, would want it to be just a guidance and
not a rigid thing, and it's certainly going to be open
to all the public input we can get on the subject. So I
don't -- yeah.

MS. GOLDBERG: Just to add two words to that,
I think it's really important as we go forward with this
task force, and other task forces, too, that we
implement the new provisions of the Board policy manual
-- really to task force you'd send it. We get task
force members to become really acquainted with the
policy manual.

MR. SIEMON: That's right there, now.
MS. GOLDBERG: Right.

MR. SIEMON: So do I need to make a motion --

MS. ROBINSON: I have a question, because I guess I was confused or maybe I went brain-dead or something yesterday afternoon. But during the public comment the members of the working group, the national working group, spoke and I was unclear, were you -- was the Board saying that you don't want to work with that group? I mean, I just was really confused about -- you know, they've done all this work to try and develop standards. How are you going to work with them or are you or what?

MR. SIEMON: Well, this is my opinion only. I just related it to how we worked with OTA. You know, we've never -- we take their recommendations, some of those people in our committee, but we certainly never turned over a task force to an outside group before that I'm aware of. So just using that as a -- it's no disrespect and we certainly want their input, but to turn it over entirely didn't seem -- I personally liked the proposal about 50 percent, but I haven't even talked to my committee yet.

MS. ROBINSON: Well, I'm not suggesting that you would turn over, you know, the work, I'm just -- I wanted to understand. You know, was there going to be...
some communication and some work with these folks?

MS. GOLDBERG: Yeah. I think it's essential that we have input from the task force and some overlapping membership and so on. I think the main distinction, as George said, is that we really haven't turned over a standard-setting process before to another group, and that we need a process that's perhaps more public.

MS. ROBINSON: I mean, I just -- I once had a professor who said never throw away information. So I just would hate to see the Board not take advantage of the work that that working group has done. And, I mean -- you know, you may decide that you disagree with the results of that working group, but they have spent a lot of time, it seems to me, at least from what I've heard.

MR. RIDDLE: Yeah. If I could comment on that, too? I may have been -- you know, I was at least involved in the discussion, and may have been a source of any confusion on it. But I am excited to have their work feed into our process. I think that it could really help jumpstart that. So their formal documents, we definitely want to look at and to have crossover in people, the human resources, too. So I think we do have to figure out a mechanism for kind of a call for task force members. Who do you call if you want to be on
this? How can you submit your name and credentials?

But, yeah, I would say we're very open. And I have been on a couple of conference calls with them and, you know, in conversations. So I'm familiar with some of the work that they're doing, so I totally value it. But we aren't going to limit it to that, and I think that's the issue. It's not going to be limited, it's going to be open to a broader and fully transparent, you know, stakeholder group.

So the one other thing that's not reflected in this draft, and that is -- and we didn't -- because the time was so short yesterday in the comment periods, one issue that I think needs to be resolved right up front is what makes a particular type of aquaculture or wild system organic versus one that's not. You know, and to -- it's going to be the standards at the end of the day that define that, but I think another short-term target should be, what are the principles? So looking at the current NOSB principle -- organic -- you know, principles for organic production and handling, a focal point could be what amendment to those principles is needed that's consistent with everything else there, that then can provide some guidance for the standards writing. You know, what makes this system of aquaculture organic? So that's just one thing I'd like.
to add kind of -- you know, not in a formal way, but
just in my opinion.

MS. ROBINSON: Okay. And one other thing is
the suggestion that -- you know, we realize that the
Board historically -- the industry historically, and
many people at least, have not supported the idea of
wild caught standards. But given that we have the
legislative language and you are going to explore it, I
throw out one suggestion, and that is to talk with the
folks in Alaska, who have spent a lot of time developing
a set of standards and may -- this is my sort of off-
the-cuff opinion and it's not worth very much, I'll tell
you that right up front. But from what I've heard, they
may well have, as far as wild caught seafood, the
toughest standards. And so if you want to be consistent
with, you know, your standards, you know, or the
highest, you are creating the gold standard. You know,
you may want to get in touch with those folks, because
they do have, from what we understand, extremely strict
procedures and standards for, you know, their -- for
their Alaska program of wild caught seafood, particular
for salmon. So it's just another suggestion of folks
that you could get in touch with.

MR. SIEMON: Just the one thing that wasn't
said that's in the document is that we aren't talking
about one task force of two working groups and dividing
these subjects up very differently, because they are
very different subjects. So -- and that's part of what
we're going to talk about in our recommendation, as
well. And I certainly --

CHAIRPERSON KING: Excuse me, George. If we
could just welcome A.J. We appreciate you attending.
We know you're very busy, and if you have some comments,
we'd certainly entertain that.

MR. YATES: Well, thank you very much. It's a
pleasure to be here. And I just wanted you all to know
how much we appreciate all of the hard work you're
doing, and we know that your work goes beyond the days
that you meet with us, because the issues that you deal
with on a daily basis, and looking at the regulations to
make this industry successful, takes a tremendous amount
of your time. And I want you to know how much I
appreciate that, and how much I want you to know that I
support your industry, and I want you to know that and I
want you to believe it. And I want to see this industry
continue to grow and be profitable, because that's what
-- I'm a farmer myself, so I know how important it is
that we only can stay in business if we can have a
profitable venture. I want to thank you again for all
of your hard work. And so I just wanted to stop by and

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
be able to tell you how much I appreciate the work you
do.

MR. SIEMON: Just a last comment of
acknowledging the -- getting the Alaska, and also this
is a very political issue, obviously, you know. So I
think we need to really be careful and include all the
stakeholders so we do a good job here.

MS. CAUGHLAN: Well, I just also wanted to say
again for the record that we need to remember that we
also have, as a starting point, the original task force
reports, not to lose sight of that, not to in any sense
lose sight of that. And I had some sense yesterday that
there was a dismissive tone to some of the testimony
that we were hearing from the audience. Whether that
was intentional, probably not, but I do think that we
did have two excellent working-group task force reports,
and just to keep that clear that we start with that as
we attempt to include historical perspective on all that
we do.

CHAIRPERSON KING: George, and I just want to
make clear I understand what you're saying here, that
you will create two task forces, one for aquaculture
standards and one for wild caught standards, or you're
going to deal with those two issues separately within
the same task force?
MR. SIEMON: That's what the proposal is, it's one task force of two working groups. And I have to admit, I talked to my group to get the real difference between those two programs, but that's what's been proposed and -- but it's still two distinct subjects, but we'll put them together. And it doesn't mean to me, again, that one will be held back by the other. If one comes forward and is ready for movement, we should move forward with that and not in any way hold back the other. So to me they are separate, but we are calling them one task force of two working groups.

MR. RIDDLE: Yeah, and I wanted to just respond to Goldie's comment, that that is reflected in the charge for this task force as well as to take into consideration -- yeah. But then I want to talk nuts and bolts a little bit, and that is how to kind of put out the call, and how and where the people submit, and then who makes the decision of who's appointed or selected, who serves on this task force. We really don't have all those nuts and bolts in place or figured out, so we need to. And, you know, I would hope that -- you know, that that can happen like in the next week, and the description of the task force be posted on the NOP website, and then how do you submit the instructions for submitting your, you know, CV or whatever. And then
within a month or so have -- within a month have the Executive Committee make a final selection. And say within six weeks, that task force can be seated and begin work.

MS. ROBINSON: Well, there's no problem posting that on the website, Jim.

MR. RIDDLE: Yeah.

MS. ROBINSON: Now, I think that when people want to say I'd like to be a member of the task force, we -- you know, it's your board and you're going to create the task force, so we're going to direct them to contact the Board if they want to be a member of the task force, not to contact us, okay?

MR. RIDDLE: The board is kind of vague.

MS. ROBINSON: Well, why don't we just -- you know, if you don't have any objections, we can put down, you know, the e-mail addresses of the chair and the vice chair or the Executive Committee or the Board members, and say contact a Board member if you'd like to be a member of this task force.

MS. GOLDBERG: Why don't we work this out in the Livestock Committee and -- okay.

CHAIRPERSON KING: Fine, that's sounds good.

MR. SIEMON: So we're going to make a recommendation to the Executive Committee for the task
CHAIRPERSON KING: Correct. That's our action --

MR. BANDELE: I had one point, though, Mark. You know, many times, for example, with the Compost Tea Task Force, there are certain areas that were recognized as being important and -- et cetera. So my question -- to make sure that those niches were filled, so in addition to people who are formally applying, will there be another attempt to pull in other expertise beyond just what you receive?

MR. SIEMON: And of course, my answer is, yes. And one of the concerns I have right away is to make sure there's consumer interest represented. You know, and the group that came yesterday very clearly said it's about science-based facts, but we have also another element to contend with and that's the consumer. So I'd certainly -- that'd be right away an identification.

CHAIRPERSON KING: All right, thanks a lot. It's 10 until 12:00, so, Rose, I guess we can break for lunch a few minutes early if that's okay with everyone, or if you think you can go through this in 10 or 15 minutes, we'll do that.

MS. KOENIG: Well, maybe if we can get started and then I'll see how far we get.
CHAIRPERSON KING: Okay. All right. So we'll
give it 10 minutes --

MS. KOENIG: Okay.

CHAIRPERSON KING: -- and break at 12:00 for
lunch. Thank you.

MS. KOENIG: I want to direct people's
attention -- I guess, at least on the Board, to the
book, and then maybe, Katherine, you can put it up on
the overhead -- to the document that says, "NOSB
Materials Committee recommendation for revision of the
FR petition notification draft one for discussion." So
this is the actual -- kind of the text -- the text --

CHAIRPERSON KING: Tab eight, is that correct?

MS. KOENIG: Yeah, under tab eight. But
there's a number of documents in tab eight. So there's
two that we're going to be discussing, you know, on this
agenda. Item one is kind of a text view of what's on --
you know, what was in the notice and adding to that
text. And then we also kind of took a stab at revising
the actual notice and updating some of the -- you know,
the names and the dates and stuff like that, but also
taking out sections that are no longer appropriate,
because again, the original notice came in 2000 and, you
know, now it's 2004, almost 2005, so you could expect
that there are some changes, just because the process
has gone forward.

So I just have an introduction that we were -- we were basically asked by the National Organic Program to review the notice and the -- in order to modify it to improve the materials review process. And again, this is a working draft and it's presented to begin the discussion to revise and finalize the petition notice posting. And the background for discussion is that the NOSB and the NOP need to modify the petition notification instructions to petitioners and the petition process. This will improve the ability of the technical advisory panel, the TAP contractor, to evaluate and provide consistent information on each petition substance. It will also assist the TAP analysis of whether or not a substance is synthetic or nonsynthetic based on NOP definitions and NOSB clarification of the definitions. In addition, the information provided in the petition needs to clearly address all applicable OFPA criteria.

So basically we took the notice and did an preliminary analysis and recommendation. So I'd like to go forth on those points. And the ideas that are suggested and forms the recommendations for specific changes are in bold, and the original notification is not in bold. So hopefully that aids in understanding
what is being recommended. So starting from the section
that says, "Analysis and Recommendations," the first
item is a petition seeking evaluation of a substance
must indicate within which of the following categories
the substance is being petitioned for inclusion or
removal in the National List. And in the original
petition notice, one through five was listed and we
recommended that we add six nonorganically produced
agriculture products allowed in or on process product's
label as organic or made with organic specified
ingredients.

MR. SIEMON: I'm lost. Sorry.

MS. KOENIG: It's a draft one.

MR. SIEMON: I must have the --

MS. KOENIG: It's past that, George.

MR. SIEMON: I got it in front of me.

MS. KOENIG: It's the next document, to the
next standard.

MR. SIEMON: It's on the next standard. Oh,
no wonder I couldn't find it.

MS. KOENIG: But those two documents are in
the same --

CHAIRPERSON KING: Rose, could we just provide
an overview of what you're trying to accomplish here,
and then not necessarily read all the specific points?
I know it's an initial draft. And then, you know, we can take action and committee at a later date if --

MS. KOENIG: Okay.

CHAIRPERSON KING: -- we need to go over it.

MS. KOENIG: So basically -- which I thought I read, we're trying to update these two forms, because the NOP has asked us to provide input on those. Because originally the notice was placed on the web, as I understand it -- Arthur, you can correct me -- in 2000 and -- as a proposed rule, but never -- I don't know what happened at that point when those two notices came on. And then it was my understanding that you wanted us to update that documentation or take it so that it could be put on again in an updated version to reflect the current petition process, is that correct?

MR. NEAL: This is the issue. The issue is that the materials review process has matured, and the request for information for a petitioned substance needs to catch up with the process. Petitioners need to supply the Board with information that the Board can use to help them make more informed decisions, and to help the TAP contractor have access to additional information that they didn't have before because we didn't ask for it up front. The request for information does not take into consideration 606, for example. This is a national
list, but it's not reflected here. So what we're trying
to do is modernize our request for information to
petitioners who want to petition the National Organic
Standards Board for the review or evaluation of a
substance, and that's the issue.

MS. KOENIG: Thanks, Arthur.

CHAIRPERSON KING: Okay, thank you. And I
recommend -- Rose, thank you for this. I know you've
put a ton of work into it. It's really just for
discussion purposes, and I think it's a great foundation
to begin a discussion, and I think probably best be
discussed in committee at this point and interaction
with NOP, and I'm going to recommend, unless some people
object, that we break for lunch now and come back at
1:15, so --

***

[Off the Record]

[On the Record]

***

CHAIRPERSON KING: -- and try to be as
entertaining as possible to keep everyone awake in case
you had a heavy lunch. And, Rose, thank you very much
for your input earlier, and I want to make sure you know
I wasn't trying to cut you off, I was just trying to
keep us on track. But you are up now, again, looking at

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
materials review and refining the process. It really is Rose's meeting.

MS. KOENIG: Yeah, that's what you're saying. That's right. You have to pick -- you know, and I don't know. I mean, it's really up to the Board at this point. I mean, we can go through the documents provided -- you know, I don't know if NOP had a chance to look at that. Maybe we could do the conversation by just doing that conversation with NOP, because that's not something that the committee sometimes has an opportunity to do. But -- so I don't know. You know, Mark, how would you like me to handle this? Because it seemed like you were bored stiff with it.

CHAIRPERSON KING: No, absolutely, no.

MS. KOENIG: I wasn't trying to offend anybody. You know, I don't really want to painstakingly put you through something you're --

CHAIRPERSON KING: No, no.

MS. KOENIG: -- not equipped to deal with,

so --

CHAIRPERSON KING: No, it was really more of a hunger issue, Rose. But, Kim, you had a comment.

MS. DIETZ: Rose, the Materials Committee hasn't even met on these, so I would suggest you just summarize them. We have to still go through them and
edit them, so just because they're new documents, I think in light of that fact that the Materials Committee hasn't even discussed them yet, they should probably just be summarized and then we can bring them back for the next meeting.

MS. KOENIG: And that's fine. I just didn't know if -- Arthur, if you had chance, if you wanted to include some input at this point? We're going back to the boring ones that I had to -- the petition notice, the Federal Register notice, and the -- you know, and then the document kind of describing the recommendation for revision of the FR notice -- I mean, the --

MR. NEAL: In terms of --

MS. KOENIG: -- notification.

MR. NEAL: In terms of that document, I have not had an opportunity --

MS. KOENIG: Okay.

MR. NEAL: -- to read it in its entirety. I've skimmed through it, but that's a lot -- it's a lot of material, and I do think I would need time to kind of read that and analyze it to see whether or not -- if it covers some areas that we've identified that need to be covered if something's left out.

MS. KOENIG: Okay, so maybe the best use of the time and it would be just to come to a consensus as
far as when, you know, the process so that we know -- I
mean, I'm sure you want it finished as soon as possible.
But would this be -- you know, how do you see this
document being utilized? Does it have to go again
through another -- you know, are you going to put in a
Federal Register notice? I mean, what do you want to do
with this product?

MR. NEAL: This product would replace the
Federal Register notice that is currently on our website
and in the Federal Register, so it would have to go back
through the process.

MS. KOENIG: Okay. And then --

CHAIRPERSON KING: Jim had a quick comment.

MS. KOENIG: Okay.

MR. RIDDLE: Yeah. I guess one problem here
is the version that's in the meeting book and posted on
the website was really still a discussion draft.

MS. KOENIG: Right.

MR. RIDDLE: The final -- you know, they were
flying back and forth so fast I can understand how it
happened. But I think, right now, given what's been
said and what Kim just said, it'd be good to --

MS. KOENIG: Yeah.

MR. RIDDLE: -- run it through the Materials
Committee and just make sure that they have one clean
copy of the correct draft before they waste any of their
time worrying over it.

MS. KOENIG: I agree. And the only suggestion
that I think we might want to consider -- and I don't
know if it's legally allowed -- would be, since we've
got new contractors -- we're going to train new
contractors, hopefully -- I mean, it would be nice to
orient them to at least the proposed new system. So
that's the question, how does the Board feel -- I mean,
can the Executive Committee vote on that if we get to
another draft stage, but maybe say prior to a -- maybe a
full Board meeting or a full vote on it, can this be
viewed as a working document in a sense of training
petitioners or -- because I'm not sure how, you know,
the time process for orientation of --

MS. DIETZ: Well, the last book that we
drafted, the orientation book, it wasn't approved by the
Board, it went through the Materials Committee, and I
think the Executive Committee looked at it, but it was
never formally adopted by the Board. So I guess that's
just from a past history. I think we could put stuff in
there like our Board policy manual. We put documents in
it for training purposes, but we never had to wait for a
Board meeting to approve it.

MS. KOENIG: Um-hum.
MR. NEAL: And in terms of the petitioner having a draft document to work from, it would have to be a document that has gone through the formal clearance process for them to use and submit that information to us. We can't operate off a draft. Now, if there's additional information that we feel we need, we probably need to go to them and ask them for it, if we deem that that's going to help them provide the information that's needed by the Board to make a decision --

MS. KOENIG: Right.

MR. NEAL: -- on their substance. We just kind of want to be consistent with that type of thing.

MS. KOENIG: Yeah, I guess that was the question, because some of this stuff pinpoints deficiencies that result in deficient TAPs. So as long as there an informal way of seeking that information, then I think that that's fine.

CHAIRPERSON KING: Well, and if you're concerned about the time line, then the Executive Committee, of course, is empowered to act on behalf of the Board if necessary. So if you think that's going to be an issue and you wanted to put that as part of the action plan, that's perfectly acceptable.

MS. KOENIG: Okay. Okay, any other discussion, because we can move on to the next -- I'm
still up, right?

UNIDENTIFIED SPEAKER: Yeah.

MS. KOENIG: Okay. All right, so let's take -- I just want to do the -- I want to say the Kim Show, because it's a modification of her old PowerPoint slides. That's -- well, yeah. But I did a really -- a very abbreviated form of it. What I want to do is, just for the sake of some individuals that might be in the room, just really quickly go through the materials process, just -- you know, because I know yesterday there was an individual who we recommended, you know, petition, so this is in effort to try to provide some clarity on the process as we -- you know, that we do at each meeting. So, Katherine, you can go to the next -- so basically the -- you know, this update -- this is just kind of a general outline, and some of which that we've already gotten the update from NOP as far as where things stand in terms of the process, and I would just -- if anybody has any questions, we can go back to Arthur and ask specifically about some petitions -- I mean, some substances.

You can go to the next slide, Katherine. The next -- so just -- I wanted to point out that these are the sections -- they've come up in a lot of these discussions. There are certain sections within the
regulation that we add during the materials review process to -- but we may not add to, but materials get petitioned for inclusion on various lists, the National List, within the regulation. So for crops it's either Section 60 -- 205601, that allows additional synthetics, and Section 205602 prohibits nonsynthetics. Okay, the next. And that's similar in livestock.

Next. And then in processing, there's these two sections that again you can see that through some of our discussions, but we're still trying to grasp with in terms of the -- you know, the understanding, I guess, of materials on these sections. We just acknowledge that is what exists currently. Next. We heard this update, and this slide just was from the national -- the Final Rule on -- and it has to be updated, because obviously there's been other materials that we've been updated on that have gone through the -- further through the Federal Register process. And probably the livestock I'll have to update, but we got those updates yesterday.

Next. Okay, well, there was one substance that the Crops Committee was to -- it was deferred from the last meeting, but it's on the agenda for this meeting. The Crops Committee has recommended to defer soy protein isolate, not an ideal situation, but based on the fact that as we started to write the -- what we
thought was going to be an extraction paper, which
became the synthetic versus nonsynthetic paper, I used
that soy protein isolate sort as the model to understand
the system. So it was actually a pretty efficient use
of time, and I think we pinpointed the questions that
had to be asked, we've asked those questions to both the
petitioner -- we've had Virginia Tech provide their
opinion on the questions that we asked, and we also have
gotten additional information from a scientist, who's a
feed specialist, who's provided his opinion on whether
this is synthetic or nonsynthetic. So I feel the
committee has enough information. Unfortunately, we
didn't have enough information at the right time to make
that decision. So I am confident that we are going to
be able to come back as a Crops Committee and make a
decision on this whenever the next meeting comes about.
Next.

MR. RIDDLE: And also the Livestock Committee
has a preferred substance, too.

MS. KOENIG: Okay. Do you want to -- okay.

MR. RIDDLE: And the question is, if it starts
as a favorable -- transcript, the Livestock Committee
has the substances deferred with proteinated chelates,
and the main question was if there are sources available
from nonanimal origin, the source of the protein. So
that's still waiting, you know, for further information.

MS. KOENIG: Okay. And petition materials and
progress, Arthur's probably a little bit, you know,
better equipped to answer questions. I know with the
ferric phosphate and ammonium, the committee -- the
Crops Committee has just received the TAP on those two
substances, and based on kind of the new concept that
the NOP has described, where the committee would then
look at the TAPs and kind of do a quality control step
at this point to see if it really is ready for decision
making, we are at that step. We've just received those
two TAPs and we've got -- I forget what the deadline is,
but we're going -- we have a deadline set by the NOP to
kind of meet to make a decision on whether they're
complete enough to continue, and if they are, we'll be
voting -- we'll provide a recommendation on those at the
next meeting. And if not, we'll send them back to the
contractor to clarify things that would potentially
cause a deferral.

Some of these other substances -- you know, I
know some of them are -- have been sent to the
contractors, but maybe, Arthur, you could just briefly
explain if you'd like, if you think there needs to be
some explanation on some of them?

MR. NEAL: I'll try to speak to them as best I
can. I don't think I'll be able to speak to all of them accurately. With sulfurous acid, sulfurous acid was petitioned to be used as a processing aid in a plant extract. This gets all the way back down to what can be approved on a national list. So we've been working the petitioner, and we've made them aware of where were are in the process, and right now how we cannot move forward on that petition due to the fact that we are clarifying the types of materials that can be petitioned through the act. Lime mud -- lime mud, we -- and by the way, we have not moved any of these petitions forward. This is what we were speaking about yesterday in terms of sending petitions to our new three TAP contractors. Lime mud, we'll move forward for a petition. Sodium laurel sulfate, there are issues with sodium laurel sulfate. We've been working with EPA. Sodium laurel sulfate is a EPA -- what is it -- exempt active ingredient on the list, 25B?

MS. KOENIG: Um-hum.

MR. O'RELL: Arthur, what was the petition used for, the sodium laurel sulfate? Because it's also used in handling.

MR. NEAL: I'll get there.

MR. O'RELL: Okay.

MR. NEAL: In production -- the petition used
was for use as a pesticide -- an herbicide in crop production. Under 25B, the only EPA approved use for that substance was for use as a pet food shampoo -- I mean, a pet shampoo, and it was not approved for use as a crop production material, other than the fact that it could be used in noncrops such as in roadways, ditches, and sidewalks and things of that nature. So we've been working with EPA and the petitioner on that issue. So the petitioner is reevaluating that petition, and at this moment, we'll not move forward for a TAP.

Sucrose octanoate esters was petitioned for use in honey production. It was also amended. The petition was amended to be used, I think, in crop production, as well. And that we'll move forward for a TAP. Kydacin [ph] I think was petitioned for use an agivent, and I cannot recall the status of kydacin.

MS. KOENIG: We -- as a committee we looked at kydacin and sodium laurel sulfate and lime mud. I think we recommended that it go for a TAP. I don't know, can you correct me if I'm -- we can go -- when we get to the Crops Committee report we'll clarify that.

MR. NEAL: Pulanin [ph] -- prulalin [ph] was petitioned for use in dietary supplements. Due to the position -- the nature of controversy that we're in right now concerning that, that area of production,
we've been working the petitioner and we have not moved forward with that TAP. Potassium carbonate -- potassium carbonate, I cannot -- okay, this was an older petition. Potassium carbonate was an older petition. We will have to move that one forward for a TAP, as well.

MS. KOENIG: That one on the web I know says in -- I think it says TAP, already. You know, on the web it indicates that the TAP is in progress, so -- and I know people have questioned, you know, where the progress on that one is. So it would be good to clarify that at some point on the web, whether it's in progress or not. It was something that the committee had looked at probably six months to a year ago and had recommended that it be looked at. So handling's also -- we looked at the pulanin and our recommendation I believe was to not forward that for a TAP, because it was a dietary supplement. So the handling did review it and put a stop on it.

Okay, next. These two are on other status, and a lot of these are on the web in these categories. Potassium silicate is -- I don't know what the -- the Crops Committee looked at it. It was a potential -- for the potential use in disease control, and sent it back to the petitioner in terms of providing information on that use and whether there were any EPA labels of that
-- that material for that use. So I don't know.

Arthur, if you had any additional information. We discussed, I think, at the last meeting, and if I remember correctly, there -- I don't think there was any kind of brand name with that active ingredient at that time, at least from that manufacturer.

MR. NEAL: And those two substances I cannot speak specifically to, Rose.

MS. KOENIG: Okay. Cryolite, I think I remember, it was a petition, it was one that was looked at before. There was no additional information, if I recall, on that petition. I hope I'm speaking of the right one. And I think that was just not -- the committee did not decide to go forward with that, because there was no additional information.

Next. Okay, so the material review process and -- you know, I really think we're just going to bypass this, because as you can see, you know, the minimum time frame is 145 days. We're not living up to the process that has -- you know, that we've been using to kind of explain what goes on in terms of petitioning. So ideally it would take a minimum of 145 days.

Next. And, you know, originally, you know, day 1 through 14, it goes to NOP staff and they review the petition to see if it meets all the requirements or
are not complete, and then it's handed off to the materials chairperson. Next. And then day 14 through 30, the chairperson sends a copy to the vice chair of the Materials Committee, and the vice chair of the designated NOSB committee and -- you know, there's basically a committee decision at that point as to whether or not goes on for a TAP. Next. And then 60 days prior to NOSB meeting, we get copies of the completed TAP review, and the NOSB committees will use this time frame to review the TAPs. Next. And then 30 days prior, the reviews are posted on the NOP website for review and public comment, and then copies of the TAP reports are sent to the petitioner at that point, too. Next. And then, you know, anyone who wants to get the petition, they'll find that the -- kind of that sheet that we're reviewing and hoping to update over time, that's the one that they would be utilizing now, this 2000 -- you know, 2000 version of the Federal Register notice, as a petitioner.

So I guess the bottom line on the presentation is that materials I think is in a state of change, you know, I think change for the better. We're kind of reevaluating how we have to proceed in the process and how to utilize, you know, the TAP contractors, the most effective way to how to use committees' expertise in the
most effective way. And, you know, hopefully, you know, it's my goal before I'm off of this Board, which is within a year, that this process will be established. So that's my goal, you know, as kind of my last action. So hopefully from a year from now, we'll have this -- the date's right, the process right, and in the meantime I would like to, you know, just state that I think there has been progress made since the last presentation. There is a lot more committee interaction again, included into the process, and I think it's going to be a much better process as a result of kind of the changes that we're proposing.

So with that, I have one final document. And again, it's a document that is called synthetic -- it's a clarification of the definition of synthetic that I prepared. And again I was trying to take a stab at this -- you know, at the first issue at hand, which is really the clarification of that definition. Originally -- and what's in the -- it's under the crops, and we're probably going to bypass that agenda item, as far as I know. And Nancy and I have really talked, but I think that's what we're hoping. Originally, after the last meeting when we were reviewing soy protein isolate, we got into a lot of discussion as far as whether it was a synthetic or a nonsynthetic. And, you know, we were

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
under the impression that we needed to look at the extraction process to make that determination, and that is why, on the agenda, there was to be a discussion on extraction processes.

However, when I started researching extraction and really going back to that definition, as Arthur kind of tried to drill into my head, I realized that, really, extraction wasn't -- I mean, it's part of the issue, but the larger issue is really defining synthetic and understanding where extraction, you know, occurs, you know, and when does extraction end, and then kind of post-extraction processes begin. And the concept here is that -- and if you look at the definition of synthetic, for a lot of materials, it's really not that difficult. It doesn't -- again, not rocket science to figure out there's a chemical process involved, you know. And in this document I outlined kind of a basic chemistry lesson, and I think it again could be improved [ph] as a water chemical process, is just some examples. So many of the substances, it's really pretty straightforward, and those are the TAPs that we get back, and everybody's agreed that it's synthetic and, you know, the TAP contractor has written a nice thing to say. This is surely a synthetic process, and even the petitioner has acknowledged that it's synthetic. So
those are the easy ones.

The ones that are difficult seem -- most regularly occur in the substances that are extracted from naturally occurring plants, animals, or mineral sources. And basically the definition of extraction says that the substance can be extracted in any manner -- I should say that that's the way I interpreted it. We better go back to the definition. If anybody can pull that, I think it's in this document somewhere.

MR. SIEMON: Yeah, just so I'm clear about where we're at, this is a document that you've written up, not the committee?

MS. KOENIG: Yeah.

MR. SIEMON: Is this the start of a process that's --

MS. KOENIG: It's the start of a process, yes.

MR. SIEMON: Okay, that's all I need to know.

MS. KOENIG: Yeah, yeah. Okay. So it says, "The NOSB defines a synthetic substance as one that is formulated or manufactured by a chemical process, or by a process that chemically changes the substance extracted from a naturally occurring plant, animal, or mineral sources, except that such term shall not apply to substances created by naturally occurring biological processes." So again, you know, in my mind -- and I
think there also -- there's debate here. The NOP has
stressed and it's kind of suggested, and I think there's
argument for that, that it doesn't matter what you
extracted with, okay, as long as there's not a chemical
change in that product. And I think the way
historically people have viewed materials where they've
drawn that line is that it actually means that if you're
extracting with something and it ends up being part of
the material that you end up with, well, that probably
is going to constitute a chemical change.

So I went through this document again and, you
know, talked about extraction and talked about
formulation, you know, and the differences between
extracting and then formulating, and then generic and
brand name. And again, I don't think I want to go
through at length some of the chemistry and what a
substance is and what a compound is, but I tried to kind
of illustrate with things that are on the list, and used
really visual examples of chemistry, where you kind of
see what a difference between a mixture and a compound
and a substance would be, okay? So it's really --
hopefully provides a foundation. I actually see a
vision for this document in the policy manual or some
kind of orientation process, so that everyone has kind
of an understanding and then general background, as they
come onto a board, as to what, you know, these reactions
that they're looking at are, because not everybody has
that background.

CHAIRPERSON KING: So, Rose, it's my
understanding -- and again, thank you for your work,
because I know you put in a number of hours into this,
and I think, in particular, this document is very
helpful for those who do not have a science background.
It provides a foundation and does make really positive
references to, you know, the considerations that we make
as Board members. And so it's my understanding that
you'll be taking this back to committee, they'll talk
about it, and then you're goal is to --

MS. KOENIG: Well, I think --

CHAIRPERSON KING: That's where it gets -- you
want as part --

MS. KOENIG: Well --

CHAIRPERSON KING: -- of Board policy or
just --

MS. KOENIG: No. I mean, I think that it's
the same issue as agriculture versus nonagricultural.
You know, there's no difference in my mind between
synthetic and nonsynthetic. In both cases, there is a
generally vague definition that needs to be clarified in
a working document, and I don't think it's something

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
that has to go in the regulation. I don't see it where -- I mean, I see it as our working understanding of what these definitions mean. Now maybe we would have to go through some other process, but I understood these as kind of the foundation papers that do have to be, I think, agreed upon, certainly, and do have to go out to public comment, so that we all clearly understand what we mean when we say synthetic and nonsynthetic, and when we say agriculture and nonagricultural. And that will also serve as the tool to the petitioner and the TAP contractor so that they understand -- and the reviewers -- when they say synthetic, we need to -- you know, we're going to be able to say prove to us, you know, where in the chemistry process does it make it synthetic, and how does that relate to our clarification of synthetic? So there's no gray, it should be black and white.

CHAIRPERSON KING: And I guess this is probably a question for someone on NOP to make sure that our work here is what it needs to be ongoing, in that what Rose is describing to me as guidance language or a guidance recommendation, if you will, and is that something that's going to put us on the same page as we go through this materials review process?

MR. NEAL: What is guidance language? For
whom?

CHAIRPERSON KING: This group, as we go through the materials review process. In this case, when we're considering something synthetic versus nonsynthetic. And so is that -- I want to know where you're at with that. Is that helpful? Will it suffice?

MR. NEAL: This is exactly where we want to go, but it's even beyond guidance for you. This helps people who petition to understand what it is or how their substance compares against what the Board is thinking. And there's a slight difference, too, between the nonag and the ag, because you've got nine substances in there that are not agricultural that you have to take into consideration. But we have to -- we have to begin to do what Rose has done, and that's begin addressing the hard issues, because, you know, as you look at the National List, you can see some inconsistencies with things that are considered natural now and not on this list if you go through this process, depending on how the Board comes out in terms of what we agree upon on what is synthetic and what is natural. That's why this document really needs to be vetted by the whole Board -- the full Board, so that when a decision is made, this is what the NOSB believes to be synthetic, according to the definition in the act. You know, because what you're
really doing is that you're putting feet to that
definition. Does heat treatment constitute a chemical
change? You know, these are the types of things that
have not been wrestled with specifically. They've been
addressed, but when it really comes down to the
technical aspects of it, Rose has begun to turn over
those types of things to make sure that all sides have
been viewed objectively.

CHAIRPERSON KING: And basically what I'm
attempting to do here is to put a handle on what's been
done to make sure that we make the best use of this
information, and the time that Rose has put into this,
and so we'll, as I understand it, take this back to
committee, bring this back, and then at that point the
Board will look at it. This will become part of this
ongoing materials review process that we're refining,
and at that point will be information provided to
petitioners, others involved in the process.

MR. NEAL: That's correct.

CHAIRPERSON KING: Okay.

MR. MATHEWS: Yeah. This is exactly where we
perceive the Board needing to go in order to bring
clarity to the petition and review and approval process
for all materials.

MS. KOENIG: So, you know, I think as you
review the document, the way it's written is it really provides that chemistry lesson, and it points out, again, some examples, you know, that are on the list and some that are just, you know, simply better visualized by somebody else's chemistry book, because I'm not a chemist. But -- and it brings out what I think the key issues, you know, on some of the naturals, you know, and there needs to be a lot more work. I mean, I dealt with proteins because again I was using soy protein isolate as an example. But after speaking with some of the public, you know, there's other naturals on there that are mixtures of products. So we have to not only kind of give the chemistry lesson, but we have to look at the list and kind of understand the decisions that were made, understand, you know, some of these -- again, you know, I was just speaking with -- on aquatic plants, hydrolyzed. What does hydrolyzed mean? Well, there was definition, although in the annotation, it's probably not clear and it may not be clear to everybody what that means. So we need to build on this document. But ultimately, you know, the service -- the ultimate output is there needs to be a policy and it needs to be clear as to -- you know, in -- you know, what's allowed, what's not allowed. You know, if in the extraction process, again, there's materials that are left, does
that make something synthetic? After something's extracted, if there's changes that occur after, does that not trigger the synthetic? And it has to be very well defined so that it serves as that guidance. The same with agriculture versus nonagricultural. Take that definition and first dissect the definition and then look at all the substances that are there and figure out can a policy be -- a consistent policy be generated from the thoughts that were in the minutes from those meetings that placed them there. And, you know, so I also implore again, you know, these documents, again, were not written in isolation, you know, using the ghosts of everyone out there that were in the minutes, you know, in those conversations. You know, I didn't invent this stuff. These things have been discussed, it's just they weren't well documented and they weren't in documents that the Board could utilize, you know, in one place.

CHAIRPERSON KING: Well, thank you very much again, Rose. This is a good start. George, you --

MR. SIEMON: Yeah. Rose, this looks really good, and I'll probably do poorly reading your basic chemistry as I did the first time I took the class. But I'll try hard to read through it. But -- and I just read through it trying to see if this answer the
question about when a natural becomes synthetic by the
addition of the a synthetic, and I'm not so sure I saw
it. So that was the issue we dealt with fish meal. So
is this -- maybe I missed it. Is that covered there?

MS. KOENIG: Well, like I said, I mean, I
think there's assumptions, and I don't think it's bad,
necessarily. You know, a lot of people say, don't go
there, don't go back, you know, don't go back to the
things we're assuming are natural, and I don't
necessarily share that view. I think that you examine
and you understand the basics by which people have come
to that conclusion, and I think, you know, for -- and I
did that for soy protein isolate. You know, why is
soybean meal okay, but perhaps the isolate may be
thought of as synthetic? You know, a lot has to do with
the chemical processes that occur, but you have to be
able to justify.

MR. SIEMON: Yeah.

MS. KOENIG: So you have to develop, you know,
kind of a policy looking at that. But, you know, back
to the fish meal, you know, and again, I'm not going to
-- if it was -- I think what Keith said was the take-
home message on that, that perhaps that document didn't
reflect -- and Becky and I have talked to Keith about
that. The document should say, fish meal is -- you
know, if you consider it a nonsynthetic, it's a
nonsynthetic, it always is going to be a nonsynthetic.
Again, if you add something post-extraction, the fish
meal still is nonsynthetic, it's the -- whatever you've
added after you've determined it's nonsynthetic that has
to go on the list.

MR. SIEMON: But that's the clarity we're
needed is, if you add a synthetic to a natural, that
synthetic must be on the list.

MS. KOENIG: If you --

MR. SIEMON: Somehow that was unclear --

MS. KOENIG: But --

MR. SIEMON: -- with fish meal.

MS. KOENIG: -- if you buy -- that's what I'm
saying, a lot of these documents -- because I wrote
them, they're married together. This document, if
you'll go back to the OFPA proposal, there is a
marriage, because that says, yeah, there's an OFPA
category for these, and this is the document that kind
of brings the proof that these needed to be added, this
is where they're added, this is why they're added, and
here's the category for those additions.

MR. BANDELE: Rose, I had a question. I was
looking at the definition of extraction, via NOSB 1995,
saying you can use anything. And then in the rule it
says you can only use certain extractants in the plant
extracts, in 205601.

MS. KOENIG: Those are annotations. Remember
again -- you know, on -- you know, and again, Brian may
be the best person to answer this. I'll try and if I'm
wrong, Brian, or anyone else that's out there, Emily --
on some of the -- like aquatic plant extracts, where you
have kind of a -- the extraction materials specified in
the annotation, that was essentially what -- the Board
decided that the nonhydrolyzed -- or how is it? It says
hydrolyzed, I guess, in the reg. That meant to say that
is the natural. Okay, other than hydrolyzed meant that.
The hydrolyser acknowledging was the nonsynthetic form.
And again, this is why it probably shouldn't have been
on there in that formation. So they stuck it on under
that and then put what the actual synthetic part was,
and that was -- they deemed that the extraction method
was the synthetic section, and that's what made it the
-- aquatic plants now synthetic, and that's why it was
annotated in that fashion. So that's why in that case
the extraction materials were added. In other cases, it
was different. There might've been pH adjustment, like
with fish emulsions, that was specified that now made it
synthetic. Does that -- Brian, do you think that -- or
Emily or someone out there that -- who was in those
minutes and maybe -- he's shaking his head. Okay.

MR. BAKER: Yeah, and it's a tough one, if it's appropriate. Does the Board recognize me?

MS. KOENIG: Is that okay?

MR. BAKER: Okay.

MS. KOENIG: Okay.

MR. BAKER: All right. Yes, I was -- I'm Brian Baker and I am the research director of the Organic Materials Review Institute, and was the certifier representative of the National Organic Standards Board at the April 1995 meeting in Orlando, Florida when this was first discussed. And it was a different time for TAP reviews. The TAP reviews were not as thorough or as detailed then as they have been in the past several years, so the bar has been raised. The discussion specific to aquatic plant extracts at the Orlando April of 1995 meeting, the determination was made that the substance was nonsynthetic and did not need to be added to the National List. This led to a great deal of confusion on the part of those who considered it synthetic and were concerned that it would limit the market and access to the market only to those products that were not hydrolyzed using an alkali substance, a potassium hydroxide or a sodium hydroxide.

In the transcriptions that followed in the

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
Austin November 1995 meeting, there was again some confusion, and I acknowledge, the minutes are not terribly clear, but the -- something got negated. It was actually a hydrolysis process using an alkali, such as potassium hydroxide or sodium hydroxide, that was being considered for addition to that National List as a synthetic. And for whatever reason, it was transcribed as other than hydrolyzed. So there has been a technical error that's been carried through from the Austin '95 minutes that really has been extremely difficult to interpret and implement. And I think we all can acknowledge that there's considerable confusion out there in the -- on the part of industry as to what exactly is allowed and at what limits, at what thresholds, and is it pH driven, is it driven by unreacted potassium or reacted potassium and what's available. And so again, this is an area where I have to appreciate Rose's efforts, and that we all need to go in with an open mind and be willing to reconsider decisions that were made almost 10 years ago.

CHAIRPERSON KING: Thank you, Brian.

MS. KOENIG: And by the way, if you look into that first document under that OFPA kind of draft, that we discussed interpretation of OFPA and National List, those minutes are in the document, because I...
acknowledged them. Again, you know, there was again a
marriage of these documents. So those were kind of the
minutes. The minutes are there in those excerpts -- it
was to answer your questions -- are provided from those
minutes, as Brian described. I think, Becky, you have a
question?

MS. GOLDBERG: Yeah. I'll try and be brief.
I was just going to sort of ask again what George asked.
I think what George was asking is, is we understand that
if you take a natural substance and add a synthetic to
it, the synthetic is a separate substance. And clearly
in the first document you presented, you talked about
using a category, production aids, to deal with some of
the issues of added synthetics. I think what George was
asking is -- we discussed earlier a bit about following
through with that. But well be -- will the committee
spend some more time thinking about instances where we
may not want to separate added incipients -- synthetic
incipients from naturals? It's a tricky issue and I
don't know the right answer.

MS. KOENIG: My feeling again -- and I was --
you know, I try to look at it in unbiased fashion. I
don't -- I am not one to worry so much about how many
tools are gained or lost. And so you establish the
policy, and then once the policy -- as long as the
policy's fair and allows things to be placed on and goes through the same criteria, I think it's more -- you know, don't make -- don't create a policy so that things can get in that you might want in, because it causes confusion, and I think the list in a way is the result of sort of the stuff that Michael was -- there was a lot of compromises that were dealt with to accommodate a list. So now we've got a lot of inconsistencies that we've got to deal with. So I say establish a clear policy. I say look at materials and see how they fall into those policies. I'm not saying disregard it, I'm saying come to your comfort level and develop a policy that's consistent with that -- that you think is in the best interest of the industry, that's what I'm saying. But not that's in the best interest of one particular product.

MS. GOLDBERG: Right.

MS. KOENIG: Because it will fall into this --

MS. GOLDBERG: And I don't think any of us are advocating that.

MS. KOENIG: Okay.

MS. GOLDBERG: But there still may be some tricky issues in the future where we simply --

MS. KOENIG: Yeah, I know.

MS. GOLDBERG: -- can't know the incipients

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
and medications and all that.

MS. KOENIG: Right.

MR. NEAL: To comment, too, about the addition of a synthetic to a natural, just that type -- that line of thought kind of raises a question, and that's the use of an approved inert with a natural substance. Does the addition of an approved inert with a natural substance then render the product synthetic? If I add a natural -- if I add a synthetic to a natural, it automatically becomes a synthetic. Those are the types of questions that you have to wrestle with.

MS. KOENIG: You mean in the sense of pesticides?

MR. NEAL: I mean in the sense of just the addition of a synthetic to a natural. If I add a synthetic to a natural, does it automatically make the natural a synthetic?

CHAIRPERSON KING: Well, and I think, if I understand your question here --

MS. KOENIG: No. I mean --

CHAIRPERSON KING: -- what you're saying is it's already on -- either on the National List or approved and therefore it's -- but yet it's gone from a natural to a synthetic, and does it then need to be --

MS. KOENIG: No. Yeah. No, I don't. I think...
what Arthur -- and then I think it's -- you know, and I totally understand. It takes a lot of thought to try to get an understanding of this stuff. And again, I'm not one to say that I have full understanding of it. But those are two separate -- and a natural -- if something you decide is nonsynthetic -- a natural that's nonsynthetic should never be on that list as that product. What makes it -- you know, that's what I'm saying. You draw the line as -- you know, be it -- you know, I think, by the way it's written in the OFPA or whatever that definition is -- I guess it's in the rule -- that if you take extraction as the final point, once it's extracted, then anything that's -- you know, and I explained earlier, that's post-extraction, whether it's to help preserve it, whether it's to help spread it, whether it's to fill in and add filler to something, those are all synthetics, post-extraction. That material is still, you know, a nonsynthetic up to that point. And if you can take that nonsynthetic and apply it directly, that's fine. But once it gets post, you know, either formulated or, you know, put into a form, then those additional things have to be on the list, and that's where really the brand names in some ways kicks in, because -- then you have formulated products, and that's why it's really important to understand the...
difference between mixtures and compounds and substances. That's why you've got that basic chemistry lesson. If you understand those things, then it gives you the foundation as to what things are on -- you know, what are we dealing with? Are we dealing with a compound, are we dealing with a mixture, or are we dealing with --

MS. OSTIGUY: Arthur, am I understanding your question correctly, that you're asking, does the natural change after you've added the synthetic such that we should be looking at it to put it on the National List?

MR. NEAL: I'll say, yes, and the reason why I'm asking the question is because the statement was made, when a synthetic is added to a natural, the natural becomes a synthetic. And so all I'm saying is that, as we're thinking through this process, we have to be aware that there are certain situations that we've got set up on the list, like the use of an inert -- approved inert with a natural. Does it now mean the use of an inert with a -- yeah, an inert with a natural makes that natural a synthetic. And since all synthetics have to be on a national list type of deal. So we just need to think clearly through the process, and we're all in this together. You're not standing alone and we're not letting you walk alone, because we
want to make sure that everybody reaches the same
destination. You know, we have to enforce, we have to
ensure that this is applied, you know, across the board
at the same level, there's no disadvantage to anyone,
and we want these questions answered -- we want these
questions answered just as bad as you do, honestly, we
really do. And I can't express how glad I am that Rose
has already started the process, and how important it's
going to be for the Board to now take these documents --
and that's a lot of reading and again studying, and
you'll go back to school.

MS. CAROE: Can I -- the way I'm looking at
this, Rose -- and please see if I'm following you. But
you're looking at it as, if you're mixing a natural with
another component, both components have to be
acceptable. The natural is accepted because it's
natural, the other one would have to be acceptable
because it's either listed or a natural, as well. Is
that correct?

MS. KOENIG: No, I'm saying that -- and again
-- and part of it is, I think, the confusion of the way
it's listed on the list, you know? I would like to --
you know, I think ultimately -- and let's take aquatic
plant extracts as an example, okay, because again, in
that annotation it says other than hydrolyzed. Well, it
really -- the way in my opinion, if you use these OFPA criteria as outlined in that other appendix document, okay, if you utilize that category as crop production aids, and you had underneath it -- let me see. I'm trying to, you know, maybe -- see, again, it has to be better well thought out, and maybe I shouldn't be speaking without thinking a little bit here. But --

CHAIRPERSON KING: Well, can I suggest, Rose, for the sake of the agenda -- and I'm not bored, by the way.

MS. KOENIG: Okay.

CHAIRPERSON KING: So don't --

MS. KOENIG: But I -- I think you can tell me.

CHAIRPERSON KING: I know. But I think this --

MS. KOENIG: What I'm just saying is that, you know, the -- you know, the reasons why something that would be natural, which you would consider nonsynthetic, the reasons why it would become synthetic was because there's usually an addition of something in there. Rick and then Kevin.

MR. MATHEWS: Let me take a stab at clarifying it based on what I think I hear.

CHAIRPERSON KING: And can we summarize, please? And then we know this is going back to

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
committee, they're going to discuss it, it's ongoing work, so we can't answer everything today.

MR. MATHEWS: Let's step back and consider two examples. And at the risk of bringing up old wounds, I'll move forward, anyways. We've got fish meal. Everybody recognizes fish meal as a natural. You've said that the synthetic that would be used as a preservative to meet the Coast Guard requirements to prevent spontaneous combustion would have to be on the National List in order for fish meal to contain that substance. You wouldn't be putting the fish meal on the synthetic list in company with the ethoxiquin. You would be putting ethoxiquin on the list. So what I believe Rose is trying to say is that the aquatic plant extracts were a natural, and that the materials used for the extraction process were considered, and in reality what should've been on the list is just the extractant materials rather than the aquatic plant extracts extracted in this way. So that's where the confusion I believe lies.

MS. KOENIG: Yeah.

MR. MATHEWS: Am I right, Rose?

MS. KOENIG: You're right, but, I mean, more particular -- you know, like we'll say with ethoxiquin. Go back to that example. You probably would, under that
one, annotate it for use of fish meal, because, you
know, you still may want to annotate things and keep
annotations, but it's almost the opposite of what
appears. It's not fish meal with that annotation, it's
the synthetic with the fish meal -- specify that that's
where it can be used. So it's kind of counter, and I
think that would provide clarity. And I think -- again,
I think that those who put things on the list understood
that it wasn't that they were not clear, it's just they
didn't understand how it was going to be interpreted.
And I think now that we understand how it's being
interpreted, this is what we're trying to mesh, is how
we can do it, that it's clear in the regulatory language
and the interpretation, so that when we have, you know,
products such as I talked about and letters go out and
we're not happy with the decision, it's because -- you
know, I think some of it's just because of this not
understanding of how things are interpreting and how
things are appearing.

CHAIRPERSON KING: Okay, thank you. We're
going to move on. Sorry. Dave, you're up. I didn't
want to see you yawn.

MR. CARTER: That's okay. Rose was doing such
a good job, I was going to have her handle my work, too.
Okay, we have a couple of things on the agenda here.
The first one, which you will find back under policy tab 11, and it's a misnomer to say that this is a committee draft for a vote, because the committee has not formally acted on this, so this is just for preliminary discussion. But Andrea particularly has requested that we establish a little more formalized procedure for scheduling meetings for the Board and the various committees, and so has drafted this proposal on meeting protocols. And the key points of it are that, for conference calls -- the full Board conference calls be scheduled with at least weeks notification, that standing -- or the committee calls be scheduled with two weeks notification, and that in-person meetings be scheduled with at least three months notification. And she also drafted up some language here to talk about them in -- that in requesting for e-mails, if e-mails are circulated to schedule a meeting, that 48 hours be given for a response time for any e-mails, and that there is a provision for scheduling meetings with less notice than stated, but that you have to circulate the e-mail with 48 hours in response for the e-mail, and then follow up with phone calls to the folks that didn't get back to you. So that's really the summary. Andrea, any other -- did I hit the highlights or --

MS. CAROE: Yes, you did a good job at
summarizing. I do want to say that I did create this
draft, but I also consulted with a couple other members
on the Board. And the reason that this was drafted is
that I feel it's imperative as a stakeholders' Board
that when we meet we get as many of the stakeholders at
the table as possible. And we come to this Board from
various different positions and different places, and
it's sometimes difficult to understand the perspective
of each of our specific roles and how we are able to
schedule our time. So I wanted to put on the table a
discussion and then something that we can come to
agreement on in respect for each other and our positions
and our ability to accommodate this volunteer position
and our lives. So again, not everything in that
document is generated from me, but from people that I've
spoken with. We have people that travel a lot on this
Board, we have people that have business commitments
that are not very flexible, unfortunately, and this was
put there with a couple different ways to accommodate a
quicker schedule for those times that are just
impossible to give the long notice. So that's the
history behind it, and it's on the table. It is a
working document for consideration, and hopefully to be
put into the policy manual, again, to establish that
respect for each other as members of the volunteer
MR. CARTER: Now my one comment that I would have on this particular draft, too, is that the area in talking about scheduling meetings with less notice than, for example, the two weeks for committee, that -- and I appreciate the procedure for the e-mail distribution and then following up with a phone call. I would think that perhaps we might want to give a little bit of some breathing space there on the phone calls, that a reasonable effort be made to call. Because, for example, we've got one member of the Board right now that's somewhere in Nepal or Mexico or, you know, somewhere, so that there -- something there -- if something comes up, there may be somebody that is just absolutely out-of-pocket, but that a reasonable and determined effort be made to make that contact. Anyway, that's my comment. Other comments on this? Kim?

MS. DIETZ: A question. There's italics? Is that somebody else's comments on this document? It looks like there was --

MS. CAROE: Actually, those were Mark's comments. They were your comments, Mark. So this is a working draft and I left them -- I left them that way so that we can discuss them.

MR. CARTER: And just for information, this
draft was posted just as a part of the meeting, but there -- so really it has not had notice. George?

MR. SIEMON: Yeah.

MS. DIETZ: Oh, wait, I wasn't finished.

MR. CARTER: Kim.

MS. DIETZ: I was one that supported this document and I know that oftentimes, again, when we're all traveling and all that, at least if we have to schedule emergency meetings, which we've had to in the last year, we have to get calls within a few days. A lot of us are able to meet those calls and deadlines. The other thing is that I know that there's some guidelines by NOP on setting conference calls, and there's a two-week minimum notice. So this document really is a line-list. Seven? It's two weeks, isn't it, before they can set up a conference call?

UNIDENTIFIED SPEAKER: Seven days.

MR. SIEMON: Seven days.

MS. DIETZ: Okay. Well, whatever it is, we should probably try to follow that same guideline in there. If they require seven days to set a call, then we can require a seven-day notice. So let's just try to be consistent with that.

MR. CARTER: Okay, George and then Rose.

MR. SIEMON: I just might have misunderstood
you, because I don't see it here. To set up a committee
call, you can do that entirely through e-mail. I heard
you say follow-up calls, Dave, so --

    MR. CARTER: Yeah.

    MR. SIEMON: -- I don't see that and I'd be
concerned if you add that. It says e-mail and 48 hours
to respond.

    MR. CARTER: Well, okay. If you look at the
second page at the top of it, George, it says,
"Emergency Calls."

    MR. SIEMON: Well, yeah.

    MR. CARTER: They'd be scheduled with less
notice only after each member is contacted to reach
consensus on time and date. If members do not respond
to e-mail request, the chair, their designee, must
contact the member by phone.

    MR. SIEMON: Yeah. And I have no problem with
that for an emergency call, but on a regular call --

    MR. CARTER: Yeah.

    MR. SIEMON: -- e-mail with the 48 hours is
adequate --

    MR. CARTER: Yeah.

    MR. SIEMON: -- with the two-week -- you know,
what we have written down there.

    MR. CARTER: Yeah.
MR. SIEMON: So it's -- I didn't know if I heard that.

MS. DIETZ: And then just out of respect for people, that if you get something from your chair, then you should respond, because otherwise that's going to cause more work for them, so --

MR. CARTER: Yeah. Rose?

MS. KOENIG: I mean, I like the spirit of the document. I just -- I guess I'm concerned, just kind of knowing the way things have evolved. You know, maybe it's just the past few months have just been peculiar, but, you know, as they say, the four letter word happens. And, you know, a lot of times you're in your predicament, you know, and you got to get your work done. So, you know, if we can -- I don't know if we can solve the language to say this is ideally the policy, you know, without even the emergency clause, you know, that this is our hopes, these are our aspirations. But, you know, what happens if we violate it? I mean, are we going -- is there sanctions? I mean, so that's -- you know, it's great to have a policy, but what happens if you don't meet it, you know? Do you kick off or, you know --

MR. CARTER: So you would recommend --

MS. KOENIG: So, Mark -- does Mark insult you
at the next meeting?

MR. CARTER: You recommend this be a guidance and not a directive. Okay.

CHAIRPERSON KING: Now that I recall actually commenting on this document, I'd like to argue in support of the italics text here. But seriously, I did -- Andrea and I talked about this, and it is very difficult for boards like this to be both, you know, timely and effective and efficient and accommodate everyone's schedule, and so I'm in full support of, you know, anything that helps the Board operate in a more effective fashion. Having said that, what I would really hope to avoid is boxing us in and, you know, policying and proceduring us to death. So if we can set some, you know, realistic guidelines to ensure something happens in a timely fashion, then that's great. But let's keep it somewhat of an open and flexible process.

MR. CARTER: Okay. Andrea? Yes.

MS. CAROE: Again, this was meant in the spirit of ultimate respect for each other. It is a guidelines. It wasn't meant to kick anybody off the Board. I mean, if stuff does happen, Rosie, I mean, I've had to leave this meeting a couple of times. It was unfortunate, but it's out of my control. That happens. I understand that. But what I really don't
think that everybody has the perspective of is when something hot comes in, and they have a very flexible schedule, they expect everybody else to be moving on it, too, and that's not reasonable all the time. And when it's a really hot issue, that's especially the time that we need all the stakes at the table that we can get there, and I think we lose that when we try to react quickly, just -- and not out of anybody trying to keep people out of the situation, but it's just a matter of not understanding each other's lives and how we work.

MR. CARTER: Jim and then Nancy.

MR. RIDDLE: Go to Nancy first.

MR. CARTER: Oh, was she first? Oh, okay.

Nancy and then Jim.

MS. OSTIGUY: I support -- fully support the idea of making sure everybody has sufficient notice, and I also would prefer not to give any kind of sanctions if you can't get a hold of somebody. I've been the ultimate of not being able to find, and sometimes it's purely because I've not looked at my e-mail, and that should not be anybody's responsibility but mine. What I would appreciate is that the comments that are made in the proposal repeatedly mention industry as if industry is the only folks that have the tight schedules that sometimes don't allow flexibility, at least that's how
it's interpreted by me. So I would prefer that be extracted.

MS. KOENIG: Should we put academia and

industry --

MS. OSTIGUY: Well, no, no.

MS. KOENIG: -- and leave out the farmers?

No, I'm --

MS. OSTIGUY: No.

MS. KOENIG: I know.

MS. OSTIGUY: I just think that, you know, all

of us have really heavy time constraints sometimes.

MR. CARTER: Okay.

MS. OSTIGUY: And if we just accept that as a

generalization, wonderful.

MR. CARTER: Okay.

MR. RIDDLE: Yeah. I really appreciate this
discussion and having the draft in hand. I think,

though, now that the committee should take it back and

pare it down to the bare necessity, the basics. You

know, we've heard a lot of the reasoning for it, we've

had discussion of that, we accept that, but that's not

the format of the Board policy manual. What we need to

get to down to is just the nuts and bolts of kind of the

policy, the procedures we follow as guidance, so --

MR. CARTER: Okay. All right, it seems like a
go wrap-up of the discussion, then. Okay. Then,
Mr. Chair, what I'll move onto is the Board policy
manual. I know it says Jim, but I don't think he's had
time to look through anything, and I've been sitting
here perusing it. So the -- specifically after our June
9 discussion with the Policy Development Committee, or
members of the Policy Development Committee came in and
met with members of the program, and talked about the
framework for collaboration and other ways to really
improve the working relationship between the NOP and
NOSB. Barbara offered to go through the Board policy
manual and really provide us with some advice and some
guidance to make sure that everything that we have in
the Board policy manual then is -- conforms, not only
with OFPA and the Final Rule, but with FACA and the
illustrious Paperwork Reduction Act and other things
that we fall under. And so Barbara has done an
exceptional job. I want to commend her for really going
through and providing us with some things. Yesterday
morning she came in and circulated the copies of her
comments, it's this document that says, "Policy and
Procedure," and I do just want to walk very quickly
through some of these things, and then we will put this
out for discussion. We aren't in any way in a position
to take any action on this, but I just want to highlight
a few things.

UNIDENTIFIED SPEAKER: Page eight.

MR. CARTER: Yeah.

UNIDENTIFIED SPEAKER: Can we take this down?

Take this one down?

MR. CARTER: Yeah, you can take that one down, because I'm just going to verbally summarize. And I visited with her in the hall just a few minutes, because she was so thorough in this, she even offered to edit our mission statement a little bit. But in looking through it, I actually think these are some very constructive changes, but obviously things like that, the mission statement and things that we've adopted previously, we'll have to go back and revisit. So --

MR. SIEMON: Dave?

MR. CARTER: Yeah.

MR. SIEMON: Just so I'm clear, so these corrections, they're not listed -- they're not -- I can't find what was changed in this document.

MR. CARTER: Well, most of them are listed. As we go through -- she footnoted the things. So, Barbara, if you want to --

MR. SIEMON: Okay.

MR. CARTER: -- yeah, you know, add in as we go along here. The -- if, for example, you go down
under the mission statement where it says, "Duties of the Board and officers," and it goes down. There's a footnote, two, and her suggestion is that we just draw the language directly from OFPA, you know, to include in there. I mean, that's what we're getting at with the language there. Her suggestion is just to do that directly.

MR. RIDDLE: I have a question.

MR. CARTER: Yeah.

MR. RIDDLE: I've got a question about that, then. Would that be in place of this -- those sections, duty of care, duty of loyalty, obedience, or this --

MR. CARTER: No.

MR. RIDDLE: Okay.

MR. CARTER: No. I think as -- as we went through, you know, the duty of care, duty of loyalty, and --

MR. RIDDLE: Uh-huh.

MR. CARTER: -- duty of obedience, which are pretty traditional for a board -- you know, in board policy manuals -- remain in there. There is some discussion that I think that we will look as we go forward, in how we address the conflict of interest provisions and the verbiage there. A lot of the things that are in the Board policy manual right now are just
drawn from typical -- and my background was in nonprofit management, so it was drawn from a lot of the nonprofit statutes --

MR. RIDDLE: Yeah.

MR. CARTER: -- and traditional board policy manuals, so --

MR. RIDDLE: Yeah. So back to my question, and then -- and maybe this is for Barbara. That comment is about that first paragraph, which, as I recall writing it, it was paraphrasing of some language of OFPA, trying to just summarize it. But your comment there is to actually just cut and paste the text or lift the text verbatim, correct?

MS. ROBINSON: Right.

MR. RIDDLE: Yeah, okay.

MS. ROBINSON: That's all I was saying.

MR. RIDDLE: Okay, I just wanted to make sure I understood your comment.

MR. CARTER: If you go back to page four, this is one of the areas. For example, footnote six. It talked in our Board policy manual about NOSB members, including committee and task force members and contractors, and some explanation there about, you know, the contractors and agents of the Board, because by law the Board does not contract directly with private...
entities, USDA. So, you know, some areas do address that. But under footnote nine -- and I think this is something that we need to take back to committee and talk about, because it talks about the confidentiality requirements. And the question she asked is, what are the consequences for members who fail to maintain confidentiality? The consequences are limited, because we certainly can't cut our pay.

MR. SIEMON: That'll double the turnover.

MR. CARTER: Yeah, double the -- you know, those are some things we need to -- yeah?

CHAIRPERSON KING: I just want to note that several us don't have a page four, so for -- when you forward an e-mail copy or something, and then we --

MR. CARTER: Yeah.

CHAIRPERSON KING: -- we know what the -- no. Only Jim has page four.

MR. CARTER: Page five. I was kind of proud that it took us a full five pages to get her a little bit confused. But under footnote 14, she notes that you've lost me here, because it's talking about, again, the conflict of interest provisions, and specifically -- let's see where that's referenced. The Board advocating the value of -- in private discussions. It's talking about private discussions and the like. I think what we
were referencing there, Barbara, was the fact that it's been reported in the past that sometimes members of the NOSB get together at a bar after the meeting and have a beer or something like that. I've not been particularly, you know, a participant in any of those sessions. But anyway, it's time to talk about -- you know, in our informal conversations, that we're lobbying each other for a position where there's a conflict of interest.

MR. SIEMON: Where there's a conflict of interest.

MR. CARTER: Yeah, where there's a conflict of interest. Yeah. But otherwise we can buy beer until the -- yeah. The -- going back again, page six under conducting business. Again I think some very good suggestions is just to take some of the language and make sure that we have in the Board policy manual is just verbatim with what it is in OFPA to avoid any confusion. On page eight, the -- I guess the one thing where I was a little confused on, Barbara, is under footnote 22. You should make clear that your committees do not act on their own. They are directed by the Board, based on the requirements for work, either by the Board or the secretary. I guess -- I think that's covered. And maybe you're thinking of something else,
but where it says, "Other than the Executive Committee, no committee is authorized to act in the absence of the Board." So it's really talking about the committee. The standing committees have specific areas of work, which are described later on in that section. So we can visit a little bit off-line about -- if there's some confusion -- confusion there.

The -- back on page 10, then, there are some miscellaneous polices that again were inserted in the Board policy manual directly as they were adopted by the Board. We do have some things under there. For example, there's several footnotes under policy for presenters invited by committees. You -- I notice that you say that, you know, perhaps we ought to ask for a copy of their presentation prior to them coming to the meeting. If most presenters are like me, you're usually making up your presentation on the way to the meeting, even though you've accepted, you know. But anyway, we can address that.

The one thing that -- if you go back to page 11, there is the issue of the policy for surveys conducted on behalf of the NOSB committees. This is obviously one the things that was a point of contention in the past of what we had in our policy manual and what federal regulations require. So Barbara has suggested
some language that brings us more into conformance with federal policy. But again, we have to go back and look, because what was in the Board policy is what was adopted, so we'll have to -- okay, that is -- number one in there, and it's not footnoted, but number one is new -- is -- yeah, under policy for surveys conducted on behalf of NOSB committees, that is different from what was in, and it just wasn't footnoted. Yeah. Okay?

Yeah, Jim?

MR. RIDDLE: I'm just wondering, Barbara, if you have this in revision mode or somewhere where these kind of changes that you've inserted are easily identified, or if we really have to go through this side by side to find them all? I just --

MS. ROBINSON: I don't want to make this easy on you, Jim. Well, you know, it seems like if I sent it to you -- if I just send you the document -- probably -- I'll check, but it seems like we could go up and just say, click on final -- retract the changes.

MR. RIDDLE: Yeah.

MS. ROBINSON: The final will show in markup and it would show you --

MR. RIDDLE: It would show -- uh-huh -- yeah.

MS. ROBINSON: It should show you what I did.

MR. RIDDLE: If we can get that copy, it would
really help us with our next step on this.

MR. CARTER: So anyway, yeah, that -- because I think most of the changes that she had in there, at least as I was going through on the cursory review of this, were footnoted except for the mission statement and that other one, but that would be helpful. So anyway, those are the major things that I noted as I briefly scanned this. We will take this back now to the committee and work on bringing forward a draft. Yeah, Rose?

MS. KOENIG: I had a suggestion that I remember from a couple years ago now, and it's under for the confidential information statement, and we have it -- we have -- I guess in two places now. You had it -- you know, in the materials section it talks about what -- how it looks like in a petition, and then you again in that -- in your document, have a section on CBI, right? But the problem is and the issue that came up -- and I -- you know, and we got reprimanded for it, which was understandable. But at that point, I mean, I didn't discuss it, but one of my frustrations is I don't really know how you're supposed to act with this kind of information. You know, what are -- what can we and -- you know, the materials shows where it's deleted, but where -- what are we allowed to discuss? We're not
supposed to know about it, but, you know, how do we act
when we have CBI information? What's our code of
conduct? Because there was -- you know, and I was at
fault, I remember. You know, we crossed the line on
certain issues and I don't -- and I truly say, I mean, I
didn't realize that I was crossing the line or the
committee was crossing the line, but we were told we
were, but there was nothing in the policy manual, and I
had gone back to see, you know, maybe in that first
document that they gave me. I didn't read through it
all and there was something in there and I should've
known it. But so -- I mean, it was an issue that came
up and I think -- I don't know if you all have that kind
of information in a text form, but -- or the government
has it. I mean --

MS. ROBINSON: I'm actually trying to think,
Rose, and when I go back to the office, I'll make a note
to check with our ethics officer to find out if there is
something that's actually written down someplace about,
you know, what does it mean when we say hold
confidential business information confidential? I mean,
there's a lot of commonsense stuff, obviously, that
comes to mind. But I'd just be amazed if the government
hadn't written something down about those that we could
-- that we could share with you. But it's a fair
question, so I'll see what we can find.

    MR. CARTER: George?

    MR. SIEMON: Well, I wondered the same thing, just about confidentiality between the things NOP tells NOSB. And in fact, it has rules like that or, you know, things that they want to share with us, but they want to have some sense of confidentiality. I haven't seen that in here so far, so I just wondered if FACA has something like that already. I'd like to see us to build trust in that kind of thing, if there's something put in here about that, because I don't know.

    MS. OSTIGUY: Barbara, it's possible -- one thing that might help with the Board, in general, is while for a number of us potentially CBI or any other confidential information is intuitive, but that's not always the case. My husband's on a NASA FACA board, and they actually had a workshop that covered confidentiality, and that would probably be a very good idea for it to happen every once in awhile to remind old Board members and to train new Board members.

    MS. ROBINSON: Actually that's a good idea, considering that, you know, we'll have to have some sort of orientation for new Board members next year, so I'll look into that, too, and see if there isn't someone that could come and talk to the Board and explain.
MS. OSTIGUY: I could find out who it was.

MS. ROBINSON: Okay, that'd be great.

MR. CARTER: Okay, Jim?

MR. RIDDLE: You can find out, but you can't tell. Yeah, that section under professional conduct, which is -- on page four of Barbara's revisions here, has language on nonpublic information, was the title -- or the words given, not confidential information. But that was just provided by Keith to us a couple meetings ago to take it directly out of USDA text. So that's a fairly new addition to bring it in line with the USDA requirements.

MS. ROBINSON: Right. But don't -- now, nonpublic information is not always confidential, because --

MR. RIDDLE: Yeah, yeah, yeah. I understand that, but --

MR. SIEMON: Then that answers it. I was looking for the word confidential --

MR. RIDDLE: Yeah, that was in response to George's question, which was broader than CBI.

MS. ROBINSON: Okay.

MR. CARTER: Okay, other questions or discussion?

***

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
MR. CARTER: Okay, this is another one that we will take back and working out of revision mode. But again, Barbara, I want to thank you for going through this, because I know that we put a lot of work into to developing this Board policy manual, and to know that this is the baseline for how we continue to go forward is very important.

Mr. Chair, I do have one other thing, as per our discussion yesterday on the scope document, I'd like to pass around, in order to try and move things forward as judiciously and properly as possible, I did incorporate some of the technical corrections and changes in this document. Really, those are three changes that -- I'll wait until everybody gets their copy.

UNIDENTIFIED SPEAKER: Dave, do you want this document or it this obsolete?

MR. CARTER: That's obsolete, also, yeah. This is what reflects the comments from the discussion yesterday.

MR. SIEMON: And the underlined are the improvements?

MR. CARTER: Yes. Well, some of the
underlined. I should've used something other than underlined, because, yeah -- here, you can -- okay, because I've got the original here. The -- there are really only three changes in that -- first of all, a technical correction on page one, it includes pet food as one of the areas of the scope that was unintentionally left off. When you go back to page four, it reflects, as Tom Hutchinson [ph] said during his public comments yesterday, that what was gleaned from OTA was -- and there was an error in that, so we included the underlined portions there, so that the paragraph now is amended, it reads, "The absence of specific standards for such products should not become a reason for allowing organic claim to be made for such products, if they do not meet the standard. Until standards are developed, USDA should not allow the organic claim to be made regarding these products, if they do not meet the standards." So I inserted that language there.

And then down below that is the issue that came up then under personal care products, cosmetics, and that is that, "If the words organic or made with organic are used on the principal display panel, such usage shall comply with the product content requirements of 205300, 301, 308, and 309 of the Final Rule."
So, Mr. Chair, I would -- if it's allowable, I would make a motion that we -- the Board move this document forward for posting.

CHAIRPERSON KING: Is there a second? I mean, we don't necessarily have to vote unless someone objects.

MR. SIEMON: -- or do you want to vote on these?

CHAIRPERSON KING: And I think that's good, we'll recognize him.

MR. CARTER: Yeah.

CHAIRPERSON KING: It's been moved and seconded that we move the scope document forward for posting and official recognition. Is there discussion? George?

MR. SIEMON: What's posting mean?

CHAIRPERSON KING: Posting on the web, I'm assuming --

MR. CARTER: Yeah.

CHAIRPERSON KING: -- Dave --

MR. CARTER: Yeah.

CHAIRPERSON KING: -- is what you mean. Okay.

MR. SIEMON: So just for the public record --

MR. CARTER: Right.

MR. SIEMON: -- not more than that? Okay.
UNIDENTIFIED SPEAKER: And for comments.

MR. CARTER: For comments. For public comments.

MR. RIDDLE: I just have a question about the OTA statement, because I'm the one that typed it in, and I want to know if I made the mistake and omitted that or was -- okay, that was not in the OTA report, or the organic report, you're newsletter. Is that -- pardon?

UNIDENTIFIED SPEAKER: Our --

MR. RIDDLE: Okay. Because I wanted to apologize if I was the one, but now I don't need to, so I'll save that for another time. Okay, I just wasn't clear.

MR. CARTER: Okay.

CHAIRPERSON KING: Rose.

MS. KOENIG: I have a question on clarification. All right. So if we post -- we're voting to post all these documents. Will there be kind of a generalized statement included in front of them with some kind of explanation? I guess what's -- I don't want to cause you more confusion, because they are response to directives, so do we need a statement or how are they going to appear?

CHAIRPERSON KING: I think -- yeah, in this
particular case -- and, Dave, if you feel differently, please speak up. But if you read the background section, it provides a pretty good foundation for why this document's been generated, so --

MR. CARTER: Yeah, I concur.

MS. KOENIG: I guess -- I mean, we should probably look at all of them and just make sure that there's enough language and -- okay.

CHAIRPERSON KING: We're only voting on this one --

CHAIRPERSON KING: -- at this time. So further discussion?

MS. DIETZ: This is going to be posted at the website?

MR. CARTER: If we approve it.

CHAIRPERSON KING: If we approve it.

MS. DIETZ: I'll just -- let me just say something, because everybody's looking at me. I'm usually the stickler for dates and things getting to us in advance, and I appreciate you bringing us back. I fully support posting it for public comment, and I know the urgency in getting all these documents out. So I do support it. Just for future reference, again, we need to try as a committee to make sure we get stuff out on a
timely basis, and this meeting was of rare exception, 
because I know we've all been stressed for time, but --

    MR. RIDDLE: But it was included in the
meeting book about a week ago, correct?

    MR. CARTER: Yeah. And the only reason that I
would bring this forward was that, as per the discussion
yesterday, everything in here reflects the discussion we
had yesterday. Two of the three suggestions are
technical in nature, and the other one is a quick read.

    CHAIRPERSON KING: Should I call the vote?

    UNIDENTIFIED SPEAKER: Um-hum.

    CHAIRPERSON KING: All right, it's been moved
and seconded that we approve the National Organic
Program's scope document for posting on the website.
All those in favor signify by saying aye.

    BOARD MEMBERS: Aye.

    CHAIRPERSON KING: Opposed same sign.

    ***

    [No response]

    ***

    CHAIRPERSON KING: Motion carries. One
absent. For the record, George Siemon is in the hallway
on his cell phone.

    MR. RIDDLE: Yeah, really there's two absent,
because there's one absent for the whole meeting.
CHAIRPERSON KING: That's true, that's true.

Does that conclude --

MR. CARTER: That concludes the Policy Committee report right now.

CHAIRPERSON KING: Perfect timing. Perfect timing. Let's take a break and be back here at 3:15.

***

[Off the Record]

[On the Record]

***

CHAIRPERSON KING: For those of you interested in public input, session number two, that will be tomorrow morning, and I believe, Katherine, the sign-up book has been outside, is that correct?

MS. BENHAM: Yes.

CHAIRPERSON KING: Okay. And if there are other interested parties who would like to sign up, the book is here, and if we could maybe pass that over to Katherine, and then if someone's interested in signing up, they can -- okay, all right. We'll let you keep it, and if there's anyone interested in signing up for public input tomorrow, please see Katherine.

UNIDENTIFIED SPEAKER: There are slots available.

CHAIRPERSON KING: There are slots available.
Hold on, we have question from the audience. Yes, sir.
Hold on, hold on. Yes, please go ahead.

UNIDENTIFIED SPEAKER: The departments from yesterday, will they be first?

CHAIRPERSON KING: It is my understanding that the order you had signed up in on the initial day, that you had been transferred to the following public input session. Now, it may not be exact, but we've done our best to do so. And, Katherine, can you confirm that they are all transferred? I believe -- I had made notes for everyone who had wanted to sign up. So you may wish to double-check just to make sure. Thank you. Well, we'll make every effort to get five. That's been our standard policy, and yesterday, of course, was just due to time constraints. There were probably four or five and I noted all of them, so --

MS. BENHAM: Four. Four.

CHAIRPERSON KING: Okay, that sounds about right. Okay. On the agenda next we have listed the Accreditation, Certification, and Compliant Committee. And if you'll recall, I believe it was yesterday we talked a bit about noncompliances in general, and that's been a large part of that committee's work over the last year or so. And Andrea has indicated that the committee doesn't wish to bring anything forward at this time. Do...
you have any comments?

MS. CAROE: This committee has kind of taken second seat to the committees that have been working on the directives and the responses to the directives, and due to that, important business that everybody's been working on, we've put off our items for a later date.

CHAIRPERSON KING: Jim.

MR. RIDDLE: Yeah, Andrea, during public comment yesterday, one of the certifiers brought up the issue about the information on certificates and the fact that the, you know, compliance with NOP standards or regulations is not required and there are, you know, problems because of that. And I know that in the past we've had started a draft, a draft one, when I was chair, and then we didn't follow through with it, and I would just request that the committee reconsider that for a work plan item.

MS. CAROE: Okay. And I'll include that, thanks.

CHAIRPERSON KING: Okay. We have Crops Committee, so, Nancy and/or Rose.

MS. OSTIGUY: Rose has been kind enough to agree to take care of this, since I'm slightly befuddled.

CHAIRPERSON KING: Well, and we've had some
request from the audience that Rose be more involved at
this meeting, so I think it's only appropriate.

MS. KOENIG: Okay. Yeah, more hits on --

MR. CARTER: I'm just honored to be sitting
next to you.

MS. KOENIG: Okay. So the first one was that
came on was the -- on the agenda was the presentation on
extraction or extraction procedures, if I have the
agenda in front of me. And as I explained before,
originally, when we came up with that agenda item, we
were thinking of this paper on extraction, which became
the synthetic versus nonsynthetic documents. So in
terms of that report, there is nothing to report.
However, Arthur would like to just explain kind of a
recent correspondence that he's received regarding
extractants and sort of just update the Board as to how
he sees us proceeding on the response to that request
from the public.

MR. NEAL: Thanks, Rose. About a month, a
month and a half ago -- it actually starts back further
than that -- there is a particular participant in the
industry who manufactures aquatic plant extracts. In
this manufacturing process he uses potassium carbonate
to extract the aquatic plant extract. And his question
was, this hydrolysis that is included in the National

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
List, other than hydrolysis, does hydrolysis embody the use of potassium carbonate as an extractant? The NOP did not provide him with an answer directly. What we did is we referred that question to the Crops Committee for additional insight in terms of hydrolysis based on that recommendation that was made by the Board at that time. Rose has started doing some work and she's provided the definition of hydrolysis. And what we went looking for is for some insight and comment to the NOP on that particular process, hydrolysis, and whether or not if it allows the use of potassium carbonate, so that we can provide a response to this inquirer. So that's why that particular agenda item was listed, potassium carbonate, as an extractant.

MS. KOENIG: So I guess just to be clear on the process, that the committee will discuss it and kind of hopefully craft a response that you guys would consider, or does that have to be -- the committee would vote on it and how are we going to proceed just as you see procedural-wise on the -- what do you want from us and how do we have to do it? Is that direct enough, Mark?

MR. NEAL: A valid question.

CHAIRPERSON KING: Thank you, Rose. We've come a long way, truly.
MR. NEAL: The -- I think the best -- the best steps to take forward right now is to speak with the petitioner based on our conversations at this meeting, because we did not have or we're not sure whether or not if hydrolysis allows the use of potassium carbonate. Based on our knowledge we believe hydrolysis to be really the breaking of the bonds by water. But he was referring to some process that he says has been used in the organic industry for years. But I was not aware of it and we did not want to make any false moves without making sure that, you know, all of the different avenues and aspects concerning this procedure had been reviewed. We will get with the petitioner -- I mean, with the inquirer, and let him know the discussions that took place at this meeting. But in terms of a formal response, I think we would like for the committee to agree on that particular process and vote on whether or not that process does allow the use of potassium carbonate and send that to us as a committee response. And what we can do at the next meeting, that response can be recognized and be kept in the archives of decisions that was made by the Board for future reference, if anybody else has any questions about the use of hydrolysis and it's allowance of synthetics.

MS. OSTIGUY: Just so I'm understanding what
you're requesting clearly, you want specifically, do we -- does the committee believe that potassium carbonate is a hydrolysis process? But more generally, what -- define hydrolysis.

MR. NEAL: That is correct.

MS. KOENIG: And I just had a -- what's confusing me, is this same person who's petitioned to add potassium carbonate to the materials list, or is it a different individual?

MR. NEAL: A different individual and a different use.

MS. KOENIG: Okay. All right, now it's --

CHAIRPERSON KING: Okay. Is there other questions, discussion?

***

[No response]

***

CHAIRPERSON KING: All right. Rose, this is merely --

MS. KOENIG: Okay.

CHAIRPERSON KING: -- for formality, but if you would --

MS. KOENIG: Okay. So --

CHAIRPERSON KING: -- talk about soy protein.

MS. KOENIG: So soy protein isolate, it was --
the committee met, we again reviewed the information, and we voted to defer the substance. And I'll read what I sent to Arthur, because he asked for kind of a response, and he said he was going to -- he asked for this last week and I got it to him on Thursday, and he's going to take it and probably place it on the website. He's got something on there which is kind of a Reader's Digest version. So anyway, here -- this is what the committee -- the Crops Committee voted to defer the substance and seek additional information on the extraction process to determine, one, whether or not the substance is chemically changed during the extraction process; two, whether the substance is chemically changed after it is extracted it make it more functional for its intended use or uses; and three, what happens (chemical reactions) during the neutralization step in the extraction process; four, whether there is a presence of additional substances after extraction of the petitioned substance. The Crops Committee also thought it important -- it was important for the NOSB to clarify the definition of synthetic and nonsynthetic so that this substance could be evaluated and be consistent with the intent of OFPA for inclusion on the National List. The Crops Committee has submitted a draft document to begin the discussion on the further
clarification of the definition of synthetic for the October 24 meeting, and that's the one we discussed earlier.

The committee has also used three sources to obtain further information regarding the issues stated above. The petitioner, the TAP contractor, and an expert on soy bean manufacturing from Kansas State University has provided additional information to the Board that will be considered in addition to the petition and the original TAP report on this substance. The Crops Committee will also consider public comments on this substance when making the recommendation. And basically we have -- again, as I stated before, I believe we have all of that information now at hand, and I foresee that we'll be able to make a decision on the substance.

MR. NEAL: What the NOP will ask is that that particular recommendation that Rose just read come to the program in the decision -- really in the committee recommendations form that's provided to the Board so that we can officially post that on the website as a current update to the deferral.

MS. KOENIG: So you want another version of the soy protein isolate? Not a problem.

CHAIRPERSON KING: Kim.
MS. DIETZ: Rosie, is the rest of the Board going to get all those other documents, also, for the review?

MS. KOENIG: Go ahead.

MR. NEAL: The documents are posted on the website. The only one that's not posted on the website is the one from Kansas State --

MS. KOENIG: Um-hum, um-hum.

MR. NEAL: -- because we have not -- I didn't -- we didn't know whether or not -- just because he supplied that information to Rose, whether or not we could just post up our --

MS. KOENIG: Yeah.

MR. NEAL: -- website.

MS. KOENIG: I just -- yeah.

MR. NEAL: What we're doing is we're going to ask him first before we just post it on the website.

MS. KOENIG: Because I had told him and I asked him for his opinion and I said it would be used by the Board to evaluate it. But then, you know, upon thinking about it, I thought it was only fair to let him realize that it was a public document, and we just -- we couldn't get a hold of him. So -- but as soon as we get that okay -- because, I think, potentially he could be a good resource for the Board, and I didn't want to, you
know, create a atmosphere that -- you know, that he
didn't understand the process.

Okay, the last thing is the Compost Tea Task
Force report recommendation. There was some public
comment that came to the committee regarding -- there
was -- I should mention, on the soy protein isolate,
there was one public comment that has already come in on
that substance, and that will be reviewed with -- as we
do the review and any other additional public comments
that may come in once we post our decision before the
next meeting. But on the Compost Tea Task Force, there
was a few comments that came in on that product. Two of
them concerned kind of the -- question the testing
protocol that was suggested within the document, and
they felt that it was pretty extensive. It could be --
extensive and could be pretty expensive, and weren't
comfortable with that and felt that it just was not
necessarily doable for the farmer, and these were farmer
comments. And then the second comment had to do with
the recommendation in the document that allowed for food
contact disinfectant, like all materials on that list,
and they suggested -- and I think it's a very good
suggestion -- that we do have on our list disinfectants
that are part of that larger list, and it really -- we
probably should just allow the ones that are on our
list. We don't want to say that we're opening it up to all materials.

So I think that although the first two comments I think are clearly -- they were clearly concerned for a lot the members on the task force. The way that we got buy-in from all members was specifically because we outlined a detailed protocol as far as testing of the machinery. So, you know, it's my opinion, and I think this should be discussed, as to whether we -- you know, we want to think more about those testing protocols, and an alternate or come up with another proposal on that aspect of the document. But again realizing that those who endorse the document probably would not endorse it if we made significant changes to that area.

And then second one I think is easier to handle. I think that it's a good suggestion and I think there's good justification. I think it probably would've been supported by members of the committee, because, you know, it was an oversight. We need to make sure that any materials that we're recommending for cleaning out the equipment should be consistent with our list. So I think that that comment certainly should be incorporated and considered when we vote on it.

CHAIRPERSON KING: Owusu.
MR. BANDELE: Yeah, this is a further clarification. And I think the sanitation issue came about because the task force recommended, I think, the sanitizing agents in 21 C.F.R., and some of those probably would not be on our list. And as far as the extensive testing, most of that involved compost that -- which use additives, and there was a lot of discussion in the Compost Tea Task Force about that element and whether or not adding molasses would increase human pathogens. So most of that -- of the real strict protocol was aimed at that aspect, and I think we probably would not have had buy-in from some of the members of the Compost Task Force without those rigid restrictions. But in general, as you recall, if the compost used meets the specifications of the rule, then there are no restrictions. There was quite a bit of controversy also on the fact that compost tea made without -- and manures, and that has to follow the same patterns in terms of the additives, as compost tea made with the manure-based compost.

CHAIRPERSON KING: Is there more?

MS. KOENIG: The only other thing that I had to state was that Eric Sideman had spoken with me about kind of the -- you know, how to -- originally, if you remember, you know, there was a Compost Task Force and...
tea was supposed to be considered within that task force, and then it was kind of broken off and additionally studied. So we have two documents, basically, on very similar kind of issues. And he recommended that we eventually marry the documents in some way, at least in terms of the recommendations, that the recommendations kind of get put together in some format so that they're accessible to people who need to look at them.

CHAIRPERSON KING: And do you foresee doing this at the committee level and then bringing this back at some point in the future?

MS. KOENIG: Yeah, I think it's really up to the Board and how they see the -- you know, really -- you know, the bigger question is, what is the utilization of these documents? I mean, we've got two of them. They're forms of committee recommendations. It's still not clear how they're going to be utilized by the program. So that's probably the bigger issue. So, I mean, before -- I mean, we can always pull things out and create different ways that a document could look, but I'm just not sure ultimately what the use of the documents are, so --

CHAIRPERSON KING: Jim.

MR. RIDDLE: Yeah. I mean, I think this
report has a lot of valuable information and I just --
yeah -- am confused as to how it is to used or what
we're to do with it even as a Board right now. Now I
have no problem accepting it as a committee report or a
task force report, but I do have some problems thinking
about it being a final recommendation of the Board at
this point.

MS. KOENIG: Um-hum.

MR. RIDDLE: And we received some comments
that raised some valid concerns, and I'm just looking at
the recommendation section and just item number on, that
potable water must be used to make compost tea. Well,
OFPA doesn't say that. The rule doesn't require potable
water for irrigation. You know, so how can we require,
you know, a higher standard when it's, you know, passing
through or being mixed with compost for that water, when
you can draw irrigation water out of a creek or a river,
a catch-pond? And so I have, you know, some problems
with that. So I don't know. I certainly can support
accepting it as a task force report. It provides very
valuable information.

MS. KOENIG: Yeah. And I think at this point
-- I mean, that -- I mean, I think it's two different
processes. It's sort of like with the aquatic -- the
aquatic -- the original Aquatic Task Force. That report
was voted on and either accepted and then -- you know, how that's utilized by the program or the Board in the future is a separate issue. So I think upon voting on it is that you -- you know, that it's to acknowledge that there was consensus, though not a hundred percent. I think there was one person that opposed. So -- but accepting their report. Posting it, we've got public comments. And I think determining what happens with the document is a separate issue, but --

MS. GOLDBERG: Can I make a comment?

MS. KOENIG: Yeah.

CHAIRPERSON KING: Yeah.

MS. GOLDBERG: It seems to me that with this task force report, certainly accepting it is a great thing and it's valuable information and so on, but I think it's much more useful if, actually out of it, the Crops Committee comes up with some recommendations that get put forward. Certainly with the Aquatic Species Task Force report, we accepted the report, but then we actually made concrete recommendations that the Board voted on. And I think that makes a better process and gives more direction to what we'd like to happen.

MS. OSTIGUY: Can I make a motion?

MR. BANDELE: Yeah. Well, the recommendations were made, and I think as far as the purpose is
concerned, the main -- this whole thing came about because compost tea was interpreted to be treated as manure, as far as the NOP is concerned. So the purpose was to see whether or not that was, you know, realistic and to make recommendations, otherwise. And I think, to me, I recognize the point that Jim raised in terms of item one, but the main thing as I saw it was -- the main recommendation coming out of it, as I see it, was the third recommendation, saying that if the compost tea was made in compliance with the standards for compost, then that would be allowed without restrictions. So the recommendations are there and it wasn't just an intellectual exercise.

MS. OSTIGUY: I move that the Board accept the Compost Tea Task Force report, and that I guess direct the Crops Committee to take the recommendations from this report and the Compost Task Force and put them forward as recommendations, which may or may not include all the recommendations from each of the reports.

MR. BANDELE: I'll second it.

CHAIRPERSON KING: Is there a second?

Discussion?

***

[No response]

***

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
CHAIRPERSON KING: Okay, it's been moved and seconded that the National Organic Standards Board accept the Compost Tea Task Force report and forward it onto the Crops Committee for further action. All those in favor signify by saying aye.

BOARD MEMBERS: Aye.

CHAIRPERSON KING: Opposed same sign.

***

[No response]

***

CHAIRPERSON KING: Motion carries.

MS. KOENIG: The final request would be to go back to the inerts directive document. It's similar to what we did with the scope. There was really no proposed changes that were noted from that original document. Back on five, I think, or -- and I guess for a similar process, the scope had that posted on the web.

CHAIRPERSON KING: What do we do? Is there a motion?

MS. KOENIG: Well, I was under --

MR. SIEMON: Yeah.

MS. KOENIG: -- yeah. Well, I was trying to -- if I got an understanding --

CHAIRPERSON KING: So moved.
MS. KOENIG: -- of what you wanted to do with these drafts was have them all posted, correct? And you wanted that in the form of a motion?

UNIDENTIFIED SPEAKER: And did you make one?

MR. SIEMON: I made it.

UNIDENTIFIED SPEAKER: I'll second it.

MS. DIETZ: Well, the Materials Committee hasn't even seen these documents. We haven't -- and it says from the Materials Committee, so I don't have a problem posting them, but if we're going to go through each one and post them, then this is really -- I don't think that's necessary to make motions to post them on the web. And we did discuss taking them back and looking at them and then bringing drafts forward.

CHAIRPERSON KING: Let me -- just a quick question. Then, Jim, it's my understanding you're talking about the inerts document, correct?

MS. KOENIG: Yeah, the inerts.

CHAIRPERSON KING: Okay.

MS. KOENIG: Yeah. And that's what I thought I was supposed to do, so --

CHAIRPERSON KING: Yeah. And that's fine.

MS. KOENIG: And I guess I don't understand --

CHAIRPERSON KING: And you're essentially moving that we post it for comment, correct?
MS. DIETZ: Right, like with Dave.

MS. KOENIG: Yeah, similar to what Dave -- the same --

CHAIRPERSON KING: Okay.

MS. KOENIG: -- the same section.

CHAIRPERSON KING: And is there a -- go ahead.

MR. MATHEWS: The difference from what I understood is that with Dave's, you recognize the scope and then voted to post. But Kim raises issues that there wasn't enough time to review it. So are you recognizing it and voting or just -- recognizing and voting to post or are you just posting? Just clarification for the record.

CHAIRPERSON KING: Would you like to make a motion -- an official motion?

MS. KOENIG: The motion is just to -- I don't think we're recognizing it, because I agree with Kim, it was never voted on.

CHAIRPERSON KING: Okay.

MS. KOENIG: So it's just to post.

CHAIRPERSON KING: Okay. And is there a second on that motion to post the inerts document on the NOP website for comment, is that correct?

MS. ROBINSON: Second.

CHAIRPERSON KING: Okay, it's been moved and
seconded that we post the inerts document on the NOP website for comment. Is there discussion?

    MS. ROBINSON: Yes.

    MR. RIDDLE: Yeah. Well, you know, given the seriousness of these issues and, you know, the level of discussion that we had yesterday, and the fact that they were submitted in the meeting book, you know, per deadline, you know, I wanted all four of them to be recognized at the same status. You know, I think that, you know, there were some very valid reasons why the committee couldn't complete action, but that doesn't mean that we haven't given it thorough consideration and discussion. So I don't -- we can maybe look back at the language on the one of scope, but I'd like it to -- the motion to mirror that same language, that same status. I think it's very important because of these issues and, you know, the confusion and just all of the related gravity here, that we go on record on these, the full Board.

    MS. DIETZ: And I guess I don't have a problem with going on record. My problem is that it says it's from Materials and Crops Committees and it's not. And if we're going follow protocol and these things are going to come to us in a timely fashion and we're going to vote on them in committees, then we should do that.
So -- and the other thing is I hate to waste our time to post something, get comment, and then the committees are going to have changes and then post it again, so -- and I also understand the urgency and the severity of this, that we get the public to understand. So I'm kind of in quarry [ph] on this one.

CHAIRPERSON KING: George, then Rose.

MR. SIEMON: But if we vote on this as a Board, it will no longer be a material. We'll take that title off and it will now be an NOSB Board recommendation for public comment.

CHAIRPERSON KING: That's correct.

MR. SIEMON: We're going move it out of the material, and it is bypassing a proper step, I agree, but we're not taking responsibility for that. Well -- I'm sorry. Somebody else?

CHAIRPERSON KING: Rose and Nancy.

MS. KOENIG: I mean, I was going to suggest one other option, although we can't vote on it now. It would be for the committee, if people felt like they could make a decision and go through it, I mean, we could, as a committee, meet, you know, before -- you know, and report back tomorrow and then vote on it tomorrow, if that would make people feel comfortable.

But that was -- I mean, I'm fine with George's decision.
And again, I mean, I thought I had published that e-mail prior and, you know, the justification of keeping this as materials and crops, you know, versus the other document is that, number one, most of the information or a good chunk of it came from the 2003 Inerts Task Force recommendation. So it's not -- not all of it's foreign, a lot of it was incorporated out of that document. And secondly, we discussed it in an Executive Committee call, and we ran out of time, really, on the Crops Committee call. And then at that point the chairperson had gone out of town. I mean, it wasn't out of the fact that we didn't attempt to make a vote, it was because we couldn't get a hold of anybody. We got absolutely no -- you know, I got no feedback, so -- okay.

CHAIRPERSON KING: Motion's been called. All those in favor of recognizing the inerts document and forward for posting on the NOP website signify by saying aye.

BOARD MEMBERS: Aye.

CHAIRPERSON KING: Opposed same sign.

MS. DIETZ: One abstention.

UNIDENTIFIED SPEAKER: I'm going to abstain, too.

CHAIRPERSON KING: Note three --

MR. SIEMON: Four.
CHAIRPERSON KING: Four abstentions, Katherine, and two absent. Thank you. So that's --

MR. RIDDLE: Yeah, the abstentions are counted --

CHAIRPERSON KING: Yeah.

MR. RIDDLE: -- with the affirmative.

CHAIRPERSON KING: Yeah. So that's easy.

MR. RIDDLE: With the majority.

MR. MATHEWS: So what did you do?

MS. ROBINSON: They voted to --

MR. MATHEWS: Recognize and post?

CHAIRPERSON KING: We recognized and post the document. So it's now a Board document for posting.

MS. DIETZ: That's an NOSB document --

CHAIRPERSON KING: Correct.

MS. DIETZ: -- not a materials or --

MR. RIDDLE: Yeah.

MS. DIETZ: -- Inerts Committee document?

CHAIRPERSON KING: Correct.

MS. ROBINSON: Yeah. I was going to wait and I guess bring this up tomorrow when we talked about -- when you talk about work plans. But let me make the following suggestion, which might address Kim's concerns, but also -- I hear what you're saying. You really -- you want people to know that you drafted this
feedback, you drafted these statements, and here's what you said. And while there's been, you know, public sitting here in the meeting, you know, and you really want to let the world know. But at the same time, we committed yesterday to drafting guidance statements that would reflect our concurrence with these statements. So here's a proposal, that what we do is we would publish both -- both this, your statements, and the department guidance statements. And my hope is that we can get these up on the website. I'm hoping for the first week in November, only because next week Rick is in training all week. I'm at home because of my husband's surgery. So I can draft the guidance statements. I believe that we'll have to run them back through the lawyers, but I would also send them to you so you know what we've drafted. Then -- and really lean on OGC to, you know, bless these things. And then what we would publish on the website would be, okay, here's -- and everybody knows that we had -- you know, we publish statements and cause a lot consternation. We ask the Board for feedback. This is the Board's feedback, this is our response to the Board. Here it is, here's the whole thing.

CHAIRPERSON KING: And a quick comment, and then Jim. And I think if I understand what we're
attempting to do here, Barbara, which has apparently
caused some confusion, is just to recognize that the
Board has created some feedback, and that we are
forwarding that to you. And so I think that's really
the only intent here on that point. Jim.

MR. RIDDLE: Yeah, I think that's a great
plan, Barbara. I really like it. And just like Mark
said, you know, for me it's a procedural issue,
yesterday when they were brought up, and then we
discussed them all and we didn't take any action, you
know? But as a Board we're all here together now and
this gets it on the record, that we support these. So
-- but I think that's a fine plan, as far as when
they're posted, to be set right up with kind of what
you're next step is, your response, your guidance. And
having our ability to input on that is wonderful, too.

MS. ROBINSON: Well, yeah. And then the
public, of course, free to send in any type of comment
that they want, which actually has the advantage, if
there -- you know, substantive comments that come in by
-- I don't mean to dismiss any comments, but, you know,
you may just get comments saying, you know, that-a-boy
or good job or, you know -- yeah, let's hope so.

UNIDENTIFIED SPEAKER: Way to go.

MS. ROBINSON: Yeah. But if you get -- if
there are substantive comments of a negative nature, you
definitely want to know that and put it on an agenda to
deal with at the next Board meeting, so that, you know,
so we don't perpetuate this type of thing and we go back
through this all over again.

CHAIRPERSON KING: Well, I think it sounds
like a great plan, and I guess my question at this point
is, does the Board wish -- we saw two documents that we
have not officially voted on or recognized for posting
and things of that nature, and do you wish to do the
same format -- use the same format for those?

MR. SIEMON: Yeah. Be consistent.

CHAIRPERSON KING: Okay.

MR. RIDDLE: Yeah.

MR. SIEMON: All right.

CHAIRPERSON KING: Is there a motion?

MR. SIEMON: Let's do the directive for the
origin of daily livestock first. And I just want to
note the two changes that were made yesterday in our
discussion. I didn't kill as many trees as Dave did,
and on your recommendations, where it says
"antibiotics," and this is not in -- she can't change it
up there. I had hoped she would. So we want to add
antibiotics and other prohibited substances there.
That's one change.
MS. KOENIG: What --

MR. SIEMON: We're on tab six, the origin of livestock -- dairy livestock, under recommendations.

There's no page number, but --

MS. KOENIG: What circle?

MR. NEAL: That page.

CHAIRPERSON KING: The first --

MR. SIEMON: The first bullet in the recommendations of the origin of livestock document. And it says, the clarification statement that antibiotics and other prohibited substances are not allowed. So the addition is and other prohibited substances. Everybody with me? The next bullet underneath, this will unify and clarify the standard for dairy herd conversion. We want to replace dairy herd conversion with organic dairy replacement. And that's all the changes we made to this document. The only other thing I'd say, both these documents, we have both things that relate directly to these clarification statements, and other things related to work plans, and they're not really separated, but I think that's okay. So I make the motion to accept those two additions or changes.

MR. MATHEWS: I'll second.

CHAIRPERSON KING: So moved and seconded that
we accept the Livestock Committee document, a directive
for origin of dairy livestock. Is there discussion?

***

[No response]

***

CHAIRPERSON KING: Hearing none, a call to
vote. All those in favor signify by saying aye.

BOARD MEMBERS: Aye.

CHAIRPERSON KING: Opposed same sign. One
opposed. Abstentions?

***

[No response]

***

CHAIRPERSON KING: Two absent, one opposed,
Katherine.

MR. SIEMON: Okay, the next one is the fish
meal document, which we have no changes to. But again,
I'll note in our recommendation, there is
recommendations related directly to the directive, and
some other was related to our future work plan. So I'll
make the motion to accept this as --

MR. LACY: Second.

MR. SIEMON: Mike Lacy second.

CHAIRPERSON KING: It's been moved and
seconded, and George moves, Mike Lacy seconded, that the
Board consider the NOSB Livestock Committee directive for fish meal. Is there discussion? Rose.

MS. KOENIG: Yeah. As I kind of mentioned, and Becky and I discussed, I think the wording on number one would be more consistent if he says that the committee feels that fish meal as a generic is nonsynthetic rather it say fish meal itself. And then the second, NOSB Livestock Committee believes fish meals with synthetic substances to be synthetic. That's -- that needs to be reworded, and I'm not sure I'm prepared to reword that, or propose something at this moment, but -- because I thought it was going to be looked at again.

CHAIRPERSON KING: Nancy.

MS. OSTIGUY: I'm wondering if we can just delete that. We'll have to come back and address more specifically, as Arthur has discussed adding a synthetic to a nonsynthetic, whether or not it becomes synthetic. But I think we probably can answer the question with fish meal is nonsynthetic, the first statement. And if what's added as a preservative is a nonsynthetic -- is a synthetic on the list, that it's still okay. If it's a synthetic that's not on the list, then it's not okay. So we can separate them.

MS. KOENIG: One suggestion might be to take your point one, two, three, four, five, the sixth one
down, and move it up to number two, because I think
that's what you want to say, and then just take out
number two.

MS. OSTIGUY: Um-hum.

MR. SIEMON: I accept taking out number two,
because number six covers it. Mike, a friendly
amendment or whatever you want to call it.

CHAIRPERSON KING: Okay. Other discussion?

Andrea.

MR. SIEMON: I was confused about as a
generic. Fish meal itself as a generic what?

MS. KOENIG: Well, we'll take out itself,
because I just think --

MR. SIEMON: Just say fish meal is --

MS. KOENIG: Is a generic substance.

MR. SIEMON: Okay, I accept that, too.

MS. KOENIG: Well, as a generic substance.

MR. SIEMON: All right, we both accept that.

CHAIRPERSON KING: So let's get that straight.

How is it going to read? The NOSB Livestock Committee
believes that fish meal --

MS. OSTIGUY: Is nonsynthetic.

MR. SIEMON: Is nonsynthetic.

MR. MATHEWS: Or has a generic substance to
it.

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
MR. SIEMON: No, just is nonsynthetic. And then you go down to number six, it says, "Any synthetic preservatives used must be petitioned."

MR. MATHEWS: Right.

MR. SIEMON: I don't see much room for --

MS. KOENIG: Well, okay, that's fine.

CHAIRPERSON KING: Is that okay?

MR. SIEMON: -- confusion, Rick.

MS. KOENIG: Yeah, I mean, that's fine to -- I just think itself was -- that's fine.

CHAIRPERSON KING: So it will read, the NOSB Livestock Committee believes that fish meal is nonsynthetic, is that correct?

MR. SIEMON: I liked itself on it.

MS. CAROE: I still have issue with the eighth bullet that puts a statement of commercial nonavailability in there, which would turn this into feed instead of a feed supplement.

MR. SIEMON: Well, that was why I was referring to those work plan issues in here instead of recommendations on the directives. So to me the first six bullets, now five bullets, were a direct recommendation on the directive, and things after that were work plan input. So they were -- I don't know how to --
MS. CAROE: I don't think that's distinguished in the document. I mean --

MR. SIEMON: That's why I brought it up.

CHAIRPERSON KING: Do you want to propose to distinguish it?

MS. KOENIG: We can accept this.

MR. SIEMON: We'll just have -- under that first five have recommendation on directive, and work plan recommendations for the rest of them.

CHAIRPERSON KING: So for the record, beginning with which statement will it be --

MR. SIEMON: Under recommendation would be recommendations for directive, and then after now the number five bullet that used to be number six bullet, we would have recommendations for work plan or -- work plan items.

CHAIRPERSON KING: And that begins --

MR. SIEMON: With the status of fish meal.

CHAIRPERSON KING: Thank you.

MR. SIEMON: Because you're absolutely right, that one right there in the middle that's not even related to -- it's its own little subject. Okay.

MS. ROBINSON: How about related issues for future work?

MR. SIEMON: How's that? That's --
MS. ROBINSON: As a title.

MR. SIEMON: It's the same thing, so I accept that, too.

CHAIRPERSON KING: Related issues for future work. Is that acceptable?

MR. SIEMON: Yes. Mike, I'm really agreeable.

CHAIRPERSON KING: All right. Further discussion?

[No response]

CHAIRPERSON KING: All right, it's been moved and seconded that we consider the NOSB Livestock Committee directive for fish meal and forward for posting as amended. All those in favor signify by saying aye.

BOARD MEMBERS: Aye.

CHAIRPERSON KING: Opposed same sign.

[No response]

CHAIRPERSON KING: Abstentions? One abstentions, two absent, Katherine. Motion carries.

All right. Yes, we are now ready for, and it appears to be our last agenda item of the day -- maybe not. Here's
MR. MATHEWS: There's only one absent.

MR. SIEMON: You've been saying two absent.

CHAIRPERSON KING: Yeah, because somebody stepped in the hallway and I can't add or subtract very well. So did you get that, Katherine? Okay, thank you, Rick.

MR. SIEMON: She wasn't confused.

CHAIRPERSON KING: Well, sometimes it's good to stand alone, George. The next item is election of officers. And as you well know, in our Board policy manual, we elect officers each fall, and are there nominees for the position of chair? Dave.

MR. CARTER: Yes, Mr. Chair. It's my honor to nominate somebody who has paid their dues to this Board and has been a tremendous worker. I'd like to place the name of Jim Riddle into nomination as chair.

CHAIRPERSON KING: Dave's nominated Jim for chair. Is there a second?

MS. OSTIGUY: Second.

CHAIRPERSON KING: It's been moved by Dave and seconded by Nancy that we nominate Jim Riddle as chair of the NOSB. Is there discussion?

UNIDENTIFIED SPEAKER: You didn't call for other nominations.
MR. RIDDLE: Yeah.

CHAIRPERSON KING: Oh, sorry, thank you. Are there other nominations? Are there --

MR. RIDDLE: On the record, yeah, I'm willing to accept.

CHAIRPERSON KING: Are there other nominations?

***

[No response]

***

CHAIRPERSON KING: Hearing none, call to vote. All those in favor of appointing Jim Riddle as chair of the National Organic Standards Board signify by saying aye.

BOARD MEMBERS: Aye.

CHAIRPERSON KING: Opposed same sign.

***

[No response]

***

CHAIRPERSON KING: Abstentions?

UNIDENTIFIED SPEAKER: I'm going to abstain.

MS. CAROE: I nominate Kevin O'Rell for vice chair.
CHAIRPERSON KING: Is there a second?

MS. OSTIGUY: Second.

MS. BENHAM: Who seconded?

CHAIRPERSON KING: Nancy seconded and Andrea moved to nominate Kevin O'Rell as vice chair. Are there other nominations? Are there other nominations?

[No response]

[No response]

MS. BENHAM: Does he accept?

MR. O'RELL: I would accept the nomination, thank you.

CHAIRPERSON KING: It's been moved and seconded that we appoint Kevin O'Rell as vice chair of the National Organic Standards Board. All those in favor signify by saying aye.

BOARD MEMBERS: Aye.

CHAIRPERSON KING: Opposed same sign.

[No response]

[No response]

CHAIRPERSON KING: Abstentions?

[No response]
CHAIRPERSON KING: Motion carries unanimously.

Are there nominations for the position of secretary?

Jim.

MR. RIDDLE: Yeah, I'd like to nominate Goldie Caughlan.

MR. SIEMON: I'll second that.

CHAIRPERSON KING: Jim nominated Goldie and George seconded it. Are there other nominees for the position of secretary?

MR. RIDDLE: Is she willing to do it?

CHAIRPERSON KING: Yeah. And are you willing to do it?

MS. CAUGLAN: I'm crazy. Yes.

MR. RIDDLE: What's crazy about it?

CHAIRPERSON KING: Yeah.

UNIDENTIFIED SPEAKER: She gets the egg timer.

CHAIRPERSON KING: You get the egg time, exactly, and the one-minute sheet. Let's not forget the one-minute sheet. But first, are there other nominees?

Are there other nominees?

***

[No response]

***

CHAIRPERSON KING: Seeing none, all those in favor of appointing Goldie as secretary signify by
saying aye.

BOARD MEMBERS: Aye.

CHAIRPERSON KING: Opposed same sign.

***

[No response]

***

CHAIRPERSON KING: Abstentions?

***

[No response]

***

CHAIRPERSON KING: Motion carries. Yes, congratulations. Jim?

MR. RIDDLE: Yeah, Mr. Former Chair.

CHAIRPERSON KING: Not yet.

MR. RIDDLE: Not yet. For the rest of the day. Yeah, well, I just wanted to say a couple of things, and that is I'm really looking forward to very focused and productive and fun year. And when I was asked to consider being chair, I didn't exactly jump at it. I did want to -- I don't need more stress in my life, but I do always need more fun, and I need more sense of satisfaction. I never can get enough. But anyway, so I am just really excited by how this meeting has progressed, and really looking forward to the coming year and working with the other officers and committee
chairs and the full Board and the NOP. So I just wanted
to say that, and since we have some time left, I wanted
to give a very special thank you and acknowledgement to
the outgoing Board members, or at least they hope
they're outgoing and we hope they aren't, but to
acknowledge the work that Mark has done as chair and as
a Board member prior to that. I think you've really
risen to the occasion. I really appreciate your
efforts. Kim as longtime materials queen and secretary
and just, you know, a dedicated, hardworking Board
member. I just really want to acknowledge and thank
you. And, Becky, thank you for your work and
leadership, and I will continue to work on the fish
issues. And, Owusu, thanks so much for chairing crops
when you did and all of your input and wisdom that you
share. And I have -- I brought a little something here
for each of you. No, it's better. It's better than the
cookies, even. I give --

MR. CARTER: Is it better than the organic
bimbo award that was given last night?

MR. RIDDLE: Yeah. You should open this now.

MS. DIETZ: I think I know what it is. I
think he was preparing it --

MR. RIDDLE: You do?

MS. DIETZ: -- when I called.
MR. RIDDLE: Let's see -- I think they're --
CHAIRPERSON KING: Are they all the same?
MR. RIDDLE: No, they're not all the same.
CHAIRPERSON KING: Okay.
MR. RIDDLE: Yeah, pink is for Kim. I've got a little color code. And white for Becky, and green for Owusu. Go ahead.
MS. DIETZ: Is it going to go whee?
MR. RIDDLE: No, no, no, no, no. You can just rip the --
CHAIRPERSON KING: There aren't synthetic materials in here, are there, Jim? Well, look at that. It's a USDA pig. Thank you very much.
MS. GOLDBERG: Thank you.
MR. RIDDLE: An official USDA stress pig, sheep, cow, and chicken.
MR. BANDELE: And, Jim, as a vegetarian, thank you very much. I appreciate it.
MR. RIDDLE: Yeah. And then the jam is some of our homemade raspberry jam, and it actually is all organic and --
UNIDENTIFIED SPEAKER: Is that USDA certified?
MR. RIDDLE: No, no, we are certified, actually.
MR. SIEMON: Under $5,000.
MR. RIDDLE: But, yeah, we're under 5,000.

But anyway, I figured that you've all helped us out of a jam and now it's time for you to get into some jam. Thank Joyce for that, too.

CHAIRPERSON KING: I just want to say thank you to everyone in this room, Board members included. And it's hard to imagine that I have served on this Board for five years. Time flies when you're having fun, although it hasn't always been fun. It has been challenging and interesting, and I've probably learned as much in this process as any that I've had an opportunity to be involved in my life, and I appreciate that very much. It's interesting to say that I will miss it, which sounds very bizarre at this point.

UNIDENTIFIED SPEAKER: Well, there's plenty of opportunities.

CHAIRPERSON KING: Is there? Yes, yes. Well, as I understand, office states you can't serve consecutive terms, so I'll be gone for quite awhile.

UNIDENTIFIED SPEAKER: Not for a task force.

CHAIRPERSON KING: Oh, good, good, I understand. So I want to thank everyone for your support ongoing, and look forward to assuming some new roles in the industry, and would give other outgoing members at this time an opportunity to make comments if
they so desire.

MS. DIETZ: We're going down the line. I wasn't prepared to give a speech. We've never done this before. We've got time. Oh, we're wasting time. Where's the beeper? We have five minutes?

CHAIRPERSON KING: Yeah.

MR. RIDDLE: Yeah.

MS. DIETZ: You know, I've thoroughly enjoyed this Board and I'm very happy to see us with this last meeting -- it won't be our last, I know that -- with the attitudes and the cohesiveness, and I do cherish all of you, and we've all done a great job, and you should be very proud. This last five years with the implementation, it's been a tremendous task and I commend all of you. But I'm not going anywhere, so I plan on sticking around and being very involved in this industry as I have my whole life so far.

MS. GOLDBERG: And I want to second what Kim said about -- such a good outgoing note for all of us, with the spirit of cooperation, and saying I'm going to miss the members of this Board and being together as a group quite a great deal. So I'm not going to take my five minutes.

MR. BANDELE: And I won't take the remainder. But again I'd like to thank everyone for the opportunity.
to serve. I have a tremendous respect for the integrity of the Board, but oftentimes we have not always agreed on everything, but in spite of our differences and background and training, et cetera, we were able to come up with a consensus with some very tough, tough situations. So again, I'll miss everyone, and thanks for the opportunity.

CHAIRPERSON KING: Yes, Barbara.

MS. ROBINSON: Just on behalf of the department, we would certainly like to say thank you to the outgoing Board members, thank you for your hard work and your dedication. Yeah, I know, we haven't always agreed, but that's not what this is about. It's about helping this industry grow, and your dedication, it has never, ever, ever been questioned, nor has your integrity. And it's been my pleasure to work with you. Jim, congratulations. We look forward to a productive year with you getting you retrained. But actually I do believe if we keep our sense of humor and we keep our perspective, we're going to make this work. So thank you all very much.

MR. RIDDLE: Yeah. And tomorrow the first thing on our agenda, we have one hour to talk about work plans and meeting schedules. And to help facilitate that, I've kind of been keeping a scorecard -- not a
scorecard, but writing a list of some of the work plan
items as they've come up, divided by each of the
committees. So just to help you do that or maybe you
can stay up later and watch the debate and not have to
feel that you have to suffer over them, but they are
just suggestions. But so I got a sheet for each of the
committee chairs. And we talked a little bit during the
break about committee chair assignments and, you know,
with five new members coming on the Board, you know, we
don't know who we'll have to draw from and what kind of
expertise they'll be bringing to the table. So I don't
anticipate any changes in the very short-term. But at
the same time, we do have an understanding. It's not
part of our policy manual, but it's certainly just a
good idea that people in their last year on the Board
aren't in every position of authority and chairing every
committee, but we really have a shortage of people
losing five, and five more going off with only four
available, so we're going to have to keep some people in
their last year on the Board in positions as committee
chairs until we have some new people, see who they are,
but I think it's really critical for the four people
that have longer terms to just recognize the opportunity
-- put it that way -- for chairing committees. And if
you aren't chairing yet, to step into vice chair in a
very active role and prep yourself for chairing. So I just wanted to say that, and then that's it. So we should plan on our -- discuss our work plans and our future meetings tomorrow morning.

MR. SIEMON: I wondered, since we have time today --

CHAIRPERSON KING: Do you -- I don't know.

MR. SIEMON: Oops, I didn't have my thing on.

CHAIRPERSON KING: We may have time. I don't know if the department's prepared to discuss that today. We hadn't really put it on the agenda. It's something for consideration, considering some of the issues before us.

MR. SIEMON: Well, I'll just -- okay.

MR. MATHEWS: We're prepared.

MR. SIEMON: I'm quite concerned about what I heard yesterday about the methionine thing, that if we wait until an April meeting that it will not be able to be dealt with, and I feel like we've a lot of workload that's coming up, a lot of discussion, committee recommendations that weren't quite ready or required a lot of TAPs, and I'd like to see us have the meeting in January, so that if we go forward with anything on the methionine, we have time to do it. So we avoid -- we have a lot of responsibility here, so --
CHAIRPERSON KING: So you literally want to try to put something on the counter, and I think we just have to ask the department first if they're going to have the money in time.

MR. SIEMON: I'm starting -- I'm rolling the ball.

MS. ROBINSON: We're very much in favor of -- well, you'll have new members, so you'll need an orientation.

MR. SIEMON: Yeah.

MS. ROBINSON: You've put an awful lot of work on the table in the last two days.

CHAIRPERSON KING: So are you saying --

MR. MATHEWS: When are the new members --

CHAIRPERSON KING: Yeah.

MR. MATHEWS: -- appointed?

MS. ROBINSON: Well, the -- your terms expire January 23.

MS. CAROE: So the new members --

MS. ROBINSON: The 24th.

MS. CAROE: -- come in on the 24th of January.

So to set a meeting in January, we won't have new members yet.

MS. ROBINSON: Well, we're talking about late January or early February, but not waiting -- the point
is not waiting until April for a meeting. That's the point, really, and we can do that.

MR. MATHEWS: In reviewing the minutes from the April meeting, there was a lot of things that were discussed as being addressed in the next meeting, so I think that there's plenty to do for a January meeting. There's the materials things that Rose has brought up. You -- the methionine that George mentioned. Maybe we can get soy protein isolate done by then. You have two TAP reviews that the reports, if they're acceptable, maybe we can move forward with those. So there's -- I would say that there's plenty of things that the Board and we can work on between now and the end of January, the first part of February. And so even though Katherine, who will be stressed out over Christmas, we can do it.

MS. CAROE: I propose that we hold off until like the second week in February so our new members, who are newly appointed, can accommodate it.

MR. RIDDLE: Well, the other option would be to shoot for earlier in January with this group.

MS. CAROE: Well, let's --

MR. RIDDLE: As far as being productive on work, you know, we wouldn't have to orient.

MS. ROBINSON: You have an overlap, anyway, at York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
that meeting, both old members and new members.

CHAIRPERSON KING: Yeah.

MR. RIDDLE: Yeah. But --

MR. MATHEWS: And also keep in mind that you're talking about trying to do something early in January. Are you going to be ready well before Christmas, or are you going to need to move into the holiday season a little bit? Remember you got Thanksgiving and Christmas and New Year.

MR. RIDDLE: Oh, we'll just break down, so --

MR. MATHEWS: We have NOSB work to do.

CHAIRPERSON KING: So essentially, yeah, I mean --

MR. CARTER: It looks like one big Christmas present.

CHAIRPERSON KING: Well, I mean, let's throw some numbers at this. On what you're saying is, if it were early January, you're roughly talking about 14 weeks, essentially, give or take. So if we -- so what's real in terms of a time frame here?

MR. RIDDLE: Well, it's Andrea's suggestion.

MR. MATHEWS: I don't know that you have to decide tonight, but I like the idea that George has brought it up now so that you can be at least thinking about it overnight. Because we're thinking that you
will also need to meet probably early August.

MR. SIEMON: And furthermore, I think that with all these time tables, it's like, you know, you're getting tied by 60 days, 90 days. We're going to have to maybe break our -- do it around expo or do it -- I want to do what's most effective for the industry, and doing it instead of my expo-type time frame. I think we need to go to a workload time frame, all the lead times and all the stuff we're dealing with now.

MR. MATHEWS: Now, the reason why I mentioning August is that with the feedback from you on the sunset document, we can now move forward with pushing that through, and we would be pushing -- no guarantees, but the idea would be that we'd have something published by the end of the year on sunset. That would leave -- the next three months would be for public comment. The next three months after that would be where you're digesting the comments and coming through with your recommendations. So I envision that you would probably getting together sometime in August to address the issues and make recommendations back to us. So that works along with what George is talking about, do the workload.

CHAIRPERSON KING: So --

MS. CAUGLAN: So you'd be talking February,
April, August?

MS. ROBINSON: No.

MR. MATHEWS: No, February and August.

MS. CAUGLAN: You would not be meeting?

MR. MATHEWS: We would not meet in April or May, we would meet based on workload in January so that we can take action on the things that really need to get done. And then we would meet in August in order to take care of things related to sunset and anything else that might come up between now and next August.

MR. RIDDLE: And then we would have the option of October if we needed a third meeting, correct? I mean, does that -- is that possible?

MR. MATHEWS: That would already give you three meetings for this year -- for the fiscal year.

MR. RIDDLE: Because if was October, it'd be the next fiscal year.

MR. MATHEWS: Right.

MR. RIDDLE: Well --

MR. MATHEWS: Again, I would think that you'd want to make sure that that -- George is right, we need to do it -- we need to do meetings at this time in relation to the workload that needs to be done, because sunset is going to be critical time for us and we really need to be looking at gearing the meetings around.
sunset.

MR. RIDDLE: Um-hum.

MR. MATHEWS: So there's nothing that says we wouldn't do one in October, but then, again, it depends on what available come October.

MR. RIDDLE: Um-hum.

MS. DIETZ: If we're going to do one in February, if we could maybe discuss some dates, because the second week is horrible for me. I'm gone for 10 days in February, so --

MR. SIEMON: Well, January 31 through --

MS. DIETZ: Yeah, early February --

MR. SIEMON: -- the 4th.

MS. DIETZ: -- or late February, yes.

MR. CARTER: That date works for me.

That's --

MR. SIEMON: January 31 through the 4th, and not the whole time, obviously. And BEOFOCT [ph] is at the end of the month for any of those who would go there.

MR. RIDDLE: My daughter's getting married February 5, and I've been told to clear my calendar the week leading up to that.

MR. SIEMON: Okay. How about the last week of January, is that -- that's where we -- with the new
people? That's the 24th, 25th, 26th.

CHAIRPERSON KING: That's probably too soon.

MR. SIEMON: Oh, is it --

MS. DIETZ: I don't think that's very fair to the new members. They're going to be appointed on that Monday and they you're going to ask them to be in a meeting?

MS. CAUGLAN: Rick or Barbara, is there any way we could --

MS. ROBINSON: Sorry.

MS. CAUGLAN: Could we ask for any kind of a dispensation from the secretary as to the timing of their appointments? I mean -- because --

MR. MATHEWS: Please explain.

MS. ROBINSON: You mean, ask --

MR. SIEMON: We need to have --

MS. ROBINSON: -- them to give them to you earlier?

MS. CAUGLAN: Well, I think we're talking as though they would be appointed the third week in January. That's --

MS. ROBINSON: No, no, no, no, no. I'm saying --

MS. CAUGLAN: They might very well be appointed --
MS. ROBINSON: They could, they could be
appointed --

MS. CAUGLAN: -- earlier.

MS. ROBINSON: -- before that.

MS. CAUGLAN: Would it be --

MS. ROBINSON: But I -- you know, these guys
are -- I'll tell you what, rather than try to pick this
date, why don't you guys look at your calendars, and
starting with, say, the last week of January through the
month of February, state when you are not available for
a two-day meeting, and e-mail it in to us.

MR. SIEMON: Two days with orientation, too?

MS. ROBINSON: All right, three days.

MR. MATHEWS: Okay. Well, I can already tell
you that Arthur and I are tied up the entire last week
of January.

MS. ROBINSON: E-mail me.

MR. MATHEWS: Barbara's going to take the
meeting by herself.

MS. ROBINSON: You don't think I can?

CHAIRPERSON KING: All right. So think about
this -- think about this tonight. We'll try to get some
definitive dates on the calendar tomorrow. Is there any
business to -- hold on. Yes, but we'll talk -- we'll do
that tomorrow.

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
MR. SIEMON: Yeah.

CHAIRPERSON KING: George.

MR. SIEMON: I'd like to request if the Livestock Committee could get together here and set up a meeting so we can go forward with fish. With our two-week notice thing, if we can just set up right now -- to set up a time to meet in the next while, because we need the consensus for two weeks for a Livestock Committee call.

CHAIRPERSON KING: Okay. So the Livestock Committee's going to meet after we recess here to schedule a call. Is there any other business?

MR. RIDDLE: Well, I just wanted to clarify what George said. Given our new two-week requirement and -- no, no, no. That was -- that's a draft proposal that hasn't even gone through committee. We need the seven days before a conference call. That's really --

CHAIRPERSON KING: He was just trying to give you --

MR. RIDDLE: Yeah.

CHAIRPERSON KING: -- incentive.

MR. RIDDLE: And I just didn't want there to be confusion that we have --

MR. SIEMON: Well, but I respect that.

CHAIRPERSON KING: Well, we've never had
confusion, so let's not start now.

        MR. RIDDLE: Unnecessary confusion.

        CHAIRPERSON KING: That's right.

        MR. SIEMON: We've been --

        CHAIRPERSON KING: Owusu has a comment.

        MR. BANDELE: I have a question to Rick and, you know, and inviting feedback from the Board. I came across a unique situation where a farmer has a pond of tilapia, and he's going to be moving toward certification and he wants to use the fish waste. And it's not really manure as defined, as far as the rules as I understand it. Like, in other words, it mentioned that manure comes form livestock, and then fish is not part of the livestock, so could you clarify that?

        MR. MATHEWS: Fish is livestock under the act, and we’re going to be correcting that definition in a future rulemaking. And I believe it's in the --

        MR. BANDELE: That's right, that's right.

        MR. MATHEWS: I think it's actually in the livestock materials docket.

        MR. BANDELE: Okay. So that person would have to treat that as regular manure, in terms of whether he wanted to compost it over the 90 to 120-day period between application, according to that?

        MR. SIEMON: I considered those --
MR. MATHEWS: Is it a liquid or is it --

MR. BANDELE: Well, see, he has both. You know, you have the effluent, and then you also have the solid waste, as well.

MR. MATHEWS: Well, the solid waste is clearly manure, and I would think that the liquid would be, as well. Just like a dairy farmer has both solid and --

CHAIRPERSON KING: Okay, is there any other business to come before the Board? We will recess and reconvene tomorrow morning at 8:00 a.m. with -- public input begins at 9:00. Thank you all very much.

Proceedings

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
CHAIRMAN RIDDLE: Good morning. Mark and I talked over breakfast about who was chairing today. And he said, well, last time after the election he started the chairing, so bear with me, please, and I’ll try and feel my way through here today. On our agenda we have our committee chair reports, and then scheduling our next board meeting. And then at 9:00 a.m., is a public input session. So if you have not signed up and would like to offer comments, the sign-up sheet is still out on the table outside. So please do that, and we will go to that at 9:00. But first, we have the committee chair reports on work plans. And I would just ask, as you give or summarize your work plans and what the issues are, if we can prioritize them a bit -- I meant to suggest that late in the day yesterday -- but if you can think of it either in terms of, you know, the most pressing issues, or kind of the low hanging fruit, things that can easily be accomplished as being how to prioritize. So who’s ready first? Okay. Andrea, Accreditation Committee.

MS. CAROE: Accreditation Committee has two items on their work plan. The first item is to review and finish the document regarding the certificate...
document and the information on that document. The second item is a lesser priority, but important, and that is to provide some guidance to operations seeking certification and choosing a certifier. So we will be working with industry to collect the important aspects that an operation should consider when choosing a certifier, and the questions that they should be asking as they interview certifiers, to find the best fit for their organization. That’s it.

CHAIRMAN RIDDLE: Okay. Any questions or comments from other board members, NOP? All right. Thanks. Let’s see. Nancy’s not here yet. Who else is ready. George, are you ready to go? All right. Livestock, George.

MR. SIEMON: I was still rewriting. I’m in priority.

CHAIRMAN RIDDLE: Oh, sorry. No. I didn’t say it.

MR. SIEMON: That’s all right. It looks like our work plan is expanding. First, our top priority right now is to do this task force, to recommend the appointees to it, to the executive committee, and to establish a process. And you know what our objectives, and criteria, and all that are, keep that and get that going. Our next priority, I hope is to collaborate with
the NOP on this problem with the FGA classification, and see what we can do about that. And then we had the dairy replacement as a rule change that was going to be our first rule change, I think, that we face. And so that’s a priority issue that came out of this meeting. And then a great concern to myself -- and I think we’ve heard from the public -- is the methaninine issue. So I’d like to have us take that up and see as a committee what we feel we need to recommend that extension or not. And then we’ve got some more materials to work on. We’ve got gelate still hanging out there. And then I thought we might take a look at the material list too to see if there is any that we are concerned about that shouldn’t be set ahead of the time, if that’s -- that’s maybe not the committee, but, certainly, it’s something we face in our workload. And that’s enough.

CHAIRMAN RIDDLE: Yes. Questions or comments for George?

MRS. KOENIG: Yes. As far as the methaninine review, what I would like to see, if, you know, if the issue is alternatives, I know there’s that committee that is, you know, through OTA, that has developed and is looking at research alternatives. But, I mean, if we have this -- the TAP -- this TAP funding, and we have contractors, and we have material, I think in addition...
to having the committee’s report, I think it’s important
to have a non, you know, using a technical, you know,
contractor to also give an objective approach. And I
wouldn’t want to see that individual necessarily going
through methaninine. It think it needs to be like an
addendum to the original TAP. But really have them at
the same time, hopefully, find some feed specialists,
and particularly look at the alternatives, so that we
have some technical information in addition to whatever
the livestock committee comes up with, and whatever the
industry has been doing thus far to make a decision,
because I, personally, am not comfortable. I guess -- I
don’t want to -- I want to keep consistent with the
process if we’re going to re-look at any kind of
material.

CHAIRMAN RIDDLE: So, George, do you have a
response? Well, I guess I’d like to follow-up on that
because I’m not exactly clear, if you were suggesting
that in this methaninine issues development, going back
to one of the technical contractors for some further
information, that’s what I think Rose was suggesting.
And how could that work for the program’s standpoint?

MR. SIEMON: Well, again, all I was going to
do was bring it up to the committee about what they felt
would be the next step. But I really could just lump
that into the sunset material issues. I think there are several materials that we don’t want to live to the sunset. So I’d rather -- what I heard was get going on it sooner than later, rather than balling up. So to me, it’s part of maybe some other materials as well. So I don’t know how the rest of the committee feels. But I know it’s an issue we face, and I just wanted to bring it to the committee as an action for a work plan item.

CHAIRMAN RIDDLE: And that’s what I heard you say was separate from the methaninine issue, is to look at the livestock materials list and take up Barbara’s suggestion, are there some priority issues for early review, just to get the information flowing early on.

MR. SIEMON: And new information for a TAP might be the thing we need, just like Rose has suggested. That might be just what we need to do. Some of those cases might need a whole new TAP, quite honestly. If you’re talking about an even handed process, some of the older taps were very uneven-handed, compared to the present ones.

MS. KOENIG: And I guess that’s what is troubling me. And, again, I take it away. We could call it material X. There’s a number of X, Y’s, and Z’s on our list that have a terminated sunset. And, again, I don’t -- I’m not saying yes or no, or here or there,
but when the Board voted on it, there was a terminated sunset. Now if people want to re-look at it, is there a process to do that? You know, I don’t necessarily see that process unless maybe somebody re-petitions.

CHAIRMAN RIDDLE: Rick or Barbara? Rick?

MA. MATTHEWS: If it’s the will of the Board to take another look at methaninine -- which it seems to me that’s what George is asking for -- we can package up the analysis work that Barbara did on the methaninine tap, as well as the tap itself, send it off to one of the new vendors for a new tap drawing from the previous, and to provide additional supplemental information, if that’s what you want. In other words, if you decide you want to do something, we can get moving on it right away.

CHAIRMAN RIDDLE: Okay. Thanks. And also I’d ask the committee chairs if you have a conference call scheduled or planned, to just report on those kind of nitty gritty too. George, do you still have -- okay. Kim.

MS. DIETZ: It seems to me like the process for this is very similar. The material is on the national list. And if somebody wants to amend the annotation, they should submit a petition -- listen carefully -- to amend the annotation. And the specific
charges we had with methaninine was that somebody should be looking at alternatives to methaninine. So I would think that the Petition to Amend would list the alternatives, and the work that’s currently being done on those alternatives. And then that would give the Board the ability to go in and say, okay, this is an Amended Petition. Here’s what they’re asking for. You can request a supplemental tap based on that research, or whatever they are, and then you have the ability to open that annotation back up and make a new recommendation.

CHAIRMAN RIDDLE: Thanks. Yes, Rose.

MS. KOENIG: I would concur with Kim. I’m totally comfortable with that process. I just don’t want, you know, because once you go around the process for one material law, you know, then you don’t have a process. So, I mean, I’m not saying don’t do it, I’m just saying, we need a process. We need to have an amendment. We have a process established to allow people to do that. And they have to go through the formal networks.

CHAIRMAN RIDDLE: Yes. Thanks. George.

MR. SIEMON: Some guidance, you know, I would like to see somewhere -- reading the scope document, APE [ph] culture is an issue we’ve not faced, honey. And it
was in the scope document as well. So I’d like to --
because what Nancy is a specialist at. So to me, if
we’re ever going to face that issue, it would be a good
time to do it while she’s on the Board. So that was
something else to ask guidance for, if that’s part of
the workload or not, because it was in the scope
document as well.

CHAIRMAN RIDDLE: Barbara?

MS. ROBINSON: Well, we do have
recommendations from the Board, and there have been
drafts, something to begin building draft -- the
additional standards that might be needed. We have all
agreed that, you know, those commodities, mushrooms,
honey, greenhouse, you know, they’re covered, yet we all
recognize that there could be some, and, in fact, there
are some peculiarities, some unique practices associated
with each of those that need to have additional rule
making. And we do have past recommendations. We do
have a fair amount of documentation that we can -- and
that’s what we’re trying to do is get started
constructing some proposed rule making on those.

CHAIRMAN RIDDLE: Okay. Anything else for
George? Hearing none. All right. Dave, Policy
Development Committee?

MR. CARTER: Thank you, Jim. We have six
items on our work plan. Three of them that I put up at
the top really fall under the heading of administrative
issues that I think we want to take care of fairly
promptly. First of all is to continue to work on the
finalizing the job description or the efforts to procure
an executive director for the NOSB, work with the
program on that. Secondly, is to establish our policy,
however formally or informally, for with the NOP, NOSB
collaboration. There was discussion particularly
Tuesday of to what extent do we want to have a specific
detailed framework for collaboration or something more
informal. And I think we want to continue to work that
forward. Third is it incorporate the Board Policy
Manual revisions, which include the issue on scheduling
our meetings, incorporating those comments from Barbara,
the discussion of that, and how we incorporate that in
developing within the manual, an explanation of
technical corrections. The last three things on our
work plan then fall more under the heading of policy
issues, in which we will be working with some of the
other appropriate committees. First of all is the area
of handling of livestock medication materials. We want
to work with the Livestock Committee. But there was a
request on Tuesday that we look at particularly the four
areas, is it possible to create a category of
alternative medicines on the national list? Is there a potential to create a negative over-the-counter list? Is there a category of production age, with reference to specific use and/or is there an opportunity to have organic included as a minor use category by FDA. So I think those were the things that Barbara outlined on Tuesday, as some potential areas to look at. Fifth, or the second area under the policy areas would be in working with the Handling Committee, is the handling of organic and non-organic ingredients in made with products, and how do we begin to develop some recommendations on that? And then the sixth area is starting to establish some guidance on the issue of temporary variances for research.

CHAIRMAN RIDDLE: And would you be working with the Crops Committee on that?

MR. CARTER: Yes.

CHAIRMAN RIDDLE: Okay. Any comments, questions, for Dave? Andrea?

MS. CAROE: Could you repeat the fifth one, Dave? I don’t understand what you wrote.

MR. CARTER: Yes. Is the issue of handling of organic and non-organic ingredients in the made with category, is the discussion on somebody with the 70 percent -- meeting the 70 percent, and they use, you
know, 70 percent of one ingredient, and then 20 percent
of a non-organic of the same ingredient. There’s been
some discussion about the blending of like ingredients
in finished products.

CHAIRMAN RIDDLE: And you may have missed it,
Andrea, but during public comment this came up a couple
times, that there is inconsistency in how that’s being
applied by certifiers. Some are allowing this, and
others are not. So there’s differences in how the rule
is being read. Yes, Kevin.

MR. O’RELL: So, Dave, your intent would be to
provide a -- some type of guidance document on that,
or...

MR. CARTER: Yes.

MR. O’RELL: Okay. And that’s working with
handling.

MR. CARTER: Handling.

MR. O’RELL: We may add that to the list.

CHAIRMAN RIDDLE: All right. Anything else
for Dave? All right. Speaking of your list, Kevin,
handling.

MR. O’RELL: The top priority for the Handling
Committee work plan would be the formation of the
agricultural and non-agricultural task force to make
recommendations for materials on 205 605(a). We’ll
prepare a statement of work outlining objectives, tasks, and timetable, and make a recommendation to the Executive Committee for that taskforce, along with appointees. The second would be the pet food draft recommendation to begin work on that as a committee. Third would be sunset material review process to identify those materials that may be problematic early, and try to get a jumpstart on those. And then there’s still -- I’ve had some questions on the food contact substances, so I guess once again we will try to clarify the qualification materials classified as food contact substances, and provide a guidance statement that the Board could vote on at the next meeting. And then we will be reviewing petition substances as needed. And I need to add to the list finally working in conjunction, I guess, with the Policy Development Committee on the use of, as Dave just indicated, the non-organic and organic ingredients in a made with category.

CHAIRMAN RIDDLE: Okay. Thanks. Any -- Rose?

MS. KOENIG: I guess on the, again, the task force for agricultural and non-agricultural, I mean, I talked a little bit to Kevin, but I guess -- yesterday. The first task really is to, you know, I consider it more of a board task rather than a taskforce task. And that’s really drawing those lines, you know, analyzing
the definition, analyzing what’s on the list. And I guess I say that in terms of -- I think it’s a, you know, we identified that, you know, the fete of those documents is more board policy as to how, you know, it’s similar to synthetic and non-synthetic, how we think or how we perceive AFFA [ph], you know, after analyzing minutes, analyzing AFFA, analyzing the regulation and definitions, and what’s on the list. And I guess I get a little nervous about doing that important function. And I think there’s other functions about that section which is more policy and how it looks. But as far as the definition of that, I think that’s, to me, the first priority. And I’m not sure if you really need an outside taskforce. I mean, I think we will seek recommendations from the public. But I guess the concern I have is that if you have a taskforce with various stakeholders, depending on who the stakeholders are, we don’t want a definition -- like I said, you know, you run into the problem where you start defining something based on specific substances rather than what’s the best for materials. So that’s just my personal suggestion.

CHAIRMAN RIDDLE: Thanks, Rose. And we did talk about that yesterday. And I think we’ll leave up to the Handling Committee to take the lead on this, how
they see best fit to bring something for our consideration.

MR. O’RELL: I think what we’ll do is -- because I haven’t had a chance to talk to the Handling Committee yet during this meeting, so I guess the first thing that we’ll do is have a handling committee meeting, get input from that committee, and try to prepare, as I said, the Statement of Work, as to what are our specific objectives, and the tasks that we need to accomplish. And then maybe from that we’ll see what is the best way to go forward. Maybe it will be to seek counsel from individuals, the public, and then to decide to do it as a committee. So I guess the taskforce, what I would say is that should not be specific. Let me change that to working with the Handling Committee to find out what are our objectives and needs, and if we can handle it internally, we’ll do that, and seeking public comment.

CHAIRMAN RIDDLE: Kim.

MS. DIETZ: I guess, Rose, it’s similar to your ghostwriters, that we want to make sure that we get historical input from -- so whether we call it a taskforce or we seek other information, I guess the issue with the taskforce is confidentiality. And while working on something like this, we felt it was important
that those people working on it understood our Board Policy Manual and that portion of it. So whether or not it’s ghostwriters or taskforce, as long as I think our goal is to make sure that we look at it and get as much information as we can, from past history and from past board members.

CHAIRMAN RIDDLE: Anything else for Kevin?

MR. MATTHEWS: Yes.

CHAIRMAN RIDDLE: Rick.

MR. MATTHEWS: Actually, this isn’t just for Kevin, but I’ve -- I’m concerned because I’m not hearing about the four documents that are going to go up on the website for comments. And I would think that the scope documents should be part of policy. The antibiotics should be included in George’s for livestock. And then we still have the other two issues that we also need to be -- well, yes, the fish meal and the inerts. And, obviously, we haven’t gotten to the Materials Committee yet. But we need to make sure that all four of those are on the work plan for your next meeting.

CHAIRMAN RIDDLE: George?

MR. SIEMON: I’d be glad to -- my understanding is we can work with you all about the clarification statements you all are putting out. But there’s nothing for the next meeting on antibiotics.
Then I’m confused.

MR. MATTHEWS: Then my question is, why are you putting them out for public comment if you’re not going to be acting on public comment?

MS. ROBINSON: Wait. Let’s -- I thought yesterday that we -- what we talked about doing -- George, you’re about to fall off the table there. I thought what we talked about doing was you’ve given us your feedback, and we committed to writing guidance statements to, in effect, give the department’s concurrence with the statements that you drafted. And then we were going to put the whole kit and caboodle up on the website and say, here’s what the Board said. We’ve heard the Board. Here’s our clarification statements, our guidance statements, and where there was the need for rulemaking, we would acknowledge that. And then we just post the whole thing. And, of course, the public is always free to comment. Now I guess maybe where Rick -- maybe I’m not understanding. But then if in your meeting in February -- or whenever we have this next meeting -- I suppose you could theoretically vote and say we accept the whole thing. But I thought we were going to kind of put this thing to bed and move along.

MR. MATTHEWS: Well, maybe I just need to have

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
clarification for myself. It was -- the impression I
took away was that we were going to be seeking public
comment on your documents. And if that’s the case, than
I thought we had to address that public comment. But if
you’re not seeking public comment, well, then that’s a
different issue.

CHAIRMAN RIDDLE: Yes. Barbara, did you...

MS. ROBINSON: Well, I guess, you know, Rick
and I obviously disagree a little here. My feeling is
that since April we have received public comment. I
doubt that anybody would seriously disagree with that.
I think you’ve heard it. We certainly have heard it.
So I think at this point the ball is in our court to
respond to the Board. And so that’s what I thought we
were going to do. And correct me if I’m wrong, it’s
possible I forgot. I knew I was going to say this, but
I thought I did yesterday, that over the course of the
next week I will write the draft. I’ll draft the
statements. We will submit them to legal counsel again
to make sure that they are comfortable with what we’re
saying, that they support it, but we will submit it to
you too, to tell you this is where we’re going. And
that hopefully, if we can push the legal folks and say,
don’t put this at the bottom of the pile. Read it and
tell us that we’re okay, that we can get this published,
you know, like within the next two weeks or so.

CHAIRMAN RIDDLE: George?

MR. SIEMON: Publish means here is our interpretation, and this is the way it is.

MS. ROBINSON: Right.

MR. SIEMON: That’s the objective here.

MS. ROBINSON: Right. Right. And then we would say, okay, so we have settled these issues as far as we can with guidance statements. And then the origin of livestock will require a rule change. Everything else, I believe we agreed we could issue clarification statements on.

MR. SIEMON: But, Rick, I think it would be great for all of the committees to take a look at the new statement coming out as part of our work plan. I think that’s awesome. You know, I’d be glad to do it. I just hope some day we settle these issues and move on too.

MR. ROBINSON: Rick, well, clearly, I was confused. So I stand corrected.

CHAIRMAN RIDDLE: All right. Well, I think it’s a good reminder for each of the affected committees to kind of have it as a placeholder that there is going to be a draft response coming from Barbara. And there will be a timely -- a need for a timely turnaround and
comments. And that may just be e-mail circulation and
not formal committee meetings to generate those
comments. Goldie.

MS. CAUGHLIN: Well, I just wanted
clarification as to the role of public response to the
action of both of us as it goes up on the web.

MS. ROBINSON: I guess -- here’s what I don’t
see. You know, we’re going to respond to you with, we
think that the dialog has taken place. And I thought
that when we said on Tuesday, when each of these
statements came up, and each of them was presented, and
I believe I clearly said, and the department concurs,
that means we agree, that we would, you know, end this
talk. Now that’s not to say that, you know, we
don’t expect to get any fan mail. Everyone in the
United States, in fact, everyone who operates globally
is free to comment. And, you know, we will accept those
comments. They can write letters to you, they can
comment to the department, and, you know, that’s all
fine, well, and good. But I’m not under the impression
that we’re going to ask for public comment to keep this
iterative process going. I thought we wanted to resolve
these issues and move on. So I guess what I’m saying
is, yeah, everybody can talk to us, but we’re not -- in
fact, if that’s what you want to do, Goldie, if you want
to go out and get public comment, this isn’t the process
to do it. That requires -- then you’ve got to go
through the formal rule making process. And why do we
want to do that?

CHAIRMAN RIDDLE: Goldie, follow-up? And if
we can wrap this up, please.

MS. CAUGHLIN: It wasn’t my intent to -- I
just wanted clarification. I wanted -- I think that we
are in agreement. I just wanted it to be so that when
people read our minutes or leave this meeting, they have
an understanding that, strange as it seems, we truly are
striving to show that we are in concurrence on exactly
what we have said. And I just wanted to underscore that
I think it’s important that that be understood, and
also, secondarily, I would -- to again affirm what you
just pointed out is that always at any time, whether or
not a document on the web says public comment in the
sense of the official or formal timelines and so on,
comment is always appropriate from anybody who is a
stakeholder. And we’re all stakeholders. And positive
comments are good too.

Anything else there? Okay. We have two committees left
to report. And, Nancy, I don’t think you were in here
when I had asked the chairs to prioritize the items. So
I’ll give you a little more time if you’re not ready, and we’ll go to Rose -- or you are? Okay. We’ll go to Rose first.

MS. KOENIG: I was trying to figure out kind of the priorities. Well, a new priority came on the table at this meeting, which is how do we kind of deal with the new contractors? How do we make sure they understand the system? How do we know that they understand the kind of product that they need to give us? And I thought long and hard about kind of the NOP’s proposal, and I think it can be done in a more effective way, personally. And so -- I thought I could. And then I thought, well, what is that? I mean, it’s easier to say, yeah, you can do it in a better way. And then I thought about a recent training that I’d been involved in in the regulation. And George, from ATRA [ph], was involved in it, and the University of Kentucky, and the University of the Virgin Islands, University of Florida, and Marty Mesh [ph], and Omerie [ph], and somebody else in there. But anyway, it’s -- and, again, I’m not the inventor of it. I worked with an extension. An individual works an extension and learns how to train, how to teach. And I found out that my learning type is I can take notes and, you know, I’m a very active learner. But a lot of people aren’t that way.
most effective way of really teaching somebody or training somebody is really interactive training. And I think that I would propose -- and I’m prepared to kind of give at least one -- write one module so that the NOP kind of understands the kind of proposal. But it’s really, as I thought about it, to take the products that we want -- we basically take -- either we could take some of the existing materials, but it’s probably better to take a material that’s already been reviewed, or materials that have already been reviewed, and identify the issues in each section of OFBA [ph], and try to, you know, so the learning objectives, for example, in a system of compatible -- in compatibility with agriculture, we have a document that lists all of those. And you would give, perhaps, the, you know, all three contractors in the same room, you’d give them maybe a section to read, you know, and then they would have 30 minutes, you know, with their team, whoever’s going to eventually do the writing to figure out what the, you know, where is this compatible or isn’t compatible, and then you do a critique or an analysis with them in the room to kind of point out the things that they, you know, because you have the answers already kind of what you think, what they did correctly, what were things that they missed, so that everybody’s on the same page.
You’re training everybody in the same way. You’re putting everybody on an equal playing field through the training.

CHAIRMAN RIDDLE: Rose, if you can just summarize the work plan items, because we’re got limited time before public comment.

MS. KOENIG: Okay. All right. But I’m just saying that that would be a priority because I think it is, even though I have these other documents on board, that’s, to me a priority, is do an effective training that can be done if -- the same way for future boards. The next would be the petition notification that we went through, because that probably needs to be gone through, rule making so -- we’ve got to work with the NOP and figure out if that’s enough, if we provided enough information and modification. We have to work in the committee and vote on those documents first, and make changes. But then, really, pass it onto them, and it’s their job, as I understand, to kind of go through the Federal Register process.

CHAIRMAN RIDDLE: Well, if you bring it to the executive after the committee has voted...

MS. KOENIG: Yes. I guess that would -- that’s what we would have to do in this case if we wanted to expedite that.
CHAIRMAN RIDDLE: Right. Okay.

MS. KOENIG: So we’d have to have a comfort level on the Board to do that. We have the sunset -- we voted on the sunset document, but we need to develop our internal procedures so that we get a handle on what kind of timeframe we need, and what we’re going to have to do as committees, so that when we have these 90 days, we’re prepared to do the work that needs to be done within the 90 days. So that’s making those operating procedures. And then we need to address pretty much all of the documents, kind of the non-synthetic versus the synthetic. I’d like to take that document and really try to start to identify kind of the policies, or the benchmarks, or whatever you want to call them, that starts really setting the parameters. And we need to vote on those by the next meeting -- I assume -- so we can operate by those as we go through materials. And I’d like to have that done before we start looking at any new materials -- and there will be some that come up on the next meeting, at least as a working document, I guess. I want to put on -- update, there’s a loose structure right now for a materials review, like you saw on the slides. There’s kind of an old system; there’s a new system that Arthur has been working on at the NOP. So we just need to write that down, and we need to have
it as a working document, whether it’s what ends up
being our practice two years from now. But we need to
really understand what the procedures are, and what
NOP’s proposing, and how we understand it to exist, and
make sure that there’s an agreement in terms of the
process. So I think the committee can work on that.
And then just really -- Jim had mentioned a pre-
screening. And I guess what you were referring to --
and I agree that committees, working with the committees
-- and I guess I would have to go on each committee
telephone call. But I would suggest that the committees
get together really early on and start identifying a
list of materials that they feel might need to be
reviewed. And this is on the existing materials list as
far as sunset, you know, do the first step, even though,
you know, it will go through the materials process as we
have proposed. But, you know, I think Richard and
Barbara identified a very good system, which will allow
us to start reviewing prior to that, you know, document,
and prior to the policy. Committees are now allowed, as
I understand it, and they’re willing to let us identify
materials ahead of time and start working on taps for
those materials that are going to need additional
review. So I would suggest committees do that really
quickly. And then I think it’s just kind of a
housekeeping item, the potassium carbonate issue that
Arthur mentioned. I’m not quite sure procedurally how
you want to handle it. I mean, there’s, again, a letter
on the table. He’s asked for committee response to the
letter. I mean, we can, as a committee, maybe draft a
response, and then vote on it as a committee. I just
don’t know if the executive committee wants to vote on
that draft and then give it back to Arthur.

CHAIRMAN RIDDLE: Well, I would think ideally,
yes, that there would be summarized for the executive
committee, and we’d have a chance to discuss it and take
a position.

MS. KOENIG: Well, then I would suggest, you
know, that’s, I think, another expedited item. So we,
you know, at the next executive call we would need to
have that draft done, because there was urgency in the
letter as far as the need for a response.

CHAIRMAN RIDDLE: Okay. Is that it?

MS. KOENIG: I think so.

CHAIRMAN RIDDLE: Is that all?

MS. KOENIG: Well, my only concern -- sort of
what Richard was saying -- I mean I proposed the AFFA,
you know, we were, you know, what are we doing as far as
the -- did the committees -- because I didn’t hear them
mention it, and maybe I was wrong, that I thought
livestock and processing was going to do the same thing, trial run for the AFFA criteria, and see where -- just like I did for crops, see where materials lie, if they fit within the criteria. But I don’t know, maybe everyone expected me to do that. But I can’t, I mean, I’ve done that for crops. I think it’s up to the committees because that’s one way committees are going to understand and buy in in the process. Because if I continue to do all of this, you know, you’re not engaged enough. And it’s a dramatic change. So I think committees need to start examining it.

CHAIRMAN RIDDLE: I thought I did hear livestock mentioned along those lines. But I think it’s good, good to keep it on the table. Any other questions? Yes? And we need to...

MS. DIETZ: I’ll be quick.

CHAIRMAN RIDDLE: Yes.

MS. DIETZ: Yes, Rose, I think handling would take that with the ag, non-ag, and look at the list all at the same time. That’s what we had discussed. I have a question for Richard and Barbara on the sunset. Thank you. Assuming -- if you could just really quickly take us through the steps once the Federal Register goes out and timing, so that the public has an idea of how quickly we’re talking about this Federal Register notice
going up, and how quickly the public has to respond, whether they want a material to remain on the national list, or they are going to do the work to have a material removed. There’s a sheet on the back of the sunset provision that gives us days.

MR. NEAL: Based on what we’re anticipating, we’re anticipating an ANPR, the Advanced Notice of Proposed Rulemaking to be published by the end of the year. Let’s say if it’s published in December, that gives the public 90 days to comment on that advanced notice of proposed rule making. That advanced notice of proposed rule making, we’ll be asking the public to identify the materials or the substances, exemptions or prohibitions that should be continued for use or not continued for use in organic agriculture production, where there may be some desire to remove substances, they would have to provide data to support their position within the 90-day period. After the 90-day period is up, the Board will commence its work in analyzing those comments. Once we receive the Board’s Formal Recommendation, then we will begin to draft a proposed rule.

MS. DIETZ: How long will it take the Board to do that?

MR. NEAL: 90 days for the Board. And we give
ourselves 90 days to draft a proposed ruling.

    MS. DIETZ: We like 90.

    MR. NEAL: Then after we draft the proposed rule, then you start the government process. The Office of General Counsel, they get 90 days. Office of Management and Budget, they get 90 days. Once we get it back from them, we can finalize it, put it out for public comment. The Proposed Rule will be out for public comment for an additional, I think, 90 days. Once we receive public comment, then we finalize the proposed rule, make it into a final rule. You get 90 days for that. Then it has to go through the government process all over again. So we’re looking at a pretty lengthy process. That’s why we have to start now. So the earlier the public can start generating their ideas, and concerns, and positions on the substances that are currently identified on the national list, those that have been on the list for five years, the better off they will be. And the same for the Board. If there’s some, as Barbara stated, that you know that you want additional information on, we can go ahead and begin to get that information now.

    MS. OSTIGUY: The -- I semi-prioritized them.
We need to deal with materials. The taps that we’ve currently been sent and soy protein islet, sunset priorities, reviewing the compost and compost T [ph] reports to make recommendations for potential board vote, guidance document on commercial availability of organic seed, hydroponics and guidance on temporary variances for research.

CHAIRMAN RIDDLE: Could you please repeat that a little slower?

MS. OSTIGUY: Okay. Materials, the taps that have come in, and soy protein islet, look at sunset priorities that the Crops Committee might have, reviewing the compost and compost T reports to make recommendations for a possible Board vote, guidance on commercial availability of organic seed, hydroponics, and guidance on temporary variances for research.

CHAIRMAN RIDDLE: Okay. Thank you. Any questions, comments for Nancy? Okay. And I do have one, and that is we did receive some extensive public comments in writing in advance of this meeting from a group called Wild Farm Alliance, proposing some changes to the kind of model organic farm plan that the Board has approved to strengthen some of the section on natural resources, and they will clarify the questions being asked there. And I think that we’re going to
hear, you know, verbal comments today. And I’d just ask that the committee stay open to adding that to the work plan, you know, as time permits. Biodiversity, you know, and conservation of natural resources. Any other comments, questions for Nancy? All right. Thanks. Oh, yes, Goldie.

MS. CAUGHLIN: Nancy, was -- when you mentioned hydroponics, it’s on there as a -- I mean, do you have any...

MS. OSTIGUY: My understanding is it was talked about on Tuesday, when I wasn’t here. No. I don’t know anything about it.

MR. BANDELE: Well, the Crops Committee did some preliminary work on hydroponics, in terms of trying to determine whether or not it fit under the auspices of organic production. And we waited for further feedback from the Policy Committee, which we now have. So we’ll move forward with it.

MS. OSTIGUY: Thank you.

CHAIRMAN RIDDLE: Okay. Anything else? All right. Thanks, all committee chairs. I think it’s obvious we all have our work cut out for us, and then some. All right. So we’ve got a few minutes left to talk about the schedule for next board meetings. And we had a preliminary discussion last -- or yesterday
afternoon, and it’s been proposed sometime in January or February, and you were asked to kind of check your calendars overnight and see if we can nail this down, at least to the week, today for that meeting. And then it’s proposed that the following meeting be in August. I don’t think we need to try and get dates. That’s going to depend on the whole movement of the sunset process. But I would just propose, for the sake of time here, February -- the week February 7, through 11. No. No. It’s -- I can’t before February 5. But after February 5, my daughter’s going to be married, and I’ll have one less thing to worry about.

MS. ROBINSON: Actually, Jim, NOP also -- a meeting in January is just not going to work. Let’s just cross off January.

CHAIRMAN RIDDLE: And I had -- yes, Kim.

MS. DIETZ: Well, I had said I’m gone ten days in February, so to be gone another 25-15 days -- how about the last week in February? Is that open for anybody?

CHAIRMAN RIDDLE: So that’s a no, George? You wouldn’t be available?

MS. DIETZ: The 28th through the 4th of March?

MR. SIEMON: How about the 21st, 22nd, 23rd of February, or I’d prefer, of course, the week before,
like the 16th, 17th, 18th.

MS. DIETZ: That won’t work for me.

MR. SIEMON: How about the 21st?

CHAIRMAN RIDDLE: Well, I propose the 7th through 11th. And it sounds -- I know it’s a burden, Kim, but...

MS. DIETZ: Well, I would prefer the week of the 21st. That would work better for me. It at least gives me four or five days at home without being on the road for that long of a time. So if the 22nd, if that’s possible, would be better. And if it’s not, than I’ll just have to see if I can make it or not.

MR. SIEMON: Is President Day, is that a holiday? So we can’t do it then.

CHAIRMAN RIDDLE: So Monday, the 21st, is a federal holiday?

MS. DIETZ: Yes.

CHAIRMAN RIDDLE: President’s Day, I believe. Okay. All right.

MS. ROBINSON: If we need to have a meeting over the course of a weekend, that’s fine. I will tell you, we would much prefer the meeting to be here in Washington again, particularly if we have new members, you know.

CHAIRMAN RIDDLE: Barbara is speaking.
didn’t quite -- you kind of trailed off there.

MS. ROBINSON: We would prefer the meeting to be here in Washington.

CHAIRMAN RIDDLE: Okay. Does the 22nd, 23rd, 24th work?

MS. DIETZ: Can we do it at the end of next week? I mean, that’s a week off for children, and for those of us who are parents...

MR. O’RELL: I agree. I have the same conflict, if that’s a week off for kids, I’m sure my wife has a condo rented somewhere for skiing.

CHAIRMAN RIDDLE: You’d rather not have the meeting in Washington then?

UNIDENTIFIED SPEAKER: Or we could have the meeting where your condo is rented.

CHAIRMAN RIDDLE: I knew this would be fun. I just didn’t realize how much fun. George.

MR. SIEMON: How about the 7th, 8th, 9th, of March?

UNIDENTIFIED SPEAKER: Then you’re getting into Expo West.

MR. SIEMON: I know. Well, the expo is the 17th, 18th, and 19th.

UNIDENTIFIED SPEAKER: I like having it up at
Kevin’s condo.

MS. DIETZ: I don’t carry around schedules. I don’t work on schedule. I don’t know if that’s spring break or not. I think it may be for elementary schools in Florida, but I don’t know.

CHAIRMAN RIDDLE: Well, at some point we’re going to have to sacrifice something.

UNIDENTIFIED SPEAKER: Or somebody.

CHAIRMAN RIDDLE: Yes. Let’s at least nail down tentative, and we’ll -- yes, Rick.

MR. MATTHEWS: You can just let us make all of the decisions for...

CHAIRMAN RIDDLE: Well, we tried that. I’m glad you’ve taken credit for all of our mistakes. Whatever it takes.

UNIDENTIFIED SPEAKER: The first three weeks in February is out. Right?

CHAIRMAN RIDDLE: For one reason or another.

UNIDENTIFIED SPEAKER: Okay. Well, that’s really the best time for me.

CHAIRMAN RIDDLE: Yes. I still -- February 7th, through 11th, and then I’m hearing March 7th, through 11th. Well, let’s get something down here, and then we will confirm it. This is still tentative. Whatever we walk away today is still tentative. But I want dates.
Okay. Let’s try that March one, between the 7th and 11th of March. Pardon?

UNIDENTIFIED SPEAKER: I just don’t -- I don’t know.

CHAIRMAN RIDDLE: You don’t know. Dave?

MR. CARTER: That works for me. I’m just getting nervous that we’re waiting that long for...

CHAIRMAN RIDDLE: Yes. Well, if we’re well prepared in advance, that’s the good side of it. It gives us more time to be better prepared. Rose and George, let’s...

MS. KOENIG: I guess I need a clarification. Are the board members that are no longer on the Board as of that date, will they be voting? Are they voting members? Because, I mean, I want to accommodate schedules, but if some -- if it’s between -- so, I mean, I think we need to accommodate, for one, the voting members, because those are the ones that actually are...

CHAIRMAN RIDDLE: Well, I appreciate your sentiment. George?

MR. SIEMON: Well, my concern, again, we are moving the meeting from April forward, earlier, so that we can get -- if there was a due process, get done by October 1, or get it done. So if March doesn’t work, I think we have to do it in February. So I’d have to hear...
from NOP if March is cutting -- because April was going
to be too tight, and March worries me, the way the
government moves, still too tight. So, to me, that’s
our -- we’re working around this work plan thinking now.
And for me, methaninine is a big issue, and I want to
work around that deadline.

CHAIRMAN RIDDLE: Barbara.

MS. ROBINSON: I realize you want to try and
get a date down here, but it’s, you know, how about go
back to the idea that we send you all blank calendars
for the weeks in February, and not -- I would really not
like to see you delay as long as mid-March. But let’s
just send around the calendars. Mark the calendars that
you -- this gives everybody time to go home, check with
families and schools, and find out what the spring
breaks and that sort of thing are. I know around here
there tends to be a spring break -- winter break, I
guess they call it -- in February sometime. But I don’t
know the dates. Look at your schedules and e-mail me
back the dates that you are absolutely unavailable. And
then we’ll send it back out and say, you know, here’s
what everybody says. And we ought to be able to do this
over the course of next week, if we just -- everybody
just reads their e-mails.

UNIDENTIFIED SPEAKER: So you’re going to...
MS. ROBINSON: Yes. I’ll send you blank calendars, and then you -- see, see, this is a sign.

CHAIRMAN RIDDLE: Okay. And so it sounds like a plan. Let’s set a deadline here. Within two weeks, how about that, everyone on the Board has weighed in and we nail it down at the first executive call.

MS. ROBINSON: That sounds fine. Can everybody do that, answer their e-mail within the next week, and reply back? If I don’t hear from you, I’ll bug you.

CHAIRMAN RIDDLE: All right. Thank you, Barbara. She has to check with John Ashcroft first. You’d make a good executive director for this Board. You know how to take charge. Appreciate it. Okay.

Nancy?

MS. OSTIGUY: Just a question. When is the next executive committee phone call?

CHAIRMAN RIDDLE: Yes. Let’s not try and do that right now. Approximately a month from now. And I’ll take the lead on that of proposing dates, and get that nailed down here in the next week, and then we’ll have it set two weeks ahead of time. Okay. Anything else here before we go to public comments? Great. All right. If there are people in the audience that haven’t signed up yet, right now I have the book. I don’t know...
if there’s another copy. But you still can sign up.

There are 18 people registered, which at five minutes
each, that’s, what, about an hour and a half? So we
should have time for five minutes per comment. I think
it’s an hour and a half. I think 12 times five would be
an hour. And another six times five would be another
half hour. Maybe we need a policy on this. At any
rate, we have three hours allotted, with a break in
there somewhere that we’re definitely going to need. So
I think we have time for people to have five minutes
each. Rick?

MR. MATTHEWS: Barbara factored in questions
from the Board.

CHAIRMAN RIDDLE: Oh. Okay. Well, while
they’re getting that figured out, I just want to give a
couple reminders to people that are going to comment.
There were some people who were signed up for Tuesday
that graciously offered to comment today, and they’re at
the head of the list. And, like I said, you’ll have
five minutes. If you have someone who signed up and
have a proxy, you can have an additional five minutes.
And please make note of that when you start your
comments so that the timekeeper is aware of it. Also,
when you begin your comments, state your name. And if
you’re representing any organization or company, please
state that. Goldie will be keeping time, and we’ll hold
up a one-minute warning sign. But if you don’t happen
to look up at that time and see it, that’s not her
fault. It’s just a courtesy. It doesn’t mean that the
clock is ticking, or it’s like in suspension until you
see the -- it means it was one minute when she held it
up.

MS. CAUGHLIN: I like that prior absolution.
CHAIRMAN RIDDLE: Yes. Yes. The blinking
light and then the buzzer.

MS. CAUGHLIN: Where’s the hook?
CHAIRMAN RIDDLE: Yes. The electric shock.
And also I would just ask -- the subject matter, as
always, is wide open. So any concerns or information
that you care to share, we certainly appreciate hearing,
appreciate you taking the time to come here. The one
thing that we will not tolerate is attacks on persons,
or particular companies, or organizations, so please if
you have critical things to say, that’s not a problem.
Just don’t make them personal in how they’re offered.
So with that, Bob Bolus is the first person up, and
Leslie Zook on deck. We’ll take a break a little bit
into this.

MR. BOLUS: Is this on? Thank you for
allowing me the opportunity to speak to the National

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
Organic Standards Board this morning. My name is Robert Bolus, and I speak today as a concerned organic consumer, a veterinarian with over 25 years of experience in aquaculture and seafood safety, and as a member of the National Organic Aquaculture Working Group. I wanted to bring a number of issues to the Board’s attention this morning. We are faced with a number of important decisions regarding the use of fish meal and fish oil in aquaculture, and to a lesser extent pet foods. And I wanted to point out some salient facts about fish meal and seafood to the Board this morning.

Seafood is an important part of a healthy and balanced diet. Specifically, it provides absolutely essential component to the human diet, the highly unsaturated omega three fatty acids EPA and DHA. These essential fatty acids are found nowhere else but in the marine food chain. They’re eaten by the larvae of all marine fish, which are then, in turn, eaten by bigger fish, like anchovies and sardines, which are, in turn, eaten by even larger fish like tuna and swordfish, which are, in turn, harvested by man. This is the marine food chain that accumulates the essential fatty acids, and makes seafood an essential ingredient in the human diet. In our search for these fatty acids, we have over harvest the ocean, and are in the process of collapsing
the marine food chain that I just described. We started
at the top by harvesting all of the tuna and swordfish,
and now we have moved down the chain and are over
harvesting the herring and the sardines to use as fish
meal and fish oil in animal and aquaculture diets. It
is true that the commercial fisheries have collapsed,
and that aquaculture has grown to fill the void. A
significant portion of the catfish, rainbow trout,
tilapia, salmon, and shrimp that we consume are today
raised on farms with prepared diets based on fish meal
and fish oil. Today, fresh water fish raised on fish
meal are nutritionally equal to the marine seafood that
we are replacing. But before we consider limiting or
banning fish meal or fish oil in organic farming, let’s
make sure that the nutritional value of the products we
label as organic are equivalent in nutritional value to
the products that we wish to replace. This issue is
especially important to pregnant and nursing mothers who
absolutely must have DHA in their diets to support the
normal growth and development of their fetus. We are
clearly faced with a dilemma. The USDA clearly
recognizes the importance of seafood in a healthy diet,
and recommends that we eat at least two seafood meals a
week. Pregnant and nursing mothers are encouraged to
eat even more, especially oily fish. The FDA, on the
other hand, advises pregnant and nursing mothers to stay away from seafood because it’s contaminated with mercury and other toxins, harmful for the developing fetus. This situation is so critical that marine algae are today raised specifically for the extraction of DHA oils. These oils are now supplementing over 90 percent of the human infant formula produced worldwide. The organic solution to this dilemma is to provide organic seafood to nursing mothers, who can then provide the essential fatty acids to their babies the natural way, through their breast milk. Issues of environmental sustainability in food safety have long been of concern to the aquaculture community. The 70 plus members of the National Organic Aquaculture Working Group have spent their entire careers in marine sciences and aquaculture, much of the time searing for sustainable solutions. Aquaculture is, on the surface, superficially very like agriculture, but there are fundamental differences in the way these animals are raised. The diverse membership of the National Organic Aquaculture Working Group brings critical expertise to the decision making process of this Board. I urge the Board to accept the recommendations put forth by NOAG, and detailed in their September 29, letter to the Board. And I also urge the committee to specifically list
essentially fatty acids on their approved supplement lists. These fatty acids are just as essential as vitamins, minerals, and amino acids. Their use is not only approved by the USDA and the FDA, but encouraged.

Thank you.

CHAIRMAN RIDDLE: Thanks, Bob. Any questions, comments?

MS. GOLDBURG: Can I ask you a question? Bob, I know you work or have worked for a company that produces marine algae for supplementation...

MR. BOLUS: That’s true.

MS. GOLDBURG: ...as a source of omega three fatty acids. And I know you’ve been interested in providing it as a feed supplement to increase omega three fatty acids in animal feed. And I wonder if you could briefly tell us what the prospects are at the moment for marine algae serving as a feed supplement.

MR. BOLUS: Absolutely. There is great potential. And most of it is being realized right now. The process is one of enablement. Marine algae and the biotechnology to raise them, very similar to yeast, has largely been to support the public health dilemma for human mothers and going into breast milk. But now these alga meals are being raised in larger quantities. In combination with fish meal replacement strategies, fish
oil replacement strategies can be accommodated by the use of these alga meals. There are a number of trials in place in many of the species that I mentioned that show that these alga meals can replace fish oil and fish meal completely in the diets, at least of lower food chain species. Right now shrimp, tilapia, catfish, and other orbiverous species can be raised completely without the use of products or marine ingredients. They're used to change the diets of carnivorous species, such as salmon, are going to require some more work. But right now the technology is being used by the rainbow trout industry, tilapia, catfish, and, of course, marine shrimp.

CHAIRMAN RIDDLE: Any other questions? I just have one. I think it’s a fascinating topic, and if you could -- would be willing to provide general information, not company specific information, to the Aquatic Species Taskforce for consideration of that issue.

MR. BOLUS: I certainly would.

CHAIRMAN RIDDLE: Thanks.

MR. BOLUS: You’re welcome.

CHAIRMAN RIDDLE: Or the Livestock Committee, I guess, too. All right. Leslie Zook, and then Daisy Putsty-Lein [ph].
MS. DONWHITE: In Leslie’s absence, if I may speak on behalf of the Pennsylvania Certified Organic.

CHAIRMAN RIDDLE: Okay. And that is...

MS. DONWHITE: Lisa Donwhite.

CHAIRMAN RIDDLE: Okay. And then the next on deck would be JoAnn Baumgartner. Thanks.

MS. DONWHITE: And, actually, in fact, I’m going to be reading testimony for NODPA, the Northeast Organic Dairy Produces Alliance.

CHAIRMAN RIDDLE: And, I’m sorry, just before you start, is this then ten minutes? Do you have...

MS. DONWHITE: No. Just five.

CHAIRMAN RIDDLE: Just five. Okay. Thanks.

MS. DONWHITE: Okay. Recent questions about the pasture requirement in the National Organic Rule have prompted NODPA to blueprint a pasture policy. This policy reflects our need as producers for a quantitative, measurable, and enforceable standard for all certified organic dairy operations. We feel that the ambiguous language currently used to define pasture requirements in the organic rule has lead to disparity between operations in various regions certified by various certification agencies and has opened the door for operations without adequate or, in fact, any pasture systems to pursue organic dairy production. NODPA is
expressing producer concern that certifiers don’t have enough tools to use in requiring pasture. While the rule may evolve at the federal level into something more functional over time, there is currently an interim period during which producers, certifiers, and processors are left with the responsibility of implementing a meaningful policy which can be applicable to organic dairy farms across the nation. Consumer confidence in the USDA certified organic logo is the cornerstone of current and future growth in the industry. To compromise that confidence by overlooking the intent of the National Organic Rule and the NOSB recommendation on pasture is not in the best interest of the organic dairy sector. Processors, with the cooperation of producers and certifiers, can set and enforce minimum standards to pasture which can help protect the integrity of organic until the NOP adopts language capable of doing so. And I would just like to read the most pertinent recommendations from NODPA. NODPA supports the pasture recommendation of the NOSB Livestock Committee, dated June 7, 2001, which stated that grazed feed must provide a significant portion of the total feed requirements for organic limited animals. The NOP has failed to adopt this recommendation, and has also failed to ensure that all certifiers require sufficient pasture systems as a
basis for certification. NODPA concludes the quantitative minimum pasture policy with measurable parameters needs to be adopted by certifiers, processors, and the NOP. Consistent with the NOSB recommendations and consumer expectations, NODPA recommends the following pasture standard for all organic milk producers, and these are organic dairy animals from six months of age and up must consume no less than 30 percent of their daily dry matter intake from pasture for a minimum of 120 calendar days per year, with a maximum stocking rate for lactating ruminants of 3,000 animal pounds per acre of pasture, up to a maximum of three cows per acre. Pasture is defined as land growing suitable grasses and other ferriages from which the ruminant animals self-harvest the plant material, which is still connected to its roots for food by grazing. Feeding green shop or any mechanically harvested or stored feed on a pasture setting does not qualify as pasture. Pasture must be managed to prevent environmental degradation. And the only stage or production exemption allowed is from birth to six months of age. Lactation is not an allowable stage of production exemption from providing pasture for milking animals for the entire grazing season. And I was asked to give you a copy of this. It does go on to define...
other recommendations that they make. And -- are there any questions?

    CHAIRMAN RIDDLE:  George.

    MR. SEIMEN:  Would you tell us who NODPA is?

    MR. SIEMON:  I meant...

    MS. DONWHITE:  Oh, who the group was.

    MR. SIEMON:  ...not the people in the organization, just so everybody’s clear who this is from. The Northeast Organic Dairy Producers Alliance.

    MS. DONWHITE:  Right.

    MR. SIEMON:  Right.

    MS. DONWHITE:  Yes. I’m sorry.

    MR. SIEMON:  Was that from the Northeast group or from the whole national group, that standard?

    MS. DONWHITE:  I’ll be completely honest with you, I was handed this paper about an hour ago, and told to please read it, so I’m not sure.

    CHAIRMAN RIDDLE:  Mark?
MR. KING: This is probably more of a statement than a question. But concerning -- I would call them stocking rates, that you have there in terms of, you know, pounds per acre, pasture, that sort of thing. But if we do get a copy of that, that would be interesting to see the references, and where those numbers came from.

MS. DONWHITE: Yes. And, in fact, it does go on to talk more about stocking rates.

CHAIRMAN RIDDLE: And if you can give -- well, with Katherine [ph], she had asked me to make that announcement, and I neglected to, so I’m in trouble already. So, yes, if anyone has written comments, if you just have one copy, please give it to Katherine. Otherwise, if you have multiple copies, then you can hand them out to the Board. So, JoAnn Baumgartner is next. Laura Smith has signed up a -- would assume you have a proxy for her or no?

MS. BAUMGARTNER: No. Well, I think I can do this in five minutes, maybe six.

CHAIRMAN RIDDLE: Okay. Well, but the next -- I just want to warn the next person -- that would be George Lockwood after Laura Smith. But you’re here. Thanks.
MS. BAUMGARTNER: Thank you. I’m JoAnn Baumgartner, with the Wild Farm Alliance. We submitted a request for the NOSB to consider endorsing bio-diversity additions to the organic system plan. I, myself, was an organic farmer for ten years, and for the last three years have been working with the Wild Farm Alliance. We’re a new organization. We’re composed of sustainable agriculture advocates and wild lands conservation proponents. I know how hard it is to farm in today’s economy, and also know that the management decisions can be and are made that balance the needs of the farm and the needs of diversity and natural resource conservation. A couple of years ago IOIA requested our assistance to help them train inspectors about bio-diversity since it’s in the rule, but there’s no common understanding of what that means. We received support from Organic Farming Research Foundation Others, and formed a committee of 15 members, including organic certifiers, organic farmers and inspectors, and conservationists to define criteria for bio-diversity conservation, and to create supporting materials that will be used by organic farmers and certifiers. Well, why should we care about bio-diversity? Consider, two thirds of the land in the continental US is in agriculture. Farming is responsible for about 40
percent of the endangered species listed. And ranching
is responsible for about 20 percent of their listing.
This is due in part to the habitat destruction, but also
water development and invasive species. Our committee
began the task of developing bio-diversity criteria by
reviewing the National Organic Program Rule. And we
found the definition, or course, that organic production
must include promoting ecological balance and conserving
bio-diversity. We also found in the preamble that it
shows the intent, the use of conserve establishes that
the producer must initiate practices to support bio-
diversity. And there’s a standard that requires the
maintenance or improvement of natural resources,
including wetlands, woodlands, and wild life. Our
committee then looked at the organic bio-diversity
recommendations and standards around the world, and made
the connection between what was required by the NOP, and
what others were doing. We have drafted two, 20-page
guidebooks for farmers and for certifiers. And during
that process our committee recommended that we submit
bio-diversity criteria as an organic system plan
addition for possible NOSB endorsement. By answering
questions and mapping resources, farmers will become
more knowledgeable about bio-diversity within and beyond
their farm, and inspectors will be able to see that they

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
are making an effort, no matter what their situation. The National Organic Program Rule is a great piece of legislation. And these proposed additions will help to implement the bio-diversity and natural resource components, as written. Organic farms are ideally suited to support bio-diversity, and at the same time take advantage of nature’s benefits. Additionally, millions of members of conservation groups that don’t currently support organics will be more than likely to when bio-diversity criteria are used and transparent in the industry. Besides, I work with the committee, we are connecting with the larger community. I just came back from Kenya, where IFOM [ph] had a bio-diversity conference, and they have some key bio-diversity standards. We’re working right now to put together a bio-diversity conference that will be ahead of the eco-farm conference in California in January. So the Wild Farm Alliance and our committee respectfully request that NOSB endorse the bio-diversity criteria we submitted as additions to the NOSB’s modal organic system plan, because certifiers and farmers look to the NOSB for guidance, endorsement additions will be a critical step in establishing a common understanding and expectation. We are not seeing to rewrite the rule, and are not seeking clarification. Rather, this action is
important in implementing the regulation as written. We
ask that the Board refer the proposed organic system
plan additions to the Policy Development Committee for
consideration in development of a recommendation for
action by the full board at your NOSB spring meeting.
Questions?

CHAIRMAN RIDDLE: Thanks, JoAnn. Questions?
Yes, Barbara.

MS. ROBINSON: I’d like to suggest to the
Board that for these particular comments, that you take
a look at them and remember the working group I was
talking to you about yesterday that’s getting going in
the department to take a look at programs across USDA to
make sure that they’re not inconsistent, and that they
are -- we provide consistent guidance program and
service to the organic community, that this set of
comments these guidelines you might submit to the
Natural Resource Conservation Service, get them into the
department somehow so that agencies whose primary
mission does deal with bio-diversity and conservation,
you know, are informed of this so that they get that.

MS. BAUMGARTNER: We do have -- we have been
working with NRCS, and, in fact, somebody here from
Washington who heads the CSP Program is on our
committee. So we’re both working nationally and locally
with NRCS.

CHAIRMAN RIDDLE: I’m also hearing, Barbara, your suggestion is that the Board, if the Crops Committee takes this up, or Policy Committee, but, yes, we need to talk about that, that we also engage or solicit input, and share information with NRCS as this moves forward. But it has been, I think, kind of an undefined area of the regulation. It is required. But how do you assess compliance with those bio-diversity and natural resource sections of the rule? Dave?

MR. CARTER: Yes. I was just going to say, I think that this is something that is more -- is appropriately handled by the Crops Committee.

MS. OSTIGUY: Thank you so much.

MR. CARTER: I don’t want to hog everything.

MS. OSTIGUY: Well, it’s actually sort of near and dear to my heart anyway, so it’s fine.

CHAIRMAN RIDDLE: All right. Mark?

MR. KING: Yes. I just want to thank you for your work. As someone who does a fair amount of farm inspections, I think that this is the type of information that’s really needed at that level. So thanks for your pursuits.

MS. BAUMGARTNER: Thanks for your support.

CHAIRMAN RIDDLE: Yes. Thanks. And I did
want to also point out, we receive the documents electronically, but they’re also printed after tab four, blue divider, in our meeting book. So they’re and for the public, they are in the meeting book posted on the website. Any other questions, comments? All right. Thanks. Next up, George Lockwood, and then Karen Robin, on deck.

MR. LOCKWOOD: Thank you, Mr. Chairman. I’m George Lockwood. I appear this morning as an individual, not as a co-chair of the working group, aquaculture working group. First of all, sir, I’d like to express our disappointment and my disappointment about us being limited last Tuesday greatly in our presentation, to six minutes. We came fully prepared for a 15-minute presentation. And as a result of being limited to six minutes, we were thrown off base and really weren’t able to get our points across. That being said, you’re moving ahead within the Aquatic Animal Taskforce. We ask -- I ask that not one token member from aquaculture be placed on there, but that several. We ask in our presentation that at least half the members be from aquaculture. Whether or not that’s realistic, I don’t know, but certainly more than one individual, no one person can adequately represent the five major species groups that are going to be involved.
with a multitude of farming practices that are employed across the country, and the multitude of feed options for some of these species. I would also like to say that as far as I’m concerned, you will receive my full cooperation and the cooperation of many, perhaps not all, of the members of the aquaculture working group that we’ve assembled. And finally, sir, let me point out something that we were unable to get across in our presentation. We are going to be seeing, we expect within a matter of months, a flood of foreign products certified as organic coming into the United States marketplace, particularly in the area of salmon and shrimp. We think it’s very important that the American consumer have products that are certified under the USDA, and not Natureland, which is particularly aggressive in aquaculture now, or some other foreign certification body, particularly those in Chile, which is where much of the salmon production is going to be coming from. So thank you, sir, for this opportunity to be with you again.

CHAIRMAN RIDDLE: Thanks, George. Any questions, comments for George? George.

MR. SIEMON: Now I can look through my papers. But where do we stand now on this imported -- with this scope that we’ve done? What’s the status of this
imported fish? Can they still use the word organic without any restrictions?

MR. LOCKWOOD: You can’t use the USDA label. But if it’s certified by Natureland, and says organic, it can be labeled organically certified by Natureland.

MR. SIEMON: So the scope work we did this week didn’t change that whatsoever.

CHAIRMAN RIDDLE: Well, we wouldn’t have changed it. We would have given a recommendation on how USDA handles it. But, Barbara, could you comment?

MR. SIEMON: Is there a concurrence on that too? I just can’t recall.

MS. ROBINSON: We have said you recognized and as George points out, we don’t yet have standards for aquaculture or for wild caught seafood. Therefore, the USDA seal can’t be used. The product cannot be represented to meet the NOP standards. But, yes, other folks can use the word organic. Now they can get their products certified by a USDA accredited certifier to a set of private standards. You know, that’s why the push is on to develop standards in the -- under the NOP, that will cover these products so that, you know, everybody will be held to the same standard.

CHAIRMAN RIDDLE: Anything else? Appreciate your concerns, George, and I apologize for the way
things developed on Tuesday. It was out of our control, just how popular we are.

MR. LOCKWOOD: Thank you, Jim.

CHAIRMAN RIDDLE: Way too many comments there.

Okay.

MS. OSTIGUY: I have a question.

CHAIRMAN RIDDLE: Yes. Sorry. Nancy.

MS. OSTIGUY: Does this also mean that an American producer could label their product organic without the USDA standard?

MS. ROBINSON: Yes.

CHAIRMAN RIDDLE: George?

MR. SIEMON: The Policy Committee, can you tell me why didn’t we make a recommendation on this here and to try to reverse the directive? On this, this time, I just read through the thing. It just says about the taskforces is all it said. There’s no way we could have --

MR. CARTER: Well, I think on this particular one we’re leaving it to the taskforce to give the direction on all of this. I think if we’re going to have a taskforce to establish aquaculture recommendations on aquaculture standards, in both wild caught and farm raised, I don’t think we want to sort of confuse the thing by issuing our own set of
recommendations for a policy and then also have a
taskforce that’s developing other ones. I think we
leave them to work on that.

MS. GOLDBURG: Can I ask a question of Barbara
or Rick? It seems to me there are two issues here, one
is that a US certifier can certify a fish as organic to
some private standards, or the livestock standard, and
whatnot, and we have a little bit of that going on now.
The other issue is that people certified of private
standards that are not US standards, they’re private
standards. And does the USDA have any legal authority
to restrict the use of the word organic in the latter
situation?

MS. ROBINSON: No. That’s why, even if you
made a recommendation, you can’t undo or create a
regulation or a statute by a recommendation alone.
That’s why we have to go out and do the standards. And,
you know, it’s the pre-October 21, 2002, situation for
those commodities that are not covered.

CHAIRMAN RIDDLE: Rose.

MS. KOENIG: I guess what’s confusing to me
then, when the standards are developed then is that when
you gauge -- engage in equivalency? I mean, what is
equivalency?

MS. ROBINSON: Once we have standards, any
product that comes into the United States that
represents itself as organic, once we have standards,
must be to NOP standards.

MS. KOENIG: I see. So that’s the
distinction.

MS. ROBINSON: Yes.

CHAIRMAN RIDDLE: Just a comment. It
certainly is confusing to consumers because now on most
products the word organic does mean USDA organic,
whether the seal’s on it or not. But yet that same word
can be on something that’s not covered by the standards,
and consumers don’t know the fine points here. And what
I’m hearing is the only possible remedy on these
categories in the short-term would be as was discussed
on Tuesday involving the Federal Trade Commission and/or
FDA, where there’s jurisdiction there, if someone has
reason to believe that fraudulent, misleading label
claims are being made. Correct?

MS. ROBINSON: That and getting your Trade
Association, getting your industry groups to do the
kinds of education, the public service organizations,
educating consumers to say that, you know, there’s NOP
organic, and then there are possibly private organic
standards. But that’s the unfortunate situation that
we’re caught in. And that’s why I keep reminding you,
go back to pre-October 21, ’02. You had the same
situation for all commodities. Now you’ve got, you
know, we’ve just got some that we have not brought under
the umbrella.

CHAIRMAN RIDDLE: Goldie.

MS. CAUGHLIN: It also -- I would like to just
point out that if the USDA seal were not a voluntary
seal, if it were a required, mandatory seal, that would
go a long way toward giving the information up front to
the consumer, because one of the biggest things that I
hear from consumers is confusion right on our shelves,
with products next to each other that are organic, one
having a seal, the other not having a seal. It comes up
all the time. And, certainly, when it comes to this
sort of a situation, would go a long way toward that.
Secondly, I just -- a personal comment, I guess. I work
with a chain of food cooperatives that has vowed that we
will not be permitting the sale in our stores of fish
labeled organic, unless or until there were to be USDA
standards, period, even at our own loss of revenue,
which we know the same products being sold in other
markets. And I think we’re seeing in co-ops, certainly
in many natural food stores, an opportunity to educate.
And, hopefully, I think this is really important to get
these distinctions out.
MR. LOCKWOOD: We’re also seeing now wild oats importing Irish salmon organically certified.

MS. CAUGHLIN: Some of the other large retailers have decided not to do that, in addition to our own, or not to, you know...

MS. ROBINSON: The only comment I would make in regards to that is -- well, two. Number one, the Agricultural Marketing Service, where this program is housed, is just that. It is a marketing service. There are very few programs within AMS that are mandatory. When it comes to marketing, the philosophy of this agency is that marketing programs are voluntary. They are something that industry requests, or industry desires, and then industry can avail themselves of the marketing label. The second thing is that I would say that although we believe and we -- well, we believe that the USDA NOP standard is the gold standard, and that’s what we worked hard to create, I would just say that USDA would not sit here also and say just because Ireland has an organic standard for salmon, that it is somehow, you know, that there’s some pejorative association with that. I mean, you don’t know. The Irish organic standard may be the gold standard that, you know, eventually is adopted. In other words, I don’t want to see you get into a situation of saying,
you know, oh, yes, the Irish have got a standard for salmon, because we don’t know. We haven’t done that kind of work.

CHAIRMAN RIDDLE: Thanks. Yes. We will not tolerate personal attacks on the Irish either. Owusu. And then I’d like to wrap up this discussion if we could.

MR. BANDELE: I just have a kind of related question in terms of the -- just a point of clarification. Like something like hydroponics, which is -- can be covered by the rule but in which no guidance has yet been given, than at this point a USDA accredited certifier could certify an operation that’s organic. Is that right?

MS. ROBINSON: Yes. Yes. We believe that hydroponics are covered under the standards. They fall under the crop standards. But we recognize that, you know, there may be additional details that need to be added to the standards.

CHAIRMAN RIDDLE: George.

MR. SIEMON: If you have any information about standards in the world, like the Irish standards, or any of the work you all have done so far, it would really be great if you could send us materials to give us a jump start when we start our working group.
MR. LOCKWOOD: I have a notebook, sir, that’s about that thick, of international standards, and just the sections that apply to aquaculture. And I must say that IFOM [ph] has taken the lead in trying to pull all of this together. But there’s a wide variety of practices that occur in the international -- under international standards, various certification groups. And I would also say as I said earlier, Natureland seems to be very aggressive in the area of aquaculture, and has certified people in Chile as well as in Europe.

CHAIRMAN RIDDLE: All right. Thank you. Dave.

MR. CARTER: Just one quick question. Without getting personal, but the standards that you just referenced that are being used in Chile, I mean, are they anywhere close to what you would want to see in the US?

MR. LOCKWOOD: That’s a subject open to a lot of conjecture. I think we’re just -- right now we’re too early to give any opinion on that. Like I said, Natureland has given a lot of thought and a lot of work to this. And our approach has been to not -- to use the international certification standards as references, but really not much of a guide. We want to see what they’re doing, but we want to do what’s best for the American
farmer and the American consumer.

CHAIRMAN RIDDLE: Thank you. Okay. And we will take a break in 15 minutes at ten. It’s a scheduled break. If we can get a few more commenters in before that. Karen Robin is next. Is Karen here? Okay. Well, there’s a quick one. Grace Mariquen is next, and then Morey Johnson. Are you ready to go, Grace?

MS. MARIQUEN: I’m going to let Morey go before me.

CHAIRMAN RIDDLE: Okay. If Morey’s ready to go, that’s fine.

MR. JOHNSON: Good morning. My name is Morey Johnson. I’m with NC Plus Organics in Lincoln, Nebraska. We’re a seed company based in Nebraska. My comments today are from my position with NC Plus Organics, and not as a representative of the American Seed Trade Association. I have been on the Organic Seed Committee of the American Seed Trade Association for a number of years, and will be chairman this coming year. This past June, our committee passed a recommendation onto the -- up the chain of command of the American Seed Trade Association. And it had several important points regarding organic seed. The first thing our committee recommended was that there be a National Organic Seed
database developed under the authority of the USDA and NOP. The operation of the database could be handled internally by the USDA or could be farmed out to a designated agent. Secondly, our committee made the recommendation that this database be located on the Internet, and seed suppliers and brokers could have access on a 24/7 basis to update their inventories and keep those current. This would be a database that could be used by farmers, by certifiers, by inspectors to check on availability of species or certain particular hybrids or varieties. Thirdly, we recommended that organic seed technology products, such as priming treatments, film coats, and pelleting also be listed, provided that they were consistent with organic rules. Fourth, on the database organic varieties would have a variety and scientific names. They would have the supplier name, and these would be organic only suppliers. And the name of the organic certifier of the seed would also be listed. And finally, we -- our committee recommended that certifiers notify the USDA of exemptions on a monthly basis so that seed suppliers and others could see what seed products were not available. So we made that recommendation this summer, and that went on through the chain of command at ASGA. And I believe that has been communicated, at least in a formal
way, to the NOP. But the database is just a beginning step. We kind of recognize that. And some of the work that you have done with the commercial availability on food ingredients, and some of the things that you have said there, we would like to echo that as far as seed. I believe you made a recommendation in terms of documenting non-availability of food ingredients. And that type of procedure, we would also like to see with seed where non-organic seed is being used. We would also like, as I mentioned earlier, that there be some sort of documentation used where allowances or exemptions were permitted for the use of non-organic seed. Organic seed suppliers are kind of caught in the middle here a little bit. There are a number of suppliers in the United States that have embarked on this process. And in many cases, they are sitting on inventory that’s not moving. And so there are a lot of seed suppliers that are wondering about the future. And we, at ASGA, and individually, would like to see progress made here and clarification of the rule so that as seed suppliers, as growers, we kind of know what the rules are.

MR. KING: One of the issues, I think, that’s prevalent here, and having reviewed some contracts and understanding the distribution chain a little bit is
that, you know, demand sometimes is driven by clearly
the purchaser or the contractor in this case. And they
may have, you know, form, function, quality, parameters
within that contract that fit a certain variety of seed.
I’m sure you’re familiar with this. Therefore, that’s
driven down to the production level. And, you know, in
some cases a certified organic seed may or may not be
available. And so I see that as part of the issue here,
and was just curious how you felt about that. Because,
you’re right, I would like to see all certified organic
seed out there. But it seems to be driven almost from
the opposite end.

MR. JOHNSON: And that’s certainly a good
point. In the case of, for instance, soybeans, there
are certain manufacturers who like a particular variety
because of how it goes through the manufacturing
process, I think that’s probably also true with some
vegetable varieties as well. So the end users, the
buyers need to be integrated into this. And I guess we
would ask that they be sensitive to the organic seed
issue. And I think -- I’ve been involved in this for
five years, and I think there’s been a lot of
development of organic seed varieties that could fit
some of these uses, and could be equivalent as for the
end user. But the end user needs to be involved too.

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
CHAIRMAN RIDDLE: Rose?

MS. KOENIG: Yes. Two things. I guess -- I was trying to understand. So is that a recommendation that your organization has, you know, as far as a database? I’m not quite sure when you were saying NOP, and having a database. I don’t understand if that was just a proposal or...

CHAIRMAN RIDDLE: Barbara.

MS. ROBINSON: We have been working with ASTA [ph] on this. And at this point we’re waiting for -- I think we’ve been talking with Chip Sunderstrome [ph].

MR. JOHNSON: Well, Alexis at the ASGA Office, I think, has registered with Keith.

MS. ROBINSON: Right. Right. We’ve had many conversations. And so we’re awaiting the forwarding of the data from ASGA, and we will publish it. Because I think, obviously, one of the keys here is let’s get the database up, the listing of suppliers of certified organic seed, so that folks, you know, know what is available, but also know what’s not available.

CHAIRMAN RIDDLE: A follow-up, and then Owusu’s in line.

MS. KOENIG: I guess, you know, in general, I don’t have a problem with. I just was wondering if that service was going to be provided for all types of input.
And that’s my concern. It’s -- I mean, if another industry, whether it’s fertilizer or other inputs on farms, do they have the same access to that kind of a situation? And then if everyone has that same access, I don’t have a problem with it. And then the other thing is, if it goes on the website, I guess if they’re certified it’s not an issue. But with the seed treatments and such, like you were -- who determines if those seed treatments are compliant with NOP? Is that just part of the certification process then? And when you get those seed treatments, then does your certifier make sure that whatever you disclose the materials to the certifier and they check to see if it’s on the list? I just don’t understand how that quality control -- I guess I’m a little scared or have reservations because there’s not -- there’s some natural, certainly like clays that are used in, you know, as -- for, you know. But there’s a lot of priming and such that may go on that really might be a gray area.

MR. JOHNSON: I guess on your first comment about why is this done for seed and maybe not further inputs, seed, I think, is one of the few areas where there is an allowance for an exemption based on commercial availability. In other words, on fertilizer I’m not aware of, you know, of possible exemptions. But
on seed, there was an allowance made for exemptions.
And there was no supply there originally. And maybe
that’s one difference. As far as any of the seed
coatings or pelleting, those all would have to be
certified as organic. They’d have to approved and that
type of thing, for them to be included in this database.

CHAIRMAN RIDDLE: Owusu.

MR. BANDELE: I was just wondering, I had two
questions. First, the seeds that are not moving, would
they be more likely to be organic or vegetable seeds?
And the second question is that with not a reason -- I
mean, it’s kind of a loophole if a farmer, for example,
insists on a particular variety, and that variety isn’t
available, but maybe something similar is. He could
kind of use that as a loophole. Would that be -- is
that part of that problem as well?

MR. JOHNSON: Well, first of all, I think you
were asking is vegetable seeds less available than row
crops. I think -- was that...

MR. BANDELE: When you were talking about that
they were not moving, that the -- yes.

MR. JOHNSON: Right. It kind of varies on a
crop by crop basis. On the small grains, I would
estimate that maybe 60 percent of the acres are using
organic seed. On some of the other field crops like
corn and alfalfa, it’s probably in the ten to 20 percent range. On vegetable crops, again, I think it varies quite a bit, depending on what the species is. There are some of these that are much easier to produce organically. My general feeling, in talking with the vegetable seed people, is that they have inventories that are not moving as well. For the vegetable it seems to be much more like Mark was saying, that the vegetable -- the buyers of, say, organic carrots request a certain variety. If that variety is controlled by the particular company, and they don’t want to do organic seed, then it’s not available organically. So in vegetables, I think the buyers have a much stronger role than, say, on something like corn or alfalfa. And your second question, I....

MR. BANDELE: No. That’s fine.

CHAIRMAN RIDDLE: Okay. I have a question, and then a couple comments. You mentioned about a draft, kind of a white paper that you have. Is that publicly available, or something you could make available to the Board? Our Crops Committee is going to be taking on this issue, commercial availability.

MR. JOHNSON: This was something that NC Plus and a couple of other companies participated in through the Organic Trade Association. At this point it is a
draft only. And it is being reviewed. But I don’t think it’s available today for public viewing.

CHAIRMAN RIDDLE: Okay.

MR. JOHNSON: But it should be fairly soon.

But basically what it does is it follows up and makes some suggestions for the future.

CHAIRMAN RIDDLE: Okay. And then, yes, I had a comment about this list or database. And those are two very different things. There currently is a list of feed suppliers on the NOP website. And I don’t know, I assume that someone just has to provide proof of certification, and they’re on the list. It’s a voluntary list. It’s not a recommendation of any company. I think it says something like that, disclaimer there. And I can see, you know, without a lot of effort or expense, the program, doing a similar list of organic seed suppliers. But what you suggested was a real time database of inventories of varieties, as I understood it. And I just wonder if that is appropriate, or what. And even for both of these things if the department might look at outsourcing or moving that to a group like ATRA, which is an information supply, you know, that under contract to USDA. Just some thoughts. We don’t have to work this out now. I just wanted to...
MR. MATTHEWS: Well, the details on how it would get posted haven’t totally been worked out. It’s just that we have expressed a willingness to work with making this happen. And if it’s real time we may have security issues. So it might end up being something like a link to another site. But the point is we are willing to work with ATRA to provide both producers and the certifying agents with the information they need to comply with the regulations.

CHAIRMAN RIDDLE: And it’s a huge need. One last comment, and then we’re going to take a break.

MS. KOENIG: The one concern I have, and I think it’s probably your agency and your committee is fully aware of it. But one of the treatments that we just -- well, one of the substances that we approved, I guess last meeting, was for de-linting cotton. And there’s a lot of, I know, inputs that you use in terms of the processing of seeds for either disinfection. And then there are techniques, at least in vegetable crops, where you use inputs to do like seedless watermelons, those, you know, for the eventual expansion of the organic seed market into specialty crops or things where you have to do genetic -- non GMO genetic manipulation. Those substances would have to be included on the list. And I think the industry needs to start thinking about
those petitions, because we have the money now available
to look at those specialized uses for seed treatments.
And this is the time to, as an industry, get on the ball
for those petitions, because those types of seeds that
would require those kinds of, you know, synthetic
substances to produce the organic seeds need to be
petitioned, or else they really should not be, you know,
they’re not allowed.

CHAIRMAN RIDDLE: Arthur.

MR. NEAL: I want to address Rose’s issue. If
I understand, tell me correctly, that the companies that
would be listed would be certified. So if the companies
who were providing the seeds are certified, than the
certifying agent would ensure that the seeds were
produced according to the standard. So that should...

MS. KOENIG: Which I fully understand. And a
lot of ferriage crops or grain crops is not as much of
an issue. But once you get into vegetable crops there’s
issues there that are not -- that are a lot more
chemical. And I’m just saying, I agree, I’m not
questioning what is certified now. I’m just saying for
the industry to continue to grow...

MR. JOHNSON: One comment I would make. This
past summer I attended the International Organic Seed
Meeting in Rome. And one of the things that just really
impressed me was the number of seed treatments, seed
enhancement type products that are being investigated
and looked at in Europe. For our company and for a lot
of the companies I know, we don’t use anything, but we
have started looking at a couple of products that are on
the armory list. So I think as time goes ahead, there
will be more of these kinds of products that people will
need to look at.

CHAIRMAN RIDDLE: Okay. Thanks.

MR. JOHNSON: Thank you.

CHAIRMAN RIDDLE: And we will -- when we come
back from break -- I’ll say this first before we break,
Grace Mariquen will be first up, and then Richard
Siegel. And we will break until 10:20. But please be
back and ready to go for discipline. We might finish
early.

***

[Off the record]

[On the record]

***

CHAIRMAN RIDDLE: Next up is Grace Mariquen.
And then there’s a slight change, and following Grace
will be Gwendolyn Wired. Thanks. Go ahead, Grace.

MS. MARIQUEN: Should I wait for Goldie or...

CHAIRMAN RIDDLE: Pardon? Oh, we don’t have
our timekeeper. Yes. There’s some problem with the
women’s rooms, I guess. I don’t know anything more.
Can you handle that, Mark, please?

MR. KING: Yes. I’ll do my best. Are we
ready?

CHAIRMAN RIDDLE: Okay. Mark’s going to fill
in as timekeeper.

MS. MARIQUEN: Set, go?

CHAIRMAN RIDDLE: Yes, please.

MS. MARIQUEN: My name is Grace Mariquen, and
I’m president of Mariquen International Organic
Commodity Services, Inc. My company is based in Santa
Cruz, California, and we import organic ingredients and
supply organic ingredients domestically for the natural
food industry. I am here to explain to the Board why
the national list should be amended to reclassify yeast
as an agricultural product. Yeast is currently listed
as a non-synthetic, non-agricultural substance under
Section 205605(a). On July 30th, we requested that the
Board adopt a recommendation that yeast be transferred
to Section 205606, as an agricultural product. Yeast is
a product that needs to have its status updated on the
national list. Yeast is now commercially available in
an organic form. I know this because I import organic
yeast from Europe. The manufacturer is Ograno [ph], in
Regal, Germany. The organic yeast is called Boreal [ph]. It is certified organic by two organic certifiers in Europe, Lackon [ph] in Germany, and Beoswiss [ph], in Switzerland. Both of these are NOP accredited certifiers. The story begins back in 1997, when the first proposed NOP rule was published. Organic yeast was not yet available, so it was necessary to put the yeast on the list. When yeast was first listed it was treated as a non-synthetic and as a non-agricultural substance. At the time it did not seem to make any difference whether yeast was called non-agricultural rather than agricultural. Yeast belonged on the national list, and the category didn’t matter. In the second proposed rule and in the final rule, yeast continued to be carried as a non-agricultural substance under Section 205605(a). Then in 2002, when I began importing organic yeast, to my great shock I learned that my organic yeast was not on par with other organic ingredients. Manufacturers making organic products are not required to use organic yeast once they meet the 95 percent organic threshold. Handlers are free to use conventional yeast instead. The yeast I brought over from Europe did not sell, and I took a serious financial loss as a result. The final rule does not recognize organic yeast as an organic product. Why? Because in
the final rule, yeast, in general, is not classified as an agricultural product. So in theory, is it not certified organic. In a letter from Richard Matthews, on February 11, 2004, he confirmed that under the final rule handlers are not required to source organic yeast. I will now show you two labels. And, in fact, it’s in your packet. One of them is for halla [ph] bread from Whole Foods, and the other is from Willaver’s [ph] Certified Organic Ground Ale. And when you look at these labels, you’ll see that all the ingredients listed are organic until it gets to yeast. And the yeast is not organic, what’s being used. And the same applies to the ale. This is a paradox because organic yeast is just as commercially available as these other ingredients shown on the two labels. This is why we have made our request to the Board. At this time we are not trying to get yeast removed from the national list. Instead, we simply want to get yeast out of its straightjacket category that it’s in right now as a non-agricultural substance, and have it into a category of being an agricultural product. This will recognize that organic yeast is on the market. It will give organic yeast an even shake with other organic ingredients. Once yeast is classified as an agricultural product, then manufacturers will be required to use the organic

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
yeast under the organic preference, Section 205301(b).
They will start putting this new organic yeast into
products, and it will enhance the integrity of their
products. They will stop using conventional yeast,
which is made with synthetics. Organic yeast is made
without any synthetics. Here are some of the synthetics
that are used today in conventional yeast that’s being
used widely, ammonia, ammonia salts, sulfuric acid,
caustic sodalize [ph], synthetic anti-foaming agents.
And the waste water is really difficult to dispose of,
whereas in the organic yeast the waste water is used to
produce further products. What we’re asking is in line
with prior recommendations on the Board to look at
205606. The reason that 205606 has those five
ingredients listed is that the Board, in June of 2000,
asked the Department to move those five ingredients from
non-agricultural to an agricultural status. The
Department did this in the final rule.
CHAIRMAN RIDDLE: Time.
Rosie?
MS. KOENIG: As far as the classification, I
guess what I have a hard time understanding is if, you
know, and I read the -- I think Mr. Siegel’s letter was
from your company. Right? So I didn’t want to -- okay.
That’s what I thought. So based on that concept, if yeast is similar to mushrooms and mushrooms is under the crop standards, how, in a farm system plan, can you raise yeast to meet the requirements of the cropping requirements within a farm system plan? I mean, it’s beyond just what you grow something on.

MS. MARIQUEN: Well, is mushrooms certified organic right now?

MS. KOENIG: They are. But, you know, yeast -- there’s part, you know, yeast is a unit nucleate, you know, fungi. Not all -- figure you have, you know, a kingdom of fungi, and not all fungi are looked at as the same. And the edible fungi are fruiting bodies of certain higher, you know, fungi. So I think you need to, perhaps, look at -- and, you know, I kind of requested the processing -- although I think it’s beyond a processing -- committee -- handling committee -- sorry -- issue. But a lot of it has to do with if you’re going to bring biology into the analysis, than you really need to look at the biology of the systems, and you have to look at it in terms of the crop standards. So it’s not as simple as just saying it’s a fungi, therefore, it’s agricultural.

MS. MARIQUEN: I’m not a biologist or a scientist by no means, so I can’t address it from that
standpoint. But I do know that right now we have broccoli sprouts certified organic. We have mushrooms certified organic. We have the yeast that’s grown on whole grains, corn, wheat, and produced throughout its system with grains. So it’s an interesting point you’re bringing up from that perspective. But right now we already have set up a precedent. And I think that it’s an interesting point to be looking at, because this is just the beginning. There are people developing different kinds -- lactobacillus, that’s another one that just comes in right behind the yeast. There are people now working on a series of ingredients. So it’s important that you’re looking at this category in general, because this is only one part that you’re going to have to address.

CHAIRMAN RIDDLE: Kevin?

MR. O’RELL: Grace, I’m glad that you recognize that there is -- there are other materials on the list that would maybe come under the same -- qualify under the same decision that we’d be looking at yeast. And if you heard earlier on the Handling Committee work plan, this is a number one priority. We will be meeting on this quickly to try to see how we move forward. It’s a, certainly, a complex issue that will need to be handled, and we’ll be looking for public input as much
as we can, and getting counsel as well. This product, the yeast product that you are talking about was certified -- is certified organic by Beoswiss. Do you have their standards of how they -- or can you provide those?

MS. MARIQUEN: I think we’ve submitted a standard. If not, I’ll make sure that you have that. I think we did -- we submitted the one from Latcon. And I’ll get the one from Beoswiss.

MR. O’RELL: That would be fine. Thank you.

MS. MARIQUEN: And I also wanted to say, I’m very encouraged and glad that you’re considering this meeting that’s coming up in spring, because these are very important issues to be addressed.

CHAIRMAN RIDDLE: Kim.

MS. DIETZ: Grace, I just wanted to thank you for your patience in this process. It’s been probably a couple of years that you’ve been going and forth and trying to figure out exactly what to do with yeast, and whether we petition to remove it, or whether we work on what angle. And I also remember our first conversation when you were like, what a mess this is. And how do you guys deal with these regulations? And you sound like you’re a pro. You did very well. I wanted to tell you that. So learning is the way -- getting your feet into
it is how you learn. So thank you for your patience, and hopefully, we can figure it out for you.

MS. MARIQUEN: Thank you. And thank you, all, for your dedication and hard work. I think we all in the industry appreciate it.

CHAIRMAN RIDDLE: Thanks, Grace. Next up is Gwendolyn Wired, and then Richard Siegel. And I would just ask -- we’ve had a few more people sign up, and so we’re really going to be pressing time limits. So if the Board members can keep their comments and questions as succinct as possible. Thank you.

MS. WIRED: Good morning, Mr. Chairman, NOP staff, and ladies and gentleman of the gallery. My name is Gwendolyn Wired. I am the primary processing program reviewer for Oregontilth Certified Organic. I did pass out my comments -- it was a fairly thick packet -- on Tuesday, because I was planning to go on Tuesday. And I’m hoping that you still all have that.

CHAIRMAN RIDDLE: That was the...

MS. WIRED: Correct. If you don’t, I have more copies here.

CHAIRMAN RIDDLE: That says Oregontilth Certified Organic up in the header.

MS. WIRED: Correct. All right. I’m here today to present you with the work that Oregontilth has...
put together in regards to distinguishing agricultural
from non-agricultural substances for use in organic
process products. I’m extremely pleased to hear that
the handling committee is going to be working diligently
on this to address this issue. And I’m hoping that our
work can significantly help you in this effort, that it
can provide a springboard, a foundation to work with.
As a leading certifier of organic process product,
Oregontilth has been faced on several occasions with the
challenge of reviewing many new and some not so new
ingredients that are entering into the organic
marketplace. And in so many of these cases it’s just
extremely challenging to determine whether the substance
would fall under the national list definition of
agriculture, agricultural product, or non-agricultural
substance, and therefore, need to be petitioned. In
addition to looking at these ingredients on 605, and
figuring out whether they should go to 606, the other
problem, from a certifier standpoint, is that where
people are submitting these ingredients, such as mallic
[ph] acid, and steric [ph] acid, and innulen [ph], and
they’re providing us with this background and saying,
this is an agricultural product. And so you’re seeing
those ingredients on the panels of organic products now
in the marketplace. And we don’t know what criteria was
used to determine that that particular ingredient was, indeed, an agricultural product. The definition of an agricultural product is -- it’s broad, and that definition alone certainly, you can bring in all sorts of things -- the non-agricultural substance, a substance that’s not a product of agriculture, such as a mineral or bacterial culture that’s used as an ingredient in agricultural product. Here the example of a bacterial culture not being a product of agriculture raises the question of whether this refers to microbial cultures. And if so, then how does organic mushrooms and organic yeast, both of which are commercially available as organic, fit into this? For the purposes going on with the definition for the purposes of this part, a non-agricultural ingredient also includes a substance such as gum, citric acid, or pectin that’s extracted from, isolated from, or a fraction of an agricultural product so that the identity of the agricultural product is unrecognizable in the extract islet or fraction. The concept that an ingredient product or substance is no longer agricultural once the identity of the agricultural product is unrecognizable is nearly impossible to evaluate. And it’s not consistent with many of the agricultural products currently on the market. Most processing activities render the finished
products as unrecognizable from their original raw materials. Substances that are clearly recognized as agricultural products, such as Malta dextrin [ph], rice syrup, and vegetable protein could all be classified as non-agricultural, according to this definition, without further specification of the term’s identity and unrecognizable evaluation of the substance is difficult, at best. And furthermore, the examples of pectin and gums as non-agricultural substances is completely confusing, because both of these substances are also listed as agricultural ingredients. So in response to this, Oregontilth has put together a decision tree that’s meant to provide a standardized and transparent evaluation tool to ensure consistence among certification agencies and the organic industry. I provided you with the decision tree and accompanying narrative that explains the issue, the basis for the questions used in the decision tree, definitions to support the terminology used in the decision tree, and several examples of substances evaluated using the criteria set forth in the decision tree. I don’t think now is the time to go into the details of the decision tree. It’s a very complex subject, as we know. I put the document together. I have a degree in food science and chemistry with an emphasis on fermentation science.
And I also consulted with food science professors at the university I went to school at. So I’d just encourage you to use this information that we have provided in your process. Thank you.

CHAIRMAN RIDDLE: Thanks, Gwendolyn. Kevin?

MR. O’RELL: Yes. Just a comment. Thank you for the information. It’s very thorough. And I think it will certainly help us, and will be considered in our process as we determine this, because not only do we have to look at the materials, but we have to provide criteria and guidelines as to how we determine what is an agricultural product.

MS. WIRED: Thank you. And I also would like to offer my services in any way, any help in the process. I’d be more than happy to help out. Thank you very much.

CHAIRMAN RIDDLE: Yes. Thank you.

MS. ROBINSON: Yes. Do you -- you said you had more copies?

MS. WIRED: I do, yes.

MS. ROBINSON: Can I have one, please?

CHAIRMAN RIDDLE: Richard Siegel. And next up -- I’m losing track here -- is Mike Norman.

MR. SIEGEL: My name is Richard Siegel. I’m a lawyer in private practice here in Washington, DC. And
I’m speaking today on behalf of a group of 15 companies that supply organic ingredients. Rather than read the 15 names, they’ll be on the statement that I -- written statement that I give you. The phenomenon of multi-ingredient organic processed foods is familiar to all of us. And these new products have required a constant stream of new materials that were not previously available organically. These 15 companies that I’m representing today are active in a sub-industry that’s providing these ingredients, flavors, yeast, lecithin, molasses, spices, and colors are just some of the examples. It was anticipated that because the regulations provide for organic preference for these ingredients, that these ingredients would come to market. They would be taken up. They would be incorporated into organic products in a seamless way. And this is in a process of continuous improvement. But the ingredient companies that have gone into this business, I have found that in many cases this has not happened, and there have been departures from the principle of using only organic ingredients when available in organic processed foods labeled as organic. This has an affect on the organic integrity of the products. The permission to use a non-organic ingredient is a privilege. And this privilege should
not be abused. At the critical control point here are
the certifying agents. They make the critical decisions
working with food processors. In some cases certifying
agents have found conflicting interpretations as to
whether an organic ingredient could be used or must be
used. Omry [ph] has made interpretations which have
raised some questions. Also, there’s a dilemma when
organic ingredients come on the market, but they’re very
much more expensive than conventional. And this puts
the certifiers into sometimes a delicate situation. How
far should they go in being -- in requiring their
certified entities to use these ingredients? And
mainly, there’s a -- there are gaps in information.
Beginning last fall, the organic ingredient sector put
together an informal group of companies, which now
number 15. We presented correspondence to the NOP in
January. And we received a letter on February 11, from
Mr. Matthews, which he subsequently posted on the
website. And we’re very happy with this response, this
prompt response, and this very good first start. We
also hope, at some point, to see questions and answers
also added to the website, which will further clarify
and sharpen what our issues were. This leads us to the
next development, and that was what the Board did in
Chicago when you adopted the recommendation of your
York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
commercial availability 606 taskforce. The companies that I’m speaking for today want to thank the Board for doing this, taking this action, because we think that tightening the procedures for greater transparency and greater accountability will move this quite along. The suggestion that there be reports from certifiers each time they grant exceptions to the organic ingredient, we think that an annual report is not enough, and we would like to see this done on a spot basis. We would like to see this happen each and every time there’s an exception granted. This would probably be easier for the certifiers to do than to wait for a year and then retrieve all the information from 100 different scattered files. So that’s one issue that we would like to enhance -- see the commercial availability proposal enhanced by making the reporting by certifiers of the exceptions granted in ingredients be far more frequent than annually.

CHAIRMAN RIDDLE: Time. Conclude your thoughts there.

MR. SIEGEL: My concluding thought is we are in this industry talking more and more about our -- having a database similar to the one for seed. And we’re considering maybe using the OTA database in a different way.

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
CHAIRMAN RIDDLE: Kim.

MS. DIETZ: Thanks, Richard, for your comments. We all know that our industry is growing, and that organic, raw materials are becoming more and more available. When I as a buyer with Smuckers, about ten years ago, we actually developed the first organic flavor. We paid a flavor house to use citrus oil, organic citrus oil. We used organic extraction ingredients. And we were the only supplier at that time of organic flavors, a lemon and lime flavor. What we’re seeing is organic flavors are becoming more, and more, and more available on the market. What we’re also seeing is that the commercial availability of those quality, quantity, function, form, are not yet at the same point of natural flavors. So I would ask you to put your thinking cap on, and those 15 people that you have with you, because how are we going to transition? We’ve come leaps and bounds from ten years ago when we had no tools, basically, to any time something becomes available, we put it in as an organic form. But we still don’t have all of them. And I’m sure that’s the same with yeast. There’s all different forms of yeast. There’s all different forms of different products. So that’s going to be this dilemma, and this Board’s dilemma in the next few years with the sunset is it’s
not just the black and white, and it’s not just one product. It’s several different forms of the same product.

MR. SIEGEL: Thank you.

CHAIRMAN RIDDLE: Thanks. Anything else?

Thanks, Richard.

MR. SIEGEL: Thank you.

CHAIRMAN RIDDLE: Okay. Mike Norman, and next up Brian Baker.

MR. NORMAN: Well, my name is Mike Norman. I’m here representing AAPFCO, the Association of American Plant Food Control Officials. I am associated with AAPFCO because I am myself a plant food control official with the Washington State Department of Agriculture, and I’m responsible for all of the commercial fertilizer registrations at Washington State Department of Agriculture. So I’m the official AAPFCO liaison on the NOSB. And if you have any questions or comments you would like to take to the -- excuse me, did I say something funny?

MS. DIETZ: No, sir. I apologize. The alphabet soup that we all live with, and it was beautiful.

MR. NORMAN: Oh.

MS. DIETZ: I’m very sorry. I’ll extend your
MR. NORMAN: So I’m your point of contact for the NOSB and NOP. If you have any questions or comments you want to take to the AAPFCO, you can contact me at my Washington State Department of Agriculture e-mail address, which is Mnorman@agr.wa.gov. That concludes my presentation. Any questions?

CHAIRMAN RIDDLE: Rose?

MS. KOENIG: Yes. On the -- I guess it was -- I’ve seen so many documents -- I think it was the scope document where there was an outline of sort of what your organization was proposing in terms of labeling. My question to you is, you know, I guess are you -- how do you want to work together? I mean, it sounds like your agency has kind of lead the way in determining kind of a labeling system. But is there any way that we can help support it? You know, what would you like from us also?

MR. CARTER: Can I...

CHAIRMAN RIDDLE: Dave?

MR. CARTER: Yes. If I could, and if you could just give us an overview of the deliberative process or the decision making process that is used within AAPFCO? I’m a little bit familiar with AAFCO [ph] but not with AAPFCO, about how long it takes, what’s your committee process, and the like.
MR. NORMAN: Okay. My first suggestion is always use the acronym by the letters, like I did. The AAPFCO is the Plant Food Control Official. There’s the AAFCO, which is the Feed Control Officials. And there’s the AACO and AA Pesticide, PCO. So it’s -- because especially for AAPFCO, which is plant flood, fertilizer, and the feed, control officials, which is AAFCO. The acronym is phonetically pronounced the same way. So it’s helpful to just say the letters. The next meeting -- okay, first of all, make it clear that we’re talking about labeling for fertilizers, okay, not end use products consumed by people. So that’s a real big distinction. And the way to start would be to e-mail me. The next meeting is in February of 2005. The comments need to be in 60 days ahead of time. If you want your voice heard at the table, send me an e-mail and I’ll forward it on. Right now AAPFCO has developed a definition for organic input that was proposed in 2004, in February. I believe it went to tentative status in August, at our annual meeting, and that’s just basically a definition that more or less says a product that meets NOP definition for allowable and organic production according to NOP. Then there was a policy statement, same thing, it was proposed in February 2004, and it went to tentative status in August 2004. And it
relates to organic inputs as defined previously. Now this is what you could put on the label of a fertilizer, and this product meets -- is an organic input, and is allowable under the various different programs out there. It could be NOP. It could be the Washington State Department of Agriculture’s Organic Food Program, you know, any type of OMRI, you know, any of that type of thing. It’s kind of a bit of a four or five laundry list of different organizations. So that’s kind of just in the infancy, just getting started. And neither of those are final. And that will be up for discussion in February of 2005. And you need a 60-day lead time. So your deadline to get them to be would be about December 7, a day that may or may not live in infamy. That’s a joke. And then that would give me about four or five days to get the comments to AAPFCO people so that they’ll have time to get it on the agenda and all that type of thing.

CHAIRMAN RIDDLE: Follow-up, Dave?

MR. CARTER: Yes. Well, that’s -- because I don’t know if you’ve looked at the scope document that has been forwarded here. But we do reference that, you know, on August 3, 2004, AAPFCO, E-I-E-I-O, considered the following amendment to its model regulation, and it went through the specific language you have there. And
then the amendment’s been referred to AAPFCO labeling committee for further consideration. And then we acknowledge that, you know, this is handled by state authorities, and we recommend that the NOSB endorse the draft labeling definition for organics. So we’re trying to endorse that. And what we’re trying to figure out, this is where within we would need to submit something by December 7, to get it on your docket for...

MR. NORMAN: Yes.
MR. CARTER: Okay. All right.
CHAIRMAN RIDDLE: I have a quick comment, and then Mark. I just really want to thank you for coming here. It’s great to have an identified liaison with your organization. And it’s my understanding now as chair, that I will be following up as far as that letter and in cooperation with NOP. But I do want to point out, you said something about that that claim that you’re considering would signify compliance with NOP requirements, and then a few others. You said Washington State OMRI, et cetera. And I just want to clarify that it’s really -- those others, any accredited certifier, including Washington State, and then a materials review institute like OMRI, are operating under the constraints or requirements of the NOP. So it’s really -- that is the over-arching law and

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
regulation that any of these inputs must meet. So they
either must be natural or specific substances on the
national list. So just keep that in mind, just wanted
to remind you there.

MR. NORMAN: Yes. There’s a lot of real
important issues that need to be worked out. And the
main thing that I’ve kind of learned thus far is as I
understand it, NOP doesn’t govern labeling of
fertilizers, they govern the inputs. And we’re talking
about labeling of fertilizers. So there’s a whole world
of organic production out there for NOP. And there’s a
whole world of home and garden and other fertilizer
companies out there who have a bag with organic
ingredients. They put the name organic on it, and they
don’t feel that they need to put all the advisory
statements to someone who might want to produce an NOP
on the bag, that they consider that the producer’s
responsibility to know what it is they can and can’t
use. And in a big sense, a lot of people like organic
to mean organic across the board. And it’s -- I don’t
think that’s going to be possible. I’m not sure any one
set of definitions will ever make everyone happy. But
we’re just in the infancy getting started. And I,
myself, have only been with AAPFCO three years. And so
I’m learning.
CHAIRMAN RIDDLE: Mark. And then we need to move on.

MR. KING: Just a question for you, actually. It’s my understanding that your organization, AAPFCO, helps coordinate consistency within the states concerning their regulation of fertilizers. Correct?

MR. NORMAN: Right. The federal government doesn’t regulate fertilizer. So the organization is basically -- it defaults to the states. And the organization tries to rule by consensus with having uniform fertilizer rules nationwide so that companies don’t have to come up with 50 different labels, one for each state. And commercial fertilizer industries are also there. They’re invited to the meeting to comment. So that’s it. And my December 7, reference, please, that was a joke. I don’t know where that came from, but please take it as such. I look forward to working with you all. Okay. Thank you.

CHAIRMAN RIDDLE: One more quick, I guess.

Rose.

MS. KOENIG: I just -- I thought it might be useful, you know, the EPA has come up with a labeling, kind of alternative voluntarily labeling program for labeling pesticidal input, compliant with the NOP. So I don’t know if you’re aware of that, it was a Federal
Register Notice. But maybe you could look at that, because it may help.

MR. NORMAN: I missed the first part of what you said.

MS. KOENIG: It’s a similar type of idea that, you know, EPA has also proposed kind of a labeling program to distinguish organic products from -- it’s a voluntary program. So I’m just saying, maybe you should -- if you don’t have that document, you might want to reference it as something.

MR. NORMAN: Okay. Send your e-mails. I’ll get them forwarded to where they need to go, and look forward to meeting with you all. And I had a great walk down Washington DC, Tuesday, I think, and it’s been a great trip. Thank you. Have a safe trip home.

CHAIRMAN RIDDLE: Thank you. Thanks for coming, Mike. Okay. Brian Baker is up, and then Bob Beauregard, next.

MR. BAKER: Hello. Brian Baker, research director, Organic Materials Review Institute, or OMRI. For those of you who don’t know, and then to remind those of you who do, OMRI is still a professional, independent, transparent, non-profit that reviews materials and comparable processes for compatibility with organic production processing and handling. And
I’m pleased to be here today, and still standing, and participating in the NOSB process. It’s just absolutely crucial for clarity and consistency in the development of organic standards. And I’m really pleased with the process we’ve made over the past couple of days. And just as all of us have had to make adjustments with the implementation of the rule, it hasn’t been an easy course. But it’s something that I think has brought about a great number of improvements and has caused us to look into things that we’ve -- we once took as articles of faith. And to have that thrashed out to a public process, it hasn’t been easier or clean all the time. But I think it’s been very productive. As Barbara Robinson mentioned, we have requested a review of our generic materials list. Let me back up. The three -- we have two or three different services that we provide the organic community, the industry. One, is we publish a generic materials list. We’ve revised that generic materials list to be compliant with the National Organic Program rule. As Barbara mentioned, we have asked for that generic materials list to be reviewed by the National Organic Program to make sure that we are, in fact, in compliance, and we will work with them on that. Another service that we provide is a brand name products list, which, of course, is built upon the
generic list. We also, incidentally, provide an organic seed database. We’ve had that on line since 2001. And not many people know about it or use it. But just throw that out there, it’s there if people want to use it. We’re not a certifier. We work with certifiers to try and help them do their job better. We also hope to lessen the burden of government the NOP, AFFA officials, EPA, other regulatory agencies. So we’re not from the government, but we’re trying to help. And the ISSA [ph] we’re also pursuing, ISSA-65 accreditation, we are not pursuing certification accreditation, and instead we’re pursuing accreditation under ISSA Section 65, and we’ll be revising our procedures accordingly. So briefly, to touch on what you’ve dealt with over the past couple days, largely in support of the progress that’s been made here, the whole natural synthetic distinction is very vexing. Interpretation of the national list is easy, interpretation of the rule involves much more than that. It’s the allowed naturals and prohibited synthetics that really can cause a lot of consignation and a number of other aspects that we have to address. And the precedent that goes back to before the NOP and before the AFFA, should not be disregarded. I know that we learn new things every day, and that we have to re-evaluate processes and manufacturing sources. But the -
by in large, there’s been a body of review going back to 1979, in the California Organic Foods Act, where people had been making determinations about what’s natural, what’s synthetic, what’s subject to that. Briefly, go through the -- this whole question of what’s an inert, what’s, generally speaking, that’s been applied to pesticides and other materials. The use of -- the addition of a substance has an intended technical or functional affect. And, you know, just about everything else is active. And we’ve always treated pesticides differently in organic, because they have been so high profile and controversial. Under scope, fertilizer labeling, as long as it’s legal in most states to label non-compliant fertilizers is organic, there’s going to be this confusion. We hope to work with NOP and AFFA to eliminate that. Thank you for your time.

CHAIRMAN RIDDLE: Thanks, Brian. Any -- okay. Thanks. We have Bob Beauregard, and then Sharon Sherman.

MR. BEAUREGARD: Good morning, ladies and gentlemen. My name is Robert Beauregard, and I’m serving as general manager for the Country Hen. Did everyone receive a copy of the presentation? There’s no organic fish meal production in the United States.
CHAIRMAN RIDDLE: If you could speak up, please, sir, or move that mike closer.

MR. BEAUREGARD: There is no organic fish meal production in the United States, and there’s little fish meal being produced in the U.S. Poultry diets. The reason that fish meal is not used for poultry is most certainly due to its relatively high cost. Cod and soy, plus methaninine furnish enough of the necessary amino acids at a lower cost. The protein, poultry rations is calculated on the basis of individual amino acids, not gross protein. In spite of its high cost, the Country Hen has used fish meal for the past 15 years, except for the time when it had to meet organic standards which required the use of Nature Rocks [ph]. Nature Rocks was not available to the fish meal producer that serviced our company at that time. The company which preceded the Country Hen is called Horaso Oro [ph], and is located in Columbia, South America. They’ve used fish meal for about ten years. The reason that the owner of both of these companies believe and believes in fish meal, is that fish meal is not only very high in protein and omega threes, but also contains UGF, or an unidentified growth factor, a term that is not very -- that is not used very much today. Fish meal is not only important for chickens, but important for humans and for

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
the environment. Fish meal is good for chickens. In looking back, it is easy to see that the UGF may have been due to the effect of the omega three oil contained in the fish meal. Recent research has shown that the particular omega threes from the fish oils, called EPA and DHA, are important to the health of the bird, especially in fortifying the immune system. Three studies show that the use of fish oil reduces the severity of coccyxiosis, an inflammation in the intestines due to parasites. Since organic regs prohibit the use of conventional anti-coccy drugs, such as Amprolium, fish meal becomes very important to us in controlling coccyxiosis. Another study shows that chicken subjected to salmonella and staphylococcus faired better when the diet contained fish oil. A Purdue study has shown that fish oils also helped better bone formation. It seems obvious that Martin Day [ph] laying hens living in egg factories are existing on artificial diets. They eat a ratio composed basically of seeds high in omega six, another essential fatty acid. A hen should have a ratio of about five to one in omega six to omega three. A hen that is eating a percentage of fish meal is getting valuable omega threes, especially in the very important EPA and DHA. Hens roaming outside on spacious pasture, 50 birds per
acre, will naturally increase their omega threes from the grass if it hasn’t been stripped bare. However, they will only receive LNA, which is not as important since LNA converts very, very slowly to EPA and DHA. In addition, free ranging carries a very high risk of Avian Influenza, which can be caught from waterfowl and other birds. We prefer to include the omega threes in the normal daily diet, and to use porches instead of free ranging with its high risk of AI. Fish meal is good for humans. Fish meal is not only good for chickens, but it is good for humans too. In the 1970’s, two Danish scientists created a stir among the medical world when they found a traditional Eskimo village practically free from cancer and heart disease. The Eskimos lived on a diet high in fish and seal, full of fat and cholesterol. Since then, over 2,000 studies have been done, many of which we’ve confirmed that omega threes are very important in the control of heart disease, cancer, strokes, depression, and arrhythmia. The average American diet has a ratio of omega six to omega three of 20 to one, when the average should be four to one. A book by Dr. Aramas Symophalis [ph] called The Omega Diet, is an excellent reference on the subject.

CHAIRMAN RIDDLE: Time. And we have your complete written comments here for the parts you didn’t
get to. Any other questions? Becky? I’m sorry.

MS. GOLDBURG: I was just looking through your comments, written comments you presented. And it appears you’re getting fish meal from Canada, salmon meal.

MR. BEAUREGARD: Correct.

MS. GOLDBURG: And the salmon meal appears to be coming from New Brunswick. And the only large source of salmon in New Brunswick is farm salmon, so I assume it’s made from farm salmon byproducts. And there’s been a lot of publicity this past year about contaminants in farm salmon. And I’m wondering if you’ve done an analysis of the fish meal you used for contaminants. And if so, what are you...

MR. BEAUREGARD: Well, if I’d have gotten through the whole presentation, it will explain it. And there are several attachments on the copies that I passed out. We do test for contaminants, mercury levels, we do peroxide tests for, you know, contamination, obviously. So all those attachments are...

MS. GOLDBURG: Do you do organic chlorines?

MR. BEAUREGARD: Excuse me?

MS. GOLDBURG: Organic chlorines, like PCB’s and dioxins?
MR. BEAUREGARD: We check for all of that stuff on almost every load that comes in. We test it in the beginning of the load, and we test it at the end of the load. And we receive loads in at about a 20-ton load each time that it arrives.

MS. GOLBURG: And your data in here?

MR. BEAUREGARD: The data should all be in there.

CHAIRMAN RIDDLE: George?

MR. SIEMON: You’re aware of what we did yesterday or the last few days, with fish meal? I was just reading through your document here, and you refer to 603. Are you satisfied with what we’ve done, which is allowing fish meal, but then if there’s synthetic preservatives, that those preservatives...

MR. BEAUREGARD: Yes. The Nature Rocks is obviously -- like I said, if I had gotten through the whole thing, Nature Rocks, all of the ingredients in the Nature Rocks are natural, and they are on the list.

MR. SIEMON: So you’re satisfied with the work we’ve done.

MR. BEAUREGARD: Yes. Very satisfied. I’m very happy with it. And the other comment I would like to make is that I have a real good feeling about the positive collaboration that I’ve seen in the past couple
of days with, obviously, with the -- with both staffs. I feel good about it, and I just think it’s a real good thing.

CHAIRMAN RIDDLE: Thank you. Thanks for your comments. I’d just like to update the Board. The list shows ten people signed up left. And we have 45 minutes. Oops, was there -- Becky?

MS. GOLDBURG: Yes. Back to Mr. Beauregard. There have been two of us looking for your data on contaminants in here, and we can’t find it.

MR. BEAUREGARD: I’ve only got my presentation. I don’t have the attachments. Were those included in that? Okay. That was my mistake. Those test results were not included as attachments, but we can provide them to you with no problem. We’ll get them to you ASAP.

CHAIRMAN RIDDLE: Thank you. A quick comment, Mark.

MR. KING: Thank you, Jim. I just want to thank you for your work in putting this together. And if I’m noting this correctly, your first communication was back in May of last year, concerning this issue. Is that correct?

MR. BEAUREGARD: Not. It was not. Originally, I believe it was in -- I believe an
attachment included was back in...

UNIDENTIFIED SPEAKER: '99.

MR. BEAUREGARD: You mean the first load of fish meal?

MR. KING: No. Never mind. I was just talking about -- we'll take later.

MR. BEAUREGARD: Okay.

MR. KING: Thanks.

CHAIRMAN RIDDLE: All right. Sharon Sherman, and then Earl Luvier.

MS. SHERMAN: My name is Sharon Sherman, and I am the president of the Pet Guard Company. We distribute our products in the health food stores and veterinarian offices. We've been in business...

UNIDENTIFIED SPEAKER: Excuse me. The name of the company?

MS. SHERMAN: Pet Guard.

UNIDENTIFIED SPEAKER: Thank you.

CHAIRMAN RIDDLE: Pull the microphone...

MS. SHERMAN: We've been in business for 25 years. We're members of the NNFA, the OTA, and I've served on the Executive Board of the Southeast Region of the NNFA. Members of our company have served over the past 20 years, as a liaison to AFCO. I want to thank the NOSD and the NOP for their hard work this week. And

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
we believe there’s, of course, work still to be done. I
must disagree with some of the assumptions stated at
these meetings, and strongly agree with others. My
strongest objection deals with the belief that organic
pet food should not be classified as organic food. We
believe it is. Although the finished product is not
intended for human consumption, various regulatory
agencies, most notably the FDA and USDA, mandate that it
be made safe for human consumption. Just as organic hay
is not intended for human consumption, it’s still
organic. We feel that the need for these products has
been established and is overwhelming, simply for the
health benefit side. The public wants and needs these
products for their pet companions, since most of them
also believe and live an organic lifestyle, and they
want the same for their pet companions. The need also
has been heightened due to the mad cow issues. Our 95
percent organic pet foods are certified by three
certifying agents, OCIA, Onecertain, [ph] and
Oregontilth. The mechanics for the organic
certification process is followed just as if we’re
manufacturing green beans or organic potato chips. We
can never have 100 percent organic product because of
the vitamins and minerals which must be added due to
state and federal regulations, due to pet foods’

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
classification as a single source of nutrition for companion animals. Organic pet foods may combine more ingredients to get a single organic entity, but that should not disqualify them as an organic product. There are organic ingredients used, whether it’s organic chicken, turkey, beef, cranberries, brown rice, or carrots are raised for human consumption, so we, as a company, compete in the human channel for commodities, for organic ranchers and farmers to have another outlet for their commodities, can only further the growth of organic products, and thus ensure more sustainable, earth friendly methods for our cultural and animal husbandry in the future. I’m asking that the same standards for human fed pet foods -- human foods be used for pet foods. Do not lower the bar, but make it equivalent so that consumers can have the same confidence when they’re buying an organic product with the USDA shield, the same standards have been met by all. In conclusion, organic pet foods should be considered not as a second-class citizen, and should be regulated the same as human organic food. We’ve waited 23 years for standards to be developed so we could offer organic pet foods to the public, because we believe that the future is in organics. And, of course, we believe that it’s important from the aspect of sustainable
agriculture. And also, there are many companies that have invested millions of dollars, and contract packagers, organic processors of grains to -- and there are other pet companies that have been doing, you know, have been creating organic pet products. And I thank you.

CHAIRMAN RIDDLE: Thank you. Kevin?

MR. O’RELL: I appreciate your comments. And I don’t know if you heard earlier, but in the Handling Committee work plan, we are going to take up the pet foods, and make a recommendation to the full Board on pet food standards. I don’t think that there was any biased discussed, unless I missed something about a particular direction that we would head on. And, certainly, looking at it in terms of organic food standards is a possibility that will be discussed.

MS. SHERMAN: Thank you.

CHAIRMAN RIDDLE: Thank you. Earl Luvier, and then next up Eric Sideman [ph], to be delivered by Emily Brown-Rosen.

MR. LUVIER: My name is Earl Luvier. I’m the director of quality control for Omega Protein. Conventional fish meal can be produced from fish harvested unsustainably, which may contain contaminants, such as heavy metals, PCBs, dioxins, and pesticide
residues. I think you’re all familiar with that statement. In an earlier meeting, Barbara Robinson referred to the Alaskan fish harvest. The Alaskan fish harvest accounts for approximately 30 percent of the total U.S. production of fish meal. This is from a combination of a variety of species harvested mainly for human consumption. Due to the logistics, this is primarily shipped to or exported to Japan, and not sold here in the U.S. The remaining 70 percent of the U.S. fish meal production is from menhaden, harvested from the U.S. Atlantic and Gulf Coasts. Omega protein produces approximately 70 percent of the menhaden based fish meal. Menhaden fish meal is a product. It’s not a byproduct of any other fishing operation. When making decisions regarding sustainability, I urged the NOSB to bear in mind that this species variation. All fish meal is not created equal. At this time I’d like to submit stock assessment reports for both Atlantic and Gulf menhaden stocks that show the fisheries are not being overexploited, and are sustainable. This data was generated by the national Marine Fishery Service, National Oceanic and Atmospheric Administration, U.S. Department of Commerce. NNNF has been performing these annual studies for -- well, since the mid 1950’s. As with sustainability, issues regarding heavy metals,
PCBs, dioxins, pesticide residues vary between species. This species variation should also be taken into account when making any decisions regarding fish meal. Omega protein has been monitoring PCBs and pesticide residues for over 30 years. Heavy metals and dioxin data is a bit more resent. Tests on regular samplings performed by independent, third-party laboratories show that menhaden fish meal is well below current U.S. guidelines for human food.

CHAIRMAN RIDDLE: Thank you. Any comments, questions?

MS. GOLDBURG: Would you be willing to make your data on contaminants available to the NOSB?

MR. LUVIER: Absolutely. I don’t have them with me, but I’ll pass out some of my cards that have my e-mail address.

CHAIRMAN RIDDLE: Goldie?

MS. CAUGHLIN: What were the two areas that you mentioned? If I understood you, you were talking about the menhaden stocks that were sustainable, mentioning two geographic...

MR. LUVIER: Yes. Atlantic coast and the U.S. Gulf of Mexico coast.

MS. CAUGHLIN: Thank you.

CHAIRMAN RIDDLE: Okay. Thanks a lot. Eric
Sideman, by Emily Brown-Rosen, and then Morgan Hutchinson. And, Emily, you’re signed up on your own.

UNIDENTIFIED SPEAKER: Wait a minute.

Technical...

MS. BROWN-ROSEN: Yes. I have another one, but I’m seating that to Eric. So this could be ten minutes, but I don’t think I’ll take that long.

CHAIRMAN RIDDLE: Okay. So it’s Eric, and then Emily.

MS. BROWN-ROSEN: Well, I’ve waived my -- I’m Eric -- Eric’s got two. I’m Eric today. You might not realize that.

CHAIRMAN RIDDLE: I see. She’s ten, but it’s both for Eric.

MS. BROWN-ROSEN: Okay. I’ve been asked to present this comment from Eric Sideman, a former NOSB member, former Aquatic Taskforce member, and representing the Maine Organic Farmers and Gardeners’ Association. We would like to comment on a number of issues facing the NOP that are being considered at this meeting. The first one is certification of aquatic animals and the use of fish meal as livestock feed. We would like to comment on the proposal of the Livestock Committee to establish the new taskforce on standards for wild caught and farmed aquatic animals, and the...
proposed directive on the use of fish meal as a supplement in feed. These two issues should be considered together, because fish meal made from wild caught fish is used as a feeding grain for farmed, organic animals. And if farmed, aquatic animals are to be labeled organic, they would clearly be a livestock product and fall under the livestock regulations of the NOP rule. We support the directive prepared by the Livestock Committee, and recommend the NOSB adopt it. Well, you already did that. We feel a need to comment on these two proposals from the Livestock Committee, because we do not want to see rules written that serve one sector of our county at the cost of another. We are particularly interested in environmental costs. Organic standards have always been founded on the principle of reducing environmental impact of production to a minimum. It is important that any guidelines for aquatic production consider the impact of such production on natural populations and ecosystems, including contamination with toxins, nutrient contamination from feed, and over fishing natural populations of fish. Fish meal should only be used as a supplement to balance amino acids in livestock feed, and not be used as a major feed component for a source of protein. We believe that organic livestock should be...
fed organic agricultural products, and that the use of non-organic products should be kept to a minimum, even if they are natural. The bulk of the energy and protein for livestock, be the aquatic or land animals, should be from organic agricultural production. The NOSB proposal to set up a new aquatic animal taskforce, as pointed out by the first -- should be supported by the -- as pointed out by the first Aquatic Animal Taskforce, is the next step to develop standards. The first taskforce pointed out the reasons why wild caught fish do not meet organic principles, but they did not -- but they did welcome the development of standards for aquaculture. The original Aquatic Animal Taskforce was well balanced, and included representatives from a wide array of interested parties, including environmentalists, organic farming, processing and marketing industry representatives, and those with commercial interests in both the wild and aquaculture fish industry. The taskforce was put together in a way to avoid standards being developed that would serve any special interests and not serve the broad interests of the public. We strongly believe that the new taskforce should also be set up to represent all of these interests. It’s the only way that the recommendations can be based on all the science, including protecting the environment and the values of the organic community.
Okay. The second comment is on synthetic sources of methaninine. We would like to comment on the planned phase in 2005, of the allowed use of synthetic sources of methaninine as an additive in livestock feed. The NOSB recommendation that synthetic sources be permitted until 2005, and that producers use the years before implementation of the rule in 2005, to develop livestock feed using natural sources of methaninine. Natural sources of methaninine do exist, and include fish meal, sunflower meal, and other natural sources. AFFA limits the approved use of synthetic materials to those for which there are no natural sources. But the NOSB recommended this temporary exception to allow the industry time to change a common practice. The NOSB specifically set this phase out date so organic livestock production would come into compliance. We support this original NOSB recommendation. Third comment is on aquatic plant extracts. It touches on this potassium carbonate issue that the Crops Committee is looking at. I’m not going to read the whole thing. It goes into quite a bit of detail about the chemistry of aquatic plant extracting. I’ll just read a few parts of it. But I think you should possibly -- you have the whole written comment. Section 205601(j), one of the rule that’s only potassium hydroxide and sodium.
hydroxide is permitted materials to use when producing aquatic plant extracts. We believe that this intent of this recommendation that lead to this listing could be interpreted to include other materials used in the extraction process. We recommend that potassium carbonate be added to the list of permitted hydroxide materials that are noted in 601(j). Potassium carbonate dissolves in water to form potassium catines and carbonate anions, carbonate in water rapidly, equivalent with bicarbonate and hydroxide, hence, the increase in Ph. I don’t think I’ll read all of this chemistry. But they basically believe that the intent of the NOSB recommendation was to allow all these materials that caused the alkali hydroxide reaction. Last comment is on pet food and cosmetics. We have no objection to the USDA developing organic standards for pet food or cosmetics if the standards represent the basic principle of organic production. Production of organic pet food should follow the basic organic livestock feed standards. For example, 100 percent of the agricultural products in the food should be organically produced. Production of cosmetics and other care products should follow the basic organic processing standards, that is 95 percent of the product be made from organic agricultural products, otherwise it should follow the

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
requirements for the made with organic labeling. And that’s it. Any questions? Not that I can answer for him.

CHAIRMAN RIDDLE: Yes. Any questions for Eric? Thanks, Emily, for delivering those. And like she pointed out, they are in our meeting book, the written comments, that have more details. Okay. Next up is Morgan Hutchinson, and then Drake Sadler.

MS. BROWN-ROSEN: Hello. I’m actually reading these comments on behalf of Brendon O’Neal [ph], and Bill Mott, of the Seaweb [ph] Aquaculture Clearinghouse. This is regarding the formation of a taskforce on standards for organic production of aquatic animals. This Seaweb Aquaculture Clearinghouse believes organic standards need to be developed for aquaculture. We further support establishment by the NOSB of a new Aquatic Species Taskforce with balanced representation from all stakeholders, including the public. We believe that in order to maintain the overall integrity of the National Organic Program, and the USDA Organic Certification seal, it is especially important that new organic standards for aquaculture be consistent with and following the guiding principles and USDA’s current organic standards. Organic aquaculture standards must not be fundamentally different than the remainder of
organic standards for livestock. While we understand that there is increase in demand for organic products, including fish and shellfish, we understand that some in the industry are eager to obtain organic classification. We feel that bending the rules to accommodate certain forms of aquaculture would be a mistake. The USDA organic label is the gold standard, and should be as strong as possible. In recent years there has been pressure to adjust organic standards to current best management practices instead of adjusting industry practices to meet organic standards. Standards for organic aquaculture must not undermine the integrity, credibility, and public understanding, and trust developed for other organic standards. And organic aquaculture must be held to the high standards recently applied across most other forms of food production. Development of weak standards for aquatic organisms would undoubtedly result in consumer confidence -- reduced consumer confidence in the organic program as a whole. In this context, it is particularly important to note fundamental problems associated with proposals for organic certification of carnivorous fish aquaculture, and the use of net pens or other open systems. First, farming carnivorous fish, as currently practiced, is dependent on the use of feeds made from fish meal and...
fish oil, both of which are derived from wild fish product, and neither of which can therefore be considered organic under any of these standards. While our comments are focused on farm species, it is important to note that we share the same concerns for the certification of wild fish, and feel that their certification, under the organic label, would further undermine the organic program, current organic standards for animals or prior diet consisting of all organic materials. Therefore, if carnivorous fish, both farmed and wild, were to become certifiable as organic, this certification would require significant deviation from the well-established standards to which all other organic animal producers adhere. Furthermore, farming of carnivorous fish currently results in the net loss of fish protein, which goes against the core principles of sustainability, ecological soundness, and avoidance of damage to natural eco systems that underlie the rationale for organic production. Second, the use of open aquaculture systems, such as net pen, or in some cases cages in both near shore and offshore waters is problematic and not in agreement with basic organic principles, such as the responsible management and recycling of waste. Discharges from these facilities directly into surrounding bodies of water can include
uneaten food, feces, drugs, and other chemicals,
diseases and parasites, and exotic species and strains
of aquatic organisms. In contrast, several types of
aquaculture are well suited for -- to organic
certification. Those include aquaculture operations
raising low tropic level species, like catfish. Some
aquaculture operations raising such species in low
discharge ponds or re-circulating systems, especially
when poly-culture integrate aquaculture are
incorporated, and particularly good candidates for
consideration for organic certification. We hope that
the NOSB will take these specific points into
consideration. The NOSB should create a new aquaculture
taskforce with balanced representation from all states,
including the public. Seaweb, which has been involved
with aquaculture issues since 1998, would like to be
included on the taskforce. If wild aquatic organisms
are to be considered as well, it should be addressed by
a separate taskforce, as the issues involved are
significantly different. Members of the aquaculture
taskforce should include fish farmers, consumer
representatives, representatives of the conservation
community, scientists, and certifiers. The input of
aquaculture industry members and supporters is
important, but should be solicited as part of a balanced
panel. It is critical that experts from outside of the industry with no financial interest at stake be included. This is especially important, given that the industry members and supporters need to provide a detailed understanding of concepts such as domesticated animal nutrition and aquaculture system engineering. But they may not provide an adequate understanding of host ecosystem conditions and interactions with the farming system and the community. Diverse representation will be critical since these concepts will be equally important in deciding on appropriate standards, and on which systems and species qualify. The NOSB should create its own taskforce and not rely on recommendations of current groups that are weighted to heavily in favor aquaculture industry interests. Standards for organic aquatic organisms must remain fully consistent with other national organic standards, and under the requirements of the Organic Foods Production Act of 1990. It is our belief that the procedures and publicly recognized USDA organic label should always be a highly coveted goal for producers, and reserved only for those who are utilizing innovative and the most sustainable methods of production.

CHAIRMAN RIDDLE: Thank you. Questions, comments? Dave.

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
MR. CARTER: Can you tell me just a little bit more about the organic aquaculture clearinghouse, its composition and how long has it been around?

MS. BROWN-ROSEN: I don’t know a whole lot. I just started working for Seaweb. The aquaculture clearinghouse is a subset of Seaweb, which has been around since 1998. And the aquaculture clearinghouse is based out of Rhode Island, and mostly does working collecting scientific reports and really just gathering a database of information on aquaculture.

MR. CARTER: Okay.

MS. CAUGHLIN: The name of your primary organization, that is Seaweb?

MS. BROWN-ROSEN: Seaweb.

MS. CAUGHLIN: Thank you.

CHAIRMAN RIDDLE: Okay. Thank you. Drake Sadler, and then Joe Mendelsohn.

MR. SADLER: Good morning. My name is Drake Sadler. I’m the CEO and cofounder of Traditional Medicinals. For the past 30 years, we’ve been involved in at...

CHAIRMAN RIDDLE: Yes. We can pass it out. And we’ll need you on the mike for the transcript.

MR. SADLER: Again, my name is Drake Sadler. I’m the CEO and cofounder of a company called Traditional Medicinals.
Traditional Medicinals. We’ve been involved in organic herb agriculture for the past 30 years. You know, I’m glad I’m going at the end this morning, because it’s given me a real appreciation for the work that you do. I thought my work in the herb industry was complex. But the diversity and complexity of the issues that you face is quite overwhelming. And to mirror Grace’s comments -- I don’t see Grace here now -- but I just want to acknowledge you all for the work you’re doing.

Volunteer work is often a thankless job. And, anyway, I just appreciate all the time you put into this. And I appreciate the opportunity to speak to you. I’ve given you this handout. I’m just going to read a few comments from it, and hopefully, you will look at the document later. This morning I come to express our concerns about statements and recommendations that have been made in the National Organic Program Scope Document, with regard to certified organic herbal dietary supplement products. Of particular concern are factual errors that were made in the proceeding NOP guidance statement. Specifically, the errors of fact include the assertions that herbal dietary supplement products are neither agricultural products nor food products. According to federal law, under the Dietary Supplement Health and Education Act of 1994, “A dietary supplement shall be
Secondly, the USDA National Agricultural Statistics Service, 2002 census of agriculture, clearly identifies herbs as agricultural products. In the draft scope document approved on September 28, by the PDC, NOSB recommends addressing the questions of whether new legislation should be adopted, and rules written to either regulate the labeling or organic herbal dietary supplements, or conversely prohibit the use of organic on herbal dietary supplements. We would hope that it would now be obvious that no new legislation or rules are necessary because herbal dietary supplements, such as organic medicinal herbal teas, inarguably fall within the scope of the NOP. They’re composed of 100 percent agricultural products, and they’re legally defined as foods under the dietary supplement regulations. Now the predominant end users for certified organic medicinal herbs is in the manufacture of organic herbal dietary supplement products and other natural health products. Restricting organic medicine herbs and herbal products from NOP organic certification would have a significant negative impact on organic herb farmers and their customers. And I understand that there’s been some confusion about this matter. And I think maybe a simple way to simplify the issue would be with a couple of
examples. It’s my understanding, for example, that Smuckers makes organic juices and also makes antioxidant claims on some of their juices. Well, therein lies the conundrum. We certainly wouldn’t want to see a juice nut be allowed to be called organic, simply because it makes an antioxidant claim. I think we would all be in agreement with that. I -- grab the box of Cascadian’s [ph] Organic Honey Nut O’s cereal with organic raspberries, very clearly a healthy heart claim, a lower cholesterol claim. These claims are allowed by Food and Drug in the same way that dietary supplement claims are allowed for our organic raspberry leave tea product. They buy the fruit, we buy the leaf. There, in essence, is no difference between these products. They both make claims. They both make health claims. Those health claims are regulated by Food and Drug. And our organic certification, of course, is regulated in the same way.

CHAIRMAN RIDDLE: Time.

MR. SADLER: Thank you. That concludes my statement. I just want to, again, thank you for your attention to this matter.

CHAIRMAN RIDDLE: Thanks. Any questions, comments? Yes, Kim.

MS. DIETZ: I’ll just -- I guess I’ll ask you this question because I was going to call the pet food
people back up and ask them that question -- this question. Clearly, the scope has said that you’re not within the scope of the NOP rule for dietary supplements as it has with pet food. And the scope also said that you need to remove the USDA seal within 18 months. Have you, and do you know if people in the supplement industry have started to make those label changes, or are you guys kind of in a limbo waiting and hoping, I guess?

MR. SADLER: Yes. I can’t speak for the rest of the industry, and certainly not for the pet industry. Our company, we are -- we feel we’re in a state of limbo. And we’re really opposed to removing the use of the symbol. I mean, we are a food. Herb tea is for human food consumption. It is a food. It’s classified as a food by Food and Drug. Herbal dietary supplements are food. We’re not talking OTC drugs, we’re not talking anything else. They’re foods.

MS. DIETZ: And my other comment is that we had a guest speaker -- or a public speaker on Tuesday, who was also from the supplement industry, and she was very frustrated at, you know, what does she do now? And, I mean -- I don’t know if Barbara and Richard can answer this -- but clearly, if you feel you’re a food, then if you are regulated as a food, then you need to
try to get that straightened out.

MR. SADLER: Well, that’s why we’re here.

That’s why I’m here.

CHAIRMAN RIDDLE: Rose?

MS. KOENIG: Yes. Sometimes, although you
complimented us on understanding all issues, this is one
that I, you know, I keep on looking at Dave. I don’t
understand it because if I grow -- I grow peppermint in
my herb garden and sell it fresh, you know. I don’t, I
mean, people can take it home and dry it and make a tea.
I mean, but I call it organic. And that’s what I don’t
understand. I mean, I can understand maybe on certain
things that are dietary supplements, but -- so if you go
to the food -- I mean, if you look at the Lipton tea --
you know, I don’t know if we want to use trademarks, but
anyway. So anyway, but if you go in the tea aisle and
there’s organic tea, but because it’s in the herbal --
if you saw it as an herbal remedy it’s all of a sudden a
different type of labeling. If you could clarify that,
I just don’t understand it.

MR. SADLER: Well, yes, I mean, that’s -- I
mean, that’s the inherent problem here with when
document -- it is being exempted from -- I mean, when we
make peppermint, we produce peppermint, we buy our
peppermint from the northwest, northwest farmers. If we
just simply call it organic peppermint, or let’s say organic chamomile, and we make no calming claim or no digestive claim, which is allowed under the Dietary Supplement Law, well, then there probably would be -- I can’t imagine there would be any problem with simply labeling it as organic, and using the USDA seal. But as soon as we suggest which is allowed us in the same way that Cascadian [ph] can make a lower cholesterol claim, as soon as we suggest for a moment that there is some kind of health benefit, that appears then to put us into this category which is otherwise exempt from being able to use the USDA seal. I mean, it was just an error. I think it’s just -- it was a mistake, and just something that needs to be remedied.

MS. DIETZ: I believe, Rose, because this is an area -- we buy Echinacea. Clearly, we have a lemon, ginger Echinacea drink, and I could buy the same Echinacea from the same farmer or same broker as he does. I can label it certified organic because it’s a beverage. I believe the problem is that food and beverage are under a different jurisdiction than supplements. And so there’s that line, and there’s where the scope has said food. Beverages are allowed to be certified organic, and supplements aren’t. So that’s what we need to clear up, that distinction, and what --
where in FDA does food fall versus supplements. It’s not necessarily a label claim issue, although supplements have a laxer -- they’re allowed to say certain claims that we aren’t. So it clearly goes by the jurisdiction.

CHAIRMAN RIDDLE: Kevin.

MR. SADLER: Again, we are regulated. Both our companies are regulated by Food and Drug. When you make an antioxidant claim on your label, you’re required to substantiate that, in fact, ingredients in that product have antioxidant properties. And the same way with our raspberry leaf product, we’re required to substantiate through historical use, that raspberry leaf, in fact, has benefits for women.

CHAIRMAN RIDDLE: Kevin, and then Owusu.

MR. O’RELL: Just a point, I guess, of clarification. When the cereal or when the beverage makes a claim for an antioxidant property, they’re making it under a structure function or an approved health claim for food product. And when you’re making your claim, it clearly classifies that the claim is being made under DuShea [ph], so you’re under the dietary supplement.

MR. SADLER: Yes. But that’s an issue for Food and Drug, and not the organic standards.
MR. O’RELL: Well, I’m just trying to throw that out there and see what — do we have a response from NOP on that distinction? Okay. Okay.

MR. SADLER: I mean, Food and Drug simply clarifies that there are different kinds of claims that can be made for different kinds of foods. This is a food. What I gave you is a food. So Food and Drug, you know, has the responsibility for regulating how those claims are made. But they’re still foods.

CHAIRMAN RIDDLE: Owusu.

MR. BANDELE: Yes. The disclaimer that you have here on the organic raspberry leaf tea, would that same disclaimer be on that cereal, and why or why not?

MR. SADLER: Well, no. It would be different -- all different products have different disclaimers. And with herbal products, there are certain kinds of warnings also that are required that are different for a cereal product, for example, although if a cereal product had, I don’t know, certain kinds of grains or nuts, for example, where there might be a problem with a consumer that had an allergy to nuts, you know, there would be a failure to warn issue if they didn’t specify that there were nuts in that product.

MR. BANDELE: I wasn’t talking about the specific ones. I was talking in general, whereas this
one says, these claims have not been tested or evaluated
by Food and Drug Administration.

CHAIRMAN RIDDLE: Within FDA guidelines, there
are a variety of kinds of claims and disclaimers that
are required for all across the whole breadth of types
of products. I don’t know specifically. I haven’t read
all the labels on that particular product. But there
are different disclaimers. Goldie.

MS. CAUGHLIN: I believe the distinction is
the DuShea disclaimer -- he was reading the DuShea
requirement, which is that you must, as you do, state
that this specifically, these statements have not been
evaluated by the FDA. That is the requirement of
DuShea, under which you’re operating isn’t a requirement
under the thing -- under the other program, the
Cascadian’s, the different...

MR. SADLER: Basically, Food and Drug requires
that because they don’t want consumers to believe that
by virtue of not saying something, that Food and Drug
has endorsed or approved products for certain health
benefits.

CHAIRMAN RIDDLE: Rose, then Kim, and then
we’re going to move on.

MS. KOENIG: You can take -- as I understand
it, if you took the same tea that you’re using and just
labeled it differently and didn’t have any health claims
and just said Echinacea tea, then it would be okay.

    MR. SADLER: Sure.

    MS. KOENIG: But it’s the health -- because
you found added value in putting it in medicinals,
that’s given you added value. And what we’re saying, I
guess -- and I’m trying to understand. So what we’re
saying is that you can add that value in that sector,
but we’re drawing the line because you’ve made that
choice. If you want to not label it that way, you can
still label your product, but you can’t do it in both
sectors.

    MR. SADLER: Yes. Apparently. I’m not sure
that it adds value from our perspective, although it
probably does. I mean, the mission of our company is to
educate about the value of traditional herbal medicine.
That’s really the mission of our company.

    CHAIRMAN RIDDLE: Kim.

    MS. DIETZ: Since we’ve heard from two public
speakers on -- what do they do? Can they write to NOP,
or to write to FDA and ask for exactly where that line
is drawn on clarification as to why they aren’t under
the scope of the rule? And could they -- so we could
help -- so we could understand it also, can we get that?

    CHAIRMAN RIDDLE: Okay. If I could just
summarize or offer a brief comment myself, and that is
that I appreciate the information that you have shared,
and the other commenter on Tuesday on this issue. And I
think it’s some new information that we didn’t have as a
member of the Police Development Committee. And we may
have made a mistake in grouping both the personal care
products and the supplements, or medicinal products, in
applying the same language to both. It’s clear to me
that they are different, and it should be more refined.
And I would just ask that the NOP take this information
under consideration as you develop your response to us,
and we also take it into consideration as we review
that. And maybe we can come up with a more refined
position here before this is posted. Is that a
reasonable way to walk away today? We look at how --
and it’s the same thing Kim’s saying.

MS. DIETZ: The definition of food, because we
know cosmetics are under FDA, as well as food, as well
as supplements. So where is that distinction that this
is not a food?

CHAIRMAN RIDDLE: Thank you.

MR. SADLER: Sure. Thank you.

CHAIRMAN RIDDLE: Okay. Joe Mendelsohn, and
then Susan Perlman.

MR. MENDELSON: Good morning. Thanks again.
Thank you again, Board, and program for your work. I came here this morning thinking I was just going to sip my coffee and listen to the comments. And I’m glad I was only drinking decaf, because what I heard about the label, I think threatens, frankly, the integrity of everything that OFPA tried to create, and everything consumers expect by organic. To have labels out there with the term organic that are not consistent with this program, or not enforced by this program on food, goes, I think, against the whole intent of the OFPA, and that consumers, among others, expect consistent standards. If there is a term organic out there in which standards are not developed by this program, consumers are confused. They don’t know what organic means. And I hope everyone in this room knows that consumers think right now the term organic goes to the USDA standards. I mean, 275,000 people wrote in about creating those standards, be consistent with their expectation. Now they’ve got organic out there in products that’s not consistent with that standard, or we don’t know? I mean, that, to me, threatens the integrity of the whole industry. And I hope people recognize that. And I want to, at the risk of being redundant from my testimony earlier this week, I want to read the OFPA particular section that deals with enforcement. This is 7 USC 6519
Subsection 8, misuse of label. “Any person who knowingly sells or labels a product as organic, except in accordance with this title, shall be subject to a civil penalty of not more than $10,000.” There are at least three things that follow from that. One, to knowingly sell or label as organic, you have to be consistent with this chapter and its implementing regulations. That means if there are not standards developed for an agricultural product, you can’t be consistent with this chapter. And to use the term organic is a misuse of the term as written in the Act. Now I realize there may be some private standards out there, some that people might want to recognize. But unless the USDA says these private standards are consistent with the chapter of OFPA, then to label something as organic is a violation of the law. Two, violation of misuse of label go to the term organic, not to the use of the USDA seal. So I think removing the USDA seal, as a way of dealing with this, doesn’t remedy the violation. The Act goes to the term organic. And it also doesn’t remedy the confusion to the consumers. And, three, misuse of the term organic goes to a product, not an agricultural product. Therefore, it provides the agency with broad enforcement authority. It’s simply not true that USDA can’t enforce against
misuse of the term organic, simply because it’s an agricultural product and there’s no standards developed yet, or any other product. I mean, a product is a broad term. Agricultural product is a specific term, or more specific term. So, again, I think USDA is wrong in saying that their enforcement authority ends only on products that standards are set, and are agricultural products. And we need USDA, as consumers, to step up and enforce it. That’s what this Act wants you to do. That’s what consumers want you to do. So I think the key question then becomes, you know, how far is USDA’s enforcement -- they have discretion in how far they enforce -- how far it goes. And if it only goes to a certain point, then we’ve got to find someone else. But to have labels out there that say organic, they’re inconsistent with the standard or not recognized as consistent with the standard, if it’s a private, you know, some type of private party is, I think, a death now to this industry, and consumers are not going to want it. Thank you.

CHAIRMAN RIDDLE: Thanks, Joe. Kim -- Joe.

MS. DIETZ: Just a comment, because I’ve been thinking about this since you brought it up and Irbashi brought it up on Tuesday. We saw a tremendous backlash in this industry when the scope document came out, and
just by the fact that we couldn’t certify anymore under
the rule for certain products. And there’s -- people
are claiming million, billions, trillions of dollars
being lost in the organic industry because they’re no
longer certified under the USDA seal. I understand
where you’re coming from, but I also understand that a
lot of people have invested in the organic label, and
there’s a lot of people that have true integrity, you
know, such as Traditional Medicinals, a lot of people
that have put a lot of time and effort into trusting the
organic label. And to do away with that right now for
lots and lots of products, I’m not sure that’s the
answer. I understand the concern, and I also know that
our goal is to increase organic agriculture. And by
taking away the organic label for all these different
products is going to hurt the organic industry in the
long run. So the consumers -- somebody had made a
comment -- and I don’t know who it was -- about
educating the consumers. So that’s one thing. And the
other thing is, 20 years ago when we didn’t have
standards, we had an industry that came up with the AOS.
We had an industry that’s kind of self-enforced, and
such as like Goldie said, by just not allowing certain
things. So I take that for you to go back and think
about it. And I’m sure you have. I’m not sure taking
the organic label away is the answer.

MR. MENDELSOHN: Can I respond to that just
briefly? I certainly recognize that there are, you
know, many people who have made investments and acted
with good hearts, good intentions on a number of
products that some standards might not exist right now
under the USDA Program. I’m not saying that that’s not
-- I mean, I’m not saying that herbal products wouldn’t
come under the program. Okay. I’m not saying that.
I’m saying that right now there may not be standards for
some herbal products. I mean, arguably, I think we just
heard there probably are. But for something like fish,
the Board’s identified that standards, specific
standards for fish need to be out there. There are not
standards. Okay. That’s not saying that -- I’m not out
here saying we should never label fish organic, and that
people shouldn’t invest in that. I want to see organic
aquaculture. But right now there are not standards. If
there are not standards that you’re certifying to,
recognized by USDA, organics shouldn’t be on the label.
I’m sorry. That confuses consumers. Again, it’s not a
question -- mine is not a question of scope, it’s a
question of enforcement at this point. Okay. And I
certainly want to see proper claims on, you know,
products, and a wide range of products, as long as
they’re proper. Again, that goes to, you know, hurting the integrity -- the future of organic. I think the question is, what is organic, and creating the consistency of organics? So, I think, consistency of organic in the long run is what’s going to drive this industry. And so, you know, I wouldn’t want the industry to say I’m trying to take away their right organic. But if it’s an organic claim that consumers don’t know what it’s about, that hurts in the long run, and it shouldn’t be out there right now. I want to see organic main consistency, and then have it in the marketplace.

CHAIRMAN RIDDLE: Thanks, Joe. Rose.

MS. KOENIG: I also have a question because, again, you know, another one of those issues. These scope things are just beyond -- maybe I spend too much time thinking about synthetic and non-synthetic, which seems easy now. What Barbara said struck me, because I kind of listen, I try to figure out, oh, that makes sense now, you know, try to take pieces of information. So I guess in my mind I’ve made this division, and I don’t know if it’s the correct division, so maybe you can help me. As I understand it, things like aquaculture, things that the USDA has said is within the scope, eventually will -- there will be standards made,
and they will be able to enforce. And what I understand, if I’m correct, is that in this interim between the time now, even though everything else -- the things that we have standards we can enforce on. This interim is analogous to the interim between, you know, writing the rule, proposed rules, and finally full implementation. I was allowed to use my certification and my word organic, even though I wasn’t, at that time, you know, an accredited certifier, I could still do it and be legal. And that’s what I’m understanding is the stuff on fish, although I’m not -- I mean, it’s not ideal, I don’t necessarily like it, but stuff like aquaculture or fish is analogous to that interim period for things that, you know, for crops and livestock that were in that process at that time. So it’s not suggesting that this is going to be forever, that this is a short-term situation that we’re in until standards are developed. And I know it’s not ideal in the consumer marketplace, but that’s the reality. And then I think the other issue, as I understand, are for products that within that scope document, that they will never be -- that there’s no chance that the USDA is going to regulate. But those claims are still there. Is that what -- am I understanding you correctly?

MR. MENDELSON: My argument is, okay, we had...
a very real issue when the full program came on, I mean, phasing it. Okay. But I don’t think the law says that the development of a specific standard then triggers enforcement. Enforcement exists on -- over the term label organic. Okay. So in other words, I mean, USDA’s authority to enforce on the term organic label on fish doesn’t magically appear all of a sudden because you have a specific standard on fish. It’s clearly within the scope of the Act right now. And it’s something that they can enforce again. And, you know, I don’t think we’re in quite the analogous position with fish that we were with a whole bunch of other products because there wasn’t organic aquaculture out there. I mean, in the U.S. at least, recognized in the U.S., that needed to be phased in. Now we’re starting to see it over this interim period. So if the policy is done, the enforcement policy, if you will on that, has now allowed a couple things to come in organic, that, you know, we have no standards for, we have no idea. And it wasn’t like there was an existing history of it.

MS. KOENIG: So you’re saying in the case of fish that there may be operations -- if an operation can prove that they fit the Act now, they’re allowed to have the organic label, and if they don’t, they can’t, because that’s the only enforcing way you can enforce
the reg as it stands then.

MR. MENDELSON: No. I go -- it’s been identified that there needs to be specific standards under the Act for fish. And the Board and others haven’t said, in lieu of developing those standards, you can meet the existing Act, which I believe you’ve done under mushrooms and other things, saying we need honey, we need mushroom standards, but in lieu of that you can meet the existing standards. You haven’t done that for fish. Okay. We recognize that there needs to -- it’s a whole different deal. So, I mean, I don’t see how -- you know, I don’t think -- I don’t see how it’s -- how you can be consistent under OFPA right now for fish, because there aren’t standards. And it’s been recognized that those standards need to be developed, and if you’re not consistent with the chapter, than it’s a misuse of the term organic to have on the label right now. I hope that’s clear.

CHAIRMAN RIDDLE: Thank you.

MS. GOLDBURG: Can I ask one more question?

CHAIRMAN RIDDLE: Becky.

MS. GOLDBURG: I’ll be really brief, Jim. Joe, you know, we’re a really diverse Board here. But one of the things none of us are are attorneys, and so I think that we don’t have a full understanding of
alternative interpretations of the OFPA. And I personally think it would be useful, and there would be other Board members who would have it be useful, to have a really brief legal memo explaining your alternative interpretation to the departments.

MR. MENDELSON: After my testimony on Tuesday, I decided to do that. So I will put it on paper and get it to you. And I appreciate the opportunity. And, again, you said it’s an interpretation. And it will be my interpretation. But I’d say, you know, as part of the consumer and NGO community, we’re the, you know, we represent a great deal of the market. And so, you know, this, I think, you know, my interpretation is consistent with the way I think consumers view it. I mean, that’s my job as an advocate for them. So I just, you know, keep that in mind when you’re reading it.

CHAIRMAN RIDDLE: Thanks. We have three more commenters, Susan Perlman, and then Irbashi Rangan [ph].

MS. PERLMAN: Hi. Thank you. Again, I’m Susan Perlman. I’m with the Union of Concerned Scientists. And I want to thank you for the opportunity to comment today. I’m speaking on behalf of both the Union of Concerned Scientists and the Coalition to Keep Antibiotics Working or KAW. And I’m here to talk about
the NSOB Livestock Committee’s directive for origin of dairy livestock. For those who don’t know, Keep Antibiotics Working, is a coalition of 13 health environment consumers, humane, and other advocacy groups, including the Union of Concerned Scientists. We seek to promote -- we seek to protect the effectiveness of lifesaving antibiotics by curtailing overuse of these drugs in animal agriculture. The Union of Concerned Scientists and KAW strongly support the NSOB Livestock Committee’s directive for origin of dairy livestock. We agree that it is incumbent upon the USDA’s National Organic Program to issue a clarification statement that antibiotics are never allowed for organic animals or edible organic products once a producer is certified organic. We call for NOP to adopt the May 14, 2003, NSOB recommendations on origin of livestock, preferably as a technical correction rather than as a rule change. We urge the USDA and related agencies to approve NSOB recommended healthcare materials for livestock. We believe that these actions are necessary to maintain the integrity of the organic label for dairy products. For the label to be meaningful, it is important that after a dairy operation has been certified organic, animals brought onto the operation must be organically raised from the last third of gestation. Animals should not be
rotated between organic and non-organic production. The
dairy products of animals treated with antibiotics must
not be labeled organic. And, finally, I’d like to take
this opportunity to renew a request. In June 2004, KAW
submitted a written request to USDA Secretary Ann
Veneman, asking for public confirmation that antibiotics
are never allowed in animals used to produced organic
dairy or other animal products. We never received a
response to this letter. We are deeply concerned that
more than four months after Secretary Veneman rescinded
the Spring ’04, origin of livestock directive, there is
still no indication that this rescission has been
implemented. At this juncture, we restate our request
for the USDA to publicly confirm that the directive has
been withdrawn, and that the withdraw has been
implemented on the ground. Thank you very much.

CHAIRMAN RIDDLE: Thank you. And I don’t know
if you were here on Tuesday during our discussion of
that issue, but that has been verbally stated on the
record by the NOP, and there will be a written document
posted, addressing those issues, I believe, to your
satisfaction.

MS. PERLMAN: Great. Thank you very much.

CHAIRMAN RIDDLE: I also just want to, for the
record, point out that we’re technically the NOSB, the
National Organic Standards Board, not the National
SOB’s.

MS. PERLMAN: Oh, sorry. I’m sorry about
that.

CHAIRMAN RIDDLE: And I don’t take that as a
personal attack on the Board. Irbashi Rangan, and then
Michael Sly.

MS. RANGAN: Good morning. Here we go.

Thanks a lot. Again, I want to reiterate some points on
fish, because there’s been a couple statements made
today, and I want to just let everyone, for the record,
in this room know where Consumers Union stands on this,
as far as the education of consumers right now with
organic fish. Around the use of any organic claim on
fish at this time, is, one, perhaps a violation of AFFA.
But it doesn’t have to meet any standards, necessarily.
So there may not be any standards followed by people who
are shipping in organic fish into this country. There
may not be any verification whatsoever. And, therefore,
the meaning of that label on fish will be inconsistent
from fish product to fish product. That means fish
contaminated with mercury or PCB’s, fish raised with the
use of antibiotics maybe could be allowed to carry the
organic label. That wide variability in the meaning is
not only confusing to consumers, but in some cases that

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
could mislead and be deceptive. It is simply not in line with food standards. And if antibiotics are used in the raising of it, that goes against the entire gradient of the organic program in this county. Consumers do not want that in the organic fish that they buy. And if that is not clearly made understood, it simply may not add any value over conventional fish. Previous comments this morning outlined some of the nutritional benefits that are compounded through the fish food chain. I also want to say that that’s how contaminants are compounded through the fish food chain, so that’s how mercury gets compounded. That’s how PCB’s get compounded. And while omega threes are an important nutrient for consumers, fish is simply not the only source of them. EPA issues advisories on fish that are highly contaminated with PCB’s to consumers. The FDA has dietary recommendations on how much mercury a pregnant woman should eat. We’ve heard this morning that consumers should be eating three servings of fish a day. The fact of the matter is, for a woman of childbearing age or children, more than two, three ounce albacore tuna sandwiches a week will exceed their recommended daily intake for mercury. That’s not three servings of fish. So by slapping an organic label on it, which has no meaning, which does not take mercury
into consideration, is simply doing consumers a
disservice. As a result, Consumers Union will continue
to tell consumers not to waste their money on organic
fish. It undermines what the meaning of that label
should mean on organic fish. It also undermines your
hard work that you’re going to undertake in the
aquaculture taskforce, because until standards are made,
if we’re telling consumers don’t bother, it’s going to
be very confusing when the standards eventually do come
out. It’s really important that this label maintains
its integrity, maintains its consistency and meaning to
consumers, and we strongly urge this Board to prohibit
the use of the organic label on fish until those
standards are created.

CHAIRMAN RIDDLE: Thank you. Questions,
comments? All right. Michael Sly, our last commenter.
You’re the final word.

MR. SLY: Well, thank you. I’m just rising to
make three comments. One is on the issue of brining
closure to the April directives. I heard many good
steps in that direction, and the department is going to
be putting something up on the website, it sounds like,
as soon as they can get it cleared, and then technically
get it up on the website. The one piece of closure I
did not hear that would be, I think from an
in institutional point of view, would help prevent future NOSBs and NOPs from possibly going down that road again, would be to set a very strict deadline for bringing in that closure about the collaborative procedures. I know you all discussed that, and there was discussion at the June meeting about, you know, bringing that into writing and putting that into wherever it belongs in the procedure manuals. I think that’s essential that you do that so that is a part of the written record, and so it’s clear to future generations of boards and future USDAs that that’s a well thought through process, that it’s mutually acceptable to both parties. So I strongly urge you to lock that in, and that will help really bring that to closure. Secondly, I want to bring to your attention in a way the next wave of firestorm that is growing in the countryside related to the issue of stage of production. We think that certifiers may be interpreting stage of production in multiple ways that may not meet the needs of the consumers or organic agriculture in the long run. We urge you to look at that issue. I don’t believe on my tenure on the Board it was ever our intent that stage a production would include lactation, for instance, or other stages that are, you know, quite a long period of time. That was something that was supposed to be a very, very
discreetly narrow issue, and not something that can be broadly interpreted by certifiers. And, finally, I just want to thank all of you who are retiring off the Board for meeting your call to serve your country. I don’t take that lightly. I know it’s a huge sacrifice to do that. I also urge you, who are retiring, to take a little bit of time and try to document as a way of an exit exercise, if you will, some of the lessons learned from that experience that can be passed onto future boards. I’m still concerned about the continuity over time. And I think any place markers or wisdom that you can pass on, that will be greatly appreciated to the next round. So thank you for all of your hard work.

CHAIRMAN RIDDLE: Thank you, Michael. Any comments, questions? Yes, Barbara.

MS. ROBINSON: Michael, you’re right. We didn’t commit to a time to develop a written set of collaborative procedures. So I’ll commit that we will have something to the Board so that there can be something to be voted on and approved at the next board meeting. Okay.

MR. SLY: Thank you for that clarification.

CHAIRMAN RIDDLE: Very good. Thanks. Thanks for asking the question. I just have a few closing comments, and then I’ll open it up if any other board
members or USDA have any. I would like to thank,
sincerely thank all the members of the public who have
taken the time and offered your expertise, your
insights, your passion. I’m just so impressed, always,
by the thoughtful comments, and also your patience, and
how diligent you are. This certainly is a community
that cares. I also would like to thank Barbara,
Richard, Arthur, for sitting here with us this whole
time. I really want to see the same, you know, just
physical layout where we’re all at the same table at
future meetings, but more than that, the collaboration
that’s been expressed and exercised at this meeting.
And I really want to express my thanks for that. And
also, I want to thank other USDA staffers, and
especially Katerine Benam, [ph], all the work that you
do that facilitates our work. You really rise to the
occasion. And I want to thank the Board members. We’re
a dogged group. We -- I mean, people -- we’re just so
engaged. And I especially thank the outgoing board
members. I look forward to seeing you at the next
meeting. But thank you for your efforts over the years.
And I’m going to miss having you all to work with as we
move forward. Any other comments? Barbara.

MS. ROBINSON: Actually, I would just echo
everything you just said, Jim. Number one, to the
retiring board members, we do thank you very much for
your service, to the department, as well as to your
industry. Like I said yesterday, we recognize that you
do it on a volunteer basis, and that’s a lot to ask.
And your dedication has been completely apparent, and is
very appreciated, as are the remaining board members.
And we look forward to the same sort of dedication from
new board members. And we’re sure you’ll get them up to
speed very quickly. And as A.J. said yesterday, and I
just want to say again, and I heard it in Michael’s
remarks, I believe, that I’d like to think we turned a
corner. And this was a good meeting. And I look
forward to our meetings continuing down this road. I’ve
heard this meeting described once as a love fest, but
once as one of the most boring meetings anybody has ever
been to. Same here, Nancy. In government, we take that
as a high compliment. We were boring. At any rate, the
objective is to be constructive, to work together, and
to solve problems, and to keep this industry growing
with the highest integrity. And I have always believed
we can do it. And I still believe we can do it. We
will disagree. We’ll probably even have some fights.
But we will try not to, absolutely. And we’ll just keep
at it. We’re not going to give up because we know that
you certainly are not going to give up. So it’s your

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
industry, it’s your program, and it’s our job to serve you. Thanks.

CHAIRMAN RIDDLE: Thank you. Any other comments, board members? Any motions? Yes, Dave.

MR. CARTER: Yes. I will make a motion. But first of all, I also want to thank the officers that served for this last term, because I know you shouldered a lot of the work. And to the folks going off, I think it’s always wise to remember that you may not officially be part of the NOSB, but we will always consider you a part of the NSOB. And with that, I make a motion that we adjourn this meeting.

CHAIRMAN RIDDLE: Is there a second? Nancy seconds. All in favor, say aye.

ALL: Aye.

CHAIRMAN RIDDLE: Those opposed? Same sign. Thank you very much.
CERTIFICATE OF REPORTER, TRANSCRIBER AND PROOFREADER

IN RE: NATIONAL ORGANIC STANDARDS BOARD

HELD AT: WASHINGTON, DC

DATE: OCTOBER 14, 2004

We, the undersigned, do hereby certify that the foregoing pages, numbered 1 through 161, inclusive, are the true, accurate and complete transcript prepared from the reporting by the reporter in attendance at the above identified hearing, in accordance with applicable provisions of the current USDA contract, and have verified the accuracy of the transcript by (1) comparing the typewritten transcript against the reporting or recording accomplished at the hearings, and (2) comparing the final proofed typewritten transcript against the reporting or recording accomplished at the hearing.

The National Organic Standards Board (NOSB) meeting of February 28-March 3, 2005, was attended by 13 members:

NOSB Members Present:

James A. Riddle, Chair    Bea James
Kevin O’Rell, Vice Chair   Hubert Karreman
Goldie Caughlan, Secretary  Rosalie L. Koenig
Andrea Caroe     George Siemon
Rigoberto Delgado    Julie Weisman
David Carter    Kim Dietz
Gerald Davis
Michael P. Lacy

National Organic Program (NOP) Staff:

Barbara C. Robinson, Agricultural Marketing Service Deputy Administrator; Richard H. Mathews, NOP Associate Deputy Administrator; and Arthur Neal

OPEN SESSION – February 28, 2005, 9:00 a.m. - 5:00 p.m.

Approval of the Meeting Agenda:

The Board unanimously approved the meeting agenda.

Announcements:

Dave Carter announced that he would be absent from meeting on the following morning to attend the U.S. Department of Mint issuance of a new bison nickel in commemoration of Lewis and Clark.

The Chair announced Ann Cooper’s resignation from the NOSB. There are only two years remaining for her term as Consumer Representative and it will be added to the next round of nominations; there will be six open seats that will come out in March with a deadline sometime in June. The selection to the Board is January of 2006.

The Chair stated that following the new members’ orientation session, new operating procedures were discussed regarding the Board’s committee compositions and the committee members list will be updated on the website after the meeting.

The Chair reported that the USDA’s total budget for 2004 was $82 billion; however, he wasn’t sure how much was allocated to organic programs, between NOP and the various research dollars for organic, the organic cost share, and the National Ag Statistics Service. It totals up to about 11.9 million, which is 1/100th of a percent of the total USDA budget; there is a tremendous opportunity for growth.

The Chair announced a couple of changes in procedures and asked the committee chairs or who will present a draft for action for a vote on behalf of the committee to make a motion to introduce the draft for tabled discussion. It can always be moved and set aside or send it back to the committee for further discussion, deliberation, or development. The Board will move and second items to place them under discussion.

Additionally, to minimize redundancy and for more efficiency, the Board will wrap up the votes after discussing an item, However, it doesn’t mean that a vote can’t be held over for the next day providing that there are good reasons.
Approval of October 2004 Meeting Minutes Summary:
After several changes were proposed by Mr. Carter, the Board unanimously approved the October 2004 meeting minutes. For more information, see discussion document.

COMMITTEE PRESENTATION OF RECOMMENDATIONS AND ACTION ITEMS VOTES: (For more information on committee presentations, see meeting transcripts and agenda)

Compliance, Accreditation and Certification – Andrea Caroe, Committee Chair (pg. 23)
Ms. Caroe reported on the committee agenda items, recommendations, and action items for vote.

Materials – Rose Koenig, Committee Chair (pg. 26)
Ms. Koenig reported on the committee agenda items, recommendations and action items for a vote.

Policy – Dave Carter, Committee Chair (pg. 33)
Mr. Carter reported on the committee agenda items, recommendations, and action items for a vote.

Executive Committee Conference Call Minutes (Pg. 44)
The Chair stated for the record that the minutes will not be review during this meeting; they are not approved by the full Board only during the Exec calls. They are usually in the meeting book, however, we are behind with the review and approval, and therefore they are not in the book.

Livestock – George Siemon, Committee Chair (Pg. 45)
Mr. Siemon reported on the committee agenda items, recommendations, and action items for a vote. Mr. Neal reported that on January 24, the NOP called for nominations to the Aquatic Animals Task Force. The task force will be comprised of 24 individuals. Nomination closed on February 23, 2005.

Handling – Kevin O’Rell, Committee Chair (Pg. 58)
Mr. O’Rell reported on the committee agenda items, recommendations, and action items for a vote. Mr. Neal reported that on January 24, 2005, NOP called for nominations to the Pet Food Task Force. The task force will be comprised of 12 individuals. Nominations closed on February 23, 2005.

Crops – Nancy Ositguy, Committee Chair (Pg. 66)
Ms. Ostiguy was not available to give the report; therefore, Ms. Koenig provided a report on the committee agenda items, recommendations and action items for a vote.

NOP Update – Barbara C. Robinson, Deputy Administrator (Pg. 79-105)
(See meeting transcripts for more information)
Ms. Robinson provided update on the following issues:

- Since last summer, NOP promised to provide to the Board NOP’s accomplishments after clearance through the Department and will give a 24-hour heads-up notice before posting on the website. However, there were two items that NOP is working on that was not forwarded to the Board, and one is the collaboration document for publishing in the Federal Register, and the second was USDA response to the NOSB response to the four issues that are related to antibiotics, fish meal, inerts, and the scope of coverage of the NOP regulation. Inquiries were made to the Department regarding their status; however, they are still in the clearance process.

- A draft of the collaboration document was forwarded to the Board that addresses an agreement between the Board and NOP dealing specifically with working together on issues, and it lays out the format of when will NOP propose something to the Board and get an answer.
NATIONAL ORGANIC STANDARDS BOARD MEETING SUMMARY  
Page 3 of 4

- NOP published the Federal Register guidance docket that should have been published before last April. The docket calls for public comments, which was extended until early April.

- NOP received feedback from the Office of General Counsel (OGC) on the executive director position announcement. She is working on the draft document that will need to be polished to incorporate all of the things that Board would like to see. Projected posting of the job announcement is scheduled for Spring.

- Arthur provided updates on the task forces. NOP is still working on two dockets that deal with crops and processing. The processing docket is being held up because of the court case.

- She provided a detail report on the January 26, Harvey vs. USDA, Secretary Ann Venemen case in the 1st Circuit Court of Appeals in Boston to issue a decision on an appeal. (For more information on the court proceedings, please review the meeting transcripts).

NOSB Committee (Pg. 108) (For more discussions regarding the Board's membership, review the meeting transcripts)

The Chair reported on the Board new members and talked about the new composition of the committees. He stated that the members should be looking towards very short term changes especially for the chairs who are in the last year of their terms, and at that time a new committee chair will be announced prior to the next meeting.

End of First Day Proceedings – February 28, 2005 at 6:30 p.m.

OPEN SESSION – March 1, 2005 – 8:00 a.m. – Call the Meeting to Order – Jim Riddle, Chair

PUBLIC COMMENT SESSION

The following individuals presented public comments. Each person’s comments were recorded and transcribed for the record; some individuals presented written comments. Transcribed comments, and where applicable written comments can be found at the DESIGNATED ATTACHMENTS.

Nathaniel Bacon, Organic Dairy Advisor, NOFA Vermont, (Pg. 10)
Clark Driftmier, Aurora Organic Proxy for Mark Retzloff, (Pg. 15)
Dr. Juan Velez, Director, Farm Operations for Aurora Organic Dairy, (Pg. 18)
George Wright, Organic Dairy Farmer, New York, (Pg. 29)
Robert Hadad, Director, Farming Systems for the Farm Animal and Sustainable Ag Section, (Pg. 36)
Harriet Behar, Organic Inspector, (Pg. 38)
Mark Kastel, Co-Director, Cornucopia Institute, Proxy for William Welch and Merrill Clark, (Pg. 47)
Blake Alexandre, Organic Dairy Farmer, (Pg. 58)
Rich Ghilarducci, Humboldt Creamery Association, (Pg. 64)
Nancy Gardner, Secretary, Northeast Organic Dairy Producers Alliance, (Pg. 67)
Henry Perkins, Organic Dairy Farmer, Maine, (Pg. 71)
Roman Stoltzfoos, Organic Farmer, Lancaster, PA, (Pg. 74)
John Stoltzfoos, Organic Dairy Farmer, New York, (Pg. 78)
James Gardner, Organic Dairy Farmer, New York, (Pg. 81)
Urvashi Rangan, Scientist, Consumers Union, (Pg. 90)
Dave Johnson, NODPA, (Pg. 96)
Cathy Arnold, Dairy Producer, New York, (Pg. 105)
Kevin Englebert proxy for Arden Landis, Organic Dairy Producer, New York, (Pg. 112)
Kathleen Seus, Food Animal Concerns Trust (FACT), (Pg. 115)
Cameron Wilson, Nordorf, (Pg. 120)
Adam Eidinger, Organic Consumers Association (Pg. 128)
Grace Merriquin, President, Merriquin International, (Pg. 131)
Arthur Harvey, Organic Grower, (Pg. 138)
Tom Hutchison, Organic Trade Association (Pg. 141)
Jim Pierce, Organic Valley Crop Cooperative, (Pg. 146)
Jo Ann Baumgartner, Director, Wild Farm Alliance, (Pg. 150)
Tom Miller, Organic Dairy Farmer, (Pg. 157)
Tony Azevedo, Organic Farmer, (Pg. 161)
Martin Samson, Organic Farmer, (Pg. 165)
Vanessa Bogenholm, Organic Grower, (Pg. 169)
Diana Kay, Organic Farmer, (Pg. 173)
Craig Weakley, Director, Organic Agriculture, and Sourcing for Small Planet Foods, (Pg. 176)
Ed Zimba, Organic Dairy Farmer, (Pg. 181)
Lyle Edwards, Organic Dairy Farmer, (Pg. 186)
Jack Lazor, Organic Dairy Farmer, (Pg. 187)
Richard Siegel, Attorney, (Pg. 191)
Joe Smille, (Pg. 198)
Leslie Zook, Executive Director Pennsylvania Certified Organic, (Pg. 204)
Emily Brown-Rosen, Consultant, Organic Research Associates, (Pg. 209)
George Kuepper, National center for Appropriate Technology, (Pg. 216)
Charles Flood, Organic Dairy Farmer, (Pg. 218)
Marty Mesh, Executive Director, Florida Organic Growers and Quality Certification Services, (Pg. 231)
Diane Goodman, (Pg. 240)

End of Public Comment

Comments from Neil Blevins, Deputy Administrator for Compliance, Safety and Security (Pg. 243-261)

Mr. Blevins provided a report on the Compliance office and its responsibilities regarding compliance and enforcement.

NOP Update: Richard H. Mathews, Associate Deputy Administrator, NOP (Pg. 261-268)

Mr. Mathews reported on accreditation regulations and audits of accredited certifying agents.

PRESENTATION OF COMMITTEE ACTION ITEMS

Accreditation, Certification and Compliance Committee – Andrea Caroe (Pg. 269)

Information on Certificates Recommendations

Ms. Caroe presented eight recommendations that were made by the Committee regarding certificates that are in compliant with National Organic Program standards.
UNITED STATES DEPARTMENT OF AGRICULTURE

IN RE:

NATIONAL ORGANIC STANDARDS BOARD MEETING

Meeting held on the 28th day of February, 2005 at 9:00 a.m.

The Washington Terrace Hotel
1515 Rhode Island Avenue, NW
Washington, D.C.

TRANSCRIPT OF PROCEEDINGS

2-28-05 NOSB Meeting Participants

Chair: James A. Riddle
Vice Chair: Kevin O'Rell
Secretary: Goldie Caughlan

NOSB Members:
Andrea Caroe
David Carter
Gerald Davis
Rigoberto Delgado
Bea James
Hubert Karreman
Rosalie L. Koenig
Michael P. Lacy
George Siemon
Julie Weisman

NOP Members:
Richard Mathews
Barbara Robinson
Arthur Neal, Jr.

Other Appearances:
Kim M. Dietz
York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
INDEX

Agenda Item:          Page:
Approval of Agenda    3
Approval of October 2004  21
minutes as amended
Presentation of Discussion Items -
Reports from Committee Chairs:
Andrea Caroe, Accreditation 23
Rosalie Koenig, Materials 25, 40
David Carter, Policy Development 33
George Siemon, Livestock 44
Kevin O'Rell, Handling 58
Rosalie Koenig, Crops 66
CHAIRPERSON RIDDLE: All right, I'd like to call the meeting to order. Thank you. Well, welcome to the National Organic Standards Board Meeting, and all member of the Board have a meeting book that you received this morning, which has our agenda and the various drafts we'll be considering during this meeting. Does anyone have any changes to the agenda, comments?

[No response]

CHAIRPERSON RIDDLE: Is there a motion to approve the agenda?

MR. CARTER: I would approve -- move approval of the agenda as printed.

MR. LACY: Second.

CHAIRPERSON RIDDLE: Is there a second? Mike Lacy seconds. Any discussions, any changes?

[No response]

CHAIRPERSON RIDDLE: Hearing none, all in favor say aye?

BOARD MEMBERS: Aye.

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
CHAIRPERSON RIDDLE: Those opposed, the same

sign.

***

[No response]

***

CHAIRPERSON RIDDLE: All right, we will proceed, following the agenda as it was published prior to the meeting. Are there announcements? Dave?

MR. CARTER: Just a point of personal privilege. Mr. Chair, I -- the four years I've been here, I've never missed any minute of NOSB time. Tomorrow morning, though, I will have to be absent briefly. The -- it's here in town, but the mint is issuing a new bison nickel formally tomorrow in commemoration of Lewis and Clark, and we have a live trained buffalo coming to be on the lawn of the Capital tomorrow morning at 10:00 a.m. for that. And so I have to go up there and see that.

UNIDENTIFIED SPEAKER: If you see one run by here, we know that --

MR. CARTER: But anybody that's here that has any comments that they plan on presenting as far as the public comments tomorrow, if you have advanced copies or anything, please give those because I am very interested in the public comment.
CHAIRPERSON RIDDLE: Okay, and we'll keep a stack running there in your absence for you to read after you get back. Okay, any other Board members have announcements?

***

[No response]

***

CHAIRPERSON RIDDLE: I have a couple and one is for those that don't know -- the Board members already know, but I just wanted it in the official record that Ann Cooper has submitted her resignation from the Board. And my understanding is that the procedures for filling her seat, instead of -- there's two years remaining on Ann's term and she holds a consumer rep seat. The remainder of that term will not be filled, but it will be added to the next round of nominations. So there will actually be six seats open and that will -- the call for those nominees will likely come out in March sometime, with a deadline sometime in June. But sometime in the first half of this year there will be -- the openings will be announced with the appointments made towards the end of the year to take the seats in January of 2006.

And I also wanted to let members of the public know that this morning we had an orientation session and
discussed a lot of operating procedures of the Board and the composition of committees, and we do have, you know, some new committee members who will be introducing themselves next. But we will be updating the lists of all of the committee members on the website after this meeting. So I just wanted to mention that.

And just one final announcement. I've been doing a little number crunching and I just wanted just to go into the record for information purposes. I took a look at the USDA's total budget for 2004, which was $82 billion, and I was just curious on how much is spent on the organic programs. And between the NOP and the various research dollars for organic and the organic cost share and the National Ag Statistics Service, it totals up to about 11.9 million, which, when you do the math, is 1/100th of a percent of the total USDA budget. And I just point that out because it shows we have a tremendous opportunity for growth. But that's the reality of the situation.

MR. SIEMON: I thought the point was how understaffed NOP is.

CHAIRPERSON RIDDLE: Well, that's true, too. And how much -- how much is being done for the fastest growing sector of agriculture by this program staff as well. So I just wanted to mention that for the record.
Any other announcements before we move on?

***

[No response]

***

CHAIRPERSON RIDDLE: Okay, seeing no hands or lights, I'd ask the Board members to go around the room and introduce yourselves, and we won't go into the details that we did in our own meeting, but give a little background as well on kind of what got you here and feel free to share some of your thoughts, you know, looking forward to the coming year on the Board as well. So, Mike, would you please start?

MR. LACY: I'm Mike Lacy, science representative from the University of Georgia. This is my second or third year. I can't remember which right at the moment. But enjoyed very much the interaction, learning more and more about organic agriculture, and glad to be here again.

MR. DAVIS: My name is Gerald Davis. I'm a new member on the Board as a producer rep. I have worked in organic vegetable farming for 12 or 13 years from California. I'm an agronomist and pest control advisor by trade, and I'm looking forward to sharing this experience.

MS. WEISMAN: My name is Julie Weisman. I'm
also one of the new members of the Board. I -- I occupy one of the handler -- I'm one of the handler representatives on the Board. I -- I'm involved in the manufacture of organic flavors and other minor ingredients. And I look forward to the work that the Board will be doing in the new future. Thanks.

MR. KARREMAN: My name's Hubert Karreman, a veterinarian in Pennsylvania on the environmentalist position, one of the three. I got my start in agriculture working with the Soil Conservation Service and along the environmental issues that they deal with and that got me interested in the dairy cows. At this point I work with about 75 certified organic and transitioning dairy farms in Lancaster County, Pennsylvania.

MR. DELGADO: Well, I'm Rigoberto Delgado. I'm a producer from Texas, El Paso, Texas.

CHAIRPERSON RIDDLE: Move a little closer.

MR. DELGADO: And once again, I'm Rigoberto Delgado, a producer since 1988 from El Paso, Texas. I'm delighted to be here. I look forward to working with all of you. I'm impressed so far with the type, level, and quality of work and I hope I can contribute as much value as you have done so far.

MS. CAROE: I'm Andrea Caroe and I'm very
happy to say for the first time that I am not the newest member of this Board. This is starting my third year on the Board in the environmental seat. I have a background in running environmental laboratories in compliance with EPA regulations. Also as -- I worked in the past as an organic certifier. Presently, I am a certifier to an organization that certifies to crop-specific regions, specific, IPM environmental standards. So -- and I hold the -- I hold the environmental seat and I am chair in the Accreditation Committee of this Board.

CHAIRPERSON RIDDLE: It should be on. Yeah, this one has to stay on.

MR. O'RELL: Okay.

CHAIRPERSON RIDDLE: But you might've just shut it off.

MR. O'RELL: I would've known you had the master --

CHAIRPERSON RIDDLE: There we go.

MR. O'RELL: Okay.

MS. CAUGHLAN: That's right.

MR. O'RELL: I'm Kevin O'Rell and I'm a handler representative, also chair of the Handling Committee. This is my third year on the Board, coming on in 2002, and I bring an expertise in over 30 years of
food product development in the food and dairy industry,
which includes in the past 14 years of my own business
in product development, consulting, and regulatory
requirements. The last nine or ten years have been
involved in product development in the organic industry.

CHAIRPERSON RIDDLE: And my name is Jim Riddle
and I am a certifier representative on the Board, a
long-time organic producer, inspector, and currently
work for Rodale's newfarm.org as an organic policies
specialist. And I know that we have a lot of items on
our agenda for this meeting, and then there are other
very critical items not on our agenda that are
undercurrents to the meeting as well. But I look
forward to a very productive meeting, and we'll try and
keep it light, keep it positive, and make progress
wherever we can.

MS. CAUGHLAN: Goldie Caughlan, consumer
representative from Seattle, Washington. I work with a
chain of retail food cooperatives, but my position is
not as a retail representative, but as a consumer rep.
I think that's about it.

MS. KOENIG: My name is Rose Koenig and I'm a
producer representative from Gainesville, Florida.

MR. SIEMON: George Siemon. I'm the farmer
rep and I'm a organic egg farmer and vegetable farmer.

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
MS. JAMES: The most important one never says very much. My name is Bea James and I'm new. This is my first year and I am the retailer representative for the National Organic Standards Board. I'm from Minneapolis, Minnesota and I am the senior full-health manager for a 20 upscale grocery store chain in the twin cities are called Lunds -- and it's one of the only grocery stores where we have organic cakes on the shelf, carpet on the floor, and chandeliers in the ceiling. And I'm looking forward to where this committee has been and where we're going and how we can stay there.

MR. CARTER: Dave Carter. I'm one of the grizzled old veterans on the Board finishing our last lap. Testing.

CHAIRPERSON RIDDLE: Yeah. No, no, go ahead.

MR. CARTER: Okay.

CHAIRPERSON RIDDLE: Yeah. There, you turned it off.

MR. CARTER: There we go. The --

MR. SIEMON: That'll teach him.

MR. CARTER: Anyway, I'll learn it eventually here. Consumer rep; also chair of the Policy Development Committee. I spend part of my life as the executive director of the National Bison Association; a part of it as a founder and principal of a new pet food
company that kind of a grew out of a project of helping
natural ranchers earn a premium on more of the animal;
and part of my life doing some consulting, and part of
my life trying to get one kid out of college and one
through high school.

CHAIRPERSON RIDDLE: All right, thanks. And I
would like to point out that we have four members whose
terms have just ended. And Mark King will be joining us
later tonight. His flight got delayed. Owusu Bandele
won't be able to be with us at all for this meeting.
And I believe Becky Goldberg will be coming in on the
last day or day and a half. But we do have the honor of
having Kim Dietz here with us, and so I'd like to
introduce Kim. If you'd like to say a few words. And
at times, as there are drafts that we're considering
that Kim has helped develop, the reason the outgoing
Board members are invited is because they do have
expertise still kind of in the mix. So they're invited
to the last meeting -- or the first meeting after their
term ends, with the opportunity to provide information.
So, Kim, if you'd like to --

MS. DIETZ: I'm going to use Bea's mike.
Would you turn it on for me?

MR. CARTER: There we go. When the red
light's on, you know it's on.
MS. DIETZ: Kim Dietz. I have spent the last five years on this National Organic Standards Board. It's been a pleasure, it's been a pain, and I'm glad to off and at the same time I'm very nervous to go out, so to be honest with you all. I was the handler representative and I believe that's about it. I will be here -- recommendations on the committee level and I'll certainly be here to give you my input on that.

CHAIRPERSON RIDDLE: Thanks, Kim, and thanks for your years of service. I think we should give Kim a round of applause. Well, before we move to the minutes, I just would like to explain a little bit about how I intend to use the gavel. I think the gavel itself is pretty self-explanatory; that people may or may not have noticed yet the USDA stress turkey here. When the -- at the last meeting in October, we had gotten these stress toys that were given to each of the outgoing Board members, along with a jar of raspberry jam, and there as a chicken, a turkey -- well, no, a chicken, a lamb, a pig, and a cow. But they come in sets of five, or at least they're cheaper if you buy them in sets of five, so knowing me, I got the full set, so I was left holding the turkey. I didn't have anybody to award it to at that time. And so I thought it'd be appropriate to have it here and if things are getting stressful, if you see...
me reach for the turkey, that's a bad sign. So we want the turkey to be just left here and have a stress-free meeting as we possible can.

MS. CAUGHLAN: I just want to know, is it organic and heirloom?

CHAIRPERSON RIDDLE: No, no, this is the hybrid modern turkey. It's not edible. And then also, as we move through the next few days, we're going to change the way we have dealt with some of our business slightly, and that is, I'm asking the committee chairs or whoever is presenting a draft for action, for a vote on behalf of the committee, to make a motion to introduce the draft, then that way it's all clear what exactly is on the table for discussion. And we can always move to set it aside, to send it back to committee, or to hold it overnight for further deliberation and development, but we will move and second items to place them under discussion to begin with. So that's a little change of procedure.

The other change is that we'll try and minimize the redundancy of -- in the past we have discussed things one day and come back and voted on them a different day. We'll try and wrap up votes when we have discussed an item. It doesn't mean we can't hold them over and vote the next day if there's a good reason.
to, but that way we can avoid some redundancy and be a little bit more efficient in how we use our time. Rose?

MS. KOENIG: I just noticed in my book that I was missing a finding fact report. I didn't know if anyone else was and just to make a note to check, because I'm going to need a copy. I don't have anything behind that tab.

MS. CAUGHLAN: Which tab is it?

CHAIRPERSON RIDDLE: It's the meth tab. It comes after number five in the Livestock Committee materials.

MS. CAUGHLAN: Well, it's --

UNIDENTIFIED SPEAKER: You're missing the whole thing?

CHAIRPERSON RIDDLE: Rose is missing the meth tab. So other people should check to see.

MS. WEISMAN: Twenty pages?

CHAIRPERSON RIDDLE: Yeah.

MS. KOENIG: All right.

CHAIRPERSON RIDDLE: And it was dated May 21, 2001. It's the original technical review. Okay, everybody else has it, great. All right.

MR. CARTER: After which tab?

CHAIRPERSON RIDDLE: Well, after tab five and then you look for meth.
MR. CARTER: Yeah, yeah. Mine is actually a -- I do have something there, but it's on chelated mineral complexes, so --

CHAIRPERSON RIDDLE: Oh.

MR. SIEMON: We'll look around, it might be in it.

CHAIRPERSON RIDDLE: It's not in front of the chelates?

MR. CARTER: Okay.

MR. SIEMON: Look around, it might be there.

MR. CARTER: Oh, okay. Wait.

MR. SIEMON: I'm sure it's --

CHAIRPERSON RIDDLE: Well, we all want to get on the same page here.

MR. CARTER: Oh, yeah, it is. Okay.

CHAIRPERSON RIDDLE: You do have it?

MR. CARTER: It's ahead, okay.

CHAIRPERSON RIDDLE: Okay. All right. So the next item then on the agenda is the approval or consideration of the October 2004 meeting minutes. Is there a motion to approve? Dave?

MR. CARTER: Yeah, let me -- Mr. Chair, I would move to approve the minutes, though, with several changes. You had gone through and made some changes to the minutes and had asked me to review those as well. I
did go through those and the changes that you have
offered and circulated to the committee, I would move
that.

MS. CAUGHLAN: Second. I'm going to second
it.

UNIDENTIFIED SPEAKER: I haven't seen them.

CHAIRPERSON RIDDLE: Yeah.

MR. SIEMON: Electronically we got them.

MS. CAUGHLAN: I was on vacation. They came
late, but I have looked them over now and that's why I
can second them. But if you haven't seen them.

UNIDENTIFIED SPEAKER: No, that's all right.

MR. CARTER: And if you want me to review, I
mean, I will go down and summarize. Some of them are
just grammatical.

CHAIRPERSON RIDDLE: Yeah, I think it would be
good if you would --

MR. CARTER: Okay.

CHAIRPERSON RIDDLE: -- please. I know
it's --

MR. CARTER: The changes that are in on page
one, under approval of the 2004 meeting summary, it was
the -- four changes were proposed by Mr. Riddle and not
Mr. Mathews. The Executive Committee conference call
minutes the Board reviewed, the June and July Executive
conference call minutes, and did not approve them. The Board does not approve the Executive Committee minutes.

Under the Livestock Materials portion of it, under the four options, under number two was to change that to allow "over-the-counter" animal medications, but to provide a negative list of all prohibited ones. Number four was to specify that under the minor use/minor species that Congress had passed, legislation for minor use/minor species, and that the Board also discussed whether more communications with higher levels of USDA and FDA can facilitate the approval process in the future.

Down on page two, under the framework for collaboration, under the discussion of the Board's collaboration document, it was noted that Ms. Robinson agreed to provide a collaboration policy for NOSB consideration. And then moving to page four, under the Policy Development Committee section, where it said on behalf of USDA, Ms. Robinson concurred to add a sentence saying Ms. Robinson agreed to provide written response to all four NOSB issues papers.

MS. CAROE: Which was that? Where is that?
CHAIRPERSON RIDDLE: It's a the top of page four, right above public comments section.

MS. CAROE: Um-hum, okay.
MR. CARTER: And then also on page four is just a typographical correction on John Smiley. At the top of page five --

CHAIRPERSON RIDDLE: Joe Smiley.

MR. CARTER: Excuse me, Joe Smiley. At the top of page five, the Board voted unanimously to accept Materials Committee drafts of the recommended approach to Sunset as presented by Ms. Koenig as amended, to add the words as amended. Under the materials approved as food contact substance update -- and this one had several changes in it, so let me just -- and I'll read it slowly. The -- as recommended to be amended, the paragraph would read, On behalf of the Handling Committee, Mr. O'Rell reiterated the fact that the committee's report -- new language -- which encouraged the addition of six food contact substances -- again, new language -- to the National List, despite the possibility that they might be considered food contact substances -- end of new language -- had been accepted by the full Board at the last meeting. The six materials in question: four boiler water additives, activated charcoal, peracetic acid are in the NOP processing docket.

The April report: new language quoted from and the new language on NOP policy statement,
differentiating between synthetic substances as ingredients in contact substances. And then the remainder of the paragraph being new language which reads, the April report also noted that the Handling Committee would prioritize in their work plan to clarify the qualification of materials on the foods contact substance list.

Further down on the page, again, on page five, under Livestock Committee, the wild caught and aquaculture standards. The sentence would read, Mr. Siemon announced the Livestock Committee's intention to form a task force with two working groups, one to, and then inserted the word address, replacing the word develop. The remainder of that sentence remaining unchanged. And let's see. Whoops, I'm going up. On page six, under the Materials Committee, the revised Federal Register notice for petitioned substances, the paragraph beginning with Ms. Koenig presented a draft to request, was to add a sentence that says the draft remained at the committee level for further development.

Under Policy Development Committee, the same page, policy for NOS -- scheduling NOSB meetings and calls, where it says Mr. Carter presented a draft of the meeting conference call schedule protocols, again, to add a sentence stating the draft remained at the
committee level for further development.

On page seven, under fish meal vote, would be to change it to say the Board voted to accept rather than consider. The Livestock Committee's response to the NOP directive. So the words response to the NOP are inserted in that sentence. Under page eight, the reference to Emily Brown Rosen is deleted under the proxy for Brandon -- Brendon O'Neal [ph]. And that is it. Okay. So those are included. The amendments is a part of my motion to approve.

CHAIRPERSON RIDDLE: Okay. And your secretary accepts that?

MS. CAUGHLAN: Yes.

CHAIRPERSON RIDDLE: And is there any discussion to any of those suggested changes to the minutes?

***

[No response]

***

CHAIRPERSON RIDDLE: Seeing none, we'll go by voice vote on this again. All in favor say aye?

BOARD MEMBERS: Aye.

CHAIRPERSON RIDDLE: Those opposed, the same sign.

***

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
[No response]

***

CHAIRPERSON RIDDLE: Okay, thanks, Dave.

Yeah, George?

MR. SIEMON: Just to be incentive for the people in the audience, are we going to try to have PowerPoint up tomorrow, so as we go through some of these documents, that they have the chance to see them?

CHAIRPERSON RIDDLE: Yeah. Yes, I was just going to talk about the kind of difference between discussion items and action items. And the rest of today's agenda is, if you see on our agenda, called discussion items, items for discussion, and those are really updates on the committees' works in progress and won't be considered for votes at this meeting. And most of those there are very early stages of drafts, so really no drafts on the table yet. Tomorrow, all items that we will be considering for action or vote will be on the screen so that members of the public can see those -- you know, PowerPoint -- as we're considering them. So -- yeah. But today, we won't be voting on anything today. It's more just a discussion day.

So with that, I'm moving on to the presentation of discussion items, the reports from the committee chairs. And I have asked the committee
chairs, when you are finished with your discussion items that are listed, to also just summarize, just a few words, the action that you'll be bringing forward as well. So you weren't here earlier when I mentioned that, but --

MS. CAROE: I get to be the first one.

CHAIRPERSON RIDDLE: Yes. Well, yeah. I mean, at least you only have one of each. So I hate to put you on the spot, but accreditation starts with A and --

MS. CAROE: I always --

CHAIRPERSON RIDDLE: -- and so does Andrea. So, Andrea, if you would discuss where the committee is at on the peer review and the ANSI report.

MS. CAROE: Okay. We have one discussion item that we will be looking at in the very near future, and that is the operationalized -- institutionalized I think is the word we used for the peer review process. We had this section item for awhile and we tabled it until we saw the ANSI report and the response of the NOP; to take a look at how it's going to be used and come up with some reasonable expectations of how peer review will be standardized moving forward. This report came out very near the time when we were publishing the Federal Register action items. This committee did not have
enough time to do a thorough job at looking at this in order to have a vote on a procedure. So -- and I think the members probably now have had a chance to read that document. We will be getting together and looking at it. We'll have discussions with the NOP and create a document of procedure for how this will move forward. But at this time, it's just on the plan and we really have not done no work on this subject. Jim, do you want to add anything to that?

CHAIRPERSON RIDDLE: Well, yeah, I was -- I read the ANSI report and then the NOP response when it first came out, and then was reading it again on the flight here yesterday. And you know, I definitely see some items where the Board can have a role in both providing some recommendations for addressing some of the deficiencies or issues that were identified during the ANSI audit, but also, the Board having, you know -- you know, possibly a role in the ongoing review process. So I think that the report certainly noted numerous areas of improvement and you know, document control, the lack of a quality manual, and quite a few areas, and I certainly encourage everyone to read that. It's the kind of thing that is fundamental to the future and the credibility. The integrity of the whole program is the structure of accreditation. That's what it's all about.
So I ask people to provide input to the committee on this topic to help us craft a very well-informed recommendation.

MS. CAROE: Yes. Be sure the input -- the valuable input out there of certifiers that have gone through the accreditation process and have dealt with the ISO requirements would be helpful and we will be moving forward, yes, making recommendations, but I really feel more in a collaborative sense, working with the Program for the overall success of the Program and strengthening that. So that is -- that's it in a nutshell.

CHAIRPERSON RIDDLE: Any other comments, questions, members of the Board, on the topic?

[No response]

***

MS. CAROE: Okay. And then the only action item we do have for this meeting is, we will be voting on a recommendation for standardizing some of the information required on certificates, in order to add some consistency to what is being represented out there, the document, the certificate, and to facilitate commerce experience. We are aware of some difficulties with verifying those organic ingredients because of some
of these varieties of certificate formats that are out there. So our recommendation is in the meeting book and will be voted on in this meeting. And I don't have anything else to say on that. Is there any questions about that process? Anything?

***

[No response]

***

MS. CAROE: Then I'm done.

CHAIRPERSON RIDDLE: Okay, thanks, Andrea.

All right, next is Materials. Rose.

MS. KOENIG: Well, actually there's one discussion. But just to note, from the last meeting, we were asked to look at the petition request form that's on the web and kind of update that, but that -- which we did and presented a draft at the last meeting, but that was kind of placed on hold. It wasn't considered a priority item for this meeting. So we will confer back to the NOP and perhaps pick up those, because there was some changes made in that petition notice. And once we get information that that's something that the NOP wants us to go back and do, as far as work, will resurface, the draft will reappear. So that's one thing.

And then as far as the -- in the book it says discussion of procedures, we will -- you know, so far
the talk as far as committees just identifying materials prior to the Federal Register notice going to the public to identify materials, if you look at the Sunset policy that we adopted at the last meeting, it gives each committee the privilege of identifying materials themselves. So, you know, right now that we just -- we have given ourselves that privilege. I would like to say that we, as the Materials Committee, can provide guidance. I'm not sure how much guidance you want. I know some of the issues that the committees need to be aware of is identifying materials that are the list that are not consistent with the aqua criteria, because many of them, now that we have those forms, we are identifying where in the aqua criteria each material falls. And if you remember the draft from the last meeting, where I went through the crops and kind of divided the categories up and identified materials that fall within those categories, there were a few in crop that weren't consistent, and livestock. We haven't gone through that exercise, but that's certainly something that committee chairs and committees should be aware of. If there's things that don't fit in either the crop and the livestock categories, they should be at least identified and perhaps looked at in terms of review.

If you know something, if there's new
technical information on something, that that certainly could necessitate a review by the committee. If you feel that there may have been a technical review that was not adequate in the past, that may be a reason for a committee to look at, determining that a certain material may need to be reviewed.

Just be aware that there's $300,000 to do reviews for both Sunset and the petition, so we do have the budget to look at numerous materials. And if a committee feels that there is some justification for doing that review, they should not hesitate identifying those materials quickly. Because once a Federal Register notice goes out to the public, we will have a backlog of materials that we're going to have to deal with. Some may not need technical review, some may. So if we can jumpstart the process via the committee identification, it's something that I think would be helpful.

Just one question of clarification that I think the committee had dealt with and we've talked about it on the Board, and maybe at this meeting at some time we can get clear is that I think we've determined that Sunset is not a time, and that was within the statement to change an annotation. It's simply to either keep something on as it stands in the regulation.
now or take that off. And so the question -- and I
think that we still need some clarification, and that's
something I think the committee needs work on, is that
the if the annotation needs to be changed, our
assumption now is that the -- it would not be renewed
and it would have to, I guess, be repetitioned. So that
is just something I throw out because it's something I
think that the Materials Committee's going to have to
determine, because I have a feeling that on some of the
materials, they may be -- the committee may want to
review them because of an annotation, yet, our hands are
kind of tied as far as the fact that we can't alter a
material on the list. It's either yea or nay. So I
think that's probably the critical issue that the
Materials Committee has to think about, and it has to be
clear to both the public and the Board how that process
would proceed, because it could jeopardize or create a
gap between material that the industry is using and the
petitioning process, if it needed to be repetitioned.

CHAIRPERSON RIDDLE: Yeah, Rose, it's my
understanding from our discussion of this last time that
we did amend the draft to allow technical-type
corrections to annotations, because there are some items
like the chlorine materials, where the annotation does
not reflect the prior Board's language for the
annotations. So those kind of changes to annotations could be considered during the Sunset process, but that the Sunset process was not a time to expand the allowed uses of a substance by removing or extending its annotation. But that would take a new petition to extend the allowed uses or to change the form of the substance. You know, a substantive change to the annotation, so to speak, would take a petition, but a technical change would not. Now would be the time to make those changes. Hugh?

MR. KARREMAN: Would the new petition have to have new TAP as well, or could you use the existing TAP that was done?

CHAIRPERSON RIDDLE: Yeah. And it would depend on what the request in the petition was. If the petition, you know, requests a use that had been considered in the prior TAP review, then there wouldn't be a need for a new TAP. If it's considering something, or if it's requesting something that is a new use that was not addressed at all, then there certainly be warranted a new technical review.

MS. KOENIG: Yeah. And, Jim, you know, back -- you know, I recall that being the understanding. I just think that what we may view as a technical change and what may in reality what -- how the regulation would
view a technical change, I think might be different. So what I'm just saying is that I think that has to be clear because I think that that is an area that we may run into some issues, and we might as well try to work out that process before we get there and find out that there may be issues due to the kind of -- around the subject of annotations.

CHAIRPERSON RIDDLE: So I just wanted to make sure that I captured, just kind of in summary, some of the guidance that you're providing to each of the Crops, Livestock, and Handling Committees as they prioritize substances for early review, to look at them whether they do fit in the OFPA categories and fit the OFPA criteria, and whether or not there's new technical information about a substance, or if there's a sense that the prior review was inadequate or not sufficient, I guess. So those would be some factors to consider, right?

MS. KOENIG: Yeah. And I think, you know, as we proceed, if there are issues out of our control, you know, because of changes that --

CHAIRPERSON RIDDLE: Um-hum.

MS. KOENIG: -- may be of a legal matter on some areas of the list, then that -- then those things would have to be addressed in some guidance. But at
this point, we are going to offer guidance just on what's here today and now for all the committees.

CHAIRPERSON RIDDLE: And this early review -- this topic came up over lunch -- you know, prioritizing a substance for an early review does not mean that the substance would go off of the list any sooner, it's just, as informed stakeholders, we understand that some substances are problematic, or we know that they're going to be identified for review in this process. So it's just jumpstarting the scientific review. It has nothing to do with any of those substances disappearing or not being renewed. It's really to get the science so that we can make a better informed decision, or the rest of you that'll still be on the Board in 2007 can make a decision at that time. Okay, anything else? Any -- Rose? Or any questions? Further comments for Rose?

MS. CAROE: Just one question.

CHAIRPERSON RIDDLE: Yeah, Andrea.

MS. CAROE: You want the subcommittees to go and look at the list and determine which ones may be problematic according to OFPA and require a further TAP, is that correct? Is there going to be a process where the committees are going to bring those materials to -- does the -- who has the authority to order the TAP, is it the committee or is it the Board or is it the
Materials Committee, or what do you foresee procedurally how that would go?

MS. KOENIG: Well, I think -- can we defer, maybe, that question until -- because some of this is covered in some of our action items. So I think when we get to that action item, in terms of kind of the internal workings of the Sunset procedures, I think some of that question will be answered. So I don't want to kind of discuss it now and then go back to it. But if there's something that -- if after we review that and it's still not clear or we have to expand on things, I think that would be the appropriate time to -- and in the meantime, I'll look over that and make sure that it is addressed, and if it isn't, we can kind of discuss that at that point, if that's fine with you.

MS. CAROE: That's fine.

CHAIRPERSON RIDDLE: Okay, anything else?

***

[No response]

***

CHAIRPERSON RIDDLE: All right, Mr. Carter, the Policy Development Committee.

MR. CARTER: Okay, thank you, Mr. Chairman.

Coming out of the October meeting, the Policy Development Committee had a work plan that had six...
specific items on it and then a couple more have been added along the way. So the two items that we have are the top and the bottom of that list, and which is why one has been moved forward and the other one there's not a lot to talk about at this point.

But at the top of the list was the -- was the discussion or was the executive director job description. Just for some background information, the Organic Food Production Act does provide for a staff director, or as we call it, executive director, to be provided for the NOSB. It wasn't until just this last round that, actually, funds have been appropriated to facilitate that. And so in trying to draft this, in working with NOP, recognizing that that individual will be a federal employee and have to go through all of the appropriate requirements and qualifications for that, but at the same time, in trying to devise a job description that fits our needs and really has that individual responding to the NOSB, the Policy Development Committee, then, has developed the draft document that was forwarded to Barbara in December and she will probably provide some comments on where they're at in that process at this point.

But let me just go through and -- and since it's not in the book here, just to review the things
that have come out, the Policy Development Committee also relied on Kim Dietz to advise because of her background in human resources as well. So anyway, the description that comes through talks about the responsibilities of the executive director being -- including but not being limited to several areas. Number one, helping to organize the meetings of the Board and committees. And since it's not in the book, I will try and get a printed copy to circulate to everyone here, too, although it was circulated previously. Number two, to assist the Board's secretary in recording meeting minutes; document the proceedings of the standing committee meetings; maintain all Board archives and records; serve as the primary operational liaison to the National Organic Program; next is, in consultation with NOP, to serve as the primary operational liaison with other government agencies, and that refers to the interaction that we have with agencies such as EPA or FDA; next, in consultation with the Board chair and to the chairs of the appropriate committees, the executive director will manage the work plan established by the Board; next, assist in the preparation of all Federal Register notices pertaining to activities of the Board; next, represent the Board in fulfilling the statutory responsibilities of convene technical advisory panels;
and finally to assist the Board in the preparation of policy recommendations. So those are the general job descriptions.

When it comes to the requirements, we have recommended that, under the required qualifications, there be seven areas, specifically beginning with the education or training in management, administration, agriculture, food science, communications, public administration or related fields; secondly, education and training in chemistry and/or biology; third, ability to manage and administer multiple tasks; fourth, experience in working with volunteers and public agencies; fifth, proven ability to write and do public speaking; sixth, good computer skills; and seventh, ability to take the initiative and follow through with assigned duties.

And then under the desired qualifications is knowledge of agencies and interests involved in the implementation of the NOP, or the National Organic Program, and secondly, experience in management, education, and communications. So there are the required qualifications that, at the top, the food science, chemistry, biology, and then the usual administrative management-type of qualifications.

There was a lot of discussion there, in trying
to, you know, really cover all of the things here, but
make sure that this didn't become just a clerical
position, but it really was an executive director
position to have some liaison with -- you know, some of
the things that might be assigned with that. So that
was what was -- has been forwarded to the Program and
they will take it from there. So --

CHAIRPERSON RIDDLE: And I want to point out
that that draft was reviewed and approved by the
Executive Committee. But this is just our wish list.
It's been turned over. This is not a job posting at
this time, so don't apply yet. Wait until it comes back
out on the other end from USDA.

MR. CARTER: Okay. So -- questions on that?

***

[No response]

***

MR. CARTER: Okay. Then the second item,
which, as I mentioned, was at the bottom of our work
plan, so there's nothing to be presented at this time.
But that is the guidance for temporary variances on
research under 205.290(a)(3). And specifically, what
that refers to is the temporary variances for practices
used for the purpose of conducting research or trials of
techniques, varieties, or ingredients used in organic
production or handling, and it's trying to define -- now, that's practices and not substances. But what does that mean, and we had some discussion on this over lunch -- in trying to facilitate research of organic practices in a manner that doesn't threaten somebody's organic certification, and how do we define that? I know in here it talks about the Policy Committee working in conjunction with the Crops Committee, but even through the discussion at lunch today, it seems like there's some relationship that may come forward with some livestock issues as well. So this is one that we don't have anything. We're beginning the process and this will be part of our work plan going forward. But any input that we can get at this point will be helpful.

So --

CHAIRPERSON RIDDLE: Yeah. Any other -- any questions, comments? Yeah, Rose.

MS. KOENIG: I'm sorry. I don't want to go back, but I have to go back, because I just thought there is a little more discussion. I just wanted to put on the record on the draft job description, and I think I stated it in discussions before that, you know, I personally believe that, you know, our first and foremost jobs is the material issue. And although I think that a lot of the other characteristics are very
noble in a person, that it still is firmly my belief
that these material issues aren't going away, in fact,
they're getting more complicated every day, especially
with the Sunset review process, and that really -- that
-- a person with that technical background in either
food science or chemistry, to me, is the utmost -- of
utmost importance, because I think that is something
that -- again, not to be insulting to anyone at the NOP,
that I think that that is also a skill that would be,
really, a big additive to their staff.

MR. CARTER: Well, and just -- the NOP has
conveyed that same desire, also. I mean, that's -- so
you're -- I don't think that's being insulting or
anything there, because I know they recognize and that's
why we have put those things up at the top of the list
of required qualification.

Okay. Then, Mr. Chair, before you go on to
the next one, I'll just give a trailer here of what's
coming, coming attractions from the Policy Development
Committee over the next couple of days -- is that
tomorrow we will talk about the livestock medication
recommendations that were made by the NOSB, but have not
been approved by the FDA. Again, that was coming out
with the list of options, so to speak, of how we might
proceed with that. In cooperation with the Livestock

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
Committee, we have developed a draft document to talk about how we might proceed with those.

Also, tomorrow afternoon is the policy for NOP/NOSB collaboration. And again, that is to consider adoption of the policy to be presented by NOP. Then on Wednesday morning, if you haven't had enough of Policy Development, we're back with the Board policy and procedure manual revisions. We did talk about that in our orientation this morning. But again, coming out of the meeting, some of the new procedures we've drafted up and have put those into the manual, which was posted for public comment.

Secondly is the handling of organic and non-organic ingredients in the "Made With" category. And again, a draft document has been developed by the Policy Committee that is in the book here.

And then finally is the request for the NOP's support for changes to the use of the word organic on the AAFCO-approved fertilizer labels. And again, this was something that was discussed. It's a recommendation to NOP on how they communicate this issue. It is one that was approved by the Policy Committee, but not unanimously. And so in the draft document you have both the committee report and the minority report.

CHAIRPERSON RIDDLE: And we will be having a
report from the liaison from AAFCO earlier in that day
that will further inform our consideration of that.
Anything else for Dave -- the Policy Committee?

***

[No response]

***

CHAIRPERSON RIDDLE: Okay. Well then, we're
going to hit rewind and go back to Materials, because
Rose has pointed out that she didn't describe or
summarize the action items that the Materials Committee
will be presenting in the next days.

MS. KOENIG: See, if it's not on the agenda --

CHAIRPERSON RIDDLE: Sorry.

MS. KOENIG: What we're going to be discussing
-- and I guess only on Wednesday -- will be just a
discussion of the synthetic versus nonsynthetic. This
was a draft. The first draft was presented at the last
meeting. The committee has taken that draft and we're
not intending it to be a final draft at this meeting.
What we're trying to do is gather more input, because
previously we just -- we introduced it and brought it
back to committee. We refined it, but we're not at the
point of making a recommendation. But we do want
discussion of that so that we can come up with a final
recommendation for the next meeting. So there is an
updated draft in the book, and that is something that, certainly, we would be happy to receive public comment on and Board discussion on.

The materials review procedures, I want to just update and discuss the revised material procedures that -- that have been proposed and what we are utilizing. They have become more of a finalized procedural policy. And so there's a document in there that kind of revises that, and hopefully we'll be able to vote so that we all have an understanding of how that procedure works.

And I'm not sure there's an action item on extraction methods under the agenda, and I'm not sure, Jim, what -- because I was not present at that phone call, because my father was in the hospital.

CHAIRPERSON RIDDLE:  Yeah.

MS. KOENIG:  So I know you had to make that --

CHAIRPERSON RIDDLE:  Right. And that was a separate work plan item, but my understanding -- now, that is imbedded in your synthetic versus nonsynthetic draft.

MS. KOENIG:  Correct.

CHAIRPERSON RIDDLE:  So yeah.

MS. KOENIG:  Okay.

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
MS. KOENIG: And then finally, what we mentioned earlier with Andrea, there is a document for the internal workings of Sunset procedures --

CHAIRPERSON RIDDLE: Yeah.

MS. KOENIG: -- and that's not on that. But we can pull that in, since we thought to put that on that line item, I guess. I thought it was there, but it appears not to be. It was on -- it was something that you could open up off the website. So I know --

CHAIRPERSON RIDDLE: Oh, no, it's there. It's just -- it's the first item right after your name.

MS. KOENIG: Oh, okay. All right.

CHAIRPERSON RIDDLE: Yeah.

MS. KOENIG: Because -- all right.

CHAIRPERSON RIDDLE: Yeah.

MS. KOENIG: Oh, yeah.

CHAIRPERSON RIDDLE: They've got that in bold twice, so --

MS. KOENIG: Okay. So that --

CHAIRPERSON RIDDLE: -- it's confusing.

MS. KOENIG: Yeah. So that's why it confused me. So the Sunset document is there and that --

CHAIRPERSON RIDDLE: Okay.

MS. KOENIG: -- is the one we just discussed earlier. Thanks.
CHAIRPERSON RIDDLE: Yeah, uh-huh. Okay. And before we move to Livestock, I'm going to hit rewind even further, because I realize that after the approval of the October minutes, we were supposed to review Executive Committee conference call minutes, and we do not approve those as a full Board. Those are approved by the Executive Committee at the next meeting. And we're kind of behind in those being presented back to the Executive Committee, and them being approved and posted, and partially because of Katherine Benham's injury. And for those of you who don't know, at the end of January, Katherine slipped on the ice here in D.C. and broke her ankle badly and is still in a waist-high cast. So she's been losing more than a few minutes. She's been -- that was a joke.

MR. O'RELL: For the record.

CHAIRPERSON RIDDLE: For the record, that was a joke. No laughter. So anyway, there really -- there aren't any in the meeting book, previously. There usually are Executive Committee minutes in the meeting book, but we are behind in the review and approval. But I did just want to mention it for the record. And Katherine's injury had a lot to do with that. So okay, moving on now to Livestock. George.

MR. SIEMON: Okay. The discussion I had is
really our work plan -- and just to show the things we're working on. The first is apiculture, which Nancy Ostiguy is the one leading that, and so really it's just on our work plan for the year. So there's really not much news there.

The dairy replacement rule change was in relationship to the directives that we had about the antibiotics, and we put forward again our replacement clause that we had already recommended, asking that to be incorporated into the -- the directive about the antibiotics, but there's no -- that's really in the -- we have not -- back out of the Department yet, so there's been no action on that.

The third thing is Aquatic Animals Task Force, which I'm going to ask Arthur to give us the best update on that. It's in the Department now.

CHAIRPERSON RIDDLE: And if you'd identify yourself for the record, Arthur.

MR. NEAL: For the record, Arthur Neal, the National Organic Program. On January the 24th, 2005, the National Organics Program released and called for a nomination for an Aquatic Animals Task Force. That task force would be comprised of 24 individuals. That task force would also be split into two working groups, one for aquaculture, and another
working group for wild caught. As of today -- well, on
Wednesday, January 23rd, the nomination period closed.

CHAIRPERSON RIDDLE: February, February.

MR. NEAL: February 23rd, and I apologize --
the nomination period closed, and the Department, at
this time, has already received 16 formal nominations
for the Aquatic Animals Task Force. However, we do
acknowledge the fact that because this call for
nominations stated that nominations had to be mailed in,
there could still be some nominations coming in through
the mail, so we are waiting about -- we're still waiting
for a few more nominations to come in, that we are aware
of, through the mail, before we give it to the Livestock
Committee and begin working with them on finalizing the
process in terms of -- the inner workings of the working
group and contacting the new people who have been
nominated to let them know whether or not they have been
selected for the task force. That's the update on the
Aquatic Animals Task Force in a nutshell.

CHAIRPERSON RIDDLE: Yeah, Andrea.

MS. CAROE: Arthur, what happens if you don't
receive any more?

MR. NEAL: That is something that we'll have
to talk about after we've received what we think are the
last of the nominations. There are a couple of options;
to call for more nominations; or you may go with the
nominations that you have; or you decide that there's
not enough interest in that area and you hold off until
you get more interest. We have to talk about this after
the fact.

MR. SIEMON: And of course, we have the
members from the Board, as well, who will be on that
task force. Okay, the fourth discussion item is the
Sunset material review and you know, as was said
earlier, these are not necessary recommendations. We
think these things ought to go off the list. They're
recommendations to be looked at first and foremost. And
so in our discussions, we've identified oxytocin and
ivermectin as things we'd like to put at the top of the
list for reviews. But again, that's just the reviews
and not anything like a recommendation. So that's the
discussion items.

CHAIRPERSON RIDDLE: Yeah, George, before you
move on, the first thing you mentioned was the
apiculture, the beekeeping standards, and those -- you
know, we did have a task force that submitted a report
that was accepted by the Board, and that is in the
meeting book and was posted again on the website, and it
did generate some comments. And I just want to
acknowledge that comments were received and those will

be catalogued and could be considered by the Board. And you know, I'd really like Nancy to be here, since she is an apiculture expert. But if the Livestock Committee would keep that on your work plan, and to consider the comments that came in this round, before any further action and you know, for the Livestock Committee to feel free, I guess, to incorporate those comments into a draft recommendation that goes beyond the task force report in the coming months. And then if there are going to be, you know, proposed rules, of course, those would go out for a whole other round of public comments before there'd ever be final rules. But I did want to acknowledge that since this was --

MR. SIEMON: And what tab is that --

CHAIRPERSON RIDDLE: Well --

MR. SIEMON: I can't -- right now.

CHAIRPERSON RIDDLE: Well, it was definitely active on the website, so I assume it was in apiculture, right there after number five, the second tab down, and it's the October 16, 2001 Apiculture Task Force report. So we did receive public comments and those will be -- but it won't be lost just because we aren't taking action at this time. They will be sent to the committee for further action, okay?

MR. SIEMON: Yeah.
CHAIRPERSON RIDDLE: So just keep it on the work plan and --

MR. SIEMON: Okay.

CHAIRPERSON RIDDLE: All right.

MR. SIEMON: And then tomorrow, the action items, we have -- two of them are clarifying -- I would call clarifying, where we're using the question and answer format. You know, the different one is to deal with the issue that came up about calcium carbonate in livestock feed, and we're proposing a question and answering format to answer that. The other two is the proteinated chelate, which has been in the TAP review process, that we decided to go ahead and to allow its continued use, but we developed a series of questions to clarify that what is not -- what form of it would not be allowed, and that's in the book as well. So those are two different things which is on that tab.

And the other two, Mike Lacy will be presenting tomorrow about the DL-Methionine, which is in petition to address the extension -- the Sunset that -- the time limit on it which is to fall '05, to extend that. So that's a vote that we're going to take tomorrow. And the last one Hugh Karreman will be presenting about the pasture policy, where we were asked to take another look at the 2001 recommendation, and
we've made some modifications to that that's going to be voted on tomorrow as well.

CHAIRPERSON RIDDLE: Any comments, questions for George on any of these items?

***

[No response]

***

CHAIRPERSON RIDDLE: Okay, seeing none --
MR. SIEMON: Okay, while I got the floor --
CHAIRPERSON RIDDLE: Yes, George.
MR. SIEMON: -- we've got coffee. No, seriously, can we deliver the coffee here?
CHAIRPERSON RIDDLE: Yeah. And I think Hugh actually has a question, though, so -- and Kim does, too. All right.
MR. KARREMAN: I'm just wondering, would the -- back to the ivermectin, is -- I know it's just going to be kind of reviewed scientifically and whatnot, right? But, you know, as a priority thing. At what point could there be some kind of language saying that, if ivermectin -- ivermectin comes off, but kind of couple that with the moxidectin that was already allowed, and like kind of Sunset one as the other one as the other one becomes allowed. Is that possible to do, so there's no cap?
MR. SIEMON: That's a real good question. That's definitely the intent of our reconsidering. It's based on moxidectin, so -- coming in. So somewhere, I hope moxidectin's through by -- by that time period, you know. It shouldn't -- we hope it won't run into the same problems it ran into at other places.

CHAIRPERSON RIDDLE: Yeah, maybe Arthur could just comment on where, you know, that moxidectin is in the pipeline.

MR. NEAL: By that time frame, we're hoping the same thing. We'll just put --

MS. CAUGHLAN: We can't hear you for some reason.

CHAIRPERSON RIDDLE: Yeah, that one's not --

MS. CAUGHLAN: I don't think that's --

MR. NEAL: Can you hear me now?

CHAIRPERSON RIDDLE: Yeah, you have to be really close to that one.

MR. NEAL: Hopefully, by this time -- way before that time frame it should be in the pipeline. It's just that things have gotten clogged up in the system due to all the activity going on.

CHAIRPERSON RIDDLE: Okay. And, Kim, you had a question or a comment or --

MS. DIETZ: Just a comment. As --
CHAIRPERSON RIDDLE: Well, you'll need to speak into a mike.

MS. DIETZ: Okay.

CHAIRPERSON RIDDLE: Don't you know the rules?

MS. DIETZ: I get my exercise that way. As the committee chairs were talking about the National List, the materials they're recommending for review, if you could just give the justification as to why you picked those materials. I know that not all of them have issues that there are incomplete TAPs or what have you. Some of them are just industry concerns that we know are going to be contentious items. So if you name the material, could you just give us the justification so we understand why that material was picked?

CHAIRPERSON RIDDLE: Thank you. That's a really good reminder. Mr. Coffee?

MR. SIEMON: Yeah, we're working on it.

CHAIRPERSON RIDDLE: No, I'm not anxious for the coffee, it was --

MS. CAROE: Speak for yourself.

CHAIRPERSON RIDDLE: Yeah. But it was --

MR. O'Rell: There was a question asked.

CHAIRPERSON RIDDLE: Yeah, there was a question asked that related the ivermectin and oxytocin, that you anticipate at least recommending to the
Livestock Committee that they be priority reviews, and if you could just give a very brief rationale for why identify those two substances.

MR. SIEMON: Well, ivermectin is because of the moxidectin. We feel there is a more appropriate one for livestock that it can be used on, both in FDA approval as well in the technical review we had. So that one's fairly clear, we think there's a better alternative. Synthetic as it is, it's a better alternative.

On the oxytocin, that's just a matter of the industry growing and changing and learning to live more without the -- that, too, it's a hormone. One of the concerns the consumer has is hormones, so that one might be more debatable. But that -- things have changed a lot since 1995 in the holistic livestock care. So they're all going to be reviewed.

CHAIRPERSON RIDDLE: Right.

MR. SIEMON: These are the priorities. Well, I know --

CHAIRPERSON RIDDLE: For an early review.

MR. SIEMON: Early.

CHAIRPERSON RIDDLE: Uh-huh. Yeah. And my understanding of the Sunset process is, if no one challenges a substance, it would be renewed without a
full review.

MS. KOENIG: Yes, no.

CHAIRPERSON RIDDLE: Yeah?

MS. KOENIG: The -- you know, the wording and
the understanding within the document is that review can
take a number of different forms, okay? A review can be
that the committees have -- have looked at the list of
considered public comment. If there's no public
comment, they can use old TAP reviews if they feel that
that's necessary. So there's going to be committee
review of everything. Whether there will be an
additional technical request is the distinction. And so
the committees should identify those items that they
feel need additional technical information on so that
they can conduct the review within the committee. If
you feel that -- if you look at the old TAPs and you
feel that -- and you look at the public comment, you
know, but at this point, you're not going to have public
comment. But if you look at the old TAPs and you feel
like you know some new information that's now available,
or new techniques, that is a reason to perhaps get more
additional technical information. But if you feel that
it's adequate, you may not need that additional
technical information. Again, if you look at the Sunset
document -- and I think that philosophy applies even to
this process -- if you know, as stated in there, these substances have been hopefully reviewed to some degree. Certainly, the ones more recently, they've been under more scrutiny and better quality TAPs. So we anticipate that if there are ones that should be highlighted, are those probably that were put on many, many years ago. That's probably where the most changes have occurred. But there should be a technical reason. It could be inadequate technical information that you have available. But don't forget, you can use the technical information that has already been conducted. So -- but everything will be reviewed. It's to what degree do we seek additional technical information.

CHAIRPERSON RIDDLE: Okay, thanks for that correction. I was using review just to mean the additional scientific review by the contractor. So thanks for explaining that. Hugh?

MR. KARREMAN: As far as when you're reviewing other materials for Sunset and you're saying, George, you know, there's alternative things to various substances now in the last 10 years. Will they be brought forth, documented, kind of like I see -- it's kind of like Methionine extension. There's other -- there's research going on to look for alternatives to Methionine. Will that be the same for oxytocin and
other things like that?

CHAIRPERSON RIDDLE: Would you like to respond or -- Rose?

MS. KOENIG: Well, certainly -- you know, a lot of it again is going to be up to the committee. The optimal way of doing a review, you know, is to utilize the TAP contractor. However, committees may feel like they can gather all the information they need on a substance, because they have that ability within their committees to do so. You know, the idea is that, you know, you should bring in your own resources, if you have the expertise or resources, and you certainly should utilize the technical review panels or a contractor, if that is necessary. So that's really what the committees need to determine, you know, when they're reviewing each of those substances. But what we're saying for those that you know you want to go through the TAP contractor because you've identified that there really was a very inadequate TAP, you don't feel like you have the expertise on your committee to get the information, those are the ones that -- to me are the ones that you highlight and those are the ones that we want to, to the best of our ability, gather more technical information, and we do not want to wait, you know, until we're into this time crunch to do so.
MR. SIEMON: With oxytocin, for sure you're going to have to provide what's new. What's the alternative? So you're going to have provide some proof of the new alternatives, especially with that one.

MR. KARREMAN: Actually, I don't think there was ever a TAP review done on that one, so it'll be good to see. Because all TAP reviews have to show minimal alternatives, anyway, right, in a complete TAP. So that'll take care of itself, I think.

CHAIRPERSON RIDDLE: Um-hum.

MS. KOENIG: And one other thing -- the other thing is that, synthetics that are listed, you know, because not all synthetics come on the list at the same time, and this is the case of the oxy -- what is it, oxy --

CHAIRPERSON RIDDLE: Tocin.

MR. O'RELL: Tocin.

MS. KOENIG: Tocin. I was thinking of some other -- not the drug -- anyway -- anyway --

UNIDENTIFIED SPEAKER: Oxycontin?

MS. KOENIG: Yeah, Oxycontin. Well, if there's -- organics of the list, and I'm not saying this is the case with this material, but there may be something that was added that is a synthetic that the committee decides is more of -- that something that was
added previous. There now is another alternative that
is on the list that was not considered. So those are
the things that are considered that could be --
substitutes and alternatives. So that -- those are
areas where even substances on the list may be
justification to pull something else off, because now
you have a better synthetic --

CHAIRPERSON RIDDLE: Okay, anything else
before we go to Handling?

***

[No response]

***

CHAIRPERSON RIDDLE: Well then, Kevin,

Handling.

MR. O'RELL: Sure. For the Handling Committee
discussion items, the first is the Pet Food Task Force.
I'm going to defer to Arthur Neal. He's going to give
us an update on that after the Federal Register notice.

MR. NEAL: January 24 -- committee went out
and called the nominations for the Pet Food Task Force.
It would comprised of 12 individuals and this task force
-- with the purpose of developing labeling standards for
pet food, organic pet food. The nomination period
closed on February 23, last week -- nominations, seven
formal nominations for the Pet Food Task Force. We hope
that there may be more nominations coming through the mail. We're going to wait a couple of weeks to make sure that we receive all of the Pet Food nominations and maybe move on to -- get with the Handling Committee to discuss our next step with respect to formation of that task force.

MR. O'RELL: Thank you, Arthur. Any questions for Arthur on the Pet Food Task Force?

CHAIRPERSON RIDDLE: It's the same thing as the aquaculture -- I think the Federal Register notice had up to 12 --

MR. NEAL: Right.

CHAIRPERSON RIDDLE: -- on this.

MR. NEAL: Right. And the options -- I mean, the good options -- just because you didn't meet 12 does not mean you still can't have a task force. But that's something we will discuss once we know for certain how many nominations we have. And if we need to call for one nomination, we can definitely do that.

CHAIRPERSON RIDDLE: So each of these committees will need to work with you to come up with a plan to either seat the task forces from the nominees that have been submitted, plus the Board members that are interested, or decide whether it's best to go out with another call for nominees, correct?
MR. NEAL: Right.

CHAIRPERSON RIDDLE: Okay.

MR. NEAL: I don't think it's going to be that big of an issue. Pete Jones is actually going to be the individual who's going to work with both task forces. And the options are -- I think are well enough that they can be implemented in a fairly productive fashion.

CHAIRPERSON RIDDLE: Yeah, Hugh?

MR. KARREMAN: For both of those task forces, are there -- have they already -- are there certain charges that they need to look into or any questions that have been brought up, you know, that they need to answer, or is it just kind of forming a task force to have one and --

CHAIRPERSON RIDDLE: The -- go ahead, Arthur.

MR. NEAL: With respect to the Aquatic Animals Task Force, the charge is to develop standards for the production, handling, and labeling of aquatic -- aquatic animals and those feed products for aquatic animals. There's already great talk in the aquatic animal industry regarding these standards, and I think they're already drafting standards to apply to the task force, especially the pet food industry. We haven't heard as much talk, but we do know there is an interest. And what we said was a charge for them would be to develop...
labeling standards, production labeling standards for organic pet food. Their charge is probably best -- in Aquatic Animals Task Force because they've got more to work with with existing standards, and we already have talked about it.

CHAIRPERSON RIDDLE: Yeah. And I'd like to point out that, in your meeting book, right after tab five, the Federal Register is the sub-tab there and that has the Federal Register notice, you know, asking for nominees for these task forces, and it does have a section: what are the task force groups' objectives and time requirements? So those are summarized there and they were also contained in the scope document from the Policy Development Committee from our October meeting as well. So for the Aquatic Animals Task Force, it's certainly to work from the prior Aquatic Species Task Force report --

MS. CAUGHLAN: Right.

CHAIRPERSON RIDDLE: -- as a starting point --

MS. CAUGHLAN: Right.

CHAIRPERSON RIDDLE: -- to consider all of the existing information and then -- which did recommend development of standards for the aquaculture part of it, but did not recommend standards for the wild fish. But to start from that page and then see what can be done as
far as developing draft standards to present to the
Board first, and then we would make a recommendation to
the Department.

MR. O'RELL: Our second discussion item for
the Handling Committee is the Sunset materials review.
We had a discussion of priorities for materials, and the
result of the discussion, we identified three materials
that we felt were likely to be controversial and
indicated that we needed additional information and we
want to get on these earlier. These three items listed
under 205.605(a), one is colors. We felt that -- the
reason why is we felt that this is a group of materials
that needs a TAP review. There was never a TAP review
done on this previously, and it was not voted on by the
Board prior to being added to the list. The second item
is flavors. Again, a lot of things have changed since
this has gone on the National List. There now are
products that are out there as organic flavors. There's
a lot more that we need to know about the manufacturing
process of some of these items. Some of the flavors out
there might be impacted by 205.605(b) and the lawsuit.
Julie, do you have any additional support on the
flavors?

MS. WEISMAN: Yeah, Kevin, I did. I wanted to
agree with you that a lot of the natural flavors is on
section A as a category, as a general category, and that's because they are actually defined in C.F.R. by the FDA. And as we know, NOP is not allowed to supercede other -- other rules in the C.F.R. But I do think that -- and I think it is true that when these rules were written there were -- there were not -- organic flavors did not exist, so that has to be taken into consideration. But I would also like to add that what we call -- what our -- the category of organic flavors are almost entirely organic, in the 95-percent category. And so they're -- they may or may not be alternatives, depending on other matters that are -- that we have to await clarification on with the lawsuit.

And then the last thing I wanted to say about that is that there is going to be discussion during these meetings during the next few days about the issue of defining synthetic and nonsynthetic, and I think that -- that will also have an impact on -- on organic flavors as they're currently manufactured, being an adequate alternative to natural flavors.

MR. O'ReLL: Thank you, Julie. The third item that the Handling Committee identified was yeast, and that's surrounding the issue of the agricultural versus nonagricultural debate that continues today, which leads us into our third -- third discussion item, which is the...
clarification for the definition of agricultural versus nonag. Just a little background. There is concern that there are items that are on the National List, under 205.605(a), that have come under question as being organic or agricultural. And by their placement on 205.605(a), they are considered as nonagricultural. The Handling Committee has taken up this task of trying to get clarification for the definition of agricultural and nonagricultural. We did a lot of looking in from a historical perspective, that when the Board put together its first recommendations for the National List back in 1993, there were no legal definitions for agricultural or nonagricultural.

In certain cases, some materials were given to the Board after being assigned the status of ag versus nonag by a USDA-funded researcher. Currently we have definitions for ag and nonag in the rule, and these have been criticized as being somewhat vague. So the Handling Committee is continuing to work on this effort, and we are hoping to define this in simple terms, looking at its agricultural roots in the definition for clarification, and we hope to have a formal recommendation for the full Board at the next meeting, whenever that is scheduled. Are there any questions on the discussion items?
MR. O'RELL: For the Handling Committee we have four action items. All of these were Q and A's that came from the NOP. The first one is the status of albumen in organic wine making. The second one is to provide clarification on a calculation that we use for tea, for tea extract. The third is a question that we need to provide input to the NOP concerning the status of a material, bitter orange, as a natural processing aid. The final one is the retail certification Q and A that as asked of the NOP, and we in turn were asked to provide input concerning this retail certification issue for retail food establishments.

I think it's -- it's appropriate to point out that we had a lot of discussion within the Handling Committee regarding the process. These four Q and A's took a lot of time from the Handling Committee and diverted us from some of the other issues that we felt that we had priority to try to get to these. We're hoping that -- maybe questioning the process that we're using today, in terms of all questions going to the NOP and coming back to the NOSB and for us to have to put it to committee and have the -- getting the committee
together and hashing out these responses to go back to the NOP. We're wondering if maybe there isn't another process we might want to look at, particularly when we get an executive director on board. And that's our --

CHAIRPERSON RIDDLE: Report for now.

MR. O'RELL: -- report for now.

CHAIRPERSON RIDDLE: Any other questions, comments, any other committee members' input?

***

[No response]

***

CHAIRPERSON RIDDLE: Okay. All right, next is Crops, and Nancy Ostiguy had already scheduled a -- some academic dissertation defense and couldn't make it here today. She will be arriving tonight. And so Rose is on the Crops Committee and has agreed to provide the report here.

MS. KOENIG: And -- and fortunately, Nancy and I did not communicate when I found I was going to be doing this, so I'm going to -- hopefully, I'm representing what she would say. And then what we could do tomorrow, if there's something she wants to add, give her that opportunity if there's -- because of that fact.

As far as the Sunset material review, some of the materials that -- I know that have been identified...
that do not have specific categories in OFPA are potassium bicarbonate, hydrogen peroxide, both for disease control. So those are two disease control substances that don't fit into a category.

CHAIRPERSON RIDDLE: Oh, okay. So the rationale would be that they don't fit the OFPA category. Okay, I just wanted to make sure you're covering the rationale as well.

MS. KOENIG: Yeah.

CHAIRPERSON RIDDLE: Thanks.

MS. KOENIG: And then there's aquatic plant extract, liquid fish products, and humic acids. All have annotations that deal with the extraction procedures and/or pH adjustments. So that -- that is something I know that the committee is concerned that we have consistency with those annotations and we want to make sure that -- that the annotations, the way that they were written, and now that we understand how they're interpreted, if they really reflect what the original intention of the annotation was, because they have been -- it's something that has come back to, you know -- you know, when there was -- they've just been identified, but there's not a clear understanding that those annotations really represent what -- what the intention of the -- what their intention was, I guess,
when they were made. So again, that -- those were ones
that I discussed, that these are annotation kind of
issues and I'm not sure if they're necessarily best
dealt with there in Sunset, but I'm laying them out.
Also, peracetic acid for fire blight control doesn't
really fit into the OFPA category, either.

One area that the committee feels is --
there's a -- mulches are listed, newspaper or other
recycled -- other recycled paper. There's a -- a type
of newsprint is placed on that within the list, and we
feel that there is the processes that are now done for
paper have changed and the inks have changed, that
that's something that we need to get more -- a TAP on so
that we understand kind of that -- what's on there for
mulches. I know that's one of the ones that have been
identified for a technical review. So those are the
ones that I am aware of.

As far as the draft recommendation for
hydroponics, I know that was something that Owusu had
committed to work on. There was an original draft back
in 2001 or 2002 that the committee looked at that he had
developed. And so that is something that, as far as I
know -- and again, we can check with Nancy, but there
has been no progress on that. So that's something that
the committee must go forth and work on if standards are
needed. I mean, maybe the first discussion is just
really something that's needed. I'm not understanding
-- because we seem to be having this on every single
agenda. It's not getting done, but I don't -- I'm not
sure what's going on in the industry as far as how
certifiers are -- and that may be the best way to go
about it, if it's not -- you know, is it or is it not an
issue? Is it in an area that standards need to be
developed? We certainly don't want to do committee work
if there are operations being certified. We need to
know that, currently, if the present standards are
covering hydroponics.

And then I'm not going to go over the
temporary variance for research guidance because Dave
has, and just so you know that it's going to be a
collaborative effort between, I guess, Livestock and
Crops as far as developing those guidances.

And now, as far as the action items for the
Crops Committee, I just wanted to point out that -- that
-- I'm now optimistic. We have members on the new Crops
Committee, because of the new members that -- we'll be
able to get quorum. Unfortunately, on the drafts and
the materials that are here, we didn't have quorum,
although the votes are placed on that so that we could
get the discussion item on the agenda. And there are
drafts, but the Crops Committee had difficulty getting together on that. So that's just a note. So when it comes for discussion of these items tomorrow, there may be modifications to those recommendations, and we welcome that, because we don't feel that we really had adequate input in the determination of some of these things for Crops. So basically, the soy protein isolate technical TAP review, we're considering that for a vote; ammonium bicarbonate and ferric phosphate. So those are three materials that are scheduled to be considered — considering the petition to add it to the National List. There's the use of compost and compost tea. What was on the web, from what I gathered when I was asked to do this -- just like the old Compost Task Force reports. And I think that the idea was to have a recommendation to accept those. We'll have to have Nancy on that one, because I'm not quite sure.

CHAIRPERSON RIDDLE: Yeah, as I recall, it is to merge those into a recommendation.

MS. KOENIG: Okay, okay.

CHAIRPERSON RIDDLE: Yeah.

MS. KOENIG: And then guidance on commercial availability. There's a draft that will be discussed and perhaps voted on. Maintaining or improving natural resources, there's a draft for consideration. And then
there also was a question and answer on waxed boxes, to
provide NOP input on the status of the waxed boxes for
produce.

MS. CAUGHLAN: And this Q and A -- you
mentioned the Q and A on compost? There was two
separate --

CHAIRPERSON RIDDLE: Yeah, it would be part of
that whole --

MS. CAUGHLAN: Part of it.

CHAIRPERSON RIDDLE: Yeah.

MS. CAUGHLAN: Okay.

CHAIRPERSON RIDDLE: Yeah, the question is
about the -- the agenda says Q and A on compost, and
that would be addressed at the same time of merging the
compost and compost tea reports into a recommendation.

Hugh.

MR. KARREMAN: Just one question regarding the
newspaper. You said that's up for Sunsetting because of
new printing practices or whatever? Is that --

MS. KOENIG: Well, when I say -- again,
everything is -- everything that was on the list as of
2002 is up for Sunset.

UNIDENTIFIED SPEAKER: Automatically.

MS. KOENIG: The newsprint has been identified
by the committee, that specific item that -- again, that
we are aware that there has been technical changes in
the printing industry, and we feel that those were not
covered in the original TAP.

MR. KARREMAN: Would any action on a crop use
of newspaper affect farmers using it as livestock
bedding? Would that have any effect? If you were to
Sunset it, because, definitely, farmers chop newspaper
for bedding and I'm not sure if that would affect
livestock from a crops perspective. I just wondered.

MS. CAUGHLAN: Do they consume it?

MR. KARREMAN: They could. They shouldn't,
really, but -- I mean, not normally if they're normally
fed, no.

MS. KOENIG: Well, yeah. I mean --

MR. KARREMAN: Just --

MS. KOENIG: -- it's not on the livestock list
and it's been deemed synthetic.

MR. KARREMAN: So it would affect the
livestock?

MS. CAROE: Well, it shouldn't be part of the
cropping system, period, so --

MR. KARREMAN: Just wondering.

CHAIRPERSON RIDDLE: Well --

MS. KOENIG: I would -- I think -- the best
answer to that is that it's not -- it's on the list

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
under crops because it was determined to be a synthetic
that needed to be added. If it -- if it's being
utilized in livestock operations, it needs to be
petitioned for that use because it's -- not that I'm
aware on that livestock.

    MR. KARREMAN: I mean, it's a great way to
recycle newspaper.

    MS. KOENIG: Right. So, you know, within in
the TAP that -- again, we cannot add something through
the Sunset process that's not on the list already.
Okay. But if we're going to ask the contractors for a
technical review, we could ask them to increase the
scope to look at that utilization, although we would not
be adding it at that time during Sunset, but it would
provide us with technical information as we're going
through it -- if it was to be petitioned, that they
would already have a base of information.

    MS. CAUGHLAN: Good.

    CHAIRPERSON RIDDLE: It is on the list,
though, twice, once for mulch and then once as compost
feed stocks. So in the compost feed stock listing is
where it would directly related to livestock production
often. And that's how it gets in the compost, as being
first used as livestock bedding and then goes into the
-- into the compost stream. So it's certainly something

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
that could be addressed, like you say, in the review process, it's use there.

MR. SIEMON: It's actually -- on living conditions, 239.(a)(3), where it says, "If the bedding is typically consumed by the animal species, it must comply with the feed requirements." So then you get a debate. If this is typically --

CHAIRPERSON RIDDLE: Consumed which --

MR. KARREMAN: No, it's not.

CHAIRPERSON RIDDLE: No, uh-uh.

MR. KARREMAN: I mean, that's not impossible --

MR. SIEMON: Well then -- then it's allowed.

MR. KARREMAN: You know --

CHAIRPERSON RIDDLE: Right.

MR. SIEMON: Then it's allowed.

MR. KARREMAN: Then it's allowed, good.

CHAIRPERSON RIDDLE: Um-hum.

MR. KARREMAN: Good.

CHAIRPERSON RIDDLE: Um-hum. But to go into compost, it is regulated. There is a listing that prohibits glossier colored ink. It allows it otherwise. So it's just something to be aware of as we move forward. I think it's a good point.

MS. KOENIG: One of the things is that there's
a lot of soy-based inks now --

CHAIRPERSON RIDDLE: Oh, you're on the
newspaper.

MS. KOENIG: -- so that really is -- those
were not common at -- we believe those were not commonly
used when it was placed on there, so we would want to
know, you know, how much use soy-based inks have, those
types of things. Because, you know, the ink was
specifically placed out of the annotation.

CHAIRPERSON RIDDLE: Andrea?

MS. CAROE: So, Rose, this is one of those
situations, then, where you're actually looking at
pulling it off the list and then putting it on because
you're changing the annotation? Because if you're
interested in putting this on the list without colored
inks, if there's soy-based inks that are used and we
feel that that's consistent and organic -- should be
able to use that, then this would be one of those
situations where you're going to -- you're going to
propose removing newspaper off the list for repetition
without the annotation?

MS. KOENIG: Right now what the committee
would be doing is looking at it as it exists for the
Sunset process, and determining if that -- the way it
appears is adequate for -- for what currently is out
there. That's what I am saying. On some of these it's not clear and that's what -- we have to have further discussion, I think, with NOP as far as how we can go in determining, can we put it back on during the materials Sunset process without that annotation? I don't know.

Those are the kind of instances and peculiarities, I think, that we're going to come forth on some of these.

MS. CAROE: But if you're having a review done to extend its potential, it would be best to have two or three other questions addressed at the same time. We've done that in the past.

MS. KOENIG: I think those are ones that were placed on and there probably wasn't adequate information. There was an annotation there for a reason. We feel that we need to reexamine, because, technically, we know things have changed and that that -- the way it appears may not be sufficient and it may not be useful.

MS. CAROE: Well, I absolutely understand the logic you're presenting. It was purely a procedural question --

MS. KOENIG: Yeah.

MS. CAROE: -- based on your earlier comments that you made.

MS. KOENIG: Um-hum.
CHAIRPERSON RIDDLE: And I think, you know, if we had the Federal Register notice for Sunset out, we'd have a lot better understanding of what the rules of the game are and what can happen and what cannot. We've seen, you know, drafts, we've had input on drafts, but until it's posted in the Federal Register, we don't know the final word and what exactly can happen with an annotation or not during this review process. Anything else for Rose? Yeah. Or no, that's not a hand, that's a book.

***

[No response]

***

CHAIRPERSON RIDDLE: All right. Well, we actually --

MR. SIEMON: Yeah, what are we going to do?

CHAIRPERSON RIDDLE: We could go to recess --

MR. SIEMON: All right.

CHAIRPERSON RIDDLE: -- but --

MS. CAROE: But --

CHAIRPERSON RIDDLE: -- I think we have a lot to accomplish here in the next few days, and Barbara has offered to begin the NOP update this afternoon and address -- especially some of the issues that have been raised during our discussions so far this afternoon,
executive director, collaboration, some of those things. So that could help, you know, give us more time tomorrow for the public input session. So if Barbara and Rick are willing to -- yeah.

MR. O'RELL: Jim, just a point -- and Barbara --

UNIDENTIFIED SPEAKER 1: That's not on. It's not on.

UNIDENTIFIED SPEAKER 2: It's never on.

CHAIRPERSON RIDDLE: Huh?

UNIDENTIFIED SPEAKER: It hasn't been on.

MR. O'RELL: It's never on. They're saying it's never on.

UNIDENTIFIED SPEAKER 2: It hasn't been on the whole afternoon. There it is.

UNIDENTIFIED SPEAKER: Okay.

CHAIRPERSON RIDDLE: There, it's on.

MR. O'RELL: Just a point. I do know, in the agenda, a number of people are coming specifically tomorrow to hear the NOP --

MS. CAUGHLAN: To hear NOP's --

MR. O'RELL: -- update.

MS. CAROE: That's right.

CHAIRPERSON RIDDLE: And what is the concern if we -- go ahead, Barbara.
MS. ROBINSON: Well --

MR. SIEMON: Who are you, again?

MS. ROBINSON: For the record, Barbara Robinson.

CHAIRPERSON RIDDLE: You have to be close to those type of mikes it seems, so --

MS. CAROE: It's terribly hard to hear.

MS. ROBINSON: Well, most of the things that you brought up today I can answer them fairly straightforwardly. I suspect what you're really talking about in a little more depth, Kevin, might be related to the court case, and I can -- we can do that now or we can wait until tomorrow. That's purely up to you. You can break into your committees, because I know you do have a lot of work to do. But I thought I could at least give you the update on the things that you've raised in your committees, and then you can actually tell folks yourself where they are. Let me get to my notes real quick.

As you know, since last fall we promised --

since last summer we promised that absolutely everything we did, as soon as we got it cleared through the Department, we would be giving you a 24-hour heads-up and then it would go up on our website, and I think you'll agree that that's exactly what we've done. We've
pretty much given you guys everything that we've been working on. There are two things that we have been working on that we have not given you. One is the collaboration docket -- document. It's not a docket. It will not be published in the Federal Register. And the second is the USDA response to the NOSB response to the four issues, and those related to antibiotics, fish meal, inerts, and the scope of coverage of the NOP regulation. Every week I ask for the status on these and every week I am told that they are still in a clearance process. They are not in our office.

Now, you have seen a draft of the collaboration document. I did forward that to you through e-mail. And when it comes out of clearance, it is not going to look drastically different, because it's essentially an agreement between you, the NOSB, and we, the NOP, as to how we'll work together on issues, and it's what you saw in that draft document. It's kind of a, you know, let's categorize the issues and you know, from -- it doesn't say major or minor, but it kind of lays out that format of when would we propose something to you and get an answer to the thing.

In the meantime, we have published in the Federal Register a guidance docket, which had we had published perhaps before last April, we might not have...
gone through what we went through last April. In any
event, that docket is out there. It does call for
comments by the public, and I believe the comment date
extends until early April.

UNIDENTIFIED SPEAKER: April 4.

MS. ROBINSON: April what?

UNIDENTIFIED SPEAKER: The 4th.

CHAIRPERSON RIDDLE: The 4th.

MS. ROBINSON: 4. That's early. And so we
are very much looking forward to that. That is a formal
proposal of how USDA would issue guidance about
regulations. But again, it would be -- that also would
be an interact process. In other words, we would
propose through the Federal Register, you know, here's
what we're thinking about issuing guidance on and then
we would take comment on it. Likewise, the public may
also initiate that process and ask us to issue a
guidance. In any event, I do apologize, because we
don't have those two documents that we worked so hard to
get done.

On the USDA response to the Board statement,
you also will not see anything that is a surprise to
you. In other words, that document says what we said
last October, that we concur, and the one place where I
believe we said you asked us to issue a technical
correction, we said -- and we said it at the meeting as well, verbally, that we would have to go through rulemaking and that is the dairy replacement provision of the reg.

On the executive director, we have received feedback back from the legal folks. I am working on the draft. I thought -- I was really hoping to have a draft position announcement to bring here to at least hand out to all the Board members so you could take a look at it, and we just have been overtaken by events with the court case. We do have -- like I said, we do have a draft. I need to polish it up a little because I've written all over it. But it will incorporate, I believe, all of the things that you want in -- that was in the document that Jim and Dave forwarded to me. And so I'm hoping that, you know, later this spring we'll actually be able to get a job announcement up. As I may have told you before, we will do this electronically, but we will post it on our website when it is available and we'll tell people where to go. We don't control that process. It's done through -- you can access USAJOBS and that sort of thing. But you'll get a link to click on and you'll be able to go in, and you will actually be able to apply for the job online. And so that's the approach that we're going to take on that.

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
On the task forces, you've already had the update from Arthur on where we are with aquaculture and pet food. We have two dockets that we are still working on that -- one deals with crops and one deals with processing. Again, the processing docket is going to have some -- it will probably be held up because of the court case. And I'll give you a short -- short update where we are with the court case if you want, or if you just simply want to hold off until tomorrow, that's fine. It's up to you.

CHAIRPERSON RIDDLE: Well, there's a lot of people anxious to hear, but at the same time, they'll want to hear tomorrow. So if you don't mind repeating yourself --

MS. ROBINSON: I do it all the time.

CHAIRPERSON RIDDLE: -- I think it would be helpful. Pardon?

MS. ROBINSON: I always repeat myself, so I don't mind. Well, okay, let me just run through sort of the -- what happened and where we are today. On January 26, the 1st Circuit Court of Appeals in Boston, for the state of Maine, issued a decision on an appeal and basically, the appeals court found in -- agreed with the lower court, that is the district court, on all but two counts that were raised in the appeal.
On the third count, which dealt with what you all know as 606, the court remanded back to the district court, the lower court, and said that it was not sufficient for the Department to simply assume the interpretation that it assumed. Rather, the Department would have to make explicit the interpretation on 606.

And the court considered six counts, and the court declared that it was a reasonable determination by USDA of whom to certify and who not to require to certify, essentially recognizing that those were not actively engaged in processing did not require certification. This was the argument raised about wholesalers not needing to be certified.

The court agreed with the Secretary on 606, but then, as I just said, declared it would like the Department to declare that 606 is -- constitutes the universe of what is commercially unavailable. The court did not disagree with the lower court that a certifier's logo is not confusing, but rather furthers the asked purpose in providing traceability on products that are less than 95 percent organic. The court also agreed with the Department that it was not an unreasonable restriction to forbid certifying agents from giving uncompensated advice.

And now we come to the two most important
counts for most folks, and that is -- those were the
counts the appeals court disagreed and overturned by the
district court. The first is the 80-20 feed provision
for dairy livestock. The court pointed to the plain
language of the act and said that the Department had
exceeded its authority when it wrote the regs, wrote the
exception, and that livestock must be feed a total feed
ration of organic.

The second count the court overturned was the
claim that there could be synthetics in processed
products. The court said plainly, the clear language of
the act says that there can be no synthetics in
processed products. What -- the way the court does this
is they use a seminal case called the Chevron Case.
That case basically says you first look at the language
of the Congress. If the language of Congress is so
plain that ordinary individuals could read it and come
to the -- all come to the same conclusion, then you stop
there and you say that's it. If on the other hand the
language is ambiguous in some way, then the court is far
more deferential to what the agency does, provided the
Secretary, again, is not being arbitrary or capricious,
but that the Secretary has chosen a reasonable course to
proceed.

In these particular counts, particularly in
the synthetic, the court basically read back two
provisions in the act, which says that for -- one which
says that certified handling operations may not add any
synthetics during the processing or any post-harvest
handling of the product. And in the other section of
the law, which you're quite familiar with, is that
substances may be added during processing only if they
are nonsynthetic and not produced organically.

So then what happens? Well, the court issues
its decision and then there's 45 days from the date of
the appeals court decision -- that would be March 12,
except that's a Saturday, so we roll over to the first
Monday, so that takes us to March 14. By that time, the
Solicitor General of the Department of Justice must
recommend for an en banc, what's called en banc review.
That's e-n b-a-n-c. Or -- and that would be a review
before the full circuit court of appeals. The circuit
court has already remanded the case back, so there is no
point in going to a -- an expanded hearing at the
circuit court level.

People have asked, could you go to the Supreme
Court? The test for going to a supreme court is very
stringent, and this case does not need meet those tests.
In fact, it is -- many people have already said it was
very unlikely that the Solicitor General -- and I don't
know what the Solicitor General would recommend, before
you ask me. But it is quite conceivable the Solicitor
General would not recommend an en banc review in this
case. The court has ruled for what meets -- what rises
to justification for an en banc review, and those rules
are whether there was unanimity or not among the judges.
In this case there was a unanimous decision by all of
the judges. Whether there have been conflicting
decisions arising because of multiple court and multiple
circuit court hearings and you know, different circuits
disagreed, there have been none of those; whether the
language itself was the plain language found in the act
or the law versus the court providing its interpretive
language of what the law says. And because they point
to what's just there in black and white, it is highly
likely that -- I shouldn't say highly because -- but it
is possible the Solicitor General simply will not
recommend for an en banc review.

At that point, the case goes back to the
circuit court and the circuit court will issue what is
called a summary judgment. That summary judgment will
come back to the Department of Justice, and then the
Department of Justice will inform the Department of
Agriculture, and then we will have no but to comply with
the summary judgment issued by the court. In all
likelihood, that compliance would -- will entail a rulemaking change. You know, if your regs are not in compliance with the law, you will be told to change your regulations. But unlike rulemaking that we do on a usual basis, where we go out and propose it and then issue it and ask for comments, we will not ask for comments, because we are complying with a court order. It's not -- this isn't a debate. The other alternative that is available, of course, is an alternative that was always open to the industry, and that is a legislative remedy. The industry is always free to go to the Hill and open up the act.

As I -- you know, now you know what we know. We do not know what the Solicitor General is going to recommend, and we do not know what the summary judgment will look like. And frankly, folks, this is the first time I've ever been involved in a case like this, so I don't even know what a summary judgment looks like. I don't think it's going to be very specific. They're not going to say change Section 205, dah, dah, dah, dah, you know? I mean, I don't think courts do that. I suppose it's possible. But, you know, the big question for us and the commitment that we have made, certainly to ourselves and we hope to this industry, is that whatever we have to do, we will do our -- we will press every
limit that we can in order to, you know, minimize the
disruption to whatever extent we can on the industry, as
far as time lines, stream of commerce. Whatever it is
that we can do, we'll definitely take advantage of,
short of risking -- you know, one thing we do not want
to do is become in contempt of the court. That would
invite cutting off your funding, turning out the lights,
you know, all kinds of things.

So that's really where we are. And as I've
told folks before, as soon as we know something, you'll
know it. There's nothing to be gained here by secrets
or, you know, we don't have anything up our sleeves that
we haven't told you about, and more heads are better
than a few heads on this one. So that's where we are.
Any questions?

CHAIRPERSON RIDDLE: Rose?

MS. KOENIG: I just had one question as far as
that. And I know you may not have the answer, but when
that federal notice would come out -- I understand it's
not up for comment -- when is that active, the day that
it comes out or is there a time period for the industry
to adjust?

MS. ROBINSON: That's one of the things we'll
press for flexibility on. That's one of the -- you
know, if the court comes back and tells you to change
your regs to get into compliance with the law, any
agency would try to stretch it out as long as you can.
Well, how long can we take? Now, you know, in all
honesty, I don't know. I mean, obviously, we have a
Sunset provision that's already on the way and you know,
where everything would expire naturally,
October 21, 2007, and that's 30 months away, 30-plus
months away, and that's -- you know, is that good enough
for the court? I have no idea, Rose, I really don't. I
have -- you know, put that on the table, it does
demonstrate that we do have a process under way.

MS. KOENIG: And one more question. Back to
your comment on the remedies. If a remedy was from an
act of Congress, say, you know, a case scenario that
that act of Congress came, I would imagine -- you know,
you make action for Sunset. Say, let's do that -- 207,
and then say there was a remedy prior to that, then I
guess things would be status -- go back to status quo,
maybe. I don't know. But if the remedy comes after 207
and everything's been taken off and now you want to put
things back on, do you have to go through the whole --
you essentially would have to go through the whole
petition procedure to get --

MS. ROBINSON: Well, are you asking, if
somebody fixed this in Congress, would it interrupt the
normal Sunset process?

MS. KOENIG: No, I am talking about -- I'm saying that if something -- we can discuss it later.

MS. ROBINSON: Yeah.

MS. KOENIG: It's sort of scenario after scenario.

MS. ROBINSON: Right, right. I don't know. I mean, it would depend on what Congress does, clearly.

CHAIRPERSON RIDDLE: Bea.

MS. JAMES: Well, now that we know that we have confirmation from the court that, say for example, on one of the issues --

MS. CAUGHLAN: You don't have your mike on.

CHAIRPERSON RIDDLE: Yeah, please, get your mike.

MR. SIEMON: Hold on a second.

MS. JAMES: -- that synthetics are not allowed, going forward, how will we monitor or communicate to manufacturers and producers about that particular issue, and once there is a summary judgment, how are we going watch that and make sure that there's -- that that --

MS. ROBINSON: That there's compliance?

MS. JAMES: Yes.

MS. ROBINSON: The same way that we do now, we...
have a complaint procedure, we have a compliance process. We will, of course, be communicating immediately with all the certifying agents and explaining to them what the summary judgment is, what we have to do. Any changes that we make to the regulations will, of course, contain effective dates in them. And you know, remember, that when we threw the switch on the Program on October 21, 2002, we recognized at that time a stream of commerce issue, and we worked with that stream of commerce issue. And I believe, at that time -- Rick could probably correct me, but I'm almost positive that we said to folks was, you know, if you've got the paperwork to show that this was produced, you know, in this interim period and labeled, you know, no problem. You're -- it's just moving itself naturally through the marketplace. We do not have recall for any in this program, we don't have stop sale authority, so we can't yank a product off the shelf. But we didn't do it in October of '02, so -- but my basically reply is, we will use the same procedures that we have currently to ensure compliance with the NOP.

CHAIRPERSON RIDDLE: Goldie.

MS. CAUGHLAN: Just to point out, though, that, you know, in October of '02, it was up to you. It was up to the Department to make that decision, and that
may not be up to you to make that decision. And that, I think, is what -- it's the guillotine that's hanging.

MS. ROBINSON: You're right, Goldie. As I said, we don't know what this court is going to say to us. You know, I don't know whether they write a decision that says effective immediately or effective when you feel like it or effective within a reasonable time. We don't know.

CHAIRPERSON RIDDLE: Hugh.

MR. KARREMAN: You probably can't answer this, but I have a number of transitioning dairy farmers right now and some that are in their second year, going to be in their third year in a few months. You probably can't answer it, but, I mean, if they're -- when this comes down the final -- you know, when it comes into effect, if the people are in their second and third year of transition doing the 80-20 and they're in good faith doing that, do you think that they would all of a sudden kind of have to start a whole new year of a hundred percent?

MS. ROBINSON: Well, look, I don't envision us -- again, I -- please don't hold me to this. Nobody was doing anything wrong, okay? Everybody has been following the regulation and doing what they are reading, you know, that we say the regulation is
tantamount to the law. So everybody's been following that. Nobody's been doing anything wrong -- well, actually not complying with the regs. So the fact that a summary judgment comes out, doesn't mean we're going to run right out and yank everybody's certification. We're not going to suddenly suspend you because you were following the law; but today the law changes. The -- there is -- there is a court case, in fact, that deals with that, that says that the -- you know, the government cannot retroactively punish for -- for the fact that the laws changed. It can't go back and go get you, and it'd be like going -- the IRS coming back and you know, suddenly saying you, you know, violated the tax code because they changed it in the middle of the year. Well, you don't do that.

Now, I don't -- for the future, from that point forward, Hugh, again, I don't know. But I know that nobody's going to get punished for complying with these regulations up until they get changed.

MR. KARREMAN: What I mean is if a dairy farmer is in his or her seventh month of that year, would they be still allowed to do that 80-20 for the last five months do you think? You probably can't answer it, so -- sorry.

MS. ROBINSON: No -- yeah.
MR. KARREMAN: That's just going to be really --

MS. ROBINSON: There's going to be a million --

MR. KARREMAN: -- really weird.

MS. ROBINSON: -- and one scenarios that people come up with and we're going to have to figure out some way to address them. But --

CHAIRPERSON RIDDLE: I've got a couple questions, and they don't relate to scenarios or speculation, but rather the role of the Board, I guess. You know, what should we be looking at as far as, you know, our work plans and our role, you know, setting aside any legislative changes? Okay. And we get the summary judgment and the rule has to change to comply with the law on these two counts -- so actually on three, because on 606 there'll be a regulatory change there as well. Will the Board be consulted, active player, make a recommendation on these, or will you be pushing --

MS. ROBINSON: Well, I think you're going to hear --

CHAIRPERSON RIDDLE: -- in your position?

MS. ROBINSON: -- you're going to hear from private folks, from folks in the industry, about the
issues that they think you probably ought to be paying
attention to. I don't think that's appropriate for me
right now to stand here and give you, you know, my
thoughts on what your work plan ought to be. As far as
complying with the summary judgment, no, the Board won't
-- I mean, Jim, we really won't have a role in it, I
mean, other than -- if we can pick -- whatever we can --
you know, if we can pick a time frame or something, but
this is kind of like -- for all intents and purposes,
you have heard from the Supreme Court, and basically,
you will be told to -- we will be told to fix it and
that's it. There won't be any, well, what do you think?
How about if we do this? And while we're at it, we'll
do this, and we will be told to fix the provisions of
the regulation that, in the court's words, contravene
the law. In other words, we exceeded the authority
given to us by Congress, and there won't be any
discussion about it.

CHAIRPERSON RIDDLE: But I understood you to
say that you didn't anticipate that they would be, you
know, micromanaging the language of the change to the
rule. So someone's got to -- going to have to draft
those changes to the rule.

MS. ROBINSON: Right.

CHAIRPERSON RIDDLE: And will the Board have a
role in that?

MS. ROBINSON: Well, I actually think that the legal counsel the Department will probably be telling us how to change that language.

CHAIRPERSON RIDDLE: Uh-huh.

MS. ROBINSON: And I don't think that there will be a whole lot of -- you know, truthfully, my best answer to you is, I honestly don't know.

CHAIRPERSON RIDDLE: Uh-huh.

MS. ROBINSON: I don't know how much --

CHAIRPERSON RIDDLE: I understand.

MS. ROBINSON: -- flexibility or who's -- you know, it may just be that the lawyers walk down the hall and say strike this provision, or do this or whatever, because, you know, it's not going to get out of the Department and get published, unless the legal counsel is satisfied that it comports with that summary judgment out of the court, because no one wants to go back there.

CHAIRPERSON RIDDLE: And then my other question -- the release of something on our agenda that we aren't likely to vote on, and that is the synthetic versus nonsynthetic guidance on making those determinations. That really does impact, you know, the fallout from this case. But there's been someone else that's done -- that some of the substances on the
605(b), the synthetics list, are available in nonsynthetic form, and is that something the Board should be looking at, a re-review or a priority review for some of those substances and you know, not to give the appearance of contravening the --

MS. ROBINSON: Right.

CHAIRPERSON RIDDLE: -- you know, will of the court, that oh, all of a sudden, well, they were synthetic but now they're not synthetic.

MS. ROBINSON: I understand, I understand.

CHAIRPERSON RIDDLE: But it has to be based on the science and on -- you know, on this review and following procedures.

MS. ROBINSON: Well, all I can do is feedback to you what you guys have said to us, and that is that you want to have input to these things. So why -- I guess what I'm asking, Jim, is why ask whether you can initiate that? Why don't you just -- why can't you initiate that?

CHAIRPERSON RIDDLE: I like it when you say that.

MS. ROBINSON: Well, I mean, let me put it like this. Suppose we initiated it. What would you be telling me?

CHAIRPERSON RIDDLE: Wait for us.
MS. ROBINSON: Right. Okay. So your question was answered?

CHAIRPERSON RIDDLE: All right. Is there someone who hasn't spoken yet?

MS. JAMES: Jim --

CHAIRPERSON RIDDLE: Yeah, Rigo.

MS. JAMES: -- you know --

CHAIRPERSON RIDDLE: Well --

MS. JAMES: I'm sorry.

CHAIRPERSON RIDDLE: Yeah.

MS. JAMES: But also on that comment, though, we don't want to waste our time, either.

CHAIRPERSON RIDDLE: Yeah.

MS. JAMES: There's so many other issues to be addressed, that if you spend a lot of time trying to help propel something and not really have that voice heard --

CHAIRPERSON RIDDLE: Yeah.

MS. ROBINSON: You know, March 14 is --

CHAIRPERSON RIDDLE: Thank you.

MS. ROBINSON: -- two weeks away, and then, you know, there's a short period of time after that before you'll likely hear back from me. The district court and -- while it may be good to begin to prepare, or certainly prioritize the issues that you think need

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
to be addressed, I don't know as I'd be sitting down and rewriting 7 C.F.R. a total of five --

CHAIRPERSON RIDDLE: No.

MS. ROBINSON: I think with patience, calm, take a deep breath, everybody just -- I know this is frustrating, believe me, not nearly as frustrating as if I was one of you folks who are producing something, or one of you folks who are supplying the product to producers. But it's generally been my experience that a good approach at times like is just take a deep breath and stay calm and you know, figure out -- look at all of the options and all of the things that could happen, before we just go chasing down one way or the other. And we'll work with this industry as best we can.

CHAIRPERSON RIDDLE: Um-hum. Rigo?

MR. DELGADO: Thank you. Just for clarification, I understand that we still have to wait for the recommendation from the Solicitor General?

MS. CAUGHLAN: Get into the microphone. I can't even hear you.

MR. DELGADO: Well --

MS. CAUGHLAN: Sorry.

MR. DELGADO: -- just for clarification, in fact -- we still have to wait from the recommendation that the Solicitor General is going to give us, correct?
MS. ROBINSON: He's not going to give a recommendation to us, he will make --

MR. DELGADO: Well, he will --

MS. ROBINSON: Right.

MR. DELGADO: What is it, then?

MS. ROBINSON: The Solicitor General makes the decision whether or not to go forward, and he will decide -- he will tell us his decision. But it is up to the Solicitor General whether or not to petition the 1st Circuit Court of Appeals. And as I said, the mere fact -- maybe I didn't. The mere fact that you don't like the decision that you get is not a sufficient reason to petition the court, otherwise, as you know, it would all be -- everything would go to court every day, because there's at least one party that's never happy with the decision. So we have made our analysis known to the Solicitor -- USDA, and it's not me, it's attorneys in the USDA work with the corresponding appellant attorneys for the Department of Justice. Those are the folks that actually represent the U.S. government in court cases. And so they are well aware of the importance of this decision and its implications.

CHAIRPERSON RIDDLE: Rose?

MS. KOENIG: You know, part is my lack of understanding, and I guess the -- I've heard -- of York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
course, different people interpret different things, I guess. But does the NOP feel that it's going to impact all categories of labeling, the 70 percent "Made With," the 95 percent and the 100 percent? Are all of those impacted as far as your analysis on that decision?

MS. ROBINSON: Well, all we can do is read what the court is pointing to, and the court is pointing to the language that says the certified handling operation. So -- and we don't have any more insights. Under your regulation, a certified handling operation is a processor. The certified handling operation has -- could make a hundred percent organic product, they could make a 95 percent organic product, they could make a "Made With" product and make a less than a "Made With" product. They can make anything. The court pointed to the entity and the activity, not to the labeling. So, you know, a feed processor is a certified handling operation. And you know, the court's language -- that the act says no synthetics shall be added during any post-harvest handling or any processing of any such product. A full stop. And that's what we're reading and that's what you're saying, and that's not anything new, that's there in the act.

MS. KOENIG: So would that also impact, in your opinion, post-harvest treatments on things like in
crops, like for example, in ripening of some of the fruits? That's a -- it's a crop material, but it is a post-harvest application. Have you analyzed that or not? I mean, that's just something to think about. I don't know.

MS. ROBINSON: Well, I'm not a lawyer.

MS. KOENIG: Okay.

MS. ROBINSON: Like I said, I'm reading the same language that you are, and it's tied up in synthetics and what you do. Okay, I'm done. That's it?

MS. KOENIG: No --

CHAIRPERSON RIDDLE: Um-hum.

MS. KOENIG: -- this has a -- okay.

CHAIRPERSON RIDDLE: Rose?

MS. KOENIG: Moving off of that whole subject, is there anybody that can -- I don't know if it's fruitful at this point. We did have some questions on those annotations. I don't know if you want -- if you don't want to comment or Arthur doesn't want to comment, but you were discussion some of the things that we were going around the Board with, and one was this annotations or modification of annotations. Is there any clarity or position that the Department has on that discussion?

MS. ROBINSON: You lost me on that one. Can
we back into that?

CHAIRPERSON RIDDLE: Okay. Yeah, the Federal Register notice for Sunset --

MS. KOENIG: Yeah, because Sunset --

CHAIRPERSON RIDDLE: -- and what --

MS. ROBINSON: Oh, oh, oh.

CHAIRPERSON RIDDLE: -- is in play --

MS. ROBINSON: Oh, it is possible --

CHAIRPERSON RIDDLE: -- during those reviews.

MS. ROBINSON: -- that a statement -- you know, that doesn't necessarily mean that the Sunset docket would have to be held up, but obviously, a statement would have to be issued either amending that docket or in that docket that said, effective October 21, 2007, all synthetics -- no synthetics would be allowed for processing.

MS. KOENIG: No, that's not what I was meaning.

CHAIRPERSON RIDDLE: No, no, no, no.

MS. ROBINSON: Oh.

MS. KOENIG: We're getting off that subject.

MS. ROBINSON: Oh, okay, okay. But I thought that's you meant. Sorry.

MS. KOENIG: You don't even have to think anymore about that case.
MS. ROBINSON: All right.

MS. KOENIG: The question was, when we discussed this -- you know, the Sunset in terms of identifying certain materials that have annotations that may trigger review, you know, that discussion we had about technical versus a substantial change in that annotation and would it have to be repetitioned. I don't know if you had thought about that or have a position on that. If not, you know, we don't have to discuss it.

MS. ROBINSON: Yeah.

MS. KOENIG: But I was just wondering if you have anything --

MS. ROBINSON: I don't right at this time. I don't know what kind of flexibility you have on that. Arthur may have something more.

MR. NEAL: We're going to take it under advisement.

MS. ROBINSON: Oh. I guess we're taking that under advisement. Is that a good topic on your response? All right? Nothing else?

MR. SIEMON: -- time, but we're going to let you off easy.

CHAIRPERSON RIDDLE: You're coming back tomorrow.
MR. CARTER:  Jim?

CHAIRPERSON RIDDLE:  Yeah, Dave.

MR. CARTER:  Just one question, a procedural.

CHAIRPERSON RIDDLE:  Um-hum.

MR. CARTER:  And Barbara mentioned the -- the notice on the guidance document, and I'm wondering, do we have anything -- have you thought anything while we're convened how the Board is going to formally, you know, provide a comment on that guidance document?

CHAIRPERSON RIDDLE:  Yeah.  Well, I read it when it first came and made some notes, but then held off on drafting anything for consideration by the Policy Committee, because I wanted to see the collaboration document because I see a linkage between those, and I was quite concerned, in reading the good guidance document, that there was only one reference to the NOSB and that was just as a potential commenter, similar to a trade association, that no role in the formulation and drafting of guidance.  And in reality, we now are engaged in the drafting of guidance and I think that is critical for public confidence in the Program and just good -- coming up with good guidance.

So, you know, Barbara has told us that the draft that she presented us will not be significantly different than the collaboration document that will be
coming out. So I think that the committee should, you
know, take a look at that document. You know, the clock
is ticking. April 4 is the deadline for comments on the
good guidance docket. So I guess I would like to see
that as one of the top priorities for the Policy
Development Committee and you know, get some comments
in. Whether they -- I mean, we won't have them done to
be addressed by the Board at this meeting. They aren't
on our agenda, anyway. But if the Executive Committee
could review those at our next meeting, I will have to
schedule a meeting sometime in March or maybe April 1 to
act on it. But if the Executive Committee can be
empowered to take final action on that Policy Committee
draft, I think that's the best we can do.

And we can't begin public input, we can't
begin consideration of action items here in the
remainder of today, so unless there are other, you know,
discussion items that Board members would like to bring
up, I would suggest that --

MS. CAUGHLAN: Jokes, jokes.

CHAIRPERSON RIDDLE: Jokes. I would
suggest --

MS. CAUGHLAN: A little lightening?

CHAIRPERSON RIDDLE: I would suggest that any
committees that need to do any homework or, you know,
review the materials in the meeting book and we take the
time for committee meetings, and I guess the one
committee I would request to meet is Policy Development,
to consider some changes on the AAFCO recommendation,
because there is some new information coming out of the
Labeling Committee meeting in Phoenix. And so if we
could consider that and if we can meet -- I don't know.
Are there other committees that would like to meet Rose?

MS. KOENIG: I think go -- again, these are
the issues we had with the Crops Committee because
there's three materials. Even though Nancy isn't here,
if members of that committee could perhaps get together
and kind of review the information, I think it would be
helpful.

CHAIRPERSON RIDDLE: Oh. And -- yeah, I would
like to just read this into the record, because we do
have the five new members that introduced themselves and
they do have -- have been assigned to committees, so I
would like to read each of the committees and the new
composition.

So the Compliance, Accreditation, and
Certification Committee: Andrea Caroe, chair, myself,
Mike Lacy, Julie Weisman, and Bea James.

The Crops Committee: Nancy Ostiguy, chair,
Rose Koenig, Gerald Davis, Rigoberto Delgado, and Bea
James.

The Handling Committee: Kevin O'Rell, chair, Goldie, Andrea, Julie, and Bea. If I'm going too fast, just let me know.

But the Livestock Committee: George Siemon, chair, Nancy, Dave Carter, myself, Mike Lacy, Hugh, and Rigoberto.

The Materials Committee: Rose Koenig, chair, Goldie, Nancy, Gerald Davis, Hugh, and Julie Weisman.

And Policy Development: Dave Carter, chair, myself, Kevin, Andrea, and Rigoberto.

And I have asked the committee chairs -- well, the entire -- each of the committees to be looking to the very short-term changes, especially for the committees where the chairs are on their last year of their term, and to have a new committee chair identified, certainly prior to the next meeting, to be passing the torch, as it were, to new committee chairs on short order. So anything else on the committee -- any other committees that need to meet? Any comments?

MR. SIEMON: Maybe Hugh -- but maybe at least -- I think you and I are the only Livestock ones. I'd like to give you --

MR. KARREMAN: Sure. Get that out of the way?

CHAIRPERSON RIDDLE: Yeah.
MR. KARREMAN: Okay.

CHAIRPERSON RIDDLE: Okay, that's not an official meeting. The microphones weren't turned on, so you guys just need to talk. Yeah, Bea?

MS. JAMES: I have a question --

CHAIRPERSON RIDDLE: Yeah.

MS. JAMES: -- about the changeover of the Board and some concerns regarding the new members coming in, and that being almost half of the Board membership, and then next year we're going to be, like, the senior members, I would think. Is that something that we at some point should discuss, or should we save that for another time, or should that be done over the years?

CHAIRPERSON RIDDLE: It is.

MS. CAUGHLAN: Maybe the day after the years.

MR. O'RELL: Yeah, yeah.

CHAIRPERSON RIDDLE: Yeah. And I think it's a real structural problem, and it's something that was a concern of mine when I first came on the Board, because at that time it was, you know, five members going off three years in a row, and then two years where no one. It's staggered a little differently, but now we're going to get a year where there's six members that go off. And at that time, I propose the matrix to transition into three members every year, so then you've always got
12 members for continuity. There may be some problems
with OFPA, but I don't -- I don't know. But to me, I
invite the new Board members to tackle this and try and
propose something to get more continuity.

MS. JAMES: Well, yeah. I mean, I just have a
lot of concerns about it, because I know that even
though we all have our respective expertise, that as a
Board committee that's doing something so important,
that the senior membership is, like, critical for
success. And it just makes -- I mean, you know, when I
volunteered for this position, nobody told me I would
be, like, a senior member in a year.

CHAIRPERSON RIDDLE: You've never advanced so
fast professionally.

MS. JAMES: Yeah. And I rely on the expertise
of the people who have been doing this for, you know,
five years, four years, to help mentor us into how to --
how to do this, because it's not only studying and
learning the different respective areas that need to be
addressed, but it's also the process, which is something
that you can't learn except from somebody who's been
doing it.

CHAIRPERSON RIDDLE: Um-hum.

MS. JAMES: So I just -- you know, I just want
to bring it up, but I don't know if it's -- I feel like...
even though I'm bringing it up, it's kind of like, well, you know, give me the turkey, because that is not --
that there's nothing you can do about it.

CHAIRPERSON RIDDLE: Uh-huh.

MS. JAMES: But it is something that, as us as
just the group, I would like to be able to discuss.

CHAIRPERSON RIDDLE: Um-hum. Yeah. OFPA
clearly prohibits a Board member who's served a full
term from being reappointed, so that's not an option.

MS. KOENIG: Jim?

CHAIRPERSON RIDDLE: Yeah, Rose.

MS. KOENIG: I mean, one option would be not
only for this present group, but NOP could cordially ask
past NOSB members if they're willing to serve as a
mentoring group. They could not vote, but they could be
-- they could have a list of those still -- the past
Board members that are still interested in
participating. But, you know, they can't serve as --
and I don't know. I mean, that's something maybe you
should think about as a new member, in what capacity do
you think people could be utilized.

MS. JAMES: So if the Board now was to try to
create something like that and make it inviting so that,
you know, previous charter members could come in and
help mentor us and still get some of the support from
the USDA for funding that, is that something that we could propose?

MS. CAUGHLAN: You could propose it.

CHAIRPERSON RIDDLE: Yeah, yeah, to Dave and -- and I'm just looking in OFPA and under term, a member of the Board shall serve a term of five years, except the Secretary shall appoint the original members of the Board for staggered terms. And they were appointed on staggered terms, but just three years out, that's why you got five, five, and five. But it does not say that it's locked into those staggering rotations as such. So that could be a change recommended, or, you know, keeping advisors or mentors on. I mean, we love coming to these meetings.

MS. JAMES: I'm sure.

MR. SIEMON: It might be a fine line between staggered and staggering.

CHAIRPERSON RIDDLE: Staggering terms.

MR. SIEMON: Yeah.

CHAIRPERSON RIDDLE: Yes. Dave?

MR. CARTER: Well, no, you brought up the point I was going to make, was the five years. But just from an anecdotal side, Bea, the thing that you will find is you will become less impressed with the senior knowledge the more you work with us.
MR. SIEMON: Thanks, Dave.

CHAIRPERSON RIDDLE: Rose, again.

MS. KOENIG: The other thing, too, that, you know, maybe we could work within, right now there is a green -- you know, the green book out there that -- that well, Michael Sligh has. I know he's made copies for the new Board members, and we receive those. Those are a compilation of the old minutes. There are minutes that are on the web, at least for 2001. So certainly there are tools out there to kind of get yourself up to speed on some of these issues. So just maybe we can give you guidance as far as some of those resources, also. And -- but, I mean, I think we're all open to thinking of innovative ways to utilize past knowledge. I mean, you can always call individuals.

MS. JAMES: Right. And I'm not just, you know, thinking of myself on this Board, I'm thinking of --

MS. CAUGHLAN: Structurally.

MS. JAMES: -- structurally going forward into the future that to be the most effective would be to always kind of deal with -- encapsulate some of the wisdom from the people who have been doing it for awhile.

CHAIRPERSON RIDDLE: Um-hum. Yeah, and
speaking of one, Kim has something to offer.

MS. DIETZ: Yeah, we had a great discussion at length on the very topic, so I encourage you to pull up the past recommendations of the Board, because we tackled this for a couple of years knowing this day was coming, and we certainly didn't just drop it on you, Bea. We really tried to improve the rollover period. The other thing is, I noticed that Bea was on three committees and I would encourage you not to join more than two.

MS. CAUGHLAN: Somebody just got three seats.

MS. DIETZ: There's a tremendous time commitment, calls and that sort of thing, that you don't want to spread yourself too thin. It takes a lot work, so just think about it. Maybe that should be in the policy manual, that you try not to be on more than two committees, especially if you guys are going to be chairing probably next year.

CHAIRPERSON RIDDLE: Well, there are quite a few people on three committees.

MS. WEISMAN: Yeah, we all are.

CHAIRPERSON RIDDLE: Yeah.

MR. O'RELL: Um-hum.

CHAIRPERSON RIDDLE: Sorry. You know, I'm just --
MS. CAUGHLAN: But it doesn't mean it's the --
CHAIRPERSON RIDDLE: -- the only lucky one.
MS. CAUGHLAN: -- effective use.
CHAIRPERSON RIDDLE: No, no, but we have six committees and 15 members.
MS. CAUGHLAN: Fourteen.
CHAIRPERSON RIDDLE: Well, in theory, we have 15. Okay, we're definitely leaning towards the staggering. Any other comments before we break for some committee work?
MS. CAUGHLAN: A restroom break.
CHAIRPERSON RIDDLE: A restroom break. Okay, well, we will recess for today. And then we --
MR. CARTER: The Policy Committee will reconvene here in about 10 minutes.
CHAIRPERSON RIDDLE: In 10 minutes, and we reconvene for a public input session tomorrow morning at 8:00 a.m.
MS. KOENIG: Perhaps, also, I don't know -- there may be some overlap, but if perhaps -- at least the people that are members, if we can reconvene in about 10 minutes, and then if we have to set a different time because you've got other committee obligations, we can meet at --
UNIDENTIFIED SPEAKER: Like at 6:30.

CHAIRPERSON RIDDLE: But we already know that.

INDEX

Agenda Item: 

Speaker:

Neil Blevins, Associate Deputy Administrator for Compliance, Safety and Security 242

Richard Mathews, NOP Associate Deputy Administrator - NOP update 260

Presentation and Consideration of Committee Action Items:

Andrea Caroe, Accreditation 268
George Siemon, Livestock 273
David Carter, Policy Development 340

Action Items:

Proteinated chelate restrictions 275
Status of calcium carbonate 279
Methionine annotation - new date 300
Methionine - denial of temporary variance 304
Livestock medications 348
CHAIRPERSON RIDDLE: Good morning. I'd like to call the meeting to order and I'd like to thank you all for coming. We have a lot of issues before us at our meeting and certainly look forward to your comments and we'll do our best to represent the interests of the entire organic sector as we move forward. I have a couple of announcements before we start. Probably the most important is to let you know where the restrooms are and you have to go around the registration desk and then down to the lower level and then straight on ahead is where the restrooms --

UNIDENTIFIED SPEAKER: Or up on the second floor.

CHAIRPERSON RIDDLE: -- or up on the second floor there's restrooms, as well, so up or down, your choice. And then I also wanted to let you know that Nancy Ostiguy, one of the Board members, was driving in from Pennsylvania, or hoped to be last night and because of the storm, is hoping to be driving in today, so she'll be missing the public comment, but hopefully will be here shortly after lunch in order to take part in our meeting. And Dave Carter will be leaving about 9:30 to go to the Capitol where a new buffalo nickel is being

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
introduced and Dave is Executive Director of the National Bison Association and they'll have Cody the trained buffalo there and so Dave does need to be gone for a little while, but he'll be taking pictures.

And yesterday we talked a little bit about what constitutes a quorum and decisive votes and there was a little confusion about that. I've looked in the Board Policy Manual and under OFPA, a quorum is a majority of the Board, so we have 14 members on the Board, so a quorum is eight. So at any time we need to have eight members to have a quorum to conduct business. And then for decisive votes, it's two-thirds of the votes cast of the number of members present at that time for a decisive vote, so it does not take ten, necessarily. If we had all 14 here, then two-thirds of that would be ten at that time, but we only need eight to have a quorum to conduct business. So I just wanted to clear that up.

Okay. We'll start with public comment and we've had a sign-up sheet, or people, according to the Federal Register notice, needed to sign up in advance and really the time allotted for public comment today filled up and if you aren't on the list for today, well, during the first break you might check your name here, but you might also see if there's someone who's on the
list who would be willing to trade, but there are plenty
of slots available for Thursday comment, so you can
still sign up as a walk-in for comment on Thursday
morning.

And before we start with the commenters, I
would just like to read the rules for public commenting
that are in our Board Policy and Procedures Manual.
Well, all persons must sign up in advance and you'll be
called upon to speak in the order that you signed up and
unless otherwise indicated, each person will be given
five minutes to speak, and that's what it said in the
Federal Register notice; a person -- you need to give
your name, an affiliation before you give your comments,
so please try and remember that so I don't have to take
time reminding you.

And you may submit a written proxy requesting
that another person speak on your behalf and you can
come with a proxy from someone else and receive, you
know, speak on that person's behalf, as well as your
own, if you signed up, for a total of ten minutes, but
not to exceed ten minutes. You can't bring more than
one proxy. Or you can bring them, but they're not going
to give you any more time, so the maximum is ten. And
Goldie will be the timekeeper and she will, at four
minutes, hold up a sign giving you a warning that
there's one minute left, but if you don't see the sign, that's not her problem. Your clock keeps ticking and she will let you know when five minutes has expired and I will let you finish your sentence. So summarizing, concluding your remarks, but please respect the rule for everyone else's benefit.

And the last rule here is that individuals providing public comment will refrain from any personal attacks or from remarks that otherwise impugn the character of any individual, and that includes attacks on the Board members, attacks on USDA staff, attacks on any other individuals, either individual persons or companies, So please refrain personal attacks. I know there's a lot of passion. We don't -- we like passion. Passion is a good thing.

But if you engage in personal attacks, well, that will detract from your comments, for one thing; so it doesn't do any good. If I sense that there's a personal attack going on, I will call that to your attention, ask you to please rephrase your comments. If you persist, I will ask you to conclude your comments. So just a fair warning there. And the most helpful comments -- you can talk about anything, it is a public forum, but the most helpful comments are those which are directed at our agenda items that help us do a good job.
of representing you, our stakeholders. So with that, are there any comments, announcements from members of the Board before we start? George?

MR. SIEMON: Could you tell people that the list for the next ten, so people -- what the order is, or -- is there a list --

CHAIRPERSON RIDDLE: Yeah, I've got it.

Thanks.

MR. SIEMON: It just seemed like the queue up --

CHAIRPERSON RIDDLE: Sure, yeah. And I will always, when I call a person, let you know who's on deck, but I'll give the first five that we have signed up. First would be Nathaniel Bacon, then Mark Retzloff, Dr. Juan Velez, Clark Driftmier, and Mark Lipson are the people who have signed up in advance, so -- okay, anything else, members of the Board? All right, everyone's clear on the rules and we'll proceed. All right, Nathaniel Bacon, NOFA Vermont. Yeah, and you'll speak at the podium.

***

provide information about organic dairy production,
assist farmers through transition and do financial
planning with farmers. NOFA Vermont currently certifies
85 dairy farms in Vermont and about 15 to 20 new dairies
transition every year, so organic dairies are a real
bright spot in Vermont agriculture. Many of these farms
need to make significant investments towards
transitioning, conservation improvements and setting up
grazing systems for their animals that meet, what we
believe, is the intent of the organic standards; that is
all milking cows and older heifers graze fresh pasture
as a critical part of their nutrition, health care and
living conditions. We firmly believe that is what both
consumers of organic milk and the vast majority of
organic dairy farmers want. To do otherwise is simply
not organic farming.

I think it's important to remember that
there's no basis to discuss whether organic livestock
should be pastured or not. Pasturing is already
required in the rule; it is just being enforced
unevenly. We do need to find a way to clarify this
standard in a fair way to consumers and farmers. The
NOSB and not the recommendations do this and adoption is
needed to maintain the integrity of organic agriculture.

In the past several years, effective pasture standards
have been proposed but have not yet been acted upon. This inaction is causing a major rift in the organic community and needs to be resolved.

NOFA Vermont strongly supports a clear pasture standard that ensures all organic ruminant livestock, including milking cows, receive good pasture as a significant part of their diet. We support both the NOSB and not the pasture recommendations to put some teeth in the law. Currently, the vague wording of the pasture standard creates great difficulty in certifying dairy farms and creates an unfair playing field between dairy farms and between certifiers. Ask ten people what "access to pasture" means and you'll probably get ten different answers. But there is a research consensus on parameters that define a grazing dairy farm. Dairy farm business summaries out of both Cornell and the University of Wisconsin define grazing farms as those which provide, at minimum, 30 to 40 percent foraging pasture during the grazing season. This should be the basis for the organic pasture standard, as well.

I want to be clear. NOFA Vermont understands and supports size-neutral organic standards. This is not an issue of large farms versus small farms. If a large organic farm sets up an adequate grazing system that includes lactated cows eating green grass, it
should be certified. Large-scale grazing dairies do exist in the U.S. and internationally. Because the standard's so vague, organic farms of all sizes may be getting around the rules. The issue is when a farm seeks to avoid pasturing out of inconvenience or inadequate land base. In our opinion, adequate grazing acreage needs to be planned, just like alternative livestock health care and organic feed sources need to be planned.

We also recognize that regional and climate differences exist in respect to grazing, however this doesn't mean that the pasture standard can be simply ignored or marginalized. Organic agriculture has always recognized that in order to be sustainable, farming must be adapted to the location. It would be essentially impossible to grow pineapples in Vermont due to our cold winters. There may other areas of the country you simply can't raise organic dairy cows due to lack of pasture.

In closing, I want to take off my certifier hat and say that in my spare time I work on a 125-cow intensive grazing dairy farm. I see the many benefits of pasture directly. Many of the environmental and animal health challenges that we face during the winter barn season go away May 1 when the animals go out to

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
grass. Not coincidentally, this is also the time when visitors to the farm show up. They know that pasture is the natural place for a cow. Grazing research bears this out. In Cornell's 2003 dairy farm business summary, the cull rates for grazing farms were 25 percent lower than cull rates for confinement farms. Vet and medicine costs were 67 percent lower for grazing farms than for confinement farms. It's clear to cows and farmers, consumers, and most certifiers, that pasture is essential. I hope it's clear to the NOSB and NOP, as well. Thank you.

CHAIRPERSON RIDDLE: Thank you. Oh, Nat, question. Hugh?

MR. KARREMAN: Nat, when you mentioned the Cornell and the University of Wisconsin definitions of grazing dairy, you said 30 to 40 percent grazing. Is that just as nad [ph] or dry matter or what?

MR. BACON: It's on a dry matter basis, is my understanding, yeah.

MR. KARREMAN: Okay, thanks.

CHAIRPERSON RIDDLE: Okay, Mark Retzloff and then Dr. Juan Velez is next on deck.

***

MR. DRIFTMIER: Good morning. Mark Retzloff from Aurora Organic is indisposed. He went home sick,
so I'm another speaker, Clark Driftmier from Aurora Organic. I will speak and then free up my spot, so if someone else wants to join the list, we've got an extra spot. Good morning.

COURT REPORTER: Could you spell your name, please?

MR. DRIFTMIER: Excuse me?

COURT REPORTER: Could you spell your name?

MR. DRIFTMIER: Sure, Driftmier. Drift as in snow drift, M as in Mother-I-E-R. First of all, I'd like to send all of my greetings from the fellow employees at Aurora Organic, our farms, our farm workers, certifiers in Texas and in Colorado. It's a great pleasure to be here and to see many of you again and to see many of you for the first time. The first is overall all of the people in the organic sector need to be supportive of NOSB and the great work in the National Organic Program and I just wanted to start out by saying that Aurora Organic is very, very supportive of this work and just to clarify one thing, we will, without hesitation, follow all guidelines and interpretations and all of the rules in the guidance documents of the NOP and also the NOSB. We're very proud to be members of this industry and we're a hundred percent supportive of what you all are doing and want to follow that.
The second thing I'm going to say is that all of the decisions that should be based, made in the pasture issue and in all issues need to be science-based. There's quite a bit of science that has been published. In my belief, not enough of that science has been brought forward for discussion; some of it has, a lot more of it needs to be and I highly encourage both the NOSB and the National Organic Program to use science as the basis for all the decisions, all the recommendations in guidance documents. Included in this, I think that there should be a multi-day major science forum on the issues of organic and organic pasture where all of the different opinions and all of the different research documents to date can be fielded where people of all persuasions can partake of that science to help make science-based decisions.

The next thing I wanted to say is that the management of everything regarding managing an organic dairy should remain interpretive as it was designed in the original OFPA in 1990 by the writers of OFPA and by many who are in this room and even at this table, rather than to become overly proscriptive. The diversity of conditions across the country is so great that an overly proscriptive law, particularly one that is based on arbitrary measures and certain percentages, et cetera,
will not work across the broad diversity of agriculture in America.

I also want to say that the growth of organics and the mainstreaming of organics is a very good thing. In my own functional area, I'm a sales and marketing guy. I have seen organic move from the very, very fringe of society, if not to the very center of society, at least a little closer to the center of society than it used to be and this is a very good thing. This affects NOSB and NOP policy, as well. Everything should be done to encourage the maximum growth of organics; growth in all different sectors, growth in all different scales, growth in all different geographies. And I would like to say specifically that I believe that every geography in the United States is a wonderful place to have organic dairy.

And the last thing I'd like to say is that in this whole process we all need to work together. As Jim so rightly stated, organic is populated by people of great passions, people of strong opinions, people whose opinions are not changed easily; there is a way to go about our debates with professionalism and collegiality and respect. The world is watching us, we do live in a glass house and the true enemies of organics stand aside smirking whenever we disparage or attack one another.
So I would just like to encourage everyone here to follow professionalism and collegiality and respect in all of our discussions. Thank you very much.

CHAIRPERSON RIDDLE: Thank you, Clark.

Questions? Okay. All right, next Dr. Juan Velez and then Mark Lipson is up, but George Wright would be after him if Mark's not here.

***

MR. VELEZ: Good morning. My name is Juan Velez, V-E-L-E-Z. I am the Director of Farm Operations for Aurora Organic dairy, both Texas and Colorado. I want to thank the NOSB and the NOP for giving me the opportunity to speak this morning. I want to start by saying again that I heard something very, very important yesterday. Jim Riddle -- this is not a personal attack -- said something very important yesterday. He said it has to be done based on science and we just heard Clark saying the same thing.

Just to start, I think that we all agree very, very well that the access to pasture rule or recommendation is extremely important, specifically for three major areas of animal husbandry. The animal welfare, animal health and natural behavior of the animal. Dr. Temple Grandin, a world-renown research and an expert in animal behavior and animal welfare, made a
comment at the last American Dairy Science Association
meeting where she pointed out that the two major points
to take consideration in when you are -- about animal
welfare on a dairy farm. Body conditions of the animal
and the percent of cows that are lame at the particular
farm. Those are the summary of all the research that
she had done at dairies, extremely critical.

I've also found out some interesting articles
on -- that come from Europe. Researchers from
Switzerland in 2004, where they did some analysis of
percent of lame cows and injuries of the hock joints on
animals that were housed in a tie stall system during
the winter, but they were grazed during the grazing
season and they compared the number of injuries of the
hock joints in those cows that were in tie stall versus
cows that were on a loose housing system during the
entire year; much higher incidence of hock joint
injuries and also a higher incidence of teat injuries on
those cows that were not tie stalled during the winter.

Also, we have found that due to the highly
domesticated dairy cow that we have today and the highly
genetically selective dairy animal that we have today,
it's very difficult to maintain adequate body conditions
scored on these highly producing dairy cows when they
have only grazing as a nutritional system. Research at
Penn State University demonstrated that cows that go from a diet that would store feed to a diet on -- based on grass, lost significant body conditions score at the end of the grazing season.

I believe that this -- some objective way to measure adequately animal health that could be evaluated from a farm-to-farm, season-to-season across the entire United States. Measurements as body conditions scored percent of lame cows -- percent of cows that are chewing their cud. In other words, ruminant at any particular time as an indication of rumen health are very important factors, also as a measurement of reproductive health, we could evaluate very easily the calving interval of different dairies across the country regardless of their living conditions.

On the aspect of animal behavior, I think that we all can agree that the cows can express at freedom their animal behavior when they're grazing. My question is does that freedom of animal behavior during the four or five months of the grazing season compensate for the complete depression of such behavior during the winter time? And just to leave you with a question, do we think that we, as an industry, should reconsider, when we talk about animal behavior, the use of artificial insemination? I want to thank you again for the time.
that you have given me. That's all I have. Do you have any questions? I knew that Hugh would have some.

MR. KARREMAN: Just one question. I know from your, Aurora's two letters, at least the first one that you sent back and from what you're saying now, body condition score is a very important indicator of how -- it's in my experience with my grazing farms that -- I'll agree with you that cows drop in body condition when they go out on grass, but they're not only on grass and they're being supplemented, as well, so at least in my area of southeastern Pennsylvania I find body conditions score, indeed, becomes a little less than more during the grazing season, but it's not to a pathologic end. I think body conditions score, you have to look at it -- if we're talking health versus disease, which you're talking about health, I'd say if you get a body conditions score of less than about 2 and probably greater than about 4.3 to 4.5 in standard body conditions, scoring 05 [ph], you get on either end, you're going to have health problems. But I think anywhere in-between, they are within normal range and even cows in confinement can drop in body conditions score two points when they're fresh, when they're milking 150 pounds or whatever, they get pretty lean. So I'm not so sure I agree with body condition tagging.
right with the health, total health of the cow.

MR. VELEZ: Definitely, I agree with you. My point being is it's a measurable evaluation of a global, overall health of a dairy herd, usually regardless of whether it's in confinement, loose housing or 100 percent pasture, 30 percent of dry matter pasture, you could identify a farm that is in trouble due to a lack of adequate nutrition, whether it's over-feeding and you find five percent even though when we talk about health, when we talk about animal welfare, what I'm referring to, as Dr. Temple Grandin is, yes, every animal that is on the 2.0 body condition is an animal welfare issue. My point is you can measure that and evaluate that across different systems. But I agree with you that there's no such an ideal that it can -- I mean, there's not anything between 2 and 4.2 is healthy even though there's some variation depending on the systems, yes.

MR. KARREMAN: That's a good objective way to look at things, for sure.

MR. VELEZ: Yes.

MR. KARREMAN: One of the objectives.

MR. VELEZ: Exactly.

CHAIRPERSON RIDDLE: Yeah. Okay, Bea.

MS. JAMES: I appreciate your passion and actually, the people who have gone before you, also,
describing and talking about your concerns. I'm new, so
I'm learning about, you know, how you're explaining your
position, that it would be really useful for me if you
could tell me exactly what it is you want.

MR. VELEZ: What I exactly want is to express
my concern on the lack of fundamental evaluations and
research done in the areas to say that one system is
better than another system on -- in regards to animal
welfare, animal health and natural behavior. I have
difficulty finding out that one specific -- in the
literature, that one specific system is better on those
two factors than another system because when you read
the literature, it all goes down to good management of
the health, welfare and natural behavior, overall. In
other words, there's grazing systems that are -- that
could be terrible to all three of those factors and
confinement systems or loose house systems that are
terrible to all those factors. So I think that as an
industry, we could evaluate and measure across the
country with some specific objective measurements to
compare such systems.

CHAIRPERSON RIDDLE: Okay, thanks. Rose.

MS. KOENIG: I think, on a scientific basis,
it's fairly difficult to -- you can evaluate systems,
different parameters within a given experimental --
system, but the variability between -- I don't think it's as easy as you suggest. I mean, science is a tool, it's an evaluation tool, I agree there could be answers in science, but I don't think it's as simple as you're suggesting, because I think there's many factors and many variables in the systems and if it was so easy, I think some of that research would be conducted. So I don't -- I just don't want you to simplify those kinds of things --

MR. VELEZ: No, I -- I apologize. I didn't mean to simplify. It's a very difficult task.

MS. KOENIG: Yeah. And I think that the thing that I don't -- in one sense, there's this concept of using measurable indicators and say -- and I think that's actually the regulation -- you know, a good farmer -- I'm not an animal farmer, but I am a crop farmer, and you should be collecting that type of data to evaluate your system already. That's a requirement, as I understand, in the regulation. So I think that that's a good management practice and it probably should be conducted out there because I know we do it on our farm, evaluating our practices and -- but from the last person -- there seems like -- there seems to be this idea that you want flexibility, you don't want any numerical values in the recommendation or the definition
of access, yet you want to use numerical values to
evaluate -- so in my opinion, if you go down that line,
okay, this is my own opinion, you can't pick and choose
in some ways, that values do have an important role and
I think that, in my opinion, if you really want clarity
-- now, I'm not saying I know that number or that
percentage, be it dry matter, it could be in acreage, I
don't know, but I think that that's probably the most
clear-cut way for all farmers, but it has to be
appropriate to various geographical areas and --

MR. VELEZ: Yeah, and I'm very glad you asked
that and pointed it out and asked the question because
when we -- what I'm trying to say is if we become
extremely proscriptive on pasture, we don't have a
reason to say that 30 percent or 45 or 15 or 25 is going
to create a better, a healthier cow, is going to allow
the cow to express a behavior any better because it's
four months of the year and it's not going to for sure
provide you with a healthier animal, or is it going to
be a better well-being animal. However, what I'm saying
is if we are going to measure, we should measure
objectively what represents those three characteristics;
welfare, well-being and animal behavior, because if we
become proscriptive in a system, you can only feed so
much grain, we will be -- we'll be not allowing the
management system to get to the final objective, which is those three things, optimize those three things.

CHAIRPERSON RIDDLE: Yeah, and I don't want to prolong this; we have a lot of other speakers. I have a comment and question, I think there a couple of other Board members that still do, but I -- and to me, these factors come together in a quantifiable way by looking at number of lactations. You can assess, you know, the reproductive health, body score in a very simple quantifiable by looking at number of lactations, you know, to compare. You didn't mention that and I would just like your reaction to that --

MR. VELEZ: Definitely.

CHAIRPERSON RIDDLE: -- the lifespan of the animals on the farm, in other words.

MR. VELEZ: Definitely. What -- that -- two things about that. I think that it has be done after the farm has been in business operating for several years --

CHAIRPERSON RIDDLE: Sure.

MR. VELEZ: -- first of all, and second of all, I think that the problem with that one is that culling is an economic decision, not necessarily a welfare [ph], natural health or natural behavior decision. And any farm, small, large, big, medium is
making that culling decision based on economics, whether
the cow is producing, you know, milk or not. And I
think that is a little bit skewed in the organic
industry because of the price of milk, if you compare it
to the conventional business because the price, the
current price of milk is a big factor in the culling
decision, so it's more of an economical decision, not
necessarily a health decision.

CHAIRPERSON RIDDLE: Well, it certainly --

MR. VELEZ: There would be --

CHAIRPERSON RIDDLE: It certainly can be part
of a health maintenance program, as well as genetics,
too, so --

MR. VELEZ: Definitely. If you identify the -
- reasons extremely well in your records and you can
differentiate voluntary culling versus involuntary
culling, definitely.

CHAIRPERSON RIDDLE: Other Board members,
quickly. Hugh.

MR. KARREMAN: Juan, I just -- as a fellow
veterinarian, I totally agree that things should be
science-based. For the short time I've been on this
Board, however, I've found that science is not
everything and while I still will maintain that things
should be scientifically based and not just have

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
anecdotal stories here and there patched together, in
between there, there's reality and we, as a Board, have
to consider what the organic consumer thinks of when
they think of organic dairy cows, so I think we have to
keep that in mind.

MR. VELEZ: Definitely. I -- let me -- yes, and I think that we should also look at the research on
that aspect and see what percent of organic consumers
are drinking organic milk because cows are on pasture or
because they have 20 percent grain on the ration or is
it just because they care about their own health. I
mean, I think that we should look at the research -- and
not just think that it is because -- thank you.

CHAIRPERSON RIDDLE: Um-hum, good point.

Dave.

MR. CARTER: Yeah. Juan, very briefly, thank
you for your comments. I think one of the things that
all of us, in looking at organic systems is, it is not
just about animal health and it's not just about the
health of the land, but it's the interrelationship of
the two. And I know that you're concerned about overly
proscriptive approaches, but how, you know, how would
you view, looking at some of the NRCS, you know, areas
where they take a look at the carrying capacity of
various regions and the like and using that as some
guidelines as to how we approach the access to pasture.

MR. VELEZ: I think it's important, very critical, very important and it is -- it got some science base and like Clark said earlier, I mean, we as a company, are definitely dedicated to comply with whatever is decided, definitely, and I think that is a very good approach.

MR. CARTER: Thank you.

MR. VELEZ: Thank you.

CHAIRPERSON RIDDLE: Next is Mark Lipson or someone carrying his proxy here?

UNIDENTIFIED SPEAKER: Can you put that to the bottom of the list?

CHAIRPERSON RIDDLE: Yeah, I can keep that open. Then we have George Wright and next up, Robert Hadad.

***

MR. WRIGHT: Good morning. I'm not very good at this. To be honest with you, I'm scared to death but --

MS. CAUGHLAN: We don't bite, we really don't bite.

MR. WRIGHT: I have no scientific information. I'm a passionate dairy farmer from northern New York, wife and I farm 50 cows. We farmed for several years
conventional, switched over to organic production five
or six years ago. We love the life style, we love the
-- we love people coming to us; people drive by the
farm, they look for cows in pasture. They say this is
beautiful. And many of my family and relatives believe,
or that's what they think farms are, is our little farm
up there on the hill with 50 cows wandering around out
in the pasture and we do supplement some of their
pasture with some feed, but for the most part -- and
we're just barely on the Canadian border in northern New
York -- we don't have much of a growing season, but we
can a hundred percent graze our 50-cow herd.

We have set it up, we have made it this way to
a hundred percent graze our 50-cow herd for 120 days and
then we have to supplement a little bit each side of
the, each end of the growing season, but -- so we have a
few months in the winter, probably -- well, between four
and six depending on how spring and fall treat us, that
we have to feed them everything they get because there's
nothing there to eat.

But now to read my speech, and I'm not trying
to be a smart aleck or anything with this, but I believe
that some of the best reasons to support the pasture
policy that NOFA's presenting here today with some
numbers, is to eliminate some of the consumer doubt and

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
possible consumer fraud, only -- I mean fraud to the consumer. And I'm not going to stand here and say that grazed milk is better than confinement milk because I have no scientific proof of it, I'm not a -- I just gather information from what people tell me; I'm like a human sponge. And my concern is most of the organic consumers that I know, and my family, extensive family of a hundred or so people, believe that they're paying a premium price for product that is produced by cows grazing on green grass in sunny pastures and -- I lost my place. Oh, yes.

Even in the conventional market, milk marketing, you don't see any commercials on television or pictures on milk cartons with cows standing in a free style situation, a confinement building, bellied up to a feed bunk getting their lunch. You just don't see that kind of commercials out there, so if it's that great a thing, then why aren't we advertising it?

I just think the consumer is being lied to a little bit about where their cows are coming from. They're being portrayed as being pastured, but many of them are not being pastured -- the cows, I mean. I guess. And I'm just afraid that this is going to, in the long term, damage what I consider to be one of the greatest things in the world, the organic dairy market.
right now, is because consumers will lose confidence in
the product if they think it's all created on factory
farms and once this gets out, it seems to just keep
snowballing. And not that I have anything against the
factory farms; I feel they have their place in society.

They -- I guess I'm just going to wrap this up
as you folks on the Board here, which is an honor to be
in this country where we're able to do this kind of
stuff, stand up and run our mouth. You people on the
Board are -- have got a real important task ahead of you
and as you're deciding some of these things that you're
going to hear about pasture and this and that, to please
remember that you're not -- you're sending a message and
I assume it's probably going to affect USDA and anybody,
any other organizations that you folks are -- contact,
that whatever your decision towards pasture is going to
largely affect the outcome of dairy farming in Vermont,
I mean, in the nation as small farms.

I mean, you know, the conventional market,
almost all the small farms are now selling out, so we're
running out of small family farms. I mean, we're
going giant family farms, so -- I mean, you guys are
faced with a monumental task and all I ask is please do
-- think with your heart and try to do the best thing
that you can. Thank you.
CHAIRPERSON RIDDLE: Thank you, George. Bea, a couple --

MS. JAMES: I have a question for the gentleman.

CHAIRPERSON RIDDLE: You don't get off that easy.

MR. WRIGHT: I thought I had it made. It was quiet there for a minute.

MS. JAMES: I really appreciate hearing from you and from the real farmer, you know, a small farmer who's not used to coming out and talking in front of a group of people. I appreciate that, so thank you for that. But when you say you want us to think with our hearts and make sure we do the right thing, what would that be to you?

MR. WRIGHT: Well, all I'm saying -- I mean, you guys are talking science and I was thinking about this when I was listening. You know, science is a good thing, but science is a lot of times twisted a little bit with consumer perception and -- or you know, perception of people, the passion of things. I mean, you know, like saving the whales and stuff like that. Big business certainly didn't want that to happen or anything, but some of the organizations out there that brought it to the people's attention got the public to
denounce, you know, that kind of treatment of that animal. So I -- and that's where I just think that we've got to be careful. This is largely a public perception of what the industry is, the dairy industry. Is it still fuzzy?

MS. JAMES: So what you're saying is that you would like to see what in regard to pasture, exactly?

MR. WRIGHT: Well, I fully back the -- you know, the 120 days minimum, 30 percent dry matter and whatever the other couple things were they had in it, but just as a guideline -- and I mean there can be some -- as far as I concerned, it could be a little fuzzy logic on that. There's going to be dry years, there's going to be wet years. The main thing is to go onto a farm and actually see that there is some kind of a grazing system on this farm. You know, I'm not looking for specific intentional -- intensive grazing or anything like that, but just the intent that there's -- and I don't mean a fence around 10,000 acres, either, you know. Something that looks like they planned it.

MS. JAMES: Okay, thank you.

CHAIRPERSON RIDDLE: Hugh.

MR. KARREMAN: So George, thank you for very much for being up here. Glad we finally got to meet. I wanted to follow up on what Dave Carter said to Juan
Velez, the last speaker. So that if somehow we want to do what's right for the -- of all organic dairy farms, you would -- how would you feel, I mean, you know, following -- it might not be what NOFA wants, but what the Natural Resources Conservation Service has to say per your county for grazing. Would that be fair, because it might be different, though, in California and Washington state?

MR. WRIGHT: Oh, yeah. I mean, I -- that has to be part of the factor. I can't say as it might be a hundred percent because -- I'm not saying not this plan is a hundred percent, but maybe a merger, you know, marriage of the two, to come up with the ideal plan, you know.

MR. KARREMAN: I mean, that would allow some flexibility, as well.

MR. WRIGHT: Oh, that's what I say. I don't think that -- I mean, we've got to have some kind of a definite standard, but we can -- we don't have to maybe make it as definite as we have. I mean, we've got to have wiggle room. But not to the point where we can abuse it.

MR. KARREMAN: All right, right. Okay. Thanks.

MR. WRIGHT: Am I in the clear?
CHAIRPERSON RIDDLE: Yeah, thanks. All right, Robert Hadad or someone carrying his proxy? There's Robert. And next up is Harriet Behar.

***

MR. HADAD: Good morning. My name is Robert Hadad. I am the Director of Farming Systems for the Farm Animal and Sustainable Agriculture Section of the Humane Society of the United States. We represent over eight million constituents, all consumers who we have been in conversation with promoting organic livestock production as being a system that is -- provides good welfare for the animals and provides great opportunities for small farmers in rural communities. And we're hoping that the integrity of the organic system is maintained for everyone to continue to believe in it. I think the National Organic Program spells out ecological parameters for organic farming, more or less, and the livestock regulations are set out underneath that. In the document that I have handed out to everyone here, I try to set that argument out using examples from the regulations to try to set that out and it's too long to get into here for the brief five minutes we have.

Yet, we're here discussing access pasture for ruminants, which seems to me, I believe ridiculous at
this time. Arguing that it's too dry all the time to pasture a milking herd or that stage development allows for confinement or that pasture may not be in the best health interests for the animals, you know, it's -- the farmers that have come up here and talked, they know what pasturing means. It's been that way for a very, very long time. Cattle have evolved in an outdoor system where pasturing is about as close as you can get to a natural system. The answers to these arguments are good management, good stockmanship [ph] and there are limitations. If conditions don't allow for pasturing, as the organic regulations demand, that you can't have an organic dairy farm there. I mean, it is -- to say that every -- you know, it's the inherent right for everything to be organic if the conditions just aren't there doesn't make any sense. There are limitations. The rules are not supposed to conform to the farm, the farms are supposed to conform to the rules. Any other argument against pasture for ruminant is simply an attempt to circumvent the Natural Organic Program and gain financial advantage.

The Northeast Organic Dairy Producers Alliance have set out a great example of a definition for pasture and its usage. I include that in the document there, and we at the Humane Society endorse their definition as
the minimum requirements because organic integrity is at risk here once again -- and this issue is huge. This probably one of the biggest things we're going to run against that's going to really define whether organic is going to be believed or not. And if we screw it up, there's not going to be much left for consumers to trust in. Thank you.

CHAIRPERSON RIDDLE: Thanks, Robert. Okay, Harriet Behar and then Mark Kastel is next.

***

MS. BEHAR: Hi. I'm probably not going to get through all my comments, but you have them in front of you. I'm an organic inspector, an organic farmer and a consumer and I'm making suggestions to the various NOSB recommendations to aid in clarification of the issues, as well as to aid in verification, which as an inspector, I feel is very important. For pasture, I agree with the pasture recommendation that you have in front of you. You mark [ph] your recommendation with the following addition: "The farm plan should clearly document the significant feed value obtained from pasturing during the grazing season versus the non-grazing season.

In addition of a table to the certification agency farm plan application detailing the various York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
rations for all stages of life and the quality of the
forages during the grazing season and the non-grazing
would be verifiable. The grazing season is the same as
the crop growing season using the same inputs or
activities for a specific region. If the crops in a
region need irrigation to grow, then the pasture should
be irrigated." This suggestion allows for regional
differences.

Technical corrections. The NOSB made

recommendations many years ago with a list of technical
corrections to the current rule and I believe the NOP
agreed that this could be done with minimal
difficulties. I urge the NOSB to remind the NOP to
print these in the Federal Register very soon.

Inconsistent communication. I also urge the
NOSB to consult with the NOP in the development and
implementation of their program manual. The Federal
Register Guidance Proposal is one part and I urge
everyone present to make thoughtful and constructive
public comment. Proof of NOP compliance to the NC [ph]
audit requirements should be made public. A transparent
and consistent process must be used when developing
guidance and information must be distributed equally to
all interest parties. In the past, NOP e-mails or other
communications to only one producer or an agency,
without passing this to everyone else, has caused
confusion and lack of consistency in both products in
the market place and organic certification.

Peer review panel. The new Secretary of
Agriculture understands the need for a permanent peer
review panel for the NOP and I encourage the NOSB to
continue to work with the NOP to put this in place.

Commercial availability for organic seed --
you can just refer to this as you go through all your
things. The last section of the NOSB recommendations
states that the producer does not meet the good faith
effort in searching for and using organic seed, but they
lose certification. This is not clear if they lose
certification for their whole farm for one year, three
years, or just for that crop for that year. My
suggestion is that if all the search criteria are not
met, that the current year's crop using the non-organic
seed might not be considered organic, but that the
entire farm would not lose certification and certainly
not for three years.

The retailer discussion on labeling. I
believe that the certified retailer is the final
distributor of the enclosed packaged product and they
should be allowed to use their certification on the
private label products if they are certified. During
the inspection of this certified retailer -- will be verified that for all ingredients and processing facilities had been approved. A retailer may purchase processed products regionally from different certifiers using the same formulation, but those -- each facility might be differently certified and they may wish to use only one label or packaging for these various products produced regionally.

Information on certificates. It is difficult to verify current organic certification based on certificates issued many years in the past. I have seen certificates presented to me during inspection that were no longer valid due to the switching of agencies or whatever. I only knew that since I had been the most recent inspector of that producer in question, I would like to see that that was on a valid certificate. I would like to see a most recent inspection date or a certification annual review date added to the certificate, since this is a truthful information statement and when everyone in tracking that the non-expired certificate holder actually filed the annual inspection certification review that is required.

On diversity. As an inspector and a member of the -- Farm Task Force, I enthusiastically support an addition to the organic farm plan encouraging farmers to
clearly review their farm system and how they can
enhance the ecological services and biological diversity
to improve their operation. I'm done?

CHAIRPERSON RIDDLE: Yes, you are. A
question, though. There can be questions. Andrea.

MS. CAROE: Harriet, in regards to the
information on the certificates, you want to see an
annual renewal date or the last inspected date.
Although that would get you a lot closer to verifying
that they are compliance, there is an opportunity where
that certificate could be suspended or revoked, that you
still wouldn't know that information. Do you have any
input on how you would like to see that remedied?

MS. BEHAR: Well, if they were annually
reviewed. They have to go through an annual inspection
and certification review, so that date would show that
they had not surrendered their certificate, that they
had not been suspended from certification. You know,
right now the certificates do not expire, so I see
certificates from 2002, I have no idea if they're still
currently certified and many -- I mean, it's happened to
me numerous times, when I know that they're no longer
with that previous agency.

MS. CAROE: Well, really what I'm talking
about is if you went into a facility today and saw a
certificate that said last inspection date was April '04, you wouldn't know between April and now something's happened to that certificate.

MS. BEHAR: That's true, but at least it would be that I knew that they had gone through their annual review.

MS. CAROE: So you're just looking for getting us closer and that you recognize that's not the whole way?

MS. BEHAR: Yes.

MS. CAROE: That we need a real time system in order to really capture that up-to-the-minute data?

MS. BEHAR: That would be helpful, but this would -- and it's truthful. It's a truthful statement that shows that they've gone through the annual review that they're required to do. I understand the certificates are not to expire, but there is a truthful statement, I think, that we can add to the certificate that would verify their compliance.

MS. CAROE: Thank you.

CHAIRPERSON RIDDLE: And I want to thank you for your comments and I just invite you to get any suggested amendment language to committee chairs to be considered to incorporate some of your thoughtful concerns as we debate these items this afternoon and
MS. BEHAR: I know it's quite a smorgasbord there, but --

MR. KARREMAN: Just a quick question. From what I see on the dairy farms that I get into, they all have annual re-inspection. They would have paper otherwise milk truck's [ph] not going to pick them up, so I just guess I don't understand what the problem is because they're all annually re-inspected and they should have the paper stating that. I realize once they're certified that's forever, so what's the -- what's happening? It's not -- they're not showing --

MS. BEHAR: The certificate doesn't have a date.

MR. KARREMAN: Right.

MS. BEHAR: So let's say I'm at a dairy farm and they're buying hay from someone and they show me a certificate from the person they're buying the hay from. That certificate may say October 2002 for the issuance date of the certificate and I don't know if they've been annually inspected each year.

MR. KARREMAN: Well, then maybe the hay sellers should show the annual re-inspection paper, too.
MS. BEHAR: There is none. They would have to show their inspection report --

MR. KARREMAN: Why is that with dairy farmers? They get annually re-inspected.

MS. BEHAR: But the certificate doesn't show the date.

[Simultaneous comments]

CHAIRPERSON RIDDLE: We can talk about this further. It's not a new issue. Bea, anything -- other point here?

MS. JAMES: Well, obviously I like it when people come up there and say exactly what they want and I thank you for doing that.

MS. BEHAR: Yes.

MR. LACY: Sorry, Harriet. The last two things on your list had to do with livestock issues. Could you just very briefly mention those since you ran out of time?

MS. BEHAR: Yes. Okay, there was -- one was I was told by a Wisconsin producer that he cannot sell homeopathic and take remedies and tinctures into the state of Iowa because the FDA does not have them listed and so this is a problem that the NOSB should be working.
with the FDA to find a way for over-the-counter drugs and these remedies because the organic farmers in Iowa now cannot use these products legally and of course, there's problems with commerce that he can't sell these products.

And the other thing is the methionine, and I just really feel that the NOSB should encourage the NOP to give some money to an actual NOSB task force and actually make it happen. There is kind of a reliance on an OTA task force in the past and it really, it was all volunteers and there was no organization and so I don't want to see the extension go into infinity and I want to see a real concerted effort to see a natural solution.

CHAIRPERSON RIDDLE: But yeah, I just want to be clear. You do support the extension at this time backed up by --

MS. BEHAR: I support the extension at this time, but really want to see some money and energy put towards solving the issue.

CHAIRPERSON RIDDLE: Uh-huh. Okay, thanks.

All right, Mark Kastel and then Blake Alexander on deck.

***

MR. KASTEL: Thank you, Mr. Chairman. My name is Mark Kastel. I'm the co-director of the Cornucopia Institute. In addition to my own testimony, I have a
proxy and will be reading comments from one of our board members, William Welch, a livestock, organic livestock producer and former member of the National Organic Standards Board. I'll also read a few excerpted comments from another former Board member, Merrill Clark. The NOP has received thousands of letters and I have over a thousand additional letters and some petitions, signatures which are addressed to Chairman Riddle that I'll ask that be placed into the official record.

The Cornucopia Institute will not be presenting comprehensive testimony today, although I want to say that we are honored and humbled to stand with the hundreds of organic dairy producers from throughout the country who have reviewed and formally endorsed the testimony that will soon be presented by the Northeast Organic Dairy Producers Alliance. Like the Alliance, Cornucopia strongly supports the work of the Livestock Committee of this panel and its draft pasture recommendations. But because of past abuses, we feel strongly that there should be a base line measurement for -- to facilitate cursory oversight by certifiers and inspectors. That is not to say that a comprehensive farm plan and judicious oversight by certification authorities will not still be necessary.
The dairy community's recommendations of a minimum of 30 percent dry matter intake 120 days per year on pasture and a maximum of three cows per acre is just a starting point. Most farms will be out of compliance with the letter of the law and the spirit of these rules if they only pasture their animals according to those minimal specifications. The debate concerning access to pasture is both legal and philosophical. We are here today discussing the legal parameters of the question. But make no mistake about it, there is a higher authority than the USDA.

The final judges in this matter will be the consumers who have so heartfeltly [ph] joined with family scale farmers to create what corporations now view, with anticipation, as enhanced profit margins. They're very happy and they have reported those attributes to their shareholders.

We cannot allow corporate profiteering to besmirch the good name that organic foods have earned in the marketplace. In the eyes of the consumer, operating factory farms is not consistent with why they are willing to pay a high premium to buy organic food. The law and regulations are scale-neutral but requiring real pasture as a fundamental prerequisite of organic livestock production will reign in the abuses that are
taking place in the eyes of the consumers.

The consumer sentiment I'm articulating here is fully applicable to other livestock species, including poultry, swine. I'll spend the balance -- actually, I'd like to present for the record and I know there's already been some testimony. A number of -- a synopsis of a number of peer-reviewed published articles that very much support the benefits in terms of animal health, of a pasture-based system and the benefits of human consumption based on enhanced milk components of milk consumed from animals raised on pasture.

I'd now like to just read a couple excerpts from Mr. Welch's submission and Ms. Clark's submission. Bill Welch is a member of the Cornucopia board of directors. He's a former member of the National Organic Standards Board, a pioneering organic livestock producer raising principally poultry, chickens, turkeys and hogs and in his submission he says in his opinion, as a board member, when we discussed and voted on, what we -- in terms of pasture and in terms of stage of production, what we meant was a newborn or very young animal, a sick animal, a cow that is not ready to give birth or any circumstances that would cause harm to an animal if it was turned out on pasture. It certainly did not mean lactating animals. He goes on to say that in every one
of us -- excuse me. Everyone was aware and helped and
looked at the pasture measure in the first place through
research done by many state universities that learned
that milk from cattle on pasture had twice the amount of
CLA, one of the greatest cancer causing preventatives
known. Those are -- those comments are from Bill Welch.

And comments from Merrill Clark, who serves on
the Cornucopia's policy advisory panel; she was a member
of the National Organic Standards Board from '92 to '96.
Her testimony includes the statement, "A recent comment
in the Organic Journal of January 2005 is troubling.
The notion that certain types of farming," -- this
echoes Mr. Hadad's testimony from the Humane Society --
"that certain types of farming can only be done in
certain ways in certain parts of the country is narrow
minded."

"In fact, that" -- excuse me -- "that is what
organic farming is all about. It can only be done in
certain ways and in certain cases only in certain parts
of the country. Organic pineapple cannot be produced in
Iowa and organic beef and dairy milk cannot produced on
dry lots or in arid areas of California or Texas unless
the rules are changed." And I really thank you for the
opportunity to present two livestock producer's
testimonies who could not be here today. I'll answer
any questions or I'll stand aside and let others speak.

CHAIRPERSON RIDDLE: Just for the record, who was the proxy from, Mark?

MR. KASTEL: The proxy's from Bill Welch.

CHAIRPERSON RIDDLE: From Bill Welch. Okay, thanks. Yeah.

MR. KASTEL: And I'll submit those two documents. I'm sorry.

CHAIRPERSON RIDDLE: Andrea.

MS. CAROE: Your support of the National Organic Dairy Producers Alliance --

MR. KASTEL: Northeast.

MS. CAROE: I'm sorry. Suggests a stocking rate of no more than three cows per acre. How does that compare to the European stocking rate? I thought it was four cows per acre.

MR. KASTEL: To be honest with you, I'm not sure what the standards are in Europe, but I should also emphasize that those numbers were refined in consultation not only with the northeast farmers, but in an umbrella group -- right now it doesn't have a name. They call it the Multi-state, I believe, Ad Hoc Committee and it includes the Midwest organic dairy producers and West Coast producers. I want to emphasize, that's an upper limit.
Most farmers who will testify here today have stocking levels far lower and that's why I wanted to emphasize the qualification of our endorsement that even though a farm might operate within those parameters, it's still incumbent upon that operator to develop a farm plan that's based on the maximizing pasture potential to enhance the instinctual behavior of the cattle and maximize the health of the cattle and the quality of the milk. So someone could be operating a three-cows-per-acre and be out of compliance. In most areas that get adequate rainfall, where livestock agriculture has been historically concentrated in the United States, stocking levels should be much lower than three cows per acre.

MS. CAROE: Right. And then my question is related to organic has an international identity, so you know, even though we won't be constrained by European regulations, it's important to understand how consistent we are --

MR. KASTEL: Well, if in fact they're at four and we're more conservative, we obviously won't violate. There are other regulations in our livestock management practices which are stricter than the European standards right now.

MS. BEHAR: I have it. It's two dairy cows
per hectare.

CHAIRPERSON RIDDLE: Rose.

MS. KOENIG: And I guess maybe it's a naive question and -- I guess I'm less inclined -- I understand the spirit of the minimum or maximum number of cows per acre, but I don't -- I think that people can access acreage, if you could purchase a lot of acreage to justify a large amount of cows, it's still hard to verify that they're there, so I firmly believe more on this percentage, you know, basis on a number of days because I think that also for somebody in an area -- you don't want to penalize individuals that might have great management practices and are able to -- farm land is expensive in some areas, so if people can figure out a way to produce a healthy pasture and again, I'm not a livestock producer, but I am a vegetable producer. You don't want to provide -- or limit any individual, I think, in terms of cows, but I think that that percentage built in a -- I think accomplishes, maybe, what peoples' objectives are.

MR. KASTEL: Well, I --

MS. KOENIG: I'm not saying that that percentage is right, but --

MR. KASTEL: Sure. I agree with you in

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
principle that the dry matter intake percentage is really the governing statistic there, but let me just emphasize that three cows per acre is pretty much at the extreme, in the national polling that the dairy producers themselves did, in what's going on in organic farming right now -- and you're really accurate in your summation of access to pasture.

You can have 15,000 acres of dry land pasture and you can open that farm gate, but if you keep the feed bunks full, those animals are never going to wander out into that very poor quality pasture and so like most of organic farming, this is built on integrity and the question is have there been abuses going on of people saying we're on pasture, of having a dry yard with bale feeding and calling that pasture? And we're here today because the farmers and consumers really want this body to tighten up the -- to give some tools to the certifiers so that we can tighten up the situation in the minority of abuses that are going on right now.

CHAIRPERSON RIDDLE: Hugh.

MR. KARREMAN: I would agree. Well, two things. As far as the dry land pasture you just mentioned, I would suggest that if a farm is irrigating their crops, that they certainly can irrigate pasture. Do you agree with that?
MR. KASTEL: Absolutely.

MR. KARREMAN: Now, in areas where there --

MR. KASTEL: It may or may not be economically viable for a farm to make that kind of investment, but if they can grow crops, they can produce pasture.

MR. KARREMAN: Right. I agree with that.

Now, in areas where there's not irrigation, let's say in the Northeast, what if there's a horrible drought year and let's say -- you know, I mean, what if you can't get X amount of dry matter for X amount of days as being suggested? What happens to that farm if they only -- let's say it's 120 days, 30 percent dry matter just for argument's sake. What if they only got 88 days at 25 percent dry matter? What mechanism is there or is there any mechanism or do we just say well, they're not organic then?

MS. KOENIG: No --

MR. KASTEL: There's a mechanism that exists right now -- but first of all, let me say just like the three animals per acre -- and you could convert that to animal units if you wanted to. We're basically asking you folks to use your good judgment and Hugh, you know, it's a pleasure to have you on the Board -- in the rules right now allow producers for temporary reasons -- this is not during the entire lactation, but for temporary
reasons due to one of the factors being environmental, if you're going to -- if it's in California, some of the dairy farmers I visited there, they get their 50 or 60 inches of rain in a concentrated period of time. If you put the animals out there, they're going to tear up the pasture and likewise, if there's no feed value there, but the 120 days, the Northeast farmers are pasturing, the folks that are here today, far longer than 120 days. In Wisconsin we pasture far longer than 120 days. We try to -- and again, they're just benchmarks and that's why I emphasize that you could be at those target numbers and still be out of compliance, so it's still very important that the certifiers concentrate on that farm plan in collaboration with the farmer and develop something -- excuse me -- with integrity.

MR. KARREMAN: Thanks.

MR. KASTEL: Okay, thank you.

CHAIRPERSON RIDDLE: Mark, I thank you and I do try and wait until the end to ask my questions. And you know, I really appreciate your comments and the need for a predictable and enforceable standard. I think that is everyone's intent here regardless of scale or region and you know, I just have problems when we set numbers at a national level that may or may not be
appropriate and may not, you know, give the flexibility
that I've heard, you know, farmers express a need for
and certainly know, as an inspector, the realities on
the ground and we're looking at the -- a reference to
the NRCS prescribed raising standard which is then --
there's a national standard and then it's further
defined at the state and even county, you know, so that
it is site-specific, which is part of the organic
production definition, site-specific conditions. And I
just want to know if that's something that your group or
the people that you represent could support, which puts
some teeth in -- for enforceability, but it gives that
regional and site-specific flexibility that we also need
at the same time?

MR. KASTEL: Well, Jim, make no mistake about
it, please. We have a good rule in place right now.
The majority of all the dairy producers here today and
the majority of all the dairy producers in this country
follow that rule without confusion. They understand.
Almost every dairy farm operates with good pasture
management practices and the draft that this committee
is considering today, without further prescriptions, is
a good enhancement of that tool to help certifiers.

But the problem is that we've seen abuse, what
we're interpreting as abuse. The request that we made
of the USDA for a formal investigation was because of numerous multi-year allegations of this abuse and so the question is any rule that you folks promulgate here today, there's some lawyer somewhere or that -- will look for that loophole and some public relations -- we have farming by public relations going on now in organics. Some of the folks George talked about, the advertising. You know, is that true, is that truly reflective of conventional dairy farming or organics?

We want to deliver, we want to make sure that as a community we deliver what the consumers assumes they're getting and so we've endorsed the tools that the Northeast dairy folks have tested throughout the dairy community around the country, the organic dairy community. If you folks can figure out a better way to do that, we have great confidence because your starting point, that your heart's in the same place that we're at, so we would leave that up to your discretion. I know you're going to get more testimony today about some examples of how to come up with better enforcement.

CHAIRPERSON RIDDLE: Okay, thanks. Thanks, Mark.

MR. KASTEL: Thank you, all.

CHAIRPERSON RIDDLE: Next up is Blake Alexandre, followed by Rich Ghilarducci. Did I really
butcher that?

***

MR. ALEXANDRE: Good morning and thank you very much for the opportunity to speak here today. I truly consider it an honor and a privilege to be able to come here. This is my first trip to Washington to lobby for anything. I've handed you a letter that Stephanie, my wife, and I wrote and basically I wrote it; she added a paragraph at the beginning and end and I'd like to talk today, though, based on the comments that I've written this morning and the notes that I've come up with today. I'm also holding a herd summary sheet of our herd and it's got four years of history on it and so that's kind of my fact sheet.

Stephanie and I, first of all, we milk a lot of cows in northern California and close to 3,000 head of mature cows, milking and dry, on three different locations of which all are certified, however, one of our operations is a dual operation where we also have about 500 to 600 conventional cows still left over from our original herd and we continue to feed new cows into that herd when they fall out of the organic system.

I truly am just a dairy farmer. We have built our business, just the two of us, without our parents, without any help from any other folks, financially,
other than a bank and our education and background started out -- actually, we met at Cal Poly San Luis Obispo, where we were learning everything there was to know, at the time, about high-yield production agriculture. And somewhere along the line, about a dozen years ago, I met Dennis Avery, who wrote the book "Saving the Planet with Pesticides and Plastics" and I really fell for his talk. I actually spent a day with him and had a chance to kind of see his side of the equation and I left there, literally, wanting to go buy that book and give it to all the vocational ag students in our neighborhood.

And I was quite proud that we were doing our part, you know, to feed the world and as a high-yield production agriculture business. We were -- I stated in there we were taking advantage of all the tools of the industry and Monsanto would sell us. We were literally doing what we thought was the right thing to feed the people in an efficient way. And not just the people in our neighborhood, but the people of the world. It was a noble cause.

Somewhere along the line I then had a chance to meet Alan Savory and Alan Savory is with the holistic management concept. He runs the Savory Institute in New Mexico and a really good personal friend of mine and I
spent a day with him walking on the beach in Santa Barbara and it started all kind of to make sense. At the time we were considering organic. My friend has since gone to work for him, quit his job and works full-time out there, and I kind of learned the other side of the equation. And the first thing I brought up to him was the stuff I had learned from Dennis Avery and questioned all that and tried to get all that back in perspective because our organic venture brought a lot of new knowledge and a lot of new understanding of the whole system.

We've talked about pasture today all in regards to the cows and I think we've completely missed something. In the organic systems we need to talk about the health of the system. We haven't even talked about the health of the soil and from my understanding, which is only, you know, limited knowledge, but the health of the system, the biology in the soil, the activity of the plants, the time that the -- anyhow, that's a concern we need to address and I would love to answer questions on that. I'd like to mention, it's not in our letter, that we're certified by the Animal Humane Association and we have been for a few years and I'm quite proud of that and I think that's a significant factor. And they would never allow us to run a confinement area.
Specifically, one of my, you know, to your question, what am I asking for? I'm asking for you to give the certifiers something to hang their hat on, something that they can enforce. The rules are there, much like Mark spoke a minute ago in front of me. The rules are there, but the certifiers need help enforcing them, obviously, because they're making mistakes. I want to -- I would ask you to -- you know, to -- oh, time's up.

CHAIRPERSON RIDDLE: Time.

MR. ALEXANDRE: All right.

CHAIRPERSON RIDDLE: You can wrap it up. You were in a though there.

MR. ALEXANDRE: Okay. I believe we need to honor the concerns and the expectations of the consumers, you know. We advertise our milk with pictures of cows on green grass and that should be in the equation somewhere.

CHAIRPERSON RIDDLE: Thank you, Blake. Any questions, comments? I have one. Okay, go first.

MR. KARREMAN: When -- just, I think, from what I understand from out in California last year at the meeting, you guys were totally conventional with like, what, 1500, 2,000 head?

MR. ALEXANDRE: Yeah.
MR. KARREMAN: It sounds like you've successfully converted to organic.

MR. ALEXANDRE: Correct.

MR. KARREMAN: That's great.

MR. ALEXANDRE: Yeah, we went from three times a day milking to two times a day milking and cull rates and all that got incredibly better and the cow health and I'd say our body condition is less than what it used to be, but our cows are now athletically healthy, they exercise a lot and things are different. You know, it was mentioned earlier that cull rate is an economic decision and that's an economic decision that most dairymen don't have the privilege of exercising. The cows decide when they're going to get culled and so it's usually an economic decision to keep the cow. We never have an incentive to sell the cows that I can think of.

MR. KARREMAN: And do you irrigate pasture?

MR. ALEXANDRE: Yes, yeah. We're fully irrigated. We also have incredible rainfall of 50 inches in our -- we have our two ranches are 100 miles apart and 50 inches in one location and over 80 at the other, and then a dry season where we irrigate a lot.

CHAIRPERSON RIDDLE: Okay, thanks.

MR. ALEXANDRE: Thank you very much.

CHAIRPERSON RIDDLE: All right,
Rich Ghilarducci and then Dave Johnson on deck.

COURT REPORTER: Could he spell his last name for me?

***

MR. GHILARUDDCI: Thank you. My name is -- and I appreciate the NOSB giving me the opportunity to come up here and speak today. My name is Rich Ghilarducci and that's spelled G-H-I-L-A-R-D-U-C-C-I and I'm from Humboldt Creamery Association. We're a dairy cooperative located in northern California and we have 60 members within our region. Twelve of those 60 are certified organic dairies. On my -- I'm speaking on behalf of our membership and the organic dairies. We sat down and we discussed this and we looked at the NOSB's recommendation that you're considering today. And one of the things that just want to clarify is, and people kind of blanket the West as being the feed lot and the factory-type farms -- we do have bigger dairies, but all of our dairies are pasture-based and so when I say that, they probably spend anywhere from 10 to 11 months out on the pasture, the dairies do.

They do use some type of confinement. They've got loafing sheds during the winter time, during the heavy rainy period so that their fields are not trampled, to ruin the feed for the rest of the year. So
they do take that into consideration. Just to make sure, to give you guys some specifics on what our members have said -- I want to get that in before we close here -- is they had came up and thought that ruminant livestock must graze pasture and I think graze is a key element in your language that you submit forward to the USDA.

Access to pasture, I think that's where certifiers may have a problem when it's just a broad verbiage, access to pasture. Grazing pasture is very important to include in your language when you come up with your final decision. We do feel that as far as some of the specifics, if they're in the guidance, our members do live by the 120 days, the 30 percent dry matter coming from the land and also the three cows per acre, so we can abide by those, whether you put those in the specifics or not, we do abide by those. But we believe the most important language that you can get in there is that the cows must graze, they must get their nutrient value off of the pastures and I think that's very, very important in your final decision.

And another thing that I think one of the significant things that we heard today is -- and I'm just trying to summarize and you guys are getting hit with a lot of different verbiages -- organic dairies
need to adapt to the organic guidelines, not the opposite; that was one of the best comments made today, is that the guidelines do not adapt to the organic dairies. You cannot make the guidelines fit every dairy. It's up to the dairy industry to fit the guidelines and that may mean that geographically it doesn't fit into every region of the United States.

But we believe strongly, our membership -- I worked with our members to convert to organic, the 12 dairies. The access to pasture, as we interpret it, was very important when we -- when I proposed to our members to convert to organics because we knew from economically they would never compete in a conventional industry with confinement-type dairies, and that's what this is all about, is economics. And when I say that, you know, the difference between trying to argue the points, whether you can do -- you take the Central Valley, which is an arid region in the U.S., or in California, and where they have a lot of confined dairies.

Every one of those dairies, if you looked back 20 to 30 years ago, were pasture-based, but because of economics they converted to confined dairies. So it's not that pasture cannot be done in those areas, it's because they converted economically to achieve a different environment economically for their dairy
herds. And at this time I'll answer any questions that
you guys may have. All right, thank you very much.

CHAIRPERSON RIDDLE: Thank you very much.

Okay, Dave Johnson, then Henry Perkins.

MR. JOHNSON: Can I ask for somebody else to
speak in my proxy and then I speak in their proxy?

CHAIRPERSON RIDDLE: Just trade places with
someone else?

MR. JOHNSON: Yeah, yeah.

CHAIRPERSON RIDDLE: Yes.

MR. JOHNSON: Okay. Nancy Gardner's also on
the list.

CHAIRPERSON RIDDLE: Okay, Nancy Gardner and
then Henry Perkins.

***

MS. GARDNER: I am Nancy Gardner, wife of a
New York organic dairy farmer and secretary of the
Northeast Organic Dairy Producers Alliance. I've been
requested by the board of NODPA to read the statement
from the board. If you have any questions about this,
if it's permissible, I'd like to divert those questions
to a present board member.

"The Northeast Organic Dairy Producers
Alliance represents over 200 organic dairy producers and
many related business in New England, New York,
Pennsylvania, New Jersey and Maryland. Our mission is to enable organic family dairy farms, situated across the extensive area, to have informed discussion about matters critical to the well-being of the organic dairy industry, as a whole.

The issue of pasture is paramount importance to the organic dairy producers represented by NODPA. Due to the ambiguous language of the NOSB recommendations, the NOP standards about the pasture requirements of ruminants and the recent press and complaints to the USDA regarding pasture requirement violations, the national spotlight is on organic milk production and what that means to consumers. NODPA leaders and dairy farmers from across the country have worked diligently over the past one to two years trying to ascertain and agree on what we consider significant portion of the total feed requirements to meet.

Although NODPA supports the February 1, 2005 Livestock Committee pasture recommendation, especially the addition that reads, 'lactation of dairy animals is not a stage of production under which animals may be denied pasture for grazing,' we feel that more specifically specificity is absolutely necessary. Without numerical standards, the guidance document will continue to allow access to pasture to be a matter of York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
interpretation. Measurable parameters are needed to
provide a floor for minimum intake to ensure that all
ruminants truly have real and significant pasture intake
and a ceiling for maximum stocking rate.

We appreciate that the Livestock Committee is
seeking comment for clarifications of the definition of
pasture and more specificity on what constitutes a
significant portion of the total feed. In response to
the call, NODPA, in concert with many other organic
dairy producers and organic advocacy and customer
organizations from around the country respectfully
recommend that the definition of pasture be amended to
read, 'Pasture is land managed to maintain or improve
soil, water and vegetative resources and to provide
maximum feed value by growing sustainable grasses and
other forage from which animals graze plant materials
still connected to its roots.'

This recommended pasture definition language
seeks to tighten up and more narrowly define pasture so
that non-grazing feeding practices can no longer be
construed by some as pasture, such as feeding machine
harvest forages in outdoor setting.

We agree with the language in the Livestock
Committee wording that says, 'The grazed feed must
provide a significant portion of the total feed.
requirements.' We respectfully request the addition of the following words: 'Significant portion of the total feed means that at least 30 percent of the daily dry matter intake needs to be -- needs for all ruminants 12 months of age and up for a minimum of 120 calendar days per year should be provided by pasture. Stocking rate shall not exceed three cows per acre.'

We would ask that farms not in compliance with these provisions should be allowed one year to come into compliance, but will need to file an updated and enforceable farm plan providing for the adequate pasture within 60 days of the publishing of a new pasture guidance document by the USDA. Thirty and forty percent of forage intake from pasture has been used by the Cornell Dairy Farm Business Summary over the years as a minimum intake needed for farms to be included in their grazing farm summaries. Although there can be no significant basis" --

CHAIRPERSON RIDDLE: Time, but conclude your thought.

MS. GARDNER: -- "for the 30 percent pasture intake compared to 29.32 or 30 percent seems to be a reasonable level to qualify the term significant." In my own words, as a wife of a dairy farmer, when natural -- when a natural end is wanted, nature is its best

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
manager. Please help us. Let a cow be a cow.

CHAIRPERSON RIDDLE: Thank you, Nancy.

MS. GARDNER: Is there any questions? I can bring up a board member if you'd like to have any questions.

CHAIRPERSON RIDDLE: I think you've been clear in what you're requesting of the Board.

MS. GARDNER: Thank you.

MR. PERKINS: When do I start? Right now?

CHAIRPERSON RIDDLE: Henry Perkins.

***

MR. PERKINS: Okay. I'm Henry Perkins. I live up in Maine and I milk -- better. I have trouble with these. I don't like to get them too close to my mouth. I don't know why, but -- all right. I live in Maine and I milk about 70 cows and I'm here representing the Maine Organic Milk Producers; there's about 60 of us. And I'm also on the board of NODPA, which that nice young lady just, was part of and I guess I'm representing them, too, and I was asked to hand -- there's about 60 in here -- to a guy named Jim Riddle. That's you, but you don't have a whole lot of room, so
-- okay. I guess the way I see it, I'm here to try to help you figure out what the definition of substantial is and the way I see it every consumer here who buys organic milk does it for one or more of the following reasons: one, it doesn't have antibiotics in it; two, no pesticides; three, no synthetically produced fertilizers; four, no artificial hormones; five, these cows are -- got to be out on pasture and getting some of their nutrients from pasture, and number six, some of these people that buy this are just plain smart, so -- I'm not here to talk about that.

I'm here to talk about the pasture thing and I think I probably can do this a little bit better if I tell you what pasture is not. Pasture is not a herd of cows standing around on a slab of concrete or out on a piece of ground that has long since seen any form of grass growing that a cow get any, anything out of in the way of nourishment. Pasture is not corn silage, pasture is not grain, pasture is not green chalk [ph], pasture is not dry hay hauled to one of these areas out on the ground and pasture is not a grass -- silage. Pasture is green grass that cows rip off the roots and swallow.

Now, up here in Maine, which is one of the more northerly locations, we don't have any trouble providing 120 days of normal pasture. Most of the time
we get pasture from the 1st of May until the end of October and that is six -- 180 days, so in that period of time there's a little leeway where if you had a drought, you probably could catch it on part of the other -- 120 minus, 180 minus -- 60 days, okay. Let me see. Where was I? Okay.

Now, we talked about this up in the state of Maine and we had absolutely no trouble agreeing that lactating cows must get a substantial portion of their pasture -- nutrients from pasture, but we couldn't really agree on just how big a percentage it was and I think that's your job, okay. But as a member of NODPA, we have come up with three cows per acre, 30 percent and 120 day thing. We've got conventional farms in the Northeast here that, due to their physical layout, that makes them impractical for them to become organic, whether they would like to or not, but there is always another market for them than just, you know, you cannot twist the rules to make your farm, you must make your farm conform to the rules. And I think I'm running out of time, right? Okay, I'll take any questions.

CHAIRPERSON RIDDLE: Questions for Henry?
MR. PERKINS: Thank you.
CHAIRPERSON RIDDLE: Thank you. Thanks for coming.
MR. PERKINS: They told me to wear this.

OKAY?

CHAIRPERSON RIDDLE: Let them eat grass is what it -- we'll put that into the record.

MR. PERKINS: All right.

CHAIRPERSON RIDDLE: Okay, Carolea Arnold and then -- okay. Is there a Roman Stoltzfoos proxy? I can't quite tell what --

MR. STOLTZFOOS: Proxy for Carolea.

CHAIRPERSON RIDDLE: Okay. So you're Roman?

MR. STOLTZFOOS: Stoltzfoos.

CHAIRPERSON RIDDLE: With a proxy for Carolea --

MR. STOLTZFOOS: For Carolea, yes.

CHAIRPERSON RIDDLE: -- from -- 10 minutes.

And this will be the -- you'll be the last speaker before our break.

***

MR. STOLTZFOOS: My name is S-T-O-L-T-Z-F-O-O-S, first name, Roman, R-O-M-A-N.

Thank you for this opportunity. I'm Roman Stoltzfoos from Lancaster County, southeast Pennsylvania. I'm here representing four groups. First, it's my family. I'm going to pass a picture around to the Board of my family. Here's an experiment to see how many children
you can get on one farm. There's 11 children, by the way. I tell people we farm and raise children and truly, that's the reason we're on the farm. My wife and I decided years ago this is the best opportunity we had to work with each other and our children and we believe the family farm has been and will continue to be the best producer of safe food for America. We had this vision to make a living, to work together with our children and to be able to teach them respect for God's creation and the life-generating systems from the complexity of the soil to the complexity of human relationships.

Secondly, I am here to speak on behalf of the co-op which I'm vice president of, that's Lancaster County Organic Farmers. We are a group of over 20 grass-based dairies, most of the Amish farms located in Lancaster County and surrounding areas. We certainly support the NODPA position, some quantifiable standard that can be a safeguard for the good organic name.

Thirdly, I'm here as a board member of Natural By Nature, which is the buyer of most of the organic milk that the Lancaster County Organic Farmers produces. And fourthly, I'm here to represent the consumers who buy the milk that we produce through Natural By Nature and other channels and we believe that
their interest and belief is that their organic milk is coming from farms where cows are grazed in a reasonable way. Our cows and our farm are out on grass at least 350 days a year. There was maybe three days this winter where we didn't put them out because -- well, it would've been damaging to the grass. But we believe that they can benefit even in the winter time from being out off of concrete and away from concentrating the nutrients all in one area.

I'd like to at this time read a letter from Natural By Nature, Ned MacArthur. "At Natural Dairy Products it is our belief that pasture is an integral part of what makes organic milk special. Access to pasture is only one part of the equation. Grass from these pastures should contribute as a substantial part of the diet for both lactating and dry cows. There is overwhelming evidence that milk from cows and grass has a healthier omega profile and higher levels of the fatty acid CLA, Conjugated Linoleic Acid. In the face of this evidence, it becomes impossible to ignore the role of grass in organic milk production."

"Without a strong pasture requirement in the national organic plan, the result will be consumer confusion and a loss of credibility for the organic dairy industry. Family farms that have committed to
organic production see their market become diluted with milk from industrial farms that intend only to pass organic certification requirements by the slightest of margins and once again we will see a rift in American agriculture wherein the good of the family farmer and the consumer is put behind the needs of those few corporate entities that stand to make large profits for a few individuals."

"With a strong pasture requirement, these industrial farms will at least have to play by the same rules as the rest of the industry. It is our belief that these farms can comply with a solid pasture protocol. If they do, they will be a viable part of the nation's organic milk supply, but without a good and meaningful pasture rule, the future of the organic milk market will be obvious. Organic milk will lose much of what it makes -- what makes it special and become just another agricultural commodity that makes no meaningful connection between the land and the consumer. American family farms deserve better than this." I'll take questions if there are any. No. That's all I have. Thank you.

CHAIRPERSON RIDDLE: Thank you. Okay, well I said that you would be the last speaker before break, so I'll stick to that and when we come back from break,
John Stoltzfoos is next up followed by Jim Gardner, so it'll be a 15 minute break, so that would put us at 10 after 10:00, so I ask everyone to please be back in their seats. My microphone's not working. I didn't have it on. Ten after 10:00.

[Off the record]

[On the record]

CHAIRPERSON RIDDLE: Please take your seats. We're still missing a few Board members, but -- one, two. Okay, we do have a quorum, so we'll go ahead. Oh, here -- before we start, I wanted to also let people know that there are still slots available for testifying on Thursday and that list is in the back of the same list that's up here, so over lunch, if you haven't signed up for Thursday, that's the place to sign up. All right, where were we? John Stoltzfoos.

MR. STOLTZFOOS: Yes, my son's going to speak on my behalf, John.

CHAIRPERSON RIDDLE: Okay.

***

MR. JOHN STOLTZFOOS: I want to thank you for this opportunity to speak. I'm John Stoltzfoos from New York, Whitesville, New York. We have a dairy farm there. I have two brothers, younger brothers; I'm 22, and we all live at home with our parents. We currently...
farm on a 257 acre dairy farm and we rent 200 acres for beef, cow pasture and a hay grove.

On our farm we are -- have 70 milk cows on 65 acres of rotational grazing. Within the past two years, my brothers and I have incorporated into our body 25 head of beef cattle which we are grazing on 75 acres of open range and they are full-time pasture there. They get 100 percent of their feed forage from the pasture. Our pasture for our dairy herd provides during the summer 90 percent of the forage dry matter in the grazing season. The other 10 percent is dry hay throughout. And our grazing season runs somewhere between 150 to 170 days. In the winter our cows are outside a couple hours of a day except on very cold conditions when sometimes it drops to 30 below or something like that. Overall, our cows are outside 80 percent of the time throughout the year.

We feel very strong about pasture for these reasons: the health of a cow is a very high concern; the quality of the product for the consumer -- we feel that grass, that is one of the top qualities and is very important; and most of all, the consumers that we talk to believe that organic milk comes from cows that are on pasture.

We fully support Northeast Organic Dairy

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
Producers Alliance, that pasture definition be further refined such that pasture is land managed to maintain or improve soil, water and vegetation resources and to provide maximum feed volume by growing suitable grass and other forages from which animals graze plant material still connected to its roots. Organic dairy animals from 12 months of age and up must consume no less than 30 percent of their daily dry matter intake from pasture with no less than 120 days per year with no more than three milking cows per acre. I believe our farm is close to one cow per acre, currently.

And I urge the NOSB to adopt these recommendations so that I can see a future in true organic milk as well as our customers, for my family and the consumer. If we do not have a defined set of rules to follow on these grazing issues, I do not see a future in myself taking over the family farm. I have some friends that are on conventional dairy farms and the conventional farms in their area are just falling out and so there's no future for them and I believe that if we do not set a set of rules that it's going to fall off for the organic farmers, too. Thank you. Are there any questions?

CHAIRPERSON RIDDLE: Thank you, John. Thanks for coming. Okay, next we have Jim Gardner and then
Urvashi Rangan for Mark Lipson, who was on the list earlier.

***

MR. GARDNER: Thank you for having us here today. I know there were some questions raised earlier on the basis of science --

CHAIRPERSON RIDDLE: Your name.

MR. GARDNER: Oh, Jim Gardner, New York state. I'm a dairy farmer, have four children, true family farm. We have 50 cows and farm about 400 acres of ground. Okay, I've got about 15 years of applied research on my farm for anybody who would have questions about what goes on organic farming, whether or not grazing is sustainable. I know there was a lot of questions about the science behind it, but what I do find is that usually science catches up to what nature's already shown us, okay.

Some of the things I found by grazing cows on a sustainable system; I used to have a 26,000 pound herd average when I was doing conventional farming. I found my cull rates to be around 40 to 45 percent. I now find my cull rates near about one to two percent per year. I found the health of the cattle that I work with has greatly increased since I've started grazing many years ago. Some of the things I found were displaced almasons
[ph] have decreased entirely. The main -- I did an experiment on my own farm with that, removing all the weeds in my conventional system at the time and found that the weeds were a big component on the health of the cows. A lot of people don't like weeds in their fields -- I'll give you an example. Dandelions are a great alkalizer and a great liver cleaner when you have stored feed. If you are to feed in the spring you notice most places in the country, they come up first. They're great for clearing out the livers.

Burdock, you see cows eating burdock leaves. They clean the blood. Okay, a lot of the weeds that we see around the countryside -- I've been to California, I've been to, you know, the Northeast, Midwest and the central part of our country and some of the Southeast and the conditions for grazing do -- you know, vary quite a lot, but when farmers get involved in the grazing aspects, they do pay off greatly whether they be for the health of the farmer or the health of his bottom line.

Fresh pasture provides a lot of nutrition for cows. I mean, that's been spoken about a lot today. Vitamin A is a crucial ingredient in the cow's diet. When cows eat stored foods, Vitamin A decreases very rapidly once the foods are stored. Fresh pasture
contains lots of Vitamin A. If you're familiar with a
cow at all, they have a large hide. That's the
epithelial reculsa [ph] cells. They thrive on Vitamin A
and D from sunshine. Okay.

The three cows per acre maximum. It's a very
good stocking rate. If you go above that, you will find
you start running into concerns of manure build-up on
pastures. The 120 days of grazing minimum; I've had the
opportunity to talk to people around the countryside, in
the northern regions of our country and other areas and
have found that that's a very good number that
represents a safety -- for the most part, throughout the
country even where the region is colder and a shorter
growing season.

The 30 percent dry matter intake, there are a
lot of studies going on right now where universities are
trying to catch up to what farmers are doing. I find
that I talk to a researcher in Penn State University,
they're currently running tests. They've given amounts
of dry matter intake, amounts of wet forage intake. I
can give those names of those researchers, but they are
finding that the cows that they brought out on pasture
do have a tendency to lose weight, but I like to term
that like Alexandre, that they are athletically more
conducive. I know if you take the average -- the way
that nature was designed -- if you take a cow or a person who is overweight and they become, they go into an exercising program and eat properly, they will be healthier. There's no question about diet. I think probably most of you are probably, you know, practicing some form of nutritional balance in your life. Okay.

I would hope that you would strongly consider the NOPDA rules that were presented to you. I believe that you'll find that they've been well thought out, well researched and questioned like, as it's been presented to you, by the farmers around the United States and we've come to that conclusion, that those would be safe numbers and viable for all regions unless the region is not conducive to grazing cattle. Okay, do you have any questions?

MS. KOENIG: Yeah, just kind of --

CHAIRPERSON RIDDLE: Rose.

MS. KOENIG: -- I'm sorry -- and explanation of how you collected that consensus, you know, information from region to region to make sure that 30 percent is representative and have you thought through that, if you had a minimum of 30 percent, especially in regions that have longer grazing periods -- and I don't know, I'm just thinking about this, but it would also mean that places -- I would assume that if you had -- if
you could pasture 10 months out of the year, they still
would all mean -- meet 30 percent. So you might have
regions where there still would be perfectly good
pasture but because of that 30 percent --

MR. GARDNER: Okay. Good question. These
rules that we have written are for maximum amount of
cows, minimum amount of intake. If you exceed those
minimums, it's fine. It's like a -- the rules that we
currently have in organic standards for pasture right
now equate to having a speed limit sign on the highway
that says speed limit and it says drive safely, okay.
And it's open to anybody's interpretation of what safe
is. It could be 100 miles an hour, it could be 25 miles
an hour, okay. That's not what we're looking for. We
need direct interpretation. That's where the numbers
are key because without the numbers we don't have the
limits, the safety nets. If a person can graze at a
larger amount of dry matter intake in their region,
fantastic, as long as they meet the 30 percent, okay.

Like I said before, the stocking rates of
three cows -- we questioned farmers across the country,
okay. Majority of the farmers, you will find, will run
one to two in that range of stocking rates. Three is
quite a high number, but it can be done, okay. And
anybody that's, you know, can do that, it makes it
useful for them, too, so they're not going against what
the rules have.

CHAIRPERSON RIDDLE: Hugh.

MR. KARREMAN: I was just wondering -- you
know, I tend to agree with you as far as when the spring
flush happens the cows, you know, might seek out
dandelions and burdock and other nutritious weeds, as
people may call them, but they certainly have
nutritional components that we don't study, necessarily,
at the land grant universities and what-not. I was just
wondering, from you own farm research that you do, then,
if they have that in the springtime in the grazing
season, does your farm make hay or silo feed from that
so that they get that during the wintertime, as well?

MR. GARDNER: Yes.

MR. KARREMAN: I'm just kind of wondering.

MR. GARDNER: Yes, we do. As a matter of
fact, we specifically try to mow and bale -- we do seed,
we seed alfalfa, we seed archer [ph] grass, we seed
different kinds of legumes, trefoils and such, but we do
strive that when the dandelions are out in the fields in
May, we -- the fields that we're going to mow, we make
sure that we mow those when they're in bloom, okay, no
matter what the height are. This time of year are when
cows in the Northeast in the northern parts of our
country seem to be challenged for nutrition, okay, and you'll see the difficulty in muscle. They start to struggle getting up and down. By cleansing their blood with the stored dandelions, even though the components are lower, it will help to cleanse the livers, it will help to replenish some of the vitamins that are missing.

We also use red clover and make sure that it's -- a lot of people would mow it at the 10 percent bloom stage; we mow it at around the 50 percent bloom stage and exclusively save it for this time of year for our cows because they are -- it has a built-in detergent in the buds themselves to help clean the blood of the cattle, okay. It all works very well. There are great nutritional ways to help your cows, you know, to stay healthy.

I do have a tie stall barn. That tie stall barn, I can say, from my own applied research is that once we started changing and incorporating a year-round organic system, okay, of grazing our cows and watching and taking care of important vital systems of the cows through their nourishment that we found great health increases and better, you know, less teats stepped on in the barn. As a matter of fact, I could say zero. We've accomplished that over the last five years now, okay, and haven't changed the environment of the barn at all.

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
Any other questions?

CHAIRPERSON RIDDLE: Yeah, Gerald.

MR. DAVIS: You mentioned your cull rates dropping when you switched to organic. I think previously you mentioned your production level you were at, but you didn't say --

MR. GARDNER: Okay.

MR. DAVIS: -- where you wound up.

MR. GARDNER: Okay. What I found, when my production level was at 26,000 pounds on 50 cows -- I've got plenty of dust collectors in my basement in a box, you know, to verify that, but I found it didn't help the bottom line. My production now is about 19,000 per cow. My cows stay around a lot longer. The inputs are lower. I have heifers to sell annually, out of a small herd like that, quite a few.

I also -- the overall production of cows in their lifetime has increased, so on a cow basis, instead of having a cow last for two or three lactations, my cows are lasting four, five, six, seven, eleven, okay, so the pounds per cow that I'm receiving out of my cattle since I've done the changing has increased far more than to offset the poundage per year. I'd rather see a cow stay around a long time than -- and produce more milk in a lifetime than to stay a short while and...
produce a large amount in a short period of time.

CHAIRPERSON RIDDLE: Bea.

MS. JAMES: You mentioned that the burdock and
dandelion has optimum nutrition when it's in full bloom.
How do you determine how much of your acreage you're
going to harvest for off-season as opposed to letting
your cows forage, you know, all of that?

MR. GARDNER: Okay. The way we set it up, we
have set aside -- we have pasture areas of our farm that
exclusively the cows graze that time of year to have the
intake of those nutrients from those plants. We've set
aside other cropping areas of our farm to be able to
harvest in a timely fashion. Those areas are also
opened up to grazing later on, okay. If we have a rainy
year such as we did in the Northeast last year, our cows
are exposed more to the blood cleaning-type forages in
order to keep their livers clean because of Vitamin D
content coming from the sun is minimal with all the
cloud cover that we had last year. Does that answer
your question? Okay. Any other questions?

CHAIRPERSON RIDDLE: Thanks very much for your
comments. All right, next Urvashi Rangan for
Mark Lipson and then Cathy Arnold with a proxy from
Maureen Napp [ph]. Oh, I'm sorry. Yeah. You'll be
after Urvashi. That would be Dave Johnson will be next.
MS. RANGAN: Good morning. My name's Urvashi Rangan. I'm a scientist with Consumers Union, we're the nonprofit publisher of Consumer Reports magazine. I'd like to welcome the new members of the Board and thank Mark Lipson and OFRF for their time. I'm here to talk about a few different things. The first thing is about the directives. In April, last April 2004, the USDA published several directives that really eroded the integrity of the organic program and after a large public outcry, the Secretary then rescinded those directives. We spent last summer incredibly confused as to whether those directives were in play or not. They were simply deleted from the web site and there was no other clarification posted. There were also erroneous postings during that time justifying the positions of the USDA and why those directives made sense and this was even after the Secretary had rescinded those directives.

In October 2004 at the last NOSB meeting, several of us asked again for clarification on the status of the directives. We were assured by the USDA that clarifications would be posted on the web site within a few weeks of that meeting. We have still yet to see those clarifications posted on the web site.
There's no clarifications. There's no status update. We don't know what's happened to them and this is simply a disservice to consumers, to the certifiers, to the farmers, to the inspectors. Nobody knows what the status of that is. Can pet food be certified or not? Can aquaculture products be certified or not? Can antibiotics be used on a dairy farm or not? Can List 3 ingredients be used if you don't know that it's in your formulation or not? We need answers to these questions. We need these clarifications posted.

I think, for us at Consumers Union and many other organizations, we wonder why this is so difficult to be transparent with the public about this program. But after seeing the ANSI report, that is the audit of the accreditation process, it becomes painfully clear why these problems are in place and why it is we haven't seen these clarifications. Document control is not in order at the USDA. There don't seem to be any procedures for web site postings or web site deletions and as a result, the process cannot be comprehensive or intelligent for consumers or farmers.

We really encourage this Board to please work with the USDA to get these clarifications posted and if there are problems, then we'd like to know the status of the clarifications. We'd like to know where they are,

York Stenographic Services, Inc.  
34 North George St., York, PA 17401 - (717) 854-0077
where it's being hung up and where we might expect to
see the clarifications made.

On a separate point, we want to talk about the
petition process. At the last NOSB meeting we made
several comments about aquaculture, fishmeal, fishmeal
with synthetics. Rose, you were the one that asked us
well, why don't you just go ahead and petition it and we
did, in fact, follow that procedure this past six months
and tried to draw petitions for that as well as for a
few other things. The petition process is incredibly
long and cumbersome and in order for us at Consumers
Union or any other public agency to garner the resources
to submit a petition, it's almost prohibitive.

And I ask this Board if we could please find a
way to make it easier for the public to perhaps submit a
briefer petition initially to see if that's worthy of
going through the tap process because for us to simply
dredge all of the literature out on something, prepare
all of the materials you need, is really simply -- it's
prohibitory for us. We don't have the time to do it and
it makes it very difficult for the public then to have
to submit materials. So we'd very much like an
expedited [ph] process, some kind of streamlined form;
a two-page form that we could fill out initially to
submit to the Board.
Finally, I'd like to talk about the NOSB guidances on livestock, on the access to the -- access to pasture -- thank you. Part of the problem -- and I'm just so pleased to see all of these dairy farmers here today. I think what the farmers bring here is their expertise and their wealth of knowledge, that it is, in fact, possible to raise animals on pasture and to get them outside, and it's just -- it's very refreshing to have them here, so I appreciate that.

But I think the problem with this access to the pasture standards follow the same vein as the access to the outdoors pasture for poultry and that is that while the law requires it and consumers expect it, the regulations are weak and interpretation is loose and as a result, consumers are not getting what they expect with access to pasture or outdoors. Thank you.

CHAIRPERSON RIDDLE: Is there any comment and --

MR. MATHEWS: I have some comments.

CHAIRPERSON RIDDLE: Okay, Rick. And identify yourself, please.

MR. MATHEWS: Yeah, it's Richard Mathews. I'm the Associate Deputy Administrator, National Organics Program. You say that no statement has been made on the status of the four documents that were taken down. I'll
remind everyone that at the NOSB meeting in October we said that we'd concur with the Board's findings. Those findings were as follows. Fishmeal is allowed as long as synthetics are not used, if those synthetics are not on the National List. Again, we concurred.

List 3. List 3's are not allowed. It's a policy of when in doubt, go without. We agreed. Antibiotics. The Board said no. We agreed. With regard to aquaculture and pet food, the Board has called for the formation of task force. We agreed, we published and we are now getting nominees. When it comes to a streamlined petition process, we tried that. We tried going without all of the data. It was a nightmare and the Board had considerable problems with doing their job because of the lack of the information that needed to be provided, therefore we went back to the full petition process.

We are in the process of working to enhance that. We have a new statement of work. We have check sheets that the Board uses. The public has been notified of those check sheets, the public has been notified of the new statement of work and we are working with the Board to create a new petition process which is going to address the exact same issues. So I must state we have taken all of those actions that are being called
MS. RANGAN: Can I comment?

CHAIRPERSON RIDDLE: Yeah.

MS. RANGAN: Richard, thank you for your comments, but part of the trust-building between the public and the USDA comes with do what you say and say what you mean. At the last National Organic Standards Board meeting you all promised that we would have clarifications posted on the web site. There was so much confusion around those directives. They shouldn't have been issued in the first place. You took them off, you deleted them off the web site and we were told we would have clarifications posted within a few weeks. There are no clarifications posted. You said to the public that you would post them and you haven't done that. So in the spirit of trust-building we would much appreciate seeing those posted.

CHAIRPERSON RIDDLE: And I just want to comment because I appreciate your concerns and coming in and sharing that. The Board shares the same concerns and so has the Program. Those documents have been drafted and have gone up the chain in USDA for clearance and my understanding, they're still held up and they still will be posted, but everything we've heard reflects exactly what Richard said, that the Program...
does concur with our positions as stated in October, but we also look forward to those being released in writing. Bea, did you have --

MS. JAMES: No.

CHAIRPERSON RIDDLE: Okay. Thanks. All right, now for Dave Johnson and then Cathy Arnold, also, with a proxy from Maureen Napp.

***

MR. JOHNSON: Thank you. My name is Dave Johnson. I operate a seasonal grass-based dairy in north central PA and I'm also pleased to be able to represent the NODPA board and speak about the infamous NODPA position that everybody has heard about and just want to make sure we have the official position in writing to the Board.

Thank you for the privilege of speaking here today and I'm also very grateful that my wife was willing to accompany me here to Washington and I have four children at home that have actually been willing to run the farm while I'm gone, so I really have great appreciation for them.

In our area of Pennsylvania, we farm hilltops, about 2,000 feet in elevation. It's pretty nasty and cold. I suspect probably right now it might be up to 20 degrees with about a foot of snow on the ground, even
though we're only 200 miles from here. Our growing season, frost-free, is only about a hundred days -- hundred-day corn is a good stretch -- and we have about 7500 heating degree days, so it's a challenge even in this area of the country in farming anything. We pasture our cows and that has been historically been the case in the Northeast because one thing our climate doesn't do is give us a lot of good high hay drying weather.

Several people have referred to studies regarding pasture-based production, some in Cornell, some in Wisconsin. One thing that seems to emerge in all these studies is that our current high-production paradigm and high-producing cows aren't necessarily the best fit for grazing and a lot of my colleagues in dairying in Pennsylvania have decided that they need a different kind of cow or they need to lower production expectations to have a really healthy cow and a good operating ecological system.

And you know, pasture feeding is very difficult because it involves a really complex biological interaction between the plants and animals, and it's a tricky job to do no matter where you are in the country. Every climate, every environment faces some real challenges of how to do that. You know, we
get about 40 to 50 inches of rain, but sometimes we get five inches in a day and a lot of that's not even in the growing season, so we have mud problems and we need to put a lot of money in investing, in lanes and things like that. So it's a real challenge no matter where we are and yet there's been a lot of work done in the art of grazing, I mean, it's an old science, there's a lot of information out there. And fortunately, it can be done and we feel like there can be places for that anywhere.

NODPA's taken a position that for pasture to really mean anything, we need some definition. Walking over here, I saw grass growing in the cracks of the sidewalk. That's not pasture, I don't think, but we need to define what that is and that's why as we've talked to dairy farmers around the country, we've tried to put some figure on this. You know, 30 percent seems arbitrary for dry matter intake, but may I -- or actually comment to the fact that some of our standards are somewhat arbitrary.

Why three years for a transition for a farm? Well, it's an arbitrary figure that we've picked to try to come up with some reasonable way to turn land into organic production. 120 days seems like an arbitrary figure, but as we've talked to farmers around the

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
country, even in very dry conditions, even in very harsh, cold climates, it seems like 120 days is doable and might I add that the certifiers already have, in the provisions, an opportunity for emergency conditions.

When people find I have an organic dairy, they usually respond by saying oh, your cows are out on grass, and I think it's important that we deliver what the consumers want. And as a farmer, at the risk of saying something too touchy and feely, a lot of what we know and believe and practice is not necessarily based on sound science or scientific studies, and as a farmer, I can verify that this is the best thing for the cows and their behavior, is when I turn them into a paddock and I see them dance and sing and graze, I know it's the right thing to do. So we need to have a pasture standard that's real; it's critical to the future of our industry, it's critical to our livelihoods, it's critical to organic, period. Any questions?

UNIDENTIFIED SPEAKER: Dancing cows, that's a nice thing to --

CHAIRPERSON RIDDLE: Athletic, singing, dancing cows. Rose.

MS. KOENIG: I think I was under -- you know, the 30 percent -- I guess I had heard a Cornell report mentioned in one of the speakers that also is a member
of your organization.

    MR. JOHNSON: Right.

    MS. KOENIG: I was under the understanding that, in fact, there was some data to suggest that there was some weight to that numerical value. Am I -- did I misunderstand that?

    MR. JOHNSON: Well, it was a figure, I think, that Cornell decided to use to try to separate what is really a grazing farm from a farm that's basically confined and puts the cows in an exercise lot.

    MS. KOENIG: And was that 30 percent?

    MR. JOHNSON: That was 30 percent that they came up with, from what I understand.

    MS. KOENIG: But then -- I mean --

    MR. JOHNSON: On a dry matter basis.

    MS. KOENIG: -- I would not say that -- I would caution you by saying that they're arbitrary numbers.

    MR. JOHNSON: Okay. I mean, it may come across as an arbitrary number, but I think as researchers, they try to put a specific figure on it so that it did have some meaning. I know on my farm, I can do better than 50 percent for almost 200 days a year by really trying to push the season extension and optimize what I can do to maximize the input from grazing, and I
think most farmers, even in this Cornell study are doing far more than that. They're really trying to optimize the pasture intake.

MS. KOENIG: But I'm clear to understand that that 30 percent, even at -- you use the word arbitrary. So for the record, the 30 percent came from a Cornell study that defined --

MR. JOHNSON: Cornell used 30 percent. The 30 percent that were recommended was really a result of concession from farmers from Maine to California. We've had numerous conference calls, we've talked about it email-wise back and forth to try to come up with some consensus as to what pasturing cows means, so that's why we have tried to put some figures on it so that you, as a board, can define what does pasture mean.

I mean, it's already there in the rules, access to pasture. What does pasture mean? You've already developed a recommendation last year, I think it was, that there be a significant portion of their feed from pasture. What does significant mean? This is what we've tried to put a figure on and you know, we're recommending numbers. You ultimately have to decide what pasture and what significant feed means. We feel like a dry matter intake or a maximum stocking rate of three cows per acre is one way to go about doing it. If
you can come up with better ways, we mentioned the NRCS standards -- there's a host of things that we can do.

And I think it's doable for certifiers, too, because they already have to determine feed levels in the transition year; 80 percent organic, 20 percent non-organic. There has to be some way that the certifier is already looking at what's being fed to cows and determine where it's coming from. So I think there's ways to do it, whether you back-calculate from how much a cow producing 80 pounds of milk should be eating, whether you go out and measure your pasture levels before and after grazing; I think most good dairy farmers are already doing some way -- sometimes it's intuitive, but they are already getting good ideas as to how much the cows are eating from pasture. And that really should be in the organic plan and I hope certifiers are serious about doing that.

CHAIRPERSON RIDDLE: George.

MR. SIEMON: Yeah. Just since there's been so much reference to Cornell, maybe somebody else will know more, but one of the inputs I got was that the Cornell -- that they used the 30 percent to be included in their grazing farm summary. That was the threshold they established just to be in this other group that has -- I don't what the grazing farm summaries are used as, but
what I have as a reference to that, the reference is used as -- this document doesn't say dry matter, it says 30 percent. We've asked several times if it is dry matter, so I'll take it that it is dry matter, but this document does not say dry matter. But that's the threshold they've established to be included in grazing farms, experiments for research or you know, that kind of thing.

MR. JOHNSON: In the presentation that -- the paper that I just submitted, the NODPA position does say, "Significant portion of the total feed means at least 30 percent of the daily dry matter intake needs for all ruminants 12 months of age and up for a minimum of 120 calendar days per year," and then, "Stocking rate shall not exceed three cows per acre."

MR. SIEMON: And since I haven't been asking a lot of questions, your 120 calendar days does not mean continuous?

MR. JOHNSON: No, it may not. I mean --

MR. SIEMON: Just so I -- because I heard someone say they had a bad time in August --

MR. JOHNSON: Sure.

MR. SIEMON: -- they made up for it in September, so I just -- it doesn't say --

MR. JOHNSON: Right. I mean, I don't know if
there's areas of the country, they get two rainy seasons and have split grazing times; I don't know. But I think we've found as we've talked in consensus, that 120 days somewhere out of 365 days a year is doable, even in dry years. I've had some very, very dry years and I've definitely done better than 120 days. It's a management issue.

CHAIRPERSON RIDDLE: Hugh.

MR. KARREMAN: Just on that Cornell study, I know I was at a Penn State grazing nutrition meeting a couple of years ago and they were referencing Michigan State University kind of survey like what you've been talking about and they're using 50 percent to be included in the study, so you know, it changes from different areas.

MR. JOHNSON: I know Wisconsin's done some studies and I don't know what numbers they've used.

CHAIRPERSON RIDDLE: Thanks, Dave. And I have to say that we have a lot of people still signed up to speak this morning. I'd ask that, you know, you not repeat things that other people have said but just reference your support for them and try to offer new information. I also ask the Board to try, as much as possible, to be disciplined in asking questions to just help further our drafts as much as possible. It's all
just way too interesting. And so Cathy Arnold with an additional proxy for Maureen Napp, correct? And then Arden [ph] Landis on deck.

***

MS. ARNOLD: I guess I'd just like to start out my time first saying greetings to all of you and thank you for your time and dedication, and I am Cathy Arnold, a dairy producer from central New York. I farm with my husband and brother-in-law and along with our two children, we ship milk from 100 organic cows and have done so for the last seven years. But I just want to clarify this question, what the 30 percent is. A current cut-off figure that Cornell University uses in deciding whether farms, for their economic studies -- this is for analyzing their on-farm economic data.

They used to use 40 percent forage intake as the cut-off for grazing farms and they just couldn't get enough farms to do the work, because it's a tremendous amount of work to do, put all this, the data, together for your farm. So they reduced it down to 30 percent forage intake, but this is just the very base minimum that they require for a dairy to be included in that category, but most of those farmers are producing, using far more.

I'm also speaking with the proxy of Maureen

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
Napp from Preble, New York, who milks 75 to 80 cows with her husband, Paul, and we all support the inclusion of these NODPA figures as minimum benchmarks. And Rosie, thanks for your question earlier to Jim Gardner and our intention with this is not that farms that have a six month grazing season will only use four or if they have a ten month grazing season, it will only graze for four. We feel it's an obligation of all farms and certifiers to use the fullest extent of their grazing season, but that if an area can't even produce 120 days of grazing, then they should not be considered for organic dairy, but perhaps the NOSB would want to consider some wording to make sure that people don't misinterpret it to mean that they can shorten their grazing season down to 120 days.

My husband, Rick, was not able to come today, but he sent his thousand words in the form of a picture and a question. And this is a picture of our grazing dairy and his question to you is would you rather have a minimum pasture benchmarks attached to the pasture guidance document so that organic dairy consumers would look at an organic dairy farm and see a picture such as this or see a confinement feedlot with organic dairy cows on it? The NOP rule contains prescriptions to ensure that basic standards of organic production are
followed and prescribing numbers to ensure a minimum pasture intake is no different and I just want you to think of the fact that a 30 percent dry matter intake for only 120 days of the year ends up only being 10 percent of the annual dry matter intake of a cow, hardly a compellingly significant amount. So if we can't even get that as a minimum, you know, what kind of message are we sending to our organic dairy consumers?

Some who speak against minimum pasture benchmarks say that more study is needed and I'd just like to call your attention to this pile of books here on the table. That's just a portion of the research and books already available relating to studies on pasture and how to do it and how to do it right. And cows have been on pasture for centuries and it's only the last few decades that man has taken them off pastures and put them in confinement systems. But we don't need more extensive research to make this change; much research has already been done. The University of Vermont found that udder disease, including clinical mastitis, udder edema and teat injuries were consistently less in herds managed on pastures compared with those in confinement.

The new South Wales Regional Veterinary Laboratory found the prevalence of campylobacter being commonly isolated from feedlot beef cattle was 58...
percent compared to 66 -- compared to six percent for
dairy cattle on pasture and two percent for beef cattle
on pasture. The National Veterinary Institute of
Finland found the prevalence of Listeria was two to
three times higher during the indoor season than from
animals on pasture. North Carolina State University
found pastured cows had fewer clinical cases of mastitis
and lower cull rates. But decisions based on laws and
systems of nature need not be seen as inferior to
decisions based on human-run scientific studies. We do
not need to wait for man and research and science to
reveal all the secrets and intricacies of nature, we
just need to accept that nature knows more than we do.

But allowing artificial insemination, however,
is one area where the NOSB must allow the concern for
the safety of the humans, the men, the women and the
children, who work with and around organic livestock to
override the fact that using bulls is more natural than
AI. Too many people are killed or maimed by bulls each
year for the NOSB to ever consider prohibiting
artificial insemination on organic dairies as Aurora
Organic Dairy has called upon the NOSB to do today.

Some who speak against minimum pasture
benchmarks cite lower milk production as a result of
grazing. While it may happen, it's not a given. With
lots of good pasture and good management, pastured cows can be highly productive. We've done it for years. But the goal of organic dairy production is not to maximize output, but to allow cows to be part of their natural environment, to graze and to reap the nutritional benefits for themselves and for the milk and ultimately, the consumers, that only pasture can provide.

The current rule on access to pasture has worked where certifiers were willing to uphold the intent of the rule. However, this nonproscriptive approach has allowed abuse by some operators, operations and certifiers, as there are operations where organic dairy cows do not have access to pasture and real significant intake during the grazing season. Unless forced to do so by proscriptive rules, we're afraid that such operations will continue to exist. So I urge the NOSB to please add some prescriptive numbers to this pasture guidance document so that all organic cows will be achieving a minimum significant intake of pasture. Thank you. Any questions? Yes, George.

MR. SIEMON: Yeah, on this -- almost too radical sometimes. Are you all concerned about certifiers and inspectors and how they're going to measure the 30 percent and just turning into a tangled mess, you know, do the cows weigh 1150 pounds, do they
weigh 1175 pounds, was it dry that month, was the pasture this percent moisture, I mean, I just worry about the practical --

MS. ARNOLD: Well, my suggestion would be, I think, pretty straightforward and simple is that just prior to the grazing season, the farm documents how much stored feed they're feeding and then once they're into the grazing season, see if they've reduced that stored feed feeding by 30 percent. And most everybody is, has a nutritionist or doing rations so they calculate down to dry matter basis or -- and I think Lisa Englebert [ph] will be up here in a little while and she's a certifier and she could maybe speak to that better than I can from the certifier angle.

MR. SIEMON: The other question was I know some farmers who are pasture advocates also choose to keep their animals in, let's say, in the daytime when it's red hot and they graze nights, and that seems to be acceptable amongst the pasture advocates, but I'm concerned about, again, getting that 30 percent with that --

MS. ARNOLD: Yeah, I would think that if during the hot season in July and August, if cows went out in the morning after morning milking and they were back in the barn by 12:00 noon and then out again at the
night, if they've got good pasture out there, there's no
question they'll get 30 percent intake if the feed is
out there and they're not stuffed full when they leave
the barn. So I think it's a management issue.

CHAIRPERSON RIDDLE: Rigo.

MR. DELGADO: Thank you very much for that
beautiful picture of your farm. Quick question, can I
borrow your document, the one from Cornell?

MS. ARNOLD: Oh, yes.

MR. DELGADO: We were talking about it so much
that I want to make sure we take that as a reference.
I'll give it back to you. That's it.

CHAIRPERSON RIDDLE: Thanks. Oh, George.

MR. SIEMON: I don't want to -- did they
specify 120 days in there?

MS. ARNOLD: No.

MR. SIEMON: They didn't specify a time frame,
they just specified --

MS. ARNOLD: I don't believe they specified a
time frame, but I expect in New York, it's more than 120
days that they would've --

CHAIRPERSON RIDDLE: It was just really a
cut-off that they said to participate in this program.

MS. ARNOLD: Right.

CHAIRPERSON RIDDLE: That's where -- okay.

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
All right, Arden Landis and then next up
Kathleen Seus.

***

MR. ENGLEBERT: Well, my name is actually
Kevin Englebert. I'm here on a proxy from Arden Landis.
Thank you --

MS. CAUGHLAN: Plus your own or just --

CHAIRPERSON RIDDLE: Arden?

MS. CAUGHLAN: Are you here for one
presentation or two?

MR. ENGLEBERT: Just one.

CHAIRPERSON RIDDLE: Yeah.

MS. CAUGHLAN: Thank you.

CHAIRPERSON RIDDLE: Okay.

MR. ENGLEBERT: For myself, yeah. I'm taking
his -- my name's Kevin Englebert. I operate a 120 cow
organic dairy in upstate New York with my wife, Lisa,
and our three sons who are now 22, 19 and 15 years old
and who have been able to finally start participating in
some of these national discussions about organic
standards. I'm going to take Mr. Riddle's advice.
There's been so many eloquent speakers about the pasture
issue; that's the main reason I'm here, but I'm going to
diversify just a little bit and I'll be brief. I've
been involved in the organic industry for over 25 years
now and I can remember sitting around the kitchen table with two or three other people trying to write the standards for northern New York and also giving presentations and seminars in hope that a farmer would show up and I must say that none of us could've ever envisioned where we are today and I think this is an important time in the organic movement.

We were, back then, like an infant. No one really paid much attention to us, you know, it was just a little fad that would go away. There were pockets of small farms around the country that truly believed in what they were doing, but nobody -- there was nobody to turn to for advice or direction and it's just amazing to me how much things have changed in the last 25 years. And as you sit on the Board -- and my opinion -- back then we never had anybody challenge us as far as what we -- they could use in their farm or what their production process had to be. We simply came up with standards and the people that were involved were very idealistic and they were involved in organic agriculture because it was something they truly believed in and they just agreed with what we said and did what we laid down as our rules.

And I believe that as times have changed, you're going to be approached by people who want to
stretch rules or add ingredients that probably should
not be allowed and there would be three basic reasons
why they would. The first is, could be, the scale of
their operations. Many of the things that have been
allowed in modern agriculture have allowed farmers to
continually get bigger and bigger, but some of us
realized that those things aren't sustainable. So I
would caution you to be careful about allowing more and
more ingredients or procedures or processes that truly
aren't sustainable and really shouldn't be allowed, that
maybe the answer is to scale back on their size of the
farm and their production.

The second thing would be the health of the
soil. As someone spoke earlier, three years was just an
arbitrary number. In many cases it can take longer than
that for soils to be truly healthy. And that's where
all life begins. The soil is a living, breathing entity
and once it reaches a point that it's truly healthy and
maintained that way, the farm, the animals, the people
will also become more healthy and not require more and
more or different ingredients or treatments that a
hundred years ago weren't available, anyway.

And lastly, the thing that I can say in honest
opinion is agreed, there are many people moving into the
organic business now that really don't care about
consumers or farmers or sustainable agriculture or the health of the soil. They're, unfortunately, only motivated by one thing and that is to make money. And in my opinion, accumulating wealth and a corporate stock value and those types of things have no business influencing how decisions are made on organic standards. So you are now the current legal guardians of what started out as a very tiny, small organic movement and I hope you will take this seriously and think about those things as you face the challenges that you're met with. Thank you.

CHAIRPERSON RIDDLE: Thank you. Okay.

Kathleen Seus followed by Dennis Feland [ph].

***

MS. SEUS: Hi, my name is Kathleen Seus. I'm with Food Animal Concerns Trust or FACT. FACT is a nonprofit organization that advocates for humane and sustainable farming practices. I'm here as a representative of FACT and our 20,000 consumer supporters. I'd like to comment on access to pasture. I know you've heard a lot of comments already about it, but this is the hot topic. FACT believes dairy cows and all ruminants should have regular, if not continuous, access to pasture. For dairy cows this includes both dry and lactating cows. I've read through the comments.
of various corporations, organizations and individuals posted on the NOSB web site with regard to this issue. I've seen the call for sound science to guide the decision regarding the access to pasture requirement. I believe it's good practice to use science as a basis for informed decisions, however I have all too often seen animal agriculture commodity groups use the call for sound science as a way to avoid dealing with situations that require changes in their practices, despite the fact that animal welfare can be greatly improved with change.

And despite the plethora of animal welfare science available, any data that does not support the position of commodity agriculture has often been ignored or criticized by industry. The truth is science can be used to support both points of view, including the view that ruminants should be raised on pasture throughout their lifetime.

I'd also like to point out that there are new areas of animal well-being research emerging that not only look at physical data statistics such as sematic cell count, body conditions scores and parasite infection levels, but also at behavioral, motivational and ethical applications to assess animal well-being.

Scientific leaders in these areas include Ray Strickland.
from the University of Maryland, Janice Swanson from Kansas State University, Ed Pager and others at the Livestock Behavior Research Unit at Perdue just to name a few. If we're going to use science, let's make sure we incorporate all scientific disciplines when we make our decisions.

In fact, science can be used to support FACT's position and the position of many of the farmers we've already heard from today that dairy cows, both dry and lactating, should have access on a regular basis to pasture and I'm not going to go into that any longer. However, I think it was Rose that said science only goes so far and is only one tool that we have. Just as important as science are the guiding principles, philosophy and intent behind the National Organic Program. Twelve years and thousands of working hours, mostly volunteer in the making, FACT strongly believes the intent of the organic rule is to require dairy cows at all stages of their reproductive life to have access to pasture.

In addition, consumers expect, when they see organic dairy products in the stores and support them with their dollars, that the cows do have access to pasture. As an example, one Chicago-based consumer network has called for a boycott of dairy products that
do not provide access to pasture for lactating cows. As stated in their call to action, although the milk from cows raised on these dry lot style farms may be "technically organic" because of the feed provided to the cows, this 3,000-member organization's calling for support of "ethically organic producers," buying products from companies who understand the spirit of organics.

Unfortunately, due to imprecise terminology in the national organic rule, some companies have used creative interpretation to manipulate the wording, using temporary confinement for animal stage of production as a justification for not providing pasture to lactating animals. However, as stated earlier, this violates the spirit of organic agriculture and it's not the intent of the organic rule. These rules need to be more specific. It's not small family dairy farms that are challenging or manipulating the access to pasture requirement, but large corporations. These corporations are not philosophically committed to the spirit of organic agriculture, in fact, some of these corporations also manage commodity confinement dairy operations.

The corporations are entering the organic market place as a way to tap into a rapidly growing and profitable market segment. FACT has no qualm with large
businesses entering the organic marketplace. However, if they enter, they should abide and respect the basic principles of the philosophy of organic management practices. If large companies want to participate in organic dairy farming, they must change their management practices to meet the requirement of the organic rules and intend it, not expect the rules to change to accommodate their practices or management style.

It's important to protect consumers by protecting the integrity of the organic standard. This is true not only for dairy, but for other organic livestock, organic produce and all organic products. Otherwise, the organic standard will be meaningless. Remember, organic farming is supposed to represent the gold standard in food production. Let's make sure we keep it that way.

CHAIRPERSON RIDDLE: Thank you, Kathleen. Any questions? Okay, thanks. Next up is Dennis Feland. Is Dennis here? I'm not seeing him. Cameron Wilson, then, and then Adam Eidinger [ph]. And I would just like the record to reflect that Henry Perkins submitted 61 letters in support of his comments and Mark Kastel submitted 32 letters in support, as well as 209 petitions with five names per sheet, so 1,045 names in support of his comments. I just wanted to get that into
the record. Thanks. And you are Cameron?

***

MR. WILSON: Yeah, my name is Cam Wilson and I'm going to change the subject a little bit. We've been talking about livestock and I'm going to talk about slugs and snails and ferric phosphate. Okay. I represent the company, Nordorf [ph]. We're a German family-based company that develops natural products and one of the products we have is slug and snail bait which uses synthetic ferric phosphate as the active ingredient and we've petitioned to add synthetic ferric phosphate on the National List. The TAP review came back to us in early February with a two to one vote against allowing ferric phosphate on the grounds that alternate and effective methods exist.

So what I want to do is talk through the compatibility of synthetic ferric phosphate with organic crop productions and talk a little bit about the ineffectiveness of these alternate methods that currently exist. I'll highlight some of the comments from the scientific community about these current allowed methods, go into some of the economic needs for this type of product, discuss some of the current approvals for ferric phosphate that exist worldwide and also in this country. And then just a little bit about
where we are with the product, itself.

Compatibility with organic crop production.
EPA's bio-pesticides division determined that our ferric phosphate product will not harm humans, non-target organisms or the environment. This is from an EPA fact sheet. I believe you may have copies of this presentation that I've given, if not, you can -- it's easier to follow. According to the TAP review, synthetic ferric phosphate is consistent with organic farming and handling practices and the substance is compatible with the systems of sustainable agriculture as a crop production aid. And that was -- came from the review. That came from the TAP review.

Ferric phosphate occurs naturally in the soil, however, no mined source is commercially available. It is defined as grass, which is generally regarded as safe by the US FDA. Ferric phosphate biodegrades into iron phosphate, two nutrients that are used by plants. Synthetic ferric phosphate is already allowed for use in organic livestock production as a trace mineral and the reference to that is the National List 205603.

The ineffectiveness of alternate methods identified in the TAP review. This refers to pages one to three of the comments. I submitted a written response to the TAP review, which wasn't received until
last Friday, so you probably don't have copies of it and it hasn't been posted on the web site. However, the TAP review acknowledges severe limitations with alternate methods currently available. Letters from slug and snail research experts and organic farmers submitted to NOP state that current organic methods for slug and snail control do not work in a commercial organic agriculture and that baits would be the most effective control method. The current methods are only suitable for home gardens.

Experts in slug and snail research assert that ferric phosphate base are a more effective control measure for organic crop production and current alternate methods are not acceptable. The experts making these quotes include Dr. Ronald Hammond [ph], Ohio State University; Mark Gold [ph], the University of California; Brian Caldwell, Cornell University; Professor Glen Fisher, Oregon State University; and Dr. Maharmon Barrie [ph] from USDA.

Some of the highlights of the letters that they have submitted to NOP include the following comments: "Biological controls are not an effective option and will not -- and will sometimes feed on the actual crop." "Barrier controls are not effective because slugs and snails occur within the field."
"Dietentious [ph] earth is ineffective under moist conditions, therefore requiring constant reapplication. One mile of banding would be required for a 10-acre field, which is impractical." "Repellant controls wash off with rain or irrigation and require constant reapplications."

Two of the proposed repellants in the TAP review are copper-based products. Traps, bait stations would be required at a rate of 200 to a thousand stations per acre and would require constant filling.

CHAIRPERSON RIDDLE: So yeah, you didn't get the one minute warning.

MS. CAUGHLAN: Sorry. Too busy reading your material.

MR. WILSON: Oh, is that -- that was the one minute warning? I didn't --

CHAIRPERSON RIDDLE: No, that was actually the five minute time. So yeah, just --

MR. WILSON: Okay, I will mention you can read through the economic damage from slugs and snails. I would just like to mention one -- it's really important, is that this product, this -- ferric phosphate is already approved by the EU. It's approved in Australia. It's up for approval in the next two to three months.

In Canada, the Canadian Food Inspection Agency allows York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
USDA-approved products to come in and does not require their own standards at the moment. And there's no GMO ingredient in this product. The product is registered, it's currently used by growers, not organic growers, but -- and I respectfully ask the NOSB committee to consider adding synthetic ferric phosphate to the National Organics List.

CHAIRPERSON RIDDLE: Thanks. Hugh.

MR. KARREMAN: I don't know the whole background of the TAP review since I'm not on the Crops committee, I guess that's through the Crops. By the time -- actually, I'm pleasantly surprised to hear that there's a snail and slug bait because lungworm is a real problem for dairy farms in the northern part of the country and snails are the factor for lungworm, so I just want to state for the record I like that there's some kind of prevention for lungworm possibly out there in the organic world along with that all the other agencies around the world seem to be okay with it and that it is grass.

CHAIRPERSON RIDDLE: Rose.

MS. KOENIG: Part of the discussion yesterday in regards to Sunset, how to do it, targeting materials on the list that don't fit within OFPA categories. If you look on page 23 of the TAP review of the ferric...
phosphate, the reviewers say that ferric phosphate does not have any of the following components, and what they mean under that -- for that reason clearly that there's certain categories within the organic food production -- that materials have to fall within and if they don't fall within them, they really can't be listed. Now, I'm not saying, because we've seen it yesterday that there are some inconsistencies in doing our Sunset process -- we're going to try to reconcile the inconsistencies because we have to be consistent with OFPA. So I'd implore you to kind of look at your product and maybe tomorrow morning our discussion, you know, state your case --

MR. WILSON: Yeah, I'll be here all day tomorrow.

MS. KOENIG: And I'm not arguing with any of your EPA information. I'm asking you to tell me what category that material falls under --

MR. WILSON: Sure.

MS. KOENIG: -- in the organic food production list.

MR. WILSON: So which category --

MS. KOENIG: Yeah. And if you need some guidance, we can talk about it --

MR. WILSON: Yeah, I probably will, so --
MS. KOENIG: I asked you to refer to page 23 of the TAP because that's the one that where it says -- the reason why it's under livestock is that you stated it's under minerals and that is an OFPA category.

MR. WILSON: I guess the interpretation was did they classify it as a production aid?

MS. KOENIG: That was the interpretation and I mentioned yesterday during the meeting that there was an approach in the Crops committee during the last term -- this meeting had a quorum, so -- and some of that it wasn't a majority opinion as to whether that goes into that and additionally, that OFPA category, there has been documentation in October to kind of define that category and at this point -- we have -- there is some definition within OFPA. Yours clearly doesn't fit within that. What is described in OFPA for production aid, the Board is considering, you know, perhaps looking at an expansion of that, but at this point, there is no other guidance other than what's in OFPA --

MR. WILSON: Right.

MS. KOENIG: -- and from what I can see, as a Material chair, I can't find where it would fit within OFPA categories.

MR. WILSON: Yeah, we had this internal discussion in our own office that it -- we call -- for
us, it's a mineral and we didn't understand why it was
classified as a production aid, but we ended up with
deciding amongst ourselves that that's a nice word for a
pesticide, is a production aid, that doesn't fit into
another category, you know, such as a soap or a
horticultural oil.

MS. KOENIG: So that is -- if there has been
discussion, that would be the most truthful information
to present to the Board during that time, as far as
comment.

MR. WILSON: So whether it's classified as a
mineral or a production aid --

MS. KOENIG: Well, if you could provide us
with information and -- what production category you
feel you're --

MR. WILSON: Right.

MS. KOENIG: -- within OFPA, within those
restrictions for us to consider, that would be
fruitful --

MR. WILSON: I think it's -- like OMRI
classifies it as a vitamin/mineral section under
livestock.

MS. KOENIG: Livestock is very different
from --

MR. WILSON: Yeah.
MS. KOENIG: I don't want to take up any more time.

MR. WILSON: Okay, thank you. Appreciate that. And thank you for your time.

CHAIRPERSON RIDDLE: Yeah, thanks Cam. Okay, Adam Eidinger and then Grace Meriquin.

***

MR. EIDINGER: Good morning. My name is Adam Eidinger. Thank you for having me here today. I'm representing the Organic Consumers Association and I'm going to be submitting a petition today that's been signed by 4700 people over the last weekend over allowing factory dairy farms to be certified organic. I basically just want to read the petition and that's going to be the extent of my comments today.

"Intensive confinement of dairy cattle is unacceptable under the USDA organic label or according to federal regulations; is also inhumane and in the case of factory farms, bad for the environment. American organic consumers believe that milk and dairy products labeled organic are coming from cows that have regular access to pasture and are primarily grass-fed. Organic dairy feed lots violate organic integrity, defraud consumers and threaten to undermine consumer faith in the USDA organic label. Grain-fed cattle and dairy
animals are not as healthy, nor are their products as nutritious and healthy as grass-fed or pastured animals. Grass-fed is a traditional organic approach and the best way for both the cows and human health."

"America has 80,000 dairy farms left with an average herd size of 80 to 90 animals. Many of these farmers would go organic if they got the help in technical assistance and economic incentives to do so. The organic community needs to get off our knees and demand our fair share of the USDA budget in farm subsidies. We don't need organic feedlots with thousands of cows in intensive confinement pretending to be organic farms to produce the organic meat and dairy the country needs. A critical mass of America's family size dairy farms can make the transition to organic and meet the ever-growing market demand for organic products if they are given a helping hand to do so."

"Horizon and Aurora and other dairy feedlots need to be pressured to abandon their factory farm feedlot strategy. If they are willing to buy from genuine pasture-based organic dairy farmers, then OCA can recommend their products. Otherwise, we'll have no choice but to eventually call for consumers to avoid purchasing all factory farm organics. If we let the industrial organic model prevail, for example, factory
dairy farms selling to Wal-Marts to give them, give
consumers cheap low-grade organic products, we will run
the risk that small and medium-sized farmers and
retailers will not survive."

"The Organic Consumers Association calls on
the USDA NOP to accept livestock standards recommended
by the NOSB that call for regular pasture access and a
predominantly grass-fed diet for organic dairy cows.
Organic feedlots must cease and desist from labeling and
selling their products as organic."

The Organic Consumers Association is
submitting a petition today signed by 4700 organic
consumers over the weekend calling for USDA NOP to
uphold strict organic standards for dairy products and
to save paper, I put it on a disc rather than to print
them all out.

CHAIRPERSON RIDDLE: Yeah. All right.

MR. KARREMAN: Just a quick point. You
mentioned some specific dairy processors in your talk
and I'd just like to say that you mentioned Horizon and
I have 35 certified organic Horizon producers in my area
and their average herd size is probably about 50 cows,
so just be careful calling the whole company as a
factory farm-type situation.
MR. EIDINGER: Clearly, that's not the case. I understand -- I mean, what you're saying is true and it's not the case that Horizon is engaging in this, but we understand that plans are in the works and that's something that we are watching and concerned about, especially when you have very large retail -- the largest retailer in the country, Wal-Mart, attempting to become a major distributor.

CHAIRPERSON RIDDLE: Yeah, and we're not here to debate the merits of any one particular company, but rather to focus on the draft before us and how to clarify and strengthen the pasture requirements, so I appreciate your support in that effort.

MR. EIDINGER: Okay. Thank you.

CHAIRPERSON RIDDLE: Next is Grace Meriquin and then Arthur Harvey.

***

MS. MERIQUIN: A little change of pace. My name is Grace Meriquin and I'm president of Meriquin International based in California. We import organic ingredients for the food industry. I'm here once again to request that the Board support the classification of yeast as an agricultural product. Yeast is currently listed under Section 205.605(a) as a nonsynthetic, nonagricultural substance. It was seven months ago, on
July 30, 2004, that we first filed our request with the Board. Since then, there has been a task force of the Handling and Materials Committee working on an overall definition to distinguish nonagricultural from agricultural materials. The task force has been considering our yeast question as part of this effort and we thank you all for this consideration.

However, we want to emphasize that yeast is a special case that deserves its own solution, whether or not there's a general definition of agricultural versus nonagricultural and we are asking that yeast should be treated as an agricultural product now that it can be produced organically. In 1993 when the NOSB was planning the original National List, no one had yet heard of organic yeast and based on the state of technology at the time, the NOSB considered yeast as a nonsynthetic material, but one that could not be produced organically. In those days all yeast production relied, on some extent, on the use of synthetic materials.

To make organic products with yeast, it was necessary to put yeast on the National List. This led to the listing of yeast, beginning in 1997 in the first proposed rule as a nonsynthetic but also nonagricultural. It is important to note that the NOSB

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
voted to declare all five types of yeast listed under Section 205.605 as nonsynthetic. Yeast is, after all, a living microorganism, a fungus. Yeast is grown and harvested like a crop. There is nothing inherent in yeast that prevents it from being produced organically or being considered an agricultural product, just as mushrooms.

By 2000, a European yeast manufacturer, Grano [ph], in Germany, developed a process for making organic yeast. This yeast, Beorial [ph], is certified organic by two organic certifiers in Europe, Lacon [ph] in Germany and BioSwiss in Switzerland.

Now I'll get to the real crux of the matter and it's not easy to explain this, but because the NOP Final Rule treats yeast as a nonagricultural substance, we find ourselves in a real Catch 22. Take an agricultural ingredient. It has to be organic if organic is available. Take yeast. On the National List yeast is called a nonagricultural substance and this is -- now, this is a real problem. There is no way to require an organic ingredient to be organic if it is nonagricultural. In a letter from Richard Matthews on February 11, 2004, he confirmed that under the Final Rule, handlers are not required to source organic yeast. Presently, once manufacturers meet the 95 percent
threshold, they are free to use conventional yeast in
the remaining five percent.

To our knowledge, organic yeast is the only
organic ingredient that manufacturers are not required
to use. Because of this quirk in the Final Rule, this
is all completely legal. This is why we're asking for a
change in the status of yeast in the Final Rule. All we
ask, are asking for is a fair shake for yeast. Once the
NOP regulations put yeast on the National List as an
agricultural product, then manufacturers will be
required to use organic yeast if it's commercially
available. Manufacturers are using conventional yeast
instead of organic yeast in organic products. This
conventional yeast is made with a host of synthetics as
processing aids. Conventional yeast is made with the
following synthetics: ammonia, ammonia salts, sulphuric
acid, caustic soda lye and synthetic foaming agents.

In closing, we'd like to leave the Board with
four points. In 2000 the Board, acted decisively to
recommend that seven nonsynthetic materials be
reclassified as nonagricultural. All we're asking is
that the Board make the same type of recommendations
that it made in 2000. The second -- has presented a set
of criteria to determine whether materials are
agricultural or nonagricultural. Under this criteria

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
yeast would be an agricultural product. And finally, yeast is not a synthetic. It is not affected in any way by the recent federal ruling of Harvey versus Venemen about the synthetics in processed foods. So thank you all and I appreciate the consideration.

CHAIRPERSON RIDDLE: Thanks, Grace. Kevin.

MR. O'RELL: Grace, we certainly understand the problem and your concerns and I know that this has been an issue in front of the Handling Committee and this Board for a period of time. We understand -- we appreciate your patience in this. I know you weren't here at the update yesterday when we talked about some discussion items, or maybe you were and I missed you.

MS. MERIQUIN: Yeah, I was. You're going to discuss it at the next meeting.

MR. O'ReLL: Okay.

MS. MERIQUIN: And I appreciate that.

MR. O'RELL: Absolutely, we felt that, when we looked at the situation with yeast, it was the committee's determination that to just make a decision on yeast without clarifying the definitions of agricultural and nonagricultural would have had an impact on other items that are on 205.605(a). So in order to go through the process, we really feel we need to get the definition for agricultural, nonagricultural
clarified. We intend to make that recommendation by the
next meeting and that, in turn, we'll take on the
question of the yeast.

MS. MERIQUIN: So there will be an action
point?

MR. O'ReLL: It will be an action point at the
next meeting.

MS. MERIQUIN: Yahoo.

MR. O'ReLL: Yes.

MS. MERIQUIN: Anyone else?

CHAIRPERSON RIDDLE: George.

MR. SIEMON: Just so I understand. So once we
have that document then it will be just a simple motion
on our part to suggest to change -- let's say we say
that it's agricultural, then what's the action we're to
take?

CHAIRPERSON RIDDLE: Well, yeah. I assume
we'll have a good draft to work from and be able to act
on it and if we vote, then that would be a
recommendation for a rule change to the Department, so
it would have to re-categorize yeast or other similar
substances as agricultural.

MS. KOENIG: I would just remind the Handling
Committee that Sunset review is taking place, that you
could tap into additional funds and review this in the
context of that by utilizing outside sources, so think about perhaps including that process.

MR. O'RELL: And yesterday -- is this on? Yesterday when we -- yeah, the light -- either way. I blew it. Yesterday when we spoke about our priorities for Sunset review, we talked about three materials and yeast was one of those materials that we are expediting for a review.

MS. MERIQUIN: But you're not saying that this wouldn't then really go into effect until 2007, when you're saying that?

MR. O'RELL: Well, I think what we need to do is to complete our committee work and then make a recommendation, but as I said, we won't get at it -- it's an action item for the next meeting.

MS. MERIQUIN: I would greatly appreciate that and I thank you all.

MR. O'RELL: And I have a question and you don't have to answer it now, but if you know of any other government regulation that would categorize yeast as agricultural, that would be very helpful information --

MS. MERIQUIN: I think we've included that in a memorandum in July --

MR. O'RELL: Okay.
MS. MERIQUIN: -- because when you import yeast it's imported under an agricultural product, so --

MR. O'RELL: Okay.

MS. MERIQUIN: -- that's in keeping with what USDA has already established.

MR. O'RELL: Okay, great.

MS. MERIQUIN: Thank you.

MR. O'RELL: Thanks.

CHAIRPERSON RIDDLE: All right, Arthur Harvey and next up, Tom Hutchison.

***

MR. HARVEY: Hi, I'm Arthur Harvey from Maine. I'm a certified organic blueberry grower, a certified handler, a certified beekeeper and also an uncertified distributor of -- by virtue of the exclusion in the regulation for distributors. And I do some organic inspecting, as well. My affiliations have nothing to do with what I'm going to say here today, but I am a member of the North American Fruit Explorers, a member of the Independent Organic Inspectors Association, a member of the Organic Trade Association and a member of the planning board in my town.

My topics today will continue a discussion begun by Barbara Robinson yesterday. First of all, on the summary judgment of the appeals court decision, I
hope the NOP or the AMS will choose to seek some input to the terms of the summary judgment by a conversation with me. I will be in D.C. until Thursday after lunch and my attorney's office is approximately half a mile from here. As you know, the court will look primarily to the plaintiff for a recommended summary and the defendant also can give an opinion. However, if the plaintiff and defendant agree, then the court is almost certain to respect their recommendation. It's worth a try, in my view.

And this leads me to the broader issue of due diligence by the NOSB. The NOSB is charged with the responsibility of developing policy and consulting with the NOP on the implementation and the direction of the program. I think that this should begin and really, it must begin by the Board members, individually and collectively, studying the Organic Foods Production Act. Too often in the past I think the Board members have dipped into a particular part of the Act and pulled out a sentence or a paragraph which seemed to apply to a particular situation. That's not enough.

Any law or any court decision can be understood only by reading it as a whole as it was written. There are areas in the Act which are ambiguous, but then there are lots of areas that are not...
ambiguous and the Board members need to understand those. There are gaps in the regulation. I can mention three specific sections of the Act which have never been implemented in the regulation and I think the Board should give special attention to those. In 6510, Subsection 5 and 6 deal with storage and packaging and if you read those parts of the law you'll see that there is certainly scope for the use of synthetics in both storage and packaging and you couldn't really have packaging without some synthetics.

So any discussion of the recent court decision which eliminated synthetics in some aspects of handling should not be understood as eliminating synthetics in storage and packaging. It's a very important distinction. And I think only -- this -- these distinctions will only be made clear when the rule includes additional subsections dealing with storage and packaging.

There are also some contradiction in the rule which -- particularly in Section 105 that might bear your study, so I guess that's all I have to say at the moment.

MS. CAUGHLAN: Well, you did -- you mentioned 6510. What were the other two that you wanted to --

MR. HARVEY: Oh, yes. Well, the Safe Drinking
Water Act requirements and handling are mentioned in the Act but not carried over into the rule and I think if they were carried over into the rule, then the scandalous use of chlorine which is now occurring because of this lack in the regulation, that chlorine is being used up to 200 parts per million in handling fresh produce and carcasses and it really shouldn't be happening and if the law's requirement for safe drinking water, then that wouldn't be possible.

CHAIRPERSON RIDDLE: And what's the third?

MR. HARVEY: Well, the third -- there are these two sections in regard to packaging and storage and they are separate subsections in the law. It should be addressed.

CHAIRPERSON RIDDLE: Thanks, Arthur.

MR. HARVEY: Sure.

CHAIRPERSON RIDDLE: Tom Hutchison, then Jim Pierce.

***

MR. HUTCHISON: Tom Hutchison, Organic Trade Association. Welcome to the new Board members. Pleasure to be here. OTA thanks NOSB's Policy Development Committee for its prompt response and proposed recommendation for a rule change regarding "made with" products, that such products should not be
allowed to contain both organic and nonorganic forms of
the same ingredient and for its recommendation for
communication from USDA to the Association of American
Plant Food Control Officials concerning the use of the
word organic on fertilizer labels.

OTA thanks NOSB's Livestock Committee for
recommending an extension of the Sunset for methionine
and urges the full work to follow suit. OTA looks
forward to a recommendation on criteria for research
exemptions. OTA also thanks the Livestock Committee for
its apiculture standards, which have been needed for
some time. While the proposed standards vary from OTA's
American Organic Standards and previous NOSB-recommended
standards, OTA is most willing to accept the results of
the NOSB process, which we trust represents further
consideration of what is workable. I believe NOSB has
received comments which address the workability of the
standards and hope that the traditional balance between
rigor and workability will be maintained.

Regarding the likely affects of the Harvey
versus Veneman decision, OTA is assessing the likely
economic impact on the trade and will communicate this
to USDA. For your information, OTA has submitted to
USDA an argument against including "made with" products
in the decision based on the non-applicability of OFPA
to such products except for the organic portion of those products. OTA notes that the rigorous requirements for "made with" products in the rule, even though these are not required by the law, are also part of the carefully crafted compromise the rule represents.

Regardless of speculation regarding the ultimate remedy for the lawsuit, OTA requests that NOSB issue a statement defending its prior recommendations and process by stating in a letter to the Secretary that NOSB recommends that the Secretary work in whatever ways are possible for the NOP to continue as it has been formulated and currently exists in the NOP Final Rule. The rules, the result of a decade-long discussion among a very broad set of stakeholders, that resulted in a carefully crafted compromise allowing both strict standards and the continued growth of the organic sector. Thank you.

CHAIRPERSON RIDDLE: Bea.

MS. JAMES: Would you be willing to share a copy of what you were just reading there with --

MR. HUTCHISON: Yes. This is an amended version of the copies I had made. I will get that to you by tomorrow.

MS. JAMES: Okay, thank you. Thank you.

CHAIRPERSON RIDDLE: Okay, Rose.

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
MS. KOENIG: I just wanted to make a clarification because a number of people had said an extension on the findings. The process is that that material, the Sunset, is three years. So what is being brought forth, at least my understanding as the Materials chair is that it has been re-petitioned, okay? So when they look at it, we're not -- it is Sunset with the term Sunset on it, because I keep on hearing people saying that word, considering an extension. We're not considering an extension, we're -- it has been re-petitioned. It's just a technical change, but I think it's significant because we have to respect what the prior Boards have voted on for that particular material.

CHAIRPERSON RIDDLE: Andrea.

MS. CAROE: Addressing your comment that this Board should provide a recommendation that our prior recommendations be considered. If the judgment comes down and the court orders a remedy to the discrepancies noted in the lawsuit, we want to use -- can happen. I mean, obviously we like our prior recommendations; we wouldn't have spent the time we worked on them, but I'm sure what you expect from the Secretary or this Board to do is that it is part of summary judgment the court orders that remedy would happen.
MR. HUTCHISON: As has been noted, the remedy has not yet been set. Primarily, we're looking for a statement of USDA support for past NOSB and NOP work, including the structure of Section 605, which USDA has previously offered arguments for. We're not sure that all of those made it into the discussion around this particular case. We'd just like those to go on the record again. I would leave all the specifics of whatever's possible to the Secretary.

I'm sure that USDA knows far more than I do about how they might go about participating in the process. Options do include legal challenges still at this point, including asking for further consideration of the case and one of the good reasons to do this is because there has been a great deal of confusion around whether or not the decision is applicable to "made with" products.

That's something that certainly should have been clear in the decision and isn't, and it would have an extraordinary economic impact on the industry and therefore that should be clarified as early as possible. Again, a statement for -- of support for minimizing the impact on the trade would be helpful and those are the sorts of things that I think could come out of that.

CHAIRPERSON RIDDLE: And as you know, we don't
have an agenda item to address the impacts of the
lawsuits during this meeting and I would ask that your
comments be directed to the Policy Development Committee
and also that Barbara Robinson and Richard Mathews are
going to be giving a brief NOP update and maybe they can
respond to some of that here this afternoon, so thanks.

MR. HUTCHISON: Thank you.

CHAIRPERSON RIDDLE: Jim Pierce and then
Jo Ann Baumgartner and then we'll have to talk about
lunch.

MR. PIERCE: You ready?

CHAIRPERSON RIDDLE: Yes, indeed.

***

MR. PIERCE: Good morning, Mr. Chairman, NOSB,
NOP staff, ladies and gentlemen of the gallery. I'm
Jim Pierce, self-appointed certification czar at Organic
Valley Crop Cooperative. In preparing remarks for
today, I reviewed my files of past public comments. By
my count, at least 12 times I've given you advice,
criticism, constructive and hopefully, a smile or two.
Why? For one thing, I like it. I enjoy condensing a
thousand thoughts into 700 words and watching your
reaction, especially you, Jim and Goldie.

Another thing, I'm a man of action.
Testifying before you gives me a sense of
Accomplishment. Admittedly, some years it's like carrying a cup full of water great distances to the sea only to throw it in, but at least -- it may not make much of a difference, but darn it, along with everyone else, we've done something. And who knows? Mostly I do it because I like a challenge and God knows over the years the National Organic Standards have been a challenge.

Now, usually the comments that I bring to you are on behalf of the farmer-member-owners of the Crop Cooperative. The farmers in my co-op wholeheartedly endorse the farm-based plan approach to resolving the pasture situation and are greatly concerned about the potential loss of the whole farm transition for dairy, the 80-20 rule. The body of my testimony today, though, orbits far beyond the co-op and are presented on behalf of the greater US organic poultry community.

Our dog in this meeting's hunt is methionine. With the -- I'm sorry, I lost my place. Since the Board meeting last October, I'm fast becoming a reluctant expert on the subject with the logistical assistance of the Organic Trade Association, I led a task force of about a dozen actual experts through the process of writing a petition for the extension of methionine Sunset beyond this October. Could the petition have
been done better, he asks rhetorically? Yes, of course. Way better. Unfortunately, life is what happens while dreaming and recently life in the National Organic Standards sense has been the type of dream that you wake up from in a cold sweat. Do I honestly feel bad that we didn't deliver every attachment that we promised? Yes, sir, you betcha, as they say back home.

Finally, is the task force in agreement with the recommendation that the Livestock Committee has put forward to allow the use of methionine for three more years while research is completed? Yes, we are and as a group, we strongly encourage the rest of you on the Board to approve this recommendation. Three years is sufficient time to do meaningful trials and on various feed stuffs that show potential and to accumulate some good data from the university studies outlined in the petition.

Despite the absence of posted endorsements of our petition, as well as for your recommendation, they have been accumulating and will be submitted for the record with this testimony. The task force co-chair, Bob Buressh, has been tallying signatories, including organic egg and broiler marketers who represent hundreds of producers. The list will grow considerably since the use of synthetic methionine among poultry producers—
growers in this country is universal. For good or bad, that is the production model that we must find actual, practical, suitable alternatives to.

As accidental expert at the hub of this process, I see several potential breakthrough situations in our reliance on synthetic methionine. The most obvious is the development of alternative feedstuffs rich in natural methionine, such as potato protein, corn gluten and casein. More exciting, perhaps though, is the potential production of natural methionine through fermentation, as well as the rediscovery of heritage breeds, which produce well on lower methionine requirements.

As you may know, the organic -- the European community is also struggling with the same challenge of a hundred percent organic diets and no synthetic methionine. It's clearly in our common interest to share information in order to overcome this challenge. In researching the petition, those channels of communications have been opened.

If you, the NOSB, agree to the proposed three-year extension, then I promise you that the methionine task force will give our very best good faith effort to publish periodic reports on our progress so that you will have the assurance that the time which you have so
graciously granted us will be used as effectively as possible. Thank you very much and I'll be happy to answer any questions that I know the answer to. Okay. And who gets this for the record?

CHAIRPERSON RIDDLE: Okay. Thanks, Jim.

Jo Ann.

***

MS. BAUMGARTNER: Hello, I'm Jo Ann Baumgartner, Director of the Wild Farm Alliance. Thank you for hearing my comments today. We request that the biodiversity conservation criteria be added to the natural resource section of the NOSB's model organic system plan. To give you some background, the Wild Farm Alliance is composed of sustainable agriculture advocates and wild lands conservation proponents. We have been in existence for four years and are located in Watsonville, California. We have a national focus and a well-known national board.

A few years ago IOIA, Independent Organic Inspectors Association, asked us to send them biodiversity conservation materials for use in their inspector training sessions. After sending them some basic materials, we realized that a broad-based group should be brought together to identify biodiversity criteria. With funding support from Organic Farming

York Stenographic Services, Inc.
34 North George St., York, PA 17401 - (717) 854-0077
Research Foundation and others, a technical advisory committee was formed composed of organic farmers, certifiers, inspectors and conservationists. The committee reviewed biodiversity criteria used by organic certifiers around the world. It also thoroughly examined the National Organic rule, which requires biodiversity conservation, both in the definition of organic production and in the preamble and we found that the natural resource section requires maintenance or improvement of wetlands, woodlands and wildlife.

With this knowledge, we identified international biodiversity practices that were applicable to the NOP rule. While we were developing these educational guides for organic farmers and certifiers, which you have a summary of the guides in your packet, our committee realized that the NOSB support of biodiversity criteria in the organic system plan was an important piece of this effort, if all organic farmers and certification agencies were to truly address what is already in the NOP rule. In addition, the NOSB's endorsement would help even out the application of this rule across the country.

Organic agriculture is often thought as ecologically sustainable and indeed, it should be. While having much to offer, it also has a ways to go.
Consider that all agriculture across the continental U.S. comprises -- it takes up about two-thirds of the landscape, but its impacts to habitat and water resources make it responsible for more than a third of our wildlife and a quarter of our plants being on endangered species lists.

Organic production has well addressed toxic pollution impacts. Once the biodiversity intent of the rule is addressed, organic farms will begin to better contribute to reversing this biodiversity crisis and at the same time will reap the beneficial ecosystem services nature has to offer. And organic marketers can capitalize on this deeper commitment to biodiversity by swaying the millions of members of wildlife groups that organic is not just about clean food, but about ecologically functioning landscapes.

I know how hard it is to farm in today's global economy because I was an organic farmer for 10 years. I also know that management decisions can be and are made that balance the needs of farms with the needs of biodiversity and natural resource conservation. Last fall we submitted initial requests to NOSB. I'm going to leave the version that is before you now. The Crop Committee helped to revise and streamline it to a more concise form. It is this revised biodiversity criteria.
we are requesting to be included in the NOSB's organic system plan. This request does not seek to rewrite or clarify the rule, rather it's providing a key element in helping to implement existing regulation. By endorsing these biodiversity conservation additions to the OSP, you will be keeping the ecological integrity of organics strong.

Once a decision is made by the NOSB, we will publish our biodiversity educational guides and distribute them to a couple thousand organic farmers and certifiers. Our current and planned outreach also includes working with IOIA on their biodiversity standards, producing events like the one we just had on farm biodiversity prior to the ecofarm conference and making presentations to USDA -- staff and at inspector training sessions. Thanks for considering this request.

And then I wanted to make a comment about asher [ph]. Our board feels that the recent draft on graze feed needs to be further defined so that the word significant is articulated better, so -- any questions?

CHAIRPERSON RIDDLE: Hugh.

MR. KARREMAN: Just where is that biodiversity statement? Where do you want to put that into? I'm just not up to speed.

CHAIRPERSON RIDDLE: It's under Crops.
Committee. There'll be a tab for biodiversity, I think it's called. So I just want to be clear on what you're asking for and that is adoption by the full Board of the Crops Committee draft. You're not suggesting any amendments to it, you're comfortable with it the way it stands.

MS. BAUMGARTNER: Yes, exactly.

CHAIRPERSON RIDDLE: And then I -- just to make sure I heard you clearly then, that will -- or your group is waiting our action before you move some of your guidance forward, correct? Is it --

MS. BAUMGARTNER: Um-hum.

CHAIRPERSON RIDDLE: And then I also understand that ATTRA has funding for a project to revise the organic system plan template, so if we endorse this, it could feed into that project, as well.

MS. BAUMGARTNER: That's right. And ATTRA will be speaking about that later.

CHAIRPERSON RIDDLE: Oh, okay. All right. Anyone else? Thanks. Thanks, Jo Ann.

MS. BAUMGARTNER: Thank you.

CHAIRPERSON RIDDLE: Well, it's noon or a little after and I haven't done the numbers, but there are still quite a few people who signed up for today that we haven't gotten to. Whether to just continue...
with public comments for another half hour or to break
for lunch and come back; I mean, we have a lot of
business we need to attend to, as well. Richard has
offered the NOP update currently on the agenda as 45
minutes, to shrink that down to about 15 minutes and
really cover the most important points so we can save
some time there. The Board members, is there a sense
here, a suggestion?

UNIDENTIFIED SPEAKER: Do you think we could
get it done in a half an hour?

CHAIRPERSON RIDDLE: The remaining commenters?
No.

MR. O'ReLL: No, no. No. We've got to -- no,
take the break because -- either way.

CHAIRPERSON RIDDLE: Right, if we're going
to --

[Simultaneous comments]

MR. WRIGHT: Can I speak on behalf of some of
my fellow dairy farmers who have come across the country
out of their own pocket? It would behoove us to give
them an opportunity to make their trip worthwhile.

CHAIRPERSON RIDDLE: I understand and
sympathize with that. I see Richard reaching for the
microphone. Do you have a suggestion here?

MR. MATHEWS: Yeah. The people that are in
